The political tempest which had been long gathering over France, now began to break and to carry everything before it. Condorcet was, of course, at once hurried along by it into the midst of the conflicts and confusion of the Revolution. He greeted with enthusiasm the advent of democracy, and laboured hard to secure and hasten its triumph. He was indefatigable in writing pamphlets, suggesting reforms, and planning constitutions. The first political functions which he exercised were those of a member of the municipality of Paris. He was next chosen by the Parisians to represent them in the Legislative Assembly, and then appointed by that body one of its secretaries. In this capacity he drew up most of its addresses, but seldom ascended the tribune, his pen being a more effective weapon than his tongue. He was the chief author of the address to the European powers when they threatened France with war. He devised likewise a bold and comprehensive scheme for the organization of public instruction, and not only brought it before the Assembly but published an exposition of it in five elaborate memoirs. In the Convention he sat for the department of the Aisne. At the trial of Louis XVI. he voted the king guilty of conspiring against liberty, and worthy of any punishment short of death, but recommended an appeal to the people. He took an active part in the framing of a constitution, which was laid before the Convention in February 1793, with an elaborate prefatory dissertation of Condorcet's composition, but another was introduced, adopted, and decreed. Condorcet's severe criticism of this latter document, his denunciation of the arrest of the Girondists, and his opposition to the violent conduct of the Mountain, led to his being accused of conspiring against the Republic. He was condemned and declared to be *hors la loi.* Friends sought for him an asylum in the house of a Madame Vernet. Without even requesting to know his name, this truly heroic woman, as soon as she was assured that he was an honest and virtuous man, said, "Let him come, and lose not a moment, for while we talk he may be seized." When the execution of the Girondists showed him that his presence exposed his protectress to a terrible danger, he resolved to seek a refuge elsewhere. "I am outlawed," he said, "and if I am discovered you will meet the same sad end as myself. I must not stay." Madame Vernet's reply deserves to be immortal, and should be given in her own words: "La Convention, Monsieur, a le droit de mettre hors la loi: elle n'a pas le pouvoir de mettre hors de l'humanite; vous resterez." From that time she had his movements strictly watched lest he should attempt to quit her house. It was partly to turn his mind from the idea of attempting this, by occupying it otherwise, that his wife and some of his friends, with the co-operation of Madame Vernet, prevailed on him to engage in the composition of the work by which he is best known—the *Esquisse d'un tableau historique des progès de l'esprit humain.* Certain circumstances having led him to believe that the house of Madame Vernet, 21 Rue Servandoni, was suspected and watched by his enemies, he, by a fatally successful artifice, baffled the vigilance of his generous friend and escaped. Disappointed in finding even a night's shelter at the chateau of one whom he had befriended, he had to hide for three days and nights in the thickets and stone-quarries of Clamart. On the evening of the 7th April 1794—not, as Carlyle says, on a "bleared May morning,"—with garments torn, with wounded leg, with famished looks, he entered a tavern in the village named, and called for an omelette. "How many eggs in your omelette?" "A dozen." "What is your trade?" "A carpenter." "Carpenters have not hands like these, and do not ask for a dozen eggs in an omelette." When his papers were demanded he had none to show; when his person was searched a Horace was found on him. The villagers seized him, bound him, haled him forthwith on bleeding feet towards Bourg-la-Reine; he fainted by the way, was set on a horse offered in pity by a passing peasant, and, at the journey's end, was cast into the cold damp prison-cell. When the jailers looked in on the morning his body lay dead on the floor. Whether he had died from suffering and exhaustion, from apoplexy, or from poison, is an undetermined question.

Condorcet held many opinions which comparatively few will be found ready to indorse, but he was undoubtedly a most sincere, generous, and noble-minded man. He was eager in the pursuit of truth, ardent in his love of human good, and ever ready to undertake labour or encounter danger on behalf of the philanthropic plans which his fertile mind contrived and his benevolent heart inspired. He lived at a time when calumny was rife, and various slanders were circulated regarding him, but fortunately the slightest examination proves them to have been inexcusable fabrications. That while openly opposing royalty he was secretly soliciting the office of tutor to the Dauphin; that he was accessory to the murder of the Duc de la Rochefoucauld; or that he sanctioned the burning of the literary treasures of the learned congregations, are stories which can be distinctly shown to be utterly untrue.

Condorcet's philosophical fame is chiefly associated with the work which he wrote when lying concealed from the emissaries of Robespierre in the house of Madame Vernet. With the vision of the guillotine before him, with confusion and violence around him, he comforted himself by trying to demonstrate that the evils of life had arisen from a conspiracy of priests and rulers against their fellows, and from the bad laws and institutions which they had succeeded in creating, but that the human race would finally conquer its enemies and completely free itself of its evils. His fundamental idea is that of a human perfectibility which has manifested itself in continuous progress in the past, and must lead to indefinite progress in the future. He represents man as starting from the lowest stage of barbarism, with no superiority over the other animals which does not result directly from superiority of bodily organization, and as advancing uninterruptedly, at a more or less rapid rate, in the path of enlightenment, virtue, and happiness. The stages which the human race has already gone through, or, in other words, the great epochs of history, are regarded as nine in number. The first three can confessedly be described only conjecturally from general observations as to the development of the human faculties, and the analogies of savage life. In the first epoch, men are united into hordes of hunters and fishers, who acknowledge in some degree public authority and the claims of family relationship, and who make use of an articulate language. In the second epoch—the pastoral state—property is introduced, and along with it inequality of conditions, and even slavery, but also leisure to cultivate intelligence, to invent some of the simpler arts, and to acquire some of the more elementary truths of science. In the third epoch—the agricultural state—as leisure and wealth are greater, labour better distributed and applied, and the means of communication increased and extended, progress is still more rapid. With the invention of alphabetic writing the conjectural part of history closes, and the more or less authenticated part commences. The fourth and the fifth epochs are represented as corresponding to Greece and Rome. The Middle Ages are divided into two epochs, the former of which terminates with the Crusades, and the latter with the invention of printing. The eighth epoch extends from the invention of printing to the revolution in the method of philosophic thinking accomplished by Descartes. And the ninth epoch begins with that great intellectual revolution, and ends with the great political and moral Revolution of 1789, and is illustrious, according to Condorcet, through the discovery of the true system of the physical universe by Newton, of human nature by Locke and Condillac, and of society by Turgot, Price, and Rousseau. There is an epoch of the future—a tenth epoch,—and the most original part of Condorcet's treatise is that which is devoted to it. After insisting that general laws regulative of the past warrant general inferences as to the future, he argues that the three tendencies which the entire history of the past shows will be characteristic features of the future are:—(1) the destruction of inequality between nations; (2) the destruction of inequality between classes; and (3) the improvement of individuals, the indefinite perfectibility of human nature itself—intellectually, morally, and physically. These propositions have been much misunderstood. The equality to which he represents nations and individuals as tending is not absolute equality, but equality of freedom and of rights. It is that equality which would make the inequality of the natural advantages and faculties of each community and person beneficial to all. Nations and men, he thinks, are equal, if equally free, and are all tending to equality because all tending to freedom. As to indefinite perfectibility, he nowhere denies that progress is conditioned both by the constitution of humanity and the character of its surroundings. But he affirms that these conditions are compatible with endless progress, and that the human mind can assign no fixed limits to its own advancement in knowledge and virtue, or even to the prolongation of bodily life.

The book of Condorcet is pervaded by a spirit of excessive hopefulness, and contains numerous errors of detail, which are fully accounted for by the circumstances in which it was written. Its value lies entirely in its general ideas. Its chief defects spring from its author's narrow and fanatical aversion to all philosophy which did not attempt to explain the world exclusively on mechanical and sensational principles, to all religion whatever, and especially to Christianity and Christian institutions, and to monarchy.

Of the two editions of Condorcet's works which have been published, the earlier is in 21, and the later, to which is prefixed a *Biographie de Condorcet*, by M. Arago, is in 10 volumes. There is an able essay on Condorcet in Mr J. Morley's *Critical Miscellanies.* On Condorcet as an historical philosopher see A. Comte's *Cours de Philosophie Positive*, iv. 252–253, and *Système de Politique Positive*, iv., Appendice Général, 109–111; Laurent's *Études*, xii. 127–126; Morley's *Crit. Misc.*, 89–110; and Flint's *Philosophy of History in France and Germany*, i. 125–138. (R. F.)

CONDOTTIERI. The condottieri (Italian, *condottiere*, captain, from *condotta*, conduct, *condurre*, to lead; Latin, *conducere*) were leaders of military companies, often numerous enough to constitute a large army, which they used to hire out to carry on the wars of the Italian states. The condottieri played a very important part in Italian history during the 14th and 15th centuries, especially from the middle of the 14th to the middle of the 15th. The explanation of their origin is to be sought in the special circumstances of Italy towards the close of the Middle Ages. The republics and lordships into which the country was divided were incessantly engaged in war, while the arts of peace and luxury were cultivated to such a degree that the military spirit of the people had greatly declined in comparison with the rest of Europe. In many cities, such as Milan, tyrants had begun to supersede the old republican governments, and they found it much safer to engage a mercenary army to fight their battles than to arm their own subjects. Soldiers of foreign armies, which then as afterwards not seldom overran the Italian soil, did not always return, but often stayed with their feudal leaders, and lived at free quarters. Montreal d'Albarno, a gentleman of the Provence, was the first to give a definite form to these lawless bands. A severe discipline and an elaborate organization were introduced within the company itself, while in their relations to the people the most barbaric licence was permitted. Montreal himself was put to death at Rome by Cola di Rienza, and Count Lando succeeded to the command. The Grand Company, as it was called, soon numbered about 7000 cavalry and 1500 select infantry, and was for some years the terror of Italy. They seem to have been Germans chiefly. On the conclusion (1360) of the peace of Bretigny between England and France, Sir John Hawkwood, an able general, led an army of English mercenaries, called the White Company, into Italy, which, in the service of Pisa, and afterwards of Florence, took a prominent part in the confused interminable wars of the next thirty years. Towards the end of the century the Italians began to organize armies of the same description, the first of importance being the company of St George, originated by Alberigo, count of Barbiano. The defeat of the German emperor, Rupert, by the great condottiere, Jacopo del Verme, due to the superior equipment and organization of the Italian army, taught the northern barbarians to respect the skill of the south. Shortly after, the organization of these mercenary armies was carried to the highest perfection by Sforza Attendolo, condottiere in the service of Naples, who had been a peasant of the Romagna, and by his rival Braccio di Montone in the service of Florence. The army and the renown of Sforza were inherited by his son Francesco Sforza, who married a natural daughter of one of the Visconti of Milan, conducted the wars of that city against Venice, and eventually became duke of Milan (1450), which his family continued to rule for some generations. Less fortunate was another great condottiere, Carmagnola, who first served one of the Visconti, and then conducted the wars of Venice against his former masters, but at last awoke the suspicion of the Venetian oligarchy, and was put to death before the palace of St Mark (1432). Towards the end of the 15th century, when the large cities had gradually swallowed up the small states, and Italy itself was drawn into the general current of European politics, and became the battle-field of powerful armies,—French, Spanish, and German,—the condottieri disappeared. The soldiers of the condottieri were almost entirely cavalry, and were clad in armour from head to foot. Not being connected with the people among whom they fought by any of the ordinary ties of humanity, and given up to all the licence of the worst profession in the world, they were a dreadful scourge wherever they went. They were always ready to change sides at the prospect of higher pay. And as they were connected with each other by the interest of a common profession, and the possibility that the enemy of to-day might be the friend and fellow-soldier of to-morrow, their battles were often as bloodless as they were theatrical. Splendidly equipped armies of several thousand strong were known to fight for several hours with hardly the loss of a man. (See Symonds's *Renaissance in Italy: the Age of the Despots*, ch. ii.)

CONECTE, THOMAS, a French Carmelite monk and preacher, was born at Rennes. He travelled through Flanders and Picardy, denouncing the vices of the clergy and the extravagant dress of the women, especially their lofty head-dresses, or *hennins*. He ventured to teach that he who is a true servant of God need fear no Papal curse, that the Roman hierarchy is corrupt, and that marriage is permissible to the clergy, of whom only some have the gift of continence. He was listened to by immense congregations; and it is said that one of the means he employed to maintain his reputation as a preacher was never allowing himself to be seen in private. From Flanders, where his sumptuary reform disappeared with his departure, he passed to Italy, and, despite the opposition of Nicolas Kenton, provincial of the Carmelites, he introduced several changes into the rules of that order. But at length he was seized by order of the Pope, condemned, and burnt for heresy (1434).

CONEGLIANO a town of Italy, in the province of Treviso, on the River Mutega, with a station on the railway from Venice to Trieste, about 36 miles north of the former city. It is commanded by a large castle on a neighbouring height, and it possesses a cathedral, two conventual buildings, a number of benevolent institutions, and a triumphal arch erected in honour of the Emperor Francis I. of Austria. Several of the private houses were adorned with frescoes by Pordenone; and the cathedral and the church of S. Fiore preserve the handiwork of Cima da Conegliano, an eminent artist born in the town. Marshal Mouncey bore the title of duke of Conegliano. Population about 6000.

CONFARREATIO, a ceremony observed among the ancient Romans at the nuptials of those persons more particularly whose children were destined to be vestal virgins or *flamines diales*. Confarreatio was the most solemn of the three forms of marriage, but in later times the ceremony fell into disuse, and Cicero mentions but two, namely, *coemptio* and *usus*. The name is said to have originated in the bride and bridegroom sharing a cake of salted wheaten bread (*far* or *panis farreus*), in the presence of the *pontifex maximus*, or *flamen dialis*, who performed the ceremony. This form of marriage could only be dissolved by another equally solemn ceremony, which was called *disfarreatio*. The names *patrimi* and *matrimi* were applied to children sprung from this kind of marriage.

CONFECTIONERY, a term of rather vague application, but which may be held to embrace all preparations which have sugar for their basis or principal ingredient. In this way it may be said to include the preservation of fruits by means of sugar, the manufacture of jams and jellies, the art of preparing fruit-syrups and pastes, ices, and sweetened beverages, in addition to the various manufactures in which sugar is the more prominent and principal ingredient. The variety of the preparations thus indicated is unlimited; and we can here but notice the branches of the manufacture of sugar preparations, such as lozenges, comfits, &c., which now constitute an extensive industry.

The simplest form in which sugar is prepared as a sweet for eating is that of *lozenges*. These are simply refined sugar ground to a very fine powder, mixed with dissolved gum, and flavoured with essential oil or other ingredients.

The appliances for making lozenges on the large scale, and the processes through which the materials pass, are in many respects similar to those used in biscuit baking. The fine loaf sugar is ground to an impalpable powder between a pair of millstones, after which it is mixed with dissolved gum arabic sufficient to form a very stiff dough, and the whole is thoroughly incorporated in a mechanical mixer similar to Vicker's dough-mixing machine (see BAKING.) The doughy mass is then rendered homogeneous and reduced to a uniform cake by repeatedly passing pieces backward and forward between a pair of heavy metal rollers, the surfaces being kept from adhering by being dusted with starch flour. The cake, when sufficiently spread out, is transferred to a piece of tough web paper, and passed by an intermittent motion under a frame of cutters of the size and form of the lozenges to be formed. These punch out and take up the lozenges, and when the tube of the cutters is well filled, the whole frame is turned over, and the cut out lozenges emptied into a tray. The scrap passes along on the web, and is again rolled out into cakes with the paste from the mixer. Nothing further is done with the lozenges than allowing them to dry and harden on trays in racks in a heated apartment. Lozenges are coloured and flavoured with a great variety of ingredients, which are added in proper proportions with the dissolved gum. Medicated lozenges of many kinds are in extensive use, the various medicinal ingredients being similarly incorporated with the gum.

Hard confections, or *comfits*, constitute the second leading variety of confectionery. To make these a core or centre of some kind is required, and this may consist either of a seed or fruit, as a coriander or an almond; or it may be a small lozenge, as in the case of pan drops. Around such a core are deposited successive layers of sugar, and there is no limit to the size to which such comfits may be made. The cores are placed in large copper pans or vessels, which are geared to revolve at an inclined angle, so that by their revolution their contents keep constantly in motion, tumbling over each other. The copper pans are revolved by steam or other power, and they are kept hot by a steam jacket or double casing, into which steam is admitted through the centre on which the pans revolve. A pure strained syrup of sugar is prepared, a quantity of which is periodically applied to the contents of the pan as they appear to get dry, and after receiving a certain coating, the comfits in progress of manufacture are removed to dry and harden for some time. The comfits thus receive alternate coatings in the pan and dryings till they attain the size wanted, when they are finished with a coating of thin syrup, which may be coloured if required, and long continued friction in the pan. After hardening in a drying apartment these comfits are ready for use. A great variety of seeds and fruits are used as cores, the principal of which are almonds, caraways, corianders, cloves, cassia, pistachios, and perfumed cherry kernels.

Many forms of confection are prepared from solutions of sugar, which are boiled up to the point of crystallization. Of these ordinary *sugar candy*, or crystallized sugar, may be taken as the type. It is prepared from solutions of either brown or refined sugar, to the latter of which cochineal or some other colouring ingredient is frequently added. These solutions, when boiled to a proper degree, are poured into moulds across which at sufficient intervals are stretched pieces of string. The sugar gradually crystallizes from its solution on the sides of the mould and on the string,—it being in the meantime kept in an apartment heated from 90° to 100° Fahr. When sufficiently deposited, the remaining liquor is drained off, and the crystals removed and dried in a high uniform heat. *Fondants*, in the preparation of which the French confectioners excel, are made from solutions boiled to the point of crystallization, properly coloured and flavoured, and cast into moulds made of starch. *Sugar drops* are made from fine sugar mixed with a small proportion of water and colouring and flavouring material as desired. The mixture is dissolved by heat without allowing it to boil, and it is then poured in separate drops on a sheet of paper, on which they quickly set and harden.

What is termed boiled sugar, that is sugar which has been boiled till, on cooling and hardening, it assumes a glassy appearance and fracture, is the basis of another extensive variety of confectionery. Of this class *barley sugar* is the type and simplest example. It merely consists of sugar boiled as above indicated, flavoured with a little oil of lemon, poured on a marble slab, cut into strips, and rolled or twisted into sticks. Boiled sugar is prepared in innumerable fanciful forms by passing it, while still in a viscous condition, through small machines in which pairs of brass rollers, having patterns sunk in their surface, stamp these patterns in the plastic material. It is also worked up into the form of balls, plaited into coils, and formed into party-coloured stalks, &c. By vigorous and long-continued drawing out of boiled sugar, while it is in a plastic condition, the molecular structure of the material is changed, and from being glassy and transparent it becomes opaque, porous, and granular in appearance. In this way the preparation known as *rock* is manufactured. Various preparations of chocolate are largely used as confectionery (see CHOCOLATE).

CONFESSION is a verbal acknowledgment of sin. Among the Jews it was the custom, on the annual feast of expiation, for the high priest to make confession of sins to God in the name of the whole people. Besides this general confession, the Jews were enjoined, as a first principle of their religion, to confess their sins individually to God. Herein, indeed, lay one marked and leading feature of difference between their creed and that of the heathen around them. The Jew was taught to regard his Maker as a merciful God, who forgives sin (Mic. vii. 18, 19; Isa. lvii. 16–19). While, however, the contrite heart was insisted on as the all-important element on man's part, outward signs of humiliation were valued as tokens and manifestations of the inward sentiment, as is seen in such cases as those of David, Ahab, and the captives who returned from Babylon (2 Sam. xii. 16; 1 Kings xxi. 27; Neh. ix. 2, 3). Such conduct implied admission of wrong-doing before man as well as before heaven. In some cases, as in that of Achan (Josh. vii. 19), acknowledgment before man was demanded. In others, as in those involving sin or trespass offerings, some degree of acknowledgment to the priest seems to be implied (Lev. iv. v.). Restitution of things stolen, and general reparation for injustice were also enjoined (Ezek. xxxiii. 15, &c.) as evidences of sincerity.

In the Christian church public offenders were from an early period put to open penance. We find St Paul enjoining this, but subsequently interceding that the offender be not dealt with too severely (1 Cor. v. 2; 2 Cor. ii. 6, 7). The growth of private (or *auricular*) confession is more difficult to trace. Even those who would be most inclined to represent it as primitive admit that for the first three centuries little or no mention is made of any such practice; and though they would fain attribute such silence to persecution, or to the reserve known as the *disciplina arcani*, they seem inclined to admit that private confession was a development, and grew up gradually. Passages from the fathers, such as St Cyprian, St Basil, St Gregory of Nyssa, and others, recommending the practice, have to be confronted with the small prominence given to it in the works of St Augustine and the strong declarations of St Chrysostom on the sufficiency of confession to God. But the practice gradually became more common, especially in the West, and more a matter of rule and precept; until at length, in the fourth Lateran Council, held under Pope Innocent III., in 1215, it was enjoined upon all members of the Church of Rome once a year, by the famous 21st canon, beginning with the words, *Omnis utriusque sexus fidelis.* The mediæval church of the West fixed the number of sacraments as seven, and insisted on auricular confession as an essential part of the sacrament of penance. Confession and absolution was reserved for the priesthood. Yet a certain recognition of a quasi-priestly power, residing in the church at large, and in some sense therefore in the laity, appears in the Roman office-books, and we find laymen, in cases of extreme emergency, confessing and absolving each other. (An instance occurs in one of the earliest and most admirable of French biographies, Joinville's *Life of St Louis.*) Russia appears now to be the country where, at least in theory, confession is most insisted upon as a certificate of annual confession (often, it is said, purchased) is a condition of being a witness in court.

At the Reformation the reformed communities were unanimous in rejecting enforced auricular confession, but it is a mistake to suppose that they were equally unanimous in reprobating its use in cases where it was sought by the free choiceof penitents. The Augsburg Confession (part i. art. 11) retains it, and Melanchthon asserts that many frequently availed themselves of it. Luther did not even deny its claim to a sacramental character; nor has it ever died out among the Lutherans. But the sacramental character is denied by Calvin and the Calvinistic churches generally. Peter Martyr, Chamier, and others seem to identify absolution with the preaching of God's Word. Nevertheless absolution still retained, for a long time, a disciplinarian character even among these bodies. Thus we find the Scottish ministers offering absolution to the marquis of Montrose before his execution at Edinburgh on May 21, 1650; and his refusal seems, according to the historian Burton, to have influenced his enemies in the matter of the sepulture granted to his remains. Private confession also finds a place in the English prayer-book and homilies. Before the Revolution of 1688 it was so far common that we find Bishop Burnet, in his *History of His Own Times*, naming this or that clergyman as confessor in the family of such and such a nobleman. To divulge anything thus confided is as strictly forbidden in the reformed English as in the mediæval or modern Roman church, though an exception is made in the English canons in the case of such crimes as might endanger the life of the recipient of the confession by making him an accessory in the eye of the law.

The connection of confession with casuistry and with the morality of nations, cannot be discussed here. As regards casuistry, it must suffice to allude to the great name of Pascal, and the controversy arising out of his celebrated *Lettres Provinciales.* The question of its effect on morality is still more complex and difficult to estimate. As a rule, we may expect to find its influence well spoken of by Roman Catholics and the reverse in the opposite camps; nevertheless, some Protestant writers, as Hallam, and perhaps Sismondi, appear to view it with a certain amount of tolerance and even favour, while some Roman Catholic writers (*e.g.*, Vitellaschi, under the pseudonym *Pomponio Leto*), on the contrary, seem inclined to censure at any rate its extreme development in the form of direction, as injurious to proper self-reliance and independence of character.

It remains to add, that the terms *confessor* and *confessional* are used by ecclesiastical writers in very distinct senses, which can only be judged of by the context in which they are found. The statement that a given priest is the confessor—say of the king of Spain—means, of course, that he is the person to whom that sovereign confesses; but the term found simply after a name, as "St Leonard, confessor," means that the person so-designated underwent more or less of suffering on behalf of the Christian faith, though he may not have been an actual martyr. This latter sense is the usual one in ancient writers. In like manner the term *confessional*, which is now commonly employed to signify the structure placed in Roman Catholic churches for the purpose of hearing confessions, meant originally, in Christian antiquity, the place where a martyr had been buried. It was subsequently applied to a tomb built over a spot thus hallowed either in the crypt or in the upper part of a church.

The authorities on the subject embrace, as has been seen, acts of councils, confessions of faith, and an abundance of controversial works. The foreign Reformers—Luther, Melanchthon, Calvin, Zwingli—have all touched upon it in their writings. Among Anglican works may be named Jewell's *Apology*, and Marshall's *Penitential Discipline of the Early Church* (republished in the Anglo-Catholic Library, 1844), and various modern *Catenæ* of authorities, as Gray's *Statement on Confession.* The Roman Catholic view is set forth in such works as Klee's *Dogmatik* and *History of Dogmas* (Mayence, 1834, 1838), and Martigny's *Dictionnaire des antiquités chrétiennes*, Paris, 1865. The subject is a prominent one in the Acts of the Council of Trent, and for the fourth Lateran Council the student may refer to Labbé's *Concilia* (tom. vii., Paris, 1714). (J. G. C.)

CONFIRMATION, an ecclesiastical term denoting the laying on of hands, in the admission of baptized persons to the enjoyment of full Christian privileges. The antiquity of this ceremony is, by all the older writers, carried as high as the apostles, and founded upon their example and practice. In the primitive church the ceremony was performed immediately after baptism, if the bishop were present at the solemnity. Among the Greeks, and throughout the East, it still accompanies baptism; but the Roman Catholics make it a distinct and independent sacrament. Seven years is the stated but not the uniform age for confirmation. The view put forth in the English prayer-book is, that the person confirmed releases his godfather and godmother, by taking upon himself the baptismal vows in their place,—an aspect of the matter not apparently recognized in the ancient church, which regarded it almost exclusively as a means of grace and a preparation for the reception of the Holy Communion. This ordinance is usually reserved for the bishop only. It has, however, always been a moot point, whether he may not delegate a presbyter to perform it for him. Such delegation is not uncommon in the Eastern Churches, but is practically unknown in the West. The Calvinists (in common with most non-episcopal communities) have always rejected confirmation.

CONFUCIUS, the famous sage of China (550 or 551–478 B.C.) They are very few among all the millions of the Chinese people who would not heartily repeat the lines with which the first paragraph in a popular history of the sage concludes :—

> "Confucius! Confucius! How great was Confucius!
> Before him there was no Confucius,
> Since him there has been no other.
> Confucius! Confucius! How great was Confucius!"

The man whose memory is thus cherished by a third portion of the human race, and the stamp of whose character and teachings is still impressed, after so long a time, on the institutions of his country, demands our careful study. In order to understand the events of his life and the influence of his opinions, we must endeavour to get some impression of the China that existed in his time, in the 5th and 6th centuries before our Christian era.

The dynasty of Chow, the third which within historic time had ruled the country, lasting from 1122 to 256 B.C., had passed its zenith, and its kings no longer held the sceptre with a firm grasp. It must not be supposed that the territory under their sway extended over all the eighteen provinces which now constitute what is called "China proper." It was not a sixth part of the present empire. On the south it hardly reached half-way from the Ho, or Yellow River, to the Kiang, or Yang-tze. Cheh-kiang, Kiang-si, Hu-nan, Fuh-kien, Kwang-tung, Kwang-si, Kwei-chow, and the great provinces of Yun-nan, Sze-ch'uen, and Kan-suh on the west, were thinly peopled by barbarous tribes which acknowledged no subjection to "the Middle State." Ho-nan and Shan-si, with portions of Shen-si, Chih-li, Shan-tung, Gan-hwui, Kiang-su, and Hu-pih, were all which formed the dominions of Chow. For thirteen years of his life Confucius wandered about from state to state, seeking rest and patrons; but his journeyings were confined within the modern provinces of Ho-nan and Shan-tung, and the borders of Chih-li and Hu-pih. Many Europeans now living have travelled over much more of China than he did. The fact helps us to realize the relation of Confucius to his age, and it shows us that he gained his high position through his own unaided powers and the influences of his native country. It has never been hinted, as in the case of his contemporary, the founder of Taoism, that he learned anything from abroad.

Within this China of the Chow dynasty there might be a population, in Confucius's time, of from 10,000,000 to 15,000,000. We read frequently, in the classical books, of the "ten thousand states," in which the people were distributed; but that is merely a grand exaggeration. In what has been called, though erroneously, as we shall see, *Confucius's History of his own Times*, we find only 13 states of note, and the number of all the states, large and small, which can be brought together from it, and the much more extensive supplement to it by Tso K'iu-ming, not much posterior to the sage, is under 150.

Chow was a feudal kingdom. The lords of the different territories belonged to five orders of nobility, corresponding closely to the dukes, marquises, earls, counts, and barons of feudal Europe. The theory of the constitution required that the princes, on every fresh succession, should receive investiture from the king, and thereafter appear at his court at stated times. They paid to him annually certain specified tributes, and might be called out with their military levies at any time in his service. A feudal kingdom was sure to be a prey to disorder unless there were energy and ability in the character and administration of the sovereign; and Confucius has sketched, in the work referred to above, the *Annals of Lu*, his native state, for 242 years, from 722 to 481 B.C., which might almost be summed up in the words: "In those days there was no king in China, and every prince did what was right in his own eyes." In 770 B.C. a northern horde had plundered the capital, which was then in the present department of Si-gan, Shen-si, and killed the king, whose son withdrew across the Ho and established himself in a new centre, near the present city of Loh-yang in Ho-nan; but from that time the prestige of Chow was gone. Its representatives continued for four centuries and a half with the title of king, but they were less powerful than several of their feudatories. The *Annals of Lu*, enlarged by Tso K'iu-ming so as to embrace the history of the kingdom generally, are as full of life and interest as the pages of Froissart. Feats of arms, great battles, heroic virtues, devoted friendships, and atrocious crimes make the chronicles of China in the 5th, 6th, and 7th centuries before the birth of Christ as attractive as those of France and England in the 14th and some other centuries after it. There was in China in the former period more of literary culture and of many arts of civilization than there was in Europe in the latter. Not only the royal court, but every feudal court had its historiographers and musicians. Institutions of an educational character abounded. There were ancient histories and poems, and codes of laws, and books of ceremonies. Yet the period was one of wide-spread and ever-increasing suffering and degeneracy. While the general government was feeble, disorganization was at work in each particular state.

But three things must be kept in mind when we compare feudal China with feudal Europe,—three elements which wrought to give to the former peculiarities of character for which our better acquaintance with the latter will not have prepared us. First, we must take into account the long duration of the time through which the central authority was devoid of vigour. For about five centuries state was left to contend with state, and clan with clan in the several states. The result was chronic misrule, and misery to the masses of the people, with frequent famines. Secondly, we must take into account the institution of polygamy, with the low status assigned to woman, and the many restraints put upon her. In the ancient poems, indeed, there are a few pieces which are true love songs, and express a high appreciation of the virtue of their subjects; but there are many more which tell a different tale. The intrigues, quarrels, murders, and grossnesses that grew out of this social condition it is difficult to conceive, and would be impossible to detail. Thirdly, we must take into account the absence of strong and definite religious beliefs, properly so called, which has always been a characteristic of the Chinese people. We are little troubled, of course, with heresies, and are not shocked by the outbreaks of theological zeal; but where thought as well as action does not reach beyond the limits of earth and time, we do not find man in his best estate. We miss the graces and consolations of faith; we have human efforts and ambitions, but they are unimpregnated with divine impulses and heavenly aspirings.

Confucius appeared, according to Mencius, one of his most distinguished followers (371–288 B.C.), at a crisis in the nation's history. "The world," he says, "had fallen into decay, and right principles had disappeared. Perverse discourses and oppressive deeds were waxen rife. Ministers murdered their rulers, and sons their fathers. Confucius was frightened by what he saw,—and he undertook the work of reformation."

History of his life.

The sage was born, according to the historian Sze-ma Ts'in, in the year 550 B.C.; according to Kung-yang and Kuh-liang, two earlier commentators on his *Annals of Lu*, in 551; but all three agree in the month and day assigned to his birth, which took place in winter. His clan name was K'ung, and it need hardly be stated that Confucius is merely the Latinized form of K'ung Fu-tze, meaning "the philosopher or master K'ung." He was a native of the state of Lu, a part of the modern Shan-tung, embracing the present department of Yen-chow and other portions of the province. Lu had a great name among the other states of Chow, its marquises being descended from the duke of Chow, the legislator and consolidator of the dynasty which had been founded by his father and brother, the famous kings Wăn and Wu. Confucius's own ancestry is traced up, through the sovereigns of the previous dynasty of Shang, to Hwang-ti, whose figure looms out through the mists of fable in prehistoric times. A scion of the house of Shang, the surname of which was Tze, was invested by King Wu with the dukedom of Sung in the present province of Ho-nan. There, in the Tze line, towards the end of the 8th century B.C., we find a K'ung Kia, whose posterity, according to the rules for the dropping of surnames, became the K'ung clan. He was a high officer of loyalty and probity, and unfortunately for himself had a wife of extraordinary beauty. Hwa Tuh, another high officer of the duchy, that he might get this lady into his possession, brought about the death of K'ung Kia, and was carrying his prize in a carriage to his own palace, when she strangled herself on the way. The K'ung family, however, became reduced, and by-and-by its chief representative moved from Sung to Lu, where in the early part of the 6th century we meet with Shuh-liang Heih, the father of Confucius, as commandant of the district of Tsow, and an officer renowned for his feats of strength and daring.

There was thus no grander lineage in China than that of Confucius; and on all his progenitors, since the throne of Shang passed from their line, with perhaps one exception, he could look back with complacency. He was the son of Heih's old age. That officer, when over seventy years, and having already nine daughters and one son, because that son was a cripple, sought an alliance with a gentleman of the Yen clan, who had three daughters. The father submitted to them Heih's application, saying that, though he was old and austere, he was of most illustrious descent, and they need have no misgivings about him. Ching-tsai, the youngest of the three, observed that it was for their father to decide in the case. "You shall marry him then," said the father, and accordingly she became the bride of the old man, and in the next year the mother of the sage. It is one of the undesigned coincidences which confirm the credibility of Confucius's history, that his favourite disciple was a scion of the Yen clan.

Heih died in the child's third year, leaving his family in straitened circumstances. Long afterwards, when Confucius was complimented on his acquaintance with many arts, he accounted for it on the ground of the poverty of his youth, which obliged him to acquire a knowledge of matters belonging to a mean condition. When he was five or six, people took notice of his fondness for playing with his companions at setting out sacrifices, and at postures of ceremony. He tells us himself that at fifteen his mind was set on learning; and at nineteen, according to the ancient and modern practice in China, in regard to early unions, he was married,—his wife being from his ancestral state of Sung. A son, the only one, so far as we know, that he ever had, was born in the following year; but he had subsequently two daughters. Immediately after his marriage we find him employed under the chief of the Ki clan to whose jurisdiction the district of Tsow belonged, first as keeper of stores, and then as superintendent of parks and herds. Mencius says that he undertook such mean offices because of his poverty, and distinguished himself by the efficiency with which he discharged them, without any attempt to become rich.

In his twenty-second year Confucius commenced his labours as a teacher. He did so at first, probably, in a humble way; but a school, not of boys to be taught the elements of learning, but of young and inquiring spirits who wished to be instructed in the principles of right conduct and government, gradually gathered round him. He accepted the substantial aid of his disciples; but he rejected none who could give him even the smallest fee, and he would retain none who did not show earnestness and capacity. "When I have presented," he said, "one corner of a subject, and the pupil cannot of himself make out the other three, I do not repeat my lesson."

Two years after, his mother died, and he buried her in the same grave with his father. Some idea of what his future life was likely to be was already present to his mind. It was not the custom of antiquity to raise any tumulus over graves, but Confucius resolved to innovate in the matter. He would be travelling, he said, to all quarters of the kingdom, and must therefore have a mound by which to recognize his parents' resting place. He returned home from the interment alone, having left his disciples to complete this work. They were long in rejoining him, and had then to tell him that they had been detained by a heavy fall of rain, which threw down the first product of their labour. He burst into tears, and exclaimed, "Ah! they did not raise mounds over their graves in antiquity." His affection for the memory of his mother and dissatisfaction with his own innovation on ancient customs thus blended together; and we can sympathize with his tears. For the regular period of 27 months, commonly spoken of as three years, he observed all the rules of mourning. When they were over he allowed five more days to elapse before he would take his lute, of which he had been devotedly fond, in his hands. He played, but when he tried to sing to the accompaniment of the instrument, his feelings overcame him.

For some years after this our information about Confucius is scanty. Hints, indeed, occur of his devotion to the study of music and of ancient history; and we can perceive that his character was more and more appreciated by the principal men of Lu. He had passed his thirtieth year when, as he tells us, "he stood firm" in his convictions on all the subjects to the learning of which he had bent his mind fifteen years before. In 517 B.C. two scions of one of the principal houses in Lu joined the company of his disciples in consequence of the dying command of its chief; and being furnished with the means by the marquis of the state, he made a visit with them to the capital of the kingdom. There he examined the treasures of the royal library, and studied the music which was found in its highest style at the court. There, too, according to Szema Ts'in, he had several interviews with Lao-tze, the father of Taoism. It is characteristic of the two men, that the latter, a transcendental dreamer, appears to have thought little of his visitor, while Confucius, an inquiring thinker, was profoundly impressed with him.

On his return to Lu, in the same year, that state fell into great disorder. The marquis was worsted in a struggle with his ministers, and fled to the neighbouring state of Ts'i. Thither also went Confucius, for he would not countenance by his presence the men who had driven their ruler away. He was accompanied by many of his disciples; and as they passed by the T'ai Mountain, an incident occurred, which may be narrated as a specimen of the way in which he communicated to them his lessons. The attention of the travellers was arrested by a woman weeping and wailing at a grave. The sage stopped, and sent one of his followers to ask the reason of her grief. "My husband's father" said she, "was killed here by a tiger, and my husband also, and now my son has met the same fate." Being asked why she did not leave so fatal a spot, she replied that there was there no oppressive government. "Remember this," said Confucius to his disciples, "remember this, my children, oppressive government is fiercer and more feared than a tiger."

He did not find in Ts'i a home to his liking. The marquis of the state was puzzled how to treat him. The teacher was not a man of rank, and yet the prince felt that he ought to give him more honour than rank could claim. Some counsellors of the court spoke of him as "impracticable and conceited, with a thousand peculiarities." It was proposed to assign to him a considerable revenue, but he would not accept it while his counsels were not followed. Dissatisfactions ensued, and he went back to Lu.

There for fifteen more years he continued in private life, prosecuting his studies, and receiving many accessions to his disciples. He had a difficult part to play with the different parties in the state, but he adroitly kept himself aloof from them all; and at last, in his fifty-second year, he was made chief magistrate of the city of Chung-too. A marvellous reformation, we are told, forthwith ensued in the manners of the people, and the marquis, a younger brother of the one that fled to Ts'i and died there, called him to higher office. He was finally appointed minister of crime,—and there was an end of crime. Two of his disciples at the same time obtained influential positions in the two most powerful clans of the state, and co-operated with him. He signalized his vigour by the punishment of a great officer and in negotiations with the state of Ts'i. He laboured to restore to the marquis his proper authority, and as an important step to that end, to dismantle the fortified cities where the great chiefs of clans maintained themselves like the barons of feudal Europe. For a couple of years he seemed to be master of the situation. "He strengthened the ruler," it is said, "and repressed the barons. A transforming government went abroad. Dishonesty and dissoluteness hid their heads. Loyalty and good faith became the characteristics of the men, and chastity and docility those of the women. He was the idol of the people, and flew in songs through their mouths."

The sky of bright promise was soon overcast. The marquis of Ts'i and his advisers saw that if Confucius were allowed to prosecute his course, the influence of Lu would become supreme throughout the kingdom, and Ts'i would be the first to suffer. A large company of beautiful women, trained in music and dancing, and a troop of fine horses, were sent to Lu. The bait took; the women were welcomed, and the sage was neglected. The marquis forgot the lessons of the master, and yielded supinely to the fascinations of the harem. Confucius felt that he must leave the state. The neglect of the marquis to send round, according to rule, among the ministers portions of the flesh after a great sacrifice, furnished a plausible reason for leaving the court. He withdrew, though very unwillingly and slowly, hoping that a change would come over the marquis and his counsellors, and a message of recall be sent to him. But no such message came; and he went forth in his fifty-sixth year to a weary period of wandering among various states.

It may be well to pause here in the sketch of his life, and consider what his object and hope had been.

A disciple once asked him what he would consider the first thing to be done, if intrusted with the government of a state. His reply was, "The rectification of names." When told that such a thing was wide of the mark, he held to it, and indeed his whole social and political system was wrapped up in the saying. He had told the marquis of Ts'i that good government obtained when the ruler was ruler, and the minister minister; when the father was father, and the son son. Society, he considered, was an ordinance of heaven, and was made up of five relationships,—ruler and subject, husband and wife, father and son, elder brothers and younger, and friends. There was rule on the one side of the first four, and submission on the other. The rule should be in righteousness and benevolence; the submission in righteousness and sincerity. Between friends the mutual promotion of virtue should be the guiding principle. It was true that the duties of the several relations were being continually violated by the passions of men, and the social state had become an anarchy. But Confucius had confidence in the preponderating goodness of human nature, and in the power of example in superiors. "Not more surely," he said, "does the grass bend before the wind than the masses yield to the will of those above them." Given the model ruler, and the model people would forthwith appear. And he himself could make the model ruler. He could tell the princes of the states what they ought to be; and he could point them to examples of perfect virtue in former times,—to the sage founders of their own dynasty; to the sage T'ang, who had founded the previous dynasty of Shang; to the sage Yu, who first established a hereditary kingdom in China; and to the greater sages still who lived in a more distant golden age. With his own lessons and those patterns, any ruler of his day, *who would listen to him*, might reform and renovate his own state, and his influence would break forth beyond its limits till the face of the whole kingdom should be filled with a multitudinous relation-keeping, well-fed, happy people. "If any ruler," he once said, "would submit to me as his director for twelve months, I should accomplish something considerable; and in three years I should attain the realization of my hopes." Such were the ideas, the dreams of Confucius. But he had not been able to get the ruler of his native state to listen to him. His sage counsels had melted away before the glance of beauty and the pomps of life.

His professed disciples amounted to 3000, and among them were between 70 and 80 whom he described as "scholars of extraordinary ability." The most attached of them were seldom long away from him. They stood or sat reverently by his side, watched the minutest particulars of his conduct, studied under his direction the ancient history, poetry, and rites of their country, and treasured up every syllable which dropped from his lips. They have told us how he never shot at a bird perching nor fished with a net, the creatures not having in such a case a fair chance for their lives; how he conducted himself in court and among villagers; how he ate his food, and lay in his bed, and sat in his carriage; how he rose up before the old man and the mourner; how he changed countenance when it thundered, and when he saw a grand display of viands at a feast. He was free and unreserved in his intercourse with them, and was hurt once when they seemed to think that he kept back some of his doctrines from them. Several of them were men of mark among the statesmen of the time, and it is the highest testimony to the character of Confucius that he inspired them with feelings of admiration and reverence. It was they who set the example of speaking of him as the greatest of mortal men; it was they who struck the first notes of that pæan which has gone on resounding to the present day.

Confucius was, it has been seen, in his fifty-sixth year when he left Lu; and thirteen years elapsed ere he returned to it. In this period were comprised his travels among the different states, when he hoped, and ever hoped in vain, to meet with some prince who would accept him as his counsellor, and initiate a government that should become the centre of an universal reformation. Several of the princes were willing to entertain and support him; but for all that he could say, they would not change their ways.

His first refuge was in Wei, a part of the present Ho-nan, the marquis of which received him kindly; but he was a weak man, ruled by his wife, a woman notorious for her accomplishments and wickedness. In attempting to pass from Wei to another state, Confucius was set upon by a mob, which mistook him for an officer who had made himself hated by his oppressive deeds. He himself was perfectly calm amid the danger, though his followers were filled with alarm. They were obliged, however, to retrace their way to Wei, and he had there to appear before the marchioness, who wished to see how a sage looked. There was a screen between them at the interview, such as the present regent-empresses of China use in giving audience to their ministers; but Tze-lu, one of his principal disciples, was indignant that the master should have demeaned himself to be near such a woman, and to pacify him Confucius swore an oath appealing to Heaven to reject him if he had acted improperly. Soon afterwards he left the state.

His wanderings.

Twice again, during his protracted wanderings, he was placed in imminent peril, but he manifested the same fearlessness, and expressed his confidence in the protection of Heaven till his course should be run. On one of the occasions he and his company were in danger of perishing from want, and the courage of even Tze-lu gave way. "Has the superior man, indeed, to endure in this way?" he asked. "The superior man may have to endure want," was the reply, "but he is still the superior man. The small man in the same circumstances loses his self-command."

While travelling about, Confucius repeatedly came across recluses,—a class of men who had retired from the world in disgust. That there was such a class gives us a striking glimpse into the character of the age. Scholarly, and of good principles, they had given up the conflict with the vices and disorder that prevailed. But they did not understand the sage, and felt a contempt for him struggling on against the tide, and always hoping against hope. We get a fine idea of him from his encounters with them. Once he was looking about for a ford, and sent Tze-lu to ask a man who was at work in a neighbouring field where it was. The man was a recluse, and having found that his questioner was a disciple of Confucius, he said to him: "Disorder in a swelling flood spreads over the kingdom, and no one is able to repress it. Thau follow a master who withdraws from one ruler and another that will not take his advice, had you not better follow those who withdraw from the world altogether?" With these words he resumed his hoe, and would give no information about the ford. Tze-lu went back, and reported what the man had said to the master, who observed: "It is impossible to withdraw from the world, and associate with birds and beasts that have no affinity with us. With whom should I associate but with suffering men? The disorder that prevails is what requires my efforts. If right principles ruled through the kingdom, there would be no necessity for me to change its state." We must recognize in those words a brave heart and a noble sympathy. Confucius would not abandon the cause of the people. He would hold on his way to the end. Defeated he might be, but he would be true to his humane and righteous mission.

It was in his sixty-ninth year, 483 B.C., that Confucius returned to Lu. One of his disciples, who had remained in the state, had been successful in the command of a military expedition, and told the prime minister that he had learned his skill in war from the master,—urging his recall, and that thereafter mean persons should not be allowed to come between the ruler and him. The state was now in the hands of the son of the marquis whose neglect had driven the sage away; but Confucius would not again take office. Only a few years remained to him, and he devoted them to the completion of his literary tasks, and the delivery of his lessons to his disciples.

The next year was marked by the death of his son, which he bore with equanimity. His wife had died many years before, and it jars upon us to read how he then commanded the young man to hush his lamentations of sorrow. We like him better when he mourned, as has been related, for his own mother. It is not true, however, as has often been said, that he had divorced his wife before her death. The death of his favourite disciple, Yen Hwui, in 481 B.C., was more trying to him. Then he wept and mourned beyond what seemed to his other followers the bounds of propriety, exclaiming that Heaven was destroying him. His own last year, 478 B.C., dawned on him with the tragic end of his next beloved disciple, Tze-lu. Early one morning, we are told, in the fourth month, he got up, and with his hands behind his back, dragging his staff, he moved about his door, crooning over—

> "The great mountain must crumble
> The strong beam must break
> The wise man must wither away like a plant."

Tze-kung heard the words, and hastened to him. The master told him a dream of the previous night, which, he thought, presaged his death. "No intelligent ruler, he said, arises to take me as his master. My time has come to die." So it was. He took to his bed, and after seven days expired. Such is the account we have of the last days of the sage of China. His end was not unimpressive, but it was melancholy. Disappointed hopes made his soul bitter. No wife nor child was by to do the offices of affection, nor was the expectation of another life with him, when he passed away from among men. He uttered no prayer, and he betrayed no apprehension. Years before, when he was very ill, and Tze-lu asked leave to pray for him, he expressed a doubt whether such a thing might be done, and added, "I have prayed for a long time." Deep-treasured now in his heart may have been the thought that he had served his generation by the will of God; but he gave no sign.

When their master thus died, his disciples buried him with great pomp. A multitude of them built huts near his grave, and remained there, mourning as for a father, for nearly three years; and when all the rest were gone, Tze-kung, the last of his favourite three, continued alone by the grave for another period of the same duration. The news of his death went through the states as with an electric thrill. The man who had been neglected when alive seemed to become all at once an object of unbounded admiration. The tide began to flow which has hardly ever ebbed during three-and-twenty centuries.

The grave of Confucius is in a large rectangle separated from the rest of the K'ung cemetery, outside the city of K'iuh-fow. A magnificent gate gives admission to a fine avenue, lined with cypress trees and conducting to the tomb, a large and lofty mound, with a marble statue in front bearing the inscription of the title given to Confucius under the Sung dynasty:—"The most sagely ancient Teacher; the all-accomplished, all-informed King." A little in front of the tomb, on the left and right, are smaller mounds over the graves of his son and grandson, from the latter of whom we have the remarkable treatise called *The Doctrine of the Mean.* All over the place are imperial tablets of different dynasties, with glowing tributes to the one man whom China delights to honour; and on the right of the grandson's mound is a small house said to mark the place of the hut where Tze-kung passed his nearly five years of loving vigil. On the mound grow cypresses, acacias, what is called "the crystal tree," said not to be elsewhere found, and the *Achillea*, the plant whose stalks were employed in ancient times for purposes of divination.

The adjoining city is still the home of the K'ung family; and there are said to be in it between 40,000 and 50,000 of the descendants of the sage. The present chief of the family is in the line of the 75th generation, and has large estates by imperial gift, with the title of "Duke by imperial appointment and hereditary right, continuator of the sage." It is thus no empty honour which is still given by the sovereigns of China to Confucius, in the persons of his descendants.

The dynasty of Chow finally perished two centuries and a quarter after the death of the sage at the hands of the first historic emperor of the nation,—the first of the dynasty of Ts'in, who swept away the foundations of the feudal system, and laid those of the despotic rule which was subsequently and gradually matured, and continues to the present day. State after state went down before his blows; but the name and followers of Confucius were the chief obstacles in his way. He made an effort to destroy the memory of the sage from off the earth, consigning to the flames all the ancient books from which he drew his rules and examples (save one), and burying alive hundreds of scholars who were ready to swear by his name. But

Confucius could not be so extinguished. The tyranny of Ts'in was of short duration; and the next dynasty, that of Han, while entering into the new China, found its surest strength in doing honour to his name, and trying to gather up the wreck of the ancient books. It is a great and a difficult undertaking to determine what there was about Confucius to secure for him the influence which he has wielded. Reference has been made to his literary tasks; but the study of them only renders the undertaking more difficult. He left no writings in which he detailed the principles of his moral and social system. *The Doctrine of the Mean*, by his grandson Tze-sze, and *The Great Learning*, by Tsăng Sin, the most profound, perhaps, of his disciples, give us the fullest information on that subject, and contain many of his sayings. The *Lun Yu*, or Analects, "Discourses and Dialogues," is a compilation in which many of his disciples must have taken part, and has great value as a record of his ways and utterances; but its chapters are mostly *disjecta membra*, affording faint traces of any guiding method or mind. Mencius, Hsiin K'ing, and writers of the Han dynasty, whose works, however, are more or less apocryphal, tell us much about him and his opinions, but all in a loose and unconnected way. No Chinese writer has ever seriously undertaken to compare him with the philosophers and sages of other nations.

The sage, probably, did not think it necessary to put down many of his own thoughts in writing, for he said of himself that he was "a transmitter, and not a maker." Nor did he lay claim to have any divine revelations. He was not born, he declared, with knowledge, but was fond of antiquity, and earnest in seeking knowledge there. The rule of life for men in all their relations, he held, was to be found within themselves. The right development of that rule, in the ordering not of the individual only, but of society, was to be found in the words and institutions of the ancient sages.

China, it has already been observed, had a literature before Confucius. All the monuments of it, however, were in danger of perishing through the disorder into which the kingdom had fallen. The feudal system that had subsisted for more than 1500 years had become old. Confucius did not see this—did not see how

> The old order changeth, giving place to new,
> And God fulfils himself in many ways,
> Lest one good custom should corrupt the world."

It was impossible that in his circumstances he should see it. China was in his eyes drifting from its ancient moorings, drifting on a sea of storms "to hideous ruin and combustion;" and the expedient that occurred to him to arrest the evil was to gather up and preserve the records of antiquity, illustrating and commending them by his own teachings. For this purpose he lectured to his disciples on the histories, poems, and constitutional works of the nation. What he thus did was of inestimable value to his own countrymen, and all other men are indebted to him for what they know of China before his time, though all the contents of the ancient works have not come down to us.

He wrote, we are told, a preface to the *Shu King*, or Book of Historical Documents. The preface is, in fact, only a schedule, without any remark by Confucius himself, giving the names of 100 books, of which it consisted. Of these we now possess 59, the oldest going back to the 23d century, and the latest dating in the 8th century B.C. The credibility of the earlier portions, and the genuineness of several of the documents have been questioned, but the collection as a whole is exceedingly valuable.

The *Shi King*, or Ancient Poems, as existing in his time, or compiled by him (as generally stated, contrary to the evidence in the case), consisted of 311 pieces, of which we possess 305. The latest of them dates 585 years B.C., and the oldest of them ascends perhaps twelve centuries higher. It is the most interesting book of ancient poetry in the world, and many of the pieces are really fine ballads. Confucius was wont to say that he who was not acquainted with the *Shi* was not fit to be conversed with, and that the study of it would produce a mind without a single depraved thought. This is nearly all we have from him about the poems.

The *Li*, or Books of Rites and Ancient Ceremonies and of Institutions, chiefly of the Chow dynasty, have come down to us in a sadly mutilated condition. They are still more than sufficiently voluminous, but they were edited, when recovered under the Han dynasty, with so many additions, that it is hardly worth while to speak of them in connection with Confucius, though much of what was added to them is occupied with his history and sayings.

Of all the ancient books not one was more prized by him than the *Yih King*, or "The Book of Changes," the rudiments of which are assigned to Fuh-hsi in the 30th century B.C. Those rudiments, however, are merely the 8 trigrams and 64 diagrams, composed of a whole and a broken line (——, — —), without any text or explanation of them earlier than the rise of the Chow dynasty. The leather thongs, by which the tablets of Confucius's copy were tied together, were thrice worn out by his constant handling. He said that if his life were lengthened he would give fifty years to the study of the *Yih*, and might then be without great faults. This has come down to us entire. If not intended from the first for purposes of divination, it was so used both before and after Confucius, and on that account it was exempted, through the superstition of the emperor of the Ts'in dynasty, from the flames. It is supposed to give a theory of the phenomena of the physical universe, and of moral and political principles by the trigrams and the different lines and numbers of the diagrams of Fuh-hi. Almost every sentence in it is enigmatic. As now published, there are always subjoined to it certain appendixes, which are ascribed to Confucius himself. Pythagoras and he were contemporaries, and in the fragments of the Samian philosopher about the "elements of numbers as the elements of realities" there is a remarkable analogy with much of the *Yih*. No Chinese critic or foreign student of Chinese literature has yet been able to give a satisfactory account of the book.

But a greater and more serious difficulty is presented by his last literary labour, the work claimed by him as his own, and which has already been referred to more than once as the *Annals of Lu*. Its title is the *Ch'un Ts'iu*, or "Spring and Autumn," the events of every year being digested under the heads of the four seasons, two of which are used by synecdoche for the whole. Mencius held that the composition of the *Ch'un Ts'iu* was as great a work as Yu's regulation of the waters of the deluge with which the *Shu King* commences, and did for the face of society what the earlier labour did for the face of nature. This work also has been preserved nearly entire, but it is excessively meagre. The events of 242 years barely furnish an hour or two's reading. Confucius's annals do not bear a greater proportion to the events which they indicate than the headings in our Bibles bear to the contents of the chapters to which they are prefixed. Happily Tso K'iu-ming took it in hand to supply those events, incorporating also others with them, and continuing his narratives over some additional years, so that through him the history of China in all its states, from year to year, for more than two centuries and a half, lies bare before us. Tso never challenges the text of the master as being incorrect, yet he does not warp or modify his own narratives to make them square with it; and the astounding fact is, that when we compare the events with the summary of them, we must pronounce the latter misleading in the extreme. Men are charged with murder who were not guilty of it, and base murders are related as if they had been natural deaths. Villains, over whose fate the reader rejoices, are put down as victims of vile treason, and those who dealt with them as he would have been glad to do are subjected to horrible executions without one word of sympathy. Ignoring, concealing, and misrepresenting are the characteristics of the *Spring and Autumn*.

And yet this work is the model for all historical summaries in China. The want of harmony between the facts and the statements about them is patent to all scholars, and it is the knowledge of this, unacknowledged to themselves, which has made the literati, down to the present day, labour with an astonishing amount of fruitless ingenuity and learning to find in individual words, and the turn of every sentence, some mysterious indication of praise or blame. But the majority of them will admit no flaw in the sage or in his annals. His example in the book has been very injurious to his country. One almost wishes that critical reasons could be found for denying its authenticity. Confucius said that "by the *Spring and Autumn* men would know him and men would condemn him." It certainly obliges us to make a large deduction from our estimate of his character and of the beneficial influence which he has exerted. The examination of his literary labours does not on the whole increase our appreciation of him. We get a higher idea of the man from the accounts which his disciples have given us of his intercourse and conversations with them, and the attempts which they made to present his teachings in some systematic form. If he could not arrest the progress of disorder in his country, nor throw out principles which should be helpful in guiding it to a better state under some new constitutional system, he gave important lessons for the formation of individual character, and the manner in which the duties in the relations of society should be discharged.

Foremost among these we must rank his distinct enunciation of "the golden rule," deduced by him from his study of man's mental constitution. Several times he gave that rule in express words:—"What you do not like when done to yourself do not do to others." The peculiar nature of the Chinese language enabled him to express this rule by one character, which for want of a better term we may translate in English by "reciprocity." When the ideagram is looked at, it tells its meaning to the eye,—"a thing seen weightier than a thing heard." It is composed of two other characters, one denoting "heart," and the other—itself composite—denoting "as." Tze-kung once asked if there were any one word which would serve as a rule of practice for all one's life, and the master replied, yes, naming this character (恕, *shu*), the "*as heart*," my heart, that is, in sympathy with yours; and then he added his usual explanation of it, which has been given above. It has been said that he only gave the rule in a negative form, but he understood it also in its positive and most comprehensive force, and deplored, on one occasion at least, that he had not himself always attained to taking the initiative in doing to others as he would have them do to him.

Another valuable contribution to ethical and social science was the way in which he inculcated the power of example, and the necessity of benevolence and righteousness in all who were in authority. 1200 years before he was born, an ancient hero and king had proclaimed in China: "The great God has conferred on the people a moral sense, compliance with which would show their nature invariably right. To cause them tranquilly to pursue the course which it indicates is the task of the sovereign." Confucius knew the utterance well; and he carried out the principle of it, and insisted on its application in all the relations of society. He taught emphatically that a bad man was not fit to rule. As a father or a magistrate, he might wield the instruments of authority, and punish the transgressors of his laws, but no forthputting of force would countervail the influence of his example. On the other hand, it only needed virtue in the higher position to secure it in the lower. This latter side of his teaching is far from being complete and correct, but the former has, no doubt, been a check on the "powers that be," both in the family and the state ever since Confucius became the acknowledged sage of his country. It has operated both as a restraint upon evil, and a stimulus to good.

A few of his more characteristic sayings may here be given, the pith and point of which attest his discrimination of character, and show the tendencies of his views:—

"What the superior man seeks is in himself; what the small man seeks is in others."

"The superior man is dignified, but does not wrangle; social, but not a partisan. He does not promote a man simply because of his words, nor does he put good words aside because of the man."

"A poor man who does not flatter, and a rich man who is not proud, are passable characters; but they are not equal to the poor who yet are cheerful, and the rich who yet love the rules of propriety."

"Learning, undigested by thought, is labour lost; thought, unassisted by learning, is perilous."

"In style all that is required is that it convey the meaning."

"Extravagance leads to insubordination, and parsimony to meanness. It is better to be mean than insubordinate."

"A man can enlarge his principles; principles do not enlarge the man." That is, man is greater than any system of thought.

"The cautious seldom err."

Sententious sayings like these have gone far to form the ordinary Chinese character. Hundreds of thousands of the literati can repeat every sentence in the classical books; the masses of the people have scores of the Confucian maxims, and little else of an ethical nature, in their memories,—and with a beneficial result.

His religion and philosophy.

Confucius laid no claim, it has been seen, to divine revelations. Twice or thrice he did vaguely intimate that he had a mission from heaven, and that until it was accomplished he was safe against all attempts to injure him; but his teachings were singularly devoid of reference to anything but what was seen and temporal. Man as he is, and the duties belonging to him in society, were all that he concerned himself about. Man's nature was from God; the harmonious acting out of it was obedience to the will of God; and the violation of it was disobedience. But in affirming this, there was a striking difference between his language and that of his own ancient models. In the *King* the references to the Supreme Being are abundant; there is an exulting awful recognition of Him as the almighty personal Ruler, who orders the course of nature and providence. With Confucius the vague, impersonal term, Heaven, took the place of the divine name. There is no *glow* of piety in any of his sentiments. He thought that it was better that men should not occupy themselves with anything but themselves.

There were, we are told in the *Analects*, four things of which he seldom spoke—extraordinary things, feats of strength, rebellious disorder, and spiritual beings. Whatever the institutions of Chow prescribed about the services to be paid to the spirits of the departed, and to other spirits, he performed reverently, up to the letter; but at the same time, when one of the ministers of Lu asked him what constituted wisdom, he replied: "To give one's self earnestly to the duties due to men, and while respecting spiritual beings, to keep aloof from them,—that may be called wisdom."

But what belief underlay the practice, as ancient as the first foot-prints of history in China, of sacrificing to the spirits of the departed? Confucius would not say. There was no need, in his opinion, to trouble the mind about it. "While you cannot serve men," he replied to the inquiry of Tze-lu, "how can you serve spirits?" And what becomes of a man's own self, when he has passed from the stage of life? The oracle of Confucius was equally dumb on this question. "While you do not know life," he said to the same inquirer, "what can you know about death?" Doubts as to the continued existence of the departed were manifested by many leading men in China before the era of Confucius. In the pages of Tso K'iu-ming, when men are swearing in the heat of passion, they sometimes pause, and rest the validity of their oaths on the proviso that the dead to whom they appeal really exist. The "expressive silence" of Confucius has gone to confirm this scepticism.

His teaching was thus hardly more than a pure secularism. He had faith in man, man made for society, but he did not care to follow him out of society, nor to present to him motives of conduct derived from the consideration of a future state. Good and evil would be recompensed by the natural issues of conduct within the sphere of time,—if not in the person of the actor, yet in the persons of his descendants. If there were any joys of heaven to reward virtue, or terrors of future retribution to punish vice, the sage took no heed of the one or the other.

A very remarkable man Confucius was, persistent and condensed, but neither his views nor his character were perfect. In the China then existing he saw terrible evils and disorders, which he set himself, in the benevolence of his heart, to remedy, but of one principal cause of its unhappy condition he had no idea. Near the beginning of this article, the existence of polygamy and the evils flowing from it were referred to. Confucius never appeared to give the subject a thought. We saw how he mourned on the death of his mother; but no generous word ever passed his lips about woman as woman, and apparently no chivalrous sentiment ever kindled in his bosom. Nor had he the idea of any progress or regeneration of society. The stars all shone to him in the heavens behind; none beckoned brightly before. It was no doubt the moral element of his teaching, springing out of his view of human nature, which attracted many of his disciples, and still holds the best part of the Chinese men of learning bound to him; but the conservative tendency of his lessons—nowhere so apparent as in the *Ch'un Ts'iu*—is the chief reason why successive dynasties have delighted to do him honour. (J. LE.)

CONGÉ D'ÉLIRE, a licence from the Crown issued under the Great Seal to the dean and chapter of the cathedral church of the diocese, authorizing them to elect a bishop or archbishop, as the case may be, upon the vacancy of any episcopal or archi-episcopal see in England or in Wales. According to the *Chronicle* of Ingulphus, abbot of Crowland, who wrote in the reign of William the Conqueror, the bishoprics in England had been, for many years prior to the Norman Conquest, royal donatives conferred by delivery of the ring and of the pastoral staff. Disputes arose for the first time between the Crown of England and the See of Rome in the reign of William Rufus, the Pope claiming to dispose of the English bishoprics; and ultimately King John, by his charter *Ut liberæ sunt electiones totius Angliæ* (1214), granted that the bishops should be elected freely by the deans and chaplains of the cathedral churches, provided the royal permission was first asked, and the royal assent was required after the election. This arrangement was confirmed by subsequent statutes passed in the reigns of Edward I. and Edward III. respectively, and the practice was ultimately settled in its present form by the statute for the non-payment of first-fruits to the bishop of Rome (25 Henry VIII. c. 20). According to the provisions of this statute, upon the avoidance of any episcopal see, the dean and chapter of the cathedral church are to certify the vacancy of the see to the Crown, and to pray that they may be allowed to proceed to a new election. The Crown thereupon grants to the dean and chapter its licence under the Great Seal to elect a new bishop, accompanied by a letter missive containing the name of the person whom the dean and chapter are to elect. The dean and chapter are thereupon bound to elect the person so named by the Crown within twelve days, in default of which the Crown is empowered by the statute to nominate by letters patent such person as it may think fit, to the vacant bishopric. Upon the return of the election of the new bishop, the metropolitan is required by the Crown to examine and to confirm the election, and the metropolitan's confirmation gives to the election its canonical completeness. In case of a vacancy in a metropolitical see, an episcopal commission is appointed by the guardians of the spiritualities of the vacant see to confirm the election of the new metropolitan.

CONGER. See EEL.

CONGLETON, a market-town and municipal borough of England, in the county of Cheshire, near the border of Staffordshire, 26 miles south of Manchester by rail. It is finely situated in a deep valley, on the banks of the Dane, a tributary of the Weaver. Its main streets are well built, and its western suburb consists of handsome villas and gardens. Though a place of considerable antiquity, it makes little figure in history, and possesses few buildings of architectural interest. The parish churches, the guildhall, built in 1822, the market hall, and the town-hall dating from 1864 are the most important. At one time the leather laces known as "Congleton points" were in high repute; but the principal industry of the town is now the manufacture of silk, which was introduced in 1752 by a Mr Pattison of London. The making of salt is carried on to an extent which gives employment to nearly 200 men; and at the census of 1871 upwards of 700 were engaged in the neighbouring coal mines. There is canal communication with Macclesfield. In 1871 the population of the municipal borough, which embraces 2564 acres, was 11,344, inhabiting 2559 houses.

Arms of Congleton.

CONGLETON, HENRY BROOK PARNELL, FIRST BARON (1776–1842), was the second son of Sir John Parnell, chancellor of the Irish Exchequer, and was educated at Eton and Cambridge. In 1801 he succeeded to the family estates, and married a daughter of the earl of Portarlington; and in 1802, by his father-in-law's interest, he was returned for Portarlington to Parliament, but he speedily resigned the seat. In 1806 he was returned for Queen's County, for which he sat till 1832, when he withdrew from the representation. In 1833, however, he was returned for Dundee; and after being twice re-elected for the same city (1835 and 1837), he was raised to the peerage in 1841 with the title of Baron Congleton of Congleton. In 1842, having suffered for some time from ill health and melancholy, he committed suicide. He was a liberal Whig, and took a prominent part in the struggle of his party. In 1806 he was a lord of the Treasury for Ireland; it was on his motion on the Civil List that the duke of Wellington was defeated in 1830; in that year and in 1831 he was secretary at war; and from 1835 till 1841 he was paymaster of the forces and treasurer of the ordnance and navy. He was the author of several volumes and pamphlets on matters connected with financial and penal questions, the most important being that *On Financial Reform*, 1830.

CONGO, a country of Western Africa, extending along the coast of the Atlantic for about 185 English miles, from the River Zaire, or Congo (see AFRICA, vol. i. p. 254), which separates it from Cacongo and Loango on the north, to the Dande, which marks the boundary of Angola on the south. No very definite limit can be assigned on the eastern side; but it is hardly to be regarded as Congo territory at more than 250 miles inland. At one time the name Congo was applied not only to the country thus defined, but also to Loango, Angola, and Benguela—in short, to all the territory claimed by the Portuguese in this part of the continent.

The coast of Congo presents for the most part a succession of low cliffs and bluffs of red sandstone, sinking at intervals almost to the level of the sea; and for about 30 to 60 miles inland the country remains comparatively flat. It then begins to rise in irregular terraces till it reaches a height of about 1500 or 1600 feet; and its surface is broken with an endless variety of hill and valley and undulating plateau. The prevailing rocks in the lower terraces are mica, schist, gneiss, and shale; further inland there are extensive limestone formations; and igneous rocks occur in several quarters. The whole country is abundantly watered, partly by tributaries of the Zaire, and partly by independent streams that flow westward to the Atlantic. Of the latter the more important are the Ambrizzette, the Loge, and the Lifune; but even these are only navigable for barges. The former, as far as Congo proper is concerned, are individually insignificant. During the rainy season the surplus water is carried down in a thousand torrents, but the beds are quite dry during most of the year.

The mineral wealth of Congo is only partially explored, and even the deposits that are known to exist are very sparingly utilized. Copper mines have been worked at intervals for a considerable period at Bembe; and, though now abandoned by the Portuguese, they appeared to Lieutenant Grandy to contain a good supply of ore. Very fine malachite is also found in other parts of the country. Iron is obtained in the northern districts along the Zaire, where the general diffusion of the metal is proved by the red ferruginous character of the soil, and the fact that most of the streams are more or less chalybeate. A lake of bitumen is reported at Kinsao, near Mangue Grande; the same substance occurs at Musserra, and another deposit has been worked by the natives at Libongo. Red gum-copal occurs in various places,—among others, near Mangue Grande and in the Mossulo country; but the superstition of the natives interferes with its excavation. That diamonds have ever been found there seems no reason to believe; but garnets and even rubies occur. Salt is manufactured by the natives along the coast.

The climate of Congo is, in comparison with that of most tropical countries, remarkably cool and agreeable. In the hot season the thermometer is seldom more than from 80° to 86° Fahr. in the shade, and in the "cacimbo," or cool season, it usually ranges from 60° during the night to 75° during the day. This low temperature is principally due to the westerly breeze which sets in from the Atlantic about nine or ten o'clock in the morning, and continues blowing, not unfrequently with considerable violence, till after sunset. As this breeze dies away towards the interior, the heat is perceptibly greater; but the increasing elevation of the country soon reduces the temperature to similar limits. The different seasons of the year occur at slightly different periods, according to the altitude and position of the several districts; but the hot or rainy season may be regarded as extending from October to May or June, and the "cacimbo" as occupying the rest of the year. In October there are usually light rains in the lower country; and these are succeeded by the *Moula na Chintomba*, or great rains, which are accompanied by violent storms and thunder. Next follows, from December to March, a period known as the "little dries," and then comes another spell of heavy rains and atmospheric disturbance. In the neighbourhood of Banza Umpata, about 200 miles inland, the natives, according to Lieutenant Grandy, divide the year into the following five seasons:—*Sevoo*, or summer, from the beginning of July to the middle of September; *Bangala*, or the dry season, to the end of November; *Masanza*, to the middle of February, *Kundey*, or the period of the heavy rains, to the middle of April; and *Kintombo*, or spring, to the end of June. In its effects on the human constitution, the climate of Congo is much less deleterious than that of the coast regions further to the north; and in the higher districts even the European can maintain himself with ease in a fair state of health. Fevers and agues are not uncommon, but do not last long; and the natives suffer from bronchitis, pleurisy, small-pox, and skin diseases. The curious sleep-disease appeared in 1870, but did not spread through the country.

The flora of Congo is rich and various; and the country may be divided with remarkable precision into different zones, distinguished by the prevailing character of the vegetation. According to Mr Monteiro, the traveller, as he advances inland from Ambriz, finds during the first 25 miles baobabs, euphorbias, aloes, "muxixes" or "mukazo" (*Sterculia tomentosa*), and a great abundance of *Sanseviera angolensis*; he passes next into a region of larger, shadier trees, which continue for the next 35 miles, when the scene again changes, and the whole forest becomes one tangled maze of the most luxuriant and beautiful creepers. Near Bembe the country opens up and the oil-palm becomes the prevailing tree. In the first zone the grasses are short and delicate, in the second they are stronger and taller; in the third they develop into gigantic species with sharp knife-like blades, from 5 to 16 feet in height, which cover vast open stretches, and for several months in the year render communication through the country almost impossible. The cashew tree is exceedingly abundant along the coast from Congo to Ambrizzette. The principal objects of native cultivation are manioc or cassava, yams, ground-nuts (*Arachis hypogæa*), and maize. Sesamum and sweet potatoes are sparingly grown. Coffee of good quality is found wild in various parts, especially in the neighbourhood of Encoge. Chili pepper is abundant, and forms the principal condiment in use among the natives, who not unfrequently eat it to their own injury. The plantain, the papaw, the orange, and the pine-apple are the principal fruits, but many others thrive well. Beans, cabbages, pumpkins, cucumbers, melons, spinach, and other European vegetables can be successfully cultivated, and the first two are used by the natives. Of the beans, indeed, there are two species, the ordinary haricot and the tree-bean; the latter is sometimes left to grow for two years. The principal beverage of the inhabitants is the palm wine, but they also manufacture a beer called "garapa," from the Indian corn. According to Selim Agha, who accompanied Burton in 1863, cotton and rice come to perfection in four months, the cassava takes six or nine, and three or four are sufficient for cabbages, lettuce, endive, and carrots.

The domestic animals of Congo consist chiefly of goats, swine, dogs, and cats; and there are also a few sheep with coats of hair instead of wool. The goats are beautiful creatures, but the swine and dogs are poor and half-starved. No beasts of burden are employed by the natives; and the mules, asses, and camels introduced by the Portuguese died out. Horned cattle there are none, though they thrive well enough on the coast under the white man's care.

The larger wild animals are similar to those of the neighbouring countries on the south; but the River Zaire seems to be a natural limit for many species on the north. The variety of birds is remarkable. Flamingoes, spoon-bills, herons, ducks, and various other aquatic species abound in the rivers and marshes. The common African crow, bright-coloured starlings, rollers, and doves are very common in the lower country; and sun-birds and other insectivora frequent the palm-trees. The white ant is the most abundant of the insect tribes; and mosquitoes of a most virulent sort are very common. The chigoe (*Pulex penetrans*), introduced in 1870, spread through the country, but seems to be dying out again. Bees abound, but are not domesticated.

Animal food is not in very general use, although the natives will eat the flesh of almost any beast or bird. The Mussurongos consider the cat a great dainty; field rats are regularly captured for the kitchen, by the various tribes; the king-cricket, and some species of caterpillars, are sought after for the same purpose; and the white ant is greedily devoured in the winged state.

Congo is as destitute as the other countries of tropical Africa of what a European would call a city. The native *banzas*, or townships, consist of a few hundred huts clustered together; and the Portuguese settlements are merely commercial factories or military posts. The places of most importance along the coast are Mangue Pequeño, Mangue Grande, Quinzao, Moculla, Ambrizzette, Musserra, Quicimbo, Ambriz, and Libongo. On the River Zaire may be mentioned King Antonio's Town, Boma (anciently Lambi), and Vinda la Nzadi, or Congo Town; but the last two are on the north side of the river, and therefore are hardly to be included within our limits. The principal inland town is São Salvador, or Congo Grande, with a population at one time extravagantly estimated at 50,000; and Bauza Noki to the north and Bembe and Encoge to the south are worthy of mention. The number of villages is very considerable, and together they must make up a fair population; but it is evident from the condition of the country, as well as from the reports of the older travellers, that formerly the inhabitants must have been much more numerous.

The ordinary huts of the natives are formed of mats woven from a reedy grass, or the fibres of plants. That of the chief is constructed more skilfully of palm leaves, and is encompassed with a fence of reeds. In the coast towns the huts, though each is built separate, are comparatively close to each other; while further inland much more space is allowed to intervene, and hedges are frequently grown round small groups. The Mushicongos build on a larger scale than their Ambriz neighbours, and not unfrequently have two compartments. The household furniture and utensils, in simplicity and rudeness, are on a par with the domestic inclosures. Baskets are made of the fibres of the palm tree, and bowls and bottles of gourds and other vegetables; earthen vessels are used for boiling the victuals, and wooden spoons to eat them; while a mat of grass thrown on a raised platform constitutes the only bedding.

There is no political or ethnographical unity in the country. No one tribe is predominant, and the king of Congo, whatever may have formerly been his authority, is now no more than a local chieftain, like a dozen others. The tribes numerically important are the Mussurongos, who extend from the Zaire as far south as Mangue Grande; the Mushicongos, who lie inland to the north of Bembe; the Ambrizians along the coast, and inland as far as Quiballa; and the Mossulos to the north of the Dande. Besides the king of Congo, the king of North Bamba, or of the district between the Ambrizzette and the Loge, and the king of Encoge, with the title of "Dembo Ambuilla," possess a certain amount of prestige. Every "town" has its own headman and assembly of "Macotas," or councillors; and these in company manage its affairs. The office of headman confers no despotic power; and it descends by inheritance not from father to son, but from uncle to nephew or niece. The languages of the Mussurongo, Mushicongo, and Ambriz tribes are radically one; and indeed the natives of the whole of this part of the coast, for a distance of 450 miles, can understand one another's speech. Under the name of Fiote, this common tongue has been the object of some little attention. Barbot gives a list of 33 words, Douville a more extended vocabulary of what he calls *la langue Magialoua*, and the authors of the *Congo Expedition* a third and much better collection. Vowels and liquids are numerous, and gutturals altogether absent, so that the language has a soft and harmonious sound. In number of words it is remarkably rich. According to Captain Burton, its likeness to the Kisawahili of Zanzibar is so great that he was frequently able to understand whole sentences from this resemblance alone. Along the coast a considerable number of the natives can speak Portuguese or even English; but their pronunciation is extremely faulty, and they transfer the idiom of their own speech to the foreign tongue.

Manners and customs

The religion, if such it can be called, of the Congoese is a gross fetishism, and almost the only trace of their former superficial Christianization is the superstitious value attached to some stray crucifix now employed as a charm, a little more potent, it may be, than a string of beads or a land-shell filled full of birds' dung and feathers. Belief in witchcraft is very general, and develops itself in the most trivial and irrational style. Circumcision is practised by all the tribes; and the rite is usually performed on boys of from eight to twelve years of age, who have to undergo a preparatory discipline, and live apart from the rest of the community for a month in a special hut. Polygamy prevails,—every man having wives according to his wealth and rank. There is no nuptial ceremony; but the bridegroom makes a present to the father-in-law, provides the bride with her marriage outfit, and bears the cost of a family feast. The costume of both men and women varies considerably with rank and the degree of European influence; but in general it is very slight. The bodies of the dead are not unfrequently desiccated by roasting, and then buried in the huts which they formerly occupied. The interment is often delayed for a year or more, that all the relatives may be present at the "wake."

Since the stoppage of the slave trade, a very considerable traffic has been developed in the natural products of the country, and were it not for the inherent indolence of the natives it might be increased almost to any extent. The principal exports are the fibre of the baobab, first utilized as a paper material by Mr Monteiro in 1858; ground nuts, which find a ready market, especially in France, as an oil seed; ivory brought down from the interior; palm oil, sesamum, coffee, and an inferior kind of Indian-rubber obtained from a species of *Landolfia*. The commercial prosperity of the Congo River has been frequently interrupted by the attacks of the Mussurongo pirates, but this annoyance has been somewhat checked by the vigorous measures of the English cruisers. The last expedition of repression was that of Commodore Sir W. Hewett in 1875.

Congo was discovered by Diego Cam, probably in 1484. He erected a stone pillar at the mouth of the river, which accordingly took the title of Rio de Padrão, and established friendly relations with the natives, who reported that the country was subject to a great monarch, Mwani Congo, or Lord of Congo, resident at Ambasse Congo. The Portuguese were not long in making themselves influential in the country. Gonçalo de Sousa was despatched on a formal embassy in 1490; and the first missionaries entered the country in his train. The king was soon afterwards baptized, and Christianity was nominally established as the national religion. In 1534 a cathedral was founded, and in 1560 the Jesuits arrived with Paulo Dias de Novaes. Of the prosperity of the country at this time the Portuguese have left the most glowing and indeed incredible accounts. The attention of the Portuguese was, however, turned more particularly to the southern districts of Angola and Benguela, and their hold on Congo loosened. In 1627 their cathedral was removed to São Paul de Loanda, and São Salvador declined in importance. In the 18th century, again, in spite of the invasions of the Dutch and French, some steps were taken towards re-establishing their authority; in 1758 they formed a settlement at Encoge; from 1784 to 1789 they carried on a war against the natives of Mussolo; in 1791 they built a fort at Quincollo on the Loge, the ruins of which are still existent, and for a time they worked the mines of Bembe. At present, however, they possess no fort or settlement to the north of Ambriz, which was first occupied in 1855. The connection of other European nations with Congo has hitherto been either exploratory or commercial, and nothing more powerful has been established than a "factory" or "comptoir." In 1816 an expedition was despatched from England under the command of J. K. Tuckey, R.N., for the examination of the Zaire. It reached the river on July 6th, and managed to push up stream as far as Sangala, the highest rapid; but sickness broke out, the commander and several others died, and the expedition had to return. A survey of the first twenty-five miles of the river was effected in 1826 by the "Levin" and the "Barracouta," belonging to Captain Owen's expedition; and in 1827–29 the Frenchman Douville spent some time in various parts of the country. In 1857 the German explorer, Dr Bastian, passed from Ambriz inland as far as São Salvador; and in the same year Captain Hunt, in the "Alecto," made an attempt to ascend the river, but only reached the cataracts. Captain Burton attained the same limit in 1863, and also proceeded inland as far as Banza Noki. In 1872 an expedition under Lieutenant Grandy was despatched from England for the purpose of advancing from the west coast to the relief of Livingstone. Ambriz was chosen as the starting point, and Bembe was reached in 11 days, on the 23d of March 1873. The 15th of May found the party at Congo, but they were detained there till June 20th. Passing through Kilembella, Moila, and Tungwa (a place of about 1600 inhabitants), they arrived at Banza Umpala, on a tributary of the Zaire, about 200 miles inland, but were then obliged to retrace their steps to Congo, whence they proceeded to Banza Noki and the main river, intending to push their way up the stream. The death of Livingstone was soon after reported; and a recall shortly reached them, which brought the expedition to a close. They found the natives "exceedingly timid, superstitious, and suspicious, evidently believing that the foreigners had come to interfere with their trade and country." In 1875 a German expedition, under Captain von Homeyer, commenced exploratory operations along the Congo for the purpose of preparing the way for German colonization.

CONGREGATIONALISM, a designation assumed of late years by the religious denomination formerly known as Independents. This change of name has arisen from no radical alteration in the particular doctrinal or ecclesiastical opinions of that sect (see INDEPENDENTS), but in order to express more definitely the positive aspects of their church life and organization. The negative term Independent implied chiefly a renunciation "of the authority of pope, prelate, presbytery, prince, or parliament," and thus brought into prominence the antagonistic position of the churches so named towards National, Episcopal, and Presbyterian Churches. The word Congregational has been now almost universally substituted for it to indicate more clearly the brotherhood and fellowship maintained in their separate communities, the spiritual equality of every member, the right and the duty of all in the church to have a voice in its deliberations and decisions, the essential necessity for each society to originate its own outward forms of life. As one of the latest exponents of Congregationalism has said,[1] "When the restraints of outward law are repudiated, it is necessary to insist with all the greater intensity on making the polity of the church the expression of its own highest life. Everything must be subordinated to this. The polity must come from within; it must not be imposed from without; it may recognize outward circumstances but must not be controlled by them. If the organization of the church is to be a vital growth, the life which it is to reveal is the life which the church has received from Christ. Ecclesiastical statesmen have no right to construct various forms of polity to express the spirit and tendencies prevailing among different races of men, in different countries, and in different churches; the polity of the church must be created by the idea of the church." It is maintained that this conception of a church organization is entirely in harmony with the genius of the New Testament, and is better expressed by the word Congregational than Independent. In this sense it is applicable to other communities, in particular to the Baptists, who sometimes adopt it. Probably another reason for its employment has been the growing tendency towards outward union among churches that were mainly characterized by their isolation from each other. Independency was often regarded as a synonym for non-catholicity, and there was so strict a jealousy against all possible interference from without that close association or united action was exceedingly difficult, even amongst those whose doctrinal beliefs and ecclesiastical polity were the same. An endeavour has been made to overcome such obstacles common to co-operation without destroying or infringing the independence of the individual church, and the Congregationalists now have numerous missionary societies for home and foreign work, an association in every county, and a general Congregational Union for England and Wales. The last was established after much discussion in 1833, when a declaration of faith, church order, and discipline was adopted under these express conditions. "It is not intended that the following statement should be put forth with any authority, or as a standard to which assent should be required. Disallowing the utility of creeds and articles of religion as a bond of union, and protesting against subscription to any human formularies as a term of communion, Congregationalists are yet willing to declare, for general information, what is commonly believed among them, reserving to every one the most perfect liberty of conscience." In 1871 a revision of the constitution of the Union took place, when the "fundamental principle" of its existence was thus re-asserted. "The Union recognizes the right of every individual church to administer its affairs, free from external control, and shall not, in any case, assume legislative authority or become a court of appeal." The objects it seeks to promote were then also more definitely stated in these words, "to uphold and extend evangelical religion primarily in connection with churches of the Congregational order; to promote Scriptural views of church fellowship and organization; to strengthen the fraternal relations of the Congregational churches, and facilitate co-operation in everything affecting their common interests; to maintain correspondence with the Congregational churches and other Christian communities throughout the world; to obtain statistics relating to Congregational churches at home and abroad; to assist in procuring perfect religious equality for all British subjects, and in

[1] *Ecclesia, A Second Series of Essays on Theological and Ecclesiastical Questions*, p. 371

promoting reforms bearing on their moral and social condition." The chairman is elected annually by the vote of the delegates from the churches present at the annual meeting. Unions of a similar character exist in Scotland, Ireland, and the colonies. In 1876 it was computed[1] that the total of Congregational churches and branch-churches in Great Britain and the colonies was 3895, with other preaching places, supplied mainly by lay agency, to the number of 1248. The ordained ministers, including the missionaries of the London Missionary Society, were 3205; there were 17 colleges, employing 52 professors and educating 430 students. The expenditure for missions at home and abroad, not calculating the amounts expended by individual churches throughout the world for special local missions, was £147,270. In 1875 the Congregationalists opened their Memorial Hall and Library, which is erected in London on the site of the old Fleet Prison, in commemoration of the heroism and spiritual fidelity of the two thousand clergymen who were ejected "from their homes and livings as ministers of Christ in the Church of England, under the stringent, inhuman, and unjust provisions of the Act of Uniformity." In that building the various societies of the Congregationalists now hold their meetings.

Congregationalism in the United States has, from the earliest period of its existence, recognized the principle that each Christian society, though complete in itself, is nevertheless related to all other churches of the same faith and order. The weakness and scattered condition of those little communities which followed the settlement of the Pilgrim Fathers threw them into close association, they assisted each other by friendly advice, and from that sprang the system of councils. These have now become important institutions exercising considerable influence. It is claimed that, though every church is "independent of all outward control," "a fraternal fellowship is yet to be maintained among these independent churches; and when insoluble difficulties arise, or specially important matters claim decision—as where a pastor is to be settled or dismissed, or a church itself is to adopt its creed and commence its organic life—it is proper that the advice of other churches should be sought and given in council; such action, however, in no case being anything more than a labour of fraternal suasion or self-justification."[2] Increase Mather says, "It has eve been their declared judgment that, where there is want either of light or peace in a particular church, it is their duty to ask for counsel, with which neighbour churches ought to assist by sending their elders and other messengers to advise and help them in their difficulties; and that in momentous matters of common concernment particular churches should proceed with the concurrence of neighbour churches; so in the ordination of a pastor, much more in the deposing of one. Thus it has ever been in the churches of New England." Some writers contend that "Congregationalism differs from Independency by its recognition of this practical fellowship between the churches." The councils thus summoned are dissolved as soon as the business is settled, and should the church to which advice is offered be unwilling to accept and act upon it the other churches may consider the desirability of withdrawing from any further association with it. There are permanent councils in Connecticut, called "consociations," but they are not general in the States. In some of the county unions of England a committee is appointed annually, to which churches may appeal in any difficulty which they are unable to remove of themselves,—an approach towards the American system. According to a religious census taken by the Government there were in the United States in 1850, 1725 Congregational churches with 807,335 sittings; these had increased in 1870 to 2887 churches and 1,117,212 sittings. For the education of the ministry there are seven theological institutions. (W. B.)

[2] *Congregationalism: What it is, whence it is, and how it works*, 3d ed., Boston, 1871.

CONGRESS, in diplomacy, a term applied to an assemblage of sovereigns or ambassadors of the highest rank, convoked for the purpose of concluding a general peace, or of treating the general political interests of Europe. In this latter sense a modern congress may be regarded as a representative council of states or nations, by which differences may be adjusted, and the rules of international law determined and enforced. The greatest progress yet made in the relations of sovereign states is, that disputes, which in former times would have led to immediate war, may now be resolved, in many instances, by the common deliberations of the European powers. The term CONGRESS, however, is only strictly applicable to meetings of this nature on the most important occasions, and when all the powers are represented. The term CONFERENCE is used to describe diplomatic meetings of ministers of the first or second rank, called together for a special purpose, either to modify existing treaties by consent, or to suggest means of dealing with a critical state of affairs. Meetings of this kind have become in modern times very frequent, and are the recognized mode of dealing with the questions arising between sovereign states, and sometimes even between states and their subjects. The proceedings of these conferences are recorded in protocols, agreed to and signed by the plenipotentiaries. These documents have not always the form of treaties or conventions, but they establish the principles on which the powers agree to act, and the rules by which they are bound in honour and good faith. The number of Congresses which have been held in the last two centuries is not very large, and we shall proceed briefly to pass them in review. Conferences have occurred so frequently that it would be impossible to describe them in detail. The most important examples are, perhaps, the Conference of Petersburg in 1825, which led to the independence of Greece; the Conference of London in 1831, which separated the kingdom of Belgium from Holland; the Conference of Paris on the affairs of Crete; the Conference of 1871 for the modification of the Treaty of Paris of 1856; and the abortive Conference of Constantinople in 1877, when the six powers vainly endeavoured to obtain from the Porte guarantees for the better government of its Christian subjects. These two forms of diplomatic council differ more, however, in form and degree than in kind. Their object is the same, namely, to determine and enforce the mutual obligations of states; and they may therefore be treated under one head.

The first time we have been able to trace the use of the term *Congress* in its modern sense, is in 1636, when the Pope attempted to open negotiations for peace at Cologne, under his own mediation; but the attempt failed, and the Thirty Years' War continued for twelve years more to devastate the world. At length, however, it was agreed by the preliminaries of Hamburg, signed on the 25th December 1641, that a Congress should be held at Munster and at Osnaburgh, in Westphalia, meeting simultaneously in both those towns; the French mediating minister, representing the Catholic party, being at Munster, and the Swedish minister, representing the Protestants, at Osnaburgh. The opening of the Congress was fixed for the 11th July 1643; but the proceedings were delayed by numerous formalities, by questions of rank and precedence, by questions of neutrality and safe-conduct, and by the death of Richelieu and Louis XIII. The negotiations began in earnest in June 1645. Never before had so august an assembly met in Europe for the termination of a sanguinary war, for the stablishment of peace between two hostile creeds, and for the regulation of territorial questions by common agreement. The Empire was represented by Count Maximilian von Trautmansdorf; France by Count d'Avaux; Sweden by John Oxenstiern, a son of the great chancellor; the Pope by Cardinal Chigi, afterwards himself Pope Alexander VII.; Spain by Count Peñaranda, and by two of her subjects from Franche Comté, not to mention lesser names. England had no representative at the Congress of Westphalia. The questions in dispute and the result of these long deliberations (which were not terminated until the 24th October 1648 by the signature of the two great treaties of Munster and Osnaburgh) were worthy of the statesmen engaged in them and of the time spent in the negotiations; for the Congress of Westphalia laid the foundations of modern Europe, and its leading principles subsisted not only into the present century, but down to the war of 1870–71. It terminated the long contest between France and Austria. It established the equal rights of the Catholic, Lutheran, and Calvinistic churches in Germany. It rendered 350 German princes almost independent of the Empire, and it planted the germ of the future greatness of Prussia. This form of the German body remained unaltered till the French Revolution. But it also gave to France and Sweden a right, as mediating powers at Munster, to interfere in the affairs of Germany—a right which supported the aggressive policy of Louis XIV., and caused, in the event, innumerable quarrels. The diplomatic communications at Munster all passed through the mediators, and were generally framed in Latin. The discussions were also carried on in that language. A separate peace between the Dutch and the Spaniards was also signed at Munster in 1648, as represented in Terburg's celebrated picture, now in the National Gallery, but this was not an act of the Congress.

The term Congress was applied to the diplomatic meetings which negotiated the Peace of Nimeguen in 1678 and the Peace of Ryswick (so called from a castle near the Hague) in 1697. A contemporary French author, De Rouille, remarked that these meetings ought to be termed assemblies, not congresses, since the latter word was coarse and inappropriate. The term has since entirely lost its improper meaning, derived from an obsolete form of ecclesiastical procedure, and the diplomatic signification has triumphed. At Nimeguen England appeared for the first time at a Continental Congress, from the interest she took in the fate of Holland, and was worthily represented by Sir William Temple; France by Colbert de Croissy, D'Estrades, and D'Avaux; Spain by Don Pedro Ronquillo, governor of the Low Countries; and Holland by the count of Nassau and Beverning. Separate treaties were signed between the various parties. The Congress of Ryswick was of still greater importance to England, for it terminated the war in which we had long been engaged with France, and extorted from Louis XIV. the recognition of the right of William and Mary to the British crown. The peace was of short duration, for the War of Succession broke out in 1701; the grand alliance was formed between England, Holland, and Austria; France was defeated; peace was nearly restored in 1709 at the conferences of Gertruydenberg, which were privately carried on between the marquis de Torcy and the Grand Pensionary, but not finally concluded till 1712, when a Congress of all the belligerent powers (except the king of Spain) assembled at Utrecht. France was represented by the marshal d'Huxelles, England by the bishop of Bristol (it was the last time an English bishop acted in a civil and diplomatic capacity), the emperor by Count Sinzendorf. The decisive negotiation for peace was, however, carried on secretly and separately between London and Versailles, and whilst the Congress was occupied with formalities, Bolingbroke came to an agreement with France, which broke up the alliance and compelled the other powers to terminate the war. The other Congresses of the 18th century are those of Soissons in 1727, remarkable for the fact that Cardinal Fleury, then prime minister of Louis XV., attended it in person, and of Aix-la-Chapelle in 1748, which terminated a general war. By each of these Congresses the treaties of Westphalia, Nimeguen, Ryswick, and Utrecht were renewed and confirmed; so that their labours formed a continuous series and identical body of international legislation. No Congress was held at the termination either of the Seven Years' War in 1763 or of the American war in 1783, but the style of a Congress was assumed by the German plenipotentiaries who met at Teschen in 1779 to end the war of the Bavarian succession. It hardly deserved the name.

The French Revolution and the wars of the Empire swept away the entire political fabric of continental Europe and the treaties on which it was based. No attempt was made during that period to convoke a Congress for the purpose of a general pacification and territorial settlement; for the Congress of Rastadt, which met in December 1797 and sat till April 1799, was designed mainly to re-establish amicable relations between France and the German empire, and was not attended by the representatives of England, Russia, or Spain. These negotiations proved abortive; war was renewed; the Congress was broken up; and the ministers of the French Directory—Bonnier and Roberjot—were massacred by a party of Austrian Szeklers as they quitted the town. The Austrian Government never entirely cleared itself of complicity in this crime against the rights and usages of nations; and the event aggravated the hostility existing between France and Germany.

Upon the fall of Napoleon, it was agreed by the 32d Article of the Peace of Paris, signed on the 30th May 1814 between France and the allied powers, that "within two months all the powers which had been engaged in the war on either side should send plenipotentiaries to Vienna to settle, at a general Congress, the arrangements required to complete the provisions of the Treaty of Peace." The Congress of Vienna, which met, with some allowance for delays, early in November of the same year, was by far the most splendid and important assembly ever convoked to discuss and determine the affairs of Europe. The emperor of Russia, the king of Prussia, the kings of Bavaria, Denmark, and Wurtemberg, were present in person in the Austrian capital at the court of the Emperor Francis. Prince Metternich presided over the Congress. Prince Talleyrand represented France. Great Britain sent the secretary of state for foreign affairs—Lord Castlereagh,—besides the duke of Wellington, Lord Clancarty, and Lord Cathcart. Mr Stratford Canning, now the sole survivor of that illustrious assembly, took part in the discussion of the affairs of Switzerland, where he was then minister. Prussia was represented by Prince Hardenberg and Baron Humboldt. A hundred sovereigns and ministers were collected in Vienna, all animated by a general desire for peace and a lively sense of their own interests. Chevalier Gentz, who was named protocolist to the Congress, and who in fact drafted the treaties which were ultimately signed by all the powers, has left us a curious account of the secret proceedings of this prodigious assembly. Strange to say, the Congress itself, that is to say, the representatives of all these principalities and powers, *never met* in council; nor did any formal exchange of their respective credentials take place. The business was entirely transacted by committees of the five great powers—Austria, England, France, Prussia, and Russia; to whom, for certain purposes, the ministers of Spain, Sweden, and Portugal were added. Even with this arrangement the progress of the negotiations was extremely slow. For three months nothing was done. It was said, "Le Congrés danse, mais ne marche pas." Serious differences arose; the pretensions of Russia and Prussia, acting in concert, seemed even to threaten a renewal of war; and a secret treaty was concluded on the 3d December between England, France, and Austria, in view of that contingency. The return of Napoleon from Elba in March 1815 roused the Congress from its lethargy and terminated its disputes, by the necessity for common action; and at length the great treaties of Vienna were signed on the 7th June 1815—eleven days before the battle of Waterloo—by the plenipotentiaries of the eight powers. It is acknowledged by the draftsman of these treaties that, after all, this work was somewhat hastily and imperfectly done. Yet upon the whole, that Congress succeeded in restoring peace to Europe, which was not seriously disturbed for forty years; and it laid the foundation of a system of public law, which was long held sacred, as the common basis of the rights of every member of the European family. At the present time, after the changes which have taken place in Poland, in Italy, in Germany, in Denmark, and in France, it can hardly be said that any fragments of the work of the Congress of Vienna retain their authority, or that any similar general compact has taken its place.

The intimate relations which had sprung up during the war gave rise to a mystical union of the northern sovereigns, projected and prepared by the emperor of Russia, under the name of the Holy Alliance; and the intention of the authors of that agreement was that the powers should meet and act together in the event of fresh disturbances occurring in Europe. The practical result of this policy was seen in 1823 when another Congress met at Verona, not for the purpose of restoring peace, but in order to crush the signs of freedom and independence then beginning to display themselves in Europe. In Spain the nation demanded a constitution—she was invaded by France; in Naples a popular movement took place—Naples was occupied by Austrian troops, and the king fled to Laybach; in Germany, the people were irritated by the breach of all the liberal promises made during the war. The Congress of Verona was the source and centre of the most violent reactionary policy; and although the duke of Wellington attended it on behalf of England, it was chiefly to protest against its system of despotic intervention in the affairs of other states. M. de Chateaubriand has left an account of this, the darkest hour of the politics of Europe, in which he took an active and inglorious part. On this occasion, however, England renewed her protest against the slave trade, and obtained a declaration of the Powers condemning it.

The last Congress held in Europe was that of 1856, which met in Paris to terminate the Crimean war. Austria and Prussia, though not actual belligerents, were admitted to take part in the deliberations and general acts of the Congress, and for the first time in history the ambassadors of the Ottoman Porte appeared at a European Congress, and were formally received into the concert of the great powers. Count Walewski presided over this Congress, as minister of foreign affairs of France; Lord Clarendon, British secretary of state, and Lord Cowley were the representatives of England. In this Congress it was remarkable that France, eager for peace and anxious to court the good-will of Russia, sided with her recent adversary, and that the concessions obtained by the victorious allies were due mainly to the firmness of the British plenipotentiaries. After the conclusion of the negotiations for peace, the question of the maritime rights of belligerents and neutrals was formally brought before the Congress, as a body representing all the great powers of Europe; and a declaration was signed, which has been discussed more fully in another place. (See DECLARATION OF PARIS.) But this is an important example of the authority which may be fitly assumed and exercised by a Congress, to determine controverted questions of public law by a species of declaratory enactment.

In the autumn of 1863, the Emperor Napoleon formally proposed to the other great Powers that a Congress should assemble in Paris for the purpose of settling various questions, which appeared to threaten the future peace of Europe. To this proposal the Continental states assented; but England gave a positive refusal, on the ground, stated by Lord Russell, that such measures of prospective legislation were more likely to embroil the several Powers than to establish peace. The project was therefore abandoned; but the wars which ensued in Denmark, in Austria, and in France, within the next seven years, justified the views taken by Napoleon III. as to the dangers that threatened the peace of the world.

The most convenient summary of the Acts of the various Congresses which have been held from 1645 to 1815 is to be found in Koch Schöle's *Histoire Abrégée des Traités de Paix.* The Acts of the Congress of Vienna were published at great length by Kluber in his *Geschichte des Wiener Congresses.* The proceedings of the Congresses and Conferences in which Great Britain has taken part have invariably been laid before Parliament. (H. R.)

CONGREVE, WILLIAM (1670–1729), the greatest English master of pure comedy, was born, according to the latest and likeliest accounts, in 1670, according to the inscription on his monument, in 1672; and whether in England or in Ireland, at Bardsey near Leeds or at some place unknown beyond St George's Channel, has likewise been matter of doubt and dispute; but we may presumably accept the authority of Lord Macaulay, who decides against Dr Johnson in favour of the later date, and dismisses without notice the tradition of an Irish birthplace. To Ireland, at all events, is due the credit of his education,—as a schoolboy at Kilkenny, as an undergraduate at Dublin. From college he came to London, and was entered as a student of law at the Middle Temple. The first-fruits of his studies appeared under the boyish pseudonym of "Cleophil," in the form of a novel whose existence is now remembered only through the unabashed avowal of so austere a moralist as Dr Johnson, that he "would rather praise it than read it." In 1693 Congreve's real career began, and early enough by the latest computation, with the brilliant appearance and instant success of his first comedy, *The Old Bachelor*, under the generous auspices of Dryden, then as ever a living and immortal witness to the falsehood of the vulgar charge which taxes the greater among poets with jealousy or envy, the natural badge and brand of the smallest that would claim a place among their kind. The discrowned laureate had never, he said, seen such a first play; and indeed the graceless grace of the dialogue was as yet only to be matched by the last and best work of Etherege, standing as till then it had done alone among the barefaced brutalities of Wycherley and Shadwell. The types of Congreve's first work were the common conventional properties of stage tradition; but the fine and clear-cut style in which these types were reproduced was his own. The gift of one place and the reversion of another were the solid fruits of his splendid success. Next year a better play from the same hand met with worse fortune on the stage, and with yet higher honour from the first living poet of his nation. The noble verses, as faultless in the expression as reckless in the extravagance of their applause, prefixed by Dryden to *The Double Dealer*, must naturally have supported the younger poet, if indeed such support can have been required, against the momentary annoyance of assailants whose passing clamour left uninjured and secure the fame of his second comedy; for the following year witnessed the crowning triumph of his art and life, in the appearance of *Love for Love.* Two years later his ambition rather than his genius adventured on the foreign ground of tragedy, and *The Mourning Bride* began such a long career of good fortune as in earlier or later times would have been closed against a far better work. Next year he attempted, without his usual success, a reply to the attack of Jeremy Collier, the nonjuror, "on the immorality and profaneness of the English stage,"—an attack for once not discreditable to the assailant, whose honesty and courage were evident enough to approve him incapable alike of the ignominious precaution which might have suppressed his own name, and of the dastardly mendacity which would have stolen the mask of a stranger's. Against this merit must be set the mistake of confounding in one indiscriminate indictment the levities of a writer like Congreve with the brutalities of a writer like Wycherley,—an error which ever since has more or less perverted the judgment of succeeding critics. The general case of comedy was then, however, as untenable by the argument as indefensible by the sarcasm of its most brilliant and comparatively blameless champion. Art itself, more than anything else, had been outraged and degraded by the recent school of the Restoration; and the comic work of Congreve, though different rather in kind than in degree from the bestial and blatant licence of his immediate precursors, was inevitably for a time involved in the sentence passed upon the comic work of men in all ways alike his inferiors. The true and triumphant answer to all possible attacks of honest men or liars, brave men or cowards, was then as ever to be given by the production of work unarraignable alike by fair means or foul, by frank impeachment or furtive imputation. In 1700 Congreve thus replied to Collier with the crowning work of his genius,—the unequalled and unapproached master-piece of English comedy. The one play in our language which may fairly claim a place beside or but just beneath the mightiest work of Molière is *The Way of the World.* On the stage which had recently acclaimed with uncritical applause the author's more questionable appearance in the field of tragedy, this final and flawless evidence of his incomparable powers met with a rejection then and ever since inexplicable on any ground of conjecture. During the twenty-eight years which remained to him, Congreve produced little beyond a volume of fugitive verses, published ten years after the miscarriage of his master-piece. His even course of good fortune under Whig and Tory Governments alike was counterweighed by the physical infirmities of gout and failing sight. He died, January 29, 1729, in consequence of an injury received on a journey to Bath by the upsetting of his carriage; was buried in Westminster Abbey, after lying in state in the Jerusalem Chamber; and bequeathed the bulk of his fortune to the chief friend of his last years, Henrietta, duchess of Marlborough, daughter of the great duke, rather than to his family, which, according to Johnson, was then in difficulties, or to Mrs Bracegirdle, the actress, with whom he had lived longer on intimate terms than with any other mistress or friend, but who inherited by his will only £200. The one memorable incident of his later life was the visit of Voltaire, whom he astonished and repelled by his rejection of proffered praise and the expression of his wish to be considered merely as any other gentleman of no literary fame. The great master of well-nigh every province in the empire of letters, except the only one in which his host reigned supreme, replied that in that sad case Congreve would not have received his visit.

The fame of our greatest comic dramatist is founded wholly or mainly on but three of his five plays. His first comedy was little more than a brilliant study after such models as were eclipsed by this earliest effort of their imitator; and tragedy under his hands appears rouged and wrinkled, in the patches and powder of Lady Wishfort. But his three great comedies are more than enough to sustain a reputation as durable as our language. Were it not for these we should have no samples to show of comedy in its purest and highest form. Ben Jonson, who alone attempted to introduce it by way of reform among the mixed work of a time when comedy and tragedy were as inextricably blended on the stage as in actual life, failed to give the requisite ease and the indispensable grace of comic life and movement to the action and passion of his elaborate and magnificent work. Of Congreve's immediate predecessors, whose aim had been to raise on French foundations a new English fabric of simple and unmixed comedy, Wycherley was of too base metal and Etherege was of metal too light to be weighed against him; and besides theirs no other or finer coin was current than the crude British ore of Shadwell's brutal and burly talent. Borrowing a metaphor from Landor, we may say that a limb of Molière would have sufficed to make a Congreve, a limb of Congreve would have sufficed to make a Sheridan. The broad and robust humour of Vanbrugh's admirable comedies gives him a place on the master's right hand; on the left stands Farquhar, whose bright light genius is to Congreve's as female is to male, or "as moonlight unto sunlight." No English writer, on the whole, has so nearly touched the skirts of Molière; but his splendid intelligence is wanting in the deepest and subtlest quality which has won for Molière from the greatest poet of his country and our age the tribute of exact and final definition conveyed in that perfect phrase which salutes at once and denotes him—"ce moqueur pensif comme un apôtre." Only perhaps in a single part has Congreve half consciously touched a note of almost tragic depth and suggestion; there is something well-nigh akin to the grotesque and piteous figure of Arnolphe himself in the unvenerable old age of Lady Wishfort, set off and relieved as it is, with grace and art worthy of the supreme French master, against the only figure on any stage which need not shun comparison even with that of Célimène. (A. C. S.)

CONGREVE, Sir William, Bart. (1772–1828), the inventor of the Congreve rocket, was the eldest son of Sir William Congreve, Bart., of Walton in Staffordshire. He procured a commission in the artillery, became lieutenant-general, and assisted the duke of York in the changes introduced by him into the management of the army. He also obtained a seat in the House of Commons for Gatton, and afterwards for Plymouth. He wrote an *Elementary Treatise on the Mounting of Naval Ordnance* (1812), and a *Description of the Hydro-pneumatic Lock* (1815).

CONI (Italian, Cuneo), the capital of the province of the same name, is situated on an eminence at the junction of the Stura and Gesso, 46 miles south-west by rail from Turin and 86 miles north-east from Nice by the Col di Tenda. It was famous in Piedmontese warfare as a place of great strength; but in 1801, after the battle of Marengo, it was dismantled by the French. It is the seat of a bishopric (founded in 1817), and the official residence of the intendant-general of the division. The principal street and square are arcaded on both sides. The churches are built in a line with the houses, and though of very plain exterior they are ornamented internally with beautiful marbles, frescoes, and gilding. Their form is nearly square, but in the interior that of a Greek cross is produced by the arrangement of the piers. Since the railway has been opened between Savena and Turin, Coni has lost the Mediterranean traffic; its commerce is now confined to Turin and the neighbouring towns on the plain. In the vicinity a good wine is made called Barolo. Population, 24,300.

CONIC SECTIONS

A CONIC section is the curve in which a plane cuts a cone, which is defined in Euclid's *Elements* as "a solid figure described by the revolution of a right-angled triangle about one of the sides containing the right angle, which side remains fixed." Though the properties of conic sections can be investigated from this point of view, we consider it more advantageous to start from the following definition, which is derived from one of the properties which all conic sections possess in common.

Definition.—If a point move in such a way in a plane that its distance from a fixed point in the plane always bears a fixed ratio to its distance from a fixed straight line in the plane, the point will trace out a conic section.

The curve is called an *ellipse* if the distance from the fixed point is less than, a *parabola* if it is equal to, and a *hyperbola* if it is greater than, the distance from the fixed straight line.

The fixed point is called a *focus*, and the fixed straight line a *directrix* of the curve.

The fixed ratio of the distance from the focus to the distance from the directrix is called the *eccentricity* of the curve.

The discovery of the conic sections seems to have originated in the school of Plato. It is probable that the followers of that philosopher were led to the discovery of these curves, and to the investigation of many of their properties, in seeking to resolve the two famous problems of the duplication of the cube and the trisection of an angle, for which the artifices of the ordinary or plane geometry were insufficient. Two solutions of the former problem, by the help of the conic sections, are preserved by Eutocius, and are attributed by him to Menæchmus, the scholar of Eudoxus, who lived a little after the time of Plato.

The writings of Archimedes that have reached us show that the geometers before his time had advanced a great length in investigating the properties of the conic sections. This author expressly mentions numerous demonstrations of preceding writers, and often refers to properties as known to mathematicians. His own discoveries are worthy of the most profound and inventive genius of antiquity. In the quadrature of the parabola he gave the first and the most remarkable instance that has yet been discovered of the exact equality of a curvilinear to a rectilinear space. He determined the proportion of the elliptic spaces to the circle; and he invented many propositions respecting the mensuration of the solids formed by the revolution of the conic sections about their axes.

It is chiefly from the writings of Apollonius of Perga that we know how far the ancient mathematicians carried their speculations concerning these curves. (See APOLLONIUS.) His work on the conic sections, written in eight books, was held in such high estimation by the ancients as to procure for him the name of the Great Geometer. The first four books of this treatise only have come down to us in the original Greek; in these the author claims no further merit than that of having collected, amplified, and arranged the discoveries of preceding mathematicians. One improvement he introduced deserves particular notice. The geometers who preceded him derived each curve from a *right cone*, which they conceived to be cut by a plane perpendicular to its slant side; and Apollonius was the first to show that all the curves are produced from any sort of cone, whether right or oblique, according to the different inclinations of the cutting plane. An Arabic MS. discovered in 1658, and two others brought from the East a few years later, contain the first seven books of the treatise of Apollonius; the eighth book appears to be irrecoverably lost. Dr Halley, who in 1710 put forth a correct edition of the Conics of Apollonius, guided by the account of the different books preserved by Pappus, has given a very able restoration of the eighth book. The last four books of the Conics of Apollonius, containing the higher or more recondite parts of the science, are generally supposed to be the fruit of the author's own researches, and do much honour to his geometrical skill and invention. Even in our times the whole treatise must be regarded as a very extensive work on the conic sections,—modern mathematicians having made few discoveries of which there are not some traces to be found in the work of Apollonius.

The geometers who followed Apollonius seem to have contented themselves with commenting on his treatise. It was only about the middle of the 16th century that the study of this branch of mathematical science was revived; since that time no part of mathematics has been more cultivated, or has been illustrated by a greater variety of ingenious writings. The applications of the properties of these curves in natural philosophy have, in modern times, given them a degree of importance which they did not formerly possess; and a knowledge of them is now indispensable to any one who seeks to acquaint himself with the remarkable physical discoveries of the present age.

Apollonius and all the earlier writers on conic sections derived the elementary properties of the curves from the nature of the cone; but in 1665 Dr Wallis, in his *De Sectionibus Conicis*, laid aside the consideration of the cone, deriving the properties of the curves from a description *in plano*. In the following treatise, as has been already stated, the properties of the conic sections are deduced from their description in a plane.

An assemblage of points, all of which satisfy some condition, whether or not they form a continuous curve, is called a *locus*; as, for example, we could define a circle as the locus of a point whose distance from a fixed point is constant, or a conic section as the locus of a point whose distance from a fixed point always bears a constant ratio to its distance from a fixed straight line.

The following is a proposition which is very useful in the discussion of the properties of conic sections.

LEMMA.—The locus of a point in a plane whose distances from two fixed points in the plane always bear a constant ratio to one another is a circle.

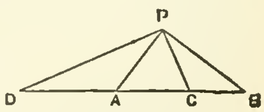

Fig. 1.

Let A, B (fig. 1) be the two fixed points, m the common ratio, and P any point on the locus.

Divide BA internally and externally in the given ratio, so that

$$\frac{CA}{CB} = \frac{DA}{DB} = m = \frac{PA}{PB}.$$

Join PC, PD.

Then, because $PA : PB = CA : CB$,
PC is the internal bisector of the angle APB (Eucl. vi. 3);
and because $PA : PB = DA : DB$,
PD is the external bisector of the angle APB (Eucl. vi. A).

Therefore the angle CPD is a right angle, and the locus of P a circle described on the line CD as diameter.

PART I.—THE PARABOLA.

DEFINITIONS.

A straight line perpendicular to the directrix, terminated at one extremity by the parabola, and produced indefinitely within it, is called a *diameter*.

The point in which a diameter meets the parabola is called its *vertex*.

The diameter which passes through the focus is called the *axis* of the parabola; and the vertex of the axis is called the *principal vertex.*

Corollary. A perpendicular drawn from the focus to the directrix is bisected at the vertex of the axis.

A straight line terminated both ways by the parabola, and bisected by a diameter, is called an *ordinate to that diameter.*

The segment of a diameter between its vertex and an ordinate, is called an *abscissa.*

A straight line meeting the parabola in two points P, Q is called a *chord.*

The focal chord which is bisected by a diameter is called the *parameter* of that diameter.

The limiting position of the chord PQ, which it assumes when the point Q moves up to and coincides with P, is called the *tangent* at P.

A line through P at right angles to the tangent is called the *normal* at P.

Proposition I.

To find where a parabola of given focus and directrix is cut by a straight line parallel to the directrix.

Let S (fig. 2) be the focus, and XK the directrix. Draw SX perpendicular to KX, and bisect SX in A; draw AZ at right angles to SX, and equal to AS. Join XZ.

Let QN be any straight line parallel to the directrix, cutting XZ in Q and the axis in N.

With centre S and radius equal to QN, describe a circle cutting QN in P and P′; these will be points on the parabola, because

$$SP : XN = QN : XN = ZA : AX = 1 : 1.$$

$\therefore$ $SP = XN =$ distance of P from the directrix.

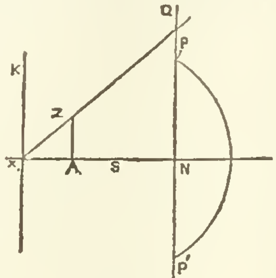

Fig. 2.

It is clear that if the point P exists, the point P′ on the opposite side of the axis also exists, and therefore the parabola is symmetrical with respect to the axis.

Again, the point P will exist, or, in other words, the circle will cut QN, as long as SP or QN is greater than SN, which is always the case as long as QN lies on the same side of AZ as the focus.

The whole of the curve, therefore, lies to the right of AZ, and branches off to an infinite distance from the directrix.

Prop. II.

To find where a parabola of given focus and directrix is cut by a straight line parallel to the axis.

Let S (fig. 3) be the focus, and XK the directrix; draw AY bisecting SX at right angles.

Let KQ be any line parallel to the axis cutting the directrix in K. Join SK cutting AY in Y, and draw YP at right angles to SK cutting KQ in P. P will be a point on the curve.

It is easily shown that the triangles SPY, KPY are equal in all respects, and that SP=PK.

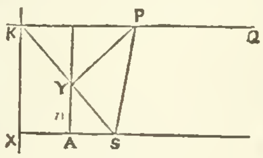

Fig. 3.

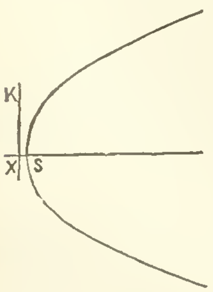

Fig. 4.

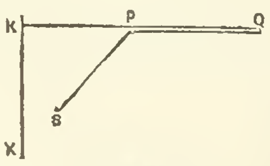

Fig. 5.

Now, the point P will exist, or, in other words, YP will intersect KQ, for all positions of KQ.

The parabola, therefore, branches off on either side of the axis to an infinite distance, and is cut by a straight line parallel to the axis in one point only.

It appears from what has gone before that the general shape of the curve is of the form given in fig. 4, which shows the focus, directrix, and axis.

It can be easily seen that all points within the curve are nearer to the focus than to the directrix, and all points without the curve are nearer to the directrix than to the focus.

A parabola can be described mechanically in the following manner (see fig. 5):—

Suppose a bar KQ to move always parallel to itself, with its end K on a line at right angles to it; then, if a string of length equal to KQ, attached to the bar at Q, and also to a fixed point S, be always kept tight by means of a ring P sliding on KQ, a pencil at P would trace a parabola whose focus is S and directrix XK.

Prop. III.

If a chord PQ (fig. 6) intersect the directrix in Z, then SZ will be the external bisector of the angle PSQ.

Join SP, SQ, and draw PM, QN perpendicular to the directrix.

Then, because the triangles PMZ, QNZ are similar,

$$PZ : QZ = PM : QN = SP : SQ.$$

$\therefore$ (Eucl. vi. A) SZ bisects the external angle of the triangle PSQ.

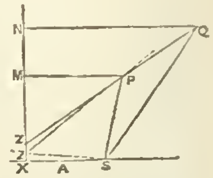

Fig. 6.

Corollary.—If the point Q move up to and become coincident with P, or if, in other words, the chord PQ become the tangent to the parabola at P, then the angle PSZ will become a right angle.

Prop. IV.

The tangent at any point of a parabola bisects the angle between the focal distance of the point and the perpendicular from the point on the directrix.

Let PZ (fig. 7) be the tangent at P, meeting the directrix in Z; then, if PM be drawn perpendicular to the directrix, it is easily seen that the two triangles SPZ, MPZ are equal in all respects, and the angle SPZ equal to the angle MPZ.

If SM be joined, it can be shown that it is bisected at right angles by PZ, and that its middle point is the point Y in Prop. ii.

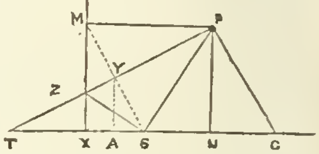

Fig. 7.

The line AY, it will be observed, is the tangent to the parabola at the vertex A.

It appears, therefore, that the locus of the foot of the perpendicular from the focus on the tangent at any point is the tangent at the vertex.

It can also be seen that, if the tangent at P meet the axis in T, then SP= ST. For the angles STP, SPT are each equal to the angle MPT, and therefore (Eucl. i. 6) SP, ST are equal.

It may further be remarked that, if O be any point in the tangent at P, then the triangles SPO, MPO are equal in all respects.

If PN be drawn perpendicular to the axis to meet it in N, then it will be seen that $PN = 2AY$
and $TN = 2AN = 2AT.$

Now, in the right-angled triangle TYS,—

$$TA : AY = AY : AS \text{ (Eucl. vi. 8)},$$

and therefore $YA^2 = TA \cdot AS$

Therefore $PN^2 = 4YA^2 = 4TA \cdot AS = 4AS \cdot AN.$

If the normal PG be drawn meeting the axis in G, then the triangles PNG, YAS are similar, and therefore—

$$NG \cdot AS = PN : YA = 2 : 1$$

$$\therefore NG = 2AS$$

Prop. V.

To draw a tangent to a parabola at a point on the curve.

First Method.—Take a point T in the axis (fig. 7), such that ST is equal to SP, and join TP. Then STP will be the tangent at P.

Second Method.—Draw SZ at right angles to SP, meeting the directrix in Z. ZP is the tangent at P.

Third Method.—On SP as diameter describe a circle; this will touch the tangent at the vertex AY in a point Y. YP is the tangent at P.

Prop. VI.

To draw a pair of tangents to a parabola from an external point.

First Method.—Let O (fig. 8) be the point. Join OS, and with centre O and radius OS describe a circle cutting the directrix (which it will always do) in M and M′.

Draw MP, M′P′, parallel to the axis, cutting the parabola in P and P′. Join OP, OP′. They are tangents to the parabola at P and P′. Join SP, SP′.

In the triangles OPS, OPM,

OP, PM = OP, PS each to each,

and OM = OS by the construction;

therefore the angles OPS, OPM are equal, and therefore OP is a tangent to the curve at P (Prop. iv.)

Second Method.—Let O (fig. 9) be the point. Upon OS as diameter describe a circle cutting the tangent at the vertex (which it will always do) in Y and Y′.

Join YO, Y′O, and, if necessary produce them to meet the curve in P, P′. They will be tangents to the curve at P, P′.

Because OYS is a semicircle, therefore the angle OYS is a right angle, and therefore YO is a tangent to the parabola (Prop. iv.)

PROP. VII.

If OP, OP′ (fig. 8) be tangents to the parabola at P, P′, then the triangles OSP, P′SO are similar, and $SO^2 = SP . SP'$.

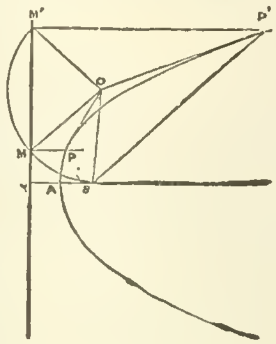

Fig. 8

Because the angle OSP = angle OMP = angle OM′P′ = angle OSP′, and the angle OPS = angle OPM = angle SMM′ = $\frac{1}{2}$ angle SOM′ (Eucl. iii. 20) = angle SOP′ (Prop. vi.); therefore the remaining angles OPS, P′OS are equal, and the triangles OPS, P′OS similar; and therefore (Eucl. vi. 4)

$$SP : SO = SO : SP', \text{ or}$$
$$SO^2 = SP . SP'.$$

PROP. VIII.

If O be the intersection of OP, OP′, the tangents to the parabola at P and P′, then OV drawn parallel to the axis will bisect PP′.

From fig. 8 we see that, if a line through O meet MM′ in Z, MM′ is bisected in Z; and, because MP, ZOV, and M′P′ are parallel, therefore PP′ is bisected in V.

PROP. IX.

The angle between two tangents is equal to half the angle subtended at the focus by the chord of contact.

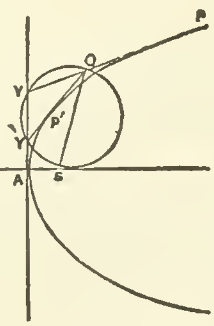

Fig. 9.

From fig. 9 we see that angle YOY′ = angle YSY′ = angle YSA − angle Y′SA = $\frac{1}{2}$ angle PSA − $\frac{1}{2}$ angle P′SA = $\frac{1}{2}$ angle PSP′.

It may be shown, by means of this proposition, that the circle which is described about the triangle formed by any three tangents to a parabola passes through the focus.

PROP. X.

If OV (fig. 10) meet the parabola in Q, the tangent at Q is parallel to PP′, and OV will be bisected in Q.

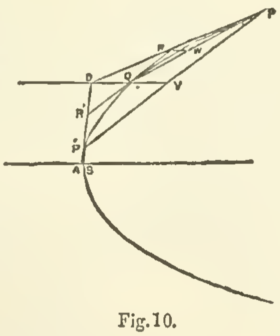

Fig. 10.

Draw the tangent RQR′ at Q, meeting OP, OP′ in R, R′. Join PQ, and let RW be drawn parallel to OQV meeting PQ in W.

Then PW = WQ (Prop. viii.) Therefore OR = RP (Eucl. vi. 2). Similarly we can shew that OR′ = R′P′. Therefore

$$OR : RP = OR' : R'P',$$

and therefore RR′ is parallel to PP′ (Eucl. vi. 2); and also

$$OQ : QV = OR : RP$$

$\therefore$ OQ = QV.

PROP. XI.

If V be the middle point of a chord PP′, and Q be the point at which the tangent is parallel to PP′, then $PV^2 = 4SQ . QV$.

Suppose in fig. 10 SQ, SR joined, and PO produced to meet the axis in T.

Then angle ORQ = $\frac{1}{2}$ angle QSP (Prop. ix.) = angle QSR (Prop. vii.), and angle QRS = angle RPS (Prop. vii.) = angle STP (Prop. iv.) = angle QOR (Eucl. i. 29); therefore the two triangles OQR, SQR are similar, and

$$OQ : QR = QR : SQ$$

therefore $QR^2 = SQ . OQ.$

But $PV = 2QR$, and $OQ = QV$,

therefore $PV^2 = 4SQ . QV.$

PROP. XII.

The parameter of the diameter QV is 4SQ.

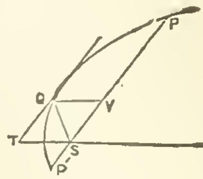

Fig. 11.

If the tangent at Q (fig. 11) meets the axis in T,

$$SQ = ST$$
$$= QV.$$

Therefore the equality $PV^2 = 4SQ . QV$ becomes $PV^2 = 4SQ^2$

therefore $PV = 2SQ$

or $PP' = 4SQ.$

PROP. XIII.

If POP′ (fig. 12) be any chord, and OR be drawn parallel to the axis through any point O to meet the curve in R, then $PO . OP' = 4SQ . RO$, where 4SQ is the parameter of diameter PP′.

Draw RW parallel to PP′ to meet QV in W.

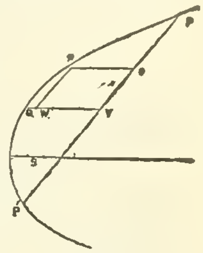

Fig. 12.

Then $PV^2 = 4SQ . QV$

and $RW^2 = 4SQ . QW,$

and RO = WV and RW = OV.

Therefore $PO . OP' = PV^2 - OV^2$ (Eucl. ii. 5).

$$= PV^2 - RW^2$$
$$= 4SQ . QV - 4SQ . QW$$
$$= 4SQ . WV = 4SQ . RO$$

PROP. XIV.

If POP′, pOp′ be any two chords intersecting in O, and Q, q are the points of contact of the tangents parallel to them, then $PO . OP' : pO . Op' = SQ : Sq$.

By Prop. xiii., $PO . OP' = 4SQ . RO$

and similarly $pO . Op' = 4Sq . RO.$

Therefore

$$PO . OP' : pO . Op' = 4SQ . RO : 4Sq . RO = SQ : Sq$$

PROP. XV.

The area included between any chord of a parabola and the curve is two-thirds of the area of the triangle formed by the chord and the tangents to the curve at its extremities.

It is easily seen in fig. 10 that the area of the triangle ORR′ is one quarter the area of the triangle OPP′, and therefore one half the area of the triangle QPP′.

Now if we draw tangents where RW, R′W′ meet the curve, we shall have two pairs of triangles whose areas are in the ratio 1 : 2, and so we may go on indefinitely. The sum of all the external triangles will be half the sum of all the internal triangles.

The sum of the external triangles is the curvilinear area OPQP′, and the sum of the internal triangles is the curvilinear area PQP′. Therefore

$$2 \times \text{area } OPQP' = \text{area } PQP'$$
$$\therefore 2 \times \text{triangle } OPP' = 3 \text{ area } PQP'$$

or

$$\text{area } PQP' = \tfrac{2}{3} \text{ triangle } OPP'.$$

PART II.—THE ELLIPSE.

DEFINITIONS.

A straight line passing through the centre, and terminated both ways by the ellipse, is called a *diameter.*

The extremities of a diameter are called its *vertices.*

The diameter which passes through the foci is called the *transverse axis,* also the *major axis.*

The diameter which is perpendicular to the transverse axis is called the *conjugate axis,* also the *minor axis.*

Any straight line not passing through the centre, but terminated both ways by the ellipse, and bisected by a diameter, is called an *ordinate* to that diameter.

Each of the segments of a diameter intercepted between its vertices and an ordinate, is called an *abscissa.*

A *chord*, *tangent*, and *normal* are defined exactly in the same words as in the case of the parabola.

PROP. I.

To find where an ellipse of given focus, directrix, and eccentricity is cut by a straight line parallel to the directrix.

Let S (fig. 13) be the focus, XK the directrix, and e the eccentricity.

Draw SX perpendicular to XK, and divide it internally and externally in the ratio $e:1$ in the points A, A′, so that SA : AX = SA′ : A′X = e : 1.

It is clear that A and A′ will both be on the same side of X as S is, because the eccentricity e is less than 1.

Draw AZ at right angles to SX and equal to AS; and join XZ.

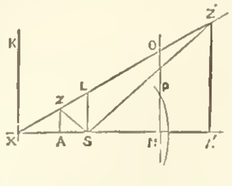

Fig. 13.

Let QN be any straight line parallel to the directrix, cutting XZ in Q and the axis in N. With centre S and radius equal to QN describe a circle cutting QN in P and P′; these will be points on the ellipse; for we have

$$SP : XN = QN : XN = ZA : AX = SA : AX = e : 1.$$

It is clear that if this point P exists, the point P′ on the opposite side of the axis also exists, and therefore the ellipse is symmetrical with respect to the axis. Again, the point P will exist, or, in other words, the circle will cut QN as long as SP or QN is greater than SN, which is always the case as long as the angle QSN is greater than half a right angle. Now if SL, A′Z′ be drawn at right angles to SX, cutting XZ in L, Z′, then (Eucl. vi. 4)

$$Z'A' : A'X = ZA : AX.$$

But $\quad SA' : A'X = SA : AX$

and $\quad SA = ZA$

$$SA' = Z'A'$$

From which it is easily seen that the angle Z′SA′ is half a right angle. The whole curve therefore lies between the two lines AZ, A′Z′.

PROP. II.

To find where an ellipse of given focus, directrix, and eccentricity is cut by a straight line perpendicular to the directrix.

Let S (fig. 14) be the focus, XK the directrix, and e the eccentricity.

Draw SX perpendicular to XK, and divide SX in A, A′, so that

$$SA : AX = SA' : A'X = e : 1;$$

and draw AR, A′R′ at right angles to SX.

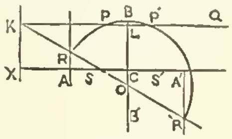

Fig. 14.

Let KQ be any line parallel to the axis cutting the directrix in K. Join SK cutting AR, A′R′ in R, R′, and upon RR′ as diameter describe a circle cutting KQ in P, P′; these will be points on the curve.

For $\quad SR : RK = SA : AX = e : 1 = SA' : A'X$

$$= SR' : R'K.$$

Therefore by the Lemma in the introduction

$$SP : PK = SP' : P'K = SR : RK = e : 1.$$

Therefore P and P′ are points on the ellipse.

Now, if the point P exists, the point P′ also exists, and it is easily seen that the middle point L of PP′ lies on a straight line bisecting AA′ at right angles. The curve therefore is symmetrical, not only with respect to the axis AA′, but also with respect to this line bisecting AA′ at right angles. The middle point C of AA′ is called the *centre* of the curve, from the fact that every straight line through C is bisected at the point.

It is evident from what has preceded that, if we measure CS′ = CS, and CX′ = CX, in the opposite direction to CS and CX, and draw X′K′ parallel to XK, the ellipse might be described with S′ for focus, X′K′ for directrix, and eccentricity e.

The ellipse, therefore, has two foci and two directrices.

Now, since $\quad SP : PK = SP' : P'K = e : 1.$

Therefore $\quad SP + SP' : PK + P'K = e : 1,$

but $\quad PK + P'K = 2KL = 2CX.$

$$\therefore \; SP + SP' = 2e \, . \, CX.$$

Now, it is easily seen that SP′ = S′P;

therefore $\quad SP + S'P = 2e \, . \, CX;$

or the sum of the focal distances of any point on the curve is constant.

Again $\quad SA : AX = SA' : A'X = e : 1$

therefore $\quad SA + SA' : AX + A'X = e : 1.$

But $\quad AX + A'X = 2CX,$

$$\therefore \; SA + SA' = SP + S'P.$$

And $\quad SA' = S'A,$

therefore $\quad SP + S'P = SA + S'A$

$$= AA';$$

or the sum of the focal distances of any point on the ellipse is equal to the *major axis*.

The point P will exist, or, in other words, the circle on RR′ as diameter will intersect KQ, if OL is less than OR when O is the middle point of RR′.

Now $\quad SX : SK = CA : OR,$

$$\therefore \; OR \, . \, SX = SK \, . \, CA;$$

and $\quad OL = OC + CL = KX \, . \, \dfrac{SC}{SX} + KX.$

Therefore the point exists if

$$KX \, . \, SC + KX \, . \, SX < SK \, . \, CA;$$

i.e., if $\quad KX \, . \, CX < SK \, . \, CA;$

if $\quad KX^2 \, . \, CX^2 < SK^2 \, . \, CA^2;$

$$< (SX^2 + KX^2) \, . \, CA^2;$$

if $\quad KX^2 \, . \, (CX^2 - CA^2) < SX^2 \, . \, CA^2;$

if $\quad KX^2 < \dfrac{SX^2 \, . \, CA^2}{CX^2 - CA^2};$ or if $KX < CB,$

when $\quad CX^2 - CA^2 : CA^2 = SX^2 : CB^2.$

When KX has this value the points P, P′ coincide in CL, say at B or B′.

It appears therefore that the ellipse lies wholly within a certain rectangle, and that its general shape is of the form given in fig. 15 which shews the centre C, the foci S, S′, and directrices XK and X′K′.

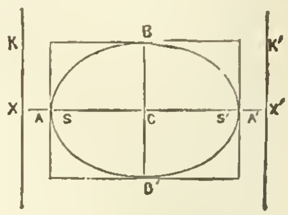

Fig. 15.

It can easily be shown that the sum of the focal distances of any point within the ellipse is less than, and the sum of any point without greater than, AA′, and also that the ratio of the focal distance of any point within the ellipse to its distance from the corresponding directrix is less than, and the ratio for any point without greater than, the eccentricity.

An ellipse can be described mechanically in the following manner.

If an endless string be placed over two small fixed pegs S, S′ and be kept tight so as to form a triangle PSS′, then a pencil at P would trace out an ellipse whose foci are S, S′, and whose major axis is equal to the length of the string minus the distance between the pegs.

PROP. III.

If a chord PQ (fig. 16) intersect in Z the directrix corresponding to the focus S, then SZ will be the external bisector of the angle PSQ.

Join SP, SQ; and draw PM, QN perpendicular to the directrix. Then because the triangles PMZ, QNZ are similar,

$$PZ : QZ = PM : QN$$

$$= SP : SQ$$

∴ (Eucl. vi. A) SZ bisects the external angle of the triangle PSQ.

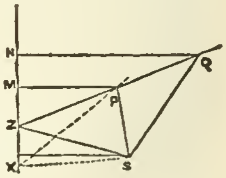

Fig. 16.

COROLLARY.—If the point Q moves up to and coincides with P, or, in other words, the chord PQ becomes the tangent to the ellipse at P, then the angle PSZ will become a right angle.

PROP. IV.

The foot of the perpendicular from the focus on the tangent always lies on the circle described on the major axis as diameter.

Let PZ (fig. 17) be the tangent at P, meeting the directrix in Z. Let S be the corresponding focus. Join SP, SZ, and draw PM, SY, perpendicular to the directrix and the tangent respectively. Join YX, SM.

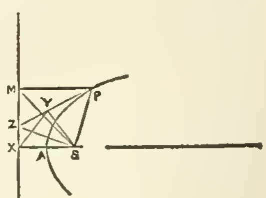

Fig. 17.

Because the angles PMZ, PSZ are right angles, a circle will circumscribe PSZM; and because the angles SYZ, SXZ are right angles, a circle will circumscribe SYZX.

Therefore $\quad$ angle SYX = angle SZX

= supplement of angle SZM = angle SPM;

and $\quad$ angle SXY = angle SZY = angle SMP.

Therefore the triangles SYX, SPM are similar,

and $\quad SY : YX = SP : PM = SA : AX.$

Therefore the locus of Y is a circle on AA′ as diameter.

(Lemma, Introduction.)

PROP. V.

The product of the perpendiculars from the foci on the tangent is constant.

If SY, S'Y' (fig. 18) be the perpendiculars from the foci on any tangent, then it is easily seen that, if YS be produced to meet the circle on AA' as diameter again in Z, ZCY' is a straight line, and

S'Y' = SZ.

Therefore SY . S'Y' = SY . SZ = AS . SA' (Eucl. iii. 35).

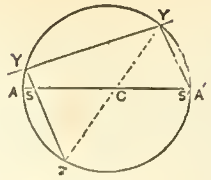

Fig. 18.

PROP. VI.

The tangent at any point of an ellipse makes equal angles with the focal distances of the point.

Let the tangent ZPZ' (fig. 19) at the point P meet the two directrices in Z, Z'. Join ZS, SP, PS', S'Z', and draw MPM' parallel to the axis, to meet the directrices in M, M'. Then because

SP : PZ = ePM : PZ = ePM' : PZ'
= S'P : PZ',

and the angles PSZ, PS'Z' are right angles (Prop. vii.), therefore the triangles PSZ, PS'Z' are similar (Eucl. vi. 7). Therefore the angle SPZ = angle S'PZ'.

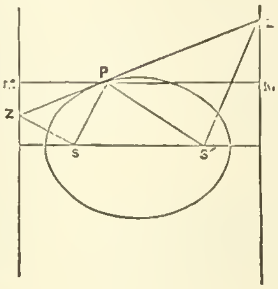

Fig. 19.

PROP. VII.

To draw a tangent to an ellipse at a point on the curve.

First Method.—Join SP, S'P, and draw a line bisecting the external angle of SPS'. This line is the tangent at P. (Prop. vi.)

Second Method.—Draw SZ at right angles to SP, meeting the corresponding directrix in Z. ZP is the tangent at P. (Prop. iii.)

Third Method.—On SP as diameter describe a circle which will touch the circle on AA' as diameter in a point Y. YP is the tangent at P. (Prop. iv.)

PROP. VIII.

To draw a pair of tangents to an ellipse from an external point.

First Method.—Let O (fig. 20) be the point, and S, S' the foci. Join OS. With centre O and radius OS describe a circle; and with centre S' and radius equal to AA' describe another circle. It can be shown that these two circles will always intersect in two points M, M'.

Join S'M, S'M', cutting the curve in P, P'. Then OP, OP' will be tangents to the curve.

Join SP, SP'.

Now SP + PS' = AA' = MS' = MP + PS'

therefore SP = MP;

and OS = OM;

therefore the two triangles OPS, OPM are equal in all respects, and the angle OPS = angle OPM.

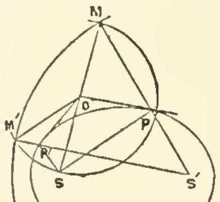

Fig. 20.

Therefore OP is a tangent to the ellipse at P (Prop. vi.)

Second Method.—Let O (fig. 21) be the point, and S, S' the foci.

Join OS, and upon it as diameter describe a circle, cutting the circle described on AA' as diameter (which it will always do) in Y, Y'.

Join OY, OY', and produce them if necessary to meet the curve in P, P'. They will be tangents to the curve at P, P'.

Because OYS is a semicircle, the angle OYS is a right angle, and therefore OY is a tangent to the ellipse (Prop. iv.)

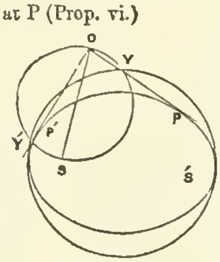

Fig. 21.

PROP. IX.

If OP, OP' be tangents to the ellipse at P, P'. and S be a focus, the angles OSP, OSP' are equal.

In fig. 20 we have

angle OSP = angle OMP
= angle M'MS' − angle M'MO
= angle MM'S' − angle MM'O
= angle OM'S' = angle OSP'.

PROP. X.

If OP, OP' be two tangents to the ellipse, and S, S' be the foci, the angles SOP, S'OP' are equal.

In fig. 21 suppose S'Z, S'Z' be drawn perpendicular to OP, OP' respectively, then

SY . S'Z = SY' . S'Z' (Prop. v.)

therefore SY : SY' = S'Z' : S'Z.

Also the angle YSY' = supplement of angle POP' = Z'SZ.

Therefore the triangles YSY', Z'SZ are similar, and the angle Y'YS = S'Z'Z, and angle Y'YS = angle Y'OS, and angle S'Z'Z = angle S'OZ.

Therefore angle SOP = angle S'OP'.

PROP. XI.

If C (fig. 22) be the middle point of AA', then CA² = CS, CX.

$$SA' : A'X = e : 1 = SA : AX.$$
$$\therefore SA' + SA : SA = A'X + AX : AX,$$
or
$$AA' : SA = XX' : AX$$
$$\therefore AA' : XX' = SA : AX = e : 1. \quad . \quad . \quad (1)$$

Again,
$$SA' - SA : SA = A'X - AX : AX.$$
or
$$SS' : SA = AA' : AX$$
$$\therefore SS' : AA' = SA : AX = e : 1. \quad . \quad . \quad . \quad (2)$$

From (1) and (2),
$$AA' : XX' = SS' : AA',$$
or
$$CA : CX = CS : CA$$
$$\therefore CA^2 = CS . CX. \quad . \quad . \quad . \quad . \quad (3)$$

Also
$$CS : CX = CS^2 : CA^2$$
$$= CA^2 : CX^2. \quad . \quad . \quad . \quad (4)$$

PROP. XII.

1. PN be an ordinate of the ellipse, then PN² always bears a constant ratio to AN. NA'.

By similar triangles PNA', Z'XA' (fig. 22),

$$PN : NA' = Z'X : XA',$$

and by similar triangles PNA, ZXA,

$$PN : NA = ZX : XA.$$

Therefore $PN^2 : AN . NA' = ZX . XZ' : XA . XA'$.

Now it appears from Prop. iii. that the angle Z'SZ is a right angle;

therefore $ZX . XZ' = SX^2$ (Eucl. vi. 8.);

and $XA . XA' = CX^2 - CA^2$.

Therefore $N^2 : AN . NA' = SX^2 : CX^2 - CA^2$
$= CB^2 : CA^2$ (Prop. ii.)

PROP. XIII.

The ordinates of the ellipse and of the circle described on AA' as diameter are in a constant ratio.

If, in fig. 22, NP be produced to meet the circle on AA' as diameter in Q, then

$QN^2 = AN . NA'$

and $PN^2 : AN . NA' = CB^2 : CA^2$ (Prop. xii.)

$\therefore PN^2 : QN^2 = CB^2 : CA^2$

and $PN : QN = CB : CA$.

COROLLARY.—The ordinates of two ellipses which have a common major axis are in a constant ratio.

It can easily be shown from the last result, if QPN, Q'P'N' be two common ordinates of the circle and ellipse,—(1) that the chords PP', QQ' will meet the axis in the same point; (2) that the tangents at P, Q will meet the axis at the same point; (3) that the intersection of the tangents at P, P' and the intersection of the tangents at Q, Q' will lie on a straight line perpendicular to the axis; (4) that the middle points of PP' and QQ' lie on a straight line perpendicular to the axis.

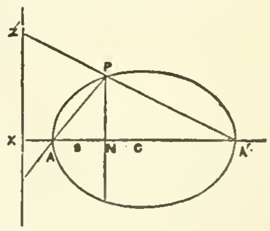

Fig 22.

It can also be shown by means of this proposition that the area of the circle is to the area of the ellipse as AC to BC, and that the area of the parallelogram formed by the four tangents at the extremities of two conjugate diameters (see definition below) is constant, and is equal to AC . BC.

PROP. XIV.

The middle points of all parallel chords in an ellipse lie on a straight line through the centre.

Let QPN, Q'P'N (fig. 23) be two common ordinates of the circle on AA' as diameter and the ellipse.

Let W, V be the middle points of QQ', PP'. W, V lie on a straight line which bisects NN' at right angles.

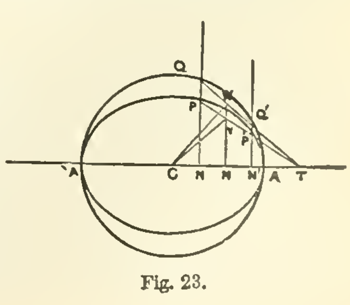

Fig. 23.

Now, as long as PP′ remains parallel to itself, QQ′ must remain parallel to itself, and therefore its middle point W lies on a fixed straight line, the diameter at right angles to QQ′. Therefore V lies on a fixed straight line through C, since WM : VM = BC : AO.

The tangents at the points where CV cuts the ellipse will be parallel to the chords PP′ which CV bisects.

Definition.—If CD be drawn parallel to the tangent at P, then CD is said to be *conjugate* to CP.

Now it is evident that CD and CP will correspond to two radii at right angles in the circle on AA′ as diameter, and therefore if CD is conjugate to CP, CP will also be conjugate to CD.

Prop. XV.

If CP, CD (fig. 24) be semi-conjugate diameters, then $CP^2+CD^2=AC^2+BC^2$.

Draw QPN, Q′DN′ common ordinates of the circle and the ellipse.

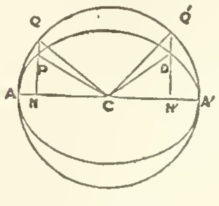

Fig. 24.

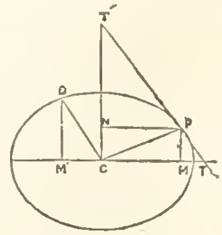

Fig. 25.

Then CQ, CQ′ will be at right angles, and therefore the two triangles QCN, CQ′N′ will be equal in all respects.

$$\therefore NC=Q'N'$$
and
$$QN=CN'.$$
$$\therefore QN^2+Q'N'^2=QN^2+NC^2=AC^2.$$
$$\therefore PN^2+DN'^2=BC^2 \text{ (Prop. xii.)}.$$
$$\therefore CP^2+CD^2=CN^2+NP^2+CN'^2+N'D^2$$
$$=Q'N'^2+NP^2+QN^2+N'D^2$$
$$=AC^2+BC^2.$$

It follows that if the tangent at P meets the axes in T, T′ (fig. 25), then $PT.PT'=CD^2$.

Draw ordinates PM, DM′ to the major axis, and PN to the minor axis.

Then $PT : PM = CD : DM'$

and $PT' : PN = CD : CM'$

$$\therefore PT.PT' : PM.PN = CD^2 : CM'.DM'.$$
$$\therefore PT.PT' : CD^2 = PM.PN : CM'.DM'.$$
$$=\frac{PM}{CM'}:\frac{DM'}{CM}$$
$$=\frac{BC}{AC}:\frac{BC}{AC}=1:1$$
$$\therefore PT.PT'=CD^2.$$

Prop. XVI.

If CP, CD be semi-conjugates, and QV be an ordinate parallel to CD, then $QV^2 : PV.VP'=CD^2:CP^2$

Draw QR an ordinate parallel to CP, and draw UQW the tangent to the ellipse at Q, meeting CP, CD in U, W.

Then $CR.CW=CD^2$

$$\therefore CR^2:CD^2=CR:CW$$
$$=UV:CU.$$

Again $CU.CV=CP^2$

$$\therefore CU:CV=CP^2:CV^2.$$
$$\therefore CU-CV:CU=CP^2-CV^2:CP^2$$

or $UV:CU=PV.VP':CP^2.$

Hence $CR^2:CD^2=PV.VP':CP^2$

or. $QV^2:PV.VP'=CD^2:CP^2.$

Prop. XVII.

If POP′ (fig. 26) be any chord, and ROCR′ the diameter through O, then

$$PO.OP':RO.OR'=CD^2:CR^2,$$

where CD is the semi-diameter parallel to PP′.

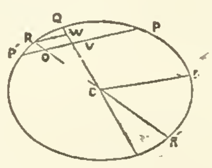

Fig. 26.

Draw CVWQ conjugate to PP′, meeting the curve in Q, and the ordinate through R in W.

Then $PV^2:CQ^2-CV^2=CD^2:CQ^2$

and $RW^2:CQ^2-CW^2=CD^2:CQ^2$ (Prop. xvi.)

$$\therefore PV^2-RW^2.\frac{CV^2}{CW^2}:CQ^2-CV^2-(CQ^2-CW^2)\frac{CV^2}{CW^2}$$
$$=CD^2:CQ^2.$$

Now $PV^2-RW^2.\frac{CV^2}{CW^2}=PV^2-OV^2=PO.OP'$

and
$$CQ^2-CV^2-(CQ^2-CW^2)\frac{CV^2}{CW^2}$$
$$=CQ^2.\left(\frac{CW^2-CV^2}{CW^2}\right)$$
$$=CQ^2.\frac{CR^2-CO^2}{CR^2}$$

Therefore $PO.OP':CQ^2.\frac{RO.OR'}{CR^2}=CD^2:CQ^2$

or $PO.OP':RO.OR'=CD^2:CR^2.$

Prop. XVIII.

If POP′, pOp′ be any two chords, and CD, Cd the semi-diameters parallel to them, then

$$PO.OP':pO.Op'=CD^2:Cd^2.$$

From the last proposition we have

$$PO.OP':RO.OR'=CD^2:CR^2$$

and $pO.Op'=RO.OR'=Cd^2:CR^2.$

Therefore $PO.OP':CD^2=RO.OR':CR^2$

$$=pO.Op':Cd^2$$

or $PO.OP':pO.Op'=CD^2:Cd^2.$

Prop. XIX.

If the two extremities of a rod slide along two fixed straight lines at right angles to one another, any fixed point in the rod will describe an ellipse.

Let OM, ON (fig. 27) be the two fixed straight lines, and MPN any position of the rod, and P the tracing point.

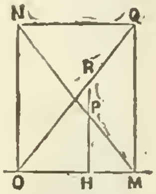

Fig. 27.

Complete the rectangle QMON and join OQ, and draw, parallel to ON, RPH to meet OQ in R and OM in H.

Then it can easily be shown that

$$OR=NP$$

and that $RH:PH=OR:PM$

$$=PN:PM.$$

The locus of R is a circle whose centre is O and radius PN. And the locus therefore of P is an ellipse whose axes are in OM and ON and equal to PN, PM respectively.

Prop. XX.

If a circle roll on the inside of a fixed circle of double the radius, any fixed point in the circumference of the moving circle will trace out a diameter of the fixed circle, and any other point in the plane of the moving circle will trace out an ellipse.

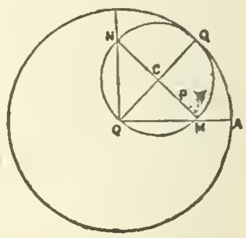

Fig 28.

If the point M (fig. 28) coincided with A at the beginning of the motion and the circle now touch at Q, the arcs MQ, QA must be equal. Therefore if C and O be the centres, the angle QCM is double the angle QOM, and therefore OCQ is always a straight line; as also MCN.

It is clear therefore that the motion of a point P in MN is exactly the same as in that of a point in the moving rod. (Prop. xix.)

PART III.—THE HYPERBOLA.

Definitions.

A straight line passing through the centre, and terminated by the hyperbola, is called a *diameter.*

The extremities of a diameter are called its *vertices.*

The diameter which passes through the foci is called the *transverse axis.*

A straight line BCB′ passing through the centre, perpendicular to the transverse axis, such that

$$BC^2=B'C^2=SC^2-AC^2$$

called the *conjugate axis.*

Any straight line terminated both ways by the hyperbola, and bisected by a diameter produced, is called an *ordinate* to that diameter.

Each of the segments of a transverse diameter produced, intercepted by its vertices and an ordinate, is called an *abscissa.*

A *chord, tangent,* and *normal* are defined exactly in the same words as in the case of the parabola.

Prop. I.

To find where an hyperbola of given focus, directrix, and eccentricity is cut by a straight line parallel to the directrix.

Let S (fig. 29) be the focus, XK the directrix, and e the eccentricity.

Draw SX perpendicular to XR, and divide it internally and externally in the ratio e to 1 in the points A, A′, so that

$$SA : AX = SA' : A'X = e : 1.$$

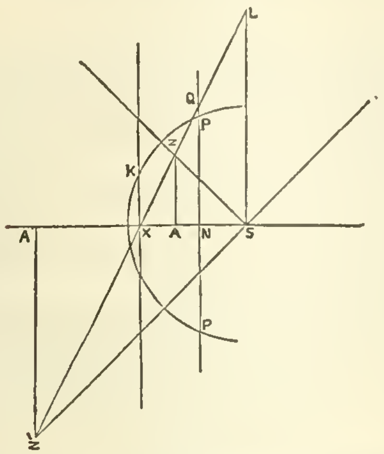

Fig. 29.

It is clear that A will lie between S and X, and A′ without SX on the side remote from S.

Draw AZ at right angles to SX and equal to AS, and join XZ.

Let QN be any straight line parallel to the directrix, cutting XZ in Q and the axis in N.

With centre S and radius equal to QN, describe a circle cutting QN in P and P′; these will be points on the hyperbola.

It is clear that if the point P exists, the point P′ on the opposite side of the axis also exists, and therefore the hyperbola is symmetrical with respect to the axis.

Again, the point P will exist, or, in other words, the circle will cut QN as long as SP or QN is greater than SN, which is always the case as long as the angle QSN is greater than half a right angle.

Now, if SL, A′Z′ be drawn at right angles to SX, cutting XZ in L, Z′, then (Eucl. vi. 4)

$$Z'A' : A'X = ZA : AX,$$
but
$$SA' : A'X = SA : AX,$$
and
$$SA = ZA,$$
$$\therefore SA' = Z'A',$$

from which it is easily seen that the angle Z′SA′ is half a right angle.

The whole curve therefore lies without the two lines AZ, A′Z′.

Prop. II.

To find where an hyperbola of given focus, directrix, and eccentricity is cut by a straight line perpendicular to the directrix.

Let S (fig. 30) be the focus, XK the directrix, and e the eccentricity.

Draw SX perpendicular to XK, and divide SX in A, A′, so that

$$SA : AX = SA' : A'X = e : 1;$$

and draw AR, A′R′ at right angles to SX.

Let KQ be any line parallel to the axis, cutting the directrix in K. Join SK, cutting AR, A′R′ in R, R′, and upon RR′ as diameter describe a circle cutting KQ in P, P′; these will be points on the curve. Now

$$SR : RK = SA : AX = e : 1$$
$$= SA' : A'X$$
$$= SR' : R'K.$$

Therefore by the Lemma in the introduction

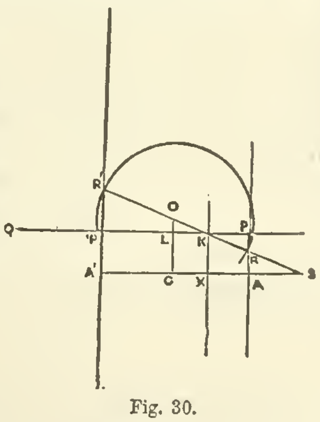

Fig. 30.

$$SP : PK = SP' : P'K = SR : RK = e : 1.$$

Therefore P and P′ are points on the hyperbola.

Now, if the point P exists, the point P′ also exists, and it is easily seen that the middle point L lies on a straight line bisecting AA′ at right angles. The curve, therefore, is symmetrical, not only with respect to the axis AA′, but also with respect to the line bisecting AA′ at right angles. The middle point C of AA′ is called the *centre* of the curve, from the fact that every straight line through C is bisected at the point.

It is evident from what has preceded that if we measure CS′ = CS and CX′ = CX, in the opposite direction to CS and CX, and draw X′K′ parallel to XK, the hyperbola might be described with S′ for focus, X′K′ for directrix, and eccentricity e.

The hyperbola therefore has two foci and two directrices.

Now, since

$$SP : PK = SP' : P'K = e : 1,$$
therefore
$$SP' - SP : P'K - PK = e : 1,$$
but
$$P'K - PK = 2LK = 2CX$$
$$\therefore SP' - SP = 2e \cdot CX.$$

Now it is easily seen that SP′ = S′P,

therefore
$$S'P - SP = 2e \cdot CX,$$

or the difference of the focal distances of any point on the curve is constant.

Again
$$SA : AX = SA' : A'X = e : 1$$
$$\therefore SA' - SA : A'X - AX = e : 1;$$
but
$$SA' - SA = AA'$$
and
$$A'X - AX = 2CX.$$
$$\therefore SP' - SP = SA' - SA = AA',$$

or the difference of the focal distances of any point on the hyperbola is equal to the transverse axis.

The point P will always exist, or in other words, the circle on

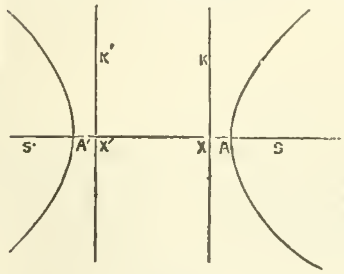

Fig. 31.

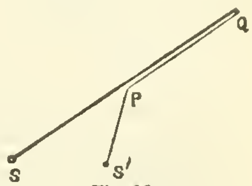

Fig. 32.

R, R′ as diameter will always intersect KQ, because R, R′ are on opposite sides of KQ.

Any straight line therefore parallel to the axis cuts the curve, and the curve must take the form given in fig. 31 which shows the centre C, the foci S, S′, and the directrices XK, X′K′.

It can easily be shown that the difference of the focal distances of any point on the concave side of either of the two branches (which is called within the curve) is greater than AA′, and the difference of the focal distances of any point outside the curve is less than AA′; and also that the ratio of the focal distance of any point within the hyperbola to its distance from the corresponding directrix is less, and the ratio for any point without is greater, than the eccentricity.

If a line BCB′ be drawn perpendicular to ACA′, and points B, B′ taken in it such that $CB^2 = CB'^2 = CS^2 - CA^2$, then AA′ is called the transverse axis, and BB′ the conjugate axis of the hyperbola.

If an hyperbola be described with BB′ for transverse axis, and AA′ for conjugate axis, then this hyperbola is said to be *conjugate* to the first one.

It is clear that the foci of the conjugate hyperbola will be in BCB′ at the same distance from C as S and S′.

An hyperbola can be described mechanically in the following manner:—

Suppose a bar SQ (fig. 32) to revolve round its extremity S which is fixed; then if a string of given length, attached to the bar at Q, and also to a fixed point S′, be always kept tight by means of a ring P sliding on SQ, a pencil at P would trace a hyperbola whose foci are S, S′, and whose transverse axis is equal to the length of the rod minus the length of the string.

Prop. III.

If a chord PQ intersect in Z the directrix corresponding to the focus S, then SZ will be the external bisector of PSQ if P, Q both lie on the same branch of the hyperbola, and SZ will be the internal bisector of the angle PSQ, if P, Q lie on different branches.

It can be shewn exactly as in Prop. iii. on the ellipse that

$$PZ : QZ = SP : PQ,$$

which proves the proposition.

Corollary.—If the point Q moves up to and coincides with P, or in other words, the chord PQ becomes the tangent to the hyperbola at P, then the angle PSZ will become a right angle.

Prop. IV.

The foot of the perpendicular from the focus on the tangent always lies on the circle described on the transverse axis as diameter.

This proposition is proved in exactly the same way as Prop. iv. on the ellipse.

Prop. V.

The product of the perpendiculars from the foci on the tangent is constant.

This proposition is proved exactly in the same way as Prop. v on the ellipse, the only difference in the figure being that S, S′ lie without the circle instead of within as in the case of the ellipse.

Prop. VI

The tangent at any point of an hyperbola makes equal angles with the focal distances of the point.

Let the tangent PZZ′ at the point P (fig. 33) meet the two directrices in Z, Z′. Join ZS, SP, PS′, S′Z′, and draw PMM′ parallel to the axis to meet the directrices in M, M′.

Then because

$$SP : PZ = ePM : PZ$$
$$= ePM' : PZ'$$
$$= PS' : PZ',$$

and the angles PSZ, PS′Z′ are right angles (Prop. iii.), therefore the triangles PSZ, PS′Z′ are similar (Eucl. vi. 7). Therefore the angle SPZ = angle S′PZ′.

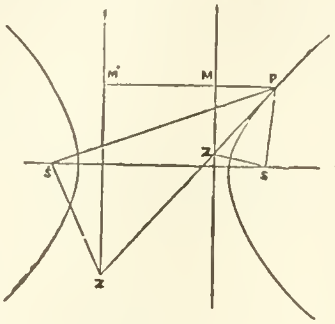

Fig. 33.

Prop. VII.

To draw a tangent to an hyperbola at a point on the curve.

First Method.—Join SP, S′P, and draw a line bisecting the angle SPS′: this line is the tangent at P. (Prop. vi.)

Second Method.—Draw SZ at right angles to SP meeting the corresponding directrix in Z: ZP is the tangent at P. (Prop. iii.)

Third Method.—On SP as diameter describe a circle which will touch the circle on AA′ as diameter in some point Y: YP is the tangent at P. (Prop. iv.)

Prop. VIII.

To draw a pair of tangents to an hyperbola from an external point.

First Method.—Let O (fig. 34) be the point, and S, S′ the foci.

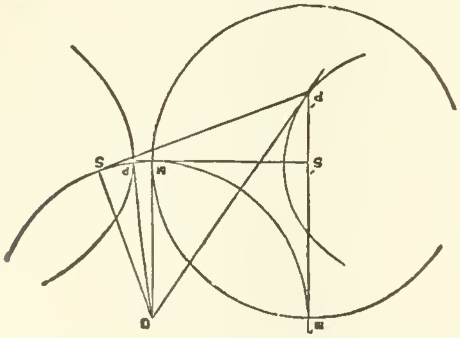

Fig. 34

Join OS; with centre O, and radius OS, describe a circle; and with centre S′ and radius equal to AA′ describe another circle. It can be shown that these circles will always intersect in two points M, M′.

Join S′M, S′M′ cutting the curve in P, P′. Then OP, OP′ will be tangents to the curve.

Join SP, SP′.

Now $S'P - SP = AA' = S'M = S'P - MP$, therefore $SP = MP$; and $OS = OM$; therefore the two triangles OPS, OPM are equal in all respects, and the angle OPS = OPM.

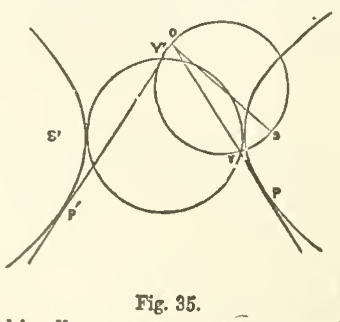

Fig. 35.

Therefore OP is a tangent to the hyperbola at P (Prop. vi.)

Second Method—Let O (fig. 35) be the point, and S, S′ the foci. Join OS, and upon it as diameter describe a circle cutting the circle described on AA′ as diameter (which it will always do) in Y, Y′.

Join OY, OY′, and produce them if necessary to meet the curve in P, P′. They will be tangents to the curve at P, P′.

Because OYS is a semicircle, the angle OYS is a right angle, and therefore OY is a tangent to the hyperbola (Prop. iv.)

Prop. IX.

If OP, OP′ be tangents to the same branch of an hyperbola at P, P′ and S be a focus, the angles OSP, OSP′ are equal: if OP, OP′ be tangents to different branches, the angles OSP, OSP′ are supplementary.

This proposition is proved in the same manner as Prop. ix. on the ellipse.

Prop. X.

If OP, OP′ be two tangents to the hyperbola, and S, S′ be the foci, the angles SOP, S′OP′ are equal.

This proposition is proved exactly in the same way as Prop. x. on the ellipse.

Prop. XI.

If C be the middle point of AA′, then $CA^2 = CS \cdot CX$.

$$SA' : A'X = e : 1 = SA : AX.$$
$$\therefore SA' - SA : SA = A'X - AX : AX.$$
$$\therefore AA' : XX' = SA : AX = e : 1. \qquad (1.)$$

Again $\quad SA' + SA : SA = A'X + AX : AX.$

or $\quad SS' : SA = AA' : AX.$

$$\therefore SS' : AA' = SA : AX = e : 1. \qquad (2.)$$

From (1) and (2)

$$AA' : XX' = SS' : AA'$$

or $\quad CA : CX = CS : CA$

$$\therefore CA^2 = CS \cdot CX. \qquad (3.)$$

Also $\quad CS : CX = CS^2 : CA^2$

$$= CA^2 : CX^2. \qquad (4.)$$

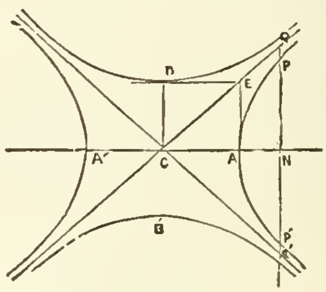

Fig. 36.

Prop. XII.

If PN be an ordinate of the hyperbola, then PN^2 always bears a constant ratio to $AN \cdot NA'$.

It is proved exactly as in the case of the ellipse Prop. xii., that

$$PN^2 : AN \cdot NA' = CB^2 : CA^2.$$

Prop. XIII.

The ordinates of two hyperbolas which have the same transverse axis are in a constant ratio.

Let PP′N be the common ordinate of two hyperbolas, whose transverse axis is AA′, and whose conjugate axes are CB, CB′.

Then $\quad PN^2 : AN \cdot NA' = CB^2 : CA^2$

and $\quad P'N^2 : AN \cdot NA' = CB'^2 : CA^2.$

Therefore $\quad PN^2 : CB^2 = AN \cdot NA' : CA^2,$

$$= P'N^2 : CB'^2.$$
$$\therefore PN : CB = P'N : CB'$$

or $\quad PN : P'N = CB : CB'.$

Definition.

The diagonals of the rectangle formed by the tangents to a hyperbola and its conjugate at their vertices are called *asymptotes.*

Prop. XIV.

If a straight line be drawn through any point Q on one of the asymptotes perpendicular to the transverse axis, meeting the hyperbola in P, P′ and the other asymptote in Q′ (fig. 36), then

$$QP \cdot QP' = BC^2.$$

From similar triangles QNC, EAC, we have

$$QN^2 : CN^2 = BC^2 : AC^2,$$

and from prop. xii.

$$PN^2 : AN.NA' = BC^2 : AC^2.$$

$$\therefore\ QN^2 - PN^2 : CN^2 - AN.NA' = BC^2 : AC^2.$$

but $QN^2 - PN^2 = QP'.QP$,

and $AN.NA' = CN^2 - CA^2$;

$$\therefore\ QP.QP' : CA^2 = BC^2 : CA^2,$$

$$QP.QP' = BC^2.$$

It is easily seen that

$$QP = Q'P',$$

therefore $PQ.PQ' = BC^2$.

Similarly it can be shewn that if RQR' be drawn parallel to AA', to meet the hyperbola in R, R', then

$$QR.QR' = AC^2.$$

It is clear that the further the point Q moves away the greater the line PQ' becomes, and it can be made greater than any assignable quantity, however large; and since $PQ.PQ' = BC^2$, therefore the line PQ becomes smaller and smaller, and can be made less than any assignable quantity, however small. Hence the *asymptote* never actually reaches the curve, though the distance between them constantly decreases, and can be made smaller than any assignable quantity.

It can easily be shewn that if the asymptote cuts a directrix in the point F, then

$$CF = CA.$$

As the asymptote may be considered as the tangent to the hyperbola at a point at an infinite distance, the foot of the perpendicular from the focus on the asymptote must lie on the circle whose diameter is AA' (Prop. iv.)

SF therefore must be perpendicular to the asymptote, as appears from other reasons (from Prop. iii., for example.)

Prop. XV.

If QPP'Q' (fig. 37) be any chord cutting the asymptotes in Q, Q' and the curve in P, P', then QP = P'Q'. and $QP.PQ' = CD^2$, where CD is the semi-diameter in the conjugate hyperbola parallel to PP'.

Draw RPR', DWW' perpendicular to the transverse axis, meeting the asymptotes in R, R', and W, W'.

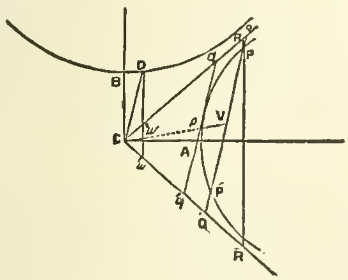

Fig. 37.

Then from similar triangles PRQ, DWC

$$PQ : PR = CD : DW$$

and from similar triangles PR'Q', DW'C

$$PQ' : PR' = DC : DW'.$$

Therefore $PQ.PQ' : PR.PR' = CD^2 : DW.DW'$;

but $DW.DW' = BC^2 = PR.PR'$ (Prop. xiv.)

therefore

$$PQ.PQ' = CD^2$$
$$= P'Q.P'Q'.$$

Now, if V be the middle point of QQ', then

$$PQ.PQ' = QV^2 - PV^2$$

and

$$P'Q.P'Q' = QV^2 - P'V^2.$$

Therefore

$$PV = P'V.$$

Thus V is the middle point of PP', as well as of QQ', or in other words PQ = Q'P'.

It is clear that when the points PP' coincide, or we have the tangent parallel to PP', say $q\,p\,q$, then

$$qp = pq' = CD,$$

and also that the line Cp will bisect all chords parallel to the tangent at p.

PV is called an *ordinate* to the diameter Cp.

Definition.

A chord which is parallel to the tangent at P is said to be *conjugate* to CP.

If a diameter CD be drawn parallel to the tangent at P to meet the conjugate hyperbola in D, CP, CD are said to be conjugate semi-diameters.

It is clear from Prop. xv. that a diameter is conjugate to the chords which it bisects.

Prop. XVI.

If CD be conjugate to CP, then CP is conjugate to CD.

Let the tangent at P meet the asymptote in L, then PL is parallel to CD; it is also equal to CD (Prop. xv.); therefore DL is equal and parallel to CP (Euclid i. 33).

Therefore LD is the tangent to the conjugate hyperbola at D, and therefore CP is conjugate to CD.

It is easily seen that PD is bisected by one asymptote, and parallel to the other asymptote.

Prop. XVII.

If P'CPV (fig. 38) be a diameter, and QV be an ordinate to CP, then $QV^2 : PV.P'V = CD^2 : CP^2$.

Draw PL the tangent at P to meet an asymptote in L, and let QV produced meet the asymptotes in R, R'.

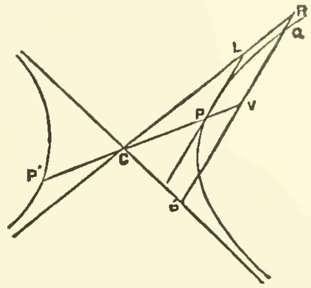

Fig. 38.

Then $RV^2 - QV^2 = RQ.QR' = PL^2$.

Theref.
$$QV^2 = RV^2 - PL^2$$
$$= \left(\frac{CV^2}{CP^2} - 1\right) PL^2$$
$$= \frac{CV^2 - CP^2}{CP^2}\, CD^2$$
$$= \frac{PV.P'V}{CP^2}\, CD^2.$$

Therefore $QV^2 : PV.P'V = CD^2 : CP^2$.

Prop. XVIII.

If POP' (fig. 39) be any chord, and ORCR' the diameter through O, then

$$PO.OP' : RO.OR' = CD^2 : CR^2,$$

where CD is the semi-diameter parallel to PP'.

Draw CQWV conjugate to PP' meeting the curve in Q, and the ordinate through R in W.

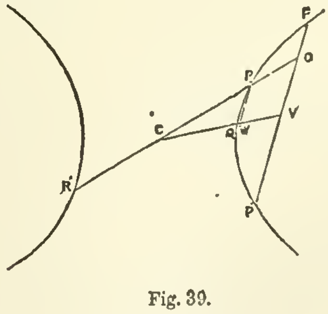

Fig. 39.

Then
$$PO.OP' = PV^2 - OV^2$$
$$= PV^2 - RW^2.\frac{CV^2}{CW^2}.$$

Now $PV^2 : CV^2 - CQ^2 = CD^2 : CQ^2$

and $RW^2 : CW^2 - CQ^2 = CD^2 : CQ^2$

$$\therefore\ PV^2 - RW^2.\frac{CV^2}{CW^2} : CV^2 - CQ^2 - (CW^2 - CQ^2)\frac{CV^2}{CW^2} = CD^2 : CQ^2$$

or
$$PO.OP' : CQ^2\left(\frac{CV^2}{CW^2} - 1\right) = CD^2 : CQ^2.$$

$$\therefore\ PO.OP' : CD^2 = CV^2 - CW^2 : CW^2$$
$$= CO^2 - CR^2 : CR^2$$
$$= RO.OR' : CR^2.$$

Therefore

$$PO.OP' : RO.OR' = CD^2 : CR^2.$$

Prop. XIX.

If POP′, pOp' be any two chords, and CD, Cd the semi-diameters parallel to them, then

$$PO.OP' : pO.Op' = CD^2 : Cd^2.$$

From the last proposition we have

$$PO.OP' : RO.OR' = CD^2 : CR^2,$$

and also $pO.Op' : RO.OR' = Cd^2 : CR^2.$

Therefore $PO.OP' : CD^2 = RO.OR' : CR^2$

$$= pO.Op' : Cd^2,$$

or $PO.OP' : pO.Op' = CD^2 : Cd^2.$

Prop. XX.

If from a point Q on one asymptote (fig. 40) ordinates QPM, QDN be drawn to two conjugate hyperbolas in P, D, PD will be parallel to the other asymptote.

$QM^2 : QN^2 = QM^2 : CM^2 = BC^2 : AC^2$

and $QM^2 - PM^2 : QN^2 - DN^2 = BC^2 : AC^2.$

$\therefore PM^2 : DN^2 = BC^2 : AC^2 = QM^2 : QN^2$

or $PM : DN = QM : QN.$

Therefore DP is parallel to NM (Eucl. vi. 2), and NM is parallel to BA. and therefore to the other asymptote.

Corollary.—It follows therefore that CP, CD are conjugate (Prop. xvi.)

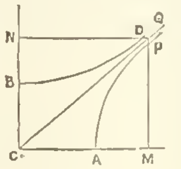

Fig. 40.

Prop. XXI.

If CP, CD be conjugate semi-diameters, $CP^2 - CD^2 = CA^2 - CB^2$.

Let ordinates PM, DN (fig. 41) in the two hyperbolas be produced, they will meet in a point Q on the asymptote (Prop. xx., Cor.)

Then $CP^2 - CD^2 = CM^2 + MP^2 - CN^2 - ND^2$

$$= QN^2 + MP^2 - QM^2 - DN^2$$

$$= QN^2 - DN^2 - (QM^2 - PM^2)$$

$$= CA^2 - CB^2 \text{ (Prop. xiv.)}$$

It follows that if the tangent at P meets the axes in T, T′, then

$$PT.PT' = CD^2.$$

For $PT : CD = PM : CN$

and $PT' : CD = CM : DN$

$\therefore PT.PT' : CD^2 = PM.CM : CN.DN$

$$= PM.QN : QM.DN$$

$$= 1 : 1$$

$\therefore PT.PT' = CD^2.$

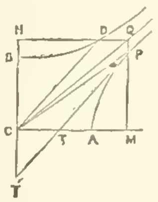

Fig. 41.

Prop. XXII.

If CP, CD be conjugate semi-diameters, the area of the triangle CPQ is constant.

Produce QP (fig. 42) to meet the other asymptote in Q′; and join MON, PLD. They are parallel to CQ′.

$\therefore QO : LO = QM : PM$ (Eucl. vi. 2.)

$QO^2 : LO^2 = QM^2 : PM^2$

$\therefore QO^2 - LO^2 : QO^2 = QM^2 - PM^2 : QM^2$

or $QL.LC : QO^2 = BC^2 : QM^2$

$\therefore 4CL.LQ : CQ^2 = BC^2 : QM^2$

or $4CL.LQ : BC^2 = CQ^2 : QM^2$

$$= CA^2 + CB^2 : CB^2$$

$$= CS^2 : CB^2$$

$\therefore 4CL.LQ = CS^2.$

Now in the right angled triangle PQD, L is the middle point of the hypotenuse; therefore PL = LD = LQ.

$\therefore 4CL.LP = CS^2.$

If PL′ be drawn parallel to CL to meet the other asymptote,

$$4PL.PL' = CS^2,$$

and the area of the quadrilateral CLPL′ is constant.

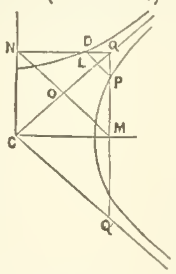

Fig. 42.

It follows that, if the tangent at P meets the asymptotes in K, K′, the area of the triangle CKK′ is constant; also that the area of the quadrilateral formed by the tangents at the extremities of two conjugate diameters is constant.

PART IV.—THE CONE AND ITS SECTIONS.

Definitions.

If through the point V, without the plane of the circle ADB (fig. 43), a straight line AV be drawn, and produced indefinitely both ways, and if the point V remain fixed while the straight line AV is moved round the whole circumference of the circle, a superficies of two sheets, which is called a *cone*, will be generated by its motion.

The fixed point V is called the *vertex of the cone*.

The circle ADB is called the *base of the cone*.

Any straight line drawn from the vertex to the circumference of the base is called a *side of the cone*.

A straight line VC drawn through the vertex of the cone, and the centre of the base, is called the *axis of the cone*.

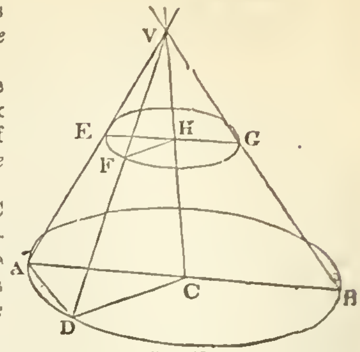

Fig. 43

If the axis of the cone be perpendicular to the base, it is called a *right cone*.

If the axis of the cone be not perpendicular to the base it is called a *scalene cone*.

Prop. I.

If a cone be cut by a plane passing through the vertex, the section will be a triangle.

Let ADVB be a cone of which VC is the axis; let AD be the common section of the base of the cone and the cutting plane; join VA, VD. When the generating line comes to the points A and D, it is evident that it will coincide with the straight lines VA, VD; they are therefore in the surface of the cone, and they are in the plane which passes through the points V, A, D, therefore the triangle VAD is the common section of the cone and the plane which passes through its vertex.

Prop. II.

If a cone be cut by a plane parallel to its base, the section will be a circle, the centre of which is in the axis.

Let EFG be the section made by a plane parallel to the base of the cone, and VAB, VCD two sections of the cone made by any two planes passing through the axis VC; let EG, HF be the common sections of the plane EFG and the planes VAB, VCD. Because the planes EFG, ADB are parallel, HE, HF will be parallel to CA CD, and

$$AC : EH = (VC : VH =) CD : HF;$$

but AC = CD, therefore EH = HF. For the same reason GH = HF; therefore EFG is a circle of which H is the centre and EG the diameter.

Prop. III.

If a scalene cone ADBV (fig. 44) be cut through the axis by a plane perpendicular to the base, making the triangle VAB, and from any point H in the straight line AV a straight line HK be drawn in the plane of the triangle VAB, so that the angle VHK may be equal to the angle VBA, and the cone be cut by another plane passing through HK perpendicular to the plane of the triangle ABV, the common section HFKN of this plane and the cone will be a circle.

Take any point L in the straight line HK, and through L draw EG parallel to AB, and let EFGN be a section parallel to the base, passing through EG; then the two planes HFKN, EFGN being perpendicular to the plane VAB, their common section FLN is perpendicular to ELG, and since EFGN is a circle (by last Prop.), and EG its diameter, the square of FL is equal to the rectangle contained by EL and LG (Eucl. iii. 35); but since the angle VHK is equal to VBA or VGE, the angles EHK, EGK are equal, therefore the points E, H, G, K, are in the circumference of a circle (Eucl. iii. 21), and HL . LK = EL . LG (Eucl. iii. 35) = FL^2, therefore the section HFKN is a circle of which HLK is a diameter (Eucl. iii. 35).

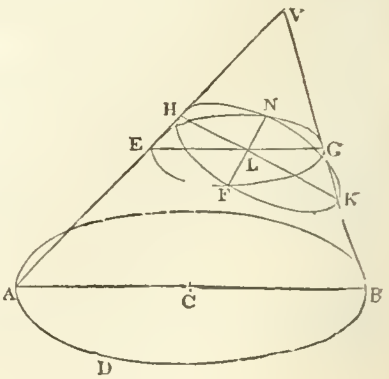

Fig. 44.

This section is called a *Subcontrary Section*.

Prop. IV.

If a cone be cut by a plane which does not pass through the vertex, and which is neither parallel to the base nor to the plane of a subcontrary section, the common section of the plane and the surface of the cone will be an ellipse, a parabola, or an hyperbola, according as the plane passing through the vertex parallel to the cutting plane falls without the cone, touches it, or falls within it.

Let ADBV (figs. 45, 46, 47) be any cone, and let ONP be the

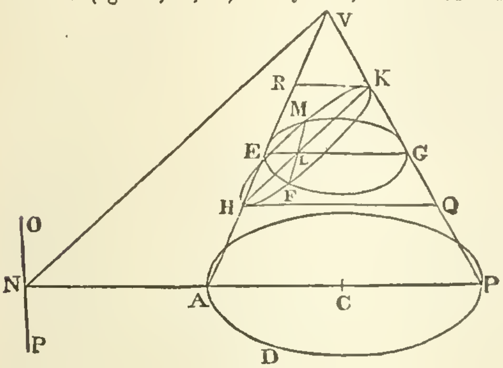

Fig. 45.

common section of a plane passing through its vertex and the plane of the base, which will either fall without the base, or touch it, or fall within it.

Let FKM be a section of the cone parallel to VPO; through C the centre of the base draw CN perpendicular to OP, meeting the circumference of the base in A and B; let a plane pass through V, A, and B, meeting the plane OVP in the line NV, the surface of the cone in VA, VB, and the plane of the section FKM in LK; then, because the planes OVP, MKF are parallel, KL will be parallel to VN, and will meet VB one side of the cone in K; it will either meet VA the other side in H, as in fig. 45, within the cone; or it will be parallel to VA, as in fig. 46; or it will meet VA, produced beyond the vertex, in H, as in fig. 47

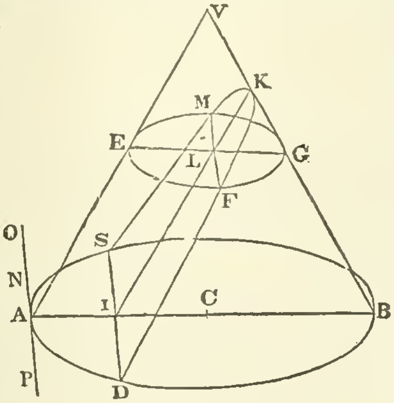

Fig. 46.

Let EFGM be a section of the cone parallel to the base, meeting the plane VAB in EG, and the plane FKM in FM, and let L be the intersection of EG and FM; then EG will be parallel to NB, and FM will be parallel to PO, and therefore will make the same angle with LK, wherever the lines FM, LK cut each other; and since BN is perpendicular to PO, EG is perpendicular to FM. Now the section EFGM is a circle of which EG is the diameter (Prop. ii.), therefore FM is bisected at L, and $FL^2 = EL . LG$.

Case 1. Let the line PNO be without the base of the cone. Through K and H (fig. 45) draw KR and HQ parallel to AB. The triangles KLG, KHQ are similar, as also HLE, HKR;

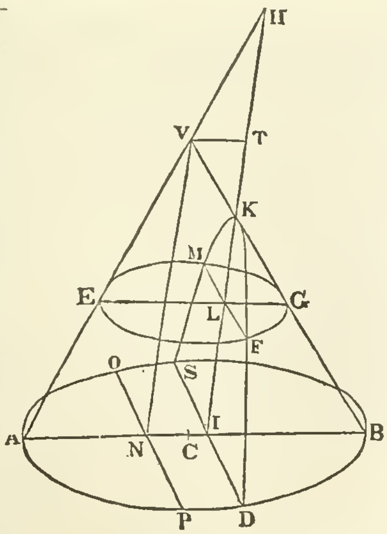

Fig. 47.

therefore $KL : LG = KH : HQ$,
and $HL : LE = KH : KR$;
therefore $KL . HL : LG . LE$ (or LF^2) $:: KH^2 : HQ . KR$.
Now the ratio of KH^2 to $HQ . KR$ is the same wherever the sections HFKM, EFGM intersect each other; therefore $KL . HL$ has a constant ratio to LF^2, consequently (Prop. xii. on the ellipse) the section HFKM is an ellipse, of which HK is a diameter and MF an ordinate.

Case 2. Next, suppose the line ONP to touch the circumference of the base in A. Let DIS (fig. 46) be the common section of the base and the plane FKM; the line DIS is evidently parallel to FLM, and perpendicular to AB, therefore $DI^2 = AI . IB$,
hence $DI^2 : FL^2 = AI . IB : EL . LG$.
But since EG is parallel to AB, and IK parallel to AV, AI is equal to EL, and
$$IB : LG = KI : KL,$$
therefore $DI^2 : FL^2 = KI : KL$.
Hence it follows from Prop. xi. on the parabola that the section DFKMS is a parabola, of which KLI is a diameter, and DIS, FLM ordinates to that diameter.

Case 3. Lastly, let the line PNO fall within the base; draw VT (fig. 47) through the vertex parallel to EG. The triangles HVT, HEL are similar, as also the triangles KVT, KGL, therefore
$$HT : TV = HL : LE,$$
and $KT : TV = KL : LG$;
therefore $HT . KT : TV^2 = HL . LK : LE . LG$ or LF^2.
Hence it appears that $HL . LK$ has to LF^2 a constant ratio, therefore the section DFKMS is an hyperbola, of which KH is a transverse diameter and FM an ordinate to that diameter (Prop. xii. on the hyperbola).

From the four preceding propositions it appears that the only lines which can be formed by the common section of a plane and a cone are these five:—1. Two straight lines intersecting each other in the vertex of the cone; 2. A circle; 3. An ellipse; 4. A parabola; 5. An hyperbola. The first two of these, however, viz., the pair of straight lines and circle, may be referred to the hyperbola and the ellipse; for if the axes of an hyperbola be supposed to retain a constant ratio to each other, and, at the same time, to diminish continually, till at last the vertices coincide, the hyperbola will evidently become two straight lines intersecting each other in a point; and a circle may be considered as an ellipse, whose axes are equal, or whose foci coincide; so that the only three sections which require to be separately considered are the *ellipse*, the *parabola*, and the *hyperbola*.

PART V.—OF CURVATURE

Definitions.

If a circle touch a curve at any point P and pass through another point Q on the curve, then if Q move up to P the limiting position of the circle, when Q coincides with P. is called the *circle of curvature* of the curve at P.

The centre of this circle is called the *centre of curvature* of the curve at the point P.

Proposition I.

The common chords of any conic and any intersecting circle are equally inclined to the axis or axes of the conic.

Let P, Q, R, S be the points of intersection of a conic and a circle.

Let PR, QS intersect in O.

Then because P, Q, R, S lie on a circle
$$PO . OR = QO . OS \text{ (Eucl. iii. 35)};$$
and because POR, QOS are two chords in a conic, the ratio
$$PO . OR : QO . OS$$
(in the parabola) = parameter of PR : parameter of QS.
(in the ellipse and hyperbola) = square on the semi-diameter parallel to PR : square on the semi-diameter parallel to QS.

Now parameters of chords in the parabola, and semi-diameters parallel to chords in the ellipse and hyperbola, are equal only when the chords are equally inclined to the axes.

The same proof applies to the pairs of chords PQ, RS and PS, QR.

Corollary 1.—If a circle touch a conic at P and cut it in Q and R, the chords PQ, PR are equally inclined to the axis, and the chord QR and the tangent at P are also equally inclined to the axis. This is seen by considering the case of S moving up to and coinciding with P.

Corollary 2.—If the circle of curvature of a conic at a point P intersect the conic again in Q, then the chord PQ and the tangent to the conic at P are equally inclined to the axis of the conic.

This is seen by considering the case of R and S, both moving up to and coinciding with P.

PROP. II.

To draw the circle of curvature at any point of a conic.

Draw the tangent at P, of which methods have been given above. Draw PQ equally inclined to the axis, cutting the conic again in Q. Draw PO at right angles to the tangent, and make the angle PQO equal to the angle QPO.

This gives O the centre of the circle of curvature.

PROP. III.

The focal chord of curvature in the parabola is equal to 4SP.

Let the common chord of the circle of curvature and the parabola be PQ, cutting the axis at F (fig. 48).

Draw the double ordinate PNP′, cutting the axis at N; the tangents at P, P′ will meet the axis in the same point T. Then

angle PFT = angle PTF = angle P′TF.

∴ TP′, PQ are parallel.

∴ PQ = 2PV = 4PF = 4PT.

Now let PS produced cut the circle again in U; join UQ.

Then angle UQP = angle TPU (Eucl. iii. 32) = angle PTS = angle PFT;

therefore UQ is parallel to SF

∴ PU : PS = PQ : PF = 4 : 1,

or PU = 4SP.

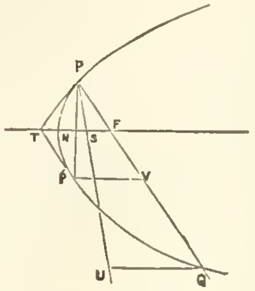

Fig. 48.

PROP. IV.

To find an expression for the chord of curvature at any point of a parabola drawn in any direction.

Using the same construction as in Prop. iii., let PW (fig. 49) be the chord required.

Draw SY parallel to the given direction to meet the tangent at P in Y.

Then angle PWU = angle SPY (Eucl. iii. 32).

and angle UPW = angle YSP. Therefore the triangles UWP, YSP are similar, and

PW : PU = SP : SY

or PW . SY = PU . SP = 4SP^2.

$$\therefore \text{PW} = \frac{4\text{SP}^2}{\text{SY}}.$$

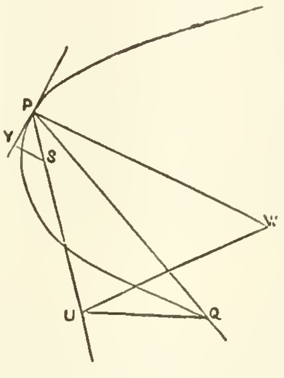

Fig. 49.

COROLLARY.—The diameter of curvature $= \frac{4\text{SP}^2}{\text{SY}}$ where SY is the *perpendicular* on the tangent.

PROP. V.

If the chord of intersection PQ (fig. 50) of an ellipse or hyperbola with the circle of curvature at P meet CD the semi-diameter conjugate to CP in K, then

PQ . PK = 2CD^2

Draw the double ordinate PNP′; the tangents at P, P′ meet in the axis at T, and the tangent at P′ is parallel to PQ, and therefore CP′ bisects PQ in V.

Let PQ meet the axes in F, F′, then

PV : PF′ = P′V : P′C = TF : TC

= PF : PK

since CD is parallel to PT.

Therefore PV . PK = PF . PF′

= PT . PT′ = CD^2

(Ellipse, Prop. xv. and Hyperbola, Prop. xxi.)

and ∴ PQ.PK′ = 2CD^2.

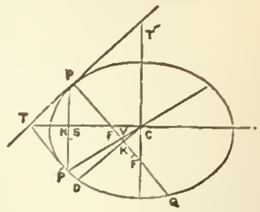

Fig 50

PROP. VI.

If the chord of curvature PQ′ (fig. 51) of an ellipse or hyperbola in any direction meet CD in K′, then

PQ′ . PK′ = 2CD^2.

The angle Q′QP = angle TPK′ = angle PKK′;

therefore the triangles PKK′, PQ′Q are similar,

and PQ′ : PQ = PK : PK′

∴ PQ′ . PK′ = PQ . PK = 2CD^2.

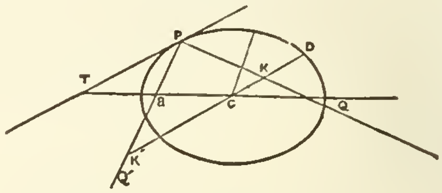

Fig. 51

If PQ″ be the chord of curvature through the focus, then

PK″ = CA

and PQ″ . CA = 2CD^2.

If PQ‴ be the chord of curvature through the centre

PK‴ = CP

and PQ‴ . CP = 2CD^2.

If PQ⁗ be the diameter of curvature

PK⁗ . CD = CA . CB

and PQ⁗ . PK⁗ = 2CD^2.

∴ PQ⁗ . CA . CB = 2CD^3.

For other powerful methods of investigating the properties of the conic sections which have been much developed of late reference is made to GEOMETRY and other headings. (H. M. T.)

CONINGTON, JOHN (1825-1869), the first occupant of the "Corpus" chair of Latin literature in the University of Oxford, was born on the 10th August 1825 at Boston in Lincolnshire, his father, the Rev. Richard Conington, being incumbent of the chapel of ease in that town. He was a remarkably precocious child, knowing his letters when fourteen months old, and being able to read well at three and a half. After two years' training at Beverley grammar school, he was sent in 1838 to Rugby, where his "remarkable memory and very good scholarship" drew special commendation from Dr Arnold. In 1843 he went to Oxford, matriculating at University College at midsummer, but entering upon residence in the October term at Magdalen, where in the interval he had been nominated to a demyship. His university distinctions were numerous. He was Ireland and Hertford scholar in 1844; in March 1846 he was elected to a scholarship at University College; in December of the same year he obtained a first-class in classics, graduating B.A. soon afterwards; and in February 1848 he became a fellow of University College. Finding no career open to him at the university, and having obtained the Eldon scholarship in 1849, he proceeded to London in fulfilment of its conditions to keep his terms at Lincoln's Inn. The profession of law, however, proved eminently distasteful to him, and after six months he resigned the scholarship, and returned to more congenial work at Oxford. During his brief residence in London he formed a connection with the *Morning Chronicle*, which was maintained for some time. He showed no special aptitude for journalism, but a series of articles on University Reform (1849-50) are noteworthy as the first public expression of his views on a subject that always deeply interested him. In 1854 his appointment to the chair of Latin literature, newly founded by Corpus Christi College, gave him a position which exactly suited him. He had published, in 1848, an edition of the *Agamemnon* of Æschylus with notes and a translation into English verse, and he had devoted much study to the other plays of Æschylus, of which the only published result is the very valuable edition of the *Choephori* (1857). From the time that he became professor, however, he confined himself with characteristic conscientiousness almost exclusively to Latin literature. The only important exception was the translation of the last twelve books of the *Iliad* in the Spenserian stanza in completion of the work of Worsley, and this was undertaken as a labour of love, in fulfilment of a promise made to his dying friend. In 1852 he commenced, in conjunction with Mr Goldwin Smith, a complete edition of Virgil with a commentary, of which the first volume appeared in 1858, the second in 1864, and the third soon after his death. Mr Goldwin Smith was compelled to withdraw from the work at an early stage, and in the last volume his place was taken by Mr Nettleship. In 1863 appeared Conington's translation of the *Odes* and *Carmen Seculare* of Horace. This was followed in 1866 by the work by which its author is best known to the general public, the translation of the *Æneid* of Virgil into the octosyllabic metre of Scott, which deservedly takes almost the highest rank in its own department. The version of Dryden is the work of a stronger artist; but for fidelity of rendering, for happy use of the principle of compensation so as to preserve the general effect of the original, and for beauty as an independent poem, Conington's version is unrivalled. That the measure chosen does not reproduce the majestic sweep of the Virgilian verse is a fault in the conception and not in the execution of the task, and Conington maintained that his choice had advantagea which more than counterbalanced this defect. His last effort in his favourite task of translation was his rendering of the *Satires, Epistles*, and *Art of Poetry* of Horace, which was published in 1869. He died at Boston on the 23d October 1869. His edition of Persius, with a commentary and a spirited prose translation, was published posthumously in 1872. In the same year appeared his *Miscellaneous Writings*, edited by Symonds, with a memoir by Professor H. J. S. Smith.

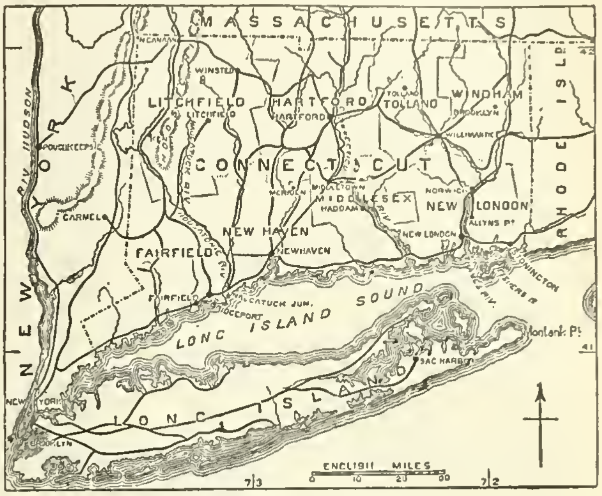
CONJEVERAM, a town of South-Eastern India, in the district of Chingleput, situated in the valley of the Wegawati, about 45 miles south-west of Madras, on the route to Arcot. It consists of wide irregular streets of mud-built houses, with cocoa-nut trees planted between them. The town is celebrated for its two pagodas, one dedicated to Kamachuma, and the larger one to Siva. The principal inhabitants are Brahmans. Handkerchiefs and cloths are manufactured.

CONNAUGHT, one of the four provinces of Ireland, occupying the western quarter of the island. It comprises the counties of Galway, Mayo, Sligo, Leitrim, and Roscommon, and contains an area of 6862 square miles, or 4,392,085 acres, of which 2,889,000 are under cultivation. The annual value of property, which, however, is based on a lower scale of prices than now obtains, is estimated at £4,188,631; and the land is divided among 5264 proprietors. An average holding in this province amounts in extent to 795 acres, while in all Ireland it amounts to only 293 acres; and the average value is 6s. 9½d. per acre, while that of all Ireland amounts to 13s. 2d. The western portion is hilly and occasionally mountainous, while the eastern part is generally level. It is well watered, and has on the greater portion of its eastern boundary the River Shannon. The River Moy is navigable from Killala to Ballina; the extensive lakes Conn, Corrib, and Mask, are navigable; and the sea coast affords many fine bays and harbours. The climate is moist and temperate. Agriculture is the main support of the population, but little progress has been made in its pursuit. The population may be considered as almost purely Celtic, and more than a third of the people speak the Irish language—a larger proportion than in the other provinces. The number of inhabitants in the province at and since the census of 1841 has been as follows:—

	Inhabitants.	Catholics.	Protestants.
1841	1,418,859	...	...
1851	1,010,031	...	...
1861	913,135	866,023	47,112
1871	845,075	803,849	41,226

In early times Connaught comprised, beyond its present limits, the territory of Thomond, forming the present county of Clare, and North Breifne, the present county of Cavan. When Sir Henry Sydney, in the 16th century, divided the province into counties, he adopted the ancient boundaries, excluding North Breifne; but in 1602 the county of Clare was restored to Munster, and Connaught now comprises the counties mentioned above.

CONNECTICUT (Indian, *Quonektacat, i.e.*, Long River), one of the six New England, and one of the thirteen original, States of the American Union, lies between 41° and 42° 3′ N. lat., and 71° 55′ and 73° 50′ W. long.



Sketch Map of Connecticut.

Physical Description.—It is bounded N. by Massachusetts about 88 miles; E. by Rhode Island, 45 miles; S. by Long Island Sound, 100 miles; W. by New York about 68 miles (in a direct line). The S.W. corner projects along the Sound under New York for about 13 miles. The area is 4750 square miles, or one-tenth of that of New York. The State lies on the S. slope of the hilly regions of New England, with a general surface much diversified; there is, however, no land above 1000 feet in elevation. Besides the Connecticut, two other large rivers flow from the N. into the Sound—the Housatonic and the Thames. The Connecticut is the largest river in New England, rising on the N. border of New Hampshire, 1600 feet above the sea, flowing S.S.W., separating Vermont and New Hampshire, crossing the W. part of Massachusetts, and central part of Connecticut, flowing S.S.E. below Middletown, and falling into the Sound at Saybrook. Its length is more than 400 miles, with a width in Connecticut varying from 500 to 1000 feet. It is navigable to Middletown (30 miles) for vessels drawing 10 feet, and to Hartford (50 miles) for those drawing 8 feet. Its principal tributary in Connecticut is the Tunxis, or Farmington, which flows S.E. from the slopes of the Green Mountains in Massachusetts, then abruptly N., and, breaking through the trap range, S.E. again to the Connecticut River at Windsor, instead of taking its seemingly natural course to New Haven, whither a part of its waters were formerly carried by the Farmington Canal. The E. part of the State is drained by the Thames, which is formed by the Yantic and Shetucket,—the Quinnebang joining the latter about two miles above. It is navigable to Norwich for the Sound steamers and West India trading vessels. In the W. part of the State is the Housatonic, with its main branch—the Naugatuck—which joins it at Derby. To this place it is navigable for small vessels. Besides these large streams there are very many smaller ones, affording, in their rapid descent from the hills, an immense amount of water power. Geologically the State is chiefly Eozoic, excepting the Triassic Sandstone and post-Tertiary terraces of the Connecticut River valley. There are several well-defined ranges of hills. Of these the Housatonic Hills are the most westerly, and extend along that river to the coast. The Green Mountain range, running S. from Vermont, terminates near New Haven. The Blue Hills of Southington—the highest in the State—are a part of the Mount Tom range of Massachusetts, and lie between the Green Mountain range and the Connecticut River. On the E. side of the river is a fourth range which the river crosses at Chatham. While the hills run N. and S., it is noticeable that the three main rivers bend (and on about the same parallel) to the S.E. The ridges and dikes of trap are exceedingly numerous through the centre of the State, having been forced up through the red sandstone which is found underlying and on the borders of the trap. These ridges have abrupt columnar W. fronts and gentle E. slopes. The mineral wealth of the State is considerable. Copper is found in the Simsbury mines at Granby, and at Bristol; but these mines have lost their former importance since the working of the abundant and purer ores of Lake Superior. Iron ore is found in great quantities in Salisbury, Kent, Sharon, Cornwall, and Canaan, and has been worked for 125 years. Limestone and marble of the very best quality are found at Canaan, Washington, and Milford. At Portland and Cromwell, on both sides of the Connecticut River, are the well-known immense quarries of freestone largely in demand for building. The excellent slate flagging from Bolton and Haddam is abundant in supply, and in great demand. Granite, gneiss, hydraulic lime, tiling slate, clay (fire, potters', and porcelain), and sulphate of barytes are found in great quantities. There were twenty extensive quarries and mines in the State in 1870. There are over 100 miles of deeply indented coast on the Sound (which measures 140 miles by 24 miles), affording excellent harbours. The chief of these are Stonington, New London, Saybrook, New Haven, Bridgeport, and Fairfield. The harbour at New London is one of the best in the country, capacious, and never frozen over. The climate of the State, while very changeable, is very healthful,—the mortality being below the average of the other States. There is scarcely any spring season, but summer opens abruptly about May 3, and the cold weather begins in November. The winters, with their keen N.W. winds, are severe, but the serenity of the sky and dryness of the air make some compensation. The mean temperature for the year is 48° Fahr. Consumption is the most fatal disease, causing 16 per cent. of all the deaths. The vegetation is rich and varied. The most abundant trees are chestnut, walnut, birch, oak, elm, maple, beech, and ash. The forests have been recklessly cut away, and only patches of woodland remain; but the people are waking up to the importance of tree-planting. As for zoology, songbirds of all sorts are plentiful, and the grouse and woodcock are increasing under the game laws, after having been nearly killed out. The Sound abounds in the best qualities of fish and shell-fish, while the freshwater varieties of the former are found in great quantities in the rivers and ponds. Aside from these there are few animals of importance save the domestic ones.

Population. Divisions.—The State is divided into 8 counties:—Hartford, New Haven, New London, Fairfield (all incorporated in 1666), Windham (1726), Litchfield, (1751), Middlesex, and Tolland (1785). New London, Middlesex, New Haven, and Fairfield occupy the lower half of the State, bordering on the Sound; the others occupy the other half, adjoining Massachusetts. The number of towns in 1876 was 167; and there were ten cities:—Hartford, the capital (population in 1870, 37,180), New Haven (50,840), Bridgeport (18,969), Norwich (16,653), Waterbury (10,826), Middletown (6923), Meriden (10,521), New London (9576), New Britain (9480), and South Norwalk. There were also 17 boroughs largely engaged in industry, of which the chief are Birmingham, Danbury, Danielsonville, Fairfield, Stamford, Stonington, Willimantic, and Winsted. The population of the State in 1679 was 12,535; in 1774 it had risen to 197,856; and from 1790 it was as follows (the last column showing its place among the other States as regards population):

	White.	Free Coloured.	Slave.	Total.	Rank.
1790	232,374	2808	2764	237,946	8
1800	244,721	5330	951	251,002	8
1810	255,179	6453	310	261,942	9
1820	267,181	7870	97	275,148	14
1830	289,603	8047	25	297,675	16
1840	301,856	8105	17	309,978	20
1850	363,099	7693	none	370,792	21
1860	451,504	8627	,,	460,147	24
1870	527,549	9668	,,	537,454	25

In 1870 there were about 7000 more females than males. About one-fifth of the population were foreign born, chiefly Irish, German, English, French, Canadian, and Scotch. It is the third State in the density of its population (113·15 to the square mile), Massachusetts (186) and Rhode Island (208) exceeding it, while New York follows next (87). In 1875 the births were 14,328 (141 illegitimate); marriages, 4385 (below the average for the last 11 years); deaths, 9833 (25 per cent. from diseases of the respiratory organs); divorces, 476 (one for every 9·21 marriages solemnized; the average for 12 years is 455). The laws regarding divorce are very lax.

Industry and Finances.—Of the total population over ten years of age in 1870 (425,896), there were engaged in all occupations, 193,421; chiefly classed as—in agriculture, 43,653; in professional and personal service, 38,704; in trade, 24,720; and in manufactures, 86,344. There is very little soil that can be called good, except in the river valleys, and agriculture is as backward as in other parts of New England. The hills through the State furnish excellent pasturage and cheap fuel. The chief cultivated fruits are apples, pears, grapes, and the numerous kinds of berries. The principal crops are hay, oats, rye, corn, potatoes, and tobacco; and in the Connecticut River valley (extending, in this State, 30 miles N. of Middletown, and 20 miles wide) farming is very productive. The tobacco raised in the valley is said to be superior to any other. In the uplands dairy products and cattle raising are the chief resources of the farmer. There were in 1870, 25,508 farms, having 1,646,752 acres of improved land, and 717,664 acres unimproved, of which 577,333 were woodland. The value of these farms was $124,241,382. Though the number of farms has increased since 1850 and 1860, yet the acreage devoted to them has decreased, as has also the cultivated farm land in proportion to the uncultivated. The farms are passing into the hands of the Irish and Germans, who do their own work and live with few comforts. Pisciculture is receiving much attention, commissioners having been appointed in 1866, who have well stocked the ponds and rivers. Black-bass, trout, and shad have been very successfully cultivated, and it is hoped as much can be done with salmon. Notwithstanding the extensive sea coast and fine harbours, the foreign commerce is not heavy,—the coast trade and fisheries being more important. There are in the State five custom districts, of which the ports of entry are Fairfield, Middletown, New Haven, New London, and Stonington. The imports from foreign countries and domestic exports for the year ending June 30, 1875, were as follows:—

Ports.	Imports.	Exports.
Fairfield	$6617	$28,927
Middletown	619	none
New Haven	1,174,921	2,925,031
New London	274,165	118,605
Stonington	858	none
Total...............	$1,457,180	$3,073,163

The chief articles of export were grain, fire-arms, provisions, and manufactures of wood. Of the total number of enrolled, registered, and licensed vessels (820), 718 were sailing vessels, with a tonnage of 53,329, and 78 were steam vessels, with a tonnage of 26,550. The fisheries are carried on from New London and Stonington. In 1875, there were 173 vessels engaged in the cod and mackerel fisheries, with a tonnage of 3756; and in the whale fishery 14, with a tonnage of 2050—a great reduction on the decade from 1850 to 1860. Engaged in coastwise trade and fisheries, there entered 2257 vessels and cleared 1678. In foreign trade there entered 161 and cleared 102. In 1870, 1001 persons were engaged in fisheries, and the annual product was $769,799. Ship-building is a considerable industry. In 1875, 34 vessels were built of 5915 tons. The great industry of the State is in manufactures. These are exceedingly numerous and very productive, and most of them such as require ingenuity and intelligence on the part of the workmen. The chief industries and some of their statistics in 1870 were :—

	Establishments.	Steam engines Horse-power	Water-wheels Horse-power.	Hands.	Capital.	Annual Product.

It ranks first among the States in the production of clocks, Indian-rubber goods, and hardware, and (small as it is) eighth in the total value of all manufactured products. It must be remembered, however, in connection with the above statistics, that the ninth United States census of 1870 is very inaccurate in relation to manufactures, the superintendent estimating that only about one-quarter of the capital invested is reported, and that there are other great errors in the way of under-estimate. In 1875 Connecticut had 1 mile of railway to 5·16 square miles of territory, and to 585 inhabitants. (Massachusetts had 1 mile to 4·29 square miles and 909 inhabitants; England 1 mile to 5·02 square miles and 1954 inhabitants.) There were 23 railroad companies, with 1184 miles of single track. The cost of these was $75,831,210; receipts for the year, $12,020,194 (50 per cent. from passengers); net earnings, $2,816,004, being 3·71 per cent. on the cost of the roads. Nine roads, costing nearly 8 millions, have no net income. The capital stock of all the companies was $59,282,784 (paid in), and debt, $17,077,739. The amount paid in dividends (only eight companies make any) was 4·3 per cent. on the entire capital of all the roads, but 9·24 on the capital of the dividend-paying ones. There is an elaborate system of State inspection of the roads and their accounts. There is a State tax of 1 per cent. on the market value of stock and bonds after deducting cash on hand. The principal lines are those running N. and S., connecting the shore with the valleys of the interior, and forming highways between the important cities of New England and New York city. Connected with these are important steamboat lines (passenger and freight) from Stonington, New London, and New Haven to New York. The waggon roads all over the State are kept in very fair condition, except in the poorer hill towns. There are about 13,000 miles of them, costing annually about $650,000. The banking interest of the State is commensurate with its large business, and shows a steadily increasing prosperity. At January 1, 1876, there were 79 national banks in the State, with a capital of $25,687,820; 4 State banks, with a capital of $1,450,000, and assets $3,917,953; 12 trust companies, with a capital of $2,450,000, and assets $6,183,643. These all do a heavy discounting and lending business with their capital and deposits, and pay dividends of 8 to 12 per cent. on their stock. The savings banks numbered 87, with a deposit of $76,489,310, and 208,030 depositors. The average income (during 1875) was 6·62 per cent., nearly all of which is paid to depositors, there being no capital stock. The management is very strictly controlled by law, and about three-quarters of the assets are lent on real estate in the State. The whole number of fire and marine insurance companies doing business in the State in 1875 was 130, of which 32 were Connecticut companies. The assets of these last were $17,345,790, of which over 16 millions were held by 10 companies (mostly in Hartford). The premiums received by all the companies were $1,949,867, and the corresponding losses $1,248,989; total risks written in the State, $165,660,801. The premiums received by the Connecticut companies from their entire business were $9,195,617, and corresponding losses $5,203,416. The life and accident companies doing business numbered 27, of which 11 were Connecticut companies; the assets of the last were $98,964,945. There were 2740 life policies issued in Connecticut in 1875, insuring $5,066,438. The life premiums paid amounted to $1,927,663. The policies in force in the State numbered 25,359, insuring $51,063,720. The Connecticut companies (all of Hartford) issued 26,104 policies, insuring $48,822,881 in 1875 (a large reduction on previous years), and paid losses of $6,463,473. The State debt in 1860 was only $50,000, which was borrowed from the school fund. From July 1, 1861, to October 1, 1865, five issues of bonds were made, amounting to $10,000,000, drawing 6 per cent. interest. This debt has been steadily reduced, and on April 1, 1876, was $5,014,500, or deducting cash in the treasury, only $4,302,775. The revenue of the State for the year ending March 31, 1876, was $2,117,719. This amount was chiefly derived from the tax of 1 mill on the grand list of the towns ($437,473), from savings banks ($462,664), mutual insurance companies ($398,266), and railroads ($302,758). In 1860 the assessed value of all property in the State was $341,256,976, and the true value $444,274,114. In 1870 the assessed value of real estate was $204,110,500, and of personal estate $221,322,728; total, $425,433,228. The true value was $774,631,524. In 1860 the total taxation, not national, was $1,015,039; in 1870, $6,064,843. The total indebtedness of towns and cities in the State on June 1, 1874, was $13,995,090, more than one-third of which was incurred in aid of railroads.

Social Statistics.—A large number of public and charitable institutions are maintained wholly or in part by the State, and for them it spent $135,463 during the year ending March 31, 1876. Among them are the following. The American Asylum for the Deaf and Dumb, at Hartford, was incorporated in 1816, being the oldest institution of the kind in the United States. In all, 2056 persons have received instruction, with an average attendance in 1875 of 218. The funds of the institution amount to $338,925. The annual State grant is $11,000. The charge per pupil is $175 a year. There is no asylum for the blind, but an annual grant of $6000 is made for the care of the indigent blind at the Perkins Institute at Boston. There is a general hospital at New Haven chartered in 1827, with a training school for nurses attached; funds, $20,000; annual grant, $2000; patients in 1875, 436. The Hartford Hospital was opened August 1, 1860; funds, $153,500, but considerably in debt; annual grant, $2000; patients in 1875, 707. The Connecticut Hospital for the Insane, at Middleton, was opened in 1868; cost, $640,043; it accommodates 450 with attendants and physicians, and is always crowded. To April 1, 1876, 1272 had been admitted. One-half the board of paupers is paid by the State. Revenue in 1875, $124,305, of which the State paid $62,004. The Retreat for the Insane at Hartford was opened in 1824, and has treated 5786 patients. Though receiving large State and private aid, it is intended for patients who can pay for comfortable accommodation. It had in 1875 about 159 inmates. The Reform School at West Meriden was opened in 1854; cost $115,000, with a farm of 195 acres. The expense to the State in 1875 was $30,368. Boys from ten to sixteen years old may be sent to it for crime, by the several courts, for not less than 9 months, and during minority. The inmates are required to labour $6\frac{1}{2}$ hours a day, and attend school $4\frac{1}{2}$ hours. The Industrial School for Girls at Middleton was opened in 1870. Its property has cost $122,363, mostly given by individuals. The expense to the State in 1875 was $16,223, and the inmates numbered 53. Girls from eight to sixteen may be committed to it for vagrancy, and are taught housekeeping, sewing, box-making, and farm and garden work. The School for Imbeciles at Lakeville cost $10,000, appropriated by the legislature. In 1875 its income was $14,165, with an average of 95 inmates. The State prison at Wethersfield, erected in 1827, is inadequate to the needs of the State, having, in March 1876, 40 more prisoners than cells, viz., 252 prisoners. Its income in 1875 was $25,539, and payments $28,414,—the deficit being due to the recent decrease in the demand for convict labour. The punishments are solitary confinement, fetters, and shackles. The warder may deduct five days from the term of imprisonment for good behaviour. Schools were begun in New Haven in 1640. The provision and regulation of schools rested with the towns till 1712; with towns and parishes together till 1798; with parishes alone till 1856, when the towns were restored to their original place in the system. Though school districts existed in 1725, and were legalized in 1766, they were not fully endowed corporate bodies till 1839. Schools have been maintained in three ways,—by taxes, by tuition fees or rate bills, and by the income of invested funds. Taxes were a source of income from the beginning to 1821, and were restored in 1854. Rate bills were not discontinued till 1868. Local school funds were begun towards the close of the 17th century, and increased by sales of land in 1733, and by excise on liquors, tea, &c., authorized by Acts of May 1766 and October 1774. The State school fund was begun in 1795, it being the money procured by the sale of lands granted by Charles II. in 1662, and described as "from Narrogancett Bay on the east to the South Sea on the west." This was, in fact, a strip of land 70 miles wide, and running one-eighth of the circumference of the globe. Subsequently, this being found to interfere with other colonial grants, all this territory was given up, save portions in New York and Ohio. The land was sold for $1,200,000; the fund, however, has increased, and at September 1, 1874, was $2,044,266; the dividend per child has varied from $1, 50 to $1 per year, decreasing with the increase of population; the fund is almost wholly invested in real estate mortgages at 7 per cent. Another fund, the entire income of which since 1855 has been devoted to schools, is the Town Deposit Fund. The 24th Congress of 1835–6 voted to deposit the surplus revenue of the Union, then on hand, with the different States in proportion to their national representation. Connecticut received $764,670, which was divided among the towns according to their population in 1830; the present income from this is about $46,000 a year. (While Connecticut has preserved this fund almost intact, in other States it has been squandered or lost.) At present, aside from the income of these funds, the maintenance of the schools is provided for by these taxes:—the town tax, which must be sufficient to maintain 30 weeks of school in the larger, and 24 in the smaller districts; the district tax to provide for buildings and repairs, or any deficit; and the State appropriation of $1, 50 per child per year. In 1865 a State Board of Education was established, whose secretary is Superintendent of Public Instruction. The following are statistics for the year ending August 31, 1875:—Districts, 1506; public schools, 1650; children from four to sixteen (on January 1, 1875), 134,976, of whom 95 per cent. attended school. Average length of school, 176 days. Teachers: males, 721; females, 1910. Average pay per month: males, $70; females, $39. Income of public schools from all sources, $1,592,858. Provision for higher education is made by various private and endowed schools, but is by no means complete. The State Normal School at New Britain was opened in 1850; the annual State grant is $12,000, and it graduates about 100 pupils a year. In 1870 there were in the State 29 academies and seminaries, with 127 instructors, 1602 pupils, and 8000 volumes in their libraries. There are three colleges. Yale College (Congregational), in New Haven, was established in 1701 by the ten foremost ministers of the colony; in 1876 it had 90 instructors, nearly 1100 students in all departments, and 101,000 volumes in the libraries; its productive funds were about $1,500,000, and its property $5,000,000. Besides its classical course, it has faculties and schools of theology, law, medicine, fine arts, together with the very prosperous Sheffield Scientific School, and several post-graduate courses of study. Trinity (formerly Washington) College, at Hartford, was founded in 1823 by Episcopalians; its property is about $1,000,000, a considerable portion of which is in productive funds; it has about 20 instructors, 90 students, and 16,000 volumes in its library. Wesleyan University (Methodist) at Middletown was founded in 1831; property in 1875, $400,000; income, $47,000; instructors, 15; students, 190; library, 27,000 volumes; women were admitted in 1872 There is a theological institute (Congregational) at Hartford, and the Berkeley Divinity School (Episcopal) is at Middleton. In 1870 the State had 64 public libraries, with 285,937 volumes; these receive State aid. There are several valuable private libraries relating to American subjects at Hartford. The newspapers and periodicals numbered 71, circulating 203,725, and issuing annually 17,454,740 copies. There were 827 religious organizations, having 902 edifices, with 338,735 sittings, and property worth $13,428,109. The Congregationalist is by far the most numerous and wealthy denomination, followed by Episcopalians, Methodists, Baptists, and Roman Catholics.

Government.—Connecticut is represented in the National Congress by two senators and four representatives, and has now six votes in the Presidential electoral college. The State constitution provides distinct executive, legislative, and judicial powers. The chief officer, or governor, must be over thirty years of age. A majority vote in each house of the legislature carries a bill over his veto. His salary is $2000. The legislature, or General Assembly, consists of a senate and house of representatives, and meets annually on the Wednesday after the first Monday in January. The senate consists of not less than 18, or more than 24, members from districts determined by the General Assembly according to population. The representatives are two from each town incorporated before 1785 or having over 5000 inhabitants, and one from every other. The senators now number 18, the representatives 244. Each legislator is paid $300 a year. There is much special and excessive legislation. All elections are by ballot. Representatives are elected annually, and the general State officers and senators biennially, on the Tuesday after the first Monday in November. Any male citizen of the United States, aged twenty-one, who shall have resided in the State one year, and in the town where he offers to vote, six months, and who can read any article of the constitution, is entitled to vote. The pardoning power is vested in the Assembly. The judicial power is vested in the following courts:—A supreme court of errors, consisting of a chief and four associates; a superior court, consisting of six judges, together with the five of the court of errors. These are all chosen for eight years by the Assembly, but are disqualified on attaining the age of seventy. They may be removed by impeachment, or by the governor on a two-thirds address of each house. Their salary is $4000 each. There are also five courts of common pleas, presided over by a single judge, chosen for four years by the Assembly, with a salary of $2500. There are inferior courts in certain cities and boroughs, with judges chosen biennially by the Assembly. Numerous justices of the peace are elected biennially by the people of the towns where they live. Probate courts are held in each district, of which there are 113; the judges are elected biennially by the people. A somewhat faulty revision of the General Statutes of the State was made in 1875. A peculiarity of the State is that, when cities are formed, they still remain (frequently) parts of towns, and have a double government. The State militia embraced, in 1875, 2636 men, though those liable to serve (viz., between the ages of eighteen and forty-five) numbered 62,103. The governor is commander-in-chief, and under him are a brigadier-general and staff and field officers. The brigade comprises four regiments of infantry (one from each congressional district) and one section of light artillery. Two regiments go into encampment for a week, and the other two have a full parade each year. The arms of the State are—three vines in fruit—2 and 1, all proper—with the motto, "Qui transtulit sustinet."

History.—The Dutch first explored the country in 1620, but made no settlement till 1633. Then they settled at Hartford, buying of the Pequot Indians, but selling soon after to the English. James I. granted the first English patent to all New England, in 1620, to Lord Say-and-Seal and others. In 1634–36 permanent settlements were made at Hartford, Wethersfield, and Windsor by companies from Massachusetts under a patent from the Plymouth colony, covering the present State and also portions of Rhode Island, Massachusetts, Long Island, and an undefined territory to the west. In 1637 these towns organized an independent government, declared war against the Pequots, and, under Captain J. Mason, nearly destroyed the tribes. In 1638 New Haven and vicinity was settled by an English company under Rev. J. Davenport and Governor Eaton. This colony was united to Connecticut in 1662,

as was Saybrook in 1644. In 1639 Connecticut, chiefly through the influence of the Rev. J. Hooker of Hartford, adopted a constitution. This was "the first one written out, as a complete form of civil order, in the New World, and embodies all the essential features of the constitutions of the American States, and of the Republic itself, as they exist at the present day. It is the free representative plan which characterizes the country." In this constitution, and during the administration of it (till 1661), the only authority recognized was the "supreme power of the commonwealth," and the people were practically independent. When Charles II. came to the throne, J. Winthrop, jun., succeeded, in 1662, in obtaining a most liberal charter, which constituted Connecticut so completely a self-governed colony that no changes were needed in the instrument when she became one of the American States. Nor was it altered till 1818. From 1685 to 1687 James II. made strenuous efforts to take away all the New England charters; and in the latter year, Sir E. Andross, the royally appointed governor, came to Hartford while the Assembly was sitting, and demanded the charter. It was, however, concealed in the famous charter oak; and, at the dethronement of James II. in 1689 (after a year and a half of oppressive rule by Andross), the colonial Government resumed its functions as if nothing had happened. From the union of the colonies, Hartford was the seat of Government till 1701, from which date it shared the honour with New Haven until 1874, when it became the sole capital. The code, commonly called the *Blue Laws of Connecticut*, is now generally considered to have been a forgery by the Rev. Samuel Peters. The early statutes were not peculiarly severe or intolerant, and no case of execution for witchcraft is known. During the French and Indian wars Connecticut supplied her full quota of soldiers; and, during the revolt of the colonies, she furnished more men in proportion to her population, and more aid in proportion to her wealth, than any other colony. A few days before the Declaration of Independence she instructed her delegates to propose such a measure. The efficient and wise governor at the time, whom Washington used to call Brother Jonathan (Trumbull), has bequeathed his nickname to the country. Connecticut ratified the U.S. Constitution, January 9, 1788, being the fifth colony to do so. She took an active part in the war of 1812, though it cost the ruin of her West India and coasting trade. The present constitution was adopted in 1818, doing away with slavery, and being otherwise remarkable for its liberality and wisdom. It has been considerably amended to meet the needs of increased and differently distributed population, and of industrial progress. Under Governor Buckingham the State took a very prominent part in the civil war of 1861–65. She furnished 54,882 men, mostly for three years; and the war expenses, not only of the State and towns, but of private individuals, were enormous. The administration of the government since has been unusually honest and cautious, owing to the even balance of the political parties who alternate in its conduct. There is no just and complete history of the State, but its records from 1636 are preserved, and furnish the best source of information. The general histories of Bancroft and Palgrave, and the special ones of Trumbull, Hollister, and Barber, present the history very fairly down to the present century. There is a bulky history of *Connecticut during the War of* 1861–65, by Crofut and Morris. In Hartford is an enterprising Historical Society with some published collections. The Reports of the Board of Education are valuable in this connection. (W. G. A.)

CONNEMARA, a wild and picturesque district in the west of Galway, Ireland, indented by numerous bays from the Atlantic, whence it derives its name. It corresponds in boundary with the barony of Ballinahinch, lying between the bays of Kilkieran and Ballinakill; but the name is often applied in a general way to the whole western division of county Galway.

CONNOR, BERNARD (1666–1698), physician, was born in Kerry, Ireland. He studied medicine at Montpellier, and afterwards at Paris. Having travelled through Italy with the two sons of the high chancellor of Poland, he was introduced at the court of Warsaw, and appointed physician to John Sobieski, king of Poland. In 1695 he visited England, and read a course of lectures on physiology in London and Oxford. He was afterwards elected member of the Royal Society and College of Physicians, and was invited to Cambridge, where he also delivered public lectures. He was the author of a treatise entitled *Evangelium Medici* (the Physician's Gospel), in which he endeavoured to explain the Christian miracles as due to natural causes. He also wrote a *History of Poland* in 2 vols.

CONOLLY, JOHN (1794–1867), physician, studied medicine at Edinburgh, where he took the degree of M.D. in 1821. He settled in practice at Chichester, whence he removed to Stratford-on-Avon. In 1827 he was appointed, when only thirty-three years of age, professor of practice of physic in University College, London. This chair he resigned after holding it four years. Subsequently he practised medicine in Warwick until 1839, in which year he was elected resident physician to the Middlesex County Asylum at Hanwell. It was in this capacity that Conolly made his name famous, by carrying out in its entirety and on a large scale the principle of non-restraint in the treatment of the insane. This principle had been acted on in two small asylums—the Retreat near York, and the Lincoln Asylum; but it was due to the philanthropic energy of Conolly in sweeping away all mechanical restraint in the great metropolitan lunatic hospital, in the face of strong opposition, that the principle became diffused over the whole kingdom, and accepted as fundamental. Dr Conolly was granted the degree of D.C.L. by the University of Oxford in 1851, in acknowledgment of these services. He died in 1867. See a memoir by Sir James Clark, Bart., published in 1869.

CONON, an Athenian general. Having already commanded on several occasions, he was chosen as one of the ten generals who superseded Alcibiades in 406 B.C. He was not present at the battle of Arginusæ, and consequently he was allowed to remain in command. In 405, however, the Athenian fleet was surprised by Lysander, at Ægospotami, and Conon fled to his friend, Evagoras, king of Cyprus. On the outbreak of the war between Sparta and the Persians, he obtained from King Artaxerxes joint command with Pharnabazus of a Persian fleet. With it in 394 B.C. he defeated the Lacedæmonians near Cnidos, and thus deprived them of the empire of the sea, which they had held since the taking of Athens. Sailing down the Ægean to Athens, he expelled the Lacedæmonian harmosts from most of the maritime towns, and finally completed his services to his country by restoring the long walls and the fortifications of the Piræeus. According to one account, he was put to death by Tiribazus, when on an embassy from Athens to the Persian court; but it seems more probable that he escaped to Cyprus, where he had considerable property, and that he died there a natural death. See GREECE.

CONRAD. For the four emperors of this name, see GERMANY.

CONRADIN (1252–1268), son of the Emperor Conrad IV. and Elizabeth of Bavaria, was at the death of his father an infant some two years old. His uncle, Manfred, the illegitimate son of Frederick II., declared himself his champion, but, having recovered the Two Sicilies, himself seized the throne. Innocent IV. now called in the aid of Charles of Anjou, who defeated Manfred, and took possession of the crown. But Charles showed favour to none but his own countrymen, and at the entreaty of the Ghibelline leaders, by whom he was acknowledged as emperor, Conradin, now only sixteen, led an army into Italy. After gaining some advantages he was utterly defeated in August 1268, and soon after, being betrayed into the hands of Charles, he was unjustly tried, condemned, and executed in the market-place of Naples, with the consent of the Pope. He left his kingdom by will to Peter of Aragon. See SICILY.

CONRART, or CONRARD, VALENTIN (1603–1675), one of the founders of the French Academy, was born at Paris in 1603, and was educated, under Calvinist parents, for a commercial life. After his father's death, however, he turned his attention to literature, made himself proficient in his own language, and in those of Italy and Spain, and being brought into contact with men of letters, soon acquired a reputation, which for many years he did nothing to support. He was made councillor and secretary to the king; and this, together with a benevolent character, a faultless taste, and a certain charm of disposition and conversation, gained him a host of friends in the highest circles. Some, however, refused to join in the applause that everywhere greeted Conrart, and posterity has echoed their verdict. His literary reputation has passed away almost as completely as that of his friend Chapelain; and a certain distinction of style, recognized by Sainte-Beuve, is all that he is now credited with. In 1629 Conrart's house became the resort of a knot of literary men, who met to talk over professional subjects, and to read for advice and approval such work as they produced. The indiscretion of one of the number led to an involuntary notoriety, and to the influx into the meetings of the club of many strangers. Among these was Boisrobert, Richelieu's newsmonger and jester, who reported to his patron what he had seen and heard. The cardinal offered the society his protection, and in this way (1634) the French Academy was created. Conrart was unanimously elected secretary, and discharged the duties of his post for forty-three years, till his death in 1675. The intelligence and conscientiousness he displayed in this capacity are perhaps his greatest titles to distinction. To the last he rigidly adhered to his hereditary faith. See ACADEMY, vol. i. p. 74; Petitot, *Mémoires Rélatifs à l'Histoire de France*, tome xlviii.; and Sainte-Beuve, *Causeries de Lundi*, 19 Juillet 1858.

CONSALVI, or GONSALVI, ERCOLE (1757–1824), cardinal and statesman, was born at Rome on the 8th of June 1757, of a noble family originally belonging to Pisa. His boyhood was sickly, and presents nothing remarkable. From the college at Urbino, he passed to the Frascati College and the religious academy at Rome, studying theology, politics, music, and literature. Entering the Pontifical court as page in 1783, he rapidly advanced, and in 1797 obtained the office of auditor of the rota, which brought him into public notice. Accused of participation in the assassination of Duphot, he was arrested by the French on their seizure of Rome, and after a period of incarceration condemned, like so many of his brethren, to exile. On the death of Pius VI. he succeeded, in conjunction with Cardinal Maury, in securing in the conclave at Venice the election of Chiaramonti as Pius VII.; and the new Pope rewarded his devotion by appointing him secretary of state. Though from the beginning an avowed antagonist of the principles of the Revolution, Consalvi was too wise not to know that even Rome required in some degree to acknowledge their influence. He accordingly instituted various reforms, and but for the bitter opposition of the Conservative party his measures would have been more thoroughgoing than they were. He permitted laymen to hold certain public offices, under surveillance of the prelates, organized a guard from among the Roman nobility, decreed a plan for redeeming the base coinage, permitted the communes a certain degree of municipal liberty, and promised the liquidation of the public debt. In the long debates between Rome and France about the Concordat, Consalvi was the leading power on the side of the church; and he fought for the Papal privileges during his visit to Paris, with a pertinacity and spirit that won at once the hatred and respect of Napoleon. Impressed with Napoleon's power, and anxious, if possible, to make him subservient to the designs of Rome, he strongly urged the Pope to accede to the conqueror's request that the imperial crown should be placed on his head by the most sacred hands in Christendom. During the Pope's absence on this mission he remained as virtual sovereign in Rome; and his regency was rendered remarkable by a great inundation, caused by the overflow of the Tiber, during which he exposed himself with heroic humanity, for the preservation of the sufferers. Not long after the return of the Pope, the amity between the Vatican and the Tuileries was again broken. Rome was full of anti-Revolutionary and anti-Napoleonic strangers from all parts of Europe. The emperor was irritated; and his ambassador, Cardinal Fesch, kept up the irritation by perpetual complaints directed more especially against Consalvi himself. "Tell Consalvi," wrote the conqueror, still flushed with Austerlitz, "that if he loves his country he must either resign or do what I demand." Consalvi did accordingly resign on the 17th June 1807, and was followed in rapid succession by Casoni, Doria, Gabrielli, and Pacca. When in 1808 Miollis entered Rome, and the temporal power of the Pope was formally abolished, he broke off all relations with the French, though several of them were his intimate friends. In 1809 he was at Paris, and, in a remarkable interview, of which he has left a graphic account in his memoirs, he received from Napoleon's own lips what was practically an apology for the treatment he had received. With unbending dignity, however, he retained his antagonism; and shortly afterwards he was one of the thirteen cardinals who refused to recognize the marriage of Marie Louise. The result, as is well known, was a confinement at Rheims which only terminated about three years afterwards, when Napoleon had extorted what terms he pleased from the half-captive Pope at Fontainebleau. On his release Consalvi hastened to his master's assistance; and he was soon after permitted to resume his functions under the restored pontificate at Rome. Despatched to England to meet the allied sovereigns, he was well received both by king and people; and at the Congress of Vienna he obtained the restitution of the Marches (Ancona, Treviso, and Fermo) and the Legations (Bologna, Ferrara, and Ravenna). The rest of his life was spent in the work of reorganizing the States of the Church, and bringing back the allegiance of Europe to the Papal throne. He was practically governor of Rome; and Pius was so much under his control that "Pasquin" said the Pope would have to wait at the gates of paradise till the cardinal came from purgatory with the keys. In his foreign policy he was actuated mainly by antagonism to Austria; in his domestic policy he imitated the centralizing system of France. In all essentials a most rigid churchman, he was disposed to yield in minor matters, and obtained the praise of many Protestant visitors to Rome for his affability and liberality. Science, literature, and especially the fine arts received his most abundant patronage; the ancient buildings of Rome were excavated and preserved by his direction; chairs of natural science and archæology were founded in the university; and extensive purchases were made for the Vatican Museum, which was augmented by the addition of the beautiful Braccio Nuovo, or new wing. These and the like expenses, however, were a heavy drain on the Papal treasury, and brought Consalvi into financial difficulties, from which he only got free by the imposing of unpopular taxes. On the death of Pius VII. he retired to his villa of Porto d'Anzio; and, though he afterwards accepted from the new Pope the honorary office of prefect of the college *De Propaganda Fide*, his political career was closed. He died on 22d of January 1824, leaving the most of his moderate fortune to the poor. A fine portrait of Consalvi by Sir T. Lawrence is preserved at Windsor, and his tomb in South Marcello is surmounted by a monument by Rinaldi.

The memoirs of his life, written with great freedom of statement and considerable force of style, have been published by Crétineau-Joly in 1864. See also M. de Pradt, *Histoire des Quatre Concordats*, 1813-1820; L. Cardinali, *Elogio detto alla memoria del card. Consalvi; Cenni biografici sul Consalvi*, published at Venice in 1824; Bartholdi, *Züge aus dem Leben des Cardinals Herc. Consalvi*, 1824; Cardinal Wiseman, *Recollections of the last Four Popes*, 1858; Crétineau-Joly, *L'église Romaine en face de la Revolution*, 1859; and Ernest Daudet, *Le Cardinal Consalvi*, 1866.

CONSANGUINITY, or KINDRED, is defined by the writers on the subject to be *vinculum personarum ab eodem stipite descendentium*, that is, the connection or relation of persons descended from the same stock or common ancestor. This consanguinity is either lineal or collateral. Lineal consanguinity is that which subsists between persons of whom one is descended in a direct line from the other, while collateral relations descend from the same stock or ancestor, but descend the one from the other. Collateral kinsmen, then, are such as lineally spring from one and the same ancestor, who is the *stirps*, or root, as well as the *stipes*, trunk, or common stock, whence these relations branch out. It will be seen that the modern idea of consanguinity is larger than that of *agnatio* in the civil law, which was limited to connection through males, and was modified by the ceremonies of adoption and emancipation, and also than that of *cognatio*, which did not go beyond the sixth generation, and was made the basis of Justinian's law of succession. The more limited meaning of *consanguinei* was brothers or sisters by the same father, as opposed to *uterini*, brothers or sisters by the same mother. The degrees of collateral consanguinity were differently reckoned in the civil and in the canon law. "The civil law reckons the number of descents between the persons on both sides from the common ancestor. The canon law counts the number of descents between the common ancestor and the two persons on one side only," and always on the side of the person who is more distant from the common ancestor. A recent American writer, Lewis Morgan (*Systems of Consanguinity and Affinity in the Human Family*, 1871), has given the terms used to denote kindred in 139 languages. The Mongoloids, the Malays, the Dravidas, and the American aborigines have the following system. All the descendants of a common ancestor or ancestors of the same generation call each other brother and sister; they call all males of the previous generation fathers, and of the following one sons. From this he draws the mistaken inference (shared by Lubbock) that the primitive marriage state was hetarism, or community of wives. The linguistic facts are more probably connected with considerations of social rank, and such associations as the vendetta. In fact, except Egypt and Persia, nearly the whole world, both civilized and savage, have joined in repudiating incest. The chief danger has now been seen to lie in the risk of transmitting defects in an aggravated form. The force of the feeling is seen in the custom of wife-stealing, or exogamy by violence. In many places even identity of name is held to be an impediment to marriage. (See also M'Lennan *On Primitive Marriage*, 2d edition, 1876.)

CONSCRIPTION. See ARMY vol. ii., pp. 565, 601 602, &c.

CONSECRATION, the act of devoting anything to sacred uses. The Mosaic law ordained that all the firstborn both of man and beast should be consecrated to God. We find also that Joshua consecrated the Gibeonites, as Solomon and David did the Nethinims, to the service of the Temple; and that the Hebrews sometimes consecrated their fields and cattle to the Lord, after which they were no longer in their own power. In England (and, indeed, in all countries where any form of episcopacy prevails) churches have always been consecrated with particular ceremonies, the form of which is either left in a great measure to the discretion of the bishops, or provided for in the recognized office-books. Cemeteries are in like manner episcopally consecrated. Consecration is also used for the benediction of the elements in the Eucharist. Consecration, or the ancient heathen ceremony of the apotheosis of an emperor, is thus represented on medals:—On one side is the emperor's head, crowned with laurel, sometimes veiled, while the inscription gives him the title of *divus*; on the reverse is a temple, a bustum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus. In others the emperor is borne up in the air by the eagle. The inscription is always *consecratio*. These are the usual symbols; but on the reverse of that of Antoninus is the Antonine column. In the apotheosis of empresses, instead of an eagle, there is a peacock. The honours rendered to these princes after death were explained by the words *consecratio*, *pater*, *divus*, and *deus*. Sometimes around the temple or altar are put the words *memoria felix*, or *memoriæ æternæ*; and for princesses, *æternitas*, and *sideribus recepta*; whilst on the one side of the head is *dea*, or θεά. The term *consecratio* is also applied by Roman authors to the devotion of priests and temples to the gods; this is likewise called *dedicatio* and *inauguratio*. In Greek we find the verbs ἱδρύω, ἱερόω, used to express the same idea, with the cognate noun ἵδρυσις and (in late authors) καθιέρωσις.

CONSERVATORY (Ital. *Conservatorio*, Fr. *Conservatoire*, Ger. *Conservatorium*), a name applied first in Italy, and afterwards throughout the Continent, to institutions for training in music and for preserving the true theory and practice of the art. They arose out of the necessity of providing trained choristers for the service of the church, and were generally maintained upon some charitable foundation which provided board in addition to a musical education for orphans and the children of poor parents, other pupils being occasionally taken on payment of fees. When fully equipped, each conservatorio had two *maestri* or principals, one for composition and one for singing, besides professors for the various instruments. Though St Ambrose and Pope Leo I., in the 4th and 5th centuries respectively, are sometimes named in connection with the subject, the historic continuity of the conservatoire in its modern sense cannot be traced farther back than the 16th century. The first to which a definite date can be assigned is the Conservatorio di Santa Maria di Loretto, at Naples, founded by Giovanni di Tappia in 1537. Three other similar schools were afterwards established in the city, of which the Conservatorio di Sant' Onofrio deserves special mention on account of the fame of its teachers, such as Alessandro Scarlatti, Leo, Durante, and Porpora. There were thus for a considerable time four flourishing conservatorios in Naples. Two of them, however, ceased to exist in the course of last century, and on the French occupation of the city the other two were united by Murat in a new institution under the title Real Collegio di Musica, which admitted pupils of both sexes, the earlier conservatorios having been exclusively for boys. In Venice, on the other hand, there were from an early date four conservatorios conducted on a similar plan to those in Naples, but exclusively for girls. These died out with the decay of the Venetian republic, and the centre of musical instruction for Northern Italy was transferred to Milan, where a conservatorio on a large scale was established by Prince Eugene Beauharnais in 1808. The celebrated conservatoire of Paris owes its origin to the Ecole Royale de Chant et de Declamation, founded by Baron de Breteuil in 1784, for the purpose of training singers for the opera. Suspended during the stormy period of the Revolution, its place was taken by the Conservatoire de Musique, established in 1795 on the basis of a school for gratuitous instruction in military music, founded by the mayor of Paris in 1792. The plan and scale on which it was founded had to be modified more than once in succeeding years, but it continued to flourish, and in the interval between 1820 and 1840, under the direction of Cherubini, may be said to have led the van of musical progress in Europe. In more recent years that place of honour belongs decidedly to the conservatorium at Leipsic, founded by Mendelssohn in 1842, which, so far as composition and instrumental music are concerned, is now the chief resort of those who wish to rise to eminence in the art. Of other Continental conservatoires of the first rank may be named those of Prague, founded in 1810, of Brussels, founded in 1833 and long presided over by the celebrated Fetis, of Cologne, founded in 1849, and those instituted more recently at Munich and Berlin, the instrumental school in the latter being under the direction of Joachim. In England the functions of a conservatoire have been discharged by the Royal Academy of Music of London, which was founded in 1822, and received a charter of incorporation in 1830. With very limited resources as compared with the larger Continental establishments, it has done excellent service in providing a constant succession of thoroughly trained professional musicians. A national training school of music was opened at South Kensington under distinguished auspices in May 1876, the object being to provide a free education of the highest kind to pupils of remarkable promise as tested by examination.

CONSISTORY, a term applied originally to an antechamber or outer-room of the palace of the emperors of Rome, where the petitioners for justice assembled and awaited the presence of the emperor, who upon his entrance into the consistory took his seat upon a tribunal, whilst the others stood around him (consistebant). The word "consistory," as a term of ecclesiastical law, in which sense it is for the most part employed in modern times, came to be used first of all to denote certain ecclesiastical councils, in which the bishop was seated, whilst the presbyters and other clergy stood around him. It came by degrees to be used generally for all ecclesiastical councils in which a bishop presided, and in which matters of order rather than of doctrine were discussed and decided. The term "consistory," as used in the Latin Church, is applied at Rome to denote the assembly of the cardinals convoked by the Pope. This assembly is styled a consistory, "quia simul præsente Papa consistunt cardinales," the Pope's presence being a necessary condition to constitute the assembly of the cardinals a consistory.

There are two kinds of consistory which the Pope is in the habit of convoking—a public consistory and a private consistory. A public consistory is now rarely summoned; it is, in fact, an extraordinary assembly of the cardinals, at which other prelates and ecclesiastical magnates are present, and over which the Pope presides in his pontifical robes of state. It was usual for the Pope to receive foreign sovereigns and their ambassadors in a public consistory, and the hat used to be conferred on newly-created cardinals in such a consistory. The private or secret consistory is the ordinary court in which the cardinals attend on the Pope, and in which the Pope formally transacts certain ecclesiastical matters, which are of high importance and are termed consistorial matters; for instance, his Holiness nominates in secret consistory to all consistorial benefices, creates cardinals, appoints to vacant bishoprics, confirms the election of bishops, deposes bishops, decrees the pallium to be sent to archbishops, unites churches, grants extraordinary dispensations, &c. This ordinary consistory of the Pope is for the most part held in a chamber of the Papal palace at Rome known as the *camera papagali* or *papagalli*, which may be translated "The Painted Chamber," as Ducange renders it, "aula ornamentis decora." The phrase seems to have come into use in the Cærimoniale Romanum, as "the Star Chamber" at Westminster came to be so called from the painting or tapestry on its walls. The term "consistory" is used in the Church of England to signify the tribunal or place of justice, which in olden times was fitted up within the nave of every cathedral church, for the most part on the left hand side of the western entrance, for the bishop of the diocese or his vicar-general to hold his court for the hearing and deciding of ecclesiastical causes. Under the questionable influence of the spirit of resistance to the authority of the bishop, which has been a distinctive characteristic of the cathedral bodies in the Church of England from the earliest period of the Papal exemptions, the deans and chapters of the cathedral churches of England have in most cases caused the consistorial court of the diocesan bishop to be removed from the nave of the cathedrals, so that it is very rare to find at the present time traces of any such structure. The last trace of the diocesan consistory of the archbishop of Canterbury was removed from his cathedral within the memory of the living, when a restoration of the nave was made; and the consistorial court of the bishop of London, which was on the south side of the nave of St Paul's cathedral church, has been converted in very recent times, under the auspices of the late Dean Milman, into a memorial chapel for the reception of a national monument of the first Duke of Wellington. The consistorial courts of the bishops of the Church of England are now but "the shadows of great names," as the state has deprived the judges of the consistorial courts of the jurisdiction formerly exercised by them in matrimonial and testamentary matters, and their corrective jurisdiction over criminous clerks has been transferred to other tribunals. It is not necessary, nor is it usual for the bishops to hold their diocesan visitations in their consistorial courts.

The term "consistory" is used in certain of the Reformed churches, which do not recognize the order of bishops, to signify the supreme governing council of presbyters and elders, and such churches are hence termed consistorial churches.

CONSOLIDATION ACTS. The practice of legislating for small portions of a subject only at a time, which is characteristic of the English Parliament, produces as a necessary consequence great confusion in the statute law. The Acts relating to any subject of importance or difficulty will be found to be scattered over many years, and through the operation of clauses partially repealing or amending former Acts, the final sense of the Legislature becomes enveloped in unintelligible or contradictory expressions. Where opportunity offers, the law thus expressed in any statute is sometimes recast in a single statute, called a Consolidation Act. Among such are the Criminal Laws Consolidation Act and the Customs Laws Consolidation Act. These observations apply to the public general Acts of the Legislature. On the other hand, in settling private Acts, such as those relating to railway and canal enterprize, the Legislature always inserted certain clauses, founded on reasons of public policy applicable to the business in question. To avoid the necessity of constantly re-enacting the same principles in private Acts, their common clauses were embodied in separate statutes, and their provisions are ordered to be incorporated in any private Act of the description mentioned therein. Such are the Lands Clauses Consolidation Act, the Companies Clauses Consolidation Act, and the Railways Clauses Consolidation Act, all passed in 1845.

CONSOLS, an abbreviation of *Consolidated Annuities*, had their origin in 1751, and now form the larger portion of the funded debt of the United Kingdom. In the progress of the national debt it was deemed expedient, on grounds which have been much questioned, instead of borrowing at various rates of interest, according to the state of the market or the need and credit of the Government, to offer a fixed rate of interest, usually three or three and a half per cent., and as the market required to give the lenders an advantage in the principal funded. Thus subscribers of £100 would sometimes receive £150 of three per cent. stock. In 1815, at the close of the French wars, a large loan was raised at as much as £174 three per cent. and £10 four per cent. stock for £100. The low rate of interest was thus purely nominal, while the principal of the debt was increased beyond all due proportion. This practice began in the reign of George II., when some portions of the debt on which the interest had been successfully reduced were consolidated into three per cent. annuities, and consols, as the annuities were called, and other stocks of nominally low interest, rapidly increased under the same practice during the great wars. In times of peace, when the rate of money has enabled portions of the debt at a higher interest to be commuted into stock of lower interest, it has usually been into consols that the conversion has been effected. Temporary deficits of the revenue have been covered by an issue of consols; exchequer bills when funded have taken the same form, though not constantly or exclusively; and some loans of the Government in recent times for special purposes, such as the relief of the Irish famine and the expenditure in the Crimean war, have been wholly or partly raised in consols. The consequence has been to give this stock a pre-eminence in the amount of the funded debt. It appears from a recent parliamentary return than of £773,313,229 of funded debt of the United Kingdom £398,147,075 consisted of consols, £107,227,854 of three per cent. reduced annuities, and £225,256,099 of new threes. The funds of the savings' banks have been applied to the absorption of reduced annuities and new threes in larger proportion than of consols. The characteristics of this large portion of the debt, though it would seem almost indistinguishable from the three per cent. reduced, which originated about the same period as the consolidated threes, are that the interest has never varied; no attempt has been made to convert it to a lower interest or into another form of stock; and not only from its larger amount than other stock is it most convenient to dealers, but from the great number and variety of its holders it is believed to express with the greatest nicety the state of monetary affairs. The price of consols, however, does not in ordinary times vary much. It has a tendency, indeed, to rise when all other securities are most shaken. In periods of panic and extreme pressure for money, it has gone down for a few days between 80 and 90; its most customary range may be said to be 95 to 97; and it has occasionally touched par. The legal provisions erecting consols are found in several clauses of 25 George II. c. 27, and the regulations for their redemption in section 24 of the same Act.

CONSPIRACY, in English law, is an agreement between two or more persons to do certain wrongful acts, which may not, however, be punishable when committed by a single person, not acting in concert with others. The following are enumerated in text-books as the things, an agreement to do which, made between several persons, constitutes the offence of conspiracy:—(1) Falsely to charge another with a crime punishable by law, either from a malicious or vindictive motive or feeling towards the party, or for the purpose of extorting money from him; (2) wrongfully to injure or prejudice a third person or any body of men in any other manner; (3) to commit any offence punishable by law; (4) to do any act with intent to pervert the course of justice; (5) to effect a legal purpose with a corrupt intent or by improper means; to which are added (6) conspiracies or combinations among workmen to raise wages.

The division is not a perfect one, but a few examples under each of the heads will indicate the nature of the offence in English law. First, a conspiracy to charge a man falsely with any felony or misdemeanor is criminal; but an agreement to prosecute a man who is guilty, or against whom there are reasonable grounds for suspicion, is not. Under the second head the text-books give a great variety of examples,—*e.g.* mock auctions, where sham bidders cause the goods to go off at prices grossly above their worth; a conspiracy to raise the price of goods by spreading false rumours; a conspiracy by persons to cause themselves to be reputed men of property, in order to deceive tradesmen; a conspiracy to cause by threats, contrivances, or other sinister means a pauper of one parish to marry a pauper of another in order to charge one of the parishes with the maintenance of both. These examples show how wide the law stretches its conception of criminal agreement. The third head requires no explanation. A conspiracy to murder is expressly made punishable by penal servitude and imprisonment (24 and 25 Vict. c. 100). A curious example of conspiracy under the fourth head is the case in which several persons were convicted of conspiracy to procure another to rob one of them, so that by convicting the robber they might obtain the reward given in such cases. The combination to effect a lawful purpose with corrupt intent or by improper means is exemplified by agreements to procure seduction, &c.

The most important question in the law of conspiracy, apart from the statute law affecting labourers, is how far things which may be lawfully done by individuals can become criminal when done by individuals acting in concert, and some light may be thrown on it by a short statement of the history of the law. In the early period of the law down to the 17th century, conspiracy was defined by the Ordinance of Conspirators of the 33 Edward I.:—"Conspirators be they that do confedr or bind themselves by oath, covenant, or other alliance, that every of them shall aid the other falsely and maliciously to indite, or cause to indite, or falsely to move or maintain pleas, and also such as cause children within age to appeal men of felony, whereby they are imprisoned and sore grieved, and such as retain men in the country with liveries or fees to maintain their malicious enterprizes, and this extendeth as well to the takers as to the givers." The offence aimed at here is conspiracy to indict or to maintain suits falsely; and it was held that a conspiracy under the Act was not complete, unless some suit had been maintained or some person had been falsely indicted and acquitted. A doctrine, however, grew up that the agreement was in itself criminal, although the conspiracy was not actually completed (Poulterer's case, 1611). This developed into the rule that any agreement to commit a crime might be prosecuted as a conspiracy. A still further development of this doctrine is that a combination might be criminal, although the object apart from combination would not be criminal. The cases bearing on this question will be found arranged under the following heads, and in chronological order, in the *Law of Criminal Conspiracies and Agreements*, by R. S. Wright (London, 1873):—Combinations against Government; combinations to defeat or pervert justice; combinations against public morals or decency; combination to defraud; combination to injure otherwise than by fraud; trade combinations. "It is conceived," says the author, "that on a review of all the decisions, there is a great preponderance of authority in favour of the proposition that, *as a rule*, an agreement or combination is not criminal unless it be for acts or omissions (whether as ends or means) which would be criminal apart from agreement.' A dictum of Lord Denman's is often quoted as supplying a definition of conspiracy. It is, he says, either a combination to procure an unlawful object, or to procure a lawful object by unlawful means; but the exact meaning to be given to the word "lawful" in this antithesis has nowhere been precisely stated. A thing may be unlawful in the sense that the law will not aid it, although it may not expressly punish it. The extreme limit of the doctrine is reached in the suggestion that a combination to hiss an actor at a theatre is a punishable conspiracy.

The application of this wide conception of conspiracy to trade disputes caused great dissatisfaction among workmen. By the Master and Servant Act, 1867, breach of contract of service might be made the subject of complaint before a magistrate, who was empowered to impose a fine when he thought it necessary. Trades unions were relieved from the stigma of illegality—which had hitherto attached to them by reason of their being combinations "in restraint of trade"—by the Trades Unions Act, 1871. In the same year the Criminal Law Amendment Act (34 and 35 Vict. c. 32) specified certain acts which, if done with a view to coercing either master or workman, were to be punishable with imprisonment. But in the meantime, the mere combination of workmen not to work with a particular person was held by the judges to amount to a conspiracy at common law (so held by Mr Baron Pollock at Leeds assizes in 1874). And the case of the London gas stokers, who were in 1872 convicted of a conspiracy to break their contract of service, directed attention to the question of punishing breach of contract as a crime. The following extract from Mr Justice Brett's charge to the jury will show the view taken by the judge: "If you think there was an agreement between the defendants to interfere with the masters by molesting them so as to control their will, and if you think that molestation was such as would be likely in the minds of men of ordinary nerve to deter them from carrying on their business according to their own will, then that is an illegal conspiracy." Again "was there a combination to hinder the company from carrying on and exercising their business by means of the men simultaneously breaking their contracts of service? Breach of contract is an illegal, nay more, it is a criminal act, and if they combined to interfere with their employers by breaking their contracts this would be using unlawful means." So in 1867, in the case of Druett, it had been laid down that if any set of men agreed among themselves to coerce the liberty of mind and thought of another by compulsion and restraint, they would be guilty of a criminal offence. These judicial opinions led to much agitation, which ended in the legislation of 1875. In that year was passed the Act for amending the law relating to conspiracy and to the protection of property, and for other purposes, 38 and 39 Vict. c. 86. This Act was intended to regulate the criminal, as the Employers and Workmen Act of the same year (c. 90) was intended to regulate the civil questions arising out of the contract for service. The corresponding Acts of 1867 and 1871 are repealed. The 38 and 39 Vict. c. 86 enacts (§ 3) that "an agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy, if such act committed by one person would not be punishable as a crime. When a person is convicted of any such agreement or combination to do an act which is punishable only on summary conviction, and is sentenced to imprisonment, the imprisonment shall not exceed three months, or such longer period, if any, as may have been prescribed by the statute for the punishment of the said act when committed by one person." The effect of the two Acts of 1875 is that breach of contract between master and workmen is to be dealt with as a civil and not as a criminal case, with two exceptions. A person employed on the supply of gas and water, breaking his contract with his employer, and knowing, or having reasonable cause to believe, that the consequence of his doing so, either alone or in combination with others, will be to deprive the inhabitants of the place wholly or to a great extent of their supply of gas or water, shall be liable on conviction to a penalty not exceeding £20, or a term of imprisonment not exceeding three months. And generally any person wilfully and maliciously breaking a contract of service or hiring, knowing or having reasonable cause to believe that the probable consequences of his so doing either alone or in combination with others will be to endanger human life or cause serious bodily injury, or to expose valuable property whether real or personal to destruction or serious injury, shall be liable to the same penalty. By section 7 every person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority, (1) uses violence to or intimidates such other person, or his wife and children, or injures his property; or (2) persistently follows such other person about from place to place; or (3) hides any tools, clothes, or other property owned or used by such other person, or deprives him of or hinders him in the use thereof; or (4) watches or besets the house or other place where such other person resides, or works, or carries on business, or happens to be, or the approach to such house or place; or (5) follows such other person with two or more other persons, in a disorderly manner, in or through any street or road, shall be liable to the before-mentioned penalties. Of course a combination to do any of these acts would be punishable as a conspiracy, as mentioned in section 3 above.

Seamen are expressly exempted from the operation of this Act. The exceptions as to contracts of service for the supply of gas and water, &c., were supported by the circumstances of the London gas stokers' case above mentioned.

Conspiracy at common law is a misdemeanour, and the punishment is fine or imprisonment, or both, to which may be added hard labour in the case of any conspiracy to cheat and defraud, or to extort money or goods, or falsely to accuse of any crime, and to obstruct, pervert, prevent, or defeat the cause of justice. Conspiracy to murder, whether the victim be a subject of the Queen or resident in her dominions or not, is by 24 and 25 Vict. c. 100 punishable by penal servitude. (E. R.)

CONSTABLE, in England, an ancient officer of the peace. The name, as well as the office, are, according to Blackstone, borrowed from the French. In the Middle Ages there was a great officer of this name, whose duties related to matters of chivalry. "The office of Lord High Constable," says Blackstone, "hath been disused in England, except only upon great and solemn occasions—as the king's coronation and the like—ever since the attainder of Stafford, duke of Buckingham, under King Henry VIII as in France it was suppressed about a century after by an edict of Louis XIII., but from that office, says Lambard, this lower constableship was first drawn, and is, as it were, a very finger of that hand."

The Statute of Winchester (13 Edw. I. st. 2, c. 6), ordaining every citizen to have armour according to his condition to keep the peace, requires that in every hundred and franchise two constables be chosen to make the view of armour twice a year, and that the said constables "shall present before justices assigned such defaults as they do see in the county about armour, and of the suits, and of watches, and of highways; and also shall present all such as do lodge strangers in uplandish towns, for whom they will not answer." These are the officers known as *high* constables; who are especially charged with the peace of the hundred, just as the *petty* constables are charged with the peace of the parish or township. They were appointed at the court of the hundred, or in default thereof by justices at special sessions (7 and 8 Vict. c. 33, § 8). By a recent Act, 32 and 33 Vict. c. 47, they are practically abolished, as the justices of each county are required to consider and determine whether it is necessary that the office of high constable of each hundred, or other like district, should be continued.

The petty or parish constable unites two offices—the ancient one of head-borough or tithing man, and the modern one, instituted about the reign of Edward III., of assistant to the high constable. Considering what manner of men were for the most part appointed to these offices, Blackstone thought it was well that they should be kept in ignorance of the extent of their powers. Besides their general duties in the preservation of the peace they are charged with the execution of warrants and the service of summonses. No action can be brought against a constable for any act done in the execution of his office unless within six months from the time of its being committed. By 24 Geo. II. c. 44, the justice who signed the warrant must be made a co-defendant in any action against the constable, and on the production of such warrant at the trial the jury must find for the constable, notwithstanding any want of jurisdiction in the magistrate. Petty constables were formerly elected at the court leet or, in default thereof, by two justices. But by 5 and 6 Vict. c. 109, it is ordered that the justices shall annually issue their precept to the overseers of each parish in their county, requiring them to return a list of persons in such parish qualified and liable to serve as constables, and that the justices on special petty sessions shall revise the list, and select therefrom such number of constables as they may deem necessary. Every able-bodied man resident within the parish, between the ages of twenty-five and fifty-five, rated to the relief of the poor or to the county rate, on any tenements of the net yearly value of £4 and upwards, is qualified and liable to serve as constable for that parish. But large classes of persons are specially exempted from the liability to serve,—including peers and members of Parliament, judges, justices, clergymen and ministers, lawyers, physicans, officers of the army and navy, public servants, &c. Licensed victuallers and beer-sellers, game-keepers, and convicts are disqualified. Every person so chosen must serve; but those who have served already shall not be liable to serve again until every other person liable shall have served. Boroughs under the Municipal Corporation Act do not come within this statute. In consequence of the establishment of a county constabulary it is now enacted, by 35 and 36 Vict. c. 92, that no such constable shall be appointed unless for parishes in regard to which the magistrates for the county shall at their general or quarter sessions determine that it is necessary that such appointment shall be made.

Special Constables are appointed to act on occasional emergencies when the ordinary police force is thought to be deficient. In the absence of volunteers the office is compulsory, on the appointment of two justices. The lord-lieutenant may also appoint special constables, and the statutory exemptions may be disregarded.

The Acts establishing and regulating county constabulary are the 2 and 3 Vict. c. 93, 3 and 4 Vict. c. 88, 19 and 20 Vict. c. 69, 20 Vict. c. 2, and 22 and 23 Vict. c. 32. The police force of every county shall be under the superintendence of a chief-constable, who, with the approbation of justices in petty sessions, may appoint constables and provisional superintendents. The chief-constable has the general superintendence and direction of the force (including the petty constables where they still exist), and he may dismiss them at his pleasure, subject to the orders of Quarter Sessions, and the rules established for the government of the force. The salaries and other expenses under these Acts are to be paid by a police rate, to be made by the justices at Quarter Sessions. Counties and boroughs may consolidate their police force. The Crown appoints inspectors to report on the efficiency of the police, and whenever a certificate shall be granted by the Secretary of State that the police has been maintained during the preceding year in a state of efficiency as to discipline and numbers, the Treasury shall grant a sum in aid of the expenses not exceeding one-fourth of the charge for pay and clothing.

CONSTABLE, Archibald (1774–1827), the well-known Edinburgh publisher, was born in the parish of Carnbee, Fifeshire, on the 24th February 1774. Having been educated at the parish school, he was, at his own request, apprenticed to a bookseller in Edinburgh, named Peter Hill. From the first he took a great interest in books; and he obtained permission from his master to attend book sales, and purchase rare works, of which he drew up carefully executed catalogues. When not yet twenty-one years of age he had married and commenced business on his own account. He took special interest in Scottish literature; the rare works in that department which he offered for sale soon brought him into notice, and from this and from his genial disposition and his unprecedented liberality towards authors, his business grew rapidly. In 1801 he became proprietor of the *Farmers' Magazine* and the *Scots' Magazine*, and on the 10th October 1802 he published the first number of the *Edinburgh Review*. Constable was for many years on the most intimate and friendly relations with Sir Walter Scott. In January 1802 he had a share in the publication of the *Minstrelsy of the Scottish Border*, and afterwards published a large proportion of Scott's poems and novels. Besides these, he published the *Annual Register*, and the works of Dugald Stewart, Brown, Playfair, and Leslie. In 1812 he purchased the copyright of the *Encyclopædia Britannica*, to which he added the supplement to the 4th, 5th, and 6th editions (1815–1824), extending to six volumes, and containing the celebrated dissertations by Stewart, Playfair, and Braude. Not the least important of his undertakings was *Constable's Miscellany*, projected in 1825, consisting of a series of original works, and standard works republished in a cheap form, the earliest and one of the most famous of the attempts to popularize wholesome literature. In 1826 pecuniary difficulties in which the firm of Constable and Co. became involved (its liabilities exceeding £250,000) obliged it to stop payment. From this time Constable's health gave way, and he died on 21st July 1827, having, by his generous dealings with authors, his literary enthusiasm, and his efforts to promote the diffusion of standard literature, gained for himself one of the most distinguished names among British publishers.

See *Archibald Constable and His Literary Correspondents*, by his son, Thomas Constable (1873).

CONSTABLE, Henry, one of the most considerable of the Elizabethan sonneteers, was born about 1556, in Yorkshire, as it is supposed, and certainly of a Roman Catholic family. He was sent to St John's College, Cambridge, where in 1579 he took his degree of B.A In the same year there appeared a volume entitled *The Forest of Fancy by H. C.*, which has been attributed to Henry Chettle, but may with far more probability be assigued to Constable. This is a black-letter romance in prose and verse, of some slight literary value. Until 1592 we lose sight of the poet altogether, but in that year appeared his principal work, the book of sonnets called *Diana*. The only sonnets in the Italian form which had preceded them were those of Sidney, printed the year before, and as Constable had been writing those poems for many years he deserves credit as being one of the first to introduce this elegant form of verse among us. His sonnets are not merely quatorzains, like Shakespeare's; he preserves the exact arrangement of rhymes, except that he usually closes with a couplet. So popular was *Diana* that in 1594 a second enlarged edition appeared. But all this time a cloud was gathering round the poet. As a Catholic and a pronounced admirer of the queen of Scots, he came under suspicion of plotting treason against Elizabeth. Almost immediately after ushering Sir Philip Sidney's *Apology for Poetry* into the world with four magnificent sonnets, in 1595, he was obliged, in October of that year, to fly for his life to France. After a short stay in Paris, he wintered at Rouen, and then set off on a long pilgrimage to Rome, Poland, the Low Countries, and Scotland. In 1600 we find him still an exile, this time in Spain. About the year 1601 he could endure the growing home-sickness no longer, and returned to England in disguise. He was discovered at once and committed to the Tower, where he languished until 1604, when he was released. Of the date of his death we know no more than can be gathered from the fact that he is spoken of as alive in 1606, and as apparently not long dead in 1616. Besides the *Diana* he was the author of four important poems which were printed in the 1600 edition of *England's Helicon*. Two of these, the exquisite lyric of "Diaphenia like the Daffadowndilly," and the charming pastoral song of *Venus and Adonis*, hold a prominent place in our early literature,—the latter especially being believed to precede Shakespeare's epic in date of composition. Some very fine *Spiritual Sonnets* of Constable have been printed in our own day, and it is understood that certain compositions of this "ambrosiac muse," as Ben Jonson styled it, are still awaiting an editor. The style of Constable is fervid and full of colour. Mr Minto has well said that his words flow with happiest impulse "when his whole being is aglow with the rapture of beauty."

CONSTABLE, John (1776–1837), landscape painter, was born at East Bergholt, in the Stour valley, Suffolk, June 11, 1776. Under the guidance of a certain John Dunthune, a plumber, he acquired in early life some insight into the first principles of landscape art, together with a habit of studying in the open air that was afterwards of much service to him. His father, who was a yeoman farmer, did not care to encourage this tendency, and set him to work in one of his windmills. The incessant watchfulness of the weather which this occupation required laid the foundation of that wonderful knowledge of atmospheric changes and effects of which his works give evidence. From an introduction to Sir George Beaumont, an amiable man but a poor painter, he became acquainted with the works of Claude and Girtin. In 1795 he was sent to London with a letter to Farington, the landscape painter. Farington encouraged him with predictions of coming eminence; and for two years he plodded on, drawing cottages, studying anatomy, and copying and painting, sometimes in London and sometimes in Suffolk. His progress, however, was not encouraging; and in 1797 he returned home, and for some time worked in his father's counting-house. In 1799 he again went to London to perfect himself as a painter; and on the 4th of February he was admitted a student of the Royal Academy. The lights and shadows of his studies from the antique at this period are praised by Leslie, but they were sometimes defective in outline. He worked from dawn till dusk, and was an untiring copyist of such masters as he had sympathy with, as Wilson, Ruysdael, and Claude. Drawings from nature made during the next year or two, in Suffolk or in Derbyshire, were of no great promise. Being naturally slow, he was yet groping blindly for something not to be found for many years. In 1802 he attended Brookes's anatomical lectures, exhibited his first picture, and, refusing a drawing mastership offered him by Dr Fisher, gave himself wholly to his vocation. He exhibited a number of paintings during the next eight years, but it was not till 1811 that he gave to the world, in his Dedham Vale, the first work in which his distinctive manner and excellences are evident. In 1816, having inherited £4000 on his father's death, he emerged from a painful state of poverty with which he had been struggling, and married. In 1818 he exhibited four of his finest works; and next year he sent to Somerset House the largest picture he had yet painted, the landscape known as Constable's White Horse. In the November following he was made associate of the Academy. His power at this time, though unrecognized, was at its highest. In 1823, however, after the exhibition of such masterpieces as the Stratford Mill, the Hay Cart, and the Salisbury Cathedral, he did not disdain to copy two Claudes. In 1824 two of his larger pictures, which he sold, were taken to Paris, and created there a profound sensation. Allowing a great deal for the influence of Bonington, who died four years afterwards, much of the best in contemporary French landscape may be said to date from them. Constable received a gold medal from Charles X., and his pictures were honourably hung in the Louvre.

In 1825, he painted his Loch ("silvery, windy, delicious" is his own description of it), and sent his White Horse to Lille for exhibition. It made, like the others, a great impression, and procured the painter a second gold medal. Other great works followed; and in 1829 he was elected Academician, to the astonishment and ill-concealed displeasure of many, and began to devote himself, in conjunction with Lucas, to the preparation of his book of *English Landscape Scenery*. Hard work brought on ill-health and low spirits; rheumatism laid hold of him, and for some time he could neither write nor paint. In 1832, however, he exhibited his Waterloo Bridge (painted, said his enemies, with his palette-knife only), with three other pictures and four drawings. In 1834 he painted his Salisbury from the Meadows, more generally known as the Rainbow, a picture he valued greatly; and in 1836 he delivered a course of lectures on his art at the Royal Institution. He died suddenly on the 1st of April 1837, leaving his Arundel Castle and Mill wet on his easel.

The principles on which this great painter worked are not far to seek. He himself has said, "Ideal art in landscape is all nonsense;" and this sentence may be said to sum up the whole of his theory and practice of painting. Turner's pictures to him were merely "golden dreams;" Both and Berghem were only fit for burning; if he proclaimed the greatness of Claude and Titian, it was that he recognized their truth. Truth in its broadest and finest sense was his only aim. He studied the country untiringly and intently, sacrificing mere detail to the larger necessities of tone ("tone is the most seductive and inviting quality a picture can possess"), reproducing to an eminent degree the sentiment of what he saw, flooding his canvas with light and shadows as one finds them, and faithfully translating such glimpses as were revealed to him of the geniality of nature. His range was limited; he succeeded best with the county familiar to him from his boyhood; but his repetitions of manner and subject are in reality so many tentatives towards perfection. His merits were recognized in France; but his studio was full of unsold pictures at his death, and it is certain that he could not have earned a livelihood by his art without abandoning his theories. Since his death, however, his pictures have greatly increased in value; and his influence on contemporary French and English landscape is recognized as both great and good.

See Leslie, *Memoirs of the Life of John Constable, R.A.*, London, second edition, 1845; and *English Landscape Scenery, a Series of Forty Mezzotint Engravings on Steel, by David Lucas, from pictures painted by John Constable, R.A.*, London, folio, 1855.

CONSTANCE, or Costnitz, a city of the grand duchy of Baden, and the chief town of a circle of its own name, formerly called the *See Kreis*, or Lake Circle, is situated on the southern or Swiss side of the Rhine, at its exit from the Lake of Constance, 30 miles east of Schaffhausen by railway. It stands 1298 feet above the level of the sea. The older portion of the city is still surrounded by its ancient walls, but beyond their limits lie extensive suburbs, of which the most remarkable are Brühl, Kreuzlingen, Paradies, and Petershausen. The last of these, which has grown up round a free imperial abbey, is situated on the other side of the river, and communicates with the city by means of a long covered bridge raised on stone piers. A large number of the buildings of Constance are of mediæval origin, and several are of high interest both to the historian and antiquary. Most remarkable are the minster, originally founded in 1048, but dating in its present form mainly from the beginning of the 16th century; St Stephen's Church, belonging to the 14th; the old Dominican convent on the island of Genf (now a cotton-printing factory); the *Kaufhaus*, or public mart, in the hall of which sat the famous council of 1414–1418; and the old chancery or town-hall, erected in 1503. Besides the various administrative offices of the circle the town further possesses a gymnasium, a lyceum, various collections of antiquities, a public collection of books and pictures in the *Wessenberg Haus*, and a valuable series of archives. Since the introduction of steam-boat and railway communication the commercial prosperity of the city has greatly increased. It now contains cotton-factories, linen-factories, carpet-looms, and breweries, maintains a considerable activity in printing and publishing, and has a vigorous and varied local trade. Population in 1864, 8516; in 1872, 10,061.

Constance probably dates from the 3d or 4th century; but it first began to be of importance in the 6th, when it became the seat of the bishop who had previously been settled at Windisch or Vindonissa in Aargau. It afterwards obtained the rank of an imperial city, and rose to be one of the largest and most flourishing municipalities in Germany. From 1414 to 1418 it was the seat of the great ecclesiastical council which, under the presidency of the emperor Sigismund, and consisting of 26 princes, 140 counts, more than 20 cardinals, 20 archbishops, 91 bishops, 600 prelates and doctors, and about 4000 priests, constituted itself the highest authority in the church, condemned to death the reformers Huss and Jerome of Prague, expelled the three rival popes John XXIII., Gregory XII., and Benedict XIII., and elected Martin V. as the legitimate successor of St Peter. Constance joined the Smalkaldic League and refused to accept the "Interim." It was accordingly deprived of its imperial privileges, and in 1549 was presented by the emperor to his brother, the Archduke Ferdinand, in whose territory it remained till 1805, when it was acquired by Baden. The bishopric, which was secularized in the latter year, had become the largest in all Germany, stretching over a great part of Würtemberg, Baden, and Switzerland, and containing 350 conventual establishments and 1760 parsonages.

CONSTANCE, Lake of (German, Bodensee), a large sheet of water on the confines of Switzerland, surrounded on the S.W. by the cantons of Thurgau and St Gall, E. by Tyrol, N.E. and N.W. by Würtemberg and Baden respectively. It is of an oblong shape, the western extremity being considerably contracted. The length of the lake from Bregenz to Spittelberg is 42 miles, with an average width of 7½ miles. It forms the great reservoir of the Rhine, receiving the upper waters of that river near the village of Altenrhein and parting with them at Constance. The mean level of the surface is 1290 feet above the sea. The depth between Romanshorn and Langenargen is 152 fathoms, between Constance and Friedrichshafen 120 fathoms, and between Lindau and the mouth of the Rhine 45 fathoms.

CONSTANT DE REBECQUE, Henri Benjamin, an eminent French statesman and publicist, was born at Lausanne, 25th October 1757, and died at Paris 10th December 1830. His family was French, and had taken refuge in Switzerland during the religious persecutions. Till the age of thirteen he lived in his father's house at Lausanne; he afterwards studied at Oxford, Erlangen, and Edinburgh successively. It was in these foreign studies that he made a beginning in the cosmopolitan culture which afterwards characterized him; in England especially he learned to admire constitutional government, and made the acquaintance of such men as Erskine and Mackintosh. Shortly before the Revolution he went to Paris, and became acquainted with some of the leading liberal spirits of that city, where, after further travels, he finally settled in 1795. He attached himself to the moderate republican party, and supported it through many changes of fortune, both in the Assemblies and by writing, under the Directory and the Consulate, till 1802, when he was expelled from the Tribunate by Napoleon. The circle to which he belonged again provoked the anger of the First Consul by its private opposition to the Government, whereupon Constant, with his celebrated friend Madame de Staël, found it advisable to retire from France. Thus arrested in his political career he turned to literature, and proceeded to Weimar, where he enjoyed the acquaintance of Goethe and Schiller, translated *Wallenstein*, and wrote the romance of *Adolphe*. He did not return to France till the overthrow of Napoleon in 1814. Attracted by the prospect of the restoration of constitutional government he supported the Bourbons; and, apparently for a similar reason, he adhered to Napoleon during the Hundred Days. After the violence of the second Bourbon restoration had subsided Constant reappeared on the political scene to maintain the principles of constitutionalism. By all legal means, in the journals and in the Chambers, as well as by political tractates and pamphlets, under Louis XVIII. and Charles X. he combated, not without success, the reactionary measures of the government. Ill-health detained him in the country during the revolution of July (1830); but at the urgent request of Lafayette he returned to the capital, and concurred in the elevation to the vacant throne of Louis Philippe. Notwithstanding his feeble health Constant continued to support the new Government, but an unsuccessful candidature for a seat in the Academy so aggravated his previous complaint, that he died a few months after the triumph of the principles to which he had consecrated his life. Adverse circumstances had prevented the champion of representative government from playing a first part in the history of France, assuming that he had the faculty to do so. His voice was dry, his manner deficient in ease and grace, and he did not excel in improvising a reply; but his intellect was clear and powerful, his culture wide, and his industry remarkable.

The greater part of his political tractates have been collected by himself under the title of *Cours de Politique Constitutionelle*. J. P. Pagès collected the speeches delivered at the Chamber of Deputies, 3 vols. in 8vo. (1832–1833). His great philosophical work was *De la religion considérée dans sa source, ses formes, et ses développements*.

The most important of his purely literary productions are the novels, *Adolphe* and *Cécile*, and the translation of *Wallenstein*. His philosophical work on religion, which occupied him more or less almost all his life, is an attempt to trace the successive transformations of the religious sentiment, his conclusion being that, while the religious instinct is imperishable, the doctrinal and ceremonial forms by which it expresses itself are transitory. A quotation or two will suffice to indicate his attitude towards the liberalism of the 18th century. "Christianity has introduced moral and political liberty into the world." "If Christianity has been often despised, it is because men have not understood it. Lucian was incapable of understanding Homer; Voltaire has never understood the Bible."

CONSTANTINE, the capital of the French province of the same name in Algeria, situated in the richest and most populous part of the country, about 50 miles inland from the port of Philippeville, in 36° 22′ 21″ N. lat. and 6° 36′ 36″ E. long. It holds a highly romantic position on a rocky plateau, cut off on all sides but the west by a deep but beautiful ravine, through which the Rummel finds its way. A striking contrast exists between the older and Moorish portion of the city, with its tortuous lanes and Oriental architecture, and the modern and French portion, with its rectangular streets and wide open squares, frequently bordered with trees and adorned with fountains. Of the squares the Place Nemours is the most spacious, but the Place du Palais is of more importance in the commercial and social life of the city. The public buildings may be divided into those dating from before the French conquest and later erections. Among the former are the Kasba or citadel, the mosques, the palace of the bey, and the harem of Salah; among the latter the court-house or *palais de justice*, the theatre, the Protestant church, and several administrative buildings. The Kasba, which occupies the northern corner of the town, is partly of Roman construction, and preserves in its more modern portions numerous remains of other Roman edifices. It is now turned into barracks, and contains within its precincts a hospital capable of accommodating 1500 patients. The mosque of Sidi el Kattani, which ranks as the finest in the city, dates only from the 18th century; but that of Souk-er Rezel, now transformed into a Christian church, and bearing the name of *Notre Dame des Sept Douleurs*, was built as early as 1143. The Great Mosque, or Djama-Kebir, occupies the site of what was probably an ancient Pantheon. A religious seminary, or Medersa, is maintained in connection with the Sidi el Kattain; and the French support a college and various minor educational establishments for both Arabic and European culture. There is an archæological society, and a collection of local antiquities has been formed. The native industry of Constantine is chiefly confined to leather goods and woollen fabrics. A considerable trade is carried on with Tunis and other places on the Mediterranean, and caravans proceed regularly by Biscara and Tuggurt into the interior. The population of the city, composed of various elements, amounted in 1872 to 30,330.

Constantine, or as it was originally called, Cirta or Kirtha, from the Phœnician word for a city, was in ancient times one of the most important towns of Numidia, and the residence of the kings of the Massylii. Under Micipsa it reached the height of its prosperity, and was able to furnish an army of 10,000 cavalry and 20,000 infantry. Though it afterwards declined, it still continued to be considered an important military post, and consequently its name is frequently mentioned during successive wars. Cæsar having bestowed a part of its territory on his supporter Sittius, the latter introduced a Roman settlement, and the town for a time was known as Colonia Sittianorum. In the war of Maxentius against Alexander, the Numidian usurper, it was laid in ruins; and on its restoration in 313 by Constantine it received the name which it still retains. It was left uncaptured during the Vandal invasion of Africa, but on the conquest of the Arabians it shared the same fate as the surrounding country. During the 12th century it was still a place of considerable prosperity; and its commerce was extensive enough to attract the merchants of Pisa, Genoa, and Venice. Frequently taken and retaken by the Turks, it finally became under their dominion the seat of a bey subordinate to the dey of Algiers. In 1826 it asserted its independence of that potentate, and was governed by Hadj Ahmed, the choice of the Kabyles. In 1837 the French under Marshal Valée took possession of the place, and about ten years afterwards it was occupied as a regular colony.

CONSTANTINE. Of the thirteen emperors of this name, two are here noticed separately. For the others see ROMAN HISTORY and GREEK EMPIRE.

CONSTANTINE I. (274–337). Flavius Valerius Aurelius Constantinus, surnamed Magnus, or the Great, was born at Naissus (*Nissa*)[1], in upper Mœsia, in February 274. He was the son of Constantius Chlorus and Helena, the wife of obscure origin (a *stabularia*, or innkeeper, according to St Ambrose) whom her husband was compelled to repudiate on attaining the dignity of Cæsar in 292.[2] The part of the empire assigned to Constantius was the extreme West, including Spain, Gaul, and Britain; but Constantine was detained in the East at the court of Diocletian, doubtless as a pledge for his father's loyalty. He served with such distinction under Diocletian in the campaign in Egypt which closed in 296, and subsequently under Galerius in the war with Persia, that he was appointed a tribune of the first rank. His majestic presence, his personal courage, and his skill in military exercises made him a great favourite with the army, and excited in a corresponding degree the jealousy of the naturally suspicious Galerius, who did not scruple, it is said, to expose him repeatedly to unusual hazards in the hope of getting rid of him. The effect of this was to strengthen in Constantine a constitutional wariness and discretion which were often of advantage to him in after life. In 305 Diocletian and Maximian abdicated, and were succeeded in the supreme rank of Augustus by the two Cæsars, Constantius and Galerius. Constantine, who had naturally the strongest claim to a Cæsarship, was passed over by Galerius, and Constantius could not venture to bestow the office while his son remained at what was virtually a hostile court. It was only after repeated letters from his colleague that Galerius gave a reluctant consent that Constantine should join his father. There was ground for supposing even then that the permission was given only to be cancelled, and Constantine accordingly acted upon it with the utmost promptitude, making the journey across Europe from Nicomedia to Boulogne in an unusually short time. At Boulogne he found his father on the point of setting out for Britain, and accompanied him. The death of Constantius soon after at York (25th July 306) brought Constantine to the first great turning-point in his career. The circumstances were critical: it was necessary to avoid on the one hand losing the favour of the army by undue hesitation, and on the other incurring the active hostility of Galerius by undue self-assertion; and Constantine displayed just that union of determination and prudence that the occasion required. Accepting with well-feigned reluctance the enthusiastic nomination of the army to the vacant throne, he wrote at the same time a carefully worded letter to Galerius, expressing regret that circumstances had not permitted him to delay assuming the purple until the imperial approbation could be signified, and begging to be recognized as Augustus in succession to his father. On the reception of the news

[1] The legend that Constantine was a native of Britain has long been generally abandoned. The passage in the panegyrist that speaks of his having ennobled Britain "illic oriendo" refers probably to his accession, as Gibbon suggests.

[2] A later tradition, adopted with characteristic credulity by Geoffrey of Monmouth, that Helena was the daughter of a British king, is a pure invention.

Galerius was greatly incensed, and threatened to give both the letter and its bearer to the flames; but more prudent counsels prevailed, and he ventured to indulge his resentment only so far as to deny the title of Augustus, which was conferred upon Severus, Constantine being acknowledged as Cæsar. The latter acquiesced in this arrangement with apparent contentment, and at once set himself as the recognized inheritor of his father's power to carry out his father's wise and vigorous policy. The barbarians of the north sustained repeated defeats, and were permanently held in check by the building of a line of forts on the Rhine; and the internal prosperity of the country was promoted by a confirmation of the tolerant policy adopted by Constantius towards the Christians, the persecuting edict of Galerius being treated as a dead letter.

The events of the next few years showed clearly the essential instability of the arrangement devised by Diocletian for the partition of the imperial power among Augustuses and Cæsars. It was in the very nature of the plan that under it those who were nominally colleagues should be in reality rivals, constantly plotting and counter-plotting for the sole supremacy. Accordingly the history of the empire from the period of the division of the imperial power by Diocletian to that of its reconsolidation under Constantine is mainly a record of the struggle for that supremacy. The narrative is necessarily intricate, and can only be fully given in a general historical article. The state of matters was complicated by a rebellion at Rome against Galerius, which had for its final result the contemporaneous reign of no less than six emperors,—Galerius, Licinius, and Maximin in the East, and Maximian, Maxentius, and Constantine in the West (308). Maxentius was the son of Maximian, and Constantine was his son-in-law, having married his daughter Fausta at Arles in 307, on which occasion he received the title of Augustus; but this family relationship did not prevent a conflict of interests. Maxentius claimed to be the sole rightful sovereign of Italy, and being supported by the prætorian guards compelled his father to quit Rome. Maximian, after a brief residence in Illyricum, from which he was driven by Galerius, took refuge at the court of his son-in-law, Constantine, who received him with the respect due to his rank. For the second time he resigned the purple, and affected to have no longer any desire of power. Very soon after, however, he was tempted, during the absence of Constantine on the Rhine, to reassume the imperial dignity and to enter into a plot with Maxentius for the overthrow of his son-in-law. Constantine, on receiving the news, acted with the necessary promptitude. He appeared at once with his troops before Arles, and compelled Maximian to retreat to Marseilles, whither he followed him. The town might have stood a protracted siege, but it preferred to deliver up the usurper, who avoided the execution of the sentence of death pronounced upon him by committing suicide[1] (February 310).

The death of Maximian was the first of a series of events which ended in the establishment of Constantine as the sole emperor of the West. It was seized upon by Maxentius as a pretext for hostile measures, which Constantine, unwilling to engage in war, ignored as long as he safely could. When the time came for action, however, he acted, as was his wont, with decision. Maxentius was preparing to invade Gaul, when Constantine, encouraged by an embassy from Rome, anticipated him by entering Italy at the head of a large and well-disciplined army. He had crossed the Cottian Alps (Mont Cenis), and was in the plains of Piedmont before Maxentius knew that he had set out. A series of successes at Susa, Turin, and Verona culminated in the decisive victory of the Milvian Bridge, near Rome (28th October 312), which left the capital open to the invader. In the hurried retreat of the defeated army Maxentius was pressed by the throng over the bridge into the river, and was drowned. The conduct of the conqueror was marked on the whole by wisdom and moderation. The slaughter of the two sons and of the more intimate favourites of the fallen emperor was a measure deemed essential if the fruits of the victory were to be retained, and cannot be imputed to wanton cruelty, especially as Constantine seems to have abstained from the too common practice of an indiscriminate massacre. The final disbanding of the prætorian guards and the destruction of their camp, the imposition of a poll-tax on the senators, and the assumption of the title of Pontifex Maximus were the other chief events of Constantine's first residence in Rome, which lasted only a few weeks,—a fact in itself significant of the decaying importance of the capital, if not prophetic of the early rise of a Nova Roma.

It was in the course of the expedition that ended with the victory of the Milvian Bridge that the celebrated incident occurred, which is said to have caused Constantine's conversion,—the appearance of a flaming cross in the sky at noon-day with the motto Ἐν τούτῳ νίκα (By this conquer). The story is told by Eusebius, who professes to have had it from the lips of the emperor himself, and also with considerable variation in the details by Lactantius, Nazarius, and Philostorgius. In order to understand the true relation of Constantine to Christianity, however, it is necessary to consider all the incidents bearing upon that relation together, and this, therefore, along with the others. There is the less violence to chronological order in delaying the critical examination of the story, inasmuch as it was first communicated by Constantine to Eusebius several years later, and as the Labarum, or standard of the cross, made in obedience to the heavenly vision was not exhibited to the army, according to Gibbon, till 323. The conversion, whatever its nature and whatever its cause, was followed, indeed, by one more immediate result of a significant kind in the important Edict of Milan (March 313), issued by Constantine and Licinius conjointly, restoring all forfeited civil and religious rights to the Christians, and securing them full and equal toleration throughout the empire.

By the victory of the Milvian Bridge Constantine became the sole emperor of the West. Very soon after a like change took place in the East. Galerius had died in May 311, and a war ensued between the two surviving emperors in which Maximin was the aggressor and the loser, as Maxentius had been in the West. After a decisive defeat near Heraclea (April 313) he took to flight, and died at Tarsus, probably by his own hand, in August of the same year. Licinius thus attained the same place in the East as Constantine held in the West. The interests of the two who now divided between them the empire of the world had been apparently identified by the marriage of Licinius to Constantine's sister Constantia, which was celebrated with great pomp at Milan in March 313. But in little more than a year they were engaged in a war, the origin of which is somewhat obscure, though it probably arose from the treachery of Licinius. After two battles, in which the Eastern emperor suffered severely, he was fain to sue for peace, which Constantine granted only on condition that Illyricum, Pannonia, and Greece should be transferred to his territory.

The peace lasted for nine years, a period during which Constantine's position grew stronger while that of Licinius grew weaker, wise and humane legal reforms and vigorous

[1] According to Lactantius (*De Mort. Persec.*, c. 29, 30,) Maximian was pardoned for this attempt, and the clemency of Constantine was only exhausted by the discovery of a plot for his assassination in bed, which failed, owing to the conjugal fidelity of Fausta. Gibbon discredits this story.

measures against the barbarians of the north marking the policy of the one, and caprice, indolence, and cruelty being the most conspicuous features in the conduct of the other. When the inevitable struggle for the supremacy came, though the army of Licinius was the larger, the issue was scarcely doubtful. The origin of the war which broke out in 323 is, like that of the previous one in 314, not quite clear; but it is probable that Constantine, having determined to make himself the sole master of the world, did not think it necessary to wait for provocation. The campaign was short but decisive. Licinius was totally defeated in a battle fought at Adrianople on the 3d July 323. This was followed by the siege of Byzantium, in which Crispus, Constantine's eldest son, who was in command of the fleet, co-operated with his father by entering the Hellespont and defeating Amandus, the admiral of Licinius, after a two days' engagement. In a final battle fought at Chrysopolis (now Scutari) Licinius was totally routed, and he fled to Nicomedia. On the intercession of his wife Constantia, the sister of Constantine, the emperor promised to spare his life; but the promise was not kept. In 324 the defeated monarch was put to death by Constantine's orders at Thessalonica, which had been fixed as the place of his exile. A treasonable conspiracy was alleged against him, but there is no evidence in support of the charge; and possible danger in the future rather than any plot actually discovered seems to have prompted Constantine to a deed which cannot escape the censure of bad faith, if not of wanton cruelty.

With the war against Licinius the military career of Constantine may be said to have closed. He was now the sole emperor of both East and West. His enlightened policy had made his power throughout the empire so secure that any attempt to usurp it would have been utterly vain. Accordingly the remainder of his reign was passed in undisturbed tranquillity. The period of peace was not inglorious, including among lesser events the convocation of the Council of Nicæa (325) and the foundation of Constantinople (328). But unfortunately it was disgraced by a series of bloody deeds that have left an indelible stain on the emperor's memory. In 326 Constantine visited Rome to celebrate the twentieth anniversary (*vicennalia*) of his accession. During the festivities his eldest son Crispus was accused of treason by Fausta, and banished to Pola, in Istria, where he was put to death. Licinius, the emperor's nephew, being included in the same charge, likewise fell a victim, and a number of the courtiers also suffered. According to another version of the story Fausta accused her step-son of attempting incestuous intercourse, and Constantine, discovering when it was too late that the accusation was false, caused her to be suffocated in her bath. The whole circumstances of Fausta's death, however, are involved in uncertainty owing to the contradictions of the different narratives. The bloody tragedy struck horror into the minds of the citizens, and it was amid ominous indications of unpopularity that Constantine quitted Rome for the last time.

It had probably been for some time clear to his mind that the empire required in its new circumstances a new political centre. A Nova Roma would mark in a visible and concrete form the new departure in imperial policy which it had been the main object of the emperor's life to initiate. At least two other places—Sardica in Mœsia, and Troy—had been thought of ere his choice was fixed upon Byzantium. No happier selection has ever been made. The natural advantages of the site are probably unsurpassed by those of any capital either in the Old or in the New World, and its political importance is evidenced by the frequency with which it has been the key to the situation in European diplomacy. The new capital, the building of which had been commenced in 328, was solemnly inaugurated on the 11th May 330, being dedicated to the Virgin Mary. The fact that the ceremonial was performed exclusively by Christian ecclesiastics, and that no pagan temple was permitted to be erected in the new city, marks in an emphatic way the establishment of Christianity as the state religion.

The closing years of Constantine's life were uneventful. One of his last schemes was that for the partition of the empire after his death among his three sons by Fausta,—Constantine, Constantius, and Constans; but it proved even less stable than the analogous scheme of Diocletian. In 337 Sapor II. of Persia asserted by force his claim to the provinces that had been taken from him by Galerius. Constantine was preparing to meet him at the head of an army, when he was taken ill, and after a brief and vain trial of the baths of Helenopolis retired to Nicomedia. Here he died on the 22d May 337. The significance of his baptism on his deathbed by the Arian bishop, Eusebius of Nicomedia, will be indicated afterwards. His body was taken to Constantinople, and buried according to his own instructions in the Church of the Apostles with imposing ceremony.

The most interesting and the most disputed subject in connection with the life of Constantine is the nature of his relation to Christianity. The facts bearing upon it are clear enough, and the controversy must therefore be entirely attributed to the manipulation and distortion of partisans. A brief statement of these facts will suffice to show how far his acceptance of Christianity was a matter of personal conviction, and how far, on the other hand, it was a matter of statesmanship. The generous conduct of Constantius towards the Christians betokens a certain measure of sympathy, and the term Χριστιανοφρων (Christian-minded) applied to him by Theophanes gives some ground for supposing that the paternal influence may have acted as a sort of *præparatio evangelica* in the mind of Constantine. But whatever may have been due to this, it did not bring him over to the new faith. His own narrative to Eusebius attributed his conversion to the miraculous appearance of a flaming cross in the sky at noon-day under the circumstances already indicated. The story has met with nearly every degree of acceptance from the unquestioning faith of Eusebius himself to the incredulity of Gibbon, who treats it as a fable, while not denying the sincerity of the conversion. On the supposition that Constantine narrated the incident in good faith, the amount of objective reality that it possesses is a question of altogether secondary importance. There is nothing improbable in the theory that accounts for the appearance of the cross by the not infrequent natural phenomenon of a parhelion. It seems likelier, however, that Constantine gave external reality to what was nothing more than an optical delusion or a dream. Eusebius, it is true, narrates both the appearance at noon-day and a dream on the following night, in which the appearance was interpreted; but the very strength of the impression made on Constantine's mind may have led him to magnify the incident without conscious misrepresentation. Whatever the nature of the appearance may have been, its effect upon the emperor, to judge from his subsequent conduct, fell far short of a true or thorough conversion; it probably did not amount to more than the creation of a superstitious belief in the symbol of the cross. This is sufficient to account for the edict of toleration and for all his legislation that seems to be based upon sympathy with Christian ideas. On the other hand, the notion of conversion in the sense of a real acceptance of the new religion, and a thorough rejection of the old, is inconsistent with the hesitating attitude in which he stood towards both. Much of this may indeed be due to motives of political expediency, but there is a good deal that cannot be so explained. Paganism must still have been an operative belief with the man who, down almost to the close of his life, retained so many pagan superstitions. He was at best only half heathen, half Christian, who could seek to combine the worship of Christ with the worship of Apollo, having the name of the one and the figure of the other impressed upon his coins, and ordaining the observance of Sunday under the name *Dies Solis* in his celebrated decree of March 321, though such a combination was far from uncommon in the first Christian centuries. Perhaps the most significant illustration of the ambiguity of his religious position is furnished by the fact that in the same year in which he issued the Sunday decree he gave orders that, if lightning struck the imperial palace or any other public building, "the haruspices, according to ancient usage, should be consulted as to what it might signify, and a careful report of the answer should be drawn up for his use." From the time of the Council of Nicæa there are fewer signs of halting between two opinions, but the interest of the emperor in Christianity was still primarily political and official rather than personal. He summoned the council, presided over its first meeting, and took a prominent part in its proceedings both before and behind the scenes. The year before it met he had, in a noteworthy letter to the Alexandrian bishops, urged such a scheme of comprehension as might include Arians and orthodox in the one church; and on this ground he has been claimed as the earliest of broad churchmen. When the result of its deliberations was the adoption, for the first time in the history of the church, of a written creed, he cordially approved of the proposal, and was thus the earliest to enforce uniformity by means of subscription. The two plans were incompatible, but the conduct of Constantine in supporting first the one and then the other was perfectly consistent. Throughout he acted in the interest of the state. The splitting up of the church into a number of bitterly contending factions would be a constant source of danger to the unity of the empire, while on the other hand the empire might gain fresh strength from the growing power of Christianity if that power were embodied in a compact and united organization. It was by this consideration, probably, that Constantine was guided in dealing with the Arian controversy; there are no traces of any engrossing personal interest on his part in the cardinal question of the *homoousion*. There are not wanting, indeed, several facts that show a real concern in the truths of Christianity as distinct from its social and political influence. Eusebius has recorded one of his sermons, and he seems to have preached frequently in refutation of the errors of paganism and in illustration and defence of the doctrines of the new faith. The same historian speaks of his taking part in the ceremonies of worship, and of his long vigils at the season of Easter. His delaying to receive baptism until he was on his deathbed does not imply that he delayed till then the full acceptance of Christianity, though it has frequently been so interpreted by those who were unaware that the doctrine that all sin committed before baptism was washed away by the simple observance of the rite not unnaturally made such procrastination very common. There is no historical foundation for the assertion of Baronius and other Catholic writers that the emperor received baptism from Pope Sylvester at Rome in 326. Equally baseless is the story of the so-called donation of Constantine, according to which the emperor after his baptism endowed the Pope with temporal dominion. It is to this that Dante alludes in his *Inferno*:—

> Ah, Constantine! of how much ill was cause,
> Not thy conversion, but those rich domains
> That the first wealthy Pope received of thee.

It has been remarked by Stanley that Constantine was entitled to be called Great in virtue rather of what he did than of what he was. Tested by character, indeed, he stands among the lowest of all those to whom the epithet has in ancient or modern times been applied. Fearlessness, decision, political sagacity, and religious tolerance he possessed from first to last; but the generous clemency of which there are traces in his earlier years cannot have any longer worked effectually in him when he sanctioned the treacherous treatment of Licinius and the atrocities that connected themselves with the murder of Crispus. Tried by achievement, however, he stands among the very first of those who have ever won the title. In fact, there are two grounds at least on which as important a place may be claimed for him as for any sovereign who has reigned during the Christian era. What he did as the founder of the complex political system which exists among all civilized nations down to the present day, and what he did as the first Christian emperor, had results of the most enduring and far reaching kind. It belongs to the historian of the empire to give a detailed account of the elaborate scheme he devised by which the civil functions of the state were separated from the military, and both from the spiritual,—the very idea of such distinctions having been previously unknown. The empire he by such means revived, though in the East it lasted a thousand years, was never again so strong as it was in his own hands; but the importance of his scheme consisted in this that it gave to empire itself, regarded as a system of government, a new structure and a new power which still survive in the political constitutions of the various nations of Europe. As to Christianity the historically significant fact is not his personal acceptance of it. It is rather that by his policy as a statesman he endowed the new religion for the first time with that instrument of worldly power which has made it—whether for good or for evil or for both is a subject of much discussion—the strongest social and political agent that affects the destinies of the human race.

The chief early sources for the life of Constantine are Eusebius, *De Vita Constantini*, which is strongly partial from the Christian standpoint of its author, and Zosimus, *Historia*, lib. ii., which is tinged by Pagan prejudice. Of secondary importance are Eutropius, Aurelius Victor, Lactantius *De Mortibus Persecutorum*, and the *Panegyrici Veteres*, vi.–x. The most valuable modern sources are Manso's *Leben Constantins des Grossen* (1817), Burckhardt's *Die Zeit Constantins des Grossen* (1853), and Broglie's *L'Église et l'empire romain du IVe siècle.* (W. B. S.)

CONSTANTINE, a Roman soldier who, in the time of Honorius, in the 5th century A.D., rose to the dignity of emperor of Gaul, Spain, and Britain, but was finally conquered and put to death by Honorius. See ROMAN HISTORY.

CONSTANTINE VII., FLAVIUS PORPHYROGENITUS (905–959), emperor of the East, author, and patron of literature, born in 905 A.D., was the only son of Leo VI. The Eastern Church sanctioned no marriage beyond the second, and when Leo, being childless by three wives, had a son by his concubine Zoe, his attempt to legitimize his wife and his son was inflexibly resisted by the Patriarch Nicholas, and his will was only carried out at the expense of excommunication. These circumstances were probably the reason why the name *Porphyrogenitus*, "born in the purple," *i.e.*, in the purple chamber in which the empresses were confined, was, while applicable to all the emperors, emphatically applied to Constantine VII. When Constantine was only six years old Leo died, leaving him under the guardianship of his uncle Alexander; but Alexander also died in the next year; and Romanus Lecapenus, the chief admiral, supported by Zoe, was appointed colleague to Constantine, and held all real power till 944, when he was forced by his sons to enter a monastery.

Meanwhile Constantine, though powerless, had been well treated, and had married Helena, the daughter of Romanus. On the deposition of his colleague, the people gave willing aid to Constantine's cause; and having banished his brothers-in-law, he became emperor in reality. Though wanting in strength of will, Constantine had intelligence and many other good qualities, and his reign on the whole was not unsatisfactory. (See GREEK EMPIRE.) He was poisoned by his son Romanus in 959. Constantine was a painter and a patron of art, a literary man and a patron of literature; and herein consists his real importance. Unable as he was to sift out the really important from the unimportant, and the credible from the incredible, it is yet from his pages that we gain the only knowledge of any extent which we possess of his time. He is the author of several works of considerable size :—1. Περὶ τῶν θεμάτων, an account of the provinces (*themata*) of the empire; 2. *De Administrando Imperio*, an account of the condition of the empire, and an exposition of the author's view of government, written for the use of his son Romanus; it also contains most valuable information as to the condition and history of various foreign nations with which the Eastern empire had been brought into connection,—as the Arabs, Iberians, Armenians, and the tribes north of the Danube—the Russians, Bulgarians, Hungarians, Chazars, and Patzinacitæ; 3. Ἔκθεσις τῆς βασιλείου τάξεως, which describes the customs of the Eastern Church and court; 4. A life of Basilius I., his grandfather; 5. Two treatises on warfare, of which his father Leo was perhaps part or sole author. The Γεωπονικά, a treatise on agriculture with which his name is connected, is generally supposed to have been executed at his command by Bassus Cassianus; and under his patronage many other works—including collections of the ancient historians (of which fragments are extant), lives of saints, and treatises on medicine—were compiled. Several Latin translations of the works of Constantine have been made, and his complete works were published at Leyden, 1617, and Paris, 1711.

CONSTANTINE PAVLOVICH (1779-1831), second son of the Czar Paul I. of Russia, was born at St Petersburg on the 8th May 1779. His name was chosen by his grandmother, the Empress Catherine, on account, it was believed, of the tradition according to which an emperor Constantine was to reign at Constantinople. At the age of seventeen the prince was married to the Princess Juliana of Saxe-Coburg, but after four years a separation took place. In all affairs connected with the army Constantine took the intensest interest. In 1799 he served in Italy, and he gained distinction at the battle of Austerlitz (1805) by the admirable order in which he retreated. He also served throughout the rest of the war with France, but never held supreme command. In the end of 1815 he was appointed generalissimo of the army of Poland. His rule was marked by an unreasonable severity, which produced deep and general discontent; but he introduced the strictest discipline. Though not nominally head of the Government, Constantine's influence was very considerable; and it was all employed in support of arbitrary principles. He abolished the liberty of the press, and any literary man or student who expressed any opinion obnoxious to him was immediately thrown into prison. On the other hand he did much to carry out many material improvements. In 1820, having fallen in love with a Polish lady, he obtained through the influence of the emperor, his brother, a decree of the Holy Synod permitting him to marry the lady; and in return he signed a paper resigning all claim to the succession to the throne. On the death of the Czar Alexander in December 1825, Nicholas, Constantine's younger brother, and after him heir to the throne, refused to allow himself to be crowned; but Constantine remained true to his promise and, though a conspiracy of the officers of the army in favour of a constitution took place, and the conspirators proclaimed Constantine czar, he persisted in supporting his brother, at whose coronation he appeared to take the oath of homage. After this Constantine's power in Poland became greater than before; his system of espionage and arbitrary government was more harshly put in force, and arrests without any specified charge became more common. At length in 1830, that year of revolutions, the general hatred of Russia burst into a rebellion. Some of the conspirators entered the prince's palace at Warsaw; but, the Polish guard remaining faithful, he escaped. He was, however, forced to release all Polish political prisoners, and to declare his intention of not calling in the Russian army to attack Poland. His Polish guard now requested liberty to rejoin the rest of the army. After granting permission, he withdrew it, and the guard deserted him. He was, nevertheless, allowed to reach the frontier in safety. In the consequent war Constantine took no important part, and after a time even the inferior command which he held was taken from him. The czar refused to allow him to live near St Petersburg, and the place of his residence was fixed at the little town of Bialystok, on the border line of Poland and Lithuania. He died on the 27th June of the following year (1831).

CONSTANTINOPLE, the capital of Turkey and of the Ottoman empire, is situated at the junction of the Bosphorus and the Sea of Marmora, in 41° 0′ 16″ N. lat. and 28° 59′ 14″ E. long. It may be said to stand upon two promontories rather than upon two continents, since the quarter now called Galata was reckoned in the time of Arcadius the 13th Region, whereas Kadikeui (Chalcedon) and Iskudar or Scutari (Chrysopolis), situated on the opposite coast of Asia Minor, have been always distinct cities. The promontories on which the capital lies are divided the one from the other by the last and largest of those inlets which cut the western shore of the channel known as the Bosphorus. This inlet is a large and important harbour, running from east to north-west, capable of floating 1200 ships. It curls up in a course of little more than four miles to the foot of the hills which, joining the heights on either side, seem to form a vast amphitheatre, till it meets the united volume of two streams—the Cydaris and Barbysus of the ancients—the two whelps of the oracle,—

> "Bless'd they who make that sacred town their home,
> By Pontus' mouth upon the shore of Thrace,
> There where two whelps lap up the ocean foam,
> Where hind and fish find pasture at one place."

This peculiar harbour has always, by reason both of its form and its fulness, been called the Golden Horn. It is "like a stag's horn," Strabo says, "for it is broken into wavy creeks like so many branches, into which the fish pelamys (πηλαμύς) running is easily snared." In former times this fish was, and at the present day might be, a source of rich revenue—ever from time immemorial rushing down from the Sea of Azoff and the Black Sea, and when it approaches the white rock, on which stands the Maiden's (miscalled Leander's) Tower, glancing off it, and shooting straight into the Horn, but never enriching the rival city on the coast of Asia—Chalcedon, "the City of the Blind." If the figure of a stag's horn resembles the harbour, that of an ancient drinking-horn would represent the general form of Constantinople proper—the Seraglio point being turned inward like the sculptured mouth-piece. On this knot the Megarian city stood gathered about its Acropolis, and occupying the easternmost hill on the verge of Europe. Constantine aimed at building his new capital, after the old, on seven hills; his wish was fulfilled—not at first, however, but a century after its dedication,—and he wished it to be in name, as in foundation, a counterpart of the ancient city. But it is the founder, not the model, that is commemorated in the name *Constantinople*, while its designation as "New Rome" lingers nowhere but in the official language of the Orthodox Eastern Church. Its Turkish name of Istamboul, or Stamboul, is said to be a corruption of the Greek words εἰς τὴν πόλιν. About the end of the 18th century it was corrupted by a fanatical fancy into Islambol, or the city of Islam. Like the name, the emblem also of the city was adopted from the Greeks by the Ottomans. The crescent and star formed its device from the earliest times, and is found on Byzantine coins and on the statues of Hecate. So the body-guard of the Sultan retain *insignia* of the Varangian Guard of the Greek empire, of which traces seem to have been discovered in the Crimea. The sign manual of the sultans, rudely representing a left hand, originated with the action of a sultan who is said to have signed with a bloody hand a treaty with the republic of Ragusa.

Under Constantine, who founded it on the site of BYZANTIUM (*q.v.*), the city was more than doubled. His forum was fixed on the second hill; the walls were extended till a new inclosure was made, which spanned the peninsula from about the end of the old bridge to the mouth of the River Lycus in Vlanga Bostan; the line of his walls was not direct, but made a compass round the Polyandrion, or Heroon. It is said that 40,000 Goths were employed in first raising and afterwards manning these works; the seven gates separated the eight cohorts, each of 5000 men. Being Arians, the Goths were allowed no room within the city which they made safe for the Orthodox, but had assigned to them a quarter outside, which was called, either from several columns or from the one of Constantine that stood thereabout, *Exokionion* (the region without the columns), and the Gothic inhabitants of the quarter were styled *Exokionitæ*. So noble was this body or guild accounted among their countrymen, that many illustrious Goths were enrolled in it,—with others, the kings of Italy. In the course of time, after Anastasius had drawn a longer line of defences higher up, from the neighbourhood of Lake Dercon on the Euxine to Selymbria on the Propontis, and many of the Gothic cohorts were called away to defend these fortifications, the meaning of the name was by degrees forgotten, until it was changed into Hexe-Kionia, or Hexe-Marmora (six marble columns); and at last this corrupt form was rendered literally by the new occupants in their tongue *Alti-Mermer* (six columns), which name remains to the present day. As this is a landmark showing the limit of Constantine's walls on the south, another sign is extant bearing witness to their extent on the north. This is a mosque, once a church, which is visible from the Golden Horn. Its Turkish name, Kahireh, or Kahrieh, is thought to have been formed into a resemblance of that of the capital of Egypt from the Greek χώρα. The monastery to which this church of the Saviour belonged was Μονὴ τῆς χώρας, or, as we say, "in the fields." This was an ancient establishment, and its church, the oldest church in the city, dates from the 3d century. Hither were brought, and entombed in sarcophagi, the remains of St Babylas and two other martyrs who suffered under Decius in the persecution of 250 A.D. At the beginning of the 5th century the Goths, being pressed by Attila and his Huns out of their settlements below the Balkan, flocked towards Constantinople to join their countrymen there and find refuge in its suburbs. It then became necessary to entrench this extra-mural camp. Accordingly in 412, under Theodosius II., the first Theodosian wall was raised by the prefect Anthemius; and in 447 a second was added by the prefect Cyrus Constantinus, who advanced the fosse, and of the earth dug out of it formed an artificial terrace between two lines of defence. The Goths were long subjected to exclusion from the city; Justinian exempted the Exocionites, indeed, from the penalties which he exacted from all other Arians in the empire, but required them still to meet for public worship outside the walls. Some monuments to members of the body of *Fœderati*, found outside the fifth gate, and perhaps the name Cerco-porta, a memento of their round church, or one of their circular forts, may mark the residence, as they intimate the heresy, of the noble guards of the Greek emperor. Arianism had died out when this body was reinforced by the Varangians—Anglo-Danes—in the 11th century; accordingly, it is not surprising to recognize in a Byzantine church in a quarter called Bogdan-Serai, within the walls on the fifth hill, the church of St Nicholas and Augustine, founded by an Anglo-Saxon who fled from the Normans to take service under the Greek emperor. It is maintained that most of the numbers distinguishing the cohorts attached to the several regions and walls remain to this day, as Deuteron, Triton, Pempton, and Hebdomon. Upon the completion of these Theodosian walls there ensued a double arrangement of gates; town-gates, communicating with the public roads, alternated with military gates which opened upon the terraces only. These town-gates, to the number of seven, communicated with the seven gates of Constantine's wall each by a broad street, which separated the cohorts and their quarters. These gates were opened in peace but shut in time of war, and then the bridges connecting them with the country roads and crossing the fosse in front were taken down at the approach of the enemy. The military gates had no such bridges leading from them; they served only to give egress to that part of the garrison which was required to work the engines of war planted upon the terraces outside and below. The city gates in the Theodosian walls had for the most part the same names as the gates in the wall of Constantine which corresponded to them—with this difference, that they were styled "New." Thus the gate "Roussion," so named from the "demus" of the "Reds," in the latter, answered to the "New" Roussion in the former. It is on this account that the existing gate is to this day called *Yeni* Kapu (*New* gate) as well as *Mevlaneh* Kapusi (gate of the Dervishes). The gate of Adrianople (Edreneh Kapusi) was formerly that of Polyandrion, and took its title from the corresponding gate in the wall of Constantine, called so because it stood near the Polyandrion or Heroon adjoining it, which was attached to the church of the Holy Apostles; the site is now occupied by the mosque of Mahomet the Conqueror (Mehmedieh).

The landward walls of Constantinople bear marks of the labour of many hands, and represent different and distant epochs.[1] Their construction is unique. If the

[1] At several points these walls have been repaired and restored, and display the names of "rois constructeurs" from Theodosius to John Palæologus. They may be described roughly as four lines drawn across the promontory which they inclose for the distance of about four English miles, and knotted at each end into a citadel. The work at each extremity is more recent than what intervenes—that near the Sea of Marmora is to this day almost perfect; and the Golden Gate remains with its flanking towers of marble, much as it appeared in the 5th century, and fronted by the smaller arch which has generally appropriated the name. Of the five towers at the other end near the Golden Horn some remains exist, viz., the tower of Anema and that of Isaac Angelus. On the north side the wall of Theodosius breaks off at the palace of the Hebdomon, and the continuous fosse ceases where a later line has been thrown out with massive towers—this is the wall of Heraclius, supposed to have been raised to protect the imperial quarter of Blachernæ, containing the palace of that name and the church of St Mary. Similarly a second wall was constructed to cover the church of St Nicolas, in the time of Leo the Armenian, whence it is called the Leontine wall. This line of defence, long impregnable, withstood siege after siege till the new artillery made

outer defence of the fosse is reckoned they are quadruple; the two inner lines are furnished with a series of towers, the smaller below, the larger above—round, octagonal, or square—at about 50 feet apart. As the gaunt array of castles droops into the valley, or seems to climb the hill beyond, one may decipher some of its now obscure inscriptions on marble or in tile work (one seems to be a prayer to Christ), and wonder at the contrivance which appears to defy a natural law. The great ditch, now a productive vegetable garden, is divided into a number of compartments or open cisterns, which used to be filled with water brought by pipes, carried along each partition-wall, and furnishing the supply from cisterns from within and without the city.

Equally remarkable with these fortifications is the system of large cisterns, which are said to have furnished water to 1,000,000 men during four months; they were a necessity to a city subject to perpetual assault. One seems to have been annexed to every considerable monastery and palace—imperial and patrician. They may be reckoned the more ancient portion of the city, which is thus subterraneous;—for while the buildings above ground are scarcely any of them, in the condition now visible, older than the time of Justinian, the cisterns that can be distinguished date from the times of Arcadius, Theodosius, and Constantine.

Imperial palaces. The position assigned to the old imperial palace is, generally speaking, that of the mosque of Ahmed, which adjoins the Hippodrome. It was not one large edifice, but a scattered group of buildings within gardens, spreading to the Hippodrome on the one side, and on the other to the sea-shore; the northernmost point of its inclosure reached the site occupied now by the fountain of Ahmed III., then by the Geranion.. This palace was gradually abandoned after the 12th century for that of Blachernæ within the Horn. It was separated from the church of St Sophia by the Augusteum—the square in which stood the statue of Justinian looking towards Persia, the Milliarium, and among other monuments the column that bore the silver statue of the Empress Eudoxia, which occasioned the remonstrances of St Chrysostom. Mahomet II., built his new palace (the seraglio) on the site of the Acropolis, about which ancient Byzantium had clustered, a situation specially favourable to his purpose, as it afforded the combined advantages of a lovely prospect, a perfect retreat from the noise of the city, and a facility for observing all the movements in the harbour. In erecting it he followed the three divisions of the palace of the Byzantine emperors—(1) the *Chalce*, the defensive part held by the guards; (2) the *Daphne*, which touched the Hippodrome and was used for receptions; and (3) the private chambers occupied by the imperial household. The three corresponding portions of the Ottoman palace are distinguished by their several gates:—(1) *Babi Houmaïoum*, the Imperial Gate, opening into the court of the Janissaries; (2) *Orta-Kapusi*, Middle Gate, in which the sultan receives on high festivals; and (3) *Babi Saadet*, Gate of Felicity, where he formerly received ambassadors. Of late years the sovereign has resided in winter at Dolma-bakcheh or Tcheragan; in summer at Begler-beg on the Asiatic shore, or at some inland kiosk.

Outline modern city. The main streets of the Stamboul of the present day follow the lines of the city of Constantine; thus the tramway, which turns from the New Bridge towards Serai Bournou, upon reaching the platform of St Sophia, enters upon the direction of the Μέση (Mése, middle street), now called Divan Yoli. The Mése parted into two branches, of which the one went to the gate Roussion, or new gate, the other to the Polyandrion. On the north of the middle street one branch passed along the shore of the Golden Horn from the place where the railway station is, and issued at the gate Xylocircus near Balata. On the south, another street passed through the two Golden Gates. These three main lines were distinguished from the smaller tortuous streets by their adornment as well as by their breadth. They were bordered by rows or covered ways and arcades called ἔμβολοι, some of them double, with pavements above, decorated with statues, &c. A few traces of the *emboli* still remain *in situ*, just as there are fragments of the ancient bazaars, khans, and baths. Imperial gates closed the lines of these principal thoroughfares.

The following is an outline of the modern city, divided according to the seven hills and the intervening valleys. On the 1st hill, the most easterly, are situated the remains of the Seraglio, former palace of the Ottoman sultans; the great church-mosque St Sophia; St Irene; the imperial mint; the Atmeidan (Hippodrome), with three of its numerous monuments remaining; the mosque of Ahmed, &c. Along the 1st valley are traced the walls of the Seraglio on the west, made up of ancient materials, and the Babi Ali or Sublime Porte. The tramway runs along this valley. On the 2d hill stands the Burnt Column, that of Constantine the Great (which stood in the centre of his forum, and under which are said to be the instruments of the Crucifixion and a Palladium of Troy), and the Mosque of Osman. The 2d valley is occupied by the bazaars, several khans, and the mosque of Valideh Sultan, or Yeni Jami, overlooking the bridge and the head of the tramway. On the 3d hill are the Seraskierat (War Office) on the site of the cemetery of the Byzantines and the forum of Theodosius; the fire-tower, and the mosque of Suliman. Along the 3d valley is carried the Aqueduct of Valens, built out of the walls of Chalcedon destroyed for the citizens' rebellion; near it is At-Bazar (horse-market). On the 4th hill rises the mosque of Mahomet II., where stood the church of the Holy Apostles and the church of the Pantocrator. South of this mosque, in a garden, is seen Kiz-tash, the Maiden's Column, or column of Marcian, once that of Venus. On the 5th hill follows the mosque of Selim, on the edge of a large open cistern, south of which is the covered cistern of Arcadius. Below

three great breaches—the first between Tekfur-Serai and Edreneh Kapusi; the second near the fifth military gate—that of Charisius, in the valley of the Lycus; and the third between Selymbria gate and Mevlaneh gate.

The walls on the western or land side of the city are connected with the continuous line which defended it on the two sides that face the water, and which, with a few breaks, is still standing. That part which runs parallel with the Golden Horn is varied in Balata by the insertion of an arch, still preserving a Victory, and by a pier now lying far back on the strand; built first by Zeno, it displays on its successive towers the names of Michael and Theophilus. The other part which turns the point shows the same names, but differs widely here and there in construction from the portions across the land and by the Horn, being formed so as to receive the beating of the waves indirectly, and strengthened with shafts of marble so as to resist most effectually the corrosive action of sea-water. This contrivance is especially to be noticed between Vlanga and Ahor-Kapusi, and shows the foresight of the builders; the great tower which locks the sea-wall with the land-walls is one mass of marble,—on the other hand the land-walls are constructed for the most part of marble or stone and brick alternately, to resist more easily, as it has been supposed, shocks of earthquake. In tracing the course of the sea-wall from the Acropolis to the Seven Towers, the sites of all and the ruins of some of the following places have been noted in order:—the Orphanotrophæum; the churches of St Demetrius, St Barbara, and the Hodegetria; the Porta Carea (corrupted into Karacapu) beyond the palace and harbour of Boucoleon; the imperial palace; the Porphyry Chamber (the origin of the epithet "born in the purple"); the palace of Hormisdas; the churches of Sts Sergius and Bacchus; the Portus Julianus and Sophianus, now Caterga Liman, with the Sophiana Palace; the Contoscalium, Koum-Capu; the harbour of Theodosius—outer and inner—now a garden called Vlanga Bostan,—its mouth flanked by two noble towers joined by a wall before the last siege; the harbour of Æmilianus; St John of the Studium; and at last the citadel called Heptapyrgion, the Seven Towers.

The entire circuit of the walls is about 13 miles.

on the north lies the Phanar (so named from a lighthouse), the Greek quarter which reaches to the Golden Horn. This division includes the church of the Patriarchate, the great school of the Greek nation, the church-mosque Fetiyeh Jamisi (Pammacaristou), and the church of the Mongols (Mougloutissa). The 6th hill is distinguished by the palace of the Hebdomon, with its coronation hall, built, it is said, by Constantine I., and known vulgarly as Tekfur-Serai—palace of the lord (τοῦ κυρίου). At its foot appears the church-mosque Kahrieh, or Kahireh, formerly Mone tes Choras (Μονὴ τῆς χώρας). Below this hill, the quarter called Balata, from Palatium, now occupied by Jews, follows the Phanar, then the ancient suburb of Blachernæ. Here are seen some remains of the Pentapyrgion, —five towers used by the Greeks of the Lower Empire as a political prison. This quarter is succeeded by Eyoub, celebrated for its mosque—which no Christian may enter—and for its cemetery. In this quarter, after Greek precedent, the sovereign is invested. On the hill near, in the Cosmidion, the first crusaders pitched their tents. The

7th hill is to be looked for in the most southern corner of the city. It is occupied by the fortress of the Seven Towers, the political prison of the sultans. It is isolated by the River Lycus.

Of the ecclesiastical buildings of Constantinople by far the most important is the Mosque of St Sophia, or *Aya Sofia Jamisi*, which ranks as perhaps the finest example of the Byzantine style. In striking contrast with the nobler specimens of Gothic architecture, it presents from the outside an uncouth and disproportionate appearance, even the effect of its unusual dimensions being destroyed by its lack of symmetry. But within the visitor cannot fail to be impressed by the bold span of the arches and the still bolder sweep of the dome, while his eye is at once bewildered and charmed by the rich, if not altogether harmonious variety of decoration, from the many-coloured pillars down to the mosaics and inscriptions on the walls. The dome is raised at the centre 180 feet above the ground, and has a diameter of 107 feet; its curve is so slight that the depth is only 46 feet, and round the rim it is relieved by a row of forty windows. The arrangement of the building may be understood from the plan on next page; and the magnificent volumes of Fossati and Salzenburg furnish all that can be desired in the way of views of the different parts of the interior. The first stone of St Sophia, or the Church of the Divine Wisdom, was laid in 532 on the site of several successive churches of the same name, the first of which had been erected by Constantine the Great. Anthemius of Tralles and Isidorus of Miletus were the architects employed by the emperor Justinian, at whose command the enterprize was commenced. No fewer than 10,000 workmen are said to have been engaged under the direction of 100 master builders; and when the work

was completed it had cost the imperial treasury about £1,000,000. The principal material of the walls was brick, but the whole interior was lined with costly marbles; and to add to its splendours the temples of the ancient gods at Heliopolis and Ephesus, at Delos and Baalbec, at Athens and Cyzicus, were plundered of their columns. To render the dome as light as possible it was constructed of pumice-stone and Rhodian bricks, and to secure the building from the ravages of fire no wood was employed except for the doors. Not long after its completion the dome was shaken by an earthquake, but it was repaired by Isidore, the grandson of the original architect. In 1453 Mahomet converted the church into a mosque, and since that date numerous minor alterations have been made in the less essential parts of the building. A pretty complete restoration was effected in 1847–49 by Fossati, who found that the weight of the dome was too great for the supporting walls, threatening the whole with destruction.[1]

The most remarkable of the church-mosques, besides St Sophia, are the following:—(1) *Kutchuk Aya Sophia*, the original model of the great church. It was built for Justinian before his accession, and dedicated to martyrs of his own Illyrian race—SS. Sergius and Bacchus. The lower stage is the original fabric. Here, according to Mahometan tradition, Messiah appeared among the worshippers. (2) *Pantocrator* (the Almighty), now Zeirek Jamisi, a triple church of the Comneni. Its monastery became the headquarters of the Latins in the 13th century. (3) *St John of the Studium*—Emer-ahor—a basilica. Here was the famous monastery of Accœmeti (watchers) and a school of church poets. (4) The *Church of the Saviour*, with the monastery of the Chora, as being not only ἐν τῇ χώρᾳ (" in the fields,") but ἡ χώρα των ζώντων the (land of the living), a gem of beauty still, even in its decay, rich with mosaic of the 14th century of a style purer and more refined than that which is more often seen and admired at Ravenna and Palermo. In this church, alternately with the Hodegetria, was kept the Holy Robe of the Virgin, which was wont to be carried in procession when the walls were threatened, and with which the patriarch Photius is said to have scared away the first Russian fleet which came against the city down the Bosphorus in the 9th century. (5) *Pammacaristou*—Fetiyeh Jamisi. The Greek patriarch moved hither from the Church of the Holy Apostles which had been assigned him. One dome of this church is still full of mosaic work.

The mosques of Constantinople are reckoned variously from 350 to 500, mesjids (chapels) included. Many of them retain the materials as well as occupy the sites of ancient churches. The great mosque of Suliman was chiefly built of the remains of the church of St Euphemia at Chalcedon, where the fourth Œcumenical Council was h 451. This church stood above the valley of Haidar-Pasha, near Kadikeui; an ayasma belonging to it stands near the railway terminus at a little distance from the shore. The imperial mosques, that of Eyoub included, are nine in number. Most of them stand on high ground; and, with the harmonious contrast of dome and minaret, they offer to the eye a more pleasing view than the Christian churches of the past. The hills may be counted as these lordly structures follow in stately order, and the monuments of Osman, Suliman, Mahomet, and Selim seem to repeat the form fixed on the first hill by the architects of Justinian; and on high festivals their soaring minarets, more airy than the campaniles of the West, and beaming with festoons of light, shine out like beacons over the neighbouring waters.

Galata and Pera.—Along the north shore of the Golden Horn spreads the quarter known as Galata, rising up to the crest of the hill and including the massive tower which crowns it. Beyond and above Galata, Pera stretches forward along the ridge that runs parallel with the shore. Both these quarters are chiefly inhabited by Christians, native and foreign. Galata is the seat of commercial establishments, Pera that of the diplomatic bodies. At the foot of the great tower of Galata is gathered a cluster of English institutions,—the consulate, consular court, consular prison, seamen's hospital, post-office, and sailors' home. Several institutions, native and foreign, have been established of late years in Pera. The main street which connects these two quarters winds up from the outer bridge. A little beyond the Municipality House, it is crossed by another near the point where it separates the Russian Embassy from the Hotel d'Angleterre; hence the Greek name of Pera Σταυροδρόμιον (the cross roads). This street, rising tortuously from above Tophaneh, is said to have been formed by the track of Mahomet's fleet of boats, which were rolled up to the crest of the hill and then down on the other side to the inlet below Kassim-Pasha, on the edge of which the Divan-Haneh (Admiralty) now stands. Before reaching the point of intersection this street,

[1] The churches of Constantinople in 1202 were, according to Alberich, 500. Of more than 50 the remains or the sites have been identified. Six of these are in the possession of Christians,—five being held by the Greeks and one by the Armenians. The five churches are (1) Mougloutissa (Mongolian); (2) St George of the Cypress in Psamathia; (3) the Ayasma (holy well) of St Mary in Blachernæ; (4) the Ayasma of the Sleep of St Mary, between the mosques Zeirek and Vefa; (5) the Ayasma of St Therapos (a Cyprian martyr) in the Seraglio wall near Pasha Kapusi. The church indicated as given to the Armenians is Perioleptou (Soulou Monastir). Possibly another church similarly transferred might be named, in Balata, to which a monastery was annexed. Three other churches, though not turned into mosques, have passed out of the hands of the Christians—St Irene, Sts Nicolas and Augustine, and St Juliana. In the sea-wall of the Seraglio gardens is the eastern entrance of another church—perhaps St George of the Mangana; to the north, is the Ayasma of the Saviour.

called Koumbaraji Sokak (street of bombardiers), passes beside the elegant English church (Crimean memorial church) which was consecrated under the name of Christ Church in 1868. The great tower of Galata, like that of the Seraskierat (War Office) on the opposite height in Stamboul, is used as a fire-tower. In the times of Genoese occupation it was the main castle or keep of the town; it was heightened, not founded, by those settlers from Italy. The original tower was built about the end of the 5th century by the emperor Anastasius Dicorus. Since that time it communicated with another huge tower (long ago destroyed), which stood near the site of the present terminus of the Adrianople Railway in Stamboul,—the tower of Eugenius. It was joined to this tower in time of war by an iron chain laid across the Golden Horn to keep out enemies' ships, while a similar chain, fastening the tower of Eugenius to a fort replaced now by the Maiden's tower (miscalled Leander's), barred the passage of the Bosphorus. From the tower of Galata there spread out, as spokes from an axle, some three or four lines of wall, which ran downward till they met on the right the line which guarded the quays, on the left a sweeping line which embraced that extension of the town which had crept along the shore as far as the modern Tophaneh. The inner line, which unequally divided the quarter that lies between the bridges, was double. Some portions of this and of the others still exist, with towers and gateways; but of the numerous tablets visible upon them when they were standing, two only remain in their original place. Below the double wall, which gave passage to troops from the great tower to the seaward wall, stands the remarkable mosque called Arab-jamisi (Saracens' mosque). Its form and contents serve as a record of the history of Galata. Its minaret, unlike the minarets of Turkish mosques, is square, recalling the Moorish towers of Spain. Remains of Genoese monuments on its floor and in the outer court testify to its Christian use. Originally a Mahometan place of worship, it is not orientated, nor has it an apsidal termination. It is said to have been first built for the Arab colony that lingered here since the invasions of Constantinople by the Arabs. When Galata, already occupied by the Genoese at the commencement of the 13th century, was, from motives of gratitude or of policy, given up entirely to that colony of daring merchants by Michael Palæologus on his recovery of the city from the Latins, this mosque became their chief church; but when, nearly two centuries afterwards, the Ottoman Turks became masters of Constantinople, it reverted to its first purpose, and Christian worship gave way to Mahometan. Besides the great tower and some ruins of walls and towers, the massive blocks of building that are now banks and merchants' offices, the palace of the podestà, the Lombard church known as St Benedict's, which is at this day a centre of French philanthropic and religious works, are existing memorials of the settlements of those Genoese merchants, the active and successful rivals of the Pisans and Venetians,—whose proper quarters lay at the foot of the tower of Eugenius, now within the Seraglio wall—and the ancestors of the enterprizing merchants of later times who are known and respected as the Greeks of the island of Scio. The names Pera and Galata have not always been restricted to their present limits. *Pera*, like *Peræa*, is Greek, designating the region over the water, and was naturally employed as from Constantinople to mark that quarter of the city which lay on the other side of the Golden Horn. The name was accordingly first given to the lower portion of the town, now called Galata and formerly Sycæ (the fig-trees). This quarter of the city was enlarged and adorned by Justinian, but before his time, under Arcadius, it was reckoned one of the regions of Constantinople. The ground which it covered seems to have been used still earlier as a cemetery of the Christian citizens, and corresponded thus with the site of the Seraskierat in Stamboul, on the third hill, which heathen monuments—discovered on the spot—show to have been the burial-place of the citizens of Byzantium. As all Galata was in former times called Pera, so Pera seems to have been sometimes included in Galata. Galata-Serai, the palace of the Turkish governor of Galata (now a Franco-Turkish lyceum), is situated in the centre of Pera. The name Galata, which has been the subject of much discussion, appears to be the corruption of the Italian *Calatæ* (descent), the name whereby that quarter of an Italian seaport town is known which spreads over the sloping shore. Until a few years ago Galata and Pera were separated by a dry moat. This has lately been filled up with streets.

Two bridges of boats span the Golden Horn and unite Galata to Stamboul. The inner one, constructed of iron, though new, has, in taking the place, adopted the name of a former bridge constructed in the reign of the Sultan Mahmoud, and is still called the Old Bridge. It stretches from the western end of Galata to the quarter on the Stamboul side which is called Oun-Capou. The outer bridge is known as that of Karakeui, as it extends from a part of Galata so named, and also as the bridge of the Valideh Sultan, because the opposite end of it rests on the shore below the mosque of the Valideh-Sultan, otherwise Yeni Jami, or the new mosque. A third bridge, constructed during the Crimean war between Hasskeui and Aivan Serai, has disappeared. There is said to have existed in ancient times one bridge—that of Justinian. The bridge built by Philip of Macedon seems to have crossed the river at the head of the Horn.

Climate.

The climate of Constantinople is generally healthy, owing to the position of the city, its natural drainage, and the currents of the Bosphorus, but the temperature is subject to great and sudden changes.

Population.

It is true of the capital, as of the country at large, that no point is so hard to ascertain as the sum total of the inhabitants and the relative proportions of its parts. Byzantius in 1851 reckoned the population of the city and its suburbs at about one million, viz.,—500,000 Turks, 220,000 or 300,000 Greeks, 50,000 or 120,000 Armenians, 70,000 Jews, 10,000 Franks, and 70,000 miscellaneous. Official statistics return the population of the city and suburbs as not exceeding 700,000 in 1877.

Education.

The Mahometan public schools are of three classes:—(1) The primary district schools—*Mahaleh*—for boys and girls mixed; (2) for boys, the provincial schools—*Rushdiyeh*—of a higher order; (3) for young men, the mosque schools—*Medresseh*,—a sort of theological seminaries. There are said to be 500 medressehs in Stamboul alone. In the first class of schools are taught the Turkish alphabet and the reading of the Koran in Arabic; in the second, reading, elements of writing, principles of arithmetic, and Turkish geography and history; in the third, besides theology, Turkish, Arabic, and sometimes the Persian language. The age of entrance into the first is about five years; into the second, ten. Most lads, on leaving these secondary schools, at about sixteen years of age, proceed no higher. Besides the public schools, which are open to all Mahometan youth without distinction, there are special Government schools. The five chief establishments are the military, naval, and artillery schools, the school of military engineering, and the medical school. To each of these is annexed a preparatory school—*Idadiyeh*. A few other special schools are a training-school for teachers in the *Rushdiyeh*, a school of languages for translators, and a school for managers of woods and forests. The most important institution for supplying good secondary instruction is the metropolitan lyceum of Galata, which has generally been under French direction. A large school for orphans of different nationalities was opened some years ago near the mosque of Selim in Stamboul.

Among the philanthropic establishments of the capital must be reckoned the *Imarets,* intended like the Greek *Xenones* to be at once hospitals and poor-houses. They are attached to most of the mosques, and may be about 300, though many are fallen into decay.

The bazaars call for particular notice. They are large fire-proof buildings, lighted from above, where the varied wares of the city are retailed.

The city numbers, besides, about 180 khans (groups of offices and store-houses for merchandize), and some 130 hammams, or baths.

The trade of Constantinople carried on now, as under the Greek empire, by foreigners, is not distinguished by any speciality. Its harbour is a convenient centre to many lines of commerce, sheep's wool, mohair, goat-skins, grain, &c., being transhipped from the coasts of Asia and the Black Sea. Great improvements have been introduced of late. Besides the steamers which secure communication with foreign ports, others ply between the city and its suburbs on the Horn, the Bosphorus, and the Sea of Marmora.

Fire brigad

The streets, though ill paved, have been some of them enlarged, and many on the Pera side are lighted with gas; but the greatest improvement of all is the formation of an active and highly disciplined fire-brigade.

It is sometimes said that modern Constantinople, after so many earthquakes in earlier centuries, and conflagrations in all, retains few relics of the past; but several monuments have been already named, and others might be added. They are most numerous about the Hippodrome—that centre and focus of the city's life, and theatre of its revolutions, its festivities, and its crimes. Besides the remains of six palaces, five columns entire or in fragments are pointed out—memorials of the 1st, 3d, 4th, and 5th centuries, and associated with the historical names of Claudius II. and Constantine, Theodosius and Arius, Arcadius, Eudoxia, Marcian, and Chrysostom. Tombs of the great lie about in various corners and courts. It is to be remembered, moreover, that the greater part of the Greek city is under ground,—that besides the ruins or remains of more than 20 churches, and of the colonnades that lined the streets or divided the bazaars, and which still are met with by the passenger along its public thoroughfares, there spread out of sight beneath his feet labyrinths of passages, cisterns, and prisons of length and direction unknown, so that he may be said to walk not so much on *terra firma,* as on a continuous roof.

The history of the city is almost a record of its sieges. About 100 years after its enlargement or foundation by Constantine the Great (330 A.D.) began that series of assaults by sea and land before which it gave way only thrice, when its gates were opened to Dandolo, Michael Palæologus, and Mahomet II. Michael, by the aid of his Varangians, recovered, 200 years before its final capture, what the Latins had held nearly 60 years; and 100 years before it surrendered, the Ottoman Turks profited by the divisions in the empire, and were called into the east of Europe as the followers of the same anti-Christian standard had been called into the west, till the last Constantine fell in defending the city which the first had raised and named. Constantinople was threatened by the Huns in the reign of Theodosius the Younger, 450; by the Huns and Slavs in that of Justinian, 553; by the Persians and Avars in that of Heraclius, 626. The Arabs besieged it in three different expeditions. They came under Sophian in 668, and attacked it six times, once every year (672–679), when Constantine Pogonatus was emperor. Leo the Isaurian repelled a second invasion under Moslemeh in 717. They were finally led by Haroun-al-Rashid, who made peace with Constantine and Irene in 782. The Russians assailed the sea-walls of the capital four times from 865 to 1043, in the reigns of Michael III. and his successors. Romanus Lecapenus, who beat them back when they were come down the second time, had to repel another enemy—the Hungarians—in 924. It was not by arms, but by the treachery of Gilpracht, the leader of the German guard, that Alexius Comnenus entered one of the land-gates and seized the throne (1081); and another Alexius, with his father Isaac Angelus, brought the Latins, who occupied the city for 56 years, after the two sieges of 1203 and 1204, until Michael Palæologus embossed his name as conqueror on the bronze gates of St Sophia. In the 15th century Constantinople was attacked by the Turks twice; under Manuel it resisted Amurath in 1422; but under Constantine Palæologus it yielded to Mahomet in 1453. The city has thus been often the aim, rarely the prize, of invasion.

The captures of the city by the Latins and the Turks brought loss to the East and gain to the West. In an age when the Goths on the one side, and Arabs on the other, had ruined traffic elsewhere, Constantinople was the greatest and almost the only commercial town in the world, while Greek supremacy at sea secured a flow of riches into the state; but, the citizens being dispersed during the sixty years of Latin occupation, all commerce was transferred to the cities of Italy. To that Latin conquest is mainly attributed the sudden development of the formative arts in the 13th century, for then there arose more frequent intercourse between the Greeks and the Italians, and many Greek artists were established in Italy, especially at Venice, Siena, Pisa, and Florence. In like manner, the fall of the city before the Turks scattered Greek learning among the Latin and Teutonic races; when Greek libraries were burnt and the Greek language proscribed, Greek MSS. of the Bible, sedulously copied by the monks of Constantinople from the 5th to the 15th century, conveyed the text into Western Europe; the overthrow of the capital of Greek literature synchronized with the invention of printing, and in a great measure caused the revival of learning. Since that last siege which introduced the Ottoman rule, the city from being the object became the starting-point of invasion; for long ages the busy hive of science and art, it was turned into a swarming nest of hornets. The mausoleum of Haireddin (Barbarossa) at Beshiktash, a suburb of the city, is a memorial of the subjugation of the Northern States of Africa; a ruin, beneath the Burnt Column, once the residence of Busbek, in the 16th century, bears witness to the privileges and the restraints of the ambassadors of Germany; and inscriptions left on the inner walls of the Seven Towers, ranging in date from 1698 to 1800, record the imprisonment and the liberation or death of captives, Venetians, French, &c., and the obstinate struggles in which the Ottomans engaged with the different powers of Europe. The last European ambassador imprisoned there was Le Brun, envoy of the French republic; he was thrown in on the news of the French landing in Egypt, and remained three years. After the tide of fortune turned on the repulse of the Turkish forces from Vienna in 1683, Constantinople began to be once more the special mark for ambition or revenge. When the peace of Carlowitz was signed in 1699 a new enemy was rising in the North; in 1770 the city was threatened by the Russian fleet joined by the English squadron. Vice-Admiral Duckworth, having forced the passage of the Dardanelles, appeared before Constantinople, but the Turks put themselves in a posture of defence, and after eight days his squadron retreated. For further historical details, see TURKEY.

CONSTANTINUS CEPHALAS. See ANTHOLOGY, vol ii. p. 103.

CONSTANTIUS, FLAVIUS VALERIUS, commonly called CONSTANTIUS CHLORUS, or the Pale (an epithet first applied by the Byzantine historians, though with doubtful accuracy, for there is evidence to show that he was, like his son, ruddy), Roman emperor and father of Constantine the Great, was born of noble Dalmatian family about 250 A.D. Having distinguished himself by his military ability and his able and gentle rule of Dalmatia, he was, in March 292, adopted and appointed Cæsar by Maximian, whose daughter Theodosia he was obliged to marry after renouncing his wife Helena. By Theodosia he became the father of Constantine. He obtained the title Augustus in 305, and died the following year. See ROMAN HISTORY.

CONSTITUTION AND CONSTITUTIONAL LAW. The word Constitution in the time of the Roman empire signified a collection of laws or ordinances made by the emperor. We find the word used in the same sense in the early history of English law, *e.g.*, the Constitutions of Clarendon. In its modern use constitution has been restricted to those rules which concern the political structure of society. If we take the accepted definition of a law as a command imposed by a sovereign on the subject, the constitution would consist of the rules which point out where the sovereign is to be found, the form in which his powers are exercised, and the relations of the different members of the sovereign body to each other where it consists of more persons than one. In every independent political society, it is assumed by these definitions, there will be found somewhere or other a sovereign, whether that sovereign be a single person, or a body of persons, or several bodies of persons. The commands imposed by the sovereign person or body on the rest of the society are positive laws, properly so called. The sovereign body not only makes laws, but has two other leading functions, viz., those of judicature and administration. Legislation is for the most part performed directly by the sovereign body itself; judicature and administration, for the most part, by delegates. The constitution of a society, accordingly, would show how the sovereign body is composed, and what are the relations of its members *inter se*, and how the sovereign functions of legislation, judicature, and administration are exercised. Constitutional law consists of the rules relating to these subjects, and these rules may either be laws properly so called, or they may not—*i.e.*, they may or may not be commands imposed by the sovereign body itself. The constitutional rule, for example, that the Queen and Parliament are the sovereign, cannot be called a law; for a law presupposes the fact which it asserts. And other rules, which are constantly observed in practice, but have never been enacted by the sovereign power, are in the same way constitutional rules which are not laws. It is an undoubted rule of the constitution that the king shall not refuse his assent to a bill which has passed both Houses, but it is certainly not a law. Should the king veto such a bill his action would be unconstitutional, but not illegal. On the other hand the rules relating to the election of members to the House of Commons are nearly all positive laws strictly so called. Constitutional law, as the phrase is commonly used, would include all the laws dealing with the sovereign body in the exercise of its various functions, and all the rules, not being laws properly so called, relating to the same subject.

The above is an attempt to indicate the meaning of the phrases in their stricter or more technical uses. Some wider meanings may be noticed. In the phrase constitutional government, a form of government based on certain principles which may roughly be called popular is the leading idea. England, Switzerland, the United States, are all constitutional governments in this sense of the word. Russia, France under the last empire, and Spain, on the other hand, would generally be said to be countries without constitutional government. A country where a large portion of the people has some considerable share in the supreme power would be a constitutional country. On the other hand constitutional, as applied to governments, may mean stable as opposed to unstable and anarchic societies. Again, as a term of politics, constitutional has come to mean, in England at least, not obedience to constitutional rules as above described, but adherence to the existing type of the constitution or to some conspicuous portions thereof,—in other words, Conservative. Thus the abolition of the Irish Church, which was in every way a constitutional measure in the judicial meaning of words, was not a constitutional measure in the party sense. In a country like Spain, on the other hand, the party called constitutional is liberal.

The ideas associated with constitution and constitutionalism are thus, it will be seen, mainly of modern and European growth. They are wholly inapplicable to the primitive and simple societies of the present or of former times. The discussion of forms of government occupies a large space in the writings of the Greek philosophers,—a fact which is to be explained by the existence among the Greeks of many independent political communities, variously organized, and more or less democratic in character. Between the political problems of the smaller societies and those of the great European nations there is no useful parallel to be drawn, although the predominance of classical learning made it the fashion for a long time to apply Greek speculations on the nature of monarchy, aristocracy, and democracy to public questions in modern Europe. Representation, the characteristic principle of European constitutions, has, of course, no place in societies which were not too large to admit of every free citizen participating personally in the business of government. Nor is there much in the politics or the political literature of the Romans to compare with the constitutions of modern states. Their political system was almost from the beginning one of empire, ruled absolutely by a small assembly or by one man.

The impetus to constitutional government in modern times has to a large extent come from England, and it is from English politics that the phrase and its associations have been borrowed. England has offered to the world the one conspicuous example of a long, continuous, and orderly development of political institutions. The early date at which the principle of self-government was established in this country, the steady growth of the principle, the absence of civil dissension, and the preservation in the midst of change of so much of the old organization, have given the English constitution a great influence over the ideas of politicians in other countries. This fact is expressed in the proverbial phrase—"England is the mother of parliaments." It would not be difficult to show that the leading features of the constitutions now established in other nations have been based on, or defended by, considerations arising from the political history of England.

In one important respect England differs conspicuously from most other countries. Her constitution is to a large extent *unwritten*, using the word in much the same sense as when we speak of unwritten law. Its rules can be found in no written document, but depend, as so much of English law does, on precedent modified by a constant process of interpretation. Many rules of the constitution have in fact a purely legal history, that is to say, they have been developed by the law courts, as part of the general body of the common law. Others have in a similar way been developed by the practice of Parliament. Both Houses, in fact, have exhibited the same spirit of adherence to precedent, coupled with a power of modifying precedent to suit circumstances, which distinguishes the judicial tribunals. In a constitutional crisis the House of Commons appoints a committee to "search its journals for precedents," just as the Court of Queen's Bench would examine the records of its own decisions. And just as the law, while professing to remain the same, is in process of constant change, so, too, the unwritten constitution is, without any acknowledgment of the fact, constantly taking up new ground.

In contrast with the mobility of an unwritten constitution is the fixity of a constitution written out, like that of the United States or Switzerland, in one authoritative code. The constitution of the United States, drawn up by a Convention in 1789, is contained in a code of articles. It was ratified separately by each State, and thenceforward became the positive and exclusive statement of the constitution. The legislative powers of the legislature are not to extend to certain kinds of bills, *e.g.*, *ex post facto* bills; the president has a veto which can only be overcome by a majority of two-thirds in both Houses; the constitution itself can only be changed in any particular by the consent of the legislatures or conventions of three-fourths of the several States; and finally the judges of the supreme court are to decide in all disputed cases whether an act of the legislature is permitted by the constitution or not. This is truly a formidable apparatus of provisions against change, and, in fact, only fifteen constitutional amendments have been passed from 1789 to the present day. In the same period the unwritten constitution of England has made a most marked advance, chiefly in the direction of eliminating the separate powers of the Crown, and diminishing those of the House of Lords. The Commons, through its nominees, the Ministry, has absorbed the entire power of the Crown, and it has more and more reduced the other House to a position of secondary importance. The American constitution of 1789 was a faithful copy, so far as it was possible to make one out of the materials in hand, of the contemporary constitution of England. The position and powers of the president were a fair counterpart of the royal prerogative of that day; the Senate and the Congress corresponded sufficiently well to the House of Lords and the House of Commons, allowing for the absence of the elements of hereditary rank and territorial influence. While the English constitution has changed much, the American constitution has changed little, if at all, in these respects. Allowing for the more democratic character of the constituencies, the organization of the supreme power in the United States is nearer the English type of the last century—is less modern, in fact—than is the English constitution of the present day.

One conspicuous feature of the English constitution, by which it is broadly distinguished from written or artificial constitutions, is the presence throughout its entire extent of legal fictions. The influence of the lawyers on the progress of the constitution has already been noticed, and is nowhere more clearly shown than in this peculiarity of its structure. As in the common law, so in the constitutions, change has been effected in substance without any corresponding change in terminology. There is hardly one of the phrases used to describe the position of the Crown which can be understood in its literal sense, and many of them are currently accepted in more senses than one.

Notwithstanding the strongly marked historical character of our political institutions, the fallacy of regarding them as elaborate contrivances devised to effect the end of good government has always more or less prevailed. It finds expression in what is called the theory of checks and balances—the theory that power is so distributed among the different elements of the state that each acts as a check on the other, and none is supreme. So Blackstone and writers of his class tell us that the English constitution is the perfection of political wisdom, inasmuch as it combines the virtues of monarchy, aristocracy, and democracy without the faults which would attend any one of these varieties of government unmodified by the others. The tendency to repeat the English type of Parliament, in artificial or paper constitutions, is probably not entirely unconnected with this habit of mind. The question of a second chamber has been a practical difficulty of the first importance in all such constitutions. The attempt to imitate the duality of the English Parliament results in two co-ordinate Houses of legislature, each of which may at any moment bring legislation to a stop. "In both the American and the Swiss constitution," says an eminent writer on this subject (Mr Bagehot), "the Upper House has as much authority as the second; it could produce the maximum of impediment, the dead-lock, if it liked; if it does not do so it is owing, not to the goodness of the legal constitution, but to the discreetness of members of the chamber." The explanation may not unreasonably be found in the impossibility of creating a second chamber with the same character which its history has imposed on the English House of Lords. Our two Houses are far from being of co-ordinate authority. In the last result, the will of the House of Commons must prevail.

A further exemplification of this view of the British constitution may be found in the fact that its highest executive council, the Cabinet, is not even known to the law.

Between England and some other constitutional countries a difference of much constitutional importance is to be found in the terms on which the component parts of the country were brought together. All great societies have been produced by the aggregation of small societies into larger and larger groups. In England the process of consolidation was completed before the constitution settled down into its present form. In the United States, on the other hand, in Switzerland, and in Germany the constitution is in form an alliance among a number of independent states, each of which may have a constitution and laws of its own for local purposes. In federal governments it remains a question how far the independence of individual states has been sacrificed by submission to a constitution. In the United States constitutional progress is hampered by the necessity thus created of having every amendment ratified by the separate vote of three-fourths of the States. (E. R.)

CONSTITUTION OF BODIES. The question whether the smallest parts of which bodies are composed are finite in number, or whether, on the other hand, bodies are infinitely divisible, relates to the *ultimate* constitution of bodies, and is treated of in the article ATOM.

The mode in which elementary substances combine to form compound substances is called the *chemical* constitution of bodies, and is treated of in CHEMISTRY.

The mode in which sensible quantities of matter, whether elementary or compound, are aggregated together so as to form a mass having certain observed properties, is called the *physical* constitution of bodies.

Bodies may be classed in relation to their physical constitution by considering the effects of internal stress in changing their dimensions. When a body can exist in equilibrium under the action of a stress which is not uniform in all directions it is said to be solid.

When a body is such that it cannot be in equilibrium unless the stress at every point is uniform in all directions, it is said to be fluid.

There are certain fluids, any portion of which, however small, is capable of expanding indefinitely, so as to fill any vessel, however large. These are called gases. There are other fluids, a small portion of which, when placed in a large vessel, does not at once expand so as to fill the vessel uniformly, but remains in a collected mass at the bottom, even when the pressure is removed. These fluids are called liquids.

When a liquid is placed in a vessel so large that it only occupies a part of it, part of the liquid begins to evaporate, or in other words it passes into the state of a gas, and this process goes on either till the whole of the liquid is evaporated, or till the density of the gaseous part of the substance has reached a certain limit. The liquid and the gaseous portions of the substance are then in equilibrium. If the volume of the vessel be now made smaller, part of the gas will be condensed as a liquid, and if it be made larger, part of the liquid will be evaporated as a gas.

The processes of evaporation and condensation, by which the substance passes from the liquid to the gaseous, and from the gaseous to the liquid state, are discontinuous processes, that is to say, the properties of the substance are very different just before and just after the change has been effected. But this difference is less in all respects the higher the temperature at which the change takes place, and Cagniard de la Tour in 1822[1] first showed that several substances, such as ether, alcohol, bisulphide of carbon, and water, when heated to a temperature sufficiently high, pass into a state which differs from the ordinary gaseous state as much as from the liquid state. Dr Andrews has since[2] made a complete investigation of the properties of carbonic acid both below and above the temperature at which the phenomena of condensation and evaporation cease to take place, and has thus explored as well as established the continuity of the liquid and gaseous states of matter.

For carbonic acid at a temperature, say of 0° C., and at the ordinary pressure of the atmosphere, is a gas. If the gas be compressed till the pressure rises to about 40 atmospheres, condensation takes place, that is to say, the substance passes in successive portions from the gaseous to the liquid condition.

If we examine the substance when part of it is condensed, we find that the liquid carbonic acid at the bottom of the vessel has all the properties of a liquid, and is separated by a distinct surface from the gaseous carbonic acid which occupies the upper part of the vessel.

But we may transform gaseous carbonic acid at 0° C. into liquid carbonic acid at 0° C. without any abrupt change by first raising the temperature of the gas above 30°.92 C. which is the *critical* temperature, then raising the pressure to about 80 atmospheres, and then cooling the substance, still at high pressure, to zero.

During the whole of this process the substance remains perfectly homogeneous. There is no surface of separation between two forms of the substance, nor can any sudden change be observed like that which takes place when the gas is condensed into a liquid at low temperatures; but at the end of the process the substance is undoubtedly in the liquid state, for if we now diminish the pressure to somewhat less than 40 atmospheres the substance will exhibit the ordinary distinction between the liquid and the gaseous state, that is to say, part of it will evaporate, leaving the rest at the bottom of the vessel, with a distinct surface of separation between the gaseous and the liquid parts.

The passage of a substance between the liquid and the solid state takes place with various degrees of abruptness. Some substances, such as some of the more crystalline metals, seem to pass from a completely fluid to a completely solid state very suddenly. In some cases the melted matter appears to become thicker before it solidifies, but this may arise from a multitude of solid crystals being formed in the still liquid mass, so that the consistency of the mass becomes like that of a mixture of sand and water, till the melted matter in which the crystals are swimming becomes all solid.

There are other substances, most of them colloidal, such that when the melted substance cools it becomes more and more viscous, passing into the solid state with hardly any discontinuity. This is the case with pitch.

The theory of the consistency of solid bodies will be discussed in the article ELASTICITY, but the manner in which a solid behaves when acted on by stress furnishes us with a system of names of different degrees and kinds of solidity.

A fluid, as we have seen, can support a stress only when it is uniform in all directions, that is to say, when it is of the nature of a hydrostatic pressure.

There are a great many substances which so far correspond to this definition of a fluid that they cannot remain in permanent equilibrium if the stress within them is not uniform in all directions.

In all existing fluids, however, when their motion is such that the shape of any small portion is continually changing, the internal stress is not uniform in all directions, but is of such a kind as to tend to check the relative motion of the parts of the fluid.

This capacity of having inequality of stress called into play by inequality of motion is called viscosity. All real fluids are viscous, from treacle and tar to water and ether and air and hydrogen.

When the viscosity is very small the fluid is said to be mobile, like water and ether.

When the viscosity is so great that a considerable inequality of stress, though it produces a continuously increasing displacement, produces it so slowly that we can hardly see it, we are often inclined to call the substance a solid, and even a hard solid. Thus the viscosity of cold pitch or of asphalt is so great that the substance will break rather than yield to any sudden blow, and yet if it is left for a sufficient time it will be found unable to remain in equilibrium under the slight inequality of stress produced by its own weight, but will flow like a fluid till its surface becomes level.

If, therefore, we define a fluid as a substance which cannot remain *in permanent equilibrium* under a stress not equal in all directions, we must call these substances fluids, though they are so viscous that we can walk on them without leaving any footprints.

If a body, after having its form altered by the application of stress, tends to recover its original form when the stress is removed, the body is said to be elastic.

The ratio of the numerical value of the stress to the numerical value of the strain produced by it is called the *coefficient of elasticity*, and the ratio of the strain to the stress is called the *coefficient of pliability*.

There are as many kinds of these coefficients as there are kinds of stress and of strains or components of strains produced by them.

If, then, the values of the coefficients of elasticity were to increase without limit, the body would approximate to the condition of a rigid body.

We may form an elastic body of great pliability by dissolving gelatine or isinglass in hot water and allowing the solution to cool into a jelly. By diminishing the proportion of gelatine the coefficient of elasticity of the jelly may be diminished, so that a very small force is required to produce a large change of form in the substance.

When the deformation of an elastic body is pushed beyond certain limits depending on the nature of the sub

[1] *Annales de Chimie*, 2me série, xxi et xxii.
[2] *Phil. Trans.* 1869, p. 575.

stance, it is found that when the stress is removed it does not return exactly to its original shape, but remains permanently deformed. These limits of the different kinds of strain are called the limits of perfect elasticity.

There are other limits which may be called the limits of cohesion or of tenacity, such that when the deformation of the body reaches these limits the body breaks, tears asunder, or otherwise gives way, and the continuity of its substance is destroyed.

A body which can have its form permanently changed without any flaw or break taking place is called *mild.* When the force required is small the body is said to be *soft;* when it is great the body is said to be *tough.* A body which becomes flawed or broken before it can be permanently deformed is called *brittle.* When the force required is great the body is said to be *hard.*

The stiffness of a body is measured by the force required to produce a given amount of deformation.

Its strength is measured by the force required to break or crush it.

We may conceive a solid body to approximate to the condition of a fluid in several different ways.

If we knead fine clay with water, the more water we add the softer does the mixture become till at last we have water with particles of clay slowly subsiding through it. This is an instance of a mechanical mixture the constituents of which separate of themselves. But if we mix bees-wax with oil, or rosin with turpentine, we may form permanent mixtures of all degrees of softness, and so pass from the solid to the fluid state through all degrees of viscosity.

We may also begin with an elastic and somewhat brittle substance like gelatine, and add more and more water till we form a very weak jelly which opposes a very feeble resistance to the motion of a solid body, such as a spoon, through it. But even such a weak jelly may not be a true fluid, for it may be able to withstand a very small force, such as the weight of a small mote. If a small mote or seed is enclosed in the jelly, and if its specific gravity is different from that of the jelly, it will tend to rise to the top or sink to the bottom. If it does not do so we conclude that the jelly is not a fluid but a solid body, very weak, indeed, but able to sustain the force with which the mote tends to move.

It appears, therefore, that the passage from the solid to the fluid state may be conceived to take place by the diminution without limit either of the coefficient of rigidity, or of the ultimate strength against rupture, as well as by the diminution of the viscosity. But whereas the body is not a true fluid till the ultimate strength, or the coefficient of rigidity, are reduced to zero, it is not a true solid as long as the viscosity is not infinite.

Solids, however, which are not viscous in the sense of being capable of an unlimited amount of change of form, are yet subject to alterations depending on the time during which stress has acted on them. In other words, the stress at any given instant depends, not only on the strain at that instant, but on the previous history of the body. Thus the stress is somewhat greater when the strain is increasing than when it is diminishing, and if the strain is continued for a long time, the body, when left to itself, does not at once return to its original shape, but appears to have taken a set, which, however, is not a permanent set, for the body slowly creeps back towards its original shape with a motion which may be observed to go on for hours and even weeks after the body is left to itself.

Phenomena of this kind were pointed out by Weber and Kohlrausch (*Pogg. Ann.* Bd. 54, 119 and 128), and have been described by O. E. Meyer (*Pogg. Ann.* Bd. 131, 108), and by Maxwell (*Phil. Trans.* 1866, p. 249), and a theory of the phenomena has been proposed by Dr L. Boltzmann (*Wiener Sitzungsberichte*, 8th October 1874).

The German writers refer to the phenomena by the name of "elastische Nachwirkung," which might be translated "elastic reaction" if the word reaction were not already used in a different sense. Sir W. Thomson speaks of the viscosity of elastic bodies.

The phenomena are most easily observed by twisting a fine wire suspended from a fixed support, and having a small mirror suspended from the lower end, the position of which can be observed in the usual way by means of a telescope and scale. If the lower end of the wire is turned round through an angle not too great, and then left to itself, the mirror makes oscillations, the extent of which may be read off on the scale. These oscillations decay much more rapidly than if the only retarding force were the resistance of the air, showing that the force of torsion in the wire must be greater when the twist is increasing than when it is diminishing. This is the phenomenon described by Sir W. Thomson under the name of the viscosity of elastic solids. But we may also ascertain the middle point of these oscillations, or the point of temporary equilibrium when the oscillations have subsided, and trace the variations of its position.

If we begin by keeping the wire twisted, say for a minute or an hour, and then leave it to itself, we find that the point of temporary equilibrium is displaced in the direction of twisting, and that this displacement is greater the longer the wire has been kept twisted. But this displacement of the point of equilibrium is not of the nature of a permanent set, for the wire, if left to itself, creeps back towards its original position, but always slower and slower. This slow motion has been observed by the writer going on for more than a week, and he also found that if the wire was set in vibration the motion of the point of equilibrium was more rapid than when the wire was not in vibration.

We may produce a very complicated series of motions of the lower end of the wire by previously subjecting the wire to a series of twists. For instance, we may first twist it in the positive direction, and keep it twisted for a day, then in the negative direction for an hour, and then in the positive direction for a minute. When the wire is left to itself the displacement, at first positive, becomes negative in a few seconds, and this negative displacement increases for some time. It then diminishes, and the displacement becomes positive, and lasts a longer time, till it too finally dies away.

The phenomena are in some respects analogous to the variations of the surface temperature of a very large ball of iron which has been heated in a furnace for a day, then placed in melting ice for an hour, then in boiling water for a minute, and then exposed to the air; but a still more perfect analogy may be found in the variations of potential of a Leyden jar which has been charged positively for a day, negatively for an hour, and positively again for a minute.[1]

The effects of successive magnetization on iron and steel are also in many respects analogous to those of strain and electrification.[2]

The method proposed by Boltzmann for representing such phenomena mathematically is to express the actual stress, $L_{(t)}$, in terms not only of the actual strain, $\theta_{(t)}$, but of the strains to which the body has been subjected during all previous time.

His equation is of the form

$$L_t = K\theta_t - \int_0^\infty \psi(\omega)\theta_{t-\omega}d\omega,$$

[1] See Dr Hopkinson, "On the Residual Charge of the Leyden Jar," *Proc. R. S.*, xxiv. 408, March 30, 1876.

[2] See Wiedemann's *Galvanismus*, vol. ii. p. 567.

where ω is the interval of time reckoned backwards from the actual time t to the time $t-\omega$, when the strain $\theta_{t-\omega}$ existed, and $\psi(\omega)$ is some function of that interval.

We may describe this method of deducing the actual state from the previous states as the historical method, because it involves a knowledge of the previous history of the body. But this method may be transformed into another, in which the present state is not regarded as influenced by any state which has ceased to exist. For if we expand $\theta_{t-\omega}$ by Taylor's theorem,

$$\theta_{t-\omega} = \theta_{t} - \omega\frac{d\theta}{dt} + \frac{\omega^2}{1\cdot 2}\frac{d^2\theta}{dt^2} - \&c.,$$

and if we also write

$$A = \int_0^\infty \psi(\omega)d\omega \quad , \quad B = \int_0^\infty \omega\psi(\omega)d\omega \quad , \quad C = \int_0^\infty \frac{\omega^3}{1\cdot 2}\psi(\omega)d\omega, \&c.,$$

then equation (1) becomes

$$L = (KA)\theta + B\frac{d\theta}{dt} - C\frac{d^2\theta}{dt^2} + \&c.,$$

where no symbols of time are subscribed, because all the quantities refer to the present time.

This expression of Boltzmann's, however, is not in any sense a physical theory of the phenomena; it is merely a mathematical formula which, though it represents some of the observed phenomena, fails to express the phenomenon of permanent deformation. Now we know that several substances, such as gutta-percha, India-rubber, &c., may be permanently stretched when cold, and yet when afterwards heated to a certain temperature they recover their original form. Gelatine also may be dried when in a state of strain, and may recover its form by absorbing water.

We know that the molecules of all bodies are in motion. In gases and liquids the motion is such that there is nothing to prevent any molecule from passing from any part of the mass to any other part; but in solids we must suppose that some, at least, of the molecules merely oscillate about a certain mean position, so that, if we consider a certain group of molecules, its configuration is never very different from a certain stable configuration, about which it oscillates.

This will be the case even when the solid is in a state of strain, provided the amplitude of the oscillations does not exceed a certain limit, but if it exceeds this limit the group does not tend to return to its former configuration, but begins to oscillate about a new configuration of stability, the strain in which is either zero, or at least less than in the original configuration.

The condition of this breaking up of a configuration must depend partly on the amplitude of the oscillations, and partly on the amount of strain in the original configuration; and we may suppose that different groups of molecules, even in a homogeneous solid, are not in similar circumstances in this respect.

Thus we may suppose that in a certain number of groups the ordinary agitation of the molecules is liable to accumulate so much that every now and then the configuration of one of the groups breaks up, and this whether it is in a state of strain or not. We may in this case assume that in every second a certain proportion of these groups break up, and assume configurations corresponding to a strain uniform in all directions.

If all the groups were of this kind, the medium would be a viscous fluid.

But we may suppose that there are other groups, the configuration of which is so stable that they will not break up under the ordinary agitation of the molecules unless the average strain exceeds a certain limit, and this limit may be different for different systems of these groups.

Now if such groups of greater stability are disseminated through the substance in such abundance as to build up a solid framework, the substance will be a solid, which will not be permanently deformed except by a stress greater than a certain given stress.

But if the solid also contains groups of smaller stability and also groups of the first kind which break up of themselves, then when a strain is applied the resistance to it will gradually diminish as the groups of the first kind break up, and this will go on till the stress is reduced to that due to the more permanent groups. If the body is now left to itself, it will not at once return to its original form, but will only do so when the groups of the first kind have broken up so often as to get back to their original state of strain.

This view of the constitution of a solid, as consisting of groups of molecules some of which are in different circumstances from others, also helps to explain the state of the solid after a permanent deformation has been given to it. In this case some of the less stable groups have broken up and assumed new configurations, but it is quite possible that others, more stable, may still retain their original configurations, so that the form of the body is determined by the equilibrium between these two sets of groups; but if, on account of rise of temperature, increase of moisture, violent vibration, or any other cause, the breaking up of the less stable groups is facilitated, the more stable groups may again assert their sway, and tend to restore the body to the shape it had before its deformation. (J. C. M.)

CONSUEGRA, a town of Spain, on the Amarguilla, in the province of Toledo, and 36 miles south-east of the city of that name. It contains about 7000 inhabitants, principally engaged in the manufacture of coarse woollens. Roman inscriptions and other remains bear witness to the antiquity of the town, which was formerly known as Consabrum; and on a neighbouring hill are the ruins of its ancient castle.

CONSUL (ὕπατος), the highest magistrate of the republic of ancient Rome. It is probable that the word is compounded of *con* and *salio*, so that *consules* signifies those who go together. They were in early times called *prætores*, *imperatores*, or *judices*.

From the abuse of the power which had been vested in the kings, the Romans were induced not only to expel the hated Tarquins from the city, but even to abolish the monarchical form of government altogether. Brutus and his companions, after the rape of Lucretia, made the people swear that no king should ever again reign at Rome. The state was henceforth ruled by two supreme magistrates called consuls. The consular office was instituted after the expulsion of the kings, 510 B.C., and continued, with few interruptions, till the establishment of the empire—a period of nearly 500 years. The leaders of the revolution which had expelled the kings were first raised to this rank. All the royal insignia were preserved except the crown. Twelve lictors preceded them alternately. The elder of the two, or he who had most children, or who had been first elected, had the *fasces* first, the other meanwhile being preceded by a public officer called *accensus*, and followed by the lictors. Sometimes they agreed to enjoy the *fasces* on alternate days, but generally for alternate months. By the law of Poplicola, the axe was taken from them and their *fasces* were lowered when they entered the assemblies of the people. A cloak with a scarlet border, and an ivory staff, were badges of their office. On public occasions they used a seat of ornamented ivory called the curule chair.

From the great power which their order originally possessed in the state, the patricians succeeded for a long time in retaining the consulship among themselves. It was not till the year 445 B.C. that the plebeians acquired sufficient courage and strength to make any attempts to acquire the right of being elected to this office. Having once begun the struggle, however, they maintained it for the space of eighty years with a spirit and resolution which made even a foreign war desirable as a relief from internal contests. Livy relates that for five years (375–371 B.C.) the opposition raised by the plebeians, under the guidance of the tribunes L. Licinius Stolo and L. Sextius, was so formidable that neither consuls nor any other magistrates could be appointed, and there was what he calls a *solitudo magistratuum.* At length the patricians, after attempting an evasion by the appointment of five military tribunes, were compelled to accede to the Licinian law, by which it was ordained (367 B.C.) that in all time coming one of the consuls should be a plebeian. L. Sextius was the first plebeian consul. But the power which was effectual in the passing of the law was not equal to its enforcement, for in 355 B.C. both consuls were patricians; and, as was often the case with Roman laws, it was found necessary to re-enact it. This time, however, the demands of the plebeians increased; and not satisfied with having one consul, they tried to add a clause ordaining it to be lawful for the people to elect both consuls from their own number. Although the attempt was successful, no example of the appointment of two plebeian consuls occurs till the year 215 B.C. The honour seems for the most part to have been equally divided between the two orders. The first foreigner who obtained the consulship was Cornelius Balbus, a native of Cadiz, and a man of extraordinary wealth.

The legal age for enjoying the consulship was forty-five; but this regulation was not strictly observed. Pompey was made consul in his thirty-sixth year, M. Valerius Corvus in his twenty-third, T. Quinctius Flaminius was created consul before he was thirty, Scipio Africanus the Elder at twenty-eight, and the Younger at thirty-eight. It was necessary for candidates to have discharged the inferior duties of quæstor, ædile, and prætor before they were eligible; and a regulation was made that they should be present at the election in a private capacity. It was also enacted that no one should be made consul a second time till after the lapse of ten years. But we find cases in which all these conditions were disregarded. Some were elected who had not previously borne any curule magistracy; and others were appointed in their absence. Some continued in office more than a year, as Marius, who was seven times consul without intermission; and others were elected before the allotted time had elapsed.

The election of consuls was made by the *comitia centuriata* in the Campus Martius. The assembly at which they were elected was always convoked and presided over by a consul, dictator, or interrex. It generally took place in the month of July, that an opportunity might be afforded for investigating the conduct of the successful candidates before they entered on their office, and that they might have time to become conversant with their duties. From their appointment to the day of their induction they were called *consules designati*, or consuls elect, and had the privilege of being first asked their opinion in the senate. The day upon which they assumed office was repeatedly changed. It seems originally to have been the Ides of September, when, in the rude days of Roman history, the consuls used annually to fix a nail in the temple of Jupiter Capitolinus to mark the year; but as it sometimes happened, when one died before the term of his office had expired, that another was immediately chosen to fill his place, the year of his successor was naturally finished before the usual time, and this necessitated a repeated change in the days of their appointment and induction. Sometimes, too, civil commotions prevented the election taking place at the usual time. As the consul whose year was completed could not in such cases discharge any of the consular duties, it was customary for the senate to nominate a temporary magistrate called interrex. His authority being limited to five days, a succession of interreges had frequently to be chosen before tranquillity was restored. At length (154 B.C.) it was enacted that consuls and all the ordinary magistrates, with the exception of the tribunes of the people, should begin their duties on the 1st of January. That day was marked by peculiar solemnities. At daybreak the consuls arose and consulted the auspices. Afterwards the senate and people waited upon them at their houses, and then, with the new magistrates clad in their state robes at their head, they all marched in solemn procession to the capitol. There victims were offered, and prayers presented for the safety and prosperity of the Roman people. After the conclusion of the religious rites a meeting of the senate was held, and the new consuls first exercised their functions by consulting it about the performance of religious ceremonies. Within five days after their induction they were obliged to swear, as they had done at their election, that they would strictly observe the laws; and at the close of their consulship they were required to take a similar oath declaring that they had done nothing contrary to the constitution.

The power of the consuls appears at first to have been similar to that of the kings; but in process of time several distinctions arose which combined to render the consular authority inferior to the regal. The office of high priest, which had been discharged by the kings, was in the time of the consulship executed by a special magistrate, called *rex sacrorum*, or *rex sacrificulus.* The power of life and death was afterwards denied to the consuls, and the symbolic axe removed from the *fasces.* While there was only one king, there were two consuls. The obvious design of the Romans in dividing the consulship was that their power might be weakened, and the safety of the people made more secure by the resistance which the ambitious designs of the one would receive from the other. For the same reason they elected them annually, and thus prevented that insolence of authority which the long continuation of it is apt to produce. They were restrained from illegal measures still further by fear of punishment when their term of office had expired; for the people had reserved to themselves the right of bringing them to trial for misconduct. The Valerian law weakened their authority by decreeing that no magistrate should scourge or put to death a Roman citizen who appealed to the people. Even the decision of one consul could be repealed by the other. But it was the creation of the tribunes of the people that especially contributed to limit their prerogatives, and strengthen the cause of liberty. And as additional magistracies were instituted, many of their old privileges were taken from them. Their judicial power was transferred to the prætors, and their censorial to the censors, while other duties originally discharged by them devolved upon ædiles and other new magistrates.

But notwithstanding these limitations, the power of the consuls was at all times very great. As civil magistrates they were at the head of the government, and all others, with the exception of the tribunes of the people, were subject to them. They assembled and presided over the senate and *comitia centuriata;* they introduced subjects of deliberation, proposed laws, and executed the decrees of both senate and people. The laws proposed by them generally received their name. The year was called after them. They gave audience to embassies, and communicated with other states. Before the establishment of the prætorship and censorship, they discharged the highest judicial functions, and superintended the assessment of the citizens. They had the right of summoning and enforcing the presence of any one they pleased. Every person was bound to turn out of the way, dismount, rise up uncover the head, or show some similar token of respect, on passing them.

The consul Acilius ordered the curule chair of the prætor Lucullus to be broken in pieces for a breach of this regulation. As military commanders they had absolute authority. They had the power of life and death over the lives of their soldiers; and accordingly they had axes in their fasces when in the field. When any great danger threatened the state the consuls were invested by the senate with extraordinary powers, which made them supreme in the city as well as out of it. Accordingly, in the early days of the republic, when the patricians were in sole possession of the consulship, and wished to subdue any outbreak of the plebeians, they feigned that some powerful enemy was marching against the city, and thus succeeded in obtaining extraordinary powers for the consuls.

After the consuls had resigned their office, they were commissioned by the senate to assume the government of provinces under the title of *proconsuls.* It was the prerogative of the senate to determine the provinces for the consuls, although it was left to themselves to decide by lot or agreement which of them each should receive. When the time arrived for a proconsul to set out for his province, he was furnished by the senate with the troops appointed for him, and everything requisite for his command. Surrounded by a train of friends, and a numerous personal staff, he marched out of the city with great pomp. He was bound to travel direct to his province; and the towns through which he passed had to supply him with necessaries for his journey. Within his province he had the command of the troops, and could employ them as he pleased. He was supreme judge both in criminal and in civil causes, and could inflict the punishment of death—except on Roman citizens, who could appeal to Rome. Justice was generally administered at circuit courts, held once a year in the principal towns. The proconsulship continued likewise for one year only, but it was often prolonged by a decree of the senate.

Under the empire the consuls were superseded by the emperors. The title, indeed, remained, and all the ceremonies were performed with exactness, and perhaps even with more magnificence than formerly. It would seem as if they attempted to conceal the loss of real power by the trappings of external pomp. The day of their induction was even more than ever a day of note in the city. Sitting on curule chairs, which were placed on lofty chariots, arrayed in rich dresses in imitation of those which used to be worn by generals in a triumph, with shoes of cloth of gold upon their feet and sceptres in their hands, they passed through the city, scattering money among the crowd, and bestowing gifts upon their friends. Their first duty, however, no longer consisted in consulting the senate about the religious duties of the state, but in formally returning thanks to the emperor for their election. The emperors had arrogated the right of assuming the consulship to themselves, or disposing of it as they thought proper. Julius Cæsar was dictator and consul at the same time. Augustus made himself consul thirteen times during his reign. Vespasian proclaimed himself perpetual consul. And in bestowing it upon others, the emperors were not content with having one pair of consuls for one year. Desirous to conciliate as many of their friends as possible, they greatly shortened the duration of the office. It was held generally for two months, which allowed twelve consuls during one year. But sometimes it lasted only a few weeks, a few days, or even a few hours, according to the pleasure of the emperor. There happened to be twenty-five consuls in the year 189 A.D. But those who entered upon their office on the 1st of January were held in greater respect, and gave their names to the year. They were called, as in the time of the republic, *consules ordinarii*; while those who were raised to the office at other times were termed *consules suffecti*, or *consules minores.*

While the republic lasted, the time that elapsed between the election and ordination of consuls was short, generally from July to January. In the time of the emperors, ordination was sometimes deferred several years. The triumvirs in 39 B.C. nominated consuls for eight succeeding years. In this way the title of *designatus* was frequently enjoyed long before the actual consulship. Caius, the grandson of Augustus, was consul designatus for five years. Nero was fourteen years old when he was nominated consul designatus, and twenty when he became consul.

Besides these different kinds of consuls, all of which existed in the republic, we find another class peculiar to the later days of the empire—honorary consuls. These enjoyed the titles and badges of consuls, but nothing more. They possessed their honours, though altogether free from their duties. All the consuls, in truth, during the period of which we speak, may with propriety be termed honorary, for the substance of their power had been taken from them. They had become the mere slaves of the emperors, although they still continued the formal discharge of their functions. Nevertheless, even in this degraded condition, the consulship was always regarded with veneration, and considered the highest dignity to which a Roman citizen could aspire.

CONSUL, a public officer authorized by the state whose commission he bears to manage the commercial affairs of its subjects in a foreign country, and formally permitted by the Government of the country wherein he resides to perform the duties which are specified in his commission, or *lettre de provision.* A consul, as such, is not invested with any diplomatic character, and he cannot enter on his official duties until a rescript, termed an *exæquatur* (sometimes a mere countersign endorsed on the commission) has been delivered to him by the authorities of the state to which his nomination has been communicated by his own Government. This *exæquatur*, called in Turkey a *barat*, may be revoked at any time at the discretion of the Government where he resides. The status of consuls commissioned by the Christian powers of Europe to reside in the Levant, and to exercise judicial functions in civil and criminal matters between their own countrymen and strangers, is exceptional to the common law, and is founded on special conventions or capitulations with the Ottoman Porte. The English consuls in the Levant were originally the officers of "the governor and company of merchants of England trading in the Levant seas," created by letters patent from James I., which were cancelled in 1826. Besides the pure consular jurisdiction—exercised under the Order in Council 30th November 1864, by a judge in the Supreme Consular Court at Constantinople, and by the ordinary consuls in provincial courts, subject to an appeal to Her Majesty's Imperial Court of Appeal, in cases beyond £500 in value—there is also the jurisdiction of the consular court of the defender's nation, where the parties are both foreign Christians, and a Turkish tribunal for cases between Turks and foreign Christians. The tendency now is to substitute mixed tribunals in both these cases. The right of British consuls to be present in the native courts, when one of the parties is a British subject, was conceded by the Treaty of Dardanelles (1809). It is not unusual in the case of consuls-general resident in Mahometan countries that they should also be accredited as political agents, or *chargés d'affaires*, in which case they are invested with the diplomatic character, and are entitled to the privileges of public ministers.

The present system of consuls *d'outre mer*, or *à l'étranger*, was preceded by the system of domestic consuls, *juges* consuls, or *marchands*, in the chief maritime cities of the south of Europe. These constituted mere tribunals of commerce which had no special concern with foreign shipping or trade. Later on, the need was felt of a safe place of deposit and of an independent jurisdiction. Particular quarters of mercantile cities were assigned to foreign traders, and disputes were decided by officers variously called governors, protectors, ancients, aldermen (in the Hanse towns), syndics, jurats, prévosts, capitouls, and échevins—all names borrowed from municipal offices. The consul was generally a wholesale dealer, named by the rector and council of the home city. He had power to fine and banish from the quarter. Similar to these were the judge-conservators, elected by British residents in the Portuguese ports. This privilege long cemented the friendly relations of the two nations, and was formally renounced only in 1842. Another singular institution, containing more than the germ of the modern consulate, was "the *Cour de la Fonde*, whose jurisdiction had supplanted the old Court of the Reis or Baillis (established by Godfrey de Bouillon at Jerusalem for the benefit of Syrian merchants), and which included a cognizance of all commercial matters, its judges being a mixed body of Franks and Syrians" (Kent's *Commentaries*, by Abdy, p. 137). The 16th century saw the introduction of foreign consuls, but the earliest treaties of Great Britain with Spain and Turkey on this subject are dated in 1665 and 1675. The right to establish consuls is now universally recognized by Christian civilized states. Jurists at one time contended that according to international law a right of "extra-territoriality" attached to consuls, their persons and dwellings being sacred, and themselves amenable to local authority only in cases of strong suspicion on political grounds. It is now admitted that, apart from treaty, custom has established very few consular privileges; that perhaps consuls may be arrested and incarcerated, not merely on criminal charges, but for civil debt; and that, if they engage in trade or become the owners of immovable property, their persons certainly lose protection. This question of arrest has been frequently raised in Europe:—in the case of Barbuit, a tallow-chandler, who from 1717 to 1735 acted as Prussian consul in London, and to whom the exemption conferred by statute on ambassadors was held not to apply; in the case of Cretico, the Turkish consul at London in 1808; in the case of Begley, the United States consul at Genoa, arrested in Paris in 1840; and in the case of De la Fuente Hermosa, Uruguayan consul, whom the *Cour Royale* of Paris in 1842 held liable to arrest for debt. In the same way consuls, unless protected by treaty, pay local taxes, although they are generally exempt from general duties on articles of personal consumption, relief from income tax being often given by treaty. They are exempt from billeting and military service, but are not entitled (except in the Levant, where also freedom from arrest and trial is the rule) to have private chapels in their houses. The exception in favour of the Levant was illustrated in 1853, when the refugee Martin Koszta, who had become United States consul at Smyrna and *chargé d'affaires* at Constantinople, was seized by the Turks. This, although a case of suspicion on political grounds, called forth a protest from America, and restitution was made. The right of consuls to exhibit their national arms and flag over the door of the *bureau* is not disputed.

The duty of consuls, under the "General Instructions to British Consuls," is to advise Her Majesty's trading subjects, to quiet their differences, and to conciliate as much as possible the subjects of the two countries. Treaty rights he is to support in a mild and moderate spirit; and he is to check as far as possible evasions by British traders of the local revenue laws. Besides assisting British subjects who are tried for offences in the local courts, and ascertaining the humanity of their treatment after sentence, he has to consider whether home or foreign law is more appropriate to the case, having regard to the convenience of witnesses and the time required for decision; and, where local courts have wrongfully interfered, he puts the Home Government in motion through the consul-general or ambassador. He sends in reports on the export and import trade of the district in which he resides; and he reports to the secretary of state when a vice-consul is required in any place, generally naming an English merchant. Under the Act 12 and 13 Vict. c. 68, extended by the Consular Marriage Act, 1868, consuls are empowered, on certain notices and declarations being given, to celebrate marriage between persons who have resided one month in the district, one of them being a British subject. They are also empowered by statute to advance for the erection or maintenance of Anglican churches, hospitals, and places of interment sums equal to the amount subscribed for the purpose by the resident British subjects.

As the powers and duties of consuls vary with the particular commercial interests they have to protect, and the civilization of the state in whose territory they reside, instead of abstract definition, we summarize the provisions on this subject of the British Merchant Shipping Acts.[1] Consuls are bound to send to the Board of Trade such reports or returns on any matter relating to British merchant shipping or seamen as they may think necessary. Where a consul suspects that the shipping or navigation laws are being evaded, he may require the owner or master to produce the log-book or other ship documents (such as the agreement with the seamen, the account of the crew, the certificate of registration); he may muster the crew, and order explanations with regard to the documents. Where an offence has been committed on the high seas, or abroad ashore, by British seamen or apprentices, the consul makes inquiry on oath, and may send home the offender and witnesses by a British ship, particulars for the Board of Trade being endorsed on the agreement for conveyance. He is also empowered to detain a foreign ship, the master or seamen of which appear to him through their misconduct or want of skill to have caused injury to a British vessel, until the necessary application for satisfaction or security be made to the local authorities. Every British mercantile ship, not carrying passengers, on entering a port gives into the custody of the consul to be endorsed by him the seamen's agreement, the indentures, &c.; a failure to do this is reported to the registrar-general of seamen. The following five provisions are also made for the protection of seamen. If a British master engage seamen at a foreign port, the engagement is sanctioned by the consul, acting as a Superintendent of Mercantile Marine Offices. The consul collects the property (including arrears of wages) of British seamen or apprentices dying abroad, and remits to H.M. paymaster-general. He also provides for the subsistence of seamen who are shipwrecked, discharged, or left behind, even if their service was with foreign merchants; they are generally sent home in the first British ship that happens to be in want of a complement, and the expenses thus incurred form a charge on the Parliamentary fund for the relief of distressed seamen, the consul receiving a commission of $2\frac{1}{2}$ per cent. on the amount disbursed. Complaints by crews as to the quality and quantity of the provisions on board are investigated by the consul, who enters a statement in the log-book and reports to the Board of Trade. Money disbursed by consuls on account of the illness or injury of seamen is generally recoverable from the owner. With regard to passenger vessels, the master is bound to give the consul facilities for inspection and for communication with passengers, and to exhibit his "master's

[1] See also instructions to Consuls prepared by the Board of Trade and approved by the Secretary of State for Foreign Affairs, 1855, and Supplementary Instructions, 1868.

list," or list of passengers, so that the consul may transmit to the registrar-general, for insertion in the Marine Register Book, a report of the passengers dying and children born during the voyage. The consul may even defray the expenses of maintaining, and forwarding to their destination, passengers taken off or picked up from wrecked or injured vessels, if the master does not undertake to proceed in six weeks; these expenses becoming, in terms of the Passenger Acts 1855 and 1863, a debt due to Her Majesty from the owner or charterer. Where a salvor is justified in detaining a British vessel, the master may obtain leave to depart by going with the salvor before the consul, who after hearing evidence as to the service rendered and the proportion of ship's value and freight claimed, fixes the amount for which the master is to give bond and security. In the case of a foreign wreck the consul is held to be the agent of the foreign owner. Much of the notarial business which is imposed on consuls, partly by statute and partly by the request of private parties, consists in taking the declarations as to registry, transfers, &c., mentioned in Schedules B, C, F, G, H, L of the Mercantile Shipping Act. Under commercial treaties with China, British consuls in the free ports of Canton, Amoy, Foo-chow-foo, Ningpo, and Shanghae have extensive judicial and executive powers. The same observation applies to Japan. (See Order in Council of 9th March 1865 and relative rules.)

The position of United States consuls is minutely described in the Regulations, Washington, 1870. Under various treaties and conventions they enjoy large privileges and jurisdiction. By a treaty with Sweden in 1818 the United States Government agreed that the consuls of the two states respectively should be sole judges in disputes between captains and crews of vessels. By convention with France in 1857 they likewise agreed that the consuls of both countries should be permitted to hold real estate, and to have the "police interne des navires à commerce." In Eastern Asia an exclusive jurisdiction, civil and criminal, is always stipulated in cases where United States subjects are interested. Exemption from liability to appear as a witness is often stipulated. The question was raised in France in 1843 by the case of the Spanish consul Soller at Aix, and in America in 1854 by the case of Dillon, the French consul at San Francisco, who, on being arrested by Judge Hoffmann for declining to give evidence in a criminal suit, pulled down his consular flag. So, also, inviolability of national archives is often stipulated. The archives of a French consul in London were once seized by a collector of local taxes and sold by auction, and in 1858 the flag, seal, arms, and record-book of the United States consulate at Manchester were levied on for a private debt of the consul. To the consuls of other nations the United States Government have always accorded the privileges of arresting deserters, and of being themselves amenable only to the Federal and not to the States courts. They also recognize foreign consuls as representative suitors for absent foreigners.

The United States commercial agents, although appointed by the president, receive no *exequatur*. They form a class by themselves, and are distinct from the consular agents, who are simply deputy consuls in districts where there is no principal consul. France is distinguished among nations for an organization of trained consuls who have intimate relations with the diplomatic corps.

See De Miltitz, *Manuel des Consuls*, London and Berlin, 1837–1843; De Cussy, *Réglements Consulaires des principaux états maritimes de l'Europe et de l'Amerique*, 1851, and *Dictionnaire du diplomate et du Consul*, Leipsic, 1846; Fynn's *British Consul Abroad;* Report of Select Committee on Consular Service (Parl. Papers), 1872; Martens, *Guide diplomatique*, Leipsic, 1866; and De Clercq, *Guide pratique des consulats*, 1858. (W. C. S.)

CONSULATE OF THE SEA, a celebrated collection of maritime customs and ordinances in the Catalan language, published at Barcelona in the latter part of the 15th century. Its proper title is *The Book of the Consulate*, or in Catalan, *Lo Libre de Consolat*. The earliest extant edition of the work, which was printed at Barcelona in 1494, is without a title-page or frontispiece, but it is described by the above-mentioned title in the epistle dedicatory prefixed to the table of contents. The only known copy of this edition is preserved in the National Library in Paris. The epistle dedicatory states that the work is an amended version of the *Book of the Consulate*, compiled by Francis Celelles with the assistance of numerous shipmasters and merchants well versed in maritime affairs. According to a statement made by Capmany in his *Codigo de los Costumbras Maritimas de Barcelona*, published at Madrid in 1791, there was extant to his knowledge in the last century a more ancient edition of the *Book of the Consulate*, printed in semi-Gothic characters, which he believed to be of a date prior to 1484. This is the earliest period to which any historical record of the *Book of the Consulate* being in print can be traced back. There are, however, two Catalan MSS. preserved in the National Library in Paris, the earliest of which, being MS. Espagnol 124, contains the two first treatises which are printed in the *Book of the Consulate* of 1494, and which are the most ancient portion of its contents, written in a hand of the 14th century, on paper of that century. The subsequent parts of this MS. are on paper of the 15th century, but there is no document of a date more recent than 1436. The later of the two MSS., being MS. Espagnol 56, is written throughout on paper of the 15th century, and in a hand of that century, and it purports, from a certificate on the face of the last leaf, to have been executed under the superintendence of Peter Thomas, a notary public, and the scribe of the Consulate of the Sea at Barcelona.

The edition of 1494, which is justly regarded as the *editio princeps* of the *Book of the Consulate*, contains, in the first place, a code of procedure issued by the kings of Aragon for the guidance of the courts of the consuls of the sea, in the second place, a collection of ancient customs of the sea, and thirdly, a body of ordinances for the government of cruisers of war. A colophon at the end of these ordinances informs the readers that "the book commonly called the *Book of the Consulate* ends here;" after which there follows a document known by the title of *The Acceptations*, which purports to record that the previous chapters and ordinances had been approved by the Roman people in the 11th century, and by various princes and peoples in the 12th and 13th centuries. Capmany was the first person to question the authenticity of this document in his *Memorias Historicas sobre la Marina, &c., de Barcelona*, published at Madrid in 1779–92. M. Pardessus and other writers on maritime law have followed up the inquiry in the present century, and have conclusively shown that the document, whatever may have been its origin, has no proper reference to the *Book of the Consulate*, and is, in fact, of no historical value whatsoever. The paging of the edition of 1494 ceases with this document, at the end of which is the printer's colophon, reciting that "the work was completed on 14th July 1494, at Barcelona, by Pere Posa, priest and printer." The remainder of the volume consists of what may be regarded as an appendix to the original *Book of the Consulate*. This appendix contains various maritime ordinances of the kings of Aragon and of the councillors of the city of Barcelona, ranging over a period from 1340 to 1484. It is printed apparently in the same type with the preceding part of the volume. The original *Book of the Consulate*, coupled with this appendix, constitutes the work which has obtained general circulation in Europe under the title of *The Consulate of the Sea*, and which in the course of the 16th century was translated into the Castilian, the Italian, and the French languages. The Italian translation, printed at Venice in 1549 by Jean Baptista Pedrezano, was the version which obtained the largest circulation in the north of Europe, and led many jurists to suppose the work to have been of Italian origin. In the next following century the work was translated into Dutch by Westerven, and into German by Engelbrecht, and it is also said to have been translated into Latin. An excellent translation into French of "The Customs of the Sea," which are the most valuable portion of the *Book of the Consulate*, has been recently published by M. Pardessus in the second volume of his *Collection des Lois Maritimes*, under the title of "La compilation connue sous le nom de consulat de la mer," whilst an English translation of "The Customs of the Sea," under that title, with the Catalan text, has been published for the first time by Sir Travers Twiss, in the appendix to the *Black Book of the Admiralty*, vol. iii. London, 1874. The introduction to the latter work contains a full account of the two Catalan MSS. in the National Library in Paris, and of the various editions of the *Book of the Consulate*. (T. T.)

CONSUMPTION. See PHTHISIS.

CONTEMPT OF COURT is any insult offered to a court of justice, or any defiance or resistance to its authority. "If the contempt be committed in the face of the court, the offender may be instantly apprehended and imprisoned at the discretion of the judges, without any further proof or examination." In other cases if the judges have reason to believe, from an *affidavit*, that a contempt has been committed, they make a rule calling on the suspected person to show cause why an *attachment* should not issue against him, or in flagrant cases the attachment issues in the first instance. (See ATTACHMENT.) The process of attachment merely brings the accused into court; he is then required to answer on oath interrogatories administered to him, so that the court may be better informed of the circumstances of the contempt. If he can clear himself on oath he is discharged; if he confesses the court will punish him by fine or imprisonment, or both, at its discretion. Both in courts of common law and courts of equity many acts are punished as contempts which are properly civil injuries, and the process of contempt enforced against them is, as Blackstone points out, to be looked upon rather as a civil execution for the benefit of the injured party than as a criminal process for a contempt of the authority of the court. Among the offences enumerated in the text books as the most usual instances of contempt are the following:—(1) Disobedience of inferior judges and magistrates; (2) Wrongdoing by sheriffs, bailiffs, jailers, and other officers in executing the process of the law; (3) Malpractice of attorneys and solicitors; (4) Misbehaviour of jurymen in collateral matters relating to the discharge of their duties; (5) Misbehaviour of witnesses; (6) Disobedience of parties in a cause to an order of the court, non-payment of costs, non-observance of awards; (7) Those committed by other persons. Among those general contempts some, says Blackstone, "may arise in the face of the court, as by rude and contumelious behaviour, by obstinacy, perverseness, or prevarication, by breach of the peace, or any wilful disturbance whatever; and others in the absence of the party, as by disobeying or treating with disrespect the king's writ or the rules and process of the court, by perverting such writ or process to the purposes of private malice, &c., by speaking or writing contemptuously of the court or judges acting in their judicial capacity, by printing false accounts (or even true ones without proper permission) of causes depending in judgment," &c.

The practice of the courts in punishing the last class of contempts is of great importance in these days, inasmuch as it involves the question of the liberty of the press. It will be seen from the following statement that the judges have assumed very extensive and arbitrary powers of interfering with the free discussion by the public of the proceedings in courts of justice.

A judgment prepared by Lord Chief-justice Wilmot in the case of an application for an attachment against J. Almon in 1765, for publishing a pamphlet libelling the Queen's Bench, is, although it never was delivered in court, constantly referred to as authoritative by later judges and writers. The chief-justice said that the offence of libelling judges in their judicial capacity is the most proper case for an attachment, for the "arraignment of the justice of the judges is arraigning the king's justice; it is an impeachment of his wisdom and goodness in the choice of his judges; and excites in the minds of the people a general dissatisfaction with all judicial determinations, and indisposes their minds to obey them. To be impartial, and *to be universally thought so*, are both absolutely necessary for the giving justice that free, open, and uninterrupted current which it has for many ages found all over this kingdom, and which so eminently distinguishes and exalts it above all nations upon the earth." Again "the constitution has provided very apt and proper remedies for correcting and rectifying the involuntary mistakes of judges, and for punishing and removing them for any perversion of justice. But if their authority is to be trampled on by pamphleteers and news-writers, and the people are to be told that the power given to the judges for their protection is prostituted to their destruction, the court may retain its power some little time, but I am sure it will eventually lose all its authority." In several cases the judges have declared that while their administration of justice may be discussed fairly and *bona fide*, it is not open to a journalist to impute corruption. A recent writer (Shortt, *Law relating to Works of Literature*) states the law to be that the temperate and respectful discussion of judicial determination is not prohibited, but mere invective and abuse, and still more the imputation of false, corrupt, and dishonest motives is punishable. In an information granted in 1788 against the corporation of Yarmouth for having entered upon their books an order "stating that the assembly were sensible that Mr W. (against whom an action had been brought for malicious prosecution, and a verdict for £3000 returned, which the court refused to disturb) was actuated by motives of public justice, of preserving the rights of the corporation to their admiralty jurisdiction, and of supporting the honour and credit of the chief magistrate," Mr Justice Buller said, "The judge and jury who tried the case, confirmed by the Court of Common Pleas, have said that instead of his having been actuated by motives of public justice, or by any motives which should influence the actions of an honest man, he had been actuated by malice. These opinions are not reconcilable; if the one be right the other must be wrong. It is therefore a direct insinuation that the court had judged wrong in all they have done in this case, and is therefore clearly a libel on the administration of justice." Many of the doctrines expressed in the above extracts go beyond the practice, if not the strict law of later times. The tendency has been to restrict the process of contempt to cases in which judges are insulted or defied in the discharge of their duties, or in which matters relating to a pending cause are publicly discussed. Bribes or menaces offered to the judges have been punished as contempts. In a recent case a judge of assize having ordered the court to be cleared on account of some disturbance, the high sheriff issued a placard protesting against "this unlawful proceeding," "and prohibiting his officers from aiding and abetting any attempt to bar out the public from free access to the court." The lord chief-justice of England, sitting in the other court, summoned the sheriff before him and fined him £500 for the contempt, and £500 more for persisting in addressing the grand jury in court, after he had been ordered to desist.

The difference between pending and decided cases has been frequently recognized by the courts. What would be a fair comment in a decided case may tend to influence the mind of the judge or the jury in a case waiting to be heard, and will accordingly be punished as a contempt. This is distinctly laid down in the case of Tichborne *v.* Mostyn, where the publisher of a newspaper was held to have committed a contempt by printing in his paper extracts from affidavits in a pending suit, with comments upon them. In the case of the Queen *v.* Castro, it was held that after a true bill has been found, and the indictment removed into the Court of Queen's Bench, and a day fixed for trial, the case is pending; and it is a contempt of court to address public meetings, alleging that the defendant is not guilty, that there is a conspiracy against the defendant, and that he cannot have a fair trial; and the court will order the parties to answer for their contempt, and fine or imprison them at discretion. In another case the publication of a winding-up petition, containing charges of fraud, before the hearing of the petition was held to be a contempt of court. The courts may, if they choose, prohibit any publication of their proceedings while the litigation is pending. It is now the invariable rule of the English press to refrain from expressing an opinion on matters relating to any pending suit. On the other hand, the discussion of decided cases shares in the licence now allowed to the expression of opinion on all public affairs in England.

The Scotch and colonial courts exercise the same power of committing for contempt as the English. It has been held in a case arising under the County Court Act, that inferior courts of record have only power over contempts committed *in facie curiæ*. The county court judge has no power of proceeding against a person for a contempt committed out of court.

The proper punishment of contempt is by fine or imprisonment at the discretion of the court. In a recent case it was held that no person can be punished for contempt, unless the specific offence charged against him is distinctly stated, and an opportunity given him of answering it. When a barrister had been suspended from practice by the supreme court of Nova Scotia for addressing a letter to the chief justice which was a contempt of court, the Privy Council on appeal discharged the order, as substituting a penalty and mode of punishment which was not the appropriate and fitting punishment for the offence. The letter was written by the defendant in his individual capacity of suitor, and had no connection with his professional status or character.

Blackstone notices the exceptional character of the punishment provided for this offence. "It cannot have escaped the attention of the reader," he says, "that this method of making the defendant answer upon oath to a criminal charge is not agreeable to the genius of the common law in any other instance." There can be no doubt that the discretionary power of judges to punish summarily by fine or imprisonment offences committed against their own dignity is liable to abuse, and careful as English judges are in enforcing it, a trial and conviction in the ordinary manner would probably be more satisfactory. The offence is by no means clearly defined, but it will be generally agreed that it is desirable to prevent and punish insulting expressions and disorderly conduct in courts of justice, as well as any such publications as may really tend to prejudice a pending cause. A judge may safely be intrusted with the power of keeping order in his court, but contempts committed elsewhere should be proceeded against like other offences.

A similar power of punishing for contempt is exercised by the two Houses of Parliament. The question was discussed in the case of Burdett *v.* Abbott, where Lord Ellenborough said, "Can the High Court of Parliament, or either of the two Houses of which it consists, be deemed not to possess intrinsically that authority of punishing summarily for contempts which is acknowledged to belong, and is duly exercised as belonging, to every superior court of law of less dignity doubtless than itself?" It was at one time held that the "privilege of committing for contempt is inherent in every deliberative body invested with authority by the constitution;" and that accordingly it extended to colonial assemblies. This opinion has been overruled by subsequent decisions. Baron Parke, in the case of Kielley *v.* Carson, says that the power of punishment for contempt attaches to bodies having judicial functions, and is an incident of those functions, except only in the case of the House of Commons, whose authority in this respect rests upon ancient usage. The Legislative Assembly of Victoria is entitled by enactment to the privileges, immunities, and powers held, and enjoyed, and exercised by the English House of Commons. Where a legislative assembly has the power of committing for contempt, the punishment lasts only till the end of the current session. "Though the party should deserve the severest censure," says Lord Denman, "yet his offence being committed the day before a prorogation, if the House ordered his imprisonment but for a week, every court in Westminster Hall, and every judge in all the courts would be bound to discharge him by *habeas corpus*." See PRIVILEGE. (E. R.)

CONTI, PRINCE OF, the title assumed by a younger branch of the House of Condé. Armand de Bourbon, prince of Conti (1629–1666), one of the princes of the blood who took part in the wars of the Fronde, was son of Henry, prince of Condé, and brother of the Great Condé. Originally destined for the church on account of the weakness of his health and the deformity of his person, he received several rich benefices, and studied at the Sorbonne, but did not enter into orders. Wanting in strength of character, he was throughout life the follower of his sister, the duchess of Longueville, whose influence over him was such as to give rise to scandal. He was induced by her to join the old Fronde, and was appointed commander-in-chief of its forces during the siege of Paris (1648); but he contented himself with riding every day at their head through the streets, never failing to leave them as they passed out of the gates. At the end of the contest the whole Condé family came into political agreement, and Conti shared his brother's imprisonment (1650). After his release his engagement to be married to the profligate Mlle. de Chevreuse was broken off by the prince of Condé, who had been won over to the court party by extravagant promises. In Condé's second rebellion Conti was concerned; but when the former fled to Spain, he made his peace with the court, married Mazarin's niece, and obtained the government of Guienne, together with the command in Catalonia, in which latter capacity he was not distinguished. He followed his sister in her conversion, entering into all her enthusiastic views, and maintaining constant correspondence with her. He wrote *Du devoir des grands et des devoirs des gouverneurs de province*; *Lettres sur la grace*; and *Traité de la comédie et des spectacles selon la tradition de l'Eglise.* (See the numerous *Mémoires* of the time and the *Lettres de Mme. de Sévigné.*) His second son, François Louis, prince of Conti (1664–1709), fought with much distinction in several campaigns; and, being distinguished by information, wit, attractive manners, and never-failing affability, he enjoyed, heartless as he was, a wonderful popularity. But this very popularity, together with a sneer he had incautiously uttered against the king, caused his banishment to Chantilly. In 1697 he was elected king of Poland, but on reaching that country he found the throne in the possession of the elector of Saxony, and at once retired without making any attempt to dispossess his rival. (See the *Mémoires de Saint-Simon*, and Desormeaux, *Histoire de la Maison de Bourbon.*) Louis François, prince of Conti (1717–1776), the grandson of François, was a brave and popular general. He was engaged in the war caused by the claims of Maria Theresa to the imperial throne; he commanded the army which crossed the Alps into Italy and defeated the Sardinians in 1744; and he also served in Germany and Flanders in 1745 and 1746. Not, however, being allowed to take part in the Seven Years' War, he supported the Parliament of Paris against the court, and earned the nickname of "the Advocate." His son was the last of the house of Conti.

CONTRABAND (Low Latin, *contrabannum*) means, according to Ducange, "merces *banno* interdicta," and was originally applied to a prohibited domestic trade in time of peace, such as that in salt. The term does not occur in the *Guidon de la Mer*, or in Grotius, and is first used to denote a prohibited neutral trade with a belligerent in the Treaty of Southampton (17th September 1625) between Charles I. and the States-General of Holland. That treaty declared that all provisions (*munitions de bouche*), provisions of war, ships, arms, sails, &c., silver, iron, &c., carried to Spanish ports, would along with the carrier ships and their crews be good prize. It was partly from the general use of such treaty-stipulations with neutrals, and partly from the custom of belligerents at the beginning of a war to issue declarations which they formally intimated to neutrals, and which forbade all trade in certain articles with the ports of their enemies, that the international law of contraband grew up. An example of the latter mode of proceeding is the "Placaart" issued in 1599 by the States-General, which, like the Berlin Decrees, completely interdicted all trade with Spain. The Treaty of Southampton itself was followed by two proclamations, which assume a belligerent right to place restrictions on neutral commerce, and which go the length of authorizing private ships to capture neutral bottoms carrying contraband. The practice of contraband is of course much older than the name. Thus in the Code of Justinian (iv. 41, 42) Marcian prohibits the sale to *barbari alienigenæ* of oil, wine, several specified kinds of arms, and generally of iron. So also the Decretals, Gregory IX. (v. 6–12), and the Bull "In Cœna Domini," c. 7, denounced excommunication against such as should supply Saracens with arms. It is in the 17th century that the military policy and commercial interests of the various European nations begin to be indicated in their treaties relating to contraband. Opinion varied so much with the political situation, that it is difficult to extract from these treaties the prevailing custom even of a single nation. At first provisions, that is corn, &c., seem generally to have been excluded from the list, and in 1674 a great English lawyer, Sir Leoline Jenkins, told Charles II. that nothing ought to be deemed contraband "but what is directly and immediately subservient to the use of war, except it be in the case of besieged places" (which raises the distinct question of blockade), or of a "general certification by Spain to all the world." The definition of the French Ordonnance de la Marine of 1681 is also limited to munitions of war, and even to such as have "la forme d'un instrument pouvant servir directement à l'usage de la guerre." On the other hand, the early writers on contraband, such as Dr Zouch (*De Jure Fetiali*, 1634) and Albericus Gentilis (*Advocationes Hispanicæ*), in discussing the question "An res amicorum ad hostes transeuntes intercipere liceat?" seem to assume that the belligerent has, apart from treaty, a right indefinitely to vary the list of articles constituting munitions of war, and it is clear that the test of "immediate subserviency" must vary with the character of the hostilities, the resources of the combatants, and the actual position of the conflict. In 1543 the English envoy, Sadler, challenged the Scotch fish trade to France as a species of "aid," a word often used in the older treaties of alliance, but which can scarcely have been intended to cover the case of habitual trade; and in 1589 Queen Elizabeth successfully justified the capture of a fleet of sixty vessels, belonging to the Hanse confederation, and carrying corn and naval munitions to Spain.[1] In all these cases some ordinance, placaart, or treaty was appealed to, but these documents were of course liable to *ex post facto* interpretation, and such interpretations were acquiesced in from necessity or from motives of policy. A powerful neutral, dissatisfied with the decision of the captor's prize court, might issue letters of reprisal. This was done by England when a cargo of tobacco, bound for Holland, was condemned in Spain on the ground that by its use "the consumption of victuals might be prolonged." The general principle, before the writings of Grotius permanently affected the public law of Europe, was, therefore, that the private right of neutral merchants to free trade must yield to the public right of the belligerent to put such limits on neutral trade as were reasonably necessary in the conduct of war,—that right being exercised in a public and legal manner. After the Peace of Westphalia, the grand pensionary of Holland, John de Witt, contended strongly for the extension of neutral rights, and in 1662 by treaty with France the Dutch adopted the definition of contraband in the 12th and 13th articles of the Treaty of the Pyrenees between France and Spain (1659), which included munitions of war, and specially excluded almost everything in the nature of ordinary provisions. For some time England maintained (as in her Treaty of Whitehall with Sweden, 1661) the doctrine that money, ships, and provisions were to be deemed contraband, but in her Treaty of Breda with Holland (1667), and her Treaty of St Germain-en-Laye with France (1677), she practically adopted the rule of the Pyrenees, with this extension, that the neutral trade might take place even between two enemy ports, provided neither was blockaded. This explains the singular agreement made by England and Holland in 1689 for a wholesale blockade of the ports, harbours, and roadsteads of France. The treaties of the 18th century proceeded for the most part on the Treaty of Utrecht, "which embodied the French doctrine of contraband" (Hall, *Rights and Duties of Neutrals*, 1874). As, however, some powers never contracted with each other on the subject, and as the treaties made were for limited periods, and were often broken by the outbreak of war, there was plenty of room for controversy and for the enforcement of national opinions. The classical division of contraband by Grotius was as follows: "Sunt res quæ in bello tantum usum habent, ut arma; sunt quæ in bello nullum habent usum, ut quæ voluptati inserviunt; sunt quæ et in bello et extra bellum usum habent, ut pecuniæ, commeatus, naves, et quæ navibus adsunt." The only difficulty arises in connection with the third class, of which Grotius says that the state of the war must be considered, and that "if seizure is necessary for defence, the necessity confers a right of arresting the goods" (*De Jure Belli et Pacis*, iii. 1. 5). A leading question in the 18th century was whether naval stores should be deemed contraband, the

[1] Continental jurists called this an attempt to starve Spain out.

Baltic powers (supported by the writings of Heineccius and Valin) inclining to the affirmative, while Bynkershoek (*Quæst. Jur. Pub.* i. 10, 1737) and Lampredi (*Del Commercio dei Popoli Neutrali in Tempo di Guerra*, § 70) maintained, in conformity with the 20th article of the Treaty of Utrecht, that goods, though possibly of warlike use, were not contraband, if not worked into the form of an instrument of war. Other authors, as Vattel (*Droit des Gens*, iii. 7, 112) and Heineccius (*De navibus ob vecturam vetitarum mercium commissis, Comm.* xiv.), attached great value to the fact of urgent need among the enemy—"si hostis laboret inopiâ"—and were prepared on this ground even to include provisions as contraband. The first armed neutrality of 1780, alarmed by the growing naval power of Great Britain, declared that only munitions of war and sulphur should be contraband. (This is the *kriegs-contrebande* of German jurists. See Lord Grenville's *Letters of Sulpicius Ward.*)[1] In 1793 both England and France made large seizures of provisions, the former pretending that there was a chance of reducing France by famine, and the French executive having assumed the direction of the whole corn trade of their country. Both sides were wrong, and were nobly rebuked by the counter declaration of the Danish minister, Count Bernstorf, in which he explained that a neutral was neither a party nor a judge, and could take no notice of a reciprocity of injuries. The United States also energetically protested against the notion that provisions, not destined to a blockaded port, could in any circumstances be contraband,—a position inconsistent with the modern American doctrine that an actual *military* destination even of luxuries will impress on the cargo a contraband character. The second armed neutrality of 1800 took up the same position as the first; and in 1803 England and Russia agreed that money, horses, ships, and manufactured articles for naval use were to be confiscated, naval stores, the produce of either country, being brought in for pre-emption. The only existing treaties of England on this subject are those with Portugal in 1820 (munitions of war, sulphur, horses, money, and naval stores) and with Brazil in 1827 (munitions of war and naval stores). Throughout the French wars, however, the law administered by Lord Stowell and others in the English prize court was much harsher than the treaty obligations of the nation. The circumstances which Lord Stowell considered favourable to a cargo were these:—1. Its being the product of the neutral country, and therefore a natural export; 2. Its being in an unmanufactured state, as hemp or iron; 3. Its destination to a commercial not a military port ("Jonge Margaretha," 1 *Rob. Adm. Rep.*) Among modern jurists Ortolan (*Diplomatie de la Mer.*, ii. 190) and Heffter (*Le Droit International*, § 160), as quoted by Hall, agree that contraband cannot be limited to munitions of war, but must extend to raw materials and merchandize, if clearly destined for actual and immediate military use. Ortolan expressly excludes provisions under all circumstances, but the tendency of modern decision is to bring all articles to the test proposed by Mr Dana, the editor of Wheaton,—"the right of the belligerent to prevent certain things from getting into the military use of the enemy,"—a principle which is obviously independent of the innocent or fraudulent intention of the owner of the cargo. Mr Hall proposes a classification of contraband goods, not being munitions of war, based on their more or less intimate connection with military operations. Among these he includes horses, saltpetre, sulphur, materials of naval construction, such as timber, cordage, pitch (stated by the British Government during the Crimean war to be contraband), marine engines, &c., and coal, if its immediate destination be military. Thus in the Franco-German war, 1870, vessels laden with coal were forbidden to sail from English ports to the French fleet in the North Sea. France, on the other hand, still holds by the decision in the case of "Il Volante" (an Austrian ship laden with *bois de construction* from Lisbon to Messina, and captured in 1807 by the French cruiser "Etoile de Bonaparte"), that ship's timber and naval stores are not contraband. Provisions of very various kinds, biscuits, cheese, wine, corn have both in England and America been held contraband (The "Commercen," 1 *Wheaton's Reports*).[1] A ship, available for war, and sent to an enemy's port with instructions either to sell or charter, has been condemned in England. The general subject of ships, however, belongs to the subject Neutrality. With regard to clothing, money, and unwrought metals, there are no recent decisions, but the rule would probably be applied that they may become contraband in certain circumstances. The ordinary penalty of carrying contraband is confiscation of cargo, but where the capture is only justified by special circumstances, or, as it is sometimes expressed, where the contraband is "conditional," and where the cargo is ordinary neutral produce, and there is perfect *bona fides* of the owner, the ship is merely carried in for pre-emption, which means the owner's value *plus* 10 per cent., with indemnity for freight and expenses of detention. Anciently, in cases of absolute contraband, both ship and cargo were forfeited; it is said Russia still does this. The right of pre-emption (*droit d'achat*) is stated by Lord Stowell to apply to all cargoes whatever bound for an enemy's port; and it is settled that any attempt at fraud, as false papers, or a concealed destination, will disentitle the owners to compensation. The same circumstances occurring in the case of a cargo of absolute contraband, even where the ship does not belong to the owner of the contraband, may forfeit the ship.

It will be remembered that the blockade runners of the American civil war raised very nice questions on this point. It was impossible to prove that these vessels after leaving Nassau were not going to Matamoras in Mexico, for they had only a floating intention of "running." The question, therefore, which came before the Supreme Court of the United States in the "Bermuda" and "Peterhoff" cases was whether the interposition of a neutral port between the neutral point of departure and the belligerent destination did protect the cargo which was admitted to be contraband There could be little doubt that the goods went straight through Texas to the Confederate States. But in several cases these cargoes were not condemned. The "Peterhoff's" cargo was army boots, artillery harness, regulation blankets, chloro form, and quinine.

Where the shipowner is innocent and does not own the cargo, he merely loses his freight and expenses. Contraband articles also involve innocent parts of a cargo in confiscation when both belong to one owner. The United States and Prussia are the only powers that have chosen the bold plan of entirely renouncing by treaty between themselves the right of confiscation, for which they have substituted an unlimited right of stoppage and detention and appropriation, subject to full compensation. This is an arrangement which may probably become more common, and will of course much weaken the effects of the law of contraband. It is impossible to prevent the seizure of private property in war, but it has been suggested that the value should be

[1] *Essay on Contraband*, London, 1801; Lord Liverpool's *Discourse on the conduct of the Government of Great Britain in respect to Neutral Nations*, London, 1801.

[1] The "Commercen" was a Swedish vessel, carrying English provisions to a Spanish port for delivery to the British commissariat in the Peninsular War. Sweden and Spain were British allies in the war with France, but neutral in the war with the United States, and there was no alliance between France and the States. The particular cargo was therefore (unjustly) condemned as enemy's goods, but doctrines were laid down as to contraband.

at once paid over by the captor's government to the neutral government for distribution. There is only one case in which a return cargo has been confiscated on the ground that the outward cargo was contraband, with fraudulent papers and fraudulent destination; the voyage was a long one,—to the East Indies. Where a neutral vessel carries despatches to a belligerent, as the ship has become a quasi-servant of the enemy, the captor generally not only seizes the papers but confiscates the ship. Despatches from or to accredited diplomatic agents or consuls residing in a neutral country do not fall under this rule, the neutral having an interest in their safe transmission. But ignorance of the contents of despatches addressed to military officials, or unaccredited agents, will not excuse their carriage. Even where the despatches have been received through force or imposition, the English prize court holds that the carrier is liable, because his suspicions ought to have been roused. A very difficult question rose in the American civil war with regard to the searching of mail bags. If the right were renounced absolutely, all belligerent despatches would choose this safe route. It was arranged that all British mails, certified to be such, should on capture be forwarded unopened. The carriage of persons in the service of a belligerent also leads to confiscation of the ship, if it amount to an intentional assistance of the belligerent. The persons carried may be mere civilians, and the port of destination neutral. The most common case is the carriage of soldiers. The exception to this rule is the case of transport of diplomatic agents, which is generally recognized as lawful, but which in the Trent affair the United States Government repudiated.

Besides the works mentioned the following may be consulted:—Twiss, *On the Rights and Duties of Nations in Time of War;* Phillimore, *Commentaries on International Law*, iii., where the literature of the subject is fully noticed; Wheaton's *Elements of International Law; Neutrality Laws Commissioners' Report*, State Papers, 71, 1871. (W. C. S.)

CONTRACT is a bargain or agreement enforceable by law. The law of contract occupies so large a space in all civilized systems of law, that only a few of its more leading principles can be conveniently stated here. There is a general harmony in the jurisprudence of modern nations on this subject which is not to be found in other departments of law. The following definitions are taken from the Indian Contract Act, 1872:—

a. When one person signifies to another his willingness to do or abstain from doing anything with a view to obtaining the assent of that other to such act or abstinence, he is said to make a proposal.

b. When the person to whom the proposal is made signifies his assent thereto, the proposal is said to be accepted. A proposal when accepted becomes a promise.

c. The person making the proposal is called the promiser, the person accepting the proposal the promisee.

d. When at the desire of the promiser, the promisee or any other person has done or abstained from doing, or does or abstains from doing, or promises to do or abstain from doing something, such act or abstinence or promise is called the consideration for the promise.

e. Every promise and every set of promises forming the consideration for each other is an agreement.

f. Promises which form the consideration or part of the consideration for each other are called reciprocal promises.

g. An agreement not enforceable by law is said to be void.

h. An agreement enforceable by law is a contract.

i. An agreement which is enforceable by law at the option of one or more of the parties thereto, but not at the option of the other or others, is a voidable contract.

j. A contract which ceases to be enforceable by law becomes void when it ceases to be enforceable.

These definitions, with some changes of expression in the direction of greater precision, are in effect the same as those which are found in English law books. The phrase "void contract," which would be a contradiction in the Indian definitions, is frequently used in English law.

The exchange of proposals and acceptances by correspondence gives rise to some peculiar difficulties. An offer or proposal may be revoked any time before acceptance; and it is revoked when notice to that effect is given to the promiser. So much is clear and free from difficulty. But when letters containing proposals or acceptances are delayed or misdirected, it is not very easy to say whether there has been a contract or not. When A wrote to B, "I offer you 800 tods of wether fleeces, &c.," "receiving your answer in course of post," but misdirected the letter, which arrived late, and B's answer accepting the offer not arriving at the expected time, A sold the goods to some one else, it was held that as the delay was caused by A's default, it must be taken as against him that the answer did not arrive in course of post (Adams *v.* Lindsell, 1 B. and Ald. 681). In cases following this some of the judges seem to be inclined to hold that a proposer is bound by an acceptance being posted to him whether it reaches him or not, and others that he is not bound unless he actually receives the acceptance. An acceptance of a proposal must be unqualified, otherwise there is no contract; the introduction of a new condition by the acceptor, or a reference to something still to be done, prevents the contract from being completed. To constitute a contract the terms must be certain; *e.g.*, an agreement to take a house, "if it were put into thorough repair, and the drawing-rooms handsomely decorated according to present style," has been rejected as too vague. A contract of course may be concluded by mere conduct, without the exchange of a single word, and multitudes of contracts in small matters of constant occurrence are so concluded. These are called *implied contracts*—a phrase, however, which covers two very different things—(1) a real contract which may be inferred as a fact from the conduct of the parties, and (2) a quasi contract, in which the law will treat the parties as if they had made a contract.

Certain classes of persons are under peculiar disabilities in matters of contract, viz., infants, lunatics, and married women. 1. As a general rule at common law contracts made by an infant (a person under twenty-one years) are voidable, unless they are in some way for his benefit, and in particular for "necessaries." By the Infants' Relief Act, 1874, contracts for repayment of money lent to infants, or for payment of goods other than "necessaries," are made absolutely void; and no action can be brought, even if they are ratified after full age and for a new consideration. The question what are necessaries is to be decided by the court and jury on the circumstances of the case, including particularly the rank in life of the infant. The protection of infants has been extended by the Court of Chancery to "expectant heirs" as they are called, *i.e.*, persons who borrow money on the credit of their expectations. The principle is a survival from the times when usury was considered wrongful, and the preservation of great families a public duty, and is utterly indefensible on any other considerations. 2. A married woman, being in the eye of the law merged in her husband, cannot bind herself by contract. 3. Contracts made by a lunatic are voidable, except where his state of mind was not known to the other contracting party. The principle is extended to drunkenness. For further information as to such disabilities see under the respective headings. The general rule as to corporations is that they can only make binding contracts under their common seal, excepting in cases of "convenience almost amounting to necessity" (see CORPORATIONS).

Of the technical terms mentioned above the most important, and certainly the most characteristic, of English law is *consideration.* A consideration is essential to the validity of every contract unless it be made in writing under seal. The meaning of the word is quite accurately expressed by a phrase used in one of the earliest cases on the subject—it is strictly a *quid pro quo.* Something, whether it be in the nature of an act or a forbearance, must move from one of the parties in order to support a promise made by the other. A mere promise by A to give something to B cannot be enforced unless there is some consideration "moving from B." Such a promise the early lawyers called a nude or naked promise—in imitation of the phrase in Roman law, *nudum pactum,* which does not, however, mean a promise unsupported by a consideration, but a contract destitute of certain essential legal formalities. But while every contract requires a consideration, it is held that the court will not inquire into the adequacy thereof; any consideration will do. Inadequacy of consideration, however, may be important where a contract is to be set aside on the ground of fraud.

Modern English law requires no formalities to make a contract enforceable, unless in certain special cases. The ancient rule both in early English and Roman law made certain formalities essential, unless in certain special cases. The ancient rule is thus the modern exception. The exceptions to the general rule in English law are the following:—

1. Contracts within the Statute of Frauds, 29 Car. II. c. 3.—The fourth section of this important Act specifies certain classes of contracts in which "no action shall be brought" unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized. Such contracts are—(1) any special promise by an executor or administrator to answer damages out of his own estate; (2) any promise to answer for the debt, default, or miscarriage of another person; (3) any agreement made on consideration of marriage; (4) any contract or sale of lands, tenements, or hereditaments, or any interest in or concerning them; (5) any agreement that is not to be performed within the space of one year from the making thereof. The 17th section enacts that no contract for the sale of any goods, wares, or merchandise for the price of £10 sterling or upwards shall be allowed to be good, except the buyer shall first accept part of the goods so sold, and actually receive the same, or shall give something in earnest to bind the bargain or in part payment; or unless some memorandum or note in writing of the said bargain be made and signed by the parties to be charged, or their authorized agents. The difference between the two sections should be noted. Contracts under the 17th section are simply void; contracts under the 4th are not void, but they are not enforceable. The 4th section is a law of procedure, and therefore a contract of the kind specified therein validly made in a foreign country could not be enforced in England, whereas a valid contract made abroad, which would be wholly void if made in England, under the 17th section, might be enforced in England. And again, money paid under an agreement made unenforceable by section 4 could not be recovered back.
2. Contracts of corporations, already alluded to.
3. Negotiable instruments, which must, of course, be in writing.
4. Other cases in which writing is required are transfer of ships, assignments of copyright, and ratification of debts barred by the Statute of Limitations.

To contracts made by deed (*i.e.,* under seal) the law attributes certain qualities which do not belong to simple contracts, *i.e.,* contracts whether verbal or in writing without seal. The peculiar properties of a deed are thus described:—"It works a merger; it operates by way of estoppel; it requires no consideration to support it; it will in some cases bind the heir of the covenanter or obligor; it can only be discharged by an instrument under seal, by the judgment of a court of competent authority, or by Act of Parliament." The language of the law-books is that from the solemnity of a deed the law itself will imply the existence of a consideration, a formula designed to bring the exceptional case of deeds within the general legal theory of consideration, and by no means to be accepted as an historical explanation. The subordinate agreements in a deed are termed covenants. The formal definition, as given in Platt on *Covenants,* is "an agreement between two or more persons by an instrument in writing sealed and delivered, whereby some of the parties engage, or one of them engages with the other or others of them, that some act hath or hath not been already done, or for the performance or non-performance of some specified duty." See DEED.

An agreement is said to be void for impossibility when the thing contemplated is in itself impossible, as contrary to the course of nature, and when it is by construction of law impossible, *e.g.,* to create a new manor. But when the thing is not in itself impossible, but is or becomes impossible in fact, an unconditional agreement is not thereby void. Thus a contract to load a full cargo of guano at a certain island does not become void by the fact that there is not enough guano on the island to make a full cargo. In a recent case (Thorn *v.* Lord Mayor of London) a contractor, who had undertaken to build a bridge according to specifications supplied by defendant, found it impossible to execute part of the work according to specification, and it had to be executed in another way. It was held that there was no condition that the plans should be reasonably practicable, and the plaintiff was not allowed to recover for work executed in an impossible attempt to comply with the specifications. In another case, a contractor bound himself under penalties to finish some buildings within a certain time, with any alterations and additions required by the defendants, and no extension of time was to be allowed for such alterations, unless expressly granted by defendants. It was held that the contractor could not excuse himself for non-completion within the proper time by showing that the alterations and additions made it impossible.

Besides the contracts which are void through defect of form or want of capacity in the parties, there is a large class of agreements which the law refuses to recognize on account of the character of the contemplated action. These may be reduced to three main divisions—*illegal* contracts, when the thing to be done is forbidden by law; *immoral* contracts, when the consideration belongs to the indefinite class of things recognized as immoral; and contracts, *against public policy, i.e.,* certain wide and more or less indefinite principles of government. In some cases, the act of agreement is in itself a criminal offence, for which see CONSPIRACY. An agreement to commit an offence, as to burn a house, or kill a man, or an agreement to do a civil injury to another, would be illegal. Promises made in consideration of illicit cohabitation in the future are void as immoral; if the consideration is illicit cohabitation in the past, it is of course no consideration, and a promise founded upon it will be void unless expressed in a deed. Of agreements which are void as being against public policy, the most important class is that of contracts in restraint of trade. The leading authority on this subject is the case of Mitchell *v.* Reynolds (1 *Smith's Leading Cases*). The law, it seems, is so jealous of the freedom of the trader, that it will not allow him to part with it on any consideration. "It is the privilege of a trader in a free country, in all matters not contrary to law, to regulate his own mode of carrying it on according to his own discretion and choice. If the law has regulated or restrained his mode of doing this, the law must be obeyed. But no power short of the general law ought to restrain his free discretion." It has been suggested that the rule dates from a time when a covenant by a man not to exercise his own trade meant a covenant not to exercise any trade at all,—every man being obliged to confine himself to the trade to which he had been apprenticed. At any rate, it is difficult to reconcile this protection of the individual will, carried to the point of absolutely limiting its exercise in one class of cases, with modern principles as to freedom of trade and contract. And the law itself breaks in upon its own theory by admitting that contracts which are only in *partial* restraint of trade may be good. A contract not to carry on the business of an ironmonger would be bad; but a contract made by the seller of an ironmonger's business not to compete with the buyer would be good. It is held that to make such a promise binding, it must be founded on a valuable consideration, must not be unlimited as to the area over which the restriction is to extend, and must not otherwise go beyond what is reasonably necessary for the protection of the other party. On the whole, it would be simpler to leave individuals to make what contracts they please in this as in other matters. The public policy which disallows contracts in restraint of marriage depends on a different set of considerations. A contract not to marry at all is void; in one case it is described as a contract to omit a moral duty, and tending to depopulation, "the greatest of all political sins." But apparently a contract by a widow not to marry is not void. The whole doctrine of public policy appears to have grown up out of the efforts of judges to counteract the admission of wagers in the common law as legal contracts. In their desire to avoid enforcing them in particular cases, they developed a theory of state interests of startling wideness and originality. A wager about the death of Napoleon I. was held void because it gave one party an interest in keeping the king's enemy alive, and the other an interest in putting him to death. (See Pollock on *Contracts*, p. 252.)

Contracts may be vitiated by mistake, misrepresentation, fraud, undue influence, &c. Mistake, to avoid a contract, must be such that there was no real agreement at all, or that the real agreement was erroneously expressed; and money paid under a mistake as to fact may be recovered. The general rule is that relief will be given against mistake as to fact, but not against mistake in law. Contracts induced by fraud, misrepresentation, &c., are in general not void but voidable at the instance of the party injured or imposed upon.

The common law did not permit the benefit of contracts to be assigned so as to give the assignee a right of action in his own name—a right which was, however, recognized in equity. By the Judicature Act, 1873, section 6, a legal right is created in the assignee when the assignment is absolute and in writing, and notice in writing given to the debtor.

The only remedy for breach of contract given by the common law was an action for the sum certain due by the defaulter, or for damages, to be ascertained by a jury. The mere payment of damages would in many cases not be a complete satisfaction to the other party, and the Court of Chancery accordingly gave in certain cases decrees for the specific performance of the contract.

The best English works on Contract are those by Addison, Chitty, and S. Martin Leake. The *Principles of Contract at Law and in Equity*, by F. Pollock, is a recent work of great merit. (E. R.)

CONVERSANO, an episcopal city of Italy, in the province of Terra di Bari, and 20 miles south-east of the city of Bari, with about 10,000 inhabitants. It has a castle, a cathedral, several convents, a diocesan seminary, a hospital, and a foundling asylum. Some trade is carried on in wine, oil, almonds, and cotton.

CONVEYANCING, the art of preparing writings to effect the transference or conveyance from one person to another of any piece of property or valuable right. It is sometimes applied in a restricted sense to the cumbrous forms which the feudal system has rendered necessary for the transference and tenure of landed property. When left to shape itself by individual practice, without legislative intervention, there were several causes rendering such conveyancing cumbrous and complex. The theory of the feudal tenures and hierarchy remaining unchanged throughout the social revolution which had virtually abolished superiority and vassalage, and brought land out of feudality into ordinary commerce, it became necessary to retain the feudal ceremonies of the Middle Ages, and to adapt them by fictions and explanations to modern exigencies. Hence, many years have not yet passed since, in Scotland, when a field was bought and sold, a party of men assembled on it, and went through the old form of symbolic investiture by the delivery of so much earth and stone from the superior bailiff to the vassal's attorney, who took instruments and had the whole recorded at length by a notary of the empire. In England, from the want of the general system of registration known in Scotland, the complexities of conveyancing had become so inextricable, that one of the most approved forms of transference was a fictitious suit and judgment of possession called a fine and recovery. To these innate sources of complexity must be added the timidity of conveyancers, who, afraid to commit themselves by attempting to abbreviate or reconstruct the forms which they find in existence, repeat them with additions from time to time as new circumstances must be provided for. Hence, to keep conveyancing within rational bounds, the legislature must interfere from time to time to sweep away excrescences, and provide brief and simple forms. This, however, is a task which cannot be easily accomplished, since it requires the very highest legal skill to adjust simple forms to all exigencies, and anticipate the various shapes in which property may fall to be dealt with. This service has been on various occasions performed by distinguished lawyers; and, while it is productive of the greatest benefits to society, it is one of the public services least susceptible of popular appreciation. In 1834 the Act abolishing fines and recoveries created a reform of this kind in the conveyancing of England, and a series of statutes passed in 1847 purified and simplified the conveyancing of Scotland.

An attempt was made in 1862 to simplify the practice of conveyancing by two Acts—one entitled an Act to Facilitate the Proof of Title to and Conveyance of Real Estate, and the other the Declaration of Title Act, 1862. The former (called also the Land Registry Act) provided for the registration of real estates and of the title thereto. The latter was intended to enable persons having interests in land to obtain a declaration of their title by which they could give an indefeasible title to any person purchasing from them. Both statutes have failed; of the latter a standard book of practice says, "it is deemed unnecessary to detail its provisions." A commission, reporting in 1868, attributed the failure of the Registry Act to the principle of registering indefeasible titles only. The "Act aimed at a standard of certainty and perfection of title beyond what is ordinarily required in conveyancing transactions, and hence as a natural consequence instead of facilitating it was found in practice to impede the transfer of land." Another attempt has been made by the Land Transfer Act of 1875, which allows the registration of a possessory, as well as of an absolute, title. It is the opinion of an eminent conveyancer that the statute will probably achieve a success greater than that achieved by its predecessors, but less than that which would be commensurate with the ability and labour with which it has been framed.

Conveyancing, which in Scotland forms part of the ordinary business of a solicitor, is in England almost a profession by itself. It is to a large extent undertaken by barristers who devote themselves specially to the work. There is also a class of conveyancers, qualified to be called to the bar, but not called, who practise under annual certificates.

An Act was passed in 1868 to consolidate the statutes relating to the constitution and completion of titles to heritable property in Scotland, and to make certain changes on the law of Scotland relating to heritable rights, and an

Amendment Act was passed in the following year. In 1874 the Conveyancing (Scotland) Act was passed, having for its object to amend the law relating to land rights and conveyancing, and to simplify the law.

CONVOCATION, an assembly of the spirituality of the realm of England, which is summoned by the metropolitan archbishops of Canterbury and of York respectively, within their ecclesiastical provinces, pursuant to a royal writ, whenever the Parliament of the realm is summoned, and which is also continued or discharged, as the case may be, whenever the Parliament is prorogued or dissolved. This assembly of the spirituality, which is at present summoned only in pursuance of a writ from the Crown, differs in its constitution and in the purport for which it is summoned from an ordinary provincial council, such as the two metropolitan archbishops of England have also been in the habit of summoning from time to time; for whereas the ordinary provincial councils of the metropolitans have comprised only the bishops of their respective provinces, with whom, however, the deans and the abbots and other governing dignitaries of the church have been on occasions associated, the Convocations of the two provinces have always comprised a definite number of representatives of the clergy of the chapters and of the beneficed clergy of the several dioceses. Further, whereas the purport of an ordinary provincial council is to consult on matters which concern the faith or the peace of the church as a religious body, the Convocations are called together to treat of matters which concern the Crown, and the security and defence of the Church of England; and the tranquillity, public good, and defence of the realm itself. All these subjects are specified as probable matters for deliberation in the royal writs, under which the archbishops are commanded to call together their respective Convocations. These assemblies would thus appear to be integral parts of the body politic of the realm of England; but when and how they originated, and when and how they became so incorporated in it is not historically clear. This much is known from authentic records, that the present constitution of the Convocation of the prelates and clergy of the province of Canterbury was recognized as early as in the eleventh year of the reign of Edward I. (1283) as its normal constitution; and that in extorting that recognition from the Crown, which the clergy accomplished by refusing to attend unless summoned in lawful manner (*debito modo*) through their metropolitan, the clergy of the province of Canterbury taught the laity the possibility of maintaining the freedom of the nation against the encroachments of the royal power. It had been a provision of the Anglo-Saxon period, the origin of which is generally referred to the Council of Cloveshoo (747), that the possessions of the church should be exempt from taxation by the secular power, and that it should be left to the benevolence of the clergy to grant such subsidies to the Crown from the endowments of their churches as they should agree to in their own assemblies. It may be inferred, however, from the language of the various writs issued by the Crown for the collection of the "aids" voted by the *Commune Concilium* of the realm in the reign of Henry III., that the clergy were unable to maintain the exemption of church property from being taxed to those "aids" during that king's reign; and it was not until some years had elapsed of the reign of Edward I. that the spirituality succeeded in vindicating their constitutional privilege of voting in their own assemblies their free gifts or "benevolences," and in insisting on the Crown observing the lawful form of convoking those assemblies through the metropolitan of each province.

The form of the royal writ, which it is customary to issue in the present day to the metropolitan of each province, is identical in its purport with the writ issued by the Crown in 1283 to the metropolitan of the province of Canterbury, after the clergy of that province had refused to meet at Northampton in the previous year, because they had not been summoned in lawful manner; whilst the mandates issued by the metropolitans in pursuance of the royal writs, and the citations issued by the bishops in pursuance of the mandates of their respective metropolitans, are identical in their purport and form with those used in summoning the Convocation of 1283, which met at the New Temple in the city of London, and voted a "benevolence" to the Crown, as having been convoked in lawful manner. The existing constitution of the convocation of the province of Canterbury—and the same observation will apply to that of the province of York—in respect of its comprising representatives of the chapters and of the beneficed clergy, in addition to the bishops and other dignitaries of the church, would thus appear to be of even more ancient date than the existing constitution of the Parliament of the realm; for the council of the realm, to which representatives of the counties and of the boroughs were for the first time summoned to the same place with the barons, to meet the king at Shrewsbury in the same year (1283) in which the Convocation of the province of Canterbury was summoned to the New Temple, differed in several important particulars from the Parliament of the realm, as at present constituted, although it is sometimes styled the Parliament of Shrewsbury, or of Acton Burnell. It was, in fact, an extraordinary council, to which the prelates, who were a constituent part of the *Commune Concilium* of the realm, were not summoned, its object being to try David, the brother of Llewelyn, prince of Wales, who had surrendered himself a prisoner, on a charge of high treason against the Crown of England. The barons alone appear to have tried and condemned the prisoner, as far as may be inferred from the language of the annalists, although the commons may have been allowed a consultative voice. At all events the commons agreed with the barons in voting an "aid" of a thirtieth to support the king's expedition into Wales, and the issuing of the ordinance known as the "Statutum de Mercatoribus" concluded the business for which the council was summoned. The settled constitution of Parliament as it exists in the present day was not completed until 1295 (23 Edward I.), when the representatives of the commons were summoned to the same place with the barons, and the clergy as a body were also convened with the laity, under a novel clause known as the "præmunientes" clause, which was inserted in the writs issued by the Crown directly to the bishops.

From this period down to the eleventh year of the reign of Edward III. there were continual contests between the spirituality of the realm and the Crown,—the spirituality contending for their constitutional right to vote their subsidies in their provincial Convocations; the Crown, on the other hand, insisting on the immediate attendance of the clergy in Parliament. The resistance of the clergy to the innovation of the "præmunientes" clause had so far prevailed in the reign of Edward II. that the Crown consented to summon the clergy to Parliament through their metropolitans, and a special form of provincial writ was for that purpose framed; but the clergy protested against this writ, and the struggle was maintained between the spirituality and the Crown until 1337 (11 Edward III.), when the Crown reverted to the ancient practice of commanding the metropolitans to call together their clergy in their provincial assemblies, where their subsidies were voted in the manner as accustomed before the "præmunientes" clause was introduced. The "præmunientes" clause, however, was continued in the Parliamentary writs issued to the several bishops of both provinces, whilst the bishops were permitted to neglect at their pleasure the execution of the writs. It is a moot question, in which of the two Houses of Parliament the representatives of the chapters and of the beneficed clergy sat, when summoned to Parliament, and whether they had a deliberative vote, or only a consultative voice. According to the "Modus tenendi Parliamentum" the proctors of the clergy sat and voted in the Lower House of Parliament. But the authority of that treatise has been impugned by many writers, because the introductory paragraph announces it to be a description of the manner of holding a Parliament in the time of King Edward, the son of Ethelred, and of William the Conqueror and his successors. The treatise itself, however, is not a mere imposture, as Dr Hody has contended in his *History of English Councils and Convocations.* It is found in several MSS. of the 14th century, and the Parliamentary writs and records of the reign of Edward II. warrant us in regarding it as a treatise framed after the actual constitution of Parliament in the reign of that king.[1] This treatise contains a chapter entitled "De Auxilio Regi," in which it is explicitly stated that the proctors of the clergy sat in the Lower House, and voted as members of the Commons on all questions which required the consent of Parliament. "Ideo oportet, quod omnia quæ affirmari vel infirmari, concedi vel negari, vel fieri debent per Parliamentum, per communitatem Parliamenti concedi debent, quæ est ex tribus gradibus sive generibus Parliamenti, scilicet ex procuratoribus cleri, militibus comitatuum, civibus et burgensibus, qui repræsentant totam communitatem; et non de magnatibus, quia quilibet eorum est pro sua propria persona ad Parliamentum, et pro nulla alia." This view is borne out by the language of the petition of the Lower House itself in the Convocation of 1547 (1 Edward VI.), that "according to the ancient custom of this realm and the tenor of the king's writs for the summoning of the Parliament, which be now, and ever have been, directed to the bishops of every diocese, the clergy of the Lower House of Convocation may be adjoined and associated with the Lower House of Parliament" (Cardwell's *Synodalia*, p. 421). The weight of evidence would thus seem to be in favour of the view that the proctors of the clergy, when summoned to Parliament under the "præmunientes" clause, sat and voted in the Lower House of Parliament, which is not altogether irreconcilable with the statement in Lord Coke's Fourth Institute, that the proctors of the clergy never had a voice in Parliament, "because they were no lords of Parliament." The reason alleged in this passage of the Fourth Institute is clearly inadequate as regards the Lower House, inasmuch as the magnates were excluded from it; but if the compiler of the Fourth Institute had in view the Upper House he is justified in saying that the proctors of the clergy did not vote in that House.

It has been matter of controversy between divines and lawyers, whether the Convocations of the two provinces are properly to be regarded as high courts of the spirituality of the realm of England, or as ecclesiastical councils of their respective metropolitans. The divines prefer to regard them as provincial councils, although perhaps in so doing they unconsciously depreciate them. It may be admitted that there is nothing in the constitution of either Convocation which is inconsistent with its being a provincial council *sui generis*, as the constituent elements of provincial councils vary indefinitely according to the custom of different national churches,—for instance the parochial clergy, whose presence by their representatives is a remarkable feature of the Convocation of the two provinces, have been allowed to appear by their representatives in more than one provincial council of the ancient Gallican Church; but the Convocations of the province of Canterbury and of York, as summoned in pursuance of a royal writ, are assuredly something more than ecclesiastical councils of their respective metropolitans. There is the high authority of Lord Coke for regarding the Convocations of the two provinces as courts of the spirituality, and the Upper House of Convocation is by statute (24 Henry VIII. ch. 12) constituted the high court of appeal in matters in which the Crown is a party in any cause before an ecclesiastical court. Perhaps the true solution of the controversy will be found in distinguishing the Upper House of Convocation from the Lower House, and just as the Upper House of Parliament is the High Court of Parliament which exercises the judicial functions of the Parliament, so the Upper House of Convocation is the High Court of Convocation, the Lower House having the right to make presentments to the Upper House in like manner as the Lower House of Parliament has the right to prefer impeachments before the Upper House of Parliament, but not to take part in adjudicating upon them. There is, indeed, an instance on record of a kind of cumulative vote of the Lower House of Convocation in 1640, when it added its voice to that of the Upper House in suspending a member of the Upper House (the bishop of Gloucester) from his office and benefice; but this was rather a question touching the privileges of the two Houses in a business which they considered to have brought scandal on the proceedings of the Convocation, the bishop of Gloucester having refused to conform himself to a resolution of both Houses in a matter of subscription to certain new canons. This, however, is not a precedent of a safe period. There is, indeed, another point of view from which the Convocation appears to have all the attributes of a high court of the metropolitan, inasmuch as the metropolitan, when he presides, or his commissary in the absence of the metropolitan, has the coercive power of an ecclesiastical judge in respect of the members of the Convocation: he directs absolutely the course of business; he may pronounce the members contumacious and punish their contumacy by suspension from office, or by sequestration of benefice, and at his pleasure may remit the penalties, and upon submission absolve the offender. He may further suspend the sittings of Convocation when he sees fit, and may continue them to such times as he thinks proper; and a schedule, or written sentence of continuation and prorogation at the termination of each session, is signed by the archbishop or his commissary, in which he is described as "judicially sitting." A curious argument has been raised in modern times upon the wording of certain ancient schedules in which it is recited that the archbishop has continued and prorogued the Convocation to a certain day "cum consensu confratrum suorum." It has been contended that these recitals are not consistent with the claim of the metropolitan to prorogue the Convocation at his pleasure. But this argument is founded on a total misconception of the object of these recitals, which was to save the legal right of the metropolitan to pronounce the bishops and clergy contumacious, if they should not attend on the day to which the Convocation was continued. Of strict right the members of Convocation were not liable to be pronounced in contempt, unless they had been cited in lawful manner to attend upon the archbishop on a given day; but if they were consenting parties to the continuation of the sittings of the Convocation to a future day, and their consent was recorded in the instrument of continuation, which is read aloud before it is signed by the metropolitan, they would thereby be perempted of all excuse for non-attendance on the plea that they had not been duly cited. Such we conceive to be the true meaning of this clause, which is rarely found in the older schedules, but occurs

[1] Sir Thomas Duffus Hardy, who edited this treatise for the Record Commissioners in 1846, places it somewhere between 1294 and 1327.

frequently in the schedules of the most turbulent period of the history of Convocation, namely, during the reign of Queen Anne. It was probably inserted in those schedules, *ex majori cautela*, after an ancient precedent with which the registrar of the Convocation was familiar. This much, however, is certain, that the phrase does not occur in any schedule of prorogation, which is not also a schedule of continuation of the sittings of Convocation to a further day.

The history of the Convocation of the province of Canterbury, as at present constituted, is full of stirring incidents, and it resolves itself readily into five periods. The first period, by which is meant the first period which dates from an epoch of authentic history, is the period of its greatest freedom, but not of its greatest activity. It extends from the reign of Edward I. (1283) to that of Henry VIII. The second period is the period of its greatest activity and of its greatest usefulness, and it extends from the twenty-fifth year of the reign of Henry VIII. to the reign of Charles II. The third period extends from the fifteenth year of the reign of Charles II. (1664) to the reign of George I. This was a period of turbulent activity and little usefulness, and the anarchy of the Lower House of Convocation during this period has created a strong prejudice against the revival of Convocation in the mind of the laity. The fourth period extends from the third year of the reign of George I. (1716) to the fifteenth year of the reign of Queen Victoria. This was a period of torpid inactivity, during which it was customary for Convocation to be summoned and to meet *pro forma*, and to be continued and prorogued indefinitely. The fifth period may be considered to have commenced in the fifteenth year of the reign of Queen Victoria (1852), and it would be premature to pronounce an opinion upon its character. It has not hitherto had to pass through any severe ordeal of political strife.

During the first of the five periods above mentioned, it would appear from the records preserved at Lambeth and at York that the metropolitans frequently convened congregations (so-called) of their clergy without the authority of a royal writ, which were constituted precisely as the Convocations were constituted, when the metropolitans were commanded to call their clergy together pursuant to a writ from the Crown. As soon, however, as King Henry VIII. had obtained from the clergy their acknowledgment of the supremacy of the Crown in all ecclesiastical causes, he constrained the spirituality to declare, by what has been termed the Act of Submission on behalf of the clergy, that the Convocation "is, always has been, and ought to be summoned by authority of a royal writ;" and this declaration was embodied in a statute of the realm (25 Henry VIII. c. 19), which further enacted that the Convocation "should thenceforth make no provincial canons, constitutions, or ordinances without the royal assent and licence." The spirituality was thus more closely incorporated than heretofore in the body politic of the realm, seeing that no deliberations on its part can take place unless the Crown has previously granted its licence for such deliberations. It had been already provided during this period by 8 Henry VI. c. 1, that the prelates and other clergy, with their servants and attendants, when called to the Convocation pursuant to the king's writ, should enjoy the same liberty and defence in coming, tarrying, and returning as the magnates and the commons of the realm enjoy when summoned to the king's Parliament.

The second period, which dates from 1533 to 1664, has been distinguished by four important assemblies of the spirituality of the realm in pursuance of a royal writ—the two first of which occurred in the reign of Edward VI., the third in the reign of Queen Elizabeth, and the fourth in the reign of Charles II. The two earliest of these Convocations were summoned to complete the work of the reformation of the Church of England, which had been commenced by Henry VIII.; the third was called together to reconstruct that work, which had been marred on the accession of Mary, the consort of Philip II. of Spain; whilst the fourth was summoned to re-establish the Church of England, the framework of which had been demolished during the great rebellion. On all of these occasions the Convocations worked hand in hand with the Parliament of the realm under a licence and with the assent of the Crown. Meanwhile the Convocation of 1603 had framed a body of canons for the governance of the clergy. Another Convocation requires a passing notice, in which certain canons were drawn up in 1640, but by reason of an irregularity in the proceedings of this Convocation (chiefly, on the ground that its sessions were continued for some time after the Parliament of the realm had been dissolved), its canons are not held to have any binding obligation on the clergy. The Convocations had up to this time maintained their liberty of voting the subsidies of the clergy in the form of "benevolences," separate and apart from the "aids" granted by the laity in Parliament, and one of the objections taken to the proceedings of the Convocation of 1640 was that it had continued to sit and to vote its subsidies to the Crown after the Parliament itself had been dissolved. It is not, therefore, surprising on the restoration of the monarchy in 1661 that the spirituality was not anxious to retain the liberty of taxing itself apart from the laity, seeing that its ancient liberty was likely to prove of questionable advantage to it. It voted, however, a benevolence to the Crown on the occasion of its first assembling in 1661 after the restoration of King Charles II., and it continued so to do until 1664, when an arrangement was made between Archbishop Sheldon and Lord Chancellor Hyde, under which the spirituality silently waived its long asserted right of voting its own subsidies to the Crown, and submitted itself thenceforth to be assessed to the "aids" directly granted to the Crown by Parliament. An Act was accordingly passed by the Parliament in the following year (16 and 17 Car. II. c. 1), entitled An Act to grant a Royal Aid unto the King's Majesty, to which aid the clergy were assessed by the commissioners named in the statute without any objection being raised on their part or behalf,[1] there being a proviso that in so contributing the clergy should be relieved of the liability to pay two subsidies out of four, which had been voted by them in the Convocation of a previous year. There was also a further proviso inserted in the same Act, that "nothing therein contained shall be drawn into example to the prejudice of the ancient rights belonging to the lords spiritual and temporal, or clergy of this realm, &c.," which Mr Hallam considers to be a saving of the rights of the clergy to tax themselves, if they think fit (*Constitutional History*, ed. 1842, ii. p. 395). But the spirituality has never reasserted its ancient liberty of self-taxation. In consequence of this practical renunciation of their separate *status*, as regards their liability to taxation, the clergy have assumed and enjoyed in common with the laity the right of voting at the election of members of the House of Commons, in virtue of their ecclesiastical freeholds, and this right has been recognized by subsequent statutes, such for instance as 10 Anne c. 23, and 18 George II. c. 18. According to a note of Speaker Onslow's, appended to Burnet's *History of his Own Times* (Oxford ed. vol. iv. p. 308), the matter was first settled by a private agreement between Sheldon and Clarendon, and tacitly assented to by

Sheldonian compact.

[1] It had always been the practice, when the clergy voted their subsidies in their Convocation, for Parliament to authorize the collection of each subsidy by the same commissioners who collected the Parliamentary aid.

the clergy. Onslow says, "Gibson, bishop of London, said to me that it was the greatest alteration in the constitution ever made without an express law."

The most important and the last work of the Convocation during this second period of its activity was the revision of the Book of Common Prayer, which was completed in the latter part of 1661. The revised book, after it had been sanctioned by the Convocation of the province of York, was presented to the Crown for its approval. The Crown having approved the book, sent it forthwith to the Upper House of Parliament, with a recommendation that the book, as reviewed by the Convocation, should be appointed by an Act of Uniformity; and accordingly the two Houses of Parliament after a conference accepted the revised book, and enacted that it should be the book which should be appointed to be used in all places of public worship in the realm. It was believed for some considerable time that the original book which had been attached to the Act of Uniformity on this occasion had been lost from the archives of the House of Lords. It was, indeed, missing for some time, but in consequence of a more careful search having been instituted in 1870 by Dr A. P. Stanley, the dean of Westminster, the original book has been discovered detached from the Act of Uniformity in the library of the House of Lords, and a fac-simile of the book with the MS. revision was made under the authority of the lords of the treasury for the use of the royal commissioners on ritual in 1871.

Third period. The Revolution in 1688 is the most important epoch in the third period of the history of the synodical proceedings of the spirituality, when the Convocation of Canterbury, having met in 1689 in pursuance of a royal writ, obtained a licence under the great seal, to prepare certain alterations in the liturgy and in the canons, and to deliberate on the reformation of the ecclesiastical courts. A feeling, however, of panic seems to have come over the Lower House, which took up a position of violent antagonism to the Upper House. This circumstance led to the prorogation of the Convocation and to its subsequent discharge without any practical fruit resulting from the king's licence. Ten years elapsed during which the Convocation was prorogued from time to time without any meeting of its members for business being allowed. The next Convocation which was permitted to meet for business, in 1700, was marked by great turbulence and insubordination on the part of the members of the Lower House, who refused to recognize the authority of the archbishop to prorogue their sessions. This controversy was kept up until the discharge of the Convocation took place concurrently with the dissolution of the Parliament in the autumn of that year. The proceedings of the Lower House in this Convocation were disfigured by excesses which were clearly violations of the constitutional order of the Convocation. The Lower House refused to take notice of the archbishop's schedule of prorogation, and adjourned itself by its own authority, and upon the demise of the Crown it disputed the fact of its sessions having expired, and as Parliament was to continue for a short time, prayed that its sessions might be continued as a part of the Parliament under the "præmunientes" clause. The next Convocation was summoned in the first year of Queen Anne, when the Lower House, under the leadership of Dean Aldrich, its prolocutor, challenged the right of the archbishop to prorogue it, and presented a petition to the queen, praying Her Majesty to call the question into her own presence. The question was thereupon examined by the Queen's Council, when the right of the president to prorogue both Houses of Convocation by a schedule of prorogation was held to be proved, and further, that it could not be altered except by an Act of Parliament. This decision of the Queen's Council is of great importance in its bearing upon the constitution of the Convocation as a part of the body politic of the realm, and is in striking contrast to a legal opinion which was circulated in print in 1855 with the names of two eminent lawyers subscribed to it, to the effect that the Convocation has the power of altering its own constitution, provided only that it has the licence of the Crown to make a canon to that effect, and such canon is subsequently approved by the Crown. During the remaining years of the reign of Queen Anne the two Houses of Convocation were engaged either in internecine strife, or in censuring sermons or books, as teaching latitudinarian or heretical doctrines; and, when it had been assembled concurrently with Parliament on the accession of King George I., a great breach was before long created between the two Houses by the Bangorian controversy. Dr Hoadly bishop of Bangor, having preached a sermon before the king, in the Royal Chapel at St James's Palace in 1717, against the principles and practice of the non-jurors, which had been printed by the king's command, the Lower House, which was offended by the sermon and had also been offended by a treatise on the same subject published by Dr Hoadly in the previous year, lost no time in representing the sermon to the Upper House, and in calling for its condemnation. A controversy thereupon arose between the two Houses which was kept up with untiring energy by the Lower House, until the Convocation was prorogued in 1717 in pursuance of a royal writ; from which time until 1861 no licence from the Crown has been granted to Convocation to proceed to business. During this period, which may be regarded as the fourth distinguishing period in the history of the Convocations of the Church of England, it was usual for a few members of the Convocation to meet when first summoned with every new Parliament, in pursuance of the royal writ, for the Lower House to elect a prolocutor, and for both Houses to vote an address to the Crown, after which the Convocation was prorogued from time to time, pursuant to royal writs, and ultimately discharged when the Parliament was dissolved. There were, however, several occasions between 1717 and 1741 when the Convocation of the province of Canterbury transacted certain matters, by way of consultation, which did not require any licence from the Crown, and there was a short period in its session of 1741 when there was a probability of its being allowed to resume its deliberative functions, as the Lower House had consented to obey the president's schedule of prorogation; but the Lower House having declined to receive a communication from the Upper House, the Convocation was forthwith prorogued, from which time until the middle of the present century the Convocation was not permitted by the Crown to enjoy any opportunity even for consultation. The spirituality at last aroused itself from its long repose in 1852, and on this occasion the Upper House took the lead. The active spirit of the movement was Samuel, bishop of Oxford, but the master mind was Henry, bishop of Exeter. On the Convocation assembling several petitions were presented to both Houses, praying them to take steps to procure from the Crown the necessary licence for their meeting for the despatch of business, and an address to the Upper House was brought up from the Lower House, calling the attention of the Upper House to the reasonableness of the prayer of the various petitions. After some discussion the Upper House, influenced mainly by the argument of Henry, bishop of Exeter, consented to receive the address of the Lower House, and the Convocation was thereupon prorogued, shortly after which it was discharged concurrently with the dissolution of Parliament. On the assembling of the next Convocation of the province of Canterbury, no royal writ of exoneration having been sent by the Crown to the metropolitan, the sessions of the

Fourth period.

Convocation were continued for several days; and from this time forth Convocation may be considered to have resumed its action as a consultative body, whilst it has also been permitted on more than one occasion to exercise its functions as a deliberative body. Its first action as a deliberative body commenced in 1861, in pursuance of a licence from the Crown granted to it upon its prayer, to amend the twenty-ninth of the canons of 1603 on the subject of sponsors at baptism. Its deliberations, however, on this subject have not yet been brought to a final conclusion. Both Houses came to an agreement as to the form of a canon to be substituted in place of the existing canon, and the Convocation of the province of York having consented to the amended canon, it was submitted to the Crown for its approval pursuant to the terms of the royal licence, under which the new canon could only acquire the validity of law by its confirmation under letters patent of the Crown. On this occasion, however, the new canon appeared to Her Majesty's Government to exceed in its terms the royal licence, and to be likely to cause greater perplexity to the clergy than the existing canon. It was accordingly sent back to the Convocation in 1865 for further amendment. The Upper House thereupon made a further amendment in the proposed form of canon, and sent it down to the Lower House for its concurrence, but the Lower House, in the Convocation of 1867, resolved to defer the consideration of the further amendment of the canon, until a committee, which has been appointed to consider the whole body of the canons of 1603 shall have made its report. This is a proceeding which cannot be considered of good augury to the Convocation as a deliberative body, seeing that the licence of the Crown to amend the particular canon was granted to Convocation at its own request. The proceedings of the Convocation on the second occasion have been of more favourable augury. A royal licence was granted to the Convocation of 1865 in response to an address on its part to the Crown, authorizing it to make a new canon in the place of the thirty-sixth, and to amend the thirty-seventh and the thirty-eighth canons so as to be in harmony with the new canon, and also to amend the fortieth canon; and certain alterations and amendments in those canons having been accordingly made by the Convocation of the province of Canterbury, and agreed to by the Convocation of the province of York under a similar licence from the Crown, the royal assent was given to the amended canons in the Convocation of 1866. On this occasion the Convocations acted with becoming promptness and decision, as there was a pressing emergency for their co-operation with the Parliament in relieving the clergy from certain subscriptions and oaths, and in altering the forms of declarations to be made by them on their admission to office or benefice (28 and 29 Vict. c. 122.) With regard to the twenty-ninth canon there was no corresponding emergency, and it may be said of it, as of other canons which have been abrogated by custom—"ubi consuetudo loquitur, lex manet sopita." It appears, however, that the report of the committee of the Lower House on the subject of an amended code of canons ecclesiastical was laid on the table of the Upper House in the session of 1874, but no further action has been taken upon it.

The order of convening the Convocation of the province of Canterbury is as follows. A writ issues from the Crown, addressed to the metropolitan archbishop of Canterbury, commanding him "by reason of certain difficult and urgent affairs concerning us, the security and defence of our Church of England, and the peace and tranquillity, public good, and defence of our kingdom, and our subjects of the same, to call together with all convenient speed, and in lawful manner, the several bishops of the province of Canterbury, and deans of the cathedral churches, and also the archdeacons, chapters, and colleges, and the whole clergy of every diocese of the said province, to appear before the said metropolitan in the cathedral church of St Paul, London, on a certain day, or elsewhere, as shall seem most expedient, to treat of, agree to, and conclude upon the premises and other things, which to them shall then at the same place be more clearly explained on our behalf." In case the metropolitical see of Canterbury should be vacant, the writ of the Crown is addressed to the dean and chapter of the metropolitical church of Canterbury in similar terms, as being the guardians of the spiritualities of the see during a vacancy. Thereupon the metropolitan, or as the case may be, the dean and chapter of the metropolitical church, issue a mandate to the bishop of London, as dean of the province, and if the bishopric of London should be vacant, then to the bishop of Winchester as subdean, which embodies the royal writ, and directs the bishop to cause all the bishops of the province to be cited, and through them the deans of the cathedral and collegiate churches, and the archdeacons and other dignitaries of churches, and each chapter by one, and the clergy of each diocese by two sufficient proctors, to appear before the metropolitan or his commissary, or, as the case may be, before the dean and chapter of the metropolitical church or their commissary, in the chapter-house of the cathedral church of St Paul, London, if that place be named in the mandate, or elsewhere, with continuation and prorogation of days next following, if that should be necessary, to treat upon arduous and weighty affairs, which shall concern the state and welfare, public good, and defence of this kingdom and the subjects thereof, to be then and there seriously laid before them, and to give their good counsel and assistance on the said affairs, and to consent to such things as shall happen to be wholesomely ordered and appointed by their common advisement for the honour of God and the good of the church.

The provincial dean, or the subdean, as the case may be, thereupon issues a citation to the several bishops of the province, which embodies the mandate of the metropolitan or of the dean and chapter of the metropolitical church, as the case may be, and admonishes them to appear, and to cite and admonish their clergy, as specified in the metropolitical mandate, to appear at the time and place mentioned in the mandate. The bishops thereupon either summon directly the clergy of their respective dioceses to appear before them or their commissaries to elect two proctors, or they send a citation to their archdeacons, according to the custom of the diocese, directing them to summon the clergy of their respective archdeaconries to elect a proctor. The practice of each diocese in this matter is the law of the Convocation, and the practice varies indefinitely as regards the election of proctors to represent the beneficed clergy. As regards the deans, the bishops send special writs to them to appear in person, and to cause their chapters to appear severally by one proctor. Writs also go to every archdeacon, and on the day named in the royal writ, which is always the day next following that named in the writ to summon the Parliament, the Convocation assembles in the place named in the archbishop's mandate. Thereupon, after the Litany has been sung or said, and a Latin sermon preached by a preacher appointed by the metropolitan, the clergy are præconized or summoned by name to appear before the metropolitan or his commissary; after which the clergy of the Lower House are directed to withdraw and elect a prolocutor, to be presented to the metropolitan for his approbation. The Convocation thus constituted resolves itself at its next meeting into two Houses, and it is in a fit state to proceed to business. The regular forms of proceeding have been carefully kept up in the Convocation of the province of Canterbury, which consists of 20 bishops, exclusive of the metropolitan, 24 deans, 56 archdeacons, 23 proctors for the chapter clergy, and 42 proctors for the beneficed clergy.

On the other hand, the proceedings of the Convocation of the province of York have been less regular, and no prolocutor of the Lower House of the Convocation appears to have been appointed since 1661, until the recent resuscitation of the Convocation as a consultative body. Its constitution differs slightly from that of the Convocation of the province of Canterbury, as each archdeaconry is represented by two proctors, precisely as in Parliament formerly under the Præmunientes clause. It consists of 6 bishops, including the bishop of Sodor and Man and exclusive of the metropolitan, 6 deans, 15 archdeacons, 6 proctors of the chapter clergy, and 30 proctors for the beneficed clergy. There are some anomalies in the diocesan returns of the two Convocations, but in all such matters the *consuetudo* of the diocese is the governing rule.

(T. T.)

CONWAY, or ABERCONWAY, a town of Carnarvonshire, in North Wales, at the mouth of the Conway, four miles south of Llandudno and forty-five miles west of Chester by railway. It is situated on the western bank of the river, and is inclosed by a lofty wall, which approaches the form of a triangle, and is a mile in circumference. The style of this ancient and highly interesting wall is Saracenic; it is fenced with twenty-one round towers, now somewhat dilapidated, and entered by three principal gateways with two strong towers. The south-eastern angle is occupied by the castle, one of the noblest of the old fortresses in England. It was built in 1284 by Edward I. to secure his possession of North Wales, and was the residence of Richard II. in 1389. During the war of the Commonwealth it was held for Charles I. by Archbishop Williams, but was taken by General Mytton in 1646. In the following reign it was dismantled by its new proprietor Earl Conway, and remains a ruin. The building is oblong in form; it is strengthened with eight massive drum towers; and part of the interior is occupied by a great hall, known as Llewelyn's, 130 feet long. The town contains some curious old houses of the Elizabethan period, a town-hall where the petty sessions are held, and St Mary's Church. The Parliamentary borough of Conway (which with Carnarvon and four others returns in conjunction a member to Parliament) extends beyond the walls of the town, and over to the right bank of the river, occupying a total area of 3312 acres. Population of town, 1862: of borough, 2620.

CONYBEARE, JOHN (1692–1755), a learned English divine, was born at Pinhoe, near Exeter, January 31, 1692. At the age of sixteen he entered Exeter College, Oxford, of which he was elected in 1710 probationary fellow. He graduated B.A. in 1713, and M.A. in 1716, and in the latter year was ordained priest. After holding a country curacy for about a year he returned to Oxford, and became tutor in his college. Ere long he made himself favourably known by the publication of two well-reasoned sermons, on "Miracles," and on the "Mysteries of the Christian Religion," and was appointed one of the preachers to the king at Whitehall. He took his degree of D.D. in January 1729, and in 1730 he was chosen master of Exeter College. By this time he had increased his reputation by several additional sermons, and in 1732 he published his great work, *A Defence of Revealed Religion*. This was written in reply to Matthew Tindal's *Christianity as Old as the Creation*, which had appeared two years before. It became very popular, and reached a third edition in 1733. It was characterized by Bishop Warburton as one of the best reasoned books in the world. Soon after its publication Conybeare was appointed dean of Christ Church, Oxford, and this post he held till 1750, when he succeeded Dr Butler in the see of Bristol. He died at Bath, July 13, 1755. A selection of his sermons, in two volumes, was published after his death.

CONYBEARE, WILLIAM DANIEL (1787–1857), dean of Llandaff, an eminent geologist, born in London, June 7, 1787, was a grandson of Bishop Conybeare. He received his early education at Westminster School, and in 1805 went to Christ Church College, Oxford, where in 1808 he took his degree of B.A., as first-class in classics and second in mathematics, and that of M.A. three years later. Early attracted to the study of geology, he became one of the first members of the Geological Society, of which he was afterwards fellow, and to whose *Transactions* he contributed many important memoirs. His first paper was communicated in 1814. In his researches he was often associated with Buckland and Phillips. In 1821 he distinguished himself greatly by the first discovery and description of a skeleton of the plesiosaurus,—his account (partly conjectural reconstruction) being minutely confirmed by subsequent discoveries. Among his most important memoirs is that on the south-western coal district of England, written in conjunction with Dr Buckland, and published in 1824. His principal work, however, is the *Outlines of the Geology of England and Wales*, written in co-operation with W. Philips, and forming at the time of its appearance (1822) the best manual on the subject. Conybeare was a fellow of the Royal Society and a corresponding member of the Institute of France. He was appointed Bampton Lecturer in 1839, and was instituted to the deanery of Llandaff in 1845. The loss of his eldest son, W. J. Conybeare, joint author with Mr Howson of the *Life and Letters of St Paul*, preyed on his mind and hastened his end. He died at Itchenstoke, near Portsmouth, a few months after his son, August 12, 1857.

COOK, CAPTAIN JAMES (1728–1779), the celebrated navigator, was born on October 28, 1728, at the village of Marton, Yorkshire, where his father was first an agricultural labourer and then a farm bailiff. At thirteen years of age he was apprenticed to a haberdasher at Straiths, near Whitby, but having quarrelled with his master, he went as an apprentice on board a collier belonging to the port, and was soon afterwards appointed mate.

Early in the year 1755 Cook joined the royal navy. Having distinguished himself, he was, on the recommendation of Sir Hugh Palliser, his commander, appointed master successively of the sloop "Grampus," of the "Garland," and the "Mercury," in the last of which he served in the St Lawrence, and was present at the capture of Quebec. He was employed also in sounding and surveying the river, and he published a chart of the channel from Quebec to the sea. In 1762 he was present at the recapture of Newfoundland; early in the following year he was employed in surveying the coasts of Newfoundland; and in 1764 he was appointed marine surveyor of Newfoundland and Labrador. While in this capacity, Cook published in the *Philosophical Transactions* an observation of a solar eclipse made at one of the Burgeo Islands, near Cape Ray, which added considerably to his reputation.

About this time the spirit for geographical discovery, which had gradually declined since the beginning of the 17th century, began to revive; and Cook was appointed to conduct an expedition which was then projected for the purpose of making observations on the impending transit of Venus, and prosecuting geographical researches in the South Pacific Ocean. For this purpose he received a commission as lieutenant, and set sail in the "Endeavour," a vessel of 370 tons, accompanied by several men of science, including Sir Joseph Banks. On the 13th April 1769 he reached Otaheite or Tahiti, where he erected an observatory, and succeeded in making the necessary astronomical observations. From Otaheite Cook sailed in quest of the great continent then supposed to exist in the South Pacific, and reached the islands of New Zealand, which had remained a *terra incognita* since the time of their first discovery. His attempts to penetrate to the interior, however, were thwarted by the continued hostility of the natives; and he had to content himself with a voyage of six months' duration round the coast, in which he traced the existence of a narrow channel dividing New Zealand into two large islands. From New Zealand he proceeded to Australia (then called New Holland), and on April 28 came in sight of Botany Bay. On account of the hostility of the natives his discoveries here also were confined to the coast, of which he took possession in the name of Great Britain. The prosecution of this voyage was attended with dangers which, on several occasions, threatened the entire loss of the ship and crew. From Australia Cook sailed to New Guinea, and thence to Batavia, where his ship, greatly shattered and disabled, had to put in for repairs.

Arriving in England, on June 11, 1771, Cook was immediately raised by the king to the rank of captain. Shortly after his return, the existence of a great southern continent began to be matter of renewed speculation, and Cook was again appointed to lead an exploratory expedition. For this purpose he was placed in command of the "Resolution," a ship of 462 tons burden, and a smaller ship called the "Adventure," with a complement in all of 193 men. Setting sail from Plymouth, July 13, 1772, he reached Madeira on the 29th of the same month, and after touching at the Cape of Good Hope, he explored the specified latitudes, but without discovering land. Satisfied that no land existed within the limits of his researches, he abandoned the investigation on the 17th January 1773, and sailed for New Zealand. After wintering among the Society Islands, he set out to make further explorations to the eastward; and afterwards, steering northward, he navigated the southern tropic from Easter Island to the New Hebrides, and discovered the island named by him New Caledonia. After a third attempt he gave up all hope of finding land, and returned to England (July 30, 1774). He was immediately raised to the rank of post-captain, appointed captain of Greenwich Hospital, and soon afterwards unanimously elected a member of the Royal Society, from which he received the Copley gold medal for the best experimental paper which had appeared during the year.

The attention of Government having been turned to the discovery of a north-west passage in the Arctic regions, Cook volunteered to conduct the expedition, and his offer was gladly accepted. Two ships, the "Resolution" and the "Discovery," were speedily equipped and placed under his care. Cook's instructions were to sail first into the Pacific through the chain of the newly discovered islands which he had recently visited, and on reaching New Albion to proceed northward as far as latitude 65° and then to endeavour to find a passage to the Atlantic. Several ships were at the same time fitted out to attempt a passage on the other side from the Atlantic to the Pacific Ocean. Setting sail from the Nore, June 25, 1776, he cruised for a considerable time in the South Pacific, discovering several small islands; and in the spring of 1777, judging it too far advanced in the season for attempting the navigation of the northern seas, he bore away to the Friendly Islands. Here he continued for several months, and only set sail for the north in January 1778. On his passage from the Friendly Islands, he discovered a group which he named the Sandwich Islands, after the earl of Sandwich, who had taken great interest in the expedition. After circumnavigating these, and laying down their position on a chart, Cook reached the coast of America in March 1778; and following the coast-line northward, penetrated into the bay afterwards known as Cook's Inlet. Disappointed of a passage in this direction, he sailed for Behring's Straits, where again he found the passage intercepted by an impenetrable wall of ice. Returning to winter at the Sandwich Islands, he discovered Mowee (Maui) and Owhyhee or Hawaii, where he met his tragical death. During the night of the 13th February 1779, one of the "Discovery's" boats was stolen by the natives; and Cook, in order to recover it, proceeded to put in force his usual expedient of seizing the person of the king until reparation should be made. Having landed on the following day, a scuffle ensued with the natives, which compelled the party of marines who attended him to retreat to their boats. Cook was the last to retire; and as he was nearing the shore he received a blow from behind which felled him to the ground. He rose immediately, and vigorously resisted the crowds that pressed upon him; but as the boats' crews were able to render him no assistance, he was soon overpowered (14th February 1779).

As a navigator, the merits of Captain Cook were of the very highest order. His commanding personal presence, his sagacity, decision, and perseverance enabled him to overcome all difficulties; while his humanity and sympathetic kindness rendered him a favourite with his crews. His valuable researches into the nature and use of antiscorbutic medicines proved of the greatest utility. The account of his first voyage was published under the care of Dr Hawkesworth, but his second was chronicled directly by himself. A narrative of his third voyage was published from his notes, by Lieutenant King. Distinguished honours were paid to his memory both at home and by foreign courts; and a suitable pension was settled upon his widow.

COOK'S ISLANDS, or the Hervey Archipelago, a considerable cluster of islands in the South Pacific, lying between the Friendly Islands and the Society Islands, in 160° W. long. and about 20° S. lat. They were discovered by Captain Cook in 1777, and in 1823 became the scene of the remarkable missionary labours of John Williams. The most important members of the group, which has a total area of about 300 square miles, are Mangeia, Raratonga, Aitutake, and Atiu. They are almost destitute of drinking water; but abound in cocoa-palms, bread-fruit trees, and plantains. The inhabitants belong to the Malay race, and display great industry and skill in various manufactures. Their houses are well built, and have a pleasant appearance with their white walls of coral lime. The population of Raratonga is estimated at 2000, of Mangeia at 2300, of Aitutake at 1550, and of Atiu at 1200 or 1500.

COOKERY. In the condition in which man finds most of the natural substances used as food they are difficult of digestion. By the application of heat he can change the character of his food, and make it more palatable and more easily digestible. The application of heat to animal and vegetable substances for the purpose of attaining these objects constitutes the science and art of cookery. Innumerable discussions have taken place among scientific men as to the natural food of man. Too much importance is, perhaps, attached to meat, but it is now generally accepted that a mixed animal and vegetable diet is best.

If we take a common vegetable food, such for instance as the potato, we find that in 1000 parts we have 760 of water, 200 parts of starch, and some mineral salts and albuminous compounds. In cooking the starch cells absorb water, and the greater number of them burst. This disintegration of the starch cells is preparatory and necessary to more important changes. The starch in all vegetable substances must undergo a similar change before it can mix with the various fluids developed in the mouth and the walls of the alimentary canal. Some of these fluids, such as the saliva and pancreatic fluid, change the starch into dextrin and then into glucose or grape sugar, and this change appears necessary before the carbon and hydrogen can be oxidized. Without the preliminary operation of cooking this change would in all cases be imperfect and often impossible; and the thorough cooking of all starchy foods is of the utmost importance. When this is imperfectly done the albuminoid envelope which incloses the starch granule has to be dissolved by the gastric juice, which is often difficult and even impossible. Much indigestion probably arises from the imperfect cooking of starchy foods.

The chief constituents of animal food are albumen, fibrin, and fat, with mineral salts and juices. The flavour of meat is due to the osmazone, and some methods of cooking, such as roasting and broiling, appear to increase this flavour. Albumen and fibrin form about one-fifth of the meat. The former always coagulates by heat, and the expansion of the juices tends to separate the solid fibres, and this separation depends very much on the methods of cooking. Albumen is as constant a constituent of all animal food as starch is of vegetable, but these bodies differ greatly in their chemical composition and in the changes which they undergo in the stomach. Albumen is taken into the system as an insoluble substance, but in contact with the gastric fluid it becomes soluble—a condition necessary for every kind of food before it can nourish the body.

Broiling.—The earliest method of cooking was probably burying seeds and flesh in hot ashes, a kind of broiling on all the surfaces at the same time, which when properly done is the most delicate kind of cooking. Broiling is now done over a clean uniform charcoal fire extending at least 2 inches beyond the edges of the gridiron, which should slightly incline towards the cook. It is usual to rub the bars with a piece of suet for meat, and chalk for fish, to prevent the thing broiled being marked with the bars of the gridiron. In this kind of cookery the object is to coagulate as quickly as possible all the albumen on the surface, and seal up the pores of the meat so as to keep in all the juices and flavour. It is, therefore, necessary to thoroughly warm the gridiron before putting on the meat, or the heat of the fire is conducted away while the juices and flavour of the meat run into the fire. Broiling is a simple kind of cookery, and one well suited to invalids and persons of delicate appetites. There is no other way in which small quantities of meat can be so well and so quickly cooked, and for persons who dine alone it is the most convenient method of cookery. Broiling cannot be well done in front of an open fire, because one side of the meat is exposed to a current of cold air. A pair of tongs should be used instead of a fork for turning all broiled meat and fish.

Roasting.—Two conditions are necessary for good roasting—a clear bright fire and frequent basting. Next to boiling or stewing it is the most economical method of cooking. The meat at first should be placed close to a brisk fire for five minutes to coagulate the albumen. It should then be drawn back a short distance and roasted slowly. If a meat screen be used it should be placed before the fire to be moderately heated before the meat is put to roast. The centre of gravity of the fire should be a little above the centre of gravity of the joint. No kitchen can be complete without an open range, for it is almost impossible to have a properly roasted joint in closed kitcheners. The heat radiated from a good open fire quickly coagulates the albumen on the surface, and thus to a large extent prevents that which is fluid in the interior from solidifying. The connective tissue which unites the fibres is gradually converted into gelatine, and rendered easily soluble. The fibrin and albumen appear to undergo a higher oxidation and are more readily dissolved. The fat cells are gradually broken, and the liquid fat unites to a small extent with the chloride of sodium and the tribasic phosphate of sodium contained in the serum of the blood. It is easily seen that roasting by coagulating the external albumen keeps together the most valuable parts of the meat, till they have gradually and slowly undergone the desired change. This surface coagulation is not sufficient to prevent the free access of the oxygen of the surrounding air. The empyreumatic oils generated on the surface are neither wholesome nor agreeable, and these are perhaps better removed by roasting than any other method except broiling. The chief object is to retain as much as possible all the sapid juicy properties of the meat, so that at the first cut the gravy flows out of a rich reddish colour, and this can only be accomplished by a quick coagulation of the surface albumen. The time for roasting varies slightly with the kind of meat and the size of the joint. As a rule beef and mutton require a quarter of an hour to the pound; veal and pork about 17 minutes to the pound. To tell whether the joint is done, press the fleshy part with a spoon; if the meat yield easily it is done. With poultry or game the flesh of the leg may be tried in the same way. Some attach importance to occasional jets of steam drawing to the fire. Roasting, when well done (and the way to do it can only be learned by careful practice), is a wholesome method of cooking.

Baking meat is in many respects objectionable, and should never be done if any other method is available. The gradual disuse of open grates for roasting has led to a practice of first baking and then browning before the fire. This method completely reverses the true order of cooking by beginning with the lowest temperature and finishing with the highest. Baked meat has never the delicate flavour of roast meat, nor is it so digestible. The vapours given off by the charring of the surface cannot freely escape, and the meat is cooked in an atmosphere charged with empyreumatic oil. A brick or earthenware oven is preferable to iron, because the porous nature of the bricks absorbs a good deal of the vapour. When potatoes are baked with meat, they should always be first parboiled, because they take a longer time to bake, and the moisture rising from the potatoes retards the process of baking, and makes the meat sodden. A baked meat pie, though not always very digestible, is far less objectionable than plain baked meat. In the case of a meat pie the surfaces of the meat are protected by a bad conductor of heat from that charring of the surface which generates empyreumatic vapours, and the fat and gravy, gradually rising in temperature, assist the cooking, and such cooking more nearly resembles stewing than baking. The process may go on for a long time after the removal of the meat from the oven, if surrounded with flannel, or some bad conductor of heat. The Cornish pasty is the best example of this kind of cooking. Meat, fish, game, parboiled vegetables, apples, or anything that fancy suggests, are surrounded with a thick flour and water crust and slowly baked. When removed from the oven, and packed in layers of flannel, the pastry will keep hot for hours. When baked dishes contain eggs, it should be remembered that the albumen becomes harder and more insoluble, according to the time occupied in cooking. About the same time is required for baking as roasting.

Boiling is one of the easiest methods of cooking, but a successful result depends on a number of conditions which, though they appear trifling, are nevertheless necessary. The fire must be watched so as properly to regulate the heat. The saucepan should be scrupulously clean and have a closely-fitting lid, and be large enough to hold sufficient water to well cover and surround the meat, and all scum should be removed as it comes to the surface; the addition of small quantities of cold water will assist the rising of the scum. For all cooking purposes clean rain water is to be preferred. Among cooks a great difference of opinion exists as to whether meat should be put into cold water and gradually brought to the boiling point, or should be put into boiling water. This, like many other unsettled questions in cookery, is best decided by careful scientific experiment and observation. If a piece of meat be put into water at a temperature of 60°, and gradually raised to 212°, the meat is undergoing a gradual loss of its soluble and nutritious properties, which are dissolved in the water. From the surface to the interior the albumen is partially dissolved out of the meat, the fibres become hard and stringy, and the thinner the piece of meat the greater the loss of all those sapid constituents which make boiled meat savoury, juicy, and palatable. To put meat into cold water is clearly the best method for making soups and broth; it is the French method of preparing the *pot au feu*; but the meat at the end of the operation has lost much of that juicy sapid property which makes boiled meat so acceptable. The practice of soaking fresh meat in cold water before cooking is for the same reasons highly objectionable; if necessary, wipe it with a clean cloth. But in the case of salted, smoked, and dried meats soaking for several hours is indispensable, and the water should be occasionally changed. The other method of boiling meat has the authority of the late Baron Liebig, who recommends putting the meat into water when in a state of ebullition, and after five minutes the saucepan is to be drawn aside, and the contents kept at a temperature of 162° (50° below boiling). The effect of boiling water is to coagulate the albumen on the surface of the meat, which prevents, but not entirely, the juices passing into the water, and meat thus boiled has more flavour and has lost much less in weight. To obtain well-flavoured boiled meat the idea of soups or broth must be a secondary consideration. It is, however, impossible to cook a piece of meat in water without extracting some of its juices and nutriment, and the liquor should in both cases be made into a soup.

Stewing.—When meat is slowly cooked in a close vessel it is said to be stewed; this method is generally adopted in the preparation of made dishes. Different kinds of meat may be used, or only one kind according to taste. The better the meat the better the stew; but by carefully stewing the coarsest and roughest parts will become soft, tender, and digestible, which would not be possible by any other kind of cooking. The only objection to stewing is the length of time; but a dinner may be prepared in this way the day before it is required. Odd pieces of meat and trimmings and bones can often be purchased cheaply, and may be turned into good food by stewing. Bones, although containing little meat, contain from 39 to 49 per cent. of gelatine. The large bones should be broken into small pieces, and allowed to simmer till every piece is white and dry. Gelatine is largely used both in the form of jellies and soups. It is said by some authorities to be comparatively valueless as a food, but more recent investigations seem to prove that gelatine, although not of the same food value as albumen, leaves the body as urea, and must therefore have taken part in nutrition. Lean meat, free from blood, is best for stewing, and, when cut into convenient pieces, it should be slightly browned in a little butter or dripping. Constant attention is necessary during this process, to prevent burning. The meat should be covered with soft water or, better, a little stock, and set aside to simmer for four or five hours, according to the nature of the material. When vegetables are used, these should also be slightly browned and added at intervals, so as not materially to lower the temperature. Stews may be thickened by the addition of pearl barley, sago, rice, potatoes, oatmeal, flour, &c., and flavoured with herbs and condiments according to taste. Although stewing is usually done in a stewpan or saucepan with a closely-fitting cover, a good stone jar, with a well-fitting lid, is preferable in the homes of working people. This is better than a metal saucepan, and can be more easily kept clean; it retains the heat longer, and can be placed in the oven or covered with hot ashes. The common red jar is not suitable; it does not stand the heat so well as a grey jar; and the red glaze inside often gives way in the presence of salt. The lid of a vessel used for stewing should be removed as little as possible. An occasional shake will prevent the meat sticking. At the end of the operation all the fat should be carefully removed.

Frying.—Lard, oil, butter, or dripping may be used for frying. There are two methods of frying,—the dry method, as in frying a pancake, and the wet method, as when the thing fried is immersed in a bath of hot fat. In the former case a frying pan is used, in the other a frying kettle or stewpan. It is usual for most things to have a wire frying basket; the things to be fried are placed in the basket and immersed at the proper temperature in the hot fat. The fat should gradually rise in temperature over a slow fire till it attains nearly 400° Fahr. Great care is required to fry properly. If the temperature is too low the things immersed in the fat are not fried, but soddened; if, on the other hand, the temperature is too high, they are charred. The temperature of the fat varies slightly with the nature of things to be fried. Fish, cutlets, croquets, rissoles, and fritters are well fried at a temperature of 380° Fahr. Potatoes, chops, and white bait are better fried at a temperature of 400° Fahr. Care must be taken not to lower the temperature too much by introducing too many things. The most successful frying is when the fat rises two or three degrees during the frying. Fried things should be of a golden brown colour, crisp, and free from fat. When fat or oil has been used for fish it must be kept for fish. It is customary first to use fat for croquets, rissoles, fritters, and other delicate things, and then to take it for fish. Every thing fried in fat should be placed on bibulous paper to absorb any fat on the surfaces. (J. C. B.)

COOLIE, or COOLY, a word applied to designate an Asiatic labourer not belonging to the skilled or artizan class. Its derivation is far from certain. Dr Engelbert Kämpfer, in his *History of Japan* (London, 1727), describes as "coolies" the dock labourers, or, as they are called in England, "lumpers," who unloaded the Dutch merchant ships at Nagasaki. At Canton to this day a labourer in any European factory is known as a "coolie;" and though some have thought that the word may be of Chinese origin, as a matter of fact it is through Europeans that the natives of the Celestial Empire first became acquainted with the term. Of late the word is almost exclusively used to designate those natives of India and China who leave their native country under contracts of service to work as field-hands or labourers in foreign plantations and elsewhere.

The organization, partly official and partly voluntary, by means of which these Eastern labourers are collected, engaged, and conveyed to their respective destinations, has within recent times developed itself into a regular trade. The French, Portuguese, and Spanish nations prosecute this trade to a certain extent, and one or two South American republics also take part in it; but the great bulk of the traffic is now undoubtedly British.

Coolie emigration is the direct offspring of the discontinuance of slavery. When slave labour was no longer available, the colonists who had used it were placed in an awkward dilemma. White men were physically incapable of field work on tropical plantations, and free negroes could not be induced to engage in it. In these circumstances there were but two alternatives open to the planters. Either they must abandon their estates, or they must import labour from other countries than those which had been drained and devastated by the slave trade. There were many considerations that pointed to India and China as the fields most likely to yield that supply of workers on getting which the very existence of the West Indies depended. Those great Asiatic empires were over-peopled, their rigid forms of civilization, which had rooted them to the soil, were gradually being loosened by the impact of

European commerce; and their reluctance to leave their native shores was removed by tempting offers made to them.

Chinese Coolies.—The first public recognition of the traffic was in 1844, when the British colony of Guiana made provision for the encouragement of Chinese emigration. About the same time the Peruvian planters, who since their separation from the mother country had restricted slavery within the narrowest limits, also looked to China as being likely to furnish an efficient substitute for the negro bondsman. Agents armed with consular commissions from Peru began to appear in Chinese ports, where they collected and sent away ship-loads of coolies. Each one was bound to serve the Peruvian planter to whom he might be assigned for seven or eight years, at fixed wages, generally about 17s. a month,—food, clothes, and lodging being provided. Cuba, profiting by the example of Peru, also engaged in the traffic. In 1847, therefore, two ships went from Amoy to Havana, one with 350, the other with 629 coolies on board. From 1847 to 1856 the trade went on briskly without attracting much notice. Gradually, however, ugly reports as to the treatment the coolies received, both on their voyage to and after their arrival in Peru and Cuba, began to come to Europe and Asia. Still more painful rumours were set afloat regarding the thievish devices used to induce Chinese emigrants to leave their native land. It was said they were kidnapped, or tempted to engage under false pretences. It was declared that the transport ships were badly equipped and overcrowded, and that on their voyages they reproduced all the horrors of the "middle passage" in the old African slave trade. Those who were safely landed in Cuba or Peru were sold by auction in the open market to the highest bidders, who thus purchased them, holding them virtually as slaves for seven years instead of for life. Brutal as was the treatment to which these poor wretches were exposed on the plantations, it was merciful compared with that which fell to the lot of those who, contrary to their agreements, had been sent to labour in the foul guano pits of the Chincha Islands. Here they were forced to toil in gangs, each under an overseer, armed with a cowhide lash 5 feet long and 1½ inches thick. It was claimed as a merit that up to four o'clock each afternoon this weapon "was not much used." After that hour, however, the weaker coolies had their flagging energies stimulated by cuts of the whip, and remonstrance and entreaty were "punished by a flogging little short of murder." This horrible treatment speedily aroused attention; and a memorial was presented to the British Government by shipmasters engaged in the Chincha Islands guano trade. Even the United States skippers declared they "never saw or heard of slavery approaching that of the middle island of the Chinchas in misery." In 1860 it was calculated that of the 4000 coolies who since the traffic began had been fraudulently consigned to the guano pits of Peru, not one had survived. Some had poisoned themselves with opium; others deliberately contrived that they should be buried alive under falling masses of guano; many jumped off the cliffs and drowned themselves in the sea. When these atrocities came to light in 1854, the British governor of Hong Kong issued a proclamation forbidding British subjects or vessels to engage in the transport of coolies to the Chinchas. Technically this was *ultra vires* on his part. But in the following year Parliament confirmed his humane policy by passing the Chinese Passengers Act (18 and 19 Vict. c. 104), which put an end to the more abominable phase of the traffic. After that no British ship was allowed to sail on more than a week's voyage with more than twenty coolies on board, unless her master had complied with certain very stringent regulations.

The consequence of this was that the business of shipping coolies for Peru was transferred to the Portuguese settlement of Macao. There the Peruvian and Cuban "labour-agents" established depôts, which they unblushingly called "barracoons," the very term used in the West African slave trade. In these places coolies were "received," or in plain words, imprisoned and kept under close guard until a sufficient number were collected for export. Some of these were decoyed by fraudulent promises of profitable employment. Others were kidnapped by piratical junks hired to scour the neighbouring coasts. Many were bought from leaders of turbulent native factions, only too glad to sell the prisoners they captured whilst waging their internecine wars. The procurador or registrar-general of Macao went through the form of certifying the contracts; but his inspection was therefore practically useless. After the war of 1856–57 this masked slave trade pushed its agencies into Wampoa and Canton. In April 1859, however, the whole mercantile community of the latter port rose up in indignation against it, and transmitted such strong representations to the British embassy in China, that steps were taken to mitigate the evil. New regulations were from time to time passed by the Portuguese authorities for the purpose of minimizing the horrors of the Macao trade. They seem, however, to have been systematically evaded, and to have been practically inoperative. In 1868 the governor of Macao attempted to put in force humane regulations, but without success, as was proved by the trial of a Chinaman, Kwok-a-Sing, on the 29th of March 1871 before Chief-Justice Smale of Hong-Kong. The prisoner had been an emigrant on board the French ship "Nouvelle Pénélope," which sailed in October 1871 from Macao with 300 coolies. They mutinied on the voyage, and killed the master and seven of the crew Kwok-a-Sing was acquitted when tried for being an accessory to this crime. In the course of his trial, however, it was proved that though some of the mutineers were hardened criminals who had shipped as coolies merely for the purpose of raising a mutiny and plundering the ship, upwards of one-third of the emigrants on board had been kidnapped and were feloniously held in bondage. Commenting on this case, the British consul said the benevolent regulations of the Macao Government looked well on paper, but in practice they were capable of being evaded to an extent that made the coolie traffic "simply a slave trade, and a disgrace to any Christian Government that permits its perpetration within its jurisdiction." At Canton and Hong-Kong the coolie trade was put under various regulations, which in the latter port worked well only when the profits of "head-money" were ruined. In March 1866 the representatives of the Governments of France, England, and China drew up a convention for the regulation of the Canton trade, which had an unfortunate effect. It left head-money, the source of most of the abuses, comparatively untouched. It enacted that every coolie must at the end of a five years' engagement have his return passage-money paid to him. The West Indian colonies at once objected to this. They wanted permanent not temporary settlers. They could not afford to burden the coolie's expensive contract with return passage-money, so they declined to accept emigrants on these terms. Thus a legalized coolie trade between the West Indies and China was extinguished.

Indian Coolies.—With reference to the Indian coolie trade it is scarcely possible to say when it began. Before the end of last century Tamil labourers from Southern India were wont to emigrate to the Straits settlements, and they also flocked to Tenasserim from the other side of the Bay of Bengal after the conquest had produced a demand for labour. Ceylon also obtained workers from Southern India, and the extent of the emigration may be estimated by the fact that, taking a period of ten years ending 1869, about 65,000 emigrants, of whom 50,000 were adult males, landed annually in the island, and some 48,000 returned each year to their homes. In Penang it is calculated that 25,000 souls out of a population of 150,000 are Indian coolies. It is in domestic and agricultural service that they are employed in the Straits settlements, and more recently large numbers of coolies have been induced to work in the tea-gardens of Assam. On the other hand, in Burmah, they work as dock labourers and porters. In Mauritius, again, the first regularly recorded attempt at organizing coolie emigration from India took place in 1834, when forty coolies were imported. Between 1834 and 1837 about 7000 labourers must have been shipped from Calcutta, and about 100 from Bombay, to Mauritius, but it was not till 1836 that the colonial Government determined to put the trade under official regulations. In 1837 an emigration law was passed for Calcutta, but it also applied to all territories of the East India Company, providing that a "permit" must be got from the Government for every shipment of coolies, that all contracts should terminate in five years, that a return passage should be guaranteed, and that the terms of his contract should be carefully explained to each coolie. As regards the emigrant ships they were allowed to carry one coolie for every ton and a half of burthen—a rule now extended to one coolie for every two tons burthen. Then as now the Indian Government watched the deportation of labour from their dominions with jealous and anxious care, and when in 1838 it was found that upwards of 25,000 natives had, up to that year, gone from all parts of India to Mauritius, the Government became a little alarmed at the dimensions the traffic was assuming. Brougham and the old anti-slavery party denounced the trade as a revival of slavery, and the Presidency Government suspended it in order to investigate its alleged abuses. The nature of these may be guessed when it is said that the inquiry condemned the fraudulent methods of recruiting them in vogue, and the brutal treatment coolies often received from ship captains and masters. It was not till 1842 that steps were taken to formally reopen the coolie trade between Mauritius and India. A regulating Act was passed, the most important provisos of which were the appointment of authorized emigration agents at Indian ports, and a prohibition against contracts being signed till the coolie had been forty-eight hours on shore in the colony for which he was bound. At first the term was for one year, and the wages were five rupees a month, food, clothing, and medical attendance being found. Return passages were also guaranteed. In 1844 coolie emigration to the West Indies was sanctioned by the Indian Government. Jamaica, Trinidad, and Demerara were permitted to import coolies under the Mauritius rules, slightly modified,—one of the most important differences being that 12 per cent. of the emigrants to the West Indies were to be women. None of the colonial codes, however, seem to have carried out this modification. In 1847 Ceylon suffered by the political accident of having a separate Government. Her supply of labour was cut off, as the Indian Government prohibited all emigration save to the West Indies and Mauritius. The unfair prohibition was withdrawn, on the Ceylon Government adopting certain protective regulations in favour of the emigrants, and ever since the coolie trade with the island has gone on pretty smoothly. In 1851 the Indian Government agreed to relieve Mauritius of the obligation to provide return passages save for the destitute and the sick. In 1853 Lord Dalhousie's Government extended the term qualifying the West Indian coolie for return from five to ten years' service. In 1857 the colonial Governments proposed to commute the coolie's claim for a return passage, by giving him its value in land; but Lord Canning's Government viewed the suggestion with great jealousy, saying there must be some guarantee that in arranging the commutation the coolie was not swindled. In 1859 voluntary commutation was agreed to by the Indian authorities. Since then many changes have taken place, but, generally speaking, the Indian coolie trade is now regulated by two Acts—those of 1864 and 1869, of which the main provisions are as follows:—

Resident colonial emigration agents are appointed for the different ports. They appoint sub-agents or remitting parties, who must bear licences from the Protector of Emigrants at Calcutta. It is their business to beat up the country for coolies when there is a demand for them. The intending emigrants, when collected, must be taken by the agents before the resident magistrate of the district, who registers each one. A copy or certificate of registration is given to each coolie, stating particulars as to age, sex, name, caste, and former occupation. Of these documents duplicates are transmitted to the colonial emigration agent. When this formality has been complied with, the coolie is then sent on to the depôt and examined there by the colonial agent and surgeons. If physically unfit for the work for which he is wanted, of course he is summarily rejected. Each coolie ship must undergo rigorous sanitary inspection, and carry a surgeon, who reports on all the deaths and cases of sickness that occur during the passage. The contract which the coolie signs with the emigration agent binds him to serve not more than for 7½ hours a day for five years, as an agricultural labourer, on the estate to which he may be sent by the authorities at the port of debarkation. The wage in money is to be that which from time to time is paid to unindentured labourers in the colony. (In Demerara the Indian coolie earns 1s. 2d. a day,—women about 1s., and children 6d. each). The coolie also is provided with a house, garden, and medical attendance,—rations and clothing being subject to the special arrangements affecting wages; while at the end of ten years' service they are entitled to a free return passage to India.

As to the treatment of the coolie in the colonies when he arrives, of course there is much dispute. Statistics indicate that it cannot have been very considerate. From 1834 to 1872 Demerara, Trinidad, Jamaica, St Vincent, and Grenada imported 161,539 coolies, of whom 16,938 have returned home, and 48,548 are dead, leaving 96,053 in those colonies. As far as official rules can protect him a great deal is done by the Government. When he lands he is subjected to an examination by the immigration agent-general and an officer of health. Those not fit for agricultural labour are set aside, and those that are fit are allotted to different plantations in accordance with the demand made for them. Family life is respected, and children under fifteen years of age must not be parted from their parents. After their five years' indenture is ended, they are at liberty to re-engage on an independent footing, a bounty of about £11 being given to those who re-contract for another term of similar duration. How these apparently equitable provisions work became a matter of dispute in the case of Demerara and Mauritius; and serious complaints were made in 1869 with reference to the former colony by Mr G. W. des Vœux, a stipendiary magistrate, who had spent five years in the country. Commissioners were therefore despatched to inquire into the matter. They suggested certain reforms for the purpose of guarding the indentured labourer against the possibility of ill-treatment, and the powers of the immigration agent-general, or protector of immigrants, were enlarged so as to enable him to inspect estates more regularly, frequently, and efficiently. The medical officers of plantations, too, were made civil servants, and relieved from their dependence on the planters for their salaries. The question of re-engagements was also dealt with by the reforming ordinance of 1868 in a provision enacting that the manager of every estate should, at the half-yearly visit of the agent-general, produce before him every coolie who had completed his term of service, or would complete it in the course of the next six months. To each coolie in this position a certificate or a provisional certificate of exemption from labour must be handed, and not till then may the manager or any employer negotiate with him for re-indenture.

The case of Mauritius was more serious. It had long been suspected that the colony had been indulging in a course of legislation, the tendency of which, says Mr Geoghegan, the under-secretary to the department of agriculture in the Government of India, was "towards reducing the Indian labourer to a more complete state of dependence upon the planter, and towards driving him into indentures, a free labour market being both directly and indirectly discouraged." In 1871, acting on a petition presented by M. Adolph de Plevitz, a resident in the colony, who loudly denounced this injustice, the governor, Sir Arthur Gordon, appointed a police inquiry commission to investigate the matter; and thereafter a royal commission was appointed at the request of the planters, and its report was presented to the Imperial Parliament in 1875. The investigation showed that the treatment experienced by the coolies was extremely unsatisfactory, and that in many respects they were too much in the power of the planters.

With reference to the treatment of the coolie in foreign colonies it is more difficult to obtain the necessary information. In Cuba the Chinese labourers were subjected to such scandalous ill-usage that the Spanish Government was forced to interfere, especially when it was found the Chinese were beginning to take part with the insurgents. In 1871 a royal decree was issued suspending the importation of coolies to the colony, and giving power to the Government to give return passages to all who had finished their contracts and were not willing to re-engage. The decree, however, has been ignored. It is well known that rather than enter into another contract the Chinaman will leave the island. But then the Cubans desire him to remain so that a permanent labouring class may be created.

In many of the French colonies Indian labourers are imported, there being a convention between the Governments of France and India which admits of this being done. There, it is feared, the coolie is the victim of abuses and oppression which, happening as they do in foreign dominions, are not easily redressed. In Cayenne there is reason to believe the mortality amongst the coolies who labour in the gold mines is abnormally high; it is said that more than half the Indians imported "cannot be accounted for." In Réunion, Guadaloupe, and Martinique they are said to be systematically over-worked; and according to Mr Geoghegan there seems to be a disposition in Réunion to prevent their having free access to the British consul when they have occasion to claim his protection. (R. WI.)

COOMASSIE, or KUMASSI, the capital of Ashantee, in Guinea, West Africa, in 6° 34′ 50″ N. lat. and 2° 12′ W. long., and 130 miles N.N.W. of Cape Coast Castle, is situated on a low rocky eminence, from which it extends across a valley to the hill opposite, and occupies an area of about 1½ miles in length and over 3½ miles in circumference. It lies in the midst of a thick and jungly forest, and is nearly surrounded by a pestilential swamp. The town was founded in the middle of the 18th century by Sy Tutu. At the time of its capture by the British (February 4, 1874) it consisted of numerous streets, some of which were broad and regular; the main avenue was 70 yards in length. The houses were painted red and white, and had alcoves and stuccoed façades. The king's palace, a handsome building, was blown up on the destruction and evacuation of the town by Wolseley's forces (February 6). About 300 yards from the site of the palace is the grove into which the bodies of some thousand criminals and victims of the rites of Ashantee superstitions were yearly cast. Coomassie has a considerable trade with Central Africa. Bowdich estimated its population at 18,000. See ASHANTEE, vol. ii. p. 6°¹.

COOPER, ABRAHAM (1787-1868), an animal and battle painter, was the son of a tobacconist, and was born in London, in 1787. At the age of thirteen he became an employé at Astley's amphitheatre, and was afterwards groom in the service of Sir Henry Meux. When he was twenty-two, wishing to possess a portrait of a favourite horse under his care, he bought a manual of painting, learned something of the use of oil-colours, and painted the picture on a canvas hung against the stable wall. His master bought it and encouraged him to continue in his efforts. He accordingly began to copy prints of horses, and was introduced by Davis, the equestrian, to Benjamin Marshall, the animal painter, who took him into his studio, and seems to have introduced him to the *Sporting Magazine*, an illustrated periodical to which he was himself a contributor. In 1814 he exhibited his Tam O'Shanter, and in 1816 he won a prize of £100 for his Battle of Ligny. In 1817 he exhibited his Battle of Marston Moor and was made Associate of the Academy, and in 1820 he was elected Academician. He died in 1868. Cooper although ill educated, was a clever and conscientious artist; his colouring was somewhat flat and dead, but he was a skilful draughtsman and a master of equine portraiture and anatomy, and had some antiquarian knowledge. He had a special fondness for Cavalier and Roundhead work, and his best pictures are those in which he has reproduced the subjects of that period.

COOPER, ANTHONY ASHLEY. See SHAFTESBURY.

COOPER, SIR ASTLEY PASTON (1768-1841), a celebrated surgeon, was born at the village of Brooke, in Norfolk, August 23, 1768. His father, Dr Cooper, was a clergyman of the Church of England; his mother was the author of several novels. At the age of sixteen he was sent to London and placed under Mr Cline, surgeon to St Thomas's Hospital. From the first he devoted himself to the study of anatomy, and had the privilege of attending the lectures of John Hunter. In 1787 he was appointed demonstrator of anatomy at St Thomas's Hospital. In 1791 he delivered part of the course of lectures on anatomy and surgery at St Thomas's Hospital. In this year he married; and in the spring of 1792 he visited Paris. In the latter year he was also appointed professor of anatomy to Surgeon's Hall,—a situation which he again filled in 1794 and 1795. In 1800 he was appointed surgeon to Guy's Hospital, on the death of his uncle, William Cooper. In 1802 he received the Copley medal for two papers read before the Royal Society of London on the destruction of the membrana tympani; and in 1805 he was elected a fellow of that society. Having taken an active part in the formation of the Medico-Chirurgical Society, he published in the first volume of its *Transactions* an account of an unsuccessful attempt to tie the carotid artery. Another of his remarkable attempts was to tie the aorta. In 1804 he brought out the first, and in 1807 the second, part of his great work on Hernia—the operation for which, on account of the defective knowledge of the local anatomy, was then frequently unsuccessful. So greatly did this work add to his reputation, that in 1813 his annual professional income rose to £21,000 sterling. He was soon after appointed professor of comparative anatomy to the Royal College of Surgeons. In 1820, he removed a steatomatous tumour from the head of George IV. About six months afterwards he accepted a baronetcy, which, as he had no son, was to descend to his nephew and adopted son, Astley Cooper; in 1827 he was elected president of the Royal College of Surgeons; and in 1830 vice-president of the Royal Society. He was also chosen member of the French Institute; the degree of D.C.L. was conferred on him by Oxford, and that of LL.D. by Edinburgh; and he was appointed sergeant-surgeon to the king. He died on the 12th February 1841, at the age of seventy-three. He was interred, by his own desire, beneath the chapel of Guy's Hospital; and a statue by Bailey was erected to his memory in St Paul's Cathedral.

His chief works are *Medical Records and Researches* (1798); *On Hernia* (1804-7); *Dislocations and Fractures* (1822); *Treatise on the Anatomy and Diseases of the Breast* (1829-40); *Anatomy of the Thymus Gland* (1832) See *Life of Sir A. Cooper*, by B. Cooper.

COOPER, CHARLES HENRY (1808-1866), the historian of Cambridge, was born at Great Marlow, 20th March 1808, being descended from a family formerly settled at Bray, Berkshire. He received his education at a private school in Reading. In 1826 he fixed his residence at Cambridge, and in 1836 was elected coroner of the borough. Four years later he was admitted a solicitor, and in course of time he acquired an extensive practice, but his taste and inclination ultimately led him to devote almost the whole of his time to literary research, and especially the elucidation of the history of the university of Cambridge. In 1849 he resigned the office of borough coroner on being elected to the town-clerkship, which he retained till his death on March 21, 1866. His earliest production, *A New Guide to the University and Town of Cambridge*, was published anonymously in 1831. *The Annals of Cambridge* followed, in 4 vols. 8vo, 1842-52, containing a chronological history of the university and town from the earliest period to the year 1849. His most important work, the *Athenæ Cantabrigienses*, a companion work to the famous *Athenæ Oxonienses* of Anthony à Wood, contains biographical memoirs of the authors and other men of eminence who were educated at the university of Cambridge. The work has not been completed; only two volumes have been published (in 1858 and 1861), embracing the period between 1500 and 1609. Cooper's other works are *The Memorials of Cambridge*, 3 vols. 1858-66, and a *Memoir of Margaret, Countess of Richmond and Derby*, 1874, a posthumous publication. He was a constant contributor to *Notes and Queries*, the *Gentleman's Magazine*, and other antiquarian publications, and left an immense collection of MS. materials for a biographical history of Great Britain and Ireland.

COOPER, JAMES FENIMORE (1789-1851), an American novelist, was born at Burlington, New Jersey, on the 15th September 1789. Reared in the wild country round the Otsego Lake, on the yet unsettled estates of his father, a judge and member of Congress, he was sent to school at Albany and at Newhaven, and entered Yale College in his thirteenth year, remaining for some time the youngest student on the rolls. Three years afterwards he joined the United States navy; but after making a voyage or two in a merchant vessel, to perfect himself in seamanship, and obtaining his lieutenancy, he married and resigned his commission (1811). He settled for a while at Westchester, the "Neutral Ground" of his earliest American romance, and produced anonymously (1819) his first book, *Precaution*, a novel of the fashionable school. This was followed (1821) by *The Spy*, which was very successful at the date of issue; *The Pioneers*, the first of the "Leatherstocking" series; and *The Pilot* (1823), a bold and dashing sea-story. The next was *Lionel Lincoln* (1825), a feeble and unattractive work; and this was succeeded in 1826 by the famous *Last of the Mohicans*, a book that is often quoted as its author's masterpiece. Quitting America for Europe he published at Paris *The Prairie* (1826), the best of his books in nearly all respects, and *The Red Rover*, by no means his worst.

At this period the unequal and uncertain talent of Cooper would seem to have been at its best. These excellent novels were, however, succeeded by one very inferior, *The Wept of Wish-ton-Wish* (1827); by *The Notions of a Travelling Bachelor* (1828), an uninteresting book; and by *The Waterwitch* (1830), one of the poorest of his many sea-stories. In 1830 he entered the lists as a party writer, defending in a series of letters to the *National*, a Parisian journal, the United States against a string of charges brought against them by the *Revue Britannique*; and for the rest of his life he continued skirmishing in print, sometimes for the national interest, sometimes for that of the individual, and not infrequently for both at once. This opportunity of making a political confession of faith appears not only to have fortified him in his own convictions, but to have inspired him with the idea of imposing them on the public through the medium of his art. His next three novels, *The Bravo* (1831), *The Heidenmauer* (1832), and *The Headman of Berne* (1833), were designed to exalt the people at the expense of the aristocracy. Of these the first is by no means a bad story, but the others are among the dullest ever written; all were widely read on both sides of the Atlantic.

In 1833 Cooper returned to America, and immediately published *A Letter to my Countrymen*, in which he gave his own version of the controversy he had been engaged in, and passed some sharp censure on his compatriots for their share in it. This attack he followed up with *The Monikins* and *The American Democrat* (1835); with several sets of notes on his travels and experiences in Europe, among which may be remarked his *England* (1837), in three volumes, a burst of vanity and ill-temper; and with *Homeward Bound*, and *Home as Found* (1838), noticeable as containing a highly idealized portrait of himself. All these books tended to increase the ill-feeling between author and public; the press was virulent and scandalous in its comments, and Cooper plunged at once into a series of actions for libel. Victorious in all of them, he returned to his old occupation with something of his old vigour and success. A *Naval History of the United States* (1839), supplemented (1846) by a set of *Lives of Distinguished American Naval Officers*, was succeeded by *The Pathfinder*, a good "Leatherstocking" novel; by *Mercedes of Castile*, and *The Deerslayer* (1841); by *The Two Admirals*, and by *Wing and Wing* (1842); by *Wyandotte*, *The History of a Pocket Handkerchief*, and *New Myers* (1843); and by *Afloat and Ashore*, and *Miles Wallingford* (1844). From pure fiction, however, turned again to the combination of art and controversy in which he had achieved distinction, and in the three *Littlepage Stories* (1845-6) he fought with a great deal of vigour. His next novel was *The Crater, or Vulcan's Peak* (1847), in which he attempted to introduce supernatural machinery with indifferent success; and this was succeeded by *Oak Openings* and *Jack Tier* (1848), the latter a curious *rifacimento* of *The Red Rover*; by *The Sea Lions* (1849); and finally by *The Ways of the Hour* (1850), another novel with a purpose, and his last book. He died of dropsy at Cooperstown, New York, in his sixty-second year.

Cooper was certainly one of the most popular authors that have ever written. His stories have been translated into nearly all the languages of Europe and into some of those of Asia, and are even now found worthy the honours of a cheap reprint. Balzac admired him greatly, but with discrimination; Victor Hugo pronounced him greater than the great master of modern romance, and this verdict was echoed by a multitude of inferior readers, who were satisfied with no title for their favourite less than that of "the American Scott." As a satirist and observer he is simply the "Cooper who 's written six volumes to prove he 's as good as a Lord" of Lowell's clever portrait; his enormous vanity and his irritability find vent in a sort of dull violence, which is exceedingly tiresome. It is only as a novelist that he deserves consideration. His qualities are not those of the great masters of fiction; but he had an inexhaustible imagination, some faculty for simple combination of incident, a homely tragic force which is very genuine and effective, and up to a certain point a fine narrative power. His literary training was inadequate; his vocabulary is limited and his style awkward and pretentious; and he had a fondness for moralizing tritely and obviously, which mars his best passages. In point of conception, each of his three-and-thirty novels is either absolutely good or is possessed of a certain amount of merit; but hitches occur in all, so that every one of them is remarkable rather in its episodes than as a whole. Nothing can be more vividly told than the escape of the Yankee man-of-war through the shoals and from the English cruisers in *The Pilot*, but there are few things flatter in the range of fiction than the other incidents of the novel. It is therefore with some show of reason that *The Last of the Mohicans*, which as a chain of brilliantly narrated episodes is certainly the least faulty in this matter of sustained excellence of execution, should be held to be the best of his works.

The personages of his drama are rather to be accounted as so much painted cloth and cardboard, than as anything approaching the nature of men and women. As a creator of aught but romantic incident, indeed, Cooper's claims to renown must rest on the fine figure of the Leatherstocking, and, in a less degree, on that of his friend and companion, the Big Serpent. The latter has many and obvious merits, not the least of which is the pathos shed about him in his last incarnation as the Indian John of *The Pioneers*. Natty Bumpo, however, is a creation of no common unity and consistency. There are lapses and flaws, and Natty is made to say things of which only Cooper, in his most verbosely didactic vein, could have been uttered But on on the whole the impression left is good and true. In the dignity and simplicity of the old backwoodsman there is something almost Hebraic. With his naive vanity and strong reverent piety, his valiant wariness, his discriminating cruelty, his fine natural sense of right and wrong, his rough limpid honesty, his kindly humour, his picturesque dialect, and his rare skill in woodcraft, he has all the breadth and roundness of a type and all the eccentricities and peculiarities of a portrait.

COOPERAGE, the art of making casks, barrels, and other rounded vessels, the sides of which are composed of separate staves, held together by hoops surrounding them. The art is one of great antiquity, being mentioned by Pliny, who ascribes its invention to the inhabitants of the Alpine valleys. The cask or barrel form is at once the strongest, tightest, and most convenient form into which wood can be fashioned as a vessel for storing either liquid or solid substances, and the manufacture has attained great precision and perfection. The trade is one in which there are numerous subdivisions, the chief of which are tight or wet and dry-or slack cask manufacture. To these may be added white cooperage, a department which embraces the construction of wooden tubs, pails, churns, and other even-staved vessels. Of all departments, the manufacture of tight casks or barrels for holding liquids is that which demands the greatest care, experience, and skill; as, in addition to perfect tightness when filled with liquid, the vessels must bear the strain of transportation to great distances, and in many cases they have to resist considerable internal pressure when they contain fermenting liquors. Cooperage is still most commonly pursued as a handicraft with the tools and appliances which have been employed from the earliest times; but many expedients of the greatest ingenuity and efficiency have been introduced or performing the numerous operations by mechanical means. Tight casks are generally made of well-seasoned oak of the best quality, free from twists and warping. Whether accomplished by hand or machinery the following are the essential operations. 1st, The preparation of the staves is the most important and difficult task of the cooper, inasmuch as a cask being a double conoid, having its greatest diameter (technically the bulge or belly) in its centre, each stave must be accurately curved to form a segment of the whole. The taper from the centre to the extremities must be curved; in cross section it must be double concave, and the joints, or edges, must be so bevelled that when bent into position they shall form a true plane through the central axis of the vessel. 2d, Trussing consists of setting the separate staves, properly bevelled and jointed, upright in a frame in order to receive trussing hoops at both ends, which serve to keep them together for the permanent hooping. The lower ends of the staves are set together in a frame and a hoop passed round them. A rope is then carried round the upper part and gradually tightened till the joints are brought quite close, when a hoop is dropped over and the rope removed. 3d, Chiming and crozing consists in finishing the two ends for receiving the heads. The chime is the bevel formed on the extremity of the staves, and the croze consists of the groove into which the ends or heads fit. 4th, Hooping, and 5th, Preparing heads or ends, are the other operations to be noticed. For wet casks hoops are generally made of iron, although wooden hoops also are employed. The heads, when made of two or more pieces, are jointed by means of dowel pins, and after being cut to the proper size they are chamfered or bevelled at the edges to fit into the croze grooves. Drawings and descriptions of a very elaborate and complete series of machines made by Messrs Allen, Ransome, & Co. of Chelsea, from the designs of Mr John Richard, for performing these various operations, will be found in *Engineering* (vol. xxi. January–June 1876).

The quantity of tight casks required in certain industries is incalculable. On the continent of Europe they are in most extensive demand in the wine-producing districts. In Great Britain, brewers and distillers must have enormous stocks, and both in Great Britain and in the United States the mineral oil and petroleum trade employ vast quantities. Slack barrels are almost as extensively employed in connection with chemical industries and the fruit and fish trades. In America slack barrels are the form most generally adopted for packing almost all kinds of dry goods for storing and transport, and the flour, rosin, fruit, and other products sent to Europe are almost invariably inclosed in such vessels.

CO-OPERATION, a term in social economics, which, though of generic significance in the science of industry and trade, has a specific and technical sense, implying the association of any number of individuals or societies for mutual profit, whether in the purchase and distribution of commodities for consumption, or in the production of commodities, or in the borrowing and lending of capital among workmen.

The most powerful co-operative force in the industrial system is what economists have termed "the division of labour," but that is in reality also a union and graduation of labour towards productive ends, and has its counterpart in the multiform divisions of capital in its application to the maintenance and extension of industry.

Co-operation, as technically understood, occupies a middle position between the doctrines of the communists and socialists (see COMMUNISM) on the one hand, and the private property and freedom of individual labour and enterprize on the other. It takes its departure from communism at a very definite and significant point. While the latter would extinguish the motive of individual gain and possession in the sentiment of a universal happiness or good, and remodel all the existing rights, laws, and arrangements of society on a basis deemed consonant to this end, co-operation seeks, in consistency with the fundamental institutes of society as hitherto developed, to ameliorate the social condition by a concurrence of increasing numbers of associates in a common interest.

The co-operative societies, springing from this idea, though attended with the most varied fortune, have greatly increased in number and in amount of business in recent years. The form, particular objects, and organic rules of these associations are by no means uniform. But, as we find them in the principal countries of Europe, they may be divided into three general classes:—1. Societies of consumption, the object of which is to buy and sell to members alone, or to members and non-members under differing conditions, the necessaries of life or the raw materials of their industry; 2. Societies of production, the object of which is to sell the collective or individual work of the members; 3. Societies of credit or banking, the object of which is to open accounts of credit with their members, and advance them loans for industrial purposes. There are numerous modifications of the principle, such as friendly societies, burial societies, societies of workmen which undertake the execution of work by contract, arrangements of private firms by which the workmen share in the profits of the employers, and building societies, now rife in most large towns, the object of which is to enable members to become owners of dwelling houses. But the above three categories define the distinguishing characteristics of the co-operative society proper; and it is somewhat remarkable that the three kinds of association have attained marked success in three different European countries. England stands at the head in societies of consumption; France, in societies of production; Germany, in societies of credit. With reference to this variety of result it may be observed that the social equality resulting from the great Revolution, in connection with the character of much of the manufacturing industry of France, has given that country a larger number of artizans who work in their own houses, and have a passion for independence in their handicraft, than is to be found in any other country. On the other hand, the masses of operatives in the factories and other great works of England, while retaining their position as wage-earners, have put forth most energy and attained their highest co-operative success in societies for the purchase, and in some degree the production, of their own immediate necessaries of life. The less abundant capital, and the want of banks and other institutions of credit in the smaller towns and remoter parts of Germany, may explain in some measure the notable development of societies of credit in that country. But no account of the phenomena in Germany would be satisfactory without placing at the head of influences the personal agency of one man—M. Schulze, of Delitzsch (a town of only 6000 inhabitants)—who had the sagacity to perceive that societies of credit were the necessary foundation of the co-operative system, and who reasoned out principles, planned, and laboured with a skill, disinterestedness, and perseverance which have crowned his idea with remarkable success.

The Credit Society of M. Schulze is practically a bank, but a bank organized on principles specially adapted to the working classes within certain limits of transaction, to which it is strictly confined. The members of the society must be men of "self-help," able to work and in regular employment, and they must hold each one equal share of the stock-capital of the society, which may be paid up in full, or by regular instalment. Dividends are only paid to the members who have paid in full, the profits due on the partly-paid shares being added to these till they reach their full amount. It follows from the principle of the society—"in proportion to the chance of gain the risk of loss—" that when the share-capital has to be called upon to liquidate the debts, it is the capital actually paid in that loses. Equality of shares and equality of advantages and risks are thus attained. But in addition to the share-capital there is a reserve fund formed out of entrance fees and a percentage of the net profits. The order of liability for deficits in the balance sheets is thus (1) reserve fund, (2) paid-in capital, and (3) private property of the members—the final principle being that of unlimited liability. Every member is responsible for the debts of the society, and the society for the debts of every member. It is obvious that a company thus constituted, and composed of the most saving and industrious workmen of a town or district, offers a solid security, and consequently the share-capital is supplemented by loans for given periods of time, debentures, and savings deposits, the last having to be guarded by conditions as to notice of withdrawal. At the beginning of a society the paid-up share-capital may not be more than the proportion of 10 to 90 of borrowed funds, but it has to be brought up as rapidly as possible to 25 per cent., and should reach a maximum of 50 per cent. The share-capital, as originally fixed, has also to be increased as the business, and the amount of funds necessary for its transaction, increase; so that the amount of each share has thus to be supplemented *plus* the increase of business *minus* the increase of members. By these means the society is protected from too small a share-capital for its liabilities, and from the temptation of appropriating large dividends out of the surplus profit, accruing from borrowed funds. Another peculiarity of the German "credit union" is that it makes advances of the funds of which it is possessed to its own members only. The two great ends to be secured being the minimum of risk and the maximum of responsibility, the first is promoted by advancing money only for industrial purposes, within due limits, among borrowers whose requirements and circumstances are or may be thoroughly known to the society, and the second by the fact that every member of the society is unlimitedly liable for any errors or losses that may arise in the administration. The advances are made in the usual forms of promissory notes with the indorsation of sureties, ordinary bills of exchange, and occasionally mortgages over real property in current accounts. Advances are not made for longer periods than the society can itself borrow; partial repayment at dates is sometimes conditioned within the period of advance; and the interest charged follows the public money-market rate. It is thus that M. Schulze, through a series of skilful regulations beyond our space to follow, solved the problem, which vexed and puzzled the socialists of a past generation, of bringing capital direct to the workman or "immediate producer."

When the little "credit union" of Delitzsch was fully organized in 1852, popular opinion was so well prepared and enlightened on the subject by M. Schulze's efforts in the Prussian Parliament and on the platform, that similar societies were rapidly organized in other parts of the country. While each society had full powers of self-regulation, they were all much on the Delitzsch model, and a general affiliation was brought about for mutual counsel and encouragement. M. Schulze then applied in the legislature for corporate rights and legal status to the associations, and after tedious labours obtained them. In 1865 he established a central credit bank at Berlin, by which the societies, while depending mainly on local credit supplies, might have access, in case of need, to the general loan market. The "credit unions," though now numerous, are only a section of the co-operative movement in Germany.

The law of the Prussian Parliament granting corporate rights to loan and credit associations extends the same privileges to "raw material and store unions," "unions for the production and sale of finished wares on a common account," "unions for the purchase of the necessaries of life wholesale and the selling of them retail," and "unions for providing their members with dwelling-houses."

The history of the co-operative movement in France is much too extensive to be traced here. But it may be observed that the French co-operators have discovered, at various periods, a strong leaning to the opinion that, while they supply the labour, the state is under obligation to supply in whole or in part the capital and other means of labour; and under this idea co-operation merges very nearly into communism. "L'état! c'est moi," said Louis XIV., and in the days of democracy the same idea not unnaturally suggests itself to an overwhelming majority of the people. This was precisely the argument which the late M. Lasalle, following the French socialists, used against Schulze and the economists in Germany. "Society," he in effect argued, "consists of 96 *prolétaires* and four capitalists. There is the state! The prolétaires have no capital, can save nothing, have nothing to save from. But the state, of which they are 96 out of 100, can come forward, cover the prolétaires with its credit, and give a new departure to the production and distribution of wealth. Capital in its personal accumulation is merely the spawn of ages of slavery, craft, and plunder." The discussion of this question had been exhausted in France more than once. Bastiat and Proudhon had quite recently fought it out between them. But there were also practical experiments and illustrations. On the revolution of February 1848, the French state recognized to some extent its duty to the proletaires, organized national workshops, and voted 3,000,000 francs for the use of fifty-six co-operative societies. Three-fourths of these societies perished after a brief period. The state lost its money, and the members did themselves no good. Only a remnant, by organizing themselves on sounder principles, survived. The "Société des Tourners en Chaises," which refused assistance from the state, and declined the principle of equality of wages, is flourishing to this day. The Society of Masons, of Piano-Makers, of "Ouvriers Lunettiers," and others, have established a strong position, beginning with small capital, and increasing it to large amounts. In Lyons there are the "Société des Tisseurs," of 1800 members, and others; at St Étienne the "Association des Rubanniers," of 1200 members, said to have half a million sterling of capital. The "society of production," of which there are at least forty examples in Paris alone, is found in nearly all the French provinces, and has proved the capacity of workmen by union to carve out business for themselves and be their own masters, while, in many cases, employing other workmen or auxiliaries at wages, who have no share in the profits. There are also in France more examples, probably, than in any other country, of workmen sharing in the profits of the firms by which they are employed, under arrangements offered and regulated by the employers or capitalists themselves.

Of the "society of consumption" there are innumerable examples in the United Kingdom, the chief being the Rochdale, Leeds, and Halifax Societies, embracing nearly the whole working population of a large manufacturing district, and carrying out their operations, from the wholesale and retail stores to dairies, flour-mills, and other auxiliary branches, including libraries and newsrooms. The supply associations in London organized by members of the Government civil service have also attained much importance; but, as these trade with the public, and divide large profits among privileged holders of shares, it has been questioned whether they can be properly regarded as co-operative societies. Nearly every town of the kingdom has a "co-operative store;" and when these are numerous in a district they usually affiliate, and open a common wholesale department in Liverpool, Glasgow, or some other emporium. The advantages in many cases may not be great, and after a brief existence the societies not unfrequently wind up. But when properly conducted and supported, they secure wholesome commodities, encourage among their members ready-money payments, and as the goods are sold at a fair margin of profit, there is every quarter or half year a dividend at the rate of 5 to 10 or more per cent. to the members on their share-capital, and a bonus to non-members on the amount of their purchases. One of the indirect advantages of the co-operative store, when established in a community, is its influence as a formidable rival on private grocers and dealers.

The most signal instances of failure of the co-operative principle in the United Kingdom have occurred in the sphere of "production," where France has given many successful examples. The united coal-miners of South Yorkshire purchased the Shirland Collieries in 1874 at a price of £70,000, of which they paid down £31,000, raising the remainder of the purchase money in debenture bonds. The working and proprietary company thus formed has never been able to pay the interest due on its bonds, and the collieries have now passed into other hands for £11,000 with the liabilities attaching to them, and the whole capital of the workmen has been lost. The purchase of collieries at a period when the coal trade and wages of mining labour were in a state of inflation, followed sharply by successive collapses, may account for this unfortunate result. The engineering factory at Ouseburn, bought up and worked for a time by operatives, is again, after a stoppage, re-established on a co-operative basis. But the failure of co-operative production has been recently illustrated in another form. In 1865 Messrs Briggs & Co., proprietors of the Whitwood and Methley Junction Collieries, entered into a permanent contract with their workmen, whereby the latter were to receive, in addition to the current rate of wages, one-half of the profits above 10 per cent. for the redemption of capital invested. As long as there were profits, and the rate of wages presented no difficulty, this answered well enough; but when the tide turned, and there were no profits, but only loss unless wages were reduced, the situation was wholly altered in the estimate of the workmen, and the compact was broken up in 1874 on the demand of the men themselves, who said they would prefer to be simply members of the "Miners' Union."

The numerous cotton factories in Lancashire, on a basis of small joint-stock shares, yielding in some cases large dividends, might almost be considered as great an example of co-operative production as any effort of the kind in France. The operatives have a large stake and much advantage in those factories; but since the spinner or weaver does not necessarily work in the factory of which he has a small proprietary share, these joint-stock establishments are probably to be regarded more as investments of the savings of the operatives than as co-operative societies. The co-operative idea, as would probably be held by its most staunch propounders, requires identity of purpose and interest, with community of advantages and risks, though not necessarily absolute equality or uniformity of individual relations, among the co-operators. When the association passes into a mere investment and trading company, the idea would seem to be lost.

The co-operative system in the United Kingdom has attained such magnitude as well as variety of development that our literature on the subject cannot be deemed so complete as would be desirable.

Mr G. J. Holyoake, than whom probably no one in England has more command of the subject, is engaged on a *History of Co-operation*, the first volume of which has been published. Valuable information on co-operative societies occurs in official documents; see, for example, the appendix of the *Eleventh and Final Report of Royal Commission as Trades Unions*, 1869. (R. SO.)

COORG, a province of Southern India, near the centre of the Western Ghats, between 11° 56′ and 12° 45′ N. lat. and 75° 25′ and 76° 13′ E. long., is bounded by Mysore, Malabar, and South Kanara, and has an area of 2000 square miles. It is a mountainous district, presenting throughout a series of wooded hills and deep valleys; the lowest elevations are 3000 feet above sea-level. The loftiest peak, Tandiandamol, has an altitude of 5781 feet; Pushpagiri, another peak, is 5682 feet high. The principal river is the Cauvery, or Kaveri, which rises on the eastern side of the Western Ghats, and with its tributaries drains the greater part of Coorg. Besides these there are several large streams that take their rise in Coorg. In the rainy season, which lasts during the continuance of the south-west monsoon, or from June to the end of September, the rivers flow with violence and great rapidity. In July and August the rainfall is excessive, and the month of November is often showery. The yearly rainfall may exceed 160 inches; in the dense jungle tract it reaches from 120 to 150; in the bamboo district from 60 to 100 inches. The climate, though humid, is on the whole healthy; it is believed to have been rendered hotter and drier of late years by the clearing of forest land. Coorg has an average temperature of about 60° Fahr., the extremes being 52° and 82°. The hottest season is in April and May. In the direction of Mysore the whole country is thickly wooded; but to the westward the forests are more open. The flora of the jungle includes *Michelia* (Chumpak), *Mesua* (Iron-wood), *Diospyros* (Ebony and other species), *Cedrela Toona* (White cedar), *Chickrassia tubularis* (Red cedar), *Calophyllum angustifolium* (Poon spar), *Canarium strictum* (Black Dammar tree), *Artocarpus*, *Dipterocarpus*, *Garcinia*, *Euonymus*, *Cinnamomum iners*, *Myristica*, *Vaccinium*, *Myrtaceæ*, *Melastomaceæ*, *Rubus* (three species), and a rose. In the undergrowth are found cardamom, areca, plantain, canes, wild pepper, tree and other ferns, and arums. In the forest of the less thickly-wooded bamboo country in the west of Coorg the trees most common are the *Dalbergia latifolia* (Black wood), *Pterocarpus Marsupium* (Kino tree), *Terminalia coriacea* (Mutti), *Lagerströmia parviflora* (Benteak), *Conocarpus latifolius* (Dindul), *Bassia latifolia*, *Butea frondosa*, *Nauclea parviflora*, and several acacias, with which, in the eastern part of the district, teak and sandalwood occur. Among the fauna may be mentioned the elephant, tiger, tiger-cat, cheetah or hunting leopard, wild dog, elk, bison, wild boar, several species of deer, hares, monkeys, the buceros and various other birds, the cobra di capello, and a few alligators. The most interesting antiquities of Coorg are the earth redoubts (*kunnidegs*), which are from 15 to 25 feet high, and provided with a ditch 10 feet deep by 8 or 10 feet wide. Their linear extent is reckoned at between 500 and 600 miles. The exports of Coorg are mainly rice, coffee, and cardamoms; and the only important manufacture is a kind of coarse blanket. Fruits of many descriptions, especially oranges, are produced in abundance, and are of excellent quality. The Coorgs, of whom the Kodagas are the chief tribe, constitute thirteen castes. They are of Dravidian origin, and retain the devil-worship of their ancestors; they speak a dialect of Canarese. They are a well-formed, bold and active, but ignorant and superstitious race. The strange institution of polyandry prevalent among them, according to which the wives of the brothers of a family are common property, appears to have arisen from the necessity of counteracting the exterminating influence of wars by making the brothers of the slain the rightful husbands of their widows. The principal towns of Coorg are Merkara, the capital, Fraserpett, Somwarpett, Periapatam, and Verajenderpetta. In 1872 Coorg contained 510 villages, and its population numbered 168,312.

Previous to its annexation to British India, Coorg was governed by a line of rajahs of the Nair caste of Hindus, mentioned in history as early as the year 1583. The ascendency of the last family of these rulers dates from the year 1632. Its princes retained their independence till the year 1773, when Hyder Ali, who had long sought the subjugation of the country, took advantage of a dispute about the succession to seize upon the sovereignty, and imprisoned the rajah. The latter subsequently effected his escape from captivity, and drove the armies of Tippoo Sultan out of Coorg; and in the war against Tippoo in the year 1791 he proved a useful auxiliary to the British. On the defeat of Tippoo a treaty was entered into between the East India Company and Viraraja of Coorg, who dying in 1807, left the throne to his daughter Devammaji. Lingaraja, her uncle, who now usurped the throne, was succeeded in 1820 by his son, Viraraja. This monarch's misgovernment and oppression of Coorg brought upon him at length the armed interference of Lord William Bentinck; in April 1834 he was deposed by General Fraser, and his dominions were annexed to British territory. Since then the revenue has improved, cultivation has been extended, and the general prosperity of the country has steadily increased.

COOT, a well-known British water-fowl, the *Fulica atra* of Linnæus, belonging to the family *Rallidæ* or Rails. The word Coot, in some parts of England pronounced Cute, or Scute, is of uncertain origin, but perhaps cognate with Scout and Scoter—both names of aquatic birds—a possibility which seems to be more likely since the name "Macreuse," by which the Coot is known in the south of France, being in the north of that country applied to the Scoter (*Œdemia nigra*) shows that, though belonging to very different families, there is in popular estimation some connection between the two birds.[1] The Latin *Fulica* (in polite French, *Foulque*) is probably allied to *fuligo*, and has reference to the bird's dark colour.[2] The Coot breeds abundantly in many of the larger inland waters of the northern parts of the Old World, in winter commonly resorting, and often in great numbers, to the mouth of rivers or shallow bays of the sea, where it becomes a general object of pursuit by gunners whether for sport or gain. At other times of the year it is comparatively unmolested, and being very prolific its abundance is easily understood. The nest is a large mass of flags, reeds, or sedge, piled together among rushes in the water or on the margin, and not unfrequently contains as many as ten eggs. The young, when first hatched, are beautiful little creatures, clothed in jet-black down, with their heads of a bright orange-scarlet, varied with purplish-blue. This brilliant colouring is soon lost, and they begin to assume the almost uniform sooty-black plumage which is worn for the rest of their life; but a characteristic of the adult is a bare patch or callosity on the forehead, which being nearly white gives rise to the epithet "bald" often prefixed to the bird's name. The Coot is about 18 inches in length, and will sometimes weigh over 2 ℔. Though its wings appear to be short in proportion to its size, and it seems to rise with difficulty from the water, it is capable of long-sustained and rather rapid flight, which is performed with the legs stretched out behind the stumpy tail. It swims buoyantly, and looks a much larger bird in the water than it really is. It dives with ease, and when wounded is said frequently to clutch the weeds at the bottom with a grasp so firm as not even to be loosened by death. It does not often come on dry land, but when there, marches leisurely and not without a certain degree of grace. The feet of the Coot are very

[1] It is owing to this interchange of their names that Yarrell in his *British Birds* refers M. Victor Hugo's description of the "chasse aux Macreuses" to the Scoter instead of the Coot.

[2] Hence also we have *Fulix* or *Fuligula* applied to a Duck of dingy appearance, and thus forming another parallel case.

remarkable, the toes being fringed by a lobed membrane, which must be of considerable assistance in swimming as well as in walking over the ooze—acting as they do like mud-boards.

In England the sport of Coot-shooting is pursued to some extent on the broads and back-waters of the eastern counties—in Southampton Water, Christchurch Bay, and at Slapton Lay—and is often conducted battue-fashion by a number of guns. But even in these cases the numbers killed in a day seldom reach more than a few hundreds, and come very short of those that fall in the officially-organized *chasses* of the lakes near the coast of Languedoc and Provence, of which an excellent description is given by the Vicomte Louis de Dax.[1] The flesh of the Coot is very variously regarded as food. To prepare the bird for the table, the feathers should be stripped, and the down, which is very close, thick, and hard to pluck, be rubbed with powdered resin; the body is then to be dipped in boiling water, which dissolving the resin causes it to mix with the down, and then both can be removed together with tolerable ease. After this the bird should be left to soak for the night in cold spring-water, which will make it look as white and delicate as a chicken. Without this process the skin after roasting is found to be very oily, with a fishy flavour, and if the skin be taken off the flesh becomes dry and good for nothing (Hawker's *Instructions to Young Sportsmen;* Hele's *Notes about Aldeburgh*).

The Coot is found throughout the Palæarctic Region from Iceland to Japan, and in most other parts of the world is represented by nearly allied species, having almost the same habits. An African species (*F. cristata*), easily distinguished by a red caruncle on its forehead, is of rare appearance in the south of Europe. The Australian and North American species (*F. australis* and *F. americana*) have very great resemblance to our own bird; but in South America half-a-dozen or more additional species are found which range to Patagonia, and vary much in size, one (*F. gigantea*) being of considerable magnitude. The remains of a very large species (*F. newtoni*) have been discovered in Mauritius, where it must have been a contemporary of the Dodo, but like that bird is now extinct. (A. N.)

COOTE, SIR EYRE (1726–1783), a celebrated general, born at Limerick in 1726, was the son of a clergyman. He served against the Pretender in 1745, and in 1754 sailed for India to join the army of Clive. In 1760, having attained the rank of colonel for his services at Plassy and Calcutta, he was sent to the Carnatic, where he took Wandewash and defeated Lally. For these exploits he received on his return to England a jewelled sword from the East India Company, and a vote of thanks from the House of Commons. In 1769 he was appointed to the chief command in Madras; but in the next year, having quarrelled with the governor, he returned to England. He was made Knight of the Bath, colonel of the 7th Foot, and governor of Fort St George. In 1780 he returned to Calcutta as commander-in-chief in Bengal and member of the supreme council. Soon after he was sent by Warren Hastings into the Carnatic, where Hyder Ali was seriously threatening the British possessions; and on the 1st July 1781 he won a decided victory at Ponto Novo, which checked the advance of his antagonist. But there was a serious deficiency of supplies, and in the next year Coote returned to Calcutta. Notwithstanding his feeble health, he again set sail in the spring of 1783 for Madras. His ship was pursued by the French; and this annoyance, acting upon his broken constitution and now extremely irritable temper, brought on a third fit of apoplexy, causing his death on the 26th April 1783. A monument was erected to his memory in Westminster Abbey.

A very flattering account of Coote is given by Wilks in his *Historical Sketches of Mysore*, 1810; see also Mill's *British India.*

COPAIBA. See BALSAM, vol. iii. p. 293.

COPAL, a hard lustrous resin, varying in hue from an almost colourless transparent mass to a bright yellowish brown, having a conchoidal fracture, and, when dissolved in alcohol, spirit of turpentine, or any other suitable menstruum, forming one of the most valuable varnishes. Like many other commercial substances, copal is obtained from a variety of sources; the term is not uniformly applied or restricted to the products of any particular region or series of plants, but is vaguely used for resins which, though very similar in their physical properties, differ somewhat in their constitution, and are altogether distinct as to their source. Thus the resin obtained from *Trachylobium Hornemannianum* is known in commerce as Zanzibar copal, or gum animé. Madagascar copal is the produce of *T. verrucosum.* From *Guibourtia copallifera* is obtained Sierra Leone copal, and another variety of the same resin is found in a fossil state on the west coast of Africa, probably the produce of a tree now extinct. From Brazil and other South American countries, again, copal is obtained which is yielded by *Trachylobium Martianum, Hymenæa Courbaril,* and various other species, while the dammar resins and the piney varnish of India are occasionally classed and spoken of as copal. Of the varieties above enumerated by far the most important in a commercial point of view is the Zanzibar or East African copal, yielded by *Trachylobium Hornemannianum.* The resin is found in two distinct conditions:—1st, raw or recent, called by the inhabitants of the coast sandarusiza miti or chakazi, the latter name being corrupted by Zanzibar traders into "jackass" copal; and 2d, ripe or true copal, the sandarusi inti of the natives. The raw copal, which is obtained direct from the trees, or found at their roots or near the surface of the ground, is not regarded by the natives as of much value, and does not enter into European commerce. It is sent to India and China, where it is manufactured into a coarse kind of varnish. The true or fossil copal is found embedded in the earth over a wide belt of the mainland coast of Zanzibar, on tracks where not a single tree is now visible. The copal is not found at a greater depth in the ground than 4 feet, and it is seldom the diggers go deeper than about 3 feet. It occurs in pieces varying from the size of small pebbles up to masses of several ounces in weight, and occasionally lumps weighing 4 or 5 ℔ have been obtained; and it is said that one piece of 35 ℔ weight has been found. After garbling and freeing from foreign matter, the resin is submitted to various chemical operations for the purpose of clearing the "goose-skin," the name given to the peculiar pitted-like surface possessed by fossil copal. The goose-skin was formerly supposed to be caused by the impression of the small stones and sand of the soil into which the soft resin fell in its raw condition; but Dr Kirk states that the copal when first dug up has no trace of the goose-skin on it. He believes the appearance to arise from an oxidation of the surface taking place to a certain depth after exposure to the air, or to be caused by some molecular change which renders the skin more brittle than the inner mass. The copal digging is conducted by the natives in a careless and desultory manner, and the whole trade is, as usual in dealings with untutored tribes, surrounded with many difficulties. It is believed that the supply is practically inexhaustible, and with proper organization the trade would be a permanent source of support to a larger community than at present inhabits the copal-yielding regions. A large proportion of the resin is sent to the European market by way of Bombay; but con

siderable quantities are also shipped direct to Hamburg and to British ports. The amount annually exported is subject to great fluctuations, which equally affect the market value of the product. During the year 1872–73 the imports into Bombay were 966 cwts., and probably at least an equal quantity went in other directions. The following analysis of Zanzibar and Madagascar copal is given by Filhol:—

	Zanzibar	Madagascar.

Hydrogen	10·40	9·42
Oxygen	9·90	10·78

COPAN, a village of Central America, in the republic of Honduras, famous for the remarkable ruins in its neighbourhood. It is situated not far from the frontier of Guatemala, on the right bank of the Rio Copan, a tributary of the Motagua, about thirty miles east of Chiquimula, in 14° 45′ N. lat. and 90° 52′ W. long. The ruins occupy a rectangular area of about 1600 feet in length and 900 feet in breadth; and the outer walls appear to be about 25 feet thick at the bottom. The principal building is an immense terrace with a perpendicular front towards the river, extending a distance of 624 feet, and attaining a height of about 70 feet above the soil. It has been calculated that this single structure must have required upwards of 26,000,000 cubic feet of stone. Numerous obelisks and statues are still standing, covered in bewildering profusion with grotesque sculpturings, which in many cases can only have been ornamental, but in others belong pretty evidently to some hieroglyphical system of symbols. The presence of what appear to be altars in front of several of the figures gives reason to suppose that they were worshipped as deities. That these erections were the work of a people of considerable artistic and engineering skill is abundantly evident; but not the slightest datum is afforded by tradition for any conjecture in regard to their origin. An identification at one time attempted with the city which offered so brave a resistance to Hernando de Chaves in 1530 is now considered as unsatisfactory. The ruins unfortunately are exposed not only to the destructive influences of nature, but also to the attacks of an ignorant populace; and according to Dr Bernouilli, who visited the spot in 1870, the dangers from the latter source are rapidly increasing as the little hamlet, which now contains a church and a cabildo, has become the centre for the surrounding district.

A very complete résumé of the various descriptions of Copan will be found in Bancroft's *Native Races of the Pacific States of North America*, vol. iv., 1875, his most important authorities being Palacio's *Carta dirijada al rey* (a 16th century account, published at Albany in 1860); the report of Col. Juan Galindo in 1835; Stephens, *Incidents of Travel in Central America*, 1841; Catherwood, *Views of Ancient Monuments in Central America*, 1844. Among those who have visited the ruins in more recent years are M. César Daly, Abbé Brasseur de Bourbourg, Mr Hardcastle, and Mr Ellerly.

COPENHAGEN (Danish, *Kiöbenhavn*; Latin, *Hafnia* or *Hafnia*), the capital of Denmark, is situated at the southern extremity of the Sound, at that part about 20 miles broad, 180 miles north-east of Hamburg, in 55° 40′ 52″ N. lat. and 12° 35′ 46″ E. long. The main portion of the city is built on low-lying ground on the east coast of the island of Seeland between the sea and a series of freshwater lakes, known respectively as St Jörgens Sö, Peblings Sö, and Sortedams Sö; a southern and smaller portion, distinguished as Christianshavn, occupies the northern part of the island of Amager or Amak. An excellent harbour is furnished by the natural channel between the two islands; and communication from one division to the other is afforded by two bridges—the Langebro and the Knippelsbro, the latter of which, an iron structure erected in 1869, has replaced the wooden drawbridge built by Christian IV. in 1620. The older city, including both the Seeland and Amager portions, was formerly surrounded by a complete line of ramparts and moats; but since 1863 these defences are being gradually demolished and filled up, to make way for new streets and squares. Towards the sea the city will be still protected by the citadel of Frederikshavn and several minor forts. Outside of the line of the ramparts, which had a circuit of about five miles, there have sprung up several extensive suburbs,—Oesterbro, Nörrebro, and Vesterbro (East Bridge, North Bridge, and West Bridge) in the Seeland portion, and Amagerbro to the south of Christianshavn; and with these suburbs the city occupies an area of 3200 acres. In the intramural city there are numerous public squares of considerable extent:—Amalienborg Place, or Frederick's Place, a handsome octagon formed by four palaces of uniform size and design, and having in the centre an equestrian statue of Frederick V., erected in 1768 at the cost of the former Asiatic Company; Kongens Nytorv (the king's new market, formerly called Hollandsaas) an irregular square, the largest in the city, with an equestrian statue of Christian V. in the centre, remarkable only for its size; the Gammeltorv and Nytorv (old and new markets), forming one oblong area; and the Slotsplace on which stand the Christiansborg Palace, the chapel royal,

the exchange, and the chancery buildings. A long street called Gothers Gade divides the Seeland portion of the intramural city into two nearly equal halves.

Public Buildings.—The citadel already mentioned is a regular polygon with five bastions, and is connected with the city by an esplanade. It was founded by Frederick III. about 1662–63, and has become associated as a state prison with the names of Griffenfeld, Struensee, and Brandt.

The royal palace of Christiansborg, originally built by Christian VI., but afterwards destroyed by fire in 1794, has since been rebuilt on an extensive scale. It occupies the site of the old castle of Bishop Absolon, which was restored at great expense by Frederick IV., and is famous in history for its Blaataarn, or Blue Tower, long used as a state prison. Over the principal entrance are two bas-reliefs by Thorwaldsen, representing Minerva and Prometheus, Hercules and Hebe, Jupiter and Nemesis, and Æsculapius and Hygeia. The Riddersal (knights' hall) is a magnificent apartment 120 feet long, 44 feet high, and

50 feet wide, with a gallery supported by Corinthian columns. In the great entrance hall is the Triumphal March of Alexander into Babylon by Thorwaldsen. In the upper part of the building is the Royal Gallery of Paintings, enriched by many valuable specimens of the Flemish, Dutch, and Italian schools. The palace also contains the council chamber and the apartments in which both Houses of the Parliament hold their sittings. The large exterior court on the west side forms a riding ground, and is inclosed on both sides by regular buildings with piazzas, containing the court theatre, stables, and riding-house. In connection with the palace is the royal library, with about 550,000 volumes and 30,000 manuscripts; and the chapel, adorned with works by Thorwaldsen and Bissen.

The palace of Rosenborg, supposed to have been planned by Inigo Jones, was erected in 1604. It is an irregular building in the Gothic style, with a high pointed roof, and flanked by four towers of unequal dimensions. It contains the coin and medal cabinet, a fine collection of Venetian glass, the famous silver drinking-horn of Oldenburg, the regalia, and other objects of interest as illustrating the history of Denmark. The Riddersal, a spacious room, is covered with tapestry representing the various battles of Christian V., and has at one end a massive silver throne. The gardens, formerly much more extensive, are open to the public, and afford an agreeable promenade.

The palace of Charlottenborg, on the Kongens Nytorv, which takes its name from Charlotte, the wife of Christian V., is a huge desolate-looking building, built in 1672. Frederick V. made a grant of it to the Academy of Arts, which holds its annual exhibition of paintings and sculpture within its walls, in April and May.

The four palaces on the Amalienborg were built for the residence of four noble families; but on the destruction of Christiansborg in 1794 they became the residence of the king and court, and so continued till the death of Christian VIII. in 1848. At present (1877) one of the four is inhabited by the king, the second by the crown prince, and the third by the queen-dowager, while the fourth is occupied by the foreign office and the principal court of justice or *Hojeste Ret*.

Prindsens Palais to the west of Christiansborg, once the residence of Christian V. and Frederick VI. when crown princes, now contains the Royal Museum of Art, the Ethnographical Museum, and the Royal Museum of Northern Antiquities. The last named was founded in 1807, and under the management of Mr Worsaae has become the richest collection of Scandinavian antiquities in the world. The chancery buildings, immediately adjoining the Christiansborg, and united to it by a corridor, consist of a large main building erected by Frederick IV., and of three others since added. Here are deposited the privy archives of the state and of the royal family. The town-hall and court-house, in the Slotsholm or Castle Island (built 1805–15), contains the municipal council chamber, the police and criminal courts, and other public offices. The exchange, also on the Castle Island, is surmounted by a remarkable spire, formed of four dragons, with their heads directed to the four points of the compass, and their bodies entwining each other till their tails come to a point at the top.

The Thorwaldsen Museum, built 1837–46 in a combination of the Egyptian and Etruscan styles, is 230 feet in length, 125 feet in breadth, and 46 feet high, and consists of two stories. In the centre is an open court, 116 feet long and 50 feet broad, containing the artist's tomb. The exterior walls are decorated with groups of figures of coloured stucco, illustrative of events connected with the formation of the museum. Over the principal entrance is the Chariot of Victory drawn by four Horses, executed in bronze from a model by Bissen. The front hall, corridors, and apartments are painted in the Pompeian style, with brilliant colours and with great artistic skill. The museum contains about 300 of Thorwaldsen's works; and in one apartment is his sitting-room furniture arranged as it was found at the time of his death in 1844.

Educational Buildings.—At the head of the educational institutions is the university, which, with its library and zoological museum, occupies a series of buildings forming a large quadrangle next Frue Kirke. It was founded by Christian I. in 1479; but its present constitution dates from 1788. There are five faculties,—a theological, juridical, medical, philosophical, and mathematical—with thirty-four professors; and the average number of students is about 1000. In 1851 an English, and in 1852 an Anglo-Saxon, lectureship was established. All the professors are bound to give a series of lectures open to the public free of charge. The university possesses considerable endowments and has several foundations for the assistance of poor students; the "regent's charity," for instance, founded by Christian, affords free residence and a small allowance to 100 bursars. In connection with the university are the observatory, the chemical laboratory in Ny Vester Gade, the surgical academy in Bred Gade, founded in 1786, and the botanic garden. The university library, formerly lodged in Trinity Church, but now in a special building erected in 1863, has been incorporated with the former Classen Library, collected by the famous merchants of that name, and now contains about 200,000 volumes, besides about 4000 manuscripts, which include Rask's valuable Oriental collection and the Arne-Magnean series of Scandinavian documents. It shares with the royal library, which has 550,000 volumes and 30,000 MSS., the right of receiving a copy of every book published in Denmark. Among the other educational institutions may be mentioned the polytechnic school, founded in 1829; the veterinary and agricultural college, established by Abildgaard in 1773, and adopted by the state in 1776; the military academy, and the school of navigation.

Among the literary and scientific associations may be mentioned the Danish Royal Society, founded in 1742, for the advancement of the sciences of mathematics, astronomy, natural philosophy, &c., by the publication of papers and essays; the Royal Antiquarian Society, founded in 1825, for diffusing a knowledge of Northern and Icelandic archæology, and stimulated by the efforts of such men as Thomsen, Rape, Finn Magnusen, and Petersen; the Society for the Promotion of Danish Literature, for the publication of works chiefly connected with the history of Danish literature; the Natural Philosophy Society; the Royal Agricultural Society; the Danish Church History Society; the Industrial Association, founded in 1838, the Royal Geographical Society, established in 1876; and several musical and other societies. The Academy of Arts was founded by Frederick V. in 1754, for the instruction of artists, and for disseminating a taste for the fine arts among manufacturers and operatives. Attached to it are schools for the study of architecture, ornamental drawing, and modelling. An Art Union was founded in 1826, and a musical conservatorium in 1870, under the direction of the composers Gadé and Hartmann.

Churches.—The principal church, or cathedral, Frue the Kirke (Church of our Lady), was almost entirely destroyed in the bombardment of 1807, but was completely restored in 1811–29. The works of Thorwaldsen, by which it is adorned, constitute its chief attraction. In the pediment is a group in *terra cotta* of sixteen figures, representing John the Baptist preaching in the wilderness; over the entrance within the portico is a bas-relief of Christ's entrance into Jerusalem; on one side of the entrance is a statue of Moses by Bissen, and on the other a statue of David by Jerichan. In a niche behind the altar stands a colossal marble statue of our Saviour, and marble statues of the twelve apostles adorn both sides of the church. Nearly opposite the Frue Kirke is St Peter's Church, built in a quasi-Gothic style, with a spire 260 feet high, and appropriated since 1585 as a parish church for the German residents in Copenhagen. The round tower of Trinity Church is 115 feet high, and is considered to be unique in Europe. It was constructed from a plan of Tycho Brahe's favourite disciple Longomontanus, and was formerly used as an observatory. It is ascended by a broad inclined spiral way, up which Peter the Great is said to have driven in a carriage and four. The Church of our Saviour in Christianshavn, dedicated in 1696, has a curious steeple 300 feet high, ascended by an external spiral staircase. The lower part of the altar is composed of Italian marble, with a representation of Christ's sufferings in the garden of Gethsemane; and the organ is considered the finest in Copenhagen. The Marble Church, intended to have been an edifice of great extent and magnificence, was commenced in the reign of Frederick V., but after twenty years was left unfinished. The Holmens Kirke, or church for the royal navy, originally erected as an anchor-smithy by Frederick II., but consecrated by Christian IV., is remarkable for a chapel containing the tombs of the great admirals Niels Juel and Tordenskjold. The churches above mentioned belong to the national Lutheran Church; the most important of those belonging to other denominations are the Reformed church, founded in 1688, and rebuilt in 1731, the Catholic church of St Ansgarius, consecrated in 1842, and the Jewish synagogue in Krystalgade, which dates from 1853.

Of the monastic buildings of mediæval Copenhagen various traces are preserved in the present nomenclature of the streets. The Franciscan establishment gives its name to the Graabrödretorv or Grey Friars' market; and St Clara's Monastery, the largest of all, which was founded by Queen Christina, is still commemorated by the Klareboder or Clara buildings, near the present post-office. The Duebrödre Kloster occupied the site of the hospital of the Holy Ghost.

Hospitals.—Among the hospitals of Copenhagen the most important are Frederick's Hospital, erected in 1752–57 by Frederick V., with accommodation for 600 patients; the Communal Hospital, erected in 1859–63, on the eastern side of the Sortedamssö, with room for 850; the General Hospital in Amalia Street, founded in 1769; the Garrison Hospital, in Rigens Gade or Empire Street, established in 1816 by Frederick VI.; a children's hospital in the same street dating from 1849; and a maternity hospital with a school of midwifery. The lunatic asylum for Copenhagen is situated at Roskilde. Of the numerous benevolent institutions in the city it is sufficient to mention Barton Hospital, dedicated by its founder, Christian I., to the Holy Ghost, with accommodation for 508 inmates; Abel Kathrine's Buildings for 24 poor women; the Copenhagen Invalids' Home, erected in 1857–59; an orphan asylum, dating from 1727; a blind asylum, erected in 1811 by a private society; a deaf and dumb asylum, founded in 1807; and an asylum for imbeciles, established in 1855. The Jewish community has several important institutions of its own. After the cholera epidemic of 1853 the medical association built several ranges of workmen's houses, and their example has been followed by various private capitalists, among whom may be mentioned the Classen trustees, whose buildings occupy an open site on the western outskirts of the city.

Theatres.—The principal theatre is the Royal, on Kongens Nytorv, a beautiful edifice of modern erection on the site of a former building of the same name which dates from 1748. Statues of Holberg and Oehlenschläger, the former by Stein and the latter by Bissen, keep watch on either side of the entrance, and the front is crowned by a group by King, representing Apollo and Pegasus and the fountain of Hippocrene. The royal court theatre is elegantly fitted up, and can accommodate about 800 spectators. The Vesterbro Theatre, outside the western gate, is seated for about 1400 persons. The casino, built in 1846, is used as a theatre, and is capable of containing about 2300 spectators; while the small saloon in the same building, seated for from 600 to 700 persons, is usually let for concerts and similar entertainments. The Tivoli Gardens, immediately beyond the western gate, form the favourite place of resort in the summer evenings. The amusements include concerts, pantomimes, gymnastic feats, and other performances. A freemasons' lodge was founded in 1870, the building being erected after the designs of Tvede.

In the neighbourhood of the city there are numerous places of public resort,—the most important being Frederiksberg, with its royal palace, its park, and its zoological gardens, about a mile and a half from the old west gate, and the Dyrehave about six miles to the north, with its fine forest of beech and oak.

Trade.—Copenhagen is becoming more and more the commercial centre of Denmark; its local industries and its foreign trade are both making rapid advances. At the commencement of 1872, 500 merchant vessels of about 51,000 tons burden belonged to the port. The harbour is large and commodious, and by the aid of canals, large vessels can come almost to the centre of the town. The entrance is commanded by the powerful batteries of Trekroner, Provesten, and Sextus. The principal imports are timber, pitch, and tar, chiefly from Norway and Sweden; flax, hemp, masts, sailcloth, and cordage from Russia; tobacco from America; wines and brandy from France; coal, earthenware, iron, steel, and salt from England; and West India produce. The principal exports are corn, rape-seed, butter, cheese, beef, pork, horses, cattle, wool, hides, skins, bones, and grain-spirits.

There are extensive cloth and calico factories, foundries, and iron-works, as well as breweries, distilleries, tanneries, sugar-refineries, lime-works, and tobacco-factories. Pianofortes, clocks, watches, surgical and mathematical instruments, and porcelain are among its other productions. The royal China factory is celebrated for its models of Thorwaldsen's works in biscuit China. Among institutions for the furthering of commerce, the most important besides the Exchange are the National Bank, with a capital of £2,190,000; the Private Bank, the Industrial, the Agricultural, and the Commercial. A large Industrial Exhibition was held in 1872; and the building, which is situated at the western side of the town near the railway station, is intended to be permanent. The population of Copenhagen in 1769 was 92,571; in 1801, 100,975; in 1834, 119,292; in 1840, 120,819; in 1845, 126,787; in 1850, 129,695; in 1860, 155,143; and in 1870, 184,291. In the last year the number of females was 96,965, and that of males 89,326; there were 3145 Jews, 1092 Catholics, 220 Baptists, and 172 Mormons. Including the suburbs, the population in 1876 was estimated at 233,000.

History.—The first mention of Copenhagen in Danish history belongs to the year 1027, when the kings of Norway and Sweden took advantage of the absence of Canute in England to attack his kingdom. It is called merely the Höfn or Haven; and it was still only a fishing village about the middle of the 12th century, when Valdemar I. presented that part of the island to Axel Hvide, renowned in Danish history as Absolon, bishop of Roskilde, and afterwards archbishop of Lund. In 1165, or shortly after, this prelate erected a castle on the spot where the Christiansborg palace now stands, and the building was called after him Axel-huus. The settlement gradually became a great resort for merchants, and thus acquired the name which, in a corrupted form, it still bears, of Kaupmannahöfn, Kjöbmannshavn, or Portus Mercatorum, as it is translated by Saxo Grammaticus. Bishop Absolon bestowed the castle and village, with the lands of Amager, on the see of Roskilde; and Bishop Erlandsen granted the little community municipal rights and privileges, which were confirmed and augmented in 1284 by King Eric Glypping. Meanwhile its prosperity was checked by an attack by the people of Lübeck in 1248, and by another on the part of Prince Yarimar of Riga in 1259. In 1306 it managed to repel the Norwegians, but in 1362, and again in 1368, it was captured by the opponents of Valdemar Atterdag. In the following century a new enemy appeared in the Hanseatic League, which was jealous of its rivalry, but their invasion was frustrated by Queen Philippa. Various attempts were made by successive kings to obtain the town from the see of Roskilde, as the most suitable for the Royal residence; but it was not till 1443 that the transference was effected, and Copenhagen became the capital of the kingdom. From 1523 to 1524 it held out for Christian II. against Frederick I.; and it was only after a year's siege that it yielded in 1536 to Christian III. From 1658 to 1660 it was unsuccessfully beleaguered by Charles Gustavus of Sweden; and in the following year it was rewarded by various privileges for its gallant defence. In 1660 it gave its name to the treaty which concluded the Swedish war of Frederick III. In 1700 it was bombarded by the united fleets of England, Holland, and Sweden; in 1728 a conflagration destroyed 1640 houses and five churches; another in 1794 consumed the Christiansborg; and a third in 1795 laid waste 943 houses, the church of St Nicolas, and the Town House. In 1801 the Danish fleet was destroyed in the roadstead by the English, under Nelson; and in 1807 the city was bombarded by the British army under Lord Cathcart, and saw the destruction of the university buildings, its principal church, and numerous other edifices. In 1853 it lost 4100 of its population from cholera.

COPERNICUS, or KOPPERNIGK, NICOLAUS (1473–1543), was born on the 19th February 1473, at Thorn in Prussia, where his father, a native of Cracow, had settled as a wholesale trader. His mother, Barbel Watzelrode, was the daughter of a well-to-do merchant. The education of Nicolaus, whose father died early, was undertaken by his uncle Lukas Watzelrode, subsequently (1489) bishop of Ermeland. After a course of instruction at the school in Thorn, he entered the university of Cracow in 1491, and during four years studied mathematical science under Albert Brudzewski, devoting his spare time to painting. At the age of twenty-three he repaired to Bologna, and attended the lectures of Domiuico Maria Novarra, professor of astronomy there. He next spent some years at Padua, where, in addition to mathematics and astronomy, he applied himself to medicine, in which, in 1499, he took the degree of doctor. In 1500 he was at Rome, enjoying the friendship of the astronomer Regiomontanus, and fulfilling with distinction the duties of a chair of mathematics. Copernicus had already been for some time a member of the chapter of Frauenburg, at which place he appears to have taken up his abode in 1503. His time was now engaged in clerical work, in giving gratuitous medical aid to the poor, and, though with but a slender stock of instruments, in the prosecution of his favourite studies. The house which he occupied at Allenstein is still to be seen, with the perforations which he made in the walls of his chamber in order to observe the passage of the stars across the meridian; also the remains of an hydraulic machine, similar to that at Marly, which he constructed for the purpose of raising the water of a rivulet for the supply of Frauenburg.

By his bishop and fellow-canons Copernicus was employed in defending their rights and privileges against the encroachments of the Teutonic knights; and when sent as a deputy to the diet of Grodno, he busied himself in considering the means of improving the corrupt coinage, and wrote a paper on that subject, which was placed among the archives of the diet. Copernicus sought by a comparative study of the various astronomical systems of the ancients to evolve from them a single system, at once simple and consistent. According to the hypothesis of the ancient Egyptians, Mercury and Venus revolved round the sun, which itself. with Mars, Jupiter and Saturn, moved round the earth. Apollonius of Perga chose the sun as the common centre of all the planetary motions, but held that, like the moon, it turned round about the earth. The principal Pythagorean philosophers, on the other hand, regarded the sun as the centre of the universe, about which the earth performed a circuit. Nicetas, Heraclides, and others assigned a central position to the earth, but supposed it to have a motion of rotation round its axis, which produced the phenomena of the rising and setting of the stars, and the alternations of day and night. Philolaus removed the earth from the centre of his system, and conceived it to have not only an axial rotation, but also an independent annual revolution round the sun. From the various ill-founded and unshapely theories of his predecessors Copernicus obtained the material for erecting a solid and imposing structure—the system with which his name is connected. This was expounded in a treatise entitled *De Orbium Cœlestium Revolutionibus Libri VI.*, the preparation of which occupied its author from about 1507 to 1530. This work Copernicus long delayed bringing before the world, being content to defer for a while the popular outcry against himself, which, as a setter-forth of truths hitherto unknown to science and as an impugner of the rights of time-honoured dogmatism, he must be prepared to endure. At length, however, yielding to the importunities of his friends, he permitted the publication of the book, which he dedicated to Pope Paul III.; in order, as he says, that he might not be accused of seeking to shun the judgment of enlightened men, and that the authority of his Holiness, if he approved of it, might protect him from the baleful tooth of calumny.

The work was printed at Nuremberg, under the superintendence of Rheticus, one of the disciples of Copernicus. The impression had just been completed, when Copernicus, who had all his life enjoyed perfect health, was attacked with dysentery, followed almost immediately by a paralysis of the right side, with loss of memory, and obscuration of the understanding. For some time he lingered, and on the day of his death, only a few hours before he expired, a copy of his work sent by Rheticus arrived, and was placed in his hands. He touched it, and seemed conscious what it was; but after regarding it for an instant, he relapsed into a state of insensibility, which soon terminated in death. He died on the 24th May 1543, at the age of seventy. His tomb, which is not distinguished from that of the other canons of Frauenburg, was in 1581 adorned with a Latin epitaph by the Polish Bishop Cromer. In 1830 a statue of Copernicus, by Thorwaldsen, was placed in the Casimir Palace at Warsaw; and in 1853 another monument to him, by Tieck, was erected at Thorn.

The first formal exposition of the theories of Copernicus in contradistinction to the notions which had hitherto prevailed, was a letter published by Rheticus, and entitled *Ad Clar. V. d. Schonerum de Libris Revolutionum eruditiss. Viri et Mathematici excellentiss. Rev. Doctoris Nicolai Copernici Torunnæi, Canonici Warmiensis, per quendam juvenem Mathematicæ studiosum, Narratio prima.* Dantzic, 1540, 4to; reprinted, with a eulogium, at Basel, 1541, 8vo. The works of Copernicus are—1. *De Revolutionibus Orbium Cœlestium Libri VI.*, Nuremberg, 1543, small folio; reprinted at Basel in 1566, with the letter of Rheticus, and also included in the *Astronomia Instaurata* of Nicolas Muler, Amsterdam, 1617 and 1640, 4to; 2. A treatise on trigonometry, with tables of sines, entitled *De Lateribus et Angulis Triangulorum*, Wittenberg, 1542, 4to; 3. *Theophylactici Scholastici Simocattæ Epistolæ morales, rurales, et amatoriæ, cum versione Latina.* In 1521, Copernicus presented to the states of his provinces his work on money; and there are several manuscript treatises of his in the library of the bishopric of Warmia.

The Life of Copernicus has been treated of by the following authors:—Gassendi (Paris, 1654); Sniadeski (Warsaw, 1803); Westphal (Constance, 1822); Percy (Paris, 1824); Czynski (Paris, 1846); Szyrma (Lond., 1846); Prowe (Thorn, 1852–55–60–65); Szulc (Warsaw, 1855); and Domenico Berti, in *Copernico e le Vicende del Sistema Copernicano in Italia* (Rome, 1876). See ASTRONOMY.

COPIAPO, an inland town of Chili, capital of the province of Atacama, is situated on a stream of the same name about 35 miles from the sea, in 27° 36′ S. lat., 70° 23′ W. long. The streets of the town, which was founded in 1734 by Count José de Manso, are straight and wide, with side pavements; but the houses are low and of timber, excepting in the streets Chañarcillo and Atacama, where they are built with more elegance and of more solid material. The principal square is 403 feet on each side, with flowers and shrubs in the centre surrounded by rows of shady pepper trees; while at the western end of the town is an avenue 52 feet broad and half a mile long with four rows of willow trees. Copiapo is connected by rail with the port of Caldera, 50 miles westward, and with the surrounding great mining districts, to which it owes its importance. From its situation in one of the driest regions of America, water is scarce, and the stream Copiapo is all utilized before it reaches the sea. Population, 12,000.

COPLEY, JOHN SINGLETON (1737–1815), historical painter, was born of Irish parents at Boston, Massachusetts. He was self-educated, and commenced his career as a portrait-painter in his native city. The germ of his reputation in England was a little picture of a boy and squirrel, exhibited at the Society of Arts in 1760. In 1774 he went to Rome, and thence in 1775 came to England. In 1777 he was admitted Associate of the Royal Academy; in 1783 he was made Academician on the exhibition of his most famous picture, the Death of Chatham, popularized immediately by Bartolozzi's elaborate engraving; and in 1790 he was commissioned to paint a portrait picture of the defence of Gibraltar. The Death of Major Pierson, now in the national collection, also deserves mention. Copley's numerous other works are little esteemed, being feeble and lifeless in drawing, and cold and dull in colour. His powers appears to greatest advantage in his portraits. He was the father of Lord Chancellor Lyndhurst. See LYNDHURST.

COPPER is a metal which has been known to and used by the human race from the most remote periods. Its alloy with tin (bronze) was the first metallic compound in common use by mankind, and so extensive and characteristic was its employment at an early stage in pre-historic times that the epoch is known in archæological chronology as the Bronze Age. Metallic relics of that age in the form of arms, ornaments, and domestic implements are still very abundant. By the Greeks and Romans both the metal and its alloys were indifferently known as χαλκός and *æs*. As, according to Pliny, the Roman supply was chiefly drawn from Cyprus, it came to be termed *æs cyprium*, which was gradually shortened to *cyprium*, and corrupted into *cuprum*, whence comes our copper, the French *cuivre*, and the German *kupfer*.

Copper (chemically, *Cuprum*, Cu) is a brilliant metal of peculiar red colour, in which respect it differs from all others excepting, perhaps, titanium. The atomic weight of copper is 63·3, and its specific gravity varies between 8·91 and 8·95, according to the treatment to which it may have been subjected. It takes a brilliant polish, is in a high degree malleable and ductile, and in tenacity it only falls short of iron, exceeding in that quality both silver and gold. By different authorities its melting point is stated at from 1000° C. to 1398° C. In electric conductivity it stands next to silver; the conducting power of silver being equal to 100, that of perfectly pure copper is given by Matthiessen as 96·4 at 13° C. On solidifying from its molten condition it expands. Copper is not affected by exposure in dry air, but in a moist atmosphere it becomes coated with green carbonate. When heated or rubbed it emits a peculiar disagreeable odour.

Copper, according to Walchner, is as widely distributed in nature as iron, and occurs in all soils, and ferruginous mineral waters and ores. It has been discovered in seaweed; in the blood of certain Cephalopoda and Ascidia, and of a species of *Limulus*; in straw, hay, eggs, cheese, meat, and other food-stuffs; in the liver and kidneys, and, in traces, in the blood of man and other animals; it has also been shown by Church to exist to the extent of 5·9 per cent. in turacin, the colouring-matter of the wing-feathers of the *Turaco*. The ores containing copper in sufficient proportion to render its extraction economically practicable are numerous. It occurs not unfrequently native, sometimes in very great masses, as on the south shores of Lake Superior, where pieces of 150 tons weight have sometimes been obtained. Native copper most frequently occurs in masses of irregular form in rocky fissures, and often crystallized. The principal ores of copper are *Cuprite*, *Melaconite*, *Malachite*, *Chessylite*, *Atacamite*, *Chrysocolla*, *Chalcocite*, *Chalcopyrite*, *Erubescite*, and *Tetrahedrite*. Cuprite, or red oxide of copper, Cu_2O, is a mineral which crystallizes in the cubic system, and contains 88·78 of metal. It occurs in most cupriferous mines, but never by itself in large quantities. Melaconite, or black oxide of copper, CuO, contains, when pure, 79·85 of the metal. It was formerly largely worked in the Lake Superior region, and is abundant in some of the mines of Tennessee and the Mississippi valley. Malachite, or green carbonate of copper, $CuCO_3$, $Cu(HO)_2$, is a beautiful and valuable ore containing about 56 per cent. of the metal; it is obtained in very large quantities from South Australia, Siberia, and other localities. Frequently intermixed with the green carbonate is the blue carbonate of copper, chessylite or azurite, $2CuCO_3$, $Cu(HO)_2$, an ore containing when pure 55·16 per cent. of the metal. It was formerly characteristic of Chessy, near Lyons. Atacamite is a hydrated oxychloride of copper, occurring chiefly in Chili and Peru; it crystallizes in the rhombic system. Chrysocolla is a hydrated silicate of copper, $CuSiO_3$, $2H_2O$, containing in the pure state 30 per cent. of the metal; it is an abundant ore in Chili, Winsconsin, and Missouri. The sulphur compounds of copper are, however, the most valuable in an economical point of view. Chalcocite, redruthite, copper-glance, or vitreous copper, is a sulphide, Cu_2S, containing very nearly 80 per cent. of copper. Copper pyrites, or chalcopyrite, a sulphide of copper and iron, $CuFeS_2$, crystallizes in the pyramidal system and contains 34·6 per cent. of copper when pure; but many of the ores, such as those worked specially by wet processes on account of the presence of a large proportion of sulphide of iron, contain less than 5 per cent. of copper. Cornish ores are almost entirely pyritous; and indeed it is from such ores that by far the largest proportion of copper is extracted throughout the world. In Cornwall copper lodes usually run east and west. They occur both in the *killas* or clay-slate, and in the *growan* or granite. Erubescite, bornite, or horseflesh ore is a sulphide of copper and iron much richer in copper than the ordinary pyrites, and containing 56 or 57 or, according to the formula $FeCu_2S_3$, 62·5 per cent. of copper. Tetrahedrite, fahlerz, or grey copper, a sulphide crystallizing in the cubical system, contains from 30 to 48 per cent. of copper, with arsenic, antimony, iron, and sometimes zinc, silver, or mercury. The numerous other compounds of copper have more interest from a mineralogical than from a metallurgical point of view.

Copper is obtained from its ores by two principal methods, which may be denominated—(1) the pyro-metallurgical or dry method, and (2) the hydro-metallurgical or wet method; and a small proportion of metallic copper is procured by (3) the electro-metallurgical method.

The methods of working vary according to the nature of the ores treated and local circumstances. The dry method, or ordinary smelting, cannot be profitably practised with ores containing less than 4 per cent. of copper, for which and for still poorer ores the wet process is preferred.

SMELTING.—In Great Britain ordinary copper smelting is almost entirely centred at Swansea in Wales, although it is also practised in Lancashire. The processes there employed for extracting copper are technically known as the "English method," in contradistinction to numerous other modified processes adopted at Continental and other foreign smelting centres. The following is an outline of the English method as conducted at Swansea.

The ores are divided by the smelter into two general classes—those containing sulphur, and those having little or no sulphur. The former are subdivided according as they contain much silica, iron pyrites, tin, arsenic, &c., or a larger or smaller quantity of copper. The object of this classification of ores in the yard is to enable the operative smelter to make up a constant working mixture, having the following characters :—

1. The copper present is not under 9 nor above 14 per cent.; if under the former it would be unprofitably poor ; if over the latter, the slags would have a tendency to retain copper, creating a loss.
2. After being calcined for an ordinary length of time, it will fuse easily without the necessity of adding flux, giving a clean and easily fused slag.
3. The mat or coarse metal obtained from fusion contains as nearly as possible 30 per cent of copper.
4. The mixture does not contain ores having impurities calculated to make the copper of too low a quality.

There is no definite or fixed rule to guide the smelter in these classifications, except a practised eye in distinguishing the character of ores, and the report of the assayer.

I. *Calcination of the Ores.*—The mixture of ores being selected according to these rules, it is carried to hoppers on the top of a large reverberatory furnace, termed the calcining furnace, and is then let down into the hearth, where, after drying a little, it is spread equally over the bottom, and covered to a depth of from 6 to 8 inches. The quantity of ore put in varies, according to the size of the furnace, from 3 tons to 4 tons. The fire of the furnace is kept low at first; after two or three hours the ore on the surface becomes visibly red, and the heat is gradually increased to a yellow red ; but this heat penetrates to the depth of only about 2 inches, consequently the ore has to be stirred and turned over by means of long iron paddles every hour, so as to expose a new surface to the action of the air and fire. The calcination lasts generally from twelve to twenty-four hours, the length of time being dependent on the proportions of silica and sulphide of iron in the charge. Calcining furnaces are now very commonly provided with Siemens regenerators and heated with gas. The following changes take place :—the sulphur is partly burned off, forming sulphurous and sulphuric acids, and partly volatilized in the free state ; arsenic is volatilized and oxidized ; and part of the copper and iron lose sulphur and combine with oxygen, forming oxides.

When the ore is sufficiently calcined, it is let down into the *cubs* or vaults beneath, by openings in the floor. Water is added to the hot ore in the cubs to prevent dust and assist further oxidation ; the ore is then removed to a yard, and there stored up, ready for the fusing furnace. The following analysis of ore, before and after calcining, will give an idea of the changes that have taken place :—

Before Calcination.		After Calcination.	
Copper	12·3	Copper	12·2
Iron	32·7	Iron	22·7
Sulphur	31·0	Oxide of Iron	18·5
Silica	24·0	Sulphur	16·2
		Silica	30·4
	100·0		100·0

II. *Fusion of Calcined Ore.*—The next operation is the fusing of the calcined ore, which is done in a reverberatory furnace, termed an ore-fusing furnace, fitted also with a hopper on the top for charging it. The charge consists of

From 25 to 30 cwt. of calcined ore ;
From 7 to 9 cwt. of sharp or metal slag from operation IV. ;
From 2 to 3 cwt. cobbing.[1]

When the charge is let down into the furnace it is spread equally over the bottom, the doors are all closed, every air-hole is stopped with clay, and the heat of the furnace increased as rapidly as possible.

After about five hours' firing, when the furnace has reached a white heat, the door-plate is removed, and a long iron rake passed through the contents to make sure that the whole is perfectly fused. This being the case, the workman begins the operation of *skimming*, that is, drawing off the slag, which floats on the surface of the mat, and removing it at the front door. When the surface is skimmed, the common practice is to let down a second charge of ore, and to fuse and skim in the same manner, before tapping the furnace to let out the metal or mat, which is generally tapped into large pits of water, and so granulated. These pits are from 6 to 8 feet deep, and from 4 to 5 feet square, and into them a perforated box is lowered, which receives the charge of metal, and is raised by a crane or pulley. The metal is then removed to a yard for the next operation. This mat is termed granulated *coarse* metal. In many cases the coarse metal is first run into moulds and subsequently crushed for the next operation.

The average composition of good coarse metal is given by Le Play as

Copper	33·7
Sulphur	29·2
Iron	33·6
Foreign metals	2·0
Slag, mechanically mixed	1·1
	99·6

That of the slag or scoriæ is

Silica, mixed and combined	60·5
Protoxide of iron	28·5
Alumina, Lime, &c.	11·0
	100·0

III. *Calcination of Coarse Metal.*—This operation is performed in the same manner as the calcination of the ore. The charge of metal, which is about 4 tons, covers the bottom of the hearth to the depth of 4 inches or so. It is put in through the hoppers fitted upon the top of the furnace, as described for the ore. The coarse metal being easily fused, great care is required not to raise the heat of the furnace too high, otherwise the metal will cake, and by adhering to the bricks will prove prejudicial both to the calcination and to the furnace. When the charge is let into the furnace, it is slowly brought to a visible red, which during the next fourteen hours is gradually increased to a bright red heat. This temperature is continued until the charge has been altogether twenty-four hours in the furnace, when it is let down through the bottom into the cubs, and water is thrown upon it.

The following analyses give an average result of the changes effected in this operation :—

Metal put into Calciner.		Metal after Calcination.	
Copper	32	Copper	33
Iron	39	Iron	38
Sulphur	25	Sulphur	13
Other matters and loss,	4	Oxygen, &c.	16
	100		100

IV. *Fusion of Calcined Coarse Metal.*—In this operation the charge for an ordinary-sized furnace of 8 feet by 13 feet is—

[1] Cobbing is the name given to broken pieces of old bricks and bottoms of furnaces that have absorbed copper.

25 cwt. of calcined metal,
5 to 7 cwt. slags from the roaster and refinery furnaces;
2 to 3 cwt. of cobbing.

In this mixture the oxide of iron is in excess in relation to the silica, and it is therefore much more easily fused than the ore; but the reactions which take place are similar: the silica and oxide of iron combine to form slag, which floats upon the surface of the mat and has to be skimmed off, after which the mat is tapped out into sand-moulds. Two charges are generally fused before the metal is tapped out. This mat is termed *blue metal* from its being of a slate-blue colour; the scoria is termed *sharp slag*, from its containing an excess of oxide of iron, and being consequently used as a flux for fusing the ore in operation II.

The following is the composition of good blue metal and sharp slag:—

Blue Metal.	
Copper	53·8
Sulphur	20·5
Iron	12·6
Insoluble	4·2
Oxygen and loss	3·9
	100

Sharp Slag.	
Oxide of iron	53
Oxide of copper	2
Silica, &c.	45
	100

Should there be no ores such as carbonates or oxides on hand to smelt, the blue metal, instead of being tapped into sand-beds as described, is run into pits of water in the same manner as coarse metal, and subjected to another calcination and fusion.

When oxides and carbonates, such as the Australian ores, are on hand, they are generally fused with the calcined coarse metal, by which means a double advantage is obtained; the excess of oxide of iron in the calcined metal fluxes the silica of the ore which has little iron, and the copper in the ore is converted into cupric sulphide, a condition necessary for reduction by the present method of smelting. The produce of this fusion is a mat termed *pimpled* or *white* metal, from its having small rough granules on the surface of the ingots. The average composition of this metal is—

Copper	78
Sulphur	18
Iron	2
Silica	2
	100

The composition of the slag from this operation is very variable; it always contains copper, and has to be remelted.

V. *Roasting.*—This operation has been often identified with calcining, from which, however, it is distinct. The roasting differs from the fusing furnace by having a large opening in the side for putting in the charge, and it is furnished with more air-holes in the bridge. The charge for an ordinary-sized furnace is ·3 tons. When the metal is brought to fusion, the air-holes of the furnace are all opened, and a free current is allowed to pass over the surface of the fused mass: the heat of the fire is then regulated so as to keep the charge in a sort of semi-fluid state. This is continued for about twenty-four hours, during which a great portion of the sulphur is driven off, and the iron, by uniting with silica and other matters, forms scoria, which is from time to time skimmed off. When all the impurities are removed, and the mat or regulus acquires the composition of sulphide of copper, Cu_2S, then (except when the regulus has been very rich) begins another operation termed the second roasting, or roasting proper, requiring other twenty-four hours. In this last roasting, when the air-holes are opened, a brisk effervescence ensues over the surface of the fluid mass.

The chemical reactions which give rise to this effervescence may be explained thus. The oxygen of the air combines in the first place with a portion of the sulphur, forming sulphurous acid. A portion of the copper is also oxidized, to form the sub-oxide, and instantly reacts upon another portion of the sulphide, reducing the metal. The reactions are chemically represented thus:—

$$2Cu_2O + Cu_2S = 6Cu + SO_2.$$

The process is a very beautiful one, and exhibits a nice adaptation of principles to practice. The sponge regulus has a specific gravity of 5, the reduced copper of about 8; so that the copper sinks to the bottom, where it is protected, and a new surface of regulus becomes exposed to the action of the air.

If the ore be pure, or if no *select* copper be required, the operation of roasting is continued until the whole of the copper is reduced; when it is tapped out into sand-moulds, forming *coarse copper*, *bed copper*, *pimpled copper*, or *blistered copper*, according to quality. The term *coarse copper* is applied occasionally to all these kinds except the blistered. If the ingot sets with contraction and exhibits a smooth hollow surface, it is termed *bed*, and generally indicates the presence of other metals, as tin. When the surface of the ingot is covered with pimples, it is termed *pimpled* copper, and indicates the presence of sulphur. When covered with large scales of oxide of copper, it is termed *blistered;* but this is only when the copper is good and ready for refining. The following analysis of blister copper is given by Le Play:—

Copper	98·4
Iron	·7
Nickel, Cobalt, and Manganese	·3
Tin and Arsenic	·4
Sulphur	·2
	100·0

To make select copper, the roasting is carried on until about one-fourth of the copper in the regulus is reduced; the furnace is then tapped, and the reduced metal is obtained at the bottom of the first and second ingots, or pigs, as *copper bottoms*, which contain most of the metallic impurities. The regulus is collected and again roasted, which produces the purest metal the ordinary process of smelting can give; it is termed *best selected.*

VI. *Refining.*—In this operation, the remainder of the sulphur and foreign metals present in the copper is removed, and the metal is brought into a condition fit for the market. The refining furnace is similar in general form to a roasting furnace, except that the bottom inclines gradually down from all sides towards a deep part, or well, which is near the end door. It has also a large door on one side, but neither opening in the roof nor side tap-hole. Siemens's regenerative furnace has been very generally introduced for refinery purposes. When the copper is to be finally ladled out of the furnace the deep part, or well, allows of the ladle being dipped into the metal till the last portions are quite baled out. From 6 to 8 tons of copper from the roasting furnace are put into the refining furnace, the doors and air-holes of which are closed, and the heat is raised until the metal is in fusion, when the air-holes are opened. A short roasting is generally required, which is done in the manner above described, and the scoria which collects is carefully skimmed off. The separation of impurities is facilitated by occasionally stirring the metal with a rake. Some refiners throw pieces of green wood upon the surface, under the impression that it assists the escape of sulphur. The roasting is continued until a ladleful of the metal taken out sets with contraction. If the metal be very coarse, it will set with a surface having a frothy appearance; if finer, it sets with expansion, first round the edge, then swelling towards the centre, forming a little mound or cone, and occasionally boiling over and throwing up jets of metal, forming a miniature volcano. When the setting of the metal in the ladle is favourable, the charge is ready for the operation of *poling.* A quantity of charcoal or anthracite coal is first thrown upon the metal to prevent oxidation by the air, and then the end of a large pole of green wood, generally of birch or oak, is inserted into the melted copper, and kept pressed down to the bottom of the metal, which spurts and boils violently. This operation, it will be at once apparent, consists in the reduction of an oxide or suboxide. Since oxide of copper dissolves in metallic copper, as a salt dissolves in water, and makes it brittle, to put pieces of wood or charcoal upon the surface would not remove the oxygen; hence the necessity of poling, in order to bring the carbonaceous matters into contact with the dissolved oxide. As the poling proceeds the refiner takes from time to time small samples called assays, which he hammers and breaks for examination. When the copper reaches the proper "pitch" the assay bends without breaking, and if cut and broken the fracture is fibrous, and presents a silky lustre. When this pitch is attained the pole is withdrawn, and a quantity of charcoal thrown upon the surface; and, if the copper is for rolling or hammering, a little lead is added to the charges to insure toughness.

In making what is termed best selected copper, the refining is performed in the manner described, but no lead is added. This quality of copper is used for the manufacture of fine alloys, such as the best brass, or Muntz's yellow metal. Copper a little over-poled is generally preferred for these purposes.

When the copper is brought to the proper pitch by the refining operation it is ladled out into moulds. The following are the forms in which British smelted copper is usually cast:—

Cake,	$19 \times 12\frac{1}{2} \times 1\frac{3}{4}$ inches,	weight 1 cwt. 1 qr.
Tile,	$19 \times 12\frac{1}{2} \times \frac{1}{4}$,,	,, 1 qr. 3 lb.
Ingot,	$11 \times 3\frac{1}{2} \times 1\frac{1}{2}$,,	,, 14 to 16 lb.

During the ladling out the refiner takes an assay at short intervals, as the metal is liable to get out of pitch, or become *dry*, as under-poled copper is termed, in which case poling has to be resumed. So much depends upon refining, that the best copper by a defect in this operation will be rendered unmarketable.

A great variety of improvements in copper-smelting have been proposed and patented, one or two of which have been usefully applied. Several modifications of the various processes are also adopted, to suit the quality of the ores and the kind of copper to be produced. These are all suggested by the experience of the smelters in dealing with the materials at their disposal.

WET PROCESSES.—Several methods of extracting copper by the wet way have been more or less in practice at various periods; but it is only of recent years that one of these has been established on a scale of great commercial extent and importance. From a very early time it has been known that the water which drained from mines containing pyritous copper ores, and which from the oxidation of the sulphide of copper contained some proportion of cupric sulphate, yielded metallic copper by precipitation in the presence of malleable or cast iron. The copper obtained in this way is known as cementation copper, and from the Spanish and Portuguese pyrites mines a considerable amount of metallic copper has long been so precipitated. The process now very extensively adopted for treating Spanish and Portuguese pyrites, and some ores of similar composition from other countries is that patented by Mr William Henderson in 1859. Mr Henderson's process is in several essential particulars the same as one patented in 1842 by Mr William Longmaid, which, however, was chiefly designed for the production of sulphate of soda, copper being only a by-product. There can be no doubt that Mr Henderson is the practical originator of the wet process, which in Great Britain now occupies a most important position among metallurgical industries.

The ores treated by the Henderson process are remarkably constant in character, and the following may be taken as representing their average composition:—

Sulphur	49·00
Iron	43·55
Copper	3·20
Lead	0·93
Arsenic	0·47
Zinc	0·35
Lime, with traces of silver, gold, &c.	2·50
	100·00

The pyrites is first employed by alkali manufacturers and other consumers of sulphuric acid as a source of that substance, in burning for which the ore loses about 30 per cent. of its weight. It is this burnt pyrites which forms the raw material of the process. The various stages it undergoes are briefly as under.

I. *Grinding.*—The burnt ore, as received from the acid burners, is first mixed with about 15 per cent. of common salt, and ground to a fine powder by passing it between a pair of heavy cast-iron rolls. As the amount of sulphur left in the burnt ore is apt to vary, it is necessary to ascertain its proportion in each parcel of burnt pyrites. When the sulphur falls short of the proportion necessary for effecting the decomposition which follows, a sufficient quantity of "green" or unburned pyrites, is added to produce a proper balance. If, on the other hand, the sulphur has been insufficiently extracted, "dead" roasted ore is added.

II. *Calcination.*—This operation is accomplished in several kinds of furnaces, that used by the Tharsis Sulphur and Copper Company being a large muffle or close furnace. By others a patent furnace with a revolving hearth and mechanical stirring arrangement has been adopted with good results; and some use open reverberatory furnaces heated by gas from Siemens's generators. During the roasting the mixture is frequently stirred, and, in the case of hand-worked furnaces, turned with long rabbles, and the completion of the operation is ascertained by test assays. When the copper has been brought into a soluble condition, the charge is raked out of the furnace and permitted to cool under a screen at its mouth. By the calcination the sulphur in the compound is first oxidized, sulphate of sodium is formed, and at the same time the chlorine from the sodium chloride unites with the copper to form cupric chloride. A small proportion of cuprous chloride is also formed, and special precautions have to be taken to prevent the extensive formation of this compound, which is dissolved only with difficulty. The hydrochloric acid and other gaseous products evolved during the calcination are condensed as "tower liquor" in ordinary condensing towers, and the product is used in the subsequent process of lixiviation.

III. *Lixiviation.*—The calcined ore is conveyed to tightly-caulked wooden tanks, in which it receives repeated washings with hot water, tower liquor, and dilute hydrochloric acid, till all the soluble copper is thereby extracted. The product of the later washings is pumped or drawn up by a modification of Giffard's injector, to serve as a first liquor for subsequent charges of the lixiviating tanks, and no solution under a definite strength is permitted to pass on to the next stage in the process. The insoluble residue in the tanks consists of "purple ore," an almost pure ferric oxide, largely used in "fettling" blast furnaces, and for smelting purposes; besides which it is available as jeweller's rouge.

IV. *Precipitation.*—The precipitation of metallic copper from the solution of its chloride is accomplished in large tanks by means of metallic iron in the same way that cementation copper is obtained from solutions of the sulphate. The solution is run into the tanks, in which there are miscellaneous heaps of old malleable iron; the chlorine combined with the copper unites with the iron, and metallic copper in a state of fine division is thrown down. The completion of the precipitation is ascertained by dipping a bright steel knife into the solution in the tank, and when no deposit of copper covers the steel the liquor is run off and a new charge conveyed into the tank. The tanks are drained periodically for removing the precipitate, which is first roughly separated from small pieces of iron, after which it is more thoroughly freed from iron, &c., by washing in water in a rocking sieve apparatus. The precipitate so obtained should contain 80 per cent. of metallic copper, which is either smelted directly for blister copper, or may be fused with the white metal of the ordinary smelting process, and subsequently roasted.

It has been found possible to extract in this process with profit the small proportions of lead, silver, and gold which Spanish pyrites is known to contain. Two processes are in operation for this purposes—one devised by Mr F. Claudet and the other by Mr W. Henderson, the original patentee of the wet process. The liquors from the first three washings contain practically all these metals, and they alone are treated. Mr Claudet precipitates them from the solution by means of iodide of potassium. Mr Henderson dilutes his solutions to from 20° to 25° Twaddell, and adds a very weak solution of a lead salt, such as the acetate, by which he obtains a cream-coloured precipitate containing about 53 per cent. of lead, 5 or 6 per cent. of silver, and 3 oz. of gold to each ton of the precipitate.

The importance of the wet process may be estimated from the fact that although it originated only in 1860, already 14,000 tons of copper are annually produced by it in Great Britain alone, out of an annual production for the whole world estimated at from 126,000 to 130,000 tons.

Alloys of Copper.—Copper unites with facility with almost all other metals, and a large number of its compounds are of the highest importance in the arts. Indeed copper is much more important and valuable as a constituent element in numerous alloys than it is as pure metal. The principal alloys in which it forms a leading ingredient are—1st, brass; 2d, bronze; and 3d, German or nickel silver; and under these several heads their respective applications and qualities will be found. These alloys are each much diversified as regards the relative proportions of the various metals which enter into their constitution, and these differences similarly modify the appearance and physical properties of the compounds. In this way for practical purposes they may be regarded as a great number of separate metals, each possessed of distinct qualities which fit it for special industrial uses. The following tables, compiled from various authorities, represent the analysis of typical examples of the several alloys:—

Table A.—*Composition of Brass or Copper and Zinc Alloys.*

	Copper.	Zinc.	Tin.	Iron.	Lead.
Roman coin—Titus	96·06	2·71	...	0·85	...
Tombac or Talmi gold	86·40	12·20	1·10	0·30	...
Statue of Minerva in Paris	83·00	14·00	2·00	...	1·00
English brass	70·29	29·26	0·17	...	0·28
Aich metal	60·20	38·10	...	1·60	...
Rosthorn's sterro-metal	54·00	40·50	...	5·50	...
Ship-nails, bad	52·73	41·18	...	...	4·72
,, good	62·62	24·64	2·64	...	8·69

Muntz's metal, or yellow sheathing, consists of 60 parts of copper and 40 of zinc, but the copper may vary from 50 to 63 per cent. and the zinc from 50 down to 37.

Aluminium bronzes are composed of pure copper with from $2\frac{1}{2}$ up to 10 per cent. of aluminium. Phosphor bronze, according to the purposes for which it is intended, contains from 3 to 15 per cent. of tin and from $\frac{1}{4}$ to $2\frac{1}{2}$ per cent. of phosphorus. Small proportions of other metals, among which are silver, nickel, cobalt, antimony, and bismuth, with sulphur, frequently enter into the composition of bronzes.

Salts of Copper.—Several salts of copper possess considerable industrial value, chiefly for the formation of blue and green pigments, in dyeing and calico-printing, and for the deposition of metallic copper by electro-metallurgy, &c. The principal salts of copper are the acetate the carbonate and the sulphate.

Acetate of Copper or *Verdigris.*—This salt is found in commerce in the two forms of basic and neutral acetate. The principal seat of the manufacture of the basic acetate is Montpellier in France, where the marc and other refuse of grapes, after the expression of the juice for wine-making, is employed as a source of the acetic acid necessary. Sheets of copper are placed among this refuse, and these soon become coated with a deposit of verdigris, which has only to be scraped off, kneaded up with water, and pressed into cakes. The neutral salt is prepared from basic acetate by dissolving it in pyroligneous acid (wood vinegar) and evaporating the solution to the crystallizing point. It is also formed by the double decomposition of the acetates of lead and calcium with sulphate of copper. Verdigris is much used as a pigment both in oil and water-colour painting and in dyeing, and as a basis of compound pigments.

Carbonate of Copper in an impure condition forms a valuable series of pigments called *verditer*, *Bremen blue*, or *Bremen green*, possessing various shades of mingled green and blue according to the nature of the compounds with which the carbonate is mixed. The basis of these pigments is prepared by an elaborate and tedious process from the oxychloride of copper.

Sulphate of Copper, $CuSO_4, 5H_2O$, called also blue stone, or Roman vitriol, is, on the large scale, prepared direct from the cementation water from pyrites mines by evaporation to the crystallizing point. It is also prepared by th oxidation of sulphide of copper in a furnace at a comparatively low heat, and by the direct action of sulphuric acid on metallic copper, as well as by various other processes. The sulphate of copper is very largely used as a basis for the preparation of other copper compounds, in electrometallurgy, in calico-printing, and in the American amalgamation method of extracting silver from its ores. In medicine it is employed as an emetic. On its use in the manufacture of chlorine, see vol. v. pp. 491 and 679.

Of pigments other than those above-mentioned having a copper basis, there may be enumerated the native carbonate, mountain or mineral green; Brunswick green, an oxychloride obtained by moistening copper foil exposed to the atmosphere with hydrochloric acid or solution of ammonium chloride; Scheele's green ($Cu_2As_2O_5$), an arsenite of copper; and Schweinfurt green, an aceto-arsenite of copper. Casselmann's green, a pigment discovered in 1865, is a compound of cupric sulphate with potassium or sodium acetate. While it almost rivals Schweinfurt green in brilliancy, it possesses the advantage of being entirely free from arsenic, which renders the latter pigment and Scheele's green so virulently poisonous. At the same time it must be remembered that all copper compounds are poisonous, although the preparations that do not contain arsenic are not so deleterious in their manufacture and applications as are the others. (J. PA.)

COPPER ASSAYING.—In the Cornish method of assaying there are five operations,—the fusion for regulus, the roasting of the regulus, fusion for coarse copper, refining, and the cleaning of the slags. (1) The sample of ore is first inspected to ascertain its quality, and is then reduced to powder. If too much sulphur is present it may be expelled by roasting the ore, or by using nitre in the fusion; in some cases it may be requisite to add sulphur in order to obtain a good regulus. A flux is employed consisting usually of lime, borax, fluor-spar, and glass, which form a slag with the excess of iron in the ore. The button of regulus obtained must be such that it separates easily from the slag without breaking. (2) The regulus ground to a fine powder is next roasted for from 20 to 30 minutes, the heat applied being raised towards the end of the operation; the sulphides of iron and copper are thus converted into oxides. (3) In the fusion for coarse copper a flux of sodium bicarbonate with tartar or borax and nitre is employed; a button of metallic copper is obtained which breaks with a fine-grained and greyish or orange-coloured fracture. (4) Refining consists first in the fusion of the button of coarse copper and the oxidation by the air of sulphur and foreign metals present in it; secondly, in the addition of refining flux, with the production of *dry* copper, or copper *at tough pitch*. Commonly a flux of three parts by measure of tartar, two of nitre, and a little salt is melted in the crucible employed for the previous operation, and into it the button of coarse copper is dropped; the surface of the fused copper having become clear of oxides, a little refining flux is now added, and in about a couple of minutes the contents of the crucible are transferred to the mould. (5) The slags from the two last operations are mixed with tartar or charcoal and fused; and the weight of the small prills or shots of copper obtained is ascertained. Assaying by the wet way is usually conducted by treating a weighed sample of the ore with nitric acid, neutralizing with ammonia, and adding standard solution of potassium cyanide till the blue colour of the liquid is discharged, copper-ammonium-cyanide, free ammonium cyanide, ammonium formate, and urea being produced. Silver, nickel, cobalt, and zinc may interefere with the estimation of the copper by this method; the first may be removed by adding a little hydrochloric acid; from the three other metals the copper can be freed by precipitating it as sulphide by means of sodium thiosulphate, the sulphide obtained being decomposed by nitric acid, and the copper estimated by ammonia and potassium cyanide in the usual manner. Before analysis by the wet way it is often advisable to roast the copper ore in order to expel sulphur. Steinbeck's process for determining the amount of copper in poor ores and schists consists in the treatment of the pulverized rock with hydrochloric acid, digestion in the cold, subsequent boiling with nitric acid, precipitation of the copper from the resulting solution by zinc in presence of platinum, and finally the titration of a solution of the precipitated copper. Dr Haen's method of estimation is based upon the formation of free iodine when excess of potassium iodide is mixed with solution of a copper salt,—the sulphate, for example. Copper is estimated gravimetrically in the metallic state, as in Luckow's electrolytical process; as cuprous sulphide, Cu_2S, which may be obtained by heating cupric sulphide, CuS, in a current of hydrogen, or a mixture of cuprous sulphocyanate, $Cu_2(CNS)_2$, with sulphur; and as cupric oxide, prepared by igniting the precipitate of hydrate, $Cu(OH)_2$, formed when potash or soda is added to solutions of cupric salts. Before the blowpipe, copper compounds give with microcosmic salt or borax a green bead, which becomes blue on cooling; when ignited on charcoal in the inner flame with sodium carbonate and cyanide, they afford scales of metallic copper; most of them, also, when heated in the inner, impart to the outer flame a brilliant green coloration.

For further details as to the chemistry of copper see CHEMISTRY, vol. v. pp. 528–30.

COPPERAS (French, *couperose;* Latin, *cupri rosa*, the flower of copper), melanterite, green-vitriol, or ferrous sulphate, is a salt of iron of the composition $FeSO_4, 7H_2O$. It has a bluish-green colour and an astringent, inky, and somewhat sweetish taste. It crystallizes in oblique rhombic prisms of the monoclinic system, but generally occurs reniform, botryoidal, incrusting, stalactitic, pulverulent, or massive in nature. It is readily dissolved by water, but is insoluble in alcohol. On exposure to the air it effloresces slightly, and if moist becomes coated with a basic ferric sulphate having, according to Berzelius, the formula $2Fe_2O_3, SO_3$, or $Fe_2(SO_4)_3.5Fe_2O_3$. If precipitated from its aqueous solution by alcohol, copperas does not readily absorb oxygen. When heated to 114° C. it loses six molecules of water, but the last molecule is not given up at a temperature of 280° C. Copperas is frequently found in metalliferous mines, being produced by the oxidation of marcasite and iron-pyrites, FeS_2, in a damp atmosphere. The oxidation of the pyrites of coal to ferrous sulphate tends to promote the disintegration of the coal; occasionally, in the presence of shale, it gives rise to the formation of finely crystallized "feather-alum," $FeAl_2(SO_4)_4, 24H_2O$. Copperas is manufactured, with alum, by the oxidation of the iron-pyrites contained in aluminous schists, such as those of the Coal-measures of Renfrew and Lanark (see ALUM, vol. i. p. 646). It may also be prepared by Spence's method of heating ground puddling-furnace slag, tap-cinder, or Cleveland or black-band ironstone with sulphuric acid. A factory for making copperas from the pyritous nodules of the clay of the Island of Sheppey, is said to have been established at Queenborough by Matthias Falconer, a Brabanter, in 1597.

Copperas is used in dyeing and tanning, in the manufacture of ink, Prussian blue, and Nordhausen sulphuric acid or fuming oil of vitriol, in medicine as an astringent and tonic, and in analytical chemistry. In the 13th century it was in request for sheep-dressing. When calcined it yields first a white salt, $FeSO_4, H_2O$, the *ferri sulphas exsiccata* of pharmacy, and finally brownish-red ferric oxide or colcothar of vitriol (*colcothar vitrioli, caput mortuum*, or *crocus Martis*), employed as a paint and polishing-powder. Colcothar may also be prepared by calcining a mixture of 100 parts by weight of copperas with 42 of common salt, and washing out the resulting sodium sulphate. *Jeweller's rouge* or plate-powder is the washed and calcined precipitate of ferric oxide obtained by adding solution of sodium carbonate to solution of copperas.

COPROLITES (from κόπρος, dung, λιθος, stone), the fossilized excrements of extinct animals. The discovery of their true nature was made by Dr William Buckland, who observed that certain convoluted bodies occurring in the Lias of Gloucestershire had the form which would have been produced by their passage in the soft state through the intestines of reptiles or fishes. These bodies had long been known as "fossil fir cones" and "bezoar stones." Buckland's conjecture that they were of fæcal origin, and similar to the *album græcum* or excrement of hyænas, was confirmed by Dr Prout, who on analysis found they consisted essentially of calcium phosphate and carbonate, and not unfrequently contained fragments of unaltered bone. The name "coprolites" was accordingly given to them by Buckland, who subsequently expressed his belief that they might be found useful in agriculture on account of the calcium phosphate they contained. The Liassic coprolites are described by Buckland as resembling oblong pebbles, or kidney-potatoes; they are mostly 2 to 4 inches long, and from 1 to 2 inches in diameter, but those of the larger Ichthyosauri are of much greater dimensions. In colour they vary from ash-grey to black, and their fracture is conchoidal. Internally they are found to consist of a lamina twisted upon itself, and externally they generally exhibit a tortuous structure, produced, before the cloaca was reached, by the spiral valve of a compressed small intestine (as in skates, sharks, and dog-fishes); the surface shows also vascular impressions and corrugations due to the same cause. Often the bones, teeth, and scales of fishes are to be found dispersed through the coprolites, and sometimes the bones of small Ichthyosauri, which were apparently a prey to the larger marine saurians. Coprolites have been found at Lyme Regis, enclosed by the ribs of Ichthyosauri, and in the remains of several species of fish; also in the abdominal cavities of a species of fossil fish, *Macropoma Mantelli*, from the chalk of Lewes. Professor Jäger has described coprolites from the alum-slate of Gaildorf in Würtemberg, assigned by him to the Keuper formation; and the fish-coprolites of Burdiehouse and of Newcastle-under-Lyme are of Carboniferous age. The so-called "beetle-stones" of the coal-formation of Newhaven, near Leith, which have mostly a coprolitic nucleus, have been applied to various ornamental purposes by lapidaries. The name "colites" (from κῶλον, the large intestine, λίθος, stone) was given by Agassiz to fossil worm-like bodies, found in the lithographic slate of Solenhofen, which he determined to be either the petrified intestines or contents of the intestines of fishes. The bone-bed of Axmouth in Devonshire and Westbury and Aust in Gloucestershire, in the Penarth or Rhætic series of strata, contains the scales, teeth, and bones of saurians and fishes, together with abundance of coprolites; but neither there nor at Lyme Regis is there a sufficient quantity of phosphatic material to render the working of it for agricultural purposes remunerative.

The term coprolites has been made to include all kinds of phosphatic nodules employed as manures, such, for example, as those obtained from the Coralline and the Red Crag of Suffolk. At the base of the Red Crag in that county is a bed, 3 to 18 inches thick, containing rolled fossil bones, cetacean and fish teeth, and shells of the Crag period, with nodules or pebbles of phosphatic matter derived from the London Clay, and often investing fossils from that formation. These are distinguishable from the grey Chalk coprolites by their brownish ferruginous colour and smooth appearance. When ground they give a yellowish-red powder. These nodules were at first taken by Professor Henslow for coprolites; they were afterwards termed by Buckland "pseudo-coprolites." "The nodules, having been imbued with phosphatic matter from their matrix in the London Clay, were dislodged," says Buckland, "by the waters of the seas of the first period, and accumulated by myriads at the bottom of those shallow seas where is now the coast of Suffolk. Here they were long rolled together with the bones of large mammalia, fishes, and with the shells of molluscous creatures that lived in shells. From the bottom of this sea they have been raised to form the dry lands along the shores of Suffolk, whence they are now extracted as articles of commercial value, being ground to powder in the mills of Mr Lawes, at Deptford, to supply our farms with a valuable substitute for guano, under the accepted name of coprolite manure." The phosphatic nodules occurring throughout the Red Crag of Suffolk are regarded by Mr Prestwich as derived from the Coralline Crag. The Suffolk beds have been worked since 1846; and immense quantities of coprolite have also been obtained from Essex, Norfolk, and Cambridgeshire. The Cambridgeshire coprolites are believed to be derived from deposits of Gault age; they are obtained by washing from a stratum about a foot thick, resting on the Gault, at the base of the Chalk Marl, and probably homotaxeous with the Chloritic Marl. An acre yields on an average 300 tons of phosphatic nodules, value £750. About £140 per acre is paid for the lease of the land, which after two years is restored to its owners re-soiled and levelled. Plicatulæ have been found attached to these coprolites, showing that they were already hard bodies when lying at the bottom of the Chalk ocean. The Cambridgeshire coprolites are either amorphous or finger-shaped; the coprolites from the Greensand are of a black or dark brown colour; while those from the Gault are greenish-white on the surface, brownish-black internally. Samples of Cambridgeshire and Suffolk coprolite have been found by Voelcker to give on analysis phosphoric acid equivalent to about 55 and 52·5 per cent. of tribasic calcium phosphate respectively (*Journ. R. Agric. Soc. Eng.*, vol. xxi. p. 358, 1860). The following analysis of a saurio-coprolite from Lyme Regis is given by Herapath (*ibid.* vol. xii. p. 91):—

Water	3·976
Organic matter	2·001
Calcium sulphate	2·026
Calcium carbonate	28·121
Calcium fluoride	not determined.
Calcium and magnesium phosphate	53·996
Magnesium carbonate	0·423
Aluminic phosphate	1·276
Ferric phosphate	6·182
Silica	0·733
	98·734

An ichthyo-coprolite from Tenby was found to contain 15·4 per cent. of phosphoric anhydride. The pseudo-coprolites of the Suffolk Crag have been estimated by Herapath to be as rich in phosphates as the true ichthyo-coprolites and saurio-coprolites of other formations, the proportion of P_2O_5 contained varying between 12·5 and 37·25 per cent., the average proportion, however, being 32 or 33 per cent.

Coprolite is reduced to powder by powerful mills of peculiar construction, furnished with granite and buhr-stones, before being treated with concentrated sulphuric acid. The acid renders it available as a manure by converting the calcium phosphate, $Ca_3P_2O_8$, that it contains into the soluble monocalcic salt, $CaH_4P_2O_8$, or "superphosphate." The phosphate thus produced forms an efficacious turnip manure, and is quite equal in value to that produced from any other source. The Chloritic Marl in the

Wealden district furnishes much phosphatic material, which has been extensively worked at Froyle. In the vicinity of Farnham it contains a bed of "coprolites" of considerable extent, and 2 to 15 feet in thickness. Specimens of these from the Dippen Hall pits, analyzed by Messrs Paine and Way, showed the presence of phosphates equivalent to 55·96 of bone-earth (*Journ. R. Agric. Soc. Eng.*, vol. ix. p. 56). Phosphatic nodules occur also in the Chloritic Marl of the Isle of Wight and Dorsetshire, and at Wroughton, near Swindon. They are found in the Lower Greensand. or Upper Neocomitan series, in the Atherfield Clay at Stopham, near Pulborough; occasionally at the junction of the Hythe and Sandgate beds; and in the Folkeston beds, at Farnham. At Woburn, Leighton, Ampthill, Sandy, Upware, Wicken, and Potton, near the base of Upper Neocomian iron-sands, there is a band between 6 inches and 2 feet in thickness containing "coprolites;" these consist of phosphatized wood, bones, casts of shells, and shapeless lumps. The coprolitic stratum of the Specton Clay, on the coast to the N. of Flamborough Head, is included by Prof. Judd with the Portland beds of that formation. In 1864 two phosphatic deposits, a limestone 3 feet thick, with beds of calcium phosphate, and a shale of half that thickness, were discovered by Mr Hope Jones in the neighbourhood of Cwmgynen, about sixteen miles from Oswestry. They are at a depth of about 12 feet, in slaty shale containing Llandeilo fossils and contemporaneous felspathic ash and scoriæ. A specimen of the phosphatic limestone analyzed by Voelcker yielded 34·92 per cent. of tricalcic phosphate, a specimen of the shale 52·15 per cent. (*Report of Brit. Assoc.*, 1865).

COPTS, the name given to the descendants of the native inhabitants of Egypt after the Mahometan conquest, supposed by some to be descended from the ancient Egyptians or else from the mixed race which inhabited the country under the Roman empire. They are Christians, and are said to comprise less than one fourteenth of the whole population. Although numerous, their numbers continue to dwindle, and they are being gradually, by marriage or conversion, absorbed in the Mussulman population of the country. Their name Kubt, or Kubti, is supposed to be derived either from Ægyptos or Egypt, or else from the town of Coptos, or even Iakobitai. Although scarcely distinguishable from the other inhabitants, they are said to have large and elongated black eyes, high cheek-bones, the lobe of the ear high, the nose straight and spread at the end, black and curly hair, thick and spread lips, and large chin. In height they are rather under the middle size; they have in general little *embonpoint*, slender limbs, and pale or bronze complexion, and a sullen expression; but they differ considerably, those who have embraced Roman Catholicism resembling more Greeks or Syrians, while the others of the Said retain their primitive type. Their dress is like that of the Mahometans, except that their turban is of a black-greyish or light-brown colour, and they often wear a black coat or gown over their other dress. In their general customs they follow the rules of the other inhabitants; the women veil their faces, both in public and at home when male visitors are present. In religion they are followers of the Eutychian heresy or Jacobite sect, so called from Jacobus Baradæus, a Syrian, who propagated the doctrine; and in 1840 there were 150,000 of this sect, while 5000 were said to be Roman Catholics, and as many of the Greek faith. The Jacobites are monophysites and monothelites. They have altogether about 130 churches or convents. Their religious orders are a patriarch, a metropolitan of the Abyssinians, bishops, arch-priests, priests, deacons, and monks. The "patriarch," called "of Alexandria," resides at Cairo, and is generally chosen by lot out of eight or nine monks of the convent of St Antony in the eastern desert designated as capable of filling the office, but he may be appointed by his predecessor. The metropolitan is appointed by the patriarch, and the twelve bishops are selected by preference from the monks. They generally baptize their children within the year, and some circumcise them about eight years of age; this rite was evidently handed down by their ancestors, as it is represented in Egyptian sculptures of the Pharaonic period. In their schools the Coptic language is taught imperfectly. In their prayers appear to be many repetitions, and they pray in this manner riding or walking. Their churches are divided into five compartments, the most important of which is the chancel (*heykel*). They observe many fasts and festivals, and some perform pilgrimages to Jerusalem. They also abstain from parts of the flesh of the pig and camel, and from that of animals which have been strangled and from blood. They do not perform military service. In their habits and customs they follow those of the other populations of Egypt; they rarely intermarry with any other sect; in their marriages they employ a go-between *vakel*, and two-thirds of the dowry is settled upon the wife during her life. The marriages take place on Saturday night, and the festivities sometimes are kept up for eight days. At these a singular custom prevails of attaching two cascabels to the wings of two pigeons, whereby the birds fly about till they are giddy, and then placing them in two hollow balls of sugar, each set on a dish; the balls are afterwards broken and the pigeons fly about the room. The preparations for the marriage consist of ablution, a procession of the bride covered with a shawl, attended by musicians, to the house of the bridegroom, stepping over the blood of a slaughtered lamb at the door, the crowning of the bride and bridegroom, and subsequent entertainments, much abridged or even omitted when a widow is married. The etiquette is not to leave the house for a year to pay visits. Divorces are only given for adultery on the part of the wife. The Copts are exceedingly bigoted, prone to be converted to Islamism, sullen, as Ammianus Marcellinus describes the Egyptians, false, faithless, and deceitful, but extremely useful as secretaries and accountants and skilful workmen. In their funeral ceremonies they follow Mussulman customs, but pay special visits on two days of the year to the sepulchres, and give away a slaughtered bullock and other viands. Both in their physical type and in some of their ceremonies they retain a resemblance to their ancestors, the ancient Egyptians.

Seventy years after their conquest by the Mahometans, 640, unsuccessful in revolt, they suffered the persecution of their masters. The monks were branded in the hand, civilians oppressed with heavy taxation, churches demolished, pictures and crosses destroyed, 722–23. A few years later all Copts were so branded. Degrading dresses were imposed upon them, 849–50. Later, under El Hakim, 997, they were compelled to wear heavy crosses and black turbans as an ignominious distinction; churches were destroyed, and many of the Copts converted. In 1301, the blue turban was introduced, but many Copts preferred a change of religion to the adoption of this head-dress. In 1321 a dreadful religious strife, attended by the destruction of churches and mosques and great loss of life, raged at Cairo between the Copts and the Mohametans; but in 1354–55 great numbers embraced Islamism, and they appear to have gradually declined.

The language of the Copts, or so-called Coptic, is that of the last stage of ancient Egyptian civilization, and that in use at the time of the Romans. In the course of centuries the old Egyptian rapidly changed, especially at the time of the 19th dynasty, when foreign conquests and high civilization had introduced into it a number of Semitic words, principally of the Aramæan family. This continued till the time of the 26th dynasty, or about the 7th century B.C., when the old forms had almost died out, and not only a great number of new words but also a difference of structure appeared in the Egyptian, which approached more nearly to the modern Coptic. This continued till the Ptolemies, under whose government a fresh infusion of words (many of them Greek) considerably altered the language, as they displaced the ancient words, and some new grammatical forms appeared; a considerable difference took place in the prefixes and affixes at that period. After the conversion of Egypt to Christianity the old demotic alphabet fell into disuse, and another was substituted—twenty-four letters of the Greek alphabet, to which were added seven others, supposed to be borrowed from the older demotic to represent sounds not found in the Greek. The language was written in this character from the end of the 4th or beginning of the 5th century, in all works relating to Christianity, and in this condition has been handed down to the present day in three different dialects, called the Sahidic or that of Upper Egypt, the Memphitic or that spoken in the neighbourhood of Memphis, and the Bashmuric or dialect of the Lake Menzaleh and its environs. Great difference of opinion has prevailed as to the relative antiquity of these dialects, some considering the Memphitic and others the Sahidic to be the most ancient. The Sahidic is softer than the Memphitic, has none of the harder aspirations, and is more intermixed with Greek. It chiefly differs, however, in construction and the use of vowels. The Bashmuric is intermediate between the two, but is softer than the Memphitic, and one great peculiarity is the use of *l* for *r*, which last letter was not known to the ancient Egyptians. The Coptic or Egyptian was in use at the 9th century, but had ceased to be intelligible in Middle Egypt in the 12th. It survived, however, as a spoken dialect till the 17th, an old man who spoke it having died only in 1633. In the Coptic Church, however, it is still in use for the religious services, and is read, although not understood except by an Arabic interpretation or glossary. It is partly studied by the Copts, and an attempt to revive the ancient language was made by the missionary Lieder at Cairo, who founded schools within the last half century. The discovery of the mode of reading hieroglyphs has rehabilitated the Coptic language, and there is no doubt that it is essentially the same as the Egyptian of the time of the Pyramids, and has retained many words of that and succeeding epochs. Like the Egyptian it is intermediate between the Aryan and Semitic languages in its *copia verborum*, and partly resembles the Semitic in its construction, in which, however, it is more closely allied to the African languages than the older Egyptian, while it differs greatly in the *copia verborum* from them. The Psalms and some other portions of the Scriptures had been translated into Coptic as early as Pachomius, 303, and from that time a succession of works, chiefly religious, were compiled in it. The commencement of the knowledge of Coptic in modern Europe is due to Kircher, who published his *Prodromus Coptus* in 1636. He was followed by Blumberg, who compiled a grammar, called *Fundamenta Linguæ Copticæ*, in 1716. A Copt, named Tuki, bishop of Arsinoe, gave out another, the *Rudimenta Linguæ Copticæ*, in 1778, in Arabic and Latin, but still in a very uncritical condition. Scholz's grammar, edited by Woide in the same year, was a remarkable work for the time; in 1783 Calusius published another grammar; but these chiefly related to the Memphitic dialect, the Sahidic being imperfectly known, and the Bashmuric quite unknown,—the first grammar of the three dialects being that of Tattam in 1830. Another more critical grammar, prepared by Champollion, was edited by Rosellini and Ungarelli, and another by Peyron in 1841, which was succeeded by the work of Schwartze in 1847. The literature chiefly consists of religious works,—the Pentateuch, Psalms, Kings, minor prophets, and book of Daniel, existing in Coptic, and few fragments in Sahidic of the book of Chronicles, and several unedited portions in that dialect. Besides these several of the apocryphal gospels and some Gnostic works, as the *Pistis Sophia*, are found in the same language; the Acts of the Apostles, sermons, homilies, martyrologies, and many liturgical compositions, and Acts of Councils occur. A great mine of this literature is found in the *Catalogus Codicum Copticorum Manuscriptorum in Museo Borgiano*, 4to, Romæ, 1810, and other sources. A great number of fragmentary inscriptions on calcareous stone or pottery, chiefly found at Elephantine, exist in the different museums of Europe. Altogether the Coptic literature is not interesting to general students beyond the relation it bears to the ancient Egyptian and its connection with exegetical theology.

(S. B.)

COPTOS, the modern *Kobt* or *Koft*, a town of Egypt, a short distance from the right bank of the Nile, about 25 miles north-east of Thebes. It is a place of great antiquity, as is proved by the name of Thothmes III. still extant on a granite pillar, but its ruins for the most part belong to a comparatively late period. After the foundation of the port of Berenice on the Red Sea in 266 B.C., its position on the caravan line raised it to great commercial prosperity; but in 292 A.D. its share in the rebellion against Diocletian led to an almost total devastation. It again appears, however, as a place of importance, and as the seat of a considerable Christian community, though the stream of traffic turned aside to the neighbouring Koos. During part of the 7th century it was called Justinianopolis in honour of the Emperor Justinian.

COPYHOLD, in English law, is an ancient form of land tenure, legally defined as a "holding at the will of the lord according to the custom of the manor." Its origin is to be found in the occupation by villani, or non-freemen, of portions of land belonging to the manor of a feudal lord. In the time of the Domesday survey the manor was in part granted to free tenants, in part reserved by the lord himself for his own uses. The estate of the free tenants is the freehold estate of English law; as tenants of the same manor they assembled together in manorial court or court baron, of which they were the judges. The portion of the manor reserved for the lord (the *demesne*, or domain) was cultivated by labourers who were bound to the land (*adscripti glebæ*). They could not leave the manor, and their service was obligatory. These villani, however, were allowed by the lord to cultivate portions of land for their own use. It was a mere occupation at the pleasure of the lord, but in course of time it grew into an occupation by right, recognized first of all by custom, and afterwards by law. This kind of tenure is called by the lawyers *villenagium*, and it probably marks a great advance in the general recognition of the right when the name is applied to lands held on the same conditions not by villeins but by free men. The tenants in villenage were not, like the freeholders, members of the court baron, but they appear to have attended in a humbler capacity, and to have solicited the succession to the land occupied by a deceased father, or the admission of a new tenant who had purchased the good-will, as it might be called, of the holding, paying for such favours certain customary fines or dues. In relation to the tenants in villenage, the court baron was called the customary court. The records of the court constituted the title of the villein tenant, held by copy of the court roll; and the customs of the manor therein recorded formed the real property law applicable to his case. Each manor might have peculiar customs of its own, and as a matter of fact there has been a great variety in the conditions under which copyhold lands are held.

Copyhold had long been established in practice before it was formally recognized by the law. At first it was in fact, as it is now in the fictitious theory of the law, a tenancy at will, for which none of the legal remedies of a freeholder were available. In the reign of Edward IV., however, it was held that a tenant in villenage had an action of trespass against the lord. In this way a species of tenant-right, depending on and strongly supported by popular opinion, was changed into a legal right. The nature of the change is vigorously described by Sir Edward Coke, "As I conjecture in Saxon's, sure I am in the Norman's time the copyholders were so far subject to the lord's will, that the lords upon the least occasion (sometimes without any colour of reason, only upon discontentment and malice, sometimes again upon sudden fantastic humour, only to make evident to the world the height of their power and authority) would expel out of house and home their poor copyholders, leaving them helpless and remediless by any course of law, and driving them to one by way of petition; but now copyholders stand upon a sure ground; now they weigh not their lord's displeasure and shake at every blast of wind; they eat, drink, sleep securely; only having a special care of the main chance, to perform exactly what duties and services soever their term doth require: then let lord frown, the copyholder cares not, knowing himself safe and not within any danger."

While copyhold was thus converted into a legal estate of the same security as any other, it retained and does still retain many incidents characteristic of its historical origin. The life of copyhold assurance, it is said, is custom. Copyhold is necessarily parcel of a manor, and the freehold is said to be in the lord of the manor. The court roll of the manor is the evidence of title and the record of the special laws as to fines, quit rents, heriots, &c., prevailing in the manor. When copyhold land is conveyed from one person to another, it is surrendered by the owner to the lord, who by his payment of the customary fine makes a new grant of it to the purchaser. The lord must admit the vendor's nominee, but the form of the conveyance is still that of surrender and re-grant. The lord, as legal owner of the fee-simple of the lands, has a right to all the mines and minerals and to all the growing timber, although the tenant may have planted it himself. Hence it appears that the existence of copyhold tenures may be traced in some parts of the country by the total absence of timber from such lands, while on freehold lands it grows in abundance. Hence also the popular saying that the "oak grows not except on free land." The copyholder must not commit waste either by cutting down timber, &c., or by neglecting to repair buildings. In such respects the law treats him as a mere lessee,—the real owner being supposed to be the lord. On the other hand, the lord may not enter the land to cut his own timber or open his mines. The limitations of estates usual in respect of other lands, as found in copypold, become subject of course to the operations of its peculiar conditions as to the relation of lord and tenant. An estate for life, or *pour autre vie* (*i.e.*, for another's life), an estate entail, or in fee-simple, may be carved out of copyhold.

A species of tenure resembling copyhold prevails in some parts of the country under the name of *customary freehold.* The land is held by copy of court-roll, but not by will of the lord. The question has been raised whether the freehold of such lands is in the lord of the manor or in the tenant, and the courts of law have decided in favour of the former. In some instances copyhold for lives alone is recognized, and in such cases the lord of the manor may ultimately, when all the lives have dropped, get back the land into his own hands.

The feudal obligations attaching to copyhold tenure have been found to cause much inconvenience to the tenants, while they are of no great value to the lord. One of the most vexatious of these is the *heriot*, under which name the lord is entitled to seize the tenant's best beast or other chattel in the event of the tenant's death. The custom dates from the time when all the copyholder's property, including the copyholder himself, belonged to the lord, and is supposed to have been fixed by way of analogy to the custom which gave a military tenant's habiliments to his lord in order to equip his successor. Instances have occurred in quite recent times of articles of great value being seized as heriots for the copyhold tenements of their owners. A race-horse worth £2000 or £3000 was thus seized. The fine payable on the admission of a new tenant, whether by alienation or succession, is to a certain extent arbitrary, but the courts long ago laid down the rule that it must be reasonable, and anything beyond two years' improved value of the lands they disallowed. The inconvenience caused by these feudal incidents of the tenure has led to a series of statutes, having for their object the conversion of copyhold into freehold.

In 1841 an Act was passed for the commutation of manorial rights in respect of lands of copyhold and customary tenure, and in respect of other lands subject to such rights, and for facilitating the enfranchisement of such land and the improvement of such tenure.

COPYRIGHT is the exclusive right of multiplying for sale copies of works of literature or art, allowed to the author thereof or his assignees. As a recognized form of property it is, compared with others, of very recent origin, being in fact the result of the facility for multiplying copies created by the discovery of printing and kindred arts. Whether it was recognized at all by the common law of England was long a legal question of the first magnitude,—and the reasons for recognizing it, and the extent of the right itself, are not quite clear from controversy even now. The short paragraph in Blackstone may still be read with interest. He thinks that "this species of property, being grounded on labour and invention, is more properly reducible to the head of occupancy than any other, since the right of occupancy itself is supposed by Mr Locke and many others to be founded on the personal labour of the occupant." But he speaks doubtfully of its existence,—merely mentioning the opposing views, "that on the one hand it hath been thought no other man can have a right to exhibit the author's work without his consent, and that it is urged on the other hand that the right is of too subtle and unsubstantial a nature to become the subject of property at the common law, and only capable of being guarded by positive statutes and special provisions of the magistrate." He notices that the Roman law adjudged that if one man wrote anything on the paper or parchment of another, the writing should belong to the owner of the blank materials, but as to any other property in the works of the understanding the law is silent, and he adds that neither with us in England hath there been (till very lately) any final determination upon the rights of authors at the common law.

The nature of the right itself, and the reasons why it should be recognized in law, have from the beginning been the subject of bitter dispute. By some it has been described as a monopoly, by others as a kind of property. Each of these words covers certain assumptions from which the most opposite conclusions have been drawn. As a monopoly it is argued that copyright should be looked upon as a doubtful exception to the general law regulating trade, and should at all events be strictly limited in point of duration. As property, on the other hand, it is claimed that it should be perpetual. There would appear to be no harm in describing copyright either as property or monopoly, if care be taken that the words are not used to cover suppressed arguments as to its proper extent and duration. Historically, and in legal definition, there would appear to be no doubt that copyright, as regulated by statute, is a monopoly. The Parliamentary protection of works of art for the period of fourteen years by the 8 Anne c. 19 and later statutes appears, as Blackstone points out, to have been suggested by the exception in the Statute of Monopolies, 21 James I. c. 3. The object of that statute was to suppress the royal grants of exclusive right to trade in certain articles, and to reassert in relation to all such monopolies the common law of the land. Certain exceptions were made on grounds of public policy, and among others it was allowed that a royal patent of privilege might be granted for fourteen years "to any inventor of a new manufacture for the sole working or making of the same." Copyright, like patent right, would be covered by the legal definition of a monopoly. It is a mere right to prevent other people from manufacturing certain articles. But objections to monopolies in general do not apply to this particular class of cases, in which the author of a new work in literature or art has the right of preventing others from manufacturing copies thereof and selling them to the public. The rights of persons licensed to sell spirits, to hold theatrical exhibitions, &c., are also of the nature of monopolies, and may be defended on special grounds of public policy. The monopoly of authors and inventors rests on the general sentiment underlying all civilized law, that a man should be protected in the enjoyment of the fruits of his own labour.

The first Copyright Act in England is 8 Anne c. 19. The preamble states that printers, booksellers, and other persons were frequently in the habit of printing, reprinting, and publishing "books and other writings without the consent of the authors or proprietors of such books and writings, to their very great detriment, and too often to the ruin of them and their families." "For preventing, therefore, such practices for the future, and for the encouragement of learned men to compose and write useful books, it is enacted that the author of any book or books already printed, who hath not transferred to any other the copy or copies of such book or books in order to print or reprint the same, shall have the sole right and liberty of printing such book or books for the term of one-and-twenty years, and that the author of any book or books already composed, and not printed and published, or that shall hereafter be composed, and his assignee, or assignees, shall have the sole liberty of printing and reprinting such book or books for the term of fourteen years, to commence from the day of first publishing the same, and no longer." The penalty for offences against the Act was declared to be the forfeiture of the illicit copies to the true proprietor, and the fine of one penny per sheet, half to the Crown, and half to any person suing for the same. "After the expiration of the said term of fourteen years the sole right of printing or disposing of copies shall return to the authors thereof, if they are then living, or their representatives, for another term of fourteen years." The last provision points to a particular view of the nature of copyright, to which we shall call attention further on. To secure the benefit of the Act registration at Stationers' Hall was necessary. In section 4 is contained the provision that if any person thought the price of a book "too high and unreasonable," he might complain to the archbishop of Canterbury, the lord chancellor, the bishop of London, the chiefs of the three courts at Westminster, and the vice-chancellors of the two universities in England, and to the lord president, lord justice general, lord chief baron of the Exchequer, and the rector of the college of Edinburgh in Scotland, who may fix a reasonable price. Nine copies of each book were to be provided for the royal library, the libraries of the universities of Oxford and Cambridge, the four Scotch universities, Sion College, and the faculty of advocates at Edinburgh. The copyright of the universities was not to be prejudiced by the Act.

It was believed for a long time that this statute had not interfered with the rights of authors at common law. Ownership of literary property at common law appears to have been recognized in some earlier statutes. The Licensing Act, 13 and 14 Car. II. c. 33, prohibited the printing of any work without the consent of the *owner* on pain of forfeiture, &c. This Act expired in 1679, and attempts to renew it were unsuccessful. The records of the Stationers' Company show that the purchase and sale of copyrights had become an established usage, and the loss of the protection, incidentally afforded by the Licensing Act, was felt as a serious grievance, which ultimately led to the statute of Anne. That statute, as the judges in Millar *v.* Taylor pointed out, speaks of the ownership of literary property as a known thing. One of the petitions in support of the proposed legislation in 1709 states that by common law a bookseller can recover no more costs than he can prove damages. "Besides," it continues, "the defendant is always a pauper, and so the plaintiff must lose his costs of suit. No man of substance has been known to offend in this particular; nor will any ever appear in it." Therefore the confiscation of counterfeit properties is prayed for. And many cases are recorded in which the courts protected copyrights not falling within the periods laid down by the Act. Thus in 1735 the master of the Rolls restrained the printing of an edition of the *Whole Duty of Man*, published in 1657. In 1739 an injunction was granted by Lord Hardwicke against the publication of *Paradise Lost*, at the instance of persons claiming under an assignment from Milton in 1667. The question, however, was raised in the case of Millar *v.* Taylor (4 Burrow, 2303) in 1769, in which the plaintiff, who had purchased the copyright of Thomson's *Seasons* in 1729, claimed damages for an unlicensed publication thereof by the defendant in 1763. The jury found that before the statute it was usual to purchase from authors the perpetual copyright of their works. Three judges, among whom was Lord Mansfield, decided in favour of the common law right; one was of the contrary opinion. The majority thought that the Act of Anne was not intended to destroy copyright at common law, but merely to protect it more efficiently during the limited periods. Millar *v.* Taylor, however, was speedily overruled by the case of Donaldson *v.* Beckett in the House of Lords in 1774. The judges were called upon to state their opinions. A majority (seven to four) were of opinion that the author and his assigns had at common law the sole right of publication in perpetuity. A majority (six to five) were of opinion that this common law right had been taken away by the statute of Anne, and a term of years substituted for the perpetuity. Lord Mansfield did not deliver an opinion, as it was unusual for a peer to support his own judgment on an appeal to the Lords. Lord Camden argued against the existence of a common law right, and on his motion, seconded by the lord chancellor, the decree of the court below was reversed. The decision appears to have taken the trade by surprise. Many booksellers had purchased copyrights not protected by the statute, and they now petitioned Parliament to be relieved from the consequences of the decision in Donaldson *v.* Beckett. A bill for this purpose actually passed the House of Commons, but Lord Camden's influence succeeded in defeating it in the House of Lords. The university copyrights were, however, protected in perpetuity by an Act passed in 1775. The arguments in the cases above mentioned raise the fundamental question whether there can be any property in literary works, and are really arguments for and against the desirability of recognizing the rights on general principles. Lord Camden was the great opponent of copyright, both as a legislator and as a judge. His sentiments may be judged by his answer to the plea that copyright was a reward to men of genius :—"Glory is the reward of science, and those who deserve it scorn all meaner views. I speak not of the scribblers for bread, who teaze the press with their wretched productions. Fourteen years are too long a privilege for their perishable trash. It was not for gain that Bacon, Newton, Milton, and Locke instructed and delighted the world. When the bookseller offered Milton five pounds for his *Paradise Lost*, he did not reject it and commit his poem to the flames, nor did he accept the miserable pittance as the reward of his labour ; he knew that the real price of his work was immortality, and that posterity would pay it."

The battle of copyright at this time appears to have been fought mainly in the interests of the booksellers, and more particularly of the London booksellers. One member presented petitions from the country booksellers, another from the booksellers of Glasgow against the Booksellers' Copyright Bill. Burke supported the bill, and Fox opposed it. In both Houses the opponents of the bill denounced the booksellers vehemently. Speaking of the Stationers' Company, Lord Camden said. "In 1681 we find a by-law for the protection of their own company and their copyrights, which then consisted of all the literature of the kingdom ; for they had contrived to get all the copies into their own hands." Again, owner was the term applied to every holder of copies, and the word author does not occur once in all their entries. "All our learning will be locked up in the hands of the Tonsons and Lintons of the age, who will set that price upon it their avarice chooses to demand, till the public become their slaves as much as their hackney compilers now are. Instead of salesmen the booksellers of late years have forestalled the market, and become engrossers." In the discussions which preceded the last Copyright Act, the interests of the authors are more prominent, but there are still curious traces of the ancient hostility to booksellers. The proceedings both in Donaldson *v.* Beckett and in the Booksellers' Copyright Bill are recorded at considerable length in the *Parliamentary History*, vol. xvii.

By the 41 Geo. III. c. 107 the penalty for infringement of copyright was increased to threepence per sheet, in addition to the forfeiture of the book. The proprietor was to have an action on the case against any person in the United Kingdom, or British dominions in Europe, who should print, reprint, or import without the consent of the proprietor, first had in writing, signed in the presence of two or more credible witnesses, any book or books, or who knowing them to be printed, &c., without the proprietor's consent should sell, publish, or expose them for sale ; the proprietor to have his damages as assessed by the jury, and double costs of suit. A second period of fourteen years was confirmed to the author, should he still be alive at the end of the first. Further, it was forbidden to import into the United Kingdom for sale books first composed, written, or printed and published within the United Kingdom, and reprinted elsewhere. Another change was made by the Act 54 Geo. III. c. 156, which in substitution for the two periods of fourteen years gave to the author and his assignees copyright for the full term of twenty-eight years from the date of the first publication, "and also, if the author be living at the end of that period, for the residue of his natural life."

The Copyright Act now in force is the 5 and 6 Vict. c. 45, which repealed the previous Acts on the same subject. The principal clause is the following (§ 3) :—That the copyright in every book which shall after the passing of this Act be published in the lifetime of its author shall endure for the natural life of such author, and for the further term of seven years, commencing at the time of his death, and shall be the property of such author and his assignees ; provided always that if the said term of seven years shall expire before the end of forty-two years from the first publication of such book the copyright shall in that case endure for such period of forty-two years ; and that the copyright of every book which shall be published after the death of its author shall endure for the term of forty-two years from the first publication thereof, and shall be the property of the proprietor of the author's manuscript from which such book shall be first published and his assigns. The benefit of the enlarged period is extended to subsisting copyrights, unless they are the property of an assignee who has acquired them by purchase, in which case the period of copyright will be extended only if the author or his personal representative agree with the proprietor to accept the benefit of the Act. By section 5 the judicial committee of the Privy Council may license the republication of books which the proprietor of the copyright thereof refuses to publish after the death of the author. The sixth section provides for the delivery within certain times of copies of all books published after the passing of the Act, and of all subsequent editions thereof, at the British Museum. And a copy of every book and its subsequent editions must be sent on demand to the following libraries :—The Bodleian at Oxford, the public library at Cambridge, the Library of the Faculty of Advocates in Edinburgh, and that of Trinity College, Dublin. The other libraries entitled to this privilege under the old Acts had been deprived thereof by an Act passed in 1836, and grants from the treasury, calculated on the annual average value of the books they had received, were ordered to be paid to them as compensation. A book of registry is ordered to be kept at Stationers' Hall for the registration of copyrights to be open to inspection on payment of one shilling for every entry which shall be searched for or inspected. And the officer of Stationers' Hall shall give a certified copy of any entry when required, on payment of five shillings ; and such certified copies shall be received in evidence in the courts as *prima facie* proof of proprietorship or assignment of copyright or licence as therein expressed, and, in the case of dramatic or musical pieces, of the right of representation or performance. False entries shall be punished as misdemeanours. The entry is to record the title of the book, the time of its publication, and the name and place of abode of the publisher and proprietor of copyright. Without making such entry no proprietor can bring an action for infringement of his copyright, but the entry is not otherwise to affect the copyright itself. Any person deeming himself aggrieved by an entry in the registry may complain to one of the superior courts, which will order it to be expunged or varied if necessary. A proprietor may bring an action on the case for infringement of his copyright, and the defendant in such an action must give notice of the objections to the plaintiff's title on which he means to rely. No person except the proprietor of the copyright is allowed to import into the British dominions for sale or hire any book first composed or written or printed and published in the United Kingdom, and reprinted elsewhere, under penalty of forfeiture and a fine of £10. The proprietor of any encyclopædia, review, magazine, periodical work, or work published in a series of books or parts, who shall have employed any person to compose the same, or any volumes, parts, essays, articles, or portions thereof, for publication on the terms that the copyright therein shall belong to such proprietor, shall enjoy the term of copyright granted by the Act.[1] But the proprietor may not publish separately any article or review without the author's consent, nor may the author unless he has reserved the right of separate publication. Where neither party has reserved the right they may publish by agreement, but the author at the end of twenty-eight years may publish separately. Proprietors of periodical works shall be entitled to all the benefits of registration under the Act, on entering in the registry the title, the date of first publication of the first volume or part, and the names of proprietor and publisher. The interpretation clause of the Act defines a book to be every volume, part, or division of a volume, pamphlet sheet of letter-press, sheet of music, map, chart, or plan separately published. The Act is not to prejudice the rights of the universities and the colleges of Eton, Westminster, and Winchester.

The Copyright Act was the result of a Parliamentary movement conducted by Mr Sergeant Talfourd and afterwards by Lord Mahon. Talfourd's bill of 1841 proposed to extend copyright to a period of sixty years after the author's death. The proposer based his claim on the same grounds as other property rights,—which would of course, as Macaulay pointed out, go to justify a perpetual copyright. He refused to accept any shorter term than sixty years. He was answered by Macaulay in a speech full of brilliant illustration and superficial argument. If copyright is to be regarded, as Macaulay regarded it, as a mere bounty to authors,—a tax imposed upon the public for the encouragement of people to write books,—his opposition to an extended term is not only justified, but capable of being applied to the existence of the right for any period whatever. The system of bounty, or of taxation for the special benefit of any class of citizen, is condemned by the principles of political economy and the practice of modern legislation. But if copyright is defended on the same principles which protect the acquisitions of the individual in other lines of activity, the reasoning of Macaulay and the opponents of perpetuity is altogether wide of the mark. The use of the phrase perpetual copyright has caused much confusion. A perpetual copyright is precisely the same sort of right, in respect of duration, as a fee-simple in land, or an investment in consolidated bank annuities. When Macaulay therefore says, "Even if I believed in a natural right of property independent of utility and anterior to legislation, I should still deny that this right could survive the original proprietors," his argument applies equally to property in land and in bank annuities. The original purchaser of a bank annuity acquires a right to the receipt of a certain sum every year for ever, and such right he may assign or bequeath to any body he chooses. The writer of a book, if the law recognized a perpetual copyright, would acquire an exclusive right to the profits of its publication for ever, and might assign or bequeath that right as he chose. In both cases the right survives the owner—if indeed such a phrase can properly be used at all. Again, Macaulay points out that a copyright fifty years after one's death is at the present moment comparatively worthless:—"An advantage to be enjoyed half a century after we are dead, by somebody, we know not whom, perhaps by somebody unborn, by somebody utterly unconnected with us, is really no motive at all to action." No doubt there is a point in the future at which a right coming into existence would for us now living be virtually worth nothing. But this is true of all rights, and not merely of the rights called copyright; and this reasoning would justify the cutting off at some point in the future of all individual rights of property whatever. The present value of a right to rent, a right to annuities, and a copyright—to arise a hundred years hence—is probably next to nothing. There may be good reasons for saying now that no such perpetuity of right ought to be recognized, that the state ought to pass a law to take for itself all profits arising out of land, and all annuities from the public funds, from and after the year 1977. The injury done to the present owners would be precisely of the same sort and extent as in the case of a copyright being cut short a hundred years hence. Macaulay asks, "Would a copyright for sixty years have roused Dr Johnson to any vigorous effort, or sustained his spirits under depressing circumstances?" A sixty years' copyright, or a perpetual copyright, would have been to Dr Johnson in his last days of the same value as a sixty years' lease or a fee-simple respectively of property yielding the same amount of income. Again, says Macaulay, the property would be certain to leave the author's family; the monopoly would fall into the hands of a bookseller. The same thing may be said of all property that is assignable; and if there is any good reason for preventing the assignment of property in certain circumstances, whether by a law of entail or otherwise, that reason may be urged in the case of copyright with the same force, and only with the same force, as in the case of land. The old animus against the bookseller is still apparent in such objections as the last.

A former Copyright Act, as we have already noticed, gave the author two periods of fourteen years, the second to be conditional on his surviving the first. The object of this enactment is evidently to prevent the copyright from falling into the hands of a bookseller. The legislature appears to have deemed authors incapable of managing their own affairs. To prevent them from being made the victims of unscrupulous publishers they put it out of their power to assign the entire copyright, by making the second period a mere contingency. It was forgotten that future profits have a present money value, and that if an author sells his copyright for its fair market value, as he surely may be left to do, he reaps the advantage of the entire period of copyright as completely as if he remained the owner to the end. From this point of view the condition attached to the second period was a positive hardship to the author, inasmuch as it gave him an uncertain instead of a certain interest. It is the difference between an assignable annuity for a certain period of twenty-eight years, and two assignable annuities for fourteen years—the second only to come into existence if the original annuitant survives the first period. The same fallacy lurks under Talfourd's complaint that as copyright is usually drawing towards an end at the close of the author's life, it is taken away at the very time when it might be useful to him in providing for his family. But if the period fixed is otherwise a fair period, the future of the author's family is an irrelevant consideration. He has, by supposition, the full property rights to which he is entitled, and he may sell them or otherwise deal with them as he pleases, and he will make provision for his family as other men do for theirs. Nothing short of a strict Entail Act can keep copyright, any more than other property, in his or his family's possession. The attempt to do this by making the latter portion of the period conditional has disappeared from legislation, but the same fallacy remains in the objections urged against long terms of copyright,

[1] Such articles must be paid for, in order to vest copyright in the proprietor of the periodical.

What would be a fair term may depend on a variety of considerations, but the chance or certainty of copyrights becoming publishers' property is certainly not one of them.

Macaulay's speech convinced the House of Commons, and Talfourd's bill was defeated. Lord Mahon's bill in 1842 reduced the proposed period to twenty-five years after death; Macaulay proposed forty-two as the fixed number in all cases. It was at Macaulay's suggestion that the clause against the possible suppression of books by the owners of copyright was introduced. Under a longer period of copyright the danger apprehended might possibly become a real one; at present we are not aware of any complaint having been made to the judicial committee under this section.

The preceding narrative records the changes in the law of copyright in books only. In the meantime the principle had been extended to other forms of mental work. The 8 Geo. II. c. 13 is an Act "for the encouragement of the arts of designing, engraving, and etching historical and other prints by vesting the properties thereof in the inventors and engravers during the time therein mentioned." It gave to every person who should "invent and design, engrave, etch, or work in mezzotinto or chiaro-oscuro, or from his own works and invention should cause to be designed and engraved, etched, or worked in mezzotinto or chiaro-oscuro, any historical or other print or prints, which shall be truly engraved with the name of the proprietor on each plate and printed on every such print or prints," a copyright for fourteen years—the period fixed by the statute of Anne,—and inflicts a penalty on those who engrave, &c., as aforesaid, without the consent of the proprietor. The 7 Geo. III. c. 38 extended the protection to those who should engrave, &c., any print taken from any picture, drawing, model, or sculpture, either ancient or modern, in like manner as if such print had been graved or drawn from the original design of such graver, etcher, or draughtsman; and in both cases the period is fixed at twenty-eight instead of fourteen years. Ten years later a further remedy was provided by giving a special action on the case against persons infringing the copyright. By the 38 Geo. III. c. 71 the sole right of making models and casts was vested in the original proprietor for the period of fourteen years.

Stage right was first protected by the 3 and 4 Will. IV. c. 15, which provided that the author (or his assignee) of any tragedy, comedy, play, opera, farce, or other dramatic piece or entertainment composed, or which should thereafter be composed, and not printed or published by the author, should have as his own property the sole liberty of representing or causing to be represented at any place of dramatic entertainment in the British dominions any such production, and should be deemed the proprietor thereof; and that the author of any such production printed and published within the ten years preceding the passing of the Act, or which should thereafter be so published, should have sole liberty of representation for twenty-eight years from the passing of the Act, or the first publication respectively, and further during the natural life of the author if he survived that period.

The publication of lectures without consent of the authors or their assignees is prohibited by 5 and 6 Will. IV. c. 65. This Act excepts from its provisions—(1) lectures of which notice has not been given two days before their delivery to two justices of the peace living within five miles of the place of delivery, and (2) lectures delivered in universities and other public institutions. Sermons by clergy of the Established Church are believed to fall within this exception.

Musical compositions are protected by a section of the Copyright Act 5 and 6 Vict. c. 45 above mentioned. The increased period of copyright fixed by that Act is extended to the right of representing dramatic pieces and musical compositions—the first public representation or performance being the equivalent of the first publication of a book. In such cases the right of representation is not conveyed by the assignment of the copyright only.

Lithographs, hitherto a doubtful subject, were brought within the provisions relating to prints and engravings by a clause of the 15 and 16 Vict. c. 12.

Lastly, in 1862, an Act was passed, 25 and 26 Vict. c. 68, by which the author of every original painting, drawing, and photograph, and his assigns, obtained the exclusive right of copying, engraving, reproducing, and multiplying it, and the design thereof, for the term of the natural life of the author and seven years after his death. The Acts relating to copyright of designs will be noticed below.

Immoral publications.

We may now notice a few of the more important principles developed and applied by courts of justice in administering the law of copyright. One of them is that there can be no copyright in any but innocent publications. Books of an immoral or irreligious tendency have been repeatedly decided to be incapable of being made the subject of copyright. In a case (Lawrence *v.* Smith) before Lord Eldon, an injunction had been obtained against a pirated publication of the plaintiff's *Lectures on Physiology, Zoology, and the Natural History of Man*, which the judge refused to continue, "recollecting that the immortality of the soul is one of the doctrines of the Scriptures, and considering that the law does not give protection to those who contradict the Scriptures." The same judge refused in 1822 to restrain a piracy of Lord Byron's *Cain*, and *Don Juan* was refused protection in 1823. It would appear from a recent case, arising out of a different subject matter,[1] that the courts are still disposed to enforce these principles. To refuse copyright in such cases is futile as a mode of punishment or repression, inasmuch as it directly opens up a wider circulation to the objectionable works. When the authorship of a book is misrepresented with intent to deceive the public, copyright will not be recognized.

Private letters.

The writer of private letters sent to another person may in general restrain their publication. It was urged in some of the cases that the sender had abandoned his property in the letter by the act of sending; but this was denied by Lord Hardwicke, who held that at most the receiver only might take some kind of joint property in the letter along with the author. Judge Story, in the American case of Folsom *v.* Marsh, states the law as follows:—"The author of any letter or letters, and his representatives, whether they are literary letters or letters of business, possess the sole and exclusive copyright therein; and no person, neither those to whom they are addressed, nor other persons, have any right or authority to publish the same upon their own account or for their own benefit." But there may be special occasions justifying such publication.

A kind of property in unpublished works, not created by the copyright Acts, has been recognized by the courts. The leading case on the subject is Prince Albert *v.* Strange (2 *De Gex and Smale's Reports*). Copies of etchings by the Queen and Prince Albert, which had been lithographed for private circulation, fell into the hands of the defendant, a London publisher, who proposed to exhibit them, and issued a catalogue entitled *A Descriptive Catalogue of the Royal Victoria and Albert Gallery of Etchings*. The Court of Chancery restrained the publication of the catalogue, holding that property in mechanical works, or works of art,

[1] Cowan *v.* Milbourn, *Law Reports*, 2 Exchequer 230, in which it was held that a contract to let a room for lectures might be broken by the lessor on finding that the proposed lectures were of an irreligious blasphemous, and illegal character.

does certainly subsist, and is invaded, before publication, not only by copying but by description or catalogue.

The question what is a piracy against copyright has been the subject of much discussion in the courts. It was decided under the statute of Anne that a repetition from memory was not a publication so as to be an infringement of copyright. In the recent case of Reade *v.* Comquest the same view was taken. The defendant had "dramatized" the plaintiff's novel, and the piece was performed at his theatre. This was held to be no breach of copyright; but the circulation of copies of a drama, so taken from a copyright novel, whether gratuitously or for sale, is not allowed. Then again it is often a difficult question to decide whether the alleged piratical copyright does more than make that fair use of the original author's materials which the law permits. It is not every act of borrowing literary matter from another which is piracy, and the difficulty is to draw the line between what is fair and what is unfair. Lord Eldon put the question thus,—whether the second publication is a legitimate use of the other in the fair exercise of a mental operation deserving the character of an original work. Another test proposed is "whether you find on the part of the defendant an *animus furandi*—an intention to take for the purpose of saving himself labour." No one, it has been said, has a right to take, whether with or without acknowledgment, a material and substantial portion of another's work, his arguments, his illustrations, his authorities, for the purpose of making or improving a rival publication. When the materials are open to all, an author may acquire copyright in his selection or arrangement of them. Several cases have arisen on this point between the publishers of rival directories. Here it has been held that the subsequent compiler is bound to do for himself what the original compiler had done. When the materials are thus *in medio*, as the phrase is, it is considered a fair test of piracy to examine whether the mistakes of both works are the same. If they are, piracy will be inferred. Translations stand to each other in the same relation as books constructed of materials in common. The *animus furandi*, mentioned above as a test of piracy, does not imply deliberate intention to steal; it may be quite compatible with ignorance even of the copyright work. This is shown by the case of Reade *v.* Lacy. The plaintiff wrote a drama called *Gold*, and founded on it a novel called *Never too Late to Mend.* The defendant dramatized the novel,—his play reproducing scenes and incidents which appeared in the original play. The vice-chancellor, presuming that the defendant had a right to dramatize the novel, found that the second play was an infringement of the copyright in the first. Abridgments of original works appear to be favoured by the courts—when the act of abridgment is itself an act of the understanding, "employed in carrying a large work into a smaller compass, and rendering it less expensive." Lord Hatherly, however, in Tinsley *v.* Lacy, incidentally expressed his disapproval of this feeling,—holding that the courts had gone far enough in this direction, and that it was difficult to acquiesce in the reason sometimes given that the compiler of an abridgment is a benefactor to mankind by assisting in the diffusion of knowledge. A mere selection or compilation, so as to bring the materials into smaller space, will not be a *bona fide* abridgment; "there must be real substantial condensation, and intellectual labour, and judgment bestowed thereon" (Justice Story.) A publication professing to be *A Christmas Ghost Story, Reoriginated from the Original by Charles Dickens, Esq., and Analytically Condensed expressly for this Work*, was found to be an invasion of Mr Dickens's copyright in the original. In the case of a musical composition Lord Lyndhurst held that it is piracy when the appropriated music, though adapted to a different purpose, may still be recognized by the ear. The quasi-copyright in names of books, periodicals, &c., is founded on the desirability of preventing one person from putting off on the public his own productions as those of another. The name of a journal is a species of trade-mark on which the law recognizes what it calls a "species of property." The *Wonderful Magazine* is invaded by a publication calling itself the *Wonderful Magazine, New Series Improved. Bell's Life in London* is pirated by a paper calling itself the *Penny Bell's Life.* So the proprietors of the *London Journal* got an injunction against the *Daily London Journal*, which was projected by the person from whom they had bought their own paper, and who had covenanted with them not to publish any *weekly* journal of a similar nature. A song published under the title of *Minnie*, sung by Madame Anna Thillon and Miss Dolby at Monsieur Jullien's concerts, was invaded by a song to the same air published as *Minnie Dale, Sung at Jullien's Concerts by Madame Anna Thillon.*

Dramatic and musical compositions, it should be observed, stand on this peculiar footing, that they may be the subject of two entirely distinct rights. As writings they come within the general Copyright Act, and the unauthorized multiplication of copies is a piracy of the usual sort. This was decided to be so even in the case of musical compositions under the Act of Anne. The Copyright Act now includes a "sheet of music" in its definition of a book. Separate from the copyright thus existing in dramatic or musical compositions is the right of representing them on the stage; this was the right created by 3 and 4 Will. IV. c. 15, above mentioned in the case of dramatic pieces. The Copyright Act, 5 and 6 Vict. c. 45, extended this right to musical compositions, and made the period in both cases the same as that fixed for copyright. And the Act expressly provides (meeting a contrary decision in the courts), that the assignment of copyright of dramatic and musical pieces shall not include the right of representation unless that is expressly mentioned. The 3 and 4 Will. IV. c. 15, prohibited representation "at any place of public entertainment," a phrase which has been omitted in the later Act, and it may perhaps be inferred that the restriction is now more general and would extend to any unauthorized representation anywhere. A question has also been raised whether, to obtain the benefit of the Act, a musical piece must be of a dramatic character. The dramatization of a novel, *i.e.*, the acting of a drama constructed out of materials derived from a novel, is not an infringement of the copyright in the novel, but to publish a drama so constructed has been held to be a breach of copyright (Tinsley *v.* Lacy, where defendant had published two plays founded on two of Miss Braddon's novels, and reproducing the incidents and in many cases the language of the original). Where two persons dramatize the same novel, what, it may be asked, are their respective rights? In Toole *v.* Young (9 Q. B., 523) this point actually arose. A, the author of a published novel, dramatized it and assigned the drama to the plaintiff, but it was never printed, published, or represented upon the stage. B, ignorant of A's drama, also dramatized the novel and assigned his drama to the defendant, who represented it on the stage. It was held that any one might dramatize A's published novel, and that the representation of B's drama was not a representation of A's drama. This case may be compared with Reade *v.* Lacy mentioned above.

Relation of copyright and stage-right.

For preventing the importation of pirated copies of books, the commissioners of customs are required to make out a list of books on which copyright subsists, and of which they have received notice from the owner or his agent, and such lists are to be exposed at the ports of the United Kingdom. If notice is not sent the importation of books will not be interfered with. If any one wrongfully causes a book to be entered on the custom lists, any one injured thereby may apply to a judge in chambers to have the entry expunged.

Newspapers stand at present on a somewhat peculiar footing with reference to the law of copyright. Their position was put in issue in the case of Cox *v.* the *Land and Water* Journal Company (*Law Reports*, 9 Eq. 324), in which the plaintiff sought to restrain the defendant from publishing a "List of Hounds" taken from plaintiff's paper—the *Field.* It was argued that there was no copyright in a newspaper article, or, if there were, that it was lost by non-registration. Vice-Chancellor Malins held that a newspaper is not within the copyright Acts, that therefore the rules as to non-registration do not apply, and that the proprietor of a paper acquires such a property (not copyright) in every article for which he pays under the 18th section of the Act, or by the general rules of property, as will entitle him to prohibit any other person from publishing the same thing in any other newspaper. The substantial justice of this decision is beyond impeachment, but as a matter of law it is by no means satisfactory. The right to prohibit publication is copyright and nothing else; and it is difficult to see how it can be enjoyed at all outside the Copyright Act, or how, if it is acquired in virtue of compliance with any of the provisions of the Act, it can avoid forfeiture as a penalty for non-registration. It is highly improbable that this decision would be confirmed, should the question ever come before a higher court. The property of a newspaper, *i.e.*, the good-will of printing and publishing it, and the exclusive right to its title, are not rights of the same nature as copyright.

Crown and university copyrights.

A special kind of perpetual copyright in various publications has for various reasons been recognized by the law (1) in the Crown and (2) in the universities and colleges. The various copyright Acts, including the last, except from their provisions the copyrights vested in the two English and the four Scotch universities, Trinity College, Dublin, and the colleges of Eton, Westminster, and Winchester. Crown copyrights are saved by the general principle which exempts Crown rights from the operation of statutes unless they are expressly mentioned. Among the books in which the Crown has claimed copyright are the English translation of the Bible, the Book of Common Prayer, statutes, orders of Privy Council, proclamations, almanacs, Lilly's Latin Grammar, year books, and law reports. The copyright in the Bible is rested by some on the king's position as head of the church; Lord Lyndhurst rested it on his duties as the chief executive officer of the state charged with the publication of authorized manuals of religion. The right of printing the Bible and the Book of Common Prayer is vested in the queen's printer and the universities of Oxford and Cambridge. These copyrights do not extend to prohibit independent translations from the original. The obsolete copyright of the Crown in Lilly's Latin Grammar was founded on the fact of its having been drawn up at the king's expense. The universities have a joint right (with the Crown's patentees) of printing Acts of Parliament. Law reports were decided to be the property of the Crown in the reign of Charles II.; by Act of Parliament they were forbidden to be published without licence from the chancellor and the chiefs of the three courts, and this form of licence remained in use after the Act had expired. The courts still maintain their right to restrain the publication of reports of their proceedings, but on quite other grounds than those pertaining to the law of copyright. University and college copyrights are made perpetual by an Act of George III., but only on condition of the books being printed at their printing presses and for their own benefit.

The rights of foreigners under the copyright Acts produced an extraordinary conflict of judicial opinion in the English courts. A foreigner who during residence in the British dominions should publish a work was admitted to have a copyright therein. The question was whether residence at the time of publication was necessary. In Cocks *v.* Purday, the Court of Common Pleas held that it was not. In Boosey *v.* Davidson, the Court of Queen's Bench, following the decision of the Court of Common Pleas in Cocks *v.* Purday, held that a foreign author might have copyright in works first published in England, although he was abroad at the time of publication. But the Court of Exchequer, in Boosey *v.* Purday, refused to follow these decisions, holding that the legislature intended only to protect its own subjects,—whether subjects by birth or by residence. The question came before the House of Lords on appeal in the case of Boosey *v.* Jeffreys, in which the Court of Exchequer had taken the same line. The judges having been consulted were found to be divided in opinion. Six of them held that a foreigner resident abroad might acquire copyright by publishing first in England. Four maintained the contrary. The views of the minority were affirmed by the House of Lords (Lord Chancellor Cranworth and Lords Brougham and St Leonards). The lord chancellor's opinion was founded upon "the general doctrine that a British senate would legislate for British subjects properly so called, or for such persons who might obtain that character for a time by being resident in this country, and therefore under allegiance to the Crown, and under the protection of the laws of England." Lord Brougham said that

> "The statute of Anne had been passed for the purpose of encouraging learned men, and with that view that Act had given them the exclusive right in their publications for twenty-one years. This, however, was clear, they had no copyright at common law, for if they had there would have been no necessity for the passing of that statute. It could scarcely be said that the legislature had decided a century and a half since that an Act was to be passed to create a monopoly in literary works solely for the benefit of foreigners. In the present case he was clearly of opinion that the copyright did not exist, and therefore that foreign law should not prevail over British law where there was such diversity between the two."

Against the authority of this case, however, must be set the opinion of two of the greatest lawyers who have occupied the woolsack in this generation—Lord Cairns and Lord Westbury. In the case of Routledge *v.* Low (*Law Reports*, 3 House of Lords, 100) Lord Cairns said,

> "The aim of the legislature is to increase the common stock of the literature of the country; and if that stock can be increased by the publication for the first time here of a new and valuable work composed by an alien who has never been in the country, I see nothing in the wording of the Act which prevents, nothing in the policy of the Act which should prevent, and everything in the professed object of the Act and in its wide and general provisions which should entitle such a person to the protection of the Act, in return and compensation for the addition he has made to the literature of the country."

And Lord Westbury said, in the same case,

> "The case of Jeffreys *v.* Boosey is a decision which is attached to and depends on the particular statute of which it was the exponent, and as that statute has been repealed and is now replaced by another Act, with different enactments expressed in different language, the case of Jeffreys *v.* Boosey is not a binding authority in the exposition of this later statute. The Act appears to have been dictated by a wise and liberal spirit, and in the same spirit it should be interpreted, adhering of course to the settled rules of legal construction. The preamble is, in my opinion, quite inconsistent with the conclusion that the protection given by the statute was intended to be confined to the works of British authors. The real condition of obtaining its advantages is the first publication by the author of his work in the United Kingdom. Nothing renders necessary his bodily presence here at the time, and I find it impossible to discover any reason why it should be required, or what it can add to the merit of the first publication. If the intrinsic merits of the reasoning on which Jeffreys *v.* Boosey was decided be considered, I must frankly admit that it by no means commands my assent."

These conclusions appear to follow also from the recent Naturalization Act of 1870, which enacts that real and personal property of every description may be taken, acquired, held, and disposed of by an alien in the same manner in all respects as by a natural born British subject. As the latter can acquire copyright by first publication, without residence in England, and as copyright is personal property, it would seem that an alien also must have copyright without the necessity of residence. It is quite clear, at all events, that residence in any part of the British dominions—not merely the United Kingdom—is sufficient; but the first publication must be in the United Kingdom. But the copyright once created extends to the whole of the British dominions.

Colonial copyright, however, is subject to a special Act, the 10 and 11 Vict. c. 95. Under English copyright books of the United Kingdom were protected in the colonies, and copies of them printed or reprinted elsewhere could not be imported into the colonies. At the same time books published in the colonies are not, as we have just mentioned, within the protection of the Copyright Act. By the Colonial Copyright Act, 10 and 11 Vict. c. 95, it is now enacted that when the legislative authority in any British possession makes proper provision by Act or ordinance for the protection of the rights of British authors, the Crown may, by Order in Council, suspend the prohibition against the importation, &c., of foreign reprints of English copyright books, so far as such colony is concerned, and the local Act shall thereupon come into operation. The following colonies have taken advantage of the Act:—New Brunswick, Nova Scotia, Prince Edward's Island, Bermuda, Bahamas, Barbados, Canada, St Lucia, St Vincent, British Guiana, Mauritius, Jamaica, Newfoundland, Granada, St Christopher, Antigua, Nevis, Cape of Good Hope, Natal (Shortt).

In 1875 an Act was passed to give effect to an Act of the Parliament of the Dominion of Canada respecting copyright. An Order in Council in 1868 had suspended the prohibition against the importation of foreign reprints of English books into Canada, and the Parliament had passed a Bill on the subject of copyright as to which doubts had arisen whether it was not repugnant to the Order in Council. Her Majesty in Council is therefore authorized to assent to the Canadian Bill (which is printed as a Schedule to the Act); and it is also enacted that, after the Bill comes into operation, if an English copyright book becomes entitled to Canadian copyright, no Canadian reprints thereof shall be imported into the United Kingdom, unless by the owner of the copyright. The following points in the Canadian Act are worth noting. Any person printing or publishing an unprinted manuscript without the consent of the author or legal proprietor shall be liable in damages (§ 3). Any person domiciled in Canada, or in any part of the British Possessions, or being a citizen of any country having an international copyright treaty with the United Kingdom, who is the author of any book, map, &c., &c.,—shall have the sole right and liberty of printing, reprinting, publishing, &c., for the term of twenty-eight years. The work must be printed and published, or reprinted or republished in Canada, whether before or after its publication elsewhere; and the Canadian privilege is not to be continued after the copyright has ceased elsewhere. And "no immoral or licentious, or irreligious, or treasonable, or seditious literary scientific or artistic work" shall be the subject of copyright (§ 4). A further period of fourteen years will be continued to the author or his widow and children. An "interim copyright" pending publication may be obtained by depositing in the office of the minister of agriculture (who keeps the register of copyrights) a copy of the title of the work; and works printed first in a series of articles in a periodical, but intended to be published as books, may have the benefit of this interim copyright. If a copyright work becomes out of print, the owner may be notified of the Act through the minister of agriculture, who, if he does not apply a remedy, may license a new edition, subject to a royalty to the owner. Anonymous books may be entered in the name of the first publisher.

Books published in a colony stand on the same footing, so far as the United Kingdom is concerned, as books published in a foreign country. Their protection in England depends on the International Copyright Acts.

The International Copyright Acts were passed in order to give foreign authors the same sort of privilege as is accorded to English authors, on the basis of reciprocity. The principal Act is the 7 and 8 Vict. c. 12, repealing an earlier Act, 1 and 2 Vict. c. 59, and amended by 15 Vict. c. 12.

Her Majesty may, by Order in Council, grant the privilege of copyright to the authors of books, &c., first published in any foreign country to be named in such order—provided always that "due protection has been secured by the foreign power, so named in such Order in Council, for the benefit of parties interested in works first published in the dominions of Her Majesty similar to those comprised in such order." Different provisoes may be fixed for different countries and different classes of works protected. No right of property shall be recognized in any book, &c., first published out of Her Majesty's dominions, save such as is created by this Act. Hence British as well as foreign authors first publishing abroad, have no protection in England unless there is a convention between England and the country in which they publish under the International Copyright Act. Thus in Boucicault *v.* Delafield,[1] the plaintiff had first performed a drama in New York, and afterwards registered it in England on the first day of its performance there, and now sought to have its unauthorized representation restrained. The court refused, holding that the Act 7 and 8 Vict. c. 12, § 19 says in effect that if "any person, British subject or not, chooses to deprive this country of the first representation of his work, then he may get the benefit of copyright if he can, under any arrangement which may have been come to between this country and the country which he so favours with his representation." If there is no such treaty or arrangement, then this country has nothing more to say to him. The publication in the British dominions of unauthorized translations of works published abroad may be prohibited by the authors for a period of five years, except in the case of political articles in the newspapers, &c. Copyright in foreign works of art, prints, articles of sculpture, &c., may also be protected under the conditions applicable to copyright in the same subjects in England. The right of representing in England dramatic pieces, &c., first performed abroad, may also be recognized in the same way. The authors of dramatic pieces first performed abroad may also acquire (under the 15 Vict. c. 12) the right to prevent the representation of any unauthorized translation of such dramatic pieces for a period not exceeding five years from the date of first publication or representation of an authorized translation. Section 6 of this Act contains the important exception that "nothing herein contained shall be so construed as to prevent fair imitations or adaptations to the English stage of any dramatic piece or musical composition published in any foreign country." This clause has given great dissatisfaction, and it has been virtually repealed by 38 Vict. c. 12.[2] The right to prevent translations of foreign books

[1] The same question was decided in the same way in the recent case (Nov. 1876) of the same plaintiff against Mr Chatterton for representing "Shaughraun," a play first brought out by plaintiff in America.

[2] The state of the law, as it is left by this Act, is worth noticing. By the 15 Vict. c. 12, the Queen may, by Order in Council, grant stage-right to foreign dramatists as mentioned above, and the enactments in force for protecting domestic stage rights are available for them; but nothing in the Act is to prevent fair imitations or adapta-

or dramatic pieces is subject to certain conditions enumerated in section 8—requiring registration, publication of an authorized translation within a certain time, &c. The Act requires, it seems, that the translation should give the English people the means of knowing the original as accurately as is possible by means of an English version; and in a recent case, where the authors of *Frou Frou* had authorized a free English version with many changes of names, &c., and considerable omissions, it was held not to be a sufficient compliance with the statute.[1] The judge pronounced it to be an imitation or adaptation only, and said that if a true translation had been published first, the plaintiff might then have acted the "version," and nobody else would have been allowed to act anything like it.

In all these cases, it must be remembered, the Crown can grant copyright to foreign productions, only on condition that a convention securing reciprocal rights is concluded with the foreign power in question, in terms of the International Copyright Act. The countries with which conventions have been concluded are the following:—Prussia, Saxony, and other German states, in 1846 and 1847; France, 1852; Belgium, 1855; Spain, 1857; Sardinia; and Hesse Darmstadt, 1862.

Defects in copyright laws.

An Association to Protect the Rights of Authors has recently been formed with the object of calling attention to the more glaring defects of the existing laws of copyright. The chief points noticed by this association are the loss of rights by first production out of the United Kingdom; the loss by dramatization of novels; the unfair conditions of stage-right in translations of foreign plays, and especially the hardship of the "fair adaptation" clause; the loss caused by the inefficient prohibition of pirated copies in Canada since the International Copyright Act was passed, and the absence of an international copyright treaty with the United States. Of these defects the "adaptation clause" has been repealed since the association was formed, and the Act already noticed was passed in 1875 to give effect to a new Copyright Act of the Canadian Parliament. In 1876 a royal commission was appointed to consider the whole question of home, colonial, and international copyright.

The question of international copyright between England and the United States has for sometime been the subject of active discussion among the authors and publishers of both countries. The chief opposition to a convention proceeds from various sections of the publishing trade in America. An interesting statement of the various groups of opinion on this subject in the United States, and of the attempts to frame a satisfactory International Copyright Act, will be found in an article by Dr C. E. Appleton in the *Fortnightly Review* for February 1877. At present a sort of customary copyright in English books is recognized by certain leading firms. When one of them has, by arrangement with the author, obtained the advance sheets of an English work, there is a tacit understanding that the others are not to reprint that particular work; but this arrangement, it appears, "is practically confined to those who are able to retaliate when the trade courtesy is violated." These great publishers have a monopoly of the English trade, and those who would gladly become their competitors, the booksellers of the Middle and Western States, would, according to Dr Appleton, oppose any International Copyright Act which did not aid them to break down that monopoly. Some of the resolutions of a meeting of the opponents of International Copyright at Philadelphia in January 1872 are worth quoting:—

1. That thought, unless expressed, is the property of the thinker; when given to the world it is as light, free to all.
2. As property it can only demand the protection of the municipal law of the country to which the thinker is subject.
3. The author of any country, by becoming a citizen of this, and assuming and performing the duties thereof, can have the same protection that an American author has.
4. The trading of privileges to foreign authors, for privileges to be granted to Americans, is not just, because the interests of others than theirs are sacrificed thereby.
5. Because the good of the whole people, and the safety of our republican institutions, demand that books shall not be made too costly for the multitude by giving the power to foreign authors to fix their price here as well as abroad.

Copyright of designs applicable to manufactures is protected by the 5 and 6 Vict. c. 100, and subsequent Acts amending the same. Before designs in general were protected, the copyright in designs for the manufacture of linens, cottons, calicos, and muslins had been recognized. The 5 and 6 Vict. c. 100. § 3, enacts "with regard to any new and original design, whether such design be applicable to the ornamenting of any article of manufacture, or of any substance, artificial or natural or partly artificial and partly natural, and whether for the pattern, for the shape or configuration, or for the ornament thereof, and by whatever means the same may be applicable, whether by printing, painting, &c., the proprietor shall have the sole right of applying such design, for the terms specified in the Act, which vary according to the class of manufacture in question." By 6 and 7 Vict. c. 65, copyright for three years was granted for designs "having reference to some purpose of utility, so far as design shall be for the shape or configuration of such article." Registration in both cases is necessary. The period of protection varies from nine months to five years, and in certain cases an extended period may be granted by the Board of Trade. Cases under these Acts are more nearly allied to patents than to copyrights.

Copyright in Foreign States.—*France.*—Copyright in France is recognized in the most ample manner. Two distinct rights are secured by law—1st, the right of reproduction of literary works, musical compositions, and works of art; and 2d, the right of representation of dramatic works and musical compositions. The period is for the life of the author and fifty years after his death. After the author's death the surviving consort has the usufructuary enjoyment of the rights which the author has not disposed of in his lifetime or by will, subject to reduction for the benefit of the author's protected heirs if any. The author may dispose of his rights in the most absolute manner in the forms and within the limits of the Code Napoléon. Piracy is a crime punishable by fine of not less than 100 nor more than 2000 francs; in the case of a seller from 25 to 500 francs. The pirated edition will be confiscated. Piracy also forms the ground for a civil action of damages to the amount of the injury sustained—the produce of the confiscation, if any, to go towards payment of the indemnity (Penal Code, Art. 425–429). The piracy on French territory of works published in a foreign country is, by a decree of 28th March 1852, brought within the above provisions. "However, when a convention has been concluded with any state this treaty modifies the effects of the decree of 28th March, in so far as its provisions may be in opposition to the said decree; the prescriptions of the new convention become the special law of the parties, and the rights of the authors and artists of that state are regulated in France by the intervening convention" (*Resumé of the Rights of Literary and Artistic Property in France*, Longman & Co.)

tions to the English stage of foreign plays, &c. Now comes the Act of 1875, which says that in case of any such order the Queen *may* direct that the said section 6 shall not apply, and thereupon the 15 Vict. c. 12 "shall take effect with respect to such dramatic pieces, and to the translations thereof *as if* the said sixth section of the said Act were hereby repealed." So that the Queen *may* repeal the sixth section in any particular case so far as to remit the question of "fair adaptations and imitations" to the common law.

[1] Wood v. Chart, (*Law Reports*, 10 Equity 204).

The following statements regarding copyright in other European countries are abridged from Copinger's *Law of Copyright* (London; Stevens & Haynes, 1870):—

Prussia.—Copyright endures for the author's life, and his heirs have a term of thirty years from his decease. When a copyright is assigned without any special stipulation, the publisher cannot issue more than one edition without the author's written permission. He may issue a reprint, on paying the author half the sum paid for the first issue.

Austria, by treaty with Sardinia, Tuscany, and the Papal States, gives copyright for thirty years after author's death.

Holland and Belgium. — Copyright formerly perpetual, now limited to the life of the author, and twenty years thereafter.

Denmark and Sweden. — Copyright formerly perpetual, now limited to thirty years in the former and twenty in the latter; if the publication is allowed to lapse, copyright falls to the state.

Spain.—The period is the author's life and fifty years thereafter.

Russia.—The author's life and twenty-five years, and ten years more if an edition is published within five years of the end of the first term.

Germany.—Period fixed in 1837 at ten years; but copyright for longer periods was granted for voluminous and costly works, and for the works of German poets. Among others the works of Schiller, Goethe, Wieland, &c., were protected for a period of twenty years from the date of the decree in each case. In 1845 the period was extended in all cases to the author's life and thirty years after.

Greece.—Copyright is for fifteen years from publication.

United States.—The first legislation on the subject of literary property in the United States appears at the close of the revolution. In 1783 laws were passed by Connecticut and Massachusetts securing to authors for specified periods the exclusive property in their literary productions, and prescribing penalties for its violation. Similar laws were passed by Virginia in 1785, by New York in 1786, and by other States. Under this system it was necessary for authors, in order to enjoy the benefits of protection in States other than that in which they resided, to copyright their works in each State having such laws. Authors' rights therefore depended on the legislation in the several States, as there was no national law relating to copyright. In order to afford to literary property, as well as to useful inventions and discoveries, adequate protection throughout the United States by a general law, the Federal Constitution, which came into force in 1789, empowered Congress "to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries." Pursuant to this provision the first copyright law of the United States was passed, May 31, 1790, entitled "An Act for the Encouragement of Learning by securing the Copies of Maps, Charts, and Books to the Authors and Proprietors of such Copies during the times therein mentioned." This statute gave to authors, who were citizens or residents of the United States, their heirs and assigns, copyright in maps, charts, and books for fourteen years, and provided for a second term of the same duration, if the author should be living at the expiration of the first. The penalty prescribed for publishing, importing, or selling a book in violation of the Act was forfeiture of copies to the author or proprietor, "who shall forthwith destroy the same," and the payment of 50 cents for every sheet found in possession of the offender, one-half to go to the author or proprietor, and the other half to the United States. The Act also provided a remedy against the unauthorized publication of manuscripts belonging to citizens or residents of the United States. In 1802 the provisions of the Act of 1790 were extended to "the arts of designing, engraving, and etching historical and other prints." In 1831 the several Acts relating to copyrights were amended and consolidated by a general law, which extended the term of protection from fourteen to twenty-eight years, with provision for a renewal for fourteen years to the author, his widow or children. Musical compositions were now for the first time expressly provided for, being placed upon the same footing as books. In 1856 was passed the first statute for giving to dramatists the exclusive right of representing their plays in public, and in 1865 photographs and negatives were declared subjects of copyright in the same manner as books, engravings, &c. All statutes relating to copyright were repealed by the general law of 1870, which, with an amendment passed in 1874, now regulates the entire subject. This law may be found in the revised statutes of the United States of 1873, and the amendment in the statutes at large of 1873–74. The term of protection is the same as that under the Act of 1831. To the subjects of copyright protected by previous statutes were added paintings, drawings, chromos, statues, statuary, and models or designs intended to be perfected as works of the fine arts.

Every author or owner, native or foreign, of an unpublished literary composition or work of art has exclusive property therein at common law. Before publication he may make of it any use which does not interfere with the rights of others. When the work is published the owner's common law rights are lost. The author or proprietor of a manuscript, if a citizen or resident of the United States, has also a statutory remedy for damages against its unlicensed publication.

In 1834 was contested in the Supreme Court of the United States the same question which had been so elaborately argued in the English case of Millar *v.* Taylor, decided by the Court of King's Bench in 1769, and finally settled by the House of Lords five years later in Donaldson *v.* Becket, viz., whether copyright in published works exists by the common law, and is therefore of unlimited duration, or is created by and wholly governed by statute. The Supreme Court, following the authority of the House of Lords, held that there was no copyright after publication except for the limited term given by the statute. Of the seven judges four concurred in this conclusion, two delivered elaborate dissenting opinions, and one was absent. This judgment has since continued to be the supreme law.

The policy of the American Government in relation to foreign authors has been far less liberal than that of England. No special arrangement for international copyright, such as subsists between Great Britain and many Continental countries, has been entered into between the United States and any foreign Government. While a foreigner in the United States is entitled to common law protection for his unpublished works, his rights after publication are determined wholly by statute. The question concerning the status of a foreign author under the copyright laws, as well as of a citizen who derives title from a foreigner, is freed from much of the doubt and difficulty that have surrounded it in the English courts. While Parliament from the reign of Anne to the present time has legislated for the benefit of "authors," leaving to the courts to determine whether that general language is applicable to all authors or is limited to those of Great Britain, the American Congress, in all its legislation for the encouragement of literature from the Act of 1790 to that of 1870, has extended protection only to such author as may be a "citizen of the United States or resident therein." Thus by express words is a foreigner excluded from the benefits of the statute. This language has nevertheless given rise to some discussion as to who may be regarded as a "resident." That word has been judicially construed to mean any person domiciled in the United States with the intention of making there his permanent abode. Neither naturalization nor a formal declaration of such intention is required. No definite period of time and no specific acts are indicated as necessary to constitute such residence. The question is to be determined by the intention of the person at the time of recording his title, while his abode is in the United States, and by his acts so far as they indicate what that intention was. If at that time he intended to remain there and make the country his place of permanent abode, his home, he becomes during the continuance of that intention a resident within the meaning of the Act, though he may afterwards change his mind and return to his native land. How long such intention shall continue the courts have not determined; but if it exists *bona fide* at the time of recording the title, valid copyright vests, and will not be defeated by any subsequent acts or change of mind on the part of the claimant. On the other hand, if a foreign author should come to the United States intending to stay temporarily, although with that intention he should actually remain a year or ten years, he would be a mere sojourner, and would not acquire a residence within the meaning of the Act. To determine thus the intention in the mind of a person will in many cases be attended with difficulty and even with fraud. It is a question of fact for the jury, whose finding will determine the law. In case of a work composed jointly by a foreign and a native author, and copyrighted by either one or both, the copyright in the part contributed by the foreign author if it could be distinguished, would not be valid. The assignee—although a citizen—of a foreign author, can acquire no more rights under the statute than the latter has.

There is, however, nothing in the statute to prevent a citizen or resident from acquiring copyright in certain works of art which he has purchased from a foreign author. By section 4952 copyright is vested in "any citizen of the United States, or resident therein, who shall be the author, inventor, designer, or *proprietor* of a book, map, chart, dramatic or musical composition, engraving, cut, print, photograph, or negative thereof, or of a painting, drawing, chromo, statue, statuary, and of models or designs intended to be perfected as works of the fine arts." Under this section any "proprietor," who is a citizen or resident, might acquire copyright in a work purchased from a foreign author. But a subsequent section, 4971, declares that nothing in the Act "shall be construed to prohibit the printing, publishing, importation, or sale of any book, map, chart, dramatic or musical composition, print, cut, engraving, or photograph, composed or made by any person not a citizen of the United States nor resident therein." This language clearly disqualifies a foreigner, or any one deriving title from him, from acquiring in the United States copyright in the works mentioned. But no mention is made of paintings, drawings, chromos, statues, statuary, models, or designs which are included in the previous section. Whether this omission is intentional or otherwise cannot be determined from the Act, but in the absence of any judicial or legislative light on this point, the only sound interpretation would seem to be that if a citizen or resident of the United States, having purchased from a foreign author any work of art of these classes, should take the requisite steps to secure copyright therein, his title would be valid. A citizen of the United States may acquire copyright while temporarily resident in a foreign country.

The same liberal construction given to the word "book" by the English courts has been accepted in the United States. A brief literary composition on a single sheet may be copyrighted as a book. There is no special provision concerning copyright in an encyclopædia, review, magazine, or periodical as is prescribed by sections 18 and 19 of the 5 and 6 Vict. c. 45. Such works are protected in the same manner as books. In the absence of special agreement to the contrary, the copyright of an article contributed to a magazine or other periodical would doubtless remain with the author for all purposes which would not deprive the purchaser of any advantage arising from its publication in the magazine. The right of subsequent publication in book form would belong to the author and not to the owner of the periodical. Such publication might be made at any time after the issue of the magazine, provided the circulation of the latter was not thereby injured. In practice newspapers are not copyrighted; hence any uncopyrighted article first published in a newspaper becomes *publici juris*, and valid copyright could not be subsequently obtained for it. But either the entire newspaper or any article published in it may be copyrighted by a compliance with the general statutory provisions relating to books. Authors may reserve the right to dramatize or to translate their own works, by printing a notice to that effect in the book. The copyright law does not protect a title independently of the book; but a title may be registered as a trade mark, or its unlawful use may be restrained on the general principles of equity. Nor is there any provision in the copyright law, as in England, for the protection of designs for industrial products. The statute of 1874 prescribes that the words "engraving," "cut," and "print" shall be applied only to pictorial illustrations or works connected with the fine arts, and that no prints or labels designed to be used for any other articles of manufacture shall be entered under the copyright law, but must be registered in the patent office.

The statute now in force grants to authors, and their executors, administrators, or assigns, copyright for twenty-eight years from the time of recording the title. At the expiration of that period the author or his widow or children may obtain an additional term of fourteen years. In order to secure copyright every applicant is required to perform three acts:—1st, before publication to transmit to the librarian of Congress in Washington a printed copy of the title of the book, map, chart, dramatic or musical composition, engraving, cut, print, or photograph, or a description of the painting, drawing, chromo, statue, statuary, model, or design; 2d, within ten days after publication to send to the same official two copies of such book or other article, or in the case of a painting, drawing, statue, model, or design a photograph thereof; 3d, to print on the title page, or the page next following, of every copy of a book, or in the case of a map, chart, musical composition, print, cut, engraving, photograph, painting, drawing, chromo, statue, statuary, model, or design to inscribe upon some visible portion of it, or upon the substance upon which it is mounted, the notice of entry for copyright in the form prescribed. Two forms are prescribed, either of which may be used:—1. "Entered, according to Act of Congress, in the year by , in the office of the librarian at Washington;" 2. "Copyright 18 . . by ". In each case the year when the copyright was entered and the name of the person, persons, or firm by whom entered are to be given. Compliance with all these conditions is essential to valid copyright. Until they are performed an action at law for infringement cannot be maintained. But equity will protect the copyright as soon as the title is recorded, and before the performance of the other two requisites. When the right is perfected an action at law may be maintained for any infringement after the recording of the title. A penalty of \$25 is further prescribed for failure to deliver to the librarian of Congress, within ten days after publication, two copies of the best edition of the book, or description or photograph of the other articles above mentioned, and a copy of every subsequent edition containing substantial changes. A penalty of \$100 is imposed upon any person who causes notice of copyright to be inserted in a book, or impressed upon any other article for which a copyright has not been obtained. The fee for securing copyright is 50 cents, to be paid to the librarian for recording the title. A copy of such record may be obtained for 50 cents. The librarian receives \$1 for recording and certifying an assignment, and $1 for every copy of an assignment furnished. Another essential condition to valid copyright is publication, and the work must be first published in the United States; but a contemporaneous publication abroad will not prejudice the author's rights. The production must also be original and innocent in character. Copyright will not vest in an unpublished work. But the statute provides that every person who shall print or publish any manuscript, without the consent of the author or proprietor, if the latter is a citizen or resident of the United States, shall be liable for damages. There is nothing in the Act to exclude a resident assignee of a foreign author from the benefits of this provision.

Copyrights pass to heirs and are assignable in law by any instrument of writing. Every assignment must be recorded in the office of the librarian of Congress within sixty days after its execution, in default of which it becomes void as against any subsequent purchaser or mortgagee for a valuable consideration without notice.

The existing statute provides that if any person without due authority shall print, publish, or import a copyrighted book, or knowing it to be so printed, published, or imported shall sell or offer it for sale, he shall forfeit every copy to the proprietor and pay such damages as may be recovered in a civil action. In case of piracy of a map, chart, musical composition, print, cut, engraving, photograph, or chromo, the offender is made liable to forfeit the plates and every sheet copied or printed, and to pay $1 for every sheet found in his possession either printing, printed, copied, published, imported, or exposed for sale. For every pirated copy of a painting, statue, or statuary found in his possession, or which he has sold or offered for sale, the offender must pay $10. The injured person may obtain from a court of equity an injunction against the publication and sale of the pirated work, and may recover at law the damages sustained by such publication. All actions at law and suits in equity under the copyright statutes must be brought in the circuit or district courts of the United States, except in the District of Columbia or any territory where the proper tribunal is the Supreme Court. Appeal lies to the Supreme Court of the United States. All actions for forfeitures or penalties must be brought within two years after the cause of action has arisen. Redress for the invasion of common law rights in unpublished works must be sought in a State court, unless the parties to the controversy are citizens of different States, in which case the courts of the United States have jurisdiction.

Stage right in the United States.—Until 1856 there was no statute giving to dramatists control over the public representation of their plays. This want was met by the Act of August 18 of that year, which was passed expressly to confer upon the author or owner of a dramatic composition the sole liberty of performing, or causing it to be performed, in public; and any one infringing this right was made liable to damages in a sum not less than $100 for the first and $50 for every subsequent unauthorized performance. The provisions of this Act have been held to apply only to cases in which copyright was secured under the Act of 1831; and as the benefits of that law were by express words limited to citizen or resident authors, foreign dramatists acquired no rights by the statute of 1856. The Act of 1870 gives to dramatists, besides the exclusive right of publishing in print, the sole liberty of representing their dramatic compositions on the stage, and declares that any person who publicly represents a copyrighted dramatic composition, without authority, shall be liable to damages in a sum not less than $100 for the first and $50 for each subsequent performance. This right is secured by copyrighting the dramatic composition as a book and endures for the same term as does the copyright in the book. The Act must be construed as giving the sole liberty of representation only in cases where the exclusive right of publication has been secured. In other words, the copyright in the printed production is made to include the right of public representation. As the former can be acquired only by citizens and residents, foreign dramatists and their assignees, as under the Act of 1856, are excluded from the benefits of the statutes. There is no statutory provision, as in England, giving to either native or foreign dramatists the exclusive right to represent their manuscript plays. While foreign dramatists are entitled to no statutory protection whatever, their manuscript plays are protected by the common law. In this respect the rights of native and foreign dramatists are the same. Such protection ceases when the play is published. When published in print the owner's rights are lost, unless in the case of a citizen, protected by statute. Whether the authorized public performance of a manuscript play, unprotected by statutory copyright, is such a publication as will give to any one, without licence from the owner, the right either to represent it on the stage or to publish it in print, is a question which is not determined by statute, as in England, but is left entirely to the courts. It has been much discussed in several leading cases since 1860; and its importance is enhanced by the fact that many, if not most, of the dramas which American managers are expected and even required to provide for an exacting public and a critical press are from the pens of English and French playwrights. It is well settled that the public performance of a manuscript drama is not such a publication as will invalidate a copyright subsequently obtained by the author; and that no one, without leave, may publish in print, or publicly represent the play, if obtained by stenography, the use of writing, or in any other way than through the memory of one or more persons who have witnessed its lawful representation. The theory has been advanced, and has received some judicial approval, that the owner of an uncopyrighted manuscript play cannot lawfully prevent another from publicly representing it, when the latter has obtained a copy through the memory of any person who has witnessed the authorized performance. This doctrine is supported by a single case decided in the Supreme Court of Massachusetts in 1860. Its soundness has been questioned by high authority, and there is little doubt that when the direct issue shall be presented for judicial determination such unlicensed use of the play will be held to be piracy. It may be regarded as conceded that the courts would not hesitate to declare unauthorized publication in print to be an invasion of the owner's rights.

Property in unpublished musical compositions, lectures, sermons, works of arts, &c., are governed by the same principles that apply in the case of dramatic productions. There is no statute, as in England, regulating the author's rights in manuscript lectures. The writer of an unpublished letter, whether possessing literary value or not, may prevent at common law its unauthorized publication by the receiver, unless publication is necessary to protect the latter against injurious representations made by the former. (E. R.—E. S. DR.)

COQUEREL, ATHANASE JOSUÉ (1820–1875), son of A. L. C. Coquerel, noticed below, a minister of the French Protestant Church, was born at Amsterdam in 1820. At an early age he succeeded his father as editor of *Le Lien*, and he held this post till 1852. In that year he took part in establishing the *Nouvelle Revue de Théologie*, which had the distinction of being the first periodical organ of scientific theology published in France. Meanwhile he had gained a high reputation as an eloquent and earnest preacher, and especially as the advocate of religious freedom in opposition to the imposition of tests. Advancing beyond his father's doctrinal position, his teaching became more and more offensive to the old orthodox party; and on the appearance (1864) of his article on Renan's *Vie de Jesus* in the *Nouvelle Revue de Théologie*, the storm of suspicion and dislike which had long been gathering burst on his head, and he was forbidden by the Paris Consistory to continue his ministerial functions. He received an address of regretful sympathy from the consistory of Anduze, and a provision was voted for him by the Protestant Liberal Union, to enable him to continue his preaching. This he did with much earnestness and success till within a few weeks of his death. Coquerel received the cross of the Legion of Honour in 1862. He died at Paris, July 25, 1875.

Coquerel's principal writings are — *Jean Calas et sa famille* (1858); *Des Beaux-Arts en Italie*, (of which an English translation was published in 1859); *La Saint Barthélemy* (1860); *Précis de l'église réformée* (1862); *Le Catholicisme et le Protestantisme considérés dans leur origine et leur développement* (1864); *Libres études*, and *La conscience et la foi* (1867).

COQUEREL, ATHANASE LAURENT CHARLES (1795–1868), French Protestant divine, president of the Presbyterian Council of Paris, was born in that city, August 27, 1795. He received his early education from his aunt, Helen Maria Williams, an Englishwoman, who at the close of the 18th century made herself a reputation by various translations and by her *Letters from France*. He completed his theological studies at the Protestant faculty of Montauban, and in 1816 was ordained pastor. During the following twelve years he resided in Holland, and preached with acceptance before Calvinistic congregations at Amsterdam, Leyden, and Utrecht. In 1830, at the suggestion of Cuvier, who then filled the office of minister of Protestant worship, Coquerel was called to Paris; and there he spent the rest of his life. Ardently attached to liberal ideas, he was not content with advocating them from the pulpit, but resolved to speak also through the press. In the first year of his Paris life he therefore established a periodical entitled *Le Protestant*, which was continued till December 1833. In the course of this year he was chosen a member of the consistory. In January 1834 appeared the first number of the *Libre Examen*, under the joint-editorship of Coquerel and Artaud, which was carried on till July 1836. Coquerel rapidly acquired the reputation of a great pulpit orator, and the liberal views which he announced with fearless freedom brought him more and more into antagonism with the rigid Calvinists. He took a warm interest in all matters of education, and distinguished himself so much by his defence of the university of Paris against a sharp attack, that in 1835 he was chosen a member of the Legion of Honour. Pained by the doctrinal divergencies which separated the Protestants of France, and longing to bring about a real union, he originated, in 1841, a periodical entitled *Le Lien*, of which such union was the avowed object. The same year appeared his *Réponse* to the *Leben Jesu* of Strauss. After the revolution of February 1848, Coquerel was elected a member of the National Assembly, where he sat as a moderate republican, subsequently becoming a member of the Legislative Assembly. He supported the first ministry of Louis Napoleon, and gave his vote in favour of the expedition to Rome and the restoration of the temporal power of the Pope. After the *coup d'état* of December 2, 1851, he confined himself to the duties of his pastorate, which he had not ceased to discharge. He was one of the most prolific of French sermon-writers, as well as one of the most famous orators of his day, and retained his popularity to the last. He died at Paris, January 10, 1868.

A large collection of his sermons was published in 8 vols. between 1819 and 1852. And in addition to the works already named, he was author of *Biographie sacrée* (1825–1826); *Histoire sainte et analyse de la Bible* (1839); *Orthodoxie moderne* (1842); *Christologie* (1858), &c. These works have had a large circulation, and most of them have been translated into English, German, and Dutch.

COQUES, or COCX, GONZALEZ (1614–1684), the son of Peeter Willemsen Cocx, a respectable Flemish citizen, and not, as his name might imply, a Spaniard, was born at Antwerp. At the age of twelve he entered the house of Peeter, the son of "Hell" Brueghel, an obscure portrait painter, and at the expiration of his time as an apprentice, became a journeyman in the workshop of David Ryckaert the second, under whom he made accurate studies of still life. At twenty-six he matriculated in the guild of St Luke; he then married Ryckaert's daughter, and in 1653 joined the literary and dramatic club known as the "Retorijkerkamer." After having been made president of his guild in 1665, and in 1671 painter in ordinary to Count Monterey, governor-general of the Low Countries, he married again in 1674, and died full of honours in his native place. Coques chose his vocation as a boy when he took lessons from the last of the Brueghels. He was trained to the execution of portraits. One of his canvases in the gallery of the Hague represents a suite of rooms hung with pictures, in which the artist himself may be seen at a table with his wife and two children, surrounded by masterpieces composed and signed by several contemporaries. Partnership in painting was common amongst the small masters of the Antwerp school; and it has been truly said of Coques that he employed Arthois for landscapes, Ghering and Van Ehrenberg for architectural backgrounds, Steenwijck the younger for rooms, and Peeter Gysels for still life and flowers; but the model upon which Coques formed himself was Van Dyck, whose sparkling touch and refined manner he imitated with great success. He never ventured beyond the "cabinet,' but in this limited field the family groups of his middle time are full of life, brilliant from the sheen of costly dress and sparkling play of light and shade, combined with finished execution and enamelled surface. The finest examples of Coques are in England. Three of his family pieces are in the collection of Sir Richard Wallace, a fourth in Buckingham Palace, a fifth and sixth in the galleries of Mr Labouchere and Mr Walter of Bearwood, a seventh in the collection of Mr Robarts, an eighth in the National Gallery. Three portraits of the Elector Palatine Frederick and his wife Elizabeth, and David Teniers, the painter, are in the Ellesmere collection. The finest specimen abroad is Coques's Family in the Dresden Museum.

CORA, an ancient city of Italy, about seven miles south-east of Rome by the Appian Way. Various traditions about its origin are found in the Roman writers; but all agree in acknowledging its great antiquity, and for a long period it ranked as one of the most important cities of Latium. After being lost sight of in history for about twelve hundred years it reappears in the 13th century, and under the name of Cori it continues to the present day, a town of from 5000 to 6000 inhabitants. Situated on a hill that rises above the Pontine marshes, and divided by an olive grove into two portions, Cori presents a fine appearance from the plain. Besides the walls erected in the 15th century by Ladislas of Naples, it preserves important remains of its earlier and perhaps its earliest defences, constructed of large polygonal blocks; part of a temple, usually distinguished by the name of Hercules, is incorporated in the church of St Pietro; two Corinthian columns of admirable execution mark the site of the temple of Castor and Pollux; numerous minor antiquities are scattered about the town; and the ravine outside the gateway leading to Ninfa is spanned by the Ponte della Catena, built of massive blocks of tufa.

See for further details Nibby, *Dintorni di Roma*; Giovanni Antolini. *Il tempio di Ercole in Cori*. Milan, 1828

CORALS

CORALS (CORALLIARIA) Under the general name of "Coral-Animals" are included all those members of the *Actinozoa* which have the power of secreting hard structures of the nature of a skeleton. Whether this skeleton be continuous or discontinuous, of conspicuous dimensions or simply of microscopic spicula, it constitutes what is known properly as the "coral" or "corallum;" and the animals which produce it are the so-called "Coralligenous Zoophytes" (*Actinozoa Coralligena*). The class of the *Actinozoa* is one of the primary divisions of the sub-kingdom of the *Cœlenterata*, or Radiated Animals; and those forms of the class which secrete a corallum belong to the orders of the *Zoantharia*, *Rugosa*, and *Alcyonaria*. No corallum is ever produced in the order *Ctenophora*, and many members of the *Zoantharia* are either destitute of a skeleton or have but an imperfect one, whilst the corallum of the *Alcyonaria* is also often rudimentary. The *Ctenophora*, therefore, will be wholly omitted here; and only those members of the *Zoantharia* and *Alcyonaria* in which a well-developed corallum is present, will be considered at any length,—the soft-bodied forms requiring no notice except in so far as they serve to elucidate the peculiarities of the Coralligenous groups.

The class of the *Actinozoa* comprises those Cœlenterate animals in which the space included within the body-walls is divided into an inner "gastric" cavity or stomach and an outer "perivisceral" cavity. The gastric sac is short and is open below, so that the perivisceral cavity freely communicates with the outer world through the mouth, and the two cavities become practically one. The perivisceral cavity, in turn, is divided into a series of compartments by the development of a series of vertical membranous plates (the "mesenteries"), which are arranged in a radiating manner between the walls of the gastric sac and the wall of the body. The reproductive organs are not external, but are attached to the faces of the mesenteries, and shed their contents into the body-cavity. The ova reach the external medium either through the mouth or through the ends of the tentacles.

The class of the *Actinozoa* is divided into four orders, viz., the *Zoantharia* (Sea-Anemones, *Madreporaria*, &c.), the *Rugosa* (*Cyathophyllum*, *Zaphrentis*, &c.), the *Alcyonaria* (Red Coral, Sea-Pens, Sea-Shrubs, Organ-pipe Corals, &c.), and the *Ctenophora* (*Beroë*, *Pleurobrachia*, Venus's Girdle, &c.)

ORDER I.—ZOANTHARIA (*Hexacoralla*).

The members of this order are distinguished by the fact that the intermesenteric chambers and tentacles are generally and fundamentally six in number, or some multiple of six, however largely they may be subsequently increased, whilst the tentacles are simple, rounded, or conical, not fringed with lateral processes. The corallum may be wholly absent (*Actinidæ*), spicular (*Zoanthidæ*), in the form of an internal axis or "sclerobasis" (*Antipathidæ*), or "sclerodermic," with a distinct wall, and generally distinct septa (as in the Madrepores, and the "Stone-corals" generally). According to the nature of the skeletal structures the *Zoantharia* are divided into the three groups of the *malacodermata*, *sclerobasica*, and *sclerodermata*.

Zoantharia malacodermata:—In this section are the animals commonly known as Sea-Anemones, in which there is either no skeleton at all (*Actinidæ*), or simply a discontinuous pseudo-skeleton composed of minute adventitious spicules scattered through the integuments (*Zoanthidæ*). Though possessing nothing that would ordinarily be termed a "coral," it may be well to insert here a general description of the anatomy of the Sea-Anemones, as they are readily accessible for study, and may be regarded as being fundamentally identical in the structure of their soft parts with the coralligenous *Zoantharia*, as well (probably) as with the extinct *Rugosa*.

The true Sea-Anemones (*Actinia*, *Tealia*, *Actinoloba*, *Sagartia*, &c.) are under ordinary circumstances simple animals, but some closely allied forms (*Zoanthus* and *Palythoa*) form compound growths or colonies, which are produced by budding, and consist of numerous polypes united by a fleshy base or cœnosarc. In the simple forms the body is generally a short cylinder or truncated cone (the "column"), usually of a fleshy or leathery consistence, and capable of undergoing great variations in shape. The lower extremity of the column usually forms a flattened discoidal area (the "base"), whereby the animal attaches itself at will to foreign bodies. The base, however, may be wholly non-adherent, pointed (*Ilyanthus*), thin, distensible, and imperforate (*Edwardsia*), or swollen, rounded, and pierced with a distinct orifice (*Peachia* and *Cerianthus*). The upper surface of the column constitutes a circular flattened area (the "disc"), which carries the tentacles round its margin, and is perforated centrally by the aperture of the mouth.

In size the Sea-Anemones vary from less than a sixth of an inch up to 2 feet in diameter; and their habits of life are very various. Generally they attach themselves by the muscular base to foreign bodies, in rock-pools, at low-water mark, or extending to considerable depths. Others, again (such as *Peachia*, *Halcampa*, and *Edwardsia*), live more or less completely buried in the sand; *Cerianthus* has the same habit, and further protects the body by the secretion of a loose, membranous, non-adherent tube; whilst *Arachnactis* is free-swimming and pelagic.

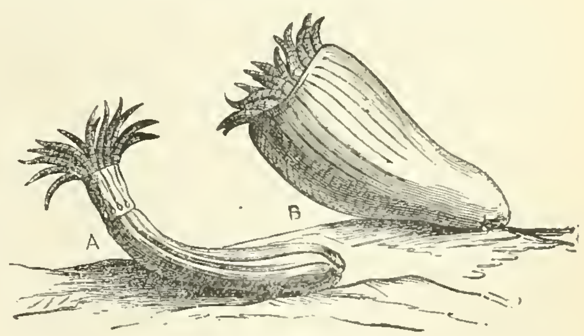

FIG. 1.—Sea Anemones.

A, *Edwardsia callimorpha*, Gosse. B, *Ilyanthus Mitchellii*, Gosse, of the natural size. (After Gosse.)

The *integuments* of the Sea-Anemones consist of an outer layer ("ectoderm"), an inner layer ("endoderm"), and a more or less largely developed intermediate layer ("mesoderm"), each of which may in turn be differentiated into successive more or less distinguishable strata. The ectoderm is composed of an exterior stratum of ciliated epithelial cells, a granular stratum crowded with "thread-cells," and a stratum of pigment to which the brilliant coloration so characteristic of these animals is due. The peripheral epithelial cells are constantly being thrown off from the surface as a viscid mucus, which may entangle foreign bodies and form a species of investing tube. In other cases (*Tealia*, *Bunodes*), the surface is studded with adhesive vesicular warts, by means of which the integument obtains an adventitious coat of fragments of shell, grains of sand, and small pieces of stone. The mesoderm is essentially composed of two layers of muscular fibres, those of the outer layer having a circular direction, whilst these of the inner layer are longitudinal in the column and become radial in the base and disc. The endoderm is likewise double in its composition, its inner stratum being formed of ciliated epithelial cells.

The "thread-cells" (cnidæ or nematocysts), which are so abundantly developed in the integument of the Sea-Anemones, are microscopic organs of offence and defence. Though differing very much in size and in the details of structure in different species, the thread-cells consist essentially of an elastic double-walled sac, one extremity of which is invaginated and carries a long, often serrated or spinose filament, which lies coiled up in the interior of the sac. On the slightest pressure the sac is instantaneously everted, and the lasso-like thread in its interior is shot forth with the rapidity of lightning, having the power of penetrating any soft body with which it may come in contact, and apparently inflicting an envenomed puncture.

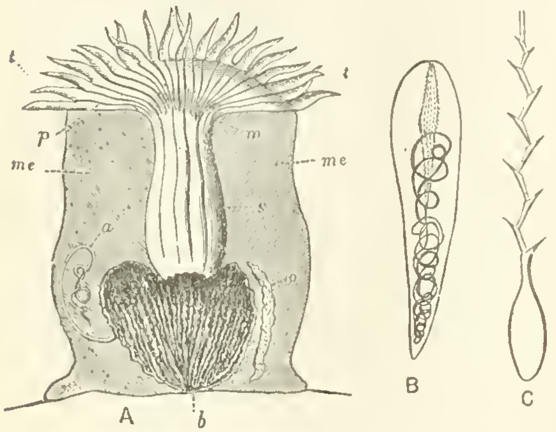

FIG. 2.—Morphology of the Actinidæ.

A, Ideal representation of a Sea-Anemone, vertically bisected; *tt*, tentacles; *p*, peristomial space; *m*, mouth; *s*, stomach; *b*, interior of the general body-cavity, below the stomach, showing the free edges of the mesenteries; *me*, one of the mesenteries; *o*, ovary; *a*, acontium. B, Thread-cell of *Caryophyllia Smithii* (after Gosse), greatly enlarged. C, Thread cell of *Tealia crassicornis* (after Gosse), with the filament everted, greatly enlarged.

The *organs of prehension* of the Sea-Anemones are the "tentacles" (*tentacula*). These are hollow, smooth, conical or filiform organs, arranged around the margin of the disc in one or more successive circles. The walls of the tentacles are formed of the general integuments of the body, and each communicates inferiorly with an inter-mesenteric chamber, and is thus filled with fluid derived from the general cavity of the body. They are capable of extension and retraction, and their extremities are commonly perforated, though sometimes swollen and impervious (*Corynactis*, *Caryophyllia*). They are abundantly furnished with thread-cells, and are, therefore, organs of touch as well as of prehension. Except in some cases, where one or more tentacles may be aborted, the number of the tentacles seems to be primitively six, and remains some multiple of this during life,—the number of these organs being increased by the development of successive cycles arranged in concentric and alternating circles. The primitive cycle consists of *six* tentacles, the second cycle also of *six*, the third cycle of *twelve*, the fourth cycle of *twenty-four*, the fifth of *forty-eight*, and so on, the number of each cycle being invariably double that of the preceding cycle, except in the case of the second cycle. Though it has been generally accepted that the number of the tentacles is primitively six in the *Zoantharia* (hence often called *Hexactiniæ*), and that their increase is as above stated, grave doubts have of late arisen as to the correctness of this view. According to Lacaze-Duthiers, the primitive tentacles are first two in number, then four, then six, then eight, and finally twelve (in the *Actiniæ*). According, also, to competent observers (Gosse, Fischer, and others) the adult Sea-Anemones by no means invariably possess tentacles which are a multiple of six, or even of five. On the contrary, various species have tentacles which are a multiple of eight, whilst in others the numerical arrangement of the tentacles seems to belong to an indeterminate type. Though showing a marked radiate arrangement, it will be subsequently shown, in speaking of the mesenteries, that even the tentacles occasionally show distinct traces of bilateral symmetry.

Internal to the circle of tentacles, the upper surface of the disc exhibits a more or less conspicuous flattened area ("peristomial space"), which is destitute of appendages, but is marked with converging lines ("radii"), which start from the bases of the tentacles and meet round the mouth, and which represent the upper attached edges of the mesenteries. In the centre of the peristomial space, often at the summit of a kind of proboscis, is placed the opening of the oval or fissure-like *mouth*. The angles of the mouth are furnished with grooves ("gonidial grooves"), which serve as channels for the conveyance of the ova to the exterior. The mouth opens by the intervention of a short corrugated and folded *gullet* into a membranous *stomach*, with thin muscular walls, usually descending about one-third of the distance towards the base. The stomach, when distended, is of a globular form, and it opens inferiorly directly into the general cavity of the body, by a wide patulous opening. When not in use, the walls of the stomach are in contact; its sides exhibit the downward continuation of the oral gonidial grooves. In some forms, a layer of coloured fat-cells is developed in the walls of the stomach towards its upper portion, and this is conjectured by Mr Gosse to represent the *liver*. No other distinct alimentary organs exist, and indigestible matters are got rid of through the mouth.

The *general cavity of the body* ("somatic cavity") freely communicates with the external medium through the stomachic sac and mouth, and is bounded externally by the integuments, and lined by the endoderm. The space thus formed is subdivided into a series of chambers or compartments by a number of radiating vertical membranous laminæ, to which the name of "mesenteries" is given. The mesenteries are essentially double, each being composed of an inward reduplication of the muscular mesoderm, covered by the endoderm, and they vary greatly in width. The first-formed and widest mesenteries ("primary mesenteries") are attached by the whole of their *outer* edges to the column-wall, by their *upper* edges to the disc from its margin to the mouth, and by their *lower* edges to the base from the circumference to the centre. The *inner* edges of the primary mesenteries are attached to the sides of the stomach, from the mouth almost to its inferior opening; but below this point they present a free, curved margin, which looks inwards towards the centre of the visceral chamber, being ultimately continued to the centre of the base. Between the primary mesenteries are developed other shorter laminæ, which agree with the preceding in being attached externally along their whole length to the column-wall, but which do not extend sufficiently far inwards to reach the walls of the stomach. According to their width these are known as "secondary" and "tertiary" mesenteries. The primitive number of the primary mesenteries is normally *six*, and the development of the remaining mesenteries is effected by the same law as governs the development of the tentacles. Thus the second cycle of mesenteries agrees with the first in being *six* in number, the third cycle is *twelve*, the fourth *twenty-four*, the fifth *forty-eight*, and so on. In some Sea-Anemones only twelve mesenteries are developed (*Peachia*), but ordinarily the number of these organs present in the adult is much greater As already indicated with regard to the tentacles, it cannot be regarded as certain that the hexameral arrangement of the mesenteries, which is so conspicuous a feature in many of the *Zoantharia*, is by any means universal in the order, or even in the *Zoantharia malacodermata* in particular. Many of the adult forms, at any rate, appear to invariably possess mesenteries which are not a multiple of six in number. According to the researches of Rötteken and Schneider, the mesenteries are invariably of three orders in the *Actiniæ*, each individual mesentery being double, and the smallest number of each order that was observed being six of the first cycle, six of the second, and twelve of the third order

It is chiefly to the star-like disposition of the mesenteries and tentacles that the Sea-Anemones owe their conspicuous radial symmetry; but indications are not wanting of true bilaterality Thus a single tentacle may be of a different colour from, or a larger size than the others; the two radii of the disc which correspond with the gonidial grooves and run to the angles of the mouth are often more conspicuous than the other radii; the mouth itself runs fore-and-aft, and divides the body into a right and left half; there may be only a single mouth-angle and gonidial groove (*Actinoloba*); and lastly, two of the mesenteries, corresponding with the opposite mouth angles, are commonly developed before the rest Even more conspicuous traces of bilateral symmetry which will be subsequently alluded to, are recognizable in many corals.

The entire body-cavity, with the intermesenteric chambers and tentacular diverticula, is filled with a transparent fluid ("chylaqueous fluid"), which is to be regarded as the representative of the *blood*. It consists of sea-water mixed with the products of digestion, containing albumen in solution along with numerous floating corpuscles, representing the "blood-corpuscles" of the higher animals. There are no proper *circulating organs*, but a free circulation of the chylaqueous fluid through all parts of the body is effected by means of the richly ciliated endoderm which lines all parts of the somatic cavity.

No distinct *respiratory organs* are present, as a rule, the function of respiration being discharged by the ciliated endoderm, as well as by the currents in the external water maintained by the cilia covering the tentacles. In some species, however, which live half-buried in the sand, there are found lobed and frilled organs attached to or beside the tentacles, and these have been conjectured to be branchial (Verrill). In the *Zoanthidæ*, also, there are found curious paired organs covered with cilia, and attached to the primary mesenteries a little below the stomach; and these may probably be regarded as gills (Dana)

The free edges of the mesenteries below the stomach are thickened, and constitute a puckered and convoluted marginal cord ("craspedum"), which is richly furnished with thread-cells. Also attached to the free edges of the mesenteries are sometimes found the organs known as "acontia." These are long, thread-like filaments, which are only attached by one end to the mesentery, and are crowded with thread-cells. The acontia seem to be undoubtedly organs of offence and defence, as they can, on irritation, be rapidly shot forth from the mouth, as well as from certain minute orifices in the body-wall (cinclides) which appear to be specially intended for their emission.

Specialized *organs of the senses* are either wanting in the Sea-Anemones, or only present in a rudimentary condition. Tactile sensibility, though well developed, is generally diffused over the surface, residing more particularly in the tentacles. Organs of hearing are wholly unknown. As regards the sense of sight, many species possess round the margins of the disc a series of brightly-coloured bead-like bodies ("marginal spherules," "bourses marginales," or "chromatophores"), which are said to be furnished with nervous filaments, and which may with great probability be regarded as imperfect organs of vision. The condition of the *nervous system* is still a matter of great obscurity, and its very existence has generally been considered as doubtful. According, however, to recent researches (Duncan), it would appear that a plexiform arrangement of nerve fibres can be detected in the base of *Actinia*, a similar nervous apparatus probably existing in the disc as well.

The *reproductive organs* are in the form of thickened bands, of an orange or pink colour, enclosed in the mesenteries near their free edges, and the ovaries and testes are similar to one another in form and structure, differing only in their contents. As a rule, the sexes appear to be distinct, but in some forms they are united in the same individual. The reproductive elements escape into the body-cavity by dehiscence of the reproductive glands, but the precise manner in which the ova of the diœcious species are fertilized has not been determined. In addition to true sexual reproduction, increase is sometimes effected, non-sexually, by gemmation or fission. Gemmation is rare amongst the Sea-Anemones, the new polypes being budded forth from the sides of the parents close to the base, and being finally detached as independent animals. Fission is not by any means so rare, and may either take place by a longitudinal cleavage of the original polype into two wholly or partially independent individuals (*Antheus* and *Actinia*), or by the separation of portions of the margins of the base of the parent, and by the development of these into new polypes (*Actinoloba*, *Sagartia*).

As regards their *development*, the fecundated ovum becomes converted into an ovate, ciliated, actively locomotive embryo ("planula"), with a double wall enclosing a central cavity. A depression next appears at one extremity, indicating the future mouth, and the embryo passes into the "gastrula" stage, by the opening up of a communication between its central cavity and the exterior medium, or by invagination on itself, it being still uncertain which of these modes is employed. The gastrula now fixes itself by one extremity to some foreign body, and the primitive mesenteries and tentacles are developed. These are originally six in number; but according to Lacaze-Duthiers, the first and second cycles (twelve in all) are developed by passing successively through the numbers two, four, six, and eight. The remaining cycles of tentacles and mesenteries are rapidly added, until the animal attains the full number of these organs proper to the adult.

As to the *geographical distribution* of the *Zoantharia malacodermata* little need be said, as the members of this group, taken as a whole, are cosmopolitan in their range. They are, however, pre-eminently characteristic of the littoral and laminarian zones, only very few forms, and these not typical Sea-Anemones, extending to depths of over 500 fathoms (*Palythoa*), and one genus (*Arachnactis*) being pelagic. As to their *distribution in time*, nothing at all can be said, as, from the soft nature of their bodies, they have left no traces of their past existence.

The *Zoantharia malacodermata* may be divided into the following three families:—

Fam. I. ACTINIDÆ.—Polypes essentially simple, the base forming a flattened sucker by means of which the animal adheres at pleasure to foreign bodies. No corallum. (*Actinia*, *Sagartia*, *Bunodes*, *Tealia*, *Bolocera*, *Antheus*, *Phymactis*, *Adamsia*, *Cancrisocia*, *Corynactis*, &c.)

Fam. II. ILYANTHIDÆ.—Polypes simple, destitute of an adherent base, free and pelagic, or living buried to the lips in mud or sand. No corallum, but occasionally a membranous epidermic tube of investment. (*Ilyanthus, Peachia, Edwardsia, Cerianthus, Halcampa.*)

Fam. III. ZOANTHIDÆ.—Polypes adherent, united by a creeping or crust-like cœnosarc, rarely solitary, and never capable of locomotion. No true corallum, but generally a pseudo-skeleton formed by adventitious particles of sand or stone imbedded in the ectoderm. (*Zoanthus, Epizoanthus, Palythoa.*)

Zoantharia sclerobasica.—The "Black Corals," or *Antipathidæ*, which comprise this group, are always composite, consisting of a number of polypes united together by a thin fleshy cœnosarc, which is spread over and supported by a simple or commonly branched horny axis, or "sclerobase." The tissues are not furnished with calcareous secretions, and the polypes have in general six simple tentacles.

The *Antipathidæ* form colonies which are attached by the base to some foreign object, and are generally more or less branched and plant-like. The colony consists of a thin fleshy crust or cœnosarc, in which the minute polypes are imbedded at intervals. The polypes are furnished with six simple conical tentacles each, though in the genus *Gerardia* as many as twenty-four of these organs may be present. The soft tissues appear to be wholly destitute of calcareous secretions of any kind, such as are found in the *Gorgonidæ*. The entire cœnosarc, with its imbedded polypes, is supported by a horny *corallum*, which is generally black in colour, and forms an axis or stem covered by the soft parts. The corallum is secreted by the cœnosarc, and is wholly external to the polypes, for which reason it constitutes what is technically called a "sclerobasis" or "sclerobasic corallum" ("foot-secretion" of Mr Dana), in contradistinction to the true tissue secretions of so many other *Actinozoa*. In some instances (*Cirrhipathes*) the sclerobasis is simple and unbranched, and may attain a length of several feet; but it is more commonly branched in a more or less plant-like and complicated manner (*Antipathes, Arachnopathes, Rhipidopathes*). The surface of the corallum may be smooth (*Leiopathes*); but it is more commonly covered with minute spines (*Antipathes*), being thus readily distinguished from the grooved or striated sclerobasis of the *Gorgonidæ*. In composition the corallum is horny.

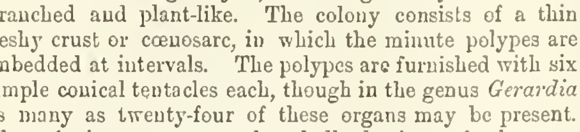

FIG. 3.—Portion of the colony of *Antipathes anguina*, Edw. and H., in its living condition, enlarged. (After Dana.)

The *Antipathidæ* constitute the only known family of the *Zoantharia sclerobasica*, as most naturalists are now agreed that the "Glass-rope Zoophytes" (*Hyalonemadæ*), with their twisted siliceous axis, are truly referable to the sponges. As regards their *distribution in space*, the *Antipathidæ* are principally inhabitants of warm seas, and are, therefore, most abundant in the neighbourhood of the equator. Several species are known from the Mediterranean; they have been found at various points in the North Atlantic; and they have even been recorded from the coasts of Greenland. They occur in depths of from 10 feet up to several hundred fathoms. As regards their *distribution in time*, the *Antipathidæ* are not known to have come into existence during the Palæozoic or Mesozoic period. They appear for the first time in the Miocene Tertiary, where they are represented by a single species (*Leiopathes vetusta*).

Zoantharia sclerodermata (*Madreporaria*).—This group includes the majority of the coralligenous zoophytes of recent seas. They may be simple, consisting of a single polype only, or composite, consisting of many polypes united by a fleshy cœnosarc. They always possess a corallum, which is partially or wholly developed within the tissues of the polypes themselves ("sclerodermic"), which does not consist simply of scattered spicules, and in which the parts are so very generally disposed in multiples of six as to justify the name of *Hexacoralla* applied to the group.

The anatomy of the soft parts of the simple *Zoantharia sclerodermata* may be considered as practically identical with that of the Sea-Anemones; and the compound forms may be regarded as being essentially composed of a number of actinoid polypes united by a common flesh or cœnosarc. It will, therefore, be unnecessary to treat here of more than the leading peculiarities of the hard parts, or "corallum," from which these organisms derive their common name of "corals."

An ordinary simple coral of this group may, then, be regarded as being essentially a Sea-Anemone, in which a more or less complicated skeleton has been developed. As in the Sea-Anemones, the animal possesses a column, a base, and a disc, the margin of the disc supporting the tentacles, and its centre being perforated by the aperture of the mouth. The mouth, often more or less proboscidiform, opens into a stomachal sac, the walls of which are connected with the parietes of the body by vertical folds of the mesoderm and endoderm ("mesenteries"), and which communicates freely below with the general cavity of the body. Within the mesenteries are contained the reproductive organs; and the disc, with its tentacles and dependent gastric sac, is permanently soft and capable of retraction and expansion. Below the stomach the soft tissues of the animal are strengthened and supported by a more or less perfect calcareous skeleton or corallum. This is composed of calcareous matter ("sclerenchyma") deposited by and in the tissues themselves, and the corallum is therefore *within* the polype, and is said to be "sclerodermic." It is thus a true "tissue-secretion," and differs very conspicuously from the "sclerobasis" of other *Actinozoa* ("foot-secretion" of Dana), which is secreted by the cœnosarc, and is not formed by a calcification of the soft parts of the polypes themselves. A typical simple corallum may be regarded as a cone, sometimes extremely depressed, sometimes so elongated as to be almost a cylinder, with an outer wall and an internal included space. The wall of the cone is known as the "theca," and it may be very imperfect, or it may be covered externally more or less completely with a secondary calcareous investment (the "epitheca"). The theca encloses a space which is known as the "visceral chamber," is variously subdivided inferiorly, and superiorly presents itself as a shallower or deeper cup-shaped depression (the "calice"). The centre of the calice is hollowed out for the reception and protection of the stomach-sac of the polype, but the theca generally rises round its margins nearly to the level of the disc. Below the calice the visceral chamber is divided into a series of vertical compartments (the "interseptal loculi") by a series of upright partitions or "septa," which spring from the inner surface of the theca and are directed inwards towards the centre. The septa are of different breadths. Some of them are much wider than the others, and often extend far enough inwards to meet in the centre of the visceral chamber. These are the "primary septa;" but there are others which fall short of the centre by a greater or less distance, and these are known as the "secondary" and "tertiary" septa, according to their width. The centre of the visceral chamber may or may not be occupied by a variously-formed structure known as the "columella." In its most typical form the columella is a calcareous rod, which extends from the bottom of the visceral chamber to the floor of the calice, projecting upwards into the latter, and having the primary septa usually closely connected with it. The continuity of the interseptal loculi is often more or less broken up by the development of incomplete more or less horizontal plates, the "dissepiments," which stretch from one septum to another; or the septa may be connected by numerous delicate cross-bars ("synapticulæ").

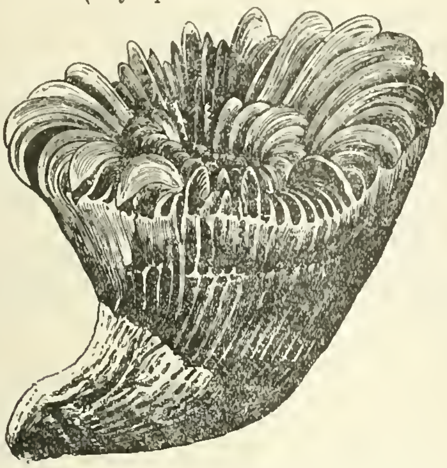

FIG. 4.—*Caryophyllia borealis*, Fleming, a simple sclerodermatous coral, twice the natural size. (After Sir Wyville Thomson.)

The above expresses the general features of the structure of a *simple* sclerodermic corallum, and it is easy to see that this structure owes its peculiarities to the fact that it has been produced by the calcification of the lower portion of a polype similar in its anatomy to an ordinary Sea-Anemone. Thus, the "theca" of the corallum corresponds to the column-wall of the polype, in the interior of which it is secreted. The "septa," again, are developed within the mesenteries of the living animal, with which they correspond, and, like the mesenteries, they are "primary," "secondary," or "tertiary," according as they reach the centre or fall short of it by a greater or less distance. It is to be recollected, however, that it is only the inferior portion of the polype which is thus hardened with carbonate of lime. The tentacular disc and mouth are placed at a level higher than the upper margin of the theca, and the digestive sac occupies the calice; whilst the whole of the space comprised within the theca is lined by the endoderm, and its outer surface is covered by the ectoderm.

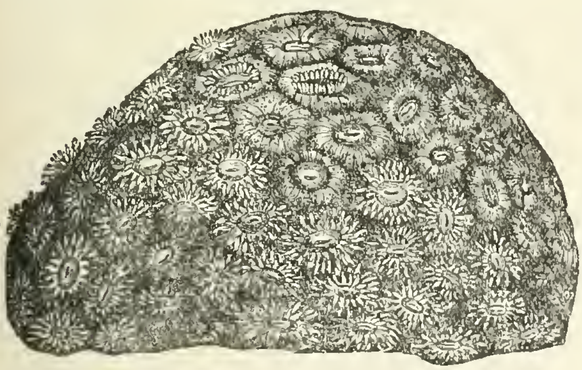

FIG. 5.—*Astræa pallida*, Dana, a compound sclerodermatous coral, in its living condition. (After Dana.)

Whilst the simple corallum is the skeleton of a single polype, the *compound* sclerodermic corallum is the aggregate skeleton composed by a colony of such polypes, and it varies in form according to the form and nature of the colony by which it is produced. Such a colony consists in general of a number of polypes united together by a common flesh or "cœnosarc," and corresponding elements are found in the corallum. Thus a compound coral consists generally of certain portions which are secreted by the individual polypes of the colony, and are known as the "corallites," and of a common calcareous basis or tissue, which unites the various corallites into a whole, is secreted by the cœnosarc, and is known as the "cœnenchyma." The latter element of a compound corallum is, however, by no means always present, the entire structure often consisting simply of the skeletons of the individual polypes ("corallites") united with one another directly and in different ways.

The compound coralla are, of course, primitively simple, and they become composite either by budding or by cleavage of the original polype. The principal methods in which this increase is effected in the *Zoantharia sclerodermata* are the following:—

1. *Lateral Gemmation.*—In this method of increase the original polype throws out buds from some point on its sides between the base and the circle of tentacles. The bud is at first simply a protuberance of the ectoderm and endoderm of the parent, containing in its interior a diverticulum of the somatic cavity; but a mouth and tentacles are developed at its distal extremity, mesenteries and septa appear in its interior, and it gradually assumes all the characters of the polype from which it was budded forth. Lateral or parietal gemmation generally gives rise to dendroid or arborescent coralla, as in the genera *Madrepora*, *Dendrophyllia*, *Cladocora*, *Oculina*, *Lophohelia*, &c., but the precise form of the resulting colony depends on the way in which the buds are given off, regularly or irregularly, singly or in numbers together, alternately or at opposite points, and also on the continuance or arrest of the growth of the parent. In other cases, where the parietal buds are given off from the edge of the calice ("marginal gemmation"), the resulting corallum may become massive by the soldering together of the separate corallites, as occurs in the genus *Astrocœnia*, where the parent corallite continues to grow side by side with its buds.

2. *Basal Gemmation.*—In this mode of growth the original polype gives forth from its base a rudimentary cœnosarc from which new buds are thrown up. Sometimes the cœnosarc has the form of rootlike prolongations from which the buds are developed at intervals. More commonly, the cœnosarc forms a more or less extensive horizontal expansion. The resulting form of corallum varies, being sometimes fasciculate, but more commonly massive or encrusting; and in all cases the youngest corallites are those which occupy the circumference of the mass. Good examples of the process of basilar gemmation are to be found in *Rhizangia*, *Astrangia*, &c.

3. *Calicular Gemmation.*—This consists in the production of buds from the calicine disc of the parent polype, which may or may not continue to grow thereafter. This mode of increase, though known to occur in forms like *Isastræa*, and some of the *Montlivaltiæ* and *Thecosmiliæ*, is very rare amongst the *Zoantharia sclerodermata*, and it may be doubted whether in certain cases it should not rather be regarded as a species of fission. Calicular gemmation, however, is seen in characteristic form amongst many Rugose corals, in treating of which it will be noticed at length.

4. *Fission.*—This consists in a process of spontaneous division or cleavage of the original polype into two individuals. This is usually effected by means of "oral cleavage," the calicine disc of the parent polype becoming divided into two portions by a groove, which gradually deepens till the original mass is converted into two halves. The proximal extremity of the parent always remains undivided, and, according to Dana, the primitive mouth and stomach are appropriated by one of the halves produced by the fission, whilst a new mouth and stomach are developed in the other half. The form of corallum produced by fission varies in different cases. Sometimes the corallum becomes "cæspitose" or tufted, consisting of a number of short diverging pairs of branches, each pair produced by the cleavage of a single corallite (*e.g.*, *Caulastræa*). In other cases the corallum becomes "massive," the corallites produced by fission remaining permanently connected with one another. In other cases, again, the secondary corallites do not become perfectly separated from one another, their calices remaining more or less completely continuous, —often so much so as to give rise to one long calicine groove, with a long line of septa on each side, or to an aggregation of such grooves. By this "serial" growth the corallum becomes "gyrate" or "meandrine;" and excellent examples may be found in the genera *Mæandrina*, *Diploria*, *Latimæandra*, *Rhipidogyra*, *Phytogyra*, &c.

Finally, it should be noticed that, though the above mentioned modes of growth may be conveniently distinguished from one another, they are nevertheless not unfrequently combined in the same individual. Thus, lateral may be combined with basal gemmation, and gemmation is commonly found accompanying fission.

It is next necessary to consider the different structures which compose the sclerodermic corallum in greater detail.

The general *form* of the corallum varies so much, that it is scarcely possible to make any statements on this subject except of an entirely general nature. The simplest corallum is most commonly cylindrical, conical, or turbinate (*Caryophyllia, Turbinolia, Balanophyllia,* &c.), but it may be more or less compressed (*Flabellum*), discoidal (some species of *Fungia*), or concavo-convex. It may be rooted by its base to some foreign object, or it may be wholly free. The compound coralla are of the most varied shape. Commonly they are arborescent or dendroid (*Madrepora, Dendrophyllia, Lophohelia,* &c.); at other times they grow in clusters of branches springing from a common base (*Mussa, Caulastræa,* and many species of *Porites, Madrepora,* &c.), the colony being "cæspitose," and convex on its distal aspect; others are "fasciculate," or composed of numerous cylindrical corallites placed parallel with one another, or slightly diverging from the base (*e.g., Calamophyllia*); others are massive and "astræiform," composed of polygonal corallites united with one another, and forming rounded, globular, hemispherical, or irregular masses (as in the typical *Astræidæ*); others are "foliaceous" (species of *Madrepora, Pocillopora, Manopora,* &c.); others, finally, are "encrusting," (*e.g.,* some of the species of *Manopora, Agaricia,* &c.)

The "*wall*" ("muraille," "eigentliche Wand") is the proper outer investment of the visceral chamber, whether we consider a simple corallum or take a single corallite in a compound corallum. The hard structures which are placed on the inside of the wall are the "endotheca," whilst those which are developed exteriorly to the wall constitute what is collectively known as the "exotheca." The condition of the wall varies greatly in different groups of the *Zoantharia,* being thick, compact, and impervious in some (*Aporosa*), and at other times more or less incomplete and pierced by larger or smaller apertures (*Perforata*). The surface of the wall may be smooth, or it may be marked with vertical ridges (costæ), or by transverse striæ or annulations of growth. Though often very distinctly recognizable, the wall may become so united with the cœnenchyma as to be no longer determinable, or its place may be more or less completely taken by the epitheca.

The "*epitheca*" is a secondary calcareous investment, which is very commonly developed in both simple and compound coralla, and is probably an integumentary secretion. In the simple coralla it is placed outside the proper wall, to which it may be closely applied, or from which it may be separated by the costæ. It may be extremely thin, or very dense; and in the latter case its development is generally at the expense of the wall, which becomes so thin as to be often irrecognizable. It varies also in its extent, sometimes covering only the basal region of the coral, and at other times extending to the margin of the calice. It is generally marked with concentric striæ and vertical ridges, often with accretions of growth, and it may give off spines or root-like processes of attachment. In the compound corals it is not unusual to find a well-developed epitheca enclosing the entire corallum below and on the sides, whilst each individual corallite is furnished with its own wall.

The external surface of the corallum often exhibits more or less prominent vertical ridges, which are known as the "costæ." The costæ in a general way correspond with the septa in number and arrangement, and they usually appear, therefore, as so many prolongations of the septa outside the wall. It does not appear, however, that this is due to the septa being really continued through the wall so as to form the costæ, but these structures would really seem to have an entirely independent origin. The projection of the costæ from the wall is generally proportionate to the development of the septa to which they correspond, and there are great differences in different cases as to their size and distance apart. They may be ornamented with spines or tubercles, and they may be united by transverse plates ("exothecal dissepiments"), which run horizontally across the intercostal spaces. Sometimes the costæ, instead of corresponding with the septa, are placed opposite the interseptal loculi, and are thus seen to be really independent of the septa. In compound coralla the costæ are often wanting when the corallites are amalgamated by their walls. In other cases the costæ are greatly developed, and serve by their coalescence to unite the various corallites into a single colony.

The "*calice*" is the generally cup-shaped depression which is seen at the upper end of a corallum or of a single corallite of a compound mass, and which lodges the gastric sac of the animal in its living condition.

The "margin" of the calice is formed by the wall, and its "floor" is occupied by the septa, the interseptal loculi, and the central structures of the corallum. Though in general more or less cup-shaped and depressed, the calice may be prominent, and the septa may be produced beyond it ("exsert"). The outline of the calice is very different in different cases, though typically more or less circular; its depth is also extraordinarily variable; and its plane varies much in the angle which it forms with the axis of the corallum. The "*septa*" ("cloisons," "Längsscheidewände"), as previously noticed, are the vertical plates which radiate from the wall towards the centre and divide the visceral chamber into a series of vertical chambers or compartments ("interseptal loculi"). The septa correspond with the mesenteries of the living animal, within which they are developed, and the tentacles correspond each with an interseptal space. In their most rudimentary condition the septa appear simply as rows of spines or tubercles, but they in general present themselves as calcareous laminæ, which can usually be shown to consist each of two closely apposed plates (in *Dasmia* of three), though often so thin and delicate as to appear single. When fully developed, a septum may be regarded as a somewhat triangular lamina, the base of which projects freely into the calice, whilst its outer margin is attached to the internal surface of the wall, and its inner margin is directed towards the centre of the visceral chamber, extending from the bottom of the coral to the floor of the calice, and being either free or united with certain other structures to be spoken of hereafter. The free edges of the septa are usually thin, and they may be plain or ornamented with spines, serrations, or granules. The parietal or attached edges of the septa are usually the thickest, but occasionally the septum widens out in the middle or centrally. The *sides* of the septa, looking into the interseptal loculi, may be smooth or may be ornamented with ridges, striæ, papillæ, or granules. The septa may be compact and imperforate, or they may be more or less porous and cribriform. Usually the various septa are quite independent of each other, but occasionally some of the smallest and latest formed septa may become inclined towards, and coalescent with, the larger and older septa.

The number of septa varies, but in none of the *Zoantharia sclerodermata,* in which septa are developed at all, are there found less than six septa in the adult corallum. Sometimes this number is permanently retained; sometimes twelve septa are present; most commonly the septa of the adult are over twelve in number. When there are more than six septa then their breadth varies, according as the mesenteries vary, and they thus become "primary," "secondary," and "tertiary." The chief facts which it is important to know about the development and arrangement of the septa are the following, taking the generally received views on this subject. At first six septa make their appearance simultaneously. These are the *primary septa*, and they may not be further added to. In other cases

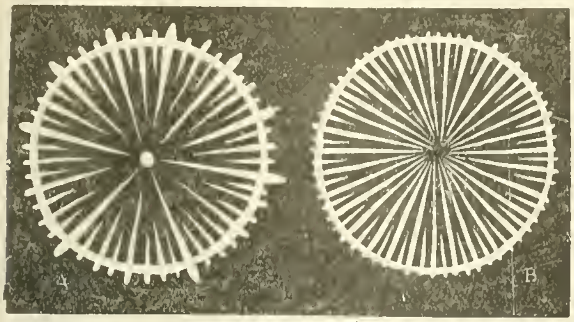

FIG. 6.—Diagram of the arrangement of the septa in the *Zoantharia sclerodermata* and *Rugosa*.

A, Transverse section of a simple sclerodermatous corallum (*Turbinolia*), showing the septa, costæ, and columella. B, Transverse section of a simple Rugose coral (*Cyathophyllum*), showing the septa, wall, and costæ.

six additional and smaller *secondary septa* are next produced, one bisecting each of the six interseptal loculi between the primary septa; and this condition may also be permanently retained (*Alveopora*). In other cases twelve additional septa are produced in the now existing twelve interseptal loculi, one to each loculus, and these are the *tertiary septa*. In a corallum in which this last state of things was permanent, we should, therefore, find twenty-four septa in all, belonging to three *orders* or *cycles*, six septa of the *first order*, six of the *second order*, and twelve of the *third order*. Such a corallum has obviously twenty-four interseptal loculi, and we should imagine that the next order of septa (if developed at all) ought to consist of twenty-four septa bisecting these loculi. This is not the case, however, and any further orders of septa that may be produced are always twelve in number. If, therefore, a *fourth order* of septa be developed, it consists of twelve shorter septa intercalated in alternate interseptal loculi; whilst the loculi still vacant are filled by the development of twelve additional septa of the *fifth order*; the twenty-four septa thus produced collectively constituting the *fourth cycle*. The septa between each pair of primary septa constitute a *system*; and in the instance just taken there are forty-eight septa in all, arranged in five *orders* according to the time of their development, but only constituting four *cycles* of equally sized septa, and forming six *systems* of eight septa each. Each system contains the following orders:—

$$\underbrace{\text{1st, 4th, 3d, 5th, 2d, 5th, 3d, 4th,}}_{8}\text{—1st, \&c.}$$

If a fifth cycle of septa be formed, then there are 96 septa, in six systems of sixteen septa each. Six cycles give 192 septa, and seven cycles produce 384; but it is far from common for these higher cycles to be completely developed.

The rule amongst the *Zoantharia sclerodermata* is that the septa are arranged in six systems, and are therefore, however numerous, some multiple of six; but this rule is not of universal application, and the typical hexameral arrangement may be departed from altogether. Thus, certain forms have the primary septa four, five, eight, or ten in number, and, therefore, have the septa of the adult arranged in a corresponding number of systems. It should be added that the researches of Lacaze-Duthiers have given rise to some doubt as to the above being truly the method in which the septa are successively developed. According to this observer the septa are developed before the wall (contrary to the received opinion), and are primitively twelve in number; but it seems clear that though this may be the case in the species examined by the French naturalist, it cannot be true of all the *Zoantharia sclerodermata*.

Between the internal edges of the septa and the axis of the visceral chamber there may exist a series of laminar processes to which the name of "*pali*" is given. The pali vary in number and size, and they may be developed internal to several orders of the septa, forming so many "crowns." They are united by their outer edges with the inner edges of the septa, whilst their internal edges are free, or are united with the columella (if present).

The axis of the visceral chamber may be vacant and unoccupied; but it is very commonly filled by the structure known as the "*columella*." The true or "essential" columella is an axial rod of a lamellar, compact, or fasciculate structure, extending from the bottom of the visceral chamber to the floor of the calice, into which it projects, and formed independently of the septa. The septa may or may not be, some of them, attached by their inner ends to the columella, or there may be pali attached to it. A "parietal" or "septal" columella may be formed by the coalescence in different ways of the inner edges of the septa, which divide and inosculate so as to form a spongy or cellular central structure. In other cases a "pseudo-columella" may be produced by the twisting together of the inner ends of a certain number of the septa.

The continuity of the interseptal loculi is liable to be more or less interfered with by the development of the endothecal structures known as the dissepiments, synapticulæ, and tabulæ. The "*dissepiments*" ("traverses") are incomplete, approximately horizontal plates, which stretch between adjacent septa, and break up the interseptal loculi into secondary compartments or cells. They may be absent, or rudimentary, or they may be so greatly developed as to render a greater or less portion of the corallum completely "vesicular," in the vicinity of the wall more especially.

The "*tabulæ*" ("planchers," "Boden") may be regarded as highly developed dissepiments, and like them are approximately horizontal, as a rule at any rate. They differ from the dissepiments in cutting across the interseptal loculi at the same level. When completely developed they extend right across the visceral chamber, and divide it into a series of stories placed one above the other, the only living portion of the corallum being that above the last formed tabula. They may, however, be present only in the central portion of the corallum, or they may spring from the wall, but not extend across the visceral chamber. Tabulæ may exist in conjunction with well-developed septa (*Alveopora*), or the septa may be rudimentary or absent (*Halysites, Favosites*).

The "*synapticulæ*" are transverse calcareous bars which stretch across the interseptal loculi, like a kind of trellis-work. They are formed by papillæ developed on the opposite faces of adjacent septa, coalescing with one another in the middle of the interseptal loculi. In other cases they may be so greatly developed as to constitute elongated ridges between the septa. They are characteristic of the *Fungidæ*.

In compound coralla the various corallites of the colony are often united together by a common calcareous tissue, which is known as the "*cœnenchyma*," and which varies very much in texture, being sometimes loose and spongy (*e.g.*, *Madreporidæ*), at other times dense and compact (*e.g.*, *Oculinidæ*). In other cases the cœnenchyma is absent or rudimentary (*Astræidæ, Turbinolidæ*), and the corallites are then united together in different ways. In some of the arborescent and fasciculate coralla the corallites are only united with one another at the points where they are budded out; but in other cases (*Syringopora*, for example) they may be united by horizontal outgrowths.

Sometimes the corallites are simply in contact with one another, or their walls may be fused together, in which case there is a great tendency for the calices to become polygonal by mutual pressure. In other cases, again, the corallites are united together by the great development and coalescence of the costæ.

The *Zoantharia sclerodermata* were divided by Milne-Edwards and Jules Haime into the four great sections of the *Aporosa*, *Perforata*, *Tabulata*, and *Tubulosa*. The first two of these groups constitute large, important, and natural divisions, whilst the two latter are of doubtful affinities and uncertain value.

(1.) The APOROSA are characterized by the fact that the calcareous tissue of the corallum is more or less compact and imperforate; the septa are well developed, and usually constitute complete lamellæ; while the walls are generally quite complete, and, as a rule, are not pierced by any apertures. Dissepiments or synapticulæ are usually present, but tabulæ are rarely developed. This section includes the most highly developed of existing corals, and it is subdivided by Milne-Edwards and Haime into six families:—

a. Turbinolidæ.—Corallum simple or compound, but never possessing a cœnenchyma; septa well developed, usually regularly granulated on the two sides, but their free edges not denticulated; interseptal loculi open and free from dissepiments or synapticulæ; costæ well marked and straight; wall imperforate. The principal genera of this family are *Bathycyathus, Brachycyathus, Trochocyathus, Leptocyathus, Thecocyathus, Discocyathus, Cyclocyathus, Paracyathus, Deltocyathus, Placocyathus, Turbinolia, Sphenotrochus, Platytrochus, Ceratotrochus, Discotrochus, Placotrochus, Blastotrochus, Rhizotrochus, Onchotrochus, Desmophyllum*, and *Flabellum*.

b. Pseudoturbinolidæ.—Corallum simple, resembling that of the preceding in most respects, but having the septa composed of three laminæ each, which are free internally, but are united externally by a single costa. The only genus of this group is the extinct *Dasmia*.

c. Oculinidæ.—Corallum compound; cœnenchyma abundant, compact, its surface smooth or striated, but not echinulate; walls imperforate, the lower part of the corallites becoming filled up in advancing age; dissepiments scanty; no synapticulæ; occasionally tabulæ. The principal genera of this family are *Oculina, Cyathohelia, Astrohelia, Synhelia, Lophohelia, Amphihelia, Diplohelia, Axohelia, Cryptohelia, Endohelia, Stylaster, Stylophora, Dendracis, Orbicella, Pocillopora*, and *Seriatopora* (?)

d. Astræidæ.—Corallum simple or compound, usually increasing by fission; walls perfect and imperforate; cœnenchyma absent, or if present lax; interseptal dissepiments abundantly developed; no synapticulæ nor tabulæ. The principal genera of this family are *Placosmilia, Trochosmilia, Parasmilia, Eusmilia, Thecosmilia, Barysmilia, Diploctenium, Montlivaltia, Dendrogyra, Rhipidogyra, Pachygyra, Stylina, Astrocœnia, Stephanocœnia, Phyllocœnia, Dichocœnia, Heterocœnia, Sarcinula, Caryophyllia, Lobophyllia, Rhabdophyllia, Cladophyllia, Symphyllia, Oulophyllia, Calamophyllia, Eunomia, Latimeandra, Meandrina, Diploria, Leptoria, Manicina, Cladocora, Favia, Goniocora, Mussa, Pleurocora, Astræa, Oulastræa, Leptastræa, Solenastræa, Prionastræa, Siderastræa, Septastræa, Isastræa, Synastræa, Thamnastræa, Goniastræa, Astroides, Angia, Cryptangia, Rhizangia, Astrangia, Phyllangia, Oulangia, Echinopora, Battersbyia*, and *Heterophyllia*.

e. Pseudofungidæ.—Corallum compound, the basal plate or wall perforated (as in the *Fungidæ*), but the corallites without synapticulæ and with interseptal dissepiments (as in the *Astræidæ*). The only genus of this family is *Merulina*.

f. Fungidæ.—Corallum simple or compound, usually discoidal or laminar; the calice shallow and open at its sides in the simple forms, confluent and not circumscribed in the compound forms; septa complete, coalescent with the costæ, imperforate, their edges dentate, and their sides echinulate or furnished with synapticulæ; wall basal, generally perforated; no dissepiments, nor tabulæ. The chief genera of this family are *Cyclolites, Fungia, Ctenactis, Micrabacia, Anabacia, Cryptobacia, Cycloseris, Trochoseris, Cyathoseris, Comoseris, Protoseris, Lophoseris, Agaricia, Pachyseris, Leptoseris*, and *Phyllastræa*.

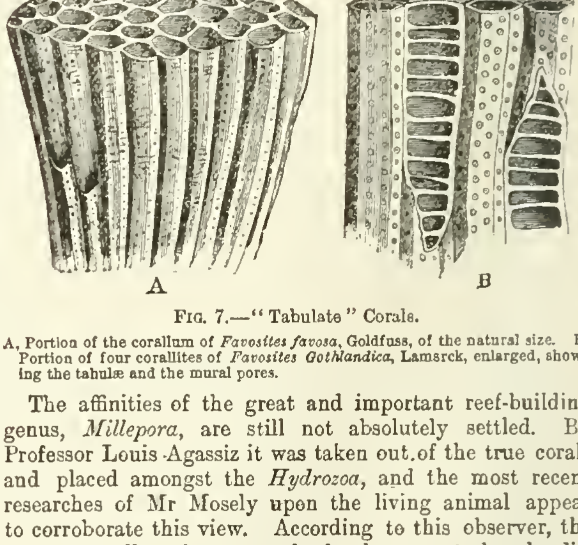
(2.) The PERFORATA are distinguished by the fact that the calcareous tissue of the corallum is more or less porous, loosely aggregated, spongy, or reticulate, the walls in all being perforated with more or fewer apertures. The septa are generally well developed, but may be represented only by trabeculæ. The visceral chamber is usually more or less completely open from top to bottom, but there may be imperfect dissepiments, and in some cases well-developed tabulæ are present. The section *Perforata* comprises the following families:—

a. Eupsammidæ.—Corallum simple or compound; septa well developed, lamellar, for the most part perforated; a spongy columella is present; walls perforated, granular, sub-costulate, often thickened with age. Septa numerous, those of the last cycle bent towards those of the penultimate cycle, so as to produce the appearance of a six or twelve-branched star; interseptal loculi open, or only with a few dissepiments; costæ rudimentary. The chief genera of this family are *Eupsammia Endopachys, Balanophyllia, Heteropsammia, Lobopsammia, Cœnopsammia, Stereopsammia, Stephanophyllia*, and *Dendrophyllia*.

b Madreporidæ.—Corallum compound, increasing by gemmation; cœnenchyma abundant, spongy, and reticulate; walls porous, not distinct from the cœnenchyma; septa often well developed; no synapticulæ, and, generally speaking, no dissepiments, but occasionally tabulæ. (The diagnosis of this family may require amendment for the reception of the *Favositidæ* proper). The chief genera of this family are *Madrepora, Explanaria, Astræopora, Turbinaria, Palæacis, Alveopora, Favositopora*, and *Columnopora* (?)

c. Poritidæ.—Corallum wholly composed of reticulate sclerenchyma; septa well developed, but only composed of styliform processes, which by their junction form a kind of irregular lattice-work. Walls reticulate, not distinct from the sclerenchyma; a few dissepiments, but no tabulæ. The principal genera of this family are *Porites, Litharæa, Coscinaræa, Rhodaræa, Poraræa, Protaræa, Microsolena, Goniopora, Montipora*, and *Psammocora*.

(3.) The TABULATA constitute a group founded by Milne-Edwards and Haime for the reception of a number of corals essentially characterized by the rudimentary condition or absence of septa, conjoined with the presence of well-developed tabulæ dividing the visceral chamber into so many distinct stories. Recent researches, however, by Agassiz, Verrill, Lindström, Duncan, Dollfus, Moseley, and others, have clearly shown that the old order *Tabulata* is a heterogeneous assemblage, comprising forms of very different zoological affinities, and that it must be broken up and redistributed, or greatly restricted. It has been unequivocally shown, in fact, that the presence of tabulæ cannot, of itself, be regarded as a point of high classificatory value; since these structures occur in forms in other respects no way related to each other. Thus, tabulæ occur in *Pocillopora, Cyathophora*, and occasionally in *Lophohelia* amongst the *Aporosa*, in *Alveopora* and *Favositopora* amongst the *Perforata*, in *Heliopora* amongst the *Alcyonaria*, in the great majority of the *Rugosa*, and in certain of the *Polyzoa* (*e.g.*, *Radiopora* and *Heterodictya*). It has also been shown that some of the so-called "tabulate corals" are not *Actinozoa* at all, but that they belong to the Molluscan order of the *Polyzoa*; and good authorities believe that this is the true position of a very large number of the forms previously included under this head. The whole of this subject is at present under investigation, and the ultimate results of the inquiry are uncertain. It will, therefore, be sufficient here to indicate the views which are now generally entertained as to the true affinities of the principal forms included by Milne-Edwards and Haime amongst the *Tabulata*.



A B

FIG. 7.—"Tabulate" Corals.

The affinities of the great and important reef-building genus, *Millepora*, are still not absolutely settled. By Professor Louis Agassiz it was taken out of the true corals and placed amongst the *Hydrozoa*, and the most recent researches of Mr Mosely upon the living animal appear to corroborate this view. According to this observer, the spongy corallum is composed of calcareous trabeculæ disposed in layers concentric with the surface of the mass, and there is the unique feature that these layers are penetrated by a series of ramifying and anastomosing canals, which communicate with the calicular cavities. There are two kinds of calices in the species examined, large and small, the former being surrounded each by a ring of the latter. The polypes, or zoöids, are of two kinds, the larger ones, occupying the large calices, having a mouth and from four to six knobbed tentacles. The smaller zoöids are more slender, have no mouth, and have from five to twenty tentacles. Mr Mosely appears to consider that the structure of *Millepora*, as examined by him, is *Hydrozoan*; but a recent investigation carried out, on the other hand, by Major-General Nelson and Professor Martin Duncan leads these authors to the opinion that *Millepora* is really *Alcyonarian*, and therefore truly referable to the *Actinozoa*.

The genus *Heliopora* has recently been examined by Mosely in its living condition, and it has been shown to be

Alcyonarian and not *Zoantharian*. With *Heliopora* must unquestionably be placed the extinct genera *Heliolites*, *Plasmopora*, *Lyellia*, and *Polytremacis*, all of which have an essentially tubular and tabulate cœnenchyma, the corallites having tabulæ and more or less distinct pseudosepta. These, therefore, must also be removed to the *Alcyonaria*. The genus *Pocillopora*, as shown by Verrill, is a true *Zoantharian*, belonging to the *Aporosa*, and apparently referable to the *Oculinidæ*. *Seriatopora*, though still imperfectly known, may with great probability be placed in the immediate neighbourhood of *Pocillopora*; and *Rhabdopora* and *Trachypora* may be provisionally grouped along with it. The genus *Axopora*, with its great columella, its reticulate sclerenchyma, and its want of septa, is in an extremely uncertain position, but may possibly be *Alcyonarian*.

There remain four groups of the *Tabulata*, which are in themselves well marked, but which are still in a doubtful position. The first of these is the group of the *Favositidæ* (comprising *Favosites*, *Emmonsia*, *Michelinia*, *Koninckia*, *Striatopora*, *Alveolites*, &c), in which the septa are rudimentary or absent, the tabulæ are extremely well developed, and the walls are perforated more or less freely with mural pores. Their septa (when present at all) may be only pseudosepta, like those of the genus *Heliopora*, and these forms may perhaps be *Alcyonaria*. In their perforated walls, however, they closely resemble the recent genera *Alveopora* and *Favositopora*, and their true affinities would thus seem to be rather with the *Madreporidæ* in the *Zoantharia perforata*. This view is further supported by the occurrence of genera like *Columnopora*, in which the perforated walls and tabulate corallites are associated with comparatively well-developed septa. Another group is that of the *Chætetidae* (comprising *Chætetes*, *Monticulipora*, *Dania*, *Constellaria*, &c., and probably *Fistulipora*, *Callopora*, and some allied forms), in which the walls of the corallites are imperforate, the tabulæ are well developed, and there are no traces of septa. This group is in a most uncertain position, it being an open question whether it should be referred to the *Alcyonaria*, the *Polyzoa*, or the *Hydrozoa*, or whether it can be retained in the *Zoantharia*. Though often associated with the *Favositidæ*, it seems certain that there is little true relationship between the two groups; and the most probable view is perhaps the one which refers the *Chætetidae* to the *Alcyonaria*. The genus *Labechia* has not been examined in sufficient detail to render its reference to this group at all certain. A third group is that of the *Theeidæ*, comprising the single genus *Thecia*, in which the corallites have no true wall, but the costæ are greatly developed, and are so filled up as to constitute a dense cœnenchyma. The affinities of this group are quite uncertain, though it may be regarded with some probability as belonging to the *Alcyonaria*. Lastly, there is a fourth group, comprising the genera *Halysites*, *Syringopora*, *Chonostegites*, and *Thecostegites*, with probably *Fletcheria* and *Beaumontia*, in which there are rudimentary septa (typically twelve in number), well developed tabulæ, and imperforate walls. In *Syringopora*, though the walls are compact, the visceral chambers of contiguous corallites are placed in communication by means of tubular connecting processes, and there is thus a decided approach to the structure of the *Favositidæ* on the one hand, whilst, on the other hand, the genus in some respects is nearly allied to *Aulopora*. The other genera of this group have no communication between their corallites. If any forms can be retained to constitute a "tabulate" order of the *Zoantharia*, it would seem to be these; but it is not possible at present to come to any decided conclusion on this point.

(4). The Tubulosa constitute a small group, including principally the genera *Aulopora* and *Pyrgia*, to which perhaps *Cladochonus* and *Stomatopora* should be added. The corallum in this group is simple (*Pyrgia*) or compound (*Aulopora*), the corallites in the latter case being united by a creeping and branched cœnenchyma. The thecæ are trumpet-shaped, tubular or pyriform, without tabulæ, and having the septa indicated by mere striæ on the inner surface of the wall. The affinities of this group are very doubtful, and it seems questionable if it can be retained in the *Zoantharia*. In some respects the forms included under this head show points of relationship with the Cyclostomatous *Polyzoa*, such as *Alecto*; but it seems more probable that they are really *Actinozoa*, and perhaps referable to the *Alcyonaria*.

As regards their *distribution in space*, the *Zoantharia sclerodermata* are, like the other members of the *Actinozoa*, exclusively marine. They are very widely distributed over the globe, occurring in all seas except the coldest, but attaining their maximum development in warm regions. They may conveniently be regarded under two heads—the one comprising the "solitary" corals, whether simple or compound, the other comprising the "reef-building" corals. The former do not constitute the great aggregations of coral which are known as "reefs," and though some of the com-

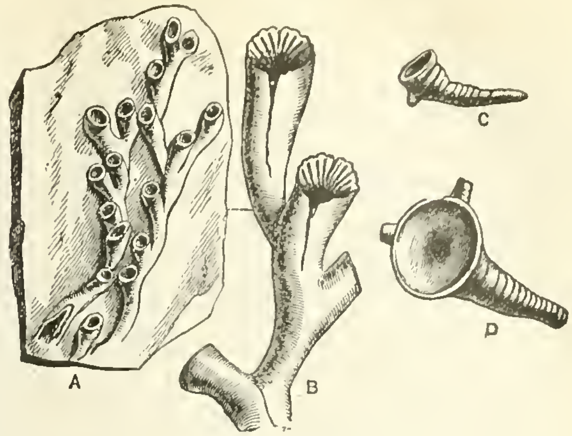

Fig. 8.—Tubulosa.

A, Portion of the corallum of *Aulopora tubæformis*, Goldfuss, of the natural size. B, Two corallites of the same, enlarged, showing the septal striæ. C, *Pyrgia Michelini*, Edw. and H., of the natural size. D, The same, slightly enlarged, showing the interior of the calice.

pound forms may, as individuals, attain a large size, they are destitute of the loose cellular cœnenchyma of so many of the reef-builders, and thus do not tend to increase indefinitely in dimensions. The solitary corals, further, are essentially and principally deep-sea forms, only rarely found in the littoral zone, or at extreme low water, abounding most in depths of from 10 to 200 fathoms, and extending their range even to depths of from 500 to over 1500 fathoms. They may, as already remarked, be either simple or compound, and amongst the more important recent genera which are solely, or chiefly, deep-water forms, may be mentioned *Caryophyllia* (rarely found in the littoral zone), *Balanophyllia*, *Flabellum*, *Sphenotrochus*, *Paracyathus*, *Desmophyllum*, *Lobopsammia*, *Thecopsammia*, *Dendrophyllia*, *Allopora*, *Oculina*, *Lophohelia*, and *Amphihelia*.

Coral Reefs.

The "reef-building" corals are essentially shallow-water forms, flourishing between extreme low-water mark and depths of from 20 to 25 fathoms. By their continued growth and aggregation they give rise to the great banks of coral which are known as "coral-reefs," the compound species often possessing a lax cellular cœnenchyma, enabling them to increase almost indefinitely in size. In other cases they increase rapidly by spontaneous fission. Amongst the more important reef-building corals of the present day may be mentioned the *Astræidæ* generally (*Astræa*, *Meandrina*, *Diploria*, *Astrangia*, *Cladocora*, &c.), the *Madreporidæ* (*Madrepora*, &c.), the *Poritidæ* (*Porites*, *Goniopora*, *Montipora*, &c.), many of the *Oculinidæ* (*Orbicella*, *Stylaster*, *Pocillopora*, &c.), the majority of the *Fungidæ* (two species of *Fungia* inhabit deep water), and the Millepores. Though principally formed by corals belonging to the *Zoantharia sclerodermata*, the growth of coral-reefs is further contributed to by various Alcyonoid corals (*Heliopora*, *Tubipora*, and numerous forms belonging to the *Gorgonidæ*), and by the calcareous algæ (Nullipores and Corallines).

The distribution of the reef-building corals seems to depend mainly upon the mean winter temperature of the sea, and they are confined to seas in which the temperature of the water during the winter does not sink on an average below 66° or 68° Fahr. The seas thus limited may be said to be comprised within a distance of about 1800 miles on either side of the equator. Even within these limits, however, apparently owing to the influence of Arctic currents, no coral-reefs are found on the western coasts of Africa and South America. The metropolis of the reef-building corals may be said to be the central Pacific Ocean, with its numerous islands and masses of continental land;

but reefs are also found more or less largely developed in the Indian Ocean, the Persian Gulf, the Red Sea, the coasts of Zanzibar, Madagascar, and Mauritius, the Gulf of Panama, the coast of Brazil, around the West Indian Islands and the shores of Florida, and around the Bermudas. According to the classification of Darwin, which is essentially the same as that adopted by other authorities, coral-reefs may be separated into three principal groups, viz.: Fringing-reefs, Barrier-reefs, and Atolls. *Fringing-reefs* are shallow-water reefs, found in the immediate neighbourhood of land, either surrounding islands or skirting the shores of continents. These shore-reefs have no channel of any great depth of water intervening between them and the land, and the soundings on their sea-ward margin indicate that they repose upon a gently-sloping surface. *Barrier-reefs*, like the preceding, may either encircle islands or skirt continents. They are distinguished from Fringing-reefs by the fact that they are placed at a much greater distance from the land, that there intervenes a channel of comparatively deep water between them and the shore, and that soundings taken close to their seaward margin indicate profound depths of water outside them. The Barrier-reefs which surround islands are termed "encircling Barrier-reefs," and they occasionally form a complete ring, though more usually discontinuous and broken at intervals. The Barrier-reefs which skirt continents attain a greater size. As an example of these may be taken the succession of reefs which form the great "barrier" on the north-east coast of Australia. These run, with occasional breaches in their continuity, for a distance of over 1000 miles, their average distance from the shore being between 20 and 30 miles, the depth of the inner channel being from 10 to 60 fathoms, and the sea outside being sometimes over 2000 feet in depth.

Atolls are ring-shaped reefs usually oval or circular in form, which enclose a central expanse of water or lagoon, without any land. Occasionally (as in Whitsunday Island) the entire circle of the Atoll may have been raised above the water. More commonly the ring is not complete, but is breached by one or more openings, which are always placed on the leeward side of the Atoll, or on the side most completely sheltered from the prevailing winds. In their structure Atolls are identical with "encircling Barrier-reefs," from which they differ only in the fact that the lagoon which they enclose does not contain an island in its centre.

Many coral-reefs are constantly submerged below the sea, and are not laid bare even at extreme low water; others are exposed to view by the recession of the tide, and are covered at high water; others, again, are partially raised above the level of the highest tides, and thus constitute dry land. If we examine a reef of the last class—say a portion of an Atoll or an encircling Barrier-reef—the following are the general phenomena which may be noticed. The general form of the reef is approximately triangular, as seen in section, with a steep and abrupt seaward face, and a long and gentle slope towards the inner lagoon or channel. The extreme outer margin of the reef is the only portion of the whole which is composed of actually living coral, and this part is not exposed to view even at extreme low water. Soundings outside this line always indicate a more or less considerable depth of water, and the outer margin of the reef is usually exposed to the beating of a tremendous surf, in which the coral-polypes find their most congenial home. Immediately inside the line of breakers is a broader or narrower platform of dead coral and coral-rock, which is only laid bare at low water, and which may be bounded internally by a ledge of brecciated coral-rock only reached by the waves at high water. Finally, the inner portion of the reef rises to the height of a few feet above the level of high water, and constitutes dry land. It is composed of blocks of coral more or less completely cemented together by the percolation of water holding carbonate of lime in solution, along with blown sand derived from the disintegration of the coral. The land generally

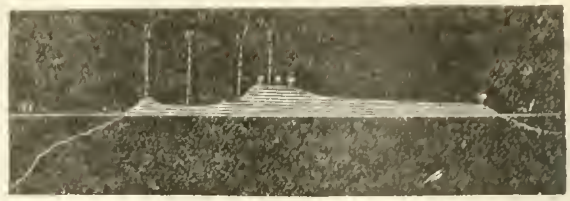

FIG. 9.—Section of Keeling Atoll. (After Darwin.)

a, Level of the sea at low water; *b*, outer edge of that flat part of the reef which dries at low water; *c*, flat of coral-rock, covered at high water; *d*, low projecting ledge of brecciated coral-rock, washed by the waves at high water; *e*, slope of loose fragments reached by the sea only during gales (the upper part, which is from 6 to 12 feet high, is clothed with vegetation; the surface of the islot slopes gently to the lagoon): *f*, level of the lagoon at low water.

bears a luxuriant vegetation, and slopes with a prolonged and gentle inclination to the inner lagoon. The beach of the Atoll is covered with coral-sand, aud with fragments of coral, which are often cemented together by the percolation of water so as to form compact oolitic or brecciated limestones. The bottom of the inner lagoon usually supports many living corals, along with accumulations of fine chalky mud, apparently largely formed from the excreta of animals, which, like the *Scari* and Holothurians, feed upon the living corals. Outside the reef, at depths greater than 25 fathoms, the bottom seems to be covered with coral-sand and dead coral.

The general method of formation of a coral-reef becomes readily intelligible on a consideration of the conditions which are requisite for the existence and welfare of the coral-polypes. The reef-building corals, in the first place, flourish most vigorously in depths up to 10 fathoms, and appear to be incapable of existing at all at depths exceeding 25, or at the utmost 30 fathoms. It follows from this that no coral-reef can begin to be formed on a sea-bottom covered by more than 30 fathoms of water. In the case, however, of Atolls and Barrier-reefs, we have reefs rising out of profound depths, soundings on their seaward margin indicating depths of from 100 up to more than 1000 fathoms, at points not far removed from the actual edge of the reef. Originally it was believed that the reef had been raised from these great depths to the surface by the exertions of the polypes themselves; but the extremely limited bathymetrical range of these animals renders this view wholly untenable. The true explanation of this problem was first afforded by the masterly researches of Mr Darwin, who showed that the production of Barrier-reefs and Atolls is really to be ascribed to the subsidence by slow degrees of the foundations on which they rest. Thus a Fringing-reef surrounding an island may be formed in depths of from 10 to 15 fathoms, and may grow till it reaches the level of low water. If, now, such a reef be supposed to sink gradually beneath the sea by a sufficiently slow subsidence, the upward growth of the corals will neutralize the downward movement of the land, so that the reef will appear to be stationary, whilst it is really growing upwards. Whilst the reef will remain to all appearance unaffected in its form, position, and size, the island which it surrounds will gradually diminish in size as the subsidence goes on, and a wide and deep channel will be formed between it and the reef. If the depression should be continued still further, the island will be reduced to a mere peak in the centre of a lagoon, and the reef, from a "Fringing-reef," will have become converted into an "encircling Barrier-reef." Simultaneously, we should find that there is now deep water all round the reef, on its outer margins; for the coral-polypes grow principally in a vertical direction, so that the width of the reef can be little or not at all greater than the width of its original base. If the depression of the land be still further continued, the central island will ultimately disappear altogether, and the

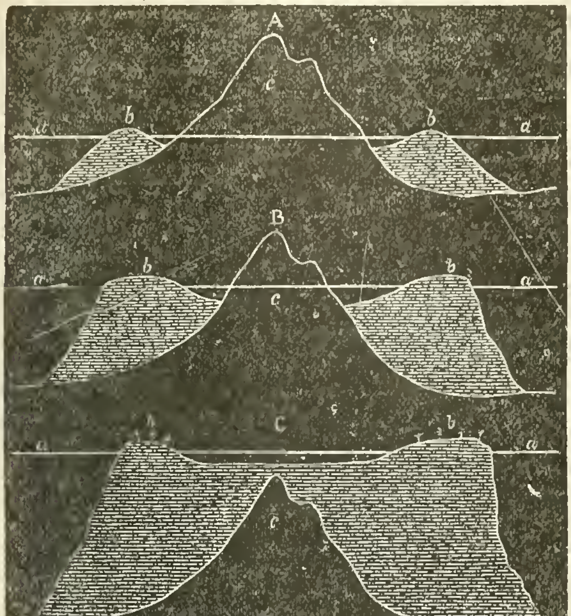

FIG. 10.—Diagrams illustrating the mode of Formation of the different kinds of Coral-reefs.

A, Ideal section of a fringing-reef surrounding an island; B, ideal section of the same, after the land has considerably subsided, and the fringing-reef has been converted into an encircling barrier-reef; C, ideal section of the same, when the subsidence has been so far continued as to bury the island under the ocean, and the barrier-reef has been converted into an atoll. *a*, sea-level; *b*, coral-reef; *c*, land.

reef will become an oval or circular ring, usually more or less incomplete, and perhaps 30, 40, or 50 miles in diameter, enclosing a central expanse of water or lagoon. It is thus seen that Fringing-reefs, Barrier-reefs, and Atolls are different stages of the same thing, the latter being produced out of the former by the progressive subsidence of the land. In order, however, that this process should be carried out, it is necessary that the rate of subsidence should not be more rapid than the rate of upward growth of the corals. If it should be so, then the reef is carried down into deep water, and becomes submerged, as is the case, for example, with the great Chagos Bank. In accordance with Mr Darwin's theory on this subject, it is found that Barrier-reefs and Atolls do not occur in the immediate vicinity of active volcanoes—regions where geology teaches us that the land is either stationary, or is undergoing slow upheaval. On the other hand, the existence of Fringing-reefs is only possible where the land is either slowly rising, or is stationary; and, as a matter of fact, Fringing-reefs are often found to be conjoined with upraised strata of post-Tertiary age. As regards their upward limits of growth, again, the coral-polypes cannot exist on levels higher than extreme low water, exposure to the sun, even for a short period, proving generally, if not invariably, fatal. The coral-polypes, therefore, can raise the reef to the level of extreme low water, but no further; and it is to the denuding power of the ocean that the elevation of the reef above this level is due. The breakers which fall upon the outer edge of the reef detach masses of dead coral, often of very large size, and these become gradually accumulated at particular spots, till they rise above the level of high water. The detached masses, thus heaped up, become compacted together by the finer sediment of the reef, and agglutinated by the percolation through them of water holding carbonate of lime in solution, till they become ultimately converted into a hard compact limestone. The new land produced in this way is protected from destruction by the vital activity of the living corals, which occupy a fringe at the outermost margin of the reef just below the level of extreme low water, and which by their continual growth preserve the inner parts of the reef from the waves.

Another condition very essential to the welfare of the coral-polypes is an abundant supply of pure and properly aerated water. They flourish, therefore, in their highest vigour at the extreme outer edge of the reef, and on its windward side, where they are exposed to the constant beating of the surge; and hence it is that the growth of the reef is principally carried on at these points. Mud and sediment are, on the other hand, very injurious to corals, and they rarely occur, therefore, on sandy or muddy bottoms. It is for this reason, also, as much probably as from the pernicious effect of an intermixture of fresh water, that openings in coral-reefs are always found to exist at points opposite the mouths of rivers. It has been shown, however, by experiment, that corals will flourish on a sandy bottom provided the water is free from sediment in suspension.

As regards the *distribution in time* of the *Zoantharia sclerodermata*, the distinction which obtains at the present day between the solitary and the reef-building corals is found to have subsisted in the past, so far at any rate as the Tertiary and Secondary periods are concerned. Thus the solitary and essentially deep-sea forms are represented in the Kainozoic and Mesozoic deposits by forms such as *Sphenotrochus*, *Flabellum*, *Balanophyllia*, *Turbinolia*, *Leptocyathus*, *Trochocyathus*, *Paracyathus*, *Oculina*, *Diplohelia*, *Astrohelia*, *Stephanophyllia*, *Stereopsammia*, *Parasmilia*, *Trochosmilia*, *Thecosmilia*, *Montlivaltia*, *Dendrophyllia*, &c. On the other hand, the reef-building and essentially shallow-water forms are represented by such genera as *Madrepora*, *Axopora*, *Porites*, *Litharæa*, *Solenastræa*, *Isastræa*, *Septastræa*, *Dendracis*, *Astrocœnia*, *Stylocœnia*, &c.

Taken as a whole, the *Zoantharia sclerodermata* have attained their maximum of development at the present day, being largely represented in the Tertiary and Secondary periods, but having their place to a great extent usurped in the Palæozoic period by the Rugose Corals. The *Aporosa* are only represented with certainty in the Palæozoic series by the two remarkable genera *Battersbyia* and *Heterophyllia*, which form an aberrant group of the *Astræidæ* (*Palastræidæ*), and of which the former is Devonian, whilst the latter is Carboniferous. The Silurian genus *Palæocyclus* was formerly regarded as belonging to the *Fungidæ*, but it is a genuine Rugose Coral. The genus *Duncanella*, of the Upper Silurian, may perhaps belong to the *Turbinolidæ*, and this may very probably be the true position of some of the corals referred to the genus *Petraia*, of the Silurian and Devonian. The genus *Columnaria* (*Favistella*) may perhaps also be referred to the *Astræidæ*. In the Permian rocks no *Aporosa* are known to have existed, the whole of this formation, as well as the greater portion of the Trias, being singularly destitute of remains of corals. Towards the summit of the Triassic series, however, in the St Cassian beds, we find a great development of the *Aporosa*, which are now represented by a number of *Astræidæ*, belonging to well-known Secondary types, such as *Montlivaltia*, *Thecosmilia*, *Cladophyllia*, *Rhabdophyllia*, *Goniocora*, *Isastræa*, *Thamnastræa*, *Elysastræa*, *Latimeandra*, and *Astrocœnia*. In the succeeding formation of the Lias the *Astræidæ* are represented by all the genera just mentioned, along with others such as *Septastræa*, *Stylastræa*, *Cyathocœnia*, *Oppelismilia*, and *Lepidophyllia*, whilst the *Turbinolidæ* are now represented for the first time (*Thecocyathus*). In the great series of the Oolites, we still find an enormous preponderance of forms belonging to the *Astræidæ*, the principal genera of this period being *Isastræa*, *Thamnastræa*, *Septastræa*, *Clausastræa*, *Convexastræa*, *Heliastræa*, *Pleurosmilia*, *Peplosmilia*, *Blastosmilia*, *Aplosmilia*, *Stylosmilia*, *Thecosmilia*, *Astrocœnia*, *Stephanocœnia*, *Rhabdophyllia*, *Cladophyllia*, *Calamophyllia*, *Baryphyllia*, *Stylina*, *Goniocora*, *Latimeandra*, *Cyathophora*, *Montlivaltia*, *Rhipidogyra*, *Pachygyra*, *Dendrogyra*, *Phytogyra*, *Favia*, &c. The *Turbinolidæ* are represented in the Oolites by genera such as *Discocyathus*, *Trochocyathus*, and *Thecocyathus*; the *Oculinidæ* appear under forms such as *Stylophora*, *Euhelia*, *Enallohelia*, *Psammohelia*, &c.; whilst the *Fungidæ* are largely represented by species of *Comoseris*, *Protoseris, Dimorphoseris, Oroseris, Anabacia, Genabacia*, &c. In the Cretaceous period the proportions of the different families of the *Aporosa* are much the same as in the Oolitic. The *Astræidæ* are still by far the most numerous, the principal Cretaceous genera being *Thamnastræa, Synastræa, Goniastræa, Isastræa, Heliastræa, Cyphastræa, Barysmilia, Trochosmilia, Placosmilia, Parasmilia, Peplosmilia, Diplocteniuum, Phyllocœnia, Cryptocœnia, Astrocœnia, Stylocœnia, Centrocœnia, Pleurocora, Cladocora, Hydnophora, Caryophyllia, Brachyphyllia, Favia, Cyathophora, Meandrina, Latimeandra, Diploria, Leptoria, Stelloria, Rhipidogyra, Eugyra, Pachygyra, Montlivaltia, Rhizangia*, &c. The *Turbinolidæ* are represented by species of *Trochocyathus, Leptocyathus, Brachycyathus, Cyclocyathus, Smilotrochus, Stylotrochus, Onchotrochus*, &c.; and the *Pseudoturbinolidæ* by the genus *Dasmia*. Amongst the *Oculinidæ* we meet with such genera as *Synhelia* and *Diblasus*; and the family of the *Fungidæ* is well represented by species of *Cyclolites, Micrabacia, Cycloseris, Podoseris, Cyathoseris, Trochoseris, Oroseris*, and *Turbinoseris*. The Cretaceous corals are not separated from those of the Eocene period by any break similar in extent to that which separates the coral-fauna of the later Palæozoic rocks from that of the younger Mesozoic; but there is nevertheless a considerable difference observable. The *Astræidæ* are no longer so abundant, and are represented by genera such as *Solenastræa, Astræa, Heliastræa, Montlivaltia, Stephanocœnia, Phyllocœnia, Astrocœnia, Stylocœnia, Parasmilia, Cœlosmilia, Cylicosmilia, Rhizangia, Dasyphyllia, Circophyllia, Latimeandra, Hydnophora*, &c. The *Turbinolidæ* are greatly developed, and are represented by numerous genera, such as *Turbinolia, Trochocyathus, Leptocyathus, Paracyathus, Flabellum, Platytrochus, Discotrochus, Sphenotrochus*, &c. The *Pseudoturbinolidæ* are represented by the genus *Dasmia*, which dies out here. Amongst the *Oculinidæ*, we meet with the genus *Oculina* itself, along with species of *Diplohelia, Stylophora*, &c. Lastly, the *Fungidæ* are represented by forms such as *Cyathoseris, Trochoseris*, and *Cyclolites*. In deposits of Miocene age, the *Astræidæ* are represented by the genera *Astræa, Prionastræa, Plesiastræa, Solenastræa, Septastræa, Astrocœnia, Caryophyllia, Lithophyllia, Montlivaltia, Hydnophora, Cladocora, Trochosmilia, Diplocteniuum, Rhizangia, Phyllangia, Cryptangia, Cladangia*, &c. Amongst the Miocene *Turbinolidæ* are the genera *Trochocyathus, Deltocyathus, Acanthocyathus, Sphenotrochus, Ceratotrochus, Desmophyllum*, and *Flabellum*; whilst the *Oculinidæ* are represented by species of *Oculina, Diplohelia, Astrohelia*, and *Stylophora*, and for the first time *Pocillopora*. The *Fungidæ*, finally, are poorly represented by the genus *Cyclolites*. The Pliocene deposits have hitherto yielded a small number of corals, belonging to solitary forms, the *Astræidæ* being represented by *Caryophyllia, Cryptangia*, &c., the *Oculinidæ* by *Oculina* itself, and the *Turbinolidæ* by forms such as *Flabellum, Sphenotrochus*, and *Paracyathus*.

The geological history of the great group of the *Perforata* is shorter and less perfectly known than that of the *Aporosa*. Leaving out of sight forms of uncertain affinities, the *Perforata* are but represented in the great pile of Palæozoic deposits by some two or three genera, and they are absent or very poorly represented in all the lower Mesozoic sediments. In the Cretaceous period they for the first time begin to be more abundant, though still sparsely developed, and it is not till the commencement of the Tertiary period that this group assumes anything like its present proportions. In the vast series of Silurian deposits the Perforate corals are only represented by two undoubted genera, namely the *Protaræa* of the Lower Silurian, which belongs to the *Poritidæ*, and is nearly allied to the genus *Litharæa*, and the singular *Calostylis* of the Upper Silurian. The Lower Silurian genus *Columnopora* may perhaps be referred to the *Madreporidæ*, and if the *Favositidæ* were ultimately referred to the same family, then we should have to admit a very considerable development of the *Perforata* in Upper Silurian times. In the succeeding period of the Devonian, rich as it is in corals, no certain representative of the *Perforata* is known. The genus *Pleurodictyum* has been referred here, but is apparently founded upon casts of *Favosites*. In the great coralliferous deposits of the Carboniferous, again, no representative of the group is known, save the single genus *Palæacis*, which appears to be a *Madreporacean*. In the Permian rocks, the Trias, and the Lias, no single example of a Perforate coral has hitherto been brought to light, and the group is represented in the Oolitic series by the single genus *Microsolena*, an aberrant member of the *Poritidæ*. In the Cretaceous series the Perforate corals are represented by members of all the existing families, *Stephanophyllia* amongst the *Eupsammidæ, Porites* amongst the *Poritidæ*, and *Actinacis* amongst the *Madreporidæ*. In the Eocene rocks a much more striking development of the *Perforata* takes place. The *Eupsammidæ* are now represented by *Eupsammia, Stereopsammia, Lobopsammia, Endopachys, Balanophyllia, Stephanophyllia, Dendrophyllia*, &c. The *Madreporidæ* appear under such forms as *Madrepora, Alveopora, Astræopora*, and *Dendracis*; and the *Poritidæ* are represented by such genera as *Porites* and *Litharæa*. In the Miocene period the *Eupsammidæ* are represented by *Balanophyllia, Stephanophyllia, Dendrophyllia, Eupsammia*, &c., the *Madreporidæ* by *Madrepora* and *Turbinaria*, and the *Poritidæ* by *Porites* and *Rhodaræa*. In the Pliocene period the *Perforata* appear to be principally represented by *Eupsammidæ*, such as *Balanophyllia, Stephanophyllia, Dendrophyllia*, and *Cœnopsammia*.

In discussing the geological distribution of the Tabulate Corals, it will be convenient to consider the group as a merely provisional assemblage of forms, which cannot at present be finally systematized. The genus *Heliopora* and its allies *Heliolites, Plasmopora*, &c., have been shown to be *Alcyonaria*, and will be considered under that head. Here, therefore, the order *Tabulata* will be taken as temporarily including the groups of the *Milleporidæ* (*Millepora, Axopora*), the *Thecidæ* (*Thecia*), the *Favositidæ* (*Favosites* and its allies), the *Chætetidæ* (*Chætetes* and its allies), and the *Halysitidæ* (*Halysites, Syringopora*, &c.) Accepting the order in this provisional aspect, it will be found that the *Tabulata* are mainly, indeed almost exclusively, confined to the Palæozoic period. The *Milleporidæ*, however, belong to the Tertiary and recent periods; *Koninckia* is Cretaceous; whilst *Michelinia* and some of the *Chætetidæ* have been stated to occur in the Oolitic series, though this determination is not free from doubt. The family of the *Thecidæ*, including the single genus *Thecia*, is exclusively Upper Silurian. Amongst the *Favositidæ*, the type-genus *Favosites* is Silurian, Devonian, and Carboniferous, attaining its maximum of development in the Devonian; *Emmonsia* has nearly the same range as *Favosites*; *Michelinia* is found in the Devonian and Carboniferous, and is doubtfully quoted from the Oolites; *Striatopora* belongs to the Upper Silurian and Devonian; *Alveolites* is abundant in the Silurian and Devonian, and disappears in the Carboniferous; *Ræmeria* is Devonian, and *Koninckia* is only known from the White Chalk. Of the *Chætetidæ*, *Chætetes, Monticulipora*, and *Stenopora* are three imperfectly separated and closely allied groups, which are represented, collectively or separately, in all the Palæozoic formations from the Lower Silurian to the Permian, inclusive; and forms very similar, if not identical, (*Heteropora, Neuropora*) occur in deposits of Mesozoic age. The genera *Dania* and *Constellaria* are closely allied to the preceding, and are Silurian. *Labechia* may be temporarily placed here also, and is likewise Silurian. *Fistulipora* and *Callopora* are nearly related to the preceding and to one another (if not identical), and they range from the Silurian to the Carboniferous. Lastly, *Beaumontia* is Carboniferous. Amongst the *Halysitidæ*, the type-genus *Halysites* is Silurian; *Syringopora* ranges from the Silurian to the Carboniferous, attaining its maximum in the Devonian; whilst the singular genus *Fletcheria*, though typically Silurian, is said to be represented by a species in the Trias (Muschelkalk). Lastly, the aberrant family of the *Milleporidæ* does not seem to have come into existence till the Eocene Tertiary, where it is represented by the genus *Millepora*. The remarkable genus *Axopora* also dates its first appearance from the Eocene. There remain some other so-called Tabulate corals which have not been noticed in the above summary, but they are not of sufficient importance to require special mention.

The small group of the *Tubulosa* is confined exclusively to the Palæozoic period. The type-genus *Aulopora* is found in the Lower and Upper Silurian, the Devonian, and the Carboniferous, attaining its maximum in the Devonian. The genus *Pyrgia* is only known as occurring in the Carboniferous rocks.

Regarding the geological history of the *Zoantharia sclerodermata* in a summary form, it will be seen that the Palæozoic period is characterized by the exclusive possession of the *Tubulosa*, the great development of the *Tabulata*, and the very small number of *Aporosa* and *Perforata*, the place of these latter groups being taken by the Tabulate and Rugose corals. The Mesozoic period is characterized by the great development of the *Aporosa*, and, towards its close, of the *Perforata*, though in a less degree; whilst the *Tubulosa* are wholly gone, and the *Tabulata*, along with the Rugose corals, have very nearly disappeared. Finally, the Kainozoic period is characterized by the greatly increased development of the *Perforata*, the *Aporosa* being proportionately diminished, though still remaining in great force, and the great recent group of the Millepores (*Tabulata?*) now for the first time making its appearance.

ORDER II.—RUGOSA.

The members of this order agree with the *Zoantharia sclerodermata* in possessing a well-developed sclerodermic corallum, with a true theca, and generally presenting both tabulæ and septa combined. The septa, however, are generally (though apparently not always) some multiple of *four*, and there is commonly a single predominant septum, or a vacant space (fossula) representing such a septum. Some of the *Rugosa* are simple, others are compound, but the latter are destitute of a true cœnenchyma.

As there are only two living genera which agree with the *Rugosa* in the tetrameral arrangement of their septa, and as it is doubtful whether we are justified in positively asserting on this ground that these genera really *are Rugosa*, this great order of *Actinozoa* requires to be considered simply as regards the hard skeleton or corallum which alone has been preserved to us in a fossil condition. The corallum of the *Rugosa* is in most essential respects identical in structure with that of the *Hexacoralla*, differing principally in the numerical law of the septa and in the common conjunction of tabulæ with the septa. It is very difficult to entertain any doubt but that the corallum of the *Rugosa* was secreted in a manner precisely similar to that of the existing *Zoantharia sclerodermata*, and that it bore essentially, if not precisely, similar relations to the soft parts of the animal which produced it. Thus, in both groups alike the corallum may be simple or compound; in both alike the simple form of corallum consists of an outer wall or "theca," inclosing a central space or "visceral chamber," which is divided into compartments by a series of radiating lamellæ, or "septa;" in both alike the structures known as "dissepiments," "tabulæ," and "columella" may be developed; in both alike the compound corallum may be regarded as essentially formed by an aggregation of "corallites," similar in their fundamental structure to the simple corallum. With these striking and substantial points of agreement there are, nevertheless, not a few respects in which the *Rugosa* differ from the *Zoantharia sclerodermata*, and these will be best discussed by briefly considering the different parts of the Rugose corallum in succession.

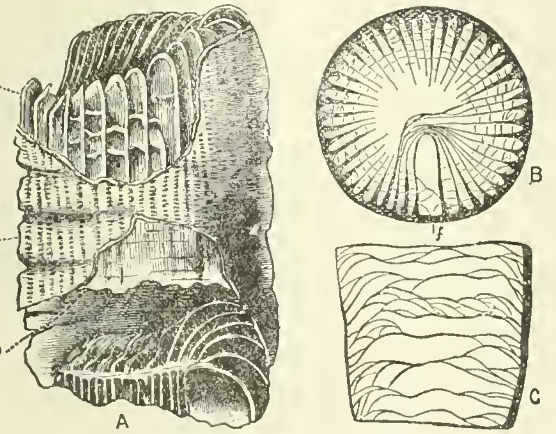

FIG. 11.—Morphology of the Rugosa.

A, Fragment of *Zaphrentis gigantea*, Lesueur, showing the septa (*s*) with the sparse dissepiments crossing the interseptal loculi the epitheca (*e*), and the thin proper wall (*w*). B, Transverse section of *Zaphrentis Guerangeri*, Edw. and H., showing the septa and dissepiments, the central area occupied solely by the tabulæ, and the fossula (*f*) formed by the confluence of a certain number of the septa. C, Longitudinal section of the last, showing the arrangement of the tabulæ. (A is after Edwards and Haime; B and C are after James Thomson.)

The *form* of the corallum, when simple, is usually more or less conical, turbinate, cono-cylindrical, or cylindroidal, but it may be discoidal (*Palæocyclus*, *Microcyclus*, &c.); or even everted (some species of *Ptychophyllum*), or sometimes prismatic (*Goniophyllum*), whilst it is often irregularly thickened by accretions of growth. The compound coralla necessarily vary much in form, being massive, fasciculate, &c., according to the method in which new corallites are produced. The principal modes in which the corallum becomes compound amongst the *Rugosa* are the following:—

(1) *Simple calicular gemmation.*—In this process the original corallite, after growing for a certain length of time, sends up a single bud from its calicine disc, which usually is continued in the same axis as that of its parent. The primitive calice may or may not be more or less completely obliterated by the gradual growth and extension of the epitheca over it, and the secondary bud may or may not produce a tertiary bud in the same manner in which it was itself produced. Not uncommonly several buds may be produced successively, each from the oral disc of its predecessor, till the aged corallum comes to consist of a series of short turbinate cups or inverted cones, superimposed one upon the other, the younger upon the older. This singular mode of gemmation is seen in various species of *Heliophyllum*, *Cystiphyllum*, &c; and it cannot possibly be regarded as being merely accidental; whilst it may not improbably be regarded as an advanced form of the physiological process by which "accretions of growth" are produced. (2) *Compound calicular gemmation.*—In this process, the primitive corallite throws up from its calicine disc two or more buds, which, after reaching a certain size, in most cases repeat the process. The resulting form of corallum differs in different cases. In such forms as *Cyathophyllum truncatum* and *C. paracida*, the parent corallite is destroyed by its buds, and these are in turn destroyed by the buds which they put forth, all the corallites remaining more or less separate, and the entire corallum assuming the form of an inverted pyramidal mass, the base of which is formed by the primitive corallite In other cases, as in *Cyathophyllum regium*, the corallites become intimately united by their walls, and the corallum becomes massive and astræiform. In other cases, again, the corallum becomes fasciculate, the budding corallites not being killed by their buds, but continuing to grow upwards side by side with them, as is seen in some of the species of *Cyathophyllum*, *Lonsdaleia*, *Endophyllum*, &c. (3) *Parietal Gemmation.*—This process consists in the production of buds from the sides of the corallites at some point between the base and the margin of the calice. It does not differ in its nature or results from the same process as seen in the *Zoantharia sclerodermata*, and it generally gives rise to a loosely fasciculate corallum, as is well seen in various forms of *Diphyphyllum*, *Lithostrotion*, &c. (4) *Basal Gemmation.*—This process consists in the formation of buds by an extension of the substance of the original polype from the margin of its base; but it is doubtful if this mode of increase occurs at all amongst the true Rugose corals. (5) *Fission.*—Increase by spontaneous cleavage or fission is also of rare occurrence amongst the *Rugosa*, though it undoubtedly occurs occasionally, as in some species of *Diphyphyllum*.

However they may be produced, the corallites of the compound coralla of the *Rugosa* are never connected together by a true cœnenchyma. When the corallites are in close contact, so that the corallum becomes massive, there is often fusion of the adjoining walls, but this is not necessarily the case. At other times the walls are wanting, and the corallites are united together by the extension and confluence of their septa (*Phillipsastræa*, *Syringophyllum*, *Smithia*, &c.), or by costæ and vesicular dissepiments (*Pachyphyllum*). In other cases the corallites are united by exothecal outgrowths (as in *Eridophyllum*).

The *wall* is usually well developed, and is not perforate. It is, however, often wanting altogether (as in *Chonaxis*, *Phillipsastræa*, *Smithia*, &c.), or very feebly represented. In many cases also there is a more or less strongly developed *accessory wall*, or internal mural investment ("muraille interne"), which is placed concentrically within the true wall, and thus divides the visceral chamber into a central and a circumferential space. This accessory wall may be present along with a well developed true wall (as in *Acervularia* and *Cyclophyllum*), or the accessory wall alone may be present, the true wall may be absent, and the corallites may be united with one another by the amalgamation of their septa and dissepiments (as in *Pachyphyllum*, *Chonaxis*, &c.)

The *epitheca* is usually well developed in the *Rugosa*, though sometimes very thin. It is closely applied as a rule to the true wall, and when thickened, the latter may be very feebly developed. In the compound coralla, there is often a general epitheca inclosing the corallites basally and laterally. We may, perhaps, also regard as being of an epithecal nature the extraordinary *opercular* structures which have been fully described by Lindström as occurring in certain Rugose corals, such as *Goniophyllum*, *Calceola*, and *Rhizophyllum*. In these forms the calice is closed completely by a calcareous plate or operculum which is single in *Calceola*, but composed of four pieces in *Goniophyllum*, and which must be supposed to have been capable of erection and retraction,—the corallum thus becoming like a bivalve shell. Indeed, the genus *Calceola* was long supposed to be referable to the *Brachiopoda*. It seems probable that some other Rugose corals, more normal in their characters than the above mentioned forms, were likewise provided with an operculum. Similar structures are observable in some Tabulate corals (as in certain species of *Favosites*), where the calices become closed in progress of growth by a false operculum; and analogous structures have been recognized in certain living corals (*Primnoa* and *Paramuricea*). Though not strictly epithecal, we may also consider in this connection the remarkable *root-like processes* ("radiciform prolongations") which are so characteristic of many of the *Rugosa* (*e.g. Omphyma, Goniophyllum, Rhizophyllum, Pholidophyllum, Ptychophyllum*, &c.) These processes may attain a length of several inches, and they consist of a process of the epitheca and wall, inclosing a diverticulum of the visceral chamber, and in some cases subdivided by dissepiments. In the simple species (such as *Omphyma*) they serve to attach the corallum to foreign objects; but similar processes occur in various compound forms (*Eridophyllum*, &c.), and serve to unite the various corallites with one another, being thus of the same nature and function as the tubular connecting processes of the Tabulate genus *Syringopora*.

The epitheca of the Rugose corals is usually marked with numerous fine encircling striæ, and with longitudinal lines, grooves, or ridges The latter, however, are usually regarded as not being true *costæ*. They differ, in fact, from the costæ of the *Zoantharia sclerodermata* in not being placed opposite the septa, but alternating with these structures, and thus corresponding with the interseptal loculi. Not uncommonly (as in many species of *Zaphrentis*, in *Streptelasma*, &c.) there are two of these pseudo-costæ, which are pre-eminently developed and run along the dorsal surface of the corallum, the other ridges converging towards this central pair in a pinnate manner. This appearance seems to be due to the fact that the growth of the corallum was effected by the intercalation of successive septa along the sides of the primary septum to which this principal pair of pseudo-costæ corresponds. In *Pholidophyllum* the costæ are double, and are covered by double longitudinal rows of small imbricated scales of an epithecal nature. In genera in which the wall is absent and the corallites are united together by the confluence of the septa (*e.g.* in *Pachyphyllum, Smithia, Phillipsastræa*), it is impossible to determine whether true costæ are present or not. True costæ are also certainly present in the genus *Holocystis*.

The *calice* in the *Rugosa* varies greatly in form, shape, depth, &c. It is usually more or less circular, or oval, sometimes semicircular or subtriangular in outline (*Rhizophyllum*), sometimes quadrilateral (*Goniophyllum*). It may be very shallow, or very deep, and its edges may be completely everted (*e.g.* in *Ptychophyllum patellatum*). It may be at right angles to the axis of the corallum, or it may have any degree of obliquity. In the simple and curved or horn-shaped coralla, it is very common for the calice to be very oblique to the axis of the coral; and in these cases the convex side of the corallum (dorsal side) is the longest, and the concave side (ventral side) is the shortest.

The *septa* of the *Rugosa* are substantially similar to those of the *Zoantharia sclerodermata* in form and structure, forming, when well developed, a series of vertical calcareous laminæ which are primitively double, spring from the inner surface of the wall, and radiate towards the centre of the visceral chamber. They are rarely or never perforate, and they vary much in the extent of their development. Sometimes they are almost wholly aborted, being only recognizable as so many faint striæ on the inner surface of the calice (as in the typical examples of *Cystiphyllum*). At other times, they extend inwards only an extremely short distance from the wall, as in the genus *Amplexus*. In other cases, again, they are well developed towards the centre of the corallum, but have no connection with the outer wall, from which they are separated by dissepimental vesicles, as in the genus *Lonsdaleia*. In other instances, finally, they have their normal arrangement, being attached externally to the wall, and extending inwards to, or near to, the centre of the visceral chamber. In rare cases the septa may be all of nearly the same size; more commonly they are markedly different in size. Most of the forms in which the septa are well developed, show a distinct tetrameral arrangement of the septa, though it does not appear possible to assert positively that the primitive and first developed cycle of septa consists of only four elements. In many cases, however, the septa of the adult are a multiple of four, and their quadripartite disposition may be plainly manifested by the fact that four of the septa are pre-eminently developed and form a conspicuous cross (*Stauria*), or by the presence of four calicine depressions which have a similar cruciform arrangement (*Omphyma*). In the typical *Rugosa* the septa, though undoubtedly not simultaneously developed, are nevertheless of only two sizes, a larger and a smaller, alternating regularly with one another; and they cannot, therefore, be distinguished according to their dimensions into a series of regular cycles. The small or secondary septa also may be occasionally absent. The primary or larger septa, be their development what it may, are for the most part equal in size; but, notwithstanding this fact, the corallum often shows a very distinct bilateral symmetry, due apparently to the primitive tetrameral disposition of the septa. This is especially shown in the general existence either of a single septum of larger size than all the others (one of the four primitive septa), or of an extraordinary vacant space, representing this septum, and known as the "septal fossula." The septal fossula usually presents itself as a more or less conspicuous depression or groove in the calice, and its position, though apparently constant in any given form, is variable, being sometimes on the convex side of the corallum in the simple forms, sometimes on the concave side, and rarely situated laterally. In general it is a simple space or deficiency caused by the absence or abortion of one of the four primary septa, and it is seen in transverse sections to be occupied by from one to three short septa. Sometimes it is accompanied by a tubular depression of the tabulæ at that point. Sometimes there are two smaller lateral fossulæ, directed at right angles to the main depression, and representing two others of the primitive septa. At other times there may be four shallow fossulæ arranged in a crucial manner (*Omphyma*), but it is not certain that these correspond with the four primitive septa. Lastly, in the genus *Metriophyllum* the septa are arranged in four groups, which are separated from one another by vacant spaces or fossulæ, though in this case also it is not certain that these spaces are homologous with the true septal fossulæ of forms like *Zaphrentis*. The precise physiological import of the fossula is uncertain; but its presence gives rise to an irregularity in the arrangement of the septa which is highly characteristic of the *Rugosa*. Whilst in *Stauria* all four of the primitive septa are pre-eminently developed, only three are thus predominant in *Anisopyllum*, and only one in *Hallia*. The free edges of the septa, where they appear in the calice, are in general plain and smooth, but they may bear granular tubercles (*Palæocyclus*), or teeth (*Zaphrentis cornicula, Heliophyllum*). The sides of the septa are likewise generally smooth, but they may be granulated (*Palæocyclus*), or they may be adorned with arched and ascending striæ (*Heliophyllum*).

The axis of the corallum is very often occupied by a *columella*, which varies much in structure in different cases. In forms such as *Cyathaxonia, Lithostrotion, Koninckophyllum*, &c., we have a proper or essential columella, which is developed independently of the septa, occupies the centre of the visceral chamber, and projects as a solid rod into the floor of the calice. In other cases the columella is composed of twisted lamellæ, which inosculate with one another so as to give rise to a vesicular axis, as in *Lonsdaleia* and *Axophyllum*. In other cases, a false columella may be produced by the twisting together of the inner edges of some of the primary septa (as in some species of *Cyathophyllum*). In other cases, finally, the axis of the visceral chamber may be occupied by a series of more or less complicated structures, which may occupy a considerable space, and which have sometimes been regarded as representing a kind of columella (*Clisiophyllum, Dibunophyllum, Rhodophyllum, Cyclophyllum*, &c). These axial structures, however, can only in a very limited sense be regarded as columellar.

The continuity of the interseptal loculi in the *Rugosa* is generally more or less interfered with by the development of endothecal *dissepiments*; but in no case are synapticulæ present. The dissepiments vary greatly in character and amount. Sometimes they are wholly wanting (*Cyathaxonidæ* and some species of *Amplexus*); at other times they may be present in small amount (*Lophophyllum*, somes species of *Amplexus*, &c.); at other times they are exceedingly abundant. In the species of *Cyathophyllum*, in *Lithostrotion*, in *Koninckophyllum*, and in other forms, the dissepiments are so largely developed towards the circumference of the visceral chamber as to give rise to a dense peripheral zone of vesicular tissue. In longitudinal sections of the corallum this vesicular tissue is seen to be composed of very minute lenticular cells arranged in oblique rows directed upwards and outwards. In other forms, such as *Campophyllum, Lonsdaleia*, &c., a similar zone of vesicular tissue exists, but the cells which enter into its composition are of very large size. In the genus *Heliophyllum*, and in certain other forms, there are found singular dissepimental structures, which are attached to the sides of the septa, but do not extend completely across the interseptal loculi. The structures in question constitute a series of plates which are attached by their bases to the sides of the septa, projecting freely into the interseptal loculi, and directed inwards and upwards in an arched manner from the interior of the wall towards the centre of the visceral chamber. These arched ridges are placed at corresponding points on the opposite side of each septum; they consequently appear on the free edges of the septa within the calice as so many spines, and they communicate to cross-sections of the septa a characteristic cross-barred appearance. In the *Cystiphyllidæ*, again, the entire visceral chamber is filled with a vesicular tissue of convex and inclined cells, which may be regarded as formed partly by dissepiments and partly by tabulæ.

Tabulæ are in general well developed amongst the Rugose corals, and coexist with well developed septa. In some genera (such as *Amplexus* and *Zaphrentis*) the tabulæ are "complete," that is to say, they pass completely across the visceral chamber from side to side, thus dividing it into a succession of distinct stories, of which only the uppermost is occupied by the living tissues of the animal. In a greater number of cases (*e.g. Cyathophyllum, Lithostrotion, Lonsdaleia, Heliophyllum*, &c,), the tabulæ are "incomplete," that is to say they do not extend across the visceral chamber, but are confined to a larger or smaller central area. The central tabulate area may or may not be pierced by a columella; and the septa may either be prolonged across the upper surfaces of the tabulæ to the centre of the corallum, or they may fall short of the centre, and thus leave a larger or smaller area of the tabulæ free to view, and conspicuously visible in the floor of the calice. The tabulæ may be well developed, approximately horizontal, remote plates, as is usually the case in *Zaphrentis* and *Amplexus*, or they may anastomoze in various ways, and become so intimately connected with one another as to give rise to a species of vesicular tissue.

As regards the *affinities* of the Rugose corals, doubts have of late years been expressed as to their systematic position and relationships. By Professor Louis Agassiz the entire order of the *Rugosa* was transferred from the *Actinozoa* to the *Hydrozoa*, but upon insufficient evidence. It had been observed by Agassiz that the living animal of *Millepora* was apparently a hydroid, closely allied to *Hydractinia*, and it was upon the strength of this observation alone that the distinguished American naturalist proposed this sweeping change. The following considerations show, however, that this change cannot be accepted. (1) *Millepora* is not a Rugose coral, but belongs to the so-called Tabulate corals, of which it constitutes a very aberrant member. Even, therefore, were it satisfactorily proved that the genus *Millepora* is a true *Hydrozoön*, as to which naturalists are not yet agreed, this would not affect the classification of the *Rugosa*, which are very distinct in their structure from the *Tabulata*, and have no affinities with them further than is implied by the fact that tabulæ are present in both. (2) It has been shown that the group of the *Tabulata* itself contains both true *Zoantharia* and true *Alcyonaria*, so that the hydroid character of *Millepora*, if admitted, would not so much as cause the removal of the *Tabulata* to the *Hydrozoa*. (3) It has further been shown that tabulæ are present in certain forms which are unquestionably *Actinozoa*, as shown by an examination of the living animal (*Pocillopora* and *Lophohelia*). It is evident, therefore, that the presence of tabulæ in itself should have no weight in determining the systematic position of any given form, unless at the same time the structure of the living animal be known. (4) Apart from the close similarity between the corallum of the *Rugosa* and that of the recent *Zoantharia sclerodermata*, the Rugose corals are provided, almost invariably, with structures which, so far as we know, are absolutely irreconcilable with the belief in their Hydrozoal affinities. They possess, namely, in almost all cases, well developed *septa*, which, if they do not absolutely imply the existence of *mesenteries* in the living animal, are, at any rate, wholly unknown as occurring amongst the recent *Hydrozoa*. We may, therefore safely accept the conclusion of Verrill, Pourtales, Claus, Duncan, Milne-Edwards, and other distinguished authorities, that Agassiz has failed to bring forward sufficient evidence in favour of his view that the *Rugosa* are referable to the *Hydrozoa*.

More lately Dr Lindström has endeavoured to show that the *Rugosa* cannot be placed amongst the *Actinozoa*, but "must form a class of their own in the great division of the Radiated Animals." The chief grounds upon which this conclusion is reached are "the compact imperforate structure of the calyx and septa (the septa originating from four primary ones), the absence of costæ, the strange septal fossæ in the bottom of the calyx, the processes resembling rootlets, the transverse floors or tabulæ in the interior, which often have a cellular or vesicular structure," and the occasional presence of an operculum. It is obvious, however, that none of the above-mentioned peculiarities are of such fundamental importance as to justify us in overlooking the substantial identity of structure which subsists between the corallum of the *Rugosa* and that of the Aporose section of the *Zoantharia sclerodermata*. The wall and septa are often compact amongst the latter; the septa have a tetrameral arrangement in the unquestionable living *Actinozoa, Haplophyllia* and *Guynia*; the septal fossula is not always recognizable amongst the *Rugosa*; the presence of rootlets and the nature of the costæ are points of secondary importance; tabulæ are present in undoubted corals belonging to the *Zoantharia sclerodermata*; and the occasional presence in some abnormal forms of an operculum would no more justify us in removing the *Rugosa* from the *Actinozoa* that we should be warranted for the same reason in removing the living *Primnoæ* from the *Alcyonaria*. Upon the whole, then, there appears to be little danger in accepting the conclusion reached by Professor Verrill, one of the most distinguished of living authorities on the subject, that there can no longer be any reasonable doubt but that the coralla of the great majority of the *Rugosa* were made by "true polypes essentially similar to those of the existing corals." Indeed, if any great change in our classification is to be made, it would seem rather to be in the direction of more closely approximating the *Rugosa* to the *Zoantharia sclerodermata*. The tetrameral arrangement of the septa is by no means always very conspicuous amongst the *Rugosa*, and it seems not unlikely that too high a classificatory value has been attached to it. Leaving this out of account, the affinities of the typical *Rugosa* with the *Aporosa* are very close, and it may be doubted if it would not be proper to establish a more intimate union between these groups. At the same time, it must not be overlooked, as pointed out by Mosely, that the *Rugosa* have certain affinities with the *Alcyonaria*, and especially with singular recent *Heliopora*. Great stress, however, can hardly be laid upon the existence of paired opercular structures in *Goniophyllum* and in the existing Alcyonarian genus *Primnoa*, since *Goniophyllum*, if a Rugose coral at all, must be referred to the *Cystiphyllidæ*, a family in which all the more characteristic features of the Rugose organization have disappeared.

The *divisions* of the *Rugosa* recognized and founded by Milne Edwards and Jules Haime, and subsequently generally adopted, are the following:—

Fam. I. Stauridæ.—The wall is well developed; the septa lamellar, extending without interruption from the bottom to the top of the visceral chamber, and showing a conspicuous quaternary arrangement. The interseptal loculi are crossed by endothecal dissepiments, and there is a central tabulate area. Of the five genera which form the family, *Stauria* has a compound corallum, astræiform in shape, and increasing by calicular gemmation; there is no columella; and the four primitive septa form a conspicuous cross. *Holocystis* is also composite and astræiform,—the corallites being united by well developed costæ, and a styliform columella being present. Of the simple genera, the Permian *Polycœlia* and the Tertiary *Conosmilia* are closely allied to one another; but the third, *Metriophyllum*, is so aberrant that it may require to be placed in a separate family, as its septa are arranged in four distinct groups, separated from one another by four distinct fossulæ.

Fam. II. Cyathaxonidæ.—In this family the corallum is simple, with a deep calice; the septa are well developed, and extend from the bottom of the visceral chamber to the floor of the calice; the interseptal loculi are completely open, and there are neither dissepiments nor tabulæ. Though exhibiting a quaternary arrangement, the four primary septa are not conspicuously developed above the others. This family makes an exceedingly close approach to the Aporose group of the *Turbinolidæ*, from which it is separated by the tetrameral arrangement of the septa. Of the genera of the family, *Cyathaxonia* is Palæozoic, whilst *Haplophyllia* and *Guynia* are recent. No Secondary or Tertiary forms are as yet known.

Fam. III. Cyathophyllidæ.—In this family the corallum is simple or compound; and the septa are always more or less interrupted, and do not extend as complete lamellæ from the bottom to the top of the visceral chamber, being more or less imperfect either internally or externally. The four primitive septa are not pre-eminently developed, so as to give rise to a conspicuous cross. The interseptal loculi are generally more or less interrupted by the development of dissepiments, and tabulæ are invariably present. The family of the *Cyathophyllidæ* is divided by Milne-Edwards and Haime into the two tribes of the *Zaphrentinæ* and the *Cyathophyllinæ*.

a. Zaphrentinæ.—In this tribe the corallum is simple and free; a well-developed septal fossula is present, which may be formed by a tubular inflection of the tabulæ on one side, or may be replaced by a cristiform process. The septa usually fall short of the centre of the visceral chamber, and, from the presence of a septal fossula, are invariably more or less irregular in their arrangement. The tabulæ are complete, and pass from one side of the visceral chamber to the other; while dissepiments are poorly developed, and there is usually nothing of the nature of a columella. The *Zaphrentinæ* are exclusively Palæozoic, and the principal genera of the family are *Zaphrentis, Amplexus, Menophyllum, Lophophyllum, Anisophyllum, Baryphyllum, Hadrophyllum, Microcyclus, Combophyllum, Trochophyllum, Aulacophyllum, Hallia*, and *Streptelasma*.

b. Cyathophyllinæ.—In this family the septa do not exhibit the irregularity which is so conspicuous in the *Zaphrentinæ*, but are more or less regularly radiate in their arrangement. In some cases, the septa may be equally divided into four groups by four shallow fossæ in the calice. A true columella may be present or absent, or there may be a pseudo-columella formed by the twisting together of the inner edges of the septa. A more or less well-developed zone of vesicular tissue, formed by endothecal dissepiments, is usually found on the exterior of the visceral chamber; and the tabulæ are not complete, but occupy a more or less extensively developed central area. The corallum may be simple or compound. All the *Cyathophyllidæ* are Palæozoic, and the principal genera are *Cyathophyllum, Campophyllum, Omphyma, Pachyphyllum, Chonophyllum, Ptychophyllum, Heliophyllum, Palæocyclus, Clisiophyllum, Dibunophyllum, Aspidophyllum, Rhodophyllum, Aulophyllum, Cyclophyllum, Acervularia, Strombodes, Phillipsastræa, Smithia, Endophyllum, Spongophyllum, Syringophyllum, Eridophyllum, Diphyphyllum, Lithostrotion, Lonsdaleia, Chonaxis, Axophyllum, Koninckophyllum*, &c.

Fam. IV. CYSTIPHYLLIDÆ.—The corallum in this family is simple, or rarely compound; the septa are rudimentary, and are generally only recognizable as so many vertical striæ within the calice. The outer wall is complete, but the entire visceral chamber is filled with small convex vesicles, sometimes arranged in infundibuliform layers, and formed by the dissepiments and tabulæ in combination. A distinct septal fossula may or may not be present. The entire family is Palæozoic, and the only undoubted genus is *Cystiphyllum* itself. In their internal structure, however, the singular operculate corals of the genera *Goniophyllum, Rhizophyllum*, and *Calceola* present striking affinities with the *Cystiphyllidæ*, whilst a species of the genus *Cystiphyllum* (*C. prismaticum*) has been described by Lindström as being furnished with an operculum. We may, therefore, with great probability, refer the above mentioned abnormal genera to this family of the *Rugosa*. It should be borne in mind that the *Cystiphyllidæ*, with or without *Goniophyllum* and its allies, are such abnormal forms that it is difficult to assert positively that they belong to the *Rugosa*, and it remains possible that they should be separated to form a special group.

As regards their *geological distribution*, the Rugose corals have a vast development in the seas of the Palæozoic period, where they seem to take the place, to a large extent at any rate, of the Aporose section of the *Zoantharia sclerodermata*. In the Secondary period only one genus (*Holocystis*) of the *Rugosa* is known, and but one is known in the Tertiary rocks (*Conosmilia*), whilst the only two living genera which could be referred here are the *Haplophyllia* of Florida and the *Guynia* of the Mediterranean.

In the Silurian period the *Rugosa* are very largely developed, especially in the upper division. The principal genera of this period are—*Cyathophyllum, Zaphrentis, Cystiphyllum, Streptelasma, Acervularia, Strombodes, Omphyma, Palæocyclus, Diphyphyllum, Amplexus, Ptychophyllum, Stauria, Syringophyllum, Goniophyllum, Rhizophyllum*, and *Pholidophyllum*. [The Lower Silurian *Columnariæ* with complete septa (*Favistella*) are probably Aporose corals; *Columnopora* is perhaps one of the *Perforata*; and *Petraia* and *Duncanella* are in a somewhat dubious position.] In deposits of Devonian age, Rugose corals are exceedingly abundant, the principal genera of this period being *Cyathophyllum, Heliophyllum, Diphyphyllum, Eridophyllum, Campophyllum, Endophyllum, Pachyphyllum, Phillipsastræa, Acervularia, Smithia, Spongophyllum, Blothrophyllum, Zaphrentis, Baryphyllum, Aulacophyllum, Anisophyllum, Trochophyllum, Combophyllum, Hadrophyllum, Microcyclus, Hallia, Metriophyllum*, and *Amplexus*. In the Carboniferous period the Rugose corals still remain very abundantly represented by forms belonging to such genera as *Cyathophyllum, Lithostrotion, Diphyphyllum, Lonsdaleia, Axophyllum, Clisiophyllum, Cyclophyllum, Rhodophyllum, Zaphrentis, Amplexus, Lophophyllum, Menophyllum, Campophyllum, Phillipsastræa*, &c. In the Permian rocks, which so far have proved to be extremely unfossiliferous, no examples of the *Rugosa* are known save the genus *Polycœlia*, so far at any rate as Britain is concerned. In the great series of the Secondary formations no *Rugosa* are as yet known save two species of the single genus *Holocystis* of the Lower Cretaceous. In the great series of the Tertiary deposits, again, there has hitherto been discovered only a single Rugose genus, the *Conosmilia* of the later Tertiaries of Australia.

ORDER III.—ALCYONARIA (*Octocoralla*).

The members of this order are *Actinozoa* in which the polypes possess eight tentacles, which are fringed on their sides with lateral pinnæ, or papillæ. As in the *Zoantharia*, the mouth opens into a tubular stomach, which in turn communicates freely with the body-cavity, and the stomach is connected with the body-wall by means of a series fo vertical membranous laminæ or mesenteries. The mesenteries, however, are only eight in number, and are not paired, one of the tentacles corresponding with and opening into each inter-mesenteric chamber. As a general rule a corallum is secreted, though this may be wanting, and its nature differs in different cases. In some forms (*Alcyonium, Xenia*, &c.) the corallum is sclerodermic, and consists of variously-formed spicules of lime scattered in the soft tissues. In others (*Tubipora*) the corallum is external and sclerodermic, with true thecæ, but without septa or tabulæ, and formed of fused spicules, detached structures of the same nature existing in the soft parts. In others (*Heliopora*) the corallum is external and sclerodermic, with true thecæ provided with septa and tabulæ. In others, finally (*Gorgonia, Corallium, Pennatula*, &c.), there is double corallum, the one consisting of a calcareous or horny sclerobasis, over which the soft parts are spread, the other consisting of sclerodermic spicules scattered in the integuments. With the exception of the single genus *Haimeia*, which is possibly not a mature form, all the *Alcyonaria* are composite. The tubular polypes are united by a cœnosarc, and their body-cavities are placed in communication by means of canals which ramify through the cœnosarc, and permit of a free circulation of nutrient fluids. The form of the colony varies greatly in different cases, being usually more or less branched, arborescent, or lobate, but being at other times massive, incrusting, creeping, linear, &c. None of them possess the power of independent locomotion, most being rooted to foreign objects in their adult condition, but some being simply sunk in the mud, and a few floating freely in the sea. Many of them exhibit the most brilliant coloration, due in many instances to the brightly-coloured spicules disseminated in their tissues. In some, lastly, it has been shown that the colony normally consists of two kinds of polypes, one sexual, the other sexless and permanently rudimentary. The *Alcyonaria* may be briefly discussed under the five following families:—

Fam. I. ALCYONIDÆ.—The members of this family are all fixed to foreign objects, and are more or less fleshy in their consistence, owing to the fact that the corallum consists simply of sclerodermic spicules scattered in the integuments, and there is no sclerobasis. The spicules are of various forms, but principally fusiform, and they are scattered through the cœnosarc and the soft tissues generally, but are often specially aggregated at the bases of the tentacles and along the tentacles themselves. The spicules may be present in very small numbers (as in some species of *Spoggodes*), but they may be present in such numbers as to render the surface rough and prickly (as in *Nepthya, Paralcyonium*, and the typical species of *Spoggodes*). The actinosoma may form lobate masses within which the polypes can be retracted at will (*Alcyonium*), or more or less branched and having the polypes non-retractile (*Xenia*). Others form membranous crusts, attached to foreign bodies, the polypes being sometimes retractile (*Anthelia*), sometimes non-retractile (*Sympodium*). Others form a creeping colony of slender stolons, sending up polypes at different points, the lower portion of the colony being so thickened by spicular secretions as to constitute a kind of tubular corallum into which the polypes can withdraw (*Cornularia*). In the genus *Sarcophyton*, lastly, it has recently been shown (Mosely) that the colony, like that of many of the *Pennatulidæ*, is dimorphic, consisting partly of sexually perfect polypes, and partly of zoöids which are destitute of generative organs and of tentacles. The zoöids, however, have a stomach and mouth, and are connected with the perfect polypes by a canal-system.

Fam. II. TUBIPORIDÆ.—This forms a very small family, including only the various species of the "Organ-pipe corals" (*Tubipora*), and often included with the preceding, to which it is closely related. In the common *Tubipora musica*, which may be taken as the type of the family, there is a very well developed sclerodermic corallum, with true thecæ enclosing the polypes, but without septa. The corallum is bright red in colour, and is composed of tubular, cylindrical thecæ, usually growing regularly side by side, but at a little distance from one another, and united at intervals by horizontal epithecal expansions, which represent external tabulæ. There are no septa, nor internal tabulæ; and Dr Perceval Wright has shown that the tubes are really composed of fused spicules. The polypes are green, with eight pinnate tentacles studded with lenticular spicules. The polypes when alarmed retract themselves within their tubes, the upper portion of the tube, as shown by Dr Wright, being composed of fusiform warty spicules which are loose, and thus allow this part to be pulled into the lower dense portion of the theca. The mouth is placed betwoe

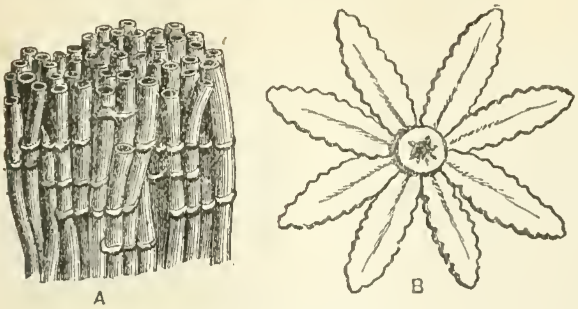

FIG. 12.—Tubiporidæ.

A, Portion of the corallum of *Tubipora musica*, of the natural size, showing the tnbular corallites and the exothecal tabulæ. B, Polypo of the same, greatly enlarged, showing the month and tentacles.

bases of the tentacles, with a slightly elevated lip, and leads into a small stomach-sac. There are eight mesenteries, within which the reproductive organs are contained. The exothecal expansions, by which the tubes are united, appear to be produced periodically as horizontal extensions from the mouths of the tubes.

Fam. III. PENNATULIDÆ.—The "Sea-pens" and "Sea-rods" are compound *Alcyonaria*, but instead of being rooted to some foreign object, they possess a fleshy, usually columnar or rod-like base, which is non-polypiferous, and is plunged in the sand and mud of the sea-bottom. The upper portion of the colony carries the polypes, and varies much in shape. Sometimes the polypes are borne on long lateral pinnæ, which give the upper portion of the actinosoma a feather-like appearance *(Pennatula)*; whilst at other times there are similar but much shorter pinnæ (*Virgularia*). In *Veretillum* the upper portion of the colony is short and club-shaped, and carries the polypes all around its circumference, and the same is the case in *Cophobelemnon.* In *Pavonaria* the polypes are non-retractile, and are disposed on one side of the slender actinosoma; whilst in *Renilla* the polypes are also unilateral, but the polypiferous surface is thin and reniform. In *Umbellularia*, the polypes are carried in a cluster at the top of the actinosoma. The corallum in the *Pennatulidæ* is usually two-fold, consisting on the one hand of a slender, styliform, horny, or calcareous axis (sclerobasis) concealed within the cœnesarc, which it serves to support, and, on the other hand, of small calcareous spicules scattered amongst the soft tissues. In some cases the sclerobasis is rudimentary. The *Pennatulidæ* often possess the power of phosphorescence in a high degree, and they possess the same system of cœnosarcal canals as is characteristic of the *Alcyonaria* generally. The polypes have eight pinnately-fringed tentacles, and eight mesenteric folds. In many cases, as originally shown by Kölliker, the colony consists of two classes of zoöids, the one composed of sexually mature polypes, the other, more numerous, composed of sexless polypes, in which tho tentacles are not developed.

FIG. 13.—Pennatulidæ.

Colony of *Veretillum cynomorium*, Linn., of tho natural size, with the polypes protruded.

Fam. IV. GORGONIDÆ.—The "Sea-shrubs" possess a more or less branched cœnosarc, which is permanently rooted to some foreign object, and is provided with a grooved or sulcate branched sclerobasis, with which are associated true tissue-secretions in the form of variously shaped sclerodermic spicules ("sclerites"). As regards their soft parts, the *Gorgonidæ* do not differ from the other *Alcyonaria*, the polypes possessing eight fringed tentacles, with eight mesenteries, united by a canal-system, which ramifies through a fleshy cœnosarc. The cœnosarc, however, is always closely applied to, and supported by, a more or less branched sclerobasis, over which it forms a thin fleshy expansion ("cortex"), and the polypes are capable of complete retraction within the cœnosarc. The soft tissues are also abundantly supplied with true sclerodermic secretions, in the form of calcareous spicules of very various shapes, and often of very brilliant colours, which are in many instances so characteristic in their form that they can bo employed as a ground of generic distinction. The spicules ("sclerites") are usually buried in the soft tissues, but they may project beyond the surface of the cœnosarc in such numbers as to render the integument rough and scoriaceous *(Muricea)*. The sclerobasis varies greatly both in texture and form. Sometimes it resembles that of the *Antipathidæ* in being corneous and unjointed, but its surface is always striate or grooved, whereas in the "Black Corals" it is smooth or echinulate. Its form is usually more or less branched, dendroid, or minutely arborescent (as in *Primnoa, Muricea, Gorgonia, Leptogorgia*, &c.), or it may bo in the shape of a regularly reticulate flabelliform expansion (*Rhipidogorgia*). In the genus *Isis* the sclerobasis is branched and articulated, composed of alternating calcareous and horny joints, and having the new branches produced from tho calcareous nodes. In *Melithæa* and *Mopsea*, again, the corallum is likewise branched and articulated; but the joints are alternately hard and soft; the hard joints being composed of fused calcareous spicules, and the flexible joints of horny matter intermixed with calcareous spicules and connective tissue, whilst the new branches are developed from the corneous segments. Lastly, in Red Coral (*Corallium*) the sclerobasis is unjointed, more or less branched, and densely calcareous. It is of a red or pink colour, and finely grooved upon its surface; and it is really composed of fused spicules, and thus differs very materially from the true sclerodermic corallum. The calcareous axis is covered with a bright red cœnosar-

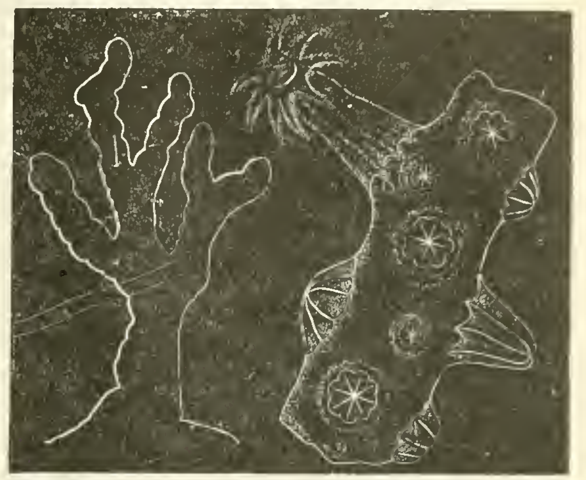

FIG. 14.—Red Coral (*Corallium rubrum*), of the natural size, and a portion enlarged.

cal crust or cortex, which is studded by the apertures for the polypes. The polypes are milk-white in colour, with eight pinnately-fringed tentacles, and completely retractile within the fleshy bark. The polypes are further placed in direct communication by means of anastomozing canals channelled out of the cœnosarc and filled with a nutrient fluid. It has been shown by Lacaze-Duthiers that the colonies of *Corallium* are sometimes composed of male polypes, sometimes of female, or occasionally all the polypes of some branches of a colony may be of one sex, and all the polypes of other branches of the opposite sex, whilst in some instances polypes occur which are hermaphrodite and combine in themselves the organs of both sexes.

Fam. V. HELIOPORIDÆ.—An examination of the living *Heliopora* in its fresh state has recently induced Mr Mosely to found this family for the reception of the existing genus *Heliopora* and a number of extinct forms previously placed amongst the *Tabulata*. In *Heliopora* there exists a well-developed sclerodermic corallum, of a composite nature, and composed of corallites united by cœnenchyma. The corallites are tubular, crossed regularly by well-developed tabulæ, and having their walls folded in such a manner as to give rise to a variable number (generally twelve) of septal laminæ. The cœnenchyma is composed of slender tubes, of smaller size than the true corallites, and packed closely side by side. The cœnenchymal tubuli are destitute of septa, but, like the corallites, are crossed by regular transverse tabulæ. The sclerenchyma is not composed of fused spicules, as in *Corallium* and *Tubipora*, but of fibro-crystalline calcareous tissue, as in the *Zoantharia sclerodermata*. The soft parts occupy only the parts of the corallum above the uppermost tabulæ, and therefore only a surface-layer of the colony is actually alive. The polypes are completely retractile, with pinnately-fringed tentacles, which are introverted in retraction. There are also eight lobed mesenteries, but these in no way correspond with the septa, the latter being twelve in number. The septa are thus seen to be pseudo-septa, and they cannot be regarded as homologous with the septa of the *Zoantharia sclerodermata*. The cœnenchymal tubes are occupied by sacs lined by the endoderm, which are closed externally but communicate freely with the somatic cavities of the polypes by means of transverse canals. Mr Mosely suggests, with great probability, that the sacs lining the cœnenchymal tubes are really of the nature of aborted polypes. (A similar suggestion was put forth by the present writer with regard to the cœnenchymal tubuli of *Heliolites* and its allies, upon other grounds. *Trans. Roy. Soc. Edin.*, vol. xxvii. p. 248.)

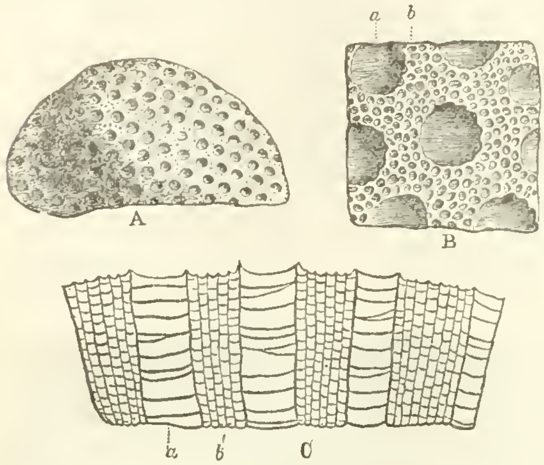

Fig. 15.

A. Small colony of *Heliolites megastoma*, M'Coy, of the natural size. B. Small portion of the surface of the same, magnified, showing the calices (*a*) and cœnenchymal tubuli (*b*). C, Vertical section of the same, enlarged, showing the tabulate corallites and the tabulate tubes of the cœnenchyma.

The investigations and discoveries of Mr Mosely with regard to *Heliopora* are of special interest, as settling the true position of a number of fossil corals, which had previously been placed in the Tabulate division of the *Zoantharia sclerodermata*, but which must now be referred to the *Alcyonaria*. The discovery, also, of tabulæ combined with a genuine sclerodermic corallum in an undoubted *Alcyonarian* further raises a question as to the true affinities not only of the *Tabulata* generally, but also of the *Rugosa;* whilst the discovery of septa which do not correspond with the mesenteries of the living animal will produce important results in the study of the fossil corals generally. Without entering into any of these questions here, there can be no doubt but that the extinct genus *Heliolites* and its allies are so closely related to *Heliopora* as to necessitate their being placed in the *Alcyonaria* as members of the family *Helioporidæ*. In the genus *Heliolites* there is a well-developed sclerodermic corallum, the corallites being tubular, regularly tabulate, and usually with well-developed septa, whilst the cœnenchyma is composed of tabulate, geometric tubuli, smaller than the corallites and without septa. In the genus *Plasmopora* the corallum is very similar to that of *Heliolites*, differing chiefly in the fact that the cœnenchyma is more vesicular, and the tubuli are not so distinct. *Propora*, again, can hardly be separated from *Plasmopora*, its chief distinction being that the calices are exsert. *Lyellia*, also, is closely related to *Heliolites*. *Polytremacis*, also, differs from *Heliolites* chiefly in its granular surface, and it is hardly separable from *Heliopora* except by the fact that its septa are more developed. Finally, there are various extinct genera, such as *Fistulipora*, *Callopora*, &c., which have very close relationships to *Heliolites*, though they are destitute of septa, and which very probably will have to be ultimately associated in the same group.

With regard to the *distribution in space* of the *Alcyonaria*, it is sufficient to say that they are very widely spread over the globe, occurring in all seas from the warmest to the coldest, and at almost all depths. The *Alcyonidæ* are for the most part inhabitants of shallow water, but the *Pennatulidæ* are represented up to almost the greatest depths yet sounded by the dredge. The *Gorgonidæ* are principally shallow-water forms, and attain their maximum of development in the seas of the tropics, abounding on coral-reefs, to the beauty of which they greatly contribute. The red coral of commerce (*Corallium rubrum*) is a Mediterranean species, and occurs principally at depths of from 5 to 6 fathoms, though extending its range up to 120 fathoms or more. It is very largely sought after, and obtains a high price for ornamental purposes. The "coral fishery" is carried on by means of machines of different construction, which are dragged over the sea-bottom, and which usually injure more of the coral than they actually bring to the surface. Hence many valuable coral-beds have been completely exhausted, and the industry has no longer the importance that it formerly possessed. The "Organ-pipe corals" (*Tubipora*) are confined to the warm seas of the "coral-reef region;" and the genus *Heliopora*, the only living representative of the family *Helioporidæ*, is confined to the Pacific and Indian Oceans.

As regards their *distribution in time*, none of the *Alcyonaria*, except the *Helioporidæ*, can be said to be known with certainty in deposits of Palæozoic age. The genus *Protovirgularia* was founded by M'Coy for the reception of a Silurian fossil which he believed to be allied to the living *Virgulariæ*, but it appears to be certainly not of this nature, and is probably a graptolite. The family of the *Helioporidæ* is well represented in the Palæozoic period; the genus *Heliolites* being Silurian and Devonian, *Propora* and *Lyellia* being Silurian, and *Plasmopora* Silurian and doubtfully Devonian. If *Callopora* and *Fistulipora* be referred to this group, then we may also consider that we have Carboniferous and Permian representatives of it. The genus *Polytremacis*, again, is confined to the Cretaceous period. The family of the *Gorgonidæ* is not known to be represented with certainty earlier than the Eocene Tertiary, two genera (*Mopsea* and *Websteria*) being found in the London clay. The genus *Corallium* has been doubtfully quoted from the Upper Oolites and Upper Cretaceous, and undoubtedly occurs as early as the Miocene. The Miocene deposits have also yielded species of *Isis*, *Gorgonia*, *Gorgonella*, and *Melithœa*. The family of the *Pennatulidæ* is not represented earlier than the latest Secondary or the earlier Tertiary deposits. The genus *Pavonaria* is said to occur in the Pisolitic Limestone of France, whilst *Graphularia* (and perhaps *Virgularia*) is found in the Eocene. The Miocene Tertiary has also yielded species of *Virgularia*, *Graphularia*, and *Cœlographula*. The family of the *Tubiporidæ* has not been recognized at all in a fossil condition. Lastly, the past existence of the *Alcyonidæ* has only been recognized with any certainty in the Pliocene deposits, the Red and White Crags having yielded a species of *Alcyonium*.

Bibliography.—Amongst the more important works and memoirs which may be consulted by the student of recent and fossil corals may be mentioned the following:—Agassiz, Louis, *Contributions to the Natural History of the United States*, vols. iii. and iv., on "Acalephs;" De Blainville, *Manuel d'Actinologie et de Zoophytology*, 1837; Bronn, *Die Klassen und Ordnungen des Thierreich's* (*Strahlenthiere*), vol. ii. parts 1-6, 1859-60; Cuvier, *Règne Animal*, 3d ed. vol. iii., "Zoophytes;" Dana, *Rep. of Wilkes's Expl., Exped.* "Zoophytes," 1848; also *Corals and Coral Islands*, 1872; Edwards and Haime, *Histoire Naturelle des Coralliaires, ou Polypes proprement dits*, 1857-60; also by the same, "Recherches sur la Structure et Classification des Polypiers recents et fossiles," in *Ann. Sc. Nat.*, 1848-52; Ehrenberg, *Beiträge zur Physiologischen Kenntniss der Corallenthiere im Allgemeinen, und besonders des Rothen Meeres*, Berl. 1834; Ellis, *Essay towards a Natural History of the Corallines, &c.*, 1755; Ellis and Solander, *The Natural History of many Curious and Uncommon Zoophytes*, 1786; Gosse, *Actinologia Britannica, A History of the British Sea-Anemones and Madrepores*, 1860; Greene, *Manual of the Cœlenterata*, 1861; Johnston, *History of British Zoophytes*, 2d ed. 1847; Kölliker, *Icones Histiologicæ, Abth. ii., die Bindesubstanz der Cœlenteraten*, 1865, Lacaze-Duthiers, *Histoire Naturelle du Corail*, also "Developpment des Coralliaires," in *Archives de Zool. Experimentale*, 1872-73; Lamarck, *Hist. Nat. des Animaux sans Vert.*, 2d ed., 1836-39; Lamouroux, *Exposition Méthodique des genres de l'ordre des Polypiers*, 1821; also *Histoire des Polypiers flexibles*, 1816; Leuckart, *Ueber die Morphologie der wirbellosen Thiere*, 1848; Pourtales, "Deep-Sea Corals;" No. 4 of the *Illust. Catalogue of the Mus. of Comp. Zoology*, 1871; Quoy and Gaimard, *Voyage de l'Astrolabe*, also *Voyage de l'Uranie;* Rapp, *Ueber die Polypen im Allgemeinen und die*

Actinien insbesondere, 1829. There are also numerous works and memoirs not above referred to by Alexander Agassiz, Louis Agassiz, Allman, Asbjornsen, Brandt, Busch, Claus, Cobbold, Costa, Dalyell, Dana, Darwin, Duncan, Fischer, E. Forbes, Frey and Leuckart, Gosse, Gray, Haime, Hollard, Johnston, Leidy, Lütken, Michelin, Milne-Edwards, Mobius, Moseley, Oersted, Phillippi, Pourtales, Quatrefages, Quoy and Gaimard, Rathke, Rötteken, Sars, Schmarda, Schneider, Stimpson, Teale, Verrill, Willemoes-Suhm, Perceval Wright, Strethill Wright, and others.

As regards *Coral-reefs*, the following may be consulted:—Dana, *Corals and Coral Islands*, 1872, and "Zoophytes" in *Report of Wilkes's Expl. Exped.*, 1848; Darwin, *On the Structure and Distribution of Coral-Reefs*, 1st ed. 1842, 2d. ed. 1874; Chamisso and Von Kotzebue, *Entdeckungs-Reise in die Südsee*, 1815; Ehrenberg, *Ueber die Natur and Bildung der Coralleninseln und Corallenbänke im Rothen Meere*, Berlin, 1834; also works or papers by Beechey, Couthouy, Flinders, Foster, Jukes, Quoy and Gaimard, Semper, &c.

As regards the *Rugosa* and *Fossil Corals* generally, the following may be consulted:—Bronn, *Lethæa Geognostica*, 1851-1856; De Fromentel, *Introduction a l'étude des Polypiers Fossiles*, 1858-61; D'Orbigny, *Cours Elémentaire de Paléontologie*, 1849; Duncan, *British Fossil Corals, Supplement, in the Monographs of the Palæontographical Society (Tertiary and Secondary Corals)*, also *Reports of the British Association*, 1868, 1869, 1871; Dybowski, *Monographie der Zoantharia Sclerodermata Rugosa aus der Silurformation Estlands, &c.*, 1873; Edwards and Haime, *Histoire Naturelle des Coralliaires*, 1857-60, also *British Fossil Corals, Monographs of the Palæontographical Society;* Geinitz, *Grundriss der Versteinerungskunde*, 1846; Kunth, *Beiträge zur Kenntniss Fossiler Korallen*, 1870; Michelin, *Iconographie Zoophytologique*, 1840-47; Münster, *Beiträge zur Petrefaktenkunde*, 1840; Pictet, *Traité de Paléontologie*, 2d ed. 1853; Owen, *Palæontology*, 2d ed. 1861; Quenstedt, *Handbuch der Petrefaktenkunde*; Reuss, *Die Fossilen Polyparien des Wiener Tertiär-becken's*, 1847. In addition to the above, descriptions of various Rugose or other fossil corals are to be found in palæontological and geological treatises, such as—Billings, *Palæozoic Fossils of Canada*, vol. i., 1861-65; De Koninck, *Animaux Fossiles du Terrain Carbonifère de Belgique*, 1842-71; Eichwald, *Lethæa Rossica*, 1855; Goldfuss, *Petrefakten Deutschlands*, 1826-33; Hall, *Palæontology of New York*, 1847, *Geology of Iowa*, 1858, and various *Reports on the State Cabinet*; Hisinger, *Lethæa Suecica*, 1837; Lonsdale in *Siluria*, and Appendix to Murch., Vern., and Keys., *Russia in Europe;* M'Coy, *British Palæozoic Fossils*, 1851, *Contributions to British Palæontology*, 1854; *Synopsis of the Carboniferous Fossils of Ireland*, 1844; Meek and Worthen, *Geological Survey of Illinois*, 1866-73; Pander, *Beiträge zur Geognosie des Russischen Reiches*, 1830; Philips, *Geology of Yorkshire*, vol. ii., 1836, and *Palæozoic Fossils of Cornwall, Devon, &c.*, 1841; Portlock, *Report on the Geology of Londonderry*, &c., 1843; Rœmer, *Die Silurische Fauna des Westlichen Tennessee*, 1860; Salter, *Catalogue of Cambrian and Silurian Fossils in the Geological Museum of Cambridge University*, 1873; Sowerby, *Mineral Conchology*, 1822, &c. In addition to the above there are various works and memoirs, wholly or in part occupied with lists or descriptions of fossil corals, and not referred to in the foregoing, by Billings, Bronn, Castelnau, Dale-Owen, Dana, De Koninck, D'Orbigny, Duncan, Dybowski, Edwards (Milne), Eichwald, Fischer von Waldheim, Fougt, Fromentel, Haime, Hall, Howse, Keyserling, King, Kunth, Kutorga, Lamarck, Lesueur, Lindström, Linné, Lonsdale, Ludwig, M'Coy, Morren, Morris, Nicholson, Phillips, Reuss, Rœmer, Rominger, Safford, Salter, Schlotheim, Schmidt, Schweigger, Steininger, Thomson (James), Tornquist, Verril, Wahlenberg, Whitfield, Wright (Dr Thomas), Zaphrinesque, &c. (H. A. N.)

Industrial Uses of Corals.—Beyond their general utility and value as sources of lime, none of the corals presents any special feature of industrial importance, excepting the red or precious coral (*Corallium rubrum*) of the Mediterranean Sea. It, however, is and has been from remote times very highly prized for jewellery, personal ornamentation, and decorative purposes generally. About the beginning of the Christian era a great trade was carried on in coral between the Mediterranean and India, where it was highly esteemed as a substance endowed with mysterious sacred properties. It is remarked by Pliny that, previous to the existence of the Indian demand, the Gauls were in the habit of using it for the ornamentation of their weapons of war and helmets; but in his day, so great was the Eastern demand, that it was very rarely seen even in the regions which produced it. Among the Romans branches of coral were hung around children's necks to preserve them from danger, and the substance had many medicinal virtues attributed to it. A belief in its potency as a charm continued to be entertained throughout mediæval times; and even to the present day in Italy it is worn as a preservative from the evil eye, and by females as a cure for sterility.

The precious coral is found widespread on the borders and around the islands of the Mediterranean Sea. The beds are generally from 2 to 10 miles from the land, and in water of about 30 up to 130 fathoms deep; but it finds its most favourable conditions in 80 fathoms water. The most important fisheries extend along the coasts of Tunis, Algeria, and Morocco; but red coral is also obtained in the vicinity of Naples, near Leghorn and Genoa, and on the coasts of Sardinia, Corsica, Catalonia, and Provence. It is said that it attains greater perfection in the east than in the south, and that it is rarely found in a western and never in a northern aspect. It is found attached to rocks embedded in a muddy sea bottom, in which it flourishes more than in a clear or sandy bed. In colour it varies through all shades of red, from a deep crimson to a delicate rose pink or flesh colour, fine tints of which are very rare and highly prized. It is also sometimes obtained of a milk white colour.

From the Middle Ages downwards the securing of the right to the coral fisheries on the African coasts was an object of considerable rivalry among the Mediterranean communities of Europe. Previous to the 16th century they were controlled by the Italian republics. For a short period the Tunisian fisheries were secured by Charles V. to Spain; but the monopoly soon fell into the hands of the French, who held the right till the Revolutionary Government in 1793 threw the trade open. For a short period (about 1806) the British Government controlled the fisheries, and now they are again in the hands of French authorities. Previous to the French Revolution much of the coral trade centred in Marseilles; but since that period, both the procuring of the raw material and the working of it up into the various forms in which it is used have become peculiarly Italian industries, centring largely in Naples, Rome, and Genoa. Although foreign crafts have to pay heavy dues for the right to fish on the Algerian coasts, the great majority of the vessels and crews belong to Torre del Greco. Two classes of boats engage in the pursuit,—a large size of from 12 to 14 tons, manned by ten or twelve hands, and a small size of 3 or 4 tons, with a crew of five or six. The large boats, dredging from March to October, collect from 650 to 850 ℔ of coral, and the small, working throughout the year, collect from 390 to 500 ℔. The Algerian reefs are divided into ten portions, of which only one is fished annually,—ten years being considered sufficient for the proper growth of the coral. No reliable estimates the amount and value of coral obtained annually exist; but in 1873 the Algerian fisheries alone, employing 311 vessels, manned by 3150 sailors, yielded raw coral valued at £113,000.

The range of value of the various qualities of coral, according to colour and size, is exceedingly wide, and notwithstanding the steady Oriental demand its price is considerably affected by the fluctuations of fashion. While the price of the finest tints of rose pink may range from £80 to £120 per oz., ordinary red-coloured small pieces sell for about £2 per oz., and the small fragments called *collette*, used for children's necklaces, cost about 5s. per oz. In China large spheres of good coloured coral command high prices, being in great requisition for the button of office worn by the mandarins. It also finds a ready market throughout India and in Central Asia; and with the negroes of Central Africa and of America it is a favourite ornamental substance.

CORAM, THOMAS (1668–1751), an English philanthropist, began life as a seaman, and rose to the position of merchant captain. He settled at Taunton, Massachusetts, for several years engaging there in farming and boat-building, and in 1703 returned to England. His acquaintance with the destitute East End of London, and the miserable condition of the children there, inspired him with the idea of providing a refuge for such of them as had no legal protector; and after seventeen years of unwearied exertion, he obtained in 1739 a royal charter authorizing the establishment of his hospital for foundling infants. It was opened in Hatton Garden, on 17th October 1740, with twenty inmates. For fifteen years it was supported by voluntary contributions; but in 1756 it was endowed with a Parliamentary grant of £10,000 for the support of all that might be sent to it. Children were brought, however, in such numbers, and so few (not one-third, it is said) survived infancy, that the grant was stopped, and the charity, which had been removed to Guildford Street, was from that time only administered under careful restrictions. Coram's later years were spent in watching over the interests of the hospital; he was also one of the promoters of the settlement of Georgia and Nova Scotia; and his name is honourably connected with various other charities. In carrying out his philanthropic schemes he spent nearly all his private means; and an annuity of £170 was raised for him by public subscription.

CORAY, ADAMANTIUS (1748–1833), a Greek scholar, was the son of a merchant of Smyrna. His grandfather, Professor Rhysius, had left a library to whoever of his grandsons should distinguish himself most at school in the study of ancient Greek. Adamantius won the prize, and a strong interest in literature was thence awakened in him. For a time, however, he devoted himself to commerce, carrying on the management of his father's business affairs in Amsterdam. But in 1779 his father's warehouse in Smyrna was destroyed by fire; and Coray was left free to follow his tastes. Two or three years after he removed to Montpellier, where he remained for six years, studying medicine, and supporting himself by translating German and English medical works into French. In 1788 he settled in Paris, where he died forty-five years later, at the age of eighty-five.

Coray's chief works are his editions of Greek authors contained in his *Bibliothèque hellénique* and his *παρεργά*; and his éditions of the *Characters* of Theophrastus, of the *De Aëre, Aquis, et Locis* of Hippoerates, and of the *Æthiopica* of Heliodorus, elaborately annotated. See *βιός 'Αδαμαντίου Κοραῆ* (Paris, 1833); and *'Απάνθισμα ἐπιστολῶν 'Αδαμαντίου Κοραῆ* (Athens, 1839).

CORBEIL, a town of France at the head of an arrondissement in the department of Seine-et-Oise, is situated at the confluence of the Essonne with the Seine, about 18 miles S.S.E. of Paris. A bridge across the larger river unites the main part of the town with a suburb on the other side, and a continuous line of houses leads to the village of Essonnes. The church of St Spire was rebuilt in the 15th century; St Jean-en-l'Isle belonged to the Templars, and dates from the 13th; and the corn-market was erected in 1780 by Viel. The industrial establishments in the town and neighbourhood include more than forty flour-mills, and several print-works, cotton-factories, and paper-mills.

From the 10th to the 12th century Corbeil was the chief town of a powerful countship; and it continued for a long time to be an important military post in connection with the commissariat of Paris. Of the numerous sieges to which it has been exposed, the most important are those by the duke of Burgundy in 1418, by the Huguenots in 1562, and by Alexander Farnese in 1590. The population of Corbeil proper in 1872 was 6016, and that of Essonnes, 551.

CORCYRA. See CORFU.

CORDAY D'ARMANS, MARIE-ANNE-CHARLOTTE, born in 1768, at St Saturnin near Séez in Normandy, was descended from a noble family, and numbered among her ancestors the dramatist Corneille. She was educated in a convent, and then sent to live with an aunt at Caen. Here she saw hardly any one but her relative, and passed her lonely hours in reading the works of the *philosophes*, especially Voltaire and the Abbé Raynal. Another of her favourite authors was Plutarch, from whose pages she doubtless imbibed the idea of classic heroism and civic virtue which prompted the act that has made her name famous. On the outbreak of the Revolution she began to study current politics, chiefly through the medium of the papers issued by the party afterwards known as the Girondins. On the downfall of this party, on May 31, 1793, many of the leaders took refuge in Normandy, and proposed to make Caen the headquarters of an army of volunteers, at the head of whom Wimpfenn, the commandant of Cherbourg, was to have marched upon Paris. Charlotte attended their meetings, and heard them speak; but we have no reason to believe that she saw any of them privately, till the day when she went to ask for introductions to friends of theirs in Paris. She saw that their efforts in Normandy were doomed to fail. She had heard of Marat as a tyrant and the chief agent in their overthrow, and she had conceived the idea of going alone to Paris and assassinating him,—doubtless thinking that this would break up the party of the Terrorists and be the signal of a counter-revolution. Apparently she had thought of going to Paris in April, before the fall of the Girondins, for she had then procured a passport which she used in July. It contained the usual description of the bearer, and ran thus: "Laissez passer la citoyenne Marie, &c., Corday, agée de 24 ans, taille de 5 pieds 1 pouce, cheveux et sourcils châtains, yeux gris, front élevé, nez long, bouche moyenne, menton rond fourchu, visage ovale." Arrived in Paris she first attended to some business for a friend at Caen, and then she wrote to Marat:—"Citizen, I have just arrived from Caen. Your love for your native place doubtless makes you desirous of learning the events which have occurred in that part of the republic. I shall call at your residence in about an hour; have the goodness to receive me, and to give me a brief interview. I will put you in a condition to render great service to France." On calling she was refused admittance, and wrote again, promising to reveal important secrets, and appealing to Marat's sympathy on the ground that she herself was persecuted by the enemies of the republic. She was again refused an audience, and it was only when she called a third time (July 15) that Marat, hearing her voice in the antechamber, consented to see her. He lay in a bathing tub, wrapped in towels, for he was suffering from a horrible disease which had almost reduced him to a state of putrefaction. Our only source of information as to what followed is Charlotte's own confession. She spoke to Marat of what was passing at Caen, and his only comment on her narrative was that all the men she had mentioned should be guillotined in a few days. As he spoke she drew from her bosom a dinner knife (which she had bought the day before for two francs) and plunged it into his left side. It pierced the lung and the aorta. He cried out, "*À moi, ma chère amie!*" and expired. Two women rushed in, and prevented Charlotte from escaping. A crowd collected round the house, and it was with difficulty that she was escorted to the prison of the Abbaye. On being brought before the Revolutionary Tribunal she gloried in her act, and when the indictment against her was read, and the president asked her what she had to say in reply, her answer was, "Nothing, except that I have succeeded." Her advocate, Chaveau Lagarde, put forward the plea of insanity, but of course he could not sustain it. She was sentenced to death, and calmly thanked her counsel for his efforts on her behalf, adding, however, that the only defence worthy of her was an avowal of the act. She was then conducted to the Conciergerie, where at her own desire her portrait (now in the museum of Versailles) was painted by the artist Hauer. She preserved her perfect calmness to the last. There was a momentary shudder when she saw the guillotine, but she recovered immediately, and placed herself in position under the fatal blade without assistance from any one. The knife fell, and one of the executioners held up her head by the hair, and had the brutality to strike it with his fist. Many believed they saw the dead face blush,—probably an effect of the red stormy sunset. It was the 17th of July 1793. It is difficult to analyze the character of Charlotte Corday, we know so little of her; but there was in it much that was noble and exalted. Her mind had been formed by her studies on a pagan type. To Barbaroux and the Girondins of Caen she wrote from her prison, anticipating happiness "with Brutus in the Elysian Fields" after her death, and with this letter she sent a simple loving farewell to her father, revealing a tender side to her character that otherwise we would hardly have looked for in such a woman.

Every writer on the Revolution has dwelt at more or less length on Charlotte Corday. Many of the current versions of her life are very incorrect and even absurd. Of biographies we may mention that of Couet de Gironville, published in 1796, that of Alphonse Esquiros which attempts a defence of Marat, and Adolphe Huard's *Mémoires sur Charlotte Corday*, 1866. Her letters and her address to the French people were printed at Caen in 1863 under the title of *Œuvres politiques de Charlotte Corday*. Lamartine in his *Histoire des Girondins* has an eloquent eulogy, which ends by styling her "*l'ange de l'assassination.*" She has even less appropriately been called the "*Jeanne d'Arc de la Révolution.*"

CORDELIERS, the name given to the Franciscans in France, from the cords which they wore round their waists; and also the name of a notorious club of the time of the French Revolution, so called because it met in a Franciscan chapel. Early in 1790 this club was thoroughly organized under the presidency of Danton. Among its other members were Marat and Camille Desmoulins, and the latter edited a paper expressing its views, under the name of *Le Vieux Cordelier.*

CORDERIUS, the Latinized form of name used by MATHURIN CORDIER (1478–1564), the author of the well-known *Colloquia*, a native in Normandy. He possessed special tact and liking for teaching children, and taught first at Paris, where Calvin was among his scholars, and, after a number of changes, finally at Geneva. He wrote several books for children; the most famous is his *Colloquia*, which has passed through innumerable editions, being used in schools for three centuries after his time.

He also wrote—*Principia Latine Loquendi Scribendique, selecta ex Epistolis Ciceronis; De Corrupti Sermonis apud Gallos Emendatione et Latini Loquendi Ratione; De Quantitate Syllabarum; Conciones Sacræ Galliæ; Remontrances et exhortations au roi et aux grands de son royaume* (Geneva, 1561).

CORDOVA (Latin, *Corduba;* French, *Cordoue*), a city of Spain, capital of a province of its own name in Andalusia, is situated on the southern declivity of the Sierra Morena and the right bank of the Guadalquivir, 75 miles north-east of Seville, and not far from one of the junctions on the railway system of Spain. Its walls, erected on Roman foundations, and principally Moorish in their superstructure, enclose a very large area; but much of the space is occupied by garden-ground cleared from the ruins of ancient buildings. The streets are for the most part so narrow and crooked that it would be much more descriptive to speak of them as lanes; and, with the exception of those in the Plaza Mayor, the houses are greatly dilapidated. As every building, however, is profusely covered with whitewash, there is little difference on the surface between the oldest and the most modern specimens. The southern suburb communicates with the town by means of a bridge of sixteen arches across the river, exhibiting the usual combination of Roman and Moorish masonry, and dominated at the one end by an elevated statue of the patron saint, St Raphael,

whose effigy is to be seen in various other quarters of the city. The most important of the public buildings are the cathedral, the old monastic establishments, the churches, the bishop's palace, the lyceum, the city hall, the hospitals, and the colleges. The old royal palace (Alcazar) is in ruins,—only one wing being sufficiently entire to serve the purpose of a prison. The cathedral, which throws all the other churches into insignificance, was originally built as a mosque by Abderrahman I. on the site, it is believed, of a Roman temple. The exterior, with the straight lines of its square buttress towers, has a heavy and somewhat ungainly appearance; but the interior is one of the most beautiful specimens of Moorish architecture in Europe. Passing through a grand courtyard about 500 feet in length, shady with palm, and cypress, and orange-trees, and fresh with the full flow of fountains, the visitor enters a magnificent and bewildering labyrinth of pillars. Porphyry and jasper and marbles of many a tint are boldly combined in a matchless mosaic. Part have come from the spoils of Nîmes or Narbonne, part from Seville or Tarragona, some from the older ruins of Carthage, and others as a present to Abderrahman from Leo of Byzantium Of different heights, they have been adjusted to their present standard of 12 feet by being either sunk into the soil or lengthened by the addition of Corinthian capitals. Twelve hundred was the number of the columns in the original building; but many have been destroyed, and, according to some accounts, less than 700 remain. They divide the area of the building, which measures 395 feet from east to west by 356 feet from north to south, longitudinally into nineteen and transversely into twenty-nine aisles—each row supporting a tier of open Moorish arches, which in its turn gives the basis for a second tier with its pillars resting on the keystones of the tier beneath. The full height of the ceiling is thus about 35 feet. The Moorish character of the building was unfortunately impaired in the 16th century by the formation in the interior of a *crucero* or high altar and choir, in the Roman style, by the addition of numerous chapels along the sides of the vast quadrangle, and by the erection of a modern tower in room of the old muezzin. The *crucero* in itself is no disgrace to the architect Hernan Ruiz, but every lover of art must sympathize with the rebuke administered by Charles V. to the cathedral authorities: "You have built here what could have been built as well anywhere else; and you have destroyed what was unique in the world." Magnificent, indeed, as the cathedral still is, it is almost impossible to realize what the mosque must have been when the worshippers thronged through its nineteen gateways of bronze, and its 4700 lamps, fed with perfumed oil, shed at once light and fragrance through its brilliant aisles. Of the exquisite elaboration bestowed on the more sacred portions abundant proof is afforded by the small heptagonal chapel of the Mihrab, roofed with a single shell-like block of snow-white marble, and inlaid with Byzantine mosaics of glass and gold.

Cordova was celebrated in the time of the Moors for its silversmiths, who are said to have come originally from Damascus; and it exported a peculiar kind of leather which took its name from the city, whence we have still the word "cordwainer." These industries, however, disappeared with the race that introduced them. In modern times, especially since the opening of the railway to Cadiz and Seville, its industry has developed in various directions, and flax, linen, silk, and woollens are now manufactured. Population, 42,000.

Corduba, probably of Carthaginian origin, was occupied by Marcus Marcellus in 152 B.C. and shortly afterwards became the first Roman colony in Spain. From the large number of men of noble rank among the colonists, the city obtained the title of *Patricia;* and to this day the Cordovese pride themselves on the purity and antiquity of their descent. The city was the usual residence of the proctor of the province of Bætica, and the seat of one of the four provincial assizes. In the wars between Cæsar and the sons of Pompey, Corduba espoused the cause of the latter. After the battle of Munda, it fell into the hands of Cæsar, who avenged the obstinacy of its resistance by putting 20,000 of the inhabitants to the sword; but in the time of Strabo it still ranked as the largest city of Spain. Under the Goths Corduba maintained its importance; and in the person of Hosius, its bishop, it furnished a president for the Council of Nice. Under the Moors it was at first an apanage of the caliphate of Damascus, but it soon became the capital of the Moorish dominions in Spain. At the death of Abderrahman, it is said, perhaps with Arabic exaggeration, to have contained within its walls 200,000 houses, 600 mosques, 900 baths, and numerous public libraries; whilst on the bank of the Guadalquivir, under the power of that monarch, there were eight cities, 300 towns, and 12,000 populous villages. In the beginning of the 13th century the Moorish empire became dismembered, and fell an easy prey to St Ferdinand of Castile in 1236. Since that period Cordova has gradually declined; and in modern times it has never recovered the assault of the French under Dupont in 1808, who stormed and afterwards pillaged the town. In the Roman period Cordova was the birthplace of Lucan and the two Senecas; and in modern times it numbers among its celebrities Avicenna, Averroes, Juan de Mena, Ambrosio Morales, Cespedes the painter, and Luis de Gongora. It also gives its name to the famous captain Gonzalo de Cordova.

CORDOVA, or CORDOBA, the chief town of a province of the same name in the Argentine Republic, 246 miles by rail from Rosario, in 31° 24′ S. lat. and 64° 9′ W. long. It lies in the very heart of the country, and occupies the bottom of a considerable depression to the south of the River Primero. The streets, which cut each other at right angles, are for the most part unpaved, but are furnished with side paths of brick; and the houses are almost all of one story. The cathedral of St Peter, built by the Italian Jesuit Primoli, ranks among the finest churches in South America, though the interior hardly corresponds to the promise of the outside; and the church of the convent of Santa Catalina is also worthy of notice. The educational institutions are of great and increasing importance, including a university established in the Colegio San Carlos, or old Jesuit monastery, which was built by the same architect as the cathedral: an ecclesiastical seminary, supported by the Government; a national observatory, instituted in 1871; and an academy of sciences. The *cabildo* or Government-house (adorned with a pillared portico), an orphan asylum, two hospitals, and several convents complete the list of the public edifices. The population in 1869 numbered about 28,500, consisting of half-breeds of various degrees, with a considerable predominance of the Spanish type. Since the opening of the railway to Rosario in 1870, the trade of the city, always of some importance, has begun to develop. The exports are mainly hides and wool, and the imports miscellaneous manufactures. Cordova was founded by Cabrera in 1573, and made the capital of the province of Tucuman by Philip V.; its main importance arose from its being the centre of the Jesuit missions of South America and the principal seat of learning on the continent. The revolutionary wars for a time destroyed its prosperity; but latterly it has much recovered. In 1871 it was the seat of a national exhibition.

CORDOVA, a town of Mexico, with about 6500 inhabitants, in the province of Vera Cruz, and 57 miles inland from the city of that name. It is situated in a very fertile district near the volcano of Orizava, and trades in tobacco, coffee, sugar, and cotton. Its streets are well paved and regularly laid out; the most of its houses are built of stone, and the cathedral, which occupies one side of a large central square, is a fine edifice, with a highly ornamented interior. The neighbourhood abounds in antiquarian remains, and at Amatlan de los Reyes especially there are traces of a temple and a cave, with fragments of carving and pottery.

COREA, a kingdom of Eastern Asia, the greater part of which occupies a peninsula stretching south from the north

Sketch Map of Corea.

ern portion of the Chinese empire. It is bounded on the N. by the elevated plains of Manchuria, E. by the Sea of Japan,

S. by the strait to which it gives its name, and W. by the Yellow Sea, and extends from about 34° to 42° 25′ N. lat., and from 124° 35′ to 130° 50′ E. long. The natives assert that it has a length of 3000 lys, or about 1000 English miles, and a breadth of 1300 lys, or about 460 miles; but this is undoubtedly an exaggeration, and the total area is probably a little more than 79,400 square miles, or about 2½ times the size of Scotland.

The eastern coast trends south-west from the confines of Russian Manchuria to the neighbourhood of the 39th parallel of latitude, and then, changing its direction to the south-east, it forms an extensive gulf, named Broughton Bay in honour of a navigator of the 18th century. With this exception it presents no remarkable irregularity of line; but even such superficial surveys as have already been effected show that it affords a considerable number of bays and harbours. Of these the most important are Lazaref, Pingai, and Chosan. The first, called Virginia Bay on the French maps, is situated in 39° 25′ N. lat., has an area of about 36 square miles, is well protected, and furnishes excellent anchoring ground. The second in 36° 36′ is comparatively small, but completely sheltered by a conical island. The third in 35° 2′ is large enough to shelter merchant vessels of all sizes and even ships of war below the rank of frigates. Throughout its whole extent this eastern shore presents mainly a succession of steep but not very lofty cliffs, sinking at intervals into irregular dunes, or into stretches of almost level sand. The south and west coasts, on the other hand, are much more varied with inlet and promontory, estuary and peninsula; and the neighbouring sea is occupied by a multitude of islands and rocks. Of these islands the largest is Quelpart, with a length of 46 miles and a breadth of about 20; but of greater importance to the navigator is the Port Hamilton group, on account of the excellent harbour to which it partly owes its name.

Mountains.—Corea is eminently a mountainous country, and the general appearance of the surface is compared by a French missionary to that of the sea under a strong gale. The principal range winds through the peninsula from north to south. From the northern frontier, till it reaches 37° of north latitude, it keeps pretty close to the eastern coast; but from that point it trends westward, and runs obliquely across the southern extremity of the country, leaving the contour of the coast to be defined by a subordinate range. Of individual summits the highest known to Europeans are Hien-fung and Tao-kwang in the Pepi Shan Mountains, to the north of Broughton Bay; and these attain no greater elevation than 8114 and 6310 feet respectively. Another of special mark, called Sedlovaya, or the Saddle, by the Russian navigators, is situated in 38° 10′ 30″ N. lat. The country to the west of the main ridge is occupied by irregular spurs; and throughout its whole extent there is no district that can properly be described as a plain.

Rivers.—Corea is well furnished with rivers and streams. In the north the boundary line is mainly marked by two of considerable size, the Ya-lu-kiang and the Mi-kiang. The former, known to the Chinese as the Aye-kiang, and to the Coreans as Am-no-kang, or the river of the Green Duck, receives numerous affluents in the early part of its course, flows first north-west and then south-west, and falls into the Yellow Sea by three distinct mouths. Its most important tributary, the Tong-kia-ula, comes from the Shan-alin Mountains in Manchuria, and forms its junction about 40° 50′ N. lat. The Mi-kiang, called by the Coreans Tu-man-kang, has a very much shorter course than the Ya-lu-kiang, but owing to the number of its tributaries, it attains no mean proportions before it reaches the eastern sea in 42° 19′ 5′ N. lat. and 130° 38′ 51″ E. long. At its mouth it is about half a mile wide, and at Hung-chung 300 yards, with a depth of about 20 feet in the middle. Its current is about 1½ knots an hour. Of the numerous streams that find their way to the Sea of Japan none require special mention till we come to the Nak-tong-kang, which rises in the eastern slopes of the main chain, and after flowing almost directly south, reaches the Strait of Corea in 34° 50′ N. lat. Among those of the western coast three at least are of considerable magnitude—the Keum-kang, the Hang-kang, on which Seoul, the capital of the kingdom, is situated, and the Tai-tang-kang, which flows past the city of Pieng-lang.

Climate and Agriculture.—The temperature of Corea, though much more equable than that of the neighbouring continent, is higher in winter and lower in summer than under the same latitudes in Europe. Such advantages as it actually has over the climate of Northern China are mainly due to the effects of the south-west monsoon. In the north the rivers remain frozen for several months in the year, and even in the furthest south the snow lies for a considerable period. In latitude 35° the lowest reading of the thermometer observed by the French missionaries was 5° Fahr.; in 37° or 38° they often found it 13° below zero. The principal articles of cultivation are rice, wheat, millet, rye, tobacco, cotton, hemp, and genseng; and of these several afford a good return. The potato, which was recently introduced, is under a Government interdict, and is only to be found in outlying districts; though its general use might do much to prevent the recurrence of the famines with which the country is ever and anon visited. Almost all the fruits of central Europe are to be obtained; but their quality is greatly deteriorated by the humidity of the climate. Water-melons and the fruit of the *Diospyros Lotus* (called kam by the natives) are mentioned as the best.

Minerals.—Corea has the reputation of being richly furnished with mineral resources; gold, silver, copper, iron, and coal are all said to be common. Gold-mining, however, is strictly prohibited; the permission at one time granted to work the silver ore at Sioun-heng-fu was shortly afterwards withdrawn; the copper mines are neglected, and Japanese copper imported; and the general use of coal is confined to certain districts.

Animals.—Of the wild animals the most remarkable are a small species of tiger, the bear, and the wild boar; and of the domestic kinds the principal are cattle, horses of diminutive proportions but considerable strength, swine, and dogs. The last are a favourite article of food. The king alone has the right of rearing sheep and goats, which are kept for the purpose of being sacrificed in religious ceremonials.

Political Divisions and Towns.—The kingdom of Corea is divided into eight provinces, of which three, Ham-kieng, Kang-wen, and Kieng-sang lie along the eastern side of the peninsula, while the others, Pieng-an, Hoang-hai, Kieng-kei, Tsiong-tsieng, and Tsien-la face the Yellow Sea. Ham-kieng and Pieng-an are the two that border on Manchuria. The former contains fourteen walled towns, among which may be mentioned Ham-heng, the provincial capital, Kieng-wen, and Mou-san; and the latter, with its centre at Pieng-iang, possesses an equal number. The chief town of Kang-wen is Wen-tsiou, situated in the heart of the country to the east of the River Hang-kang; that of Kieng-sang is Tai-kou, near a tributary of the Nak-tong-kang; of Hoang-hai, Hai-tsiou on the western coast. Han-iang, Seoul, or Seyool, the chief town of Kieng-kei, is also the capital of the kingdom and the permanent residence of the court; it is situated on the Hang-kang, and surrounded with high and thick walls, 9975 paces in circuit. The chief towns of the two remaining provinces are respectively Kong-tsiou near the River Keum-kang, and Tien-tsiou, at the foot of the range of mountains that traverses the province.

The *king* of Corea, though a vassal of the Chinese empire, is within his own country an absolute monarch, with power of life and death over the noblest in the land. He is the object of almost divine honours; it is sacrilege to utter the name which he receives from his suzerain, and that by which he is known in history is only bestowed upon him after his death by his successor. To touch his person with a weapon of iron is high treason; and so rigidly is this rule enforced that Tieng-tsong-tai-oang suffered an abscess to put an end to his life in 1800, rather than submit to the contact of the lancet. Every horseman must dismount as he passes the palace, and whoever enters the presence-chamber must fall prostrate before the throne. Should the ignoble body of a subject be touched by the royal hands, the honour thus conferred must be ever after commemorated by a badge. In consequence of such punctilious etiquette, personal access to the king is exceedingly difficult; but, as according to theory, his ear ought always to be open to the complaints of his people, an appeal to his authority is nominally permitted. He is expected to provide for the poor of his realm, and there are always a large number of pensioners on the royal bounty. The princes of the blood are most jealously excluded from power, and their interference in the slightest degree in a matter of politics is regarded as treason. The nobles, however, have within the present century extended their influence, and infringed on the royal prerogatives. The palaces are poor buildings, but an extensive harem and a large body of eunuchs are maintained.

The *government* is practically in the hands of the three principal ministers of the king, who are called respectively *seug-ei-tsieng* or admirable councillor, *tsoa-ei-tsieng* or councillor of the left, and *ou-ei-tsieng* or councillor of the right. They are nominally assisted by six *pan-tso* or judges, each of whom has his own *tsam-pan* or substitute and *tsam-ei* or adviser. The *ni-tso*, the first of these judges' departments, has charge of the public offices and employments; the *ho-tso* takes the census, apportions the taxes, and looks after the mints; the *niei-tso* supervises religious and official ceremonial; the *pieng-tso* is the department of war; the *hieng-tso* administers the criminal courts; and the *kong-tso* has the oversight of public works, commerce, &c. In the palace there are three *sug-tsi*, or functionaries charged to put on record day by day all the royal words and actions. The eight provinces of the kingdom are each administered by a governor, dependent on the ministerial council; and each of the 332 districts into which the provinces are sub-divided is under a separate mandarin. Military commanders have the chief authority in the four fortified towns of Kang-hoa, Sou-wen, Koang-tsiou, and Siong-to or Kai-seng. Theoretically every one of these posts is open to any Corean who has acquired the necessary degree in the public examinations; but actually they are almost all appropriated by the nobles. A postal system is maintained along the principal highways,—the horses being kept by the Government, and the grooms and riders holding almost the position of royal serfs. The army nominally includes every individual capable of bearing arms, who does not belong to the nobility; but only a small proportion of the men are brought under discipline. The military mandarins, though chosen from the nobles, are in far less estimation than the civil functionaries of corresponding rank. The salaries of the governors and other high officials are large, but as the term is only two years, and the custom of the country is for a person in office to support all his relatives, it is seldom that the position proves genuinely lucrative. In addition to the various regular officials already mentioned there are a number of *e-sa*, or *anaik-sa*, who are despatched by the king, armed with absolute power, to visit the provinces at irregular intervals and secretly observe the condition of affairs. Corruption, however, universally and openly prevails, and the supervision even of these irresponsible emissaries affords little protection against injustice. The mandarin is for ordinary civil cases the absolute judge within his district; but if the matter is very important it may be referred to the provincial governor, or even ultimately to the king himself. Criminal cases are decided by the military mandarin, and the final appeal is to the great court of the capital, which consists of two parts—the *po-tseng* which collects the evidence, and the *ieng-tso* which passes the sentence. Public functionaries and culprits accused of treason or rebellion are tried by a special court called the *keum-pou*, the members of which are named directly by the king. In a case of high treason the whole family of the guilty person is involved in his fate. A large portion of the real administrative power lies in the hands of the subaltern officials of the civil and military mandarins, who are distinguished by M. Dallet as "pretorians" and "satellites." The former compose a formidable hereditary class, which rarely intermarries with the rest of the community; the latter are recruited from the lower ranks of society. Torture is freely employed in judicial proceedings; and the unhappy victim may either have the bones of his legs dislocated or bent, his calves reduced to rags by blows from a heavy plank, the flesh of his thighs cut through by the continuous friction of a rough cord, or his whole body agonized by a prolonged suspension by the arms. Decapitation is the usual form of execution both in civil and military cases.

The *language* of Corea belongs to the Turanian family, and agrees with the other Turanian tongues in all the main grammatical features. It is written alphabetically, by means of fourteen consonants corresponding to the European *k*, *l*, *n*, *r*, *t*, *m* (or *b*), *p* (or *b*), *s*, *ng* or nasal *n*, *ts*, *tsh*, *kh*, *th*, *ph* (*i.e.*, *p* aspirated, not *f*) and *h*, and eleven vowels, which go to the composition of thirteen diphthongs. The letters appear either in an ordinary or a cursive form. Every line is written from the top to the bottom of the page, syllable by syllable. The vocabulary is greatly mingled with Chinese words; but these undergo the regular Corean declension. The noun has nine cases, including the nominative. Adjectives proper there are none, the nouns and verbs supplying their place. For the names of the numerals above 90, such as 100, 1000, &c., recourse is had to the Chinese. The verb possesses, besides the simple affirmative, a conditional, an interrogative, an honorific, a causative, and several other forms; but it has no distinctive inflections for number or person. The honorific form is employed in speaking of dignitaries; and indeed the verb must slightly vary according to the status of the person addressed.

The study of their native language is greatly neglected by the Coreans, and the educated classes regularly employ Chinese both in literature and social intercourse. The annals of the kingdom, the laws, scientific treatises, public inscriptions, and even shop-signs are all written in the foreign language; at the same time the Corean pronunciation is so peculiar as to be unintelligible in the ears of the inhabitants of the empire. That at one time there was an extensive native literature there seems no doubt; but it is now represented only by a few poetic collections, popular romances, and nursery tales,—to which, indeed, must be added a number of works composed by the missionaries, who have encouraged the preservation and cultivation of the national language. There is an official translation of the sacred books of Confucianism, in which it is criminal to change a single word without the order of the Government; and a sibylline book, prohibited by the authorities, circulates secretly among the people. On the capture of Kang-hoa in 1866, Admiral Roze found a library of 3000 or 4000 books finely covered with green and crimson silk, and arranged and preserved with great care. One volume particularly attracted M. Ridel's attention; it consisted of a number of marble tablets, united by gilt copper hinges; each tablet was protected by a cushion of scarlet silk, and the letters were in gold incrusted on the marble.

Education.—As in China, so in Corea, learning is ostensibly in high estimation, and all public officials must pass certain examinations. The student is left perfectly free to follow any system and receive instruction from any teacher whatever,—the examiners, who are appointed by the Government, taking account of nothing but results. The most important examinations are held once a year in the capital, and candidates flock thither from all the provinces. After the examination is over, those who have passed put on the robes of their new title, and proceed on horseback with sound of music to visit the chief dignitaries of the state, the examiners, &c. Then follows a burlesque initiation which, though not enforced by law, is rendered imperative by custom. The novice has his face stained with ink and besprinkled with flour, and is otherwise subjected to whimsical insults. There are three separate degrees, that of the *tcho-si*, that of the *tsin-sa*, and that of the *keup-tchiei*,—the last or highest being obtainable at once without the previous possession of the others. The *tsin-sa* are destined to fill administrative posts in the province, the *keup-tchiei* the higher positions about the capital and the palace. The military degree, which is also known as the *keup-tchiei*, involves but little literary culture, and is sought only by the poorer nobles. The whole system is in a state of great decay, and the purchasing of degrees or of doctoral theses is far from uncommon. Besides the possessors of the above-mentioned degrees there is a special class of scholars, known as the middle class, who devote themselves from father to son to the study of various special branches necessary in public employ:—the interpreters, who are trained either in Chinese, Manchu (Hon-hak), or Mongolian; the *koang-sang-kam*, or school of sciences, devoted to astronomy, geoscopy, and auspication; the *ei-sa*, or school of medicine, including a branch for the royal service and another for the public; the *sa-tsa-koan*, or school of recorders, employed in the preservation of the archives and the drawing up of official reports for Pekin; the *to-hoa-si*, intrusted with the preparation of maps, and the execution of the portrait of the king, which after his death is added to the royal gallery; the *nioul-hak*, or school of law, which deals mainly with the penal code; the *kiei-sa*, from which clerks are obtained for the financial and public works department; and the *hem-nou-koan*, which is intrusted with the management of the Government hydraulic clock.

Religion.—Buddhism, according to native tradition, was introduced into Corea in the 4th century of our era, and under the dynasty of Korio it became the official religion. On the establishment, however, of the Tsi-tsien in the 14th century it gave place to the doctrine of Confucius, which continues to the present day as the established creed. In its main features the Confucianism of Corea is identical with the Chinese system; but it is accompanied and intermingled with various popular superstitions. Worship is offered not only to the Sia-tsik, or patron of the kingdom, but also to the Siang-tiei, whom some regard as a supreme divinity, and others identify with the sky. To the latter public sacrifices, consisting of pigs, sheep, and goats, are offered for the purpose of preventing or obtaining rain, removing epidemic diseases, or otherwise interfering with the course of natural events. The Sia-tsik is hardly known in the provinces; but in the capital his temple is the most sacred of all. Among the educated classes the only form of religion in real force is the worship of their ancestors, and consequently the greatest importance is attached to all the ceremonial details of funerals, mourning, and tombs. In every district there is a temple of Confucius called *kiang-kio*, with an extensive domain attached; and if the revenue is not sufficient to maintain the necessary expenses, the treasury of the district must supply the deficit. There still exist several of the large pagodas erected during the period of the official status of Buddhism; they are built in the Chinese style, and are frequently remarkable for the beauty of their situation. Except in the province of Kieng-sang the Buddhist monks, or bonzes, retain no influence; they have but little learning, and their numbers are diminishing. The belief in evil spirits is common among the Coreans; their action is frequently controlled by the propitious or unpropitious character of times and seasons, and almost every event is the sign of fortune or mishap. The serpent is the object of superstitious respect; and, instead of killing it, the Corean feeds it as regularly as his domestic animals. Of first importance for the happiness of a family is the preservation of the ancestral fire, and every housewife has all the anxiety and responsibility of a Vestal Virgin. The number of astrologers and fortune-tellers throughout the country is extraordinary. The blind are reputed to be endowed with special prophetic aptitude, and, as a natural consequence, a large proportion of those who are deprived of sight make gain of their affliction. In the capital these blind seers are formed into a regular corporation legally recognized, and their services are in great request for the discovery of secrets, the foretelling of the future, and the exorcizing of devils. In this latter operation they trust principally to noise as a means of frightening the spirits, whom they ultimately catch in a bottle and carry off in triumph.

Manners and Customs.—Women hold a very low position in Corean estimation, and count for little in the sight of the law. Not only are they destitute of all political and social influence, but they are not held personally responsible for their actions, and live in a state of lifelong pupilage. At the same time they enjoy a considerable amount of freedom, and it is only among the upper classes that they are kept in seclusion. Marriage is altogether an affair of etiquette; the terms are settled by the heads of the families, and the bride and bridegroom have no opportunity of seeing each other till they meet on the marriage platform, and bow to each other as man and wife. After marriage there is little social intercourse between the pair, both men and women keeping company with their own sex. Among the lower classes second marriages are equally permissible to both sexes; but among the nobles the second marriage of a widow is considered so reprehensible that the offspring of such a union is branded as illegitimate. Polygamy is not permitted, but concubinage is a recognized institution. Strong affection for their children is one of the better characteristics of the Coreans, and infanticide and exposure are almost unknown. Adoption is a common expedient to prevent the extinction of a family, and the choice of the child is regulated by a rigid etiquette. Filial piety is in the highest estimation, and the conduct of a son towards his father is guided by innumerable rules. If he meets him on the way, he must do him humblest obeisance; if he writes to him, he must employ the most respectful forms in the language; if the father is sick, the son must attend him; if the father is in prison, the son must be at hand without; if the father is exiled, the son must accompany him on his journey. On the death of his father the eldest son becomes the head of the family, responsible for all the duties of a father towards his brothers and sisters, who receive no share in the patrimony, but merely dowries and donations on marriage, &c. Between the various members of a family, even after they have separated from the domestic hearth, there remains the greatest intimacy and affection; and the slightest connection of blood is recognized as a bond of attachment.

Industry and Trade.—The industrial arts are but slightly developed, the peasant himself in most cases supplying by his own labour the greater part of his needs. The one manufacture in which the Corean ranks really high is that of paper, a material employed as in Japan in a great variety of ways. Trade is mainly carried on by means of markets or fairs, but transactions are hampered by the deficiency of the currency. Only one kind of coin, a small piece of copper known as a "sapeke," is recognized, and even this is not in use in the northern provinces, where barter alone is in vogue. The roads of the country offer but few facilities for traffic; wheeled vehicles are unknown, and much of the transport of goods is effected by porterage. Except at the capital there is hardly, over any of the numerous streams, a structure worthy to be called a bridge. Foreign commerce there is none, unless the fair which is held annually for several days at Pien-men on the occasion of the passage of the ambassadors, or that which takes place every two years at Hung-chung, is to be counted an exception. The Chinese or Japanese ships are allowed to fish for trepang along the coast of Pieng-an and for herring on that of Hoang-hai; but they are prohibited, not only from landing, but from holding any communication with the Coreans at sea.

Dwellings and Dress.—The houses of the Coreans are of one story, flimsily constructed of wood, clay, and rice-straw, usually covered with thatch and badly provided with windows. Lamentable accounts are given of the general poverty of the common people. Their houses are only about ten or twelve feet square; the floor is the bare earth, covered in rare instances with mats of poor quality; no chairs are in use, people squatting on the floor; and there is nothing worthy of the name of a bed. The ordinary shoe or sandal is formed of straw, and leaves the great toe exposed; but stockings are worn by all. Wide pantaloons and a long vest are the principal articles of attire,—the well-to-do wearing also a large overcoat, which the peasant uses on gala occasions only. The national hat is composed of a framework of bamboos covered with an open kind of haircloth; it protects neither from rain, cold, nor sun, and is altogether very inconvenient. The principal material of the wearing apparel is cotton cloth, rough in texture, and of its natural colour; but a rude kind of silk fabric is not uncommon among the wealthier classes.

History.—Corea, or Chosen, as it is called by the natives, appears for the first time in Chinese history in 1122 B.C., as affording an asylum to the refugee viscount of Ke; and since that period it has been claimed as an integral part of the Chinese empire. Neither at that time, nor for centuries afterwards, does it seem to have formed a political unity,—various states, as Hwuy, Shin-han, Pih-tse, and Sin-lo being mentioned in the Chinese records. In the first century of our era three of these states stand out as important:—Kao-li in the north and north-east, Pih-tse in the west, and Sin-lo in the south. Out of the civil wars which fill the next ten hundred years Sin-lo emerges predominant; but in the 11th century the king of Kao-li, known as Wang-kian, or Wang the founder, united the whole peninsula under his sway, and established the dynasty which has given its name to the country. The fall of the Mongolian dynasty in China brought about a similar revolution in Corea; and in 1392 Tai-tso or Li-tan became the founder of the present dynasty of Tsi-tsien, and the author of the system of administration still in force. The Chinese at that time imposed on the Coreans the use of their chronology and calendar.

Under Siong-siong, who held the throne from 1506 to 1544, the Coreans carried on a war with Japan, but in 1597 the great Japanese monarch Taiko-sama retaliated by a remarkable invasion. According to the journal of O-o-gawutsi, a Japanese general who took part in the expedition, the force consisted of 163,000 horsemen; three-fourths of the country was occupied and several of the oldest cities destroyed, in spite of the fact that two Chinese kings appeared to assist the Coreans with a force of 100,000 horsemen. The death of Taiko-sama in 1598 led the Japanese to abandon their conquest; and in 1615 peace was definitively signed, but only on conditions of great hardship for the Coreans. A tribute was exacted and the fort of Fusan-kai was retained; and the Corean king till 1790 had to send an embassy to Japan to announce his accession. When the Manchu dynasty ascended the throne of China, the Coreans defended the Mings; but being defeated by the new power, they had in 1637 formally to recognize the Manchu sovereignty, and to pay henceforward a heavy annual tribute. Since 1636 there has been no war with China or with Japan; and the Coreans have maintained in regard to every other nation the most absolute isolation. The ambassadors sent annually to Peking have been the means of conveying some little knowledge of Western nations to their countrymen; but the result has rather been to make them more exclusive. It is recorded in a Corean work that Tsiang-tou-wen, i saw a European named Jean Niouk in the Chinese capital, and obtained from him books, pistols, telescopes, and other curiosities; and Ricci's *Tien-tsou-sir-ei*, or *True principles about God*, are mentioned by Ni-siou-sipong, a Corean author. In 1784 Ni-tek-tso having had his attention aroused by some Chinese work on the Christian religion thus introduced, requested his friend Seng-houng-i, soon after sent with the embassy, to make inquiry about the subject. The result was the formation of a Christian sect, which speedily attracted the attention of the Roman Catholic mission, whose agents succeeded, in spite of the jealous watch of the Corean authorities, in making their way into the country. Persecution soon broke out, and has continued at intervals ever since. In 1831 a vicar apostolic was appointed by the Pope, and repeated efforts were made to effect a firm footing; but in 1866 the last Europeans were expelled. To avenge the murder of the French missionaries, Admiral Roze undertook an expedition in the end of that year. He destroyed the city of Kang-hoa, with its important military establishments, but obtained no concessions from the Government. Several American vessels having been burned by the Coreans, the United States in 1867 despatched Commander Schufeldt to remonstrate with the native authorities, but he returned as he went. Nothing further was done till 1870, when a force under Admiral Rodgers proceeded up the river towards the capital, with the intention of communicating directly with the Government. It was met by a determined resistance on the part of the Coreans, and though the American vessels were secure against the native artillery, and American guns soon silenced the forts, the admiral was constrained by political difficulties to bring his expedition to a close. In 1875 a convention was arranged by the Coreans with Moriyama, the Japanese ambassador; but its terms were soon infringed and an attack was made on the gun-boat "Unyokan." The Japanese Government accordingly despatched Karoda as high commissioner, who succeeded in concluding a treaty with important concessions to Japan. The Japanese are now entitled to send a permanent resident to the capital; three ports are opened to Japanese trade; Corean ports may be entered by Japanese vessels in distress; and Japanese mariners are free to survey the Corean coast.

Literature.—The European literature about Corea is comparatively scanty; of all the works that have yet been published, that which gives the completest account is M. Dallet's *L'Église de la Corée* (1874), based mainly on the reports of the members of the Roman Catholic mission. The earliest source of information is the narrative of H. Hamel, a Dutchman, who was shipwrecked on the coast of the Island of Quelpart in 1654, and spent thirteen years in captivity; it is contained in the collections of Astley, Pinkerton, &c. Brief notices will be found in B. Hall's *Account of a Voyage to the West Coast of Corea*, 1818; Macleod, *Voyage of H. M. S. Alceste*, 1819; A. Young, *Remarks on Corea*, 1865; A. Williamson, *Journeys to North China*, 1870; and *Fortnightly Review*, 1875. Professor Pfizmaier of Vienna, the Japanese scholar, has published a German translation of the Japanese account of the campaign of 1597, in the *Denkschriften d. k. Akad. d. Wissenschaften*, 1876, and promises *Darlegungen aus der Geschichte und Geographie Corea's*. A French translation of the journal of Kwei-lin, Chinese ambassador to Corea in 1866, appears in the *Revue de Géog.*, 1877. For the language see *A Translation of a Comparative Vocabulary of Chinese, Corean, and Japanese*, by W. H. Medhurst, Batavia, 1835. A grammar and vocabulary by W. F. Meyers, secretary of the English Legation at Pekin, and a dictionary compiled by the French missionaries are to be published. (H. A. W.

CORELLI, ARCANGELO (1653–1713), a celebrated violin player and composer for that instrument, was born at Fusignano near Imola. Of his life little is known. His master on the violin was Bassani. Matteo Simonelli, the well-known singer of the Pope's chapel, taught him composition. His talent as a player on the violin seems to have been acknowledged at an early period, but his first decided success he gained in Paris at the age of nineteen, To this success he owed his European reputation. From Paris Corelli went to Germany and settled at Munich, where he remained for nearly nine years, much admired at court and in the city. In 1681 he returned to Rome, and contracted a close friendship with Cardinal Ottoboni, who made him the conductor of his private chapel. With the exception of a visit to Naples by invitation of the king, Corelli remained in Rome till his death in 1713. His life was quiet and wholly devoted to his art. The style of execution introduced by him and preserved by his pupils, such as Geminiani, Locatelli, and many others, has been of vital importance for the development of violin-playing. In the same sense it may be said that his compositions for the instrument mark an epoch in the history of chamber music; for his influence was not confined to his own country. Even the great Sebastian Bach submitted to it. Musical society in Rome owed much to Corelli. He was received in the highest circles of the aristocracy, and arranged and for a long time presided at the celebrated Monday concerts in the palace of Cardinal Ottoboni. Corelli died possessed of a considerable sum of money and a valuable collection of pictures, the only luxury he had indulged in. Both he left to his benefactor and friend, who, however, generously made over the first part of the legacy to Corelli's relations. The composer's bust, placed on his grave at the expense of the Count Palatine Philip William, and under the supervision of Cardinal Ottoboni, is at present in the Museo Capitolino. Corelli's compositions are distinguished by a beautiful flow of melody and by a masterly treatment of the accompanying parts, which he is justly said to have liberated from the strict rules of counterpoint. Six collections of concerti, sonatas, and minor pieces for violin, with accompaniment of other instruments, besides several concerted pieces for strings, are authentically ascribed to this composer. The most important of these is the *XII. Suonati a Violino e Violone* o *Cimbalo* (Rome, 1700).

CORENZIO, BELISARIO (*c.* 1558–1643), a Greek, studied at Venice under Tintoretto, and then settled at Naples, where he became famous for unscrupulous conduct as a man and rapid execution as an artist. Though careless in composition and a mannerist in style, he possessed an acknowledged fertility of invention and readiness of hand; and these qualities, allied to a certain breadth of conception, seem in the eyes of his contemporaries to have atoned for many defects. When Guido Reni came in 1621 to Naples to paint in the chapel of St Januarius, Corenzio suborned an assassin to take his life. The hired bravo killed Guido's assistant, and effectually frightened Reni, who prudently withdrew to Rome. Corenzio, however, only suffered temporary imprisonment, and lived long enough to supplant Ribera in the good graces of Don Pedro di Toledo, viceroy of Naples, who made him his court painter. Corenzio vainly endeavoured to fill Guido's place in the chapel of St Januarius. His work was adjudged to have been under the mark and inferior to that of Fabrizio Santafede and Carracciolo. Yet the numerous frescoes which he left in Neapolitan churches and palaces, and the large wall paintings which still cover the cupola of the church of Monte-Casino are evidence of uncommon facility, and show that Corenzio was not greatly inferior to the *fa prestos* of his time. His florid style, indeed, seems well in keeping with the overladen architecture and full-blown decorative ornament peculiar to the Jesuit builders of the 17th century. Corenzio died, it is said, at the age of eighty-five by a fall from a scaffolding.

CORFU, the ancient *Corcyra*, an island of Greece, in the Ionian Sea, off the coast of Albania or Epirus, from which it is separated by a strait varying in breadth from less than two to about fifteen miles. In shape it is not unlike the sickle or *drepane*, to which it was compared by the ancients,—the hollow side, with the town and harbour of Corfu in the centre, being turned towards the Albanian coast. Its extreme length is about forty miles and its greatest breadth about twenty. The area is estimated at 227 square miles, and the population is about 72,500. Two high and well-defined ranges divide the island into three districts, of which the northern is mountainous, the central undulating, and the southern low-lying. The most important of the two ranges is that of San Salvador, probably the ancient Istone, which stretches east and west from Cape St Angelo to Cape St Stefano, and attains its greatest elevation of 3300 feet in the summit from which it takes its name. The second culminates in the mountain of Santi Deca, or Santa Decca, as it is called by misinterpretation of the Greek designation οἱ Ἅγιοι Δέκα, or the Ten Saints. The whole island, composed as it is of various limestone formations, presents great diversity of surface, and the prospects from the more elevated spots are magnificent.

Vegetation and Agriculture.—Travellers generally agree that, with the exception, perhaps, of Crete, Corfu is the most beautiful of all the Greek isles, but resident foreigners complain of the monotonous colour of the olive, whose grayish-green is little relieved by the cypress and pine, or the mulberry and *jujubier*. This lack of variety, which is the more to be regretted as the island is adapted for the oak, the plane, the Spanish chestnut, and the walnut, is mainly due to the fact that the government of Venice at one time gave premiums for planting olive-trees, partly to encourage the produce of oil, and partly to discourage the raising of wheat. Once planted, the olive has suited the people. Single trees of first quality yield sometimes as much as 2 gallons of oil, and this with little trouble or expense beyond the collecting and pressing of the fallen fruit. As the trees are allowed to grow unrestrained, they are generally much larger and more wide-spreading than those in Provence or Tuscany, and some are not less than three centuries old. It is worthy of remark that Homer names, as adorning the garden of Alcinous, seven plants only—the wild olive, the oil olive, the pear, pomegranate, apple, fig, and vine. Of these the apple and pear are now very inferior in Corfu; the others thrive well, and are accompanied by all the fruit-trees known in Southern Europe, with addition of the Japanese medlar (or loquat) and, in some spots, of the banana. When undisturbed by cultivation, the myrtle, arbutus, bay, and ilex form a rich brushwood and the minor *flora* of the island is extensive.

Corfiot proprietors in general display little taste for the country, and their absenteeism is probably increased by the "*colonia perpetua*," by which the landlord grants a lease to the tenant and his heirs for ever, in return for a rent, payable in kind, and fixed at a certain proportion of the produce. Of old, a tenant thus obtaining half the produce to himself was held to be co-owner of the soil to the extent of one-fourth; and if he had three-fourths of the crop, his ownership came to one-half. Such a tenant could not be expelled but for non-payment, bad culture, or the transfer of his lease without the landlord's consent. Attempts have been made to prohibit so embarrassing a system; but as it is preferred by the agriculturists, the existing laws permit it. The portion of the olive crop due to the landlord, whether by *colonia* or ordinary lease, is paid, not according to the actual harvest, but in keeping with the estimates of valuators mutually appointed, who, just before the fruit is ripe, calculate how much each tree will probably yield. The large old fiefs (*baronie*) in Corfu, as in the other islands, have left their traces in the form of quit-rents (known in Scotland by the name of feu-duties), generally equal to one-tenth of the produce. But they have been much subdivided, and the vassals may by law redeem them.

The Corfiot peasantry are reputed the idlest of all the Ionians. The olive receives little or no culture from them, and the vineries alone are laboured by the broad heart-shaped hoe. The vintage, which begins on the festival of Santa Croce, or the 26th of September (O.S.), is neither a pretty nor a lively scene, and little care is taken in the various operations. None of the Corfu wines are prized.

Cottagers cultivate no gardens for themselves; they purchase their vegetables in the Corfu market, and a considerable sum goes annually to buy in Apulia the garlic and onions so largely used by the people.

The capital (noticed below) is the only city or town of much extent in the island; but there are a number of villages, such as Benizze, Gasturi, Ipso, Glypho, with populations varying from 300 to 1000.

Corfu contains very few and unimportant remains of antiquity. The site of the ancient city of Kerkyra is well ascertained, about 1½ miles to the south-east of Corfu, upon the narrow piece of ground between the sea-lake of Calichiopulo and the Bay of Castrades, in each of which it had a port. Under the hill of Ascension are the remains of a temple, popularly called of Neptune, a very simple Doric structure, which still in its mutilated state presents some peculiarities of architecture. Of Cassiope, the only other city of ancient importance, the name is still preserved by the village of Cassopo, and there are some rude remains of building on the site; but the temple of Zeus Cassius for which it was celebrated has totally disappeared. Throughout the island there are numerous monasteries and other buildings of Venetian erection, of which the best known are Paleocastrizza, San Salvador, and Pelleka.

The ancient Corcyreans delighted to identify their island with the Homeric Scheria—the kingdom of Alcinous and his Phæacian subjects; but the first authentic event in the history of Corcyra is its colonization in 734 B.C. by the Corinthians, and the expulsion of the previous Cretan and Liburnian settlers. So prosperous was the new community that in a short time it rivalled the mother country, and in 695 B.C., in a sea-fight which is remarkable as the first on record, destroyed the fleet which had been sent to compel its allegiance. Not long afterwards, however, it was forced to recognize Corinthian supremacy by the tyrant Periander, the son of Cypselus. At a subsequent period its dissensions with the parent state brought on the Peloponnesian war, during which it repelled several attempts of the Lacedæmonians. After various vicissitudes it fell into the hands of Pyrrhus, king of Epirus, and on his death it was seized by the Illyrian pirates. Under the Romans, who obtained possession in 229 B.C., it became an important naval station, and so continued till the fall of the Eastern Empire. In 1081 Robert Guiscard, the Norman, captured Corfu, and in 1085 he died at Cassopo. It was again conquered by his nephew Roger of Sicily in 1146; but it was recovered by Manuel Comnenus in 1152. In 1192 Richard I. of England landed at Corfu on his voyage from Palestine; and the forces of the fifth crusade were welcomed to the island after the capture of Zara. The Genoese corsair, Leon Vetrano, who had made himself master of what was then regarded as a Venetian possession, was defeated and executed, and the Venetian senate in 1206 sent a colony of ten noble families to secure its occupancy. Through the rest of the 13th and most of the 14th century, Corfu and the other Ionian Islands were a prey by turns to corsairs, and to Greek and Neapolitan claimants; and it was not till 1386 that the Corfiots voluntarily placed themselves under Venice, which in 1401, on the payment of 30,000 ducats, had its right to the island recognized by Ladislas, king of Naples. Barbarossa ravaged Corfu in 1537, and Selim II. did much the same in 1570. In 1571 the great fleet which was about to become illustrious through the battle of Lepanto, was reviewed at Corfu by the generalissimo, Don John of Austria. The last and greatest struggle for the possession of the city and island was in 1716, when the forces of Achmet III. were defeated by the Venetians under Count Schulenburg, already famous for his crossing of the Oder and his share in the battle of Malplaquet. The peace of Campo Formio gave the Ionian Islands to the French, but in 1799 they were forced to capitulate to a Russo-Turkish fleet. By the treaty of Paris, 1815, the republic of the Ionian Islands was revived, and placed under the protectorate of Great Britain, Corfu being the chief island of the group. In 1864 that protectorate was resigned in favour of the kingdom of Greece, and Corfu now forms one of the nomarchies of that country, along with the neighbouring islands of Merlera, Fano, Salmastraki, Paxo, Antipaxo, and Leukadia.

Literature:—Baron Theotoky, *Détails sur Corfou*; Mustoxidi, *Notizie per servire alla storia Corcirese*, 1804; J. P. Bellare, *Précis des operations générales de la division française du Levant*, 1805; Jervis, *History of Corfu*, 1852; Alb Mousson, *Ein Besuch auf Korfu im Sept. 1858*, Zurich, 1859; Ansted's *The Ionian Islands*, 1863; Tuckermann's *Greeks of To-day*, 1874.

CORFU, the capital of the above island, stands on the broad part of a peninsula, whose termination in the citadel is cut from it by an artificial fosse formed in a natural gulley, with a salt-water ditch at the bottom. Seen from the water, or from a height, it is picturesque in masses, but in detail it is not to be praised for either beauty or comfort. Having grown up within fortifications, where every foot of ground was precious, there is nothing spacious about it except the handsome esplanade between the town and the citadel. Indeed, it is still, in spite of recent improvements, a perfect labyrinth of narrow, tortuous, up-and-down streets, accommodating themselves to the irregularities of the ground, few of them fit for wheel carriages. The palace, built by Sir Thomas Maitland, is a large structure of white Maltese stone, but the exterior has no architectural merits, although internally its apartments are very stately. In several parts of the town may be found houses of the Venetian time with some traces of past splendour, but they are few, and are giving place to structures in the modern and more convenient French style. Of the thirty-seven Greek churches the most important are the cathedral, dedicated to Our Lady of the Cave (ἡ Παναγία Σπηλιώτισσα); St Spiridion's, with the tomb of the patron saint of the island; and the suburban church of St Jason and St Sosipater, reputed the oldest in the island. The city is the seat of a Greek and a Roman Catholic bishop; and it possesses a gymnasium, a theatre, an agricultural and industrial society, and a library and museum preserved in the buildings formerly devoted to the university, which was founded by Lord Guildford in 1823, but disestablished on the cessation of the English protectorate. There are three suburbs of some importance—Castrades, Manduchio, and San Rocco. The old fortifications of the town, being so extensive as to require a force of from 10,000 to 20,000 troops to man them, were in great part thrown down by the English, and a simpler plan adopted, limiting the defences to the island of Vido and the old citadel. Population about 25,000.

CORIANDER, the fruit, improperly called seed, of an Umbelliferous plant (*Coriandrum sativum*), a native of the south of Europe and Asia Minor, but naturalized and cultivated in the south of England. The plant produces a stem rising about a foot in height, with bipinnate leaves and flowers in pink or whitish umbels. The fruit is globular and externally smooth, having five indistinct ridges, and the mericarps, or half-fruits, do not readily separate from each other. It is used in medicine as an aromatic and carminative, and on account of its pleasant and pungent flavour it is a favourite ingredient in hot curries and sauces. The fruit is also used in confectionery, and as a flavouring ingredient in various *liqueurs*. The essential oil on which its aroma depends is obtained from it by distillation. The tender leaves and shoots of the young plant are used in soups and salads.

CORIGLIANO, a town of Italy, in the province of Calabria Citeriore and the district of Rossano, situated on a river of the same name, about four miles from the coast, on a steep hill, which is surmounted by an ancient castle and fringed at the foot by orange and lemon plantations. It is supplied with water by an extensive aqueduct, and carries on the manufacture of liquorice and a trade in timber. Population about 10,000.

CORINGA, a seaport town of British India, in the collectorate of Godavery and presidency of Madras, is situated in 82° 19′ E. long. and 16° 49′ N. lat., on the estuary of a branch of the Godavery River. The harbour is protected from the swell of the sea by the southward projection of Point Godavery, and affords a shelter to vessels during the south-west monsoon. Across its entrance is a bar, which shows a depth of about 15 feet at spring tides. The repairing and building of small coasting ships is a staple industry of Coringa. The chief exports are teak, salt, and piece-goods; the imports are silk, paper, and copper. In 1787 a gale from the north-east occasioned an inundation which swept away the greater part of the town with its inhabitants; and in 1832 another storm desolated the place, carrying vessels into the fields and leaving them aground. Of Europeans the French, who still hold the neighbouring settlement of Yanaon, were the first to establish themselves at Coringa. In 1759 the English took possession of the town, and erected a factory five miles to the south of it.

CORINNA, a Greek poetess, born at Tanagra in Bœotia, of interest for the influence which she exerted on Pindar. The fragmentary traditions which have been preserved represent her now as the poet's friend and instructress, and again as his rival and competitor. By her he is said to have been advised to adorn his poems with the Greek myths, and then when he employed them too lavishly, to have been warned that they ought to "be sown by the hand and not poured forth from the sack." She also blamed him for having used an Attic idiom in one of his lyrics. The victory which she gained in the poetic contest with her friend in the public games at Thebes is ascribed by Pausanias to her beauty and the free use she made of the local Bœotian dialect; and the story goes that Pindar gave expression to the same opinion by calling her in the heat of his chagrin a "Bœotian swine," with allusion to a common Greek proverb. By the Greeks she was esteemed as the first of the nine lyrical muses. The fragments of her poetry have been collected by Ursinus, Wolf, Schneider, and Bergk.

See Leopold Schmidt, *Pindar's Leben und Dichtungen*, 1862.

CORINTH (now corrupted into Gortho) was originally called Ephyre, but the name Κόρινθος is as old as Homer. This most populous and thriving of Greek cities was situated at the southern end of the isthmus which connects Peloponnesus with the mainland of Hellas. The citadel, Acrocorinthus, occupied the summit of a precipitous rock, 1886 feet in height, which is in fact an offshoot from the Oneion, a mountain range skirting the northern shore of Achaia, but which appears, especially when viewed from the north, to be detached. From this height the view includes the Geraneian range at the opposite end of the isthmus, and the higher mountains of Northern Greece behind it, while in the foreground lies to the left the Corinthian Gulf stretching westward, and the Saronic Gulf to the east, together with the strip of flat land which divides the one of these from the other. Another narrow plain stretches along the southern shore of the Corinthian Gulf in the direction of Sicyon, and was proverbial in ancient times for the value of its agricultural produce. The city of Corinth lay not at the foot of the hill on which the citadel stood, but on a ledge or shelf of that hill at a height of about 200 English feet. A lofty wall—according to Strabo, 85 stadia (about ten miles) in length—inclosed both city and citadel, and two walls, each 12 stadia in length, inclosed the road to the harbour of Lechæum on the Corinthian Gulf; Schœnus and Cenchreæ, the two harbours belonging to the city on the Saronic Gulf, lay at a greater distance.

From its position Corinth enjoyed in prehistoric times two advantages especially important in the infancy of navigation. On the long gulf which stretched from Corinth westwards, called in early times after Crissa, the port of Delphi, and later after Corinth itself, vessels could sail for above 100 miles without losing sight of land and between fertile shores. And secondly, the natives of Corinth were skilful in dragging vessels of all kinds across from sea to sea, thus saving them the dangers of the perilous voyage round the Peloponnesus. That the Phœnicians did not overlook these advantages we know from the many traces of Phœnician occupation remaining in later times, especially the worship of the Phœnician Athene, Aphrodite Urania (the Sidonian Astarte), and Melicertes (the Tyrian Melkarth).

The important *cultus*, at the isthmus, of Poseidon, the great divinity of the Ionians, proves the earliest Greek inhabitants of Corinth to have been Ionian, but Thucydides states that it was under Æolian princes. The earliest of these of whom we hear is Sisyphus, according to one legend lover of Medea, according to another grandfather of Bellerophon, the great local hero who tamed the winged horse Pegasus, and slew the monstrous Chimæra. The character of mingled greed and cunning, ascribed to Sisyphus, is doubtless intended to embody the qualities which distinguished the people of the commercial city from their rural neighbours. This was in the age preceding the Trojan War. On the return of the Heraclidæ the Dorian invaders, after subduing the rest of Peloponnesus, attacked Corinth, and having mastered it proceeded against Megara and Athens. Corinth fell into the hands of a descendant of Hercules, named Aletes (the wanderer), and was reconstituted on Dorian principles, but not, it would appear, with the same rigidity as Argos, Sicyon, and other cities, for we find eight tribes instead of the usual three, and it is certain that the aristocracy of the city did not disdain to lead in trade, and resembled rather the nobility of Venice than the pure-blooded warrior-caste of other Dorian cities. The most wealthy family was that of the Bacchiadæ, the descendants of Aletes, who furnished first a succession of kings, and afterwards yearly prytaneis who ruled with kingly power. It was about 657 B.C. that Cypselus, a Bacchiad on his mother's side, succeeded in overthrowing this oligarchy and, by the aid of the commons, establishing his power at Corinth so firmly that he could even forego the foreign body-guard and the external supports of the Greek tyrant. His son and successor, Periander was sometimes reckoned among the wise men of Greece, and probably did more than any other man to shape the colonial and mercantile policy of the city. Under him Corinth reached the summit of prosperity, but Periander's family was destroyed by internal dissensions, and his nephew Psammetichus was after a brief reign put down by the Spartans about 584 B.C.

It was in the period between Aletes and Psammetichus that lay the golden days of Corinth. Then were made a series of splendid discoveries and inventions, which increased the trade and multiplied the resources of the city, and enabled it to found the numerous colonies which were the basis at once of its wealth, its power, and its policy. To begin with the loftier arts. Arion graced the court of Periander, and secured for Corinth the honour of the invention of the dithyramb; Eumelus and Eumolpus, both Corinthians, were among the earliest and the most celebrated of the cyclic poets. Corinthian architecture was renowned until the later time when a light and ornate style of building took its origin and its name from the city. Corinthian pottery was early celebrated, and it is said that the art of ornamenting earthenware was improved at Corinth by Butades, Eucheir, and Eugrammus. Even painting was either introduced into Greece, or was much improved, by the Corinthians Aridices, Ecphantus, and Cleanthes. Still it was in the useful rather than the ornamental and imaginative arts that Corinth most excelled. There the trireme was invented, and the machinery for the transport of ships carried to the highest perfection, while Corinthian bronzes, tables, coffers, and objects of luxury were renowned on all shores of the Ægean and Adriatic. One of the most remarkable of these pieces of handiwork was the well-known chest of Cypselus, still preserved at Olympia in the time of Pausanias, made of cedar and inlaid with a multitude of figures in gold and ivory, a miracle of archaic art.

The wealth and prosperity of the city caused its rulers to plan early a scheme of colonization. Professor Ernst Curtius has given reasons for supposing that at the time of the Lelantian war, of which Thucydides speaks, between Chalcis and Eretria in Eubœa, Corinth was, together with Samos, a firm ally of the former city, and that it was in company with the Chalcidians that the Corinthians made their first attempts at colonization. That these attempts were, through a series of years, made almost constantly in a western rather than an eastern direction was due to the position of Ægina, which island lay right in the track of travellers from Corinth to Asia Minor or the Euxine,—the Æginetans having maintained a constant hostility to the Corinthians from the earliest times, until their island was finally conquered by the Athenians, who had received for the war a detachment of ships sent from Corinth. It was in the 8th century that the two greatest colonies, Corcyra and Syracuse, were founded. Syracuse remained, even in the time of her greatest prosperity, a grateful and dutiful daughter, but Corcyra very soon after its foundation was engaged in hostilities with the mother-city, and, though reduced to obedience in the time of Periander, finally ousted Corinthian commerce from the northern part of the Adriatic, and maintained undivided supremacy over the cities of Dyrrhachium and Apollonia. But south of the straits of Sybota, which divided the southern point of Corcyra from the mainland, Corinth was supreme. To her the towns of Achaia, Phocis, and Locri, on both sides of the Corinthian Gulf, looked as their head; she ruled all the rich country watered by the Achelous, which region, indeed, became in time almost more Corinthian than the isthmus itself, while all the Dorian cities of Sicily and Southern Italy looked to the navy of Corinth to keep up their connection with the mother country.

It is said that Corinth adhered in a special manner to the customs of Phœnicia as regards colonies, at any rate the city was in this respect successful beyond the rest of Greece. Expeditions were directed to some promising point on the Illyrian or Acarnanian coast, the approval of the Delphic oracle was secured, and volunteers were invited from all parts of Greece. At the head of the colony was placed some cadet of the Bacchiadæ, or another great family, and some of the mercantile nobility accompanied it, retaining in the new home much of the oligarchical predominance which they had enjoyed at home. It was probably the preservation of this aristocratic tinge which made the union closer between colony and mother-city, so that the Corinthian envoys could boast (Thucydides, i. 38) that Corinth was of all cities the most popular with her colonies; and, with the exception of Corcyra, few of the new settlements gave the mother-city any trouble. Alone among cities Corinth imposed on all her colonies a uniform coinage, the different issues of which are so similar in appearance that it has been doubted if Corinth did not keep in her own hands all minting of silver.

After Psammetichus had been put down, a timocracy was instituted, with hierarchy of grades. Corinth set an early example in that system of political classification according to revenue which was afterwards adopted in Rome and other cities. At the same time, it is clear that in so commercial a city an organization of this kind would not produce an exclusive land-owning aristocracy.

It was about the middle of the 5th century B.C. that Corinth started upon a more restless and aggressive career. At that time her very existence was threatened by the growing greatness of Athens, which city had gained the mastery of Megara and predominant power among the cities of Achaia. Soon after the beginning of the Peloponnesian war, an Athenian fleet under Tolmides appeared in the Corinthian Gulf, and seizing upon Naupactus, and expelling thence the Locrian colonists whom Corinth had stationed there to defend her interests, established in that city a colony of Messanian fugitives, in order to cut the communications of Corinth close to their base. Hence the bitter and vindictive animosity felt by the Corinthians towards Athens, which caused them, after that city had surrendered to Lysander to urge upon the Spartans its total destruction. No sooner, however, was the Spartan supremacy undisputed, than a party among the Corinthians, whether seduced by Persian gold, or following notions of supposed expediency, began to cabal with Athens and Argos against the Lacedæmonians, with whom the aristocracy of the city still sided. Hence bitter dissensions and many calamities to the Corinthians, whose city was more than once the battle-field of parties, as well as of the Argive and Lacedæmonian troops. The events of the war hence arising, and called Corinthian, belong to the history of Greece. The city, weakened by sedition, fell easily into the hands of Philip II. of Macedon, whose successor, the fifth Philip, called it, in virtue of its splendid position, one of the three fetters of Greece. As the chief city of the Achæan League during the latter part of its existence, Corinth claimed a share in the 2d century in the latest glories of Greece. There Flamininus proclaimed the liberties of Greece; and as the ally of Rome, Corinth reached a high point of wealth and splendour. But that alliance was broken off, and the result was the total destruction of the city by Mummius in 146 B.C., and the sale of its inhabitants into slavery. The richness of the city at this period in all the accumulated results of Greek science and art was immense, as we know from the statements of Polybius, an eye-witness. The Romans secured a vast spoil of statues, pictures, and furniture, of which a part was purchased by Attalus of Pergamus, a part sent in many ships to Rome, and much also destroyed in mere wantonness. Notwithstanding, the place remained a quarry whence in after ages were dug innumerable treasures of art. The Corinthian territory was given to Sicyon, and the site lay waste until the time of Julius Cæsar. The great dictator settled there a colony of needy Greeks and Roman freedmen, which he called after himself Laus Julia, and made the seat of government of Achaia. Between the new Corinth and the old the site was the only bond of connection, yet the historic splendours of the place seem to have mastered the minds of the new inhabitants, who before long began to resume all the local *cults*, and to claim the past glory of the city as their own. Latin, however, as we know from coins, remained the official language, and the duumviri were usually the freedmen of the emperors or of Roman nobles.

The new city, from its position, soon acquired a great trade with Ephesus, Thessalonica, and other cities. For this reason it attracted St Paul, who visited it more than once, and spent many months there in converse with Aquila and Priscilla, and in preaching in the synagogue. Hence were written the two Epistles to the Thessalonians, and here was founded a church which claimed for a long period the deepest anxieties of the apostle and after his death of Clement,—the temptations to sensual indulgence and antinomian heresies being here stronger than in most of the Greek cities.

Unfortunately, it is only of this second Corinth that we possess detailed descriptions. It was visited both by Strabo and Pausanias. From the former we learn that the summit of the Acrocorinthus bore a little temple of Aphrodite, and that just below the summit gushed out the fountain Peirene, which once more rose to the surface down in the lower city. Just below this fountain were the remains of a marble building, supposed to have been the remains of the palace of the monarch Sisyphus. From the account of Pausanias (ii. ch. 1–4) we may gain a clear notion of the topography of the city and the isthmus. In the midst of the city was the market-place, commanded by a lofty statue of Pallas made of bronze, and surrounded by many temples, among others those of the Ephesian Artemis and of Fortune, and by statues standing in the open air. Hence three principal roads led in various directions. The first passed westwards towards Sicyon, leading by a temple of Apollo, the Odeum, and the tomb of the children of Medea, Mermerus and Pheres, whom a local legend asserted to have perished at the hands of the Corinthians, after they had brought their poisoned gifts to Glauce. A little further on was the temple of Athene Chalinitis (the bridler), so called because she bridled for Bellerophon the unruly Pegasus; the statue of the goddess was of wood and doubtless ancient, a fact which proves that the sack by Mummius cannot have been so complete as might have been imagined. Near this temple was a theatre, probably a work of Roman times, and a temple of the Roman Jupiter Capitolinus.

The second road led north towards the harbour of Lechæum and the Corinthian Gulf. It first passed Propylæa, surmounted by two gilt quadrigæ driven by Phaethon and Helios, and next the grotto where issued afresh the same fountain Peirene which rises near the summit of the Acrocorinthus, and filled a large basin with sweet water, used by the inhabitants for drinking, and as a bath in which to dip the vessels of Corinthian bronze while still red-hot, a process which was supposed to make their fineness unapproachable. The water-supply of the city was unrivalled, yet the emperor Hadrian constructed an aqueduct all the way from the Stymphalian Lake, a work, if we may believe Pausanias, of vain ostentation.

The third road led eastwards, first to the fashionable suburb of the city, a cypress-grove called Craneion. This quarter is well described in Becker's *Charicles*. It abounded with the life which distinguished Corinth from other cities, crowds of travellers, seeking both gain and pleasure, with the lively booths which offered the former, and the crowds of female slaves who ministered to the latter. Here was the tomb of Lais, to whom her fellow-citizens paid almost divine honours, and here, strangely, the monument of the great cynic, Diogenes of Sinope, who had passed his life in the midst of this gay and dissolute company. On the Craneion the road divided into two branches. Of these the more southerly ran to the harbour of Cenchreæ, a roadstead fenced on both sides by promontories stretching out to sea, but not much assisted by art; while the more important Lechæum, on the other side of the isthmus, was almost entirely artificial. The more northerly branch of the road led to the little harbour of Schœnus, and the world-renowned spot where were celebrated every second year the Isthmian Games. These games were held in honour in early times of Melicertes, in later times of Poseidon, and close by were temples of both deities. That of Poseidon was not large; it contained statues of Poseidon, Amphitrite, and Thalassa, and in front was a crowd of statues of the victors in the games. The shrine of Melicertes stood under a pine; it was circular, and contained, as we know from coins, a statue of the divinity reclining on the back of a dolphin. Melicertes (also called Palæmon) had also a subterranean chapel where the most solemn oaths were administered, and it was said that perjurers seldom left the spot unpunished. Close to the temples was the stadium of the games made of white marble, and not far from it the road on which triremes were transported from sea to sea. There were also traces of a canal which, projected by Alexander the Great, resolved on by Julius Cæsar, commenced by Nero, was never dug more than a few hundred yards inland from the Corinthian Gulf.

In the Middle Ages Corinth suffered many disasters. It was sacked by Alaric, and at a later period was most bitterly contended for by the Turks and the Venetians. During the Middle Ages the city occupied the hill of Acrocorinthus itself, not the ledge at its base, but it has now resumed its earlier position. The modern town is small and wretched, and retains few remains of antiquity The most remarkable among these are seven columns of an exceedingly ancient temple of the Doric order, and some traces of the Roman amphitheatre.

The best authorities on the subject are—Ernst Curtius, *Peloponnesos*, vol. ii. p. 514, and a dissertation in the *Hermes*, vol. x.; Barth, *Corinthiorum Commercii et Mercaturæ Historiæ Particula*, Berlin, 1843; Dr Wm. Smith's article in his *Dictionary of Ancient Geography*. The autonomous coins afford valuable data for the history of the Corinthian league, and the coins of Roman times offer representations of many of the most interesting objects of the later city. (P. G.)

CORINTHIANS, Epistles to the. These two letters of St Paul occupy a unique position among the Pauline epistles. They are remarkable as being in their primary aspect historical rather than doctrinal, while, at the same time, all the fundamental doctrines of Christianity, as connected with the miraculous facts on which they rest, are suggestively implied. These epistles, too, together with those to the Galatians and to the Romans, have been admitted as genuine writings of St Paul, even by the most audacious critical assailants of the New Testament canon. The external testimony to them is early and complete, and the internal evidence of authorship and age makes it impossible to doubt the genuineness and authenticity of these remarkable documents. There are, perhaps, no other epistles in the New Testament in which there is so much of "local colouring," or so many temporal and local allusions. These letters throw great light both upon the early circumstances of the Christian church and upon the character of the great missionary to the Gentiles; and whilst they are very full of what was due to the special occasions on which they were written, the universal applicability of the Christian principles laid down in them must be patent to every thoughtful student. Stier speaks of the Epistles to the Corinthians as being "a pathology and *materia medica* for all that are designed to be physicians of the church in a larger or lesser circle;" and Bleek remarks on the first epistle, that it "serves as a type and pattern in dealing with the multifarious tendencies, relations, and disorders of the Christian church, almost all of which have their counterpart in the Corinthian Church, and are continually repeated with various modifications at various times."

The history of the two epistles seems to be this. Paul's first visit to Corinth and his long and eventful sojourn there are mentioned in Acts xviii. 1–18. After his departure from the rich and luxurious capital of Achaia, evils which, we can perceive, were very likely to spring up in such a place began to appear in the Christian community. The Hellenic tendency to philosophical speculation and to factious partisanship, and the sensuality and licentiousness which had made the word *corinthianize* a synonym for self-indulgence and wantonness, became roots of bitterness, strife, and immorality. The presence of Apollos (Acts xviii. 27, 28) was doubtless advantageous, and St Paul evidently alludes to a successful prosecution of evangelistic work by the learned Alexandrian, when he says "I planted, Apollos watered" (1 Cor. iii. 6). Yet it would seem that invidious comparisons had been made between the simpler preaching of the Apostle Paul and the probably more philosophical and refined style of Apollos, so that some of the Corinthian Christians began to regard Apollos as their leader, rather than Paul, who had first preached the gospel unto them. The reluctance of Apollos to return to Corinth at the time when Paul wrote what we know as the first epistle (1 Cor. xvi. 12), can best be accounted for by a consciousness on his part of the rivalry which had arisen between the two factions; and the manner in which Paul urged, and Apollos declined, the mission of the latter to Corinth may be viewed as equally creditable to the magnanimity of the older teacher and to the modesty and prudence of the younger. But a far more dangerous division of the church existed than that between those who favoured Paul and those who preferred Apollos. In the Epistles to the Corinthians we have indications of the antagonism and envy of a Judaizing section, who may have been encouraged by emissaries from Palestine, like those complained of in Galat. ii. 4 (comp. Acts xv. 1, 24). These Judaizers would make much of the fact that Paul was not one of the original twelve apostles; and they seem to have endeavoured to undermine his authority, by depreciating his position as a teacher, and by deriding his personal qualifications. Nor were dissensions and tendencies to split up into parties the only evils that infested the Corinthian Churches. Paul, when at Ephesus on his third missionary journey, heard of these "contentions" from the members of a Christian household, who were either resident at Corinth or connected with the place (1 Cor. i. 11); but he heard of something worse still, and more glaringly inconsistent with the Christian profession. Licentiousness was common among them, and a grievous case of incest had taken place (1 Cor. v. 1, &c.), which called for the severest censure and punishment. That the apostle had been awake to the peculiar dangers of the Corinthian Christians in respect of the licentiousness and luxury for which Corinth was noted, appears from the fact that he had previously written a letter which has not come down to us (1 Cor. v. 9), exhorting the Christians to avoid intercourse with fornicators. Alford conjectures that this letter may have also contained some instructions as to the collection (1 Cor. xvi. 1), and an announcement of an intended plan of visiting them, which he afterwards abandoned, perhaps on purpose to see what effect would be produced by the letter known to us as the first epistle, which was in reality a second one.

A good opportunity was presented for communicating with the Corinthians by the arrival of Stephanas, Fortunatus, and Achaicus (1 Cor. xvi. 17), who probably brought a letter from Corinth (1 Cor. vii. 1, &c.), requesting instructions on divers points to which St Paul replies in the first of our two epistles. This letter from Corinth (as Paley points out) seems to have made little or no mention of the disorders and divisions which the apostle rebukes. These came to the apostle's ears by private report and not in an official communication. We have here a satisfactory explanation of the varied contents of our first epistle. After an introduction which is graceful, conciliatory, and affectionate (1 Cor. i. 1–9), the writer alludes to the indications of party spirit and dissension which had been reported to him, and, while he very earnestly vindicates the claim of the gospel to be a revelation of divine wisdom, deprecates the tendency to overrate human eloquence and intellect (i. 10–iv. 16.) He tells them that he is sending Timotheus to remind them of his teaching, and that he intends himself to come soon (iv. 17–21). He then rebukes their licentiousness and their litigiousness (v., vi.), and afterwards proceeds to answer the several inquiries which had been put before him by the Corinthian letter, viz., questions concerning marriage, questions concerning meat offered to idols, and questions concerning spiritual gifts (vii.–xiv.). With his replies to particular points he blends a spirited defence of his own authority and conduct (ix.), and serious exhortations as to the behaviour of women in the Christian assemblies, and the manner in which Christians should partake of the Lord's Supper (x., xi.) One doctrinal subject is treated of directly in the epistle. Some among the Corinthians had denied the resurrection of the dead. The apostle shows that the fact of the resurrection of Jesus Christ from the dead is the basis of Christian teaching and the spring of Christian hope (xv.) He then makes reference to the collection which he was making for the brethren at Jerusalem, speaks of his own plans, sends greetings from the churches of Asia, and concludes with solemnity and tenderness (xvi.)

The subscribed note to this epistle, which asserts that it was written from Philippi, is a palpable error, possibly grounded upon a misapprehension of xvi. 5. The letter was evidently written from Ephesus, some time before Pentecost, and after winter (xvi. 6, 8), and, not improbably, near the season of the Jewish feast of the Passover (v. 7, 8), in the year 57 A.D. Whether Timothy was the bearer of the letter or not seems doubtful (xvi. 10); and it is more probable that the three messengers from Corinth, already mentioned as having brought a letter for St Paul, returned with his reply. But Timothy and Erastus were sent together into Macedonia, and Erastus (comp. Rom. xvi. 23 and 2 Tim. iv. 20) may have been returning to his home in Corinth. Then occurred the notable disturbance at Ephesus recorded in Acts xix. 23, &c. Paul left Asia for Macedonia (Acts xx. 1), and our second epistle to the Corinthians may have been written either at Philippi or at Thessalonica, at a time when Timothy had rejoined him (2 Cor. i. 1).

It has been a frequent remark of commentators that there is no letter among those written by St Paul so full of personal feeling as the Second Epistle to the Corinthians. The "tumultuous conflict of feeling," "the labyrinth of conflicting emotions," by which the writer was agitated, is reflected in the rapid transitions and confused eagerness, as we may term it, of his style. We can trace a twofold current of emotion,—one, of relief and gratitude because he had heard from Titus (2 Cor. vii. 7) better tidings than he had expected of the effect produced by his former letter, and the other, of righteous indignation against those persons at Corinth, who were trying to undermine his influence and misrepresent his work. We may also perceive indications of mental dejection, and references to bodily suffering which add much to the personal interest of the letter. It has been conjectured that, besides "the trouble in Asia" (i. 8) and his daily anxieties about "all the churches" for which he felt himself responsible (xi. 28), the apostle was suffering about this time from an attack of that painful and chronic malady which he calls "a stake in the flesh" (xii. 7). Titus had been sent to Corinth as a special messenger some time after the despatch of the letter from Ephesus, and was expected by Paul at Troas, but did not rejoin him until he had come into Macedonia. The news that the greater part of the Corinthian Church was loyal to their old teacher, and had attended to his injunctions in the matter of the offender mentioned in 1 Cor. v., and had "sorrowed unto repentance" (2 Cor. vii. 10, 11), was very consolatory to him; but it is plain that Titus must have also informed Paul of very distinct and virulent opposition to him on the part of certain teachers and a faction of the Corinthians attached to them. Hence the indignant strain which especially appears in the latter part of the epistle, where irony and remonstrance and pathos are so wonderfully blended, and where the desire to vindicate his authority, to substantiate his personal claims to the respect and affection of the church, and to expose the mischief which was being done by the false teachers, causes him to review his own toils and infirmities in the touching picture of his work which we have in xi. 21–xii. 21. The epistle (so far as it admits of analysis) may be roughly divided into three portions, viz.:—(1) a very earnest description of his own interest in and relation to the Corinthian churches, and of the impression produced on his mind by what Titus reported (i.–vii.); (2) some exhortations to liberality in respect of the collection which was going on in Macedonia and Achaia for the brethren at Jerusalem (viii., ix.); (3) a vindication of his apostolic authority against the calumnies and misrepresentations of those who were endeavouring to subvert it (x.–xiii.) The epistle was taken to Corinth by Titus, who was quite ready to undertake a second journey (viii. 17), and with him went two other brethren (*ib.* 18, 22), who were selected "messengers of the churches," in charge of the contributions to the collection already mentioned. It has been noticed that this letter was "addressed not to Corinth only but to all the churches in the whole province of Achaia, including Athens and Cenchreæ, and perhaps also Sicyon, Argos, Megara, Patræ, and other neighbouring towns, all of which probably shared more or less in the agitation which affected the Christian community at Corinth" (Howson).

We may here mention the conjecture of Bleek that between our 1 Corinthians and 2 Corinthians another letter intervened, which Titus took with him on his first mission, and that this is the letter which is referred to in 2 Cor. ii. 3, vii. 8 as one of unusual severity. If this conjecture, which is a plausible one, be admitted, there must have been four letters from the Apostle Paul to the Corinthians, two of which have not been preserved. At any rate our 2d epistle is one in which all the affection and eagerness of the apostle culminate, and it gives to us, more than any other of his letters which have come down to us, an idea of the intensity of the zeal and sympathy with which he laboured in the cause of the gospel. "What an admirable epistle," wrote George Herbert, "is the second to the Corinthians! how full of affections; he joys, he sorrows, he grieves, and he glories; never was there such care of a flock expressed save in the great Shepherd of the fold, who first shed tears over Jerusalem, and then blood."

There are three special points in connection with the Epistles to the Corinthians on which a few further remarks must be made. One is the question whether a visit to Corinth, which is not mentioned in the Acts, yet seems alluded to in several passages of the epistles (2 Cor. xii. 14, xiii. 1, 2, and comp. ii. 1, xii. 21), took place. The opponents of this view rely principally on the *argumentum a silentio* (which in this case, however, is a very weak one, when we consider the evidently compendious nature of St Luke's narrative in the Acts), and on the expression "a *second* benefit," in 2 Cor. i. 15, 16. But this expression seems to refer to St Paul's intention to pay a double visit to Corinth, one in going to, and a second in returning from, Macedonia. The advocates of the unrecorded visit urge, first, that the language about the "third" visit cannot reasonably be explained by saying that it was the third time St Paul *intended* to come; and, secondly, that it is very natural to suppose that the apostle would have found some opportunity for at least a short visit during his three years' residence at Ephesus. This visit appears to have been a very painful one, during which St Paul must have had sad forebodings of the evils which he rebukes in our first epistle; but it must have been a brief one, and the language of 1 Cor. xvi. 7 might possibly allude to the hurried nature of a former visit.

Another disputed point, and one which it is perhaps impossible to determine, is, What was the nature of the "Christine" party at Corinth? Were they a separate faction at all? if so, were they a Judaizing faction or a philosophizing one? Some hold that 1 Cor. i. 12 does not oblige us to believe in the existence of distinct parties or factions in the church, but only of certain tendencies. The indications throughout the epistles are, at any rate, sufficient to show that a strong antagonism existed between a Judaizing faction and a more liberal, less formal, and less scrupulous body of professed Christians, some of whom adhered to Paul as their recognized leader, while others preferred Apollos. We can quite understand how the Judaizing party would seize on the name and position of Peter, or Cephas (and it is noticeable that the Hebrew designation is preferred), as a rallying point, where they could oppose the claims of Paul and Apollos. But who were those who boasted that they were peculiarly Christ's? Some (as Howson, Alford, Stanley) think it probable they were an extreme section of the Judaizers. Others (as Neander and Olshausen) consider that they may have been "philosophical" Greeks who, "with arrogant self-will," professed to belong to no party, and renounced all "apostolic" intervention, perhaps modelling for themselves a peculiar form of Christian doctrine by means of some collection of memorable sayings and actions of Christ.

A third point which calls for brief notice is the "gift of tongues," of which so much is said in the first of our two epistles. It is quite what we should expect that a gift which ministered rather to individual notoriety than to general edification should have been abused and overrated in a Greek community like that at Corinth. It does not seem probable, nor is there evidence forthcoming to show, that the "gift of tongues" was used for purposes of instruction. It was a mystical condition rather than a linguistic faculty,—an ecstatic utterance connected with a peculiar state of religious emotion. Stanley compares Montanist utterances, the prophets of Cevennes, Wesleyan paroxysms, and Irvingite manifestations as phenomena which, "however inferior to the manifestations of Apostolic times, have their origin in the same mysterious phase of human life and human nature."

The evidential value of the epistles to the Corinthians is very great. For we have in them indisputable historical and biographical *data* which in various ways imply and establish all the fundamental facts which concern the origin of the Christian church, and indicate the process, of which we have a more direct narrative in the Acts, whereby Christianity was extended beyond the range of Jewish influences and prejudices, and its principles brought into contact with "the culture and vices of the ancient classical world."

There are not many special writers on these epistles. Among the Germans may be mentioned Osiander, Heydenreich, Billroth. But the book in which English readers will find the most complete and specific treatment of the subject is that by Dean Stanley. He divides the epistles into sections, and appends paraphrases of their contents. There are important notes on the allusions to the Eucharist in 1 Cor., on the miracles and organization of the apostolic age, and on the gifts of tongues and of prophecy. He adds a short dissertation on the relation of the epistles to the gospel history. In Conybeare and Howson's *Life and Epistles of St Paul* there is a very instructive review of the condition of the primitive church, with special reference to spiritual gifts, ordinances, divisions, &c. (ch. xiii.), and the whole history of the period during which the Epistles to the Corinthians were written is admirably treated. The Armenian epistles from the Corinthians to St Paul, and from St Paul to the Corinthians, are apocryphal. They may be seen in Stanley's book. Paley's *Horæ Paulinæ* and Birks's *Horæ Apostolicæ* contain interesting examples of undesigned coincidences between the epistles and the narrative in the Acts. Birks thinks that the Sosthenes mentioned in 1 Cor. i. 1, whose name never occurs in the other epistles, may be identified with the ruler of the synagogue mentioned in Acts xviii. 17. A full discussion on "the thorn in the flesh" will be found in an interesting note of Professor Lightfoot on Gal. iv. 13. (W. S. S.)

CORIOLANUS, Caius (or Cneius) Marcius, a Roman patrician, said in the legend to have belonged to the 5th century B.C., and to have been a descendant of King Ancus Marcius. Brought up by his proud but patriotic mother Veturia (or, as Plutarch calls her, Volumnia), Coriolanus developed into the foremost warrior of his time, and it was from his prowess at the siege of Corioli, when he took the town single-handed, that he received his cognomen. But his hatred of the plebs lost him the consulship, and when he ventured to advise that the people, who were suffering from a dearth of corn, should not be relieved from the supplies obtained from Sicily unless they would consent to the abolition of their tribunes, he was condemned to banishment. Obtaining the command of the Volscian army, he advanced against his native city. In vain the first men of Rome prayed for moderate terms. He would agree to nothing less than the restoration to the Volscians of all their land, and their admission among the Roman citizens. At last his mother, his wife, Volumnia, and his children, accompanied by a company of Roman matrons of the highest birth, came to the Volscian camp, and by their tears and entreaties prevailed. He led back the Volscian army, and, according to one account, paid with his life the penalty of his tenderness. Niebuhr has shown that several important parts of the legend are probably historical.

CORIOLI, an ancient Latin city, celebrated as giving a surname to C. Marcius Coriolanus. It is first mentioned in Roman story as falling into the hands of the Volsci, and being retaken from them by the Romans, 493 B.C. It was never a large or important place, and seems to have dropped out of existence before the close of the 5th century B.C. The site of Corioli is now unknown. Nibbey and Gell have quite conjecturally assigned it to the hill called Monte Giove, about nineteen miles from Rome on the way to Antium, while others, with as little ground, have suggested a hill four miles nearer Antium.

CORK (perhaps from *cortex*, bark) is the outer layer of the bark of an evergreen species of oak (*Quercus Suber*). The tree reaches the height of about 30 feet, growing in the south of Europe and on the North African coasts generally; but it is principally cultivated in Spain and Portugal. The outer layer of bark in the cork oak by annual additions from within gradually becomes a thick soft homogeneous mass, possessing those compressible and elastic properties upon which the economic value of the material chiefly depends. The first stripping of cork from young trees takes place when they are from fifteen to twenty years of age. The yield, which is rough, unequal, and woody in texture is called virgin cork, and is useful only as a tanning substance, or for forming rustic work in ferneries, conservatories, &c. Subsequently the bark is removed every eight or ten years, the quality of the cork improving with each successive stripping; and the trees continue to live and thrive under the operation for 150 years and upwards. The produce of the second barking is still so coarse in texture that it is only fit for making floats for nets and for similar applications. The operation of stripping the trees takes place during the months of July and August. Two cuts are made round the stem,—one a little above the ground, and the other immediately under the spring of the main branches. Between these three or four longitudinal incisions are then made, the utmost care being taken not to injure the inner bark. The cork is thereafter removed in the sections into which it has been cut, by inserting under it the wedge-shaped handle of the implement used in making the incisions. After the outer surface has been scraped and cleaned, the pieces are flattened by heating them over a fire and submitting them to pressure on a flat surface. In the heating operation the surface is charred, and thereby the pores are closed up, and what is termed "nerve" is given to the material. In this state the cork is ready for manufacture or exportation.

Cork possesses a combination of properties which peculiarly fits it for many and diverse uses, for some of which it alone is found applicable. The leading purpose for which it is used is for forming bungs and stoppers for bottles and other vessels containing liquids. Its compressibility, elasticity, and practical imperviousness to both air and water so fit it for this purpose that the term cork is even more applied to the function than to the substance. Its specific lightness, combined with strength and durability, recommend it above all other substances for forming life-buoys, belts, and jackets, and in the construction of life-boats and other apparatus for saving from drowning. On account of its lightness, softness, and non-conducting properties it is used for hat-linings and the soles of shoes, the latter being a very ancient application of cork. It is also used in making artificial limbs, for lining entomological cases, for pommels in leather-dressing, and as a medium for making architectural models. Chips and cuttings are ground up and mixed with india-rubber to form kamptulicon floor-cloth, a preparation now, however, almost superseded by linoleum, which consists chiefly of a mixture of boiled linseed oil and ground cork applied over a canvas backing. The inner bark of the cork-tree is a valuable tanning material.

Certain of the properties and uses of cork were known to the ancient Greeks and Romans, and the latter, we find by Horace (*Odes*, iii. 8), used it as a stopper for wine-vessels:—

> "Corticem adstrictum pice dimovebit
> Amphoræ"—

It appears, however, that cork was not generally used for stopping bottles till so recent a period as near the end of the 17th century, and bottles themselves were not employed for storing liquids till the 15th century. Many substitutes have been proposed for cork as a stoppering agent; but except in the case of aerated liquids none of these has recommended itself in practice. For aerated water bottles several successful devices have recently been introduced. The most simple of these is an Indian-rubber ball pressed upwards into the narrow of the bottle neck by the force of the gas contained in the water; and in another system a glass ball is similarly pressed against an Indian-rubber collar inserted in the neck of the bottle.

The cutting of corks by machinery has been found to be a matter of much difficulty, owing to the liability of the cutting edges becoming blunt, and the necessity of keeping them very sharp. Many machines have been proposed, but the work is still almost entirely done by hand labour. Messrs Crawhall & Campbell of Glasgow have recently introduced a machine which appears to be at once simple, expeditious, and efficient. The apparatus cuts corks and bungs of any diameter up to $3\frac{1}{2}$ inches, either parallel or tapered, and an expert workman can turn off about 6 gross of corks per hour.

CORK, a maritime county in the south-west of Ireland, province of Munster, bounded on the S. by the Atlantic, E. by Waterford and Tipperary, N. by Limerick, and W. by Kerry. It is the largest county in Ireland, and contains an area of 1,849,686 acres, or 2890 square miles. The outline of the county is irregular; its sea margin is for the most part bold and rocky, and is intersected by the Bays of Bantry, Dunmanus, and Roaring Water. The southern part of the coast projects several headlands into the ocean, and its south-eastern side is indented by Cork Harbour, and Ballycotton and Youghal Bays.

The surface of the country is undulating. It consists of low rounded ridges, with corresponding valleys, running east and west, except in the western portion of the county, which is more mountainous. Those valleys are drained by the Blackwater, the Lee, and the Bandon River. The most elevated part of the county is in connection with the Boghra Mountains, the highest of which, Cahorbanaghor, reaches 2239 feet. North of the Blackwater the county is comparatively level, being a portion of the great plain which occupies a large part of the centre of Ireland. Of the principal rivers the Blackwater has its source in the county of Limerick. The Lee originates in Goughanbarra Lake, and the Bandon River rises in the Cullinagh Lake. There are also some smaller streams which flow directly into the sea, the more important of these being in the south-west portion of the county. No lakes of any magnitude occur, the largest being Inchigeelagh, which is an expansion of the River Lee between Macroom and its source. Of the total area 14,368 acres are covered with water. The scenery of the western parts of the county is bold and rugged. In the central and eastern parts, especially in the valleys, it is green and sheltered, and in some spots well wooded.

Geology and Minerals.—With reference to the geology of the county, the hills are principally composed of Old Red Sandstone, which is the lowest formation that occurs. In the western and mountainous districts these rocks consist of purple and green-coloured sandstones and grits—"Glengarriff grits"—which are several thousand feet thick. In the central and eastern districts the same rocks occur in the form of brownish purple sandstone and shales—"brounstones." The veins are highly contorted, and form anticlinal axes, and they exhibit change in various degrees. They are locally extensively used as building stones, and are usually split along their cleavage planes. These Old Red Sandstones have afforded no traces of fossils in this county. Upon the "brounstones," the highest member of the Old Red Sandstones, the "Yellow Sandstones" occur. They have a thickness of about 800 feet, and afford fossil plants, shells, and crustaceans. To the Yellow Sandstone succeeds the base of the Carboniferous group. These consist of black slaty rock—"Carboniferous slabs." In the eastern parts of the county these strata rise about 900 feet thick; westwards they increase greatly, being at the Old Head of Kinsale about 6500 feet in thickness. They have at their base grey gritty beds of varying thickness—the "Coomhola grits." Both members of the series are fossiliferous, and the Carboniferous slates have been extensively worked in many localities for roofing. They are, however, much inferior to the Bangor slates.

The principal valleys in the county of Cork, except in the case of the Bandon River, are in their lower parts occupied by Carboniferous limestone, overlying the Carboniferous slate and occurring at synclinal troughs. The limestones are commonly light grey in colour and of great thickness. For the most part they are very pure carbonate of lime, thick-bedded and compact. Some are used as marbles, but their most extensive application is as building stones, which are durable and of good colour. In the neighbourhood of the city of Cork (Little Island), near the centre of the synclinal trough, a brecciated red limestone is worked, being polished as a marble. It is known as "Red Cork Marble." In some localities near the city of Cork the limestone is dolomitic, and is extensively quarried for the manufacture of magnesia. Some portions of the limestones are very fossiliferous. Near Mallow it is thin-bedded and contains nodules of schist. Succeeding the limestone, which represents the scar limestone and Yoredale series of England, are shales and flags, equivalents of the millstone grits, on which lie the coal measures south of Kanturk. The coal is anthracitic, very irregular in thickness, and highly inclined. The strata are much contorted and crushed, the coal frequently occurring in "pockets." Several seams are known, some of which are worked. These coals have only a local sale, being used principally for lime-burning.

In the south-west part of the county igneous rocks are partially developed. Copper pyrites was formerly extensively mined in the south-west of the county, especially at Berehaven or Allihies,—the rocks more prolific in copper being the Yellow Sandstone series. Little is now being done at those or other copper mines in the county.

Lead also occurs in small veins, but not in sufficient quantity to be worked. Near Glandore manganese, mostly in the form of psilomelane, has been largely worked, but is now abandoned.

Clay which is used for brick-making occurs near Youghal, where there are extensive potteries. Bricks are also made from the silty clay deposited by the River Lee on small islands in the Douglas Channel.

Climate.—The climate is moist and warm, the prevailing winds being from the west and south-west. The rainfall in the city is about 40 inches *per annum*,—that of the whole county being somewhat higher, about 44 inches. The mean average annual temperature is about 52° Fahr. The snow-fall during the winter is usually slight, and snow rarely remains long on the ground except in sheltered places. The thermal spring of Mallow was formerly in considerable repute; it is situated in a basin on the banks of the Blackwater, rising from the base of a limestone hill. It has been long celebrated for the cure of pulmonary, chlorotic, stomach, and urinary complaints, in the cure of which its waters are said to be very efficacious. The temperature of the water, 72° Fahr., is nearly invariable. The climate of Mallow is soft and agreeable. The chief places for sea-bathing are Blackrock, Passage, Monkstown, and Queenstown in the vicinity of Cork; Kinsale, Ballycotton, and Youghal are also much frequented by invalids during the summer months.

Fisheries.—The Kinsale fishery, now established about fifteen years, promises to be the most remunerative of the industrial resources of the south of Ireland. The mackerel-fishery in 1875 commenced as usual about the middle of March, and lasted to the second week in June, at which time over £185,000 worth of fish was caught and purchased from the fishermen. In 1876 there were engaged in the trade 383 boats from Cornwall, the Isle of Man, Howth, Arklow, and Kinsale, the proportion from the last-named place numbering 60. There were also twenty-two hulks in the harbour used as icehouses, on the deck of which the fish was packed for the English markets. Eight Norwegian barks laden with ice arrived. These, with eleven steamers especially chartered for the fish trade, fifteen Jersey trading cutters for conveying fish, and three Cork tugs, comprised the staff of the local trade. The fishing boats are supplied with trains of nets, 2½ miles in length and 8 feet in depth. They start early in the morning for the fishing grounds, and at sunset let down the nets. They are floated with small pieces of cork, and the bottom of the nets is sunk by heavy ropes. They are allowed to drift all night, and the mackerel are caught by running their heads into the meshes of the net. They are purchased by the fish-buyers, packed in boxes containing 120 each, and immediately forwarded per steamer to Bristol, Milford, and Holyhead, for Birmingham, London, Manchester, and Liverpool. The fishery extends from Cape Clear nearly to Cork Harbour. Hake, cod, and haddock, which were formerly taken in great abundance here, seem to have in a great measure left the coast.

Agriculture.—The soils of the county exhibit no great variety. They may be reduced in number to four:—the calcareous in the limestone districts; the deep mellow loams found in districts remote from limestone, and generally occurring in the less elevated parts of the grey and red sandstone districts; the light shallow soils, and the moorland or peat soils, the usual substratum of which is coarse retentive clay.

In a district of such extent and variety of surface, the state of agriculture must be liable to much variation. The more populous parts near the sea, and in the vicinity of the great lines of communication, exhibit very favourable specimens of agricultural improvement.

No advancement has recently been made in the extent of land placed under tillage, and the principal crops raised are oats, potatoes, and turnips. In 1876 the total area under tillage amounted to 430,541 acres, of which 157,365 were under corn crops, 127,206 under green crops, and 145,370 grass under rotation. The corn and green crops were thus distributed in the two years 1873 and 1876 respectively

Acreage.	Oats.	Wheat.	Barley, &c.	Potatoes.	Turnips.
1873	115,990	19,133	25,470	68,338	40,476
1876	117,330	18,043	21,990	71,958	39,528

Dairies are extensive, and the character of the Cork butter stands high in the English and foreign markets. Cork possesses the largest number of live stock of any county in Ireland, except in sheep and asses, in the former of which it is exceeded by Galway, and in the latter by Tipperary. The numbers of live stock in the years 1873 and 1876 were as follows:—

	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.*
1873	54,044	8168	372,412	342,697	136,661	23,526	971,821
1876	53,425	9312	365,729	322,349	170,048	25,102	1,135,951

The total value of the land, exclusive of the city of Cork, according to the return of 1875, was £1,059,994, and the average value per acre 11s. 7½d.—that of all Munster being 11s. 2½d. The county in the same year was divided among 5889 separate proprietors, of whom 3091 possessed less than one acre, being a much larger proportion of small owners than in the rest of Munster. The average size of the holdings amounted to 309½ acres—that of all Munster being 374. Eighteen proprietors owned upwards of 10,000 acres each, and held a total of one-fifth of the whole county. The principal proprietors were the earl of Bantry, 69,500 acres; duke of Devonshire, 32,550; Sir George C. Colthurst (Ardrum), 31,260; Countess of Kingston (Mitchelstown), 24,421; earl of Kenmare, 22,700; earl of Cork and Orrery, 20,165; Sir H. W. Becher (Ballygiblin), 18,933; earl of Egmont (Lohort Castle), 16,766; R. H. E. White (Glengarriff), 16,175; and Lord Fermoy, 15,543. Of waste ground there was estimated to be 15,350 acres.

Administration.—The county is divided into east and west ridings (the county of the city is in the east riding); it is subdivided into 33 baronies, containing 251 parishes, which form the diocese of Cork, Cloyne, Ross, and part of Ardfert. Since the disestablishment of the Irish Church, that body has under the diocesan scheme reduced the number of parishes by amalgamation to ninety-five.

The Cork military district has barracks at Cork (headquarters), Kinsale, Fermoy, Ballincollig, Queenstown, Spike Island, Camden and Carlisle Forts at the entrance to the harbour (lately fortified with all the improvements of modern science), Bandon, Youghal, and Buttevant. The constabulary force of the county consists of 674 men in the east and west ridings, two inspectors, and seventeen sub-inspectors; the officers have their headquarters at Cork and Bandon. The poor law unions are Bandon, Bantry, Castletown, Clonakilty, Cork, Dunmanway, Fermoy, Kanturk, Kinsale, Macroom, Mallow, Midleton, Millstreet, Mitchelstown, Skibbereen, Skull, and Youghal.

Population.—The number of inhabitants in this county has greatly decreased within the last thirty years. At the last census (1871) there was a population of 517,076 persons (males, 256,062; females, 261,014); in 1861 it was 544,818 and in 1851, 649,308, showing a decrease between 1851 and 1871 of about 20 per cent., while that of all Munster was 25 per cent. The estimated population of the county for 1875 was 507,016. The principal towns are Cork, population 102,526; Queenstown, 10,340; Fermoy, 7388; Kinsale, 7050; Bandon, 6131; Youghal, 6081; Mallow, 4165; Skibbereen, 3695; and Midleton, 3603.

During the five years ending 1875, the average number of emigrants per annum amounted to 7110, and the total number from 1851 was 301,573, the largest proportion of any Irish county. Of late years, however, the exodus has considerably abated.

The prevailing religion of the inhabitants is the Roman Catholic. In 1871 there were 517,076 Catholics to 49,455 Protestants (40,493 Episcopalians, and 8962 of various denominations)—the proportion of Protestants to the whole population amounting to little more than 9½ per cent., while that of all Munster was 6½

The number of persons in 1871 of five years and upwards who could read and write was 219,074; 49,091 could read but could not write, and 183,114 could neither read nor write; 11,628 were returned as able to speak Erse only.

Representation.—Previous to the Union the county returned twenty-six members to the Irish Parliament. At that time, however, the representation was reduced to eight—two for the county, two for Cork city, and one each for the boroughs of Mallow, Bandon, Youghal, and Kinsale.

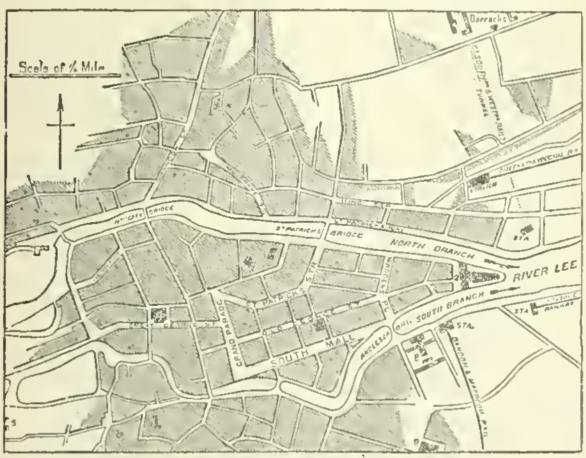
History.—According to Ptolemy, the districts now known by the names of the county of Cork and Desmond were anciently inhabited by the Coriondi, Udiæ or Vodii, Velabori, and Uterni, which Dr Smith considers to be a corruption of the name Iberi. Before the arrival of Strongbow Cork was a kingdom of itself, governed by the MacCarthys; but in 1172 Dermod MacCarthy, who had sworn fealty to Henry II., threw off his allegiance, and attacked the English under Raymond le Gros, thereby forfeiting the crown. What formed his kingdom was granted by Henry II. to Robert Fitz-stephen and Milo de Cogan, with the exceptions of the city of Cork and the adjoining cantred belonging to the Ostmen of the same city, which were retained by the king. It was made shire ground by King John in 1210, who appointed sheriffs and other local officers for its government. For many years, however, the royal writs were of little efficacy in many parts of it, as the great families still virtually commanded the allegiance of the inhabitants.

Fitzstephen's share of the grant descended through the female line to the Barrys and Roches, whilst that of De Cogan became vested in Maurice Fitzgerald, growing into an extent of territory and consequent power far exceeding any ever possessed by the MacCarthys. Whilst making a show of attachment to the English, the Fitzgeralds intrigued with the foreign Roman Catholic powers (who projected the conquest of Ireland during the reign of Queen Elizabeth), and ultimately broke out into open rebellion. After being utterly defeated, Gerald, the fifteenth and last earl of Desmond, when a fugitive in the wilds of Kerry, was slain by an obscure individual named Kelly. Against this earl of Desmond an act of attainder was passed in 1583, and the Fitzgeralds of Desmond, after having maintained their power and possessions for upwards of 300 years, were reduced to utter ruin; their strong castles were seized, and their vast estates, to the extent of no less than 574,628 acres, confiscated by the Crown. These were again transferred to English settlers, called undertakers or planters, who were bound not to convey any part of the lands to the native Irish, or to intermarry with or maintain any of them. Sir Walter Raleigh obtained 40,000 acres, which afterwards passed to the family of Boyle, earl of Cork; Arthur Robins, 18,000; Hugh Worth, 12,000; Fane Beecher, 12,000; Arthur Hyde, 12,000; Sir Warham St Leger, 6000; Sir Thomas Norris, 6000; Hugh Cuffe, 6000; Thomas Say, 5800; Sir Richard Beacon, 1600; and Edmund Spenser, the poet, 3028. This attempt to set aside or extirpate the native population failed. The Irish outbade the English settlers, and were therefore, at least for a time, found to be more profitable tenants, so that ultimately they re-occupied nearly all the lands as tenants under the English undertakers. In 1602 a large portion of the estates of Sir Walter Raleigh and Fane Beecher were purchased by the earl of Cork, who had them colonized with English settlers; and by founding or rebuilding the towns of Bandon, Clonakilty, Baltimore, Youghal, and afterwards those of Midleton, Castlemartyr, Charleville, and Doneraile, which were incorporated and made parliamentary boroughs, the family of Boyle became possessed of nearly the entire political power of the county. In 1641 and the following years the sons of the earl of Cork, more especially Lord Broghill, rendered good service to the Parliamentary cause, and obtained considerable military renown. The course of events led to the forfeiture of the estates of Lords Muskerry and Roche, and afterwards of those of the earl of Clancarty, Viscount Kenmare, Sir Richard Nagle, and others, to the extent of 250,000 acres. Since that period no events of equal importance have occurred in this county.

Antiquities.—The earlier antiquities of the county are rude monuments of the Pagan era, such as stone circles, druids' altars, "raths" or circular mounds of earth, and stone pillars. There are two so-called druids' altars, the most perfect at Castlemary near Cloyne, and certain pillar stones scattered through the county, with straight marks cut on the edges called Ogham inscriptions, the interpretation of which is still a subject of much controversy.

The remains of the old ecclesiastical buildings are in a very ruinous condition, being used as burial-places by the county people. The principal is Kilcrea, founded by Cormack M'Carthy about 1465, some of the tombs of whose descendants are still in the chancel; the steeple is still nearly perfect, and chapter-house, cloister, dormitory, and kitchen can be seen. Timoleague, situated on a romantic spot on a rising ground at the extremeend of Courtmacsherry Bay, contains some tombs of interest, and is still in fair condition. Buttevant Abbey contains some tombs of the Barrys and other distinguished families. All these were the property of the Franciscans. There are two round towers in the county, one in a fine state of preservation opposite Cloyne Cathedral, the other at Kinneigh. From the chapter seal of Ross, which is dated 1661, and seems to have been a copy of a much earlier one, there is a good representation of a round tower and stone roofed church, with St Fachnan, to whom the church is dedicated, standing by, with a book in one hand and a cross in the other. Of Mourne Abbey, near Mallow, once a preceptory of the Knights Templars, and Tracton Abbey, which once sent a prior to Parliament, the very ruins have perished.

Of the castles, Lohort, built in the reign of king John, is by far the oldest, and in its architectural features the most interesting; it is still quite perfect and kept in excellent repair by the owner, the earl of Egmont. Blarney Castle, built by Cormack M'Carthy about 1449, has a world-wide reputation, to which Millikin's song, "The Groves of Blarney," in no small degree contributed; it is also bound up with the civil history of the county and the war of the great rebellion. Castles Mahon and Macroom have been incorporated into the residences of the earls of Bandon and Bantry. The walls of Mallow Castle attest its former strength and extent, as also the castle of Kilbolane. The castles of Kilcrea and Dripsy are still in good condition. (R.C.)



Plan of Cork.

1. School of Design and Museum.	4. Court House.	7. Barracks.
2. Custom House.	5. Queen's College.	8. Corn Exchange.
3. Theatre.	6. Cathedral	9. Blind Asylum.

CORK, a city and port, is a county in itself, 138 miles south-west of Dublin direct and 165 by rail, and 11 miles north-west of the port of Queenstown, in 51° 53′ 39″·3 N lat and 8° 20′ W. long. Until lately it ranked as the second city in Ireland, but of late Belfast has far surpassed it in population, wealth, and commerce. The original site of the city seems to have been located in the vicinity of the cathedral, which was founded by St Fin-Barre about 622. In the 9th century this place was frequently pillaged by the Northmen or Danes. According to the *Annals of the Four Masters*, a fleet burned Cork in 821; in 846 the Danes appear to have been in possession of the city, for a hosting was made to demolish their fortress; and in 1012 a great fleet of foreigners burned Cork. The Danes then appear to have founded the new city on the banks of the River Lee for the purpose of trade. The city was anciently surrounded with a wall, and we find in the city council book an order for its reparation so late as the year 1748. In the beginning of the 18th century the ground on which the principal part of the present city is built consisted of numerous islands intersected by canals or connected by drawbridges, through which small vessels could pass at high tide. The river now consists of the north and south branches. Both are lined with fine quays of cut limestone, the north spanned by four and the south by as many more bridges. The principal streets are St Patrick Street, Grand Parade, South Mall, and Great George Street. There are 517 streets, roads, lanes, and public passages in the borough, measuring 54¼ miles. St Patrick's Bridge is an elegant structure, commenced in 1859.

Churches.—There are eight Protestant parish churches, including the cathedral. St Luke's has lately been separated from St Ann de Shandon. There are three Roman Catholic parish churches, and the church of St Patrick. The Franciscan, Dominican, Augustinian, Carmelite, and St Vincent de Paul orders have also their respective churches; there are besides three convents and two monasteries. The principal church is the new Protestant cathedral, the foundation stone of which was laid, 12th January 1865. It succeeds a rather mean building, the foundation stone of which was laid in 1735 on the site of a very ancient cathedral which suffered during the siege of Cork in September 1689–90. This building is in the Early French style, and when completed will cost near £100,000. The tower and spires now being erected are the gift of two merchant princes of Cork—Mr William Crawford and Mr Francis Wise—and will cost £30,000. The entire cathedral is due to the indefatigable exertions and munificence of Dr John Gregg, bishop of Cork, Cloyne, and Ross. The other Protestant churches are extremely poor externally, except St Nicholas and St Luke's; the latter is a neat structure on the high ground north-east of the city. The Roman Catholic cathedral is being restored to suit the fine Gothic steeple which adjoins it. The other Roman Catholic churches, St Mary, St Peter and Paul, St Patrick, Holy Trinity, and St Vincent de Paul are magnificent structures, and rank amongst the finest modern ecclesiastical edifices in Ireland. There are also the Presbyterian, a Baptist, an Independent, and two Wesleyan Methodist places of worship, as well as a Friends' meeting house.

Public Buildings.—The court-house is an elegant Grecian structure with a Corinthian portico about 30 feet in height. The Corn Exchange, Savings Bank, Provincial Bank, and Bank of Ireland are handsome buildings of cut limestone. The custom-house is built at the juncture of the two branches of the River Lee, and commands the river. The Commercial Buildings, Chamber of Commerce, and Hibernian, National, and Munster Banks all possess some architectural merit.

Educational, Scientific, and Charitable Institutions.—The Queen's College, built on the site of an old feudal castle, is a fine structure, in the Tudor-Gothic style. It was opened 1849, and now possesses a library of about 22,000 volumes, a good museum, and a laboratory furnished with all the apparatus necessary for the advancement of modern scientific inquiry. The Model School has a daily attendance of about 381 pupils; Christian Brothers, 1870 pupils; Sisters of Charity, 750 pupils; Presentation Nuns, 1650 pupils; Sisters of Mercy, 600 pupils; Presentation Brothers, 1200 pupils. There are also the several parochial and industrial schools which are well attended. Under the auspices of the National Board is the Cork Agricultural School, about two miles from the city, for the purpose of educating pupils exclusively in agricultural science.

The Cork Library, which was founded 1790, contains a valuable collection of books in every department of literature. The Royal Cork Institution, established by a royal charter in 1807, in addition to an extensive library of works chiefly scientific and historical, and a rare collection of Oriental MSS., possesses a valuable collection of minerals classified for examination. The fine collection of casts from the antique presented by the Pope to King George IV., which are now the property of the institution, are used by the pupils of the Cork School of Art. There are numerous literary and scientific societies, and the Cork Cuvierian and Archæological Society, which publishes a monthly report of its proceedings. There also are young men's societies presided over by the clergy of the different religious denominations.

The North and South Infirmary and Fever Hospital are supported by public grants, and hospitals have been established and supported by private benevolence for almost every form of human suffering. The Cork District Lunatic Asylum occupies a fine position on the brow of a hill in the western suburb. It contains a daily average of 730 patients; the recoveries are computed at about 43·3 per cent. The Cork Union Workhouse contains a daily average of 2000 inmates, about one-half of whom are daily under hospital treatment. The buildings, out-offices, &c., occupy about 18 acres of land; the annual income from taxation is £40,000.

The city water-works were erected under local Acts of 1852–56 at a cost of £100,000. They supply the city with 5,000,000 gallons of water daily, also 625 hydrants and 166 public fountains; the extent of main pipes is 59 miles, of service pipes, about 66. Since the passing of the Intramural Burial Act the corporation of Cork has established a new cemetery (St Fin-Barre's) about a mile west of the city, at a cost of £12,000. It is already adorned with some handsome and costly monuments. St Joseph's cemetery, founded by Father Matthew in 1830 on the site of the old Botanic Gardens of the Cork Institution, is also beautifully planted and much used

Trade.—The Cork Butter Exchange may be considered as the centre of the most important branch of manufacture not only in the county but in the entire province of Munster. Stafford in his letters mentions the exportation of corn and butter from Cork in 1633 to Spain. The present market dates from 1769, from which time there exists an unbroken series of accounts. The largest number of firkins of butter on record that passed through the market was that of the year ending 14th April 1876. The number amounted to 431,796 firkins, representing a marketable value of nearly £1,700,000. The season 1859–60 approached it very closely (431,462), which was accounted for by the gold fever then at its height in Australia, Cork being the only market capable of meeting the demand, supplying a kind of butter suited to bear a long voyage; its preparation is a *spécialité*, the system of classification by branding being carried out under the inspection of an expert. Each firkin contains on an average 74 lb. Wheat and corn are extensively imported into Cork, the facilities for discharging vessels of great burden being lately increased by deepening the channels of the river and erecting jetties along the Marina. For the year ending 31st December 1875 there were 620,240 quarters of wheat and 289,275 quarters of corn discharged in the port of Cork (a quarter is about 480 lb). There are three distilleries and four breweries in the city, which manufacture largely for home consumption and exportation. The tanning trade is also extensively carried on. An extensive flax-mill has been lately established, and a manufactory for chemical manure, which produces about 10,000 tons annually. A large traffic is also carried on in the exportation of cattle (for which special steamers are sometimes run twice a week), eggs, feathers, and fish, particularly salmon, for which the River Lee is celebrated. The registered tonnage of vessels at the port in 1876 was 34,801. The number and tonnage of vessels entering the port, employed in the cross channel and coasting trade, reached 2644 vessels and 667,316 tons; in the British colonial trade, 62 vessels of 27,641 tons; in the foreign trade, 637 vessels, tonnage 161,739. The custom duties of the port average about £288,641.

Municipality.—The city, which is represented in Parliament by two members, is presided over by a mayor, a high sheriff, fourteen aldermen, and forty-one town councillors. It has from time to time received several charters; the oldest, a copy of which only remains, is preserved in the Library of the British Museum (*Harl.*, No. 441). The principal charter is that of James I. The council books of the corporation from 1610 to 1800 have just been published. Cork holds a conspicuous place in the annals of Ireland, as will be seen by reference to the calendar of state papers, lately published under the master of the rolls. On 28th September 1689–90, the city surrendered to the earl of Marlborough after five days' siege, when the duke of Grafton was mortally wounded. The Irish were in possession of the city and Elizabeth Fort adjoining, which capitulated after being attacked with the muskets of a few soldiers, who fired into it from the steeple of the cathedral of Cork, which was directly opposite. The principal subsequent events of any moment will be found recorded in the council books above mentioned.

Population.—The decrease in the population of the county has not extended to the city in the same proportion. In 1851 the inhabitants of the municipal borough, within an area of 2266 acres, numbered 85,745; in 1861, 80,121, and in 1871, 78,642 (males, 36,847; females, 41,795), showing a decrease within twenty years of about $8\frac{1}{4}$ per cent., that of the county being 20 per cent. The Parliamentary borough, which has an area extending to 46,086 acres, contained 102,526 inhabitants in 1871. Of the population in the municipal borough 66,716 were Catholics and 11,926 Protestants. The proportion of Protestants, of whom 9196 were Presbyterians and 1028 Episcopalians, is equal to $15\frac{1}{4}$ per cent. of the whole population, considerably higher than in the county. (R.C.)

CORK, EARLS OF. See BOYLE, vol. iv. p. 183.

CORLEONE, a town of Sicily, in the province of Palermo, about 23 miles south of the city of that name, on the slope of a hill near the head waters of the Belici. It is well built and has two castles, one in ruins and the other used as a prison, and several good churches, of which the chief was restored in 1392. The town was one of the Saracen settlements in Sicily, and the castles are believed to be of Saracen erection; the inhabitants are principally descendants of a Lombard colony, introduced in 1227 by Frederick II., and traces of the Lombard dialect are still observable. A fair trade is carried on with Palermo. The population, including the suburb of S. Niccolo, exceeds 16,000.

CORMENIN, LOUIS MARIE DE LA HAYE, VISCOUNT DE (1788–1868), a French jurist and political pamphleteer, was born at Paris, January 6, 1788. His father and his grandfather both held the rank of lieutenant-general of the admiralty. In consequence of the suppression of the colleges he received his early education at a private school at Paris, and afterwards studied in the school of law. At the age of twenty he was received advocate, and about the same time he gained some reputation as a writer of piquant and delicate poems. In 1810 he received from Napoleon I. the appointment of auditor to the council of state; and after the restoration of the Bourbons he became master of requests. During the period of his connection with the council he devoted himself zealously to the study of administrative law, and acquired those stores of exact knowledge which afterwards furnished the material for his principal work as a jurist. He was selected to prepare some of the most important reports of the council. Among his separate publications at this time are noted,—*Du Conseil d'Etat envisagé comme conseil et comme juridiction dans notre monarchie constitutionelle* (1818), and *De la responsabilité des agents du gouvernement*. In the former he claimed, for the protection of the rights of private persons in the administration of justice, the institution of a special court whose members should be irremovable, the right of oral defence, and publicity of trial. In 1822 appeared his *Questions de droit administratif*, in which he for the first time brought together and gave scientific shape to the scattered elements of administrative law. These he arranged and stated clearly in the form of aphorisms, with logical deductions, establishing them by proofs drawn from the archives of the council of state. This is recognized as his most important work as a jurist, and has become the chief authority on its subject. It has passed through five editions, the fifth, which was published in 1840, being thoroughly revised. In 1828 Cormenin entered the Chamber of Deputies as member for Orleans, took his seat in the Left Centre, and began a vigorous opposition to the Government of Charles X. As he was not gifted with the qualifications of the orator, he seldom appeared at the tribune; but in the various committees he defended all forms of popular liberties, and at the same time delivered, in a series of powerful pamphlets, under the pseudonym of "Timon," the most formidable blows against tyranny and all political and administrative abuses. The ministerialists named him "l' homme du contentieux." After the revolution of July 1830, Cormenin was one of the 221 who signed the protest against the elevation of the Orleans dynasty to the throne; and he resigned both his office in the council of state and his seat in the chamber. He was, however, soon re-elected deputy, and now voted with the extreme Left. The discussions on the budget in 1831 gave rise to the publication of his famous series of *Lettres sur la liste civile*, which in ten years ran through twenty-five editions. In the following year he had the distinction of being elected by four arrondissements; he took his seat for Belley. In 1834 he was elected by two arrondissements, and sat for Joigny, which he represented till 1846. In this year he lost his seat in consequence of the popular prejudice aroused against him by his trenchant pamphlet *Oui et non* (1845) against attacks on religious liberty, and a second entitled *Feu! Feu!* (1846), written in reply to those who demanded a retractation of the former. In this he re-asserted his principles still more relentlessly. Sixty thousand copies were rapidly sold. One inevitable penalty which he had to suffer for these incisive manifestoes was exclusion from the French Academy and the Academy of Moral and Political Sciences. Cormenin was an earnest advocate of universal suffrage before the revolution of February 1848, and had remorselessly exposed the corrupt practices at elections in his pamphlet—*Ordre du jour sur la corruption électorale*. After the revolution he was elected by four departments to the constituent assembly, and became one of its vice-presidents. He was also member and president of the constitutional commission, and for some time took a leading part in drawing up the republican constitution. But the disputes which broke out among the members led him to resign the presidency. He was soon after named member of the council of state and president of the *comité du contentieux*. It was at this period that he published two pamphlets—*Sur l'indépendence de l'Italie*. After the *coup d'état* of December 2, 1851, Cormenin, who had undertaken the defence of Prince Louis Napoleon after his attempt at Strasburg, accepted a place in the new council of state of the empire. Four years later, by imperial ordinance, he was made a member of the Institute. One of the most characteristic works of Cormenin, not yet mentioned, is the *Livre des orateurs*, a series of brilliant studies of the principal parliamentary orators of the restoration and the monarchy of July, the first edition of which appeared in 1838, and the eighteenth in 1860. In 1846 he published his *Entretiens de village*, which procured him the Montyon prize, and of which six editions were called for the same year. His last work was *Le droit de tonnage en Algérie* (1860). Cormenin was distinguished also as a practical philanthropist, and is said to have established more charitable institutions than any layman of his time in France. He was admitted to the Legion of Honour in 1821, and was promoted commander in 1865. He died at Paris, May 6, 1868.

CORMONTAIGNE, Louis de (1696–1752), a French military engineer, was born at Strasburg. He was present as a volunteer at the sieges of Friburg and Landau, and in 1715 he entered the Engineers. From 1733 to 1745 he took part in several of the most important sieges in the Polish and Austrian wars. Having gained the rank of *maréchal de camp* he received charge of the line of fortifications from Calais to the Rhone; and he built new defences at Strasburg, Metz, and Thionville, at which last place he died.

With the exception of the *Architecture militaire*, printed at the Hague in 1741, and reprinted at Paris in 1809 as the *Mémorial pour la fortification permanente et passagère*, and extracts published and used as text-books, the works of Cormontaigne remained in MS. till the beginning of the present century. First published at Berlin in 1803, the *Mémorial pour l'attaque des places* was printed at Paris in 1806, as also was the *Mémoire pour la défense des places*. All three treatises were republished, with a preface, by Bousmard in 1809.

CORMORANT—from the Latin *corvus marinus*, through the French (in some *patois* of which it is still "cor marin," and in certain Italian dialects "corvo marin" or "corvo marino")—a large sea-fowl belonging to the genus *Phalacrocorax*[2] (*Carbo*, *Halieus*, and *Graculus* of some ornithologists), and that group of the Linnæan Order *Anseres*, now partly generally recognized by Illiger's term *Staganopodes*, of which it with its allies forms a Family *Phalacrocoracidæ*.

The Cormorant (*P. carbo*) frequents almost all the sea-coast of Europe, and breeds in societies at various stations, most generally on steep cliffs, but occasionally on rocky islands as well as on trees. The nest consists of a large mass of sea-weed, and, with the ground immediately surrounding it, generally looks as though bespattered with whitewash, from the excrement of the bird, which lives entirely on fish. The eggs, from four to six in number, are small, and have a thick, soft, calcareous shell, bluish-white when first laid, but soon becoming discoloured. The young are hatched blind, and covered with an inky-black skin. They remain for some time in the squab-condition, and are then highly esteemed for food by the northern islanders, their flesh being said to taste as well as a roasted hare's. Their first plumage is of a sombre brownish-black above, and more or less white beneath. They take two or three years to assume the fully adult dress, which is deep black, glossed above with bronze, and varied in the breeding-season with white on the cheeks and flanks, besides being adorned by filamentary feathers on the head, and further set off by a bright yellow gape. The old Cormorant looks as big as a Goose, but is really much smaller; its flesh is quite uneatable.

Taken when young from the nest, this bird is easily tamed and can be trained to fish for its keeper, as was of old time commonly done in England, where the Master of

[1] Some authors, following Caius, derive the word from *corvus vorans* and spell it Corvorant, but doubtless wrongly.

[2] So spelt since the days of Gesner; but possibly *Phalarocorax* would be more correct.

the Cormorants was one of the officers of the royal household. Now-a-days the practice is nearly disused, though a few gentlemen still follow it for their diversion. When taken out to furnish sport, a strap is fastened round the bird's neck so as, without impeding its breath, to hinder it from swallowing its captures.[1] Arrived at the waterside, it is cast off. It at once dives and darts along the bottom as swiftly as an arrow in quest of its prey, rapidly scanning every hole or pool. A fish is generally seized within a few seconds of its being sighted, and as each is taken the bird rises to the surface with its capture in its bill. It does not take much longer to dispose of the prize in the dilatable skin of its throat so far as the strap will allow, and the pursuit is recommenced until the bird's gular pouch, capacious as it is, will hold no more. It then returns to its keeper, who has been anxiously watching and encouraging its movements, and a little manipulation of its neck effects the delivery of the booty. It may then be let loose again, or, if considered to have done its work, it is fed and restored to its perch. The activity the bird displays under water is almost incredible to those who have not seen its performances, and in a shallow river scarcely a fish escapes its keen eyes and sudden turns, except by taking refuge under a stone or root, or in the mud that may be stirred up during the operation, and so avoiding observation.[2]

Nearly allied to the Cormorant, and having much the same habits is the Shag, or Green Cormorant of some writers (*P. graculus*). The Shag (which name in many parts of the world is used in a generic sense) is, however, about one-fourth smaller in linear dimensions, is much more glossy in plumage, and its nuptial embellishment is a nodding plume instead of the white patches of the Cormorant. The easiest diagnostic on examination will be found to be the number of tail-feathers, which in the former are fourteen and in the Shag twelve. The latter, too, is more marine in the localities it frequents, scarcely ever entering fresh or indeed inland waters.

In the south of Europe a still smaller species (*P. pygmæus*) is found. This is almost entirely a fresh-water bird, and is not uncommon on the lower Danube. Other species, to the number perhaps of thirty or more, have been discriminated from other parts of the world, but all have a great general similarity to one another. New Zealand and the west coast of Northern America are particularly rich in birds of this genus, and the species found there are the most beautifully decorated of any. All, however, are remarkable for their curiously-formed feet, the four toes of each being connected by a web, for their long stiff tails, and for the absence, in the adult, of any exterior nostrils. When gorged, or when the state of the tide precludes fishing, they are fond of sitting on an elevated perch, often with extended wings, and in this attitude they will remain motionless for a considerable time, as though hanging themselves out to dry, but hardly, as the fishermen report, sleeping the while. It was perhaps this peculiarity that struck the observation of Milton, and prompted his well-known similitude of Satan to a Cormorant (*Parad. Lost*, iv. 194); but when not thus behaving they themselves provoke the more homely comparison of a row of black bottles. Their voracity is proverbial. (A. N.)

CORN LAWS. Legislation on corn was early applied both to the home and foreign trade in this essential produce. Roads were so bad, and the chain of home trade so feeble, that there was often scarcity of grain in one part, and plenty in another part of the same kingdom. Export by sea or river to some foreign market was in many cases more easy than the carriage of corn from one market to another within the country. The frequency of local dearths, and the diversity and fluctuation of prices, were thus extreme. It was out of this general situation that the first corn laws arose, and they appear to have been wholly directed towards lowering the price of corn. Exportation was prohibited, and home merchandize in grain was in no repute or toleration. As long as the rent of land, including the extensive domains of the Crown, was paid in kind, the sovereign, the barons, and other landholders had little interest in the price of corn different from that of other classes of people, the only demand for corn being for consumption, and not for re-sale or export. But as rents of land came to be paid in money, the interest of the farmer to be distinguished by a remove from that of the landowner, the difference between town and country to be developed, and the business of society to be more complex, the ruling powers of the state were likely to be actuated by other views; and hence the force which corn legislation afterward assumed in favour of what was deemed the agricultural interest. But during four centuries after the Conquest the corn law of England simply was that export of corn was prohibited, save in years of extreme plenty under forms of state licence, and that producers carried their surplus grain into the nearest market town, and sold it there for what it would bring among those who wanted it to consume and the same rule prevailed in the principal countries of the Continent. This policy, though, as one may argue from its long continuance, probably not felt to be acutely oppressive, was of no avail in removing the evils against which it was directed. On the contrary it prolonged and aggravated them. The prohibition of export discouraged agricultural improvement, and in so much diminished the security and liberality even of domestic supply; while the intolerance of any home dealing or merchandize in corn prevented the growth of a commercial and financial interest strong enough to improve the means of transport by which the plenty of one part of the same country could have come to the aid of the scarcity in another.

Apart from this general feudal germ of legislation on corn, the history of the British corn laws, as they have come down to recent times, may be said to have begun with the statute in the reign of Henry VI., 1436, by which exportation was permitted without state licence, when the price of wheat or other corn fell below certain prices. The reason given in the preamble of the statute was that the previous state of the law had compelled farmers to sell their corn at low prices, which was no doubt true, but which also showed the important turn of the tide that had then set in. M'Culloch, in his elaborate article in the *Commercial Dictionary*, to which reference may be made for the most authentic details on this subject, says that the fluctuation of the prices of corn in that age was so great, and beyond all present conception, that "it is not easy to determine whether the exportation price of 6s. 8d. for wheat" [12s. 10d. in present money per quarter] "was above or below the medium price." But while the medium price of the kingdom must be held to be unascertainable in a remote time, when the medium price in any principal market town of England did not agree with that of another for any year or series of years, one may readily perceive that the cultivators of the wheat lands in the south-eastern counties of England, for example, who could frequently have sold their produce in that age to Dutch merchants to better advantage than in their own market towns, or even in London, but were prohibited to export abroad, and yet had no means of distributing their supplies at home so as to realize the highest medium price in England, must have

[1] It was formerly the custom, as we learn from Willughby, to carry the Cormorant hooded till its services were required, by which means it was kept quiet. At the present time its bearer wears a wire-mask to protect his eyes and face from the bird's beak.

[2] See Capt. Salvin's chapters on "Fishing with Cormorants," appended to his and Mr Freeman's *Falconry* (London: 1859).

felt aggrieved, and that their barons and knights of the shire would have a common interest in making a strong effort to rectify the injustice in Parliament. This object appears to have been in some measure accomplished by this statute, and twenty-seven years afterwards (1463) a decided step was taken towards securing to agriculturists a monopoly of the home market by a statute prohibitory of importation from abroad. Foreign import was to be permitted only at and above the point of prices where the export of domestic produce was prohibited. The landed interest had now adopted the idea of sustaining and equalizing the value of corn, and promoting their own industry and gains, which for four centuries, under various modifications of plan, and great changes of social and political condition, were to maintain a firm place in the legislation and policy of England. But there were many reasons why this idea, when carried into practice, should not have the results anticipated from it.

The import of grain from abroad, even in times of dearth and high prices at home, could not be considerable as long as the policy of neighbouring countries was to prohibit export; nor could the export of native corn, even with the Dutch and other European ports open to such supplies, be effective save in limited maritime districts, as long as the internal corn trade was suppressed, not only by want of roads, but by legal interdict. The regulation of liberty of export and import by rates of price, moreover, had the same practical objection as the various sliding-scales, bounties, and other legislative expedients down to 1846, viz., that they failed, probably more in that age than in later times, to create a permanent market, and aimed only at a casual trade. When foreign supplies were needed, they were often not to be found; and when there was an excess of corn in the country a profitable outlet was both difficult and uncertain. It would appear, indeed, that during the Wars of the Roses the statutes of Henry VI. and Edward IV. had become obsolete; for a law regulating export prices in identical terms of the law of 1436 was re-enacted in the reign of Philip and Mary (1554). In the preceding reign of Edward VI., as well as in the succeeding long reign of Elizabeth, there were unceasing complaints of the decay of tillage, the dearth of corn, and the privations of the labouring classes; and these complaints were met by the same kind of measures—by statutes encouraging tillage, forbidding the enlargement of farms, imposing severer restrictions on storing and buying and selling of grain, and by renewed attempts to regulate export and import according to prices. In 1562 the price at which export might take place was raised to 10s. per quarter for wheat, and 6s. 8d. for barley and malt. This only lasted a few years, and in 1570 the export of wheat and barley was permitted from particular districts on payment of a duty of 1s. 8d. per quarter, although still liable to prohibition by the Government or local authority, while it was entirely prohibited under the old regulations from other districts. Only at the close of Elizabeth's reign (1603) did a spark of new light appear in a further statute, which removed the futile provisions in favour of tillage and against enlargement of pastoral farms, and rested the whole policy for promoting an equable supply of corn, while encouraging agriculture, on an allowed export of wheat and other grain at a duty of 2s. and 1s. 4d. when the price of wheat was not more than 20s., and of barley and malt 12s. per quarter. The import of corn appears to have been much lost sight of from the period of the statute of 1463. The internal state of England, as well as the policy of other countries of Europe, was unfavourable to any regular import of grain, though many parts of the kingdom were often suffering from dearth of corn. It is obvious that this legislation, carried over more than a century and a half, failed of its purpose, and that it neither promoted agriculture, nor increased the supply of bread. So great a variance and conflict between the intention of statutes and the actual course of affairs might be deemed inexplicable, but for an explanation which a close economic study of the circumstances of the times affords.

Besides the general reasons of the failure already indicated, there were three special causes in active operation, which, though not seen at the period, have become distinct enough since. (1) A comparatively free export of wool had been permitted in England from time immemorial. It was subject neither to conditions of price nor to duties in the times under consideration, was easier of transport and much less liable to damage than corn, and, under the extending manufactures of France and the Low Countries, was sure of a foreign as well as a domestic market. Here was one description of rural produce on which there was the least embargo, and on which some reliance could be placed that it would in all circumstances bring a fair value; while corn, the prime rural produce, was subject as a commodity of merchandize to every difficulty, internally and externally, which meddling legislation and popular prejudice could impose. The numerous statutes enjoining tillage and discouraging pastoral farms—or in other words requiring that agriculturists should turn from what was profitable to what was unprofitable—had consequently no substantial effect, save in the many individual instances in which the effect may have been injurious. (2) The value of the standard money of the kingdom had been undergoing great depreciation from two opposite quarters at once. The pound sterling of England was reduced in weight of pure metal from £1, 18s. 9d. in 1436, the date of the first of the corn statutes, to 4s. 7¾d. in 1551, as far as can be estimated in present money, and to £1, 0s. 6¾d. under the restoration of the coinage in the following year. At the same time the greater abundance of silver, which now began to be experienced in Europe from the discovery of the South American mines, was steadily reducing the intrinsic value of the metal. Hence a general rise of prices remarked by Hume and other historians; and hence also it followed that a price of corn fixed for export or import at one period became always at another period more or less restrictive of export than had been designed. (3) The wages of labour would have followed the advance in the prices of commodities had they been left free, but they were kept down by statute to the three or four pence per day at which they stood, when the pound sterling contained one-fourth more silver, and silver itself was much more valuable,—a refinement of cruelty, for which an excuse is hardly to be found in the prevailing ignorance of principles of political economy, great as that was. The feudal system was breaking up; a wage-earning population was rapidly increasing both in the farms and in the towns; but the spirit of feudalism remained, and the iron collar of serfdom was rivetted round the necks of the labourers by these statutes many generations after they had become nominally freemen.[1] The result was chronic privation and discontent among the common people, by which all the conditions of agriculture and trade in corn were further straitened and barbarized; and an age, in some high respects among the most brilliant in the annals of England, was marked by an enormous

[1] Mr M'Culloch, to whose researches on this subject every subsequent writer must be much indebted, found from a comparison of the prices of corn and wages of labour in the reign of Henry VII. and the latter part of the reign of Elizabeth, that in the former period a labourer could earn a quarter of wheat in 20, a quarter of rye in 12, and a quarter of barley in 9 days; whereas, in the latter period, to earn a quarter of wheat required 48, a quarter of rye 32, and a quarter of barley 29 days' labour. See the article CORN LAWS in 8th edition of this work.

increase of pauperism, and by the introduction of the merciful but wasteful remedy of the Poor Laws.

The corn legislation of Elizabeth remained without change during the reign of James, the civil wars, and the Commonwealth. But on the restoration of Charles II. in 1660, the question was resumed, and an Act was passed of a more prohibitory character. Export and import of corn, while nominally permitted, were alike subjected to heavy duties—the need of the Exchequer being the paramount consideration, while the agriculturists were no doubt pleased with the complete command secured to them in the home market. This Act was followed by such high prices of corn, and so little advantage to the revenue, that Parliament in 1663 reduced the duties on import to 9 per cent. *ad valorem*, while at the same time raising the price at which export ceased to 48s., and reducing the duty on export from 20s. to 5s. 4d. per quarter. In a few years this was found to be too much free-trade for the agricultural liking, and in 1670 prohibitory duties were re-imposed on import when the home price was under 53s. 4d., and a duty of 8s. between that price and 80s., with the usual make-weight in favour of home supply, that export should be prohibited when the price was 53s. 4d. and upwards. But complaints of the decline of agriculture continued to be as rife under this Act as under the others, till on the accession of William and Mary, the landed interest, taking advantage of the Revolution as they had taken advantage of the Restoration to promote their own interests, took the new and surprising step of enacting a bounty on the export of grain, which continued to infect the corn laws of the kingdom, varied, on one occasion at least, with the further complication of bounties on import, until a comparatively recent period. The duties on export being abolished, while the heavy duties on import were maintained, this is probably the most one-sided form which the British corn laws ever assumed, but it was attended with none of the advantages anticipated. The prices of corn fell, instead of rising. There had occurred at the period of the Revolution a depreciation of the money of the realm, analogous in one respect to that which marked the first era of the corn statutes (1436–1551), and forming one of the greatest difficulties which the Government of William had to encounter. The coin of the realm was greatly debased, and as rapidly as the mint sent out money of standard weight and purity, it was melted down, and disappeared from the circulation. The influx of silver from South America to Europe had spent its action on prices before the middle of the century; the precious metals had again hardened in value; and for forty years before the Revolution the price of corn had been steadily falling in money price. The liberty of exporting wool had also now been cut down before the English manufactures were able to take up the home supply, and agriculturists were consequently forced to extend their tillage. When the current coin of the kingdom became wholly debased by clipping and other knaveries, there ensued both irregularity and inflation of nominal prices, and the producers and consumers of corn found themselves equally ill at ease. The farmers complained that the home-market for their produce was unremunerative and unsatisfactory; the masses of the people complained with no less reason that the money wages of labour could not purchase them the usual necessaries of life. Lord Macaulay, in his *History of England*, says of this period, with little exaggeration, that "the price of the necessaries of life, of shoes, of ale, of oatmeal, rose fast. The labourer found that the bit of metal which, when he received it, was called a shilling, would hardly, when he purchased a pot of beer or a loaf of rye bread, go as far as sixpence." The state of agriculture could not be prosperous under these conditions. But when the Government of William surmounted this difficulty of the coinage, as they did surmount it, under the guidance of Sir Isaac Newton, with remarkable statesmanship, it necessarily followed that prices, so far from rising, declined, because, as one reason, they were now denominated in a solid metallic value. The rise of prices of corn attending the first years of the export bounty was consequently of very brief duration. The average price of wheat in the Winchester market, which in the ten years 1690–99 was £2, 10s., fell in the ten years 1716–25 to £1, 5s. 4d., and in the ten years 1746–55 to £1, 1s. 2⅝d. These figures are enough to dispel much illusion as to the effect of promoting particular branches of industry by legislative and fiscal protection. The system of corn law established in the reign of William and Mary was probably the most perfect to be conceived for advancing the agricultural interest of any country. Every stroke of the legislature seemed complete to this end. Yet it wholly failed of its purpose, because no industrial interest whatever can by any artificial means prosper, save in harmonious connection with the progress of other interests. If the price of wheat again rose in 1750–60 and 1760–70 to £1, 19s. 3½d. and £2, 11s. 3⅜d., it was simply because many causes had meanwhile been at work, as invariably happens in such economic developments, the operation of which no statutes could embrace, either to control or to prevent. Between the reign of William and Mary and that of George III., the question of bounty on export of grain had, in the general progress of the country, fallen into the background, while that of the heavy embargoes on import had come to the front. Therefore it is that Burke's Act of 1773, as a deliberate attempt to bring the corn laws into some degree of reason and order, is worthy of special mention. This statute permitted the import of foreign wheat at a nominal duty of 6d. when the home price was 48s. per quarter, and it stopped both the liberty to export and the bounty on export together when the home price was 44s. per quarter. There was probably an error in stopping export and cutting off bounty on export at the same point of price. But apart from this passing blemish, the statute of 1773 was worthy of the genius of Burke, and it would have been well for the country to have imbibed more fully its spirit and principles.

Few questions have been more discussed or more differently interpreted than the elaborate system of corn laws dating from the reign of William and Mary. Even so careful an observer as Malthus was of opinion that the bounty on export had enlarged the area of subsistence. But a bounty on export is obviously liable to the same objection as a heavy duty on foreign import. It fails to create a natural, and therefore permanent, market for the favoured produce. The foreigner is induced at the expense of the exporting state to take the commodity at less cost than it can be produced. A bounty on export consequently never adjusts itself to the real conditions either at home or abroad. That the bounty on export of corn had large operation is sufficiently attested by the fact that, in the years from 1740 to 1751, bounties were paid out of the Exchequer to the amount of £1,515,000, and in 1749 alone they amounted to £324,000. But the trade thus forced was of no permanence, and the British exports of corn, which reached a maximum of 1,667,778 quarters in 1749–50, had fallen to 600,000 quarters in 1760, and continued to decrease.

Burke's Act lasted long enough to introduce a regular import of foreign grain, varying with the abundance or scarcity of the home harvest, yet establishing in the end a systematic preponderance of imports over exports. The period, moreover, was marked by great agricultural improvements, by extensive reclamation of waste lands, and by an increased home produce of wheat, in the twenty years from 1773 to 1793, of nearly 2,000,000 quarters. Nor had the course of prices been unsatisfactory. The average price of British wheat in the twenty years was £2, 6s. 3d., and in only three years of the twenty was the price a fraction under £2. But the ideas in favour of greater freedom of trade, of which the Act of 1773 was an indication, and of which another memorable example was given in Pitt's Commercial Treaty with France, were overwhelmed in the extraordinary excitement caused by the French Revolution, and all the old corn law policy was destined to have a sudden revival. The landowners and farmers complained that an import of foreign grain at a nominal duty of 6d., when the price of wheat was only 48s., deprived them of the ascending scale of prices when it seemed due; and on this instigation an Act was passed in 1791, whereby the price at which importation could proceed at the nominal duty of 6d. was raised to 54s., with a duty of 2s. 6d. from 54s. to 50s., and at 50s. and under 50s. a prohibitory duty of 24s. 3d. The bounty on export was maintained by this Act, but exportation was allowed without bounty till the price reached 46s.; and the permission accorded by the statute of 1773 to import foreign corn at any price, to be re-exported duty free, was modified by a warehouse duty of 2s. 6d., in addition to the duties on import payable at the time of sale, when the corn, instead of being re-exported, happened to be sold for home consumption. The legislative vigilance in this statute to prevent foreign bread from reaching the home consumer is remarkable. There were deficient home harvests for some years after 1791, particularly in 1795 and 1797, and Parliament was forced to the new expedient of granting high bounties on importation. At this period the country was involved in a great war; all the customary commercial relations were violently disturbed; freight, insurance, and other charges on import and export were multiplied fivefold; heavier and heavier taxes were imposed; and the capital resources of the kingdom were poured with a prodigality without precedent into the war channels. The consequence was that the price of corn, as of all other commodities, rose greatly; and the Bank of England having stopped paying in specie in 1797, this raised nominal prices still more under the liberal use of bank paper in loans and discounts, and the difference that began to be established in the actual value of Bank of England notes and their legal par in bullion.

The average price of British wheat rose to £5, 19s. 6d. in 1801. So unusual a value must have led to a large extension of the area under wheat, and to much corn-growing on land that after great outlay was ill prepared for it. In the following years there were agricultural complaints; and in 1804, though in 1803 the average price of wheat had been as high as £2, 18s. 10d., an Act was passed, so much more severe than any previous statute, that its object would appear to have been to keep the price of corn somewhere approaching the high range of 1801. A prohibitory duty of 24s. 3d. was imposed on the import of foreign wheat when the home price was 63s. or less; and the price at which the bounty was paid on export was lowered to 40s., while the price at which export might proceed without bounty was raised to 54s. Judging from the prices that ruled during the remaining period of the French wars, this statute would appear to have been effective for its end, though, under all the varied action of the times on a rise of prices, it would be difficult to assign its proper place in the general effect. The average price of wheat rose to £4, 9s. 9d. in 1805, and the bank paper price in 1812 was as high even as £6, 6s. 6d. The bullion prices from 1809 to 1813 ranged from 86s. 6d. to 100s. 3d. But it was foreseen that when the wars ended a serious re-action would ensue, and that the rents of land, and the general condition of agriculture, under the warlike, protective, and monetary stimulation they had received, would be imperilled. In the brief peace of 1814 the average bullion price of British wheat fell to 55s. 8d. All the means of select committees of inquiry on agricultural distress, and new modifications of the corn laws, were again brought into requisition. The first idea broached in Parliament was to raise the duties on foreign imports, as well as the prices at which they were to be leviable, and to abolish the bounty on export, while permitting freedom of export whatever the home price might be. The latter part of the scheme was passed into law in the session of 1814; but the irritation of the manufacturing districts against the new scale of import duties was too great to be resisted. In the subsequent session an Act was passed, after much opposition, fixing 80s. (14s. more than during the wars) as the price at which import of wheat was to become free of duty.

This Act of 1815 was intended to keep the price of wheat in the British markets at about 80s. per quarter; but the era of war and great expenditure of money raised by public loans had ended, the ports of the Continent were again open to some measure of trade and to the equalizing effect of trade upon prices, the Bank of England and other banks of issue had to begin the uphill course of a resumption of specie payments, the nation had to begin to feel the whole naked weight of the war debt, and the idea of the protectors of a high price of corn was proved by the event to be an utter hallucination. The corn statutes of the next twenty years, though occupying an enormous amount of time and attention in the Houses of Parliament, may be briefly treated, for they are simply a record of the impotence of legislation to maintain the price of a commodity at a high point when all the natural economic causes in operation are opposed to it. In 1822 a statute was passed reducing the limit of prices at which importation could proceed to 70s. for wheat, 35s. for barley, 25s. for oats; but behind this apparent relaxation was a new scale of import duties, by which foreign grain was subject to heavy three-month duties up to a price of 85s.,—17s. when wheat was 70s., 12s. when between 70s. and 80s., and 10s. when 85s., showing the grasping spirit of the would-be monopolizers of the home supply of corn, and their reluctance to believe in a lower range of value for corn as for all other commodities. This Act never operated, for the reason that, with the exception in some few instances of barley, prices never were so high as its projectors had contemplated. The corn trade had passed rapidly beyond reach of the statutes by which it was to be so painfully controlled; and as there were occasional seasons of scarcity, particularly in oats, the king in council was authorized for several years to override the statutes, and do whatever the public interests might require.

In 1827 Canning introduced a new system of duties, under which there would have been a fixed duty of 1s. per quarter when the price of wheat was at or above 70s., and an increased duty of 2s. for every shilling the price fell below 69s.; but though Canning's resolutions were adopted by a large majority in the House of Commons, his death and the consequent change of ministers involved the failure of his scheme of corn duties. In the following year Mr Charles Grant introduced another scale of import duties on corn, by which the duty was to be 23s. when the price was 64s., 16s. 8d. when the price was 69s., and only 1s. when the price was 73s. or above 73s. per quarter; and this became law the same year. This sliding scale was more objectionable, as a basis of foreign corn trade, than that of Canning, though not following so closely shilling by shilling the variation of prices, because of the abrupt leaps it made in the amount of duties leviable. For example, a merchant who ordered a shipment of foreign wheat when the home price was 70s. and rising to 73s., instead of having a duty of 1s. to pay, should on a backward drop of the home price to 69s. have 16s. 8d. of duty to pay. The result was to introduce wide and incalculable elements of speculation into all transactions in foreign corn. The prices during most part of this period were under the range at which import was practically prohibited. The average price of British wheat was 96s. 11d. in 1817, but from that point there was in succeeding years a rapid and progressive decline, varied only by the results of the domestic harvests, till in 1835 the average price of wheat was 39s. 4d., of barley 29s. 11d., and oats 22s. The import of foreign grain in these years consisted principally of a speculative trade, under a privilege of warehousing accorded in the statute of 1773, and extended in subsequent Acts, by which the grain might be sold for home consumption on payment of the duties, or re-exported free, as suited the interest of the holders.

The Act of 1822 admitted corn of the British possessions in North America under a favoured scale of duties, and in 1825 a temporary Act was passed, allowing the import of wheat from these provinces at a fixed duty of 5s. per quarter, irrespective of the home price, which, if maintained, would have given some stability to the trade with Canada. The idea of a fixed duty on all foreign grain, however, appears to have grown in favour from about this period. It was included in the programme of import duty reforms of the Whig Government in 1841, and fell with its propounders in the general election of that year. Sir Robert Peel, on succeeding to office, and commencing his remarkable career as a free-trade statesman, introduced and carried in 1842 a new sliding scale of duties somewhat better adjusted to the current values. But public opinion by this time had penetrated the imprudence of the whole system; and the prime minister, convinced, as he confessed, by the arguments of Cobden and the Anti-Corn Law League, and stimulated into action by the failure of the potato crop in Ireland, put an effectual end to the history of the corn laws by the famous Act 9 and 10 Vict. c. 22. It was provided under this measure that the maximum duty on foreign wheat was to be immediately reduced to 10s. per quarter when the price was under 48s., to 5s. on barley when the price was under 26s., and to 4s. on oats when the price was under 18s., with lower duties as prices rose above these figures; but the conclusive part of the enactment was that in three years—on 1st of February 1849—these duties were to cease, and all foreign corn to be admitted at a duty of 1s. per quarter, and all foreign meal and flour at a duty of 4½d. per cwt.—the same nominal imposts which were conceded to grain and flour of British possessions abroad from the date of the Act. Moreover, in 1860, even these nominal duties were abolished in a Customs Duties Act, and since that time corn and other provisions have been admitted into the United Kingdom free of all fiscal charge.

As has been remarked above more than once the distribution of corn supplies in the kingdom was much impeded by laws directed against all dealing in corn as an article of ordinary merchandize, apart from questions of foreign import or export. The theory was that when corn was plentiful in any district it should be consumed at what it would bring, without much respect to whether the next harvest might be equally abundant, or to what the immediate wants of an adjoining province of the same country might be. The first statute on the subject appears to have been passed in the reign of Edward VI., though the general policy had prevailed before that time both in popular prejudice and in the feudal custom; and by this statute any one who bought corn to sell it again was made liable to two months' imprisonment with forfeit of the corn. A second offence was punished by six months' imprisonment and forfeit of double the value of the corn, and a third by the pillory, and utter ruin. Severe as this statute was, liberty was given by it to transport corn from one part of the country under licence to men of approved probity, which implied that there was to be some buying of corn to sell it again and elsewhere. Practically "engrossing" came to be considered buying wholesale to sell again wholesale. "Forestalling" was different, and the statutes were directed against a class of dealers who went forward and bought or contracted for corn and other provisions, and spread false rumours in derogation of the public and open markets appointed by law, to which our ancestors appear to have attached much importance, and probably in these times not without reason. The statute of Edward VI. was modified by many subsequent enactments, particularly by the statute of 1663, by which it was declared that there could be no "engrossing" of corn when the price did not exceed 48s. per quarter, and which Adam Smith recognized, though it adhered to the variable and unsatisfactory element of price, as having contributed more to the progress of agriculture than any previous law in the statute book. In 1773 these injurious statutes were abolished, but the penal character of "engrossing" and "forestalling" had a root in the common law of England, as well as in the popular prejudice, which kept the evil alive to a later period. As the public enlightenment increased the judges were at no loss to give interpretations of the common law consistent with public policy. Subsequent to the Act of 1773, for example, one Waddington was convicted and punished for engrossing hops; but though this was deemed a sound and proper judgment at the time, yet it was soon afterwards overthrown in other cases, on the ground that buying wholesale to sell wholesale was not in "restraint of trade" as the former judges had assumed. Popular antipathy to corn-dealers and corn-dealing survived to still more recent times; but meal riots, and violent interference with the storing or movement of grain, may be said to have wholly disappeared from the United Kingdom since the repeal of the corn laws in 1846.

Freedom of export of corn from customs duties has become the general rule of nearly all foreign countries. The opening of so great a market as the United Kingdom for corn free of import duty, from every quarter alike, was calculated in itself to have considerable influence in dispelling the ancient prejudice against a free export of grain. It is somewhat curious to remark that Spain, which has not been forward in adopting modern ideas of trade, saw the advantage to her various splendid wheat-producing provinces of freedom of export of wheat as early as 1820, and three years afterwards extended this freedom to all "fruits of the soil" in Spain, which has since remained the policy of the country. But heavy duties on the import of cereal produce continue to be levied there, and must fall with very different effects on various parts of a kingdom in which the physical difficulties of interior transport are so great, and so little has hitherto been done to overcome them. Rice imported into any part of Spain is subject to a duty of 75s. per ton, wheat to 25s., dry pulse to 25s., oats to 21s. 8d., and barley, rye, and maize to 18s. 9d. per ton. The cereal produce of Portugal is exported free of duty, but on the import of wheat and flour by sea, there are duties at the rate of 6 rees per kilo on wheat and 8 rees on flour; inland, or through "dry ports," the duty is 2 rees on wheat and 4 rees on flour. Export and import of grain in France were prohibited down to the period of the repeal of the British corn laws, save when prices were below certain limits in the one case and above certain other limits in the other. But export of grain and flour from France has for many years been free of duty. On the import of grain and flour, on the other hand, France not only levies duties, but makes a distinction between countries within and beyond Europe. The duty on grain imported into France from countries outside of Europe is 60 centimes, and on flour 1f. 20c., per 100 kilos, and from countries in Europe on grain 3f. 60c., and on flour 4f. 20c., per 100 kilos. These duties on import have accompanying drawbacks on export when the grain has been converted into flour, or the flour into biscuits. In Belgium the export and import of grain are alike free of duty, and, as far as we have ascertained, this remark applies also to flour and other manufactures of grain. The policy of the Netherlands, which was formerly favourable to import and export of grain from the advantages possessed by Rotterdam and Amsterdam as international entrepôts, has undergone some change in recent times. For some years prior to 1845 there was a moderate sliding scale of import duties on grain in Holland, and this gave place, on the ravages of the potato disease which fell on many parts of that country with only less severity than in Ireland, to a low fixed duty which proved satisfactory in its operation. At the present time the import duties on grain, beans, pulse, &c., are 1·50 guilders (2s. 6d.) per hectolitre, or 2·8 Winchester bushels, and on bread, biscuit, flour, 40c. (8d.) per 100 ℔; these exhibit, more especially in the case of raw grain, a considerable increase on the duties which were deemed sufficient and expedient about the period of the repeal of the English corn laws. In Italy there are no duties on the export of grain, which, though extremely irregular in one season as compared with another, shows a remarkable progressive increase within the last fifteen years. Flour does not figure largely in the list of Italian exports, and for this there may be some reason in the peculiar tax which the Italian Government levies on the milling of all grain, whether of domestic or foreign produce, and which can hardly be compensated even by drawbacks on export as long as the domestic industry of flour-making is cramped by a severe excise. This is the more worthy of being remarked, because the commerce of Italy includes a great portion of the very best qualities of wheat from the Black Sea; and in her flour, and macaroni, and vermicelli preparations, so highly prized in her domestic consumption, she has a basis of what might become a considerable foreign trade. The duties on import of grain and flour in Italy are not high—75c. on wheat and other grain per 100 kilos, and 1·25f. on flour and 75c. on bran for the same quantity. The franc and centime, being received in the Italian custom-houses in the paper-money of the country, is of lower value than the franc and centime in France, though of the same denomination in metallic coinage. From Austria and Hungary the export of grain is also free of duty; and in the internal corn trade of the Austrian empire, important measures of improvement now pending are likely to be accomplished.

The great countries, famous for a production of raw materials much beyond their own means of consumption, are favourable, of course, to the utmost freedom of export. The empire of China itself was never unwilling to sell to foreigners tea, for which there was no domestic use. The United States promote transit and export of corn, internally and externally, with all the intelligence and resources of a civilized people. If the shareholders in railways and canals and steam-boat lines in the United States were consulted, they would probably say that this policy of freedom of export had been promoted beyond due bounds of equity. But on the other hand, the protective and prohibitive tariff of the United States on necessary supplies to agriculturists must be held to be equivalent to an embargo on the export of American corn, as well as cotton, tobacco, and other raw products of the soil. The same remark applies to Russia, which, while expediting her export of raw produce with help of borrowed capital, as much as possible, maintains a high tariff against foreign commodities, and lays the foundation even of her conquests in the interior of Asia, by decreeing that nothing shall be sold within her territories but what is of Russian manufacture or Russian merchandize.

The facility with which the soundest views of the efficacy of freedom of trade in corn, as a permanent policy, may be called in question under circumstances of extremity, was shown in the course of the recent famine in Bengal. A cry arose in India for a prohibition of the export of rice, and was supported by some of the most enlightened organs of public opinion at home. The governor-general, Lord Northbrook, who had taken a different view of the situation, was subjected to severe rebuke; but the more the reasons were examined the more clear it became that the wisdom was on his part and the imprudence on the other. Mauritius, for example, almost wholly tilled not only by subjects of Great Britain but by natives of India, would have been reduced by prohibition of export to almost as great starvation as the poor people in the districts where the harvest had failed. The rice of India, moreover, exported to Europe, was of a quality seldom or never used by the common people of India, and its arrest could have been of the slightest possible utility in relieving the famished districts. Besides the whole internal trade and movement of rice in India had to be taken into consideration. There was extreme scarcity in several provinces of Bengal, but there was the usual abundance in many other parts of India. A decree prohibiting export would have stopped the customary movement of rice in Hindustan; diminished the supplies in all the central markets, and both aggravated the calamity and put difficulties in the way of its being overcome. The sound policy was to allow scope to all effective demand for rice in India according to the ordinary course of trade, and as there were some tens of thousands of people in a certain quarter of India who had no effective demand to offer, to bring the help of the Government to their relief. This was the policy pursued, and the result was that the famine in Bengal was relieved, as no famine in India had been before, with the least avoidable disturbance of the markets on which India is dependent for the sale of her surplus produce. (R. SO.)

CORN TRADE. The effect of the opening of the ports of the United Kingdom freely to the agricultural produce of all parts of the world has been to extend the foreign trade in corn, both more rapidly in point of time and more largely in measure than could have been pre-conceived. This result was promoted by the more liberal policy which began at the same time to be generally adopted with respect to the export and import of grain, and by the active efforts of the great corn-producing countries not only to extend their cultivation, but to increase the facilities of transport both inland and seawards. The consequence is that a commodity which, though of the first necessity, had long been the most difficult to move under the prevailing laws and conditions of trade, has become one of the principal articles of commerce. It is carried as far as any other article of merchandize, and yet is greater in bulk and in difficulty of transport than any other principal commodity with which it may be compared in value. It may be said, indeed, that if the immense imports of foreign grain into the United Kingdom, during the last thirty years, could have been foreseen when the British corn laws were repealed, the most ardent believer in the creative and compensatory resources of free trade could scarcely have reconciled the figures with anything short of an overwhelming decline of British agriculture. Yet the home production and trade of corn have not lost ground during this period, while agricultural improvement has made more progress, and the total value of the products of the soil been more signally increased than in any previous thirty years that could be named. We propose in this notice to show the progress of the foreign trade in corn, and the changes in the principal sources of foreign supply since 1816, as well as the effect of this unlimited competition on British agriculture and on the home trade in corn, and then to add some information as to the relation of home and foreign supply, expenses of transport, and other incidents of the trade in various principal centres.

Quantities and Sources of Foreign Supply of Corn in 1841–45 *and* 1871–75.—The following are the average annual quantities of corn and flour imported into the United Kingdom in the five years preceding 1846, by the various countries which were then importers[1]:—

The most cursory observation of these figures will disclose results surprising to the present generation. It is to be remarked, for example, that down to 1846 Prussia and other countries of Germany supplied more than one-half the whole import of wheat into the United Kingdom, that the little country of Denmark had greatly more traffic in export of grain to British ports than the whole Russian empire, and that the transatlantic trade in wheat and flour or other corn with the United Kingdom, apart from Canada, had barely begun to exist. Nor can it fail to be noticed how wide-spread the commerce in corn had become even in these circumstances, and that it was usual to send cargoes of wheat and flour to England from places so distant as Chili and La Plata, and Australia and the East Indies.

The statistics of the corn trade have become much more voluminous since 1846, and it is necessary to give some distinction to wheat and wheat flour, and the sources of their supply. It has also followed from the great trade in foreign grain that the measure should be weight, and not quantity in local bushels or quarters. The Board of Trade for many years has thus given its returns of wheat and other raw grain, as well as meal and flour, in cwts. The cwt. would be equal to two bushels of 56 lb; but the weight of a bushel being usually 61 lb, the quarter (or eight bushels) is 448 lb. The following are the average annual quantities of corn and flour imported into the United Kingdom in the five years 1871–75:—

	Wheat.	Wheat Meal and Flour.
	Cwts.	Cwts.

Other Grain from all Countries.

	Barley.	Oats.	Pease.	Beans.	Indian Corn or Maize.
Cwts.	11,067,067	11,667,679	1,387,021	2,943,249	19,653,493

The import of foreign wheat and flour into the United Kingdom has increased more than sevenfold, and of all foreign grain nearly ten-fold, in the thirty years of free trade. The United States, from a small and unsteady commerce in grain, have risen to the first place, not only in wheat and flour, but in Indian corn, of which they contribute two-thirds of the supply. Russia stands second on the list, the great bulk of her export of wheat being now received from the southern ports of the empire. Canada, while scarcely sustaining its former supply of flour, has increased its average annual export of wheat to the United Kingdom from 110,000 cwts. to 3,230,000 cwts. The trade in corn has not only been extended over vast territories in various quarters of the world which thirty years ago were comparatively uncultivated or absolute deserts, but no former exporting country appears to have lost ground. All have shared more or less in the general progress, though a decline in wheat is perceptible from Denmark and other countries on the northern verge of the wheat region, which now require more for home consumption. The increased import of barley, which is not so great as that of wheat, but still remarkable, comes chiefly from Northern Europe and France. It will be observed, from the figures denoting the ratio in which foreign supplies were taken up in the home consumption and the overplus sent to other markets in the two quinquennial periods above compared, that the re-export of foreign grain and flour from the United Kingdom has not increased with the magnitude of the supplies, but on the contrary has much diminished. This result can only be attributed to the organization of the trade, and the intelligence with which this vast movement of grain is directed.

Effect of Foreign Competition on British Agriculture and Corn-Production.—The acreage of the various crops, and the numbers of live stock in the United Kingdom, are now given with all desirable accuracy in the annual agricultural returns, for which the country is indebted to a motion in the House of Commons in 1862 by Mr Caird.[1]

[1] Compiled from the parliamentary returns of "Revenue, Population, and Commerce," Sessions 1843–47.

[1] Mr Caird, afterwards M.P. for Stirling, a landowner and practical agriculturist, travelled through Ireland on a tour of inquiry in the year immediately subsequent to the great failure of the potato crops, and in 1850–51 visited nearly every county in England as the commissioner of the *Times*. He has since pursued the same course of investigation with practised powers of judgment, which have been well verified in the actual results of the corn trade in the United

Previous to the adoption of free trade in corn, this information was a subject, not of official inquiry from farm to farm, but of general estimate, which could not but err considerably. There is thus a difficulty in tracing the exact effect of a free and increasing import of foreign grain on the domestic tillage; but the difficulty is not so great as might be supposed, nor is it of much importance in view of the authentic data available during the greater part of the period in question. M'Culloch, in his article on the Corn Trade, in the eighth edition of this work, estimated the acreage under wheat in England in 1852–53 at 3,000,000 acres, in Scotland 350,000, and in Ireland 400,000 acres—or 3,750,000 acres for the three kingdoms. The agricultural returns for 1867 gave 3,640,000 as the total wheat acreage of the United Kingdom. M'Culloch's estimate of the extent under barley in England, viz., 1,000,000 acres, was probably wider of the mark than his estimate of the area of wheat crops. The agricultural returns for 1867 at least gave 2,000,000 acres of barley in England; it must be remembered, however, that in the intervening years British barley had been in increasing demand for malting, and had been commanding higher prices relatively to the prices of wheat. There is a medium authority, between M'Culloch's estimate and the undisputed agricultural returns, in the estimates of Mr Caird, who had peculiar advantages of ascertaining the acreage under every condition of crop in England as early as 1850. The result of his estimate of the agricultural arrangement in England and the ascertained facts in the returns of 1867 was that, in the interval, there had been a diminution in wheat of 280,000 acres, in oats 450,000, in beans and pease 320,000, and in bare fallow 247,000—in all, under these heads, a diminution of 1,297,000 acres; but, on the other hand, an increase of barley 500,000 acres, of root crops 300,000, and of clover 20,000—in all an increase of 820,000 acres, leaving a net diminution under tillage of 477,000 acres, which may be supposed to have gone into permanent pasture. In Scotland and Ireland the effects on the area of tillage were more marked than in England. The production of wheat fell off in these countries about one-half. The loss in production of wheat in Scotland appears to have been recovered by a nearly equal increase in barley and oats; but in Ireland, besides the decrease in wheat, there was a decline of about one-sixth both in barley and oats. The returns conducted by the registrar-general of Ireland since 1848 show that the estimated yield of corn of all kinds fell from 11,500,000 quarters in 1857 to 8,800,000 quarters in 1866, and of potatoes from 3,500,000 to 3,000,000 tons in these ten years. But in the same period there was a great increase of live stock—120,000 head of cattle, 1,000,000 of sheep, and 278,000 swine. The growth of flax and of various green crops had also been extended; and the number of population depending upon agriculture had been diminished by a constant emigration to England and Scotland and abroad. There can be no doubt that the greatest change under free trade in corn fell upon the agriculture of Ireland; but there is no reason to believe that the total value of the produce of the soil in Ireland lost ground, while it is certain that in the later development it has greatly increased. The annual produce of land is shown in one of Mr Caird's tables to be £52, 17s. in Ireland, £60, 12s. in England, and £66, 15s. in Scotland, per head of all persons owning, farming, or assisting in the cultivation of farms.

The diminution of tillage in the United Kingdom under unlimited competition with foreign corn is so small as, when closely examined, to become almost imperceptible. For it must be borne in mind that the extension of large towns in these thirty years has occupied in building area alone what would form a considerable county, and has been spreading market gardens over always increasing spaces of what was formerly agricultural land. What has happened is that the poorer class of lands, from which crops of wheat and other corn were systematically taken, have been turned partially into pasture, and in still larger proportion into a more various and profitable culture both of white and green crops, barley in some instances having the preference over wheat, and bare fallow in others being economized in favour of the general productive interests of the farms. Nor have the British farmers hesitated to extend greatly their wheat area from time to time, when the state of supply and the rate of prices gave a necessary stimulus. After deficient harvests and higher prices, the acreage under wheat was increased from 3,640,000 in 1867 to 3,951,000 in 1868, the harvest of which latter year was so bountiful that, what with the increased acreage, the larger average crop, and the greater weight per bushel of the finer grain, the total produce of wheat was 16,436,000 quarters of 488 ℔ as compared with 9,380,000 quarters in 1867. The increase of one harvest, indeed, was equal to one-third of the total annual consumption of home and foreign wheat. The average price, which in May of that year, when it reached its maximum, was 73s. 8d., had fallen in December to 50s. 1d. The acres under wheat in Great Britain have fallen from 3,630,300 in 1874 to 2,994,958 in 1876, but the acres under barley have increased in the same period from 2,287,987 to 2,533,106, and under oats from 2,596,384 to 2,789,585.

If the price of corn under free trade be considered, it will be seen, indeed, how little reason there could be for any material displacement of the domestic production; for though there has been a small decline of the price of wheat, it has been more than met by the increase of the price of barley and oats, to the surprise of those alarmists who forget that corn can nowhere be produced without much cost, that nowhere is the average produce per acre so great as in England and Scotland, and that to its cost of production in the most fertile or distant regions there have to be added freight and other charges, besides the ordinary rate of mercantile profit. This is clearly shown by a comparison of the septennial average prices of grains, returned in the *Gazette* by the tithe commissioners. In the seven years ending Christmas 1846, the prices per imperial bushel were—

Wheat.	Barley.	Oats.		
7s. 0½d.	4s.	2s. 8½d.	...	13s. 9d.

The average *Gazette* prices per imperial bushel in the seven years ending 1875 were—

Wheat.	Barley.	Oats.		
6s. 6¾d.	4s. 10d.	3s. 2½d.	...	14s. 7¼d.

When the various elements of agricultural improvement are taken into account—amelioration of the soil by drainage and manure, better methods, improved implements, and not least (since this has involved but little capital outlay) the greater economy, speed, and safety with which harvests are gathered, as well as sent to market—the production of wheat in England must be held to be as profitable now as it ever was, though the greater consumption and the rise in the price of barley have made that grain a more remunerative crop than wheat on soils suited to the production of fine quality.

This would not in itself account, however, for what all are cognizant of, viz., a great increase of agricultural prosperity since 1846; and the truth is that the free trade

Kingdom. Mr Caird, at the request of the Statistical Society of London, prepared a paper on "Our Daily Food," which was published; and he contributed a second paper on the same subject, which appeared in the *Journal of the Statistical Society*, March 1869. Both of these papers contain valuable information.

policy, and the general movement with which it was associated, opened an extraordinary demand for other farm produce than corn, of which our agriculturists were not slow to avail themselves. The estimate of live stock in the United Kingdom, antecedent to 1846, did not approach the accuracy to which M'Culloch, by his careful analysis, had reduced the estimate of acreage under corn and its produce. Conjectural enumerations of the various kinds of live stock were current which, on the first agricultural census, were found to have been almost double what could possibly have existed. The agricultural returns will reduce all uncertainty of this kind to a minimum in future. But there has been no uncertainty as to the increasing value of live stock and its produce on farms, or as to the remarkable degree in which this appreciation has tended to modify and enrich the agricultural system of the kingdom, during the whole period of free trade. The price of meat, of dairy produce, and of wool, as well as other minor articles in the same category, has increased at least 50 per cent.; nor has there been any sign of abatement in this rise of value, notwithstanding increasing imports of foreign live animals, and of preserved and more or less manufactured produce of foreign live stock. Mr Caird in 1868 estimated the annual value of home produce of corn consumed at £84,700,000; of the foreign supply of corn consumed at £25,000,000; of home beef and mutton, £47,200,000; of foreign supply, £6,500,000; of home butter and cheese, £30,100,000; of foreign supply, £8,400,000. And this does not include wool (£8,000,000), green crop not used on farms, and various other considerable articles of domestic farm produce, which have, and always must have, a great superiority in English markets.

Relation of Home and Foreign Supply.—Since the home produce of corn stands in the general proportion to foreign supply of 84 to 25, the yield of the domestic harvests continues mainly to regulate price, and in consequence also the amount of import for home consumption. One or two successive inferior harvests in the United Kingdom are accompanied with a rise of price, amounting in extreme cases to 20s. or 25s. per quarter of wheat. These higher prices bring out more extensively the surplus produce of other countries than lower prices would do; but with fairly abundant domestic harvests, and the resulting lower range of prices, the import from abroad does not abruptly cease, but continues fully equal to the supply of the domestic consumption, on an equilibrium of value, which appears to have satisfied on the whole both domestic and foreign producers. According to all the authorities on the subject, the consumption of bread in the United Kingdom does not vary much from one year to another, and certainly does not vary in the ratio of the price of bread. The difference, however, between a 6d. and 9d. quartern loaf is so considerable that it must have some effect in the household economy. In 1868, when the price of bread was at the highest, the average annual consumption of 20,800,000 quarters of wheat in the previous six years fell to 19,780,000 quarters, which is about equal to a fall of 1 per cent. of consumption for 10 per cent. rise in price. It is difficult to give any mercantile problems of such magnitude a definite solution, but the necessary consumption of corn in the United Kingdom, under all variations of price, rests on a solid basis; and given the number of acres under crop, and the average produce per acre in weight, it would not be impossible to determine the amount of foreign corn for which there would be an effective demand in the United Kingdom in any year within calculable ranges of value. The trade has been solving these questions in its own practical way. Many vessels laden with corn, from transatlantic and other distant countries to England, are stopped at Cork or Falmouth for orders from the consignees in England as to what port in Western Europe they shall discharge at. It is necessary to read the markets to the latest points of time; and imports are made into the United Kingdom for re-export as well as home consumption. The great markets for import of corn in Western Europe exhibit little variation owing to the convenience with which supplies may be sent from one port to another; but even in this limited though densely peopled sphere, there are elements of disturbance in supply and demand which have to be taken into account. France, for example, has probably the largest wheat area, in proportion to population, of any European country; and yet the average produce of wheat per acre in France is so low—15½ bushels—that a bad harvest makes France a large importer, and an abundant harvest a large exporter, of wheat and flour. An increase of 1 bushel per acre in France is equal to 2,000,000 quarters. Were the average produce of wheat, by any better system of culture, to be increased in France from 15 to 18 bushels—a not immoderate attainment—she would be able alone to supply all the requirements, so far as they have been developed, of the United Kingdom.[1] This surprising effect of the difference of a bushel or two per acre in the average yield of any harvest applies equally to all the large exporting countries, such as Russia or the United States. The latter country was even an importer of wheat from England so late as 1859, but the great extension of agriculture in the Western States and in California, and the extending practice in the Southern States of raising corn as well as cotton, may be believed to have placed a similar abnormal occurrence at a great distance.

The question naturally arises how, from such widespread sources and under such immense effects of good or bad harvests in increasing or diminishing supply, the trade is so adjusted as to produce any equable degree of value and steady production of grain? Of this apparent difficulty there are two explanations—first, the regions favourable to the culture of wheat in both hemispheres are so extensive that it seldom or rather never occurs that there is a general abundance or general failure of harvests. Nature distributes this inequality so variously that the more the commerce in corn is extended, the less is abundance or scarcity of harvest felt in any one part of the world. And secondly, the large corn-exporting countries, though they may have no market so extensive as the United Kingdom for their surplus produce, have many other markets, not only in Western Europe, but within their own more immediate spheres—the ports of the Black Sea, for example, having the countries of the Mediterranean to supply, and the United States not only the inequalities of production within its own vast area, but parts of Canada, the West Indies, Mexico, and South America.

Cost of Transport.—Harbour dues, freight, and insurance form an important element in the transport of grain. Their amount affects directly the price accruing to the producers, while at the same time they require careful calculation on the part of the merchants or shippers. Where large crops have to be moved many vessels have to be chartered

[1] M. de Lavergne, whose valuable work on the *Rural Economy of Great Britain and Ireland* is well known, has given the following explanation, in a letter to Mr Caird, of the state of wheat culture in France:—"The official returns give a mean yield of 14½ hectolitres per hectare, the actual yield being more above than below the estimate. Eight departments — Le Nord, Oise, Aisne, Somme, Seine-et-Oise, Seine-et-Marne, Seine, and Eure-et-Loire have a yield equal to the English average; but the forty-five departments which form the southern part of the territory do not yield more than 10 hectolitres to the hectare. This feeble yield is caused in many of the departments by bad cultivation, and in the south by the dryness of the climate in spring. The statistical returns also show 5,148,000 hectares of fallow (say 12,000,000 acres), which is in fact the third of the surface, sown with cereals." The proportion of bare fallow in England is greatly less, and has been undergoing reduction.

beforehand, and if the rates fixed in the charters be lower or higher than what turn out to be available rates of freight in the ports, the charterers will experience an advantage or disadvantage in the price of the grain, and the sellers of corn *vice versa*. This difficulty is chiefly felt in the more distant voyages. From Antwerp, for example, the average expense of carrying corn to England is about 1s. to 1s. 6d. per quarter. From Spain, in addition to a difficult inland carriage, the average freight to England is about 4s. per quarter. In the United States, where corn is carried hundreds of miles by railways and canals, and over 3000 miles of sea, the cost of transport bears a large proportion to the price at which the farmers can afford to sell or the merchants to buy—the latter being always ruled by the price to be realized in the great centres where corn, alike of near and distant production, finds a common level of value. At San Francisco, though the question of transport is almost wholly maritime, there is annually much speculation, turning chiefly on rates of freight. The harvests of California and Oregon yield a surplus produce of from 700,000 to 800,000 tons. An immense shipping is thus required at San Francisco every autumn and winter, and the rates of freight to Europe vary as much as from £2, 15s. to £3, 10s. per ton. (R. SO.)

CORNARO, LUIGI (1467–1566), a Venetian nobleman, famous for his treatises on a temperate life. From some dishonesty on the part of his relatives he was deprived of his rank, and induced to retire to Padua, where he acquired the experience in regard to food and regimen which he has detailed in his works. In his youth he lived freely, but after a severe illness at the age of forty, he began under medical advice gradually to reduce his diet. For some time he restricted himself to a daily allowance of 12 oz. of solid food and 14 oz. of wine; later in life he reduced still further his bill of fare, and found he could support his life and strength with no more solid meat than an egg a day. So much habituated did he become to this simple diet, that when he was above seventy years of age the addition by way of experiment of two ounces a day had nearly proved fatal. At the age of eighty-three he wrote his treatise on the *The Sure and Certain Method of Attaining a Long and Healthful Life;* and this was followed by three others on the same subject, composed at the ages of eighty-six, ninety-one, and ninety-five respectively. They are written, says Addison (*Spectator*, No. 195), "with such a spirit of cheerfulness, religion, and good sense, as are the natural concomitants of temperance and sobriety." He died at the age of ninety-eight. His case is an evidence that those who have suffered the results of sensual excesses may, not only with safety, but with advantage, adopt the opposite extreme of ascetic abstinence; but it does not show that persons with unimpaired constitutions, living regular lives, would be the better for it. A proof of this is the rarity with which his system has been persisted in, compared with the frequency with which his books have been read.

The first three treatises were published during his life (Padua, 1558), and all four have since been frequently reprinted in the original and other languages. An English translation of the *Sure Method* has gone through more than thirty editions.

CORNEILLE, PIERRE (1606–1684), was born at Rouen, in the Rue de la Pie, on the 6th of June 1606. The house, which was long preserved, was destroyed a few years ago.

His father, whose Christian name was the same, was *avocat du roi à la Table de Marbre du Palais*, and also held the position of *maître des eaux et forêts* in the vicomté of Rouen. In this latter office he is said to have shown himself a vigorous magistrate, suppressing brigandage and plunder without regard to his personal safety. He was ennobled in 1637 (it is said not without regard to his son's distinction), and the honour was renewed in favour of his sons Pierre and Thomas in 1669, when a general repeal of the letters of nobility recently granted had taken place. There appears, however, to be no instance on record of the poet himself assuming the "de" of nobility. His mother's name was Marthe le Pesant.

After being educated by the Jesuits of Rouen, Corneille at the age of eighteen was entered as *avocat*, and in 1624 took the oaths, as we are told, four years before the regular time, a dispensation having been procured. He was afterwards appointed advocate to the admiralty and to the "waters and forests," but both these posts must have been of small value, as we find him parting with them in 1650 for the insignificant sum of 6000 livres. No other evidence of any professional employment on his part is forthcoming, though he seems to have discharged certain parochial functions. His first play, *Mélite*, was acted in 1629. It is said by Fontenelle to have been inspired by personal experiences, and was extremely popular, either because or in spite of its remarkable difference from the popular plays of the day, those of Hardi. In 1632 *Clitandre*, a tragedy, followed; in the following year *La Veuve*, and in 1634 the *Galerie du Palais* and *La Suivante*, all the three last-named plays being comedies. In 1634, also, having been selected as the composer of a Latin elegy to Richelieu on the occasion of the cardinal visiting Rouen, he was introduced to the subject of his verses, and was soon after enrolled among the "five poets." These officers (the others being Colletet, Bois Robert, and De l'Etoile, who in no way merited the title, and Rotrou, who was no unworthy yokefellow even of Corneille) had for tasks the more profitable than dignified occupation of working up Richelieu's ideas into dramatic form. No one could be less suited for such work than Corneille, and he soon incurred his employer's displeasure by altering the plan of the third act of *Les Thuileries*, which had been intrusted to him.

Meanwhile the year 1635 saw the production of two dramas—*La Place Royale*, a comedy of the same stamp as his preceding works, and *Médée*, a grand but unequal tragedy. In the next year the singular extravaganza entitled *L'Illusion comique* followed, and was succeeded by the *Cid*. The triumphant success of this, perhaps the most "epoch-making" play in all literature, the jealousy of Richelieu and the Academy, the open attacks of Scudéri and Mairet and others, and the pamphlet-war which followed, are among the best-known incidents in the history of letters. The trimming verdict of the Academy, when its arbitration was demanded by Richelieu, and not openly repudiated by Corneille, was virtually unimportant; but it is worth remembering that Scudéri, a writer of at least temporary eminence and of some talent, gravely and apparently sincerely asserted and maintained of this great play that the subject was utterly bad, that all the rules of dramatic composition were violated, that the action was badly conducted, the versification constantly faulty, and the beauties as a rule stolen! Corneille himself was awkwardly situated in this dispute. The *esprit bourru* by which he was at all times distinguished, and which he now displayed in his rather arrogant *Excuse à Ariste*, unfitted him for controversy, and it was of vital importance to him that he should not lose the outward marks of favour which Richelieu continued to show him. Perhaps the pleasantest feature in the whole matter is the unshaken and generous admiration with which Rotrou, the only contemporary whose genius entitled him to criticise Corneille, continued to regard his friend, rival, and in some sense (though Rotrou was the younger of the two) pupil. Finding it impossible to make himself fairly heard in the matter, Corneille (who had retired from his position among the "five poets") withdrew to Rouen and passed nearly three years in quiet there. In 1639, or at the beginning of 1640, appeared *Horace* with a dedication to Richelieu. The good offices of Madame de Combalet, to whom the *Cid* had been dedicated, and perhaps the satisfaction of the cardinal's literary jealousy, had healed what breach there may have been, and indeed the poet was in no position to quarrel with his patron. Richelieu not only allowed him 500 crowns a year, but soon afterwards employed his omnipotence in reconciling the father of the poet's mistress, Marie de Lampérière, to the marriage of the lovers. These were years of considerable importance to Corneille. Not only *Horace* but *Cinna* appeared therein. A brief but very serious illness attacked him, and the death of his father increased his family anxieties by leaving his mother in very indifferent circumstances.

Towards the end of 1640 *Polyeucte* was produced; and in the following year Corneille figured as a contributor to the *Guirlande de Julie*, a famous album which the marquis de Montausier, assisted by all the literary men of the day, offered to his lady love Julie d'Angennes. 1642 saw *La Mort de Pompée* and the memorable comedy of *Le Menteur*, which though adapted from the Spanish stood in relation to French comedy very much as *Le Cid*, which owed to Spain only its subject, stood to French tragedy. The sequel which followed it in 1644 was not popular, but *Rodogune* was a brilliant success. *Théodore*, a tragedy on a somewhat perilous subject, was the first of Corneille's plays which was definitely damned. Some amends may have been made to him by the commission which he received to write verses for the *Triomphes poétiques de Louis XIII.* Soon after (January 22, 1647) the Academy at last (it had twice rejected him on frivolous pleas) admitted the greatest of living French writers. *Heraclius* (1647), *Andromede* (1650), a spectacle rather than a play, *Don Sanche d'Aragon* (1650), and *Nicomède* (1651) were the products of the next few years' work; but in 1653 *Pertharite* was received with decided disfavour, and the poet in disgust resolved, like Ben Jonson, to quit the loathed stage. In this resolution he persevered for six years, during which he worked at a verse translation of the *Imitation of Christ* (finished in 1656), at his three *Discourses on Dramatic Poetry*, and at the *Examens* which are usually printed at the end of his plays. In 1659 Fouquet, the Mæcenas of the time, persuaded him to alter his resolve, and *Œdipe*, a play which became a great favourite with Louis XIV., was the result. It was followed by *La Toison d'Or* (1660), *Sertorius* (1662), and *Sophonisbe* (1663). In this latter year Corneille was included among the list of men of letters pensioned at the proposal of Colbert. He received 2000 livres. *Othon* (1664), *Agésilas* (1666), *Attila* (1667), and *Tite et Bérénice* (1670), were generally considered as proofs of failing powers,—the cruel quatrain of Boileau—

Après l'Agésilas
Hélas!
Mais après l'Attila
Holà!

in the case of these two plays, and the unlucky comparison with Racine in the *Bérénice*, telling heavily against them. In 1665 and 1670 some versifications of devotional works addressed to the Virgin had appeared. The part which Corneille took in *Psyché* (1671), Molière and Quinault being his coadjutors, showed signs of renewed vigour; but *Pulchérie* (1672) and *Suréna* (1674) were allowed even by his faithful followers to be failures. He lived for ten years after the appearance of *Suréna*, but was almost silent save for the publication, in 1676, of some beautiful verses thanking Louis XIV. for ordering the revival of his plays. He died at his lodging in the Rue d'Argenteuil on the 30th of September 1684. For nine years (1674–81), and again in 1683, his pension had, for what reason is unknown, been suspended, and he was in great straits. The story goes that at last Boileau, hearing of this, went to the king and offered to resign his own pension if there were not money enough for Corneille, and that Louis sent the aged poet 200 pistoles. He might have said, with a great English poet in like case, "I have no time to spend them." Two days afterwards he was dead.

Corneille was buried in the church of St Roch, where no monument marked his grave until 1821. He had six children, of whom four survived him. Pierre, the eldest son, a cavalry officer, left posterity in whom the name has continued; Marie, the eldest daughter, was twice married, and by her second husband, M. de Farcy, became the ancestress of Charlotte Corday. Repeated efforts have been made for the benefit of the poet's descendants, Voltaire, Charles X., and the *Comédie Francaise* having all borne part therein.

The portraits of Corneille (the best and most trustworthy of which is from the burin of Lasne, an engraver of Caen) represent him as a man of serious, almost of stern countenance, and this agrees well enough with such descriptions as we have of his appearance and with the idea of him which we should form from his writings and conduct. His nephew Fontenelle admits that his general address and manner were by no means prepossessing. Others use stronger language, and it seems to be confessed that either from shyness, from pride, or from physical defects of utterance, probably from all three combined, he did not attract strangers. Racine is said to have assured his son that Corneille made verses "cent fois plus beaux" than his own, but that his own greater popularity was owing to the fact that he took some trouble to make himself personally agreeable. Almost all the anecdotes which have been recorded concerning the greatest of French dramatists testify to a rugged and somewhat unamiable self-contentment. "Je n'ai pas le mérite de ce pays-ci," he said of the court. "Je n'en suis pas moins Pierre Corneille," he is said to have replied to his friends whenever they dared to suggest certain shortcomings in his behaviour, manner, or speech. "Je suis saoul de gloire et affamé d'argent" was his reply to the compliments of Boileau. Yet tradition is unanimous as to his affection for his family and as to the harmony in which he lived with his brother Thomas who had married Marguerite de Lampérière, younger sister of Marie, and whose household both at Rouen and at Paris was practically one with that of his brother. No story about Corneille is better known than that which tells of the trap between the two houses, and how Pierre, whose facility of versification was much inferior to his brother's, would lift it when hard bestead, and call out "Sans-souci, une rime!" Notwithstanding this domestic felicity, an impression is left on the reader of Corneille's biographies that he was by no means a happy man. Melancholy of temperament will partially explain this, but there were other reasons. He appears to have been quite free from envy properly so called, and to have been always ready to acknowledge the excellencies of his contemporaries. But, as was the case with a very different man—Goldsmith—praise bestowed on others always made him uncomfortable unless it were accompanied by praise bestowed on himself. As Guizot has excellently said, "Sa jalousie fut celle d'un enfant qui veut qu'un sourire le rassure contre les caresses que reçoit son frère."

Another cause of discomfort must have been the pressure of poverty. His pensions covered but a small part of his long life and were most irregularly paid. The occasional presents of rich men, such as Montauron (who gave him 1000, others say 200, pistoles for the dedication of *Cinna*) and Fouquet (who commissioned *Œdipe*), were few and far between, though they have exposed him to reflections which show great ignorance of the manners of the age. Of his professional earnings, the small sum for which, as we have seen, he gave up his offices, and the expression of Fontenelle that he practised "sans goût et sans succès" are sufficient proof. His patrimony and his wife's dowry must have been both trifling. On the other hand, it was during the early and middle part of his career impossible, and during the later part very difficult, for a dramatist to live decently by his pieces. It was not till the middle of the century that the custom of allowing the author two shares in the profits during the first run of the piece was observed, and even then revivals profited him nothing. Thomas Corneille himself, who to his undoubted talents united wonderful facility, untiring industry, and (gift valuable above all others to the playwright) an extraordinary knack of hitting the public fancy, died, notwithstanding his simple tastes, "as poor as Job." We know that Pierre received for two of his later pieces 2000 livres each, and it would seem that this was the utmost he ever did receive.

But if his gains in money were small and insufficient, it must not be supposed that his reward in fame was stinted. Corneille, unlike many of the great writers of the world, was not driven to wait for "the next age" to do him justice. The cabal which attacked the *Cid* was a cabal of a purely cliquish character, and had, as we are assured on the amplest evidence, no effect whatever on the judgment of the public. All his subsequent masterpieces were received with the same ungrudging applause, and the rising star of Racine, even in conjunction with the manifest inferiority of the last five or six plays of the author of *Cinna*, with difficulty prevailed against the towering reputation of the latter. The great men of his time—Condé, Turenne, the maréchal de Grammont, the knight-errant duc de Guise—were his fervent admirers. Nor had he less justice done him by a class from whom less justice might have been expected, the brother men of letters whose criticisms he treated with such scant courtesy. The respectable mediocrity of Chapelain might misapprehend him; the lesser geniuses of Scudéri and Mairet might feel alarm at his advent; the envious Claverets and D'Aubignacs might snarl and scribble. But Balzac did him justice; Rotrou, as we have seen, never failed in generous appreciation; Molière in conversation and in print recognized him as his own master and the foremost of dramatists. We have quoted the informal tribute of Racine; but it should not be forgotten that Racine, in discharge of his duty as respondent at the Academical reception of Thomas Corneille, pronounced upon the memory of Pierre perhaps the noblest and most just tribute of eulogy that ever issued from the lips of a rival. Boileau's testimony is of a more chequered character; yet he seems never to have failed in admiring Corneille whenever his principles would allow him to do so. Of his conduct in the poet's dire necessity we have spoken already, and there is one story of the period of his extreme old age which must not be omitted. Questioned as to the great men of Louis XIV.'s reign, he is said to have replied: "I only know three,—Corneille, Molière, and myself." "And how about Racine?" his auditor ventured to remark. "He was an extremely clever fellow whom I taught with great difficulty to write verse." It was reserved for the 18th century to exalt Racine above Corneille. Voltaire, who was prompted by his natural benevolence to comment on the latter (the profits went to a relation of the poet), was not altogether fitted by nature to appreciate Corneille, and moreover, as has been ingeniously pointed out, was not a little wearied by the length of his task. His partially unfavourable verdict was endorsed earlier by Vauvenargues, who knew little of poetry, and later by La Harpe, whose critical stand-point has now been universally abandoned. Napoleon I. was a great admirer of Corneille ("s'il vivait je le ferais prince," he said), and under the Empire and the Restoration an approach to a sounder appreciation was made. But it was the glory of the romantic school, or rather of the more catholic study of letters which that school brought about, to restore Corneille to his true rank, that of the greatest writer of France,—perhaps the only one who up to our own times can take rank with the Dantes and Shakespeares of other countries. So long, indeed, as a certain kind of criticism was pursued due appreciation was impossible. When it was thought sufficient to say with Boileau that Corneille excited, not pity or terror, but admiration which was not a tragic passion; or that

> D'un seul nom quelquefois le son dur ou bizarre
> Rend un poème entier ou burlesque ou barbare;"

when Voltaire could think it crushing to add to his exposure of the "infamies" of *Théodore*—"après cela comment osons nous condamner les pièces de Lope de Véga et de Shakespeare?" it is obvious that the *Cid* and *Polyeucte*, much more *Don Sanche d'Aragon* and *Rodogune*, were sealed books to the critic.

Almost the first thing which strikes a reader is the singular inequality of this poet. Producing, as he certainly has produced, work which classes him with the greatest names in literature, he has also signed an extraordinary quantity of verse which has not merely the defects of genius, irregularity, extravagance, *bizarreté*, but the faults which we are apt to regard as exclusively belonging to those who lack genius, to wit, the dulness and tediousness of mediocrity. Molière's manner of accounting for this is famous in literary history or legend. "My friend Corneille," he said, "has a familiar who inspires him with the finest verses in the world. But sometimes the familiar leaves him to shift for himself, and then he fares very badly." That Corneille was by no means destitute of the critical faculty his *Discourses* and the *Examens* (often admirably acute) of his plays show well enough. But an enemy might certainly contend that a poet's critical faculty should be of the Promethean, not the Epimethean order. The fact seems to be that the form in which Corneille's work was cast, and which by an odd irony of fate he did so much to originate and make popular, was very partially suited to his talents. He could imagine admirable situations, and he could write verses of incomparable grandeur—verses that reverberate again and again in the memory. But he could not, with the patient docility of Racine, labour at strictly proportioning the action of a tragedy, at maintaining a uniform rate of interest in the course of the plot and of excellence in the fashion of the verse. Especially in his later plays a verse and a couplet will crash out with fulgurous brilliancy, and then be succeeded by pages of very second-rate declamation or argument. It was urged against him also by the party of the *Doucereux*, as he called them, that he could not manage, or did not attempt, the great passion of love, and that except in the case of Chimène his principle seemed to be that of one of his own heroines:—

Style and peculiarities.

> "Laissons, seigneur, laissons pour les petites ames
> Ce commerce rampant de soupirs et de flammes."
> (Aristie in *Sertorius*.)

There is perhaps some truth in this accusation, however much some of us may be disposed to think that the line just quoted is a fair enough description of the admired ecstasies of Achille and Bajazet. But these are all the defects which can be fairly urged against him; and in a dramatist bound to a less strict service they would hardly have been even remarked. On the English stage the liberty of unrestricted incident and complicated action, the power of multiplying characters and introducing prose scenes, would have exactly suited his somewhat intermittent genius, both by covering defects and by giving greater scope for the exhibition of power.

How great that power is can escape no one. The splendid soliloquies of Medea which, as Voltaire happily says, "annoncent Corneille," the entire parts of Rodrigune and Chimène, the final speech of Camille in *Horace*, the discovery scene of *Cinna*, the dialogues of Pauline and Sévère in *Polyeucte*, the magnificently-contrasted conception and exhibition of the best and worst forms of feminine dignity in the Cornélie of *Pompée* and the Cléopatre of *Rodogune*, the singularly fine scene in *Don Sanche d'Aragon*, between the haughtiness of the Spanish nobles and the unshaken dignity of the supposed adventurer Carlos, and the characters of Aristie, Viriate, and Sertorius himself, in the play named after the latter, are not to be surpassed in grandeur of thought, felicity of design, or appropriateness of language. Admiration may or may not properly be excited by tragedy, and until this important question is settled the name of tragedian may be at pleasure given to or withheld from the author of *Rodogune*. But his rank among the greatest of dramatic poets is not a matter of question. For a poet is to be judged by his best things, and the best things of Corneille are second to none.

It was, however, some time before his genius came to perfection. It is undeniable that the first six or seven of his plays are of no very striking intrinsic merit. On the other hand, it requires only a very slight acquaintance with the state of the drama in France at the time to see that these works, poor as they may now seem, must have struck the spectators as something new and surprising. The language and dialogue of *Mélite* are on the whole simple and natural, and though the construction is not very artful (the fifth act being as is not unusual in Corneille superfluous and clumsy) it is still passable. The fact that one of the characters jumps on another's back, and the rather promiscuous kissing which takes place, are nothing to the liberties usually taken in contemporary plays. A worse fault is the *στιχομυθία*, or, to borrow Butler's expression, the Cat and Puss dialogue which abounds. But the common objection to the play at the time was that it was *too* natural and too devoid of striking incidents. Corneille accordingly, as he tells us, set to work to cure these faults, and produced a truly wonderful work, *Clitandre*. Murders, combats, escapes and outrages of all kinds are provided; and the language makes *The Rehearsal* no burlesque. One of the heroines rescues herself from a ravisher by blinding him with a hair-pin, and as she escapes the seducer apostrophizes the blood which trickles from his eye, and the weapon which has wounded it, in a speech forty verses long. This, however, was his only attempt of the kind. His next four pieces were comedies. They are not particularly comic, and they labour under the same defect of construction as *Mélite*. But there is claimed for them the introduction of some important improvements, such as the choosing for scenes places well known in actual life (as in the *Galerie du Palais*), and the substitution as a stock comic character of the soubrette in place of the old inconvenient and grotesque nurse. It is certain, however, that there is more interval between these six plays and *Médée* than between the latter and Corneille's greatest drama. Here first do we find those sudden and magnificent lines which characterize the poet. The title role is, however, the only good one, and as a whole the play is heavy. Much the same may be said of its curious successor, *L'illusion comique*. This is not only a play within a play, but in part of it there is actually a *third* involution, one set of characters beholding another set discharging the parts of yet another. It contains, however, some very fine lines,—in particular, a defence of the stage and some heroics put into the mouth of a braggadocio. We have seen it said of the *Cid* that it is difficult to understand the enthusiasm it excited. But the difficulty can only exist for persons who are insensible to dramatic excellence, or who so strongly object to the forms of the French drama that they cannot relish anything so presented. To relish *Iphigénie* one must in some sort make oneself of the age of its first spectators. But Rodrigune, Chimène, Don Diègue are not of any age but of all time. The conflicting passions of love, honour, duty, are here represented as they never had been on a French stage, and no one who has ever felt either can be indifferent to their representation in the "strong style" which was Corneille's own. Of the many objections urged against the play, perhaps the weightiest is that which condemns the frigid and superfluous part of the Infanta. *Horace*, though more skilfully constructed, is perhaps less satisfactory. There is a hardness about the younger Horace which might have been, but is not made, imposing, and Sabine's effect on the action is quite out of proportion to the space she occupies. The splendid declamation of Camille, and the excellent part of the elder Horace, do not altogether atone for these defects. *Cinna* is perhaps generally considered the poet's masterpiece, and it undoubtedly contains the finest single scene in all French tragedy, a scene which may take rank with any other perhaps ever written. The blot on it is certainly the character of Emilie, who is spiteful and thankless, not heroic. *Polyeucte* has sometimes been elevated to the same position. There is, however, a certain coolness about the hero's affection for his wife which somewhat detracts from the merit of his sacrifice; while the Christian part of the matter is scarcely so well treated as in the *Saint Genest* of Rotrou or the *Virgin Martyr* of Massinger. On the other hand, the entire parts of Pauline and Sévère are beyond praise, and the manner in which the former reconciles her duty as a wife with her affection for her lover is an astonishing success. In *Pompée* (for *La Mort de Pompée*, though the more appropriate, was not the original title) the splendid declamation of Cornélie is the chief thing to be remarked. *Le Menteur*, which in its English form is well known to play-goers on this side the Channel, fully deserves the honour which Molière paid to it. Its continuation, notwithstanding the judgment of some French critics, we cannot think so happy. But *Théodore* is perhaps the most surprising of literary anomalies. The central situation, which so greatly shocked Voltaire and indeed all French critics from the date of the piece, does not seem to blame. A virgin martyr who is threatened with loss of honour as a bitterer punishment than loss of life offers points as powerful as they are perilous. But the treatment is thoroughly bad. From the heroine, who is in a phrase of Dryden's "one of the coolest and most insignificant" heroines ever drawn, to the undignified Valens, the termagant Marcelle, and the peevish Placide, there is hardly a good character. Immediately upon this in most printed editions, though older in representation, follows the play which (therein agreeing rather with the author than with his critics) we should rank as his greatest triumph, *Rodogune*. Here there is hardly a weak point. The magnificent and terrible character of Cléopatre, and the contrasted dispositions of the two princes, of course attract most attention. But the character of Rodogune herself, which has not escaped criticism, comes hardly short of these. *Heraclius*, despite great art and much fine poetry, is injured by the extreme complication of its argument and by the blustering part of Pulchérie. *Andromède*, with the later spectacle piece, the *Toison d'Or*, do not call for comment, and we have already alluded to the chief merit of *Don Sanche*, a play which, however, deserves both admiration and study. *Nicomède*, often considered one of Corneille's best plays, is chiefly remarkable for the curious and unusual character of its hero. Of *Pertharite* it need only be said that no single critic has to our knowledge disputed the justice of its damnation. *Œdipe* is certainly unworthy of its subject and its author, but in *Sertorius* we have one of Corneille's finest plays. It is remarkable not only from its many splendid verses and for the nobility of its sentiment, but from the fact that not one of its characters lacks interest, a commendation not generally to be bestowed on its author's work. Of the last six plays we may say that perhaps only one of them, *Agésilas*, is almost wholly worthless. Its irregular verses make one very glad that they found few imitators. In the others, though the spectator would not be likely to appreciate them, yet the reader will find not a little verse of the brand which only Corneille could impose. Not a few speeches of *Suréna* and of *Othon* are of a very high order. As to the poet's non-dramatic works, we have already spoken of his extremely interesting critical dissertations. His minor poems and poetical devotions are not likely to be read save from motives of duty or curiosity. The verse translation of à Kempis, indeed, which was in its day immensely popular (it passed through many editions), condemns itself. Yet these, as well as his greater works, deserve honour as the instruments by which Corneille wrought, prehaps, a mightier change in his mother tongue than any one man ever effected. Of him much rather than of Dryden might it be said, *Lateritiam invenit, reliquit marmoream*. And in so saying it need not be forgotten that for some purposes brick is better than marble.

The subject of the bibliography of Corneille has been recently treated in the most exhaustive manner by M. E. Picot in his *Bibliographie Cornélienne* (Paris, 1875). Less elaborate but still ample information may be found in Taschereau's *Vie* and in M. Marty Laveaux's edition of the *Works*. A short but useful list is given in Louandre's edition, vol. i. p. 47. The chief collected editions in the poet's lifetime were those of 1644, 1648, 1652, 1660 (with important corrections), 1664, and 1682. In 1692 T. Corneille published a complete *Théâtre* in 5 vols. 12mo. Numerous editions appeared in the early part of the 18th century, that of 1740 (6 vols. 12mo, Amsterdam) containing the *Œuvres diverses* as well as the plays. Eight editions are recorded between this and that of Voltaire (12 vols. 8vo; Geneva, 1764, 1776, 8 vols. 4to), whose *Commentaires* have often been reprinted separately. In the year IX. (1801) appeared an edition of the *Works* with Voltaire's commentary and criticisms thereon by Palissot (12 vols. 8vo, Paris). Since this the editions have been extremely numerous. Those chiefly to be remarked are the following. Lefèvre's (12 vols. 8°, Paris, 1854), well printed and with a useful variorum commentary, lacks bibliographical information and is disfigured by hideous engravings. Louandre's (2 vols. 18mo, Paris, 1853), though entitled *Œuvres des* *deux Corneilles*, contains only twelve pieces with some miscellaneous works of Pierre. It is, however, very well edited, and good as far as it goes. Of Taschereau's, in the *Bibliotheque Elzévirienne*, only two volumes were published. Lahure's appeared in 5 vols. (1857–62) and 7 vols. (1864–66). The edition of Ch. Marty Laveaux in Regnier's *Grands Ecrivains de la France* (1862–1868), in 12 vols. 8vo, is likely for some time to remain the standard. In appearance and careful editing it leaves nothing to desire, containing the entire works, a lexicon, full bibliographical information, and an album of illustrations of the poet's places of residence, his arms, some title pages of his plays, facsimiles of his writings, &c. Nothing is wanting but variorum comments, which Lefèvre's edition supplies. A handy edition of the plays appeared in 1873 (3 vols. 8vo Paris). Fontenelle's *Life of His Uncle* is the chief original authority on that subject, but Taschereau's *Histoire de la Vie et des Ouvrages de P. Corneille* (1st ed. 1829, 2d in the Bibl. Elzévirienne, 1855) is the standard work. Its information has been corrected and augmented in various later publications, but not materially. Of the exceedingly numerous writings relative to Corneille we can only mention the *Recueil de dissertations sur plusieurs tragédies de Corneille et de Racine* of the Abbé Granet (Paris, 1740), the criticisms already alluded to of Voltaire, La Harpe, and Palissot, the well-known work of Guizot, *Corneille et son temps*, and the essay of Sainte-Beuve. The best-known English criticism, that of Hallam, is inadequate. The translations of separate plays are very numerous, but of the complete *Théâtre* only one version (into Italian) is recorded by the French editors. Fontenelle tells us that his uncle had translations of the *Cid* in every European tongue but Turkish and Slavonic, and M. Picot's book apprises us that the latter want at any rate is now supplied. Corneille has suffered less than some other writers from the attribution of spurious works. Besides a tragedy, *Sylla*, the chief piece thus assigned is *L'occasion perdue recouverte*, a rather loose tale in verse. Internal evidence by no means fathers it on Corneille, and all external testimony (except a foolish story that the poet composed his devotional works as a penance for its production) ascribes it to a contemporary poet Cantenac. It has never been included in Corneille's works. It is curious that a translation of Statius (Thebaid, bk. iii.), an author of whom Corneille was extremely fond, though known to have been written, printed, and published, has entirely dropped out of sight. Three verses quoted by Ménage are all we possess. (G. SA.)

CORNEILLE, Thomas (1625–1709), was nearly twenty years younger than his brother, the day of his birth being August 20, 1625. His skill in verse-making seems to have shown itself early, as at the age of fifteen he composed a piece in Latin which was represented by his fellow pupils at the Jesuits' College of Rouen. He soon followed his brother's steps, and his first piece, *Les Engagements du Hasard*, was acted in 1647. From this time forward he produced a constant series of plays, sometimes in collaboration, oftener alone. At his brother's death he succeeded to his vacant chair in the Academy. He then turned his attention to philology, producing a new edition of the *Remarques* of Vaugelas in 1687, and in 1694 a dictionary intended to supplement that of the Academy. A complete translation of Ovid's *Metamorphoses* (he had published six books with the *Heroic Epistles* some years previously) followed in 1697. In 1704 he lost his sight and was constituted a "veteran," a dignity which preserved to him the privileges, while it exempted him from the duties, of an Academician. But he did not allow his misfortune to put a stop to his work, and soon produced a large *Geographical and Historical Dictionary* in 3 vols. folio. This was his last labour. He died on the 8th of December 1709, aged eighty-four. It has been the custom to speak of Thomas Corneille as of one who, but for the name he bore, would merit no notice. This is by no means the case; on the contrary, he is rather to be commiserated for his connection with a brother who outshone him as he would have outshone almost any one. Of his forty-two plays (this is the utmost number assigned to him) the last edition of his complete works contains only thirty-two, but he wrote several in conjunction with other authors. Two are usually reprinted at the end of his brother's selected works. These are *Ariane* and the *Comte d'Essex*, in the former of which Rachel attained success. But of *Laodice*, *Camma*, *Stilico*, and some other pieces, Pierre Corneille himself said that "he wished he had written them," and he was not wont to speak lightly. *Camma* especially deserves notice. Thomas Corneille is in many ways remarkable in the literary history of his time. His *Timocrate* had the longest run recorded of any play in the century. For *La Devineresse* he and his coadjutor De Visé received above 6000 livres, the largest sum known to have been thus paid. Lastly, one of his pieces (*Le Baron des Foudrières*) contests the honour of being the first which was hissed off the stage. (G. SA.)

CORNELIA, one of the greatest women in Roman history, was the younger daughter of Scipio Africanus the Elder, the conqueror of Carthage, and mother of the two great tribunes, Tiberius and Caius Gracchus, and of Cornelia, the wife of Scipio Africanus the younger. On the death of her husband, refusing numerous offers of marriage, including even one from King Ptolemy, she devoted herself to the education of her children, a task for which her lofty spirit and wide attainments rendered her admirably fitted, and which had the most extraordinary results. The only attack ever made upon her lofty reputation was the charge that she was concerned in the death of her son-in-law, Scipio, which was, there is no reason to doubt, a mere baseless slander. On her death a statue was erected to her memory bearing the inscription—"Cornelia, mother of the Gracchi." She is said to have presented her sons to a Campanian lady, who asked to see her jewels, as the only jewels of which she could boast. After the murder of Caius, the second of her sons, she retired to Misenum, where she devoted herself to Greek and Latin literature, and to the society of men of letters. See Plutarch's *Lives of Tib. and C. Gracchus*.

CORNELIUS, Peter von, the leader of the German art revival, was born in Düsseldorf in 1784, and died in Berlin, March 6, 1867.

Cornelius, like other great painters, is reported to have manifested his artistic talent at a very early age. His father, who was inspector of the Düsseldorf Gallery, dying whilst the painter was yet a boy, the young Cornelius was stimulated to extraordinary exertions. The reasons for this he has himself pathetically expressed in a letter to the Count Raczynski. "I was in my sixteenth year," he writes, "when I lost my father, and it fell to the lot of an elder brother and myself to watch over the interests of a numerous family. It was at this time that it was attempted to persuade my mother that it would be better for me to devote myself to the trade of a goldsmith than to continue to pursue painting—in the first place, in consequence of the time necessary to qualify me for the art, and in the next, because there were already so many painters. My dear mother, however, rejected all this advice, and I felt myself impelled onward by an uncontrollable enthusiasm, to which the confidence of my mother gave new strength, which was supported by the continual fear that I should be removed from the study of that art I loved so much."

His earliest work of importance was the decoration of the choir of St Quirinus Church at Neuss. At the age of twenty-six he produced his designs from *Faust*. On October 14, 1811, he arrived in Rome, were he soon became one of the most promising of that brotherhood of young German painters which included Overbeck, Schadow, Veit, Schnorr, Pforr, Vogel, and Wächter,—a member of a fraternity (some of whom selected a ruinous convent for their home) who were banded together for resolute study and mutual criticism. Out of this association came the men who, though they were ridiculed at the time, were destined to found a new German school of art.

At Rome Cornelius participated, with other members of his fraternity, in the decoration of the Casa Bartoldi and the Villa Massimi, and while thus employed he was also engaged upon designs for the Nibelungenlied. From Rome he was called to Düsseldorf to remodel the Academy.

and to Munich by the then crown-prince of Bavaria, afterwards Louis I., to take the direction of those decorations which his royal highness had projected for the Glyptothek. Cornelius, however, soon found that attention to such widely separated duties was incompatible with the just performance of either, and most inconvenient to himself; eventually, therefore, he resigned his post at Düsseldorf to throw himself completely and thoroughly into those works for which he had been commissioned by the crown-prince. He therefore left Düsseldorf for Munich, where he was joined by those of his pupils who elected to follow and to assist him. At the death of Director Langer, 1824–25, he became director of the Munich Academy.

The fresco decorations of the Ludwigskirche, which were for the most part designed and executed by Cornelius, are perhaps the most important mural works of modern times. The large fresco of the Last Judgment, over the high altar in that church, measures 62 feet in height by 38 feet in width. The frescoes of the Creator, the Nativity, and the Crucifixion in the same building are also upon a large scale.

Amongst his other great works in Munich may be included his decorations in the Pinakothek and in the Glyptothek; those in the latter building, in the hall of the gods and the hall of the hero-myths, are perhaps the best known. About the year 1839–40 he left Munich for Berlin to proceed with that series of cartoons, from the Apocalypse, for the frescoes for which he had been commissioned by Frederick William IV., and which were intended to decorate the Campo Santo, or Royal Mausoleum, forming one of the wings of the new cathedral. These were his final works.

It is difficult to convey to the English reader any adequate notion of the important position which this great designer and master spirit held in contemporary art; for Cornelius, as an oil painter, possessed but little technical skill, nor do his works exhibit any instinctive appreciation of colour. Even as a fresco painter his manipulative power was not great. And in critically examining the execution in colour of some of his magnificent designs, one cannot help feeling that he was, in this respect, unable to do them full justice. This criticism will even hold after making due allowance, in works of a high intellectual aim, for the claims of form over those of colour. Cornelius and his associates formed their styles on the study of the great Italian masters, or rather, we should say, endeavoured to follow in their own works the spirit of the Italian painters. But as in family descent so in the works of genius we may sometimes detect the indications of several distinct formative influences. Thus in Cornelius the Italian strain is to a considerable extent modified by the Dürer heritage. This is true not only of Cornelius but of all the original members of the Munich school of thirty years since. This Dürer influence is manifest in a tendency to overcrowding in composition, in a degree of attenuation in the proportions of and a poverty of contour in the nude figure, and also in a leaning to the selection of Gothic forms for draperies. These peculiarities are even noticeable in Cornelius's principal work of the Last Judgment, in the Ludwigskirche in Munich. The attenuation and want of flexibility of contour in the nude are perhaps most conspicuous in his frescoes of classical subjects in the Glyptothek, especially in that representing the contention for the body of Patroclus. But notwithstanding these peculiarities there is always in his works a grandeur and nobleness of conception, as all must acknowledge who have inspected his designs for the Ludwigskirche, for the Campo Santo, &c.

The difficulty which many have of understanding how a painter of such comparatively slight technical skill could materially influence the art of his age lies in their want of ability to estimate the value of a dominant or leading mind. They are alive only to those practical matters which come within the compass of their own understandings. Yet that mental calibre, that grasp of thought, that knowledge of principles, and that power of directing other men which Cornelius possessed, are the very qualities which are of the greatest value, since for one man who possesses them, there are thousands who have the capacity either for acquiring technical skill, for observing facts, or for administrative routine. Cornelius was a man of that far rarer order of regal minds who transform wastes into kingdoms. If he were not dexterous in the handling of the brush, he could conceive and design a subject with masterly purpose. If he had an imperfect eye for colour, in the Venetian, the Flemish, or the English sense, he had vast mental foresight, and could direct the German school of painting into those paths which promise to make it, at no distant date, the first on the continent of Europe.[1] He had great political prevision, too; his favourite motto of "Deutschland über Alles" indicates the direction and the strength of his patriotism.

Carl Hermann was one of Cornelius's earliest and most esteemed scholars, a man of simple and fervent nature, painstaking to the utmost, a very type of the finest German student nature; Kaulbach and Eberle were also amongst his valued scholars. The reader may here be reminded that the vast importance of the practice of mural painting to the fine arts of a country consists in the necessity which it involves of obtaining the assistance of scholars in the carrying out, within reasonable time, of extensive mural works. Hence the institution of scholarship in Germany as in the great Italian art epoch. Every public edifice in Munich and other German cities which was embellished with frescoes, became, as in Italy, a school of art of the very best kind; for the decoration of a public building begets a practical knowledge of design. The development of this institution of scholarship in Munich was a work of time. The cartoons for the Glyptothek were all by Cornelius's own hand. In the Pinakothek his sketches and small drawings sufficed; but in the Ludwigskirche the invention even of some of the subjects was intrusted to his scholar Hermann.

To comprehend and appreciate thoroughly the magnitude of the work which Cornelius accomplished for Germany, we must remember that at the beginning of this century Germany had no national school of art. Germany was in painting and sculpture behind all the rest of Europe. Yet in less than half a century Cornelius founded a great school, revived mural painting, and turned the gaze of the art world towards Munich. The German revival of mural painting had its effect upon England, as well as upon other European nations, and led to those famous cartoon competitions being held in Westminster Hall, and ultimately to the partial decoration of the Houses of Parliament. When the latter work was in contemplation, Cornelius, in response to invitations, visited England (November 1841). His opinion was in every way favourable to the carrying out of the project, and even in respect of the durability of fresco in the climate of England.

Cornelius, in his teaching, always inculcated a close and rigorous study of nature, but he understood by the study of nature something more than what is ordinarily implied by

[1] There were, of course, other distinguished artists besides Cornelius who contributed to the success and the glory of the German art revival —notably Overbeck, who was his fast ally in that art-loving fraternity of his early manhood, Schnorr von Carolsfeld, Heinrich Hess, Wilhelm von Kaulbach, Veit, Schadow, &c.; also those scholars who assisted in the execution of the great mural works in Munich and elsewhere, some of whom themselves became eminent, whilst others esteemed it a sufficient privilege to be permitted to help in the great and national work

that expression, something more than constantly making studies from life; he meant the study of nature with an inquiring and scientific spirit. "Study nature," was the advice he once gave, "in order that you may become acquainted with its *essential* forms."

The personal appearance of Cornelius could not but convey to those who were fortunate enough to come into contact with him the impression that he was a man of an energetic, firm, and resolute nature. He was below the middle height and squarely built. There was evidence of power about his broad and overhanging brow, in his eagle eyes and firmly gripped attenuated lips, which no one with the least discernment could misinterpret. Yet there was a sense of humour and a geniality which drew men towards him; and towards those young artists who sought his teaching and his criticism he always exhibited a calm patience.

The reader may consult Mr Beavington Atkinson's excellent papers on German art, contributed to the *Art Journal* in 1865, and Dr Förster's life of the painter, published at Munich. (W. C. T.)

CORNETO, a town of Italy with about 4000 inhabitants, in the province of Rome and district of Civita Vecchia, on the River Marta, two miles from the railway between Civita Vecchia and Leghorn. Dating probably from about the 8th century, and fortified in the 14th or 15th, it still presents a distinctly mediæval aspect. Among its more interesting buildings are the now ruinous cathedral of St Maria di Castello, of the 12th century, the mansion of the Cardinal Vitelleschi, now used as a hotel, and the *palazzo communale* with its fresco-paintings. During the great Guelf and Ghibelline struggle Corneto adhered enthusiastically to the Papal cause, and it was the first place in Italy that had the honour of welcoming back Gregory XI. from Avignon. Its interest to the archæologist and the traveller depends on its connection with a much earlier age; it occupies the western extremity of Montarozzi, a volcanic spur of the Ciminian Hills, which served as a necropolis for the old Etruscan city of Tarquinii, and the neighbourhood is rich in various kinds of Etruscan remains. The most interesting of these are the painted tombs, which, though referred to in a Latin poem of the 15th century, and the object of a commission by Innocent VIII., were practically lost sight of till the present century. The largest, indeed, known as the *Grotta del Cardinale*, was discovered in 1669, but the discovery was again forgotten till 1780. General attention was drawn to the district by Mr Byres in 1842, and investigations have since been prosecuted by Prince Lucien Bonaparte, Signor Avvolta, Baron Stackelberg, Kestner, and other archæologists. The subjects represented on the walls are of very miscellaneous character, and, according to the best authorities, the tombs belong to very different epochs. That known as the *Grotta Querciola* contains a banqueting-scene and a boar-hunt; the *Grotta del Morto*, a picture of a dead man attended by mourners; the *Delle Bighe*, a chariot race; and the *Del Barone*, warlike games, horsemen, and similar subjects. These were all known before 1840, and several of them have become greatly decayed; but the loss has so far been made good by more recent discoveries. Among these may be mentioned the *Tomba Baietti*, adorned with figures of gymnasts, dancers, and horsemen; the *Del Cacciatore*, with a variety of well-designed hunting scenes; and the *Del Letto Funebre*, with charioteers, pugilists, and other figures.

The first extant treatise on the tombs of Corneto is a manuscript of the year 1756, by an Augustinian monk, Padre Jeannicola Forlivesi. See J. Byres, *Hypogæi, or The Sepulchral Caverns of Tarquinia*, 1842; Dennis, *The Cities and Cemeteries of Etruria*; and especially the *Bollettino* and *Annali dell' Instituto di Corresp. Arch. di Roma*, which, in the earlier volumes, are full of details of the Corneto discoveries and continue to give information as occasion serves.

CORNHERT, Theodore (1522–1590), a Dutch writer on politics and theology, was born at Amsterdam of a good Dutch family. While a child he was for some years in Spain and Portugal. On returning to Holland, having married a wife without fortune in defiance of the provisions of his father's will, he was obliged to accept a situation as *major-domo* to the father of the Henry Brederode who took so prominent a part in the contest with Spain. Afterwards he settled in Haarlem as an engraver on copper. In 1562 he obtained the post of secretary to the city of Haarlem, and in 1564 that of secretary to the burgomasters of that city. He now threw himself into the struggle of his country against Spanish tyranny; and he was employed to draw up the famous manifesto which the prince of Orange published in 1566. Not long after he was seized and imprisoned by the Government; but he escaped to Cleves, where he maintained himself by his art. When the States, however, obtained their freedom, Cornhert returned home, and became secretary of state; but this position he did not long retain, on account, it is said, of the rigour with which he strove to repress military disorders. Cornhert was also famous as a theologian. At thirty years of age, having become interested in theology, and being desirous of consulting St Augustine, he commenced the study of Latin. He entered into controversy alike with Catholics and Reformers, with both of whom he refused to communicate. Reformers, he said, were sadly wanted, but those who called themselves such were not the kind that the church required; what was needed was apostles directly inspired from heaven. Till such were sent, he advised all churches to join together in an undogmatic communion.

He wrote a treatise against the capital punishment of heretics, a pamphlet defending the rebellion of the United Provinces, a preface to the Dutch grammar published by the Society of Rhetoricians of Amsterdam, and a number of poems, including, according to some, the popular song, *Wilhelmus van Nassouwen*, which, however, is attributed by others to Philip van Marnix. His collected works appeared in 1630.

CORNUTUS, L. Annæus, was a Stoic philosopher of great repute, who flourished in the reign of Nero. He was a native of Leptis, a city of Libya, but resided for the most part of his life in Rome. He is best known as the teacher and friend of Persius, who dedicated his fifth satire to him, and in it describes in glowing terms his affection for him. The youthful poet at his death left a large sum of money and all his books to Cornutus. Cornutus took the books, but gave the money to the poet's sisters. He also revised the poems of Persius before their publication, but committed the task of editing them to Cæsius Bassus, who requested the privilege of discharging that duty. He was well known to the famous men of the court of Nero and to Nero himself. Indeed, some have inferred from his name Annæus that he was a freedman of that family, and thus connected with Seneca and Lucan. He was banished by Nero under the following circumstances. Nero intended to write a history of the Romans in heroic verse. Before beginning his work he consulted various persons, and amongst them Cornutus, as to the number of books of which it should consist. Some advised him to make his poem in 400 books, but Cornutus urged that the number was too great, and that nobody would read so long a poem. Whereupon some one said, "Chrysippus, whom you praise and imitate, wrote many more." "Yes," said Cornutus, "but these books are useful for the life of man." Nero was enraged, and thought of putting him to death, but contented himself with banishing him to some island. We hear nothing more of Cornutus. Cornutus seems to have been a voluminous writer, but considerable uncertainty hangs about the subject of his literary activity, owing mainly to the circumstance that we do not know how many of the writings attributed to authors of the name of

Cornutus are to be assigned to this one. With considerable certainty we may ascribe to him a *Commentary* or *Notes on Virgil*, which is frequently quoted by Servius. It also appears likely that he wrote notes on Persius, and that these notes form the nucleus of the *Scholia* which the manuscripts attribute to Cornutus. Otto Jahn thinks that they are the production of a Cornutus who lived in the Middle Ages. He also wrote books on rhetoric, one of which, *De Figuris Sententiarum*, is mentioned by Aulus Gellius, and another, Ῥητορικαὶ τέχναι, is noticed by Simplicius. Some have inferred from corrupt passages in ancient writers that he wrote tragedies and satires: but the inference is not warranted. He also wrote on philosophical subjects. The only work that has come down to us has appeared under the title *De Natura Deorum.* Theodoret and the *Etymologicum Magnum* speak of it as being περὶ Ἑλληνικῆς θεολογίας, and this seems to have been its real name. It is an exceedingly interesting book, and deserves much more attention than it has received. It is a manual of Greek theology for the use of Stoic boys. It is marred by many absurd etymologies, but it abounds in beautiful thoughts, worthy of the teacher of Persius. Fabricius (*Bibl. Græc.*, vol. iii. p. 554, Harless) gives a list of the earlier editions. In this century it has been only once edited. Frederic Osann edited it from the papers of Jean Bapt. Casp. d'Ansse de Villoison, Göttingen, 1844. Much information in regard to Cornutus will be found in Martini's *Literaria Disputatio*, Leyden, 1825, and in Otto Jahn's *Prolegomena to Persius.*

Plate IX. CORNWALL, the most westerly county in England, is also that which extends farthest to the south. The extreme western point of the mainland is the Land's End, 5° 41′ 31″ W. long.; the extreme southern point is the Lizard Head, in 49° 57′ 30″ N. lat. It is bounded on all sides by the sea, except on the east, where it joins Devonshire. The River Tamar forms the general boundary between the two counties from its source in the parish of Morwenstow. At the source of the river the boundary turns westward to the sea, cutting off from Cornwall the point of Hartland. Cornwall is in effect a long promontory, which gradually narrows toward the Land's End, and has one deeply projecting spur ending in the Lizard. The breadth of the county is nowhere very great; and the two seas, the English and the British channels, are visible at once from several parts of the high land of the interior. The greatest length of the county, from the Tamar to the Land's End, is 80 miles. It covers an area, including the Scilly Islands, of 869,878 acres, or 1359 square miles; contains 9 hundreds (16 divisions), 216 parishes, 28 market towns; and in 1871 had 362,343 inhabitants (169,706 males, 192,637 females). The population in 1861 numbered 369,390 persons, and in 1851 it was 355,559, showing an increase between 1851 and 1871 of 2 per cent. Cornwall is included in the western circuit. Originally forming part of the diocese of Exeter, it was in 1876 disjoined therefrom and erected into a separate bishopric—that of Truro. The assizes for the county are held at Bodmin.

Rivers.—The rivers all flow towards the south, with the exception of the Camel and the Alan, which, uniting, fall into the sea at Padstow. Every northern coombe, however, has its streamlet. The rivers of the south coast are—the Tamar, by far the most important; the Lynher, which falls into it; the Looe and the Fowey rivers, falling into creeks at those places; and the Fal, on which stands Falmouth. Except the Tamar none of these streams are of great size or length of course.

Geology.—The Carbonaceous formations of North Devon extend into the north-western angle of Cornwall, but by far the greater part of the county belongs to the Devonian or grauwacke series of rocks, consisting of slates and shales, which occupy much of South Devon, and occur again in North Devon and Somersetshire. From the Devonians four large patches of granite project at intervals. The Land's End district forms the most westerly of these granite patches, each one of which is of considerably less area than the granitic region of Dartmoor, east and north of which true granite does not occur in England except in Cumberland and Westmoreland. The highest point of the Dartmoor granite rises to 2050 feet. The highest point in Cornwall is Brown Willy, 1368 feet. This is in the most easterly patch of granite, and the height of each patch diminishes westward until the granite of the Scilly Isles, which lie beyond the Land's End, and belong to the same system, reaches, at its highest, to no more than 140 feet. A large mass of serpentine occupies the district about the Lizard Head; and the Devonian rocks are traversed by numerous veins and outbreaks of trap and of "elvans,"—the name locally given to porphyries, granitic and felspathic. The most curious pile of weathered granite is the Cheesewring, near Liskeard. Roche Rocks are formed by protruding trap. The mineral veins, for which Cornwall has so long been famous, occur in both the Devonian rocks and the granitic.

Scenery.—The distinctive scenery of Cornwall is to be observed on her coast line, which is much indented, and consists mostly of bold, rugged, and fantastically shaped rocks.

Soil.—The position of the county between two seas, and the character of its geological formations, affect the cultivation of the soil, and the character of its climate. The soil of a great part of Cornwall is indifferent, and the interior, where the ground rises to its greatest height, is so completely exposed to the sea-winds that sweep across it from east and west, that it remains almost without cultivation. The granite district west of Launceston is broken and picturesque, with rough *tors* or hills and boulders. This is for the most part a region of furze and heather; but after passing Bodmin, the true Cornish moorland asserts itself,—bare, desolate, and impracticable, broken and dug into hillocks, sometimes due to primæval stream-works, sometimes to more modern search for metals. The seventy miles from Launceston to Mount's Bay have been not untruly called "the dreariest strip of earth traversed by any English high road." There is hardly more cultivation on the higher ground west of Mount's Bay, or in the "Meneage," or "rocky country," the old Cornish name of the promontory which ends in the Lizard. Long coombes and valleys, however, descend from this upper moorland towards the coast on both sides. In them the soil is frequently rich and deep; there are good arable and pasture farms, and the natural oak wood which these coombes or gullies contain has been well cared for and increased by modern plantations. Hitherto, however, the wealth of Cornwall has lain not so much in the soil, but underground, and in the seas which beat against her coast. Hence the favourite Cornish toast,—"fish, tin, and copper."

The *climate* of Cornwall is peculiar. Snow seldom lies for more than a few days, and the winters are less severe than in any other part of England. The sea-winds, except in a few sheltered places, prevent timber-trees from attaining to any great size, but the air is mild, and the lower vegetation, especially in the Penzance district, is almost southern in its luxuriance. This is partly due to the influence of the Gulf Stream, which passes but a short distance west of the Scilly Islands. Geraniums, fuchsias, myrtles, hydrangeas, and camellias grow to a considerable size, and flourish through the winter at Penzance and round Falmouth; and in the Scilly Isles a great variety of exotics may be seen flourishing in the open air. Stone fruit and

NINTH EDITION:

even apples and pears, do not attain the same full flavour as in the neighbouring county, owing to the want of dry heat. The pinaster, the *Pinus austriaca*, *Pinus insignis*, and other firs succeed well in the western part of the county. All native plants display a perfection of beauty hardly to be seen elsewhere, and the furze, including the double blossomed variety, and the heaths, among which *Erica vagans* and *ciliaris* are peculiar to Cornwall, cover the moorland and the cliff summits with a blaze of the richest colour. On the whole the climate is healthy, though the constant west and south-west winds, bringing with them great bodies of cloud from the Atlantic, render it damp and showery.

Agriculture has not received so much attention here as the more remunerative although more speculative pursuit of mining. Barley, wheat, and oats are the principal corn crops, and the acreage under each of these is much the same in amount; while of green crops one-half the acreage is occupied by turnips, a fifth by mangolds, and only a tenth by potatoes. Early potatoes, brocoli, and asparagus are grown extensively around Penzance, where the climate is very equable, and these products are sent off in large quantities to the London market. The stock of animals is considerable, and has recently been increased to some extent. The cattle, which on some farms are used for ploughing, belong mostly to the Devon breed. The following tables, taken from the agricultural returns, show the acreage of crops and numbers of live stock in the years 1873 and 1876 respectively:—

	Acres under corn crops.	Green crops.	Grass under rotation.	Percentage of area under cultivation.
1873	150,106	60,244	149,785	59
1876	143,211	60,281	138,721	60½

	Cattle.	Sheep.	Pigs.	Horses.
1873	145,286	408,173	62,827	37,466
1876	155,950	437,440	62,206	30,613

With reference to the division of the land, according to the "Owners of Land" Return, 1873, the county was in that year divided among 13,866 separate proprietors, holding land estimated at a total value of £1,235,167. There were 8717 owners of less than 1 acre, and the largest separate holding amounted to 25,910 acres. Of the whole proprietors 62 per cent. held less than 1 acre of land, which is a little under the proportion of small proprietors in the neighbouring county of Devon, and still more under that of all England. The average size of the holdings was 54 acres, while that of all England was 34, and the average value per acre was £1, 12s. 6½d. as against £3 the average of the whole country. The proprietors who in 1873 held more than 10,000 acres in the county were the following:—Viscount Falmouth, 25,910; Lord Robartes (Lanhydrock), 22,234; Hon. G. M. Fortescue (Boconnoc), 17,208; G. L. Bassett (Tehidy Park), 16,969; Earl of Mount Edgcumbe, 13,288; Duchy of Cornwall, 12,516; C. H. T. Hawkins (Probus), 12,119; and Lord John Thynne, 10,244.

Economic Geology and Mines.—The granite, the slate, and the serpentine of Cornwall are of the first importance. The mines are among the chief features of the county. Granite is largely quarried in various districts, especially at Luxulian, on the Liskeard moors, and at Penryn, and has served for the material of London and Waterloo bridges, the docks of Chatham, and many great public works. The granite of Cornwall is for the most part coarse-grained; but in this respect it differs considerably in different places, and the coarse-grained rock is often traversed by veins of finer texture. From the Delabole quarries, in the Devonian series, near Tintagel, the best slate in the kingdom is extracted, and is largely exported; 120 tons are raised on an average daily. These slates were in great repute in the 16th century and earlier. Serpentine is quarried in the Lizard district, where alone it is found, and, besides its use as a decorative stone, it is exported in small quantities to Bristol for the manufacture of carbonate of magnesia. China-clay is prepared artificially from decomposed granite, chiefly in the neighbourhood of St Austell, and is exported to an annual amount of about 80,000 tons. The chief mineral productions of Cornwall, considered as objects of trade, are tin and copper, the former being found nowhere in the United Kingdom except in Cornwall and Devon. Both these metals occur most plentifully in the Devonian series, but for the most part in the neighbourhood of granite, or of its modification, elvan. The veins of ore are arranged in groups as follows:—1. That of St Austell, chiefly stanniferous; 2. St Agnes, chiefly stanniferous; 3. Gwennap, Redruth, and Camborne, chiefly cupriferous; 4. Breage, Marazion, and Gwinear, of mixed character; 5. St Just and St Ives, mainly stanniferous. Besides tin and copper, antimony ores are found where the Devonian rocks are much traversed by traps, as at Endellyon, Port Isaac, and St Germans. Manganese is also found under similar conditions. Some lead occurs, and some small mines are worked, but with no great results; and iron, in lodes, as brown hæmatite, has been worked extensively near Lostwithiel and elsewhere. Metals occur in the lines of fault and fissure, which extend through the different geological formations of Devon and Cornwall. In Devon and in East Cornwall these lines run nearly N. and S., and are crossed by others running E. and W. In West Cornwall the lines are more bent, and the main fissures take a direction nearly parallel with the general range of land. Metallic fissures are locally termed lodes. Ores are not disseminated through all parts of the fissures in which they are found, but are gathered in patches known as "bunches of ore," the intervening portions containing strings and specks of metal, but in quantities too small to be profitably worked. It should be observed that in all lodes or fissures, whatever may be the nature of their produce, the parts most highly inclined are always the most productive. Tin occurs not only in lodes but in streams of stones and minute grains, carried from the head of the lode, where it neared the surface, apparently by some great force of water, which must have rushed from N. to S., since the great streams of tin are in all instances carried toward the S. coast. Stream tin is found immediately on the hard rocky surface of the country, and is covered by numerous tertiary deposits, which indicate that much of the coast line has been depressed and again raised, since the first deposit of the tin stones. Oxide of tin also generally occurs in the "gossan," or ochreous substance which forms the upper part of a good copper lode. The native ore from the mine or the stream-work is known as black tin. White tin is the metal after smelting. In the stream works tin pebbles are sometimes found of 10 or 12 ℔ weight, and great masses of rock richly impregnated with metal have occurred weighing more than 200 ℔. But the small or grain tin, as it is called, is of better quality.

Tin occurs in both granite and slate; copper for the most part in granite. The most important Cornish copper ore is the sulphuret, commonly known as grey ore by the miners; but copper pyrites, or the bisulphuret of copper, occurs far more frequently in both Cornwall and Devon. The tin of Cornwall has been known and worked from a period long before the dawn of certain history. Copper, which lies deeper in the earth, and consequently cannot be "streamed" for, was almost unnoticed in the county until the end of the 15th century, and little attention was paid to it until the last years of the 17th. No mine seems to have been worked exclusively for copper before the year

1700; and up to that time the casual produce had been bought by Bristol merchants, to their great gain, at the rate of from £2, 10s. to £4 per ton. In 1718 a Mr Coster gave a great impulse to the trade by draining some of the deeper mines, and instructing the men in an improved method of dressing the ore. From that period the present trade in Cornish copper may be said to date its rise, the annual produce, with occasional exceptions, having until recent times progressively increased. In 1851 the mines of Devon and Cornwall together were estimated to furnish one-third of the copper raised throughout other parts of Europe and the British Isles (De la Beche). It has been calculated that the clear profits from fourte of the most productive mines in Cornwall (both tin and copper), during the present century, have reached to £2,756,640, the value of the entire produce having been £13,158,203. From this gross sum the expenses of labour, materials, working costs, and "dues" or royalties have to be deducted. The number of years during which these fourteen mines have been worked varies from 5 to 66.

The underground wealth of Cornwall is, however, not only diminishing in quantity and quality, but the process of raising it is becoming too expensive to be continued. No copper lodes of great importance have been discovered of late years, while the surface or stream tin is nearly exhausted. Almost all the Cornish tin is now raised from deep mines at heavy expense, and has to compete with the vast supplies which arrive from foreign countries. The Cornish miners are an intelligent and independent body of men. They are in request in whatever part of the world mining operations are conducted; and it may fairly be asserted that the solution of every intricate problem in mining geology is generally assigned to a Cornish agent, and every task requiring skill, resource, and courage intrusted to a Cornish miner. About 28,000 persons used to be employed in the mines, but emigration to more remunerative fields abroad has recently reduced that number most materially. For many centuries a tax on the tin, after smelting, was paid to the earls and dukes of Cornwall. The smelted blocks were carried to certain towns to be coined,—that is, stamped with the duchy seal before they could be sold. By an Act of 1838 the dues payable on the coinage of tin were abolished, and a compensation was awarded to the duchy instead of them.

Stannary Courts.—By ancient charters, the tinners of Cornwall were exempt from all other jurisdiction than that of the stannary courts, except in cases affecting land, life, and limb. The earliest charter is that of Edmund earl of Cornwall, but the freedom then assured was rather confirmed than given for the first time; and it is probable that the customs of the stannary courts are of high antiquity. Twenty-four stannators were returned for the whole of Cornwall. Their meeting was termed a parliament, and when they assembled they chose a speaker. In earlier times, the combined tinners of Devon and Cornwall assembled on Hingston Down, a tract of highland on the Cornish side of the Tamar. After the charter of Earl Edmund, the Cornish stannators met (apparently) at Truro; those of Devonshire at Crockern Tor on Dartmoor. An officer was appointed by the duke of Cornwall or the Crown, who was Lord Warden of the Stannaries, and the parliaments were assembled by him from time to time, in order to revise old or to enact new laws. The last Cornish stannary parliament was held at Truro in 1752. For a long series of years little or no business was transacted in the stannary courts; but the necessity for a court of peculiar jurisdiction, embracing mines and mining transactions of every description within the county of Cornwall having become more and more apparent, a committee was appointed to report on the subject, and an Act of Parliament was afterwards (1836) passed, suppressing the law-courts of the stewards of the different stannaries, and giving to the vice-warden their jurisdiction, besides confirming and enlarging the ancient equity jurisdiction of that office. Several statutes have since been passed defining and amending the stannary laws. From the judgments of the vice-warden an appeal lies to the Lord Warden, and from him to the Supreme Court of Judicature. The court, thus renewed, has greatly benefited the mining interests of Cornwall.

Fisheries.—The fisheries of Cornwall and Devon are the most important on the south-west coasts. The pilchard is in great measure confined to Cornwall, living habitually in deep water not far west of the Scilly Isles, and visiting the coast in great shoals,—one of which is described as having extended from Mevagissey to the Land's End, a distance, including the windings of the coast, of nearly 100 miles. In summer and autumn pilchards are caught by drift nets; later in the year they are taken off the northern coast by seine nets. Forty thousand hogsheads, or 120 million fish, have been taken in the course of a single season, requiring 20,000 tons of salt to cure them. The northern shoals are by far the largest. Twelve millions have been taken in a single day; and the sight of this great army of fish passing the Land's End, and pursued by hordes of dog-fish, hake, and cod, besides vast flocks of sea-birds, is one of the most striking that can be imagined. The fishery gives employment to about 10,000 persons, and a capital of nearly £300,000 is engaged in it. The headquarters of the fishery are Mount's Bay and St Ives, but boats are employed all along the coast. When brought to shore the pilchards are carried to the cellars to be cured. They are then packed in hogsheads, each containing about 2400 fish. These casks are largely exported to Naples and other Italian ports—whence the fisherman's toast, "Long life to the Pope, and death to thousands." Besides pilchards, mackerel are taken in great numbers on the southern coast. Conger eels of great size, weighing from 60 to 120 ℔, are found near the shores, and among other fish taken should be mentioned mullet and John Dory. Recently a brisk trade in "sardines" has been established—young pilchards taking the place of the real Mediterranean fish.

History.—Although there can be no doubt that Cornwall and Devonshire are referred to under the general name of Cassiterides, or the "Tin Islands," it cannot be said that we have any authentic historical knowledge of either county until after the Roman conquest of Britain. It remains uncertain whether Phœnician or Carthaginian traders actually visited Cornwall, or whether they obtained their supplies of tin through Gaul. But we know that the tin of the district was largely exported from a very early period, and that the mines were still worked under the Romans. Cornwall formed part of the British kingdom of Damnonia, which long resisted the advance of the Saxons westward, and remained almost unbroken in power until the reign of Ine of Wessex (688–726). From that time the borders of the British Kingdom gradually narrowed, until, about the year 926, Athelstane drove the Britons from Exeter, and fixed the Tamar as the limit between them and the Saxons of Devon. At this period, and perhaps for some time after, the Britons of West Wales (the name given by the Saxons to the old Damnonian kingdom) retained their line of chiefs, though under some kind of subjection to the kings of Wessex. The British bishop, Conan, submitted to archbishop Wulfhelm of Canterbury after Athelstane's conquest, and was reappointed by him in 936. The Cornish see was afterwards merged in that of Crediton, and in 1050 the place of the united sees was transferred to Exeter, where it remained till 1876. But Cornwall, although the mass of the people remained Celtic, speedily received Saxon masters, and in the Domesday Survey the recorded names of the owners of land in the days of the Confessor are all Saxon. The conqueror bestowed nearly the whole county on his half brother, Robert of Mortain, and thus arose what Mr Freeman styles "that great earldom and duchy of Cornwall which was deemed too powerful to be trusted in the hands of any but men closely akin to the royal house, and the remains of which have for ages formed the apanage of the heir-apparent to the crown." Of the earls, the most important were the brother of Henry III., Richard, king of the Romans, and his son Edmund. In 1336 the earldom was raised to a duchy by Edward III. in favour of his son, the Black Prince, and of his heirs, eldest sons of the kings of England. Since that time the Prince of Wales has always been duke of Cornwall When there is no Prince of Wales the revenues of the duchy are appropriated by the Crown. When the duchy was first created by Edward III., the lands belonging to and dependent on it included, not only the great open moors of Cornwall, and Dartmoor forest in Devonshire, but 9 parks, 53 manors, 10 castles, 13 boroughs and towns, and 9 hundreds. Considerable changes and reductions have, however, been since made, and the income of the duchy is at present derived from lands in Somerset and Devon as well as in Cornwall itself. The history of the duchy is virtually that of Cornwall. There has been little to connect it with the general history of the country except during the Civil War, when Cornwall was for the most part royalist, and some sharp fighting took place within its bounds. Besides much skirmishing, there were two important battles, that of Braddock Down (Jan. 19, 1642–3), and that of Stratton, (May 15, 1643), both gained for the king.

Antiquities.—No part of England is so rich as Cornwall in antiquities of the primæval. period. These chiefly abound in the district between Penzance and the Land's End, but they occur in all the wilder parts of the county. They may be classed as follows. (1.) *Cromlechs.* These in the west of Cornwall are called "quoits," with a reference to their broad and flat covering stones. The largest and most important are those known as Lanyon, Caerwynen, Mulfra, Chûn, and Zennor quoits, all in the Land's End district. Of these Chûn is the only one which has not been thrown down. Zennor is said to be the largest in the British Isles, while Lanyon, when perfect, was of sufficient height for a man on horseback to ride under. Of those in the eastern part of Cornwall, Trethevy near Liskeard and Pawton in the parish of St Breock are the finest, and have remained intact. (2.) Rude uninscribed *monoliths* are common to all parts of Cornwall. Those at Boleit, in the parish of Buryan, are the most important. (3.) *Circles,* none of which are of great dimensions. The principal are the Hurlers, near Liskeard; the Boskednan, Boscawen-ûn, and Tregeseal circles; and that called the Dawns-ûn, or Merry Maidens. All of these, except the Hurlers, are in the Land's End district. The other circles that may be mentioned are the "Trippet Stones," in the parish of Blisland, and one at Duloe. (4.) Long *alignments* or *avenues* of stones, resembling those on Dartmoor, but not so perfect, are to be found on the moors near Roughtor and Brown Willy. A very remarkable monument of this kind exists in the neighbourhood of St Columb, called the "Nine Maidens." It consists of nine rude pillars placed in a line, while near them is a single stone known as the "Old Man." (5.) *Hut dwellings.* Of these there are at least two kinds, those in the eastern part of the county resembling the beehive structures and enclosures of Dartmoor, and those in the west, comprising "hut-clusters," having a central court, and a surrounding wall often of considerable height and thickness. The beehive masonry is also found in connection with these latter, as are also (6.) *Caves,* or subterraneous structures, resembling those of Scotland and Ireland. (7.) *Cliff castles* are a characteristic feature of the Cornish coast, the chief being the "Little Dinas" near Falmouth, Trevelgue near St Columb, and Treryn, Mên, Kenedjack, Bosigran, and others in the west. These are all fortified against the land side. (8.) *Hill castles,* or camps, are very numerous. Castel-an-Dinas, near St Columb, is the best example of the earth-work camp, and Chûn Castle near Penzance, of the stone.

Of early and mediæval antiquities the most noticeable are crosses, scattered all over the county, and of various dates, from the 6th to the 16th century, many resembling the early crosses of Wales; inscribed sepulchral stones of the 7th and 8th centuries, of which the "mên scryffa" in Madron is a good example; and oratories of the early Irish type. St Pirans is the most important of these.

The Cornish churches, for the most part, belong to the Perpendicular style of architecture, and are generally low in the body, but with high and plain granite towers. The rich tower of Probus, however, is an exception, as well as the church of St Mary Magdalene at Launceston, the exterior of which is covered with sculpture. Within, the chief feature is the absence of a chancel arch. The castles of Launceston, Trematon, and Restormel seem to be of the time of Henry III., but the mounds which occur in the first two are no doubt much earlier,—possibly marking British strongholds. Tintagel has but a few shapeless walls. Of later castles there is Pendennis (built temp. Henry VIII.); St Michael's Mount, although castellated at an early period, has nothing more ancient than the 15th century.

Language.—The old Cornish language survives in a few words still in use in the fishing and mining communities, as well as in the names of persons and places, but the last persons who spoke it died toward the end of the 18th century. It belonged to the Cymric division of Celtic, in which Welsh and Armorican are also included. The most important relics of the language known to exist are three dramas or miracle plays, edited and translated by Edwin Norris, Oxford, 1859. A sketch of Cornish grammar is added, and a Cornish vocabulary from a MS. of the 13th century (Cotton MSS. Vespasian A. 14, p. 7*a*). The best dictionary of the language (indeed the only one) is Williams's *Lexicon Cornu-Britannicum,* London, 1865. Some valuable remarks on this ancient language will be found in Max Müller's *Chips,* vol. iii. See also CELTIC LITERATURE, vol. v. pp. 298, 323.

Parliamentary Representation.—The duchy returns 13 members to Parliament, 4 for the county (2 from the east division and 2 from the west division) and 9 from the following boroughs:—Truro, 2 (pop. 11,049); Penryn (pop. 3679) and Falmouth (pop. 5294), 2; St Ives, 1 (pop. 6965); Liskeard, 1 (pop. 4700); Bodmin, the assize town, 1 (pop. 4672); Helston, 1 (pop. 3797); and Launceston, 1 (pop. 2935). The only unrepresented town of importance is Penzance, which has a population of 10,414.

Gentleman's Seats.—The principal houses to be noticed in Cornwall are—Mount Edgecumbe (earl of Mount Edgecumbe), originally Tudor of Queen Mary's time, but much altered; the grounds and gardens are, however, more important than the house; Cotele, on the Tamar (dowager countess of Mount Edgecumbe),—a most striking place, the house Tudor, temp. Henry VIII. and Elizabeth, and little changed; it contains the ancient furniture; Antony, the seat of the Carews; Pentillie (A. Coryton, Esq.); Port Eliot (earl of St Germans); Trelawne (Sir John Trelawny); Menabilly (Jonathan Rashleigh, Esq.); Boconnoc (Hon. G. M. Fortescue), where are the finest woods in the county; Lanhydrock (Lord Robartes), built between 1636–1651, and containing a very picturesque gallery, with richly moulded roof; Glynn (Lord Vivian);

Pencarrow (dowager lady Molesworth); Heligan (John Tremayne, Esq.); Carclew (Col. Tremayne), where the gardens are fine and interesting; Tregothnan (Viscount Falmouth); Clowance (Rev. A. H. M. St Aubyn); and St Michael's Mount (Sir John St Aubyn), from its site one of the most remarkable places in Great Britain.

Bibliography.—Besides the works which have already been mentioned, the following are important:—*Bibliotheca Cornubiensis*, a catalogue of the writings, both MS. and printed, of Cornishmen, and of works relating to the county of Cornwall, by G. C. Boase and W. P. Courtney, London, 1874; *A Glossary of Cornish Names*, by the Rev. J. Bannister, Truro, 1871; *Report on the Geology of Cornwall, Devon, and West Somerset*, by H. T. de la Beche, London, 1839 (this report contains the most complete general view of the geology of Cornwall; valuable papers on the subject are scattered through the *Transactions of the Geol. Soc.*, and the *Journals and Reports of the Royal Institution of Cornwall*, established in 1818); *A Handbook to the Mineralogy of Cornwall and Devon*, by J. H. Collins, Truro, 1871; *Cornish Fauna*, by J. Couch, Truro, n. d.; *Annual Reports of the Royal Polytechnic Society of Cornwall*, established 1833. Of county histories the earliest is Carew's *Survey of Cornwall*, first published in 1602. The collections of Hals and Tonkin were partly printed by Davies Gilbert in 1838, with additions of his own, under the title of *The Parochial Hist. of Cornwall.* Lyson's *Cornwall*, 1814, remains the most useful and most accurate history of the county. *The Parochial and Family History of the Deanery of Trigg Minor*, by Sir John Maclean, London, 1873, &c. (published in parts) is exhaustive for that division. The folk lore of Cornwall is well illustrated in *Popular Romances and Drolls of the West of England*, by R. Hunt, London, 1865; and in *Traditions and Hearthside Stories of West Cornwall*, by W. Bottrell, Penzance, 1870-3. Murray's *Handbook for Cornwall and Devon*, 8th ed., 1872, is also a work well worth consultation. On the antiquities of the county the following authorities are important:—Dr W. Borlase's *Antiquities of Cornwall*, 1754 and 1769; W. C. Borlase's *Nænia Cornubiæ*, 1872, and a paper by the same author in the *Archæol. Journ.*, vol. xxx., on "Vestiges of Early Institutions in Cornwall;" Blight's *Ancient Crosses of Cornwall*, 1858; Hadda and Stubbs' *Councils*, vol. i.; Blight's *Churches of West Cornwall*, 1865. (R. J. K.)

CORNWALL, Barry. See Procter.

CORNWALLIS, Charles, Second Earl and First Marquis (1738-1805), was the eldest son of Charles, the first earl Cornwallis. Having been educated at Eton and St John's College, Cambridge, he entered the army. For some time he was member of Parliament for Eye; in 1761 served a campaign in Germany, and was gazetted to a lieutenant-colonelcy in the 12th Foot. In 1762 he succeeded to the earldom and estates of his father; in 1765 he was made aide-de-camp to the king and gentleman of the bedchamber; in 1766 he obtained a colonelcy in the 33d Foot; and in 1770 he was appointed governor of the Tower. In public life, he was distinguished by independence of character and inflexible integrity; he voted without regard to party, and opposed the ministerial action against Wilkes and in the case of the American colonies. But when the War of Independence broke out, he accompanied his regiment across the Atlantic, and served not without success as major-general. In 1780 he was appointed to command the British forces in South Carolina, and in the same year he routed Gates at Camden. In 1781 he defeated Greene at Guilford, and made a destructive raid into Virginia; and in 1782 he was besieged at York Town by French and American armies and a French fleet, and was forced to capitulate. With him fell the English cause in the United States. He not only escaped censure, however, but in 1786 received a vacant garter, and was appointed governor-general of India and commander-in-chief in Bengal. As an administrator he projected many reforms, but he was interrupted in his work by the advance of Tippoo Sahib. In 1791 he assumed in person the conduct of the war and captured Bangalore; and in 1792 he laid siege to Seringapatam, and concluded a treaty with Tippoo Sahib, which stripped the latter of half his realm, and placed his two sons as hostages in the hands of the English. For the Permanent Settlement of the Land Revenue under his administration, see Bengal, vol. iii. p. 570. He returned to England in 1793, received a marquisate and a seat in the Privy Council, and was made master-general of the ordnance with a place in the Cabinet. Five years afterwards (21st June 1798) he was appointed to the viceroyalty of Ireland, and the zeal with which he strove to pacify the country gained him the respect and good-will of both Roman Catholics and Orangemen. On 17th July a general amnesty was proclaimed, and a few weeks afterwards the French army under Humbert was surrounded and forced to surrender. In 1801 Cornwallis was replaced by Lord Hardwicke, and soon after he was appointed plenipotentiary to negotiate the treaty of Amiens (1802). In 1805 he was again sent to India as governor-general. He was in ill-health when he arrived at Calcutta, and while hastening up the country to assume command of the troops, he died at Ghazepore, in the province of Benares, October 5, 1805.

CORO, or Santa-Aña de Coro, a maritime town of Venezuela, South America, and capital of the province of Falcon, is situated in a sandy plain at the inner angle of a peninsula, dividing the Gulf of Venezuela from the Caribbean Sea, 155 miles W.N.W. of Valencia. It is ill built, the streets are unpaved, and there are no public buildings of consequence except two churches. The climate is hot but not unhealthy. The water-supply is brought by mules from springs at some distance from the town. About seven miles to the north-east is the port, near the mouth of the little Rio Coro. The export trade with the West Indies, in mules, goats, hides, cheese, pottery-ware, indigo, and cochineal, is considerably less than formerly. Coro is one of the oldest settlements of the Spaniards on the north coast of S. America. It was founded on the 26th July 1527 (St Ann's day), by Juan de Ampués, who named it Santa Ana de Coriana after the Indian tribe inhabiting the spot. It came also to be known as Venezuela (or Little Venice), which was the name given originally to an Indian village founded on piles in the water on the east side of the lake of Maracaibo. In 1578 Carácas was made the seat of the government of the country instead of Coro, and in 1583 the bishopric of Coro, founded in 1536, was transferred thither. In 1815 Coro was made the chief town of a province. It suffered greatly in the Venezuelan war of independence. Population about 7000.

COROMANDEL COAST, the eastern seaboard of India between Cape Calimere, in 10° 17′ N. lat. and 79° 56′ E. long., and the mouths of the Kistnah or Krishnah. The shore, which is shallow, is without a single good natural harbour, and is at all times beaten by a heavy sea. Communication with ships can be effected only by catamarans and flat-bottomed surf-boats. The north-east monsoon, which lasts from October till April, is exceedingly violent for three months after its commencement. From April till October hot southerly winds blow by day; at night the heat is tempered by sea-breezes. The principal places frequented by shipping are Pulicat, Madras, Sadras, Pondicherri, Cuddalor, Tranquebar, Nagore, and Nagapatnam. The name Coromandel is said to be derived from *Cholamandal*, the mandal or region of the ancient dynasty of the Chola.

CORONA, in astronomy, the name given to the phenomenon seen round the sun during a total eclipse. This phenomenon is doubtless a complex one, and comprises effects due (1) to the sun's surroundings or the various layers of its atmosphere, (2) to the sunlight falling on something between us and the sun, and (3) to certain physiological effects in the eye. These effects will be discussed under the heading Sun. In the meantime it may be stated that the solar part of the phenomenon comprises the *chromosphere*, the layer of brightly incandescent hydrogen, with other included metallic vapours, which lies immediately over that interior part of the sun which we ordinarily see; the *prominences* or *red flames*, which are local uprisings of the chromosphere; and outside all, the *coronal atmosphere*, which consists, so far as is yet known, of hydrogen less brightly incandescent than that in the chromosphere, and of an unknown substance, the vapour density of which appears to be less than that of hydrogen.

CORONATION, literally a crowning, a placing of a crown on the head. The word is restricted, in use, to the ceremony or solemnity of placing a crown on the head of an actual or future king or emperor to signify his accession or his formal recognition as actual or future sovereign. The custom of marking the commencement of a king's reign by some special rite is a very ancient one. The Jewish kings, like the Jewish high priests, were anointed; but, as the crown was among the insignia of their new royalty, it is probable that they were also crowned, and in some cases certain that they were. We read, for example, of the crowning as well as of the anointing of King Joash (2 Kings xi. 12), and when David, or rather Joab, had subdued Rabbah, the crown which the king of Rabbah had worn was taken from him, and placed upon David's head. We find among the nations of modern Europe a tolerably exact counterpart of all these observances. After the destruction of the western Roman empire, the tribal chiefs or kings among whom the Roman territory was divided appear generally to have been crowned on their accession or election to office. This was customary, we know among the Franks, the Lombards, and the Burgundians, as it was also among our own Saxon ancestors. The revival of the empire by Charlemagne was marked by his solemn coronation at Rome by the Roman Pontiff. His successors in the empire for more than three hundred years were, without exception, inaugurated in the same way. The rule was followed, though not invariably, for some time afterwards, most of the emperors up to the time of Frederick III. (1440) being crowned, as Charlemagne had been, at Rome. On the day before the coronation, the Roman elders met the emperor-elect at the gate of their city, had their charters confirmed by him, and received an oath from him that he would preserve their good customs. On the next day the emperor went to Saint Peter's, and was there met by the Pope and his clergy, and was solemnly blessed and crowned. From Frederick III. downwards, this custom, always distasteful to the Roman people, wholly ceased to be observed. Charles V. received the imperial crown at the Pope's hands, not at Rome but at Bologna, and at the same time with the Lombard or Italian crown. There were, besides the imperial crown, three other distinct crowns, some or all of which were assumed by each emperor according to his respective rights. The German crown, which by the time of Charles V. had become the most important of the four, was taken at Aix-la-Chapelle; the Lombard or Italian crown generally at Milan; and the Burgundian crown, of less importance than the other two, at Arles. Charlemagne, uniting in his own person what were always distinguishable and what became afterwards distinct sovereignties, took them all four. Charles V. took first the German crown at Aix-la-Chapelle. It was not until 1530 that he took his other two crowns at Bologna. From the time of Charles V., down to the close of the empire in 1806, every emperor bound himself at his accession that he would proceed to Rome, and receive the imperial crown from the Pope, but as a matter of fact no one of them complied with the obligation.

We have clear traces of the coronation of the English kings before the Conquest, though, as in the case of the Jewish kings, we read of their being anointed more frequently than we read of their being crowned. Bath, Winchester, or Kingston-upon-Thames was the place commonly chosen for the rite. After the foundation of Westminster Abbey by Edward the Confessor, Westminster succeeded to the privilege to the exclusion of the others. Harold, we read, was made king at Westminster, and so was William I. Of the actual crowning of the kings before William there are sometimes precise notices by the chroniclers, and the ceremony itself is sometimes to be found represented on medals. That the king was hallowed or anointed is, however, the phrase generally employed; but that crowning also was an essential part of the rite we may infer from the case of William, I., of whom we are told that Archbishop Aldred hallowed him to king at Westminster, and also swore him, ere that he would set the crown on his head, that he would as well govern the nation as any king before him best did. For some time the archbishops of Canterbury claimed the sole right of crowning, personally or by deputy. Becket made it a cause of complaint against Henry II. that he had not been called in to crown Henry's son, and he even procured the excommunication of the archbishop of York and the bishop of Durham for having acted in the matter without his licence. It was usual with the early Norman kings to be crowned more than once, and also, as we have seen in Henry II.'s case, to have their sons crowned, and oaths of allegiance taken to them during their own lifetime. The reader will be reminded here of the case of David and Solomon, though he may refer the resemblance to nothing more than an accidental choice of the same obvious means to secure a disputable succession. He will find, however, in some parts of the English coronation rite traces of its Jewish original not so easily to be explained away.

The coronation of Richard I. is the earliest of which we have a circumstantial account. The archbishop of Canterbury officiated at it, and with him were the archbishops of Rouen, of Treves, and of Dublin, and all the bishops of the kingdom. The king was accompanied to the abbey by a grand procession of nobles, and among them came the earl of Chester bearing the royal crown. When the crown had been laid on the altar, and the coronation oath had been taken by Richard, next came the actual ceremony of coronation, or rather the long series of ceremonies of which the placing of the crown on Richard's head formed a part. After Richard had drawn near to the altar, his head was first covered with a sacred linen cap. He was then anointed in several places. The great crown was then brought to him, and was by him handed to the archbishop, who placed it on the king's head. After various further rites and prayers, the king left the altar and went back to his former seat, and there exchanged the great crown for a lesser crown, which he continued to wear when he left the abbey.

The doubtful title of Henry IV. was confirmed by a double ceremony. The already crowned king, Richard II., was brought to the Tower of London in his coronation robes, holding in his hands his crown and other royal insignia. These he resigned into the hands of Henry, then duke of Lancaster. The public assumption of them by Henry was made afterwards with great splendour. On the day appointed, after having confessed and heard three several masses, he went to Westminster Abbey with a vast procession of nobles and clergy. A high scaffolding was erected in the abbey, and on this Henry was displayed to the people, seated, and with his head bare. The archbishop of Canterbury then demanded of the assembly whether he should crown Henry, and was answered by general shouts of yes, yes. Henry then drew near to the altar, and was first anointed by the archbishop in six places. The crown of Edward the Confessor was then brought forward, blessed by the archbishop, and placed by him upon Henry's head. Mass was then again said, and the king and his attendants left the abbey. Henry VI. was twice crowned while he was still a child, first at the abbey at Westminster, afterwards at Saint Denis near Paris. Representations of the two ceremonies are to be found in Strutt's *Manners and Customs*. The coronation of Richard III. has also been very fully recorded. It does not differ materially from the instances already given. The directions followed, both in these cases and subsequently, are taken from the *Liber Regalis*, in the archives of Westminster Abbey; nor, indeed, from the nature of the case is there much room for variety in essentials. The anointing and crowning may be accompanied by circumstances of more or less magnificence, but the acts themselves are likely to be done in much the same way at one time and at another.

Coronation Oath.—The imposition of some form of coronation oath appears to be as old as the ceremony of coronation. It is natural enough that, at the commencement of each new reign, the king and people should mutually give and receive pledges from each other, the people promising obedience to lawful commands, the king binding himself to act with justice and to observe the established laws. There are informal traces of this to be found in abundance in the histories of the Jewish kings. It was still more regularly the case among the tribal chiefs who broke up the western Roman empire, and established themselves upon its ruins. Hereditary title was far from absolutely recognized, and the will of the people had a most potent influence in determining the succession. There was thus room for something like an express bargain, the new chief or king receiving his dignity on conditions which his people imposed upon him. The custom thus established continued after the rules of succession had become settled. The election to the imperial office was marked in the same way. Before the time of Charles V. a verbal promise had been thought sufficient, but on Charles's election a formal "capitulation" of rights and liberties was drawn up in writing by the German electors, signed by the new emperor's ambassadors, and solemnly confirmed by himself on his coronation at Aix-la-Chapelle. From that time forward the same conditions were observed at each election, the attacks by Charles V. upon the rights of his German subjects not having convinced them of the intrinsic worthlessness of agreements of the kind. We have seen already the form of coronation oath prescribed to William I. of England, and we know, too, the amount of regard he paid to it. Richard I. was sworn to keep the holy ordinances of God, to exercise justice, to abolish grievous laws, and to put in practice all laws that were good. The *Liber Regalis* prescribes a series of similar oaths. The king is to grant and to confirm the laws and customs of his predecessors, and especially those of the glorious king Saint Edward. He promises peace and agreement to God, the holy church, and the people, and swears further, with a vast amount of verbiage, to maintain law and justice, to uphold customs, and to perform rightly all the other duties of his office. The modern form of the coronation oath dates from the coronation of William and Mary in 1689, with some slight necessary alterations and additions made afterwards at the Unions with Scotland and with Ireland. The oath, in 1689, was made at every point more precise and explicit than before; and, in particular, there was added an express engagement on the part of the sovereign to maintain "the laws of God, the true profession of the Gospel, and the Protestant reformed religion as it is established by law." It provided, further, that the king should preserve to the bishops and clergy, and the churches committed to their charge, all their actual and future legal rights and privileges. Its intention, as the debates at the time prove, is to restrain the king in his administrative, not in his legislative, capacity. It binds him to observe the established law. It does not and cannot bind him to refuse his assent to all subsequent changes of the law in ecclesiastical any more than in civil matters. The point, obvious enough in itself, deserves notice chiefly because the opposite view was taken by George III., fatally for Pitt's project of Catholic emancipation, a measure of relief to which it is difficult to see how the coronation oath, whatever force is given to it, could with any reason be thought opposed. In connection with the subject of coronation, see also CROWN. (S. H. R.)

CORONELLI, VINCENZIO (1650–1718), an Italian geographer, was born at Venice. Having by his skill in mathematics become known to the Count d'Estrées, Coronelli was employed by the count to make globes for Louis XIV. In 1685 he was appointed cosmographer to the republic of Venice, and four years afterwards public professor of geography. He founded an academy of cosmography at Venice, and died in that city in 1718. He published about 400 geographical charts, an abridgement of cosmography, several books on geography, and other works. See Tiraboschi, *Litteratura Italiana*.

CORONER, an ancient officer of the common law, so called, according to Coke, because he had principally to do with pleas of the Crown. The lord chief justice of the Queen's Bench is said to be the principal coroner of the kingdom, and may in any place exercise the jurisdiction of the coroner. The duties of the office are now practically confined to holding inquests in case of violent or sudden death.

The office is and always has been elective, the appointment being made by the freeholders of the county assembled in county court. By the Statute of Westminster the First it was ordered that none but lawful and discreet knights should be chosen as coroners, and in one instance a person was actually removed from office for insufficiency of estate. Lands to the value of £20 per annum (the qualification for knighthood) were afterwards deemed sufficient to satisfy the requirements as to estate which ought to be insisted on in the case of a coroner. The complaint of Blackstone shows the transition of the office from its original dignified and honorary character to a paid appointment in the public service. "Now, indeed, through the culpable neglect of gentlemen of property, this office has been suffered to fall into disrepute, and get into low and indigent hands; so that, although formerly no coroners would condescend to be paid for serving their country, and they were by the aforesaid Statute of Westminster expressly forbidden to take a reward, under pain of a great forfeiture to the king; yet for many years past they have only desired to be chosen for their perquisites; being allowed fees for their attendance by the statute 3 Henry VII. c. 1, which Sir Edward Coke complains of heavily; though since his time those fees have been much enlarged." The mercenary character of the office, thus deprecated by Coke and Blackstone, is now firmly established, without, however (it need hardly be said), affording the slightest ground for such reflections as the above. The coroner is in fact a public officer, and like other public officers receives payment for his services. The person appointed is almost invariably a qualified legal or medical practitioner, the duties of the office being supposed to require some acquaintance with the learning of both of these professions. The property qualification appears to be virtually dispensed with, the county being liable for any penalties that may be incurred by the coroner. The appointment is held for life, but is vacated by the holder being made sheriff. He may also be removed by the writ *de coronatore exonerando*, for sufficient cause assigned, as, for instance, that he is engaged in other business, or incapacitated by old age or sickness, &c. By 23 and 24 Vict. c. 116, the lord chancellor may remove any coroner for "inability or misbehaviour in his office."

The coroner is primarily an officer of the county, elected by the freeholders. In certain liberties and franchises, the appointment is made by the Crown, or lords holding a charter from the Crown. By the Municipal Corporations Act, in any borough having a separate quarter-sessions the council may appoint a coroner; in other boroughs the coroner for the county has jurisdiction.

The remuneration of the county coroner is now regulated by the Act 23 and 24 Vict. c. 116 above mentioned. The system of payment by fees, established by an earlier Act of the same reign, is abolished, and payment is to be made by salary calculated on the average amount of the fees, mileage, and allowances usually received by the coroner for a period of five years, and the calculation is to be revised every five years. The home secretary is to decide between the coroner and the justices when they cannot agree. Borough coroners under the Municipal Corporations Act are to be paid by fees.

The duties of the office are ascertained by the 4 Edward I. st. 2:—"A coroner of our lord the king ought to inquire of these things, first, when coroners are commanded by the king's bailiffs or by the honest men of the county, they shall go to the places where any be slain, or suddenly dead or wounded, or where houses are broken, or where treasure is said to be found, and shall forthwith command four of the next towns, or five, or six, to appear before him in such a place; and when they are come thither, the coroner upon the oath of them shall inquire in this manner, that is, to wit, if it concerns a man slain, if they know when the person was slain, whether it were in any house, field, bed, tavern, or company, and if any, and who, were there, &c. It shall also be inquired if the dead person were known, or else a stranger, and where he lay the night before. And if any person is said to be guilty of the murder, the coroner shall go to their house and inquire what goods they have, &c." Similar directions are given for cases of persons found drowned or suddenly dead, for attachment of criminals in cases of violence, &c. It is the duty of the township to give notice of violent or sudden death to the coroner; and the inquisition is held before him and a jury of not less than twelve persons, constituting a court of record. Their charge is to inquire how the party came by his death. The inquisition must be *super visum corporis*; if the body be not recovered, the coroner can only sit in virtue of a special commission. By 6 and 7 Vict. c. 12, it was provided (in remedy of the inconveniences of the common law) that the coroner only within whose jurisdiction the body shall be lying dead, shall hold the inquest, although the cause of death may have happened somewhere out of his jurisdiction. And in the case of any body found dead in the sea, &c., the inquest, in the absence of a deputy coroner for the admiralty, shall be held by the coroner of the place where the body is first brought to land.

At the inquest the evidence is taken on oath, and the Crown or any party suspected may tender evidence. The medical man attending the deceased, if any, may be ordered to attend, and the coroner may order a *post mortem* examination. If the jury are not satisfied they may name any properly-qualified practitioner, who shall be required to attend and give evidence, or make a *post mortem* examination. The verdict must be that of twelve at least of the jury. If any person is found guilty of murder or other homicide the coroner shall commit him to prison for trial; he shall also certify the material evidence to the court, and bind over the proper persons to prosecute or to give evidence at the trial. He may in his discretion accept bail for a person found guilty of manslaughter. Since the abolition of public executions, the coroner is required to hold an inquest on the body of any criminal, on whom sentence of death has been carried into effect. The question of reopening the coroner's inquests after verdict given was discussed in a recent case. The Queen's Bench, on a suggestion on the part of the Crown that there was a probability of fixing the suspected crime by further inquisition, ordered the verdict to be quashed and a new inquest to be held.

There has been of late years much discussion on the subject of the coroner's office, and legislation at no distant time may be expected. The points on which reform is generally asked for may be briefly indicated. It is desirable that the qualification for the office should be fixed, and that it should be a legal and not a medical qualification. The duties of the office are mainly judicial; such medical information as may be necessary can be had from experts; while of course a knowledge of the technical rules of evidence is essential to the efficient discharge of the coroner's duties. Again, that the election to a judicial office, wholly unpolitical in character, should be by vote of the freeholders of the county is generally felt to be an anomaly. A county coroner recently declared that the expense of contesting the county amounted, in his own case, to several thousand pounds. Payment, depending directly or indirectly on fees, also produces unfortunate results. It leads occasionally to disputes between the coroners and the justices, and exposes the former to the suspicion of holding unnecessary inquests for the sake of increasing their income. In any circumstances the propriety of holding an inquest may be a question of great delicacy, and a slight mistake on either side may subject the officer to unmerited obloquy. In some cases the present state of the law involves the great evil of too much inquiry. Besides the coroner's inquest there are, in cases of a criminal character, the public examination before a magistrate, and the private examination by the grand jury. But it may also happen that not merely one but two or more inquests may be held in the same matter. In the case of a railway accident or a collision at sea, the victims may die in different jurisdictions, and if there is a suspicion of criminal negligence, the accused party must practically stand his trial several times over. He may even be acquitted by one jury and condemned by another.

There is no corresponding office in Scotland. (E. R.)

COROT, Jean Baptiste Camille (1796–1875), French landscape painter, was born at Paris in July 1796. He received an ordinary school education at Rouen, and was then apprenticed to a Paris draper. From childhood it was evident that he was a born artist; but prudential motives induced his father sternly to repress the strivings and utterances of his genius. He continued therefore to drudge at the draper's counter till his twenty-sixth year. He then finally escaped from the grip of trade, and his genius had its own way in the world. He entered the *atelier* of Michallon; and on the death of his master the same year (1822) he passed to that of Victor Bertin. But he did not get on happily with, or learn much from either of these teachers. At length he made his escape from the town and the school with their oppressive conventionalities, and took refuge with nature in the fields of Italy. Here he studied, dreamed, and painted for several years. In 1827 he began to exhibit at the Salon, his first works being Vue prise à Narni and La Campagne de Rome. The public passed them by without much notice, but artists saw in them decisive proof that a new poet-painter was among them. From this time he worked on vigorously for nearly fifty years, seldom failing to make his appearance at the Salon. Public recognition and "golden joys" were very slow to come; nor was it till he was nearly seventy that he became a wealthy man. He had obtained a medal of the second class in 1833, and medals of the first class in 1848 and 1855. He received the cross of the Legion of Honour in 1846, and was promoted officer in 1867. Corot was one of the most original of painters. He was almost exclusively a landscape painter; for although in a very few cases his pictures bear historical titles, landscape is even in these the predominant element. And with him it was always the poetry of landscape, never the topography. He stood in nature's presence, reverent, loving, enthusiastic, watching for the most delicate effects and changes of light, especially at early dawn and at dewy eve and in still moonlight, on cloud and sky, on tree and stream,—seeing thus what but few eyes do see, and ever striving to reproduce in his works his own impression of magical dreamy beauty. His works, like those of Millet, are mostly touched with sadness; but while Millet is stern and almost savage, Corot is always tender and delicate. In his chosen field he stands almost alone and unrivalled. Among his works are—Vue d'Italie (1834); Souvenir des environs de Florence (1839); La Danse des Nymphes; Soleil couchant dans le Tyrol (1850); Effet de Matin; Dante et Virgile; Macbeth; Agar au Désert; Soleil levant; Souvenir d'Italie; Le Repos; La Solitude (1866); Un Matin à Ville d'Avray (1868); Une Danse Antique; and Le Bûcheron. The two last mentioned were exhibited, after his death, at the Salon of 1875. In the social circle Corot was one of the frankest and most genial of men. His favourite relaxation after a long day's work was the theatre, where to the last he is said to have followed the performance with the fresh delight of a child. Naturally of a generous disposition, he gave away with a large hand the wealth which flowed in on him in his later years; and many a touching tale is told of distress relieved and sad hearts comforted by his ministrations. The affectionate regard generally felt towards him is shown in the designation "le Père Corot" by which he was commonly known. In 1874 he lost a beloved sister; and after this sharp blow he never recovered his former gaiety of heart. One of his last acts was the gift of a pension to the widow of his brother artist Millet, who had died not long before. In December 1874 a gold medal designed for the occasion was presented to him by many French artists in token of honour and esteem. Corot died at Paris, after a long period of failing health, February 22, 1875.

CORPORATION. A corporation is a association of persons which the law treats in many respects as if it were itself a person. It has rights and duties of its own which are not the rights and duties of the individual members thereof. Thus a corporation may own land, but the individual members of the corporation have no rights therein. A corporation may owe money, but the corporators as individuals are under no obligation to pay the debt. The rights and duties descend to the successive members of the corporation. This capacity of perpetual succession is regarded as the distinguishing feature of corporations as compared with other societies. One of the phrases most commonly met with in law-books describes a corporation as a society with perpetual succession and a common seal. The latter point, however, is not conclusive of the corporate character.

The legal attributes of a corporation have been worked out with great fulness and ingenuity in English law, but the conception has been taken full-grown from the law of Rome. The technical term in Roman law corresponding to our corporation is *collegium;* a more general term is *universitas.* A *collegium* or *corpus* must have consisted of at least three persons, who were said to be *corporati—habere corpus.* They could hold property in common and had a common chest. They might sue and be sued by their agent (*syndicus* or *actor*). There was a complete separation in law between the rights of the *collegium* as a body and those of its individual members. The *collegium* remained in existence although all its original members were changed. It was governed by its own by-laws, provided these were not contrary to the common law. The power of forming *collegia* was restrained, and societies pretending to act as corporations were often suppressed. In all these points the *collegia* of Roman closely resemble the corporations of English law. There is a similar parallel between the purposes for which the formation of such societies is authorized in English and in Roman law. Thus among the Roman *collegia* the following classes are distinguished:—(1) Public governing bodies, or municipalities, *civitates;* (2) religious societies, such as the *collegia* of priests and Vestal Virgins; (3) official societies, *e.g.*, the *scribæ*, employed in the administration of the state; (4) trade societies, *e.g.*, *fabri*, *pictores*, *navicularii*, &c. This class shades down into the *societates* not incorporated, just as our own trading corporations partake largely of the character of ordinary partnerships. In the later Roman law the distinction of corporations into civil and ecclesiastical, into lay and eleemosynary, is recognized. The latter could not alienate without just cause, nor take land without a licence—a restriction which may be compared with our statutes of mortmain. All these privileged societies are what we should call *corporations aggregate.* The *corporation sole* (*i.e.*, consisting of only a single person) is a refinement of our own, for although Roman law held that the corporation subsisted in full force, notwithstanding that only one member survived, it did not impute to the successive holders of a public office the character of a corporation. When a public officer in our law is said to be a corporation sole, the meaning is that the rights acquired by him in that capacity descend to his successor in office, and not (as the case is where a public officer is not a corporation) to his ordinary legal representative. The best known instances of corporation sole are the king and the parson of a parish. The conception of the king as a corporation is the key to many of his paradoxical attributes in constitutional theory—his invisibility, immortality, &c.

The Roman conception of a corporation was kept alive by ecclesiastical and municipal bodies. When English lawyers came to deal with such societies, the corporation law of Rome admitted of easy application. Accordingly, in no department of our law have we borrowed so copiously and so directly from the civil law. The corporations known to the earlier English law were mainly the municipal, the ecclesiastical, and the educational and eleemosynary. To all of these the same principles, borrowed from Roman jurisprudence, were applied. The different purposes of these institutions brought about in course of time differences in the rules of the law applicable to each. In particular, the great development of trading companies under special statutes has produced a new class of corporations, differing widely from those formerly known to the law. The reform of municipal corporations effected by the Act of 1837 has also restricted the operation of the principles of the older corporation law. These principles, however, still apply when special statutes have not intervened. But the extent and importance of Parliamentary legislation on corporations have withdrawn the attention of writers from corporation law pure and simple, and there has been no book on that subject since Mr Grant's, published in 1850. Two earlier treatises by Mr Kyd and Mr Willcocks may be mentioned. American lawyers have dealt more satisfactorily with corporations, and special reference may be made to Abbott's *Digest of Corporation Law.*

The legal origin of corporation is ascribed by Grant to five sources, viz., common law, prescription, Act of Parliament, charter, and implication. Prescription in legal theory implies a grant, so that corporations by prescription would be reducible to the class of chartered or statutory corporations. A corporation is said to exist by implication when the purposes of a legally constituted society cannot be carried out without corporate powers. Corporations are thus ultimately traceable to the authority of charters and Acts of Parliament. The power of creating corporations by charter is an important prerogative of the Crown, but in the present state of the constitution, when all the powers of the Crown are practically exercised by Parliament, there is no room for any jealousy as to the manner in which it may be exercised. The power of chartering corporations belonged also to subjects who had *jura regalia, e.g.*, the bishops of Durham granted a charter of incorporation to the city of Durham in 1565, 1602, and 1780, and the last was the charter in operation up to the passing of the Municipal Corporations Act. The charter of a corporation is regarded as being of the nature of a contract between the king and the corporation. It will be construed more favourably for the Crown, and more strictly as against the grantee. It cannot alter the law of the land, and it may be surrendered, so that, if the surrender is accepted by the Crown and enrolled in Chancery, the corporation is thereby dissolved. The use made of this power of the Crown in the reigns of Charles II. and James II. will be familiar to most readers. Chartered corporations were originally held to be *ex necessitate* immortal; only a statute could give a society corporate privileges to ensue for a limited time. But now, by 1 Vict. c. 77 § 29, the Crown may incorporate for any period.

Every corporation, it is said, must have a name, and it may have more names than one, but two corporations cannot have the same name. And corporations cannot change their name save by charter or some equivalent authority.

The possession of a common seal, though, as already stated, not conclusive of the corporate character, has been held to be an incident of every corporation aggregate. The inns of courts have common seals, but they are only voluntary societies, not corporations. Generally speaking, all corporate acts affecting strangers must be performed under the common seal; acts of internal administration affecting only the corporators, need not be under seal. The rule has been defended by high judicial authority as following necessarily from the impersonal character of a corporation; either a seal or something equivalent must be fixed upon so that the act of the corporation may be recognized by all. In the matter of contracts, however, the strict rule of law has been found untenable. A large exception has long been recognized by the courts. In cases of "convenience almost amounting to necessity," the use of the seal will not be necessary in order to bind a corporation. Examples given in the old cases of such convenience are the retainer of an inferior servant, authority to make a distress, or drive away cattle damage feasant, &c. This exception has been extended in different degrees in different classes of corporations. In trading corporations it has been lately held that it will include all contracts entered into for the purposes for which the society was incorporated, and will not be limited to matters of constant occurrence or small importance. In other corporations the same latitude does not appear to be encouraged by the decisions. Goods of a kind which must have been necessary from time to time, and actually supplied to a corporation under a contract not sealed, may be sued upon. But an engagement as clerk to a workhouse was held not binding on a board of guardians because not under their seal. And where a municipal corporation caused some tolls to be let by auction, they were not allowed to recover on the contract because it was not under their seal. And work done for local improvements, under an unsealed contract, was held to give no claim against a corporation. In such cases the fact of the contract being executed makes no difference as against the corporation, but where the corporation has executed an unsealed contract, it may recover thereon.

The somewhat unsatisfactory principles as to the dissolution of corporations are not now of much practical importance. A corporation may of course be abolished by statute, but not by the mere authority of the Crown. It is held that a corporation may become extinct by the disappearance of all its members or of any integral part, or by surrender of charter if it is a chartered society, or by process of law for abuse of powers. In such cases the real property of the corporation will go to the heir of the founder, and the personal property as *bona vacantia* to the Crown. Corporations created by statute cannot surrender, nor will they be suffered to avoid elections so as to become extinct for want of members.

The power of the majority to bind the society is one of the first principles of corporation law, even in cases where the corporation has a head. It is even said that only by an Act of Parliament can this rule be avoided. The binding majority is that of the number present at a corporate meeting duly summoned. Votes given for an illegal purpose or a disqualified person are considered as thrown away, and in an election votes must be given *for* some particular candidate,—if they are merely *against* a candidate, they are void.

In corporations which have a head (as colleges), although the head cannot veto the resolution of the majority, he is still considered an integral part of the society, and his death suspends its existence, so that a head cannot devise or bequeath to the corporation, nor can a grant be made to a corporation during vacancy of the headship.

A corporation has power to make such regulations (by-laws) as are necessary for carrying out its purposes, and these are binding on its members and on persons within its local jurisdiction if it has any. Such by-laws must not be at variance with the law of the land, nor retrospective in their operation, nor unreasonable. They must further be in harmony with the objects of the society, and must not infringe or limit the powers and duties of its officers. A by-law to compel the giving of a dinner was held to be invalid unless it could be shown that the interest of the corporation was to be promoted thereby.

The power to acquire and hold land was incident to a corporation at common law, but its restriction by the statutes of mortmain dates from a very early period. The English law against mortmain was dictated by the jealousy of the feudal lords, who lost the services they would otherwise have been entitled to, when their land passed into the hands of a perpetual corporation. The vast increase in the estates of ecclesiastical corporations constituted by itself a danger which might well justify the operation of the restricting statutes. Accordingly, in Magna Charta (9 Hen. III. c. 36) there is a clause against the granting of land to religious houses. The statute 7 Edward I. st. 2, c. 1 (*De Religiosis*), and the Statute of Westminster the Second extended by 15 Richard II. c. 5, prohibited corporations from buying land in mortmain under penalty of forfeiture. The next lord might enter within a year, and each succeeding lord had half a year, and for default of intermediate lord the king should have the lands for ever. If the king and the lords waived their rights, the corporation could hold the land without question. Hence a practice grew up for the king to grant to a corporation a licence to hold the lands given to it; and this, although, strictly speaking, a waiving of the king's rights, was in course of time held sufficient to bar the mesne lord's right also. Its power to do so was expressly confirmed by 7 and 8 Will. III. c. 37, —not that there was any doubt about it in practice, but to avoid the hateful example of anything like a power in the Crown to suspend the laws. A licensed corporation can hold lands to the extent of its licence.

The Mortmain Acts applied only to cases of alienation *inter vivos*. There was no power to devise lands by will until 32 Henry VIII. c. 1 (explained by 34 and 35 Henry VIII. c. 5), and when the power was granted corporations were expressly excluded from its benefits. No devise to a corporation, whether for its own use or in trust, was allowed to be good; land so devised went to the heir, either absolutely or charged with the trusts imposed upon it in the abortive devise. A modification, however, was gradually wrought by the judicial interpretations of the Charitable Trusts Act 43 Elizabeth c. 4, and it was held that a devise to a corporation for a charitable purpose might be a good devise, and would stand unless voided by the Mortmain Acts;—so that no corporation could take land, without a licence, for any purpose or in any way; and no licensed corporation could take lands by devise, save for charitable purposes. Then came the 9 George II. c. 36, commonly but improperly called the Mortmain Act. Its effect is generally to make it impossible for land to be left by will for charitable uses, whether through a corporation or a natural person.[1] The new Wills Act does not renew the old provision against devises to corporations, which therefore fall under the general law of mortmain. The result is simply that corporations cannot take land for any purpose without a licence, and that neither corporations nor natural persons can take land by devise for charitable uses (see CHARITIES). The policy of the law of mortmain may be compared with the rule against perpetuities—a rule which forbids the operation of settlements purporting to regulate the devolution of land for ever. The longest period for which the law will allow the future disposition of land to be tied up is a life or lives in being, and twenty-one years thereafter.

The power of corporations at common law to alienate their property is a question of much greater difficulty, and no satisfactory solution of it is to be found in the cases or text-books. Coke is understood to say in his report of Sutton's Hospital case that they have the power to alienate, but later authorities are sometimes quoted on the other side. "All civil corporations," says Kyd, "such as the corporations of mayor and commonalty, bailiffs and burgesses of a town, or the corporate companies of trades in cities and towns, &c., have and always have had an unlimited control over their respective properties, and may alienate in fee, or make what estates they please for years, for life, or in tail, as fully as any individual may do in respect of his own property." And he makes the same assertion as to the common law right of colleges and ecclesiastical corporations. Grant, however, argues that no civil corporation can be supposed to hold land otherwise than as "clothed with a public purpose," and that, therefore, there is no right of alienation. Recent judicial decisions, however, seem to favour it. In a case before the late master of the rolls (Evan *v.* Corporation of Avon, 29 Beavan 144), it was held that a municipal corporation, apart from the Municipal Corporations Act, has full power to dispose of all its property like a private individual, and in the more recent case of Riche *v.* Ashbury Company (*Law Reports*, 9 Exchequer, 224) Mr Justice Blackburn, quoting the opinion of Coke in Sutton's Hospital case, lays it down that at common law a corporation might bind itself to anything to which a natural person could bind himself, and deal with its property as a natural person might, and that an attempt to forbid this by the king, even by express negative words, does not bind the law. When land is held by a corporation for charitable or other fiduciary purposes the Court of Chancery will interfere to prevent any improper alienation.

In the case of ecclesiastical and college property, the dangers incident to unlimited power of alienation produced what are known as the restraining statutes in the reign of Elizabeth. The first of these, 1 Elizabeth c. 19, applies only to bishops, and forbids alienations whereby an estate should pass other than for the term of twenty-one years or three lives, with accustomed yearly rent or more reserved. The 13 Elizabeth c. 10 extends this principle to other ecclesiastical persons and to colleges. The alienation of college and church property is now permitted by modern statutes, under the supervision of commissioners. The Municipal Corporations Act, 1835, deals with the alienation of municipal property in a similar spirit.

As already indicated, the more important classes of corporations are now governed by special statutes which exclude or modify the operation of the common law principles. The most considerable class of societies still unaffected by such special legislation are the Livery Companies; for an account of which see COMPANIES. Under the same heading will be found an account of the important enactments regulating joint-stock companies.

The question to what extent the common law incidents of a corporation have been interfered with by special legislation has become one of much importance, especially under the Acts relating to joint-stock companies. The most important case on this subject is that of Riche *v.* The Ashbury Railway Carriage Company before mentioned, in which, the judges of the Exchequer Chamber being equally divided, the decision of the court below was affirmed. The view taken by the affirming judges, viz., that the common law incidents of a corporation adhere unless expressly removed by the legislature, may be illustrated by a short extract from the judgment of Mr Justice Blackburn:—

"If I thought it was at common law an incident to a corporation that its capacity should be limited by the instrument creating it, I should agree that the capacity of a company incorporated under the Act of 1862 was limited to the object in the memorandum of association. But if I am right in the opinion which I have already expressed, that the general power of contracting is an incident to a corporation which it requires an indication of intention in the legislature to take away, I see no such indication here. If the question was whether the legislature had conferred on a corporation, created under this Act, capacity to enter into contracts beyond the provisions of the deed, there could be only one answer. The legislature did not confer such capacity. But if the question be, as I apprehend it is, whether the legislature have indicated an intention to take away the power of contracting which at common law would be incident to a body corporate, and not merely to limit the authority of the managing body and the majority of the shareholders to bind the minority, but also to prohibit and make illegal contracts made by the body corporate, in such a manner that they would be binding on the body, if incorporated at common law I think the answer should be the other way."

On the other hand, the House of Lords, agreeing with the three dissentient judges in the Exchequer Chamber, pronounced the effect of the Companies Act to be the opposite of that indicated by Mr Justice Blackburn. "It was the intention of the legislature, not implied but actually expressed, that the corporations should not enter, having regard to this memorandum of association, into a contract of this description. The contract in my judgment could not have been ratified by the unanimous assent of the whole corporation." In such companies, therefore, objects beyond the scope of the memorandum of association are *ultra vires* of the corporation. The doctrine of *ultra vires*, as it is called, is almost wholly of modern and judicial creation. Its first emphatic recognition of it appears to have been in the case of companies created for special purposes with extraordinary powers, by Act of Parliament, and, more particularly, railway companies. The funds of such companies, it was held, must be applied to the purposes for which they were created and to no other. Whether this doctrine is applicable to the older or, as they are sometimes called, ordinary corporations, appears to be doubtful. A recent author (Brice on *Ultra Vires*) writes:—

"Take, as a strong instance, a university or a London guild. Either can undoubtedly manage, invest, transform, and expend the corporate property in almost any way it pleases, but if they proposed to exhaust the same on the private pleasures of existing members, or to abandon the promotion, the one of education, the

[1] Devises to colleges are excepted from the operation of the Act, but such devises must be for purposes identical with or closely resembling the original purposes of the college; and the exception from this Act does not supersede the necessity for a licence in mortmain.

other of their art and mystery, it is very probable, if not absolutely certain, that the Court of Chancery would restrain the same, as being *ultra vires*."

Municipal Corporations.—The introduction of corporations into cities and towns does not appear to date farther back than the reign of Henry VI., although they had long possessed what may be called a quasi-corporate character. By that time the corporate character of ecclesiastical and educational societies and even of guilds had been recognized, and the great convenience of corporate powers was, no doubt, the reason why they were demanded by the commonalties of towns. The inhabitants of Plymouth appear to have petitioned for a corporation in 13 Henry IV., and the charter of Kingston-on-Hull in 18 Henry VI. is said to be the first charter of municipal incorporation in England. The ultimate effect of these charters was in general to reduce the boroughs into close corporations, the members of which engrossed the municipal and political powers to the exclusion of the general body of the inhabitants. The legal dependence of such corporations on the charter of the king suggested the measures above referred to by which the Crown attempted to get the control of the corporations. The reversal of the judgments obtained in the proceedings against corporations formed one of the first acts of the people after the Revolution of 1688, and thereafter corporations shared with private persons the advantages of freedom from arbitrary interference on the part of the Crown. Freedom from state control, however, means in the case of corporations the growth of abuses. The Corporations Act of the reign of Charles II., one of the measures forced on the king by the jealousy of his Parliament for the rights of the church, provided that no person should be elected to office in any corporate town, who should not within one year previously have taken the sacrament of the Lord's Supper according to the rites of the church and this enactment, although after a time suspended by temporary statutes, was not finally abolished till 9 Geo. IV. c. 17, which substituted for the test a declaration not to injure or weaken the Church of England. The important powers, municipal, political, and judicial, possessed by town corporations, the large ascertained amount of property in their hands, their exclusiveness, secrecy, and almost total freedom from responsibility,—all these abuses were acquiesced in till the reform of the House of Commons in 1832 enabled Parliament to turn its attention to the reform of other public institutions. The royal commissioners appointed in 1834 reported that "there prevails among the inhabitants of a great majority of the incorporated towns a general and in our opinion a just dissatisfaction with the municipal institutions—a distrust of the self-elected municipal councils, whose powers are subject to no popular control, and whose acts and proceedings, being secret, are not checked by the influence of public opinion; a distrust of the municipal magistracy, tainting with suspicion the local administration of justice; a discontent under the burthen of local taxation, while revenues are diverted from their legitimate use." The publication of this report was followed by the Municipal Corporations Act, 5 and 6 Will. IV. c. 26, by which, in all the boroughs named in the schedules to the Act, the laws, customs, charters, theretofore in force, are repealed where inconsistent with the provisions of the Act. Section 2 reserves all rights of property and beneficial exemptions to freemen, their wives and children; but freedom is not in future to be acquired by gift or purchase. The body corporate in such borough shall be called the mayor, aldermen, and burgesses of such borough, and by that name shall have perpetual succession, and shall be capable in law, by the council hereinafter mentioned, to do and suffer all things which now lawfully they and their successors respectively may do and suffer by any name or title of incorporation. It has been held that this Act does not create new corporations, although it alters the name, title, and constitution of the governing body. All corporate funds, after payment of debts, salaries, &c., as specified in the Act, are expressly appropriated to public purposes. Advowsons in the possession of the body corporate are to be sold under the direction of the ecclesiastical commissioners, and the proceeds invested in securities for the use of the corporation. The general regulations of municipalities under this and subsequent Acts not affecting them in their character as corporations, belong to the subject of Municipal Government.

This beneficial Act was unfortunately limited in its operation. London and all its corporations were left out, and the municipal government of the metropolis is at this moment a medley of independent jurisdictions in striking contrast with the orderly corporations of other large towns. And on the other hand, many small boroughs were omitted in the original Act, which still exhibit in the mismanagement of their property and powers the abuses against which that Act was directed. In 1875 and 1876 resolutions on the subject were laid before the Parliament, and from a return procured by Government, it appeared that the number of unreformed corporations was 102. Many of these were places of some importance, and in possession of considerable property. Government yielded to the general feeling that inquiry was desirable, and a royal commission was appointed to consider the subject. (E. R.)

CORPULENCE, or Obesity, is a condition of the body characterized by the over-accumulation of fat under the skin and around certain of the internal organs. In all healthy persons a greater or less amount of fat is present in these parts, and serves important physiological ends, besides contributing to the proper configuration of the body. Even a considerable measure of corpulence, however inconvenient, is not inconsistent with a high degree of health and activity, and it is only when in great excess or rapidly increasing that it can be regarded as a morbid state. The extent to which obesity may proceed is illustrated by numerous well-authenticated examples recorded in medical works, of which only a few can be here mentioned. Thus Bright, a grocer of Maldon, in Essex, who died in 1750, in his twenty-ninth year, weighed 616 ℔. Dr F. Dancel records the case of a young man of twenty-two, who died from excessive obesity, weighing 643 ℔. In the *Philosophical Transactions* for 1813 a case is recorded of a girl of four years of age who weighed 256 ℔. But the most celebrated case is that of Daniel Lambert of Leicester, who died in 1809 in his fortieth year. He is said to have been the heaviest man that ever lived, his weight being 739 ℔ (52 st. 11 ℔). Lambert had publicly exhibited himself for some years prior to his death which occurred suddenly at Stamford. At the inn where he died two suits of his clothes were preserved, from which some idea of his enormous dimensions may be obtained, when it is stated that his waistcoat could easily inclose seven persons of ordinary size. Lambert ate moderately, drank only water, and slept less than most persons. He is said to have had an excellent tenor voice.

Health cannot be long maintained under excessive obesity, for the increase in bulk of the body, rendering exercise more difficult, leads to relaxation and defective nutrition of muscle, while the accumulations of fat in the chest and abdomen occasion serious embarrassment to the functions of the various organs in those cavities. In general the mental activity of the highly corpulent becomes impaired, although there have always been many notable exceptions to this rule.

Various causes are assigned for the production of corpulence, but it must be admitted that in many cases it cannot be accounted for. In some families there exists an hereditary predisposition to an obese habit of body, the manifestation of which no precautions as to living appear capable of averting. But beyond this it is unquestionable that certain habits favour the occurrence of corpulence. A luxurious, inactive, or sedentary life, with over-indulgence in sleep and absence of mental occupation, are well recognized predisposing causes. The more immediate exciting causes are over-feeding and the large use of fluids of any kind, but especially alcoholic liquors. Fat persons are not always great eaters, though many of them are, while again, leanness and inordinate appetite are not infrequently associated. Still, it may be stated generally that indulgence in food, beyond what is requisite to repair daily waste, goes towards the increase of flesh, particularly of fat. This is more especially the case when the non-nitrogenous (the fatty, saccharine, and starchy) elements of the food are in excess. Although it is still undetermined whether the fat of the body is derived alone from these, or also from the nitrogenous (albuminous) elements of the food, it seems certain that while an excess of the latter constituents accelerates the oxidation and metamorphoses of the fatty tissues, an excess of the non-nitrogenous retards these changes, and thus tends directly to the production of obesity (Parkes). The want of adequate bodily exercise will in a similar manner produce a like effect, and it is probable that many cases of corpulence are to be ascribed to this cause alone, from the well-known facts that many persons of sedentary occupation become stout, although of most abstemious habits, and that obesity frequently comes on in the middle-aged and old, who take relatively less exercise than the young, in whom it is comparatively rare. Women are more prone to become corpulent than men, and appear to take on this condition more readily after the cessation of the function of menstruation.

For the prevention of corpulence and the reduction of superfluous fat many expedients have been resorted to, and numerous remedies recommended. It is unnecessary to allude to these in detail, further than to state that they embrace such regimen as bleeding, blistering, purging, starving, the use of different kinds of baths, and of drugs innumerable, most of which means have been found utterly to fail in accomplishing the desired object. The drinking of vinegar was long popularly supposed to be a remedy for obesity. It is related of the marquis of Cortona, a noted general of the duke of Alba, that by drinking vinegar he so reduced his body from a condition of enormous obesity that he could fold his skin about him like a garment. Such a remarkable result was only a proof of the injury done to his health by the excessive use of vinegar. There is no evidence, whatever, that this liquid has any power to remove fat, while its pernicious effects upon the health, when taken in large quantity, are well known to medical men. Another medicinal agent, which has been proposed on the high authority of Dr T. King Chambers, is the *liquor potassæ*. This medicine, which is recommended on the ground of the chemical affinity of the alkalis for fats, is directed to be taken in teaspoonful doses in milk twice or thrice daily, at the same time that a restricted diet and abundant exercise is enjoined. But even this plan, although occasionally yielding good results, cannot be said to have been widely successful. The more rational and hopeful system of treatment appears to be that which is directed towards regulating the quality as well as the quantity of nutriment ingested. This method has of late years received much attention, chiefly in consequence of the publication, in 1863, of a pamphlet entitled *Letter on Corpulence, Addressed to the Public by William Banting*, in which was narrated the remarkable experience of the writer in accomplishing the reduction of his own weight in a short space of time by the adoption of a particular kind of diet. Mr Banting describes the condition of obesity in which he was in August 1862, and which, although certainly less than those examples above mentioned, appears to have been sufficient to prove a source of much discomfort and even of actual suffering. After trying almost every known remedy without effect, he was induced, on the suggestion of Mr Harvey, a London aurist, to place himself upon an entirely new form of diet, which consisted chiefly in the removal, as far as possible, of all saccharine, starchy, and fat food, the reduction of liquids, and the substitution of meat or fish and fruit in moderate quantity at each meal, together with the daily use of an antacid draught. Under this regimen his weight was reduced 46 lb in the course of a few weeks, while his health underwent a marked improvement. Mr Banting's recorded experience, as might have been expected, induced many to follow his example, and in numerous instances the effects were all that could be desired. But in many cases the diminution in weight was found to be attended with such a serious impairment of health as to render the carrying out of this system impossible It is probable that in some at least of these cases the unfavourable effects might have been avoided had the change in diet been more gradually brought about. There seems little reason to doubt that this method, founded as it is on well-recognized principles of physiological chemistry, is that which is most likely to yield the best results in the treatment of corpulence. It evidently cannot, however, be safely adopted in all cases, and ought not to be attempted to be carried out except under medical advice and observation; for however desirable it be to get rid of superabundant fat, it would be manifestly no gain were this to be achieved by the sacrifice of the general health. An important element in the treatment of obesity is the due regulation of the amount of bodily exercise, and this, too, ought to be made the subject of the physician's careful attention.

Cursory Remarks on Corpulence, or Obesity considered as a Disease, by William Wadd, 3d ed., London, 1816 ; *Corpulence or Excess of Fat in the Human Body*, by Dr. T. King Chambers, London, 1850 ; *Traité théorique et pratique de l'obésité*, by Dr F. Dancel, Paris, 1863; *Letter on Corpulence, addressed to the Public by William Banting*, 3d ed., London, 1864; *The Practice of Medicine*, by Dr Tanner, London, 6th ed., London, 1869. (J. O. A.)

CORPUS CHRISTI, a festival of the Church of Rome observed on the first Thursday after Trinity Sunday, in honour of the doctrine of the Eucharist. It was instituted by Pope Urban IV., in 1264, and is still celebrated as one of the greatest feasts of the church.

CORREA DA SERRA, JOSÉ FRANCISCO (1750–1823), a Portuguese politician and man of science, was born at Serpa, in Alemtejo, in 1750. Having been educated at Rome, he took orders under the protection of the duke of Alafoès, uncle of Mary I. of Portugal. In 1777 he returned to Lisbon, where he resided with his patron, with whose assistance he founded the Portuguese Academy of Sciences. Of this institution he was named perpetual secretary, and he received the privilege of publishing its transactions without reference to any censor whatever. His use of this right brought him into conflict with the Holy Office; and consequently in 1786 he fled to France, and remained there till the death of Pedro III., when he again took up his residence with Alafoès. But having given a lodging in the palace to a French Girondist, he was forced to flee to England, where he found a protector in Sir Joseph Banks, and became a member of the Royal Society. In 1797 he was appointed secretary to the Portuguese legation, but a quarrel with the ambassador drove him once more to Paris (1802), and in that city he resided till 1813, when he crossed over to New York. In 1816 he was made Portuguese minister-plenipotentiary at Washington, and in 1820 he was recalled home, appointed a member of the Financial

Council, and elected to a seat in the Cortes. Three years after, and in the same year with the fall of the constitutional Government, he died. Correa da Serra ranks high as a botanist, though he published no great special work. His principal claim to renown is the *Colecção de Livros ineditos da Historia Portugueza*, 4 vols. (1790–1816), an invaluable selection of documents, exceedingly well edited.

CORREGGIO, or Coreggio, is the name ordinarily given to Antonio Allegri (1494–1534), one of the most celebrated Italian painters, of the most vivid and impulsive inventors in expression and pose, and of the most consummate executants. The external circumstances of his life have been very diversely stated by different writers, and the whole of what has been narrated regarding him, even waiving the question of its authenticity, is but meagre.

The first controversy is as to his origin. Some say that he was born of poor and lowly parents; others, that his family was noble and rich. Neither account is accurate. His father was Pellegrino Allegri, a tradesman in comfortable circumstances, living at Correggio, a small city in the territory of Modena; his mother Bernardina Piazzoli degli Aromani, also of a creditable family of moderate means. Antonio was born at Correggio, and was carefully educated. He was not (as has been often alleged) strictly self-taught in his art—a supposition which the internal evidence of his pictures must of itself refute. They show a knowledge of optics, perspective, architecture, sculpture, and anatomy. The last-named science he studied under Dr Giovanni Battista Lombardi, whom he is believed to have represented in the portrait currently named Il Medico del Correggio (Correggio's physician). It is concluded that he learned the first elements of design from his uncle, Lorenzo Allegri, a painter of moderate ability at Correggio, and from Andrea Bartolotti, named Tognino, and that he afterwards went to the school of Francesco Ferrari Bianchi (named Frari), and perhaps to that of the successors of Andrea Mantegna in Mantua. He is said to have learned modelling along with the celebrated Begarelli at Parma; and it has even been suggested that, in the Pietà executed by Begarelli for the church of Santa Margherita, the three finest figures are the work of Correggio, but, as the group appears to have been completed three years after the painter's death, there is very little plausibility in this story. Another statement connecting Begarelli with Correggio is probably true, namely, that the sculptor executed models in relief for the figures which the painter had to design on the cupolas of the churches in Parma. This was necessarily an expensive item, and it has been cited as showing that Correggio must have been at least tolerably well off,—an inference further supported by the fact that he used the most precious and costly colours, and generally painted on fine canvases, or sometimes on sheets of copper.

The few certain early works of Correggio show a rapid progression towards the attainment of his own original style. Though he never achieved any large measure of reputation during his brief lifetime, and was perhaps totally unknown beyond his own district of country, he found a sufficiency of employers, and this from a very youthful age. One of his early pictures, painted in 1514 when he was nineteen or twenty years old, is a large altar-piece commissioned for the Franciscan convent at Carpi, representing the Virgin enthroned, with Saints; it indicates a predilection for the style of Leonardo da Vinci, and has certainly even greater freedom than similarly early works of Raphael. This picture is now in the Dresden Gallery. Another painting of Correggio's youth is the Arrest of Christ. A third is an Ancona (or triple altar-piece—the Repose in Egypt, with Sts Bartholomew and John) in the church of the Conventuali at Correggio, showing the transition from the painter's first to his second style. Between 1514 and 1520 Correggio worked much, both in oil and in fresco, for churches and convents. In 1520 he began his famous fresco of the Ascension or Assumption of Christ, on the cupola of the Benedictine church of St John in Parma; here the Redeemer is surrounded by the twelve apostles and the four doctors of the church, supported by a host of wingless cherub boys amid the clouds. This he finished in 1524, and soon afterwards undertook his still vaster work on another cupola, that of the cathedral of the same city, representing the Assumption of the Virgin, amid an unnumbered host of saints and angels rapt in celestial joy. It occupied him up to 1530. The astounding boldness of scheme in these works, especially as regards their incessant and audacious foreshortenings—the whole mass of figures being portrayed as in the clouds, and as seen from below—becomes all the more startling when we recall to mind the three facts—that Correggio had apparently never seen any of the masterpieces of Raphael or his other great predecessors and contemporaries, in Rome, Florence, or other chief centres of art; that he was the first artist who ever undertook the painting of a large cupola; and that he not only went at once to the extreme of what can be adventured in foreshortening, but even forestalled in this attempt the mightiest geniuses of an elder generation—the Last Judgment of Michelangelo, for instance, not having been begun earlier than 1533 (although the ceiling of the Sixtine Chapel, in which foreshortening plays a comparatively small part, dates from 1508 to 1512). The cupola of the cathedral has neither skylight nor windows, but only light reflected from below; the frescoes, some portions of which were ultimately supplied by Giorgio Gandini, are now dusky with the smoke of tapers, and parts of them, both in the cathedral and in the church of St John, have during many past years been peeling off. The violent foreshortenings were not, in the painter's own time, the object of unmixed admiration; some satirist termed the groups a "guazzetto di rane," or hash of frogs. This was not exactly the opinion of Titian, who is reported to have said, on seeing the pictures, and finding them lightly esteemed by local dignitaries, "Reverse the cupola, and fill it with gold, and even that will not be its money's worth." Annibale Caracci and the Eclectics generally evinced their zealous admiration quite as ardently. Parma is the only city which contains frescoes by Correggio. For the paintings of the cupola of St John he received the moderate sum of 472 sequins; for those of the cathedral, much less proportionately, 350. On these amounts he had to subsist, himself and his family, and to provide the colours, for about ten years, having little time for further work meanwhile. Parma was in an exceedingly unsettled and turbulent condition during some of the years covered by Correggio's labours there, veering between the governmental ascendency of the French and of the Pope, with wars and rumours of wars, alarms, tumults, and pestilence.

Other leading works by Correggio are the following:—The frescoes in the Camera di San Paolo (the abbess's saloon) in the monastery of S. Lodovico at Parma, painted towards 1519 in fresco,—Diana returning from the Chase, with auxiliary groups of lovely and vivacious boys of more than life-size, in sixteen oval compartments. In the National Gallery, London, the Ecce Homo, painted probably towards 1520; and Cupid, Mercury, and Venus, the latter more especially a fine example. The oil-painting of the Nativity named Night, or La Notte, for which 40 ducats and 208 livres of old Reggio coin were paid; the nocturnal scene is partially lit up by the splendour proceeding from the divine Infant. This work was undertaken at Reggio in 1522 for Alberto Pratoneris, and is now in the Dresden Gallery. The oil-painting of St Jerome, termed also Day (Il Giorno), as contrasting with the above-named Night. Jerome is here with the Madonna and Child, the Magdalene, and two Angels, of whom one points out to the Infant a passage in the book held by the Saint. This was painted for Briscida Bergonzi from 1527 onwards, and was remunerated by 400 gold imperials, some cartloads of faggots and measures of wheat, and a fat pig. It is now in the gallery at Parma. The Magdalene lying at the entrance of her cavern: this small picture (only 18 inches wide) was bought by Augustus III. of Saxony for 6000 louis d'or, and is in Dresden. In the same Gallery, the two works designated St George (painted towards 1532) and St Sebastian. In the Parma Gallery, the Madonna named "della Scala," a fresco which was originally in a recess of the Porta Romana, Parma; also the Madonna "della Scodella" (of the bowl, which is held by the Virgin—the subject being the Repose in Egypt): it was executed for the church of San Sepolcro. Both these works date towards 1526. In the church of the Annunciation, Parma, a fresco of the Annunciation, now all but perished. Five celebrated pictures painted or begun in 1532,—Venus, Leda, Danae, Vice, and Virtue: the Leda, with figures of charming girls bathing, is now in the Berlin Gallery, and is a singularly delightful specimen of the master. In Vienna, Jupiter and Io. In the Louvre, Jupiter and Antiope, and the Mystic Marriage of St Catharine. In the Naples Museum, the Madonna Reposing, commonly named La Zingarella, or the Madonna del Coniglio (Gipsy-girl, or Madonna of the Rabbit). On some of his pictures Correggio signed "Lieto," as a synonym of "Allegri." About forty works can be confidently assigned to him, apart from a multitude of others probably or manifestly spurious.

The famous story that this great but isolated artist was once, after long expectancy, gratified by seeing a picture of Raphael's, and closed an intense scrutiny of it by exclaiming "Anch' io son pittore" (I too am a painter), cannot be traced to any certain source. It has nevertheless a great internal air of probability; and the most enthusiastic devotee of the Umbrian will admit that in technical *bravura*, in enterprizing, gifted, and consummated execution, not Raphael himself could have assumed to lord it over Correggio.

In 1520 Correggio married Girolama Merlino, a young lady of Mantua, who brought him a good dowry. She was but sixteen years of age, very lovely, and is said by tradition to have been the model of his Zingarella. They lived in great harmony together, and had a family of four children. She died in 1529. Correggio himself expired at his native place on the 5th of March 1534. His illness was a short one, and has by some authors been termed pleurisy. Others, following Vasari, allege that it was brought on by his having had to carry home a sum of money, 50 scudi, which had been paid to him for one of his pictures, and paid in copper coin to humiliate and annoy him; he carried the money himself, to save expense, from Parma to Correggio on a hot day, and his fatigue and exhaustion led to the mortal illness. In this curious tale there is no symptom of authenticity, unless its very singularity, and the unlikelihood of its being invented without any foundation at all, may be allowed to count for something. He is said to have died with Christian piety; and his eulogists (speaking apparently from intuition rather than record) affirm that he was a good citizen, an affectionate son and father, fond and observant of children, a sincere and obliging friend, pacific, beneficent, grateful, unassuming, without meanness, free from envy, and tolerant of criticism. He was buried with some pomp in the Arrivabene Chapel, in the cloister of the Franciscan church at Correggio.

Regarding the art of Correggio from an intellectual or emotional point of view, his supreme gift may be defined as suavity,—a vivid spontaneous lambent play of the affections, a heartfelt inner grace which fashions the forms and features, and beams like soft and glancing sunshine in the expressions. We see lovely or lovable souls clothed in bodies of corresponding loveliness, which are not only physically charming, but are so informed with the spirit within as to become one with that in movement and gesture. In these qualities of graceful naturalness, not heightened into the sacred or severe, and of joyous animation, in momentary smiles and casual living turns of head or limb, Correggio undoubtedly carried the art some steps beyond anything it had previously attained, and he remains to this day the unsurpassed or unequalled model of pre-eminence. From a technical point of view, his supreme gift—even exceeding his prodigious faculty in foreshortening and the like—is chiaroscuro, the power of modifying every tone, from bright light to depth of darkness, with the sweetest and most subtle gradations, all being combined into harmonious unity. In this again he far distanced all predecessors, and defied subsequent competition. His colour also is luminous and precious, perfectly understood and blended; it does not rival the superb richness or deep intense glow of the Venetians, but on its own showing is a perfect achievement, in exact keeping with his powers in chiaroscuro and in vital expression. When we come, however, to estimate painters according to their dramatic faculty, their power of telling a story or impressing a majestic truth, their range and strength of mind, we find the merits of Correggio very feeble in comparison with those of the highest masters, and even of many who without being altogether great have excelled in these particular qualities. Correggio never *means* much, and often, in subjects where fulness of significance is demanded, he means provokingly little. He expressed his own miraculous facility by saying that he always had his thoughts at the end of his pencil; in truth, they were often thoughts rather of the pencil and its controlling hand than of the teeming brain. He has the faults of his excellences—sweetness lapsing into mawkishness and affectation, empty in elevated themes and lasciviously voluptuous in those of a sensuous type, rapid and forceful action lapsing into posturing and self-display, fineness and sinuosity of contour lapsing into exaggeration and mannerism, daring design lapsing into incorrectness. No great master is more dangerous than Correggio to his enthusiasts; round him the misdeeds of conventionalists and the follies of connoisseurs cluster with peculiar virulence, and almost tend to blind to his real and astonishing excellences those practitioners or lovers of painting who, while they can acknowledge the value of *technique*, are still more devoted to greatness of soul, and grave or elevated invention, as expressed in the form of art.

Correggio was the head of the school of painting of Parma, which forms one main division of the Lombardic school. He had more imitators than pupils. Of the latter one can name with certainty only his son Pomponio, who was born in 1521 and died at an advanced age; Francesco Capelli; Giovanni Giarola; Antonio Bernieri (who, being also a native of the town of Correggio, has sometimes been confounded with Allegri); and Bernardo Gatti, who ranks as the best of all. The Parmigiani (Mazzuoli) were his most highly distinguished imitators. (W. M. R.)

CORRÈZE, an inland department of France, formed from the southern portion of the old province of Limousin, is bounded N. by the departments of Haute-Vienne and Creuse, E. by Puy-de-Dôme and Cantal, S. by Lot, and W. by Dordogne, and lies between 44° 55′ and 45° 40′ N. lat. The surface of the country is in general hilly, but in the south-west there are some plains. In the north an offshoot of the mountains of Auvergne separates the basins of the Dordogne and Loire. The soil is mostly poor and thin.

moderately fertile in the low, but heathy and unproductive in the high lands. In certain districts there are forests of oak, birch, beech, elm, and poplar. The average temperature of Corrèze is low, and the climate is damp, as several of the higher mountain summits are covered with snow for many months in the year; the summer heat in the valleys is, however, excessive. The principal rivers are the Dordogne and the Vezère, with its affluent the Corrèze. The chief productions are wheat and other cereals, hemp, flax, and wine of an inferior quality. Chestnuts are a staple article of diet with many of the people. Cattle, sheep, goats, horses, mules, and pigs are reared in considerable numbers. The mineral resources, which are little developed, include ores of iron, copper, lead, tin, and antimony, besides coal, marble, slates, clay, millstones, grindstones, granite, and porphyry. The manufactures are firearms, glass, bricks, leather, coarse woollens, paper, lace, wax candles, and nut oil. The department is divided into the arrondissements Tulle, Brive, and Ussel, containing 29 cantons and 286 communes. The chief town is Tulle. The total area is 2265 square miles, and the population in 1872 numbered 302,746.

CORRIENTES, or SAN JUAN DE CORRIENTES, a town of the Argentine Republic, South America, and capital of the province of Corrientes, is situated on the left bank of the Parana, below its junction with the Paraguay, in 27° 27′ 31″ S. lat. and 58° 46′ W. long. It has a college, Government house, museum, several schools and churches, and a good quay; and is an emporium for the maté, sugar, cotton, and tobacco of Paraguay, and for the furs of the Chaco Indians. The exports are chiefly hides, wool, and timber. Population, 10,546. Corrientes was founded by Alonzo de Bera on the 3d April 1588.

CORRY, a city of 6800 inhabitants, in Erie County, Pennsylvania, which owes its existence and its prosperity to the petroleum wells discovered in 1861. Besides the numerous establishments, connected with the oil-trade, it has engineering works, steam-mills, and tanneries; and, favoured as it is by its position at a railway junction, it is rapidly developing a considerable traffic. Its incorporation as a city dates from 1866.

CORSEUL, or CORSEULT. See CÔTES-DU-NORD.

CORSICA (Greek, Κύρνος; Latin, *Corsus* and *Corsica*; French, *Corse*), a large island of the Mediterranean, belonging to France, is situated immediately to the north of Sardinia (from which it is separated by the narrow strait of Bonifacio), between 41° 20′ and 43° N. lat., and 8° 30′ and 9° 30′ E. long. Population, 258,507. It lies within 54 miles west of the coast of Tuscany, 98 miles south of Genoa, and 106 miles south-east of the French coast at Nice. The extreme length of the island is 116 miles, and its breadth 52 miles; and it has an area of 3376 square miles—about one-third of the extent of Sardinia. The greater part of the surface of Corsica is occupied by a central range of lofty and rugged mountains, diverging in all directions, the highest peaks being Monts Cinto (8889 feet), Rotondo (8609), Pagliorba (8284), Padro (7846), and d'Oro (7841). On the west and south of the island the spurs of this range either terminate abruptly on the shore or run out to a great distance into the sea, forming bays and gulfs, some of which afford excellent harbours. The prevailing rocks are of granite, gneiss, and mica slate, with occasional beds of syenite, porphyry, and serpentine. Minerals are not worked to any great extent, although lead is found in some quantity at Luri, antimony at Ersa, and copper at Bastia, Ponte Leccia, &c. On the eastern side of the island, between Bastia and Porto Vecchio, there intervenes between the mountains and the sea a considerable tract of low country, where there are plantations of olive trees, almond and fig trees, and vineyards. The oil produced is, however, not of the best quality, and much of the wine is exported to France in a raw state for the manufacture of liqueurs. Corsica is well watered with rivers, which, though short in their course, bring down large volumes of water from the mountains. The longest is the Golo (the Tavela of the Romans), which enters the sea on the east coast through the large salt-water lake of Biguglia; further south on the same side of the island are the Tavignano and the Rezzanese; while on the east side is the Taravo. The other streams are all comparatively small. From the rugged and in-

Island of Corsica.

dented outline of the coast there are an unusual number of bays and harbours. Of the former the most important on the western side of the island are Porto, Sagone, Ajaccio, and Propriano; of the latter, St Florent, Ile Rousse, Calvi, and Ajaccio. On the eastern side, which is much less rugged and broken, the only harbours worth mentioning are Bastia and Porto Vecchio (the Portus Syracusanus of the ancients), and the only gulf that of Santa Manza. At the extreme south are the harbour and town of Bonifacio, giving name to the strait which separates Corsica from Sardinia.

Of the internal resources of the island the most important consist of those vast forests that cover the summits of the hills, and which furnished timber for the navies of antiquity. Partly, however, from the indolence of the inhabitants, and partly from the difficulties of land carriage, this source of wealth is comparatively neglected. The mountain pastures are made available for the rearing of cattle, horses, asses, and mules. Sheep of a peculiar black breed, called *mufflons*, inhabit the more inaccessible parts of the mountains, and goats and pigs abound in the island. The uncultivated districts are generally overgrown with a thick tangled underwood, consisting of arbutus, myrtle, thorn, laurel, broom, and other shrubs, and called by the natives *maquis*, which, however, is easily cleared off by burning. Throughout the island the growth of the cereal crops is generally abandoned for the easier cultivation of the olive and vine. Chestnuts constitute an important article of food, but wheat, maize, and barley are also cultivated. The backward state of agriculture is caused principally by the minute subdivision of the land, a system which perpetuates the social evils of hereditary feuds and jealousies, by which Corsica has long been distracted. A large proportion of the exports of the island consists of honey and wax, which are procured from the forests. The former of these has a somewhat bitter flavour, from the yew and box trees on which the bees feed. Beyond the making of oil, wine, soap, bricks, and coarse glass, the Corsicans are entirely destitute of manufacturing industry, and their commerce consists for the most part of the spontaneous produce of the island. The fisheries of tunny, pilchard, and anchovy are extensively prosecuted for the supply of the Italian markets; but comparatively few of the native Corsicans are engaged in this department of industry. The Government have constructed 700 miles of excellent roads (*Routes Nationales*), round the entire island, and crossing it at various points, by which regular communication is maintained by means of diligences. Corsica, which forms a department of France, is divided into five arrondissements, subdivided and peopled as follows:—

Arrondissements.	Cantons.	Communes.	Population (1872).
1. Ajaccio	12	72	66,701
2. Sartene	8	46	33,495
3. Bastia	20	93	74,124
4. Calvi	6	34	24,516
5. Corte	16	110	59,671
Total	62	355	258,507

Of this number 130,406 were males and 128,101 females; and compared with the census of 1851, the total population has increased by 22,256 souls, or nearly 9 per cent. in twenty-one years.

The principal towns are Ajaccio (pop. 16,545), the capital and the seat of the bishop of the island (who is under the archbishop of Aix), the prefect, and the commander of the forces; Bastia (pop. 17,850), Corte (5430), and Sartene (4166). Education is very backward among the islanders, about 40 per cent. being returned as unable to read or write. There are, however, several colleges, such as the lyceum of Bastia, the Collége Fesch of Ajaccio, the Collége de Calvi, and the École Paoli de Corte. The people are sober in their habits, but not enterprizing and without much knowledge of sanitary laws. Their proneness to agrarian outrages has brought upon them an evil repute, but thanks to the strenuous efforts of the French Government this spirit of lawlessness has been greatly curbed. A great part of the agricultural labour is performed by labourers from Tuscany and Lucca, who periodically visit the island for that purpose.

History.—It is not known who the original inhabitants of Corsica were. The Phocæans of Ionia were the first civilized people that established settlements in Corsica. About the year 560 B.C. they landed for the first time on the island, and founded the city of Aleria, which after a short occupation they were compelled to abandon. After an interval of a few years they again returned, rebuilt Aleria, which they fortified, and endeavoured to maintain their ground against the natives. After a struggle of some years they were again compelled to leave the island. The next foreign occupants of Corsica were the Tuscans, who founded the city of Nicæa, but they in their turn were compelled to give way before the growing maritime power of the Carthaginians, whose jurisdiction in the island was unquestioned till the beginning of the first Punic war. On that occasion the Romans sent out a fleet, drove the Carthaginians from the island, and exacted at least a nominal homage from the native population. They did not, however, fully establish their power here till about thirty years later, and even then rebellions and revolts were of constant occurrence. The first step made towards the real subjugation of the island was the establishment of the two colonies on its eastern coast—that of Aleria by Sulla, and that of Mariana by Marius. In the time of the emperors, the island had fallen into disrepute among the Romans, by whom it was used chiefly as a place of banishment for political offenders. One of the most distinguished of these sufferers was the younger Seneca, who spent in exile here the eight years ending 49 A.D.

On the downfall of the Roman empire in the West, Corsica passed into the hands of the Vandals. These barbarians were driven out by Belisarius, but after the death of that illustrious general, 565 A.D, the resistless hordes of Attila once more gained possession of the island. Since that period it has successively owned the dominion of the Goths, the Saracens, the Pisans, and the Genoese. The impress of the last is to be found in the style of the church architecture and notably in the *patois* of the people; while the armorial crest of the island, a Moor's head, is ascribable to the Saracen occupation. Corsica was ceded by the Genoese to the French in 1768; and for a few years after the French Revolution of 1793 it was placed under the protection of Great Britain. Since 1814 it has been in undisturbed possession of the French. Corsica is famous as the birthplace of Pascal Paoli and of Napoleon Bonaparte.

CORSSEN, WILHELM PAUL (1820–1875), a distinguished German philologist, was born at Bremen, January 20, 1820, and received his school education in the Prussian town of Schwedt, to which his father, a merchant, had removed. After spending some time at the Joachimsthal Gymnasium in Berlin, where his interest in philological pursuits was awakened by the Rector Meinike, he proceeded to the university, and there came especially under the influence of Boeckh and Lachmann. His first important appearance in literature was as the author of *Origines Poesis Romanæ*, by which he had obtained the prize offered by the "philosophical" or "arts" faculty of the university. In 1846 he was called from Stettin, where he had for nearly two years held a post in the gymnasium, to occupy the position of lecturer in the royal academy at Pforta (near Naumburg), and there he continued to labour for the next twenty years. The philosophico-historical class of the Royal Prussian Academy of Sciences having, in 1854, offered a prize for the best work on the pronunciation and accent of Latin, he gained the day by means of a treatise which at once took rank, on its publication under the title of *Ueber Aussprache, Vokalismus, und Betonung der Lateinischen Sprache* (2 vols. Leipsic, 1858–59), as one of the most erudite and masterly works in its department. This was followed in 1863 by his *Kritische Beiträge zur Lat. Formenlehre*, which were supplemented in 1866 by *Kritische Nachträge zur Lat. Formenlehre.* In the discussion of the pronunciation of Latin he was naturally led to consider the various old Italian dialects, and the results of his investigations appeared in miscellaneous communications to Kuhn's *Zeitschrift für vergleichende Schriftforschung.* The state of his health obliged him to give up his professorship at Pforta, and return to Berlin, in 1866; but it produced almost no diminution of his literary activity. In 1867 he published an elaborate archæological study entitled the *Alterthümer und Kunstdenkmale des Cistercienserklosters St Marien und der Landesschule Pforta*, in which he gathers together all that can be discovered about the history of the establishment where he had taught so long; and in 1868–69 he brought out a new edition of his work on Latin pronunciation. From a very early period he had been attracted to the special study of Etruscan remains, and had at various times given occasional expression to his opinions on individual points; but it was not till 1870 that he had the opportunity of visiting Italy and completing his equipment for a formal treatment of the whole subject by personal inspection of the monuments. In 1874 appeared the first volume of *Ueber die Sprache der Etrusker*, in which with great ingenuity and erudition he endeavours, it cannot be said with complete success, to prove that the Etruscan language was cognate with that of the Romans. Before the second volume had received the last touches of his hand he was cut off by a comparatively early death, which had in all probability been hastened by those long hours which he had spent "in damp grave-chambers," painfully deciphering by candle-light the faded and fragmentary inscriptions of forgotten days. Whatever may be the ultimate decision of criticism on the great question at issue, and however unfortunate his conjectures may be proved by later investigators, it cannot be denied that he has brought the matter one step nearer to a final conclusion. The posthumous volume appeared in 1875, having been edited by E. W. A. Kuhn.

CORT, Cornelius (1536–1578), was born at Horn in Holland, and studied engraving under Jerom Cockx of Antwerp. About 1565 he went to Venice, where Titian employed him to execute the well-known copper-plates of St Jerome in the Desert, the Magdalen, Prometheus, Diana and Actæon, and Diana and Calisto. From Italy he wandered back to the Netherlands, but he returned to Venice soon after 1567, proceeding thence to Bologna and Rome, where he produced engravings from all the great masters of the time. At Rome he founded the well-known school in which, as Bartsch tells us, the simple line of Marcantonio was modified by a brilliant touch of the burin, afterwards imitated and perfected by Agostino Caracci in Italy and Nicolas de Bruyn in the Netherlands. Before visiting the Peninsula, Cort had been content to copy Coxcie, F. Floris, Hemskerk, Mostaert, Spranger, and Stradan. In Italy he gave circulation to the works of Raphael, Titian, Polidoro da Caravaggio, Baroccio, Giulio Clovio, Muziano, and the Zuccari. His connection with Jerom Cockx and Titian is pleasantly illustrated in a letter addressed to the latter by Dominick Lampson of Liége in 1567. Cort is said to have engraved upwards of 151 plates.

CORTE-REAL, the name of a noble Portuguese family. In 1500 Gaspard Corte-Real sailed from Lisbon, landed on the coast of Labrador, and, having named the country, returned home with some of the natives whom he had captured. In 1501 he undertook a second voyage to the Arctic seas, from which he did not return. In the following year his brother Miguel led an expedition for the purpose of discovering him, but he also never returned. The king, Emmanuel, sent out two ships to the assistance of the brothers, but no traces of either could be found. A third brother, Vasco, was only prevented from risking the fate of Gaspard and Miguel by the king's command. To the same family belonged the poet, Jeronymo Corte-Real. He also was a sailor; for the first fact in his life that has come down to us is that, about 1571, he was appointed captain-general of a fleet fitted out for explorations in the Indies. The invasion of Philip II. in 1580 found him in retirement at Evora; but of the rest of his life there is nothing satisfactorily known except that he died before 1594. His *Diú*, an epic founded on the siege of Diú, and his *Austriad*, celebrating the victory won in 1571 by Don John of Austria over the Turks at Lepanto, have no great merit. His best work is the *Naufragio de Sepulveda* (published in 1594), a poem describing the shipwreck and death of Lionor de Sa (the mother of his wife) and of Manoel de Souza. An edition of this story, which has been translated into both French and Spanish, appeared at Lisbon in 1849.

See Ferdinand Denis, *Chroniques chevaleresques de l'Espagne et Portugal;* and Sismondi, *Littérature du midi de l'Europe.*

CORTES, a Spanish term literally signifying the "courts," and applied to the States, or assembly of the States, of the kingdom. See Spain and Portugal.

CORTES, Hernan, or Hernando (1485–1547), conqueror of Mexico, was born at Medellin, a small town of Estremadura, in 1485. He belonged to a noble family of decayed fortune, and, being destined for the bar, was sent, at fourteen years of age, to the university of Salamanca; but study was distasteful to him, and he returned home in 1501, resolved to enter upon a life of adventure. He arranged to accompany Ovando, who had been appointed to the command of St Domingo, but was prevented from joining the expedition by an accident that happened to him in a love adventure. He next sought military service under the celebrated Gonsalvo de Cordova, but a serious illness frustrated his purpose. At last, in 1504, he set out, according to his first plan, for St Domingo, where he was kindly received by Ovando. He was then only nineteen, and remarkable for a graceful physiognomy and amiable manners, as well as for skill and address in all military exercises. He remained in St Domingo, where Ovando had successively conferred upon him several lucrative and honourable employments, until 1511, when he accompanied Diego Velasquez in his expedition to the island of Cuba. Here he became alcalde of St Iago, and displayed great ability on several trying occasions. An opportunity was soon afforded him of showing his powers as a military leader in an enterprize of the first importance. Grijalva, lieutenant of Velasquez, had just discovered Mexico, but had not attempted to effect a settlement. This displeased the governor of Cuba, who superseded Grijalva, and intrusted the conquest of the newly discovered country to Cortes. The latter hastened his preparations, and, on the 18th of November 1518, he set out from St Iago, with 10 vessels, 600 or 700 Spaniards, 18 horsemen, and some pieces of cannon. Scarcely had he set sail, however, when Velasquez, probably apprehensive that his lieutenant would carry off all the glory as well as the profit of the enterprize, recalled the commission which he had granted to Cortes, and even ordered him to be put under arrest; but the attachment of the troops, by whom he was greatly beloved, enabled him to persevere in spite of the governor; and on the 4th of March 1519 he landed on the coast of Mexico. Advancing along the gulf, sometimes taking measures to conciliate the natives, and sometimes spreading terror by his arms, he took possession of the town of Tabasco. The noise of the artillery, the appearance of the floating fortresses which had transported the Spaniards over the ocean, and the horses on which they fought, all new objects to the natives, inspired them with astonishment mingled with terror and admiration; they regarded the Spaniards as gods, and sent them ambassadors with presents. Cortes here learned that the native sovereign was called Montezuma; that he reigned over an extensive empire, which had lasted for three centuries; that thirty vassals, called caciques, obeyed him; and that his riches were immense and his power absolute. No more was necessary to inflame the ambition of the invader, who did not hesitate to undertake the conquest of this great empire, which could only be effected by combining stratagem and address with force and courage. He laid the foundation of the town of Vera Cruz, caused himself to be elected captain-general of the new colony, and, like Agathocles, burned his vessels to cut off the possibility of retreat and show his soldiers that they must either conquer or perish. He then penetrated into the interior of the country, drew to his camp several caciques hostile to Montezuma, and induced these native princes to facilitate his progress. The republic of Tlascala, which was hostile to Montezuma, opposed him; but he routed its army, which had resisted all the forces of the Mexican empire, dictated peace on moderate terms, and converted the people into powerful auxiliaries. His further advance was in vain attempted to be checked by an ambuscade laid by the inhabitants of Cholula, on whom he took signal vengeance. Surmounting all other obstacles he arrived, with 6000 natives and a handful of Spaniards, in sight of the immense lake on which was built the city of Mexico, the capital of the empire. Montezuma received him with great pomp, and his subjects, believing Cortes to be a descendant of the sun, prostrated themselves before him. The first care of Cortes was to fortify himself in one of the beautiful palaces of the prince, and he was planning how to possess himself of the riches of so opulent an empire, when intelligence reached him that a general of the emperor, who had received secret orders, had just attacked the garrison of Vera Cruz and killed several of his soldiers. The head of one of the Spaniards was sent to the capital. This event undeceived the Mexicans, who had hitherto believed the Spaniards to be immortal, and necessarily altered the whole policy of Cortes. Struck with the greatness of the danger, surrounded by enemies, and having only a handful of soldiers, he conceived and instantly executed a most daring project. Having repaired with his officers to the palace of the emperor, he announced to Montezuma that he must either accompany him or perish. Being thus master of the person of the monarch, he next demanded that the Mexican general and his officers who had attacked the Spaniards should be delivered into his hands; and when this had been done he caused these unfortunate men, who had only obeyed the orders of their sovereign, to be burned alive before the gates of the imperial palace. During this cruel execution Cortes entered the apartment of Montezuma, and caused him to be loaded with irons, in order to force him to acknowledge himself a vassal of Charles V. The unhappy prince yielded, and was restored to a semblance of liberty on presenting the fierce conqueror with 600,000 marks of pure gold, and a prodigious quantity of precious stones. Scarcely had he reaped the fruits of his audacity, however, when he was informed of the landing of a Spanish army, under Narvaez, which had been sent by Velasquez to compel him to renounce his command. In this emergency Cortes acted with his usual decision and courage. Leaving 200 men at Mexico, under the orders of his lieutenant, he marched against Narvaez, whom he defeated and made prisoner, and he then enlisted under his standard the Spanish soldiers who had been sent to attack him. On his return to the capital, however, he found that the Mexicans had revolted against the emperor and the Spaniards, and that dangers thickened around him. Montezuma perished in attempting to address his revolted subjects; upon which the latter, having chosen a new emperor, attacked the head-quarters of Cortes with the utmost fury, and, in spite of the advantage of fire-arms, forced the Spaniards to retire, as the only means of escaping destruction. Their rearguard, however, was cut in pieces, and they suffered severely during the retreat, which was continued during six days. Elated with their success, the Mexicans offered battle in the plain of Otumba. This was what Cortes desired, and it proved their destruction. Cortes gave the signal for battle, and, on the 7th of July 1520, gained a victory which decided the fate of Mexico. Immediately afterwards he proceeded to Tlascala, assembled an auxiliary army of natives, subjected the neighbouring provinces, and then marched a second time against Mexico, which, after a gallant defence of several months, was retaken on the 13th of August 1521. These successes were entirely owing to the genius, valour, and profound but unscrupulous policy of Cortes; and the account of them which he transmitted to Spain excited the admiration of his countrymen. The extent of his conquests, and the ability he had displayed, exalted the censure which he had incurred by the irregularity of the operations; and public opinion having declared in his favour, Charles V., disregarding the pretensions of Velasquez, appointed him governor and captain-general of Mexico, at the same time conferring on him the valley of Guaxaca, which was erected into a marquisate, with a considerable revenue. But although his power was thus confirmed by royal authority, and although he exerted himself to consolidate Spanish domination throughout all Mexico, the means he employed were such that the natives, reduced to despair, took arms against the Spaniards. This revolt, however, was speedily subdued, and the Mexicans were everywhere forced to yield to the ascendency of European discipline and valour. Guatimozin, who had been recognized as emperor, and a great number of caciques, accused of having conspired against the conquerors, were publicly executed, with circumstances of great cruelty, by order of Cortes. Meanwhile the court of Madrid, dreading the ambition and popularity of the victorious chief, sent commissioners to watch his conduct and thwart his proceedings; and whilst he was completing the conquest of New Spain his goods were seized by the fiscal of the Council of the Indies, and his retainers imprisoned and put into irons. Indignant at the ingratitude of his sovereign, Cortes returned in person to Spain to appeal to the justice of the emperor, and appeared there with great splendour. The emperor received him with every mark of distinction, and decorated him with the order of St Iago. Cortes returned to Mexico with new titles but diminished authority, a viceroy having been intrusted with the administration of civil affairs, whilst the military department, with permission to push his conquests, was all that remained to Cortes. This division of powers became a source of continual dissension, and caused the failure of the last enterprizes in which he engaged. Nevertheless, in 1536, he discovered the peninsula of California, and surveyed a part of the gulf which separates it from Mexico. At length, tired of struggling with adversaries unworthy of him, whom the court took care to multiply, he returned to Europe, hoping to confound his enemies. But Charles V. received him coldly. Cortes dissembled, redoubled the assiduity of his attendance on the emperor, accompanied him in the disastrous expedition to Algiers in 1541, served as a volunteer, and had a horse killed under him. This was his last appearance in the field, and if his advice had been followed the Spanish arms would have been saved from disgrace, and Europe delivered nearly three centuries earlier from the scourge of organized piracy. Soon afterwards he fell into neglect, and could scarcely obtain an audience. One day, however, having forced his way through the crowd which surrounded the emperor's carriage, and mounted on the door-step, Charles, astonished at an act of such audacity, demanded to know who he was. "I am a man," replied the conqueror of Mexico proudly, "who has given you more provinces than your ancestors left you cities." This haughty declaration of important services ill-requited could scarcely fail to offend a monarch on whom fortune had lavished her choicest favours; and Cortes, overwhelmed with disgust, withdrew from court, passed the remainder of his days in solitude, and died, near Seville, on the 2d of December 1554, being then in the sixty-third year of his age.

The only writings of Cortes are five letters on the subject of his conquests, which he addressed to Charles V., and which have fortunately been given to the world. The best edition of them is that of Don Francisco Antonio Lorenzana, archbishop of Mexico, entitled *Historia de Nueva-España escrita por su esclarecido conquistador, Hernan-Cortes, aumentada con otros documientos y notas* (Mexico, 1770, 4to), a work the noble simplicity of which attests the truth of the recital it contains. An English translation of the letters, by George Folsom, was published at New York in 1843. The conquests of Cortes have been described with pompous elegance by Antonio de Solis in his *Historia de la Conquista de Mejico*, and with more truth and simplicity by Bernardo Diaz del Castillo in his work under the same title. See also Robertson's *History of America*, Prescott's *History of the Conquest of Mexico*, and Sir Arthur Helps's *Life of Hernando Cortes* (2 vols. Lond. 1871)

CORTESE. See Courtois.

CORTONA, a city of Italy, in the province of Arezzo, and about thirteen miles south of the city of that name, occupying the summit and slope of a steep hill that, from a height of 2000 feet above the sea, overlooks the fertile valley of the Chiana or Clanis. Its ancient fortifications, which are well preserved in almost their total circuit, present not only portions of Roman and mediæval works, but magnificent specimens of the so-called Cyclopean architecture. The cathedral, a building of the 15th century, but restored by Galilei in the 18th, contains a number of paintings by Luca Signorelli and Pietro Berettini, who were both natives of the town; the tomb of John Baptist Tommasi, the last grand-master of the Order of Malta; and a large sarcophagus, adorned with bas-reliefs of the Lapithæ and Centaurs, in which, according to the fanciful hypothesis of the local antiquaries, were the remains of the Consul Flaminius, who perished in the battle of Lake Thrasymene against the Carthaginian invader. Among the other churches, which are almost all in possession of paintings of interest to connoisseurs, the most important is Santa Margherita, a fine building of the 13th century by Nicola and Giovanni Pisano, which occupies the top of the hill and is embosomed in cypress trees. The *Accademia Etrusca*, founded by Ridolfino Venuti in 1726, has a museum in the *palazzo pretorio*, which numbers amongst its various treasures a bronze candelabrum of sixteen lights, ranked among the finest specimens of Etruscan art. In the same building is preserved the Bonbucci Library, which contains a fine MS. of Dante and a curious unpublished work called the *Notti Coritane*, or *Nights of Cortona*. Outside of the town is an Etruscan tomb of some architectural interest, known as the Grotto of Pythagoras. The population of the commune is upwards of 26,000; that of the city is only 3973.

The origin of Cortona, or Corythus, as it is called by Virgil, is lost in remote antiquity; and little light is thrown on the question by the statement of Dionysius that it was founded by the Umbrians, and passed from them to the Pelasgians. It was certainly one of the most powerful of the twelve Etrurian cities, and continued to maintain its position under the Romans; but probably from the fact that its supposed impregnability led the successive conquerors of Italy to pass it by, its name is rarely found in the ancient classics, and we are even ignorant of the date when it first fell into the hands of the Romans. It was colonized about the end of the 2d century B.C., but as the colony was never renewed it is not mentioned in the lists of Pliny or Ptolemy. It was one of the first bishoprics of the Christian church; and after the barbarian invasions, it reappears in the Middle Ages as a place of importance. Held for about a century by the Casale family, it was transmitted by them to King Ladislas of Naples, who, in his turn, in 1412 bestowed it on the Florentines.

CORUNNA (Spanish, *La Coruña;* French, *La Corogne;* English, formerly often The Groyne), a city and seaport of Spain, the capital at one time of Galicia, and now of a province of its own name, is situated on the north-west coast, 43 miles north of Santiago de Compostella, in 43° 23′ N. lat. and 8° 27′ W. long. It is of first rank both as a fortress and a port, and is the seat of a superior court and a commercial tribunal. There is an upper and a lower town, the former built on the east side of a small peninsula, and the latter on the isthmus connecting the peninsula with the mainland. The upper town is the more ancient, and is still surrounded by walls and bastions and defended by a citadel; but it has been gradually outgrown by the lower, which, though at first a mere Pescaderia, or fishing-village, is now comparatively well built, and has several broad and handsome streets. There is little remarkable in the public buildings, though they include six churches, of which Santiago dates from the 11th and the Colegiata from the 13th century, five convents, two hospitals, a palace for the captain-general of Galicia, a theatre, a school of navigation, an arsenal, and barracks. The harbour, though of rather difficult access, is perfectly secure, and it is defended by several forts, of which the most important are San Diego on the east and San Antonio on the west. These fortifications are of little practical importance on the land side, as they are commanded by a hill that overlooks the city. The so-called Tower of Hercules to the north, supposed to have been originally built by the Romans, has been raised in modern times to a height of upwards of 360 feet, and is now crowned with a fine revolving light visible for a distance of twelve miles to sea. English, French, and Belgian steamers call here on their way to South America for mails or emigrants; and upwards of 300 merchant ships, mostly British, enter the port every year. The trade consists mainly in the export of fat cattle—20,000 of which were sent to England in 1873,—eggs, meats, fruits, and sardines; and in the importation of general grocery-goods and manufactured articles. Besides a large Government tobacco-factory, which employs about 3000 women, there are in the city two glass-factories, two cotton-factories, and several steam saw-mills and sardine-curing establishments; and the herring and pilchard fisheries give employment to a number of the inhabitants. According to the census of 1869, the population of the town and suburbs was about 30,000; in 1874 it was estimated at 40,000.

Corunna, possibly at first a Phœnician settlement, is identified with the ancient Ardobrica, a seaport mentioned by Mela in the country of the Artabri, from whom the name of Portus Artabrorum was given to the bay on which the city is situated. In the Middle Ages, and probably at an earlier period, it was called Caronium, a name which is much more probably the origin of the present designation than the Latin Columna which is sometimes put forward. The harbour has always been of considerable importance, but it is only in comparatively modern times that it has made a figure in history. In 1588 it gave shelter to the Invincible Armada; and in 1598 the town was captured and burned by the English under Drake and Norris. In 1747, and again in 1805, the bay was the scene of a naval victory of the English over the French; and in 1809 an action took place in the neighbourhood which has become one of the most celebrated in British military annals. The French under Marshal Soult attempted to prevent the embarkation of the English under Sir John Moore, but were successfully repulsed in spite of their numbers. Moore was mortally wounded in the engagement, and expired shortly after its termination. He was hastily buried on a bastion near the sea; and a monument in the Jardin de San Carlos raised by the British Government commemorates his bravery and intrepidity. In 1820 the town joined the revolutionary movement and declared the constitution, but in 1823 it had to capitulate to Bourck, the French general.

CORVEY, a famous Benedictine abbey in Saxony, situated on the Weser, in the neighbourhood of Höxter, with which it communicates by an avenue about three-quarters of a mile in length. It was founded by Louis the Pious in 813, and received its name from the fact that the first body of monks by whom it was held came from Corbie in Picardy. Raised to the rank of a bishopric in 1793, it was secularized in 1802, and bestowed on the Nassau Orange family; and since then it has passed through various hands to those of the present prince of Ratibor, who received it in 1840 by the will of Victor Amadeus of Hesse-Rothenberg. The abbey, or, as it is now called, the castle of Corvey, possesses a very extensive library, especially rich in old illustrated works; but the ancient collection due to the literary enthusiasm of the Benedictines is no longer extant. It at one time preserved the famous manuscript of Tacitus which contains the six books of the *Annals*. Widukind composed his history of the Saxons within the precincts of Corvey; and the *Annales Corbejenses* of the monks can still be read in Pertz's *Monumenta Germaniæ Historica*, vol. iii. The *Chronicon Corbejense*, published by Wedekind in 1824, has been proved a forgery. (See Wigand, *Geschichte der Abtei Korvey*, Höxter, 1819, and *Der Korveische Güterbesitz*.)

CORVISART-DESMARETS, JEAN NICOLAS, BARON DE (1755–1821), French physician, was born at Vouziers, in Champagne. His parents intended him for the profession of the law, but he turned aside to the study of medicine, in which he took an enthusiastic interest. He became parish doctor of Saint-Sulpice, and then obtained a post in the hospital of La Charite, where he founded a flourishing clinical school. He was next appointed professor in the Collége de France (in which position he was eminently successful), and member of the Academy of Sciences. But he was still struggling with debt when the Empress Josephine introduced him to Napoleon, by whom he was created baron and member of the Legion of Honour. His only original work of importance is his *Essay on Diseases of the Heart and the Great Vessels.*

CORVUS, M. VALERIUS, one of the most illustrious generals of the early Roman republic, was born about 370 B.C. The legend which accounts for his cognomen of *Corvus* (the raven) tells how, while fighting with a gigantic Gaul, he was assisted by a raven, which baffled his enemy by fluttering in his face. He was twice dictator and six times consul, and he occupied the curule chair twenty-one times. In his various campaigns he defeated successively the Gauls, the Volsci, the Samnites, the Etruscans, and the Marsi. His most important victory was that which he won over the Samnites at Mount Gaurus (343 B.C). He died a hundred years old about 270 B.C.

CORYATT, THOMAS (1577–1617), was born at Odcombe, Somersetshire, where his father, the Rev. George Coryatt, prebendary of York Cathedral, was rector. Educated in Westminster School and Gloucester Hall, Oxford, he entered the household of Prince Henry, the eldest son of James I. In 1611 he published a curious account of a walking tour, under the title of *Coryatt's Crudities hastily gobbled up in Five Months' Travels in France, Italy, &c.* At the command of Prince Henry, verses in mock praise of the author (afterwards published by themselves as the *Odcombian Banquet*) were added to the volume, written in a number of languages, and some in a mixture of languages, by Ben Jonson, Donne, Chapman, Drayton, and many other of the literary men of the time. In the same year he published a second volume of a similar kind, *Coryatt's Crambe, or his Coleworte twice Sodden.* In 1612 he set out on another journey, which also was mostly performed on foot. He visited Greece, the Holy Land, Persia, and Agra, whence he sent home an account of his adventures. He died at Surat in 1617.

CORYBANTES, in Greek mythology, were associated with the Phrygian goddess Rhea Cybele as her first worshippers and priests. They were of the same class of beings as the Curetes, Cabiri, and Dactyls of Mount Ida in Crete, and were of the nature of *dæmones*, supposed by some to have sprung from the earth like trees (δενδροφυεῖς). The wild orgiastic dance with clangour of music, which was part of the worship of Cybele, was traced to them, and was called κορυβαντιᾶν, whence a derivation of their name has been sought in a word to express this din of music and dance. An old derivation traced it to Κόριον, a hill said to be in Cyprus, but not otherwise known to be there. Besides the power of music the Corybantes exercised also cures by magic and other arts of superstition. Of the other *dæmones* with whom the Corybantes were identified in antiquity the Cabiri have already been described (see CABIRI.) The Curetes were associated with the infancy of Zeus in Crete, where they kept guard over him, dancing and clanging their shields. They were thought of as having skill in working in metals and in finding them under the earth. They had also prophetic powers, and made a wild dance part of their ceremony of worshipping Zeus. Through being identified with the Corybantes they became associated with the goddess Cybele, and were found connected with her worship in its various centres in Asia Minor. The Dactyls of Crete were distinctly associated with Rhea Cybele, and were chiefly thought of as being possessed of metallurgic powers, as their names, Kelmis, Damnameneus, and Akmon, imply, though they were also skilled in music.

CORYPHÆUS (from κορυφη, the top or the head), in ancient tragedy, was the leader of the chorus. Hence coryphæus passed into a general name for the chief or leader of any company or movement.

COS (or STANKO, or STANCHIO, by corruption from ἐς τὰν Κῶ), an island in that part of the Turkish archipelago which was anciently known as the Myrtoan Sea, not far from the south-western corner of Asia Minor, at the mouth of the Gulf of Halicarnassus, or Bay of Budrum. Its total length is about 25 miles, and its circumference about 74. A considerable chain of mountains, known to the ancients as Oromedon, or Prion, extends along the southern coast with hardly a break except near the island of Nisyros; so that the greatest versant and most important streams turn towards the north. The whole island is little more than a mass of limestone, and consequently unites great aridity in the drier mountain regions with the richest fertility in the alluvial districts. As the attention of the islanders is mainly directed to the culture of their vineyards, which yield the famous Sultana raisins, a considerable proportion of the arable land is left untouched, though wheat, barley, and maize are sown in some quarters, and melons and sesamum seed appear among the experts. Formerly one of the most valuable products of the island was its lemons and oranges, but since the destruction of the trees by a severe frost in 1850, these fruits hardly take any place in the market. The wild olive is abundant enough, but neglected; and cotton, though it thrives well, is only grown in small quantities. As the principal harbour, in spite of dredging operations, is only fit for smaller vessels, the island is not of so much commercial importance as it would otherwise be; but since 1868 it has been regularly visited by steamers, and about fifty vessels annually enter the harbour. The only town in the island is Cos, or Stanko, at the eastern extremity, remarkable for its fortress, founded by the knights of Rhodes, and for the gigantic plane-tree in the public square. The fortress is supposed to occupy the site of the temple of Æsculapius so celebrated in antiquity, and it preserves in its walls a number of interesting architectural fragments. The plane-tree has a circumference of about 30 feet, and its huge and heavy branches have to be supported by pillars; of its age there is no certain knowledge, but the popular tradition connects it with Hippocrates. The town is supplied by an aqueduct, about four miles in length, with water from a hot chalybeate spring, which is likewise named after the great physician of the island. The villages of Pyli and Kephalas are interesting, the former for the Greek tomb of a certain Chamylos, and the latter for a castle of the knights of St John and the numerous inscriptions that prove that it occupies the site of an ancient city called Isthmos. The population of the island amounts to about 10,400 souls, of whom about a third are Mahometans, and the rest, with the exception of a dozen Jewish families, Christians.

Cos is said to have been colonized from Epidaurus, the great Peloponnesian centre of the worship of Æsculapius, and it is certai that the Æsculapian cultus had a remarkable hold in the island. For a time the city was a member of the Dorian Pentapolis which held its federal assemblies in the Triopian headland; but at a later date it became subject to the Athenians by whom it was fortified. The Emperor Claudius made it a free state, and to Antoninus Pius it was indebted for restoration from the effects of a great earthquake. During the Greek and Roman period the island was famous for its purple and its wines; the Coan robes were celebrated by the poets for the delicacy and transparency of their texture; and it also enjoyed a nobler celebrity as the birthplace of Hippocrates the physician and Apelles the artist. In modern times its history presents few details, the most interesting fact being its possession by the knights of St John.

Inseln*; Leake's paper in the *Transactions of the Roy. Soc. of Lit.*, 1843; C. T. Newton, *Travels and Discoveries in the Levant*, 1865.

COSENZA, a city of Italy, the seat of an archbishopric, and the capital of the province of Calabria Citra, is situated in a deep glen at the junction of the Busento with the Crati, twelve miles east of the Mediterranean. It is intersected by the Busento, which is there crossed by two bridges. The streets are generally narrow and crooked, and the lower part of the town is said to be unhealthy. The *tribunale*, or palace of justice, one of the finest edifices in the kingdom, is on the eastern bank; and an old castle, now used as barracks, crowns the summit of an eminence on the opposite side of the river. It has also a diocesan seminary, a royal college, a theatre, a foundling hospital, and academies of science and literature, manufactures earthenware and cutlery, and trades in silk, rice, wine, fruits, and flax. Population of the commune, 15,960; of the city, 12,613.

Cosenza is a place of great antiquity, having under the name of Consentia been the chief city of the Bruttii. It was possibly captured by Alexander of Epirus, and certainly became the place of his sepulture. After various vicissitudes during the Carthaginian war, it was finally reduced by the Romans about 204 B.C.; and in the reign of Augustus it received a Roman colony. Alaric, king of the Goths, died while besieging the city in 410 A.D., and was buried in the bed of the Busento, which was turned from its course for his interment. During the Middle Ages the city retained its importance, and in the 11th century it was raised to the rank of an archbishopric. In 1461 it was taken by Roberto Orsini, and suffered severely; and in the beginning of the present century, it was the seat of the French commission which made itself so notorious by its sanguinary proceedings in Calabria. Among its celebrities may be mentioned the grammarian Parrhasius and the philosopher Telesio.

COSIN, JOHN (1594–1672), bishop of Durham, was born at Norwich, November 30, 1594. From the grammar school of his native city he passed, at the age of sixteen, to Caius College, Cambridge, where he graduated B.A. After a few years he took holy orders and was appointed domestic chaplain to the bishop of Durham. At the close of 1624 he was made a prebendary of Durham, and in the following year archdeacon of the East Riding of Yorkshire. Before this time he had married, and in 1628 he took his degree of D.D. He first became known as an author in 1627, when he published his *Collection of Private Devotions*, a manual stated to have been prepared by command of the king, Charles I., for the use of the maids of honour to the queen. This book, in connection with his insistence on points of ritual in his cathedral church and his friendship with Bishop Laud, exposed him to the suspicion and hostility of the Puritans; and the book was rudely handled by Prynne and Burton (who both, nine years later, were set in the pillory and mutilated for their free speeches on other matters). In the year following this publication Cosin took part in the prosecution of Prebendary Smart for a sermon against Papistical bishops and priests and practices; and the prebendary was deprived. In 1634 Cosin was appointed master of Peterhouse, Cambridge; and in 1640 he became vice-chancellor of the university. In October of this year he was promoted to the deanery of Peterborough. A few days before his installation the Long Parliament had met; and among the complainants who hastened to appeal to it for redress was the ex-prebendary, Smart. His petition against the new dean was considered; and early in 1641 Dr Cosin was sequestered from his benefices. Articles of impeachment were, two months later, presented against him, but he was dismissed on bail, and was not again called for. He took part, in 1642, in sending the university plate to the king, and was for this offence deprived of the mastership of Peterhouse. He thereupon withdrew to France, preached at Paris, served as chaplain to some members of the household of the exiled royal family, and at the Restoration he returned to England. He was reinstated in the mastership, restored to all his church benefices, and in a few months raised to the see of Durham (December 1660). This dignity he enjoyed for about eleven years; and during this time he applied a large share of his revenues to the promotion of the interests of the church, of schools, and of charitable institutions. He died in London, January 15, 1672.

Among his writings are a *Historia Transubstantiationis Papalis*, *Notes and Collections on the Book of Common Prayer*, and a *Scholastical History of the Canon of Holy Scripture*. A collected edition of his works, forming 5 vols. of the Oxford *Library of Anglo-Catholic Theology*, was published between 1843 and 1855.

COSMAS, surnamed from his maritime experiences *Indicopleustes*, a writer of the 6th century. We know nothing of his history except what can be gathered from one of his works which has come down to us, a book which is in itself a mere bank of mud, but is remarkable on account of certain geographical fossils of considerable interest which are found imbedded in it. The first part of the work, embracing books i.–v., can be shown to have been written soon after 535; to these seven more books appear to have been gradually added by the author. He was a monk when he wrote, but in earlier days apparently had been a merchant, and in that capacity had sailed on the Red Sea and the Indian Ocean, visiting Abyssinia and Socotra (Αἰθιοπία and ἡ νῆσος ἡ καλουμένη Διοσκορίδους), and apparently also the Persian Gulf, Western India, and Ceylon. The book, which was written at Alexandria, is called by the writer Χριστιανικὴ τοπογραφία περιεκτικὴ παντὸς τοῦ κόσμου, *A Christian Topography Embracing the Whole World*, and the great object of it is to denounce the false and heathen doctrine of the rotundity of the earth, and to show that the tabernacle in the wilderness is the pattern or model of the universe. Thus the earth is a rectangular plane twice as long as it is broad. The heavens come down to the earth on all four sides like the walls of a room. From the north wall to the south wall, at an undefined level, a semi-circular waggon vault is turned, and at the same level stretches the "firmament" (στερέωμα) like a flat ceiling. All below the firmament is this world; the story above is heaven, or the world to come. In fact, one of the huge receptacles in which female travellers of our own day carry their dresses forms a perfect model of the universe of Cosmas. Midway in the rectangular surface below lies the inhabited earth, encompassed by Ocean. Beyond Ocean, bordering the edge, is the unvisited transoceanic land on which, in the far east, lies Terrestrial Paradise. Here, too, on a barren and thorny soil, without the walls of Paradise, dwelt man from the fall to the deluge. The ark floated the survivors across the great ocean belt to this better land which we inhabit. The earth rises gradually from south to north and west, culminating in a great conical mountain behind which the sun sets. Repeatedly the writer overflows with indignation against those who reject these views of his, "not built on his own opinions and conjectures, but drawn from Holy Scripture, and from the mouth of that divine man and great master, Patricius."[1] The wretched people who chop logic, and hold that the earth and heaven are spherical, are mere blasphemers, given up for their sins to the belief of such impudent nonsense as the doctrine of Antipodes, and so forth. Altogether the book is a kind of caricature type of that process of loading Christian truth with a dead weight of false science which has had so many followers and done so much mischief. Similar cosmography was taught by Diodorus of Tarsus, and other Nestorian doctors

[1] This Patricius is stated by Cosmas to have been afterwards *Catholicos* of Persia. This and other circumstances identify Patricius with Mar Abas, who ruled the Nestorian Church from 536 to 552 (see Assemani, *Bibl. Orient.* tom. ii. and iii.).

Among the curious pieces of information very sparsely found amid this stuff are notices of *Ethiopia* (Abyssinia) and its traffic for gold with Inner Africa, of *Taprobane* or *Sielediba* (Ceylon), *Male* (Malabar), and the products and animals of those regions. But the most interesting geographical circumstance is the fact that Cosmas is not only the first who mentions China by a name on which there can be no controversy, *Tzinista*, *i.e.*, the Persian *Chinistán*, but also that he had a very correct idea of its position as lying on the extreme eastern coast of Asia, and "compassed by the ocean running round it to the left just as the same ocean encompasses Barbary (*i.e.*, the Somáli country beyond Abyssinia) round to the right." He knew also that a ship sailing to China, after running east for a long way, and leaving the Clove Country behind, had to turn north at least as far as a ship bound for Chaldæa would have to run up the Persian Gulf, and thus it was intelligible how Tzinista by the overland route lay much nearer Persia than might have been thought from the length of the sea voyage thither.

The work has been preserved in at least two MSS. One is in the Vatican, a very fine uncial MS. of the 8th century, with figures apparently from drawings by Cosmas himself; the other a parchment MS. of the 10th century, is in the Medicean. This last alone contains the 12th book, and of that a leaf is lost. An account of the work is given in the *Bibliotheca* of Photius, who speaks contemptuously of the author. Some geographical extracts were first published in Thévenot's *Collection of Travels* (1696). The whole work was edited by Montfaucon in his *Collectio nova Patrum et Script. Græc.*, 1706 (vol. ii), and is republished in *Bibl. Veterum Patrum* of P. Andrea Gallandi (vol. xi., Venice, 1776). It appears from allusions in the book itself that Cosmas also wrote a more detailed *Topography of the Earth*, a work on the motions of the stars, and a *Commentary on Canticles*. The loss of the first is to be regretted. (H. Y.)

COSMAS, of Prague (1045–1126), a Bohemian priest and historian, wrote a *Chronicon Bohemorum*, which contains the history and traditions of his country up to nearly the time of his death. This work was printed in 1602, and again among the *Scriptores Rerum Bohemicarum* (Prague, 1783).

COSMOGONY, a theory of the origin of the world and its inhabitants. Such a theory is never found on the lowest stage of human culture. Thus, "it never occurred to the Eskimos," says Dr Brinton, "that the earth had a beginning;" and the Abipones of South America "never troubled themselves about what went on in the heavens" (Sir J. Lubbock). And even when a theory of the world's origin is formed, it is at first of the simplest character. Two elements, no more, are necessary. With regard to the first, there is a consensus of opinion among primitive races that, before the present order of things, water held all things in solution. Thus the Accadians, whose mythology passed into that of the Semitic Babylonians, "considered the humid element as the vehicle of all life, the source of all generation" (Lenormant). To "make pregnant" this "vast abyss" a creator or organizer is necessary, who is educed, at least not unfrequently, from the abyss itself. Thus, in a Japanese myth reported by Mr Tylor (*Journ. of Anthropol. Inst.*, July 1876), "while the earth is still soft like mud, or like oil floating on the surface of water, there arises out of the mass the flag or rush called *asi*, from which there springs the land-forming god." Some, content with throwing the speculative difficulty further back, imagine the present creation to be rather a re-creation. Hence the notion of world-ages "rounded off by sweeping destructions," the last of which was the deluge. Thus, among the non-Aryan Santals of Bengal, "the tradition of the creation is mixed up with one of the deluge, if indeed the creation with these less gifted races does not begin with the flood. . . . . The Santal legend describes rather the subsidence of waters than a creation" (Dr Hunter, *Rural Bengal*, pp. 150–1). Some simple-minded tribes suppose the earth to have been fished up from the depths of the sea, that is, from the transparent depths of their own Pacific (Waitz and Gerland, *Anthropologie der Naturvölker*, vi 241). The egg is another common mythic element. It is found in Phœnicia, Egypt, India, China, Polynesia, and Finland, associated with one or another of the ideas of mixture, generation, fragility, the dome-like appearance of the sky, and the form of the sun and the planets. The Creator himself assumes the most Protean shapes, ranging from the magnified man to the musk-rat. From this brief introduction we pass on to a few specimen cosmogonies of the more important races.

Until the year 1876 our materials for the Babylonian cosmogony were almost entirely confined to second-hand extracts from Berosus (? 280–260 B.C.) Many (Niebuhr was not among them) doubted their trustworthiness. But the reign of scepticism is over. The late talented decipherer, George Smith, has, it would seem, actually discovered some of the cuneiform tablets from which the priest of Bel compiled. No doubt Berosus was uncritical—he was an Euhemerist, like his contemporaries. But he was honest and learned in cuneiform, and enjoyed access to unmutilated documents, whereas the tablets in our possession are fragmentary, and their interpretation is only inchoate. We cannot, therefore, yet afford to ignore the Berosian narratives, which Syncellus and others have preserved. (See Müller's *Fragmenta Histor. Græc.*, ii. 497, and with caution Cory's *Ancient Fragments*, by Hodges, pp. 58–60.) One of these contains a cosmogony, or rather two cosmogonies, the latter of which is fragmentary, and fitted rather awkwardly into the former. Its resemblances to Gen. i. are obvious, such as the primæval flood, which Berosus calls Thauatth (= *Tihavtu* or *Tihamtu*), and creation by cutting or dividing. But the divergences are equally striking—*e.g.*, Berosus tells of certain composite beings who dwelt in the dark primæval water. This seems to indicate that the water means the æther, which is in fact one of its mythic senses, and that the monsters are the constellations. Mr G. Smith compares this narrative with a tablet derived from the city of Cutha (*Chaldæan Account, &c.*, pp. 102–3), but the parallel is fallacious. Tiamat, the primæval flood, is only mentioned in the latter incidentally, and the monsters are placed on the earth, not in Tiamat.

But there is a much more important cosmogony, for which we are indebted to the library of King Assurbanipal (673–626 B.C.). The tablets (probably twelve in number) are copies of much older originals, which Mr G. Smith would place near 2000 B.C., *i.e.*, at the beginning of the literary period. This is perhaps too early, to judge from the absence of a statement in the colophon that the copy had an "old" original (Mr Sayce in *Academy*, ix. 4). But "late" in Babylonian history is still early from the point of view of Greek and Hebrew literary history. The fragments have been arranged by Mr Smith on valid internal grounds in an order corresponding to the cosmogony in Gen. i. The Babylonian parallels are very striking, and would probably be still more so if the tablets were complete. They are—(1) the general arrangement, (2) the introduction of a god speaking, (3) the notion of the primæval flood, called *tiamat* (feminine) like the *tĕhôm* (masculine) of Gen. i., (4) the repeated eulogy on the previous creative work as "delightful," and (5) the mention of the stars as placed to determine the year. The chief differences arise from the polytheism of Babylonia, and yet some have seen a survival of polytheistic language in Gen. i. 26.

The sacred archives, now lost, of the Phœnicians were known, it seems, to Sanchoniathon, who found a translator(?) in Philo of Byblus (end of 1st century A.D. ?). The origin and value of Philo's work (only known from the extracts in Eusebius) have been discussed by Ewald and M. Renan, with a tolerably satisfactory result. The latter, writing from the shores of Phœnicia, calls it "the admirably faithful mirror of that which I have under my eyes" (*Rev. archéol.*, iii. 172). Distorted and discoloured as the myths in Philo may be, they are such as no forger could have invented. Among them are parts of two, if not three, cosmogonies (Müller, *Fragm. Hist. Gr.*, iii. 565, comp. with caution Cory's *Anc. Fragments*, pp. 1–5). The text is here and there corrupt, and its mythic meaning obscure. Movers and Bunsen are fantastic, nor can we accept Mr Sayce's theory (*Academy*, March 20, 1875), though he is right in seeking for a clue in Babylonia. The first part, however, is clear, with its chaos black as Erebus, and its wind (comp. Gen. i. 2) which became enamoured of its own elements. The explanation of this is due to M. de Vogüé (*Mélanges*, pp. 60, 61). The wind is the creating deity regarded as one; the ἀρχαί are the two sides or persons of the deity when analyzed. In the inscriptions we find both Baal and Tanith "the Name, or Face, of Baal," *i.e.*, the male and female principles, the conjugal union of which produced creation. In another cosmogony we meet with the woman Baau, "which is interpreted Night," probably the *bōhu*, or chaos of Gen. i. 2 (a Babylonian parallel has also been found). On the whole these cosmogonies agree with the Babylonian and portions of the Hebrew, though laying a somewhat greater stress on the life-evolving power of matter (which may be due to the systematizers), and in one case ("Chysor, the opener" = the Egyptian demiurge Ptah) influenced from Egypt. The Semitic (and probably pre-Semitic) notion of creation by division is, however, no longer traceable.[1]

Such were the myths current among the near relatives of the Israelites. But what beliefs had the Israelites themselves? The Old Testament contains three cosmogonies:—Gen. i.–ii. 4*a*; Gen. ii. 4*b*–7; and Prov. iii. 19, 20, viii. 22–31 (with Job xv. 7, 8). Only the first is perfect. The second seems to be fragmentary, and adds but little to our knowledge. The third is poetical and speculative. All three apparently proceed from the lettered class, and have been attributed to an outburst of historic and prehistoric study in the Babylonian and Persian period. It would be too much to say that the Israelites had no cosmogony before the exile, but the probability is that it was comparatively undeveloped, and in the competition of beliefs had fallen into the background. The chief characteristic of Gen. i. is the union of two apparently inconsistent phraseologies, the supernaturalistic and the evolutionary. Thus the pre-existence of matter seems to be asserted in vv. 2, 3. "Now the earth was (*i.e.*, was involved in) chaos [Heb. *tōhū va-bōhū*], and darkness was upon the face of the flood [Heb. *tĕhōm*], and the wind of Elohim was hovering upon the face of the waters"—this describes the circumstances under which the following act took place; "then Elohim said, Let light (the condition of life) be, and light was." The writer uses language common to other cosmogonies, but strives to accommodate it to his own high type of religion. It was not, he consciously or unconsciously implies, a blind force inherent in nature, which produced the first beginnings of life, nor was the Creator himself the offspring of chaos; *his* demiurge was a supernatural being, whom some orthodox commentators have identified with the Logos of later writers, and who was from the first preparing the "rude mass" for its human inhabitants. The peculiar expression, "the wind of Elohim was hovering," suggests different comparisons; thus, on a far lower stage of religious progress, the Polynesians often describe the heaven-and-air-god Tangaloa as a bird hovering over the waters (Waitz, vi. 241). In the earliest form of the narrative in Gen. i. it may have been "the bird of Elohim;" "wind" seems to be an interpretation. Another peculiar form of expression is the creation of the light before the sun (v. 3), which may be supposed to be paralleled by similar expressions elsewhere. The Egyptian god Thoth, the demiurge, is said to have "given the world light when all was darkness, and there was no sun;" and the Orphic light-god Phanes is anterior to the sun. But it is the place of a commentator to trace similar phenomena throughout the first cosmogony, and also to exhibit the evidence of the various redactions through which the section has passed. For, as Dr Schrader (1863) and Mr R. Martineau (1868) have shown, the narrative in its original form did not divide creation into days, but merely gave a catalogue of divine works. We need only add that the word for "to create" in Gen. i. originally meant "to carve." The Hellenistic Jews, it is true, took it in the sense of "to create out of nothing," but many think this is not favoured by the context in Genesis. The problem of the origin of matter seems not to have arisen among the Jews of the 6th century B.C.

The Egyptians have left us no ancient cosmogonical system, though speculation was early rife among them. They appear to have had three great creative deities. Ptah, "the opener" (of the world-egg ?), was *probably* the god of the cosmic fire, who prepared matter for Amen-Ra to organize. But it was to Ra that the honour of creation was chiefly ascribed (see the unsurpassable hymn in *Records of the Past*, ii. 129–136)—to Ra, *i.e.*, the sun-god, as the people supposed, or the *anima mundi*, as the priests. One of Ra's (later) manifestations was Chnum, the divine breath which stirred the primeval waters (as in Gen. i. 2, except that Chnum is never represented as a bird), and the fashioner of gods and men (see *Records of the Past*, ii. 145, and comp. Gen. ii. 7). Thoth, originally the moon-god, became the principle of creative intelligence, and with him were worshipped the eight cosmic forces called Sesennu. He is called "the tongue of Ra," though elsewhere Ra himself is said to create by a word, and this ascription of speech to the deity is, according to M. Naville, one of the most important points in common between the Egyptian and the Hebrew cosmogonies, to be added therefore to those we have already mentioned,—chaos, the divine breath, the creation of light before the sun, and the moulding hand of the deity.

We hasten on to the Aryan nations of the East. The Iranian parallels to the early chapters of Genesis have been greatly exaggerated. The only really valuable ones are those contained in the Avesta, which, though the date of its final redaction is uncertain, is probably in the main earlier than the return of the Jews from Babylon. The cosmogonical parallels are (1) the ascription of creation to the will of a supernatural deity, and (2) the ideal perfection attributed to the newly created world. Yet even here some deduction is necessary. For apparently the world is produced out of pre-existent matter, according to Genesis (see above); out of nothing, according to the Avesta. And though Ahura-mazda (Ormuzd) is generally described in the Avesta as the sole creator, there is an ancient passage (Yasna, ch. xxx.) in which a good and an evil spirit are spoken of as joint-creators. Still, in the period of Darius and Xerxes (to which the first Hebrew cosmogony in its final form probably belongs) we have the best possible evidence for the sole creatorship of Ahura-mazda, for the great cuneiform inscription at Naksh-i-Rustam describes him as "the great God of gods, who made heaven and earth, and made men," and similar language occurs in the royal inscriptions at Elvend, Van, and Persepolis.

[1] The writer regrets not to have received Graf Baudissin's *Studien zur semitischen Religionsgeschichte* in time for this article, but finds nothing to alter in the above remarks.

There is a well-known Vedic hymn ("Nor aught, nor naught existed," &c.), which has been adduced to prove the antiquity of the most refined speculations among the Hindus. But it seems unwise to adduce this as a typical race-myth, for it probably marks the end rather than the beginning of a theological stage (Goldstücker's *Pánini*, p. 144, comp. Max Muller's *Anc. Sansk. Lit.*, pp. 559–565). Another hymn of the same Mandala (Rig Veda x. 90) embodies the comparatively naive conception of the world as the covering of the divinity, Purusha being represented as a prodigious body, from which the various parts of creation proceeded. This is intermixed, however, with the much less simple theory of the sacrifice of the cosmogonic agent himself, the primitive unity parting into different forms as the limbs of the victim are severed on the altar. In the S'atapatha Brāhmana we meet again with the primeval waters and the world-egg, which according to one account produce Prajāpati, and according to another are produced by him. In the same Brāhmana we find the first mention of the tortoise-theory, the origin of which has been well pointed out by Mr Tylor (*Early History of Mankind*, p. 340). The cosmogony in Manu (Dr Muir's *Sanskrit Texts*, iv. 26) is still more deeply tinged with speculation. Here we meet with "the self-existent Lord," who "*with a thought* created the waters, and deposited in them a seed," which becomes a golden egg, in which egg "he himself is born as Brahmā, the progenitor of all the worlds." Contrast this theory of the speculative Hindu, ascribing creation to a thought, with that of the more energetic Semites and Egyptians—"God said, Let it be, and it was so."

Turning to Africa, we find that Old Calabar and Zululand are among the few regions where cosmogonical speculation seems to have at least germinated (see Bastian, Callaway, Tylor). Even the important myths of the American and Polynesian races must on this occasion be dismissed in a few lines. With regard to the former, Dr Brinton's *Myths of the New World* and Mr Bancroft's *Native Races of North America* will supply the reader with much food for thought. Let him not neglect the poetic narrative of the Quichés, with its Hurakan (comp. "hurricane"), the thunder-god, the Heart of Heaven, and the Creator, nor the still more important myth of the north-west Athapascas, nor, for its curiosity, the "Darwinian theory" of the Ahts of Vancouver Island. With regard to the latter, the sixth volume of Waitz and Gerland, and the works of Sir George Grey (*Polynesian Mythology*) and Mr Gill (*Myths and Songs of the South Pacific*), are full of suggestive material and remarkable parallels to the myths of more civilized races. The cosmogony, however, which opens Mr Gill's fascinating collection is too complicated and artificial to be ancient or even (perhaps) indigenous. Even Sir George Grey's delightful story of the rending apart of Heaven and Earth (comp. Gen. i. 6–10) must be pronounced modern as compared with the simple stories of the heaven-god Tangaroa. It is only in the last stage of a religion that cosmogonies are systematized,—

> "Greek endings, each the little passing bell
> That signifies some faith's about to die,"

though the death-struggle may be prolonged, and may issue in a higher life.

Besides the works already expressly cited see Bastian, *Geographische Bilder* (for a remarkable Old Calabar story); Naville, *La litanie du soleil* (translation from the Egyptian, with commentary); The Funeral Ritual (or Book of the Dead), by Dr Birch, in Bunsen's *Egypt*, vol. vi.; Spiegel's *Avesta*, &c. (T. K. C.)

COSNE, a town of France in the department of Nièvre, at the head of an arrondissement on the right bank of the Loire, 35 miles N.N.W. of Nevers. It has a tribunal of primary instance, a communal college and an agricultural society. Some ruins of its mediæval walls, towers, and castle are still preserved. In the vicinity there are extensive forges for the making of anchors and other heavy iron articles. Cosne is mentioned in the Antonine Itinerary under the name of Condate, but it was not till the Middle Ages that it rose into importance as a military post. It was at Cosne that the arrest of Crussol took place which gave rise to the War of the Public Weal under Louis XI.

COSSACKS, certain Russian tribes originally settled on the southern frontiers of Russia in Europe, but now distributed through various parts of the empire, and largely modified by successive intrusions of alien blood. They probably derive their name, which in Russian appears as *Kazak*, from a word synonymous in Tartar with a freebooter and in Turkish with a light-armed soldier. Ethnographically and historically they are divided into two principal sections, the Cossacks of Little Russia, or of the Dnieper, and the Cossacks of Great Russia, or of the Don.

The former or Malo-Russian branch seems to have grown up in the 13th and 14th centuries, and probably owed its existence to the confusion caused by the Tartar invasion. Bands of hardy refugees from the surrounding regions, mainly with Russian blood in their veins, gathered together for mutual defence in the islands of the Dnieper, where the natural character of the situation of itself afforded them considerable protection. Their numbers were rapidly increased, and before long they formed a strong and active community. In the 16th century they were enrolled among the vassals of Poland, but were permitted to retain a number of privileges which put them on a level with the Polish nobility. Their constitution was consolidated, their territory extended, and their valour utilized by the able policy of King Stephen Bathori. Meanwhile the more ardent adventurers amongst them were united into a strict military confederation, not unlike in many respects to those orders of knights which in similar circumstances sprung up in Western Europe for the defence of Christendom. They established their *setcha*, or fortified camp, on an island in the Dnieper, to the south of the *Porogi*, or cataracts, and from this circumstance acquired the name of Zaporogians, or Dwellers beyond the Cataracts. The members were bound by a vow of celibacy; but as every one was welcome to join the association who was willing to submit to its rules, so every one was free to depart as soon as he found it irksome to obey. Freedom and independence were of the first necessity to the Cossacks; their constitution was purely democratic; their *hetmans* or leaders were chosen by popular election, and held their office only for one year. This independent spirit was abundantly displayed in their policy; they lent their services now to the king of Poland, now to Russia, now to the Sultan, and now, it might be, even to the Tartar Khan himself. In 1571, when their leader was put to death by Bathori for having invaded Moldavia on his own authority, thousands of his followers left the country, and went to join their brethren on the Don; and in the following century, the main body which had remained behind, after carrying on a successful war against Poland under the astute Khmelnicky, put themselves under the protection of Russia, whose right to the whole country of the Cossacks, with the exception of a small portion to the west of the Dnieper, was formally recognized by the peace of Radzine in 1681. In 1708 the famous Ivan Stevanovitch Mazeppa, who had succeeded in raising himself to the office of hetman, joined the standard of Charles XII. of Sweden; and this revolt brought down on the Cossacks the vengeance of Peter the Great, who ultimately deprived them of all their privileges and abolished their military organization. The Zaporogians, who left the country after the capture of their setcha, were recalled by the Empress Anne; but they proved so-obstinately obstructive to the civil settlement of the country that they had again to be expelled. They retired for the most part to the Crimea, and on the incorporation of that district with the Russian empire they were deported to Kuban to defend the frontiers against the Caucasian tribes. A small band which had migrated to the Balkan, was recalled in 1828 by the Emperor Nicholas, and sent to form a sort of coast-guard on the Sea of Azoff. The character of the Zaporogian fraternity which was thus destroyed has been the object of very divergent judgments,—some writers seeing in it little more than an organized band of ruffian adventurers, while others raise its members to the dignity of patriots and martyrs who fought and died in defence of national and religious liberty. The last view is well presented by Kulish, one of the most recent of the historians of Little Russia, and it receives no small support from the popular songs in which their virtues and valour are still commemorated among the people of the Ukraine.

The Cossacks of the Don have all along had more direct connection with the empire than their brethren of the Dnieper; and their insurrections, though numerous, have had less of the character of genuine revolt. About seven years after the foundations of their capital Cherkask had been fixed in the marshes of the Don, Ivan IV., irritated at their conduct, despatched against them his general Murashkine. At the approach of the formidable invader the Cossacks dispersed; one band under Yermak pushed eastwards, and effected the conquest of Siberia; another company established themselves in the Ural Mountains and expelled the Tartars from Jaik (Uralsk); while a third probably found a refuge in the Caucasus, where their descendants are still known as the Grebenski, or Mountain Cossacks. In 1637 the portion still left on the Don expelled the Turks from the town of Azoff; and they managed to keep possession of it till 1642 without aid from the Russian Government. Exasperated by the execution of some of their number, and by an attempt to introduce alterations in their religion, they were easily excited to rebellion by the freebooter Stenka (or Stephen) Razine; but after it had risen to a formidable height, the insurrection was suppressed, and its leader executed at Moscow in 1671. In the following century another adventurer found in the discontent of the Cossacks a formidable means of supporting his pretensions; but the success of Pugacheff was as temporary as that of Razine, whom the local superstition imagined to have come to life in his person. The result to the Cossacks was a serious diminution of their privileges, and an extension of Russian control.

Gradually brought under a more rigid military discipline, this restless and warlike race has furnished the empire with one of the most valuable elements in its national army; and their services in the protection of the frontiers from the Caucasus to China are almost incalculable. They form a first-rate irregular cavalry, and render excellent service as scouts and skirmishers; but their steadiness can hardly be trusted in an important engagement. So great is their superstition, that in the midst of a conflict they have been known to give chase to a hare in order to avert the omen by its destruction, and they still retain a large measure of the freebooter's fondness for plunder.

According to their present distribution the Cossacks are distinguished as Cossacks of the Don, of the Azoff, of the Danube, of the Black Sea, of the Caucasus, of the Ural, of Orenburg, of Siberia, of the Chinese frontiers, and of Astrakhan. In their organization they retain the communistic habits of earlier times. The territory is the common property of the stanitza or township; the hay can only be cut after public notice by the Ataman; and no fish can be captured except at prescribed periods, when the whole community join in the enterprize.

Among the privileges still retained by the Cossacks the most important are freedom from taxes, and the right of distilling, brewing, hunting, and fishing.

Kostmaroff, the Malo-Russian historian; Alfred Rambaud, "L'Ukraine et ses chansons historiques," in *Revue des Deux Mondes*, 1877.

COSTA RICA, The Republic of, the most southern of the five states of Central America, occupies the isthmus between about 8° and 11° N. lat., and 82° and 86° W. long. It is bounded on the N. by Nicaragua, the frontier claimed on this side running from the Pacific coast at the stream called La Flor, immediately north of Salinas Bay, to the Lake of Nicaragua, and along its southern shore to the Rio San Juan, and thence down the right bank of the river to its most southerly mouth—but this line is disputed by the Nicaraguan Government; on the S. by the Colombian state of Panamá, the recognized boundary extending from the Golfo Dulce to the Chiriqui river south of the islet called Escudo de Veragua—this line also overlapping a debatable borderland; on the N.E. by the Caribbean Sea; and on the S.W. by the Pacific Ocean.

Its area within these limits, officially stated at 26,040 English square miles, has been found by planimetric measurements, made at Gotha, to be more accurately 21,495 square miles, or not quite double that of Belgium.

The population, which consists mainly of people of Spanish descent, little mixed with foreign elements, is officially estimated at 175,000 (according to M. Belly it is 154,000), including about 5000 civilized Indians of pure blood, 1200 negroes, and 600 Chinese; but besides these there are from 10,000 to 12,000 uncivilized Indians within the limits of the republic.

The Atlantic coastland is generally low, and is characterized by numerous lagoons which have been formed by the prevailing currents opposite the river mouths, the chief break in its extent being the great Lagoon or Gulf of Chiriqui; the Pacific coast rises higher and is marked by the two large peninsulas which inclose the Gulfs of Nicoya and Dulce. Inland the surface of the country is much diversified, but is chiefly occupied by mountains, plateaus, and valleys. In the northern portion a great volcanic range extends from north-west to south-east, from between the Lake of Nicaragua and the Pacific coast to the centre of Costa Rica, separating a narrower Pacific descent from the broader slope to the Atlantic; the peaks of Orosi (5200 feet), Rincon de la Vieja, Miravalles, Poas (8845 feet), Barba, Irazu (10,850 feet), and Turrialba, (10,330 feet), are the summits of this range. The form of the southern half of Costa Rica is determined by the great range called the Montaña Dota, 7000 to 9000 feet in elevation, which extends from west to east nearly across the country, in about 9° 40′ N. lat., and from which two branch range sxtends south-eastwards, the one close along the Pacific coast as far as the lower Terraba river, the other through the centre of the country, rising to its highest points in the Cerro Chiripó and Pico Blanco or Nemú, 11,740 feet above the sea. Between the northern and southern masses lie the broad table-lands of San José and Cartago, marked out on the Pacific side by the ridges called the Cerro del Aguacate and Cerro de Candelaria, and towards the Atlantic by the Cerro Mateo. This central plateau has an elevation of from 3000 to 4000 feet above the sea, and is the most important, and as yet almost the only cultivated region of the country.

The rivers which flow down the Atlantic slope in the

N.E., the Rio Frio, San Carlos, Sarapiqui, and Colorado, are tributaries of the boundary river San Juan, the outlet of Lake Nicaragua; the others of this slope from N. to S., the Reventazon, Pacuar, Chiripó or Matini, Sixaula or Estrella, Changuenola, and Chiriqui, flow independently to the Atlantic lagoons. On the Pacific side from N. to S. the chief rivers are the Tempisque and Las Piedras, flowing to the head of the Gulf of Nicoya; the Rio Grande, from the high borders of the plateau of San José; the Rio de Pirris, Naranjo, and Rio Grande de Terraba.

In contrast to the south-western descent, the Atlantic slope is covered with dense impenetrable forest, and has remained almost closed to traffic and civilization from the earliest times of colonization. Indians still living in a savage state occupy some portions of this wild forest country. The former tribes of the Reventazon and Pacuar have been completely exterminated; those remaining are the Pranzos or Guatusos Indians of the valley of the Rio Frio in the north, the Bizeita tribe on the Sixaula River, and the Terrbis on the Changuenola, in the south-east, sometimes collectively called the Talamanca Indians. The latter tribes have remained in hostility to each other since the discovery of the country; they are perfectly uncivilized, hunters with bow and arrow, and independent of the Government; they trade a little with adventurers from Jamaica, bartering sarsaparilla, hides, and turtle-shells for arms and powder, cotton stuffs, and tobacco. The Mosquito Indians come annually in canoes to the Atlantic coast in May and June to fish for turtle in the Lagoon of Chiriqui. The Pacific slope, on the other hand, is characterized by wide savannahs or llanuras, bordered by forest, and is much more accessible.

The climate varies with the elevation, from the tropical heat of the coast, which is often fever-stricken, to the temperate and healthy air of the plateau and the cold of the mountain heights. In the plateau of San José the north-east trade wind, prevailing from October to April, brings dry weather; from April to October the south-west monsoon, blowing up from the Pacific, brings almost daily rain, excepting within a remarkable period of about a fortnight of dry weather in June, called the "Veranillo de San Juan." The rainfall at San José (3872 feet above the sea) averages from 40 to 60 inches annually; the average temperature here is about 68° Fahr., rising to 76° in the hottest month of summer and falling to 55° Fahr. in the coldest. The country is subject to earthquakes; a very severe one occurring in 1841 destroyed the town of Cartago.

Costa Rica is exceedingly fertile, its forests being filled with an immense variety of timber trees and useful dye woods, such as mahogany, ebony, Indian-rubber, Brazil-wood, and oak; almost all the fruits of the tropical and temperate zones are found to thrive, and flowering plants are in rich profusion. Coffee is the staple cultivated product of the country, and is grown chiefly on the plateau lands of San José and Cartago,—the special adaptability of these to the growth of this plant being attributed to the nature of the soil, which consists of layers of black or dark brown volcanic ash of from 1 to 6 yards in depth. Rice, maize, barley, potatoes, beans, bananas, and yucca are also cultivated to some extent in the interior; cocoa, vanilla, sugar-cane, tobacco, cotton, and indigo, on the warm coast lands, but as yet only for home consumption. About 1150 square miles of the country are under cultivation.

In the forests the wild animals of Central America—the tapir, jaguar, ocelot, puma, deer, and wild pigs—are numerous; a multitude of birds, including the humming bird and the splendid quetzal or trogon, fill the woods; the reptiles include the alligator of the rivers, the iguana, and many other lizards, the boba, tuboba, black snake, rattlesnake, and corale. Among domestic animals oxen and mules are the most valuable, almost all the traffic of the country being carried on by means of ox-waggons.

As yet the chief highway of Costa Rica is the waggon road from Punta Arenas on the Gulf of Nicoya virtually the only port of the country, to the capital San José, and thence to Cartago on the central plateau. Mule tracks lead north-westwards from Punta Arenas through the province of Guanacaste to Nicaragua, from San José north-east by the valley of the Sarapiqui to Grey Town on the Atlantic, from Cartago eastwards to Puerto Limon also on the Atlantic, and southward over the western spurs of the Montaña Dota to the plains of Terraba. A railroad from Alajuela to the capital and through Cartago to Puerto Limon, part of a proposed inter-oceanic highway, was begun in 1871, and in December 1873 the portion between Alajuela and Cartago, 42 miles, had been completed. Owing to financial difficulties, however, the work ceased in 1874, and only sufficient hands were employed to keep the part finished in working order. Two hundred miles of telegraph line had been completed in 1875.

There are no manufacturing industries in Costa Rica. The country is rich in minerals—gold, silver, copper, iron, nickel, zinc, lead, marble—but up to the present time gold, silver, and copper are the only ores that have been worked. The principal gold mines are—(1) those of Trinidad, 4 leagues inland from Punta Arenas, 1200 feet above the sea, worked on a small scale by a Costa Rican company,—the quartz yields gold of a fineness of about 17½ carats; and (2) the mines of the Cerro del Aguacate, one of which is worked by the native "Compania de la Montaña del Aguacate," also in an imperfect manner, but with good results. Another called the "Sacra Familia," lies a little north of the Aguacate mine, at an elevation of 3000 feet above the sea; it has two chief veins, one containing galena and zinc blend, with silver, and grey copper ore also yielding silver, and a second, with a lode of gold quartz similar to that of Trinidad. This mine is also worked on a small scale by private individuals, and gives gold of about 15½ carats fine. Gold is said also to exist in the wild Indian country of the Atlantic slope, but the position of the supposed mines is uncertain.

Costa Rica is divided into six provinces, in which the population is distributed as follows according to the estimate of M. Belly:—

San José,	45,000	Capital—	San José,	15,000
Cartago,	36,000	,,	Cartago,	10,000
Hérédia,	30,000	,,	Hérédia,	9,000
Alajuela,	29,000	,,	Alajuela,	6,000
Guanacaste,	8,000	,,	Liberia,	2,000
Punta Arenas,	6,000	,,	Punta Arenas,	1,800

The government is vested in a president elected for four years, and a first and second vice-president, aided by four ministers and the national congress of deputies also elected for four years. The present constitution, the seventh which has been in force in the republic, dates from 1871. All men between the ages of eighteen and thirty form the militia of the republic, and in 1874 numbered 16,380,—900 being employed in active service. All men between the ages of thirty and fifty-five years form a reserve. The religion of the state is Roman Catholic, but full liberty for the public exercise of all religions is granted by the constitution. The revenue of the republic, derived from customs, monopolies of spirits and tobacco, from the national bank, sales of land, and various taxes, chiefly that on the exportation of coffee, amounted in 1875 to £517,605; the expenditure in the same year was £556,221, showing a deficit of £38,616.

In 1871 the Government contracted in London a loan of £1,000,000, and in 1872 another of £2,400,000 for the construction of an inter-oceanic railway. In 1875 the external debt from this source was £2,401,300. Of this sum £1,116,000 had been spent on the railroad previous to the close of 1873, when the further execution of the work ceased. The interest and sinking fund of this loan are far in arrears; the country is bankrupt, and the Government has made no attempt to pay even part of its liabilities.

The value of the coffee exported in 1874 was estimated at £892,800; and that of hides, timber, &c., at £20,000.

Imports are chiefly of Manchester goods, hardwares, flour, salt, and sugar, chiefly shipped from England; but trade with France, Germany, and the United States was increasing in 1875. Only about a fourth part of the trade of the republic passes through Puerto Limon on the Atlantic, to which there is a mule track, the bulk of goods being carried round to the Pacific port of Punta Arenas, whence there is a highway to the interior.

Costa Rica was one of the first discovered portions of the American continent; Columbus touched on its shores in his third voyage, and it is probable that Spanish adventurers first established themselves within it after the fourth voyage of Columbus in 1502. In 1821, when all the provinces which formed the kingdom of Guatemala declared their independence of the mother country, two parties, one desiring union with Mexico under the dynasty of Iturbide, the other seeking to form a separate republic, divided opinions in the revolted provinces. In Costa Rica the town of Cartago chose the former; San José the latter. The opposing factions met at a place called the Laguna de Ochomogo. The republicans were victorious, and the seat of government was transferred from Cartago to San José. In 1824 Costa Rica joined the federation of the Central American States, but on the dissolution of that union in 1839 became an independent republic. Internal disturbances and overturnings of the Government have been less frequent in Costa Rica than in the other states of Central America, and its progress has been correspondingly greater. Of recent years, however, the Government has been obliged to maintain an army to guard itself against smouldering revolutions, and at the present time (1877) angry discussions are taking place with Nicaragua on the question of boundaries. On the other hand, an attempt is being made to induce the Central American republics to join again in forming one government.

J.)

COSTANZO, Angelo di (about 1507–1591), an Italian historian and poet, was born at Naples about 1507. His great work is *Le Istorie del Regno di Napoli dal* 1250 *fino al* 1489, which first appeared at Naples in 1572, and was the fruit of thirty or forty years' labour; but ten more years were devoted to the task before it appeared in its final form at Aquila (1582). It is still one of the best histories of Naples; and the style is distinguished by clearness, simplicity, and elegance. As a poet Costanzo is remarkable for finical taste, for polish and frequent beauty of expression, and for strict obedience to the poetical canons of his time.

COSTELLO, Dudley (1803–1865), a journalist, novelist, and miscellaneous writer, was born in Ireland in 1803. He was the son of Colonel J. F. Costello, and choosing his father's profession, was educated at Sandhurst College, and served for a short time with his regiment in Canada and the West Indies. His literary and artistic tastes led him to quit the army, and he then passed some years (1822–1831) at Paris. During this period he was introduced to Baron Cuvier, and was employed by him as draughtsman in the preparation of his work on comparative anatomy. He next occupied himself in copying illuminated manuscripts in the Bibliothéque Royale; and to him and his sister belongs the merit of being the first to draw general attention to the beautiful forgotten art, and of thus leading to its revival. About 1832 Costello became foreign correspondent to the *Morning Herald*, and from this time he was regularly occupied as journalist and contributor to periodical literature. During the last twenty years of his life he held the post of sub-editor of the *Examiner*. He wrote *A Tour through the Valley of the Meuse* (1845), and *Italy, from the Alps to the Tiber* (1861). Among his novels are *Stories from a Screen* (1855), *The Millionaire* (1858), *Faint Heart never won Fair Lady* (1859), and *Holidays with Hobgoblins* (1860). He died in London, September 30, 1865. A few years before his death a pension of £100 per annum was conferred on him.

COSTELLO, Louisa Stuart (1799–1870), an historical and miscellaneous writer, elder sister of the preceding, was born in Ireland in 1799. Her father dying while she was young, during the occupation of France by the allies, she aided in the support of her mother and brother by her skill as an artist. At the age of sixteen she published a volume of verse entitled *The Maid of the Cyprus Isle, and other poems*. This was followed in 1825 by *Songs of a Stranger*, dedicated to W. L. Bowles. Ten years later appeared her *Specimens of the Early Poetry of France*, which was illustrated by beautifully executed illuminations, the work of her brother and herself. It was dedicated to Moore, and procured her his friendship as well as that of Sir Walter Scott. Henceforth literature was the labour of her life. Her principal works are—*A Summer among the Bocages and Vines* (1840); *The Queen's Poisoner* (or *The Queen-Mother*), an historical romance (1841); *Béarn and the Pyrenees* (1844); *Memoirs of Eminent Englishwomen* (1844); *The Rose Garden of Persia* (1845), a series of translations from Persian poets, with illuminations by herself and her brother; *The Falls, Lakes, and Mountains of North Wales* (1845); *Clara Fane* (1848), a novel; *Memoirs of Mary of Burgundy* (1853); and *Memoirs of Anne of Brittany* (1855). She died at Boulogne, April 24, 1870.

COSTER, Laurence. See Koster and Printing.

COSTS. When a person brings an action in law against another and succeeds, it is only fair that the defendant, besides paying the sum which he ought to have paid, should also recoup the expenses incurred by the plaintiff in prosecuting a rightful claim. On the other hand, when the action fails, the defendant is justly entitled to be repaid the expenses he has incurred in defending a wrongful claim. That costs should follow the event may therefore be taken as the first principle of the law relating to this subject; but there are many special circumstances which interfere to modify its application. The action, though successful, may be in its nature frivolous or vexatious, or it may have been brought into a higher court where a lower court would have been competent to deal with it; and on the other hand the defendant, although he has escaped a judgment against him, may by his conduct have rendered the action necessary, or otherwise justifiable. In such cases the rule that costs should follow the event would be felt to work an injustice, and exceptions to its operation have therefore to be devised. The law of England as to costs, simple as the subject may appear, is in reality highly complicated.

At common law, costs were not given either to plaintiff or defendant, although the damages given to a successful plaintiff would include the expense he had been put to in taking proceedings. The defendant in a wrongful action could not even recover his costs thus indirectly, and the indirect costs given to a plaintiff under the name of damages were often inadequate and uncertain. Costs were first given under the Statute of Gloucester (6 Edward I. c.1), which enacts that "the demandant shall recover damages in an assize of novel disseisin and in writs of mort d'ancestor, cosinage, aiel, and beziel, and further that the demandant may recover against the tenant the *costs* of his writ purchased together with the damages above said. And this Act shall hold in all cases when the party is to recover damages." The words "costs of his writ" were extended to mean all the legal costs in the suit. The clause gives costs, wherever damages are recovered, and no matter what the amount of the damages may be. Costs were first given to a defendant by the Statute of Marlebridge in a case relating to wardship in chivalry (52 Henry III. c. 6); but costs were not given generally to successful defendants until the 23 Henry VIII. c. 15, which provides that "if in the actions therein mentioned the plaintiff after appearance of the defendant be nonsuited, or any verdict happen to pass by lawful trial against the plaintiff, the defendant shall have judgment to recover his costs against the plaintiff, to be assessed and taxed at the discretion of the court, and shall have such process and execution for the recovery and paying his costs against the plaintiff, as the plaintiff should or might have had against the defendant, in case the judgment had been given for the plaintiff." By the 4 James I. c. 3, this "good and profitable law" was extended to other actions not originally specified, although within the mischief of the Act, so that in any action wherein the plaintiff might have costs if judgment were given for him, the defendant if successful should have costs against the plaintiff. The policy of these enactments is expressed to be the discouragement of frivolous and unjust suits. This policy was carried out by other and later Acts. The 21 James I. c. 16 § 6 (the statute for the limitation of actions) orders that if the plaintiff in an action of slander recover less than 40s. damages, the plaintiff shall be allowed no more as costs than he gets as damages. By the 43 Elizabeth c. 6 it had been enacted that in any personal action not being for any title or interest in land, nor concerning the freehold or inheritance of lands nor for battery, where the damages shall not amount to 40s. no more costs than damages shall be allowed. By 3 and 4 Vict. c. 24 (Lord Denman's Act), where the plaintiff in an action of tort recovers less than 40s., he shall not be allowed costs unless the judge certifies that the action was really brought to try a right besides the right to recover damages, or that the injury was wilful or malicious. Not to speak of other enactments on this subject, the County Court Acts, 1867, laid down the following rule:—If in any action in any of the superior courts the plaintiff shall recover a sum not exceeding £20 if the action is founded on contract, or £10 if founded on tort, whether by verdict, judgment by default, or on demurrer, or otherwise, he shall not be entitled to any costs of suit unless the judge certify on the record that there was sufficient reason for bringing such action in such superior court, or unless the court or a judge at chambers shall by rule or order allow such costs.

Costs in equity were subject to the discretion of the court, but as a general rule the maxim of the civil law, *victus victori in expensis condemnatus est*, was followed. The successful party has a *prima facie* claim to costs, but the court might, on sufficient cause shown, not only deprive him of his costs, but even in some rare cases order him to pay the costs of his unsuccessful opponent. There was a class of cases in which the court generally gave costs to parties sustaining a certain character, whatever might be the result of the suit (*e.g.*, heirs-at-law, mortgagees, &c). A defendant would have been exempted from costs if he had made such a tender of payment as would have rendered a suit unnecessary—such tender to be full and unconditional, and to include costs already incurred, as well as the principal claim.

The following rule as to costs is laid down in the Rules of Court appended to Judicature Act, 1875, order 55:—"Subject to the provisions of the Act the costs of and incident to all proceedings in the High Court shall be in the discretion of the court; but nothing herein contained shall deprive a trustee, mortgagee, or other person of any right to costs out of a particular estate or fund to which he would be entitled under the rules hitherto acted upon in courts of equity: provided that, where any action or issue is tried by a jury, the cost shall follow the event, unless upon application made at the trial, for good cause shown, the judge before whom such action or issue is tried, or the court, shall otherwise order." The provisions of the County Court Act, 1867, above referred to, still hold good, as well as those of Lord Denman's Act, depriving a plaintiff of costs when he recovers less than 40s. on an action of tort, unless the judge certifies; and of 21 James I. c. 16, making costs no more than damages in actions of slander where damages are assessed under 40s.

In the taxation of costs certain principles are observed which may be briefly adverted to. Thus in some cases costs are to be taxed as "between party and party," in others as between solicitor and client. "No definite rules can be laid down with respect to the difference between the costs to be allowed upon one principle of taxation and those allowed upon the other. In general, however, in taxations as between party and party, only those charges will be allowed which are strictly necessary for the purposes of the prosecution of the litigation, or are contained in the table of fees annexed to the general orders and regulations of the court; while in taxations as between solicitor and client the party will be allowed as many of the charges which he would have been compelled to pay his own solicitor, as being costs of suits, as fair justice to the other party will permit" (Daniel's *Chancery Practice*). Costs are taxed between party and party unless otherwise specially directed. Costs of interlocutory motions made in the course of a litigation are sometimes said to be "costs in the cause," that is, they abide the result of the principal issue. A party succeeding in an interlocutory motion, and paying the costs therein made costs on the cause, would recover the amount of such costs if he had a judgment for costs on the result of the whole trial, but not otherwise.

When one of the parties makes default, as in failing to proceed to trial according to notice at the time appointed, he becomes liable to the other for what are called the "costs of the day."

Regulations as to costs of proceedings in the Supreme Court of Judicature will be found in order vi. of the Additional Rules of Court under the Judicature Act, 1875. Two scales of fees which may be charged by solicitors are printed—the lower to be the general charge for matters assigned to the different divisions of the court (except causes relating to sums over £1000 in the Chancery division) and actions for special injunctions. But a court or judge may in any case direct the fees in either scale to be allowed "to all or either or any of the parties and as to all or any part of the costs."

The court of appeal shall have power to make such order as to the whole or any part of the costs of the appeal as may seem just (Rules of the Judicature Act, 1875). (E. R.)

COSTUME

COSTUME, as defined for the present inquiry, is limited to personal attire, but with the exclusion of armour, which has been dealt with under a separate heading.

Greek Costume.

The inquiry begins with Greek costume, as to which, so far as it consists of dress, the general remark may be made that its history is for the most part free from what is known as the changes of fashion, for this reason that the Greeks did not attempt to reconcile the two opposite principles of covering and at the same time displaying the figure, that is to say, of cutting the dress to fit the body. There are changes which will be noted between the dress worn after 450 B.C. and that of an earlier date, when the material was heavier and the figure more closely enveloped, suggesting a difference of climate in these different periods.

Female Dress.—The chief and indispensable article of female dress was the *chiton*, consisting of one piece of material sewed together in the form of a sack open at top and bottom, in height reaching from the neck to the feet of the wearer, and in width equal to that of the extended arms. Within this stands the figure, and first it is girt round under the breasts, to keep it from falling, by a girdle (*zoster*).

Fig. 1.—Bronze statuette (stand of mirror) wearing Chiton. From Athens. Brit. Mus.

Next, the upper edges are fastened together on the top of the shoulders by a brooch (*fibula*), and the arms are either left bare, pressing down into folds at each side the masses of material, or these masses may be gathered round each arm, and fastened down the outside with buttons and loops so as to form sleeves (*chiton cheiridotos*). The chiton could be left open down one side for convenience in dancing, and was then called *chiton schistos*. To secure greater warmth on the breast and shoulders the chiton was made long enough to be doubled back from the top, and this part reaching to the waist was called the *diploïs* or *diploïdion*. It could be also made of a separate piece. Underneath the chiton was worn a band of cloth (*tænia*) to support the breasts, and in addition to this a cord was sometimes crossed round the breasts outside the chiton to assist either in supporting them or in bringing out their form. Round the loins was worn, perhaps not always, either a short petticoat of thick woollen stuff or a sort of bathing drawers, ῷα λουτρίς, such as acrobats wore. So far we have mentioned all the dress that was necessary for indoor wear, which, also, since it had to be got into, was called ἔνδυμα, as opposed to other parts of dress, which were thrown round the body, and were called πειβλήματα. To the latter class belongs the next article of importance in female dress, the *himation*, a garment worn also by men. While the chiton was generally made of linen, of which there was a variety of fabrics (*e.g.*, those of Amorgos, Tarentum, Sicily, Crete, and Phrygia), or of cannabis (made from hemp), or of byssos (flax from India and Egypt chiefly), or of silk (*serica*), the himation consisted of woollen stuff, and was worn like a plaid. It was first thrown over the left shoulder, leaving the short end to hang down in front; the long end was then gathered round the back with the right hand, brought under the right arm, and across the body in front, and finally held in this position by being thrown over the left fore arm. Or instead of being passed under the right arm it could be brought over the right shoulder so as to envelop the right arm, then carried closely round the neck, and finally thrown over the left shoulder with an end hanging down behind; or again, it could be still further drawn up over the back of the head to form a hood. As regards colours, it will be found, when we have taken away black for the use of mourners (τὰ δὲ μέλανα ἱμάτια ὀρφάνινα ἐκάλουν), that the others were employed in a great variety of combinations. An important point was always to have a deep border round the foot of the chiton, either of some uniform colour which suggests solidity and heaviness, so as to weigh down the dress, or of some pattern which would suggest strength to prevent the dress from being torn when striding. Strong contrasts of colours were used, such as a white chiton with a pink himation, or a white chiton with a broad blue border round the foot. Besides embroidery, another kind of ornament consisted of designs beaten out in thin gold and stitched on the dress. Great numbers of those have been found in tombs where the dress itself has entirely perished. Greek vases and sculptures represent Amazons and Persians wearing trousers (*anaxyrides*), but this article of dress did not come into use among the Greeks themselves.

Fig. 2.—Terracotta statuette, wearing Chiton and Himation. From Tanagra. Brit. Mus.

While the chiton and himation, as above described, continued to be the standard dress from about 450 B.C. onwards, it is the rule to find in figures of an earlier date the himation worn as in fig. 3, where it has more of the appearance of a chiton, having like it a diploïdion, and enveloping the greater part of the figure, so that the chiton proper appears as distinctly an under garment. It is a himation of this kind that the archaic figure of Athena wears, and since we know that the name for this garment of hers was *peplos*, it would perhaps be more correct to use this word instead of himation for the upper garment of the earlier period. Among other reasons also for this is the negative evidence that the word peplos does not occur in the inventory of female dresses on an inscription from Athens in the British Museum, in which the latest date given is 335 B.C. Pollux, it is true (vii. 47), cites it in his list of names for dresses worn by women.

Returning to the dress after 450 B.C., we find that the chiton could be tucked up under the girdle till the skirt reached only to the knees, as in the figures of Artemis. A short linen chiton, reaching half way down the thighs, was called *kypassis*. The diploïdion, when once made of a separate piece, could have the form of a sleeveless jacket reaching nearly to the knees. A diploïdion worn only in front was called a *hemidiploïdion*. A chiton worn to leave one breast bare was called *heteromaschalos;* worn without a girdle, as by priests and old women, it was *orthostadios*, or perhaps *zoma*. The *ampechonion* appears to have been a small shawl. The *kimbarikon* was a transparent under-chiton. The following names of dresses are still undetermined—*kandys* or *kandyke*, *epomis*, *pharos*, *phœnole*, *xystis* (*xyston*), *heanos*, *mandye*, *ephestrides*, and *amphiestrides*.

FIG. 3.—Bronze statuette, wearing Peplos. From Ravenna. Brit. Mus.

As regards the covering of the head, that was perhaps most generally accomplished by drawing the himation up over the back of the head like a hood; or, instead of this, a separate piece of cloth was made to perform this service, the end of it falling under the himation. This was the *kalyptra*, or veil. A cap merely intended to cover in the hair and hold it together was called *kekryphalos*. When hats were worn they were of circular shape, and either of some stiff material, as the Thessalian or Bœotian hat (Θεσσαλὶς κυνῆ), observed in terra-cottas from Tanagra in Bœotia and in Pompeian paintings, or of pliant material which could be bent down at the sides like the *petasus* worn by Atalanta. Similar to this seems to have been the *kausia* or Macedonian hat. The *kyrbasia*, or *kidaris*, was a high pointed hat of Persian origin, as was also the *tiara*, which served the double purpose of an ornament and a covering for the head. When the object was only to hold up the hair from the neck, the *sphendone* was used, which, as its name implies, was in the form of a sling; but in this case it was called more particularly *opistho-sphendone*, as a distinction from the sphendone when worn in the front of the head. The head ornaments include the *diadema*, a narrow band bound round the hair a little way back from the brow and temples, and fastened in the knot of the hair behind; the *ampyx*, a variety of the diadem; the *stephane*, a crown worn over the forehead, its highest point being in the centre, and narrowing at each side into a thin band which is tied at the back of the head. Different from this is the *stephanos*, which is a crown of the same breadth and design all round, as on the coins of Argos with the head of Hera, who is expressly said by Pausanias to wear a stephanos. This word is also employed for crowns of laurel, olive, or other plant, when the form would be the same all round the head. Crowns made of wicker-work (*poloi kalathoi*) were also worn (see Gerhard, *Antike Bildwerke*, pls. 303–305). When the hair, as was most usual, was gathered back from the temples and fastened in a knot behind, hair pins were required, and these were mostly of bone or ivory, mounted with gold or plain. So also when the hair was tied in a large knot above the forehead, as in the case of Artemis, or of Apollo as leader of the Muses. The early Athenians wore their hair so, with a pin representing a grasshopper (τέττιξ), in allusion to their claim of having originally sprung from the soil (Thucyd. i. 6). Whether this knot was the *krobylos* is not determined. In archaic figures the hair is most frequently arranged over the brow and temples in parallel rows of small curls which must have been kept in their places by artificial means, probably by small spirals of gold wire, such as are found in early Etruscan tombs lying near the head of the skeleton. Ear-rings (ἐνώτια, ἑλλόβια, ἑλίκτηρες) of gold, silver, or bronze plaited with gold, and frequently ornamented with pearls, precious stones, or enamel, were worn attached to the lobes of the ear. For necklaces (ὅρμοι), bracelets (ὄφεις), brooches (πέροναι), and finger-rings (δακτύλιοι or σφραγῖδες) the same variety and preciousness of material was employed. The gold used was always very thin; the intrinsic value, for example, of the famous Milo necklace in the British Museum is very slight, while the extraordinary amount of skilled workmanship in it would represent a very high value in labour. This is the rule in the best period of Greek art, that the jewellery is of value according to its workmanship; but in later times preciousness of material determined the value. In the earliest jewellery, amber is conspicuous, alternating with pale gold or electrum. For the feet the sandal (σάνδαλον, πέδιλα) was the usual wear; in exceptional cases, as for the bath, shoes, and for hunting, high boots were worn. The hunting boot was laced up the front, and reached to the calves. Gloves (*cheirides*) were worn by the Persians, but apparently never by the Greeks unless to protect the hands when working (*Odyssey*, xxiv. 230).

Male dress.—Fig. 4 represents the dress of a Greek citizen, such as it appears, for example, on the frieze of the Parthenon. It consists of nothing more than a himation such as that already described for women, but worn differently; and from the simplicity of this attire it may be seen in how ridiculously awkward a position Blepyrus was placed by his wife's having carried off his himation and shoes (Aristoph., *Eccles.*, 310 *sqq.*) But underneath the himation was sometimes also a short linen chiton similar to that worn by armed men under their armour; and with this chiton on, the himation could be laid aside on occasion. Workmen of all kinds wore only a short chiton girt round the waist, and let loose from the right shoulder to leave the arm free. In this case the material varied according to the necessary exposure to cold,—a fisherman, for example, having a chiton of hide, as had also slaves; but the slave's chiton was more like a jacket with sleeves reaching to the wrist, and corresponding to the σύσειρα as defined by Pollux (vii. 70), who mentions further the βαίτη and σίσυρα as garments of hide worn by peasants in the form of mantles. The same class of persons wore at other

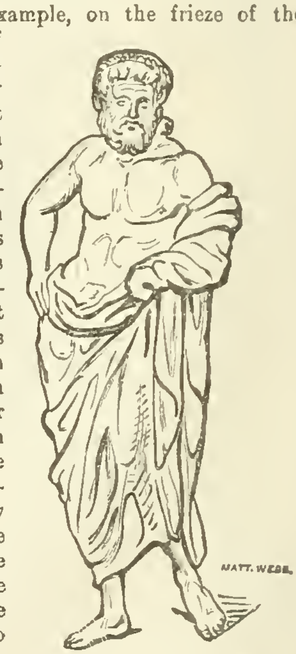

FIG. 4.—Bronze statuette, wearing Himation. From Greece. Brit. Mus.

times the κατωνάκη, a mantle of woollen stuff with border of sheepskin. But among the citizen class where the himation, as in fig. 4, was the proper dress for a man of mature years, younger men and youths appear to have worn it only as a sort of undress to wrap round them when heated in the palæstra or at the bath. In public appearances they wore a linen chiton girt at the waist, and reaching half-way down the thighs, and on their shoulders a purple *chlamys* of woollen stuff fastened with a brooch on the right shoulder as in fig. 5. The *chlamys* was properly a military mantle, and is said to have been introduced from Macedonia, as was also the *kausia*, worn along with it by Athenian youth, a round hat with flat pliant brim resembling the *petasus* of Hermes. In winter a mantle of thick stuff, the *chlæna*, was sometimes worn, while in summer the himation could be replaced by the thin linen *chlanis*. For official or priestly dignity an ungirt chiton reaching to the feet (*chiton orthostadios*) was worn. Sandals, shoes, or high boots were used as occasion required. The citizen of mature years wore no covering for the head. That was confined to youth, workmen, and slaves. His hair was cut short on the top, and lay on the head without parting. At the sides and round the neck it was allowed to fall a short way. His beard was of moderate size. Before Alexander's time only the Spartans shaved the upper lip, but after that shaving became more general. Except a finger ring, a brooch to fasten the chlamys, or on occasion a wreath, the citizens usually wore no ornaments. While with this class there was no limit to the display of limbs, it was on the other hand the object of the slave's dress to conceal the limbs as far as possible, and for this purpose he wore, besides the jacket with long sleeves already noticed, close-fitting hose reaching to the ankles. For his head he had, like fishermen and other workmen, a pointed cap (*pilos*).

FIG. 5.—Terracotta figure, wearing Chlamys and Chiton. From Tanagra. Brit. Mus.

The constancy to one fashion observed in the dress of the Greeks is not remarkable when we remember that the fashions with which they were familiar in other nations must have shared in their minds the association with servitude and lower civilization which attached to these nations. Yet if it is true that they entered Greece from the north, and had previously permanent settlements in that region, it is curious that they did not retain in their costume some evidence of the colder climate in which they had lived, unless, indeed, the hose relegated to slaves furnish such evidence. This same difficulty occurs with regard to the Etruscans, whose dress is peculiarly the natural one for an Oriental climate; and it is the more remarkable in their case since the cold of the north of Italy would, it might be supposed, have induced them to retain part of the dress peculiar to the north, had they, as is argued, been previously settled there.

ETRUSCAN.

The female dress of the Etruscans consisted, like that of the Greeks, in (1) a *chiton poderes*, reaching to the feet, and girt at the waist; (2) a himation, worn in the fashion of a shawl, as occasionally on early Greek figures, or as a plaid; (3) a hat (*tutulus*) rising to a high point; and (4) pointed shoes. The chiton, with diploïdion on the breast, which is so conspicuous in Greek art after 450 B.C., does not so far as we know occur in pure Etruscan representations of dress; nor is the himation found wrapped round the body as in Greek figures of this period (see fig. 2 above). It seems to have been much narrower as used by the Etruscans, and more like a shepherd's plaid. Instead of a himation a close-fitting jacket of thick stuff is worn by an archaic Etruscan female figure in the British Museum, fig. 6. The pointed hat (*tutulus*) resembles the Persian *kidaris*, and from its Oriental appearance has been cited as a survival of part of the national dress from the time when the Etruscans inhabited Lydia. On a celebrated terracotta sarcophagus in the British Museum the female figure reclining on the lid wears a Greek chiton of a thin white material, with short sleeves fastened on the outside of the arm, by means of buttons and loops; a himation of dark purple thick stuff is wrapped round her hips and legs; on her feet are sandals, consisting of a sole apparently of leather, and attached to the foot and leg with leather straps; under the straps are thin socks which do not cover the toes; she wears a necklace of heavy pendants; her ears are pierced for ear-rings; her hair is partly gathered together with a ribbon at the roots behind, and partly hangs in long tresses before and behind; a flat diadem is bound round her head a little way back from the brow and temples. Purple, pale green, and white, richly embroidered, are favourite colours in the dresses represented on the painted tombs.

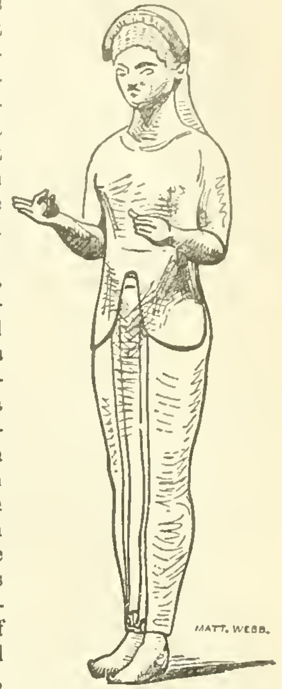

FIG. 6.—Bronze Etruscan figure. From Sessa. Brit. Mus.

No less essentially identical with the Greek are the representations of male dress on works of Etruscan art dating from the period of national independence. The chief article of male dress was called the *tebenna*. On the other hand there are the statements of ancient writers that the *toga prætexta*, with its purple border (περιπόρφυρος τήβεννα), as worn by Roman magistrates and priests, had been derived from the Etruscans (Pliny, *N. H.*, ix. 63, *prætextæ apud Etruscos originem invenere*); and the Roman toga, though placed round the body much in the same way as the Greek himation, yet differed from it in shape so far that, while the latter was an oblong, the toga was a circular piece of stuff (*toga rotunda*), of which a large segment was doubled back so as to reduce the whole to little more than a semicircle. By this means a greater profusion of folds was obtained, and this at first sight is the characteristic difference between the Greek and Roman male dress. But though the toga, worn as it was by the Romans, does not occur in early Etruscan art, there is sufficient likeness between it and the tebenna which does occur, to justify the statement of the Roman toga being derived from the earlier costume of the Etruscans. It would have been equally, perhaps more, correct to have traced it to a Greek origin, the tebenna having been worn in Argos and Arcadia (Pollux, vii. 61) apparently from early times. Under the tebenna, or toga, which was necessary only for public appearance, the Etruscans wore a short tunic similar to the Greek chiton. For workmen and others of inferior occupation this appears to have been the only dress. Youths, when engaged in horsemanship and other exercises, wore a chlamys round the shoulders, just as the youths similarly engaged on the Parthenon frieze. But the Etruscan chlamys, again, is semicircular in cut, and was fastened on the breast by buttons and a loop, or tied in a knot, whereas the Greek chlamys was oblong and fastened on the shoulder by a brooch (*perone*). On public or festal occasions the Etruscan noble wore, besides the tebenna, a *bulla*, or necklace of *bullæ*, and a wreath, *corona Etrusca.* The bulla was a circular gold locket containing a charm of some kind against evil. On the later sarcophagi the male figures wear not only a wreath, or *corona* proper, but also a garland of flowers hung round the neck. The Roman manner of wearing occasionally the toga, with the end thrown over the left shoulder, and wrapped round the waist (*Gabino cinctu*), was derived, it was said, from Etruria. The upper fold of the tebenna could be drawn up over the head if needed. As a separate male head-dress there was the *galerus*, a hat of leather, said to have been worn by the Lucumos in early times, or the *apex*, a pointed hat corresponding to the *tutulus* worn by females. The fashion of shoes worn by Roman senators was said to have been derived from Etruria. Etruscan shoes were prized both in Greece and in Rome.

ROMAN.

Male dress.—Fig. 7 represents the full Roman dress of tunica and toga, the former being visible only on the right shoulder and breast. The toga as here worn is, when spread out, a nearly elliptical piece of cloth, its greatest length being three times the height of the person who wears it, and its greatest breadth equal to at least twice the height of the wearer. It is, therefore, correctly called *toga rotunda.* The first step is to double back a segment of this ellipse so that it may nearly resemble a semicircle, and thus also justify the other definition of the toga as semicircular (περιβόλαιον ἡμικύκλιον). With the long straight edge so obtained, and with the smaller segment on the outside, the toga is thrown over the left shoulder, one end hanging down in front and over the left arm to the ground. The long end is then gathered round the back with the right hand, brought under the right arm and across the body, and finally thrown again over the left shoulder so that it may hang down the back some distance. The segment which was doubled back may be drawn over the back of the head like a veil, or, more generally, is drawn up as far as the neck and round the right shoulder, from which it forms a sweep in front of the body resembling the curve of a bay, whence it is called the *sinus.* The end, at first allowed to fall down in front, is drawn up a little and hangs over the edge, which passes round the waist in front. This is perhaps what is called the *umbo.* Instead of the loose end of the toga being thrown over the left shoulder, as here, it was sometimes carried round under the left arm and tied tightly round the waist. This was called the *cinctus Gabinus*, and from having been once, it appears, a common fashion of citizens when engaged in war, was retained as the official form in certain ceremonies arising out of war, as at the opening of the temple of Janus. The toga was of a thin woollen stuff, and as to colour was always white for the ordinary burgesses. A white toga with a purple border (*toga prætexta*) was worn as a distinction by those holding public offices, entitling them to the curule chair and the fasces, by the great colleges of priests (Flamen Dialis, Pontifices, Augurs, Septemviri, Quindecimviri, and Arvales), but in this case only during the act of performing their offices, and by boys up to their sixteenth year, when they assumed the *toga virilis.* The tribunes and ædiles of the plebs and the quæstors were denied the right to the prætexta. A purple toga (*toga purpurea*) was always the mark of high office, and as such was worn by the magistrates of republican times, though not except on public occasions, as well as by the emperors. The purple toga was sometimes embroidered with gold (*toga picta*), and it could only be worn with an under-dress of the same colour (*tunica palmata*). The prætexta, on the other hand, with its purple border, could only be worn along with a white tunic under it with a purple stripe (*clavus*). The prætexta was laid aside when the wearer retired from office, but the clavus, or purple stripe on the tunic, was retained, and became in consequence the distinguishing mark of the senatorial order.

FIG. 7.—Bronze statuette, wearing Toga. Brit. Mus.

The tunica corresponds exactly to the Greek chiton, reaching, like it, half way down the thigh, and being girt round the waist, but with the apparent difference that the Greeks rarely brought the stuff pressed down by both arms up round the arms so as to form sleeves down to the elbows, as did the Romans frequently. Further, it was a custom of the Romans to wear two tunics,—Augustus is said to have worn four. The one next the skin was known as the *subucula*, and the other as the *supparus*, or *intusium.* Only the latter had sleeves (*tunica manicata*), and over it passed the girdle (*cinctura*). The tunic of the senatorial order had, as has been said, a broad purple stripe, *latus clavus*, woven into it down the front, whence it was called *tunica laticlavia.* That of the knightly order had two narrow purple stripes and was known as *tunica angusticlavia.* Tunics with two narrow stripes, one passing over each shoulder before and behind, are seen on Roman bronze statuettes of boys represented acting as Camilli at sacrifices. The tunic was usually of linen, just as the toga was of wool, and the national colour for ordinary purposes was white. Poor persons were doubtless content with the natural colour of the linen or wool, and when in mourning the higher classes wore a dark-coloured toga (*toga palla* or *sordida*), though this was not always the rule.

More convenient than the toga, but retaining a general likeness to it, was the *pallium*, an adaptation of the Greek himation. Among other substitutes for the toga were (1) the *trabea*, which formed the official dress of the Augurs and Salii, resembling in shape the Etruscan tebenna, and being purple in colour; (2) *paludamentum*, an adaptation of the Greek chlamys, worn by the emperor as head of the army, purple in colour, though white was also allowed, (3) *sagum*, or *sagulum*, similar to the last, but worn only by soldiers; it differs from the *chlamys* in having the corners rounded off so as to be nearly circular when folded out; (4) *pænula*, worn in rainy weather to cover the dress, and made of thick flaxen material (*gausape*) or leather, with or without a hood, and formed of an elliptical piece of stuff with a round hole in the middle for the head to pass through; (5) *lacerna*, a sort of *chlamys* of expensive material and colours, worn in the theatre or circus in presence of the emperor. As regards covering for the head, there was the hood of the pænula in rough weather (*cucullus* or *cucullio*), or the toga could be drawn up over the head, or there was a separate article—the *ricinium*—in the form of a veil, as worn by the Arval Brothers. Workmen and others wore hats or caps corresponding to the Greek pilus (*pileus*) and petasus. As an ornament for the head the diadem was only occasionally used till the time of Constantine. It was declined by Cæsar. After Caracalla the most usual mark of an emperor was a crown of radii. The heavy garments worn out of doors, or officially, were replaced at dinner by *vestes cœnatoriæ* of thin material. Trousers (*braccæ*) were not worn till after the Parthian and Celtic wars, and even then only by soldiers who were exposed to northern climates. The legs were protected by flat bands (*fasciæ*) laced round them up to the knees. On the feet senators wore shoes of red leather (*mulleus, calceus senatorius*), ornamented with knobs of ivory or brass, and having a high sole. The patrician order wore shoes of black leather (*calceus patricius*), ornamented with an ivory crescent, and hence called *lunula*. For unofficial occasions, and for persons not belonging to these orders, there were the sandals (*soleæ*). The *compagus*, said to have been introduced from Etruria by Romulus, appears to have been a high hunting boot laced up the front, while the *caliga* appears to have been a sort of shoe. For personal ornament finger-rings of great variety in the material and design were worn, sometimes to the extent of one or more on each finger, many persons possessing small cabinets of them. But at first the Roman citizen wore only an iron signet ring. A gold ring was introduced for persons sent on foreign embassies, but by degrees the *jus annuli aurei* was extended to all classes of citizens. In the case of baldness, a wig (*capillamentum*) was allowed to men as well as women during the empire. Till 290 B.C. it was the custom of men to let the hair and beard grow long. From that time shaving and short hair were the fashion, till under Hadrian, when long beards were again grown.

Female Dress.—The proximity of wealthy Greek towns in the south of Italy, and the extensive intercourse between the Romans and Greece and the East even in republican times, offered tempting facilities to Roman ladies for the supply of dress, and the result is that in artistic representations their dress does not differ in any important particulars from that of the Greeks as already described. Still the names for the main articles of dress remain Roman, from which it may be inferred that the differences between the original Roman and the imported Greek dress were not essential as regards shape. Next the skin was worn the *tunica interior* (*intusium* or *interula*), loose and without sleeves. Under the breasts passed the *mammillare* or *strophium*. Then came the *tunica* proper, generally called *stola*, girt at the waist, and with sleeves fastened down the arms as in the chiton. Over this was thrown for out-door wear the *palla*, or plaid, identical with the Greek himation. A veil over the back of the head (*flammeum* or *ricinium*) was the mark of a well-to-do matron. In rainy weather a hood like the Etruscan tutulus was worn. To cover or hold up the hair, nets were used (*mitra calantica, calvatica*), but this simple article was far from common among the Roman ladies, whose chief characteristic in works of art is the elaborateness of their manner of braiding and twining the hair. After the Germanic wars a blond colour of hair became fashionable, and to get this dyeing was resorted to. Generally the eyebrows and eyelashes were painted; even the veins on temples were sometimes touched with delicate blue colour. The complexion was improved by various powders and washes. The teeth were carefully looked after, false ones making up the deficiency of nature. For the feet sandals, but by preference shoes, were made use of, generally of bright colours and embroidered with gold or pearls; socks or stockings were confined to ceremonial appearances. Personal ornaments consisted of brooches (*fibulæ*), bracelets (*armillæ*), armlets (*bracchialia*), ear-rings (*inaures*), necklaces (*monilia*), wreaths (*coronæ*), and hair-pins (*crinales*). The torc (*torques*), or cord of gold worn round the neck, was introduced from Gaul. A profusion of precious stones, and absence of skill or refinement in workmanship, distinguish Roman from Greek or Etruscan jewellery; but in the character of the designs there is no real difference.

EGYPTIAN AND ASSYRIAN.

Egyptian.—The ordinary male dress of the Egyptians, previous to about 1600 B.C., consisted of a piece of linen cloth tied round the loins, with occasionally an upper garment or skin of a tiger or leopard thrown round the body. Though this continued even to much later times to be the dress of many, yet from the date just given distinctions of grade in society began to be marked by different ways of girding the loins, by greater size of the cloth, by twining it up round the body, and by wearing two or more loin cloths of different materials (Weiss, *Kostümkunde*, i. fig. 18, p. 33). The peculiarly Ethiopian dress was in the form of a sleeveless skirt with fringe round the lower edge, hanging loose except among poorer people, who wore it fitting close to the body. The rule in early times was to go barefooted except on occasions of ceremonial, when a sort of hose of network or greaves were worn. But under the new empire, after 1600 B.C., covering for both feet and head came into general use, the former consisting of sandals, the latter of a cap made of leather, or of what some call cotton. Magistrates and others of rank wore from the earliest times sandals, and on the head a square of cloth folded diagonally with its three points gathered together at the back of the neck. The dress of a king was distinguished by a triangular projecting skirt (fig. 8) of leather and ornamented with gold. Over this he wore a chiton and a sash round the waist. On his head was a crown, *pshent*, which could be of three kinds, either that of Lower or of Upper Egypt, or a combination of these two, the latter having nearly the appearance of a mitre. A queen wore a long, thin, and richly ornamented chiton, with sash round waist and shoulders (fig. 9). A broad collar round neck and over breast was worn both by men and women who could afford it. The taste for ornament was general, men wearing armlets, bracelets, anklets, and finger-rings, while women not only wore these articles in greater size, number, and richness, but also diadems, girdles, and bands of ornament round the breasts and hips. The national dress, however, for poorer women was a simple close-fitting

FIG. 8.—An Egyptian King.

skirt reaching up to the breast and held up by straps over the shoulders. Woollen garments were worn chiefly by the poor, and occasionally by the rich, or by priests, who were permitted an upper dress of this material. Next the skin it was unlawful to wear it, nor could any one be buried in a dress of this material (Herod. ii. 81). A priest had to put off the woollen part of his dress before entering a temple. Cotton (εἰρίοισι ἀπὸ ξύλου, Herod. iii. 47) appears to have been manufactured in Egypt, but to have been less used than linen, or *byblus*, which was made from flax and cotton.

Fig. 9.—An Egyptian Queen.

Assyrian.—In weaving, embroidery, and dyeing the Assyrians surpassed the other ancient nations, as is known from tradition and may be seen in their existing sculptures. While the characteristic dress of an ordinary Egyptian was a cloth girt round the loins, that of an Assyrian was a long skirt worn close round the body and with short sleeves. This was worn by all classes, and apparently by women as well as by men. Only royal and priestly persons were allowed an upper garment, at least during the early and flourishing period of Assyria. By the time of Herodotus a considerable variety of other dresses had been introduced among the different classes. The king's dress, as will be seen in fig. 10., consists of a long chiton, or skirt, with short sleeves, and above this a mantle with heavy fringes passing over one shoulder, or in other cases over both shoulders. The dress of a priest consisted of an under-chiton, and over it a sort of long narrow plaid with frings wrapped spirally round the figure (Weiss, i. fig. 119, *a*, p. 202). Diadems variously ornamented were worn by officers of the court and by certain priests, as were also sandals. Hose did not come into use till a late period, and then chiefly as part of the military dress. Necklaces, armlets, bracelets, and finger-rings were worn in abundance by Assyrians of rank. (A. S. M.)

Fig. 10.—An Assyrian King.

Jewish.

Of the dress generally worn in ancient Israel there are known to exist no original authentic representations, nor is it possible to refer to any minute descriptions of it either in the one great source of Jewish history or in the pages of Josephus. Certain paintings and sculptures, it is true, in Egypt and Assyria, have been supposed to represent captive Israelites; but, even should this supposition be correct, in the figures thus represented there is nothing whatever which could be accepted as typical of national costume. On the other hand, while in certain details and accessories of the dress adopted by the different classes of the Israelite community, there doubtless arose from time to time both fresh modifications and decided changes of fashion and adjustment, the general essential typical characteristics of dress may be assumed to have continued the same in Israel,—the same, also, as in no slight degree continue to distinguish the Oriental costume still worn in Palestine. The garments, certainly, were loose and flowing; the girdle was in universal use; and a primary motive in the headgear was protection for the wearer from the hot sunshine of the East. The garments, in whatever manner or degree they may have been affected by varieties of material and adornment, certainly may be divided into two distinct groups, the under and the outer garments,—the former being light and specially adapted to a hot climate, and the latter being of heavier materials and suited to the colder seasons. As in the case of their arts, so in their costume the Israelites must be considered to have been influenced by usages prevalent in Egypt and Phœnicia; subsequently, by those of Assyria; and, still later, by those of the Romans. Again, it is more than probable that local influences introduced fashions of their own into the costume of the dwellers in the more mountainous districts of Palestine. For peculiar classes among them the Israelites had costumes specially appointed. For the priesthood there were their own official vestments, for which regulations were laid down with extreme minuteness, and enforced by supreme authority. The kings and princes had their "royal apparel," and for the warriors appropriate appointments were provided. Different ranks of persons, too, in various ways were distinguished by the richness, the costliness, the simplicity, or the meanness of their attire. So far as externals went, the episode in the Gospel of the rich man clothed in purple and fine linen with a Lazarus at his gate, so true a picture of Oriental life, would have been equally consistent had it found a place in some one of the earlier chapters in the same national history. Of the distinctive characteristics of female costume in Israel nothing is known, beyond the general fact that it was rich and delicate as far as circumstances would admit, and that personal ornaments were highly prized. Thus much is certain that the veil, a modern fashion now so prevalent in the East, in its modern acceptation was unknown among the women of ancient Israel, with certain exceptions only that are altogether at variance with the uses and associations of the Oriental veil at the present day. Furs, used both for warmth and adornment, with cloth woven from camels' and from goats' hair, including the "sackcloth" of sorrow and humiliation, were in use from an early period; so also, doubtless, was woollen cloth, the natural material for the clothing of a pastoral people. Familiarity with fabrics of linen, cotton, and silk, with those of various materials of foreign manufacture, may be considered to have been acquired by the Israelites in and from Egypt. There, too, they became familiar with the process of dyeing, and with the use of coloured threads, and of gold-thread or fine wire, for textile purposes; and there they learned both to introduce various figures and devices into their woven fabrics, and to enhance their effectiveness with the needle. Needlework and embroidery, indeed, were extensively used by them in the production of various decorative fabrics. Whatever may have been the use in Israel of fabrics and decorations that were coloured, those that were white (the natural hue of any material, as well as actual whiteness, being understood to be implied by this term "white") were in general use by the Israelites for their dress, and also were held by them in the highest estimation. This preference possibly may be traced to the provision in the Mosaic law which, apparently with the view to impress on the mind of the Israelites the idea of simplicity, and to protect them from the hurtful effects of Oriental luxury and extravagance, forbade the use of mixed textures such as would be produced by wool and flax in combination.

The particular garments of the Israelites, of which express mention is made, include the following :—

I. *Under Garments.*—(1.) The *sadin*, a light wrapper, worn next to the person. (2.) The *cetoneth*, or under-tunic, either sleeveless or having open sleeves, moderately loose, varying in length, and adjusted about the waist in such a manner as to form a pocket from an overlapping fold. Corresponding with the modern *kaftan*, the *cetoneth* was habitually in use, worn either with or without the *sadin*, by both sexes, and by persons of all ranks. (3.) The *miel*, or over-tunic, made with sleeves, longer and somewhat thicker in substance than the *cetoneth*, and, like it, in general use. To both these garments the term "coat" is applied in our version of the ancient Scriptures.

II. *Outer Garments.*—To all these garments, alike in being designed only for occasional use or for use under exceptional conditions and circumstances, in their generic character the term "cloak," as understood by ourselves, appears to have been applicable. Of these cloaks, robes, mantles, or wrappers there were several varieties, which differed from each other as well in form as in material, substance, and ornamentation; fringes, however, seem to have been generally attached to them; and they were worn with various modes of adjustment. The word *malbush* distinguished a robe of state. Express mention is made, but unattended with any precise descriptive notices, of more than one variety of shawl, worn by women, which might be so adjusted as to form a head-covering in addition to enveloping the person. To very light female robes also, which were long and flowing, occasional references are made. Of the male head-dresses worn by Israelites, distinct from such coverings for the head as might act as hoods formed by wrapping the mantle or cloak about the head, we have no exact knowledge. Though no such relics are known to be still in existence, goldsmiths' work and jewellery certainly enjoyed a high degree of estimation in ancient Israel, as always has been the case with all Eastern races; and they constituted important elements in the decoration of Jewish costume.

The passages of chief importance in the Old Testament, in which the vestments of the priesthood are enumerated and described, occur in Exodus xxviii., xxix., and xxxix., and in Leviticus viii. and xvi. In the Apocryphal books also reference may be made to Ecclesiasticus xlv., and to 1 Maccabees x. 21, in which last passage the entire investiture of the high priest is designed to be understood. Very full descriptive notices of the sacerdotal vestments of the Jewish priesthood are given by Josephus, in his *Antiquities*, iii. 7, and in his *Wars*, v. v. 7. Further illustration on the same subject is given in his *Epistle to Fabiola*, ii. 574, written at Bethlehem by St Jerome, 396 A.D.

An "order" or "change of garments," for a man—always in the East highly esteemed as both an honourable and a valuable present—among the Israelites consisted of a *cenoneth* and a *miel*, with perhaps a *sadin*, and certainly one or more of the occasional outer robes, mantles, or cloaks. In presents of this kind, the number of the "changes of garments," which from their loose and flowing character would not fail to adapt themselves to general use, was studiously adjusted to the degree of estimation in which the recipient was held, and not without an indirect and yet significant reference to the dignity of the giver. The expression "naked," when applied to an Israelite, denoted, not a condition of actual nudity, but the fact of being attired only in a single under garment, and consequently implied the being in readiness for active exercise or violent exertion. The strongly marked and comprehensive distinction between the East and the West receives a characteristic illustration in the Oriental usage of uncovering the feet and covering the head, in token of respect and even of adoration. The "rending the garments," generally the outer garment only, an act so strange to us in the West, to the Israelites, in common with other Orientals, was peculiarly significant of grief, indignation, humiliation, and despair.

Among the figures painted in the very ancient tomb at Beni Hassan, in Egypt, occurs a group of figures from which the annexed woodcut has been drawn (fig. 11), conjectured to represent the arrival of Joseph's brethren when they went to purchase corn in the land of the Pharaohs. Again, considerably later, but as early as the days of the Pharaoh-Necho, by whom Josiah was defeated and slain at Megiddo, among some figures sculptured in one of the tombs discovered by Belzoni, near Thebes, which represent captives of different nations brought before their Egyptian conqueror, four Jews are supposed to have been introduced after the manner shown in fig. 12. The fringe commanded by Moses, Num. xv. 38, to be worn by his people, and which probably was a relic of a still more ancient usage in the family of Jacob, may be considered to have been shown in both these groups. In the almost total absence of other not less improbable ancient examples, these figures may be accepted as contemporary representations of persons whose attire, such as it is shown to have been, at any rate may be considered to represent corresponding articles of dress in use in ancient Israel. Captive Jews, once more, are undoubtedly represented in the fine series of Assyrian bas-reliefs commemorating the capture of Lachish by Sennacherib, discovered and described by Mr Layard (*Nineveh and Babylon*, p. 152; and 2d series of *Monuments of Nineveh*, plates xx. to xxiv.) The physiognomy of these Jewish captives is strikingly indicated in the sculptures in question, but of their national costume but very little is shown; for "they had been stripped of their ornaments and their fine raiment, and were left barefooted and half-clothed. From the women, too, had been removed the 'splendor of the foot ornaments, and the caps of network, and the crescents; the ear pendents, and the bracelets, and the thin veils; the head-dresses, and the ornaments of the legs, and the girdles, and the perfume boxes, and the amulets; the rings and the jewels of the nose; the embroidered robes, and the tunics, and the cloaks, and the satchels; the transparent garments, and the fine linen vests, and the turbans, and the mantles;' for they wore, 'instead of a girdle, a rope; and, instead of a stomacher, a girding of sackcloth.'" (See Isa. iii. 18, &c.; and Ezek. xvi. 10, &c.) Upon the exceedingly interesting description of the dress worn in ancient times by the women of Israel, as given by the two great prophets, Mr Layard remarks that

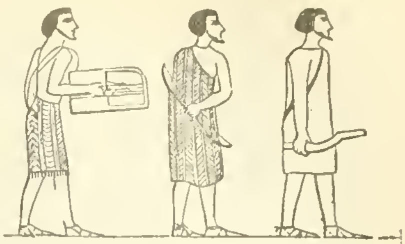

FIG. 11.—From Beni Hassan.

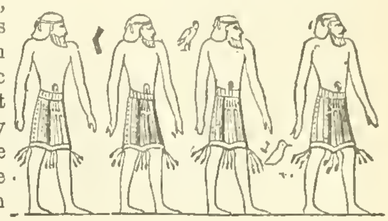

FIG. 12.—From tombs near Thebes.

FIG. 13.—Indoor Costume of modern Syrian Women.

"most of the ornaments enumerated, probably, indeed, the whole of them, if we were acquainted with the exact meaning of the Hebrew words, are still to be traced in the costumes of Eastern women inhabiting the same country. Many appear to be mentioned in the Assyrian inscriptions among objects of tribute and spoil brought to the king." With this reference to the dress and ornaments of the female inhabitants of Syria at the present day, of whom two groups are represented in figs. 13 and 14, the following brief but graphic passage from the same writer's *Nineveh and Babylon* (p. 472) may consistently be associated. On approaching Baghdad, the low banks of the Tigris — the river itself gradually becoming wider and wider, and its stream being almost motionless—were seen to "swarm with Arabs,—men, women, and naked children. Horsemen and riders on white asses were hurrying along the river side. Turks in flowing robes and broad turbans; Persians in high black caps and close-fitting tunics; the Bokhara pilgrim in his white head-dress and way-worn garments; the Bedouin chief in his tasselled *keffieh* and striped *aba*; Baghdad ladies, with their scarlet and white draperies fretted with threads of gold, and their black horse-hair veils concealing even their eyes; Persian women wrapped in their sightless garments; and Arab girls in their simple blue shirts,—all were mingled together in one motley crowd." In the costume in common and constant use at the present day, as well by men—such as is exemplified in the groups shown in figs. 15 and 16—as by women in the towns and villages of Syria, may be discerned the transmitted representations of the general character and aspect of the attire of the same regions in remote centuries; as, in like manner, the patriarchal dress of ancient Israel may be assumed to have had its primitive type in a great measure reproduced in our own times in the long coarse shirt, the ample striped *aba* of camels' hair (the coloured stripe that alternates with the white one, denoting the wearer's tribe), and the red and yellow *keffieh*, folded and tied in hereditary fashion about his swarthy face and over his neck and shoulders by the Bedouin Arab of the desert (fig. 17).

ORIENTAL.

If it may be said, as it may certainly be said with truth, of Oriental costume both in its general character and its specific details, that it is distinguished, in contrast to that of the ever-changing West, by the pervading and characteristic unchangeableness of the East, equally true it is that the vast populations which throng the wide expanse of the earth's surface included in "The East," comprehend in their numbers the inheritors and the wearers of costumes exhibiting in many peculiar and distinctive features an almost endless variety. At the same time, precisely as a distinct recognition as well of the range as of the applicability and the significance of the one term "The East" suggests no confusion of ideas respecting different Eastern realms and peoples, so also all Oriental costume so far bears the impress of Eastern requirement and association as in a certain degree to admit of a single general classification. Thus, unlike to each other in not a few of their personal qualities as any two human beings well could be, and differing also in many decidedly marked particulars in regard to their costume, the nomad Bedouin of Arabia in every essential respect is no less a true and truly typical Oriental than the most gorgeously attired and, after his fashion, the most refined of the native potentates of Hindustan. So, also, notwithstanding the points of difference between their costumes, the costume as well of the one as of the other is unmistakably Oriental. The same may be said of the dresses of the different races that inhabit Hindustan. And they all share an equally true Oriental brotherhood, and especially in externals, in however decided a manner and degree each race may bear its own distinctive impress even in those very externals, with the natives of Japan and China and Burmah, of Persia, Arabia, Modern Egypt, Armenia, and Turkey, and with other Eastern races also that need not to be here particularized. Unless when circumstances reduce their attire to proportions so scanty as scarcely, if at all, to exceed that of the savage tribes who inhabit some tropical districts, or when influenced by some exceptional conditions, all Orientals are more or less inclined to wear loose and long and flowing garments; their trousers, when any are worn, are very large and gathered in at the ankles; they have their heads habitually covered, whether with a turban, fez, or some variety of cap of a local hereditary style; their feet, when not bare, are very lightly equipped; they delight in white fabrics, mingled with such as exhibit the most brilliant colours and the richest designs; and they indulge in an abundance and variety of personal ornaments. Also a general resemblance prevails between the costumes of the two sexes. The decorative arts of China and Japan, always national both in the selection and the treatment of their subjects, in connection with certain universally esteemed varieties of their manufactures, have familiarized the world with the typical characteristics of the costumes worn by all ranks and classes in those countries. Recent events have caused the more remarkable costumes of India to become well known through several popular publications; and the same may also be said concerning the costumes of other Oriental nations, and those of them more particularly which are nearest to Europe and have the closest relations with Europeans. In South-Eastern Europe itself, the costume of the modern Greeks exhibits semi-Oriental qualities.

Ecclesiastical.

Without extending to any notice of the ordinary attire habitually worn in everyday life, at successive periods, by ecclesiastical personages of all ranks and orders in the Christian church, *ecclesiastical costumes* here may be considered to imply and consequently to include the vestments, distinctively official and ministerial in their character and use, which such personages would wear only when actually engaged in the functions of their respective offices, or on occasions of special state and solemnity. The habits, which with the advance of time came to be assumed by the members of the monastic orders, may most appropriately and advantageously be treated apart by themselves.

That ministering vestments, properly so called, and with them ecclesiastical insignia, were unknown among Christians of the apostolic age may be considered as unquestionably certain; and, in like manner, in the three succeeding centuries only the faintest traces, if indeed any authentic traces whatever of such vestments can be said either to exist, or to have left indications of ever having existed. The long and flowing garments, suggestive of peaceful repose and enjoyment, and always in some degree endowed with dignified associations, whenever the circumstances of the times would permit, doubtless, were worn by the primitive Christian ministers when discharging their official duties; but it also is no less certain that on the same occasions precisely similar garments were generally worn by Christian worshippers, whose condition justified their appearing in them. During the prolonged stormy period of the second group of four centuries in the Christian era the primitive ecclesiastical costume—the costume, be it remembered, at times of joyous festival and solemn ceremonial adopted by *all* persons of comparatively high social standing—still was retained unchanged in its general style and aspect, and having experienced only such slight modifications and additions as naturally would have their development with the course of events. As time passed on, keeping pace both with innovations upon primitive doctrine and with vicissitudes of political position, in various ways these modifications became modified, and to these additions fresh novelties gradually were added. Even at the commencement of the 9th century, when the true historic era of ecclesiastical costume may be defined to have commenced with it, the two most remarkable circumstances in connection with ecclesiastical costume were, on the one hand, its approximately unchanged character, and, on the other hand, its close general resemblance, amounting almost to identity, to the old civil costume, which in the state dresses of the Roman official dignitaries survived the sweeping changes of barbarian revolution. It is worthy of especial remark that the earliest evidence of the introduction of any insignia distinctive of rank and dignity in ecclesiastical costume is to be derived from the presence of two dark strips of varying width on the long white tunics in which certain early figures, certainly to be regarded as habited in ecclesiastical vestments, are represented; and these strips can be considered in no other light than as adaptations from the *clavi*, some broad and others narrow, so well known in classic attire to distinguish the Roman senatorial and equestrian ranks. Equally remarkable is the fact that the Christian hierarchy should have derived the insignia of their rank in the church, through the high position of civil power in the state exercised by the early bishops of Rome, from the official decorations of the Roman magistracy as well of the republic as of the empire. It will be borne in mind that all changes in ecclesiastical vestments, and all additions to those of early date, made by authority during the Middle Ages, were designed to be suggestive of some symbolical motive and to convey some doctrinal significance—considerations, however important in many respects in themselves, which it would be out of place here to discuss even superficially, when treating of all ecclesiastical vestments simply in their capacity as "costume." In connection also with the full development in the 11th and 12th centuries of that type of vestments which, when once it had been formally established, has been maintained with but slight modifications in the Roman Church to the present time, no unimportant part was taken by the attempts, first contemplated in the 9th century, that were made to assimilate such vestments as might be distinctive of the Christian ministry with those appointed in the Mosaic law for the priesthood in Israel. The idea that any such similitude might exist, or should be made to attain to existence, once having arisen would naturally take a strong hold on the minds of the more ambitious and also of the more learned ecclesiastics of those times. So, when in the first instance the points of difference between the two types of vestments were found to be far more decided than those of resemblance, a process of deliberate assimilation was decreed, which brought about as close an approximation between the two types as was held to be desirable—an approximation, it scarcely is necessary to add, that removed the elaborate and ornate vestments of mediæval Christendom as far as possible from retaining any affinity to the dignified simplicity of Christian ministerial costume in primitive times.

Vestments in use in the West.

1. The *Alb*.—In the Acts of the Council of Toledo, 633, the habits and insignia of the three orders of the clergy are thus defined:—of the bishop, the *orarium*, the *ring*, and the *staff;* of the presbyter, the *orarium* and the *planeta;* and of the deacon, the *orarium* and the *alba* or *alb*. In this definition it may be assumed to have been implied that the *alb* was common to the three orders, as the *planeta* was worn by bishops as well as by presbyters. Its name abbreviated from *tunica alba*, and at first the simple and yet dignified white linen tunic that in the primitive ages was held to be the costume appropriate for the Christian ministry, in the 9th century the *alb* began to have its loose and flowing proportions contracted; and these changes were continued until the vestment was made to fit with comparative closeness about the person of the wearer, when it was confined about the waist by a narrow girdle. The pure simplicity of the early white tunic also was superseded by the addition of rich "orfreys" (*aurifrigia*) of embroidery and goldsmiths' work. These "apparels" (*paruræ*), in the form of masses and stripes, were attached to the lower part of the alb and to the wrists of its sleeves. In the second half of the 14th century the wrist-apparels of albs, instead of encircling the sleeves as previously had been the custom, appear only upon the upper part of them.

2. The *Stole*, the name in the 9th century given to the ancient *orarium*, itself as it would seem having its prototypes in the Roman *clavi*, is a narrow scarf adjusted about the neck so as to have its extremities hanging down in front of the wearer. Originally white and without ornament, stoles after a time were made of various colours, were enriched with orfreys and fringed at their ends. Worn immediately over the alb, the stole is crossed upon the breast of the wearer, being retained in that position by passing under the girdle. When the chasuble is worn, and worn without the episcopal dalmatic and tunic, the ends of the stole appear issuing from beneath it. In some few early ecclesiastical effigies, which are without a chasuble, but in its stead have a cope open in front, the entire adjustment of the stole is distinctly shown.

Fig. 18.—From brass at Horsham, showing Stole, &c.

as in fig. 18 drawn from a brass at Horsham. This effigy also shows in what manner the alb, amice, and maniple are worn, and it may advantageously be compared with fig. 20, also drawn from a brass to Peter de Lacy, rector of Northfleet, in Northfleet Church, in which the stole for the most part is covered by the chasuble. Its ancient name *orarium*, equivalent to our "handkerchief," shows the mediæval stole to have been designed as well to wipe the face as, in accordance with primitive usage, to cover it when offering prayer. For deacons it was appointed to wear the stole depending from over the left shoulder only, so as to show but one end of it on the front of their persons (fig. 19). The idea of a connection in the significance of the stole to denote dignity with the ribband worn as a knightly distinction is obvious.

FIG. 19.—Deacon —9th century.

3. The *Maniple.*—A short species of stole, the representative of the ancient *mappula* and its successor, the maniple, which is worn so as to hang from the left wrist, may be considered to have been substituted in the first instance for the purposes to which the stole itself originally had been applied. Like the stole, however, the maniple, regarded as one of the ecclesiastical vestments as early as the 9th century, soon became merely a decorative accessory of the official costume of ecclesiastics (see figs. 18, 20).

4. The *Chasuble.*—This super-vestment, worn over the alb and the stole, and by ecclesiastics of episcopal rank also over the dalmatic and tunic, which in the 11th century was expressly associated with the ecclesiastical office, is identical with the *casula* of the 9th century and, through it, derived from the *planeta* of still earlier times. Both *planeta* and *casula*, however, as over-garments furnished with a hood which would envelop the entire person, were worn by laymen, the chief if not the only distinction between those two garments being that the former from its greater costliness was in use by persons of rank and wealth, while the latter was adopted by the humbler and poorer classes. In form and general character both the *planeta* and the *casula* appear to have resembled the ancient *pœnula*, an outer garment worn in Italy long before our era, and of which the memory still survives in the title of the ecclesiastical super-vestment of the East. Circular or oval in form, and having in the centre an aperture for the head of the wearer to pass through, the chasuble covers the arms as well as the body, so that when they are raised it falls over the arms both before and behind. Made of various materials and of different colours, in early representations of it this vestment is constantly found to have been elaborately adorned with embroideries and other decorative accessories, also with a profusion of orfreys in gold and silver work enriched with gems (fig. 20). A favourite form of chasuble-orfrey, evidently an imitation of the archiepiscopal pall, encircles the head-aperture and, passing over the shoulders of the wearer, falls in a straight line down both the back and the front of his person.

FIG. 20. — From brass at Northfleet, showing Chasuble, &c.

5. The *Amice.*—First mentioned as a vestment in the 9th century, and from the following century enriched with apparels, when opened out the *amice* was square in shape, and it was adjusted precisely after the manner of its present adjustment, beneath both alb and chasuble, about the throat and over the shoulders. In monumental effigies the apparel of this vestment is represented either falling back from the throat of the wearer, or, in the later examples, standing up somewhat stiffly around it; and this position over the chasuble sometimes has suggested the mistaken idea that the apparel of the amice forms a collar to the chasuble itself. By holding it for a few moments over the head at the time of putting it on, the amice in course of time was considered to symbolize the Christian helmet (see fig. 20).

6. The *Dalmatic*, a full-sleeved tunic reaching about to the knees. Long after its adoption as an ecclesiastical vestment, the dalmatic continued in use in Rome as a garment appropriate for secular officials on occasions of ceremony and state; and at the present time it continues, as it continued through the Middle Ages, to be a royal robe as well in England as on the Continent. Like the other ancient vestments, originally white and plain, in the 10th century the dalmatic assumed various colours, and in the 12th and the succeeding centuries it followed the colour of the chasuble. Appointed to be worn by deacons over the alb as the distinctive vestment of their order, when made of costly materials and richly adorned the dalmatic was added to their official costume by prelates, by them to be worn immediately under the chasuble. In early episcopal effigies the lower part of the dalmatic is represented, appearing beneath the chasuble, richly fringed and partially slit up at the sides, as in fig. 21, drawn from the corresponding part of the brass to Thomas Cranley, archbishop of Dublin, in the chapel of New College, Oxford, 1417. Nearly a century earlier (1325), in the cathedral of St Nazaire at Carcassonne in France, the statue of Bishop Pierre de Roquefort, which is without the chasuble, shows with admirable distinctness the form and adjustment of the episcopal dalmatic, with the tunic appearing beneath it, the ends of the stole being visible issuing from beneath them both. The large sleeves of the dalmatic and the tight sleeves of the tunic are shown at the wrists, and from the left wrist the maniple hangs down (fig. 22). Over the other vestment (as in fig. 18) is a cope, fastened across the breast with a morse charged with an *Agnus Dei*. The prelate wears his mitre, and in his hand he holds his pastoral-staff. In England, in Norwich Cathedral, there is a similar example of the episcopal habit in the effigy of Bishop Goldwell (1498), which represents both dalmatic and tunic as shorter than in the French statue; the dalmatic also has a broad central vertical band of rich embroidery, and at the wrists the sleeves of the alb, tunic, and dalmatic are shown. Figures of deacons, rare in mediæval art, when they occur generally profess to represent St Lawrence, with the instrument of his martyrdom. In fig. 23, reduced from a drawing on vellum in a MS. of the 13th century in the Lambeth Library, the dalmatic, which is nearly as long as the unusually short alb, is shown as it was ornamented and worn at that period. Another good example, much later in date, also a figure of St Lawrence, is sculptured in one of the canopied compartments of the monumental chantry of Prince Arthur Tudor in Worcester Cathedral. Fig. 19, from the *Tiber Pontificalis* of Landolfus, a MS. of the 9th century, shows how the stole was disposed over the left shoulder by a deacon wearing an alb and a dalmatic.

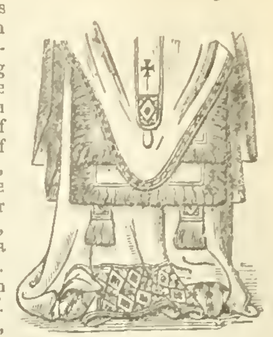

FIG. 21.—From brass at Oxford, showing Dalmatic.

FIG. 22.—Showing Dalmatic, &c. (After Viollet-le-Duc.)

FIG. 23.—From vellum drawing at Lambeth, showing Dalmatic, &c.

7. The *Tunic.*—The vestment distinguished by this name, worn by prelates between the alb and the dalmatic, is rather longer than the vestment last named, and its sleeves also are somewhat longer and not quite so full. As the vestments increased in number, and at the same time became less simple and more splendid, the gradual addition of one tunic after another, to be traced from the 9th century downwards, was strictly in keeping with the spirit of the times. Early in the 14th century it had a remarkable parallel in the succession of surcoats, with which, regardless of their palpable inconvenience, the knights covered their armour. It is specially curious to observe how studiously the men-at-arms carried out their imitation of the ecclesiastical vestments of their day, by making each one of their successive surcoats in front of their persons shorter than the one beneath it, so displaying them all. In the case of the ecclesiastical vestments, the tunic proper, become distinctively

the *alb* or under-tunic, was covered by the *tunic*, a rich and splendid vestment; and the *dalmatic*, shorn of its ancient length in order to leave the second or middle tunic visible, followed, third in order, and became the super-tunic of the group. The tunic, like the dalmatic, partially slit at its sides and generally fringed, is well represented in monumental effigies and other early works (see fig. 21).

8. The *Cope*, a voluminous cloak or outer garment, originally furnished with a hood for covering and protecting the head, and of sufficient size to envelop the entire person of the wearer, would naturally admit of every possible variety in material, colour, and ornamentation, and it also would be used as well by laymen, as by ecclesiastics of all orders and by monks. Richly adorned copes, however, appear in mediæval times to have been considered as almost exclusively ecclesiastical vestments of stately dignity, to be worn in processions and on those ceremonial occasions which would be distinguished from the service of the altar. Such copes, having splendid border-apparels into which canopied figures of sainted personages frequently were introduced with heraldic and other devices, were fastened across the breast by a morse, often of costly material and highly artistic workmanship (see fig. 22).

9. The *Almuce* or *Aumuce*, a hood of fur, was apparently introduced in the 13th century, its object being to afford protection from cold in processions, &c., and in the 15th century a cape and pendants also of fur were added to it.

10. The *Surplice*, an alb, almost of primitive form, ample and flowing, and closely resembling the surplice of the present day, was in use in the Middle Ages in processions and on certain occasions of ceremony. An excellent example of a surplice of the 15th century is given in the noble brass to Prior Nelond, at Cowfold, Sussex, 1433.

11. The *Mitre.*—First mentioned among ecclesiastical vestments about the middle of the 12th century, though some kind of dignified episcopal head-gear certainly had been in use considerably earlier, the mitre originally was made of linen embroidered; and it does not appear in its well-known double or cleft form until the 12th century had made a considerable advance, when it began to be constructed of some rich material and to receive costly adornment. Previous to the 14th century, when they attained to the perfection of their form, mitres were very low, their contour then being concave. Subsequently they became more and more elevated, and their contour was changed from concave to convex. Two short bands of some rich material, fringed at the ends, form the *infulæ* of a mitre, and depend from it, one on either side.

12. The *Crosier* and the *Pastoral-Staff.*—The former, having a cross-head, is appropriated to archbishops; and the latter, the official pastoral-staff of bishops and abbots, has a crook-head, like the head of a shepherd's staff. Expressly mentioned as the ensign of the episcopal office in the first half of the 7th century, as early as the 10th century the pastoral-staff became enriched with elaborate and precious ornamentation, and was adorned with a *vexillum*, or scarf, attached to the staff immediately below the cross or crook-head. The idea that some special signification is conveyed by the position in which in monumental effigies and in other episcopal figures the pastoral-staff is represented to be held appears to be without any foundation.

13. The episcopal *Ring*, *Gloves*, and *Boots.*—Early in the 7th century, and probably still earlier, a ring of large size, to be worn on the right hand, formed a regular part of the episcopal insignia; and in the full development of the vestments which took place in the 12th century, embroidered gloves, made with an opening to display the ring, and corresponding boots or shoes were included as components of the full official attire of the hierarchy.

14. The *Pall* ("*Pallium*").—This remarkable vestment, sent by the Pope to prelates of archiepiscopal rank, and restricted to their order, being in fact a peculiar form of the orarium or stole, consists of a narrow band of white lamb's wool, forming a circle to rest on the chasuble around the throat and over the shoulders, from which circle depend two other bands of the same fabric and width to hang down, the one on the front and the other on the back of the prelate, thus, whether seen in front or behind, presenting the appearance of the letter Y. The depending bands, which terminate in fringes and appear occasionally to have been fastened with golden pins to the chasuble, like the circular band, are charged with crosses pattée-fitchée of black or purple silk. This pall, constantly represented in early works of Christian art through successive centuries, and blazoned among ourselves in the armorial insignia of the archiepiscopal see of Canterbury, is seen to have varied but slightly in either its form or its adjustment from the 9th century to the 16th. An apparel, evidently designed to represent the pall, is found constantly to have been adopted for the ornamentation of mediæval chasubles. The pall still in use in the Roman Church has the pendant bands considerably shorter than they appear in the early representations (see fig. 21).

15. The *Chimere* and *Rochet.*—Of the former it will be sufficient to state it to be a modification of the cope; while the latter, a long sleeveless robe representing a garment known as a *colobium* in ancient times, appears to have been assigned distinctively for episcopal use, and also after the Reformation to have been allied to the full lawn-sleeves well known at the present day, from being well suited to be worn under another vestment. By prelates of the Reformed Church a short cassock of black silk is worn with their ordinary attire. A long loose black cassock also was commonly worn by ecclesiastics during the 17th and 18th centuries.

VESTMENTS IN USE IN THE EAST.—In its general bearing, what has been said of the vestments in use in Western Christendom, and particularly in reference to their use during the first eight centuries of our era, with comparatively slight modifications, is also applicable to the official vestments of the church in the East,—the chief distinctions between the vestments of the East and the West, in addition to such as may in a great degree be traced to the influences of climate and to certain local associations, being a closer adherence in the former than in the latter to the earliest usages. The Greek Church also, being very tenacious in its own usages, to the present day retains everywhere its mediæval vestments, their forms, names, and uses remaining unchanged—the *sticharion* corresponding with the alb and the early dalmatic of the West; the *phælonion*, with the chasuble and its earlier predecessors, the casula and planeta; the *omophorion*, with the pall; and the *orarion*, with the orarium and its successor the stole.

MONASTIC.

The habits worn during the Middle Ages by the monastic orders may be briefly described as follows:—

Benedictines.—Gown or cassock of black, white, or russet cloth, with white or black fur, and black cape and hood.

Cluniacs.—Habit entirely black.

Cistercians.—White cassock with cape and small hood; over this when in the church a white gown, when abroad a black gown.

Carthusians.—Habit entirely white, except black cloak.

Augustines.—Black cassock under white full-sleeved tunic; over all, black cloak and hood; square black cap.

Præmonstratensians, White Canons.—Cassock and tunic, long cloak and hood, and round cap,—all of them white.

Gilbertines.—Monks.—Black cassock and hood, and white cloak lined with lamb's wool. Nuns.—Black tunic, cloak, and hood, the last lined with lamb's wool.

Dominicans, or "Black Friars."—Same habit as that worn by the Augustine monks.

Franciscans, or "Grey Friars."—Loose and long grey cassock girded with a cord; hood or cowl and cloak of the same.

Carmelites, or "White Friars."—Habit white throughout; but from about 1240 to about 1290, their cloaks were party-coloured, white and red.

Austin Friars, or "Eremites."—White cassock girded with a leather thong, with short tunic and hood; and over these, long, black gown with wide sleeves and hood.

Crossed ("*Crutched*") *Friars.*—Blue habit, with plain red cross.

Maturines, or "Trinitarian Friars."—Habit entirely white, with eight-pointed cross of red and blue.

The monastic garment named "scapulary," the exact character of which has not been decidedly determined, appears to have been a short super-tunic, sleeveless, but having a hood or cowl.

ACADEMIC.

In the Middle Ages, professors or doctors and bachelors of divinity, and graduates of the universities above the rank of bachelor in the faculties of arts and law, in addition to the customary costume of their time and station, in connection with their academic rank wore long flowing gowns having slits at the sides for their arms to pass through, with large capes or tippets and hoods, the latter having pendant streamers, these capes and hoods in many instances forming parts of the same article of dress. Graduates of the highest rank also wore round caps, pointed in the crown, and of a dark colour. In the 15th century, when distinctions appear first to have been introduced into the costumes of masters and bachelors of arts, the gowns of the latter were shorter than those of masters, and had full sleeves reaching to the wrists and pointed at the back. The capes and hoods of bachelors also were bordered with white fur or wool. By various peculiarities of form, colour, and lining, the gowns, capes, and hoods of graduates of all the higher ranks certainly were distinguished; but in the comparatively rare examples of monumental effigies represented in academic habit, which almost without exception are destitute of colour, these distinctions are not shown in any regular or marked and decided manner. Throughout the last two hundred years, if not for a still longer period, the academic habits of the University of Oxford have retained their forms unaltered. They may generally be classified in two groups—ecclesiastical and civil. The gowns of the former, worn by all graduates in both divinity and arts, and also by all members on the foundation of any college, have loose sleeves, are destitute of collars and gathered in in small plaits at the back, and bear a general resemblance to what is known of the more ancient habits, the sleeves of the masters' gowns still having slits (now cut horizontally, instead of vertically) for the passage of the arms. On the other hand, the gowns of graduates in law and the other faculties, and of undergraduates who are not on the foundation of any college, besides being of less ample proportions, have falling collars and closer sleeves, which latter in the undergraduates' gowns have dwindled into mere strips; and they evidently derive their origin from parts of the ordinary dress of civilians in the 16th and 17th centuries. The gowns of graduates of the University of Cambridge for the most part are the same as those worn in the sister university; but at Cambridge the undergradnates, not being on the foundation, of almost every college have a gown appropriated to their own college. The hoods of their degrees worn by graduates in the faculties of divinity and arts are distinguished as follows:—D.D., Oxford scarlet cloth, lined with black silk; Cambridge, scarlet cloth, lined with lilac blossom or pink silk, M.A., Oxford, black, lined with cherry-colour or crimson; Cambridge, black, lined with white; Dublin, lined with blue; Durham, lined with purple; London, lined with brown. B.A. hoods are black and bordered with white fur

EARLY EUROPEAN AND MEDIÆVAL.

For the purpose of the present article the terms "early European" and "mediæval" may be considered to apply to the period ranging from the withdrawal of the Romans from Britain to the accession of the Stuarts to the throne of Great Britain—that is, from about the close of the first quarter of the 5th century to the commencement of the 17th century; and the latter term, "mediæval," may date the commencement of its application from the establishment of his Anglo-Saxon dynasty by Egbert at the opening of the 9th century.

A prolonged period of total darkness having passed away, at first, and for a considerable time, in addition to written descriptions and indirect notices which frequently are far from being intelligible, and to such actual relics as originally were deposited with the remains of the dead without any view either to monumental commemoration or to historical illustration, the authorities are restricted to the illuminated compositions which so happily are associated with early MSS. After a while, the earliest seals and some ivory carvings lend such aid as may lie within the compass of their power Next follow those invaluable illustrators of costume, monumental effigies of every class, with which may be allied figures represented in architectural sculpture and painting, upon seals also and coins. Actual relics throughout the era of monumental effigies gradually increase in both number and variety, until at length the ages of personal portraiture, properly so called, are duly reached. It will be borne in mind that until some years after the close of the 15th century, defensive armour occupied a most important position in what strictly was the "costume" of the men of the higher classes, whose effigies, with rare exceptions only, appear sculptured, engraven, or painted in their armour, precisely as the men themselves had been armed and equipped when in life. In the Middle Ages in Europe, costume, considered as dress distinct and distinguished from armour, was affected in no slight degree by the prevailing character of the armour of each successive period, so long as a defensive equipment of any kind continued to be generally adopted. Dresses that had been devised expressly to be worn, some of them under defences of mail or plate, and others over them, suggested much in the way of garments that never would have any direct connection with armour. Again, when not armed, nobles, knights, and men-at-arms naturally would adopt such loose and flowing garments as would combine the greatest degree of ease with a dignified aspect; and their example in this respect would be certain to be very widely followed. The feudal system, also, powerfully aided by the heraldic sentiment that at once grew up in the feudal era and gave to it its tone and colour, exercised a powerful influence upon the costume of the various classes who, under varying conditions, were dependent upon a common feudal superior. And this influence, while adapting itself in matters of detail to personal considerations, in its general bearing acted with uniform effect upon the entire community. Of the extravagance of so many of the diverse costumes that followed each other in rapid succession during the 14th and 15th centuries, much may be directly traced to the development of heraldry in those ages, and to the enthusiastic delight in armorial devices and insignia then universally prevalent. The singular resemblance in many marked particulars between the dresses of the two sexes, observable in the Middle Ages, undoubtedly was stimulated by the science and art of the contemporary heralds; as the strange and often wildly fantastic crests and the mantlings displayed upon their helms and basinets by the one sex were parodied, and sometimes were fairly outdone, by the equally strange and no less wildly fanciful head-gear adopted by the other sex, with a view either to conceal or to enhance the natural glory of their hair. Mediæval costume, once more, would experience both changes and modifications arising out of the introduction of fresh manufactures, and necessarily resulting from the constantly expanding range of the foreign commercial relations of different countries. Costume, moreover, would be certain to be attracted by the progressive phases of national civilization, culture, and refinement, even though it might not consistently keep pace with them. Fashion, too, always arbitrary and often inexplicable, would not fail to do its work effectually, under the diversified conditions and aspects of advancing centuries, among races by whom to costume it is assigned, not merely to clothe the persons of both sexes, but also to display and adorn the human figure.

It will be observed that, in all countries among civilized races, in the degree that climate is more temperate, in that same degree is costume more liable to changes and fluctuations, and more completely under the sway of fashion. In regions that are very hot or very cold, fashion, however quaint and eccentric, is long-lived and tenacious of its hold, so that the costume of one generation for the most part is reflected in that of its successor. In like manner, costume, and especially in its general character, is comparatively permanent among mountaineers. The history of costume, it must be added, approximately complete and explicit as it may be, can contain but little more than scant notices of the unavoidably simple or even rude attire of a considerable proportion of the laborious population in every country and at every period.

Subjugation by the Romans in the first centuries of the Christian era naturally was followed by a general conformity among the conquered populations to the costume of their more civilized as well as more powerful rulers, so that after a while Roman dress may be considered to have become European. And, as Rome herself through her Eastern connections had yielded in no slight degree to Oriental influences in matters connected with costume, so also Roman influence in the West carried with it much that was strongly marked with the characteristics of the East. This singular association also in after times derived fresh impulses, as well in peaceful costume as in armour and other military matters, through the direct agency of the crusades, acting in concert with an artistic current flowing westwards continually in the Middle Ages from Byzantium.

ANGLO-SAXON.—Generally simple in its character and designedly adapted both to the tastes and sentiments and to the usages and requirements of a hardy and temperate race, the prevailing costume of the Anglo-Saxons consisted of a sleeved tunic, varying in length, but generally comparatively short, partly open at the sides, and confined about the waist by a girdle. Over this tunic, which was made of various colours, and both plain and occasionally enriched with varied ornamentation, a short cloak was worn by the young, while in its stead a mantle of ampler dimensions and greater length was adopted by persons more advanced in age. Similar mantles, not assumed as wrappers for extra warmth or protection against the weather, were in general use at ceremonies and festivals. Trews or drawers, continued to form hose for the lower limbs, with shoes or low boots, completed the ordinary attire of the men, who wore their beards, and delighted in having long and flowing hair. Ornaments, many of them of gold and remarkable for beauty of design and excellence of workmanship, were freely used by the Anglo-Saxons of both sexes; and the numerous fibulæ, brooches, armlets, and other personal ornaments that have been discovered in their graves attest the attainment of the Anglo-Saxons to an advanced condition of civilization and refinement. A peculiarity in the dress of the men of all ranks was the cross-gartering of their hose, or their simply covering their legs below the knee with crossed swathing bands fastened at the knee. The females wore long tunics or gowns, made loose and high, and girt in about the waist. Over these they had shorter tunics, often much enriched, and with sleeves, unlike the close-fitting sleeves of their under tunics, that were very wide, and widest at the wrist. Over all, mantles of ample size and provided with hoods to cover the head were thrown, and disposed with effective gracefulness. Coverchefs also were habitually in use, to cover the head when the mantle would not be assumed; and they often were so adjusted as to encircle the face and to cover both the throat and the shoulders; so that they may correctly be regarded as prototypes of the wimple, so popular in somewhat later times. The girdle, it may be added, as worn by both sexes, was rather a swathing band, folded for doing girdle duty, than a girdle proper. The costume of the princes, the nobles, and the wealthy, while in its general character the same as that already described, was distinguished by greater richness of material and more costly adornment. As if to parody the universal fashion of cross bandages for the legs, the Anglo-Saxons habitually wore upon their arms twisted bracelets or *torques*, or, in their stead, a number of simple bracelets—a custom common to them and all their kindred of Scandinavian descent.

COSTUMES (ESPECIALLY ENGLISH) FROM THE 11TH TO THE 17TH CENTURY.

Century XI.—During the brief rule of the Danes, the national costume does not appear to have experienced any change in England The advent of the Normans brought with it to England the establishment of that luxury in dress, with which the Anglo-Saxons previously had become in some degree acquainted, and which was destined to so great an extent to supersede the still prevailing simplicity of their hereditary attire. The Norman conquerors, however, with their short cloaks and shaven faces, were not slow to adopt so much of the Saxon style of dress as led them to wear tunics of ample proportions, and in many ways to assume whatever in that dress was most graceful and dignified. Still, as in other things, so in costume, until the 12th century had made a considerable advance the powerful and wealthy Anglo-Normans preserved an external visible distinction between themselves and their Anglo-Saxon fellow-subjects. And yet, the ordinary costume of the people of England appears to have undergone no characteristic change during the second half of the 11th century, seeing that short tunics and capes, cloaks with hoods, cross-bandaged chausses or hose, shoes or low boots, and caps pointed in the crown continued in general use. But it was not so with the nobles, who speedily indulged in every species of ostentatious display upon their persons, covering their rich dresses with ornamentation, introducing gorgeous novelties in fabrics, with costly furs, lengthening their garments till they swept the ground, and widening their sleeves till they hung down open-mouthed from their wrists. To these wide and open-mouthed sleeves the Norman ladies speedily added long pendant lappets, in which extravagant form this portion of their dress was commemorated in the heraldic "maunche" of later times (fig. 24). Tunics richly adorned, made to fit closely about the figure, but with long and loosely flowing skirts, and having the "maunche" sleeves, with splendid mantles of ample size which were fastened on one of the shoulders and were furnished with hoods, enjoyed the highest favour with the Norman ladies, who also wore their hair in heavy and long braids, when the century of the Conquest came to its termination.

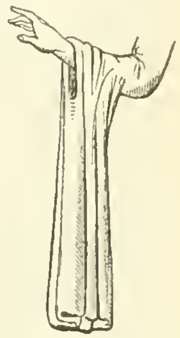

FIG. 24.—"Maunche" Sleeve.

Century XII.—Like their armour—if to their defensive equipment the term armour may be applicable—and weapons, the costume of the Normans when they established themselves in England, while exhibiting significant tokens of affinity to that worn by their own Scandinavian contemporaries, had become assimilated to the dress prevalent among the races with whom they were familiar more to the south. As a matter of course, also, through what remained of the 11th century, and until the succeeding century had far advanced, the distinctive characteristics of Anglo-Saxon and Anglo-Norman attire were retained, and appeared simultaneously in use; nor can they be considered to have become blended in what might claim to be accepted as a single national costume before the reign of Henry III. Many circumstances appear to have combined to have caused the same general character of costume, unless under special local circumstances, to have prevailed throughout Europe during the period of mediæval armour—from the second half of the 12th century, that is, till the end of the 16th—the same general uniformity in essentials being further observable in the armour itself. It may here be remarked, that both the armour and the costume represented in the monumental effigies of the Middle Ages are alike in being distinguished by a pervading simplicity and an absence of excesses, which in a signal degree qualify them to be accepted as typical rather than as exceptional examples and authorities. This is especially the case with the monumental effigies of various kinds, second to none as works of mediæval art, that abound throughout England. It but too frequently happens, however, that in forming their estimate of costume, reversing the judicious and sound principles adopted by the monumental artists of the Middle Ages, writers permit themselves to select as their types the occasional eccentricities and vagaries of fashion or of individual extravagance.

The first sculptured representations of English sovereigns that are known to exist in England appear at the sides of the great west doorway-arch of Rochester Cathedral, and they show the costume worn by Henry I. and his queen Matilda of Scotland. The king, in whose reign beards and long hair again came into fashion, has gathered about his person a flowing tunic, worn under a dalmatic and a mantle; his queen also wears corresponding garments, the sleeves of her dalmatic (or over-tunic) being even wider than those of her consort. Her hair she wears in two very long braids, one of them hanging down on either side on the front of her person. Under and upper tunics, girdles, and mantles, both with and without hoods, pointed caps and low hats with wide brims, and leggings and shoes, are represented in the various illuminations of this era, which convey very clear and well-defined ideas of the costume then in use by various classes and both sexes. Towards the close of this century the costume of Henry II. and of his Queen Eleanor, as represented in their effigies, may be accepted as characteristic illustrations of a period in which considerable luxury in dress was becoming generally prevalent. The king is attired in an under-tunic reaching to his feet, and a blue tunic almost of the same length, both garments having comparatively tight sleeves reaching to the wrists; over the upper-tunic is a dalmatic of crimson enriched with a floral pattern in gold, long but not very full, and without any front-opening being apparent, its full sleeves shorter than those of the tunic; over all, a purple mantle, fastened with a morse on the right shoulder, covers the left arm, and is drawn up on the right side so as partly to cover the figure also on the right side below the girdle. The gloves are jewelled, and the boots, green in colour, enriched with gold and armed with golden spurs, are broad and slightly pointed. Over a white under-tunic, visible only at the throat where it is fastened by a circular brooch, the queen wears a long tunic or gown, loose throughout, its sleeves tight at the wrists and enlarging upwards to the shoulders, which is secured about the waist by a buckled girdle. The pattern upon this dress, which is represented to have been worn uncovered by a dalmatic, and is white, consists of golden crescents in pairs, set reversed and contained within the meshes of an interlaced lozenge-work also golden. The mantle of blue, studded with golden crescents, is secured across the breast with a cord, and, falling back from the shoulders, it is gathered up on both sides and drawn partly across the figure in front. About her face the queen has a plain wimple; and beneath her crown her head is covered with a coverchef, which falls in folds on either shoulder. The king also is crowned; but his sceptre has been broken away from his right hand. In her illuminated portraits, Eleanor of Aquitaine is represented with a wimple, which is fastened with a circlet of gems; her under tunic, or cote-hardi, fitting closely and having tight sleeves, is gathered into a rich collar about her throat; over this dress is a loose tunic, long and flowing, guarded with fur, its full and open sleeves also being lined with fur: and, over all, there is the ever-present mantle, generally of some light material, so adjusted that at the pleasure of the wearer it might be drawn over the head. Henry II. is not known to have been represented wearing the short cloak of Anjou, familiarly associated with his name. A few years later the same royal attire is represented in the effigy of Richard I. Here, over a white under-tunic, the long tunic and the almost equally long crimson dalmatic are shown to be slit up at the sides; the latter garment has very full sleeves, which hang down from a little above the wrists, and the rich girdle, covered by the mantle in his father's effigy, is shown. The mantle, of royal blue and gold, has a different adjustment, being fastened in the centre over the chest by a large morse, from which it falls back over the right shoulder, but on the left side it is drawn forward so as partly to cover the person and to hang down in folds over the arm; and on the right side also this mantle is drawn forward below the girdle. The king is crowned; he wears gloves, jewelled at the back of the hand; and to his enriched boots, which in their form and adornment resemble his father's, his spurs are attached by buckled straps. In all these royal effigies it is certain that a faithful representation is given of the remains, attired as had been the custom of these personages in life, when lying in state before interment. In that warlike and turbulent age, when the possession of good arms and armour and the means of effecting improvements in them were objects of supreme importance, the peaceful population appear to have been content to retain the system and style of dress in use shortly after the establishment of the Norman dynasty. A tunic, worn over some under-garment, generally made to reach about to the knees, but sometimes very short, constantly made with a cape and occasionally also with a hood, loose chausses or trews and light hose and pointed boots or shoes, with some kind of cap for head-gear, and a hood to the favourite cloak or mantle, formed the prevalent male dress. The nobles and other men of rank, when not in their armour, aspired to rival the princes in the richness of their attire; and, in addition to such costumes as might be habitual to them when engaged in active occupations, wealthy citizens were not slow to follow the higher and perhaps still richer classes as closely as might be permitted to them, by indulging in long and flowing gown-like tunics when in repose or on occasions of ceremony and festivity. The long tunics which came into use by men early in the century at first had long sleeves very wide at the wrists; and at the same time the sleeves of their tunics were worn of extravagant length and proportions by ladies of rank. This extravagance, particularly in the male attire, however, had almost disappeared before the close of the century. On the whole, the female attire may be said in its common use to have been subjected to but little of decided change, except that in its general aspect it exhibited somewhat less of an Oriental character than it had done at the commencement of the century. The powerful influence exercised by the East through the crusades on the armour and military appointments of the warriors of the West, did not take effect till the next century in matters connected with Western female fashions and usages.

Century XIII.—As in the century next succeeding, in both the first and the second half of the 13th century, royal costume, which may be accepted as the most perfect example of the dress of the higher and wealthier classes, is happily exemplified with the highest contemporary authority. King John, upon whose monument (itself a work of the Tudor era) in Worcester Cathedral rests the earliest of the royal portrait effigies that are in existence in England, is attired in a loose tunic reaching from the throat almost to the ankles, having tight sleeves, and its colour being golden. Over this is a loose full-sleeved crimson dalmatic, shorter than the tunic, bordered about the throat-opening and at the very wide extremities of the sleeves with richly gemmed gold embroidery, and secured about the waist by a buckled girdle having a long pendant end. The mantle, worn over all, which hangs down the back of the figure, is gathered up on the right arm in a manner long as well as very generally adopted by both sexes. The king, who has red hose with black boots and golden spurs, is crowned, a circlet of jewels which binds his hair appearing on his brow from beneath his crown. In his gloved hands, the gloves being gemmed, he holds his sword and what remains of his sceptre. Among notices of King John's costume, he is recorded to have appeared at a certain Christmas festival in a white damask tunic with a jewelled girdle and gloves, his mantle being of red satin embroidered with sapphires and pearls. Over a white under-tunic fastened with a circular brooch at the throat, Queen Isabel of Angoulême appears in her effigy habited in a long blue tunic covered with single golden crescents; this robe, which is loose and flowing throughout, has its full sleeves gathered in at the wrists, and it is adjusted about the waist by a rich girdle secured by a buckle. The queen wears a wimple and on her coverchef rests her crown; her mantle, which hangs from her shoulders and on her right side is drawn partly over her figure, is yellow covered with red roses and green leaves. Berengaria, the widow of Richard I., who died about 1235, is attired in the same fashion; but her tunic, of ampler proportions, is more gracefully disposed; her large brooch is elaborately enriched; from her gemmed girdle on her left side an aumoniere, or purse, is suspended; her mantle, secured by a narrow cord across her breast, is not drawn forward; she wears no wimple, and her coverchef is so adjusted about her crowned head as to permit her wavy hair to be visible. The effigy of this royal widow displays no tokens of any such style or accessories of costume as might have reference to her condition of widowhood.

The crowned effigy of Henry III. (1272), a noble work, is remarkable for the classic grace and dignity of the adjustment of the ample mantle about the king's person, over his long tunic and dalmatic; this mantle is fastened by a large morse on the right shoulder. The king's boots, which are elaborately embroidered with small gold lions enclosed in lozenge-work, are without spurs. During the long reign of this weak prince but few decided changes appear to have taken place to affect what gradually had settled down into becoming the national costume in England. New varieties, however, of rich and costly fabrics continued to be introduced, and they were eagerly adopted as materials for their dress by both sexes of the wealthier classes. Eleanor of Provence is represented clad in an embroidered mantle having an ermine collar, fastened with a small brooch over a close-fitting and wide-skirted tunic of gold brocade, having its sleeves so cut as nearly to cover the hands. At this time furs of various kinds were greatly in request. The fashion, too, which had been introduced in the time of Rufus and was long prevalent, of cutting the borders of dresses into fantastic patterns became more general, and often was carried to excess. Sleeveless tunics, which would show the sleeves as well as the lower parts of the longer under-tunics, began to assume a recognized position in the female attire of the time and, no longer braided in long tails, ladies' hair was arranged within network of gold or silver filagree or of silk, the wimple and coverchef, now constantly of very rich materials, being retained in use, and often so adjusted as to display the countenance in a triangular form after the manner of the mail coif of the knights. Of this fashion the effigy of Aveline, first countess of Lancaster, in Westminster Abbey, affords a truly characteristic illustration (fig. 25). At this same period the diapered patterns and rich tissues of Ypres attained to a great celebrity, and heraldic devices began to appear as decorative accessories of dress. No effigy of the warlike Edward I. exists, to show him either in his mail, or in such attire as it pleased him to assume when not fully armed; but, doubtless, the fine effigy of Fair Rosamond's son, Earl William

Fig. 25.—Head-dress from Effigy of countess of Lancaster.

Longespée, in Salisbury Cathedral, may be accepted as a sufficiently accurate illustration of the *military uniform* of the first Edward after the Conquest, who also may be assumed to have been attired, when his mail had been laid aside, much after the fashion of his father. It is well known that in his day princes and nobles arrayed themselves in flowing robes, worn over comparatively closely fitting tunics or doublets, these garments being made of silk damasks and satins of brilliant colours, with adornments of goldsmiths' work and furs, in the use of which they were freely followed by the knights and the wealthy classes as well as by the ladies of their era. Not content with the triangular adjustment of the wimple, towards the close of this century the ladies adopted the strange and unsightly gorget to cover their throats, thus still more closely adapting the aspect of their own head-gear and its accessories to the mail coifs and the helms of their martial lords. The beautiful effigy of Eleanor of Castile, which rests upon a massive plate of bronze gilt and diapered with the armorial castles and lions of Castile and Leon, is remarkable as well for the dignified simplicity of the costume as for the sweet expression of the countenance. Secured by a narrow band which she holds in her left hand, the queen's long and ample mantle for the most part envelops her person, disclosing only the upper part of her wide-sleeved tunic and the close-fitting sleeves of the dress worn beneath it; she wears neither wimple nor coverchef, but allows her luxuriant hair to fall in rich waves from beneath her diadem upon her shoulders.

Century XIV.—The royal attire represented in the two halves of this century in the effigies of Edward II. and Edward III. is a tunic (the under-tunic not being visible) descending to the feet and having tight sleeves; a dalmatic, open in front to midway between the knees and the waist, of the same length; and a long flowing mantle, secured across the breast by a broad band of rich workmanship. The dalmatic of the father, who is crowned and in his ungloved hands holds a sceptre and an orb, has full sleeves reaching only to the elbows, but prolonged in broad lappets of moderate length, while that of the son has its sleeves tight and but little shorter than those of his tunic. In both cases the mantle, covering the shoulders but not drawn across the chest or covering any part of the front of the person, falls at the back of the wearer. The boots of Edward III., richly embroidered, are acutely pointed at the toes, but not of extravagant length; the aged monarch is bareheaded, with long flowing hair and beard; his two sceptres have been broken away. One of the crowned statuettes upon the monument of her younger son, John of Eltham, duke of Cornwall, apparently represents Isabelle of France, queen of Edward II., in a tunic and mantle, having her throat and head enveloped in a combination of a wimple with a gorget, after a fashion equally strange and unbecoming, but which, nevertheless, in her time was prevalent. This queen, who delighted in splendid extravagance, is recorded to have habitually worn, richly embroidered and adorned with jewels, dresses of cloth of gold or silver, with others of velvet of various colours and of shot taffeta, and with others also of green cloth of Douay and of rose satin. The inventories of wardrobes and jewellery that still exist show, in a significant manner peculiar to themselves, the extent, variety, and unbounded extravagance of the costumes of both sexes, with their costly accessories and ornaments. In strong contrast to the tales thus told, the costume of the effigy of Queen Philippa is simply a gown or tunic, quite tight to the figure and laced down the front; the sleeves tight, traversed from the shoulder onwards by a close-set row of small buttons, and prolonged from the wrists so as partly to cover the hands; and the skirt being very full and falling in rich folds over the feet. A narrow girdle encircles the royal person, adjusted, not as in earlier times somewhat tightly around the waist, but loosely and about the hips, precisely as the military belt had begun to be worn by the other sex. Over this tunic, the only other garment visible, a mantle, falls from the shoulders down the back. The queen's hair, confined within a reticulated covering of goldsmith's work beneath her diadem, is bound by a circlet and made to project prominently on each side of the face. At the close of the century, the effigies of Richard II. and Anne of Bohemia show the same costume to be repeated in the case of both royal personages, the whole being covered with the royal heraldic badges; and the queen's hair falls unconfined and naturally over her shoulders. Other effigies of ladies of different ranks, notably a fine one of Lady Stapleton at Ingham in Norfolk, give similar examples of the costume worn by the two queens. Established in use early in the century, the display of heraldic insignia blazoned upon articles of dress rose into the highest favour and popularity during the brilliant reign of Edward III., and they also were lavishly adopted in the luxurious times of his grandson. Indeed, with the progress of this century, mediæval costume both attained to its highest splendour, and also exhibited much of its extreme extravagance. It became the fashion, for example, for both sexes to wear hanging from their sleeves long lappets, sometimes prolongations of the actual sleeves, and at other times mere strips, and their hoods were prolonged in points to correspond with them. Dresses, some very long, others very short, having their edges cut and jagged in a most bizarre manner, often were worn partycoloured, the colours in many cases having been chosen expressly with a view to produce the most vivid contrast; boots and shoes had their pointed toes made twice or even thrice the length of the wearer's foot; and head-gear, exhibiting no little diversity of fantastic forms, was universally prevalent. The fashions of England corresponded with those of France, though apparently they were not carried here quite to the same excess that they were on the Continent. The singular aim of each sex, not only to emulate the other in the sumptuous style and profuse adornment of their dress, but also to imitate the form and fashion of each other's attire, obtained in both countries. The consistent adjustment of the knightly surcoats and jupons over armour, enhancing its effect while partly covering it, suggested to the ladies to adopt kirtles or cotes-hardi, that from being merely sleeveless became sideless also. This form of garment, so well adapted for the display of what was worn under it, assumed several varieties of treatment. Sometimes it was little more than the front and back of a jacket, as in fig. 26; and at other times it became a complete dress, with the exception of sides and sleeves, in which case it was either made to fit closely about the person both before and behind, and then was continued to form a loose and flowing skirt of ample proportions and great length, or with a similar skirt the upper part of the dress also hung loosely about the figure, as in fig. 27. In the next century this same dress

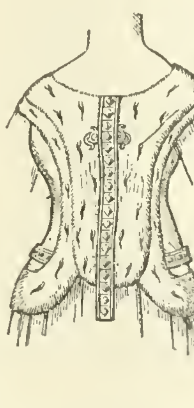

Fig. 26.—Part of Statue of Jean de Bourbon, from St Denis, 1379.

Fig. 27.—From MS., 1430. (After Viollet-le-Duc.)

at times was worn cut off at the knees, so as to leave the lower part of the under-tunic visible as well as its sides and sleeves. This dress constantly was richly guarded and sometimes lined with costly furs, and it generally was also adorned down the front with a continuous series of massive studs or other goldsmiths' work. It appears also to have been a never-failing usage in connection with this fashion of a sideless kirtle to display the girdle of the under-tunic, which rested loosely on the hips, as it passed under the sideless garment both before and behind. Found to have been in use, in the form at first of a long and flowing sleeveless robe or gown, early in the 14th century, this sideless kirtle or cote-hardi continued to enjoy unabated favour for not much less than two centuries. It appears, certainly not later than 1320, in effigies at Bedale, Selby, and Staindrop—the Selby lady having the flowing skirt of her sideless dress blazoned with armorial insignia; in her effigy at Oxford, Lady Montacute is represented in this dress, 1354; and it is repeated in the effigies of Lady Beauchamp, at Worcester, 1384; of Queen Joanna of Navarre, at Canterbury, 1407; of Lady Harcourt, at Stanton Harcourt, 1471; and of the Duchess of Suffolk, at Ewelme, 1474: the two ladies last named, whose husbands were K.G., wear the garter of the order, the former as an armlet and the latter as a bracelet. Still later, 1500, in her beautiful effigy in Westminster Abbey, Elizabeth Arundel, wife of Sir Giles Daubeney, K.G., treasurer to Henry VII., is represented in this same sideless over-tunic which reaches only about to the knees, so displaying the lower part of the long and flowing under-tunic as well as its sides and sleeves. M. Viollet-le-Duc has shown the sideless kirtle to have been no less fashionable and no less capable to maintain its position in France, than we possess abundant evidence to prove it to have been in England. The same fashion also prevailed at the same period in other parts of Europe. At Worcester a closely wimpled effigy illustrates in a remarkable manner the usage, at the commencement of the century, to attach small enamelled shields of arms in profusion upon the dresses of ladies of rank, a mode of decoration shown again in a brass at Trotton, 1310. Throughout this century the wimple and coverchef continued to be worn, or the hair was confined within bands of fretwork, or had some light and delicate covering which did not extend to the face and throat. In the second half of the century the hair appears to have been worn partly within the favourite fretwork, and in part falling on the shoulders; the coverchef also then assumed the forms of a variety of caps, and some of the more extravagant head-dresses of the following century began to make their appearance. For protection from the cold and wet the hoods of mantles always were available, and hats wide in the brim were also worn. The hip-belt was universal. Pocket-holes, into which the hands of the wearers often are represented to have been inserted, are shown to have been made in the outer-tunics and robes. Throughout the era of splendid armour, men of distinction so constantly are represented in their armour that the typical and specially characteristic male costume of the Middle Ages is commonly considered to have been identified with what in reality ought to be distinguished as the military equipment of the period. Rarely, however, as we see the more accessible and popular of their "counterfeit presentments" in peaceful guise, the warriors of those days when circumstances permitted gladly laid aside basinet and hauberk and panoply of plate, in order to assume some less weighty and uneasy garb. Under the armour close-fitting doublets and hose were worn, made either of leather or of some quilted fabric. When without their armour, the dress of nobles and knights in many respects was assimilated to the garments assumed by them over their armour. The general costume of men of all classes at the same period was closely in accord with the style prevalent with their contemporaries of exalted rank, the essential distinctions of different classes being comparative costliness and splendour of adornment. It will be observed that garments fitting closely to the person were in constant use, as is well exemplified in fig. 28, and also such others as were Oriental in their length and flowing looseness. Early in the 14th century two or three surcoats were worn over the armour; but later the short jupon, generally jagged at the edges and sleeveless, but sometimes plain and having sleeves reaching only to the elbows, superseded them, when a similar jupon made of some rich material and often having a hood, was adopted to be worn with a hip-belt, without the armour. The hip-belt, as was the case with the other sex who borrowed it from the men, was universal.

Fig. 28.—(*c.* 1330 A.D.)

The hose, shoes, boots or buskins, always sharply pointed, became very long as the century advanced. Rows of buttons, also, some of them very small and closely set, were in great favour. Heraldic devices, assumed as military insignia, became the favourite ornaments of the dress of peace. The military camail, again, the representative of the mail-coif of earlier times, found a parallel in

Fig. 29.—The Black Prince.

Fig. 30.—Lionel, duke of Clarence.

the hood when resting on the shoulders, and in the cape which so frequently was associated with the peaceful attire of this century. See fig. 28, which also gives a characteristic illustration of the prolonged sleeve-lappets that still held their ground with resolute tenacity. Six of the original beautiful bronze statuettes, representing two of the daughters and four of the sons of Edward III.,[1] which still remain *in situ* on the south side of that monarch's monument in Westminster Abbey, form a group so happily illustrative of both male and female costume in the second half of the 14th century before it had degenerated into the extravagancies of the reign of Richard II., that it has appeared desirable here to introduce the accompanying sketches of the entire group (figs. 29-34). One of these statuettes (fig. 29) is especially

Fig. 31.—Son of Edward III.

Fig. 32.—Son of Edward III.

interesting, since it is a contemporary portrait of the Black Prince when he was not armed, which consequently may be agreeably associated with his noble armed effigy upon his own monument at Canterbury. The doublet and hose, doubtless worn by the Black Prince under his voluminous mantle with its deeply jugged lower border, is effectively shown in the statuettes of two of his brothers, Lionel, duke of Clarence (fig. 30), who also wears his mantle; and a younger brother (fig. 31), not now to be identified in consequence of his shield of arms having long been lost. The effigy of the fourth brother (fig. 32), enveloped like the Black Prince in his mantle, has also lost the armorial shield which would have declared his name and title. With the costume of these royal

Fig. 33.—Daughter of Edward III.

Fig. 34.—Daughter of Edward III.

brothers may be compared the habit of a civilian, who lived at the same time with them, as it is shown in his monumental brass at Shottesbroke (fig. 35). The corresponding French costume of a few years earlier, which continued in fashion till the close of the century, is well exemplified in figs. 28 and 36. The effigies of the two royal sisters (figs. 33, 34) speak for themselves as expressive and authoritative typical illustrations of the female dress of their era in its simplest and most characteristic forms, as the entire group in which they appear attests the dignified simplicity which the artists of the Middle Ages, with such excellent taste, have shown that they held to be appropriate for the costume, in itself always accurate and historically true, to be represented in monumental sculpture. Without introducing much of actual novelty, except in the case of some of the head-dresses which from this time continued in use under the fourth, fifth, and sixth Henries, the concluding quarter of the 14th century was distinguished—as we learn from contemporary illuminations—by the pervading love of lavish extravagance in dress in all classes, and by the excess to which the more fanciful devices and fashions of earlier times were carried. Thus, the jagged borders

FIG. 35.—Civilian, *c.* 1375

FIG. 36.—Lancelot du Lac, *c.* 1360. From Viollet-le-Duc.

of tunics and mantles became more than ever fantastic; the tunics and mantles themselves attained to a larger size, and the hanging sleeves commonly attached to them drooped to the very ground. Hoods, from being merely pointed, were prolonged in pipe-like extensions ("liripipes"), and the points of boots and shoes were made sharper, and the boots and shoes were made longer than ever. The singularly quaint and bizarre usage of making dresses party-coloured, the colours being selected in the majority of instances with a view to decided contrast, derived doubtless from heraldic impalements and quarterings with fields of different tinctures, and carried out in the livery colours assumed by the retainers and dependants of great houses,—a fashion which had established itself during the palmy heraldic days of Edward III.,—became general in the reign of Richard II., and then it was carried out in every variety of the details, accessories, and ornaments of costume.

Century XV.—Remarkable for a sustained succession of important changes in armour, and also from the fact that after about 1405, and until about 1475, the panoply of steel was worn uncovered by any surcoat or jupon, this turbulent century also witnessed a variety of changes in costume—changes that maintained a general uniformity throughout the greater part of Europe—which in their turn led in the succeeding century to the equally general establishment of the Tudor fashions. Heraldic devices continued to constitute favourite accessories and ornaments of dress, and in no slight degree determined both its character and its aspect. To the crests of the knightly helms, and to the contoises or scarves and the mantlings displayed from them by the knights, may be assigned, as being the sources whence they were suggested, the more extravagant and quaint varieties of the female head-gear which prevailed at this period. And, in like manner, the "livery colours" of the nobles and other personages of distinction, introduced during the preceding century, together with their armorial badges, all of them worn by their partisans, adherents, and dependants, imparted a heraldic character to the costume of the middle and even of the humbler classes. The only royal monumental effigies of this century are those of Henry IV. and of his second wife, Joanna of Navarre, at Canterbury. The king's dalmatic, of ample proportions and ungirt by any girdle, falls to his feet, completely covering his tunic, except at the wrists of its tight sleeves, which have an under row of small buttons set in contact; over these sleeves are the large and open sleeves of the dalmatic itself, which is remarkable from having at each side a very large opening to give access to the pockets of the tunic. About the shoulders and covering the chest is a cape or tippet; and, over all, there is a mantle, its hood adjusted about the neck of the wearer, which is secured by a broad and rich band, with morses, cords, and tassels. Upon his head the first Lancastrian king wears a crown of elaborate splendour. The effigy of Queen Joanna, from which, as also is the case with the companion effigy of her royal husband, the hands and the greater part of the arms have been broken away, represents her attired in a close-fitting tunic with a narrow very rich hip-girdle, under a long sleeveless and sideless cote-hardi, cut low and fitting tightly in the body, but having a loose, long and flowing skirt, and adorned with a row of rich circular studs down the front. The mantle, which falls over the back of the figure and is not gathered up at the arms, is secured by a cordon attached to two lozenge-shaped studs. As a necklace the queen wears the Lancastrian collar of SS.; and her hair, which is plaited in bands within golden network, is surmounted by a truly beautiful crown. Thus the costume of this royal lady shows no change from the ruling fashion of the previous century. At this same time female dresses were worn made full, and either gathered into a kind of close collar about the throat, or having a broad collar falling over the shoulders, their sleeves very large and full and sometimes quite open, while at other times they also were gathered in (but not closely) at the wrists; these dresses, often having a row of small buttons from the throat downwards, were so adjusted by a belt as to have very short waists. At this period also, and till the middle of the century, the tunic commonly worn by men, with the exception of being shorter, in form was almost identical with the full-sleeved kirtle also in common use by the other sex. Among characteristic examples of the ordinary costumes of the first half of the 15th century are effigies, some sculptured and some engraved, at Chipping Campden, Willoughby, Northleach, Kingston-on-Thames, Great Tew, Higham Ferrers, and Bedington. In the third quarter of the century the male dress in general use underwent but little change, the very long tunics of earlier times still remaining in favour; but the female kirtles are seldom seen with very full sleeves, the sleeves of the under-tunic being continued in the form of mittens so as partly to cover the hands, the outer sleeves ending in cuffs that are turned back. While the costume of the commonality thus was at any rate comparatively simple and sober, throughout the turbulent period that succeeded the death of Henry V. till the establishment of the Tudors, it would appear as if the fierce excitement and the terrible vicissitudes of a prolonged civil war had impelled the nobility and others of the upper classes in England—encouraged in such a course, as it would seem, and still further stimulated to pursue it by the contemporaneous fashions of France—to have sought a not altogether inconsistent kind of relief in both the revival and the invention of almost every conceivable extravagance and absurdity in dress and personal ornament. Long and loose robes having immense drooping sleeves had as their contemporaries close-fitting tunics reaching down not quite to the knees, with others of looser make which descended midway between the knee and the ankle, and also with jerkins cut short only a few inches below the hips, made very full, and gathered in with a belt about the waist. Of these tunics and jerkins the sleeves assumed an endless variety of form and decoration, being sometimes made to fit tightly, but more generally being large and open, and at their extremities either jagged or bordered with fur. These large sleeves enabled the wearers to display the sleeves of their under garments, and in so doing to emulate the ladies with their sideless cote-hardis and kirtles. Mantles of the richest materials and splendidly adorned, which were made to reach about to the knees, were worn as parts of the regular dress. The half-boots or shoes distinguished as *poulaines* continued to be long and very sharply pointed; and men of rank and fashion actually walked about in clogs, pointed like their poulaines, and exceeding them in length by several inches. The excesses in attire characteristic of this period culminated (in every acceptation of that word) in the female head-dresses, that appear literally to have exhausted the inventive faculties both of the ladies themselves and of those persons who ministered to their tastes and wishes. From their more decidedly characteristic features, some of the more popular of these strange varieties of head-gear

FIG. 37.—"Horned" Head-dress, c. 1475.

FIG. 38.—"Mitre" Head-dress, *c.* 1475.

have been distinguished as the "horned," the "mitre," the "steeple"—in France known as the "hennin,"—and the "butterfly" (figs. 37–40). Examples of all these head-dresses in their various modifications of contour, size, accessories, adornment, and adjustment, abound in the monuments and illuminated MSS. of both France and England; also, as in the general character of the costume of each era, the same fashions of head-gear are found to have prevailed about the same period in other European countries. The most remarkable example of the "horned" head-dress that has been observed either in France or England, is represented in the effigy of Beatrice of Portugal, who married one of the earls of Arundel in the time of Henry V., which remains in good preservation in Arundel church in Sussex; fig. 37, from the brass to Lady Halsham in the same county, shows a simpler and more moderate form of the same head-dress. Fig. 38 is drawn from a portrait of Elizabeth of York when young, in stained glass at Little Malvern. The "hennin," fig. 39, is a French example, reproduced from the always effective pages of Viollet-le-Duc. The "butterfly," shown in fig. 40, is another example in which the type of a particular head-gear is exhibited with no less of moderation than of accuracy. In every case, to these head-dresses veils, generally of ample proportions and often of great length or depth, and always of some light and delicate material, were attached, and from the actual structure worn in connection with the hair upon the head they either were expanded by wires or were permitted to fall drooping freely.

FIG. 39.—"Steeple" Head-dress ("Hennin"). From Viollet-le-Duc.

FIG. 40.—"Butterfly Head-dress.

Extravagancies in head-gear, however, were not restricted to the fashions of one sex only; on the contrary, at this same period, among other strange eccentricities and fancies, a kind of cap, in form somewhat resembling a turban, was introduced and generally worn by men, which on one side had attached to it a cluster of very large bows or puffs (the prototype of the "cockade" of later times), while on the other side a broad band or scarf of the same material as the cluster of bows hung down to the ground, or even trailed along upon it, unless it should be the pleasure of the wearer to tuck it up in his girdle, or to wind it round either his head or his throat and shoulders. This strange male head-gear, of which a French example is given in fig. 41, showing the upper part of the scarf when hanging down, often was treated as a hood for occasional use only, when it rested on one of the shoulders of the wearer, its cluster of bows drooping over his back, and the long band or lappet pendant in front of his person, his head, meanwhile, if not bare, being covered with a cap, round or square or peaked, or by a brimless hat adorned with an upright feather and a jewel. In the 13th and 14th centuries the knightly surcoats and jupons, worn over armour, had their counterparts in the robes and tunics of peaceful attire; and so, in like manner, the shortened tunics and still shorter jerkins, that were in common use when the 15th century was bringing the great civil struggle to its termination in the accession of the Tudors, may be considered to have been suggested by the short "tabard" with its short and full sleeves and its heraldic blazonry, at that time worn by men-at-arms over their plate-armour. At the same time and till the end of the century, the long tunics still in use, which some years earlier had been slit up in front and had their full sleeves somewhat gathered in at the wrists, were made still longer, and had collars either close-fitting or open and falling back; they also were made open in front throughout their entire length, and their loose sleeves were of a uniform size from the shoulder to the wrist. At this same time also rosaries, and gypcières or purses, were worn attached to their girdles by both sexes. About the year 1480 the long and acutely pointed poulaines were superseded by coverings for the feet of both sexes which exhibited the opposite extreme of being short, very broad, and rounded or sometimes almost square at the toes. In the concluding quarter of this century, the super-tunic or gown of the ladies, made to fit closely and having a long and flowing skirt, the sleeves also close-fitting and with cuffs either turned back or drawn over the hands, was open above the short waist, the collar falling back over the shoulders and showing the under-tunic either carried up to fit closely at the throat, or sometimes cut square and low. Rich and broad necklaces were worn, and belts of goldsmiths' work with long pendants. The "horned" head-dress became either sharper in its points, or considerably less pointed and more graceful. The "butterfly" head-dress increased in favour, and was worn with the hair drawn back into an enriched caul or cap. About 1490 an angular or "diamond" head-dress superseded the "butterfly;" it had a ridge, after the manner of a gabled roof of a house, over the head, and forming an anglo above the centre of the forehead, from which it descended with a slope on each side of the face; then, another angle having been formed slightly below each eye, this head-gear, which inclosed the back of the head in a species of cap, was continued as a broad lappet falling over each shoulder in front of the person of the wearer; occasionally, also, two other similar lappets depended behind (see fig. 42).

FIG. 41.—Head-dress with Scarf.

Early Painted Glass.—Upon the costume, always without doubt in a signal degree characteristic of the period in which it was executed, of the various figures introduced by mediæval artists into their numerous pictures executed in glass, Winston has made the following concise remarks:—

Early English Gothic, 1175 to 1300.—"Robes, whether lay or ecclesiastical, are generally short, in male figures hardly reaching to the ankles, and in females scarcely more than touching the ground. The female dress usually consists of a close garment with tight sleeves and a loose robe and shoes; the head is sometimes bare, but more commonly draped. The male dress, usually appropriated to dignified persons, also consists of a close garment confined at the waist, and furnished sometimes with tight and sometimes with loose sleeves, a robe or mantle, and long hose, to which is often added a cap greatly resembling the Phrygian bonnet. The costume of ordinary persons is generally a short tunic, confined at the waist and reaching nearly to the knees, and sometimes a short cloak; when this is used, the legs of the figure are generally represented encased in hose, or in a loose sort of stocking setting in folds about the leg, and with or without shoes."

Decorated English Gothic, 1300 to 1380.—"The draperies of this period are much more flowing and ample than those of the last; and in ecclesiastical and female figures the robe is generally long and envelops the feet. The secular emale costume usually consists of a garment fitting tightly to the arms and body, and having a wide long skirt trailing along the ground; upon it sometimes are depicted the armorial bearings of the wearer. A cloak or mantle is often loosely thrown over it. The wimple is a frequent adjunct to the head-dress, and the hair is usually plaited down on each side of the face and inclosed in a net or cowl. The ordinary costume of dignified laymen consists of a long robe and loose cloak,—the hair and beard being arranged in loose and wavy locks. The usual secular dress is a short jerkin or tunic reaching about half-way down the thighs, and tight hose and shoes, upon which model the armour of this period was formed."

Perpendicular English Gothic, 1380 to about 1550.—"Greater repose was given to the figures in this than in either of the former styles, and the draperies are generally disposed in very broad and grand folds. The female dress in general consists either of a close-bodied dress with long skirts and tight sleeves, or of a looser dress with sleeves wide at the shoulders and tight at the wrists. A cloak is often added, upon which armorial bearings, when used, are emblazoned more frequently than on the other garment. The variety of the head-dresses is great, especially towards and during the reign of Edward IV. The secular male costume, until almost the end of Edward IV.'s reign, appears usually to have consisted of a furred gown of tunic-like form, reaching rather below the knees, slit nearly half-way up the middle, and confined round the waist with a girdle; it had either wide sleeves narrowing toward the wrist, or small at the shoulder and wide at the wrist like those of a surplice. The legs were inclosed in pointed-toed hose. The hair, until the latter part of the reign of Edward IV., appears to have been cropped closely all round, and after this time to have been cut straight across the forehead, but allowed to grow long behind and at the sides of the face, and to have been smoothed down like a club. In the reign of Henry VII. long furred gowns reaching to the feet and obtusely-toed shoes were used; they continued in fashion during the next reign also."

Century XVI.—"We find," says M. Paul Lacroix, writing specially with reference to the costume prevalent in France, "that a distinct separation between ancient and modern dress took place as early as the 16th century. In fact, our present fashions may be said to have taken their origin from about that time. It was during this century that men adopted clothes closely fitting to the body,—overcoats with tight sleeves, felt hats with more or less wide brims, and closed boots and shoes. The women also wore their dresses closely fitting to the figure, with tight sleeves, low crowned hats, and richly trimmed petticoats. These garments, which differ altogether from those of antiquity, constitute, as it were, the common type from which have arisen the endless varieties of modern male and female dress; and there is no doubt that fashion thus will continually be moving backwards and forwards from period to period, sometimes returning to its original model, and sometimes departing from it." Before arriving, however, at the useful and generally consistent and becoming dress of the present day, the fashions of both male and female attire had to pass on from the 16th century through a series of changes in every respect no less strange and extravagant, and yet always more or less directly tending in the same direction, than those which the earlier centuries had witnessed and then had carried away with themselves. And even now more than a little remains to be accomplished, before the ordinary costume in general use can be considered to have realized what ought to be its true aim—the most perfect attainable applicability, that is, to the condition and the requirements of the wearer, due but not excessive attention at the same time being bestowed upon appropriate effectiveness of appearance.

At the commencement of this century in England, there are the royal effigies of Henry VII. and his queen, Elizabeth of York. The king himself is represented as having his person entirely enveloped in a loose fur-lined robe or gown of ample size, reaching from its close fur collar about his neck to his feet, and so adjusted as to disclose but little of the garments worn beneath it. On his head he has the square cap that came into use and was generally worn during his reign. The queen wears a richly adorned angular head-dress (fig 42), from beneath which her hair falls unconfined over her shoulders; and the adjustment of her royal mantle is such as to display the upper part of her tunic, which is cut square and does not quite reach to her throat. The countess of Richmond, the mother of Henry VII., in her effigy appears wrapped from head to foot in a loose mantle, her tunic having plain and tight sleeves; and on her head she has a plain angular head-dress with a plaited wimple, over which the lappets fall. This costume may be regarded to have been designed to denote the widowhood of this four times married lady. Thus it appears that in their costume the effigies of these royal personages exhibit none of the distinctive insignia of royalty, and consequently they may be accepted as typical of the costume of their era. Neither of Henry VIII. nor of any one of his queens is there any monumental effigy; but this deficiency is more than compensated by the portraits painted by Holbein, made familiar to all by engravings; while other artists have left no less characteristic pictures representing personages of different ranks and classes who at the same period lived in France and England. Armour, which in the course of this century gradually became less esteemed for purposes of defence, and in a corresponding degree came to be more and more regarded as but little more than a splendid component or accessory of dress, in its form and aspect was closely assimilated to certain garments made of textile materials and in fashion among the armour-wearing classes. Much of curious and suggestive mutual illustration, accordingly, is to be obtained by a comparison between the aspect of a man of rank of this century in his armour, and the same person when in his customary attire. In the time of the first of the Tudor princes men wore two distinct varieties of dress. The one was a long and loose gown, having wide open sleeves, girt about the waist with a belt or scarf, above which it was open, its broad collar falling back over the shoulders; thus an under-tunic or vest was displayed, that in its turn allowed the shirt to be visible both at the throat and the wrists; the hose were tight, and the shoes very broad at the toes. The other form of dress consisted of a short tunic or vest, tight and close-fitting as the hose, worn under an open doublet with long sleeves made throughout very large and loose; hats, low in the crown and broad in the brim and having plumes of feathers, were either worn on the head over a small and closely-fitting cap or coif, or they were carried hanging from over one of the shoulders down the back. The angular cap represented in the royal effigy also was constantly worn, and the cap (fig. 41) with the cluster of bows and the long pendant sash continued in use. Under Henry VIII., in men's attire, from midway between the knee and the hip, or from the knee itself, downwards to the wide and easy shoes, all was tight, while about the upper part of the lower limbs and the body all was loose, capacious, and broad, the entire costume at the same time being distinguished by decided stiffness and formality. At the line of junction between the tight and the loose portions of the dress, the trunk hose, at the time in question universally worn, were gathered in closely either at the middle of the thigh or at the knee, and then they were widely puffed out as they rose to meet the jerkin or jacket, which was open in front and reached only to the hips. These jerkins sometimes were closed at the throat, when a small falling white collar or band was worn; or the jerkin was spread open to display a sleeveless vest, and an embroidered shirt having large sleeves and small ruffles at the wrists. The doublets, or coats, worn over the other garments were very short and very full, an especial object being to give to the figure, and particularly about the shoulders, the appearance of as much breadth and squareness as possible. A cloak, as short as the doublet, was suspended from the shoulders, rather for display than for use; the head-covering was a round cap, low and flat, adorned with a jewel and a single small waving feather; and, attached to the belt, with a gypcière or purse, a dagger was carried horizontally in front of the wearer. The sword, when worn, was a rapier. It was at this period a peculiar and universally prevalent fashion, varying in degrees of eccentricity and extravagance, to slash the garments, so as either simply to show glimpses of some under-dress, or to have some different material of another colour drawn out in puffs through the slashes. This slashing and puffing was extended even to the broad shoes, the tight hose alone being exempted. Besides being frequently slashed and striped, the trunk hose were habitually made with a succession of alternate gatherings-in and puffings-out. All this display, made regardless of true taste and solely in order to accomplish as much of display as possible, naturally was attended with a prevalent indulgence in the use of rich and costly fabrics and splendid decorations. Of King Henry himself it is recorded, at his famous meeting with Francis I. in 1540, that he was apparelled in "a garment of cloth-of-silver damask, ribbed with cloth-of-gold, as thick as might be; the garment was large and plaited very thick, of such shape and make as was marvellous to behold." The French king was attired in a splendour quite equal to that of his royal English guest; and the nobles and courtiers of both countries took care to emulate their sovereigns in their attire, and in wearing several gorgeous costumes, all of them in the same style of fash every day. The costume of Henry II. of France, represented in the woodcut, fig. 43, from the original portrait by Clouet, is a characteristic example of the fashion prevalent in the middle of the 16th century, and it also shows how close was the resemblance between the fashions of male dress at that time in France and England. The costume of the middle and the humbler classes at this era, as naturally would be expected, bore a decided general resemblance to the more elaborate and costly attire of the dignified and wealthy of their contemporaries. They wore the same short close jerkin, the short doublet often with lappet sleeves, the short cloak, the flat round cap plainly made from simple materials, and the tight leggings and broad shoes with the puffed upper hose. Or, instead of the short cloak, they wore a long gown, furred, and with hanging sleeves, sometimes pierced midway for the arms to pass through; a coif tied under the chin also was commonly worn under the flat cap. The doublets of the men of the Elizabethan portion of this century, which were made long-breasted and padded so as to fit the body tightly, were carried down in front to a prolonged peak, and so they closely resembled both the stomachers of the ladies and the breastplates of the military. The fashion of these grotesque doublets, apparently originally Venetian, travelled to England by way of France. The hose, if of the English "trunk" type, were puffed out immediately from the middle of the thigh, where they met the tight leggings or stockings that were carried up beneath them, as in fig. 44; but the French and Venetian hose, also in fashion in England, swelled out gradually from the knee, and the stockings sometimes were drawn over them. These dresses constantly were puffed and slashed, padded and banded throughout, one long slash being carried down the entire length of each sleeve of the doublet. The contemporary portrait of the French king, Henry III., about 1575, from which the woodcut (fig. 45) has been drawn, shows very distinctly the tapering French hose and the long peaked doublet, with the treatment of those garments characteristic of that

period. Very large circular ruffs, in their form and adjustment differing little, if at all, from those worn by the other sex, formed essential features of the male attire in the reign of Elizabeth, when very short cloaks also continued to be worn. At the same period, long gowns guarded with fur, having open collars falling back, and their sleeves comparatively tight and having puffs at the shoulders, were in common use, as were caps and hats greatly varying in form, colour, material, and adornment. It must be added, that amidst

FIG. 45.—From Portrait of Henry III. of France, 1576.

all this extravagance and eccentricity of attire, there also existed a taste for simplifying the fashions of the time so as to render them at least comparatively graceful and becoming. In connection also with the costume of the 16th century, it will be kept in remembrance, as one of the most decided innovations ever introduced into male dress, that two distinct coverings were given to the lower limbs when the hose were worn in part tight and plain, and partly puffed out, slashed, and embroidered. The term "hose" then was applied, by way of distinction, to the upper portion, while to the lower the name of "stocking" was assigned. Towards the close of the century the hose of that period also became "breeches;" and so, in process of time, the old and long-used word "hose" came to be retained only as an equivalent for "stockings." Early in the 16th century noble ladies and gentlewomen introduced various modifications of the universal angular head-dress. Their dresses, fitting closely about the figure, and with long skirts open in front to display the under-dress, were made low and cut square about the neck; their sleeves, tight at the shoulder, suddenly became very large and open, disclosing the puffed sleeves of the under-dress; sometimes, however, these dresses were worn high, with short waists, and a small falling collar. Necklaces and numerous other ornaments of jewellery were in general use; chains also, with objects of various kinds for use or ornament attached to them, hung down from the universal girdles, or the girdles themselves had one long pendant end that was elaborately enriched. By country ladies and by the wives and daughters of citizens a similar style of dress, somewhat simplified, was generally adopted. Somewhat later, the sleeves of dresses had puffs at the shoulders, and when the dresses were made open above the girdle, a "partlet," or kind of habit-shirt, was worn beneath them and carried up to the throat; the head-dress at the same time, while generally retaining an angular contour, was small and made to fit almost closely to the head. At this same time, the general resemblance which all along may be traced between the dresses of the two sexes became universally decided. After the accession of Queen Elizabeth in 1558, the well-known costume, associated with herself from about the middle till the close of her reign, gradually became established. Of the long, peaked, and tight stomachers of the ladies, and of the padded and quilted doublets of the men, it might be said with equal truth that each garment was a parody of the other. Ruffs, often of exaggerated amplitude and of a painfully severe stiffness, were worn by both sexes; sometimes open in front and rising like an expanded fan around the throat and head, more generally they completely encircled the throat, and rested, nearly at right angles to it, on the shoulders. In their puffings and slashings the sleeves of the dresses of both sexes were alike; nor was almost a corresponding resemblance wanting between the trunk hose and the "petticoat-breeches" of one sex, and the skirts of the kirtles and gowns and the veritable petticoats that were made to expand by enormous wheel-like "farthingales," as in fig. 46, from the hips of the other sex. Ornaments of every kind abounded. The richest and most showy fabrics in endless variety were in great request, and were worn with abundance of lace, feathers, and embroidery. The monumental effigy of Elizabeth herself, the last memorial of its class commemorative of an English sovereign, represents the queen as attired at all points in the characteristic fashion, by herself set to her time, and identified with her name; and the sister effigy of Queen Mary Stuart, like that of Elizabeth, the work of James I. and in Westminster Abbey, gives another, but a somewhat simpler and a much more graceful, example of the same costume—the queen of Scots wearing the cap that bears her name. As at other periods, the general female costume in the Elizabethan era was a modification of the dress of the court, the circumstances and position of different classes and individuals determining the degree of resemblance.

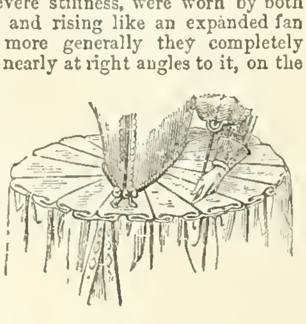

FIG. 46.—Farthingale.

In taking a retrospective glance at the numerous changes in costume which had taken place from ancient times to the 16th century, M. Lacroix remarks that "among European nations during the Middle Ages we find there to have been but one common standard of fashion, which varied from time to time according to the particular customs of each country, and in accordance also with the peculiarities of each race. In Italy, for example, dress always maintained a certain character of grandeur, ever recalling the fact that the influence of antiquity had not been altogether lost. In Germany and Switzerland garments generally had a heavy and massive appearance, and in Holland still more so. England uniformly studied a kind of instinctive elegance and propriety. It is a curious fact that Spain invariably partook of the heaviness peculiar to Germany, either because the Gothic element still prevailed there, or that the Walloon fashions had an especial attraction to her, owing to associations and general usage. France was then, as she is now, fickle and capricious, fantastical and wavering, not indeed from indifference, but because she always was ready to borrow from every quarter anything that pleased her. She, however, never failed to place her own stamp upon whatever she adopted, so making any fashion essentially French, even though she had only just borrowed it from Spain, England, Germany, or Italy. In all these countries we have seen, and still see, entire provinces adhering to some ancient custom, causing them to differ altogether in character from the rest of the nation. This is simply owing to the fact of the fashions having become obsolete in the neighbouring places; for every local costume faithfully and rigorously preserved in any community at a distance from the centre of political action or government, must originally have been brought there by the nobles of the country. Thus, the head-dress of Anne of Brittany (1498–1514) is still that of the peasant-women of Penhoet and Labrevack; and the tall conical 'hennin' (fig. 39) of Isabel of Bavaria (1400) is still the head-dress of Normandy." With the view "briefly to indicate the last connecting link between modern fashions and those of former periods," the same writer proceeds to point out how, "under Francis I. (1515–1547), the costumes adopted from Italy became almost stationary. Under Henry II. (1547–1559), and especially after the death of that prince, the taste for frivolities made immense progress, and the style of dress in ordinary use seemed day by day to lose the few traces of dignity which it previously had possessed. The fashion of ruffs had been introduced into France by Catherine de' Medici (1560); and at the beginning of the 17th century that of small collars. Dresses, tight at the waist, began to be made very full round the hips by means of large padded rolls; and these were still more enlarged by a monstrous arrangement of padded whalebone and steel, which subsequently became the ridiculous 'paniers' that were worn almost down to the present century. Under the last of the Valois (1500) men's dress was short, the jacket or jerkin was pointed and trimmed round with small peaks; the velvet cap was trimmed with aigrettes; the beard was pointed; a pearl hung from the left ear; and a small cloak or mantle, which reached only to the waist, was carried on the shoulder. The use of gloves made of scented leather became universal. Ladies wore their dresses long, very full, and of costly materials, little or no change in these respects having taken place during the reign of Henry IV. (1589–1610). At this period the men's high hose were made longer and fuller, especially in Spain and the Low Countries, and the fashion of large soft boots, made of doeskin or of black morocco, became universal. For a long time, even in the towns, the costume of the bourgeois was almost unchanged. Never having adopted either the tight-fitting hose or the balloon breeches, they wore an easy jerkin, a large cloak, and a felt hat, which the English made conical and with a broad brim. Towards the beginning of the 17th century, the high hose, which were worn by the northern nations profusely trimmed, were transformed into the 'culottes,' which were full and open at the knees. A division thus was suddenly made between the lower and the upper parts of the hose, as if the garment which covered the lower limbs had been cut in two, and then garters were necessarily adopted. Almost throughout Europe, the felt hat became a cap taking the exact form of the head, and having a wide and flat brim turned up on one side. To boots and shoes high heels were added, in place of those which before had been flat and had been accompanied with single soles. Two centuries later a terrible social agitation took place in Europe, after which male attire became plain, ungraceful, mean, and more paltry than ever; whereas female dress, the fashions of which were perpetually changing, became graceful and elegant, though often approaching the extravagant and absurd."

Century XVII.—During the reign of the first Stuart sovereign of Great Britain the fashions of dress, which under his Tudor predecessor had culminated without undergoing any changes sufficiently marked to give to them a fresh character, attained to even an exaggerated extravagance. Notwithstanding the absence of any effigy of him, we are familiar with the personal appearance and costume of James I. and VI., and in his costume we possess a true type of the dress prevalent during his reign. The long-waisted, peaked, and close-fitting slashed doublets of the days of Elizabeth, still longer in the waist, more acutely peaked, and as far as was possible more closely fitting than ever, habitually were kept in shape by means of stays worn under them. The trunk-hose mercilessly slashed, became larger than before, padded garments being specially congenial to the disposition and temperament of the king; and, having attained to a balloon shape, they tapered down to the knees of the wearer, where they were secured by sashes tied in bows at the side. Cloaks and ruffs remained unchanged. Hats came into fashion that were tall in the crown, slightly conical in shape, with a narrow brim turned up on one side, and adorned with a jewel and a single feather, or with a rich band and a plume. Large rosettes were worn on the shoes, which retained their broad shape, and often had high red heels. Rapiers, worn without any belt crossing the person, were narrow and very long in the blade. In like manner, the female dresses underwent but little change, except in having their worst features and especially their farthingales, with the lavish profusion of their tasteless adornment, intensified. It was at this time, however, that the custom of painting the face began to prevail; and while ruffs or bands of immoderate size stretched forth from the ladies' necks, they wore the front of their dresses cut away immediately beneath them in a manner that exposed the bosom in defiance of all modesty. Less fashionable ladies, between 1615 and 1625, discarded the tight and pointed stomacher and farthingale, and wore over an easy jerkin and ample petticoat, a loose gown open in front, made high to meet the ruff, and with long hanging sleeves through which the tight sleeves of the jerkin were displayed; or they followed the fashion of their time, modified and without its more salient absurdities. The same may be said of the men who were content in some degree to follow the fashion, while altogether repudiating being leaders of it. With the costume of the reign of Charles I., on the whole more sober, and in more than a few respects really elegant, Vandyck has made the world happily familiar. At first the ruffs were retained, their size only having been diminished; but all traces both of the angular head-dress and of the Mary Stuart cap, and with them of the farthingale, disappeared; and after a while the ruffs followed then. The ladies wore the very full sleeves of their dresses tied in at the elbows as well as gathered in at the wrists; their bodies, tightly fitting, sometimes were long and pointed, and at other times not longer than the natural waist; the long petticoat of some rich material was displayed beneath a loose and open robe or gown, that was gathered up and had short loose sleeves with deep white cuffs, and a deep falling collar or "band" was fastened closely at their throat; or they wore large kerchiefs over their bodies, and gowns having flowing skirts and comparatively tight sleeves. Coverchefs or hoods also were worn, from which descended long veils, often of such ample proportions as to resemble mantles. Patches at this time began to make their appearance; and notwithstanding their intrinsic absurdity and their strange faculty for disfigurement, they continued in fashion throughout the century. Men's doublets or coats, the true prototypes of the frock-coats of the present day, having full sleeves made tight at the wrists, were rather longer and worn buttoned from the waist (where they showed the shirt) upwards to the falling white band; plain white cuffs, sometimes superseded by others of lace, were also worn. The trunk-hose became loose breeches of uniform width and open at the knees, where they were fringed or had a border of lace, and were fastened with sash-like garters; the stockings were tight; the shoes had large roses; and the felt hat was large and wide in the brim. By the men of fashion this costume, in itself really worthy of decided commendation, was easily made to assume a fantastic aspect, by the adoption of rich and variously coloured fabrics and the addition of lace, bunches of ribbon, feathers, embroidery, and gold lace, and numerous "points" or laces to fasten the breeches to the stockings, with boots long in the foot, and having tops of enormous width that were turned down and lined with lace. These gentlemen, who delighted in having long hair, also wore or more frequently carried on their left arm a short cloak; and they were provided with basket-hilted rapiers having blades of great length. Besides rejecting all bright colours, and every kind of ornamental accessory, a very different class of their contemporaries reduced this same costume to its simplest possible conditions, thus contrasting one extreme with another most opposed to it. These men, who to their closely-cropped hair owed their famous designation as "Roundheads," with their sombre and plain garments wore their felt hats of excessive height, with a great breadth of brim, and perfectly plain. The buff-coats, adopted at this period as parts of the military uniform, conformed in their general character to the doublets worn as ordinary dress. While retaining the characteristic features of the fashions of their times, the dresses of the female members of the "Roundhead" section of the English community were made with the plainest simplicity—a simplicity, however, which the taste and ingenuity of the wearers rarely failed to render graceful and becoming. On his restoration, Charles II. brought with him to England the fashions of dress with which he had been familiar in France; and they suited well both his own character and that irresistible and widespread reaction from the stern and yet manly gloom of the Protectorate that burst out into a frenzy of national recklessness. Shortly after the king's return, indeed, and for some little time after the re-establishment of the monarchy, in the families of graver citizens a quiet style of dress, not unlike what had been prevalent for several years, continued in use by both sexes. Men wore plain doublets of moderate length, full breeches slightly ornamented at the knees, large bands, shoes tied over the instep in bows of moderate size, and loose cloaks having long open sleeves; pointed beards and moustaches continued to be worn also, and under their felt hats the men retained the coifs of past times, or they covered their heads with coifs or caps only. Plain and in the body closely fitting, the ample skirts of the ladies' dresses, open in front to display an equally unpretending under-dress, occasionally were partly covered by a no less plain apron; their bands or collars, fastened in front with formal bows, were very large and generally quite plain; and their close hoods they wore tied under the chin, beneath flowing veils or mantles. The very different style of costume which Charles himself had learned to wear at the court of Louis XII. of France, and which he speedily taught his own subjects to assume, consisted of a comparatively long and loose doublet richly laced and embroidered, having large and puffed out sleeves turned back a little below the elbow, leaving the lower arm to be covered by the full sleeves of the shirt with their lace ruffles at the wrists. Under this doublet was a vest, sleeveless but otherwise resembling it, which was left open at the waist; in their turn, from beneath the vest the breeches displayed their expanded width, with their ornamental bunches of ribbon above the knees and lace ruffles below them. A falling band of the richest lace enveloped the throat, and was loosely tied with an equally rich scarf of which the ends hung down over the vest; an enormous periwig superseded the natural hair, its curls falling in abundance over the shoulders, the beard being close shaven and only a slight moustache permitted to remain. The hat, broad-brimmed and having its brim on one side slightly turned up, was adorned with a rich band and a profusion of drooping feathers; the stockings were tight to the leg, and the shoes, made very high over the instep, were tied with immense bows that extended horizontally on either side of the foot; and a short cloak, no less splendid in both material and enrichment than the other portions of this gorgeous attire, either was suspended from the left shoulder or carried on the left arm. The sword, a rapier long and narrow in the blade, was suspended from a very broad and elaborately enriched belt crossing the person over the right shoulder. It will be understood that in the production of this costume the richest and most showy fabrics were employed; also that the men delighted in exhibiting in their dress every variety as well of colour and tint as of material, white, black, scarlet, and different shades of brown being in especial favour, with trimmings of gold and silver lace, buttons and twist, and ribbons of all breadths and every hue. The accompanying woodcut, drawn from an original contemporary authority (fig. 47), gives a correct general idea of the costume of the period of Charles II. In the autumn of 1666, as we learn from the ever-observant Pepys, the king in council declared his purpose to set a more sober and less costly fashion for dress, which he declared that he would not alter. Accordingly, under his doublet Charles appeared in a "vest," "being a long cassock," as Pepys explains, "close to the body, of black cloth and pinked with white silk under it; and a coat, or doublet, over it; and the legs ruffled with white ribbon, like a pigeon's leg; and upon the whole," adds the diarist, "I wish the king may keep it, for it is a very fine and handsome garment." The king kept it so far as afterwards it pleased him, and no further. This vest, or waistcoat, has

Fig. 47.—Costume, temp. Charles II.

undergone many changes, indeed, but it never has fallen into disuse since that 15th day of October 1666. In 1680 both vest and doublet became considerably longer, the latter reaching quite to the knees, and the former being but little shorter. The doublet was worn open, a sash about the waist then confining the vest. The brims of the hats at the same time became narrower, and bows of ribbon often were worn in place of feathers. The baudrick, or diagonal sword-belt, worn over the doublet was very broad, and allowed the hilt of the rapier to hang considerably below the left hip. About this time also, when jack-boots resembling those that had formed a part of the military appointments of the troopers in the civil war came into fashion, the sleeves of doublets were lengthened, and made with very broad cuffs which doubled back from the wrists. In the short reign of James II. (1685–1688), when the moustache disappeared, doublets and vests still further increased in length, and the cuffs of the doublet-sleeves became extravagantly large; more prominence was given to the lace cravats, which were worn loosely about the throat and with their ends hanging down over the upper part of the vest; the breeches and stockings remained without any change of form or adjustment; half-boots were worn, and buckles began at times to supersede roses and bows upon shoes; and at this time the sword was occasionally carried thrust through the lower part of the doublet, and almost in a horizontal position. The costume of the ladies of the Charles II. era, represented with such grace and effectiveness in Lely's pictures, Planché thus describes: "A studied negligence, an elegant deshabille, is the prevailing character of the costume in which they are nearly all represented; their glossy ringlets escaping from a baudeau of pearls, unveiled by even the transparent lawn of the band or of the partlet; and the fair round arm reclines upon the voluptuous satin petticoat, while the gown of the same rich materials piles up its voluminous train in the background." During the early part of the reign, however, much of the Puritan formality of then recent times lingered in female dress, as it did also in the attire of the male portion of the commonalty. Tightly laced bodices at no time lost favour with females of all ranks and classes. Hoods were worn, but generally only for protection from the weather, the prevailing usage being for females to wear their own hair in natural ringlets flowing over their shoulders, and with small curls over their foreheads; false hair, indeed, was sometimes, but only sometimes, worn, and worn in an extravagant fashion. The custom of painting and placing patches on the face became more common as the second half of the century advanced; and the immodest practice of exposing the bosom then attained to the extreme of indelicacy. As might have been expected at that era, the seldom dormant aim of the one sex to imitate the costume of the other was in full activity; thus, Pepys says,—"Walking in the gallery at Whitehall (June 1, 1664), I find the ladies of honour dressed in their riding garbs, with coats and doublets with deep skirts, just for all the world like mine, and their doublets buttoned up the breast, with periwigs and with hats; so that only for a long petticoat dragging under their men's coats, nobody would take them for women in any point whatever; which was an odd sight, and a sight that did not please me." Somewhat later, a similar "odd sight" excited a corresponding feeling, the disapproval being blended with perplexed surprise, in the mind of Sir Roger de Coverley (*Spectator*, June 2, 1711). Whether worn by men or women, the ordinary dresses of the commonalty in their general character resembled those of the noble and wealthy, but were much simpler in both style and materials.

Accompanied by no other decided or marked innovation than the introduction of tight knee-breeches, which during the following century were worn by all classes, and still form no unimportant part of English costume, the reign of William III. witnessed such modifications in the costume of the two preceding centuries as tended to make it more formal and appropriate, while at the same time leading the way to the tasteless frivolities and excesses of the next succeeding century. The doublets or coats of the gentlemen, their favourite colour some tint of claret when not scarlet or black, were longer, made to fit stiffly to the body, and laced and embroidered along the edges and seams and around the pocket-holes or the large flaps of the pockets in their skirts; and their comparatively tight sleeves had enormous cuffs that were laced and adorned with buttons; large shoulder-knots of ribbon were also worn. The vests, retaining their length, were left unbuttoned below the waist. Sashes occasionally were worn, and sometimes over the doublet. The breeches were made to fit tolerably closely to the limbs, and were quite tight at the knees, where the tightly-fitting stockings, if not gartered, were drawn over them in a roll. The shoes, very high in the heel and fastened with buckles, had flaps which covered the instep and rose in front of the legs for 3 or 4 inches. The full shirt-sleeves with their lace ruffles were shown at the wrists; the loose neckcloth, had long pendant ends terminating in lace, if it was not entirely made of that material. The periwig, if possible more voluminous than ever, was abundantly powdered. The hat, sometimes triangular in form and with a narrow turned-up brim, was low in the crown, edged with gold-lace, and covered with feathers; or, being wide-brimmed, its brim was slightly turned up at the sides, when it was adorned only with a laced band and a small tuft of ribbons or feathers. The cloak, when in use, was rather longer than the doublet. In winter, the men kept their hands warm in small muffs that were suspended from ribbons about their necks; and for summer wear they had gloves edged with lace. When not attached to a broad and elaborately enriched belt crossing the right shoulder over the doublet, the rapier was carried thrust through the left pocket-hole of the doublet itself, the weapon being to form an acute angle at the back of the wearer. A costume such as this, as a matter of course, would be subjected to various modifications, and would constantly be simplified in many particulars without any essential departure from the actual type. The accompanying figure (fig. 48), drawn from a contemporary French engraving which represents an assemblage of the most illustrious personages in France in the year 1696, when compared with the numerous effigies and other portraits of the same era in this country, shows the typical dress to have been identical in its essentials, and characteristic on both sides of the Channel at the close of the 17th century. Further comparison, extending its range over the greater number of the countries of Europe, would serve to demonstrate the comprehensive prevalence of this same typical dress, and at the same time to assign its various subordinate local modifications to the varying influences of climate and of national character. In the female dress of this period, as it is exemplified in portraits of ladies of rank and fashion, stiffness and a formality of aspect were strangely blended with eccentricity and frivolous display. Bodices, very long in the waist and rather obtusely pointed both behind and before, were very tightly laced over rigid corsets; rich petticoats or under-dresses, partly covered with equally rich small aprons, were displayed from under full and flowing dresses that were gathered up in masses at the back of the wearer, or were drawn back and made to trail along on the ground behind her. At first very short and wide and edged with lace, from within which the delicate sleeves of the undergarment issued forth, the sleeves of the gowns after a while became tight and were prolonged to the wrists where they terminated in deep and wide upturned cuffs whence drooped a profusion of lace lappets or ruffles. Furbelows were introduced and worn in profusion upon dresses of every kind, including scarves and cloaks; and the fashion for adopting doublets and vests, with neckcloths, resembling those worn by men was prevalent in riding and walking costume. Heavy head-dresses also succeeded to the flowing ringlets and to the natural gracefulness of the coiffure of the era of Charles II. The hair, combed up and with an inclination backwards from the forehead, was surmounted by strata of ribbon and lace, sometimes intermingled with feathers, and a kerchief or scarf of some very light material thrown over all was permitted to hang down to the waist over en below it. Structures so produced assumed various forms, some of them being made to project while others either rose vertically or expanded in a horizontal direction, height, however, being the special aim; but in every case the result was the reverse of graceful or becoming. Hats, low in the crown and with wide brims, were worn over hoods when cold or when protection from wet required their adoption.

Fig. 48.—French Costume, 1696.

Modern Costume.

Century XVIII.—The 17th century having been treated as a period of transition in the matter of costume between the Middle Ages and modern times, the era of modern costume may be defined to commence with the 18th century—that is, fourteen years before the accession of the sovereigns of the House of Hanover to the crown of Great Britain. Until in the course of this century it fell into general disuse for regular military service, defensive armour must be considered to have maintained a claim to have been regarded, under certain conditions and to a certain extent, as identified with the dress of an important and influential section of the community; that claim, however, which lingered so long and with such tenacity, altogether ceased to exist shortly after the commencement of the era of modern costume. For a considerable time, indeed almost till the middle of the century, costume must be considered to have been modified rather than subjected to decided innovation. Men's dress remained the same in its general character, but became improved from being simplified and from having its decoration toned down. Planché says:—"Square-cut coats and long-flapped waistcoats with pockets in them, the latter meeting the stockings, still drawn up over the knee so high as entirely to conceal the breeches (then made to fit with comparative tightness to the limbs), but gartered below it; large hanging cuffs and lace ruffles; the skirts of the coat stiffened out with wire or buckram, from between which peeped the hilt of the sword, deprived of the broad and splendid belt in which it swung in preceding reigns; blue or scarlet silk stockings with gold or silver clocks; lace neckcloths; square-toed short-quartered shoes, with high red heels and small buckles; very long and formally curled perukes, black riding wigs, bag-wigs, and nightcap wigs; small three-cornered hats laced with gold or silver galloon, and sometimes trimmed with feathers,—composed the habit of the noblemen and gentlemen during the reigns of Queen Anne and George I." To this habit, the dress of the commonalty, according to custom, conformed in all characteristic essentials. Meanwhile, when they did not wear such head-dresses as were very low, the ladies continued to elevate their strange and uncouth head-gear. About 1710, as if resolved that their figures should rival their heads in extravagance, they introduced the hooped petticoat, at first worn in such a manner as to give to the person of the wearer below her very tightly laced waist a contour resembling the letter V inverted—Λ. The hooped dresses, thus introduced, about 1740 attained to an enormous expansion; and, being worn at their full circumference immediately below the waist, they in many ways emulated the most outrageous of the farthingales of the Elizabethan age. Some few years also before the middle of this century the "saque" made its appearance: it was a loose gown, open in front, which was worn hanging from the shoulders quite free of the person of the wearer, and was gathered up over the hoop when not permitted to trail along on the ground; in this unsightly garment any approach to "fit" was necessarily out of the question. At the same period, the men began to lay aside more of their lace and of the other ornamental accessories of their garments; their coats became longer, and their waistcoats somewhat shorter; the cuffs of their collarless coats increased in size until they reached their elbows; their stockings, when still drawn over their breeches above the knee, were so adjusted as to permit their breeches to be seen, but the breeches began to be made to fasten over the stockings, with buttons and buckles below the knee; their wigs ceased to curl over their shoulders, and pigtails came into fashion. The costume of this era has been immortalized by Hogarth. During the forty years of this century that George III. was king, the fashions of dress passed through a remarkable variety of changes, each change contributing its own full share to the aggregate of extravagance and absurdity that was surpassed at no earlier period. About 1760 a passion for adorning the dress of both sexes began to revive; and it soon exercised its influence, reckless of all true taste, with unsparing energy—the head-dresses of the ladies, which about 1780 attained to the culminating degree of extravagant unsightliness, being its specially favoured field for operations. Fig. 49, faithfully reproduced from a contemporary engraving, shows under one of its least extravagant and tasteless forms a fashionable head-dress of the period in question. As a matter of course, in the construction of every variety of head-gear such as this, which in every instance necessarily obliterated all traces of the true form of the head and destroyed all proportion in the entire figure, false hair was used in abundance with a profusion of objects of a so-called decorative order. Until about 1785 the type of men's dress remained established without any essential change: the coat was made to fall back more than had been the usage a few years earlier, the object being to display more effectively the long-flapped waistcoat with the pockets in its laced flaps; the stockings always were gathered up below the knee under the breeches, which were fastened by buckles; the heels of shoes were lowered, and the buckles worn in them were comparatively small; cocked-hats were worn, with laced ruffles and cravats, and bag-wigs, which generally were powdered; and a broad black ribbon, called a "solitaire," was placed about the throat and fastened behind. This costume about 1785 gave way to the dress that in France was developed with the advance of the Revolution. Men's coats became very long, and sloped off from the waist, where they were buttoned, both upwards and downwards; their sleeves were moderately tight with small close-fitting cuffs, and their collars either were high and doubled back stiffly, or made to spread upon the shoulders; the flaps of their pockets were placed at the back and close together; and all puffing and lace and embroidery were laid aside. The flaps of waistcoats, if retained at all, were short, and the garment itself was made open at the throat, the frill of the shirt appearing from under it. The breeches, fitting very tightly, either were cut short at the knee, or carried a few inches below it and there buttoned and tied with strings, knee-buckles except for court-dresses having gone out of fashion; the tight breeches also at this same time frequently were prolonged as pantaloons to the middle of the calf of the leg, where they were met by half top-boots. A rather large cravat was tied loosely in bows about the throat; the hair, worn long generally, was powdered and tied in a queue; and the hats, round in form, were either of moderate height in the crown, or tall and conical, and their nearly flat round brim was either narrow or moderately broad. The ladies delighted in tight bodices, furbelowed dresses, gorgeous petticoats, worn over hoops varying in size, and saques, which in reality were the mantles of early times revived, without a revival of their grace and elegance. About 1770, the sleeves of the ladies' dresses were tight on the upper arm, where they suddenly became very large, and, drooping at the elbow, they terminated in rich fringes of lace ruffles; a few years later the sleeves expanded from the shoulder, till they became a succession of constantly enlarging ruffles and lappets; and again, before 1780, they became tight throughout, with small cuffs and no lace at the elbows, when they were worn with long gloves. Influenced, doubtless, by the great portrait-painters of that time, about 1785 the female head-dresses gradually subsided, and their worst features for the most part disappeared. Hats having an immense expanse of brim grew into favour, and the natural hair was permitted to fall over the shoulders in ringlets. Small hoops were worn in 1788, with a dress open in front and trailing on the ground behind, their sleeves tight and frilled at the elbows. This dress often was worn with a tight and very low bodice, a white kerchief being gathered closely about the throat, and while entirely enveloping the bust, being

FIG. 49.—Head-dress, c. 1780.

puffed out from beneath the chin so as to resemble the breast of a pigeon. Round straw hats, with drooping edge-frills, bows of ribbon, feathers, and high crowns, completed this costume. Then in about five years came the era of short waists, that might be distinguished as the waistless era, when ladies' dresses, no longer distended by hoops, fell in straight loose folds to their feet. About 1795 open dresses were discarded; the saques ceased to be; waists became longer, and when the present century dawned they regained their natural position and form. At this time bonnets were worn that incased the wearer's head, or were flat and projecting. They also were adorned with a taste that was comparatively simple and becoming; and, at the same time, the hair, free from powder, was dressed in curls about the face and neck. While thus in ordinary life costume at the close of the 18th century became approximately what might be desired, court-dress still exhibited the extravagancies that under other conditions had happily become obsolete, the hoop with all its really offensive mass of so-called decorative allies retaining their ground in defiance of all opposition, until the chief offender and its worst associates were banished by royal command when George IV. had become king.

Baronial.

The peers of the United Kingdom, on occasions of state and ceremony, over their habitual dress wear robes of scarlet cloth, made long and of ample dimensions, which are adjusted on the right shoulder and are guarded with bands or rows of ermine, the robes of the different orders and ranks of the peerage being distinguished as follows:—Barons, who now form the lowest order of British peers, on their scarlet robes have two bands of ermine; viscounts, whose order intervenes between the barons and the earls, have two and a half bands of ermine; the robes of earls have three bands; those of marquises have three and a half rows; and upon the robes of dukes, whose order is the highest, the ermine is in four rows.

For notices of the costume and insignia of members of orders of knighthood, see HERALDRY.

Judicial and Forensic.

So long as the highest offices in the law were held, in accordance with mediæval usage, by dignified ecclesiastics, those eminent personages were represented in their monumental effigies, not as wearing judicial or other legal dress and robes, but as habited in the official vestments of their rank as churchmen; and that this practice continued in force down to the time of the Reformation is shown in the brass in Ely Cathedral to Thomas Goodrich, bishop of that see, who also was lord high chancellor of England. Monumental effigies of judges, however, and of other personages of note in the law, occasionally occur from the middle of the 14th century downwards, which give information as to the form and adjustment of legal robes that doubtless is authentic, and therefore valuable; but these authorities do not extend to any indications of colour. The actual dress of these legal personages evidently differed but little, if it differed at all, from the ordinary costume of their day; but over their dress they wore a tippet, and a robe which with rare exceptions was fastened on the right shoulder, and their heads were covered with a close-fitting coif, in addition to which in the 15th and 16th centuries they carried the hood with the long pendant scarf, so characteristic of those times, cast over one of their shoulders. It is probable, also, that the long and loose gown with wide sleeves in general use assumed at a comparatively early period the aspect of an official robe by being made of the same material and colour as the unquestionably official mantle. In the second half of the 15th century and in the century following, the gowns worn by the judges when on the bench, and on all occasions of state and ceremony, certainly constituted parts of their official attire. Scarlet appears to have been the prevalent colour of judicial robes, with linings and trimmings of miniver—the white skin of the ermine—until the 17th century, when on certain occasions the judges wore robes of black or violet; but robes and gowns of a yellowish hue, and distinguished as "mustard-coloured," were also worn; and there is a record of an issue of "liveries" of both cloth and silk with fur from the great wardrobe, in the time of Edward III., to the justices, the colour of each fabric being green. Again, in similar allowances under Richard II. and Henry VI., "green" is a colour specially mentioned with "violet in grain," and fur of "miniver." In his fine sculptured effigy at Harwood in Yorkshire, Chief Justice Sir William Gascoigne (died in 1419) is represented having suspended from his girdle an anlace or short sword, with a gypcière; and the same appendages also appear in several brasses to judges. In four illuminations, which have been reproduced in fac-simile and published in the *Archæologia* (xxxix. 358), in which are represented sittings of the king's four superior courts in the time of Henry VI.—Chancery, King's Bench, Common Pleas, and Exchequer—the robes and costume of the lord chancellor, judges, serjeants, barristers, and officers of the courts are shown with minute attention to both colour and details. The chancellor and one judge who sits beside him, and all the judges of the three other courts, are alike in being attired in ample robes of scarlet, lined and trimmed with white fur; but the chancellor alone wears a scarlet robe which is not fastened on the shoulder and has openings pierced on each side to admit his arms passing through, so showing the sleeves of his under garment to be white; he is further distinguished by having about his shoulders and over his robe a tippet of scarlet, lined and bordered with white fur; the white lining of his hood, also, stands up about his neck like a collar, and on his head he has a close-fitting dark brown cap. Under his scarlet robe, the judge sitting on the right of the chancellor, who holds in his hands a sealed document, is habited in a gown of the same colour; bare-headed and tonsured, he also has the white lining of his hood adjusted about his neck after the manner of a collar. To the right and left, two on each side, their seats on the same level with the two central scarlet-robed figures, four other personages, who may have been masters in Chancery, are seated, habited in flowing "mustard-colour" robes not adjusted on the shoulder, and having falling over their shoulders large hoods of the same colour lined with white; they all are bare-headed, and three of their number certainly are tonsured. Five judges sit in the Court of King's Bench, robed alike in scarlet gowns, with tippets, and mantles worn over their tippets, and fastened on the right shoulder. All these robes are lined and bordered with white, and the mantles have scarlet hoods worn as collars closely encircling the throat. These five judges wear white coifs, as do the seven judges, all of them robed exactly like their brethren of the King's Bench, who preside in the Court of Common Pleas. Over the Court of Exchequer a baron presides, who is robed in the same manner as the judges of the two courts last named; but he differs from them in wearing (doubtless over his coif, which is not shown) a large scarlet hood-like cap, of the fashion prevalent at his day. He sits with two other judges on each side of him, who wear "mustard-colour" robes of the same character; two of them also wear the large caps; while the two others, wearing coifs, hold similar caps in their hands; all these caps are "mustard-colour."

At the table in each court stand serjeants, counsel, notaries, clerks, and officers of various ranks, all of them in their proper official costume. All of them bare-headed, some of these persons wear full-sleeved gowns reaching to their feet, of blue, green, or mustard-colour; and their gowns, which have small black collars, are adjusted at the waist with narrow black girdles. Others, wearing similar girdles, are habited in gowns of the same fashion that are party-coloured, the division and junction of the two colours being vertical or per pale, and the colours being blue and green, blue or green and mustard-colour, green and murrey, and two tints of green. These gowns also are "rayed," or striped, either diagonally or vertically, with yellow, white, or blue. The notaries carry at their girdles their inkhorn and penner. The serjeants alone, who appear in each one of the four pictures, are habited in long and flowing gowns, worn without any belt, all of them party-coloured blue and green and rayed, with tippets and hoods of the same colours; these learned gentlemen, also, have on their heads coifs similar to those worn by the judges (fig. 50). The use of party-coloured garments, undoubtedly of heraldic origin, by persons of various classes and ranks, has already been noticed. In the absence of any express record of the source whence certain officers of the law derived their party-coloured gowns, it has been considered probable that these were livery gowns, presented to serjeants and barristers by their clients of high rank, with their retaining fees. However this may be, it appears certain that their party-coloured robes were worn by serjeants long before the 15th century; and, when giving his view as to their significance, in the following passage from a charge delivered to certain serjeants then newly created, in the thirty-sixth year of Queen Elizabeth, the lord chief justice suggested these party-coloured robes having been worn by the judges:—"By the party-coloured garments," said that learned personage, "being both of deep colours, and such as the judges themselves in ancient times used (for so we receive it by tradition), is signified soundness and depth of judgment, an ability to discerne of causes, what colour soever be cast over them, and under or with what vail or shadow soever they be disguised." In the 15th century Sir John Fortescue said of a judge,—"Being a serjeant-at-law, he is clothed in a long priest-like robe, with a furred cape about his shoulders, and thereupon a hood with two labels (such as doctors of the law wear in certain universities with their coif); but, being made a justice, instead of his hood he must wear a cloak closed upon his right shoulder, all the other ornaments of a serjeant still remaining, saving that his vesture shall *not be party-coloured* as a serjeant's may, and his cape furred with miniver, whereas the serjeant's cape is ever furred with white lambskin." Whatever at various periods may have been the usage with judges, the wearing of party-coloured by serjeants appears to have been finally discontinued about the commencement of the present century. In our own times, except on some special occasions when their robes are either purple or scarlet, serjeants wear a black silk gown, like that of queen's counsel. The robes of the junior members of the bar, made of black stuff instead of silk, are further distinguished by certain peculiarities of form. Reminiscences of the coifs of earlier days, and of the caps with the pendants, still linger in the wigs worn by the entire learned brotherhood of the law, and in certain peculiar appendages attached to their robes. The large bands also, worn at the present day, may be considered to have had their prototypes in the labels already mentioned, which appear, dependent on his breast from his hood, in the brass to Thomas Rolf, barrister, 1440, at Gosfield, Essex. Fine and characteristic examples of judicial costume are preserved in various monumental effigies, some sculptured and others engraved, which include in their number the memorials of Judge Thomas Owen, 1598, and Lord Chief Justice Sir Thomas Richardson, 1634, both in Westminister Abbey; the effigy of Judge Richard Harper, *temp.* Mary, at Swarthstone, Derbyshire; and the brasses, ranging in date from 1400 to 1553, at Deerhurst, Watford, Gunby, Graveney, Latton, Dagenham, Cowthorpe, Norbury, Milton, and Narburgh. It may here be added that, in various representations of notaries of the 15th and 16th centuries, they appear in the ordinary civilian attire of their period with a pen-case and inkhorn suspended from the girdle of their tunic; there is a good example in a brass in the church of St Mary's Tower, Ipswich; while several of these personages are introduced into the illuminations representing the courts of law described above.

FIG. 50.—Serjeant-at-law (time of Henry VI.)

Naval and Military

Any attempt to notice in detail the naval and military uniforms in use at successive periods even in England would far exceed our present limits. At the same time, it appears desirable here to observe that the very decided distinction between "uniform," and especially military uniform, and contemporary civil costume now obtaining is of comparatively recent date. Throughout the armour era such distinction can scarcely be said to have existed, nor were the services afloat and on land distinguished by special and recognized peculiarities of dress. In the navy, the distinctive characteristics of uniform have become the cocked hat, epaulets of bullion, the crown-and-anchor button, and a by no means lavish application of gold-lace—the cloth, a dark blue with facings and lining of white, except during the reign of William IV., when the white was superseded by scarlet. Gradations of naval rank are indicated by the presence of a crown, a star or stars, and an anchor on the shoulder-strap of the epaulets, and by the size and comparative richness of the bullion; also by the number and the breadth of distinct strips of gold-lace that encircle the cuffs of coats and jackets; all executive officers being further distinguished by a coil of the gold-lace attached to the uppermost of the cuff-circles. From the time that the stout "buff-coat" of the era of the Commonwealth succeeded to what still lingered of the plate panoply and the mail of earlier times, the uniform of the British army, for a while in many essential features conforming to the prevailing characteristics of the general costume of the day, has undergone a succession of changes for the most part more remarkable for variety and often for caprice, than expressive either of true taste in the consistent adornment of a soldier's person, or of considerate adjustment to the exigencies of military service, the exceptions being the judicious innovations happily introduced early in the present century by the duke of Wellington. Scarlet obtains as the distinctive national British military colour, certain arms of the service being attired in blue or dark green; while the recent volunteer movement has brought with it a variety of uniforms expressly adapted for use by the reserved forces. For a comprehensive, accurate, and copiously illustrated sketch of British military costume, readers are referred to the

History of the Dress of the British Soldier, by Captain John Luard.

Highlands of Scotland.

Without a rival in the picturesque individuality of its character, the national costume of the Highlands of Scotland is remarkable as well for the manner in which it has been made to distinguish the various clans or septs of the same race, as for a certain general uniformity that significantly intimates the brotherhood of the clans as alike sharing a single common nationality. It probably is due to its own distinctive peculiarities that the Scottish Highland dress should have been inherited and transmitted from generation to generation almost without any change, and that at the present day it should be held in as high a degree of estimation as it ever enjoyed in past times. In early ages, having been influenced in a certain degree by the general fashions of dress prevalent at successive periods, a comparatively slight use of defensive armour having also for a while been adopted as a military accessory, shortly after the commencement of the 17th century this costume may be considered to have assumed the character which since that time it has maintained, with scarcely any modification except in the style of the short tunic. Before the accession of James VI. of Scotland to the throne of Great Britain, the tunic and the "phillibeg," or kilt, formed a single garment, whereas apparently during the reign of the son of Queen Mary Stuart the kilt became a separate garment, to be adjusted about the waist, and reaching not quite to the knees after the manner of a short petticoat, a vest and tunic being separate garments also. Stockings, gartered below the knees, which thus would be left bare, with shoes, completed the equipment of the lower limbs. A cap or bonnet, without any peak, decorated with a spray of heather, was worn as a head covering, the bonnets of the chiefs being distinguished by the addition of eagles' feathers. In front of the person, and depending from a belt encircling the waist, was worn the "spleuchan," or pocket-purse, covered with fur; and a "plaid," or scarf, of ample dimensions, generally adjusted across the person of the wearer, and having the ends hanging down from a brooch fastened on the left shoulder, as in fig. 52, completed the costume; occasionally, however, the plaid was gathered up so as to admit more free movement in the manner represented in fig. 51.

Fig. 51.—Chief of the Clan MacDonell.

Fig. 52.—Piper of the Clan Gregarach.

The weapons were a broadsword, or "claymore," having a straight blade and a basket-hilt, attached to a broad baudrick which passed over the right shoulder, and a dirk worn on the right side, the sheath of the dirk being also provided with a hunting-knife. Before the general use of firearms by the Highlanders, they carried for defence a circular target on the left arm. The two accompanying figures, which show the different modes of adjusting the plaid, are also examples, the one of the tartan in which green is the prevailing colour, with narrow checks of red (fig. 51), a chief of the clan MacDonell, and the other (fig. 52), a piper of the clan Gregarach, of a tartan which is red with narrow black checks. The colours, and the "set" or patterns of the checks, of the tartans of the different clans, the Royal Stuart being the richest of all, have been determined for a considerable time, the actual era of their original introduction not having been definitively determined. The costume of each clan is fully and faithfully represented in M'Ian's volumes, referred to below.

Bibliography.

To compensate in some degree for unavoidable conciseness, as much space as possible is here assigned to references to publications which comprehend within their range the consideration and illustration of minute details, and which also treat of costume under widely varying conditions and regarded from very different points of view. No attempt is made to give a list that is even approximately complete, but attention is directed to a selected series of works of a typical and authoritative character, in which is concentrated direct, specific, and suggestive information. In its historical aspect, the study of costume implies a systematic comparison of the costumes of different races and countries. Reference must also be made to those monumental works of art that have come down to our own times comparatively unmutilated, which are also of equal value as illustrations of armour. (See Arms and Armour.)

Egyptian.—The great and magnificent foreign works on the "monuments" of Egypt by Lepsius (*Denkmäler aus Ægypten und Æthiopen*, with 899 plates), Champollion, and Rosellini; *Egypt and Nubia*, by David Roberts, R.A. In the two series of Sir G. Wilkinson's *Manners and Customs of the Ancient Egyptians* (6 vols. with 600 illustrations) the subject is exhaustively treated; see also the smaller work (2 vols. copiously illustrated) by the same author. Equally excellent is the companion work, Lane's *Manners and Customs of the Modern Egyptians*, 5th edition, illustrated. See also the *British Museum Photographs*, part ii., 118 plates.

Assyrian.—Layard's *Monuments of Nineveh*, two series; and, by the same author, *Nineveh and its Remains*, and *Nineveh and Babylon; British Museum Photographs*, part iii., 245 plates.

Greek and Roman.—The best illustrators are the *British Museum Photographs*, parts iv. and v., 175 and 97 plates; with other photographs of Greek and Roman draped statues and busts, and also others of certain gems and vases by ancient artists. The fac-simile representations will be advantageously associated with Smith's and Rich's *Dictionaries of Greek and Roman Antiquities*. See also Hope's *Costumes of the Ancients* (Egyptian, Greek, and Roman); Hamilton's *Etruscan and Greek Vases;* Millingen's *Ancient Unedited Monuments* (Greek), and Inghirami's great work, *Monumenti Etruschi* (14 vols., including the *Vasi Fittili*).

Oriental.—Simpson's *India Ancient and Modern* (2 vols., 50 illustrations); Forbes Watson and J. W. Kaye's *People of India* (with photographs); *Chinese Costumes, and the Employments of Chinese Traders*, edited by Sir J. Bowring (3 vols.); and J. Thompson's illustrated volumes on China, the Straits of Malacca, &c. Also Audsley and Bowe's splendid *Keramic Art of Japan*, and Sir R. Ker Porter's illustrated *Travels in Persia*, &c. For the costumes of Central Asia, Schuyler's *Turkistan* and Captain Burnaby's *Khiva*.

Ecclesiastical.—*Vestiarium Christianum*, by Rev. W. B. Marriott, written with true historical impartiality, and illustrated with 63 excellent photographs and engravings, commencing from the earliest known examples of authority, and tracing the history of ecclesiastical vestments from its origin. The subject is further worked out in D'Agincourt's *History of Art by its Monuments* from 4th to 16th century (51 plates of sculpture and 204 of painting), and in Lee's *Glossary of Liturgical and Ecclesiastical Terms*. In its full development, from the 13th century downwards, effigies of ecclesiastics, which abound in England and in some parts of the Continent, are among the most perfect of the mediæval exponents and illustrators of costume; and they themselves have been fully and faithfully illustrated in the following works on early monumental art:—Stothard's *Monumental Effigies of Great Britain;* Waller's *Monumental Brasses;* Cotman's *Brasses of Norfolk and Suffolk;* Boutell's *Monumental Brasses and Slabs*, and *Monumental*

Brasses of Great Britain; Hollis's *Monumental Effigies* (incomplete); Haines's *Manual of Monumental Brasses.*

MISCELLANEOUS WORKS ON COSTUME.—Bruce's *Bayeux Tapestry*; 4to., 17 fac-simile plates, 1856; Fairholt's *Costume in England*, 8vo., illustrated, 1860; Fowler's (William, of Winterton) *Examples of Mediæval Art*, atlas folio, 116 plates, 1796–1829; Froissart's *Chronicles*, translated by Johnes, 4 vols. roy. 8vo., 72 plates and numerous woodcuts, 1844; Hogarth's *Works*, engraved by himself, with descriptions by J. Nichols, atlas folio, 153 plates, 1822; Holbein's *Portraits of the Court of Henry VIII.*, imp. 4to., 80 plates, 1828; Humphrey's (R. N.) *Illuminated Books of the Middle Ages*, folio, London, 1849; Lodge's *Portraits and Memoirs of Illustrious Personages of Great Britain*, 12 vols. imp. 8vo., 240 plates, 1823–35; Luard's *History of the Dress of the British Soldier from the Earliest Period to the Present Time*, 8vo., 50 plates, 1852 (the later portions are the best); Melan and Logan's *Clans of the Scottish Highlands*, 2 vols. imp. folio, 72 plates, 1857; Malcolm's *Manners and Customs of London*, 6 vols. 8vo, 63 plates, 1810–11; Nichols's *Progresses, Pageants, &c., of Queen Elizabeth*, 7 vols. 4to., numerous plates, 1823–28; Planché's *History of British Costume*, small 8vo. 1836; Planché's *Encyclopædia of Costume*, 2 vols. 4to, 1876–77; Semple's (Miss), *Costume of the Netherlands*, folio, 30 plates, 1817; Shaw's *Dresses and Decorations of the Middle Ages* (from 7th to 17th century), 2 vols. imp. 8vo., 94 plates, and numerous woodcuts; 1840–43; Strutt's *Regal and Ecclesiastical Antiquities of Great Britain*, roy. 4to., 72 plates, 1842; Strutt's *Dresses and Habits of the English*, 2 vols. roy. 4to., 153 plates, 1842; Westwood's *Miniatures of Anglo-Saxon and Irish Manuscripts*, imp. folio, 54 plates, 1868.

Of *foreign works* on costume, the two that have special claims to the attention, the admiration, and the grateful confidence of students are—Hefner-Alteneck, *Costume du moyen-âge chrétien*, 4 vols. imp. 4to., 420 plates, Frankfort, 1840–50; and Viollet-le-Duc, *Dictionnaire raisonné du mobilier française*, 6 vols. 8vo., Paris, 1858–75 (the first four volumes, rich in admirable engravings, are specially devoted to armour and costume). Besides these, the following are of importance:—Bonnani's *Costumes of the Religious Orders*, 2 vols. 4to., 249 plates, Rome, 1741; Bonnard et Mercuri, *Costumes historiques des XIIe, XIIIe, XIVe, et XVe siècles*, 2 vols. imp. 4to., 200 plates, Paris, 1867; Burgmair, *Triomphe de l'Empereur Maximilien I.*, atlas folio, 135 plates, Vienna, 1796; Chapuy, *Le moyen âge pittoresque*, 2 vols. folio, 180 plates, 1837; Chevignard et Duplessis, *Costumes historiques des XVIe, XVIIe, et XVIIIe siècles*, 2 vols. imp. 4to., 150 plates, Paris, 1867; Du Sommerard, *Les arts au moyen âge*, 10 vols. (5 folio, and 5 of text 8vo), 510 plates, Paris, 1838–48; Duflos, *Recueil d'estampes, représentant les grades, les rangs, et les dignités, suivant le costume de toutes les nations existantes*, large folio, 240 plates, Paris, 1779–80; *Espana artistica y monumental*, 3 vols. imp. folio, 145 plates, Paris, 1842–59; Fabri's *Raccolta di Varii Vestimenti ed Arti del Regno di Napoli*, folio, 27 plates, Naples, 1773; Helyot, *Histoire des ordres monastiques, religieux, et militaires*, 8 vols. 4to., 812 plates, Paris, 1792; Jaquemin, *Iconographie methodique du costume du Ve au XIXe siècle*, roy. folio, 200 plates, Paris; Lacombe, *Galerie de Florence et du Palais Pitti*, 4 vols. roy. folio, 192 plates, Paris, 1789–1807; Lacroix, Paul, *Manners, Customs, and Dress during the Middle Ages and the Renaissance*, 8vo. London, 1874; Lacroix, Paul, *Military and Religious Life in the Middle Ages and the Renaissance*, 4to. London, 1874; Lacroix, Paul, *The 18th Century, its Institutions, Customs, Costumes*, 8vo. London, 1875–76; Lanté, *Gallerie française de femmes célèbres*, atlas 4to., 70 plates, Paris, 1841; Malliot et Martin, *Recherches sur les costumes, les mœurs, les usages religieux, civiles, et militaires des anciens peuples*, 3 vols. 4to., 228 plates, Paris, 1809; Pauly, *Description ethnographique des peuples*, roy. folio, St. Petersburg, 1862; Pauquet Frères, *Modes et costumes historiques et étrangers*, 2 vols. med. 4to., 196 plates, Paris, 1873; Racinet, M.A., *Le costume historique*, in two forms, large and small, Paris, 1876; Straub, G.M, *Trachten oder Stammbuch*, small oblong 4to. (several hundreds of curious woodcuts of costumes), 1600; Vecellio, *Habiti Antichi et Moderni de tutti il Mondo*, 3 vols., 8vo., Venice, 1859–63.

Examples and illustrations of early costume of great interest and value may be found in the *Archæologia*, M. Didron's *Annales Archéologiques*, the *Journals of the Archæological Societies*, the various County Histories, the *Monumenta Vetusta of the London Society of Antiquaries*, and other kindred works. (C. B.)

COTA, RODRIGO, a Spanish poet of the 15th century, said to have been born at Toledo. Nothing is known of his life or death, saving that he was poor and of humble rank. To him is attributed the popular *Coplas de Mingo Revulgo*, an anonymous pastoral satire against Henry IV. of Castile, which has been often edited and often imitated and which is unquestionably one of the first attempts at dramatic poetry in Spanish literature. To him, too, is sometimes ascribed the authorship of a similar piece, the *Dialogo entre el amor y un viejo.* Besides these, he is supposed to have written the first act of the celebrated novel-drama, the *Celestina* (1480), which was finished in twenty-one acts by Fernando de Rojas. For an account of the influence of the *Celestina* on the Castilian drama, and of the numerous editions, imitations, and translations of it, see Ticknor, *History of Spanish Literature*, vol. i. pp. 235–244.

CÔTE D'OR, a department in the east of France, formed of the northern region of the old province of Burgundy. It is bounded N. by the department of Aube, N.E. by Haute-Marne, E. by Haute-Saône and Jura, S. by Saône-et-Loire, and W. by Niévre and Yonne, and lies between 46° 55′ and 48° 2′ N. lat. The surface is mostly rugged. A chain of hills runs from north-east to south-west through the centre of the department, separating the basin of the Seine from that of the Saône, and forming the connecting-link between the Cévennes and the Vosges mountains. Extending southwards from Dijon is a portion of this range which, on account of the excellence of its vineyards, bears the name Côte d'Or, whence that of the department. The rivers are numerous but small, the only one navigable being the Saône. The Burgundy Canal, connecting the Rivers Saône and Yonne, traverses the department from south-east to north-west. The soil is generally stony, but rich. Wine in large quantities, cereals, fruit, beetroot, rape-seed, mustard, honey, flax, hemp, and hops are produced; and good horses, sheep, and cattle are reared. The iron mines furnish large quantities of ore; and anthracite, marble, lithographic stone, gypsum, and potter's clay are worked. The manufactures include iron, steel, nails, tiles, oil, leather, grindstones, paper, cloth, sugar, beer, and spirits. The department is divided into the arrondissements of Dijon, Beaune, Châtillon, and Semur, containing 36 cantons and 717 communes. The chief town is Dijon. The total area is 3382 square miles, and the population in 1872 was 374,510.

COTES, ROGER (1682–1716), an English mathematician and philosopher, born at Burbage, Leicestershire, of which place his father was rector. When only twenty-four years of age he was appointed Plumian professor of astronomy and experimental philosophy in the university of Cambridge. He took orders in 1713; and the same year, at the request of Dr Bentley, he published the second edition of Newton's *Principia* with an original preface. He died June 5, 1716, at the age of thirty-three, leaving unfinished a series of elaborate researches on optics, in reference to which Newton observed, "If Mr Cotes had lived, we should have known something." With regard to pure mathematics, the principal discovery of Cotes consists in a theorem which still bears his name, and which furnishes the means of integrating by logarithms and arcs of the circle the rational fractions whose denominator is a binomial. His papers were collected and published by his successor Dr Robert Smith.

CÔTES-DU-NORD, a maritime department of the north-west of France, formed from the northern part of the province of Brittany, is bounded on the N. by the English Channel, on the E. by the department of Ille-et-Vilaine, on the S. by Morbihan, and on the W. by Finistère, and is situated between 48° 3′ and 48° 57′ N. lat. To the north the country is flat, but to the south it is rugged and undulating. A chain of granitic hills, the Monts du Menez, runs east to west through the department, dividing it into two unequal parts, of which the southern is the smaller.

Towards its western extremity this chain bifurcates to form the Montagnes-Noires, to the south-west of the department, and the Montagnes d'Arès in Finistère. The rivers of the Channel slope are the Rance, Arguenon, Gouessan, Gouet, Trieux, Tréguier, and Léguer, while the Blavet, Meu, Oust, and Aulne belong to the southern slope. Off the coast, which is steep, rocky, and much indented, are the Sept-Iles, Bréhat, and other small islands. The principal bays are those of St Malo and St Brieuc. The rocks of the district are granite, porphyry, gneiss, schist, and allied rocks, and workable slate and marble. Many of the plains on both sides of the chain of hills are sandy and sterile, and much of the soil is stony. The more important products are hemp, flax, cereals, wax, honey, lead, and iron; the chief industries are the rearing of horses, sheep, goats, and cattle; sea-fishing; the manufacture of sail-cloth, linen, spun-wool, sugar, and paper; and smelting and forging. The department is divided into the five arrondissements of St Brieuc, Dinan, Guingamp, Lannion, and Loudéac, which contain 48 cantons and 384 communes. The chief town is St Brieuc. Corseul, or Corseult, a small town of some 3000 inhabitants, six miles to the north-west of Dinan, is interesting for the Roman remains discovered there, and for its preservation of the name of the ancient Celtic tribe of the Curiosolitæ. The total area of Côtes-du-Nord is 2658½ square miles, and the population in 1872 was 622,295. Bas Breton is spoken in the arrondissements of Guingamp and Lannion, and in part of those of Loudéac and St Brieuc.

COTOPAXI, a volcano of the Andes, in Ecuador, 35 miles S.S.E. of Quito, remarkable as the loftiest in the world. The earliest outbursts on record took place in 1532 and 1533; and since then the eruptions have been both numerous and destructive. Among the most important are those of 1744, 1746, 1766, 1768, and 1803. In 1744 the thunderings of the volcano were heard at Honda on the Rio Magdalena, about 500 miles distant; in 1768 the quantity of ashes ejected was so great that it covered all the lesser vegetation as far as Riobamba; and in 1803 Humboldt reports that at the port of Guayaquil, 160 miles from the crater, he heard the noise day and night like continued discharges of a battery. There were considerable outbursts in 1850, 1854, 1856 and 1864; and the escape of steam and smoke still continues. The appearance of the mountain is in the highest degree sublime,—its summit presenting the aspect of a perfect cone, which stands out against the sky in bold relief and splendour of snow. In 1802 Humboldt made a vain attempt to scale the cone, and pronounced the enterprize impossible; and the failure of Boussingault in 1831, and the double failure of Wagner in 1858, seemed to confirm his opinion. In 1872, however, Dr Wilhelm Reiss succeeded on the 27th and 28th of November in reaching the top, and in the May of the following year the same feat was accomplished by Dr A. Stübel. According to Dr Reiss the height of the north-west peak of Cotopaxi is 19,498 feet above the level of the sea, and that of the south-west peak 19,429, while the snow-line on the western side is at a height of 15,180 feet, and on the southern at 15,174.

See Dr. Reiss, "Ueber eine Reise," &c., in *Zeitschrift der Deutschen Geolog. Gesellschaft*, 1873; Stübel, in *Bulletin de la Soc. de Géogr. de Paris*, 1874; also article ANDES, vol. ii. p. 17.

COTRONE a town of Italy. See CROTONA.

COTTA, a family intimately connected with the history of German literature.

JOHANN GEORG COTTA was the founder of the illustrious Cotta publishing-house. At the time of the Reformation the family (originally of noble Italian blood) lived in Eisenach; and we hear of them later as being settled in Dresden. Johann Georg started business at Tübingen in 1640

His son, JOHANN FRIEDRICH (1701–1779), born March 12, 1701, devoted himself to theological study, and began his public career as lecturer in Jena University. He then travelled in Germany, France, and Holland, and, after a stay of several years in London, became professor at Tübingen in 1733. In 1736 he removed to the chair of theology in the university of Göttingen, which had been instituted as a seat of learning, two years before, by George II. of England, in his capacity as elector of Hanover. In 1739, however, he returned, as extraordinary professor of theology, to his Alma Mater, and, after successively filling the chairs of history, poetry, and oratory, was appointed ordinary professor of theology in 1741. Finally he died, as chancellor of the university, on the 31st of December 1779. His learning was at once wide and accurate; his theological views were orthodox, although he did not believe in strict verbal inspiration. He was a voluminous writer. His chief works are his edition of Johann Gerard's *Loci Theologici*, and the *Kirchen Historie des Neuen Testaments.*

The most famous member of the family was JOHANN FRIEDRICH FREIHERR COTTA VON COTTENDORF (1764–1832), a grandson of the theologian, who was born at Stuttgart April 27, 1764. He attended the gymnasium of his native place, and originally meant to study theology, but became greatly interested in the science of war. In 1782 he entered, as a student of mathematics, in the university of Tübingen, and on the recommendation of Professor Pfleiderer, was elected tutor of Prince Lubomirski in Warsaw. While engaged in tuition, he continued his own studies with great enthusiasm; and, in his zeal for self-culture, he spent a considerable time in Paris, studying French and natural science, and mixing with distinguished literary men. After practising as an advocate in one of the higher courts, Cotta, in compliance with his father's earnest desire, undertook to conduct the publishing business at Tübingen, which, in the hands of subordinates, had very much declined. He started in December 1787, and laboured incessantly to acquire familiarity with all the details. The house connections rapidly extended; and, in 1793, the *Allgemeine Zeitung*, of which Schiller was to be editor, was planned. Schiller was compelled to withdraw on account of his health; but his friendship with Cotta deepened every year, and was a great advantage to the poet and his family. Cotta awakened in Schiller so warm an attachment that, as Doering tells us, when a bookseller offered him a higher price than Cotta for the copyright of *Wallenstein*, the poet firmly declined it, replying, "Cotta deals steadily with me, and I with him." In 1795 Schiller and Cotta founded the *Horen*, a periodical very important to the student of German literature. The poet intended, by means of this work, to infuse higher ideas into the common lives of men, by giving them a nobler human culture, and "to reunite the divided political world under the banner of truth and beauty." The *Horen* brought Goethe and Schiller into most intimate relations with each other and with Cotta; and Goethe, while regretting that he had already promised *Wilhelm Meister* to another publisher, contributed the *Unterhaltung Deutscher Ausgewanderten*, the *Roman Elegies*, and a paper on Literary Sansculottism. Fichte sent essays from the first; and the other brilliant German authors of the time were also represented. In 1798 the *Allgemeine Zeitung*, which is still the leading daily paper in Germany, appeared at Tübingen, being edited first by Posselt and then by Huber. It soon wielded a mighty influence, and must prove a valuable storehouse to the historian. In 1798 the editorial office was transferred to Stuttgart, and in 1803 to Augsburg. In 1799 Cotta entered on his political career, and was sent to Paris by the Würtemburg states as their representative.

where he made friendships which proved very advantageous for the *Allgemeine Zeitung*. In 1801 he paid another visit to Paris, in a political capacity, when he carefully studied Napoleon's policy, and treasured up many hints which were useful to him in his literary undertakings. He still, however, devoted most of his attention to his own business, and, for many years, made all the entries into the ledger with his own hand. He relieved the tedium of almost ceaseless toil by pleasant intercourse with literary men. With Schiller, Huber, and Pfeffel he was on terms of the warmest friendship; and he was also intimate with Herder, Schelling, Fichte, Richter, Voss, Hebel, Tieck, Therese Huber, Matthisson, the brothers Humboldt, Johann Müller, Spittler, and others, whose works he published in whole or in part. In the correspondence of Alexander von Humboldt with Varnhagen von Ense we see the familiar relations in which the former stood to the Cotta family. In 1795 appeared the *Politischen Annalen* and the *Jahrbücher der Baukunde*, and in 1798 the *Damenalmanach*, along with some works of less importance. In 1807 he issued the *Morgenblatt*, to which Schorn's *Kunstblatt* and Menzel's *Literaturblatt* were afterwards added. In 1810 he removed to Stuttgart; and from that time till his death he was loaded with honours. State affairs and an honourable commission from the German booksellers took him to the Vienna Congress; and in 1815 he was deputy-elect at the Würtemberg Diet. In 1819 he became representative of the nobility; then he succeeded to the offices of member of committee and (1824) vice-president of the Würtemberg second chamber. He was also chosen Prussian privy court counsellor, Bavarian chancellor, and knight of the order of the Würtemberg Crown. Meanwhile such publications as the *Polytechnische Journal*, the *Hesperus*, the *Würtembergischen Jahrbücher*, the *Hertha*, the *Ausland*, and the *Inland* issued from the press. In 1828–29 appeared the famous correspondence between Schiller and Goethe. Cotta was an unfailing friend of young struggling men of talent. In addition to his high standing as a publisher, he was a man of great practical energy, which flowed into various fields of activity. He was a scientific agriculturist, and promoted many reforms in farming. He was the first Würtemberg landholder who did away with servitude on his estates. In politics he was throughout his life a moderate liberal. In 1824 he set up a steam printing press in Augsburg, and, about the same time, founded a literary institute at Munich. In 1825 he started steamboats, for the first time, on Lake Constance, and introduced them in the following year for the Rhine traffic. In 1828 he was sent to Berlin, on an important commission, by Bavaria and Würtemberg, and was there rewarded with orders of distinction at the hands of the three kings. He died on the 29th of December 1832.

His son, Freiherr Georg Cotta von Cottendorf, who was born in 1796, and died in 1863, succeeded to the management of the business on the death of his father. He was materially assisted by his brother-in-law, Chamberlain Freiherr von Reischach. He greatly extended the connections of the firm; and, in 1865, the house had establishments for different kinds of publications at Stuttgart, Augsburg, Leipsic, and Munich. The business is still in the hands of the Cotta family. (T. GI.)

COTTABUS (Greek, κότταβος, κόσσαβος, or ὄτταβος), a game of skill for a long time in great vogue in ancient Greece, frequently alluded to by the classical writers of the period, and not seldom depicted on the ancient vases. The object of the player was to cast a portion of wine left in his drinking cup in such a way that without breaking bulk in its passage through the air, it should reach a vessel set to receive it, and there produce a distinct noise by its impact. The thrower, in the ordinary form of the game, was expected to retain the recumbent position that was usual at table, and in flinging the cottabus, to make use of his right hand only. To succeed in the aim no small amount of dexterity was required, and unusual ability in the game was rated as high as corresponding excellence in throwing the javelin. Not only was the cottabus the ordinary accompaniment of the festal assembly, but at least in Sicily a special building of a circular form was sometimes erected so that the players might be easily arranged round the basin, and follow each other in rapid succession. Like all games in which the element of chance found a place, it was regarded as more or less ominous of the future success of the players, especially in matters of love; and the excitement was sometimes further augmented by some object of value being staked on the event. Various modifications of the original principle of the game were gradually introduced, and no fewer than nine different kinds, though some of these have no very striking individuality, have been described by Groddeck in his essay on the subject, published in his *Antiquarische Versuche*, 1800. In one variety a flotilla of shallow saucers was set swimming in a basin, and he was regarded as the victor who sank the greatest number by his casts; in another the difficulty of the task was increased by setting up a small figure called a μάνης, and requiring the jet of wine first to strike on this, and then to fall with a noise into the vessel beneath; while in a third two scales were balanced in such a way that the weight of the liquid cast into either scale caused it to dip down, and touch the top of an image. In the boisterous mirth of convivial gatherings the players seem sometimes to have set a slave or one of their companions whom they wished to annoy, in the place of the μάνης; and from this ill-mannered custom the word ἀποκοτταβίζειν is occasionally used in the sense of to insult. The game appears to have been of Sicilian origin, but it spread through Greece from Thessaly to Rhodes, and was especially fashionable at Athens. Dionysius, Alcæus, Anacreon, Pindar, Bacchylides, Æschylus, Sophocles, Euripides, Aristophanes, Antiphanes, have frequent and familiar allusion to the κότταβος; but in the writers of the Roman and Alexandrian period such reference as occurs shows that the fashion had died out In Latin literature it is almost altogether unknown.

For ancient accounts see Athenæus, xv.; the Scholiast on Aristopanes, *Pac.*; the Scholiast on Lucian's *Lexiphrones*; Tzetzes, *Chiliad*, vi.; Suidas, *s.v.* κοτταβίζειν; Nonnus, xxxiii.; and for modern investigation, Meursius, *De ludis Græcorum*; Becker, *De ludicro cottaborum*, Dresden, 1754–55; Fr. Jacobs, "Ueber den Kottabus," in Wieland's *Attisches Museum*, iii.; Osann, *Beiträge zu griech. Litt. Geschichte*, 1835; Panofka, *Recherches sur les noms de vases grecques*, 1827; Otto Jahn "Kottabos auf Vasenbildern," with illustrations, in *Philologus*, 1867; and *Annali dell' Instituto di corresp. Arch. di Roma*, 1868 and 1870.

COTTEREAU, Jean. See Chouans.

COTTIN, Sophie (1773–1807), *née* Restaud, was born at Tonneins, Lot-et-Garonne, and was educated at Bordeaux. At seventeen she married a banker, who died three years after, when she removed to Paris. In 1798 she published anonymously her *Claire d'Albe*, to obtain money, it is said, for a friend who was proscribed and exiled. Her second romance, *Malvina* (1800), was also anonymous; but the success of *Amélie Mansfield* (1802) induced the authoress to reveal her identity. In 1805 appeared *Mathilde*, a crusading story, sentimental and extravagant to a degree; and in 1806 she produced her last story, the famous *Elisabeth, ou les exilés de Sibérie.* At the date of her death Madame Cottin was engaged on an educational novel, and on a treatise entitled *La réligion prouvée par le sentiment.* Her worst fault is a tendency to exaggerate the virtues of her characters. A complete edition of her works was published, in two volumes, in 1847.

COTTON

COTTON, an indigenous product of all intertropical regions, consists of the down or fine cellular hair attached to the seeds of plants belonging to the genus *Gossypium*, natural order *Malvaceæ*. The plants which supply the raw material for one of our greatest industries, and for the clothing of all nations, may claim to be ranked amongst the most valuable of nature's productions. The genus has occasioned no small degree of perplexity to botanists, and the genealogy of the different varieties is still involved in much uncertainty. Linnæus admitted five species of Gossypium, an estimate which by some subsequent botanists has been more than quadrupled. The investigations of Professor Parlatore, who, in a handsome folio with coloured plates, described the cottons which he had seen cultivated in Italy, led him to the conclusion that there were seven species of cotton only, the rest being merely varieties. These are :—

FIG. 1.—Cotton Plant.

1. *Gossypium arboreum*, Linn., found in Ceylon, the Moluccas, Arabia, Senegal, &c.
2. *G. herbaceum*, Linn., growing in Siam, China, India, Italy, &c.
3. *G. sandwichense*, Parl., indigenous to the Sandwich Islands.
4. *G. hirsutum*, Linn., including Siamese, Bourbon, Upland Georgia, and Louisiana cottons.
5. *G. barbadense*, Linn., comprising Sea Island and Barbadoes cotton, with long staple.
6. *G. tahitense*, cottons from the Society Islands, Tâhiti, &c., in the Pacific.
7. *G. religiosum*, Linn., including Peruvian and other cottons, principally with seeds in adherent files.

Some authorities have enumerated ten species, and the cultivators of cotton have been still more extravagant in the multiplication of species or varieties. Not regarding the effects produced by soil, climate, or culture, they have given new or provincial names to the different sorts of the same species, and have invented a nomenclature which has only produced additional confusion. In Dr Royle's exhaustive work entitled *The Culture of Cotton in India* the reader will find a trustworthy source of information upon the botanical part of the subject.

The cottons of the New and those of the Old World constitute the two great typical divisions of the kinds most known to commerce—these are the Oriental and the Occidental, the Indian and the American cottons. The botanical characteristics, though slight, are sufficiently marked to prevent the one being mistaken for the other,—the seed of the Eastern plant is never black or naked, and the curvature at the base of the leaf lobes is compounded of two opposite curves, and not purely heart-shaped as in the case of the Western plant. Numerous varieties of each type are to be found constituting distinct races of the same species, and affording ample scope for experimenters in their efforts for the improvement of the plant.

Oriental, Asiatic, or Indian Cottons.—All these, although the several varieties may be distinguished from one another, belong to the species designated by Linnæus *Gossypium herbaceum*. There is one exception, however, to be made, and that is the singular purple-blossomed cotton-tree, the *Gossypium arboreum*, Linn., held sacred by the Hindus, known also as *Gossypium religiosum*, grown about the temples in India, which supplies the material for the sacerdotal tripartite thread of the Brahmans, the emblem of their Trinity. The plant has dark-green leaves, bears handsome red-purple blossoms, and produces silky cotton. Attempts have been made to improve its cultivation by hybridizing, and to bring it into general use, but hitherto without success, and it remains almost entirely unknown to commerce. With the exception, then, of this curious species, the numerous varieties of Indian cottons are but different forms of *Gossypium herbaceum*. One of these is cultivated to a considerable extent in the Levant, and is known in the market as Smyrna cotton. The different kinds of Indian cotton are usually included in the generic term *Surats*. The principal sorts are *Hingunghât*, *Oomrawuttee*, *Broach*, *Dhollera*, and *Dharwar*. The Hingunghât, which may perhaps be said to possess the highest qualities, stands at the head of the different descriptions grown in the Central Provinces and the Berars. The staple is of moderate length and strength, white, soft, and silky, and well adapted for spinning. Dharwar, in the southern part of the Bombay Presidency, is the only district in India where exotic cotton has been successfully cultivated; the variety grown is chiefly acclimatized American cotton, from seed of the New Orleans species, *Gossypium hirsutum*. In the North-Western Provinces, Assam, and other parts of India, various kinds of cotton are grown, but none of them is of so much importance to the manufacturer as any of those already enumerated. The cottons produced in China and Central Asia also belong to the same species, but little or no supply is furnished for export to other countries.

The Occidental or American Cottons.—These, which have become known to the civilized world only since the discovery of America, consist of two great divisions—the *Barbadensian* or black-seeded cottons, bearing pure yellow blossoms, with a reddish-purple spot at the base of the petals, and the *Hirsute* or hairy cotton, more or less covered with a distinct clothing of hairs, bearing white or faintly primrose-coloured blossoms. The two cannot always be distinguished from each other by the appearance of the seed, as the black-seeded cottons are occasionally found with a tuft of short hairs or fuzz at one or both ends, and the hairy, though generally downy all over, are also sometimes found with seeds black or naked. On this account some authorities have concluded that the two kinds belong to the same species—the Barbadensian; but carefully conducted experiments show that the variation in the seeds may be attributed to peculiarities of soil or cultivation, and that the specific characteristics of the two kinds remain unaltered generation after generation. The cottons most in demand among manufacturers are those of the Western world, viz., the Sea Island and

New Orleans or Uplands, varieties which are altogether unequalled by the products of any other part of the globe. The Sea Island plant in the soft maritime climate of the low-lying islands off the coast of Georgia, where frost is scarcely known, has surpassed all other descriptions of cotton in the strength, length, and beauty of its staple. The "Georgian Uplands" cotton, sometimes called "Boweds," is the result of attempts to cultivate Sea Island cotton on the uplands of Georgia. Sea Island cotton has also been successfully introduced into Queensland, the Fiji Islands, Tahiti, and Egypt. Of the other great Western cotton, the New Orleans, which is probably of Mexican origin, there are two principal varieties—one with green seeds and hardy constitution, the other with white, tawny, or greyish seeds, longer and more silky in staple. The New Orleans and Boweds cottons constitute the great production of the United States, and are known in English and European markets as "American cottons." The sowing time is March and April, and the crop is gathered from August to the end of the year, or even later in the absence of frost. There are several forms of this Hirsute or Orleans type, such as the Cuba Vine, a large and showy plant, another bearing yellow or brown stapled cotton used for nankeen cloths, and a third kind, producing the "Bourbon" cotton; but all these are more remarkable than useful. The fine Venezuela and the West Indian green-seeded cottons belong to the same race, the latter differing only by a faint blotch of purple at the base of the pale yellow petals. The black-seeded, long-stapled cottons (*G. barbadense*), though of the Sea Island type, are found in such diversified forms, and so widely spread over the different parts of the globe, that some of them have been classed as separate species. The Peruvian and the Brazilian may be adduced as instances; the latter, known by the name of "kidney" cotton, is remarkable for the curious arrangement of its seeds, eight or ten of which adhere together in compact kidney-shaped masses, but there is little else to distinguish it from other forms of black or naked seeded cottons. The various black-seeded cottons cultivated in Brazil, together with the Peruvian and some other descriptions, constitute the *Gossypium acuminatum* of Royle. Colonel Trevor Clarke has made the cotton plant his special study with a view to its improvement by hybridization, and it is to be hoped that ere long he may be induced to publish the results of his investigations.

Cotton Ginning.—The lobes in every boll of cotton contain seeds which, except when covered with down, resemble the coffee-berry, and which have to be separated from the fibre, by a process called "ginning." When this is done there remains of the bulk, as gathered from the tree, about one-third of clean cotton fit for manufacturing purposes, and two-thirds of seed. The separation of the seed from the lint is accomplished by different methods. The most primitive as well as the most rude and simple machine employed is the churka used by the Chinese and Hindus, and known in Italy under the name of manganello. It consists of two wooden rollers fixed in a frame and revolving in contact, between which the cotton is drawn to the exclusion of the seeds. Though various attempts have been made to increase the efficiency of the churka, which is still extensively used in India, there has been but little real improvement, and it is found impossible to clean cotton rapidly by means of it. Hence ginning establishments with machines worked by steam power have now been introduced into the principal cotton districts of India. In the year 1792 Eli Whitney, an American, produced his saw gin, the machine which, under various modifications, is still employed for cleaning the greater proportion of the cotton grown in the Southern States. It consists of a series of saws revolving between the interstices of an iron bed upon which the cotton is placed so as to be drawn through whilst the seeds are left behind. As the fibre of the long-stapled cottons was found to be injured by the action of the saws, and to be more or less cut or "nepped," another more recent American invention, the Macarthy gin, has come into use for cleaning Sea Island, Egyptian, and Brazilian cotton. The fibre is drawn by a leather roller between a metal-plate called the "doctor," fixed tangential to the roller, and a blade called the beater, which moves up and down in a plane immediately behind and parallel to the fixed plate. As the cotton is drawn through by the roller the seeds are forced out by the action of the movable blade, which in some machines is made to work horizontally instead of vertically. Attempts continue to be made so to improve both the saw gin and the roller gin as in the one case to prevent injury to the staple, and in the other to increase the efficiency or capability of the machine to clean large quantities of cotton quickly. The "needle" saw gin is a recent invention intended to prevent the fibre from being cut. It consists of steel-wire set in block tin with the bottom of the teeth rounded or made smooth. On the other hand the double-action Macarthy gin, with two movable blades or beaters, the "knife-roller" gin, the "lock-jaw" gin, and others have appeared as rivals to the saw gin. The machine which will clean the largest quantity in the shortest space of time is naturally preferred, unless such injury is occasioned as materially to diminish the market value of the cotton. This has sometimes been the case to the extent of 1d. or 2d. per ℔, and even more as regards Sea Island or long-stapled cottons. The production, therefore, of the most perfect and efficient cotton cleaning machinery is of importance alike to the planter and the manufacturer, and although considerable improvement has already been effected, there is still room for further efforts in the same direction. The seed obtained in ginning that is not required for sowing, comprising many thousands of tons, is pressed for oil, which when refined is in some cases used to mix with olive oil, or is converted into cake for feeding cattle, or into a material for making paper, whilst the ultimate residuum, or refuse, is made into soap. Even the stalks of the cotton plant are made to answer some valuable purposes. Besides being used for thatch and baskets, a fibre is obtained that can be converted into gunny and other kinds of cloths, equal to those manufactured from jute. They furnish also a material that can be used for the manufacture of the common kinds of paper. The cotton when cleaned or separated from the seed is pressed, chiefly by hydraulic power, into bales varying in weight in different countries, and in this state it is ready for market and for the various processes of manufacture.

Cotton Supply.—The capability of the world to furnish in sufficient abundance the raw material required by the vast and ever-expanding cotton industry has from time to time, and under the pressure of dire necessity, been well ascertained. Happily it has been found possible to cultivate cotton over almost the whole of the intertropical and in many of the temperate portions of the globe, so that if from any cause there should be a deficiency in one part this may be compensated by the superabundance in others. The most ancient cotton-growing country is probably India. For five centuries before the Christian era cotton was largely used in the domestic manufactures of India; and the clothing of the inhabitants then consisted, as now, chiefly of garments made from this vegetable product. More than two thousand years before Europe or England had conceived the idea of applying modern industry to the manufacture of cotton, India had matured a system of hand-spinning, weaving, and dyeing which during that vast period received no recorded improvement. The people, though remarkable for their intelligence whilst Europe was in a state of barbarism, made no approximation to the mechanical operations of modern times, nor was the cultivation of cotton either improved or considerably extended. Possessing soil, climate, and apparently all the requisite elements from nature for the production of cotton to an almost boundless extent, and of a useful and acceptable quality, India for a long series of years did but little towards supplying the manufacturers of other countries with the raw material which they required. Between the years 1788 and 1850 numerous attempts were made by the East India Company to improve the cultivation and to increase the supply of cotton in India, and botanists and American planters were engaged for the purpose. One great object of their experiments was to introduce and acclimatize exotic cottons. Bourbon, New Orleans, Upland Georgia, Sea Island, Pernambuco, Egyptian, &c., were tried but with little permanent success. The result of these and similar attempts, more recently made, has been to establish the conclusion that efforts to improve the indigenous cottons are most likely to be rewarded with success. As will be seen from the table showing the imports of cotton into Great Britain, on a subsequent page, the largest supply obtained from India prior to the American civil war was in 1857, being upwards of 680,000 bales, of the value of £5,458,426; but in 1866, owing to the efforts employed to increase the production of cotton, the import from India had reached a total of 1,847,760 bales, of the value of £25,270,547. The quantity now obtained from India averages something over one million of bales annually, being the largest supply procured from any one country with the exception of America. The cultivation of cotton is not of so remote a date in China as in India. In the accounts of the revenues and of the arts of China during the period of the celebrated dynasty which commenced about 1100 years before the Christian era, and lasted for some centuries, no mention is made of the cotton plant; nor, indeed, is there any notice of cotton in these records until about 200 years before the Christian era; from which period to the 6th century the cotton cloth, which was either paid in tribute, or offered in presents to the emperors, is always mentioned as a thing rare and precious. The annals record as a singular circumstance that the Emperor Ou-ti, who ascended the throne in 502, had a robe of cotton. In the 7th century we find the cotton plant mentioned, but its cultivation appears to have been then confined to gardens; and the poems and romances of that period are occupied in celebrating the beauty of its flowers. It was in the 11th century that the cotton plant was first removed from the gardens to the fields, and became an object of common culture; and it is only from this period that we can date the commencement of the manufacture in China. The cotton tree was introduced into that country at the time of its conquest by the Mongol Tartars in the year 1280; after which period every encouragement was given by the Government to the culture and manufacture of cotton. Considerable difficulties, however, were at first encountered through the prejudices of the poeple and the opposition of those engaged in the manufacture of woollen and linen; and it was not until the year 1368 that they were altogether surmounted. After that date rapid progress was made, and cotton has ever since supplied the material manufactured for the clothing of a large proportion of the population of China. The Chinese, in addition to their own growth of cotton, obtain large imports from India and the Burmese territories. A famine which happened in China about the close of the 18th century induced the Government to direct, by an imperial edict, that a greater portion of the land should be devoted to the cultivation of grain. Since then the importation of cotton from India has been considerable, though but a small part of that which is consumed in their manufactures. China, indeed, was never a source of supply to other countries, excepting to a small extent and for a brief period, when the whole world was ransacked to meet the exigencies of the cotton famine.

Central and South America and the West Indies, though now but comparatively insignificant sources of supply, were formerly of much greater importance. On the conquest of Mexico, in 1519, it is said that Cortes received garments of cotton as presents from the natives of Yucatan, as well as cotton cloths for coverings to his huts; and the clothing of the Mexicans was found to consist chiefly of cotton. In Peru raw cotton and cotton fabrics have long been known to exist, and specimens from the ancient Peruvian tombs were at an early period brought to Europe for exhibition. In the time of the Incas, in 1532, there is evidence that the plant was successfully cultivated; and the tree-cotton of Peru has often attracted attention, and been made the subject of examination for the purpose of determining whether it is the veritable *Gossypium arboreum* of Linnæus. It is represented to be not only exceedingly beautiful, but valuable on account of its abundant crops. It yields largely for four or five years, and may be maintained for eight or ten years without being renewed. The *Gossypium peruvianum* or *acuminatum*, cultivated in the coast valleys of Peru, is an arborescent kind growing to 10 or 15 feet in height. It produces the cotton of Brazil, Pernambuco, Maranhão, Peru, &c. The Anguilla cotton, better known as Sea Island, is represented to be a native of Honduras; it spread thence to the West Indies, and was carried to the United States shortly after the revolution. The West Indies, before the present century, was the chief source from which England derived the cotton then required. The finest ever brought to the English market, or probably ever grown, was raised in the island of Tobago between the years 1789 and 1792 upon the estate of Mr Robley. The West Indian cottons have generally been highly esteemed, but the cultivation has been neglected for the sake of sugar, which was found to be a more profitable crop.

Amongst the countries which in more recent times have become prominent for the supply of cotton, Egypt deserves to be specially mentioned, furnishing a staple which for quality and length holds a high rank and comes next to Sea Island. Cotton was doubtless grown in Egypt at a very remote period, but was cultivated only to a small extent, and chiefly for home consumption, before the early part of the present century, when the inferior indigenous was superseded by the present exotic plant, the produce of which has obtained a high reputation. Its introduction was due to Mahò Bey, who had been governor of Dongola and Sennaar, and had brought seed of the plant with him from Ethiopia. In his garden at Cairo it was discovered about the year 1820, by a Frenchman named Jumel, in the service of Mehemet Ali. That sagacious ruler saw the advantages likely to accrue from the cultivation of a product suited to the soil and climate of the country, and which was in great and growing demand. His measures were carried out with such energy, and upon such a scale, as to enable him so early as 1823 to export to England 5623 bales of this new description of cotton. Jumel, who had resided for some years in America, and had some acquaintance with cotton, after some not very satisfactory first essays in cotton-growing, associated himself with a Cairo merchant, and commenced a small plantation near the obelisk of Heliopolis. His efforts proving highly successful, he was at length entrusted with the control of the viceroy's cotton plantations, which became immensely profitable under his direction. The new description of Egyptian cotton has since been known by the name "Jumel" in France, and "Mahò," or "Mako," in England. Its cultivation has rapidly extended throughout Lower Egypt, the soil as well as the climate being found to be specially favourable. The scantiness of the population, and the difficulty of providing adequate supplies of food, seem the only causes likely to curtail the production of cotton. The thickly populated inverted alluvial delta of the Soudan, between the Blue and the White Nile, is said to be even more favourable to the growth of cotton than the lower parts of the valley, and to afford room for the plantation of ten times the area obtainable in Egypt proper. It is not, perhaps, too much to say that Egypt is the finest cotton-growing country in the world; it is not surpassed in productiveness even by the Southern States of America. So firmly is the growth of cotton established, and so fully are both the Government and the people alive to its importance and advantages, that there is no reason to apprehend that it will be allowed to decline, or that Egypt will ever lose its position as a source of supply. It will be seen from the table of imports on page 486 that the Egyptian supply, which in 1859–60 was only about 100,000 bales, has since become nearly 300,000. The bales, too, have been increasing in size, and now contain six cantars, or about 600 ℔ each.[1]

The growth of cotton in Turkey, as elsewhere, was greatly stimulated and increased during the time of scarcity, but it has since declined largely on account of the feebleness of the Government and the corruption of its agents, and the expectations once entertained have not been fulfilled. The country possesses, however, splendid cotton-growing capabilities, and might be made a very prolific source of supply. Much of the cotton produced is taken by Continental manufacturers. From Brazil cotton of excellent quality has long been obtained, and in various provinces of that vast empire its cultivation has for many years been a favourite and profitable branch of agriculture. The plant thrives in all the varied climates from Para in the north down to Rio Grande in the south, and requires scarcely any care to guard it either from sun or frost. Owing to the demands occasioned by the cotton famine, cotton was for the first time grown for export in the province of São Paulo; and the experiments commenced in 1861, with some New Orleans seed sent out from England by the Cotton Supply Association, and freely distributed, became the means of procuring from this one province a quantity as large as had been received from the whole of Brazil in any year previous to the American civil war. This cotton, known as "Santos" in the market, has been steadily growing in favour with the manufacturer. The rank which Brazil holds amongst the countries from which cotton is imported may be ascertained by reference to the table already mentioned. From several other sources, such as Italy, the Cape of Good Hope, Natal, and other parts of Africa, Queensland, Australia, Fiji, Tahiti, &c., smaller supplies of cotton are obtained, but they are all of minor importance.

These and all others, whether large or small, dwindle into insignificance when compared with America, which is *par excellence* the great cotton-producing country of the world. About the year 1770[2] the planters in the Southern States of the American Union began to turn their attention to the production of cotton; and besides carrying the cultivation to a great extent, they introduced qualities before unknown. The supplies continued to be small up to the end of the century. In 1792 the quantity exported from the United States was only 138,324 ℔, but by the year 1800 it had increased to nearly 18,000,000 ℔. At the close of the war in 1815 the revival of trade led to an increased demand, and the progress of cotton cultivation in America became rapid and continuous, until at length about 85 per cent. of the raw material used by English manufacturers was derived from this one source. With a capacity for the production of cotton almost boundless, the crop which was so insignificant when the century began had in 1860 reached the enormous extent of 4,824,000 bales. This great source of supply, when apparently most abundant and secure, was shortly after suddenly cut off, and thousands were for a time deprived of employment and the means of subsistence. In this period of destitution the cotton-growing resources of every part of the globe were tested to the utmost; and in the exhibition of 1862 the representatives of every country from which supplies might be expected met to concert measures for obtaining all that was wanted without the aid of America. The colonies and dependencies of Great Britain, including India, seemed well able to grow all the cotton that could be required, whilst numerous other countries were ready to afford their co-operation. A powerful stimulus was thus given to the growth of cotton in all directions; a degree of activity and enterprise never witnessed before was seen in India, Egypt, Turkey, Greece, Italy, Africa, the West Indies, Queensland, New South Wales, Peru, Brazil, and in short wherever cotton could be produced; and there seemed no room to doubt that in a short time there would be abundant supplies independently of America. But ten years afterwards, in the exhibition of 1872, which was specially devoted to cotton, a few only of the *thirty-five* countries which had sent their samples in 1862 again appeared, and these for the most part only to bear witness to disappointment and failure. America had re-entered the field of competition, and was rapidly gaining ground so as to be able to bid defiance to the world. True, the supply from India had been more than doubled, the adulteration once so rife had been checked, and the improved quality and value of the cotton had been fully acknowledged, but still the superiority of the produce of the United States was proved beyond all dispute, and American cotton was again king. Slave labour has disappeared, and under new and more promising auspices a fresh career of progress has been commenced. With a rare combination of facilities and advantages, made available with remarkable skill and enterprise, the production of cotton in America seems likely for a long series of years to continue to increase in magnitude and importance.

Table I. (page 486) shows the quantity of the raw material annually furnished to English manufacturers during the past three-quarters of a century by the chief sources of supply. The table also contains a statement of the exports, the annual consumption, the average prices, and the stocks at the end of each year, as well as details of the American produce, exports, &c.

The statement embodied in Table II. (p. 487), issued under the authority of the Liverpool Cotton Brokers' Association, shows the total American crop (including Sea Island produce), the stock in the ports, and the total supply from 1826–27 to 1875–76. Table III. gives the appropriation of the American crops.

[1] The discovery of a new variety of cotton plant said to be much more prolific than any previously known in Egypt, has just been reported from that country.

[2] It is related that in the year 1764 William Rathbone, an extensive American merchant in Liverpool, received from one of his correspondents in the Southern States a consignment of eight bags of cotton, which on its arrival in Liverpool was seized by the custom-house officers, on the allegation that it could not have been grown in the United States, and that it was liable to seizure under the Shipping Acts, as not being imported in a vessel belonging to the country of its growth. When afterwards released, it lay for many months unsold, in consequence of the spinners doubting whether it could be profitably worked up.

TABLE I.—*Import, Export, and Stocks of Cotton in Great Britain in Thousands of Bales during the present Century; with the Annual Consumption in Millions of lbs., and the Weekly Average in Bales; also the Average Prices, &c.*

No reliable account of crops in bales is obtainable earlier than 1821, and of exports earlier than 1826. An official return published by the United States Government some years ago estimated the crop of 1801 at 40,000,000 lb, that of 1811 at 80,000,000 lb, and that of 1821 at 170,000,000 lb. The exports to Europe were 21,000,000 lb in 1801, 62,000,000 lb in 1811, and 125,000,000 lb in 1821, including 19,000,000 lb to Great Britain in 1801, 47,000,000 lb in 1811, and 93,000,000 lb in 1821. In 1815, according to a report published by Congress, the consumption of cotton in the United States amounted to 27,000,000 lb, or 90,000 bales of 300 lb each. In 1821 the consumption was estimated at 45,000,000 lb.

No record of crops or shipments kept during the years 1862–65, owing to the war.

COTTON MANUFACTURE AND TRADE.

The manufacture of cotton had its origin in the East, where the cotton plant is indigenous, and where the climate renders a light and absorbent fabric a suitable clothing for the people. It has in consequence been long established over every part of Asia, although it was only in India that the fabric was manufactured extensively with a view to foreign exchange.

Arrian mentions cotton cloth among the commodities which the Romans brought from India; but the quantity imported by them was inconsiderable, from the preference which they gave to woollen clothing. The difference between ancient and modern Indian imports appears to have arisen, not from any diversity in the nature of the goods produced in that country, but from variety in the tastes or in the wants of the nations with which it has traded.

The implements used by the Indians in the different processes of the cotton manufacture, from the cleaning of the wool to its conversion into the finest muslin, may be purchased for the value of a few shillings, and are of so rude and simple a construction as to be evidently the invention of a very early period. With the exception of the loom, none of them deserves the name of a machine, or displays the slightest mechanical ingenuity. They spin the yarn upon the distaff; and yet, with all the advantages which we in this country derive from machinery, we have only recently been able to equal, either in fineness or quality, the yarn which is produced by means of this primitive instrument. The well-managed use of the finger and thumb of the Indian spinner, patiently and carefully applied in the formation of the thread, and the moisture at the same time communicated to it, are found to have the effect of incorporating the fibres of the cotton more perfectly than can be accomplished by our most improved machines.

The loom is composed of a few sticks or reeds, which the Indian carries about with him, and puts up in the fields under the shade of a tree, or at the side of his cottage. He digs a hole large enough to contain his legs and the lower part of the "geer," and fastens the balances to some convenient branch overhead. Two loops underneath the geer, in which he inserts his great toes, serve as treadles; and he employs the shuttle, formed like a large netting needle, but of a length somewhat exceeding the breadth of the cloth, as "battoon," using it alternately to draw through the weft and strike it up. The reed is the only part of the weaving apparatus which approaches, in the perfection of its construction, to the instruments we use. The loom has no beam, and the warp is laid out upon the ground the whole length of the piece of cloth. The weavers live entirely in villages, as they could not, if shut up in towns, work in this manner.

It is probable that the whole of the implements which have just been described existed as we now find them before the people of India were divided into castes. The transmission of the same employment from father to son (which is the invariable practice in India), while it has the effect of conveying unimpaired the knowledge acquired in any art, tends to check its farther advancement. To the same cause, however, which thus prevented improvement in India, is to be attributed that dexterity in his particular employment which the Indian artizan possesses. From the earliest age he learns to spin and weave under the direction of his father; and having no hope or desire of advancement in any other line, he gains, through constant practice, that wonderful skill which may thus be considered almost as a family inheritance. To be able to manage his ill-constructed loom even in the production of ordinary fabrics, he is obliged to acquire such a sleight of hand, that it is not surprising if, out of the multitude trained in this manner, a few should be found capable of producing those muslins which are said, when spread upon the grass, to appear like the gossamer web. From the superiority of these goods, and from their retaining the beauty of their appearance longer than European muslins, it has been supposed that the cotton of which they are made is of better quality than any known to the European manufacturers. This, however, is a mistake; there is no cotton in India of a quality superior to the best Sea Islands.

As the largest country in the world producing cotton, it was reasonable to expect that India would also at an early period engage in its manufacture, and to such a degree of perfection was this branch of industry carried, that some of the fabrics produced have never been equalled, and have attained a world-wide celebrity. The kind of manufacture for which Manchester is famous bears a name which indicates its Eastern origin, and Calicut has supplied the designation of our English calico. Formerly the East India Company was in the habit of making a great part of its remittances in manufactures, and actually advanced, through its resident, the funds required to enable the workmen to produce the goods. The resident, when not engaged in providing goods for the Company's investment, was authorized to employ the weavers on his own account. This state of things, which was often attended with abuses, has disappeared, and for a long period British manufactured cottons have been largely imported into India. Common muslins were made in every village throughout the Peninsula. Orme says, "When not near the high road or a principal town, it is difficult to find a village in which every man, woman, and child is not employed in making a piece of cloth." The very fine muslins made at Dacca, and which were of such exquisite texture as to be poetically designated "webs of woven wind," were intended chiefly for the use of the potentates of the country, who kept agents to superintend the workmen employed in the manufacture; but since the assumption by Government of the territories of these Indian princes, the demand has fallen off, and a considerable part of the population have betaken themselves to the cultivation of indigo. The cotton from which the Dacca muslins are woven grows in a district of not more than forty miles in length by three in breadth, and in so limited a quantity as never to have become an article of commerce.[1] Long cloths and fine pullicats were made in the Madras Presidency, coarse piece goods and pullicats in Surat, the finest calicoes at Masulipatam, and table-cloths of a superior quality at Patna.

The apprehension often expressed that the inhabitants of India, in possession of the raw material, would, by the introduction of machinery, and by their cheaper labour and superior manual dexterity, be enabled some day to undersell us so as greatly to injure, if not to ruin, and put an end to the Indian demand for English manufactures, has to some extent been realized. The most important industry in the Bombay Presidency is now the manufacture of cotton cloth and yarn. Whilst this has always existed in nearly every village, it is only in recent years that steam spinning and weaving mills have been introduced. The first factory was started in 1863 at Kurla, Bombay, and in 1874 the number had increased to thirteen in the town and island, employing 60,000 spindles and 848 looms. These, together with other mills at Surat, Broach, and Ahmedabad, with an aggregate of 405,000 spindles and 4500 looms, had furnished employment for 10,000 people. Since then the number has been still further increased both in Bombay and other parts of the country, as well as in the presidencies of Bengal and Madras, and in some of the native states. It is probable that at present there are nearly 1,250,000 spindles and upwards of 10,000 looms employed in the various mills scattered over different parts of the country. Encouraged by the protective import duty on foreign manufactures the number of mills is constantly on the increase, and the English trade in certain heavy and coarse descriptions of goods has consequently sustained serious injury. The import duty on English manufactures has been repeatedly condemned by Government, and its abolition has been expressly promised, but it is still retained for the convenient season when the Indian treasury shall be able to dispense with this small source of revenue. Meanwhile new mills, supported to a large extent by English capital, and fitted with English machinery, such as that recently established at Nagpore, are constantly springing up, which will doubtless, under all changes, obtain a share of the trade of the country, and will not probably be seriously injured by the free importation of English manufactures. They have an advantage both in their proximity to the raw material and in the cheapness of native labour. The manufacture of cotton cloth has long been diffused all over the Central Provinces, hand-looms may be found at work in every considerable village, and the agricultural and labouring classes have hitherto preferred the home manufactures to any other. The increase of foreign importations, however, has led to a growing taste for English piece-goods, and the productions of Indian mills have materially affected the local industry.

The cotton manufacture in China is of immense extent, and is carried on almost entirely for home consumption. Almost the only cotton goods exported from China are nankeens. Owing to greater encouragement on the part of the Government, and a less rigid adherence to ancient usages by the people, there has been considerable increase in native manufactures in China; and it will be seen from the table of exports that there has been a remarkable increase in the extent and value of English trade with that country during recent years. In this trade we have now to encounter American competition, which, however, is less formidable than it might be, on account of the protective policy of the United States.

In the interior of Africa, Clapperton and Landers found that cotton was not only grown but also spun and made into cloth. It would be interesting to know the methods which the natives have adopted, and from what source they obtained their acquaintance with the art of weaving. The settlers in Liberia appear to have established

[1] The wool is equal in fineness to the very best Sea Islands, and of still stronger staple, but so short as to preclude the possibility of its being spun by our machinery. The district in which the cotton is grown is stated to be periodically overflowed. The yarn is of different grists, the coarsest greatly finer than the highest number spun in England (No. 250), while the finest has been rated by an experienced spinner to be not under 350. How this yarn can be spun by the distaff and spindle, or woven afterwards by any machinery, is almost beyond conception. Machine-spun cotton yarn has, however, more recently been produced in Manchester which very greatly exceeds in fineness any yarn ever known to have been produced by the hand labour of India.

a communication across the country with Timbuctoo, and to have found there a market for cotton cloths. Increased commercial intercourse with the interior of Africa, and the opening up of markets there for British manufactures, are still objects to be earnestly pursued.

The manufacture of cotton goods in Europe is said to have been first attempted by the commercial states of Italy, before the discovery of the passage to India by the Cape of Good Hope. These enterprizing communities were the entrepôts through which the cotton fabrics of India passed to the different markets of the West; and being situated in the neighbourhood of countries where cotton was grown, and familiar with manufacturing processes, it is supposed that they were led to attempt the imitation of articles so much valued, and bringing so high a price. Another account assigns the introduction of the cotton manufacture into Europe to a later date, and gives to the people of the Low Countries the honour of having been the first manufacturers of these articles, in imitation of the cotton fabrics which the Dutch, about the beginning of the 17th century, began to import from India. But this last account cannot be correct; for Guicciardini in 1560, in a very full list which he gives of the different articles annually imported into and exported from Antwerp,[1] then the greatest commercial mart in Europe, specifies fustians and dimities of many fine sorts among the manufactured articles imported from Milan, and mentions cottons generally among those brought from Venice. But in the articles exported from Antwerp, although we find linens sent to almost every country, cotton cloth is not once mentioned. Italy, therefore, at that time had a cotton manufacture, which, it is probable, soon after made its way to the Netherlands; for we know it was brought from the latter country to Britain by Protestant refugees about the close of the 16th or early in the 17th century.

That this manufacture was carried on in England at a pretty early period of the 17th century we know on good authority. Lewis Roberts, in his *Treasures of Traffic*, published in the year 1641, says, "The town of Manchester buys linen yarn from the Irish in great quantity, and weaving it, returns the same again in linen into Ireland to sell. Neither does her industry rest here; for they buy cotton wool in London that comes from Cyprus and Smyrna, and work the same into fustians, vermilions, and dimities, which they return to London, where they are sold, and from thence not seldom are sent into such foreign parts, where the first material may be more easily had for that manufacture." These goods were woven chiefly about Bolton, and were purchased there at the weekly market by the Manchester dealers, who afterwards finished them, and either sent them to London for export, or sold them to their customers over the country.

At this period, and for a long time after, the weaver provided his own warp, which was of linen yarn, and the cotton wool for his weft; but as much time was lost in seeking these materials, agents for their sale were established in the different villages by the Manchester purchasers. Each weaver's cottage formed a separate and independent little factory. The yarn for his warp was bought by him in a prepared state, the wool for his weft was carded and spun by the female part of his family, and the cloth was woven by himself and his sons.

It would be impossible to enumerate all the descriptions of cotton goods which, in succession, were brought forward from the commencement of the manufacture.[2] The pattern cards of the principal houses in the trade, which were circulated from time to time through the kingdom, and over the continents of Europe and America, exhibited specimens of nearly two thousand kinds.

For the introduction and after improvement of many of these articles England is indebted to John Wilson of Ainsworth. This gentleman was originally a manufacturer of fustians at Manchester, but had early engaged in the manufacture of cotton velvets. His improvements in the mode of dressing, of finishing, and particularly of dyeing these goods acquired for them so high a character, that both in the home and foreign market his articles sold in preference to those of every other manufacturer. His plan for cleaning off the loose and uneven fibres was by the use of razors. He afterwards successively employed, for this end, singeing by spirits of wine and the application of a hot iron resembling a weaver's drying iron. At a later period he effected his object by drawing the goods rapidly over a cylinder of cast-iron heated to redness, by which they were in a superior manner cleared of the down or pile which had been raised upon them in the various operations of weaving, washing, bleaching, or dyeing. Wilson, having a turn for chemical inquiries, investigated the different known processes of dyeing; and by the improvements he introduced in the application of them to his own manufacture, materially advanced that art. The many valuable improvements introduced by Wilson into the different processes connected with the cotton manufacture had the effect not only of establishing it more firmly, but of rapidly enlarging its extent.

Lancashire manufactures.

A considerable share of the calico-printing business was transferred, about the year 1760, from London to Lancashire, in consequence of the cheaper accommodation for carrying on the work, and the lower wages of the workmen. A fall in prices thereupon took place, which produced an increased demand for calicoes. These goods were at that time made of linen warp and cotton weft, it having been found impracticable, before Sir Richard Arkwright's discovery, to spin cotton warp of sufficient strength.

At this period the dealers from Manchester, in place of buying fustians and calicoes from the weaver, as had been the practice before, began to furnish him with materials for the cloth, and to pay him a fixed price per piece for the work when executed. Along with the portion of linen warp, they gave him out a portion of cotton wool, which he was obliged to get spun into the weft he was to use. But so fast was the manufacture by this time outstripping the process of spinning, that it frequently happened that the sum which the master weaver was allowed by his employer was less than what he found himself obliged to pay to those whom he employed to spin it. He durst not, however, complain, much less abate the spinner's price, lest his looms should be unemployed. In this state of things, the further progress of the manufacture must have been stopped, if a more productive mode of spinning had not been discovered.

It has been said that the yarn produced at this time in England, by the one-thread wheel, the only spinning machine known, did not exceed in quantity what 50,000 spindles of our present machinery can yield. To have reared and trained hands sufficient to have doubled this quantity, had it been possible, must have been the work of a length of time, and the amount of the manufacture would still have been insignificant. A change in the system, therefore, had become indispensable; and we find that different ingenious individuals had already begun to employ themselves in contriving a better mode of spinning.

[1] See Macpherson's *Annals of Commerce.*

[2] The fustians that were made at this early period of the manufacture were those denominated herring-bone, pillows for pockets and outside wear, strong cotton ribs and barragon, broad-raced linen thickset and tufts, with whitened diaper, striped dimities, and jeans. At some distance of time there were added to these, cotton thicksets, goods figured in the loom, and, at a still later date, cotton velvets, velveteens, and strong and fancy cords.—(Aiken's *History of Manchester.*)

When we contrast the splendid inventions connected with the cotton manufacture, which from this period burst forth in rapid succession, with the passive acquiescence in the use of imperfect machinery during the long period which preceded, we are apt to ascribe these improvements to the circumstance alone of a number of men of genius having at that moment arisen, and to forget that the ultimate cause existed in the times calling their energies into action.

Already, about the year 1750, the fly-shuttle had been invented by Kaye of Bury—one of the most important steps in the progress of the art of weaving; and in the year 1760 improvements had begun to be made in the carding process.

James Hargreaves, a weaver at Stanhill, near Church, in Lancashire, an illiterate man, possessed of no great mechanical knowledge, had adapted the stock cards used in the woollen manufacture to the carding of cotton, and had besides greatly improved them. By his invention a person was able to do double the work, and with more ease than by hand carding. In the stock cards, one of the cards is fixed, whilst the other, being suspended by a cord over a pulley, is worked by the carder; and in this way two or three cards can be applied to the same stock.

This contrivance was soon succeeded by the cylinder cards, or carding engine. It is not ascertained who was the inventor of this valuable machine, but it is known that the father of the late Sir Robert Peel was among the first who used it, and that, so early as 1762, he, with the assistance of Hargreaves, erected a carding engine with cylinders at Blackburn. This machine did not differ materially from that now in use, except that it had no contrivance for detaching the cotton from the cards, an operation which was performed by women with hand cards.

There had been several unsuccessful attempts to improve the mode of spinning before 1767, when Hargreaves invented the "Spinning Jenny," patented in 1770. The idea of this machine is said to have been suggested to him by seeing a common spinning wheel, which had been accidentally overturned, continue its motion while it lay on the ground. After several unsuccessful attempts to carry into execution the conception he had formed, he succeeded in producing a rudely-constructed "jenny" of eight spindles, turned by bands from a horizontal wheel. In it the eight rovings were passed between two pieces of wood laid horizontally the breadth of the machine; and these, being grasped in the spinner's hand, and drawn out by him, formed the rovings into threads. The structure of this jenny was soon afterwards greatly improved, and it was

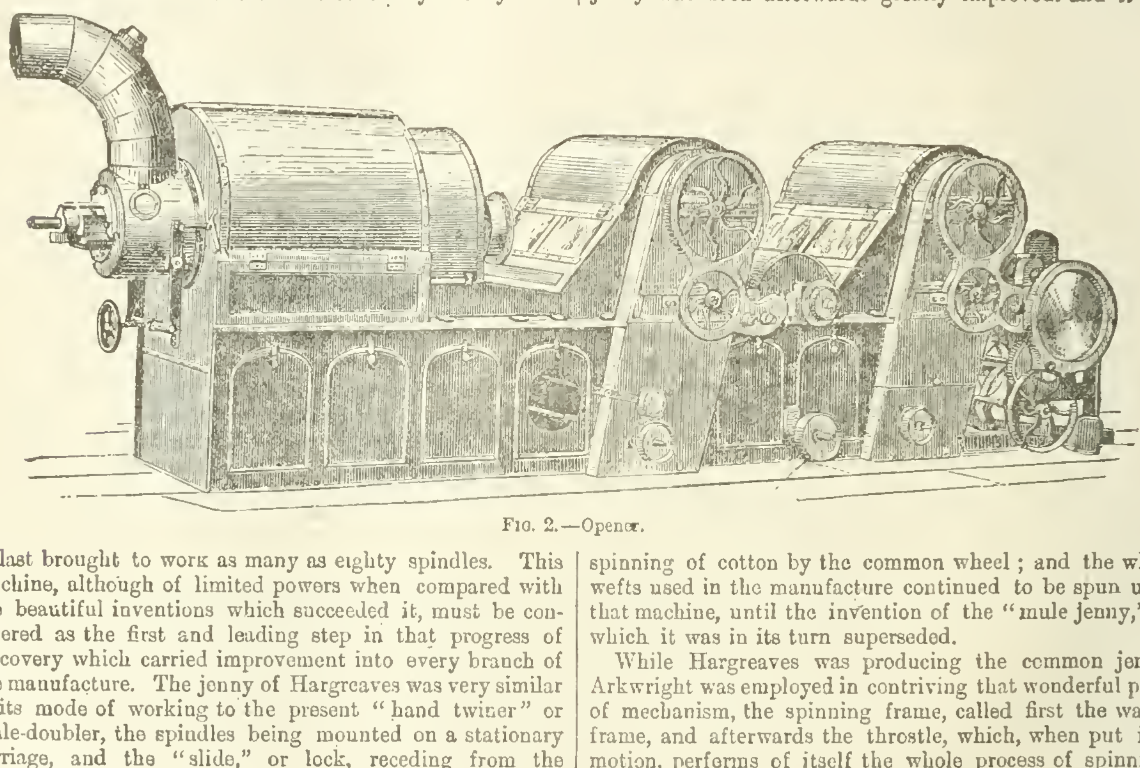

Fig. 2.—Opener.

at last brought to work as many as eighty spindles. This machine, although of limited powers when compared with the beautiful inventions which succeeded it, must be considered as the first and leading step in that progress of discovery which carried improvement into every branch of the manufacture. The jenny of Hargreaves was very similar in its mode of working to the present "hand twiner" or mule-doubler, the spindles being mounted on a stationary carriage, and the "slide," or lock, receding from the spindles during the twisting of the threads, and returning to the spindle again during the winding on of the yarn. These hand twiners are being rapidly replaced by self-acting twiners; but the type of Hargreaves's remains substantially the same as at first. His principle of drawing the fibre is still in universal use for carded wool.

Hargreaves's invention occasioned great alarm among those who earned their subsistence by the old mode of spinning, and even produced popular commotion. A mob broke into his house and destroyed his machine; and some time after, when a better knowledge of its advantages had begun to bring his spinning jenny into general use, the people rose a second time, and, scouring the country, broke to pieces every carding and spinning machine they could find. The jenny in a short time put an end to the spinning of cotton by the common wheel; and the whole wefts used in the manufacture continued to be spun upon that machine, until the invention of the "mule jenny," by which it was in its turn superseded.

While Hargreaves was producing the common jenny, Arkwright was employed in contriving that wonderful piece of mechanism, the spinning frame, called first the water-frame, and afterwards the throstle, which, when put into motion, performs of itself the whole process of spinning, leaving to the workmen only the office of supplying the roving or prepared material, and of joining or piecing the thread when it breaks. See Arkwright, vol. ii. p. 540. On Arkwright's removal to Nottingham he obtained from Messrs Wrights, bankers there, and afterwards from Mr Need of Nottingham and Strutt of Derby the assistance necessary to enable him to perfect his inventions and turn them to advantage, and in the year 1769 he obtained his patent for spinning with rollers. In 1772 his patent was contested, but a verdict was given in his favour, and his right to the exclusive use of the discovery remained afterwards undisturbed. Soon after his removal to Cromford, he followed up his first great discovery with other inventions for preparing the cotton for spinning, for which he took out another patent in the year 1775. But in 1781 his right to this patent was disputed; and judgment was finally given against him in November 1785, and the patent cancelled. Arkwright's inventions for preparing the cotton, which are sometimes spoken of as the most wonderful parts of the process of spinning, do not appear so striking as the first effort of his genius. Although only to have been conceived by an original and fertile mind, they are still but improved arrangements of a machine previously in use, or suitable adaptations of his own spinning machine. But the power of Arkwright's mind was perhaps marked by nothing more strongly than the judgment with which, although new to business, he conducted the great concerns to which his discovery gave rise, and the systematic order and arrangement which he introduced into every department of his extensive works. His plans of management were universally adopted by others; and after long experience, they have not yet in any material point been improved.

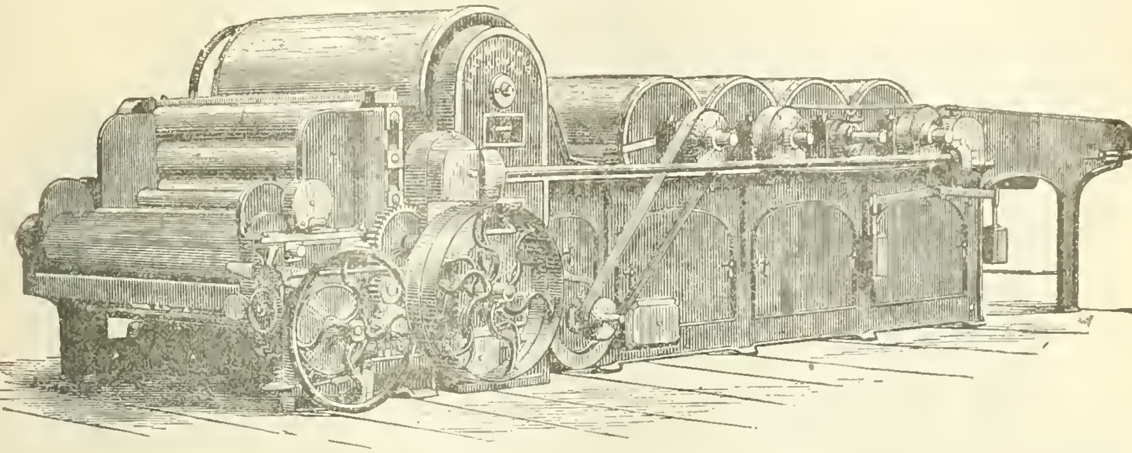

Fig. 3.—Three-cylinder Opener, Beater, and Lap Machine.

Machinery.

The principal machines used in cotton spinning, taking them in the order in which they are employed, are the following:—The opener, scutcher and lap machine, carding engine, combing machine, drawing frame, slubbing frame, intermediate frame, and roving frame; the throstle, the self-acting mule and hand mule, doubling frame, and mule doublers or twiners. The first two are employed in the process of cleaning the raw cotton, and separating its matted flocks. In the lap machine it is fashioned into flat folds; in the carding machine it is carded and further cleaned and the fibres straightened; and in the drawing frame it is formed into a loose rope the fibres of which are laid parallel. In the slubbing frame it is slightly twisted; and in the intermediate and finishing frames it is still farther twisted, particularly in the higher numbers; but it is not yet yarn. The throstle frame is chiefly used

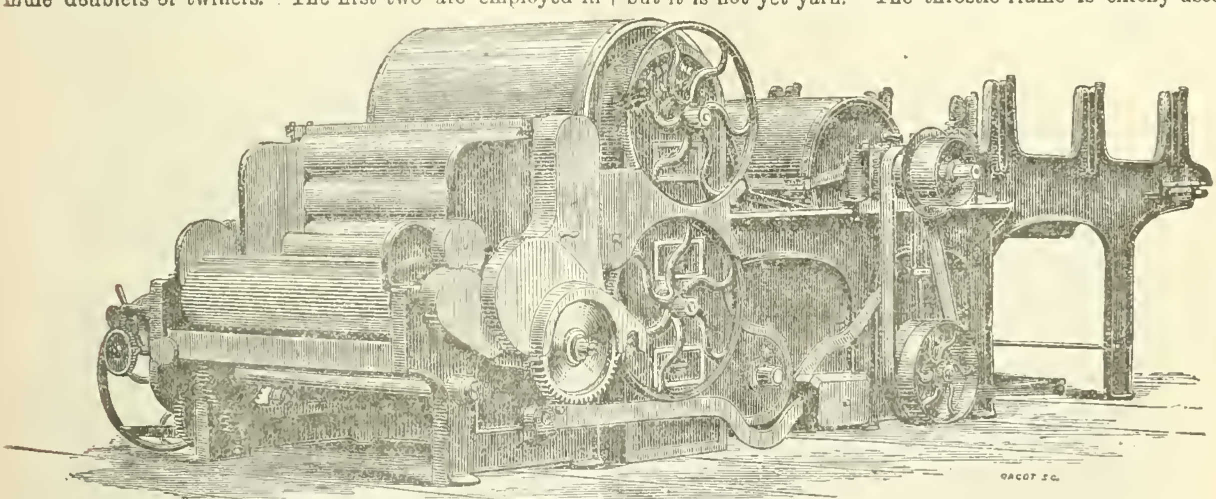

Fig. 4.—Single Scutcher and Lap Machine.

for coarse warps; whilst upon the self-acting and hand mules both coarse and fine yarns are spun.

The Opener.—In this machine the raw cotton is spread uniformly on a feeding table; from this it is taken by a pair of feeding rollers, and by them subjected to the action of a *beater.* The beater consists of a cylinder bearing at intervals four or six rows of projecting teeth. It is 18 inches in diameter over the teeth, with an average of 40 inches in width, and when in motion makes 1400 revolutions in a minute. By an ingenious contrivance a strong draught of air is made to play through the newly-opened cotton, carrying away the dust and other foreign particles which adhere to it. This machine is capable of opening up about 15,000 lb of cotton in 56 hours. The cotton is carried forward between two perforated zinc or wire cylinders connected with the draught, the cotton being taken from another pair of feed rollers and a beater with two or three blades, and from this beater the cotton passes through a second pair of perforated cylinders, from which it is taken off by a pair of rollers and delivered to calender rollers, and formed into laps for the *scutcher.* Various kinds of openers have been patented which differ in some respects from one another, each claiming to have some special advantage; of these Crichton's may be mentioned, and that of Lord Brothers (see fig. 2), which possesses an arrangement for drawing the cotton by means of a vacuum

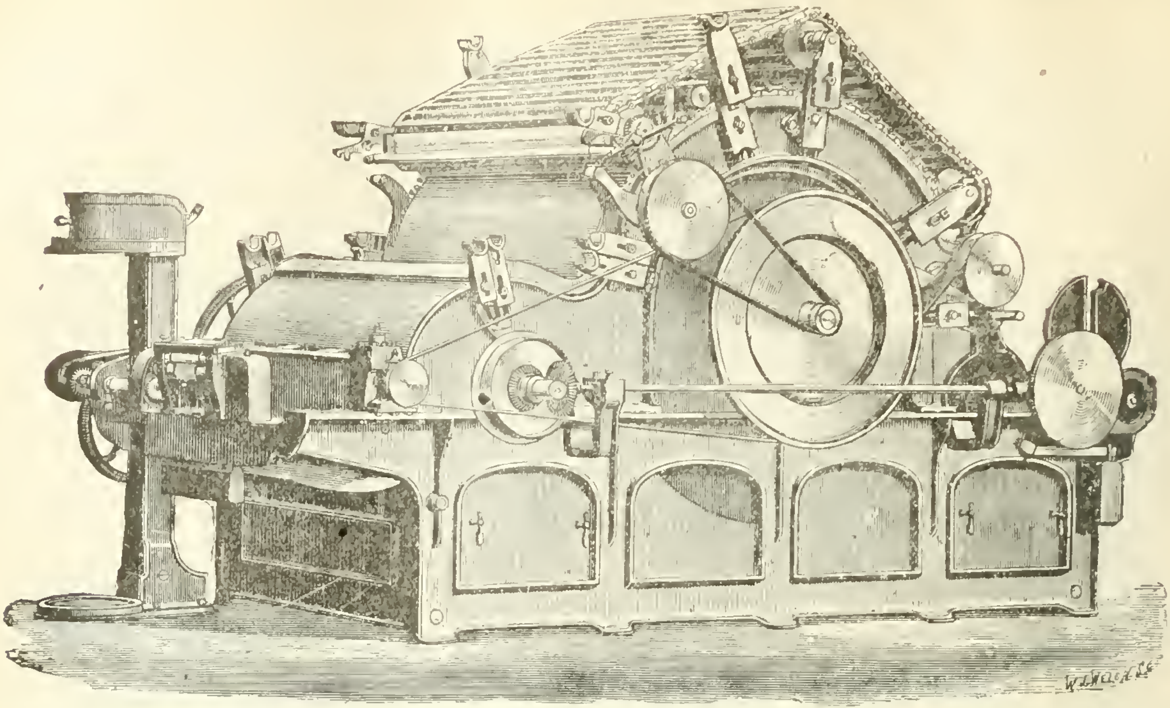

Fig. 5.—Self-stripping Flat Carding Machine.

from places situated at long distances from the blowing room, and claims among other advantages that it will open up 25,000 lb per week of 56 hours. In this machine an ingenious contrivance presents the cotton to the cylinder by

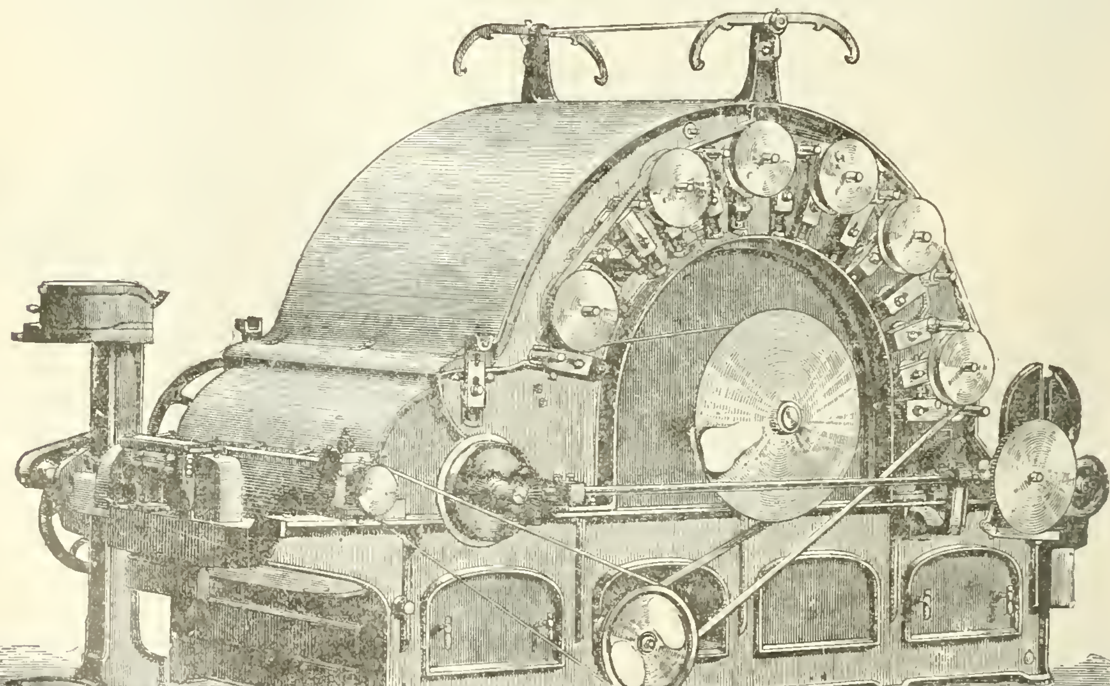

Fig. 6.—Roller and Clearer Carding Machine.

one roller working in a trough formed by a series of weighted levers. These reduce the risk of breaking the fibre, and at the same time by moving a horizontal bar connected with a pair of cones acting upon the feed roller so regulate the supply of the cotton as to dispense with the necessity of weighing it, and make a more uniform lap.

The SCUTCHER, which has also a lap machine combined with it (fig. 4), in many respects resembles the opener. In some cases it is fed with cotton in a loose fleece, and in others, instead of the loose cotton, three or four laps are placed upon the feeder, and the beater or beaters are used in place of the cylinder. The cotton is further cleaned

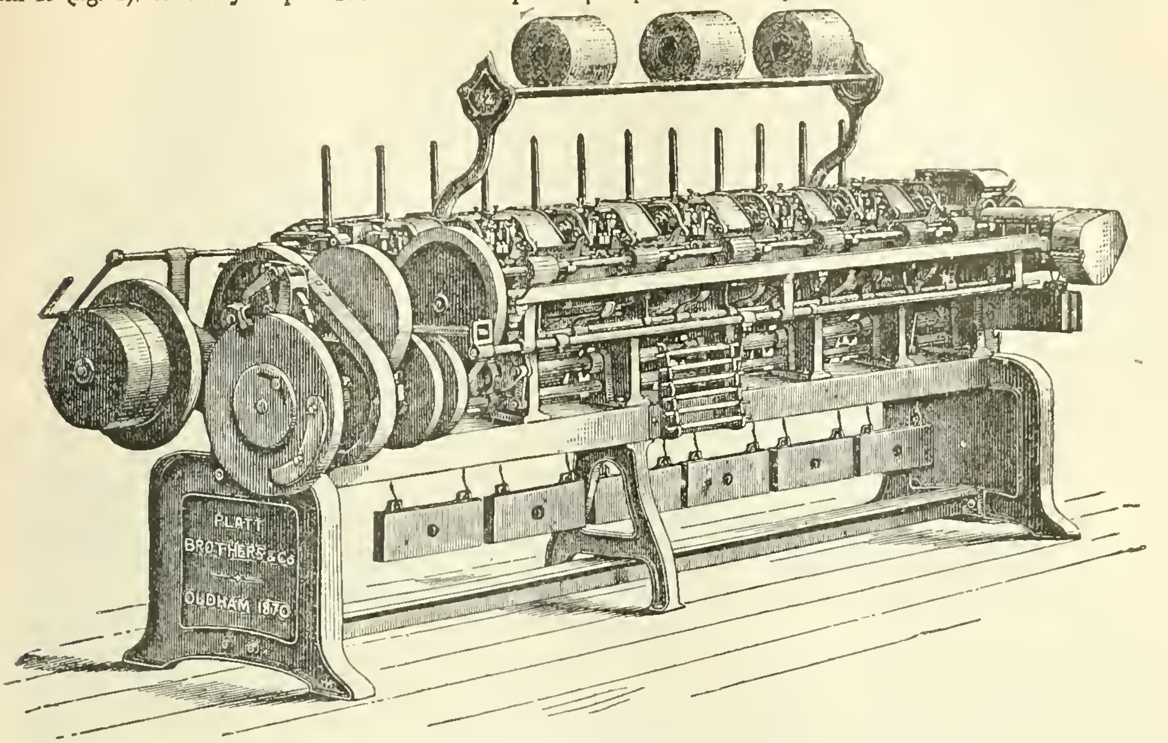

FIG. 7.—Combing Machine.

and carried forward in the same manner as in the opener, making laps for the second or finishing scutcher, which is of similar construction to the first, the laps going from this machine to the carding engine.

The CARDING ENGINE (figs. 5 and 6) consists of one large or *main* cylinder covered with cards, a smaller one called the *doffer*, and a still smaller one called the *taker in*. The main cylinder is surmounted with small ones, called rollers, covered in like manner with cards, by whose revolutions in opposite directions to those of the large cylinder,

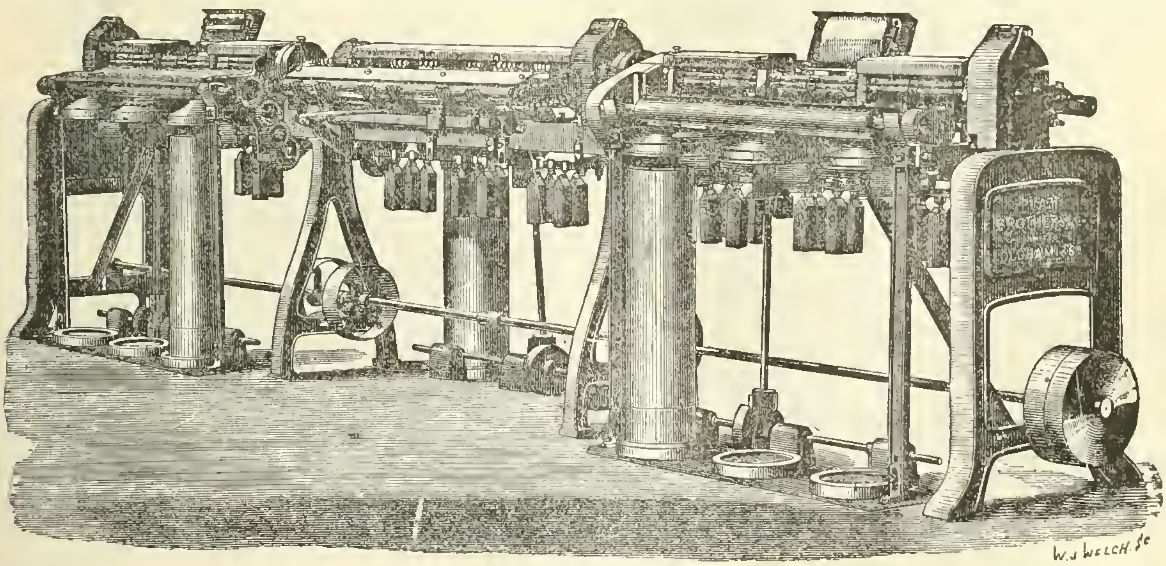

FIG. 8.—Drawing Frame.

and with different velocities, the cotton is carded and put on the second cylinder or *doffer*. In some cases the main cylinder is furnished with what are technically termed "flats,"—a series of flat cards revolving to form an endless travelling lattice. The third cylinder, or *taker in*, which is really the first to act upon the cotton, is usually covered with a stronger wire; it receives the cotton from a pair of feed-rollers, striking out the heavier part of the dirt remaining from the scutching, and delivering the cotton to the main cylinder. The cotton is taken from the doffer in a very light fleece by means of a vibrating comb, and this fleece is drawn together into a funnel which forms it into a narrow web; then passing through two pairs of calender rollers, it is coiled into a can. The carding engines are often made with two main cylinders and a connecting cylinder called the *tummer*, but in all other respects they resemble those already described. The cans with the slivers are next taken to the

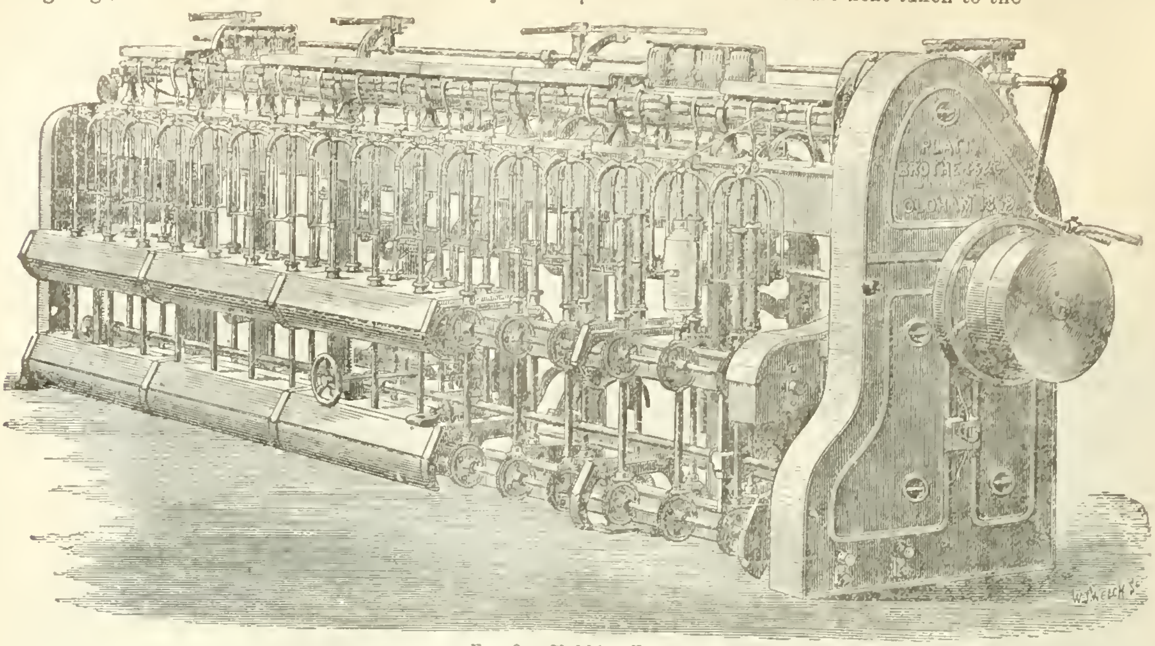

Fig. 9.—Slubbing Frame.

Drawing Frame (fig. 8), where the processes of elongation or attenuation are carried on through the successive pairs of rollers with which it is provided. The lower roller of each pair is furrowed, or fluted longitudinally, and the upper one is neatly covered with leather to give the two a proper hold of the cotton. There are generally four pairs or rows of rollers in each drawing frame, and three heads, each head containing five or six deliveries. Six ends or

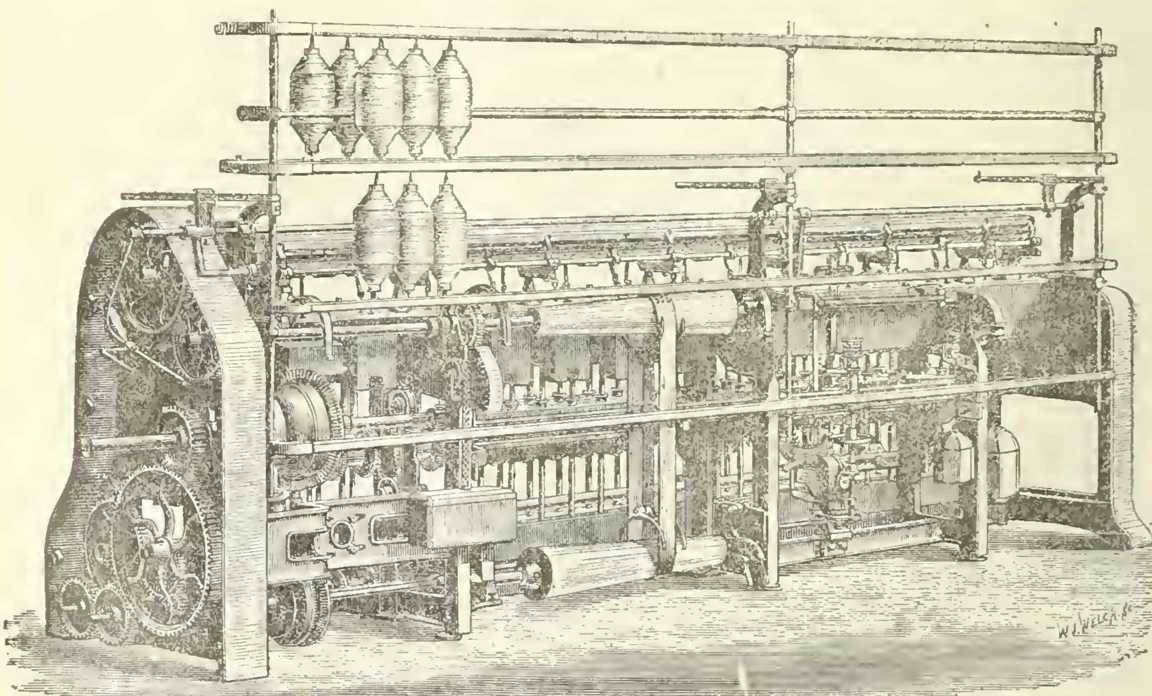

Fig. 10.—Roving Frame.

slivers are, as a rule, put up to each box, and drawn down into one by each line of rollers going at an accelerated speed, the front roller revolving about six times faster than the back roller. The first doubling being 6 into 1, the next will be 36, and the third 216. Fine spinners will some times have four heads of drawings and double 8 ends into 1 at the first head, and 8 into 1 afterwards, which makes the total number of doublings in the drawing frame 4096.

Slubbing Frame (see fig. 9).—The operation which succeeds that of the drawing frame is slubbing, where the sliver has a certain amount of twist imparted to it, and is wound on a bobbin. In this process the end or sliver from the last head of the drawing frame is drawn out by means of three pairs of rollers, and this is twisted as it emerges from the front line of rollers by the action of vertical spindles and flyers, which at the same time wind the ends upon bobbins in successive layers. As the bobbins fill and increase in diameter their rate is gradually made slower at each layer by a very ingenious piece of mechanism known as "the sun and planet motion," consisting of a large wheel within which two other wheels are made to work, the interior one having a regular motion, and the sun wheel being driven from a pair of cone drums with a rate of speed constantly decreasing. Thus the slubbing frame answers three purposes,—it draws out the cotton, twists it, and winds it upon a bobbin; the first is done by the rollers, the second by the spindles, and the third by the flyers and pressers. Following this is

The INTERMEDIATE FRAME, of similar construction, but having a larger number of spindles and sometimes smaller-sized bobbins. Instead of having cans put at the back it has what are termed *creels*, in which the slubbing bobbins are put so as to be drawn off through the rollers of the frame and doubled two into one. It is called *intermediate* because it comes between the slubbing and roving frames. Spinners of low numbers or counts sometimes omit this frame, and set the slubbing frame bobbins into the "creels" of the roving frame.

The ROVING FRAME (fig. 10).—This, which is the last required before the operations of spinning, strictly so called, commence, resembles in principle the slubbing and intermediate frames. It has a greater number of spindles than either, seldom less than 100, and often 164; and these spindles are set closer together, and the bobbins are shorter and smaller than in the intermediate frame.

For medium counts, from 60's to 100's, the cans are taken to a lap machine or doubler, where from 80 to 120 ends or slivers are formed into a lap, which is placed at the back of the finisher card; this machine has the main cylinder surmounted with flats (see fig. 5) instead of rollers and clearers. From this finisher card the cans are taken to the drawing frame in the way already described. For the higher numbers this card, the finisher card, is used as a breaker or first card; and from it the cans are taken to the lap machine, where from 15 to 30 ends are formed into a small lap for the *combing machine* (fig. 7), and the cans from the comber are taken to the drawing frame. The degree of elongation completed by the roving frame is technically described by the number of hanks roving per pound, each hank consisting of 840 yards; for instance, the hank roving usual for the lower counts up to 30's would be 2½ to 4 hanks in the pound. For the medium counts four frames are generally used to reduce the roving to the necessary degree of fineness, say 12 to 14 hanks roving, for the mule, viz., slubbing, intermediate, roving, and fine jack frames. For the higher counts sometimes a fifth frame is used, called a second roving frame, reducing the finished roving to from 30 to 35 hanks. The first preparation goes to the throstle or to the self-acting mule, the second to the self-acting mule chiefly, and the third or higher numbers to the hand mule.

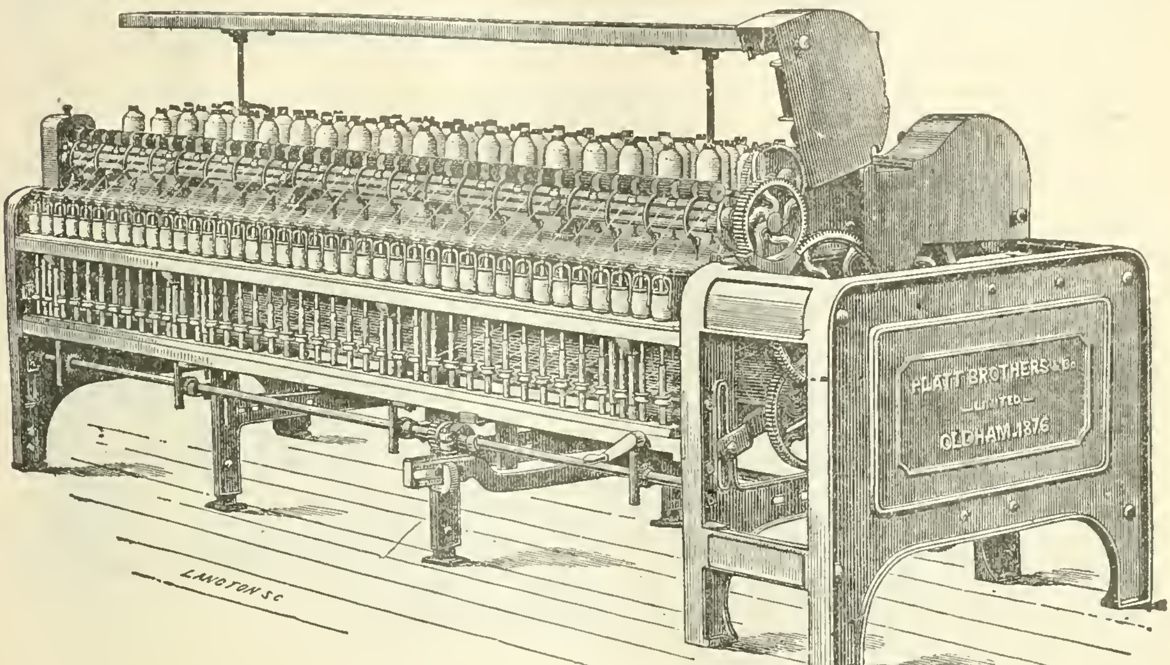

FIG. 11.—Throstle with Spindles and Flyers.

The THROSTLE.—The spinning frame, or throstle (see figs. 11 and 12), is made with two sets of drawing rollers, one on each side. Between these the roving bobbins are placed, and the rove is drawn through them to the requisite fineness, and formed into thread by the action of the spindles and flyers, which are placed in front of each set of rollers, at such distances apart from one another as may be required for the different-sized bobbins and counts of yarn to be spun; the latter vary from 6's up to 60's. The number of spindles commonly put into the throstle is from 100 to 150 on each side, being a total of between 200 and 300 in a frame. The twist is put into the yarn by the revolutions of the spindles and flyer, and the yarn is wound on to the bobbin by the friction of a piece of woollen cloth extending along the rail upon which the bobbins rest; the amount of friction required for the varying counts of yarn is regulated by the differing weights and the shape of the bottom of the bobbins, and also by the fineness or coarseness of the cloth placed underneath.

An improvement on the throstle, which was thought to be very promising, was made by Mr Danforth, an American spinner of Scotch birth. His object was to obviate the vibration of the spindle (caused by the flyer being placed on the top of it, with nothing to keep it steady), whereby it is prevented from being driven with advantage beyond a certain limited speed. To remedy this, Danforth introduced into his throstle a stationary spindle, on the top of which he fixed an inverted conical cup. In this improved throstle the bobbin revolves on the spindle with great rapidity, and by a transverse motion is raised and depressed so as to be, when at the highest point, entirely within the cup, and when at the lowest entirely below it. The edge of the cup, passing thus along the whole length of the bobbin, builds the yarn equally on every part while it is receiving the necessary twist, and gives also the drag required to wind the yarn upon the bobbin. Danforth's improvement gives a great increase of quantity, but the waste it causes is such as to form, in the opinion of many spinners, an insuperable objection to its use, though as regards the stronger material of worsted it is still extensively used. The throstle frame is now exclusively used for the production of warps. In the most approved machines of this kind the spindles make 5500 revolutions a minute, each spindle producing twenty-seven hanks per week of 56 hours when spinning 32's. The Danforth frame is now entirely out of use except for worsted.

The ring and traveller frame is also an American invention. It was introduced into England under the name of the "Niagara Throstle" by Sharp, Stewart, & Co., but found very little favour amongst English cotton spinners. In America, however, it is very extensively used, and owing to some important recent improvements it is beginning again to attract attention in England. Its peculiarities are that instead of a flyer on the top of the spindle there is a small steel traveller working in a ring placed in a third rail, commonly called the ring rail, and

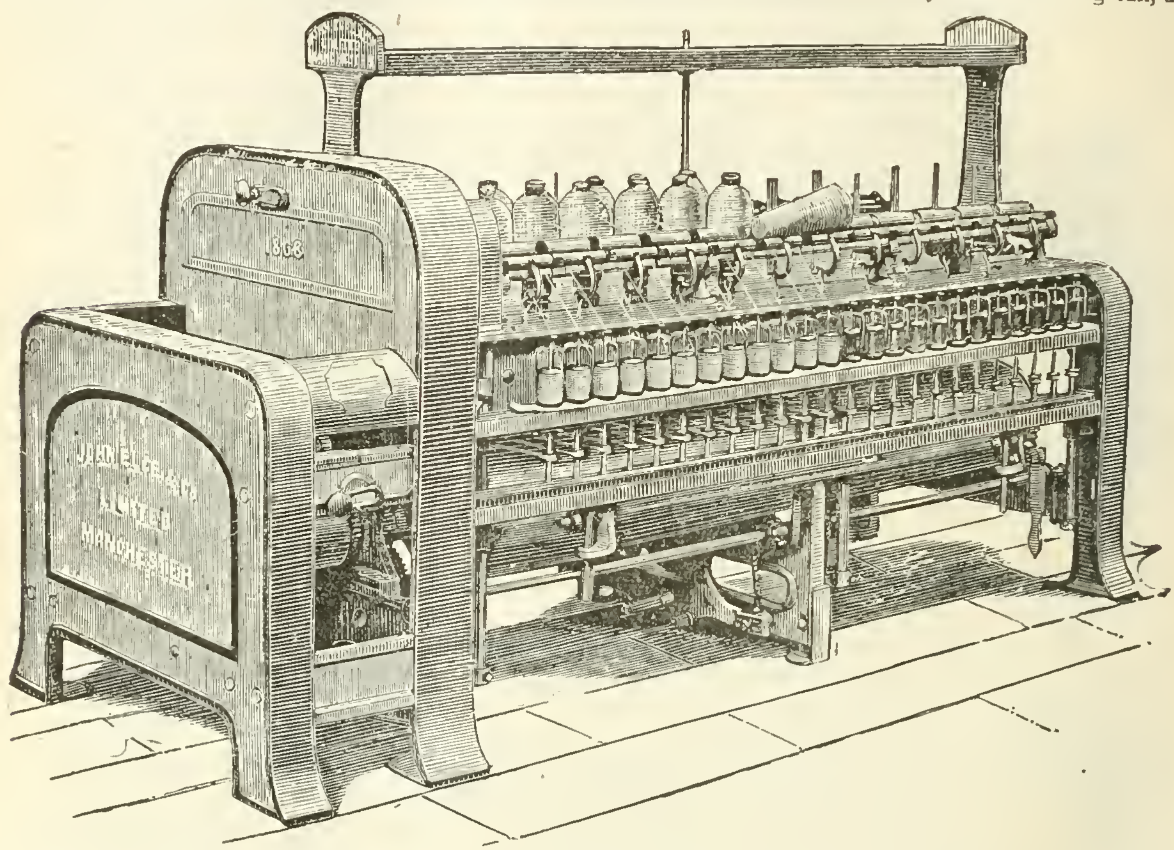

FIG. 12.—Throstle.

passing over the bobbin, which moves up and down the full length of the bobbin; the twist is given by the revolution of the spindle, the drag or winding of the thread on the bobbin (fixed to the spindle and carried round with it) being effected by the friction of the traveller in its revolutions round the ring. The travellers are of varying weights and sizes to suit the different counts of yarn. The spindles generally make about 6000 to 7000 revolutions per minute.

Messrs John Elce & Co. claim to have introduced an improvement in the throstle, in which two tin cylinders are employed instead of one for driving the spindles, whereby a longer band is obtained, and a saving of friction and power is said to be effected.

The MULE (fig. 13).—Probably no inventive contribution has been offered to the cotton trade more important than the mule. Samuel Crompton of Bolton completed in 1775 his invention of the "mule jenny," in contriving which he had been engaged for several years. But this machine, possessing great merit and advantages, did not come into general use, nor was its value known, until after the expiration of Arkwright's patent,—the spinner till then being confined to the rove prepared for common jenny spinning, which was unsuitable to the mule jenny.

After the spinner was allowed to make use of Arkwright's fine process of preparation, by his patent being cancelled, the power of this machine became known; and its introduction forms an important era in the history of the cotton manufacture. Being fitted to supply those counts or "grists" and qualities of yarn which the other machines could not produce, it enabled the manufacturer to enter upon fabrics which otherwise it would have been in vain to attempt. Warps of the finest quality are spun upon the mule; while on the throstle yarn of a finer grist than No.

40 could not without the combing machine, be spun to advantage. Since the introduction of the latter, throstles have been constructed to spin yarns as fine as Nos. 80 or 100. The reason is that the fine thread has not strength to stand the drag required for winding the yarn upon the bobbin,—the difficulty being occasioned by each thread having its own drag regulated separately. In Crompton's mule and Hargreaves's jenny this difficulty was avoided by the spinner putting the required tension or drag on the yarn by the "faller," which operating on all the threads at once, and being controlled by the hand of the spinner, allowed the tension of the yarn during the winding on to be easily governed. All wefts, from the lowest to the highest numbers, are now spun upon Crompton's machine, the use of Hargreaves's jenny having been almost entirely superseded by it as regards cotton, though not as regards woollen. It was some time, indeed, after the mule came into use before it was ascertained that the finest yarn required for the manufacture could be produced from it. But in the year 1792, Jonathan Pollard of Manchester succeeded in spinning yarn of 278 hanks to the pound, from cotton wool grown by Mr Robley, in the island of Tobago. This yarn was sold at twenty guineas per pound to the muslin manufacturers of Glasgow.

The mule, in its structure and operation, is a compound of the spinning frame and of Hargreaves's jenny; from which circumstance it probably received its name. It contains a system of rollers like that belonging to the throstle; but the attenuated roving, as it issues from between the rollers, is twisted by the action of the spindles, which, in the mule, are mounted on a movable carriage that recedes from the rollers a little faster than the roving is delivered by them. The mode of putting the twist in by means of the spindles is exactly the same as in the jenny, and in fact resembles the most ancient method of using a spinning spindle. When a sufficient length of yarn or a "stretch" had been spun the rollers and spindles were stopped, the yarn coiled round the bare spindles was unwound, or "backed off," as it is technically called, the faller was put down by the spinner and the "nose" of the

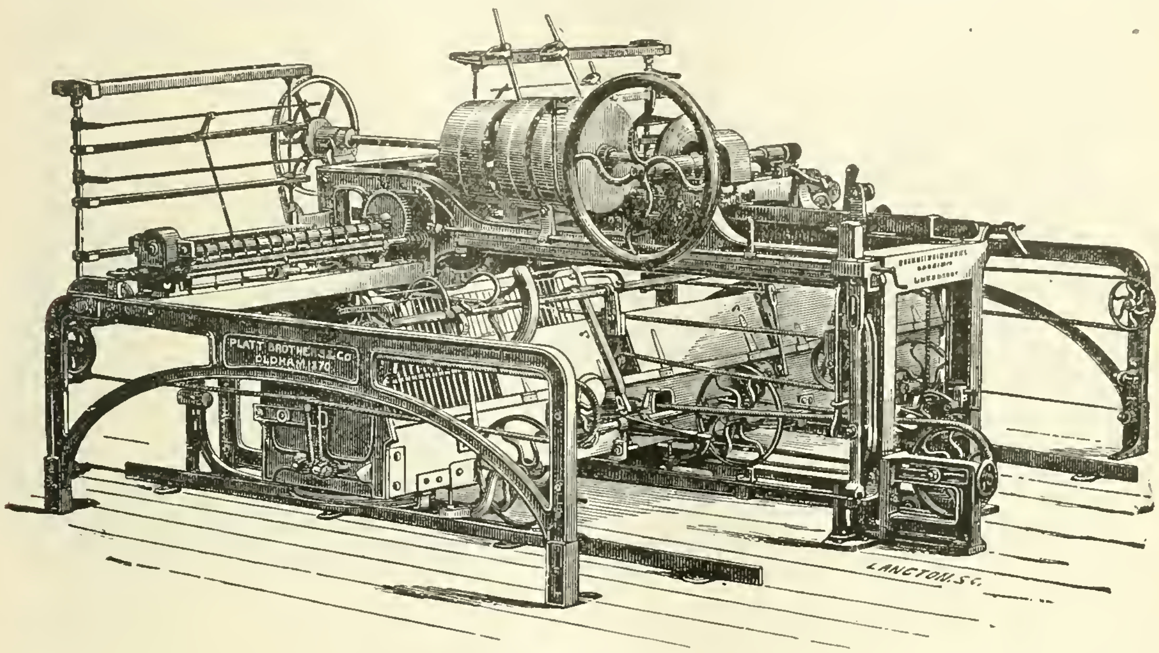

FIG. 13.—Hand Mule.

cop, and the spindles turned during the run in of the carriage with sufficient quickness to wind the spun yarn on the top of the yarn already wound on the spindles. When the spindle points have been brought by the running in of the carriage within a short distance of the delivery rollers, the rollers and spindles are again set in motion for another stretch. The manner of backing off and winding the spun yarn on the spindles is exactly the same as that used in Hargreaves's jenny. Crompton's great merit consisted in the adaptation of the best features of the throstle and the best principles of Hargreaves's jenny, so as to obtain from the combination of the two the principal elements of a perfect spinning machine. The motive power being manual, the work was rendered more fatiguing as the mules became longer, and thus the size of the machine was restricted by the strength of the spinner. In spinning the finer counts of yarn it became customary to continue the outward movement of the carriage, and the rotation of the spindles, a short time after the rollers were stopped; the movement of the carriage was then arrested, but the rotation of the spindles continued until the proper amount of twist had been put in the yarn. This last operation resembles that performed by the common jenny, and produces a similar effect.

In 1792 William Kelly of Glasgow, at that time manager of the Lanark mills, obtained a patent for moving the mule by power, in order to relieve the spinner of the most laborious part of his work, and thus enable him to attend to a longer mule and spin the yarn at a reduced cost Kelly's machinery was contrived so as to move every part of the mule, even to the returning of the carriage into its place, after the draught was finished. Had it come into full operation, fewer men need have been employed as spinners, and children would have been able to do a great part of the duty required. But, after a short trial, it was discovered that this invention, though intended to bring out the carriage, and return it again during the winding on of the yarns, was found to be valuable only for bringing out the carriage. A spinner could, however, serve two mules, the one carriage moving out during the time that the other was returning.

It was next found unnecessary to confine the mule to 144 spindles, the largest number it had till then contained; for, with the assistance of the above mechanical improvement, the spinner could manage two mules of 300 or 400 spindles each. The process of mule spinning continued to be conducted upon this plan till several proprietors of large cotton works restored the part of Kelly's machinery which returns the carriage into its place after the draught is completed, thus further lessening the fatigue to the spinner. All that is to be done by the spinner in this case is, with a slight touch of the hand, to shift the belt, so as to allow the carriage to be moved back into its resting position, and, as this takes place, to manage the guide for building the cop, regulate the motion of the carriage as it recedes, and govern the speed of the spindle for winding on the yarn.

Some improvements were from time to time made in the headstocks, which either rendered the mule more automatic or else enabled the spinner to work a larger pair of machines; but notwithstanding the work still required the greatest attention and care, as well as an amount of skill that could only be attained by long practice. Spinners thus became a very important and powerful class, demanding and obtaining a high rate of wages, and sometimes occasioning to their employers more trouble than any other class. This, doubtless, contributed to the introduction of the self-acting mule. At the same time, it must be observed that great improvements were introduced, and still continue to be made, in the construction of the hand mule, perfecting and extending its operative powers, and enabling it to do its work almost automatically with the aid of the most delicate control of the spinner, who has no longer to use his strength to drive the various parts, but is required chiefly to regulate or reduce the velocity of the backing off and winding on, though the same unremitting attention and care are as necessary as before. The hand mule, as it is designated, is therefore quite as complex a machine as the modern self-acting mule.

Self-acting Mule (fig. 14).—In 1818 William Eaton obtained a patent for a self-acting mule, in which the operations ordinarily performed by the spinner were effected by automatic means, and this machine, though not extensively adopted, contained several ingenious arrangements

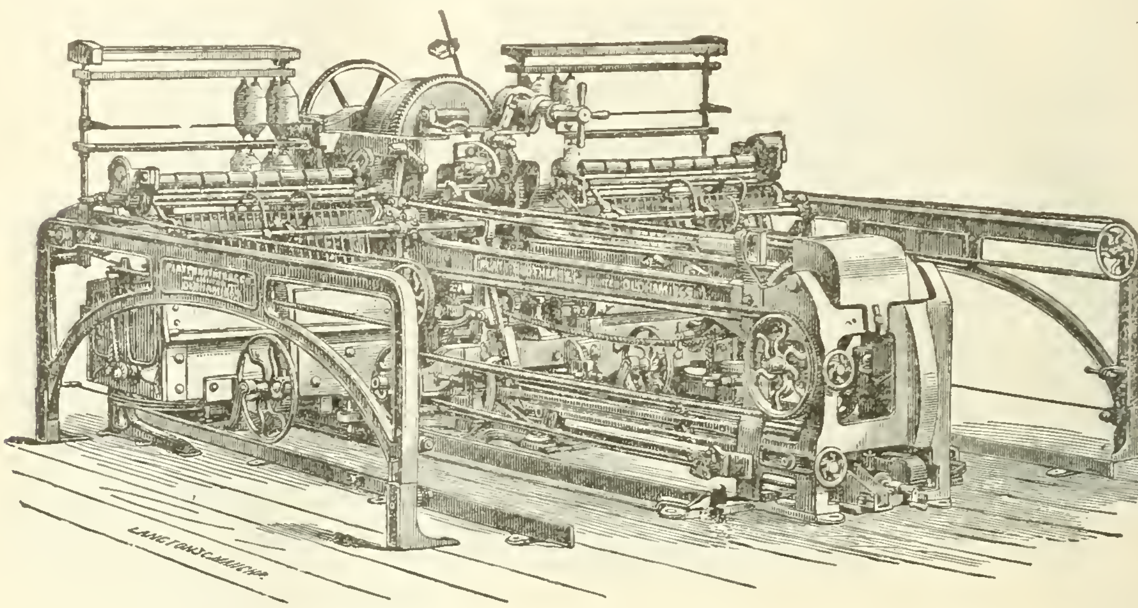

Fig. 14.—Self-acting Mule.

His faller lock, after a lapse of thirty-six years, was said to be re-invented, and still continues to be the best in use at the present day. His apparatus for governing the formation of the cop was founded on correct principles, and was a beautiful contrivance, much superior to many that have been since introduced. Mr Smith of Deanston, Scotland, was also the author of several valuable inventions, and others might be named who made efforts, more or less successful, to provide the desired machine.

About 1824 Richard Roberts directed his attention to the best means of rendering the hand mule self-acting, and in 1825 a patent was taken out for his invention. In the mule now introduced the governing power was exercised by what was then and has ever since been called a "cam shaft," by which all the movements were so regulated as to succeed each other in their proper order, the termination of one operation being the initiation of the next. In 1830 Roberts took out another patent for his "quadrant" winding apparatus, and thus completed his self-acting mule, which in its chief essential features remains the same at the present day; for though as regards the headstock there have been improvements, yet the whole combination still bears indelible marks of his genius. Many improvements have of late years been introduced and patented, and the self-acting mule now in use is superior in its manner of working to the one made by Roberts. It is now employed for spinning all sizes of yarns up to 100's and in a few cases as high as 160's, and in the manufacture of these numbers a great saving is effected by its use. It has now almost entirely superseded the hand mule, which only retains its position for the production of the finest yarns, and in a few years will undoubtedly have to give place altogether to the self-actor, on which yarn up to 160's, or even 200's, has already been successfully spun.[1]

Effects of Machinery, &c., on Production and Cost.

About the year 1790 the average product of yarn No. 40 was little more than a hank per spindle per day; but

[1] Fuller details of cotton machinery may be found in a work entitled the *Science of Modern Cotton Spinning, &c.*, by Evan Leigh, C.E.; in a paper by Mr John Platt, on machinery for the preparing and spinning of cotton, published in *The Proceedings of the Institution of Mechanical Engineers*; and in Spon's *Dictionary of Engineering*.

by the year 1812 it had advanced to two hanks per day, and in 1830 to $2\frac{3}{4}$. The effect of this increase of production upon the cost of the article was very great, as will be seen by the following statement of the reduction of the cost of spinning, and in the price of yarn.

We have already noticed that, until the cancelling of Arkwright's patent, by which the mule spinner became at liberty to use his improved mode of preparation, the few fine wefts required were spun on Hargreaves's jenny. In the year 1786 this yarn was sold in Glasgow and Paisley at 31s. per pound for No. 90, 7s. per pound being the price of spinning it; the warp, spun upon the water or throstle frame, was sold at 47s. 6d. the pound for No. 90.

It was stated by Crompton that, immediately upon completing his invention of the mule in the year 1775, he obtained 14s. per pound for the spinning and preparation of No. 40; that a short time after he got 25s. per pound for No. 60; and that to show that it was not impossible to spin yarn of so fine a grist, he then manufactured a small quantity of No. 80, for the spinning and preparation of which he got 42s. per pound. For some little time after the mule came into general use, in the year 1786, it was the practice in many places for the spinner to purchase the wool in a prepared state; and separate concerns for preparing cotton were established and carried on. At that time 10s. per pound was paid for spinning No. 100; but soon afterwards the cost for this number was reduced, first to 8s. and then to 6s. 8d. In 1790 the price of spinning No. 100 was 4s. per pound. In 1792 it was brought to 3s. 1d., and in 1793 to 2s. 6d., at which price it continued till 1795, when, the mule coming to be worked by machinery, and an increase being made in the number of spindles, the spinner was enabled so to extend the quantity of his produce as to admit of another considerable reduction in cost. The price of spinning No. 100 was in the course of a few years brought down to 8d. per pound, and continued so until 1826, when it was further reduced to $6\frac{1}{2}$d. per pound. Notwithstanding this extraordinary diminution of the price of spinning, such have been the effects of the improvements in machinery, in the selection and preparation of wool, and in the skill and tact brought to bear on the work, that the spinner is able to earn more money now than he did when the wages were at the highest.

The sale prices of the yarn during this period were as follows:—

In 1786, for No. 100 ...	38s.	In 1797	19s.
1788	35s.	1799	10s. 11d.
1791	29s. 9d.	1301	8s. 9d.
1793	15s. 1d.	1803	8s. 4d.
1795, spun from Bourbon cotton wool....	19s.	1805	7s. 10d.
		1807	6s. 9d.

After 1807 the price of yarn underwent various fluctuations; it fell in 1829 to 3s. 2d., and in 1831 to 2s. 11d., at which price it remained in 1832. Since 1832 the fluctuations have not been extreme, the price never rising above 5s. 6d., at which it stood in 1836, nor falling below 2s. 9d., as in 1842. Prices for No. 100 at the close of 1876 were warp-twist 2s. 10d., medium 2s. 6d., and weft 1s. 10d.

But the benefits of improved machinery have not been confined to the reduction of the cost of the yarn; they have at the same time considerably increased the quantity which a workman can produce in the same hours of labour.

Application of Steam Power.—During the time that the machines for the different processes of cotton spinning were advancing towards perfection, James Watt had been employed in maturing and reducing to practice his conceptions for extending the powers of the steam-engine.

Among the engines erected by Bolton and Watt in 1785 was one for Messrs Robinsons, at Papplewick, in Nottinghamshire, for spinning cotton,—the first instance of the application of steam to this manufacture. In 1787 they put up one for the Messrs Peel, at Warrington, for cotton spinning, and three others for the same purpose at Nottingham. No rotative engine had yet been erected at Manchester; and it was seven years after Bolton and Watt had received their patent that they constructed for Mr Drinkwater the first engine used there for spinning cotton. In 1790 they erected one for spinning cotton at Nottingham for Sir Richard Arkwright, another at Manchester for Mr Simpson, and a third at Papplewick for Messrs Robinsons. Some time before this Sir Richard Arkwright and others, from an ill-judged economy in the first cost, had introduced into their spinning factory atmospherical or Newcomen's engines, with rotative motions applied to them. But quickly perceiving their error, they abandoned them;—and Bolton and Watt's engines soon came to be universally used among cotton spinners and all other manufacturers.

Cotton Supply Improved.—In an account of the means which contributed to the fall in the price of spinning we must not overlook the progressive improvement in the cultivation of the raw material which has taken place, and in the application of its different qualities to their most profitable uses. Previous to the year 1793, the cotton used in the coarser articles of the manufacture, with the exception of a small quantity imported from India and from the Levant for the fustian trade, was wholly the growth of the British and French West India Islands. That for the better kind of goods was raised in Demerara, Surinam, and Berbice. The wool for fine goods was grown in the Brazils; and that for the few very fine muslins then manufactured, in the isle of Bourbon.

In 1787 the descriptions of cotton imported into Britain appear to have been as follows:—

From the British West Indies	....	6,800,000 lb
From the French and Spanish colonies	....	6,000,000
From the Dutch	do.	1,700,000
From the Portuguese	do.	2,500,000
From the Isle of Bourbon, by Ostend	....	100,000
Smyrna and Turkey	....	5,700,000
		22,800,000

Had we continued to derive our sole supply of cotton from these countries, the progress of the manufacture would have been greatly retarded, not only from the difficulty of making the production keep pace with the increasing consumption, but from the impossibility of obtaining the qualities suited to the finer descriptions of goods, which the improved machinery enabled us to undertake. But as we have already seen, more abundant supplies were procured from America, and of qualities before unknown. It was soon found that the Sea Island cotton grown in the small islands extending along the American coast from Charleston to Savannah was so exquisitely fine, long, and strong in staple as to surpass any cotton previously obtained from any part of the globe. After a succession of trials its superiority was fully admitted, and it soon came into use for the purposes for which Bourbon cotton had been employed before 1796, and in a short time entirely supplanted it.

Progress of Cotton Manufacture in England.

Nottingham, where Arkwright commenced operations, was the seat of the stocking manufacture, in which moreover his partner Need was largely engaged, and the whole produce of his spinning was therefore at first devoted to that industry. The cotton yarn for stockings requires to be particularly smooth and equal; and to secure these qualities, it is spun by a process differing a little from that employed for ordinary twist. Being from two roves in place of one, it is called double-spun twist. The introduction of this article produced a great change in the stocking manufacture. Hand-spun cotton was entirely laid aside; and stockings made of twist were of so superior a quality, that in a short time they wholly supplanted those made from thread.

About the year 1773 Need and Strutt made the important discovery, that the yarn produced by the spinning frame had sufficient strength to fit it for warp, although its firmness and hardness rendered it less suitable for weft. The weft, therefore, continued to be spun by Hargreaves's jenny; and from this time the calicoes, and other articles in imitation of India goods, which had hitherto been manufactured with linen warp, came to be made wholly of cotton; and the progressive increase of these manufactures, particularly of calicoes, after this time, was unexampled.

After having made a considerable quantity of those goods, Need and Strutt discovered that, when printed, they were subject to double the duty charged upon calicoes woven with linen warp, and that their sale was even prohibited in the home market. After a long and expensive application to the legislature, they succeeded in procuring the repeal of those impolitic laws. Nearly about the same period, calicoes entirely of cotton were begun to be made at Blackburn, and also at Preston,—which places soon became the seat of their manufacture, and for a long time the great market to which the printers from all parts of the kingdom resorted for their supplies. This branch went on increasing for many years in a most extraordinary degree. About the year 1805, it was calculated that the number of pieces sold annually in the Blackburn market was not less than a million; and by that time the manufacture of this article was not confined to the country around Blackburn, but had spread into the north-west district of Yorkshire, principally about Colne and Bradford, from which part of the country 20,000 pieces weekly are said to have been sent to Manchester.

The first attempts to make muslins in Britain commenced simultaneously in Lancashire and at Glasgow about the year 1780, but were without success. There was no yarn fitted for the weft of these goods, except that spun upon Hargreaves's jenny; and when made of this, it was found they were not of a marketable quality. Recourse was then had to wefts brought from India, and although a better article than the former was by this means produced, it was still not of a quality to compete successfully with Indian muslin. As soon, however, as the invention of the mule jenny enabled the spinner to produce yarns suited to such fabrics, the manufacture of the finest cotton articles became an important branch of trade in this country. That machine, as has been mentioned, came into use at the end of the year 1785, upon Arkwright's patent being cancelled; and it is from that period we ought to date the commencement of this part of the manufacture. So rapid was its increase, that in 1787 it was computed that 500,000 pieces of muslin were in that year manufactured in Great Britain.

Power Loom Weaving.—The credit of the invention of the power loom is due to the Rev. E. Cartwright of Hollander House, Kent. The circumstances of his discovery, which will be found fully detailed in the following letter, are curious, and of interest in the history of inventions. Mr Cartwright says—

"Happening to be at Matlock in the summer of 1784, I fell in company with some gentlemen of Manchester, when the conversation turned on Arkwright's spinning machinery. One of the company observed, that as soon as Arkwright's patent expired, so many mills would be erected, and so much cotton spun, that hands never could be found to weave it. To this observation I replied, that Arkwright must then set his wits to work and invent a weaving mill. This brought on a conversation on the subject, in which the Manchester gentlemen unanimously agreed that the thing was impracticable; and, in defence of their opinion, they adduced arguments which I certainly was incompetent to answer, or even to comprehend, being totally ignorant of the subject, having never at that time seen a person weave. I controverted, however, the impracticability of the thing, by remarking that there had lately been exhibited in London an automaton figure which played at chess.

"Some little time afterwards, a particular circumstance recalling this conversation to my mind, it struck me that, as in plain weaving, according to the conception I then had of the business, there could only be three movements, which were to follow each other in succession, there would be little difficulty in producing and repeating them. Full of these ideas I immediately employed a carpenter and smith to carry them into effect. As soon as the machine was finished, I got a weaver to put in the warp, which was of such materials as sail-cloth is usually made of. To my great delight a piece of cloth, such as it was, was the produce. As I had never before turned my thoughts to anything mechanical, either in theory or practice, nor had ever seen a loom at work, or knew anything of its construction, you will readily suppose that my first loom must have been a most rude piece of machinery. The warp was placed perpendicularly, the reed fell with a force of at least half a hundred-weight, and the springs which threw the shuttle were strong enough to have thrown a Congreve rocket. In short, it required the strength of two powerful men to work the machine at a slow rate, and only for a short time. Conceiving in my great simplicity that I had accomplished all that was required, I then secured what I thought a most valuable property by a patent, 4th April 1785. This being done, I then condescended to see how other people wove; and you will guess my astonishment when I compared their easy mode of operation with mine. Availing myself, however, of what I then saw, I made a loom, in its general principles nearly as they are now made; but it was not till the year 1787 that I completed my invention, when I took out my last weaving patent, August 1st of that year."

But the idea of weaving by machinery was not new, although it had never been carried into practice. About the close of the preceding century, a drawing and a description of a similar loom (a circumstance unknown to Cartwright) had been presented to the Royal Society of London. The movements, too, in both are the same in principle with those of the inch or tape loom, a machine which had long been in use. Cartwright, after obtaining his second patent, erected a weaving factory at Doncaster, which he filled with looms. This concern was unsuccessful, and was at last abandoned. But still the invention was considered so important to the country, that some years after, upon an application from a number of manufacturers at Manchester, Parliament granted Cartwright a sum of money as a remuneration for his ingenuity and trouble. About the year 1790, Grimshaw of Manchester, under a licence from Cartwright, erected a weaving factory, which was to have contained 500 looms, for weaving coarse sacking cloth. He intended also to attempt the weaving of fustians. But after a small part of the machinery had been set agoing, the work was destroyed by fire; and as the concern during the short trial that had been made did not promise to be successful, the mill was not rebuilt. Weaving by power, in fact, could never have succeeded but for the discovery, by Mr Radcliffe of Stockport, of a process for dressing the web before it is put into the loom. The stoppage of the work from time to time for dressing the web made it impossible to do more than attend to one loom; but owing to the introduction of this process, one person was soon enabled to attend to two looms, and can now attend even to four.

The contrivances for "dressing" are very ingenious, the machinery employed in it deriving its movement from the power which gives motion to the looms. The yarn is first wound from the cop upon bobbins by a winding machine. These are then taken to the warping mill and made into warps of such number of ends and such lengths as may be required by the manufacturer. The warp is taken to the beaming machine to be wound on to beams, and then to the dressing machine, and passed through strong starch liquid, &c. Where the manufacturer is also a spinner he can dispense with the warping mill, the bobbins being taken at once to the beaming machine. The warp is then compressed between two rollers, to free it from the moisture it had imbibed with the dressing, and drawn over a succession of tin cylinders heated by steam, to dry it. During the whole of this last part of its progress, it is lightly brushed as it moves along, and fanned by rapidly revolving fanners.

Peter Marsland of Stockport, who for many years had a large factory for weaving cotton cloth of a superior quality, was the inventor of an improvement upon the power-loom, by means of the double crank, for which, about the year 1807, he obtained a patent. The operation of the crank is to make the lathe give a quick blow to the cloth on coming in contact with it, and by that means render it more stout and even.

The weaving of calicoes by power did not succeed in Lancashire so early as it did in Scotland. In 1817, the number of power-looms in Lancashire was estimated to be about 2000, of which only about 1000 were said to be then in employment. The cause of this was that the price paid at the time we refer to for weaving by the hand had been forced down to the very lowest degree by the depressed state of trade, and the pressure of an overgrown population bearing upon the means of employment. Wages had fallen below the rate at which the goods could be produced by machinery. This struggle for existence between the two processes terminated, however, as might have been expected. The hand-weavers, finding it impossible to go on with the reduced wages, gradually gave way. Their numbers ceased to increase; and the extraordinary addition to the amount of the manufacture since that time has been the product of the power-loom. Goods of very low and fine qualities are still woven by the hand.

There is a branch of the cotton manufacture yet to be noticed,—a branch not derived from the East, like muslin, but one that has had its origin in England,—namely, the bobbinet or Nottingham lace manufacture, which now furnishes employment for a large amount of labour and capital. See LACE.

Cotton Manufacture in Scotland.

Previous to 1778 there were no pure cotton fabrics woven in Scotland, and the only form in which the fibre was used to any considerable extent was in the manufacture of blunks, a coarse kind of handkerchef having linen warp and cotton weft. The first cotton-mill in Scotland was erected at Penicuik, and the second at Rothesay in 1779. These were succeeded by others at Barrhead, Johnstone, and other localities where a suitable supply of water could be obtained, as, excepting horses and oxen, it was at that period the only power available. The name of David Dale is closely associated with the early progress of cotton spinning and weaving in Scotland. In 1785 Dale began, with Arkwright, who that year had been beaten out of his patent rights by the Lancashire spinners, to erect cotton-mills at New Lanark. These mills were the most extensive of their period; and they at a later time acquired a very wide notoriety by being made the scene—in conjunction with his establishment at Orbiston in the parish of Bothwell—of the attempt of Robert Owen, Dale's son-in-law, to commence the regeneration of society by a practical exemplification of the virtues of socialism. Owen's fidelity to his convictions cost him a princely fortune, and the mills passed in 1827 into the hands of a firm with, perhaps, less lofty but more practical views. By the year 1787 there were nineteen cotton spinning-mills in Scotland.

Although all the great inventions which revolutionized the spinning trade were of English origin, many adaptations which greatly facilitated the working of spinning machinery were devised by the ingenuity of Scotch manufacturers. Cartwright's power-loom was introduced into Glasgow in 1793, by James Lewis Robertson, who, when on a visit to London, had seen it in operation in the hulks. He obtained and brought away two, which he had fitted up in a cellar in Argyle Street, the motive power being a large Newfoundland dog which walked inside a revolving drum or cylinder. In the following year about forty power-looms were fitted up in a factory at Milton, near Dumbarton, for weaving printing-calicoes, and in 1801 John Monteith erected a factory for the accommodation of 200 looms at Pollokshaws. The looms were subsequently adopted in 1805 by Archibald Buchanan for the Catrine Mills; and as the apparatus improved in efficiency its progress became rapid, new power-loom factories being erected almost every year thereafter in Glasgow, till in 1817 there existed fifteen factories containing 2275 looms.

Glasgow and Paisley manufacturers having been from very early times engaged in the linen, cambric, and lawn trade, to which in the latter town in the year 1760 the manufacture of silk gauzes was added, it was natural that on the introduction of cotton spinning the attention of weavers should be directed to the finer and more delicate fabrics into which cotton fibre can be wrought. Muslins, therefore (plain for the most part in Glasgow, and fancy ornamented in Paisley), were among the earliest and principal cotton fabrics produced on the looms of the west of Scotland. About the year 1780 James Monteith, the father of Henry Monteith, the founder of the great print-works at Barrowfield, and of the spinning and weaving mills at Blantyre, warped a muslin web, the first attempted in Scotland; and he set himself resolutely to try to imitate or excel the famous products of Dacca and other Indian muslin-producing centres. As the yarn which could then be produced was not fine enough for his purposes, he procured a quantity of "bird-nest" Indian yarn, "and employed James Dalziel to weave a 6-4th 12^{oo} book with a hand-shuttle, for which he paid him 21d. per ell for weaving. It is worthy of remark that the same kind of web is now wrought at $2\frac{5}{8}$d. per ell. The second web was wove with a fly shuttle, which was the second used in Scotland. The Indian yarn was so difficult to wind that Christian Gray, wife of Robert Dougall, bellman, got 6s. 9d. for winding each pound of it. When the web was finished Mr Monteith ordered a dress of it to be embroidered with gold, which he presented to Her Majesty Queen Charlotte."[1]

Once fairly established, the muslin trade and various other cotton manufactures developed with extraordinary rapidity, and diverged into a great variety of products which were disposed of through equally numerous channels. Among the earliest staples, along with plain book muslins, came mulls, jacconets or nainsooks, and checked and striped muslins. Ginghams and pullicats formed an early and very important trade with the West Indian market, as well as for home consumption. These articles for a long period afforded the chief employment to the hand-loom weavers in the numerous villages around Glasgow and throughout the west of Scotland. The weaving of sprigged or spotted muslins and lappets was subsequently introduced, the latter not having been commenced till 1814. Although the weaving of ordinary grey calico for bleaching or printing purposes has always held and still retains an important place among Glasgow cotton manufactures, it has never been a peculiar feature of the cotton industry; and the very extensive bleaching and print-works of the locality have always been supplied with a proportion of their material from the great cotton manufacturing districts of Lancashire.

[1] Cleland's *Former and Present State of Glasgow*, 1840.

About the end of last century the ornamentation of plain muslins with hand-sewed patterns began to be practised as a domestic industry in the west of Scotland; and by rapid degrees it rose into high reputation, many manufacturers having realized large fortunes from the trade during its palmy days. The trade continued to flourish till the great commercial crash of 1857, which compelled many to retire from it, and others thereafter gradually withdrew, till it dwindled down to its present comparatively humble proportions. When in its zenith it afforded home-employment to large numbers of females not only throughout the west of Scotland, but across the Irish Channel. Elaborate and artistic patterns were prepared for embroidering by specially trained designers; these patterns were printed, from engraved cylinders of wood, on the surface of suitable pieces of muslin, on which also was printed the number of the pattern, the length of time allowed for sewing it, and the price to be paid by the agent or manufacturer on the work being satisfactorily performed.

Thread Manufacture, a branch of trade very intimately related to ordinary textiles, is carried on on a large scale in Glasgow, and is the outstanding feature in the industries of Paisley. From that town there are probably sent out a greater length and weight of sewing thread than from all the other thread factories of Great Britain combined. Within a comparatively recent period, what constituted the staple trade of the town from thirty to forty years ago—shawl weaving—has greatly decreased, whilst the manufacture of cotton thread has considerably extended, principally through the almost universal introduction of sewing machines for dressmaking and other purposes. These machines, by requiring for the most part double threads, and by increasing the sewed work while lessening the cost of dressmaking, have very greatly increased the demand for thread.

The process of thread-making is so well known that few words are required to describe it. It is chiefly carried on by twisters, who purchase the yarn needed from cotton-spinners. To spin from the raw cotton, and twist yarn into thread, in the same factory, would require premises of much greater extent than any hitherto employed; or the spinning and twisting would need to be confined to a small range of numbers. The manufacture of sewing cotton is, therefore, generally understood as confined to the twining or doubling of yarn previously obtained from the spinner. When the yarn is received it is tested by being reeled from the cops, and having a certain length of hank weighed. This is called sizing. The next process is cop-winding—that is, winding it from the cop on bobbins—two or three ply as required. These bobbins are taken to the twisting frame and twisted first two ply, then this is doubled or tripled for four or six cord as required. Each number of yarn has its own twist, that is, the number of turns it gets per inch. When finished the thread is taken from the twisting frames, and according to the size so much of it is wound upon a large bobbin, from which it is reeled into hanks for bleaching or dyeing. After bleaching it is given out in bundles to the hank-winder, who winds it on a large bobbin, and that in its turn is handed to the spooler, who fills the bobbin with a certain length of thread—say 100, 200, or 300 yards, and upwards. The largest portion of thread made is sold on spools, which contain a great variety of lengths. After spooling the bobbins are labelled on each end; they are then arranged in dozens and grosses, papered and stringed, and finished for the market. The qualities principally used are 3, 4, and 6 cord—the greatest portion of the sewing-machine thread being 6-cord. A large quantity of thread is now polished, and is known in the trade as *glacé*. Of late there has been an increasing demand for crotchet thread, the manufacture of which is somewhat similar to the process for ordinary sewing cotton.

The spools are made of birch or ash—preferably the former—and the wood is obtained chiefly from the Highlands of Scotland. Finished spools are made in large quantities by wood turners in various localities, particularly in the Lake districts in the north of England, and find their way to those thread manufacturers who are unable to turn the whole of the spools they require. The birch, to be in proper condition, is cut when the sap is out of it, and partially rinded at once to prevent souring. After remaining in stock till perfectly dry it is sawn up into cross sections, from which are blocked out the various diameters of spools wanted. The blocking machines now in use over the whole country were invented at Ferguslie Works, Paisley (Messrs J. & P. Coats), and by their employment a great saving in both wood and labour is effected. These blocks are placed on the self-acting lathe, which turns them out finished spools with great rapidity.

Statistics of Scotch Cotton Trade.—In the year 1787 there were only nineteen cotton mills in the whole of Scotland, of which Lanarkshire and Renfrewshire each possessed four. In the report of Leonard Horner as one of the Factory Commissioners, dated 1834, it is stated that "in Scotland there are 134 cotton mills; with the exception of some large establishments at Aberdeen and one at Stanley near Perth, the cotton manufacture is almost confined to Glasgow and the country immediately adjoining, to a distance of about 25 miles radius; and all these cotton mills, even including the great house at Stanley, are connected with Glasgow houses or the Glasgow trade. In Lanarkshire, in which Glasgow is situated, there are 74 cotton factories; in Renfrewshire, 41; Dumbartonshire, 4; Buteshire, 2; Argyleshire, 1; Perthshire, 1. In these six counties there are 123 cotton mills, nearly 100 of which belong to Glasgow. . . . . In Lanarkshire there are 74 cotton mills, 2 woollen and 2 silk factories; 78 steam-engines and 5 water wheels; total horse-power, 2914, of which steam 2394, water 520. Total persons employed in factories, 17,969." In 1838, according to the report on hand-loom weavers by Mr Symons, there were more than 37,000 hand-looms in the west of Scotland directly connected with cotton weaving. According to a Parliamentary return the cotton industries of Lanark, Ayr, and Renfrew in 1850 were distributed in 146 factories, of which 94 were in Lanark, 51 in Renfrew, and 4 in Ayr. These establishments had jointly 1,410,054 spindles and 21,575 power-looms, the whole of which gave occupation to 31,710 persons. In 1861 the same counties possessed 143 factories, with an aggregate of 1,577,584 spindles and 28,085 power-looms, in all employing 36,903 hands. In the year 1875 the three counties possessed 84 cotton factories, in which there were 1,526,980 spinning and doubling spindles and 27,489 power-looms, the whole cotton industry giving occupation to 33,276 individuals. The total number of factories in Scotland in the same year was 96, containing 1,711,214 spindles and 29,171 power-looms, giving employment in all to 35,652 persons, of whom nearly 30,000 were females above thirteen years of age.

It may be gathered from this table that the Glasgow district has still a practical monopoly of the Scotch cotton trade, not more than 10 per cent. of the work being distributed among counties other than the three above named. On the other hand Scotland, taken altogether, does not employ in cotton factories more than one-thirteenth part of the number of operatives in the enormous cotton industries of England, while Scotch spindles are only as one to twenty-five of the English, and power-looms are as one to about fourteen.

In some of the Glasgow establishments the only fabrics manufactured are printers' cloths, grey calicoes, jacconets, and fancy textures, which are subsequently prepared for the market by calico-printing. In the case of others exclusive attention is bestowed on the weaving of coloured goods, such as ginghams, Oxford and other fancy shirtings, dress stripes, &c., and several devote their attention peculiarly to the weaving of muslins and similar delicate fabrics.

Cotton Manufacture in Ireland.

Little notice has been taken of the cotton manufacture in Ireland, the great seat of the once rival flax manufacture; but it may be observed that cotton has not furnished any considerable employment for capital and labour in that island. Some attempts to introduce the manufacture of cotton goods in Ireland were made as early as 1770, but the manufacture continued on a very limited scale until the year 1790. After this period the progress was more considerable, although out of all comparison with what took place during the same time in Great Britain; indeed, its products have never been such as to enter into competition with those of England.

The chief seat of this manufacture in Ireland is Belfast, and the district of country situated within twenty miles of that town. But a good many calicoes, fustians, and cotton checks are made in Dublin, Balbriggan, Bandon, and Cork. All these goods are consigned to factors in Dublin for sale, except a part of the calicoes, which the manufacturers sometimes dispose of to printers on the spot.

The cotton trade of Ireland is, as already indicated, at the present day of limited extent, embracing only 8 factories, and giving employment to about 3000 persons.

Statistics of Progress of the Cotton Manufacture.

The enormous increase which has taken place in the production and consumption of cotton, as shown in the accompanying tables, implies a corresponding increase in the manufacture and consumption of yarn and cloth. It would be difficult to find any trade which has exhibited so rapid a development, or which has attained such vast proportions, as the British cotton manufacture. It has for three quarters of a century gone on extending from year to year, working up all the cotton which the world could supply, and producing goods in enormous quantities, which have found their way into every part of the globe. At the beginning of the century less than a *hundred thousand* bales of cotton were sufficient for the requirements of Great Britain, and now about *three and a half millions* of bales are required. The quantity of yarn and piece goods produced for home and foreign consumption amounted in 1863 to 404,979,000 ℔ in weight, and in value to £59,795,000; but in 1875, a year of great stagnation in the cotton trade, the production had reached 1,088,890,000 ℔ in weight, and £95,447,000 in value. Notwithstanding protracted periods of depression, and increased competition on the part of other nations, England at the present time employs more spindles than all the rest of the world combined.

Tables IV. and V. subjoined show the quantities of yarn produced, and the principal markets to which yarn and goods are consigned for the years stated. From Table VI. (page 504) it appears that the value of the production of the cotton manufacture of Great Britain in 1875 exceeded £95,000,000 sterling, of which upwards of £77,000,000 was the value of goods and yarn made for exportation. Table VII. (page 505) presents a synoptical view of the cotton industry of Great Britain.

In the year 1812, when Crompton applied to Parliament for a remuneration for his invention, he found by as accurate an investigation as he could make that the number of mule spindles in the country was between four and five millions; and Kennedy, in his memoir of Crompton, has stated that the number in 1829 had increased to seven millions. In 1817, he estimated the number of persons employed in the spinning of cotton in Great Britain at 110,763, and the number of spindles in motion at 6,645,833, and the quantity of yarn produced at 99,687,500 ℔. The quantity of cotton yarn spun in 1832 was 222,000,000 ℔, of which 132,000,000 ℔ was manufactured into cloth, giving employment to 203,373 looms; but in 1853 the yarn spun was 685,440,000.

A tolerably accurate estimate of the capital now invested in the cotton trade and of the persons dependent upon its

TABLE IV.—*The quantities of Cotton Yarn spun, and the quantities exported and worked up at home, from* 1819 *to* 1876.

prosperity may be formed from the following particulars taken from the reports of the factory inspectors. In 1871 the cost of the buildings and machinery employed in the trade was £57,000,000, whilst the floating capital was not less than £30,000,000, making together at least £87,000,000, sterling. From a Parliamentary return issued in August 1875, it appears that in that year there were in the United Kingdom 2655 factories employed in spinning, weaving, and other industries connected with the manufacture of cotton. Of that number 2542 were in England and Wales, 105 in Scotland, and only 8 in Ireland. These factories contained 71,166 carding machines, 2901 combing machines, 37,515,772 spinning spindles, 4,366,017 doubling spindles, and 463,118 power looms. The total number of persons employed was 479,515,—of these 440,336 being in England, 36,104 in Scotland, and 3075 in Ireland. Of the total number 115,391 were adult males, 258,667 were females above thirteen years of age, 38,557 were males between thirteen and eighteen, and the remainder were half-time boys and girls in about equal numbers. Probably the number of persons directly or indirectly dependent on the cotton trade in the United Kingdom is not much under two millions.

As successive mechanical inventions came to be applied to the manufacture, they changed the principle of production, and made what had been nearly wholly a product of labour become almost entirely a product of capital. Important results flowed from this change. It enabled Great Britain, the principal holder of these machines, to become the furnisher of a commodity which up to that time had been brought at a great expense from India. It further enabled her to reduce its cost, and render what till then had been accessible only to the rich, and of limited sale, an article of general wear. During the long struggle which took place between machinery and hand labour, this country continued to be the nearly exclusive possessor of the machines by which the reduction of cost was effected. Having in consequence, in a great measure, a monopoly of the supply, she was enabled to reap that harvest of prosperity which so unusual a combination of circumstances was

TABLE VII.—*A Comparative Statement of the Quantities of Yarns and Piece Goods, and the Aggregate Value of these and other Cotton Products Exported to the various Countries of the World, with the Population of each Country, and the value of British Cotton Products Consumed by each per Head, in the Years* 1851, 1861, 1871.

calculated to produce; an improvement in the condition of every class of the community followed the advance of the manufacture.

To preserve the pre-eminence gained by this great branch of British industry against all the competitors which it has had to encounter, has tasked to the utmost the inventive genius and energies of all connected with it. The rival manufacturers in India, Europe, and America have put forth all their resources to impair or destroy the supremacy which England has established in the markets of the world. In almost all cases, not even excluding our own colonies and dependencies, these rivals, in addition to any natural advantages which they might possess, have been aided by the establishment of high protective tariffs.

Fears have often been expressed that the lower wages for which the labourers of some other countries can work, may ultimately enable them to take the manufacture out of our hands. In reply to this, it may perhaps be sufficient to recall to our readers the small part of the cost of the commodity which now belongs to the labour of the hand, and the daily diminution which is taking place even of that part, by the introduction of new mechanical substitutes. Thus, for example, in 1767 each spindle required a person to work it; but now one man, with the aid of two piecers to take up and join his broken ends, can work two thousand spindles. In speaking on this subject in 1874 Mr Hugh Mason, then president of the Manchester Chamber of Commerce, endeavoured to reassure some of his timid colleagues by such facts as these, viz., that in 1850 the export from this country of cotton cloth had attained for the first time the amount of 1,000,000,000 yards; that in 1860 the exports for the first time had reached 2,000,000,000 yards; and that in the year 1870 the export of manufactured cotton goods from this country had amounted for the first time to 3,000,000,000 yards. Although foreign competitors are able in common with ourselves to buy the best machinery that can be made, and have free and cheap imports of the raw material, in addition to any special advantages as to cheaper labour and longer hours or otherwise which they may possess, and although great advances have taken place in the wages of the operatives employed in our factories, while there has been great diminution in the hours of labour during these two decades, and these are now still further reduced, we have still almost undisputed possession of the home trade, and our foreign trade has at the same time increased from 1,000,000,000 yards to 3,000,000,000 yards of our manufactured cotton cloth. The quantity of cotton piece goods exported from the United Kingdom in 1876 exceeds that ever exported before in any one year, and amounts to 3,668,582,100 yards, an average of more than 10,000,000 yards a day.

The following table presents a summary of the cotton industry of Great Britain for the year 1876:—

TABLE VIII.—*Details of Cotton Industry.*

Number of factories	2,655
Number of spindles (including doubling)	41,881,789
Number of power looms	463,118
Number of persons employed	479,515
Estimated capital invested	£90,000,000
Quantity of cotton consumed (in bales of 400 lbs. each)	3,185,942
Cost of cotton consumed	£32,855,000
Quantity of yarn produced	1,131,056,000 ℔
Quantity of cloth manufactured	898 906,000 ℔
Quantity of yarn and goods made for home consumption	163,906,000 ℔
Quantity of yarn and piece goods exported	967,150,000 ℔
Annual value of home consumption of yarns and cloth	£17,777,000
Annual value of exports of yarn and cloth	£72,079,000
Total annual value of cotton manufactures	£89,856,000

The rapid growth and enormous extent of the cotton industry, the numerous vicissitudes through which it has passed, the elasticity which it has shown in periods of deep depression, and the vitality and latent power which, notwithstanding all past development and progress, it still possesses, may well excite astonishment and admiration. It is a proud memorial of the genius, and energy, and enterprise of the men who have conducted it from its small beginnings to its present gigantic proportions. Whilst at home the consumption of cotton goods has been steadily increasing, the export trade with all its fluctuations remains more than double that in any other article of commerce. The free-trade policy of Britain promotes an interchange of commodities with all other countries. We are as ready to purchase what they can offer as we are to sell them our goods, and even in the same branch of manufacture there are often shades of difference in the fabrics produced, upon which taste, or fashion, or caprice has fixed an arbitrary value, which may make the exchange of goods by rivals mutually beneficial. This example and influence are beginning to lead other countries to perceive and understand that isolation and rigid protection can confer but little real benefit even upon themselves, and must eventually injure those who thus stand aloof from the commercial comity of nations.

Cotton Industry on the Continent.

The progress and present state of the cotton industry on the continent of Europe have been carefully ascertained by Messrs Ellison & Co., from their own special correspondents in all the manufacturing centres. The statistics furnished by them, in their review of the cotton trade for the season 1875–76, are as follows:—

Russia and Poland.—Spindles in Russia, 2,300,000; in Poland, 200,000; total, 2,500,000. Average consumption of cotton 60 ℔ per spindle per annum.

Sweden and Norway.—Spindles in Sweden, 245,000; in Norway, 60,000; total, 305,000. Average consumption of cotton 65 ℔ per spindle per annum.

Germany.—The estimates vary, but the following is the nearest approximation attainable:—

	Spindles.
Alsace	1,650,000
Bavaria	875,000
Prussia	700,000
Saxony	500,000
Baden	350,000
Würtemberg	315,000
Hanover. Oldenburg, &c.	260,000
Total	4,650,000

Some estimates exceed this, and make the total 5,000,000 or 5,200,000. Average consumption of cotton for all Germany about 55 ℔ per spindle per annum.

Austria.—Spindles in Austria, 1,555,000, including 740,000 in Bohemia, and 500,000 in the Vienna district. Average rate of consumption of cotton 67 ℔ per spindle per annum.

Switzerland.—According to a recent Government estimate, made in view of negotiations for a new treaty of commerce, the number of spindles is 1,854,091. Average consumption of cotton, used chiefly for the production of fine goods, about 25 ℔ per spindle per annum.

Holland.—The estimated number of spindles is 230,000. Average consumption of cotton about 60 ℔ per spindle per annum.

Belgium.—Estimated spindles, 800,000. Average consumption of cotton about 50 ℔ per spindle per annum.

France.—The total number of spindles is about 5,000,000, and the average consumption of cotton 42 ℔ per spindle per annum.

Spain.—Estimated number of spindles, 1,750,000. Average consumption of cotton about 46 ℔ per spindle per annum.

Italy.—The total number of spindles is about 800,000. The consumption of cotton averages 56 ℔ per spindle per annum.

The total number of spindles at work in the various manufacturing countries of Europe is 19,440,000, to which must be added 9,500,000 in the United States, and 39,000,000 in Great Britain, making a total of 67,940,000, requiring not less than 7,000,000 bales of cotton of 400 ℔ each, or at least 2,800,000,000 ℔, to keep them in operation.

Cotton Manufacture in the United States.

The Government of the United States at an early period evinced great anxiety to promote the establishment of the cotton manufacture in the northern part of the Union. In tracing the rise of the American cotton manufacture, we shall refer chiefly to the public documents, in which its growth is studiously detailed, and the difficulties it has had to struggle with are anxiously dwelt upon.

Before the year 1791, America possessed no manufacture except for domestic production and family use. But it appears from a report of the secretary to the American treasury, drawn up in 1810, that a cotton-mill was erected in the State of Rhode Island in that year; that another mill was erected in the same State in 1795, and two more in the State of Massachusetts in 1803 and 1804; that during the three succeeding years ten more were erected in Rhode Island, and one in Connecticut, making together fifteen mills, working about 8000 spindles, and producing about 300,000 pounds of yarn in the year; that by a return which was made at the date of the report, eighty-seven additional mills had been erected by the end of the year 1809, which with others soon to be in operation, would, it was estimated, work more than 80,000 spindles at the commencement of 1811. The capital required to carry on the manufacture was believed to be at the rate of sixty dollars per spindle, each producing annually from forty-five pounds of cotton about thirty-six pounds of yarn, of the average worth of one dollar twelve and a half cents per pound. Eight hundred spindles employed forty persons, viz., five men and thirty-five women and children.

We learn the farther progress of this manufacture from a report of the House of Representatives, presented in the spring session of 1816. The report states that the quantity of cotton manufactured in the year 1815 was 90,000 bales, a quantity nearly equal to that used in the cotton manufacture of France; and that the quantity used in 1810 was 10,000 bales; in 1805, 1000 bales; and in 1800, 500 bales; and gives the following statement of the condition of the cotton industry in the United States:—

Capital employed	40,000,000 dollars.
Males employed from the age of seventeen and upwards	10,000
Women and female children	66,000
Boys under seventeen years of age	24,000
Cotton manufactured, 90,000 bales	27,000,000 lb
Cotton cloth of various kinds manufactured	81,000,000 yards.
Cost	24,000,000 dollars.

At the date of this report the duty upon cotton goods imported into the United States was 15 per cent; but before charging it, 10 per cent. was added to the invoice, and the duty thus raised to $16\frac{1}{2}$ per cent. Upon the recommendation of the committee, 10 per cent. more was imposed; and the whole being charged upon £110 for every £100 of net value brought it up to $27\frac{1}{2}$ per cent. Besides this, it was ordered that all cotton goods below $13\frac{1}{2}$d. per yard should be rated at $13\frac{1}{2}$d., and the difference added to the amount of the invoice before calculating the duty.

New tariff Acts were successively passed in 1824, 1828, 1832, and 1854, in each of which the duty upon cotton goods imported was declared to be 25 per cent. *ad valorem*, the coarser fabrics being rated as in 1816.

The manufacture, under this protection against foreign competition, rapidly increased. Power-loom works were erected; the most approved processes both in spinning and weaving were adopted; and the business was generally successful. The manufacture is no longer confined to the States of New York and Rhode Island, and the New England States, though in these it has been greatly extended. In other Northern States, such as New Jersey, Pennsylvania, Delaware, Maryland, Ohio, and Indiana new mills have been erected; whilst in the Southern States, especially in Alabama, Georgia, North and South Carolina, Mississippi, Virginia, &c., the manufacture as well as the growth of cotton has become an important industry. The following statement (Table IX.) shows the progress already made:—

	Number of Mills.	Number of Spindles.	Average size of Yarn.	Average consumption of Cotton per Spindle.	Quantity of Cotton used.	Quantity of Cotton used.

increase, until the anticipated condition has at length been reached when the product exceeds the demand for the home consumption. As the surplus could not be disposed of in foreign markets, the manufacturers have had to experience similar distress to that which befell the cotton manufacturers of France in the years from 1827 to 1832. Owing, however, to the different circumstances of the two countries, this state of things in America may be expected to be of a more temporary character. The depression existing in the cotton industry since the crisis of 1873, has excited the desire for a wider field for American enterprize, a successful competition with other countries in the markets of the world. But all aspirations of this kind must be doomed to disappointment so long as the protectionist policy of the States is upheld—the very means which they adopt to shut out all other manufactures from their markets must have the effect of shutting out their own from the markets of the world—they cannot sell freely to other nations from which they refuse to buy. Although, therefore, much is from time to time spoken and written by alarmists of the danger to be apprehended by the cotton-manufacturing interests of England from American competition, we believe the fears entertained to be without any real foundation. The addition of 50 per cent., more or less, made by the tariff to the cost of English-made goods would be unnecessary to prevent competition, if the American manufacturer could produce those goods as cheaply as his foreign rival. If America be thought to possess any superiority over England in the greater facility and cheapness with which the raw material can be provided—and even this may be doubtful—such advantage is more than counterbalanced in other respects, and especially as regards labour. Wages in the States have been gradually declining, and are probably now 20 per cent. lower than in 1869, but they are still about 40 per cent. higher than in 1860. The following is a statement of the weekly wages in cotton mills:—

Overseer,—	carding	\$21·00
Picker tende	,,	6·74
Grinders,	,,	8·28
Strippers,	,,	6·84
Overseer,—	spinning	21·00
Mule spinners,	,,	9·12
Mule backside piecers,	,,	2·40
Frame spinners,	,,	4·62
Overseer,—	dressing	21·00
Second hand,	,,	11·88
Spoolers,	,,	5·94
Warpers,	,,	5·70
Drawers and twisters,	,,	5·52
Dressers,	,,	10·92
Overseer,	weaving	21·00
Weavers,	,,	5·61

The hours of labour are from 60 to 66 per week.

The following is about the present rate of wages paid in English cotton mills:—

Carder	32s. to 40s.	per week
Under-carder	27s. ,, 32s.	,,
Grinders	25s. ,, 28s.	,,
Card tenters	14s. ,, 16s.	,,
Drawing tenters	16s. ,, 18s.	,,
Slubbing tenters	16s. ,, 18s.	,,
Intermediate tenters	16s. ,, 18s.	,,
Roving tenters	16s. ,, 18s.	,,
Back tenters	9s. ,, 10s.	,,
Spinning.		
Mule overlookers	35s. to 40s.	,,
Throstle ,,	30s. ,, 35s.	,,
Self-actor minders	32s. ,, 40s.	,,
,, piecers	14s. ,, 17s.	,,
Throstle spinners	12s. ,, 14s.	,,
,, doffers	9s. ,, 11s.	,,
Half-timers	4s. 6d.	,,
Doublers	14s. to 18s.	,,
Weaving.		
Beamers	15s. ,, 20s.	,,
Drawer in	24s.	,,
Weavers	15s. ,, 20s.	,,
Reelers	15s. ,, 20s.	,,
Engineer	35s. ,, 40s.	,,

The hours of labour ($52\frac{1}{2}$ per week) are shorter than those in America. If the artificial barriers which are at present kept up to exclude English manufactures from the United States were thrown down, they would probably even there be able to maintain a successful competition, whilst as regards all neutral markets, where they can meet on equal terms, English manufacturers need never be afraid of the issue. Past progress and success furnish the means and the motive for further exertions, both to extend their manufactures and to open out new channels of trade. (I. W.)

COTTON, CHARLES (1630–1687), an English translator, poet, and wit, was born at Beresford in Staffordshire. He was educated at Trinity College, Cambridge, and afterwards spent some time on the Continent. At the age of twenty-eight he succeeded to an estate greatly encumbered through his father's extravagance, and the rest of his life was that of a country gentleman. He gained the friendship of Izaak Walton, whose fishing expeditions to the Dove he was privileged to accompany; and to the *Complete Angler* he added *Instructions how to angle for a Trout or Grayling in a Clear Stream.* His second wife, the countess of Ardglass, had a jointure of £1500 a year, but it was secured from his extravagance, and at his death in 1687 he was insolvent. Cotton is the author of a good deal of verse, much of which is jocular. Though his love songs are frequently quaint and frigid, they are sometimes exceedingly gay and spirited, as are also most of his bacchic verses.

His chief works are—Translations of the *Horace* of Corneille, the *Life of the Duke d'Espernon*, and the *Fair One of Tunis*, and above all his famous and often published translation of Montaigne (1683, 1869, &c.); the *Scarronides, or Virgil Travestie*, a coarse parody of the first and fourth books of the *Æneid*, which ran through fifteen editions; a humorous poem, the *Voyage to Ireland;* and a serious poem of small merit, the *Wonders of the Peak.*

COTTON, GEORGE EDWARD LYNCH (1813–1866), head-master of Marlborough School and bishop of Calcutta, metropolitan in India and Ceylon, was born at Chester, October 29, 1813. He was the son of an officer who was killed at the battle of the Nivelle, a fortnight after his son's birth, and grandson of Dr Cotton, formerly dean of Chester. He received his education at Westminster School, whence he passed in 1832 to Trinity College, Cambridge. Here he became an adherent of the Low Church party, and at the same time the intimate friend of several disciples of Dr Arnold, among whom were Dr Vaughan of Harrow, W. J. Conybeare, and Dr Howson. The influence of Arnold was powerful enough to determine the character and course of his whole life. He graduated B.A. in 1836, and was forthwith appointed by Dr Arnold to an assistant-mastership at Rugby. Here he worked steadily and devotedly for fifteen years, inspired with the spirit and heartily entering into the plans and methods of his beloved master. He became master of the fifth form about 1840. He made himself the sympathizing companion and friend of his pupils; and by the force of his character and the geniality of his disposition gained their unbounded esteem and love. In 1852 he accepted the appointment of head-master of Marlborough College, which was then in a state of serious financial embarrassment and of almost hopeless disorganization; but, giving himself to the task of reforming it with all his heart, in his 'six years' of rule he rescued it from impending dissolution and raised it to a high position. In 1858 Cotton was offered the see of Calcutta, vacant by the death of Dr Daniel Wilson; and this high post, after much hesitation about quitting Marlborough, he accepted. For its peculiar duties and responsibilities he was remarkably fitted by the simplicity and solidity of his character, by his large tolerance, by his capacity of sympathy with other men, and by the experience which he had gained as teacher and ruler at Rugby and Marlborough. It was natural that the cause of education should especially engage his attention in his new sphere; and through his zealous endeavours a large number of schools were established, the working of which must be among the most beneficent influences of English rule in India. Bishop Cotton endeared himself to men of all parties, and his sudden death was mourned as a loss throughout his vast diocese. On his return journey from a visitation tour in the autumn of 1866, he slipped while passing in the twilight, October 6, along the plank from his barge towards the shore at Kooshtea, on the Ganges, and was drowned. The body was borne away by the current and never seen again. A memoir of his life, with selections from his journals and correspondence, edited by his widow, was published in 1870.

COTTON, Sir Robert Bruce (1570–1631), the founder of the Cottonian Library, born at Denton in Huntingdonshire in 1570, was a descendant, as he delighted to boast, of Robert Bruce. He was educated at Trinity College, Cambridge, where he took his B.A. degree at the age of fifteen. His antiquarian tastes were early displayed in the collection of ancient records, charters, and other manuscripts, which had been dispersed from the monastic libraries in the reign of Henry VIII.; and throughout the whole of his life he was earnestly engaged in gathering materials for his library and museum of antiquities from all parts of England and the Continent. Perhaps his first pamphlet is that maintaining the right of the English ambassador to precedence over the envoy of Spain, which was written at the request of Elizabeth. On the accession of James I. he was knighted, and soon after he was employed in drawing up a *Memorial on Abuses in the Navy*, in consequence of which a navy commission was appointed, of which he was made a member. He also presented to the king an historical *Inquiry into the Crown Revenues*, in which he speaks freely about the expenses of the royal household, and asserts that tonnage and poundage are only to be levied in war time, and to "proceed out of good will, not of duty." In this paper he proposed the creation of the order of baronets, each of whom was to pay the Crown £1000; and in 1611 he himself received the title. In 1615 Cotton, as the intimate of the earl of Somerset, whose innocence he always maintained, was placed in confinement on the charge of being implicated in the murder of Overbury; nor did he obtain his release till he had paid £500 for a pardon. Shortly before he had been examined before a royal commission, being suspected of having made known to Gondomar, the Spanish ambassador, the intentions of the English court. The charge is supported by the despatches of Gondomar to Madrid, though probably Cotton deserves no serious blame. From Charles I. and Buckingham Cotton received no favour; he was the intimate friend of Sir John Eliot, Sir Symonds d' Ewes, and John Selden. In 1626 he gave advice before the council against debasing the standard; and in January 1628 he was again before the council, urging in courtly language the summons of a Parliament. His arguments on the latter occasion are contained in his tract entitled *The Danger in which the Kingdom now standeth and the Remedy.* In October of the next year he was arrested, together with the earls of Bedford, Somerset, and Clare, for having circulated a tract known as the *Proposition to bridle Parliament*, which had been addressed some fifteen years before by Sir Robert Dudley to James I., advising him to govern by force; the circulation of this by Parliamentarians was regarded as intended to insinuate that Charles's government was arbitrary and unconstitutional. Cotton was himself released the next month; but the proceedings in the Star Chamber continued, and, to his intense vexation, his library was sealed up by the king. The pain caused by a base attempt to extort money by attacking his character further weakened his already failing health; and on the 6th of May 1631 he died. He was buried in Conington Church, where a monument is erected to his memory. His son, Sir Thomas, added considerably to the Cottonian library; and Sir John, the fourth baronet, presented it to the nation in 1700. In 1731 the collection, which had in the interval been removed to the Strand, and thence to Ashburnham House, was seriously damaged by fire. In 1757 it was transferred to the British Museum.

See the article Libraries, and Edwards's *Lives of the Founders of the British Museum*, vol. i. Several of Cotton's papers have been printed under the title *Cottoni Posthuma;* others have been published by Thomas Hearne.

COTYS, a name common to several kings of Thrace. Of these the most important began to reign in 382 B.C. He was notorious both for cruelty and for drunkenness. Almost the whole of the information we possess of his reign is connected with his quarrels with the Athenians. The first of these was for the Thracian Cheronese, in which Cotys was assisted by the Athenian Iphicrates, to whom he had given his daughter in marriage. On the revolt of Ariobarzanes from Persia, Cotys opposed him and his ally, the Athenians. In 358 he was murdered by the sons of a man whom he had wronged, and the Athenians rewarded his assassins with golden crowns.

COULOMB, Charles Augustin (1736–1806), a distinguished French natural philosopher, was born at Angoulême, June 14, 1736), and belonged to a noble family of Montpellier. He chose the profession of military engineer, spent three years, to the decided injury of his health, at Fort Bourbon, Martinique, and was employed on his return at Aix, Rochelle, and Cherbourg. He gained great distinction in 1773 by his *Statical Problems Applied to Architecture*, which he presented to the Academy of Sciences in 1779; he shared with Van Swinden the prize for improvements in the construction of compasses, and two years later he obtained the prize of the Academy by his *Theory of Simple Machines, comprehending the Effects of Friction and the Stiffness of Ropes.* In 1781 he was stationed permanently at Paris. There being a proposal for the construction of a system of canals in Brittany, Coulomb was sent as royal commissioner to the estates of that province. He expressed decided disapproval of the scheme, and his opinion caused him to be thrown into prison. He remained firm, however, and refused to give any other verdict, and at length he succeeded in convincing the estates, who showed their appreciation of his candour by making him handsome offers, and presenting him with a seconds watch, adapted for scientific experiments. Coulomb was also appointed intendant-general of waters and fountains, chevalier of St Louis, member of the legion of honour, and member of the Academy of Sciences. On the outbreak of the revolution he gave up his offices, and retired from Paris to a small estate which he possessed at Blois. He was recalled to Paris for a time in order to take part in the new determination of weights and measures, which had been decreed by the Revolutionary Government. Of the National Institute he was one of the first members; and he was appointed inspector of public instruction in 1802. But his health was already very feeble, and four years later he died of slow fever. His fame rests chiefly on his most elaborate and important investigations in electricity and magnetism, and on his invention of the torsion balance.

Coulomb's chief works, besides those already mentioned, are—*Methods of executing without Water all Kinds of Hydraulic Works; Observations on the Daily Labour of Men; On Heat; Experiments on the Circulation of Sap; On the Cohesion of Fluids, and their Resistance to Slow Motions; Theoretical and Experimental Researches on the Force of Torsion;* and several treatises on electricity and magnetism.

COUNCIL. Early in its history the Christian church gave outward expression to a sense of the mutual dependence of its members by summoning Councils, or Synods, where on common ground the spokesmen of the Christian community sought, with zeal and acumen, but often not without passion, prejudice, and diplomacy all too human, to discover the mind of the Spirit. There prevailing practices were approved or reprehended, and the dim persuasions of the few or the many were sharpened into dogmatic statement binding on all. On the great movements of Christian thought, much has ever been reserved for individuals to accomplish, the collective church gradually and unofficially recognizing the indefeasible power of some one spiritual or ecclesiastical genius; but the councils have deeply left their mark on the doctrine and on the constitution of the church. The minor synods, forming a well-balanced system of regularly recurring assemblies, served as an important organ for the administration of ecclesiastical business; and the greater councils, summoned to meet pressing emergencies, often proved turning-points in the church's history. At them the pulse of the visible church beat high. The councils have not inaptly been called "the pitched battles of church history;" but while they have at times caused the forces of the heretics to draw more closely together, and have more than once precipitated schism, or rendered it more determined and persistent, it is not the less true that the synods of the church universal have been her great legislative assemblies, when discussion and decision, more or less full and deliberate, have restored into one channel the main stream of ecclesiastical life, and have brought home, alike to those within and to those without the pale, a sense of the church's corporate oneness.

It is characteristic of the church of Christ that it was left free to mould its constitution according to its circumstances. The founders of Christianity left no detailed constitutional code. And as in other regards, so it was here; neither Christ nor the apostles prescribed a synodal system for the infant church, or enacted when and where councils should assemble, how they should be constituted, and what they should determine. Much zealous labour has been spent in proving that the councils, even as a developed organization, are a divine institution,—a difficult task certainly, if it be necessary to agree that what is human is therefore not divine, but accidental and "invented." The most various Christian parties have with one consent sought the prototype of all Christian councils in that assembled at Jerusalem under the apostles; and from its scanty record in Acts xv. (the other apostolic assemblies reported in Acts i., vi., xxi., being passed by as irrelevant) the advocates of the most divergent systems have extracted precise rules for the convening and the guidance of ecclesiastical assemblies. But even if we fully accept the historical accuracy of the report, it is impossible to decide with certainty the relation of the apostles to the "presbyters," and of both to the "brethren;" and the decree embodying the decision of the Jerusalem Council contains rather a practical compromise, the arrangement of a *modus vivendi* in the spirit of peace and mutual forbearance, than a final settlement on grounds of principle of the grave and long-lasting problem as to what should be the relations between the new Christian church and the old Jewish law. It points to temporary concession, not to the formulation of a permanent creed.

It is not till after the middle of the 2d century that we find the example of Jerusalem followed, and councils called to solve questions that threatened the unity and well-being of the Christian church and community. The earliest councils historically attested are those convened in Asia Minor against the Montanists; though it is by no means unlikely that at a much earlier period the Christian Greeks gave scope, in ecclesiastical affairs, to their instinct for organization, for taking common action in regard to matters affecting the public good. Near the end of the 2d century again, varying views as to the celebration of Easter led to councils in Palestine, at Rome, in Pontus, Gaul, Mesopotamia, and at Ephesus. These councils were all specially called to consider particular questions. But before the middle of the 3d century, it seems that in Asia Minor at least the councils or synods had become a standing institution, and met yearly. About the same time we find councils in the Latin Church of North Africa. Before the end of this century there were councils meeting regularly in almost every province in Christendom, from Spain and Gaul to Arabia and Mesopotamia; and by extension and further organization, there was soon formed a system of mutually correspondent synods that gave to the church the aspect of a federative republic.

The developing episcopal system suggested plainly enough a gradation of rank and functions for the various synods. A synod composed of all the clergy under one bishop, with their bishop as president, stood at the bottom of the scale, and is commonly named the *diocesan* synod. The *metropolitan* synod, or *provincial* council, met under the presidency of the metropolitan, and included all the bishops of his ecclesiastical province. Such metropolitan synods the Council of Nicæa recommended to be held twice a year. When all the bishops of a patriarchate met under the patriarch, or all those of a nation under its primate or first metropolitan, the council was *patriarchal* or *national* or *primatial* (not infrequently termed *concilium generale* or *plenarium*). Occasionally the bishops of adjoining provinces met, the senior metropolitan presiding, for the consideration of matters common to a district of wider area than the one ecclesiastical province. The σύνοδοι ἐνδημοῦσαι held at Constantinople by the metropolitan, who invited as many bishops to meet him as chanced to be then in the city, though not irregular, corresponded to no territorial division of the church. *Concilia mixta*, held chiefly during the Middle Ages in Germany, England, Spain, and Italy, were constituted not less of temporal than of spiritual princes, and resolved questions not solely ecclesiastical. *General* synod was usually the name for an assembly of the bishops from all portions either of the Western or of the Oriental division of the church. Such a synod was that of Arles, whither, in 314 A.D., Constantine summoned the bishops of the Western Church. But the minor councils were soon overshadowed by the *œcumenical* councils, at which the whole of Christendom was held to be represented, and which by universal agreement came ultimately to be regarded as having authority for the whole church.

At the diocesan synods, presbyters were members as well as the bishop, but they had only a *votum consultativum*. The regular members of the higher synods were the bishops alone or their representatives, and exercised the *votum decisivum*. But other clergy, deacons, doctors of theology and of canon law, and abbots, were invited to assist the bishops with their advice, and it seems that sometimes at least the abbots were permitted to give a decisive vote. Laics, especially emperors, kings, and their commissioners, were often present, and to some English councils even abbesses were admitted. Save at the Councils of Constance and Basel, the voting was by count of heads; but at Constance the voting was according to nations, in order to counteract the numerical predominance of the Italian Bishops. A similar method was adopted at the Council of Basel.

It has never been settled beyond dispute which of the councils are to be regarded as truly and authoritatively representative of the Christian οἰκουμένη. And of those that may fairly be called œcumenical, one differs widely from another, not merely in its catholicity of spirit and in the abiding interest of the questions discussed, but in the width of area from which its members were drawn, and the extent of territory throughout which its authority was at the time recognized. At the earliest universal councils the representatives of the Western Church were a small minority; at Nicæa hardly 10 of the 318 (?) bishops were of the Latin-speaking church. The council at Constantinople in 381 was at first only a general synod of the Oriental church; and it was not till the 6th century that it was recognized as œcumenical in the West. Some councils, such as those summoned to Pavia and Siena, were designed to be œcumenical, but led to no such result. The whole Greek Church acknowledges still but seven œcumenical councils. The English Church after the Reformation practically recognized the first five. The doctrinal definitions of the first four councils became the common property of the churches of the Reformation, but Protestant authors rarely refer to the later councils save polemically. The Latins even are not entirely agreed amongst themselves. The claims of the council at Sardica in 343 to universal authority have been asserted but seldom conceded. Some Catholics have protested against the œcumenicity of the synod in 1311 at Vienne, generally reckoned the 15th œcumenical. Most Catholics, including some of those most anxious to promote reforms, refused to admit the Gallican claim in favour of the council summoned to Pisa in 1409; and its rank as a universal council has never been allowed by the most approved Catholic theologians. The Gallicans wished to have the Council of Constance recognized as œcumenical throughout; good Catholics acknowledge only the sittings held after Pope Martin V. was chosen, or such earlier decrees as were afterwards sanctioned by this Pope. Some Gallicans regard the Council of Basel as œcumenical from beginning to end; most insist on regarding it as legitimate only till it was transferred to Ferrara; many Catholics, amongst others Bellarmine, decline to admit the œcumenicity of any of its decrees. The Council of Ferrara-Florence, a Papal continuation of that at Basel, was at first protested against by the Gallican party, but is fully accepted by most Catholic theologians and canonists. The Gallicans were also slow to admit the binding authority of the 5th Lateran synod, the 18th œcumenical council.

The question as to the number of councils is naturally of most consequence to the only section of the church that still assumes the right to summon councils and to call them œcumenical. The view that prevails in the Roman Catholic Church may best be shown by giving a list of the councils accepted as œcumenical by Hefele (*Conciliengeschichte*, 2d ed. vol. i. pp. 59, 60).

20.	Vatican Council	1869-1870

These œcumenical councils fall naturally into several groups or series. The first eight, including that at Constantinople in 869, were summoned by the emperors, all the later ones by the popes,—and this though the analogy of the inferior councils seems to demand that the representative assemblies of the universal church should be summoned by the head of the church alone. Catholics always assert that no council can be œcumenical unless called by the Pope, or by a temporal prince with and by the Pope's assent obtained before or after; and Catholic authors have been at pains to attempt a proof that, even at the councils undoubtedly summoned by the emperors, the bishop of Rome stood to the calling of them in a relation different from that of the other patriarchs. In the case of the 3d œcumenical council, for example, Hefele contends that the Pope did not merely, like the other bishops, passively assent, but actively sanctioned the summons.

The exclusive right of the popes to preside was unhesitatingly admitted at all the later councils; but at the earlier ones, where manifestly emperors, empresses, or their commissioners were the formal presidents, Catholic canonists have persuaded themselves that such presidency was merely in regard to external matters, and that the true president was always episcopal. Even at the Council of Nicæa, they argue, Hosius and the two Roman presbyters who signed the decrees first must have done so as deputies of the Roman bishop, and as such must have been the true presidents.

The first eight councils differed from the rest in that, whereas all others met within the bounds of the Western Church, they were all held in the East. Further, the great majority of those who attended them were Greeks and spoke Greek alone; and the chief subjects of debate at several turned on distinctions not safely translatable into the Western tongues. The first six of these eight councils were occupied mainly, though by no means exclusively, with aspects of the great trinitarian and christological controversies, and their decrees are accordingly of high dogmatical interest.

Of councils held in the West a well-defined sub-group includes the 9th (the 1st Lateran) to the 15th (at Vienne in 1311). The first of these is significantly enough concerned with the dispute about the right of investiture; and though some of this series of seven discussed or defined dogmas, as did the brilliant 4th Lateran Council, they were for the most part busied with matters pertaining to the rights and dignity of the popes and with questions concerning their election. Indeed several of them have less the aspect of free and independent councils than of assemblies gathered for the official ratification of the proceedings of Pope and Curia.

The reasons for the calling of universal synods are of various kinds. When a serious heresy or schism has arisen, when it is doubtful which of two opposing popes is legitimate, when it is proposed to undertake some grand design against the enemies of the church, when the Pope is accused of heresy or other grave fault, when the cardinals will not or cannot elect a Pope, and when a root and branch reformation of the church is in view,—councils may or must be summoned. It was the last of these grounds for assembling the universal church that led to the 16th, 17th, and 18th œcumenical councils; and the 19th, that of Trent, though the sufficiency of the reforms agreed to by it was unanimously denied by Protestant reformers, must also be reckoned amongst the reforming councils.

The Vatican Council is the last of those claiming to be œcumenical; and in decreeing the infallibility of the Pope, it has appeared to many that the 20th council has shown cause why, for all essential purposes, there needs never be another. The very institution of councils seems in itself an admission that apart from them there was no source of accessible and infallible authority on disputed points. If the assembly at Jerusalem was really a council, then even where Paul and at least one of the original twelve apostles were present, the settlement of a question with vast doctrinal and practical issues was arrived at by means of open debate amongst the members of the synod. Unhesitating belief in frequent and miraculous manifestations of the divine will was universal for centuries; yet when the illumination of the Holy Spirit was most urgently needed for the establishment of Christian truth, recourse was had to the collective opinion of assembled representatives, to discussion more or less calm and candid, and to the counting of votes,—a most noteworthy feature in the development of the church. And it deserves to be remarked that thus, in times of all-embracing despotism, the church secured for the representatives of the Christian community one side of corporate and individual freedom, a measure of independence such as could not fail to keep alive a feeling hostile to the extension of imperial, though Christian, tyranny into at least one of the provinces of thought and action.

The infallibility of universal councils, ultimately admitted by the whole Catholic Church, was early claimed. "It seemed good to the Holy Ghost and to us," words occurring in the Jerusalem decree, could not but suggest to the successors of the apostles that the synods assembled under them were favoured by the special superintendence of the Holy Ghost; and this was distinctly asserted by Cyprian. But the sanction of the Pope has always been held by modern Catholics as necessary to the infallibility of any council; and the decrees even of the minor councils attain to infallibility if approved by the Pope and accepted by the church at large. A limitation of synodical authority that merely recognized the Pope as an integral part of the church might be agreed to even by those who asserted that œcumenical councils are superior to the popes, a theory long and vehemently contended for and against in the church. That the councils are above the popes was the view of the Councils of Constance and Basel, and was formulated as one of the four Gallican propositions; whereas at the 5th Lateran Council Pope Leo X. roundly asserted the authority of the Pope over all councils.

Yet the infallibility of universal councils was most confidently accepted by the very parties in the church which were least disposed to concede absolute authority to any other ecclesiastical institution,—notably by the Gallicans and by the German Reformers in the early stages of the Reformation. And the institution of councils, both of occasional councils called for special purposes and of those meeting statedly, was inherited by the Protestant churches. The Synod of Dort is an instance of a general council of churches adhering to the Reformed confessions; the Westminster Assembly was designed to be a national council. It is of course in the Presbyterian churches that councils have received their most systematic development, and, without claiming infallible authority, retain the most extended powers as legislative, administrative, and judicial. In the Church of Scotland the regular gradation of kirk sessions, presbyteries, provincial synods, and general assembly of representative ministers and elders supervises and regulates all the functions of the church, and forms a compact and balanced system of constitutional government. In non-presbyterian churches synods have various degrees of deliberative or decisive authority. Even now the reorganization of the synodical system of the United Protestant Church of Prussia is regarded both by churchmen and by statesmen in Germany as one of the ecclesiastical questions of the day.

The chief collections of the Acts of the Councils of the Catholic Church are that by Hardouin, published at Paris in 1715 in 12 folios and the still more complete one by Mansi (Florence and Venice, 1758-1799) in 31 folio vols. but extending only to the 15th century. By far the most elaborate recent work on the Councils is the *Conciliengeschichte* of Dr Hefele, bishop of Rottenburg (7 vols., 1st ed. 1855-1874; 2d ed. 1873, *sqq.*). (D. P.)

COUNCIL BLUFFS, a town of the State of Iowa, United States, near the left bank of the Missouri, opposite to Omaha in Nebraska, and on the line of the great continental railroad from Chicago to San Francisco. It is a rapidly growing place, and in 1870 had 10,020 inhabitants. Open prairie surrounds it on all sides. A mile west of the town the Missouri is spanned by a great iron bridge, one of the finest in the country.
