COUNT, COUNTESS (Latin, *Comes*, *Comitissa*). In the peerage of Great Britain and Ireland the Continental title count, when its highest and most dignified acceptation, is represented by earl,—an earl's wife, however, being styled countess. In the times of the Roman commonwealth, personages of different degrees of rank, who in various capacities officially accompanied the proconsuls and proprietors into the provinces, bore the common designation of *comites*, either *a comitando* or *a commeando*. At a later period, the *comites*, as personal companions and counsellors of the prince, whose name they always added to the title of their office, became lords of the palace, whence the origin of their style as *counts palatine*. At a considerably later era, this same title implied princely rank, dignity, and power enjoyed by the bearer under a supreme imperial sovereign. By Constantine the title *comes* was first established as a definite dignity; but this same title, within a short time after its first formal establishment, was conferred indiscriminately upon various classes of public officers, of whom a long list, specifying the capacity in which each one served, is given by Du Cange. After the fall of the Roman empire the governors of provinces and cities who commanded in war and during peace presided over the administration of the laws retained the titles of *duces* and *comites* (dukes and counts); occasionally also the distinction between these titles failed to be observed, and some counts became governors of provinces. Under the last king of the second royal dynasty of France, the dignity of the counts of the highest rank was rendered hereditary, when they even aspired to independent sovereignty. From the inability of Hugh Capet to maintain the supremacy of the Crown against their encroachments, these great peers assigned to his reign their first assumption of coronets with their arms, to denote their enjoyment of sovereign power in their particular counties or territories. In after times, the dignity of count, hereditary in the male line, was granted by a sovereign upon his erecting a territory into a county, with a reserve of sovereignty and jurisdiction to the Crown, and also with reversion to the Crown in default of heirs male. At the present day, from the custom of styling all the sons of a count also counts, the titular bearers of this designation on the Continent are very numerous, while their rank is little more than nominal. In Germany the equivalent for count is *Graf*, and the several orders of these German counts are distinguished by the formation of compound titles, as "landgraves," "palsgraves," &c. See EARL.

COUNTY is the chief of the administrative areas into which England is divided. This is an ancient division, and, according to the popular manner of accounting for the origin of social institutions, is attributed to the wisdom of our early kings, and more particularly of King Alfred. It is tolerably clear, however, that this theory is a reversal of the natural process, and that, instead of counties having been formed by the division of the country, the country itself was formed by the aggregation of counties. The county, in fact, is the representative of an independent kingdom or community, now long merged in the larger unity of the English kingdom. The same mistake that has been made as to the historical relations of the county and the kingdom is repeated in the popular accounts of the subdivisions of the county itself. Alfred the Great, it is said, divided the county into hundreds, and these again into tithings. The truth is exactly the contrary—the subdivision of the county being an earlier aggregate than the county itself. The parish, the manor, and the township all appear to be traceable to the independent tribal settlement—the village community—of the early Saxons. They appear in history with their political and judicial organism complete. A combination of these units forms the district of the hundred; and a combination of hundreds forms the county. All of these groups have the same kind of organization. They all have their moots or meetings, partly judicial partly political in character, and their head-man or reeve. The Witenagemot of the Saxon kingdom is the folk-moot for the whole kingdom, corresponding to the folk-moot for the shire or county.

In the period preceding the Norman Conquest two officers appear at the head of the county organization. These are the ealdorman or earl and the scirgerefa or sheriff. The latter was more particularly the representative of the king; the former represented, in dignity at least, the head of the county before it had ceased to be an independent community. After the Conquest the sheriff became a purely royal officer (*vice-comes* or *ballivus*). He held an annual court (the sheriff's tourn or leet) to which the vassals of the king were suitors. These were the judicial tribunals for the people within the jurisdiction of the county. An appeal lay from them to the king, and the growth of the king's court, in its three developments—King's Bench, Common Pleas, and Exchequer—tended to draw suits at the first instance away from the county court into the higher tribunal. The county court, moreover, arranged the assessment of rates, and the sheriff was, in fact, the financial representative of the Crown within his district. When the principle of representation came into existence, the county court was the assembly which elected the knights of the shire. The ancient offices of coroner and verderer were also filled up by the same assembly. The county organization thus in many points retained the features of an independent political society. From the time of the Plantagenets its importance in the constitution declined.

The office of sheriff in England has lost all its financial and nearly all its judicial duties. He is now chiefly a ministerial officer—he arrests or imprisons, summons and returns the jury, carries the judgment or sentence of the court into effect, &c.

The military functions of the sheriff were in the reign of Henry VIII. (or, according to some, Edward VI.) handed over to a new officer, the lord-lieutenant, who is now more prominently associated with the headship of the county than the sheriff is. The office is honorary, and is held during royal pleasure, but virtually for life. The Government of the day invariably appoints one of its own supporters,—generally a person of high position in the county. He is the chief conservator of the peace and keeper of the records of quarter sessions. He is also commander of the militia and yeomanry of the county, whose officers he appoints.

In the United States of America the county forms the section into which the State is divided; it is again subdivided into townships. The financial affairs of the county are superintended by county officers, and each county is provided with a court of inferior jurisdiction. Louisiana is the only State which is divided into parishes, instead of counties.

The *Counties Palatine* are three in number, viz., Durham, Chester, and Lancaster. The counts palatine (earl of Chester, bishop of Durham, and duke of Lancaster) exercised royal rights within their districts. Chester was united with the Crown under Henry III., but the palatinate jurisdictions survived in the other two cases. The Court of Common Pleas at Lancaster and the Court of Common Pleas at Durham are among the courts whose jurisdiction is transferred to the High Court of Justice by the Judicature Act, 1873. The palatine authority of the bishop of Durham was vested in the Crown by 6 and 7 Will. IV. c. 19. The duchy of Lancaster has still its own chancellor, in whose name a chancery court is held, presided over by a vice-chancellor, and the courts of the lord chancellor of England do not run in the districts. The chancery court is not affected by the Judicature Act. Section 99 of that Act, provides that, from and after the commencement of this Act, the counties palatine of Lancaster and Durham shall respectively cease to be counties palatine, so far as respects the issue of commissions of assize, or other like commissions, but not further or otherwise.

Counties of cities, or *counties corporate*, are cities which have acquired the privileges of counties. The officers of the counties in which these towns are situated have no jurisdiction within them. Among them are London, York, and Bristol.

County Court.—The jurisdiction of the ancient County Court has within recent years been revised and extended with the view of making justice cheaper and more accessible, especially in disputes about small amounts. The 9 and 10 Vict. c. 95 (County Courts Act, 1846), reciting various Acts, the provisions of which should be amended, and that one rule and manner of proceeding for the recovery of small debts and demand, should prevail throughout England; that the County Court is a court of ancient jurisdiction, having cognizance of all pleas of personal actions to any amount by virtue of a writ of justices issued in that behalf; that the proceedings in the County Court are dilatory and expensive, and that it is expedient to alter and regulate the manner of proceeding in the said courts for the recovery of small debts and demands; that the courts established under the said recited Acts of Parliament, or such of them as ought to be continued, should be holden after the passing of this Act as branches of the County Court under the provisions of this Act,—enacts that "it shall be lawful for her Majesty, with the advice of her Privy Council, to order that this Act shall be put in force in such county or counties as to her Majesty, with the advice aforesaid, shall seem fit." By section 2 her Majesty, with the advice aforesaid, may divide the whole or part of any such county, including all counties of cities and counties of towns, cities, boroughs, towns, ports, and places, liberties and franchises therein contained into districts, and may order that the County Court shall be holden under this Act in each of such districts. Courts under this Act are to have "all the jurisdiction and powers of the County Court for recovery of debts and demand as altered by this Act," and shall be courts of record. For all other purposes the County Court shall be holden as if this Act had not passed. Judges, treasurers, registrars, high bailiffs, and their assistants were to be appointed for each district. The 21 and 22 Vict. c. 74 § 3 limits the number of judges to sixty. The salary of a County Court judge was originally fixed at £1200, but as a rule he now receives £1500. He must be a barrister-at-law of seven years' standing; after appointment he cannot sit as a member of Parliament, or practise at the bar. The appointment is made by the lord chancellor, with whom also rests the power of dismissal for sufficient cause shown. Lawyers of considerable repute have in many cases accepted these appointments.

The jurisdiction of the County Courts was at first confined to pleas in personal actions, when the sum claimed was not more than £20, but it has since been considerably enlarged. The limit was raised to £50 by the 13 and 14 Vict. c. 61. A jurisdiction in ejectment, where the annual rent or value of the land was not more than £20, was conferred by the County Courts Act, 1867. Up to 1865 the jurisdiction of the County Courts was with a few trifling exceptions a common law jurisdiction, but the County Courts Act of that year conferred an equitable jurisdiction, limited as to the value of the amount at stake to £500. This Act, and the power to set up equitable defences to actions under the Common Law Procedure Act, 1854, are noticeable in the history of English law, as anticipations of the fusion of law and equity now being carried out under the recent Judicature Act. Jurisdiction in probate (up to £200), in admiralty, in bankruptcy, and certain powers in aid of the jurisdiction of other courts have also been conferred by separate Acts. By the consent of parties the court may have jurisdiction in any action. In certain cases (*e.g.*, recovery of penalties for bribery at municipal elections, &c.) the County Courts have exclusive jurisdiction. Otherwise they have jurisdiction concurrently with the superior courts, but when a case which a County Court might have tried is brought into a superior court, the costs will not in general be granted. The County Courts Act, 1867, dealing with this subject enacts (§ 5) that costs shall not be recoverable by the plaintiff in any action in the superior courts, when the amount recovered does not exceed £20 in a case of contract, or £10 in a case of tort (civil injury)—unless the judge certify that there was a good reason for bringing the action in a superior court. By § 8 when any action of contract is brought in a superior court for a sum in dispute not exceeding £50, the judge may on the application of the defendant order the case to be sent to the County Court. By § 8 proceedings in equity may be transferred to the County Court which might have commenced therein; and by § 10 in actions for tort, the judge may, on an affidavit by defendant that the plaintiff has no visible means of paying costs if unsuccessful, send down the case to the County Court. These provisions, which it will be observed only indirectly compel suitors to resort to the County Courts in cases of minor importance, are embodied in the Judicature Act, 1873, by section 67:—"The provisions contained in the fifth, seventh, eighth, and tenth sections of the County Court Act, 1867, shall apply to all actions commenced or pending in the said High Court of Justice on which any relief is sought which can be given in a County Court."

A County Court judge may determine all matters of fact as well as law, but a jury may be summoned at the option of either plaintiff or defendant when the amount in dispute exceeds £5, and the judge may at his discretion summon a jury in any case. Counsel as well as attorneys may appear in the County Courts, but as the object of the legislature was to establish a cheap tribunal, costs are in the discretion of the judge, and the remuneration for professional services recoverable as costs is paid on a reduced scale. By the Judicature Act, 1873, appeals from County Courts and other inferior courts are heard in divisional courts of the High Court of Justice, consisting of such judges as may be assigned for that purpose, and the decision of any such divisional court shall be final, unless it gives special leave to appeal to the Court of Appeal. The Acts relating to County Courts are now numerous, and through frequent amendment and repeal are in a state of great confusion. A Consolidation Act is much to be desired. (E. R.)

COURAYER, Pierre Francois le (1681–1776), a Roman Catholic theological writer, was born at Vernon, in Normandy, in 1681. While canon regular and librarian of the abbey of St Geneviève at Paris, he conducted a correspondence with Archbishop Wake on the subject of Episcopal succession in England, which supplied him with material for his work *On the Validity of English Ordinations*, published in Holland in 1727, in which he tries to prove that there has been no break in the line of ordination from the apostles to the English clergy. His opinions, however, having exposed him to a prosecution in his native country, he took refuge in England, where he was presented by the university of Oxford with a doctor's degree. In 1736 he published a French translation of Father Paul Sarpi's *History of the Council of Trent*, and dedicated it to Queen Caroline, from whom he received a pension of £200 a year. Besides this he translated Sleidan's *History of the Reformation*, and wrote several theological works. Courayer died in 1776, after two days' illness, and was buried in the cloister of Westminster Abbey. In his will, dated two years before his death, he declared himself still a member of the Catholic Church, although dissenting from many of its opinions.

COURIER, Paul Louis (1773–1825), French Hellenist and political and miscellaneous writer, was born at Paris, January 4, 1773. His father, Jean Paul Courier, was owner of the estate of Méré in Touraine, to which he retired when, in consequence of a serious quarrel with a duke, he was compelled to leave Paris. The son, still in his childhood, imbibed a bitter aversion to the nobility, which seemed to strengthen with time. He would never take the name "de Méré," to which he was entitled, lest he should be thought a nobleman. At the age of fifteen he was sent to Paris to complete his education; and there he studied chiefly mathematics and Greek. For Greek literature he had a passionate fondness, and attained in it so remarkable a proficiency that he was complimented by German scholars. Destined by his father for the army, he entered the school of artillery at Châlons, and received his appointment as sub-lieutenant in September 1792. He served in various campaigns of the Revolutionary wars, especially in those of Italy in 1798–1799 and 1806–1807, and in the German campaign of 1809. He attained the rank of *chef d'escadron* in 1803. Meanwhile, whenever circumstances left him at leisure, he devoted himself to his favourite studies. He made his first appearance as an author in 1802, when he contributed to the *Magasin Encyclopédique* a critique on Schweighäuser's edition of Athenæus. In the following year appeared his *Eloge d'Hélène*, a free imitation rather than a translation from Isocrates, which he had sketched in 1798. Courier quitted the army after the battle of Wagram (1809), the savage independence of his nature rendering subordination and obedience irksome and intolerable to him; while his superiors found it hard to bear the chastisement of his satirical humour, which he freely indulged without respect of persons. After leaving the army he went to Florence, and was fortunate enough to discover in the Laurentian Library a complete manuscript of Longus's *Daphnis and Chloe*, an edition of which he published in 1810. In consequence of a misadventure—blotting the manuscript—he was involved in a quarrel with the librarian, and was compelled by the Government to leave Tuscany. He retired to his estate at Veretz (Indre-et-Loire), but frequently visited Paris, and divided his attention between literature and his farm. After the second restoration of the Bourbons the career of Courier as political pamphleteer began. He had before this time waged war against local wrongs in his own district, and had been the adviser and helpful friend of his neighbours. He now carried the war into a larger field, and by his letters and pamphlets made himself one of the most dreaded opponents of the Government of the Restoration. In 1817 he was a candidate for a vacant seat in the Institute; and failing, he took his revenge by publishing a bitter *Lettre à Messieurs de l'Académie des Inscriptions et Belles-Lettres* (1819). This was followed (1819–1820) by a series of letters published in *Le Censeur*, which by the extraordinary power displayed in them gives him a place in literature only second to the author of the *Lettres Provinciales*. The proposal, in 1821, to purchase the estate of Chambord for the duke of Bordeaux called forth from Courier the *Simple Discours*, one of his most powerful and successful pieces. For this he was tried and condemned to suffer a short imprisonment and to pay a fine. Before he went to prison he published a *Compte Rendu* of his trial, which had a still larger circulation than the *Discours* itself. In 1823 appeared the *Livret de Paul Louis*, the *Gazette de Village*, and other pieces, which were followed in 1824 by his famous *Pamphlet des Pamphlets*, called by his biographer, Armand Carrel, his swan-song. Courier projected a translation of Herodotus, and published a specimen, in which he attempted to imitate archaic French; but he did not live to carry out his plan. In the spring of 1825, on a Sunday afternoon (April 10), Courier was found shot in a wood near his house. The murderers remained undiscovered for five years. The writings of Courier, dealing with the facts and events of his own time, are valuable sources of information as to the condition of France before, during, and after the Revolution. Their literary merits are thus set forth in the *Edinburgh Review* (vol. xlix.):—

"They abound in plain, strong, masculine sense, illustrated with classical allusions, naturally and happily introduced, and seasoned with wit more brilliant than is almost anywhere else to be found; for it has the keen edge of Swift's satire, with a style of more pointed epigram, and the easy playfulness of Voltaire, without his pertness and flippancy. His statements and narratives are short, and so clear as to present a sudden and lively picture; his arguments are models of conciseness and force."

A *Collection Complète des Pamphlets Politiques et Opuscules Littéraires de P. L. Courier* appeared in 1826. An edition of his works, with an essay on his life, &c., by Armand Carrel, was published in 1834.

COURLAND, or KURLAND, one of the Baltic provinces of Russia, lying between 56° and 57° 45′ N. lat. and 21° and 27° E. long., is bounded on the N.E. by the River Düna, separating it from the governments of Vitebsk and Livonia, N. by the Gulf of Riga, W. by the Baltic, and S. by the government of Kovno. The area is 10,535 square miles, of which 101 square miles are occupied by lakes. Population (1870), 619,154. The surface is generally low, and the coast-lands, which run out northwards, inclosing the Gulf of Riga, by a broad promontory to the Domes-näs, opposite the island of Oesel, are flat and marshy. The interior is characterized by wooded dunes, covered with pine, fir, birch, and oak, with swamps and lakes and fertile patches between. Usmaiten, the largest lake, is 24 miles in circuit. The highest point of the province, called the Hüningsberg, in the neighbourhood of the capital, is scarcely 700 feet above the sea. The Windau, Aa, and the frontier river Düna pass through the province from the south-east. Owing to the numerous lakes and marshes the climate is damp and foggy, and the winter is severe, though less rigorous than that of Livonia. Agriculture is the chief occupation of the inhabitants, the principal crops being rye, barley, and oats; flax, hemp, and a little tobacco are also grown. Fisheries, cattle-rearing, and hunting are also carried on to some extent. Except in the making of tiles and in distillation manufactures are insignificant. Iron and limestone are the chief minerals of the province; amber is found on the coasts. The peasantry of Courland are partly the Letts of Courland, or Kures, mixed with Polish and Russian blood; partly Esthonian Letts, with German, Swedish, and Finnish admixture, such as the Livs of the north-west coast of the promontory of Courland, and the "Krevinnes," or Krivingians, living in the district of Bauske, in the interior. The prevailing religion is the Lutheran,—only a small proportion of the people belonging to the Greek Church. Mitau, centrally placed, and in railway communication with Riga, is the capital of the province and its largest town; but Libau and Windau on the Baltic coast are its busiest places. Anciently Courland was an independent possession of the Teutonic knights, who also owned Livonia, and it comprised the two duchies of Kurland and Semgall. As Russian power continued to extend, and the knights could no longer hold their own in Livonia, the duchies were placed, in 1561, under the feudal government of Poland. By the marriage of Duke Frederick William of Kurland to the Russian Princess Anna, daughter of Czar Ivan, in 1710, Courland came into close relation with Russia, and remained for a long period an object of contention between that country and Poland. Ultimately, in 1795, the assembly of nobles in Courland resolved to place the country under the Russian sceptre. The Baltic provinces—Esthonia, Livonia, and Courland—ceased to form collectively a general government of the Russian empire by ukase of January 1876; their separate administration is now based on the same general system as that of the other governments of the empire, modified by some local and special dispositions.

COURSING may be defined as the hunting of game by dogs solely by means of the organs of sight. From time to time the sport has been pursued by various nations against various animals, but the recognized method has generally been the coursing of the hare by greyhounds. Such sport is of great antiquity, and is fully described by Arrian in his *Cynegeticus* about 150 A.D., when the leading features appear to have been much the same as in the present day. Other Greek and Latin authors refer to the sport; but during the Middle Ages it was but little heard of. It may be divided into private and public coursing. The former is more pursued for the sake of filling the pot with game than with the view of affording the exhilarating sport furnished by the latter. The private sportsman seldom possesses good strains of blood to breed his greyhounds from, or has such opportunities of trying them as the public courser. The first known set of rules in England for determining the merits of a course were drawn up by Thomas, duke of Norfolk, in Queen Elizabeth's reign; but no open trials were heard of until half a century later, in the time of Charles I. The oldest regular coursing club whereof any record exists is that of Swaffham, in Norfolk, which was founded by Lord Orford in 1776. During the next seventy years many other large and influential societies sprang up throughout England and Scotland, but the first open champion meeting was held at Glasgow in 1835, and since then they have spread rapidly throughout the country. The chief followers of the sport are to be found amongst the yeoman and middle classes, who prefer coursing to horse-racing on account of its being more economical and devoid of the chicanery connected with the latter. Several noblemen, however, keep large kennels of greyhounds, are enthusiastic patrons of coursing, and further the sport by preserving hares and providing coursing grounds. The season lasts about six months, commencing at the end of September. During 1875–76 the value of the stakes and other prizes coursed for in the United Kingdom was upwards of £40,000. It was not until 1858 that a coursing parliament, so to speak, was formed, and a universally accepted code of rules drawn up. In that year the National Coursing Club was founded. It is composed of representatives from all clubs in the United Kingdom of more than a year's standing, and possessing more than twenty-four members. Their rules govern meetings, and their committee adjudicate on matters of dispute. It must be borne in mind that a comparative trial of two dogs, and not the capture of the game pursued, is the great distinctive trait of modern coursing. Clubs either rent grounds to course over or are allowed the use of land by large proprietors who are supporters of the sport; but in either case a good stock of strong hares must be maintained by preserving or otherwise. The chief breeds of coursing greyhounds now in vogue are the Newmarket, the Lancashire, and the Scotch. The breeding and training of a successful kennel is a precarious matter; and the most unaccountable ups and downs of fortune often occur in a courser's career. A club meeting is managed by the society's own members, and an open or champion one by whoever may be appointed secretary, assisted in both cases by a committee. An agreed on even number of entries are made for each stake, and the ties drawn by lot. After the first round the winner of the first tie is opposed to the winner of the second, and so on until the last two dogs left in compete for victory. A staff of beaters drive the hares out of their coverts or other hiding-places, whilst the slipper has the pair of dogs in hand, and slips them simultaneously by an arrangement of nooses, when they have both sighted a hare promising a good course. The judge accompanies on horseback, and the six points whereby he decides a course are—(1) speed; (2) the go-bye, or when a greyhound starts a clear length behind his opponent, passes him in the straight run, and gets a clear length in front; (3) the turn, where the hare turns at not less than a right angle; (4) the wrench, where the hare turns at less than a right angle; (5) the kill; (6) the trip, or unsuccessful effort to kill. He may return a "no course," as his verdict, if the dogs have not been fairly tried together, or an "undecided course" if he considers their merits equal. The open Waterloo meeting, held at Altcar near Liverpool, every spring, is now the recognized fixture for the decision of the coursing championship, and the Waterloo cup is the "Blue Riband" of the leash.

Rabbit coursing is much pursued in the suburbs of Lancashire manufacturing towns. It is conducted more artificially than hare coursing, the rabbit being dropt by hand some twenty yards in front of the dogs, and the victor being the first that catches and holds the game.

The chief works on coursing are—Arrian's *Cynegeticus*, translated by the Rev. W. Dansey, 1831; T. Thacker, *Courser's Companion and Breeder's Guide*, 1835; Thacker's *Courser's Annual Remembrancer*, 1849–1851; D. P. Blaine, *Encyclopædia of Rural Sports*, third edition, 1870; J. H. Walsh, *The Greyhound*, third edition, 1875, and *British Rural Sports*, twelfth edition, 1875; and the *Coursing Calendar*, edited by J. H. Walsh. (H. F. W.)

COURT. This name is now usually restricted to judicial tribunals, almost the only exception being the household of the king, which is still called the Court. All courts are not even now purely judicial in character; the County Court, for instance, is still the assembly of the freeholders of the county in which representatives and certain officers are elected. Such assemblies in early times exercised political and legislative as well as judicial functions. But these have now been almost entirely separated everywhere, and only judicial bodies are now usually called courts. In every court, says Blackstone, there must be three parts,—an *actor* or plaintiff, *reus* or defendant, and *judex*, or judge.

The language of legal fictions, which English lawyers invariably use in all constitutional subjects, makes the king the ultimate source of all judicial authority, and assumes his personal presence in all the courts.

"As by our excellent constitution," says Blackstone, "the sole executive power of the laws is vested in the person of the king, it will follow that all courts of justice, which are the medium by which he administers the laws, are derived from the power of the Crown. For whether created by Act of Parliament or letters patent, or subsisting by prescription (the only methods by which any court of judicature can exist), the king's consent in the two former is expressly, in the latter impliedly given. In all these courts the king is supposed in contemplation of law to be always present; but as that is in fact impossible, he is then represented by his judges, whose power is only an emanation of the royal prerogative."

These words, which are still printed in modern editions of the commentaries, might give a false impression of the historical and legal relations of the courts and the Crown, if it is not remembered that they are nothing more than the expression of a venerable fiction. The administration of justice was, indeed, one of the functions of the king in early times; the king himself sat on circuit so late as the reign of Edward IV., and even after regular tribunals were established, a reserve of judicial power still remained in the king and his council, in the exercise of which it was possible for the king to participate personally. The last judicial act of an English king, if such it can be called, was that by which James I. settled the dispute between the Courts of Chancery and the Court of Common Law. Since the establishment of Parliamentary government the courts take their law directly from the legislature, and the king is only connected with them indirectly as a member of the legislative body. The king's name, however, is still used in this as in other departments of state action. The courts exercising jurisdiction in England are divided by certain features which may here be briefly indicated.

1. We may distinguish between courts exercising general and those exercising special jurisdiction. The latter are the Admiralty, Ecclesiastical, and University Courts, the limits of which are sufficiently indicated by their names. These administer principles of justice founded on the canon and civil law, but the extent of their jurisdiction is ascertained by the Common Law Courts. 2. Superior and inferior courts. The former are the Courts of Common Law at Westminster, and the Court of Chancery, now High Court of Justice. The latter are the local or district courts, County Courts, &c. 3. Courts of record and courts not of record. "A court of record is one whereof the Acts and judicial proceedings are enrolled for a perpetual memory and testimony, which rolls are called the records of the court, and are of such high and supereminent authority, that their truth is not to be called in question. For it is a settled rule and maxim that nothing shall be averred against a record, nor shall any plea or even proof be admitted to the contrary. And if the existence of the record shall be denied it shall be tried by nothing but itself; that is, upon bare inspection whether there be any such record or no; else there would be no end of disputes. All courts of record are the courts of the sovereign in right of the Crown and royal dignity, and therefore any court of record has authority to fine and imprison for contempt of its authority" (Stephen's *Blackstone*). 4. Courts may also be distinguished as civil or criminal. 5. A further distinction is to be made between courts of first instance and courts of appeal. In the former the first hearing in any judicial proceeding takes place; in the latter, the judgment of the first court is brought under review. Of the superior courts, the High Court of Justice in its various divisions is a court of first instance. Over it is the Court of Appeal, and over that again the House of Lords. The High Court of Justice is (through divisional courts) a court of appeal for inferior courts. 6. There is a special class of local courts, which do not appear to fall within either the first or second of the classes above-mentioned. Some, while administering the ordinary municipal law, have or had jurisdiction exclusive of their superior courts; such were the Common Pleas of Durham and Lancaster (now transferred to the High Court of Justice), and such still is the Chancery Court of the duchy of Lancaster. Others have concurrent jurisdiction with the superior courts; such are the Lord Mayor's Court of London, the Passage Court of Liverpool, &c.

The distribution of judicial business among the various courts may be exhibited as follows.

Criminal Courts.—1. The lowest is that of the justice of the peace, sitting singly, but more usually in petty sessions of two or more, to determine in a summary way certain specified minor offences. In populous districts, such as London, Manchester, &c., atipendiary magistrates are appointed, generally with enlarged powers. Besides punishing by summary conviction, justices may commit prisoners for trial at the assizes. 2. The justices in Quarter Sessions are commissioned to determine felonies and other offences. The 5 and 6 Vict. c. 38 contains a list of offences *not* triable at Quarter Sessions —treason, murder, forgery, bigamy, &c., (see QUARTER SESSIONS). The corresponding court in boroughs is presided over by the recorder. 3. The more serious offences are reserved for the judges of the superior courts sitting under a commission of oyer and terminer or gaol delivery for each county. The Assize Courts, as they are called, sit in general in each county twice a year, following the division of circuits; but winter assizes are now held under 39 and 40 Vict. c. 57, which permits several counties to be united together for that purpose. London, which occupies an exceptional position in all matters of judicature, has a high criminal court of its own, established by 4 and 5 Will. IV. c. 36, under the name of the Central Criminal Court. Its judges usually present are a rota selected from the superior judges of common law, the recorder, common sergeant, and the judge of the City of London Court. The Court of Queen's Bench (now Queen's Bench Division) has a general superintendence over all other courts of criminal jurisdiction, and criminal cases may be moved into the Queen's Bench by the writ of *certiorari*. By 11 and 12 Vict. c. 78, the Court for Crown Cases Reserved was established, to which any question of law arising on the trial of a prisoner may after conviction be remitted by the judge in his discretion.

Civil Courts.—In certain special cases, civil claims of small importance may be brought before justices or stipendiaries. Otherwise, and excepting the special and peculiar jurisdictions above mentioned, the civil business of the country may be said to be divided between the County Courts (taking small cases) and the High Court of Justice (taking all others). Before the constitution of the High Court of Justice the judges of the common law courts sat separately with a jury to try cases at Nisi Prius, the sittings being at Westminster for Middlesex, at Guildhall for the City of London, and according to circuits for the rest of the country; and this arrangement is still followed by the divisions corresponding to the common law courts.

The effect of the recent Judicature Acts on the constitution of the superior courts may be briefly stated. There is now one Supreme Court of Judicature, consisting of two permanent divisions called the High Court of Justice and the Court of Appeal. The former takes the jurisdiction of the Court of Chancery, the three Common Law Courts, the Courts of Admiralty, Probate, and Divorce, the Courts of Pleas at Lancaster and Durham, and the courts created by commissions of assize, oyer and terminer, and gaol delivery. The latter takes the jurisdiction of the Court of Appeal in Chancery (including Chancery of Lancaster), the Court of the Lord Warden of the Stannaries, and of the Exchequer Chamber, and the appellate jurisdiction in admiralty and heresy matters of the judicial committee; and power is given to the

Queen to transfer the remaining jurisdiction of that court to the Court of Appeal. By the appellate Jurisdiction Act of 1876, the House of Lords is now enabled to sit for the hearing of appeals from the English Court of Appeal and the Scotch and Irish courts during the prorogation and dissolution of Parliament. The lords of appeal, of whom three must be present, are the lord chancellor, the lords of appeal in ordinary, and peers who have held "high judicial office" in Great Britain or Ireland. The lords in ordinary are an innovation in the constitution of the House. They hold the rank of baron for life only, have a right to sit and vote in the House during tenure of office only, and a salary of £6000 per annum.

Among obsolete or decayed courts, besides those incidentally mentioned above, the following are the most noticeable:—

The *Court Leet*, an old local court described as the most ancient known to the law. It was a court of record, and exercised civil as well as criminal jurisdiction. Its origin and nature are fully discussed in Scriven *On Copyhold.*

Court Baron, the court of a manor, presided over by the lord, and of which the free tenants of the manor are suitors.

Court of Pié Poudre (*pedis pulverisati*), having jurisdiction in fairs and markets.

Court of Chivalry, or Knights' Court, held by the lord high constable, in matters relating to jousts and tournaments.

The Court of the Marshalsea of the Household of the Kings of England, and the Court of our Lady the Queen, of the Palace of the Queen at Westminster, and Her Majesty's Court of Record for the Honour of Peveril are abolished by the 12 and 13 Vict. c. 101.

The history of English courts affords a remarkable illustration of the continuity that characterizes our institutions. It would hardly be too much to say that all the courts now sitting in England may be traced back to a common origin, and at any rate the higher courts are all offshoots from the same original judicature. Leaving out of account the local courts, we find the higher jurisdiction after the Conquest concentrated along with all other public functions in the king and council. The first sign of a separation of the judicial from the other powers of this body is found in the recognition of a Curia Regis, which may be described as the king's council, or a portion of it, charged specially with the management of judicial and revenue business. In relation to the revenue it became the Exchequer, under which name a separate court grew up whose special field was the judicial business arising out of revenue cases. By the Great Charter, the inconvenience caused by the curia following the king's person was remedied, in so far as private litigation was concerned, by the order that common pleas (Communia Placita) should be held at some fixed place; and hence arose the Court of Common Pleas. The Curia Regis, after having thrown off these branches, is represented by the Queen's Bench, so that from the same stock we have now three courts, differing at first in functions, but through competition for business, and the ingenious use of fictions, becoming finally the coordinate Courts of Common Law of our later history. In one line of development the council becomes, by the addition of representatives from counties and boroughs, the Parliament in its two Houses of Lords and Commons. But an inner circle of counsellors still surrounded the king, and in his name claimed to exercise judicial as well as other power; hence the chancellor's jurisdiction, which became, partly in harmony with the supra-legal power claimed from which it sprang, and partly through the influence of the ecclesiastical chancellors by whom it was first administered, the Equity of English law. Similar developments of the same authority were the Court of Requests (which was destroyed by a decision of the Common Pleas) and the Court of Star Chamber,—a Court of Criminal Equity, as it has been called, which, having been made the instrument of tyranny, was abolished in 1641. Even then the productive power of the council was not exhausted; the judicial committee of the Privy Council, established by 2 and 3 Will. IV. c. 92, superseding the previous Court of Delegates, exercises the jurisdiction in appeal belonging to the king in council. The appellate jurisdiction of the Lords rests on their claim to be the representatives of the ancient great council of the realm. (E. R.)

COURT-MARTIAL. Courts-martial have inherited part of the jurisdiction of the old *Curia Militaris*, or Court of the Chivalry, in which a single marshal and at one time the High Constable proceeded "according to the customs and usages of that court, and, in cases omitted according to the civil law, *secundum legem armorum*" (Coke, 4 Ins. 17). The modern form of the courts was adopted by ordinance in the time of Charles I., when English soldiers were studying the "articles and military laws" of Gustavus Adolphus and the Dutch military code of Arnhem; it is first recognized by statute in the first Mutiny Act, 1 Will. and Mary c. 5. The royal prerogative of issuing commissions under the sign-manual for holding courts-martial, although superseded as regards the United Kingdom by the express power to make certain articles of war which the Mutiny Acts confer on the sovereign, still exists as regards courts-martial held abroad. But the Mutiny Acts also provide for the issue to commanders abroad of warrants to convene courts-martial, or to authorize field-officers to convene them, and even make it lawful in special cases beyond sea for any officer to convene a detachment general court-martial without warrant or commission. The trial of the militia, yeomanry, and volunteers is provided for by "The Volunteer Act, 1863," and "The Regulation of the Forces Act, 1871." In India the *punchayats*, or native military tribunals, are frequently employed. All commissioned officers on full pay, officers of the general staff, although on half staff pay, and officers on brevet rank, are eligible as members of a court-martial. The president of the court is necessarily the senior combatant officer present, unless it has been his duty to investigate the charges against the prisoner; and it is a general rule that the members should be of equal, or superior, rank to the prisoner. Impartiality is secured by the system of "roster;" *i.e.*, the "tour of duty" is from the senior downwards. The jurisdiction of courts-martial is not confined to purely military offences, but, as regards felonies and misdemeanours mentioned in the Mutiny Act or the Articles, is concurrent with, though subordinate to, the jurisdiction of the ordinary criminal courts. The Mutiny Act, indeed, directs that soldiers charged with common offences against the peace should be delivered up to the magistrate. Officers tried in an ordinary court can be punished afterwards by court-martial only by cashiering or reduction. There is a wholesome regulation against sending home for trial accused officers or men, except in cases of unavoidable necessity, but the jurisdiction extends to offences wherever committed. No court-martial can sit in one of H. M. ships in commission, but the "Naval Discipline Act, 1866," subjects land forces on board to its provisions. Half-pay officers are not subject to martial law, but it is thought they ought to be made so, as they derive advantage from retaining their commissions. Even the licensed sutlers, who follow the autumn manœuvres, are under the Mutiny Act. So are paid recruiting officers, though not themselves enlisted, and, to a certain extent, the "army reserve." But a prisoner of war on parole cannot be brought to trial, and all military offences prescribe in three years. From the administration of martial law must carefully be distinguished the procedure by court-martial authorized by the 143d Article of War in places where there is no "form of civil judicature in force," and with regard to civil crimes. In such cases the court-martial applies the civil law, but its jurisdiction is ousted wherever there is a competent civil court under the royal authority, although that court may itself administer not British law, but French, or Roman-Dutch, or any other form of colonial law, and may do so by machinery of procedure quite unfamiliar to British soldiers. This special jurisdiction of courts-martial in non-military offences would also exist where the ordinary courts had been closed by a declaration of martial law (see case of Rev. John Smith of Demerara, June 1824, 2 Hansard xi. 976).

The old form of field or drum-head court-martial (in which no notice was given, no oath administered, and no written record kept) being now happily extinct, there remain three forms—(1) general and detachment general courts-martial, (2) district and garrison courts-martial, and (3) regimental and detachment courts-martial, which are distinguished by their powers of awarding punishment, and by the dress of the officers attending them—viz., review order, marching order, drill order. The two latter are called minor courts, and commissioned officers are not amenable to their jurisdiction. A great many offences are, by the Articles of War, made appropriate to the different courts, the general rule being that the general court is not to be resorted to except in aggravated cases, punishable by penal servitude or death. By permission of a general officer the regimental court may try an offence expressly assigned to a higher court, but in no case may it try desertion. To a certain extent these rules are set aside on the line of march or on board ship, but there is always a maximum of punishment which each court is bound to observe. In 1868 the number of members required for a general court at home was reduced from thirteen to nine, a judge-advocate being in attendance. The general court can try all military offences in whatever regiment under the command committed, and it is the only martial court which takes cognizance of civil offences; it also hears appeals from regimental courts. The detachment general court which is since 1860 only competent "beyond seas," where it is impracticable to hold a general court, was introduced by Wellington, "to repress the spirit of plunder and outrage which had broken out in the army after the battle of Vitoria" (*Supp. Desp.* viii. 104). It consists of three commissioned officers, summoned without royal warrant, to investigate any offence against the person or property of an inhabitant of the country where the detachment is. The sentence must be confirmed by the general officer. The district or garrison court, which superseded in 1829 the older general regimental court, consists of seven members, the president doing the work of a judge-advocate in summoning witnesses, administering oaths, and transmitting the proceedings to the judge-advocate-general in London. The power of this court to imprison non-commissioned officers and privates was in 1864 extended from six months to two years; and in 1869 it received additional power to impose forfeitures and to discharge with ignominy. Another form of district court was that formerly called detachment court for the trial of warrant officers (*i.e.*, officers appointed by warrant under the signature of colonels or commandants of corps). The regimental court, summoned by the colonel, consists of five or three members, with power to inflict limited sentences of imprisonment, corporal punishment, solitary confinement, and also fines, stoppages, and other punishments not peculiar to this court. There are also courts or boards of inquiry, called by an exercise of the royal prerogative to inquire into such questions as the failure of an expedition, or the necessity for an armistice or convention, often in order to determine whether or not a court-martial should be held. It was found in the well-known cases of Lord Bentinck (1820) and Lieutenant-Colonel Dawkins (1873) that the Crown may withhold the proceedings of these courts from the courts of law, and that military witnesses are protected from actions of damage in respect of their evidence before such a court. Where an officer is called before the court of inquiry he is not put on oath, or even bound to answer questions which he thinks may be prejudicial to him; and in connection with the celebrated Simla court-martial (1867) this rule was extended to the production of documents. The Articles of War of 1860 introduced a regimental court of inquiry for the purpose of hearing the complaints and redressing wrongs of non-commissioned officers "and soldiers in any matter respecting their pay or clothing." This court, which is generally held by the captain, also inquires into cases of maiming and mutilation, and all its judgments may be appealed against to a general court. Smaller courts of inquiry examine cases of illegal absence, loss of medals, and the return of officers who may have been taken prisoner by the enemy by their own neglect.

All members of a court-martial take an oath not only to try according to the evidence, but to keep the sentence of the court secret until approved, and to keep secret the votes and opinions of particular members. Even a peer, if serving on a court-martial, cannot use his privilege of giving judgment on honour. As might be expected, the army has a very varied experience in the forms of swearing witnesses. Besides the ordinary Protestant mode of kissing the Bible or Testament, and the ordinary Catholic mode of marking a cross on the closed book, Mahometans are sworn by kissing or placing on their head the Koran, Sikhs upon the Grinth, Hindus upon the Vedas, or by touching the Brahman's foot; and, according to caste custom, Indian witnesses sometimes insist on the oath being administered by a Brahman. But in India affirmations are now generally taken. While a Jew insists on wearing his hat, as in the synagogue, all soldiers, though bound to remain covered before the court, remove their caps in swearing, just as a Protestant witness ungloves his hand. Kaffir witnesses before a court-martial have sworn by their own chief, and a Kaffir chief by the king of England. The colonial legislatures, however, have generally made provision for receiving unsworn evidence of barbarous and uncivilized people who have no religious belief. The judge-advocate is a legal assessor and clerk, but in no sense the prosecutor, although the judge-advocate-general still frames and sanctions the formal charges in the indictment. The latter is a Parliamentary officer appointed on change of ministry, and a member of the Privy Council. He advises the Crown as to the legality of courts-martial, reviews proceedings brought under his notice, confidentially advises the commander-in-chief, and is the custodier of the court records. The prosecutor is a staff officer, or the prisoner's commanding officer, or a field-officer of the regiment, or an adjutant. The prisoner is generally entitled to have legal assistance, and also a private interpreter as a check on the translation of the interpreter for the prosecution. He has no peremptory challenges; but he may challenge on the grounds of defect of rank, inexperience, prejudice, or malice. Formerly, if the prisoner "stood mute," the court-martial entered a verdict of guilty, but this is now altered in conformity with common sense. Where he does not adduce evidence in defence, the prisoner (contrary to the rule under Denman's Act in criminal courts) has a right to the last word. The judgment of the court is by simple majority, except in capital charges, which require the concurrence of two-thirds. The same distinction holds in the subsequent voting on the sentence. Since 1868 the word "honourably" has disappeared from verdicts of acquittal; and the finding "that the charge has not been proved" has been discontinued. Capital punishment awarded for military offences is generally carried out by shooting, but hanging is also competent. In trifling cases between officers the court frequently dictate the terms of a written or verbal apology; and in separate remarks they often observe on the conduct of the prosecutor, on the frivolous or groundless nature of the charges, or the intemperate defence of a prisoner whom they acquit. Such remarks are acted on at headquarters. As a general rule the sovereign's confirmation is required to the decision of a general court. Officers commanding abroad (except in India) have a limited power of confirmation depending on the nature of the sentence. The commander-in-chief in India may confirm all sentences; and this absolute power was also given to Lord Raglan in the Crimea. Even in India, however, a capital sentence by court-martial for a civil offence requires the approval of the governor-general. When a decision, not of acquittal, comes up for approval, it is indispensable that the judge-advocate-general should have a personal audience with the queen. Her Majesty may not only disapprove, but may also order revision of the proceedings; and where the conviction is sustained, the sentence may be remitted or mitigated, but the professional penalties which martial law attaches to conviction cannot be remitted. The members of courts-martial and those who carry out their sentences are of course liable for illegal sentences or irregularities. Thus in 1861, owing to a defect in the Acts regulating the transfer of colonial prisoners, Lieutenant Allen recovered £200 from H.R.H. the duke of Cambridge for false imprisonment.

In conclusion, it may be stated that treason and other non-military offences, which, if committed in England, would be punishable in the ordinary criminal courts, are tried by a general court-martial, if committed on service at Gibraltar, or in India, 120 miles distant from any of the three presidencies; or elsewhere in the queen's dominions, where there is no competent civil court, or out of the queen's dominions.

Naval Courts Martial.—The administration of the barbarous naval law of England was long entrusted to the discretion of commanders acting under instructions from the lord high admiral, who was supreme over both the royal and merchant navy. It was the leaders of the Long Parliament who first secured something like a regular tribunal by passing in 1645 an Ordinance and Articles concerning Martial Law for the Government of the Navy. Under this ordinance Blake, Monk, and Penn issued instructions for the holding general and ship courts-martial with written records, the one for captains and commanders, the other for subordinate officers and men. Of the latter the mate, gunner, and boatswain were members, but the admirals reserved a control over the more serious sentences. Under the Act 13 Car. II. c. 9, the high admiral again received power to issue commissions for holding courts martial—a power which continues to be exercised by the Board of Admiralty. During the 18th century, under the auspices of Anson, the jurisdiction was greatly extended, and the Consolidation Act of 1749 was passed in which the penalty of death occurs as frequently as the curses in the commination service. The Naval Articles of War have always been statutory, and the whole system may now be said to rest on the Naval Discipline Acts of 1860 and 1866. The navy has its courts of inquiry for the confidential investigation of charges "derogatory to the character of an officer and a gentleman." Under the Act of 1866 a court-martial must consist of from five to nine officers of a certain rank, and must be held publicly on board of one of H.M. ships of war, and where three such ships are together. The rank of the president depends on that of the prisoner. A judge-advocate attends, and the procedure resembles that in military courts, except that the prisoner is not asked to plead; and the sentence, if not one of death, does not require the confirmation of the commander-in-chief abroad or of the Admiralty at home. The court has a large and useful power of finding the prisoner guilty of a less serious offence than that charged, which might well be imitated in the ordinary criminal courts. The death sentence is always carried out by hanging at the yard arm; Admiral Byng, however, was shot in 1757. The Board of Admiralty have, under the Naval Discipline Acts, a general power of suspending, annulling, and modifying sentences which are not capital. The jurisdiction extends to all persons belonging to the navy, to land forces and other passengers on board, shipwrecked crews, spies, persons borne on the books of H.M. ships in commission, and civilians on board who endeavour to seduce others from allegiance. The definition of the jurisdiction by locality includes harbours, havens, or creeks, lakes or rivers, in or out of the United Kingdom; all places within the jurisdiction of the Admiralty; all places on shore out of the United Kingdom; the dockyards, barracks, hospitals, &c., of the service wherever situated; all places on shore in or out of the United Kingdom for all offences punishable under the Articles of War except those specified in section 38 of the Naval Discipline Act, 1860. Under the Marine Mutiny Acts the royal marine forces are, while on board, or borne on the books of H.M. ships, subject to naval courts martial. In other circumstances the Articles of War made by the Lord High Admiral for the government of the royal marines are carried out by general courts-martial, district or garrison courts-martial, divisional and detachment courts-martial, courts-martial on the line of march or in transport ships, all held under the authority, mediate or immediate, of the lord high admiral. The regulations of these different courts in the Marine Mutiny Act are very much the same as in the case of courts martial for the land forces. Officers of both services often sit together.

See Simmons *On the Constitution and Practice of Courts-Martial*, 7th ed. 1875; Clode, *Military and Martial Law*, 1872; and Thring's *Treatise on the Criminal Law of the Navy*, 1861. The earlier writers on courts-martial are Adye (1796), M'Arthur (1813), Maltby (1813, Boston), James (1820), D'Aguilar (1843), and Hough, *Precedents in Military Law* (1855). See also the annual Mutiny Acts and the Articles of War, and the articles MILITARY LAW and NAVY.

COURT, ANTOINE (1696–1760), who has been designated the "Restorer of Protestantism in France," was born at the village of Villeneuve-de-Berg, in the province of the Vivarais, in 1696. His parents were poor, belonging to the peasant class, and were unable to give him what was considered a good education. But they were pious folk, adherents of the Reformed Church, against which the most ruthlessly cruel persecution was so long directed by the French Government. Brought up in the fear of God, and early acquainted with the Holy Scriptures, he began to show in his boyhood the signs of a high calling. He was eight years old when the Camisard revolt was finally suppressed, and nineteen when the infamous decree of Louis XIV. was published, declaring that all who professed the Reformed faith should be punished as relapsed heretics. Antoine, taken to the secret meetings of the persecuted Calvinists, held "in dens and caves of the earth," often in darkness, no pastor nor "prophet" present to teach or console, began, when only seventeen, to speak and exhort in these congregations of "the desert." The desire naturally arose in him to deliver the people, and to build up on solid foundations the church which was threatened with extinction. For this purpose he proposed four things as essential:—regular religious meetings for teaching and worship; suppression of the fanaticism of the "inspired," and of the disorders to which it gave rise; restoration of discipline by the establishment of consistories, conferences, and synods; and the careful training of a body of pastors. To the execution of this vast undertaking he devoted his life. The scene of his labours for fifteen years was Languedoc, the Vivarais, and Dauphiny. His beginnings were very small prayer-meetings in "the desert," attended by some half-dozen or dozen persons only. But the work progressed under his wise direction, and after forty years' labour he addressed on one occasion a meeting of 10,000 on the spot where at first he could scarcely gather fifty. In 1724 another heavy blow was struck at Protestantism in the edict of Louis XV., which again assuming that there were no Protestants in France, prohibited the most secret exercise of the Reformed religion, and imposed monstrous penalties. It was impossible fully to carry out its menaces. But persecution raged, especially against the pastors. Many of them were executed, and many fled. A price was set on the life of Antoine Court; and in 1730 he quitted France and took up his abode at Lausanne. He had seen that it was necessary to have a theological college, and Lausanne appeared to be a fitting place for it. He therefore, with the aid of some of the Protestant princes, established the college, and during the remaining thirty years of his life he filled the post of director. He had the title of deputy-general of the churches, and was really the pillar of their hope. He carried on a very extensive correspondence; and, through the often repeated persecutions of his fellow-religionists, fought their battle manfully. The college of Lausanne sent forth all the pastors of the Reformed Church of France till the days of the first French empire. Court formed the design of writing a history of Protestantism, and made large collections for the purpose; but this he did not live to carry out. His character has been thus drawn by M. de Végobre :—he possessed sound straightforward sense, wonderful facility of expression, intrepid courage joined with consummate prudence, astonishing vigour to support the greatest fatigues of body and mind, purity and integrity ever beyond suspicion, and unshaken devotion to the holy cause to which he had consecrated himself. Antoine Court died at Lausanne in 1760. He was the father of the more generally known Court de Gebelin. He hardly finds a place in biographical dictionaries; indeed, for a long time his name and work were almost ignored even by French writers on the history of the Reformed Church.

For details of his life see Peyrat's *Histoire des Pasteurs du Désert*, Coquerel's work bearing the same title, and De Félice's *Histoire des Protestants de France*. The first special biography of Court appears to be that by M. Edmond Hugues, entitled *Antoine Court, Histoire de la Restauration du Protestantisme en France au XVIII. Siècle*, published in 1872.

COURT DE GEBELIN, ANTOINE (1725–1784), a celebrated French scholar, was the son of the preceding, and was born at Nîmes in 1725. He received a good education, and became, like his father, a pastor of the Reformed Church. This office, however, he soon relinquished, to devote himself entirely to literary work. He had conceived the project of a work which should set in a new light the phenomena, especially the languages and mythologies, of the ancient world; and, after his father's death, he took up his abode at Paris for the sake of being within reach of the necessary books for his intended researches. After long years of studious devotion, he published in 1775 the first volume of his vast undertaking under the title of *Le Monde Primitif, analysé et comparé avec le monde moderne*. The ninth volume appeared in 1784, leaving the work still unfinished. The literary world marvelled at the encyclopædic learning displayed by the author, and supposed that the Forty of the Academy, or some other society of scholars, must have combined their powers in its production. Now, however, the world has well-nigh forgotten the huge quartos. These learned labours did not prevent Gebelin from pleading earnestly the cause of religious tolerance. In 1760 he published a work entitled *Les Toulousaines*, advocating the rights of the Protestants; and he afterwards established at Paris an agency for collecting information as to their sufferings, and for exciting general interest in their cause. He co-operated with Franklin and others in the periodical work entitled *Affaires de l'Angleterre et de l'Amérique* (1776, *sqq.*), which was of course devoted to the support of American independence. He was also a supporter of the principles of the economists, and Quesnay called him his well-beloved disciple. In the last year of his life he became acquainted with Mesmer, and published a *Lettre sur le magnétisme animal*. He was imposed upon by speculators in whom he placed confidence, and was reduced to destitution by the failure of a scheme in which they engaged him. He died at Paris, May 10, 1784.

COURTOIS, JÂQUES AND GUILLAUME (1621–76 and 1628–79). The two French painters who bore these names are also called by the Italian equivalents Giacomo (or Jacopo) Cortese and Guglielmo Cortese. Each of the brothers is likewise named, from his native province, Le Bourguignon, or Il Borgognone.

Jâques Courtois was born at St Hippolyte, near Besançon in 1621. His father was a painter, and with him Jâques remained studying up to the age of fifteen. Towards 1637 he came to Italy, was hospitably received at Milan by a Burgundian gentleman, and entered, and for three years remained in, the French military service. The sight of some battle-pictures revived his taste for fine art. He went to Bologna, and studied under the friendly tutelage of Guido; thence he went to Rome, where he painted, in the Cistercian monastery, the Miracle of the Loaves. Here he took a house, and entered upon his own characteristic style of art, that of battle-painting, in which he has been accounted to excel all other old masters; his merits were cordially recognized by the celebrated Cerquozzi, named Michelangelo delle Battaglie. He soon rose from penury to ease, and married a painter's beautiful daughter, Maria Vagini; she died after seven years of wedded life. Prince Matthias of Tuscany employed Courtois on some striking works in his villa, Lappeggio, representing with much historical accuracy the prince's military exploits. In Venice also the artist executed for the senator Sagredo some remarkable battle-pieces. Returning to Florence, he entered the Society of Jesus, taking the habit in Rome in 1655; it was calumniously rumoured that he adopted this course in order to escape punishment for having poisoned his wife. As a Jesuit father, Courtois painted many works in churches and monasteries of the society. He lived piously in Rome, and died there of apoplexy on 20th May 1676 (some accounts say 1670 or 1671). His battle-pieces have movement and fire, warm colouring, and great command of the brush,—those of moderate dimensions are the more esteemed. They are slight in execution, and tell out best from a distance. Courtois etched with skill twelve battle subjects of his own composition. The Dantzic painter named in Italy Pandolfo Reschi was his pupil.

Guillaume Courtois, born likewise at St Hippolyte, came to Italy with his brother. He went at once to Rome, and entered the school of Pietro da Cortona. He studied also the Bolognese painters and Guercino, and formed for himself a style with very little express mannerism, partly resembling that of Maratta. He painted the Battle of Joshua in the Quirinal Gallery, the Crucifixion of St Andrew in the church of that saint on Monte Cavallo, various works for the Jesuits, some also in co-operation with his brother. His last production was Christ admonishing Martha. His draughtsmanship is better than that of Jâques, whom he did not, however, rival in spirit, colour, or composition. He executed some etchings, moreover. Guillaume Courtois died of gout on 15th June 1679.

COURTRAI, in Flemish KORTRYK, a manufacturing and fortified town of Belgium, capital of the arrondissement of Courtrai, province of West Flanders, 26 miles south-west of Ghent. It is a neat well-built town, situated on both sides of the Lys or Leye, and connected by railways with most of the principal places in Belgium. Among its remarkable public buildings are the hôtel de ville, a Gothic edifice, built in 1526, and containing two singularly-carved chimney-pieces, representing the Virtues and Vices, and events in the early history of the town, and the church of Notre Dame, a Gothic structure, founded in 1238 by Baldwin, count of Flanders and emperor of Constantinople, but, except a small portion on one side, modernized and lined with marble. This church contains Vandyck's celebrated painting of the Raising of the Cross. In St Martin's Church is a beautiful tabernacle of carved stone-work in the richest Gothic style, erected probably about the end of the 15th century; this church, which dates from about 1390, was rebuilt in the 15th century, and again after being burned in 1862. Courtrai has also an exchange, a college, an academy of design, two orphan asylums, and a public library. A great part of its inhabitants are employed in the spinning of flax and the weaving of plain and damask linens; 5000 to 6000 women are employed in lace-making, besides which cotton and woollen goods, paper, sugar, tobacco, leather, soap, &c., are manufactured. The vicinity is highly cultivated, producing large quantities of the finest flax for supplying the manufactories of the town and for exportation. Courtrai existed in the time of the Romans under the name of Cortoriacum, which was afterwards changed to Curtricum. In the 7th century it was a municipal city, and in 1302 was fought under its walls the famous battle of the Spurs, in which 20,000 Flemings, chiefly weavers from Ghent and Bruges, routed and put to flight a French army of 7000 knights and noblemen, and 40,000 infantry. About 700 gilt spurs were gathered on the field of battle, and hung up as a trophy in the church of the convent of Groenangen, now destroyed. The town was taken by the French in 1793, and made the capital of the department of Lys. Population (1874) 27,076.

COUSIN, Victor (1792–1867), was, like another eminent Frenchman, Jean Jacques Rousseau, the son of a watchmaker. He was born in Paris, in the Quartier St Antoine, on the 28th November 1792. The year of his birth was a critical one for France and for Europe. The ruins of the Bastille, which adjoined the place of his birth, already symbolized the wreck of the ancient order of things. The National Assembly had in the autumn decreed the deposition of the king; the National Convention had been appointed to try him as Louis Capet (21st September), and three days later France was declared a republic. While the childhood of the future philosopher was passing in the Quartier St Antoine, the king was guillotined in the neighbouring Place de la Révolution; Christianity was deposed, like the monarch himself, and the worship of reason solemnly inaugurated; Marie Antoinette passed through her bitter humiliations to execution. Before the boy was old enough to be sent to the secondary school of the Quartier, Danton and Robespierre had risen, tyrannized, and fallen; the Girondists had gone down before the Jacobins, and Bonaparte had been proclaimed consul. A youth whose predilections were towards letters or philosophy had his lot cast in especially troubled times. At the age of ten young Cousin was sent to the secondary or grammar school of the Quartier St Antoine, named *Lycée Charlemagne*, a seminary of a rank analogous to the Prussian gymnasium. Here he studied until he was eighteen. This embraced the time of the Consulate and the First Empire,—the period of the power of Bonaparte down to very near the commencement of its decline. The *Lycée* had a connection with the university, and when Cousin left the secondary school, he was *crowned* in the ancient hall of the Sorbonne for the Latin oration delivered by him there, in the general concourse of his school competitors. This juvenile distinction may be taken as the sign and promise of that fervid oratorical power for which in after years he was so remarkable. Curiously enough, it was this very hall of the Sorbonne which afterwards witnessed the greatest oratorical triumphs of his manhood, and it was in a suite of rooms under the same roof that he passed in quiet reflective seclusion the latter years of his long and active intellectual life. The careful classical training of the *Lycée* had at this early period strongly disposed him to literature. He was already known among his compeers for a decided superiority in Greek and familiarity with the best Greek authors. From the *Lycée* he passed to the Normal School of Paris,—an institution of the higher educational order corresponding very much to the faculty of arts in our Scottish universities. It was destined to train the best youths of the secondary schools for teachers in the more advanced departments. At first simply a pupil, he very soon became a monitor or *maître-répétiteur* in Greek. His impulse at this time was entirely towards letters. But it was now his fortune to meet with a powerful influence in a somewhat opposite direction. This was the teaching of Laromiguière, who was then lecturing on philosophy in the Normal School. Cousin was through life essentially open to and impressible by outward influences; and the earnestness and striking power of intellectual analysis displayed by the thinker in France who first opened up to him the questions of philosophy, and first, though only slightly, broke up the beaten path of Condillacism, were very certain to modify his character and studies. In the second preface to the *Fragmens Philosophiques*, in which he manfully and candidly states the varied philosophical influences of his life and their relation to his own opinions, he speaks of the grateful emotion excited by the memory of the day in 1811, when as a pupil in the Normal School destined to letters, he heard Laromiguière for the first time. "That day decided my whole life. Laromiguière taught the philosophy of Locke and Condillac, happily modified on some points, with a clearness and grace which in appearance at least removed difficulties, and with a charm of spiritual *bonhomie* which penetrated and subdued." Cousin was set forthwith to lecture on philosophy, and he speedily obtained the position of master of conferences (*maître de conférences*) in the school. It was the practice of his pupils, who were usually in the third year of their course, to take notes and make a summary of the lectures delivered, and thereafter to meet in conference, the master presiding, for the purpose of discussing the principal points contained in them. This was the revival of a process very much akin to the mediæval practice of *determining* as it was called. Cousin in the first preface to the *Fragmens* refers with great pleasure to the cherished memories of this period, when, he himself young and ardent and surrounded by sympathetic pupils, they together, forgetful of all else, essayed "the eternal problems" of speculative philosophy.

Early philosophical influences.

The youthful thinker very soon, however, passed beyond the point of view of Laromiguière. Royer-Collard was lecturing in the chair of the history of modern philosophy in the faculty of letters. Cousin was very speedily attracted by him, and the teaching of Royer-Collard formed the second great philosophical impulse of his life. This teacher, as he tells us, "by the severity of his logic, the gravity and weight of his words, turned me by degrees, and not without resistance, from the beaten path of Condillac into the way which has since become so easy, but which was then painful and unfrequented, that of the Scottish philosophy." In 1815–16 Cousin attained the position of *suppléant* or assistant to Royer-Collard in the chair of the faculty of letters. But there was still another mind which influenced the young and susceptible philosopher at this early period. This was Maine-de-Biran,—the expounder of the volitional theory of cause, and the upholder of a highly spiritual philosophy. Cousin regarded Maine-de-Biran as the unequalled psychological observer of his time in France, alike in the delicacy and the depth of his analysis. All these men strongly influenced both the method and the matter of his philosophical thought. To Laromiguière he himself attributes the lesson of decomposing thought, even though the reduction of it to sensation was inadequate. Royer-Collard taught him that even sensation is subject to certain internal laws and principles which it does not itself explain, which are superior to analysis and the natural patrimony of the mind. De Biran made a special study of the phenomena of the will. He taught him to distinguish in all cognitions, and especially in the simplest facts of consciousness, the fact of voluntary activity, that activity in which our personality is truly revealed. It was through this "triple discipline," as he calls it, that Cousin's philosophical thought was first developed, and that in 1815 he entered on the public teaching of philosophy in the Normal School and in the faculty of letters[1]. But the energy and impressibility of the young professor were not to be limited by the philosophical thought of his own country. He betook himself to the study of German, worked at Kant and Jacobi, and then sought to master the *Philosophy of Nature* of Schelling. By this he was at first greatly attracted. The influence of Schelling became manifest in his teaching, and it may be observed very markedly in the earlier form of his philosophy. He sympathized with the principle of faith of Jacobi, but regarded it as arbitrary so long as it was not recognized as grounded in reason. In 1817 he went to Germany, and met Hegel at Heidelberg. In this year appeared Hegel's *Encyclopædia of the Philosophical Sciences*, of which Cousin had one of the earliest copies. He thought Hegel not particularly amiable; but the two became friends. The following year Cousin went to Munich, where he met Schelling for the first time, and spent a month with him and Jacobi, obtaining a deeper insight into the *Philosophy of Nature*. His contrast of Hegel and Schelling is interesting. No two people, he tells us, can be more unlike than the master and the disciple. "Hegel lets fall words few and profound, and somewhat enigmatic; his speech is strong but embarrassed; his immovable countenance, his clouded forehead, seem the image of thought which turns back on itself. Schelling is thought developed. His language is like his look, rapid, full of *éclat* and life. He is naturally eloquent."

Cousin's future course in life as a professor of philosophy seemed now to be determined. But the political troubles of the country were to interfere for a time with this promising career. In the events of 1814–15 Cousin took the royalist side. He at first adopted the views of the party of which Royer-Collard was the philosophical chief, known as *doctrinaire*. He seems then to have gone further than this party, and even to have approached the extreme Left or *Carbonari* section of politicians. This has been alleged, though it is not in accordance with the usual moderation of his character and political views. Then came a reaction against liberalism, and in 1821–22 Cousin was deprived of his offices alike in the faculty of letters and in the Normal School. The Normal School itself was swept away. He simply shared at the hands of a narrow and illiberal Government, influenced mainly by the priesthood, the fate of Guizot, who was ejected from the chair of history. Such was the spirit which actuated the first restoration and the Government of Louis XVIII. This enforced abandonment of public teaching was not wholly an evil to the young speculator. He again set out for Germany with a view to further philosophical study. And here there occurred a curious episode in his life. While at Berlin in 1824–25 he was arrested and thrown into prison, either on some ill-defined political charge at the instance of the French police, or on account of certain incautious expressions which he had let fall in conversation. This imprisonment was in fact the result of the persistent persecution of the man who exercised free thought and preached toleration, at the hands of the priestly party in France, who, ruling a weak king, had already deprived the professor of his public offices. Cousin was liberated at the end of six months,—having thus for an abstract philosopher had a tolerable taste of political martyrdom. He continued under the suspicion of the French Government for three years longer. It was during this period, however, that he thought out and developed what is distinctive in his philosophical doctrine. His eclecticism, ontology, and his philosophy of history were declared in principle and in most of their salient details in the *Fragmens Philosophiques* of 1826. The preface to the second edition (1833) and the *Avertissement* to the third (1838) aimed at a vindication of his principles from hostile contemporary criticism. Even the best of his later books, the *Philosophie Ecossaise*, the *Du Vrai, du Beau, et du Bien*, and the *Philosophie de Locke* were simply matured revisions of his lectures during the period from 1815 to 1820. The lectures on Locke were first sketched in 1819, and fully developed in the course of 1829.

During the seven years of forced abandonment of teaching, he produced, besides the *Fragmens*, the edition of the works of Proclus (6 vols. 1820-27), and the works of Descartes (11 vols., 1826). He also commenced his *Translation of Plato* (13 vols.), which occupied his leisure time from 1825 to 1840.

We see in the *Fragmens* very distinctly the fusion of the different philosophical influences of his life to which we have referred, and by which his opinions were finally moulded and matured. For Cousin was as eclectic in cast of thought and personal habit of mind, as he was in philosophical principle and system. It is with the publication of the *Fragmens* of 1826 that the first great widening of his reputation is associated. In 1827 followed the *Cours de l'Histoire de la Philosophie.*

In 1828 popular feeling forced the king (Charles X.) to a change of ministry, and M. Martignac returned to the constitutional Charter of 1814, which sought to conciliate liberty and order, but which had been most unfaithfully worked under the restoration. A more enlightened and tolerant spirit seems to have arisen, and M. de Vatimesnil, minister of public instruction, recalled Cousin along with Guizot to their professorial positions in the university. Cousin's re-appearance in the chair, "on the occasion," as he said, "of the return of the constitutional hopes of France," was marked by an enthusiastic demonstration on the part of students and auditors. The professoriate in Paris reached its golden age, at least in this century, when Guizot, Villemain, and Cousin were now colleagues in the faculty of letters.

The three years which followed 1828 was the period of Cousin's greatest distinction and triumph as a lecturer. He re-appeared in sympathy with the national feeling of the time; he had suffered for his adherence to popular principles; his return to the chair was at once a compensation for what he had undergone, and the symbol of the triumph of constitutional ideas. This prepared a ready sympathy for him. The hall of the Sorbonne was crowded with auditors as the hall of no philosophical teacher in

[1] *Fragmens Philosophiques*,—Préface Deuxième.

Paris had been since the days of Abelard. The lecturer had a singular power of identifying himself for the time with the system which he expounded, and the historical character he pourtrayed. Clear and comprehensive in the grasp of the general outlines of his subject, he was at the same time exceedingly methodical and vivid in the representation of details. In exposition he had the rare art of unfolding and aggrandizing. Beginning with the simple or particular, he proceeded readily and easily to complete the listener's grasp of the matter in hand. There was a rich deep-toned resonant eloquence mingled with the speculative exposition; his style of expression was clear, elegant, and forcible, abounding in happy turns and striking antitheses. To this was joined a singular power of rhetorical climax. His philosophy exhibited in a striking manner the generalizing tendency of the French intellect, and its logical need of grouping details round central principles. The pretension even to grasp and formulize the history of philosophy was dazzling to the imagination of a Parisian auditory, however little ground it might have in fact or reason.

There was withal a moral earnestness and elevation in his spiritual philosophy which came home to the hearts of his hearers, and which seemed to afford a ground for higher development in national literature and art, and even in politics, than the traditional philosophy of France had appeared capable of yielding. It was thus not to be wondered at that the philosophical orator was received with enthusiasm, and that his lectures produced more ardent disciples, imbued at least with his spirit, than it has been the fortune of any other professor of philosophy in France to gather round him in this century. Tested by the power and effect of his teaching influence, Victor Cousin occupies a foremost place in the rank of professors of philosophy, who like Jacobi and Schelling in Germany and Dugald Stewart in Scotland, have united the rare gifts of speculative, expository, and imaginative faculty. Tested even by the strength of the reaction which his writings have in some cases occasioned, his influence is hardly less remarkable, and the degree of petulant detraction to which he himself and his philosophy have been subjected even in France may be taken as the tribute of envy to his power. The taste for philosophy,—especially its history,—was revived in France to an extent unknown since the 17th century.

Among the more distinguished men who were influenced by the teaching and example of Cousin, and who have carried on philosophical work in his manner and spirit, we may note Jouffroy, Damiron, Garnier, Barthelemy St Hilaire, Ravaisson, Rémusat, Jules Simon, and Franck. Jouffroy and Damiron were first fellow students, and then auditors and disciples. Jouffroy, however, always kept firm to the early—the French and Scottish—impulses of Cousin's teaching. The best research in the history of philosophy, and the best thought of France during the period from 1830 to 1848, were doubtless due to the teaching and writings of Cousin. In fact, for fully fifty years of the philosophical life of France, Cousin has been the greatest power. He continued to lecture regularly for two years and a half after his return to the chair. The three bloody days of July 1830 led to the flight of Charles X. This was followed by the accession of Louis Philippe, "by the will of the people,"—which meant very much the *bourgeoisie* of Paris and the middle class of the country. Cousin sympathized entirely with the revolution of July, and he was at once recognized by the new Government as a friend of national liberty and constitutional rights. Writing in June 1833 he explains both his philosophical and his political position:—

"I had the advantage of holding united against me for many years, both the sensational and the theological school. In 1830 both schools descended into the arena of politics. The sensational school quite naturally produced the demagogic party, and the theological school became quite as naturally absolutism, safe to borrow from time to time the mask of the demagogue in order the better to reach its ends, as in philosophy it is by scepticism that it undertakes to restore theocracy. On the other hand, he who combated any exclusive principle in science was bound to reject also any exclusive principle in the state, and to defend representative government."

The Government was not tardy in honouring his public services as a professor and his contributions to the philosophical literature of the country. He was induced by the ministry of which his friend Guizot was the head to take a part in national administration. He ceased to lecture, but retained the title of professor of philosophy. He became a member of the council of public instruction and counsellor of state, and in 1832 he was made a peer of France. Finally, he accepted the position of minister of public instruction in 1840 under Thiers. He was besides director of the Normal School and virtual head of the university, and from 1840 a member of the Institute (Academy of the Moral and Political Sciences). His character and his official position at this period gave him great power in the university and in the educational arrangements of the country. In fact, during the seventeen and a half years of the reign of Louis Philippe, Cousin mainly moulded the philosophical and even the literary tendencies of the cultivated class in France.

But the most important work he accomplished during this period was doubtless the organization of primary instruction in the country. It was to the efforts of Cousin that France owed her advance, in primary education, from 1830 to 1848. Prussia and Saxony had set the national example, and France was guided into it by Cousin. Forgetful, as has been well said, of "national calamity and of personal wrong," he looked to Prussia as affording the best example of an organized system of national education; and he was persuaded that "to carry back the education of Prussia into France afforded a nobler (if a bloodless) triumph than the trophies of Austerlitz and Jena." In the summer of 1831, commissioned by the Government, he proceeded to Germany, visiting Frankfort and Saxony, and spending some time in Berlin. The result was a series of reports to the minister, afterwards published as *Rapport sur l'État de l'Instruction Publique dans quelques pays de l'Allemagne et particulièrement en Prusse*. (Compare also *De l'Instruction Publique en Hollande*, 1837.) His views were readily accepted on his return to France, and soon afterwards through his influence there was passed the law of primary instruction. (See his *Exposé des Motifs et Projet de Loi sur l'Instruction Primaire, présentés à la Chambre des Députés, Séance du 2 Janvier* 1833.)

In the words of a reviewer at the time (*Edinburgh Review*, July 1833), these documents "mark an epoch in the progress of national education, and are directly conducive to results important not only to France but to Europe." The *Report* was translated by Mrs Austin in 1834. The translation was frequently reprinted in the United States of America. The legislatures of New Jersey and Massachusetts distributed it in the schools at the expense of the States. Cousin remarks that, among all the literary distinctions which he had received, "None has touched me more than the title of foreign member of the American Institute for Education." To the enlightened views of the ministries of Guizot and Thiers under the citizen-king, and to the zeal, energy, and ability of Cousin in the work of organization, France owes what is best in her system of primary education,—a national interest which had been neglected under the Revolution, the Empire, and the Restoration (see *Exposé*, p. 17). In the first two years of the reign of Louis Philippe more was done for the education of the people than had been either sought or accomplished in all the history of France. France since then has, perhaps, owing to political troubles and ecclesiastical obstacles, followed but falteringly in the steps of Prussia; but some considerable progress has been made on the lines laid down by Cousin in a spirit of far-seeing patriotism. If, in 1866, about 30 per cent. of the military conscripts were unable to read, yet we must put alongside of this the fact that, while in 1824, the year of the accession of Charles X., out of the 44,000 communes of France 25,000 were without schools, in that same year of 1866 there were 41,000 free and public schools for boys, and 14,000 for girls. In connection with his services to education we ought not to omit a notice of his noble and eloquent defence of university studies in the Chamber of Peers in 1844, when he stood manfully forth against the clerical party on the one hand, and the levelling or Philistine party on the other. His speeches on this occasion were afterwards published in a most interesting tractate entitled *Défense de l'Université et de la Philosophie.*

This period of official life from 1830 to 1848 was spent by him, so far as philosophical study was concerned, in revising his former lectures and writings, in maturing them for publication or re-issue, and in research into certain periods of the history of philosophy. In 1835 appeared *De la Métaphysique d'Aristote, suivi d'un Essai de traduction des deux premiers livres;* in 1836, *Cours de philosophie professé à la faculté des lettres pendant l'année* 1818, and *Ouvrages inedits d'Abélard.* This *Cours de Philosophie* appeared later in 1854 as *Du Vrai, du Beau, et du Bien.* From 1825 to 1840 appeared *Cours de l'Histoire de la Philosophie;* in 1839 *Manuel de l'Histoire de la Philosophie de Tennemann,* translated from the German. In 1840-41 we have *Cours d'Histoire de la Philosophie Morale au* XVIII[e] *Siècle* (5 vols). In 1841 appeared his edition of the *Œuvres Philosophiques de Maine-de-Biran;* in 1842, *Leçons de Philosophie sur Kant,* and in the same year *Des Pensées de Pascal.* The *Nouveaux Fragments* were gathered together and republished in 1847. Later, in 1859, appeared *Petri Abælardi Opera.*

During this period also he seems to have turned with fresh interest to those literary studies which in his youth he had abandoned for speculation under the influence of Laromiguière and Royer-Collard. To this renewed interest we owe his studies of men and women of note in France in the 17th century. This was an epoch of the national history whose spiritualism, alike in philosophy and religion, had a special attraction for him. He turned to it with increasing regard in his latter years, as best representing his own personal convictions and feelings. As the results of his work in this line, we have, besides the *Des Pensées de Pascal,* 1842, already noticed, *Etudes sur les Femmes et la Société du* XVII[e] *Siècle,* 1853. He has sketched Jacqueline Pascal, Madame de Longueville, Madame de Sablé, Madame de Chevreuse, Madame de Hautefort. There is as yet no complete edition of his numerous works, which is a great desideratum.

When the reign of Louis Philippe came to a close through the opposition of his ministry, with Guizot at its head, to the demand for electoral reform and through the disgraceful policy of the Spanish marriages, Cousin, who was opposed to the Government on these points, lent his sympathy to Cavaignac and the Provisional Government. He published a pamphlet entitled *Justice et Charité,* the purport of which showed the moderation of his political views. It was markedly anti-socialistic. But from this period he passed almost entirely from public life, and ceased to wield the personal influence which he had done during the preceding years. After the *coup d'état* of the 2d December, he was deprived of his position as permanent member of the superior council of public instruction. From Napoleon and the empire he stood essentially aloof. A decree of 1852 placed him along with Guizot and Villemain in the rank of honorary professors. His sympathies were apparently with the monarchy, under certain constitutional safeguards. Speaking in 1853 of the political issues of the spiritual philosophy which he had taught during his lifetime, he says,—"It conducts human societies to the true republic, that dream of all generous souls, which in our time can be realized in Europe only by constitutional monarchy."[1]

During the last years of his life, he occupied a suite of rooms in the Sorbonne, where he lived very simply and unostentatiously. The chief feature of the rooms was the noble library, the cherished collection of a lifetime, which was spread over the walls of each apartment. Besides Latin and Greek classics, representing the studies of his youth, it was rich in philosophical literature, especially historical. The compartments for Italian and English literature and philosophy were especially full and interesting; and the whole was so carefully and methodically arranged that its learned possessor could quite readily lay his hand on any volume of his treasures. The present writer may perhaps be pardoned for saying that he well recollects a forenoon spent with him in these rooms, some twelve years ago. The kindliness of his manner, the richness of his talk, his wonderful acquaintance with British literature, politics, and philosophy, the massive head with hair slightly turned to grey, and the kindling dark brown eyes, are elements in the picture of a very pleasant memory.

Death.

M. Cousin died at Cannes on the 13th January 1867 in his sixty-fifth year. In the front of the Sorbonne, below the lecture-rooms of the faculty of letters, is a tablet recording an extract from the will of Victor Cousin, in which he appropriately bequeathes his noble and cherished library to the halls of his professorial work and triumphs.

His philosophy

There are three distinctive points in the philosophy of M. Cousin. These are his method, the results of his method, and the application of the method and its results to history,—especially to the history of philosophy. It is usual to speak of his philosophy as eclecticism. It is eclectic only in a secondary and subordinate sense. All eclecticism that is not self-condemned and inoperative implies a system of doctrine as its basis,—in fact, a criterion of truth. Otherwise, as Cousin himself remarks, it is simply a blind and useless syncretism. And Cousin saw and proclaimed from an early period in his philosophical teaching the necessity of a system on which to base his eclecticism. This is indeed advanced as an illustration or confirmation of the truth of his system,—as a proof that the facts of history correspond to his analysis of consciousness. These three points—the method, the results, and the philosophy of history—are with him intimately connected; they are developments in a natural order of sequence. They become in practice Psychology, Ontology, and Eclecticism in history.

First, as to method. On no point has Cousin more strongly and frequently insisted than the importance of the method which philosophy may adopt. That which he adopts, and the necessity of which he so strongly proclaims, is the ordinary one of observation, analysis, and induction. This may seem commonplace enough, but it is really not so; it makes all the difference in the world as to the character of a philosophy whether we follow the reflective analysis of experience, or a deductive method of the construction of notions. The observational method Cousin

[1] *Du Vrai, Du Beau, Du Bien,*—Preface.

regards as that of the 18th century,—the method which Descartes began and abandoned, and which Locke and Condillac applied, but applied imperfectly, and which Reid and Kant used with more success, yet not completely. He insists that this is the true method of philosophy as applied to consciousness, in which alone the facts of experience appear. But the proper condition of the application of the method is that it shall not through prejudice of system omit a single fact of consciousness. If the authority of consciousness is good in one instance, it is good in all. If not to be trusted in one, it is not to be trusted in any. Previous systems have erred in not presenting the facts of consciousness, *i.e.*, consciousness itself, in their totality. The observational method applied to consciousness gives us the science of psychology. This is the basis and the only proper basis of ontology or metaphysics—the science of being—and of the philosophy of history. To the observation of consciousness Cousin adds induction as the complement of his method, by which he means inference as to reality necessitated by the data of consciousness, and regulated by certain laws found in consciousness, viz., those of the reason. By his method of observation and induction as thus explained, his philosophy will be found to be marked off very clearly, on the one hand from the deductive construction of notions of an absolute system, as represented either by Schelling or Hegel, which Cousin regards as based simply on hypothesis and abstraction, illegitimately obtained; and on the other, from that of Kant, and in a sense, of Hamilton, both of which in the view of Cousin are limited to psychology, and merely relative or phenomenal knowledge, and issue in scepticism so far as the great realities of ontology are concerned. What Cousin finds psychologically in the individual consciousness, he finds also spontaneously expressed in the common sense or universal experience of humanity. In fact, it is with him the function of philosophy to classify and explain universal convictions and beliefs; but common sense is not with him philosophy, nor is it the instrument of philosophy; it is simply the material on which the philosophical method works, and in harmony with which its results must ultimately be found.

The three great results of psychological observation are Sensibility, Activity or Liberty, and Reason.

These three facts are different in character, but are not found apart in consciousness. Sensations, or the facts of the sensibility, are necessary; we do not impute them to ourselves. The facts of reason are also necessary, and reason is not less independent of the will than the sensibility. Voluntary facts are alone marked in the eyes of consciousness with the characters of imputability and personality. The will alone is the person or *Me*. The me is the centre of the intellectual sphere without which consciousness is impossible. We find ourselves in a strange world, between two orders of phenomena which do not belong to us, which we apprehend only on the condition of our distinguishing ourselves from them. Further, we apprehend by means of a light which does not come from ourselves. All light comes from the reason, and it is the reason which apprehends both itself, and the sensibility which envelopes it and the will which it obliges but does not constrain. Consciousness then is composed of these three integrant and inseparable elements. But Reason is the immediate ground of knowledge, and of consciousness itself.

But there is a peculiarity in M. Cousin's doctrine of activity or freedom, and in his doctrine of reason, which enters deeply into his system. This is the element of spontaneity in volition and in reason. This is the heart of what is new alike in his doctrine of knowledge and being. Liberty or freedom is a generic term which means a cause or being endowed with self-activity. This is to itself and its own development its own ultimate cause. Free-will is so, although it is preceded by deliberation and determination, *i.e.*, reflection, for we are always conscious that even after determination we are free to will or not to will. But there is a primary kind of volition, which has not reflection for its condition, which is yet free and spontaneous. We must have willed thus spontaneously first, otherwise we could not know, before our reflective volition, that we could will and act. Spontaneous volition is free as reflective, but it is the primary act of the two. This view of liberty of will is the only one in accordance with the facts of humanity; it excludes reflective volition, and explains the enthusiasm of the poet and the artist in the act of creation; it explains also the ordinary actions of mankind, which are done as a rule spontaneously and not after reflective deliberation.

But it is in his doctrine of the Reason that the distinctive principle of the philosophy of Cousin lies. The reason given to us by psychological observation, the reason of our consciousness, is impersonal in its nature. We do not make it; its character is precisely the opposite of individuality; it is universal and necessary. The recognition of universal and necessary principles in knowledge is the essential point in psychology; it ought to be put first and emphasized to the last that these exist, and that they are wholly impersonal or absolute. The number of these principles, their enumeration and classification, is an important point, but it is secondary to that of the recognition of their true nature. This was the point which Kant missed in his analysis, and this is the fundamental truth which Cousin thinks he has restored to the integrity of philosophy by the method of the observation of consciousness. And how is this impersonality or absoluteness of the conditions of knowledge sought to be established? The answer is in substance that Kant went wrong in putting necessity first as the criterion of those laws. This brought them within the sphere of reflection, and gave as their guarantee the impossibility of thinking them reversed; and led to their being regarded as wholly relative to human intelligence, restricted to the sphere of the phenomenal, incapable of revealing to us substantial reality—necessary, yet subjective. But this test of necessity is a wholly secondary one; these laws are not thus guaranteed to us; they are each and all given to us, given to our consciousness, in an act of spontaneous apperception or apprehension, immediately, instantaneously, in a sphere above the reflective consciousness, yet within the reach of knowledge. And "all subjectivity with all reflection expires in the spontaneity of apperception. The reason becomes subjective by relation to the voluntary and free self; but in itself it is impersonal; it belongs not to this or to that self in humanity; it belongs not even to humanity. We may say with truth that nature and humanity belong to it, for without its laws both would perish."

But what is the number of those laws? Kant reviewing the enterprize of Aristotle in modern times has given a complete list of the laws of thought, but it is arbitrary in classification, and may be legitimately reduced. According to Cousin, there are but two primary laws of thought, that of causality and that of substance. From these flow naturally all the others. In the order of nature, that of substance is the first and causality second. In the order of acquisition of our knowledge, causality precedes substance, or rather both are given us in each other, and are contemporaneous in consciousness.

These principles of reason, cause and substance, given thus psychologically, enable us to pass beyond the limits of the relative and subjective to objective and absolute reality,—enable us, in a word, to pass from psychology, or the science of knowledge, to ontology, or the science of being. These laws are inextricably mixed in consciousness with the data of volition and sensation, with free activity and fatal action or impression, and they guide us in rising to a personal being, a self or free cause, and to an impersonal reality, a not-me—nature, the world of force—lying out of us, and modifying us. As I refer to myself the act of attention and volition, so I cannot but refer the sensation to some cause, necessarily other than myself, that is, to an external cause, whose existence is as certain for me as my own existence, since the phenomenon which suggests it to me is as certain as the phenomenon which had suggested my reality, and both are given in each other. I thus reach an objective impersonal world of forces which corresponds to the variety of my sensations. The relation of these forces or causes to each other is the order of the universe.

But these two forces, the me and the not-me, are reciprocally limitative. As reason has apprehended these two simultaneous phenomena, attention and sensation, and led us immediately to conceive the two sorts of distinct causes, correlative and reciprocally finite, to which they are related, so, from the notion of this limitation, we find it impossible under the same guide not to conceive a supreme cause, absolute and infinite, itself the first and last cause of all. This is relatively to self and not-self what these are to their proper effects. This cause is self-sufficient, and is sufficient for the reason. This is God; he must be conceived under the notion of cause, related to humanity and the world. He is absolute substance only in so far as he is absolute cause, and his essence lies precisely in his creative power. He thus creates, and he creates necessarily.

This theodicy of Cousin laid him open obviously enough to the charge of pantheism. This he repels, and his answer may be summed up as follows. Pantheism is properly the deification of the law of phenomena, the universe God. But I distinguish the two finite causes self and not-self from each other and from the infinite cause. They are not mere modifications of this cause or properties, as with Spinoza,—they are free forces having their power or spring of action in themselves, and this is sufficient for our idea of independent finite reality. I hold this, and I hold the relation of these as effects to the one supreme cause. The God I plead for is neither the deity of Pantheism, nor the absolute unity of the Eleatics, a being divorced from all possibility of creation or plurality, a mere metaphysical abstraction. The deity I maintain is creative, and necessarily creative. The deity of Spinoza and the Eleatics is a mere substance, not a cause in any sense. As to the necessity under which Deity exists of acting or creating, this is the highest form of liberty, it is the freedom of spontaneity, activity without deliberation. His action is not the result of a struggle between passion and virtue. He is free in an unlimited manner, the purest spontaneity in man is but the shadow of the freedom of God. He acts freely but not arbitrarily, and with the consciousness of being able to choose the opposite part. He cannot deliberate or will as we do. His spontaneous action excludes at once the efforts and the miseries of will and the mechanical operation of necessity.

The elements found in consciousness are also to be found in the history of humanity and in the history of philosophy. In external nature there are expansion and contraction which correspond to spontaneity and reflection. External nature again in contrast with humanity expresses spontaneity; humanity expresses reflection. In human history the East represents the spontaneous stage; the Pagan and Christian world represent stages of reflection.

This was afterwards modified, expanded, and more fully expressed by saying that humanity in its universal development has three principal moments. First, in the spontaneous stage, where reflection is not yet developed, and art is imperfect, humanity has thought only of the immensity around it. It is preoccupied by the infinite. Secondly, in the reflective stage, mind has become an object to itself. It thus knows itself explicitly or reflectively. Its own individuality is now the only or at least the supreme thing. This is the moment of the finite. Thirdly, there comes an epoch in which the self or me is subordinated. Mind realizes another power in the universe. The finite and the infinite become two real correlatives in the relation of cause and product. This is the third and highest stage of development, the relation of the finite and the infinite. As philosophy is but the highest expression of humanity, these three moments will be represented in its history. The East typifies the infinite, Greece the finite or reflective epoch, the modern era the stage of relation or correlation of infinite and finite. In theology, the dominant philosophical idea of each of these epochs results in pantheism, polytheism, theism. In politics we have in correspondence also with the idea, monarchy, democracy, constitutionalism.

Eclecticism thus means the application of the psychological method to the history of philosophy. Confronting the various systems co-ordinated as sensualism, idealism, scepticism, mysticism, with the facts of consciousness, the result was reached "that each system expresses an order of phenomena and ideas, which is in truth very real, but which is not alone in consciousness, and which at the same time holds an almost exclusive place in the system; whence it follows that each system is not false but incomplete, and that in reuniting all incomplete systems, we should have a complete philosophy, adequate to the totality of consciousness." Philosophy, as thus perfected, would not be a mere aggregation of systems, as is ignorantly supposed, but an integration of the truth in each system after the false or incomplete is discarded.

Such is the system in outline. The historical position of the system lies in its relations to Kant, Schelling, and Hegel. Cousin was opposed to Kant in asserting that the unconditioned in the form of infinite or absolute cause was but a mere unrealizable tentative or effort on the part of the mind, something different from a mere negation, yet not equivalent to a positive thought. With Cousin the absolute as the ground of being is grasped positively by the intelligence, and it renders all else intelligible; it is not as with Kant a certain hypothetical or regulative need.

With Schelling again Cousin agrees in regarding this supreme ground of all as positively apprehended, and as a source of development, but he utterly repudiates Schelling's method. The intellectual intuition either falls under the eye of consciousness, or it does not. If not, how do you know it and its object which are identical? If it does, it comes within the sphere of psychology; and the objections to it as thus a relative, made by Schelling himself, are to be dealt with. Schelling's intellectual intuition is the mere negation of knowledge.

Again, the pure being of Hegel is a mere abstraction,—an hypothesis illegitimately assumed, which he has nowhere sought to vindicate. The very point to be established is the possibility of reaching being *per se* or pure being; yet in the Hegelian system this is the very thing assumed as a starting-point. Besides this, of course, objections might be made to the method of development, as not only subverting the principle of contradiction, but as galvanizing negation into a means of advancing or developing the whole body of human knowledge and reality. The intellectual intuition of Schelling, as above consciousness, the pure being of Hegel, as an empty abstraction, unvindicated, illegitimately assumed, and arbitrarily developed, are equally useless as bases of metaphysics. This led Cousin, still holding by essential knowledge of being, to ground it in an analysis of consciousness,— in psychology.

The absolute or infinite—the unconditioned ground and source of all reality—is yet apprehended by us as an immediate datum or reality; and it is apprehended in consciousness,—under its condition, that, to wit, of distinguishing subject and object, knower and known. The doctrine of Cousin was, as is well known, criticised by Sir W. Hamilton in the *Edinburgh Review* of 1829, and it was animadverted upon about the same time by Schelling. The latter Cousin calls the greatest thinker, and the former the greatest critic of the age. Hamilton's objections are as follows. The correlation of the ideas of infinite and finite does not necessarily imply their correality, as Cousin supposes; on the contrary, it is a presumption that finite is simply positive and infinite negative of the same,—that the finite and infinite are simply contradictory relatives. Of these "the positive alone is real, the negative is only an abstraction of the other, and in the highest generality even an abstraction of thought itself." A study of the few sentences under this head might have obviated the trifling criticism of Hamilton's objection which has been set afloat recently, that the denial of a knowledge of the absolute or infinite implies a foregone knowledge of it. How can you deny the reality of that which you do not know? The answer to this is that in the case of contradictory statements,—A and not A,—the latter is a mere negation of the former, and posits nothing; and the negation of a notion with positive attributes, as the finite, does not extend beyond abolishing the given attributes as an object of thought. The infinite or non-finite is not necessarily known, ere the finite is negated, or in order to negate it; all that needs be known is the finite itself; and the contradictory negation of it implies no positive. Non-organized may or may not correspond to a positive,—*i.e.*, an object or notion with qualities contradictory of the organized; but the mere sublation of the organized does not posit it, or suppose that it is known beforehand, or that anything exists corresponding to it. This is one among many flaws in the Hegelian dialectic, and it paralyzes the whole of the *Logic*. Secondly, The conditions of intelligence, which Cousin allows, necessarily exclude the possibility of knowledge of the absolute,—they are held to be incompatible with its unity. Here Schelling and Hamilton argue that Cousin's absolute is a mere relative. Thirdly, It is objected that in order to deduce the conditioned, Cousin makes his absolute a relative; for he makes it an absolute cause, *i.e.*, a cause existing absolutely under relation. As such it is necessarily inferior to the sum total of its effects, and dependent for reality on these—in a word, a mere potence or becoming. Further, as a theory of creation, it makes creation a necessity, and destroys the notion of the divine. Cousin made no reply to Hamilton's criticism beyond alleging that Hamilton's doctrine necessarily restricted human knowledge and certainty to psychology and logic, and destroyed metaphysics by introducing nescience and uncertainty into its highest sphere,—theodicy.

The attempt to render the laws of reason or thought impersonal by professing to find them in the sphere of spontaneous apperception, and above reflective necessity, can hardly be regarded as successful. It may be that we first of all primitively or spontaneously affirm cause, substance, time, space, &c., in this way. But these are still in each instance given us as realized in a particular form. In no single act of affirmation of cause or substance, much less in such a primitive act, do we affirm the universality of their application. We might thus get particular instances or cases of these laws, but we could never get the laws themselves in their universality, far less absolute impersonality. And as they are not supposed to be mere generalizations from experience, no amount of individual instances of the application of any one of them by us would give it a true universality. The only sure test we have of their universality in our experience is the test of their reflective necessity. We thus after all fall back on reflection as our ground for their universal application; mere spontaneity of apprehension is futile; their universality is grounded in their necessity, not their necessity in their universality. How far and in what sense this ground of necessity renders them personal are of course questions still to be solved.

But if these three correlative facts are immediately given, it seems to be thought possible by Cousin to vindicate them in reflective consciousness. He seeks to trace the steps which the reason has spontaneously and consciously, but irreflectively, followed. And here the question arises—Can we vindicate in a reflective or mediate process this spontaneous apprehension of reality?

The self is found to be a cause or force, free in its action, on the ground that we are obliged to relate the volition of consciousness to the self as its cause, and its ultimate cause. It is not clear from the analysis whether the self is immediately observed as an acting or originating cause, or whether reflection working on the principle of causality is compelled to infer its existence and character. If self is actually so given, we do not need the principle of causality to infer it; if it is not so given, causality could never give us either the notion or the fact of self as a cause or force, far less as an ultimate one. All that it could do would be to warrant *a cause* of some sort, but not this or that reality as the cause. And further, the principle of causality, if fairly carried out, as universal and necessary, would not allow us to stop at personality or will as the ultimate cause of its effect,—volition. Once applied to the facts at all, it would drive us beyond the first antecedent or term of antecedents of volition to a still further cause or ground,—in fact, land us in an infinite regress of causes.

The same criticism is even more emphatically applicable to the influence of a not-self, or world of forces, corresponding to our sensations, and the cause of them. Starting from sensation as our basis, causality could never give us this, even though it be allowed that sensation is impersonal to the extent of being independent of our volition. Causality might tell us that a cause there is of sensation somewhere and of some sort; but that this cause is a force or sum of forces, existing in space, independently of us, and corresponding to our sensations, it could never tell us, for the simple reason that such a notion is not supposed to exist in our consciousness. Causality cannot add to the number of our notions,—cannot add to the number of realities we know. All it can do is to necessitate us to think that a cause there is of a given change, but *what* that cause is it cannot of itself inform us, or even suggest to us, beyond implying that it must be adequate to the effect. Sensation might arise, for aught we know, so far as causality leads us, not from a world of forces at all, but from a will like our own, though infinitely more powerful, acting upon us, partly furthering and partly thwarting us. And indeed such a supposition is, with the principle of causality at work, within the limits of probability, as we are already supposed to know such a reality,—a will—in our own consciousness. When Cousin thus set himself to vindicate those points by reflection, he gave up the obvious advantage of his other position that the realities in question are given us in immediate and spontaneous apprehension. The same criticism applies equally to the inference of an absolute cause from the two limited forces which he names self and not-self. Immediate spontaneous apperception may seize this supreme reality; but to vindicate it by reflection as an inference on the principle of causality is impossible. This is a mere paralogism; we can never infer either absolute or infinite from relative or finite.

The truth is that M. Cousin's doctrine of the spontaneous apperception of impersonal truth amounts to little more than a presentment in philosophical language of the ordinary convictions and beliefs of mankind. This is important as a preliminary stage, but philosophy properly begins when it attempts to co-ordinate or systematize those convictions in harmony, to conciliate apparent contradiction and opposition, as between the correlative notions of finite and infinite, the apparently conflicting notions of personality and infinitude, self and not-self; in a word, to reconcile the various sides of consciousness with each other. And whether the laws of our reason are the laws of all intelligence and being,—whether and how we are to relate our fundamental, intellectual, and moral conceptions to what is beyond our experience, or to an infinite being,—are problems which Cousin cannot be regarded as having solved. These are in truth the outstanding problems of modern philosophy.

Volition. Cousin's doctrine of spontaneity in volition can hardly be said to be more successful than his impersonality of the reason through spontaneous apperception. Sudden, unpremeditated volition may be the earliest and the most artistic, but it is not the best. Volition is essentially a free choice between alternatives, and that is best which is most deliberate, because it is most rational. Aristotle long ago touched this point in his distinction between βούλησις and προαίρεσις. The sudden and unpremeditated wish represented by the former is wholly inferior in character to the free choice of the latter, guided and illumined by intelligence. In this we can deliberately resolve upon what is in our power; in that we are subject to the vain impulse of wishing the impossible. Spontaneity is pleasing, sometimes beautiful, but it is not in this instance the highest quality of the thing to be obtained. That is to be found in a guiding and illumining reflective activity.

Eclecticism is not open to the superficial objection of proceeding without a system or test in determining the complete or incomplete. But it is open to the objection of assuming that a particular analysis of consciousness has reached all the possible elements in humanity and in history, and all their combinations. It may be asked, Can history have that which is not in the individual consciousness? In a sense not; but our analysis may not give all that is there, and we ought not at once to impose that analysis or any formula on history. History is as likely to reveal to us in the first place true and original elements, and combinations of elements in man, as a study of consciousness. Besides, the tendency of applying a formula of this sort to history is to assume that the elements are developed in a certain regular or necessary order, whereas this may not at all be the case; but we may find at any epoch the whole mixed, either crossing or co-operative, as in the consciousness of the individual himself. Further, the question as to how these elements may possibly have grown up in the general consciousness of mankind is assumed to be non-existent or impossible.

It was the tendency of the philosophy of Cousin to outline things and to fill up the details in an artistic and imaginative interest. This is necessarily the case, especially in the application to history of all formulas supposed to be derived either from an analysis of consciousness, or from an abstraction called pure thought. Cousin was observational and generalizing rather than analytic and discriminating. His search into principles was not profound, and his power of rigorous consecutive development was not remarkable. These qualities are essential to the formation of a lasting body of philosophic knowledge. He has left no distinctive principle of philosophy which is likely to be permanent. But he has left very interesting psychological analyses, and several new, just, and true expositions of philosophical systems, especially that of Locke and the philosophers of Scotland. He was at the same time a man of impressive power, of rare and wide culture, and of lofty aim,—far above priestly conception and Philistine narrowness. He was familiar with the broad lines of nearly every system of philosophy ancient and modern. His eclecticism was the proof of a reverential sympathy with the struggles of human thought to attain to certainty in the highest problems of speculation. It was eminently a doctrine of comprehension and of toleration. In these respects it formed a marked and valuable contrast to the arrogance of absolutism, which really means a supreme egoism, to the narrow dogmatism of sensationalism, and to the not less narrow doctrine of church authority, preached by the theological school of his day. His spirit, while it influenced the youth of France, saved them from the effects of all these lowering influences. As an earnest educational reformer, as a man of letters and learning, who trode "the large and impartial ways of knowledge," and who swayed others to the same paths, as a thinker influential alike in the action and the reaction to which he led,—in some cases the petulant detraction which may pass as a tribute to power,—Cousin stands out conspicuously among the memorable Frenchmen of the 19th century.

We might be inclined to modify the strength of some of the following expressions, but we cannot help feeling that they are in the main true:—"A profound and original thinker, a lucid and eloquent writer, a scholar equally at home in ancient and in modern learning, a philosopher superior to all prejudices of age or country, party or profession, and whose lofty eclecticism, seeking truth under every form of opinion, traces its unity even through the most hostile systems." Such was the estimate of Victor Cousin by the acutest critic and most resolute opponent of his philosophy in this century.[1] (J. V.)

COUSTOU, the name of a famous family of French sculptors. Nicholas Coustou (1658–1733) was the son of a wood-carver at Lyons, where he was born. At eighteen he removed to Paris, to study under Coysevox, his uncle, who presided over the recently-established Academy of Painting and Sculpture; and at three-and-twenty he gained the Colbert prize, which entitled him to four years education at the French Academy at Rome. He afterwards became rector and chancellor of the Academy of Painting and Sculpture. He was remarkable for his facility; and though he was specially influenced by Michelangelo and Algardi, his numerous works are among the most typical specimens of his age now extant. The most famous are the Union of the Seine and Marne and the Berger Chasseur in the gardens of the Tuileries, and the Descent from the Cross placed behind the choir altar of Notre Dame; he also supplied a large number of statues to Versailles and Marly.

His younger brother, Guillaume Couston (1678–1746), was a sculptor of still greater merit. He also gained the Colbert prize; but refusing to submit to the rules of the Academy, he soon left it, and for some time wandered houseless through the streets of Rome. At length he was befriended by the sculptor Legros, under whom he studied for some time. Returning to Paris, he was in 1704 admitted into the Academy of Painting and Sculpture, of which he afterwards became director; and,

[1] Sir W. Hamilton, *Discussions*, p. 541.

like his brother, he was employed by Louis XIV. His finest works are the famous group of the Horse Tamers in the Champs Elysées at Paris, the Ocean and Mediterranean at Marly, the bronze Rhône which formed part of the statue of Louis XIV. at Lyons, the façade of the Chateau d'Eau, and the bas-reliefs of the entrance of the Hôtel des Invalides. His work is specially distinguished by its fire and energy.

Guillaume Coustou, the younger (1716–1777), the son of Nicholas, also studied at Rome, as winner of the Colbert prize. While to a great extent a copyist of his predecessors, he was much affected by the bad taste of his time, and produced little or nothing of permanent value.

COUTANCES, a town of France, capital of an arrondissement of the department of La Manche, and the seat of a bishop, is built on a granite ridge which rises between the canalized River Soulle and the stream called the Bulsard, 16 miles W.S.W. of St Lô and 7 miles from the sea. From the hill, up the sides of which the crooked streets of the town are built, a fine panorama of the surrounding country is obtained. The cathedral of Notre Dame on the height, with two lofty towers terminating in spires, was inaugurated by William the Conqueror in 1056, and is one of the finest specimens of ecclesiastical architecture in Normandy. The churches of St Nicolas and St Pierre, dating from the 14th and 15th centuries, are also fine. The palais de justice, lycée, episcopal palace, and halle aux grains are among the chief buildings. Some manufactures of woollen and cotton goods, marble working, and traffic in corn, poultry, cattle, and horses are the industries of the town. Coutances is the ancient Roman Cosedia in the country of the Unelli. Towards the end of the 3d century its name was changed to Constantia. Many traces of Roman work are still to be seen in its environs. An aqueduct, between the town and a hill on the east, was constructed about the middle of the 13th century on the site of one which was built by the Romans; originally it had sixteen arches, but eleven of these are now ruined. In the Middle Ages Coutances was capital of the vice-county of Coutentin or Cotentin, a district noted for its breed of cattle. It was held by the English from 1417 to 1449. Population (1872), 14,557.

COUTHON, Georges (1756–1794), one of the most notorious actors in the Reign of Terror, was born at Orsay (Orcet), a village in the district of Clermont in Auvergne, in 1756. He studied law, and was admitted advocate at Clermont in 1785. At this period he was noted for his integrity, gentle-heartedness, and charitable disposition. His health was feeble, and his body was half paralyzed from a recent misadventure. In 1787 he was a member of the provincial assembly of Auvergne. When the Revolution began Couthon avowed the most liberal sentiments, but at the same time spoke with great moderation He became very popular, and was appointed chief magistrate of Clermont and president of the tribunal of the town. With the progress of events, however, his feelings rose to a higher pitch, and his sympathies were with the van of the Revolutionary army. In 1791 he was elected deputy to the legislative assembly; and here he soon took his place among the most violent of the Jacobins. He advocated extreme measures against the king. A visit to Flanders for the sake of health brought him into close intercourse and sympathy with Dumouriez. In September 1792 Couthon was elected member of the National Convention, and voted the death of the king without appeal. He soon attached himself to Robespierre, for whom at first he felt only aversion; and he was the first to demand the arrest of the proscribed Girondins. In July 1793 he became a member of the Committee of Public Safety, and in the following month he was sent as commissioner of the army to conduct the siege of Lyons. Impatient at the slow progress made by the besieging force he collected a body of 60,000 men, and having stormed the place resolved on its destruction. He made a beginning with a kind of state ceremonial. Carried on a litter, with a silver hammer in his hand, he struck the doors or walls of the houses doomed to be demolished, and his army of satellites then executed his orders. The demolition was carried on for six months, and the cost of it was enormous. Couthon's rage, however, chiefly vented itself on the buildings; the slaughter of the inhabitants was the work of his successor Collot d'Herbois. Couthon returned to Paris, where Robespierre felt the need of his assistance. He was one of the promoters of the infamous law of the 22d Prairial, which shortened the proceedings before the Revolutionary Tribunal by depriving the accused of the aid of counsel or of witnesses for their defence. This was not long before the 9th Thermidor. Couthon had become one of the Triumvirate, with Robespierre and St Just, and alarmed at the opposition which was rising against their power and projects, declined to make the visit which he had promised to Auvergne. He was arrested at the same time with his colleagues, and after being subjected to indescribable sufferings and insults, was taken on the same car with his master to the scaffold. There, amidst the exultations and execrations of the fierce crowd, he wept with terror, and died by the guillotine (9th Thermidor) July 28, 1794.

COUTTS, Thomas, an eminent banker, head of the London house of Coutts & Co., was born probably about 1731. He was the fourth son of John Coutts, who carried on business at Edinburgh as a corn factor and negotiator of bills of exchange, and who in 1742 was elected lord provost of the city. The family was originally of Montrose, but one of its members had settled at Edinburgh about or before 1696. Soon after the death of John Coutts, the ex-provost, the business was divided into two branches, one carried on at Edinburgh, the other in London. The London branch was in the hands of Patrick and Thomas Coutts, the eldest and the youngest sons of John Coutts. From the death of his brother in 1788, Thomas, as surviving partner, became sole head of the firm; and under his direction the banking house rose to the highest distinction. His ambition was to establish his character as a man of business and to make a fortune; and he lived to succeed in this aim and long to enjoy his reputation and wealth. A gentleman in manners, hospitable and benevolent, he counted amongst his friends some of the literary men and the best actors of his day. Of the enormous wealth which came into his hands he made munificent use. His private life was not without its romantic elements. Soon after his settlement in London he married Elizabeth Starkey, a young woman of humble origin, who was in attendance on the daughter of his brother James. They lived happily together, and had three daughters,—Susan, married in 1796 to the third earl of Guildford; Frances, married in 1800 to the first marquis of Bute; and Sophia, married in 1793 to Sir Francis Burdett, Baronet. Mrs Coutts dying in 1815, her husband soon after married the popular actress, Harriet Mellon; and to her he left the whole of his immense fortune. He died in London, February 24, 1822. His widow married in 1827 the duke of St Albans, and died ten years later, having bequeathed her property to Angela, youngest daughter of Sir Francis Burdett, who then assumed the additional name and arms of Coutts. She was created Baroness Burdett-Coutts in 1871.

COVENANTERS, in Scottish history, the name applied to a party, embracing the great majority of the people, who during the 17th century bound themselves to establish and maintain the Presbyterian doctrine and polity as the sole religion of the country, to the exclusion of Prelacy and

Popery. An account of the covenanting cause as a religious and political movement belongs to the history of Scotland. There were several successive Covenants, similar in spirit and expression, the most important historically being the National Covenant of 1638 and the Solemn League and Covenant of 1643. These were both based upon earlier documents. In 1581 the General Assembly of Scotland adopted a confession of faith, or national covenant, drawn up by John Craig, condemning Episcopal government, under the name of hierarchy. This covenant was signed by James I. and enjoined on all his subjects. It was again subscribed in 1590 and 1596. The subscription was renewed in 1638, and the subscribers engaged by oath to maintain religion in the same state in which it existed in 1580, and to reject all innovations introduced since that time. This oath annexed to the confession of faith of 1581 received the name of the National Covenant. The additional matter was prepared by Johnston of Warriston and Alexander Henderson, and was intended to suit the document to the special circumstances of the time. It was adopted and signed by a large gathering in Greyfriars' Churchyard, Edinburgh, on the 28th February, and copies were sent next day throughout the country for additional signatures. The Solemn League and Covenant was established in the year 1643, and formed a bond between Scotland, England, and Ireland for the united preservation of the Reformed religion in the Church of Scotland, the reformation of religion in England and Ireland "according to the Word of God and the example of the best Reformed churches," and the extirpation of Popery and Prelacy. It was sworn and subscribed by many in both nations, approved by the Parliament and Assembly at Westminster, and ratified by the General Assembly of Scotland in 1645. King Charles I. disapproved of it when he surrendered himself to the Scottish army in 1646; but in 1650 Charles II. by a solemn oath declared his approbation both of this and of the National Covenant; and in August the same year he made a further declaration at Dunfermline to the same purpose, which was renewed on the occasion of his coronation at Scone in 1651. In the same year also the covenant was ratified by Parliament, and subscription to it required from every member,—it being declared that without such subscription the constitution of the Parliament was null and void. It was afterwards renounced by Charles, and declared illegal by 13 and 14 Car. II. c. 4 (1662).

The two Covenants are usually published along with the Westminster Confession of Faith, though they are not now included among the authoritative symbols of any Presbyterian church. See M'Crie's *Sketches of Scottish Church History*, Cunningham's *Church History of Scotland*, Grub's *Ecclesiastical History of Scotland*, and Burton's *History of Scotland*.

COVENTRY, an ancient city and municipal and parliamentary borough of England, in the county of Warwick, 18 miles E.S.E. of Birmingham. It stands on a gentle eminence, and is watered by the Sherbourne and the Radford Brook, which unite within the town. Of its ancient fortifications two gates and some portions of the wall are still extant, and several of the older streets present a picturesque appearance, from the number of half-timbered houses projecting over the footways. In the course of the present century, and more especially since 1850, great improvements have been made in various quarters. The most remarkable buildings are the churches; and of these the oldest are St Michael's, one of the finest specimens of Perpendicular architecture in England, with a beautiful steeple rising to a height of 303 feet; Holy Trinity Church, a cruciform structure in the Later English style, with a steeple at the intersection 237 feet high; and St John's, or Bablake Church, which is nearly a parallelogram on the ground plan, but cruciform in the clerestory, with a tower in the centre. All three have been restored under the direction of Sir G. Gilbert Scott. Christ Church only dates from 1832, but it is attached to the ancient spire of the Grey Friars' Church. Of secular edifices the most interesting is St Mary's Hall, erected by the united guilds in the early part of the 15th century. The principal chamber, situated above a fine crypt, is 76 feet long, 30 feet wide, and 34 feet high; its roof is of carved oak, and in the north end there is a large window of old stained glass, with a curious piece of tapestry beneath nearly as old as the building. In the treasury is preserved a valuable collection of ancient muniments. Among the other public buildings of the city may be mentioned the new corporate offices and police court, the county hall, the drapers' hall, the hospital, the corn-exchange, the market hall, the self-supporting dispensary, the free library, the institute, the baths, the theatre, and the barracks. The cemetery is one of the most beautiful in the kingdom. The educational institutions include a well-endowed free grammar school, founded in the reign of Elizabeth, and held in the disused church of the hospital of St John, a school of art, seven endowed charity schools, and a county reformatory for girls; and among the charitable foundations, which are numerous and valuable, Bond's hospital for old men and Ford's hospital for old women are remarkable as fine specimens of ancient timber work.

Arms of Coventry.

Coventry was early celebrated for its manufactures, and had numerous guilds or trading companies. It was noted for its woollens in the 15th century, and subsequently acquired such a reputation for its dyeing that the expression "as true as Coventry blue" became proverbial. The weaving of tammies, camlets, shalloons, &c., succeeded; but these branches of industry no longer exist. At present the staple trades are ribbon and trimming weaving, elastic web manufacturing, dyeing, and watchmaking; to which may be added the weaving of woollens, carpets, and carriage-lace, the spinning of cotton, the manufacture of sewing machines and bicycles, art metal-work, and iron-founding. The fairs are numerous and well attended. The borough returns two members to Parliament. In 1871 the population of the municipal borough was 37,670 (17,750 males, and 19,920 females), and of the parliamentary borough, which comprises an area of 6448 acres, 41,348.

Coventry derives its name (Conventre, or convent town), from a Benedictine priory, founded in 1043 by Earl Leofric and his wife Lady Godiva, who were afterwards buried within the priory church. According to a well-known popular tradition, exquisitely related in Tennyson's poem, the inhabitants were freed from the earl's excessive taxation by the romantic devotion of the lady, who rode through the streets of the city "clothed on with chastity," and thus compelled her husband to keep his oath. A procession, instituted in the time of Charles II. in commemorative imitation of the event, continued for many years to be annually celebrated; and an effigy called Peeping Tom is still pointed out projecting from an upper window at the corner of Smithford Street, popularly reputed to represent an inquisitive tailor, who was struck blind for having peered at the lady as she passed, while every other eye was averted in thankful reverence. Carmelite, Franciscan, and Carthusian monasteries were early established in the city, which was not long in acquiring a high position in the country. Gosford Green, outside its eastern walls, was chosen in 1397 for that great wager of battle between the dukes of Hereford and Norfolk, which was interrupted by Richard II., and formed such an important episode in the tragic history of the time. During the Wars of the Roses the citizens adhered to the Lancastrian party, and were consequently rewarded by Henry VI., whose charter, constituting the city and certain adjacent villages a separate county, continued in force till 1842. In the course of the 15th century several Parliaments were held in the town; and in 1569 it afforded for a short time a prison-house to Mary, Queen of Scots. During the troubles of the commonwealth the citizens espoused the cause of the Parliament; and on the restoration of Charles II. their fortifications were dismantled as a penalty for their disloyalty. To the student of English literature Coventry has a special interest on account of its mystery-plays, full details in regard to which will be found in Thomas Sharp's *Dissertation*, 1825. Various explanations of the popular phrase "to send to Coventy" have been suggested,—none of them particularly satisfactory. See Reader's *History of Coventry*, 1810; B. Poole's *History of Coventry*, 1869; and Sharp's *Antiquities of Coventry*, ed. by Fretton, 1871.

COVERDALE, Miles (1488–1569), the celebrated translator of the first complete English Bible, was born in Yorkshire in 1488. He was educated at Cambridge in the house of the Augustine friars, and, after having been admitted into that order, was ordained priest at Norwich in 1514. On the promulgation of the Reformed opinions at Cambridge, Coverdale was amongst the first to abandon his allegiance to the Church of Rome; and probably finding it unsafe to remain in England, he went abroad, and according to Foxe assisted Tyndale in translating the Bible. There seems, however, to be some reason to doubt Foxe's statement, which is entirely unsupported by corroborative evidence. Coverdale remained in total obscurity until 1535, when he published his own translation, with a dedication to Henry VIII., who had now come to an irreparable breach with the Pope. This was the earliest translation of the whole Bible in the English language, and the Psalms in it are those which are now used in the Book of Common Prayer. Although it is not an immediate version of the original (the title bearing that it is "truly translated out of Douche and Latyn"), it has many merits. Much of the rhythmical flow and finely-balanced cadence of the authorized version may be traced back to Coverdale. With the sanction of the king, Coverdale went to Paris in 1538 to superintend the publication of a new edition; but a decree of the Inquisition broke up the printing-establishment, and consigned the sheets already finished to the flames. A few copies, however, having been sold as waste-paper, were preserved; and these, with the presses which were transported to England, were used in printing *Cranmer's* or *the Great Bible*, under the superintendence of Coverdale, which was published in 1539. After 1540 Coverdale seems to have again resided for some time abroad. He returned to England after the death of Henry (1547), and was appointed almoner to the queen dowager, Catherine Parr. In 1551 Coverdale was appointed to the see of Exeter; and in consideration of his poverty the customary payment of first-fruits was remitted to him. On the accession of Mary he was thrown into prison, and released only on condition of leaving his native country. He received the grace of exile instead of execution through the urgent intercession of the king of Denmark, whose chaplain Mac Alpine was his brother-in-law. On the invitation of the latter, he repaired for a time to the court of Denmark, but afterwards retired to Geneva, where he was associated with other English exiles in executing the Geneva translation. On his return to England, after the death of Mary, he was not reinstated in his bishopric; and in 1563 he declined the see of Llandaff. He held for some time the rectory of St Magnus, London Bridge, but resigned it in 1566. The rest of his life was spent in translating from the works of the Continental Reformers, and in the publication of tracts for the spread of the Reformation. The date of Coverdale's death is uncertain, but he was buried in the chancel of the church of St Bartholomew, February 19, 1569. The third centenary of the publication of Coverdale's Bible was held, October 4, 1835, when a medal was struck to commemorate the occasion. Coverdale's remains now lie in the church of St Magnus, to which they were removed when St Bartholomew's Church was taken down in 1840.

See *Writings and Translations of Coverdale*, edited for the Parker Society by Pearson (1844); *Remains of Coverdale*, edited for the Parker Society by Pearson (1846). The latter includes a biographical notice. See also Westcott's *General View of the History of the English Bible* (1868), and Eadie's *The English Bible* (1876).

COVILHA, a town of Portugal, in the province of Beira-baixa, on the south-eastern slope of the highest part of the Serra da Estrella, where it descends to the upper valley of the River Zezere, 30 miles north of Castello-Branco, to which district it belongs. The town, which is perched on the declivity in the form of an amphitheatre, has been compared to a collection of swallows' nests, and is 2180 feet above the sea. It has several churches and convents. Population (1864), 9022. The people are chiefly employed in the manufacture of the brown cloth called *saragoça*, which is worn throughout Portugal. At the village of Unhacs-da-Serra, five miles W.S.W., there are noted sulphurous baths.

COVINGTON, a city of the United States, in Kenton County, Kentucky, on the Ohio, at its confluence with the Licking, and directly opposite Cincinnati (see plan, p. 783 of vol. v.). Its principal buildings are the city hall, the United States court house, the high school, the Oddfellows' hall, the hospital of St Elizabeth, the Benedictine priory of St Joseph's, and the Benedictine nunnery of St Walburga; and its industrial establishments comprise numerous tobacco and cigar factories, and several iron-mills, distilleries, glass-works, silk factories, &c. Covington, as well as the contiguous town of Newport, is practically a suburb of Cincinnati, with which they have communication by a bridge and steam ferries. Since 1871 it has been supplied with water by water works on the Holly system. Covington was founded in 1812, and received incorporation as a city in 1834. In 1840 its population was 2026; in 1860, 16,471; and in 1870, 24,505. A considerable proportion of the inhabitants are Roman Catholics. There is a German orphan asylum about 4 miles from the city under Catholic management.

COWELL, Dr John (1554–1611), jurist, was born at Ernsborough, Devonshire. He was educated at King's College, Cambridge, and ultimately became professor of civil law in that university, and master of Trinity Hall. In 1607 he compiled a law dictionary, in which he exalted the king's prerogative so much that he was prosecuted before the House of Commons by Sir Edward Coke, and saved from imprisonment only by the interposition of James I. Cowell also wrote a work entitled *Institutiones Juris Anglicani*.

COWES, West and East, two towns of England, in the county of Hants, on the estuary of the Medina, on the north coast of the Isle of Wight, directly opposite to the mouth of Southampton Water. The port between them is the chief one of the island, and is the head quarters of the Royal Yacht Squadron (founded in 1815) it is in constant steam communication with Ryde, and with Portsmouth and Southampton, each eleven miles distant. A steam ferry across the Medina, here 600 yards broad, unites the towns. Behind the harbour the houses rise picturesquely on gentle wooded slopes, and numerous villas adorn the vicinity. The towns owe their origin to two forts or castles, built on each side of the mouth of the Medina by Henry VIII. in 1540, for the defence of the coast; the eastern one has disappeared, but the west castle still stands and is used as the club-house of the Yacht Squadron. The marine parade of West Cowes, and the public promenade called the Green, are close to the castle. Within the town the streets are narrow; there are no buildings of architectural pretensions; and the place is quiet excepting in the yachting and bathing season from May to November. The resident population is chiefly employed in the ship-building yards, where yachts of the finest models and smaller naval vessels are built, and in ship provisioning. West Cowes is in railway communication with Newport and Ryde. Population (1871), 5730. On the opposite side of the Medina a broad carriage way leads to East Cowes Castle, a handsome edifice built by Nash, the favourite architect of George IV., in 1798, and immediately beyond it are the grounds surrounding Osborne House, the residence of the queen, completed in 1845. Norris Castle, on the rising ground above the shores of the Solent, built in 1799, and Whippingham Church on the right bank of the Medina, are other buildings of interest in the neighbourhood of East Cowes, the population of which in 1871 was 2058.

COWLEY, Abraham (1618–1667), the most popular English poet during the lifetime of Milton, was born in the city of London late in 1618. His father, a wealthy citizen, who died shortly before his birth, is believed to have been a grocer. His mother was wholly given to works of devotion, but it happened that there lay in her parlour a copy of *The Faery Queen*. This became the favourite reading of her son, and he had twice devoured it all before he was sent to school. As early as 1628, that is in his tenth year, he composed his *Tragicall History of Piramus and Thisbe*, an epical romance written in a six-line stanza of his own invention. It is not too much to say that this work is the most astonishing feat of imaginative precocity on record; it is marked by no great faults of immaturity, and by constructive merits of a very high order. Two years later the child wrote another and still more ambitious poem, *Constantia and Philetus*, being sent about the same time to Westminster School. Here he displayed the most extraordinary mental precocity and versatility, and wrote in his thirteenth year yet another poem, the *Elegy on the Death of Dudley, Lord Carlton*. These three poems of considerable size, and some smaller ones, were collected in 1633, and published in a volume entitled *Poetical Blossoms*, dedicated to the head-master of the school, and prefaced by many laudatory verses by schoolfellows. The author at once became famous, although he had not, even yet, completed his fifteenth year. His next composition was a pastoral comedy, entitled *Love's Riddle*, a marvellous production for a boy of sixteen, airy, correct, and harmonious in language, and rapid in movement. The style is not without resemblance to that of Randolph, whose earliest works, however, were at that time only just printed. In 1636 Cowley was elected into Trinity College, Cambridge, where he betook himself with enthusiasm to the study of all kinds of learning, and early distinguished himself as a ripe scholar. It was about this time that he composed his scriptural epic on the history of King David, one book of which still exists in the Latin original, the rest being superseded in favour of an English version in four books, called the *Davideis*, which he published a long time after. This his most grave and important work is remarkable as having suggested to Milton several points which he afterwards made use of. This epic, written in a very dreary and turgid manner, but in good rhymed heroic verse, deals with the adventures of King David from his boyhood to the smiting of Amalek by Saul, where it abruptly closes. In 1638 *Love's Riddle* and a Latin comedy, the *Naufragium Joculare*, were printed, and in 1641 the passage of Prince Charles through Cambridge gave occasion to the production of another dramatic work, *The Guardian*, which was acted before the royal visitor with much success. During the civil war this play was privately performed at Dublin, but it was not printed till 1650. It is bright and amusing, in the style common to the "sons" of Ben Jonson, the university wits who wrote more for the closet than the public stage. The learned quiet of the young poet's life was broken up by the civil war; he warmly espoused the royalist side. Cambridge became in 1643 too hot to hold him, and he made his way to Oxford, where he enjoyed the friendship of Lord Falkland, and was tossed, in the tumult of affairs, into the personal confidence of the royal family itself. After the battle of Marston Moor he followed the queen to Paris, and the exile so commenced lasted twelve years. This period was spent almost entirely in the royal service, "bearing a share in the distresses of the royal family, or labouring in their affairs. To this purpose he performed several dangerous journeys into Jersey, Scotland, Flanders, Holland, or wherever else the king's troubles required his attendance. But the chief testimony of his fidelity was the laborious service he underwent in maintaining the constant correspondence between the late king and the queen his wife. In that weighty trust he behaved himself with indefatigable integrity and unsuspected secrecy; for he ciphered and deciphered with his own hand the greatest part of all the letters that passed between their majesties, and managed a vast intelligence in many other parts, which for some years together took up all his days, and two or three nights every week." In spite of these labours he did not refrain from literary industry. During his exile he met with the works of Pindar, and determined to reproduce their lofty lyric passion in English. At the same time he occupied himself in writing a history of the civil war, which he completed as far as the battle of Newbury, but unfortunately afterwards destroyed. In 1647 a collection of his love verses, entitled *The Mistress*, was published, and in the next year a volume of wretched satires was brought out under his name, with the composition of which he had nothing to do. In spite of the troubles of the times, so fatal to poetic fame, his reputation steadily increased, and when, on his return to England in 1656, he published a volume of his collected poetical works, he found himself without a rival in public esteem. This volume included the later works already mentioned, the *Pindarique Odes*, and some *Miscellanies*. Among the latter are to be found Cowley's most vital pieces. This section of his works opens with the famous aspiration—

> What shall I do to be for ever known,
> And make the coming age my own?

It contains elegies on Wotton, Vandyck, Harvey, and Crashaw, the last two being among Cowley's finest poems, brilliant, sonorous, and original; the amusing ballad of *The Chronicle*, giving a fictitious catalogue of his supposed amours; various gnomic pieces; and some charming paraphrases from Anacreon. The *Pindarique Odes* contain weighty lines and passages, buried in irregular and inharmonious masses of moral verbiage. Not more than one or two are good throughout, but a full posy of beauties may easily be culled from them. The long cadences of the Alexandrines with which most of the strophes close, continued to echo in English poetry from Dryden down to Gray, but the *Odes* themselves, which were found to be obscure by the poet's contemporaries, immediately fell into disesteem. *The Mistress* was the most popular poetic reading of the age, and is now the least read of all Cowley's works. It was the last and most violent expression of the amatory affectation of the 17th century, an affectation which had been endurable in Donne and other early writers because it had been the vehicle of sincere emotion, but was unendurable in Cowley because in him it represented nothing but a perfunctory exercise, a mere exhibition of literary calisthenics. He appears to have been of a cold, or at least of a timid, disposition; in the face of these elaborately erotic volumes, we are told that to the end of his days he never summoned up courage to speak of love to a single woman in real life. Soon after his return to England he was seized in mistake for another person, and only obtained his liberty on a bail of £1000. In 1658 he revised and altered his play of *The Guardian*, and prepared it for the press under the title of *The Cutter of Coleman Street*, but it did not appear until 1663. Late in 1658 Oliver Cromwell died, and Cowley took advantage of the confusion of affairs to escape to Paris, where he remained until the Restoration brought him back in Charles's train. Wearied with the broils and fatigues of a political life, Cowley obtained permission to retire into the country; through his friend, Lord St Albans, he obtained a property near Chertsey, and here, devoting himself to the study of botany, and buried in his books, he lived in comparative solitude until his death, which occurred on the 28th of July 1667, a period otherwise famous for the publication of *Paradise Lost*. On the 3d of August he was buried in Westminster Abbey beside the ashes of Chaucer and Spenser, where in 1675 the duke of Buckingham erected a monument to his memory. Throughout their parallel lives the fame of Cowley completely eclipsed that of Milton, but posterity instantly and finally reversed the judgment of their contemporaries. The poetry of Cowley rapidly fell into a neglect as unjust as the earlier popularity had been. As a prose writer, especially as an essayist, he holds, and will not lose, a high position in literature; as a poet it is hardly possible that he can enjoy more than a very partial revival. The want of nature, the obvious and awkward art, the defective melody of his poems destroys the interest that their ingenuity and occasional majesty would otherwise excite. He had lofty views of the mission of a poet and an insatiable ambition, but his chief claim to poetic life is the dowry of sonorous lyric style which he passed down to Dryden and his successors of the 18th century.

The works of Cowley were not collected till 1688, when Thomas Sprat, afterwards bishop of Rochester, brought out a splendid edition in folio, to which he prefixed a graceful and elegant life of the poet. There were many reprints of this collection, but since the early part of the 18th century no good edition of Cowley's poems has appeared. The Essays, on the contrary, have frequently been revived with approval. (E. W. G.)

COWPER, William (1731–1800), the best of English letter-writers and the most distinguished poet of his day, was born on the 26th of November 1731, at Great Berkhamstead, Hertfordshire. His father, who held the living of the parish, was chaplain to George II. He married Ann, daughter of Roger Donne, of Ludham Hall in Norfolk. This lady, after giving birth to several children who died in infancy, expired in childbed in 1737, leaving two sons—William (the poet) and John. Cowper, who retained the most affectionate remembrance of his mother, embalmed her memory in one of the most affecting tributes that ever came from the heart of a son.

At the age of six years Cowper was placed at Dr Pitman's school, in Market Street, Bedfordshire. His health was delicate, and he was in consequence exposed to the laughter and ridicule of his rude companions. One boy seems especially to have been the object of his terror. "His savage treatment of me," he says, "impressed such a dread of his figure on my mind, that I well remember being afraid to lift my eyes upon him higher than his knees, and that I knew him better by his shoe-buckle than by any other part of his dress." The cruelty of this boy's conduct was such that on its being discovered he was expelled the school, and Cowper was removed. The mental anguish he endured at this time aggravated, no doubt, the constitutional tendency to despondency which throws such a peculiar interest over much of his after-life. At the period of his removal from Dr Pitman's school he was afflicted with inflammation in the eyes; specks appeared in both of them, and it was feared that blindness would ensue. He was in consequence placed at the house of an eminent oculist, where he remained two years, deriving little benefit from his residence there, his cure being slow and imperfect.

At ten years of age Cowper was placed at Westminster School. In after-life he lamented that his learning at this time consisted entirely of Latin and Greek, to the exclusion of the more important matter of religion. Surrounded by strangers, and unable from his unconquerable shyness to mingle with them on easy terms, his fits of depression grew darker and more frequent; and those unhappy views of his spiritual condition, which afterwards produced such deplorable results, began to oppress his mind. In his memoir he relates some of his religious experiences. Crossing St Margaret's churchyard late in the evening, his curiosity was excited by a glimmering light, and he went to see whence it proceeded. A gravedigger was at work with a lantern; and just as Cowper came to the spot a skull was thrown up which struck him on the leg. This circumstance gave an alarm to his conscience, and he afterwards considered it one of the most valuable religious impressions he received at Westminster. His mental excitement was followed by the notion that he was exempted from the penalty of death, which in its turn was displaced by lowness of spirits and intimations of a consumptive tendency. At thirteen he was seized with small-pox, which completely restored his eyesight. Although threatened by consumption he seems to have excelled at cricket and football, and to have distinguished himself in his studies. It is curious to know that Warren Hastings, Churchill, Lloyd, and Colman were his fellow-students in Westminster.

Cowper was taken from Westminster at eighteen years of age; and, after spending a few months at home, was articled to Mr Chapman, an attorney in London. He seems to have most poetically disliked his new position and duties. Thurlow, afterwards lord chancellor, was engaged in the same office; and Cowper describes their leisure as being spent in "giggling and making giggle, instead of studying the law." The following is related of his intimacy with Thurlow a few years later. One evening, in the presence of ladies, Cowper playfully said, "Thurlow, I am nobody, and shall always be nobody, and you will be chancellor. You shall provide for me when you are." Thurlow replied with a smile, "I surely will." "These ladies," rejoined Cowper, "are our witnesses." "Let them be so," answered the future chancellor, still smiling, "for I will certainly do it." After completing his three years' articles with Mr Chapman, he removed to the Middle Temple in 1752. The solitariness of his life at this time was productive of the most pernicious results. In his melancholy memoir he describes the dejection and unrest, the horror and despair, he underwent during these miserable months. At length relief came. Sitting with a few friends by the sea near Southampton, the cloud of misery which had overshadowed his spirit so long rolled away, and so happy did he feel that he could have wept for transport had he been alone. Returning to London, and actuated by what he afterwards considered the instigation of Satan, he burned his prayers, and plunged into pleasure and gaiety. In 1754 he was called to the bar, but, instead of following his profession, he seems to have yielded himself up to the charms of literature and social intercourse. About this time his father died, leaving him a small patrimony. In 1759 he removed to the Inner Temple, where law was still deserted for literature. He devoted much of his time to the study of Homer, and, in conjunction with his brother, translated some of the books of the *Henriade*. This appears to have been the gayest part of Cowper's life. He had formed literary acquaintances amongst whom were many of his old schoolfellows; he became a member of the Nonsense Club, and occasionally contributed prose and verse to the periodicals of the day.

While in Mr Chapman's office, Cowper was a frequent visitor at the house of his uncle, Mr Ashley Cowper, in Southampton Row,—the attraction being his fair cousin. Miss Theodora Jane Cowper was the younger of two daughters (the elder of whom, afterwards Lady Hesketh, is well known as the poet's constant correspondent for many years), and by her brilliant beauty and fascinating manners won the heart of her shy relative. Excited by her presence and sparkling spirits, Cowper became cheerful and even gay, his bashfulness began to wear off; he mixed in company, and occasionally attempted to shine in conversation. He became fastidious in his attire, a critic in ruffles, a haunter of looking-glasses. Seeing how matters were tending, Mr Cowper opposed their contemplated union on prudential considerations. His daughter pooh-poohed his fears. He asked what she would do if she married her cousin? "Do, sir," answered the high-spirited girl, "Wash all day, and ride out on the great dog at night." Mr Cowper afterwards changed his position, and objected to their marriage on the score of nearness of connection. The lovers pled, but he was inexorable. Miss Cowper thought it her duty to obey her father. They parted and never met again.

During this courtship, Cowper addressed several poems to his cousin, which exhibit all the gentleness and tenderness of his nature. They are unlike the love-poems of every other poet. They have no fervour, no emotion, no fire. Perhaps Cowper's nature was incapable of strong and devouring passion. The memory of his love and his disappointment seems to have been soon and painlessly effaced. With the lady it was different; she could not so easily forget. The little poems which, in his brief dream of passion, he had addressed to her, she carefully treasured up. Unknown to him, her hand was unwearied in its kind and delicate attentions. She never forgot him, and although surviving his death many years, died unmarried.

Cowper's pecuniary resources being at this time slender, he became naturally anxious to obtain suitable employment. An influential kinsman presented him with the lucrative office of clerk to the committees of the House of Lords. Some difficulty, however, being raised as to his relative's right of appointment, an examination at the bar of the House was demanded to test Cowper's fitness for the performance of his duties. Although the prospect of such a public appearance must have been exceedingly painful to him, he resolved to prepare for the ordeal. He attended regularly at the office, and thus describes the result:—"The journal books were thrown open to me—a thing which could not be refused, and from which, perhaps, a man in health and with a head turned to business might have gained all the information he wanted; but it was not so with me; I read without perception, and was so distressed that had every clerk in the office been my friend it could have availed me little, for I was not in a condition to receive instruction, much less to elicit it out of manuscripts without direction." The dreadful trial that awaited him filled his days, and re-appeared in dreams. He found no rest. At a tavern he met some miserable men, and suicide became the subject of conversation. The idea was new to him, and held him with a horrid fascination from which he could not escape. He was pursued and goaded by imaginary voices, until at last in a paroxysm of madness he attempted self-destruction. The garter by which he was suspended broke, and he fell heavily to the ground. His laundress hearing the fall, and thinking him in a fit, ran to his assistance; but by the time she reached him he had crept into bed. His mind now became a prey to the keenest remorse. The wrath of God seemed hanging over him on account of his sin. In these circumstances, every thought of his official employment was, of course, abandoned; measures were adopted for his security, and in 1763 he was placed under the care of Dr Cotton of St Albans.

After remaining two years at St Albans he removed to Huntingdon. Here he first met the Unwins, and so charmed was he with their society, that in a short time he became the inmate of their home. On the death of Mr Unwin in 1767 the family removed to Olney; and on the recommendation of Mr Newton, the curate of the parish, Cowper accompanied them. About this time his brother died; and in the winter of 1773 his malady returned. Through his long illness he was attended by Mrs Unwin with the most affectionate care. To beguile the tedium of recovery, he occupied himself with carpentry and gardening, and in domesticating his famous hares. Up till this time he had only written a few hymns; he now, at Mrs Unwin's suggestion, commenced a poem on the *Progress of Error*. Composition, once begun, was so ardently prosecuted that in a few months his first volume, consisting, with the poem already mentioned, of *Table Talk*, *Conversation*, *Truth*, *Expostulation*, *Hope*, *Charity*, and *Retirement*, was ready for the press. It attracted little attention. One critic declared that "Mr Cowper was certainly a good pious man, but without one spark of poetic fire." In 1781 he met Lady Austen, and the casual acquaintance soon ripened into the warmest intimacy. Her lively spirits chased from his mind the demon of melancholy. He wrote songs which she set to music and sang to the harpsichord. It is said that observing him one evening in a fit of depression, she related the story of John Gilpin, with which he was so delighted that after retiring to rest he turned it into verse, and repeated it with great glee when they met next morning at the breakfast-table. The *Task*, undertaken at the suggestion of his new friend, was begun in the winter of 1783 and published in 1785. Its success was complete, and his reputation was at once established. Never, perhaps, in England had poetry been at so low an ebb as at this time. The brilliant point and antithesis of Pope had degenerated into the inflated diction of Darwin and the feeble sentimentalities of Hayley. Cowper's hearty and natural verse extinguished these weaklings for ever. Although Cowper cannot be placed in the first rank of English poets, yet few are attended with such retinues of love and blessing. His verse is a transparent medium through which you look into a gentle and most lovable human spirit, and you come to know him as thoroughly as if you had lived in the same house with him for years. His muse does not sit apart in sublime seclusion—she comes down into the ways of men, mingles in their every-day concerns, and is interested in crops and rural affairs. You see by the slight tan on her cheek that she has been much in the harvest-fields. Cowper rather talks than sings. His blank verse makes no pretensions to majesty; it is colloquial sometimes in its bareness, yet in its artless flow is ever delightful as the conversation of a beloved and gifted companion.

Cowper brought back nature to poetry, and his influence has been extensive and lasting. He is, to a certain extent, the prototype of Wordsworth. Indeed, many passages in the *Excursion* read like extracts from the *Task*. It is curious also to observe in Cowper's verse that subjectivity which is supposed to be the characteristic of more recent times. His ailings, his walks, his musings, his tamed hares, his friends, his indignation at slavery, his peculiar views of religion, are the things he delights to portray—the *Task* is a poem entirely about himself.

On Lady Austen leaving Olney, her place was filled by the Throgmortons, whose acquaintance Cowper had made on the occasion of a *fête* which they gave to the surrounding gentry. He was delighted with his new friends and spent much time in their society. During this period he was not idle; he had commenced his translation of Homer, and in the winter of 1785 had advanced as far as the 20th book of the *Iliad*. Owing to the rigorous care he bestowed upon his work it did not advance so rapidly as he at first anticipated, and was not published till 1791. Cowper was now in the zenith of his reputation. Rumours of his fame were wafted to the quiet residence of Olney from that world which he had so long forsaken, he was hailed the first poet of the day, and his old friend Thurlow (whose greatness he had foreseen) opened a correspondence with him and thanked him for his translation. To the mild spirit of Cowper the last circumstance must have been peculiarly grateful. While engaged upon Homer, his dreaded malady returned, but was happily driven away by the charms of society and constant literary occupation. He well knew that if he remained inactive the dark spirit would regain his throne; and no sooner was Homer given to the world than we find him engaged on an edition of Milton. But the labour was too much; his brain sunk beneath the incessant demands made on its energies, and so great was his distress that he was obliged to relinquish the undertaking. The clouds were now closing dark and heavy over the evening of Cowper's life. Mrs Unwin was an invalid; he was ever by her bedside, and nursed her with a tenderness, if possible, deeper than her own. Beneath the tension of sorrow the cord snapped. His malady returned, which was never destined in this life to be rolled away. Mrs Unwin died on the 17th of December 1796. Cowper, with wandering brain and feeble as a child, was led into the room; the presence of the dead drew from him one wild passionate exclamation, he then relapsed into silence, and it is said never more uttered her name. The deepest dejection, alternating with fits of spiritual despair, hung over him to the end. Dropsy appeared in his limbs; and after being reduced to the last stage of feebleness, he died peacefully on the 25th of April 1800. (A. S.)

The posthumous writing of Cowper, with a life by his friend Hayley, appeared in 1803–4. The best life, that by Southey, with an excellent edition of his works, was published in 1833–37, and with additional letters, in *Bohn's Standard Library* (1853–54). Other editions of his works, with memoirs, are those of Grimshawe (1835), Dr Memes (1852), and George Gilfillan. Lives have also been written by H. F. Cary, M'Diarmid, and Thomas Taylor. See, besides a study by Sainte-Beuve in the *Moniteur* (Nov. 13, 20, 27, and Dec. 4, 1854), Stopford Brooke's *Theology in the English Poets*, and Léon Boucher, *William Cowper, sa correspondence et ses poésies*.

COWRY, the popular name of the shells of the *Cypræida*, a family of mollusks. Upwards of 100 species are recognized, and they are widely distributed over the world,—their habitat being the shallow water along the sea-shore. The best known is the money cowry or *Cypræa moneta*, a small shell about half an inch in length, white and straw-coloured without and blue within, which derives its distinctive name from the fact that in various countries it has been employed as a kind of currency. It is most abundant in the Indian Ocean, and is collected more particularly in the Maldive Islands, in Ceylon, along the Malabar coast, in Borneo and other East Indian Islands, and in various parts of the African coast from Ras Hafun to Mozambique. It was formerly in familiar use in Bengal, where, though it required 3840 to make a rupee, the annual importation was valued at about £30,000. In the countries of Further India it is still in use; and in Siam, for example, 6400 cowries are equal to a *tical* or about 1s. 6d. In Western Africa—Congo, Yoruba, &c.—it is the usual tender, and before the abolition of the slave trade there were large shipments of cowry shells to some of the English ports for reshipment to the slave coast. As the value of the cowry was very much greater in Western Africa than in the regions from which the supply was obtained, the trade was extremely lucrative, and in some cases the gains are said to have been 500 per cent. The use of the cowry currency has gradually spread inland in Africa, and Barth found it fairly recognized in Kanó, Kukawa, Muniyoma, Gando, and even Timbuktu. In Muniyoma he tells us the king's revenue was estimated at 30,000,000 shells, every full-grown man being required to pay annually 1000 shells for himself, 1000 for every pack-ox, and 2000 for every slave in his possession. In the countries on the coast the shells are fastened together in strings of 40 or 100 each, so that fifty or twenty strings represent a dollar; but in the interior they are laboriously counted out one by one, or, if the trader be expert, five by five. The districts mentioned above receive their supply of *kurdi*, as they are called, from the west coast; but the regions to the north of the Land of the Moon, where they are in use under the name of *simbi*, are dependent on Moslem traders from Zanzibar. Among the Niam-Niam and other tribes who do not recognize their monetary value, the shells are in demand as fashionable decorations, just as in Germany they were in use as an ornament for horses' harness, and were popular enough to acquire several native names, such as *Brustharnisch* or breastplates, and *Otterköpfchen* or little adders' heads. Besides the *Cypræa moneta* various species are employed in this decorative use. The *Cypræa aurora* is a mark of chieftainship among the natives of the Friendly Islands; the *Cypræa annulus* is a favourite with the Asiatic islanders; and several of the larger kinds have been used in Europe for the carving of cameos. The tiger cowry, *Cypræa tigris*, so well known as a mantelpiece ornament in England and America, is commonly used by the natives of the Sandwich Islands to sink their nets; and they have also an ingenious plan of cementing portions of several shells into a smooth oval ball which they then employ as a bait to catch the cuttle-fish. While the species already mentioned occur in myriads in their respective habitats, the *Cypræa princeps* and the *Cypræa umbilicata* are extremely rare. Of the former, indeed, perhaps not more than two or three specimens are known,—one of them being in the British Museum, and another having drawn £40 at the sale of the collection of the earl of Mountnorris.

COX, DAVID (1783–1859). The remarkable development of the English school of landscape-painting during the first half of the present century gives importance to the name of David Cox. He is, indeed, to use a phrase now sufficiently common, a representative man, having practised his art through the entire period, outliving and overcoming public indifference, and reaping at last a harvest of appreciation that astonished himself. Besides, he dedicated his life to home scenery and its atmospherical conditions exclusively, so that his productions are truly English, while their artistic mastery, and their power to convey the impressions he intended, are unsurpassed, perhaps unequalled, by the works of any of his contemporaries, even those of higher genius and much more general culture. It must be remembered also, that in Cox's works we see our native art of water-colour painting in its purest condition, expressing only a direct, general, and honest sentiment by the simplest means, before the doctrine of "art for art's sake" had made our painters determined to show on their canvas more than they see in nature.

In a small house attached to the forge of his father, a hardworking master smith, in a mean suburb of Birmingham, Cox was born, 29th April 1783. Turning his hand to what he could get to do, Joseph Cox, the father, was both blacksmith and whitesmith, and when the war began took to the making of bayonets and horse shoes, on wholesale commission, and immediately the boy David was thought able to assist he was taken from the poor elementary school in the neighbourhood, and set to the anvil. The attempt to turn the boy to this kind of labour had, however, been made too early; it was too heavy for his strength, and he was sent to what was called by the cyclops of Birmingham a "toy trade," making lacquered buckles, painted lockets, tin snuff boxes, and other "fancy" articles. Here David very soon acquired some power of painting miniatures, and his talents might have been misdirected had his master, Fieldler by name, not released him from his apprenticeship by dying,—dying by his own hand; and David found an opening as colour-grinder and scene-painter's fag in the theatre then leased, with several others, by the father of Macready, the tragedian.

This obscure step, not one of promotion at the time, was really the most important incident in the uneventful career of Cox. It may be remembered that scene-painting has been to our landscape-painters what the goldsmith education was to the masters of the Italian renaissance, and we are safe in saying that the habits of hard work on a large scale, and the rough and ready self-dependence thus cultivated, can never be too much commended. The boy, who had inherited a rather weakly body, and had been trained with care by a pious mother, while intellectually negative and unable to cope with any kind of learning whatever, had endless perseverance, great strength of application, and all through life remained genial, gentle, simple-minded, and modest, his penetration and self-reliance being wholly professional, inspired by his love of nature and his knowledge of his subject. Not very quick, and with little versatility, he went step by step in one line of study from the time he began to get the smallest remuneration for his pictures to the age of seventy-five, when he painted large in oil very much the same class of subjects he had of old produced small in water-colours, with the same impressive and unaffectedly noble sentiment, only increased by the mastery of almost infinite practice. He was never led astray by fictitious splendour of any kind, except once indeed in 1825, when he imitated Turner, and produced a classic subject he called Carthage, Æneas, and Achates. He never visited Venice or Egypt, or crossed the Channel except for a week or two in Belgium and Paris, and never even went to Scotland for painting purposes. Bettws-y-Coed and its neighbourhood was everything to him, and characteristics most truly English were beloved by him with a sort of filial instinct. So completely did he love the country, that even London, where it was his interest to live, had few attractions, and did not retain him long.

This residence in the metropolis which began in 1804 was, however, of the most essential educational advantage to him. The Water-Colour Society was established the year after he arrived, and was mainly supported by landscape-painters. He was not, of course, admitted at first into membership, not till 1813, before which time an attempt to establish a rival exhibition had been made. In this Cox joined, the result being very serious to him, an entire failure entailing the seizure and forced sale of all the pictures. At that time the tightest economy was the rule with him, and to save the trifling cost of new strainers or stretching boards, he covered up one picture by another. When these works were prepared for re-sale, fifty years afterwards, some of them yielded picture after picture, peeled off the boards like the waistcoats from the body of the gravedigger in Hamlet!

While lodging near Astley's Circus he married his landlady's daughter, and then took a modest cottage at Dulwich, where he gradually left off scene-painting and became teacher, giving lessons at ten shillings a lesson. This entailed walking to the pupils' homes, and the gift of the paintings done before the pupils. These have since been frequently sold for 30 or 40 guineas, but his own price, when lucky enough to sell his best works, was never over a few pounds, and more frequently about fifteen shillings. Sometimes, indeed, he sold them in quantities at two pounds a dozen to be resold to country teachers. By and by he resisted the leaving of the work done to the pupil, but with little advantage to himself, as he saw no end to the accumulation of his own productions, and actually tore them up, and threw them into areas, or pushed them into drains during his trudge homeward. A number of years after he pointed out a particular drain to a friend, and said, "Many a work of mine has gone down that way to the Thames!"

Shortly after he had turned thirty, his stay in London suddenly ended. He was offered the enormous sum of £100 per annum by a ladies' college in Hereford, and thither he went. This sum he supplemented by teaching in the Hereford grammar school for many years, at six guineas a year, and in other schools at better pay, but still, and up to his fortieth year, we find his prices for pictures from eight to twenty-five shillings. Cox has no history apart from his productions, and these particulars as to his remuneration possess an interest almost dramatic when we contrast them with the enormous sums realized by his later works, and with the "honours and observance, troops of friends," that accompanied old age with him, when settled down in his own home at Harborne, near his native town, where he died on June 7, 1859, aged seventy-six.

Cox's second short residence in London, dating from 1835 to 1840, marks the period of his highest powers. During those years, and for twelve years after, his productiveness kept pace with his mastery, and it would be difficult to overrate the impressiveness of effect, and high feeling, within the narrow range of subject displayed by many of these works. He was now surrounded by dealers, and wealth flowed in upon him. Still he remained the same, a man with few wants and scarcely any enjoyments except those furnished by his brush and his colours. The home at Harborne was a pleasant one, but the approach to the front was useless as the door was kept fastened up, the only entrance being through the garden at the back, and the principal room appropriated as his studio he was content to reach by a narrow stair from the kitchen. Neither in it nor elsewhere was there any luxury or even taste visible:—no *bric-a-brac*, no objects of interest, few or no books, no pictures except landscapes by his friends. When in winter, after his wife's death, the fire went out, and the cold at last surprised him, he lifted his easel into the little dining-room and began again. A union of his friends was formed in 1855 to procure a portrait of him, which was painted by Sir J. Watson Gordon; and an exhibition of his works was opened in London in 1858 and again another in 1859. This was actually open when the news of his death arrived.

The number of David Cox's works, great and small, is enormous. He produced hundreds annually for perhaps forty-five years. This being the case, it has been the interest of dealers to force their price. Mr Flatou, himself an adept, used to boast that it took six horse-dealers to make one picture-dealer, so that it is difficult to say what is their intrinsic or permanent value. Before his death and for ten years thereafter, their prices were remarkable, as witness the following, obtained at auction—Going to the Mill, £1575; Old Mill at Bettws-y-Coed, £1575; Outskirts of a Wood, with Gipsies, £2305; Peace and War, £3430. (W. B. SC.)

COX, RICHARD (1499–1581), born at Whaddon, Buckinghamshire, was educated at Eton, and afterwards at King's College, Cambridge, of which he became a fellow in 1519. He was invited to Oxford by Cardinal Wolsey; but having adopted the Reformed opinions, he was stripped of his preferment, and thrown into prison. On his release, however, he was appointed master of Eton School, and in 1541 he was made prebendary of Ely Cathedral. Through the influence of Cranmer he was chosen tutor to Prince Edward; and on the accession of that prince he was sworn of the Privy Council, and made king's almoner. Under Mary he was stripped of his preferments, and committed to the Marshalsea; he escaped, however, to Strasburg, where he resided with Peter Martyr. By Elizabeth he was elevated to the see of Ely. Cox was a man of considerable learning. He was distinguished by the violence of the measures which he recommended for the extirpation of Popery and dissent.

He translated the four gospels, the Acts of the Apostles, and the Epistle to the Romans, in the Bishops' Bible, and had a considerable share in compiling and revising the liturgy; and he wrote *Two Latin Orations on the Dispute between Dr Tresham and Peter Martyr*, London, 1549, and *Resolutions of some Questions concerning the Sacrament*, printed in the Collection of Records at the end of Burnet's *History of the Reformation*.

COXCIE, MICHAEL (1499–1592), was born at Malines, and studied under Bernard van Orlay, who probably induced him to visit Italy. At Rome in 1532 he painted the chapel of Cardinal Enckenvoort in the church de Anima; and Vasari, who knew him personally, says with truth "that he fairly acquired the manner of an Italian." But Coxcie's chief business in Italy was not painting. His principal occupation was designing for engravers; and the fable of Psyche in thirty-two sheets by Agostino Veneziano and the Master of the Die are favourable specimens of his skill in this respect. During a subsequent residence in the Netherlands Coxcie greatly extended his practice in this branch of art. But his productions were till lately concealed under an interlaced monogram M.C.O.K.X.I.N. Coxcie, who married in Italy, displayed the peculiar bias of his taste by christening his eldest son Raphael. He returned in 1539 to Malines, where he matriculated, and painted for the chapel of the guild of St Luke the wings of an altar-piece now in Sanct Veit of Prague. The centre of this altar-piece, by Mabuse, represents St Luke pourtraying the Virgin; the side pieces contain the Martyrdom of St Vitus and the Vision of St John in Patmos. At Van Orlay's death in 1541 Coxcie succeeded to the office of court painter to the regent Mary of Hungary, for whom he decorated the castle of Binche. He was subsequently patronized by Charles V., who often coupled his works with those of Titian; by Philip II., who paid him royally for a copy of Van Eyck's Agnus Dei; and by the duke of Alva, who once protected him from the insults of Spanish soldiery at Malines. There are large and capital works of his (1587–88) in St Rombaud of Malines, in Ste Gudule of Brussels, and in the museums of Brussels and Antwerp. His style is Raphaelesque grafted on the Flemish, but his imitation of Raphael, whilst it distantly recalls Giulio Romano, is never free from affectation and stiffness. Coxcie was working at a picture in Antwerp when he met with a fall. He was taken in an ailing state to Malines, where he died on the 5th of March 1592.

COXE, WILLIAM (1747–1828), archdeacon of Wilts, traveller, and historian, was born at London in 1747. He was elected fellow of King's College, Cambridge, in 1768, and afterwards went abroad on a visit to the different Continental states, where he prosecuted the researches which were afterwards incorporated into his historical works. On his final return to England he was appointed to the rectory of Bemerton, and in 1808 was preferred to the archdeaconry of Wilts. Towards the close of his life his vision became seriously impaired, and for nearly seven years before his death he was totally blind. He died at Bemerton in 1828.

Of his numerous works the most important are—*Sketches of the Natural, Civil, and Political State of Switzerland* (1779); *Private Correspondence of Charles Talbot, Duke of Shrewsbury* (1821); *Travels in Switzerland* (1789); *Travels in Poland, Russia, Sweden, and Denmark* (1784); *Histories of the House of Austria, and of the Kings of Spain of the House of Bourbon; Memoirs of John, Duke of Marlborough; Memoirs of Sir Robert Walpole; Memoirs of the Administration of Henry Pelham* (posthumous, 1839); *Literary Life and Select Works of B. Stillingfleet.*

COYPEL, the name of a French family of painters. Noel Coypel (1628–1707), also called, from the fact that he was much influenced by Poussin, Coypel le Poussin, was the son of an unsuccessful artist. Having been employed by Edward to paint some of the pictures required for the Louvre, and having afterwards gained considerable fame by other pictures produced at the command of the king, in 1672 he was appointed rector of the French Academy at Rome, to which he is said to have done good service. After four years he returned to France; and not long after he became director of the Academy of Painting. The Martyrdom of St James in Notre Dame is perhaps his finest work. His son, Antoine Coypel, was still more famous. Antoine studied under his father, with whom he spent four years at Rome. At the age of eighteen he was admitted into the Academy of Painting, of which he became professor and rector in 1707, and director in 1714. In 1716 he was appointed king's painter, and he was ennobled in the following year. Antoine Coypel received a careful literary education, the effects of which appear in his works; but the graceful imagination displayed by his pictures is marred by the fact that he was not superior to the artificial taste of his age. He was a clever etcher, and engraved several of his own works. His *Discours prononcés dans les Conférences de l'Académie royale de Peinture, &c.*, appeared in 1741. His half-brother, Noel Nicolas (1691–1734), was also a popular artist; and his son, Charles Antoine (1694–1752), was painter to the king and director of the Academy of Painting. The latter published interesting academical lectures in *Le Mercure* and wrote several plays which were acted at court, but were never published.

COYSEVOX, ANTOINE (1640–1670), one of the most able and famous of French sculptors, born at Lyons in 1640, belonged to a family which had emigrated from Spain. He was only seventeen when he produced a statue of the Madonna of considerable merit; and having studied under Leranbert, and trained himself by taking copies in marble from the Greek masterpieces (among others from the Venus de Medici and the Castor and Pollux), he was engaged by the bishop of Strasburg, prince and cardinal Fürstenberg, to adorn with statuary the palace of Saverne. After four years spent on this work, he returned to Paris in 1671, having gained very considerable fame. He was now employed by Louis XIV. in producing a large number of statues for Versailles; and he afterwards worked with no less facility and success for the palace at Marly. His works are far too numerous to mention; but among them are the Mercury and Fame, placed first at Marly and afterwards in the gardens of the Tuileries;

Neptune and Amphitrite, in the gardens at Marly; Justice and Force, at Versailles; and statues, in which the likenesses are said to have been remarkably successful, of most of the celebrated men of his age, including Louis XIV., Louis XV., Colbert (at Saint-Eustache), Mazarin (in the church des Quatre-Nations), Condé the Great, Maria Theresa of Austria, Louvois, Turenne, Vauban, Cardinals de Bouillon and de Polignac, Fénelon, Racine, Bossuet, Comte d'Harcourt, Prince de Fürstenberg, and Charles Lebrun.

CRAB, a name common to all the species of short-tailed Decapod Crustaceans (*Brachyura*), as well as to the forms intermediate between the short-tailed and long-tailed groups (*Anomoura*), and derived from the Latin *Carabus*, the name by which the common edible species was known to the Romans. The abdomen in the true crabs is short, and is completely folded beneath the breast. In the female this part is broad and rounded, and bears certain leafy appendages to which the ova are attached before spawning; in the male the abdomen is much narrower and is somewhat triangular in shape. Like all other Decapod Crustaceans crabs are furnished with ten legs, of which the anterior pair are modified so as to form nippers—powerful prehensile organs and principal weapons of offence. These are largest in the male, and the right claw is generally larger than the left. The other limbs usually end in a single claw, which in the posterior pair in swimming-crabs is more or less flattened and paddle-like (Plate X. fig. 2). Their eyes, which are compound, are placed upon stalks, measuring in some instances an inch in length (Plate X. fig. 3), and these when not in use fit into cavities in the carapace or shell which covers the entire upper surface. Crabs, like insects, undergo metamorphosis. On emerging from the egg they are provided with long tails, swimming appendages, and sessile eyes, and bear so little resemblance to the parent form that until half a century ago their connection with the crab was altogether unsuspected. They were then known as *zoëas*. After moulting, the eyes appear on stalks and nippers on the anterior pair of legs, but this form is still sufficiently uncrablike to have deceived early zoologists, who described it as forming a distinct genus (*Megalops*), and it is not till a further casting of the skin that the creature assumes the perfect form. As its internal parts continue to grow its external shell soon becomes too small, and is cast off,—the crab generally concealing itself until its new and greatly enlarged covering gets sufficiently hardened. This process of moulting takes place very frequently in the young crab, and gradually becomes rarer as the creature approaches its full growth, crabs being often found with oysters attached to the carapace which from their size must have grown there for three or four years. A still more remarkable power is that possessed by crabs of reproducing limbs which have been voluntarily thrown off, or have been lost by accident. This renewal only takes place when the limb has been severed at the second articulation; but when broken at any point nearer the extremity the creature generally succeeds in throwing off the part between.

Among the numerous species of crabs which abound everywhere on or near the sea-coast the following may be noticed.

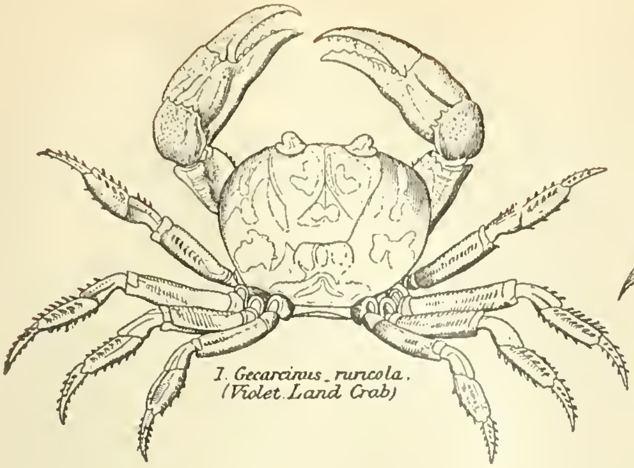
(1) The Great or Edible Crab (*Cancer pagurus*), the Carabus of the Romans and the Partan of Scotland. This is one of the largest, and as an article of food is certainly the most valuable, of the short-tailed Decapods, being everywhere esteemed for the delicacy of its flavour. It abounds chiefly on the rocky parts of the coasts of Europe, and often measures 12 inches across the carapace, weighing in the larger specimens fully 12 lb. The principal British crab-fisheries are off the north-east coast of Scotland, in the Firth of Forth, and off the coast of Cornwall; and the home produce is largely supplemented by imports from Norway. In the capture of this crustacean "crab-pots," made of wicker-work, with the entrance at the top, and baited with dead fish, are employed. These are sunk in the proper localities, and their position indicated by a piece of cork attached to a line connected with the wicker trap. In the sheltered bays of the west of Scotland this crab is also caught in calm weather by poking it from behind with a long pole, which the crustacean immediately seizes, and which is then gently shaken, making the crab adhere all the more tenaciously, and giving the fisherman the opportunity he seeks of hoisting it into his boat. When caught, crabs are kept alive till wanted by being placed in perforated boxes which are then sunk at some convenient spot in the sea. Those caught off Lizard Point are conveyed to Falmouth Harbour, where they are individually branded, and put in boxes which are then placed under water. Recently it was stated on good authority, that one of those cases having gone to pieces, thus liberating the imprisoned crabs, many of them were shortly after caught again on their old feeding-ground—a distance of eleven miles from the place where they had been confined. As they had been conveyed to Falmouth by boat, it is impossible with our present knowledge to say by what sense they were thus unerringly guided on their return journey.[1]

(2) The Shore Crab (*Carcinus mœnas*) is the species most commonly met with on all parts of the British coast. Although found in deep water, its favourite haunts are beneath the stones that lie between low and high water mark, and its awkward sidelong gait as it sidles off to its place of concealment must be familiar to the most casual observer of shore life. It is a shy creature, eluding observation beneath stones or buried in the sand, its telescopic eyes alone visible, and feigning death when unable otherwise to cope with danger. Unlike the former species, its legs, especially the posterior pair, are flattened and ciliated so as to form swimming organs. Owing probably to the small size of this species, it has obtained little prominence as an article of food, although in flavour it is said to rival the Great Crab. Large numbers, however, are eaten by the poorer classes in seaport towns, and they are also to be had in the London fish markets. They feed chiefly on the spawn of fish and the smaller crustaceans.

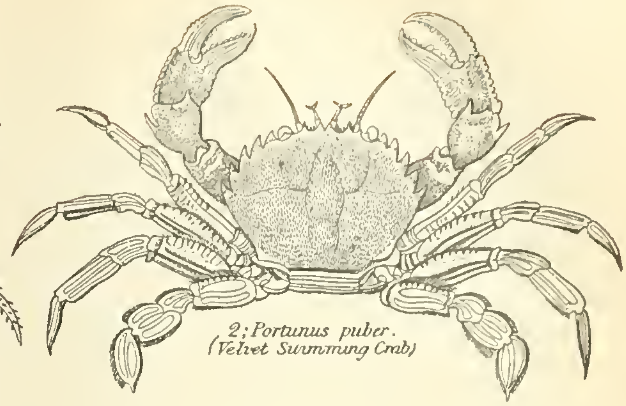
(3) Pea Crabs (*Pinnotheres*, Plate X. fig. 5) are small crustaceans in which the sexes so differ that the males and females were at one time described as separate species. The female is larger than the male, and its external covering is softer; and they are further remarkable in taking up their residence in the shells of living bivalve mollusks, especially in the pinna, the cockle, and the mussel. The soft-bodied female is never found outside of its adopted shell, although the harder cased male is thus occasionally met with. The Pinna Pea Crab (*Pinnotheres veterum*), which abounds in the Mediterranean, makes its home in the pinna shell, and ancient writers have given highly imaginative descriptions of the object of this alliance between crustacean and mollusk. It was believed that on the entrance of food

[1] The male crab is generally larger than the female, especially in its claws, and is more sought after as a table delicacy; the flesh of both sexes immediately after the casting of the shell is watery and unwholesome. During moulting the female is generally guarded by a male, which if removed is shortly replaced by another, and it is after the completion of the moulting process in the female that the union of the sexes takes place. The spawn is carried for a considerable time on the abdominal appendages before being deposited, an operation which takes place in spring and summer. Recently fears were entertained that through over-fishing the stock of crabs in British waters was being seriously diminished, and a commission at present (1877) sitting was appointed to take evidence on this matter at the principal seats of the crab fishery. From the evidence already collected it appears that these fisheries are now much less productive than formerly, and that the size of the crabs has greatly diminished, while their cost has enormously increased; for while forty years ago a dozen of the largest crabs could be had for 10d., the same number of medium sized specimens now costs 3s. Those who have given evidence are generally in favour of a 5-inch gauge in order to prevent the wanton destruction of young crabs; and also of a close time; but great diversity of opinion exists as to the best season for this, although the period from the beginning of June to the end of August is that most generally recommended.

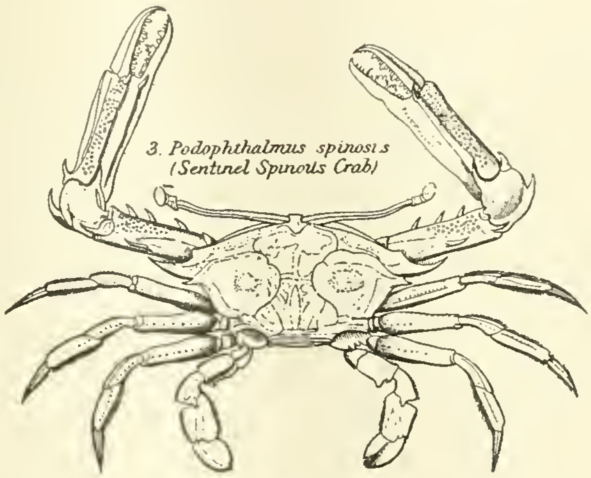
CRABS.



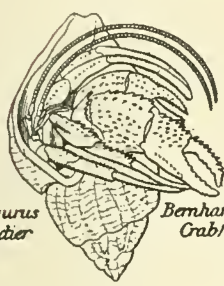
1. *Gecarcinus ruricola.*
(Violet Land Crab)



2. *Portunus puber.*
(Velvet Swimming Crab)

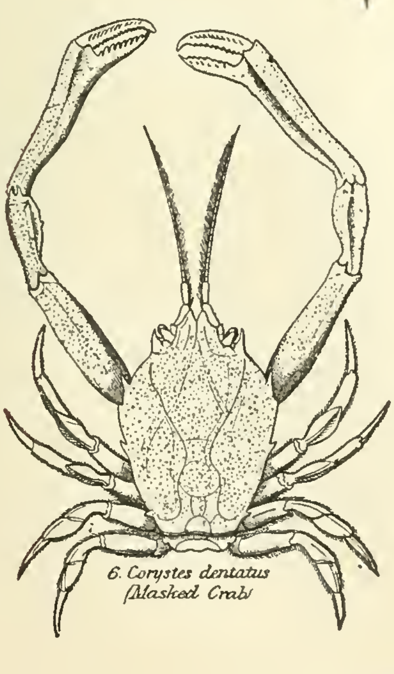


3. *Podophthalmus spinosus*
(Sentinel Spinous Crab)

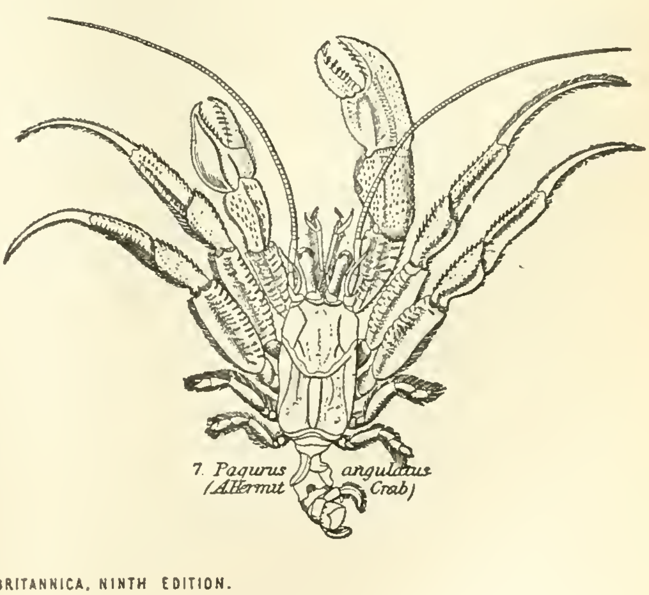


4 *Pagurus Bernhardus.*
(Soldier Crab)

5. *Pinnotheres pisum.*
(Pea Crab)



6. *Corystes dentatus*
(Masked Crab)



7. *Pagurus angulatus*
(A Hermit Crab)

"within the gaping circuit of the shell," the active little crab pricked the tender sides of its sluggish partner, who understanding the hint closed its shell upon the prey

"Thus fed by mutual aid, the friendly pair
Divide their gains, and all the plunder share."

(4) The *Inachus Kempferi*, found in Japanese waters, is the largest of known crabs. It measures 10 feet between the tips of its nippers, each of which is 5 feet in length. The body, however, is comparatively small and triangular in shape. It is said to be eaten by the Japanese.

(5) Land Crabs occur in various parts of the tropical world, and are especially abundant in the West Indies. The Violet Land Crab (*Gecarcinus ruricola*, Plate X. fig. 1) of Jamaica lives in communities and forms burrows in the ground, often two or three miles from the sea. These crabs are provided with powerful pincers, which they are not loath both to use and to lose, for when attacked they fix upon the enemy with their great claw, which is then thrown off, and as the muscles connected with it retain their tension for some time after the severance, the creature seeks to make its escape while pain is still being inflicted by the now independent claw. They remain in their burrows by day, and come forth at night in search of food, running about with great speed and retiring, when possible, to their holes, in the presence of danger. They renew their connection with the sea once a year, visiting it in order to deposit their spawn. They travel by night, directed by a powerful instinct which causes them to march straight for their destination, surmounting whatever difficulties may be in their way. At this season they are taken in great numbers, and their flesh is regarded as one of the chief delicacies of the island. Like their marine congeners they cast their shell, but unlike these, it is immediately after the moulting process that they are in best condition for the table. The Calling Crab (*Gelasimus tetragonon*) of Ceylon has its left claw exceedingly small, while its fellow is larger than all the rest of the body, and this it carries aloft as if brandishing a weapon (see CRUSTACEA, fig. 65); while the Racer Crab (*Ocypoda ceratophthalma*) digs deep burrows in the sandy roads of that island, sufficient to render them dangerous for horsemen, were the holes not regularly filled up by a band of labourers.

(6) The Robber Crab (*Birgus latro*) belongs to that division (*Anomoura*) of the Decapod Crustaceans which forms a connecting link between crabs and lobsters, the abdominal segments not being folded beneath the breast as in true crabs. It is an inhabitant of the islands in the Indian Ocean, and makes its burrows under the cocoa-nut trees, the fruit of which forms its principal food. It was formerly supposed to ascend these trees and break off the nuts, but the researches of Darwin, Bennet, and others seem to prove that they only make use of the nuts which they find already fallen. In order to get at the edible contents of these, they strip off the fibrous envelope so as to lay bare the eye-spots, into one of which they insert the sharp edge of a claw, and by working this backward and forward they gradually scoop out the substance of the nut. According to another authority, after inserting the claw, they sometimes proceed to crack the hard shell by beating it against a stone. The fibre which they remove from the nut is employed by them in lining their burrows; it is also gathered by the natives and made into mats, &c. The Robber Crab attains a length of 2 feet, and has usually a mass of fat under the tail which, according to Darwin, often yields when melted as much as a quart of limpid oil.

(7) In the Hermit Crabs (*Paguridæ*, Plate X. fig. 7) the abdomen is soft and pulpy and destitute of protecting plates, the safety of this defenceless part being provided for by the entrance of those creatures into univalve shells to which they become so closely attached by means of certain hooked appendages of the abdomen, that it is impossible to drag a Hermit Crab from its adopted shell without tearing the body asunder. The mouth of the shell is guarded by the claw, the larger pincers of some of these crabs being, says Darwin, "most beautifully adapted when drawn back to form an operculum to the shell nearly as perfect as the proper one." The most common and the largest of the British species is the Soldier Crab (*Pagurus bernhardus*, Plate X. fig. 4), to be seen at all seasons on our coasts, inhabiting a great variety of univalve shells from the tiny natica to the largest whelk, the latter being the shell usually chosen by the adult crab. It changes its residence so soon as it has outgrown the dimensions of the place, and its new premises seem to be generally selected with a view to the future growth of the creature. Dead shells appear in some cases to be thus employed, but it is believed that in most instances the crab kills the mollusk in order to secure its shell. Hermit Crabs are largely used as bait. See CRUSTACEA.

CRABBE, GEORGE (1754–1832), was born at Aldborough, in Suffolk, December 24, 1754, and was the son of an officer of the customs. He appears to have been designed by his father first for an employment similar to his own, and afterwards for the medical profession. He was apprenticed to an apothecary, and received an education merely sufficient to qualify him for such an occupation, and by no means to advance him in that literary career in which he became eventually distinguished. His poetical taste was first elicited by the casual perusal of some verses in the *Philosophical Magazine*, which his father, who was a mathematician and averse to poetry, had separated from the scientific portions of that periodical, and thrown aside as unworthy. The spark thus kindled burnt steadily; and even while a schoolboy he versified much, and made sundry ambitious attempts in the highest walks of composition. The attainment of a prize offered by the editor of the *Lady's Magazine* for a poem on Hope, although a humble species of success, sufficed to encourage him to renewed exertions; and in 1778 he quitted the profession of medicine, which he had always disliked, and repaired to London, determined to apply himself to literature. His early efforts in his new career were attended with disheartening circumstances. The first poem he offered for publication could find no publisher. From the first that was printed he obtained no profit, in consequence of the publisher's bankruptcy. It was entitled *The Candidate, a Poetical Epistle to the Authors of the Monthly Review*, and appeared anonymously in 1780. Soon afterwards he became acquainted with Burke, an acquaintance from which may be dated the dawn of his literary rise. Without an introduction, and impelled by distress, he applied to Burke, who kindly took him by the hand, afforded him the advantage of his criticism and advice, recommended him to Dodsley the publisher, invited him to his house, and made him known to many distinguished men of that time, among whom were Reynolds, Johnson, and Fox. Crabbe's first published poems, after the commencement of his acquaintance with Burke, were *The Library* and *The Village*, both of which received the benefit of Burke's observations, and the second of which was in a great measure composed at Beaconsfield. In 1781 Crabbe, who by the recommendation of Burke had been qualifying himself for holy orders, was ordained a deacon, and he took priest's orders the following year. After serving a short time as curate at Aldborough, through the influence of this generous and distinguished friend he was introduced to the duke of Rutland and became his domestic chaplain. Nor did Burke's kindness stop here; for he obtained for him from Lord Thurlow, in 1783, a presentation to the rectory of Frome St Quintin, in Dorsetshire, which he held for six years. About this time he married, and resided for some time at Swefling, county of Suffolk, officiating as curate to the minister of Great Yarmouth. About 1789 he was presented, through the instrumentality of the duchess of Rutland, to the rectories of Muston in Leicestershire and West Allington in Lincolnshire. In 1813 he was preferred to the rectory of Trowbridge, county of Wilts, which, together with the smaller living of Croxton Kerrial, in Leicestershire, he held to the time of his death. After *The Village*, published in 1783, which had received the corrections and commendations of Dr Johnson, Crabbe next produced *The Newspaper*, published in 1785. After this time his poetical labours were long suspended, owing probably to the dedication of his time to domestic affairs and the duties of his profession, or, as he himself ascribes it, to the loss of those early and distinguished friends who had given him the benefit of their criticism. He had, however, the satisfaction of seeing his next work, *The Parish Register*, published in 1809, read and approved by Fox. The success obtained by these poems, which far exceeded that which had attended his earlier efforts, encouraged him to write again; and in 1810 he published one of his best poems, *The Borough*, and in 1812 *Tales in Verse*. His last publication was entitled *Tales of the Hall*, and appeared in 1819. The latter years of his life he spent in the tranquil and amiable exercise of his domestic and clerical duties, at his rectory of Trowbridge, esteemed and admired by his parishioners, among whom he died, after a short illness, on the 8th February 1832, aged seventy-seven. He was buried in the chancel of Trowbridge Church. Crabbe's only prose publications were a *Funeral Sermon on Charles, duke of Rutland*, preached at Belvoir, and an essay on the natural history of the vale of Belvoir, written for Nichols's *History of Leicestershire*, in which it is thankfully acknowledged. His fame rests solely on his poems, of which *The Parish Register* and *The Borough* are destined to a reputation, if not as brilliant, yet probably as enduring as that of any other contemporary productions.

Crabbe is one of the most original of our poets; and his originality is of that best kind, which displays itself not in tumid exaggeration or flighty extravagance—not in a wide departure from the sober standard of truth—but in a more rigid and uncompromising adherence to it than inferior writers venture to attempt. He is pre-eminently the poet of reality in humble life; and to its representation he has applied himself with a rigorous fidelity which startled the timid fastidiousness of many readers. He discarded the aid of those pleasing illusions with which humble life had previously been enveloped; condemned as fictitious the prevalent representations, and in their stead fearlessly exhibited the stern, harsh, naked truth, and determined to rely for popularity on the fidelity and vigour of his delineations. His chief characteristics are force and accuracy; and through these, and the originality of his style, he compels us to bestow our attention on objects that are usually neglected. His poetry, unlike that of others, directs our sympathy where it is well for the cause of humanity that it should be directed, but whence the squalidness of misery and want too frequently repels it. Much of his success arises from his graphic delineation of external objects, but more from his knowledge of the human heart, and his powerful treatment of the passions. Both the milder and the more violent emotions are portrayed with ability, but in the latter he is most strikingly successful. Despair and remorse are exhibited with a tragic strength that has been rarely equalled; and madness has been seldom drawn with a more powerful hand than in his poem of *Sir Eustace Grey*. He has been called the satirist of the poor; but we must be careful lest we attach to this expression too harsh an acceptation. It is true he discountenances those romantic day-dreams which associate virtue inseparably with poverty, and an Arcadian innocence with rural life He shows that demoralization is the attendant of distress, and that villagers may be equally dissipated, and more dishonest than the profligates of a wealthier class; but he shows this in a spirit rather of pity than of anger; and whilst he denounces and exposes crime, he makes us interested not so much in its punishment, as, what is still better, in its prevention. He spares not the vices of the poorer classes; but at the same time he does more justice to their virtues, and renders them more important objects of consideration than perhaps any other imaginative writer.

With many sterling merits as a poet, Crabbe has numerous defects. His descriptions are forcible and exact, but they are too detailed. They have too much of the minuteness of a Dutch picture; and it is a minuteness exhibited in the representation of disgusting objects. He never shrinks from the irksome task of threading the details of vice and misery. Abject depravity is a too favourite subject of his pen; and he does not seem sufficiently aware that there is a species of wickedness which counteracts our sympathy with suffering, and a degree of insignificance which extinguishes our interest in guilt. His skill in displaying the morbid anatomy of our moral nature has rendered him too prone to that unpleasing exercise of his talents; and his habit of tracing the deformities of character has given to his expositions too much the appearance of invective. His taste is very inferior to his other powers. Even with subjects naturally pleasing he is apt to blend disagreeable images. His descriptions of natural scenery, graphic as they are, have little in them of elevation. There is no genial glow about them, as if the contemplation of nature had warmed and inspired him. His deficiency of taste displays itself also sometimes in his humour, which is apt to verge upon buffoonery. His style is little to be commended. It is too often clumsy and ungraceful,—diffuse without freedom, homely without being easy, and antithetical without being pointed. His diction is frequently harsh and quaint, and compels us to feel that the merit of his works resides rather in their ideas than in the dress in which he clothes them. His lines are deficient in refinement and polish, and frequently offend the ear by something uncouth and prosaic in the sound, and the absence of musical rhythm. Such are the defects which have conduced to deprive him of that popularity which his merits would otherwise have obtained for him. (T. H. L.)

A complete edition of Crabbe's works was published in 1834, in 8 volumes 12mo, the first volume containing his Life by his son, the Rev. George Crabbe. A reprint, in one volume royal 8vo, was issued in 1867.

CRACOW (Polish, *Krakov;* German, *Krakau*), a city of the crownland of Galicia, Austria, the capital anciently of Poland, and more recently of a small Polish republic which bordered on the Prussian, Austrian, and Russian dominions where they meet. The city stands in a fertile plain on the left bank of the Vistula, where the stream of the Rudowa joins it, nearly 200 miles north-east of Vienna in latitude (of observatory) 50° 3′ 50″ N., longitude 19° 57′ 30″ E., and at an elevation of 650 feet above the sea. The main railway line of Galicia, called the Carl Ludwig's Bahn, uniting the system of Germany along the outskirts of the Carpathian range with the lines about the Lower Danube, crosses the Vistula at Cracow. A line of detached forts has been built round the city, and a castle on a height commands the town. Promenades occupying the place of the old walls, planted with trees, divide the old town from the seven extensive suburbs of Stradom, Ribaki, Kleparz, Piasek, Wesola, Smolensk, and Wielopole; and an arm of the Vistula cuts off the Jewish quarter of Kasimierz. In the old town the extensive castle of the Polish kings on the rock of Wawel, dating from the 14th century, has been for the most part rebuilt to serve as barracks and for a hospital. The Stanislas Cathedral (Lady Church), built in 1359, contains many interesting antiquities relating to the kingdom of Poland; the monarchs were crowned in this edifice, which also holds the mausoleum of the Sigismunds, the silver coffin of the holy Stanislas, and the remains of John Sobieski, of Poniatowski, and of Kosciusko; it is adorned by sculptures by Thorwaldsen, and a wooden carved altar (1472–1484) by Veit Stoss, who was a native of

11. Summer Theatre.
12. Observatory.
13. Cathedral.
14. Military Hospital.

Cracow. There are forty churches in the city, with twenty-three convents of monks and nuns. In the Ringplatz stand the old Gothic cloth booths and the ancient Rathhaus with a fine tower. A relic of the old wall remains in the Floriane gate on the esplanade. The university of Cracow, founded by Casimir the Great, and carried out by Jagellon in 1401, has sixty-nine professors and about 450 students, and possesses a library of 140,000 volumes and numerous MSS. Attached to it are an observatory, botanic gardens, natural, historical, and medical museums, a laboratory, and medical schools. Cloth, leather, and agricultural implements are manufactured to some extent in Cracow, and a busy traffic in grain, wood, salt, wine, linen, and pigs is carried on by the Vistula. In the neighbourhood there are coal and zinc mines. Besides a bridge over the old Vistula, the Franz Joseph Bridge on five stone piers and the railway bridge cross the river to the villages of Podgorze and Stawisko on the opposite bank. Three miles north-west of Cracow a huge mound 125 feet in height was raised in 1824 to the memory of Kosciusko, and this has now been utilized as the site of a fort. The village of Krzezowice in this direction is a favourite resort of Cracow people, and has a fine castle, a Gothic church, sulphur baths, and iron and zinc mines. Eight miles south-east of Cracow, united to it by a branch railway, are the village and famous salt-mines of Wieliczka; about 1000 miners are constantly employed here, and the annual yield of salt amounts to more than a million cwts. Population (1869), 49,835, including about 10,000 Jews.

Cracow takes its name from the Polish Prince Krak or Krakus, and dates from about the year 700. Perhaps no city has suffered greater vicissitudes. It was taken in 1039 by the Bohemians, in 1241 by the Mongols, by the Swedes in 1655 and in 1702, and by the Russians in 1768. It remained the capital of Poland from 1320 till 1609, when the seat of government was transferred to Warsaw, but the kings of Poland were crowned in it till 1764. On the third partition of Poland in 1795 Austria took possession of this portion; but in his campaign of 1809 Napoleon wrested it from that power, and incorporated it with the duchy of Warsaw, which was placed under the rule of Saxony. In the campaign of 1812 the Emperor Alexander made himself master of this and the other territory which formed the duchy of Warsaw. At the general settlement of the affairs of Europe by the great powers in 1815, it was agreed that Cracow and the adjoining territory should be formed into a free state; and, by the General Treaty of Congress signed at Vienna in 1815, "the town of Cracow, with its territory, is declared to be for ever a free, independent, and strictly neutral city, under the protection of Russia, Austria, and Prussia." In February 1846, however, an insurrection broke out in Cracow, apparently a ramification of a widely-spread conspiracy throughout Poland. The senate and the other authorities of Cracow were unable to subdue the rebels or to maintain order, and, at their request, the city was occupied by a corps of Austrian troops for the protection of the inhabitants. The three powers, Russia, Austria, and Prussia, made this a pretext for extinguishing this independent state; and having established a conference at Vienna (November 1846) the three courts after due deliberation, contrary to the assurance previously given, and in opposition to the expressed views of the British and French Governments, came to the conclusion to extinguish the state of Cracow and to incorporate it with the dominions of Austria.

CRAIG, JOHN (*c.* 1512–1600), one of the Scottish Reformers, was born about 1512. He was educated at the university of St Andrews, and entered the Dominican order. But, being suspected of heresy, he was cast into prison. Retiring to the Continent, he obtained the patronage of Cardinal Pole, and for some years taught in Dominican schools, and performed other services for the order. He was converted to Protestantism by the *Institutes* of Calvin, and, having made a brave confession of his heresy before the Inquisition, he was condemned to be burnt. But on the eve of his execution Pope Paul IV. died, and the mob broke open the prisons. Craig fled to Vienna, and the emperor, Maximilian II., refused to surrender him to the Inquisition. He now returned to his native country, and after preaching for some time in Edinburgh became coadjutor to Knox. It was he who proclaimed the banns of marriage between Queen Mary and Bothwell, but he openly denounced their union. On the death of Knox in 1672 he naturally succeeded to the leadership of the Scottish Church. He took the most prominent part in drawing up the *Second Book of Discipline*, and he was the author of the *First Covenant*, otherwise called the *King's Confession* (1581), and of *Craig's Catechism* (1592), which was for half a century in general use in Scotland. But though he was bold enough to rebuke the king in his sermons, he yielded to his commands, and signed a declaration, promising obedience to the bishops and submission to an Act that had been passed forbidding the assembling of church courts without royal licence. Craig's coadjutor and successor was Andrew Melville.

CRAIG, SIR THOMAS (*c.* 1538–1608), of Riccarton, one of the earliest and one of the ablest writers on the law of Scotland, and a poet of some note, was born about the year 1538. It is probable that he was the eldest son of William Craig of Craigfintray, or Craigston, in Aberdeenshire, but beyond the fact that he was in some way related to the Craigfintray family nothing regarding his birth is known with certainty. He is first heard of as a student at St Andrews, where he was entered at St Leonard's College in

1552, and where he took the B.A. degree in 1555. From St Andrews he went to France, like most of his countrymen of that day who were destined for the bar, to study the canon and the civil law. He himself makes more than one allusion in his works to what he had learned at Paris, but as the civil law was not at that time publicly taught there, it is more than probable that he attended the lectures of the great civilians of some of the other French schools. He returned to Scotland about 1561, and, after spending some time in acquiring a practical acquaintance with the forms of court procedure, was admitted advocate in February 1563. In 1564 he was appointed justice-depute by the justice-general, Archibald, earl of Argyll; and in this capacity he presided at many of the criminal trials of the period. He is not mentioned as deputy of the justice-general after 1573; and in the course of the following year he appears as sheriff of Edinburgh, so that he probably resigned the one office on being nominated to the other. In 1606 he is described as procurator for the church; and this completes the list of his regular preferments, although his name is found in more than one commission of importance. He never became a Lord of Session, a circumstance that was unquestionably due to his own choice. His extensive practice, added to the emoluments of his various offices, no doubt, much exceeded what he would have had as a judge; but in truth he probably felt that his studious and retiring disposition unfitted him for the rough work, diplomatic and military as well as judicial, that was in those days expected of a Scotch judge. In this respect he presents a striking contrast to his contemporary Balfour, who was implicated in every conspiracy of his time, and to whom no office, judicial, ecclesiastical, or military, came amiss. Craig even, it is said, refused the honour of knighthood which the king wished to confer on him in 1604, when he came to London as one of the Scottish commissioners regarding the union between the kingdoms—the only political object he seems to have cared about; but in accordance with James's commands he has always been styled and reputed a knight. Craig was married to Helen, daughter of Heriot of Trabroun in Haddingtonshire, by whom he had four sons and three daughters. His eldest son, Sir Lewis Craig, was raised to the bench in 1604, and among his other descendants are several well-known names in the list of Scotch lawyers. He died on the 26th February 1608.

The greatest of Craig's literary labours is his treatise on the feudal law. The object of the *Jus Feudale* was to assimilate the laws of England and Scotland, but instead of this, it is the first, and by no means the least, in the series of works which has built up and solidified that of Scotland into a separate system. Craig's anxiety to promote the union of the kingdoms led him to prepare two other elaborate treatises,—the *De Unione Regnorum Britanniæ Tractatus*, and the *De Jure Successionis Regni Angliæ.* But while he was alive to the benefits of union, his *De Hominio Disputatio*, in which he combats the assertion that Scotland was a fief of the English crown, shows that he was no less determined to maintain the historical independence of his country. Craig's first poem appeared in 1565. It is an *Epithalamium* in honour of the ill-fated marriage of the Queen and Darnley. It contains passages of real poetic feeling, but as a whole it is laboured and heavy; and this fault, as perhaps might be expected of a learned feudal lawyer, more or less disfigures all Craig's subsequent efforts.

Except his poems, none of Craig's works appeared during his lifetime, and some of them exist even now only in manuscript. The first edition of the *Jus Feudale* was not published until 1655, nearly fifty years after its author's death. It was edited by Robert Burnet of Crimond, afterwards a judge in the Court of Session, who had married Craig's granddaughter, and was the father of the famous bishop of Salisbury. A second edition, edited by Menckenius, was published at Leipsic, in 1716; while the last and best edition appeared at Edinburgh in 1732, with a short life by the editor, James Baillie. Manuscripts of the *De Jure Successionis* belong to the Advocates' Library and to the Edinburgh University Library, but the book itself has never been published. A translation of it by James Gatherer, afterwards a Scotch bishop, appeared in 1703. The *De Unione* exists only in manuscript, in the Advocates' Library; and the same is true of the *De Hominio*, although a translation of it, under the title *Scotland's Sovereignty asserted*, was published by George Ridpath, London, 1695. Most of the poems have been reprinted in the *Delitiæ Poetarum Scotorum.* There is an excellent life of Craig by Mr Fraser Tytler, Edinburgh, 1823.

CRAIK, George Lillie (1799–1866), professor of English literature at Queen's College, Belfast, was the son of a schoolmaster in Fifeshire. He studied at the university of St Andrews with the intention of entering the church, but altering his plans, removed to London, at the age of twenty-five, to devote himself to literature. He became connected with a short-lived literary paper called the *Verulam*; in 1831 he published his *Pursuit of Knowledge under Difficulties* among the works of the Society for the Diffusion of Useful Knowledge; he contributed a considerable number of biographical and historical articles to the *Penny Cyclopædia;* and he edited the *Pictorial History of England*, himself writing much of the work. In 1844 he published his *History of Literature and Learning in England from the Norman Conquest to the Present Time*, illustrated by extracts, and in the same year his *History of British Commerce from the Earliest Times.* In the next year appeared his *Spenser and his Poetry*, an abstract of Spenser's poems, with historical and biographical notes and frequent quotations; and in 1847 his *Bacon, his Writings and his Philosophy*, a work of a similar kind. The four last-mentioned works appeared among *Knight's Weekly Volumes.* Two years later Craik obtained the chair of history and English literature at Queen's College, Belfast, a position which he held till his death, which took place on the 23d February 1866. Besides the works already noticed, Craig published the *Romance of the Peerage, Outline of the History of the English Language*, and *The English of Shakespeare.*

CRAIL, formerly Carrail, a royal and parliamentary burgh and seaport of Scotland, in the county of Fife, nine miles south-east of St Andrews. It is said to have been a town of some note as early as the 9th century; and its castle, of which there are hardly any remains, was the residence of David I. and others of the early Scottish kings. It was constituted a royal burgh by a charter of Robert Bruce in 1306, and had its privileges confirmed by Robert II. in 1371, by Mary in 1553, and by Charles I. in 1635. Of its priory, dedicated to St Rufus, a few ruins are to be seen below the east end of the town; its principal church is of great antiquity, and was raised to the collegiate rank in 1517; and many of the ordinary houses are of a massive and antique description. It unites with St Andrews and other burghs in returning a member to Parliament. Population of borough, 1112.

CRAKE, a genus of birds belonging to the order *Grallæ* of which the Corn Crake (*Ortygometra crex*) is the most familiar example. This bird is a summer visitor to Britain and to Northern Europe generally, where its migrations extend as far north as Iceland. It reaches Britain in April, and leaves in October, having meanwhile raised a brood of young. It frequents rich meadows and green corn-fields in the neighbourhood of water, where its presence is made known by the peculiar creaking sound emitted by the male as a call note to the female. After mating their *crek-crek*, not unlike the noise made by passing the nail of the finger over the teeth of a small comb is much seldomer heard, and the work of building the nest which is a simple structure formed of dried plants placed on the ground, is proceeded with. The eggs, from seven to fourteen in number, are about $1\frac{1}{2}$ inches in length and an inch in breadth, and are of a slightly reddish-white colour spotted and speckled with reddish-brown. The young crakes are covered at first with a black down, but soon assume their feathers, and are able to fly in six weeks. The upper plumage of the male is for the most part a yellowish-brown, each feather being marked with a central streak of a darker colour, and the under surface a pale buff transversely barred with reddish-white. The Corn Crake, or Land Rail, as it is sometimes called, feeds on snails, slugs, worms, and seeds. It is a shy and timid bird, seeking safety in concealment among the rank herbage which it frequents, and through which it runs with amazing rapidity; its note may thus be heard in quick succession proceeding from the most diverse parts of the same field, a circumstance which seems to have suggested the idea that the crake possessed for protective purposes a certain ventriloquial power. It seldom takes wing unless driven to it, and then flies slowly, with its legs hanging down, to the nearest place of concealment, and is thus much oftener heard than seen. In common with many other animals it is said to feign death as a means of avoiding a threatened danger. As an article of food the Corn Crake is regarded as a great delicacy. The Spotted Crake (*Ortygometra porzana*), a smaller and more aquatic species, is much less common in Britain than the former, from which it is readily distinguished by the numerous white spots on the upper surface of its plumage. It breeds on marshy ground, frequently at the water's edge. The Little Crake and Baillon's Crake both occur in Britain as rare summer visitors.

CRAMP, a painful spasmodic contraction of muscles, most frequently occurring in the limbs, but also apt to affect certain internal organs. This disorder belongs to the class of diseases known as local spasms, of which other varieties exist in such affections as spasmodic asthma and colic. The cause of these painful seizures resides in the nervous system, and operates either directly from the great nerve centres, or, as is generally the case, indirectly by reflex action, as, for example, when attacks are brought on by some derangement of the digestive organs.

In its most common form, that of cramp in the limbs, this disorder comes on suddenly, often during sleep, the patient being aroused by an agonizing feeling of pain in the calf of the leg or back of the thigh, accompanied in many instances with a sensation of sickness or faintness from the intensity of the suffering. During the paroxysm the muscular fibres affected can often be felt gathered up into a hard knot. The attack in general lasts but a few seconds, and then suddenly departs, the spasmodic contraction of the muscles ceasing entirely, or, on the other hand, relief may come more gradually during a period of minutes or even hours. A liability to cramp is often associated with a rheumatic or gouty tendency, but occasional attacks are common enough apart from this, and are often induced by some peculiar posture which a limb has assumed during sleep. Exposure of the limbs to cold will also bring on cramp, and to this is probably to be ascribed its frequent occurrence in swimmers. Cramp of the extremities is also well known as one of the most distressing accompaniments of cholera. It is likewise of frequent occurrence in the process of parturition, just before delivery.

This painful disorder can be greatly relieved and often entirely removed by firmly grasping or briskly rubbing the affected part with the hand, or by anything which makes an impression on the nerves, such as warm applications. Even a sudden and vigorous movement of the limb will often succeed in terminating the attack.

What is termed cramp of the stomach, or gastralgia, usually occurs as a symptom in connection with some form of gastric disorder, such as aggravated dyspepsia, or actual organic disease of the mucous membrane of the stomach, and must be dealt with in reference to those particular ailments.

The disease known as *Writer's Cramp*, or *Scrivener's Palsy*, is a spasm which affects certain muscles when engaged in the performance of acts, the result of education and long usage, and which does not occur when the same muscles are employed in acts of a different kind. This disorder owes its name to the relative frequency with which it is met with in persons who write much, although it is by no means confined to them, but is liable to occur in individuals of almost any handicraft. It has been termed by Dr Duchenne *Functional Spasm*.

The symptoms are in the first instance a gradually increasing difficulty experienced in conducting the movements required for executing the work in hand. Taking, for example, the case of writers, there is a feeling that the pen cannot be moved with the same freedom as before, and the handwriting is more or less altered in consequence. At an early stage of the disease the difficulty may be to a large extent overcome by persevering efforts, but ultimately, when the attempt is persisted in, the muscles of the fingers and occasionally also those of the forearm, are seized with spasm or cramp, so that the act of writing is rendered impossible. Sometimes the fingers instead of being cramped move in a disorderly manner and the pen cannot be grasped, while in other rare instances a kind of paralysis affects the muscles of the fingers, and they are powerless to make the movements necessary for holding the pen. It is to be noted that it is only in the act of writing that these phenomena present themselves, and that for all other movements the fingers and arms possess their natural power. The same symptoms are observed and the same remarks apply *mutatis mutandis* in the case of musicians, artists, compositors, seamstresses, tailors, and many mechanics in whom this affection may occur. Indeed, although actually a rare disease, no muscle or group of muscles in the body which is specially called into action in any particular occupation is exempt from liability to this functional spasm. Hence the cause has been ascribed to over-use of the parts concerned, although this is regarded as doubtful by many high authorities, since cases have been observed where there had been no excessive strain upon the function of the affected muscles, while again in persons who pursue their special occupation, even to the utmost possible amount of fatigue, the symptoms of this disorder are exceedingly rare. It is, however, difficult to account for the phenomena on any other theory, and at all events the complaint is greatly aggravated by over-exertion of the parts.

In the treatment of this complaint the only effectual remedy is absolute cessation from the work with which the attack is associated. It is sometimes recommended that the opposite hand or limb be used so as to afford the affected part entire rest, but this is generally followed with the extension of the disease to that locality also. Peculiar forms of penholder and other mechanical contrivances have been suggested so as to enable the occupation to be carried on, but they do not afford any relief to the disease, for the cure of which the only means that can be relied on is entire rest. (J. O. A.)

CRANACH, Lucas (1472–1553), one of the representative painters of Germany at the time of the Reformation, was born at Cronach in Upper Franconia, and learnt the art of drawing from his father. It has not been possible to trace his descent or the name of his parents. We are not informed as to the school in which he was taught, and it is a mere guess that he took lessons from the South German masters to whom Mathew Grunewald owed his education. But Grunewald practised at Bamberg and Aschaffenburg, and Bamberg is the capital of the diocese in which Cronach lies. According to Gunderam, the tutor of Cranach's children, Cranach signalized his talents as a painter before the close of the 15th century. He then drew upon himself the attention of the elector of Saxony, who attached him to his person in 1504. The records of Wittenberg confirm Gunderam's statement to this extent that Cranach's name appears for the first time in the public accounts on the 24th of June 1504, when he drew 50 gulden for the salary of half a year, as *pictor ducalis*. The only clue to Cranach's settlement previous to his Wittenberg appointment is afforded by the knowledge that he owned a house at Gotha, and that Barbara Brengbier, his wife, was the daughter of a burgher of that city. Of his skill as an artist we have sufficient evidence in a picture dated 1504 (Fiedler collection at Berlin), preserved till lately in the Sciarra Colonna Palace at Rome. But as to the development of his manner prior to that date we are altogether in ignorance. In contrast with this obscurity is the light thrown upon Cranach after 1504. We find him active in several branches of his profession,—sometimes a mere house-painter, more frequently producing portraits and altar-pieces, a designer on wood, an engraver of copper-plates, and draughtsman for the dies of the electoral mint. Early in the days of his official employment he startled his master's courtiers by the realism with which he painted still life, game, and antlers on the walls of the country palaces at Coburg and Lochau; his pictures of deer and wild boar were considered striking, and the duke fostered his passion for this form of art by taking him out to the hunting field, where he sketched "his grace" running the stag, or Duke John sticking a boar. Before 1508 he had painted several altar-pieces for the Schlosskirche at Wittenberg in competition with Dürer, Burgkmair, and others; the duke and his brother John were portrayed in various attitudes, and a number of the best woodcuts and copper-plates were published. Great honour accrued to Cranach when he went in 1509 to the Netherlands, and took sittings from the Emperor Maximilian and the boy who afterwards became Charles V. Till 1508 Cranach signed his works with the initials of his name. In that year the elector gave him the winged snake as a motto, and this motto or *Kleinod*, as it was called, superseded the initials on all his pictures after that date. Somewhat later the duke conferred on him the monopoly of the sale of medicines at Wittenberg, and a printer's patent with exclusive privileges as to copyright in Bibles. The presses of Cranach were used by Luther. His chemist's shop was open for centuries, and only perished by fire in 1871. Relations of friendship united the painter with the Reformers at a very early period; yet it is difficult to fix the time of his first acquaintance with Luther. The oldest notice of Cranach in the Reformer's correspondence dates from 1520. In a letter written from Worms in 1521, Luther calls him his gossip, warmly alluding to his "Gevatterin," the artist's wife. His first engraved portrait by Cranach represents an Augustine friar, and is dated 1520. Five years later the monk dropped the cowl, and Cranach was present as "one of the council" at the betrothal festival of Luther and Catherine Bora. The death at short intervals of the Electors Frederick and John (1525 and 1532) brought no change in the prosperous situation of the painter; he remained a favourite with John Frederick I., under whose administration he twice (1537 and 1540) filled the office of burgomaster of Wittenberg. But 1547 witnessed a remarkable change in these relations. John Frederick was taken prisoner at the battle of Mühlberg, and Wittenberg was subjected to stress of siege. As Cranach wrote from his house at the corner of the market-place to the Grand-Master Albert of Brandenburg at Königsberg to tell him of John Frederick's capture, he showed his attachment by saying, "I cannot conceal from your Grace that we have been robbed of our dear prince, who from his youth upwards has been a true prince to us, but God will help him out of prison, for the Kaiser is bold enough to revive the Papacy, which God will certainly not allow." During the siege Charles bethought him of Cranach, whom he remembered from his childhood, and summoned him to his camp at Pistritz. Cranach came, reminded his majesty of his early sittings as a boy, and begged on his knees for kind treatment to the Kurfürst. Three years afterwards, when all the dignitaries of the empire met at Augsburg to receive commands from the emperor, and when Titian at Charles's bidding came to take the likeness of Philip of Spain, John Frederick asked Cranach to visit the Swabian capital; and here for a few months he was numbered amongst the household of the captive elector, whom he afterwards accompanied home in 1552. He died at Weimar, in October 1553.

The oldest extant picture of Cranach, the Rest of the Virgin during the Flight in Egypt, marked with the initials L.C., and the date of 1504 (Mr Fiedler, Berlin), is by far the most graceful creation of his pencil. It is enlivened by a host of angels ministering in the pleasantest way to the wants of the infant Saviour. The scene is laid on the margin of a forest of pines, and discloses the habits of a painter familiar with the mountain scenery of Thuringia. There is more of gloom in landscapes of a later time; and this would point to a defect in the taste of Cranach, whose stag hunts (Moritzburg, Madrid, Labouchere collection) are otherwise not unpleasing. Cranach's art in its prime was doubtless influenced by causes which but slightly affected the art of the Italians, but weighed with potent consequence on that of the Netherlands and Germany. The business of booksellers who sold woodcuts and engravings at fairs and markets in Germany naturally satisfied a craving which arose out of the paucity of wall-paintings in churches and secular edifices. Drawing for woodcuts and engraving of copper-plates became the occupation of artists of note, and the talents devoted in Italy to productions of the brush were here monopolized for designs on wood, or on copper. We have thus to account for the comparative unproductiveness as painters of Dürer and Holbein, and at the same time to explain the shallowness apparent in many of the later works of Cranach; but we attribute to the same cause also the tendency in Cranach to neglect effective colour and light and shade for strong contrasts of flat tint. Constant attention to mere contour and to black and white appears to have affected his sight, and caused those curious transitions of pallid light into inky grey which often characterize his studies of flesh; whilst the mere outlining of form in black became a natural substitute for modelling and chiaroscuro. There are, no doubt, some few pictures by Cranach in which the flesh-tints display brightness and enamelled surface, but they are quite exceptional. As a composer Cranach was not greatly gifted. His ideal of the human shape was low; but he showed some freshness in the delineation of incident, though he not unfrequently bordered on coarseness. His copper-plates and woodcuts are certainly the best outcome of his art; and the earlier they are in date the more conspicuous is their power. Striking evidence of this is the St Christopher of 1506, or the plate of Elector Frederick praying before the Madonna (1509). It is curious to watch the changes which mark the development of his instincts as an artist during the struggles of the Reformation. At first we find him painting Madonnas. His first woodcut (1505) represents the Virgin and three saints in prayer before a crucifix. Later on he composes the marriage of St Catherine, a series of martyrdoms, and scenes from the Passion. After 1517 he illustrates occasionally the old gospel themes; but he also gives expression to some of the thoughts of the Reformers. In a picture of 1518 at Leipsic, where a dying man offers "his soul to God, his body to earth, and his worldly goods to his relations," the soul rises to meet the Trinity in heaven, and salvation is clearly shown to depend on faith and not on good works. Again sin and grace become a familiar subject of pictorial delineation. Adam is observed sitting between John the Baptist and a prophet at the foot of a tree. To the left God produces the tables of the law, Adam and Eve partake of the forbidden fruit, the brazen serpent is reared aloft, and punishment supervenes in the shape of death and the realm of Satan. To the right, the Conception, Crucifixion, and Resurrection symbolize redemption, and this is duly impressed on Adam by John the Baptist, who points to the sacrifice of the crucified Saviour. There are two examples of this composition in the Galleries of Gotha and Prague, both of them dated 1529. One of the latest pieces with which the name of Cranach is connected is that which Cranach's son completed in 1555, and which is now in the cathedral of Weimar. It represents Christ in two forms, to the left trampling on Death and Satan, to the right crucified, with blood flowing from the lance wound. John the Baptist points to the suffering Christ, whilst the blood stream falls on the head of Cranach, and Luther reads from his book the words, "The blood of Christ cleanseth from all sin." Cranach sometimes composed gospel subjects with feeling and dignity. The Woman taken in Adultery at Munich is a favourable specimen of his skill, and various repetitions of Christ receiving little children show the kindliness of his disposition. But he was not exclusively a religious painter. He was equally successful, and often comically naive, in mythological scenes, as where Cupid, who has stolen a honeycomb, complains to Venus that he has been stung by a bee (Weimar, 1530, Berlin, 1534), or where Hercules sits at the spinning-wheel mocked by Omphale and her maids. Humour and pathos are combined at times with strong effect in pictures such as the Jealousy (Augsburg, 1527, Vienna, 1530), where women and children are huddled into telling groups as they watch the strife of men wildly fighting around them. Very realistic must have been a lost canvas of 1545, in which hares were catching and roasting sportsmen. In 1546, possibly under Italian influence, Cranach composed the Fons Juventutis of the Berlin Gallery, executed by his son, a picture in which hags are seen entering a Renaissance fountain, and are received as they issue from it with all the charms of youth by knights and pages.

Cranach's chief occupation was that of portrait-painting, and we are indebted to him chiefly for the preservation of the features of all the German Reformers and their princely adherents. But he sometimes condescended to depict such noted followers of the Papacy as Albert (Kur-Mainz) of Brandenburg, Anthony Granvelle, and the duke of Alva. A dozen of likenesses of Frederick III. and his brother John are found to bear the date of 1532. It is characteristic of Cranach's readiness, and a proof that he possessed ample material for mechanical reproduction, that he received payment at Wittenberg in 1533 for "sixty pairs of portraits of the elector and his brother" in one day. Amongst existing likenesses we should notice as the best that of Albert, elector of Mainz, in the Berlin museum, and that of John, elector of Saxony, in the museum of Weimar.

Cranach had three sons, all artists:—John Lucas, who died at Bologna in 1536; Hans Cranach, whose life is obscure; and Lucas, born in 1515, who died in 1586. General von Cranach, now commanding the fortress of Cologne, is one of the last descendants of the painter of Wittenberg.

CRANBERRY, the fruit of plants of the genus *Oxycoccus*, natural order *Vacciniaceæ*. *O. palustris*, the common cranberry plant, is found in marshy land in northern and central Europe and North America. Its stems are wiry, creeping, and of varying length; the leaves are evergreen, dark and shining above, glaucous below, revolute at the margin, ovate, lanceolate, or elliptical in shape, and not more than half an inch long; the flowers, which appear in May or June, are small and pedunculate, and have a four-lobed, rose-tinted corolla, purplish filaments, and anther-cells forming two long tubes; the berries ripen in August and September; they are pear-shaped and about the size of currants, are crimson in colour, and often spotted, and have an acid and astringent taste. The American species, *O. macrocarpus*, is found wild from Maine to the Carolinas. It attains a greater size than *O. palustris*, and bears bigger and finer berries, which are of three principal sorts, the *cherry* or round, the *bugle* or oblong, and the *pear* or bell-shaped, and vary in hue from light pink to dark purple, or may be mottled red and white. It was first cultivated in England for the sake of its fruit by Sir Joseph Banks. *O. erectus* is a species indigenous to Virginia and California, and is remarkable for the excellent flavour of its berry.

Air and moisture are the chief requisites for the thriving of the cranberry plant. It is cultivated in America on a soil of peat or vegetable mould, free from loam and clay, and cleared of turf, and having a surface layer of clean sand. The sand, which needs renewal every two or three years, is necessary for the vigorous existence of the plants, and serves both to keep the underlying soil cool and damp, and to check the growth of grass and weeds. The ground must be thoroughly drained, and should be provided with a supply of water and a dam for flooding the plants during winter to protect them from frost, and occasionally at other seasons to destroy insect pests; but the use of spring-water should be avoided. The flavour of the fruit is found to be improved by growing the plants in a soil enriched with well-rotted dung, and by supplying them with less moisture than they obtain in their natural habitats. Propagation is effected by means of cuttings, of which the wood should be wiry in texture, and the leaves of a greenish-brown colour. In America, where, in the vicinity of Cape Cod, Massachusetts, the cultivation of the cranberry commenced early in the present century, wide tracts of waste land have been utilized for that purpose,—low, easily flooded, marshy ground, worth originally not more than from $10 to $20 an acre, having been made to yield annually $200 or $300 worth of the fruit per acre. The yield varies between 50 and 400 bushels an acre, but 100 bushels, or about 35 barrels, is estimated to be the average production when the plants have begun to bear well. In 1871 there were in New Jersey about 2000 acres in fruiting, which in the previous year had produced 150,000 bushels of cranberries, and 4000 acres more had been prepared and planted. A total of 75,000 barrels was obtained in 1869 in the States and Territories of America. Cranberries should be gathered when ripe and dry, otherwise they do not keep well. The darkest-coloured berries are those which are most esteemed. The picking of the fruit begins in New Jersey in October, at the close of the blackberry and whortleberry season, and often lasts until the coming in of cold weather. From 3 to 4 bushels a day may be collected by good workers. New York, Philadelphia, Boston, and Baltimore are the leading American markets for cranberries, whence they are exported to the West Indies, England, and France in great quantities. England was formerly supplied by Lincolnshire and Norfolk with abundance of the common cranberry, which it now largely imports from Sweden and Russia. The fruit is much used for pies and tarts, and also for making an acid summer beverage. The Mount Ida berry, cowberry, or red whortleberry, *Vaccinium Vitis idæa*, is sometimes sold for the cranberry. The Tasmanian and the Australian cranberries are the produce respectively of *Astroloma humifusum* and *Lissanthe sapida*, plants of the order *Epacridaceæ*.

CRANBROOK, a town of England, in the county of Kent, six miles south of the Staplehurst station, on the South-Eastern Railway. It has a fine church dedicated to St Dunstan, which is remarkable for a baptistery in which the ceremony used to be administered by immersion. As the central town of the agricultural district called the Weald of Kent, it carries on a pretty extensive trade in malt, hops, and general goods; but its present condition is in striking contrast to the activity it displayed from the 14th to the 17th century, when it was one of the principal seats of the broadcloth manufacture. In the neighbourhood are the ruins of the old mansion house of Sissinghurst, or Saxenhurst, built by Sir John Baker in the time of Edward VI., and interesting as the birthplace of Sir Richard Baker the chronicler. Population of the parish in 1871, 4331.

CRANE (in Dutch, *Kraan;* Old German, *Kræn;* cognate, as also the Latin *Grus*, and consequently the French *Grue* and Spanish *Grulla*, with the Greek *γέρανος*), the *Grus communis* or *G. cinerea* of ornithologists, one of the largest Wading-birds, and formerly a native of England, where Turner, in 1544, said that he had very often seen its young ("*earum pipiones sæpissime vidi*"). Notwithstanding the protection afforded it by sundry Acts of Parliament, it has long since ceased from breeding in this country. Sir T. Browne (*ob.* 1682) speaks of it as being found in the open parts of Norfolk in winter. In Ray's time it was only known as occurring at the same season in large flocks in the fens of Lincolnshire and Cambridgeshire; and though mention is made of Cranes' eggs and young in the fen-laws passed at a court held at Revesby in 1780, this was most likely but the formal repetition of an older edict; for in 1768 Pennant wrote that after the strictest inquiry he found the inhabitants of those counties to be wholly unacquainted with the bird, and hence concluded that it had forsaken our island. The Crane, however, no doubt then appeared in Britain, as it does now, at uncertain intervals and in unwonted places; showing that the examples occurring here (which usually meet the hostile reception commonly accorded to strange visitors) have strayed from the migrating bands whose movements have been remarked from almost the earliest ages. Indeed, the Crane's aerial journeys are of a very extended kind; and on its way from beyond the borders of the Tropic of Cancer to within the Arctic Circle, or on the return-voyage, its flocks may be descried passing overhead at a marvellous height, or halting for rest and refreshment on the wide meadows that border some great river, while the seeming order with which its ranks are marshalled during flight has long attracted attention. The Crane takes up its winter-quarters under the burning sun of Central Africa and India, but early in spring returns northward. Not a few examples reach the chill polar soils of Lapland and Siberia, but some tarry in the south of Europe and breed in Spain, and, it is supposed, in Turkey. The greater number, however, occupy the intermediate zone and pass the summer in Russia, North Germany, and Scandinavia. Soon after their arrival in these countries the flocks break up into pairs, whose nuptial ceremonies are accompanied by loud and frequent trumpetings, and the respective breeding-places of each are chosen.

The nest is formed with little art on the ground in large open marshes, where the herbage is not very high—a tolerably dry spot being selected and used apparently year after year. Here the eggs, which are of a rich brown colour with dark spots, and always two in number, are laid. The young are able to run soon after they are hatched, and are at first clothed with tawny down. In the course of the summer they assume nearly the same grey plumage that their parents wear, except that the elongated plumes, which in the adults form a graceful covering of the hinder parts of the body, are comparatively undeveloped, and the clear black, white, and red (the last being due to a patch of papillose skin of that colour) of the head and neck are as yet indistinct. During this time they keep in the marshes, but as autumn approaches the different families unite by the rivers and lakes, and ultimately form the enormous bands which after much more trumpeting set out on their southward journey.

The Crane's power of uttering the sonorous and peculiar trumpet-like notes, of which mention has been made, is commonly and perhaps correctly ascribed to the formation of its trachea, which on quitting the lower end of the neck passes backward between the branches of the furcula and is received into a hollow space formed by the bony walls of the carina or keel of the sternum. Herein it makes three turns, and then runs upwards and backwards to the lungs. The apparatus on the whole much resembles that found in the Whooping Swans (*Cygnus musicus*, *C. buccinator*, and others), though differing in some not unimportant details; but at the same time somewhat similar convolutions of the trachea occur in other birds which do not possess, so far as is known, the faculty of trumpeting. The Crane emits its notes both during flight and while on the ground. In the latter case the neck and bill are uplifted and the mouth kept open during the utterance of the blast, which may be often heard from birds in confinement, especially at the beginning of the year.

As usually happens in similar cases, the name of the once familiar British species is now used in a general sense, and applied to all others which are allied to it. Though by many systematists placed near or even among the Herons, there is no doubt that the Cranes have only a superficial resemblance and no real affinity to the *Ardeidæ*. In fact the *Gruidæ* form a somewhat isolated group. Professor Huxley has included them together with the *Rallidæ* in his *Geranomorphæ;* but a more extended view of their various characters would probably assign them rather as relatives of the Bustards—not that it must be thought that the two families have not been for a very long time distinct. *Grus*, indeed, is a very ancient form, its remains appearing in the Miocene of France and Greece, as well as in the Pliocene and Post-pliocene of North America. In France, too, during the "Reindeer Period" there existed a huge species—the *G. primigenia* of M. Alphonse Milne-Edwards—which has doubtless been long extinct. At the present time Cranes inhabit all the great zoogeographical Regions of the earth, except the Neotropical, and some sixteen or seventeen species are discriminated. In Europe, besides the *G. communis* already mentioned, we have as an inhabitant that which is generally known as the Numidian or Demoiselle-Crane (*G. virgo*), distinguished from every other by its long white ear-tufts. This bird is also widely distributed throughout Asia and Africa, and is said to have occurred in Orkney as a straggler. The eastern part of the Palæarctic Region is inhabited by four other species that do not frequent Europe (*G. antigone*, *G. japonensis*, *G. monachus*, and *G.*

leucogeranus), of which the last is perhaps the finest of the family, with nearly the whole plumage of a snowy white. The Indian Region, besides being visited in winter by four of the species already named, has two that are peculiar to it (*G. torquata* and *G. indica*—both commonly confounded under the name of *G. antigone*). The Australian Region possesses a large species known to the colonists as the "Native Companion" (*G. australis*); while the Nearctic is tenanted by three species (*G. americana*, *G. canadensis*, and *G. fraterculus*[1]), to say nothing of the possibility of a fourth (*G. schlegeli*), a little-known and somewhat obscure bird, finding its habitat here. In the Ethiopian Region we have two species (*G. paradisea* and *G. carunculata*) which do not occur out of Africa, as well as two others forming the group known as "Crowned Cranes"—differing much from other members of the family, and justifiably placed in a separate genus, *Balearica*. One of these (*B. pavonina*) inhabits Northern and Western Africa, while the other (*B. regulorum*) is confined to the eastern and southern parts of that continent.

With regard to the literature of this species, a paper "On the Breeding of the Crane in Lapland" (*Ibis*, 1859, p. 191), by the late Mr John Wolley, is one of the most pleasing contributions to natural history ever written, and an admirably succinct account of all the different species was communicated by the late Mr Blyth to *The Field* newspaper in 1873 (vol. xl. p. 631, vol. xli. pp. 7, 61, 136, 189, 248, 384, 408, 418), which it is much to be regretted has not since been published in a more accessible form; while a beautiful picture representing a flock of Cranes, resting by the Rhine, during one of their annual migrations, is to be found in Mr Wolf's *Zoological Sketches*. (A. N.)

CRANE, a machine for raising and lowering heavy weights, and removing them from one place to another. Its chief parts are the jib, an inclined or horizontal beam at the end of which the weight is suspended; the upright crane post or stalk, on which the crane turns; the stay, beneath and supporting the jib; the barrel, round which the chain attached to the weight is coiled; and the winch, pinion, and handles. In place of a stay, chains or tension-bars above the jib are commonly employed; the latter at their upper end form eyes for the pivot of the sheave, or are pinned to the socket of the jib; below they are fixed to the cast-iron framing that carries the wheel-work. To prevent the acceleration of the movement of descending weights brakes are employed, in one form of which a lever causes friction by bringing a piece of wood, strengthened with iron, into contact with a plain wheel attached to the barrel of the crane. The winch handle has given it a radius of about 18 inches, and its centre is placed at 3 feet or 3 feet 2 inches from the ground; the limit of the average stress on it to be allowed for each labourer, working constantly at the rate of 220 feet a minute, has been found to be 15 lb. The length of the journals of the axles is made $1\frac{1}{2}$ to 2 times their diameter, which must be proportionate to the torsion of the wheels to be resisted. The diameter of the axles of the crane-barrel, if of cast-iron, should be proportional to the cube root of the strain upon them in cwts; if of wrought iron, to $\frac{9}{11}$ths of the same. The chain or rope ought not to be worked with more than one-half the weight which it is estimated to be capable of bearing. The strength of the jib varies almost directly as the fourth power of its diameter, and inversely as the square of its length. In cranes for lifting great weights the jib may be made to rest against a circular rail let into masonry, instead of bearing against the crane post. The ends of the jib should not be rounded, but should be cut square, so as to lie evenly against the iron sockets into which they fit. In iron cranes the post is a hollow pillar of cast-iron, fixed by means of cross-shaped framings of the same material into a block of masonry; the jib is of iron, or of wood with terminal sockets of that metal. A crane at Earl Grey's Dock, Dundee Harbour, when worked by eight men, is capable of lifting 30 tons; it can be moved round by one man by the application of horizontal gearing; its total weight is not above 60 tons. The double crane for wharfs and pier-heads is framed and braced so as to balance exactly when turned on its pivot. In another double crane, used in the building of breakwaters, one jib is employed in laying, while the other lifts a stone. The derrick is a temporary crane consisting of a spar supported by guys or stays; in this crane the iron beam or derrick can, by raising or lowering, be set at any required angle.

The cranes in general use in the earlier part of the last century were primitive contrivances worked by means of a large hollow wheel, within which a man walked forwards or backwards according as goods were to be raised or lowered; the jib of the crane was fixed on a pivot, so as to turn round about $\frac{3}{4}$ths of a circle. After this a simpler form, still in use, was introduced, with the wheel fixed on a portion of the jib projecting behind the crane post. One of the first examples of traversing cranes was erected by Mr Rennie in the Mahogany Sheds at the West India Docks. For this kind of crane a railway is constructed on parallel frames of timber reaching across the roof of a building, and on this is a carriage supported on wheels, and capable, therefore, of being moved backwards or forwards by means of the machinery attached to it. The chain that bears the weight is connected with the carriage, and hangs down between the two lines of rails. By making the framework supporting the railway movable, as well as the carriage, goods can be transported in any required direction. The frames of railway traversing cranes are composed of two triangular timber structures, mounted on strong wheels; these by toothed wheels and pinions are caused to move along the railroad on which they are placed. At one time vacuum cranes were employed, to work which small oscillating cylinders, similar to those of high-pressure steam engines, were put in communication with a receiver exhausted of air by steam pumps. Afterwards steam came to be applied immediately as the motive power of cranes. In the direct-acting steam crane, the crane post itself is the steam cylinder, and the steel wire rope for lifting the load constitutes the piston-rod; to turn the crane round, steam is admitted to a cylinder beneath and forming part of the bed-plate. The first crane worked by pistons acted on by water-power was established at Newcastle-on-Tyne in 1846. Reservoirs at great heights for providing water-pressure can be dispensed with by the use of Sir W. Armstrong's accumulator, an apparatus consisting of a cast-iron cylinder in which the water supplied by an engine is pressed upon by a loaded plunger. The excess of water pumped into the accumulator at any time is employed in raising the plunger; this, on reaching a certain height, begins to close a throttle-valve in the steam-pipe of the engine, and thus lessens its rate, until fresh demands are made upon the contents of the accumulator. The water discharged by the cranes may be led by a return-pipe to a cistern over the engine room, in order again to supply the force-pumps. To avoid jerks and concussions owing to the momentum of the jib after the closing of the water passages, a clack-valve is provided which opens up into the supply-pipe whenever the pressure in the cylinder of the hydraulic press becomes greater than that in the accumulator. The tubular cranes of Fairbairn are made of wrought-iron plates rivetted together. The jib, which is curved, is rectangular in cross-section, and tapers upwards to its extremity, and below the ground to a considerable depth, where it terminates in a shoe of cast-iron on which the crane revolves. The plates forming the edges of the jib are connected by means

[1] There is, however, some doubt whether this be not a form of the preceding.

of angle iron, and those of its convex or upper side by chain rivetting. The curvature of the jib allows of the raising of weights to its highest point. The chain-barrels and the spindles for the wheel-gearing are preferably inclosed within the jib.

CRANMER, Thomas (1489–1556), archbishop of Canterbury, was born at Aslacton in Nottinghamshire on the 2d July 1489. The second son of Thomas Cranmer and of his wife Anne Hatfield, he belonged to a family that had been settled in Nottinghamshire from the time of the Norman Conquest. He received his early education, according to Morice his secretary, from "a marvellous severe and cruel schoolmaster," whose discipline must have been severe indeed to deserve this special mention in an age when no schoolmaster bore the rod in vain. The same authority tells us that he was initiated by his father in those field sports, such as hunting and hawking, which formed one of his recreations in after life. To early training he also owed the skilful horsemanship for which he was conspicuous. At the age of fourteen he was sent by his mother, who had recently become a widow, to Cambridge, where he entered at Jesus College. Little is known with certainty of his university career beyond the facts that he became a fellow of his college in 1510 or 1511, that he had soon after to vacate his fellowship, owing to his marriage to "Black Joan," a relative of the landlady of the Dolphin Inn, and that he was reinstated in it on the death of his wife, which occurred in childbirth before the lapse of the year of grace allowed by the statutes. During the brief period of his married life he held the appointment of lecturer at Buckingham Hall, now Magdalene College. The fact of his marrying would seem to show that he did not at the time intend to enter the church, and there are indications that the profession of his choice was the law. It has been conjectured with some plausibility that the death of his wife caused him to change his intention and qualify himself for holy orders. He was ordained in 1523, and soon after he took his doctor's degree in divinity. According to Strype, he was invited about this time to become a fellow of the college founded by Cardinal Wolsey at Oxford; but Dean Hook shows that there is some reason to doubt this. If the offer was made it was declined, and Cranmer continued at Cambridge filling the offices of lecturer in divinity at his own college and of public examiner in divinity to the university. It is interesting, in view of his later efforts to spread the knowledge of the Bible among the people, to know that in the capacity of examiner he insisted on a thorough acquaintance with the Holy Scriptures, and rejected several candidates who were deficient in this qualification.

It was a somewhat curious concurrence of circumstances that transferred Cranmer, almost at one step, from the quiet seclusion of the university to the din and bustle of the court. In 1528 the plague known as the sweating sickness, which prevailed throughout the country, was specially severe at Cambridge, and all who had it in their power forsook the town for the country. Cranmer went with two of his pupils named Cressy, related to him through their mother, to their father's house at Waltham in Essex. The king (Henry VIII.) happened at the time to be residing in the immediate neighbourhood, and two of his chief counsellors, Gardyner, secretary of state, afterwards bishop of Winchester, and Fox, the lord high almoner, afterwards bishop of Hereford, were lodged at Cressy's house. Meeting with Cranmer, they were naturally led to discuss what was the absorbing question of the day, the king's meditated divorce from Catherine of Aragon. The opinion of the future archbishop was given with the modesty that befitted an unknown man. He professed not to have studied the cause as the others had done; but it seemed to him that if the canonists and the universities should decide that marriage with a deceased brother's widow was illegal, and if it were proved that Catherine had been married to Prince Arthur, her marriage to Henry could be declared null and void by the ordinary ecclesiastical courts. The necessity of an appeal to Rome was thus dispensed with, and this point was at once seen by the king, who, when Cranmer's opinion was reported to him, ordered him to be summoned in these terms:—"I will speak to him. Let him be sent for out of hand. This man, I trow, has got the right sow by the ear."

At their first interview Cranmer was commanded by the king to lay aside all other pursuits and to devote himself to the question of the divorce. He was to draw up a written treatise, stating the course he proposed, and defending it by arguments from scripture, the fathers, and the decrees of general councils. There is reason to believe that he entered upon the task somewhat reluctantly, but in the reign of Henry VIII. it was emphatically true that the king's will was law, and no refusal was possible. His material interests certainly did not suffer by compliance. He was commended to the hospitality of Anne Boleyn's father, the earl of Wiltshire, in whose house at Durham Place he resided for some time; the king appointed him archdeacon of Taunton and one of his chaplains; and he also held a parochial benefice, the name of which is unknown. When the treatise was finished Cranmer was called upon to defend its argument before the universities of Oxford and Cambridge, which he visited, accompanied by Fox and Gardyner. Immediately afterwards he was sent to plead the cause before a more powerful if not a higher tribunal. An embassy, with the earl of Wiltshire at its head, was despatched to Rome in 1530, that "the matter of the divorce should be disputed and ventilated," and Cranmer was an important member of it. He was received by the Pope with marked courtesy, and was appointed "Grand Penitentiary of England;" but his argument, if he ever had the opportunity of stating it, did not lead to any practical decision of the question. Returning home through France and Germany, he had interviews in the latter country with the elector of Saxony and other Protestant princes.

It is usual to attribute to the influence of this Continental visit a further recoil in Cranmer's mind from Roman Catholicism and an advance to what is now known as Protestantism. Now there are, it is true, indications that he was dissatisfied with much that he saw at Rome, and it is a probable conjecture that his intercourse with the German princes had some effect in modifying his doctrinal views. But it must be remembered that the modern idea of Protestantism and Roman Catholicism as two broadly marked, clearly divided, and antagonistic systems was only forming in Germany, and was all but unknown in England in Cranmer's day. It would be unnecessary to state so obvious a truth, were it not for the seemingly ineradicable tendency of hasty thinkers to throw back familiar distinctions in religion and politics to a period when such distinctions had not come into existence. The fact that Cranmer is persistently described as the "first Protestant archbishop of Canterbury," which, if true at all, is true only in a very modified sense, shows the necessity for this caution.

Cranmer had only been a few months in England when he received a second commission from the king appointing him "Conciliarius Regius et ad Cæsarem Orator." In the summer of 1531 he accordingly proceeded to Germany as sole ambassador to the emperor, with the design of furthering the divorce. His mission was fruitless, but he did not at once return to England. At Nuremberg he had become acquainted with Osiander, whose somewhat isolated theological position he probably found to be in many points analogous to his own. Both were convinced that the old order must change; neither saw clearly what the new order should be to which it was to give place. They had frequent interviews, which had doubtless an important influence on Cranmer's opinions. But Osiander's house had another attraction of a different kind from theological sympathy. His niece Margaret won the heart of Cranmer, and early in 1532 they were married. In the case of a strong character like Luther, marriage implied an express practical rejection of the authority of Rome to impose celibacy upon priests; no such inference can safely be made in the case of Cranmer, whose character was weak and whose action was generally determined by the influences of the moment. Hook finds in the fact of the marriage corroboration of Cranmer's statement that he never expected or desired the primacy; and it seems probable enough that, if he had foreseen how soon the primacy was to be forced upon him, he would have avoided a disqualification which it was difficult to conceal and dangerous to disclose.

Expected or not, the primacy was forced upon him within a very few months of his marriage. In August 1532 Archbishop Warham died, and the king almost immediately afterwards intimated to Cranmer, who was still in Germany, his nomination to the vacant see. Cranmer's conduct was certainly consistent with his profession that he did not desire, as he had not expected, the dangerous promotion. He sent his wife to England, but delayed his own return in the vain hope that another appointment might be made. How long he ventured to wait is uncertain, but when he arrived in England he found the arrangements matured for his consecration, his "nolo episcopari" being unavailing against the king's command. The papal bulls of confirmation were dated February and March 1533, and the consecration took place on the 30th March. One peculiarity of the ceremony has occasioned considerable discussion. It was the custom for the archbishop elect to take two oaths, the first of episcopal allegiance to the Pope, and the second in recognition of the royal supremacy. The latter was so wide in its scope that it might fairly be held to supersede the former in so far as the two were inconsistent. Cranmer, however, was not satisfied with this. He had a special protest recorded, in which he formally declared that he swore allegiance to the Pope only in so far as that was consistent with his supreme duty to the king. The morality of this course has been much canvassed, though it seems really to involve nothing more than an express declaration of what the two oaths implied. It was the course that would readily suggest itself to a man of timid nature who wished to secure himself against such a fate as Wolsey's. It showed weakness, but it added nothing to whatever immorality there might be in successively taking two incompatible oaths.

In the last as in the first step of Cranmer's promotion Henry had been actuated by one and the same motive. The business of the divorce had now become very urgent, and in the new archbishop he had an agent who might be expected to forward it with the needful haste. The celerity and skill with which Cranmer did the work intrusted to him must have fully satisfied his master. During the first week of April Convocation sat almost from day to day to determine questions of fact and law in relation to Catherine's marriage with Henry as affected by her previous marriage with his brother Arthur. Decisions favourable to the object of the king were given on these questions, though even the despotism of the most despotic of the Tudors failed to secure absolute unanimity. The next step was taken by Cranmer, who wrote a letter to the king, praying to be allowed to remove the anxiety of loyal subjects as to a possible case of disputed succession, by finally determining the validity of the marriage in his archiepiscopal court. There is evidence that the request was prompted by the king, and his consent was given as a matter of course. Queen Catherine was residing at Ampthill in Bedfordshire, and to suit her convenience the court was held at the priory of Dunstable in the immediate neighbourhood. Declining to appear she was declared contumacious, and on the 23d May the archbishop gave judgment declaring the marriage null and void from the first, and so leaving the king free to marry whom he pleased. In the whole proceeding, which had as much of the form as it had little of the spirit of justice, the archbishop's subserviency was pitiful, and it is difficult to acquit him of the graver charge of knowingly pronouncing an unrighteous sentence.

The coronation of the new queen, Anne Boleyn, at which Cranmer officiated, took place on the 1st June, little more than a week after the sentence which deprived her predecessor of her rights. During that interval it is asserted by some authorities that the king and Anne were publicly married by the archbishop. This, however, seems unlikely. A private marriage had taken place in the previous November, or more probably in January. Hook conjectures that the later ceremony was not a repetition of the marriage, but merely an official and public recognition of it.

The splendid pageantry of the coronation made the marriage popular for a few days with the citizens of London, but a deeper current of feeling in the opposite direction soon set in. The deliberate judgment of the country was undoubtedly one of indignant disapproval, and it speedily found utterance through the pulpit—the chief organ of public opinion in the days when there was no press. So outspoken were the preachers in their denunciation of the king's conduct that it was deemed necessary to silence them by an arbitrary exercise of authority. Cranmer's very first act of episcopal jurisdiction was to prohibit all preaching within his own diocese, and to arrange for its restriction by the other bishops of his province. His conduct in this can, of course, only be fairly judged by the standard of his own time, but the forcible suppression of all preaching was a curiously inconsistent measure to be adopted, even from motives of political urgency, by the "first Protestant archbishop of Canterbury"

Cranmer was little at court during the three years of Anne Boleyn's ascendency there. The period was eventful, and he found abundant occupation in his ecclesiastical and parliamentary duties. He was an active promoter of the measures which led to the final breach with Rome. These included the appointment of bishops by the king alone without bulls or licences from the Pope, the prohibition of the payment of Peter's pence or other contributions to Rome, and the renunciation by the archbishop of the title of legate. The independence of the Church of England was finally asserted by the two Houses of Convocation in the declaration that "the bishop of Rome has no greater jurisdiction given him in this realm of England than any other foreign bishop," and this statement may be held to embody the general result of Cranmer's ecclesiastical policy as shown in the details just mentioned. It is to be noted to his credit that he pled for More and Fisher even after he had failed to persuade them to admit the royal supremacy.

Cranmer's share in the divorce of Anne Boleyn in 1536 is perhaps less obscure than most things connected with that very mysterious transaction. When the king had made up his mind, the archbishop was summoned from

Kent to Lambeth, where he was kept a virtual prisoner until he had indicated that he would be compliant. In a letter to Henry he pled generously for the queen, but the plea was robbed of whatever force it might have had by a closing sentence in which he stated his willingness to obey the king's commands. The proceedings were gone through with the same hypocritical show of judicial formality as in the case of Queen Catherine, and on the 10th June 1536 the archbishop fulfilled his promise of obedience by declaring the marriage he had himself sanctioned to have been null and void from the first. It is urged in his favour that before doing so he had received from Anne a confession of some impediment existing before her marriage with the king which rendered the marriage invalid, but it does not appear in what the impediment consisted, and the plea can scarcely be accepted. Even if it could, few would be inclined to question the judgment of Hook that "of Cranmer's conduct in the affair the less that his admirers say, the greater will be their discretion." And this was not the last time in Henry's reign that the archbishop stooped to act the same degrading part. In 1540 he presided over the Convocation that disannulled the marriage with Anne of Cleves, which he had celebrated almost immediately before. To his next and last interposition in the matrimonial affairs of the king no discredit attaches itself. When he was made cognizant of the charges against Catherine Howard, his duty to communicate them to the king was obvious, though painful; and his choice of the time and manner of his fulfilling it was both delicate to his royal master and considerate to the accused.

Meanwhile Cranmer was actively carrying out the policy which has associated his name more closely, perhaps, than that of any other ecclesiastic with the Reformation in England. Its most important feature on the theological as distinct from the political side was the endeavour to promote the circulation of the Bible in the vernacular, by encouraging translation and procuring an order in 1538 that a copy of the Bible in English should be set up in every church in a convenient place for reading. Only second in importance to this was the re-adjustment of the creed and liturgy of the church, which formed Cranmer's principal work during the latter half of his life. The progress of the archbishop's opinion towards that middle Protestantism, if it may be so called, which he did so much to impress on the formularies of the Church of England, was gradual, as a brief enumeration of the successive steps in that progress will show. In 1535 he corrected a second edition of the book known as the *King's Primer*, the original composition of which has been attributed to him, and which was in several points Protestant in doctrine. In 1538 an embassy of German divines visited England with the design, among other things, of forming a common confession for the two countries. This proved impracticable, but the frequent conferences Cranmer had with the theologians composing the embassy had doubtless a great influence in modifying his views. He had not strength of conviction enough, however, to oppose out and out the reactionary statute of 1538, known as the Six Articles, or "whip with the six strings." Foxe and others following him have indeed asserted that he did so, but Hook shows that the archbishop was present at the first and second readings of the bill, and also when it received the royal assent, while the only method of opposing it was to have absented himself. No doubt he had and urged strong objections to it, but these must have been overcome in the end by the arguments or the authority of the king. During the period between 1540 and 1543 the archbishop was engaged at the head of a commission in the revision of the "Bishop's Book," or *Institution of a Christian Man*, and the preparation of the *Necessary Erudition*, known as the "King's Book," which was a modification of the former work in the direction of Roman Catholic doctrine. In 1543 was issued his translation of the Litany, which was substantially the same as that now in use, and shows his mastery of a rhythmical English style. In 1547 appeared the *Homilies* prepared under his direction. Four of them are attributed to the archbishop himself—those on Salvation, Faith, Good Works, and the Reading of Scripture. His translation of the German Catechism of Justus Jonas, known as Cranmer's Catechism, appeared in the following year. Important, as showing his views on a cardinal doctrine, was the *Defence of the True and Catholic Doctrine of the Sacrament*, which he published in 1550. It was immediately answered from the side of the "old learning" by Gardyner. From these and other works which need not be mentioned it is not difficult to fix Cranmer's theological position. It may be best described in general terms as that of the historical High Church party in the Church of England, of which indeed Cranmer may be regarded as one of the chief founders. Transubstantiation was the discriminating doctrine between Romanists and Protestants in England, just as justification by faith was the discriminating doctrine in Germany; and it is to be noted that Cranmer did not renounce the dogma until after the death of Henry VIII. Ultimately, after much thought and controversy, he rested content with the acceptance of the fact of real presence apart from any theory, whether of transubstantiation or consubstantiation; and this course has proved satisfactory to the most eminent theologians of his school in the Church of England down to the present day. If it be added that, on the questions on which they differ from the Roman see, he would have found himself in substantial harmony with the Old Catholics of Germany, his views of ecclesiastical polity will be understood by most readers.

In what may be called the external work of the English Reformation, Cranmer's part was secondary, the principal agent being naturally Cromwell. The dissolution of the monasteries was the work of the minister, not of the archbishop; but the latter showed a laudable zeal in trying to secure as much as possible of the confiscated monastic property for the benefit of religion and learning. Although the relations of Cranmer with Cromwell had never been very intimate, he was generous enough to intercede for the minister after his fall in June 1540. But with his usual weakness he did not persist in his intercession after he saw that the king was determined. In fact he was present in Parliament when the bill of attainder was read, and so consented to it.

The course taken by Cranmer in promoting the Reformation exposed him to the bitter hostility of the reactionary party or "men of the old learning," of whom Gardyner and Bonner were leaders, and on two occasions—in 1543 and 1545—conspiracies were formed in the council to effect his overthrow. The king, however, remained true to him, and both conspiracies signally failed. It illustrates a favourable trait in the archbishop's character that he forgave all the conspirators, though he might doubtless have secured their punishment through his influence with the king. He was, as his secretary Morice testifies, "a man that delighted not in revenging."

Cranmer was present with Henry VIII. when he died (1547), and did his duty as spiritual adviser faithfully and kindly. By the will of the king he was nominated head of a council of regency composed of sixteen persons, but he acquiesced in the arrangement by which Somerset became lord protector. He officiated at the coronation of the boy king Edward VI., and instituted a significant change in the order of the ceremony, by which the right of the monarch to reign was made to appear to depend upon inheritance alone, without the concurrent consent of the people. The fact deserves mention, as there are other indications that the archbishop was a firm believer in the doctrine of the "divine right."

During this reign the work of the Reformation made rapid progress, the sympathies both of the protector and of the young king being decidedly Protestant. Cranmer was therefore enabled without let or hindrance to complete the preparation of the church formularies, on which he had been for some time engaged. The first prayer-book of Edward VI. was finished in November 1548, and received legal sanction in January 1549; the second was completed and sanctioned in April 1552. The archbishop presided over the commissions that compiled them, and much of the work was done by himself personally. The forty-two articles of Edward VI. published in 1553 were based upon a German source, but they owe their form and style almost entirely to the hand of Cranmer. The last great undertaking in which he was employed was the revision of his codification of the canon law, which had been all but completed before the death of Henry. The task was one eminently well suited to his powers, and the execution of it was marked by great skill in definition and arrangement. It never received any authoritative sanction, Edward VI. dying before the proclamation establishing it could be made, and it remained unpublished until 1571, when a Latin translation by Dr Walter Haddon and Sir John Cheke appeared under the title *Reformatio Legum Ecclesiasticarum*. That it was never authorized is matter for satisfaction in view of the fact that it laid down the lawfulness and necessity of persecution to the death for heresy in the most absolute terms. That Cranmer in this matter practised what he preached, his conduct in the cases of Frith, Hewat, and others sufficiently testifies. If, however, he was a persecutor both in theory and practice, it must be remembered that no one of any party in his day had grasped the principle of religious toleration.

Cranmer stood by the dying bed of Edward as he had stood by that of his father, and he there suffered himself to be persuaded to take a step against his own convictions which may be said to have sealed his doom. He had pledged himself to respect the testamentary disposition of Henry VIII. by which the succession devolved upon Mary, and now he violated his oath by signing Edward's "device" of the crown to Lady Jane Grey. On grounds of policy and morality alike the act was quite indefensible; but it is perhaps some palliation of his perjury that it was committed to satisfy the last urgent wish of a dying man, and that he alone remained true to the "twelfth day queen," when the others who had with him signed Edward's device deserted her. On the accession of Mary he was summoned to the council, reprimanded for his conduct, and ordered to confine himself to his palace at Lambeth until the queen's pleasure was known. With a firmness unusual to his character he refused to follow the advice of his friends and avoid the fate that was clearly impending over him by flight to the Continent. Any chance of safety that lay in the friendliness of a strong party in the council was more than nullified by the bitter personal enmity of the queen. On the 14th September 1553 he was sent to the Tower, where Ridley and Latimer were also confined. The immediate occasion of his imprisonment was a strongly worded declaration he had written a few days previously against the mass, the celebration of which, he heard, had been re-established at Canterbury. He had not taken steps to publish this, but by some unknown channel a copy reached the council, and it could not be ignored. In March 1554 he and his two illustrious fellow-prisoners were removed to Oxford, where they were confined in the Bocardo or common prison. Ridley and Latimer were unflinching, and suffered bravely at the stake on the 16th October 1555; it was fated that Cranmer was to reach the same end by a longer and less honourable path. It is impossible to give all the details of the intricate process against him, which at first involved the double charge of treason and heresy. Against the former of these he emphatically protested, and it was on the latter alone that he was ultimately condemned. The pontifical authority having been restored in England his case was tried by a Papal commission. At his first appearance before the court he protested against the jurisdiction of the bishop of Rome, both by a formal declaration and by the significant action of putting on his hat and standing upright before the Pope's commissioner, the bishop of Gloucester, after having bowed respectfully to the representative of the queen. On the expiration of eighty days from the issue of a summons to Rome, which of course it was not in his power to obey even had he been willing, he was excommunicated by a Papal consistory, and a commission was sent to England to degrade him from his office of archbishop. This was done with the usual humiliating ceremonies in Christ Church, Oxford, on the 14th February 1556, and he was then handed over to the secular power. But before the secular power did its last and worst, Cranmer was to inflict upon himself a degradation deeper far than any that could be inflicted on him from without. The story of his recantations is so notorious as to be known to many who know almost nothing else of his life. Under the pressure of delusive promises by various agents, whose conduct cannot be too strongly condemned, he was induced to sign no less than six of these, each ampler and more abject in its terms than that which had gone before. The last was dated the 18th March. On the 20th Dr Cole, the provost of Eton, visited Cranmer in his prison with the view of ascertaining whether he remained steadfast in his new purpose, and he received what seemed a satisfactory answer. Next day, Saturday, the 21st March, he was taken to St Mary's Church, and asked to repeat his recantation in the hearing of the people as he had promised. To the surprise of all he declared with dignity and emphasis that what he had recently done troubled him more than anything he ever did or said in his whole life; that he renounced and refused all his recantations as things written with his hand, contrary to the truth which he thought in his heart; and that as his hand had offended, his hand should be first burned when he came to the fire. If, as Hook is inclined to think, he made this statement in the belief that his life would be spared if he persisted in his recantation, he seems all but entitled to the crown of martyrdom; if, as Macaulay maintains, he made it after learning that he was to die in any case, and that a lie would therefore serve him as little as the truth, then, as Macaulay says, he was no more a martyr than Dr Dodd. The question is important, but there are no materials for settling it definitely.

Immediately after his unexpected declaration he was led to the stake at the same place where Ridley and Latimer had suffered a few months before. As he had said, his right hand was steadfastly exposed to the flames, and several times during the burning he was heard to exclaim with a loud voice, "This hand hath offended—this unworthy hand." The calm cheerfulness and resolution with which he met his fate show that he felt that he had cleared his conscience, and that his recantation of his recantations was a repentance that needed not to be repented of.

It was a noble end to what, in spite of its besetting sin of infirmity of moral purpose, was a not ignoble life. He was often pitiably, sometimes criminally, weak, and never so much both as in his last days. The key to his character is well given in what Hooper said of him in a letter to Bullinger, that he was "too fearful about what might happen to him." This weakness made him the tool of Henry in the most scandalous transactions of his reign, and the tool of Edward in what he knew to be an unjust alteration of the succession, and it robs him of his undisputed claim to rank among the noble army of martyrs. But while one may not admit that claim, there is a grandeur in the circumstances of his death, and especially in the incident of the voluntary burning of the right hand, which the popular instinct has not failed to appreciate as all but redeeming him from disgrace. It is only, however, a hero in life who can be in the true sense a martyr in death; and the archbishop was as little the one as the other. And so it is that brave old Latimer wears the crown, while the timid Cranmer passed through the same fiery gates into the city without the martyr's glory, though also without the apostate's shame.

See Foxe's *Acts and Monuments* (The Book of Martyrs), Strype's *Memorials of Cranmer* (1694), *Anecdotes and Character of Archbishop Cranmer*, by Ralph Morice, and two contemporary biographies (Camden Society's publications), *Remains of Thomas Cranmer*, by Jenkyns (1833), *Lives of Cranmer* by Gilpin (1784), Todd (1831), and Le Bas, and Hook's *Lives of the Archbishops of Canterbury*, vols. vi. and vii. (1868). (W. B. S.)

CRANNOGS (Celtic, *crann*, a tree), the term applied in Scotland and Ireland to the stockaded islands so numerous in ancient times in the lochs of both countries. The existence of these lake-dwellings in Scotland was first made known by Mr John Mackinlay, a fellow of the Society of Antiquaries of Scotland, in a letter sent to George Chalmers, the author of *Caledonia*, in 1813, describing two crannogs, or fortified islands in Bute. The crannog of Lagore, the first discovered in Ireland, was examined and described by Sir William Wilde in 1840. But it was not until after the discovery of the pile-villages of the Swiss lakes, in 1853, had drawn public attention to the subject of lake-dwellings, that the crannogs of Scotland and Ireland were systematically investigated. The results of these investigations show that they resemble the Swiss lake-dwellings in nothing, except that they are placed in lakes. The crannog is a type of stronghold peculiar to Celtic countries. No example is known in England, although over a hundred have been examined and described in Ireland, and perhaps about half that number in Scotland. As a rule they have been constructed on islets or shallows in the lochs, which have been adapted for occupation, and fortified by single or double lines of stockaded defences drawn round the margin. To enlarge the area, or raise the surface level where that was necessary, layers of logs, brushwood, heather, and ferns were piled on the shallow, and consolidated with gravel and stones. Over all there was laid a layer of earth, a floor of logs, or a pavement of flagstones. In rare instances the body of the work is entirely of stones, the stockaded defence and the huts within its inclosure being the only parts constructed of timber. Occasionally a bridge of logs, or a causeway of stones, formed a communication with the shore, but often the only means of getting to and from the island was by canoes. One or two of these hollowed out of a single tree are usually found in connection with a crannog. The stockade was commonly of piles of oak, but occasionally of pine, yew, or alder. Remains of huts of logs, or of wattled work, are often found within the inclosure. Three crannogs in Dowalton Loch, Wigtonshire, examined by Lord Lovaine in 1863, were found to be constructed of layers of fern and birch and hazel branches, mixed with boulders, and penetrated by oak piles, while above all there was a surface layer of stones and soil. The remains of the stockade round the margin were of vertical piles mortised into horizontal bars, and secured by pegs in the mortise holes. The crannog of Cloonfinlough in Connaught had a triple stockade of oak piles connected by horizontal stretchers, and inclosing an area 130 feet in diameter, laid with trunks of oak tree. In the crannog of Lagore there were about 150 cartloads of bones, chiefly of oxen, deer, sheep, and swine, the refuse of the food of the occupants. The implements, utensils, and weapons found in the Scottish and Irish crannogs are usually of iron, or, if objects of bronze and stone are found, they are commonly such as were in use in the Iron age, differing in form and ornamentation from the relics of the Stone and Bronze ages. Stone celts are said in one or two instances to have occurred in Irish crannogs, but such instances are rare and exceptional, and no object of stone or bronze similar to those usually assigned to the Stone or Bronze age has been found in any crannog in Scotland. The objects usually found in the Irish crannogs are swords, spears, javelins, dagger-blades, knives, and axes of iron, mostly of the forms which are characteristic of the period of the Scandinavian invasions from the 9th to the 12th century. Besides these there are cauldrons, basins, and other utensils of thin hammered bronze; pins, brooches, and horse-trappings of cast-bronze; combs, pins, handles of implements, ornaments, and other objects of bone; pots, dishes, and bowls of coarse, unglazed, and hand-made pottery, often ornamented with zig-zag lines and rude impressed or incised patterns of crossed or parallel lines and triangular markings; quernstones, whetstones, pestle-stones, round stone balls, &c. Few objects have been found in the Scottish crannogs except at Dowalton, which yielded basins of thin bronze, sorely clouted, part of a large cauldron, beads of glass and amber, and bracelets of vitreous paste, iron slag, crucibles, large hammer-heads of iron, quernstones, whetstones, and a shoe of stamped leather. A saucepan of Roman make was found in the loch in the neighbourhood of the crannogs, but it is not certainly connected with any of them. Crannogs are frequently referred to in the Irish annals. Under the year 848 the *Annals of the Four Masters* record the burning of the island of Loch Gabhor (the crannog of Lagore), and the same stronghold is noticed as again destroyed by the Danes in 933. Under the year 1246 it is recorded that Turlough O'Connor made his escape from the crannog of Lough Leisi, and drowned his keepers. Many other entries occur in the succeeding centuries. In the register of the Privy Council of Scotland, April 14, 1608, it is ordered that "the haill houssis of defence, strongholds, and *crannokis* in the Yllis (the western isles) pertaining to Angus M'Conneill of Dunnyvaig and Hector M'Cloyne of Dowart sal be delyverit to His Majestie." Judging from the historical evidence of their late continuance, and from the character of the relics found in them, the crannogs of Scotland and Ireland may be regarded as the very latest class of prehistoric strongholds, reaching their greatest development in early historic times, and surviving through the Middle Ages. In Ireland Sir William Wilde has assigned their range approximately to the period between the 9th and 16th centuries. See Lake Dwellings.

Wilde's *Descriptive Catalogue of the Antiquities in the Museum of the Royal Irish Academy*, Article "Crannogs," pp. 220, 233; Wakeman on "the Crannogs of Fermenagh" in the *Journal of the Royal Historical and Archæological Association of Ireland*, 4th series, vol. i. pp. 305–314, 360–370 and 553–564; "Notice of two Crannogs in Bute," by John Mackinlay, in the *Proceedings of the Society of Antiquaries of Scotland*, vol. iii. pp. 43–46; "Scottish Artificial Islands or Crannogs," by John Stuart, Secretary of the Society of Antiqnaries of Scotland, in their *Proceedings*, vol. vi. pp. 114–178; *Catalogue of Antiquities in the National Museum of the Society of Antiquaries of Scotland*, p. 60. (J. AN.)

CRANTOR, a Greek philosopher of the Old Academy, famous as the first commentator on Plato, was born, probably about the middle of the 4th century, at Soli in Cilicia, and was a fellow pupil of Polemo in the school of Xenocrates at Athens. His poems, which are said to have been deposited in the temple of Athena at Soli, have entirely perished; but of his celebrated work *On Grief* numerous extracts have been preserved in Plutarch and in Cicero *D Consolatione*.

CRAPE is a silk fabric of a gauzy texture, having a peculiar crisp or crimpy appearance. ' It is woven of hard spun silk yarn ' in the gum " or natural condition. There are two distinct varieties of the textile—1st, soft, Canton, or Oriental crape, and 2d, hard or crisped crape. The wavy appearance of Canton crape results from the peculiar manner in which the weft is prepared, the yarn from two bobbins being twisted together in the reverse way. The fabric when woven is smooth and even, having no *crepé* appearance, but when the gum is subsequently extracted by boiling it at once becomes soft, and the weft, losing its twist, gives the fabric the waved structure which constitutes its distinguishing feature. Canton crapes are used, either white or coloured, for ladies' scarves and shawls, bonnet trimmings, &c. The Chinese and Japanese excel in the manufacture of soft crapes. The crisp and elastic structure of hard crape is not produced either in the spinning or in the weaving, but is due to processes through which the gauze passes after it is woven. What the details of these processes are is known to only a few manufacturers, who so jealously guard their secret that, in some cases, the different stages in the manufacture are conducted in towns far removed from each other. Commercially they are distinguished as single, double, three-ply, and four-ply crapes, according to the nature of the yarn used in their manufacture. They are almost exclusively dyed black and used in mourning dress, and among Roman Catholic communities for nuns' veils, &c. In Great Britain hard crapes are made at Braintree in Essex, Norwich, Yarmouth, Manchester, and Glasgow. A very successful imitation of real crape is made in Manchester of cotton yarn, and sold under the name of Victoria crape.

CRASHAW, RICHARD (1613–1650), the poet, styled "the divine," was born in London in 1613. He was the son of a strongly anti-papistical divine, Dr William Crashaw, who distinguished himself, even in those times, by the excessive acerbity of his writings against the Catholics. Richard Crashaw was originally put to school at Charter House, but in July 1631 he was admitted to Pembroke College, Cambridge, where he took the degree of B.A. in 1634. The publication of Herbert's *Temple* in 1633 seems to have finally determined the bias of his genius in favour of religious poetry, and next year he published his first book, *Epigrammatum Sacrorum Liber*, a volume of Latin verses. In March 1636 he removed to Peterhouse, and was made a fellow of that college in 1637. It was about this time that he made the acquaintance and secured the lasting friendship of Cowley. In 1641 he is said to have gone to Oxford, but only for a short time; for when in 1643 Cowley left Cambridge to seek a refuge at Oxford, Crashaw remained behind, and was forcibly ejected from his fellowship in 1644 In the confusion of the civil wars he escaped to France, where he finally embraced the Catholic religion, towards which he had long been tending. During his exile his religious and secular poems were collected by an anonymous friend, and published under the title of *Steps to the Temple* and *The Delights of the Muses*, in one volume, in 1646. This same year Cowley found him in great destitution at Paris, and induced Queen Henrietta Maria to extend towards him what influence she still possessed. At her introduction he proceeded to Italy, where he became secretary at Rome to Cardinal Palotta. In 1648 he published two Latin hymns at Paris. He remained until 1649 in the service of the cardinal, to whom he had a great personal attachment; but his retinue contained persons whose violent and licentious behaviour were a source of ceaseless vexation to the sensitive English mystic. At last his denunciation of their excesses became so public that the animosity of those persons was excited against him, and in order to shield him from their revenge, he was sent by the cardinal in 1650 to Loretto, where he was made a canon of the Holy House. In less than three weeks, however, he sickened of fever, and died, not without grave suspicion of having been poisoned. He was buried in the Lady Chapel at Loretto. A collection of his latest religious poems, entitled *Carmen Deo Nostro*, was brought out in 1652, dedicated at the dead poet's desire to the faithful friend of his sufferings, the countess of Denbigh. Crashaw excelled in all manner of graceful accomplishments; besides being an excellent Latinist and Hellenist, he had an intimate knowledge of Italian and Spanish; and his skill in music, painting, and engraving was no less admired in his lifetime than his skill in poetry. Cowley embalmed his memory in an elegy that ranks among the very finest in our language, in which he, a Protestant, well expressed the feeling left on the minds of contemporaries by the character of the young Catholic poet:—

> His faith, perhaps, in some nice tenets might
> Be wrong; his life, I'm sure, was in the right:
> And I, myself, a Catholic will be,
> So far at least, dear saint, to pray to thee!

The poetry of Crashaw will be best appreciated by those who can with most success free themselves from the bondage of a traditional sense of the dignity of language. The custom of his age permitted the use of images and phrases which we now justly condemn as incongruous and unseemly, and the fervent fancy of Crashaw carried this licence to the most rococo excess. At the same time his verse is studded with fiery beauties and sudden felicities of language, unsurpassed by any lyrist between his own time and Shelley's. There is no religious poetry in English so full at once of gross and awkward images and imaginative touches of the most etherial beauty. The temper of his intellect seems to have been delicate and weak, fiery and uncertain; he has a morbid, almost hysterical, passion about him even when his ardour is most exquisitely expressed, and his adoring addresses to the saints have an effeminate falsetto that makes them almost repulsive. The faults and beauties of his very peculiar style can be studied nowhere to more advantage than in the *Hymn to Saint Theresa*. Among the secular poems of Crashaw the best are *Music's Duel*, which deals with that strife between the musician and the nightingale which has inspired so many poets, from Strada down to Coppée, and *Wishes to his supposed Mistress*. In his latest sacred poems, the *Carmen Deo Nostro*, sudden and eminent beauties are not wanting, but the mysticism has become more pronounced, and the ecclesiastical mannerism more harsh and repellant. The themes of Crashaw's verse are as distinct as possible from those of Shelley's, but it may, on the whole, be said that at his best moments he reminds the reader more closely of the author of *Epipsychidion* than of any earlier or later poet.

Crashaw's works were first collected, in one volume, in 1858 by W. B. Turnbull. In 1872 an edition, in 2 vols. was printed for private subscription by the Rev. A. B. Grosart. (E. W. G.)

CRASSUS, LUCIUS LICINIUS (140–91 B.C.), a celebrated Roman orator most highly praised by Cicero. He commenced his political career, at the age either of nineteen or of twenty-one, by bringing a charge against Carbo the friend of the Gracchi, who in consequence took poison. He took part in more than one of the most famous cases in the annals of Roman law, and attained a wonderful reputation. In 95 B.C. he became consul, and at the expiration of his term of office proconsul in Gaul. He was almost as much distinguished for his wealth and the elegant luxury in which he indulged as for his eloquence and wit.

CRASSUS, MARCUS LICINIUS, the triumvir, surnamed the Rich on account of his wealth, which he acquired by educating slaves and selling them at a high price, by working silver mines, and by skilful purchases of land and houses. The proscription of Cinna obliged him to flee to Spain; but after Cinna's death he passed into Africa, and thence to Italy, where he ingratiated himself with Sulla. Having been sent against Spartacus, he gained a decisive victory, in which 12,000 of the rebels were killed, and was honoured with an ovation at his return. Soon afterwards he was elected consul with Pompey, 72 B.C., and he displayed his opulence by entertaining the populace at 10,000 tables. He was afterwards censor, and he joined Pompey and Cæsar in forming the first triumvirate. As his love of riches was greater than his love of glory, Crassus was satisfied with the province of Syria, which promised to be an inexhaustible source of wealth. Having crossed the Euphrates he hastened to make himself master of Parthia; but he was defeated and taken prisoner by Surena, the Parthian general, who put him to death by pouring molten gold down his throat. His head was then cut off and sent to Orodes. See ROMAN HISTORY.

CRATES, of Athens, an Athenian actor and author of comedies of the 5th century B.C. He acted in the comedies of Cratinus; and his own pieces are distinguished chiefly, first, by the fact that they did not depend for their interest upon political references, and secondly, by the fact that he introduced drunkards on the stage,—a class of characters that had never appeared there before, although very frequently after his time.

CRATES, of Mallus in Cilicia, a Greek grammarian and Stoic philosopher of the 2d century B.C., was leader of the literary school and head of the library of Pergamus. Almost the only event of his life with which we are acquainted is the visit which he made to Rome about 157 B.C. as ambassador of Attalus II., king of Pergamus, and which is said to have given an impulse to the study of Latin grammar. Crates wrote many works —commentaries on the *Theogony*, Euripides, and Aristophanes, a treatise on the Attic dialect, and works on agriculture and geography,—but some suppose the geographer to have been a different person.

CRATES, of Thebes, a Cynic philosopher of the 4th century B.C., was a pupil of Diogenes, whose extreme cynicism he rivalled. He gave up his large fortune, directing the banker to whom he intrusted it to give it to his sons if they should prove fools, but to the poor if his sons should prove philosophers. He besides attacked all who did not follow his example, not scrupling to force himself into their houses, and thus he gained the nickname of the "door-opener." Poor and ugly as he was, he gained the affection of a young woman of good family, Hipparchia, who refused to marry the most eligible suitors, for his sake threatened to commit suicide, and at last was allowed by her parents to become his wife. Crates was the author of a number of philosophical letters; but those published under his name among the Aldine classics and by Boissonade are not genuine.

CRATINUS (519–423 B.C.), one of the greatest of the Athenian masters of comedy. Our knowledge of his personal history consists of only one or two facts:—he was the son of a certain Callimedes; he was triarch of the Æneau tribe; he died in 423 B.C., at the age (Lucian tells us) of ninety-seven; and the end of his life was devoted to drinking. His comedies also are now lost, with the exception of small fragments; but as to their character his contemporaries are in general agreement. They were distinguished by their direct and vigorous political satire, a marked exception being the burlesque Οδυσσεῖς, which was probably written while a law was in force forbidding all political references on the stage, and which is also remarkable for the absence of the chorus. Persius calls their author "the bold;" and even Pericles, when at the height of his power, did not escape their vehement attacks. Of his last comedy the plot has come down to us. It was occasioned by the sneers of Aristophanes and others who declared that he was no better than a doting drunkard. Roused by the taunt Cratinus put forth all his strength, and in 423 B.C. produced the Πυτίνη, or *Bottle*, which so completely vindicated his powers that he gained the first prize, and triumphed over the *Clouds* of Aristophanes This victory, however, was very possibly determined partly by other than artistic considerations, for Aristophanes would have to struggle against the influence of the sophists, the rhetoricians, and the disciples of Socrates. In this comedy, good-humouredly making fun of his own weakness, Cratinus represents the comic muse as the faithful wife of his youth. His guilty fondness for a rival —the bottle—has aroused her jealousy. She demands a divorce from the archon; but her husband's love is not dead, and he returns penitent to her side. The style of Cratinus has been likened to that of Æschylus; and Aristophanes, in the *Knights*, compares him to a rushing torrent. He appears to have been fond of lofty diction and bold figures, and he was most successful in the lyrical parts of his dramas, his choruses being the popular festal songs of his day. Cratinus is said to have been the first to fix the number of actors at three; but the statement is very doubtful, for Aristotle says that in his time the author of the rule was not known.

CRATIPPUS, a Peripatetic philosopher, belonging to Mytilene, was contemporary with Cicero, whose son he taught at Athens, and by whom he is praised in the *De Officiis* as the greatest of his school. He was also the friend of Pompey, whose flight after the battle of Pharsalia he shared, for the purpose, it is said, of convincing him of the justice of providence; and Brutus, while at Athens after the assassination of Cæsar, attended his lectures. The only work attributed to Cratippus is a treatise on divination. His view of the subject is given by Cicero in the *De Devinatione* (i. 32) He seems to have held that, while motion, sense, and appetite cannot exist apart from the body, thought reaches its greatest power when most free from bodily influence, and that divination is due to the direct action of the divine mind on that faculty of the human soul which is not dependent on the body.

CRATIPPUS, a contemporary of Thucydides, to whose history he made considerable additions, filling in omissions and continuing it to the time of Conon.

CRAUFORD, QUENTIN (1743–1819), an English author. In early life he went to India, where he entered the British army, and on the conclusion of peace devoted himself to commerce. Returning to Europe before the age of forty with a handsome fortune, he settled at Paris, where he gave himself to the cultivation of literature and art, and formed a good library and collection of paintings, coins, and other objects of antiquarian interest, and where he remained till his death, with the exception of ten years from the outbreak of the Revolution to the Peace of Amiens.

He wrote, among other works, *The History, Religion, Learning, and Manners of the Hindus* (London, 1790), *Researches Concerning the Laws, Theology, Learning, and Commerce of Ancient and Modern India* (1817), *History of the Bastille* (London, 1792), *On Pericles and the Arts in Greece, Essay on Swift and his Influence on the British Government, Notice sur Marie Antoinette*, with whom he had personal acquaintance (Paris 1809), *Mémoires de Mme. du Hausset.*

CRAWFORD, THOMAS (1814–1857), American sculptor, was born of Irish parents at New York, March 22, 1814. He showed at an early age great taste for art, and learnt to draw and to carve in wood. In his nineteenth year he entered the studio of a firm of monumental sculptors in his native city; and at the age of twenty he went to Rome and became a pupil of Thorwaldsen. The first work which made him generally known as a man of genius was his group of Orpheus entering Hades in Search of Eurydice, executed in 1839. This was followed by other poetical sculptures, among which were the Babes in the Wood, Flora, Hebe and Ganymede, Sappho, Vesta, the Dancers, and the Hunter. Among his statues and busts are especially noteworthy the bust of Josiah Quincy, executed for Harvard University (now in the Boston Athenæum), the equestrian statue of Washington at Richmond, Virginia, the statue of Beethoven in the Boston music hall, statues of Channing and Henry Clay, and the colossal figure of Armed Liberty for the Capitol at Washington. For this building he executed also the figures for the pediment and the bronze doors. The groups of the pediment symbolize the progress of civilization in America. Crawford's works include a large number of bas-reliefs of Scriptural subjects taken from both the Old and the New Testaments. He made Rome his home, but he visited several times his native land,—first in 1844, in which year he married, next in 1849, and lastly in 1856. His studio at Rome was very attractive to visitors, and for some time he ranked as sculptor next after Gibson. His works always bore the stamp of original invention and freshness of thought, although in execution they were open to criticism. During his last years he suffered from a tumour on the brain, which deprived him of sight; and he was compelled to leave many works unfinished. He sought relief at Paris and in London, but in vain, and died in London on the 10th of October 1857.

CRAWFURD, JOHN (1783–1868), a Scottish author, was born in the island of Islay, Scotland. After studying at Edinburgh he became surgeon in the East India Company's service. He afterwards resided for some time at Penang, and he was from 1811 to 1817 British representative at Java. In 1821 he served as envoy to Siam and Cochin-China, and in 1823 became governor of Singapore. In 1861 he was elected president of the Ethnological Society.

He wrote a *History of the Indian Archipelago* (1820), *Descriptive Dictionary of the Indian Islands and Adjacent Countries* (1856), *Journal of an Embassy to the Court of Ava in* 1827 (1829), *Journal of an Embassy to the Courts of Siam and Cochin-China, exhibiting a view of the actual State of these Kingdoms* (1830), *Inquiry into the System of Taxation in India, Letters on the Interior of India*, an attack on the newspaper stamp-tax and the duty on paper entitled *Taxes on Knowledge* (1836), and a valuable Malay grammar and dictionary (1852).

CRAYER, GASPARD DE (1582–1669), was born at Antwerp, and learnt the art of painting from Raphael Coxcie. He matriculated in the guild of St Luke at Brussels in 1607, resided in the capital of Brabant till after 1660, and finally settled at Ghent. Amongst the numerous pictures which he painted in the last of these cities, one in the town museum represents the Martyrdom of St Blaise, and bears the inscription A° 1668 æt. 86. Crayer, one of the most productive yet one of the most conscientious artists of the later Flemish school, was second to Rubens in vigour and below Vandyck in refinement; but he very nearly equalled both in most of the essentials of painting; and it is probably true, as stated by modern critics, that his fame was unfairly overshadowed by that of two great contemporaries with whom he was on terms of intimacy. He was well known and always well treated by Albert and Isabella, governors of the Netherlands. The Cardinal-Infant Ferdinand made him a court-painter. His pictures abound in the churches and museums of Brussels and Ghent; and there is scarcely a country chapel in Flanders or Brabant that cannot boast of one or more of his canvases. But he was equally respected beyond his native country: and some important pictures of his composition are to be found as far south as Aix in Provence, and as far east as Amberg in the Upper Palatinate. His skill as a decorative artist is shown in the panels executed for a triumphal arch at the entry of Cardinal Ferdinand into the Flemish capital, some of which are publicly exhibited in the museum of Ghent. Crayer died at Ghent. His best works are the Miraculous Draught of Fishes in the Gallery of Brussels, the Judgment of Solomon in the Gallery of Ghent, and Madonnas with Saints in the Louvre, the Munich Pinakothek, and the Belvedere at Vienna. His portrait by Vandyck was engraved by P. Pontius.

CRAYON, a coloured material for drawing, employed generally in the form of pencils, but sometimes also as a powder, and consisting of native earthy and stony friable substances, or of artificially prepared mixtures of a base of pipe or China clay with Prussian blue, orpiment vermilion, umber, and other pigments. Calcined gypsum, talc, and compounds of magnesium, bismuth, and lead are occasionally used as bases. The required shades of tints are obtained by adding varying amounts of colouring matter to equal quantities of the base. The ingredients of crayons or pastils are made into a paste with gum, turpentine, or alcoholic solution of shellac, and pulverized as finely as possible in a mill, which subjects them repeatedly to the action of a revolving cast-iron grinder. The paste is introduced into a copper cylinder, closed at one end by a plate pierced with holes of the diameter of the crayons to be made. Through these it is forced by means of a piston, and the vermicular pieces obtained are then cut into the required lengths, and dried in a furnace at a gentle heat. Black crayons may be manufactured from a mixture of one part of lamp-black with about two-thirds of its bulk of clay; red crayons from powdered and elutriated hæmatite worked up into a paste with gum arabic and a little soap. White crayons are commonly formed by sawing chalk of good quality into convenient shapes. Mixtures of soap, wax, and lamp-black are employed for lithographic crayons or chalks. The late well-known zoological lithographer, George Ford, employed chalks made after the following receipt:—

Yellow wax, ...	32 oz.
Curd soap, ...	24 ,,
Mutton tallow, . . .	4 ,,
Washing soda (dissolved in 7 oz. water), ...	1 ,,
Paris black (sifted), . . .	7 ,,

The wax is gradually incorporated with the melted soap by heating, and as the resultant mass begins to burn, the soda is added; afterwards the black is by degrees stirred in. The melted tallow may be added at any stage in the operation.

Crayons are valuable to the artist in enabling him to make groupings of colours and to secure landscape and other effects with ease and rapidity. The outline as well as the rest of the picture is drawn in crayon. The colours are softened off and blended by the finger, with the assistance of a stump of leather or paper; and shading is produced by cross-hatching and stippling. The paper employed is of loose but not soft or spongy texture, and is of various tints, warm grey or yellowish being generally preferred. For portraits pumice-paper and red or brown crayons are considered most suitable. The colours are fixed by the process known as transudation. The drawing is supported face downwards by its edges or corners, and a solution of isinglass is applied to the back with a brush in quantity sufficient to penetrate to the coloured surface of the paper, which may then be turned upwards to dry. The fixing solution is prepared as follows:—three-quarters of an ounce of isinglass is infused for a day in $2\frac{1}{2}$ ounce of pure vinegar; a pint of hot water is added, and the solution of isinglass is filtered and mixed with an equal volume of spirits of wine. The art of painting in crayons or pastils is supposed to have originated in Germany in the 17th century. By Johann Alexander Thiele (1685–1752) it was carried to great perfection, and in France it was early practised with much success. Amongst celebrated crayon-painters may be mentioned Carriera Rosalba (1675–1757), W. Hoare (1707–1792), F. Cotes (1726–1770), J. Russell (1744–1806), and the late Mr Bright.

CREAM OF TARTAR, acid potassium tartrate, or "bitartrate of potash," $HKC_4O_6H_4$, is obtained from argol or crude tartar, the crust or deposit formed by wines in bottles and casks in which they are undergoing fermentation. Red are usually richer in argol than white wines. A ton of grapes yields, according to the nature of the fruit, quantities varying between 1 and 2 lb of argol, of which, in good samples, an average of about 83 per cent. is cream of tartar. French red wines examined by M. Fauré contained from ·06664 to ·19728 per cent. by weight of this salt, and white wines from ·09172 to ·15208 per cent.; M. Jacob found from ·7 to 1·201 grammes per litre in the wines of Tonnerre. The manufacture of cream of tartar is conducted as follows. Ground granulated argol is wetted and then dissolved in water at a temperature of 100° C.; after two or three days, during which insoluble impurities subside, the clear liquid is drawn off into earthen vessels. The crystals it deposits are re-dissolved in boiling water holding finely comminuted pipe-clay and animal-charcoal in suspension. The solution after standing till a thin film of crystals appears on its surface is run into conical coolers, the sides of which become in eight or nine days coated with fine clear crystals, colouring matters having been precipitated by the clay and charcoal. The crystals are then bleached and dried by exposure to sunlight and air. In Venice the impurities of the crude tartar are separated by repeated crystallizations, and finally by adding white of egg and wood-ashes to the boiling solution, and removing the scum formed. The name "cream of tartar" was originally given to the crust of minute pure white crystals formed on the surface of cooling solutions. Cream of tartar is a colourless, transparent salt, crystallizing in four-sided prisms belonging to the trimetric system, and having a specific gravity of about 1·96. It is precipitated when a potassium salt is added to a solution of free tartaric acid. It is soluble in alkalies, alkaline carbonates, and mineral acids, but insoluble in acetic acid and alcohol. Its insolubility in the last-mentioned is the cause of its separation from wines as they mature. One part by weight of the salt is soluble at 0° C. in about 416 (Chancel), and at 100° C. in about fifteen parts of water. The solution has an acid reaction, and dissolves many metallic oxides, furnishing double tartrates. When heated, cream of tartar is decomposed, with the formation of potassium carbonate (the *sal fixum tartari* of the older chemists) and carbon, inflammable gases possessing an odour of burnt bread being at the same time evolved. Potassium carbonate is produced also when the salt is kept moist or in solution for some years. Cream of tartar—*potassæ tartras acida*—is used in medicine as a refrigerant, diuretic, and mild purgative; in dyeing as a mordant for wool; in the manufacture of tartaric acid and potassium carbonate; and with powdered chalk and alum for cleaning silver. *Rochelle salt*, $KNaC_4O_6H_4$, is made by neutralizing cream of tartar with sodium carbonate; *tartar emetic*, $K(SbO)C_4O_6H_4$, by boiling it with three-fourths of its weight of antimony trioxide, filtering the hot solution, and crystallizing. *Black flux*, the result of the incineration of tartar is much employed in assaying, and may be prepared by deflagrating two or three parts of the salt with one of nitre; for *white flux* equal weights of the two salts are required. Tartars, even those intended for the manufacture of tartaric acid, should be free from any considerable quantity of calcium tartrate, as the moisture of the air soon converts that salt into calcium carbonate. The substances most used to adulterate cream of tartar are calcium chloride and sulphate, and the chloride and acid sulphate of potassium.

CREASOTE, CREOSOTE, or KREASOTE (κρέας, flesh, and σώζειν, to save), is a product of the distillation of wood-tar, more especially that made from beech-wood; tar from the wood of conifers contains it in but small quantity. The distillation of the tar is carried on till only a thick pitchy substance is left. From the lowermost layer of the distillate is obtained by the action of sodium carbonate a yellowish oil, the heavier part of which is isolated by rectification in a glass retort, and mixed with potash solution to dissolve out its creasote. The creasote is separated from the filtered potash solution by sulphuric acid, is distilled with alkaline water, and again treated with potash and acid, till its purification is effected; it is then distilled at 200° C. (392° Fahr.), and dried by means of calcium chloride. Creasote is a highly refractive, colourless, oily liquid, first obtained by Reichenbach, in 1832, from beech-wood tar. It consists mainly of a mixture of the compounds—phenol, $C_6H_5.OH$, cresol, $C_6H_4.CH_3.OH$, phlorol, $C_6H_3(CH_3)_2.OH$, guaiacol, $C_6H_4.OCH_3.OH$, and creosol, $C_6H_3.CH_3.OCH_3.OH$. The so-called coal-tar creasote is more or less impure carbolic acid, containing paracresol and other bodies. Creasote has a strong odour and hot taste, is a non-conductor of electricity, and burns with a smoky flame. Its specific gravity is 1·037 at 20° C.; its boiling point is 203° C. (397° Fahr.); and it is still liquid at −27° C. (−16·6° Fahr.) Rhenish creasote can be distilled for the most part between 199° and 208° C., giving a liquid of specific gravity 1·077 at 14° C. Creasote dissolves sulphur, phosphorus, resins, and many acids and colouring matters; and is soluble in alcohol, ether, and carbon disulphide, and in 80 parts by volume of water. It is distinguished from carbolic acid or phenol by the following qualities:—it turns the plane of a ray of polarized light to the right, forms with collodion a transparent fluid, and is nearly insoluble in glycerine; whereas carbolic acid has no effect on polarized light, gives with about two-thirds of its volume of collodion a gelatinous mass, and is soluble in all proportions in glycerine; further, alcohol and ferric chloride produce with creasote a green solution, turned brown by water, with carbolic acid a brown, and on the addition of water a blue solution. Creasote, like carbolic acid, is a powerful antiseptic, and readily coagulates albuminous matter; wood-smoke and pyroligneous acid or wood-vinegar owe to its presence their efficacy in preserving animal and vegetable substances from putrefaction. Creasote is given in medicine combined with acetic acid, syrup, spirit of juniper, and water. In small quantities it acts as a sedative of the stomach, but in over-doses it is a violent poison, causing severe pain in the abdomen, nausea, headache, giddiness, and stupor. It is administered in cases of vomiting, diarrhœa, cholera, intestinal bleeding, and chronic gleet, and to assuage hunger and thirst in diabetes; in the form of a gargle it is of service in excessive salivation, and its vapour, mixed with that of water, is sometimes recommended for inhalation. Externally it is applied as a stimulant and styptic, and for the treatment of decayed teeth; and an ointment containing it is used as a remedy for ring-worm. Creasote is also employed for preserving timber from dry-rot, and for the curing of fish and hams. The principal supplies of creasote are brought from Archangel, Stockholm, and America.

CRÉBILLON, CLAUDE PROSPER JOLYOT (1707–1777), a French novelist and wit of the 18th century, was the only son of Crébillon, the tragic poet. His life was spent at Paris, except about five years, during which, on account of certain political references made in his novels, he was first imprisoned and afterwards forced to live in exile in England and elsewhere. He married an English lady of noble family, Lady Stafford, who is said to have been captivated by his person and his books, and to have offered herself as his bride. Their life is said to have been passed in much affection and mutual fidelity; and it would be unjust to judge Crébillon's private life from his novels, the immorality of which is not surpassed in literature. For some years Crébillon held the incongruous office of censor.

CRÉBILLON, Prosper Jolyot de (1674–1762), a famous French tragic poet, was born at Dijon, where his father was notary-royal. Having been educated at the Jesuits' school of the town, and at the Collége Mazarin, he became an advocate, and was placed in the office of a lawyer named Prieur at Paris. The encouragement of his master, an old friend of Scarron's, induced him to continue with more serious intention his youthful habit of rhyming, and he soon produced a *Mort des Enfants de Brutus*, which, however, he failed to bring upon the stage. But in 1705 he succeeded with *Idoménée*, the representation of which gained him considerable fame; in 1707 his *Atrée et Thyeste* was repeatedly acted at court; and in 1711 he produced his finest play, the *Rhadamiste et Zénobie*, which is one of the masterpieces of the French classical tragedy. But his *Xerxes* (1714) was only once played, and his *Sémiramis* was an absolute failure. Meanwhile, in 1707, Crébillon had married a girl without fortune, who had since died, leaving him an infant son. His father also had died, insolvent. His three years' attendance at court had been fruitless. Envy had circulated innumerable slanders against him. Oppressed with melancholy, he removed to a garret, where he surrounded himself with a number of dogs, cats, and ravens, which he had befriended; he became utterly careless of cleanliness or food, and solaced himself with constant smoking. But in 1731 he was elected member of the French Academy; in 1735 he was appointed royal censor; and in 1745 Mme. de Pompadour, in her enmity to his rival Voltaire, presented him with a pension of 1000 francs and a post in the royal library. In 1748 his *Catilina* was played with great success before the court; and in 1754, eight years before his death, appeared his last tragedy, *Le Triumvirat*. Such was the rivalry of Voltaire, that to prove his own superiority he took the subjects of no less than five of Crébillon's tragedies—*Sémiramis, Electre, Catilina, Le Triumvirat, Atrée*—as subjects for tragedies of his own. For vigour and passion Crébillon is unsurpassed in the French classical drama; his faults are want of culture and the consequent absence of classical correctness, and a want of care which displays itself in his style and even in the mechanism of his verse.

See D'Alembert, *Éloge de Crébillon;* La Harpe, *Littérature;* L'Abbé de la Porte, *Biographie de Crébillon.* There are numerous editions of his works.

CRÉCY, or Cressy, a town of France, department of Somme, on the Maye, 12 miles N. by E. of Abbeville; though an ancient place it has now only about 1300 inhabitants. It is famous in history for the great victory gained here on the 26th of August 1346 by Edward III., with about 30,000 men, over the French of Philip of Valois, said to be 100,000 strong, commanded by the Comte d'Alençon. The flower of French chivalry, and the king of Bohemia, fighting for France, were slain in the battle. Here it was that the Black Prince gained his spurs, and that he adopted the triple feather crest of the fallen Bohemian king, with the motto *Ich Dien*, still worn by our princes of Wales. This battle was one of the earliest in which cannon were used by the English. This Crécy must not be mistaken for another small town of the same name in the department of Seine-et-Marne, on the Grand Morin, 25 miles east of Paris, also an ancient place formerly fortified with double ramparts and towers.

CREDI, Lorenzo di (1459–1537), was the least gifted of three artists who began life as journeymen with Andrea del Verrocchio at Florence. Though he was the companion and friend of Leonardo da Vinci and Perugino, and closely allied in style to both, he had neither the genius of the one nor the facility of the other. We admire in Da Vinci's heads a heavenly contentment and smile, in his technical execution great gloss and smoothness of finish. Credi's faces disclose a smiling beatitude; his pigments have the polish of enamel. But Da Vinci imparted life to his creations and modulation to his colours, and these are qualities which hardly existed in Credi. Perugino displayed a well-known form of tenderness in heads, moulded on the models of the old Umbrian school. Peculiarities of movement and attitude become stereotyped in his compositions; but when put on his mettle, he could still exhibit power, passion, pathos. Credi often repeated himself in Perugino's way; but being of a pious and resigned spirit, he generally embodied in his pictures a feeling which is yielding and gentle to the verge of coldness. Credi had a respectable local practice at Florence. He was consulted on most occasions when the opinion of his profession was required on public grounds, *e.g.*, in 1491 as to the fronting, and in 1498 as to the lantern of the Florentine Cathedral, in 1504 as to the place due to Michelangelo's David. He never painted frescoes; at rare intervals only he produced large ecclesiastical pictures. The greater part of his time was spent on easel pieces upon which he expended minute and patient labour. But he worked with such industry that numbers of his Madonnas exist in European galleries. The best of his altar-pieces is that which represents the Virgin and Child with Saints in the cathedral of Pistoia. A fine example of his easel rounds is in the gallery of Mayence. Credi rivalled Fra Bartolommeo in his attachment to Savonarola; but he felt no inclination for the retirement of a monastery. Still, in his old age, and after he had outlived the perils of the siege of Florence (1527), he withdrew on an annuity into the hospital of Santa Maria Nuova, where he died.

CRÉDIT FONCIER and CRÉDIT MOBILIER are finance institutions, which had their origin in the joint-stock speculation and sanguine promotion of public works which marked many years of the second empire in France, and to which the introduction of limited liability in England had given a great stimulus on the British side of the Channel. The parent institutions in Paris were followed by similar establishments in some other capitals. As the terms imply, the crédit foncier contemplates loans and advances on real securities, and the crédit mobilier on what is called with us personal or movable estate. Whether such limits and distinctions have been ever strictly observed in the practical working of these credit banks is doubtful. The crédit mobilier of France has had a more unfortunate experience than the crédit foncier, though the latter has by no means sustained the promise of its early years. While the mania of launching new projects continued, enormous profits were made, which could only be the result of heavy promotion charges, and the shares rose in value with the extraordinary liberality of the dividends. But the system of business pursued had the result of mixing the credit banks very closely with the various companies and undertakings they were promoting, and of throwing back upon them a growing mass of depreciated or unsaleable securities; while the abatement or collapse of speculation restricted the business from which the main part of the former income had been derived. The rates of dividend and the value of the shares consequently fell as rapidly as they had risen. This has been the practical experience of the crédit foncier and the crédit mobilier of France, which were the first, and remain the greatest examples of the finance companies so named. The crédit foncier of England (there has been no crédit mobilier in London) has had much the same course as the French companies; large profits for a few years were followed by increasing difficulties, and the locking up of large amounts of capital in hopeless undertakings. The Imperial Land Company of Marseilles has absorbed £260,000, the Santiago and Carril Railway £193,000, and both are failures. The directors in these circumstances have been applying the annual profits to a reserve fund, and addressing themselves to a class of loans and advances on securities differing little from that of ordinary bankers and many finance companies under various names.

CREDITON, a market town of England, county of Devon, on the Creedy, near its junction with the Exe, eight miles north-west of Exeter. Population (1871), 4222. It is situated in a narrow vale, between two steep hills, and is divided into two parts, the east or old town, and the west or new town. The church, formerly collegiate, is a noble edifice, in the later Pointed style, with a fine tower 100 feet in height springing from the centre. There are places of worship for Baptists, Independents, Methodists, and Unitarians, a free grammar school with exhibitions to both universities, blue-coat, national, and infant schools, a mechanics' institution, a public library, and a newsroom. There were formerly extensive woollen and serge manufactories there, but the inhabitants are now chiefly engaged in shoemaking and agriculture. Crediton was the birthplace, about 680, of the Anglo-Saxon Winfrid, better known as St Boniface, "the Apostle of Germany." It returned two members to the Parliament at Carlisle in the reign of Edward I., and from 909 to 1049 was the seat of a bishopric, which was afterwards removed to Exeter. Fairfax with Cromwell took possession of Crediton in 1645. The present modern appearance of the town is mainly due to the removal of the old houses by fires which occurred in 1743 and 1769.

CREECH, Thomas (1659–1701), an English translator from the classics, was born at Blandford near Sherborne in Dorsetshire. He studied at Wadham College, Oxford, and obtained a fellowship first in that college and afterwards at All Souls'. In 1699 he received a college living, but not more than two years after he hanged himself. The immediate cause of the act was not improbably a money difficulty, though according to some it was a love disappointment; but Creech was naturally of a melancholic temper. Creech's fame rests on his translation of Lucretius, in which, according to Otway, the pure ore of the original "somewhat seems refined." But in truth the commonplace equability of its rhymed heroic couplets, the chief merit of which is their straightforward simplicity, is very far from being an adequate translation of the powerful poetry of Lucretius; and even the easy mechanism of the rhyme is faulty in innumerable cases. Creech's version of Horace, which is still less adequate, was a failure from the first. He also translated the *Idylls of Theocritus*, the *Thirteenth Satire* of Juvenal, the *Astronomicon* of Manilius, and parts of Plutarch, Virgil, and Ovid. Creech's edition of the text of Lucretius, with notes borrowed from Lambinus and Faber, has been much used.

CREEDS, or Confessions of Faith, may be defined as authorized formularies of Christian doctrine. The three ancient or, as they are sometimes called, œcumenical creeds are the most important, although the briefest, of such documents, and mainly call for attention in such an article as this. The more detailed confessions since the time of the Reformation will also be enumerated. But their special description belongs to the history of theology, or what the Germans call "Symbolik." Our aim is not to deal with the substance or theological import of the creeds, but only to present to the reader the most recent and satisfactory information as to their origin, history, and acceptance by the church.

Creeds are a gradual growth in the history of the Christian church, but their rudiments may be said to have existed from its first foundation,—from the answer of St Peter to our Lord, when asked "Whom do men say that I am?" "Thou art the Christ" (Mark viii. 27–29); or the statement of St Paul in the Epistle to the Romans (x. 9), "If thou shalt confess with thy mouth the Lord Jesus, and shalt believe in thine heart that God hath raised Him from the dead, thou shalt be saved." All subsequent confessions of faith are in fact more or less expanded developments of the original baptismal formula, derived from the commission given by Christ to the apostles in the conclusion of St Matthew's Gospel (xxviii. 19):—"Go ye therefore and teach (make disciples of) all nations, *baptizing them in the name of the Father, and of the Son, and of the Holy Ghost.*" From this simple acknowledgment of the threefold Name, possibly from the still simpler acknowledgment of Jesus as "the Christ" or Messiah, have sprung all the more elaborate *credenda* of the Christian church.

I. Writers on the creeds have professed to find in the later writings of the New Testament traces of a more definite summary of belief: as in the allusions of the 2d Epistle to Timothy (i. 13) to a "form of sound words;" and "the deposit," or "good deposit," which was to be kept (1 Tim. vi. 20; 2 Tim. i. 14); also in the "faithful words" or "sayings" enumerated in the first and second of these epistles (1 Tim. i. 15; ii. 1; iv. 8, 9; 2 Tim. ii. 11), and a remarkable passage in the opening of the sixth chapter of the Epistle to the Hebrews. But it may be questioned how far any of these passages have anything beyond a general meaning. It must certainly be held doubtful whether, supposing they did point to any articles of faith beyond the original statement of the baptismal formula, they could be held to apply to the first apostolic age. All such inferences are two-edged,—the presumption of articulated dogma in any part of the New Testament Scriptures being one of the strongest evidences of the later or non-apostolic origin of these Scriptures.

It is not till a much later age—the age of Irenæus and Tertullian (175–200)—that we meet with any definite summaries of Christian belief. We may presume, and rightfully presume, that such summaries existed before, and were even rendered to the candidates for baptism under the form of *Traditio Symboli;* but no such summaries are traceable in Christian literature before this period. Not to speak of the doubtful genuineness of the writings appealed to—such as the alleged Epistle of Ignatius to the Trallians (c. iv)—it is admitted by those most anxious "to demonstrate that from the earliest times there existed some form of words in the church of the character of a creed," that the passages quoted either from the writings of the Apostolic Fathers or of Justin Martyr "do not seem to have been meant to be used in this way, if we take them in conjunction with their context" (Lumby's *History of the Creeds*, p. 12). "Some fancy," says Bingham (*Origines*, b. x. c. iv), "that the creed may be found in the writings of Ignatius, Clemens Romanus, Polycarp, and Justin Martyr. But Bishop Pearson has rightly observed that these writers, however they may incidentally mention some articles of faith, do not formally deliver any rule of faith used in their times."

It is not, then, till a good deal more than a century after the death of St Paul and only somewhat less than a century after the death of St John, that we meet with any definite summaries of dogmatic belief in Christian literature, and even then there is no evidence that these summaries had any authoritative character. They expressed, no doubt, the belief of the churches to which the writers belonged; but half a century after the time of Irenæus (250), it is evident from the statements of Cyprian, then bishop of Carthage, that the baptismal creed of the North African Church, which was at this period more dogmatic in its tendencies than any other church in the East or the West, was of a comparatively brief character. The passage of Cyprian is found in one of his letters (*Ep.* 76), addressed "to Magnus, his son," on baptizing the Novatians, and implies plainly that the only addition to the original baptismal formula which had then obtained any authority in the Church of Carthage, was a clause as follows—"Dost thou believe in the remission of sins and eternal life through the holy church?"[1]—a clause of interrogation which, he adds, they (the Novatians) could not honestly answer "because they have no church."

The creed which is found in the well-known treatise of Irenæus against Heresies (*Adv. Hæreses*) in three different forms (i. 10, iii. 4, iv. 33) is of a far more elaborate character even in its simplest form, which is all that can be quoted here. It particularizes on the part of the true or spiritual disciple a "complete faith (πίστις ὁλόκληρος) in one God Almighty, of whom are all things; and in the Son of God, Jesus Christ our Lord, by whom are all things, and His dispensations by which the Son of God became man; also a firm trust in the Spirit of God, who hath set forth the dispensations of the Father and the Son, dwelling with each successive race of men, as the Father willed" (iv. 33, § 7). The creed of Tertullian is also found in three several forms in his writings—(1) *De Præscript. Hæret.*, c. xiii.; (2) *De Virg. Veland.*, c. i.; (3) *Adv. Prax.*, c. ii.),—in the first mentioned of these writings in a more detailed form than in the others. The shortest of the three, or the creed in the treatise *De Virginibus Velandis*, may be held to be the most primitive in form. We give it as an abbreviated specimen of the others. "The rule of faith is indeed altogether one, irremovable, and irreformable—the rule, to wit, of believing in one only God omnipotent, the Maker of the universe, and His Son Jesus Christ, born of the Virgin Mary, crucified under Pontius Pilate, raised again from the dead on the third day, received in the heavens, sitting now at the right hand of the Father, about to come to judge the quick and the dead through the resurrection of the flesh as well [as of the spirit]."

In the preface to Origen's great work *De Principiis* there is also a summary of articles of faith professing to have been "clearly delivered in the teaching of the apostles," which, no doubt, fairly represents the faith of the Alexandrian Church in his time. The amplified and explanatory language of the creed, however, bears clearly the trace of Origen's own hand, and gives it even less a character of general authority than those previously mentioned.

Turning to the Church of Rome in the second half of the 3d century, we meet with the fragments of a creed in a treatise of Novatian (*De Trin.*, Migne, iii. 886) of a more simple and popular character, and corresponding, therefore, more nearly to the form which the creed ultimately assumed in the West. It only requires faith "in God the Father and Lord omnipotent, the most perfect Maker of all things; . . . also in the Son of God, Christ Jesus, our Lord God, but Son of God; . . . also in the Holy Spirit." Novatian, at first a presbyter of the Church of Rome, was afterwards a schismatic bishop, whose followers, we have seen, were placed by Cyprian beyond the pale of the church, but there seems no reason to doubt that his "Regula Veritatis" (the same form of expression, it deserves to be noticed, as that used by Tertullian) represents the Roman creed of his time.

These may be said to represent all the distinctive authorities in creed literature before the formation of an authorized creed at Nicæa in 325. There is sometimes also quoted a creed of Gregory Thaumaturgus, who was a pupil of Origen at Cæsarea in Palestine—a creed both more elaborate and precise in its theological terms than that of his great teacher; but besides that its form is rather oratorical than confessional, this creed cannot be said to present any distinctive features. It is sufficiently evident that "confessions of faith," or "rules or standards of truth," existed in the Ante-Nicene Church from the age of Irenæus, or the last quarter of the 2d century, and there is every reason to conclude that they existed even before this, although we get no trace of them in Christian literature. Candidates for baptism were, no doubt, always required to profess their belief in the name of the Father, the Son, and the Holy Ghost. But it is equally evident that there was no rule of faith universally accepted by the church, or authoritatively imposed by any Catholic body up to the time of the Nicene Council. Each church seems to have had its own "regula veritatis," or "confessio fidei," identical in substance, but varying in form and language, and varying even in the same church in completeness. The simpler, less detailed, or less theological forms are plainly at once the more original and the more generally or popularly accepted forms.

There is further supposed to be a marked distinction between the creeds of the Eastern and the creeds of the Western Church, although the division of Latin or Western Church is only beginning to emerge at the period we have reached. Irenæus, although a bishop of the West, was an Oriental Greek in language and theology. Hippolytus, who was bishop in or near Rome in the second half of the 3d century, still wrote and taught in Greek. Tertullian and Cyprian of the North African Church are the only representatives of Latin theology. Even thus early, however, the creeds of the Oriental Church are supposed to show a tendency to theological expansion or dogmatic adaptation which is not observable in the Western—the creed of Novatian, for example, which has been already quoted. "The Eastern creeds, while they have all along retained their characteristic notes, were at first by far the more flexible, readily adapting themselves to meet the exigencies of the church, in her maintenance of the faith once delivered to the saints against the perversions of heretics, with which the East, owing to the genius of its subtle-witted people, was infested much more than the West. . . . . The case of the Western creeds was widely different. With them no council ever interfered. They were left to the custody of the several churches, while at the same time each church seems to have felt itself at liberty to make additions or alterations to some extent where occasion required." These remarks of Professor Heurtly in his *Harmonia Symbolica* (1858) point mainly to a later period than the end of the 3d century, and to a classification which he himself makes of the creeds into a Western group typified by the "Apostles' Creed," and an Eastern represented by the creed of Nicæa. But the distinction, to some extent, underlies the inchoate creeds of the Ante-Nicene Church as well, and helps us to understand the true historical order of the creeds, which has been disturbed by the traditionary prestige assigned to what is known as the Apostles' Creed. There was no such creed as yet, nor till long afterwards, in the familiar form in which it is now held by the Western churches. In

[1] Credis remissionem peccatorum et vitam æternam per sanctam ecclesiam?

simplicity of structure and of thought the Apostles' may, indeed, be called the oldest of the creeds. It takes us back to the most primitive stratum of Christian belief. But as a matter of fact and chronology, what is now known as the "Apostles' Creed" is not found in anything like its present form, till four centuries after the faith of the Eastern Church was definitely settled in the Nicene Symbol. It is to this latter creed, therefore, that we must first turn our attention in historical order.

II. The circumstances in which the Council of Nicæa was assembled have already been briefly sketched in the articles ARIUS and ATHANASIUS. The opinions of Arius promulgated in the commencement of the 4th century made such commotion in the church as to call forth not only the admonition of bishops, but the intervention of the imperial government in the hands of Constantine, who had professed himself a Christian, and become the patron of the peace and prosperity of the church. The distractions of the Donatist schism on the one hand, and of the Arian heresy on the other, were subjects of grave anxiety to a prince, one of whose motives in joining the rapidly increasing influence of the Christian church, as he himself professes in a letter addressed to Alexander (bishop of Alexandria) and Arius jointly, was the establishment throughout his dominions "of some one definite and complete form of religious worship." In the same letter he gave some very good advice on the subject of the prevailing religious contentions. "My advice," he says, "is neither to ask nor answer questions which, instead of being scriptural, are the mere sport of idleness or an exercise of ability; at best keep them to yourselves and do not publish them. You agree in fundamentals (περὶ τοῦ κορυφαίου)." (Euseb., *Vit. Const.* iii. 66). The epistolary efforts of Constantine, however, had no effect in allaying the theological dissensions of the Church of Alexandria, which, on the contrary, with the banishment of Arius spread widely throughout all the Eastern churches. The conclusion was accordingly formed of convoking a general council of bishops in which the Catholic doctrine should be formally declared. This the first œcumenical council met at Nicæa in Bithynia in the summer of the year 325. It contained about 300 bishops. The traditionary number is 318; but there is no clear evidence of the actual number, which has been variously estimated from 218 to 320. Besides prelates there was a large number of presbyters and attendants. Hosius, bishop of Cordova, the chief counsellor of Constantine in the Western Church, who had been the bearer of his letter to Arius and Alexander, is supposed to have acted as president, although others probably shared this office. Eusebius, in speaking of the presidency, uses the plural number. Among the most renowned of the assembled bishops may be mentioned Alexander of Alexandria (attended by his more celebrated deacon, and subsequently his successor in the Alexandrian bishopric, Athanasius), Eustathius of Antioch, Eusebius of Cæsarea in Palestine, his namesake, and some suppose his brother, of Nicomedia, Macarius of Jerusalem, Leontius of Cæsarea in Cappadocia, Cæcilian of Carthage, Marcellus of Ancyra, Spyridion of Cyprus, and other known although less distinguished names.

There is no detailed record of the proceedings of the council. Eusebius of Cæsarea and Athanasius both wrote about it; but it is impossible to trace out in any continuous form the actual proceedings of the council, from anything that they say. "We know not," Dean Stanley says, "whether it lasted weeks or days" (*Eastern Church*, p. 129). So far as can be gathered, however, there was much discussion untrammelled by the exercise of any external authority. Arius himself, being only a presbyter, had no seat in the conclave, but he appears to have been frequently called upon or allowed to express his opinions, his chief opponent in argument being Athanasius. At first the Arian party seem to have made a bold defence of their opinions, and to have found considerable support in the council; but ultimately they formed but a small minority. After an unsuccessful effort on their part to submit the draft of a creed, which, only called forth violent disapprobation, and was in fact torn in pieces by the excited assemblage, Eusebius of Cæsarea produced a confession of faith which he had been taught in his youth as the confession of the Church of Palestine. It was favoured by the emperor, and would have been accepted by the Arians. But the very fact that the Arians were disposed to accept the creed introduced by Eusebius, indisposed the orthodox party to its adoption. An expression, used by his namesake of Nicomedia with the view of characterizing unfavourably the extreme orthodox position—the expression Homoousion (Ὁμοούσιον)—at length became the battle-ground betwixt the parties. The Arians violently condemned it; the Eusebians or semi-Arians also at first strongly disapproved of it; but to the majority it became the very term they were in search of, in order to discriminate their view of the relation of the Father and Son from Arianism; and accordingly it was adopted. The assent of the emperor was gained: Hosius of Cordova announced the creed of the church at length settled; and even the two Eusebii after a time gave in their adhesion to the expression, although reluctantly, and in the case of Eusebius of Nicomedia apparently with an amount of reserve which led to future difficulties.

The following are the terms of the creed as issued by the council:—

> "We believe in one God, the Father Almighty, maker of all things, both visible and invisible; and in one Lord, Jesus Christ, the Son of God, begotten of the Father, *only begotten, that is to say of the substance of the Father, God of God* and Light of Light, very God of very God, begotten, not made, being of one substance with the Father (ὁμοούσιον τῷ πατρί), by whom all things were made, *both things in heaven and things on earth;* who, for us men and for our salvation, came down and was made flesh, made man, suffered and rose again on the third day, went up into the heavens, and is to come again to judge the quick and the dead; and in the Holy Ghost."

Then followed the clauses anathematizing the several assertions of the Arians, that "there was a time when He (Jesus Christ) was not"—"before He was begotten He was not,"—"He came into existence from what was not," and that He is of a different "person" or "substance" (ἑτέρας ὑποστάσεως ἢ οὐσίας).

This the original form of the Nicene Creed, it will be observed, differs considerably from what is popularly known as the Nicene Creed. Afterwards certain clauses (which we have marked in italics) were omitted, and others of more importance added, especially the present conclusion of the creed, following the simple statement in the original of belief in the Holy Ghost.

> "I believe in the Holy Ghost [the Lord and Giver of life, who proceeded from the Father (and the Son), who with the Father and the Son are worshipped and glorified, who spake by the prophets. And I believe one Catholic and Apostolic Church. I acknowledge one baptism for the remission of sins. And I look for the resurrection of the dead, and the life of the world to come]."

The history of the addition of these clauses is involved in some obscurity. They have been often attributed to the Council of Constantinople which, in 381, followed that of Nicæa, and the existing creed has been consequently called by the special title of the Nicæno-Constantinopolitan Creed. But, on the one hand, the enlarged creed is found in a work written by Epiphanius seven years before the date of this council (Migne, xliii. col. 232), and on the other hand there is nothing said in the canons of the Constantinopolitan Council respecting the enlargment of the creed. On the contrary, it is said in the first canon of the council that "the creed of the 318 bishops assembled at Nicæa shall not be made void, but remain for ever." The probable explanation is that the original Nicene Creed became gradually enlarged in the East, as the dogmatic instinct of the church developed under the pressure of the varying forms of Arian, Apollinarian, and semi-Arian heresy. It was deemed necessary to meet the growth of heretical opinions by additional growths of authoritative Catholic opinion, and as the additions to the creed were really expansions of its implied thought—and not in any sense arbitrary external supplements—they came to be identified with the original creed, and to pass under its name. This view of the matter is favoured by the fact that the third œcumenical council, held at Ephesus in 431, chiefly for the condemnation of the Nestorian heresy, which was supposed to separate not only the natures but the person of Christ, enjoined in its seventh canon "that no person shall be allowed to bring forward, or to write, or to compose any other creed besides that which was settled by the Holy Fathers who were assembled in the city of Nicæa." As the fuller creed was almost certainly well known by this time (it having been already in existence before 381), such a statement seems only consistent with the idea that the two creeds were regarded by the Ephesine fathers as virtually identical. For the first time, at the Council of Chalcedon, which was held twenty years later, or in 451, the enlarged creed is found following the original and simpler form of the creed. It is appended as forming a ratification of "the same faith," and is distinctly attributed to "the 150 fathers who afterwards assembled in the great city of Constantinople" (in 381). The shorter form, or the exposition (ἔκθεσις) of the 318, is assigned the first place, but the other is added,—"that those things also should be maintained which were defined by the 150 Holy Fathers of Constantinople for *the taking away of the heresies which had then sprung up*, and the confirmation of the same, our Catholic and apostolic faith."

At the same time there is evidence, from what took place at the council, that there was still a large number of bishops who greatly preferred the creed in its original and simpler form, and it appears long to have maintained its ground alongside of the others in the Eastern churches. In the same churches the clause "God of God" which, appearing in the original, had dropped out of the expanded creed, was restored in course of time, although the real date of the restoration is unknown; and in addition to this clause the well-known "filioque" clause was added by the Western churches at the Council of Toledo in the year 589. From this date no changes have been made in the "Nicene" Creed. It has remained without the "filioque" clause the œcumenical creed of the Eastern Church; and with the addition of this clause it has taken its place amongst the three great creeds of the Western Church.

III. What is known as the "Apostles'" Creed claims our notice next as the second of the three œcumenical creeds in chronological order. The growth of this creed is involved in considerable obscurity. The tradition which ascribes it to the apostles themselves, it is needless to say, has no authority, and does not reach beyond the 5th century, if it can be carried back so far. The definite source of the legend is supposed to be two sermons spuriously attributed to St Augustine, and found in the appendix to his works. In point of fact, as we have already seen, the creeds prevalent in the Roman and North African Churches, the original representatives of Latin Christendom, were of the briefest character up to the end of the 3d century. The creeds of Cyprian and Novatian already quoted are specimens. The first example of a more expanded creed after the manner of the "Apostles'" is to be found singularly enough in a Greek writer, Epiphanius, who in the 72d book of his *Treatise on Heresies* quotes the confession of faith presented by Marcellus, bishop of Ancyra in Galatia, to Julius, bishop of Rome, as follows—"I believe in God the Father Almighty; . . . . . and in Jesus Christ, His only begotten Son, our Lord, who was born of the Holy Ghost and the Virgin Mary, who under Pontius Pilate was crucified and buried, and on the third day rose from the dead, ascended into heaven, and sitteth at the right hand of the Father, whence He is coming to judge the quick and the dead; and in the Holy Ghost, the Holy Church, the remission of sins, the resurrection of the flesh, everlasting life" (Epiphan., *Hær.* 52).

Marcellus had been one of the most active of the orthodox party at the Council of Nicæa, and on his return to his diocese had distinguished himself with such zeal against the Arians that he was accused of having fallen into the opposite error of the Sabellians. He was accordingly deposed from his see by a synod held at Constantinople in 336, and betook himself to Rome. It was while there, and with the view of exhibiting his orthodoxy, that he addressed to Julius the above profession of faith, which he describes as the faith which he "learnt and was taught from the Holy Scriptures." As he was himself a Greek he probably expressed himself in the Greek language. In any case, it is in Greek that the creed has been preserved to us.

It has been doubted from this circumstance, as well as from the position of Marcellus himself, whether his creed can be taken as representing the Roman creed of the time to which it belongs. It has been supposed too expanded for this, as it is beyond question that "the Roman Church used at baptism, and still uses, a much less elaborate form." It is not improbable, however, that while the earlier and briefer form was retained in the baptismal service, a larger formulary of faith had also grown up from the original simplicity of this form, in obedience to the general growth of the dogmatic sentiment in the West as in the East. It is certain that within half a century from this date, or about the year 390, there is to be found a creed equally detailed—the creed not merely of the Church of Aquileia of which Rufinus was a presbyter, but of the Church of Rome, with which he compares the other, pointing out the differences betwixt the two. Still in neither of these creed-forms, nor yet in those found in the writings of St Augustine, do we approach the complete detail presented by the Apostles' Creed as now received. The chief clauses awanting are those relating to the descent into hell and the communion of saints. Generally also, the expression descriptive of the church is simply "The Holy Church," instead of the "Holy Catholic Church." "The earliest creed to be met with entirely identical with the present formula occurs in a short treatise published by Mabillon from an ancient manuscript entitled 'Libellus Pirminii de singulis libris canonicis Scarapsus (scriptis?)' . . . . . . "The creed occurs twice in Pirminius's treatise. In the first instance the story is repeated of the several articles having been contributed each by a several apostle, and each article is assigned to its supposed contributor. The other creed, which is identical with the former, is given as it was used in the baptismal service" (Heurtly, *Harmonia Symb.* pp. 70–71). There is little known of the life of Pirminius, but he seems to have been active as a missionary in France and Germany in the 8th century, and the date of his death is "about the year 758." Although the "Apostles'" Creed was no doubt substantially in existence long before this probably from the end of the 4th century, there is no historical evidence of its reception in its completed form till this period, or about the middle of the 8th century, or more than four centuries later than the original form of the Nicene Creed.

IV. The history of the "Athanasian" Creed, or the "Symbolum Quicunque," as it is often called, opens up a more doubtful inquiry than that of either of the preceding creeds. The evidence before us is of an entirely different character. "Here," as it is said by a recent writer on the subject (Lumby, in his *Hist. of the Creeds*, p. 186), "is neither the synodical authority of the former, nor the gradual growth of the latter; but when the composition appears for the first time as a document of authority, it is cited in its completeness, and as the work of the father whose name it has since for the most part borne, although it was not brought to light for many centuries after his death."

In one opinion all investigators are now agreed,—that the so-called "Athanasian" Creed is not the production of the famous father of the 4th century whose name it bears. The conclusive reasons against this supposition may be stated as follows:—(1) There is no trace of such a creed in any of the older MSS. of the works of Athanasius; (2) Athanasius himself (*Ep. ad Antioch*, i. 2.), in consistency with the prevailing church sentiment of his time, expressly disclaims as superfluous the use of any creed except the Nicene; (3) the original language of the "Athanasian" symbol is clearly Latin and not Greek; (4) the symbol was entirely unknown to the Greek Church up to the year 1000; and (5) there is no evidence of its existence even in the Latin Church before the end of the 8th or the commencement of the 9th century.

This last and all-important fact has been completely established by recent investigations. Dr Swainson particularly, in his elaborate volume on the Creeds (1875), has exhausted all the historical evidence on the subject, and, while not venturing to assign the creed to a definite author, has proved in the most conclusive manner that the existence of the creed cannot be traced before the age of Charlemagne, and that its origin is almost certainly to be ascribed to the demand then existing for a more detailed exposition of the faith than was to be found in the Apostles' Creed. Nor does he hesitate to ascribe its origin to a deliberate purpose of imposture similar to that which led in the same age to the forgery of the famous "false Decretals," and the equally famous "Donation of Constantine." He expresses himself as follows:—"We have four or five independent lines of witnesses agreeing in bringing forward the Quicunque into notice within five and twenty years before or after the death of Charlemagne:—i. the testimony of quotation; ii. testimony of canons; iii. testimony of literary collections of creeds or rules of faith; iv. testimony of psalters; v. testimony of versions. . . . That the production of this work under the name of Athanasius was an intentional and deliberate attempt to deceive, no reasonable person can question. It was analogous to the production of the forged Decretals. And it is doubtless to the skill with which the imposture was wrought out that we owe the difficulty that has been felt in discovering the author" (Swainson, pp. 380–381). Other writers, such as the Rev. E. S. Ffoulkes (*On the Athanasian Creed*), and Mr Lumby, whose compact and interesting volume on *The History of the Creeds* has been already quoted, come virtually to the same conclusion as to the date of the Athanasian symbol. Mr Ffoulkes has formed, indeed, a peculiar theory as to its authorship by Paulinus, bishop of Aquileia, in the end of the 8th century,—a conclusion which is repudiated by Dr Swainson. They agree, however, that there is no evidence of its existence before this time. It may be useful to give a brief summary of the reasons for this conclusion.

And first a distinction must be made. What these writers, of course, mean is that there is no satisfactory evidence of the existence of the Athanasian symbol as constituting a distinct creed before the time to which they refer its origin. Many of the dogmatic expressions or formulæ of the creed by themselves must be admitted to have been in existence long before. The expressions were, in fact, current in the schools of the Western Church, more or less from the time of Augustine, to whose famous treatise *De Trinitate*, not a few of them have been specially attributed. This is the real explanation of the supposed traces of the Athanasian symbol in these earlier times. Language, similar to that which it ultimately embodied, had been accumulating for centuries as the natural result of the study of Augustine and the increasing pressure of Arian modes of thought from many quarters. This process of theological definition had been advanced by such men as Hilary, bishop of Arles (429), Vicentius of Lerins (434), and Vigilius of Thapsus (500), to whom severally the authorship of the Quicunque has been ascribed. The ascription rests in each case on certain plausibilities arising, among other things, out of a common stratum of dogmatic phraseology. But such phraseology had really become a common property of the church of that time, and is to be found in the confessions of synods and collections of sermons and books of devotion from the 5th century downwards. Nothing definite as to the authorship of the Quicunque can be rested on such resemblances, or even on the use of the name of Athanasius. The fact remains that during all this time, and long afterwards, there is no evidence of such a *creed being in existence or having any authority.*

The first traces of such a creed are reached in the 8th century. Then in distinct quarters there come before us the two parts of the creed now in use. The first part, down to the end of the 26th clause, which specially deals with the doctrine of the Trinity, seems then to have existed by itself under the general title of "Fides Sanctæ Trinitatis," and "Fides Catholica Sanctæ Trinitatis." The second part, which treats of the incarnation of our Lord, is in a similar manner found by itself in a MS. known as the Colbertine MS., which cannot be placed earlier than 730. But the two parts are not as yet found in combination, nor as claiming any distinctive symbolic authority. They seem rather put forward as expositions or explanations of the original Nicene doctrine than as new creeds having any authority by themselves. The two documents not only exist apart, but they are evidently regarded by those who use them as separately independent and complete.

That there was no authoritative "Athanasian" Creed, such as we now have, even at the end of the 8th century, is held to be clearly proved by what occurred at the several councils of the church, which were held both in the East and the West at this time. In 787 there was held once more at Nicæa what is reckoned by the Church of Rome the *seventh* œcumenical council. At this council there were recited three several confessions amplifying in several details what is known as the Niceno-Constantinopolitan Creed. These amplified confessions, attributed to different bishops, all indicate the prevailing need that was felt for some more detailed exposition of the doctrine of the Trinity; but the fact, not only that the "Athanasian" symbol does not make its appearance amongst them, but that, when the synod at last comes to recite its own belief, it does so in a form quite distinct from the "Athanasian," and finally falls back upon the old Creed of Constantinople, to which it refuses to make any addition, plainly serve to show that this symbol or exposition could not even have been known to the Eastern Church at this time, and still less have acquired any authority.

But the Councils of Frankfort (794) and of Friuli (796) are still more decisive. For here in the West and in the centres of ecclesiastical activity which marked the age of Charlemagne, the Quicunque, if known anywhere, may be supposed to have been known and recognized. All the prominent characters of Western Christendom—the Emperor Charles himself, and his two chief counsellors Alcuin and Paulinus of Aquileia—took part more or less in these councils. Paulinus was "the episcopal soul of the Council of Frankfort, and president as well as soul of that of Friuli. No movement could have taken place in Italy, France, or Germany in matters ecclesiastic, nor any document have been set forth of such importance as the Quicunque, that could have escaped the knowledge of Paulinus and Alcuin." In these circumstances the absence of all allusion to the Quicunque in the records of these councils is fatal to the idea of its authoritative acceptance as a creed at that time. Not only so, but a form of faith which is found in the records of the Council of Frankfort, and which is supposed to have been composed either by Paulinus himself or under his guidance, shows by its language that he could not have been familiar with any such document as the Quicunque, for the obvious reason that it would have served his purpose better than the form which he uses. In this document "he deals both with the doctrine of the Trinity and the Incarnation, and puts his expressions on one occasion into the exact language used in the Athanasian Creed, which language was, no doubt, current in a separate form long before; but he never attains to anything like the precision which is exhibited in the creed, and which, had it been known to him, must have commended that work to his use. And there is not to be found the slightest notice of Athanasius in the whole proceedings of the council." From a further document of the same council, a synodical letter which the bishops of Gaul and Germany addressed to those of Spain, it is also evident that they were equally with Paulinus ignorant of any such authoritative exposition of the Catholic faith as the Quicunque. And to complete the evidence on the subject there is a letter of Charlemagne himself to the bishops of Spain, which indicates with equal clearness that, while his mind was full of many expressions similar to those in the creed, he yet had no knowledge of such an authoritative document to which he could appeal in advising them as to the details of the Trinitarian doctrine.

In summing up the subject we cannot do better than quote the words of Mr Lumby, whom we have already so far quoted :—

"The evidence which presents itself two years later seems to make it more clear that the Quicunque was unknown to the great minds of the West. The Council of Friuli met 796 A.D., and, as we have before said, its assembly was for the discussion of the doctrines of the Trinity and the Incarnation. The president and summoner of the council was Paulinus, and it is with his speech that we are concerned. After some preamble, in which he observes that his first idea is to set forth 'the very text of the creed' as a law and rule for the direction of their proceedings, he goes on to consider what the next step is to be. And he would first clear away some objections. 'For I believe,' says he, 'that in the records of some synods it is laid down . . . that no one may lawfully teach or frame another symbol of our faith. Far be it from us, as far be it from every faithful heart, to frame or teach another symbol or faith, or in another manner than they (the holy fathers of Nicæa) appointed. But according *to their meaning we have decreed to deliver in exposition* these matters which haply on account of the brief statement of the truth are less understood by the simple and unlearned than they ought to be.'

Here then is the definite confession of a want which the Quicunque would have supplied. The symbol by itself is too compendious—it needs exposition—the unlearned and simple do not sufficiently understand it; and for their sakes a longer and more explanatory treatise is to be prepared, adhering to the meaning of the fathers, who put forth the full creed. *In half a century or little more after these words were uttered, it can be shown that our form of the Athanasian Creed was known and used and looked upon as a most satisfactory exposition of the doctrines in debate at Friuli.* Can it be believed, that if it had been known to Paulinus and the fathers there assembled, they would not have welcomed it as a most excellent comment on the Trinity and the Incarnation, and as the most opportune solution of all their difficulties?"

The address or exposition with which Paulinus followed up his announcement is then given. It is too long to insert here, but it lays down the lines on which the Quicunque may be said to have been fashioned. "Many attributes and qualities are predicated of the Father, then a repetition of the same, and their predication of the Son and of the Holy Ghost,—not indeed in the detached way in which each separate predication is dealt with in the Quicunque, but yet evidently a step in the direction of that greater elaboration and distinctness."

The results, therefore, of the most recent investigations into the subject may be stated as follows. In the very end of the 8th century the Quicunque is unknown as a creed-document. It is nowhere mentioned at synods whose special business was to discuss the subject matter which it afterwards sets forth with such elaborate and authoritative detail. But during this century there are found in separate forms two documents which, when combined, constitute the framework of our present creed. The discussions of the time had a tendency to bring forward all contributions towards the explanation or fuller settlement of the doctrines of the Trinity and the Incarnation. Addresses like those of Paulinus, and the correspondence betwixt him and Alcuin and Charlemagne himself, all point to the necessity of some authoritative exposition of the old and simpler creed. The demand seems to have created the supply; and accordingly, before the end of the following century, in its third quarter there is evidence of the existence of the Athanasian symbol in the very words as nearly as possible which are now used. This evidence is found in a prayer-book of Charles the Bald, written about 870. "The Quicunque then had not only been compiled, but had by this time made itself reputation enough to be included in the service-book. If twenty years be allowed for the gaining of acceptance, the date is carried back to the middle of the century, or 850 A.D." But there are two earlier MSS., showing more variations from the present form than is presented by the copy in the prayer-book of Charles the Bald. These point to an earlier stage of growth in the document, and the limits of the period during which the two parts of the Quicunque, previously, as we have seen, in separate existence, were probably combined and moulded into a creed claiming general acceptance, may be therefore carried back to the first quarter of the century, 800–825. The creed, in short, appears to have been the response of the Christian consciousness of the age immediately following that of Charlemagne to the necessity for such an authoritative exposition of the faith to which this age everywhere testifies. So far, of course, there is no question of imposture in its origin. Imposture is not the name to give to such a natural and inevitable result of the working of the mind of the Western Church towards a more elaborate and detailed confession of its Trinitarian faith. The imposture consists not in the rise of the creed, nor yet in the acceptance of its ambitious formulæ, but in the ascription of it, probably not without the concurrence of the heads of the church, to a name with which it must have been known to have nothing to do. This was done, no doubt, with the view of securing to it credit and authority, and was supposed to be justified by its special doctrinal import, but it was none the less an assumption, the fictitious character of which could hardly have been unknown to those who first used the creed and gave it currency in the church.

With the adoption of the "Athanasian" symbol the creed-formations of the early and mediæval church terminate. Nor is it to be forgotten of the three so-called "Catholic" creeds, that only one of them is in the broadest sense "Catholic" or "Œcumenical." Neither the "Apostles'" nor the "Athanasian" Creed is known to the Greek or Oriental Church, which remained faithful to the faith "settled by the Holy Fathers" at Nicæa, or at least to the faith as subsequently enlarged to its present form (with the exception of the "filioque" clause). No doubt, in the East as well there were in circulation many expositions of the Nicene doctrine, called forth by the same doctrinal necessities as prevailed in the West. The proceedings of the Second Council of Nicæa (787), to which we have already adverted, sufficiently show this. But none of these expositions attained to any general acceptance, or rose as in the West to the same authoritative level as the ancient creed. It remained alone in its eminence, protected by the denunciations which the third council, which assembled at Ephesus in 431, directed against clergymen or laymen "who shall dare to compose any other creed." Of all Christian creeds, therefore, the Nicene or Niceno-Constantinopolitan is the only really "Catholic" or œcumenical creed, deliberately discussed and adopted by the representatives of the universal church. The two others associated with it in the services of the Western Church have not only never had acceptance beyond the range of that church, but are very gradual *growths* within it, without any definite parentage or deliberate and consultative authority. They emerge gradually during many centuries from the confusions and variations of Christian opinion, slowly crystallizing into definite shape; and such authority as belongs to them is neither primitive nor patristic. It is the reflected assent of the later church in the West, and the uncritical patronage of a comparatively ignorant age, which have alone elevated them to the same position as the faith defined at Nicæa, which is the only truly Catholic or universal symbol of the universal church.

V. After the Reformation a new era of creed-formations, or confessions of faith, set in. The process of exposition out of which we have seen the "Athanasian" symbol to have gradually risen, became once more urgent, not only in the disrupted branches of the church, which were called into existence by the activity of the several Reformers, but also in the Roman Church, from which the churches of the Reformation were broken off. As we said at the outset, we cannot do more here than present a summary of the many confessions which then sprung up. And here, as in the previous part of this article, the best principle of arrangement will be the chronological, not merely because this order is most suitable to our plan, but because it really sheds most light on the formation of the several documents, and alone brings them into rightly intelligent relation to one another. We will hardly be able to do more than enumerate the titles and the dates of the multiplied confessions of the Reformed churches. But even this will be more than the English reader can readily find elsewhere in a complete form.

1. The confessions of the Lutheran Church claim the first attention in chronological order. The first of these is the *Confessio Augustana*, or Confession of Augsburg, compiled by Melanchthon, and presented in German and Latin to the Emperor Charles V., in 1530, in the name of the evangelical states of Germany. It consists of twenty-one articles, beginning (1) De Deo; (2) De Peccato Originis; (3) De Filio Dei; (4) De Justificatione, &c.; and ending (21) De Cultu Sanctorum. The articles are terse and significant, and express with clearness and brevity the doctrinal position of the Lutheran Church. In addition to the twenty-one more positive articles, there are seven of a more controversial character, treating of the ecclesiastical abuses which Lutheranism had corrected, or, as they are called, *Abusus mutatos*, viz., (1) De Utraque Specie; (2) De Conjugio Sacerdotum; (3) De Missa; (4) De Confessione; (5) De Discrimine Ciborum; (6) De Votis Monachorum; and (7) De Potestate Ecclesiastica. Secondly, immediately following the Confession of Augsburg appeared the *Apologia Confessionis Augustanæ*, also prepared by Melanchthon, in reply to a professed confutation of the original document by certain Roman Catholic divines. The Apology follows the order of the confession, but sometimes several articles are grouped together when referring to one main topic; and the Apology is thus divided into only sixteen sections, although greatly more extended, nearly five times larger, in fact, than the Confession itself. To these two primary documents were afterwards added, thirdly, the Articles of Smalkald—*Articuli Smalcaldici*—prepared by Luther himself in 1536, and signed at Smalkald by an assembly of evangelical theologians, and, fourthly, the *Formula Concordiæ*, composed in 1576 after considerable doctrinal divisions had broken out in Lutheranism. This latter document was not so universally accepted as the others by the Lutheran churches, but it has always been reckoned along with them as of confessional authority. To these remain to be added Luther's two catechisms, which have also a confessional position among the Lutherans. The *Catechismus Major* and the *Catechismus Minor* were both issued in 1529, and take their place in the list of symbolic books betwixt the Smalkald Articles and the Formula Concordiæ. The collective documents are issued as a Concordia, or *Liber Concordiæ*, printed with the three older creeds in advance, and together they sum up the confessional theology of Lutheranism.

2. The course of the Reformation, as is well known, evoked not only the ecclesiastical but the dogmatic activity of the Roman Catholic Church, and the Council of Trent, reckoned by that church as the eighteenth œcumenical council, was summoned in the end of 1545, in order to formulate more distinctly the doctrinal position of Roman Catholicism in opposition to Protestantism. This council sat at intervals for eighteen years, from the 13th December 1545 to the 4th December 1563, sometimes at Bologna, but chiefly at Trent. Its results are arranged in the forms of twenty-five sessions, each session generally dealing with an important head of doctrine in the shape of a "decretum," followed, but not always, by a series of "canons," "ut omnes sciant, non solum quid tenere et sequi, sed etiam quid vitare et fugere debeant." Hence the title under which the results of the synod are known—"Canones et Decreta Sacrosancti Œcumenici Concilii Tridentini." The *Professio Fidei Tridentinæ*, which was drawn up under Pius IV. (1564), and the *Catechismus Romanus*, published under the authority of his successor Pius V. (1566), are considered by the Roman Catholic Church as symbolical writings of the second rank.

3. Passing to the confessions of the Reformed churches, we encounter more symbolic documents than there are churches. Nimeyer's *Collectio Confessionum in Ecclesiis Reformatis Publicatarum* contains twenty-eight confessions, the most important of which may be classified as follows:—(*a*) Pre-Calvinian: the *Confessio Tetrapolitana*, or the confession of the four cities,—Strasburg, Constance, Meiningen, and Landau,—composed by Martin Bucer in twenty-three articles, and presented to the Emperor Charles V. in 1530, the same year as the Augsburg Confession was presented; the *Confessio Basiliensis*, supposed to be drawn up by Myconius at Basel in 1534; and the *Confessio Helvetica*, prepared in the same city by a company of theologians, amongst whom were Bullinger and Myconius, and presented to the Lutheran divines assembled at Smalkald in 1537; and (*b*) Post-Calvinian: the

Consensus Tigurinus, and the *Confessiones Gallicana, Belgica*, and *Helvetica* II. The *Confessio Tigurinus*, or "Consensio mutua" in re sacramentaria ministrorum Tigurinæ Ecclesiæ et D. J. Calvini" was intended, as its title bears, to mediate betwixt the Zwinglian and the Genevese or Calvinian doctrine of the Sacraments. It was drawn up in 1549, and consisted of twenty-six articles. The *Confessio Gallicana* has been attributed, although doubtfully, to Calvin himself. It was accepted by a Reformed synod in France in 1559, and presented in the following year to Francis II. It was confirmed at a synod in Rochelle in 1571, and remained up to modern times the confession of the French Reformed Church. The *Confessio Belgica* is said to have been composed originally as a private document by Guido of Bres in 1562. First printed in French, it soon appeared in Dutch, and gradually gained such general acceptance among the congregations in the Netherlands that it was confirmed at the Synod of Dort, 1618, as the confession of the Dutch Reformed Church. The *Confessio Helvetica* II. was drawn up by Bullinger in 1564, and held in great esteem not only by the Swiss churches but by the Reformed congregations of Poland, Hungary, and Scotland. The well-known *Decrees of the Synod of Dort*, printed in 1619, also claim to be added to the series, and a host of Catechisms, which also possessed more or less confessional authority—the famous Heidelberg Catechism and the Genevese Catechism, amongst others. The Arminians had their *Confessio* or *Declaratio*, composed by Simon Episcopius about 1622, and the Socinians their Racovian Catechism, adopted, as the name bears, at Racow in Poland in 1605.

4. To this long series of Protestant confessions there remain to be added the *Thirty-nine Articles* of the Church of England, and the *Westminster Confession of Faith*, which is the doctrinal standard, not only of the Church of Scotland, but of the chief Presbyterian churches both in Britain and in America. The former were gradually prepared, chiefly it is said by Cranmer, and passed through various phases, beginning with the *ten* articles of 1536, and attaining the number of forty-two in 1552, till they were finally settled as thirty-nine (1562-1571). To this series of confessional documents also belong what are known as the *Lambeth Articles*, composed by Archbishop Whitgift in 1575, but which were never accepted as authoritative, and the *Irish Articles*, supposed to have been chiefly composed by Archbishop Ussher in 1615.

The Irish Articles form an appropriate transition to the *Westminster Confession of Faith*, which is said to have borrowed from the former some of its special phraseology. The Westminster document was the outcome of the great Puritan agitation of the 17th century, and as it is the last, so it is one of the most elaborate and finished of the long series of Protestant confessions. The Westminster Assembly met in the autumn of 1643, and sat for upwards of five years. The Confession of Faith was completed in the third year of its existence in 1646, and laid before the English Parliament in the same year. It never attained to any position of legal authority in England. But in Scotland it was accepted in the year following its composition by the General Assembly of the Kirk, as "agreeable to the Word of God, and in nothing contrary to the received doctrine, worship, discipline, and government of this Kirk," and two years afterwards, on the 7th February 1649, it was ratified and approved by the Estates of the Scottish Parliament. The Westminster Confession thus took the place in Scotland of the old *Scoticana Confessio Fidei* of John Knox. It retained this position of authority in 1690, when Presbyterianism was finally established in Scotland, and possesses, as we have said, symbolical authority, not only for Scottish Presbyterianism, but for the large Presbyterian churches in America and Australia which have sprung from it or own connection with it. The *Confession of Faith* extends to thirty-three chapters, ranging over the most abstruse topics of theology; and along with it are generally printed the Larger and Shorter Catechisms, which have also been approved by the General Assembly of the Church of Scotland, but which do not possess the legal or statutory authority of the *Confession*.

The study of creeds and confessions in their theological import is known as the study of symbolical theology, a name familiar to all students of German theological literature. Winer's *Confessions of Christendom* (translated in Clark's Foreign Theological Library, 1873) and *Mather's Comparative Symbolik* (Leipsic, 1853) are specimens of this branch of theological study. For the literature of the creeds with which the article has chiefly dealt, the student may be recommended to Lumby's *History*, more than once quoted, but above all to Dr Swainson's elaborate volume, to which we have also referred. A forthcoming work by Dr Schaff, in three volumes, entitled *The Creeds of Christendom, with a History and Critical Notes*, will probably contain the most exhaustive discussion of the subject in English literature. (J. T.)

CREEK INDIANS. See INDIANS.

CREFELD, or KREFELD, a town of Germany, capital of a circle of the same name, in the province of Düsseldorf, twelve miles north-west of the town of that name, 125 feet above the sea. This town is one of the finest in Rhenish Prussia, being well and regularly built, while the surrounding fertile district is almost entirely laid out in gardens. It is the most important seat of the silk and velvet manufactures in Germany, and in this industry the greater part of the population of town and neighbourhood is employed. There are upwards of 200 silk factories, and large quantities of silk goods are exported, chiefly to the United States. The other industries of the town, especially cotton and woollen weaving, are very considerable, and about 2000 gardens in the neighbourhood give employment to a large number of workers. The manufactures to which Crefeld owes its prosperity were introduced by religious refugees from the neighbouring duchy of Juliers about the close of the 17th century. Population (1875), 62,905.

CREMA, an ancient town of Lombardy, in the province of Cremona, on the right bank of the Serio and on the railway from Bergamo to Cremona, twenty-five miles E.S.E. of Milan. Population (1871), 8154. It is well built in the midst of a rich agricultural district, is inclosed by a ditch and old fortifications and has a castle, a cathedral (of date about 1400) and numerous other churches, and several palaces. It has manufactures of lace, hats, thread, and silk; and the vicinity produces excellent flax.

CREMATION, or the burning of human corpses, may be said to have been the general practice of the ancient world, with the important exceptions of Egypt, where bodies were embalmed, Judæa, where they were buried in sepulchres, and China, where they were buried in the earth. In Greece, for instance, so well ascertained was the law that only suicides, unteethed children, and persons struck by lightning were denied the right to be burned. At Rome, one of the XII. Tables said, "Hominem mortuum in urbe ne sepelito, neve urito;" and in fact, from the close of the republic to the end of the 4th Christian century, burning on the pyre or *rogus* was the general rule.[1] Whether, in any of these cases, cremation was adopted or rejected for sanitary or for superstitious reasons, it is difficult to say. Embalming would probably not succeed in climates less

[1] Macrobius says it was disused in the reign of the younger Theodosius. (Gibbon, v. 411.)

warm and dry than the Egyptian. The scarcity of fuel might also be a consideration. The Chinese are influenced by the doctrine of Feng-Shui, or incomprehensible wind water; they must have a properly placed grave in their own land, and with this view corpses are often sent home from California. Even the Jews used cremation in the vale of Tophet when a plague came; and the modern Jews of Berlin and the Spanish and Portuguese Jews at Mile End Cemetery have been among the first to welcome the lately revived process. Probably also, some nations had religious objections to the pollution of the sacred principle of fire, and therefore practised exposure, suspension, throwing into the sea, cave-burial, desiccation, or envelopment.[1] Some at least of these methods must obviously have been suggested simply by the readiest means at hand. Cremation is still practised over a great part of Asia and America, but not always in the same form. Thus, the ashes may be stored in urns, or buried in the earth, or thrown to the wind, or (as among the Digger Indians) smeared with gum on the heads of the mourners. In one case the three processes of embalming, burning, and burying are gone through; and in another, if a member of the tribe die at a great distance from home, some of his money and clothes are nevertheless burned by the family. As food, weapons, &c., are sometimes buried with the body, so they are sometimes burned with the body, the whole ashes being collected.[2] The Siamese have a singular institution, according to which, before burning, the embalmed body lies in a temple for a period determined by the rank of the dead man,—the king for six months, and so downwards. If the poor relatives cannot afford fuel and the other necessary preparations, they bury the body, but exhume it for burning when an opportunity occurs. There can be little doubt that the practice of cremation in modern Europe was at first stopped, and has since been prevented in great measure, by the Christian doctrine of the resurrection of the body; partly also by the notion that the Christian's body was redeemed and purified.[3] Science has shown that burning merely produces quickly what putrefaction takes a long time to accomplish; but the feeling of opposition still lingers among the clergy of more than one nation. Some clergymen, however, as Mr Haweis in his *Ashes to Ashes, a Cremation Prelude*, London, 1874, have been prominent in the reforming movement. The objection was disposed of by Lord Shaftesbury when he asked, "What would in such a case become of the blessed martyrs?" The very general practice of burying bodies in the precincts of a church in order that the dead might take benefit from the prayers of persons resorting to the church, and the religious ceremony which precedes both European burials and Asiatic cremations, have given the question a religious aspect. It is really a sanitary one. The disgusting results of pit-burial made cemeteries necessary. But cemeteries are equally liable to overcrowding, and are often nearer to inhabited houses than the old churchyards. There is indeed a disposition to build villas near ornamental cemeteries. It is possible to make a cemetery safe approximately by selecting a soil which is dry, close, and porous, by careful drainage, and by rigid inforcement of the rules prescribing a certain depth (8 to 10 feet), and a certain superficies (4 yards) for graves. But one has only to read such a work as Baker's *Laws Relating to Burial* to see how many dangers burial legislation has to contend with. A certain amount of irrespirable gas will escape into the air, or into sewage drains, and thus reach houses, or will percolate so as to contaminate water which is afterwards used. The great Paris cemeteries inflict headache, diarrhœa, and ulcerated sore throat on their immediate neighbours; and a great mass of similar well-authenticated facts may be brought against even recent cemeteries in various countries. A dense clay, the best soil for preventing the levitation of gas, is the worst for the process of decomposition. The danger is strikingly illustrated in the careful planting of trees and shrubs to absorb the carbonic acid. Vault-burial in metallic coffins, even when sawdust charcoal is used, is still more dangerous than ordinary burial. It must also be remembered that the cemetery system can only be temporary. The soil is gradually filled with bones; houses crowd round; the law itself permits the re-opening of graves at the expiry of fourteen years. We shall not, indeed, as Browne says, "be knaved out of our graves to have our skulls made drinking bowls and our bones turned into pipes!" But on this ground of sentiment cremation would certainly prevent any interruption of that "sweet sleep and calm rest" which the old prayer that the earth might lie lightly has associated with the grave. And in the meantime we should escape the horror of putrefaction and of the "small cold worm that fretteth the enshrouded form."

For the last ten years many distinguished physicians and chemists in Italy have warmly advocated the general adoption of cremation, and in 1874, a congress called to consider the matter at Milan resolved to petition the Chamber of Deputies for a clause in the new sanitary code, permitting cremation under the supervision of the syndics of the commune. In Switzerland Dr Vegmann Ercolani is the champion of the cause (see his *Cremation the most Rational Method of Disposing of the Dead*, 4th ed.; Zurich, 1874), and there are two associations for its support. So long ago as 1797 cremation was seriously discussed by the French Assembly under the Directory, and the events of the Franco-Prussian war have again brought the subject under the notice of the medical press and the sanitary authorities. The military experiments at Sédan, Chalons, and Metz, of burying large numbers of bodies with quicklime, or pitch and straw, were not successful, but very dangerous. The matter was considered by the municipal council of Paris in connection with the new cemetery at Méry-sur-Oise; and the prefect of the Seine in 1874 sent a circular asking information to all the cremation societies in Europe. The municipality of Vienna has actually made cremation permissive. There is a propagandist society, called the "Urne," and the main difficulty for the poor seems to be the cost of conveying the bodies five miles. To overcome this a pneumatic tube has been proposed. Dresden, Leipsic, and Berlin are the centres of the German movement, and Professor Reclam's *De la Crémation des Cadavres* seems to be the most important work. In Britain the subject has slumbered for two centuries, since in 1658 Sir Thomas Browne published his quaint *Hydriotaphia, or Urnburial* (see edition by St John, London, 1838), which was mainly founded on the *De Funere Romanorum* of the learned Kirchmannus. In 1817 Dr J. Jamieson gave a sketch of the "Origin of Cremation" (*Proc. Royal Soc. Edin.*, 1817), and for many years prior to 1874 Dr Lord, medical officer of health for Hampstead, continued to urge the practical necessity for the introduction of the system. It was Sir Henry Thompson, however, who first brought the question prominently before the public, and started in 1874 the Cremation Society of London. Its object is to introduce through the agency of cemetery companies, and parochial and municipal authorities, and burial boards, some rapid process of disposing of the dead, "which cannot offend the living and shall render the remains absolutely innocuous." Thompson's problem was—"Given a dead body, to re-

[1] The Colchians, says Sir Thos. Browne, made their graves in the air, *i.e.*, on trees.

[2] In the case of a great man there was often a burnt offering of animals and even of slaves (See Cæsar, *De Bell. Gall.* iv.)

[3] A temple of the Holy Ghost (see Tertullian, *De Anima*, c. 51, cited in Müller, *Lex. des Kirchenrechts*, s.v. "Begräbniss")

solve it into carbonic acid, water, and ammonia, rapidly, safely, and not unpleasantly." Relying on the evidence which suggested recent burial legislation (see *Report to the General Board of Health on a General Scheme for Extra-mural Sepulture*, Clowes and Son, 1850, signed by Lord Shaftesbury, Chadwick, and Southwood Smith; also Walker *On Graveyards*, Longmans, 1839), he pointed out that in the neighbourhood of cemeteries there is a constantly increasing risk of contaminated air and water. The problem he solved by the Siemens process of cremation, which, when generally employed, would effect a great saving in the cost of funerals, and would also leave a quantity of bone earth equal in value to the bones imported into this country chiefly for manure. The British authorities in India have already had much practical experience of cremation. Poor Hindus often did not supply wood and oil (ghee) enough for the total consumption of the body, and hence Sir Cecil Beadon at Calcutta, and the sanitary commissioner of Madras, both found it necessary in the public interest to erect cinerators on the burning ghat or ground (Latin, *ustrina*), which might be used on payment of a fee. So also at Poonah, Colonel Martin, struck with the high cost (above 12 rupees) of even a poor funeral, constructed in 1864 a pentagonal cinerator for the use of Brahmans and the other Hindu castes. The idea is spreading rapidly in New York.

Among the practical methods of cremation which have recently been attempted, we may mention, in the first place, the experiments of Dr Polli at the Milan gas works, which have been fully described in Dr Pietra Santa's book, *La crémation des morts en France et à l'étranger*, and those of Professor Brunetti, who exhibited an apparatus at the Vienna Exhibition of 1873, and who states his results in *La Cremazione dei Cadaveri*, Padua, 1873. Polli obtained complete incineration or calcination of dogs by the use of coal-gas mixed with atmospheric air, applied to a cylindrical retort of refracting clay, so as to consume the gaseous products of combustion. The process was complete in two hours, and the ashes weighed about 5 p.c. of the weight before cremation. Brunetti used an oblong furnace of refracting brick with side-doors to regulate the draught, and above a cast-iron dome with movable shutters. The body was placed on a metallic plate suspended on iron wire. The gas generated escapes by the shutters, and in two hours carbonization is complete. The heat is then raised and concentrated, and at the end of four hours the operation is over; 180 lb. of wood costing 2s. 4d. sterling was burned. In the reverberating furnace used by Sir Henry Thompson a body, weighing 144 lb., was reduced in fifty minutes to about 4 lb of lime-dust. The noxious gases, which were undoubtedly produced during the first five minutes of combustion, passed through a flue into a second furnace and were entirely consumed. In the ordinary Siemens regenerative furnace (which has been adapted by Reclam in Germany for cremation, and also by Sir Henry Thompson) only the hot-blast is used, the body supplying hydrogen and carbon; or a stream of heated hydrocarbon mixed with heated air is sent from a gasometer supplied with coal, charcoal, peat, or wood,—the brick or iron-cased chamber being thus heated to a high degree before cremation begins. In one arrangement both gas and air are at a white heat before they meet and burst into flame in the furnace. The advantages of the Siemens furnace and gas producer (which would cost about £800 in construction) are that the heat of the expended fuel is nearly all retained by the regenerators, and that the gas retort admits of the production being stopped without much loss. Some difficulty has been felt about keeping the ashes free from foreign material. The Greeks used a shroud of asbestos, the Egyptians one of amianth. Mr Eassie suggests a zinc coffin,—that metal being volatile. It is also suggested that the ashes might be deposited in urns, and these placed in a columbarium which might be in the church or at home.

See Eassie, *Cremation of the Dead*, London, 1875,—a valuable book in which nearly every source of information on the subject is indicated. (W. C. S.)

CREMONA, a province of Lombardy, Italy, lying between the Rivers Oglio and Adda, north of the Po, which separates it from Parma and Piacenza. It is conterminous along the Oglio on the north-east with Mantua and Brescia, and with Bergamo on the north; the Adda separates it from Milan on the west. It is about fifty miles in extreme length from north-west to south-east, and fifteen miles in width, containing 632 square miles, and (in 1871) 300,595 inhabitants. The surface is level, and the soil very fertile, producing abundant crops of wheat, rice, maize, and flax. Horses and black cattle are numerous, and silk is an extensive production, but the sheep are few. There are no important manufactures carried on except the spinning of silk.

CREMONA, the capital of the above province and the seat of a bishop, is situated on the north bank of the Po, crossed there by a bridge, 46 miles south-east of Milan; lines of railway unite it north and westward with Brescia, Bergamo, Pavia, and Milan, and eastward with Mantua. It is well built, of an oval shape, about six miles in circumference, and surrounded by walls flanked with towers and wet ditches. It possesses many good buildings, principally churches, richly adorned with frescoes and paintings by native artists. The cathedral is an ancient structure, begun in 1107 and completed in 1606, thus including very various styles of architecture. The interior is composed of a nave, with two aisles, divided by eight immense pillars, and is gorgeously coloured and gilded. Near the cathedral is the great tower, the *Torazzo*, erected 1261–1284, the highest in northern Italy, being 396 feet in height. In the third story is an enormous astronomical or astrological clock. The *Palazzo Pubblico*, also a relic of old Cremona, begun in 1206, contains a few paintings by old masters. Cremona has also civil, criminal, and commercial tribunals, a lyceum, a gymnasium, a theatre, a public library, hospitals, asylums, and other charitable institutions, and numerous schools. Its manufactures include silks, cottons, porcelain, earthenware, and chemical products. It has a considerable trade by the Po, which is navigable thence to the Adriatic, in agricultural produce, oil, wax, honey, and silk; and the surrounding district is noted for its superior flax. It was formerly celebrated for its violins and other musical instruments, but the manufacture of these has now declined. Violins of Cremona have been known to sell at from 100 to 200 guineas each. Population, with suburbs (1871), 30,508. The site of Cremona was taken by the Romans from the Gallic Cenomani, and colonized by them at various periods. The town suffered in the invasions of the Goths and Lombards, and subsequently in the conflicts of the Guelphs and Ghibellines. In 1799 the Austrians defeated the French at Cremona.

CREOLE (Spanish, *Criollo*), is a term which primarily was used to denote an inhabitant of the Spanish colonies who was descended from the European settlers, as distinguished from the aborigines, the negroes, and mulattoes. It is now more loosely employed, the name being frequently applied to a native of the West Indies, whose descent is partly but not entirely European. A part of the coloured population of Cuba are at times designated creole negroes, in contradistinction to those who were brought direct from Africa. The creole whites, owing to the enervating influence of the climate, are not a robust race, but exhibit an elegance of gait and a suppleness of joint that are rare among Europeans.

CREON, in Greek fable, son of Lycæthus, king of Corinth and father of Glauce, who was beloved by Jason, and whose tragical fate he shared. See JASON and MEDEA.

CREON, in Greek fable, son of Menœceus, became king of Thebes at the death of Laius, the husband of his daughter Jocasta. Thebes was then trembling before the cruelty of the Sphynx, and Creon offered his crown and his daughter to whoever should solve the fatal enigma proposed by the monster. Œdipus, the son of Laius, ignorant of his parentage (see ŒDIPUS), having accomplished the task, received the reward, and married Jocasta, his mother. By her he had two sons, Eteocles and Polynices, who mutually agreed after their father's death to reign in alternate years. Eteocles first ascended the throne, being the elder, but at the appointed time he refused to resign, and his brother attacked him at the head of an army of Argives. The war was to be decided by a single combat between the brothers, but both fell. Creon, now resuming the government during the nonage of Leodamus, the son of Eteocles, commanded that the Argives, and above all Polynices, the cause of all the bloodshed, should not receive the rites of sepulture, and that any one who infringed this decree should be buried alive. Antigone, the sister of Polynices, refused to obey, and sprinkled dust upon her brother's corpse. The threatened penalty was inflicted; but Creon's crime did not escape unpunished. His son, Hæmon, the lover of Antigone, killed himself on her grave; and Thebes was attacked by Theseus, by whose hand Creon fell. See ANTIGONE.

CREOSOTE. See CREASOTE.

CRESCIMBENI, GIOVANNI MARIO (1663–1728), critic and poet, was born at Macerata in 1663. Having been educated by a French priest at Rome, he entered the Jesuits' College of his native town, where he produced a tragedy on the story of Darius, and versified the *Pharsalia.* In 1679 he received the degree of doctor of laws, and in 1680 he removed again to Rome. The study of Filicaja and Leonio having convinced him that he and all his contemporaries were working in a wrong direction, he resolved to attempt a general reform. In 1690, in conjunction with fourteen others, he founded the celebrated academy of the Arcadians, and began the contest against false taste and its adherents. The academy was most successful; branch societies were opened in all the principal cities of Italy; and the influence of Marini, opposed by the simplicity and elegance of such models as Costanzo, soon died away. Crescimbeni officiated as secretary to the Arcadians for thirty-eight years. In 1705 he was made canon of Santa Maria; in 1715 he obtained the chief curacy attached to the same church; and about two months before he died (1728) he was admitted a member of the Order of Jesus.

His principal work is the *Istoria della volgar Poesia*, Rome, 1698, an estimate of all the poets of Italy, past and contemporary, which may yet be consulted with advantage. The most important of his numerous other publications are the *Commentarij*, 5 vols., Rome, 1702–1711, and *La Bellezza della volgar Poesia*, Rome, 1700.

CRESPI, DANIELE (1590–1630), an Italian historical painter, born at Milan, studied under Giovanni Battista Crespi and Procaccini. He was an excellent colourist; his drawing was correct and vigorous, and he grouped his compositions with much ability. His best work, a series of pictures from the life of Saint Bruno, is in the monastery of the Carthusians at Milan. Among the most famous of his paintings is a Stoning of St Stephen at Brera, and there are several excellent examples of his work in the city of his birth and at Pavia.

CRESPI, GIOVANNI BATTISTA (1557–1663), an Italian painter, sculptor, and architect, was born at Cerano. He was a scholar of considerable attainments, and held a position of dignity in his native city. He was head of the Milanese Academy founded by Cardinal Frederick Borromeo, and he was the teacher of Guercino. He is most famous as a painter; and, though his figures are neither natural nor graceful, his colouring is good, and his designs full of ideal beauty.

CRESPI, GIUSEPPE MARIA (1665–1747), an Italian painter, called "Il Spagnuolo" from his fondness for rich apparel, was born at Bologna, and was trained under Angelo Toni, Domenico Canuti, and Carlo Cignani. He then went through a course of copying from Correggio and Baroccio; this he followed up with a journey to Venice for the sake of Titian and Paul Veronese; and late in life he proclaimed himself a follower of Guercino and Pietro da Cortona. He was a good colourist and a facile executant, and was wont to employ the camera obscura with great success in the treatment of light and shadow; but he was careless and unconscientious. He was a clever portrait painter and a brilliant caricaturist; and his etchings after Rembrandt and Salvator are in some demand. His greatest work, a Massacre of the Innocents, is at Bologna; but the Dresden Gallery possesses twelve examples of him, among which is his celebrated series of the Seven Sacraments.

CRESSWELL, SIR CRESSWELL (1793–1863), the first judge of the English Divorce Court, was a descendant of an old Northumberland family, and was born in 1793. He was educated at the Charter House and at Emmanuel College, Cambridge, the latter of which he entered in 1810. He graduated B.A. in 1814, and M.A. four years later. Having chosen the profession of the law he studied at the Middle Temple, and was called to the bar in 1819. He joined the northern circuit, and was not long in earning a distinguished position among his professional brethren. In 1837 he entered Parliament as Conservative member for Liverpool, and he soon gained a reputation as an acute and learned debater on all constitutional questions. In January 1842 he took his seat on the bench of the Common Pleas, being knighted at the same time; and this post he occupied for sixteen years. When the new court for probate, divorces, and matrimonial causes was established (1858), Sir Cresswell Cresswell was requested by the Liberal Government to become its first judge and undertake the arduous task of its organization. Although he had already earned a right to retire, and possessed large private wealth, he accepted this new task, and during the rest of his life devoted himself to it most assiduously and conscientiously, with complete satisfaction to the public. In one case only, out of the very large number on which he pronounced judgment, was his decision reversed. His death was sudden. By a fall from his horse, July 17, 1863, his knee cap was injured. He was recovering from this when on the 29th of the same month he died of disease of the heart.

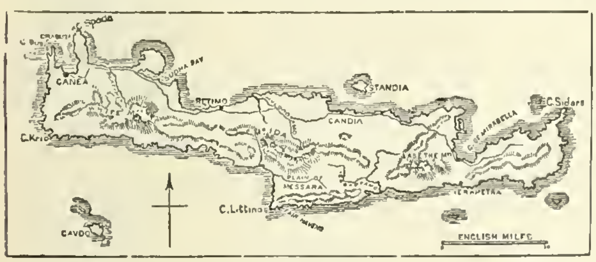
CRESSY. See CRÉCY.

CREST. See HERALDRY.

CREST, a town of France, in the department of Drôme and arrondissement of Die, situated on the right bank of the River Drôme, there crossed by a fine stone bridge. It carries on the manufacture of woollens, cotton, and beetroot sugar. On the curious rock which commands the town there are some remains of the ancient castle to which it was indebted for its importance in the Middle Ages. It ranked for a time as the capital of the duchy of Valentinois, and in that capacity belonged before the Revolution to the prince of Monaco. The communal charter, dating from the 12th century, is preserved in the public archives. Population in 1872, 5568.

CRESWICK, THOMAS, an English landscape painter (1811–1869), was born at Sheffield, and educated at Hazelwood, near Birmingham. At Birmingham he first began to paint. His earliest appearance as an exhibitor was in 1827, at the Society of British Artists in London; in the ensuing year he sent to the Royal Academy the two pictures named Llyn Gwynant, Morning, and Carnarvon Castle. About the same time he settled in London; and in 1836 he took a house in Bayswater. He soon attracted some attention as a landscape-painter, and had a career of uniform and encouraging, though not signal success. In 1842 he was elected an associate, and in 1850 a full member of the Royal Academy, which, for several years before his death, numbered hardly any other full members representating this branch of art. In his early practice he set an example, then too much needed, of diligent study of nature out of doors, painting on the spot all the substantial part of several of his pictures. English and Welsh streams may be said to have formed his favourite subjects, and generally British rural scenery, mostly under its cheerful, calm, and pleasurable aspects, in open daylight. This he rendered with elegant and equable skill, colour rather grey in tint, especially in his later years, and more than average technical accomplishment; his works have little to excite, but would, in most conditions of public taste, retain their power to attract. Creswick was industrious and extremely prolific; he produced, besides a steady outpouring of paintings, numerous illustrations for books. He was personally genial,—a dark, bulky man, somewhat heavy and graceless in aspect in his later years. He died at his house in Bayswater, Linden Grove, December 28, 1869, after a few years of declining health. Among his principal works may be named England, 1847; Home by the Sands, and a Squally Day, 1848; Passing Showers, 1849; the Wind on Shore, a First Glimpse of the Sea, and Old Trees, 1850; a Mountain Lake, Moonrise, 1852; Changeable Weather, 1865; also the London Road, a Hundred Years ago; the Weald of Kent; the Valley Mill (a Cornish subject); a Shady Glen; the Windings of a River; the Shade of the Beech Trees; the Course of the Greta; the Wharfe; Glendalough, and other Irish subjects, 1836 to 1840; the Forest Farm. Mr Frith for figures, and Mr Ansdell for animals, occasionally worked in collaboration with Creswick.

CRETE, or CANDIA, one of the largest islands in the Mediterranean, situated between 34° 50′ and 35° 40′ N. lat., and between 23° 30′ and 26° 20′ E. long. It is thus the most southerly portion of Europe. By its position south of the Ægean Sea or Archipelago, extending to the north-west to within 60 miles of Cape Malea in the Peloponnesus, while its north-east angle is distant only about 110 miles from Cape Krio in Asia Minor (a great



Island of Crete.

part of which interval is filled up by the large islands of Carpathus and Rhodes), it forms the natural limit between the Archipelago and the Mediterranean, as well as one of the chief lines of natural connection between the southern shores of Europe and Asia. The island is of a very elongated form, being not less than 160 miles in length, while its breadth does not anywhere exceed thirty-five miles, and is in some places narrowed to only ten or twelve miles.

Mountains.—By far the greater part of the surface of the island is occupied by ranges of mountains, some of which attain to a very considerable height. Nearly in the centre of the island rises the lofty group, or rather mass, of Mount Ida, now called Psiloriti (a corruption of ὑψηλορειτίον, "the high mountain"), which is not less than 8060 feet in height, forming a nearly isolated mass, separated by tracts of comparatively low elevation from the mountain ranges to the east and west of it. In the western portion of the island is found the range of the White Mountains (called by the natives Madara Vouna), the central group of which is nearly if not quite as elevated as Mount Ida, rising to a height of at least 8000 feet, and of considerably greater extent, sending down spurs to the west and north-west, which fill up almost the whole of that portion of the island, while the main mass abuts directly upon the south coast for a space of twenty-five to thirty miles, and is then continued by a ridge of inferior elevation, but still ranging from 5000 to 6000 feet in height, till it sinks into the plain of the Messara nearly due south of Mount Ida, from which it is separated only by the valley of Sulia. The eastern half of the island is less mountainous, and none of the summits attain so great an elevation; but the central group of the Lasethe Mountains rises to the height of 7100 feet, and its summits, like those of Mount Ida and the White Mountains, are covered with snow throughout the greater part of the year. The range of Mount Kophino, which separates the plain of the Messara from the south coast, rises abruptly from the sea to a height of 3750 feet, while the subordinate ranges, that fill up the extreme eastern portion of the island, nowhere attain to the elevation of 4000 feet. The isolated peak of Mount Luktas, nearly due south of the city of Candia, though not exceeding 2700 feet in height, has attained great celebrity from its being reputed in ancient times to contain the burial-place of Zeus, which continued to be regarded with veneration by the Cretans till after the time of Constantine.

The intervals between these mountain groups are filled up for the most part by undulating tracts, consisting of hills of Tertiary formation and comparatively low elevation, but still rising occasionally to a height of from 2000 to 3000 feet. Such a tract is that which extends across the island from the neighbourhood of Candia to the plain of Messara in the south; and a similar one, though of less extent, between Hierapytna on the south and the Gulf of Mirabella on the north, forms a kind of isthmus not more than seven miles across by which the easternmost portion of Crete is united with the rest of the island. Very few plains of any considerable extent occur. Much the largest of these is that called the plain of Messara, in the south of the island, which extends inland from the sea at the foot of Mount Ida, between the slopes of that mountain and the range of Mount Kophino, which, as already stated, separates it from the sea. It is about thirty-five miles in length, with a breadth of from six to ten miles. The plain which adjoins the city of Canea is of great fertility but of small extent, not exceeding seven or eight miles in width.

One leading characteristic of the mountain regions of Crete is the occurrence of depressed valleys or basins at a considerable height above the sea, forming crater-like hollows without any outlet for their waters, and containing plains of considerable extent, which afford admirable pasturage in spring and early summer. The most remarkable of these upland basins (which appear to answer precisely to the Yaïlahs of the Lycian Taurus) are that called Nida, on the flanks of Mount Ida, at an elevation of between 5000 and 6000 feet; the more extensive one called Omalo, in the White Mountains, at a height of about 4000 feet; and one in the Lasethe Mountains about 3000 feet above the sea, which is the most extensive of the three, and incloses a beautiful plain, containing no less than fifteen villages, with a population of between 3000 and 4000 souls.

Rivers.—From its peculiar conformation it naturally results that Crete contains no rivers of any importance. The most considerable stream is that called the Ieropotamo (the ancient Electra), which flows through the plain of the Messara and falls into the sea on the south coast. The Mylopotamo (the ancient Oaxes), which traverses the fertile district north of Mount Ida, is the most important of those on the north coast; while the Platania, a small stream which falls into the sea a few miles west of Canea, deserves notice chiefly as being mentioned by Homer under the name of Iardanus.

Coast-line.—The coasts of Crete, in consequence of its mountainous character, present a very broken and varied outline. In the west especially they form a number of rugged and lofty promontories, of which the north-west extremity is the headland now called Cape Busa, the ancient Corycus, and the south-west angle is formed by Cape Krio, the Kriu Metopon of ancient geographers. East of Cape Busa the lofty mountain headland of Cape Spada projects more than twelve miles from the general coast-line; and again, beyond Canea, the mountainous peninsula called Akrotiri bounds the Bay of Sudha, which constitutes a naturally sheltered harbour of sufficient size to afford protection to all the fleets of Europe. The north coast is again deeply indented, in the eastern portion of the island, by the Gulf of Mirabella, beyond which the coast runs out far to the north-east, ending in the narrow and rocky promontory of Cape Sidaro, the Sammonium of the ancients. The south coast is less broken and irregular, and contains few good harbours,—the mountains in many parts rising almost like a wall directly from the sea. There is, however, one small but well-sheltered bay, about five miles east of Cape Littinos, still called Kaloi Limenes, or "the Fair Havens," under which name it is mentioned in the voyage of St Paul.

Islands.—The islands which are found around the coasts of Crete are for the most part mere rocks, unworthy of notice. The largest is that of Gavdo, the ancient Clauda, which is also mentioned in the Acts of the Apostles, and (probably on that account) became in the Middle Ages the see of a bishop, though it is only about five miles long by three in breadth, and contains at the present day only about seventy families. The small island of Dia, now called Standia, which lies about eight miles north of the city of Candia, has a good port, and in consequence bore an important part during the memorable siege of that city. The isolated rock of Grabusa, off the north-west angle of the island, has obtained celebrity from its having been converted by the Venetians into a fortress, long reputed impregnable, which did not fall into the hands of the Turks until long after the capture of Candia. For the same reason it became a stronghold of the Greeks during the war of independence, and at that period afforded shelter to a considerable population.

Vegetation.—Though so large a part of Crete is occupied by mountains, the rest of the island is of great fertility, and there can be no doubt that, under a better system of government, it would become one of the richest and most productive islands in the Mediterranean. The forests which once covered the mountains have indeed for the most part disappeared, but the cypress still grows wild in the higher regions, while the lower hills are covered with olive woods. Oranges and lemons also abound, and are of excellent quality, so as to furnish almost the whole supply of continental Greece and Constantinople. Chestnut woods, as in Greece itself, are local and exceptional; the same is the case with the valonia oak; while in some districts the carob tree is so abundant as to form an important article of consumption. Pears, apples, quinces, mulberries, and other fruit-trees flourish in abundance, as well as vines, though the Cretan wines no longer enjoy the reputation which they possessed in the time of the Venetians. Tobacco and cotton succeed well in the plains and low grounds, though not at present cultivated to any great extent.

Animals.—Of the wild animals of Crete, the only one that deserves special notice is the wild goat, which is still found in considerable numbers on the higher summits of Mount Ida and the White Mountains. It is the same species (*Capra ægagrus*) which is found in the Caucasus and Mount Taurus, and is distinct from the ibex or bouquetin of the Alps. Crete enjoys the same immunity which is possessed by several other large islands from the presence of serpents of all kinds,—a privilege ascribed by popular belief to the intercession of Titus, the companion of St Paul, who according to tradition was the first bishop of the island, and became in consequence its patron saint, previous to its conquest by the Venetians. Wolves also are not found in the island, though so common in Greece and Asia Minor.

History.—The earliest history of Crete, like that of most parts of continental Greece, is to so great an extent mixed up with mythology and fable as to render it impossible to arrive at any clear conclusions concerning it. The Cretans themselves claimed for their island to be the birthplace of Zeus, as well as the parent of all the other divinities usually worshipped in Greece as the Olympian deities. But passing from this region of pure mythology to the semi-mythic or heroic age, we find almost all the early legends and traditions of the island grouped around the name of Minos, one of those personages of the earliest Greek history of whom it is impossible to say whether any element of truth underlies the mass of mythical and poetical fable by which it has been surrounded. According to the received tradition, Minos was a king of Cnossus in Crete, who was a son of Zeus, and enjoyed through life the privilege of habitual intercourse with his divine father. It was from this source that he derived the wisdom which enabled him to give to the Cretans the excellent system of laws and governments that earned for him the reputation of being the greatest legislator of antiquity. At the same time he was reported to have been the first monarch who established a naval power, and acquired what was termed by the Greeks the *Thalassokraty*, or dominion of the sea.

Whatever truth there may have been in this last tradition (which was received as an undoubted fact both by Thucydides and by Aristotle), it is certain that when we first hear of the Cretans, in the Homeric poems, they appear as a seafaring race, and apparently the only Greek people who at that early period attempted to compete with the Phœnicians as bold and adventurous navigators. The position of their island was moreover such as to give them great natural facilities for the command of the Ægean and the surrounding islands, as well as for communication with Phœnicia and Egypt.

Even at the earliest period when we have any information concerning it, the population of Crete was of a very mixed character, and we are told in the *Odyssey* (xix. 175) that besides the Eteocretes, who, as their name imports, must have been the original inhabitants, the island contained Achæans, Pelasgians, Dorians, and Cydonians. Subsequently the Dorian element became greatly strengthened by fresh immigrations from the Peloponnesus, and during the historical period all the principal cities of the island were either Dorian colonies, or had adopted the Dorian dialect and institutions. It is certain that at a very early period the Cretan cities were celebrated for their laws and system of government, the origin of which was of course attributed to Minos, but which had much in common with those of the other Dorian states, as well as with those of Lycurgus at Sparta, which were, indeed, according to one tradition, copied in great measure from those already existing in Crete.[1]

It is certain that whatever merits the Cretan laws may have possessed for the internal regulation of the dif-

[1] Among the features common to the two were the *syssitia*, or public tables, at which all the citizens dined in common. Indeed, the Cretan system, like that of Sparta, appears to have aimed at training up the young, and controlling them, as well as the citizens of more mature age, in all their habits and relations of life. The supreme governing authority was vested in magistrates called Cosmi, answering in some measure to the Spartan Ephori, but there was nothing corresponding to the two kings at Sparta. These Cretan institutions were much extolled by some writers of antiquity, but receive only qualified praise from the judicious criticisms of Aristotle (*Polit.* ii. 10).

ferent cities, they had the one glaring defect, that they made no provision for any federal bond or union among them, or for the government of the island as a whole. It was owing to the want of this that the Cretans scarcely figure in Greek history as a people, though the island, as observed by Aristotle, would seem from its natural position calculated to exercise a preponderating influence over Greek affairs. Thus they took no part either in the Persian or the Peloponnesian war, or in any of the subsequent civil contests in which so many of the cities and islands of Greece were engaged. At the same they were so far from enjoying tranquillity on this account that the few notices we find of them in history always represent them as engaged in local wars among one another; and Polybius tells us that the history of Crete was one continued series of civil wars, which were carried on with a bitterness of animosity exceeding all that was known in the rest of Greece.

In these domestic contests the three cities that generally took the lead, and claimed to exercise a kind of *hegemony* or supremacy over the whole island, were Cnossus, Gortyna, and Cydonia. But besides these three, there were many other independent cities, which, though they generally followed the lead of one or other of these more powerful rivals, enjoyed complete autonomy, and were able to shift at will from the alliance of one to the other. Among the most important of these were—Lyttus or Lyctus, in the interior, south-east of Cnossus; Rhaucus, between Cnossus and Gortyna; Phœstus, in the plain of Messara, between Gortyna and the sea; Polyrrhenia, near the north-west angle of the island; Aptera, a few miles inland from the Bay of Sudha; Eleutherna and Axus, on the northern slopes of Mount Ida; and Lappa, between the White Mountains and the sea. Phalasarna on the west coast, and Chersonesus on the north, seem to have been dependencies, and served as the ports of Polyrrhenia and Lyttus. Elyrus stood at the foot of the White Mountains, just above the south coast. In the eastern portion of the island were Prœsus in the interior, and Itanus on the coast, facing the east, while Hierapytna on the south coast was the only place of importance on the side facing Africa, and on this account rose under the Romans to be one of the principal cities of the island.[1]

Though it was continually torn by civil dissensions, the island maintained its independence of the various Macedonian monarchs by whom it was surrounded; but having incurred the enmity of Rome, first by an alliance with the great Mithridates, and afterwards by taking active part with their neighbours, the pirates of Cilicia, the Cretans were at length attacked by the Roman arms, and, after a resistance protracted for more than three years, were finally subdued by Q. Metellus, who earned by this success the surname of Creticus (67 B.C.). The island was now reduced to a Roman province; but by a very singular arrangement was united for administrative purposes with the district of Cyrenaica or the Pentapolis, on the opposite coast of Africa, a disposition which continued unchanged till the time of Constantine. Thenceforth Crete constituted a separate province under a governor of consular rank, and continued to form part of the Byzantine empire till the 9th century, when it fell into the hands of the Saracens (823). It then became a formidable nest of pirates, but defied all the efforts of the Byzantine sovereigns to recover it till the year 960, when it was reconquered by Nicephorus Phocas. In the partition of the Greek empire after the capture of Constantinople by the Latins in 1204, Crete fell to the lot of Boniface, marquis of Montferrat, but was sold by him to the Venetians, and thus passed under the dominion of that great republic, to which it continued subject for more than four centuries.

Under the Venetian Government Candia, a fortress originally built by the Saracens, and called by them "Khandax," became the seat of government, and not only rose to be the capital and chief city of the island, but actually gave name to it, so that it was called in the official language of Venice "the island of Candia," a designation which from thence passed into modern maps, where it retained its position down to our own days. The ancient name of Krete or Kriti was, however, always retained in use among the Greeks, and is gradually resuming its place in the usage of literary Europe. The government of Crete by the Venetian aristocracy was, like that of their other dependencies, very arbitrary and oppressive, and numerous insurrections were the consequence. But with all its defects their administration did much to promote the material prosperity of the country, and to encourage commerce and industry; and it is probable that the island enjoyed during this period a more prosperous condition than it has done at any subsequent time. Their Venetian masters at least secured to the islanders external tranquillity, and it is singular that the Turks were content to leave them in undisturbed possession of this opulent and important island for nearly two centuries after the fall of Constantinople. It was not till 1645 that the Turks made any serious attempt to effect its conquest; but in that year they landed with an army of 50,000 men, and speedily reduced the important city of Canea. Retimo fell the following year, and in 1648 they laid siege to the capital city of Candia. This was the longest siege on record, having been protracted for more than twenty years; but in 1667 it was pressed with renewed vigour by the Turks under the grand vizier Achmet Kiuprili, and the city was at length compelled to surrender (September 1669). Its fall was followed by the submission of the whole island. (See Daru, *Histoire de Venise*, chap. xxxiii.)

From this time the island continued subject to the Ottoman rule without interruption till the outbreak of the Greek revolution. After the conquest a large part of the inhabitants embraced Mahometanism, and thus secured to themselves the chief share in the administration of the island. But far from this having a favourable effect upon the condition of the population, the result was just the contrary, and according to the testimony of an intelligent traveller, Crete was the worst governed province of the Turkish empire. The regular authorities sent from Constantinople were wholly unable to control the excesses of the janissaries, who exercised without restraint every kind of violence and oppression. Hence, when in 1821 the revolution broke out in continental Greece, the Cretans, headed by the Sfakiot mountaineers, at once raised the standard of insurrection, and carried on hostilities with such success that they soon made themselves masters of the whole of the open country, and drove the Turks and Mahometan population to take refuge in the fortified cities. These, however, defied all the efforts of the insurgents; and the contest was prolonged without any decisive result, until in 1830 the allied powers (France, England, and Russia) who had intervened in the contest between

[1] But besides these there were many small towns, which still enjoyed or claimed the privileges of autonomy. In the earliest times, indeed, Crete was said to have contained a hundred cities, and though this was doubtless a mere poetical exaggeration, the existing remains show that the whole island was studded with numerous fortified strongholds, each of which may at times have asserted its independence. Such petty fortresses were well suited to a people of the predatory habits which distinguished the Cretans in all ages, notwithstanding the boasted excellence of their government. Throughout the flourishing period of Greece, indeed, the Cretans were principally known as furnishing mercenary troops, who were distinguished for their skill in the use of the bow, so that a force of Cretan archers became almost a necessary addition to every Greek army.

Greece and Turkey, transferred the island of Crete to the government of Mehemet Ali, viceroy of Egypt. This change of masters brought some relief to the unfortunate Cretans, who at least exchanged the licence of local misrule for the oppression of an organized despotism; and the government of Mustafa Pasha, the ruler of the island for a considerable period, was more enlightened and intelligent than that of most Turkish governors.

In 1840 Crete was again taken from Mehemet Ali, and replaced under the dominion of the Turks, as it has continued ever since. Great improvement has undoubtedly taken place in the administration, and the island is said to be now the best governed and the most lightly taxed of all the provinces of the Turkish empire. But the strong desire of the Cretans for freedom and union with the Greek monarchy has given rise to two successive revolts; the first of which in 1859 was speedily repressed; but the second, in 1866, lasted for a considerable period, and required great exertions on the part of the Porte to put it down. It was followed by the concession of additional privileges to the Christian inhabitants, and a kind of constitutional government, which has placed the island in quite an exceptional position among Turkish provinces.

In all these insurrections, as well as in those against the Venetians in former days, a leading part has been borne by the people known as Sfakiots, a race of hardy mountaineers inhabiting the highlands and upland plains of the White Mountains, and who, from the rugged and inaccessible nature of their country, have always enjoyed a condition of semi-independence, while their active and warlike habits have rendered them formidable neighbours to the inhabitants of the plains. There is, however, no ground for supposing them to be in any respect a distinct race from the other population of the island; they appear to be, on the contrary, the lineal representatives of the ancient Cretans, who have preserved comparatively unimpaired the character and manners of their forefathers. A curious proof of this is found in their still wearing high boots, a fashion noticed by ancient writers as characteristic of the Cretans, and which was then, as now, wholly unknown to the Greeks of the mainland. It is mentioned also by Venetian writers, that as late as the 17th century the Sfakiots retained that skill in the use of the bow for which the Cretans were so celebrated in antiquity, and were with difficulty induced to lay it aside for the more civilized firearms of their rulers.

Population.—The inhabitants of Crete under the Venetians were estimated at about 250,000 souls. After the Turkish conquest the population was for a time greatly reduced, but afterwards gradually rose, till it was supposed again to have attained to about 260,000 at the time of the outbreak of the Greek revolution in 1821, of whom about half were Mahometans. The ravages of the war from 1821 to 1830, and the emigration that followed, produced a great diminution, and the population of the island was estimated by Mr Pashley in 1836 at only about 130,000. Since then it has again materially increased; it was calculated by Captain Spratt in 1865 as amounting to 210,000, and this nearly agrees with the latest official estimate which gives 200,000 inhabitants in all, of whom less than 40,000 are Mahometans. It must be observed that very few of these are Turks,—the Mussulman population being almost entirely of native Cretan origin. Hence the Greek language is the only one spoken throughout the island, even in the towns and among the Mahometans.

Towns.—The only considerable towns in Crete are Candia, so long the capital of the island; Canea, which has succeeded to that dignity since the renewal of the Turkish dominion in 1840; and Retimo, or Rhithymno, also on the north coast, a small fortified town, with a good port and about 10,000 inhabitants. Ierapetra, on the south coast, on the site of the ancient Hierapytna, though reckoned the fourth city of the island and the capital of the eastern district, is a very poor place, with not more than about 2000 inhabitants.

Crete has of late years been carefully examined and explored. The older descriptions of the island by Tournefort, Pococke, Olivier, and other travellers may now be considered as obsolete, and superseded by the more recent works of Pashley (*Travels in Crete*, 2 vols. 8vo, London, 1837), and Captain Spratt (*Travels and Researches in Crete*, 2 vols. 8vo. London, 1865), which between them contain a full description of the whole island. At the same time its geography has been placed on a satisfactory basis by the admirable survey executed, under the orders of the British admiralty, by Captain Graves and Captain (now Admiral) Spratt. A curious and interesting addition to its archæology has been also made by the publication of a description of the island, drawn up under the Venetians (about 1538), and preserved in manuscript in the Library of St Mark, whence it has been published by Mr Falkener in the *Museum of Classical Antiquities*, vol. ii. pp. 263-303. From this treatise we learn how many architectural remains of the ancient cities were still visible in the 16th century, which have long since disappeared. All that can be gathered from ancient authors concerning the mythology and early history of the island is brought together by Meursius (*Creta*, &c., in the 3d vol. of his works) and Hoeck (*Kreta*, 3 vols. 8vo, Göttingen, 1823-29), but the latter work was published before the recent researches which have thrown so much light on the topography and antiquities of the island. (E. H. B.)

CRETINISM may be defined as an endemic idiocy, of which the characteristic is an arrested development of body as well as mind. The origin of the word is doubtful. Its southern French form *Chrestiaa* suggested to Michel a derivation from *cresta* (*crête*), the goose foot of red cloth worn by the Cagots of the Pyrenees. The Cagots, however, were not cretins. Again *Christianus* (which appears in the Lombard *cristanei*, and the Savoyard *innocents* and *gens du bon dieu*) is merely a translation of the older *cretin*, which is probably connected with *creta* (*craie*)—a sallow or yellow-earthy complexion being a common mark of cretinism. Many other symptoms show that the whole organism is stunted. We quote the vivid picture by Beaupré (*Dissertation sur les Crétins*, translated in Blackie on *Cretinism*, Edin. 1855):—

"I see a head of unusual form and size, a squat and bloated figure, a stupid look, bleared hollow and heavy eyes, thick projecting eyelids, and a flat nose. His face is of a leaden hue, his skin dirty, flabby, covered with tetters, and his thick tongue hangs down over his moist livid lips. His mouth, always open and full of saliva, shows teeth going to decay. His chest is narrow, his back curved, his breath asthmatic, his limbs short, misshapen, without power. The knees are thick and inclined inward, the feet flat. The large head drops listlessly on the breast; the abdomen is like a bag."

Generally the cretin is deaf and dumb, or able to utter only a hoarse cry. He is indifferent to heat, cold, blows, and even the most revolting odours. Some appear to want intelligence altogether, and even the power of articulation. Others acquire the rudiments of language, and are able to perform simple tasks. There are, indeed, several distinct varieties of cretinism which have been noticed by Abercrombie, founding on the descriptions of Fodéré and De Saussure (*De Fatuitate Alpina*, Edin. 1803), Wenzel (*Ueber d. Cretinismus*, Vienna, 1802), and Guggenbühl of the Abendberg at Interlaken. The abnormal cranial development has been studied by Virchow (*Der Cretinismus in Unterfranken*, Würzburg, 1852) and Vogt (*Mémoires sur les Microcéphales*, Geneva, 1867). Many cretins are hydrocephalic; but more frequently the skull is microcephalic, with premature ossification of the sutures and induration of portions of the brain matter. The anterior lobes are said to be much lighter than in healthy brains, but this difference does not extend to the cerebellum. Vogt maintains that the *microcéphale* has a pithecoid skull at the crown, and a human skull at the base and crown. But his suggestion that this is a case of atavism, and that cretins represent a stage through which the human race passed in its evolution from the ape is generally repudiated. (See the *Races of Man* by Oscar Peschel, London, 1867, p. 66, and a paper by Dr Ireland of Larbert on the Reports of Drs Lombroso and Valenti of Bologna, *Edin. Med. Journal*, xx. p. 109). It is said too that the respiration of cretins reaches only 15 instead of the normal 18 per minute. Many die very young in epileptic convulsions, and survival to old age is extremely rare. But the most striking sign of cretinism is the *goitre*, variously known as bronchocele and struma, kropf (German), wen or derby neck (English), mumps or branks (Scotch). From this must be distinguished the weaver's goitre, caused by the emanations from steeped flax; the exophthalmic goitre, also called Grave's disease, which is marked by palpitations of the heart and prominence of the eyeballs; and the smaller goitre which is sometimes connected with uterine affections. We should also mention the epidemic goitre, such as that which attacked Captain Cook's crew in 1772, when they drank water from a melting iceberg. The endemic goitre is a tumour of the thyroid gland of varying size, sometimes filled with a viscous fluid, sometimes containing pus cysts and calcareous deposits. There is a large body of evidence to the effect that goitre and cretinism are causally related,—that they are at least effects of the same causes; or, as Maffei expresses it, "goitre is the beginning of that degeneration of which cretinism is the end." No doubt, perfectly sane and healthy persons have goitres. For instance Fodéré, an eminent man of science who published an *Essai sur le Goître* at Turin in 1792, himself suffered from this deformity when a boy, and re-caught it when lecturing at Strasburg. But these cases are few, and the statistical inquiries of Roesch in Wurtemberg (*Ueber d. Cretinismus*, Erlangen, 1844), and of Niepce in Dauphiné (*Traité du Goître et du Crétinisme*, Paris, 1852) have established that the great mass of cretins have goitres, and that goitre generally appears at the age when development is arrested, that is, seven or eight years. Of Aosta, the home and centre of cretinism, Malacarne wrote in 1789, *Un mentecàtto senza gozzo e una cosa rarissima.* The two things have been observed together in Africa and both Americas by Park, Richardson, Humboldt, and other distinguished travellers. Again cretinism is found in certain districts; it is in these districts also that the non-cretinous cases of goitre are for the most part found. Healthy parents, coming to an endemic district, produce children with goitres, or cretins; parents with goitres, removing to an untainted neighbourhood, often lose their own goitres, and seldom produce children subject to the deformity. Nor does intermarriage with a healthy stranger avert the danger, if the household remain subject to the endemic conditions. It may be added that in both Europe and the United States deaf mutism, a form of arrested development, is found in local contact with cretinism and goitre. Deaf-mutes are often found in families of which the other members are cretins, and they are found as a class in the neighbourhood of a cretin district. What then are the causes of cretinism, of which we shall take goitre as a symptom? In the first place, the phenomenon is not confined to any one race. The whites, the Indians, the negroes, and the half breeds of Central and South Africa all exhibit the disease in certain localities. So do the Malays and the Dyaks of Borneo, the Mongolians of Nepaul, Siberia, and the Kwang Tung Mountains in China, the Berbers of Mount Atlas. Nor is it confined to one elevation or character of surface. It appears on the sea shore, as at Viborg, and at the mouth of the St Lawrence; on inland plains, like those of Lombardy and Alsace; at the moderate elevations of La Barthe and Luz in the Pyrenees; and on the high Peruvian plateau of Pasco, and in the Himalayan valley of the Jumna. Nor can any thermic conditions be laid down; for the symptoms range from the deserts of Algeria to Irkutsk in Siberia, from an average temperature of 80° Fahr. to one of 14° Fahr. The idea of Fodéré that cretinism is caused by a humid atmosphere does not receive much encouragement from the facts. Peru has a very dry climate, and goitre is the principal endemic; the British Isles with much rain and fog have little or no cretinism; at Cuzco, where it rains, as the inhabitants say, thirteen months in the year, the disease is unknown. Morel, Virchow, and Koeberlé (in his *Essai sur Crétinisme*, Strasburg, 1862) have maintained that cretinism is caused by a special form of marsh-fever, malaria, or even a special organic poison-germ in the atmosphere. The maximum of miasmic fever, however, has a geographical habitat very different from that of cretinism, which frequently occurs in a rare atmosphere, impregnated with ozone. Hygienic regulation, too, successfully resists cretinism, while respiration is sufficient to let in the atmospheric poison. The favourite explanation of De Saussure, that cretinism is caused by the stagnation of air in the deep valleys of the Alps and Pyrenees, overlooks the well-known fact that morning and evening winds regularly ventilate these valleys. Proceeding on this error, the Sardinian commission recommended that trees near dwelling-houses should be cut down (see *Rapport de la Commission Sarde*, Turin, 1848). Milk and vegetable diet, various kinds of farinaceous food, and defective hygiene have also been made responsible for the disease. But it is not only the poor, the ill-fed, and ill-clad who contract goitre and become idiots; persons in comfortable circumstances, living with every regard to cleanliness, in a fertile country under a fine climate, are subject to the ailment. In Piedmont, for instance, it was calculated that less than three-fifths of the cretins belonged to the poor people; of course poverty aggravates every disease. The general result of these abortive theories is that some local telluric conditions must be ascertained. There are fragments of evidence showing the persistence of cretinism in particular localities, the inhabitants of which have changed from time to time. Every one knows Juvenal's line—"Quis tumidum guttur miratur in Alpibus?" and Shakespeare's "mountaineers, dewlapped like bulls, whose throats had hanging at 'em wallets of flesh." Catholic legends tell how in the 5th and 7th centuries Champagne and Liége were condemned for some sacrilege to have women with goitres. The *Life of Charlemagne* states that in 772 his soldiers caught the goitre on the banks of the Rhine. It has always been a popular as well as a scientific belief that water is the vehicle of the poison. "Struma oritur ex metallicis et mineralibus aquis," says Paracelsus. Endemic goitre has been observed to increase when the summer heats altered the chemical character of the water used for drinking and cooking; and it sometimes disappears before modern arrangements for water supply. Goitre has in fact been artificially produced by the use of water, for the purpose of evading the conscription. But the question remains what is the poison thus conveyed? One opinion was that there might be too little iodine. The old practice of eating the ashes of sea-sponge led Coindet of Geneva to apply iodine to goitre with success. It was also maintained that there might be a deficiency of the phosphates of lime and magnesium. These views apparently proceeded on the principle that the human body required a certain normal proportion in the chemical elements which it consumed. The whole subject has been elaborately treated by M. St Lager in *Études sur les causes du crétinisme et du goître endémique*, Paris, 1867. He takes the pathology of cretinism as illustrating the wider question of the dependence of the human organism on the chemical constitution of the soil. He has made an inquiry into the geological features of the districts in which cretinism is endemic, compared with the statistics of the cretin population. He finds that cretinism is confined to metalliferous districts, and occurs most frequently where iron pyrites and copper pyrites predominate.

Although dogs, pigs, and probably also horses, oxen, and sheep have been affected by goitre, there is no reliable evidence of a connection between goitre and feeble or stunted organization in any of the lower animals.

Pronounced cretinism seems to be incurable. Dr Guggenbühl's treatment at the Abendberg was chiefly psychological, and belongs to the general theory of the treatment of idiots. But the Swiss commission, who reported on the Abendberg on 15th May 1849, say that the greater part of the inmates were not cretins at all, but merely scrofulous children. Accordingly on Guggenbühl's death the Bern Government declined any longer to support the establishment. Similar establishments have been founded at Marienberg in Würtemberg by Dr Roesch, at Aosta in Piedmont, Basseno in Savoy, at Abbiategrasso in Lombardy, at Albany, Utica, and other places in the United States. (See, for a list of idiot schools, *Die Heil und Pflege Anstalten für psychisch. Kranke*, by Dr H. Laehr, Berlin, 1875.) An institution at Highgate, London, was founded in imitation of the Abendberg. It may be interesting to note the places in which cretins have been found in the United Kingdom. In England these are Oldham, Sholver Moor, Crompton, Duffield, Cromford (near Matlock), and other points in Derbyshire; endemic goitre has been seen near Nottingham, Chesterfield, Pontefract, Ripon, and the mountainous parts of Staffordshire and Yorkshire, the east of Cumberland, certain parts of Worcester, Warwick, Cheshire, Monmouth, and Leicester, near Horsham in Hampshire, near Haslemere in Surrey, and near Beaconsfield in Buckingham. There are cretins at Chiselborough in Somerset. In Scotland cretins and cases of goitre have been seen in Perthshire, on the east coast of Fife, in Roxburgh, the upper portions of Peebles and Selkirk, near Lanark and Dumfries, in the east of Ayrshire, in the west of Berwick, the east of Wigtown, and in Kirkcudbright.

See Inglis, *Treatise of English Bronchocele*, 1844; *Cretinism in Scotland*, by Coldstream, 1847; Mitchell on the Nithsdale neck or goitre in Scotland, in *Med. and Chir. Review* 1862. See also Virchow, *Pathologie des Tumeurs*, Paris, 1863; Maffei, *Der Cret. in den Norischen Alpen*, Erlangen, 1844; Morel, *Traité des Dégénérescences*, Paris, 1857; *Report of Royal Commission of Cretinism in Lombardy*, Milan, 1864; *Report of Austrian Commission*, Vienna, 1861. (W. C. S.)

CREUSE, a department of central France, comprising the greater portion of the old province of Marche, bounded N. by the departments of Indre and Cher, E. by Allier and Puy-de-Dôme, S. by Corrèze, and W. by Haute-Vienne, with an area of 2150 square miles. The surface is hilly, with a general inclination north-westward in the direction of the valley of the Creuse, sloping from the mountains of Auvergne and Limousin, which rise southward and branch into the department. The highest point within its limits is in the forest of Châteauvert, 3050 feet above the sea. Rivers, streams, and lakes are numerous, but none are navigable; the principal is the Creuse, which rises on the north side of the mass of Mount Odouze on the border of the department of Corrèze, and passes through the department, dividing it into two nearly equal portions, receiving the Petite Creuse from the right, and afterwards flowing on to join the Vienne. The valleys of the head-streams of the Cher and of its tributary the Tardes occupy the eastern side; those of the heads of the Vienne and its tributary the Thorion, and of the Gartempe joining the Creuse, are in the west of the department. The climate is in general cold, moist, and variable; the rigorous winter covers the higher cantons with snow; rain is abundant in spring, and storms are frequent in summer, but the autumn is always fine. Except in the valleys the soil is poor and infertile, so that agriculture is not in an advanced state, and the produce of corn, chiefly rye, oats, and buckwheat or "sarrasin," is not sufficient for home consumption. The chestnut abounds in the north and west, and its fruit is largely used. Cattle rearing and sheep breeding are the chief industries of the department. Creuse supplies Poitou and Vendée with draught oxen. Coal is mined to some extent, chiefly in the basin of Ahun, but though iron ore, antimony, and kaolin are known, they are not worked. Millstones are quarried at Lésigny. There are thermal springs at Évaux in the east of the department. A railway uniting the systems of the Loire and Garonne basins crosses the department from east to west, and a branch line leads up the valley of the Creuse to Aubusson. With Haute-Vienne Creuse forms the diocese of Limoges. The department is divided into the four arrondissements of Guéret, the capital (population, 4899), Aubusson, the largest place (population, 6034), Bourganeuf, and Boussac, and further into twenty-five cantons. Population of department (1872), 274,633. Home labour is not sufficient for the support of the population, and from 20,000 to 25,000 of the inhabitants of the department go yearly to other parts of France in search of employment.

CREUTZ, Gustaf Philip, Count, a Swedish poet, was born in Finland in 1729. After concluding his studies in Abo he received a post in the Court of Chancery at Stockholm in 1751. Here he met Count Gyllenborg, with whom his name is as firmly united as Beaumont's with Fletcher's. Their friendship woke the poetic vein in each of the young men, and they formed, in unison, the one great figure in the poetic literature of Sweden in the 18th century. Under the patronage of the eminent poetess, Fru Nordenflycht, the volumes they published together became widely admired; to their own generation they seemed equal in fame, but posterity has given the palm of genius to Creutz. His greatest work is contained in the 1762 volume, the idyll of *Atis and Camilla*; the exquisite little pastoral entitled *Daphne* was published at the same time, and the generous and loving Gyllenborg was the first to proclaim and to delight in the supremacy of his friend. In 1763 Creutz practically closed his poetical career; he went to Spain as ambassador, and after three years to Paris in the same capacity. In France he enjoyed the friendship of all the great literati of the day, especially of Marmontel. In 1783 Gustavus III. recalled him and heaped honours upon him, but he died soon after, on the 30th of October 1785. *Atis and Camilla* was long the most admired poem in the Swedish language; it is written in a spirit of pastoral which is now to some degree faded, but in comparison with most of the other productions of the time it is freshness itself. Creutz introduced a melody and grace into the Swedish tongue which it lacked before, and he has been styled "the last artificer of the language."

CREUZER, Georg Friedrich (1771–1858), a German philologist and archæologist, born on March 10, 1771, at Marburg, was the son of a bookbinder of that town. Having studied at Marburg and Jena, he for some time lived at Leipsic as a private tutor; but in 1802 he was appointed professor at Marburg, and two years later professor of philology and ancient history at Heidelberg. The latter position he held for nearly forty-five years, with the exception of a short time spent at the university of Leyden, where he was unable to remain on account of the injurious effect produced upon his health by the Dutch climate. He had the honour of being one of the principal founders of the Philological Seminary established at Heidelberg in 1807. The Academy of Inscriptions of Paris appointed him one of its members, and from the grand-duke of Baden he received the dignity of privy councillor. He died at the age of eighty-seven, February 16, 1858. Creuzer's first and most famous work was his *Symbolik und Mythologie der alten Völker, besonders der Griechen* (Leipsic, 1810–12), in which he maintained that the mythology of Homer and Hesiod came from an Eastern source through the Pelasgians, and was the remains of the symbolism of an ancient revelation. This work was vigorously attacked by Hermann, in his *Briefen über Homer und Hesiod*, and his letter, addressed to Creuzer, *Ueber das Wesen und die Be-*

handlung der Mythologie; by Voss, in his *Antisymbolik;* and by Lobek, in his *Aglaophamos.* Of Creuzer's other works the principal are an edition of Plotinus; a partial edition of Cicero, in preparing which he was asssisted by Moser; *Die Historische Kunst der Griechen* (Leips. 1803); *Epochen der Griech. Literaturgeschichte* (Marburg, 1802); *Abriss der römischen Antiquitäten* (Leips. 1824); *Zur Geschichte altrömischer Cultur am Oberrhein und Neckar* (Leips. 1833); *Zur Gemmenkunde* (Darmstadt, 1834); *Das Mithreum von Neuenheim* (Heidelberg, 1338); *Zur Galerie der alten Dramatiker* (Heidelberg, 1839); *Zur Geschichte der classischen Philologie* (Leips. 1854).

See the autobiographical *Aus dem Leben eines alten Professors* (Leips. and Darmstadt, 1848), to which was added in the year of his death *Paralipomena der Lebenskizze eines alten Professors* (Frankfort, 1858); also Starck, *Friedrich Kreuzer, sein Bildungsgang und seine bleibende Bedeutung* (Heidelberg, 1875).

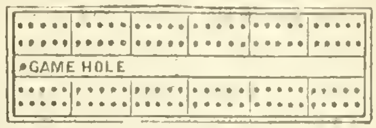
CREUZOT, LE, a town of France, department of Saône-et-Loire, 12 miles S.S.E. of Autun, on the high ground which extends between the Cevennes and Côte d'Or, 1355 feet above the sea. Situated in a district which is rich in coal and iron, it has the most extensive iron works in France, rivalling those of Birmingham, Essen, or Liége, and since 1837 has gathered round these a population amounting in 1872 to 21,408. Three distinct though connected industries are in full activity about Creuzot,—the mining of coal in the Creuzot-Blanzy basin, the smelting of iron ore, and the manufacture of all kinds of machinery. The factories occupy about 300 acres, of which 50 are covered with workshops, where locomotives and marine engines are constructed for all parts of the world. About 100,000 tons of rails are turned out annually. Besides its immediate supply Creuzot draws to it a large part of the coal taken from the central basin of France; excepting the mineral from Change near Épinac, little native French iron is used in the factories, which are chiefly provided from Elba and Algeria. Railways connect Creuzot with the Canal due Centre and the Saône, and westward with the navigation of the Loire.

CREVIER, JEAN BAPTISTE LOUIS (1693–1765), a French author, was born at Paris, where his father was a printer. He studied under Rollin, and held the professorship of rhetoric in the college of Beauvais for twenty years. He completed Rollin's *Histoire Romaine* by the addition of eight volumes; he also published two editions of Livy, with notes; *L'Histoire des Empereurs des Romains, jusqu' à Constantin,* 1749, 12 vols. 12mo; *Histoire de l'Université de Paris,* 7 vols. 12mo; and a *Rhétorique Françoise,* which enjoyed much popularity.

CREWE, a town of Cheshire, and an important station on the London and North-Western Railway, to which it is altogether indebted for its importance. It is the centre of six lines of railway, connecting it with Manchester, Chester, Birmingham, and other large towns, and is 21 miles east by south of Chester, and 54 miles north-west of Birmingham. It is inhabited principally by persons in the employment of the railway companies, and is well laid out. Crewe is not only one of the busiest railway junctions in the world, but possesses an enormous establishment for the manufacture of everything used in railways, steelworks, and engine and carriage factories on a great scale. It has a mechanics' institute, library, schools, baths, &c. The country round is flat and uninteresting. The town was built on an estate called Oak Farm in the parish of Monk's Coppenhall, and takes its name from the original stations having been placed in the township of Crewe, in which the seat of Lord Crewe is situated. Population (1871), 17,810.

CRIBBAGE, a game at cards, of uncertain etymology. Very similar game called noddy was formerly played: the game was fifteen or twenty-one up, marked with counters, occasionally by means of a noddy board. Cribbage seems to be an improved form of noddy.

A complete pack of fifty-two cards is required, and a *cribbage board* and *four pegs.* The board is drilled with sixty *holes* for each player (see diagram), and one hole



Cribbage Board

(called the *game hole*), common to both. The divisions into spaces of ten holes each are to facilitate counting. The game is marked by inserting the pegs in the holes, commencing with the outer row at the game-hole end, and going *up* the board. When the thirtieth hole is reached the player comes *down* the board, using the inner row of holes. The pegs belonging to one player should differ in colour from those belonging to the other. When one peg has been used, and another score is made by the same player, the second peg of the same colour is asserted ahead of the first, according to the number of holes to be scored. This peg is called the *foremost* peg, the other the *hindmost* peg. When a fresh score accrues the hindmost peg is taken out and placed in front of the foremost (which now becomes the hindmost), and so on until one player scores sixty-one holes or more, when he wins, and places his foremost peg in the game hole. If the losing player fails to obtain thirty holes his adversary wins a *double* when so agreed.

The game may be played by two players, five or six cards being dealt to each, and each putting out two for crib; or by three players (with an extra board), five cards being dealt to each, each putting out one for crib, and a card from the top of the pack being dealt to complete the crib; or by four players (two being partners against the other two, sitting and playing as at whist, and one partner scoring for both), five cards being dealt to each, and each putting out one card for crib. Two-handed five-card cribbage is the most scientific game. It is played in the following manner.

The players cut for deal. In cutting, whether for deal, to the dealer, or for start, at least four cards must be cut, and at least four left in the bottom packet. The player who cuts the lower card deals. The cards rank king (highest), queen, knave, ten, down to the ace (lowest). At the two-handed five-card game only, the non-dealer is entitled to score three holes (called *three for last*) at any time during the game. Three for last is usually scored while the dealer is dealing the first hand.

The non-dealer cuts the pack; the dealer re-unites the packets, and gives one card to his adversary, and then one to himself, and so on alternately until each has five cards. The undealt portion of the pack is placed face downwards on the table.

The players then look at their hands and *lay out,* each putting two cards face downwards on the table, on the side of the board nearest to the dealer. The four cards so laid out are called the *crib.* A player must not take back into his hand a card he has laid out, nor must the crib be touched during the play of the hand.

After laying out, the non-dealer cuts the pack (when more than two play, the player to the dealer's left) and the dealer turns up the top card of the lower packet, called the *start.* If the start is a knave the dealer marks two (called *two for his heels*). The score is forfeited if not marked before the dealer plays a card.

The hands are then played. The non-dealer lays face upwards on the table on his side of the board any card from his hand he pleases; the dealer then does the same on his side of the board, and so on alternately. When more than two play, the player to the leader's left plays the second card, and so on round to the dealer. As soon as the first card is laid down the player calls out the number of pips on it; if a picture card, ten. When the second card is laid down, the player calls out the sum of the pips on the two cards played, and so on until all the cards are played, or until neither player has a card which will *come in, i.e.*, which can be played without passing the number thirty-one. If one player has a card or cards that will come in and the other has not, he is at liberty to play them; at the six-card game he is bound to play as long as they can come in. When more than two play, the player next in rotation is bound to play, and so on until no one can come in. At the two-handed five-card game, when neither can come in the play is at an end; but at the other games the cards already played are turned face down, and the remainder of the hands are played in rotation, and so on until all the cards are played out.

The object of the play is to make pairs, fifteens, sequences, or the go, or to prevent the adversary from scoring. Flushes formerly counted in play; but now they do not.

Pairs.—If a card is put down of the same denomination as the one last played, the player *pairing* is entitled to score two holes. If a third card of the same denomination is next played a *pair royal* is made, and the maker of the pair royal is entitled to score six holes. If a fourth card of the same denomination is next played, twelve holes are similarly scored for the *double pair royal.* Kings pair only with kings, queens with queens, and so on with knaves and tens, notwithstanding that they are all *tenth cards* in play, *i.e.*, that the number called when playing any of them is ten.

Fifteens.—If either player during the play reaches fifteen exactly, by reckoning the pips and tens of all the played cards, he is entitled to mark two.

Sequences.—If during the play of the hand three or more cards are consecutively played which make an ascending or descending sequence, the maker of the sequence marks one hole for each card forming the sequence or *run.* King, queen, knave, and ten reckon in sequence in this order, notwithstanding that they are all tenth cards in play. The other cards reckon in sequence according to the number of their pips. The ace is not in sequence with king, queen. If one player obtains a run of three, and his adversary puts down a card that is in sequence, he marks four, and so on. And, be it observed, if there is a break in the sequence, and the break is filled up during the play, without the intervention of a card not in sequence, the player of the card that fills the break scores a run. An example will render this clear. The cards are played in this order (A playing the first card, B the second, and so on alternately), A B A B
4, 3, 2, ace. A gets a run of three, B a run of four. Had B's last card been a five he would similarly have scored a run of four, as there is no break. Had B's last card been a four, he would have scored a run of three. The cards need not be played in order; it is sufficient that the card last played completes a sequence, although it may be an intermediate card. Thus the cards being played in this order, A B A B A
4, 2, 5, 3, 6, B marks a run of four for his last card played, A a run of five. But suppose the cards played thus, A B A B A B
4, 2, 5, 3, 5, 6. B takes a run of four for the fourth card played, but there is no run for any one else, as the second five (which forms no part of the sequence) intervenes. Again, if the cards at six-card cribbage are thus played, A B A B A B A B
4, 2, 3, ace 5, 2, 4, ace, A takes a run of three, B a run of four, A a run of five. B then playing the deuce has no run, as the deuce he previously played intervenes. A then makes a run of five, and lastly B has no run the ace previously played blocking the three.

The *go, end hole,* or *last card* is scored by the player who approaches most nearly to thirty-one during the play, and entitles to a score of one. If thirty-one is reached exactly, it is a go of two instead of one.

Compound Scores.—If often happens that more than one of the above scores are made at the same time, when the player reckons both. Thus a player pairing with the last card that will come in scores both pair and go. Similarly a pair and a fifteen, or a sequence and a fifteen, can be reckoned together.

When the play is over, the hands are *shown* and counted aloud. The non-dealer has *first show,* and scores first; the dealer afterwards counts and scores what he has in hand and then what he has in crib. In counting the hands and crib, the start is made use of by both players to assist in forming combinations.

The combinations in hand or crib which entitle to a score are fifteens, pairs or pairs royal, sequences, flushes, and his nob.

Fifteens.—All the different cards that, taken together, make fifteen exactly, without counting all the same cards twice over in one fifteen, entitle the holder to a score of two. Tenth cards count ten towards a fifteen. For example a tenth card and a five reckon two, or *fifteen-two* as it is often called. Another five in the hand or turned up, would again combine with the tenth card, and entitle to another fifteen, or *fifteen-four,* if the other cards were a two and a three, two other fifteens would be counted,—one for the combination of the three and two with the tenth card, and one for the combination of the two fives with the three and two. Similarly, two tenth cards and two fives reckon fifteen-eight; a nine and three threes give three different combinations, and reckon fifteen-six; and so on for other cards.

Pairs.—Pairs are reckoned as in play.

Sequences.—Three or more cards in sequence count, as in play one for each card. If one sequence card can be substituted for another of the same denomination, the sequence reckons again. For example 3, 4, 5, and a 3 turned up, reckon two sequences of three. At the six-card game or in crib, with another 3 there would be three sequences of three, and so on for all cards that can make a fresh combination.

Flushes.—If all the cards in hand are of the same suit, one is reckoned for each card. If the start is also of the same suit, one is reckoned for that also. In crib, no flush is reckoned, unless the start is of the same suit as the cards in crib.

His nob.—If a player holds the knave of the suit turned up he counts one for his nob.

A couple of examples will render the counting clear. Say the crib consists of 6, 7, 7, 8, 8. The score would be four fifteens (eight), two pairs (four), four sequences of three (twelve); total twenty-four. Again, a hand of 4, 5, 6 (same suit) and a 5 turned up counts two fifteens (four), a pair (two), two sequences of three (six), and a flush (three); total fifteen.

The points accrue in the following order:—two for his heels; points made in play as soon as declared; non-dealer's show; dealer's show (hand and crib).

After the points in hand and crib are reckoned, the cards are put together and shuffled, and the opponent of the last dealer deals, and so on alternately until the game is won.

HINTS TO PLAYERS.—In laying out, the non-dealer should discard such cards as are not likely to score in crib; the dealer should put out good cards for his own crib. It is so important to *baulk* the crib that the non-dealer should often sacrifice scores in his own hand. Thus with queen, knave, ten, four, ace, the dealer should put out the four and the ace; the non-dealer the queen and ten. But towards the end of the game, if the non-dealer has cards that will probably take him out, the consideration of baulking the crib need not influence him. The best baulks are a king or an ace, as those cards only reckon one way in sequences. King with ten, nine (best baulk), eight, seven, six, or ace, are good baulks; so is queen, with any of these cards except the ten. Next to these wide even cards are good baulks (even cards being less likely to score in fifteens than odd ones); and lastly cards that are not in sequence. Two cards of the same suit should not be put out by the non-dealer if there is as good a discard of cards of different suits. The best cards for the dealer to put out (and therefore those to be avoided by the non-dealer), are fives, five and six, five and a tenth card, three and two, seven and eight, four and one, nine and six, pairs (especially low pairs), and close cards. It is generally right to keep a sequence in hand, as if the start is of the same denomination as one of those kept, the dealer reckons eight at least. A pair royal is a good hand to keep.

In playing, the best card to begin with is ace, two, three, or four, as the only chance of an adverse score is by pairing, and pairing is always dangerous on account of the possibility of its being capped by a pair royal. Pairing is often declined, as it is common to open the play with a card of which a duplicate is held (except with two fives). When leading from a sequence, the middle card should not be led. If a close card is played to the one led it often happens that the adversary wishes a run of three to be made against him, he holding a card that will complete a run of four. Having the choice of pairing or of making fifteen, prefer the latter; but if a seven or eight is led, and a fifteen is made, the adversary has the chance of a run of three. During the play, a four should not be added to a call of seven (making eleven), as if paired the opponent scores four. All similar combinations should be avoided, as twelve made with a three, twenty-seven with a four, twenty-eight with a three, and twenty-one with any card, as then a tenth card (of which there are sixteen) comes in for two. It is very desirable to win the go, as this makes a difference of at least two to the score in each deal. The best chance of winning the go with two low cards and a high one is to begin with a low card, with two high cards and a low one to begin with a high one. The dealer has the best chance of making the go.

The most important guide to the play is the score. The player who is ahead in the game should endeavour to keep so by playing wide cards, declining pairs, and declining to make fifteen with close cards. This is called *playing off.* The one who is behind in the game should *play on, i.e.,* score whenever he can, running the risk of a larger score being made against him. To calculate whether to play on or play off, the average points scored should be kept in mind. Each player ought to reckon slightly over six in hand and play and five in crib, or seventeen and a half in two deals to be *at home.* A player who scores more than the average and leaves his adversary six or seven points in arrear is *safe at home.* When at home it is best to play off; when the adversary is safe at home it is best to play on.

Near the end of the game and wanting points in play to play out, it is advisable to keep two low cards and one high one.

At six-card cribbage it is not so important to baulk the crib as at five-card. The average scores are twelve for the non-dealer, seventeen for the dealer. At the end of the second deal a player is at home at twenty-nine holes. In the first deal it is an advantage to exceed the average, consequently both players with fair hands should play on; but with poor hands they should play off.

Laws.—*Cutting.*—1. There must be a fresh cut for deal after every game, unless rubbers are played. 2. If in cutting for deal or start more than one card is exposed, adversary may choose which card he pleases. 3. Errors in cutting to the dealer necessitate a fresh cut. *Dealing.*—4. Cards must be dealt by one at a time. If two are dealt together, error may be rectified, if it can be done by moving one card only; otherwise non-dealer marks two holes, and there must be a fresh deal. 5. If dealer exposes his own cards, no penalty. 6. Faced card in pack necessitates a fresh deal. 7. Player dealing out of turn, error can be rectified prior to start being turned up; otherwise not. 8. Non-dealer marks two holes, and has the option of a fresh deal—(*a*) if dealer exposes any of non-dealer's cards, and (*b*) if dealer gives too many or too few cards to either player. In *b* cases non-dealer may look at his hand before electing; if he elects to stand the deal when he has a surplus card he returns a card unshown to the pack; if, when the dealer has a surplus card, he draws one and looks at it; if when either has too few cards, imperfect hand is completed from pack. *Laying out.*—9. If either player lays out when he holds too many cards, adversary marks two holes, and has option of a fresh deal. If he stands the deal he draws surplus card from offender's hand and looks at it. 10. If either player lays out with too few cards he must play with his hand short. 11. If a player takes back a card laid out, adversary marks two holes, and has option of fresh deal. 12. Crib must not be touched before hand is played. *Playing.*—13. Player playing with too many cards, same penalty as in law 9. Playing with too few cards, no penalty. 14. Card once played that will come in cannot be taken up again. Card that will not come in shown in play, no penalty. 15. If two cards are played together the one counted is deemed to be played. 16. If a player at six-card cribbage or at three or four handed cribbage neglects to play a card that will come in, adversary may require it to be played, or may mark two holes. 17. Miscounting during play no penalty. *Showing and scoring.*—18. When reckoning, cards must remain exposed until adversary is satisfied. If a player mixes his cards with the pack, or hand and crib together, before adversary is satisfied, he forfeits score. 19. If a player scores more than he is entitled to, adversary may correct his score, and add points overscored to his own. This law applies also to placing peg in game hole in error. Scoring two few, no penalty. Player is not entitled to any assistance in reckoning. 20. If a player touches his opponent's pegs except to correct an overscore, or touches his own pegs when he has no score to make, his adversary marks two holes. 21. If a player displaces his foremost peg he must put it behind the other. If he displaces both, adversary may place hindmost peg where he believes it to have been, and the other peg behind it. (H. J.)

CRICHTON, James (1560-1582), commonly called "the Admirable Crichton," was the son of Robert Crichton, lord-advocate of Scotland in the reign of James VI., and was born at Eliock, in Dumfriesshire. He was sent when ten years old to Saint Salvator's College, St Andrews, where he took his master's degree at fifteen. In 1577 he was still living in Scotland; some time after that date, however, a quarrel with his father, who had become a Protestant, drove him to France. In Paris his dialectics and his sword-play are said to have gained him equal admiration; and, according to Urquhart's very doubtful story, a contest in twelve languages resulted in an easy victory over the whole staff of the Sorbonne. His Parisian triumphs were followed by a couple of years of obscure campaigning in the French army, but in 1580 he appeared at Venice. A Latin poem addressed to Aldus Manutius laid the foundation of a lasting friendship with the great printer, who dedicated his edition of Cicero's *Paradoxa* to Crichton, and, according to some, conferred on him still more substantial favours; he also became intimate with Sperone Speroni, and with Lorenzo Massa and Giovanni Donati. His first public display was the delivery of an address to the doge and senate, whom he astonished with his eloquence and oratorical grace; and he followed this up with a series of disputations on mathematical, theological, and philosophical subjects, which so extended his fame that it was reckoned the highest honour to Mazzoni, a famous dialectician, thrice to have met and vanquished him in argument. But these exertions produced an illness which held him prostrate for four months. At Padua, the scene of his next exhibition, he astonished the assembled professors by extemporizing in succession a Latin poem, a daring onslaught on certain Aristotelian errors, and an impassioned oration in praise of ignorance. His return to Venice was signalized by the publication of the challenge preserved by Aldus Manutius, in which he undertook not only to refute innumerable errors in Aristotelians, mathematicians, and schoolmen, but to meet his opponents on any ground, and to conduct the dispute either logically, or according to the secret doctrine of numbers, or in a hundred sorts of verse; and in the church of San Paolo and San Giovanni the young Scotsman held his own for three days against all comers. He then seems to have quitted the republic for Mantua, where he had been appointed tutor to Vincenzo Gonzaga, heir to the dukedom. There he distinguished himself, according to Urquhart, by killing a professional duellist, who had challenged and vanquished many of the best swordsmen of Italy, and by playing before the court some fifteen characters in succession, keeping the stage for five hours. His brilliance made men envious, and he is said to have supplanted the prince in the affections of his mistress. One July evening in 1582 he was attacked by three masquers in the streets of Mantua. But he fought so well that their leader to save his life was forced to discover himself. It was Vincenzo Gonzaga himself. The tutor fell on his knees, and presenting his sword, asked pardon; but the prince basely run him through the body.

The standard biography is that of Patrick Fraser Tytler,—*Life of James Crichton of Cluny*, 1819. See also David Irving's notice in earlier editions of the present work, and "The Discovery of a Most Exquisite Jewel," in the *Works of Sir Thomas Urquhart of Cromarty* (Maitland Club), Edinburgh, 1834.

CRICKET (*Achetidæ*), a family of saltatory Orthopterous Insects, characterized by the great length and slenderness of the antennæ, and by the horizontal position of the wings and wing-covers when at rest. The wings when folded form long slender filaments, which often reach beyond the extremity of the body, and give the appearance of a bifid tail, while in the male they are provided with a stridulating apparatus by which the well-known chirping sound, to which the insect owes its name, is produced. The abdomen of the female ends in a long slender ovipositor, which, however, is not exserted in the Mole Cricket. The House Cricket (*Acheta domestica*) is of a greyish-yellow colour marked with brown. It frequents houses, especially in rural districts, where its lively, if somewhat monotonous, chirp may be heard nightly in the neighbourhood of the fireplace. It is particularly fond of warmth, and is thus frequently found in bakeries, where its burrows are often sunk to within a few inches of the oven. In the hot summer it goes out of doors, and frequents the walls of gardens, but returns again to its place by the hearth on the first approach of cold, where, should the heat of the fire be withdrawn, it becomes dormant. It is nocturnal, coming forth at the evening twilight in search of food, which consists of bread crumbs and other refuse of the kitchen. The Field Cricket (*Acheta campestris*) is a larger insect than the former, and of a darker colour. It burrows in the ground to a depth of from 6 to 12 inches, and in the evening the male may be observed sitting at the mouth of its hole noisily stridulating until a female approaches, "when," says Bates, "the louder notes are succeeded by a more subdued tone, whilst the successful musician caresses with his antennæ the mate he has won." The musical apparatus in this species consists of upwards of 130 transverse ridges on the under side of one of the nervures of the wing cover, which are rapidly scraped over a smooth, projecting nervure on the opposite wing. The female deposits her eggs—about 200 in number—on the ground, and when hatched the larvæ, which resemble the perfect insect except in the absence of wings, form burrows for themselves in which they pass the winter. The Mole Cricket (*Gryllotalpa vulgaris*) owes its name to the striking analogy in its habits and structure to those of the common mole. Its body is thick and cylindrical in shape, and it burrows by means of its front legs, which are short and greatly flattened out and thickened, with the outer edge partly notched so as somewhat to resemble a hand. It prefers loose and sandy ground in which to dig, its burrow consisting of a vertical shaft from which long horizontal galleries are given off; and in making those excavations it does immense injury to gardens and vineyards by destroying the tender roots of plants, which form its principal food. It also feeds upon other insects, and even upon the weak of its own species in the absence of other food. It is exceedingly fierce and voracious, and is usually caught by inserting a stem of grass into its hole, which being seized, is retained till the insect is brought to the surface. The female deposits her eggs in a neatly constructed subterranean chamber, about the size of a hen's egg, and sufficiently near the surface to allow of the eggs being hatched by the heat of the sun.

CRICKET is the national game of Englishmen. The prevalent love of the pastime may perhaps be cited as an instance of the development of the national character, requiring, as it does, such a combination of intellectual and physical qualities—broad and open shoulders, stout arms and quick legs, with patience, calculation, and promptness of execution.

In the infancy of the game stumps did not exist. A circular hole in the turf supplied their place, and it is surmised that the batsman was put out either by being caught, or, when running, by the outside returning the ball into the cavity ere the striker placed the base of his bat therein. This led to unseemly tussles between the batsman and fielders, often to the detriment of the latter's hands. It is surmised from the old records of the Hambledon Club that the first description of wicket comprised one stump only, 18 inches high, which was displaced with the ball, in lieu of "holing" the same, in order to put the runner out, but absolute proof on this point is wanting. The date of a second stump being added is buried in obscurity. It is only known that they were placed 2 feet apart, with a connecting cross-bar on the top, the height being 1 foot; and a large hole for putting the ball into was excavated between the stumps. The dimensions of 22 inches by 6 inches were adopted in 1702, and thus, as far as is known, matters remained till, in 1775, at a Hambledon Club match, the ball was observed to pass thrice between the two stumps without dislodging the cross-bar. To obviate this a third stump was added in the middle, and the modern bails were substituted for the cross-bar. The next alteration was to 24 inches by 7 inches in 1798, and in 1817 another inch was added to the height; at which dimensions, viz., 27 inches by 8 inches, the wicket remains in 1877. It is possible that there were other intermediate alterations from time to time; but, as each year's laws have not been preserved, this is uncertain. From the earliest days, however, the wickets have always been placed one chain or 22 yards apart.

Cricket bats were at first made with a sweeping curve at the base, which made them available for hitting only. They were broader, and far more cumbersome than the lithe spring-handled implements of the present day,—the shape now in use appearing to have become prevalent about 1825, when round arm bowling came permanently into vogue. A sketch of the various shapes in use from early times downwards, will be found in the frontispiece of Mr Frederick Gale's *Echoes from the old Cricket Fields*. No evidence exists as to the size and weight of the first balls used. At the end of the 18th century they were much of the same dimensions as now, but both materials and workmanship have vastly improved even since the first "treble sewn" was manufactured.

Cricket is divided into single and double wicket, and it is a moot point which of the two was the parent game. Judging, however, from the earliest evidence extant, it seems probable that single wicket was the first instituted, as it is less complicated and requires fewer players. In their pavilion at the Kennington Oval the Surrey County Cricket Club possesses the earliest known picture of the game in anything like its present form. The date is 1743, and the stumps are aptly described by Mr Frederick Gale as "a skeleton hurdle of about 2 feet wide and 1 foot high." The bat is of the old-fashioned curved shape, and the score was kept by notching each individual run on a stick. With the exception that all play was evidently forward of the wicket (the same is the case now in single wicket matches with less than five a side), the leading features of the game are identical with those of the present day. Single wicket, however, was never much practised after a knowledge of the game became thoroughly diffused, except by great players for a large stake or a championship. It is with the double wicket game that we are more immediately concerned, that being the now universally accepted form.

The most radical change that has ever taken place in the development of the game is the introduction of round or straight arm bowling in lieu of the underhand. That the new style was first discovered (about 1785) by Tom Walker, a professional of the old Hambledon Club, is now generally admitted; but the dogged conservatism of the day pronounced it to be unfair, and successfully repressed the innovation. About 1805 the style was revived by Mr John Willes, a great Kentish amateur. It was not, however, until 1825, when Mr G. T. Knight of Alton strenuously took up the cudgels on behalf of the so-called "throwing bowling," that it became a permanent institution, and then only after many bickerings and much controversy. The new style created a great revolution in cricket, as it afforded the bowlers much greater command over their delivery both in strength and in direction. From time to time various other new points have arisen requiring special legislation, and changes have taken place in the mode of conducting the game.

Much labour and careful attention are required in laying out a good cricket ground and maintaining the same in proper order. As a general rule the shorter and more level the turf can be got the better. Double wicket requires two sides of eleven players each, the choice of first innings being decided by lot. Two strikers go in, one at

each wicket, and the object of the fielders is to dislodge them according to the rules of the game. The other strikers go in by rotation as arranged by their captain. When a ball is hit the striker may, if possible, score a run by reaching the opposite hopping crease ere the wicket is put down, each time he successfully traverses the distance between the two popping creases counting as one run. When sufficient time is available each side has two innings, and that scoring the largest number of runs is the winner. Otherwise both sides may agree to decide the issue on the result of one innings apiece, and it is sometimes arranged to allow six balls in each over, instead of four. At the end of each over, the whole of the outside change their positions; another bowler delivers an over from the opposite wicket, and so on alternately. A general idea of the position of the players may be formed from the accompanying diagram, but variations take place according to the description of bowling in use.

A captain is chosen on each side, who has the entire management of his eleven. In conjunction with the opposing captain he makes the necessary arrangements for the match. He should be a thorough judge of all points of the game, and able to place the field to the best advantage according to the description of the bowling and peculiarities of the striker. Constant practice is necessary to become a good bowler, and obtain such a thorough command of the ball as to vary the pace and pitch as well as to impart twist. The two chief varieties of balls are "lengths" and "not lengths," according as their pitch deceives the striker's eye as much as possible or not. A batsman's first rule is to play with a straight bat, as he thereby gains most protection for his stumps; and he should make the most of his stature. Batting is divided into "forward" and "back play," according as the batsman stretches forward to meet the ball, or keeps the body perpendicular or slightly inclined backwards. The fielders should ever be on the alert, their business being to stop or catch the ball, and return it to one of the wickets with all possible haste. For further details of each player's duties and full instructions how to play the game correctly, we must refer our readers to the Rev. James Pycroft's excellent work, *The Cricket Field*. Single wicket is sufficiently explained by the laws, the only material difference being that the batsman has to reach the bowling stump and return to the popping crease—a distance of 44 yards in place of 22 yards—for every run he scores. The laws of the game as now constituted by the Marylebone Cricket Club are as follows:—

1. The ball must weigh not less than $5\frac{1}{2}$ nor more than $5\frac{3}{4}$ ounces. It must measure not less than 9 nor more than $9\frac{1}{4}$ inches in circumference. At the beginning of each innings, either party may call for a new ball.

2. The bat must not exceed $4\frac{1}{4}$ inches in the widest part; it must not be more than 38 inches in length.

3. The stumps must be 3 in number, 27 inches out of the ground; the bails 8 inches in length; the stumps of equal and of sufficient thickness to prevent the ball from passing through.

4. The bowling crease must be in a line with the stumps, and 6 feet 8 inches in length, the stumps in the centre,—with a return crease at each end towards the bowler at right angles.

5. The popping crease must be 4 feet from the wicket, and parallel to it, unlimited in length, but not shorter than the bowling crease.

6. The wickets must be pitched opposite to each other by the umpires, at the distance of 22 yards.

7. It shall not be lawful for either party during the match, without the consent of the other, to alter the ground by rolling, watering, covering, mowing, or beating, except at the commencement of each innings, when the ground shall be swept and rolled unless the next side going in object to it. This rule is not meant to prevent the striker from beating the ground with his bat near to the spot where he stands during the innings, nor to prevent the bowler from filling up holes with saw-dust, &c., when the ground shall be wet.

8. After rain the wickets may be changed with the consent of both parties.

9. The bowler shall deliver the ball with one foot on the ground behind the bowling-crease, and within the return crease, and shall bowl one over before he change wickets, which he shall be permitted to do twice in the same innings, and no bowler shall bowl more than two overs in succession.

10. The ball must be bowled. If thrown or jerked the umpire shall call "no ball."

11. The bowler may require the striker at the wicket from which he is bowling to stand on that side of it which he may direct.

12. If the bowler shall toss the ball over the striker's head, or bowl it so wide that, in the opinion of the umpire, it shall not be fairly within the reach of the batsman, he shall adjudge one run to the party receiving the innings, either with or without an appeal, which shall be put down to the score of wide balls; such ball shall not be reckoned as one of the four balls; but if the batsman shall

by any means bring himself within reach of the ball, the run shall not be adjudged.

13. If the bowler shall deliver a "no ball," or a "wide ball," the striker shall be allowed as many runs as he can get, and he shall not be put out except by running out. In the event of no run being obtained by any other means, then one run shall be added to score of "no balls" or "wide balls" as the case may be. All runs obtained for "wide balls" to be scored to "wide balls." The names of the bowlers who bowl "wide balls," or "no balls," in future to be placed on the score, to show the parties by whom either score is made. If the ball shall first touch any part of the striker's dress or person (except his hands), the umpire shall call "leg bye."

14. At the beginning of each innings the umpire shall call "play;" from that time to the end of each innings no trial ball shall be allowed to any bowler.

15. The striker is out if either of the bails be bowled off, or if a stump be bowled out of the ground ;

16. Or if the ball from the stroke of the bat or hand, but not the wrist, be held before it touch the ground, although it be hugged to the body of the catcher ;

17. Or if in striking, or at any other time while the ball shall be in play, both his feet shall be over the popping crease, and his wicket put down, except his bat be grounded within it ;

18. Or if in striking at the ball he hit down his wicket ;

19. Or if, under pretence of running or otherwise, either of the strikers prevent a ball from being caught, the striker of the ball is out ;

20. Or if the ball be struck and he wilfully strike it again ;

21. Or if in running the wicket be struck down by a throw, or by the hand or arm (with the ball in hand), before his bat (in hand) or some part of his person be grounded over the popping crease ; but if both bails be off, a stump must be struck out of the ground ;

22. Or if any part of the striker's dress knock down the wicket ;

23. Or if the striker touch or take up the ball while in play, unless at the request of the opposite party ;

24. Or if with any part of his person he stop the ball, which in the opinion of the umpire at the bowler's wicket, shall have been pitched in a straight line from it to the striker's wicket and would have hit it.

25. If the players have crossed each other, he that runs for the wicket which is put down is out.

26. A ball being caught, no run shall be reckoned.

27. The striker being run out, the run which he and his partner were attempting shall not be reckoned.

28. If a lost ball be called, the striker shall be allowed six runs, but if more than six shall have been run before lost ball shall have been called, then the striker shall have all that have been run.

29. After the ball shall have been finally settled in the wicket-keeper's or bowler's hand, it shall be considered dead ; but when the bowler is about to deliver a ball, if the striker at his wicket go outside the popping crease before such actual delivery, the said bowler may put him out, unless (with reference to the 21st law) his bat in hand, or some part of his person, be within the popping crease.

30. The striker shall not retire from his wicket and return to it to complete his innings after another has been in, without the consent of the opposite party.

31. No substitute shall in any case be allowed to stand out or run between the wickets for another person without the consent of the opposite party ; and in case any person shall be allowed to run for another, the striker shall be out if either he or his substitute be off the ground in manner mentioned in laws 17 and 21, while the ball is in play.

32. In all cases where a substitute shall be allowed, the consent of the opposite party shall also be obtained as to the person to act as substitute, and the place in the field which he shall take.

33. If any fieldsman stop the ball with his hat, the ball shall be considered dead, and the opposite party shall add five to their score. If any be run they shall have five in all.

34. The ball having been hit, the striker may guard his wicket with his bat, or with any part of his body except his hands, that the 23rd law may not be disobeyed.

35. The wicket-keeper shall not take the ball for stumping until it have passed the wicket ; he shall not move until the ball be out of the bowler's hand ; he shall not by any noise incommode the striker ; and if any part of his person be over or before the wicket, although the ball hit it, the striker shall not be out.

36. The umpires are the sole judges of fair and unfair play ; and all disputes shall be determined by them, each at his own wicket ; but in case of a catch which the umpire at the wicket bowled from cannot see sufficiently to decide upon, he may apply to the other umpire, whose opinion shall be conclusive.

37. The umpires in all matches shall pitch fair wickets ; and the parties shall toss up for choice of innings. The umpires shall change wickets after each party has had one innings.

38. They shall allow two minutes for each striker to come in and ten minutes between each innings. When the umpire shall call "play" the party refusing to play shall lose the match.

39. They are not to order a striker out unless applied to by the adversaries.

40. But if one of the bowler's feet be not on the ground behind the bowling crease and within the return crease when he shall deliver the ball, the umpire at his wicket, unasked, must call "no ball."

41. If either of the strikers run a short run the umpire shall call "one short."

42. No umpire shall be allowed to bet.

43. No umpire is to be changed during the match, unless with the consent of both parties, except in case of violation of 42d law ; then either party may dismiss the transgressor.

44. After the delivery of four balls the umpire must call "over," but not until the ball shall be finally settled in the wicket-keeper's or bowler's hand ; the ball shall then be considered dead ; nevertheless, if any idea be entertained that either of the strikers is out, a question may be put previously to, but not after, the delivery of the next ball.

45. The umpire must take especial care to call "no ball" instantly upon delivery, "wide ball" as soon as it shall pass the striker.

46. The players who go in second shall follow their innings if they have obtained eighty runs less than their antagonists, except in all matches limited to one day's play, when the number shall be limited to sixty instead of eighty.

47. When one of the strikers shall have been put out, the use of the bat shall not be allowed to any person until the next striker shall come in.

Note.—The committee of the Marylebone Club think it desirable that previously to the commencement of a match, one of each side should be declared the manager of it; and that the new laws with respect to substitutes may be carried out in a spirit of fairness and mutual concession, it is their wish that such substitutes be allowed in all reasonable cases, and that the umpire should inquire if it is done with consent of the manager of the opposite side.

Complaints having been made that it is the practice of some players when at the wicket to make holes in the ground for a footing, the committee are of opinion that umpires should be empowered to prevent it.

Single Wicket.

1. When there shall be less than five players on a side, bounds shall be placed twenty-two yards each in a line from the off and leg stump.

2. The ball must be hit before the bounds to entitle the striker to a run, which run cannot be obtained unless he touch the bowling stump or crease in a line with it with his bat, or some part of his person, or go beyond them, returning to the popping crease as a double wicket, according to the 21st law.

3. When the striker shall hit the ball one of his feet must be on the ground and behind the popping crease, otherwise the umpire shall call "no hit."

4. When there shall be less than five players on a side neither byes nor overthrows shall be allowed, nor shall the striker be caught out behind the wicket, nor stumped out.

5. The fieldsman must return the ball so that it shall cross the play between the wicket and the bowling stump, or between the bowling stump and the bounds ; the striker may run till the ball be so returned.

6. After the striker shall have made one run, if he start again he must touch the bowling stump, and turn before the ball cross the play to entitle him to another.

7. The striker shall be entitled to three runs for lost ball, and the same number for ball stopped with hat, with reference to the 28th and 33d laws of double wicket.

8. When there shall be more than four players on a side there shall be no bounds. All hits, byes, and overthrows shall then be allowed.

9. The bowler is subject to the same laws as at double wicket.

10. No more than one minute shall be allowed between each ball.

Bets.

1. No bet upon any match is payable unless played out or given up.

2. If the runs of one player be betted against those of another, the bet depends on the first innings unless otherwise specified.

3. If the bet be made on both innings, and one party beat the other in one innings, the runs of the first innings shall determine it.

4. If the other party go in a second time, then the bet must be determined by the number on the score.

County Cricket.

The following laws of county qualification were established at a meeting held in the Surrey County Pavilion, Kennington Oval, on June 9, 1873 :—

1. That no cricketer, whether amateur or professional, shall play for more than one county during the same season.

2. Every cricketer born in one county and residing in another shall be free to choose at the commencement of each season for which of those counties he will play, and shall, during that season, play for that county only.

3. A cricketer shall be qualified to play for any county in which he is residing and has resided for the previous two years; or a cricketer may elect to play for the county in which his family home is, so long as it remains open to him as an occasional residence.

4. That, should any question arise as to the residental qualification, the same should be left to the decision of the committee of the Marylebone Club.

History.—The name cricket is cognate to the Saxon *cric* or *cryc*, a crooked stick. This germ of the modern bat is seen in the earliest representation of the pastime about the middle of the 13th century. In a MSS. in the King's Library, 14 Bv, entitled *Chronique d'Angleterre, depuis Ethelberd jusqu'à Hen. III.*, there is found a grotesque delineation of two male figures playing a game with a bat and ball. This is undoubtedly the first known drawing of what was destined to develop into the scientific cricket of modern times. The left hand figure is that of the batsman, who holds his weapon perpendicularly in the right hand with the handle downwards. The right hand figure shows the catcher, whose duty is at once apparent by the extension of his hands. In another portion of the same MSS., however, there is a male figure pointing a bat, with the base curved like a leopard's head, towards a female figure in the attitude of catching, but the ball is absent. On p. 126 of King Edward I.'s wardrobe account for the year 1300, there occurs the following entry, viz., "Domino Johanni de Leek capellano Domini Edwardi fil' Regis, pro den' per ipsum liberat' eidem Domino suo ad ludendum ad *creag'*, et alios ludos per vices, per manus proprias apud Westm', 10 die Marcii, 100s. Et per manus Hugonis camerarii sui apud Newenton mense Marcii, 20s—summa, £6." Here is found the earliest allusion to the game as designated by a term analogous to the modern word "cricket," as well as indisputable proof that even in these early times the game was followed by the first personages in the realm, who of course spoke French. In a Bodleian Library MSS., No 264, dated 18th April 1344, and entitled *Romance of the Good King Alexander*, fielders for the first time appear in addition to the batsman and bowler. All the players are monks with their cowls up and down alternately, the former having been erroneously taken for female figures by Strutt in his *Sports and Pastimes.* On the extreme left of the picture, the bowler, with his cowl up, poises the ball in the right hand with the arm nearly horizontal. The batsman comes next with his cowl down, a little way only to the right, standing sideways to the bowler with a long roughly-hewn and slightly-curved bat, held vertically, handle downwards in the left hand. On the extreme right come four figures—with cowls alternately down and up, and all having their hands raised in an attitude to catch the ball should it be missed by the batsman, or be tipped in their direction. Judging, however, from the positions of bowler and batter, the out players are not placed so as to field a direct but a side hit. But the want of perspective in the composition renders any estimate of their object uncertain. It is evident, however, that the bat was always held in the left hand at this date, since on the opposite page of the same MSS. a solitary monk is figured with his cowl down, and so holding a somewhat elongated oval-shaped implement. The close roll of 39 Edw. III. (1365), Men. 23, disparages certain games on account of their interfering with the practice of archery, where the game of cricket is probably included among the pastimes denounced as "ludos inhonestos, et minus utiles aut valentes." In this instance, cricket was clearly considered fit for the lower orders only. Judging from the drawings, it can only be conjectured that the game consisted of bowling, batting, and fielding, though it is known that there was an inside and an outside, for sometime during the 15th century the game was called "Hondyn or Hondoute," or "Hand in and Hand out." Under this title it was interdicted by 17 Edw. IV. c. 3 (1477–78), as one of those illegal games which still continued to be so detrimental to the practice of archery. By this statute, any one allowing the game to be played on his premises was liable to three years' imprisonment and £20 fine, any player to two years' imprisonment and £10 fine, and the implements to be burnt. The inference that hand in and hand out was analogous to cricket is made from a passage in the Hon. Daines Barrington's *Observations on the more Ancient Statutes from Magna Charta to* 21 *James I.* cap. 27." Writing in 1766, he comments thus on the above statute, viz: "This is, perhaps, the most severe law ever made against gaming, and some of these forbidden sports seem to have been manly exercises, particularly the *handyn* and *handoute* which I should suppose to be a kind of cricket, as the term *hands* is still retained in that game."

The word "cricket" first occurs about the year 1550. In Russell's *History of Guildford* (p. 203), it appears there was a piece of waste land in the parish of Holy Trinity in that city, which was enclosed by one John Parish, an innholder, some five years before Queen Elizabeth came to the throne. In 35 Elizabeth (1593), evidence was taken before a jury and a verdict returned, ordering the garden to be laid waste again and disinclosed. Amongst other witnesses John Derrick, gent., and one of H. M.'s coroners for Surrey, *ætat.* fifty-nine, deposed he had known the ground for fifty years or more, and "when he was a scholler in the free school of Guildford, he and several of his fellowes did runne and play there at *crickett* and other plaies." In the original edition of Stow's *Survey of London* (1598), the word does not occur, though he says, "The ball is used by noblemen and gentlemen in tennis courts, and by people of the meaner sort in the open fields and streets." It might justly be surmised that such a national game as cricket would soon be introduced at public schools. Accordingly, the first trace of it is found at Winchester College in 1650, since Lisle Bowles, writing of the good Bishop Ken, who was admitted to Winchester, 13th January 1650–51, says, "On the fifth or sixth day our junior . . . . is found for the first time attempting to wield a cricket bat." In 1688 we find a "ram and bat" charged in an Etonian's school bill. Two other noteworthy references to the game are found during the last quarter of the 17th century. The first is in a somewhat ribald poem (1658), entitled *The Mysteries of Love and Eloquence, or the Arts of Wooing and Complimenting*, by Edward Philips, John Milton's nephew, who, in a dialogue between a country bumpkin and his mistress going to a fair, makes the latter say, "Would my eyes had been beat out of my head with a cricket ball." The second occurs in the diary of the Rev. Henry Teonge, a naval chaplain to H. M. ship "Assistance," and states that during a visit to Antioch on 6th May 1676, several of the ship's company, accompanied by the consul, rode out of the city early, and amongst other pastimes indulged in "krickett." During the first half of the 18th century the game became popular, and is repeatedly noticed by writers of the time, such as Swift, D'Urfey, Pope, Soame Jenyns, and Strype in his edition of Stow's *Survey of London.*

In 1748 it was decided that cricket was not an illegal game under the well-known statute 9 Anne cap. 19, the Court of King's Bench holding "that it was a very manly game, not bad in itself, but only in the ill use made of it by betting more than ten pounds on it; but that was bad and against the law." In these early times even, the pastime was followed by all classes, and Frederick, prince of Wales, died in 1751 from internal injuries caused by a blow from a cricket ball whilst playing at Cliefden House. Nevertheless, this commingling of aristocrats and plebeians on the cricket sward was viewed with apprehension, and repeatedly discountenanced by writers of the day. Games were played for large stakes. Ground proprietors and tavern keepers farmed and advertised matches, the results whereof were not always above suspicion. The old artillery ground at Finsbury appears to have been the earliest scene of action of this class of matches. But the true birthplace of the game in its developed state was no cockney inclosure, but the broad open downs of the southern counties of England, and more especially in the great hop-growing districts. The large hop fairs, notably that of Weyhill, were the rendezvous for all comers from the southern counties, and it is probable that the great county matches were arranged on these occasions. The first record preserved of a match is between Kent and All England, which, judging from an advertisement in the *General Advertiser* of the day, was played on August 4, 1746, at the Artillery Ground, the score being kept in the modern fashion.

The old Hambledon Club was the first founded in England, and lasted from 1750 to 1791. Its playing fields were Broad Half Penny and Windmill Downs. When at its zenith the club frequently contended with success against All England. Their great players were more or less retained by noblemen and wealthy patrons of the game, and this club remained invincible for some forty years. Though a cricket club existed at Hambledon down to 1825, the original society was broken up in 1791, owing to the distance from the metropolis. A dispersion of its famous players through neighbouring counties took place, and was naturally accompanied with a diffusion of the precepts of the game, which gradually extended northward and westward, till, at the end of the 18th century, cricket had become established as the national game of England. The famous Marylebone Cricket Club now justly ranks as the leading club of the world, frames the laws governing the game, and arbitrates on all disputes connected therewith. This society sprang out of the old Artillery Ground Club, which played at Finsbury till about 1750, when they moved to White Conduit Fields, and became the White Conduit Cricket Club. In 1787 they were remodelled under their present title, and moved to Old Lords' Ground, on the site of Dorset square, thence in 1824 to Middle Lords' Ground at South Bank on the site of the Regent's Canal, and finally in 1827 to the present Lords' Ground, which in 1864 became their freehold property. The Surrey County Club, with the Kennington Oval as their headquarters, was formed in 1845. In the same year the famous I Zingari Club, confined exclusively to amateurs—first saw light, and commenced its Bohemian wanderings throughout Great Britain, and often into foreign countries. In 1846 an "All England Eleven," under the captaincy of Clarke, "The Nottingham Bowler," commenced playing matches against odds in various parts of the country. Since then several professional elevens annually play what may be termed exhibition matches, in all parts of Great Britain. Such contests are often detrimental to the professionals engaged in them, but on the other hand they have done much to diffuse a zeal for cricket, and at the present time there is not a county, large city, university, or public school, town or village, in England, which does not possess its cricket club, without mentioning the British colonies, and wherever Englishmen assemble abroad in sufficient numbers

The chief works on cricket are—H. Bentley's *Scores from 1786 to 1822*, published in 1823; John Nyren's *Young Cricketer's Tutor*, 1833; N. Wanostrocht's *Felix on the Bat*, various editions, 1845–1855; *Cricket Notes*, by W. Bolland (Hon. S. Ponsonby), 1851; F. Lillywhite's *English Cricketers' Trip to Canada and the United States*, 1860; F. Lillywhite's *Cricket Scores and Biographies*, 1746 to 1840, 1862; Rev. J. Pycroft's *Cricket Tutor*, 1862; Rev. J. Pycroft's *Cricket Field*, various editions, 1862–1873; Rev. J. Pycroft's *Cricketana*, 1865; *Jerks in from Short Leg*, by Quid (R. A. Fitzgerald), 1866; G. H. Thomas), 1871; R. A. Fitzgerald's *Wickets in the West*, 1873; *Marylebone Cricket Club Scores and Biographies*, 1876, a continuation of Lillywhite's *Scores and Biographies*; and C. Box's *English Game of Cricket*, 1877. (H. F. W.)

CRICKLADE, a town and parliamentary borough of England on the northern borders of the county of Wilts, situated in a flat stretch of country on the right bank of the Thames, not far from the Thames and Severn Canal. The town consists of one rather mean-looking street; and its principal buildings are St Sampson's Church restored in 1864, St Mary's with a fine Gothic cross in the churchyard, and public chambers built in 1861. The trade is purely agricultural and local. The position of the town at the passage of the Thames gave it some little importance in the Saxon period, and it sent representatives to Parliament as early as the reign of Edward I. The present parliamentary borough, which extends partly into Gloucestershire, and includes no fewer than fifty-two parishes or parts of parishes, with an area of 26,694 acres, had in 1871 a population of 43,622, of whom less than 2000 were in the town.

CRIEFF, a town in Perthshire, Scotland, on the north bank of the Earn, seventeen miles west of Perth by rail. It is situated on a declivity rising from the river, which is here crossed by a bridge. It consists of a main street with narrower streets branching off at right angles, and contains several churches, an endowed academy for boys, an industrial institution, and a mechanics' institute. The town is comparatively modern, but an ancient sculptured stone still stands in the High Street and also the old town cross. Crieff owes its growth mainly to the central position it occupies in the district of upper Strathearn, which is noted for its beauty and salubrity. Strathearn House, a large hydropathic establishment on the slope of a hill above the town, attracts many visitors. Population in 1871, 4027.

CRIME is a word which, in every-day speech, is sometimes made to include more and sometimes less than the subject of the present article. On the one hand, the breach of a moral principle, with which the law has never concerned itself, is sometimes loosely described as criminal; on the other hand, a distinction is sometimes drawn between crimes and minor offences, though the law prescribes a punishment for minor offences as well as for crimes. But if moral theories and slender shades of difference in guilt are disregarded, crime is simply conduct (either in commission or in omission) of which the state disapproves, and for which it demands a penalty.

Though, however, it is possible to give a definition of crime which may hold good for all times and for all countries, it by no means follows that crime is always and everywhere the same. On the contrary, the growth and the changes of criminal laws are among the most curious monuments of revolutions in public opinion as displayed by legislation. Nor can the study of morals be altogether dissociated from the study of crime, because the moralist may and frequently does influence the legislator, and that which is but a moral lapse in one generation may become a criminal offence in another. So also deeds which have been considered praiseworthy at one period, may at another be punishable; and new conditions of society may cause penalties to be exacted for action or for negligence which would be altogether inconceivable to the savage.

It is obvious that no moral philosopher or legislator, no one even uniting in himself the functions of both, would be able to devise a penal code which would be all-sufficient, and which would be applicable to every possible detail in the development of an ever-expanding civilization. New circumstances demand new laws; and the adaptation of new laws to new circumstances is not the least interesting feature in the history of any country. Religious beliefs, religious and other theories of ethics, the attacks of foreign enemies, the growth of commerce, the progress of science, everything which affects the condition of the community, may affect its criminal legislation.

In very primitive tribes murder, robbery, and rape are not crimes—not, at least, in the modern sense. For one tribe to attack another by surprise, to slaughter its men, to appropriate its land, and to ravish or enslave its women was, and in some places still is, very meritorious conduct. The first approach towards the reprobation of murder is to be found in the ancient blood-feud which, however, resembles quite as much the ferocity of the wild beast deprived of its young as the indignation of the civilized human being at an attack upon the general security of life. The family of the slain assumed the right to exact vengeance of the slayer and his kin if members of the same tribe as themselves; and the earliest form of vengeance was bloodshed. This was not modified until men had arrived at the notion of property distinguishable from that which was held in common by the tribe—a very important stage in the progress of human affairs.

It is well established that the tenure of land in severalty is of later date than tenure by the tribe or community at large; and as soon as the claim of any individual to any particular piece of land was recognized, in any form, the right of property in movables must have been recognized also, if indeed the latter did not precede the former. Sooner or later the ownership of certain families was admitted in the case of plots of ground and flocks and herds, the ownership of particular persons in the case of arms and armour and the implements of agriculture. Hence arose the practice of compounding with the avengers of blood. The relatives of the slain agreed to accept cattle, or any movable goods of which they might stand in need, as an equivalent for the life of the kinsman whom they had lost. But Governments which had advanced very little on the path of civilization perceived that the loss of a tribesman was a loss to the community, because—if for no other reason—it represented a diminution of force in a conflict with a rival tribe. When a fine was paid for murder, therefore, a portion of it only was allotted to the kin of the person murdered, and the remainder to the king or other governing power.

As soon as the state had thus claimed a share of the blood-fine, *wer*, or ποινή, the foundation of the criminal law had been laid—a distinction had been drawn between injuries affecting the individual alone and injuries affecting the community also. It was perhaps only natural that, when movables were accepted as compensation for a life held to be forfeited for murder, the wrongful appropriation of movables should be punishable by death—a not uncommon penalty in many primitive laws. Extreme severity of punishment for all offences (except homicide) committed within the boundaries of the tribe is indeed the characteristic of all the earliest attempts to deal with crime. The idea of the uncivilized man is that the most ferocious chastisement is the most certain deterrent; and as he has won most of that which he possesses by taking it forcibly from others, he is not disposed to attribute to his fellow tribesmen any very high respect for property in the abstract.

Nevertheless, with the tenure of land in severalty, and the acquisition of some personalty, was necessarily developed, in one form or other, the idea of protection for life and property in general. But small tribes continued to be engaged in frequent conflicts with their neighbours; and the principles of right and wrong which were applied to the various individuals composing any one tribe were in practice, if not in theory, long disregarded in dealings with the stranger. Outside a certain circle of no very great extent killing was still no murder, taking no theft or robbery, capture or violation of a woman no rape, in the modern sense. When tribes became united into nations, the rivalry of clan against clan was not immediately extinguished; and the sentiments of the robber chieftain coexisted with governments which sanctioned laws for the repression of robbers and their deeds of violence. National growth out of these discordant elements is to be traced, with the greatest clearness, in the marvellously complete series of records preserved in the English Public Record Office, and not least in those which concern the Scottish and Welsh borders.

The law of development is not restricted to one island, or to races speaking one particular language. Its range appears to be as wide as history, and is sometimes to be detected even where history can hardly be said to exist. If, for instance, we compare the Latin word *virtus*, the Greek word ἀνδρεία, and the Cymric word *gwroldeb*, with the English word *virtue*, we find a curious light thrown upon the progress of human opinion. The first three all had originally the same meaning—"virility;" and all three acquired precisely the same secondary signification—"courage." The reason, of course, was that in the most primitive times courage was the one great quality which above all others commanded approbation. The want of a moral attribute so universally approved was in those days a crime, and the *imbelles*, or cowards, were, if Tacitus is to be believed, subjected by the Germans to a punishment sufficiently horrible. They were thrown under a hurdle and smothered in filth. But now the word *virtue*, which once had the special meaning of strength of muscle and nerve in the man, has (if any special meaning at all) that of chastity in the woman.

Brave law-breakers, in past times, have not only believed themselves to be good men and true, but have also had the sympathy of great numbers of their fellow-countrymen. Indeed, if we regard the history of criminal legislation and of crime in England, we find the ideas of the primitive tribesman steadily resisting the advance of civilization, retreating very slowly from position to position, and rarely yielding one without a long and desperate struggle. A most prominent example of this tenacity was in the crime of forcible entry, which hardly ceased to be common before the 18th century. When valour was the greatest or only virtue, one clan took land by force from another, and clansman differed from clansman only in the greater or less vigour and courage shown in making the appropriation. Long after this half-savage condition of society, it remained a maxim of the English law that there was no legal possession of land without actual seisin. The law, indeed, would not allow its right hand to know that which was done by its left. It forbade forcible entries in the reign of Richard II., while forcible entries were an essential part of its theory. As late even as the reign of William IV. the fiction of a forcible entry continued to be one of the chief implements of the conveyancer's art. Without the "common recovery" he would have been unable to carry on the ordinary routine of his business; and the basis of that fictitious action at law was that one person had wrongfully disseised another of his land.

The much abused Court of Star-Chamber owed its definite constitution under the Tudors to a very laudable desire for the repression of forcible entries and certain other kindred offences. Nor was it altogether unsuccessful in attaining the object for which it was established. Those private feuds in which the nobles, like the heads of tribes, had previously delighted, began to die out when private armies could no longer be kept on foot under the name of retainers, or supplied with uniforms under the name of liveries and tokens. Yet the fact that the Star-Chamber did not entirely put an end to forcible entries is a proof that even the most vigorous legislation is not all-powerful against the human nature and the surrounding circumstances with which it may have to deal. Those circumstances, and even that nature, may to some extent be changed, for were it otherwise the British empire and British civilization could now have no existence. But there is a reciprocal action and reaction of laws upon society and of society upon laws. No edict or statute ever made a sudden and complete alteration in the manners of a whole nation, though the growing wisdom of a nation may frequently have suggested a law, and though a well-devised law may have gradually fostered the growth of national wisdom. If it is true that *nemo repente fuit turpissimus* it is no less true that *nemo repente fuit honestissimus*.

The modern security of life and property of every description represents the triumph of new ideas over old. There is or was a popular delusion that the savage was noble, that while his manners were simple his nature was honest, and that he abhorred all such mean arts as those commonly attributed to the huckster and the trader. The truth is that his misdeeds were limited to his own particular sphere of action, which was excessively small, and that if he did not commit some of the offences known in our own time it was because he had not the opportunity. Fraud has never increased in equal proportion with the increase of trade and civilization. It infected commerce at the very beginning, and existed during the darkness of the Middle Ages in every form then possible. It may and it sometimes does assume new shapes as society groups itself anew, as occupations and the relations of man to man are changed. But force is its near relative and ally, and it flourishes in times of violence and anarchy. It made itself conspicuous throughout the age of chivalry, though poets and romance writers have attempted to hide it away. With infinite difficulty has civilized mankind so far gained the victory over its own primitive nature as to concur, with some approach to unanimity, in reprobation of the forger-monk, the brigand-knight, and the man who regarded a woman as a chattel and a tempting object for appropriation.

It is most necessary to bear in mind the contrast between the habits or ideas of one period and of another, if we wish to estimate correctly the position of the criminal in modern society, or the alleged uniformity of human actions to be discovered in statistics. There is, no doubt, some truth in the statement that in a modern civilized country—Great Britain, for example—the statistics of one year bear a very strong resemblance to the statistics of another in many particulars. But a little reflection leads to the conclusion that there is nothing at all marvellous in such coincidences, and that they do not prove human nature to be unalterable, or circumstances to be unchangeable. They only show what might have been predicted beforehand, that human beings of the same race, remaining in circumstances approximately the same, continue to act upon nearly the same motives and to display nearly the same weaknesses.

The statistics of a quarter of a century, of half a century, even of a whole century (if we had them complete for so long a period), could tell us but little of those subtle changes in human organization which have come to pass in the lapse of ages, and the sum of which has rendered life in Britain in the 19th century so different as it is from life in the 6th. Some of the earliest statisticians, indeed (and their science is of very recent origin), did an injustice both to themselves and to their favourite study through their own enthusiasm. They were eager to claim for numbers all and more than all that had been claimed by the Pythagoreans of old. Not content with praising the virtues of numbers in general, they appeared to believe that the particular numbers of a particular period would suffice for the discovery of social and political principles of universal application. They found certain uniformities in an area so bounded, and a time so short, as to bear to the previous existence of the whole earth and its inhabitants about the same proportion that a drop of water bears to the ocean; and they assumed that they had found a law or laws of a range co-extensive with human existence. But this exaggeration does not impair the real value of the statistical method or of some of the facts which it has brought to light. It has supplied us with some generalizations which are demonstrably true within certain limits, and which constitute useful elements of comparison with others discoverable elsewhere. It has not established that human conduct, regarded as a great whole, is absolutely invariable, but it has supplied a powerful instrument for an inquiry into the conditions by which variation may be determined.

If, for instance, we look at the statistics of homicide and suicide in England during any ten recent years we perceive that the figures of any one year very little exceed or fall below the general average. Yet no inference could be more erroneous than that homicide has always borne the same proportion to population in England as at present, for in the reign of Edward III. there were in proportion to population at least sixteen cases of homicide to every one which occurs in our own time. On the other hand, according to modern statistics, the number of male suicides is far greater than the number of female; and the inference that the number of male suicides always has been greater is at least supported by records as early as the middle of the 17th century. Again, the homicides in one country may be and are far more numerous than in another, among equal populations; but nowhere does there exist any exception to the rule that there are more male suicides than female. Thus it is clear that any suggestion of uniformity offered by statistics requires the most careful verification before being accepted as even approximately true; but it is also clear that the suggestion may be of the highest value in leading us to distinguish those cases in which uniformity really exists from those in which uniformity is only apparent.

The criminal statistics of any one country and period should be carefully examined by the light of history, and of any relevant details which can be procured from other parts of the world. Only by the aid of the adequate information thus to be acquired can criminal legislation ever be wise and effective, no matter what definition of crime may be accepted by the legislators. A knowledge of human nature in the widest sense, not excepting, indeed, some of the principles of physiology, may give some power of discriminating between the mutable and the immutable, the possible and the impossible, in human affairs. Without it, well-meaning efforts to improve the condition of society may be not only unsuccessful but even mischievous. Without it, disappointment is apt to follow upon the failure of some apparently well-conceived law to effect the purpose for which it was devised. The disposition inherited from past ages can (in some fields of action and in some individuals at least) as little be changed by the *fiat* of a Government, as the ebb and flow of the sea can be controlled by the word of a king. But, nevertheless, there is good reason to believe that judicious lawgivers may gradually effect a salutary change in the manners of a people.

One of the most remarkable illustrations of uniformity in the phenomena of crime is one which may be regarded also as an illustration of the influence of past conditions of society upon the present. As the human embryo passes through sundry stages of an inferior state of existence, so, after birth, the human being is before the age of thirty more apt to fall into courses which we now regard as criminal (but which the savage considered laudable) than the human being of more advanced years. This, like the rule of the sexes in suicide, is a rule having no exception at any time or in any country concerning which it is possible to obtain information. But even here the proportions are not absolutely invariable, though the general law holds universally good. From various causes, of which one is the abolition of transportation, another the establishment of reformatories, the criminal age has perceptibly risen in England since the year 1851. So also, although the general law that men are more prone to commit suicide than women is altogether beyond dispute, the proportions of the sexes vary considerably in suicide and in various crimes in different countries, and apparently also at different times in the same country. Hence we may infer that there is hardly any social change of which the human species need absolutely despair, though some changes may be far more easily brought about, and may more reasonably be the subject of legislation, than others. But all legislation should be adapted to the possibilities of the existing generation.

A very curious feature of crimes in the modern sense, though one susceptible of very easy explanation, is the effect upon them of the seasons. Those which are prompted by the animal passions are most common in the summer months; larceny, and offences wholly or partly prompted by want, in the winter months. As might also have been predicted *a priori*, theft increases in times of adversity, and various minor offences, such as drunkenness, in times of prosperity. The metropolitan police returns, indeed, show a very complete descending scale of drunkenness, beginning with a maximum on that day of the week on which wages are paid, and ending with a minimum six days afterwards.

Insanity, in its relation to crime, is a subject which might appropriately be considered in connection with the tendencies inherited by each human being at birth, but cannot be adequately discussed here. Suffice it to say that as youth, when the instincts and passions are at their strongest, is the period at which the human being is most inclined to commit crimes in general (as now understood), so old age, when both the bodily powers and the intellect are decaying, is the period at which one particular class of sexual offences is most frequently committed; and there is good reason to suppose that persons committing them in earlier years are weak-minded also. Kleptomania and homicidal monomania are asserted by medical theorists to be forms of mental aberration. This doctrine, however, though perhaps sufficiently well-founded, can hardly be established upon the basis of a very wide induction, but only by a subtle reasoning from particular instances upon which it is now impossible to enter.

With regard to the very complex subjects of the prevention and punishment of crime, it may be suggested that the broader the view taken by legislators the more likely to their legislation to be successful. Crime, as defined at any period, may be considered a recognized disease of the body social. But as well might the physician concentrate his whole attention upon each individual pustule of an eruptive fever, one after the other, as the criminal legislator upon actual criminals alone. The symptoms of a malady are of course not to be neglected, and it is necessary to be careful in the treatment of persons who have already fallen into crime. Prison management and every form of punishment are important subjects ; but the preservation from guilt of the great majority who are as yet guiltless is of an importance infinitely higher. There is one golden rule taught by history with respect to punishments—let them not afford an evil example of cruelty to the spectators. There is one great preventive of crime, one great antidote to instincts inherited from the past, and that is education. But the education which is effectual is not simply that of the schoolroom; it is the sum of the external circumstances which can in any way affect the character of any individual in the state. So far, therefore, as legislation has the power of diminishing crime, it can exercise its power by indirect means quite as much as by direct—indeed far more. If the crimes of the English in the 19th century are different both in quantity and in kind from those of the 14th, the difference, we may be quite sure, is not wholly nor even principally caused by changes in the criminal law.

See various passages in the books of Numbers, Deuteronomy, and Joshua, in Homer's *Iliad* (especially book xviii.), in Cæsar *De Bello Gallico*, in the *Germania* of Tacitus, in the *Codex Theodosianus* (especially lib. ix.), in the *Ancient Laws and Institutes of England*, and the *Ancient Laws and Institutes of Wales*, (both published by the Record Commission), in the *Ancient Laws and Institutes of Ireland*, *Senchus Mor* (published by commissioners), in Maine's *Ancient Law* and *Village Communities*, in M'Lennan's *Primitive Marriage*, in Savigny's *Geschichte des römischen Rechts in Mittelalter*, and (so far as natural or inherited tendencies are concerned) in Darwin's *Descent of Man* and Herbert Spencer's *Principles of Psychology*.

See also the *Rotuli Curiæ Regis* (published in part by Palgrave), the *Records of the Court of Queen's Bench and of the Star Chamber*, the *State Papers* relating to the Scottish Border, the *Criminal Papers*, and various other Records and State Papers preserved in the Public Record Office in London, the *Records* of the various circuits, the *Statutes* relating to criminal affairs, the *Year Books* and other legal Reports, various collections of *Criminal Trials*, the *Criminal Tables* (England and Wales, 1810—1855), the *Judicial Statistics* of England and Wales, of Scotland, and of Ireland, the *Reports of the Inspectors of Prisons* for England and Wales, for Scotland, and for Ireland, the *Reports of the Directors of Convict Prisons*, the *Compte général de l'administration de la justice criminelle en France* (published annually), the *Statistik der preussischen Schwurgerichte*, Quetelet *Sur l'Homme*, Guerry's *Statistique morale de la France* and *Statistique morale de l'Angleterre comparée avec la statistique morale de la France*, various papers in the *Journal of the Statistical Society*, and in the *Transactions of the Association for the Promotion of Social Science*, Beccaria's *Dei Delitti e delle Pene*, Bentham's works, Livingstone *Système de legislation criminelle*, the *Indian Penal Code*, Taylor's *Medical Jurisprudence*, Chevers's *Indian Medical Jurisprudence*, Maudsley's *Responsibility in Mental Disease*, and other sources indicated in Pike's *History of Crime in England*. (L. O. P.)

CRIMEA, the ancient Tauric Chersonese, called by the Russians by the Tatar name Krym, or Crim, a peninsula in the Black Sea forming part of the Russian government of Taurida, with the mainland of which it is connected by the Isthmus of Perecop, about six miles wide. It is situated between 44° 22′ and 46° 10′ N. lat. and 32° 30′ and 36° 40′ E. long. ; is rhomboid in form, the angles being directed to the cardinal points ; measures 125 miles from N. to S. and 200 miles from W. to the E. extremity of the peninsula of Kertch, at the east angle of the quadrilateral ; and contains an area of between 9000 and 10,000 English square miles. Its coasts are washed by the Black Sea, except to the north-east, where is the Sivash, "Putrid Sea," a shallow lagoon connected with the Sea of Azoff by a very narrow opening, and separated from it by a low sandy tongue of land called the Tonga or Arabat Spit.

Three parts of the Crimea are a continuation of the steppe of South Russia, the remainder on the south and south-east coast consisting of hills and mountains of calcareous rocks that have been disturbed by volcanic agency, and exhibit in various parts diorite, melaphyre, aphrite, diabase, amygdaloid, and diorite porphyry. The volcanic eruptions are more manifest near Cape St George, and at Cape Laspy, Kastropolo, Aloupka, Yalta, and Byouk Lambat, and have formed the eminences at Ayou-dagh, Kastel, Ouragou, and Kara-dagh, and to the south of Sympheropol and Kara-sou-bazar. The mountains rise almost abruptly from the sea to an altitude in some parts of fully 4000 feet, the highest, called by the ancients Trapezus, "the Table Mountain" from the flatness of its summit, and now called by the Tatars Tchadyr-dagh, "Tent Mountain," being 4800 feet above the level of the sea. Stalactite and stalagmite caverns are numerous, two of the most remarkable being on the Tchadyr-dagh. Criumetopon, the "ram's head" of Strabo, was at the south part of the range, and may have been Cape Aïa to the east of Balaclava, or the range of cliffs that extends from that promontory to Aïtodor. The coast of the mountainous region is exceedingly picturesque, and numerous vineyards have been formed along its sunny slopes ; the soil consists of decomposed rock, the chief component part being slate clay. The mud baths on the sea shore at Saky are celebrated for the relief they afford in cases of rheumatism, paralysis, skin diseases, &c. ; there is a hospital for naval and military patients, and a private bathing establishment. In the peninsula of Kertch are clusters of mud volcanoes near the town of Kertch and village of Yeny-Kaleh, where the mud, quite cold and black, bubbles actively but silently out of the earth ; it is not utilized.

The principal rivers are the Salghyr, its tributary the Kara-sou, the Belbeck, Katcha, Alma, and Boulganack. They all rise on the northern slopes of the mountain range ; their beds are almost dry in autumn, but they become rapid and dangerous torrents in spring.

The general climate from the end of March to December is most salubrious and delightful, the heat being moderate and the nights cool and serene ; but the summers are irregular, the thermometer sometimes rising to 90° and 100° Fahr. in the shade—the mean annual temperature at Sympheropol being 50°, at Sevastopol 55°, and at Yalta 58°. The weather in the steppe and mountainous parts differ, the former being subject to high winds, hailstorms (sometimes destructive), snowstorms, and frost. In summer long droughts prevail, completely parching up the verdure, which in July and August is quite burnt up. In some winters the mountain tops are covered with snow, which continues on the higher summits until May, yet their temperature is moderate. Ice is rarely seen on the south slopes, and snow seldom falls, the winters throughout being mild, though rains are heavy and winds variable. The greater heats, which last from May to September, are endurable owing to sea and land breezes, the prevalent winds being S.E and E., when the weather is clear and dry ; S. and S.W. winds are invariably accompanied with rain. The autumn, particularly in August and September, is unhealthy on the sea-shore of the south coast, fever and ague being prevalent but not dangerous ; an altitude, however, of 40 feet or 50 feet is security against attack. Dense fogs occur in March, April, and May, sometimes lasting many hours, but they seldom overspread the land. Climate.

In ancient times the Crimea, the Tauric Chersonese, produced a great quantity of corn, which was exported to various parts of Greece ; we read that 2,100,000 *medimni* (a medimnus = 12 gallons) were sent in one year from Theodosia to Athens by Leucon, king of the Bosphorus (393–353 B.C.). The population is now in some measure supplied with corn from Russia, the drought that has prevailed for many years preventing the district from being a grain-producing country ; but where the land is capable of irrigation it is grown, and there is rich pasturage ; much good land, however, remains uncultivated from a dearth of manual labour. The grains sown are wheat, barley, oats, rye, maize, millet, and peas; flax and tobacco are also planted. The vine overspreads the declivities of the south coast, from the valley of the Boulganack to Aloushta, and again at

Soudak and Theodosia, 13,500 acres yielding annually about 3,050,000 gallons of wine, sold new at 4s. 10d. to 5s. 6d. the *vedro* (2·86 gallons). A small proportion is exported. Orchards are interspersed with the vineyards, but the best apples are the produce of the valleys of the Alma, Belbeck, Katcha, and Salghyr, the estimated value of the supply sent yearly into Russia being £150,000. The more common indigenous trees and shrubs are the Tauric pine, juniper, yew, oak, beech, which is abundant and attains a large size, elm, wych elm, maple, ash, poplar, and fir; the last grows well on the highlands and on the south slopes, where it reaches a great height; the Babylonian willow and tamarind grow thickly by the side of streams; there is also the hide sumach (*Rhus coriaria*), hawthorn, honey-suckle, barbariss, and the dog-rose, which becomes quite a tree, bearing white, pink, and yellow blossoms. The wild fruit-bearing trees are the mountain ash, *kyzyl*, a small red plum, the apple, pear, and vine; it is said that the wild olive is occasionally to be found. In the gardens of the south coast large numbers of plants have been acclimatized, and trees of all kinds grow to perfection, especially the cypress and magnolia. Wild flowers, such as the white and violet crocus and sweet-scented violet, appear as early as February, lilies of the valley and white and sweet peas being plentiful in May, and in summer the woods are filled with peonies, *Asphodelus taurica*, veronica, geranium, and orchids. In the highlands the vegetation is always vigorous. In July they are covered with *Thymus*, *Sideritis*, *Galium*, *Myosotis*, and *Odontarrhena*, *Gentiana cruciata*, and *Symphytum tauricum*. In the gardens are cultivated the following fruits:—melons, *karpouz*, "water-melon," large, of excellent flavour, and greatly consumed; strawberries, gooseberries, raspberries, and currants; pomegranates, pears, figs, plums, peaches, apricots, cherries, mulberries, quinces, walnuts, almonds, hazel-nuts, and chesnuts; also many sorts of vegetables.

Animals. Wolves, foxes, weazels, and hares are about the steppe and in the mountains, where are also the Persian and roe deer; while the steppe is infested with the souslyk (*Spermophilus*). The forests of Tchadyr-dagh are preserved for the crown, but permission to shoot, from June 29 (July 11), may be obtained. Domesticated animals include double-humped camels, buffaloes, beeves, and several kinds of sheep, one sort being distinguished by short curly hair of a bluish-grey colour; the merino sheep was introduced in 1804, and the breed is well maintained. The horses are small, hardy, and intelligent, but uncouth in appearance. The birds consist of eagles, vultures, hawks, ospreys, storks, herons, and some other birds of prey; partridges, which on the steppe are strong on the wing by the end of July; the ordinary, double, and jack snipe, quails, pigeons, bustards, swans, geese, bitterns, and wildfowl of every description, especially on the Sivash and north-west coast; also crows, owls, thrushes, blackbirds, king-fishers, &c. Serpents that are harmless, lizards, and frogs are abundant. The scorpion, mentioned by Pallas, is now very rare, but tarantula spiders and scolopendra, both noxious, frequently make their appearance in dwellings. Caterpillars and the mole cricket (*Gryllo Valpa vulgaris*) are very destructive in gardens. Bees are abundant, and produce excellent honey and a great deal of wax. In the rivers are taken trout, roach, dace, and cray-fish, and at their estuaries the sturgeon is sometimes found, and the salmon is speared. A great variety of fish haunt the coast, such as red and grey mullet, herring, mackerel, turbot, soles (at Eupatoria), plaice, whiting, bream, haddock, pilchard, *soudak* (the pike perch), whitebait, eels, and a variety of shell-fish, crabs, &c., but no lobsters.

The Tatar population, the largest in the peninsula, amounted in 1874 to 127,682, according to the census taken a few months after the promulgation of the *oukaz* on the new system of general conscription, in which the Tatars were included. There are also Russians, Armenians, Gypsies, Greeks, Jews, and some Germans. The Nogai of the steppe have long since disappeared as natives, and are replaced by Tatars of almost pure Turkish descent, and speaking a language closely assimilating the Turkish. The Tatars on the south coast are a mixed race, largely alloyed with Greek, Italian, and Ottoman blood, and greatly despised by the former; but all are Mahometans, and strict observers of the Koran. The Tatars are extremely indolent, and never think of learning a trade; they busy themselves about their fields and gardens from the end of May to about the third week in August, but remain quite idle throughout the rest of the year. They are most hospitable to strangers, every Tatar of means keeping an *óda*, or house of call for travellers, the first duty of a Tatar being the exercise of hospitality, on which he prides himself. Their cottages are constructed, when possible, on the slopes of rising ground, the rock forming the back of the habitation, which is usually whitewashed and kept scrupulously clean, ensconced by fruit trees and verdure. The Tatars are very abstemious, drinking milk and *bouza*, a fermented liquor made of millet; *koumyss*, "mare's milk," is much employed by them medicinally. The men wear baggy trowsers, a short embroidered jacket, and a cap of lamb skin; the women colour their nails, eyebrows, and frequently their hair, made up into numerous thin plaits, with *kna*, a mineral dye, and wear loose trowsers tightened at the ancles, a loose coat, and a red cap ornamented with numerous coins; they tie a kerchief round the waist, the opposite corners hanging down behind. The females, more especially on the south coast, have quite given up wearing the *yashmak*, "veil," since the occupation of the country by the allies in 1854–56. The *mourzas*, "nobles," live in retirement, shunning intercourse with Christians, but their women are not kept in seclusion, every village has its *molla*, who is also the "elder," and responsible to the authorities. The Armenians and Greeks hold the trade, as do also the Jews who are Karaims, "readers," of the Holy Scriptures, adhering strictly to the text of the Old Testament, and rejecting all oral traditions and rabbinical writings, keeping themselves quite apart from the Talmudists, to whom they are most odious. There are about 5000 Karaims in the peninsula. Russians and Germans are chiefly engaged in agriculture, while the gypsies are the artificers. The Russian language is very general throughout the peninsula.

Sympheropol, the chief town and seat of government (population, 17,000), is situated on the Salghyr, where was Ak-mesjyd, the second capital of the khanate. Like all Russian towns, it has fine broad streets at right angles to each other, and the usual whitewashed churches with green domes. Baghtchasarai and Kara-sou-bazar were given up by Catherine II. to the exclusive occupation of the Tatars, and have remained purely Oriental towns. Baghtchasarai, "garden palace," was the capital of the khans after the destruction of Solkhat, now Esky-Crim; their palace is preserved to this day. Kertch, at the east end of the peninsula, is a fairly thriving port of transit for produce from ports in the Sea of Azoff, and imports into Russia of cattle and horses from the plains of the Kouban and of Circassia. It is a military station of some importance, the entrance to the straits of Kertch, or Yeny-Kaleh, the ancient Cimmerian Bosphorus, being protected by the formidable Pavlovsky fortress, a combination of masked batteries and covered ways over an extent of two miles. Theodosia, formerly Caffa, where a small export and import trade is carried on, thrives as a favourite watering-place. Sevastopol, in the superb harbour that bears its name, created a military port and fortress by Catherine II., was Towns.

bombarded and occupied by the Allies in September 1855. Eupatoria, formerly Khezlevé and Kozloff, is the great emporium for salt, and during Turkish occupation was the principal port in the Crimea; its inhabitants are chiefly Karaims, who have here a "spiritual institution" under their *Gahan*. Balaclava, the *Symvolon limen* of Strabo, *Cembalo* of the Genoese, is a small Greek fishing village in a splendid land-locked harbour to the east of Sevastopol, remarkable as being occupied by the British during the war. Yalta is a small but fashionable watering-place on the south coast, with excellent hotels and many inducements to visitors, the season lasting from May to September. Near Yalta is Livadia, the residence of the empress, and other imperial properties.

The most valuable commercial production is salt, of which the yearly supply is 15,000,000 *pouds* (a poud = 36 ℔ English). Salt entering Russia is excised at 30 copecks (9d.) per poud, and the entire revenue to the Government from the salt-lakes in the Crimea is estimated at £1,785,714. There are no manufactures, but the principal articles of export are wine, *kil* (*i.e.*, fuller's earth), honey, wax, hides, lambskins, and wool. A reddish marble from quarries near Tchadyr-dagh is exported in small quantities. Communications in the peninsula are maintained by excellent post-roads and bridle-paths; and a railroad which connects Sevastopol, Baghtchasarai, and Sympheropol with the south of Russia was opened for traffic in January 1875.

The earliest known inhabitants of the Crimea were the Cimmerians, who were driven out by the Scythians about 680–631 B.C., and fled into Asia Minor, leaving only a remnant, who took refuge in the mountains and were afterwards known as the Tauri. These appear to have been a savage people, from the fact that all strangers that landed, or were cast on their coast, were sacrificed to the virgin goddess Iphigenia, afterwards apparently identified with a goddess of their own mythology by the Grecians, who named the country the Tauric peninsula after their predecessors, whence the Russian name Taurida. The numerous crypts existing about the rocky heights were in all probability the troglodyte caves of the Tauri; in some parts they were converted into hermitages and retreats by the Greeks during Byzantine occupation, and were again so utilized by their successors in the last century; these caves are to be seen at Ak-Kaya, Tepe-Kerman, Katch-Kalen, Tcherkess-Kerman, Mangoup, Mangoush, Tchyfout-Kaleh, Inkerman, &c.

In the year 658 B.C. the Heracleotes crossed the Axine, as the Black sea was then called, and founded a colony near where is now Sevastopol, the territory they occupied becoming known as the Heracleotic Chersonese, to distinguish it from the Tauric Chersonese. The city of Chersonesus flourished under its own free institutions during the space of 1000 years, and even longer, though it became a dependency of the Eastern empire; it was taken in 988 by the Russian grand-prince Vladimir, who there received baptism, and was completely destroyed in 1363, by Olgerd, grand prince of Lithuania. In the 7th century B.C., other Grecians, the Milesians, settled at Theodosia, and later at Nymphæum and Panticapæum (Kertch), which last city became their metropolis under the authority of an archon, and afterwards of a king, whose dominion, the kingdom of the Bosphorus, included Phanagoria on the eastern shore of the Cimmerian Bosphorus, a city founded with others at the same time as Panticapæum, and the emporium of the people on the Asiatic shores of the strait. Parisades, sovereign in 115 B.C., being hard pressed by the Scythians, voluntarily ceded his dominion to Mithridates, king of the Pontus, whose son Pharnaces, after his own downfall, was permitted by Rome to assume the sovereignty of the Bosphorus, a sovereignty that continued until a late period under the protection of the Roman empire. The peninsula was overrun successively by the Alans (62 A.D.), the Goths, whose descendants, peaceably employed in agriculture, remained until the early part of the 14th century, the Huns in 376, the Khozars in the 8th century, expelled by the Byzantines in 1016, and the Kiptchaks, who possessed themselves, about 1050, of Khazary, by which name the peninsula was called, after the Khozars, they being in their turn expelled by the Mongols, about 1237. Panticapæum, or Cerchio (Kertch), was for a time (1343), occupied by the Venetians, their successors being the Genoese, who had established themselves at Caffa (Theodosia) in 1263–67, and to whom the seaboard known as Gothia, extending to Cembalo (Balaclava), was ceded in 1315. Cembalo, Soldaia (Soudak), and Caffa were strongly fortified by them, Caffa being the centre of an extensive Asiatic trade that included Persia, India, and China. The ruins of the Genoese fortifications still remain.

After the destruction of the Golden Horde by Tamerlane, the Tatars of the Crimea elected, about 1428, a khan for themselves, a descendant through Toktamish of Jinghis Khan, one Hadgy, who assumed the name of Ghyrey, his capital being at Solkhat, now Esky-Crim. This khanate continued independent until the conquest of Crim by Mahomet II. (1475), who made the khan prisoner, and sent the Genoese and other Christians into servitude and slavery. The khans, thenceforth the vassals of the sultans, were at the head of a warlike race, by whom the Russian provinces were being continually devastated until the year 1777, when Suwaroff dispersed the troops of Dyvlett Ghyrey, who fled to the Caucasus, and the usurper Selim Ghyrey ascended the throne under the protection of Catherine II. He was, however, forced to appeal to Russia for succour against revolt amongst his own subjects, and the Crimea was eventually annexed to the Russian empire by order of the empress, August 1, 1783, the treaty for its cession by the Porte being signed January 9, 1784.

The Crimea was occupied by the allied forces of Great Britain, France, and Sardinia during the Russo-Turkish war of 1853–56. The British and French troops landed near Eupatoria, September 14, 1854, and did not evacuate the peninsula until July 12, 1856, during which period were fought the battles of the Alma, Tchornaya, Balaclava, and Inkerman, and the formidable fortress of Sevastopol was reduced by siege.

CRIMINAL LAW. A crime is an offence which the law punishes directly, as distinguished from an offence which it punishes indirectly by giving an action for damages to the person injured. The criminal or penal law is that portion of the law which deals with crimes. Sometimes it is attempted to distinguish crimes fom civil injuries by saying that the former are offences against the state, the latter offences against individuals, or again by saying that the former are prosecuted by the state, the latter by private persons. But all illegal acts are offences against the state, and in England the state is not, nominally at least, the prosecutor of criminal offences. Civil injuries, or torts, as they are called in the law of England, are offences for which the injured person may sue in a court of justice. Torts and crimes do not therefore necessarily exclude each other, for the same act may be both a tort and a crime in the sense that the injured person may sue for damages, and the offender may likewise be prosecuted and punished. Further, it should be observed that many offences which are crimes in the sense of being directly punishable, are, so far as the morality of the act is concerned, far removed from the class of crimes. To allow your chimney to go on fire is a crime in the sense that it is punishable by fine, but it is not a crime in the sense of the preceding article, or in the ordinary acceptation of the term.

The law of England on the subject of crimes is, like the rest of the law, composed of a large number of enactments, resting on a basis of common law. Its leading definitions and distinctions are derived from the common law, modified by judicial interpretation and by statute. A few of the general principles of the criminal law of England will be stated here; for information as to the law relating to specific crimes reference should be made to the respective heads.

The absence of systematic arrangement and of any precise definition of crimes is due to the historical character of the criminal law. "It is founded," says a high authority, "on a set of loose definitions and descriptions of crimes, the most important of which are as old as Bracton. Upon this foundation there was built, principally in the course of the 18th century, an entire and irregular superstructure of Acts of Parliament, the enactments of which were for the most part intended to supply the deficiencies of the original system. These Acts have been re-enacted twice over in the present generation—once between 1826 and 1832 and once in 1861; besides which they were all amended in 1837. Finally, every part of the whole system has been made the subject of judicial comments and constructions occasioned by particular cases, the great mass of which have arisen within the last fifty years." (*View of the Criminal Law of England*, by J. Fitzjames Stephen).

A crime being defined as an action specifically forbidden under penalty of direct punishment, it may be stated, without entering into a minute analysis, that to render a person liable to punishment he must have a guilty intention, or, as it is called in English law, malice. This malice will be inferred from the fact that the forbidden action has been done; a man will be presumed to have intended the natural consequences of his own acts. The inference, however, may be rebutted by evidence showing that the criminal intention required to constitute a crime was not as a matter of fact present. And there are certain conditions from which the law will infer the impossibility of any such intention. A child under seven is held to be incapable of committing a crime. If a married woman commits an alleged crime in presence of her husband, she will be held to have acted under his compulsion. The state of mind described as insanity, also excludes the possibility of criminal intention.

Crimes are divided into treasons, felonies, and misdemeanours. The first class includes offences against the state, *e.g.*, violence to the person of the king, or resistance to the authority of the sovereign power. The distinction between felonies and misdemeanours is not so easily drawn, and is founded if anything on the nature of the punishment and not of the crime in such case. In the definitions of crime in Bracton, misdemeanours appear as a less serious class of crimes, after the graver crimes of treason, crimen falsi, homicide, mayhem, arson, rape, and theft have been described. They are "minor or lighter crimes, prosecuted civilly as in personal actions for injuries." They are regarded as of the nature of wrongs done to the sovereign power. In a trial for felony the jury are required to make true deliverance between the queen and the prisoner at the bar. In a trial for misdemeanour they are to try the issue joined between the queen and the defendant. The principal common law misdemeanours—libel conspiracy, and nuisance—have an obviously direct reference to the public peace, and may without much violence be regarded as grievances to the sovereign power itself. In Russell *On Crimes*, a misdemeanour is said to be the name generally applied to offences for which the law has not provided a particular name. But so many crimes have been created misdemeanours by statute which do not differ in character from felonies, that no distinction founded on the nature of the crime can be drawn between them. Nor can they be distinguished by the greater or less severity of the punishment, for some misdemeanours are punished more severely than felonies. Besides, however, the differences in the mode of trial noted above, felonies differed from misdemeanours inasmuch as they involved a forfeiture of property—a distinction which no longer exists, since forfeiture for felony was abolished by 33 and 34 Vict. c. 23. And in general there are greater facilities for arresting the criminal in case of felony than in misdemeanours.[1] It is unfortunate that a distinction so fundamental should be so utterly vague. All the crimes known to the law may be divided into felonies and misdemeanours, for treason is after all a case of felony, but it is impossible to say what felony is or what a misdemeanour is without an enumeration of the specific crimes which are ranked under each head. The Consolidation Acts form a classification of crimes which is more easily understood, although it does not cover the whole of the criminal law. Thus the Acts of 1861 (24 and 25 Vict. cc. 96, 97, 98, 99, and 100) relate respectively to larceny, malicious injuries to real property, forgery, coinage, and offences against the person.

The definitions of particular crimes are still to be sought in the common law and the decisions of the judges. The Consolidation Acts for the most part leave them as they stood, *e.g.*, the Larceny Act does not define the crime of larceny. The consequence is that exact definitions are very difficult to frame, and the technical view of a crime sometimes includes more, sometimes less, than it ought. Thus the crime of murder, as settled by the existing law, would include offences of such very different moral gravity as killing a man deliberately for the sake of robbing him, and killing a man accidentally in an attempt to rob him. On the other hand, offences which ought to have been criminal were constantly set aside by the judges as not being within their definition of the particular crimes alleged, and the legislature has constantly had to interfere. In this way the penalties of larceny were gradually extended to embezzlement, frauds by trustees, &c.

Attempts to commit crimes are themselves crimes. It is laid down in Russell *On Crimes* (vol. i. p. 189) that "an attempt to commit a felony is a misdemeanour, and an attempt to commit a misdemeanour is a misdemeanour, whether the offence be so by common law or by statute." An attempt to murder was at common law no more than a misdemeanour punishable by two years' imprisonment. This was the case until 1861; but now by the 24 and 25 Vict. c. 100 (Offences against the Person Act), any person attempting by the means specified therein, or by any other means, to commit murder, is guilty of felony and punishable by penal servitude for life or for any term not less than three years, &c., or to be imprisoned for not less than two years with or without hard labour or solitary confinement.

Persons accused of a crime may be either principals or accessories, and these are further distinguished into principals of the first and second degree, and accessories before

[1] Any one who has obtained a drove of oxen or a flock of sheep by false pretences may go quietly on his way and no one, not even a peace officer, can apprehend him without a warrant, but if a man offers to sell another a bit of dead fence supposed to have been stolen, he not only may but is required to be apprehended by that person (Greaves, *Criminal Law Consolidation Acts*).

and after the fact. Principals in the first degree are those who *have actually and with their own hands committed the fact.* Principals in the second degree are those who were present *aiding* and *abetting* at the commission. An accessory before the fact is one who, being absent at the time of the offence committed, doth yet procure, counsel, command, or abet another to commit a felony. And an accessory after the fact is one who, knowing a felony to have been committed by another, receives, relieves, comforts, or assists the felon. Participation in the commission of a felonious act in any of these ways is a felony (Russell *On Crimes*, vol i. p. 156). By the Accessories and Abettors Act (24 and 25 Vict. c. 94) accessories before the fact may be tried and punished as principals, and accessories after the fact may be indicted as such or as substantive felons.

Criminal procedure in England is distinguished by several special features, the most remarkable of which is its close similarity to procedure in ordinary civil cases. Crimes are left, like civil injuries or breaches of contract, to be prosecuted by the persons injured, and the nature of the trial, the character of the tribunal, and the rules of evidence are the same as in an ordinary litigation at common law. Mr J. F. Stephen, in the excellent treatise already quoted, aptly distinguishes the English system as "litigious" from the "inquisitorial" system prevailing in France and other countries.

Preliminary jurisdiction in criminal cases is possessed by the justices of the peace, who may also under special Acts convict in a summary manner for offences of minor importance. When the justices are satisfied that there is a *prima facie* case they commit the prisoner for trial either at the quarter sessions or at the assizes. (See COURTS.) The following cases are not liable at quarter sessions:—Misprision of treason; offences against the queen's person, prerogative, &c., or against Parliament; offences subject to the penalties of præmunire; blasphemy; unlawful oaths (administering or taking); perjury and false affirmation; setting fire to crops of grain, wood, heath, &c.; bigamy; abduction; concealment of birth; bankruptcy offences; blasphemous libels; bribery; conspiracies for offences not triable at sessions; stealing records or documents, &c. A trial at quarter sessions or assizes begins by the presentation of an indictment to the grand jury, who are selected for the occasion, to the number of from twelve to twenty-three, from the gentlemen of standing within the district for which the court is sitting. The judge delivers a charge to the grand jury, shortly pointing out the nature of their duties, and directing their attention to any peculiarities in the cases that are to come before them. The grand jury discuss each case *seriatim*, and hear witnesses in private (in general only those for the prosecution), and if they are satisfied that there is a *prima facie* case against the prisoner they return a true bill, and the case goes to trial before the judge and a common jury. If the grand jury do not return a true bill, the case is at an end, unless there has been a verdict on a coroner's inquisition, or unless it is a case which may be proceeded on by way of information. A criminal trial in open court now differs in very few points from any ordinary civil cause. For a long time prisoners were not allowed to have the benefit of professional advocacy except in cases of high treason, and the privilege was not conceded until the Prisoners' Counsel Act of 1836. Sir J. Stephen fixes at the same date the entire exemption of prisoners from interrogation,—a practice which would appear to be connected, in legal reason, with the rule which made a party to a cause an incompetent witness. In this respect the contrast between a criminal trial in England and a criminal trial in France is very striking. The constant interrogation and browbeating of the prisoner by the judge, consistent as it may be with the inquisitorial theory of their procedure, is always revolting to Englishmen, accustomed to see in every criminal trial a fair fight between the prisoner and the prosecution. Confessions, which are the object of many proceedings in a French inquisition, are regarded with suspicion by the English law. During the spring assizes of 1877 a prisoner was charged with having committed a murder twenty years ago, and the counsel for the prosecution, with the consent of the judge, withdrew from the case because the only evidence, besides the prisoner's own confession, was that of persons who either had never known him personally or could not identify him.[1] Although a prisoner may have counsel to defend him if he can afford to pay the customary fee, no provision is made by law for his being so represented. But the custom of the courts has imposed upon judges exceptional care for the prisoner's interests, and on the prosecuting counsel exceptional forbearance when the prisoner is undefended. It was often said before the Prisoners' Counsel Act (and it is still true) that the judge is the prisoner's counsel. In exceptional circumstances the judge will call on some member of the bar to undertake the prisoner's defence.

As there is no provision made by law for the prisoner's defence, so there is no public prosecutor. The absence of such an officer has long been an admitted defect in the English system, but no successful attempt has yet been made to deal with it. It is generally agreed that an official staff of prosecuting counsel would not be desirable. But there certainly ought to be some public officer charged with the preparation, if not of all criminal cases, at least of those which the injured person does not wish to conduct himself. At present a private person is bound over by the magistrates to prosecute at his own expense, and the consequence often is that many persons will forego an injury rather than submit to the trouble and risk of a prosecution. The prosecutor can recover his costs from the county, unless they are disallowed by the judge. The county again is entitled to be recouped by the Treasury, and between these two bodies there has been a standing feud on the subject of criminal costs for some years.

Properly speaking there is no appeal in criminal trials. The verdict of the jury is final. Any substantial defect or informality in the procedure may be taken before the Queen's Bench by writ of error, but such cases are not now of frequent occurrence. And if any question of law arises at the trial, the judge may reserve it for the opinion of the court for the consideration of crown cases reserved, by whom the conviction may be either quashed or confirmed.

Punishments under the common law were excessively severe, but their operation was mitigated by the singular privilege of BENEFIT OF CLERGY (*q.v.*). Blackstone laments that "among the variety of actions which men are daily liable to commit, no less than 160 have been declared by Act of Parliament to be felonies without benefit of clergy, or, in other words, to be worthy of instant death." The more atrocious punishments have disappeared from the law, and the penalty of death is now practically restricted to murder. Fine, imprisonment with or without hard labour and with or without solitary confinement, and penal servitude,[2] are the most usual punishments, and a wide discretion is left to the judges.

[1] "No confession made by the prisoner is admissible which is made in consequence of any inducement of a temporal nature, having reference to the charge against the prisoner, held out by a person in authority" (Roscoe's *Digest of Criminal Evidence*). Notwithstanding the general bearing of the law against confessions, it is held that a confession obtained by artifice or by spiritual solicitation may be used in evidence.

[2] By 16 and 17 Vict. c. 99, all sentences of transportation were converted into penal servitude

By the Penal Servitude Act, 1864, the shortest period of penal servitude for an offence committed after the passing of the Act is five years, and where any previous Act had fixed a maximum of less than five years, the period of five years is to be substituted for such shorter term. The same Act gives the form of licence under which a convict may be allowed to be at large during the remaining portion of his time, subject to the condition of abstaining from crime and from association with criminal characters, &c., and of preserving and producing his licence when called upon by a magistrate or officer. By the Prevention of Crimes Act, 1871, every holder of a licence under the Penal Servitude Acts must notify his residence and any change of residence to the police (section 6). The Prevention of Crimes Act, 1871, likewise repeals the Habitual Criminals Act of 1869, and substitutes new provisions, of which the following are the most important. Section 5 provides for the registering and photographing of criminals.[1] Section 7 specifies circumstances under which a person who has been *twice* convicted on indictment may, within seven years of the expiration of the last of the two sentences, subject himself to imprisonment with or without hard labour for a term not exceeding one year,—*e.g.*, if it appears to a magistrate that "there are reasonable grounds for believing that he is getting his livelihood by dishonest means;" or if he refuses to give his name and address when charged with an offence before the magistrates; or if he is found in any place public or private under circumstances which satisfy the court that he was about to commit, or waiting for an opportunity to commit, an offence; or if he is found in a dwelling-house, &c., without being able to give a satisfactory account of his presence. By section 8, "where any person is convicted on indictment of a crime, and a previous conviction of a crime is proved against him, the court having cognizance of such indictment may, in addition to any other punishment which it may award to him, direct that he is to be subject to the supervision of the police for a period of seven years, or such less period as the court may direct, commencing immediately on the expiration of the sentence passed on him for the last of such crimes." Persons subject to police supervision, like convicts out on ticket-of-leave, must notify their residence to the police, and males must report themselves once a month. The Larceny Act of 1861 had made a previous conviction for felony or indictable misdemeanour, or two summary convictions, matter of aggravation on a charge of simple larceny; and section 116 of that Act provides for the trial of the question whether there has been such a previous conviction. It is only after the prisoner has been found guilty of the subsequent offence that the question whether he has been previously convicted can be gone into, unless he offers evidence of good character in the trial for the offence, in which case the prosecutor may prove the previous conviction. This section is adopted in the Prevention of Crimes Act, 1871.

The prerogative of pardon, as exercised by the Home Secretary, occasionally has the effect of a rehearing of the case, *e.g.*, when new evidence is discovered after the trial, or the verdict of the jury gives dissatisfaction to the public. In such cases the Home Secretary, after consultation with the judge, or if necessary with such skilled persons as he may select, decides on his own responsibility to grant or withhold a pardon.[2] This is not perhaps the most satisfactory way of reviewing the sentence of a criminal court.

The distinguishing feature of Scotch criminal law is the existence of a public prosecutor. At common law persons injured have the right to prosecute, but "private prosecution, except in the most trifling summary complaints, is now wholly unknown in practice" (Macdonald's *Criminal Law of Scotland*). The lord advocate and his deputies are the public prosecutors in the Supreme Court; in the inferior courts the procurator-fiscal prosecutes. The public prosecutor cannot be compelled to prosecute, nor can he be prevented from prosecuting. (E. R.)

CRIMMITZSCHAU, or KRIMMITZSCHAU, a manufacturing town of Saxony, in the circle of Zwickau, and seven miles N.N.W. of the town of that name, on both banks of the Pleisse, and on the Saxon Western State Railway, 760 feet above the sea. Brewing was formerly the most important industry, but woollen weaving and cotton weaving have now taken the chief place; the manufacture of machinery has also become very considerable. Lime-burning is carried on in the neighbourhood, and the surrounding district is noted for its wheat growing. Population (1875), 17,649.

CRISPIN AND CRISPINIAN, two saints whose festival, as marked in the calendar, is on the 25th of October. According to the tradition they were brothers, born at Rome, whence they travelled in company with St Denis to Soissons, in France, towards the close of the 3d century, to propagate the Christian religion; and that they might not be chargeable to others for their maintenance, they exercised at night the trade of shoemakers, while preaching during the day. The shoes they made were sold at a low price to the poor, an angel miraculously furnishing the leather. According to another version of the story, the saints stole the leather so as to enable them to benefit the poor. When it was known that they were Christians, the governor of the town, after subjecting them to cruel tortures, ordered them to be beheaded. The date of their martyrdom is usually given as 287, though the Roman legend gives 300. They are regarded as the tutelary saints of shoemakers.

CRISSA, or CRISA, in ancient geography, one of the oldest cities of Greece, was situated in Phocis, at the foot of one of the spurs of Mount Parnassus. Its name occurs both in the *Iliad* and in the Homeric *Hymns*, where it is described as a powerful place, with a rich and fertile territory, reaching to the sea, and including within its limits the sanctuary of Pytho. As the town of Delphi grew up around the shrine, and the seaport of Cirrha arose on the Crissean Gulf, Crissa gradually lost much of its importance. By the ancients themselves the name of Cirrha was so often substituted for that of Crissa, that it soon became doubtful whether these names indicated the same city or two different cities. The question was practically settled by the investigations of Ulrichs, who unravelled with much care the history of the towns. From its position Cirrha commanded the approach to Delphi, and its inhabitants became obnoxious to the Greeks from the heavy tolls which they exacted from the devotees who thronged to the shrine. The Amphictyonic Council declared war against the Cirrheans in 595 B.C., and having taken the town, razed it to the ground, and consecrated its territory to the temple

[1] A Register of Habitual Criminals in England and Wales for the years 1869–76 has recently been printed in the printing works of Her Majesty's prison, Brixton. "The list," says the *Times* of March 7, 1877, "has been framed by separating from the great mass of returns those which refer to persons who have been convicted on indictment of a crime, and thereupon have had a previous conviction proved against them. It is thus a complete register of habitual and professional criminals, and has been printed for circulation among the police and the authorities of prisons, in order to enable them to identify persons who come under their charge." The proportion of habitual criminals born in different localities gives some curious results. Thus the town of Stafford heads the list with 1·881 to every 1000, followed closely by Worcester, Taunton, and Lancaster, all of them towns with under 20,000 inhabitants. On the other hand, London, which produces the largest number (1503), stands at the rate of only ·461 to the 1000. Of the habitual criminals on the list 1082 come from Ireland, and 158 from Scotland.

[2] A good example will be found in the case of Smethurst, reported at length in Stephen's *View of the Criminal Law*.

at Delphi. The plunder of the town was sold to defray the expenses of the Pythian games. In 339 the people of Amphissa began to rebuild the city, and to cultivate the plain. This act brought on the second Sacred War, the conduct of which was intrusted by the Amphictyons to Philip of Macedon, who took Amphissa in the following year. Cirrha was afterwards rebuilt, but never regained its former importance. Crissa is probably represented by the modern Chryso, and the ruins of Cirrha, including extensive remains of its port, are to be seen in the neighbourhood of the Pleistus.

CRITIAS, an Athenian orator and poet, and one of the thirty tyrants. In his youth he habitually listened to the conversations of Socrates, but his manhood was devoted to selfish political intrigues. He stirred up the Penestæ of Thessaly against their masters, and made himself so troublesome at home that he was banished by the people. Returning to Athens he was made ephor by the oligarchical party; and he was the most cruel and unscrupulous of the thirty tyrants who in 404 B.C. were appointed by the Lacedæmonians. See GREECE.

CRIVELLI, CARLO, CAVALIERE, a Venetian painter, was born in the earlier part of the 15th century. The only dates that can with certainty be given are 1468 and 1493; these are respectively the earliest and the latest years signed on his pictures—the former on an altar-piece in the church of San Silvestro at Massa near Fermo, and the latter on a picture in the Oggioni collection in Milan. Though born in Venice, Crivelli seems to have worked chiefly in the March of Ancona, and especially in and near Ascoli; there are only two pictures of his proper to a Venetian building, both of these being in the church of San Sebastian. He is said to have studied under Jacobello del Fiore, who was painting as late at any rate as 1436; at that time Crivelli was probably only a boy. The latter always signed as "Carolus Crivellus Venetus;" from 1490 he added "Miles," having then been knighted by Ferdinand II. of Naples. He painted in tempera only, and is seen to most advantage in subject pictures of moderate size. He introduced agreeable landscape backgrounds; and was particularly partial to giving fruits and flowers (the peach is one of his favourite fruits) as accessories, often in pendent festoons. The National Gallery in London is well supplied with examples of Crivelli; the Annunciation, and the Beato Ferretti (of the same family as Pope Pius IX.) in religious ecstasy, may be specified. Another of his principal pictures is in San Francesco di Matelica; in the Vatican Gallery is a Dead Christ, and in the Brera of Milan the painter's own portrait. Crivelli is a painter of marked individuality,—hard in form, crudely definite in contour; stern, forced, energetic, almost grotesque and repellent, in feature and expression; simply vigorous in his effect of detachment and relief, and sometimes admitting into his pictures objects actually raised in surface; distinct and warm in colour, with an effect at once harsh and harmonious. His pictures gain by being seen in half-light, and at some little distance; under favouring conditions, they grip the spectator with uncommon power. Few artists seem to have worked with more uniformity of purpose, or more forthright command of his materials, so far as they go. It is surmised that Carlo was of the same family as the painters Donato Crivelli (who was working in 1459, and was also a scholar of Jacobello) and Vittorio Crivelli. Pietro Alamanni was his pupil.

CROATIA AND SLAVONIA, a crown-land of the Hungarian kingdom, which extends from 14° 25′ to 20° 25′ E. long., and is bounded on the N.W. by Carniola and Styria, N. by Hungary, S. by Servia, Bosnia, and Dalmatia, and W. by Dalmatia and the Adriatic, on which it has a coast-line of about 88 miles. Inclusive of the districts belonging to the Military Frontier, it has a total area of about 16,785 English square miles; and according to the census of 1869 its total population amounted to 1,864,021, of whom 695,997 are assigned to the military portion.

Mountains.—The whole country may be divided into two great natural sections, of which the more important belongs to the basin of the Danube, and is mainly defined by that river and its two extensive tributaries, the Drave and the Save, while the other consists of the highlands of the Adriatic coast. The mountains are partly outrunners of the Alpine system, and partly prolongations of the Karst; but the line of demarcation has not as yet been clearly defined. The former, known chiefly as the Warasdin Mountains, stretch eastward with gradually diminishing elevation through more than half the length of the country to the neighbourhood of Diakovar, and attain their greatest height of 3483 feet in Mount Ivancica. The latter consist of three more or less distinct chains running north-west and south-east:—the Velebit or Velebitch, with a mean height of 3318 feet, which gives its steep and barren character to the southern part of the coast; the Kapela, with a mean height of 2488 feet, lying further inland, and connecting itself with the mountains of Carniola; and the Plisevica, with a mean height of 3214 feet, which forms the boundary between Bosnia and Croatia. The mean height of the whole of the plateau to which these ranges belong is estimated at 2074 feet. Many parts of the mountain regions are richly wooded with pine, beech, and chestnut, and many of the smaller valleys and glens are abundantly fertile. The richest part of Croatia, indeed, is not the valley of the Drave or the Save, but the hilly district between the Kostel, the Ivancica, and the Agram Mountains, called by the natives Zagorye, or the Land behind the Hills. A small group known as the Vrdnik Mountains rises in the east of Slavonia.

Rivers, &c.—From the point where it begins to form the Croatian boundary, to its junction with the Danube below Esseg, the Drave receives only one important tributary, the Bednya; but the Save is the recipient of a large number of considerable affluents:—the Sotla, the Krapina, the Zelina, the Lonya, the Ilova, the Pakra, and the Olyava from the Warasdin Mountains; and the Kulpa, the Korana, and the Unna from the Karst. The Recina falls into the sea; the Gaska loses itself in swampy hollows; and the Lika plunges into a rocky abyss not far from Gospich. Extensive marshes occur along the main rivers in Slavonia; and there is an interesting cluster of seven lakes—called the Lakes of Plitvica, in connection with the Korana. Warm mineral springs rise at Krapina, at Toplice near Warasdin, at Stubica near Agram, at Daruvar, and at Topusko near Glina; and there is a sulphurous spring at Lipik near Pakrac.

Climate.—The climate of the lowlands is equable and temperate; but the Karst district is exposed to very violent and sudden changes. The mean temperature throughout the year for Agram is 52° Fahr., and throughout the hottest month 72°. At Fiume it is very much warmer. The rain comes mainly with the south-west wind, and the annual fall varies from 23 inches in the lowlands to 51 in the Karst. The coast districts are exposed to the violent wind called the Bora, which while it lasts is strong enough to render all locomotion impossible.

Agriculture.—About 16 per cent. of the whole country is unproductive, and in the eastern districts a considerable proportion of the rest is assigned to pasture. The chief crops are wheat, oats, rye, potatoes, flax, and hemp; tobacco is also grown; and a good deal of attention is bestowed on the vine, though the national beverage is prepared from the damson plum. Horses are raised in Slavonia; the oak and beech woods furnish food to great herds of swine; and the heath districts give excellent opportunity for the keeping of bees.

Manufactures and Commerce.—With the exception of a few establishments for silk-spinning, two or three glass-works, and the distilleries which are scattered throughout the country, the only manufactories are at the seaport towns of Fiume, Buccari, and Porto Re. Iron-ore is worked at Rude, Ruyevac, and Brod, sulphur at Radoboy, and coal at Pregrada; but none of the mines are of great importance. The traffic of the country is furthered not only by its 580 miles of navigable river, but by upwards of 2000 miles of regular road and several lines of railway meeting at Agram. Among the roads the most famous are the Maria Louisa, which connects Carlstadt with Fiume, and the Josephina, which passes inland from Zengg.

Divisions.—The territory of Croatia and Slavonia is divided into eight comitats named after their respective administrative centres,—Agram, Fiume, Kreutz, Warasdin, Bellovar, Esseg, Pozsega, and Bukovar. The city of Agram or Zagrab is the capital of the crown-land, and is rapidly rising in importance. Of the other towns it is sufficient to mention, in Croatia, Sissek, with its grain-trade, Karlstadt, the seat of a Greek Church bishop, Kopreinitz, Buccari, with its free port, St Georgen, and Zengg; and in Slavonia, Diakovar, the seat of the famous bishop Strossmayer, and Semlin, one of the most valuable military and commercial ports on the Danube. Sluin, Glina, and Petrinya were respectively the centres of the 1st, 2d, and 3d banal regiments; and Brod, Gradiska, Likka, Ogulin, Ottocsan, and Peterwardein give their names to the other military districts.

Government.—The united kingdom of Croatia and Slavonia is represented by a separate minister, without a portfolio, and in the Hungarian diet by thirty-four members on the table of deputies, and two envoys from the national diet on the table of magnates. The national diet is composed of the Roman Catholic bishop, the Greek Catholic bishop, the prior of Aurana, the magnates, counts, and barons, and seventy-seven deputies of towns, districts, &c. The kingdom is autonomous in domestic affairs, public worship, education, and justice; and by the law of November 1874 the administrative and the judicial departments are to be kept completely distinct. At the head of the Government is the Ban or Banus, who also ranks as a privy coun illor. The highest court is the so-called septemviral table at Agram; and next in order is the banal table. According to a law of 1873, 55 per cent. of the taxes of the kingdom fall to the Hungarian treasury, and the remainder is assigned to domestic expenses.

The Croats proper form about 74 per cent. of the total population, Serbs about 23 per cent., and the small remaining portion is composed of Germans, Magyars, Jews, Italians, and Albanians. The Croats are Catholics, and employ the Latin alphabet for their Slavonic language, which is closely connected with the Serbian, and breaks up into two main dialects—the Sloveno-Croatian and the Serbo-Croatian. The Serbs are members of the Greek Church, and employ the Cyrillic alphabet.

The principal educational institution in the country is the university established in 1874 at Agram, where there is also the South Slavonian Academy of Sciences and Arts, founded in 1866, as well as a Society of Agriculture, Literature, and History. Diocesan seminaries for Catholic theologians are maintained at Agram, Diakovar, and Zengg; and the priests of the Greek Church have institutions at Carlowitz, Pakrac, and Plaski. General education is still much neglected, and about six-sevenths of the population can neither read nor write.

History.—Croatia and Slavonia were, for the most part at least, included in the ancient Pannonia; and remains dating from the Roman period are still to be seen at Mitrovitz, Illok, Sotin, and Tovarnik. After the Ostrogoths and the Avars had come and gone, the territory was in 640 taken possession of by the Slavonic races to which it owes its name—the Chrovats, Chorvats, or Horvats, and the Slavs. Temporary recognition of the Frankish kings, and the Byzantine emperors, was followed by the establishment of a more independent kingdom, which included not only Croatia and Slavonia, but also Dalmatia. In 1075, Zwonimir Demetrius, to whom the national party looks back as to the national hero, formally rejected the Byzantine overlordship, and received from Gregory VII. of Rome the title of king. In the 12th and 13th centuries the land was the object of frequent contest between the Byzantines and the Hungarians; and in the 14th and 15th it was still more harassed by the rivalry of Hungary with Venice. In 1524 the whole country fell into the hands of the Turks; but in 1526, after the battle of Mohacs, the districts of Agram, Kreutz, and Warasdin were attached to the Austrian crown, and by the Carlowitz peace of 1699, the whole of the country to the north of the Unna was resigned by the sultan. In 1767 the three kingdoms of Croatia, Dalmatia, and Slavonia were united under the name of Illyria, but the union was broken in 1777. Croatia and Slavonia continued to be regarded as part of the Hungarian kingdom; but a strong national reaction took place in 1848-9 against the Magyar supremacy, and in reward for the service rendered against the Magyar revolt by the ban Jellalich, Austria declared the country independent of Hungary. In 1860, however, the policy of Vienna was altered, and Croatia and Slavonia were again obliged, in spite of the strong opposition of a large party, to resume their former connection with Hungary, which was not recognized by the national diet till 1868, and then only after the central administration had interfered with the elections in a most arbitrary manner.

See Csaplovicz, *Slawonien und Kroatien*, 1819; Paton's *Highlands and Islands of the Adriatic*, 1849; Neigebaur, *Die Südslawen und deren Länder*, 1851; A. O. Zeithammer, "Zur physicalischen Geographie Kroatiens and Slawoniens" in Petermann's *Mittheilungen*, 1859, and "Die Wagrechte und Senkrechte Gliederung Oesterreichisch-Kroatiens," ditto, 1861; "Sugli antichi ghiacciaj della Drava," in *Atti di Accademia di Milano*, 1871; Steinhauser, *Geographie von Oesterreich-Ungarn*, 1872; Dr P. Matkovic, *Kroatien-Slavonien nach seinen physischen und geistigen Verhaltnissen*, Agram, 1873; and a paper from the same authority on "Die Orographische Gruppirung der Süd-Croatischen Hochebene," in Petermann's *Mitth.*, 1873.

CROCODILE (*Crocodilia*), an order of Reptiles which, in the possession of a four-chambered heart, and of distinct sockets for the teeth, and in the traces of a diaphragm, differs from the other reptilian orders, and shows an approach in organization to warm-blooded animals. The presence of a four-chambered heart does not prevent that commingling of venous and arterial blood previous to its entrance into the system, which is common to all reptiles, as this is effected in the present order by means of a communication between the main arterial and venous tubes, immediately outside the heart. Crocodiles are further characterized by the presence of a partial dermal skeleton, developed in the leathery integument, consisting of numerous square bony plates, keeled in the centre, and forming a complete dorsal shield. The vertebræ of the neck bear upon each other by means of rib-like processes, the neck being thus deprived to a great extent of its mobility; hence the difficulty experienced by crocodiles in turning. The limbs are short and insufficient to support its entire weight; it consequently drags its body somewhat along the ground. The toes, of which there are five on each of the posterior limbs, and four on the anterior pair, are more or less webbed, while the three inner ones only are provided with claws. The nostrils, eyes, and ears have lids or valves by which they can be closed at will, and the nostrils do not open into the cavity of the mouth, but are carried back to the pharynx, which can also be shut off from the outside by means of a valvular apparatus—an arrangement of the greatest possible service to those reptiles in preventing suffocation while seizing and holding their prey beneath the surface of the water. The tongue is attached all round to the bottom of the mouth, and for this reason the crocodile was formerly supposed to be destitute of that organ. The teeth, which are numerous, sharp, and conical, are arranged in a single row in both jaws, each tooth having its own socket, and the hollow at its base containing the germ of a larger one, which by its growth gradually displaces the other. Three and even four generations of teeth, incased within each other, are often thus contained in a single socket, but the number of teeth above the surface remains the same at all ages. The fourth tooth on each side of the lower jaw is larger than the others, and fits into a notch or pit in the upper surface. As in snakes, the lower jaw is attached to a process connected with and extending backwards from the skull, which greatly adds to the animal's gape, while giving it the appearance, in opening its mouth, of moving both jaws. Beneath the lower jaw are two orifices connected with glands which secrete a musky substance.

Crocodiles are amphibious, leaving the water to bask in the sun on the mud-banks of rivers and marshes, or to devour the prey they have previously drowned. They are oviparous, depositing their eggs—from twenty to sixty in number, and inclosed in a calcareous shell—in holes made in the sand or mud of the river side, where they are left to be hatched by the heat of the sun, or as is the case with certain American species, in hillocks formed by themselves, which they hollow out and fill with leaves and other decaying vegetable matter, where the eggs are hatched by the heat generated in the decomposing mass. On quitting the egg the young crocodiles are led to the water by the female parent, who feeds them for some time with food which she herself disgorges, and otherwise shows the greatest solicitude for their safety. The male takes no part in rearing the young, but is said on the contrary to attack and devour them when not prevented by his mate. Large numbers also fall victims to the rapacity of fishes and turtles, while the smaller Carnivora and certain birds destroy great quantities of the eggs. The eggs, which in the common crocodile are nearly as large as those of a goose, are in spite of their musky flavour held in great estimation as an article of food in the regions where they occur, and this leads to a still further diminution of the crocodilian progeny. During the first year the young are said to feed on the larvæ of insects and on small fishes. Crocodiles are inhabitants of the rivers and marshy lagoons of tropical and subtropical regions, a few only frequenting the brackish water of estuaries. One species—the Alligator of North America—has a range sufficiently north of the tropics to encounter ice in winter, while one of the Indian crocodiles ascends the courses of the rivers it frequents to such a height above the sea that the water it occupies is often frozen. During the dry season these reptiles bury themselves in the mud and remain dormant until the return of moister conditions, and they have thus been known to exist without food for a whole year. Tennent states that in Ceylon he has met with the mud case from which the Marsh Crocodile of that island had recently withdrawn, and he also tells of an officer who, camping out one night, was disturbed by a strange motion of the earth beneath his bed—a phenomenon explained in the morning by the emergence of a crocodile. They also bury themselves in the mud on the approach of danger, and when taken unawares they feign death as a means of escape. The writer above alluded to states that on one occasion his party came upon a sleeping crocodile, which on being struck, after it had awakened and seen itself surrounded, lay perfectly quiet and apparently dead; in a little while it was seen to glance furtively about, and then make a rush towards the water. On receiving a second blow it again feigned death, and this time no amount of poking could elicit the slightest sign of life, until a lad by gently tickling it under the fore leg caused the reptile so far to forget itself as to draw up its limb. They resort to a somewhat similar stratagem in order the more readily to reach their prey. Lowering their head and tail they allow themselves to be carried down by the current of the stream, and in this position are said to bear the closest resemblance to floating logs of wood—a disguise well fitted to allay suspicion in the animal they are seeking to approach. They feed on fishes, and on the numerous quadrupeds which visit their haunts in order to drink. The latter they seize and drag into the water, holding them under the surface till life is extinct, and afterwards conveying the dead body to the nearest sand-bank or river island, where it is often hidden until putrefaction has rendered it sufficiently digestible. Although timid they do not hesitate to attack man, when off his guard, and bathing in tropical rivers is rendered dangerous by their presence.

There are three families of living crocodiles—Gavials, True Crocodiles, and Alligators. The Gavials are readily distinguished by their greatly elongated and narrow snout, and by the uniform size of their teeth (the five or six front pairs excepted), of which the Gangetic species has fifty-two or fifty-four above, and fifty or fifty-two below. It inhabits the lower parts of Indian rivers, especially the Ganges, where it performs the useful office of devouring the carcases of animals that otherwise would pollute the sacred river. It attains a length of over 17 feet, and the male is furnished with a large and prominent swelling in front of the nostrils.

The true Crocodiles have the so-called canine tooth of the lower jaw fitting into a notch or furrow in the upper surface; the hind legs are bordered by a serrated fringe, and the toes are almost completely webbed. Of these there are twelve species, four of which are Asiatic, occurring eastward from the rivers and estuaries of India to Australia; three are African, one ranging from Egypt to the Cape, the others confined to the rivers of West Africa; while four belong to the Neotropical Region of Central and South America. The Common Crocodile (*Crocodilus vulgaris*) may be taken as typical of the family. It inhabits the chief rivers of Africa, but is best known as a denizen of the Nile, where in ancient times the Egyptians regarded it as a divinity. At Memphis and other cities temples were raised in its honour, in which live crocodiles were kept,—these sacred reptiles being reared with the greatest care, fed luxuriously, and adorned with costly trinkets. They were thus rendered perfectly tame, and took part in the religious processions and other ceremonies performed in their honour. When dead their bodies were embalmed, and extensive grottoes have been discovered at Maabdeh containing large numbers of those reptilian mummies. The inhabitants of several Egyptian cities, however, regarded the crocodile with entirely opposite sentiments, considering it to be the incarnation of Typho, the genius of evil; and among these the ichneumon, as the deadliest foe of the crocodile, was thought worthy of divine honours. Once a year the people of Apollinopolis had a solemn hunt, in which they killed as many crocodiles as possible, casting the dead bodies before the temple of their god; and so expert had they grown in this sport that they did not hesitate to enter the Nile, and bring the crocodile ashore by force. Crocodiles appear to have been formerly abundant in all the known parts of the Nile, but have now disappeared from the delta, and according to a recent authority are rarely seen to the north of Beni Hassan, and are evidently receding from below the second cataract. This is largely owing to the constant persecution they are subjected to by the passengers on board the Nile steamers, to which also must be attributed their exceeding wildness, for it is now almost impossible to come within rifle shot of them. A small black-headed plover (*Charadrius melanocephalus*) may often be seen perched on the reptile's back, attracted by the numerous insects which find a congenial residence there; and this active little bird, by rising in the air and uttering a shrill cry, gives its bulky patron timely warning of the approach of man. Towards the sources of the Nile the crocodile is still abundant. Sir Samuel Baker states that when navigating the Albert Nyanza he observed every basking place covered with them, the creatures lying parallel to each other like trunks of trees prepared for shipment, and that on one bank he counted twenty-seven of large size. The flesh of this species is eaten by the natives, but it does not seem suited to the European palate. "To my taste," says the authority just referred to, "nothing can be more disgusting than crocodile flesh. I have eaten almost everything, but although I have tasted crocodile I could never succeed in swallowing it. The combined flavour of bad fish, rotten flesh, and musk is the *carte de diner* offered to the epicure." In Siam the flesh of another species is regularly sold in the market as human food. The Common Crocodile usually measures about 15 feet in length.

Alligators differ from the preceding group in having the canine tooth fitting into a pit in the upper jaw; the hind legs are also destitute of fringe, and the toes are less completely webbed. They are found in America only, and with one exception are confined to its tropical parts. The Alligator (*Alligator mississippiensis*) occurs in the rivers and swamps of Mexico and the United States, where it is a source of danger to all animals venturing to enter the water. In winter this species retires into holes on the river banks, and there hybernates. While thus dormant it is often got at by the negroes, who unearth it for the sake of the tail, which they reckon a delicacy. It is said to attain a length of 15 to 18 feet. The remaining eight species of alligators are found chiefly in South America, where they are known as Caymans and Jacarés. They abound in the Amazon and the Orinoco, the silence of whose lonely banks is seldom broken except by their nocturnal bellowings. According to Humboldt they resemble their Old World allies in lying basking in the sunshine, wherever a shallow in the river discloses a sandbank, "with open jaws, motionless, their uncouth bodies often covered with birds."

Fossil remains referable to the order *Crocodilia* occur for the first time in the Trias, and continue to appear in allied forms during succeeding periods. These have been very fully investigated, and Professor Huxley has given a remarkably complete sketch of the life-history of the entire order, recent and fossil. This he divides into three sub-orders. I. In the *Parasuchia*, among other characters, both pterygoid and palatine bones are destitute of bony plates to prolong the nasal passages, and the centra of the vertebræ are amphicœlian, as in fishes. To this group belongs the earliest of the crocodiles—the Triassic *Stagonolepis* of the Elgin sandstone, which somewhat resembled a cayman, with the snout of a gavial. II. In the *Mesosuchia*, the bony plates of the palatine bones prolong the nasal passages and give rise to posterior nares, and the vertebral centra are amphicœlian. This group includes such forms as *Teleosaurus* and *Steneosaurus*, ranging from the Liassic to the Cretaceous formations. III. In the *Eusuchia*, both pterygoid and palatine bones give off plates which prolong the nasal passages, and the centra of the vertebræ are mostly procœlous. The species contained in this group make their appearance in the Greensand of North America and in the Eocene of Europe, and to it belongs all the existing crocodiles. This group was at one time much more generally distributed than it is at present, representatives of gavials, crocodiles, and alligators, now so widely apart, and altogether absent from Europe, being found together in the Eocene beds of the south-west of England. The greatly restricted range which characterizes their present distribution seems to mark the crocodiles as a declining group. (J. Gl.)

CRŒSUS, king of Lydia, was the son and successor of Alyattes. It was supposed by Clinton and Bähr that for fifteen years he shared the throne with his father; however that may be, he became sole king on the death of Alyattes, about 568 B.C. (according to the computation of Rawlinson), when, Herodotus tells us, he was thirty-five years old. He speedily reduced all the Greek cities in Asia Minor, and soon most of the tribes to the west of the River Halys (the Kizil Irmak) were subject to him. The wealth, meanwhile, which he had inherited from his father had been enormously increased, until it far surpassed that of any other sovereign with whom the Greeks were acquainted. He was therefore to them the type of human prosperity and the bitter contrast of his fall powerfully impressed itself on their imagination, which became in part the creator of the vividly dramatic story so finely told by Herodotus. The most famous incident in that story was the visit of Solon. After ostentatiously displaying all his treasures, the king asked the sage who was the happiest man he had ever known. Tellus of Athens, was the reply, for he lived while his country was prosperous; he was surrounded with children and children's children, who were both beautiful and good; and he died upon the field of battle after having gained a gallant victory over the enemy. And next to him Solon counted two Argive youths, Cleobis and Bito, whose strength and skill won prizes at the games, who, when the oxen failed to appear from the fields in time, piously drew their mother's car forty-five furlongs to the festival of Juno, and as reward received the praises of all men, and were allowed to die in the very temple of the goddess, after offering their sacrifices and feasting at the holy banquet in her honour. For two reasons, added the wise man, Crœsus with all his fortune was not to be held so fortunate as these,—the gods are jealous of human prosperity, and no man can be called fully happy till a happy death has closed a happy life. Soon after misfortunes began to thicken about Crœsus. His son, despite all the care with which, being warned in a dream, he drew him from the dangers of battle, and sought to shield him even from accident, was unintentionally slain at a boar-hunt by Adrastus. News came also of the conquests of Cyrus, who had overcome Astyages, the brother-in-law of Crœsus. The oracle of Delphi prophesied that if Crœsus went to war he would "destroy a mighty empire," and that he was to flee when a "mule" sat on the throne of Media; and, secure in what appeared to him the most unambiguous of prophecies, Crœsus invaded Cappadocia. But the mighty empire he was to destroy proved to be his own; he was repulsed, and soon Sardis was stormed and taken by Cyrus. Crœsus, careless of life, was about to be slain, when one of his sons, hitherto dumb, in his fear overcame his infirmity, and made known his father's rank. Crœsus was therefore spared to be taken as a prisoner before Cyrus. He was placed on a funeral pyre, and, as he watched the rising flames, he thought of Solon, whose name burst from his lips. When questioned, he repeated the warning of the sage, which so powerfully affected the mind of Cyrus that he ordered the flames to be extinguished. The efforts of the soldiers, however, were in vain; but, as Herodotus narrates, the prayers of Crœsus prevailed upon Apollo, whose temples he had formerly enriched with costly gifts, to send a heavy fall of rain which quenched the fire. The wisdom of Crœsus gained the friendship of Cyrus, who also made him minister to his son, Cambyses. But, having ventured to reprove Cambyses for an act of cruelty, Crœsus was forced to seek safety in flight; and here ends the story of his life. It is said that, when he reproached the oracle which had led to his fall, he received the convincing answer that Cyrus was the "mule" foretold, as he was the son of a Median princess and a Persian subject. Apollo, it was added, had done what he could by prevailing on the fates to delay the fall of Crœsus full three years.

See Herodotus (bk. i.), in Rawlinson's edition of which (1875) there is a discussion of the historical facts of the story, an amplified version of which is given in Damascenus.

CROFT, WILLIAM (1677–1727), doctor of music, was born in 1677, at Nether Eatington in Warwickshire. He received his musical education in the Chapel Royal under Dr Blow. He early obtained the place of organist of St

Annes, Westminster, and in 1700 was admitted a gentleman extraordinary of the Chapel Royal. In 1707 he was appointed joint-organist with Blow; and upon the death of the latter in 1708 he became sole organist, and also master of the children and composer of the Chapel Royal, besides being made organist of Westminster Abbey. In 1715 he obtained his degree of doctor of music in the university of Oxford. In 1724 he published an edition of his choral music, in 2 vols. folio, under the name of *Musica Sacra, or Select Anthems in score, for two, three, four, five, six, seven, and eight voices, to which is added the Burial Service, as it is occasionally performed in Westminster Abbey.* This handsome work was the first of the kind executed on pewter plates and in score. John Page, in his *Harmonia Sacra*, published in 1800 in 3 vols. folio, gives seven of Croft's anthems. Of instrumental music, Croft published six sets of airs for two violins and a bass, six sonatas for two flutes, six solos for a flute and bass. He died in August 1727, and was buried in the north aisle of Westminster Abbey, where a monument was erected to his memory by his friend and admirer Humphrey Wyrley Birch. Burney in his *History of Music* devotes several pages of his third volume (pp. 603-612) to Dr Croft's life, and criticisms of some of his anthems.

CROKER, JOHN WILSON (1780-1857), statesman and author, was born in Galway on the 20th December 1780. He belonged to a respectable family of English origin that had been settled in Ireland for several generations, being the only son of John Croker, well known and popular as the surveyor-general of Ireland. He was educated at Trinity College, Dublin, where he graduated in 1800. Immediately afterwards he was entered as a student of Lincoln's Inn, and in 1802 he was called to the Irish bar. In 1803 he published anonymously *Familiar Epistles to J. F. Jones, Esquire, on the State of the Irish Stage*, a series of witty and caustic criticisms in verse on the leading dramatists of the day, which passed through several editions in a short time. Equally successful was the *Intercepted Letter from China* (1805), also anonymous, a satire on Dublin society. In 1807 he published a pamphlet on *The State of Ireland, Past and Present*, in which he advocated Catholic emancipation. In the following year he entered Parliament as member for Downpatrick, obtaining the seat on petition, though he had been unsuccessful at the poll. The notorious case of the duke of York furnished him with an opportunity of obtaining patronage and place of which he skilfully availed himself. The speech which he delivered on the 14th March 1809, in answer to the charges of Colonel Wardle, was generally regarded as the most able and ingenious defence of the duke that was made in the debate; and to the gratitude of the latter for this service was probably due Croker's appointment in the close of the year to the office of secretary to the Admiralty, which he held without interruption under various administrations for more than twenty years. In 1827 he became the representative of the university of Dublin, having previously sat successively for the boroughs of Athlone, Yarmouth, and Bodmin. He was a determined opponent of the Reform Bill, and vowed that he would never sit in a reformed Parliament; his parliamentary career accordingly terminated in 1832. Two years earlier he had retired from his post at the Admiralty on a pension of £1500 a year. Many of his political speeches were published in a pamphlet form, and they show him to have been a vigorous and effective, though somewhat unscrupulous and often virulently personal, party debater. The same character attaches to him in his capacity as a political writer. He was one of the founders of the *Quarterly Review*, and for many years was one of its leading contributors on political and historical subjects. The rancorous spirit in which many of his articles were written did much to embitter party feeling, and to cause men on both sides of greater eminence than himself to stoop to unworthy controversy. It also reacted unfavourably on Croker's reputation as a worker in the department of pure literature by bringing political animosities into literary criticism. No reply is possible to the majority of the criticisms which Macaulay in his unsparing review brings against Croker's *magnum opus*, his edition of Boswell's *Life of Johnson* (1831), but with all these defects the work had merits which Macaulay was of course not concerned to point out. It certainly possessed whatever evidence of excellence is afforded by the fact of a very extensive circulation. Its success in this respect led the publisher to propose to Croker the preparation of an annotated edition of Pope's works, on which he was occupied for several years. It was left unfinished at the time of his death, but it has since been completed by Peter Cunningham and the Rev. W. Elwin, and published. A list of Croker's other chief works is given below. Special mention, however, may be made of his *Stories from the History of England for Children*, not only because it had a very large circulation, but because it was taken by Scott as the model for his *Tales of a Grandfather*. In an amusing letter to Croker accompanying a presentation copy of the latter work, Sir Walter speaks of it as "a sample of the *swag*."

Croker did good service to the cause of literature and art by other means besides his pen. He was one of the founders of the Athenæum Club. In his place in Parliament he advocated the claims of the fine arts upon state recognition and aid at a time when these claims had fewer supporters than they have now. In his later years his house at West Molesey near Hampton Court was the resort of many eminent literary men, chiefly of his own party. He died at St Albans Bank, Hampton, on the 10th August 1857.

The chief works of Croker not already mentioned were his *Letters on the Naval War with America*; *A Reply to the Letters of Malachi Malagrowther*; *Military Events of the French Revolution of* 1830; a translation of Bassompierre's *Embassy to England*; and several lyrical pieces of some merit, such as the *Songs of Trafalgar*. He also edited the *Suffolk Papers*, *Hervey's Memoirs of the Court of George II.*, the *Letters of Lady Hervey*, and *Walpole's Letters to Lord Hertford*.

CROKER, THOMAS CROFTON (1798-1854), an antiquary and humourist, was born in Cork in 1798. He was apprenticed to a merchant, but in 1819, through the interest of John Wilson Croker, who had been a friend of his father, he became a junior clerk in the Admiralty, where he afterwards obtained one of the first clerkships. In 1825 he produced his most popular book, the *Fairy Legends of the South of Ireland* (reprinted in 1834), which he followed up by the publication of his *Legends of the Lakes*, his *Adventures of Barney Mahoney*, and an edition of the *Popular Songs of Ireland*. In 1827 he was made a member of the Irish Academy; and in 1839 and 1840 he helped to found the Camden and Percy Societies, for the former of which he published (1841) an edition of certain *Narratives Illustrative of the Contests in Ireland in* 1641 *and* 1690, and for the latter his *Revolution in Ireland in* 1688, and several other works. He was also a member of the Hakluyt, Archæological, and Antiquarian Societies. He died in London, August 8, 1854.

CROLY, GEORGE (1785-1860), a distinguished literary divine of the Church of England, was born in Dublin about 1785, and received his education at Trinity College there. Croly, although a staunch unbending Tory, owed to Lord Brougham his promotion to the living of St Stephen's, Walbrook, London. The appointment conferred honour on Brougham, as the presentee was a keen partisan, and had zealously served his political friends with his pen. He was neglected by the Tories very much as Sydney Smith was by the Whigs. Croly was a great pulpit orator, and continued, not unworthily, the illustrious school of Irish eloquence, which boasts such names as Burke, Sheridan, and Grattan. He was also a ripe classical scholar, and in early life showed no common aptitude for music. He died on November 24, 1860. Croly was a man of restless energy, and won laurels in many fields. It is as a literary man, however, that he claims attention. And here the first thing that strikes us is his extraordinary versatility. Poems, biographies, dramas, sermons, novels, satires, magazine articles, newspaper leaders, and theological works were dashed off by his facile pen; and, according to Hogg, the Ettrick shepherd, he was great in conversation. While a young man, Croly wrote dramatic criticism for a short-lived paper called the *New Times*. His genuine satiric vein was seen in one of his earliest works, *The Times*, and in one of his latest, the *Modern Orlando*, which appeared in 1854. His poems were first issued in a collected form by Henry Colburn and Richard Bentley, in 1830. The principal are—*Paris in* 1815, which embodies a description of the works of art then to be found in the Louvre; *The Angel of the World*, an Arabian tale; a collection of short poems, with corresponding engravings, entitled *Gems from the Antique; Catiline*, a tragedy; and *Sebastian*, a Spanish tale. *Pride shall have a Fall*, a comedy, is not included in this edition. His poetry, although of a high order, suffered from being contemporaneous with that singularly rich outburst of song in virtue of which the early years of the present century almost rival the Elizabethan era. The pieces, too, are remarkable rather for fine passages than for sustaining the interest of the reader throughout. *Paris in* 1815, however, achieved a temporary popularity; some of his lyrics inspire enthusiasm; and he is particularly successful in his conception of Catiline's character. Croly's prose writings cover a wide field. He was one of the earliest contributors to *Blackwood's Magazine*; he edited the *Universal Review*, and wrote a number of leaders for the *Britannia*, a Conservative organ, which supported the system of protection. To theology he contributed, in 1827, *The Apocalypse of St John, a new Interpretation*; and volumes of sermons were issued by him from time to time. He is the author, too, of a number of sketches, a *Life of Edmund Burke*, a character of Curran, a history of King George IV., and an able review of Napoleon's career. Croly, however, was most successful as a novelist. His chief fictions are—*Tales of the Great St Bernard; Marston, or the Soldier and Statesman*; and his masterpiece, *Salathiel, The Immortal.* Salathiel is the character better known as the Wandering Jew. This legend has been treated poetically by various writers, including A. W. von Schlegel, Schubert, Goethe, and Mrs Norton, and is the subject of Eugène Sue's famous work, *Le Juif errant.* Croly's book gives us vivid pictures of scenery in the East, and is full of striking imagery and noble bursts of eloquence. Indeed the language, as well as the scenery, is Asiatic in character; and its Oriental luxuriance sometimes passes into extravagance. Croly's works, as a whole, exhibit strong sense, a fertile imagination, and a genuine, if somewhat too showy, eloquence. He is a signal instance of great professional success, joined to high distinction in other fields.

CROMARTY, a county in the north of Scotland, consisting of eleven detached portions scattered throughout Ross-shire, with which county it is for most purposes incorporated. One of these portions, that which is situated on the south shore of the Cromarty Firth (from which it takes its name *cromachty*, or crooked bay), is the original county; and this district still preserves for Cromarty a separate lord-lieutenancy and commission of supply. As a county, it was originally very inconsiderable in extent; but by the additions which were made to it towards the end of the 17th century it was increased to fifteen times its former size. Of these additions, one is a small district surrounding Tarbat House, on the northern shore of Cromarty Bay; and a second runs from the south side of Tain Firth to the Moray Firth, cutting off that portion of the county of Ross which terminates in Tarbat Ness, the extremity of which also belongs to Cromarty. Two more fragments lie on the south of the River Carron, in the parish of Kincardine; the sixth extends northward from the burgh of Dingwall, situated chiefly in the parish of Fodderty, and occupied in great part by the peak and slopes of Ben Wyvis; the seventh lies to the north of Loch Fannich in the parish of Contin, at some distance to the north-west of which a triangular morsel is found to the north of Loch Nid; the ninth is that which stretches along the southern shore of Little Loch Broom; and the tenth is the district of Ullapool and Coygach, with the adjacent islets, lying between the northern shore of Loch Broom and Sutherlandshire. This district, which is the largest portion of the county, occupies an area of about 20 miles in length by 9 in breadth. The straggling arrangement of Cromarty was produced by the influence of George, Viscount Tarbat, afterwards earl of Cromarty, who, wishing to have all his various lands included in one shire, got them annexed to his own county in 1685 and 1698. The total extent of the county is estimated at 220,800 acres, or 345 square miles, equal to about a tenth of the area of the united county of Ross and Cromarty. The Cromarty Firth forms one of the finest harbours on the east coast of Scotland, securely sheltered at its mouth by two remarkable crags called the "Soutars." See Ross.

Cromarty, the county town, is situated near the mouth of the firth of that name on its southern shore, 16 miles N.N.E. of Inverness. It is a small irregularly built town, and carries on some trade in herring and white fish. The corporation consists of a provost and nine councillors, and the town forms one of the Wick group of burghs, which returns one member to Parliament. Population, 1476.

CROME, John (1769–1821), English landscape painter, founder and chief representative of the "Norwich School," often called Old Crome, to distinguish him from his son, was born at Norwich, December 21, 1769. His father was a weaver, and could give him only the scantiest education. His early years were spent in work of the humblest kind; and at a fit age he became apprentice to a house-painter. To this step he appears to have been led by an inborn love of art and the desire to acquaint himself by any means with its materials and processes. During his apprenticeship he sometimes painted signboards, and devoted what leisure time he had to sketching from nature. Through the influence of a rich art-loving friend he was enabled to exchange his occupation of house-painter for that of drawing-master; and in this he was engaged throughout his life. He took great delight in a collection of Dutch pictures to which he had access, and these he carefully studied. About 1790 he was introduced to Sir William Beechey, whose house in London he frequently visited, and from whom he gathered additional knowledge and help in his art. In 1805 the Norwich Society of Artists took definite shape, its origin being traceable a year or two further back. Crome was its president and the largest contributor to its annual exhibitions. Among his pupils were Stark, Vincent, Thirtle, and Bernay Crome, his son. Cotman too, a greater artist than any of these, was associated with him. Crome continued to reside at Norwich, and with the exception of his short visits to London had little or no communication with the great artists of his own time. He first exhibited at the Roya

Academy in 1806; but in this and the following twelve years he exhibited there only fourteen of his works. With very few exceptions Crome's subjects are taken from the familiar scenery of his native county. Fidelity to nature was his dominant aim. "The bit of heath, the boat, and the slow water of the flattish land, trees most of all—the single tree in elaborate study, the group of trees, and how the growth of one affects that of another, and the characteristics of each,"—these, says Mr Wedmore, are the things to which he is most constant. He still remains, says the same critic, of many trees the greatest draughtsman, and is especially the master of the oak. His most important works are—Mousehold Heath, near Norwich, now in the National Gallery; Clump of Trees, Hautbois Common; Oak at Poringland; the Willow; Coast Scene near Yarmouth; Bruges, on the Ostend River; Slate Quarries; the Italian Boulevards; and the Fishmarket at Boulogne. He executed a good many etchings, and the great charm of these is in the beautiful and faithful representation of trees. Crome enjoyed a very limited reputation during his life, and his pictures were sold at low prices; but since his death they have been more and more appreciated, and have given him a high place among English painters of landscape. He died at Norwich after a few days' illness, April 22, 1821. A collection of his etchings, entitled *Norfolk Picturesque Scenery*, was published in 1834, and was re-issued with a memoir by Dawson Turner in 1838, but in this issue the prints were retouched by other hands. For a genial and appreciative *critique* on this attractive painter, see Mr Frederick Wedmore's *Studies in English Art* (1876).

CROMLECH (Gaelic or Welsh *crom*, curved, vaulted, and *leac* or *llech*, a monumental stone) is the name given in Britain to those megalithic monuments exclusively which consist of a great stone supported on three or more stones set on end in the ground. In France, however, and on the Continent generally, it is exclusively employed to denote a totally different class of monument, for which in this country we only use the descriptive names of "stone circles," or "circles of standing stones." This application of the term in different countries to different classes of monuments has given rise to much confusion. The earliest known use of the word occurs in Bishop Morgan's translation of the Bible into Welsh (1588), where "the clefts of the rocks" of our translation is rendered by *cromlechydd y creigiau*. Its earliest occurrence in the special sense in which it has continued to be used by antiquaries is in a description of some ancient remains by Rev. John Griffith of Llanddyfnan (1650), in which he says, "There is a crooked little cell of stone not far from Alaw, where according to tradition Bronwen Leir was buried; such little houses, which are common in this country, are called by the apposite name *cromlechaw*." The restricted sense in which the term has been applied in recent times in this country has given rise to the notion that a *cromlech*, or great stone supported on props of smaller size, is a species of structure complete in itself, and distinct from the *dolmen* or chambered cairn. Mr Fergusson, in his recent work on *Rude Stone Monuments*, has described the monuments usually known by the term cromlech as "free-standing dolmens," and maintains that they were never intended to be covered with a mound or cairn. It is evident that the removal of the loose stones of the enveloping cairn would leave its megalithic chamber exposed as a cromlech, and undeniable that many of the examples adduced as "free-standing dolmens" in England do exhibit traces of such removal. But on the other hand the *steendysser* or "Giants' Graves" of Denmark and Sweden, which are perfectly analogous to the cromlechs of this country, are never wholly hidden in the mounds which envelop their bases. The present tendency is towards the entire disuse of the term cromlech, and the adoption of the term dolmen for all the varieties of tombs with megalithic chambers, whether "free-standing" or partially or wholly enveloped in mounds of stones and earth.

CROMPTON, SAMUEL (1753–1827), the inventor of the spinning-mule, was born at Firwood near Bolton-le-Moors, Lancashire, of poor parents. While yet a boy he lost his father, and removed with the rest of his family to Hall-in-the-Wood, near Bolton, where he educated himself as well as circumstances would allow, maintaining himself by working as a cotton-spinner. His musical capacity—he had sufficient taste and knowledge to compose several hymn-tunes—enabled him to earn a little money by playing the violin at the Bolton Theatre. Meanwhile he was working hard to perfect his invention for spinning yarn for the manufacture of muslin, and he had brought it into working order before his marriage, which took place in 1780. The expense of a patent proving too costly for his limited means, he was glad to make known the construction of his machine to a few manufacturers for very small sums of money. Several refused to fulfil their agreement, and all he received was about £60. The use of his invention spread rapidly, and he constantly made improvements upon it; but though in 1801 he had, with the aid of £500 lent him by a friend, extended his business by employing a number of hands besides his own family, he was nearly sixty years of age before he obtained any important pecuniary recompense. Urged by the monetary difficulties in which he had involved himself through his somewhat shy and unbusiness-like temperament, he drew up a paper showing how marvellously extensive and useful was the employment of the mule, and £5000 was allowed him by Parliament. In 1826, however, his business had again failed, and another attempt was made to obtain a second Government grant, but without success. He died on the 26th June 1827. (See his Life by G. French.)

CROMWELL, OLIVER, Lord Protector of the British Commonwealth, was born at Huntingdon, 25th April 1599. His father, Robert Cromwell, was the second son of Sir Henry Cromwell of Hinchinbrook, surnamed, for his munificence, *The Golden Knight*. His mother,[1] Elizabeth Steward, was the daughter of a gentleman of some property in the city of Ely. The connection of the Cromwell family with that of the celebrated Thomas Cromwell, earl of Essex, and of the Stewards with the royal line of Scotland, is not without interest.[2] The stories of Cromwell's youthful visions and adventures, his violence and profligacy, are derived from the most questionable authority, and are little worthy of serious notice. The authentic facts of his early history seem to be confined to these:—that he was educated at Huntingdon grammar-school, under a rigid and pious instructor, Dr Thomas Beard; on 22d April 1616 he was admitted a fellow-commoner of Sidney Sussex College, Cambridge; on his father's death in June 1617 he left the university, carrying away at least as much Latin as enabled him in after years to make occasional use of that language; and soon after he proceeded to London to gain some knowledge of law. There is no proof that he ever attended any of the inns of court; and regarding his life in London, and the

[1] The character of Cromwell, in some of its noblest aspects, seems to have been inherited from his mother. She died at Whitehall, November 16, 1654, in her ninetieth year. "A little before her death," says Thurloe, "she gave my lord her blessing in these words:—'The Lord cause His face to shine upon you, and comfort you in all your adversities, and enable you to do great things for the glory of your Most High God, and to be a relief unto His people. My dear son, I leave my heart with thee. A good night!'"

[2] See the proofs adduced in Foster's *British Statesmen*, vi. 2; Carlyle's *Letters and Speeches of Cromwell*, i. 32, 40.

limits of his residence there, we are equally destitute of information. On 22d August 1620 he was married at St Giles's Church, Cripplegate, to Elizabeth, daughter of Sir James Bourchier of Felsted, in Essex, a woman of very amiable and prudent character, whose gentle virtues sweetened his domestic life to its close, amid all outward vicissitudes.[1] He now returned to Huntingdon, and assumed the management of his patrimonial estate; and in the quiet routine of a farmer's life fulfilled for nearly ten years, without any incident chronicled in history, the ordinary duties of a country gentleman. We are left to imagine, so far as we can, the silent and unnoticed growth of a great soul, limited as yet in its outgoings to the cares of a farm, —the thoughts that struggled and sank to rest in the stillness of home,—the powerful religious convictions, the "splenetic fancies," the deep fits of melancholy, that ultimately resulted in an open profession of Christianity, and a steady adherence thenceforward to that strict and earnest form of it which had received from its enemies the derisive name of Puritanism. The house of Oliver Cromwell became from this time a resort of "godly men;" and in their prayers and preachings, their interests and their grievances, he took a zealous and active part. On 17th March 1628 he took his seat in the House of Commons as member for Huntingdon. The increasing influence of Puritanism, reacting against the arbitrary and ceremonious tendencies of the king, was powerfully exhibited in the transactions of this brief but memorable Parliament. On 11th Feburary 1629, a few weeks before the close of its second session, Cromwell made his first recorded speech,—calling the attention of the House to the scandalous fact "that Dr Alablaster had preached flat popery at Paul's Cross," and even been encouraged therein by his diocesan; while "Mainwaring, so justly censured by this House for his sermons, was by the same bishop's means preferred to a rich living." "If these," he said, "are the steps to church preferment, what are we to expect?" "It is amusing," remarks Mr Hume, "to observe the first words of this fanatical hypocrite, corresponding so exactly to his character." The correspondence is remarkable enough; but those who have formed a different estimate of Cromwell from that of the sceptical historian may find more than amusement in this first sound of "the imperial voice" which in after days "arrested the sails of the Libyan pirates and the persecuting fires of Rome."[2]

About two years after this Cromwell sold his lands in Huntingdon, and stocked a grazing farm at St Ives, where he resided for five years. In 1636 he removed to Ely, where he had succeeded to the property of his uncle, Sir Thomas Steward. Events meantime were tending to a great crisis. His first cousin, John Hampden, had on the 11th January in this year refused to pay his "ship-money;" in the streets of London, in the midst of pale crowds, good men were being mutilated, branded, and pilloried; Scotland had risen in a flame against a forced episcopacy, and the patience of England was drawing near exhaustion. In April 1638 sentence was delivered against Hampden. The spirit of resistance rose with each new check. In his own district Cromwell had now some opportunity for its exercise, and that victoriously. The great work of draining the fens and completing the Bedford Level had proceeded successfully, till the interference of royal commissioners excited a general outcry of dissatisfaction. Cromwell took an active part in the opposition; and his successful zeal in the business procured him the popular title of "Lord of the Fens." In April 1640 a new Parliament met, in which he took his seat as member for Cambridge. In three weeks it was dissolved. Another was summoned for the 3d November, which became ever memorable in history as the "Long Parliament." Cromwell again sat for Cambridge. Of his share in its proceedings for about two years there is little record. That he was an active member there can be no question. One interesting glimpse we obtain from the graphic narrative of Sir Philip Warwick. It brings before us a Monday morning, early in November 1640, when the writer, then "a courtly young gentleman," came into the House, "well clad," and found a remarkable figure in possession of the House, "a gentleman whom I knew not, very ordinarily apparelled," his linen "plain and not very clean," his stature "of a good size, his sword stuck close to his side, his countenance swoln and reddish, his voice sharp and untunable, and his eloquence full of fervour." This personage was pleading, amid considerable attention, on behalf of a troublesome young man of the name of Lilburne, amanuensis to Mr Prynne, "who had disperst libels against the queen for her dancing and such like innocent and courtly sports." The impression made on the gay young courtier was anything but favourable. "I sincerely profess," he says, "it lessened much my reverence unto that great council, for this gentleman was very much hearkened unto."

The inevitable rupture at length took place, and the king and Parliament made their appeal to the sword. On 12th January 1642 Charles left Whitehall to return no more till the day of his execution. Military preparations on both sides began; and now, at the mature age of forty-three, Oliver Cromwell girded on his armour, and, with his eldest son Oliver[3] by his side, left his quiet home and farm to fight for England's liberty. With no knowledge of the art of war, but much of himself, of men, and of the Bible, this stout English squire had made up his mind in no hasty or factious spirit to draw the sword against his king, and venture his life for what he believed with his whole heart and soul to be the cause of "freedom and the truth in Christ." Out of his moderate fortune he subscribed £500 "for the service of the commonwealth;" £100 more he

[1] She died in the house of her son-in-law Claypole, October 8, 1672. The following letter from her husband, penned the day after the battle of Dunbar, may be taken as a specimen of his private correspondence. "For my beloved wife, Elizabeth Cromwell, at the Cockpit; these. Dunbar, 4th September 1650:—My Dearest,—I have not leisure to write much. But I could chide thee that in many of thy letters thou writest to me, that I should not be unmindful of thee and thy little ones. Truly, if I love you not too well, I think I err not on the other hand much. Thou art dearer to me than any creature; let that suffice. The Lord hath showed us an exceeding mercy; who can tell how great it is? My weak faith hath been marvellously upheld. I have been in my inward man marvellously supported; though, I assure thee, I grow an old man, and feel infirmities of age stealing upon me. Would my corruptions did as fast decrease! The particulars of our late success Harry Vane or Gilbert Pickering will impart to thee. My love to all dear friends. I rest thine, Oliver Cromwell." (*Letters and Speeches*, iii. 67.)

[2] Macaulay, Essay on Hallam's *Constitutional History*.

[3] We may here subjoin a brief notice of Cromwell's family, gathered from a note by Mr Carlyle. Oliver (born in 1623) entered as a cornet in the same division of cavalry with his father, who seems to have regarded him with deep affection and hope. He was killed shortly before the battle of Marston Moor. The Protector, on his death-bed, alludes to this Oliver's death: "It went to my heart like a dagger, indeed it did." Richard was born in 1626, and died in 1712, a man of mild and indolent character, unfit for any office requiring strong powers of mind. Henry, born in 1628, died in 1674. He entered the army at sixteen, and greatly distinguished himself by his courage, prudence, and resolution. He accompanied his father to Ireland in 1649, and in 1657 was appointed lord deputy there. He governed with great ability. "He is a governor," said Cromwell, "of whom I myself might learn." Of the daughters, the eldest, Bridget, born 1624, died 1681, was married first to Ireton, afterwards to Fleetwood. Elizabeth, born 1629, died 1658, was married to Mr Claypole, who became Master of the Horse to the Protector. Mr Carlyle calls her "a graceful, brave, and amiable woman." Mary, born 1637, died 1712, was married to Lord Fauconberg. Dean Swift called her "handsome and like her father." Frances, born 1638, died 1721, was married first to Mr Rich, again to Sir John Russel. Charles II. at one time entertained the idea of allying himself with Cromwell by marrying her.

expended on arms; and during the summer he was actively engaged in raising volunteers. His first exploit was to seize the magazine in the castle at Cambridge, and prevent the carrying away of the university plate to help the royal exchequer. In September he received his commission as captain of a troop of horse. In the first campaign the royal troops generally had the advantage. Cromwell already knew in his own person wherein lay the strength of Puritanism, and the secret of its success. He spoke on the subject to his cousin Hampden. "Old decayed serving men and tapsters," and such "base mean fellows," he said, "could never encounter gentlemen and persons of quality." To match "men of honour" they must have "men who had the fear of God before them," and would "make some conscience of what they did." "A few honest men," he elsewhere said, "are better than numbers." Mr Hampden thought his cousin "talked a good notion, but an impracticable one." To turn "good notions" into facts, however, was the characteristic work of Cromwell,—"impracticable" being a word for which we may suppose him to have had as little tolerance as Napoleon. On this principle of selection accordingly he gradually enlisted around him a regiment of 1000 men, whose title of "Ironsides" has become famous in history. "They never were beaten." "Had his history," says Mr Forster, "closed with the raising and disciplining of these men, it would have left a sufficient warrant of his greatness to posterity."

During the winter associations for mutual defence were formed among the counties. Of these the "Eastern Association" alone, through the prompt and indefatigable activity of Cromwell, proved really efficient. During the spring of 1643, having now attained the rank of colonel, he employed himself in quelling all royalist attempts throughout the association, giving them the final blow by the capture of Lowestoft, with a considerable body of influential royalists and a large supply of warlike stores. His services were next devoted to Lincolnshire, and with similar success. Towards the end of July the marquis of Newcastle, after his victory at Atherton Moor, advanced with a large army against Gainsborough, which was garrisoned by a small Parliamentary force under Lord Willoughby. Cromwell threw himself between the town and the enemy's van, under General Cavendish, forced his way up a sandy eminence, in the face of a body three times superior in number to his own, and drove them in total rout down the other side. Their commander, an accomplished young nobleman, was killed on the spot. "This victory," says Whitelocke, "was the beginning of Cromwell's great fortunes, and now he began to appear in the world." The other Parliamentary leaders, meantime, had met with a series of humiliating reverses, and at the close of the summer the popular cause seemed in imminent peril. In August the earl of Manchester took the command of the Eastern Association, with Cromwell as one of his colonels. On 9th October they effected a junction with Fairfax at Boston, and on the 11th Cromwell and Fairfax encountered the royal force under Sir John Henderson on the field of Winceby, near Horncastle. Cromwell led the van, which advanced to the battle singing psalms. His horse was killed in the first charge, and fell upon him. As he rose he was again struck down, but recovering himself he mounted a "sorry horse" belonging to a trooper, and mingled in the fight. The enemy gave way at the first onset, and were pursued with terrible slaughter for many miles. During the remainder of this season Cromwell was occupied in attending to the security of the Eastern Association, in raising funds, and settling public affairs in Ely, of which he had some months previously been appointed governor.

On 10th April 1644 the Scotch Covenanted army of 21,000 men under Lesley, earl of Leven, united with Fairfax at Wetherby, and proceeded to invest York. They were presently joined by Manchester and Cromwell, now lieutenant-general and second in command. On hearing of this, Prince Rupert hurried from Lancashire at the head of 20,000 men, and relieved York. The Parliamentary army raised the siege, drew out to meet the enemy on Marston Moor, and on the evening of the 2d July gave a death-blow to the royal cause in the north of England. To Cromwell belonged the chief glory of the victory. While the right wing under Fairfax was overpowered by the furious onset of Prince Rupert, Cromwell carried all before him on the left, and, suddenly wheeling round, charged the victorious cavalry of Rupert with such overwhelming force that they were "swept off the field,"—"God made them as stubble to our swords." In the west, on the other hand, Essex and Waller succeeded only in losing their armies. The Parliament, still confiding in these generals, granted them fresh forces, and summoned Manchester and Cromwell to join them. On 27th October they met the king at Newbury, and a sanguinary conflict ensued, with dubious success. During the night the king effected a safe retreat. Cromwell urged Manchester to pursue him, but in vain. Twelve days thereafter, the king and Prince Rupert returned, revictualled Dennington Castle, and carried off their artillery. Cromwell again pressed Manchester to attack them, but the timid earl was immovable. The fruit of these disagreements was a rupture, ending in important results. On 25th November Cromwell, having been called upon to give an account of the affair at Newbury, charged Manchester in the House of Commons with neglect of the Parliamentary interests; and on the 9th December openly urged the necessity of remodelling the army. The "self-denying ordinance," discharging members of Parliament from military offices, and permitting enlistment without the signing of the Covenant, was finally passed on 3d April 1645. Meantime Fairfax had been nominated general, the "new model" was passed, and the raising of troops and remodelling of the old army proceeded with activity.

The wisdom of these changes was proved by the triumphant result of the next campaign. Cromwell's services were by this time felt to be indispensable. He accordingly received a dispensation from the self-denying ordinance, and was hastily despatched (April 23) to intercept a force of 2000 men sent by Rupert to convoy the king from Oxford to Worcester. On the second day he attacked and routed them at Islip Bridge, took Bletchington House on the same day, and on the 26th gained another victory at Radcot Bridge. On 31st May the king suddenly stormed Leicester; the southward movement of his army exposed the eastern counties to imminent danger; and Fairfax, appealed to for help, immediately solicited the appointment of Cromwell as his lieutenant-general. The request was granted, and Cromwell, collecting 6000 chosen horse, joined the camp at Northampton without the loss of an hour, amid the acclamations of the whole army. Decisive action attended his presence; on the very day following, June 14, 1645, the royal army was beaten to pieces on the field of Naseby, and the first civil war virtually brought to an end. Cromwell and his Ironsides decided as usual the fate of the day. Proceeding victoriously south-westward, the Parliamentary army encountered the "Clubmen," a new and somewhat formidable party in the royal interest. At Shaftesbury Cromwell dispersed a large body of them, after which they appeared no more. On 11th September Bristol was stormed; and again turning southward the army took every town and stronghold in its way. Cromwell particularly distinguished himself by his sieges. Basing House, the residence of the marquis of Winchester, had for four years defied all besiegers, and was regarded by the royalists as impregnable. On 14th October Cromwell wrote to the speaker—"I thank God I can give you a good account of Basing." He had stormed it that morning at 6 o'clock, having, says Hugh Peters, "spent much time with God in prayer the night before." A few more such successes ended the campaign and the war. On 22d April 1646 Cromwell returned to his place in Parliament, and was received with the most distinguished honours.

During the next two years he resided for the most part in London, taking a due share in the negotiations with the king, and in the important contest between the Presbyterians and Independents, represented respectively by the city and army, which ended in the triumph of the latter. On the one side the support of the army was felt to be now an unnecessary burden, while the fact that so many of the soldiers had never taken the Covenant was displeasing to the strict Presbyterians, especially to those who had held commands in the old army. On the other side it was regarded as a most hazardous policy to disband the army without any surer guarantee for the nation's peace than the promises of the king. The formal claims of the soldiers, however, were forty-three weeks' arrears of pay, indemnity for acts done in the war, and discharge according to contract. After much unsatisfactory negotiation, the celebrated rendezvous or army convocation took place (June 10, 1647) on Triploe Heath near Cambridge. The Parliamentary commissioners were saluted in every regiment with the cry "Justice! Justice!" On the same day a letter signed by the general (Fairfax) and chief officers was despatched to the mayor and corporation of London. It expressed in moderate language their desires, containing at the same time the significant intimation that "for the obtaining of these things we are drawing near your city." A succession of events, varied by the advance and retreat of the army as the Parliament resisted or yielded, ended in the entry of the army into London, August 6, after having received full satisfaction of all its demands. On 12th November the king escaped from Hampton Court, leaving the Parliamentary leaders convinced, after months of fruitless negotiation, of the hopelessness of further treating with him. On 3d January 1648 it was decided that there should be no more addresses to his Majesty. In March news came from Scotland that a royalist army under the duke of Hamilton was preparing to invade England. The smouldering elements of insurrection now broke out. In London an alarming riot was only crushed by "a desperate charge of cavalry." Similar risings in Norwich, Canterbury, Exeter, &c., were put down by Fairfax. A more formidable revolt took place in Wales, and thither Cromwell was ordered to hasten. On 11th May he took the town of Chepstow, and after a protracted siege Pembroke Castle was surrendered to him on 11th July. Having settled Wales, Cromwell now hastened northwards and joined Lambert in Yorkshire. Hamilton, with 17,000 Scots, and Sir Marmaduke Langdale, with 4000 Yorkshiremen, were advancing in loose combination into Lancashire. Cromwell, marching westward at the head of 8600 men, attacked them at Preston on 17th August. The rout and chase extended over three days, at the end of which Hamilton's army was a total wreck. 2000 men were slain, and 10,000 (the duke himself in the number) made prisoners. So rapid and unexpected had been the movement of Cromwell, that Hamilton did not know till the close of the first day with what enemy he had been engaged. Following up this amazing success, Cromwell proceeded northward by Durham and Berwick across the border. On 4th October he entered Edinburgh, where he was welcomed with enthusiasm. During two days he lodged in "the earl of Murrie's house, in the Cannigate," receiving visits from persons of distinction; and on the day of his departure he was entertained to a sumptuous banquet in the castle. Having received satisfactory guarantees of future amity, he took his departure on the 7th October, leaving Scotland "in a thriving posture," and "like to be a better neighbour than when the great pretenders to the Covenant, and religion, and treaties, had the power in their hands." Returning by Carlisle, which was delivered up according to agreement with the Scots, he laid siege to Pontefract Castle. It held out stubbornly. On 6th December, the day of "Pride's Purge," having left Lambert to conduct the siege, Cromwell arrived in London, and on the morrow received the thanks of the House for his services. During the following month he sat assiduously in the High Court of Justice for trying the king; and after the execution was nominated to the new council of state.

The critical state of Ireland now demanded the most vigorous measures,—the whole country, with the exception of Dublin and Derry, having, through the exertions of Ormond, been roused into open war against the Commonwealth. On 15th March 1649 Cromwell was nominated lord-lieutenant for Ireland. Some work, however, still remained to be done at home. The wild doctrines of the Levellers, propagated mainly through the restless activity of John Lilburne, had made dangerous way in the army. The flame of discontent soon broke out into open mutiny at the various headquarters. By prompt activity, and a just exercise of "vigour and clemency," Cromwell and Fairfax quelled this alarming insurrection; two or three of the ringleaders were shot; the rest were admonished and submitted. On 10th July Cromwell left London in great state, and after some weeks spent in preparations at Bristol, embarked at Milford Haven, August 13,—"followed," as Milton tells us, "by the well-wishes of the people, and the prayers of all good men." He landed in Dublin on the 18th, and was received with the most lively demonstrations of joy. On 3d September he appeared before Tredah (Drogheda), which Ormond had garrisoned with 3000 of his best troops. On the 10th Cromwell's batteries began to play, and the governor received a summons to surrender. It was rejected, and the bombardment proceeded. Next day a breach was made, and the storming party entered, but met with a vigorous repulse. Cromwell, witnessing this from the batteries, hastily headed a second assault, drove in the enemy, and, "being in the heat of the action," put the whole garrison without mercy to the sword. "I am persuaded," he wrote in his despatch, "that this is a righteous judgment of God upon these barbarous wretches, who have imbrued their hands in so much innocent blood; and that it will tend to prevent the effusion of blood in the future. Which are the satisfactory grounds to such actions, which otherwise cannot but work regret and remorse." "The execrable policy of that regicide," says Carte, "had the effect he proposed. It spread abroad the terror of his name." Towns and garrisons were yielded up in rapid succession; and, with the exception of Wexford, where a similar slaughter took place (October 11), the subsequent effusion of blood in Ireland was comparatively small. The arm of resistance had been thoroughly paralyzed. On 2d December Cromwell retired to winter quarters. Before resuming the campaign, he issued, in answer to a manifesto from an assembly of the Popish hierarchy at Clonmacnoise, a "Declaration for the Undeceiving of Deluded and Seduced People." In this remarkable document Cromwell, with rude but masterly hand, tears up the sounding pretences of the hierarchy, points to the true causes of Ireland's miseries, rebuts the charges of "massacre" and "extirpation," and invites the inhabitants of Ireland to submit peaceably to the Commonwealth, with assurance of inviolate protection in their just rights and liberties. These promises were no empty words; the results of Cromwell's conquest and government in Ireland were a general peace and prosperity, admitted, even by his bitterest enemies, to be without example in the previous history of that misgoverned country. On 29th January 1650 he again took the field. Success everywhere attended him and his lieutenants. At Clonmel 2000 men of Ulster made a last desperate effort in the royal cause. After a fierce and gallant resistance the place was stormed, and surrendered on 9th May. Cromwell had some time previously received orders to return to England; and having thus, within the brief space of nine months, reduced a hostile kingdom to comparative obedience, he sailed for England, leaving Ireton as his deputy, and entered London in triumph on 31st May.

The threatening aspect of affairs in Scotland had hastened his recall. Charles, willing "to sign anything," had taken the Covenant, and forces were being raised against the Commonwealth. The command of the northern expedition was offered to Fairfax, but he declined to act against the Scottish Presbyterians, save in the event of their invading England; and on 26th June Cromwell was nominated captain-general of all the forces of the Commonwealth. He made his preparations with his usual promptitude, and on the 29th marched from London,—Lambert, Fleetwood, Whalley, Monk, Pride, and Overton commanding under him. On 23d July he crossed the border at Berwick. The inhabitants everywhere fled at his approach, the clergy having represented the English invaders as "sectaries and blasphemers," "monsters of the world," who would "put all the men to the sword, and thrust hot irons through the women's breasts." By dint, however, of encouraging proclamations, combined with the extreme discipline preserved in the army, the confidence of the people was gradually restored. On 28th July Cromwell encamped at Musselburgh. The Scotch army, commanded by David Lesley, as superior to the English in numbers as it was inferior in discipline, lay strongly fortified between Edinburgh and Leith. On the second day after the arrival of Cromwell the enemy made a vigorous sally, but were repulsed with loss. "This," wrote Cromwell to the president of the council, "is a sweet beginning of your business, or rather the Lord's." Lesley, however, was not to be drawn into an open encounter. Fabius himself was not more skilful in wearing out by cautious manœuvring the patience of an enemy. During a whole month Cromwell marched and countermarched round Edinburgh, in vain attempting to provoke a battle, his supplies failing, the season advancing, and sickness reducing his men "beyond imagination." Declarations and responses, with no satisfaction on either side, had meanwhile passed between him and the Scotch commissioners. On 31st August he left Musselburgh, and fell back upon Dunbar, where his ships lay. Lesley immediately hastened to cut off his retreat, and, pressing closely in the rear, took possession of the heights above Dunbar, and the only pass that left a southward opening to the enemy. Thus hemmed in, the sea behind, the enemy encircling him on the hills, 23,000 strong, his own men reduced by sickness from 14,000 to 11,000, Cromwell's good fortune seemed, on the 2d September 1650, to have at length forsaken him. "Before the fight," he afterwards wrote to Ireton, "our condition was made very sad, the enemy greatly insulted and menaced us." Not even then, however, did his strong trust in God and in himself for a moment desert him. "He was a strong man," said one who knew him; "in the dark perils of war, in the high places of the field, hope shone in him like a pillar of fire, when it had gone out in all the others." "In the mount the Lord would be seen; He would find out a way of deliverance and salvation."[1] On the afternoon of that gloomy day, Cromwell, reconnoitring the enemy's position, saw that Lesley was moving his forces to the right, and "shogging" down his right wing to more open ground. At once recognizing the advantage this offered for "attempting upon the enemy," he decided, after consulting his officers, to begin the attack on the morrow before dawn. The battle, however, did not begin till six. The "dispute" was hot on the right for about an hour, when Cromwell's own regiment came to the charge, and "at the push of pike" drove in "the stoutest regiment" of the enemy. At that moment the sun's beams broke out through the morning mist, over the hills and the sea, and the flashing lines of steel. Then was Oliver heard to say, in the words of the Psalmist, "Let God arise, let his enemies be scattered!" Horse and foot now charged resistlessly on every side; the Scottish ranks fell back in wild confusion, wrecked and scattered in tumultuous flight. Before 9 o'clock 3000 of them were slain, and 10,000 prisoners, with all their baggage, train, and artillery, were in the hands of the English, who "lost not thirty men."

He now took possession of Edinburgh, where he spent the most of the winter and spring. The city clergy had shut themselves up in the castle, and refused on his invitation to return to their flocks. Some correspondence ensued, in the course of which the general showed himself rather more than a match for the theologians even on their own ground. In February a deputation from Oxford came to inform him of his election as chancellor of the university. Shortly after, we find him pleading in behalf of a "pious and laudable scheme" for establishing a college at Durham. About this time he was seized with a dangerous illness, brought on by exposure to wet and cold, which, after a temporary convalescence, broke out in several severe relapses. The Council of State expressed their consideration by sending two physicians from London to attend him. In the interval he spent ten days in Glasgow, where he held a friendly conference with some of the leading Presbyterian ministers. The Scotch army meantime lay intrenched at Torwood near Stirling. Towards the end of June, Cromwell, having recovered from his illness, moved westward. Finding the enemy too strong to be dislodged, he sent a portion of his army under Lambert across the Firth. At Inverkeithing they defeated a large body of the enemy, killing about 2000 men. Inchgarvie and Burntisland soon after surrendered to Monk; and Cromwell, crossing with his army to Fife, marched upon Perth, which surrendered on the second day. Charles, finding his supplies thus cut off, determined on a bold stroke, and, breaking up his camp, marched into England. Cromwell, leaving Monk behind him, sent his light horse in advance, under Lambert, joined by Harrison, and followed at some distance. The tidings of the royal movement excited great alarm in London, and it was even suspected that the general had betrayed the Commonwealth. Cromwell, not unaware that such fears would arise, wrote to the Parliament simply relating the facts, and expressing full confidence of success. The militia flocked to his standard all along his march; and by the time he reached Worcester he found himself at the head of upwards of 30,000 men. There, on the 3d of September 1654, the anniversary of Dunbar, after a fierce and unequal contest, the Scotch army was shivered into ruin, and the last hope of royalism buried. "The dimensions of this mercy," said Cromwell in his despatch, "are above my thoughts. It is, for aught I know, a crowning mercy."

At this point Cromwell's career as a soldier ends, and the events of his life become identified with the general history of Britain. After the battle of Worcester, the management of Scotland, where his deputy Monk had been completely successful in crushing royalism, naturally fell

[1] *Letters and Speeches*, iii. 40, 59.

under the chief direction of Cromwell. That country was now united to the Commonwealth by Act of Parliament; a small army distributed in garrisons preserved the peace of the country; justice was strictly administered; the affairs of the church were committed to a commission of pious and judicious ministers; and during the whole period of Cromwell's government Scotland prospered under a strict but beneficent rule. In the interval between the battle of Worcester and the dismissal of the "Rump" Parliament, Cromwell took no continuously visible part in public affairs The general opinion among historians seems to be that during these nineteen months the ambitious general was busily occupied in the course of profound dissimulation and intrigue which had marked his whole career, and that as the premeditated result of the selfish scheme of usurpation which had lurked darkly in his bosom even on the banks of the Ouse, he entered the House of Commons on 20th April 1653, expelled the Parliament, and assumed the reins of power. These views may be left untouched; certain it is that the great assembly that moulded the Commonwealth had now, at the end of twelve years, exhausted its vitality, and dwindled into a numerical fragment of a Parliament, and a mere mockery of representative government. It had become in fact an oligarchy, which absorbed to itself not merely the whole administration of public affairs, but the control of many private interests. Their "only serious occupation to maintain themselves in power, and defend themselves against their enemies,"[1] these men wasted months in debating questions of mere technicality, and prolonged time after time the duration of their power, after the voice of the nation, so far as it was capable of being interpreted, had pronounced it intolerable. After months of discussion and delay, they had completed their measure for electing a new Parliament, professedly with the view of laying down their power into the hands of their successors, when it was found that by this act the members of the existing Parliament were to be *de jure* members of the new, and to constitute a committee for deciding on the admission of their successors! On the morning of 20th April, Cromwell, being informed that this measure was getting hurried through the House, entered with his troopers, and dissolved the Parliament. By that daring act he became the sole head of power in the nation, and nothing was left him but to use it as wisely and firmly as he could. The consequences of that act left him thenceforth no honourable retreat had he desired it. *One* strong hand was needed to give consistency and unity to the action of the state, alike in its internal and its foreign relations; and, from the hour that Cromwell seized the helm, the ship of the Commonwealth rode the waves, if not without straining or accident, yet with a proud and steady march. Few tears were shed for the departed "statesmen;" the nation quietly submitted, if it did not positively approve; the business of the state went on without interruption; the leaders of the army and navy, many of them ardent republicans, continued at their posts, sinking their private opinions in their concern for the country's good. As soon as possible, summonses were issued in Cromwell's name to 140 "persons of approved fidelity and honesty," selected from the nation by himself and his council to act as a Parliament in the existing emergency. This extraordinary assembly met on the 4th of July. The old and vulgar charge against them, as a herd of mean and contemptible fanatics, is of a piece with the general run of historic portraitures of Cromwell himself, and has been sufficiently answered even by writers who have little favour for him. They were in fact a body of most sincere and earnest men, only too eager and comprehensive in their efforts to accomplish a national reformation. They attempted too much, they aroused a storm of hostility from the classes whose interests they threatened; they bowed before it; internal dissensions and intrigue hastened their fall; and on 12th December they resigned their power into the hands of Cromwell, who now found himself in the solemn position of being the uncontrolled arbiter of the peace and safety of Britain. Earnestly desirous, as he throughout evinced himself, of giving his country a stable and constitutional government, he was willing now, rather than that England should sink into the abyss of anarchy, to brave the dangers and the odium that attach to the name of a usurper. Four days after the resignation of the "Little Parliament," it was openly proclaimed that Oliver Cromwell had been invested with the office of supreme governor of the British Commonwealth under the title of "Lord Protector;" and on 16th December 1653 he was solemnly installed in Westminster Hall.

All the chief courts of Europe sent their congratulations to the new sovereign, and soon they were made to feel and bow to his power. A Parliament was summoned for the 3d of September 1654; and in the meantime Oliver and his council proceeded with vigour in the settlement of domestic and foreign affairs. "In less than nine months," says M. Guizot, "eighty-two ordinances, bearing upon almost every part of the social organization of the country, bore witness to the intelligent activity and to the character, at once conservative and reformatory, of the Government." Of these it is sufficient to mention the partial reform of the Court of Chancery, and the settlement of ecclesiastical affairs by the commission of "Triers," a body of able and pious men who, by the impartial testimony of Baxter, "did abundance of good to the church." A plot, the first of many, to assassinate the Protector, was discovered in the month of July. The principal conspirators, Gerard and Vowel, were executed; and on the same day, as a terrible example to Europe of British justice, Don Pantaleon Sa, brother of the Portuguese ambassador, was publicly beheaded for his share in the murder of an English citizen. On the 3d September the Parliament met. The Protector had already concluded peace with the Netherlands, Sweden, Denmark, and Portugal; and a treaty with France was proceeding hopefully towards settlement. The Parliament began business by deliberating whether they should approve the newly established frame of government—in other words, by calling in question the authority which had called them together. Oliver at once hastened to set them right. "I told you," he said, "that you were a 'free Parliament,' but I thought it was understood withal that I was the Protector, and the authority that called you!" He concluded an earnest and powerful address by requiring them to sign a document pledging themselves to acknowledge the existing Government. One hundred and fifty of the republican members refused to sign, and withdrew. The rest resumed their sitting; but their subsequent proceedings were scarcely more satisfactory than their inauspicious commencement. Instead of accepting as a fact the power of the Protector, and aiding him in the work of government, they occupied themselves in interposing as many checks as they could to his influence. Deeply grieved at the failure of each successive attempt to govern by constitutional means, Cromwell was not therefore discouraged. If Parliaments would not help him, he was determined to govern without them. His scheme of "Major-generals" followed,—"a little poor, invention," as he called it, for preserving order in the country, and crushing the now imminent attempt at a combination between the Royalists and the Levellers.' Though arbitrary, and in many instances oppressive, this scheme accomplished the great end of its establishment—the preservation of the country's peace

But while the enemies of peace and order at home were

[1] Guizot. *History of Cromwell and the English Commonwealth*

made to feel the invincible power of his government, it was in his relations with foreign states that the commanding genius of Oliver was most conspicuously displayed. No monarch ever so sustained in the eyes of Europe the majesty of the British power. The grand object of his foreign policy was to unite the Protestant states, with Britain at their head, in a defensive league against Popery, then as now the enemy of civil and religious liberty. Spain, "the great underpropper of the Roman Babylon," the "natural enemy of the honest interest," he determined to humble, and in due time he did. With France, less subject to the yoke of Rome, he allied himself, making such terms as he pleased, extorting from the crafty Mazarin,[1] a prince of the Church of Rome, protection for Rome's enemies, and full pardon for offences committed against her in the heart of France itself! In the summer of 1655 the persecution of the Protestants in the valleys of Piedmont afforded an occasion for displaying in the noblest light the greatness of the Protector and of the nation which he represented. The tidings of these cruel oppressions affected the stern conqueror to tears. The treaty with France was ready to be signed that day. He refused to put his name to it until he received assurance of protection for the persecuted Piedmontese; and immediately wrote, not only to the duke of Savoy himself, but to Louis XIV., to Cardinal Mazarin, the kings of Sweden and Denmark, the States-General, the Swiss cantons, and even to Ragotzki, prince of Transylvania, pleading for their interposition. Had his remonstrances proved unsuccessful, he had fully prepared to exact compliance at the point of the sword. A Protector not of the British realms only, but of the Protestantism of Europe, this "usurper" might claim, without fiction the title "Defender of the Faith." Meantime the supremacy of England on the seas was upheld by Blake, whose guns thundered along the shores of the Mediterranean, exacting justice and submission from every hostile power. The duke of Tuscany, the Pope, the deys of Tunis, Tripoli, and Algiers, each in succession, were forced to make reparation for injuries to English commerce and liberty. The Mediterranean was cleared of pirates, and the confidence of peaceful merchants was restored. "By such means as these," said Cromwell, "we shall make the name of Englishman as great as that of Roman was in Rome's most palmy days."

After a lapse of nearly two years, Cromwell, still clinging to the wish of restoring the ancient constitution, now made another experiment at governing with a Parliament. It met on 17th September 1656. About a hundred of the inveterate republicans were excluded, and the House, now tolerably in harmony with the Protector's views, proceeded to a settlement of the nation. The major-generals were abolished early in spring; the form of a new constitution, with two Houses of Parliament, and one governing person, with the title of "King," was proposed; and during three months the subject was discussed amidst the intense expectation of the whole people. That Cromwell was willing and even desirous to add this element of stability to his government there can be no doubt; but seeing that the dangers that threatened to accompany the assumption of the title were likely to overbalance its advantages, he finally declined it. The remaining points of the constitution were agreed on, and on 26th June 1657 he was again, with additional solemnity and increased power, invested with the Protectorate. The new Parliament assembled on 20th January 1658. The Commons refused to acknowledge the Protector's House of Peers, and on 4th February he dissolved them, concluding his last speech with the solemn words—"God be judge between me and you!" The whole weight of government again rested on his shoulders, and with unabated energy he went on with his work, crushing the designs of domestic enemies, and maintaining abroad the full prestige of his power. His struggles were now drawing to an end. "He being compelled," says Maidston,[2] "to wrestle with the difficulties of his place, so well as he could, without parliamentary assistance, in it met with so great a burthen as (I doubt not to say) it drank up his spirits, of which his natural constitution yielded a vast stock, and brought him to his grave; his interment being the seed-time of his glory and England's calamity." On the 6th August his favourite daughter, Elizabeth, died after a lingering illness, during which the Protector had watched unremittingly by her side. His health, already declining, now visibly broke down. On Friday, the 3d of September 1658, the anniversary of his Fortunate Day, the spirit of Cromwell was released from its earthly toils,—Nature herself seeming to prophesy, in the voice of the tempest that had swept over England, that a great power was passing away.

"It has often been affirmed," says Lord Macaulay, "but apparently with little reason, that Oliver died at a time fortunate for his renown, and that, if his life had been prolonged, it would probably have closed amidst disgraces and disasters. It is certain that he was to the last honoured by his soldiers, obeyed by the whole population of the British Islands, and dreaded by all foreign powers, that he was laid among the ancient sovereigns of England with funeral pomp, such as London had never before seen, and that he was succeeded by his son Richard as quietly as any king had ever been succeeded by any prince of Wales."[3]

Historians, till within a comparatively recent period, have been nearly unanimous in their judgment on the character of Cromwell. That he was a man of extraordinary abilities was a necessary and universal admission, but served for the most part only "to point the moral" as an aggravation of his crimes. The only question concerning so terrible a prodigy seemed to be, how far a selfish and unscrupulous ambition may have been modified in him by a blind fanaticism, how far in deceiving others he may gradually have fallen into deception of himself. That his history should have been so interpreted admits of easy explanation. The recoil of sentiment that followed the death of Cromwell, and with him of Puritanism as a visible power, was great in proportion to the intensity of the previous strain; and a man who attempted to realize Christianity as a practical element in the government of nations, and addressed armies and parliaments in the language of the Bible, was not likely to be looked upon with sympathy in the age of Bolingbroke and Hume. Had Cromwell been less of a Christian and more of a Pagan, historians might have accorded to him some of that leniency with which they have spoken of the vices of a Cæsar or a Peter the Great. But the same office which cowardly hands had done for his bones, servility, ignorance, and prejudice did for his memory; and during most part of two centuries, the name

[1] It was said that Mazarin "feared Oliver more than the devil," and changed colour at the mention of his name.

[2] Letter to Winthrop, governor of Connecticut (Thurloe, i. 763). From the same source we take this description of the Protector's personal appearance and character. "His body was well-built, compact, and strong, his stature under six feet (I believe about two inches), his head so shaped as you might see in it a storehouse and shop both of a vast treasury of natural parts. His temper exceedingly fiery, as I have known, but the flame of it kept down for the most part or soon allayed with those moral endowments he had. He was naturally compassionate towards objects in distress, even to an effeminate measure; though God had made him a heart wherein was left little room for any fear, but what was due to Himself, of which there was a large proportion, yet did he exceed in tenderness towards sufferers. A larger soul I think hath seldom dwelt in a house of clay than his was."

[3] *History of England*, vol. i. p. 139.

of the greatest man of his own age, and one of the noblest of any age, has been associated with all the infamy that belongs to a life-long career of unmitigated hypocrisy and insatiable ambition. Truth, however, at length begins to prevail, and Cromwell's own prophetic hope is attaining fulfilment—"I know God has been above all ill reports, and will in his own time vindicate me." "In speaking," said Milton, "of a man so great, and who has deserved so signally of this commonwealth, I shall have done nothing if I merely acquit him of having committed any crime, especially since it concerns, not only the commonwealth, but myself individually, as one so closely conjoined in the same infamy, to show to all nations and ages, as far as I can, the supreme excellence of his character, and his supreme worthiness of all praise." The most eloquent of English historians has defended, in pages read by all the world, both the Puritans and their king; and another historian, with still deeper love and admiration, has paid his "tribute to the memory of a hero," in a work which will henceforth enable posterity to know what kind of man Oliver Cromwell really was.[1]

There is no severer test of a man's character than the use he makes of absolute power. Tried by this test Cromwell bears comparison favourably with any of the greatest names in history. Elevated into supremacy, regal save only in name, he still preserved the plain simplicity of his former life. Armed with more than regal power, he limited himself within the strict bounds of necessity. Personally he cared little for the outward shows of royalty, but he stinted no pomp or ceremony so far as it seemed to involve the nation's dignity. Too great to be jealous or vindictive for himself, he was swift and stern in crushing the enemies of public tranquillity. He was truly a terror to evil-doers, a praise to them that did well. He fostered learning, though himself not learned, and allied with some to whom learning was profanity. "If there was a man in England who excelled in any faculty or science, the Protector would find him out, and reward him according to his merit." The head of a triumphant cause, he was so little of a fanatic that he tolerated all sects, so long as they meddled not to disturb the state. His large and healthy spirit was bound by no party sympathies, but yearned towards all good men, of whatever name. At an era when toleration was looked upon by many as foolish in politics and criminal in religion, he stood out in glorious prominence as the earnest advocate of the rights of conscience, and proclaimed all men answerable to God alone for their faith. Popery and prelacy he proscribed, on grounds political rather than religious; to the adherents of both he showed private lenity; under his rule men no more suffered at the stake or the pillory. So far did his thoughts reach beyond his age, that he desired, and earnestly attempted, to extend the rights of citizenship to the outcast and persecuted Jews. Himself the greatest, "the most English of Englishmen"—he was determined that England should be the greatest of states. He encouraged trade, planted colonies, made wise peace with whom he would, or waged just and successful war. All Europe trembled at his voice, and the flag of Britain thenceforth waved triumphant over every sea. In fine, considering the comparative position of Britain in the times that preceded and followed him, the circumstances of his life, and the difficulties with which he had to contend, making all allowance for his errors and his failings, he was a man for all ages to admire, for all Britons to honour in proud remembrance. No royal name, at least since Alfred's, is more worthy of our veneration than that of the "Usurper," Oliver Cromwell. (A. NI.)

[1] "The collection of all his speeches, letters, and sermons," says Hume, "would make a great curiosity, and, with a few exceptions, might pass for one of the most nonsensical books in the world." How the *Letters and Speeches of Oliver Cromwell, with Elucidations by Thomas Carlyle*, reply to this remarkable verdict, readers must judge for themselves. No such noble service was ever rendered to the memory of a great man by a single hand. For an able biography in which a very opposite view is taken of the character of Cromwell, the reader is referred to Mr Forster's *Statesmen of the British Commonwealth*, vols. vi. vii.

CROMWELL, or CRUMWELL, THOMAS, earl of Essex. Of the life of Thomas Cromwell before he entered the service of Henry VIII., crowded with stirring incident as we know it was, the accounts that we possess are meagre and far from authentic. Even the year of his birth is unknown, but 1490 has been fixed upon as a probable approximate date. His childhood was passed near London—perhaps, as Foxe says, close by Putney—where his father, according to Foxe, and also according to the stronger evidence of Chappuys, the ambassador from Charles V.,[2] carried on the trade of a blacksmith. During his boyhood he lost his father, and his mother then married a fuller, whence Pole's assertion, "pater ejus pannis verrendis victum quæritabat."[3] It has been conjectured that, as a boy, Cromwell entered the household of Cecily, marchioness of Dorset, and that therefore his family must have possessed some influence; but the letter referred to by Sir Henry Ellis as the only evidence of connection with the house of Dorset belongs in all probability to the period when he was engaged in the cloth trade.[4]

While still in his teens Cromwell made his way to Italy, where he was to read Machiavelli, and acquire those views of conduct and statesmanship which determined his career. He first passed over to Flanders, and obtained a situation as clerk in the English factory at Antwerp. He then took service, there is good reason to believe, as a soldier in Italy; but the story narrated by Foxe, that he was one of the duke of Bourbon's followers at the siege of Rome in May 1527, is extremely doubtful. The inaccuracy of Foxe is notorious, and there is evidence in letters of his own that Cromwell was in England in January 1527, and again in 1528. It nevertheless remains possible that during the interval he was at Rome on some diplomatic mission. Some time also he spent in the office of a merchant at Venice, with whom Pole claims to have had personal acquaintance; and Foxe asserts that, subsequently to his return to England, he paid another visit to Italy, being engaged by the leading merchants of Boston in Lincolnshire to procure certain privileges from the Pope. The well-known story of the kindly help which he received while in distress from the Florentine banker Frescobaldi, and the noble gratitude which he displayed in his prosperity, rests apparently on no more certain authority than a novel of Bandello and the statement of Foxe though it is an interesting illustration of the fame which he acquired as a man who never failed to remember a kindness.

From his signature on the title-deed of a manor in Buckinghamshire, dated 1512,[5] it appears that Cromwell was then practising, as we know he afterwards practised, as a scrivener—a combination of attorney and money-lender. He also for a time followed his step-father's trade of cloth-merchant. In 1523 he obtained a seat in Parliament; and he had most likely already entered the service of Cardinal Wolsey. That he had done so within two or three years after there is positive evidence to prove.[6] His

[6] The signature of Cromwell as witness is affixed to a paper drawn up to prove the transfer of certain letters from Sir W Gascoyne, the

principal employment was to collect the confiscated property of the monasteries granted by the Pope to Wolsey for the endowment of his colleges at Ipswich and Oxford; and the manner in which he performed this task, while it added very considerably to his purse, aroused numerous and vehement complaints. Indeed, many expected to see him mount the scaffold when his master's protection ceased to be of avail.

Among the followers of Wolsey, however, he had made himself of the first importance; and when ruin overtook the cardinal, it was on Cromwell that he leant. There are letters extant in Wolsey's handwriting, addressing Cromwell as a familiar friend, and earnestly begging his presence and advice; and there is one in the handwriting of Cromwell, containing such counsel as might have been given by an equal, and, with an air that savours somewhat of hypocrisy, congratulating the fallen minister on being now "at liberty to serve God," and "banish and exile the vain desires of this unstable world." For his fidelity, and especially for his defence of Wolsey in the House of Commons,[1] Cromwell received from his contemporaries the highest praise. His conduct appears to have been simply that of a man who, not forgetful of his own interests, was honourably desirous of serving a patron to whom he was deeply indebted. At first he remained with the cardinal, whom he accompanied to his uncomfortable exile at Esher. But he was not long content to serve in unprofitable obscurity, and he was besides in some alarm for his personal safety. New and aspiring projects began to fill his mind. Cavendish, Wolsey's gentleman-usher and biographer, tells how on All-Hallows day he found him gazing out of a window at Esher, with his primer in his hand, employed, unlike his wont, in saying his matins. He complained with tears to Cavendish that, while he had received no promotion from the cardinal, he was like to share his fall, and announced his intention of riding to the court that very afternoon to stake his fortunes on an interview with the king. An account of that interview has been given by Pole,[2] who asserts that he received his information from some of the courtiers present. Trusting in Henry's love of power and his bitter irritation against the Pope, Cromwell ventured to reveal the daring policy which he had conceived. The authority of the Papacy in England was to be altogether abolished; and thus, not only was the painful question of the divorce to be easily settled, but the allegiance of the clergy, then divided, as Cromwell proved by reference to the bishops' oaths, between their sovereign and their spiritual head, was all to be claimed by the former. And, besides, Cromwell appealed to the king's cupidity by showing that all the wealth of the clergy was at the disposal of the king, since they (in common, indeed, with the whole nation) had, by receiving Wolsey as Papal legate, fallen under the penalties of præmunire. The boldness and originality of this advice, and the reputation for ability, address, and fidelity which he had gained, pointed Cromwell out to Henry as likely to prove a minister of no ordinary value; and he was at once taken into favour. The way, however, had been previously prepared. The duke of Bedford, whose life Cromwell had saved in Italy, spoke in his behalf; and he had recently laid several of the other courtiers under obligations. He had advised the cardinal to advance his interest at court by conferring handsome presents on those who had the greatest influence with the king, and had himself undertaken to fix the amounts, and choose the recipients, of these gifts.

Thus Cromwell gained entrance into the king's service. His rise was rapid, for he possessed qualities which admirably fitted him for success as a minister of Henry VIII. He was capable of carrying on a strong and arbitrary government with a hand that shrank from no measure that seemed necessary, and an eye that never failed in its vigilance; and, whenever the king chose to act independently, he was supple enough to bend, and to bend gracefully, to the inevitable. In him also the king found a servant who did not scorn to offer the flattery which he expected, who performed with zeal and care any service, however trivial, and who was ever ready to join heartily in the hunting, gambling, and other pastimes in which he delighted. That, with these qualities, he was of obscure birth was a circumstance in his favour; for the policy of humbling the nobility, which had been steadily pursued by Henry VII., had not been reversed by his son. Immediately, or almost immediately, after his interview with the king, Cromwell was appointed privy councillor. One more service he rendered to Wolsey, as the bearer of the king's gift of a thousand pounds; but his fortunes were no longer linked with those of the cardinal. By 1532 he had obtained the posts of master of the jewels and clerk of the hanaper; in 1533 he was raised to the office of chancellor of the exchequer for life. By 1535 he had become master of the rolls, secretary of state, and, most important of all, had been appointed to the highest office in the church as vicar-general in ecclesiastical affairs,—a title which was afterwards changed (with what change of power, if any, is now unknown) for that of vicegerent. In 1536 he was made lord privy seal. In 1537 he received the Order of the Garter. And, besides these dignities and offices, he held those of great chamberlain, dean of Wells, chancellor of the university of Cambridge, justice of the forests north of the Trent, and Baron Cromwell of Okeham. On the 17th April 1540 he was created earl of Essex.

To narrate the details and trace out the effects of Cromwell's policy belongs to history. In this biography it is sufficient to consider the general character of the measures for which he was responsible, to estimate his aims and motives, and discuss the means which he employed.

A great scheme, consistently carried out, is manifest throughout the whole of his political career. All power was to be centralized in the hands of the king, or in those of the ministers whom he appointed; for the present, that is, in the hands of Cromwell himself. In secular affairs this centralization was already almost complete. Parliament voted, and the judges decided, as the king wished; and juries could be readily frightened into abject submission. The power of the nobles, which of old had been the

---

treasurer of Wolsey's household, to John Higden, dean of Cardinal College, and dated the 29th October of the seventeenth year of Henry VIII. *i.e.* 1525. (See Brewer, *Calendar, &c.* vol. iv. part 1, p. 768). And there are extant two letters written in 1526, and addressed to Cromwell as "one of my Lord Cardinal's Council," and "counsellor to my Lord's Cardinal's grace" (Brewer, *Calendar*, vol. iv. part 1, pp. 1048-9). Sir Henry Ellis (*Original Letters*, 2nd ser. 2nd vol. p. 117) expresses the opinion that "he must have been in Wolsey's service at least as early as 1524."

[1] Cavendish (*Life of Wolsey*, p. 276), says that a bill had been passed in the House of Lords to "have my Lord Cardinal condemned of treason, . . . against which Master Cromwell inveighed so discretely, with such witty persuasions and deep reasons that the same would take there no effect." But Herbert quotes the articles of the bill, because, he says, "our vulgar chronicles misreport them," and proves that it was not a bill of impeachment, but one intended to disqualify Wolsey from being restored to office (*Life of Henry VIII.* pp. 408–16, Murray's ed.). He adds, "These articles were presented to the Lords, and then sent down to the Lower House, where Thomas Cromwell (obtaining the place of a burgess) so wittily defended his master that no treason could be laid to his charge. And upon this honest beginning Cromwell obtained his first reputation." Mr Brewer (*Calendar, &c.* vol. iv. Introd. p. 553), however is inclined to believe that Cromwell risked nothing by his defence of Wolsey. The bill was dated 1st Dec., when Cromwell was already in the king's service; and there is no reason to believe that Henry was in favour of the measure, which, on the contrary, was likely to be distasteful to him as intended to limit his prerogative.

[2] *Apologia ad Carolum V.* pp 120–121, quoted by Tytler, *Life of Henry VIII.* p. 308

national safeguard against despotism, had been laid in the dust by the Wars of the Roses and the successful policy of Henry VII. The church alone retained a species of independence. That independence it was therefore Cromwell's first aim to destroy. The momentous contemporary events which suggested his scheme gave him the opportunity of effecting its accomplishment. It was the support of the Papacy which alone enabled the English clergy to make any stand against their sovereign; and on the Continent that authority had been repudiated by several states. In England the king's mind was ripe for a breach with Rome; and the new learning had spread a general desire for ecclesiastical reform. Henry was soon persuaded to sever every bond that united England with Rome. Parliament complied with its usual facility. The clergy were forced, as the price of escape from the penalties of præmunire, to acknowledge the king's headship of the church. And all Cromwell's foreign policy was directed to support this great revolution; England was to be placed at the head of a Protestant league which should defy the emperor and the Pope.

Such being Cromwell's policy, it was natural that he should make himself the recognized protector of Protestant heretics. He was unable to offer the slightest resistance to the passing of the Six Articles, by which Henry sought to fix the faith of England and terrify all parties into order, but he allowed no Lutheran to pay the penalties which the Articles enacted. He was the patron of Coverdale; and to him was due that version of the English Bible known as the *Great Bible*, the first edition of which has taken his name. In 1539 he obtained the office of licenser of Bibles; and he distributed copies all over England, commanding that in every parish church whoever desired to read should have free opportunity. Whether he had any sympathy with doctrinal Protestantism is very doubtful. Foxe is a most insufficient authority for the statement that he abjured the errors of Rome on the perusal, while in Italy, of the Latin New Testament of Erasmus; it may, nevertheless, be true that he did read the New Testament, not without after results.[1] But his stay in Italy, while it would tend to make him the enemy of the Papacy, would equally tend to make him altogether anti-theological in his habits of thought. Distress, however, seems to have driven him to the consolations afforded by the doctrines of the old religion. In his perplexity at Esher, he is said to have betaken himself to the repetition of prayers to the Virgin; and his will, dated 1529, also goes to show that he was doctrinally no heretic. In it he orders the appointment of a priest at a salary of £6, 13s. 4d. per annum, to sing masses for his soul; for the same object he saddles a bequest to his brother-in-law and sister with £8 a year, and leaves 20s. to each of the five orders of friars in London; and he directs £20 to be divided among poor householders that they may act as his beadsmen. It is possible, however, that this may merely have been a politic deference to custom. Both the last speech of Cromwell, which announces his return to Catholicism, and his last prayer, which is Protestant in its tone, are of very doubtful authenticity.

The work for which Cromwell is popularly remembered, that which earned him his distinctive title of "malleus monachorum," was the abolition of the monasteries. The means he employed to accomplish this measure were characteristic. Commissioners were sent to visit the monks and nuns, and give reports of whatever irregularities could be discovered in their conduct. The juggleries of pretended miracles were exposed; rough farces in ridicule of the priests, and even of the sacraments, were allowed to be acted in place of the mysteries or miracle-plays. Every shrine was destroyed, all its costly gifts being seized by the king. The bones of St Thomas à Becket, the hero of a signal triumph of the Papacy over the Crown, were dug up and burnt as those of a traitor; his name was removed from the service-book; his festival ordered to be neglected; every window erected to his memory ruthlessly destroyed; Cromwell even thought it worth while to publish a proclamation giving an official account of his treasons. A grant of the monastic property to the king was obtained from the Commons, who expected that the pressure of taxation would thus be relieved. And the nobles and wealthier commoners were conciliated by the chances that offered of cheap purchases of land.

For seven years Cromwell was supreme in the royal council, and supreme in all the departments of the administration. He was not altogether independent; every measure of importance had to be approved, and many were modified, by the king, who, moreover, often chose to act for himself in matters of the greatest moment, without even seeking his minister's advice. Yet during the period of his ministry Cromwell was certainly responsible for the general character of the government. The servant of a master who spared no life that endangered his authority or even disturbed his tranquillity, living in an age when to allow any to escape whose acts or avowed opinions were inconsistent with the policy of the Government would have been considered mere weak-minded lenity, he carried out the principles of his master, he followed the practice of his age, with stern and unvarying regularity. A position of unparalleled danger, both from traitors at home and from foreign attacks, had been assumed by the Government. The greatest promptitude and vigour were essential to safety. But during Cromwell's ministry vigour and promptitude were carried to an extreme. Laws never equalled for severity in the history of England were enacted. No opposition was allowed to endure for a moment. It is true that the blood of More and Fisher, of the marquis of Exeter, Lord Montague, and the countess of Salisbury (the last of whom, indeed, was executed ten months after the death of Cromwell) was shed in no private quarrel. Cromwell's policy had been adopted by the king; and in some cases he was no more than the king's official agent. Yet that he fully sympathized with these severities is past a doubt. The condemnation of Exeter, Montague, and the countess of Salisbury by attainder without trial was due to his suggestion. It was he, as numerous memoranda of his remain to prove, who enforced the execution of the laws of treason upon minor offenders. It was he who doomed "the Abbott Redyng to be sent down to be tryed and executed at Redyng with his complycys,"—"the Abbott of Glaston to be tryed at Glaston and also to be executed there with his complycys," and who ordered "that the evydens be well sortyd and the indytmentts well drawn against the said abbotts and their complycys," and "to send Gendon to the Towre to be rskkyd."[2] He also—all attempts at persuasion proving futile—superintended the trial of the seven noble Carthusians of the Charterhouse, whom, breaking through the hitherto unbroken custom, he hanged in their clerical garb, that it might be vividly

[1] Dean Hook (*Lives of the Archbishops of Canterbury*, vol. i. p. 120) asserts of Cromwell that it is "more than doubtful whether he ever understood Latin at all." But the evidence points decidedly in the opposite direction. Latimer writes to him partly in Latin (Strype, vol. i. pt. i. p. 512); in a letter to Henry VIII. he quotes in that language part of a letter from Melanchthon which he had received (Strype, vol. i. pt. ii. p. 403); and Coverdale addresses him in terms which could not have been applied in those days except as an insult to any man ignorant of so common an accomplishment.

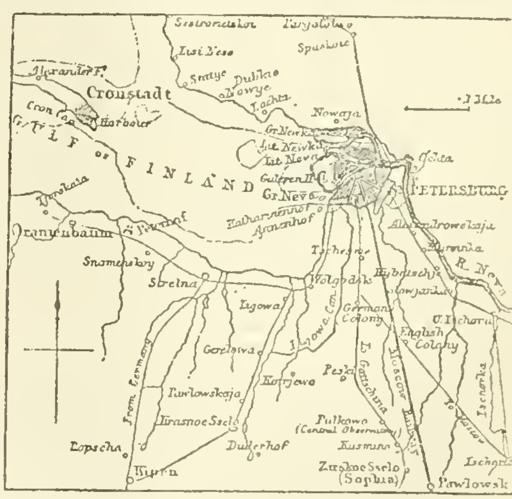
[2] Ellis, *Original Letters*, 2d series, vol. ii. p. 121. Such entries, it must in fairness be remembered, do not imply that the cases had been prejudged: as to the facts of the charges there was no doubt

impressed upon the imagination of the people that there was no longer any law in England higher than loyalty. And that he had not visited Italy in vain is proved by a very characteristic letter[1] written in August 1537 to Michael Throgmorton, once a spy of his own, now a follower of Cardinal Pole's, in which, after hinting that both master and servant may yet obtain mercy by submission, he breaks into a threat—"There may be found ways enough in Italy to rid a traitorous subject. Surely let him not think but, when justice can take no place by process of law at home, sometimes she may be enforced to take new means abroad." In private matters Cromwell's temper was equally arbitrary. Stowe's father, for instance, as the chronicler himself narrates, had his house removed upon rollers, without his consent or even knowledge, to make room for Cromwell's buildings in Throgmorton Street, London; and Foxe, partisan as he was, gives other instances.

Such a career could not fail to surround Cromwell with numerous and implacable enemies, and to afford many real grounds of accusation. His private expenditure had been splendid; he was fond of adding house to house; and two hundred poor persons were daily fed at his door. The cost of the system by which he supported his power had been enormous. Presents had been freely lavished upon men of influence, and an army of spies and agents had been maintained and generously rewarded. Such expenses his private fortune and the grants he had received from the king were quite inadequate to support; and it was easy to prove, not only that he had been in the regular habit of receiving gifts from suitors and others who desired his favour, but that much of the public money had been used by him without passing through the public treasury. He was the patron of heretics. His promises of a full treasury and relieved taxation had not been fulfilled; taxation, indeed, had been increased; and, for that and many other reasons, his government was now extremely unpopular. The nobles, almost to a man, and most of the clergy, were his foes; but perhaps his deadliest enemy was his old companion in the service of Wolsey, Stephen Gardyner, bishop of Winchester, whom he had in vain attempted to crush under the Act of Supremacy. That part of his policy of which the accomplishment was desired by Henry was completely achieved, and Henry had no longer any interest in supporting him. He had, besides, committed a fatal mistake. His enemies had potent means in their possession for kindling against him all the fury of which Henry's nature was capable. It could be proved, beyond the possibility of doubt, that he had been long engaged in negotiations with the German Protestant princes without the knowledge of the king, whom, besides, to further his plans, he had involved in the hateful marriage with Anne of Cleves. His danger had not been unforeseen; and two years before his fall he is said to have arranged his affairs, so that his family, and his servants, to whom he was always a thoughtful and generous master, should not be left unprovided for. But the blow fell unexpectedly. On the 10th of June 1540 at the council table, the duke of Norfolk rose and accused him of high treason. Witnesses were present to swear that he had declared that he would fight in support of his opinions, "sword in hand, against the king and all others," and that in a year or two he would have so far carried out his policy that the king should no longer be able to resist it. In vain he passionately exclaimed against the absurdity of charging him with treason. His enemies had attained their revenge. In rude triumph the duke of Suffolk stripped him of his George; the earl of Southampton tore the Garter from his knee. He was immediately removed to the Tower. That night in the city the bells of the churches rang out peals of joy, bonfires blazed, and many of the citizens held exultant revel. His friend Cranmer alone uttered a word in his favour. A bill of attainder, accusing him of peculation, extortion, bribery, contempt for the nobility, heresy, and treason, was passed with acclamation. Twice in vain he appealed to the king for mercy in terms of the most pitiful entreaty. Having drawn up a statement concerning Henry's relations with Anne of Cleves, adapted to facilitate her divorce, he took the opportunity to protest against the injustice and illegality of condemning him unheard, and concluded with a pitiful cry for "Mercy! mercy! mercy!" And again, in a letter which he contrived to convey to the king by the hands of his old servant, Sir Ralph Sadler, he attempted to defend himself, especially against the charge—which he well knew would be one of the most fatal brought against him—of having divulged certain of the royal secrets, and once more, in humble but passionate language, besought pardon. Henry was moved, but remained inexorable; and, on the 28th July 1540, Thomas Cromwell was beheaded.

Original information concerning the career of Thomas Cromwell is to be found in Brewer, *Calendar of State Papers of the Reign of Henry VIII.*; Sir Henry Ellis, *Original Letters*; Reginald Pole, *Apologia ad Carolum V.*; and Strype, *Ecclesiastical Memorials*, and *Memorials of Abp. Cranmer*. Foxe and Burnet, on one side, and Lingard, on the other, are partisans; and even their statements of fact are most inaccurate. (T. M. W.)

CRONSTADT, or Kronstadt, a strongly fortified seaport town of Russia and the great naval station of the Russian fleet in the northern seas, the seat of the Russian admiralty and of a military governor, is situated on the island of Kotlin, near the head of the Gulf of Finland, twenty miles west of St Petersburg, of which it is the chief port, in 59° 59′ 30″ N. lat., and 29° 46′ 30″ E. long. The island of Kotlin, or Kettle (Finn., *Retusari*, or Rat Island) is of calcareous formation, and in general outline forms



Environs of St Petersburg, showing position of Cronstadt.

an elongated triangle, seven miles in length by about one in breadth, with its base towards St Petersburg and the mouths of the Neva, and its apex extending obliquely seawards. The eastern or broad end is occupied by the town of Cronstadt, and shoals extend for a mile and a half from the western point of the island to the rock on which the Tolbaaken lighthouse is built. The island thus divides the approach by sea to St Petersburg into two channels; that on the northern side is obstructed by shoals which extend across it from Kotlin to Lisi-ness on the mainland, and is only passable by vessels drawing less than 15 feet; the southern channel, the highway to the capital,

[1] Froude, *History*, vol. iii. p. 44-48.

is narrowed by a spit which projects from opposite Oranienbaum on the mainland, and, lying close to Cronstadt, has been strongly guarded by batteries. The town of Cronstadt is built on level ground, and is thus exposed to inundations, from one of which it suffered in 1824. Its streets are regular and well paved; the houses, with the exception of those belonging to the Government, are chiefly of one story. On the south side of the town there are three harbours—the large western or merchant harbour, capable of containing 1000 ships, the western flank of which is formed by a great mole joining the fortifications which traverse the breadth of the island on this side, the middle harbour used chiefly for fitting out and repairing vessels, and the eastern or war harbour for vessels of the Russian navy. The Peter and Catherine Canals, communicating with the merchant and middle harbours, traverse the town. Between them stood the old Italian palace of Prince Menschikoff—the site of which is now occupied by a large building used as a school for pilots. Among other public buildings may be mentioned the extensive naval hospital, the British seamen's hospital established in 1867, the civic hospital, admiralty, arsenal, dockyards and foundries, custom-house, barracks, exchange, several Greek churches, a Lutheran church, and English and Roman Catholic chapels. Defending the navigable passages are Forts Alexander, Risbank, Constantine, Peter the Great, Menschikoff, and Cronslott, all built of granite and armed with heavy guns. During the Russian war of 1854–55 Cronstadt was considered impregnable. Almost all vessels bound for St Petersburg touch at Cronstadt, and those drawing more than 8 to 10 feet of water load and unload here, the goods being conveyed to and from the capital in lighters. The port is ice-bound during the winter months from November till April; but in other months about 3000 vessels enter and clear. There is regular steam communication with St Petersburg, Peterhof and Oranienbaum, Revel, Helsingfors, Stockholm, Stettin, Lubeck, and Havre. The exports consist chiefly of tallow, corn, hemp, and flax, brought from the surrounding districts of the mainland. A very large proportion of the inhabitants are sailors, and large numbers of artizans are employed in the dockyards. The ironclad turret ship "Peter the Great" (9600 tons) and the "Duke of Edinburgh" were built at Cronstadt in 1874–75. Cronstadt was founded in 1710 by Peter the Great, who took the island of Kotlin from the Swedes in 1703. The population at the census of 1867 was 45,115, but this varies very considerably at different times of the year, the town being very full in summer and partially deserted in winter.

CRONSTADT, KRONSTADT, or KRÜNEN (Romanic, *Brasiovu*, Magyar, *Brassó*), a town of Transylvania, Austria, situated on the slope of the Transylvanian Alps, near the south-eastern corner of the principality, at an elevation of 1830 feet above the sea. It is the capital of a district of the same name, also known as Burzenland, from the stream of the Burze, a tributary of the Alt, which waters it, a rich agricultural and pastoral country, though high-lying and with a cold climate, inhabited by an industrious population of Germans, Hungarians, Wallachs, Armenians, and Greeks. The town stands in a narrow valley, shut in by mountains, and consists of a well-built inner town dating from the 13th century and surrounded by walls, with suburbs named Altstadt, Blumenau, and Bulgarei. Cronstadt is the most populous centre of Transylvania; three-fifths of the people of the inner town are Germans; the suburbs are chiefly inhabited by Magyar Szeklers, and by Wallachs. Its principal buildings are the Gothic Protestant church, the finest in the principality, other Lutheran churches, a Gothic Catholic church, the Rathhaus with high tower, and a market-house built in 1545. On a height over the town rises a strong old castle of the German knights. After Hermannstadt this is the most important manufacturing and trading town of Transylvania. Iron and copper working, paper manufacture, and printing (Cronstadt was the first place in Transylvania at which a printing press was established), wax bleaching, turkey-red dyeing, wool spinning, linen weaving, leather and bottle making are its chief industries, and it possesses at least sixty large trading houses. Its communications are kept up by a railway uniting it with the Hungarian system, and by passes over the mountains into Wallachia. The nearest of these passes are those of Tömösch, nine miles south, with a summit elevation of 3645 feet, and that which leads through the village of Törzburg, 20 miles south-west of the town. Population of commune (1869), 27,766.

CROQUET, Fr. from *croc*, a crook, or crooked stick (Du Cange, *Glossarium*). The game has been derived by some writers from *paille-maille* (mall), which was played in Languedoc at least as early as the 13th century. Mall was fashionable in England in the time of the Stuarts. It was played with a ball (*pila*), and a mallet very similar to the mallets now in use, and with two hoops, or a hoop and a peg, the game being won by the player who ran the hoop or hoops and touched the peg under certain conditions in the fewest number of strokes. Croquet certainly has some resemblance to paille-maille, played with more hoops and more balls.

It is said that the game was brought to Ireland from the south of France by the eldest daughter of Sir Edward Macnaughten some twenty-five years ago; but Mr Dickson, an ivory turner, of Gracechurch Street, London, remembers having made a set of croquet implements for Ireland over forty years ago. At all events, the re-introduction of the game by Miss Macnaughten, under whose auspices it was first played on the lawn of the late Lord Lonsdale, in 1852, marks the time when it became of sufficient importance to find a regular maker of croquet implements in London. Shortly afterwards, in 1856, Mr Jaques of Hatton Garden, London, saw the game in Ireland, and commenced manufacturing it in England, where it soon became very popular.

One of the first symptoms that the game had taken root was the playing of a public match on the bowling green at Evesham in Worcestershire in 1867. In 1868 the first all-comers' meeting was held on the cricket ground at Moreton-in-Marsh. In the same year the All England Croquet Club was formed, and on the grounds of this club at Wimbledon the annual contest for the championship takes place. The laws of the game, which are used in all public matches, were settled by a conference of delegates from the principal croquet clubs in 1869, 1870, and 1873 (*Conference Laws*, De la Rue and Co.). In addition to these, laws for the regulation of prize-meetings (Horace Cox) were issued by the A. E. C. C., which are the authority for the management of such meetings. According to these laws, match games are played on a ground measuring 40 yards by 30, with four balls, two forming a side against the other two,—one player owning two balls, or four players each taking one ball. In match play the hoops and pegs are set and run as in the diagram (fig. 1).

The hoops are of $\frac{1}{2}$-inch round iron, painted blue, and are 4 inches in width (inside measurement) for handicaps, and for ladies and ordinary matches, and $3\frac{3}{4}$ inches wide, steel braced, with oak sockets, for championship matches for gentlemen. They and the pegs are thus named *in order*—*i.e.*, in the order in which they are to be run or made. First hoop, second, third; three to peg, two to peg, one to peg; turning peg; first, second, and third back; three, two, and one to go out or last hoop; winning peg.

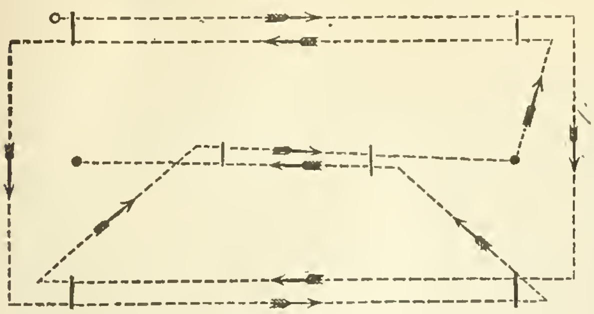


FIG. 1.—Croquet Ground—Setting of Hoops.

Distances on a full-sized ground.—Pegs in centre line of ground, 8 yards from nearest boundary. Hoops up centre line of ground 8 yards apart and 8 yards from pegs. Corner hoops 7 yards from centre and in a line with pegs. Starting spot 1 foot from left-hand corner hoop and opposite its centre.

The height of the hoops and pegs and various minor matters have been also settled by the same authorities. The balls are of boxwood, $3\frac{5}{8}$ inches in diameter, and should weigh not less than $14\frac{1}{2}$ oz. There is no restriction as to the size, weight, number or material of the mallets employed; in striking, the cue and mace strokes are not allowed, and the head of the mallet only must be used. The most approved mallets have boxwood heads and ash handles; they weigh from 3 ℔ to 4 ℔, and are from 32 inches to 35 inches in length. The patterns vary considerably.

In playing the game, the objects are to make all the *points* (hoops and pegs) of the balls belonging to one side, in the order shown in the diagram, and to prevent the adversaries from doing the same. The side that first succeeds in making all its points in order wins the game. The striker is entitled to another stroke, or to continue his turn so long as he succeeds in making his next point, or in causing his ball by a stroke of the mallet to hit another ball (called making a *roquet*), when he must place his ball in contact with the one roqueted, and striking his own ball with the mallet he must move the two balls which are in contact, sending them in any directions he pleases, called *taking croquet*. If in his stroke after taking croquet he hits another ball or makes his next point, he similarly continues until he fails to do either, when it is his adversary's turn. Each ball can only be roqueted once during each turn, unless a point in order is made, when each ball can again be roqueted as at first. This rule does not apply to the winning peg, as when that is hit in order the ball is out of the game.

The striker should stand with the feet about 15 inches apart, with the toe of the right foot at right angles to the line of aim, the other being somewhat turned out. The body should be inclined over the ball, so that the player can look down upon it. The mallet should be grasped with both hands, and the striking face placed close to the ball, so that a line drawn through the mallet head and centre of the ball gives the line of aim. The striker, having taken his aim, should keep his eye on *his own* ball, and should then lift the mallet, and strike the ball quietly and without hurry, in the line of aim. For gentle strokes the wrist is mainly used; harder strokes are played more from the arm and shoulder.

When able to make a roquet at several yards with tolerable certainty, the learner should next practise *rushing*, *i.e.*, roqueting with such force as to move the ball aimed at some distance, and *cutting*, which is a rush played fine instead of full. To avoid accidentally jumping over in playing rushes, care must be taken not to hit down on the striker's ball; this is effected by carrying the mallet up towards the left shoulder after striking,—just the stroke that would be called badly hit at cricket.

When able to rush, the strokes made in taking croquet, viz., splitting, taking off, rolling, passing, and stopping, should be practised.

The *split*, which sends the two balls in different given directions, may be made to a certainty by dividing the angle, as in the half push at billiards. Thus, if the striker wishes to croquet his own ball in the direction A (fig. 2), and the other ball in the direction B, he must aim in the direction C, and strike, not push his ball.

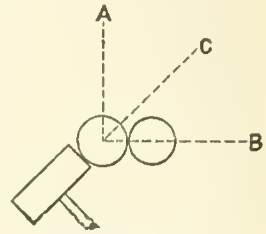

FIG. 2.—Illustrating the "split" at croquet.

The *take off* is merely a thin split, in which the roqueted ball is moved slightly. If an imaginary line is drawn through the balls and another at right angles to it, as in diagram, and the aim made a little to the right of the second line, viz. at A (fig. 3), the striker's ball will travel in the direction required, viz., to B, and the other ball to C. When taking off from the side of the ball furthest from the striker, the aim must be slightly to the left of the line of aim.

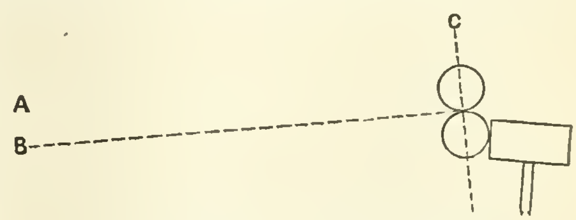

FIG. 3.—Illustrating the "take off" at croquet.

Rolling croquet, in which the balls are sent together in nearly the same line, is made by trailing the mallet after the balls as soon as the stroke or tap is made. Care must be taken not to make a second tap, or the stroke is foul.

Passing croquet is a sort of roll. The front ball must be placed about 30 degrees out of the line along which it is intended to pass the striker's ball, in order to avoid a kiss, and, after the stroke, the mallet must remain in contact with the striker's ball, and its rate of going must be accelerated by a push. If the ball is hit twice the stroke is foul.

The *stop stroke* is made by means of a sharp clean tap, the mallet being arrested in its onward course as soon as it has struck the ball. For stop strokes, where it is desired to move the striker's ball very little and to send the other ball a considerable distance, a light mallet (called a stop mallet) is required.

In addition to the mastery of these strokes and also of the *jump* stroke, which is played by striking down on the ball, and is very useful for running narrow hoops at an angle, *strength* has to be learned in order to obtain position. Judging strength is mainly a matter of practice.

When the above strokes can be played with tolerable certainty, they should be made use of in practising *breaks*. A break is made when two or more points are scored in order. To practise the break, place the striker's ball on the starting spot (see diagram of setting); place a ball several feet on the other side of the first hoop, a ball near the second hoop, and one in the middle of the ground. Make the first hoop, and then roquet the ball placed near. Drive this ball by a medium roll near the third hoop, and leave the striker's ball near the ball in the middle of the ground. Roquet this ball and take off to the second hoop. Use the ball placed there to make that hoop; then roquet it after running the hoop and send it to the hoop three to peg, going to the middle of the ground with the striker's ball. Take off to the third hoop, make it with the ball placed there to help, and then send it to the hoop one to peg, going with the striker's ball to the one in the middle of the ground. Then rush it to hoop two to peg, and take off to the hoop three to peg, or failing a rush, roll or split it to two to peg, and the striker's ball to three to peg. Make that hoop, and split, roll, or rush the ball placed there to help to hoop second back, going to ball placed near hoop two to peg.

By judicious repetition of these or similar tactics there is no limit to the number of points that can be made. The practice should be continued until, on good ground, with 4-inch hoops and three balls to help, the break of fourteen points becomes a feat easy of accomplishment.

In order to become an adept at the game, judgment must be added to mere execution. Judgment cannot be taught in writing, further than by laying down certain principles of play. They are briefly as under:—

1. Keep the partner balls together, the adverse balls apart.

It is clear, from the remarks on the break, that at most one or two points can be made without a ball or balls to help; hence going to the next hoop in order is very poor tactics, if we regard the advantages gained by helping partner by keeping near him, and by separating the adversaries, or at least giving partner the opportunity of separating them.

2. When out of the break, it is often a nice point whether to go to partner, or to finesse to the boundary, or to take a shot at the opponents. As a rule a long shot should not be attempted if failure would leave the ball in the adversary's game, where it may be brought into play to help him in his break. Also the question often arises whether to separate the adversaries at once or to continue the break. The answers to these questions must depend on the striker's estimate of his ability and of his adversary's ability, and on the state of the game.

The principal exception to playing to partner's ball is when the ball played with is a rover and the adversary is also a rover, and has a fair probability of making a roquet next time. For, under these circumstances, the opponent will take off to the two adverse balls and rush the rover up to the winning peg, and very probably peg it out.

3. Keep the last player in your game.

The object of this is to prevent the adversaries from combining at their next stroke. It compels the next player either to take an uncertain shot which may bring him into the game, or to finesse.

The last player may be kept, either by sending him to partner during or at the end of the turn, or by putting him near partner's hoop and then going to partner.

The striker should, if the opportunity offers during his break, pick up the last player for the reasons already given.

When sending the next player away, choose such part of the ground to send him that if he takes a shot it brings him into partner's game.

4. Make the break with two or three balls to help, in preference to one.

The reason is obvious to those who have practised the break. Skilful players endeavour to keep all the balls in the break; but the safe plan for novices is to dismiss the next player and to make the break with two balls to help.

5. When in the break do not play uncertain strokes on the next player.

For any mistake made then gives the break to the adversary. It is, however, a matter of judgment how far risks may be run, varying with the amount of skill and nerve of the striker.

When partner's ball is a long way off, using the last player to help is just as dangerous as using the next player.

6. At the end of the break play partner's game.

This is accomplished by leaving him the last player's ball to help and going to his hoop, or *vice versa*, or by leaving him a rush to his hoop and a ball at his next hoop but one, and in several other ways, which will be apparent to any thoughtful player.

See Walter Jones Whitmore, *Croquet Tactics*, London, 1868; Arthur Lillie, *The Book of Croquet*, London, 1872; R. C. A. Prior, M.D., *Croquet Notes*, London, 1872; James Dunbar Heath, *The Complete Croquet Player*, London, 1874. (H. J.)

CROSS (Latin, *crux*; Greek, σταυρός). In its simplest aspect, a figure produced by the intersection of two lines at right angles, the cross in its primary signification is understood to denote an instrument for inflicting capital punishment, or a gibbet formed of two pieces of wood fixed together cross-wise without any reference to their relative proportions. Metaphorically, the term cross implies death thus inflicted, and so it becomes synonymous with crucifixion, and is often used to denote any exceptionally severe pain or heavy trial. The manner in which Christ suffered has caused the cross, as the instrument for crucifixion, either to be associated directly or indirectly with His death, or to be regarded as having a reference to that fundamental fact of Christian history. And the same fact may be assumed to be symbolized by the cross in every modification of form and variety of adornment in use, for whatsoever purpose, throughout Christendom.

The ancient practice of execution by hanging criminals on trees apparently led to the adoption of crosses constructed for a similar purpose. Hence, hanging from some part of a tree and the being fixed to a cross appear to have conveyed to the Romans the same import; accordingly the expressions *infelix arbor* and *infelix lignum*, each of which may consistently be rendered "the accursed tree," alike denoted crucifixion (Cicero, *Pro Rabir.*, 3; Seneca, *Ep.*, 101; Tertull., *Ap.* viii. 16).

The barbarous execution by crucifixion, of which traces are to be found from remote times among the nations of the East and North, was carried into effect in two forms —(1) when the sufferer was left to perish bound to a tree or an upright stake, sometimes after being impaled; and (2) when by nails driven through his hands and feet, his limbs also sometimes further secured by cords, the sufferer was fixed with outstretched arms to a cross having a horizontal bar as well as a vertical stake. The terms employed in the Gospel narratives render it certain that Christ thus was crucified. According to Lipsius (*De Cruce*, i. 5–9) and Gretser (*De Cruce Christi*, vol. i. c. 1), a single upright stake was distinguished as *crux simplex*, while to the actual cross, formed of two pieces of wood, the name *crux composita* or *compacta* was applied. The *crux composita*, compound cross, or "cross" properly so called, appears under the following modifications of form:—*Crux immissa* or *capitata*, formed as in this figure †; *crux commissa* or *ansata*, thus formed, T; and *crux decussata*, when the cruciform figure is set diagonally after the manner of the Roman letter X. It was upon a *crux immissa* that Christ is generally believed to have died. This cross is a "Latin cross," when the shaft below the transverse bar is longer than that part which rises above the transverse bar, as †; and when the four limbs are of equal length, as in +, it is a "Greek cross." The ×, or *crux decussata* is further distinguished as the "St Andrew's cross," in consequence of the apostle Andrew, according to a tradition, having been crucified on a cross of this form. The *crux commissa*, T, is also entitled the "Cross Tau," from the Greek capital T; and in the Middle Ages it was distinguished as the "cross of St Anthony."

The gratuitous barbarity of scourging as a prelude to crucifixion, and of compelling the condemned sufferer to carry his cross, or one of the parts of it, to the place of execution, were but too strictly in keeping with the cruel character of the Romans. Crucifixion with the head downwards, of which Seneca speaks (*Consolat. ad Marc.*, c. xx.), the mode in which St Peter is said to have chosen to suffer, was a refinement on the barbarity of the cross no less consistent with Roman cruelty.

The well-known legend of the "Invention of the Cross" (commemorated on the 3d of May), or the finding the actual cross on which Christ had suffered, by the Empress Helena, the mother of Constantine the Great rests on the concurrent testimony of four Byzantine ecclesiastical historians (Rufinus, i. 7; Socrates, i. 13; Theodoret, i. 18; and Sozomen, ii. 1), who all wrote between 75 and 100 years after the incidents related, and whose story was accepted and supported by Cyril of Jerusalem, Ambrose, and Chrysostom (see also Tillemont, *Mem. Eccles.*, the chapter on Helena, and Jortin's *Remarks*, vol. iii.). The story is to the effect that the empress, when visiting the scenes hallowed by the Saviour's ministry and sufferings, in the seventy-ninth year of her age (326), was guided to the site of Calvary by an aged Jew who had treasured those local traditions which the anti-Christian animosity of the heathen conquerors of Jerusalem had not been able to obliterate. On excavation at a considerable depth three crosses were found; and with them was the title placed by Pilate's command on the cross of Christ, lying apart by itself. The cross of Christ was identified by a miracle, one only of the three crosses found having proved to be endowed with the power of instantaneous healing conveyed by a touch. This test by miracle was applied at the suggestion of Macarius, bishop of Jerusalem; and its result, of course, was held to be conclusive. Having built a church over the site of the "Invention," where she deposited the greater part of the supposed real cross, Helena took the remainder to Byzantium, whence a portion of it was sent by Constantine to Rome, where it was placed in the church of Santa Croce in Gerusalemme, built expressly to receive so precious a relic. A festival to commemorate the discovery of this relic soon was established; pilgrimages, undertaken in order to obtain a sight of it, next followed; then fragments of the sacred wood were sold at high prices to wealthy votaries; and, after a while, in order to meet the exigencies of the case, the Roman ecclesiastical authorities assured the increasing crowds of anxious purchasers that the wood, if no longer working miracles of healing, exercised a power of miraculous self-multiplication, *ut detrimenta non sentiret, et quasi intacta permaneret* (Paulinus, *Ep.* xi. *ad Lev.*). In the 13th century, what remained of the portion of the cross taken by Helena to Constantinople is said to have been removed, during the reign of St Louis, to Paris, and to be still preserved in the Sainte Chapelle.

After the capture of Jerusalem by the Persians, in 614, the remains of the cross were taken to his capital by Chosroes II.; but, having been recovered by Heraclius (628), they were brought by him to Constantinople, and afterwards to their former resting-place in Jerusalem, where their re-appearance was said to be hailed with a miraculous welcome. In after times this restoration was commemorated by the festival of the "Exaltation of the Cross," held on the 14th of September. The transient revival of the Christian power in Jerusalem was speedily followed (637) by the conquest of the Holy City by the Saracens, by whom the cross relic may be assumed to have been destroyed; at all events, after the Saracen conquest nothing more is heard of that relic in connection with Jerusalem. A subterranean chapel, however, said to have been built upon the site of Helena's church, and which bears the title of the "Chapel of the Invention of the Cross," still exists, and is connected by a flight of steps with the so-called Church of the Holy Sepulchre.

The piece of wood supposed to have been inscribed with the title placed upon the cross of Christ, and found with the three crosses by Helena, and retaining traces of Hebrew and Roman letters, is said to be still preserved at Rome, whither it was sent by Constantine. After having been long lost to sight and apparently to remembrance also, this relic—so goes its history—was accidentally discovered in the leaden chest in which it had been deposited by Constantine; and both the fact of its discovery and the genuineness of the relic itself were attested by a Bull of Pope Alexander III. The earliest writers are silent as to the kind of wood of which the title-board and also the three crosses were made; but a tradition, which notwithstanding its extreme improbability may be traced to a very early era, represents the true cross to have been formed either of cypress, pine, and cedar, or of cedar, cypress, palm and olive. (See facsimile reproduction, 1863, 4to, by J. P. Berjeau, of the *History of the Holy Cross*, originally printed by J. Veldeuer in 1483.)

In connection with the discovery of the cross itself and its attendant title, the nails used at the crucifixion, and asserted to have been included in the "Invention" by Helena, have a legendary history of their own. One of the original four is declared to have been thrown by the empress herself into the Adriatic when agitated by a violent storm, with the effect of producing an instantaneous calm. A second nail after having been placed either in his crown or in his helm by Constantine, is said to have been found in a mutilated state in the church of Santa Croce. The Duomo of Milan claims the possession of the third nail, and Treves that of the fourth. It must be added that some early traditions limit the number of the nails to three; while, on the other hand, certain writers have raised the number of the nails as high as fourteen, for the safe keeping of each one of which places have been found. In the illustrations of the crucifixion given by Lady Eastlake (*History of our Lord*, vol. ii.), sometimes we find a single nail, and at other times two nails, used for the feet. That accomplished lady seems to consider the separation of the feet with a nail for each to be characteristic of the earlier conceptions of the crucifixion, which present Christ after He had been nailed on the cross as still "alive and erect, and apparently elate; His feet always separate, and with two nails upon the footboard, or *suppedaneum* (a Greek feature), to which they were attached; the arms at right angles with the body, the hands straight, the eyes open." The *suppedaneum* is supposed to have been a piece of wood projecting slightly from the shaft of the cross beneath the feet of the sufferer, with a view to afford some support to his body. It is in the later representations that one of Christ's feet appear placed over the other, the ankles being crossed, when a single nail pierces both the feet, or both the ankles. For many curious particulars concerning representations of the crucifixion and its attendant incidents in early and mediæval art, readers are referred to Lady Eastlake's volume; also to Mrs Jameson's *Legends of the Madonna*, and *Sacred and Legendary Art*. Early writers all incline to the more probable opinion that Christ was attached to the cross while it lay on the ground; Bonaventura, however (born 1221), states that he ascended a ladder, and was nailed to the cross standing, after the cross itself had been erected and fixed in its position. "The impress of each opinion is seen in art," writes Lady Eastlake (*Hist. of our Lord*, ii. pp. 130–133), "that of our Lord ascending the ladder on the cross being the earliest, that of His extending himself on the ground being the most frequent." A remarkable example of the latter opinion occurs in the sculpture of one of the bosses in the vaultir , of the twelfth bay of the nave of Norwich Cathedral, wh re the figure of Christ is further represented as having the extremities of the limbs drawn by cords to the shaft and the ends of the transverse beam of the cross, as a preliminary to the driving the nails. The cross, when raised and fixed erect, doubtless elevated the sufferer to no unnecessary height, his feet then probably being not more than 18 or 20 inches above the surface of the ground. In comparatively late mediæval heraldry the cross, with the other instruments connected with crucifixion—as the hammer, nails, ladder crown of thorns, spear, hyssop, scourge, seamless coat, and dice —were often blazoned on shields introduced in Gothic edifices and upon monumental memorials, as "Symbols of the Passion."

The name *crucifix* is applied to a Latin cross, in size either small or large, to which a human figure, designed to represent the body of Christ when suffering crucifixion, is affixed.

As a symbol of the Christian faith at once pre-eminently characteristic and significant, the cross in various modifications of its form would naturally be adopted on very many occasions, and used in a diversity of ways throughout the Christian world. Scarcely less natural also was it that from an early era Christian writers should have treated the symbolism of the cross with fanciful and even extravagant refinement, and endowed it with mysterious attributes; while superstition, which as time advanced threw so baneful a shadow over Christianity itself, would not fail to deal after its own fashion with the sign of the cross. It is curious, on the other hand, that a cruciform device having diverse significations should have occupied a prominent position among the many sacred and mystic figures and symbols connected with the mythologies of heathen antiquity. Such certainly was the case in Egypt, Assyria, Persia, and India, and also among the Scandinavian races of the North. Possibly the cross figure sometimes may have found its way among heathen symbols in early Christian times; and, again, the presence of the great symbol of Christianity in such an alliance on other occasions may have suggested an early Christian influence that never had any real existence. In the Middle Ages the cross sign was universally held to be the special and distinctive symbol of Christianity, as, to the present day, the cross and the crescent are symbols which distinguish the faith of the Christian from that of the Moslem.

In the great art of Christian architecture, and throughout the entire range of mediæval decorative art, the cross sign has exercised a most powerful influence. The ground on which the grandest churches, as well as many others of a less aspiring order were erected, was made to assume a cruciform plan, so that the very walls from their foundations upwards might carry with them, as they rose, the image of the sacred sign, to receive its crowning figure displayed in the ridge-lines of their roofs. Crosses, exhibiting an endless variety of form, proportion, and adornment, surmounted the loftiest and most important architectural members of cathedrals and churches; and here and there upon the masonry they attested the consecration for Christian worship of the buildings which bore them; five crosses, in like manner (their number determined by the five wounds of the crucified Christ) gave similar witness to the consecration of every altar slab; and monumental stones of every kind in the pavements of the churches repeated the same great sign, to proclaim that each one of the dead who rested there had died in the faith. With the triumph of Christianity, the cross at once was recognized as a universal symbol of the highest dignity and honour. It was made of the most precious materials, enriched with the most costly gems, and adorned with most exquisite art. The cross became the proudest ensign upon royal diadems; and it gave both their form and their name to the noblest insignia of knightly rank. The cross crowned the sceptres of princes; and the greatest warriors were proud to see the cross as well in the hilts of their swords as in the banners under which they fought. In private life also the cross was held in corresponding estimation; and, accordingly, the most beautiful and most highly prized personal ornaments appeared in some cruciform type. Thus was art taught to aid in realizing the enthusiastic sentiment of Justin Martyr, when he said (*Apol.* i. 72)—"The sign of the cross is impressed upon the whole of nature. There is hardly a handicraftsman, also, but uses the figure of it among the implements of his industry. It forms a part of man himself, as may be seen when he raises his hands in prayer."

The simplest treatment of the plain rectangular cross (fig. 1), with a view to its enrichment, may be assumed to have consisted either in expanding each limb from the point of their common intersection, and so forming a "Maltese

Figs. 1–6.—Varieties of Cross.

cross" (fig. 2), or by giving some ornamentation to each limb at its extremity (fig. 3). The expanded cross, when of Greek proportions (fig. 2), would readily suggest having its extremities bounded by curved lines, and then the inclosure of such a cross within a circle would naturally follow (fig. 4). The next step would be either to place a circular disc upon the cross, as at Iona (fig. 5), or to extend the limbs of the cross beyond the circle, as in fig. 10, the west gable cross of Washburn Church in Worcestershire, or in fig. 6,

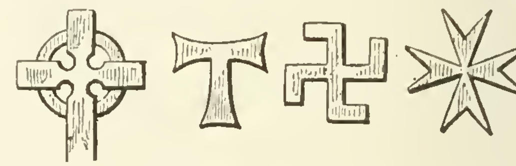

Fig 6. Fig. 7. Fig. 8. Fig. 9.

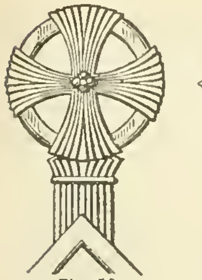
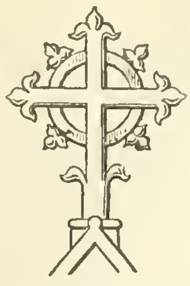
also at Iona. In any of these cases the addition of a shaft would produce a Latin cross. The circular band, again, thus associated with a cross would naturally lead to the introduction of decorative accessories specially connected with itself, as in fig. 11, from the gable cross of the nave of the church at Castle-acre, Norfolk. The combination of an erect cross with a diagonal one would be another modification, producing a cross of eight points, easy of attainment, and one that in its turn would suggest and lead to a variety of further modifications of construction, with many diversified enrichments. From known examples still in existence, and in fair if not perfect preservation, it is evident that the mediæval artists delighted to expatiate in the wide field opened out before them for designing the cross sign under fresh conditions of both form and decoration. They wrought leaves and flowers into cruciform figures, and adorned their crosses with foliage in every degree of richness. They made the cross both simple and compound; they introduced it in combination with other figures and devices; and they composed it from figures and devices, each one of them having some definite motive or significance of its own.

Market and other Crosses.—In addition to acting as a finial to gables, as in figs. 10 and 11, and in fig. 12 from the east gable of the nave of Hethersett Church in Norfolk, and also to various other architectural members of edifices, the symbol which surmounted them gave its name in the Middle Ages to certain structures well known as "crosses." These include *market-place crosses*, open arched and vaulted structures, sometimes of considerable size; *churchyard crosses*, usually consisting of a tall shaft raised on steps and often much enriched, and either surmounted by a bold cruciform figure, or having a canopied head with statuettes and a cross finial; and *wayside crosses*, in their general character resembling those erected in churchyards, designed to commemorate some memorable incident on the spot where it took place. Many of these crosses still exist in different parts of England, and some are of very early date; the Irish crosses, also, are eminently curious and





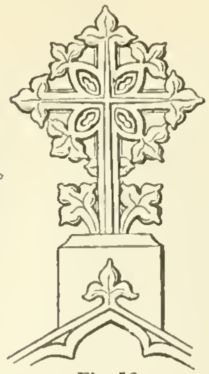


Fig. 10. Fig. 11. Fig. 12.

Figs. 10–12.—Finial Crosses.

interesting. Upright architectural crosses of memorial, erected with a view to their being expressly associated with sepulchral commemoration, may be considered to form a distinct class. Such are the beautiful and justly famous *Eleanor crosses*, originally nine in number,—at Lincoln, Northampton, Stony Stratford, Woburn, Dunstable, St Alban's, Waltham, and Cheap and Charing in London. From the accounts of the executors of Queen Eleanor it appears that the whole of these crosses, designed to mark the places where the funeral procession of the first Edward's first consort halted for rest, were executed and erected between 1291 and 1294. The cross at Geddington, generally considered one of the "Eleanor" series, is not recorded in the roll; and of the nine therein specified two only now are standing,—those at Northampton and Waltham

Monumental crosses upon stone coffin lids or sepulchral slabs, which in England first appear at the close of the 11th century, and from that period gradually become general, are executed either in low relief or by incised lines; in some instances the two methods of treatment are combined. Occasionally repeated in the same example, the cross sign, exhibiting a truly wonderful variety of design, at first appears alone, the shaft or stem almost always considerably elongated, and often enriched with sprouting foliage or some other ornamentation. Fig. 13, from Stradsett church, Norfolk, and fig. 14, from Bosbury, Here-

Figs. 13 and 14.—Monumental Crosses.

fordshire, are characteristic examples of enriched monumental crosses. When the elongated shaft of a cross on a slab rises from two or more steps at its base, it is said to be a *Calvary cross*. After a while, a brief inscription is found to have been added. Then the further addition appears to have been introduced of some device or figure, which might symbolize the profession, occupation, rank, or office of the person commemorated,—such as a pastoral staff for a prelate, a chalice for a priest, a sword for a knight, a trumpet for a trumpeter, a bell for a bell-founder, a hammer and pincers with a sword for an armourer, a horse-shoe and hammer for a smith, &c. In a few instances, a knightly sword placed erect in the centre of a slab either acts as the shaft of a cross, or with its cruciform guard to the hilt the figure of the weapon itself becomes the cross symbol. There are also occasionally found early monumental stones, upon which both a cross and the head or bust and the feet of a human figure are so treated as to form a single composition. Kneeling figures, again, are sometimes introduced either at the foot of a monumental cross, or on each side of the shaft of such a cross; and full length figures, and sometimes half figures, in other examples appear placed within the expanded floriated heads of monumental crosses. (See Walter's and Boutell's *Monumental Brasses;* Boutell's *Christian Monuments;* and Cutts's *Manual of Sepulchral Slabs.*)

In the heraldry of the Middle Ages the cross, its form and enrichment treated in many ways, as a charge is second to none in rank and estimation (see Heraldry). The English cross of St George is a plain red cross set erect on a white ground; the Scottish cross of St Andrew is a plain diagonal white cross on a blue ground; and the Irish cross of St Patrick is a plain diagonal red cross on a white ground. The "Tau" cross, which occasionally is found in English heraldry, is blazoned as in fig. 7. Another form of cross, shown in fig. 8, bears the name of "Fylfot," and is one of the most singular, as it is one of the most ancient, of the many forms and modifications of this symbol. Considered by some writers to be composed of four Greek capital "Gammas" conjoined, this mystic figure, which was in high favour with early secret societies, sometimes was called "Gammadion." In the mythology of the North, again, it was held to symbolize "Mjolnir," the formidable cross-formed hammer of Thor, and is accordingly known by the third title of "Thor's hammer." It occurs in both Scandinavian and Roman relics; and it was in frequent use as a decorative device in the Middle Ages, especially as a mark upon bells. On the monument of Bishop Bronescomb, 1281, in Exeter Cathedral, the fylfot has its limbs alternately yellow and red.

Initial crosses were placed in the Middle Ages at the commencement of inscriptions, and occupied a similar position in written documents of all kinds. The initial cross of the inscription to Abbot Thomas Delamere, upon his brass at St Alban's (1360), is an interesting example, since it is formed of a delicate erect cross floriated at its extremities, which surmounts a bolder diagonal cross, or cross saltire, the armorial ensign of the abbey of St Alban.

Fig. 15.—Cross of the Dannebrog.

Knightly crosses.—The cross worn, as distinctive of their order, by the Knights Templars, was a red cross of eight points (fig. 9) upon white. The cross of the Knights Hospitallers, or Knights of St John, was of similar form, but white and worn on a black ground; from the years 1278 and 1289, however, when engaged with military duties, the Knights of St John wore a plain straight white cross upon red. (For the crosses of the monastic orders, see Costume, p. 463). The cross of the Danish order of the Dannebrog (fig. 15), a white cross surmounting a red one, with the royal crown, the cipher of reigning sovereign, and the motto "For God and the King," is a characteristic example of the use of the great Christian symbol in the insignia of the knighthood of the present day. In the highest class of British insignia, the cross appears on the circlets only of the imperial crown and of the coronets of princes and princesses of the blood royal.

A *pectoral cross*, formed of rich and costly materials, was worn at times by ecclesiastics of the highest rank. In the East pectoral crosses were worn, suspended about the neck and resting on the breast, as both imperial and episcopal ornaments. Characteristic examples of the *pectorale* occur in the effigies of Bishops Kilkenny, 1255, at Ely; Giffard, 1301, at Worcester; and Langton, 1321, at Lichfield. This same term "pectorale" may consistently be applied to all crosses, worn under similar conditions by personages of exalted rank. Of such crosses a specimen of singular interest and great beauty, now well known from fac-simile reproductions of it as the "Dagmar cross" (fig. 16 shows both sides of it), was found

Fig. 16.—Dagmar Cross.

about 1690 (when her tomb was opened), lying on the breast of the remains of Dagmar, "the bright day," the queen of Waldemar II., king of Denmark, who died in 1213. This jewel, certainly of Byzantine design and workmanship, is of gold, enamelled, having on one side a crucifix, and on the other side portraits of Christ (in the centre), of St Basil, St John Chrysostom, St Mary the Virgin, and St John the Apostle-Evangelist.

Crosier or *Crozier* is the title given to the official staff of an archbishop, which has a cross-head, and so is distinguished from the "pastoral staff" of bishops and abbots, the head of which is curved and resembles that of a shepherd's crook. Examples of the crosier occur in the brasses to Archbishops de Waldeby, 1397, in Westminster Abbey, and Cranley, 1417, in New College Chapel, Oxford; the latter example has a crucifix for its head, which is the case also in a remarkable drawing of an archbishop in the *Lambeth Psalter* (*c.* 1300) in the library at Lambeth. The fine effigy of Archbishop Walter de Gray at York, 1255, has a crook-head staff of great beauty; in his brass, too, at Chigwell, Essex, Archbishop Harsnett, 1631, is represented, not with a crosier, but with a pastoral staff. Instead of having crook-heads, the crosiers of the prelates of the Greek Church have heads of the "Tau" form, and the extremities of the horizontal bar are curved upwards. The staff of a patriarch has a double cross-head; and the head of the pontifical staff of the Pope has a triple cross. Good examples of the pastoral staves of bishops and abbots abound in their monumental effigies, of which one of the most admirable is in the brass to Abbot Delamere (*c.* 1360), at St Alban's. The magnificent enamelled staff of Bishop William of Wykeham, as is well known, is still preserved at New College, Oxford. (C. B.)

CROSSBILL (Fr. *Bec-croisé*, Germ. *Kreutzschnabe*), the name given to a genus of birds, belonging to the family *Fringillidæ*, or Finches, from the unique peculiarity they possess among the whole class of having the horny sheaths of the bill crossing one another obliquely,[1] whence the appellation *Loxia* (λοξός, *obliquus*), conferred by Gesner on the group and continued by Linnæus. At first sight this singular structure appears so like a deformity that writers have not been wanting to account it such,[2] ignorant of its being a piece of mechanism most beautifully adapted to the habits of the bird, enabling it to extract with the greatest ease, from fir-cones or fleshy fruits, the seeds which form its usual and almost invariable food. Its mode of using this unique instrument seems to have been first described by Townson (*Tracts on Nat. Hist.*, p. 116, London: 1799), but only partially, and it was Yarrell who, in 1829 (*Zool. Journ.*, iv. pp. 457–465, pl. xiv. figs. 1–7), explained fully the means whereby the jaws and the muscles which direct their movements become so effective in riving asunder cones or apples, while at the proper moment the scoop-like tongue is instantaneously thrust out and withdrawn, conveying the hitherto protected seed to the bird's mouth. Without going into details it may be observed that in the Crossbills the articulation of the mandible to the quadrate-bone is such as to allow of a very considerable amount of lateral play, and, by a particular arrangement of the muscles which move the former, it comes to pass that so soon as the bird opens its mouth the point of the mandible is brought immediately opposite to that of the maxilla (which itself is movable vertically), instead of crossing or overlapping it—the usual position when the mouth is closed. The two points thus meeting, the bill is inserted between the scales or into the pome, but on opening the mouth still more widely, the lateral motion of the mandible is once more brought to bear with great force to wrench aside the portion of the fruit attacked, and then the action of the tongue completes the operation, which is so rapidly performed as to defy scrutiny, except on very close inspection. Fortunately the birds soon become tame in confinement, and a little patience will enable an attentive observer to satisfy himself as to the process, the result of which at first seems almost as unaccountable as that of a clever conjuring trick.

The Common Crossbill of the Palæarctic Region (*Loxia curvirostra*) is about the size of a Skylark, but more stoutly built. The young (which on leaving the nest have not the tips of the bill crossed) are of a dull olive colour with indistinct dark stripes on the lower parts, and the quills of the wings and tail dusky. After the first moult the difference between the sexes is shown by the hens inclining to yellowish-green, while the cocks become diversified by orange-yellow and red, their plumage finally deepening into a rich crimson-red, varied in places by a flame-colour. Their glowing hues are, however, speedily lost by examples which may be kept in confinement, and are replaced by a dull orange, or in some cases by a bright golden-yellow, and specimens have, though rarely, occurred in a wild state exhibiting the same tints. The cause of these changes is at present obscure, if not unknown, and it must be admitted that their sequence has been disputed by some excellent authorities, but the balance of evidence is certainly in favour of the above statement. Depending mainly for

[1] As an accidental malformation, however, the peculiarity has been many times observed in other groups of birds, and especially in the Crows (*Corvidæ*). Such cases may be well compared to the monstrosity often seen in Rabbits and other members of the Order *Glires*, wherein the incisor teeth grow to inordinate length.

[2] The special animosity of De Buffon on this point may perhaps be explained by the existence of a mediæval legend (of which, however, be it said, he takes no notice), best known to English readers by Mr Longfellow's pretty version of Mosen's poem, to the effect that the bird acquired its peculiar conformation of bill and coloration of plumage in recognition of the pity it bestowed on the suffering Saviour at the crucifixion

food on the seeds of conifers, the movements of Crossbills are irregular beyond those of most birds, and they would seem to rove in any direction and at any season in quest of their staple sustenance. But the pips of apples are also a favourite dainty, and it stands recorded by the old chronicler Matthew Paris (*Hist. Angl.* MS. fol. 252), that in 1251 the orchards of England were ravaged by birds, "pomorum grana, & non aliud de eisdem pomis comedentes," which, from his description, "Habebant autem partes rostri cancellatas, per quas poma quasi forcipi vel cultello dividebant," could be none other but Crossbills. Notice of a like visitation in 1593 was published by Wats (*Vit. 2 Offar.* &c., 1640, p. 262), but of late it has become evident that not a year passes without Crossbills being observed in some part or other of England, while in certain localities in Scotland they seem to breed annually. The nest is rather rudely constructed, and the eggs, generally four in number, resemble those of the Greenfinch, but are larger in size. This species ranges throughout the continent of Europe,[1] and occurs in the islands of the Mediterranean and in the fir-woods of the Atlas. In Asia it would seem to extend to Kamtschatka and Japan, keeping mainly to the forest-tracts.

Three other forms of the genus also inhabit the Old World—two of them so closely resembling the common bird that their specific validity has been often questioned. The first of these, of large stature, the Parrot-Crossbill (*L. pityopsittacus*), comes occasionally to Great Britain, presumably from Scandinavia, where it is known to breed. The second (*L. himalayana*), which is a good deal smaller, is only known from the Himalaya Mountains. The third, the Two-barred Crossbill (*L. tænioptera*), is very distinct, and its proper home seems to be the most northern forests of the Russian empire, but it has occasionally occurred in Western Europe and even in England.

The New World has two birds of the genus. The first (*L. americana*), representing our common species, but with a smaller bill, and the males easily recognizable by their more scarlet plumage, ranges from the northern limit of coniferous trees to the highlands of Mexico, or even further. The other (*L. leucoptera*) is the equivalent of the Two-barred Crossbill, but smaller. It has twice occurred in England. (A. N.)

CROTCH, WILLIAM (1775–1847), doctor of music, was born at Norwich, on 5th July 1775. When only three years and a half old, he was able to play tunes with their basses on the organ with great correctness. Dr Charles Burney, the English historian of music, gave an interesting account of the infant Crotch in the *Philosophical Transactions of the Royal Society* (vol. lx. pt. i. for 1779). Crotch also exhibited in his childhood a talent for drawing, which he afterwards cultivated so far as to become a very respectable amateur painter of landscapes. At the early age of twenty-two he was appointed professor of music in the university of Oxford, and there in 1799 he took his degree of doctor in that art. In 1800 and the four following years he read lectures on music at Oxford. Next he was appointed lecturer on music to the Royal Institution, and subsequently, in 1822, principal of the London Royal Academy of Music. His last years were passed at Taunton in the house of his son, the Rev. W. R. Crotch, where he died suddenly on the 29th December 1847. He published a number of vocal and instrumental compositions, of which the best is his oratorio of *Palestine*. In 1831 appeared an 8vo volume containing the substance of his lectures on music, delivered at Oxford and in London. Previously, he had published three volumes of *Specimens of Various Styles of Music*, referred to in his lectures. Among his didactic works is *Elements of Musical Composition and Thorough-Bass* (London, 1812). He arranged for the pianoforte a number of Handel's oratorios and operas, besides symphonies and quartetts of Haydn, Mozart, and Beethoven. The great expectations excited by his infant precocity were not fulfilled; for he manifested no extraordinary genius for musical composition. But he was a hard student and a sound musician, and justly holds a high place among English cultivators of his art.

CROTON OIL (*Crotonis Oleum*) is prepared from the seeds of *Croton Tiglium*, a euphorbiaceous tree indigenous to the Malabar coast and Tavoy, and grown in many parts of the East Indies. The tree is from 15 to 20 feet in height, and has few and spreading branches; alternate, oval-oblong leaves, acuminate at the point, and covered when young with stellate hairs, and small, downy, greenish-yellow, monœcious flowers. The male blossoms have five petals and fifteen stamens; the females are apetalous, but bear three bifid styles. The fruit or capsule is obtusely three-cornered, and $\frac{3}{4}$ths of an inch long; it consists of three carpels each inclosing a seed. The seeds resemble those of the castor-oil plant; they are about half an inch long, and $\frac{2}{5}$ths of an inch broad, and have a cinnamon-brown, brittle integument; between the two halves of the kernel lie the large cotyledons and radicle. The kernels contain from 50 to 60 per cent. of oil, which is obtained by pressing them, when bruised to a pulp, between hot plates. Croton oil is a transparent and viscid liquid of a brownish or pale-yellow tinge, an acrid, peculiar, and persistent taste, a disagreeable odour, and acid reaction. It is soluble in volatile oils, carbon disulphide, and ether, and to some extent in alcohol. It contains acetic, butyric, and valeric acids, with glycerides of acids of the same series, and a volatile body, $C_5H_8O_2$, metameric with angelic acid, termed by Geuther and Fröhlich *tiglic acid*, and considered by them as possibly identical with Frankland and Duppa's methylcrotonic acid, $C(C_2H_4)''CH_3.CO.OH$. According to the chemists before-mentioned the crotonic acid of Schlippe, $C_4H_6O_2$, is not present in croton-oil. To what the oil owes its medicinal properties has not yet been certainly determined. It is a rapidly-acting and strong purgative. A single drop is a sufficient dose, and need only be placed on the tongue to insure its action. It is employed in cases of obstinate constipation, paralysis, apoplexy, and dropsy. It may be added to castor-oil to increase the effect of that drug. Nausea and vomiting sometimes follow its administration, and over-doses are extremely poisonous, and bring on intestinal inflammation. The best antidote is an emetic of copper sulphate. Applied to the skin croton oil produces pustulation. It is used externally in gout, neuralgia, rheumatism, and tumours; and with oil of cajeput and rectified spirit it is employed as a liniment in lung and laryngeal diseases. Croton oil has long been known in India as a medicine, and has been in use in England since 1813. Seeds for manufacturing it are imported mostly from Cochin and Bombay. It is occasionally adulterated with olive, castor, and nut oil.

CROTONA, or CROTON, now COTRONE, a celebrated city of Magna Græcia, at the mouth of the small river Æsarus, in the country of the Bruttii, on the western shore of the Ionian Sea. It was founded in the year 710 B.C. by a colony of Achæans under the command of Myscellus, in accordance with a decree of the oracle at Delphi. The first well-established fact in its history is its friendship with Sybaris; and till the arrival of Pythagoras the two cities continued advancing in material prosperity and cultivating the arts of war and peace with much success. The Crotoniats regarded Hercules as their tutelary divinity,

[1] Dr Malmgren found a small flock on Bear Island (lat. 74½° N.), but to this barren spot they must have been driven by stress of weather.

and were renowned for their skill in all athletic exercises; the Sybarites were distinguished by luxury and effeminacy. The government of Crotona, oligarchical in form, had hitherto been confined to the council of 1000, who traced their descent from the Achæan founders of the city. But a secret society of 300 of the disciples of Pythagoras contrived to guide and even overawe the supreme council, till the people, who were excluded from all share in the government, expelled the Pythagoreans from the city, and established a democracy. Before this revolution, however, the Crotoniats, under the command of the celebrated athlete Milo, had marched against Sybaris, and, though opposed by an army three times their own in number, had taken it and levelled it with the ground. This event is usually dated 510 B.C. Before thirty years had elapsed, the Crotoniats themselves sustained a still more disgraceful defeat from the united forces of the Locrians and Rheggians, which, however, was not attended with such disastrous consequences to their city. During the Athenian invasion of Sicily, Crotona remained neutral; it supplied the Athenians with provisions, but refused to allow them a passage through its territory. In 389 B.C. the city fell into the hands of the elder Dionysius; but on his death in 377 it recovered its independence. Its prosperity, however, was greatly impaired by intestine feuds and the growing power of external foes. Being hard pressed by the Bruttians, Crotona sought and received assistance from the Syracusans, but had ultimately to conclude a treaty with the enemy, as it was now in danger from its own exiles. Menedemus, their general, defeated the exiles, and established a tyranny which lasted for some time. In the beginning of the 3d century B.C., the city was held for some years by Agathocles; and in the wars of the Romans with Pyrrhus it suffered so severely that more than half the area within its walls ceased to be inhabited. In the absence of Pyrrhus in Sicily, it was seized by the Roman consul Cornelius Rufinus (277 B.C.); but during the latter years of the second Punic War it was the headquarters of Hannibal for three successive winters. This completed the ruin of the town, which, though colonized a few years after from Rome, sank into obscurity, and is not again mentioned in history till the wars of Narses and Belisarius against the Goths. After that it remained subject to the Byzantine emperors till it passed into the hands of the Normans.

The medical school of Crotona was, in the days of Herodotus, and long after, the most renowned in Greece,—its proudest name being that of Alcmæon. It is not known whether there was anything remarkable about the architecture of Crotona; but the temple of the Lacinian Juno, six miles from the city, was the most sacred and magnificent work of the kind in the whole of Magna Græcia, and contained, among other ornaments, the "Helen" of Zeuxis. One column of this great edifice still stands amid a mass of shapeless ruin.

About a mile from the site of the old Crotona is the modern town of Cotrone, in the Bay of Tarento, with a small but excellent harbour. It is the seat of a bishop, and retains the castle and walls that were erected in the time of Charles V. It surrendered to the English in 1806, but was again occupied by the French. Population, 7700.

CROUP (synonym, *Cynanche trachealis*), a common and dangerous form of disease, occurring chiefly in young children. Its essential nature is an acute inflammation of the air passages, particularly the larynx and trachea, accompanied with the exudation of a fibrinous material or "false membrane" which spreads over the interior of the tube, narrowing its calibre, and thus obstructing respiration.

Croup occurs most frequently in the second and third years of life, although it may affect children of any age. It is exceedingly rare in adults.

The attack sometimes comes on suddenly in the night without previous warning, but in general some premonitory symptoms exist in the shape of the phenomena of a common cold or catarrh, which may precede the onset of the croup for several days. There is a slight hoarseness of the voice and an occasional cough of a peculiarly harsh or brassy sound, together with a feeling of pain in the throat and breast, and a high degree of feverishness and general disturbance. The disease soon assumes its characteristic features. The loud croupy cough comes on in frequent paroxysms, and is attended with an increasing difficulty of breathing, the respirations partaking of the shrill metallic noise of the cough, while the voice is reduced to a hoarse whisper. The child lies with the head thrown back making strong efforts to breathe, the countenance indicating intense suffering and anxiety. At first little or nothing is expectorated with the cough, but as the latter increases fragments of the so-called false membrane are brought up into the mouth, with the effect of affording some temporary relief to the breathing. The power of swallowing is not much impaired. Should the attack undergo no abatement, symptoms of asphyxia soon make their appearance. The surface of the body becomes livid, the respiration long drawn out and laboured, while the cough continues to recur in fits which threaten instant suffocation. Drowsiness or coma succeeds; and death takes place, either gradually from exhaustion, or suddenly in the midst of a suffocative paroxysm. Throughout the whole course of the disease remissions in the severity of the symptoms are common, and generally occur during the daytime, the attack returning with all its violence as night approaches. In favourable cases the symptoms undergo gradual abatement, and there is a speedy return to health, but it is to be borne in mind that one attack of croup appears to predispose to another, and relapses are not uncommon.

The inflammatory product, or false membrane formed in the air passages in the course of an attack of croup, varies both as to its amount and the extent of its distribution. It may consist merely of a thin white film covering portions of the windpipe, or on the other hand it may have the character of a tough compact membrane of several lines in thickness, and may extend from the upper part of the larynx down to the ramifications of the bronchial tubes. It adheres closely to the mucous surface, and although large portions are occasionally detached by coughing or vomiting, the false membrane appears to be reproduced with great rapidity. It is the chief source of danger in the disease, and where it has spread downwards into the bronchial tubes death by asphyxia is the rapid result.

Croup is apt to be complicated with other serious diseases, such as bronchitis and inflammation of the lungs, and it may also be accompanied with many of the phenomena of diphtheria, in which case it has been named diphtheritic croup. This latter form of the disease is sometimes observed when croup occurs in connection with some of the infectious diseases, such as measles, scarlet fever, or small-pox. On this point it ought to be stated that much discussion has from time to time taken place respecting the relation of croup to diphtheria, not a few eminent authorities holding that in all essential points they are one and the same disease. The generally prevailing opinion, however, among physicians who have had extensive opportunities of observation, is, that while many points of similarity exist betwen croup and diphtheria they cannot be regarded as identical. See DIPHTHERIA.

Croup has sometimes appeared in an epidemic form. This was the case in the year 1805–7, when it spread over a large portion of the continent of Europe. In the last named year an inquiry into the nature of the disease by the faculty of medicine of Paris was ordered by Napoleon I., whose nephew, the crown-prince of Holland, had fallen a victim to the epidemic, and who offered a prize for the best essay on the subject. Besides the two prize essays of MM. Jurine and Albers, many valuable treatises were written, and it is to the information thus obtained that much of our present knowledge of this malady is due.

Croup is a disease of northern climates, and of low-lying, damp, and cold localities. The exciting cause of an attack is generally exposure to cold, particularly cold winds, such as prevail in winter and spring. There appears to be in some families a special liability to this disease, as shown in the readiness with which the children are attacked on slight exposure. Male children appear to be more frequently affected than female. Croup is not contagious.

The mortality from croup is very great, and it has been computed that about one-half of those in whom the attack is developed die. Its course is in general rapid, seldom exceeding three or four days. It sometimes proves fatal in less than one day, while again recovery may take place after several days' severe suffering.

With respect to the treatment of croup, it may be stated that in few acute diseases are greater vigilance and more prompt and energetic measures requisite. The disease in many cases hastens on with such rapidity that as regards treatment the loss of a few hours may be fatal to the patient. In the earlier or premonitory stage, when the only symptoms present are hoarseness and some amount of croupy cough, it is essential that the child should be kept in a warm temperature, while warm baths and medicines to promote perspiration, such as small doses of antimonial or ipecacuanha wine should be administered. The abstraction of blood by one or two leeches over the upper part of the breast-bone is recommended by many physicians when the child is robust and the attack violent. When the breathing becomes embarrassed the administration of emetic doses of the above-named medicines, or of the sulphate of zinc or of copper, are of great use, as in the act of vomiting portions of false membrane may be dislodged and expelled from the air passages. The child should be surrounded with an atmosphere of steam (see BRONCHITIS), and fomentations, by means of a sponge or piece of flannel dipped in hot water, applied to the neck. Abundance of liquid nutriment may be given, thirst being always present. When remedies such as those now indicated fail to afford relief, and the child threatens to die from asphyxia, the question of tracheotomy has to be considered as a last resource. This operation has so often succeeded in croup as to justify its being resorted to in the circumstances now described Indeed, in the opinion of many competent authorities, more lives might be saved were the operation performed earlier in the course of the attack than is commonly the case. However this may be, it is certain that not only are many children thus rescued from death, but even where the operation fails to accomplish this, suffering is greatly mitigated and death rendered easier.

What is known as SPASMODIC CROUP (synonyms, *False Croup, Laryngismus stridulus, Spasm of the Glottis, Child-Crowing*) bears some resemblance to the disease above described as regards its chief symptom, but differs from it entirely as to its pathology. This affection occurs mostly in young infants during dentition, and manifests itself by a sudden and violent interruption to the breathing, during which the attempts to inspire are accompanied with a noise resembling the crowing of a cock. Unlike true croup this disease is unattended with fever or inflammation of the air passages, and is a purely nervous ailment depending on the irritation of the nerves which regulate the closing of the aperture of the glottis (the upper part of the larynx). This irritation is usually of reflex origin, being due to some disturbance at some distance from the part, as teething or disorders of the stomach or bowels, all of which, as first shown by Dr Marshall Hall, have the effect of bringing on attacks of this kind. The attack is sometimes precipitated in a child liable to it by exposure to a cold wind, or by its being violently tossed in the arms of a nurse. The nervous origin of the seizure is further proved by the fact that the child-crowing is often accompanied by marked contraction of the muscles of the fingers and toes, and also sometimes by convulsions. During the spasm all the symptoms of asphyxia are rapidly developed, and unless relief is speedily obtained death may suddenly take place. The attack often passes off with a forcible expiratory effort, after which the child lies quite exhausted. The paroxysm, however, is apt to return. Like croup, a liability to this disease may run in families, and sometimes with disastrous results. The treatment must bear reference to any cause likely to have given rise to the attack. For relief during the paroxysm efforts to make a sudden impression on the nervous system should be used, such as warm baths or cold affusion to the surface of the body. Artificial respiration ought to be tried where death threatens from asphyxia, and tracheotomy performed, if time be sufficient to make the attempt. (J. O. A.)

CROUSAZ, JEAN PIERRE DE (1663-1748), professor of philosophy and mathematics, was born at Lausanne, of a noble Protestant family. He was destined by his father for the profession of arms, but his tastes were literary. Instead of joining the army, he went to study at Geneva, especially devoting himself to mathematics and the Cartesian philosophy, which he adopted. After some time spent in travelling, he returned to his native place, where he was successively appointed pastor, professor of philosophy, and rector of the academy. In 1724 he was called to Groningen to teach mathematics, and appointed governor to the young Prince Frederick of Hesse-Cassel. The king of Sweden also conferred upon him the title of counsellor of embassies

His works are exceedingly voluminous, but seldom rise above mediocrity. The most important are *Système des Réflexions qui peuvent contribuer à la netteté et à l'étendue de nos Connoissances, ou nouvel Essai de Logique; Traité du Beau*, in which he maintains the view that beauty entirely consists of unity in diversity; *De l'Education des Enfans; Examen du Traité de la Liberté de Penser d'Antoine Collins; Géométrie des Lignes et des Surfaces rectilignes et circulaires; Examen du Pyrrhonisme ancien et moderne*, an attack chiefly on Bayle; *Œuvres diverses; Traité de l'Esprit Humain; Réflexions sur la belle Wolfienne;* and an attack on the Leibnitzian theory of Pope's *Essay on Man.*

CROW (Holland, *Kraai*, Germ. *Krähe* Fr. *Corbeau*, Lat. *Corvus*), a name most commonly applied in Britain to the bird properly called a Rook (*Corvus frugilegus*), but perhaps originally peculiar to its congener, now-a-days usually distinguished as the Black or Carrion-Crow (*C. corone*). By ornithologists it is also used in a far wider sense, as under the title Crows, or *Corvidæ*, is included a vast number of birds from almost all parts of the world, and this family is probably the most highly developed of the whole Class *Aves*. Leaving out of account the best known of these, as the Raven, Rook, Daw, Pie, and Jay, with their immediate allies, our attention will here be confined to the Crows in general; and then the species of the Family to which the appellation is more strictly applicable may be briefly considered. Of the limits and subdivisions of this Family it is at present desirable to speak with great caution, if not doubt. All authorities admit that it is very extensive, and is capable of being parted into several groups, but scarcely any two agree on either head. Especially must reserve be exercised as regards the group *Streperinæ*, or Piping Crows, belonging to the Australian Region, and referred by some writers to the Shrikes (*Laniidæ*): and the Jays too have been erected into a distinct Family (*Garrulidæ*), though it seems hardly possible to separate them even as a Subfamily from the Pies (*Pica* and its neighbours), which lead almost insensibly to the typical Crows (*Corvinæ*.) Dismissing these subjects for the present, it will perhaps be most convenient to treat of the three groups which are represented by the genera *Pyrrhocorax* or Choughs, *Nucifraga* or Nutcrackers, and *Corvus* or True Crows in the most limited sense.

Pyrrhocorax comprehends at least two very good species, which have been needlessly divided generically. The best known of them is the Cornish Chough (*P. graculus*), formerly a denizen of the precipitous cliffs of the south coast of England, of Wales, of the west and north coasts of Ireland, and some of the Hebrides, but now greatly reduced in numbers, and only found in such places as are most free from the intrusion of man or of Daws (*Corvus monedula*), which last seem to be gradually dispossessing it of its sea-girt strongholds, and its present scarcity is probably in the main due to its persecution by its kindred. In Britain, indeed, it would appear to be only one of the survivors of a more ancient fauna, for in other countries where it is found it has been driven inland, and inhabits the higher mountains of Europe and North Africa. In the Himalayas a larger form occurs, which has been specifically distinguished (*P. himalayanus*), but whether justifiably so may be doubted. The general colour is a glossy black with steel-blue reflections, and it has the bill and legs bright red.[1] The remaining species (*P. alpinus*) is altogether a mountaineer, and does not affect a sea-shore life. Otherwise it frequents much the same kind of localities, but it does not occur in Britain. The Alpine Chough is somewhat smaller than its congener, and is easily distinguished by its shorter and bright yellow bill. Remains of both have been found in French caverns, the deposits in which were formed during the "Reindeer Age." Commonly placed by systematists next to *Pyrrhocorax* is the Australian genus *Corcorax*, represented by a single species (*C. melanorhamphus*), but osteologists must be further consulted before this assignment of the bird, which is chiefly a frequenter of woodlands, can be admitted without hesitation.

Nucifraga is another very distinct form of *Corvidæ*, peculiar to the Old World, and best exemplified by the European Nutcracker (*N. caryocatactes*), while in the New World it is somewhat remotely represented by the genus *Picicorvus*, of which only one species (*P. columbianus*), until lately very rare in collections, and only inhabiting the western slopes of the Rocky Mountains, is known. The Common Nutcracker has a wide range in the Palæarctic Region, chiefly keeping to subalpine or subarctic pine-forests, and feeding on the seeds of one or another species of fir. It seems nowhere to be numerous, though roving bands of seventy or a hundred have been occasionally observed. It has long been known as a rare straggler to the British Islands, but little was ascertained of its economy till some fifteen years ago. It has now been discovered to breed, though in small numbers, in some of the denser forests of Middle Sweden, on the island of Bornholm, and in the Bavarian and Tyrolese mountains. It appears to build its nest and lay its eggs very early in the year, long before the snows have disappeared, and this fact, coupled with that of its becoming in the breeding season one of the most silent of birds, when at other times it is rather noisy than not, will account for the mystery which enwrapped its domestic arrangements not having been sooner dispelled. Considerable difference has been observed in the form and size of the bill of examples of this species, but this is now supposed to depend on the sex—that of the cock being stout and short, while in the hen it is long and thin.[2] The bird is about the size of a Jay, and of a dark sooty-brown colour spangled with white, nearly each body-feather ending in a tear-shaped patch of that colour. Besides the European species, which also extends into Northern or Central Asia, three others, very nearly akin to it, have been described from the Himalayas. Of their American cousin, Clarke's Crow, as it is called (*Picicorvus columbianus*), an excellent account has been given by Dr Coues (*Ibis*, 1872, pp. 52–59).

Coming now to what may be literally considered Crows, attention must be mainly directed to the Black or Carrion-Crow (*Corvus corone*) and the Grey, Hooded, or Royston Crow (*C. cornix*). Both these inhabit Europe, but their range and the time of their appearance are very different. Without going into minute details, it will suffice to say that the former is, speaking generally, a summer visitant to the south-western part of this quarter of the globe, and that the latter occupies the north-eastern portion—an irregular line drawn diagonally from about the Firth of Clyde to the head of the Adriatic roughly marking their respective distribution. But both are essentially emigrants, and hence it follows that when the Black Crow, as summer comes to an end, retires southward, the Grey Crow moves downward, and in many districts replaces it during winter. Further than this, it has now been incontestably proved that along or near the boundary where these two birds march they not infrequently interbreed, and it is believed that the hybrids, which sometimes wholly resemble one or other of the parents and at other times assume an intermediate plumage, pair indiscriminately among themselves, or with the pure stock. Hence it has of late seemed to many ornithologists who have studied the subject, that these two birds, so long unhesitatingly regarded as distinct species, are only local races of one and the same dimorphic species. No structural difference—or indeed any difference except that of range (already spoken of) and colour—can be detected, and the problem they offer is one of which the solution is exceedingly interesting if not important to zoologists in general.[3] The mode of life of the Crows needs not to be described. Almost omnivorous in their diet, there is little edible that comes amiss to them, and, except in South America, they are mostly omnipresent. The number of species described is considerable, but doubtless should and will be ruthlessly curtailed when a revision of the group is undertaken by any ornithologist working with proper materials. The Fish-Crow of North America (*C. ossifragus*) demands a few words, since it betrays a taste for maritime habits beyond that of other species, but our own Crows of Europe are not averse on occasion to prey cast up by the waters, though they will hardly draw it thence for themselves. The so-called "Hooded Crow" of India (*C. splendens*) is not very nearly allied to its European namesake, from which it can be readily distinguished by its smaller size and the lustrous tints of its darkest feathers, while its confidence in the human race has been so long encouraged by its intercourse with an unarmed and inoffensive population, that it becomes a plague to the European abiding or travelling where it is abundant. Hardly a station or camp in British India is

---

[1] Hence the "russet pated choughs" of Shakespeare, an expression which has much exercised many of his commentators, who did not see that "pated" meant "patted" or footed (*cf.* the heraldic *croix patée*), instead of having anything to do with the bird's head, which is as black as that of a Raven. See *Nature*, v. p. 160.

[2] An exactly similar sexual distinction is observable in the Huia of New Zealand (*Heterolocha*), which was for a long time included among the *Corvidæ*, but is now referred to the Starlings (*Sturnidæ*.)

[3] As bearing upon this question may be mentioned the fact that the Crow of Australia (*C. australis*) is divisible into two forms or races, one having the irides white, the other of a dark colour. It is stated that they keep apart and do not intermix.

free from a crowd of feathered followers of this species, ready to dispute with the Kites and the cooks the very meat at the fire; and when any lengthened settlement is established the Crows will build their nests of the wire from the Englishman's soda-water bottles. (A. N.)

CROWE, EYRE EVANS (1799-1868), journalist and historian, was born about the year 1799. He commenced his work as a writer for the London newspaper press in connection with the now defunct *Morning Chronicle*, and he afterwards became a leading contributor to the *Examiner* and the *Daily News*. Of the latter journal he was principal editor for some time previous to his death. The department he specially cultivated was that of Continental history and politics, with which he made himself intimately acquainted by means of study, travel, and correspondence with leading public men abroad. To permanent literature he made contributions of considerable value in his *Lives of Foreign Statesmen* (1830), *The Greek and the Turk* (1853), and *Reigns of Louis XVIII. and Charles X.* (1854). These were followed by his most important work, the *History of France* (5 vols., 1858-68), which is full, impartial, and laborious, and written in a clear though somewhat colourless and unimpassioned style. It is founded upon original sources, in order to consult which the author resided for a considerable time in Paris. He died in London on the 25th February 1868.

CROWLAND, or CROYLAND, an ancient town and parish of Lincolnshire, situated in a low flat district, about eight miles north-east from Peterborough. It stands at the confluence of the Welland and the Catwater drain; and at their junction there is a curious triangular bridge (figured in art. BRIDGES, vol. iv. p. 331), passable only on foot. The origin of Crowland was in a hermitage founded in the 7th century by St Guthloc; an abbey was founded in 714 by King Ethelbald, which was burnt in 870 by the Danes, restored by Ethelred II., burnt again in 1091, and again rebuilt in 1112. Of this there are still some interesting remains. Among its abbots was the historian Ingulphus. Weekly markets are held at Crowland, and there are three fairs annually. Population (1871), 2459.

CROWN, a circular ornament worn around the head. The name is applied, at present, only to the head-dress worn by kings or emperors as a badge of their dignity. Originally it was of much wider meaning. The simplest and earliest form of the crown appears to have been a fillet or band, tied about the head, and serving for use, as well as ornament, by keeping up the hair. The name of crown is also given to garlands of leaves or branches, worn by the guests at private banquets, and on almost any occasion of more than common festivity. It was natural that those who wished to mark a distinction between themselves and their fellow-men should adopt a head-dress differing from that in general use, just as they adopted different and distinctive garments. In countries governed by a king, a special head-dress was, at a very early period, one of the recognized symbols of royalty. A very simple form of the royal crown was a diadem or fillet of gold fastened round the head and tied behind. This by degrees became more and more elaborate in its structure and ornament, and assumed a variety of forms, in most of which the original diadem is to be traced, just as the diadem itself is a clear advance of the original ribbon or garland.

Crowns are often mentioned in Scripture; but the term was applied to other ornaments for the head besides those worn exclusively by royal personages. For example, the head-dress of the Jewish high-priest—a linen band with a plate of gold fastened in front—is also called a crown.

Among the kings of Egypt and of the East crowns were in common use. The crowns of the Ptolemies were, in general, plain fillets of gold encircling the head, but we find them sometimes making use of the more ornate radiated crown. The Seleucidæ of Syria used the plain golden fillet. But the crowns of the Oriental kings have usually been much more ornate, sometimes of very massive construction, and profusely adorned with pearls and gems.

In the republics of historical Greece and Rome the crown long continued in use in its first and most simple form. There is no mention made by Homer of the crown as a royal distinction, nor does he seem to have known it at all except as an ornamental wreath or garland. The most celebrated crowns among the Greeks were the wreaths gained at the great inter-Hellenic games, by the victors in the races and athletic contests. In the course of later Athenian history, we find crowns of gold frequently bestowed in recognition of distinguished public services. It was by Alexander the Great, and the successors of Alexander, that the crown was first worn in Greece as the symbol of royal rank. The form used was generally that of a simple band of gold.

The early Roman kings are commonly represented with plain bands of gold encircling their heads. During the historical period of Roman history, besides the crown in private use at feasts and funerals, there were several kinds of crowns bestowed for public services, and indeed in recognition of almost any kind of honourable distinction. These were frequently so designed in shape or material as to be symbolical of the service they commemorated. The corona muralis, for instance, was a crown of gold, decorated with turrets, given to him who had first scaled the walls of a besieged place; the corona vallaris, decorated with pales, to him who had first forced an intrenchment; the corona navalis, decorated in general with little figures of the prows of ships, to him who had gained a signal victory at sea. The corona obsidionalis, given to a general who had delivered a Roman army from blockade, was a crown of grass or herbs plucked at the spot where this important service had been rendered. The crowns of the Roman emperors were of several forms, regulated by the fancy of the wearer, from the simple golden fillet to the radiated crown which marked an admitted claim to divine honours.

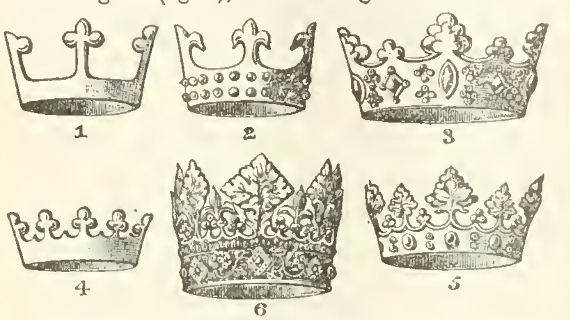
In the nations of modern Europe crowns have always been in general use among personages of the highest rank. The most remarkable are the papal and the imperial crowns. The papal crown is a lofty uncleft mitre, encircled by three coronets rising one above the other, surmounted by a ball and cross, and with ribbons at each side, similar to those of the mitre of an Italian bishop. This form of crown was first assumed by Pope Benedict XII., 1344.

The crowns that are most celebrated in connection with the imperial dignity are the Imperial crown proper, the German crown, and the Italian or Lombard crown. The first of these was of gold, rising into a semicircle above the head, surmounted by a small cross, and adorned with pearls and precious stones. The second is always spoken of as the silver crown, but it appears from the evidence of eye-witnesses that its material was, in fact, gold. The third was known as the iron crown, though it appears that the only iron in it was one of the nails used or said to have been used at the crucifixion, and that in this case too the rest of the material was gold. It was with this, or with a later imitation of it, that Napoleon I. was crowned as king of Italy at Milan in 1805. The Imperial crown, now in use in the empires of the Continent, in its form is very remarkable, being cleft somewhat after the manner of a mitre, having also the general contour of a modern convex mitre in its elevated part which rises above the golden leafage that heightens the gemmed circlet. In the open space between the two divisions formed by the cleft a single arch rises, surmounted by a mound and cross.

The English royal crown has gradually grown up from its early simple form into various aspects of elaborate splendour. Before the Norman Conquest the head-dress which appears to have been habitually worn by the Anglo-Saxon princes was a fillet of pearls; their coins, however, and illuminations in MSS. of their era, show them to have been by no means unfamiliar with a nearer approach to a true crown, in the form of a radiated diadem. The great seals, the coinage, monumental effigies, and various other contemporary representations, supply a complete series of examples of the crown in its varieties of design and enrichment, from the time of the Conqueror.

In addition to several modifications in both the treatment and the grouping of the adornments of the regal circlet, the English crown has undergone a complete change in the character of the figures with which the circlet has been heightened; and it also has had its original aspect of an open crown completely altered by its enriched circlet being arched over with jewelled bands of gold, when the diadem thus inclosed was surmounted by a mound and cross.

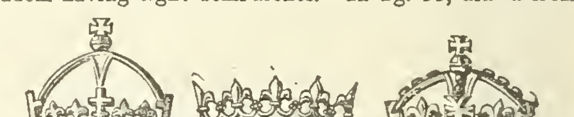
The crown worn by William I. and his successors was a plain circlet heightened with four spikes having trefoil-heads (fig 1). Henry I. appears to have enriched the circlet with gems (fig. 2), and on his great seal the trefoils



FIGS. 1–6.—Royal Crowns—William I. to Henry IV.

of his father's crown assume a form resembling that of fleurs-de-lys. The effigies of Henry II., Richard I., John, and their queens, show the crown to have made such an advance in the dignity of its aspect as is shown in fig. 3. The crowns of Richard and Berengaria, however, have four large leaves only heightening the circlets, while the crowns of Henry, Alianore, John, and Isabella have four smaller leaves alternating with the four larger ones. The crown of Henry III. has a plain circlet heightened with trefoils, a slightly raised point intervening between each pair of the leaves (fig. 4). A similar crown was worn by Edward I., the trefoil-leaves being alternately large and comparatively small. The truly beautiful crown of Edward II. (fig. 5), as it is represented in his effigy, was formed of four large and as many smaller leaves of a deeply serrated type, rising with graceful curves from the jewelled circlet, and having eight small flowers alternating with the leaves. This form of crown appears to have remained unchanged during the reigns of Edward III. and Richard II.

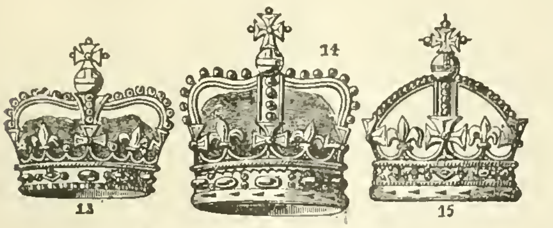
It would seem from the crown, fig. 6, sculptured with elaborate care upon the head of his effigy at Canterbury, that Henry IV. determined to distinguish the accession of a Lancastrian prince by displaying an unprecedented magnificence in the emblem of his sovereignty. The splendidly jewelled circlet of this crown is heightened with eight large and rich leaves, and as many true fleurs-de-lys—their first appearance on an English crown,—the whole, alternating with sixteen small clusters of pearls, three in each. The famous "Harry crown," of which this may be assumed to be a faithful representation, was broken up and employed as security for the loan required by Henry V., when he was about to embark on his expedition to France; but the costly fragments are recorded to have been redeemed in the 8th and 9th years of Henry VI. The arched crown in its earliest form (fig. 7), was introduced by Henry V.; and, with the arches crosses, which from the time of Henry VI. always have been crosses patées, appeared to supersede the earlier foliage upon the circlet. The arches at different periods have varied both in number and in contour. At first they were elevated almost to a point; then they were somewhat depressed at their intersection; still later this depression was increased, the arches themselves thus having an ogee contour, as in fig. 13; and finally, in the coronation crown of Queen Victoria (fig. 16), the arches, which bend over almost at right angles, are flattened where the mound rests on them at their intersection. The crown of Henry VI. appears to have had three arches, or six semi-arches; and there are the same number in the crown that ensigns the hawthorn-bush badge of Henry VII. The crown of Edward IV. had two arches, or four semi-arches; and a crown arched in the same manner (fig. 9) appears on the great seal of Richard III. Both arched and open crowns are represented in sculpture, illuminations, and other works, until the close of the reign of Edward IV.; and, occasionally, as late as the reign of Henry VIII. a royal shield displays an unarched crown. Whatever other changes or modifications the English crown may have experienced since the time of Henry V., the circlet has always been heightened with alternate crosses patees and fleurs-de-lys, with some minor accessories of jewels; also, when the crown has two arches, each of the four semi-arches always has risen from within one of the crosses upon the circlet. Edward IV. sometimes has his royal shield of arms ensigned with an open crown, its circlet heightened with eight crosses and eight fleurs-de-lys. Upon his seal as earl of Chester, the same sovereign has the circlet of his open crown heightened with fleurs-de-lys only, alternating with small clusters of pearls (fig. 8). The crown actually worn by Henry VII. appears, from his monument at Westminster, to have had two arches, its circlet being heightened with four crosses and four fleurs-de-lys. A similar crown (fig. 9) appears on the great seal of Henry VIII. During the reigns of Edward VI., Mary, and Elizabeth, the crown experienced no change; but in her great seal Elizabeth is represented wearing a small diadem having eight semi-arches. In fig. 11, drawn from



FIGS. 7–12.—Royal Crowns—Henry V. to Charles I.

the royal achievement of Henry VII., sculptured with great spirit above the south entrance to King's College Chapel, Cambridge, the royal motto is inscribed upon the circlet. The interior of the same noble building is enriched with numerous other splendid crowns executed in full relief. In these examples of the crowns of Tudor sovereigns there are four crosses and as many fleurs-de-lys; it must be added, however, that eight crosses and the same number of fleurs-de-lys are commonly represented, though certainly only as variations from the more authoritative number, on Tudor crowns. The form of arches shown in fig. 12 for the first time appears upon the great seal of Edward VI.

The crown of the Stuart sovereigns, the first kings of Great Britain, James I. and Charles I., had four arches, each of the eight semi-arches springing from the alternating crosses and fleurs-de-lys of the circlet (fig. 10). This crown, described to have been formed of massive gold, weighing 7 lb 6 oz., and valued at £1110, was in 1649



Figs. 13–15.—Recent forms of the English Crown.

broken up and defaced, with other royal insignia. The crown made for Charles II. (fig. 13), and also worn by James II., William III., and Anne, closely resembled an earlier type; and, indeed, it differed only in its proportions from the crown of more recent times (fig. 14),—the crown of Her Majesty's immediate predecessors on the throne, which still forms a part of the regalia of the British empire. The crown (fig. 16), made for the coronation of Queen Victoria, has its entire surface completely covered with jewels, —its circlet, crosses, fleurs-de-lys, arches, and mound being alike in displaying varieties of the same precious constructive materials. This coronation crown is lined with a cap of violet velvet, in accordance with a usage that first appeared upon the great seal of Henry VIII; but in all the earlier crowns the caps were of crimson or purple velvet. It only remains to direct attention to the form, fig. 15, under which, with Her Majesty's sanction, the crown of Queen Victoria is represented, happily for its effective appearance without any cap or lining, on all occasions of the ordinary use of the symbol of regal dignity and power.

Fig. 16.—Coronation Crown of Queen Victoria.

The crown introduced into the English coinage by Henry VIII. in both gold and silver, bears a crowned rose and crowned shield of arms, with the royal cipher. The silver crown of Edward VI. has the king on horseback and the royal shield; but that of Elizabeth substitutes a crowned bust for the equestrian figure. In both these silver coins the royal shield is charged in pretence with a floriated cross, which, extending beyond the shield, divides the legend into four parts. The crown of Charles II. has four crowned shields of England, Scotland, France, and Ireland in cross. The crown of recent years, that bears the device of St George and the dragon, strangely represents the Christian champion under the aspect of a nude classic warrior armed with a sword, instead of his appearing in mediæval armour, and piercing his adversary with a lance. See Heraldry. (C. B.)

CROYDON, a town, parish, and district of England in the north-east of the county of Surrey, nine miles south of London, with stations on several lines of railway. It stands near the sources of the River Wandle, under Banstead Downs, and is a place of great antiquity. The original site, further west than the present town, is supposed to have been that of the *Noviomagus* of the Antonine Itinerary, and it is the *Croindone* (French, *croie dune*, chalk-hill) of the Domesday Book. In the neighbourhood there are distinct traces of Roman occupation, and several gold coins bearing the stamp of the later emperors have been found. A cluster of twenty-five tumuli between the town and Addington Park, and a circular encampment with a double moat, form the most interesting portion of the remains. The manor of Croydon was presented by William the Conqueror to Archbishop Lanfranc, who is believed to have founded the archiepiscopal palace there, which was the occasional residence of his successors till about 1750, and of which the chapel and hall still remain. The newer town of Croydon consists principally of a well-built street extending along the high road to Brighton with branch streets. The principal buildings are the parish church, close to the palace, a large and handsome structure in perpendicular style, with an ancient flint and stone tower; several newer churches; the town hall, a semi-classical edifice built in 1809; a public hall built in 1862, and the market-house, water-works, and prison. Considerable weekly corn and cattle markets are the chief business of the town. The summer assizes for Surrey are held alternately there and at Guildford. Its site is remarkable for the number of springs which issue from the soil. One of these, called the "Bourne," bursts forth a short way above the town at irregular intervals of from one to ten years or more; and after running as a torrent for two or three months, it as quickly vanishes. This phenomenon seems to arise from rains which, falling on the chalk hills, sink into the porous soil and reappear after a time from crevices at lower levels. Population (1871), 55,652.

CRUCIFIX and CRUCIFIXION. See Cross.

CRUDEN, Alexander (1701–1770), author of the well-known *Concordance* to the English Bible, was born at Aberdeen in 1701. He studied at Marischal College with the intention of entering the church, and took his M.A. degree after the usual curriculum of four years. He was prevented from fulfilling his purpose, however, by an attack of insanity, caused by a disappointment in love. After being for some time in confinement he partially recovered, and removed to London, where he employed himself as a private tutor and a corrector of the press. In 1732 he opened a bookseller's shop near the Royal Exchange, but met with little success. His *Concordance*, a laborious, comprehensive, and accurate work, which has been of the utmost service to biblical students, was commenced in 1733. The first edition appeared in 1737, and was dedicated to Queen Caroline, who died a few days after the work was presented to her, leaving its author without the acknowledgment he had been led to expect. A second and revised edition appeared in 1761. In the interval between the publication of the two editions he was twice confined in a lunatic asylum, where he seems to have been treated with great cruelty. His chief delusion was that he had received a special divine commission to reform all manner of abuses, and he accordingly assumed the title of Alexander the Corrector. He was in the habit of carrying a sponge with which he effaced all inscriptions that seemed to him contrary to good morals, and in particular he showed his detestation of Wilkes by obliterating the number 45 (the offensive number of the *North Briton*) wherever he found it. Besides labouring constantly at the improvement of his *Concordance*, he prepared a number of other works, including a *Brief Compendium of the Bible*, a *Scripture Dictionary*, and an elaborate index to Newton's edition of Milton. He also wrote a curious autobiography, in which his delusions are very apparent, under the title *Adventures of Alexander the Corrector*. He was found dead in the attitude of prayer on the 1st November 1770

CRUSADES

THE Crusades were a series of wars undertaken professedly for the purpose of delivering the Holy Land from the dominion of the infidel, and so named from the cross worn as a badge by those who devoted themselves to the enterprize. These wars, it was held, were rendered necessary, not only by the profanation involved in the fact of Mahometan rule over the country which had been the birthplace and cradle of Christianity, but by the insults and injuries constantly inflicted on Christian pilgrims. From age to age the belief had been growing that no work could conduce more to the soul's health than a visit to the holy places of Palestine. In proportion to the rapidity with which this belief had spread over the Christian world, a feeling of vehement indignation was awakened by the likelihood, if not the certainty, that the Saracen conqueror would put his ban on the performance of that which was deemed to be an act of the highest Christian duty.

It is scarcely necessary to say that this was not a notion which can be traced back to the earliest ages of the Christian church, and that the creed of the first believers was in this respect in complete antagonism with the idea which brought the Jews year by year to Jerusalem for the celebration of the Passover. The local ritual which belonged to the only temple known to the Jews had for them been displaced by a purely spiritual worship, which proclaimed that men were as near to God in one place as in another. In whatever channel their feelings might otherwise have run, the circumstances of the Christian church in the first century left absolutely no room for the development of local association. Yet a few years, and the history of this weary world would be closed by the return of the Son of man to judgment, and by the summons which should call the dead from their graves. But the course of events which led to the establishment of Christianity as the religion of the Roman empire insured the growth of a sentiment far more nearly allied to that of the Jewish pilgrims, when gathered for the great annual feast in the city of David. The Christian converts in Rome and Corinth, in Athens and Alexandria, had been worshippers of the Capitoline Jupiter, or the Olympian Zeus, of Isis and Osiris, of Phœbus, Artemis, or Mithras. That these converts had undergone a vast change for the better we need not and we cannot doubt; but the framework of their old associations had not been broken, and the men who had followed the journeyings of Phœbus from his birthplace in Delos to his final home in Delphi, might now with feelings immeasurably deeper and more earnest move from spot to spot noted in the gospel narratives, until the pilgrimage begun in the grotto of Bethlehem ended on the mount of the ascension. The whole of Palestine thus became sacred soil, but for a time the rapid growth of this local veneration called forth something like remonstrance or warning. Teachers like Augustine could remind their hearers that they were not to seek righteousness in the East, nor mercy in the West, and that a voyage to the Holy Land was a useless task for men whose faith placed them at once in the immediate presence of their Lord. But the practice of some among them was not altogether consistent with their precepts. Jerome could insist that heaven was not more easily approached from Palestine than from Britain; but the saint had crossed the sea to take up his abode in a cave at Bethlehem, and had no rebuke to offer to the Roman ladies who followed him, partly to feast upon his eloquence, and in part to derive strength and comfort from contemplating the scenes of the Saviour's ministry. Such feelings seldom fail to provide their own nourishment. The vehement devotion stirred by the sight of Calvary would impart a priceless value to that instrument of punishment which by bearing the body of Jesus had become veritably a tree of life; and in due time the yearning for this relic was rewarded by its discovery. Its genuineness had been attested by the healing of a dying woman who derived no benefit from touching the crosses to which the two thieves had been fastened; and the great churches built by the first Christian emperor and his mother over the Holy Sepulchre and the Cave of the Nativity became sanctuaries which the Christians regarded with a devotion immeasurably more passionate than that which the Jews felt for the temple at Jerusalem. The stream of pilgrims, which probably had long been gathering volume, now swelled into something like the proportions of a flood; and each man found not merely that he could worship on spots which brought him nearer to heaven, but that the devotion of the faithful had done or was doing much to smooth the difficulties or lessen the dangers of his journey. It was not wonderful that the enthusiasm thus fostered should give birth to convictions which no calamities could destroy or even shake. According to this new belief the shirt which the pilgrim wore when he entered Jerusalem would, if used as his winding-sheet, carry him straight to heaven. His death, if it happened during his sojourn in Palestine, made him an object of envy to his kinsfolk and friends. If he returned home, he was treated as one whose sins had been washed away, and perhaps as the bearer of relics whose virtues were so potent as to make the weary journey to Jerusalem a work of supererogation.

Capture of Jerusalem by Khosru III.

The tide of pilgrimage thus flowing steadily onwards was first arrested by the armies of the Persian king, Khosru III., the grandson of Nushirvan. Jerusalem was taken, 611 A.D.; 90,000 Christians, it is said, were slaughtered; and the disaster was crowned by the carrying away of the true cross into Persia. Marching on into Egypt, Khosru received a letter from a citizen of Mecca, charging him to acknowledge Mahomet as the prophet of the one God. He tore the letter into shreds. Mahomet replied only by warning him that his treatment of the letter was a sign of the way in which his kingdom would be treated by-and-by. The punishment of Khosru was to come, however, not from Mahomet, but from the Emperor Heraclius, who, waking from the sluggish inactivity of the earlier part of his reign, defeated the Persians in the passes of Mount Taurus, and destroyed the birthplace of Zoroaster. In the end Khosru was murdered by his son Siroes, from whom Heraclius recovered the true cross by a treaty which also delivered those of his subjects who had been taken prisoners by the Persians. In the following year, 629, Heraclius himself knelt among the worshippers in the church of the Holy Sepulchre. Eight years later, 637, the disciples of Mahomet, now lords of Damascus, laid siege to Jerusalem; but after a blockade of four months a treaty made with the caliph Omar in person secured to the Christians not merely the safety of their persons and goods, but the free exercise of their religion, subject only to the conditions that Mahometans should have the right of admission to their churches at all hours; that the cross should not be seen on the exterior of any building, or be carried about the streets; and finally, that the Christians should be disarmed, and should show respect to their conquerors by wearing a distinguishing dress and by rising up at the approach of true believers. The hardships thus imposed may have been sensibly felt; but pilgrims and merchants still came and went practically without let or hindrance; and even the attack of the Fatimite caliph Hakem, four centuries later, 1010, scarcely changed things for the worse. The rule of his predecessors in Egypt had for the Christians been lighter than that of the Abbasside caliphs of Baghdad; but the object on which the mad Hakem had set his heart was nothing less than the destruction of the great Christian sanctuary. Such persecution as there was fell on the Jews only, and the tax imposed on each pilgrim and levied on his entering Jerusalem was probably not resented as a wrong. To the wealthier Christians it brought an opportunity for securing a higher degree of merit by paying the charge for their poorer brethren; while the completion of the first Christian millennium removed a burden which had lain with increasing heaviness on the spirits and energies of men, and gave a fresh impetus to the feeling which carried the devout to the Holy Land. The end of the 10th century, it was almost universally believed, would be the end of the world. The beginning of a new age relieved them of this mental incubus, and the stream of pilgrims became larger than ever. The path followed by these devotees was not always strewn with roses. Inclement seasons, poverty, and sickness proved fatal to many; but these disasters were not caused by the attack of open enemies, and the conversion of Hungary removed a formidable obstacle for those who had to traverse the heart of Europe in order to reach Palestine.

Revival of pilgrimage after the 10th century.

Conquests of the Seljukian Turks.

A few years later these fairer prospects were permanently clouded by the advance of the Seljukian Turks, who in their inroads into the Eastern empire found themselves effectually aided by the subjects of the emperor. The causes of discontent were indeed many and deep. Extortion and tyranny, both secular and ecclesiastical, had alienated thousands, while the population was seriously lessened by the accumulation of land in the hands of a few owners. Before the close of the 11th century, 1076, Jerusalem had opened her gates to the Seljukian Toucush; and in place of a legal toll the pilgrims found themselves subjected henceforth to indefinite extortion, to wanton insult, and to massacre. The sanctuaries of the Christians were profaned, their worship was interrupted, their patriarchs were thrown into dungeons. The effect of these changes was felt not by the devout only. The supplying of their wants had called forth the energies of merchants; and the fleets of Genoa, Pisa, and Amalfi hurried to the ports of the Holy Land for the great Easter fair at Jerusalem. All these were now driven away, and there remained only the miserable train of pilgrims, who returned to Europe, if they returned at all, with tales of dire indignities done to men, women, and children alike.

Efforts of Hildebrand (Gregory VII.)

The recital of these wrongs went far towards fanning into flame the feelings which the popes had hitherto failed to waken in sufficient strength. The idea of an armed host which should inflict summary vengeance on the oppressors of the Christians had already dawned on the mind of the great Hildebrand, Gregory VII.; it had been vehemently urged by his successor Victor III.; but neither had struck the right chord. Such enterprizes can never be set in motion, with any solid results, except when the flood-tide of popular feeling gives its own weight to the sanction of religious authority. Nor was this result more satisfactory when, in 1081, Robert Guiscard set out from Brundusium (Brindisi) with a fleet of 150 ships and a force of 30,000 men. Guiscard himself besieged Dyrrhachium (Durazzo) in vain; under his son Bohemond his fleet was miserably defeated. Four years later Guiscard made another attempt, which was frustrated by his death at Cefalonia (Kephallenia). But Hildebrand had been dead only ten years when a vast throng of clerks and laymen was gathered to meet Urban II. at Piacenza (Placentia). In Italy, however, Urban felt that he could not look for the enthusiasm which would justify him in making the final venture. From Piacenza he made his way to his old home in the great abbey of Cluny, and in the autumn of 1095 appeared at Clermont, in the territories of the count of Auvergne.

Here he found that there was no longer any need of holding back. To the north of the Alps the indignation of the people had been roused to fever heat by the preaching of Peter the Hermit. With the stature and ungainliness of a dwarf, emaciated by the austerities of his self-imposed discipline, this man, who had forsaken his wife and abandoned his military standard under the counts of Boulogne, had returned from the Holy Land with his heart on fire, not so much from the memory of the hardships which he had himself undergone as for the cruelties and tortures which he had seen inflicted on his fellow-Christians. Simeon, the patriarch of Jerusalem, to whom he first betook himself, could only bewail the weakness of the emperor and of his government. "The nations of the West shall take up arms in your cause," was the reply of the hermit, who soon afterwards, armed with the special blessing of Urban II., mounted his ass, and with bare head and feet, carrying a huge crucifix, traversed the Teutonic lands, rousing everywhere the uncontrollable indignation which devoured his own soul. His vehemence carried all before him, none the less, perhaps, because he bade them remember that no sins were too heinous to be washed away by the waters of the Jordan, no evil habits too deadly to be condoned for the one good work which should make them champions of the cross. Urban, however, and his counsellors, knew well that before the fatal die could be prudently cast a serious task lay before them. The system of feudalism substituted personal ascendency for the dominion of law; and wherever the personal bond failed, the resort was inevitably to private war. The practice of such wars had become virtually an organized trade; and if a large proportion of the population should be drawn away to fight against the infidel in Palestine, those who remained at home would be without defence. Such wars were therefore formally condemned; the women and the clergy, merchants and husbandmen, were placed under the special protection of the church, and the Truce of God was solemnly confirmed. The nearer and more immediate dangers being thus guarded against, Urban from a lofty scaffold addressed the assembled multitude, dwelling in the first place, and perhaps not altogether prudently, on the cowardice of the Turks, and on the title to victory which birth in a temperate climate conferred on the Christians. They were thus sure of success, and sure, too, to win an infinitely higher blessing—the remission of their sins. Sufferings and torments more excruciating than any which they could picture to themselves might indeed await them; but the agonies of their bodies would redeem their souls. "Go then," he said, "on your errand of love, which will put out of sight all the ties that bind you to the spots which you have called your homes. Your homes, in truth, they are not. For the Christian all the world is exile, and all the world is at the same time his country. If you leave a rich patrimony here, a better patrimony awaits you in the Holy Land. They who die will enter the mansions of heaven, while the living shall pay their vows before the sepulchre of their Lord. Blessed are they who, taking this vow upon them, shall obtain such a recompense; happy they who are led to such a conflict, that they may share in such rewards." With the passionate outburst, "It is the will of God, it is the will of God," the vast throng broke in upon the Pontiff's words. "It is, indeed, His will," the Pope went on, "and let these words be your war-cry when you find yourselves in presence of the enemy.

Speech of Pope Urban II. at Clermont.

You are soldiers of the cross; wear then on your breasts or on your shoulders the blood-red sign of Him who died for the salvation of your souls."

So was sanctioned the mighty enterprize which hurled the forces of Latin Christendom on the infidels who had crushed the East under the yoke of Islam; and so it received its name. Of the thousands who hastened to put on the badge the greater number were animated probably by the most disinterested motives, while some had their eyes fixed on the results of more politic calculations. For the multitude at large there was the paramount attraction of an enterprize which the abbot Guibert boldly put before them as a new mode of salvation, which enabled the layman without laying aside his habits of wild licence to reach a height of perfection scarcely to be attained by the most austere monk or the most devoted priest. Nay more, the assumption of the cross set the debtor free from his creditor so long as he wore the sacred badge, opened the prison door for the malefactor, annulled the jurisdiction of the lord over the burgher or the peasant, and enabled the priest and the monk to escape from the monotony of the parish and the cloister. It might be thought that these privileges would tell hardly on the creditor, the capitalist, and the usurer; but these reaped the most solid benefits. The princes who bound themselves by the vow must provide equipments for themselves and their followers, and carry with them sums of money sufficient for their needs. These sums must be raised by loan or mortgage; and as all wished to get horses, arms, and money in exchange for lands, the former became inordinately dear, the latter absurdly cheap. Thus the real gain lay on the side of the merchant and the trader, or of the landowner who was prudent enough to add to his own domains by availing himself of the necessities of his neighbour. All this, however, had been effected by the authority and sanction of the Holy See, which had taken under its protection the dominions of all crusading princes.

Increased power of the Pope and clergy.

It was for the Pope to decide whether those who had taken the vow should set off at once, whether some grace time should be allowed, or whether the vow should be remitted altogether. The Pope became therefore possessed of a dispensing power which placed him virtually above all other sovereigns. His gains, moreover, were immediate. The crusades tended, beyond doubt, to merge the smaller into larger fiefs, which again were absorbed into the royal domain, thus largely promoting that growth of the sovereign power which in the end broke up the feudal system. Those results belonged to the distant future; but the Pope was enabled, rather he was constrained, to send his legates into every land, both to enlist soldiers under the standard of the cross, and to collect money for their support. He became thus at once the administrator of vast revenues which were raised partly by subsidies imposed as a necessary obligation on the clergy, and in part by the voluntary contributions of the laity. With the Pope the ecclesiastical body generally acquired enormous power. The lands of the church, though money might be borrowed upon them, could not be alienated; but it was only in comparatively a few instances that it was necessary to burden them at all. The monastic houses might send some of their members to the Holy Land; the rest remained at home, and became mortgagees or trustees of estates belonging to the crusaders. If these died without heirs, the guardians became absolute owners; and of those who returned not a few withdrew into the cloister, and endowed with their worldly goods the community which they joined.

In the enterprize sanctioned by the Council of Clermont, no nation, as such, took any part; and this fact serves perhaps to explain the measure of its success and its failure. Had it been necessary to wait for strictly national action, the work perhaps would never have been done at all; but had it been a national undertaking some attempt must have been made to establish a commissariat, and to insure something like harmonious and efficient generalship. As it was, the crusading army was simply a gathering of individual adventurers who depended on their own resources, or of reckless pilgrims who neither possessed nor cared to provide any. The contributions made to this army by the different countries of Europe varied largely. From Italy, where the charm was in great part dispelled by the struggle between Pope and anti-Pope, few came besides the Normans who had fought under the standard of Robert Guiscard. The Spaniards were fully occupied with a crusade nearer home, which was to turn the tide of Mahometan conquest that had once passed the barriers of the Pyrenees and threatened to flow onwards to the shores of the Baltic. In Germany there was no great eagerness among partisans of emperors whom popes had sought to humble, to undertake a difficult and dangerous pilgrimage. In England the condition of things which followed the victory of William over Harold prevented both the conquerors and their subjects from committing themselves to distant enterprizes, while the Red King was more anxious to have the duchy of his brother Robert in pledge than ready to run the risk of losing his own kingdom. Thus the task of reconquering Palestine fell to princes of the second order.

The chief of the first crusade.

Foremost among these was Godfrey of Bouillon in the Ardennes, duke of Lothringen (Lorraine), whose high personal character brought to his standard, we are told, not less than 10,000 horsemen and 80,000 infantry, and who was accompanied by his brothers Baldwin and Eustace count of Boulogne. Next to him, perhaps, may be placed (1) Hugh, count of Vermandois, surnamed the Great, according to some, as being the brother of Philip I., the French king, or as others would have it, simply from his stature; (2) Robert, duke of Normandy, who had pawned his duchy to his brother the English king, and who was destined to end his days in the dungeons of Cardiff castle; (3) Robert, count of Flanders, celebrated by his followers as the Sword and Lance of the Christians; (4) Stephen, count of Chartres, Troyes, and Blois; (5) Adhemar (Aymer), bishop of Puy, the first of the clergy who assumed the cross, and rewarded as such with the office of Papal legate; (6) Raymond, count of Toulouse, lord of Auvergne and Languedoc, the leader, it is said, of 160,000 horse and foot, and widely known for his haughtiness and his avarice not less than for his courage and his wisdom; (7) the politic and ambitious Bohemond, son of Robert Guiscard, who had left to him, not his Apulian domains, but only the principality of Tarentum, to which Bohemond was resolved to add a kingdom stretching from the Dalmatian coast to the northern shores of the Ægean Sea; (8) Tancred, son of the Marquis Odo the Good and of Emma, the sister of Robert Guiscard, the hero who beyond all his colleagues appears as the embodiment of those peculiar sentiments which gave rise to the crusades, and who approaches nearest to the idea of Chaucer's "very perfect gentle knight."

The Feast of the Assumption, August 15, 1096, had been fixed at the Council of Clermont as the day on which the crusaders should set off for Constantinople; but little more than half the interval had gone by, when the hermit Peter undertook the task of leading to Palestine a motley crowd of men and women. Peter was accompanied as far as Cologne by Walter the Pennyless, who thence led his followers to Hungary, while another multitude marched under Emico, count of Leiningen, and a fourth followed the guidance of the monk Gotschalk. Behind those came, we are told, a throng of men, women, and children, amounting to 200,000, under standards on which were painted a goose and a goat, symbols of the mysterious faith of Gnostics and Paulicians. These undisciplined multitudes turned fiercely upon the Jews, who were massacred in the streets of Verdun, Treves, and the great Rhenish cities, until the emperor interfered and took them under his protection. Of the followers of Peter 7000 only, it is said, reached Constantinople. These by the orders of the Emperor Alexius were at once conveyed across the Bosphorus, and there, with the bands of Walter the Pennyless, fell into a trap laid for them by the Seljukian Sultan David, surnamed Kilidj Arslan, the Sword of the Lion. A heap of bones alone remained to tell the story of their destruction, when the hosts under Godfrey came thither on their march to Palestine. These had advanced unopposed as far as the Hungarian border, where three weeks were lost in negotiations with the Hungarian king, who dreaded a repetition of the violence which his people had suffered at the hands of the rabble led by Peter and the moneyless Walter. With Stephen of Chartres, Robert of Flanders, and Robert of Normandy, Hugh of Vermandois had set out to make his way through Italy, and taken ship at Bari. Wrecked on the coast between Palos and Durazzo, he was detained at the latter place until the pleasure of the Emperor Alexius should be known. Alexius at once ordered that he should be brought to Constantinople, and so charmed his prisoner by the gracious manner which he could put on or off at will, that Hugh not only paid him homage and declared himself his man, but promised so far as he could to get his colleagues to follow his example.

The tidings of Hugh's detention roused the wrath of Godfrey, who, having in vain demanded his release, marched from Philippopolis, and appeared before the walls of Constantinople at Christmas 1096. Alexius saw before him a mighty host; another not less formidable was on its way, he was told, under Bohemond and Tancred; and Bohemond, as he knew, claimed by right of inheritance no small part of his empire. These swarms he had brought upon his land by his appeals for the aid of Western Christendom, and he was now anxious at one moment to rid himself of their presence, at another to win the submission of the crusading chiefs, and so obtain a hold on their future conquests. At length a compact was made by which they gave him their fealty so long only as they remained within his borders, and pledged themselves to restore those of their conquests which had been recently wrested from the empire, while on his part he promised to supply them with food and to protect all pilgrims passing through his dominions. Bohemond, on reaching Constantinople, was indignant when he learnt that his colleagues had become vassals of the emperor; but he soon found that he must at least appear to follow their example, and he was repaid by a splendid bribe from Alexius, who adopted Godfrey as his son. With Raymond of Toulouse Alexius had a harder task. This chief, who scarcely regarded himself as the vassal even of the French king, refused to do more than be the emperor's friend on equal terms, even though Bohemond threatened that, if the quarrel came to blows, he should be on the side of Alexius. The latter, however, soon saw through the temper of Raymond; and the harmony which followed this dispute was so thorough that Anna Comnena could speak of him as shining among the barbarians as the sun among the stars of heaven.

It was not until the Feast of Pentecost, 1097, that the last of the bands of Latin pilgrims was conveyed to the Asiatic shore. During the whole interval the risk of conflict between the Latins and Greeks had been great. Between them there was in truth a radical opposition. The crusading chiefs hated the idea of a central authority, and clung to the right of private war as the dearest of their privileges. Of public law they could scarcely be said to know anything. The Greeks, on the other hand, were ready to put up with a large amount of corruption in their rulers so long as these secured to them the protection of person and property. Among the Latins, again, the clergy, having been brought by Hildebrand and Damiani under the yoke of celibacy, had become a close order or caste, which shrunk from the notion of allegiance to any temporal master. As a rule the Greek priests were married; and as they owned the authority of the emperor, they were despised by their Western brethren for their cowardice. In short, there was nothing to bring the two peoples together, and everything to exasperate the suspicion and hatred which had grown up between them.

Whatever may have been the numbers of the crusaders (and the chaplain of Count Baldwin could speak of them as six millions), they found themselves on the eastern shore of the Bosphorus confronted by a formidable adversary in Kilidj Arslan, who, retreating with his horsemen to the mountains, swooped down upon the Christians, by whom his capital city of Nice (Nikaia) was vainly invested for seven weeks. At length the city was surrendered, not to the crusaders but to Alexius, and the former, advancing on their eastward march, were again confronted by the Turks near the Phrygian Dorylæum. The battle, desperately contested, ended in the complete defeat of the latter; but the son of Kilidj Arslan, hastening on before the crusaders as they marched to Cogni, Erekli, and the Pisidian Antioch, gave out before the gates of each city that he was come as a conqueror. On his way he had ravaged the land; in the towns the houses had been plundered and the granaries emptied; and the crusaders had to journey through a country which could supply nothing. The burning heat caused fatal sickness; and as if these miseries were not enough, the acquisition of Tarsus was followed by an attempt at private war between Tancred and Baldwin, owing to a dispute for the precedence of their banners. The remissness of the enemy, which might easily have cut them off in the passes of Mount Taurus, allowed them to march safely through the defiles; and Baldwin, Godfrey's brother, was enabled to comply with a request for help made by the Greek or Armenian ruler of Edessa. Welcomed into the city Baldwin made himself master, and the Latin principality of Edessa thus established lasted for fifty-four or, as some have supposed, forty-seven years. Latin principality of Edessa.

In the Syrian Antioch the crusaders hoped to win a splendid prize at the cost of little effort or none. Its walls were mostly in ruins; but the Seljukian governor, Baghasian, had resolved on determined resistance. The siege which followed has no interest for the military historian. At no time was the blockade complete, and it was brought to a successful issue only by treachery. Three months had already passed when the crusaders found themselves in desperate straits for want of food. They had wasted with frantic folly the cattle, the corn, and the wine which had fallen into their hands; and when this first famine was relieved by a foraging expedition under Tancred, the supplies so brought in were wasted with equal recklessness. A second famine drove away not only Taticius, the lieutenant of the Greek emperor, but William of Melun, whose sledge-hammer blows dealt in battle had won him the surname of the Carpenter, and even the hermit Peter. Taticius made his way to Cyprus; the other two were caught and brought back to the camp by Tancred. It was at this time, when the general prospect seemed so discouraging, that envoys from the Fatimite caliph of Egypt offered to guarantee to all unarmed pilgrims an unmolested sojourn of one month in Jerusalem, and to aid the crusaders on their march to the Holy City, if they

Siege of Antioch.

would acknowledge his supremacy within the bounds of his Syrian empire. The reply of the crusaders was brief and definite. God had destined Jerusalem for Christians; if any others held it, they were invaders who must be cast out. This defiance was followed by a victory won over some reinforcements which were hastening from Cæsarea and other cities to the aid of Baghasian. But the time went on; the siege was still protracted; and there were rumours that a Persian army was approaching. To Bohemond it seemed that there was no hope of success except from fraud, and that from fraud he might reap a goodly harvest. In a renegade Christian named Phirouz he found a traitor ready to do his work; and he was able now to announce in the council that he could place the city in their hands, and that he would do so if they would allow him to rule in Antioch as Baldwin ruled in Edessa. In spite of a protest from Raymond of Toulouse the compact was accepted, 1098; and on the same night Bohemond with a few followers climbed the wall, and having seized ten towers, of which they killed all the guards, opened a gate, and admitted the Christian hosts. In the confusion which followed their entrance some of the besieged shut themselves up in the citadel. Of the rest 10,000, it is said, were massacred. Baghasian escaped beyond the besieger's lines; but he fell from his horse, and a Syrian Christian, cutting off his head, carried it to the camp of the crusaders, who now passed from famine to plenty, from extreme hunger to wild riot. They were committing a blunder as well as a sin. The Persians were at hand; and the Turks in the citadel found that the crusaders lay between themselves and the hosts of Kerboga, prince of Mosul, and Kilidj Arslan. The Latin camp was again wasted with famine. Stephen of Chartres, who had deserted it before the betrayal of the city to Bohemond, had on his westward journey met the Emperor Alexius, who was marching to the aid of the crusaders with a large body of pilgrims from Europe. Stephen's tidings were followed by an order for retreat, and the pilgrims were compelled to turn back with their companions. Protesting in vain against this shameful breach of his duty and his vow, Guy, a brother of Bohemond, said in the vehemence of his rage that if God were all-powerful He would not suffer such things to be done.

Miraculous discovery of the Holy Lance.

In Antioch the desperation of the crusaders made them listen eagerly to stories of dreams and revelations from heaven. A Lombard priest had learnt in a vision that the third year of the crusade should see the conquest of Jerusalem; and those who had heard from the lips of the Saviour Himself a rebuke of the vices which had caused all their disasters, had also been assured that in five days the needful help would be granted to them. The impulse, once given, gained strength. Peter Barthelemy, the chaplain of Raymond of Toulouse, related a revelation made to him by St Andrew. The steel head of the spear which had pierced the side of the Redeemer as He hung on the cross had been hidden, according to this tale, in the church of St Peter; and the recovery of this lance would be followed by immediate and decisive success. Two days were to be spent in special devotion; on the third they were to search for the long-lost weapon. The night had come, and their toil had thus far gone for nothing, when the priest stepped down into the pit. After some strokes of his spade he came upon the holy relic, which was carefully wrapped in a cloth of silk and gold. The priest displayed the lance head; and in a few minutes the wonderful tidings had been spread through the city. A few months later Arnold, the chaplain of Bohemond, publicly denied the genuineness of the relic, and charged the chaplain of Raymond with deliberate imposture. Barthelemy appealed to the ordeal of fire, and passed it, to all appearance, successfully. The bystanders were loud in their exultation; but Peter had been fatally injured, and in a few days he died.

Meanwhile the holy lance, borne by the Papal legate Adhemar, had effectually aided the crusaders in the decisive struggle with Kerboga, before whom Peter the Hermit had appeared as an envoy charged to submit to him the alternative of baptism or of retreat from a land which St Peter had bestowed upon the Christians. The answer was a curt refusal, and a battle followed in which Bohemond was severely pressed by Kilidj Arslan, and Kerboga was bearing down the forces of Godfrey and Hugh of Vermandois, when some knights, clothed in white armour and mounted on white horses, were seen riding along the slopes of the neighbouring hills. "The saints are come to our help," cried the Papal legate, and the imagination of the people at once beheld in these strangers the martyrs St George, St Theodore, and St Maurice. The impulse imparted by this conviction was irresistible. The complete defeat of Kerboga and Arslan was followed by the surrender of the garrison in the citadel, and Bohemond remained lord of Antioch.

Suffe[rings] of th[e] crusa[ders].

The crusaders as a body wished to set off at once on their march to Jerusalem; but their leaders shrank from the danger of traversing waterless wastes at the end of a Syrian summer. While some of the crusaders were busied with expeditions against neighbouring cities, many more were pressed by more anxious cares, arising from an outbreak of plague which proved fatal, among others, to the Papal legate Adhemar.

Marc[h of] the c[ru]sade[rs to] Jeru[salem].

Ten months after the fall of Antioch the crusaders, having become masters of Laodicea, were bidden by the Emperor Alexius to await his coming in June. But with him their forbearance had reached its limit, and they bade him remember that, having broken his compact, he had no longer any claim on their obedience. Marching across the plain of Berytus and along the narrow strip of country once celebrated for the wealth and splendour of the great Phœnician cities, the army at length reached Jaffa, and thence turned inland to Ramlah, a town only sixteen miles distant from Jerusalem. Two days later they came in view of the holy city. At the sight of the distant walls and towers all fell on their knees, in an outburst of thankfulness which could express itself only in sighs and tears, while they stooped to kiss the sacred soil. The rest of the march they performed with bare feet and in the garb of pilgrims; but their armour was again put on, when Raymond of Toulouse with his followers invested the city from the western side, while Godfrey and Tancred, with Robert of Normandy and Robert of Flanders, blockaded it from the north. On the fifth day a desperate attempt was made to storm the walls, with a single ladder and with no siege instruments. It was no wonder that in spite of all their efforts the assailants should be beaten back and hurled from the ramparts. Thirty days more passed away, while Gaston of Bearn was busily occupied in directing the construction of siege engines of timber brought from the woods of Shechem. During the whole of this time the besiegers were in the greatest distress from lack of water. All the cisterns and receptacles of any kind had been carefully destroyed by the enemy, whose horsemen harassed or cut off the parties of Christians who were sent about the country to search for it. Nor was the discipline of the camp by any means what it should be; and the phantom of Adhemar of Puy appeared, it was said, to denounce the licence which was provoking the divine judgments. But if there was wild riot in some quarters, there was devotion and enthusiasm in others. Tancred generously made up his quarrel with Bohemond, and like the Levites round the walls of Jericho, the clergy moved round the city in

Sieg[e and] conq[uest of] the city.

procession singing hymns and followed by the laity. The Saracens, it is said, insulted them from the walls by throwing dirt upon crucifixes. On the second day of the final assault, when it seemed that in spite of almost superhuman efforts the crusaders must fail, a horseman was seen, or supposed to be seen, waving his shield on Mount Olivet. "St George the Martyr has again come to help us," shouted Godfrey, and the cry, taken up and carried along the ranks, banished every feeling of weariness, and sent them forth with overwhelming strength for the supreme effort. It was Friday; and at the moment in the afternoon when the last cry was uttered by the Saviour on His cross Letold of Tournay, it is said, stood on the walls of Jerusalem, followed first by his brother Engelbert, and then by Godfrey. The gate of St Stephen was stormed by Tancred; the Provençals climbed up the ramparts by ladders; and the city was in the hands of the Christians. So terrible, it is said, was the carnage which followed that the horses of the crusaders who rode up to the mosque of Omar were knee-deep in the stream of blood. Infants were seized by their feet and dashed against the walls or whirled over the battlements, while the Jews were all burnt alive in their synagogue. In the midst of these horrors Godfrey entered the church of the Sepulchre, clothed in a robe of pure white, but bare-footed as well as bare-headed, and knelt at the tomb to offer his thanksgiving for the divine goodness which had suffered them to realize the yearning of their hearts. In the profound enthusiasm and devotion of the moment his followers beheld the dead take part in the solemn ritual, and heard the voice of Adhemar rejoicing in the prayers and resolutions of penitence offered by the prostrate warriors of the cross. Among the living, too, there were those who called forth the deepest gratitude; and the vast throng fell at the feet of the hermit Peter, who thus saw the consummation of the enterprize which was mainly his work, and of whom after the completion of his task we hear no more. On the next day the horrors of that which had preceded it were deliberately repeated on a larger scale. Tancred had given a guarantee of safety to 300 captives. In spite of his indignant protest these were all brought out and killed; and a massacre followed in which the bodies of men, women, and children were hacked and hewn until their fragments lay tossed together in heaps. The work of slaughter ended, the streets of the city were washed by Saracen prisoners.

So ended the first and the most important of the crusades. Its history shows us clearly the nature of these religious wars and the mode in which they were carried on. Those which follow may be more briefly noticed, as they tend generally to assume more and more of a political character. The first crusade had to all appearance fully attained its object. Godfrey was really king of Jerusalem, although he would not bear the title in a city where his Lord had worn the crown of thorns. His reign lasted barely one year, and this year was signalized less by his victory over the Fatimite caliph of Egypt than by the promulgation of the code of laws known as the Assize of Jerusalem. These laws embodied the main principles of feudalism, while they added a new feature in the judicial courts, the king presiding in the court of the barons, his viscount in that of the burgesses. On Godfrey's death his brother Baldwin was summoned from his principality of Edessa, 1100, and crowned king by the Patriarch Daimbert. During his reign of eighteen years most of the old crusading chiefs passed away. Stephen of Chartres was slain at Ramlah in 1101. Four years later Raymond died on the sea coast. In 1112 Tancred was cut off in the prime of manhood, three years after Bohemond had ended his stormy career at Antioch. The Emperor Alexius, the only man who derived lasting benefit from these expeditions, outlived them all. If his empire was to last, the Turks must be drawn off from the nearer regions of Asia Minor. This result the crusades accomplished, and thus prolonged the existence of the empire for three centuries and a half. The second successor of Godfrey was his kinsman Baldwin du Bourg, in whose reign, 1118–31, Tyre became the seat of a Latin archbishopric. After Baldwin II., the uneventful reign of Fulk of Anjou (1131–44) was followed by that of his son Baldwin III., a boy thirteen years of age (1144–62), in whose days the fall of Edessa called forth again the religious enterprize of the West. Of this second crusade St Bernard was the apostle, as the hermit Peter had been of the first. In the Council of Vezelai, 1146, Louis VII., the French king, put on the blood-red cross, and his example was reluctantly followed some months later by the Emperor Conrad. The story of this expedition brings before us a long series of disasters. Conrad lost thousands in an attempted march across Asia Minor; Louis took ship at Attaleia and succeeded in making his way to Jerusalem. Conrad at length reached Ptolemais; and the two sovereigns, abandoning the project of rescuing Edessa, resolved to turn their arms against Damascus, 1148. The siege was a miserable failure, brought about, it is said, by the treachery of the barons of Palestine. Bernard himself was for the moment overwhelmed by the completeness of the catastrophe; but the conviction of the reality of his own mission soon assured him that the fault lay in the sinfulness of the pilgrims—an idea which, having fixed itself in some minds, had its issue in the pathetic and awful tragedies called the Children's Crusades. None but innocent hands, it was thought, could accomplish the work of conquest in the Holy Land; and in 1212 the great experiment was tried, with 30,000 children, so the tale went, under the boy Stephen, and 20,000 German boys and girls under the peasant lad Nicholas, to end in death by sea or on land, or in the more fearful horrors of the slave-market. For the present this notion was only in embryo; and the monk John had more success in reviving old feelings by declaring that the places of the fallen angels had been filled by the spirits of those who had died as champions of the cross in Bernard's crusade. In 1162 Baldwin III. died at the early age of thirty-three. The great aim of his brother Amalric, who succeeded him, 1162, was to obtain possession of Egypt and thus to prevent Noureddin, the sultan of Aleppo, from establishing himself in a country which would enable him to attack the Latin kingdom from the south as he already could from the north. It may be said that nothing but his own greed for money stood in the way of his success; and Saladin, the nephew of Noureddin, was thus enabled to rise to power in Egypt, and finally, by setting aside the Fatimite caliph, to put an end to a schism which had lasted 200 years. Nor was this all. Amalric's son and successor, Baldwin IV., was a leper, who, being obliged by his disease to appoint another as his delegate, fixed on Guy of Lusignan, the husband of his sister Sibylla. For the time the arrangement came to naught; but when in 1186 the death of Baldwin IV. was followed in a few months by that of Baldwin V., the infant son of Sibylla by her first marriage, Guy managed to establish himself by right of his wife as king of Jerusalem. Over his kingdom the storm was now ready to burst. The army of Saladin assailed Tiberias; and Raymond, count of Tripolis, the son of Raymond of Toulouse, although he had refused to own his allegiance to Guy, hastened to Jerusalem to beg the king to confine himself to a defensive warfare, which could not fail to be crowned with success. His advice was rejected; and the fatal battle of Tiberias, 1187, almost destroyed the

Failure of the enterprize

The children's crusades

army which should have defended the capital, while the true cross fell into the hands of the conquerors. Against the comparatively defenceless city Saladin now advanced; but he pledged himself that, if it were surrendered, he would provide for the inhabitants new homes in Syria, and would supply them with the money which they might need. His offer was refused, and Saladin made a vow that he would take ample vengeance. But when at length the issue was seen to be inevitable and the besieged threw themselves on his mercy, Saladin agreed that the nobles and fighting men should be sent to Tyre, and that the Latin inhabitants should be reduced to slavery, only if they failed to pay a ransom fixed according to age and sex. Having entered the city Saladin advanced to the mosque of Omar. As he approached, the cross, which still flashed on its summit, was hurled to the ground and trailed through the mire. Thus fell the Latin kingdom eighty-eight years after Godfrey became the Defender of the Holy Sepulchre. At no time had it exhibited any signs of real stability. Resting on the rule that no faith was to be kept with the unbeliever, it justified treachery. It recognized no title to property except in the Christians, and the temptation thus held out to robbery went far to demoralize the people. It kept up constant irritation by petty forays, while it did little to promote military science or discipline. Its leaders were for the most part devoid of statesmanship. As banded together rather for a religious than a political purpose, they could withdraw from the enterprize as soon as they had fulfilled their vows, and thus the cohesion needed for its permanent success was unattainable. More than all, it had to put up with, if it did not sanction, the growth of societies, each of which claimed independent jurisdiction over its own members. The great military orders of the Hospital and the Temple had come into existence as fraternities devoted to works of mercy in behalf of poor pilgrims. But under the conditions of their sojourn in Palestine it was necessary to bear arms; the bearing of arms involved the need of discipline; and the military discipline of a brotherhood animated by monastic enthusiasm became formidable. These orders were further strengthened by privileges and immunities conferred, some by the kings of Jerusalem, some by the popes. Their freedom from tithe brought them into direct antagonism with the clergy, and the clergy in their turn complained that these orders gave shelter to excommunicated persons, while the fiercest enmity of the Templar was reserved for his brother of the order of the Hospital of St John. On a kingdom composed of such elements as these the old curse of the house divided against itself cannot fail to descend.

Leading to the fall of the Latin kingdom.

It may have been something like the insight of a statesman which led King Amalric to fix his thoughts on the conquest of Egypt, as the means, not only of preventing the co-operation of hostile powers to the north and the south of the Latin kingdom, but of opening a country of vast resources to the merchant and the trader. There can be no doubt that these considerations prompted the Lateran Council, 1179, to declare that the first object of every crusade should be the conquest of Damietta; but with this determination these enterprizes ceased to be strictly crusades, and the old spirit is seen again only in the royal saint, Louis IX. For the time the fall of Jerusalem seemed to waken again the impulse which had stirred the hearts of Godfrey and Tancred. On the plain between Gisors and Trie the pleadings of William, archbishop of Tyre, prevailed with Henry II. of England and Philip Augustus of France to assume the cross, 1188. Having thus far shown a marked reluctance to the undertaking, Henry may now have really meant to fulfil his promise; but the quarrels and treachery of his sons interposed a fatal hindrance, and soon brought him to his grave. For his son and successor, Richard, the idea of rescuing the holy city from the Turk had an irresistible attraction, and his whole mind was bent on raising money for the purpose. This task done, he met the French king at Vezelai, where forty-four years ago Louis VII. had listened to the vehement eloquence of Bernard. The two sovereigns made their way to Sicily, while the Emperor Frederick I. (Barbarossa) was advancing with his host to Constantinople. Frederick himself was drowned in a Cilician river, 1190, and of those whom he had brought across the Bosphorus not a tenth, it is said, reached Antioch. The efforts of the Latins of Palestine were now directed chiefly against Acre, which had been besieged for two years before Richard and Philip set foot on the Holy Land. The former was prostrated with fever; but his fiery zeal proved stronger than his sickness, and Saladin was compelled, 1191, to assent to a compact which bound him to surrender the true cross, and to give hostages for the payment of 200,000 pieces of gold within forty days. The money was not paid in time, and the hostages, numbering 3000 or more, were all, it is said, slaughtered on the summit of a hill from which the tragedy might be seen in the camp of Saladin. The sequel of the story tells us of battles won and lost to little purpose. The victory of Richard at Azotus opened the road to Jaffa and Jerusalem, and the army had advanced as far as Ramlah, when the men of Pisa, with the knights of the Hospital and the Temple, insisted that the troops could never be kept together after the recovery of Jerusalem, and thus that its re-conquest would really be fatal to the crusade. In June 1192 Richard again led his forces towards the holy city, and was again foiled by the lack of a commissariat and the destruction of the wells and cisterns which for miles round had been shattered by the enemy. His prowess was signally shown in the relief of Jaffa; but in the issue he obtained from Saladin simply a truce for three years and eight months, which insured to pilgrims the right of entering Jerusalem untaxed; and thus, leaving the Holy Land, he set out on the homeward journey which was to be interrupted by a long captivity in a Tyrolese castle as the prisoner of Henry VI. Although this third crusade had been marked by the woful waste of splendid opportunities, it had still secured to the Christians the possession of a long strip of coast, bounded by two important cities, which might serve as a base of operation in future enterprizes, while it had also done much to neutralize the results which Saladin had looked for from his earlier victories.

Fruitless victories of Richard.

The fourth crusade may be dismissed in a few words. It was an enterprize set on foot by the knights of St John, 1193, seconded by Pope Celestine III. in the hopes of getting rid of the Emperor Henry VI., the son of Barbarossa, who claimed the island of Sicily, and encouraged by Henry as a means for promoting his own designs. Henry had no intention of going on the errand himself; but his barons with their followers defeated the Turks between Tyre and Sidon, 1196, recovered Jaffa which had been taken after Richard's departure, obtained possession of Berytus, and lost all that they had gained by their folly and disunion in the siege of the castle of Thoron, 1197. Jaffa was again taken by the Saracens; and the Latin kingdom became little more than a title with which Isabella, the sister of Baldwin IV., linked that of Cyprus on her marriage with Amalric of Lusignan, who had succeeded his brother Guy as sovereign of that island.

The fifth crusade was an undertaking of vastly greater importance. Innocent III., who now sat in St Peter's chair, was a man of incomparably loftier genius than Urban II., and he was raised to the Pontifical throne, 1198, at a time when the European world generally seemed in a state of dissolution. He saw at once how in such a state of things the crusades had served and would serve to promote the Papal power. But if the popes had thus the means and the justification for interfering in the affairs of every kingdom, and acquired the power of demanding contributions, levying subsidies, and dispensing with or enforcing vows, the mode in which the revenues so raised had been administered had roused a wide and deep suspicion which might more than counterbalance all the gains. Hence it came to pass that Innocent, even in the plenitude of his spiritual pretensions, was compelled to defend himself against charges of personal corruption; and when in Fulk of Neuilly he had found an apostle not less devoted and only less eloquent than Bernard, the same suspicion came in to chill enthusiasm and lead men to criticise rather than to worship. Nevertheless, a goodly company prepared for the great work was at length brought together, 1201, the most prominent among the leaders being Simon of Montfort, Walter of Brienne, and Geoffrey of Villehardouin, the historian of the crusade. But the story of previous crusades had at least opened men's eyes to the fearful risks of a march across Asia Minor, and the army wholly lacked the means of transport by sea. In this strait whither could they betake themselves but to Venice? For 85,000 silver marks the doge, Henry Dandolo, covenanted to convey them to the Holy Land; but when the fleet was ready, 51,000 marks only were forthcoming, although the counts of Flanders and St Pol had sold all their plate and strained their credit to the utmost. To the amazement of the crusaders the doge announced that the 34,000 marks would be remitted if they would conquer for the republic the town of Zara, which had been unjustly taken from her by the Hungarian king. To Venice at this time came Alexius, the son of the Byzantine Emperor Isaac Angelus, whom his brother Alexius had blinded and thrust into a dungeon. The pleadings of the younger Alexius may have wakened in the mind of Dandolo some thought of what was soon to be achieved at Constantinople; but for the present he stuck to his bargain about Zara with inflexible pertinacity. Zara was taken, November 15, 1202; and the crusaders expressed their wish to hasten at once to the Holy Land. Dandolo replied that the new conquest must be guarded against the king of Hungary, and that famine in Western Asia rendered the eastward voyage during the winter impracticable. Envoys from Byzantium were also earnest in insisting that the ends of the crusade would be best promoted by placing Alexius on the imperial throne, and that the crusaders' mission was rather the establishment of right everywhere than the wresting of a particular spot from the grasp of the Infidel. They added that the first care of Alexius would be to bring the Eastern Church into submission to the Roman See, while his second would be to provide 400,000 marks for the service of the crusaders, and to accompany them himself to the Holy Land. On hearing these tidings Innocent professed amazement and indignation; but Dandolo was resolved that neither threats nor interdicts should interfere with the execution of his will. The Venetian fleet at length, 1203, reached Scutari, where they received a message from the usurper Alexius promising help if during their stay they would do his subjects no harm. The reply was a summons to come down from his throne; and the appeal lay only to the sword. With ordinary courage Alexius must have carried the day; by giving the order for retreat he sealed his own doom, and on his flight from the city the blinded Isaac Angelus, drawn from his prison, was again wrapped in the imperial robes, and his son Alexius raised to share his dignity. But fresh disappointments were in store for the crusaders. Alexius gave them to understand that the winter must be spent in Constantinople; and Dandolo effectually supported him by saying that until the spring the Venetian fleet should not move. In the meantime feuds and factions were doing their old work in Constantinople. The young Alexius, offended at the plainness of speech which told him that solemn compacts must be adhered to, sent a squadron of fire ships against the Venetians. The project failed; and in a little while his throne was filled by Alexius Ducas, called Mourzoufle from the darkness and shagginess of his eye-brows. Dandolo insisted on the restoration of Alexius; and Mourzoufle had him killed in prison. This deed was held to justify the crusaders in placing a Latin emperor on the Byzantine throne; and this task was achieved after a second siege, 1204, which was followed by riot and carnage altogether disgraceful to Western chivalry. Innocent III. might well ask how the return of the Greek Church to ecclesiastical unity was to be looked for when they saw in the Latins only works of darkness for which they might justly loathe them worse than dogs. The committee of twelve—half French, half Venetian—charged with the election of an emperor, fixed their choice on Dandolo; but the old man, who had well-nigh completed his tale of a hundred winters, cared little for the office, while the Venetians had no wish to see one man at once doge and emperor. Two only remained who could well be made competitors for the throne—the marquis of Montferrat, and Baldwin of Flanders. The choice of the electors fell on the latter, who was a descendant of Charles the Great, and a cousin of the French king; and Baldwin was crowned by the Papal legate in the great church of Justinian.

Baldwin emperor of the East.

The crusaders had thus done great things, although not precisely the things which at the outset Innocent would have had them do. The old schism of the Greek Church had been brought to an end, and the dominion of the Holy See vastly enlarged. But the benefits secured to Venice were at least more enduring. The conquest of Zara was the first step only toward the establishment of a great maritime empire; the factories at Pera were exposed only to attacks by sea, and here her ships could guard them. Her settlements were seen in the richest islands of the Ægean; and this development of her greatness seemed to foster a spirit of independence which Innocent III. regarded with instinctive suspicion. It was the fault of the Venetians, he said, that the whole enterprize had not been brought already to a brilliant consummation. What might not an army which had done so much at Zara and Byzantium have achieved in the Holy Land?

Effect of the crusade on the power of Venice.

The Latin empire thus set up was not more durable than the kingdom of Jerusalem. Baldwin, as emperor, was really nothing more than a chief among his peers; and although he thus lacked the authority of the sovereigns whose title he bore, he attempted tasks which even they must have failed to accomplish. By the crusaders the Greek people were regarded as barbarians or heathens, and their clergy as the ministers of a false faith. The former were excluded from all offices and dignities; the Assize of Jerusalem was substituted for the Code of Justinian; and no native was allowed to take part in the administration of this law. Such changes could portend nothing but future evil; nor were other signs of speedy downfall wanting. The conquerors began to quarrel, and Baldwin found himself at open war with Boniface of Montferrat, now lord of Thessalonica. Like Boniface, the other chiefs of the crusade had been splendidly rewarded. The count of Blois received the dukedom of Nice; and the Venetian Dandolo became the sovereign of Romania, with Geoffrey of Villehardouin as his marshal. But the power of the Eastern Cæsars was rather divided than crushed. New empires sprung up at Nice, Trebizond, and Durazzo; and the Latins encountered an enemy still more formidable in the Bulgarian Calo-John, who ordered a massacre of the

Latin rule in Constantinople.

Latins in Thrace, 1205. Eager for vengeance, Baldwin marched against him; but he was taken prisoner, and the army was saved only by the skill and heroism of Villehardouin, who has left us a narrative of the campaign. The liberation of Baldwin was demanded by the Pope; the reply was that he had died. The cause was never known; and for a year his brother Henry, who was elected to succeed him, refused to take the title of emperor. The ten years of Henry's reign, 1206–1216, stand out in pleasant contrast with the lives of the emperors who were to follow him. Henry at the least saw that his brother had made a fatal mistake in confining the work of government exclusively to the Latins. Greeks were again admitted to public offices and honours; to the imposition of a foreign liturgy or of a foreign dogma Henry offered a passive resistance, while his throne, placed on the right hand of the patriarch's chair in the church of Sancta Sophia, was significant of his thoughts on the question of Papal supremacy. With his death the male line of the counts of Flanders came to an end. In a fatal moment the offer of his crown was accepted by Peter of Courtenay, count of Auxerre, the husband of Henry's sister Yolande. Like Baldwin, Peter fell into the hands of his enemies on his eastward journey, and died without seeing the city of which he was the sovereign, 1218. During the reign of his successor Robert, the second son of Yolande, the range of Latin dominion was rapidly narrowed. When Robert died, Baldwin, Yolande's youngest son, was still a child only seven years old; and John of Brienne, the titular king of Jerusalem, was raised to the imperial throne. At length, after his death, the second Baldwin became emperor; but the twenty-five years of his reign he spent chiefly in distant lands, begging for help in money. In vain the Pope proclaimed a crusade in his behalf. The end was drawing nigh. The envoys sent by him to Michael Palæologus were bidden to tell their master that he might have peace on the payment of an annual tribute amounting to the whole revenue from customs and excise at Constantinople. A few years later, 1261, Baldwin was driven from the imperial city, and spent the rest of his days wandering over Europe and telling the story of his misfortunes. So fell the Latin empire, having dealt the death-blow to the hopes which were dearest to the heart of Pope Innocent III. The reconcilement of the Eastern with the Western Church would, he knew, be best achieved by a close union between the subjects of the Eastern and the Western empires. The policy of the Latin emperors had opened a gulf of separation which has not to this day been closed, and had converted the dislike and suspicion of former generations into vehement jealousy or furious hatred.

Fall of the Latin empire of the East.

The sixth crusade.

When the Latin empire fell the era of the crusades was fast drawing to its close; and of the expeditions which had been undertaken before its downfall one only was prompted by the spirit which had animated the hearers of Urban II. at Clermont. The conditions of the conflict were widely changed; and the course adopted by the Christian leaders showed their conviction that the surest road to Jerusalem was by way of Egypt. Again and again this plan might have been carried out successfully; and again and again the crusaders threw the chance away. Thus, in the year 1219, the Syrian Sultan Coradin had offered peace to the besiegers of Damietta, pledging himself to surrender not merely the true cross but the whole of Palestine, with the exception of two forts for the protection of pilgrims bound to Mecca. The offer was rejected; Damietta was taken and plundered; and in the spring of 1220 the army insisted on attempting the conquest of Egypt. The Sultan Kameel offered them terms as favourable as those of Coradin, and these were also refused. The Nile rose; and the Egyptians inundated the camp of their enemies, who in their turn were compelled to sue for peace by surrendering Damietta. This disaster made the Pope Honorius III., who had been elected on the death of Innocent, still more anxious for the fulfilment of the crusading vow which had long since been taken by the Emperor Frederick II., the grandson of Barbarossa. In a conference at Ferentino, 1223, it was agreed that Frederick should marry Iolante, the daughter of the titular king of Jerusalem, and thus go forth as his heir to recover his own inheritance. Two years were allowed for preparation; but it was found necessary at San Germano to grant two more. When at length Frederick married Iolante in 1225, he declared that his father-in-law, John of Brienne, was king only by right of his wife, on whose death the title had passed to her daughter, and that thus Frederick was now king of Naples, Sicily, and Jerusalem. Still the months rolled away, and the vow of Frederick remained unfulfilled. Honorius had already been obliged to remonstrate; his successor Gregory IX., 1227, found himself constrained to use sharper weapons. The contrast between the two men was marked indeed. In Gregory IX., chosen Pope at the age of fourscore years, the ascetic severity of Gregory the Great was united with the iron will of Gregory VII. Frederick was a young man of thirty-three, born and bred in Sicily, steeped in the luxury of a gorgeous and voluptuous court, where the charms of art and the refinements of literature and philosophy in some measure redeemed the sensuous indulgence at which Gregory would have stood aghast. The Pope had indeed enough to disquiet him in the reports which came from this Sicilian paradise. Frederick was spending his days amongst a motley company gathered from all the countries of Europe,—a company in which Christians, Jews, and Saracens mingled freely. A society such as this could exist only in an atmosphere of tolerance, and tolerance in Gregory's eyes was only another name for indifference, and indifference of heresy. The spell, therefore, must be broken; and Frederick must be sent forth to do battle in distant lands with the Infidels to whom he showed so dangerous a liking in his own. At length his forces were gathered at Brindisi, 1228, but fever broke out among them; and Frederick, having embarked, was compelled after three days to put into the harbour of Otranto. Gregory could endure no more. Frederick was solemnly excommunicated, and the excommunication was followed by interdict. Papal messengers forbade him now to leave Italy until he had made satisfaction for his offences against the church. Frederick retorted by sending his own envoys to demand the removal of the interdict, and then sailed to Ptolemais. Here he found friends in the Teutonic Knights and their grand-master Herman of Salza; and although he was ready to fight, he was still more willing to gain his ends without bloodshed. At length a treaty signed by the Sultan Kameel, 1229, surrendered to Frederick the whole of Jerusalem with the exception of the mosque of Omar, and restored to the Christians the towns of Jaffa, Nazareth, and Bethlehem. Success thus achieved exasperated rather than appeased the Pontiff. The interdict followed him to the holy city, and when he went to his coronation as king of Jerusalem in the Church of the Sepulchre, not a single priest took part in the rite, and Frederick was compelled to crown himself. The letters which he wrote to announce a success which he regarded as splendid roused only a storm of indignation. Gregory charged him with a monstrous attempt to reconcile Christ and Belial, and to set up the impostor Mahomet as an object of veneration or worship.

Relatic of Frederick Gregor IX.

Excomnicatio Frederi

Frederi and the Sultan Kameel

The treaty with Kameel, which closed the sixth crusade, was for ten years. On neither side, probably, was it strictly kept, and the injuries done to pilgrims on their way from Acre to Jerusalem were alleged as a sufficient reason for sending out the expedition headed by Richard, earl of Cornwall (brother of the English Henry III., and afterwards king of the Romans). This expedition may be regarded as the seventh in the list of the crusades, and deserves notice as having been brought to an end, like that of Frederick, by a treaty, 1240. The terms of the later covenant were even more favourable to the Christians; but two years later the Latin power, such as it was, was swept away by the inroad of Korasmians, pushed onwards by the hordes of Jenghiz Khan. The awful havoc thus caused was alleged by Pope Innocent IV. as a reason for again summoning Christendom to the rescue of the Holy Land. But nearly seven years passed away before the French king, Louis IX., was able to set sail for Egypt on the eighth crusade. This royal saint, who lives for us in the quaint and graphic chronicle of his seneschal Joinville, may with truth be said to have been animated by a spirit of devotion and self-sacrifice which no other crusading eader manifested in anything like the same measure. Intolerant in theory, if he could be said to have any theory, and bigoted in language, Louis had that true charity which would make him succour his enemies not less readily than his friends. Nor was his bravery less signal than his gentleness. It was displayed not only on the battle-field, but during the prolonged miseries of a captivity in which he underwent keener pain for the sufferings of others than for his own. He had, indeed, the highest virtues of the monk, the most ardent love of justice and truth, the most vehement hatred of wrong; but as he laid no claim to the qualities of a general, so most assuredly it cannot be said that he possessed them. His dauntless courage saved his army from complete destruction at Mansourah, 1249; but his offer to exchange Damietta for Jerusalem was rejected, and in the retreat, during which they were compelled to fight at desperate disadvantage, Louis was taken prisoner. With serene patience, with unwavering firmness, and with an unclouded trust in God, he underwent sufferings for which the Saracens, so Joinville tells us, frankly confessed that they would have renounced Mahomet; and when the payment of his ransom set him free, he made a pilgrimage in sackcloth to Nazareth, 1250. With a firmness which nothing could shake he denied himself the solace of looking on the holy city. His sense of duty would not allow him to reap the fruits of an enterprize in which he had failed, and so to set an evil example to others. As a general he had achieved nothing, but his humiliation involved no dishonour; and the genuineness of his faith, his devotion, and his love had been fully tested in the furnace of affliction.

e ninth isade.

The crusading fire was now rapidly burning itself out. In the West there was nothing to awaken again the enthusiasm which had been stirred by Peter the Hermit and by Bernard; while in Palestine itself almost the only signs of genuine activity were furnished by the antagonism of the religious military orders. There was, in truth, disunion and schism everywhere. The relations between the Venetians and the men of Genoa and Pisa were at best those of a hollow truce; and the quarrels of the Templars and Hospitallers led in 1259 to a pitched battle, in which almost all the Templars were slain. Some eight years later the tidings that Antioch had been taken by the Infidels revived in St Louis the old yearning for the rescue of the holy places; but he modestly expressed his fear that his sins might again bring on the Christian arms the disasters of his Egyptian expedition. Cheered by the sympathy of the Pope Clement IV., he embarked with an army of 60,000 men, 1270; but a storm drove his ships to Sardinia, and thence they sailed for Tunis. They had encamped, it is said, on the site of Carthage, when a plague broke out. The saintly king was among the victims; and this truest of all crusaders died uttering the words, "I will enter Thy house, O Lord; I will worship in Thy sanctuary." The arrival of the English Edward, who was soon to succeed to the throne on the death of Henry III., brought about no immediate change in the circumstances of the crusaders. In the following year Edward reached Acre, took Nazareth—the inhabitants of which he massacred—fell sick, and during his sickness narrowly escaped being murdered by an assassin sent by the emir of Joppa. Having made a peace for ten years, he returned to Europe; and the ninth and last crusade was at an end. An earnest attempt to renew the struggle was made in the Council of Lyons, 1274, by Gregory X., Edward's friend; and Rodolf of Hapsburg pledged himself to join the expedition then decreed; but in less than two years Gregory died, and the scheme fell to the ground. Of the attempts made in succeeding years to rekindle the old enthusiasm it is enough to say that all proved abortive. The Holy Land could no longer, as it seemed, furnish a home even for the military orders. The Teutonic Knights made their way to Lithuania and Poland, the Hospitallers to Cyprus and to Rhodes. The Templars fell victims to a plot as iniquitous and treacherous as any that has disgraced the annals of mankind. When their services had ceased to be useful in Palestine the French king found that much benefit might be derived from a confiscation of their vast possessions. The proceedings against the order in England are scarcely to be compared with the surpassing horrors of the proscription in France which ended in the burning of the grand-master Du Molay; but in both countries the power of falsehood in compassing the destruction of men innocent of the particular crimes laid against them was seen as perhaps it had never been seen before. The fury with which they were persecuted was indeed a legitimate result of the crusades, for which the unbelief of the enemy supplied the primary motive. The theory of putting down error by force had received a sanction which was applied in the dealings of the popes with Albigensian and other heretics.

Suppression of the Knights Templars.

General re view of th causes and consequences of the crusades.

The narrative of the crusades brings out with sufficient clearness both their causes and their consequences. We have seen that, while the popular impulse which led to them could not issue in vigorous action without the sanction of religion, the mere authority even of the popes was wholly powerless to set Latin Christendom in motion until popular indignation had reached the fever heat. We have been able to watch the effect of these enterprizes in changing the face not only of the East but of the West, securing to the popes the exaction and administration of vast revenues and of a dispensing power still more momentous in its issues, strengthening and extending royal authority by the absorption of fiefs, but for the moment increasing in incomparably larger measure the wealth and influence of the clergy. We have seen the introduction of feudal principles into Jerusalem and Constantinople, and have marked the effects which followed the substitution of the Assize of Jerusalem for the Code of Justinian. The story has shown us that the contact of Western with Eastern Christendom brought about in some respects results precisely opposite to those which were anticipated from it, and that the establishment of the Latin empire of Constantinople rendered hopeless that union of the churches which Innocent III. had regarded as its certain fruit. But if the crusades thus disappointed the expectations of their promoters, they achieved some results the benefits of which have been felt from that day to the present. They failed, indeed, to establish the permanent dominion of Latin Christendom, whether in New Rome or in Jerusalem; but they prolonged for nearly four centuries the life of the Eastern empire, and by so doing they arrested the tide of Mahometan conquests as effectually as it was arrested for Western Europe by Charles Martel on the plain of Tours. They saved the Italian and perhaps even the Teutonic and the Scandinavian lands from a tyranny which has blasted the fairest regions of the earth; and if they added fuel to the flame of theological hatred between the Orthodox and the Latin churches, if they intensified the feelings of suspicion and dislike between the Eastern and the Western Christians, they yet opened the way for an interchange of thought and learning which had its result in the revival of letters and in the religious reformation which followed that revival. If, again, of their leaders some showed themselves men of merciless cruelty and insatiable greed, there were others who like Tancred approached the ideal of the knightly chivalry of a later generation, and others again whose self-sacrifice, charity, and heroic patience furnish an example for all time. The ulterior results of the crusades were the breaking up of the feudal system, the abolition of serfdom, the supremacy of a common law over the independent jurisdiction of chiefs who claimed the right of private wars; and if for the time they led to deeds of iniquity which it would be monstrous even to palliate, it must yet be admitted that in their influence on later ages the evil has been assuredly outweighed by the good.

CRUSENSTOLPE, Magnus Jakob, a Swedish historian, was born in 1795. He became early famous both as a political and an historical writer. His first important work was a *History of the Early Years of the Life of King Gustavus IV. Adolphus*, which was followed by a series of monographs and by some politico-historical novels, of which *The House of Holstein-Gottorp in Sweden* is considered the best. He obtained a great personal influence over King Karl Johan, who during the years 1830–33 gave him his fullest confidence, and sanctioned the official character of Crusenstolpe's newspaper *Fäderneslandet*. In the last-mentioned year, however, the historian suddenly became the king's bitterest enemy, and used his acrid pen on all occasions in attacking him. In 1838 he was condemned, for one of these angry utterances, to be imprisoned three years in the castle of Waxholm. He continued his literary labours until his death in 1865. Few Swedish writers have wielded so pure and so incisive a style as Crusenstolpe, and it is by virtue of the elegance of his writings that he will survive, for his historical worth is injured by the passionate bias of his political and personal antipathies.

CRUSIUS, Christian August (1715–1775), after Buddæus the most distinguished theological opponent of the Wolfian philosophy and critical methods, was born on the 10th of January 1715, at Leuna, in Merseburg, a division of Prussian Saxony, and passed to the university of Leipsic in 1734. After attending the usual classes, he became extraordinary professor of philosophy in Leipsic in 1744, professor of theology in 1750, and theological principal in 1755. He died on the 18th of October 1775. Two of the great objects of his life were to place philosophy on a thoroughly satisfactory basis for the future, and to bring philosophical conclusions into harmony with orthodox theology. The university was divided by the disputes that were rife into two parties—the "Ernestianer" and the "Crusianer." The former contended for a purely grammatical interpretation of Scripture, and carried out their theory to its logical consequences. They thus subjected the sacred writings to the same laws of exposition as are applied to other ancient books. Ernesti, adopting the principles he had employed in dealing with the classics, looked at the Bible from a purely philological stand-point. Crusius, on the other hand, explained Scripture in the light of the labours of the church and the usually received theological system. This had great influence on his philosophical position. He had inherited a bias against the Wolfian views from his teacher Rüdiger; and numerous works were issued by him on logic, metaphysics, psychology, and moral philosophy—all with a direct controversial bearing. The system of Crusius was not successful, but it had a few very enthusiastic supporters. His mysticism and sincere religious spirit endeared him to the Pietists and the followers of Zinzendorf, who would naturally regard him as an able opponent of the extreme rationalizing tendencies (Aufklärung) of the time. His views of prophecy, too, and of its important connection with the Christian economy, had considerable influence on Hengstenberg and Delitzsch. The principal works of Crusius are *Hypomnemata ad theologiam propheticam* and his *Moral Theology*. The latter is in two parts. In the first, taking revelation as his starting point, he combats the Wolfian idea of human perfection, and treats of the depravity, conversion, and sanctification of man. He seems to have held, like Dr Wardlaw, that natural, as distinguished from Christian, ethics are not legitimate. The second part is devoted more specially to morals. The book, although prolix, is animated by genuine religious feeling. Although Crusius had great influence on many of his contemporaries, he unfortunately outlived his reputation. He was a profound, subtle, and original thinker, and was, perhaps, drawn into mysticism by his attempts to reconcile theology and philosophy. His works have fallen into the background; but he is still remembered for his profound learning, unfeigned piety, and purity and earnestness of character. Few controversialists have left behind them so stainless a name.

CRUSTACEA

THERE is probably no class among the Invertebrata which offers so many striking family and individual peculiarities as are to be met with among the Crustacea. Having a special type of structure, and possessed of numerous characteristics in common, they nevertheless put on such diverse appearances both in the young and adult stages of their existence as frequently to have baffled the most able investigators, whilst many of the vagrant members of the class still challenge further research.

The masterly and exhaustive labours of Charles Darwin on the Cirripedia have rescued that aberrant group from obscurity, and many of the parasitic forms have been relegated to the various orders of which they are in reality only degenerated members, their organs having suffered atrophy, and frequently their entire structure having undergone modification, in consequence of the peculiar existences which they lead. But our advance towards a more correct knowledge of the class, as a whole, has been mainly derived from the accumulated store of embryological and developmental studies which—commenced in 1823 by Vaughan Thompson—have in these later years been so successfully prosecuted by Audouin and Milne-Edwards, Darwin, Spence Bate, Van Beneden, Claus, Anton Dohrn, A. S. Packard, O. F. Müller, Fritz Müller, and very many other naturalists. Much, however, still remains to be accomplished.

The CRUSTACEA belong to the sub-kingdom ANNULOSA, and to the division ARTHROPODA, in which are also included the INSECTA, the MYRIAPODA, and the ARACHNIDA; they are known also as ARTICULATA, from the body being composed of a series of distinct rings or segments, each segment usually possessing a pair of jointed appendages or limbs articulated to it. They may be defined to be those Articulata which, whenever respiratory organs are specially developed, possess branchiæ and not tracheæ. By this definition they are at once separated from all insects and myriapods, which invariably possess tracheæ. But it remains a difficulty, if it be not altogether impossible in the present state of science, to frame any definition which shall similarly include all CRUSTACEA and exclude all ARACHNIDA. In both classes, in fact, there are forms which possess no special respiratory organs; and if in these cases we resort to other characters, none which are of universal application have as yet been discovered.

It may be said, however, that as a rule these exceptional Crustacea possess more than four pairs of locomotive appendages, have two pairs of antennary organs, and possess a simple alimentary canal; while the Arachnida generally have not more than four pairs of locomotive appendages, possess at most one pair of antennary organs, and have their alimentary canal produced into cœca (Huxley).

EXTERNAL STRUCTURE.—The skin of the Crustacea is more or less completely hardened by a horny deposit

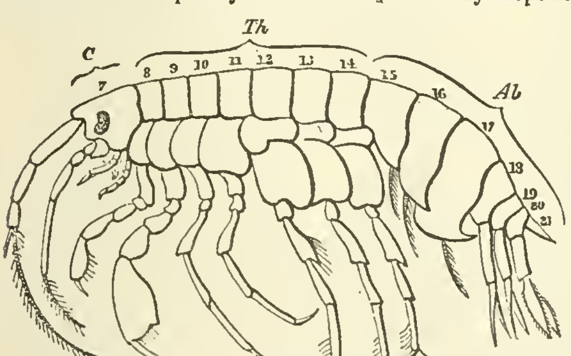

FIG. 1.—Diagram figure of *Gammarus locusta*, Fabr. (after Spence Bate and J. O. Westwood).
C = cephalon or head; Th = thorax; Ab = abdomen. (See Table of Appendages, next page.)

called "chitine," with or without the addition of lime,[1] thus forming a defensive covering to the softer tissues of the animal. This hardened envelope serves also as an external skeleton, giving rigidity and support to the internal organs; and to its inflections, projections, and rugosities the muscles and membranes of the body and appendages are attached.

BODY-SEGMENTS.—The crustacean exo-skeleton consists of a series of rings, usually a repetition of each other, and differing only in modification according to the necessity of the various portions of the animal. Each of these divisions is called a *somite* (Huxley).

The normal number of *somites*, or segments, is twenty-one;[2] but instances occur among the extinct Trilobita and the recent Phyllopoda and Branchiopoda, in which a larger number of segments than twenty-one are to be met with. On the other hand, many recent and fossil forms offer examples of Crustacea in which one or more segments are never developed; but this apparent absence is generally due to their coalescence, and we shall not unfrequently find indications of this if we bear in mind the theory of Oken, that each pair of appendages indicates a separate segment. A knowledge, too, of the earlier (larval) stages of some of these forms[3] has revealed the presence of the normal number of free segments in the young individual which in later life are permanently soldered together.

Although the segments of the Crustacea are greatly modified in the different orders, yet they can nevertheless be shown to be all composed of two lateral moieties resembling each other; we can also distinguish two arcs, the one superior, the other inferior, as shown in the annexed figure (fig. 2).

The superior central pair united constitute the *tergum* (*t*, *t*), and the lateral are called the *epimera* (*ep*, *ep*). The inferior arc is composed of the same number of pieces. The two median pieces unite to form the *sternum* (*s*, *s*), and the latero-inferior pair are called the *episternum* (*es*, *es*). They are always united at the sternum; but there generally exists, between the inferior arc and the epimera situated above, a wide space destined for the articulation of the corresponding appendage (Milne-Edwards).

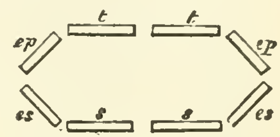

FIG. 2.—Ideal segment.

Mr C. Spence Bate, in his "Report on the British Edriophthalmia" (*Brit. Assoc. Repts.*, 1855), differs from Milne-Edwards and other previous writers who had considered the series of scale-like plates at the sides of the body-segments of the Amphipoda as representing the "epimeral pieces" of each somite; on the contrary, he considers them to be the dilated coxal joint (or *protopodite*) of each limb. This view he adheres to in his chief work[4] (1863, p. 3) on the sessile-eyed Crustacea, and reiterates in his Report[5] (1875, p. 47), where he writes the *epimera* as sectional pieces in a theoretical construction of a somite *cannot exist*; they are really portions of the integument of the appendages. That they are present in the Amphipoda attached to the coxal joint of seven pairs of the limbs is

[1] Chevreul gives the following analysis of the shell of the common crab:—

Animal matter	28·6
Phosphate of lime	6·0
Carbonate of lime	62·8
Phosphate of magnesia	1·0
Soda salts, &c.	1·6
	100·0

[2] In all the higher Crustacea the body is normally composed of twenty-one segments, but, of these, the last never bears true appendages, and is developed subsequently to the others from the dorsal surface of the body. Hence we are justified in regarding it, not as a somite or primitive typical segment of the body, but as a peculiar median appendage, to which the special name of "telson" (Spence Bate) may be applied. Thus the number of somites becomes reduced to twenty, each bearing its pair of appendages (Huxley, *Medical Times and Gazette*, 1857, p. 507). Professor Bell considers the extremely minute and movable points attached to the extremity of this segment in *Palæmon serratus* to be a pair of rudimentary appendages (*Hist. Brit. Stalk-eyed Crustacea*, p. xx., 1853).

[3] As, for instance, the larval stages of *Limulus polyphemus*.

[4] *History of British Sessile-eyed Crustacea*, 2 vols., Spence Bate and J. O. Westwood, 1863.

[5] *British Association Reports*, Bristol, 1875, published 1876

readily seen; but in the Decapoda, Stomapoda, and Isopoda it cannot by any means be so easily demonstrated. "We know of no example of a ring in which we are able to distinguish all the pieces that we desire to enumerate. In some there is an absence of certain pieces from the places they should occupy; sometimes they are very intimately soldered together, so that we cannot detect even a trace of separation; but in studying each of them separately, where it is most distinct, we shall be able to form a clear idea, and recognize its character in spite of its union with its neighbouring pieces. Moreover, although this analysis of the ring may not be always practicable, it is none the less true that it facilitates much the study of the exterior skeleton of articulated animals, and that it will permit us often to establish analogies where the greatest difference would at first sight appear to exist" (Milne-Edwards).

Professor Huxley in his lectures[1] has somewhat simplified Milne Edwards's view of the crustacean segment. Taking for his type one of the body rings, or *somites*, of the common lobster (fig. 3), he points out that it consists of a convex upper part, called the *tergum* (*t*), and a flatter inferior side, the *sternum* (*s*), the angle of junction on each side of the tergum and sternum being produced downwards, forming what is termed the *pleuron* (or *epimera*) (*pl.*) For ordinary studies this view of a somite will be found sufficiently clear and simple.

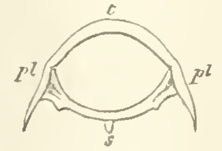

Fig. 3.

From the inner surface of these tegumentary rings in the Crustacea various plates are given off which project into the internal cavity, constituting in some instances cells and canals. According to Milne-Edwards, these processes are always developed at the points of union of two rings or of two neighbouring pieces of the same segment; and this disposition has obtained for them the name of *apodema* (fig. 4). They are the result of a fold of the integumentary membrane which penetrates more or less deeply between the organs, and which is strengthened with calcareous matter like the rest of the external structure, and always formed of two thin plates soldered together. They serve the office fulfilled by the bones in the Vertebrata, *viz.*, that of affording solid surfaces to which the muscles are attached.

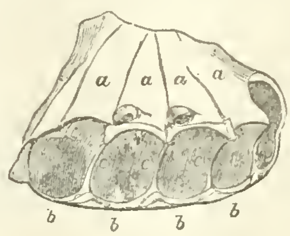

FIG. 4.—Lateral portion of the thorax of a crab (*Portunus marmoreus*).
a, a, a, the epimera; *b, b, b*, the sternum; *c, c, c*, the apodemata rising from the sternum and separating the insertions of the legs.

DIVISIONS OF THE BODY IN THE CRUSTACEA.—By general consent and usage the body of a crustacean is divided into three regions, namely, head (or *cephalon*), *thorax*, and *abdomen* (see figs. 1 and 6), to each of which divisions seven out of the twenty-one segments are attributed. These terms are used as a matter of convenience, and are not assumed to be homologous with the grand divisions of *head, thorax*, and *abdomen*, in the Vertebrata.[2] All writers agree in considering the last seven[3] segments to be abdominal. The only difference of opinion is as to the division of the first fourteen,—how many are cephalic and how many thoracic.

Dr Dana is of opinion that Crustacea have no distinct head, but only a *cephalothorax* composed of the fourteen anterior segments, yet he admits that in the Edriophthalmia the seven most anterior pairs of appendages are devoted to the mouth and organs of sensation, and in the extinct *Pterygotus* and in the Trilobita a distinct head certainly exists.

Professor Huxley considers that the division in the Podophthalmia is indicated by the cervical fold and by the sudden change in the character of the appendages between the sixth and seventh somites, and an equally marked similarity between the latter and those of the eighth and ninth pair. So that according to this view we should have six *cephalic*, eight *thoracic*, and six *abdominal* somites (for Professor Huxley regards the *telson* as not being a true somite but a median appendage, like the post-oral plate in *Pterygotus*). But, as Dana well observes, the mouth organs may become legs, or the legs may become mouth organs by slight variations, therefore this line of division can hardly be maintained on the character of the appendages alone, seeing it does not hold good for other groups equally entitled to consideration, as is the Podophthalmia.[4]

The subjoined table may serve to show these several views more clearly:—

Arrangement and Nomenclature of the Somites or Body-rings of the Crustacea, with their Appendages.

1st.	Somite bearing the eyes.	VII. "Segments of *Head*" (Edwards, Bell, &c.) "*Cephalon*" (C. Spence Bate). VI.	"Cephalic somites" (Huxley).	XIV. "Segments of the Cephalothorax" (Dana).
2	„ bearing antennules, or 1st (internal) antennæ.			
3.	„ bearing antennæ, or 2nd (external) antennæ.			
4.	„ bearing mandibles.			
5.	„ bearing 1st maxillæ.			
6.	„ bearing 2d maxillæ.			
7.	„ bearing 1st maxillipeds.	VII. "Segments of *Thorax*" (Edwards, Bell, &c.) "*Pereion*" (C. Spence Bate). VIII.	"Thoracic somites" (Huxley).	
8.	„ bearing 2d „			
9.	„ bearing 3d „			
10.–14.	„ bearing organs of prehension, ambulatory legs, or natatory appendages.			
15.–20.	Each somite furnished with a pair of appendages, usually natatory, but variously modified, often branchiferous.	VII. "Segments of *Abdomen*" (Milne-Edwards, Bell, &c). "*Pleon*" (C. Spence Bate). VI.	"Abdominal somites" (Huxley). VII.	"Segments of the Abdomen" (Dana).
(21.)	Caudal somite destitute of appendages, "telson," or median appendage.		"Telson" (C.S. Bate, Huxley).	

THE APPENDAGES.—Just as we find a typical number of twenty-one body segments to prevail among the Crustacea, so also in the appendages the type number of joints is seven, any departure from which is disguised by fusion of one or more joints together, the obsolete condition of others, or the depauperization of the limb into numerous *articuli* (see fig. 5). At the coxal joint, or *protopodite*, each limb usually bifurcates; firstly, there arises the external limb proper, or *exopodite*, which is normally seven-jointed; and secondly, the internal branch, or *endopodite*, which may serve as a mouth organ, a branchial appendix, a swimming organ, or a protection for the ova or the young. The appendages

[1] *Medical Times and Gazette*, 1857.

[2] Mr C. Spence Bate, F.R.S., has, since 1855, earnestly advocated the adoption of the terms "*pereion*" and "*pleon*" as less objectionable and more expressive than *thorax* and *abdomen* for the second and third divisions of the body (the term *cephalon* for the head being, of course, generally adopted). In his recent paper "On the Anatomy of the American King-Crab (*Limulus polyphemus*)," *Trans. Linn. Soc.* 1872, vol. xxviii. pp. 462–3, Prof. Owen has proposed the terms "*cephaletron*" and "*thoracetron*" for the anterior and posterior divisions of the body in *Limulus*, and "*pleon*" for the "tail-spine." As other carcinologists are not agreed in regarding the long ensiform tail-spine of *Limulus* as representing the abdomen, we are still left in doubt, and have come to the conclusion that any satisfactory revision of the existing nomenclature must comprehend not one class only but the entire group of the Arthropoda, in the several classes of which the terms proposed to be altered are now in general use.

[3] That is—reckoning the *telson* as the twenty-first segment.

[4] In the Edriophthalmia the normal arrangement mostly is maintained, the fourth to the seventh pairs being epistomial appendages, and the eighth to the fourteenth ambulatory organs.

belonging to the three divisions of the body differ from each other in a greater or less degree in proportion to the higher or lower grade which we examine. Thus among the Decapoda (crabs and lobsters) the cephalic, thoracic, and abdominal somites all possess appendages with well marked

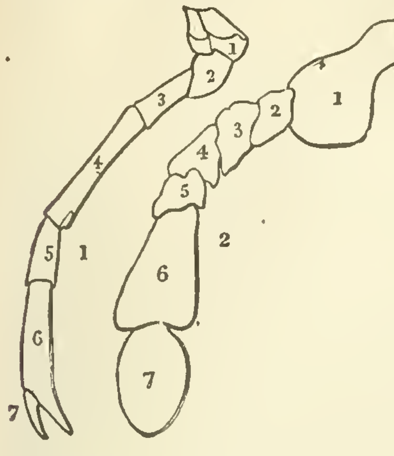

FIG. 5.—(1.) Walking of Lobster (*Homarus vulgaris*), Edw.; (2.) Swimming Jaw-foot of *Pterygotus*.

characters, each series being highly differentiated for the functions to be performed by it. Among the Entomostraca, the appendages of the anterior cephalic somites alone are highly specialized, the others being either mere vegetative repetitions of one another, or else altogether wanting.

FIG. 6.—Diagram of the segments and appendages of the Common Lobster (*Homarus vulgaris*).

C = cephalon; 13. Th = thorax, showing the apodemata; Ab = abdomen. 1, Eyes; 2, antennules; 3, antennæ; 4, mandibles; 5, first maxillæ; 6, second maxillæ; 7, first maxillipedes; 8, second maxillipedes; 9, third pair maxillipedes. 10, One of the antepenultimate pair of thoracic legs of female; *p*, protopodite; *ep*, epipodite; *g*, gill. 11, One of the last pair of thoracic limbs in male; *p*, protopodite. 14, Third abdominal somite; *ex*, exopodite; *en*, endopodite. *l* = labrum; *m* = metastoma. 15-20, abdominal segments; T, 21st segment, or telson.

First pair.—The first cephalic somite supports the eyes, *the most constant of all the organs*, and probably the only pair of appendages which are never diverted from their normal use, though sometimes atrophied. In the more highly cephalized forms, the Decapoda-Brachyura (crabs), the eyes are placed on the outer side of the two pairs of antennæ, but the anatomical evidence shows that the most anterior pair of nerves, in this as in all other orders of Crustacea, is that which is connected with the ophthalmic organs.

Second pair.—The second somite bears the first pair of antennæ (or *antennules*), called the inner pair in the higher forms, and the upper pair among the lower Crustacea. Ordinarily they are slender, tapering, freely-moving, multi-articulate organs. In the lobster both the endopodite and exopodite are equally developed from a common basal-joint or *protopodite* (see 2 in fig. 6).

Third pair.—The third somite supports the second or posterior pair of *antennæ*, sometimes called the outer pair in the higher, and the inferior pair in the lower forms of Crustacea. In the lobster these are represented by a basal-joint or *protopodite*, and a long filamentary, multi-segmented endopodite, to the outer base of which a small scale is attached representing the exopodite. In all the higher Crustacea the three most anterior somites are always *præoral*, being in front of the buccal orifice, and in most genera, moreover, they are specially set apart as bearing the organs of sense. Generally they are so closely blended together, both in the earlier stages of development and also in the adult forms, as to defy separation, the presence of three somites being only demonstrable by dissection, and by a knowledge of the fact that each pair of appendages, wherever it exists, presupposes a segment or ring to which it belongs. The genus *Squilla* affords, perhaps, the best evidence of the separate existence of these cephalic rings. In it the first, or ophthalmic somite, is quite distinct from the second and third antennary, which are also separable from one another, although the latter blends with the next somite, and the succeeding ones can only be distinguished by dissection. Usually the antennæ or feelers are constant appendages; but still, the number and disposition of these organs varies extremely. Some of the lowest forms are wholly without antennæ, or are furnished with them in a merely rudimentary state. Some species have only a single pair, the normal number, however, as we have already pointed out, is two pairs. In position they are inserted on the superior or inferior surface of the head, according to the development of the somites composing the cephalon. Ordinarily they are slender flexible multi-articulate appendages, but even among the higher forms they are subject to extraordinary modifications; thus in the Scyllaridæ, the external pair are developed into broad flat organs of natation, and probably also for burrowing. In *Arcturus*, an Isoped, they are the nursery for the young; in the Entomostraca they are usually natatory organs; in *Pterygotus* and *Limulus* they are chelate, serving, as in the Copepoda, as clasping organs for the male. In the last free condition of the Cirripedia and Rhizocephala they serve as the organs for attachment,—being converted into cement-ducts in the former, and into root-like organs of nutrition in the latter. The second pair of antennæ and sometimes even the first pair become mouth organs in the Merostomata.

Fourth to Ninth pairs. Epistomial or *Mouth Organs.*—In the Decapoda the six succeeding pairs may be called mouth-organs or epistomial appendages, being all engaged in duties subservient to nutrition. The fourth somite bears the actual jaws or mandibles proper with their palpi, outside which lie two pairs of maxillæ, followed by three pairs of maxillipeds or jaw-feet. In each successive somite, these organs become less highly specialized mouth-organs, and betray the fact that they are after all only simple feet modified. Thus in *Squilla* (a Stomapod) the eighth somite (first thoracic) bears a pair of robust claws, the terminal joint of which is furnished with long and sharp teeth, these forming the principal organs of prehension; whilst the ninth somite bears a pair of ordinary feet like the two following pairs (see fig. 71).

In most of the Edriophthalmia the mouth-organs extend only to the seventh somite, the eighth and ninth being included with the ambulatory members.

In the Decapoda we can detect the more or less rudimentary endopodite and exopodite in the fifth pair of appendages, and in each succeeding pair to the ninth; the eighth and ninth pairs also bear a third organ called an *epipodite*, and a gill or branchial organ.

Tenth to Fourteenth Pairs.—In the higher forms the five somites which follow (and which might be termed the postoral somites) bear the true walking limbs (*pereiopoda*, Spence Bate), the first pair of which in the Decapoda are usually developed into powerful chelæ, and serve as the chief organs of prehension.

These podites are usually seven-jointed, and each bears a gill on its basal-joint. They are formed by the endopodite, the exopodite being present only in the larval-limb of the Decapoda; but in the adult *Mysis* (Stomapoda), eight pairs of limbs (that is to say, the five pairs of *pereiopodites* or "walking-feet," and the three pairs of maxillipeds or "jaw-feet,") are all furnished with two branches, one the *endopodite*, the other the *exopodite*, as in the larval Decapod.

Fifteenth to Twentieth pairs.—The next six somites bear each a pair of swimming-feet (or *pleopodites*). In the Decapoda-Brachyura these remain (like the segments on which they are borne) as extremely rudimentary organs furnished with hairs which serve for the protection of the eggs after extrusion. In the Macroura they assist in swimming, and are composed of a simple exopodite and endopodite. The sixth pair are developed into broad plates, forming the lateral lobes to the tail.

The *Twenty-first* or caudal segment is destitute of appendages, and has therefore been considered by Prof. Huxley and others as a "median appendage," and not as a somite.[1] It varies in form, being sometimes a broad flat plate in the Decapoda, or a minute terminal one in the Amphipoda, or greatly developed as a roof to the branchiæ in some Isopoda, or forming a long terminal spine in the Xiphosura.

INTERNAL STRUCTURE.—NERVOUS SYSTEM.—The typical form of the nervous system in the young of all the Articulata is a chain of ganglions placed along the *ventral* surface of the body, and traversed in front by the gullet. This typical arrangement, however, undergoes great modifications in the several orders of Crustacea. Taking the Edriophthalmia, for example (fig. 7), we find the nervous system to consist of two parallel chords traversing the length of the body, each having its own ganglionic enlargement in each somite in juxtaposition, but not confluent; so that there is a distinct pair of ganglions for each segment. These are again united by transverse commissures, and each ganglionic knot gives off nervous filaments to the limbs of its particular somite.

FIG. 7a.—Nerves of *Talitrus*.
FIG. 7b.—Nerves of *Cymothoa*.
FIG. 8. Nerves of *Homarus*

In the lobster (Decapoda-Macrura), the nervous system consists of a longitudinally disposed series of different-sized ganglions connected together by commissural cords (fig. 8).

Primitively there is a pair of ganglions to each somite, but the three first pairs are fused together in the adult so as to form a large cerebral ganglion placed in front of the mouth, and called the supra-œsophageal ganglion. From this a nervous chord passes back on each side of the gullet to the large post-oral ganglion, which is made up of six pairs of primitive ganglions fused together. Then follow five pairs of thoracic and six abdominal ganglions all distinct, but connected one with another by a nervous band formed of the primitive commissural chords which have coalesced along the middle line.[2]

No solid internal skeleton separates this nervous axis from the alimentary system, though reflections of the external integument (*apodemata*) pass inwards, and more or less protect it. From this nervous axis all the nerves are given off, but none arise by two distinct roots like the spinal nerves of man.

In the prawn (*Palæmon*) and spiny lobster (*Palinurus*) the thoracic ganglia coalesce to form a long, elliptical, perforated nervous mass. In the hermit-crab (*Pagurus*) the cephalic ganglion presents a transversely quadrate form, sending off the usual nerves to the eyes, antennæ, &c. The lateral œsophageal chords, after supplying the digestive system with the stomato-gastric nerves, unite below to form the ganglion which distributes nerves to the maxillary apparatus and pharynx. This is succeeded by a large oblong ganglion situated at the base of the great nippers, and of the second pair of feet, both of which pairs it supplies. The lateral chords, diverging for the passage of the artery, re-unite to form a third thoracic ganglion, smaller than the second, supplying the third pair of thoracic feet, and sending off three pairs of nerves posteriorly. Of these the lateral pair goes to the fourth diminutive pair of feet, the median pair supplies the fifth pair of feet; the two remaining dorsal nerves, which are of minute size, form the continuations of the abdominal chords, and pass along the under or concave side of the soft, membranous, and highly sensitive abdomen to the anus, anterior to which the last small ganglion is situated; this supplies the nerves to the muscles of the caudal plates, here converted into claspers for enabling the animal to adhere to the columella of the spiral shell which it may have selected to protect the portion of its body undefended by the usual dense and insensible crustaceous covering (Owen).

The general progress of the development of the nervous system in the Crustacea has been, as we have seen, attended with increased size and diminished numbers of its central or ganglionic masses. The divisions of each pair of ganglions first coalesce by transverse approximation; distinct pairs of ganglions approximate longitudinally, conjoining as usual from behind forwards; confluent groups of ganglions are next found in definite parts of the body, as on the thorax of those species which have special developments and uses for particular legs. In the crab, in which the general form of the body attains most compactness, the ventral nervous trunks are concentrated into one large oval ganglion, from which the nerves radiate to all parts of the trunk, the legs, and the short tail.

A corresponding structure of the nervous system is also well displayed in *Maia* (fig. 9.) An analogous concentration, but not an homologous one, obtains in *Limulus*. Here the nervous substance is chiefly massed round the œsophagus, the fore part of the ring expanding into a pair of ganglions, from which the nerves are sent off to the small median ocelli and the large lateral eyes; the nerves to the latter are of great length, wind round the anterior apodemata, and bend back to their termination, breaking up into a fasciculus of minute filaments before penetrating the large compound eye. Two stomato-gastric nerves arise from the upper and fore part of the ring. From the under surface of the fore part of the ring, a small pair of nerves pass to the first short pair of forcipated antennules; five large nerves proceed from each side of the ring to the five succeeding jaw-feet. A pair of slender nerves

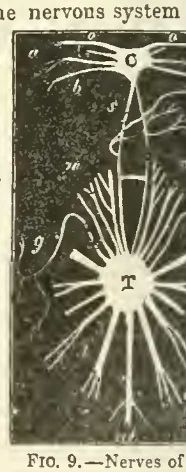

FIG. 9.—Nerves of *Maia squinado*, Latr.
C=cephalic ganglion; T=thoracic ganglion; *o, o*, optic nerves; *a, a* antennary nerves; *b, b, c*, stomato-gastric nerves; *s*, medullary cords uniting C and T; *m*, maxillary nerves; *g, g*, nerves of the flanks; *l, l*, nerves of the legs; *ab*. abdominal nerves.

[1] Prof. Bell writes:—"Normally there are twenty-one pairs of appendages or limbs; generally speaking, even in the higher forms, *twenty only are perceived*, as the terminal joint of the abdomen, which forms the central piece of the fan-like fin, has none which are perceptible. I have, however, observed them frequently in the common prawn, *Palæmon serratus*, in the form of extremely minute points attached to the very extremity of the segment, and movable." Mr A. H. Garrod, F.R.S., is also of opinion that the telson should be regarded as the twenty-first segment, having its appendages modified by cohesion and adhesion. See Humphrey's *Journal of Anatomy and Physiology*, vol. v. p. 271 (1871).

[2] This double ganglionic chain of the lobster was found by Newport to be composed of two orders of fibres, forming distinct and superposed fasciculi or columns, which the author designates *columns of sensation and of motion*, analogous to the fasciculi of the anterior and posterior columns of the spinal chord of the higher animals. These fasciculi are but indistinctly discernible in the interganglionic chords, but become extremely apparent in the ganglions themselves, for these enlargements belong exclusively to the inferior or *sensitive* fasciculi, and the superior or *motor* fasciculi pass over their dorsal surface without penetrating their substance at all.

pass to the spiny-edged lamelliform appendage. The posterior part of the nervous ring is prolonged backwards in the form of a chord having four ganglionic enlargements on its ventral surface, and terminates opposite the penultimate post-abdominal plate in a fifth slight ganglionic enlargement which bifurcates; each division sends off a few nerves as it proceeds to the caudal appendage, on entering which it is resolved into a plexus or kind of *cauda equina*. Besides the principal nerves above mentioned many smaller nerves are given off to other parts of the body. The sides of the great œsophageal ring are united by two transverse commissural bands; but the most remarkable feature of the nervous axis of this crustacean is its envelopment by an arterial trunk. A pair of aorta from the fore part of the heart arch over each side of the stomach, and seem to terminate by intimately blending with the sides of the œsophageal nervous ring. They, in fact, expand upon, and seem to form its neurilemma; a fine injection thrown into them coats the whole central mass of the nervous system with its red colour (Owen, *Lectures—Invertebrata*, 1855).

Tracing the nervous system in the Crustacea from its simplest type, a vermiform cord with a series of independent nerve centres, we see these becoming successively conjoined in a greater and greater degree, as if in obedience to some law of attraction, until in the crab the maximum centralization of the class is attained. But in whatever form it exists in this section of the Arthropoda we may bear in mind the conclusion that

"the nervous system of the Crustacea consists uniformly of medullary nuclei (ganglions) the normal number of which is the same as that of the members or rings of the body, and that all the modifications encountered, whether at different periods of the incubation, or in different species of the series, depend especially on the approximation, more or less complete, of these nuclei (an approximation which takes place from the sides towards the median line, as well as in the longitudinal direction), and to an arrest of development occurring in a variable number of the nuclei."—(Milne-Edwards.)

Divisions of the Nerves in the Crustacea.—Three principal divisions have been recognized in the nervous system of the Crustacea:—

(1.) All those nervous filaments which take their rise in, and are exclusively connected with, the supraœsophageal nerve-centre, forming the true *sensori-volitional* system. (2.) Other ganglions superadded to the abdominal columns with their nervous filaments, serving for the automatic reception and reflection of stimuli, forming the *motor* system. (3.) The stomato-gastric nerves, connected partly with the brain and partly with the œsophageal columns (analogous to the great sympathetic or organic nerves of the Vertebrata), forming a third group, the *ganglionic* system.

Seat of the Senses in the Crustacea.—Although, as regards the relative size of the several ganglions in the nervous chain of the Crustacea generally, there is little difference between the anterior and posterior masses, and often a disparity between the supra- as compared with the infra-œsophageal ganglions,[1] yet, nevertheless, it is generally admitted that in these animals there is an evident tendency observable towards a centralization of the nervous functions in the anterior portion of the ganglionic chain, viz., the supra-œsophageal ganglion. But still there is a wide interval between this first indication and the concentration of the faculties of perception and of will in a single organ—the brain—of which every other portion of the nervous system then becomes a mere dependency.

Organs of Feeling.—As regards the development of the individual senses, one may reasonably conjecture that the sense of touch can be but feebly exercised by the common integument of the Crustacea, if indeed it can be said to exist at all, except in those parts of the body which remain soft and undefended by a calcareous crust, such as the under side of the abdomen or the soft body of the hermit-crabs. The hairs with which many of the Crustacea are induced may to some extent compensate for this low endowment of the tactile sense.

There can be no doubt, however, that the sense of touch is mainly concentrated in the two pairs of long, many-jointed, and highly flexible antennæ with which numbers of this class are provided. These special organs of touch are directly connected with the cephalic ganglion, and are well adapted, both by actual exploration and as media for conveying vibratory sensations, to furnish to the brain most correct and rapid ideas of surrounding objects.

The smaller but similarly-formed flabelliform appendages attached to the maxillæ and maxillipeds doubtless perform a similar office in the testing of all objects brought near to the mouth; these latter, however, are not directly connected with the supra-œsophageal, but with the mandibular ganglion.

Organs of Sight.—The eyes of Crustacea present a greater variety in their gradation than is to be found in any other class of the Arthropoda.

Commencing with only a median fixed (bifid ?) eye-spot in the larval and simpler forms, we see these organs advance progressively, through all the stages of sessile-eyed development in the Merostomata and Edriophthalmia, to the highest condition in the Podophthalmia, that of two distinct compound eyes, endowed with all the essential optical apparatus, and placed on movable peduncles.

It has been doubted by some naturalists whether the eyes are organs of so much importance in the economy of the Crustacea as are the antennæ or organs of touch; but experiments performed on the eye of the living lobster, when out of water, or even in a shallow aquarium, can hardly be deemed as either a conclusive or a satisfactory test of the sensitiveness of the cornea in an eye accustomed to convey impressions of surrounding objects to the optic nerve when at a depth of several fathoms beneath the water.

If the open-air experiments as to the sensitiveness of the lobster's eye had

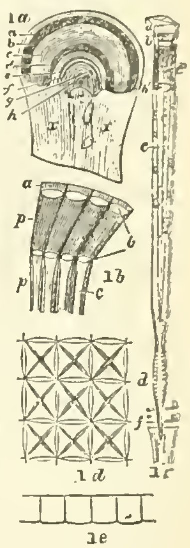

Fig. 10.

Fig. 10.—Structure of Eye of Lobster (*Homarus vulgaris*). After Newton.

1*a*. Longitudinal and horizontal section of a right eye seen by reflected light (× 4). *a*, cornea; *b*, first band of pigment, beneath which are the crystalline cones; *c*, a broad band of radiating fibres free from pigment; *d*, second black band composed of the pigmented spindle-shaped bodies, the lower ends of these bodies are covered with an opaque white pigment which forms *e*, the first white band; *h*, bundles of radiating fibres; *i*, enlarged end of the optic nerve, *x*. The muscles and connective tissue which naturally fill the cavity have been omitted in this figure.

1*b*. A group of elements showing the relation of the pigment to the cones. The cornea is not present. *a*, substance intermediate between cornea and cone; *b*, crystalline cone; *c*, nerve rod; *p*, pigment.

1*c*. A partly diagrammatic view of one of the elements of the eye from the cornea to the optic ganglion. *a*, cornea; *b*, substance between cornea and cone; *b'*, lower end of crystalline cone; *c*, nerve rod, around which is seen the investing membrane with its nuclei; *d*, spindle-shaped or transversely striated body; *f*, perforated membrane at surface of optic ganglion; *p*, pigment.

1*d*. A portion of cornea as seen by reflected light, showing the cross and central spot.

1*e*. Perpendicular section from the middle of the cornea, showing the smooth outer and slightly convex inner surfaces.

been made instead on a living shore or land crab, of the genus *Grapsus*, *Gelasimus*, *Gecarcinus*, or *Ocypoda*, it would speedily have been found that in point of rapidity of perception and movement, guided by sight, these shore and land crabs are quite equal to the most sharp-sighted insect, or the most agile of lizards.

As already stated, the eyes are the most constant and persistent organs possessed by the Crustacea as a class,

[1] In *Maia squinado*, for example, although the supra-œsophageal or cephalic ganglion is large, yet, in consequence of the union of the cephalo-thoracic somites, the thoracic ganglion is fully three times its size. — See *supra*, fig. 9.

indeed, if we except certain parasitic Isopodous forms and the Cirripedia and Rhizocephala, we shall find that the faculty of sight is possessed by the whole class.[1] Even in those exceptional cases in which the eyes are aborted, we find that in the earlier and larval stages of their existence the parasitic and sedentary forms possessed eyes, and it is only as an effect of a kind of retrograde metamorphosis which the animal undergoes that the organs of vision disappear in the adult.[2] Two forms of visual organs are met with in the Crustacea, namely, smooth or *simple* eyes (*ocelli* or *stemmata*) and *compound* eyes; but though there are some few forms in which (as in *Apus* and *Limulus*) both ocelli and compound eyes are present, the latter form of eyes is that most generally met with in the class.

The structure of the *simple* eye does not differ greatly from that observed among higher animals. There is, firstly, a transparent cornea, smooth and rounded, which is, in fact, only a part of the general tegumentary covering modified. Immediately behind the cornea is the crystalline lens, generally of a spherical form; this is again followed by a gelatinous mass analogous to the vitreous humour, and this mass is, in its turn, in contact with the extremity of the optic nerve. A layer of pigment of a deep colour envelops the whole of these parts, lining the internal wall of the globe of the eye up to the point at which the cornea begins to be formed by the thinning of the tegumentary envelope rendering it transparent. The number of these simple eyes does not exceed two or three.

In the Branchiopoda (*Nebalia*, *Branchipus*, *Daphnia*) behind a simple cornea, undivided externally, we find a variable number of distinct crystalline lenses and vitreous humours, each included in a pigmentary cell, and terminating by contact with the optic nerve. These are, no doubt, an aggregation of stemmata under a common cornea.

In some of the Edriophthalmia a still further advance to a true compound eye is met with. In these the cornea appears to consist of two transparent laminæ, the external layer being smooth and the internal one facetted, each facet being a distinct cornea resting on a separate crystalline lens of its own. In the *compound eye*, properly so called, the two membranes, external and internal, constituting the cornea, are both divided into facets, each facet seemingly being equivalent to a distinct ocellus, furnished with its own crystalline cone (or lens) and nerve rod; each invested with its own pigment coating, which, being darker at intervals, gives to a section through the compound eye as a whole the appearance of pigment-bands repeated at various depths beneath the cornea, and in front of the expanded termination of the optic nerve (*retina*). Although these facets are always hexagonal in the eye of an insect, they are variable in form among the Crustacea. Thus in *Homarus*, *Astacus*, *Penæus*, *Galathea*, and *Scyllarus*, the facets are square; whilst in *Pagurus*, *Squilla*, *Gebia*, *Callianassa*, and the crabs, they are hexagonal. In *Limulus* and the Trilobites the lenses are *round*, not being in actual close contact with each other. Milne-Edwards mentions that in *Idotea* each facet has a kind of supplemental lens of a *circular shape* set within the cornea in front of each proper crystalline lens, and equal in size to the corneal facet, and apparently evolved in the substance of the cornea itself, but under favourable circumstances capable of being detached from it. In *Phacops caudatus* the small circular lenses of the external compound eyes drop out, leaving a corresponding concavity beneath.

Emmerich long since proposed to use the external characters of the eyes of Trilobites as a means of classification, dividing them into "hyaline"-eyed and "facetted"-eyed groups; but he does not seem to have been aware of the perfect analogy which the structure of the eyes of the modern Edriophthalmia afford in illustration of this ancient and extinct group.

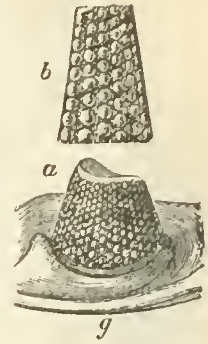

FIG. 11.—Eye of Trilobite (*Phacops caudatus*), U. Silurian. (After Buckland). *a*, the entire eye; *g*, the genal border of head; *b*, a portion of the facetted surface, much enlarged.

Stemmata or *ocelli* are always immovable and sessile; the compound eyes with smooth corneæ, although usually sessile, are, however, occasionally supported on pedicles, as in *Nebalia* and *Branchipus*.

The compound facetted eyes are subject to the same variations,—genera being found with hyaline and facetted corneæ in the same order. In some of the compound sessile eyes the facets are round; but in all the pedunculated compound eyes they are either square or hexagonal.

The peduncles supporting the eyes in the Stomapoda and Decapoda vary greatly in length, but every consideration tends to the conclusion that these movable eye-stalks are really the pair of appendages of the first cephalic ring. Indeed, in *Squilla* one is actually able to separate the eye-stalks with the segment upon which they are borne from the cephalic shield.

In *Macrophthalmus* and some other crabs the eye-stalk is of very considerable length (see fig. 65), extending even to the outer angle of the front of the carapace, which is furnished with a long groove or furrow into which the eye can be folded down, and so placed out of reach of injury when not in active use. This furrow is called the *orbital fossa*.

ORGAN OF HEARING.—Milne-Edwards, Owen, Bell, and others consider the external organ connected with the sense of hearing to be situated on the first joint of the outer and larger antennæ in the lobster and other Macroura, and to consist of a conical process beneath which is a cavity having a round orifice closed by a membrane. Behind the process, and connected with the cavity, is a large sac filled with a clear liquor; a nerve arising in common with the external antennal nerve is spread upon the delicate walls of the supposed acoustic sac.

In *Maia* and other crabs the membrane is replaced by a movable calcareous disc pierced by a small oval opening, over which is stretched a thin elastic membrane (which might be termed the internal auditory membrane), near to which the auditory nerve appears to terminate.

The auditory apparatus of the Crustacea consequently consists essentially of a cavity full of fluid, over which a nerve adapted to perceive sonorous impulses is distributed, assisted by an elastic membrane, and placed near the base of the antennæ which, like a rigid stem, assists in rendering certain vibrations perceptible.

In both the lobster and the crab a gland filled with a greenish substance is connected with the membranous sac. This structure and the absence of otolites has led Farre to suggest that the organ may be olfactory; but the chief

[1] The fact that *Niphargus*, *Crangonyx*, and some other dwellers in subterranean waters, as well as *Callianassa Macandrei*, a burrowing marine crustacean, are blind, is certainly the result of their habitats, not a normal state of the organs of vision. In the Mammoth Cave, Kentucky, and the caves of Carniola and Adelsberg, Crustacea, insects, and other animals have been met with, all blind or with but imperfect organs of vision.

[2] In the Cirripedia the individuals are *hermaphrodite*, fixed when adult, and all blind (unless the complemental male of *Ibla Cumingii* be an exception,—see Darwin's *Mon. Cirripedia*, Ray Soc., p. 196), but in the parasitic Isopoda, and in many of the Copepoda, it is the female alone which is so remarkably transformed, whilst the male retains his powers of sight, his freedom, and his normal aspect.

parts of the structure bear a close correspondence with an auditive vesicle and a tympanic membrane.[1]

ORGAN OF SMELL.—Professor Owen[2] refers the sense of smell to a small sac, fringed with fine hairs, opening externally by a narrow cleft in the basal joint of the first or median antennæ. A branch of the antennal nerve terminates in a small prominence at the bottom of this sac. From the presence of some minute siliceous particles within the cavity (although it is admitted that these must have found their way in from the exterior fortuitously) Dr Farre[3] has been led to suggest that the small antennæ are acoustic organs, and that the grains of sand may act as otolites.

Milne-Edwards admits as indubitable the presence of well-developed organs of smell, but considers we are reduced to conjecture when we are required to point out the precise seat of those organs.[4]

ORGANS OF TASTE.—Like almost all other animals the Crustacea *select* their food, showing decided preference for particular kinds; this selection is doubtless actuated by two senses, *smell* and *taste*. Whether we are correct in assigning to the inner pair of antennæ the duties of the olfactory organ or not, it cannot be doubted that the sense of taste is distributed over that portion of the tegumentary membrane which lines the interior of the mouth and œsophagus, but there is no modification of these parts which needs to be specially noticed here.

ORGANS OF NUTRITION.—In the larval stages of the higher Crustacea, and also among the adult lower and simpler forms, fewer of the somites have their paired appendages differentiated to perform special offices. Thus in the larval Decapod the chief natatory organs are the maxillipeds; this is also the case in the Merostomata. In *Limulus* (fig. 12) all the locomotory organs are also subservient to the duties of nutrition, being organs of locomotion at their distal, and mandibles and maxillæ at their proximal extremity.

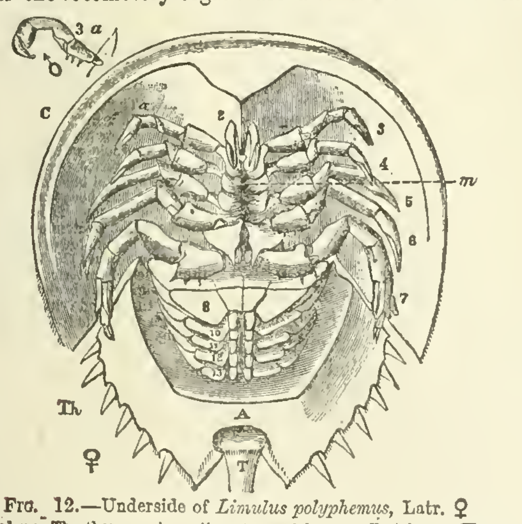

FIG. 12.—Underside of *Limulus polyphemus*, Latr. ♀

C=cephalon; Th=thorax; A, rudimentary abdomen; T=telson. (The eyes 1, cannot be seen in this figure, being on the upper surface of head-shield.) 2, The chelate antennules; 3*a*, antennæ (3*a′* detached antenna of male); 4–7, mandibles, maxillæ, and maxilliped; *m*, the mouth; 8, operculum, bearing on its inner and upper surface the ovaries and reproductive organs; 9–13, branchigerous feet.

In fact, as already stated, we have abundant evidence to prove that the maxillary organs of the Malacostraca are but modifications of entire limbs, translated from the locomotive series and set apart as special mouth-organs. By far the larger proportion of the Crustacea have a proper normal mouth furnished with suitable organs of mastication, but among the parasitic Copepoda and certain aberrant parasitic Isopods, &c., they become merely organs of attachment, the mouth being suctorial; or (as in the Rhizocephala) it may be altogether wanting, and the limbs completely lost, and from the point of attachment root-like tubes may be developed, which, sinking deep into the body of the host, convey to the parasite its nutriment ready digested and prepared.

If instead of these latter we examine the Decapoda we shall find the mouth placed centrally near the front and upon the under side of the cephalon. It is provided with a small simple median piece, called a *labrum*, or upper lip, in front, and a bifid *metastoma*, or lower lip, behind; the paired appendages (mandibles, maxillæ, &c.) being placed on either side of the buccal orifice.

The food, whether living or dead, being first seized by the forcipated thoracic feet, is brought near to the maxillipeds, and by the help of these external organs of prehension portions are separated and introduced by the maxillæ to the trenchant and powerful mandibles, when having undergone further subdivision they are swallowed.

No organ corresponding to a tongue exists in the Crustacea, the mouth being only the anterior and outward expansion of the œsophagus, which is short, rises vertically, and terminates directly in the stomach.

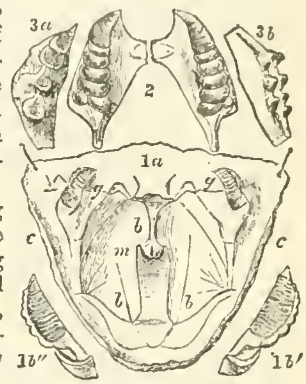

FIG. 13.—Gastric Teeth of Crab and Lobster.

1*a*, Stomach of common crab, *Cancer pagurus*, laid open, showing *b*, *b*, *b*, some of the calcareons plates inserted in its muscular coat; *g*, *g*, the gastric teeth, which when in use are brought in contact with the sides of the smooth fixed plate *m*; *c*, *c*, the muscular coat; 1*b′* and 1*b″*, the gastric teeth enlarged to show their grinding surfaces; 2, gastric teeth of common lobster, *Homarus vulgaris*; 3*a* and 3*b*, two crustacean teeth (of *Dithyrocaris*) from the Carboniferous series of Renfrewshire.

The wall of the stomach is composed of two membranous layers, separated by one of muscular fibres, which increase in thickness at the openings leading from the œsophagus and into the intestine.

The stomach is globular in form and of great capacity, and may be divided into an anterior or "cardiac" part, and a posterior or "pyloric" region. The food on reaching the "cardiac" region of the stomach is subjected to a further process of mastication, by means of a complex apparatus composed of several calcareous pieces, moved by appropriate muscles, inserted in the membranous wall of the stomach (fig. 13, 1*a*), armed with a smooth median plate and two lateral molar-like-organs, having a singular mimetic and superficial resemblance to the molar teeth of some small marsupial rodent. Two smaller points (bicuspid in the lobster, tricuspid in the crab) complete the calcareous apparatus; in the pylorus a series of fine hairs are placed, which, doubtless, act like a strainer, preventing the escape of the coarser particles of the food until they have repeatedly been subjected to the molar-like action of the gastric teeth. A long and straight intestine continues from the stomach backwards, and terminates beneath the telson.

Two cœcal salivary glands of a greenish colour are situated on either side of the œsophagus.

The liver in the Decapoda is of large size, and bilaterally symmetrical; its structure is highly ramified, not solid like the human liver. The secreted fluid or bile is poured by two openings into the pylorus.

[1] Spence Bate marks this organ as "olfactory" in the crab (*Brit. Assoc. Reports*, Bristol, 1875, pl. i. fig. 10, and explanation). Mivart calls the green gland the kidney of the lobster, and says "no organ of smell has been determined" (*Pop. Sci. Rev.*, vol. vii., 1868, p. 350) See Fritz Müller's suggestions as to this green gland, p. 652.

[4] Milne-Edwards, in Todd's *Cyclopædia of Anatomy*, vol. i. p. 758

This organ, so large in the crab, undergoes great modifications in the various orders; in the Edriophthalmia only three pairs of biliary vessels, analogous to those of insects, remain. No vessels have as yet been detected by which the chyle or nutritious fluid elaborated by the digestive processes is taken up, as it passes along the intestinal canal, and transferred to the circulatory system; we can only, therefore, conclude that it is transferred by absorption to the irregular venous receptacles which are in contact with the walls of the intestines.

Circulatory System.—In most of the Crustacea the circulation is of the same simple character as that observed in the aquatic larvæ of insects, save that in the Crustacea the blood is conveyed to the gills for the purpose of oxygenation; but where no special respiratory organs are developed, the fine hairs and filamentous appendages attached to the feet doubtless subserve that office, or in some the entire surface of the body. The heart consists of an elongated contractile dorsal vessel, larger behind than before, connected anteriorly and posteriorly by several branches with the inferior or returning vessels, which running along the whole body receive the blood from the anterior extremity, and carry it into the posterior extremity of the dorsal vessel.

In the male *Entoniscus Cancrorum* the heart (fig. 14) is situated in the third abdominal segment. In the *Cassidina* the heart (fig. 15) is likewise short and furnished with two pairs of fissures, and is situated in the last segment of the thorax and the first of the abdomen. Lastly, in the young *Anilocra* the heart (fig. 16) extends

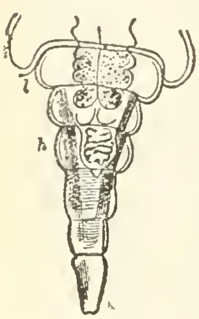

Fig. 14.

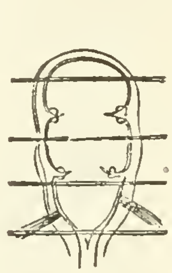

Fig. 15.

through the whole length of the abdomen, and is furnished with four or five fissures which are not placed in pairs, but alternately to the right and left in successive segments (Fritz Müller, *Für Darwin*, pp. 41-42).

In the Decapoda the heart is placed near the dorsal surface of the cephalic shield immediately beneath the integument above the intestinal tube, and is retained in its place by lateral pyramidal muscles. It consists of a single chamber or ventricle, suspended in a large sac, called the *pericardium*, but wholly distinct from the part so named in man. The structure of the heart is made up of the interlacement of numerous muscualr fibres fixed by their extremities to neighbouring parts, and passing for some distance over the aggregate at each end, the whole structure reminding one of a number of stars superposed on each other, the rays of which do not correspond (Milne-Edwards). The ventricle has three pairs of apertures so closed by valves as to readily allow the entrance of blood from the pericardium, but to hinder its regurgitation. It has three other pairs of openings, each of which is the commencement of an arterial trunk conveying blood all over the body. These arteries have valves at their origin, and ramify and end ultimately in capillaries, which open into what are called venous sinuses, because they are channels without any definite shape. The venous blood collects in a great sternal sinus, and thence passes up into the gills to be oxygenated, after which it proceeds to the pericardium to find its way into the ventricle (fig. 17). From the researches of MM. Audouin and Milne-Edwards,[2] it had been considered as conclusively proved that in the Decapod Crustacean only aerated or arterial blood found its way into the heart, to be distributed by it over the general system. But Professor Owen has shown[3] that in addition to the two great branchial trunks which pour their streams of aerated blood into the heart from the gills, four other valvular orifices, two connected with the series of caudal, and two with the series of lateral sinuses, communicate with the ventricle, and return a portion of carbonized or venous blood to the heart; the circulation is, therefore, to some extent mixed, and as both venous and arterial blood reach the ventricle, they are propelled thence through the system (see fig. 18). The returning blood is not redistributed through the liver, as in man, *i.e.*, there is no portal circulation. There are no lymphatic vessels. The blood is a slightly dusky fluid, containing numerous nucleated corpuscles, which change their form with remarkable rapidity.

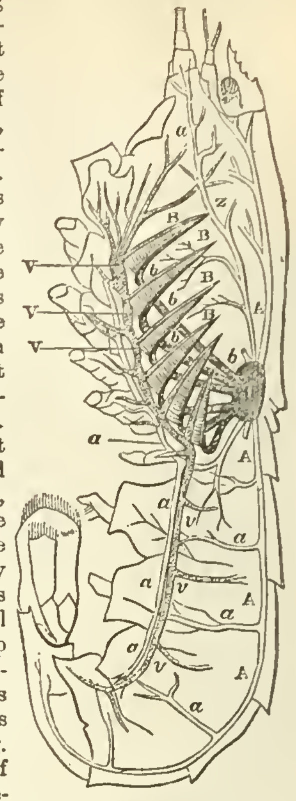

Fig. 17.—Diagram of Circulation of Lobster (*Homarus vulgaris*). (After Allen Thomson.)

H=heart. The aortic heart consisting of a single ventricular cavity, and situated below the posterior margin of the thoracic shield, gives off six systemic arteries (A, *a*), which convey the arterial blood to the various organs of the body and to the liver (*l*). The venous blood returning thence in the systemic veins (*v*, *v*) is collected on the lower surface of the body into sinuses (V, V), from which the branchial arteries (B, B) take their origin; the branchial veins (*b*) return the blood which has passed through the gills to the heart. See also fig. 18.

Respiratory Organs.—As the type upon which the Crustacean class is constructed is specially fitted for aquatic existence, branchial organs or gills in some form are essential for the aeration of the blood. The appendages which fulfil this office are attached either to the thoracic or abdominal members or to both. Where they are most highly developed, as in the crab and lobster, they assume

[1] By the kindness of his friend, Mr Charles Darwin, M.A., F.R.S., &c., &c., the present writer has been permitted to use a large number of the illustrations from the English edition of Fritz Müller's admirable little book, entitled *Facts and Arguments for Darwin*, translated from the German by W. S. Dallas, F.L.S., Assistant Secretary Geol. Soc. Lond. From Fritz Müller's store of interesting facts and observations the writer has also largely drawn, especially in regard to his researches in the larval development of the Crustacea, and he takes occasion at once to acknowledge the same with thanks.

[2] Recherches Anatomiques et Physiologiques sur la Circulation dans les Crustacés, *Ann. des Sciences Nat.*, t. ii.

[3] *Lectures on Comp. Anatomy and Physiology of the Invertebrata*, 2d edition, 1855, p. 318.

the form of pyramidal bodies, each consisting of a central ascending stem, with numerous horizontal branches or plates folded close together through which the blood circulates. There are twenty-two such structures in the lobster, eleven on each side of the thorax, attached to the basal joints of the thoracic limbs,[1] each pair of gills being furnished with its epipodite, or upper footlet, which serves to keep the gills apart from each other. In their most simple form they consist of a mere sac-like appendage held by a small neck pendant from the coxal joint, and exposed in the water without protection.

In the Decapoda they become more complex in structure and more voluminous, and would be extremely liable to injury if not protected by some means. But, as Spence Bate[2] truly observes, being *external* to it, they could not be covered or protected by their own somite, as, if it had passed over them, the branchial appendages would have become internal, their character and constitution would therefore be changed; they would cease to be external; in fact, they would cease to be branchiæ. These appendages, however, exist as branchiæ, and are nevertheless securely covered and protected; not, indeed, by their own somite, but by the great development of the mandibular and posterior antennal somites incorporated together, forming the carapace so characteristic of the typical Crustacean.

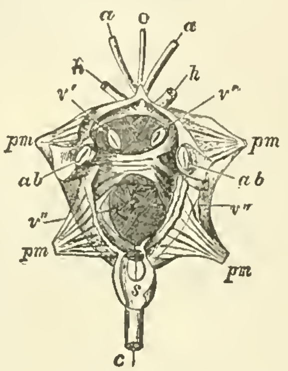

FIG. 18.—Heart of *Homarus vulgaris*, Edw., laid open. (Copied from Owen's Lectures, p. 318.)

o, the ophthalmic artery; *a*, *a*, the antennal arteries; *h*, *h*, the hepatic arteries; *v'*, *v'*, openings to dorsal sinuses protected by semilunar valves; *ab*, *ab*, large orifices by which the arterial blood from the branchiæ enters the heart; *v''*, *v''*, orifices by which lateral sinuses conduct venous blood to the heart; *s*, sternal artery; *c*, superior caudal artery; *pm*, *pm*, lateral pyramidal muscles which retain the heart *in situ*.
N.B.—Bristles have been passed through the orifices *v''*, *v''*, to indicate their position.

The branchial appendages are thus external in relation of the body of the animal, but covered over and protected by the lateral walls of the carapace. To complete this so as effectually to protect these organs without pressing on them or interfering with their functions, a very considerable amount of lateral development has taken place, and a peculiar reflection so as to bring the margin of the carapace below the branchial appendages, and to protect them from rude contact with the limbs. Externally, the carapace covers and protects both the hepatic and branchial organs; but, internally, a calcareous wall of demarcation exists between the two. This wall, which Milne-Edwards terms the *apodema*, is continued into a thin membranous tissue that makes a distinct and well-defined separation between the branchial appendages and the internal system, so that the aqueous element so necessary for the aeration of the blood as it passes through the branchiæ may have full power to play upon the gills, and yet leaving no passage that would admit it to the internal viscera so as to derange the general economy of the animal (Spence Bate). The gills are not ciliated, and thus they require that the water within the branchial cavity in which they are placed should be incessantly renewed by other means. In the crabs two passages communicate with the branchial chamber, one for the entrance, the other for the exit of the water necessary to respiration. The efferent orifice always opens on each side in front of the mouth under the posterior maxilliped. The afferent opening varies greatly in position in the different groups.

In the Macroura (lobsters), and in some of the Anomoura (hermit-crabs), the margin of the carapace is not accurately fitted to the thorax along its lower lateral border; the branchial cavity is thus open along the whole extent of its inferior edge, and so the water finds its way readily into the respiratory chamber.

In the Brachyura (crabs), the afferent orifice is more circumscribed, but varies in a still greater degree. In nearly all it exists as a cleft of considerable breadth in front of the base of the first pair of ambulatory appendages between the carapace and the thorax.

In the Ocypoda, the third and fourth pair of feet are more closely approximated than the rest, and their margins bear a dense border of long silky peculiarly-formed hairs. Between the basal-joints of these feet, Fritz Müller has discovered a round orifice opening into the branchial cavity, and he finds this to be a true incurrent orifice for the admission of air or water into the branchial chamber.[3]

In the genus *Ranina*, according to Milne-Edwards, the ordinary anterior entrant orifice to the gill-cavity is altogether wanting; it is placed instead at the origin of the abdomen.

In *Grapsus*, Fritz Müller[4] has observed that, when under water, the respiratory in-current enters near the front in the usual manner, but when air is breathed, the anterior incurrent orifice being closed, and the hinder border of the carapace elevated, a wide fissure is opened upon each side above the last pair of feet leading directly into the branchial chamber.

In *Leucosia* the two apertures are close together, the incurrent opening being situated in front of the mouth, and the water passing in by a conduit parallel to the excurrent canal. The circulation of the medium within the respiratory atrium is brought about partly by the movements of the legs to which the branchiæ are attached, and partly by the epipodites which ascend between the gills. The main agent, however, is the "scaphognathite," a flabelliform appendage of the second pair of maxillipeds, which, rising and falling continually, occasions a rapid current from behind forwards in the water, filling the branchial chamber.

Branchiæ such as we have described, enclosed beneath the overarching lateral walls of the carapace, are specially characteristic of the Decapoda (crabs and lobsters).

In the Amphipoda the head shield is small, and no longer covers the thoracic somites, as in the Decapoda. The branchiæ, however, are still borne on the coxal joint of the thoracic legs, but they depend unprotected from each limb, and are bathed in the surrounding medium, which is made to pass rapidly over them by the action of the abdominal flabellæ.

In *Squilla* we find the appendages of the first five pairs of abdominal somites devoted to the office of aerating the blood; the branchiæ, however, are not included in a cavity, but float freely in the water which bathes the entire surface of the animal.

In the Isopoda the abdominal appendages are all devoted to respiration, the anterior and outer pair in *Idotea* (fig. 19) being specially modified into a strong *operculum* (*op*), opening laterally and shutting over the five pairs of delicate branchial appendages within.

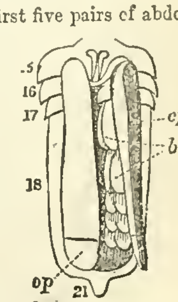

FIG. 19.—Branchiæ of *Idotea*.
op, operculum; *br*, branchia. The numbers indicate the segments.

In *Limulus* five pairs of thoracic feet are modified into broad lamellæ, to the inner and upper surfaces of which the gills are attached, whilst the most robust and anterior pair is modified into a broad operculum covering the succeeding five branchigerous pairs, and also the reproductive organs (see fig. 12).

In *Apus* (Branchiopoda), save the antennæ and oral appendages of the head, all the other somites bear simple lamelliform gill-feet, of which there are, according to Baird, about sixty pairs, affording an excellent illustration of mere vegetative repetition of parts.

Although the act of respiration by gills seems a peculiarly aquatic method of aerating the blood, yet in both the

[1] "The number of branchial pyramids," says Milne-Edwards, "varies greatly, especially in the Macroura; at the most it is twenty-two, as in *Astacus*, and nearly allied species; in other Macroura the number is eighteen, as in *Palinurus*, *Scyllarus*, *Penæus*; fifteen in *Gebia*; twelve in *Pandalus*; ten in *Callianassa*; eight in *Palæmon*; seven only in *Crangon*, *Hippolyte*, *Sergestes*. In the Anomoura the number also varies very much. In the Brachyura we can almost always reckon nine branchiæ on each side; two of this number are, however, merely rudimentary. Sometimes one or more of the last, or last but one, are entirely wanting" (Todd's *Encyclop.* vol. i. p. 781).

[4] *Op. cit.*, p. 31.

Podophthalmia and the Edriophthalmia we meet with numerous amphibian and terrestrial forms.

No Macrouran Decapod, so far as ascertained, voluntarily quits the water, although the common lobster, the river crayfish, and the spiny lobster, all display great tenacity of life when removed from their native element. Their inability to leave the water is, no doubt, due to the fact that the carapace is less acurately fitted to the thorax than in the crabs. Certain of the Anomoura, or hermit-crabs, however, find no difficulty in adapting themselves to terrestrial conditions. The writer has kept the *Cenobita Diogenes* from the Antilles, tenanting an *Achatina* shell, alive in a Wardian case for three months, during which period he displayed great activity and most remarkable powers as a climber. These West Indian crabs are not infrequently brought over alive to England with cargoes of guano and other natural products (fig. 20).

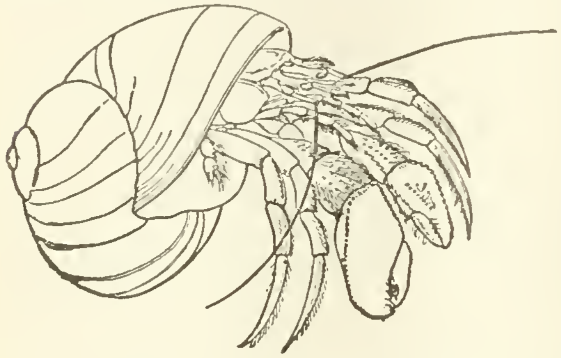

Fig. 20.—Hermit-Crab (*Cenobita*) in shell. (After Morse.)

Darwin refers to the abundance of hermit-crabs on Keeling Island in the Indian Ocean (*Voyage of the Beagle*, p. 544), all living on the cocoa-nut, and each ensconced in some shell obtained from the neighbouring beach. On the same island is found another most remarkable and very large terrestrial Anomourous Crustacean, the *Birgus latro*, living in burrows at the base of the cocoa-nut trees, upon the fruit of which it subsists. This large hermit-crab seeks no artificial covering for its fleshy body, the integument of which is chiefly membranous, but has the tergal pieces of its abdominal somites calcified. It is said (by Darwin) to visit the sea nightly for the purpose of moistening its gills, and the young are hatched in the water, and pass there their earlier stages of existence.

Many of the shore-crabs, as *Grapsus*, and the freshwater crab, *Thelphusa*, are not only able to leave the water temporarily; the former *habitually* lives out of that element, whilst many sub-tropical forms, as *Gecarcinus*, *Gelasimus*, &c., frequently live at a distance from the sea, and certainly possess the power of breathing air. But in all land-crabs it seems essential that the gills should, if not immersed in water, at least have the air surrounding them *saturated with moisture.* Milne-Edwards found that *Gecarcinus* (fig. 21) has the membrane lining the walls of the respiratory cavity modified in a manner analogous to that observed in fishes of the order Acanthopterygiæ. Sometimes this provision consisted of folds and *lacunæ* serving as reservoirs for the water; sometimes, as in *Birgus*, of a spongy mass well calculated to store up the fluid necessary to keep the branchiæ sufficiently moistened to enable them to perform their functions.

The swift-footed sand-crabs (Ocypoda) are exclusively terrestrial, and can scarcely live for a single day in water; in a much shorter period, a state of complete relaxation occurs, and all voluntary movements cease. In fact, these land-dwelling crabs are as truly asphyxiated by immersion in water, as the aquatic species of *Cancer* become when taken from that element and left in the air.

Fig. 21.—*Gecarcinus ruricola*, Land-crab of Montserrat, West Indies.

Among the Amphipoda, *Talitrus* and *Orchestia* both live out of the sea, the former making a burrow for itself, the latter choosing moist places under sea-weed, or hiding in the damp sand. With us *Orchestia* lives within reach of the sea spray, but in the southern hemisphere species have been met with many miles inland, choosing terrestrial plants for their abode, sometimes at an elevation of 1500 feet above the sea.

Among the Isopods *Sphæroma* is quite a littoral form, ranging from the equator to the colder temperate shores. The genus *Ligia* also lives above high-water mark, but never far away from the sea.

All the Oniscidæ are terrestrial in their habits, living under stones, moss, or decaying wood, and in similar damp situations; they breathe air (which, however, must be saturated with moisture) by the aid of a series of respiratory branchial plates on the under side of the abdominal somites, in the same manner as in *Idotea* (already noticed), and in addition to this by the inspiration of air by means of certain spiracular orifices on several of the basal pairs of these same appendages (fig. 22).

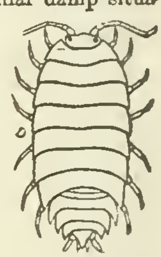

Fig. 22.—Common Woodlouse, *Oniscus asellus.*

In a large number of the lower and simple forms, including also the parasitic Crustacea and the Cirripedia, no special organs of respiration exist, and we are led to conclude that this office is performed by the surface of the body and its appendages generally.

Muscular System.—All the muscles of the body, even those of the intestine, are composed of striated fibres.

Reproductive Organs.—The organs of generation are easily to be discerned in most of the Crustacea, but the analogy between these parts in the male and female is so great in many genera as to need the most careful examination in order to discriminate between the two. Generally, however, the males may be discerned by their having one or more pairs of limbs especially modified to assist in the marital act.

With the exception of the Cirripedia the two sexes appear never to exist together in the same individual among the Crustacea.

The small size and great dissimilarity of the males of some of the parasitic genera caused them to remain long unknown, and led to the error of supposing the females to be hermaphrodite, as Darwin has shown to be really the case in the Cirripedes. But even in this division

Darwin has found small males parasitic on the female which he has named "complemental males." They are destitute of a mouth, and appear to exist only for the performance of this one function of reproduction (Darwin, *Cirripedia*, Ray Soc. 1851).

Bilateral symmetry generally prevails among the members of this class, and as a consequence we find always a pair of these organs arranged one on either side of the body, perfectly distinct, and often wholly independent of each other. The male is provided with a paired gland or testes, and two excretory ducts, by which the spermatozoa are discharged on reaching the efferent openings, usually situated on either side in the basal joints of the seventh pair of thoracic appendages, or the first pair of abdominal limbs. In both the Crab and Lobster the first pair of abdominal appendages of the male are specially modified to take part in the process of fecundating the female.

Milne-Edwards denies that these appendages have any claim to be considered as fulfilling the office of conveying the fecundating fluid to the body of the female, but Spence Bate has frequently taken *Carcinus mænas* with these styliform appendages deeply inserted within the vulvæ of the female. He has also shown the existence of a *vas deferens* in these false feet (*Ann. and Mag. Nat. Hist.*, 2nd series, vol vi., p. 109).

The ovaries in the crab resemble four cylindrical tubes placed longitudinally in the thorax, and divided into two

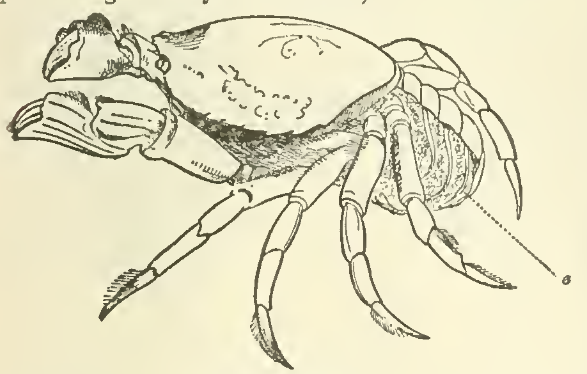

FIG. 23.—Side view of Crab (Morse), the abdomen extended and carrying a mass of eggs beneath it; *e*, eggs.

symmetrical pairs, each opening into a distinct oviduct, yet communicating with each other by a transverse canal and by the intimate union of the two posterior tubes. The oviducts and ovaries are of a whitish colour, and become united to a kind of sac[1] on each side, the neck of which opens externally in the sternal pieces of the fifth thoracic somite, which bears the third pair of walking appendages.

In the Anomoura and Macroura there are no copulatory pouches, and the vulvæ open on the basal joint of the third pair of ambulatory legs. It is possible, therefore, that in these forms the fecundation of the ova does not take place until the eggs are actually extruded, which we know to be the case in *Limulus*, and probably in some other forms, and as is also the case in fishes.

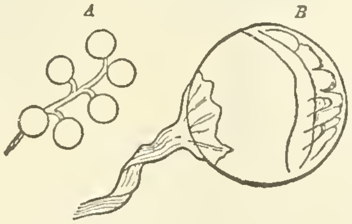

FIG. 24.—A, a few eggs of the Common Crab enlarged; B, a single egg greatly enlarged, showing more plainly the hardened thread (*t*) by which they are attached to each other. This egg also shows the commencement of the development of the embryo. (Morse's *Zoology*.)

If we except *Gecarcinus*, certain other land-crabs, and *Limulus*, the female does not abandon her eggs after their extrusion. Those of the Decapoda when extruded are coated with a viscous secretion which thickens into threads, and causes the eggs to adhere to each other and to the fine hairs with which the swimmerets of the abdomen of the lobster and the female crab are fringed (fig. 23). Fig. 24 shows the method of attachment of the eggs. Here they are retained securely until the period of hatching has arrived, when the brood in most cases is dispersed.

This is not, however, always the case, for whilst examining a female *Dromia* from Australia, the writer discovered more than a dozen young ones adhering to the false abdominal feet of the parent,—the young, except in size, agreeing perfectly with the parent.

In *Mysis* the two endopodites of the hinder pair of thoracic feet in the female are developed into a broad plate on either side, and bent under the sternum, thus forming together an incubatory pouch or marsupium, in which the eggs are first deposited, and within which the young are secluded during their minority. In Thysanopoda the eggs and young are contained in a pair of oval sacs dependent from the posterior feet, forcibly reminding one of the ovarian sacs in *Cyclops*.

In the Amphipoda the ova are nurtured by the female within a pouch formed by a series of foliaceous plates, one of which is attached to each of the four anterior pairs of legs of the thorax. In the genus *Podocerus* the parent builds a nest in a very bird-like manner, amid the branches of the submarine zoophyte forests, and in one of these Mr Spence Bate met with two broods of different ages, clearly demonstrating that the maternal care for their young is continued long after birth.[2] Similar ovigerous plates are developed in the fore-legs of females of the Isopoda. In all these sessile-eyed forms the parent seems specially solicitous for the safety of its young. In *Asellus*, *Talitrus*, and *Gammarus*, they appear to quit the maternal pouch and return to it as to a place of safety. *Caprella* carries its young attached to its body; the female *Arcturus* supports them adhering to her large antennæ.

In *Daphnia*, besides the several groups of ova which are successively hatched within the bivalved shell, and excluded during the spring and summer, giving rise to fertile females, there is formed each autumn an opaque layer within the incubatory cavity of the female, which hardens in two pieces like a small bivalved-shell, and is called the *ephippium* or saddle, and is placed on the dorsal surface of the *Daphnia*, but within the shell of the parent. Another structure, similar to the *ephippium*, and called the "internal ephippium," placed within it, is found to contain two bivalved capsules, in each of which a fertilised egg is lodged, which remains in a passive state through the winter, but hatches by the first warmth of spring, giving rise to females only (no males being hatched till autumn), these females in turn giving rise also to as many as six generations of fertile females. Their fecundity is so great as to be almost beyond the power of figures to express.[3]

DEVELOPMENT OF THE CRUSTACEA.—In nearly all the Crustacea, the young undergo a series of metamorphoses *after quitting the egg*. This rule appears to apply more constantly among the truly marine forms. Among the stalk-eyed Crustacea some few species at least quit the egg in the form of their parents, with the full number of jointed appendages to the body. This is the case, according to Rathke,[4] with *Astacus fluviatilis*, the common river crayfish (fig. 25), and according to Westwood[5] in a West Indian land crab (*Gecarcinus*). The present writer has

[5] J. O. Westwood in *Phil. Trans.* 1835, vol. cxxv. p. 311. Fritz Müller remarks, in reference to Westwood's paper—This is a solitary exception of a single species investigated by Westwood. In the same genus Vaughan Thomson found zoëa-brood, which has also been met with in other terrestrial crabs (*Ocypoda* and *Gelasimus*) The mode of life is in favour of Thomson. "Once a year," says Troschel, "they migrate in great crowds to the sea in order to deposit their eggs, and afterwards return, much exhausted, towards their dwelling-places, which are reached only by a few." For what purpose would be these destructive migrations in species whose young quit the egg and the mother as terrestrial animals? Fritz Müller, *Facts and Arguments for Darwin*, translated by W. S. Dallas, F.L.S., 1869, p. 48.

also found an Australian *Dromia* protecting its brood on its false abdominal feet, the young differing from the parent only in point of size.

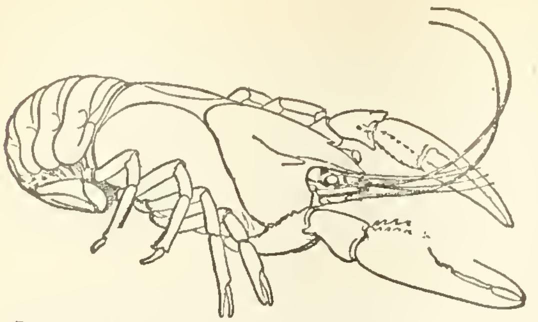

FIG. 25.—Freshwater Cray-fish from the Mississippi River. (Morse.)

The young of the terrestrial Isopoda (*Oniscus*, *Porcellio*, and *Armadillo*) likewise nearly resemble their parents at birth.

In the king-crabs (*Limulus*) the young undergo their principal moults *before* quitting the egg, when they differ but little in aspect from the adult. The metamorphosis undergone by the common lobster appears to be but slight. The young, according to Van Beneden, are distinguished from the adult by having their feet provided like those of *Mysis* with a swimming branch projecting freely outwards, whilst the abdominal and caudal appendages are undeveloped. In nearly all the marine Crustacea the young quit the egg in the condition of *zoëa*. We are acquainted with many examples in all three divisions of the Decapoda.

But we are indebted to Mr C. Spence Bate for the most complete series of observations on the development of one species, the common shore-crab, (*Carcinus mœnas*) from the zoëa to the sexually mature animal.[1]

He has shown that in this species the metamorphosis is a perfectly gradual one, and that, dissimilar as is the zoëa when it quits the egg from the adult animal, yet nevertheless the change at each moult is so small that it is only by a comparison between the earliest and the last stages that we perceive the amount of the change which has actually taken place.

"The most important peculiarities," writes Fritz Müller, "which distinguish this zoëa-brood from the adult animal are as follows. The middle body (thorax), with its appendages, those five pairs of feet to which these animals owe their name of Decapoda, is either entirely wanting, or scarcely indicated; the abdomen and tail are destitute of appendages, and the latter consists of a single piece (fig. 26). The mandibles, as in the Insecta, have no palpi. The maxillipeds, of which the third pair is often wanting, are not yet brought into the service of the mouth, but appear in the form of biramose natatory feet. Branchiæ are wanting, or where their first rudiments may be detected as small verruciform prominences, these are dense cell-masses through which the blood does not yet flow, and which have therefore nothing to do with respiration. An interchange of the gases of the water and the blood may (and no doubt does) occur all over the thin-skinned surface of the body; but the lateral parts of the carapace may unhesitatingly be indicated as the chief seat of respiration.

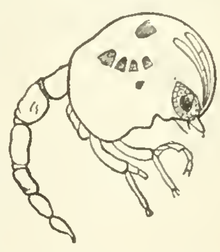

FIG. 26.—Zoëa of Common Shore-crab, *Carinus mænas*, Penn. sp., in its first stage. (Spence Bate.)

"They consist, exactly as described by Leydig in the Daphniæ, of an outer and inner lamina, the space between which is traversed by numerous transverse partitions dilated at their ends; the spaces between these partitions are penetrated by a more abundant flow of blood than occurs anywhere else in the body of the zoëa. A constant current of water passes beneath the carapace from behind forwards, maintained as in the adult animal by a foliaceous appendage from the second pair of maxillæ.

[1] On the development of Decapod Crustacea, *Phil. Trans.*, 1858, pl. xl.-xlvi. p. 589.

"The zoëæ of the crabs are usually distinguished by long, spiniform processes of the carapace (fig. 27). One of these projects up-

FIG. 27.—Zoëa of Common Shore-Crab in its second stage. *r*, rostral spine; *s*, dorsal spine; *m*, maxillipeds; *t*, buds of thoracic feet; *a*, abdomen. (Spence Bate.)

wards from the middle of the back, a second downwards from the forehead, and frequently there is a shorter one on each side near the

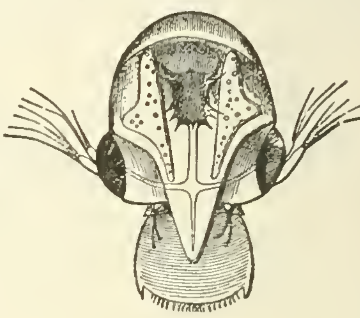

Fig. 29.

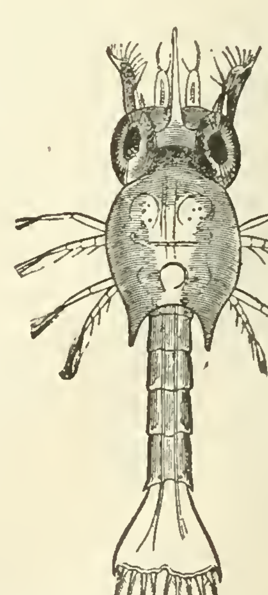

Fig. 28. Fig. 30.

FIG. 28.—Zoëa of *Porcellana stellicola*, F. Müll., mag. 15 diam.

FIG. 30.—Zoëa of Hermit-Crab, magn. 45 diam. (Fritz Müller.)

posterior inferior angles of the carapace. But in the zoëa of *Maia*, *Eurynome*, and an allied genus to *Achœus*, the spines are wanting in the first two genera, and but of inconsiderable size in the last-named genus.

"The following are the more important peculiarities in the zoëa of the crabs, although less striking than these processes of the carapace, which, in combination with the large eyes, often give them so singular an appearance. The anterior (inner) antennæ are simple, not jointed, and bear two or three olfactory filaments at the extremity; the outer antennæ frequently form a long spine-like process, and bear a minute squamiform process like the antennal scale in prawns. Of the natatory feet (afterwards *maxillipeds*) only two pairs are present, the third is entirely wanting, or present, like the five following pairs of feet, only as minute buds. The tail in zoëa is very variable in form, but nearly always bears three pairs of setæ upon its hinder margin."[1]

When the young zoëa first escapes from the egg, it is enveloped by a membrane veiling the spinous processes of the carapace, the setæ of the feet, and the antennæ; but this is cast off in a few hours. The zoëæ of *Porcellana* (fig. 28) seem to differ widely from true crabs, but really approach them very closely. The dorsal spine is wanting, but the frontal and lateral spines are of extraordinary length, and directed straight forward and backward. The tail bears *five* pairs of setæ.

The zoëa of *Hippa eremita* also resembles that of the crab in general appearance and in mode of locomotion (fig. 29). The carapace has only a short broad frontal process; and the caudal plate is edged with numerous short setæ. The zoëæ of hermit-crabs (fig. 30) have simple antennules like those in the Brachyuran zoëæ. The antennæ bear a scale-like appendage on the outside analogous to that in the prawn. There are only two pairs of well-developed natatory feet (maxillipeds), but the third pair are present in the form of two-jointed rudimentary appendages destitute of setæ. The hinder border of the tail bears five pairs of setæ.

The zoëæ of the shrimps and prawns agree closely with the Anomoura. They have a small median eye between the large compound ones. The third pair of maxillipeds are always present.[2]

In investigating the development of the spiny lobster, Claus found embryos in the ova with completely segmented bodies, but wanting the abdominal and caudal appendages and the last two thoracic somites. They have a single median eye, the anterior antennæ are simple, the posterior have a small secondary branch; the maxillipeds are divided into two branches.[3]

The most singular example of lowly development recorded by Fritz Muller is that of a prawn of the genus *Penæus*.

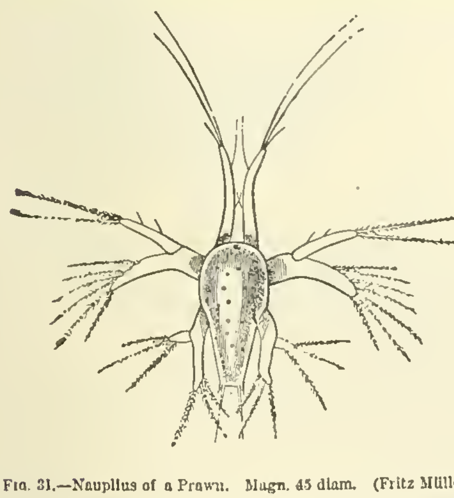

Fig. 31.—Nauplius of a Prawn. Magn. 45 diam. (Fritz Müller.)

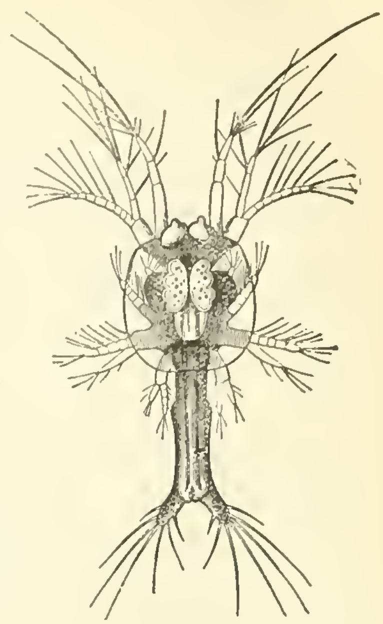
The young appear to quit the egg with an unsegmented ovate body, a median frontal eye, and three pairs of natatory feet, of which the anterior pair are simple and the others biramose, agreeing with the larval form common to the lower Crustacea, to which O. F. Müller has given the name of *nauplius*.[4] In this stage there is no trace of a carapace, no trace of paired eyes, no trace of masticating organs, and the mouth itself is overarched by a helmet-like hood. In one of these species the intermediate forms which lead from the nauplius to the prawn have been discovered by Fritz Müller in a nearly continuous series (*op. cit.* p. 57)



32.—Young Zoëa of the same Prawn. Magn. 45 diam. (Fritz Müller.)

After successive moults the nauplius gives place to the zoëa period, during which the paired eyes, the segments of the thorax and abdomen, and the various appendages are produced in bud-like succession. The zoëa next passes into the *mysis*-stage; the antennæ cease to serve for locomotory organs, and their place is taken by the thoracic feet clothed with setæ (fig. 34). The abdomen, furnished with powerful muscles, jerks the animal through the water in a series of lively jumps.

In the case of those Crustacea in which the young, as in *Mysis*, are retained within the incubatory pouch of the parent after quitting the egg, the larva emerges from the egg in a far more rudimentary and destitute condition than in those genera in which no such protective arrangement exists. Van Beneden, whose description of the development of *Mysis* is confirmed by Fritz Müller, mentions the very curious fact that the first segment that makes its appearance is the tail. In other stalk-eyed Crustacea the embryo has the ventral surface of the anterior and posterior halves of the body folded together, and the dorsal surface forms the external convexity of the young animal within the egg; but in *Mysis* the ventral surface is external and convex. The tail soon acquires the furcate form characteristic of the zoëa of the prawn; two thick ensiform appendages next make their appearance at the anterior end of the body, and behind these a pair of

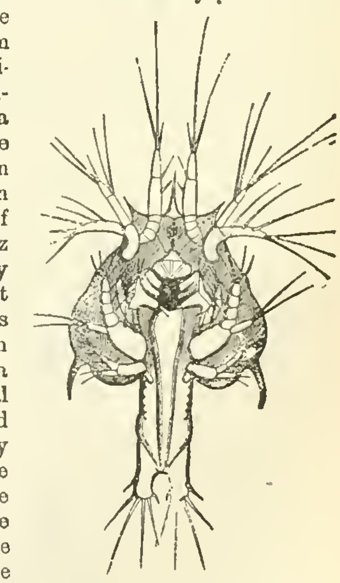


Fig. 33.—Youngest observed Zoëa of another Prawn. The minute buds of a third pair of maxillipeds are visible. The formation of the abdominal segments has commenced. Paired eyes still wanting. Magn. 45 diam. (Fritz Müller.)

[1] Fritz Müller, *Facts and Arguments for Darwin*, pp. 49–52.

[2] Fritz Müller, *op. cit.*, pp. 53–55.

[3] Coste asserts that he has bred young *Phyllosoma* from the ova of *Palinurus vulgaris*, a statement, says Fritz Müller, that requires further proof, especially as the more recent investigations of Claus upon *Phyllosoma* by no means favour this conclusion (Fritz Müller, *op. cit.* p. 57).

[4] Compare fig. 31 with the nauplii of *Apus* and *Artemia*, 5 and 6 of fig. 57, and with that of *Balanus*, fig. 60, A, and fig. 61.

tubercles; these are the antennæ and mandibles. At this immature stage of its development the egg-membrane bursts before any internal organ, or even any tissue except the cells of the cutaneous layer, is formed. The young animal may now be said to be in its nauplius-stage, but its nauplius-skin resembles more nearly a second egg-membrane within which its further development proceeds. The ten pairs of appendages of the cephalic and thoracic divisions

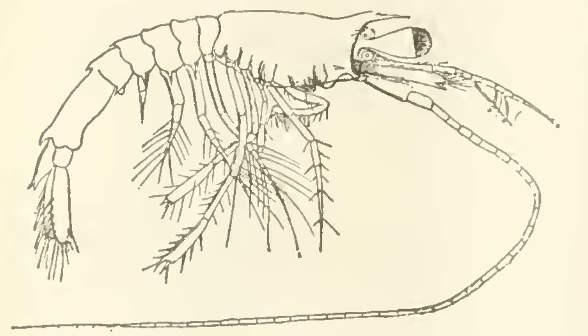

Fig. 34.—Older larva produced from Zoëa represented in fig. 33. The last segment and the last two pairs of feet of the middle-body are wanting. Magn. 20 diam. (Fritz Müller.)

of the body make their appearance simultaneously, and at a later period the five abdominal feet. Soon after the young *Mysis* has cast its nauplius envelope, it leaves the brood-pouch of its mother.

In *Squilla mantis* the eggs do not adhere to the abdominal feet of the parent (which in this genus are branchiferous), but are (says Fritz Müller) deposited in the form of thin, round, yellow plates within its submarine burrow. The spawn is consequently difficult to procure, and quickly dies when removed from its natural hatching-place. In the embryo of *Squilla* the heart is short; the body is long and segmented, but without appendages; the tail is bilobate, and there are indications of the rudiments of six pairs of limbs. If it acquires more limbs before exclusion, the youngest larva must be on a par with the youngest of *Euphausia* observed by Claus. Only two larval forms of *Squilla* are mentioned by Fritz Müller; the elder of these zoëa (fig. 35) resembles the mature *Squilla*,

Fig. 35.—Zoëa of a Stomapod, probably *Squilla*. Magn. 15 diam (Fritz Müller.)

particularly in the structure of the great raptorial thoracic feet and of the last cephalic pair; but the six pairs of feet which follow these are still wanting, although their somites are clearly seen. The abdomen shows rudiments of four pairs of branchial feet and one or two pairs of biramose natatory feet, but the tail has no appendages and still appears as a simple lamina.

The investigations of Goodsir, in 1843,[1] made us acquainted with a most singular family of Crustacea, the *Diastylidæ*, or *Cumaceæ*, which have been placed in the Podophthalmia near to *Mysis*. In general aspect the adult animal presents the most larval and embryonic characters, and might with propriety have been treated as a larval form, had not Goodsir, and subsequently Kröyer, actually taken the young from the brood-pouch of the parent. The antennæ are very small, the thoracic feet are, in most, furnished with setæ; in *Cuma* and *Alauna* the abdominal segments are moniliform and destitute of appendages. The caudal segment bears two long bifurcated styles. In *Bodotria* (fig. 36) five of the abdominal somites

Fig. 36.—Male of *Bodotria*. Magn. 10 diam. (Fritz Müller.)

bear finlets. The young examined by Kröyer, taken from the brood-pouch of the female (which resembles that in *Mysis*), were already one-fourth the length of the parent, which they resembled in every respect. Whether or not there is a considerable development of the young of *Cumaceæ* within the brood-pouch of the parent is not certainly known. In the embryo the caudal portion is bent upwards as in the Isopoda, and the last pair of thoracic feet are wanting.

The development of the Edriophthalmia, or sessile-eyed Crustacea, is more simple than that of the stalk-eyed forms. In the "rock-slater," *Ligia* (fig. 37), the embryo is bent *upwards* within the egg, as in *Mysis*, and has also, like *Mysis*, a larval membrane within which the young *Ligia* is developed. In *Mysis* this larval skin may be compared to a nauplius; in *Ligia*, however, it is destitute of appendages, and resembles a maggot with a long simple tail (fig. 37). The dorsal surface of the young

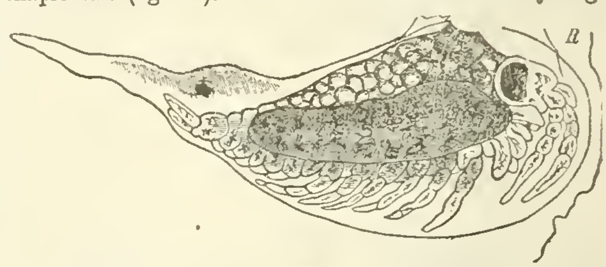

Fig. 37 —Maggot-like larva of *Ligia*. Magn. 15 diam. *R*, remains of egg-membrane. We see on the lower surface, from before backwards, the anterior and posterior antennæ, the mandibles, the anterior and posterior maxillæ, maxillipeds, six ambulatory feet, the last segment of the middle-body destitute of appendages, five abdominal feet, and the caudal feet. (Fritz Müller.)

Ligia is united to the larval skin a little behind the head. A foliaceous appendage is produced at this point, but exists only for a short time, and disappears before the young slater quits the brood-pouch of the mother. The young animal, when it commences to take care of itself, resembles the parent, save that it has only six, instead of seven pairs of ambulatory feet, and the last thoracic somite is but slightly developed and is destitute of appendages. The sexual peculiarities in this as in the young of other Crustacea are not developed at this early period; thus the males lack the hand-like enlargements of the anterior ambulatory feet, and the copulatory appendages are also absent.

The eggs and early stages of *Asellus aquaticus* have

[1] Edinb. *New Phil. Journ.* 1843. See also Bell, *British Stalk-eyed Crustacea*, 1853, pp. 321–333, and Fritz Müller. *Für Darwin*, Engl trans. p. 81

been investigated by numerous observers. De Geer, Rathke,[1] Spence Bate,[2] and Anton Dohrn[3] have made careful observations on the embryology and development of this abundant freshwater Isopod. As in *Ligia* the embryo is bent upwards within the egg. It quits the egg in a most imperfect state, more so, says Rathke, than any other articulated or vertebrated animal. It is furnished in its earliest stages with two lateral external appendages, which probably are homologous with the foliaceous appendage observed by Fritz Müller at the back of the head in *Ligia*. These zoëal appendages are subsequently moulted. Moreover in the young *Asellus* there are only six leg-bearing segments, and six, instead of seven, pairs of legs as in the adult. The curvature of the embryo upwards, instead of downwards, seems to have been generally observed by Rathke, Dohrn, Fritz Müller, and others. The larval skin is in some genera so closely applied to the egg itself as possibly to be mistaken for an inner egg-membrane. The absence of the last pair of thoracic feet seems also a constant character; all the other limbs are usually well developed in the young of normal Isopods; but in the remarkable and aberrant genus *Tanais* (fig. 38) all the abdominal feet are wanting, but not the caudal appendages; they make their appearance, however, simultaneously with the last pair of the thoracic feet.

Among the many interesting facts relative to the development of the Crustacea not the least remarkable are the series of retrograde metamorphoses which certain Isopods undergo as a consequence of their assuming a parasitic mode

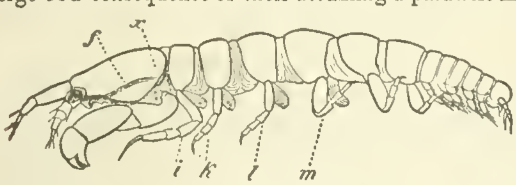

FIG. 38.—*Tanais dubius* (?) Kr. ♀, magnified 25 times, showing the orifice of entrance (*x*) into the cavity overarched by the carapace in which an appendage of the second pair of maxillæ (*f*) plays. On four feet (*i, k, l, m*) are the rudiments of the lamellæ which subsequently form the brood-cavity. (Fritz Müller.)

of life when adult. Thus the *Cymothoa*, or "Fish-lice," which in the adult state live parasitic on fishes, clinging firmly by means of their short recurved hook-like feet, are

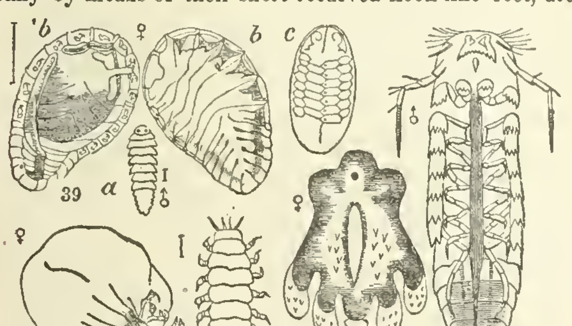

FIG 39.—*Bopyrus squillarum*, Latr. *a*, male; *b'*, female (underside); *b*, the same (dorsal view). (After Spence Bate.)
FIG. 40.—*Phryxus abdominalis*. *a*, the male; *b*, female (ventral aspect). (After Spence Bate.)
FIG. 41.—*Cryptothiria Balani*. *a*, male; *b*, female; *c*, larva. (After Spence Bate.)

lively free-swimming Crustacea in the larval state. Still greater is the metamorphosis which the adult female undergoes in *Bopyrus* (fig. 39), *Phryxus* (fig. 40), *Ione*, *Gyge*, and several other allied genera, which are parasitic on crabs and lobsters, taking up their abode within the branchial cavity. The adult is usually quite destitute of eyes; the antennæ are rudimentary; the broad and flat body is frequently unsymmetrically developed in consequence of the confined space in which it lives; its segments are more or less amalgamated together; the feet are stunted, and the abdominal appendages transformed into foliaceous or highly branched gills. The males are diminutive in size, but usually they have their eyes, antennæ, and feet better preserved than the females; the abdomen is, however, rudimentary, and not unfrequently altogether destitute of appendages.

Among the Isopoda, in the remarkable genera *Cryptothiria*, *Cryptoniscus*, and *Entoniscus*, we meet with forms even still more debased in their adult parasitic condition than *Bopyrus*.

In the case of *Cryptothiria Balani*[4] (fig. 41), first noticed as a male cirripede by Goodsir in 1843, but not rightly determined until 1851, by C. Spence Bate, the female is a large inert seven-lobed fleshy mass, destitute of exserted antennæ, jaws, legs, or branchial appendages, lying within the shell, and attached to the base of the animal of *Balanus balanoides*. The male is free and resembles the male in the *Bopyridæ*; its body is long and slender, and is furnished with seven pairs of legs; it has been met with by Spence Bate, Dana, and other observers within the body-cavity of *Balani*. Here then we have a Crustacean belonging to a higher order, viz., the Isopoda, living parasitic within the shell and deriving its nourishment from one belonging to a lower order, viz., the Cirripedia.

The history of *Cryptothiria pygmæa* (Rathke, sp.) and

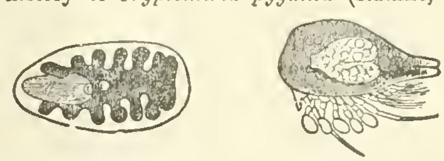

Fig. 42. Fig. 43.

FIG. 42.—*Cryptoniscus planarioïdes*, female. Magn. 3 times. (Fritz Müller.)
FIG. 43.—Embryo of the same. Magn. 90 diam. (Fritz Müller.)

Cryptoniscus planarioïdes (F. Müller) is perhaps still more remarkable. Professor Bell had long ago noticed the frequent presence of a singular parasite on the inner surface of the abdomen of *Portunus* and *Carcinus* on our coasts, having *prima facie* the aspect of a bag of immature eggs. This had been described by Rathke in 1841 as an Entozoarian, but has since been proved by its transformations to be a Cirripede, and was named *Peltogaster*. In 1858 Lilljeborg found what he deemed to be a female *Peltogaster* with an egg-sac; but a careful dissection led to the discovery that another parasite of a higher order, namely a *Cryptothiria*, had become *parasitic upon the parasite*. The most curious part of this super-parasitic history is, that the roots of *Sacculina* and *Peltogaster* (two forms of rhizocephalous Cirripedia parasitic on crabs and hermit-crabs) seem constantly to be made use of by two parasitic Isopods, namely, a *Bopyrus* and the before-mentioned *Cryptoniscus planarioïdes*. These take up their abode beneath the *Sacculina*, and cause it to die away by intercepting the nourishment conveyed by the roots; the roots, however, continue to grow, even without the *Sacculina*, and frequently attain an extraordinary extension, especially when a *Bopyrus* obtains its nourishment from them (Fritz Müller, *op. cit.* p. 94). The free males and the young of *Cryptothiria* and *Cryptoniscus* are unlike young Cirripedes,

but resemble the young of *Bopyrus*; they are, in fact, larval Isopods.

The female of *Entoniscus* (fig. 44) resides within the body of a species of *Porcellana*, lying in a thin-walled sac between the liver, intestine, and heart of its host, the head being destitute of eyes or antennæ; the thorax has become an irregular inarticulate sac, beset with enormous brood laminæ; the long vermiform and extremely mobile abdomen has sword-shaped legs; and swelling out above it in a globular form, as if in a hernial sac, the heart lies at the base of the first segment. The young of this singular parasite closely resembles that of *Bopyrus* and *Cryptothiria*.

Fig. 44.—*Entoniscus cancrorum*, female. Magn. 3 times. (Fritz Müller.)

The embyro of the Amphipoda can be distinguished from that of the Isopoda at a very early period; the former being bent downwards with the dorsal surface external, whilst the latter is bent backwards with the ventral surface external. The embryo in all the genera which have been examined is attached on the anterior part of the back to the inner egg-membrane by a peculiar structure—reminding one of the union of the young Isopoda with the larval membrane, and of the unpaired "adherent organ" on the nape of the Cladocera, so remarkably developed in *Evadne*, and persistent through its life in that genus; but though present in the young of *Daphnia*, it disappears in the adult (Fritz Müller).

The metamorphosis of the young Amphipod after it quits the egg seems greatly reduced and simplified, for before quitting the egg it acquires its full number of segments and limbs.[1] In those instances in which certain of the segments are amalgamated together, or where one or more segments are deficient in the adult, we find the same fusion and the same deficiencies in the young animals taken from the brood-pouch of their mother. The development of the Hyperiidæ, an oceanic group of Amphipods found only in the gill-cavities of the *Medusæ*, is very exceptional and remarkable. Thus, in *Hyperia* the youngest larvæ, taken by Fritz Müller from the brood-pouch of the mother, already possessed the whole of the thoracic feet; on the other hand, those of the abdomen were not as yet developed. All the feet are at first simple, but soon become converted into highly denticulated prehensile feet. In this state they remain for a very long time,—the abdominal appendages growing into powerful natatory organs, whilst the eyes, at first wanting or very minute, expand into large hemispheres occupying the entire lateral, and even encroaching upon the dorsal and frontal walls of the head. The females (*Hyperia*) are distinguished by a very broad thorax, and the males (*Lestrigonus*) by their long antennæ. The youngest larvæ cannot swim, but are provided with chelate feet (as shown by Spence Bate) by which they cling firmly to the swimming-laminæ of their host. The feet of the adults are simple, but they are then excellent swimmers, and are not unfrequently met with free in the open sea. The diversity in structure of the antennæ in the adult male and female Hyperiidæ is so great as to have led naturalists to place them in separate genera or even families; but this difference is developed only when the animals are full-grown. Up to this period the young of both sexes resemble the females. In the male shore-hoppers (*Orchestia*) the second pair of the anterior feet is provided with a powerful hand (fig. 45), as

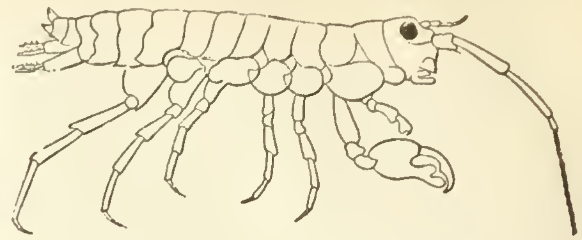

Fig. 45.—*Orchestia Darwinii*, n. sp. male. (Fritz Müller.)

in the majority of Amphipoda, but quite different from the female; the young nevertheless resemble the female. This is also the case in the adult male in *Limulus*, in which the second pair of appendages (antennæ) are peculiarly modified (see 3*a* in fig. 12 above); but in the young male they exactly resemble those of the adult female. According to Spence Bate and Fritz Müller, this second pair of antennæ are absent in the females of *Brachyscelus*, although the male possesses them, like other Amphipods.

In the foregoing brief sketch of the evolution of the young in the Malacostraca, it will be perceived that certain lines of development are followed, but these are subject to great diversity, and often vary greatly in the same order.[2] Thus we have:—

I. The larval metamorphosis undergone within the egg.[3]
II. The larval metamorphosis undergone within the incubatory pouch of the mother.[4]
III. The young first appearing as free-swimming *zoëæ*.[5]
IV. The young first appearing as *nauplii*.[6]

These four stages in the larval development of the Crustaceæ, it will be perceived, are not by any means strictly confined to particular orders of the Malacostraca, nor do they hold good for all the members of the group in which they have been observed to occur. There is, in fact, no "hard and fast" rule in the class, but on the contrary, there would appear to be numerous exceptions and variations in every group.

In considering the larval development of the Entomostraca, we shall find that their early history, when compared with that of the Malacostraca, is greatly simplified, and that the first or nauplius form of the young, which Fritz Müller *exceptionally* met with in *Penæus*,[7] has now become the rule almost without exception.

Embryology of Limulus.—Starting with that remarkable representative of a most ancient and now almost extinct order, the Merostomata, we find in *Limulus* a genus in which the young may be said to undergo all their earlier metamorphoses within the egg, thus at once offering an exception to the general rule as regards the Entomostraca. The embryology of *Limulus* has been investigated by Dr Anton

[1] "Even peculiarities in the structure of the limbs, so far as they are common to both sexes, are usually well marked in the newly-hatched young, so that the latter generally differ from their parents only by their stouter form, the smaller number of the antennal joints and olfactory filaments, and also of the setæ and teeth with which the body or feet are armed, and perhaps by the comparatively larger size of the secondary flagellum" (Fritz Müller, *Für Darwin*, Engl. trans. p. 76)

[2] In the normal Isopoda, as we have seen, the development of the young is one of progress to the adult; but in the parasitic forms the young animal before attaining the adult state actually has to undergo a retrograde metamorphosis.

[3] An instance of this occurs in the Decapoda-Brachyura, viz., *Gecarcinus* (J. O. Westwood); in the Anomoura, *Dromia* (H. Woodward); in the Macroura, *Potamobius* (*Astacus*) *fluviatilis* (Rathke). In the Amphipoda the young appear to have always acquired their full number of segments and appendages before quitting the egg (Fritz Müller, Spence Bate, &c.)

[4] In the Stomapoda by *Mysis*, and *Cumaceæ* (?); in the Isopoda by *Asellus*, *Ligia*, &c.

[5] In the Decapoda-Brachyura by *Carcinus* (Spence Bate), by *Cyclograpsus* and many other crabs and lobsters (Fritz Müller).

[6] In the Decapoda-Brachyura by a prawn near to *Penæus* (Fritz Müller).

[7] It is very desirable that this remarkable and isolated case in the development of the Macrouran Decapod should be confirmed by others.

Dohrn[1] and Dr A. S. Packard.[2] The natural history of the king-crab has been studied by the Rev. Samuel Lockwood,[3] and its anatomy has quite recently formed the subject of two elaborate memoirs by Professor Owen,[4] and by Dr Alphonse Milne-Edwards.[5]

We can only very briefly notice these important contributions to our knowledge of the Xiphosura here.

The female *Limulus* of the north-east American coast spawns twice every year during the months of May, June, or July,[6] at the great high tides. It comes up to near high-water mark, spawning under water; thus the eggs are daily exposed to the sun's warmth for a short time at low water. Great numbers arrive in pairs, the male grasping the sides of the shield of the female with his strong and peculiarly modified chelate antennæ. The eggs are deposited by the female in a hole in the sand, and are fecundated by the male after deposition, and are then left to hatch. Only one other similar case is on record, namely, that of the common freshwater cray-fish, in which, according to M. Chantran, the eggs are fecundated after expulsion from the oviducts. The eggs occupy from fifty to seventy days in hatching, according to the favourable or unfavourable conditions under which they are deposited; some which Dr Lockwood set aside in a jar of sea-water in a dark place hatched after 350 days!

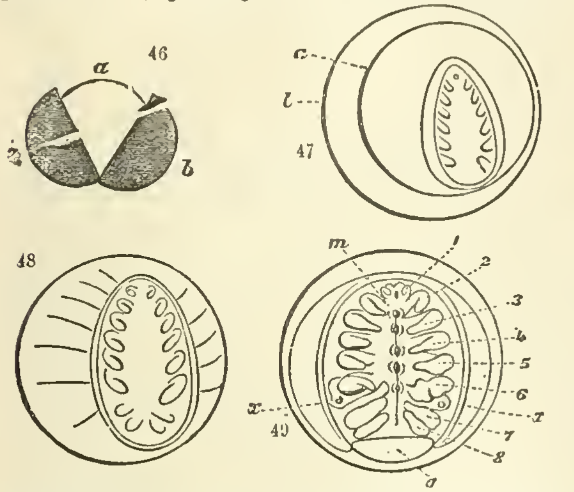

Fig. 46.[7]—Egg of *Limulus polyphemus*: *a*, protoderm; *b*, the chorion (after Dohrn).
Fig. 47.—Third stage in the embryo of *Limulus*: *a*, protoderm; *b*, chorion (after Packard).
Fig. 48.—Fourth stage (?) in the embryo of *Limulus* (after Dr. Packard's figure).
Fig. 49.—Fourth stage (?) in the embryo of *Limulus*: 1, antennule; 2, antenna; 3–6, maxillipedes; 7 and 8, thoracic plates afterwards bearing the branchiæ; *m*, the mouth; *x*, the ovarian apertures (?); *a*, the abdomen (after Dohrn).

The egg has two membranes, a dense inelastic chorion and an inner elastic protoderm.[8] This chorion remains entire so long as development is arrested or is sluggish, but as soon as the embryo increases in size, the tough chorion splits asunder, and the inner elastic protoderm enlarges, becomes dense, and vicariously fulfils the duties of the former (fig. 46).

A similar splitting of the external egg-membrane has been noticed in *Apus*. Fritz Müller points out that in some Isopoda (as for instance *Philoscia*) the larval skin is not only without any folds or sac-like diverticula, but is closely applied to the egg-membrane. This second egg-membrane in *Limulus* may perhaps therefore correspond to this first larval skin. Certainly, when the embryo first appears, its position is the same as in *Asellus*, *Ligia*, *Philoscia*, and other Isopods, *i.e.*; with its ventral surface convex (figs. 47 and 48). In its first stage the larval *Limulus* has six bud-like indications on each side of the mesial line, where the paired *cephalic* appendages will be developed (fig. 47). In later stages (figs. 48–52) we have first two, then more, up to six pairs, of *thoracic* natatory feet (which in the adult become branchiferous), and traces of as many as nine post-cephalic somites, but the last three never attain appendages. As the young *Limulus* increases in size, the yolk gradually becomes absorbed, and the larva assumes the position of an Amphipod in the egg, having its dorsal surface convex, instead of its ventral, which is now concave (fig. 52). There appears to be no stage seen in larval *Limulus* which can be compared with the nauplius stage of *Apus* (as Dr Packard has supposed).[9] The

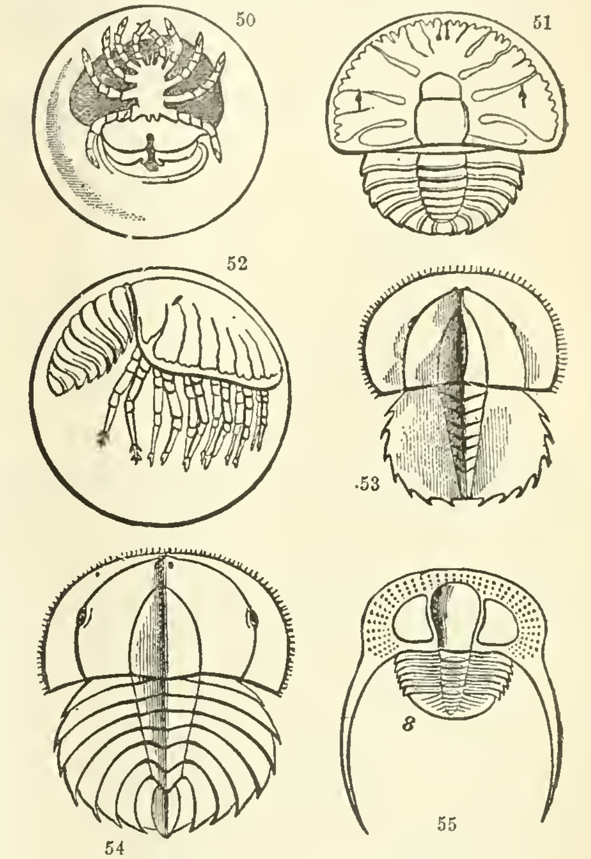

Fig. 50.—Fifth stage (?) of embryo of *Limulus* (after Dohrn). At this stage the chorion is split, and the protoderm is expanded by the admission of water by endosmose, in which the embryo is seen to revolve.

[6] These investigations are confined to the American king-crab, and were made at Raritan Bay, New Jersey. Van der Hoeven's memoir on Limulus was written on the East Indian *Limulus moluccanus* (*Rech. sur l'Hist. Nat. et Anatom. des Limules*, fol. 1838, Leyden, p. 48, plates 1–7).

[7] Figs. 46–55 are from H. Woodward's paper on the "Relationship of the Xiphosura to the Eurypterida, &c.," *Quart. Journ. Geol. Soc.* 1872, vol. xxviii. p. 50.

[8] Dohrn calls the inner membrane in the egg of Limulus the "chorion" and the outer the exochorion, but Packard's term "protoderm" appears preferable for the former.

[9] Packard, *op. cit.* p. 163.

Trilobiten stadium of Dohrn[1] resembles *Prestwichia rotundata* from the Coal-measures far more than any known Trilobite. Packard has figured an earlier (?) stage of *Limulus* than Dohrn's "Trilobiten-stadium," which much more nearly resembles *Trinucleus*[2] (compare figs. 51 and 55).

In its earlier stages the young *Limulus* can roll its posterior segments under its head-shield, and when it at last leaves the egg it can swim well, and has been captured by Alexander Agassiz, swimming freely on the surface of the ocean, three miles from Naushon Island, Buzzard's Bay.[3] At this period it has no caudal spine or telson; this is acquired only at a later moult, whilst a year or more elapses before the young males can be distinguished by their modified antennæ from the females (see *3a* in fig. 12).

In the shield-bearing, naked, and bivalved Phyllopoda, represented by *Apus*, *Nebalia*, *Branchipus*, and *Estheria*,

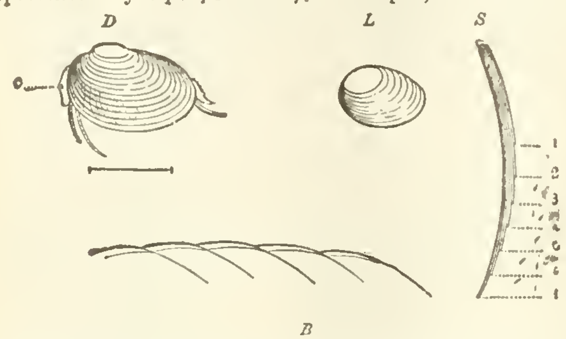

FIG 56.—*Estheria*, sp. *D*, from Dubuque, Iowa; (*e*) the eye. *L*, from Lynn, Massachusetts (nat. size). *S* presents a highly magnified section of one of the valves to show the successive moults. *B*, an enlarged portion of the edge of the shell along the back, showing the overlap of each growth. (Morse's *Zoology*).

the embryological development is no doubt analogous, though less is known in regard to *Estheria* (fig. 56).

In *Apus* the male is not certainly known, all the progeny observed being fertile females. Probably, however (as is the case in *Daphnia*), males appear at a particular season of the year, and these suffice to render fertile several generations of females. The females let their eggs fall to the bottom of the water, where they remain until hatched by the sun's warmth. The eggs of *Apus* occupy from two to three weeks in hatching; the chorion splits, as in *Limulus*, revealing a semi-transparent inner egg-membrane. This also soon after bursts, giving freedom to a simple nauplius like that exceptionally met with by Fritz Müller in a prawn allied to *Penæus*. The large cephalic shield, so characteristic of the adult *Apus*, is not seen in these early stages, and when it first appears, it closely resembles that of *Peltocaris*, an extinct Silurian form (4 in fig. 57). The nauplius, being short-bodied, does not display those graceful undulatory motions in the water observed in the adult, but progresses rather by a series of jerks like the adult *Cyclops*. At the end of eight or ten days the young Phyllopod has acquired considerable size. The body-segments and feet, so numerous in *Apus*, *Artemia*, and *Branchipus* (*5a* in fig. 57), are formed gradually (in repeated moults) from before backwards, without any sharply-defined regions of the body being discernible either by the time of

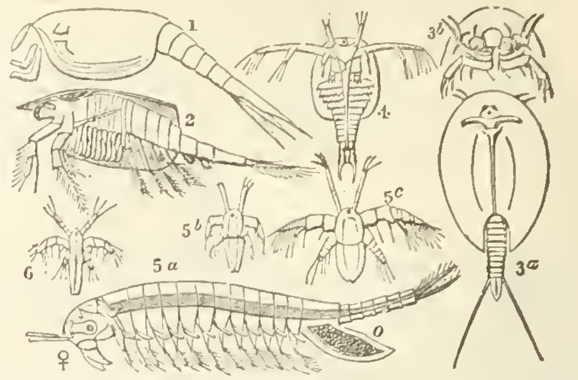

FIG. 57.—PHYLLOPODA.—1, *Ceratiocaris papilio*, U. Silurian, Lanark; 2, *Nebalia bipes* (one side of carapace removed to show branchial feet), Marine British; 3, *Lepidurus Angassi*: *a*, dorsal aspect; *b*, ventral aspect of head showing the hypostome and mandibles; hab. freshwater, Australia; 4, larva of *Apus cancriformis*; 5, *Branchipus stagnalis*: *a*, adult female; *b*, first larval stage; *c*, second larval stage; 6, larva of *Artemia salina*.

their appearance or their form. All the feet are of the same pattern and resemble the maxillæ of the higher Crustacea.[4]

The young animal exuviates about twenty times during the first two or three months; it is then full grown, and in every respect resembles the parent.

Nebalia (2 in fig. 57) presents a remarkable exception to the rest of its order, the young apparently (like *Daphnia*) undergoing no metamorphosis after they quit the egg. Metschikoff, who has recently studied the development of *Nebalia*, states that he has observed that it passes through both a nauplius and a zoëa stage within the egg,[5] and he therefore regards *Nebalia* as a Phyllopodiform Decapod. We hardly see sufficient grounds at present for assigning *Nebalia* to a higher order than that in which it is now placed.

The Cladocera do not afford any additional aid in embryological research. They appear to quit the egg only smaller than the parent, but with their full number of limbs.

Of the developmental history of the Ostracoda but little is known. Zenker states that their anterior limbs are developed first, and the youngest stages, according to Claus, are shell-bearing nauplius-forms.

In the Copepoda (3–7 in fig. 58), the buckler does not cover more than the head and thorax, the abdominal segments, which are nearly cylindrical, extending beyond it. They are met with both in fresh waters and in the sea all over the world, and are most numerously represented both in a free state and as parasites. The larvæ of the non-parasitic forms (*3b–d* in fig. 58), all possess at the earliest period the three anterior pairs of limbs, *i.e.*, the future antennæ and

---

[1] Dohrn, *op. cit.* p. 639, Taf. xv. fig. 4.

[2] Salter supposes (*Quart. Journ. Geol. Soc.*, vol. iii., 1847, p. 252) that the membranous margin of the head-shield of *Trinucleus* was once entire, "then became plicate, then perforate, and lastly separated into linear processes." It seems more probable that the margin of the head-shield was originally digitate, then gradually closed up, leaving only perforations along the sutures in some, and only plicæ in others. We have an analogous case in *Haliotis*, *Scissurella*, and *Pleurotomaria* amongst the Mollusca, in which a slit becomes partially or wholly closed up, leaving perforations at intervals. In the Mollusca it is connected with the respiratory functions, but in *Limulus*, *Hemiaspis*, and *Trinucleus* it is probably a remnant of the margins of the primitive segments which have coalesced to form the cephalic shield.

[3] Packard, *op. cit.* p. 155.

[4] "The maxilla of the Decapod larva is a sort of Phyllopodal foot" (Claus). "We might," says Fritz Müller, "regard the Phyllopoda as zoeæ which have not arrived at the formation of a specialized thorax or abdomen, but have instead repeatedly reproduced the appendages which first follow the nauplius limb." The present writer has compared the Decapod larva in which the maxillæ serve temporarily as organs of natation and locomotion with the similar appendages which *persistently* fulfil this office in *Pterygotus*, *Stylonurus*, and *Limulus* (H. Woodward, *Mon. Pal. Soc. Merostomata*).

[5] The greatest caution should be exercised in instituting comparisons between the so-called "nauplius" and "zoëa" stages of any one Crustacean, when such stages are passed *within* the egg, and those of any other Crustacean whose young actually pass through such stages *after they have quitted the egg*. In the Decapoda we at present know of *only one instance* in which the young appears as a free-swimming *nauplius*; in the majority we see *only the zoëal and larval* stages; in some even the zoëal stage is overleaped, and the young appears as a larva differing but little, if at all, from the parent.

mandibles,—the anterior pair with a single joint, the two following pairs being bifurcate. The eye is single, and the labrum and mouth already occupy their permanent positions. The hinder body is short, the abdominal segments not being yet developed. In subsequent moults these posterior segments appear, and new limbs sprout forth. In the second stage a fourth pair of extremities is added; these are the future maxillæ; then follow three new pairs of limbs, the maxillæ, and two anterior pairs of natatory feet. The three anterior pairs of appendages still represent rowing-feet. At the next moult the first cyclops-stage is arrived at, when there is a resemblance to the adult in the structure of the antennæ and buccal organs, but the number of body-segments and appendages is

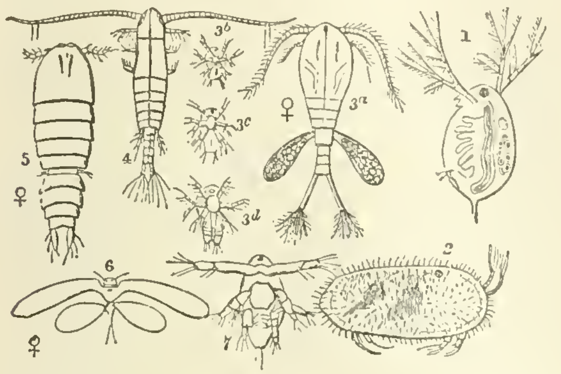

FIG. 58.—(1) CLADOCERA, (2) OSTRACODA, (3-7) COPEPODA. 1, *Daphnia pulex*, freshwater, near London. 2, *Candona hispida*, freshwater, near London. 3, *Cyclops quadricornis*: *a*, ♀, adult with eggs; *b*, *c*, *d*, three stages of development of nauplius. 4, *Cetochilus septentrionalis*, Firth of Forth. 5, *Sapphirina ovatolanceolata*, Dana, ♀, Atlantic, off harbour of Rio Janeiro. 6, *Nicothoe astaci*, ♀, with egg-sacs (from gills of common Lobsters, London Market). 7, Nauplius of Copepod. (After Fritz Müller.)

still much less than in the parent. Only the rudiments of the third and fourth pairs of natatory feet are seen, and the body is made up of an oval cephalothorax, the second, third, and fourth thoracic segments, and an elongated terminal joint. In the *Cyclopidæ* the posterior antennæ have lost their secondary branch, and the mandibles have completely thrown off the previously existing character of natatory feet; whilst in other families these appendages are persistent, although more or less altered. Many of the parasitic Copepoda do not pass beyond this stage of free development. Such forms as *Lernanthropus* and *Chondracanthus* never acquire the third and fourth pairs of limbs, nor does the fifth thoracic somite separate from the abdomen. Others, such as *Achtheres*, even fall to a still lower grade, by the subsequent loss of the two pairs of natatory feet. But all free Copepoda and most of the parasitic Crustacea pass through a longer or shorter series of stages of development, in which the limbs acquire a higher degree of division into joints in continuous sequence, the posterior pairs of feet are developed, and the last thoracic segment and the different abdominal segments are successively separated from the common terminal portion (Claus). Some parasitic Copepods, such as *Achtheres percarum*, certainly quit the egg like the rest in the nauplius-stage; the oval astomatous body bears two pairs of simple rowing feet, and behind these are two inflations marking the third pair, each having a long seta. Beneath this nauplius-skin a very different larva lies concealed, which in a few hours bursts its clumsy envelope, and makes its appearance in a form which agrees both in the segmentation of its body and the development of its extremities with the first cyclops-stage. The entire series of nauplius-stages which are passed through by the free Copepods are in this case completely overleapt.

Although the parasitic species of Copepoda are all more or less permanently fixed when adult, they pass their youthful stages as freely locomotive larvæ. To this rule there is a singular exception in the genus *Caligus*. The young animal (described by Burmeister as a peculiar genus, *Chalimus*) lies at anchor upon a fish by means of a cable springing from its forehead, and having its extremity firmly seated in the skin of the fish. When sexual maturity is attained the cable is cut, and the adult *Caligus*, which is an admirable swimmer, is not unfrequently captured swimming freely in the sea (Fritz Müller).

The animals belonging to the last division comprise two orders, the Rhizocephala and the Cirripedia. They have long been kept distinct from the Crustacea, and, together with various parasitic forms of Copepoda, whose developmental history was not known, classed as Epizoa and Cirripedia.

By later zoologists the Rhizocephala have been placed with the Pœcilopoda, but as this division includes many genera which prove to be merely parasitic forms of

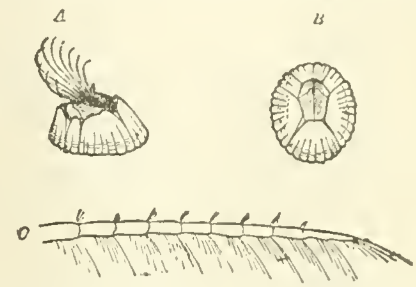

FIG. 59.—*A*, *Balanus* (young), side view with cirri protruded. *B*, upper surface of same; valves closed. *C*, highly magnified view of one of the cirri. (Morse.)

Copepoda, it will be more convenient to separate them. All the animals of this last division, which for convenience we would designate under the general name of Anchoracephala, are attached when adult;—in the Cirripedia by means of cement ducts which deposit calcareous matter, forming in the adult *Balanidæ* (figs. 59–60) a broad shelly

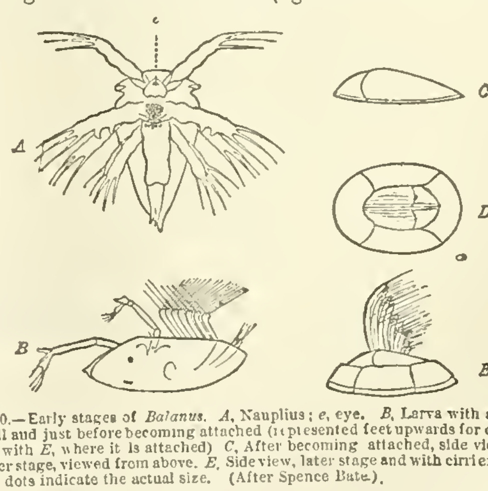

FIG. 60.—Early stages of *Balanus*. *A*, Nauplius; *e*, eye. *B*, Larva with a bivalve shell and just before becoming attached (represented feet upwards for comparison with *E*, where it is attached). *C*, After becoming attached, side views. *D*, Later stage, viewed from above. *E*, Side view, later stage and with cirri extended. base, and a simple attachment in the pedunculated *Lepadidæ*; in the Rhizocephala by ramifying nutritive roots, which sink deep into the interior of the body of the animal upon which they become parasitic (see figs. 82 and 83, p. 665). In all the members of this division the young appear as naupliiform larvæ [1] which speedily moult their first coat. The body is unsegmented and pyriform, having a median eye,[2] a first

[1] See Mr C. Spence Bate's Memoir, *Annals and Mag. Nat. Hist.* 1851, 2d series, vol. viii. p. 324, plates 6, 7, 8.

[2] In *Sacculina purpurea* and in some species of *Lepas* the median eye is wanting.

pair of minute antennæ, two anterior horns, which inclose the second pair of antennæ,[1] one pair of uniramous and two pairs of biramous natatory legs, a forked terminal projection to the body, and a posterior point to the carapace (see fig. 60 A, and fig. 61).

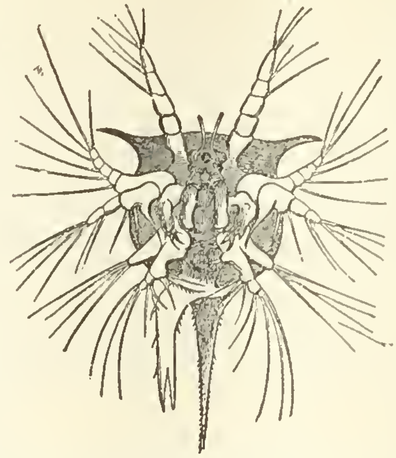

Fig. 61.—Nauplius of *Tetraclita porosa* after the first moult. Magn. 90 diam. The brain is seen surrounding the eye, and from it the olfactory filaments issue. Behind it are some delicate muscles passing to the buccal hood. (Fritz Müller.)

The nauplii of the Anchoracephala are distinguished from the Copepoda by possessing a dorsal shield or carapace, which sometimes, as in *Sacculina purpurea*, projects far beyond the body all round. They are also further distinguished by possessing a pair of so-called "olfactory filaments," which spring directly from the head. These filaments, or horns of the carapace (which are interpreted as the second pair of antennæ by Darwin), are believed by Fritz Müller to be the homologue of the so-called "green gland," which opens at the end of a conical process at the base of the inferior antennæ in the Decapoda, and of the conical process, with an efferent duct traversing it, seen on the inferior antennæ of the Amphipoda.

The abdomen of the young Cirripede is produced into a long tail-like furcate extremity, that of the young in Rhizocephala into a movable caudal fork.

The young Cirripedes have a mouth, stomach, &c., and their posterior pairs of limbs are fitted for organs of prehension and manducation. In the young of Rhizocephala all these organs are wanting. The young Cirripede, having to undergo several moults as a nauplius, is provided with organs to sustain its life. The young Rhizocephalon being astomatous, cannot sustain life in its nauplius state for long, and must therefore more rapidly pass through its transformations. They both at length arrive at an equally astomatous *pupa*-stage. In this stage we see the young animal with its carapace folded together like a bivalved shell; the foremost limbs become transformed into very peculiar adherent feet, and the two following pairs, like the frontal horns, are cast off with the nauplius-skin. Behind these are six pairs of powerful biramose natatory feet, with long setæ and two short setigerous caudal appendages. The young pupæ of the Rhizocephala and Cirripedia agree in every particular, save that the latter possesses a pair of composite eyes; sometimes also traces of the frontal horns seem to persist.

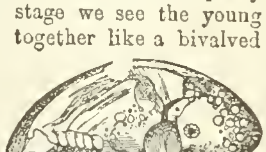

Fig. 62.—Pupa of a Balanide (*Chthamalus?*). Magn. 50 diam. The adherent feet are retracted within the rather opaque anterior part of the shell. (Fritz Müller.)

When the proper time arrives the pupæ of the Cirripedia attach themselves by means of their prehensile antennæ to rocks, shells, turtles, cetacea, drift-wood, ships, &c.; the carapace becomes converted into the peculiar sessile-shell of the *Balanus*, or the pedunculated *Lepas*; the natatory feet grow into long cirri by which nourishment is whirled to the mouth, now open and furnished with mandibles and maxillæ. The pupæ of Rhizocephala in like manner attach themselves to the abdomen of crabs, *Porcellanæ*, and hermit-crabs; but they remain astomatous, lose all their limbs completely, and appear as sausage-like, sack-shaped, or discoidal excrescences upon their host, filled with ova (figs. 82 and 83); from the point of attachment closed tubes, ramifying like roots, sink deep into the interior of the host, twisting around the intestine, or are diffused among the sac-like tubes of the liver. The only manifestations of life which persist in this most retrogressively metamorphosed Crustacean are powerful contractions of the roots and alternate expansion and contraction of the body, causing water to flow into the brood-cavity, to be again expelled through a wide orifice (Fritz Müller).

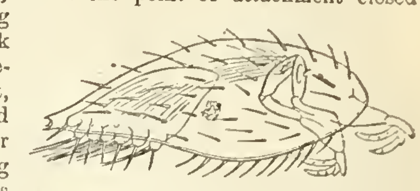

Fig. 63.—Pupa of *Sacculina purpurea*. Magn. 180 diam. The filaments on the adherent feet may be the commencements of the future roots. (Fritz Müller.)

Darwin has recorded various anomalous cases of development in the Cirripedia; amongst others, that of *Cryptophialus minutus* (which forms a separate section Abdominalia, Darwin), parasitic in the shell of *Concholepas peruviana*. The egg, at first elliptical, becomes broader anteriorly, then acquires three club-shaped horns, one at each anterior angle and one behind. Subsequently the posterior horn disappears, and the adherent feet may be recognized within the anterior ones. From this "egg-like larva" the pupa is directly produced. Its carapace is but slightly compressed laterally, and is hairy as in *Sacculina purpurea*; the adherent feet are large, the natatory feet wanting, as are also the corresponding cirri in the adult animal. Mr Spence Bate mentions a similar case in a Rhizocephalon, in which the nauplius-stage is overleaped and the young quits the eggs as a pupa-form larva.

Exuviation in the Adult and Reparation of Injuries.—As we have already seen, the young Crustacean, on quitting the egg, usually undergoes a series of larval metamorphoses more or less numerous, and subject to considerable variation even among closely-allied forms. Eventually, whether by a direct or an indirect route, a form is attained in all, which, save in size, closely agrees with the adult.

Amongst the Insecta the larva usually undergoes repeated moults during its growth, from the time when it first quits the egg until it reaches the pupa-stage, a period of rest in most, but not in all insects,[2] and an astomatous stage in some larval Crustacea.[3] From the pupa springs the *full-grown* and perfect insect, when no further moult or change takes place—indeed, in some insects the parent only lives to deposit its eggs, and then dies. The immature Crustacean, in passing through its nauplial and zoëal stages, may moult its skin seven or eight times, or even more; nevertheless, when it reaches the *imago* stage, it has not nearly attained the size of the adult parent, but continues to grow and cast its calcareous envelope as often as its increased size necessitates its so doing. When adult, it

[1] "Olfactory filaments" (Fritz Müller).

[2] The aquatic pupa of the dragon-fly is active and predaceous.

[3] The pupæ of Rhizocephala and Cirripedia are both astomatous.

[4] *Imago.*—Darwin has applied the term "pupa-stage" to the free-swimming astomatous larva in the Cirripedia previous to its settling down, casting off its pupa-coat, and becoming adult. The writer has long doubted if the Crustacea ever really arrive at this highest or *imago* condition, and whether they are not always in a "pupa-period" all their lives. The larval *Aphis*—the branchiated *Axolotl*—are but arrested stages of development of more advanced forms, but they deposit eggs, and in the case of the *Axolotl* they possess all the attributes of the perfect animal, save the persistent external larval branchiæ.

still continues to moult probably through its entire lifetime, even to extreme old age.[1]

In casting its shell a crab not only parts with every joint and plate of its limbs and carapace, of its long and slender antennæ, its external eyestalks, the plates of the tail, the appendages of the mouth, the lining of its gills, but even its stomach, with the gastric teeth and the slender apodemata, which give support to the muscles of the limbs and body—so that when the crab has escaped from its old suit, the cast-off shell seems nearly as perfect as the animal itself

When exuviating, the crab and lobster both escape from their old shells by a line of dehiscence which opens between the posterior border of the carapace and its union with the abdomen. Professor Bell also states that in the great crab (*Cancer pagurus*) and some other forms, the carapace divides at the junction of the epimera with the dorsal piece or tergum.

In *Limulus* the carapace splits all round the anterior border, at the union of the dorsal and ventral walls. *Limulus* sheds its shell five to six times during the first year, and probably once annually after that period.

Sir John Dalyell, Mr Couch, Mr Gosse, Mr Spence Bate, Mr Warrington, and others, have given excellent accounts of the process of moulting of various Crustacea. An accurate observer, Mr Harper, states[2] that he confined six small specimens of the common shore-crab (*Carcinus mœnas*) in separate glasses, and fed them daily, until one of them showed that something was amiss by refusing food. Soon after it cast its shell, an operation which only occupied five minutes. When very young this crab moults frequently. The same author registered the dates, and preserved the exuviæ of one which moulted on April 11, 1858, and on May 22, July 3, August 30, and September 26 of the same year; the acceleration of the last moult is attributed to the creature having been fed daily, "like a prize beast," on purpose to try the effect on its growth. Some of these little crabs had lost part of their limbs, but after a moult new limbs appeared of very diminutive size; after a second moult each new limb had increased to one-half as large as the rest, and in the third moult it had reached to its proper bulk and form. Hermit-crabs shed their hard shell before pulling off the exuviæ of the tail; their increase at each moult is much less rapid than in the common crab. Prawns exuviate more frequently. Mr Warrington saw the change occur with much regularity every twelve days in the summer season. With the exception then of certain parasitic forms of Crustacea, which, like the Rhizocephala, have undergone such a complete retrograde metamorphism that no trace of articulations or appendages remain, all the Crustacea periodically exuviate their dermal covering, whether calcareous, chitinous, or membranaceous. In the Cirripedia it would not be possible to exuviate the adherent shell of the adult *Balanus*, or the peduncle of *Lepas* or *Scalpellum*, but, even in this aberrant division, the lining membrane of the shell and the many-jointed cirri are regularly moulted.[3]

It has long been known that Crustacea possess the power of voluntarily casting their limbs, and of restoring such as have thus been lost by the animal's will or by accident.[4] If one or more distant phalanges of a limb be torn off, the animal has the power to throw off the remaining part of the limb also. This separation always occurs near the basal extremity of the first phalanx. When the limb is thrown off, the blood-vessels and nerve retract, thus leaving a small cavity; from this the germ of the future leg springs, and is at first seen as a nucleated cell. A cicatrix forms over the raw surface caused by the separation, which afterwards forms a sheath for the young leg.[5]

Principal Divisions of the Crustacea.

The subjoined table is intended to give only a general outline of the Crustacean class, with the sub-classes, legions, and orders.

Of the thirteen orders enumerated two only (printed in italics in the table) are extinct, namely the *Trilobita* and *Eurypterida*. These two lost orders disappeared in the Carboniferous epoch.

Table of Classification of the Crustacea.

Class CRUSTACEA.

Sub-Class 1. *THORACIPODA* (or *Malacostraca*).

Legion I. Podophthalmia.

Order 1. Decapoda.
Sub-Order (*a*) Brachyura, *Crabs.*
(*b*) Anomoura, *Hermit-crabs.*
(*c*) Macroura, *Lobster*, *Prawn.*
" 2. Stomapoda, *Squilla*, *Mysis*, *Diastylidæ.*

Legion II. Edriophthalmia

" 3. Isopoda, *Oniscus*, *Idotea*, *Sphæroma.*
" 4. *Trilobita*, *Phacops*, *Asaphus*, *Calymene*, &c.
" 5. Amphipoda, *Talitrus*, *Gammarus*, &c.

Sub-Class 2. *GNATHOPODA* (or *Entomostraca*).

Legion III. Merostomata.

" 6. Xiphosura, *Limulus*, *Bellinurus*, &c.
" 7. *Eurypterida*, *Eurypterus*, *Pterygotus.*

Legion IV. Branchiopoda

" 8. Phyllopoda, *Apus*, *Nebalia*, *Artemia.*
" 9. Cladocera, *Daphnia*, *Lynceus*, &c.

Legion V. Lophyropoda.

" 10. Ostracoda, *Cypris*, *Candona*, *Cythere.*
" 11 Copepoda (*a*) Liberata: *Cyclops*, *Cetochilus*, *Diaptomus.*
(*b*) Parasita: *Lernanthropus*, *Caligus*, *Nicothoe*

Legion VI. Anchoracephala.

" 12. Rhizocephala, *Sacculina*, *Peltogaster.*
" 13. Cirripedia, (*a*) *Balanidæ*, &c.
(*b*) *Lepadidæ*, &c.

If the old definition between the two great groups, the Malacostraca and the Entomostraca, be maintained, namely, that the former shall consist only of forms having

[1] Prof. Bell observes, "There is no doubt that exuviation in many of the higher forms takes place annually with great regularity until the growth is completed, which in many species is not the case before the animal is many years old. This is proved by the extent to which the size increases at each moult, compared with the difference between the young and the old animal; and it is evident that after the growth has reached its maximum, the crust ceases to be changed, from the fact which I have seen in several instances, as in the common crab, the lobster, and some others, where the carapace of the still living creature was the seat of barnacles so large, that several years must probably have been required for attaining their existing size" (*British Stalk-eyed Crustacea*, Introduction, xxxiv.). The young male of *Limulus*, according to Packard, does not attain to the period of puberty before it is four years old. Many Entomostraca infested with bell-animalcules depend on the moulting of their carapace as their only chance of surviving and escaping these prolific parasites.

[2] *Glimpses of Ocean Life* (1860).

[3] The frequency with which they exuviate, together with the durability of the cast-off integuments, explains the astonishing masses of exuviæ which Mr C. W. Peach observed annually off the coast of Cornwall, especially in the months of April and May; but he has seen quantities also in September. He could easily have filled several quart-measures with them (Darwin's *Balanidæ*, p. 157).

In connection with the exuviation of the Cirripedia Darwin mentions a most remarkable fact (*op. cit.* p. 15): "In regard to the female organs, the ovarian tubes and cæca inosculate together; there are no oviducts; the ova, connected together by membrane, and so forming the ovigerous lamellæ, become exposed *by the exuviations of the lining tunic* of the carapace or sack, and by the formation of a new tunic on the underside of these lamellæ,—a process unknown in other Crustaceans."

[4] It is a well-authenticated fact that the roll of thunder and the discharge of artillery over that part of the sea where lobsters resort will cause them to throw off their great claws. The same effect is also produced by the infliction of any sudden injury. If *Porcellana platycheles* be seized by the claw it immediately casts it off and beats a retreat without it.

[5] H. Goodsir, *Ann. and Mag. Nat. Hist.*, vol. xiii. p. 67.

more than twenty-one segments, the introduction of the Trilobita among these may be looked upon as inappropriate. If, however, we admit that the Trilobita had (as there seem good grounds for allowing) true special locomotory appendages other than gill-feet or jaws, as in the Malacostraca generally, then we submit that they are appropriately classed. The main characteristic of the Malacostraca seems to be, not so much the possession of twenty-one segments, an inheritance really common to the whole class, but the presence of the seven anterior (cephalic) appendages especially set apart for the senses and nutrition, with separate post-cephalic organs of locomotion;—whereas the peculiarity of the Entomostraca seems to be that the seven anterior (cephalic) organs are not specially set apart as organs of sense and nutrition, but are employed in nearly all the class as the chief locomotory organs, the posterior feet being branchial or ovarian lamellæ, or altogether wanting. The writer ventures to propose therefore, instead of

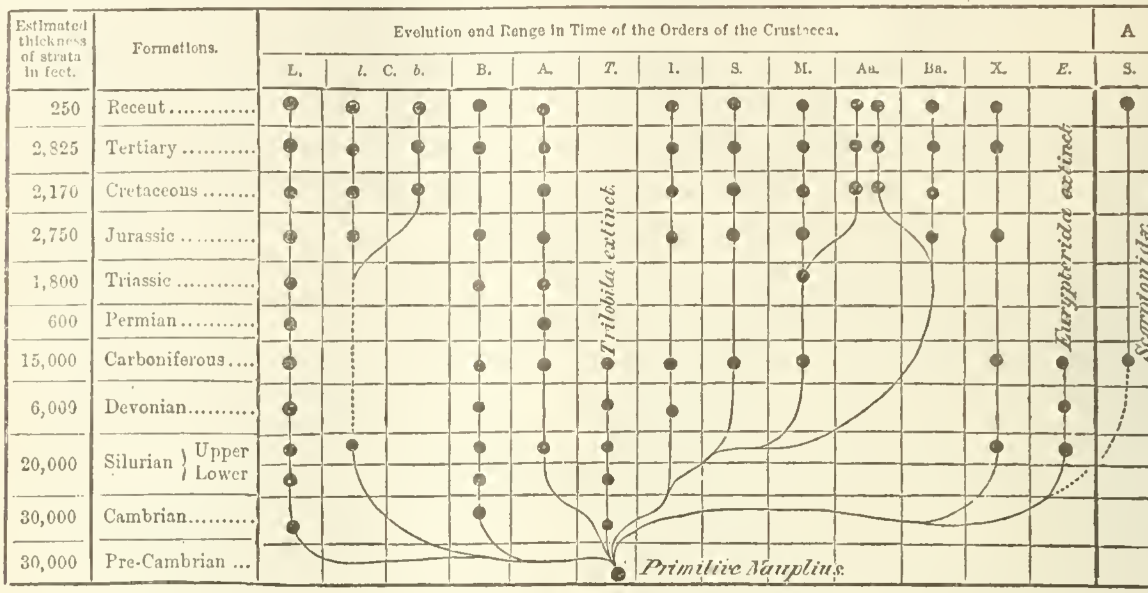

FIG. 64.—Diagram showing the probable evolution and actual range in time of the several orders of Crustacea.

Explanation.—The letters at the top of each column represent the several orders and sub-orders of Crustacea,—one family of the Arachnida, the *Scorpionidæ*, being placed beside the Eurypterida to show its range in time and probable derivation from the Crustacea. The vertical lines show the actual range in time, the black dots denote the strata in which remains of each order have been met with. The curved lines, uniting order to order, are intended to show the *probable* evolution of the class from a common great ancestor; but numerous as are the indications of affinities afforded by the Crustacea, the group is too ancient to be certainly traced back in time to a common parent; even the *lowest* Cambrian rocks have yielded evidence of two orders, namely, the Trilobita and Ostracoda, whilst the Middle Cambrian furnishes a Phyllopod Crustacean (*Hymenocaris*). As the branches of this genealogical tree of the Crustacea are not arranged in a circular manner, they cannot of course be made to show the affinities which each order presents to every other order or branch, any more than does the dried plant show the natural verticillate arrangement of its leaves and branches when pressed out flat upon the page of a *Hortus Siccus*.

L=the LOPHYROPODA. Of this legion, the order Ostracoda is well represented throughout the entire series, from the Cambrian to the Tertiary and also in the seas and fresh-waters of to-day.

C=the CIRRIPEDIA.—*l*=the Lepadidæ, or pedunculated Cirripedes, appear first in the Wenlock Limestone (U. Silurian); represented by a single form (*Turrilepas Wrightianus*, H. Woodw.). Numerous forms occur in the Secondary and Tertiary strata, and they are abundantly distributed throughout the warmer seas of the world. *b*=the Balanidæ, or sessile Cirripedes, are represented by a single form, the *Pyrgoma cretacea*, H. Woodw., in the Chalk, abundantly in the Tertiary rocks, and in recent deposits, and are distributed in the seas all over the world at the present day.

B=the BRANCHIOPODA.—Of this division the order Phyllopoda appears in the Cambrian rocks, and is well represented in Silurian and Carboniferous strata; they are also met with in the Secondary and Tertiary formations, and living in fresh, brackish, and marine waters, widely distributed over the globe.

A=the AMPHIPODA.—This order has a single representative in the Upper Silurian, *Necrogammarus Salweyi*, H. Woodw.; it is represented by *Gampsonyx?* in the Coal, by *Prosoponiscus* in the Permian, and by several forms in the Secondary and Tertiary formations, and abundantly in recent freshwater and marine localities.

T=the *TRILOBITA*. This extinct order appears in the Cambrian, attains its maximum development in the Silurian, and terminates in the Carboniferous period.

I=the ISOPODA.—This order is represented in the Devonian by a single species, *Præarcturus gigas*, H. Woodw., and by remains in the Carboniferous strata. Many species occur in the Secondary and Tertiary strata. It is largely represented to-day by land, freshwater, and marine types.

S=STOMAPODA.—*Pygocephalus Huxleyi*, H. Woodw., from the Coal-measures, probably belongs to this division. True *Squillas* and *Mysis*-like Crustacea occur in the Jurassic rocks (Secondary). Forms of this order are abundant in our modern seas.

M=the MACROURAN division of DECAPODA. A single species, *Anthrapalæmon Grossartii* Salter, appears in the Coal-measures. This order is well represented from the Trias to the present day, and is now one of the prevalent types, occurring both in fresh and salt water.

Aa=the ANOMOURA, or irregular-tailed DECAPODA. This sub-order embraces forms related both to the Crabs (*e.g. Dromia, Porcellana, Dorippe*) and to the Lobsters (*e.g. Pagurus, Galathea, Munida*). Their earliest appearance is in the Cretaceous period; there are numerous living forms, both terrestrial and marine.

Ba=the BRACHYURA.—The oldest known crab is the *Palæinachus longipes*, H. Woodw., from the Gt. Oolite. Crabs are well-represented from the Upper Secondary to the present day, when they attain their maximum within the warmer latitudes, being represented by land, freshwater, and marine forms.

X=the XIPHOSURA, or king-crabs. These are remarkable for their longevity; they appear first in the Upper Silurian (*Neolimulus falcatus*, H. Woodw.); again in the Coal-measures, next in the Oolite and Tertiaries, and living to-day in the Old and New Worlds.

E=*EURYPTERIDA*.—This extinct order contains some of the largest known members of the Crustacean class (*e.g.*, *Pterygotus anglicus*, Devonian). It ranges from the Upper Silurian to the Coal-measures. On morphological grounds there is good reason to conclude that the Eurypterida are the ancestors of the Scorpionidæ, to which they present the strongest affinity.

A=ARACHNIDA. S=SCORPIONIDÆ.—The scorpions range from the Coal-measures, apparently unaltered, to the present day.

the terms Malacostraca[1] and Entomostraca,[2] which convey no idea of any structure or function common to either division to which they are applied, the adoption of the terms Thoracipoda[3] and Gnathopoda,[4] which embody the salient character in each sub-class.

The Trilobita are probably represented to day by the Isopoda, to which doubtless they are closely related. There is reason to believe the members of the other extinct order, the *Eurypterida*, to have been the aquatic branchiferous ancestors of the terrestrial tracheated air-breathing *Scorpionidæ*; nevertheless they need not on that account be removed from their present position in the Crustacean

[1] From μαλακός, soft, and ὄστρακον, a shell,—a term not specially appropriate or applicable to crabs and lobsters.

[2] From ἔντομος, an insect, and ὄστρακον, a shell,—a name quite applicable to the Ostracoda, but not to all the sub-class.

[3] From θώραξ, the thorax (or middle body), and πούς, ποδός, a foot, in allusion to the prevalent use in the Malacostraca of the thoracic series of appendages as special organs of locomotion.

[4] From γνάθος, the jaw, the mouth, and πούς, ποδός, a foot, in allusion to the prevailing character in the Entomostraca, in which the head and *mouth-organs* are also mainly used in locomotion. We should of course have preferred to use the term *Cephalopoda* for this sub-class, had not that designation been already appropriated for the cuttle-fishes, &c.

class;[1] and the *Scorpionidæ* should of course still form a part of the class Arachnida, which may, however, be conveniently placed beside the Crustacea, as in the annexed diagram (fig. 64), in which their probable morphological and ancestral relationship is indicated.

Types of Existing Crustacea.

Sub-class 1. Thoracipoda (or *Malacostraca*).

I. Podophthalmia: (1.) Decapoda—(*a*) Brachyura.—Crabs are certainly the highest representatives of the Crustacean class, and in this ten-footed order[2] are included some of the most active and intelligent members of the community,—the "land-crabs," and "shore-crabs," and also the largest *living* representative of the class, the *Inachus Kempferi* from Japan.

Crabs furnish the best illustration among the Crustacea of that concentration of organs around a single nerve-centre, which Professor Dana aptly terms *cephalization*.

Instead of a long vermiform body composed of a large number of annuli, each having its own nerve-ganglion, we have in the crab one large cephalo-thoracic ganglion representing nearly the entire nerve force of the body, the supra-œsophageal ganglion only giving rise to the nerves of sense and volition. (See fig. 9, nerves of *Maia*.)

This highest cephalized type is exemplified by *Maia*, but as a matter of fact the triangular crabs, of which *Maia squinado* and *Inachus Kempferi* are examples, do not embrace, by any means, the liveliest and most intelligent of the order; on the contrary, we should decidedly award the highest place for intelligence to the quadrangular land and shore-crabs; indeed, it is amongst such genera as *Grapsus, Gelasimus, Ocypoda, Gecarcinus*, &c., that we find the most rapidly moving *terrestrial* forms of Crustacea. Most of the land-crabs retreat to burrows in the ground during the heat of the day, and issue forth at dusk to feed on the growing crops of sugar-cane, rice, or maize. The *Gecarcinus ruricola* (see *ante*, fig. 21) is peculiarly destructive to the young sugar-canes in the West Indies. In the highlands of the Deccan land-crabs are most abundant. *Gecarcini* are found at Mahableshwar at an elevation of 4500 feet above the sea. These land-crabs probably do not visit the sea at all, as do the Jamaica land-crabs, but deposit their eggs, when near the time of hatching, in the freshwater streams, the banks of which they are known to frequent. Many of the land-crabs have the chelate limbs largely developed, usually more strongly so in the males, *e.g.*, the male of *Macrophthalmus Latreillii*; in others one claw only is very disproportionately enlarged, as in the males of the "calling-crab" (*Gelasimus*), which are said in running to carry this claw elevated as if beckoning with it. Fritz Müller says, however, that the species common in Brazil (a small *Gelasimus* with one claw *very large*) always holds it

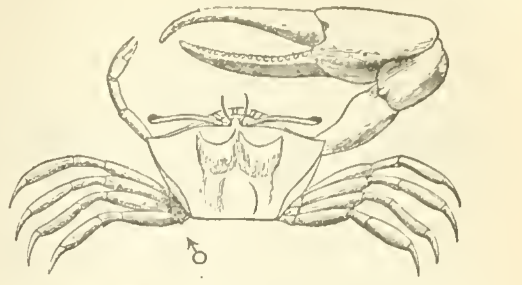

Fig. 65.—The "Calling-Crab" (*Gelasimus*). ♂ a land-crab common in the cassava-fields, Brazil.

closely pressed against its body. Vast numbers of land-crabs are met with on the sea-shore and among rocks along the coast, especially in the warmer temperate and sub-tropical regions of the earth. Of the genus *Thelphusa* one freshwater species (*T. fluviatilis*) is a native of the rivers of southern Europe. It is eaten by Catholics during Lent, and hence called "Lenten crab." This crab is also common to the rivers of India.

Although some land-crabs are certainly vegetarians in diet, the class, as a whole, are carrion feeders, greedily devouring animal matter even in a putrescent state. The *Portunidæ* and *Carcinidæ* perform the duties of sanitary police around our coasts between tide-marks, being assisted by swarms of "sand-hoppers" (*Talitrus locusta*); whilst below low-water mark the prawns, *Maias*, great crabs, and lobsters share the task. Many sea-side resorts would be extremely unwholesome were it not for the labours of these useful but unpaid scavengers.

The swimming-crabs are mostly predaceous; forms like *Portunus pelagicus* and *Polybius Henslowii* (fig. 66) have exceedingly thin shells, and all the feet, save the great chelate claws, are modified into oars. They are thus enabled to live and hunt at their ease, often hundreds of miles from land. The writer has seen Henslow's swimming-crab in the middle of the Bay of Biscay far out of sight of land. Crouch, the Cornish naturalist, states that they fasten upon pilchards and mackerel with their knife-like claws, and never relax their hold until the terrified victim floats exhausted on the surface.

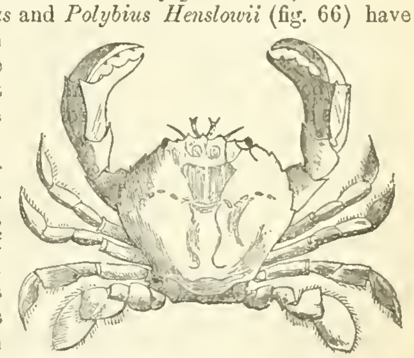

Fig. 66.—Henslow's Swimming-crab. *Polybius Henslowii*, Leach, coast of Cornwall.

Two genera of Tertiary Land-crabs have been described from English localities (*Goniocypoda*[3] and *Litoricola*).[4] *Macrophthalmus* occurs fossil in China, where it is prized as a valuable *materies medica*.[5] *Ranina*, "the frog-crab" of the Indian Ocean and Japan, occurs in Tertiary rocks[6] in Bunde and Ebenda, Germany, in San Stefano, Italy, and

[1] In a paper on the structure of the Xiphosura and their relationship with the Eurypterida (*Quart. Journ. Geol. Soc.*, 1866, vol. xxiii. p. 35), the writer first suggested the probable genealogico-morphological relationship between *Pterygotus* and *Scorpio*; and in a subsequent communication (*op. cit.* 1871, p. 46) he combated the proposal of Dr Anton Dohrn to remove the Trilobita, Eurypterida, and Xiphosura from the Crustacea, and to combine them with *Scorpio* as a new class beside the Crustacea; he also pointed out wherein the evidence relied upon by Dohrn for establishing such an order fails. The classification of the *Eurypterida* and *Xiphosura* proposed in his monograph (*Pal. Soc. Mon. Merostomata*, Pt. i.–iv., 1866–72) has been adopted by Professors Owen and Huxley both, and has received the sanction of many eminent carcinologists. The writer has given his views as to the close affinity between the extinct Trilobita and the modern Isopoda in *Brit. Assoc. Reports, Edinb.*, 1871, and *Geol. Mag.* 1871, vol. viii. p. 289, pl. 8.

[2] The crabs belong to the legion Podophthalmia, all the members of which are distinguished by having their compound eyes placed on movable eye-stalks (hence called "stalk-eyed Crustacea"). They also have the gills covered by the carapace, forming, in fact, a more or less completely enclosed branchial chamber. Only one other Crustacean viz., *Tanais* (fig. 38), an Isopod, has such an arrangement—in *Tanais* also the eyes are pedunculated. In *Nebalia* (2 in fig. 57), a Phyllopod, the eye is pedunculated, but in these instances the peduncle is not articulated. In the Trilobita several species occur with compound pedunculated eyes, but the eye-stalk has no articulus.

in Malta. Rumphius says, "It loves to climb upon the roofs of houses."[1]

More than fifty genera of fossil Crustacea, referable to the Decapoda-Brachyura, have been described by Milne-Edwards, Bell, Reuss, M'Coy, H. Woodward, and others The oldest known crab is the *Palæinachus longipes*, H. Woodw., from the forest marble, Wilts (*Quart. Journ. Geol. Soc.*, 1866, vol. xxii. Pl. xxiv. p. 493).

I. PODOPHTHALMIA: (1.) DECAPODA—(*b.*) ANOMOURA.—The irregular-tailed or Anomourous Crustaceans, of which the hermit-crab is a type (figs. 20 and 67), are excellent

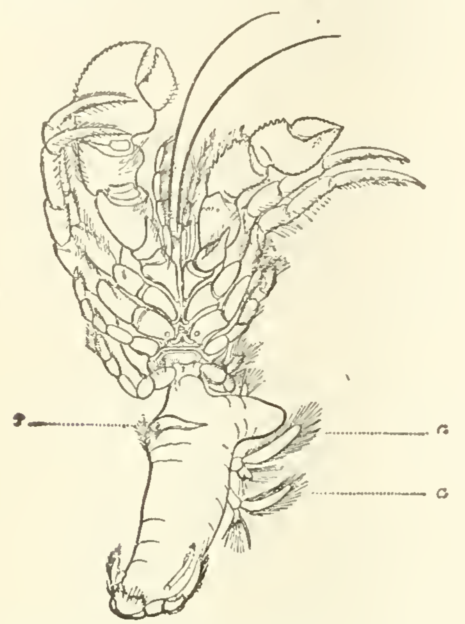

FIG. 67.—Hermit-Crab removed from its shell (see *ante*, fig. 20).
r, hardened ridge which bears against the columella of snail-shell; *a*, *a*, the appendages to which the eggs are attached. (Morse)

examples both of arrested development and retrograde metamorphosis in the adult, resulting from disuse and consequent atrophy of particular parts or organs.

We have seen among the Isopoda the females of the *Bopyridæ*, which live parasitic within the branchial chamber of other Crustaceans, or under their abdomen, or within the parietes of a *Balanus*, or actually within the body of a *Porcellana*. In the Rhizocephala we have seen the free-swimming pupa become attached to the soft body of the *Pagurus*, cast off its shell, lose all its limbs, and appear as a sausage-like, sack-shaped, or discoidal excrescence, without even a mouth, its body, filled with ova, attached by its antennæ, which are modified into roots, that anchor it and at the same time bring it ready prepared nourishment from the juices of its hosts (see figs. 82 and 83). After such extreme retrogression, the depauperization of certain parts and organs observable in the Anomoura is easily to be understood and admitted.

If we bring together for study a series of Anomourous Crustacea, we shall be at once able *superficially* to divide them into two sections, the *Macrourous* and the *Brachyurous Anomoura*.

(A.) *Irregular* BRACHYURA.	(B.) *Irregular* MACROURA.
1. *Lithodes.*	1. *Galathea.*
2. *Porcellana* (fig. 68.)	2. *Munida.*
3. *Dromia.*	3. *Paguri* (fig. 67.)
4. *Dorippe.*	4. *Birgus.*
5. *Homola.*	

We have also burrowing forms which obviously are near to these, although not actually classed with them, viz.,

1. *Ranina.*	1. *Callianassa.*
2. *Corystes.*	2. *Gebia.*
	3. *Axius.*

In both these sections of the Anomoura we find the same peculiarity, namely, that the fifth pair of (thoracic) legs, and sometimes indeed the fourth and fifth hinder pairs, are not formed for walking, but are minute and rudimentary, and are placed *above* the level of the other legs.

In *Porcellana* and *Lithodes*, in *Galathea* and *Muñida*, the posterior legs are simply rudimentary. In *Dorippe* and *Dromia*, in *Pagurus* and *Birgus*, though still disproportionately small, they are modified into organs for holding on with. This rudimentary condition of the posterior thoracic feet in the Anomoura at once recalls the last larval stages of nearly all the Malacostraca,[2] in which the hinder thoracic somites are not yet developed, or if so, are either destitute of appendages, or have only rudimentary ones.

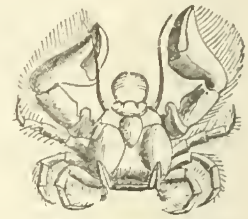

FIG. 68.—*Porcellana platycheles* Penn. sp. British. Habitat under stones at low-water.

The chelate form of the two posterior pairs of feet in *Dromia* and *Dorippe*, in *Homola* and *Birgus*, being a variable characteristic, and not present in all Anomoura, is doubtless developed as an *individual* specific modification, like the chelate penultimate feet in *Brachyscelus* and the ante-penultimate pair in *Phronima*.[3]

Some Anomoura have chelate terminations to a pair of their rudimentary feet, others have both pairs simple.[4] This is at once elucidated when we inquire into their economy. *Dromia* does not carry about a turbinated shell like *Pagurus*, but clothes itself with the *skin* of its victim, a "sea-lemon" (*Doris*) for example, or encourages a parasitic sponge of showy colour to grow upon its back, holding it in its place with its two hind pairs of rudimentary feet, just as the other true hermits hold their shells on over their soft-skinned bodies (Gosse).

Professor Verrill has described a *Dorippe* (*D. facchino*), which always carries an *Actinia* (the *Cancrisocia expansa*, St.) upon its back. Like most other cases of *commensalism* this friendly association of the crab and sea-anemone was begun long ago and has been regularly adhered to. When young the *Dorippe* carries a small shell (? the half of a bivalve), which it holds in position by means of its two hind pairs of legs. The *Actinia* fixes itself when young to the shell, and afterwards by its growth completely conceals the carapace of the crab, replacing the shell which is, no

[1] (Fritz Muller, *Für Darwin*, p. 30). This statement of the old Dutch naturalist seems most extraordinary, and needs further investigation. All the feet in *Ranina* seem adapted for digging, and an allied but much smaller form (*Raninoides*) from Trinidad, a truly marine species, is a most expert burrower into sand or mud, going down tail foremost. According to Milne-Edwards, in *Ranina* the ordinary entrant orifice to the branchial cavity is altogether wanting, and the entrance is by a canal which opens *beneath* the abdomen. Such an arrangement seems rather to favour the notion of its fossorial habits.

[2] In *Palæmon* and *Penæus* (Macroura), in *Dulichia*, *Caprella*, *Ligia*, and *Asellus* (Isopoda), in *Lestrigonus* (Amphipoda), and even in the Brachyura where the young apparently undergo little transformation when compared with the less cephalized forms, the thoracic somites are developed last, and then from before backwards. (See Spence Bate on the Development of Decapod Crustacea, 1857, *Phil. Trans.* 1858, p. 595.)

[3] In *Cenibota Diogenes*, one of the land-hermits, the penultimate pair of feet are furnished with curious rasp-like surfaces to their extremities, to enable it to hold on to the smooth inner surface of the spiral shell it has chosen for a habitation.

[4] In the *Hyperiæ* the youngest larvæ cannot swim; they are helpless little animals which cling firmly by their chelate feet to the swimming laminæ of the *Medusæ* in the gill-cavity of which they live when adult; the adults lose the prehensile character of the feet and acquire the power of swimming.

doubt, after a time either disintegrated or abandoned when the *Dorippe* moults. A *Sagartia*, associated with a hermit-crab on our own coasts, is said entirely to dissolve away the *Buccinum* in which the *Pagurus* is lodged, and to supply its place, as in the case of *Dorippe*, with its expanded foot.

Several specimens of a small species of *Pagurus*, common on the French coast, have been brought to the writer, each crab tenanted in what appeared to be the shell of a small *Buccinum* or *Nassa*; but the whole was so completely encrusted by a sponge as to leave no part visible externally. On cutting one open vertically the spiral form of the interior cavity of the shell was very distinctly seen, but the shell itself had been entirely dissolved away by the sponge.[1]

A *Zoanthus* has been described by Duben and Koren under the name of *Mammalifera incrustata*, which is commonly found parasitic on shells that are tenanted by a species of *Pagurus*. In all cases the shell is destroyed after a while, *not by the hermit-crab*, but by some process of disintegration or absorption, the diffused basal crust of the Zoophyte forming a perfect cast of it, and affording shelter to the crab. This form occurs in Shetland and in the North of England, as well as in Norway, and is regarded by Mr Hincks as distinct from *Zoanthus Couchii*, Gosse (Rev. T. Hincks, *Ann. and Mag. Nat. Hist.* 1862, p. 304).

The *Adamsia palliata* always selects shells tenanted by *Pagurus Prideauxii*, but instead of adhering to the spire the "cloak-anemone" fixes itself to the smooth inner lip of the shell, so that when the hermit is feeding, the mouth of the anemone is just below that of the crab, and ready to receive any fragment he may let fall. When the *Adamsia* is very young, less than half-an-inch in diameter, its outline is circular; but as it grows older it expands laterally, forming two lobes, which creep along the mouth of the shell, until they meet and coalesce on its outer lip. The base of the cloak-anemone is then perforated, and through this opening the hermit puts out or retracts his head and legs.[2]

In all the Anomoura the abdomen is more or less modified; for instance, in the Brachyurous type, it is not closely bent under the body, as in ordinary crabs, some *Porcellanæ* (fig. 68) carrying it extended straight out; whilst in the long-tailed forms, like *Galathea*, the epimera are shorter, and the segments are less arched than in the lobster. The caudal plates are also more rudimentary. In *Pagurus* (fig. 67), the abdomen is naked, only a mere trace of the shelly plates remaining. In *Birgus latro* the sternal portion only of the abdominal somites remains.

If we turn for an instant to the *Thalassinidæ*, a family of burrowing Macroura, we find the hard and shelly epimeral pieces of the body-segments are not properly developed, and the lobes of the tail are in like manner rudimentary; the integument of the body is extremely thin and soft (approaching that of the hermit-crabs, which like themselves live concealed in various foreign substances living and dead, *e.g.*, shells, sponges, *Actiniæ*, &c.).[3]

There can be no doubt that both in the case of the true hermit-crabs, and in that of the burrowing Crustacea, the

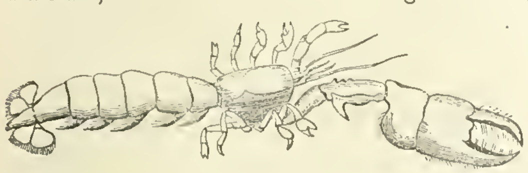

FIG. 69.—*Callianassa subterranea*, Leach, a burrowing Crustacean; coast of Devon (other species are found fossil in the Chalk, Greensand, London Clay, &c.).

non-development of the *hard* calcareous covering to the abdomen (in *Callianassa* extending to the whole body except the legs and chelæ) is due to the same cause, viz., disuse of the abdomen and caudal fin for natation, and to their constant habit of living in concealment.

In the case of *Birgus latro*, when quite young it probably conceals itself in some shell, but as it grows to such a large size and becomes so enormously fat, from feeding upon the cocoa-nut, it must abandon its early disguise and conceal itself within a burrow instead. The writer has received a small hermit-crab very like *Birgus*, the abdomen of which was concealed in a sponge.

If then the Anomoura be the descendants of certain Crustacea in which an arrested stage of development in the young has become a persistent character in the adult, or in which organs atrophied by disuse have at last come to be suppressed or greatly modified, the conclusion seems obvious that we are dealing not with a distinct sub-order equivalent to the Brachyura or the Macrura, but with a group composed of various irregular forms at present placed intermediate to, but originally belonging to *both* these divisions.

Forms allied to *Homola* and *Dromia*—*Homolopsis* and *Dromilites*—occur fossil, the former in the Gault and the latter in the London Clay (in fig. 70); no other Anomourous forms have been met with, save some legs and chelæ in the Chalk, which have been attributed to a *Pagurus*.

Remains of *Callianassa* are very abundant in the Cretaceous and Tertiary rocks of Europe, and have been found fossil even as far off as Japan. It is always the hands which are preserved, the body being usually too delicate for fossilization.

I. PODOPHTHALMIA: (1.) DECAPODA—(*c.*) MACROURA. —The common lobster and prawn are excellent examples of the Macroura. In this truly aquatic type the abdomen is no longer rudimentary, as in the crabs, but is developed into a powerful organ for leaping and swimming. The body-segments are of nearly equal growth, and being compressed at the sides, or cylindrical in form, they present a well-marked contrast to the crabs, or Brachyura, in which the segments are expanded laterally. The abdomen is terminated by a broad swimming tail. The Macroura are numerically very abundant in both marine and fresh water.

The lobster prefers a rocky coast, and being somewhat of a *gourmand* in his tastes is tempted by the fisherman on our shores to such good purpose, that as many as 25,000 live lobsters are often delivered at Billingsgate in a day. If only as many are eaten in the whole of England as in London, this would be at the rate of 50,000 per day, or

[1] They are found tenanting shells covered by *Cellepora edax* and by *Hydractinia*. The hermit-crabs are known to break out the spiral columella of the shell they inhabit to give themselves more room.

[2] Gosse, *Glimpses of Ocean Life*; see also Professor Verrill's article, *American Naturalist*, vol. iii.

[3] We may compare the differences of their tests to that which exists between a lady's white and delicate hand, encased from infancy in a kid glove, and the hand of a primitive savage who uses his digits constantly for delving in the ground for roots. In the one the covering membrane is thin and soft, in the other hard and horny. One might even go further and imagine that, by continued disuse, the nails would be no longer developed; certainly they have in civilized life become less powerful as offensive weapons, and the toe nails on the feet have really in most persons commenced to become atrophied.

[4] From Professor Owen's *Palæontology*, p. 50, fig. 10.

18,250,000 annually. March to August is the period of greatest catch.[1]

The river cray-fish, *Astacus fluviatilis* (fig. 25), also common to the rivers of Europe, is largely caught, and when fresh boiled is not to be despised. It is largely imported into London, and is used by the *chefs* at the West End to garnish dishes. The writer with a friend caught as many as 900 cray-fish in a single evening from 8 till 12 (with a series of simple scale-like nets baited with liver), along the bank of the Thames and Severn Canal, Gloucestershire. The Murray river cray-fish from Australia (*Potamobius serratus*) is as large as a fine sea-lobster, and has its segments ornamented with spines, reminding one of the spiny lobster[2] (*Enoploclytia sussexiensis*) from the chalk of Sussex and Kent.[3]

More than fifty genera of fossil Macroura have been met with and described; the earliest known is the *Anthrapalæmon Grossartii* from the Lower Carboniferous series near Glasgow. Similar forms have been obtained from the Coal-measures in England; from Illinois, U.S.; from Bohemia, &c.

I. PODOPHTHALMIA: (2.) STOMAPODA.—All the members embraced within the three divisions of the preceding order (Decapoda) were cryptobranchiate, in this order they are nudibranchiate, *i.e.*, the gills are composed of plates or simple filaments attached to the feet, whilst the carapace, so largely developed in the order Decapoda, is here both shorter and narrower, and the body less compact. Taking *Squilla* (fig. 71) as an example, the segments are much less coalesced than in the lobster. Those bearing the eyes and the antennules are readily separable from the front of the head, and are not covered by the carapace, which only conceals eight segments, whereas in the lobster it covers fourteen, and in the crab twenty-one. The gills are borne by the abdominal swimming feet, free and uncovered. The first pair of thoracic limbs are developed into a pair of large and formidable claws, the terminal joint of which bears a row of long, sharp, and recurved teeth; these double back upon the edge of the penultimate joint which has a groove to receive them, like a pocket-comb.

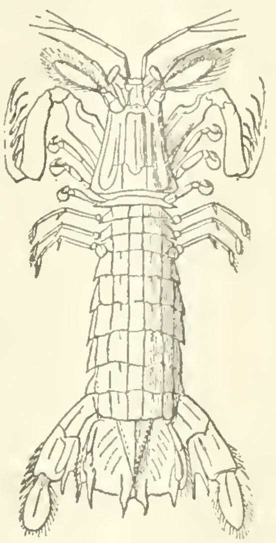

Fig. 71.—*Squilla mantis*, Rondel.; south coast of England and Mediterranean.

In *Mysis*, "the opossum shrimp," another member of this order, the two posterior pairs of feet only are branchiferous; all the feet are biramous and flagellate; in the female the hinder feet are modified into broad plates which, uniting beneath the body, form a pouch or *marsupium* in which the eggs are protected and the young pass through their infancy.[4]

These opossum-shrimps, which are pelagic in their habits, are frequently met with in countless myriads towards the surface of the Greenland Sea, and, though small, they form the chief part of the food of the common whale (*Balæna mysticetus*).[5]

Some forms of *Erichthys* are included in this division; these, like *Mysis*, are also pelagic, and occur abundantly on the surface of the Indian and Atlantic Oceans, where, together with the larvæ of Cirripedes and many other oceanic cosmopolites, they may be taken with the towing net in abundance.

Numerous specimens of true *Squilla* (*Sculda pennata*, Münst) and of a *Mysis*-like Crustacean have been found fossil in the Solenhofen limestone, of Oolitic age, in Bavaria. With the Stomapoda are also placed a group of very anomalous and larval-looking Crustacea (the *Diastylidæ*) originally noticed in 1843 by Mr Harry Goodsir, who obtained them from the Firth of Forth. They closely resemble Copepoda in aspect, and might readily be confounded with the larval stages of some Decapod. They have, however, been found with their eggs borne by the female in an incubatory pouch beneath the thorax, as in *Mysis*.

The branchiæ are situated on each side of the thorax immediately above the insertion of the legs, and approach in their comb-like appearance to those of the higher Crustacea.

Three genera have been established for these singular forms, namely, *Cuma*, *Alauna*, *Bodotria* (see fig. 36).

II. EDRIOPHTHALMIA: (3.) ISOPODA.—From the stalk-eyed Podophthalmia we pass now to the sessile-eyed Edriophthalmia, in which the eyes with one exception are fixed immovably on the surface of the head. As in the higher forms, the eyes are compound, consisting in the young of some ten or twelve lenses only, but in the adult of as many as sixty to eighty. In nearly all, the body is distinctly divisible into three parts—the head usually very small, the seven thoracic segments well and evenly developed, the abdominal somites more or less coalesced. The general conformity in size and function of the thoracic somites and their seven pairs of legs characterizes the majority of the Isopoda. These legs are nearly uniform, and are fitted either for walking or for swimming, or as powerful hook-like organs to enable them to adhere to the fishes on which they are parasitic. The branchiæ in this order are transferred from the thoracic legs to the abdominal appendages, which are converted into special organs of respiration.

One group of Isopods, the *Oniscidæ* (forming Spence Bate's and Westwood's family Ærospirantia), familiar in our gardens under the names of "woodlouse," "sow-bug," and "armadillo" (fig. 22), are all air-breathers, incapable of existing in water, but breathing air which, however, it is necessary must be saturated with moisture. Several of the species which inhabit caves are destitute of eyes (*e.g.*, *Titanethes albus*, Schrodte). The "great sea-slater" (*Ligia oceanica*) is common on all our coasts, running with agility and feigning death when attacked. The genus *Armadillo*, found commonly in our gardens and woods, and so called from the perfect way in which the segments roll together, forcibly reminds one of "the great Barr Trilobite" (*Illænus Barriensis*), from the Silurian of Staffordshire (7 in fig. 73).

A very interesting little Isopod (presented to the British Museum by Dr Milligan of Tasmania), from Flinders Island, Bass's Straits, and named in MS. by

[1] Lobsters are sent alive to the London market, packed in damp seaweed, moss, or heather, from Stornoway in the Island of Lewis, from Ireland, Scotland, the Orkneys, the south coast, and Channel Islands, and from Norway. Fishermen and salesmen are said to know the south coast, Cornish, Scotch, Irish, or Norwegian lobsters at sight, just as cattle salesmen know a "Hereford" or "Devon," a "Scotch" or "Irish" beast. The largest common lobsters weigh from 8 to 12 lb. But the great lobster of the American coast (largely imported in tins into Europe) weighs more than twice as much.

[2] Dixon's *Geology of Sussex*, tab. 38, figs. 6, 7.

[3] For the numerous species of *Palæmonidæ* belonging to this division, we must refer the reader to Bell's *British Stalk-eyed Crustacea*, to Dana's magnificent volumes and atlas on the Crustacea found during the United States exploring expedition, and to De Haan's *Fauna Japonica*, and Milne-Edwards's *Hist. Nat. des Crustacées*.

[4] An allied species to *Mysis*, *Thysanopoda* (obtained in myriads by Couch on the Cornish coast from the stomachs of mackerel), carries its eggs, as does *Cyclops quadricornis*, in two bag-like ovaries depending from the posterior thoracic somite (Bell's *Brit. Stalk-eyed Crust.*)

[5] Otho Fabricius, *Fauna Groenlandica*, p. 245.

Mr Adam White *Ceratocephalus Grayanus*, offers many points of analogy with the extinct Trilobites. The fragile mode of articulation of its walking legs, and their entire

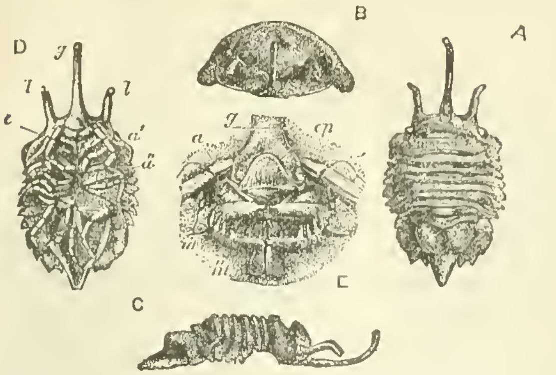

FIG. 72.—*Ceratocephalus Grayanus*; Flinders Island, Bass's Straits. A, the dorsal aspect. B, front view of the head showing the curvature of the three spines. C, side view. D, ventral aspect: *g*, the glabellal spine; *l*, *l*, the two lateral or genal spines of the head; *e*, the eye; *a*,′ the antennule; *a″*, the antennæ the legs are seen folded up beneath the body. E, the mouth enlarged, showing *ep*, the epistoma or upper lip plate, *m′*, the mandibles, *m″*, the pectinated maxilla, *a*, the antenna; the epistoma is set in the base of the glabellal spine *g*.

concealment beneath the body-segments, are very suggestive. This Isopod is near to the *Sphæromidæ*, but will form a distinct family, as the antennæ are inserted beneath and within the margin of the head-shield; apparently it does not roll itself into a ball.

The *Sphæromidæ* are very littoral in their habits; they range from the equatorial latitudes to the colder temperate zones, but are not found in Polar regions. They are vegetable feeders, and some (like *Limnoria*) are guilty of destroying timber. When molested or alarmed they roll themselves up into a ball. The *Sphæromidæ* present many points of analogy, if not of affinity, with the extinct Trilobites.

In this order we find the *Limnoria terebrans* (or the "gribble," as it is called by the fishermen). It is one of the most destructive creatures, attacking all woodwork below tidemarks; the only wood which it cannot destroy is teak. Although its ravages had gone on for ages, it was only made known to the scientific world and described by Dr Leach in 1811.

In the aberrant genus *Tanais* (fig. 38) the first pair of thoracic legs are converted into chelæ, and the head-shield is covered by a carapace, abundantly traversed by currents of blood, beneath which a stream of water passes, maintained as in the zoëæ and adult Decapoda by a flabelliform appendage of the second pair of maxillæ, which is wanting in all other Edriophthalmia. The abdominal feet, which in other Isopoda act as respiratory organs, are simple natatory feet in *Tanais*. These characters, together with the pedunculated eyes and the great chelate hands, give to *Tanais* a very decapod-like aspect (see fig. 38).

The *Idoteidæ* contain representatives of some of the largest known Isopoda, some of which are above 4 inches in length.

The *Ægidæ*[1] and *Cymothoidæ* have all the feet furnished with a robust finger, sharp at the tip, for seizing and holding on to fishes upon which they are parasitic. Another family, the *Bopyridæ* (fig. 39) are parasitic chiefly on members of their own class, frequently occupying the branchial chamber of the common prawn, and distorting the carapace on one side. A fossil *Bopyrus* is observed lying in the branchial cavity of a crab (*Palæocorystes*) from the Gault and Greensand.[2] We have already referred to these and other parasitic forms in the earlier part of this article.

Isopoda are met with as far back as the Old Red Sandstone, where remains of a gigantic species allied to *Arcturus* have been discovered; others occur in the Carboniferous and Oolitic periods. The Purbeck beds of Swanage, Dorset, also yield abundance of a freshwater form, the *Archæoniscus Brodiei*; species of *Oniscus* and *Sphæroma* are found fossil in the Cretaceous, the Eocene, and the Miocene of Europe.

II. EDRIOPHTHALMIA: (4.) TRILOBITA.—So long ago as 1821 Audouin placed the Trilobites with the Isopoda, whilst Macleay assigned them a distinct order between the Isopoda and the Phyllopoda. Later researches by Milne-Edwards

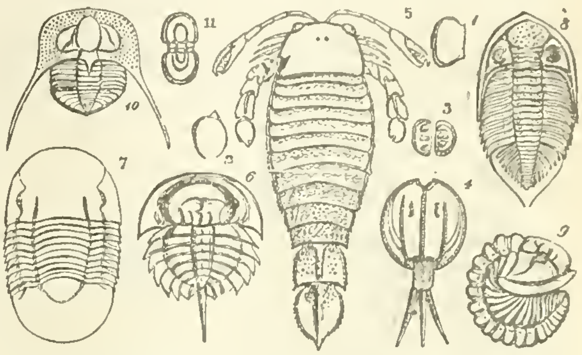

FIG. 73.—1, *Leperditia Baltica*, Wahl.; U. Silurian, Gothland. 2, *Entomoconchus Scouleri*, M.C.; Carbonifs. L. Ireland. 3, *Beyrichia complicata*, Salter; Lr. and others have caused the Trilobita to be referred to the Entomostraca, on account of the very variable number of body-rings observed in the several genera (from six to twenty-six) evidencing a much lower type of structure than the Isopoda, in which the thorax is composed of seven free and movable segments with a head-shield and anchylosed caudal somites. Moreover, until the discovery of presumed ambulatory appendages in an *Asaphus* from the Trenton Limestone in 1870,[3] the only appendage previously observed was the hypostome or lip-plate. There seems, however, no good reason to urge against the conclusion that the Trilobita were an earlier and more generalized type of Crustacea, from which the later and more specialized Isopoda have arisen,—a view which the writer is glad to say he shares with the distinguished carcinologists, Professor Dana[4] in America, and Mr C. Spence Bate in England, although at present more evidence is needed as to the nature of the locomotory appendages in this extinct group. If we range the characters of Trilobita and Isopoda side by

[1] One species, *Eurydice pulchra*, common in the Dee, Cheshire, actually attacks bathers. "If you remain a moment still in the water dozens will fasten on you and nip most unpleasantly. I have had to jump into the water again after coming out from bathing, and splash violently to get rid of the hosts that had stuck to me while clinging to the side of the boat preparatory to getting in. They continue to bite after you are out of the water."—Extract of letter from Mr Walker to Mr C. Spence Bate.

[2] Mr James Carter, F.G.S., lately showed the writer a *Palæocorystes* from the Cambridge Greensand, having a *Bopyrus* lodged in each of its branchial chambers.

[3] Billings, *Quart. Journ. Geol. Soc.*, vol. xxvi. p. 479.

[4] Professor Dana writes, "The Trilobita probably belong with this second type" (the Edriophthalmia, or *Tetradecapoda*, as Dana names them) "rather than with the Entomostraca. Yet they show an aberrant character in two important points. First, the segments of the body are multiplied much beyond the normal number, as in the Phyllopoda among the Entomostraca; and Agassiz has remarked upon this as evidence of that larval analogy which characterizes in many cases the earlier forms of animal life. In the second place, the size of the body far transcends the ordinary Isopodan limit. This might be considered a mark of superiority; but it is more probably the reverse. It is an enlargement beyond the normal and most effective size, due to the same principle of vegetative growth which accords with the (occasional) inordinate multiplication of the segments in the body" (*American Journ. Science*, July, 1856, vol. xxii. p. 11).

side, we shall find there are sufficiently good grounds for placing them in the Edriophthalmia together [1]

Perhaps no investigator of fossil forms has devoted so much careful research to any group as M. Barrande has expended upon the extinct Trilobita. Writing recently upon the divisions of their body he arranges them in four groups, according to the number of their free movable thoracic segments.

The 1st, of 2 genera, has from	1 to 4	free thoracic segments.
,, 2nd ,, 24	,,	5 to 9	,,
,, 3d ,, 32	,,	10 to 13	,,
,, 4th ,, 16	,,	14 to 26	,,

We thus perceive that the number of those forms of Trilobites which have a great excess of *free segments* is not large when we consider the group as a whole.

In the higher and more specialized forms of Isopoda of the present day, we do not find the number of segments

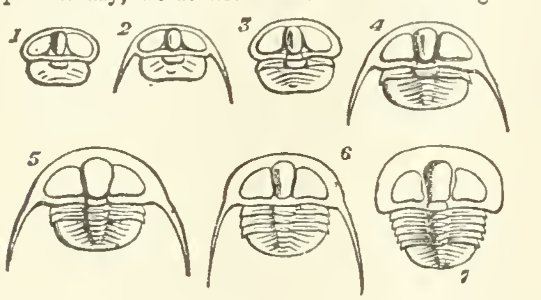

FIG. 74.—*Trinucleus ornatus*, Sternb. sp. (copied from Barrande's *Système Silurien du Centre de la Bohême*, Prague, 1852, 4to, plate 30). Specimens arranged in series according to their supposed age. (All the stages figured by Barrande are not given here.)
1. Young individual, destitute of thoracic segments, composed of head-shield and pygidium only.
2. Another of the same stage, in which the genal or cheek spines are developed.
3. Individual with one thoracic segment developed, but without the genal spines.
4. Another of the same stage, with the genal spines.
5. Individual with two thoracic segments, and with the genal spines present.
6. Individual with three thoracic segments, and possessing the genal spines.
7. Individual with five thoracic segments, but without genal spines.

absolutely adhered to without any variations; on the contrary, we constantly meet with individuals in which more or fewer segments are welded together, so as to conceal the normal number of seven thoracic somites between the head and the abdomen. Such being the case, we cannot be surprised to find considerable variation in a group like the Trilobita, which, if they really are the remote ancestors of the recent Isopoda, must, according to the views suggested above, be the prototypes of the larvæ rather than of the adult stage of the living Isopoda.[2]

In his researches among the Trilobites of Bohemia M. Barrande has discovered forms which, there is every reason to believe, exhibit (as he has so admirably shown in his great work) the gradual development of the Trilobite from the earliest form on quitting the egg to the adult. We give seven of the earliest stages of *Trinucleus ornatus* and seven of *Sao hirsuta*, copied from M. Barrande's monograph

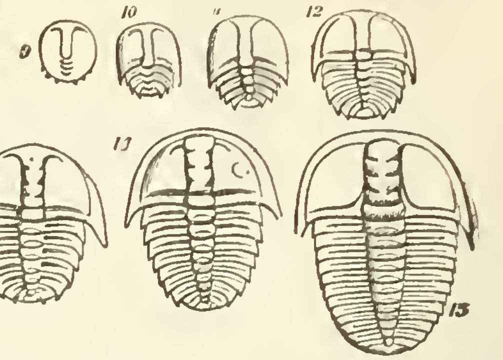

FIG. 75.—*Sao hirsuta*, Barrande (copied from pl. 7 of Barrande's work above cited). Barrande figures twenty stages of this trilobite, of which seven are reproduced here.
1. First stage. A young individual in which the limit of the head-shield is not indicated as separating it from the pygidium.
2. Second stage. Young individual with the head-shield separated, and having indications of three soldered segments to the pygidium.
3. Third stage, in which the genal angles of the head and the splay border of the pygidium are well seen, and four or five soldered segments indicated.
4. Fourth stage, in which two free thoracic segments are developed behind the head, and two or three soldered segments represent the pygidium.
5. Fifth stage, in which the thorax is longer than the head, and is composed of three movable segments and three soldered segments in the pygidium.
6. Sixth stage, in which four free segments succeed the head, and three or four soldered segments form the pygidium.
7. Tenth stage, in which eight free segments succeed the head, and three soldered segments form the pygidium.
In the twentieth stage figured by Barrande the adult has seventeen free thoracico-abdominal segments and two soldered ones (the pygidium).

One most striking feature in the Trilobita is the remarkable development of their compound eyes (fig. 11), a subject ably discussed and illustrated long ago by Dr Buckland in his *Bridgewater Treatise* (1836).

Perhaps the eye of the Trilobite may be best compared with that of *Limulus*, but there are forms like *Æglina* in which the eyes are enormously developed, occupying nearly the entire head-shield with their facetted surfaces.

We have an analogous development of the organs of vision amongst some of the pelagic Amphipoda, the *Hyperiidæ*, and in a very singular form brought home by the "Challenger," the *Thaumops pellucida* (*Phil. Trans.* 1873). The "facial suture" in the head-shield of the Trilobita, which separates the lateral genal portion from the glabella, was for a long time considered as peculiar to Trilobites and *Limuli*, but C. Spence Bate has ably shown that it homologizes with the suture which traverses the inferior surface in the carapace of the Brachyurous Decapod and the cervical suture in the Macrouran type (*Report Brit. Assoc.*, Bristol, 1875, p. 46.)

The Trilobita are the chief representatives of the Crustacean class in Cambrian times.[3] More than 500 species have been described; out of these 350, representing 42 genera, have been recorded from the Lower Palæozoic rocks of Bohemia alone by Barrande.

About 51 genera and 304 species are British in Cambrian[4] and Silurian rocks; ten are Devonian, and four Carboniferous. A gigantic *Paradoxides*, nearly two feet in length, occurs in the Middle Cambrian, and large forms of *Asaphus*, *Homalonotus*, *Lichas*, &c., are met in the Bala group. *Phacops*, *Sphærexochus*, *Encrinurus*, *Calymene*, *Illænus*, and *Acidaspis* are among the Upper Silurian forms,—some, like *Acidaspis*, being extravagantly ornamented with spines and tubercles. The Devonian has

[1] H. Woodward, *Report on Structure and Classification of Fossil Crustacea*, Brit. Assoc. Edinburgh, 1871.

[2] The larvæ of *Bopyrus*, *Cryptothiria*, and *Asellus*, and the adult *Ægidæ*, *Idoteidæ*, *Sphæromidæ*, and *Oniscidæ* offer many points of analogy with the extinct Trilobita (see the *History of the British Sessile-eyed Crustacea* by C. Spence Bate, F.R.S., and J. O. Westwood M.A., in 2 vols. 1863-68, 8vo.)

[3] *Agnostus*, the earliest genus met with, reminds one of the larval forms of *Sao* and *Trinucleus*.

[4] The large accession in late years to the fauna of these Cambrian rocks has resulted from the labours of Mr Henry Hicks, F.G.S.

fewer and less varied forms of Trilobites. Those in the Carboniferous belong nearly all to two genera (*Phillipsia* and *Griffithides*), both small, neat, and simple forms. None are met with in rocks of later date.

II. EDRIOPHTHALMIA : (5.) AMPHIPODA.—This order, as Spence Bate has well observed, constitutes a group among the Edriophthalmia, parallel with the Macroura among the Podophthalmia, whilst the Isopoda may represent the broad and flattened Brachyura, the *Caprellæ* offering a kind of parallelism with *Squilla* and its allies. As in the Isopoda, the head is small and carries only the organs of sense and nutrition ; the sessile eyes[1] are generally small, yet in a few instances they are extremely large (*e.g.*, *Lestrigonus* and *Thaumops*), covering the entire sides of the head.

The seven thoracic segments, constituting the middle-body, are well developed and nearly equal in size ; all the segments are compressed laterally as in the *Palæmonidæ*.

The two anterior pairs of the seven thoracic legs (see Th. 8, 9 in fig. 1), which are jaw-feet in the Podophthalmia, are here developed into arm-like legs, having an enlarged penultimate joint or hand, against which the seventh and terminal joint doubles back, like a finger against the palm, and so forms a prehensile organ similar in form to the claws in the *Crangonidæ*. The best-formed claws are seen in *Orchestia Darwinii* (fig. 45), and in *Melita exilii* (fig. 76).

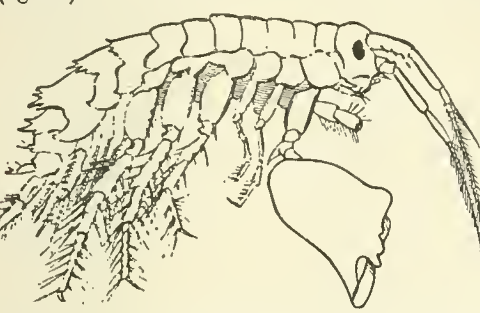

FIG. 76.—*Melita exilii*. n. sp., male, enlarged five times. The large branchial lamellæ are seen projecting between the legs. (Fritz Müller.)

The ova are nourished within a pouch formed by a series of foliaceous plates attached to the four anterior pairs of legs ; except in the *Hyperiidæ*, which are parasitic on Medusæ, as already mentioned. The males in the Amphipoda closely resemble the females (save in those forms in which the hands are enlarged in the male), but contrary to the general rule the females are much smaller than the males.

This division, like the preceding one, has its terrestrial representatives, *Talitrus* and *Orchestia*, the "sand-hoppers,"[2] living out of the sea, but choosing moist places. *Orchestia* with us loves to live within reach of the sea spray, but some species in the southern hemisphere (*O. tahitiensis*, *telluris*, and *sylvicola*) live many miles inland, some under plants at an elevation of more than a thousand feet above the sea. But by far the largest section are natatorial in their habits, being most active and untiring swimmers. One form, *Gammarus pulex* (fig. 77), is most common in our freshwaters, two other genera, both *blind*, *Niphargus*, with three species, and *Crangonyx*, with one species, are found in wells in England,[3] and from their structure there is every reason to conclude they are as truly indigenous to these underground water-courses in the Chalk, Oolite, or Carboniferous Limestone, as are the numerous species of blind Crustacea met with in the waters flowing through the Mammoth Cave, Kentucky.

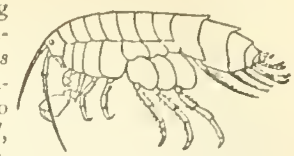

FIG. 77.—*Gammarus*, sp., fresh water

A curious subdivision of Amphipods is formed by the *Podocerides* (*Amphithoë* and *Podocerus*), all the species of which invariably construct nests in which they take shelter and nourish their young. These abodes are built of wood or stones, mud, clay, &c., united together by a cement excreted by the animals themselves. Some closely resemble miniature birds'-nests, others are in the form of tubes.

This division includes another most destructive wood-borer, the *Chelura terebrans*, so devastating to piles and submarine timber all round the shores of Europe, but not recorded from other lands. Finally, we come to the minute aberrant forms of *Dulichiidæ* and *Caprellidæ* (fig. 78), in which the body is reduced to a slender elongated cylindrical form, the thorax having only about six somites (one being absent and two soldered together), and the abdomen being quite rudimentary. They have long antennæ and feet, all fitted for climbing and holding on by. Their singular appearance has caused them to be called "spectre shrimps."

FIG. 78.—*Caprella tuberculata*, Guerin ; south coast. (Spence Bate.)

With these aberrant forms are associated the *Cyamidæ* (fig. 79), a family which affix themselves by their strong recurved legs to the rough portions of the Cetacea upon which they feed. The feet are all prehensile ; the third and fourth somites bear the branched or simple branchiæ. The abdomen, as in the *Caprellidæ*, is rudimentary ; the eggs and young are sheltered by four broad lamellar plates, developed from the appendages on the under side of the body of the female. Spence Bate and Westwood have figured five species. They approach in many respects to the Pycnogonidæ, which also live parasitic on Cetacea (see ARACHNIDA, vol. ii. p. 276–77), but we must not attempt to discuss their affinities here. A fragment of a presumed Amphipodous Crustacean has been described by the writer from the Upper Silurian (the *Necrogammarus Salweyi*) another, the *Gampsonyx fimbriatus*, occurs in the Coal-measures of Germany, Bohemia, and America. Mr Spence Bate has described one from the Permian of Durham, the *Prosoponiscus problematicus*, its modern living representative, the *Sulcator*, making peculiar tracks upon our shores to-day like those met with upon the surfaces of slabs of

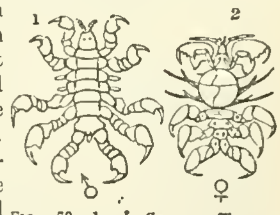

FIG. 79.—1, ♂ *Cyamus Thompsoni*, Gosse found attached to *Hyperoodon bidens*, Portland Roads. 2. ♀ *Cyamus ovalis*, Vauzeme, found attached to common whale. (Spence Bate.)

[1] The outer integument of the eyes is never divided into facets, except in the *Hyperiidæ*. In many of the *Phoxides* the eyes appear to be wanting ; but this is probably caused by the absence of any colouring pigment. In *Niphargus* the eyes are obsolete or rudimentary. In *Ampelisca* they appear like four simple organs resembling the ocelli of true insects (Spence Bate and Westwood, *Brit. Sess. Crust.* vol. i. p. 4).

[2] It is in the summer months that they occur in such vast myriads upon our sandy shores. At Whitsand Bay Mr Twain saw "not millions, but cartloads," of one species (*Talitrus locusta*) lying piled together along the margin of the sea. They devour offal of every description, including dead carcasses of animals, which they rapidly assimilate and remove. In their turn they afford a repast to the ring-plover, the common wood-pigeon, and numerous shore-birds which rapidly devour them, as well as some coleopterous insects (the *Cillenum laterale* and *Broscus cephalotes* (Bate and Westwood).

[3] Spence Bate and Westwood (*Sessile-eyed Crustacea*, vol. iii. p. 311–328).

Palæozoic rocks. Several other Amphipod-like forms occur in the lithographic stone of Bavaria. The world-wide distribution of the Amphipoda accords well with their range in time, which was as great or even greater than the Isopoda.

Sub-class 2. GNATHOPODA (or *Entomostraca*).

III. MEROSTOMATA: (6.) XIPHOSURA.—The king-crab (*Limulus*) is a remarkable type of crustacean closely related to the extinct Eurypterida. Found living in the seas of China and Japan and on the north-east coast of North America, it exemplifies a peculiar and most ancient order, the affinities of which are not at first readily recognized because its nearest allies have passed away. The head-shield is enormously expanded so as to shelter all the anterior appendages beneath it; and the succeeding segments are so soldered together as to appear like one piece, although all the hind-segments are free and movable in the larva. The eyes are fixed on the head-shield; the antennules are chelate, and placed in front of the mouth. The antennæ, mandibles, maxillæ, maxillipeds, are all converted into walking legs, forming also chelate appendages and, at their bases, jaws; thus serving admirably to illustrate the most prominent characteristic of the sub-class GNATHOPODA, "mouth-footed."

The thoracic feet are flattened out into broad bilobed plates which cover the branchiæ and the egg-pouches. The abdomen is rudimentary, being partly represented by the

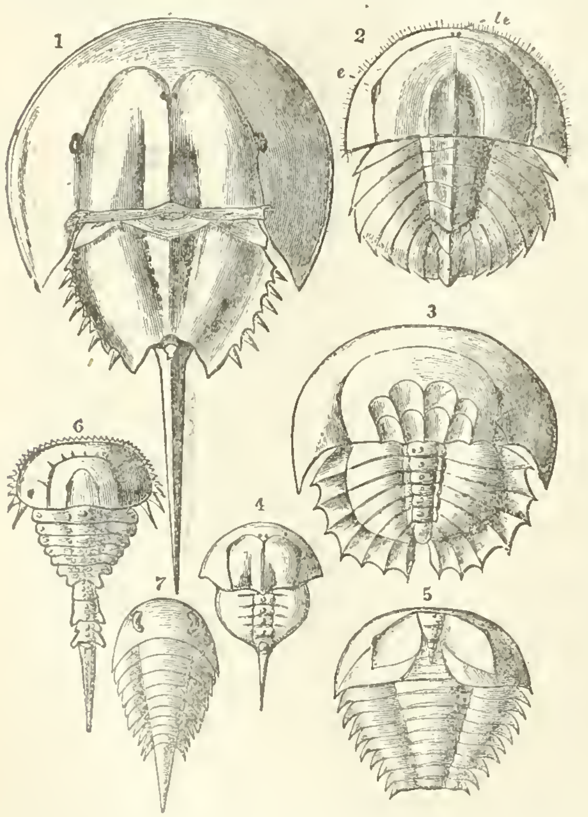

FIG. 80.—1, *Limulus polyphemus*, adult (dorsal aspect). 2, *Limulus polyphemus*, young (dorsal aspect). 3, *Prestwichia rotundata*, Coal M., Shropshire. 4, *Prestwichia Birtwelli*, Coal M., Lancashire. 5, *Neolimulus falcatus*, U. Silurian, Lanark. 6, *Hemiaspis limuloides*, L. Ludlow, Leintwardine, Shropshire. 7, *Pseudoniscus aculeatus*, U. Silurian, Russia.

posterior portion of the hinder shield, and partly by the long ensiform tail-spine (?) (See Owen's Memoir, *Trans. Linn. Soc.*, vol. xxxviii., 1873.) But in the larvæ, as has been already shown, these post-cephalic somites are free and unanchylosed, and the tail-spine is undeveloped, thus connecting the modern king-crab with its far-off ancestors in the Coal and Silurian periods. The oldest species known is the *Neolimulus falcatus*, H. Woodw. (5 in fig. 80), from the Upper Silurian of Lanarkshire, in which the segments are apparently all free and unanchylosed.

In the Coal-measures no fewer than three genera and eight species of small Limuloid Crustaceans have been met with, viz. *Bellinurus* (four species), *Prestwichia* (three species), and *Euproops* (one species),—the last named an American form. Many of these closely resemble young larval *Limuli*. The Oolitic *Limuli* found in the lithographic stone of Solenhofen agree closely with existing species, one form even equalling in size the living *Limulus polyphemus* from the American coast (1 in fig. 80; see also fig. 12).

III. MEROSTOMATA: (7.) EURYPTERIDA.—In this order we become acquainted with the second extinct type of the Crustacean class, and by far the most interesting, because all the appendages as well as the body-rings have been preserved to us, whereas in the Trilobita the former are remarkable by their almost entire absence.

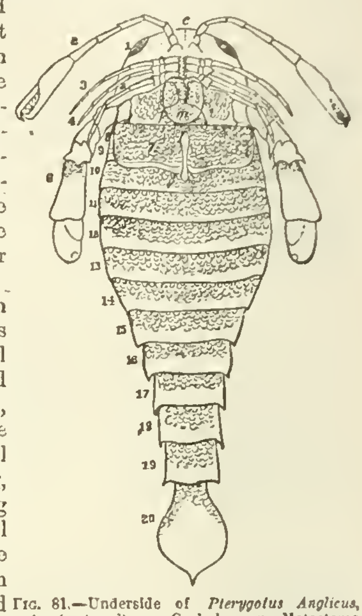

FIG. 81.—Underside of *Pterygotus Anglicus*, Ag. (restored). *c*, Cephalon; *m*, Metastoma or post-oral plate. 1, The compound eyes; 2, Chelate antennæ; 3, The mandibles; 4, First maxillæ; 5, Second maxillæ; 6, Maxillipeds; 7, The operculum or thoracic plate, which fits closely against the ventral surfaces of the two anterior thoracic somites, 8 and 9. 8–14, Thoracic somites; 15–19, Abdominal somites; 20, Telson.

Unlike *Limulus*, in which all the segments in the adult are soldered together into a fore and hind body and telson, in the *Eurypterida* the body is long and well adapted for swimming, the segments being quite distinct and well developed; the feet are also fitted for natation (see 5 in fig. 73, and fig. 81).

We again observe the reiteration of the same well-marked characteristics in the legion Merostomata—already noticed in the Edriophthalmia and Podophthalmia; namely, the division into *Brachyuran* and *Macrouran* forms which exemplify the crawling and swimming types, by the soldering together of the body-segments in the one and the retention of free movement in the somites in the other. The characters of these two orders of the Merostomata are summarized in the subjoined table.[1]

Limulus (Fossil and living).	*Pterygotus* (Fossil, extinct).
1. Eyes sessile, compound.	1. Eyes sessile, compound.
2. Ocelli distinctly seen.	2. Ocelli distinctly seen.
3. All the limbs serving as mouth-organs.	3. All the limbs serving as mouth-organs.
4. Metastoma *rudimentary*.	4. Metastoma *large*.
5. *All* the thoracic segments bearing branchiæ or reproductive organs.	5. *Anterior* thoracic segments bearing branchiæ or reproductive organs.
6. Other segments destitute of any appendages.	6. Other segments destitute of any appendages.
7. Thoracic segments *anchylosed*.	7. Thoracic segments *unanchylosed*.
8. Abdominal segments *anchylosed and rudimentary*.	8. Abdominal segments *free and well developed*.

Numerous species of these ancient extinct long-bodied Merostomata have been met with and described by Hall in

[1] Taken from H. Woodward's Report on the structure and classification of the fossil Crustacea (*Brit. Assoc. Reports, Edinburgh*, 1871).

America, by Fischer in Russia and Sweden, and by Huxley, Salter, and Woodward in Britain (see H. Woodward's monograph in Pal. Soc., 4 parts, 1865–1872).

The most perfect specimens of the genera *Slimonia*, *Pterygotus*, and *Eurypterus* have been obtained by Dr J. Slimon of Lesmahagow, Lanark. The largest known remains, representing specimens from 5 to 6 feet in length, are from the Devonian of Forfarshire, belonging to the great *Pterygotus anglicus* and to *Stylonurus scoticus* obtained by Mr James Powrie, F.G.S., Reswallie, Forfar.

In the Upper Silurian we have one English genus, *Hemiaspis* (6 in fig. 80), and three Russian forms, *Exapinurus*, *Pseudoniscus* (7 in fig. 80), and *Bunodes*, which, like the Anomoura, serve to bridge over the interval between the *Limuli* and *Pterygoti*, the hind-body being partially developed. The best illustration of the Eurypterida is to be found in the zoëa of the common shore-crab, *Carcinus mœnas* (figs. 26 and 27), in which the principal locomotory organs are the maxillipeds, and the abdominal somites are destitute of all appendages. The latest representative of this extinct order has been found in the Lower Carboniferous series of West Lothian, the *Eurypterus Scouleri*, which however differs greatly from all the other forms.

IV. Branchiopoda: (8.) Phyllopoda.—This order includes not only the bivalved *Estheria* and *Nebalia*, and the shield-bearing *Apus*, but two forms of naked gill-footed Crustacea, *Branchipus* and *Artemia* (5 in fig. 57). Of the shield-bearing forms the fresh-water *Apus* may serve as a good example. The eyes are placed in front on the dorsal surface of the carapace and are nearly confluent. The first pair of feet (maxillipeds) are long and branching; to these succeed about sixty pairs of branchial feet. The thoracic and abdominal somites are nearly cylindrical and are composed of about thirty articulations, terminated by two long, many-jointed tail-spines.

Probably *Apus* has more articulations to its appendages and body than any other Crustacean. Schaffer tabulated them, and found they numbered 1,802 604, Latreille puts them down at not less than 2,000 000 *Apus* affords an excellent illustration of a form in which the mere vegetative repetition of parts is carried to an extreme distance beyond the normal number of body-rings so characteristic of the class.

In *Nebalia*, the marine type (1 in fig. 57), the carapace or head-shield has a well-marked rostrum, and is more compressed laterally than in *Apus*, covering the head and thorax and even a part of the abdomen. The eyes in *Nebalia* are placed on peduncles beneath the carapace; the number of segments is not excessive as in *Apus*.

In *Estheria* (fig. 56), the carapace is composed of two valves, subovate in outline, like a bivalve molluscan shell, which it also resembles in being united by the umbones of each valve on the anterior dorsal border, and in each valve being marked by regular concentric lines of growth.

Branchipus (5 in fig. 57) and *Artemia* are destitute of any carapace, so that the elegant wave-like motion of their many-jointed transparent bodies and branchial feet can be freely observed. The former inhabits our fresh waters, the latter is marine, being peculiarly prolific in the brine-pans at Lymington, where the workmen firmly believe that the "brine-shrimp" aids in some way the rapid deposit of salt, through the constant agitation caused by such myriads of these minute and restless Entomostraca in the water.

Chirocephalus or *Branchipus* is believed to be only a variety of *Artemia*, resulting from change of conditions between a fresh and an extremely saline fluid medium.[1]

[1] See M. W. J. Schmankewitsch's paper on the transformations of *Artemia* and *Branchipus*, *Ann. and Mag. Nat. Hist.* vol. xvii. March 1876.

In Professor T. Rupert Jones's monograph on fossil *Estheriæ*, out of thirty-eight localities recorded for that genus living, three only were met with in brackish water.

Mr John Arthur Phillips, F.G.S., states that the *Artemia fertilis* is exceedingly abundant in the highly-saline waters[2] of Mono and Owen's Lakes, California. These little Crustacea congregate in such dense serpentine or annular masses in the water that a breeze sufficient to ruffle the surface of the lake scarcely affects the water filled by the *Artemiæ*, which remains perfectly smooth. The only other inhabitant of these salt-lakes is the larva of a dipterous insect, the *Ephydra californica*, Torrey, which is collected by the Indians, and, when dried in the sun, forms an important article of food. Myriads of gulls and other aquatic birds visit these lakes in summer to feed upon the *Artemiæ* and larval *Ephydræ*.

Nebalia, at the present day, seems but the puny and degenerate representative of the once giant pod-shrimps of Silurian times, the caudal somites of one of which measured 8 inches and the tail spines 6 to 7 inches in length, the carapace not being preserved.[3] The ancestors of *Nebalia* date back to the Menevian group, *Hymenocaris major* being the earliest known. *Ceratiocaris papilio* is so abundant in the Upper Silurian of Lesmahagow, Lanark, as to cover entire beds with its remains.

Many fossil forms, as *Dithyrocaris*, *Discinocaris*, *Aptychopsis*, and *Peltocaris*, carried their head-shield flat and expanded like *Apus* at the present day; one of these, a *Discinocaris* from Moffat, Dumfriesshire, had a carapace 7 inches in diameter. These forms occur in all the Palæozoic rocks. *Estheriæ* are found in the various strata from the Carboniferous Limestone to the Tertiary. Although *Branchipus* or *Chirocephalus* is destitute of any head-shield, its fossil remains have just been transmitted to the writer together with numerous Dipterous and Coleopterous insects from a freshwater deposit, associated with plant remains, at Gurnet Bay, in the Isle of Wight.

IV. Branchiopoda: (9.) Cladocera.—In the Cladocera are placed a number of minute animals furnished with branching natatory antennæ and five or six pairs of short foliaceous feet; the body (except the head which is distinct and projecting) is entirely inclosed within a carapace, formed of two valves joined together on the back; the eye is single and very large. The Cladocera are chiefly freshwater, and are distributed over the whole world. Of this order the *Daphnia pulex* (1 in fig. 58), so abundant in our fresh waters, is a good example. So numerous are they in our ponds in summer as frequently to impart a blood-red hue to the water for many yards in extent. In order to realize the wonderful fecundity of this and allied genera,[4] it is necessary to realize that when a *Daphnia* is only ten days old, eggs commence to be formed within the carapace, and under favourable conditions of light and temperature, it may have three broods a month or even a greater number,—the larger species having as many as forty or fifty eggs at once. No males appear until the autumn, so that all the earlier broods are derived from females, whose parent was fertilized, and died after depositing its eggs, the year before, and these continue to reproduce fertile female offspring throughout the summer.

[2] In 1866 Mr Phillips found that the waters of Owen's Lake had a specific gravity of 1·076, and contained 7128·24 grains of solid matter per gallon. This solid matter held in solution consisted of chloride, sulphate, and carbonate of sodium, 6813·28; sulphate, phosphate, and silicate of potassium, 298·02; and organic matter, 16·94 grains per imperial gallon.

[3] See *Geol. Mag.* 1866, vol. iii. pl. 10. fig. 8, p. 203; and *Geol. Mag.* 1871, vol. viii. pl. 3. fig. 3, p. 104.

[4] See Memoir by Professor Leydig, *Naturgeschichte der Daphniden*, 4to. Tübingen, 1860; Sir John Lubbock in *Phil. Trans.* 1857; Baird's *British Entomostraca* (Ray Society).

F. Goldenberg has lately described a fossil form belonging to this division (*Lyncites ornatus*) from the Coal-measures of Saarbruck.[1]

V. LOPHYROPODA: (10.) OSTRACODA.—In the Ostracoda, of which *Cypris*, *Candona* (2 in fig. 58), and *Cythere* are examples, the body is entirely enclosed in a carapace composed of two nearly equal parts like a bivalve shell. Two pairs of antennæ, one pair long, with hairy filaments, one pair short, stout, and recurved (like feet), and three pairs of short feet, may be seen protruded from the carapace, which is compact and brittle, yet is capable of protecting the living animal during long periods of drought, buried in the dried-up mud of pools. *Cypris* frequents stagnant water, living on dead animal matter. *Cythere* is found in pools along the sea-shore.

Like the Phyllopoda, the Ostracoda are of immense geological antiquity, *Primitia prima* occurring in the Lower Cambrian of St David's. There is abundant evidence, in almost every stratum, of the former existence of these little bivalved Crustacea, often in vast numbers; their size in early times was much larger, *Leperditiæ* as big as large horse-beans being found in Silurian strata, but the living forms are all microscopic. M. Ch. Brongniart has just described a fossil Ostracod, *Palæocypris Edwardsi*, inclosed in silex from the coal of St Étienne, in which all the organs are most perfectly preserved.[2] It closely resembles the modern form. The Ostracoda help with other microscopic organisms to build up the Chalk. They make up the great mass of the *Cypris* shales of the Wealden, Isle of Wight, and many Tertiary beds are largely composed of their remains.

V. LOPHYROPODA: (11.) COPEPODA—(*a.*) LIBERATA.—The free Copepods, of which *Cyclops*, *Canthocamptus*, and *Cetochilus* may serve as examples, have the head and thorax closely enveloped in a carapace with which the front rings of the thorax are confluent. The abdominal somites are much diminished in size and cylindrical. The single or paired external ovisacs are attached to two of the posterior somites, which are usually welded together. The single sessile median eye is situated near the front of the head; in the males of *Diaptomus* and *Anomalocera* the eye is pedunculated. The antennæ are very long and powerful natatory organs (in *Cetochilus*, 4 in fig. 58, and *Diaptomus* equalling the entire length of the animal's body); in the males one or both of the antennæ have a swelling near the centre or towards the extremity, followed by a movable joint which acts like a hinge and serves as a clasper to detain the female. There are five pairs of rowing feet, one pair of which are usually rudimentary.

The species belonging to this family are to be found in both fresh water and the sea. In the muddiest and most stagnant pools and in the clearest springs *Cyclops* abound (3*a* in fig. 58). The marine species frequent the pools along shore and the open ocean in equal abundance. They assist in producing that luminous appearance in the sea called "phosphorescence," for want of a better name (5 in fig. 58).

The fecundity of this order is truly surprising. *Cyclops quadricornis* is often found with thirty or forty eggs on each side; and though those species which have but a single ovisac do not carry so many, their number is still very considerable. Jurine isolated female specimens of *Cyclops*, and found them to lay eight to ten times within three months,—each time about forty eggs. At the end of a year one female would have produced 4,442,189,120 young! *Cetochilus* (4 in fig. 58) is so abundant, both in the Northern Seas and in the South Atlantic, as to serve for food to such an immense animal as the whale. They colour the sea for many miles in extent, and when the experienced whaler sees this ruddy hue upon the ocean he knows he has arrived at the "pasture of the whales." They are to be seen in vast quantities off the Isle of May in the Firth of Forth during the summer months; many Cetacea are attracted thither, and vast shoals of fish also come to feed upon them. One anomalous type of free Copepods is the *Notodelphys acidicola*, described by Allman, which is found swimming freely in the branchial sac of the *Ascidia communis*. In this species the female has the fourth anterior segment of the body peculiarly modified, so as to form on its dorsal surface a marsupium for receiving and retaining the ova until they are hatched, when they escape by an opening between the sac and the upper surface of the body-ring.

We have no positive records of Copepoda occurring in a fossil state.

V. LOPHYROPODA: (11.) COPEPODA—(*b.*) PARASITA.—The parasitic Copepods are divisible into two groups, the first comprising the peripatetic genera, in which the male and female both retain their organs of locomotion in the adult state, and can change their habitat whenever needful; this division would include the fresh-water *Argulidæ* and the marine *Caligidæ*. The second division embraces the fixed parasites, in which the females when adult lose their locomotory appendages and become fixed, deriving their nourishment by a true suctorial mouth, armed with styliform mandibles, from the fishes and other animals upon which they are parasitic. The larvæ when they emerge from the egg are nauplii, like those of other Copepods. The males and females are then alike; after attachment the female often attains a large size, and is soon little more than a maggot-like body, with immense paired ovaries attached to her abdomen. The male is very small and resembles a fat *Acarus*; he is usually parasitic on the female, adhering to the vulva.

Almost every fish has some form of these Copepod parasites, either on its skin, its eyes, or its gills.

Argulus foliaceus is of a rounded oval shape, the carapace inclosing the thoracic somites in a deep notch behind, and the body terminating with a bilobed telson. The antennæ are formed into recurved hooks for holding on by, when the animal shifts its position. The second pair of foot-jaws are converted into powerful suckers by which it attaches itself to its host. The mouth is tubular, and has a sharp styliform organ within it, affording good evidence of its suctorial habits. There are four pairs of biramose natatory feet. The animal, when detached, swims with extreme rapidity and elegance, and no fish, however rapid, can escape from its adherence.

The female is much larger than the male. She leaves the fish on which she is parasitic when desirous to deposit her eggs, which she fixes to a stone or other inorganic body at the bottom of the water. As many as 400 are deposited at one time by a single female. *Argulus catostomi* is said to lay 1500 eggs at once. The young are hatched in thirty-five days, and after about three moults as free Copepod larvæ they put on the adult form.

It would be impossible to give a detailed account of all the varied forms of Copepoda in an article like the present; we therefore must refer the reader to the works of Baird, Claus,[3] and others for fuller information.

VI. ANCHORACEPHALA: (12.) RHIZOCEPHALA.—These have been referred to under Metamorphosis, so that we need not allude to them further here, save only to give illustrations of two genera, *Peltogaster* (fig. 82) and *Sacculina* (fig. 83).

VI. ANCHORACEPHALA: (13.) CIRRIPEDIA.—Forty years

[1] *Giebel und Siewert's Zeitschrift*, 1870, vol. i. p. 524.
[2] *Ann. des Soc. Geol. France*, t. vii. pt. vi.

[3] See Dr C. Claus, *Die Frei Lebenden Copepoden mit Besonderer Berücksichtigung der Fauna Deutschlands der Nordsee und des Mittlemeeres*, 37 plates, Leipsic, 1863, 4to.

ago the Cirripedia were still arranged as Mollusca in many public museums; nor is this surprising, considering the

Fig. 82. Fig. 83.

Fig. 82.—Young of *Peltogaster socialis* on the abdomen of a small hermit-crab; in one of them the fasciculately ramified roots, *r*, in the liver of the crab are shown. The animal and roots are deep yellow. (Fritz Müller.)
Fig. 83.—Young of *Sacculina purpurea* with its roots; the animal purple-red, the roots dark grass green. Magn. 5 diam. (Fritz Müller.)

fixed condition of their shells and the degree of external resemblance between *Lepas* and *Teredo* on the one hand, and *Balanus* and a compound of a *Patella* and a *Chiton* shell on the other. Strauss in 1819 first affirmed that Cirripedes were Crustacea. But this view was disregarded until J. Vaughan Thompson's capital discovery in 1830 of their metamorphosis, since which time they have been almost universally placed with the Crustacea.

The Cirripedia are classed by Darwin in three great divisions:—(1) Thoracica (limbs thoracic); (2) Abdominalia (limbs abdominal); (3) Apoda (appendages wanting). In the first division are embraced the *Balanidæ*, the *Verrucidæ*, and the *Lepadidæ*; in the second a single genus, *Cryptophialus minutus*, the third is also represented by one form, the *Proteolepas bivinct*.

(1) Thoracica.—Cirripedes ordinarily are bisexual,[1] in which respect they differ from all other Crustacea,—the male (where it exists distinct) being minute and rudimentary in structure and permanently epizoic on the female. In these latter facts we find an analogy in the Copepoda Parasita just noticed. The male has the excretory organ single, median, and probosciform, and placed at the extremity

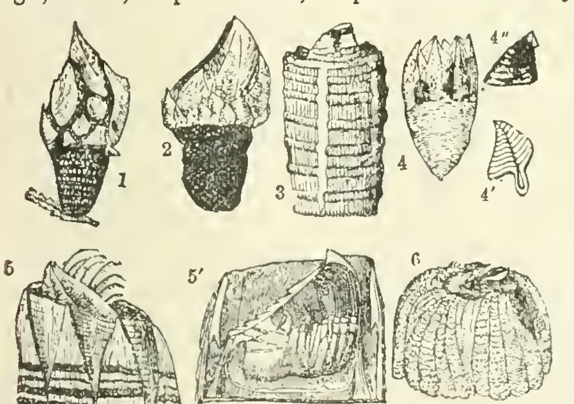

Fig. 84.—1, *Scalpellum rostratum*, Darwin, Philippine Islands; 2, *Pollicipes cornucopiæ*, Leach, European Seas; 3, *Tubicinella trachealis*, Shaw, attached to whales; 4, *Acasta sulcata*, Lamk., in sponges, New South Wales (4′, tergum; 4″, scutum); 5, *Balanus tintinnabulum*, Linn., Atlantic; 5′, Section of *Balanus*, Linn.; 6, *Coronula diadema*, Linn., attached to whales.

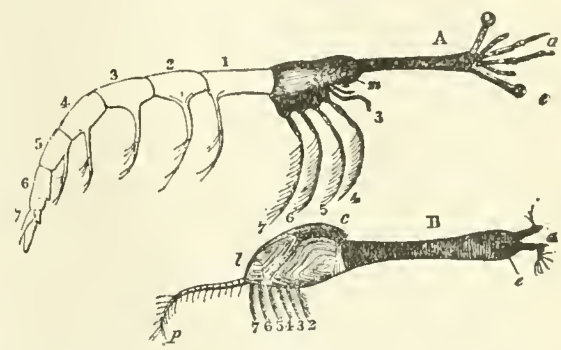
of the abdomen,—in all these respects differing from other Crustacea in which the male organ is laterally double. In the female organs the ovarian tubes and cæca inosculate together; there are no oviducts, the ova connected together by membrane, and so forming the "ovigerous lamellæ," become exposed by the exuviation of the lining tunic of the carapace or sack, and by the formation of a new tunic on the under side of the lamellæ, a process unknown in any other Crustacean. The Thoracica are mainly divided into *Balanidæ* and *Lepadidæ*; in the former, the animal when adult is inclosed in the parietes of its shell, and fixed to some living or dead object by a broad shelly basis, the aperture being protected by the opercular valves. In the *Lepadidæ* the animal is attached by the extremity of a more or less long muscular peduncle, and its body is lodged within the shelly valves of the capitulum. In some species, as in *Pollicipes* and *Scalpellum*, the peduncle is covered with more or less numerous rows of scales or squamæ. This peduncle in *Pollicipes* and *Scalpellum* corresponds with the basis in *Balanus*, as may clearly be seen if a *Pollicipes* with a short peduncle and a *Balanus* with a deep cup-formed or cylindrical basis be compared, the animal being in part lodged in both, as in *Ibla* and *Lithotrya*. The scales which surround the base of the valves in *Pollicipes* correspond with the parietes of the walls of *Balanus*, the valves of the capitulum of the former being homologous with the opercular valves in the latter (fig. 84). The body consists of six, perhaps of seven, posterior thoracic somites. In the division Thoracica the abdomen is undeveloped.[2] The thoracic segments support six pairs of cirri. Each cirrus consists of a two-jointed pedicel, carrying two multi-articulated rami. The mouth has a labrum, palpi, mandibles, and two pairs of maxillæ; within the sack a folded membrane forms the branchiæ. Darwin concludes that in the Cirripedia the body may be said to be composed, at most, of but seventeen segments.

In order to indicate the homologies which still exist between the parts of an adult Cirripede and an ordinary free



85.—Theoretical view of the homologies of the Cirripedia with other Crustacea. A, *Leucifer* (a Stomapod); B, *Lepas*. *a*, antennæ; *e*, *e*, the eyes; *m*, the mouth; *p*, the penis. (After Darwin.)

Crustacean, we give the accompanying illustrations from Darwin (fig. 85). The upper figure is a Stomapod Crustacean (*Leucifer*); the abdomen, being rudimentary in the adult Cirripedia, is only shown in faint outlines. The lower figure is of a mature *Lepas* with the antennæ and eyes, which are actually present in the larva, retained for the sake of completing the comparison. "All that we externally see of a Cirripede, whether pedunculated or sessile, is the three anterior segments of the head of a Crustacean, with its anterior end permanently cemented to a surface of attachment, and with its posterior end projecting vertically from it" (Darwin).

The thoracic appendages of the Cirripedia present us with yet another wonderful modification of the Crustacean type; these biramous multi-articulated cirri are neither natatory, nor ambulatory, nor branchial, but "captorial," or fitted for sweeping the water, and thus catching prey,—their alternate extensile and retractile wave-like movements bringing all floating particles and minute organisms within reach of the inclosed mouth.[3]

[1] All the *Balanidæ* are bisexual and hermaphrodite, no males or complemental males having been found in any of them.

[2] In the pupa, however, of this order, and in the mature animal of the two other orders (the *Abdominalia* and *Apoda*), it is formed of three segments.

[3] Mr Gosse mentions that the little crab, *Porcellana platycheles* (fig.

(2) Abdominalia.—The single Cirripede, the *Cryptophialus minutus*, forming this section is the smallest known, being less than $\frac{1}{10}$th of an inch in length. It is met with imbedded in vast numbers in the living shell of *Concholepas Peruviana*, the crypts almost touching each other. The three abdominal somites bear three pairs of cirri, the thoracic somites being apodal. The sexes are distinct, the minute almost globular male being lodged within the crypt occupied by the female. Darwin found from one or two up to seven males attached to the same female.

(3) Apoda.—This section, like the last, contains only a single form, the *Proteolepas bivincta*, resembling the larva or maggot of a fly attached by two threads; the mouth is suctorial; it has no limbs; its body is shell-less, and it lies parasitic within the sack of *Alepas cornuta*.

Cirripedia occur attached to the most varied objects, living and dead, throughout the seas of the globe. Sessile forms like *Tubicinella*, *Coronula*, *Platylepas*, *Chelonobia*, &c., are found attached to, and imbedded in, the epidermis of the whale, and on the shell of the turtle, &c. Pedunculated forms are similarly widely distributed. Fritz Müller calls attention to one anomalous form described by Darwin, the *Anelasma squalicola*, parasitic upon sharks in the North Sea, which seems to offer a remarkable analogy to the Rhizocephala. This Lepadide, he says, seems in a fair way to lose its cirri and buccal organs altogether. "The widely-cleft shell-less test is supported upon a thick peduncle, which is imbedded in the skin of the shark. The surface of the peduncle is beset with much-ramified hollow filaments, which penetrate the shark's flesh like roots." Cement glands and cement were not visible. "It seems to me," says Fritz Müller, "hardly doubtful that the ramified hollow filaments are themselves nothing but the cement ducts converted into nutritive roots, and that it is in consequence of the development of this new source of nourishment that the cirri and buccal organs are in the highest degree aborted." All the mouth organs are minute and rudimentary; the cirri thick, inarticulate, and destitute of bristles; the muscular tissue without transverse striation, and the stomach perfectly empty.[1]

"The *Lepadidæ*," writes Darwin, "include a much greater range of forms than the *Balanidæ*, and this is what might have been expected, for it is the most ancient family, and extinction has done its work in separating genera which, according to analogy, were once more nearly connected by intermediate forms."

The most ancient sessile Cirripede found fossil is the *Pyrgoma cretacea*, H. Woodw., from the Chalk. Previous to 1865 the oldest-known pedunculated Cirripede was the *Pollicipes rhæticus*, Moore. In that year the writer described a curious and most anomalous form of Cirripede, from the Upper Silurian of Dudley, with imbricated calcareous plates (fig. 86), under the name of *Turrilepas Wrightii*, previously described as a *Chiton*. The fossil form with which it has been compared is more perfect and equally bizarre, viz., the *Loricula pulchella* (see 6 in fig. 70), originally discovered in the Chalk of Rochester and since in that near Norwich. It affords evidence of a most aberrant form of Lepadide, in which the capitulum is very small; the body of the animal was lodged in a broadly-expanded peduncle, clothed in five rows of smooth loricated calcareous scales, which, if both sides were perfect, would have possessed ten rows and the plates would have exceeded 200 in number. In Bate and Westwood's *Sessile-eyed Crustacea* (vol. ii. p. 268) is figured a larval form of *Cryptothiria Balani* (reproduced in fig. 41 above), which

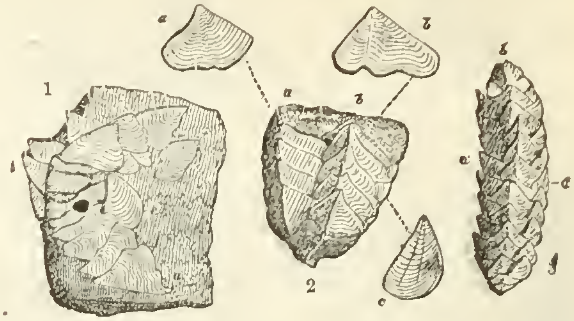


Fig. 86.—*Turrilepas Wrightii*, H. Woodw. (*Chiton Wrightii*, De Kon.); U. Silorian, Dudley. The detached figures, *a*, *b*, *c*, indicate the three forms of plates of which the peduncles are composed in 1, 2, and 3 which bear the corresponding letters. The opercular valves are not known.

seems to afford evidence of a similar arrangement of plates. Possibly *Loricula* was parasitic like *Bopyrus*.

In conclusion, sufficient evidence has been adduced to show that the normal development of the Crustacean class has been one of progressive advancement, the forms of to-day, when viewed as a whole, being more highly developed and more differentiated than those which the geological record has preserved to us. But in any large community or class it is only the few that outstrip the many in the struggle for existence. Thus the Podophthalmia and Edriophthalmia present numerous examples of high advancement, both in intelligence and in attaining to a terrestrial life, especially in the Decapoda-Brachyura. The Ostracoda, Phyllopoda, and Xiphosura are good instances of merely persistent forms. They are orders the members of which have branched out long since into by-ways of their own, where, being checked from further progress, they have, by their great tenacity of life and large powers of reproduction, held their ground through the long lapse of ages from Silurian times to the present day, whilst higher orders have been modified or swept away.

But the history of some Crustacea has been *retrogressive*, probably in a few instances from arrested larval development, as, for example, in the case of the imperfectly-developed fifth pair of legs in *Porcellana*, *Galathea*, and *Munida*; in most instances, however, retrogression seems clearly traceable to the parasitic or sedentary mode of life which the members have adopted. We have examples of this in the loss of eyesight in Crustacea passing their lives in subterranean caverns, wells, and streams; the loss and atrophy of a part of the defensive armature of the body in the burrowing *Thalassinidæ*; the complete loss of the abdominal calcareous covering in *Pagurus*; the general atrophy of limbs and loss of symmetry of the body in the *Bopyridæ* through residence within the branchial chambers of other Crustacea; and the complete or partial loss of all or nearly all recognizable Crustacean characters in the adult female, or in both sexes, by parasitism on Crustacea, fishes, &c., in certain of the *Bopyridæ*, in the Copepoda, in the Rhizocephala, and in the Cirripedia.

Viewed as a whole, the Crustacea probably offer the best illustration of a class constructed on a common type, retaining its general characteristics, but capable of endless modifications of its parts, so as to suit the extreme requirements of every separate species.

The outline of this great class here attempted necessarily lacks many important details; these must be filled in by the reader from the various works referred to throughout the article. (H. W.)

68), which lives concealed, holding tightly to the under side of flat stones at low water, does exactly the same thing with its maxillipeds as the barnacles do with their cirri; it keeps up a semicircular sweeping movement, so that a constant current conveys all the small living and dead objects within reach of its mouth.

CRUVEILHIER, Jean (1791–1874), a French anatomist, was born at Limoges. Having been educated at the university of Paris, where he received his doctor's degree in 1816, he practised for some years in his native town, at Paris, and at Montpellier. In 1825 he became professor of anatomy in the university of Paris, and ten years later he was the first occupant of the recently founded chair of pathological anatomy. He was also created Commander of the Legion of Honour.

The chief works of Cruveilhier are his *Anatomie pathologique du corps humain* (1st vol., 1829, 2d vol., 1842), *Traité d'Anatomie pathologique générale* (1849–64), *Anatomie du Système nerveux de l'Homme* (1845), *Traité d'Anatomie descriptive* (1851).

CRUZ, Juan de la (1542–1591, a Spanish mystic, whose family name was Yepes, was born at Ontiveros, in Old Castile. He took the vows at twenty-one, and soon became the faithful and ardent follower of Santa Teresa in her plans for the reform of the Carmelite order, to which he belonged. His zeal drew upon him the wrath of his brethren, through whose influence he was imprisoned for nine months. His release was procured by Santa Teresa, under whom he worked with fervent devotion for many years; but in 1591, having ventured to oppose his superiors, he was sent to a monastery in the Sierra Morena. His health, however, gave way, and he was allowed to change his residence to the monastery of Ubeda, where he died in 1591. In 1675 he was beatified, and in 1726 he was canonized. The poems and prose works of San Juan de la Cruz, which are chiefly devotional and never secular, though rhapsodical and mystical and often obscure, are distinguished by much passionate eloquence and beauty of diction.

Since 1619, the date of the first edition, they have been frequently reprinted. They have been several times translated into French, and a Latin version appeared at Cologne in 1639. A complete edition forms volume xvii. of the *Biblioteca de Autores Españoles*, where is also contained an interesting treatment of his character; and his poems are published in Depping's *Floresta de Rimas Castellanas*, and in an edition by Storck (Munster, 1854), who has also published a German version. See, besides, the highly laudatory and popular life published in 1625, and the lives by Joseph de Jesu-Maria and by Sainte-Alexis.

CRUZ, Ramon de la, Spanish dramatist, was born at Madrid in 1731. Nothing is known of his life, save that he was an employé in the ministry of finance, that he was a member of the Academy of Seville and of the Roman "Arcadians," and that between 1786 and 1791 he published some ten volumes of plays. Among his 300 pieces he is remembered only by his *sainetes*, little farcical sketches of city life, written to be played between the acts of a greater play, or as afterpieces.

Specimens are to be found in Ochoa, *Tesoro del Teatro Español*, vol. v.; and seventeen of the best of them have been translated into French, and published, with an introduction, by Antoine de Latour, in his *Sainetes de Ramon de la Cruz*, Paris, 1865. A complete edition, comprising upwards of 110, was issued by Don Agostino Duran in 1848. See Ticknor's *Spanish Literature*, iii. 249–251.

CRYOLITE, so named from κρύος, ice, and λίθος, stone, on account of its ready fusibility, is a massive, usually granular or indistinctly crystalline, cleavable, translucent to transparent, brittle mineral, of a snow-white (sometimes reddish or brownish) colour, vitreous lustre, hardness 2·5, and specific gravity 2·9–3·077. Its transparency is increased by immersion in water. Before the blowpipe it fuses easily to an opaque white enamel It is a double fluoride of aluminium and sodium, with the percentage composition—aluminium 13, sodium 32·8, fluorine 54·2, answering to the formula $Al_2F_6,6NaF$. Cryolite is used in the manufacture of soap, soda, aluminium sulphate, alum, and cryolite glass; and, till superseded by bauxite, was the chief source of aluminium. That metal was first obtained from it, early in 1855, by Allan Dick, who fused the mineral with alternate layers of small pieces of sodium in a magnesia-lined crucible. Rose, in September of the same year, published a method of producing aluminium by heating together cryolite, potassium chloride, and sodium. According to M. Gauduin a mixture of equal parts of cryolite and barium chloride forms a flux superior to borax for soldering iron, or brazing copper, brass, and bronze. Cryolite was discovered and named by Abildgaard about the year 1800, and was subsequently described by D'Andrada and Karsten, and accurately analyzed by Klaproth. Giesecke in 1822 first made known its occurrence at Ivigtot, in the colony of Frederikshaab, South Greenland. It is found there associated with galena, pyrites, and chalybite, and forms a vein 80 feet in thickness. At Miask in the Urals it occurs with chiolite, lepidolite, and fluor. In 1875 thirty-three cargoes of the mineral, representing a total of 5076 cubic yards, were shipped from the mine at Ivigtot, where the number of labourers employed during the summer was 136. The tax on the mine yielded to the revenue of Greenland in twenty years, or from 1853 to 1874, the sum of £46,402.

CRYPT (Latin, *crypta*, from the Greek κρύπτω, I hide), a vault or subterranean chamber, especially under churches. In classical phraseology "crypta" was employed for any vaulted building, either partially or entirely below the level of the ground. It is used for a sewer (*crypta Suburæ*, Juvenal, *Sat.* v. 106); for the "carceres," or vaulted stalls for the horses and chariots in a circus (Sidon. Apoll., *Carm.* xxiii. 319); for the close porticoes or arcades, more fully known as "cryptoporticus," attached by the Romans to their suburban villas for the sake of coolness, and to the theatres as places of exercise or rehearsal for the performers (Plin., *Epist.* ii. 15, v. 6, vii. 21; Sueton., *Calig.* 58; Sidon. Apoll., lib. ii. epist. 2); and for underground receptacles for agricultural produce (Vitruv. vi. 8, Varro *de re Rust.* i. 57). Tunnels, or galleries excavated in the living rock, were also called *cryptæ*. Thus the tunnel to the north of Naples, through which the road passes to Puteoli, familiar to tourists as the "Grotto of Posilipo," was originally designated *crypta Neapolitana* (Seneca, *Epist.* 57). In early Christian times *crypta* was appropriately employed for the galleries of a catacomb, or for the catacomb itself. Jerome calls them by this name when describing his visits to them as a schoolboy, and the term is used by Prudentius (Catacombs).

A crypt, as a portion of a church, had its origin in the subterranean chapels known as "confessiones," erected around the tomb of a martyr, or the place of his martyrdom. This is the origin of the spacious crypts, some of which may be called subterranean churches, of the Roman churches of St Prisca, St Prassede, St Martino ai Monti, St Lorenzo fuori le Mura, and above all of St Peter's,—the crypt being thus the germ of the church or basilica subsequently erected above the hallowed spot. When the martyr's tomb was sunk in the surface of the ground, and not placed in a catacomb chapel, the original memorial-shrine would be only partially below the surface, and consequently the part of the church erected over it, which was always that containing the altar, would be elevated some height above the ground, and be approached by flights of steps. This fashion of raising the chancel or altar end of a church on a crypt was widely imitated long after the reason for adopting it ceased, and even where it never existed. The crypt under the altar at the basilica of St Maria Maggiore in Rome is merely imitative, and the same may be said of many of the crypts of our early churches in England. The original Saxon cathedral of Canterbury had a crypt beneath the eastern apse, containing the so-called body of St Dunstan, and other relics, "fabricated," according to Eadmer, "in the likeness of the confessionary of St Peter at Rome" (Basilica). St Wilfrid constructed crypts still existing beneath the churches erected by him at the latter part of the 7th century at Hexham and Ripon. These are peculiarly interesting from their similarity in form and arrangement to the catacomb chapels with which Wilfrid must have become familiar during his residence in Rome. The cathedral, begun by Æthelwold and finished by Elphege at Winchester, at the end of the 10th century, had spacious crypts "supporting the holy altar and the venerable relics of the saints" (Wulstan, *Life of St Æthelwold*), and they appear to have been common in the earlier churches in England. The arrangement was adopted by the Norman builders of the 11th and 12th centuries, and though far from universal is found in many of the cathedrals of that date. The object of the construction of these crypts was twofold,—to give the altar sufficient elevation to enable those below to witness the sacred mysteries, and to provide a place of burial for those holy men whose relics were the church's most precious possession. But the crypt was "a foreign fashion," derived, as has been said, from Rome, "which failed to take root in England, and indeed elsewhere barely outlasted the Romanesque period" (*Essays on Cathedrals*, p. 331). Of the crypts beneath our Norman cathedrals, that under the choir of Canterbury is by far the largest and most elaborate in its arrangements. It is, in fact, a subterranean church of vast size and considerable altitude, and in consequence of the elevation of the floor of the upper church is scarcely, if at all, below the level of the soil, and is therefore fairly well lighted. The whole crypt was dedicated to the Virgin Mary, and contained two chapels especially dedicated to her,—the central one beneath the high altar, enclosed with rich Gothic screenwork, and one under the south transept. This latter chapel was appropriated by Queen Elizabeth to the use of the French Huguenot refugees who had settled at Canterbury in the time of Edward VI. There were also in this crypt a large number of altars and chapels of other saints, some of whose hallowed bodies were buried here. At the extreme east end, beneath the Trinity Chapel, the body of St Thomas (Becket) was buried the day after his martyrdom, and lay there till his translation, July 7, 1220. The cathedrals of Winchester, Worcester, and Gloucester have crypts of slightly earlier date (they may all be placed between 1080 and 1100), but of similar character, though less elaborate. They all contain piscinas and other evidences of the existence of altars in considerable numbers. They are all apsidal. The most picturesque is that of Worcester, the work of Bishop Wulstan (1084), which is remarkable for the multiplicity of small pillars supporting its radiating vaults. Instead of having the air of a sepulchral vault like those of Winchester and Gloucester, this crypt is, in Professor Willis's words, "a complex and beautiful temple." Archbishop Roger's crypt at York, belonging to the next century (1154–1181), was filled up with earth when the present choir was built at the end of the 14th century, and its existence forgotten till its disinterment after the fire of 1829. The choir and presbytery at Rochester are supported by an extensive crypt, of which the western portion is Gundulf's work (1076–1107), but the eastern part, which displays slender cylindrical and octagonal shafts, with light vaulting springing from them, is of the same period as the superstructure, the first years of the 13th century. This crypt, and that beneath the Early English Lady Chapel at Hereford, are the latest of our existing cathedral crypts. That at Hereford was rendered necessary by the fall of the ground, and is an exceptional case. Later than any of these crypts was that of St Paul's, London. This was a really large and magnificent church of Decorated date, with a vaulted roof of rich and intricate character resting on a forest of clustered columns. Part of it served as the parish church of St Faith. A still more exquisite work of the Decorated period is the crypt of St Stephen's chapel at Westminster, than which it is difficult to conceive anything more perfect in design or more elaborate in ornamentation. Having happily escaped the conflagration of the Houses of Parliament in 1834—before which it was degraded to the purpose of the Speaker's state dining-room—it has been restored to its former sumptuousness of decoration, and is now one of the most beautiful architectural gems in England.

Of Scottish cathedrals the only one that possesses a crypt is the cathedral of Glasgow, rendered celebrated by Sir Walter Scott in his novel of *Rob Roy* (ch. xx.). At the supposed date of the tale, and, indeed till a comparatively recent period, this crypt was used as a place of worship by one of the three congregations among which the cathedral was partitioned, and was known as "the Laigh or Barony Kirk." It extends beneath the choir transepts and chapter-house; in consequence of the steep declivity on which the cathedral stands it is of unusual height and lightsomeness. It belongs to the 13th century, its style corresponding to our Early English, and is simply constructional, the building being adapted to the locality. In architectural beauty it is quite unequalled by any crypt in the United Kingdom, and can hardly anywhere be surpassed It is an unusually rich example of the style, the clustered piers and groining being exquisite in design and admirable in execution. The bosses of the roof and capitals of the piers are very elaborate, and the doors are much enriched with foliage. "There is a solidity in its architecture, a richness in its vaulting, and a variety of perspective in the spacing of its pillars, which make it one of the most perfect pieces of architecture in these kingdoms" (Fergusson). The care that is taken of this beautiful architectural gem, and the lavish outlay with which its windows have been decorated with stained glass, are a gratifying proof that the citizens of Glasgow fully appreciate the treasure they possess. In the centre of the main alley stands the mutilated effigy of St Mungo, the patron saint of Glasgow, and at the south-east corner is a well called after the same saint.

Crypts under parish churches are not very uncommon in England, but they are usually small and not characterized by any architectural beauty. A few of the earlier crypts, however, deserve notice. One of the earliest and most remarkable is that of the church of Lastingham near Pickering in Yorkshire, on the site of the monastery founded in 648 by Cedd, bishop of the East Anglians. The existing crypt, though exceedingly rude in structure, is of considerably later date than Bishop Cedd, forming part of the church erected by Abbot Stephen of Whitby in 1080, when he had been driven inland by the incursions of the northern pirates. This crypt is remarkable from its extending under the nave as well as the chancel of the upper church, the plan of which it accurately reproduces, with the exception of the westernmost bay. It forms a nave with side aisles of three bays, and an apsidal chancel, lighted by narrow deeply splayed slits. The roof of quadripartite vaulting is supported by four very dwarf thick cylindrical columns, the capitals of which and of the responds are clumsy imitations of classical work with rude volutes. Still more curious is the crypt beneath the chancel of the church of Repton in Derbyshire. This also consists of a centre and side aisles, divided by three arches on either side. The architectural character, however, is very different from that at Lastingham, and is in some respects almost unique, the piers being slender, and some of them of a singular spiral form, with a bead running in the sunken part of the spiral. Another very extensive and curious Norman crypt is that beneath the chancel of St Peter's-in-the-East at Oxford. This is five bays in length, the quadripartite vaulting being supported by eight low, somewhat slender, cylindrical columns with capitals bearing grotesque animal and human subjects. Its dimensions are

36 by 20 feet and 10 feet in height. This crypt has been commonly attributed to Grymboldt in the 9th century; but it is really not very early Norman. Under the church of St Mary-le-Bow in London there is an interesting Norman crypt not very dissimilar in character to that last described. Of a later date is the remarkably fine Early English crypt groined in stone, beneath the chancel of Hythe in Kent, containing a remarkable collection of skulls and bones, the history of which is quite uncertain. There is also a Decorated crypt beneath the chancel at Wimborne Minster, and one of the same date beneath the southern chancel aisle at Grantham.

Among the more remarkable French crypts may be mentioned those of the cathedrals of Auxerre, said to date from the original foundation in 1085; of Bayeux, attributed to Odo, bishop of that see, uterine brother of William the Conqueror, where twelve columns with rude capitals support a vaulted roof; of Chartres, running under the choir and its aisles, frequently assigned to Bishop Fulbert in 1029, but more probably coeval with the superstructure; and of Bourges, where the crypt is in the Pointed style, extending beneath the choir. The church of the Holy Trinity attached to Queen Matilda's foundation—the "Abbaye aux Dames" at Caen—has a Norman crypt where the thirty-four pillars are as closely set as those at Worcester. The church of St Eutropius at Saintes has also a crypt of the 11th century, of very large dimensions, which deserves special notice; the capitals of the columns exhibit very curious carvings. Earlier than any already mentioned is that of St Gervase of Rouen, considered by Mr E. A. Freeman "the oldest ecclesiastical work to be seen north of the Alps." It is apsidal, and in its walls are layers of Roman brick. It is said to contain the remains of two of the earliest apostles of Gaul—St Mellon and St Avitianus.

Space forbids our particularizing the numerous crypts of Germany. One at Göttingen may be mentioned, where cylindrical shafts with capitals of singular design support "vaulting of great elegance and lightness" (Fergusson), the curves being those of a horseshoe arch. The crypts of the cathedrals or churches at Halberstadt, Hildersheim, and Naumburg, also deserve to be noticed; that of Lubeck may be rather called a lower choir. It is 20 feet high and vaulted.

The Italian crypts, when found, as a rule reproduce the "confessio" of the primitive churches. That beneath the chancel of St Michele at Pavia is an excellent typical example, probably dating from the 10th century. It is apsidal and vaulted, and is seven bays in length. That at St Zeno at Verona (c. 1138) is still more remarkable; its vaulted roof is upborne by forty columns, with curiously carved capitals. It is approached from the west by a double flight of steps, and contains many ancient monuments. St Miniato at Florence, begun in 1013, has a very spacious crypt at the east end, forming virtually a second choir. It is seven bays in length and vaulted. The most remarkable crypt in Italy, however, is perhaps that of St Mark's, Venice. The plan of this is almost a Greek cross. Four rows of nine columns each run from end to end, and two rows of three each occupy the arms of the cross, supporting low stunted arches on which rests the pavement of the church above. This also constitutes a lower church, containing a *chorus cantorum* formed by a low stone screen, not unlike that of St Clement at Rome (see Basilica, vol. iii. p. 417), inclosing a massive stone altar with four low columns. This crypt is reasonably supposed to belong to the church founded by the doge P. Orseolo in 977. There are also crypts deserving notice at the cathedrals of Brescia, Fiesole, and Modena, and the churches of St Ambrogio and St Eustorgio at Milan. The former was unfortunately modernized by St Charles Borromeo. The crypt at Assisi is really a second church at a lower level, and being built on the steep side of a hill is well lighted. The whole fabric is a beautiful specimen of Italian Gothic, and both the lower and upper churches are covered with rich frescoes. The crypts at Rome have been already mentioned.

Domestic crypts are of frequent occurrence. Mediæval houses had as a rule their chief rooms raised above the level of the ground upon vaulted substructures, which were used as cellars and storerooms. These were sometimes partially underground, sometimes entirely above it. The underground vaults often remain when all the superstructure has been swept away, and from their Gothic character are frequently mistaken for ecclesiastical buildings. All our older towns are full of crypts of this character, now used as cellars. They occur in Oxford and Rochester, are very abundant in the older parts of Bristol, and, according to Mr Parker, "nearly the whole city of Chester is built upon a series of them with the Rows or passages made on the top of the vaults" (*Domestic Architecture*, iii. p. 91). The crypt of Gerard's Hall in London, destroyed in the construction of New Cannon Street, figured by Mr Parker (*Dom. Arch.*, ii. 185), was a very beautiful example of the lower story of the residence of a wealthy merchant of the time of Edward I. It was divided down the middle by a row of four slender cylindrical columns supporting a very graceful vault. The finest example of a secular crypt now remaining in England is that beneath the Guildhall of London. The date of this is early in the 15th century, 1411. It is a large and lofty apartment, divided into four alleys by two rows of clustered shafts supporting a rich lierne vault with ribs of considerable intricacy. There is a fine vaulted crypt of the same date and of similar character beneath St Mary's Hall, the Guildhall of the city of Coventry. (E. V.)

CRYPTOGRAPHY (from κρύπτειν, to hide), or writing in cipher (from Arabic *cifr*, empty, void), called also steganography (from στεγάνη, a covering), is the art of writing messages, &c., in such a way as to be understood by those only who possess the key to the characters employed. The unravelling of the writing is called deciphering. Cryptography having become a distinct art, Bacon classed it (under the name *ciphers*) as a part of grammar. Secret modes of communication have been in use from the earliest times. The Lacedemonians, according to Plutarch, had a method which has been called the *scytale*, from the staff (σκυτάλη) employed in constructing and deciphering the message. When the Spartan ephors wished to forward their orders to their commanders abroad, they wound slantwise a narrow strip of parchment upon the σκυτάλη so that the edges met close together, and the message was then added in such a way that the centre of the line of writing was on the edges of the parchment. When unwound the scroll consisted of broken letters; and in that condition it was despatched to its destination, the general to whose hands it came deciphering it by means of a σκυτάλη exactly corresponding to that used by the ephors. Polybius has enumerated other methods of cryptography.

The art was in use also amongst the Romans. Upon the revival of letters methods of secret correspondence were introduced into private business, diplomacy, plots, &c.; and as the study of this art has always presented attractions to the ingenious, a curious body of literature has been the result.

John Trithemius, the abbot of Spanheim, was the first important writer on cryptography. His *Poligraphia*, published in 1500, has passed through many editions, and has supplied the basis upon which subsequent writers have worked. It was begun at the desire of the duke of Bavaria;

but Trithemius did not at first intend to publish it, on the ground that it would be injurious to public interests. The next treatises of importance were those of John Baptist Porta, a Neapolitan mathematician, who wrote *De furtivis literarum notis*, 1563; and of Blaise de Vigenere, whose *Traité des chiffres* appeared in Paris, 1587. Lord Verulam proposed an ingenious system of cryptography on the plan of what is called the double cipher; but while thus lending to the art the influence of his great name, he gave an intimation as to the general opinion formed of it and as to the classes of men who used it. For when prosecuting the earl of Somerset in the matter of the poisoning of Overbury, he urged it as an aggravation of the crime that the earl and Overbury "had cyphers and jargons for the king and queen and all the great men,—things seldom used but either by princes and their ambassadors and ministers, or by such as work or practise against or, at least, upon princes." Other eminent Englishmen were afterwards connected with the art. John Wilkins, subsequently bishop of Chester, published in 1641 an anonymous treatise entitled *Mercury, or The Secret and Swift Messenger*,—a small but comprehensive work on the subject, and a timely gift to the diplomatists and leaders of the civil war. The deciphering of many of the royalist papers of that period, such as the letters that fell into the hands of the Parliament at the battle of Naseby, has by Henry Stubbe been charged on the celebrated mathematician Dr John Wallis (*Athen. Oxon.*, iii. 1072), whose connection with the subject of cipher-writing is referred to by himself in the Oxford edition of his mathematical works, 1689, page 659; as also by John Davys. Dr Wallis elsewhere states that this art, formerly scarcely known to any but the secretaries of princes, &c., had grown very common and familiar during the civil commotions, "so that now there is scarce a person of quality but is more or less acquainted with it, and doth, as there is occasion, make use of it." Subsequent writers on the subject are John Falconer (*Cryptomenysis Patefacta*), 1685; John Davys (*An Essay on the Art of Decyphering: in which is inserted a Discourse of Dr Wallis*), 1737; Philip Thicknesse (*A Treatise on the Art of Decyphering and of Writing in Cypher*), 1772; William Blair (the writer of the comprehensive article "Cipher" in Rees's *Cyclopædia*), 1819; and G. von Marten (*Cours Diplomatique*), 1801 (a fourth edition of which appeared in 1851). Perhaps the best modern work on this subject is the *Kryptographik* of J. L. Klüber (Tübingen, 1809), who was drawn into the investigation by inclination and official circumstances. In this work the different methods of cryptography are classified. Amongst others of lesser merit who have treated on this art, may be named Gustavus Selenus (*i.e.*, Augustus, duke of Brunswick), 1624; Cospi, translated by Niceron in 1641; the marquis of Worcester, 1659; Kircher, 1663; Schott, 1665; Hiller, 1682; Comiers, 1690; Baring, 1737; Conrad, 1739, &c.

Schemes of cryptography are endless in their variety. Bacon lays down the following as the "virtues" to be looked for in them:—"that they be not laborious to write and read; that they be impossible to decipher; and, in some cases, that they be without suspicion." These principles are more or less disregarded by all the modes that have been advanced, including that of Bacon himself, which has been unduly extolled by his admirers as "one of the most ingenious methods of writing in cypher, and the most difficult to be decyphered, of any yet contrived" (Thicknesse, p. 13).

The simplest and commonest of all the ciphers is that in which the writer selects in place of the proper letters certain other letters in regular advance. This method of transposition was used by Julius Cæsar. He "per quartam elementorum literam," wrote *d* for *a*, *e* for *b*, and so on. There are instances of this arrangement in the Jewish rabbis, and even in the sacred writers. An illustration of it occurs in Jeremiah (xxv. 26), where the prophet, to conceal the meaning of his prediction from all but the initiated, writes *Sheshach* instead of Babel (Babylon), the place meant; *i.e.*, in place of using the second and twelfth letters of the Hebrew alphabet (*b*, *b*, *l*) from the beginning, he wrote the second and twelfth (*sh*, *sh*, *ch*) from the end. To this kind of cipher-writing Buxtorf gives the name Athbash (from *a*, the first letter of the Hebrew alphabet, and *th* the last; *b* the second from the beginning, and *h* the second from the end). Another Jewish cabalism of like nature was called Albam; of which an example is in Isaiah vii. 6, where Tabeal is written for Remaliah. In its adaptation to English this method of transposition, of which there are many modifications, is comparatively easy to decipher. A rough key may be derived from an examination of the respective quantities of letters in a type-founder's bill, or a printer's "case." The decipherer's first business is to classify the letters of the secret message in the order of their frequency. The letter that occurs oftenest is *e*; and the next in order of frequency is *t*. The following groups come after these, separated from each other by degrees of decreasing recurrence:—*a, o, n, i; r, s, h; d, l; c, w, u, m; f, y, g, p, b; v, k; x, q, j, z*. All the single letters must be *a*, *I*, or *O*. Letters occurring together are *ee, oo, ff, ll, ss*, &c. The commonest words of two letters are (roughly arranged in the order of their frequency) *of, to, in, it, is, be, he, by, or, as, at, an, so*, &c. The commonest words of three letters are *the* and *and* (in great excess), *for, are, but, all, not*, &c.; and of four letters—*that, with, from, have, this, they*, &c. Familiarity with the composition of the language will suggest numerous other points that are of value to the decipherer. He may obtain other hints from Poe's tale called *The Gold Bug*. As to messages in the Continental languages constructed upon this system of transposition, rules for deciphering may be derived from Breithaupt's *Ars decifratoria*, 1737, and other treatises.

Bacon remarks that though ciphers were commonly in letters and alphabets yet they might be in words. Upon this basis codes have been constructed, classified words taken from dictionaries being made to represent complete ideas. In recent years such codes have been adapted by merchants and others to communications by telegraph, and have served the purpose not only of keeping business affairs private, but also of reducing the excessive cost of telegraphic messages to distant markets. Obviously this class of ciphers presents greater difficulties to the skill of the decipherer.

Figures and other characters have been also used as letters; and with them ranges of numerals have been combined as the representatives of syllables, parts of words, words themselves, and complete phrases. Under this head must be placed the despatches of Giovanni Michael, the Venetian ambassador to England in the reign of Queen Mary,—documents which have only of late years been deciphered. Many of the private letters and papers from the pen of Charles I. and his queen, who were adepts in the use of ciphers, are of the same description. One of that monarch's letters, a document of considerable interest, consisting entirely of numerals purposely complicated, was in 1858 deciphered by Professor Wheatstone, the inventor of the ingenious crypto-machine, and printed by the Philobiblon Society. Other letters of the like character have been published in the *First Report of the Royal Commission on Historical Manuscripts*, 1870. In the second and subsequent reports of the same commission, several keys to ciphers have been catalogued, which seem to refer themselves to the methods of cryptography under notice. In this connection also should be mentioned the "characters," which the diarist Pepys drew up when clerk to Sir George Downing and secretary to the earl of Sandwich and to the Admiralty, and which are frequently mentioned in his journal. Pepys describes one of them as "a great large character," over which he spent much time, but which was at length finished, 25th April 1660; "it being," says he, "very handsomely done and a very good one in itself, but that not truly alphabetical."

Shorthand marks and other arbitrary characters have also been largely imported into cryptographic systems to represent both letters and words, but more commonly the latter. This plan is said to have been first put into use by the old Roman poet Ennius. It formed the basis of the method of Cicero's freedman, Tiro, who seems to have systematized the labours of his predecessors. A large quantity of these characters have been engraved in Gruter's *Inscriptiones.* The correspondence of Charlemagne was in part made up of marks of this nature. In Rees's *Cyclopædia* specimens were engraved of the cipher used by Cardinal Wolsey at the court of Vienna in 1524, of that used by Sir Thomas Smith at Paris in 1563, and of that of Sir Edward Stafford at Madrid in 1586; in all of which arbitrary marks are introduced. The first English system of shorthand—Bright's *Characterie*, 1588—almost belongs to the same category of ciphers. A favourite system of Charles I., used by him during the year 1646, was one made up of an alphabet of twenty-four letters, which were represented by four simple strokes varied in length, slope, and position. This alphabet is engraved in Clive's *Linear System of Shorthand*, 1830, having been found amongst the royal manuscripts in the British Museum. An interest attaches to this cipher from the fact that it was employed in the well-known letter addressed by the king to the earl of Glamorgan, in which the former made concessions to the Roman Catholics of Ireland.

Complications have been introduced into ciphers by the employment of "dummy" letters,—"nulls and insignificants," as Bacon terms them. Other devices have been introduced to perplex the decipherer, such as spelling words backwards, making false divisions between words, &c. The greatest security against the decipherer has been found in the use of elaborate tables of letters, arranged in the form of the multiplication table, the message being constructed by the aid of preconcerted key-words. Details of the working of these ciphers may be found in the treatises named in this article. The deciphering of them is one of the most difficult of tasks. A method of this kind is explained in the Latin and English lives of Dr John Barwick, whose correspondence with Hyde, afterwards earl of Clarendon, was carried on in cryptography. In a letter dated 20th February 1659-60, Hyde, alluding to the skill of his political opponents in deciphering, says that "nobody needs to fear them, if they write carefully in good cyphers." In his next he allays his correspondent's apprehensiveness as to the deciphering of their letters.

"I confess to you, as I am sure no copy could be gotten of any of my cyphers from hence, so I did not think it probable that they could be got on your side the water. But I was as confident, till you tell me you believe it, that the devil himself cannot decypher a letter that is well written, or find that 100 stands for Sir H. Vane. I have heard of many of the pretenders to that skill, and have spoken with some of them, but have found them all to be mountebanks; nor did I ever hear that more of the King's letters that were found at Naseby, than those which they found decyphered, or found the cyphers in which they were writ, were decyphered. And I very well remember that in the volume they published there was much left in cypher which could not be understood, and which I believe they would have explained if it had been in their power."

An excellent modification of the key-word principle was constructed by the late Admiral Sir Francis Beaufort; it has been recently published in view of its adaptation to telegrams and post-cards.

Ciphers have been constructed on the principle of altering the places of the letters without changing their powers. The message is first written Chinese-wise, upward and downward, and the letters are then combined in given rows from left to right. In the celebrated cipher used by the earl of Argyle when plotting against James II., he altered the positions of the words. Sentences of an indifferent nature were constructed, but the real meaning of the message was to be gathered from words placed at certain intervals. This method, which is connected with the name of Cardan, is sometimes called the trellis or cardboard cipher.

The wheel-cipher, which is an Italian invention, the string-cipher, the circle-cipher, and many others are fully explained, with the necessary diagrams, in the authorities named above,—more particularly by Klüber in his *Kryptographik.* (J. E. B.)

CRYSTALLOGRAPHY. When water containing saline matter in solution is allowed to evaporate slowly, the salt it contains is thrown down in bodies of peculiar forms, bounded by smooth, even surfaces meeting in straight lines. Fused metals consolidating in certain favourable conditions appear as similar bodies. And in nature also, in cracks or fissures of the rocks, or imbedded in their mass, minerals resembling these in form are frequently found. These regular polyhedric, or many-sided bodies, whether natural or artificial, are named crystals, and the science naming and describing the forms they assume, and pointing out the relations that exist among them, is termed crystallography. In a theoretical point of view this science may be regarded as a branch of mathematics, and might be studied independent altogether of the fact of any material bodies existing in the forms described. Practically, however, its chief interest and value is as a mean of distinguishing many salts, ores, and other substances, either formed artificially or, more especially, occurring naturally as minerals. At present no particular system of crystallography has found general acceptance, and referring for the details of the one adopted in the description of mineral species to MINERALOGY, we propose in this place to give an account of the history of the science, pointing out the more remarkable steps in its progress, the chief general results attained, and some of the best works from which further information in regard to it may be obtained.

The term crystal, found in most modern European languages, is derived from the Greek word κρύσταλλος, meaning ice or frozen water, and subsequently transferred to pure transparent stones cut into seals, and, as was thought, only produced in the extreme cold of the lofty passes of the Alps. Pliny, who notices this rock-crystal in his *Natural History* (book xxxvii.), points out clearly enough the hexagonal form of the crystals, remarking that it is not easy to give any reason why they grow in this form, more especially as the points have not the same appearance (*eo magis quod neque mucronibus eadem species est*), and the polish of the sides is such that no art can equal it. The forms of other minerals are also noticed by him, but the term crystal still had regard to the ice-like transparency and purity of the stone, a reference entirely lost in the modern scientific use of the word.

It is not wonderful that these bodies, often so remarkable for the beauty of their forms, colours, and other physical properties, attracted considerable attention even in the so-called dark ages. But these notices rather amuse us by their quaint absurdity, as we should now regard it, than throw light on the progress of the science. Thus Albertus Magnus in the middle of the 13th century tells how the cold in the lofty mountains makes the ice so dry that it congeals into crystal (*ex illo sicco coagulat glaciem in crystallum*). Agricola, three centuries later, knew little more, though affirming that *crystallus* was not ice but rather *succus frigore densatus*. Still he indicates some simple forms of crystals, and notes the fissile structure of some stones, as the *lapis specularis* (probably gypsum or mica), a property which as cleavage soon exercised much influence. Nicolaus Steno, the Dane, born in 1638 at Copenhagen, but for a time resident at Florence, amidst his well-known studies in anatomy, found leisure also to speculate on questions concerning the structure of the earth and the nature of gems and precious stones. As his treatise *De solido intra solidum naturaliter contento*, published in 1669, anticipated in geology some modern speculations and theories subsequently confirmed, so it also contains the germs of important facts in crystallography. It was still the wondrous rock-crystal with the polished sides of the middle prism and the terminal points of the pyramids, joined by the central axis of the crystal, that formed the starting-point of his speculations, and led him to introduce some new notions and terms into the science. How these crystals originated was doubtful, but they evidently grew, not from within like plants, but from without, by the addition of new layers of minute particles carried to the crystal by a fluid, and laid down specially at the ends, as shown by the fine striæ that are never wanting on the middle planes. His rejection of extreme cold as the *causa efficiens*, for something similar to magnetic power, is again a suggestive idea, and not less his conclusion that crystals therefore were not formed only at the first beginning of things, but continue to grow even at the present day. Still more important as a step in the progress of the science would be his assertion that the number and length of the sides in the plane of the axis may vary widely without change in the angles (*in plano axis, laterum et numerum et longitudinem varie mutari non mutatis angulis*), could we regard it as having a wider application than to the case in hand. It was perhaps more a deduction from the mathematical form of the body than a generalization from observed facts. But some of his other descriptions show great powers of observation, and in his notice of the cleavage of calcspar, and its division into other rhomboidal bodies, we have again a fact that in other hands was to bear important fruits.

Erasmus Bartholinus, another Dane (born 1625, died 1698), made known, in his *Experimenta Crystalli Islandici disdiaclastici* (1670), another property of the same mineral, very remarkable in itself and its results to science. This was the double refraction of the beautifully transparent variety sent from the Rödefiord in Iceland to Copenhagen. In the same tract, it may be mentioned in passing, occurs the first reference to the blowpipe as a mean of applying heat to minerals. But the optical fact, turning the attention of mathematicians to crystals, had more direct influence on our science. The celebrated Huyghens described the same *miranda refractio*, and pointed out its laws; he also measured the angles of the rhomboids with a close approximation to truth, and remarked the occurrence of a less distinct double refraction in quartz—*in crystallo duplex esset refractio.* He likewise observed the peculiar cleavage of calcspar, which he tried to explain by building up the crystals of spheroids. Leeuwenhoek also, in his *Arcana Naturæ* (1695), mentions cleavage in gypsum and Muscovy glass, and tried to estimate the thickness of the laminæ, which Newton in his *Optics* in 1706 showed could be calculated from his doctrine of the colour of thin plates. In the same work Newton gives an account of the double refraction of Iceland spar and the laws it follows, and, observing the changes to which the rays were subject, asks if these rays of light may not have different sides, with different properties—the first anticipation of the polarization of light, so important in this science. Returning to Leeuwenhoek, we find him showing salts of various forms, growing up in solutions under his microscopes. About this time too Guglielmini in his treatise on these bodies, *De Salibus Dissertatio Epistolaris* (1707), tried to prove that they could all be divided into molecules of a few regular forms, and affirms as a consequence that the inclination of the planes and angles is always constant. At a somewhat earlier period the celebrated Robert Boyle had published a treatise on precious stones, in which he describes many properties of crystals and their peculiar forms which he compares to those of salts. He also pointed out the crystallization of bismuth from fusion by heat—a fact often overlooked by later observers.

The attention of men of science was now thoroughly directed to the forms and origin of these bodies, and many curious observations might be collected from the writings of De la Hire, Woodward, Cappeller, Henckel, and others. But we pass on to Linnæus, whose *Systema Naturæ* formed, in this as in other departments of natural science, the commencement of a new period in its history. In his first edition in 1736 he gave a classification which, as he says himself, though far from perfect and often blamed, had enabled others mounted on his shoulders to see wider. Some of these successors he enumerates in the twelfth edition of his *System* (1768)—among them Wallerius, Swab, and Cronstedt. He admits in the preface that he had laid aside the study of stones in which he once delighted, and therefore could not boast of his knowledge of lithology. *Lithologia mihi cristas non eriget, lapides enim quos quondam in deliciis habui, tradita demum aliis disciplina, seposui*, are his characteristic words. Still there is much that was important in his work. Thus he distinguishes figured stones from those that are amorphous, and notes the difference of the *tessellata* or cubical from the *prisma* or long columnar and the *pyramis* or pointed forms. Then he figures rudely, it may be, and describes some forty common forms of crystals, and gives examples of minerals in which they occur. His table of "*Affinitates crystallorum*" is even more suggestive, and could scarcely fail, if followed out, to lead to further advances. The use he made of these forms as important characters in describing and classifying minerals was well calculated to promote their study. Even the fact that he cut out models in wood of the forms he saw, shows in what a truly practical manner he regarded the subject. His notions regarding the formation of crystals were, however, very imperfect. Salt, he affirms, is the only known natural cause of crystallization, and consequently the forms of the crystals of other substances were determined by the salts in union with them. This is the more remarkable, as he refers to an anonymous author in his own country, to whom he applies the words of Isaac, *vox Swabii, manus Cronstedti*, as refuting this theory from the fact that crystals of metals were produced by fusion.

The advanced character of these views of Linnæus appears more strongly when we contrast them with those of his great rival Buffon. According to him crystals are only a result of organization, so that the prisms of rock crystal, the rhombs of calcspar, the cubes of sea salt, the needles of nitre, and others are produced by the motions of organic molecules, and specially of those derived from the remains of animals and plants found in calcareous masses, and in the layer of vegetable earth covering the surface of the globe. Hence he takes no note of crystallization among the characters of minerals. Very different was the influence of Linnæus on Romé Delisle (born 1736, died 1790), whose *Essai de Cristallographie* appeared first in 1772, and in an enlarged form in 1783. Working in the spirit of his master, he formed a large collection of mineral crystals which he examined with great care, comparing the forms of the faces and measuring the angles. In doing this he soon found that the same mineral assumed various forms,—calcspar, for instance, sometimes that of a six-sided prism, at others of a rhomboid, and fluor-spar in some cases forming cubes, in others octahedrons. In trying to explain this fact, he assumed that in each species there was a certain original form, generally the most simple he could find, from which all the others might be derived when cut in a particular manner. Thus by cutting off the angles of the cube, it may be converted into an octahedron. Werner in his treatise *On the External Character of Minerals* had used the terms truncation, bevelling, acumination (*Abstumpfung, Zuschärfung, Zuspitzung*) for similar changes on the fundamental forms, but Delisle probably had no knowledge of this fact, and in other respects could borrow little from Werner, who in crystallography scarce went beyond Linnæus. The progress Delisle made in the ten years between his first and second work (*Cristallographie ou Description des formes propre à tous les corps du règne minéral*, 1783) is truly remarkable. He now affirms in clear and distinct terms "that amidst all the innumerable variations of which the primitive form of a salt or crystal is susceptible, there is one thing that never varies and remains constantly the same in each species,—that is, the angle of incidence, or the respective inclination of the faces to each other." Hence these angles are truly characteristic of each species, but only of the primitive forms, from which others, which he names secondary, are derived by various modifications. Of these principal primitive forms he assumes six; but these are less skilfully chosen and, as now seen, not always truly distinct. But many defects were compensated for by the great labour he expended on figuring and his superior accuracy in measuring crystals. This he was able to secure by the use of the goniometer recently invented by Carangeau, the new instrument, as it were, transforming the science. Then his observation of twin crystals, or macles, as he named them,—which he showed were characterized by their re-entering angles as made up of two crystals, or two halves of one crystal, in a reversed position,—was also a noteworthy step. How much he accomplished may be judged from the fact that he gives figures of more than 500 regular forms, in place of the forty described by Linnæus. He had probably carried his system as far as it could go, and not merely familiarized the forms of crystals to mineralogists, but also suggested the possible connections that might exist among them.

Delisle seems to have assigned little value to cleavage, and in his preface speaks contemptuously of the crystalloclastes (*brise-cristaux*) as innovators in the science. But even earlier, in 1773, Bergman, the well-known Swedish chemist, had shown its importance, and used this peculiar structure to explain the relations of the different forms of crystals observed in the same mineral. Starting from the rhombohedron of calcspar, he placed it with the chief axis upright, and then building up other similar rhombs on it, formed a six-sided prism with rhombic ends. By stopping at a certain stage, it became a dodecahedron, or body with twelve rhombic faces, which he assumed, not quite accurately, to be the same as that proper to garnet. Again, placing this garnet-form in proper position and adding other rhombs, he showed how it easily changed into another characteristic of the hyacinth (*in aliam facile migrat*), whilst by other changes different crystals were produced. But he did not proceed far in the direction thus indicated, and deeper views, with more accurate facts and measurements, were required before this could be done.

These were found in the works of Réné Just Haüy (born 1723, died 1822), who seems to have been led almost by accident to his theory. Curiously it is still the same mineral that with him, as with so many of his predecessors, forms the starting-point. When looking over the cabinet of Citizen Defrance a hexahedral prism of calcspar was accidentally broken from a group to which it belonged, and given him in a present. This crystal showed at the base, where it had been detached, a broken corner with the peculiar brilliant lustre, "poli de la Nature," of the cleavage faces. Haüy's attention was arrested by the fact, and he tried to obtain similar faces on other corners, but he only succeeded on the three alternate edges at each end of the prism. Continuing the process further, he found that he could remove slice after slice, till no vestige of the original prism was left, but in place of it a rhomboid perfectly similar to the Iceland spar and lying in the middle of the prism. The fact struck him with surprise, mingled with the hope that it was not isolated, and this, he says, served to "develop my ideas regarding the structure of crystals, and has been, as it were, the key of the theory" (*et a été comme la clef de la théorie*). Following it out on differently formed crystals of this mineral he found they could all be reduced to a similar internal nucleus. But when the mineral was distinct the nucleus had a different form. Thus in fluor-spar the nucleus was an octahedron; in heavy spar a right prism with rhombic bases; in galena, or sulphate of lead, a cube; and so of other substances. In each also these forms were constant, relative to the entire species, so that its angles were subject to no appreciable variation. Even where crystals cannot be thus mechanically divided, Haüy stated that theory aided by certain indications might serve to discover the primitive form.

Haüy's theory of structure of crystals

On these and other similar facts, Haüy erected his celebrated theory of the structure of crystals. In each mineral there exists what he calls its integrant molecules,—solid bodies incapable of further division and of invariable form, with faces parallel to the natural joints indicated by the mechanical division of the crystals, and with angles and dimensions given by calculation and observation combined. These molecules are marked in different species by distinct and determinate forms, except in a few regular bodies, such as the cube, which do not admit of variations. From these primitive or integrant molecules all the various crystals found in each species are built up according to certain definite laws, and thus the secondary crystals, as he names them, are produced. Of primitive forms only six were known from observation. These were the parallelopiped, the octahedron, the tetrahedron, the regular hexahedral prism, the dodecahedron with equal and similar rhombic faces, and the dodecahedron with triangular faces, consisting of two regular six-sided pyramids joined base to base. In order to produce those secondary crystals which covered over the primitive form, so as to disguise it in so many different ways, he supposed the enveloping matter to be made up of a series of laminæ, each decreasing in extent either equally in all directions, or only at certain parts. This decrease takes place by the regular subtraction of one or several ranges of integrant molecules in each successive layer; and theory, determining by calculation the number of these ranges, can represent all the known results of crystallization, and even anticipate discoveries, and indicate hypothetical forms which may one day reward the research of naturalists. He thus claims for his theory that greatest proof of its truth and value which a scientific theory can present,—the power to anticipate observation and to foretell future discoveries. As an example of this process Haüy showed how by applying successive layers of integrant molecules, each less by one row all round, to the faces of the primitive cube, a rhombic dodecahedron was necessarily formed. In other cases he assumed that the decrease was not parallel to the edges, but took the angles as its point of departure, and thus was parallel to a diagonal. In the case above supposed the decrease took place by two ranges in breadth for one in height or thickness, but other less simple ratios might be supposed, as of two in breadth to three in height, and to these the name mixed decrements were given. There were other possible modes of decrease also distinguished, to which it is needless now to refer. But by these and other modes of procedure Haüy showed how the various secondary crystals could arise from his assumed primitive forms or molecules.

The great advance secured by this theory of Haüy's was the firm establishment of the idea that the forms of crystals were not irregular or capricious, but definite and based on fixed and ascertainable laws. Hence he showed that, whilst certain secondary forms may be deduced from a given nucleus, there are other forms that cannot occur. Further he pointed out what he named "the law of symmetry," in consequence of which, when any change of a crystal form took place by its combination with other forms, all similar parts—angles, edges, faces—were modified in the same way at the same time. All these changes too, he said, could be indicated by rational coefficients or commensurable numbers.

Law of symmetry.

A not less important principle, which Haüy endeavoured to establish, was the intimate relation of the crystalline form to the chemical composition of minerals, so that even prior to analysis the real diversity of species formerly conjoined might be inferred from differences in the angles. As an example of this may be mentioned his discovery of the difference of the angles in crystals classed together as "heavy spar," a difference only explained when Vauquelin showed that those with the larger angle from Sicily contained the new earth strontia, discovered by Klaproth, instead of the baryta found in those from Derbyshire. The modifications which this view has had to undergo from wider observations will be noticed afterwards, but even its enunciation by Haüy formed a great stimulus to research both as to the forms and the composition of minerals. Taken in connection with the perspicuous and elegant style of his work, its clear arrangement and full illustration by figures, its influence on the progress of the science may be readily understood. Many deficiencies in his system are now easily seen, and some of the most fatal were soon brought to light by the very stimulus his works gave to the science.

Relation to chemical composition

Thus one of the first to criticise the system was Weiss, who translated Haüy's work into German in 1804. He not only pointed out that the primitive forms erred both in excess and defect, but struck deeper at the theory by showing that the integrant molecules might better be entirely laid aside. They were not wanted to explain the observed facts, and the so-called planes built up of them would not reflect the light. Bernhardi, a medical man in Erfurt, attacked the theory from other points of view. Thus he objected to the prisms which Haüy had chosen as primitive forms that their dimensions could not be determined from themselves, their height depending on another form, and therefore that octahedrons or double pyramids were preferable. Then he showed that various crystals were more readily explained from other forms than those taken as their primaries by Haüy, and that in the regular forms it was quite indifferent whether the cube or regular octahedron was chosen, whilst among the irregular forms other divisions might be established, more conformable to nature. It is needless to specify further criticisms on Haüy's theory, as its very merits soon led to its being replaced by more profound views. Thus the importance it ascribed to the angles of the faces and cleavages of crystals for the true determination of minerals formed a strong motive for their more accurate determination. The discovery also of the reflecting goniometer in 1809 by Wollaston (born 1766, died 1829) enabled this to be done with a degree of accuracy previously impossible. The writings of Dr Wollaston himself, of Mr Brooke, and especially the *Introduction to Mineralogy* (1816) of William Phillips (born 1773, died 1828) were specially rich in material of this kind. The influence of this accumulation of facts was shown less in the correction of Haüy's data than in the necessity it involved of some new and more workable theory for connecting the facts than that adopted by the French mineralogist.

Criticisms of Haüy's system.

For this science is chiefly indebted to Weiss, already mentioned as the translater and critic of Haüy's great work. Born at Leipsic in 1780, and educated in its university where he began to teach in 1803, he inaugurated his appointment as ordinary professor of physics in 1808 by the publication the following year of a dissertation, *De indagando formarum crystallinarum charactere geometrico principali*. In this he pointed out for the first time the importance of the axes of crystals, to which, however, Haüy had referred. "The axis," he says, "is truly the line governing every figure (*omnis figuræ dominatrix*) round which the whole is uniformly disposed. All the parts look to it, and by it they are bound together as by a common chain and mutual contact." But the axes are not mere geometric lines physically dead and powerless. It is in reference to them that the forces work which have formed the crystals. Hence the importance of the inclination of the faces to the axes as characterizing forms, and the simpler numbers by which the relations of these faces might be expressed. He further points out various distinctions in the forms of crystals, in which his followers have traced the germs of the systems of crystallization he subsequently established. This was done in his memoir, "Uebersichtliche Darstellung der verschiedenen natürlichen Abtheilungen der Krystallisationssysteme," published in 1815 in the *Transactions of the Academy of Berlin*, to which city he had been transferred in 1820. In this memoir the terms regular system, four-membered system, two-and-two-membered system, and others afterwards used first appear. In other memoirs in the same series, of which the more important were those on the crystallization of felspar, epidote, gypsum, and quartz, his views were more fully developed. Along with these views of the general relations of crystals Weiss also introduced important improvements in the mode of designating the faces of crystals, so as to render it more easy to calculate their angles. Haüy had already done this in conformity to his theory of decrements, but the expressions were complex and the numbers large. But here as elsewhere, Weiss says, the mechanical atomistic views by which Haüy was led must be laid aside, in order to allow the ascertained knowledge of the mathematical laws and relations of crystalline structure to come out purely. Leaving out of view, therefore, the supposed primitive forms, and looking only to what was above and beyond them, Weiss referred all to the essential relations of the axes or the co-ordinates of the faces, and thus gave at once far more precision and simplicity to the symbols, and facilitated the necessary calculations.

It often happens in periods of intellectual activity that several inquirers are engaged on the same subject, and, following it out in similar directions, come to results that more or less coincide. Such seems to have been so far true in regard to crystallography, and these discoveries of Weiss have been claimed for Mohs. Born in the Hartz in 1773, he studied at Halle, turning his attention specially to mining. In 1812 he became professor in Grätz, and in 1818 succeeded Werner in Freiberg, which a few years later he left for Vienna, where he taught with great success. He died in 1839. The dates of their publications leave no doubt that Weiss preceded him in promulgating these new views, but also show that Mohs wrought them out in a more systematic form, and made them more generally known. In 1820 he published his *Charakteristik des naturhistorischen Mineralsystemes*, followed in 1822 by his *Grundriss der Mineralogie*. Both these treatises were translated into English, the second by the well-known Haidinger, then residing in Edinburgh. The clearness and precision with which he marked out and defined the various terms and new ideas required, and followed out the laws regulating combinations, had a great effect in giving a wider currency to his writings. The thorough mode in which he traced out the *series* of forms in the systems and explained these also added to their popularity. Professor Jameson too gave it a higher authority and wider acceptance, describing it "as eminently distinguished by its originality and simplicity." Its success was further promoted by the remarkable discovery made about the same time by Sir David (then Dr) Brewster. In connection with his observations on the polarization of light, this distinguished optician had endeavoured to point out the connection between Haüy's nuclei or primitive forms of crystals and the number of their axes of double refraction, and even shown that Haüy had in some cases chosen erroneous forms, as they did not agree with their optical characters. The appearance of Mohs's views threw unexpected light on the fact, as his system of crystallography harmonized in a most remarkable manner with the arrangement proposed on optical grounds. In reality, as now well known, all minerals crystallizing in the regular system of Weiss and Mohs with equal and uniform axes show only single refraction; those belonging to the two and one axial and three and one axial systems of Weiss, the pyramidal and rhombohedral of Mohs, have double refraction with only one optical axis; whilst those in the three other systems show double refraction and two optical axes. As Whewell has well remarked, "Sir D. Brewster's optical experiments must have led to a classification of crystals into the above systems, or something nearly equivalent, even if the crystals had not been so arranged by attention to their forms."

The establishment of this system, whether due to Weiss or Mohs, or in part to both, gave to crystallography as a pure science essentially its present form. Taken in connection with the law that the indices marking the relative dimensions of the parameters are always rational numbers, and seldom large, with the symmetry of forms, and the grouping of the faces in zones, we have the leading principles on which it depends. The subsequent progress of the science has been rather directed to working out and completing the structure, and showing the mutual relations of its essential principles, than to modifying the foundations on which it rests. These researches have taken two chief directions, the one explaining the geometrical properties of crystals, and the systems under which in consequence of these properties they necessarily fall to be classed, while the second has regard to the physical properties of crystals, that is, of the various bodies, especially the native minerals, assuming these forms. Before noticing these we must refer to another point in which Haüy's views were also about the same time remarkably modified and extended.

Haüy, we have seen, maintained that a very close connection always existed between the crystalline character and the chemical composition of minerals, so that from diversity in the angular measurement of two crystals we might infer a difference in their chemical composition, or the reverse. More accurate analyses soon showed that this law had not that universal application which Haüy assumed, and even in 1815 Fuchs had pointed out that certain elements were what he named vicarious, so that in compounds a certain amount of one could replace so much of some other. The remarkable theories and researches of Berzelius soon rendered some change in this respect inevitable, and it was carried out by the discovery of isomorphism by his pupil Mitscherlich in 1822. The subject, however, belongs less to crystallography than to chemistry or mineralogy, and we can only mention the general principle. Mitscherlich showed that there are certain substances which crystallize in forms closely resembling each other, and with the corresponding angles only differing by one or two degrees, or even less. Thus the carbonates of iron and manganese, or lime and magnesia, agree nearly in form and dimensions. Such substances were named isomorphous, and were found to have the tendency to replace or be substituted for each other in compound bodies, with very slight modification of the forms or angles of the crystals. Though at first denied by Haüy and his followers, this truth is now fully established, and has had vast influence in the determination and classification of minerals. As modifying the same conclusion of Haüy, but in an opposite direction, we must also mention Mitscherlich's further discovery of dimorphism, according to which the same element (as sulphur), or the same compound (as carbonate of lime), when crystallizing under different conditions, especially as regards temperature, may assume two distinct forms of crystals belonging even to different systems. Instances are even known of trimorphism and polymorphism, in which the same substance may occur in three or more forms of crystallization.

Powers operating still unknown.

The mode of formation of crystals, and the powers that are active in their formation, were, as we have seen, favourite subjects of speculation with the earlier writers on crystallography, and are closely connected with the chemical composition of minerals to which we have just referred. This subject continues to attract many inquirers, and has given occasion to some remarkable speculations; but it can hardly be affirmed that much progress has been made in this direction. Crystals may still be seen, as in the time of Leeuwenhoek, springing out of solutions under the microscope, and continuing to increase in size, but the powers that are active escape our notice, and we are still left almost in the same region of speculation as our predecessors. Such discussions, in truth, concern rather the general constitution of matter than the special corner whose history we have been following, so that the words of Brewster still hold true:—"In whatever way crystallographers shall succeed in accounting for the various secondary forms of crystals, they are then only on the threshold of their subject. The real constitution of crystals would be still unknown; and though the examination of these bodies has been pretty diligently pursued, we can at this moment form no adequate idea of the complex and beautiful organization of these apparently simple bodies."

Returning to the more special subject of pure or geometric crystallography, one great object of recent inquiry has been to discover some method of designating the forms or faces of crystals by numbers or symbols, that would at once point out their general relations to each other, and facilitate the calculation of their angles so as to check or control observation. Haüy had already attempted to do this in his great work, by means of his theory of decrements, but his materials were still too imperfect, and his symbols are often very complex. Still the weight of his name retains great influence in France, where a system founded on his, but modified by the more recent views, prevails. It is generally associated with the name of Armand Lévy (born 1794, died 1841), who in 1837 published an important work on Mr Heuland's collection (*Description d'une collection des Minéraux formée par M. H. Heuland*), illustrated by numerous plates of crystals. He assumes six prisms or parallelopipeds as primary forms, and designates the faces, angles, and edges by letters, as was done by Haüy. This system is adopted and explained by Dufrénoy in his *Traité de Minéralogie* (Paris, 1844–56), and by Des Cloizeaux in his *Manuel* (Paris, 1862–74.)

In Germany also various methods have appeared. Weiss himself only published special papers, but his views have been wrought out by several of his many followers. Thus one of his favourite pupils, F. E. Neumann, in his "Contributions" (*Beiträge zur Krystallonomie*) in 1823, showed how crystals might be represented not so much by the faces as by their normals, that is, by lines drawn from the centre of the system vertical to the faces. Cleavage, he says, and the reflection of light, &c., all indicate a force acting vertical to the faces, or in the normal. He further brought clearly out the arrangement of the faces in zones, and showed how they could be represented to the eye either by lines on a plain surface, or by great circles on the circumscribing sphere. Quenstedt of Tübingen, another pupil of Weiss, made known a similar method in 1835, which he has since illustrated in his *Methode der Krystallographie* in 1840, in his *Mineralogie*, 1855 (2d ed. 1863), and more fully in his *Grundriss der bestimmenden und rechnenden Krystallographie*, 1873. The truest representative of Weiss, however, is generally regarded as Gustaf Rose, who laid the foundation of his reputation by his account of the "crystallization of sphene and titanite" in 1820. His *Elemente der Krystallographie* first appeared at Berlin in 1833, and in a third edition in 1873.

Mohs's method was expounded in his works already noticed, and became better known in Britain by Haidinger's translation of his *Treatise on Mineralogy*, published at Edinburgh in 1825; and is further explained in Mohs's *Anfangsgründe der Naturgeschichte des Mineralreichs* (1832, 2d edition by Zippe, 1839). Haidinger, besides many memoirs, has also published a separate work in which the method is fully explained (*Handbuch der bestimmenden Mineralogie*, 1845). But wider success and more general adoption has attended the method of Dr Carl Naumann, in which the faces are represented by means of their co-ordinates, and thus in an easily understood form. Born in 1797, Naumann began his studies under Werner, and completed them under Mohs, and has been regarded as carrying out the system of his teacher, whilst trying to mediate between him and Weiss. His *Lehrbuch der reinen und angewandten Krystallographie* appeared in 1830; his *Anfangsgründe der Krystallographie* in 1841, 2d edition, 1855, and his *Theoretische Krystallographie* in 1856. His *Elemente der Mineralogie*, first published in 1846, and of which a ninth edition appeared in 1874, has still further extended his method and nomenclature. His system, occasionally in slightly altered form, has wide prevalence in Germany, and has been introduced into this country in Nicol's *Mineralogy*, 1849, and in the article on MINERALOGY in the eighth edition of the present work. Dana in his *Mineralogy*, 1854, has given it wide currency in America; he has endeavoured to simplify the mode of representing the faces. Another method, which in Germany in great measure divides the field with Naumann's, may be said to have had its origin in Britain. In 1825 Dr Whewell published in the *Philosophical Transactions* a memoir on "A General Method of Calculating the Angles of Crystals," in which he referred only to Haüy's views, and in 1826 another "On the Classification of Crystalline Combinations," founded on the methods of Weiss and Mohs, especially of the latter, with which he had in the meantime become acquainted. The author himself states that his method had little value as a method of calculating the angles of crystals. But in 1839 Professor Miller of Cambridge, partly adopting his views, and partly aiding himself by the suggestions of Neumann and of Grassmann, who, without any knowledge of what his predecessor had done, had re-invented the method of representing the position of the faces of crystals by corresponding points on the surface of a circumscribing sphere, brought out his *Treatise on Crystallography*. In his edition of Phillips's *Mineralogy*, 1852, the same system was also employed. In Germany this system has found many followers, and is used in several of the best text-books, among which may be mentioned the *Lehrbuch der Krystallographie* of Karsten, 1861, and the works with the same title of Von Lang, 1866, and Dr A. Schrauf, 1866.

The relative merit of the methods mentioned cannot be discussed in this place. The system of Naumann is, perhaps, the one now most generally prevalent, and most easily understood by beginners, as giving the most graphic picture of the various forms and their combinations. Miller's system, on the other hand, is regarded as better adapted for the various calculations needed in the higher portions of the science, and is therefore often preferred by those who make a special study of the subject. How closely their merits are balanced is shown by the fact that Groth, in his recent valuable work, *Physikalische Krystallographie*, Leipsic, 1876, whilst preferring Naumann's, deems it necessary to explain Miller's also to his readers, and to give a comparative table of the symbols employed by Naumann, Miller, and Lévy, so that the one may be, as it were, translated into the other. Similar tables may also be found in Des Cloizeaux's *Mineralogie* and in Schrauf's *Atlas*.

Many very interesting facts have also been recently ascertained, showing the intimate relation that exists between the various physical properties of crystals and their crystallographic characters, proving very distinctly that the systems of crystals are not mere artificial arrangements of speculative men, but have a real foundation in the structure of the bodies observed. We saw already how Brewster proved this connection in reference to their optical properties. He continued his researches on this subject for many years, and it was also pursued by many of his contemporaries, among whom Biot, Sir John Herschel, and Haidinger may be named. More recently the stauroscope, invented by Von Kobell, and the polarizing microscope of Nörremberg have proved valuable aids in investigating these properties. In France M. des Cloizeaux has specially directed attention to the optical properties of crystals and their value in mineralogy (*De l'emploi des propriétés optiques biréfringentes en Minéralogie*, 1857, and *Sur l'emploi du microscope*, in 1864), and in his *Manuel de Minéralogie* records many remarkable observations made both by himself and others. In Britain and in Germany these investigations have recently been conjoined with the examination with the microscope of thin slices of minerals and rocks. The method of preparing such transparent sections was first described by William Nicol of Edinburgh, to whom is also due the discovery in 1828 of the peculiar prisms of Iceland or calcareous spar which are now known by his name, and which form an almost indispensable part of apparatus for such researches. It is scarcely possible to avoid noticing the important influence which this one mineral with its marked properties has had on the progress of the science whose history we are describing. In this country a new impulse was given to the study by Mr Sorby's memoir "On the Microscopical Structure of Crystals," published in the *Journal of the Geological Society* in 1848. In Germany the workers in this field are so numerous that we cannot specialize individuals, but shall only refer to the works of Zirkel (*Mikroskopische Gesteinsstudien*, 1863, *Mikroskopische Beschaffenheiten der Mineralien*, 1873, &c.), Schrauf (*Lehrbuch der physikalischen Mineralogie*, 1868), and Rosenbusch (*Mikroscopische Physiographie der*

Physic- propert-

Mineralien, 1873), both for further information on the subject generally, and for lists of the more important recent publications. How valuable it has become may be seen from the fact that these transparent sections, examined between two Nicol's prisms, from the phenomena of the interference of light, readily enable the observer to determine to which of the six systems of crystallization the mineral interposed belongs, and thus to fix one of its most essential characters. In this way the exact composition of many fine-grained crystalline rocks can be determined, and much light thrown on their history.

In regard to the other physical properties of crystals, it must suffice to say that they all indicate a similar close dependence on their geometric character. The same systems shown by their mathematical forms and optic properties reappear in reference to their relations to heat, magnetism, electricity, and other properties. The regular or tesseral minerals, with simple refraction of light, are shown by Senarmont's researches also to conduct heat uniformly in all directions, and their magnetic and electric peculiarities are similar. The tetragonal and hexagonal crystals with one chief axis, as they show double refraction of light with a single optic axis, have also analogous modes of conducting heat, of expanding under its influence, and of transmitting magnetism and electricity. And again, the three other systems with unequal axes, as they show two optic axes, exhibit also corresponding peculiarities in respect to the other properties mentioned. In this we have a remarkable instance of connection of the various physical sciences, and a strong proof of the sound basis that crystallography attained by the discoveries of Weiss and Mohs.

A great deal has been recently done in improving the instruments employed in determining the forms and dimensions of crystals. Though for first and rough approximations to the angles the early form of the hand goniometer may still be used, even the reflecting goniometer of Wollaston no longer meets the requirements of modern accuracy. In 1820 the Royal Academy of Sciences at Berlin offered a prize for the best methods of measuring these angles, which was gained by Dr Kupffer. Malus added a telescope to Wollaston's goniometer, and other methods of increasing its accuracy have been proposed, as by Babinet and Mitscherlich. Frankenheim, Haidinger, and others have also endeavoured to perfect the methods or means of observation which now, as tested by comparison with the results of calculation, seem fully adequate to the wants at least of determinative mineralogy.

The forms of crystals that occur in native minerals are described more or less fully in several of the works already mentioned. The *Atlas der Krystal-Formen des Mineralreiches* of Dr A. Schrauf, 1865–1873, is intended to form a complete collection of all the forms observed in the mineral kingdom,—estimated as exceeding 10,000 in number, described in very many separate treatises and memoirs, and every day becoming more numerous. The arrangement is alphabetical, and the work, from its accuracy and rich material, is highly valuable but still unfinished. The forms of salts and artificial crystals are described in Rammelsberg's *Handbuch der krystallographische Chemie*, 1855, and supplement, 1857, and many of them also in Groth's *Krystallographie*.

The history of crystallography is related in C. M. Marx's *Geschichte der Krystallkunde*, 1825; Whewell's *History of the Inductive Sciences*, vol. iii.; Von Kobell's *Geschichte der Mineralogie*, 1864; Kenngott's *Uebersicht der Resultate der Mineralogische Forschungen*, 1844–1865; Quenstedt's *Grundriss*, 1873, &c., from which further information may be obtained. (J. NI.)

CSOKONAI, Mihaly Vitez (1773–1805), an Hungarian poet, was born at Debreczin in 1773. Having been educated in his native town, he was appointed while still very young to the professorship of poetry there; but soon after he was deprived of the post on account of the immorality of his conduct. The remaining twelve years of his short life were passed in almost constant wretchedness, and he died in his native town, and in his mother's house, when only thirty-one years of age. Csokonai was the author of a mock-heroic poem called *Dorottya*, two or three comedies or farces, and a number of love-poems. Most of his works have been published, with a life, by Schedel (1844–47).

CSOMA DE KÖRÖS, Alexander (*c.* 1790–1842), or as the name is written in Hungarian, Körösi Csoma Sandor, an Hungarian traveller and philologist, born about 1790 at Körös in Transylvania, belonged to a noble family which had sunk into poverty. He was educated at Nagy-Enyed and at Göttingen; and, in order to carry out the dream of his youth and discover the origin of his countrymen, he divided his attention between medicine and the Oriental languages. In 1820, having received from a friend the promise of an annuity of 100 florins (about £10) to support him during his travels, he set out for the East. He visited Egypt, and made his way to Tibet, where he spent four years in a Buddhist monastery studying the language and the Buddhist literature. To his intense disappointment he soon discovered that he could not thus obtain any assistance in his great object; but, having visited Bengal, his knowledge of Tibetan obtained him employment in the library of the Asiatic Society there, which possessed more than 1000 volumes in that language; and he was afterwards supported by the Government while he published a Tibetan-English dictionary and grammar (both of which appeared at Calcutta in 1834). He also contributed several articles on the Tibetan language and literature to the *Journal of the Asiatic Society of Bengal*, and he published an analysis of the *Kah-Gyur*, the most important of the Buddhist sacred books. Meanwhile his fame had reached his native country, and procured him a pension from the Government, which, with characteristic devotion to learning, he devoted to the purchase of books for Indian libraries. He spent some time in Calcutta, studying Sanskrit and several other languages; but, early in 1842, he commenced his second attempt to discover the origin of the Hungarians. He had only reached Darjiling when he died on the 11th April 1842. An oration was delivered in his honour before the Hungarian Academy by Eötrös, the novelist.

CTESIAS, a Greek physician and historian, who flourished in the 5th century B.C. He was born of an Asclepiad family at Cnidus in Caria, and was in the early part of his life physician to Artaxerxes Mnemon, having, according to Diodorus Siculus, been taken prisoner of war. He was the author of a treatise on rivers, another on the Persian revenues, a history of India, which is only of value as recording the beliefs of the Persians about India, and, most famous of all, a history of Persia—the *Persica*, written in opposition to Herodotus, and professing to be founded on the Persian royal archives. Of his two histories we possess abridgments by Photius, which have been published by Stephens (Paris, 1557–1594). As to the worth of the *Persica* there has been much controversy, both in ancient and modern times. Its chief modern defenders have been Freret, in the *Mémoires de l'Académie des Inscriptions*, vol. v., and Bähr, in his *Prolegomenon* to his edition of what has come down to us of the works of Ctesias (Frankfort, 1824). Aristotle rejected the testimony of Ctesias, which is opposed to that of the Jewish Scriptures, of the Persian historan Berosus, and of recently discovered cuneiform inscriptions. See Rawlinson's *Herodotus* (vol. i. pp. 71–74).

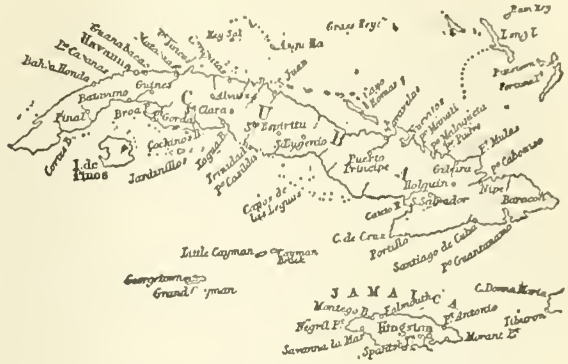
CTESIPHON, an ancient city in the south of Assyria, situated on the left bank of the Tigris, about twenty-five miles south-east of Baghdad. It is reported by Ammianus to have been founded by a Parthian, Varanes by name, of whose history nothing is known; it rose into importance when the city of Seleucia on the opposite bank began to decline; and under the Parthian kings, who originally selected it as a winter residence, it ultimately acquired the rank of the sole capital of their dominions. On the fall of the Parthian empire it naturally declined; but on the establishment of the Persian dynasty of the Sassanids it recovered somewhat of its prosperity, and was occasionally chosen as the residence of royalty on account of the pleasure-grounds and hunting-parks in the vicinity. At the time when it fell into the hands of the Roman emperor Severus (232 A.D.) its population must have been very great, as it furnished no fewer than 100,000 prisoners of war. About 263 it was besieged by Odenathus, king of Palmyra; and in the minority of Sapor II. it was taken by storm by a Mesopotamian chieftain named Thair. Though the emperor Julian gained the day in a great battle before the city, and its capture seems to have been one of the chief objects of his manœuvres, he retired without attempting an investment. In 637 it was abandoned by Yezdejird, the last of the Sassanids, and seized by Sa'ad, the Arabian general, who found within its walls so extensive and costly a booty that, after the works of art and a fifth of the whole were set apart for the caliph, he was able to bestow 12,000 dirhems, or upwards of £300, on each of his 60,000 soldiers. After this date the destruction of the city seems to have been rapidly accomplished; and in the present day the site is marked by desolate ruins which, instead of preserving the ancient name of Ctesiphon or the more modern name of Maidan, are known to the people of the district as the burial-place of Soliman Pak, the barber of Mahomet. Amid the mounds of sun-dried bricks, one building still remains sufficiently entire to give some authentication to the glowing descriptions of the Arabian writers. This is the Takht-i-Khesra (throne of Chosroes), Tak-i-Khesra (arch of Chosroes), or, using the other form of Chosroes's name, the arch of Nushirvan, which consists of the great central hall of the palace, built in all probability by the monarch whose name it perpetuates. According to Tabari, the edifice when complete was 450 feet in length, 180 feet in breadth, and 150 feet in height: adorned in front by a portico of twelve marble pillars of the noblest dimensions; and the vaulted hall, which had a height of 85 feet and a width of 72, was decorated with the signs of the zodiac in golden stars. The whole building appears from the remains to have been composed of baked bricks covered with a coating of plaster; but the Arabian writers speak of it as consisting of polished stone. See Flandin, *Voyage en Perse;* Rawlinson, *The Seventh Oriental Monarchy.*

CUBA, the largest and richest of the West India Islands, and the most important colony of Spain, was discovered by Columbus on 28th October 1492, during his first voyage. It was first called Juana in honour of Prince John, son of Ferdinand and Isabella; but after Ferdinand's death it received the name of Fernandina. It was subsequently designated Santiago, from the patron saint of Spain; and still later Ave Maria, in honour of the Virgin. Its present name is that by which it was known among the natives at the time of its discovery. It was then divided into nine independent principalities, under as many *caciques.* The aborigines are described as living in a state of happy tranquillity among themselves, and possessing a religion devoid of rites and ceremonies, but inculcating a belief in the existence of a great and beneficent Being and in the immortality of the soul. Cuba was twice visited by Columbus after its discovery—in April 1494, and again in 1502. In 1511 his son Diego Columbus, for the purpose of colonizing the island, fitted out an expedition, consisting of above 300 men, under Diego Velasquez, who had accompanied his father on his second voyage. Their first settlement was Baracoa, and in 1514 they founded Santiago and Trinidad. In July 1515 was planted a town called San Cristoval de la Havana, which name was transferred in 1519 to the present capital, the first-named place being now called Batabano. In 1538 Havana was reduced to ashes by a French privateer; and to prevent a similar disaster in future the Castillo de la Fuerza, a fortress which still exists, was built by Fernando de Soto, governor of Cuba, afterwards famous for his explorations in the southern and western regions of the United States, as well as for the discovery of the Mississippi. In 1554 the French again attacked and destroyed Havana. The early settlers devoted themselves principally to the rearing of cattle; but about 1580 the cultivation of tobacco and the sugar-cane was commenced, and this led to the introduction of the system of negro slavery. Previous to 1600 two other fortresses were built for the defence of Havana—the Moro and the Punta, which are still in existence. For about a century and a half after this period the island was kept in a state of almost perpetual fear of invasion from the French, English, Dutch, or the pirates infesting these seas; and several ineffectual efforts were made to reduce it. About 1665 the walls of Havana were commenced. In 1762 Havana was taken by an English fleet and army under Lord Albemarle, the former consisting of more than 200 vessels of all classes, and the latter of 14,041 men, while the Spanish army numbered 27,610 men. The defence was exceedingly obstinate. The English commenced operations on the 6th of June; but it was not until the 30th of July that the Moro Castle surrendered; and on the 14th August the city capitulated. The spoil divided among the captors amounted to £736,185. By the treaty of Paris, in February of the following year Cuba was restored to the Spaniards, and from that time its progress has been rapid; indeed, this restoration is regarded by native writers as the true era whence its importance and prosperity are to be dated. The administration of Las Casas, who arrived as captain-general in 1790, is represented by all Spanish writers as a brilliant epoch in Cuban history. He promoted with indefatigable perseverance a series of public works of the first utility, introduced the culture of indigo, extended the commercial importance of the island by removing as far as his authority extended the trammels imposed upon it by the old system of privilege and restriction, and made noble efforts to effect the emancipation of the enslaved native Indians. By his judicious administration the tranquillity of the island was maintained uninterrupted at the time of the revolution in San Domingo; although, as is generally believed, a conspiracy was formed at the instigation of the French among the free people of colour in Cuba. In 1795 a number of French emigrants arrived from San Domingo. In 1802 Jesu Maria, a populous suburb of Havana, was destroyed by a fire, which deprived 11,400 people of their habitations. On the deposition of the royal family of Spain by Napoleon (the news of which arrived in July 1808) every member of the Cabildo took oath to preserve the island for the deposed sovereign, and declared war against Napoleon. Since that time the island has been ruled over by a succession of governor-captain-generals from Spain, armed with almost absolute authority, some of whom have conducted themselves honourably, while the names of others are loaded with infamy, the office having been frequently sought and bestowed only as the means of acquiring a fortune. The deprivation of political, civil, and religious liberty, and exclusion from all public stations, combined with a heavy taxation to maintain the standing army and navy, have resulted in a deadly hatred between the native Cubans and the mass of officials sent from Spain. This has manifested itself in frequent risings for greater privileges and freedom. Of this kind were the conspiracy of the "Black Eagle" in 1829, the insurrection of the black population in 1844, the conspiracy of Narciso Lopez in

1848, his landing with 600 men from the United States in 1850, and his third attempt in 1851, which cost his life and that of many of his followers. Soon after this a reformist party sprang up, desirous of coming to a settlement which should insure the rights of the colony without impairing the interests of Spain, and after protracted efforts this party succeeded in obtaining an inquiry at Madrid on the reforms needed by Cuba; but the only alteration decreed was that of a new system of taxation, more oppressive than the former. Great sympathy had long been shown for the Cubans by the people of the United States, and in 1848 President Polk had gone the length of proposing through the American ambassador at Madrid a transference of the island to the United States for a sum of $1,000,000. A similar proposal was made ten years afterwards in the senate—the sum suggested being $30,000,000—but after debate it was withdrawn. When the Spanish revolution of 1868 broke out, the advanced party in Cuba at once matured their plans for the liberation of the island from the military despotism of Spain, rose in arms at Yara in the district of Bayamo, and made a declaration of independence, dated at Manzanillo, on the 10th of October of that year. This insurrection soon assumed formidable dimensions in the eastern portion of the island; on the 18th of October the town of Bayamo was taken, and on the 28th the jurisdiction of Holguin rose in arms. Early in November the patriots defeated a force which had been sent against them from Santiago de Cuba, and the greater number of the Spanish-American republics hastened to recognize the Cubans as belligerents. During subsequent years, in spite of the large and continued increase of the number of troops sent from Spain, and organized by the Spanish authorities in the island, the yearly campaigns up to the present time have shown that in the eastern interior the Cuban patriots are practically invincible, and that by maintaining a guerilla warfare they can attack and harass and even defeat their enemies who may be bold enough to act on the aggressive.

In a debate on Cuban affairs in the Cortes of Madrid in November 1876 it was stated that, during the past eight years, in attempting to crush the insurgents, Spain had sent to Cuba 145,000 soldiers and her most favoured commanders, but with little or no result. On the other hand Cuba, under the perpetual apprehension of the rebellion, has seen her trade decrease, her crops reduced, and her creoles deserting to the United States and Spanish republics; and her taxes have been trebled in vain to meet the ever-increasing expenses and floating debts.

The island of Cuba is long and narrow, somewhat in the form of an irregular crescent with its convex side towards the north. It divides the entrance to the Gulf of Mexico into two passages, that to the north-west being 130 English miles wide at the narrowest part, between the points of Ycacos in Cuba and Sable on the Florida coast, and the south-west passage of nearly the same width, between the Cabo de San Antonio of Cuba and the Cabo de Catoche, the most salient extremity of the peninsula of Yucatan. On the north-east, east, and south-east, narrower channels separate it from the Bahamas, Hayti, and Jamaica. Cuba lies between 74° and 85° W. long., and 19° and 23° N. lat. Its length, following a curved line through its centre, is 730 miles, and its average breadth is 80 miles. The area of Cuba is 43,319 English square miles; the neighbouring island of Pinos, 1214 square miles; and the smaller coastal islands, 1350 square miles;—in all 45,883 square miles. The coast of Cuba is generally low and flat, and is surrounded by numerous islands and reefs, which render the approach both difficult and dangerous to those not acquainted with the proper channels. The low nature of the shore subjects it to frequent floods and inundations; and especially on the north side of the island there are many large lagoons, from which a considerable quantity of salt is obtained. No island, however, in proportion to its size, has a greater number of excellent



Cuba and adjacent islands.

harbours, many of them accessible even to ships of the line. Of these the chief are the ports of Bahia, Honda, Mariel, Havana, Matanzas, Cardenas, Nuevitas, and Nipe on the northern side, and Guatanamo, Santiago de Cuba, Trinidad, and Cienfuegos on Xagua Bay on the southern.

The highest part of the island is in the range extending in the south-east from the Punta de Maysi to Cape Cruz, called the Sierra or Montaños de Maestra or Cobre, the summits of which are the Pico de Tarquino, 7670 feet, the highest point of the whole island; Gran Piedra, 5200 feet; Yunque and Ojo del Toro, 3500 feet. From this sierra a ridge of much smaller general elevation follows nearly the central line of the island westward throughout its extent, rising to form a more marked range in the extreme west of Cuba, on which the Pan de Guajaibon attains 2530 feet. An almost isolated mass, of which the Pico de Potrerillo is the summit, 2990 feet above the sea, rises immediately behind the harbour of Trinidad, near the centre of the southern coastland. The south-eastern sierra is one great calcareous mass, resting on a schistose formation. The summits are for the most part rocky and naked, occasionally interrupted by more gentle undulations. The central and western parts of the island contain two formations of compact limestone, one of clayey sandstone, and another of gypsum. Caverns abound in the limestone formations. The secondary formations, east of Havana, are pierced by syenitic and euphotide rocks united in groups. The syenite strata are intercalated with serpentine, and inclined to the north-west. In some places petroleum runs out of rents in the serpentine; and abundant springs of this fluid are also found in the eastern part of the island.

The rivers are necessarily short, and flow toward the north and south. The largest is the Cauto, rising in the Sierra del Cobre, and falling into the Bay of Buena Esperanza on the southern coast, after a course of fifty leagues, for twenty of which it is navigable by boats, though at low water obstructed by bars. The Sagua la Grande rises in the Sierra del Escambray, and falls into the sea in front of the Boca de Maravillas, being navigable for five leagues. The principal of the other rivers are the Sagua le Chica, the North and South Iatibonica, the Cuyaguateje, Sasa, Agobama, and Hanabana. North-east of Guantanamo the hills of the south-eastern sierra are known as those of Quibijan and Baracoa, and in the hill of Moa in this range there is formed a huge cavern in which the River Moa descends from a height of 100 yards, forming a superb cascade.

Situated within and near the border of the northern tropical zone the climate of the low coastlands of Cuba is that of the torrid zone, but the higher interior of the island enjoys a more temperate atmosphere. As in other lands on the border of the tropics, the year is divided between a hotter and wetter season, corresponding to the northern declination of the sun, and a cooler and drier period. The months from the beginning of May to October are called the wet season, though rain falls in every month of the year. With May spring begins in the island, rain and thunder are of almost daily occurrence, and the temperature rises high with little daily variation. The period from November to April is called the dry season by contrast. On a mean of seven years, the rainfall at Havana in the wet season has been observed to be 27·8 inches, of the dry months 12·7 or 40·5 inches for the year At Havana in the warmest months, those of July and August, the average temperature is 82° Fahr., fluctuating between a maximum of 88° and a minimum of 76°; in the cooler months of December and January the thermometer averages 72°, the maximum being 78°, the minimum 58°; the average temperature of the year at Havana, on a mean of seven years, is 77°. But in the interior, at elevations of over 300 feet above the sea, the thermometer occasionally falls to the freezing point in winter, hoar frost is not uncommon, and during north winds thin ice may form, though snow is unknown in any part of the island. The prevailing wind is the easterly trade breeze, but from November to February cool north winds (*los nortes*, or "northers"), rarely lasting more than forty-eight hours, are experienced in the western portion of the island, to which they add a third seasonal change. From 10 to 12 o'clock are the hottest hours of the day; after noon a refreshing breeze (*la virazon*) sets in from the sea. Hurricanes may occur from August to October, but are less frequent than in Jamaica or Hayti, and sometimes five or six years may pass without such a storm. Slight shocks of earthquake are occasionally felt. There are no diseases specially indigenous to the island; the yellow fever, which breaks out with renewed virulence regularly with the wet season in the coastlands and seaports of Cuba, annually causing great loss of life, is quite unknown in the interior.

Minerals. The mineral riches of the island have not yet been explored to any considerable extent. Though gold and silver have undoubtedly been found in the island, the quantity has never been sufficient to repay the labour of search. Gold was sent to Spain from this island by the early settlers, but it was more probably the accumulated wealth of the aborigines in previous centuries, wrested from them by tyranny and rapine at the period of the conquest, than the product of honest labour on the part of the colonists. Traces of auriferous sand are found in the rivers Holguin, Escawbray, &c. Some specimens of the finest gold have been obtained from the workings of Agabama and Sagua la Grande, but at an expense of time and labour that could not remunerate the parties engaged in it. In 1827 silver and copper were discovered in the jurisdiction of Villa Clara, and the first ores gave no less than 7 oz. of pure silver to the quintal ($=107\frac{3}{4}$ lb) of ore; but they have become less productive, probably from not being properly worked. The Cobre copper mines, twelve miles from Santiago, in the eastern part of the island, are of great extent, and very rich; a village of 2000 inhabitants has formed on their site, and a railroad unites them with the shipping port of Punta de Sal. As much as 50 tons of ore are taken out daily. the richest part of which, being broken up, is shipped to Europe; while the poorer part is smelted at the works, yielding about 14 per cent. of metal. These mines were wrought with some success during the 17th century, and had been abandoned for more than 100 years. Coal of a highly bituminous character, affording a strong heat, and leaving very little solid residue in the form of ashes or cinders, is very abundant. In some places it degenerates into a form resembling asphaltum, and near the coast it is often found in a semi-liquid state like petroleum or naphtha. In the quarries near Havana a thick slate is found, fit for floors and pavements. Marbles and jaspers, of various colours, and susceptible of a high polish, are found in many parts of the island, and particularly in the Isle of Pines. It is generally believed that iron exists in various districts of Cuba, and many parts of the great Cordillera undoubtedly contain rocks of a ferruginous nature; but from the difficulty of access, the scarcity of fuel, and the want of capital, no extensive mining operations have been engaged in. Native loadstone, however, has been found in various parts, and chalybeate springs are numerous.

The only peculiar quadruped known in the island is the *jutia* or *hutia*, an animal shaped like a rat, and from 12 to 18 inches in length exclusive of the tail. It is of a clear black colour, inhabits the hollows and clefts of trees, and feeds on leaves and fruits. Its flesh is insipid, but is sometimes eaten. A few deer are found about the swamps, but they are supposed to have been introduced from the continent. The woods abound in wild dogs and cats, sprung from these animals in a domestic state, and differing from them only in habits and size. They are very destructive to poultry and cattle. Of domestic animals, the ox, the horse, and the pig are the most valuable, and form a large proportion of the wealth of the island; the sheep, goats, and mules, are less numerous. The manati frequents the shores. The domestic fowls include geese, turkeys, peacocks, and pigeons. The indigenous birds are distinguished by the beauty of their plumage, and are very numerous, including upwards of 200 species. Birds of prey are few. The vulture and turkey-buzzard are protected by law and custom, on account of their services in the removal of offal. The rivers, bays, and inlets are well supplied with fish. Oysters and other shell-fish are numerous, but of inferior quality. The reefs and shallows, and the sandy portion of the beach, abound in turtle; and the crocodile, cayman, and iguana are common. Large numbers of land-crabs are frequently seen; they cross the island from north to south every spring, when the rains commence. Snakes are not numerous; the *maja*—12 or 14 feet in length, and 18 or 20 inches in circumference—is the largest, but is harmless; the *juba*, which is about 6 feet long, is venomous. Among the insects may be specially noticed the bee and the phosphorescent fly. These flies are very numerous, and much used among the poorer inhabitants. Fifteen or twenty of them confined in a calabash pierced with holes frequently serve during the night as a sort of lantern. The noxious insects are the chigoe or jigger, a species of ant called vivajagua, the mosquito, the sand-fly, the scorpion (less poisonous than that of Europe), and spiders whose bite is malignant enough to produce fever.

The forests of Cuba are of vast extent, and so dense as to be almost impenetrable. It is estimated that of nearly 20,000,000 acres of land still remaining perfectly wild and uncultivated, nearly 13,000,000 are uncleared forest. Mahogany and other hard woods, such as the Cuban ebony, cedar, sabicei, and granadilla, valuable for manufactures, cabinet work, and ship-building, are indigenous, and are exported to a considerable extent. The palm is the queen of the Cuban forests, and the most valuable tree on the island. The most common species, the *Palma Real* (*Oreodoxa regia*), is found in all parts, but especially in the west. The fruits of Cuba are those common to the tropics, of which the pine-apple and orange are the most esteemed. Of the alimentary plants, the plantain is by far the most important. Next in order come the sweet and bitter cassava—the sweet root being eaten as a vegetable, and the bitter converted into bread after its poisonous juice has been extracted. The sweet potato, and other farinaceous roots, are also common. Indian corn is indigenous, and rice is extensively cultivated; cocoa or chocolate is also grown.

The chief agricultural products of Cuba are, however, sugar, coffee, and tobacco. The "ingenios" or sugar estates, with large buildings and mills for sugar-refining and distillation of rum, are the most important industrial establishments of the island, varying in extent from 500 to as much as 10,000 acres. Of late years, partly from the effects of the insurrection, and partly from the rapidly extending cultivation of beet-root sugar in other countries, the demand for Cuban sugar has been diminishing, and the sugar estates have not flourished. The United States take about 70 or 80 per cent. of the sugar grown in Cuba, the greater part of the remainder passing to Europe. The quantity exported in 1873 from the ports of Havana, Matanzas, Cardenas, Sagua la Grande, Remedios, Nuevitas, Santiago de Cuba, Trinidad, and Cienfuegos exceeded 600,000 tons, of a value of about £12,000,000. Besides this 242,000 tons of molasses were exported. After the "ingenios" the "cafetales" or coffee estates are the most important establishments. They vary in extent from 100 to upwards of 1000 acres, or even more in the mountain districts,—the number of hands employed being as high as 100 in the low country, but generally averaging fifty or sixty negroes to 1000 acres. The first coffee plantation was established in 1748, the seeds having been brought from San Domingo. Though at one time coffee was sent out from Cuba in enormous quantities, it does not now figure largely in the exports. Tobacco is indigenous to Cuba, and its excellent quality is celebrated in all parts of the world. The estates devoted to its cultivation are scattered over the greater part of the island, but the finest qualities of tobacco are those grown in the country west of Havana, known as the "vuelta abajo." In 1873, 224,765,000 cigars were exported, besides nearly 13,500,000 ℔ of leaf, to the United States, Great Britain, Hamburg and Bremen, Holland, France, and Spain. Among the other industrial establishments of Cuba may be mentioned the numerous cattle farms, cotton plantations, fruit and vegetable farms, chocolate plantations, and "colmenaries" or farms devoted to the production of honey and wax.

The imports consist mainly of jerked beef from South America, codfish from the British North American provinces, flour from Spain, rice from Carolina, Spain, and the East Indies, wine and olive oil from Spain, boards for boxes and barrels from North America, coals from Europe and North America, and petroleum from the United States, besides large quantities of British, German, and Belgian manufactures and hardwares. Heavy differential duties in favour of goods imported into Cuba in Spanish ships are in force, so that the greater part of the imports arrive in these. Cattle are imported from Florida and the coasts of the Mexican Gulf. There are no manufacturing industries of importance in the island.

Education is in a remarkably backward state in Cuba. In the absence of recent statistics, it is estimated that of perhaps 100,000 children of free parents, not a tenth part receive lettered education of any kind; and even among the higher classes of society liberal education is very far from being universally diffused. A few literary and scientific men, wherever educated, are however to be found both in the higher and middle ranks, and, previous to the disturbances which began in 1868, the question of public instruction excited much interest among the creole population, an impetus to this having been given by the same liberal portion of the population which originated the *Sociedad Economica* of Havana and Santiago de Cuba, an institution which has for its object the advancement of education and popular industry. At Havana is the royal university with a rector and thirty professors and medical and law schools, as well as an institution called the Royal College of Havana. There is a similar establishment at Puerto Principe, in the eastern interior; and both at Havana and Santiago de Cuba there is a college in which the branches of ecclesiastical education are taught, together with the humanities and philosophy. Besides this there are several private schools, but none are accessible to the masses. The inhabitants of Havana can scarcely be said to have any literature—a few daily and weekly journals, under a rigid censorship, supply almost all the taste for letters in the capital.

The Roman Catholic is the only religion tolerated by Government. At first there was but one diocese, which included not only the whole island, but also Louisiana and the two Floridas, all under one bishop. In 1788 Cuba was divided into two dioceses, each embracing half the island. The eastern diocese, or that of Santiago de Cuba, was in 1804 erected into an archbishopric, while that of Havana still remains under a bishop.

Politically the island is a province of Spain ruled over directly by a governor-captain-general of the class of lieutenant-general of the Spanish army, whose authority for the time being is despotic. He is appointed by the Crown, the term of office being generally from three to five years, is responsible only to the sovereign of Spain, and is supreme head of the civil, military, and ecclesiastical jurisdictions of Cuba. The captain-general is assisted by governors of departments, who have under their orders the lieutenant-governors, commanders of the thirty-two jurisdictions of the island, each of which is subdivided into "partidos" or captaincies. In each city or town a municipal body termed the *ayuntamento*, or town council, is at the head of affairs, but municipal representation exists only in appearance. The military division is into two departments—that of the west with Havana for its capital, and that of the east with Santiago de Cuba for its head-quarters. The boundary between these departments, which is also the limit of the dioceses, starts from the brook Yana in front of the eastern part of the island of Yuriguano, and terminates near Sabana-la-Mar. Divisions.

The judicial division comprises the whole island, as the territory of the "Real Audiencia Pretorial," or supreme court. In each of the twenty-six judicial districts into which this is subdivided there is an "alcalde mayor," having for auxiliary delegates the ordinary "alcaldes," or local judges. The "Real Audiencia," holding session at Havana, is a species of council of state which the captain-general consults on all difficult matters of administration. The maritime division is subject to a commander-general, and consists of five stations or provinces, with their centres at Havana, Trinidad, San Juan de los Remedios, Nuevitas, and Santiago de Cuba.

In popular language the different portions of the island are distinguished as the *Vuelta Abajo*, or the portion extending from the meridian of Havana to the western extremity of the island; the *Vuelta Arriba*, from the meridian of Havana towards the east as far as Cienfuegos; *Las Cinco Villas* from the meridian of Cienfuegos to that of Santo Espiritu; and *Tierra Adentro* from that of Santa Espiritu to Holguin and the extreme east of the island.

The Crown revenues of the island are the *rentas maritimas*, including duties on imports, exports, and tonnage, and the local or municipal duties levied at some of the custom-houses; the *impuestas interiores*, including the tax on home manufactures, the sale of stamped paper, the profits derived from the lottery, and the impost on cock-fights; deductions from the *rentas ecclesiasticas*, particularly those called the royal ninths and the consolidated fund, the sinking fund, the *media annata*, and the annual and monthly revenues of the clergy; personal deductions, such as from the pay of public functionaries, and the price of exemption from military service; miscellaneous receipts, as the produce of the sale of royal lands, the rents of vacant livings and of unclaimed estates, the produce of vendible offices; and casual receipts, including deposits, confiscations, donations, and the recovery of arrears.

Previous to the outbreak of the insurrection of 1868 the total revenue of Cuba had reached nearly to 26,000,000 dollars, of which sum about 6,000,000 dollars was annually remitted to Spain, leaving the remainder to cover the expenses of the army, navy, and civil service of the island. Since 1868 the imposts have been much increased, but have not been sufficient to cover the enormous increase of expenditure consequent on the rebellion. The Government of the island has thus been compelled to borrow large sums for its war funds. Public finances are specially under the management of the Government bank called the Banco Español, and have fallen into an unsatisfactory and confused state consequent on the steps taken by the island Government for obtaining funds by the emission of large amounts of notes without additional security, and without a special guarantee for each issue from the Madrid Government, resulting in a depreciation of the paper, or a premium on gold and silver.

The coins in use are chiefly the old Spanish "doblon," or "onza de oro," worth about £3, 4s., or 16 silver dollars of Spain, but it is legal tender for 17 dollars in the island. Gold coins of half a doblon, "media onza," of 8 dollars 50 cents, and of half and quarter that amount, and the "peso," or dollar in gold or silver, are also in circulation. There is scarcely any smaller silver currency in Cuba, excepting the American 10 cent piece or dime, called the "real sencilla."

Communication.

The roads of Cuba are generally in a very wretched condition. Several railways have been established. The oldest, opened in 1838, extends from Havana to Guines, a distance of forty-five miles, and has branches to Batabano, San Antonio, and Los Palos. There are lines in operation from Matanzas to Sabanilla, Cardenas to Bamba and Jucaro, and thence to unite with the line which crosses the island between Sagua la Grande and Cienfuegos, as well as from Puerto Principe to Nuevitas. The whole length of lines in operation is nearly 400 miles. Coastal communication is kept up by steamers which ply regularly between the different ports. Numerous lines of steamers run between Havana and New York, New Orleans, Key West, Philadelphia, and Baltimore; and with Europe communication is maintained by English mail as well as French and German lines of ocean steamers. The island is connected by telegraph with the mainland and with Jamaica.

Population.

Conflicting accounts render it impossible to arrive at anything like certainty as to the number of inhabitants on the island at the time of its conquest; but it may be estimated at from 300,000 to 400,000. There is little doubt, however, that before 1560 the whole of this population had disappeared from the island. The first census of Cuba was taken in 1774, when the population was 171,620. In 1791 it was 272,300. The following table gives the population since that period:—

Year.	Whites.	Free Blacks.	Slaves.	Total.
1811...	274,000	114,000	212,000	600,000
1817...	290,021	115,691	225,268	630,980
1827...	311,051	106,494	286,942	704,487
1841...	418,291	152,838	436,495	1,007,624
1846...	425,769	149,226	323,759	898,752
1849...	457,133	164,410	323,897	945,440
1860...	604,610	207,735	367,370	1,179,715

Owing to the disturbed condition of the island, no census of the inhabitants has been taken since that of 1861. The results of the enumeration of that year made the total population 1,396,530, distributed thus:—

Naturalized Whites	730,894
Asiatic Coolies	34,834
Mexicans (Yucatese)	1,047
	766,775
Free Coloured	232,493
Slaves	370,553
	603,046
Resident foreigners	5,298
Passing ,,	3,987
Spaniards	17,424
	26,709

An estimate, based on this census, made in 1869 gives the total population as 1,414,508, including 50,000 coolies.

The following statement appears in *The Times*, March 16, 1877:—

"The American press despatch from Havana states that the official figures show that in the year 1870 there were in the island 363,000 slaves; in 1873, 287,000; and 1876, 199,000.

The numbers of free blacks in the island in 1873 was 26,000; in 1874, 50,000; in 1875, 75,000; and in 1876, 84,000. The free blacks in the four jurisdictions in which no census could be taken are estimated at 6000."

Writing in 1872, Mr Gallenga quotes an official statement of the population, giving a total of 1,359,437; or 1,034,616 in the western division of which Havana (population, 230,000) is the chief city; 75,725 in the central districts round Puerto Principe (population, 31,000); and 249,096 in the eastern division, the chief town of which is Santiago de Cuba (population, 37,000). The only other town of importance is Matanzas with a population of 36,000.

The inhabitants of Cuba are divided into four classes,—the native Spaniards, who occupy nearly all the offices of power and trust; the creoles, who are mostly planters, farmers, or lawyers, and are generally looked upon with contempt by the Spaniards; the third class, composed of free mulattoes and free negroes in about equal parts, who are excluded by law from all civil offices; those under servitude, constituting the fourth class, divided into the *bozales*, those recently brought from Africa,—the *ladinos*, those imported before the law of 1821 prohibiting the slave trade,—and the *criollos*, those born on the island. Cuba was long notorious for the extent to which the slave trade was carried on there, and the ineffectual efforts made to suppress it. The English Government succeeded, however, in 1853 in inducing the Spanish Government to pledge itself to adopt measures for its suppression; and the importation of African slaves has consequently ceased for a number of years. In their place Asiatic coolies have been introduced in considerable numbers, and the plan has worked well for the planters, though it is almost certain death in a short time to the coolies, who are slaves in almost every sense.

Under a better and more liberal system of government, there can be no doubt that Cuba would speedily attain a much higher state of prosperity and importance than it has yet enjoyed. Great as is its productiveness at present, some writers assert that under good government it would be increased five-fold; its mineral resources would then be fully developed, and it would be able fully to take advantage of its admirable position to develop its trade.

Ferrer, "Estudios fisicos, geogr., y geologicos de Cuba," in *Revista de España*, t. xxii. 1871; S. Hazard, *Cuba with Pen and Pencil*, London, 1873; A. Gallenga, *The Pearl of the Antilles*, London, 1873; Hippolyte Piron, *L'Ile de Cuba*, Paris, 1876. (K. J.)

CUBEBS (Arabic, *kabábah*), the fruit of species of plants belonging to the genus *Cubeba*, natural order *Piperaceæ*. The cubebs of pharmacy are produced by *C. officinalis* (*Piper Cubeba*, Linn.), a climbing woody shrub indigenous to South Borneo, Sumatra, Prince of Wales Island, and Java. It has round, ash-coloured, smooth branches; oblong, or ovate-oblong, coriaceous, shining leaves, 4 to $6\frac{1}{2}$ inches long, and $1\frac{1}{2}$ to 2 inches broad; and diœcious flowers. The fruits are small, globose, about $\frac{1}{6}$th inch in diameter, and not so large as white pepper; their contracted bases or pedicles are between $\frac{1}{3}$ and $\frac{1}{2}$ inch in length; and from forty to fifty of them are borne upon a common rachis. Commercial cubebs consist of the dried ripe berries, usually with their pedicles attached; the pericarp is greyish-brown, or blackish and wrinkled; and the seed, when present, is hard, white, and oily. The odour of cubebs is agreeable and aromatic; the taste, pungent, acrid, slightly bitterish, and persistent. About 15 per cent. of a volatile oil, polymeric with oil of turpentine, is obtained by distilling cubebs with water; after rectification with water, or on keeping, this deposits rhombic crystals of *camphor of cubebs* or *hydrate of cubebene*, $C_{30}H_{48},2H_2O$; *cubebene*, the liquid portion, has the formula $C_{30}H_{48}$. *Cubebin* is a crystalline substance existing in cubebs, discovered by Soubeiran and Capitaine in 1839; it may be prepared from cubebene, or from the pulp left after the distillation of the oil. The drug, along with gum, fatty oils, and malates of magnesium and calcium, contains also about 1 per cent. of *cubebic acid*, and to this and to a resin Bernatzik and Schmidt attribute its therapeutic effects. Cubebs are administered for arresting excessive mucous urethral discharges, also as a gentle stimulant, carminative, and stomachic. They are most safely employed in gonorrhœa when the inflammation is confined to the mucous membrane of the urethra. The introduction of the drug into medicine is supposed to have been due to the Arabian physicians in the Middle Ages. Cubebs were formerly candied and eaten whole, or used ground as a seasoning for meat. Their modern employment in England as a drug dates from 1815. "Cubebæ" were purchased in 1284 and 1285 by Lord Clare at 2s. 3d. and 2s. 9d. per ℔ respectively; and in 1307 1 ℔ for the King's Wardrobe cost 9s., a sum representing about £3, 12s. in present value (Rogers, *Hist. of Agriculture and Prices*, i. 627–8; ii. 544). The plant *Cubeba Clusii* produces the *African cubebs* or West African black-pepper, the berry of which is smoother than that of common cubebs, and usually has a curved pedicle. It is said by Stenhouse (*Ann. Ch. Pharm.*, xcv. 106) to contain piperin and not cubebin. In the 14th century it was imported into Europe from the Grain Coast, under the name of pepper, by merchants of Rouen and Lippe.

CUBITT, Thomas (1788–1855), who attained distinction as a builder and capitalist, was born at Buxton, near Norwich. Few men have exhibited greater self-reliance in early life in the pursuit of a successful career. In his nineteenth year, when he was working as a journeyman carpenter, his father's death quickened the desire to reach an independent position, and induced him to undertake a voyage to India, as captain's joiner. On his return to London, two years after, in the possession of a small capital, he began business as a carpenter, and the growth of his establishment was steady and rapid. He was one of the first to unite the many trades, until then more or less separate, which are now comprised in a "builder's" business; and this amalgamation very much increased his success. One of the earlier works which gave him reputation was the London Institution, Moorfields; but it is from 1824 that the vast building operations date which identify his name with many splendid ranges of London houses, such as Tavistock, Gordon, Belgrave, and Lowndes Squares, and the district of South Belgravia. While these and similar extensive operations were in progress, a monetary panic, which proved ruinous to many, was surmounted in his case by a determined spirit and his integrity of character. He took great interest in sanitary measures, and published, for private circulation, a pamphlet on the general drainage of London, the substance of which was afterwards embodied in a letter to the *Times*; the plan he advocated was subsequently adopted by the conveyance of the sewage matter some distance below London. He regarded with the eye of a philanthropist the provision of open spaces in the environs of London as places of public recreation, and was one of the originators of Battersea Park, the first of the people's parks. At a late period he received professionally the recognition of royalty, the Palace at Osborne being erected after his designs, and under his superintendence; and in the *Life of the Prince Consort* he is described by the Queen as one "than whom a better and kinder man did not exist." In 1851, although he was not identified with the management of the Great Exhibition, he showed the warmest sympathy with its objects, and aided its projectors in many ways, especially in the profitable investment of their surplus funds. As a capitalist he regarded as inseparable the interests of employers and employed, and he always had the elevation of his workpeople at heart. He was elected president of the Builders' Society some time before his death, which took place at his seat of Denbies, near Dorking, in 1855.

CUBITT, Sir William (1785–1861), a distinguished English engineer, was born at Dilham in Norfolk, where his father was a miller. He received his early education at the village school, and subsequently profited greatly by the access he had to a clergyman's library. While still very young he worked in his father's mill, and served an apprenticeship of four years (1800–1804) as a joiner and cabinetmaker at Stalham. After working for a short time with his father, he became associated with an agricultural machine-maker, named Cook, who resided at Swanton. He now showed great talent in making accurate and highly finished patterns for the iron castings of horse threshing-machines and other implements. He turned his attention to windmills, which were, at that time, encumbered with sails so large that they proved exceedingly difficult to manage during a storm. His investigations led him to the invention of self-regulating windmill sails, which were patented in 1807, and are now universally used. In 1812 he entered the important works of Messrs Ransome of Ipswich, of which he soon became chief engineer. He improved the port and gasworks of Ipswich, and ultimately became a partner of the Messrs Ransome, and remained with them till 1826, when his increasing interest in great engineering undertakings led to his removal to London. Meanwhile, the subject of the employment of criminals had been much in his thoughts; and the result was his invention of the treadmill, which he meant to be used for grinding corn, pumping water, &c., and did not contemplate as an instrument of punishment. Shortly after 1818 all the principal jails in the kingdom introduced the invention. In 1822 an account of the treadmill, "invented by Mr William Cubitt of Ipswich," was issued by the Society for the Promotion of Prison Discipline. Mr Cubitt had been very busy, while in Ipswich, having issued reports in 1814, 1820, and 1822 on the Norwich navigation. In 1822 he first became intimate with Telford. After his removal to London he was almost constantly engaged in important engineering works, and was often requested to give his opinion and evidence on the improvement of canals, harbours, ports, and rivers, the making of railways, and designs for bridges. His face was well known in the committee rooms at Westminster. Among his works may be mentioned the Oxford canal, the Birmingham and Liverpool Junction Canal, the improvement of the River Severn, the Bute docks at Cardiff, the Black Sluice drainage and its outfall sluice at Boston harbour, the Middlesborough docks and coal drops in the Tees, and the South-Eastern Railway, of which he was chief engineer. His advice was often asked about proposed alterations on the Thames, Tees, Tyne, Ouse, Weaver, Nene, Witham, and Welland; and he submitted important reports on these rivers. He was a member of commission for the improvement of the Shannon, in which capacity he did good service. On the Croydon Railway he applied the atmospheric system of traction; and on the Great Northern Railway, constructed by his son Mr Joseph Cubitt, he effected many valuable improvements. On the Continent, too, his opinion was much valued. The Hanoverian Government consulted him about the harbour and docks at Harburg; the water-works of the city of Berlin were constructed under his immediate superintendence; his report on the proposed Paris and Lyons railway had much weight in determining what offer was to be accepted; and he was consulting engineer for the line of railway from Boulogne to Amiens. Among his later works we may mention two large floating landing stages at Liverpool, and the bridge for carrying the London turnpike across the Medway at Rochester.

In 1850 he was consulted by Sir Robert Peel in regard to a building in Hyde Park for the International Exhibition. His name is identified with the *original* plan; and he gave such high satisfaction that Her Majesty was graciously pleased to confer the honour of knighthood on him in 1852. Ultimately Sir Joseph Paxton's plan was adopted, with the approval of Mr Cubitt. Public recognition, sometimes withheld in the case of literary men, is generally ample in the case of those who devote themselves to practical usefulness. Cubitt accordingly was chosen a fellow of the Royal Society in 1830; he was also a fellow of the Royal Irish Academy, a member of the Society of Arts, and of the Institution of Civil Engineers, of which he became successively a member of council in 1831, vice-president in 1836, and president in 1850 and 1851. In 1858, after a singularly arduous and successful career, he retired from public business; but he never ceased to take an interest in engineering work till his death, which took place on the 13th October 1861, at his house on Clapham Common, London.

CUCA, or Coca (*Erythroxylon Coca*), is a plant of the natural order *Erythroxylaceæ*, the leaves of which are used as a masticatory in the western countries of South America.[1] It resembles a blackthorn bush, and grows to a height of 6 or 8 feet. The branches are straight, and the leaves, which have a lively green tint, are thin, opaque, oval, tapering at the extremities, and similar to tea-leaves; on each side of the strong mid-rib is a longitudinal vein. Good samples of the dried leaves are uncurled, are of a deep green on the upper, and a grey-green on the lower surface, and have a strong tea-like odour; when chewed they produce a sense of warmth in the mouth, and have a pleasant, pungent taste. Bad specimens have a camphoraceous smell and a brownish colour, and lack the pungent taste. The flowers are small, and disposed in little clusters on short stalks; the corolla is composed of five yellowish-white petals, the anthers are heart-shaped, and the pistils are three in number. The flowers are succeeded by red berries. The seeds are sown in December and January in small plots (*almacigas*) sheltered from the sun, and the young plants when from $1\frac{1}{2}$ to 2 feet in height are placed in holes (*aspi*), or, if the ground is level, in furrows (*uachos*) in carefully-weeded soil. The plants thrive best in hot, damp situations, such as the clearings of forests; but the leaves most preferred are obtained in drier localities, on the sides of hills. The leaves are gathered from plants varying in age from one and a half to upwards of forty years. They are considered ready for plucking when they break on being bent. The first and most abundant harvest is in March, after the rains; the second is at the end of June, the third in October or November. The green leaves (*matu*) are spread in thin layers on coarse woollen cloths and dried in the sun; they are then packed in sacks, which, in order to preserve the quality of the leaves, must be kept from damp.

It has been estimated that cuca is used by about 8,000,000 of the human race, being consumed in Bolivia, Peru, Ecuador, Colombia, and Rio Negro. In Peru the Indians carry a leathern pouch (the *chuspa*, or *huallqui*) for the leaves, and a supply of pulverized unslaked lime, or a preparation of the ashes of the quinoa plant (*Chenopodium quinoa*), called *llipta* or *llucta*. Three or four times a day labour is suspended for *chacchar* or *acullicar*, as the mastication of cuca is termed. The leaves, deprived of their stalks, are chewed and formed into a ball (*acullico*) in the mouth; a small quantity of the lime or llipta is then applied to the acullico to give it a proper relish. Two or three ounces of cuca are thus daily consumed by each Indian.

Cuca is a powerful stimulant of the nervous system; it enables fatigue to be borne with less nourishment and greater ease than ordinarily, and diminishes the difficulty of breathing in ascending mountains; when used externally it is said to be a remedy for rheumatism and headache.

The poet Cowley represents the Indian "Pachamma" as addressing Venus thus:—

> "Our *Varicocha* first this *Coca* sent,
> Endow'd with Leaves of wondrous Nourishment,
> Whose Juice succ'd in, and to the Stomach tak'n
> Long Hunger and long Labour can sustain;
> From which our faint and weary Bodies find
> More Succour, more they chear the drooping Mind,
> Than can your *Bacchus* and your *Ceres* join'd.
> Three Leaves supply for six days march afford,
> The *Quitoita* with this Provision stor'd
> Can pass the vast and cloudy *Andes* o'er."
> (*Plants*, bk. v. p. 121, *Works*, 9th ed. Lond. 1700.)

Dr Pöppig (*Travels in Chili and Peru*) considers the habit of cuca-chewing to be as dangerous to the health as opium-eating, and in the highest degree pernicious, and Mr J. A. Lloyd alludes to cuca as a "poisonous narcotic" (*Journ. R. Geog. Soc.*, 1854, p. 260). It does not, however, appear from the writings of Garcilasso that he observed any ill results among the Peruvian Indians from the practice of cuca-chewing. Von Tschudi refers to numerous instances of their longevity and good health, notwithstanding the habit, almost from boyhood, of masticating cuca three times a day. Markham regards cuca as the least injurious, and the most soothing and invigorating of all the narcotics used by man; and Dr Archibald Smith (*Peru as it is*, London, 1839) states that cuca when fresh and good, and used in moderate quantity, increases nervous energy, removes drowsiness, enlivens the spirits, and enables the Indian to bear cold, wet, great bodily exertion, and even want of food, to a surprising degree, with apparent ease and impunity. Though it is said, if taken to excess, to

[1] Garcilasso de la Vega, writing of the plant, says that it is called *cuca* by the Indians, *coca* by the Spaniards; and Father Blas Valera states that the leaves are called *cuca* both by Indians and Spaniards. (*The Royal Commentaries of the Yncas*, 1609–1617; trans. by C. R. Markham, Hakluyt Soc., 1871). See also, on the name *cuca*, Christison, *Brit. Med. Journ.*, April 29, 1876, p. 527.

occasion tremor in the limbs, and even a gloomy sort of mania, such dire effects, he considers, must be of rare occurrence, since, after living for years in constant intercourse with persons accustomed to frequent cuca plantations, and with Indian yanacones or labourers, all of whom, whether old or young, masticated the favourite leaf, he never witnessed a single instance in which the chewer was affected with mania or tremor.

Cuca was used by the Peruvian Indians in the most ancient times. It was employed as an offering to the sun, or to produce smoke at the great sacrifices; and the priests, it was believed, must chew it during the performance of religious ceremonies, otherwise the gods would not be propitiated. Cuca is still held in superstitious veneration among the Peruvians, and is believed by the miners of Cerro de Pasco to soften the veins of ore, if masticated and thrown upon them.

Cocaine, the alkaloid to which cuca owes its special properties, was discovered by Niemann in 1859. The formula assigned to it is $C_{16}H_{19}NO_4$, or $C_{17}H_{21}NO_4$ (Lossen). It is highly poisonous, and its physiological action is apparently identical with that of theine, caffeine, guaranine, and theobromine, which all, as has been shown by Dr A. Bennet, "induce a series of symptoms affecting the nervous, respiratory, circulatory, vaso-motor, and glandular systems" (*Edin. Med. Journ.*, October 1873, p. 323).

Tschudi, *Travels in Peru*, &c., 1838-42 (Lond. 1847); C. R. Markham, *Travels in Peru and India*, p. 232 (Lond. 1862).

CUCKOO, or Cuckow, as the word was formerly and more correctly spelt—changed without any apparent warrant except that accorded by custom, while some of the more scholarly English ornithologists, as Montagu and Jenyns, have kept the older form—the common name of a well-known and often-heard bird, the *Cuculus canorus* of Linnæus. In some parts of the United Kingdom it is more frequently called Gowk, and it is the Greek *κόκκυξ*, the Italian *Cuculo* or *Cucco*, the French *Coucou*, the German *Kuckuk*, the Dutch *Koekkoek*, the Danish *Kukker* or *Gjög*, and the Swedish *Gök*. The oldest English spelling of the name seems to have been *Cuccu*.

No single bird has perhaps so much occupied the attention both of naturalists and of those who are not naturalists, or has had so much written about it, as the common Cuckow and of no bird perhaps have more idle tales been told. It strange and, according to the experience of most people, its singular habit of intrusting its offspring to foster-parents is enough to account for much of the interest which has been so long felt in its history; but, as will presently appear, this habit is shared probably by many of its Old-Word relatives, as well as in the New World by birds which are not in any near degree related to it. In giving here a short account of this species, there will be no need to refute much of the nonsense about it which has found access to works even of respectable authority; but, besides the known facts of its economy, there are certain suppositions in regard to parts of its history that are unknown, which suppositions are apparently probable enough to deserve notice.

To begin with the known facts. The Cuckow is a summer-visitant to the whole of Europe, reaching even far within the Arctic circle, and crossing the Mediterranean from its winter-quarters in Africa at the end of March or beginning of April. Its arrival is at once proclaimed by the peculiar and in nearly all languages onomatopœic cry of the cock—a true song in the technical sense of the word, since it is confined to the male sex and to the season of love. In a few days the cock is followed by the hen, and amorous contests between keen and loud-voiced suitors are to be commonly noticed, until the respective pretensions of the rivals are decided. Even by night they are not silent; but as the season advances the song is less frequently heard, and the Cuckow seems rather to avoid observation as much as possible, the more so since whenever it shews itself it is a signal for all the small birds of the neighbourhood to be up in its pursuit, just as though it were a Hawk, to which indeed its mode of flight and general appearance give it an undoubted resemblance—a resemblance that misleads some beings, who ought to know better, into confounding it with the Birds-of-prey, instead of recognizing it as a harmless if not a beneficial destroyer of hairy caterpillars. Thus pass away some weeks. Towards the middle or end of June its "plain-song" cry alters; it becomes rather hoarser in tone, and its first syllable or note is doubled. Soon after it is no longer heard at all, and by the middle of July an old Cuckow is seldom to be found in these islands, though a stray example, or even, but very rarely, two or three in company, may occasionally be seen for a month longer. This is about as much as is apparent to most people of the life of the Cuckow with us. Of its breeding comparatively few have any personal experience. Yet there are those who know that diligent search for and peering into the nests of several of our commonest little birds—more especially the Pied Wagtail (*Motacilla lugubris*), the Titlark (*Anthus pratensis*), the Reed-Wren (*Acrocephalus streperus*), and the Hedge-Sparrow (*Accentor modularis*)—will be rewarded by the discovery of the egg of the mysterious stranger which has been surreptitiously introduced therein, and waiting till this egg is hatched they may be witnesses (as was the famous Jenner in the last century) of the murderous eviction of the rightful tenants of the nest by the intruder who, hoisting them one after another on his broad back, heaves them over to die neglected by their own parents, of whose solicitous care he thus becomes the only object. In this manner he thrives, and, so long as he remains in the country of his birth, his wants are anxiously supplied by the victims of his mother's dupery. The actions of his foster-parents become, when he is full grown, almost ludicrous, for they often have to perch between his shoulders to place in his gaping mouth the delicate morsels he is too indolent or too stupid to take from their bill. Early in September he begins to shift for himself, and then follows the seniors of his kin to more southern climes.

Of the way in which it seems possible that this curious habit of the Cuckow may have originated something has been already said (see Birds, vol. iii. p. 772). But in connection with its successful practice a good deal yet remains to be determined, most of which, however probable, is still to be proved. So much caution is used by the hen Cuckow in choosing a nest in which to deposit her egg that the act of insertion has been but seldom witnessed. The nest selected is moreover often so situated, or so built, that it would be an absolute impossibility for a bird of her size to lay her egg therein by sitting upon the fabric as birds commonly do; and there have been a few fortunate observers who have actually seen the deposition of the egg upon the ground by the Cuckow, who, then taking it in her bill, introduces it into the nest. Of these, so far at least as this country is concerned, the earliest seem to be two Scottish lads, sons of Mr Tripeny, a farmer in Coxmuir, who, as recorded by Macgillivray (*Brit. Birds*, iii. pp. 130, 131), from information communicated to him by Mr Durham Weir, saw most part of the operation performed, June 24, 1838. But perhaps the most satisfactory evidence on the point is that of Herr Adolf Müller, a forester at Gladenbach in Darmstadt, who says (*Zoolog. Garten*, 1866, pp. 374, 375) that through a telescope he watched a Cuckow as she laid her egg on a bank, and then conveyed the egg in her bill to a Wagtail's nest. Cuckows too have been not unfrequently shot as they were carrying a Cuckow's egg, presumably their own, in their bill, and this has probably given rise to the vulgar, but seemingly groundless, belief that they suck the eggs of other kinds of birds. More than this, Mr Rowley, who has had much experience of Cuckows, declares (*Ibis*, 1865, p. 186) his opinion to be that traces of violence and of a scuffle between the intruder and the owners of the nest at the time of introducing the egg often appear, whence we are led to suppose that the Cuckow ordinarily, when inserting her egg, excites the fury (already stimulated by her Hawk-like appearance) of the owners of the nest by turning out one or more of the eggs that may be already laid therein, and thus induces the dupe to brood all the more readily and more strongly what is left to her. Of the assertion that the Cuckow herself takes any interest in the future welfare of the egg she has foisted on her victim, or of its product, there is no evidence worth a moment's attention.

But a much more curious assertion has also been made, and one that at first sight appears so incomprehensible as to cause little surprise at the neglect it long encountered. To this currency was first given more than a hundred years ago by Salerne (*L'Hist. Nat.* &c., Paris: 1767, p. 42), who was, however, hardly a believer in it, and it is to the effect, as he was told by an inhabitant of Sologne, that the egg of a Cuckow resembles in colour that of the eggs normally laid by the kind of bird in whose nest it is placed. In 1853 the same notion was prominently and independently brought forward by Dr Baldamus (*Naumannia*, 1853, pp. 307–325), and in time became known to English ornithologists, most of whom were sceptical as to its truth, as well they might be, since no likeness whatever is ordinarily apparent in the very familiar case of the blue-green egg of the Hedge-Sparrow and that of the Cuckow, which is so often found beside it.[1] Dr Baldamus based his notion on a series of eggs in his cabinet,[2] a selection from which he figured in illustration of his paper, and, however the thing may be accounted for, it seems impossible to resist, save on one supposition, the force of the testimony these specimens afford. This one supposition is that the eggs have been wrongly ascribed to the cuckow, and that they are only exceptionally large examples of the eggs of the birds in the nests of which they were found, for it cannot be gainsaid that some such abnormal examples are occasionally to be met with. But it is well known that abnormally-large eggs are not only often deficient in depth of colour, but still more often in stoutness of shell. Applying these rough *criteria* to Dr Baldamus's series, most of the specimens stand the test very well, and, though no doubt more precise and delicate examination, than any to which they seem to have been submitted, were desirable, there are some other considerations to be urged. For instance, Herr Braune, a forester at Greiz in the principality of Reuss (*Naumannia, tom. cit.* pp. 307, 313), shot a hen Cuckow as she was leaving the nest of an Icterine Warbler (*Hypolais icterina*). In the oviduct of this Cuckow he found an egg coloured very like that of the Warbler, and on looking into the nest he found there an exactly similar egg, which there can be no reasonable doubt had just been laid by that very Cuckow. Moreover Herr Grunack (*Journ. für Orn.*, 1873, p. 454) has since found one of the most abnormally-coloured specimens, quite unlike the ordinary egg of the Cuckow, to contain an embryo so fully formed as to show the characteristic zygodactyl feet of the bird, thus proving unquestionably its parentage. Now these being both of them extreme cases, Dr Baldamus may fairly claim attention to his assertion; for short of absolutely disbelieving his word we must admit that he has ground for it. On the other hand, we must bear in mind the numerous instances in which not the least similarity can be traced—as in the not uncommon case of the Hedge-Sparrow already mentioned, and if we attempt any explanatory hypothesis it must be one that will fit all round. Such a one then seems to be this. We know that certain kinds of birds resent interference with their nests much less than others, and among them it may be asserted that the Hedge-Sparrow will patiently submit to various experiments. She will brood with complacency the egg of a Redbreast (*Erithacus rubecula*), so unlike her own, and for aught we know to the contrary may even be colour-blind. In the case of such a species there would be no need of anything further to insure success—the terror of the nest-owner at seeing her home invaded by a Hawk-like giant, and some of her treasures tossed out, would be enough to stir her motherly feelings so deeply that she would without misgiving, if not with joy that something had been spared to her, resume the duty of incubation so soon as the danger was past. But with other species it may be, nay doubtless it is, different. Here assimilation of the introduced egg to those of the rightful owner may be necessary, for there can hardly be a doubt as to the truth of Dr Baldamus's theory (the only theory, by the way, he has put forth), as to the object of the assimilation being to render the Cuckow's egg "less easily recognized by the foster-parents as a substituted one." But in this place it is especially desirable to point out that there is not the slightest ground for imagining that the Cuckow, or any other bird, can voluntarily influence the colour of the egg she is about to lay. Over that she can have no control, but its destination she can determine. It would seem also impossible that a Cuckow having laid an egg, should look at it, and then decide from its appearance in what bird's nest she should put it. That the colour of an egg-shell can be in some mysterious way affected by the action of external objects on the perceptive faculties of the mother is a notion too wild to be seriously entertained. Consequently, only one explanation of the facts can here be suggested. Every one who has sufficiently studied the habits of animals will admit the tendency of some of those habits to become hereditary. That there is a reasonable probability of each Cuckow most commonly putting her eggs in the nest of the same species of bird, and of this habit being transmitted to her posterity, does not seem to be a very violent supposition. Without attributing any wonderful sagacity to her, it does not seem unlikely that the Cuckow which had once successfully foisted her egg on a Reed-Wren or a Titlark should again seek for another Reed-Wren's or another Titlark's nest (as the case may be), when she had another egg to dispose of, and that she should continue her practice from one season to another. It stands on record (*Zoologist*, 1873, p. 3648) that a pair of Wagtails built their nest for eight or nine years running in almost exactly the same spot, and that in each of those years they fostered a young Cuckow, while many other cases of like kind, though not perhaps established on authority so good, are believed to have happened. Such a habit could hardly fail to become hereditary, so that the daughter of a Cuckow which always put her egg into a Reed-Wren's, Titlark's, or Wagtail's nest would do as did her mother. Furthermore it is unquestionable that, whatever variation there may be among the eggs laid by different individuals of the same species, there is a strong family likeness between the eggs laid by the same individual, even at the interval of many years, and it can hardly be questioned that the eggs of the daughter would more or less resemble those of her mother. Hence the supposition may be fairly regarded that the habit of laying a particular style of egg is also likely to become hereditary. Combining this supposition with that as to the Cuckow's habit of using the nest of the same

[1] An instance to the contrary has been recorded by Mr A. C. Smith (*Zoologist*, 1873, p. 3516) on Mr Brine's authority.

[2] This series was seen in 1861 by the writer.

species becoming hereditary, it will be seen that it requires but an application of the principle of "Natural Selection" to show the probability of this principle operating in the course of time to produce the facts asserted by the anonymous Solognot of the last century, and by Dr Baldamus and others since. The particular *gens* of Cuckow which inherited and transmitted the habit of depositing in the nest of any particular species of bird eggs having more or less resemblance to the eggs of that species would prosper most in those members of the *gens* where the likeness was strongest, and the other members would (*cæteris paribus*) in time be eliminated. As already shewn, it is not to be supposed that all species, or even all individuals of a species, are duped with equal ease. The operation of this kind of natural selection would be most needed in those cases where the species are not easily duped,—that is, in those cases which occur the least frequently. Here it is we find it, for observation shows that eggs of the Cuckow deposited in nests of the Red-Backed Shrike (*Lanius collurio*), of the Bunting (*Emberiza miliaria*), and of the Icterine Warbler approximate in their colouring to eggs of those species—species in whose nests the Cuckow rarely (in comparison with others) deposits eggs. Of species which are more easily duped, such as the Hedge-Sparrow, mention has already been made.

More or less nearly allied to our Cuckow are many other forms of the genus from various parts of Africa, Asia, and their islands, while one even reaches Australia. How many of these deserve specific recognition will long be a question among ornithologists which need not be discussed here. In some cases the chief difference is said to lie in the diversity of voice—a character only to be appreciated by those acquainted with the living birds, and though of course some regard should be paid to this distinction, the possibility of birds using different "dialects" according to the locality they inhabit (see BIRDS, vol. iii. p. 771, note 1) must make it a slender specific diagnostic. All these forms are believed to have essentially the same habits as our Cuckow, and, as regards parasiticism, the same is to be said of the large Cuckow of Southern Europe and North Africa (*Coccystes glandarius*) which victimizes Pies (*Pica mauritanica* and *Cyanopica cooki*) and Crows (*Corvus cornix*). True it is that an instance of this species, commonly known as the Great Spotted Cuckow, having built a nest and hatched its young is on record, but the later observations of Dr A. E. Brehm, Canon Tristram, Stafford Allen, and others tend to cast doubt on the credibility of the ancient report. It is worthy of remark that the eggs of this bird so closely resemble those of one of the Pies in whose nest they have been found, that even expert zoologists have been deceived by them, only to discover the truth when the Cuckow's embryo had been extracted from the supposed Pie's egg. This species of Cuckow, easily distinguishable by its large size, long crest, and the primrose tinge of its throat, has more than once made its appearance as a straggler in the British Isles. Equally parasitic are many other Cuckows, belonging chiefly to genera which have been more or less clearly defined as *Cacomantis*, *Chrysococcyx*, *Eudynamis*, *Oxylophus*, *Phœnicophaes*, *Polyphasia*, *Surniculus*, and *Zanclostoma*, and inhabiting parts of the Ethiopian, Indian, and Australian Regions;[1] but there are certain aberrant forms of Old-World Cuckows which unquestionably do not shirk parental responsibilities. Among these especially are the birds placed in or allied to the genera *Centropus* and *Coua*—the former having a wide distribution from Egypt to New South Wales, living much on the ground and commonly called Lark-heeled Cuckows (an obvious misnomer)—the latter bearing no English name, and limited to the island of Madagascar. These build a nest, not perhaps in a highly-finished style of architecture, but one that serves its end.

[1] Evidence tends to show that the same is to be said of the curious Channel-bill (*Scythrops novæ-hollandiæ*), but absolute proof seems to be wanting.

Respecting the Cuckows of America, the evidence, though it has been impugned, is certainly enough to clear them from the calumny which attaches to so many of their brethren of the Old World. There are two species very well known in parts of the United States and some of the West-Indian Islands (*Coccyzus americanus* and *C. erythrophthalmus*), and each of them has occasionally visited Europe. They both build nests—remarkably small structures when compared with those of other birds of their size—and faithfully incubate their delicate sea-green eggs. In the south-western States of the Union and thence into Central America is found another curious form of Cuckow (*Geococcyx*)—the Chapparal-cock of northern and Paisano of southern settlers. The first of these names it takes from the low brushwood (*chapparal*) in which it chiefly dwells, and the second is said to be due to its Pheasant-like (*faisan* corrupted into *paisano*, which is properly a countryman) appearance as it runs on the ground. Indeed, one of the two species of the genus was formerly described as a *Phasianus*. They both have short wings, and seem never to fly, but run with great rapidity. Returning to arboreal forms, the genera *Neomorphus*, *Diplopterus*, *Saurothera*, and *Piaya* (the last two commonly called Rain-birds, from the belief that their cry portends rain) may be noticed—all of them belonging to the Neotropical Region; but perhaps the most curious form of American Cuckows is the Ani (*Crotophaga*), of which three species inhabit the same Region. The best-known species (*C. ani*) is found throughout the Antilles and on the opposite continent. In most of the British colonies it is known as the Black Witch, and is accused of various malpractices—it being, in truth, a perfectly harmless if not a beneficial bird. As regards its propagation this aberrant form of Cuckow departs as much in one direction from the normal habit of birds as do so many of our familiar friends of the Old World in the other, for several females unite to lay their eggs in one nest. Full details of its economy are wanting, but it is evident that incubation is carried on socially, since an intruder on approaching the rude nest will disturb perhaps half a dozen of its sable proprietors, who, loudly complaining, seek safety either in the leafy branches of the tree that holds it, or in the nearest available covert, with all the speed that their feeble powers of flight permit. (A. N.)

CUCUMBER (*Cucumis*), a genus of the natural order *Cucurbitaceæ*, represented by indigenous species in most warm regions of the globe, and distinguished by the following characters:—plants, annual or possessing a perennial thick root; stems, rarely if ever climbing; leaves, heart-shaped, sometimes reniform, with three to seven lobes, and crenulate or denticulate margin; flowers, monœcious and yellow, having tubular campanulate calices, petals but slightly adherent, three free stamens, and a tripartite, obtuse, and spheroidal stigma; fruits or pepones, three to six celled, smooth or echinate; and seeds, more or less compressed, ovate, sharp-edged, and of a yellow or dirty-white colour. *Cucumis sativus*, the common cucumber, is an annual, indigenous probably to tropical Asia; the branches ramify little; the leaves are hairy and have three to five sharply-pointed lobes; the ovary is often fusiform; the fruits are for the most part oblong, obscurely trigonal or cylindrical, and except in one variety contain three carpels, and their flesh is white, firm, and of an agreeable sub-acid taste. In its characters it is one of the most uniform species of its genus. The principal varieties are (1) the small Russian cucumber, the fruit of which is ovoid, smooth, scarcely larger than a hen's egg, and when ripe of a dull orange colour; (2) the common long cucumber; (3) the white cucumber, with fruits usually shorter and proportionally thicker than in the preceding kind; (4) the Sikkim cucumber, the leaves of which may be seven or even nine-lobed, while its fruits are long-oval in shape, have the skin marbled with yellowish-white and reddish-brown, and regularly contain five placentæ.

The cucumber usually trails on the ground, but it can be made to grow well in an upright position, supported by its tendrils. It thrives best in deep, loose, and rich earth, but if supplied with liquid manure it may be cultivated in old tan or brick-rubbish. An excellent soil is a sandy loam with a fourth part of rotten dung intermixed. A damp atmosphere and a temperature of from 75° to 80° Fahr., with plenty of light, are the conditions best suited to the cucumber; but it can be grown at so low a temperature as 50,° and will bear fruit at 60°; in the presence of abundant moisture a heat between 90° and 110° may be borne. Exposure to the air on cold nights is highly injurious to the plants, rendering them sickly, and rapidly producing mildew. In England cucumbers are cultivated in dung and hot-beds, also in pots, and during summer in the open fields. At Sandy in Bedfordshire the temperature of the soil of cucumber plantations is in a week or ten days raised 8° or 10° above that of the neighbouring soil by turning in the surface-earth, and covering the ground with litter at the close of every sunny day. To promote the formation of fruit the young shoots of the cucumber should be nipped off occasionally between the thumb and finger, and should be allowed to proceed no further than the second joint beyond the fading fruit-blossom. The plants are raised from both seeds and cuttings. For procuring good seed the following method has been given. A strong plant is chosen, and allowed to bear only one fruit, which, when ripe and yellow, is cut and laid by in a dry place; when it begins to rot, it is cut in pieces, the pulp is allowed to ferment, and the seeds are then washed from it with water, those which float being rejected. The seed retains its vitality for a considerable period, and that which has been kept for some years is said to produce the best fruit-bearing plants. The seed-bed for cucumbers is made 3 feet high at the back, and 6 inches less in front. After its preparation eight or nine days are allowed to elapse before the seed is sown. The tops of the young plants are kept at a distance of 6 or 8 inches from the glass of the frame by lowering from time to time the pots in which they grow. By pinching off the leading shoot that rises at the base of the petiole, fresh shoots are made to proceed from the base of the seed-leaves; these are in their turn nipped back when the length of two joints. Plants grown in winter in frames and hot-houses are given as much light and air as possible, and care is taken not to supply them with very cold water. On account of their expense, dung-beds have been generally superseded by hot-beds for the growth of cucumbers. The cucumber is a common vegetable in all parts of India; in the cold season it is cultivated in the grain fields, and in summer in the sandy beds and islands of rivers. In Cashmere, as in China and Persia, cucumbers and melons are grown in the lakes on floats formed by cutting through, at about 2 feet under the water, the roots of sedges, reeds, and other aquatic plants, which, being pressed together, are made to form a bed about 2 yards in breadth, and of indefinite length. The heads of the plants are next cut off, laid upon its surface, and covered with a thin coat of mud. The float is moored in its place by a stake of willow driven through it at each end, and confervæ and weeds from the bottom of the lake are piled on it in conical mounds about 2 feet in height, and 2 feet broad at the base, and having a hollow at the top filled with soft mud, in which the young cucumber and melon plants are placed. No further labour is requisite save that of gathering the fruit (Moorcroft, *Journ. R. Geog. Soc.*, ii. p. 258).

The varieties of the common cucumber are exceedingly numerous, and constantly changing. Among the longer sorts may be mentioned Dale's Conqueror, Blue Gown, and Hamilton's Invincible. Though generally eaten as a salad or pickled, the cucumber is used in the preparation of various cooked dishes, and is occasionally preserved. The juice is said to be an ingredient in some pomades and cosmetics. For pickling, the young unripe fruit, or gherkins, and the Russian variety are employed. Cucumbers were much esteemed by the ancients. According to Pliny (xix. 23), the Emperor Tiberius was supplied with them daily, both in summer and winter. Naudin enumerates thirteen well-determined and eight doubtful species of the genus *Cucumis*. Of one of these, *C. Figarei*, he describes five, and of another, *C. Melo*, or the melon, no less than thirty varieties. Among the latter is the *C. Chate* of Linnæus, the fruit of which is supposed to be the same as the *kishuim* or "cucumbers" of the Scriptures (Num. xi. 5; Isa. i. 8; Baruch vi. 70). Forskal describes the plant as follows:—"Stalks smooth, with rigid bristles; leaves lobed, scabrous on both sides, with obtuse angles; fruit, hairy when young, smooth when old, attenuated at both ends." The fruit, he tells us, is common in Egypt, where it is grown in the open fields. By many a drink is prepared from it when ripe. The pulp is broken and stirred by means of a stick thrust through a hole cut at the umbilicus of the fruit; the hole is then closed with wax, and the fruit, without removing it from its stem, is buried in a little pit; after some days the pulp is found to be converted into an agreeable liquor (*Flora Ægyptiaco-Arabica*, p. 168, 1775). Various species of *Anguria*, *Citrullus*, *Coccinia*, *Cucurbita*, *Ecbalium*, *Luffa*, *Melothria*, *Mukia*, *Sicyos*, *Telfairia*, and *Trichosanthes* have been referred to the genus *Cucumis*. The squirting cucumber, *Ecbalium elaterium*, the Σίκυος ἄγριος of Theophrastus, furnishes the drug elaterium. Owing to the exmosis of the juice of the fruit through the strong cortical tissue that lines its central cavity, a pressure is accumulated sufficient to cause the severance of the fruit from its peduncle, and the consequent sudden ejection of its contents. The *Cucumis serotinus* of Turkey and *C. Conomon* of Japan are varieties of *C. Melo*; the "serpent cucumber" of Central America is the species *Trichosanthes colubrina*.

Nat.*, 4e. ser. Bot. t. xi. p. 5, 1859; Loudon, *Horticulturist*, ed. Robinson, 1871.

CUDDALOR, or GUDALUR, a municipal town of British India, in the Madras Presidency and the district of South Arcot, situated on the western shore of the Bay of Bengal at the estuary of the River Panar, 102 miles S.S.W. from Madras, and 15 S.S.W. from Pondicherry. It lies low, but is regarded as exceptionally healthy, and serves as a kind of sanatorium for the surrounding district. The principal trade is the export of cotton; but some attention is also given to the fisheries and the manufacture of paper, sugar, and salt. In the neighbourhood are the ruins of the fort of St David. The English East India Company obtained a grant of the town from the rajah of Gingee in 1681; and their factory was, in consequence of the increasing trade, wholly rebuilt and fortified in 1702. The town was taken by the French in 1758; but two years later it was recaptured by Sir Eyre Coote. In 1782, after the destruction of Colonel Braithwaite's detachment by Tippoo, it was forced to surrender to the combined forces of the French and Hyder Ali, when the works were greatly strengthened, and a strong garrison sent to defend them. In 1783 it was besieged by the British, who were repulsed, with the loss of 942 killed and wounded, in a desperate attempt to storm the works. It finally passed into British possession by the treaty of 1795. Population in 1871, 40,290.

CUDDAPAH, or Kadapa, a district of British India in the presidency of Fort St George or Madras, situated between 13° 12′ and 16° 19′ N. lat. and 77° 52′ and 79° 48′ E. long. It is bounded on the N. by Karnaul, on the E. by Nellor, on the S. by North Arcot and Mysore; and on the E. by Ballárí. The district is in shape an irregular parallelogram, divided into two nearly equal parts by the range of the Eastern Gháts which intersects it throughout its entire length. The two tracts thus formed possess totally different features. The first, which constitutes the north, east, and south-east of the district, is a low-lying plain; while the other, which comprises the southern and south-western portion, forms a high table-land from 1500 to 2500 feet above sea-level. The chief river is the Penaur, which enters the district from Ballárí on the west, and flows eastwards into Nellor. Though a large and broad river, and in the rains containing a great volume of water, in the hot weather months it dwindles down to a very inconsiderable stream. Its principal tributaries are the Kundaur, Saglair, Cheyair, and Papagni rivers. The total area of the district is 8367 square miles, of which 2728 were returned as under cultivation in 1874–75. Cuddapah is subdivided into eleven *táluks* or sub-districts, and contains 1062 villages. The population in 1872 was returned as follows:—Hindus, 1,242,317; Mahometans, 103,676; Native Christians, 4068; Europeans and Eurasians, 202; Buddhists, 4; others, 387; total, 1,351,194. The principal town and the administrative head-quarters of the district is Cuddapah, situated on the banks of the Bogá River in 14° 32′ N. lat. and 78° 54′ E. long. Population—Hindus, 10,611; Mahometans, 5338; Christians, 222; others, 104; total, 16,275. The total revenue of Cuddapah district in 1874–75 amounted to £245,222, of which £200,987 was derived from the land assessment.

CUDWORTH, Ralph (1617–1688), the most learned and philosophical of the Cambridge Platonists, was born at Aller, Somersetshire, in 1617. His father, rector of Aller, and an editor of Perkins's works, died in 1624. His widow married a second time Dr Stoughton, under whose care young Cudworth was well grounded in school learning. In 1630 he was entered a pensioner in Emmanuel College, Cambridge, of which his father had been a fellow. He commenced residence in 1632, took the degree of M.A. in 1639, was soon after chosen fellow, and became so eminent as a tutor as to have at one time twenty-eight pupils. He was next presented to the rectory of North Cadbury in his native county, and in 1642 he published a *Discourse concerning the true Notion of the Lord's Supper*, and a treatise entitled, *The Union of Christ and the Church, in a Shadow*. In 1644 he took the degree of B.D., and in the same year was chosen master of Clare Hall. In the following year he was appointed professor of Hebrew, and for some time devoted himself with special zeal to the study of Jewish antiquities. Two years after (March 31, 1647) he preached before the House of Commons on 1 John ii. 3, 4, and his discourse on this occasion was published, along with another sermon following out the theme. For some time it appeared as if the insufficiency of his income would force him to leave Cambridge, but this loss to the university was averted by his appointment to the mastership of Christ's College in 1654. He was one of the persons named by a committee of Parliament in 1657 for the revision of the English translation of the Bible. Through his intimacy with Thurloe, the secretary of state for Cromwell and his son Richard, he was confidentially consulted on various occasions by the Protectors in regard to university and Government appointments. In 1659 we find him engaged with discourses in defence of Christianity against Judaism. Like so many others, he published Latin verses on the restoration of King Charles II. in 1660. He was presented to the rectory of Ashwell in Herefordshire in 1662, and installed prebendary of Gloucester in 1678. He had a design in 1665 to publish a treatise concerning moral good and evil, and as he had been encouraged to do so by Dr Henry More, the latter's *Enchiridion Ethicum* appears to have almost occasioned a rupture of friendly relations between them. Cudworth's *magnum opus*, the *True Intellectual System of the Universe, wherein all the Reason and Philosophy of Atheism is refuted, and its Impossibility demonstrated*, appeared in 1678. This marvellously learned work, bulky as it is, is merely a fragment, the first of three parts,—the *Treatise on Eternal and Immutable Morality*, published in 1731 by Bishop Chandler, and a *Discourse on Liberty and Necessity*, belonging to the same whole. Its publication had been delayed for seven years, owing to the opposition of some parties at court, probably admirers of Hobbes. It was flatteringly received in the learned world, but offended the narrowly orthodox as well as the sceptics against whom it was written. Some persons were even so thoughtless or malicious as to construe the candour with which its author stated the arguments of atheists as a device to lead his readers to believe that the atheist had the best of the reasoning. If Warburton may be credited, misrepresentations of this kind deterred Cudworth, a peaceable man, averse to theological polemics, from publishing the rest of his work. He died at Cambridge on the 26th of June 1688, and was buried in the chapel of Christ's College. He left behind him a daughter, Damaris, a lady of considerable genius, known, under the name of Lady Masham, as the intimate and valued friend of John Locke. Several of Cudworth's MSS. are preserved in the British Museum. It is not to the national credit that, with the exception of *A Treatise of Freewill*, edited by the Rev. Mr Allen in 1838, they have not only not been published, but no adequate account or summary has been given of them.

The *True Intellectual System*, to justify its general title and fulfil its author's plan, should have contained two other parts, each on the same scale as the part which we possess. There appeared to Cudworth to be three systems which deny liberty and involve necessity,—three sorts of fatalism. The first is materialistic fatalism, which suppresses with the idea of liberty every idea of God and spirit, and explains all phenomena, even those of thought and feeling, by mechanical laws, and the formation of all beings by the combination and concourse of atoms; the second is a theological or religious fatalism, advocated by various scholastic and later divines, which makes good and evil, right and wrong, the creation of the will of God, and thus destroys liberty by destroying its condition and its law; and the third is Stoical fatalism, which, although not denying the Divine existence or the rectitude of the Divine nature, affirms that all that happens is determined by an eternal and unchangeable necessity. These are the three chief false systems of the universe, according to Cudworth, and he would oppose to them three great principles, the fundamentals or essentials of religion:—to the first the existence of God and of a spiritual world; to the second the eternal and immutable distinction of right and wrong;

and to the third the freedom and responsibility of man. The proof of these three truths with the refutation of the opposite errors seemed to him to be the establishment of a system of the universe entitled to be called, in opposition to those refuted, *true*, and, in distinction from physical systems, like the Ptolemaic, Tychonic, and Copernican, *intellectual*. The first of these forms of fatalism is the only one with which his principal work deals. It includes four species of materialistic atheism, namely,—the atomic, adopted by Democritus, Epicurus, and Hobbes, which recognizes no other substances than material atoms and no other forces than their movements; the hylopathic, maintained by Anaximander, which makes infinite matter, devoid of understanding and life, form all things by "a secretion or segregation" which takes place according to inherent law; the hylozoic, asserted by Strato of Lampsacus, which explains everything by the supposition of an inward, self-organizing, plastic life in matter; and the cosmoplastic, perhaps held by Seneca and the younger Pliny, which represents the universe as an organized being, like a plant, with a spontaneous and necessary but unconscious and unreflective development. They are, however, reducible to two—the atomic and hylozoic,—the one best represented by Democritus, the other by Strato; the one explaining everything by matter and movement, the other everything by matter endowed with life; the one mechanical, the other dynamical.

The history of the atomic philosophy is narrated by Cudworth at great length and with vast erudition, but no one will now be found to accept the view which he gives of its development as even in the main accurate. Like his friend, Henry More, he derives the atomic theory, in so far as it is a purely physical speculation, from Moses, and his conclusions as to its transmission are in many respects not less untrustworthy. He would make it out to have been taught by Pythagoras, Empedocles, and, in fact, nearly all the ancient philosophers, and only to have been mutilated and perverted by Leucippus and Democritus. He had the merit, however, of seeing very clearly that the atomic theory in itself, or what he calls the atomic physiology, had no natural or even necessary connection with the atomic atheism. He contends that "so far from being either the mother or nurse of atheism, or any ways favourable thereto (as is vulgarly supposed), it is indeed the most opposite to it of any, and the greatest defence against the same." He states with great fulness and fairness the arguments which have been urged in support both of the atomic and hylozoic atheism. He refutes them, although in a cumbrous and discursive manner, with great strength of reason. It is in connection with the refutation of hylozoic atheism that he brings forward the celebrated hypothesis, which he held in common with More, of a plastic nature,—a substance intermediate between matter and spirit,—a power which prosecutes certain ends but not freely or intelligently,—an instrument by which laws are able to act without the immediate agency of God. He argues that to refer the life and motion of the universe immediately to God renders Divine Providence "operose, solicitous, and distractious," implies that all things are done miraculously and none of them by an inward principle of their own, and is inconsistent with the slow and gradual development of nature and with its "errors and bungles." It is not wonderful that few should have been convinced by such arguments. Nothing can be toilsome to omnipotence or perplexing to omniscience. It is not more difficult to believe the life and motions of the universe due to the immediate action of God than the life and motions of the secondary agent which Cudworth imagined to animate nature and "drudgingly to execute a part of the work of Providence." An unconscious and "necessitated plastic power" cannot remove from the creator of it the blame of any "errors or bungles" it may commit. Cudworth's hypothesis became in 1703-4 the subject of an interesting controversy between Bayle and Leclerc,—the former maintaining, and the latter denying, that it was favourable to the atheistical inference. It has been recently reproduced by Joseph John Murphy in his work on *Habit and Intelligence*. What Cudworth designated "plastic nature" is almost identical with what Murphy calls "unconscious intelligence." It was descended from the *anima mundi* of Plato, and is still represented in the *Unbewusste* of Von Hartmann.

After the three chapters which describe and refute atomic and hylozoic atheism, there comes a fourth which "swells," as Cudworth himself says, "into a disproportionate bigness." Its aim is to prove that the belief in one supreme God has been generally entertained even throughout the pagan world; that only a few men, darkened in mind and depraved in heart, have discarded and denied it; and that polytheism was the worship of many gods subordinate to the One God, of the One God under many names, and of the One God and subordinate gods in images and symbols, but not the exclusion of the worship of "one sovereign and omnipotent Deity from which all their other gods were generated or created." Nowhere does our author show more learning nor more elevation and breadth of thought than in the survey of religions which this discussion involves. He carefully searches in the heathen religions which he reviews for features of truth, traces of the presence of God, evidences of His having never left himself without a witness in human hearts. At the same time, his reasoning is, on the whole, far from satisfactory. It is at many points perverted by the unconscious desire to establish a foregone conclusion; and the testimonies brought forward have as often meanings imposed on them as educed from them. The lengthened discussion of the Platonic and Christian Trinities contained in this chapter gave great dissatisfaction to various persons. Cudworth was accused by some, in consequence of it, with being a Tritheist, and by others of being an Arian. He could not possibly be both; he undoubtedly meant to be neither. He wished to be orthodox, and believed that he was so. He erred chiefly by representing Plato as having come far nearer to the Christian doctrine than he really did.

What is of most interest, perhaps, in the last chapter is the attempt at a positive demonstration of the existence of God. This, he explains, cannot be accomplished *a priori*, as if from anything antecedent to the Divine existence, but may nevertheless be necessarily inferred from undeniable principles of reason. He refutes the assertion of Descartes that we can be certain of nothing, not even of mathematical reasoning and truth, till certain that there is a God, good and holy, who cannot and will not deceive us. He shows that although this hypothesis bears a resemblance of piety it really leads to universal scepticism. He then adduces three metaphysical proofs of the Divine existence. The first is substantially that of Anselm and Descartes, drawn from the idea of an absolutely perfect being. Cudworth modifies it, however, in the same way which Leibnitz soon afterwards also did. He does not, that is to say, conclude at once the Divine existence from the idea of a perfect being, but shows before doing so that this idea is accordant with reason, *i.e.*, involves in it no contradiction. The second proof, instead of thus proceeding from the idea of perfection to that of necessary existence, proceeds from the idea of existence to that of perfection. Theists and atheists, materialists and spiritualists, agree that something certainly existed of itself from all eternity. They differ only as to whether that something be a perfect or an imperfect Being. But that which existed from all eternity must have done so naturally and necessarily, including necessary and eternal self-existence in its own nature. There is nothing, however, it is argued, which contains necessary eternal existence in its own nature or essence, but only an absolutely perfect Being,—all imperfect things being in their nature contingently possible, either to be or not to be. Hence a perfect Being, or God, existed of himself from eternity. The third argument is founded on the very nature of knowledge. It is that knowledge is possible only through ideas which must have their source in an eternal reason. Sense is not only not the whole of knowledge, but is in itself not at all knowledge; it is wholly relative and individual, and not knowledge until the mind adds to it what is absolute and universal. Knowledge does not begin with what is individual but with what is universal. The individual is known by being brought under a universal instead of the universal being gathered from a multitude of individuals. And these universals, νοήματα, or ideas, which underlie all the knowledge of all men, which originate it, and do not originate in it, have existed eternally in the only mode in which truths can be said to be eternal, in an eternal mind. They come to us from an Eternal Mind, which is their proper home, and of which human reason is an emanation. "From whence it cometh to pass, that all minds, in the several places and ages of the world, have ideas or notions of things exactly alike, and truths indivisibly the same. Truths are not multiplied by the diversity of minds that apprehend them; because they are all but ectypal participations of one and the same original or archetypal mind and truth. As the same face may be reflected in several glasses, and the image of the same sun may be in a thousand eyes at once beholding it, and one and the same voice may be in a thousand ears listening to it, so when innumerable created minds have the same ideas of things, and understand the same truths, it is but one and the same eternal light that is reflected in them all ('that light which enlighteneth every man that cometh into the world'), or the same voice of that one everlasting Word, that is never silent, re-echoed by them." In different forms and with different references this argument is to be found in Plato, Augustine, Aquinas, Malebranche. Bossuet, Fenelon, Cousin, and Ferrier.

The *Treatise concerning Eternal and Immutable Morality* deals with the second form of fatalism. Over against the assertion that *all* moral good and evil is arbitrary and factitious, not by nature but by law, there is placed the directly contradictory proposition, nothing is morally good or evil by mere will without nature. Whatever is at all must be what it is not by will but by nature. Omnipotence itself cannot set aside this condition, cannot do what is contradictory; and contradictory it is that things should be what they are not, should be indifferently anything, either this or that, round or square, white or black, according to mere will and pleasure. And "things may as well be made white or black by mere will without whiteness or blackness, equal and unequal without equality and inequality, as morally good and evil, just and unjust, honest and dishonest, by mere will, without any nature of goodness, justice, honesty." The existence of merely positive duties,—the fact that certain commands carry with them an obligatory force, and that it is often wrong to do a thing which has been forbidden although it would have been otherwise quite legitimate,—is argued to be no exception to this truth, since in all such cases the obligation springs not from mere will but from a deeper source, from an underlying natural justice or equity, which is the true foundation both of the right in a superior to command and of obligation in an inferior to obey. Cudworth is thus led to discriminate precisely natural from positive right. Things naturally good are those which the reason obliges us to immediately, absolutely, and perpetually, and on no condition of any voluntary act that may be done or omitted intervening; things positively good are those which the reason obliges to only through the intervention of some such act bringing them under some rule of natural justice. But even the things which thus pass from being indifferent to being positively right or wrong are strictly speaking only brought into a new relation to us, and have not a new nature bestowed on themselves. They remain in themselves what they were,—indifferent, neither good nor evil. And any moral character which may be ascribed to the doing of them consists not in what is done, but in a regard to the natural right which dictates fidelity to engagements and submission to just authorities. Will thus carries with it no creative moral force,—as mere will, indeed, no moral force whatever. Cudworth completes his proof of this position by a refutation of the opinion that rectitude, although not dependent on the will of the creature, depends on the mere will of the Creator. He argues that it represents what is really a contradiction to be the object of divine power. He further insists that there is in God a wisdom superior to His will and a goodness superior to His wisdom; that the perfection of will is to be thus twice determined, first by wisdom and then by goodness, first by truth and then by righteousness. That moral distinctions are arbitrary, grounded not in reality but in will, Cudworth saw was the necessary consequence of a belief that all cognizable distinctions are arbitrary, that all being and knowledge are relative, having no real existence in themselves but only an existence of appearance relative to something else. He perceived with perfect clearness that unless there is an absolute in knowledge there can be no absolute in morals. The larger portion of his treatise is, in consequence, an examination into the nature of sense and knowledge, designed to prove that sense is not knowledge; that sense is a confused perception obtruded on the soul from without, whereas knowledge is an inward native energy of the mind, not arising from things acting from without; that even simple corporeal things, passively perceived by sense, are known or understood only by the active power of the mind; that some ideas of the mind proceed not from outward sensible things, but arise from the inward activity of the mind itself; that the intelligible notions of things, though existing only in the mind, are not figments of the mind, but have an immutable nature; that science or knowledge is the only firm thing in the universe. Among the ideas not drawn from sense but imposed by reason on particular acts, Cudworth places the conceptions of moral good and evil. These, like other noemata, are necessary, eternal, and immutable. They are not created by reason but essential to reason. Reason does not find them, but brings them with it. Reason, however, and not sense or feeling of any kind, is their organon. Sense apprehends in the imperfect way it does only through the working of reason; feeling is ever varying and individual. Sense is altogether blind to whatever partakes of the necessary; feeling is in no direct contact with what really and absolutely is. Adam Smith and many others have pronounced this conclusion absurd and unintelligible, without attending to the circumstance that Cudworth has at least endeavoured, and laboriously endeavoured, to show by his examination of sense and knowledge that what is really altogether absurd and unintelligible is that mere sense should give us any knowledge whatever,—that sense should ever rise to the rank of perception until reason has brought its object under some universal category.

In the tractate on free-will he endeavours to establish that man possesses a contingent or fortuitous liberty of self-determination when there is a perfect equality of objects.

He rests this conclusion on two arguments:—first, that otherwise were a second world created exactly like the present it would have an exactly similar history; and, secondly, that otherwise the mind could make no choice in the many cases where several objects precisely alike were presented to it. He sees clearly, at the same time, that this power is not the free-will which is the condition of praise and blame. In every conceivable case where two objects of choice perfectly equal are presented to the mind, praise or blame for the preference of the one to the other is unreasonable. It is only the preference of the better to the worse that is praiseworthy; only the preference of the worse to the better that is blameworthy. Accordingly he argues that man has also a power of determining himself better or worse. In the prosecution of this argument he finds it requisite to maintain that there are not two separate faculties in the soul, the one confined to will and the other to understanding, but that there is a soul which wills understandingly and understands willingly. Its first motive principle is the desire of good in general. Its free-will is distinctive of a rational imperfect being. A perfect being, essentially good and wise, cannot have such a power, it being impossible it should ever improve, much less impair itself. He endeavours to refute not only the arguments designed to show freedom impossible, but those intended to prove it confined to Deity.

Vast erudition was combined in Cudworth with remarkable speculative power. The extent and obtrusiveness of his erudition and his discursiveness in argumentation have caused him to get much less credit for philosophical ability than he deserves. It is only the real student of his writings who can be expected to recognize it; and, although he may be often consulted, he is probably now seldom studied.

Thomas Birch's *Account of the Life and Writings of Ralph Cudworth*, D.D., is the chief, but very inadequate, biographical authority. In all respects the best view of Cudworth, as a man and a philosopher, is that given by Principal Tulloch in *Rational Theology*, &c., vol. ii. There is a good special dissertation on "the plastic nature" by Janet, and an excellent estimate of Cudworth as a Platonist in Prof. v. Stein's *Sieben Bücher zur Geschichte des Platonismus*, B. vi. (R. F.)

CUENCA, a province of New Castile, Spain, lying between 39° 20′ and 40° 40′ N. lat., and 1° 10′ and 3° 10′ W. long., with the provinces of Guadalajara and Teruel on the N., Valencia on the E., Albacete and Ciudad Real on the S., Toledo on the W., and Madrid on the N.W. Area, 6726 square miles. It occupies the eastern part of the ancient kingdom of New Castile, and slopes from the Sierra de Cuenca (highest point, the Cerro de San Felipe, on the N.E. border of the province, 5905 feet) down into the great southern Castilian plain watered by the upper streams of the Guadiana. The rocky and bare highland of Cuenca on the north and east includes the upper valley of the Jucar or Xucar and its tributary streams, but in the north-west the province is watered by tributaries of the Tagus. The forests are proverbial for their pine timber, and rival those of Soria; considerable quantities of timber are floated down the Tagus to Aranjuez, and thence taken to Madrid for building purposes. Excessive droughts prevail; the climate of the hills and of the high plateaus is rude and cold, but the valleys are excessively hot in summer. The soil where well watered is fertile, but little attention is paid to agriculture, and three-fourths of the area is left under pasture. The rearing of cattle, asses, mules, and sheep is the principal employment of the people; olive oil, nuts, wine, wheat, silk, wax, and honey are the chief products of the province. Mining of iron, copper, alum, and saltpetre is carried on to a small extent; jasper and agates are found. Manufactures are limited to the coarsest stuffs. Population in 1870, 238,731.

CUENCA, the capital of the above province, and the seat of a bishop, is finely placed on a rocky eminence girt about with hills, beside the river Jucar at its confluence with the stream of the Huecar, at an elevation of 2960 feet above the sea, and distant about eighty-five miles E.S.E. from Madrid. It was once a flourishing town, celebrated in arts and literature, and the focus of the provincial wool-trade, but has now a population of barely 7400. Its cathedral was founded by Alphonso VIII. in 1177, and is one of the most remarkable in Spain. A fine bridge (erected in 1523) passes over the Jucar to the convent of San Pablo. A few paper mills, and some wool-washing and silver-working, are the remnant of its former industries.

CUENCA, an inland town of the Andes of Ecuador, S. America, about 190 miles S. of Quito and 60 miles S.E. of the port of Guayaquil. It stands on a plain at an elevation of about 8640 feet above the sea, near the hill of Farqui, chosen by the French astronomers as their meridian in 1742. It is a cathedral city, and contains several monasteries, besides a college and other educational institutions. Cuenca has an extensive trade in cheese, oats, grain, and other agricultural produce. The population, which is estimated at 25,000, is in great part Indian. In the re-division of the republic into 11 provinces, which took place in 1875, the former province of Cuenca ceased to bear that name.

CUIRASS, or CORSLET, the plate armour, whether formed of a single piece of metal or other rigid material or composed of two or more pieces, which covers the front of the wearer's person. In a suit of armour, however, since this important piece would be worn in connection with a corresponding defence for the back, the term *cuirass* commonly is understood to imply the complete body-armour, including both the breast and the back plates. Thus this complete body-armour appears in the Middle Ages frequently to have been described as a "pair of plates." The *corslet*, a comparatively light cuirass, is more strictly a breast-plate only. As parts of the military equipment of classic antiquity, cuirasses and corslets of bronze, and at later periods also of iron or some other rigid substance, were habitually in use; but while some special kind of secondary protection for the breast had been worn in earlier times by the men-at-arms in addition to their mail hauberks and their "cotes" armed with splints and studs, it was not till the 14th century that a regular body-defence of plate can be said to have become an established component of mediæval armour. As this century continued to advance, the cuirass is found gradually to have come into general use, in connection with plate defences for the limbs, until, at the close of the century the long-familiar interlinked chain-mail is no longer visible in knightly figures, except in the camail of the basinet and at the edge of the hauberk. The prevailing, and indeed almost the universal, usage throughout this century was that the cuirass was worn covered. Thus, the globose form of the breast-armour of the Black Prince, in his effigy in Canterbury Cathedral, 1376, intimates that a cuirass as well as a hauberk is to be considered to have been covered by the royalty-emblazoned jupon of the Prince. The cuirass, thus worn in the 14th century, was always made of sufficient length to rest on the hips; otherwise, if not thus supported, it must have been suspended from the shoulders, in which case it would have effectually interfered with the free and vigorous action of the wearer. Early in the 15th century, the entire panoply of plate, including the cuirass, began to be worn without any surcoat; but in the concluding quarter of the century the short surcoat, with full short sleeves, known as the tabard, was in general use over the armour. At the same time that the disuse of the surcoat became general, small plates of various forms and sizes (and not always made in pairs, the plate for the right or sword-arm often being smaller and lighter than its companion), were attached to the armour in front of the shoulders, to defend the otherwise vulnerable points where the plate defences of the upper-arms and the cuirass left a gap on each side. About the middle of the century, instead of being formed of a single plate, the breast-plate of the cuirass was made in two parts, the lower adjusted to overlap the upper, and contrived by means of a strap or sliding rivet to give flexibility to this defence. In the second half of this 15th century the cuirass occasionally was superseded by the "brigandine jacket," a defence formed of some textile fabric, generally of rich material, lined throughout with overlapping scales of metal, which were attached to the jacket by rivets, having their heads, like studs, visible on the outside. In the 16th century, when occasionally, and by personages of exalted rank, splendid surcoats were worn over the armour, the cuirass—its breast-piece during the first half of the century globular in form—was constantly reinforced by strong additional plates attached to it by rivets or screws. About 1550 the breast-piece of the cuirass was characterized by a central ridge, called the "tapul," having near its centre a projecting point; this projection, somewhat later, was brought lower down, and eventually the profile of the plate, the projection having been carried to its base, assumed the singular form which led to this fashion of the cuirass being distinguished as the "peascod cuirass." Corslets provided with both breast and back pieces were worn by foot-soldiers in the 17th century, while their mounted comrades were equipped in heavier and stronger cuirasses; and these defences continued in use after the other pieces of armour, one by one, had gradually been laid aside. The cuirass and the corslet also at last ceased to be worn, until their revival in modern armies, in which mounted cuirassiers, armed as in earlier days with breast and back plates, in some degree have emulated the martial splendour of the body-armour of the era of mediæval chivalry. Cuirasses had been worn for some years by the modern soldiers of France before they were introduced into the British army. It was after the era of Waterloo that certain historical cuirasses were taken from their repose in the Tower of London, and adapted for service by the Life Guards and the Horse Guards.

CUJAS, or CUJACIUS, JACQUES, or, as he called himself, JACQUES DE CUJAS (1520-1590), one of the greatest of jurisconsults, was born at Toulouse, where his father, whose name was Cujaus, was a fuller. Having taught himself Latin and Greek, he studied law under Arnoul Ferrier, then professor at Toulouse, and rapidly gained a great reputation as a lecturer on Justinian. He was an unsuccessful candidate for the chair of law at his native place in 1554, but in the same year he was appointed to a similar position at Cahors, and about a year after L'Hôpital called him to Bourges. Duaren, however, who also held a professorship at Bourges, stirred up the students against the new professor, and such was the disorder produced in consequence that Cujas was glad to yield to the storm, and accept an invitation he had received to the university of Valence. Recalled to Bourges at the death of Duaren in 1559, he remained there till 1567, when he returned to Valence, where he gained a European reputation, and collected students from all parts of the Continent, among whom may be mentioned Joseph Scaliger and De Thou. In 1573 Charles IX. appointed Cujas counsellor to the Parliament of Grenoble, and in the following year a pension was bestowed on him by Henry III. Margaret of Savoy induced him to remove to Turin; but after a few months (1575) he once more took his old place at Bourges. But the religious wars drove him thence. He was called by the king to Paris, and permission was granted him by the Parliament to lecture on civil law in the university of the capital. A year after, however, he finally took up his residence at Bourges, where he remained till his death in 1590, in spite of a handsome offer made him by Gregory XIII. in 1584 to attract him to Bologna.

The life of Cujas was altogether that of a scholar and teacher. In the religious wars which filled all the thoughts of his contemporaries he steadily refused to take any part. *Nihil hoc ad edictum prætoris*, "this has nothing to do with the edict of the prætor," was his usual answer to those who spoke to him on the subject. His merit as a jurisconsult, which has been surpassed by none, arose from the fact that he turned from the ignorant commentators on Roman law to the Roman law itself. He consulted a very large number of manuscripts, of which he had collected more than 500 in his own library; but, unfortunately, he left orders in his will that his library should be divided among a number of purchasers, and his collection was thus scattered, and in great part lost. His emendations, of which a large number were published under the title of *Observations and Corrections*, were not confined to law-books, but extended to many of the Latin and Greek classical authors. In jurisprudence his study was far from being devoted solely to Justinian; he recovered and gave to the world a part of the Theodosian Code, with explanations; and he procured the manuscript of the *Basilica*, a Greek abridgment of Justinian, afterwards published by Fabrot (see BASILICA). He also composed a commentary on the *Consuetudines Feudorum*, and on some books of the Decretals. In the *Paratitla*, or summaries which he made of the Digest, and particularly of the Code of Justinian, he condensed into short axioms the elementary principles of law, and gave definitions remarkable for their admirable clearness and precision. His lessons, which he never dictated, were continuous discourses, for which he made no other preparation than that of profound meditation on the subjects to be discussed. He was impatient of interruption, and upon the least noise he would instantly quit the chair and retire. He was strongly attached to his pupils, and Scaliger affirms that he lost more than 4000 livres by lending money to such of them as were in want.

In his lifetime Cujas published an edition of his works (Neville, 1577). It is beautiful and exact, but incomplete; it is now very scarce. The edition of Colombet (1634) is also incomplete. Fabrot, however, collected the whole in the edition which he published at Paris (1658), in 10 vols. folio, and which was reprinted at Naples (1722, 1727), in 11 vols. folio, and at Naples and at Venice (1758), in 10 vols. folio, with an index forming an eleventh volume. In the editions of Naples and Venice there are some additions not to be found in that of Fabrot, particularly a general table, which will be found very useful, and interpretations of all the Greek words used by Cujas.

See Papire-Masson, *Vie de Cujas* (Paris, 1590); Terrasson, *Histoire de la Jurisprudence Romaine*, and *Mélanges d'Histoire, de Littérature, et de Jurisprudence*; Bernardi, *Éloge de Cujas* (Lyons, 1775); Hugo, *Civilistisches Magazin*; Berriat Saint Prit, *Mémoires de Cujas*, appended to his *Histoire du Droit Romain*; *Biographie Universelle*; Gravina, *De Ortu et Progressu Juris Civilis*.

CULDEES. On no subject connected with the early ecclesiastical history of the British Islands has there been more discussion than on that of the Culdees. Their very name has furnished matter for dissertations, and their doctrines, mode of life, and peculiar institutions have been the fruitful source of controversy. There is still room for doubt as to details, but in all-important points the truth has been sufficiently ascertained by the learned Scottish and Irish antiquaries who have devoted their attention to the question. The discussion may now be held as practically settled in Britain, though Continental scholars of some mark are still disposed to carry it on.

It is of no consequence whether the word Culdee is of Latin or Celtic origin. The name is equally significant and of similar meaning in both languages. It is not precisely ascertained at what time that name was first used. It was unknown to Bede and the biographers of St Columba, but seems to have been established early in the 10th century as the title of an order of ecclesiastics possessing numerous establishments in Scotland and Ireland, and a very few also in England and Wales. The Culdees resided in monasteries, but were not tied down by monastic rules so strict as those of the followers of Columba or Columbanus, or of the Benedictine order and its various branches. Their institute bore some resemblance to the rule of the canons-regular of St Augustine, but still more to that of the secular canons so well known in the history of England during the 10th and 11th centuries. They were not united in one great community like the Columbites and Cistercians, or the orders of the Mendicant Friars, but resided in their separate monasteries or colleges, each of which was governed by its abbot, and was practically independent of the others. The Scottish monasteries are the best known, and it is in connection with them that the history of the order is most important. Their chief houses in that country were St Andrews, which numbered among its superiors King Constantine, who in earlier years had fought against the English sovereign Athelstan at Brunanburh; Dunkeld, of which Crinan, grandfather of Malcolm Canmore, was one of the lay abbots; Lochleven, famous as giving us the oldest of Scottish library catalogues; and Abernethy and Brechin, remembered chiefly in connection with their round towers.

It was long fondly imagined by Protestant writers that the religious belief and worship of the Culdees supplied complete evidence of primitive truth having been preserved free from Roman corruptions in one remote corner of Western Europe. It is now certain that this opinion is entirely opposed to historical evidence. In doctrine, ritual, and government there was no difference between the Culdees and the monastic communities in the Latin Church, except that the former, as was to be expected in a remote and uncivilized country distracted by repeated invasions of the Northmen, and by almost uninterrupted civil dissensions, were more superstitious and corrupt than their brethren on the Continent. In ecclesiastical discipline and morals there was the same inferiority. The "pure Culdees" are familiar in poetry and legend, but are unknown to history. At no time distinguished above their fellows for learning or piety, they gradually became still more remiss. The chief endowments of their monasteries were seized by nobles, who called themselves abbots, but were neither ecclesiastics nor discharged any ecclesiastical functions, and who transmitted their titles and estates to their families in hereditary descent. In one respect these nobles were better than the corresponding class who, as priors of St Andrews and abbots of Arbroath and Paisley, or the like, fought on either side in the civil wars of the 16th century;—they gave up a portion of their revenues to ecclesiastics, who, under the name of priors, discharged the spiritual functions of superiors of the monasteries.

Such a system naturally tended to become more corrupt as time went on. We need not believe all that is told to the prejudice of the Culdees by the chroniclers of a later age; but it is certain that the changes introduced into the Scottish Church by the influence of Queen Margaret and her son King David effected a great and beneficial revolution. The Culdees in general conformed to the stricter discipline enforced by these sovereigns. The lay abbots had to resign their titles if not their estates; the chief houses of the old rule reappeared as Benedictine and Augustinian monasteries; and, in one case at least, that of Brechin, the Culdees became for a time the chapter of the new cathedral. The last appearance of the Culdees in Scottish history is in connection with the unsuccessful attempts of the prior and brethren of the order at St Andrews, in the beginning of the 14th century, to maintain their ancient privilege of assisting at the election of a bishop of the primatial see.

The best and fullest account of the Culdees is to be found in Dean Reeves's *Culdees of the British Islands as they appear in History, with an Appendix of Evidences*, Dublin, 1864.

CULLEN, William (1710–1790), an eminent physician and medical teacher, was born at Hamilton, Lanarkshire, on 15th April 1710. His father, who was a writer by profession, was factor to the duke of Hamilton, and was owner of a small estate in the parish of Bothwell. William received his early education at the grammar school of Hamilton, and he appears to have subsequently attended some classes at the university of Glasgow. He commenced his medical career as apprentice to Mr John Paisley, surgeon in Glasgow, who was a man of learning and possessed a valuable medical library, and under whom Cullen prosecuted his studies with great ardour. After completing his apprenticeship at Glasgow Cullen became surgeon to a merchant vessel trading between London and the West Indies. On his return to Scotland in 1732 he settled as a practitioner in the parish of Shotts, Lanarkshire, where he resided for about two years. He thereafter proceeded to Edinburgh to pursue his studies at the university, which was then rapidly rising into fame as a medical school. Here he spent two winter sessions, and was one of the founders of what is now known as the Royal Medical Society, a students' association which meets weekly for the discussion of subjects of medical and scientific interest. Leaving Edinburgh in 1736, Cullen commenced practice in Hamilton, where he rapidly acquired a high reputation, and was employed by many of the families of distinction in the locality, including that of the duke of Hamilton. About this time he became acquainted with the celebrated Dr William Hunter, who resided with him as his pupil for nearly three years. Hunter was about to enter into partnership with Cullen, when, an opening occuring, he removed to London to engage in those anatomical and obstetric pursuits with which his name will ever stand associated. Cullen took the degree of M.D. at the university of Glasgow in 1740; and, resolving to confine his attention to the practice of physic, took into partnership Thomas Hamilton, surgeon, who undertook the surgical part of the work. While at Hamilton Cullen was twice elected a magistrate of the town, and in this capacity he displayed great ability, and was of great service to the community. In 1741 he married Miss Johnston, daughter of a clergyman in the neighbourhood, a lady of beauty and accomplishment, by whom he had a large family. He continued to practise in Hamilton till 1744, when he was induced to settle in Glasgow. During his residence at Hamilton, besides the arduous duties of medical practice, Cullen found time to devote to the study of the natural sciences, and especially of chemistry, for which he seems to have had special predilections. On coming to Glasgow he appears to have begun to lecture in connection with the university, the medical school of which was as yet imperfectly organized. Besides the subjects of theory and practice of medicine, Cullen lectured systematically on botany, materia medica, and chemistry. His great abilities, enthusiasm, and power of conveying instruction on the most difficult subjects made him a successful and highly popular teacher, and his classes increased largely in numbers. At the same time he diligently pursued the practice of his profession. Chemistry was the subject which at this time seems to have engaged the greatest share of Cullen's attention, and there can be no doubt that to him was due the credit of placing that science on a more philosophical basis than it had hitherto occupied, while at the same time he laboured to render it specially subservient to agriculture and other useful arts. He was himself a diligent investigator and experimenter, and he did much to encourage original research among his pupils, one of whom was Dr Joseph Black, who became the most celebrated chemist of his time. In 1751, a vacancy having occurred in the professorship of medicine, Cullen, through the influence of the duke of Argyll, was appointed by the king to the chair, but he still continued to lecture on chemistry. In 1756 he was elected by the town council of Edinburgh joint professor of chemistry in the university of that city, along with Dr Plummer, on whose death in the following year the sole appointment was conferred on Cullen. This chair he held for ten years—his classes always increasing in numbers. He also practised his profession as a physician with eminent success. About this time he delivered, along with some of his colleagues, lectures on clinical medicine in the Royal Infirmary, which he continued to do till near the close of his career. This was a work for which Cullen's experience, habits of observation, and scientific training peculiarly fitted him, and in which his popularity as a teacher, no less than his power as a practical physician, became more than ever conspicuous. During the winter session of 1760-61 the professor of materia medica, Dr Alston, died, and the students presented a petition to Cullen to undertake the work of finishing the course of lectures on that subject,—a request with which he readily complied. He delivered an entirely new course of lectures, in which the subject was treated in such a masterly and scientific as well as interesting and practical manner as to gain the high commendations of his students and of the medical profession generally, by whom copies of his pupils' notes were in great request. An incorrect edition of the lectures was ten years afterwards published in London without Dr Cullen's knowledge, and widely circulated throughout Europe.

On the death of Dr Whytt, the professor of the institutes of medicine, in 1766, the patrons offered the chair to Dr Cullen, who accepted it, resigning that of chemistry, in which he was succeeded by Dr. Black, who was then professor of chemistry in Glasgow. In the same year Dr John Gregory was appointed professor of practice of physic on the death of Dr Rutherford. For this chair Cullen was likewise a candidate, and a strong effort was made to induce the patrons to confer the appointment on him, but without success. In 1769 an arrangement was, however, entered into between Drs Gregory and Cullen, by which they agreed to deliver alternate courses on the theory and practice of physic. This arrangement proved eminently satisfactory in the hands of these two distinguished men, but it was brought to a close by the sudden and premature death of Gregory in 1773. Cullen was then appointed sole professor of the practice of physic, and he continued in this office till a few months before his death, which took place on 5th February 1790.

Cullen's fame rests on his great power and influence as a teacher, and on his important contributions to theoretical and practical medicine.

As a lecturer Cullen appears to have stood unrivalled in his day. His clearness of statement and power of imparting interest to the most abstruse topics were the conspicuous features of his teaching, and in his various capacities as a scientific lecturer, a physiologist, and a practical physician, he was ever surrounded with large and increasing classes of intelligent pupils, to whom his eminently suggestive mode of instruction was specially attractive. The grasp and vigour of his mind were shown in the facility with which he mastered the many different branches of medical knowledge which he taught; while his scientific spirit equally appears in his refusal to accept what he describes as the "false facts" so prevalent in his day, and by the zeal with which he pursued original observation and experimental research both as a chemist and as a physician, with the view of arriving at truth. Cullen has been frequently represented as a purely speculative physician; but this view is far from just. It is to be borne in mind that in his time medicine was to a large extent mixed up with metaphysical speculation, that its ascertained facts were few, and that the science of physiology was then in its infancy. If, therefore, in opposing what he held to be false theories he was led to advance new views and speculations of his own, still no one who attentively reads the works of this great physician and teacher can fail to perceive that his constant aim was in the direction of disengaging his science from the hypothetical mazes in which it was involved, and placing it upon the solid basis of fact.

Previous to the days of Cullen, and during his early life, the medical philosophy or medical doctrines of Boerhaave were universally taught in the schools. Boerhaave attempted to combine into one system the vital philosophy of Hippocrates (the vis medicatrix naturæ), the chemico-humoral principle of Paracelsus, the mechanical doctrines of Bellini, and a few of the other doctrines taught by former medical philosophers. He attributed, however, more to the chemical and mechanical forces than to the powers of life, and of course embraced a large portion of the doctrine of the humoral pathologists. Cullen, seeing that many of the facts then known were irreconcilable with Boerhaave's doctrines, became their warm opponent, especially taking offence at those doctrines which attributed almost every disease to a vitiation of the fluids of the body, Indeed, he might almost be said to have adopted as his motto the celebrated aphorism of Hoffmann, "Universa pathologia longe rectius atque facilius *ex vitio motuum microcosmicorum in solidis*, quam ex variis affectionibus vitiosorum humorum, deduci atque explicari possit, adeoque omnis generis nervosi affectionibus sint referendæ." Living at the time he did, when the doctrines of the humoral pathologists were carried to an extreme extent, and witnessing the ravages which disease made on the solid structures of the body, it was not surprising that he should oppose a doctrine which appeared to him to lead to a false practice, and to fatal results, and adopt one which attributed more to the agency of the solids, and very little to that of the fluids of the body. The Cullenian system was certainly an immense improvement on those which preceeded it, and has served as a valuable stepping-stone for the rational doctrines which now prevail, more especially those which relate to the influence of the nervous system alike in healthy and morbid action. He was obliged to introduce the doctrine of a spasm in the extreme vessels in order to account, on his theory, for many of the phenomena of disease; still we cannot refuse to him the honour of having been an able and successful improver in medical science. His classification of diseases was remarkable for its simplicity and clearness. He divided diseases into four great classes—1st, Pyrexiæ, or febrile disease, as typhus fever; 2d, Neuroses, or nervous diseases, as epilepsy; 3d, Cachexiæ, or diseases resulting from bad habit of body, as scurvy; and 4th, Locales, or local diseases, as cancer. His nosological arrangement has served to a considerable extent as the groundwork of modern nosologies, and was a great improvement, both in simplicity and clearness, on the involved productions of his predecessors.

Cullen's chief works are—*First Lines of the Practice of Physic*, Edin. 1774, 4 vols. 8vo; second edition, 1788; *Institutions of*

Medicine, Edin. 1770, 12mo; *Synopsis Nosologiæ Methodicæ*, Edin. 1785, 2 vols. 8vo; *Treatise on the Materia Medica*, Edin. 1789, 2 vols. 4to. The first volume of an account of *Cullen's Life, Lectures, and Writings* was published by Dr John Thomson in 1832, and was reissued with the second volume (completing the work) by Drs W. Thomson and D. Craigie in 1859.

CULLERA, a walled seaport-town situated on the left bank of the River Jucar, near its mouth, in the province and 20 miles south of the capital of Valencia. It stands on the southern slope of the hill called Zorras, which terminates in Cape Cullera, on the outskirts of a fine agricultural district noted for its rice, and carries on a considerable coasting trade with France and the Mediterranean. Its streets are irregularly built, but clean, and there are three small plazas. An old castle, extensive barracks, churches, convents, and a hospital are its chief buildings. Agriculture and fishing are the chief industries. Population about 8000.

CULLODEN, a desolate tract of moorland, otherwise known as Drummossie, about five miles south-east from Inverness in Scotland, celebrated as the scene of the battle of April 16, 1746, by which the fate of the house of Stuart was decided. A mile to the north is Culloden House, which at the time of the rebellion belonged to Duncan Forbes, the president of the Court of Session, and has since furnished the historical student with a valuable collection known as the *Culloden Papers*, ranging from 1625 to 1748. Discovered in 1812, they were published in 1815 by Duncan George Forbes, at that time the representative of the Culloden family.

CUMÆ, CUMA, or in Greek Κύμη, the oldest and one of the most important of the Greek colonies in Italy, was situated on the shore of Campania, between the lakes Acherusia and Liternus, and about six miles north of Baiæ. The most generally received opinion is, that Cumæ was founded by a joint colony, partly from the Æolian Cumæ or Cyme and partly from Chalcis in Eubœa, who agreed that they should call the city by the name of one of the parent states, while it should take rank as a colony of the other. The date of its foundation is unknown; but it is certain that Cumæ had attained a high degree of prosperity while Rome was still struggling into existence. In the 8th century B.C. it had extended its power on every side into Campania; and, like Sybaris and Crotona, had begun to plant flourishing colonies, and establish itself besides as a maritime power. Of its colonies the most prosperous was Neapolis, destined to survive as the modern Naples; and among its maritime stations were the harbours of Dicæarchia (Puteoli) and Misenum. The first event which led to the decline of Cumæ was the establishment of the supremacy of the Etruscans by sea; but a severer blow still was the invasion of Campania by that people and their allies about the year 522 B.C. This attack was repelled, though at a great loss to the Cumæans, chiefly by the ability of Aristodemus, who overthrew the existing government, and established a tyranny, which endured for twenty years. At the end of that period he was driven out of the city by the nobles, who had once more become powerful. Twenty-two years later the Cumæans, unable any longer of themselves to resist the growing power of the Tuscans, called in the aid of Hero of Syracuse, and with his assistance defeated their opponents. In 520 B.C. the Samnites, a more formidable foe, made themselves masters of Cumæ, put the male citizens to the sword, and established a colony of their own in the city. Admitted to the Roman franchise in 338 B.C. Cumæ ever after continued faithful to its alliance with Rome; and in the second Punic war, though by that time it had greatly declined, it held out against Hannibal. In the later ages of the republic it attained a kind of reflected prosperity from the neighbourhood of Baiæ, and other favourite retreats of the Roman nobility; but it is mentioned as "Vacuæ Cumæ," "Quieta Cuma," with reference to its half-deserted appearance. In the wars of the Goths and Romans, Cumæ once more became for a short time important, as the last stronghold of the Gothic kings in Italy. In 552 it surrendered to the victorious arms of Narses; in the 9th century it was burned by the Saracens; and in the 13th, having become a rendezvous for robbers and pirates, it was destroyed by the people of Naples. Some remains of Cumæ are still to be seen. Of these the principal are a ruinous amphitheatre, a brick arch, supposed to be one of the old gates of the city, and several temples named respectively after Apollo, Diana, the Giants, and Serapis. Bronze statues and vases have at different times been dug up. Not the least interesting spot at Cumæ was a great cavern in the rock on which the citadel stood, regarded by the Cumæans as the place whence the Sibyl propounded her enigmas. This cavern existed unimpaired till the time of Narses, who availed himself of it to undermine the walls of the town; and the remains are still pointed out to the traveller.

CUMANA, a city of Venezuela, capital of a province of the same name, stands on the Gulf of Cariaco, at the mouth of the Manzanares, 180 miles east of Caracas. It is the oldest European city in South America, having been founded by Diego Castellon in 1523. It was almost totally destroyed by the terrible earthquake of 1766, and has since repeatedly suffered from earthquakes. The houses are generally low and flat, and have a poor appearance; but the style of building has recently been much improved. Cumana possesses a capacious roadstead, and presents great facilities for obtaining provisions. The principal trade is in cattle, smoked meat, dried fish, coffee, cotton, sugar, tobacco, salt, and petroleum. Population (1873), 9427.

CUMBERLAND, a county of England, at its north-west extremity, situated between 54° 6′ and 55° 7½′ N. lat. and 2° 13′ and 3° 30′ W. long., and bounded on the N. by the Solway Firth and Scotland, on the E. by Northumberland and Durham, on the S. by Westmoreland and North Lancashire, and on the W. for about 70 miles by the Irish Sea. It is at a medium about 50 miles long and 30 miles broad, within a bounding line of 215 miles, of which 75 are sea coast; and it contains an area of 1516 square miles, or 970,161 acres, of which the mountainous district comprises more than a third, and the lakes and waters 8000 acres, the remainder consisting of inclosed and cultivated land with a few commons still uninclosed, but capable of great improvement. The principal divisions are locally termed "wards." These wards are five in number, viz., Cumberland ward, Eskdale, Leath, Allerdale-above-Derwent, and Allerdale-below-Derwent. The ward of Allerdale-above-Derwent was formerly included in the diocese of Chester; but since 1856 it has been joined to the rest of the county for ecclesiastical purposes, and all the county is now in the diocese of Carlisle, with the exception of the parish of Alston, in the extreme east, which belongs to the diocese of Durham. The county is embraced in the northern circuit, the assizes being held at Carlisle, and there is a court of quarter sessions. Cumberland contains the city of Carlisle, 19 market-towns, and 112 parishes. The population in 1871 was found to be 220,253 (males, 109,079; females, 111,174), having increased during the preceding ten years to the extent of 14,969 souls, or 7·2 per cent. The number of inhabitants to a square mile is exceptionally small, being 145, while that of all England is 389½.

Cumberland presents every variety of surface. The south-western district is generally mountainous, rugged, and sterile, yet contains several rich though narrow valleys, with numerous fine lakes, islands, rivers, cascades, and

ENCYCLOPÆDIA BRITANNICA NINTH EDITION

woodlands, which, combined or contrasted with the gigantic masses around them, exhibit many remarkable scenes of grandeur, desolation, and beauty.' Scawfell, Skiddaw, and Helvellyn, rising to the height of more than 3000 feet, belong to this quarter. The highest part of that immense ridge known as the Pennine chain, and not inaptly termed the "backbone" of England, which, rising in Derbyshire, extends in a continuous chain into the Lothians of Scotland, forms the eastern boundary; the culminating point of this ridge is Crossfell, nearly 3000 feet high; it is surrounded with other lofty and bleak eminences, which retain the snow upon them for more than half the year.

The following are the loftiest heights, with their respective elevations:—

	Feet.		Feet.
Scawfell Pike	3210	Bowfell	2960
Scawfell	3162	Great Gable	2949
Helvellyn	3118	Pillar	2927
Skiddaw	3058	Blencathra	2847
Great End	2984	Grisdale Pike	2593

The north and north-eastern part of the county consists of the vale of the Eden, which separates the Pennine chain from the mountainous system of the south-west, and gradually expands into the great Cumbrian plain, extending north and north-west to the shores of the Solway. A tract of low land, varying from two to five miles in breadth, and consisting generally of a gravelly or sandy soil, extends along the coast-line.

[*Geology.*—The oldest rocks known in this county are the Skiddaw slates representing ancient marine deposits of clay and sand formed during a long period of subsidence, and containing a few fossils (graptolites, trilobites, phyllopod crustacea, &c.). These old mud rocks have been much contorted, cleaved, and metamorphosed, the metamorphosed portions, including chiastolite slate, spotted schist, and mica schist (rarely gneissic), being specially developed around the granite of Skiddaw Forest. The quiet marine conditions under which these slates were formed seem to have given way to a long series of volcanic outbursts, at first sub-marine in character, but soon becoming sub-aerial. Thus, above the Skiddaw slates are piled up great thicknesses of volcanic ashes and lavas—the volcanic series of Borrowdale (or green slates and porphyries). Then must have followed a renewed period of depression beneath the waters of the sea, and upon the denuded surface of volcanic rocks the great series of sedimentary strata known as the Coniston limestone and the overlying Upper Silurian (Westmoreland, about Windermere and Kendal) was deposited.

The next geological epoch (the Devonian or Old Red) is unrepresented in Cumberland by any sedimentary deposition, except quite towards it close; but during the long lapse of time between the Upper Silurian and the commencement of the Carboniferous, that mighty but probably slow elevation and denudation of all the previously formed rock-groups took place, which resulted in the first appearance of the Cumberland mountain district, the rough-hewn block out of which, during long succeeding ages, mountain and valley were carved. Around this early nucleus was formed the conglomerate so well shown in Mell Fell and at the foot of Ullswater, and then the thick series of Carboniferous rocks, the limestones, sandstones, shales, and coal-seams, which form so admirable a framework to the mountain country.

In Carboniferous times there must have been frequent alternations of marine and low-lying land conditions over large parts of Cumberland. At the close of this period the conditions around the mountain nucleus, whether marine or partly fresh-water, allowed of the deposition of great thicknesses of sandstones (mostly red) and marls, together with some breccias and magnesian limestone, which make up the geological formations known as the Permian and New Red (or Trias). With the exception of a small area occupied by Liassic rocks, near Carlisle, no newer formations are known in Cumberland; but during that great length of time represented by the Secondary and Tertiary rocks of the rest of England, the area which is now our lake district seems to have been dry land, and to have been sculptured and moulded by atmospheric denudation into its present form. Within comparatively recent times this district has been the home of glaciers, which have left abundant traces of their former existence in the ice-scratched and rounded rocks, perched blocks, and glacial moraines.

Besides these various rock-groups, there are several large masses of granite and granitoid rocks in the area of the mountain district. Granite occurs in Skiddaw Forest and in Eskdale. Syenitic and quartz-felsitic rocks occur in Buttermere and Ennerdale (closely associated with the Eskdale granite), in St John's Vale, and in other smaller masses. Bosses and dykes of diorite and dolerite are of frequent occurrence among the older Silurian rocks, but the basalt known as the Whin Sill is the only instance of intrusive igneous rocks yet recognized among the post-Silurian strata.

The mineral resources are extensive. Among the Lower Silurian rocks (Skiddaw slates and volcanic series) are veins of iron (but little worked), lead, and copper, while the celebrated plumbago mine occurs in the midst of some intrusive dioritic and diabasic masses among the volcanic rocks of Borrowdale. The valuable deposits of hematite are found in connection with the Carboniferous limestone, and the Whitehaven coal-field furnishes a large supply of valuable fuel. Lead veins of much value occur in the limestone area in the east of the county, and specially in the neighbourhood of Alston.

Slates are worked in the volcanic series, in which case they consist of cleaved ash-beds, and flags are largely wrought among the Coniston series in the Upper Silurian. Building stone of more or less value is found in the various formations developed in the county. (J. C. WA.)

The climate necessarily corresponds with the variety of surface. Along the shore-level it is mild and temperate, though subject to an excess of moisture compared with the eastern part of the country; among the mountains the winters are sometimes very rigorous, but more frequently subject to heavy and almost incessant rain for days at a time. The average yearly rainfall, as shown by careful observation for several years back, is as follows:—Carlisle, 30 inches; Wigton, 34; Whitehaven, 50; Keswick, 59; while at Seathwaite, in Borrowdale, 420 feet above the sea-level, it amounts to about 140 cubic inches. On the Sty-Head Pass, at an elevation of 1077 feet, the rain-guage showed in the year 1872 the enormous fall of 243·98 cubic inches, which, as far as has yet been ascertained, marks this region as the wettest spot in Europe. Black peaty earth is the most prevalent soil in the mountainous districts, and is found, too, in the moors and commons of the eastern parts of the county. About one-half the cultivated land consists of dry loams, excellently adapted for the growth of turnips, potatoes, grain, and herbage. Fertile clays occupy only a small portion, but clay, wet and sterile, forms the subsoil in many parts. The principal rivers are the Eden, Irthing, Derwent, Greta, Caldew, and Esk. The Eden has its source in Westmoreland, near the borders of Yorkshire, and, pursuing a north-westerly direction through Cumberland, passes Kirkoswald and Carlisle, falling into the Solway Firth near Rockliffe Marsh, where it forms a fine estuary. The land on its banks is for the most part very narrow, and in some places the high grounds approach to the water's edge. On this river there are several valuable salmon-fisheries belonging to different owners. The Derwent rises among the picturesque crags at the head of Borrowdale, in the south-west group of mountains, whence it dashes from rock to rock until it reaches Derwentwater Lake, from which it again flows onward through the vale of Keswick, thence through Bassenthwaite Lake, and, after being joined by the Cocker, near Cockermouth, falls into the sea at Workington. The basin of the Derwent includes within its area six lakes and about a dozen mountain tarns, all of which lie embosomed in the midst of scenery unsurpassed in loveliness and grandeur in Great Britain. The Caldew rises on the south-east side of the Skiddaw and enters the Eden near Carlisle after a course of 24 miles, in which it gives motion to many corn and cotton mills. The vale through which it flows in its lower part is very beautiful and well-wooded. The Esk enters Cumberland from Scotland near a place called the Moat, and, flowing westerly by Longtown, falls into the Solway Firth. The Liddel, another Scottish river, which in one part separates Cumberland from Scotland, joins the Esk after the latter has passed into England.

Landed property is much divided in this county, and the smaller holdings were formerly generally occupied by their owners, who were known as "statesmen," *i.e.*, "estatesmen," a class of men long noted for their sturdy independence and attachment to routine husbandry. Most of these estates were held of the lords of manors under customary tenure, which subjected them to the payments of fines and heriots on alienation as well as on the death of the lord or tenant. According to the *Agricultural Survey* printed in 1794, about two-thirds of the county was held by this tenure, in parcels worth from £15 to £30 rental. On large estates, also, the farms were in general rather small, few then reaching £200 a year, held on verbal contracts, or very short leases, and burdened like the small estates with payments or services over and above a money rent; but a great change has taken place in all these respects within the last forty years. The "statesmen" have been gradually becoming extinct as a class, and many of the small holdings have fallen into the hands of the larger landed proprietors. According to the *Owners of Land Return*, 1873, the county was divided among 15,513 separate proprietors, the total value of the land being estimated at £1,201,980. There were 9617 owners of holdings which did not exceed 1 acre in extent, 1764 owners of holdings from 1 to 10 acres, 1061 owners of 10 to 50 acres, and 3071 owners of 50 acres and upwards, the largest possessing 47,730 acres. From the above-mentioned return it appears that 62 per cent. of the total proprietors in Cumberland hold less than 1 acre; while in the neighbouring county of Westmoreland only 39 per cent. belonged to this class, and in all England the average is 71 per cent. The average extent of the holdings in Cumberland was 47 acres against 34 acres in all England, and the value per acre was £1, 12s. 11d. as against £3, 0s. 2d. throughout the whole country. There were five proprietors in the county owning more than 10,000 acres, viz., the earl of Carlisle (Castle Howard), 47,730 acres; earl of Lonsdale (Lowther Castle), 28,228; Sir F. U. Graham (Netherby) 25,270; Henry Howard (Greystoke Castle), 13,008; and Lord Leconfield (Cockermouth Castle), 11,147.

Farms are commonly let upon leases of seven or fourteen years, and the farmers can compare favourably with those of neighbouring counties in intelligence and skill in husbandry. The live stock consists of horses of rather a small size; the longhorned breed of cattle, for which Cumberland was noted, has been entirely supplanted by the improved shorthorns, of which the stocks of several of the large proprietors include animals from the best blood in the kingdom; Galloways, Ayrshires, and cross-breeds are also kept on dairy-farms. The sheep on the lowland farms are generally of the Leicester class or cross-bred between the Leicester and Herdwick, with a few South-downs. Throughout the mountainous districts the Herdwick has taken the place of the smaller black-faced heath variety of sheep once so commonly met with on the sheep farms. They are peculiar to this part of England; the ewes and wethers and many of the rams are polled, the faces and legs are speckled, and the wool is finer and heavier in fleece than that of the heath breed. They originally came from the neighbourhood of Muncaster in the Duddon and Esk district, and are said to be sprung from parents that escaped from a wrecked ship of the Spanish Armada. In general they belong to the proprietors of the sheep-walks, and have been farmed out with them from time immemorial in herds of from 300 to 1000, and from this circumstance it is said they have obtained the name of "Herdwicks." From the agricultural returns for the years 1873 and 1876 it will be seen that the numbers of live stock remain pretty stationary, with the exception of sheep, which have apparently decreased latterly—these returns, however, are not so complete as they might be.

	Cattle.	Sheep.	Pigs.	Horses.
1873......	128,538	561,513	28,229	19,071
1876......	128,409	516,305	27,178	19,838

Grain is not so much grown as formerly, a great proportion of the land being laid down in grass for the breeding and rearing of cattle; butter and bacon are largely exported to the populous districts of Lancashire and Yorkshire.

	Acreage Under Corn Crops.	Under Green Crops	Grass under rotation.	Under all kinds of cultivation.	Percentage of area of county.
1873...	100,704	50,676	99,958	541,631	55¾
1876...	94,794	48,207	96,317	549,590	56½

Nearly three-fourths of the corn crops consist of oats, and about one-fifth wheat, while two-thirds of the green crops are turnips, and a fifth potatoes. That excellent variety of oats called the potato-oat was first discovered in Cumberland in 1788, whence it has now spread over every part of the United Kingdom. Among the farm implements the single-horse cart deserves to be noticed, as being almost exclusively used, and with great advantage, as it is not only the most convenient and economical carriage for the farmer, but is much less injurious to the public roads than the waggons and heavily-loaded carts used in many other English counties, which could not easily travel the hilly roads of many parts of Cumberland.

The principal manufactures of this county are calicoes, ginghams, corduroys, and other cotton fabrics, established at Dalston, Carlisle, Warwick Bridge, and a few other places. Cotton printing is carried on to some extent in Carlisle. Cockermouth possesses a large new mill for the manufacture of tweeds, and also an old established thread manufactory. A manufactory of coarse earthenware near Dearham, pencil mills at Keswick, and paper mills at Egremont, with breweries, tanneries, soap and biscuit manufactories at Carlisle, comprise all the other chief manufacturing establishments of any note in Cumberland. Coal is found at different places in the eastern mountains, and also near Brampton in the northern part of the county, but in greatest abundance on the west of the Calder, and thence through the Maryport, Workington, and Whitehaven districts; in 1871, 4596 persons were employed in the pits. Owing to the development of the iron trade in the west of the county the consumption of coal is very considerable; but a large export trade is still carried on from the Cumberland seaports to Ireland. Mining operations have taken a new direction in recent years. The discovery and opening out of immense beds of iron ore in the Cleator district have given increased employment to the population. This ore is of the quality known as hematite; and, being exceedingly rich and well adapted for the manufacture of Bessemer steel, it is largely exported to the Cleveland and other districts to mix with ore of an inferior quality. In 1871 thirty-three iron mines were registered for Cumberland in the Mining Record Office, employing 3771 miners; but since that date many new mines have been opened, and all the mines have been worked on a more extensive scale than before. Furnaces for smelting the ore are established at Workington, Maryport, Seaton, Parton, and Harrington; and at Workington are established large works for the manufacture of iron and Bessemer steel.

The famous black-lead mines are situated at the head of Borrowdale, in the south-west range of mountains. The mineral is found in the green slate, generally lying in nodules or irregular granular kidney-shaped masses. These masses are as a rule small; but early in the present century an extraordinary mass was found which, it is said, yielded 70,000 ℔ of pure plumbago. With the exception of a couple of trials made at an interval of twenty years by different companies, this "wad-mine" has been practically closed for more than thirty years. The lead now used for pencils is an imitation of the plumbago, made chiefly from Mexican lead mixed with antimony and other ingredients.

The principal lead-mines are at Alston Moor, on the south-east border of the county, in the Caldbeck fells, and in the mountains around Keswick. The ore is found in veins nearly perpendicular, and not unfrequently contains a considerable proportion of silver. Copper was formerly raised from the mines of Caldbeck, Hesket-New-Market, and Newlands near Keswick, but these mines have not been wrought for many years. The ore is a sulphuret, and usually contains both iron and arsenic. In 1871, 1082 persons were employed in lead-mining.

The most considerable towns in Cumberland are Carlisle (population, 31,074), Penrith (8317), Whitehaven (13,298), Workington (7979), Maryport (6938), Wigton (3425), Cockermouth (5115), Keswick (2777), Brampton (2617), and Egremont (2377). The seaports are Whitehaven, Workington, Maryport, Harrington, and Silloth. Whitehaven was among the first ports in the kingdom to embark in the East India trade after it was thrown open, and possessed a fair share of the trade with America and the West Indies long before the Mersey and the Clyde; the first Clyde ventures to the West Indies were made in Whitehaven bottoms.

The lakes and mountains of Cumberland have long attracted the admirers of the wild and beautiful in natural scenery. The lakes, including the mountain tarns, are thirty-four in number; of these Ullswater is the largest, and Derwentwater the most beautiful. Ullswater is partly situated in Cumberland, and partly in Westmoreland; it is 9 miles in length and from $\frac{1}{4}$ mile to $\frac{3}{4}$ mile in breadth. Winding round the base of vast rocky mountains in its upper part, it is only seen in the successive portions,—the scenery on its margin presenting new and striking objects at every successive stretch. Derwentwater is of an irregular figure, approaching to an oval, about 3 miles in length and from $\frac{1}{2}$ mile to $1\frac{1}{2}$ miles in breath. It is seen at one view, expanding within an amphitheatre of mountains, rocky but not vast, broken into many fantastic shapes, opening by narrow valleys the view of rocks which rise immediately beyond and which are again overlooked by others. Its shores are well wooded, and its bosom spotted by well-wooded islands, of which Lord's Island, Derwent Isle, and St Herbert's are the principal. Lord's Island was the residence of the ill-fated Derwentwater family, the last earl of which was beheaded for participation in the rebellion of 1715. St Herbert's Isle receives its name from the fact of its having been the abode of a holy man of that name mentioned by Bede, as contemporary with St Cuthbert of Farne Island in the 7th century. Derwent Isle, about 6 acres in extent, contains a handsome summer residence surrounded by tastefully laid-out lawns, gardens, and timber of large growth. The celebrated Falls of Lodore, at the upper end of the lake, consist of a series of cascades which rush over an enormous pile of protruding crags from the height of nearly 200 feet. What is called the "Floating Island" appears occasionally at intervals of from two to five years, on the upper portion of the lake in front of the Lodore Falls. This somewhat singular phenomenon is supposed to owe its appearance to an accumulation of gas, formed by the decay of vegetable matter, detaching and raising to the surface the matted weeds which constitute the floor of the lake at this point.

The following table shows the extent of the lakes and their elevation above the sea-level, &c. :—

	Length.	Breadth.	Elevation.	Greatest Depth.
	Miles.	Miles.	Feet.	Feet.
Ullswater	9	$\frac{3}{4}$	477	218
Bassenthwaite	4	$\frac{3}{4}$	226	78
Derwentwater	3	$1\frac{1}{2}$	238	81
Crummock	3	$\frac{3}{4}$	321	132
Wastwater	[illegible]	$\frac{1}{2}$	204	...
Thirlmere	3	$\frac{1}{4}$	533	108
Ennerdale	$2\frac{1}{2}$	$\frac{3}{4}$	369	80
Buttermere	$1\frac{1}{4}$	$\frac{1}{2}$	331	93
Loweswater	1	$\frac{1}{2}$	429	60

The present county of Cumberland was formed by the addition of a portion of the old English kingdom of Yorkshire to the southern part of the old British kingdom of Strathclyde. It first became a portion of the kingdom of England in the reign of William Rufus, who rebuilt Carlisle which the Danes had destroyed 200 years before. At a conference held at York, Henry III., in full satisfaction of the claims of the Scots, who considered Strathclyde to be a tributary kingdom to Scotland, agreed to assign lands to them of the yearly value of £200 within the counties of Northumberland and Cumberland, if lands of that value could be found therein, without the limits of the towns where castles were erected. But after this arrangement there still remained a tract between the two kingdoms called the "debateable ground," the resort of the worst characters of both, who continued to disturb the borders, down to the union of the two crowns. Of the ancient British antiquities of Cumberland the most remarkable is a circle of stones, about three miles from Kirkoswald, called Long Meg and her Daughters; and there is a unique little circle of 48 stones between Threlkeld and Keswick, called the Druid's Temple, scarcely two miles from the latter place—the stones are porphyritic greenstone. The Roman wall may still be traced across the country from the Solway to Northumberland. A great many coins, altars, and other vestiges of antiquity have been discovered from time to time at the Roman stations on its line. In the mountainous parts the manners of the people were down to a recent period somewhat peculiar, and in some of the secluded dales the native inhabitants still lead a primitive kind of existence; but increased intercourse with the outside world, induced by the extension of railways and the spread of education, is doing much to bring them on a level with the peasantry of more favoured parts of the kingdom.

Cumberland sends eight members to Parliament:—two for the Eastern Division, two for the Western Division, two for Carlisle, one for Whitehaven, and one for Cockermouth. It is governed by a lord-lieutenant, high-sheriff, deputy lieutenant, and magistrates. (H. I. J.)

CUMBERLAND, a city of the United States, capital of Alleghany county, Maryland, on the north bank of the Potomac river, 179 miles west of Baltimore. It contains a court-house, a county prison, a market-house, and several handsome churches; and as the western terminus of the Chesapeake and Ohio Canal and the seat of a railway junction, it enjoys excellent opportunities for trade. There are flour-mills and iron-furnaces in the neighbourhood; and an extensive factory for the manufacture of steel rails is maintained by the Baltimore and Ohio railway company. A few miles to the west is the commencement of the great Cumberland coal region. Population in 1870, 8056.

CUMBERLAND, RICHARD (1632–1718), bishop of Peterborough, was the son of a respectable citizen of London, and was born in the parish of St Ann, near Aldersgate. He was educated in St Paul's school, and at Magdalene College, Cambridge, where in due time he took his degrees in arts, and obtained a fellowship. He took the degree of B.A. in 1653; and, having proceeded M.A. in 1656, he was next year incorporated to the same degree in the university of Oxford. For some time he applied himself to the study of physic; and although he did not adhere to this profession, he retained his knowledge of anatomy and medicine. Payne informs us that "he distinguished himself, whilst he was a fellow of the college, by the performance of his academical exercises. He went out batchelor of divinity at a publick commencement; and tho' it was hardly known that the same person performed those great exercises twice, yet such was the expectation he had raised, that he was afterwards sollicited to keep the act at another publick commencement for his doctor's degree." He took the degree of B.D. in 1663, and that of D.D. in 1680. Among his contemporaries and intimate friends were Dr Hezekiah Burton, Sir Samuel Moreland, who was distinguished as a mathematician, Sir Orlando Bridgeman, who became keeper of the great seal, and Samuel Pepys.

To this academical connection he appears to have been in a great measure indebted for his subsequent advancement in the church. When Bridgeman was appointed lord keeper, he nominated Cumberland and Burton as his chaplains, nor did he afterwards neglect the interest of either. Cumberland's first preferment was the rectory of Brampton, in Northamptonshire, which was bestowed upon him in 1658 by Sir John Norwich. He then quitted the university, and went to reside on his benefice, where he zealously devoted himself to the duties of his sacred office, and to the prosecution of those abstruse studies to which he had long been addicted. In 1661 he was appointed one of the twelve preachers of the university. His character was very remote from that of a preferment-hunter; and in this unambitious retirement he might have spent the remainder of his life, if the lord keeper, who obtained his office in 1667, had not invited him to London, and soon afterwards bestowed upon him the rectory of Allhallows at Stamford. In his new situation he acquired new credit by the fidelity with which he discharged his important functions. In addition to his ordinary duties, he undertook the weekly lecture, and thus was obliged to preach thrice every week in the same church. This labour he constantly and assiduously performed, and in the mean time found sufficient leisure, as well as inclination, to prosecute his scientific and philological studies.

At the mature age of forty he published his earliest work, entitled *De Legibus Naturæ Disquisitio Philosophica, in qua earum Forma, summa Capita, Ordo, Promulgatio, et Obligatio e Rerum Natura investigantur; quin etiam Elementa Philosophiæ Hobbianæ, cum moralis tum civilis, considerantur et refutantur*, London, 1672, 4to. It is dedicated to Sir Orlando Bridgeman, and is prefaced by an "Alloquium ad Lectorem," contributed by the authors' friend Dr Burton. It appeared during the same year with Puffendorf's *De Jure Naturæ et Gentium*. This work of the English divine was highly commended in a subsequent publication of the German lawyer, and his weighty suffrage must have had the effect of making it known on the Continent. The book was reprinted at Lübeck in 1683, and again in 1694. It was likewise reprinted at Dublin. As the work was printed in London while the author was residing at Stamford, the first edition contains many typographical errors; nor are they removed in the subsequent editions. Bentley afterwards undertook to revise the entire text, and, according to his grandson's account, he most effectually performed this task; but Barbeyrac, who had the use of the corrected copy, and who was a more competent judge of its value, entertained a less favourable opinion. This copy is now in the library of Trinity College, Cambridge. The author's family intended to publish a splendid edition of the work, but their laudable design was never executed.

Tyrrell, who was the grandson of Archbishop Ussher, and is himself well known as a writer on history and politics, digested Cumberland's doctrines into a new form, and published a considerable volume under the following title: *A brief Disquisition of the Law of Nature, according to the Principles and Method laid down in the Reverend Dr Cumberland's (now Lord Bishop of Peterborough's) Latin Treatise on that subject; as also his Confutations of Mr Hobbs's Principles put into another method: with the Right Reverend Author's approbation*, London, 1692, 8vo. Another edition appeared in 1701. A complete English version of the original work was published by John Maxwell, M.A., prebendary of Connor, under the title of *A Treatise of the Laws of Nature*, &c., London, 1727, 4to. A French translation was executed by Barbeyrac, and published at Amsterdam in 1744.

Having thus established a solid reputation, Dr Cumberland next prepared a work on a very different subject,—*An Essay towards the Recovery of the Jewish Measures and Weights, comprehending their Monies; by help of ancient standards, compared with ours of England: useful also to state many of those of the Greeks and Romans, and the Eastern Nations*, London, 1686, 8vo. This work, which is dedicated to his friend Pepys, obtained a copious notice from Leclerc, and was translated into French.

About this period he was greatly depressed, like many other good men, by apprehensions respecting the growth of Popery; but his fears were at length dispelled by the Revolution, which likewise brought along with it another material change in his circumstances. In the course of the year 1691, he went, according to his custom on a post-day, to read the newspaper at a coffee-house in Stamford, and there, to his great surprise, he read that the king had nominated Dr Cumberland to the bishopric of Peterborough. The face of the bishop elect was scarcely known at court, and he had resorted to none of the usual methods of advancing his temporal interest.

"Being then sixty years old," says his great-grandson, "he was with difficulty persuaded to accept the offer, when it came to him from authority. The persuasion of his friends, particularly Sir Orlando Bridgeman, at length overcame his repugnance; and to that see, though very moderately endowed, he for ever after devoted himself, and resisted every offer of translation, though repeatedly made and earnestly recommended. To such of his friends as pressed an exchange upon him he was accustomed to reply, that Peterborough was his first espoused, and should be his only one; and, in fact, according to his principles, no church revenue could enrich him; for I have heard my father say that, at the end of every year, whatever overplus he found upon a minute inspection of his accounts was by him distributed to the poor, reserving only one small deposit of £25 in cash, found at his death in his bureau, with directions to employ it for the discharge of his funeral expenses,—a sum in his modest calculations fully sufficient to commit his body to the earth."

To the duties of his new station he applied himself with great assiduity. His charges to the clergy are described as plain and unambitious, the earnest breathings of a pious mind. His old age was fresh and vigorous, nor did he discontinue his episcopal visitations till after he attained his eightieth year. When Dr Wilkins published the New Testament in Coptic, he presented a copy to the bishop, who began to study the language after he had completed the age of eighty-three. "At this age," says his chaplain, "he mastered the language, and went through great part of this version, and would often give me excellent hints and remarks, as he proceeded in reading of it." He died in 1718, in the eighty-seventh year of his age: he was found sitting in his library, in the attitude of one asleep, and with a book in his hand. The great-grandson of Bishop Cumberland was Richard Cumberland, the dramatist, the subject of the following notice.

Bishop Cumberland was eminently distinguished by his gentleness and humility. He was of a temper so cool and sedate that it could not be roused to anger, and through the whole course of his life his soul is represented as having been in a constant state of calmness and serenity, hardly ever ruffled by any passion. The theory which he maintains in his principal work is founded on benevolence, and it naturally flowed from the habitual temperament of the author's mind. He was a man of a sound understanding, improved by extensive learning, and has left behind him several monuments of his talents and industry.

The care of Cumberland's posthumous publications devolved upon his domestic chaplain Payne, who soon after the bishop's death edited "*Sanchoniatho's Phœnician History*, translated from the first book of Eusebius, *De Præparatione Evangelica*: with a continuation of Sanchoniatho's history by Eratosthenes Cyrenæus's Canon, which Dicæarchus connects with the first Olympiad. These authors are illustrated with many historical and chronological remarks, proving them to contain a series of Phœnician and Egyptian chronology, from the first man to the first Olympiad, agreeable to the Scripture accounts," Lond. 1720. The preface contains an account of the life, character, and writings of the author, which was likewise published in a separate form, and exhibits a pleading picture of his happy old age. A German translation appeared under the title of *Cumberland's Phönizische Historie des Sanchoniathons, übersetzt von Joh. Phil. Cassel*, Magdeburg, 1755, 8vo. The sequel to the work was likewise published by Payne,—*Origines Gentium antiquissimæ; or Attempts for discovering the Times of the first Planting of Nations: in several Tracts*, Lond. 1724, 8vo.

[The philosophy of Cumberland is expounded in the treatise *De Legibus Naturæ*. The merits of the work are almost confined to the general character and substance of the speculation it contains, for its style is destitute of both strength and grace, and its reasoning is diffuse and immethodical to a trying degree. Its main design is to combat the principles which Hobbes had promulgated as to the constitution of man, the nature of morality, and the origin of society, and to prove, in opposition to what he had maintained, that self-advantage is not the chief end of man, that force is not the source of personal obligation to moral conduct nor the foundation of social rights, and that the state of nature is not a state of war. The views of Hobbes seem to Cumberland utterly subversive of religion, morality, and civil society, and he endeavours, as a rule, to establish directly antagonistic propositions. He refrains, however, from denunciation; he uses only calm and moderate language, and is a uniformly fair opponent up to the measure of his insight.

Laws of nature are defined by him as "immutably true propositions regulative of voluntary actions as to the choice of good and the avoidance of evil, and which carry with them an obligation to outward acts of obedience, even apart from civil laws and from any considerations of compacts constituting governments." This definition he says will be admitted by all parties. Some deny that there are any such laws, but they will grant as readily as their opponents that this is what ought to be understood by them. There is thus common ground for the two opposing schools of moralists to join issue. The question between them is, Do such laws exist or do they not? In reasoning thus Cumberland obviously forgot what the position maintained by his principal antagonist really was. Hobbes must have refused to accept the definition proposed. He did not deny that there were laws of nature, laws antecedent to government, laws even in a sense eternal and immutable. The virtues as means to happiness seemed to him to be such laws. They precede civil constitution, which merely perfects the obligation to practise them. He expressly denied, however, that "they carry with them an obligation to outward acts of obedience, even apart from civil laws and from any consideration of compacts constituting governments." And many besides Hobbes must have felt dissatisfied with the definition. It is the reverse of unambiguous or luminous. In what sense is a law of nature a "proposition?" Is it as the expression of a constant relation among facts, or is it as the expression of a divine commandment? A proposition is never in itself an ultimate fact although it may be the statement of such a fact. And in what sense is a law of nature an "immutably true" proposition? Is it one which men always and everywhere accept and act on, or merely one which they always and everywhere ought to accept and act on? The definition, in fact, raises various doubts and difficulties, and can scarcely be said to clear away any.

The existence of such laws as are defined may, according to Cumberland, be established in two ways. The inquirer may start either from effects or causes. The former method had been taken by Grotius, Sharrock, and Selden. They had sought to prove that there were universal truths, entitled to be called laws of nature, from the concurrence of the testimonies of many men, peoples, and ages regarding them, through collecting the opinions of persons widely removed in space and time from one another, and through generalizing the operations of certain active principles. Cumberland admits this method to be valid, but he prefers the other, that from causes to effects, as showing more convincingly that the laws of nature carry with them a divine obligation. It not only establishes laws of nature as universal, but as having been meant to be; it shows that man has been constituted as he is in order that they might be. In the prosecution of this method he expressly declines to have recourse to what he calls "the short and easy expedient of the Platonists," the assumption of innate ideas of the laws of nature. He has not, he says, been so happy as to learn the laws of nature by so simple a way. He thinks it ill-advised to build the doctrine of natural religion and morality on an hypothesis which many philosophers, both Gentile and Christian, had rejected, and which could not be proved against Epicureans, the principal impugners of the existence of laws of nature. He cannot assume, he says, without proof that such ideas existed from eternity in the divine mind, but must start from what sense and experience furnish, and thence by search into the nature of things discover what their laws are. It is only through nature that we can rise to nature's God. His attributes are not to be known by direct intuition. He did not think, then, that the ground taken up by More, Cudworth, and the other members of the Cambridge Platonic school was such as they could hold against an adversary like Hobbes or from which they could successfully assail him. His sympathies, however, were all on their side. He wished success to their efforts, and he would do nothing to diminish their chances of success. He would not even oppose the doctrine of innate ideas, because it looked with a friendly eye upon piety and morality. He granted that it might, perhaps, be the case that ideas were *both* born with us and afterwards impressed upon us from without.

All the laws of nature, Cumberland maintains, may be reduced to one,—the law of universal benevolence, of effort to promote the happiness of all rational agents. This, he thinks, is the root and source of the entire world of moral good. "No action can be called morally good which does not in its own nature contribute somewhat to the happiness of men." The theory of Cumberland implies as an antecedent the system of Hobbes. Had there not been a theory of selfishness, a doctrine which made self-love the universal principle of conduct, we should not have had the whole nature of virtue resolved into a principle of benevolence as it was by Cumberland. His opinion was evidently a reaction from the opposite. In his dislike of the selfish theory he was tempted to carry his refutation of it to the uttermost and maintain the negative in the directest terms of antithesis. There was no other so forcible mode of denying the obnoxious theory as by positively affirming and defending its contrary,—that no virtuous action whatever is self-regarding, or, in other words, that the only principle of right conduct is benevolence. The principle, therefore, which he lays down as fundamental is that to pursue to the utmost of our power the general good of the whole system of rational beings is to contribute to the utmost of our power to the good of each of its parts, our own individual happiness inclusive, and that to pursue an opposite end is to entail opposite results, and among others our own individual misery. It is just the opposite of the central idea of Hobbes. The happiness of the whole community, according to Hobbes, will be best promoted if each man looks to himself and attends to his own interests. The happiness of each individual, according to Cumberland, will be best promoted if each man begins by endeavouring to promote the happiness of the whole society. Both were right and both were wrong. Man is to a great extent ruled by selfishness; the uncivilized man almost wholly. In savages and in children selfishness is a decidedly stronger principle than benevolence. The human being is keenly susceptible to its own sensational pleasures and pains when almost incapable of entertaining any wide or elevated conceptions of general good. Benevolence as a steady and vigorous principle of action does not manifest itself early in the history either of the individual or of the race. Then, there is a good deal of sense and truth in saying, Let the individual take care of himself and the common good will be thereby best secured. It is far from certain that if every man were setting the common good before him as his direct and immediate object the great majority of them would not do more harm than good. If the selfishness of the ignorant be bad, there is danger of their benevolence being worse. On the other hand, Hobbes was wrong in affirming that man is governed solely by self-interest, and Cumberland was right in maintaining that disinterested benevolence is a principle of human nature. It exists from the first in the human constitution, although only in germ, and moral progress is marked throughout by its growth in strength. History shows us the obstacles interposed by the narrowness and darkness of the human understanding, the coldness and selfishness of the human heart, the jealousies of classes, and the antipathies of nations continuously, if slowly, yielding in favour of universal benevolence, benevolence to all rational and even sentient beings. Thus far the truth is with Cumberland. His error is when he asserts that benevolence is the sole principle of virtue. This clearly is an error, although it is one in which he was followed by Hutcheson and some other philosophers. Benevolence cannot be legitimately made to include love to God and the exercises of piety nor what have been called the personal virtues. It is only itself virtuous when brought under conformity to the moral law.

In attempting to prove that all the virtues are forms or varieties of benevolence Cumberland never appeals to history, although he believed that the law of universal benevolence had been accepted by all nations and generations; and he carefully abstains from arguments founded on revelation, feeling that it was indispensable to establish the principles of moral right on nature as a basis. There was another line of reasoning open to him, viz., deduction of the propriety of certain actions from the consideration of the character and position of rational agents in the universe; and this is that which he follows. He argues that all that we see in nature is framed so as to avoid and reject what is dangerous to the integrity of its constitution; that the human race would be an anomaly in the world had it not for end its conservation in its best estate; that benevolence of all to all is what in a rational view of the creation is alone accordant with its general plan; that various peculiarities of man's body indicate that he has been made to co-operate with his fellow men and to maintain society; and that certain faculties of his mind explicitly and positively show the common good to be more essentially connected with his perfection than any pursuit of private advantage. The whole course of his reasoning proceeds on, and is pervaded by, the principle of final causes.

To the question, What is the foundation of rectitude? he replies, the greatest good of the universe of rational beings. He may be regarded as the founder of the utilitarian school in England, which numbers a Hume, Bentham, the Mills, and Bain among its adherents. His utilitarianism is quite distinct from what is known as the selfish system; it errs by going to the contrary extreme, by almost absorbing individual good in universal good. Nor does it look merely to the lower pleasures, the pleasures of sense, for the constituents of good, but rises above them to include especially what tends to perfect, strengthen, and expand our true nature. Existence and the extension of our powers of body, thought, and feeling are held to be good for their own sakes without respect to enjoyment. Cumberland's views on this point were long abandoned by utilitarians as destroying the homogeneity and self-consistency of their theory; but J. S. Mill and some recent writers have reproduced them, without recognition of their paternity, as necessary to its defence against charges not less serious then even inconsistency.

The answer which Cumberland gives to the question, Whence comes our obligation to observe the laws of nature? is that happiness flows from obedience, and misery from disobedience to them, not as the mere results of a blind necessity, but as the expressions of the divine will—the reward attached by that will to obedience, and the punishment attached by it to disobedience. This reward and punishment, supplemented by future retribution, the happy immortality which awaits the good and the misery coming on the wicked, are, in his view, the sanctions of the laws of nature, the sources of our obligation to obey them. To the other great ethical question, How are moral distinctions apprehended? he replies that it is by means of reason, of right reason. But by right reason he means merely the power of rising to general laws of nature from particular facts of experience. It is no peculiar faculty or distinctive function of mind; it involves no original element of cognition; it begins with sense and experience; it is gradually generated and wholly derivative. This doctrine lies only in germ in Cumberland, but will be found in full flower in Hartley, Mackintosh, and later associationists. (R. F.)]

CUMBERLAND, RICHARD (1732–1811), a dramatic and miscellaneous writer, was born in the Master's Lodge of Trinity College, Cambridge, on the 19th of February

1732. He was the great-grandson of his namesake, the bishop of Peterborough; and his father, Dr Denison Cumberland, became successively bishop of Clonfert and of Kilmore. His mother was Joanna, the youngest daughter of the great Bentley, and the heroine of John Byrom's once popular little eclogue, *Colin and Phœbe.* Of the great Master of Trinity his grandson has left a kindly account; he afterwards collected all the pamphlets bearing on the *Letters of Phalaris* controversy, and piously defended the reputation of his ancestor in a *Letter* to Bishop Lowth, who had called him "aut caprimulgus aut fossor." Cumberland was in his seventh year sent to the grammar-school at Bury St Edmunds; and he relates how, on the head-master Arthur Kinsman undertaking, in conversation with Bentley, to make the grandson as good a scholar as the grandfather himself, the latter retorted: "Pshaw, Arthur, how can that be, when I have forgot more than thou ever knewest?" Bentley died during his grandson's Bury school-days; and in 1744 the boy, who, while rising to the head of his school, had already begun to "try his strength in several slight attempts towards the drama," was removed to Westminster, then at the height of its reputation under Dr Nicholls. Among his schoolfellows here were Warren Hastings, George Colman (the elder), Lloyd, and (though he does not mention them as such) Churchill and Cowper. From Westminster Cumberland passed, in his fourteenth year, to the familiar Trinity, where at first he was, according to custom, left to study on his own account. Afterwards, however, under the advice of the master, Dr Smith, he applied himself closely to mathematics, and in 1750 he took his degree as tenth wrangler. His account of his degree examination, as well as that for a fellowship at his college (part of which he underwent in the "judges' chamber," where he was born), is curious; he was (by virtue of an alteration in the statutes) elected to his fellowship in the second year of his degree.

Meanwhile his projects of work as a classical scholar had been interspersed with attempts at imitating Spenser—whom, by his mother's advice, he "laid upon the shelf"—and a dramatic effort (unprinted) on the model of Mason's *Elfrida*, called *Caractacus.* He had hardly abandoned these pursuits in order to read for his fellowship, when he was offered the post of private secretary by the earl of Halifax, First Lord of Trade and Plantations in the duke of Newcastle's ministry. His family persuaded him to accept the office, to which he returned after his election as fellow. It left him abundant leisure for literary pursuits, which included the design of a poem in blank verse on India. He was fortunate enough to obtain a lay fellowship at Trinity, but this he not long afterwards resigned on his marriage—in 1759—to Miss Elizabeth Ridge, to whom he had paid his addresses on receiving through Lord Halifax "a small establishment as crown-agent for Nova Scotia." In 1761 he accompanied his patron (who had been appointed lord-lieutenant) to Ireland as Ulster secretary; and in acknowledgment of his services was afterwards offered a baronetcy. By declining this he thinks he gave offence; at all events, when in 1762 Halifax became secretary of state, Cumberland in vain applied for the post of under-secretary, and could only obtain the clerkship of reports at the Board of Trade under Lord Hillsborough. While he takes some credit to himself for his incorruptibility when in Ireland, he showed zeal for his friends, and obtained a bishopric for his father. On the accession to office of Lord George Germaine (Sackville) in 1775, Cumberland was appointed secretary to the Board of Trade and Plantations, which post he held till the abolition of that board in 1782 by Burke's economical reform. Before this event he had, in 1780, been sent on a confidential mission to Spain, to negotiate a separate treaty of peace with that power; but though he was well received by King Charles III. and his minister Floridablanca, the question of Gibraltar proved a stumbling-block, and the Gordon riots at home a most untoward occurrence. He was recalled in 1781, and was refused repayment of the expenses he had incurred, and for which only £1000 had been advanced to him. He thus found himself £4500 out of pocket: in vain, he says, "I wearied the door of Lord North till his very servants drove me from it;" his memorial remained unread or unnoticed either by the prime minister or by secretary Robinson, through whom the original promise had been made. Soon after this experience he lost his office, and had to retire on a compensation allowance of less than half-pay. He now took up his residence at Tunbridge Wells; but during his last years he mostly lived in London, where he died May 7, 1811.

Cumberland's literary productions are spread over the whole of his long life; they are very numerous, but it is only by his contributions to the drama, and perhaps by his *Memoirs*, that he is likely to be remembered. In the latter, however, he dwells with more or less of paternal fondness on a great number of other productions. Among these should in the first instance be mentioned the collection of essays and other pieces entitled *The Observer* (2 vols., 1785; afterwards republished in 5 vols., and in 6, including a translation of *The Clouds* of Aristophanes). This collection found a place, as the author complacently points out, among *The British Essayists.* For the accounts given in *The Observer* of the Greek writers, especially the comic poets, Cumberland availed himself of Bentley's MSS. and annotated books in his possession; his translations from the Greek fragments, which are not inelegant but lack closeness, are republished in Bailey's *Comicorum Græcorum* (part i., 1840) and *Hermesianactis, Archilochi, et Pratinæ Fragmenta.* Cumberland also produced *Anecdotes of Eminent Painters in Spain* (2 vols., 1782); with a *Catalogue of the King of Spain's Paintings* (1787); two novels, *Arundel* (2 vols., 1789,—a story in letters "hastily put together during a few idle weeks at Brighthelmstone") and *Henry* (4 vols., 1795,—a "diluted comedy" on the construction and polishing of which he seems to have expended great care); and a religious epic, *Calvary, or the Death of Christ*, in 8 books (1792); and (as his last publication) a poem entitled *Retrospection.* He is also said to have been concerned in an epic, the *Exodiad* (with Sir James Bland Burges) and in *John de Lancaster*, a novel in 3 vols. Besides these he wrote the *Letter to the Bishop of O[xfor]d* in vindication of Bentley; another *to the Bishop of Llandaff* on his proposal for equalizing the revenues of the Established Church (1783); a *Character* of Lord Sackville, whom in his *Memoirs* he vindicates from the stigma of cowardice; and an anonymous pamphlet, *Curtius rescued from the Gulf*, against the redoubtable Dr Parr. He was also the author of a version of fifty of the Psalms of David; of a tract on the evidences of Christianity; and of other religious exercises in prose and verse, the former including "as many sermons as would make a large volume, some of which have been delivered from the pulpits.' Lastly, he edited a short-lived critical journal called *The London Review*, conducted on a principle to which Cumberland doubtless attached high importance,—that the articles should bear the names of the contributors.

Cumberland's *Memoirs*, which he begun at the close of 1804 and concluded in September 1805, were published in 1806, and a supplement was afterwards added. This sufficiently ample narrative of his public and private life (which includes a long account of his Spanish mission) contains some interesting reminiscences of several persons of note,—more especially Bubb Dodington, Single-Speech Hamilton, and Lord George Sackville among politicians, and of Garrick, Foote, and Goldsmith; but the accuracy of some of the anecdotes concerning the last-named is not beyond suspicion. In general the book exhibits its author as an amiable egotist, careful—though not arrogantly so—of his own reputation, given to prolixity, and little remarkable for wit, but a good observer of men and manners. The uneasy self-absorption which Sheridan immortalized in the character of Sir Fretful Plagiary in *The Critic* is apparent enough in this autobiography, but presents itself there in no offensive form. The comparative estimates of the author's own works and the development of their designs are harmless if uninteresting; the long quotations from unpublished or forgotten productions almost ask to be skipped; on the other hand the incidental criticisms of actors have been justly praised, for Cumberland was possessed of theatrical instinct, though not of dramatic genius. Lastly, his morality and piety are here at least free from affectation in their expression, though not less effusive than in his comedies themselves.

Cumberland was hardly warranted in the conjecture that no English author had yet equalled his list of dramas in point of number; but as the plays, published and unpublished, which he produced have been computed to amount to a number exceeding by four that of the sons of Priam, he must be allowed to have been fairly prolific as a dramatist. About 35 of these are regular plays, to which have to be added 4 operas and a farce; and about half of the whole list are comedies. Among these again the best-known, upon which the literary reputation of their author virtually rests, belong to what he was pleased to term "legitimate comedy," and to that species of it known as "sentimental." The two terms are in point of fact mutually contradictory; but this was precisely the proposition Cumberland was at so much pains to disprove, though his most successful works remain among the most striking illustrations of its truth. He asserted, with some show of reason, that in his sentimental comedy he was following in the footsteps of the new comedy of the Greeks; he was less willing to confess that he was in truth an imitator of native models; for he was by no means the creator in our dramatic literature of the species he so assiduously cultivated. The essential characteristic of these plays is the combination of plots of domestic interest with the rhetorical enforcement of moral precepts, and with such comic humour (and it is usually but little) as the author possesses. These comedies are primarily, to borrow Cumberland's own phraseology, designed as "attempts upon the heart;" and British hearts are "hearts that feel." He takes great credit to himself for weaving his plays out of "homely stuff, right British drugget," and for eschewing "the vile refuse of the Gallic stage;" on the other hand, he borrowed (often perhaps unconsciously) from the sentimental literature of his own country, including Richardson, Fielding, and Sterne. The favourite theme of his plays is virtue in distress or danger, but safe of its reward in the fifth act; their most constant characters are men of feeling and young ladies who (to quote a retort of Goldsmith upon the sentimental dramatists) are either prudes or coquettes. Cumberland's comic power—such as it was—lay in the invention of comic characters taken from the "outskirts of the empire," and professedly intended to vindicate from English prejudice the good elements in the Scotch, the Irish, and the colonial character. For the rest, patriotic sentiment (such as became one who in his old age was a major of volunteers) liberally asserts itself by the side of general morality. If Cumberland's dialogue never approaches the brilliancy of Sheridan's, and if his characters have about them that air of unreality which in his *Retaliation* Goldsmith satirized with so exquisite a grace, the construction of the plots is as a rule skilful, and the situations are contrived with what Cumberland indisputably possessed—a thorough insight into the secrets of theatrical effect. In this respect at all events he was the "Terence of England," that there is hardly one of his principal plays in which the audience is not allowed to enjoy that most thrilling of theatrical emotions which is produced by a meeting between parent and child after long years of separation or ignorance of one another's existence. It should be added that, though Cumberland's sentimentality is often wearisome, his morality is generally sound; that if he was without the genius requisite for elevating the national drama, he did his best to keep it pure and sweet; and that if he borrowed much, as he undoubtedly did, it was not the vicious attractions of other dramatists of which he was the plagiary.

After making his *début* as a dramatic author with a tragedy, *The Banishment of Cicero* (of which the plot, though inspired by Middleton, rather strikingly deviates from history), published in 1761 after its rejection by Garrick; and producing in 1765 a musical drama, *The Summer's Tale*, which was performed for a few nights and afterwards compressed into an afterpiece, *Amelia* (1768), Cumberland first essayed sentimental comedy in *The Brothers* (1769). This comedy has more vigour than some of its author's later works; its theme is inspired by *Tom Jones;* its comic characters are the jolly old tar Captain Ironsides, and the henpecked husband Sir Benjamin Dove, whose progress to self-assertion is perhaps as genuinely comic a notion as Cumberland ever executed, though, as he confesses, not altogether an original one. The epilogue paid a compliment to Garrick, who accordingly interested himself in the production of Cumberland's second and by far most successful comedy, *The West-Indian* (1771). The hero of this comedy is a young scapegrace fresh from the tropics, "with rum and sugar enough belonging to him to make all the water in the Thames into punch,"—a libertine with generous instincts, which in the end prevail. The chief comic character is Major O'Flaherty, an honest Irish adventurer, in whom Cumberland took no little pride, but who is in truth neither particularly Irish nor particularly humorous. This comedy was received with the utmost favour; it was afterwards translated into German by Boden, and Goethe acted in it at the Weimar court. The next play of some importance was *The Fashionable Lover* (1772), a sentimental comedy of the most pronounced type, with an ill-used heroine and a man of feeling exhibiting the very prurience of sentimentality; "who dreams," he exclaims, "that I am the lewd fool of pity, and thou my pandar, Jarvis, my provider?" The comic characters are an honest Scotch steward, whose Scotch is if anything more doubtful than O'Flaherty's Irish, and an antiquarian Welsh tutor Doctor Druid, less creditable to the "outskirt of the empire" represented by him. *The Choleric Man* (1775), founded on the *Adelphi* of Terence, but not, as the author in his long "dedication" protests, on Shadwell's *Squire of Alsatia*, is of a similar type, the comic element rather predominating, but philanthropy being duly represented by a virtuous lawyer called Manlove. Among subsequent comedies may be mentioned *The Natural Son* (1785), in which Major O'Flaherty, now divested of all humour, makes his reappearance; *The Impostors* (1789), a comedy of intrigue noteworthy for the absence of sentiment, but marred in one of the scenes by an indelicacy of feeling which is unlike Cumberland,—the heroine, "a pleasant child of nature," must have admirably suited Mrs Jordan; *The Box Lobby Challenge* (1794), a mere protracted farce, where there is likewise no sentiment, except in Lindamira's novel; *The Jew* (1794), an essentially serious play creditable to Cumberland's good feeling, and highly effective when the character of Sheva is played as it was by the great German actor Döring; *The Wheel of For-*

tune (1795), which has a vague resemblance to Kotzebue's *Stranger* (not produced on the English stage till 1798), and in which the character of the misanthropist Penruddock, who cannot forget but learns to forgive, was a celebrated part of John Kemble, while the lawyer Timothy Weasel was made comic by Suett; *First Love* (1795); *The Last of the Family* (1795); *False Impressions* (1797), in which, as the hero instead of the heroine is the injured innocent, the sentimentality is less formidable,—the diction of the apothecary Scud will startle readers of Dickens by its striking resemblance to that of Mr Alfred Jingle; *The Sailor's Daughter* (1804); and a *Hint to Husbands* (1806), which, unlike the rest, is in blank verse. These appear to be all the comedies by Cumberland printed in his lifetime, during which were also published his farce of *The Note of Hand* (1774); the songs of his musical comedy, *The Widow of Delphi* (1780); his tragedies of *The Battle of Hastings* (1778); and *The Carmelite* (1784), a romantic domestic drama in blank verse, in the style of Home's *Douglas*, furnishing some effective scenes for Mrs Siddons and John Kemble as mother and son, but ill-constructed, inasmuch as the hero reveals himself several times in succession; the domestic drama (in prose) of *The Mysterious Husband* (1783), in which the chief character, the bigamist Lord Davenant, is, for so incredible a scoundrel, prematurely remorseful, and is ultimately got rid of by suicide, but the intricate plot is cleverly contrived; and some minor pieces.

His posthumously printed plays include the comedies of *The Walloons* (acted 1782—Henderson, who afterwards performed Lord Davenant, achieving a great success as the villainous father Sullivan); *The Passive Husband* (acted as *A Word for Nature*, 1798); *The Eccentric Lover* (acted 1798); and *Lovers' Resolutions* (once acted in 1802); the serious quasi-historic drama *Confession*; the drama *Don Pedro* (acted 1796); and the tragedies of *Alcanor* (acted as *The Arab*, 1785); *Torrendal*; *The Sibyl, or The Elder Brutus* (afterwards amalgamated with other plays on the subject into a very successful tragedy for Edmund Kean by Payne); *Tiberius in Capreæ*; and *The False Demetrius*, the last on a theme already treated by an earlier English dramatist, and destined to be the last which occupied the genius of Schiller. Beside these and other dramatic productions of more or less originality, Cumberland, as already stated, translated the *Clouds* of Aristophanes (1797), and altered for the stage Shakespeare's *Timon of Athens* (1771), "engrafting on the original the part of Evanthe for the purpose of writing up the character of Alcibiades," and inserting other "new matter," of which he has preserved a specimen in his *Memoirs*, as well as Massinger's *The Bondman* and *The Duke of Milan* (both 1779). (A. W. W.)

CUMBERLAND, William Augustus, Duke of, son of George II. and Queen Caroline, was born on the 15th of April 1721. When five years of age he was created duke of Cumberland; and when still very young he gave interesting amusement to his grandfather and the London public by the ability with which he drilled and manœuvred a company of boy soldiers under his own charge. His education was well attended to, and his courage and capacity in outdoor exercises were notable from his early years. In 1740 he sailed as a volunteer in the fleet under the command of Sir John Norris; but he quickly became dissatisfied with the navy, and early in 1742 he began the military career in which he was destined to play so prominent a part.

The importance for England of the European struggle which began with the death of Charles VI. was that France had declared against the young Hungarian queen. The war on the part of Britain was begun by a force of over 16,000 men being despatched to Flanders under the command of the earl of Stair. The English troops were reinforced by Hessians and Hanoverians in British pay, and in 1743 George II. and the "martial boy" shared in the glory of Dettingen (27th June). The duke of Cumberland, who led the left of the victorious army, and was wounded in action, displayed an energy and valour on the report of which in England that tide of his popularity began to flow which was in flood at Culloden, and which steadily ebbed thereafter till his death.

In 1745 the duke was again in Flanders, and on this occasion he was in full command, having under him British, Hanoverian, Austrian, and Dutch troops to the number of 50,000. Advancing to the relief of Tournay, which was besieged by Marshal Saxe, he engaged the greatest general of the age at Fontenoy on the 11th of May. It cannot now be doubted that, had the duke been supported by the allies in his marvellously courageous attack on the superior positions of the French army, Fontenoy would not have been recorded as a defeat to the British arms. Three times renewing his attack in spite of repulse, he was at last forced to yield, which he did by effecting a dogged and masterly retreat.

Notwithstanding a severity of discipline which would astonish soldiers of the present day, the young duke had the power to inspire his men with a strong attachment to his person and a very lively *esprit de corps*. As a general his courage and resolution were not sufficiently tempered with sagacity and tact; but he displayed an energy and power in military affairs which pointed him out to the British people as the one commander upon whom they could rely to put a decisive stop to the marvellous successes of Prince Charles Edward in the rebellion of 1745–46.

He was accordingly recalled from Flanders, and immedidately proceeded with his preparations for quelling the insurrection. He joined the midland army under Sir John Ligonier, and was at once in pursuit of his swift-footed foe. But the retreat of Charles Edward from Derby disconcerted his plans; and it was not till they had reached Penrith, and the advanced portion of his army had been repulsed by Lord George Murray on Clifton Moor, that he became aware how hopeless an attempt to overtake the retreating Highlanders would then be. Carlisle having been retaken, he retired to London, till the news of the defeat of Hawley at Falkirk roused again the fears of the English people, and centred the hopes of Britain on the royal duke. He was appointed commander of the forces in Scotland.

Having arrived in Edinburgh on the 30th of January 1746, he at once proceeded in search of the young Pretender. (See Charles Edward.) He diverged, however, to Aberdeen, where he usefully and energetically employed his time in training the well-equipped forces now under his command for the peculiar nature of the warfare in which they were about to engage. What the old and experienced generals of his time had failed to accomplish or even to understand, the young duke of Cumberland, as yet only twenty-four years of age, effected with simplicity and ease. He prepared to dispose his army so as to withstand with firmness that onslaught on which all Highland successes depended; and he inspired his men with courage by directing each, on the fierce assault being made, to transfix with his bayonet not his immediate opponent but the kilted warrior on his right.

On 8th April 1746 he set out from Aberdeen on that expedition so fruitful in disaster to his enemies, and so fatal to the last hopes of Jacobitism. To his astonishment he was not opposed on the Spey. To his great advantage the attempt of Lord George Murray to surprise his troops as they lay encamped near Nairn proved worse than futile to the exhausted and starving foe, whom on the morrow he engaged and defeated at Culloden. This battle, fought on the 15th of April, resulted in the total overthrow of the Highland army. It is vain to deny that the men wounded in battle were deliberately despatched by orders of the duke, and that his hard and unsparing nature, coupled with his firm and unfeeling resolve to treat the vanquished merely as rebels, induced him to deny to those whom he had conquered the privileges of war or their rights as fellow-countrymen. His excesses have been over-estimated, but it cannot be gainsaid that they were unconstitutional and most cruel. The relief occasioned to Britain by the duke's victorious efforts was acknowledged by his being voted an income of £40,000 per annum in addition to his revenue as a prince of the royal house.

Henceforth, however, the career of Cumberland was to be one of signal defeat. In 1747 he was again on the Continent opposing the still victorious Marshal Saxe; and at Lauffeld, near Maestricht, the Dutch, Austrian, and English allies under the joint command of the duke and his brother-in-law Prince William of Nassau received a notable defeat. Ten years afterwards Cumberland soured his popularity both as a soldier and a statesman by the affair of Closterseven. When Frederick the Great was suffering the terrible defeats of Prague and Kolin, at the hands of the Austrians, the duke of Cumberland was attempting to defend Hanover at the head of a motley army, raised chiefly in Brunswick, Prussia, and the Electorate. But it was quite in vain; and at Hastenbeck, near Hameln, on the 26th of July 1757, he was defeated by the superior forces of D'Estrees. In September of the same year his defeat had almost become disgrace. Driven from point to point, and at last hemmed in by the French under Richelieu, he capitulated at Closterseven on the 8th of the month, abjectly agreeing to disband his army and to evacuate Hanover, which he had undertaken to defend. His disgrace was completed on his return to England by the king's refusal to be bound by the terms of the duke's agreement. In chagrin and disappointment he retired into private life, after having formally resigned the public offices he held.

It was not till shortly before his death that he again appeared on the stage of public affairs. In 1765, when the debates on the regency bill were agitating the people of England, George III., dissatisfied with Grenville and his ministry, applied to his royal uncle the duke of Cumberland, who was now in failing health, to open negotiations with Pitt for a return to power. On Pitt's declinature, and symptoms of violence becoming evident among the populace, Cumberland again attempted to extricate the king from his unfortunate position by a second negotiation with the great and popular statesman. This too was, however, unsuccessful. On 31st October 1765 the duke died. His statue stands in Cavendish Square.

See, in addition to the histories of the time and the literature of the Rebellion, *Historical Memoirs of the Duke of Cumberland; A Journey through part of England and Scotland along with the Army under the command of H.R.H. the Duke of Cumberland;* and especially *William Augustus Duke of Cumberland*, by A. N. Campbell-Maclachlan, 1876. (T. S.)

CUMBRAE ISLANDS. See Bute.

CUMIN, or Cummin (*Cuminum Cyminum*), is an annual, umbelliferous, herbaceous plant, indigenous to Upper Egypt, but early cultivated in Arabia, India, and China, and in the countries bordering the Mediterranean. Its stem is slender and branching, and about a foot in height; the leaves are multifid, with filiform segments; the flowers are small and white. The fruits or achenes, the so-called seeds, which constitute the cumin of pharmacy, are fusiform or ovoid in shape, and compressed laterally; they are two lines long, are hotter to the taste, lighter in colour, and larger than caraway seeds, and have on each half nine fine ridges, overlying as many oil-channels or vittæ. Their strong aromatic smell and warm bitterish taste are due to the presence of about three per cent. of an essential oil. The tissue of the seeds contains a fatty oil, with resin, mucilage and gum, malates, and albuminous matter; and in the pericarp there is much tannin. The volatile oil of cumin, which may be separated by distillation of the seed with water, is mainly a mixture of cymol or cymene, $C_{10}H_{14}$, and cuminic aldehyde, $C_6H_4(C_3H_7)COH$. Cumin is mentioned in Isaiah xxviii. 25, 27, and Matthew xxiii. 23, and in the works of Hippocrates and Dioscorides. From Pliny we learn that the ancients took the ground seed medicinally with bread, water, or wine, and that it was accounted the best of condiments as a remedy for squeamishness. It was found to occasion pallor of the face, whence the expression of Horace, *exsangue cuminum* (*Epist.* i. 19), and that of Persius, *pallentis grana cumini* (*Sat.* v. 55). Pliny relates the story that it was employed by the followers of Porcius Latro, the celebrated rhetorician, in order to produce a complexion such as bespeaks application to study (xx. 57). In the Middle Ages cumin was one of the commonest spices of European growth. Its average price per pound in England in the 13th and 14th centuries was 2d., or, at present value, about 1s. 4d. (Rogers, *Hist. of Agric. and Prices*, i. 631). It is stimulant and carminative, and is employed in the manufacture of curry powder. The medicinal use of the drug is now almost confined to veterinary practice. Cumin is exported from India, Mogador, Malta, and Sicily.

CUMMING, Roualeyn Gordon, Scottish traveller and sportsman, generally known as "the Lion Hunter," was born March 15, 1820. He was the second son of Sir William G. Gordon Cumming, baronet, of Altyre and Gordonstown, North Britain. In his early years a strong love for nature in her wildest forms and a passion for sport displayed themselves in him, at once foreshadowing and determining his future career. He was educated at Eton, and at the age of eighteen passed the examination at Addiscombe and entered the Indian army (Madras Light Cavalry). In consequence of the injurious effects of the climate on his health he did not remain long in India, but retired from the service and returned to Scotland. During his stay, however, he had laid the foundation of his large and interesting collection of hunting trophies and specimens of natural history. After indulging for a time in his favourite pursuits in his native land, he resolved to visit the prairies and mountain solitudes of the Far West. This project, however, was relinquished in favour of a visit to South Africa. He joined the Cape Riflemen, and in 1843 began his five years' hunter's life, the story of which is told in his well-known work, published in 1850. He did not remain long in the army; but for the sake of absolute freedom sold out and set forth to explore the unknown regions of interior Africa. His waggon was his only home; and even this he often quitted for the sake of bolder ventures either alone or attended only by savages. His collection, the South African Museum, was exhibited in London in 1851, at the time of the Great Exhibition, and was illustrated by a lecture delivered by the famous hunter himself. The museum was afterwards exhibited in various parts of the country. During the last eight years of his life he resided at Fort Augustus, where his collection attracted many visitors. He died there, March 24, 1866.

CUNARD, Sir Samuel (1787–1865), baronet, civil engineer, founder of the Cunard line of Atlantic steam-ships, was born at Halifax, Nova Scotia, in 1787. He was the son of a merchant, and was himself trained for the pursuits of commerce, in which, by his abilities and enterprizing spirit, he attained a conspicuous position. When, in the early years of steam navigation, the English Government made known its desire to substitute steam vessels for the sailing ships then employed in the mail service between

England and America, Cunard heartily entered into the scheme, came to England, and accepted the Government tender for carrying it out. A company was formed, the members of which were Cunard, Messrs Burns of Glasgow, and Messrs MacIver of Liverpool, these two firms being then proprietors of rival lines of coasting steamers between Glasgow and Liverpool. For the first contract with the Government four steam-vessels were built, and the first voyage was successfully made by the "Britannia" from Liverpool to Boston, U.S., between July 4 and 19, 1840. Such was the small beginning of an undertaking which in the course of thirty-seven years has grown into one of the vastest of private enterprizes, and may even rank in importance, as to the extent of interests involved in it, and the number of hands employed, with railway and other public companies. In 1852 the company began to substitute iron screw steamers for the wooden vessels with paddle-wheels in use up to that time. The Cunard fleet has always borne the highest character for the build, manning, management, and provisioning of the ships; and the reward of the scrupulous care exercised has been a rare immunity from what are called "casualties." In acknowledgment of his energetic and successful services Cunard was, in 1859, created a baronet. He died in London, April 28, 1865.

CUNEIFORM WRITING. The cuneiform or "wedge-shaped" system of writing takes its name from the wedge-like form of its characters, which were once extensively used over Western Asia. It has sometimes been called "arrow-headed" from the supposed resemblance of the several strokes which compose a character to the head of an arrow. The characters were originally hieroglyphics, each denoting an object or idea, and, like the Chinese, were gradually corrupted into the forms we see on the Assyrian monuments. They were invented by the primitive Accadian population of Chaldea, who spoke an agglutinative language, and were borrowed from them by their Semitic conquerors, the Babylonians and Assyrians. The characters had come to be used phonetically as well as ideographically even in Accadian times; but they were not redacted into a systematic syllabary until the Semites changed the Accadian words they represented into as many phonetic values. The abundance of clay in Babylonia caused this material to be largely employed for writing purposes, and the impress of the metal style upon it gave the characters their wedge-like appearance. The Semites carried the new syllabary with them into Assyria, and, as in Babylonia, continued to employ it both as a syllabary and as a collection of ideographs; that is to say, a character might not only denote a mere unmeaning syllable, but an idea as well. As each character had answered to several different Accadian words, the Assyrian syllabary by changing these words into phonetic values became necessarily polyphonous. In the 9th century B.C. the Alarodian tribes of Armenia borrowed a selected number of characters and ideographs from the Assyrian syllabary, giving to each character one value only. At a subsequent date the "Turanian" population of Media and northern Susiania did the same, producing the syllabary of the Protomedic transcripts which accompany the Persian and Babylonian inscriptions of the Achæmenian kings. The Persian cuneiform alphabet of 40 characters was itself taken from the same source under the reign of Darius; the meaning of each character, when used as an ideograph, being expressed in Persian, and the initial letter of the Persian word being then assigned to it as a value. The cuneiform system of writing had been in use in southern Susiania in very early times, and accordingly the forms of the characters employed there agree with those found in the oldest Chaldean inscriptions. Indeed it is probable that it was invented by the Accadians before they had descended into Babylonia from the mountains of Elam, about 3000 B.C. As employed in Babylonia and Assyria, the cuneiform writing tended to become more and more simplified, unnecessary wedges being discarded, and we may therefore divide it into Archaic, Hieratic, Assyrian, and Later Babylonian. See INSCRIPTIONS.

CUNITZ, MARIA, a celebrated astronomer, born about the beginning of the 17th century, was the eldest daughter of a doctor of medicine in Silesia, and the wife of a Dutch physician, Elias de Loewen, whom she married in 1630. She is said to have understood Polish, German, French, Italian, Latin, Greek, and Hebrew, and to have had an extraordinary general culture, but her principal study was mathematics and astronomy. Her tables, published under the title *Urania Propitia, sive Tabulæ Astronomicæ*, which gained for her a great reputation, were composed in a Polish convent, where, with her husband, she had taken refuge at the outbreak of the Thirty Years' War. They were printed in Latin and German (Oels, 1650, and Frankfort, 1651), and dedicated to the Emperor Ferdinand III.

CUNNINGHAM, ALLAN (1784-1842), a Scottish poet and prose writer, was born at Blackwood, in Dumfriesshire, and began life as a stone mason's apprentice. He commenced literary work as collector of ballads for Cromek's *Remains of Nithsdale and Galloway Song;* but, instead of collecting ballads, he sent in poems of his own, which the editor inserted without suspicion. In 1810 he repaired to London, where he supported himself partly by working in the studio of Bubb the statuary, and partly as a newspaper reporter, till 1814, when he obtained the situation of clerk of the works in the studio of Francis Chantrey, in which he continued till the sculptor's death in 1841. He meanwhile continued to be busily engaged in literary work. Cunningham's prose is often spoiled by its misplaced and too ambitious rhetoric; his verse also is often over-ornate; and both are full of mannerisms. Some of his songs, however, from their brightness, vigour, and warmth of feeling, hold a high place in our lyrical literature.

His chief works are *Lives of the Most Eminent British Painters, Sculptors, and Architects* (1829-1833), *Sir Marmaduke Maxwell*, a dramatic poem, *Traditionary Tales of the Peasantry*, several novels (*Paul Jones, Sir Michael Scott, Lord Roldan*), the *Maid of Elwar*, a sort of epic romance, the *Songs of Scotland* (1825), *Biographical and Critical History of the Literature of the Last Fifty Years* (1833), an edition of *The Works of Robert Burns*, with notes and a life containing a good deal of new material (1834), *Biographical and Critical Dissertations* affixed to Major's *Cabinet Gallery of Pictures*, and *Life, Journals, and Correspondence of Sir David Wilkie*, finished two days before his own decease, and published in 1843. An edition of his *Poems and Songs* was issued by his son, Peter Cunningham, in 1847.

CUNNINGHAM, PETER (1816-1869), topographical and antiquarian litterateur, was born in London, April 7, 1816. He was the son of the Scottish poet Allan Cunningham, and was educated at Christ's Hospital. He led a singularly uneventful life; for at the age of eighteen he was appointed by Sir Robert Peel, in recognition of his father's genius and reputation, to a junior clerkship in the audit office, and after twenty years' faithful and efficient service he was promoted to a chief clerkship. This post he filled till 1860, when he retired from the public service. His literary career began before his official, and his first published work was *The Life of Drummond of Hawthornden, with large selections from his poetical works.* This volume appeared in 1833. His most important topographical work is the *Handbook of London*, the first edition of which was published in 2 vols. in 1849, and the second in 1 vol. in 1850. It bears a high character for fulness and accuracy of information, and is made particularly attractive by the intermingling of authentic anecdote and incident with the necessary details of names and dates. Among Cunningham's other publications are,—*Songs of England*

and Scotland (1835), *Handbook of Westminster Abbey* (1842), a *Life of Inigo Jones* for the old Shakespeare Society (1848), *Modern London* (1851), *The Story of Nell Gwynn* (1852), and a "Memoir of J. M. W. Turner," prefixed to Burnett's *Turner and his Works* (1852). In 1854 he edited, for Mr Murray's "Library of British Classics," the works of Oliver Goldsmith and Johnson's *Lives of the Poets*, with additional lives. He was a contributor to the *Athenæum*, *The Illustrated London News*, *Fraser's Magazine*, and other periodicals. He was also engaged as collaborateur with Croker on a new edition of Pope's works. He died at St Alban's, May 18, 1869.

CUNNINGHAM, WILLIAM (1805-1861), a Scottish theologian and ecclesiastic, was born at Hamilton, in Lanarkshire, on the 2d October 1805. After the usual course of study at the university of Edinburgh, in which he acquitted himself with distinction, he was licensed to preach in 1828. Two years afterwards he was ordained to a collegiate charge in Greenock, where he remained for three years, refusing during that time a presentation offered him to a parish in Glasgow. In 1834 he was transferred to the charge of Trinity College parish, Edinburgh. His removal thus coincided with the commencement of the period known in Scottish ecclesiastical history as the Ten Years' Conflict, in which he was destined to take a leading share. In the stormy discussions and controversies which preceded the Disruption the weight and force of his intellect, the keenness of his logic, and his firm grasp of principle made him one of the most powerful advocates of the cause of spiritual independence; and he has been generally recognized as one of three to whom mainly the existence of the Free Church is due, the others being Chalmers and Candlish. On the formation of the Free Church in 1843 Cunningham was appointed professor of church history and divinity in the New College, Edinburgh, of which he became principal in 1847 in succession to Chalmers. His career as a professor was very successful, his controversial sympathies combined with his evident desire to be rigidly impartial qualifying him to be an interesting delineator of the more stirring periods of church history, and a skilful disentangler of the knotty points in theological polemics. His logical faculty and his total lack of imagination perhaps made him too ready to seek to compress all spiritual truth within the rigid limits of intellectual forms. These qualities are reflected in two able works published posthumously in 1862, his *Historic Theology in the Christian Church* and his *Reformers and the Theology of the Reformation.* In 1859 the church marked its sense of obligation to him by appointing him moderator of the General Assembly. He had received the decree of D.D. from the university of Princeton in 1842. He died on the 14th December 1861. Though impulsive and unsparing and sometimes apparently a little unscrupulous in debate, Cunningham was like many great controversialists of his class distinguished for the amiability, simplicity, and integrity of his character. His intellectual rigidity was balanced by a considerable breadth of sympathy, as is evidenced by the fact that he was one of the founders of the Evangelical Alliance. A *Life of Cunningham* by Rainy and Mackenzie appeared in 1871. A theological lectureship at the New College, Edinburgh, was endowed in 1862, to be known as the Cunningham lectureship.

CUPAR-FIFE, so called to distinguish it from Coupar-Angus in Perthshire, is a royal and parliamentary burgh of Scotland, and the principal town of the county of Fife. It stands on the left bank of the Eden, in the centre of the Howe or Hollow of Fifeshire, about 6 miles from the sea, and is about 32 miles distant by railway and ferry from Edinburgh. The town-hall, the county hall, and the corn-exchange are the chief public buildings, and the principal educational establishment is the Madras Academy, originally founded in 1823 by a joint-stock company, but extended and modified in keeping with the will of Dr Bell, the well-known originator of the "Madras System," who left it a valuable endowment. The staple trade of Cupar has long been the manufacture of linen; and it also possesses breweries, corn-mills, and tan-yards. There are several collieries in the neighbourhood; and a stone quarry and a considerable pottery exist at Cupar Muir, about a mile and a half to the west of the town. The parliamentary burgh is a member of the St Andrews district; its population in 1871 was 5105. Cupar received its municipal freedom about 1356 by charter from David II. It was early remarkable for its castle, which occupied the height to the east of the town now crowned by the academy buildings, and was one of the principal strongholds of the Macduffs, the earls or thanes of Fife. Being situated between Falkland and St Andrews, the town was frequently visited by the Scottish kings; and in 1583 it was for a time the residence of the court of James VI. The estate of Sir David Lindsay of the Mount was within three miles of Cupar; and on a green esplanade in front of Macduff Castle, still called the Play-field, the satirical drama of the *Three Estates* and the *Tragedy of the Cardinal* were first performed. From the press of Mr Tullis in Cupar there appeared about the beginning of the present century editions of Virgil, Horace, and other classical authors, by Dr Hunter of St Andrews, which obtained high reputation for their accurate typography. The Scotch proverb, "They that will to Cupar maun to Cupar," owes its origin to the fact that Cupar was the seat of a court of justice, and refers originally to the obstinacy of persons determined to appeal to the law.

CUPID (AMOR, Ἔρως), in classical mythology, was the god, first, of the principle of love as it was seen to exist throughout nature, and, secondly, of love as a human passion. In the former and earlier phase of his character, he resembled Hermes, and like him was probably a deity of the primitive Pelasgians, since the worship of him at Parion on the Hellespont was connected with the Pelasgic religion of Samothrace, one of the deities of which is named Ἀξί-ερος. The same primitive character appears at Thespiæ, where the symbol of his worship was an unhewn stone (ἀργὸς λίθος). He was the oldest of the gods, being the son of Chaos, or of night and day, or of heaven and earth, with a variety of other poetic parentages. But as god of human love he was the son and constant companion of Aphrodite (Venus); yet even in this respect his earlier character is partly visible, since she was goddess of spring-time, and brought him up in the fields till spring burst from the beautiful island of Cyprus, and spread fertility over the earth. In his ethical capacity he was regarded as the most recent of the gods, and was represented as a beautiful winged youth with bow and arrows or with a torch. The fact of his having wings would preclude him from being classed with the great deities. But as messenger of Venus he would have the same right to them that Iris derived from her office as messenger of the gods. At Thespiæ gymnastic and musical contests (Erotidia) were held in his honour every four years; and generally in Greece his statue was to be found beside those of Hermes and Hercules in the palæstra. The statue of Cupid by Praxiteles at Thespiæ was greatly celebrated. The Spartans and Cretans sacrificed to him before battle. In later works of arts Cupid assumed simultaneously a number of forms (Ἔρωτες), each identical with the other, as if to indicate his presence at many points at once. We have also Eros and Anteros, or love and its opposite. The story of Cupid and Psyche, as given by Apuleius and as illustrated in later art, is a figurative explanation of the course of human love. The great beauty of Psyche, a king's daughter, excites the jealousy of Venus, who sends Cupid to her to inspire her with love for some ordinary person. But he is caught by her charms and lives with her happily in a fairy palace, she being under a vow not to look on him with her mortal eyes. Taunted for this by her sisters she breaks the vow and Cupid vanishes. Venus now imposes on her many sore troubles. At last she must fetch a box for her from Hades, which curiosity makes her open on the way, and the scent escaping from it overpowers her. Cupid comes to her aid, implores Jupiter in her behalf, and with his consent she is removed to Olympus, where she lives for ever with Cupid.

CUPPING. The operation of cupping is one of the methods adopted by surgeons to draw blood from an inflamed part in order to relieve the inflammation. The apparatus required is a spirit lamp and a glass cup with a rounded edge. The skin is washed and dried; the air is rarefied in the cup by the flame of the lamp; the cup is then firmly applied to the skin. A partial vacuum forms within the cup as the air cools, and the blood rushes from the neighbouring parts to the skin under the cup Either the blood is drawn from the patient's body through a number of small wounds which are made in the skin, with a special instrument, before the cup is applied; or the cup is simply applied to the unbroken skin and the blood drawn into the subcutaneous tissue within the circumference of the cup. The result of both methods is the same,—namely, a withdrawal of blood locally from the inflamed part. The former is called moist cupping, the latter dry cupping. Moist cupping is inapplicable on exposed surface, as the mark of the small skin wounds is indelible.

CURAÇOA, or CURAÇAO, an island in the Caribbean Sea, lying off the north coast of Venezuela, in 12° N. lat., 69° W. long. It is 40 miles in length from N.W. to S.E., and 10 in average breadth; the area is 212 square miles. The island is hilly and deficient in water, being wholly dependent upon the rains; yet, owing to the industry of the Dutch planters, considerable quantities of sugar, cotton, indigo, tobacco, and maize are raised. A peculiar variety of orange, the *Citrus Aurantium curassuviensis*, grows abundantly, and furnishes the distinguishing ingredient in the liqueur which takes its name from the island. The principal export is salt. The shores, which are bold, are in some places deeply indented, and present several harbours, the chief of which is Santa Anna, on the south-west side of the island. The entrance to this, which is narrow, is protected by Fort Amsterdam and other batteries; but the harbour itself is large and secure, and is the port of the chief town Curaçoa, or Willemstad. The population in 1875 amounted to 23,972, about one-third being emancipated negroes. All belonged to the Roman Catholic Church, except about 2000 Protestants and 1000 Jews. The island was settled by the Spaniards about 1527, and was captured by the Dutch in 1634. It was taken by the English in 1798 and again in 1806, but was restored in 1814 to the Dutch, in whose possession it has since remained.

CURASSOW (*Cracinæ*), a group of gallinaceous birds forming one of the sub-families of *Cracidæ*, the species of which are among the largest and most splendid of the game birds of South America, where they may be said to represent the pheasants and grouse of the Old World. They are large, heavy birds, many of them rivalling the turkey in size, with short wings, long and broad tail, and strong bill. In common with the family to which they belong, they have the hind toe of the foot placed on a level with the others, thus resembling the pigeons, and unlike the majority of gallinaceous birds. With the exception of a single species found north of Panama, the curassows are confined to the tropical forests of South America, east of the Andes, and not extending south of Paraguay. They live in small flocks, and are arboreal in their habits, only occasionally descending to the ground, while always roosting and building their nests on the branches of trees. Their nests are neat structures, made of slender branches interlaced with stems of grass, and lined internally with leaves. They feed on fruits, seeds, and insects. They are said to be domesticated in several parts of South America, and Bates states that when journeying up the Amazon he was amused "at the excessive and almost absurd tameness of a fine curassow turkey (*Mitua tuberosa*)," which ran about one of the planter's houses in which he happened to stay. Large numbers of these birds were, according to Temminck, brought to Holland from Dutch Guiana towards the end of last century, and got so completely acclimatized and domesticated as to breed in confinement like ordinary poultry; but the establishments in which these were kept were broken up during the troubles that followed on the French Revolution. Their flesh is said to be exceedingly white and delicate, and this, together with their size and the beauty of their plumage, would make the curassows an important gain to the poultry yards of Europe, should they yet be successfully reared. The sub-family of curassows contains four genera and twelve species, all confined to South America, with the exception of *Crax globicera*—Central American species, which extends northward into Mexico. This bird is about 3 feet in length, of a glossy black colour, with green and purple reflections over the whole body, excepting the abdomen and tail coverts, which are white. In common with the other species of this genus its head bears a crest of feathers curled forward at the tips, which can be raised or depressed at will. The female is of a reddish colour, although varying greatly in this respect, and was until lately described as a separate species—the Red Curassow. In another species, *Crax incommoda*, the greater part of the black plumage is beautifully varied with narrow transverse bars of white. The Galeated Curassow (*Pauxi galeata*) is peculiar in having a large blue tubercle, hard and stony externally, but cellular within, and resembling a hen's egg in size and shape, situated at the base of the bill. It only appears after the first moulting, and is much larger in the male than in the female.

CURATE (from the Latin *curare*, to take care of), properly a presbyter who has the cure of souls within a parish, being the Latin equivalent of the Greek *parochus*. The term curate is used in this general sense in certain rubrics of the Anglican Prayer Book, in which it is applied equally to rectors and vicars as to perpetual curates. In a more limited sense it is applied in the Church of England to the incumbent of a parish who has no endowment of tithes, as distinguished from a perpetual vicar, who has an endowment of small tithes, which are for that reason sometimes styled vicarial tithes. The origin of such unendowed curacies is traceable to the fact that benefices were sometimes granted to religious houses *pleno jure*, and with liberty for them to provide for the cure; and when such appropriations were transferred to lay persons, being unable to serve themselves, the appropriators were required to nominate a clerk in full orders to the ordinary for his licence to serve the cure. Such curates, being not removable at the pleasure of the appropriators, but only on due revocation of the licence of the ordinary, came to be entitled perpetual curates. The term "curate" in the present day is almost exclusively used to signify a clerk who is assistant to an incumbent; and a clerk in deacon's orders is competent to be licensed by a bishop to the office of such assistant curate. The consequence of this misuse of the term "curate" has been that the title of "perpetual curate" has fallen into desuetude in the Anglican Church, some inconvenience being found to result from the indiscriminate application of the term "curate," in the case of perpetual curacies, both to the incumbent of the parish and to his assistant curate, and an Act of Parliament (31 and 32 Vict. c. 117) has accordingly been passed to authorize such incumbents to style themselves vicars. The Act provides as follows:—

"The incumbent of the church of every parish or new parish for ecclesiastical purposes, not being a rector, who is or shall be authorized to publish banns of matrimony in such church, and to solemnize therein marriages, churchings, and baptisms, according to the laws and canons in force in this realm, and who is or shall be entitled to take, receive, and hold for his own sole use and benefit the entire fees arising from the performance of such offices without any reservation thereout, shall from and after the passing of this Act, for the purposes of style and designation, but not for any other purpose, be deemed and styled the vicar of such church and parish or new parish, as the case may be, and his benefice shall for the same purpose be styled and designated a vicarage."

CURES, an old town of the Sabines, not far from the left bank of the Tiber, about 25 miles from Rome. It was renowned in Roman story as the birth-place of Tatius, the colleague of Romulus, and of Numa the second king of Rome; and, according to the belief of the ancients, the term *Quirites*, the distinguishing epithet of the Roman people, was derived from its name. If it be true, as Strabo asserts, that Cures was at one time a large city, it early fell into decay. About 100 B.C. it was colonized by Sulla, and continued to prosper till about the 4th century of the Christian era. It was finally destroyed by the Lombards before the end of the 6th century. Remains of the town have been discovered at the modern village of Correse.

CURETON, WILLIAM, D.D. (1808–1864), a famous English Orientalist, was born at Westbury, in Shropshire. After being educated at the Free Grammar School of Newport, and at Christ Church, Oxford, he took orders in 1832, became chaplain of Christ Church College, sub-librarian of the Bodleian, and, in 1837, assistant keeper of MSS. in the British Museum. He was afterwards appointed select preacher to the university of Oxford, chaplain in ordinary to the queen, rector of St Margaret's, Westminster, and canon of Westminster. He was elected fellow of the Royal Society, corresponding member of the German Oriental Society and of the Institute of France, and foreign associate of the Institute, member of the French Asiatic Society and of the Historico-Theological Society of Leipsic, and trustee of the British Museum. He died in 1864.

Cureton's most remarkable work was the edition with notes and an English translation of the Epistles of St Ignatius to St Polycarp, the Ephesians, and the Romans, from a Syriac MS., found in the monastery of St Mary Deipara, in the desert of Nitria, near Cairo. He held that the MS. he used gave the truest text, that all other texts were inaccurate, and that the epistles contained in the MS. were the only genuine epistles of St Ignatius that we possess—a view which received the support of F. C. Baur, Bunsen, and many others, but which was opposed by Dr Wordsworth and by several German scholars. Cureton supported his view by his *Vindiciæ Ignatianæ* and his *Corpus Ignatianum.—a Complete Collection of the Ignatian Epistles, genuine, interpolated, and spurious.* He also edited a partial Syriac text of the *Festal Letters of St Athanasius*, which was translated into English by Henry Burgess (1854), and published in the *Library of Fathers of the Holy Catholic Church; Remains of a very Ancient Recension of the Four Gospels in Syriac, hitherto unknown in Europe; Spicilegium Syriacum, containing Remains of Bardesan, Meliton, Ambrose, Mara Bar Scrapion; The third Part of the Ecclesiastical History of John, Bishop of Ephesus*, which was translated by Payne Smith; *Fragments of the Iliad of Homer from a Syriac Palimpsest*; an Arabic work known as the *Thirty-first Chapter of the Book entitled The Lamp that guides to Salvation*, written by a Christian of Tekrit; *The Book of Religious and Philosophical Sects*, by Muhammed al Sharastani; a *Commentary on the Book of Lamentations*, by Rabbi Tanchum; and the *Pillar of the Creed of the Sunnites*. Cureton also published several sermons, among which was one entitled *The Doctrine of the Trinity not Speculative but Practical*. After his death Dr W. Wight of the British Museum edited with a preface the *Ancient Syriac Documents relative to the earliest Establishment of Christianity in Edessa and the neighbouring Countries, from the year of our Lord's Ascension to the beginning of the fourth Century; discovered, edited, and annoted by the late W. Cureton.*

CURFEW, CURFEU, or COUVRE-FEU, a signal, as by tolling a bell, to warn the inhabitants of a town to extinguish their fires and lights and retire to rest. This was a common practice throughout the various countries of Europe during the Middle Ages, especially in cities taken in war. In the law Latin of those times it was termed *ignitegium*, or *pyritegium*. The curfew is commonly said to have been introduced into England by William the Conqueror, who ordained, under severe penalties, that at the ringing of the curfew-bell at eight o'clock in the evening all lights and fires should be extinguished. It seems probable, however, that he merely enforced an existing and very common police regulation to that effect. The absolute prohibition of lights after the ringing of the curfew-bell was abolished by Henry I. in 1100. The practice of tolling a bell at a fixed hour in the evening, still extant in many places, is a survival of the ancient curfew. The common hour was at first seven, and it was gradually advanced to eight, and in some places to nine o'clock. In Scotland ten was not an unusual hour. As a precaution against conflagrations, the curfew was a most useful regulation, at a period when it was the custom to place the fire in a hole in the middle of the floor, under an opening in the roof to allow the escape of the smoke. When a family retired to rest for the night, the fire was extinguished by covering it up; and hence the term *couvre-feu*, or curfew. But this salutary regulation served another important end, since by obliging people to keep within doors, nocturnal brawls in the streets were in a great measure prevented. There is a popular tradition, for which no historical authority can be assigned, that the severity exhibited by William the Conqueror in enforcing obedience to the curfew, was more particularly designed to prevent the English from assembling in secret to plan schemes of rebellion against himself. The ringing of the "prayer-bell," as it is called, which is still practised in some Protestant countries, originated in that of the curfew-bell.

CURIA, the name of the ten divisions into which a tribe was divided by the constitution of Romulus. There being three tribes, there were thirty curiæ, a number which was not altered when the number of the tribes was increased to thirty-five. This division was a division of the populus, to the exclusion of the plebs; and hence the assembly of the populus was called the *comitia curiata*. But when Servius Tullius instituted the *comitia centuriata* as the sovereign assembly of the republic, the *comitia curiata* lost almost all power other than ecclesiastical, except that of conferring upon magistrates the *imperium* and the privilege of taking auspices; and even this remnant of their political authority became a mere form, which was sometimes neglected. But the curiæ retained all their ecclesiastical functions; each elected a chief priest, or *curio*, and a subordinate priest, called the *curialis flamen*, while together they elected the *curio maximus*, who presided over the *curiones*. The *comitia curiata* alone could sanction *adrogatio*, or the adoption of a man who was *sui juris*, or not under the control of parents. The building in which a curia met was also called a *curia*; and the name was given, besides, to the buildings in which a senate met, and even to a senate itself, though never to the senate of Rome.

Under the later empire the "curiales" exercised many important and very diversified functions, which Jacobus Gothofredus gives a catalogue of under twenty-two heads (see *Animad. in Cod. Theod.*, lib. xii. tit. i.). Bingham speaks of these offices of the "curiales" as synonymouwith "municipal" offices. The holders of them were by special ecclesiastical constitution made incapable of receiving holy orders. And, on the other hand, clerks—or at least such as had no property of their own apart from that derived from any ecclesiastical benefice—were exempted from the duty of accepting the office of "curialis."

Papal Court.—At a later period, probably not earlier than the 12th century, the phrase *curia Romana* came to be synonymous with *corte Romana*, and was used to signify the entire body of persons employed in attendance on the Pope and in transacting the business of the Roman see. It seems indeed to have been at that time occasionally used in a sense equivalent to the "Holy See," comprising, in the idea signified, the Pontiff himself.

In process of time, however, a distinction seems to have established itself between the "corte Romana" and the "curia Romana." The former phrase is declared by Lunadoro in his *Relazione della Corte di Roma*, first published in 1641, to mean the whole body of cardinals, bishops, and prelates of all ranks who hold office in the Papal court and government; whereas at that period and for some time previously the curia Romana had come to signify what we should call "the bar" practising in the Papal courts of justice. But it is curious that the old wider and less precise signification of the term is found surviving long afterwards in the writings of Lutherans and Jansenists, who found its larger signification convenient to them in attacking and satirizing the Roman Papal system. Thus in modern writings the phrase "curia Romana" will be found very ordinarily to mean different things, according to the sympathies and in some degree to the country of the writer using it. In the mouth of a Lutheran, a Calvinist, a Jansenist, or even perhaps of a Gallican, it will mean the whole ecclesiastical and administrative system of Rome. In the mouth of the friends of the Papacy, especially of the Italians, it will be found to signify the body of lawyers practising in the Roman courts. The latter is of course, at all events in recent times, the more correct use of the term; and it will probably be found that in the mouth of a learned writer, even among Protestants, this will be the sense attached to it. Thus Bingham, in a curious passage illustrating the change in the signification of the word "curia," where he is treating of the meaning of the phrase "curiæ tradi" as an ecclesiastical punishment (*Orig. Eccl.*, lib. 17, ch. 2, sec. 8), shows that the more accurate significance of the word was an entirely legal one. The celebrated controversialist Bergier, on the other hand, in his *Theological Dictionary*, defines "corte Romana" as "a phrase used in our days by modern newfangled writers in contempt of the dogmatic constitutions and pontifical briefs of the holy Roman apostolic see. If I remember rightly this phrase was first used by Calvin and his followers." Now all the writers thus twitted by the French theologian would have used "curia" as synonymous with "corte." And modern anti-ecclesiastical Italian writers will be found using the word similarly. But the proper present ecclesiastical sense of the term is most accurately rendered in English by the "Roman bar"—the body of those privileged to practise in the different pontifical courts of justice.

It will be seen, in short, that the use of the term has been shifting and uncertain to a singular degree,—shifting both, as the meaning of other words shifts, by lapse of time, and also not only according to the nationality but according to the views and prejudices of the person using it.

It may be added that the building now occupied by the Italian Chamber of Deputies, was called the Curia Innocenziana, having been built by Innocent XII. for the reuniting of the various "curiæ" before existing in the city.

For a detailed account of the officials who were at different times comprised in the idea of the Curia, of the duties, orders, and hierarchical distinctions and privileges of those, of the story of the pious confraternity into which they formed themselves under the patronage of St Ivo the Briton, &c., the curious inquirer must be referred to Lunadoro, *Corte di Roma*; *Compendio Istorica del pio istituto, congregazione, e venerab. arciconfraternita sotto l'invocazione dell' Immacolata Concezione, e di S. Ivo avocato de' poveri oppressi*; Bernini, *Del tribunale della Rota*; Cancellieri, *Possesse de' Pontifici*; and Moroni, *Dict. de Erudit. Eccles.*

CURLEW, in French *Courlis* or *Corlieu*, a name given to two birds, of whose cry it is an imitation, both belonging to the group *Limicolæ*, but possessing very different habits and features.

1. The Long-billed Curlew, or simply Curlew of most British writers, the *Numenius arquata* of ornithologists, is one of the largest of the family *Scolopacidæ*, or Snipes and allied forms. It is common on the shores of the United Kingdom and most parts of Europe, seeking the heaths and moors of the interior and more northern countries in the breeding-season, where it lays its four brownish-green eggs, suffused with cinnamon markings, in an artless nest on the ground. In England it has been ascertained to breed in Cornwall and in the counties of Devon, Dorset, Salop, and Derby—though sparingly. In Yorkshire it is more numerous, and thence to the extreme north of Scotland, as well as throughout Ireland, it is, under the name of Whaup, familiar to those who have occasion to traverse the wild and desolate tracts that best suit its habits. So soon as the young are able to shift for themselves, both they and their parents resort to the sea-shore or mouths of rivers, from the muddy flats of which they at low tide obtain their living, and, though almost beyond any other birds wary of approach, form an object of pursuit to numerous gunners. While leading this littoral life the food of the Curlew seems to consist of almost anything edible that presents itself. It industriously probes the mud or sand in quest of the worms that lurk therein, and is also active in seeking for such crustaceans and mollusks as can be picked up on the surface, while vegetable matter as well has been found in its stomach. During its summer-sojourn on the moorlands insects and berries, when they are ripe, enter largely into its diet. In bulk the Curlew is not less than a Crow, but it looks larger still from its long legs, wings, and neck. Its bill, from 5 to 7 inches in length, and terminating in the delicate nervous apparatus common to all birds of its family, is especially its most remarkable feature. Its plumage above is of a drab colour, streaked and mottled with very dark brown; beneath it is white, while the flight-quills are of a brownish black.

Nearly allied to the Curlew, but smaller and with a more northern range, is the Whimbrel (*N. phæopus*), called in some parts Jack-Curlew, from its small size—May-fowl, from the month in which it usually arrives—and Titterel from one of its cries.[1] This so much resembles the former in habit and appearance that no further details need be given of it. In the countries bordering on the Mediterranean occurs a third species (*N. tenuirostris*), the home of which has yet to be ascertained. Some fifteen other species, or more, have been described, but it is probable that this number is too great. The genus *Numenius* is almost cosmopolitan. In North America three very easily recognized species are found—the first (*N. longirostris*) closely agreeing with the European Curlew, but larger and with a longer bill; the second (*N. hudsonicus*) representing our Whimbrel; and the third (*N. borealis*), which has several times found its way to Britain, very much less in size—indeed the smallest of the genus. All these essentially agree with the species of

[1] The name Spowe (*cf.* Icelandic *Spói*) also seems to have been anciently given to this bird (see Stevenson's *Birds of Norfolk*, vol. ii. p. 201.)

the Old World in habit; but it is remarkable that the American birds can be easily distinguished by the rufous colouring of their axillary feathers—a feature which is also presented by the American Godwits (*Limosa*).

2. The Curlew of inlanders, or Stone-Curlew—called also, by some writers, from its stronghold in this country, the Norfolk Plover, and most wrongly and absurdly the Thick-Knee or Thick-Kneed Bustard—is usually classed among the *Charadriidæ*, but it offers several remarkable differences from the more normal Plovers. It is the *Charadrius œdicnemus* of Linnæus, the *C. scolopax* of Sam. Gottl. Gmelin, and the *Œdicnemus crepitans* of Temminck. With much the same cry as that of the *Numenii*, only uttered in a far sweeter tone, it is as fully entitled to the name of Curlew as the bird most commonly so called. In England it is almost solely a summer-visitor, though an example will occasionally linger throughout a mild winter; and is one of the few birds whose distribution is affected by geological formation, since it is nearly limited to the chalk-country—the open spaces of which it haunts, and its numbers have of late years been sensibly diminished by their inclosure. The most barren spots in these districts, even where but a superficial coating of light sand and a thin growth of turf scarcely hide the chalk below, supply its needs; though at night (and it chiefly feeds by night) it resorts to moister and more fertile places. Its food consists of snails, coleopterous insects, and earth-worms, but larger prey, as a mouse or a frog, is not rejected. Without making the slightest attempt at a nest, it lays its two eggs on a level spot, a bare fallow being often chosen. These are not very large, and in colour so closely resemble the sandy, flint-strewn surface that their detection except by a practised eye is difficult. The bird, too, trusts much to its own drab colouring to elude observation, and, on being disturbed, will frequently run for a considerable distance and then squat with outstretched neck so as to become almost invisible. In such a case it may be closely approached, and its large golden eye, if it do not pass for a tuft of yellow lichen, is perhaps the first thing that strikes the searcher. As autumn advances the Stone-Curlew gathers in large flocks, and then is as wary as its namesake. Towards October these take their departure, and their survivors return, often with wonderful constancy, to their beloved haunts (see Birds, vol. iii. p. 766). In size this species exceeds any other European plover, and looks even still larger than it is. The bill is short, blunt, and stout; the head large, broad, and flat at the top. The wings and legs long—the latter presenting the peculiarity of a singular enlargement of the upper part of the tarsus, whence the name *Œdicnemus* has been conferred. The toes are short and fleshy, and the hind-toe, as in most *Charadriidæ*, is wanting. This Curlew seems to have been an especial favourite with Gilbert White, in whose classical writings mention of it is often made. Its range extends to North Africa and India. Five other species of *Œdicnemus* from Africa have also been described as distinct: whether there are so many may be doubted. Australia, however, possesses a very distinct species (*Œ. grallarius*), and the genus has two members in the Neotropical Region (*Œ. bistriatus* and *Œ. superciliaris*). The analogy of all these birds to the Bustards (*Otididæ*) is manifest, but that they have any really close affinity to that family is questionable. An exaggerated form of *Œdicnemus* is found in *Æsacus*, of which two species have been described, one (*Æ. recurvirostris*) from the Indian, and the other (*Æ. magnirostris*) from the northern parts of the Australian Region. (A. N.)

CURLING, a game in which the players throw large rounded stones upon a rink or channel of ice, towards a mark called the tee. Where the game originated is not precisely known; but as it has been popular in North Britain for the last three centuries at least, and down till our own day been practised chiefly by natives of that country, it may correctly be spoken of as a Scottish pastime. Some writers, looking to the name and technical terms of the game, trace its invention to the Low Countries: thus "curl" may have been derived from the German *kurz weil*, a game; "tee" from the Teutonic *tighen*, to point out; "bonspiel," a district curling competition, from the Belgic *bonne*, a district, and *spel*, play; though the supposition that "rink" is just a modification of the Saxon *hrink*, a strong man, seems scarcely tenable. Then, it is further stated that, as curling is called "kuting" in some parts of Lanarkshire and Ayrshire, and very much resembles quoiting on the ice, the name may have some connection with the Dutch *coete*, a quoit; while Kilian in his *Teutonic Dictionary* represents the term *khuyten* to mean a pastime in which large globes of stone are thrown upon ice like the quoit or discus. Possibly enough some of the Flemish merchants who settled in Scotland towards the close of the 16th century may have brought the game to the country. Unfortunately, however, for the theory that assigns to it a far-away origin, we find no early mention of it in the literature of the Continent; while Camden, when describing the Orkney Islands in 1607, tells us that one of them supplies "plenty of excellent stones for the game called curling;" and incidental references to it as a game played in Scotland are made by several authors during the first half of the same century. If the game be not indigenous to Scotland it certainly owes its development to that country, and in the course of time it has come to be nearly as much the national sport of the Caledonians as "the rough bur thistle" their heraldic emblem.

With very rude engines it was played at first,—random whin boulders fashioned by the finger of nature alone, or misshapen granite blocks, bored through to let in the thumb of the player, having been the channel-stones used by the primitive curlers of the country. Even before Bannockburn was fought the ice of the Scottish lochs may have been employed as the arena of a bloodless strife; though it is only as a piece of pardonable witticism that Ossian has been quoted as follows to show that curling was practised by his somewhat mythical heroes—"Fly, son of Morven, fly; amid the circle of stones Swaran, bends at the stone of might." In course of years the rough block of the game was superseded by a symmetrical object usually made of whinstone or granite, beautifully rounded, brilliantly polished, and supplied with a convenient handle; so that the curling stone now used is as great an improvement on its remote predecessor as the Martini rifle is on the old matchlock which figured at Marston Moor and Culloden. It is circular in form, its weight from 35 to 50 ℔, its circumference from 30 to 36 inches, and the height is about one-eighth of the girth. With engines of such shape and bulk, costing with handles from £2 to £2, 10s. per pair, all the societies, 472 in number, connected with the Royal Caledonian Curling Club play their spiels when "cauld cauld frosty weather" supplies the required arena. Most of these societies are located in the Land of Cakes and Curlers; but many of them are transatlantic, no fewer than 37 belonging to the Ontario province branch alone; while there are many hundreds of independent curling fraternities north of the Tweed, who play for their own hand, under arrangements of their own, though the rules and usages of the Caledonian Curling Club form a code which largely regulates "the roaring game," as Burns calls it, all over the world.

On a rink 42 yards long, or so, with a tee at each end, the stone is hurled, the hurler, or curler, when delivering it standing on one side of the goal or tee, so as to bring the stone over the tee when delivering it; or, according to another arrangement, he occupies a small circle a foot in diameter behind a ring of 7 feet radius drawn round the tee. To cover this goal or lie close to it is the player's chief object; but often when he has realized his aim, a rival stone "up the rink like Jehu roars," driving his stone nowhere, settling down in its pride of place, but only to be served perhaps in a similar way itself before the match is at an end. No stones that lie outside the large

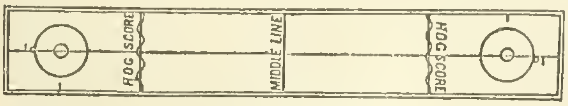

Diagram of Curling Rink.

circles of 7 feet radius round the tee are allowed to count, and all laggard stones that manifest a pig-like indolence, and do not pass the well-named hog score, which is drawn at a distance of one-sixth the rink from each tee, are removed as obstructive cumberers of the channel. Games can be played by two persons, but usually matches are arranged for with numerous competitors formed into rinks of four players a side, two stones being used by each player. It is customary for the parish clubs of a district, marshalled by their respective skips or captains, to try their skill against each other once a year or so; while annually (when weather permits) a great contest, which is at least semi-national, is waged between the curlers north and south of the River Forth.

At first the game is remarkably simple, the leader, as we have said, endeavouring to top or closely neighbour the tee, and his immediate opponent having a similar object in view. When, during the progress of the game, one, two, or more stones have been well planted, the supporters of those who placed them there are usually directed by their skip rather to guard the winning stones than venture too near them at the risk of injuring their position. On the other hand the tactics of the opposing party will consist in efforts to knock off the guards, dislodge the well-planted stones, or get their own still better placed where that is possible. It sometimes happens that the stone nearest the tee—the winner, as it is called—is so well protected that it cannot be touched directly, and defies removal unless it be assailed by an ingenious master-stroke technically termed *wicking* or *inringing*, whereby a stone is sent in an oblique direction so as haply to hit the winner; and, if it not only does that, but becomes the winner in its stead, the man who throws it is sure to be hailed by his exulting comrades as a prince among curlers, if not "the king o' a' the core." "Wicking, or inringing," says the late Sir Richard Broun, Bart., in his admirable work *Memorabilia Curliana* (published in 1830), "the prettiest and most scientific point in the game by far, is to take the shot and leave yourself behind the rampart of your adversary's barricade, when to all appearance their winner was impregnable;" and this is done "by taking an inner angle off a side shot in such a manner as to change and direct the course of your stone upon the one to be projected." When, however, science fails, and the ice is so blocked up as almost to hide the tee, an effort of strength and hazard is resorted to in the hope of some benefit "turning up." This, by the curlers of the south of Scotland, is called "rebutting." The player in such cases is usually told by his skip to "put plenty of powder in the horn," and the stone is delivered with tremendous force, so as to go crashing through guards and double guards, sometimes doing more harm than good, and sometimes also changing in a moment the whole fortunes of the game.

Many fine songs have been written about curling, from which lines might be quoted descriptive of all its leading points, its implements, "channel stones, crampets (flat pieces of iron with spikes below fastened on the sole of the shoe to keep the player from slipping), and besoms so green," with which the rink is swept; also in praise of the game as a promoter of mental enjoyment, bodily health, and the best of good-fellowship. The late Dr Henry Duncan's song on the subject has never been excelled; and he succeeds in packing into a single stanza some of its chief characteristics:—

"There draw a shot; there lay a guard;
And here beside him lie, man;
Now let him feel a gamester's hand;
Now in this bosom die, man.
There fill the port, and block the ice;
We sit upon the tee, man!
Now take this in-ring sharp and neat,
And make this winner flee, man."

The Ettrick Shepherd also ranks among the laureates of the rink.

The following rules of the game are abridged from the *Annual of the Royal Caledonian Curling Club*:—

1. The tees shall be set down 40 yards apart; and in an exact alignment with the tees a line shall be drawn on the rink. Seven feet behind each tee a circle 6 inches in diameter shall be also drawn on the ice on the left-hand side of said line (looking to the tee to be played to), the inner side of which shall be distant from said line 6 inches. Upon this circle, and as near as may upon the centre of it, every player, whether standing on the ice or on a board or other rest, shall, in the delivery of his stone, place, or in stepping out, put down his left or fore foot, if he be a right hand player. For a left-hand player, another such circle shall be placed in like manner, and for the like purpose on the right hand side of said line. And in the event of a hack, hatch, trigger, &c., being used, it shall be right behind said circle, and not less distant therefrom than 2 feet, nor greater in length than 12 inches.

A circle of 7 feet radius to be described from each tee as a centre, and every stone to count which is either within, or resting on, this circle. All played stones passing the tee, and going beyond the 7 feet radius, shall be put off the ice. The hog-score to be distant from each tee one-sixth part of the length of the whole rink played on. Every stone to be a hog which does not clear this score; but no stone to be such which has struck another stone lying over the hog-score. A line shall be drawn on the ice, at a right angle to the rink, half-way betwixt the tees, called "the middle line." In no case shall the rink be less than 32 yards.

2. All matches to be of a certain number of heads, to be agreed on by the clubs, or fixed by the umpire, before commencement; or otherwise, by time, or shots, if mutually agreed on.

3. Every rink to be composed of four players a side, each using two stones. The rotation of play observed during the first head of a match shall not be changed.

4. The skips opposing each other shall settle by lot, or in any other way they may agree upon, which party shall lead at the first head, after which the winning party shall do so.

5. All curling stones shall be of a circular shape. No stone shall be of a greater weight than 50 lb imperial, or of greater circumference than 36 inches, or of less height than one-eighth part of its greatest circumference.

6. No stone, or side of a stone, shall be changed after a match has been begun, or during its continuance, unless by consent.

7. Should a stone happen to be broken, the largest fragment shall be considered in the game for that end—the player being entitled afterwards to use another stone, or another pair.

8. If a played stone rolls over, or stops, on its side or top, it shall be put off the ice. Should the handle quit the stone in delivery, the player must keep hold of it, otherwise he shall not be entitled to replay the shot.

9. Players, during the course of each end, to be arranged along the sides of the rink, anywhere skips may direct; and no party, except when sweeping according to rule, shall go upon the middle of the rink, or cross it, under any pretence whatever. Skips alone to stand at or about the tee—that of the playing party having the choice of place, and not to be obstructed by the other.

10. If a player should play out of turn, the stone so played may be stopped in its progress, and returned to the player. Should the mistake not be discovered till the stone be at rest, or has struck another stone, the opposite skip shall have the option of adding one to his score, allowing the game to proceed, or declaring the end null and void. But if a stone be played before the mistake has been discovered, the head must be finished as if it had been properly played from the beginning.

11. The sweeping shall be under the direction and control of the skips. The player's party may sweep the ice anywhere from the

centre line to the tee, and behind it,—the adverse party having liberty to sweep behind the tee, and in front of any of their own stones when moved by another, and till at rest. Skips to have full liberty to clean and sweep the ice behind the tee at any time, except when a player is being directed by his skip.

12. If in sweeping or otherwise, a *running* stone be marred by any of the party to which it belongs, it may, at the option of the opposite skip, be put off the ice; if by any of the adverse party, it may be placed where the skip of the party to which it belongs shall direct. If otherwise marred, it shall be replayed.

13. Every player to be ready to play when his turn comes, and not to take more than a reasonable time to play. Should he play a wrong stone, any of the players may stop it while running; but if not stopped till at rest, the one which ought to have been played shall be placed instead, to the satisfaction of the opposing skip.

14. No measuring of shots allowable previous to the termination of the end. Disputed shots to be determined by the skips, or, if they disagree, by the umpire, or, when there is no umpire, by some neutral person chosen by the skips. All measurements to be taken from the centre of the tee, to that part of the stone which is nearest it. No stone shall be considered without a circle, or over a line, unless it clear it;—and in every case, this is to be determined by placing a square on the ice, at the circle or line.

15. Skips shall have the exclusive regulation and direction of the game for their respective parties, and may play last stone, or in what part of it they please; and, when their turn to play comes, they may name one of their party to take charge for them.

16. If any player shall speak to, taunt, or interrupt another, not being of his own party, while in the act of delivering his stone, one shot shall be added to the score of the party so interrupted.

17. If from any change of weather after a match has been begun, or from any other reasonable cause, one party shall desire to shorten the rink, or to change to another one, and, if the two skips cannot agree, the umpire shall, after seeing one end played, determine whether the rink shall be shortened, and how much or whether it shall be changed, and his decision shall be final. (W. M'D.)

CURRAGH, a level stretch of open ground in the county of Kildare, in Ireland, famous for its race-course and its military camp. It has an area of upwards of 4800 acres; and its soft natural sward, which has never been broken by the plough, affords excellent pasture for sheep. From the peculiarity of its herbage, the district is known in the neighbourhood as "the short grass;" and the young men of Kildare are jocularly distinguished as the "boys of the short grass." The land is the property of the Crown, which appoints a special officer as the ranger of the Curragh; but the right of pasturage is possessed by the landowners of the vicinity. The oldest mention of the Curragh occurs in the *Liber Hymnorum* (the manuscript of which probably dates from the 10th century) in connection with St Bridget, who is said to have received a grant of the district from the king of Leinster, and is popularly credited with the honour of having turned it into a common. It is evident, however, that long before the days of the saint the downs of Kildare had afforded a regular place of assembly for the people of the south of Ireland, and the turf had already become familiar with the hoofs of the race-horse. The *Aenach Colmain*, or Curragh fair, is frequently mentioned in the Irish annals from the Book of Lecan downwards; and the plain appears from time to time as the scene of hostile encounters between the kings of Meath, Leinster, and Offaly. In 1234 the earl of Pembroke was defeated there by the viceroy of Ireland, Lord Geoffrey de Monte Marisco; and in 1406 the Irish under the prior of Connell were routed by the English. In 1789 the Curragh was the great rendezvous for the volunteers; and in 1804 it saw the gathering of 30,000 United Irishman. The camp was established at the time of the Crimean war, and is capable of accommodating 10,000 men; 6769 was the number of persons registered at the census of 1871. The races, for which Sir William Temple obtained a grant of £100 a year from Government, are held in April, June, September, and October. The early history of the Curragh has been investigated by Mr W. M. Hennessy, *Proceedings of the Royal Irish Academy*, 1866.

CURRAN, JOHN PHILPOT (1750–1817), Master of the Rolls in Ireland, and one of the most brilliant wits and orators of his day, was born on the 24th July 1750, at Newmarket, Cork, where his father, a descendant of one of Cromwell's soldiers, was seneschal to the manor-court. Pleased with his bright boyish vivacity and wit, the rector of his native place, the Rev. Nathaniel Boyse, first gave him lessons and then sent him to school at Middleton. At the age of nineteen he became a sizar of Trinity College, Dublin; and in 1773, having taken his M.A. degree, he entered the Middle Temple. During his residence in London he gave some little attention to the study of law, but gained far more by his assiduous attendance at the students' debating societies. In 1774 he married a lady who brought him a small dowry; but the marriage proved most unhappy, not without fault on the part of Curran, and Mrs Curran finally eloped from her husband.

In 1775 Curran was called to the Irish bar, where he very soon obtained a practice. On his first rising in court, excessive nervousness prevented him from even reading distinctly the few words of a legal form, and when requested by the judge to read more clearly he became so agitated as to be totally unable to proceed. But, his feelings once roused, all nervousness disappeared. His effective and witty attack upon a judge who had sneered at his poverty, the success with which he prosecuted a nobleman for a disgraceful assault upon a priest, the duel which he fought with one of the witnesses for this nobleman, and other similar exploits, gained him such a reputation that he was soon the most popular advocate in Ireland.

In 1783 Curran was appointed king's counsel; and in the same year he was presented to a seat in the Irish House of Commons. His conduct in connection with this affair displays his conduct in a most honourable light; finding that he differed radically in politics from the gentleman from whom he had received his seat, he offered to buy another to replace that which he occupied. In his parliamentary career Curran was throughout sincere and consistent. He spoke vigorously in behalf of Catholic emancipation, and strenuously attacked the ministerial bribery which prevailed. His declamations against the Government party led him into two duels—the first with Fitzgibbon, then attorney-general, afterwards Lord Clare; the second with the secretary of state, Major Hobart, afterwards Lord Buckingham. The Union caused him the bitterest disappointment; he even talked of leaving Ireland, either for America or for England.

Curran's fame rests most of all upon his speeches in behalf of the accused in the state trials that were so numerous between 1794 and 1803; and among them may be mentioned those in defence of Hamilton Rowat, the Rev. William Jackson, the brothers Shears, Finnerty, Lord Edward Fitzgerald, Tone, and Kirwan. Another of his most famous and characteristic speeches is that against the marquis of Headfort, who had eloped with the wife of a clergyman named Massey. On the arrest of Emmett, who had formed an attachment to his daughter, Curran was himself under suspicion; but, on examination before the Privy Council, nothing was brought forward to implicate him in the intended rebellion.

In 1806, on the death of Pitt and the formation of the Fox ministry, Curran received the post of Master of the Rolls, with a seat in the Privy Council, much to his disappointment, for he had desired a position of greater political influence. For eight years, however, he performed the distasteful duties of this office. He then retired on a pension of £3000; and the three remaining years of his life were spent in London, where he became one of the most brilliant members of the brilliant society which included Sheridan, Erskine, Thomas Moore, and William Godwin. He died at his house in Brompton on the 14th October 1817.

Curran's legal erudition was never profound; and though he was capable of the most ingenious pleading, his appeal was always to the emotions of his audience. His best speeches are one fiery torrent of invective, pathos, national feeling, and wit. His diction was lofty and sonorous. To his personal presence he owed nothing; for he was short, slim, and boyish-looking, and his voice was thin and shrill.

See *Curran and his Contemporaries*, a most entertaining work, by Charles Phillips, a personal friend of Curran's (1818), and the *Life of Curran* by his son, W. H. Curran (1819, and with additions by Dr Shelton Mackenzie, New York, 1855), both of which contain numerous samples of Curran's eloquence. See also *Curran's Speeches* (1805, 1808, 1845), *Memoirs of Curran*, by Wm. O'Regan (1817), *Letters to Rev. H. Weston* (1819).

CURRANTS, the dried seedless fruit of a variety of the grape-vine, *Vitis vinifera*, cultivated principally in Zante, Cephalonia, and Ithaca, and near Patras in the Morea. Currants were brought originally from Corinth, whence their name; in the 13th and 14th centuries they were known as *raisins de Corauntz*. In the Ionian Islands the currant-vine is grown on the sides of the lower hills, or in the valleys, the grape-vine occupying the higher and less open and rich ground. Gypseous marls, or calcareous marls containing a little gypsum, are preferred to limestone soils, as they allow of the deep penetration of the roots of the vines. The most favourable situations are those where a good supply of water can be obtained for the irrigation of the plantations. This is carried on from the end of October to the close of the year, after which all that is necessary is to keep the ground moist. The vines are planted in rows 3 or 4 feet apart. Propagation is effected by grafting on stocks of the grape-vine, or by planting out in spring the young vigorous shoots obtained at the end of the previous year from old currant-vines that have been cut away below the ground. The grafts bear fruit in three years, the slips in about double that time. The vine-stock for grafting is cut down to the depth of a foot below the surface of the soil; two or three perpendicular incisions are made near the bark with a chisel; and into these are inserted shoots of the last year's growth. The engrafted part then receives an application of moist marl, is wrapped in leaves and bound with rushes, and is covered with earth, two or three eyes of the shoots being left projecting above ground. In December the currant plantations are cleared of dead and weak wood. In February the branches are cut back, and pruned of median shoots, which are said to prevent the lateral ones proceeding from the same bud from bearing fruit. In order effectually to water the trees, the earth round about them is in February and March hoed up so as to leave them in a kind of basin, or is piled up against their stems. In May, when the leaves begin to show, the ground is thoroughly turned, and if requisite manured, and is then re-levelled. By the middle of April the leaves are fully out, and in June it is necessary to break back the newly-formed shoots. The fruit begins to ripen in July, and in the next month the vintage takes place. At this season rain is greatly dreaded, as it always damages and may even destroy the ripe fruit. The plantations, which are commonly much exposed, are watched by dogs and armed men. In Cephalonia the currant-grape is said to ripen at least a week earlier than in Zante. To destroy the oïdium, a pest that severely injures the plantations, the vines are dusted, at the time the fruit is maturing, with finely-ground brimstone. The currants when sufficiently ripe are gathered and placed on a drying ground, where they are exposed to the sun in layers half an inch thick; from time to time they are turned and swept into heaps, until they become entirely detached from stalk. They are then packed in large butts for exportation. The wine made from the currant-grape is inferior in quality, but is said to be capable of much improvement. The fresh fruit is luscious and highly flavoured, but soon cloys the palate. In 1834 the duty on currants was made 22s. 2d. per cwt., or one-half what it had previously been; in 1844 it was reduced to 15s., and in 1860 to 7s. per cwt. In 1874 the imports of currants into the United Kingdom were:—

	Cwts.	Value.
From Austrian territories	6978	£ 8,606
,, Greece	963,358	1,278,974
,, other countries	2,119	2,994
Total	972,455	£1,290,574

The currants of British kitchen-gardens are the produce of *Ribes nigrum* and *R. rubrum*, deciduous shrubs of the natural order *Grossulariaceæ*, indigenous to Britain, Northern and Central Europe, Siberia, and Canada. The former species bears the black, the latter the red currant. White currants are the fruit of *R. album*, a cultivated variety of *R. rubrum*. Both red and black currants are used for making tarts and pies, jams, jellies, and wine; the latter are also employed medicinally in lozenges, and in the preparation of a gargle for sore throat, are occasionally preserved in spirits, and in Russia are fermented with honey to produce a strong liquor. The leaves as well as the roots of the black currant have been recommended for their therapeutic virtues. A kind of black currant, bearing poor and acid fruit, is indigenous to Tierra del Fuego. Royle mentions three Himalayan species of currants; their fruit he found to contain less saccharine matter than that of their cultivated European congeners.

CURRENCY. See MONEY.

CURRIE, JAMES (1756–1805), a Scotch physician and an editor of Burns, was the son of the minister of Kirkpatrick Fleming, in Dumfriesshire, where he was born. He was destined for business, and while still very young was sent out to Virginia. The outbreak of the first American war, however, changed his prospects considerably; he had a long and dangerous illness; and he still further damaged his chance of success by contributing a series of letters to an American journal under the signature of "An Old Man," in defence of the mother country. At last he found it necessary to leave America, and reaching home at the age of twenty, he applied himself with energy to the study of medicine. In 1780, with the object of procuring military service in Jamaica, he took his degree at Glasgow; but not obtaining the post he had in view, he settled at Liverpool, where in 1783 he was elected physician to the infirmary. The fatigues of his professional work, acting upon a hereditary tendency to pulmonary disease, forced him in 1804 to give up practice, and retire to the south of England, where he died in the following year. Among Currie's works may be mentioned a Tory pamphlet signed "Jasper Wilson" and entitled *A Letter, Commercial and Political, addressed to the Right Honourable William Pitt*, which ran quickly through several editions; and *Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Fevers and other Diseases*. But he is best known for the edition of Burns, with an introductory criticism and an essay on the character and condition of the Scottish peasantry, which he undertook in behalf of the family of the poet, whose personal acquaintance he had enjoyed.

CURRY, a name applied to a great variety of seasoned dishes. In India the following are employed as ingredients in curries:—anise, coriander, cumin, mustard, and poppy seeds; allspice, almonds, asafœtida, butter or ghee, cardamoms, chillies, cinnamon, cloves, cocoa-nut and cocoa-nut milk and oil, cream and curds, fenugreek, the tender unripe fruit of *Buchanania lancifolia*, cheroonjie nuts (the produce of another species, *B. latifolia*), garlic and onions, ginger, lime-juice, vinegar, the leaves of *Bergera Kœnigii* (the curry-leaf tree), mace, mangoes, nutmeg, pepper, saffron, salt, tamarinds, and turmeric. The annexed table shows the composition of four kinds of Indian curry powder:—

	Lbs.			Oz.
Black pepper	2	1	1	8
Cardamoms	2	...	...	4
Chillies	1	2	1	6
Cinnamon	2	...	...	4
Coriander seeds	20	12	3	8
Cumin seeds	1	2	½	...
Fenugreek	1	1	½	2
Garlic	2	1	...	6
Ginger	2	2	½	8
Mustard seed	1	1	½	...
Turmeric	4	2	1	9
Poppy seed	2	2	...	6

The cumin and coriander seeds are generally used roasted The various materials are cleaned, dried, ground, sifted, thoroughly mixed, and bottled. Upwards of forty different methods of preparing curry are given in the *Indian Domestic Economy and Receipt Book*, 2d ed. Madras, 1850.

CURRYING. See LEATHER.

CURTIUS, METTUS or METIUS, the hero of two legends connected with the part of the Roman forum called the Lacus Curtius, which appears to have once been a marsh, and where sacrifices were regularly offered. The first legend makes him the leader of the Sabine army in a battle with the Romans under Tullus Hostilius. To escape from the attack of the Romans he was forced to ride into a swamp which occupied the spot, hence called the Lacus Curtius. The second legend, which is dated 362 B.C., tells how a gulf suddenly appeared in the forum, according to one account riven by a thunder-bolt, and the aruspices declared that it would never close till what was dearest to Rome was thrown therein. At this announcement a noble youth, Mettus Curtius, came forward, declaring that her citizens were the most valuable possessions of the city; and, armed and on horseback, he leapt into the chasm, which forthwith closed over his head.

CURTIUS, QUINTUS RUFUS, the celebrated biographer of Alexander the Great. Of his personal history nothing whatever is known with certainty, some fixing his epoch in the Augustan, others as far down as the mediæval age, but most critics in the time of Vespasian. Niebuhr held him to be a contemporary of Septimius Severus. His work originally consisted of ten books, but the first two of these are entirely lost, and the remaining eight are incomplete. The best modern editions of the text are those of Zumpt, Baumstark, and Mützell.

See Niebuhr, *Kleine Schriften*, vol. i.; Buttmann, *Ueber das Leben des Geschichtschreibers Q. Curtius Rufus*; Pinzger, "Ueber das Zeitalter des Q. Curtius Rufus," in Seebode's *Archiv. für Philologie*.

CURVE

THIS subject is treated here from an historical point of view, for the purpose of showing how the different leading ideas in the theory were successively arrived at and developed.

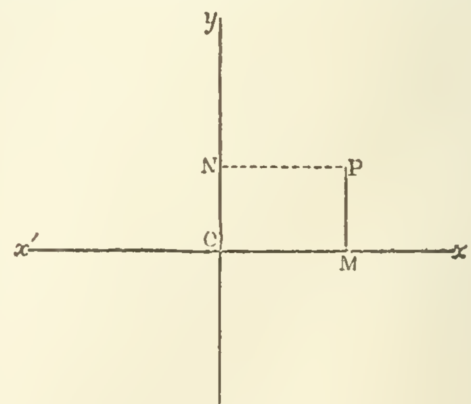
A curve is a line, or continuous singly infinite system of points. We consider in the first instance, and chiefly, a plane curve described according to a law. Such a curve may be regarded geometrically as actually described, or kinematically as in course of description by the motion of a point; in the former point of view, it is the locus of all the points which satisfy a given condition; in the latter, it is the locus of a point moving subject to a given condition. Thus the most simple and earliest known curve, the circle, is the locus of all the points at a given distance from a fixed centre, or else the locus of a point moving so as to be always at a given distance from a fixed centre. (The straight line and the point are not for the moment regarded as curves.)

Next to the circle we have the conic sections, the invention of them attributed to Plato (who lived 430 to 347 B.C.); the original definition of them as the sections of a cone was by the Greek geometers who studied them soon replaced by a proper definition *in plano* like that for the circle, viz., a conic section (or as we now say a "conic") is the locus of a point such that its distance from a given point, the focus, is in a given ratio to its (perpendicular) distance from a given line, the directrix; or it is the locus of a point which moves so as always to satisfy the foregoing condition. Similarly any other property might be used as a definition; an ellipse is the locus of a point such that the sum of its distances from two fixed points (the foci) is constant, &c., &c.

The Greek geometers invented other curves; in particular, the "conchoid," which is the locus of a point such that its distance from a given line, measured along the line drawn through it to a fixed point, is constant; and the "cissoid" which is the locus of a point such that its distance from a fixed point is always equal to the intercept (on the line through the fixed point) between a circle passing through the fixed point and the tangent to the circle at the point opposite to the fixed point. Obviously the number of such geometrical or kinematical definitions is infinite. In a machine of any kind, each point describes a curve; a simple but important instance is the "three-bar curve," or locus of a point in or rigidly connected with a bar pivotted on to two other bars which rotate about fixed centres respectively. Every curve thus arbitrarily defined has its own properties; and there was not any principle of classification.

The principle of classification first presented itself in the *Géométrie* of Descartes (1637). The idea was to represent any curve whatever by means of a relation between the coordinates (x, y) of a point of the curve, or say to represent the curve by means of its equation.

Descartes takes two lines xx', yy', called axes of coordinates, intersecting at a point O called the origin (the



axes are usually at right angles to each other, and for the present they are considered as being so); and he determines the position of a point P by means of its distances OM (or

NP) $=x$, and MP (or ON) $=y$, from these two axes respectively; where x is regarded as positive or negative according as it is in the sense Ox or Ox' from O; and similarly y as positive or negative according as it is in the sense Oy or Oy' from O: or what is the same thing—

			x	y
In quadrant	xy',	or N.E., we have	+	+
,,	$x'y$	,, N.W. ,,	−	+
,,	xy'	,, S.E. ,,	+	−
,,	$x'y'$	,, S.W. ,,	−	−

Any relation whatever between (x, y) determines a curve, and conversely every curve whatever is determined by a relation between (x, y).

Observe that the distinctive feature is in the *exclusive* use of such determination of a curve by means of its equation. The Greek geometers were perfectly familiar with the property of an ellipse which in the Cartesian notation is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, the equation of the curve; but it was as one of a number of properties, and in no wise selected out of the others for the characteristic property of the curve.[1]

We obtain from the equation the notion of an algebraical or geometrical as opposed to a transcendental curve, viz., an algebraical or geometrical curve is a curve having an equation $F(x, y)=0$, where $F(x, y)$ is a rational and integral function of the coordinates (x, y); and in what follows we attend throughout (unless the contrary is stated) only to such curves. The equation is sometimes given, and may conveniently be used, in an irrational form, but we always imagine it reduced to the foregoing rational and integral form, and regard this as the equation of the curve. And we have hence the notion of a curve of a *given order*, viz., the order of the curve is equal to that of the term or terms of highest order in the coordinates (x, y) conjointly in the equation of the curve; for instance, $xy-1=0$ is a curve of the second order.

It is to be noticed here that the axes of coordinates may be any two lines at right angles to each other whatever; and that the equation of a curve will be different according to the selection of the axes of coordinates; but the order is independent of the axes, and has a determinate value for any given curve.

We hence divide curves according to their order, viz., a curve is of the first order, second order, third order, &c., according as it is represented by an equation of the first order, $ax+by+c=0$, or say $(*\between x, y, 1)=0$; or by an equation of the second order, $ax^2+2hxy+by^2+2fy+2gx+c=0$, say $(*\between x, y, 1)^2=0$; or by an equation of the third order, &c; or what is the same thing, according as the equation is linear, quadric, cubic, &c.

A curve of the first order is a right line; and conversely every right line is a curve of the first order.

A curve of the second order is a conic, or as it is also called a quadric; and conversely every conic, or quadric, is a curve of the second order.

A curve of the third order is called a cubic; one of the fourth order a quartic; and so on.

A curve of the order m has for its equation $(*\between x, y, 1)^m=0$; and when the coefficients of the function are arbitrary, the curve is said to be the general curve of the order m. The number of coefficients is $\frac{1}{2}(m+1)(m+2)$; but there is no loss of generality if the equation be divided by one coefficient so as to reduce the coefficient of the corresponding term to unity, hence the number of coefficients may be reckoned as $\frac{1}{2}(m+1)(m+2)-1$, that is, $\frac{1}{2}m(m+3)$; and a curve of the order m may be made to satisfy this number of conditions; for example, to pass through $\frac{1}{2}m(m+3)$ points.

It is to be remarked that an equation may *break up*; thus a quadric equation may be $(ax+by+c)(a'x+b'y+c')=0$, breaking up into the two equations $ax+by+c=0$, $a'x+b'y+c'=0$, viz., the original equation is satisfied if either of these is satisfied. Each of these last equations represents a curve of the first order, or right line; and the original equation represents this pair of lines, viz., the pair of lines is considered as a quadric curve. But it is an *improper* quadric curve; and in speaking of curves of the second or any other given order, we frequently imply that the curve is a proper curve represented by an equation which does not break up.

The intersections of two curves are obtained by combining their equations; viz., the elimination from the two equations of y (or x) gives for x (or y) an equation of a certain order, say the resultant equation; and then to each value of x (or y) satisfying this equation there corresponds in general a single value of y (or x), and consequently a single point of intersection; the number of intersections is thus equal to the order of the resultant equation in x (or y).

Supposing that the two curves are of the orders m, n, respectively, then the order of the resultant equation is in general and at most $=mn$; in particular, if the curve of the order n is an arbitrary line $(n=1)$, then the order of the resultant equation is $=m$; and the curve of the order m meets therefore the line in m points. But the resultant equation may have all or any of its roots imaginary, and it is thus not always that there are m real intersections.

The notion of imaginary intersections, thus presenting itself, through algebra, in geometry, must be accepted in geometry—and it in fact plays an all-important part in modern geometry. As in algebra we say that an equation of the m-th order has m roots, viz., we state this generally without in the first instance, or it may be without ever, distinguishing whether these are real or imaginary; so in geometry we say that a curve of the m-th order is met by an arbitrary line in m points, or rather we thus, through algebra, obtain the proper geometrical definition of a curve of the m-th order, as a curve which is met by an arbitrary line in m points (that is, of course, in m, and not more than m, points).

The theorem of the m intersections has been stated in regard to an *arbitrary* line; in fact, for particular lines the resultant equation may be or appear to be of an order less than m; for instance, taking $m=2$, if the hyperbola $xy-1=0$ be cut by the line $y=\beta$, the resultant equation in x is $\beta x-1=0$, and there is apparently only the intersection $(x=\frac{1}{\beta}, y=\beta)$; but the theorem is, in fact, true for every line whatever: a curve of the order m meets every line whatever in precisely m points. We have, in the case just referred to, to take account of a point at infinity on the

[1] There is no exercise more profitable for a student than that of tracing a curve from its equation, or say rather that of so tracing a considerable number of curves. And he should make the equations for himself. The equation should be in the first instance a purely numerical one, where y is given or can be found as an explicit function of x; here, by giving different numerical values to x, the corresponding values of y may be found; and a *sufficient* number of points being thus determined, the curve is traced by drawing a continuous line through these points. The next step should be to consider an equation involving literal coefficients; thus, after such curves as $y=x^3$, $y=x(x-1)(x-2)$, $y=(x-1)\sqrt{x-2}$, &c., he should proceed to trace such curves as $y=(x-a)(x-b)(x-c)$, $y=(x-a)\sqrt{x-b}$, &c., and endeavour to ascertain for what different relations of equality or inequality between the coefficients the curve will assume essentially or notably distinct forms. The purely numerical equations will present instances of nodes, cusps, inflexions, double tangents, asymptotes, &c.,—specialities which he should be familiar with before he has to consider their general theory. And he may then consider an equation such that neither coordinate can be expressed as an explicit function of the other of them (practically, an equation such as $x^3+y^3-3xy=0$, which requires the solution of a cubic equation, belongs to this class); the problem of tracing the curve here frequently requires special methods, and it may easily be such as to require and serve as an exercise for the powers of an advanced algebraist.

line $y=\beta$; the two intersections are the point $(x=\frac{1}{\beta}, y=\beta)$, and the point at infinity on the line $y=\beta$.

It is moreover to be noticed that the points at infinity may be all or any of them imaginary, and that the points of intersection, whether finite or at infinity, real or imaginary, may coincide two or more of them together, and have to be counted accordingly; to support the theorem in its universality, it is necessary to take account of these various circumstances.

The foregoing notion of a point at infinity is a very important one in modern geometry; and we have also to consider the paradoxical statement that in plane geometry, or say as regards the plane, infinity is a right line. This admits of an easy illustration in solid geometry. If with a given centre of projection, by drawing from it lines to every point of a given line, we project the given line on a given plane, the projection is a line, *i.e.*, this projection is the intersection of the given plane with the plane through the centre and the given line. Say the projection is *always* a line, then if the figure is such that the two planes are parallel, the projection is the intersection of the given plane by a parallel plane, or it is the system of points at infinity on the given plane, that is, these points at infinity are regarded as situate on a given line, the line infinity of the given plane.[1]

Reverting to the purely plane theory, infinity is a line, related like any other right line to the curve, and thus intersecting it in m points. real or imaginary, distinct or coincident.

Descartes in the *Géométrie* defined and considered the remarkable curves called after him ovals of Descartes, or simply Cartesians, which will be again referred to. The next important work, founded on the *Géométrie*, was Sir Isaac Newton's *Enumeratio linearum tertii ordinis* (1706), establishing a classification of cubic curves founded chiefly on the nature of their infinite branches, which was in some details completed by Stirling, Murdoch, and Cramer; the work contains also the remarkable theorem (to be again referred to), that there are five kinds of cubic curves giving by their projections every cubic curve whatever.

Various properties of curves in general, and of cubic curves, are established in Maclaurin's memoir, "De linearum geometricarum proprietatibus generalibus Tractatus" (posthumous, say 1746, published in the 6th edition of his *Algebra*). We have in it a particular kind of *correspondence* of two points on a cubic curve, viz., two points correspond to each other when the tangents at the two points again meet the cubic in the same point.

The *Géométrie Descriptive* by Monge was written in the year 1794 or 1795 (7th edition, Paris, 1847), and in it we have stated, *in plano* with regard to the circle, and in three dimensions with regard to a surface of the second order, the fundamental theorem of reciprocal polars, viz., "Given a surface of the second order and a circumscribed conic surface which touches it . . . . then if the conic surface moves so that its summit is always in the same plane, the plane of the curve of contact passes always through the same point." The theorem is here referred to partly on account of its bearing on the theory of imaginaries in geometry. It is in Brianchon's memoir "Sur les surfaces du second degré" (*Jour. Polyt.*, t. vi. 1806) shown how for any given position of the summit the plane of contact is determined, or reciprocally; say the plane XY is determined when the point P is given, or reciprocally; and it is noticed that when P is situate in the interior of the surface the plane XY does not cut the surface; that is, we have a real plane XY intersecting the surface in the imaginary curve of contact of the imaginary circumscribed cone having for its summit a given real point P inside the surface.

Stating the theorem in regard to a conic, we have a real point P (called the pole) and a real line XY (called the polar), the line joining the two (real or imaginary) points of contact of the (real or imaginary) tangents drawn from the point to the conic; and the theorem is that when the point describes a line the line passes through a point, this line and point being polar and pole to each other. The term "pole" was first used by Servois, and "polar" by Gergonne (*Gerg.*, t. i. and iii., 1810-13); and from the theorem we have the method of reciprocal polars for the transformation of geometrical theorems, used already by Brianchon (in the memoir above referred to) for the demonstration of the theorem called by his name, and in a similar manner by various writers in the earlier volumes of Gergonne. We are here concerned with the method less in itself than as leading to the general notion of duality. And, bearing in a somewhat similar manner also on the theory of imaginaries in geometry (but the notion presents itself in a more explicit form), there is the memoir by Gaultier, on the graphical construction of circles and spheres (*Jour. Polyt.*, t. ix., 1813). The well-known theorem as to radical axes may be stated as follows. Consider two circles partially drawn so that it does not appear whether the circles, if completed, would or would not intersect in real points, say two arcs of circles; then we can, by means of a third circle drawn so as to intersect in two real points each of the two arcs, determine a right line, which, if the complete circles intersect in two real points, passes through the points, and which is on this account regarded as a line passing through two (real or imaginary) points of intersection of the two circles. The construction in fact is, join the two points in which the third circle meets the first arc, and join also the two points in which the third circle meets the second arc, and from the point of intersection of the two joining lines, let fall a perpendicular on the line joining the centre of the two circles; this perpendicular (considered as an indefinite line) is what Gaultier terms the "radical axis of the two circles;" it is a line determined by a real construction and itself always real; and by what precedes it is the line joining two (real or imaginary, as the case may be) intersections of the given circles.

The intersections which lie on the radical axis are two out of the four intersections of the two circles. The question as to the remaining two intersections did not present itself to Gaultier, but it is answered in Poncelet's *Traité des propriétés projectives* (1822), where we find (p. 49) the statement, "deux circles placés arbitrairement sur un plan . . . ont idéalement deux points imaginaires communs à l'infini;" that is, a circle *qua* curve of the second order is met by the line infinity in two points; but, more than this, they are the same two points for any circle whatever. The points in question have since been called (it is believed first by Dr Salmon) the circular points at infinity, or they may be called the circular points; these are also frequently spoken of as the points I, J; and we have thus the circle characterized as a conic which passes through the two circular points at infinity; the number of conditions thus imposed upon the conic is = 2, and there remain three arbitrary constants, which is the right number for the circle. Poncelet throughout his work makes continual use of the foregoing theories of imaginaries and infinity, and also of the before-mentioned theory of reciprocal polars.

Poncelet's two memoirs "Sur les centres des moyennes harmoniques," and "Sur la théorie générale des polaires réciproques," although presented to the Paris Academy in 1824, were only published (*Crelle*, t. iii. and iv., 1828,

[1] More generally, in solid geometry infinity is a plane,—its intersection with any given plane being the right line which is the infinity of this given plane.

1829), subsequent to the memoir by Gergonne, "Considerations philosophiques sur les élémens de la science de l'étendue" (*Gerg.*, t. xvi., 1825–26). In this memoir by Gergonne, the theory of duality is very clearly and explicitly stated; for instance, we find "dans la géométrie plane, à chaque théorème il en répond nécessairement un autre qui s'en déduit en échangeant simplement entre eux les deux mots *points* et *droites*; tandis que dans la géométrie de l'espace ce sont les mots *points* et *plans* qu'il faut échanger entre eux pour passer d'un théorème à son corrélatif;" and the plan is introduced of printing correlative theorems, opposite to each other, in two columns. There was a reclamation as to priority by Poncelet in the *Bulletin Universel* reprinted with remarks by Gergonne (*Gerg.*, t. xix., 1827), and followed by a short paper by Gergonne, "Rectifications de quelques théorèmes, &c.," which is important as first introducing the word *class*. We find in it explicitly the two correlative definitions :—"a plane curve is said to be of the mth degree (order) when it has with a line m real or ideal intersections," and "a plane curve is said to be of the mth class when from any point of its plane there can be drawn to it m real or ideal tangents."

It may be remarked that in Poncelet's memoir on reciprocal polars, above referred to, we have the theorem that the number of tangents from a point to a curve of the order m, or say the class of the curve, is in general and at most $= m(m-1)$, and that he mentions that this number is subject to reduction when the curve has double points or cusps.

The theorem of duality as regards plane figures may be thus stated :—two figures may correspond to each other in such manner that to each point and line in either figure there corresponds in the other figure a line and point respectively. It is to be understood that the theorem extends to all points or lines, drawn or not drawn; thus if in the first figure there are any number of points on a line drawn or not drawn, the corresponding lines in the second figure, produced if necessary, must meet in a point. And we thus see how the theorem extends to curves, their points and tangents : if there is in the first figure a curve of the order m, any line meets it in m points ; and hence from the corresponding point in the second figure there must be to the corresponding curve m tangents; that is, the corresponding curve must be of the class m.

Trilinear coordinates (to be again referred to) were first used by Bobillier in the memoir, "Essai sur un nouveau mode de recherche des propriétés de l'étendue" (*Gerg.*, t. xviii., 1827–28). It is convenient to use these rather than Cartesian coordinates. We represent a curve of the order m by an equation $(*\between x, y, z)^m = 0$, the function on the left hand being a homogeneous rational and integral function of the order m of the three coordinates (x, y, z); clearly the number of constants is the same as for the equation $(*\between x, y, 1)_m = 0$ in Cartesian coordinates.

The theory of duality is considered and developed, but chiefly in regard to its metrical applications, by Chasles in the "Mémoire de géométrie sur deux principes généraux de la science, la dualité, et l'homographie," which forms a sequel to the "Aperçu Historique sur l'origine et le développement des méthodes en Géométrie" (*Mem. de Brux.*, t. xi., 1837).

We now come to Plücker; his "six equations" were given in a short memoir in *Crelle* (1842) preceding his great work, the *Theorie der Algebraischen Curven* (1844).

Plücker first gave a scientific dual definition of a curve, viz., "A curve is a locus generated by a point, and enveloped by a line,—the point moving continuously along the line, while the line rotates continuously about the point;" the point is a point (ineunt) of the curve, the line is a tangent of the curve.

And, assuming the above theory of geometrical imaginaries, a curve such that m of its points are situate in an arbitrary line is said to be of the order m; a curve such that n of its tangents pass through an arbitrary point is said to be of the class n; as already appearing, this notion of the order and class of a curve is, however, due to Gergonne. Thus the line is a curve of the order 1 and class 0; and correspondingly dually thereto, we have the point as a curve of the order 0 and class 1.

Plücker moreover imagined a system of line-coordinates (tangential coordinates). The Cartesian coordinates (x, y) and trilinear coordinates (x, y, z) are point-coordinates for determining the position of a point; the new coordinates, say (ξ, η, ζ) are line-coordinates for determining the position of a line. It is possible, and (not so much for any application thereof as in order to more fully establish the analogy between the two kinds of coordinates) important, to give independent quantitative definitions of the two kinds of coordinates; but we may also derive the notion of line-coordinates from that of point-coordinates; viz., taking $\xi x + \eta y + \zeta z = 0$ to be the equation of a line, we say that (ξ, η, ζ) are the line-coordinates of this line. A linear relation $a\xi + b\eta + c\zeta = 0$ between these coordinates determines a point, viz., the point whose point-coordinates are (a, b, c); in fact, the equation in question $a\xi + b\eta + c\zeta = 0$ expresses that the equation $\xi x + \eta y + \zeta z = 0$, where (x, y, z) are current point-coordinates, is satisfied on writing therein $x, y, z = a, b, c$; or that the line in question passes through the point (a, b, c). Thus (ξ, η, ζ) are the line-coordinates of any line whatever; but when these, instead of being absolutely arbitrary, are subject to the restriction $a\xi + b\eta + c\zeta = 0$, this obliges the line to pass through a point (a, b, c); and the last-mentioned equation $a\xi + b\eta + c\zeta = 0$ is considered as the line-equation of this point.

A line has only a point-equation, and a point has only a line-equation; but any other curve has a point-equation and also a line-equation; the point-equation $(*\between x, y, z)^m = 0$ is the relation which is satisfied by the point-coordinates (x, y, z) of each point of the curve; and similarly the line-equation $(*\between \xi, \eta, \zeta)^n = 0$ is the relation which is satisfied by the line-coordinates (ξ, η, ζ) of each line (tangent) of the curve.

There is in analytical geometry little occasion for any explicit use of line-coordinates; but the theory is very important; it serves to show that in demonstrating by point-coordinates any purely descriptive theorem whatever, we demonstrate the correlative theorem; that is, we do not demonstrate the one theorem, and then (as by the method of reciprocal polars) deduce from it the other, but we do at one and the same time demonstrate the two theorems; our (x, y, z) instead of meaning point-coordinates may mean line-coordinates, and the demonstration is then in every step of it a demonstration of the correlative theorem.

The above dual generation explains the nature of the singularities of a plane curve. The ordinary singularities, arranged according to a cross division, are

	Proper.	*Improper.*
Point-singularities—	1. The stationary point, cusp, or spinode ;	2. The double point, or node ;
Line-singularities—	3. The stationary tangent, or inflexion ;	4. The double tangent :—

arising as follows :—

1. The cusp : the point as it travels along the line may come to rest, and then reverse the direction of its motion.
3. The stationary tangent : the line may in the course of its rotation come to rest, and then reverse the direction of its rotation.
2. The node : the point may in the course of its motion come to coincide with a former position of the point, the two positions of the line not in general coinciding.
4. The double tangent : the line may in the course of its motion come to coincide with a former position of the line, the two positions of the point not in general coinciding.

It may be remarked that we cannot with a real point and line obtain the node with two imaginary tangents (conjugate or isolated point, or acnode), nor again the real double tangent with two imaginary points of contact; but this is of little consequence, since in the general theory the distinction between real and imaginary is not attended to.

The singularities (1) and (3) have been termed proper singularities, and (2) and (4) improper; in each of the first-mentioned cases there is a real singularity, or peculiarity in the motion; in the other two cases there is not; in (2) there is not when the point is first at the node, or when it is secondly at the node, any peculiarity in the motion; the singularity consists in the point coming twice into the same position; and so in (4) the singularity is in the line coming twice into the same position. Moreover (1) and (2) are, the former a proper singularity, and the latter an improper singularity, *as regards the motion of the point*; and similarly (3) and (4) are, the former a proper singularity, and the latter an improper singularity, *as regards the motion of the line*.

But as regards the representation of a curve by an equation, the case is very different.

First, if the equation be in point-coordinates, (3) and (4) are in a sense not singularities at all. The curve $(*\between x, y, z)^m = 0$, or general curve of the order m, has double tangents and inflexions; (2) presents itself as a singularity, for the equations $d_x(*\between x, y, z)^m = 0$, $d_y(*\between x, y, z)^m = 0$, $d_z(*\between x, y, z)^m = 0$, implying $(*\between x, y, z)^m = 0$), are not in general satisfied by any values (a, b, c) whatever of (x, y, z), but if such values exist, then the point (a, b, c) is a node or double point; and (1) presents itself as a further singularity or sub-case of (2), a cusp being a double point for which the two tangents become coincident.

In line-coordinates all is reversed:—(1) and (2) are not singularities; (3) presents itself as a sub-case of (4).

The theory of compound singularities will be referred to further on.

In regard to the ordinary singularities, we have

m,	the	order,	
n	,,	class,	
δ	,,	number of double points,	
κ	,,	,,	cusps,
τ	,,	,,	double tangents,
ι	,,	,,	inflexions;

and this being so, Plücker's "six equations" are

(1) $n = m(m-1) - 2\delta - 3\kappa$,

(2) $\iota = 3m(m-2) - 6\delta - 8\kappa$,

(3) $\tau = \frac{1}{2}m(m-2)(m^2-9) - (m^2-m-6)(2\delta+3\kappa) + 2\delta(\delta-1) + 6\delta\kappa + \frac{9}{2}\kappa(\kappa-1)$,

(4) $m = n(n-1) - 2\tau - 3\iota$,

(5) $\kappa = 3n(n-2) - 6\tau - 8\iota$,

(6) $\delta = \frac{1}{2}n(n-2)(n^2-9) - (n^2-n-6)(2\tau+3\iota) + 2\tau(\tau-1) + 6\tau\iota + \frac{9}{2}\iota(\iota-1)$.

It is easy to derive the further forms—

(7) $\iota - \kappa = 3(n-m)$,

(8) $2(\tau-\delta) = (n-m)(n+m-9)$,

(9) $\frac{1}{2}m(m+3) - \delta - 2\kappa = \frac{1}{2}n(n+3) - \tau - 2\iota$,

(10) $\frac{1}{2}(m-1)(m-2) - \delta - \kappa = \frac{1}{2}(n-1)(n-2) - \tau - \iota$,

(11, 12) $m^2 - 2\delta - 3\kappa = n^2 - 2\tau - 3\iota, = m+n$,—

the whole system being equivalent to three equations only; and it may be added that using α to denote the equal quantities $3m+\iota$ and $3n+\kappa$ everything may be expressed in terms of m, n, α. We have

$$\kappa = \alpha - 3n,$$
$$\iota = \alpha - 3m,$$
$$2\delta = m^2 - m + 8n - 3\alpha,$$
$$2\tau = n^2 - n + 8m - 3\alpha.$$

It is implied in Plücker's theorem that, $m, n, \delta, \kappa, \tau, \iota$ signifying as above in regard to any curve, then in regard to the reciprocal curve $n, m, \tau, \iota, \delta, \kappa$ will have the same significations, viz., for the reciprocal curve these letters denote respectively the order, class, number of nodes, cusps, double tangents, and inflexions.

The expression $\frac{1}{2}m(m+3) - \delta - 2\kappa$ is that of the number of the disposable constants in a curve of the order m with δ nodes and κ cusps (in fact that there shall be a node is 1 condition, a cusp 2 conditions) and the equation (9) thus expresses that the curve and its reciprocal contain each of them the same number of disposable constants.

For a curve of the order m, the expression $\frac{1}{2}m(m-1) - \delta - \kappa$ is termed the "deficiency" (as to this more hereafter); the equation (10) expresses therefore that the curve and its reciprocal have each of them the same deficiency.

The relations $m^2 - 2\delta - 3\kappa = n^2 - 2\tau - 3\iota, = m+n$, present themselves in the theory of envelopes, as will appear further on.

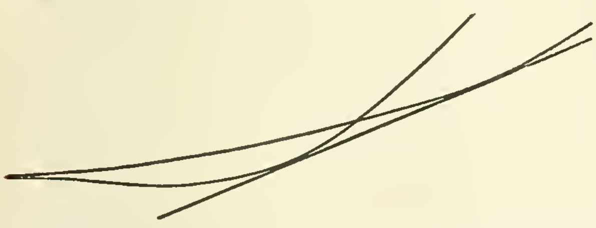
With regard to the demonstration of Plücker's equations it is to be remarked that we are not able to write down the equation in point-coordinates of a curve of the order m, having the given numbers δ and κ of nodes and cusps. We can only use the general equation $(*\between x, y, z)^m = 0$, say for shortness $u = 0$, of a curve of the mth order, which equation, so long as the coefficients remain arbitrary, represents a curve without nodes or cusps. Seeking then, for this curve, the values n, ι, τ of the class, number of inflexions, and number of double tangents,—first, as regards the class, this is equal to the number of tangents which can be drawn to the curve from an arbitrary point, or what is the same thing it is equal to the number of the points of contact of these tangents. The points of contact are found as the intersections of the curve $u = 0$ by a curve depending on the position of the arbitrary point, and called the "first polar" of this point; the order of the first polar is $= m - 1$, and the number of intersections is thus $= m(m-1)$. But it can be shown, analytically or geometrically, that if the given curve has a node, the first polar passes through this node, which therefore counts as two intersections, and that if the curve has a cusp, the first polar passes through the cusp, touching the curve there, and hence the cusp counts as three intersections. But, as is evident, the node or cusp is not a point of contact of a proper tangent from the arbitrary point; we have, therefore, for a node a diminution 2, and for a cusp a diminution 3, in the number of the intersections; and thus, for a curve with δ nodes and κ cusps, there is a diminution $2\delta + 3\kappa$, and the value of n is $n = m(m-1) - 2\delta - 3\kappa$.

Secondly, as to the inflexions, the process is a similar one; it can be shown that the inflexions are the intersections of the curve by a derivative curve called (after Hesse who first considered it) the Hessian, defined geometrically as the locus of a point such that its conic polar in regard to the curve breaks up into a pair of lines, and which has an equation $\mathrm{H} = 0$, where H is the determinant formed with the second differential coefficients of u in regard to the variables (x, y, z); $\mathrm{H} = 0$ is thus a curve of the order $3(m-2)$, and the number of inflexions is $= 3m(m-2)$. But if the given curve has a node, then not only the Hessian passes through the node, but it has there a node the two branches at which touch respectively the two branches of the curve; and the node thus counts as six intersections; so if the curve has a cusp, then the Hessian not only passes through the cusp, but it has there a cusp through which it again passes, that is, there is a cuspidal branch touching the cuspidal branch of the curve, and besides a simple branch passing through the cusp, and hence the cusp counts as eight intersections. The node or cusp is not an inflexion, and we have thus for a node a diminution 6, and for a cusp a diminution 8, in the number of the intersections; hence for a curve with δ nodes and κ cusps, the diminution is $= 6\delta + 8\kappa$, and the number of inflexions is $\iota = 3m(m-2) - 6\delta - 8\kappa$.

Thirdly, for the double tangents; the points of contact of these are obtained as the intersections of the curve by a curve $\Pi = 0$, which has not as yet been geometrically defined, but which is found analytically to be of the order $(m-2)(m^2-9)$; the number of intersections is thus $= m(m-2)(m^2-9)$; but if the given curve has a node then there is a diminution $= 4(m^2-m-6)$, and if it has a cusp then there is a diminution $= 6(m^2-m-6)$, where, however, it is to be noticed that the factor $(m^2 - m - 6)$ is in the case of a curve having only a node or only a cusp the number of the tangents which can be drawn from the node or cusp to the curve, and is used as denoting the number of these tangents, and ceases to be the correct expression if the number of nodes and cusps is greater than unity. Hence, in the case of a curve which has δ nodes and κ cusps, the apparent diminution $2(m^2 - m - 6)(2\delta + 3\kappa)$ is too great, and it has in fact to be diminished by $2\{2\delta(\delta - 1) + 6\delta\kappa + \frac{9}{2}\kappa(\kappa - 1)\}$, or the half thereof is 4 for each pair of nodes, 6 for each combination of a node and cusp, and 9 for each pair of cusps. We have thus finally an expression for $2\tau, = m(m-2)(m^2-9) - \&c.$; or dividing the whole by 2, we have the expression for τ given by the third of Plücker's equations.

It is obvious that we cannot by consideration of the equation $u = 0$ in point-coordinates obtain the remaining three of Plücker's equations; they might be obtained in a precisely analogous manner by means of the equation $v = 0$ in line-coordinates, but they follow at once from the principle of duality, viz., they are obtained by the mere interchange of m, δ, κ with n, τ, ι respectively.

To complete Plücker's theory it is necessary to take account of compound singularities; it might be possible, but it is at any rate difficult to effect this by considering the curve as in course of description by the point moving along the rotating line; and it seems easier to consider the compound singularity as arising from the variation of an actually described curve with ordinary singularities. The most simple case is when three double points come into coincidence, thereby giving rise to a triple point; and a somewhat more complicated one is when we have a cusp of the second kind, or node-cusp arising from the coincidence of a node, a cusp, an inflexion, and a double tangent, as shown in the annexed figure, which represents the



singularities as on the point of coalescing. The general conclusion (see Cayley, *Quart. Math. Jour.*, t. vii., 1866, "On the higher singularities of plane curves") is that every singularity whatever may be considered as compounded of ordinary singularities, say we have a singularity $= \delta'$ nodes, κ' cusps, τ' double tangents, and ι' inflexions. So that, in fact, Plücker's equations properly understood apply to a curve with any singularities whatever.

By means of Plücker's equations we may form a table—

m	n	δ	κ	τ	ι
0	1	–	–	0	0
1	0	0	0	–	–
2	2	0	0	0	0
3	6	0	0	0	9
,,	4	1	0	0	3
,,	3	0	1	0	1
4	12	0	0	28	24
,,	10	1	0	16	18
,,	9	0	1	10	16
,,	8	2	0	8	12
,,	7	1	1	4	10
,,	6	0	2	1	8
,,	6	3	0	4	6
,,	5	2	1	2	4
,,	4	1	2	1	2
,,	3	0	3	1	0

The table is arranged according to the value of m; and we have $m = 0$, $n = 1$, the point; $m = 1$, $n = 0$, the line; $m = 2$, $n = 2$, the conic; of $m = 3$, the cubic, there are three cases, the class being 6, 4, or 3, according as the curve is without singularities, or as it has 1 node, or 1 cusp; and so of $m = 4$, the quartic, there are nine cases, where observe that in *two* of them the class is $= 6$,—the reduction of class arising from two cusps or else from three nodes. The nine cases may be also grouped together into four, according as the number of nodes and cusps $(\delta + \kappa)$ is $= 0$, 1, 2, or 3.

The cases may be divided into sub-cases, by the consideration of compound singularities; thus when $m = 4$, $n = 6$, $= 3$, the three nodes may be all distinct, which is the general case, or two of them may unite together into the singularity called a tacnode, or all three may unite together into a triple point, or else into an oscnode.

We may further consider the inflexions and double tangents, as well in general as in regard to cubic and quartic curves.

The expression for the number of inflexions $3m(m-2)$ for a curve of the order m was obtained analytically by Plücker, but the theory was first given in a complete form by Hesse in the two papers "Ueber die Elimination, u.s.w.," and "Ueber die Wendepuncte der Curven dritter Ordnung" (*Crelle*, t. xxviii., 1844); in the latter of these the points of inflexion are obtained as the intersections of the curve $u = 0$ with the Hessian, or curve $\Delta = 0$, where Δ is the determinant formed with the second derived functions of u. We have in the Hessian the first instance of a covariant of a ternary form. The whole theory of the inflexions of a cubic curve is discussed in a very interesting manner by means of the canonical form of the equation $x^3 + y^3 + z^3 + 6lxyz = 0$; and in particular a proof is given of Plücker's theorem that the nine points of inflexion of a cubic curve lie by threes in twelve lines.

It may be noticed that the nine inflexions of a cubic curve are three real, six imaginary; the three real inflexions lie in a line, as was known to Newton and Maclaurin. For an acnodal cubic the six imaginary inflexions disappear, and there remain three real inflexions lying in a line. For a crunodal cubic, the six inflexions which disappear are two of them real, the other four imaginary, and there remain two imaginary inflexions and one real inflexion. For a cuspidal cubic the six imaginary inflexions and two of the real inflexions disappear, and there remains one real inflexion.

A quartic curve has 24 inflexions; it was conjectured by Salmon, and has been verified recently by Zeuthen, that at most 8 of these are real.

The expression $\frac{1}{2}m(m-2)(m^2-9)$ for the number of double tangents of a curve of the order m was obtained by Plücker only as a consequence of his first, second, fourth, and fifth equations. An investigation by means of the curve $\Pi = 0$, which by its intersections with the given curve determines the points of contact of the double tangents, is indicated by Cayley, "Recherches sur l'élimination et la théorie des courbes" (*Crelle*, t. xxxiv., 1847), and in part carried out by Hesse in the memoir "Ueber Curven dritter Ordnung" (*Crelle*, t. xxxvi., 1848). A better process was indicated by Salmon in the "Note on the double tangents to plane curves," *Phil. Mag.*, 1858; considering the $m - 2$ points in which any tangent to the curve again meets the curve, he showed how to form the equation of a curve of the order $(m-2)$, giving by its intersection with the tangent the points in question; making the tangent touch this curve of the order $(m-2)$, it will be a double tangent of the original curve. See Cayley, "On the Double Tangents of a Plane Curve" (*Phil. Trans.*, t. cxlviii., 1858), and Dersch (*Math. Ann.*, t. vii., 1874). The solution is still in so far incomplete that we have no properties of the curve $\Pi=0$, to distinguish one such curve from the several other curves which pass through the points of contact of the double tangents.

A quartic curve has 28 double tangents, their points of contact determined as the intersections of the curve by a curve $\Pi=0$ of the order 14, the equation of which in a very elegant form was first obtained by Hesse (1849). Investigations in regard to them are given by Plücker in the *Theorie der Algebraischen Curven*, and in two memoirs by Hesse and Steiner (*Crelle*, t. xlv., 1855), in respect to the triads of double tangents which have their points of contact on a conic, and other like relations. It was assumed by Plücker that the number of real double tangents might be 28, 16, 8, 4, or 0, but Zeuthen has recently found that the last case does not exist.

The Hessian Δ has just been spoken of as a covariant of the form u; the notion of invariants and covariants belongs rather to the form u than to the curve $u=0$ represented by means of this form; and the theory may be very briefly referred to. A curve $u=0$ may have some invariantive property, viz., a property independent of the particular axes of coordinates used in the representation of the curve by its equation; for instance, the curve may have a node, and in order to this, a relation, say $A=0$, must exist between the coefficients of the equation; supposing the axes of coordinates altered, so that the equation becomes $u'=0$, and writing $A'=0$ for the relation between the new co-efficients, then the relations $A=0$, $A'=0$, as two different expressions of the same geometrical property, must each of them imply the other; this can only be the case when A, A′ are functions differing only by a constant factor, or say, when A is an invariant of u. If, however, the geometrical property requires two or more relations between the coefficients, say $A=0$, $B=0$, &c., then we must have between the new coefficients the like relations, $A'=0$, $B'=0$, &c., and the two systems of equations must each of them imply the other; when this is so, the system of equations, $A=0$, $B=0$, &c., is said to be invariantive, but it does not follow that A, B, &c., are of necessity invariants of u. Similarly, if we have a curve $U=0$ derived from the curve $u=0$ in a manner independent of the particular axes of co-ordinates, then from the transformed equation $u'=0$ deriving in like manner the curve $U'=0$, the two equations $U=0$, $U'=0$ must each of them imply the other; and when this is so, U will be a covariant of u. The case is less frequent, but it may arise, that there are covariant systems $U=0$, $V=0$ &c., and $U'=0$, $V'=0$, &c., each implying the other, but where the functions U, V, &c., are not of necessity covariants of u.

The theory of the invariants and covariants of a ternary cubic function u has been studied in detail, and brought into connection with the cubic curve $u=0$; but the theory of the invariants and covariants for the next succeeding case, the ternary quartic function, is still very incomplete.

In further illustration of the Plückerian dual generation of a curve, we may consider the question of the *envelope* of a variable curve. The notion is very probably older, but it is at any rate to be found in Lagrange's *Théorie des Fonctions analytiques* (1798); it is there remarked that the equation obtained by the elimination of the parameter a from an equation $f(x, y, a)=0$ and the derived equation in respect to a is a curve, the envelope of the series of curves represented by the equation $f(x, y, a)=0$ in question. To develop the theory, consider the curve corresponding to any particular value of the parameter; this has with the consecutive curve (or curve belonging to the consecutive value of the parameter) a certain number of intersections, and of common tangents, which may be considered as the tangents at the intersections; and the so-called envelope is the curve which is at the same time generated by the points of intersection and enveloped by the common tangents; we have thus a dual generation. But the question needs to be further examined. Suppose that in general the variable curve is of the order m with δ nodes and κ cusps, and therefore of the class n with τ double tangents and ι inflexions, $m, n, \delta, \kappa, \tau, \iota$ being connected by the Plückerian equations,—the number of nodes or cusps may be greater for particular values of the parameter, but this is a speciality which may be here disregarded. Considering the variable curve corresponding to a given value of the parameter, or say simply the variable curve, the consecutive curve has then also δ and κ nodes and cusps, consecutive to those of the variable curve; and it is easy to see that among the intersections of the two curves we have the nodes each counting twice, and the cusps each counting three times; the number of the remaining intersections is $=m^2-2\delta-3\kappa$. Similarly among the common tangents of the two curves we have the double tangents each counting twice, and the stationary tangents each counting three times, and the number of the remaining common tangents is $=n^2-2\tau-3\iota$ ($=m^2-2\delta-3\kappa$, inasmuch as each of these numbers is as was seen $=m+n$). At any one of the $m^2-2\delta-3\kappa$ points the variable curve and the consecutive curve have tangents distinct from, yet infinitesimally near to each other, and each of these two tangents is also infinitesimally near to one of the $n^2-2\tau-3\iota$ common tangents of the two curves; whence, attending only to the variable curve, and considering the consecutive curve as coming into actual coincidence with it, the $n^2-2\tau-3\iota$ common tangents are the tangents to the variable curve at the $m^2-2\delta-3\kappa$ points respectively, and the envelope is at the same time generated by the $m^2-2\delta-3\kappa$ points, and enveloped by the $n^2-2\tau-3\iota$ tangents; we have thus a dual generation of the envelope, which only differs from Plücker's dual generation, in that in place of a single point and tangent we have the group of $m^2-2\delta-3\kappa$ points and $n^2-2\tau-3\iota$ tangents.

The parameter which determines the variable curve may be given as a point upon a given curve, or say as a parametric point; that is, to the different positions of the parametric point on the given curve correspond the different variable curves, and the nature of the envelope will thus depend on that of the given curve; we have thus the envelope as a derivative curve of the given curve. Many well-known derivative curves present themselves in this manner; thus the variable curve may be the normal (or line at right angles to the tangent) at any point of the given curve; the intersection of the consecutive normals is the centre of curvature; and we have the evolute as at once the locus of the centre of curvature and the envelope of the normal. It may be added that the given curve is one of a series of curves, each cutting the several normals at right angles. Any one of these is a "parallel" of the given curve; and it can be obtained as the envelope of a circle of constant radius having its centre on the given curve. We have in like manner, as derivatives of a given curve, the caustic, catacaustic, or diacaustic, as the case may be, and the secondary caustic, or curve cutting at right angles the reflected or refracted rays.

We have in much that precedes disregarded, or at least been indifferent to, reality; it is only thus that the conception of a curve of the m-th order, as one which is met by every right line in m points, is arrived at; and the curve itself, and the line which cuts it, although both are tacitly assumed to be real, may perfectly well be imaginary. For real figures we have the general theorem that imaginary intersections, &c., present themselves in conjugate pairs; hence, in particular, that a curve of an even order is met by a line in an even number (which may be $=0$) of points; a curve of an odd order in an odd number of points, hence in one point at least; it will be seen further on that the theorem may be generalized in a remarkable manner. Again, when there is in question only one pair of points or lines, these, if coincident, must be real; thus, a line meets a cubic curve in three points, one of them real, the other two real or imaginary; but if two of the intersections coincide they must be real, and we have a line cutting a cubic in one real point and touching it in another real point. It may be remarked that this is a limit separating the two cases where the intersections are all real, and where they are one real, two imaginary.

Considering always real curves, we obtain the notion of a branch; any portion capable of description by the continuous motion of a point is a branch; and a curve consists of one or more branches. Thus the curve of the first order or right line consists of one branch; but in curves of the second order, or conics, the ellipse and the parabola consist each of one branch, the hyperbola of two branches. A branch is either re-entrant, or it extends both ways to infinity, and in this case, we may regard it as consisting of two legs (*crura*, Newton), each extending one way to infinity, but without any definite separation. The branch, whether re-entrant or infinite, may have a cusp or cusps, or it may cut itself or another branch, thus having or giving rise to crunodes; an acnode is a branch by itself,—it may be considered as an indefinitely small re-entrant branch. A branch may have inflexions and double tangents, or there may be double tangents which touch two distinct branches; there are also double tangents with imaginary points of contact, which are thus lines having no visible connection with the curve. A re-entrant branch not cutting itself may be everywhere convex, and it is then properly said to be an oval; but the term oval may be used more generally for any re-entrant branch not cutting itself; and we may thus speak of a once indented, twice indented oval, &c., or even of a cuspidate oval. Other descriptive names for ovals and re-entrant branches cutting themselves may be used when required; thus, in the last-mentioned case a simple form is that of a figure of eight; such a form may break up into two ovals, or into a doubly indented oval or hour-glass. A form which presents itself is when two ovals, one inside the other, unite, so as to give rise to a crunode—in default of a better name this may be called, after the curve of that name, a limaçon. Names may also be used for the different forms of infinite branches, but we have first to consider the distinction of hyperbolic and parabolic. The leg of an infinite branch may have at the extremity a tangent; this is an asymptote of the curve, and the leg is then hyperbolic; or the leg may tend to a fixed direction, but so that the tangent goes further and further off to infinity, and the leg is then parabolic; a branch may thus be hyperbolic or parabolic as to its two legs; or it may be hyperbolic as to one leg, and parabolic as to the other. The epithets hyperbolic and parabolic are of course derived from the conic hyperbola and parabola respectively. The nature of the two kinds of branches is best understood by considering them as projections, in the same way as we in effect consider the hyperbola and the parabola as projections of the ellipse. If a line Ω cut an arc aa', so that the two segments ab, ba' lie on opposite sides of the line, then projecting the figure so that the line Ω goes off to infinity, the tangent at b is projected into the asymptote, and the arc ab is projected into a hyperbolic leg touching the asymptote at one extremity; the arc ba' will at the same time be projected into a hyperbolic leg touching the same asymptote at the other extremity (and on the opposite side), but so that the two hyperbolic legs may or may not belong to one and the same branch. And we thus see that the two hyperbolic legs belong to a simple intersection of the curve by the line infinity. Next, if the line Ω touch at b the arc aa' so that the two portions ab', ba lie on the same side of the line Ω, then projecting the figure as before, the tangent at b, that is, the line Ω itself, is projected to infinity; the arc ab is projected into a parabolic leg, and at the same time the arc ba' is projected into a parabolic leg, having at infinity the same direction as the other leg, but so that the two legs may or may not belong to the same branch. And we thus see that the two parabolic legs represent a contact of the line infinity with the curve,—the point of contact being of course the point at infinity determined by the common direction of the two legs. It will readily be understood how the like considerations apply to other cases,—for instance, if the line Ω is a tangent at an inflexion, passes through a crunode, or touches one of the branches of a crunode, &c.; thus, if the line Ω passes through a crunode we have pairs of hyperbolic legs belonging to two parallel asymptotes. The foregoing considerations also show (what is very important) how different branches are connected together at infinity, and lead to the notion of a complete branch, or circuit.

The two legs of a hyperbolic branch may belong to different asymptotes, and in this case we have the forms which Newton calls inscribed, circumscribed, ambigene, &c.; or they may belong to the same asymptote, and in this case we have the serpentine form, where the branch cuts the asymptote, so as to touch it at its two extremities on opposite sides, or the conchoidal form, where it touches the asymptote on the same side. The two legs of a parabolic branch may converge to ultimate parallelism, as in the conic parabola, or diverge to ultimate parallelism, as in the semi-cubical parabola $y^2=x^3$, and the branch is said to be convergent, or divergent, accordingly; or they may tend to parallelism in opposite senses, as in the cubical parabola $y=x^3$. As mentioned with regard to a branch generally, an infinite branch of any kind may have cusps, or, by cutting itself or another branch, may have or give rise to a crunode, &c.

We may now consider the various forms of cubic curves, as appearing by Newton's *Enumeratio*, and by the figures belonging thereto. The species are reckoned as 72, which are numbered accordingly 1 to 72; but to these should be added 10^a, 13^a, 22^a, and 22^b. It is not intended here to consider the division into species, nor even completely that into genera, but only to explain the principle of classification. It may be remarked generally that there are at most three infinite branches, and that there may besides be a re-entrant branch or oval.

The genera may be arranged as follows :—

1, 2, 3, 4	redundant hyperbolas
5, 6	defective hyperbolas
7, 8	parabolic hyperbolas
9	hyperbolisms of hyperbola
10	„ „ ellipse
11	„ „ parabol
12	trident curve
13	divergent parabolas
14	cubic parabola;

and thus arranged they correspond to the different relations of the line infinity to the curve. First, if the three intersections by the line infinity are all distinct, we have the hyperbolas; if the points are real, the redundant hyperbolas, with three hyperbolic branches; but if only one of them is real, the defective hyperbolas, with one hyperbolic branch. Secondly, if two of the intersections coincide, say if the line infinity meets the curve in a onefold point and a twofold point, both of them real, then there is always one asymptote: the line infinity may at the twofold point touch the curve, and we have the parabolic hyperbolas; or the twofold point may be a singular point,—viz., a crunode giving the hyperbolisms of the hyperbola; an acnode, giving the hyperbolisms of the ellipse; or a cusp, giving the hyperbolisms of the parabola. As regards the so-called hyperbolisms, observe that (besides the single asymptote) we have in the case of those of the hyperbola two parallel asymptotes; in the case of those of the ellipse the two parallel asymptotes become imaginary, that is, they disappear; and in the case of those of the parabola they become coincident, that is, there is here an ordinary asymptote, and a special asymptote answering to a cusp at infinity. Thirdly, the three intersections by the line infinity may be coincident and real; or say we have a threefold point: this may be an inflexion, a crunode, or a cusp, that is, the line infinity may be a tangent at an inflexion, and we have the divergent parabolas; a tangent at a crunode to one branch, and we have the trident curve; or lastly, a tangent at a cusp, and we have the cubical parabola.

It is to be remarked that the classification mixes together non-singular and singular curves, in fact, the five kinds presently referred to: thus the hyperbolas and the divergent parabolas include curves of every kind, the separation being made in the species; the hyperbolisms of the hyperbola and ellipse, and the trident curve, are nodal; the hyperbolisms of the parabola, and the cubical parabola, are cuspidal. The divergent parabolas are of five species which respectively belong to and determine the five kinds of cubic curves; Newton gives (in two short paragraphs without any development) the remarkable theorem that the five divergent parabolas by their shadows generate and exhibit all the cubic curves.

The five divergent parabolas are curves each of them symmetrical with regard to an axis. There are two non-singular kinds, the one with, the other without, an oval, but each of them has an infinite (as Newton describes it) *campaniform* branch; this cuts the axis at right angles, being at first convex, but ultimately concave, towards the axis, the two legs continually tending to become at right angles to the axis. The oval may unite itself with the infinite branch, or it may dwindle into a point, and we have the crunodal and the acnodal forms respectively; or if simultaneously the oval dwindles into a point and unites itself to the infinite branch, we have the cuspidal form. Drawing a line to cut any one of these curves and projecting the line to infinity, it would not be difficult to show how the line should be drawn in order to obtain a curve of any given species. We have herein a better principle of classification; considering cubic curves, in the first instance, according to singularities, the curves are non-singular, nodal (viz., crunodal or acnodal), or cuspidal; and we see further that there are two kinds of non-singular curves, the complex and the simplex. There is thus a complete division into the five kinds, the complex, simplex, crunodal, acnodal, and cuspidal. Each singular kind presents itself as a limit separating two kinds of inferior singularity; the cuspidal separates the crunodal and the acnodal, and these last separate from each other the complex and the simplex.

The whole question is discussed very fully and ably by Möbius in the memoir "Ueber die Grundformen der Linien dritter Ordnung" (*Abh. der K. Sachs. Ges. zu Leipzig*, t. i., 1852). The author considers not only plane curves, but also cones, or, what is almost the same thing, the spherical curves which are their sections by a concentric sphere. Stated in regard to the cone, we have there the fundamental theorem that there are two different kinds of sheets: viz., the single sheet, not separated into two parts by the vertex (an instance is afforded by the plane considered as a cone of the first order generated by the motion of a line about a point), and the double or twin-pair sheet, separated into two parts by the vertex (as in the cone of the second order.) And it then appears that there are two kinds of non-singular cubic cones, viz., the simplex, consisting of a single sheet, and the complex, consisting of a single sheet and a twin-pair sheet; and we thence obtain (as for cubic curves) the crunodal, the acnodal, and the cuspidal kinds of cubic cones. It may be mentioned that the single sheet is a sort of wavy form, having upon it three lines of inflexion, and which is met by any plane through the vertex in one or in three lines; the twin-pair sheet has no lines of inflexion, and resembles in its form a cone on an oval base.

In general a cone consists of one or more single or twin-pair sheets, and if we consider the section of the cone by a plane, the curve consists of one or more complete branches, or say circuits, each of them the section of one sheet of the cone; thus, a cone of the second order is one twin-pair sheet, and any section of it is one circuit composed, it may be, of two branches. But although we thus arrive by projection at the notion of a circuit, it is not necessary to go out of the plane, and we may (with Zeuthen, using the shorter term *circuit* for his *complete branch*) define a circuit as any portion (of a curve) capable of description by the continuous motion of a point, it being understood that a passage through infinity is permitted. And we then say that a curve consists of one or more circuits; thus the right line, or curve of the first order, consists of one circuit; a curve of the second order consists of one circuit; a cubic curve consists of one circuit or else of two circuits.

A circuit is met by any right line always in an even number, or always in an odd number, of points, and it is said to be an even circuit or an odd circuit accordingly; the right line is an odd circuit, the conic an even circuit. And we have then the theorem, two odd circuits intersect in an odd number of points; an odd and an even circuit, or two even circuits, in an even number of points. An even circuit not cutting itself divides the plane into two parts, the one called the internal part, incapable of containing any odd circuit, the other called the external part, capable of containing an odd circuit.

We may now state in a more convenient form the fundamental distinction of the kinds of cubic curve. A non-singular cubic is simplex, consisting of one odd circuit, or it is complex, consisting of one odd circuit and one even circuit. It may be added that there are on the odd circuit three inflexions, but on the even circuit no inflexion; it hence also appears that from any point of the odd circuit there can be drawn to the odd circuit two tangents, and to the even circuit (if any) two tangents, but that from a point of the even circuit there cannot be drawn (either to the odd or the even circuit) any real tangent; consequently, in a simplex curve the number of tangents from any point is two; but in a complex curve the number is four, or none,—four if the point is on the odd circuit, none if it is on the even circuit. It at once appears from inspection of the figure of a non-singular cubic curve, which is the odd and which the even circuit. The singular kinds arise as before; in the crunodal and the cuspidal kinds the whole curve is an odd circuit, but in the acnodal kind the acnode must be regarded as an even circuit.

The analogous question of the classification of quartics (in particular non-singular quartics and nodal quartics) is considered in Zeuthen's memoir "Sur les differentes formes des courbes planes du quatrième ordre" (*Math. Ann.*, t. vii., 1874). A non-singular quartic has only even circuits; it has at most four circuits external to each other, or two circuits one internal to the other, and in this last case the internal circuit has no double tangents or inflexions. A very remarkable theorem is established as to the double tangents of such a quartic:—distinguishing as a double tangent of the first kind a real double tangent which either twice touches the same circuit, or else touches the curve in two imaginary points, the number of the double tangents of the first kind of a non-singular quartic is $= 4$; it follows that the quartic has at most 8 real inflexions. The forms of the non-singular quartics are very numerous, but it is not necessary to go further into the question.

We may consider in relation to a curve, not only the line infinity, but also the circular points at infinity; assuming the curve to be real, these present themselves always conjointly; thus a circle is a conic passing through the two circular points, and is thereby distinguished from other conics. Similarly a cubic through the two circular points is termed a circular cubic; a quartic through the two points is termed a circular quartic, and if it passes twice through each of them, that is, has each of them for a node, it is termed a bicircular quartic. Such a quartic is of course binodal ($m=4$, $\delta=2$, $\kappa=0$); it has not in general, but it may have, a third node, or a cusp. Or again, we may have a quartic curve having a cusp at each of the circular points: such a curve is a "Cartesian," it being a complete definition of the Cartesian to say that it is a bicuspidal quartic curve ($m=4$, $\delta=0$, $\kappa=2$), having a cusp at each of the circular points. The circular cubic and the bicircular quartic, together with the Cartesian (being in one point of view a particular case thereof), are interesting curves which have been much studied, generally, and in reference to their *focal* properties.

The points called *foci* presented themselves in the theory of the conic, and were well known to the Greek geometers, but the general notion of a focus was first established by Plücker (in the memoir "Ueber solche Puncte die bei Curven einer höheren Ordnung den Brennpuncten der Kegelschnitte entsprechen" (*Crelle*, t. x., 1833). We may from each of the circular points draw tangents to a given curve; the intersection of two such tangents (belonging of course to the two circular points respectively) is a focus. There will be from each circular point λ tangents (λ, a number depending on the class of the curve and its relation to the line infinity and the circular points, $=2$ for the general conic, 1 for the parabola, 2 for a circular cubic, or bicircular quartic, &c.); the λ tangents from the one circular point and those from the other circular point intersect in λ real foci (viz., each of these is the only real point on each of the tangents through it), and in $\lambda^2-\lambda$ imaginary foci; each pair of real foci determines a pair of imaginary foci (the so-called antipoints of the two real foci), and the $\frac{1}{2}\lambda(\lambda-1)$ pairs of real foci thus determine the $\lambda^2-\lambda$ imaginary foci. There are in some cases points termed centres, or singular or multiple foci (the nomenclature is unsettled), which are the intersections of improper tangents from the two circular points respectively; thus, in the circular cubic, the tangents to the curve at the two circular points respectively (or two imaginary asymptotes of the curve) meet in a centre.

The notions of *distance* and of lines *at right angles* are connected with the circular points; and almost every construction of a curve by means of lines of a determinate length, or at right angles to each other, and (as such) mechanical constructions by means of linkwork, give rise to curves passing the same definite number of times through the two circular points respectively, or say to circular curves, and in which the fixed centres of the construction present themselves as ordinary, or as singular, foci. Thus the general curve of three bar-motion (or locus of the vertex of a triangle, the other two vertices whereof move on fixed circles) is a tricircular sextic, having besides three nodes ($m=6$, $\delta=3+3+3$, $=9$), and having the centres of the fixed circles each for a singular focus; there is a third singular focus, and we have thus the remarkable theorem (due to Mr S. Roberts) of the triple generation of the curve by means of the three several pairs of singular foci.

Again, the normal, *qua* line at right angles to the tangent, is connected with the circular points, and these accordingly present themselves in the before-mentioned theories of evolutes and parallel curves.

We have several recent theories which depend on the notion of *correspondence*: two points whether in the same plane or in different planes, or on the same curve or in different curves, may determine each other in such wise that to any given position of the first point there correspond α' positions of the second point, and to any given position of the second point α positions of the first point; the two points have then an (α,α') correspondence; and if α,α' are each $=1$, then the two points have a (1, 1) or rational correspondence. Connecting with each theory the author's name, the theories in question are—Riemann, the rational transformation of a plane curve; Cremona, the rational transformation of a plane; and Chasles, correspondence of points on the same curve, and united points. The theory first referred to, with the resulting notion of Geschlecht, or *deficiency*, is more than the other two an essential part of the theory of curves, but they will all be considered.

Riemann's results are contained in the memoirs on "Abelian Integrals," &c. (*Crelle*, t. liv., 1857), and we have next Clebsch, "Ueber die Singularitäten algebraischer Curven" (*Crelle*, t. lxv., 1865), and Cayley, "On the Transformation of Plane Curves" (*Proc. Lond. Math. Soc.*, t. i., 1865). The fundamental notion of the rational transformation is as follows:—

Taking u, X,Y,Z to be rational and integral functions (X,Y,Z all of the same order) of the coordinates (x,y,z), and u', X′,Y′,Z′ rational and integral functions (X′,Y′,Z′ all of the same order) of the coordinates (x',y',z'), we transform a given curve $u=0$, by the equations $x':y':z'=X:Y:Z$, thereby obtaining a transformed curve $u'=0$, and a converse set of equations $x:y:z=X':Y':Z'$; viz., assuming that this is so, the point (x,y,z) on the curve $u=0$ and the point (x',y',z') on the curve $u'=0$ will be points having a (1,1) correspondence. To show how this is, observe that to a given point (x,y,z) on the curve $u=0$ there corresponds a single point (x',y',z') determined by the equations $x':y':z'=X:Y:Z$; from these equations and the equation $u=0$ eliminating x,y,z, we obtain the equation $u'=0$ of the transformed curve. To a given point (x',y',z') not on the curve $u'=0$ there corresponds, not a single point, but the system of points (x,y,z) given by the equations $x':y':z'=X:Y:Z$, viz., regarding x',y',z' as constants (and to fix the ideas, assuming that the curves $X=0, Y=0, Z=0$ have no common intersections), these are the points of intersection of the curves $X:Y:Z=x':y':z'$, but no one of these points is situate on the curve $u=0$. If, however, the point (x',y',z') is situate on the curve $u'=0$, then one point of the system of points in question is situate on the curve $u=0$, that is, to a given point of the curve $u'=0$ there corresponds a single point of the curve $u=0$; and hence also this point must be given by a system of equations such as $x:y:z=X':Y':Z'$.

It is an old and easily proved theorem that, for a curve of the order m, the number $\delta+\kappa$ of nodes and cusps is at most $=\frac{1}{2}(m-1)(m-2)$; for a given curve the deficiency of the actual number of nodes and cusps below this maximum number, viz., $\frac{1}{2}(m-1)(m-2)-\delta-\kappa$, is the "Geschlecht," or "deficiency," of the curve, say this is $=D$. When $D=0$, the curve is said to be unicursal, when $=1$, bicursal, and so on.

The general theorem is that two curves corresponding rationally to each other have the same deficiency. [In particular a curve and its reciprocal have this rational or (1, 1) correspondence, and it has been already seen that a curve and its reciprocal have the same deficiency.]

A curve of a given order can in general be rationally transformed into a curve of a lower order; thus a curve of any order for which $D=0$, that is, a unicursal curve, can be transformed into a line; a curve of any order having the deficiency 1 or 2 can be rationally transformed into a curve of the order $D+2$, deficiency D; and a curve of any order deficience $=$ or >3 can be rationally transformed into a curve of the order $D+3$, deficiency D.

Taking x',y',z' as coordinates of a point of the transformed curve, and in its equation writing $x':y':z'=1:\theta:\phi$ we have ϕ a certain irrational function of θ, and the theorem is that the coordinates x,y,z of any point of the given curve can be expressed as proportional to rational and integral functions of θ, ϕ, that is, of θ and a certain irrational function of θ.

In particular if $D=0$, that is, if the given curve be unicursal, the transformed curve is a line, ϕ is a mere linear function of θ, and the theorem is that the coordinates x,y,z of a point of the unicursal curve can be expressed as proportional to rational and integral functions of θ; it is easy to see that for a given curve of the order m, these functions of θ must be of the same order m.

If $D=1$, then the transformed curve is a cubic; it can be shown that in a cubic, the axes of coordinates being properly chosen, ϕ can be expressed as the square root of a quartic function of θ; and the theorem is that the coordinates x,y,z of a point of the bicursal curve can be expressed as proportional to rational and integral functions of θ, and of the square root of a quartic function of θ.

And so if $D=2$, then the transformed curve is a nodal quartic; ϕ can be expressed as the square root of a sextic function of θ, and the theorem is, that the coordinates x,y,z of a point of the tricursal curve can be expressed as proportional to rational and integral functions of θ, and of the square root of a sextic function of θ. But $D=3$, we have no longer the like law, viz. ϕ is not expressible as the square root of an octic function of θ.

Observe that the radical, square root of a quartic function, is connected with the theory of elliptic functions, and the radical, square root of a sextic function, with that of the first kind of Abelian functions, but that the next kind of Abelian functions does not depend on the radical, square root of an octic function.

It is a form of the theorem for the case $D=1$, that the coordinates x, y, z of a point of the bicursal curve, or in particular the coordinates of a point of the cubic, can be expressed as proportional to rational and integral functions of the elliptic functions sn$u$, cn$u$, dn$u$; in fact, taking the radical to be $\sqrt{1-\theta^2.1-k^2\theta^2}$, and writing $\theta=\text{sn}u$, the radical becomes $=\text{cn}u.\,\text{dn}u$; and we have expressions of the form in question.

It will be observed that the equations $x':y':z'=X:Y:Z$ before-mentioned do not of themselves lead to the other system of equations $x:y:z=X':Y':Z'$, and thus that the theory does not in anywise establish a (1, 1) correspondence between the points (x, y, z) and (x', y', z') of two planes or of the same plane; this is the correspondence of Cremona's theory.

In this theory, given in the memoirs "Sulle Trasformazioni geometriche delle Figure piani," *Mem. di Bologna*, t. ii. (1863) and t. v. (1865), we have a system of equations $x':y':z'=X:Y:Z$ which *does* lead to a system $x:y:z=X':Y':Z'$, where, as before, X,Y,Z denote rational and integral functions, all of the same order, of the coordinates x,y,z, and X',Y',Z' rational and integral functions, all of the same order, of the coordinates x',y',z', and there is thus a (1,1) correspondence given by these equations between the two points (x,y,z) and (x',y',z'). To explain this, observe that starting from the equations $x':y':z'=X:Y:Z$, to a given point (x,y,z) there corresponds one point (x',y',z'), but that if n be the order of the functions X,Y,Z, then to a given point x',y',z' there would, if the curves $X=0$, $Y=0$, $Z=0$ had no common intersections, correspond n^2 points (x,y,z). If, however, the functions are such that the curves $X=0$, $Y=0$, $Z=0$ have k common intersections, then among the n^2 points are included these k points, which are fixed points independent of the point (x',y',z'); so that, disregarding these fixed points, the number of points (x,y,z) corresponding to the given point (x',y',z') is $=n^2-k$; and in particular if $k=n^2-1$, then we have one corresponding point; and hence the original system of equations $x':y':z'=X:Y:Z$ must lead to the equivalent system $x:y:z=X':Y':Z'$; and in this system by the like reasoning the functions must be such that the curves $X'=0$, $Y'=0$, $Z'=0$ have n'^2-1 common intersections. The most simple example is in the two systems of equations $x':y':z'=yz:zx:xy$ and $x:y:z=y'z':z'x':x'y'$; where $yz=0$, $zx=0$, $xy=0$ are conics (pairs of lines) having three common intersections, and where obviously either system of equations leads to the other system. In the case where X,Y,Z are of an order exceeding 2 the required number n^2-1 of common intersections can only occur by reason of common multiple points on the three curves; and assuming that the curves $X=0$, $Y=0$, $Z=0$ have $a_1+a_2+a_3\ldots+a_{n-1}$ common intersections, where the a_1 points are ordinary points, the a_2 points are double points, the a_3 points are triple points, &c., on each curve, we have the condition

$$a_1+4a_2+9a_3+\ldots(n-1)^2a_{n-1}=n^2-1;$$

but to this must be joined the condition

$$a_1+3a_2+6a_3\ldots+\tfrac{1}{2}(n-1)(n-2)\,a_{n-1}=\tfrac{1}{2}n(n+3)-2,$$

(without which the transformation would be illusory); and the conclusion is that a_1, $a_2,\ldots a_{n-1}$ may be any numbers satisfying these two equations. It may be added that the two equations, together give

$$a_2+3a_3\ldots+\tfrac{1}{2}(n-1)(n-2)\,a_{n-1}=\tfrac{1}{2}\,(n-1)(n-2),$$

which expresses that the curves $X=0$, $Y=0$, $Z=0$ are unicursal. The transformation may be applied to any curve $u=0$, which is thus rationally transformed into a curve $u'=0$, by a rational transformation such as is considered in Riemann's theory: hence the two curves have the same deficiency.

Coming next to Chasles, the principle of correspondence is established and used by him in a series of memoirs relating to the conics which satisfy given conditions, and to other geometrical questions, contained in the *Comptes Rendus*, t. lviii. *et seq.* (1864 to the present time). The theorem of united points in regard to points in a right line was given in a paper, June–July 1864, and it was extended to unicursal curves in a paper of the same series (March 1866), "Sur les courbes planes ou à double courbure dont les points peuvent se déterminer individuellement—application du principe de correspondence dans la théorie de ces courbes."

The theorem is as follows: if in a unicursal curve two points have an (α,β) correspondence, then the number of united points (or points each corresponding to itself) is $=\alpha+\beta$. In fact in a unicursal curve the coordinates of a point are given as proportional to rational and integral functions of a parameter, so that any point of the curve is determined uniquely by means of this parameter; that is, to each point of the curve corresponds one value of the parameter, and to each value of the parameter one point on the curve; and the (α,β) correspondence between the two points is given by an equation of the form $(*\between\theta,1)^\alpha\ (\phi,1)^\beta=0$ between their parameters θ and ϕ; at a united point $\phi=\theta$, and the value of θ is given by an equation of the order $\alpha+\beta$. The extension to curves of any given deficiency D was made in the memoir of Cayley, "On the correspondence of two points on a curve,"—*Proc. Lond. Math. Soc.*, t. i.(1866),—viz., taking P,P' as the corresponding points in an (α,α') correspondence on a curve of deficiency D, and supposing that when P is given the corresponding points P' are found as the intersections of the curve by a curve Θ containing the coordinates of P as parameters, and having with the given curve k intersections at the point P, then the number of united points is $a=\alpha+\alpha'+2kD$; and more generally, if the curve Θ intersect the given curve in a set of points P' each p times, a set of points Q' each q times, &c., in such manner that the points (P,P') the points (P,Q') &c., are pairs of points corresponding to each other according to distinct laws; then if (P,P') are points having an (α,α') correspondence with a number $=a$ of united points, (P,Q') points having a (β,β') correspondence with a number $=b$ of united points, and so on, the theorem is that we have

$$p\,(a-\alpha-\alpha')+q(b-\beta-\beta')+\ldots=2kD.$$

The principle of correspondence, or say rather the theorem of united points, is a most powerful instrument of investigation, which may be used in place of analysis for the determination of the number of solutions of almost every geometrical problem. We can by means of it investigate the class of a curve, number of inflexions, &c.,—in fact, Plücker's equations; but it is necessary to take account of special solutions: thus, in one of the most simple instances, in finding the class of a curve, the cusps present themselves as special solutions.

Imagine a curve of order m, deficiency D, and let the corresponding points P,P' be such that the line joining them passes through a given point O; this is an $(m-1,m-1)$ correspondence, and the value of k is $=1$, hence the number of united points is $=2m-2+2D$; the united points are the points of contact of the tangents from O and (as special solutions) the cusps, and we have thus the relation $n+\kappa=2m-2+2D$; or, writing $D=\tfrac{1}{2}(m-1)(m-2)-\delta-\kappa$, this is $n=m(m-1)-2\delta-3\kappa$, which is right.

The principle in its original form as applying to a right line was used throughout by Chasles in the investigations on the number of the conics which satisfy given conditions, and on the number of solutions of very many other geometrical problems.

There is one application of the theory of the (α,α) correspondence between two planes which it is proper to notice.

Imagine a curve, real or imaginary, represented by an equation (involving, it may be, imaginary coefficients) between the Cartesian coordinates u, u'; then, writing $u = x + iy$, $u' = x' + iy'$, the equation determines real values of (x, y), and of (x', y'), corresponding to any given real values of (x', y') and (x, y) respectively; that is, it establishes a real correspondence (not of course a rational one) between the points (x, y) and (x', y'); for example in the imaginary circle $u^2 + u'^2 = (a + bi)^2$, the correspondence is given by the two equations $x^2 - y^2 + x'^2 - y'^2 = a^2 - b^2$, $xy + x'y' = ab$. We have thus a means of geometrical representation for the portions, as well imaginary as real, of any real or imaginary curve. Considerations such as these have been used for determining the series of values of the independent variable, and the irrational functions thereof in the theory of Abelian integrals, but the theory seems to be worthy of further investigation.

The researches of Chasles (*Comptes Rendus*, t. lviii., 1864, *et seq.*) refer to the conics which satisfy given conditions. There is an earlier paper by De Jonquieres, "Théorèmes généraux concernant les courbes géométriques planes d'un ordre quelconque," *Liouv.*, t. vi. (1861), which establishes the notion of a system of curves (of any order) of the index N, viz., considering the curves of the order n which satisfy $\frac{1}{2}n(n+3) - 1$ conditions, then the index N is the number of these curves which pass through a given arbitrary point. But Chasles in the first of his papers (February 1864), considering the conics which satisfy four conditions, establishes the notion of the two characteristics (μ, ν) of such a system of conics, viz., μ is the number of the conics which pass through a given arbitrary point, and ν is the number of the conics which touch a given arbitrary line. And he gives the theorem, a system of conics satisfying four conditions, and having the characteristics (μ, ν) contains $2\nu - \mu$ line-pairs (that is, conics, each of them a pair of lines), and $2\mu - \nu$ point-pairs (that is, conics, each of them a pair of points,—coniques infiniment aplaties), which is a fundamental one in the theory. The characteristics of the system can be determined when it is known how many there are of these two kinds of degenerate conics in the system, and how often each is to be counted. It was thus that Zeuthen (in the paper *Nyt Bydrag*, "Contribution to the Theory of Systems of Conics which satisfy four Conditions," Copenhagen, 1865, translated with an addition in the *Nouvelles Annales*) solved the question of finding the characteristics of the systems of conics which satisfy four conditions of contact with a given curve or curves; and this led to the solution of the further problem of finding the number of the conics which satisfy five conditions of contact with a given curve or curves (Cayley, *Comptes Rendus*, t. lxiii., 1866), and "On the Curves which satisfy given Conditions" (*Phil. Trans.*, t. clviii., 1868).

It may be remarked that although, as a process of investigation, it is very convenient to seek for the characteristics of a system of conics satisfying 4 conditions, yet what is really determined is in every case the number of the conics which satisfy 5 conditions; the characteristics of the system $(4p)$ of the conics which pass through $4p$ points are $(5p)$, $(4p, 1l)$, the number of the conics which pass through 5 points, and which pass through 4 points and touch 1 line: and so in other cases. Similarly as regards cubics, or curves of any other order: a cubic depends on 9 constants, and the elementary problems are to find the number of the cubics $(9p)$, $(8p, 1l)$, &c., which pass through 9 points, pass through 8 points and touch 1 line, &c.; but it is in the investigation convenient to seek for the characteristics of the systems of cubics $(8p)$ &c., which satisfy 8 instead of 9 conditions.

The elementary problems in regard to cubics are solved very completely by Maillard in his *Thèse, Recherche des caractérisques des systèmes élémentaires des courbes planes du troisième ordre* (Paris, 1871). Thus, considering the several cases of a cubic

		No. of consts.
1.	With a given cusp	5
2.	,, cusp on given line	6
3.	,, cusp	7
4.	,, a given node	6
5.	,, node on given line	7
6.	,, node	8
7.	non-singular	9

he determines in every case the characteristics (μ, ν) of the corresponding systems of cubics $(4p)$, $(3p, 1l)$, &c. The same problems, or most of them, and also the elementary problems in regard to quartics are solved by Zeuthen, who in the elaborate memoir "Almindelige Egenskaber, &c.," *Danish Academy*, t. x. (1873), considers the problem in reference to curves of any order, and applies his results to cubic and quartic curves.

The methods of Maillard and Zeuthen are substantially identical; in each case the question considered is that of finding the characteristics (μ, ν) of a system of curves by consideration of the special or degenerate forms of the curves included in the system. The quantities which have to be considered are very numerous. Zeuthen in the case of curves of any given order establishes between the characteristics μ, ν', and 18 other quantities, in all 20 quantities, a set of 24 equations (equivalent to 23 independent equations), involving (besides the 20 quantities) other quantities relating to the various forms of the degenerate curves, which supplementary terms he determines, partially for curves of any order, but completely only for quartic curves. It is in the discussion and complete enumeration of the special or degenerate forms of the curves, and of the supplementary terms to which they give rise, that the great difficulty of the question seems to consist; it would appear that the 24 equations are a complete system, and that (subject to a proper determination of the supplementary terms) they contain the solution of the general problem.

The remarks which follow have reference to the analytical theory of the degenerate curves which present themselves in the foregoing problem of the curves which satisfy given conditions.

A curve represented by an equation in point-coordinates may break up: thus if $P_1, P_2, ..$ be rational and integral functions of the coordinates (x, y, z) of the orders $m_1, m_2 ..$ respectively, we have the curve $P_1^{\alpha_1} P_2^{\alpha_2} .. = 0$, of the order $m, = \alpha_1 m_1 + \alpha_2 m_2 + ..$, composed of the curve $P_1 = 0$ taken α_1 times, the curve $P_2 = 0$ taken α_2 times, &c.

Instead of the equation $P_1^{\alpha_1} P_2^{\alpha_2} .. = 0$, we may start with an equation $u = 0$, where u is a function of the order m containing a parameter θ, and for a particular value say $\theta = 0$, of the parameter reducing itself to $P_1^{\alpha_1} P_2^{\alpha_2} ...$ Supposing θ indefinitely small, we have what may be called the penultimate curve, and when $\theta = 0$ the ultimate curve. Regarding the ultimate curve as derived from a given penultimate curve, we connect with the ultimate curve, and consider as belonging to it, certain points called "summits" on the component curves $P_1 = 0$, $P_2 = 0$, respectively; a summit Σ is a point such that, drawing from an arbitrary point O the tangents to the penultimate curve, we have $O\Sigma$ as the limit of one of these tangents. The ultimate curve together with its summits may be regarded as a degenerate form of the curve $u = 0$. Observe that the positions of the summits depend on the penultimate curve $u = 0$, viz., on the values of the coefficients in the terms multiplied by $\theta, \theta^2, ..$; they are thus in some measure arbitrary points as regards the ultimate curve $P_1^{\alpha_1} P_2^{\alpha_2} .. = 0$.

It may be added that we have summits only on the component curves $P_1 = 0$, of a multiplicity $\alpha_1 > 1$; the number of summits on such a curve is in general $= (\alpha_1^2 - \alpha_1) m_1^2$. Thus assuming that the penultimate curve is without nodes or cusps, the number of the tangents to it is $= m^2 - m, = (\alpha_1 m_1 + \alpha_2 m_2 + ..)^2 - (\alpha_1 m_1 + \alpha_2 m_2 + ..)$. taking $P_1 = 0$ to have δ_1 nodes and κ_1 cusps, and therefore its class n_1 to be $= m_1^2 - m_1 - 2\delta_1 - 3\kappa_1$ &c., the expression for the number of tangents to the penultimate curve is

$$= (\alpha_1^2 - \alpha) m_1^2 + (\alpha_2^2 - \alpha_2) m_2^2 + .. \quad + \quad 2\alpha_1 \alpha_2 m_1 m_2 + .. \\ + \alpha_1(n_1 + 2\delta_1 + 3\kappa_1) + \alpha_2(n_2 + 2\delta_2 + 3\kappa_2) + .. \;;$$

where a term $2\alpha_1 \alpha_2 m_1 m_2$ indicates tangents which are in the limit the lines drawn to the intersections of the curves $P_1 = 0, P_2 = 0$ each line $2\alpha_1 \alpha_2$ times; a term $\alpha_1 (n_1 + 2\delta_1 + 3\kappa_1)$ tangents which are in the limit the proper tangents to $P_1 = 0$ each α_1 times, the lines to its nodes each $2\alpha_1$ times, and the lines to its cusps each $3\alpha_1$ times;

the remaining terms $(a_1^2 - a_1)\ m_1^2 + (a_2^2 - a_2)\ m_2^2 + \ldots$ indicate tangents which are in the limit the lines drawn to the several summits, that is, we have $(a_1^2 - a_1)\ m_1^2$ summits on the curve $P_1 = 0$, &c.,

There is of course a precisely similar theory as regards line-coordinates; taking Π_1, Π_2 &c., to be rational and integral functions of the co-ordinates (ξ, η, ζ) we connect with the ultimate curve $\Pi_1^{a_1} \Pi_2^{a_2} \ldots = 0$, and consider as belonging to it certain lines, which for the moment may be called "axes" tangents to the component curves $\Pi_1 = 0$, $\Pi_2 = 0$ respectively. Considering an equation in point-coordinates, we may have among the component curves right lines, and if in order to put these in evidence we take the equation to be $L_1^{\gamma_1} \ldots P_1^{a_1} \ldots = 0$, where $L_1 = 0$ is a right line, $P_1 = 0$ a curve of the second or any higher order, then the curve will contain as part of itself summits not exhibited in this equation, but the corresponding line-equation will be $\Lambda_1^{\delta_1} \ldots \Pi_1^{a_1} \ldots = 0$, where $\Lambda_1 = 0, \ldots$ are the equations of the summits in question, $\Pi_1 = 0$, &c., are the line-equations corresponding to the several point-equations $P_1 = 0$, &c.; and this curve will contain as part of itself axes not exhibited by this equation, but which are the lines $L_1 = 0, \ldots$ of the equation in point-coordinates.

In conclusion a little may be said as to curves of double curvature, otherwise twisted curves, or curves in space. The analytical theory by Cartesian coordinates was first considered by Clairaut, *Recherches sur les courbes à double courbure* (Paris, 1731). Such a curve may be considered as described by a point, moving in a line which at the same time rotates about the point in a plane which at the same time rotates about the line; the point is a point, the line a tangent, and the plane an osculating plane, of the curve; moreover the line is a generating line, and the plane a tangent plane, of a developable surface or torse, having the curve for its edge of regression. Analogous to the order and class of a plane curve we have the order, rank, and class, of the system (assumed to be a geometrical one), viz., if an arbitrary plane contains m points, an arbitrary line meets r lines, and an arbitrary point lies in n planes, of the system, then m, r, n are the order, rank, and class respectively. The system has singularities, and there exist between m, r, n and the numbers of the several singularities equations analogous to Plücker's equations for a plane curve.

It is a leading point in the theory that a curve in space cannot in general be represented by means of two equations $U = 0$, $V = 0$; the two equations represent surfaces, intersecting in a curve; but there are curves which are not the complete intersection of any two surfaces; thus we have the cubic in space, or skew cubic, which is the residual intersection of two quadric surfaces which have a line in common; the equations $U = 0$, $V = 0$ of the two quadric surfaces represent the cubic curve, not by itself, but together with the line. (A. CA.)

CURZOLA (Slavonic, *Karkar*), a city of Dalmatia, Austria, the capital of an island of the same name in the Adriatic, which is situated between 42° 50′ and 43° 1′ N. lat. and 16° 40′ and 17° 20′ E. long, and has a length of about 25 miles, with an average breadth of 4 miles. The city is about 55 miles north of Ragusa. It is regularly built, and, besides the old cathedral, the *loggia* or council chambers, and the palace of its former Venetian governors, it possesses the noble mansion of the Arnieri, and other specimens of the domestic architecture of the 15th and 16th centuries, and still retains the massive walls and towers that were erected in 1420. Its principal industry is the building of the boats for which it is famed throughout the Adriatic. Originally, as it would seem, a Phœnician settlement, Curzola was afterwards colonized by Greeks from Cnidus; but nothing is known of its earlier history. The present name is a corruption of Corcyra Nigra, or Κέρκυρα Μέλαινα, the designation by which it was known to the Greeks and Romans. In 997 it came under the suzerainty of Venice, and it was one of the earliest cities in Dalmatia to receive municipal rights. In 1571 it defended itself so gallantly against the Turks under Uluch Ali of Algiers that it obtained the designation *fidelissima*. Population, 2200.

CUSA, NICOLAS DE [NICOLAUS CUSANAS] cardinal (1401–1464), was the son of a poor fisherman named Krypffs or Krebs, and derived the name by which he is known from the place of his birth, Cues or Cusa, on the Moselle, in the archbishopric of Treves. In his youth he was employed in the service of Count Ulrich of Manderscheid, who, seeing in him evidence of exceptional ability, sent him to study at the school of the Brothers of the Common Life at Deventer, and afterwards at the university of Padua, where he took his doctor's degree in law in his twenty-third year. Failing in his first cause he abandoned the legal profession, and resolved to enter the church. After filling several subordinate offices he became archdeacon of Liége. He was a member of the Council of Basel, and dedicated to the assembled fathers a work entitled *De Concordantia Catholica*, in which he maintained the superiority of councils over popes, and assailed the false decretals and the story of the donation of Constantine. A few years later, however, he had reversed his position, and zealously defended the supremacy of the Pope. He was intrusted with various missions in the interests of Catholic unity, the most important being to Constantinople, to endeavour to bring about a union of the Eastern and Western churches. In 1448 he was raised by Pope Nicolas V. to the dignity of cardinal; and in 1450 he was appointed bishop of Brixen against the wish of the Archduke Sigismund, who opposed the reforms the new bishop sought to introduce into the diocese. In 1451 he was sent to Germany and the Netherlands to check ecclesiastical abuses and bring back the monastic life to the original rule of poverty, chastity, and obedience,—a mission which he discharged with well-tempered firmness. Soon afterwards his dispute with the Archduke Sigismund in his own diocese was brought to a point by his claiming certain dues of the bishopric, which the temporal prince had appropriated. Upon this the bishop was imprisoned by the archduke, who, in his turn, was excommunicated by the Pope. These extreme measures were not persisted in; but the dispute remained unsettled at the time of the bishop's death, which occurred at Lodi in Umbria on the 11th August 1464. In 1459 he had acted as governor of Rome during the absence of his friend Pope Pius II. at the assembly of princes at Milan; and he wrote his *Crebratio Alcorani*, a treatise against Mahometanism, in support of the expedition against the Turks proposed at that assembly. Some time before his death he had founded a hospital in his native place for thirty-three poor persons, the number being that of the years of the earthly life of Christ. To this institution he left his valuable library.

The interest of Cusa for later times lies in his philosophical much more than in his political or ecclesiastical activity. As in religion he is entitled to be called one of the "Reformers before the Reformation," so in philosophy he was one of those who broke with scholasticism while it was still the orthodox system. In his principal work, *De docta ignorantia* (1440), supplemented by *De Conjecturis libri duo* published in the same year, he maintains that all human knowledge is mere conjecture, and that man's wisdom is to recognize his ignorance. From scepticism he escapes by accepting the doctrine of the mystics that God can be apprehended by intuition (*intuitio, speculatio*), an exalted state of the intellect in which all limitations disappear.

God is the absolute maximum and also the absolute minimum, who can be neither greater nor less than He is, and who comprehends all that is or that can be ("deum esse omnia, ut non possit esse aliud quam est"). Cusa thus laid himself open to the charge of pantheism, which did not fail to be brought against him in his own day. His chief philosophical doctrine was taken up and developed more than a hundred years later by Giordano Bruno, who calls him the divine Cusanus. In mathematical and physical science Cusa was much in advance of his age. In a tract, *Reparatio Calendarii*, presented to the Council of Basel, he proposed the reform of the calendar after a method resembling that adopted by Gregory. If he was not before his own age he was not behind many in the present day in a treatise *De Quadratura Circuli*, in which he professes to have solved the problem; and the same remark applies to a prophecy that the world would come to an end in 1734, which he hazarded in his *Conjectura de novissimis diebus*. Most noteworthy, however, in this connection is the fact that he anticipated Copernicus by maintaining the theory of the rotation of the earth.

The works of Cusanus were published in a complete form by Henri Petri (1 vol. fol. Basel, 1565). See Hartzheim's *Vita Nicolaus de Cusa* (Treves, 1730), Martini's *Das Hospital Cues und dessen Stifter* (Treves, 1841), and Scharpff's *Der Cardinal und Bischof Nic. von Cusa als Reformator in Kirche, Reich, und Philos. des 15 Jahrhund.* (Tübingen, 1871).

CUSH, the eldest son of Ham, from whom seems to have been derived the name of the *Land of Cush*, which is commonly rendered by the Septuagint and by the Vulgate *Ethiopia*. The locality of the land of Cush is a question upon which eminent authorities have been divided; for while Bochart maintained that it was exclusively in Arabia, Schulthess and Gesenius held that it is to be sought for nowhere but in Africa. Others again, such as Michaelis and Rosenmüller, have supposed that the name Cush was applied to tracts of country both in Arabia and Africa—a circumstance which would easily be accounted for on the very probable supposition that the descendants of the primitive Cushite tribes emigrated across the Red Sea from the one continent to the other. The existence of an African Cush cannot reasonably be questioned, though the term is employed in Scripture with great latitude, sometimes denoting an extensive but undefined country (Ethiopia), and at other times one particular kingdom (Meroë). It is expressly described by Ezekiel as lying to the south of Egypt beyond Syene; Mizraim and Cush (*i.e.*, Egypt and Ethiopia) are often classed together by the prophets; the inhabitants are elsewhere spoken of in connection with the Lubim and Sukkiim, which were certainly nations of Africa, for they belonged to the vast army with which Shishak, king of Egypt, "came out" against Rehoboam, king of Judah; and, finally, in the ancient Egyptian inscriptions the country to the south of Egypt is called Keesh, or Kesh. Though there is a great lack of evidence to show that the name of Cush was ever applied to any part of Arabia, there seems no reason to doubt that a portion of the Cushite race did early settle there. In the 5th century the Himaryites, in the south of Arabia, were styled by Syrian writers Cushæans and Ethiopians. By modern scholars the name Cushites has been adopted as the designation of the early non-Semitic language of Babylonia; and the reasoning of Canon Rawlinson goes to show that there was a close connection between Babylon and Egypt.

CUSTARD APPLE, a name applied to the fruit of various species of the genus *Anona*, natural order *Anonaceæ*. The members of this genus are shrubs or small trees having alternate, exstipulate leaves, and flowers with three small sepals, six petals arranged in a double row, and numerous stamens. The fruit of *A. reticulata*, the common custard apple, or "bullock's heart" of the West Indies, is dark brown in colour, and marked with depressions, which give it a quilted appearance; its pulp is reddish-yellow, sweetish, and very soft; the kernels of the seeds are said to be poisonous. The sour-sop, the fruit of *A. muricata*, grows in the West Indies, and in the neighbourhood of Bombay; it is covered with soft prickles, is of a light-greenish hue, and has a peculiar but agreeable sour taste, and a scent resembling that of black currants. The sweet-sop, which is cultivated in both the Indies, is produced by *A. squamosa*; it is an ovate fruit, with a thick rind and luscious pulp. According to Royle, an acrid principle, fatal to insects, is contained in its seeds, which, powdered and mixed with the flour of gram (*Cicer arietinum*), are used by the natives of India in washing the hair. *A. Cherimolia* furnishes the Peruvian Cherimoyer, which is held to be of very superior flavour, and is much esteemed by the Creoles. *A. palustris* is valued in Jamaica for its wood, which serves the same purposes as cork; the fruit, commonly known as the alligator-apple, is not eaten, being reputed to contain a dangerous narcotic principle.

CUSTOMS DUTIES are taxes on the import and export of commodities, and rank among the most ancient, as they continue to prevail as one of the most common modes, in all countries, of levying revenue for public purposes. In an insular country like the United Kingdom customs duties came in process of time to be levied only or chiefly in the seaports, and thus applied only to the foreign commerce, where they may be brought under the control of fair and reasonable principles of taxation. But this simplification of customs duties was only reached by degrees; and during a long period special customs were levied on goods passing between England and Scotland; and the trade of Ireland with Great Britain and with foreign countries was subjected to fiscal regulations which could not now stand in the light of public reason. The taxes levied, on warrant of some ancient grant or privilege, upon cattle or goods at a bridge or a ferry or other point of passage from one county or province to another, of which there are some lingering remains even in the United Kingdom, and those levied at the gates of cities on the produce of the immediate country—a not uncommon form of municipal taxation on the European continent—are all of the nature of customs dues. It is from the universality of this practice that our English term of "customs" appears to have been derived. In countries of extensive land frontiers the system of taxation by duties on foreign commodities becomes still more complicated. Custom-houses have to be established along the land borders and at particular points on the rivers or the railways; and the foreign and domestic tax-collectors are brought into immediate contact. Some European Governments distinguish in their rates of duty between "dry" or land ports and "wet" or sea ports; and others vary their dues on foreign commodities according to the zones of the globe from which the commodities come. Nothing has consequently been more perplexing to the merchant than customs duties. They are a labyrinth through which he has had to steer with caution and circumspection; while, at the same time, it has offered to the more unscrupulous traders temptations to fraud. The smuggling which proceeds under customs duties is only to be checked by the most careful administration, by a system proceeding as far as possible on the simplicity of generally recognized principles, and by duties so moderate in amount as to reduce to a minimum the temptation of fraud.

A customs duty on the *import* of commodities has to be paid by the domestic consumers of the commodities. The foreign producer will not sell them at less than they cost, and the importing merchant will not bring them in unless he obtain this cost, his own fair profit, and the import duty over and above these essential constituents of the transaction. An import duty is thus in some cases a tax which consumers may pay lightly or heavily as they choose, and has accordingly a flexibility that is not unimportant in taxation. But if the commodity be one of domestic as well as foreign supply, the effect of the customs duty is to raise the price of the domestic supply in some proportion to the duty; and the consumer, in so far as the commodity is one of necessity to him, has no choice. He has to pay the tax, with the further dissatisfaction of knowing that it goes to no public purpose, but only into the pockets of some of his own private neighbours. A customs duty on the *export* of commodities, on the other hand, has to be paid by the foreign consumers, one of the most agreeable forms of taxation to be conceived. But this desire of taxing foreigners for domestic revenue is met by the competition of general commerce, and nations have to be chary of levying duties on the export of the products of their own industry. It is only where they have some special monopoly of the product that they can enter upon such a course without the gravest disadvantage to themselves.

Wherever the principle of free trade is recognized, these distinctions have to be strictly observed; and in the past thirty years' regime of free trade in the United Kingdom, the whole system of customs duties, in its principles, its rates of duty, and its administration, has undergone a complete revolution. Of many hundreds of articles on which customs duty was levied in the seaports, only five or six, of exclusively foreign origin, now remain to yield the customs revenue of the kingdom. Yet this revenue has never declined. It is much larger than when the whole elaborate system of customs duties was in force. The best literature of this interesting subject, apart from the standard works of British, French, and German economists, is to be found in the Budgets of the British Parliament since 1842; in the Acts consolidating and reforming the custom-house administration, particularly the Act of 1853 drawn by Mr Wilson, editor of *The Economist*, and then secretary of the treasury; in the reports of the Hon. David Wells, late commissioner of revenue in the United States; and in the annual reports of the British custom-house commissioners, in which alone there is a magazine of the most valuable facts. Of recent years the only controversy of the British public with the custom-house relates to what has been deemed the too careless admission of adulterated or worthless commodities, in respect to which there may have to be a further reform in the future. In the case of commodities on which a duty is levied, and must be paid before they pass into consumption, there would seem to be a responsibility on the part of the duty-levying power to ascertain that the commodity is what it is professed to be.

CUSTOS ROTULORUM, in England, is one of the justices of the peace, and keeper of the records for the county. He nominates the clerk of the peace. He is described by Lambard as a "man for the most part especially picked out either for wisdom, countenance, or credit." He is nominated by the royal sign-manual.

CUTCH, or KACHH, a native state in the south-western extremity of Hindustan, situated between 68° and 72° E. long. and 22° and 25° N. lat. It is a peninsular tract of land, inclosed towards the W. by the eastern branch of the Indus, or the Koree, on the S. by the Indian Ocean and the Gulf of Cutch, and on the N. and E., towards the interior, by the great northern *Ran*, or *Runn*, an extensive salt morass or lake, which from May to October is flooded with salt water, and communicates in its greatest extent with the Gulf of Cutch on the west and the Gulf of Cambay on the east, these two gulfs being united during the monsoon.

The interior of Cutch is studded with hills of considerable elevation, and a range of mountains runs through it from east to west, many of them of the most fantastic shapes, with large insulated masses of rock scattered in all directions. In the intervening valleys the country is not deficient in fertility and verdure, and is sufficiently productive in all cases where the nature of the government permits the cultivator to enjoy the fruits of his labour. But this very seldom happens. Many of the hills are covered with jungle, and with the strongholds and dens of petty chiefs, who sometimes protect, but more frequently issue forth to plunder the lower country. The general appearance of Cutch is barren and uninteresting. The greater part is a rock destitute of soil, and presenting the wildest aspect; the ground is cold, poor, and sterile; the rains are generally scanty, and often fail altogether; and the whole face of the country bears marks of volcanic action. From the violence of tyranny, and the rapine of a disorderly banditti, by which this district has from time immemorial been infested, as well as from shocks of earthquakes, the villages have a ruinous and dilapidated appearance; and, with the exception of a few fields in their neighbourhood, the country presents a rocky and sandy waste, with in many places scarcely a show of vegetation. Water is scarce and brackish, and is chiefly found at the bottom of low ranges of hills, which abound in some parts; and the inhabitants of the extensive sandy tracts suffer greatly from the want of it. Owing to the uncertainty of the periodical rains in Cutch, the country is liable to severe famines, which, along with the internal broils by which it has been harassed, have greatly obstructed cultivation, and thinned the inhabitants, many of whom have been induced to emigrate to Bombay and Gujarát; and, in addition to all these evils, an uncommonly violent earthquake, which occurred on the 16th of June 1819, nearly destroyed Bhuj, the capital, and greatly injured the towns of Anjar, Mandávi, and Moondria or Mundra. The soil of Cutch produces grain, cotton, tobacco, ghee, &c.; and iron and coal have been discovered, the latter near the surface of the ground, on the banks of one of the rivers, seven miles north-east of Bhuj, but it is not in general use as fuel.

The Ran, or Runn, which communicates with the Gulf of Cutch, and sweeps round the northern side of that province, is a very extensive salt morass, varying in breadth from five to eighty miles across, and during the rains nearly impassable for horsemen. The total area of this immense morass may be estimated at about 8000 square miles, without including any portion of the Gulf of Cutch, which is in many parts so shallow as to resemble a marshy fen rather than an arm of the sea. The Runn is said to be formed by the overflow of the rivers Pharan, Luní, Banás, and others, during the monsoon; but in December it is quite dry, and in most places hard. The wild ass is very common on the borders of this lake, being seen in herds of from 60 to 70 at a time.

The temperature of Cutch during the hot season is high, the thermometer frequently rising to 100° or 105°; and in the months of April and May, clouds of dust and sand, blown about by hurricanes, envelop the houses, the glass windows scarcely affording any protection. For nine months of the year the climate is comparatively temperate and agreeable; but the approach of October is equally dreaded by the native and European population as extremely unhealthy, and at the close of the monsoon the oppression of the atmosphere is described as being intolerable. The influence of the monsoon is greatly moderated before it reaches this region, and the rains sometimes fail altogether; but although in this case the necessary consequences are want and misery to the great body of the people, these dry seasons are far more favourable to the health of Europeans. The monsoon generally sets in with great violence from the north-east before it settles in the south-west. The prevailing wind is westerly, and it blows west by south and west by north ten months in the year. The easterly winds, which do not blow more than a month in the year, are always unhealthy and unpleasant, and bring with them, if they continue long, epidemics and locusts. Cutch is considered unhealthy by the natives of other parts of the country; and Dr Burnes, who was stationed there, and gives an account of its medical topography, mentions that he has known many persons from Bombay, especially servants, who were perfectly useless from continued sickness in Cutch, but who recovered their health the moment they left it. He also adds, that he never was at any station where recoveries from fever were so tedious and incomplete. The hospital returns do not, however, he adds, show any extraordinary sickness. Cholera has made no progress in Cutch. The most common diseases among the natives are fever and rheumatism; and fever is also the prevailing disease among Europeans, the first attacks of which are always the most dangerous. These, however, are not ordinarily severe, and easily yield to the remedy of sulphate of quinine without any serious injury to the constitution. There are some stations at Cutch particularly noxious, such as Narrona, a village in a marsh 24 miles north-east of Bhuj, near the Runn, and Lakshpat Bandar, remarkable for the badness of its water.

The principal towns are Bhuj, Anjar, Jharrá, Kantkot, and Katáriá. The principal seaports are Mandávi and Mundra. The town best known to Europeans is Bhuj, which is situated inland, and is surrounded by an amphitheatre of hills, some of which approach within three or four miles of the city. The hill of Bhujá, on which the fort is situated, and under the south-west angle of which is the cantonment of the Cutch brigade, rises to the height of 500 feet in the middle of the plain, and is detached from other high ground. The residency is four miles distant in a westerly direction. There are many mountain streams, but no navigable rivers. They scarcely contain any water except in the rainy season, when they are very full and rapid, and discharge themselves into the Runn, all along the coast of which the wells and springs are more or less impregnated with common salt, and other saline ingredients.

Various causes have contributed to thin the population of this country. In 1812 it was ravaged by a famine and pestilence, which destroyed a great proportion of its inhabitants,—according to some accounts, nearly one-half. This, joined to the tyranny and violence of the Government until the year 1819, and more lately to a succession of unfavourable seasons, has forced many of the cultivators to remove to Sind and other countries. The inhabitants may be estimated at 500,000, of whom one-third are Mahometans and the remainder Hindus of various castes. The Jharijá Rájputs form a particular class, being the aristocracy of the country; and all are more or less connected with the family of the Ráo, or prince. There are in Cutch about 200 of these Jharijá chiefs, who all claim their descent from Sacko Goráro, a prince who reigned in Sind about 1000 years ago. From him also the reigning sovereign is lineally descended, and he is the liege lord of whom all the chiefs or nobles hold their lands in feu, for services which they or their ancestors had performed, or in virtue of their relationship to the family. They are all termed the brotherhood of the Ráo, and supposed to be his hereditary advisers, and their possessions are divided among their male children. To prevent the breaking down of their properties, the necessary consequence of this law of inheritance, there is no doubt that infanticide is common among them, and that it extends to the male as well as the female progeny. The Jharijás consider it unlawful to marry any female of their own tribe, being all descended from a common parent. They accordingly marry into the families of other Rájputs; and to this unfortunate regulation may be chiefly ascribed the destruction of all the female children. The Jharijás have a tradition that when they entered Cutch they were Mahometans, but that they afterward adopted the customs and religion of the Hindús. It is certain, indeed, that they still retain many Mahometan customs. They take oaths equally on the Koran or on the Shastrás; they employ Mussulman books; they eat from their hands; the Ráo, when he appears in public, alternately worships God in a Hindu pagoda and a Mahometan mosque; and he fits out annually at Mandávi a ship for the conveyance of pilgrims to Mecca, who are maintained during the voyage chiefly by the liberality of the prince. The Mahometans in Cutch are of the same degenerate caste with those usually found in the western parts of India. The Miánás forms a particular class, who claim the same descent as the Jharijás, and boast of their constancy to the Mahometan creed, while the latter apostatized; but they have now entirely degenerated, and are little better than banditti, always ready to commit outrages, and to sally out in disorderly bands to plunder the defenceless country. Such has been the weakness and tyranny of the rulers of Cutch, that they have frequently had recourse to these wretched auxiliaries in order to aid them in their inordinate exactions, while at other times they recruited the army from the same race. They were nearly extirpated under the rigorous rule of Fathi Muhammad, but of late years they have returned in considerable numbers to their villages among the hills. In the seasons of scarcity of 1823 and 1824, many of them emigrated to Sind, where, joining with other adventurers, they formed disorderly bands, who made forays into Cutch, several villages of which they plundered and burned. The natives are in general of a stronger and stouter make, and even handsomer, than those of Western India; and the women of the higher classes are also handsome. The peasants are described as intelligent, and the artizans are justly celebrated for their ingenuity and mechanical skill. The palace at Mandávi, and a tomb of one of their princes at Bhuj, are fair specimens of their architectural skill. In the manufacture of gold and silver ornaments they display great taste and nicety. The natives of this country are in general peaceable and obedient subjects, for robberies and murders are seldom committed except by the Miánás. The quantity of opium which they use is enormous; its effects, according to Dr Burnes, are less deleterious to their constitution than might be supposed.

History.—The country of Cutch was invaded about the 9th century by a body of Mahometans of the Summa tribe, who under the guidance of five brothers emigrated from Sind, and who gradually subdued or expelled the original inhabitants, consisting of three distinct races. The descendants of these five leaders assumed the name of Jharijá, from a chief named Jharrá, who set an example of female infanticide by putting to death his seven daughters in one day. Cutch continued tranquil under their sway for many years, until some family quarrel arose, in which the chief of an elder branch of the tribe was murdered by a rival brother. His son fled to Ahmadábád to seek the assistance of the viceroy, who was married to his sister, and who reinstated him in the sovereignty of Cutch, and Murvi in Káthiáwár, in the title of Ráo, or Rawul, in the year 1519.

The succession continued in the same line from the time of this prince until 1666, when a younger brother, Prágjí, murdered his elder brother and usurped the sovereignty. This line of princes continued till 1760 without any remarkable event, when, in the reign of Ráo Gor, the country was invaded four times by the Sinds, who wasted it with fire and sword. The reign of this prince, as well as that of his son Ráo Rahiden, by whom he was succeeded in 1778, was marked by cruelty and blood. The latter prince was dethroned, and, being in a state of mental derangement, was during his lifetime confined by Fathi Muhammad, a native of Sind, who continued, with a short interval (in which the party of the legal heir, Bháiji Bawa, gained the ascendency), to rule the country until his death in 1813. It was in the reign of Fathi Muhammad that a communiaction first took place with the British Government. During the contests for the sovereignty between the usurper and the legal heir, the leader of the royal party, Hansráj; the governor of Mandávi, sought the age of the British. But no closer connection followed at that time than an agreement for the suppression of piracy, or of inroads of troops to the eastward of the Runn, or Gulf of Cutch. But the Gulf continued, notwithstanding to swarm with pirates, who were openly encouraged or connived at by the son of Hansráj, who had succeeded his father, as well as by Fathi Muhammad. The latter left several sons by different wifes, who were competitors for the vacant throne. Husáin Miyán succeeded to a considerable portion of his father's property and power. Jugjevan, a Bráhman, the late minister of Fathi Muhammad, also received a considerable share of influence; and the hatred of these two factions was embittered by religious animosities, the one being Hindu and the other Mahometan. The late Ráo had declared himself a Mahometan, and his adherents were preparing to inter his body in a magnificent tomb, when the Jharijás and other Hindus seized the corpse and consigned it to the flames, according to Hindu custom.

The administration of affairs was nominally in the hands of Husáin Miyan and his brother Ibráhim Miyán. Many sanguinary broils now ensued, in the course of which Jugjevan was murdered, and the executive authority was much weakened by the usurpations of the Arabs and other chiefs. In the meantime Ibráhim Miyán was assassinated; and after various other scenes of anarchy, the Ráo Bharmulji, son of Ráo Rahiden, by general consent, assumed the chief power. But his reign was one continued series of the grossest enormities; his hostility to the British became evident, and accordingly a force of 10,500 men crossed the Runn in November 1815, and were within five miles of Bhuj, the capital of the country, when a treaty was concluded, by which the Ráo Bharmulji was confirmed in his title to the throne, on agreeing, among other stipulations, to cede Anjar and its dependencies in perpetuity to the British. He was, however, so far from fulfilling the terms of this treaty that it was determined to depose him; and an army being sent against him, he surrendered to the British, who made a provision for his maintenance, and elevated his infant son to the throne.

In 1822 the relations subsisting between the ruler of Cutch and the British were modified by a new treaty, under which the territorial cessions made by the Ráo in 1816 were restored in consideration of an annual payment. The sum fixed was subsequently thought too large, and in 1832 the arrears, amounting to a considerable sum, were remitted, and all future payments on this account relinquished. From that time the Ráo has paid a subsidy of £20,000 per annum to the British for the maintenance of the military force stationed within his dominions. Suttee has been prohibited in Cutch; and, under British influence, various other measures of a salutary and beneficent character have been adopted.

CUTCH GUNDAVA, a district in the province of Baluchistan, situated at the bottom of the mountains lying south-east of Khelat, between 27° 40′ and 29° 50′ N. lat. and 67° 20′ and 69° 17′ E. long. It is about 150 miles in length, and measures nearly an equal distance in its greatest breadth. The Hala range of mountains extends along its western frontier, and forms the eastern wall or face of the elevated table-land of central Baluchistan. Through this range are two great passes,—the celebrated Bolan Pass in the north leading in a north-westerly direction, and the Mula Pass, which, more to the south, takes an extensive circuit, the two extremities pointing towards the north, and the convexity towards the south. The soil is rich, black, and loamy, and produces every spices of grain, as also cotton, indigo, madder, and other commodities. The rains are heavy in June, July, and August; it rains also, but not so heavily, in the spring months. The climate during the summer is unhealthy, owing to the simoom or pestilential wind which blows at that time, causing the death of many of the inhabitants. Great quantities of grain are exported from this district to the seaports of Kurrachee and Sonmiani. Cutch Gundava is the most populous part of Baluchistan, and constitutes the most valuable portion of the dominions of the Khan of Khelat, who during winter resides at the chief town.

CUTHBERT, St (. . .–687). The precise date and place of the birth of Cuthbert are unknown. Some writers assert that he was born in Ireland. It is much more probable, or rather it is almost certain, that he was of English descent, and born in that part of the kingdom of Northumbria which lay north of the Tweed, and was afterwards included in the Scottish kingdom. The original abbey of Melrose—to be distinguished from the later Cistercian foundation of that name, which lies higher up the Tweed—had been founded before the middle of the 7th century. The first abbot was Eata, one of the twelve English disciples of the Scottish Aidan; and under him Cuthbert, then probably in early youth, became a monk. He accompanied Eata on the latter being appointed superior of the monastery at Ripon, founded by Alchfrid, son of Oswy, king of Northumbria. When the dispute arose between the English and Scottish ecclesiastics as to the proper time of keeping Easter, Eata, rather than conform to the English usage, returned to Melrose along with Cuthbert, who soon afterwards was appointed prior of that monastery. Eata having subsequently adopted the English rule was appointed abbot of Lindisfarne by king Oswy, and Cuthbert, still accompanying him, held the office of prior. Under the influence of that intense desire to lead a life of absolute solitude by which the Scottish monks of the school of St Columba were so frequently impelled, Cuthbert, after a residence of considerable duration at Lindisfarne, resigned his office and retired to the neighbouring island of Farne. From this seclusion Egfrid, king of Northumbria, endeavoured to recall him. Cuthbert at first resisted the king's entreaties, but was at last induced to comply and to become bishop of Lindisfarne. He was consecrated at York during the Easter festival of 685 by Theodore, archbishop of Canterbury. After exercising his episcopal office for two years he again retired to his solitude of Farne, where he died on the 20th of March 687.

During his lifetime Cuthbert had been reverenced as a saint, a reverence which his holy life and faithful discharge of all his duties had well deserved. His austere and secluded mode of living added greatly to the estimation in which he was held, and as usual at that period the performance of miracles was freely ascribed to him. Two accounts of his life were written within a short time after his decease, one by an unknown author, the other by the most distinguished ecclesiastic of the age—the Venerable Bede. They give an interesting account of Cuthbert while prior of Melrose. His labours were not confined to his monastery. He went about the country, sometimes on horseback, but more frequently on foot, preaching to the rude people, and instructing them in their religious duties, following in all respects the example of St Aidan and the other early Scottish missionaries. When bishop of Lindisfarne he continued to act in the same manner, as well knowing, to use the words of Bede, that "He who said, Thou shalt love the Lord thy God, also said, Thou shalt love thy neighbour as thyself."

The fame of Cuthbert increased as time went on, and excelled that of all the saints of the north. His remains were preserved at Lindisfarne as the most precious treasure of the church; and, when the island towards the end of the 9th century was attacked by the heathen Danes, the monks fled carrying the relics with them, which were finally deposited at Durham, when that city became the seat of the Northumbrian bishopric. During the Middle Ages his shrine at Durham was almost as famous as that of St Thomas at Canterbury, and attracted the visits of innumerable pilgrims. The English army rallied round the banner of St Cuthbert at the battle of Neville's Cross, and it is said to have been carried for the last time at the rising known as the Pilgrimage of Grace in the reign of Henry VIII. When the whole mediæval system was beginning to crumble and after its entire overthrow, the popular reverence for his name did not cease in his own northern region. The last Roman Catholic bishop of Durham, and not the least famous of his line, was Cuthbert Tunstall; and in the present century one of our most renowned seamen was Cuthbert Collingwood, the friend and colleague of Nelson.

The original authorities for the life of St Cuthbert are the two biographies already referred to and the notices in Bede's *Ecclesiastical History*. Bede mentions that what he wrote, whether in the history or in the life, was derived from the records of the monastery of Lindisfarne, or from the testimony of those to whom Cuthbert was personally known. (G. G.)

CUTLERY (French, *coutillerie*, from the Latin *culter*, a knife) is a branch of industry which originally embraced the manufacture of all cutting implements of whatever form or material. The progress of manufacturing industry has, however, detached from it the fabrication of several kinds of edge-tools, saws, and similar implements, the manufacture of which is now regarded as distinct branches of trade. On the other hand modern cutlery includes a great number of articles which are not strictly cutting implements, but which, owing to their more or less intimate relation to table or pocket cutlery, are classed with such articles for convenience sake. A fork, for example, is an important article of cutlery, although it is not a cutting tool, and silver or German silver forks in no way answer to the common definition of cutlery, as "cutting implements made of steel."

The original cutting instruments used by the human race consisted of fragments of flint, obsidian, or similar stones, rudely flaked or chipped to a cutting edge; and of these tools numerous remains yet exist. Stone knives and other tools must have been employed for a long period by the prehistoric races of mankind, as their later productions show great perfection of form and finish. In the Bronze period, which succeeded the Stone age, the cutlery of our ancestors was fabricated of that alloy. The use of iron was introduced at a later but still remote period; and it now, in the form of steel, is the staple article from which cutlery is manufactured.

From the earliest period in English history the manufacture of cutlery has been peculiarly associated with the town of Sheffield, and at the present day that town not only practically monopolizes the ordinary cutlery trade of Great Britain, but undoubtedly remains the chief centre of the industry for the whole world. The prominence of the manufacture in his own age is attested by Chaucer, who says of the whittler of Trompington—

"A Shefeld thwytel bare he in his hose."

The thwytel or whittle of that period was a very poor rude implement, consisting of a blade of bar steel fastened into a wooden or horn handle. It was used for cutting food as well as for the numerous miscellaneous duties which now fall to the pocket knife. To the whittle succeeded the Jack knife,—the Jacques-de-Liége, or Jock-te-leg of the Scottish James VI.,—which formed the prototype of the modern clasp knife, inasmuch as the blade closed into a groove in the handle. This improved form was probably introduced to Sheffield by Protestant refugees from the Low Countries who came to England during the reign of Queen Elizabeth. Shortly thereafter, about the beginning of the 17th century, the pocket knife with spring back was introduced, and no marked improvement thereafter took place till the early part of the present century. In 1624, two centuries after the incorporation of the Cutlers' Company of London, the cutlers of Hallamshire—the name of the district of which Sheffield is the centre—were formed into a body corporate for the protection of the "industry, labour, and reputation" of the trade, which was being disgraced by the "deceitful and unworkmanlike wares of various persons." The Act of incorporation specifies the manufacture of "knives, scissors, shears, sickles, and other cutlery," and provides that all persons engaged in the business shall "make the edge of all steel implements manufactured by them of steel, and steel only, and shall strike on their wares such mark, and such only, as should be assigned to them by the officers of the said company." Notwithstanding these regulations, and the pains and penalties attached to their infringement, the corporation was not very successful in maintaining the high character of Sheffield wares. Most manufacturers made cutlery to the order of their customers, on which the name of the retailer was stamped, and very inferior malleable or cast iron blades went forth to the public with "London made," "best steel," and other falsehoods stamped on them to order. The corporate mark and name of a few firms, among which Joseph Rodgers & Sons stand foremost, are a guarantee of the very highest excellence of material and finish; and such firms decline to stamp any name or mark other than their own on their manufactures. In foreign markets, however, the reputation of such firms is much injured by impudent forgeries; and so far was this system of fraud carried that inferior foreign work was forwarded to London to be transshipped and sent abroad ostensibly as English cutlery. To protect the trade against frauds of this class the Trades Mark Act of 1862 was passed chiefly on the instigation of the Sheffield Chamber of Commerce.

Sword cutlery, which embraces the manufacture of all military cutting weapons, has always been a distinct branch of trade; and it attained great perfection long before much attention was bestowed upon the tools appertaining to the arts of peace. Damascus blades, with their peculiar variegated watered appearance and their unequalled excellence of metal, have possessed from an early period the highest reputation; and the method by which its structure was produced was long a matter of speculation. The following remarks by Dr Percy (*Metallurgy—Iron and Steel*) explain the method of which Damascus or damask work is produced:—

"The damasked portion is due to the difference in coloration, resulting from the action of acids on iron and steel, the surface of the former being left with a metallic tissue, and that of the latter being left coated with a black firmly adherent carbonaceous residue. By suitably piling together bars of steel and iron, welding them, and then drawing them out under the hammer, or otherwise, patterns of various kinds may be produced, just as is done in the case of glass, by heating together variously coloured pieces of glass, and drawing them out into rods."

The sword blades of Toledo, and the workmanship of Andrea de Ferrara in the 16th century, were also triumphs of metal-work. While Sheffield is now the great centre of the manufacture of ordinary cutlery, Birmingham occupies the leading place in the sword cutlery department; but the sword and its cogeners do not now hold the important position either in civil or in military life which they occupied in earlier ages.

The variety of materials which go to complete any single article of cutlery is very considerable; and as the stock list of a cutler embraces a vast number of articles different in form, properties, and uses, the master cutler must have a practical knowledge of a wide range of substances. The leading articles of the trade may be classed under—1st, domestic cutlery, which includes carving and table knives and forks, pocket or clasp knives, razors, scissors, and similar articles; and 2d, tool cutlery, under which head may be arranged surgical knives and lancets, butchers' and shoemakers' knives, gardeners' pruning-knives, &c., sickles, scythes, and a vast number of other allied cutting implements. The blades or cutting portions of a certain number of these articles are made of shear steel, and for others cast steel only is employed. Sometimes the cutting edge alone is of steel, backed or strengthened with malleable iron, to which it is welded. Tangs on which handles are fastened, and other non-cutting portions, are also very often of malleable iron. Brass, German silver, silver, horn, tortoise-shell, ivory, bone, mother-of-pearl, and numerous fancy woods are all brought into requisition for handles and other parts of cutlery, each demanding special treatment according to its nature. The essential processes in making a piece of steel cutlery are—1st, forging; 2d, hardening and tempering; 3d, grinding; and 4th, polishing; and to these of course are added the diverse operations of fitting and handling of various kinds.

The following outline of the stages in the manufacture of a razor will serve to indicate the sequence of operations in making an article which, though simple in form, demands the highest care and skill in the departments which strictly appertain to cutlery. The first essential of a good razor is that it be made of the finest quality of cast steel. A razor must further, according to Mr Ebenezer Rhodes, a practical cutler who writes an *Essay on the Manufacture of a Razor*, present "due proportion, form, temperature, fitness, and regularity of concavity." The steel for razors is obtained in bars half an inch in breadth, and the thickness of the back of the instrument. Such a bar the forger takes, and, heating one end of it to the proper forging temperature, he, with great dexterity, fashions it upon his anvil, giving it roughly the required form, edge, and concavity. It is then separated from the remainder of the bar, leaving only sufficient metal to form the tang, if that is to be made of steel; sometimes a tang of malleable iron is welded to the blade. The tang of the "mould," as the blade in this condition is termed, is next drawn out, and the whole "smithed" or beaten on the anvil to compact the metal and improve the form and edge of the razor. At this stage the razor is said to be "forged in the rough," and so neatly can some workmen finish off this operation that a shaving edge may be given to the blade by simple whetting. The forged blade is next "shaped" by grinding on the dry stone, in which operation it is considerably reduced in weight, and the oxidized scale is removed, which allows the hardening and tempering to be done with certainty and proper effect. The shaped razor is now returned to the forge, where the tang is file-cut and pierced with the joint-hole, and into the blade is stamped either the name and corporate mark of the maker, or any mark and name ordered by the tradesman for whom the goods are being manufactured. The hardening is accomplished by heating the blade to a cherry-red heat and suddenly quenching it in cold water, which leaves the metal excessively hard and brittle. To bring it to the proper temper for a razor, it is again heated till the metallic surface assumes a straw colour, and upon plunging it into water, it is ready for the process of wet grinding. The wet grinding is done on stones which vary in diameter from 4 to 12 inches according to the concavity of surface desired. The stones recommended by Mr Rhodes are from 6 to 8 inches in diameter, which produce, he says, "razors sufficiently hollowed or ground out for any service, however hard, to which they may be applied; and they combine a desirable strength and firmness of edge, with a requisite degree of thinness." "Lapping," which is the first stage in polishing, is performed on a wheel of the same diameter as the wet-grinding stone. The lap is built up of segments of wood having the fibres towards the periphery, and covered with a metallic alloy of tin and lead. The lap is fed with a mixture of emery powder and oil. "Glazing" and "polishing," which follow, are for perfecting the polish on the surface of the razor, leather-covered wheels with fine emery being used; and the work is finished off with crocus. The finished blade is then rivetted into the scales or handle, which may be of ivory, bone, horn, or other material; and when thereafter the razor is set on a hone it is ready for use.

The processes employed in making a table knife do not differ essentially from those required for a razor. Knife blades are made from shear steel, and, after forging the blade, a piece of malleable iron sufficient for the bolster or shoulder and tang is welded to it. The bolster is formed with the aid of a die and swage called "prints," and the tang is drawn out. The tang is variously formed, according to the method by which it is to be secured in the shaft, and the various processes of tempering, wet grinding, and polishing are pursued as described above. Steel forks of an inferior quality are cast and subsequently cleaned and polished, but the best quality are forged from bar steel, and the prongs are cut or stamped out of an extended flattened extremity called the mould or "mood." In the United States of America machinery has been extensively adapted for performing the various mechanical operations in forging and fitting table cutlery, and to some extent machines have been introduced in Sheffield. In the making of a common pocket-knife with three blades not fewer than one hundred separate operations are involved, and these may be performed by as many workmen. The diversity of quality and workmanship is probably greater in the cutlery trade than in any other, although differences are not readily apparent to the unskilled critic, and the range of prices is correspondingly wide.

In the cutlery trade the division of labour is carried out to such an extreme degree as to exercise a very baneful influence on the operatives—who, as a class, are socially and morally inferior to many of their fellows. Cutlery grinding, which is one of the most important and distinctive departments of the trade, possesses the bad eminence of being one of the most unhealthy and deleterious of all occupations. Grinders are divided into three classes—dry, wet, and mixed grinders, according as they work at dry or wet stones. This branch of trade is, in Sheffield, conducted in distinct establishments called "wheels," which are divided up into separate apartments or "hulls," dry grinding being as much as possible separated from the wet grinding. Dry grinding, such as is practised in the shaping of razors described above, the "humping," or rounding of scissors, and other operations, is by far the most injurious and fatal process. Red-hot particles of steel fly off, injuring and sometimes blinding the eyes, unless they are protected; and the atmosphere is loaded with fine dust of silica and steel, inducing inflammation of the lungs, pleurisy, and grinders' asthma. The men work in a peculiarly constrained position, and under highly unsanitary conditions; and although a fan has been invented and extensively introduced which, placed behind the stones, by suction draws away a large proportion of the grinding dust, and renders the atmosphere comparatively pure, many grinders still neglect to keep it working or positively refuse to have it. In a communication to the Social Science Association (Sheffield meeting, 1865) Dr John C. Hall stated that there were then 3090 men and 1073 boys employed in grinding,—wet, dry, and mixed. "The average ages of all the fork grinders living," he says, "does not exceed 29; scissors grinders, 32; edge tool and wool-shear grinders, 33; table-knife grinders, 35 . . . . . On taking down the ages of all the grinders—wet, mixed, and dry—at one of our largest wheels, I found the average 34; boys under 21 were excluded from this calculation." Dr Hall gives the accompanying table of the ages of 290 men over 21 years of age employed in razor grinding:—

Ages.	Persons.	Ages.	Persons.
21 to 25	83	45 to 50	29
25 ,, 30	67	50 ,, 55	9
30 ,, 35	26	55 ,, 60	8
35 ,, 40	35	60 ,, 65	3
40 ,, 45	29	65 ,, 75	1

The operation of the Factories and Workshops Acts has, in recent years, exercised a beneficial influence on the health of the grinding trade; and the more general use of the fan in dry grinding has considerably reduced the excessive mortality among the operatives. (J. PA.)

CUTTACK. See CATTACK.

CUTTLE-FISH. The cuttle-fishes are the "Dintenfische" of the Germans and the "Seiches" of the French, and they constitute the most highly organized members of the class of the *Cephalopoda*. The great class of animals now known to naturalists under the name of *Cephalopoda* was fully recognized by Aristotle as a well-marked division of animals, under the name of *Malakia*. Even at the early period at which he lived (384–322 B.C.), this acute observer recognized at least nine species of Cephalopods—including the Argonaut and the Pearly Nautilus; and he also recorded the singular phenomena of reproduction, phenomena which were not scientifically confirmed and fully established till the year 1850, by the researches of Verany and H. Müller. The other classical writers (*e.g.*, Pliny) added nothing to Aristotle's observations. The next contribution of importance to the elucidation of the history of the Cephalopods was made by Rumph (1705) in his *Rariteit-Kamer*, describing the curiosities of Amboyna. The old Dutch naturalist gives in this work an account of the structure and habits of the Pearly Nautilus, which, though long discredited, is now known to be in the main correct, and which is accompanied by a fair figure of the soft parts of the animal. The relations of various fossil forms (such as Ammonites) to the *Cephalopoda* were first recognized in the earlier portion of the 18th century; and Breynius (1732) detected the true affinities of the Belemnite. Linnæus gives a summary of the knowledge of his time as to these animals, but separates the naked from the testaceous forms. The first establishment of the class *Cephalopoda*, however, as a definite natural group, is due to the genius of Cuvier (1798), to which we also owe this now universally accepted name. Cuvier's researches on this subject are contained in his *Leçons d'Anat. Comparée* (1799–1805), and were subsequently republished in an enlarged form in his *Mémoire sur les Céphalopodes et leur Anatomie* (1817). Since the appearance of this classical work, our knowledge of the natural history of the Cephalopods has been immensely increased by the researches of Delle Chiaje, Meckel, Von Siebold, De Blainville, Owen, Van Beneden, Peters, Van der Hoeven, Gray, Huxley, A. Hancock, Milne-Edwards, Kölliker, H. Müller, Leuckart, Steenstrup, Keferstein, Férussac, D'Orbigny, &c.; and, as regards fossil forms, by Buckland, D'Orbigny, Quenstedt, Oppel, Owen, Huxley, Phillips, Von Buch, Münster, Barrande, Von Hauer, Von Meyer, Hyatt, Hall, Meek, and many other palæontologists. One of the principal steps in advance upon the knowledge possessed by Cuvier was taken in 1835, when Dujardin showed that the *Foraminifera*, previously included by Plancus, Soldani, Fichtel, Linnæus, and others in the *Cephalopoda*, were in reality of a much lower grade of organization, and were not systematically related to the true *Mollusca*.

The class *Cephalopoda* comprises *Mollusca* in which there is a distinct head, and a toothed "tongue" or "odontophore," whilst the hinder extremity of the body is inclosed in a muscular mantle-sac, which may or may not secrete an external shell. The mouth is placed near the centre of the "foot," and the margins of this structure are split up into 8 (Octopod Cuttle-fishes), 10 (Decapod Cuttle-fishes), or numerous (Pearly Nautilus) muscular processes, or "arms." The lateral margins of the foot ("epipodia") constitute, by apposition or fusion, a muscular tube (the "funnel") through which the effete water of respiration is expelled.

The class *Cephalopoda* is divided into the two great orders of the *Tetrabranchiata* and the *Dibranchiata*.

The *Tetrabranchiate* order comprises only the living species, or varieties, of the Pearly Nautilus (*Nautilus pompilius*), along with a vast number of fossil forms, and is characterized by the possession of an external, many-chambered, siphunculate shell; by the presence of numerous arms, which are devoid of suckers; by the possession of four branchiæ; by the absence of an ink-sac; and by the fact that the "funnel" does not form a complete tube.

The order *Dibranchiata*, with which alone we are concerned here, comprises the true cuttle-fishes, in which there are either 8 or 10 arms, provided with suctorial discs; there is no external shell, or, in the single case in which such a structure is present (the female Argonaut), it is single-chambered, and is not secreted by the mantle; there are only two branchiæ; an ink-sac is present; and the "funnel" forms a complete tube.

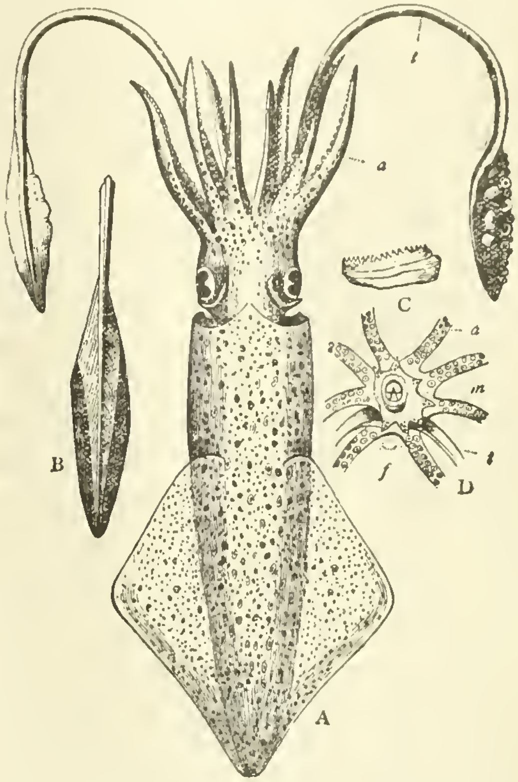


FIG. 1.—A, *Loligo vulgaris*; *a*, arms; *t*, tentacles. B, pen of the same reduced in size; C, side-view of one of the suckers, showing the horny hooks surrounding the margin; D, view of the head from in front, showing the arms (*a*), the tentacles (*t*), the mouth (*m*), and the funnel (*f*).

The body of a cuttle-fish is symmetrical, and is divisible into an anterior cephalic portion (*prosoma*) and a posterior abdominal portion (*metasoma*). The former of these is developed into a distinct head, furnished on its sides with large and prominent eyes, and having the mouth in the centre of its anterior surface, surrounded by eight or ten "arms." The latter incloses the various viscera, and is enveloped in an integumentary sac, which corresponds to the "mantle" ("*pallium*") of the Gasteropods and Lamellibranchs. The mantle-sac is formed by the coalescence of the two pallial lobes along the ventral surface of the body, and it is attached directly to the metasoma along the dorsal surface, whilst it is free inferiorly, and incloses a space (the "pallial chamber") which contains the gills, and into which the intestine and the ducts of the generative organs and ink-sac open.

The *integument* of the cuttle-fishes consists of several layers, of which the most important is one which corresponds to the lowermost layer of the epidermis, and which is distinguished by the possession of numerous large-sized cells filled with pigment-granules (" chromatophores "). These pigment-cells are capable of expanding and contracting in their dimensions, and of altering in shape, and below them are other flattened nucleated refracting cells, which co-operate with the former in the production of the marvellous play of changing colours which the cuttle-fishes exhibit under excitement or irritation.

The *muscular system* of the cuttle-fishes is well developed, the fibres being long and spindle-shaped, and only in certain situations (*e.g.*, in the branchial hearts) transversely striated. The mantle is in all highly muscular, but the most important muscular organs are the " arms," the " tentacles," the " fins," and the " funnel." The " arms " are long processes produced by the splitting up of the antero-lateral margins of the foot, and the mouth is placed in the centre of their bases. In all the cuttle-fishes eight arms are present, but the so-called *Decapods* have in addition the " tentacles," whilst the *Octopods* are devoid of these supplementary processes. The arms are longer or shorter pointed processes, formed principally of longitudinal muscles, with well-marked radial bundles of fibres, and having a nerve and an artery occupying the axis of each. They are placed symmetrically round the mouth, forming a dorsal pair, a ventral pair, and two lateral pairs on each side; and their bases are connected by an inter-brachial membrane, which in some instances (*Cirrhoteuthis*) extends nearly to their points. On the inner surface of the arms are placed the suckers (" acetabula "), in the form of muscular cup-like discs, which may be sessile or stalked, and which are arranged generally in one or two, or rarely in four, rows. Each acetabulum consists of a cup, the margin of which is formed by a muscular ring, sometimes strengthened by a horny girdle (which may be smooth or may be produced into teeth), whilst its centre is occupied by an elevated papilla composed mainly of radial muscular fibres. When the sucker is applied to any object, the contraction of the muscular fibres causes the depression of this muscular papilla, and creates a partial vacuum, thus enabling each sucker to act as a most efficient organ of prehension—their action being sometimes supplemented (as in *Onychoteuthis*) by the conversion of the central papilla into a horny hook. The so-called " tentacles " of the Decapod Cuttle-fishes resemble the true arms in structure, but are very much longer, and only carry suckers on their swollen and club-shaped extremities. They are placed on the ventral surface of the animal, between the third and fourth pairs of arms (counting from the middle line of the back); they may or may not be retractile into pouches placed below the eyes; and they may attain a length many times greater than that of the body itself. The tentacles are organs of prehension, and the arms are, in addition, employed by the animal in locomotion, enabling it to walk head downwards, at the bottom of the sea, or, when webbed, to swim through the water in a retrograde manner. One of the arms of the male cuttle-fishes, as will subsequently appear, is also more or less largely engaged in the work of reproduction, and may for this reason be greatly modified.

The sides of the body in all the Decapod Cuttle-fishes, and in a few of the Octopods (*e.g.*, *Pinnoctopus*), are more or less extensively produced into muscular expansions or *fins*, supported internally by a cartilaginous basis. These fins are employed by the animal in swimming head foremost, and they may extend along the whole length of the metasoma (as in *Sepia*), or they may be confined to the hinder end of the body (as in *Loligo*, *Cheiroteuthis*, *Onychoteuthis*, &c.)

The " funnel " of the cuttle-fishes is a muscular tube, formed by the union of the " epipodia," and placed on the lower surface of the body, with its anterior extremity projecting beyond the mantle, whilst it opens posteriorly into the pallial chamber. It serves for the extrusion (by means of the outgoing respiratory currents) of the undigested portions of the food and of the excretions of the kidneys and ink-sac; whilst the water which has passed over the gills is expelled through it in a succession of jets, subserving in this way the secondary purpose of driving the animal backwards through the water.

As regards the *digestive system*, the mouth is placed centrally, surrounded by the bases of the arms; and it conducts into a powerfully muscular buccal cavity, in which are contained two strong horny jaws and a well-developed " tongue." The jaws, or " mandibles," are purely horny (not partially calcareous, as in the Pearly Nautilus), and they have very much the form of a parrot's beak, working vertically, the lower one projecting most and receiving the upper mandible within it in the act of biting. The so-called " tongue " is a muscular organ, part of which is covered with numerous papillæ, and is apparently an organ of taste; whilst another portion is developed into a lingual ribbon essentially similar in its structure to the " odontophore " of the *Gasteropoda*. The œsophagus—sometimes simple (*Decapoda*), sometimes provided with proventricular or crop-like dilatations (*Octopoda*)—conducts from the buccal chamber to the stomach, the latter organ being of large size, highly muscular, of a generally rounded shape, and having appended to its pyloric extremity a capacious diverticulum, into which the bile-ducts open. Into the œsophagus open the ducts of one or two pairs of salivary glands; and the liver is of large size and highly developed, whilst certain glandular structures which pour their secretion into the bile-ducts are believed to represent the pancreas. The intestine is usually short, mostly of nearly uniform calibre, straight or slightly convoluted, and terminates in an anal aperture placed in the median line of the pallial chamber close to the base of the funnel.

The *excretory organs* of the cuttle-fishes are the kidneys and the ink-sac; and the integumentary sinuses in connection with the so-called " aquiferous pores " may possibly also have an excretory function. The kidneys (*r*, *r*, fig. 2) are spongy, cellular, tufted, or massive organs appended to the two posterior branches of the vena cava, and sometimes developed on others of the principal veins, just before they open into the branchial hearts. They are contained, along with the veins to which they are attached and the corresponding branchial heart on each side, in two serous sacs, which are separated centrally by the chamber containing the systemic heart, and which open by distinct apertures into the pallial chamber. The renal appendices are in direct communication with the veins on which they are situated, and have the form of membranous, often plicated sacs, covered externally with a layer of glandular cells which secrete a yellowish fluid. This fluid escapes into the serous sacs surrounding the kidneys, and is thence expelled into the mantle-cavity by the apertures before mentioned. The identity of this fluid with the renal secretion of the higher animals is shown by its containing uric acid (as proved by Harless).

The ink-sac is a glandular organ, present in all known Dibranchiates, generally of a pyriform shape, situated in different portions of the visceral chamber, but communicating by a longer or shorter duct either with the terminal portion of the intestine, or, more commonly, directly with the pallial cavity by a special aperture of its own, situated close beside the anus and at the base of the funnel. The ink-sac has strong fibrous walls, often with a silvery lustre, and its secretion is a brown or black fluid, containing a large amount of a carbonaceous pigment (" sepia "), along with various mineral salts. It is employed by the cuttle-fishes as a means of protection against their enemies, as they have the power of at will expelling jets of it into the surrounding water, and thus raising a cloud under cover of which they make their escape. The colouring matter of the ink is highly indestructible, is often found preserved in fossil Dibranchiates, and was formerly employed in the manufacture of the paint "sepia."

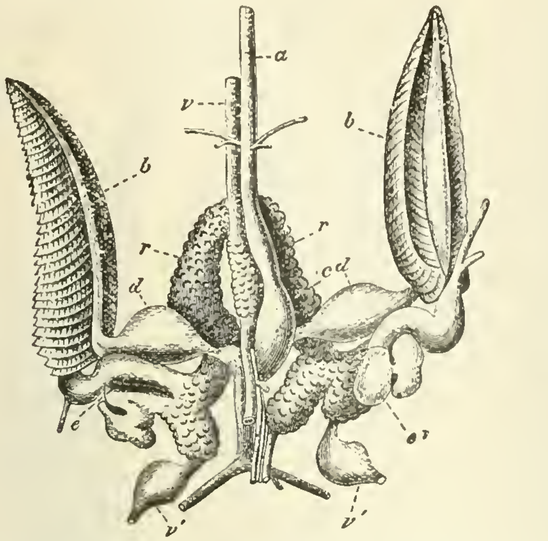

FIG. 2.—Central organs of the circulation, gills, and renal organs of *Sepia officinalis* (after John Hunter). *a*, aorta; *v*, vena cava; *v′*, *v′*, visceral veins; *c*, systemic heart; *d*, *d*, dilatations of branchial veins on entering the heart; *e*, *e*, branchial hearts; *b*, *b*, branchiæ; *r*, *r*, renal organs.

The *circulatory organs* of the cuttle-fishes consist of arteries, veins, generally an intermediate system of capillaries, a more or less extensively developed system of sinuses or lacunæ amongst the tissues, a central systemic heart, and two accessory or "branchial" hearts, whereby the venous blood is propelled through the breathing organs. The general course of the circulation is as follows. The venous blood returned from the arms, the anterior portion of the body and mantle generally, and the funnel is collected into a main ventrally-placed vein (the vena cava). This is reinforced by a great vein (*canalis venosus*), which brings the blood from a venous sinus surrounding the buccal chamber, the gullet, stomach, and liver in the Octopods, but which is of comparatively small dimensions in the Decapods. The great venous channel thus formed splits into two branches (the so-called "branchial arteries"), which further receive the venous blood returned from the posterior viscera and hinder portion of the mantle by special vessels (the "visceral veins"). The branchial arteries then pour their contents by valvular apertures into two special muscular contractile chambers, which are termed the "branchial hearts," and are situated, one on each side, at the bases of the gills. The branchial hearts drive the blood through the gills, where it is aerated, and whence it issues, as arterial blood, by the so-called "branchial veins," which convey it to the true systemic heart. This organ is placed in the middle line of the body, between the renal sinuses on each side, and below the bifurcation of the vena cava. The two branchial veins open into it by contractile dilatations, which may be regarded as auricles, and it consists of a single muscular cavity, which propels the blood into the systemic aorta. By this vessel the aerated blood is distributed to the tissues generally, finding its way back to the veins mostly through the intervention of a system of capillaries, but partly by the venous sinuses and lacunæ before-mentioned. Besides the true aorta there arise from the systemic heart minor arterial vessels, by which the blood is conveyed to the mantle, fins, and reproductive organs. The blood contains microscopic corpuscles, and is remarkable in containing a notable amount of copper.

The *respiratory organs* of the cuttle-fishes consist of two gills or branchiæ, one of each side of the body, placed in the cavity of the mantle-sac. The branchiæ are of an elongated pyramidal figure, and each consists of a central stem, attached below to the visceral mass and along one side to the mantle, the other side being free. The central stem bears a larger or smaller number of triangular laminæ, in turn supporting similar secondary laminæ, which finally carry still smaller tertiary laminæ; and the blood is thus minutely distributed through the gill. In the absence of a ciliated branchial surface, the necessary respiratory currents are maintained by the alternate contractions and expansions of the muscular walls of the pallial chamber. As the mantle dilates, the water from the exterior makes its way into the mantle-cavity by the opening between the rim of the mantle and the neck. The water, after passing over the gills, is then expelled through the funnel by the contraction of the mantle. The course of the out-going current through the funnel is determined either by the presence of suitable valves at the base of this organ, which permit the egress of water, but do not permit its ingress, or by the articulation of the sides of the funnel with the rim of the mantle-sac, in such a manner that the opening into the mantle-cavity is completely closed during the exspiratory act, the funnel alone remaining open. As before remarked, the outgoing respiratory currents serve to take with them the excrementitious portions of the food and the secretions of the kidneys and ink-sac; and they are also concerned in swimming, as the animal can by their means propel itself backwards through the water.

The *nervous system* of the cuttle-fishes consists of the three principal pairs of ganglia characteristic of the Lamellibranchs and Gasteropods—namely, the cephalic, pedal, and parieto-splanchnic. These form an œsophageal collar, which consists of a smaller dorsal mass (the cephalic ganglia), and a larger ventral mass (the pedal and parieto-splanchnic ganglia), united by commissures. The central organs of the nervous system are protected by a cartilage, foreshadowing the cranium of the vertebrate animals; and the cerebral ganglia supply the nerves to the buccal mass and eyes, whilst the pedal ganglia supply nerves to the auditory organs, funnel, and arms, and the nervous supply of the mantle and viscera generally is derived from the parieto-splanchnic ganglia. The *organs of sense* of the cuttle-fishes are highly developed, and consist of the eyes, auditory sacs, and perhaps of an olfactory apparatus. Space will not permit of a description of these, and it must suffice to say that the organs of vision are of large size, and more highly developed than in any other invertebrate animals, consisting of a sclerotic, choroid, retina, vitreous humour, aqueous humour, and crystalline lens; the organs of hearing are two chambers hollowed out of the cartilage of the cranial plate, each containing a membranous sac with an otolith; and the organs of smell have been doubtfully sought in certain cavities which open by small apertures behind the eye, and are supplied with filaments from the cephalic ganglia.

Of the *skeletal structures* which these animals possess, some are integumentary and exoskeletal, whilst others may be regarded as constituting a true endoskeleton. In the latter category are the various internal cartilaginous structures which are found in the cuttle-fishes, protecting vital organs, or serving as a base of insertion for muscles. Some of these, such as the cartilages which strengthen the anterior rim of the mantle-sac, and serve for its articulation in some forms with the funnel, and the cartilages of the fins (when present) need no further notice; but the cranial cartilage is of greater importance. This latter forms a plate, which surrounds the gullet, and incloses and protects the great œsophageal nerve-collar, and which sends off prolongations which strengthen and protect the eye, thus discharging the functions of the orbits of higher animals.

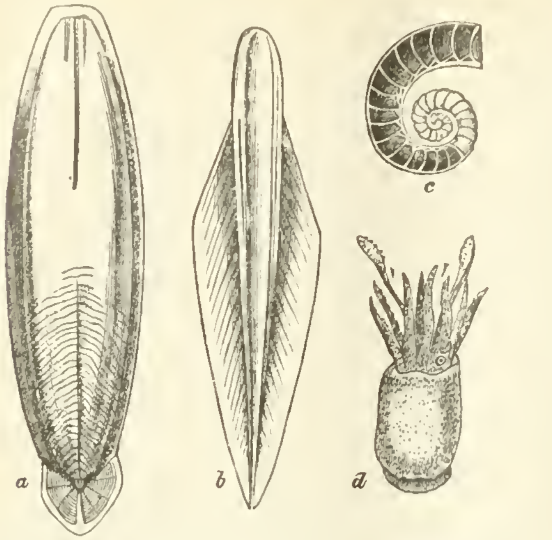

Fig. 3.—*a*, Internal skeleton ("sepiostaire") of *Sepia ornata*, Rang.; *b*, Internal skeleton ("pen") of *Histioteuthis Bonelliana*, D'Orb.; *c*, Internal skeleton ("phragmacone") of *Spirula fragilis*, Lamarck; *d*, Animal of *Spirula Peronii*.

The *integumentary skeleton* of the cuttle-fishes consists of an external shell only in the Paper Nautilus (*Argonauta*) but in all others in which it is present at all it is composed of certain horny or calcareous structures, which are lodged in the substance of the mantle, and are there are concealed from view. This internal skeleton, so characteristic of the Dibranchiates, is well developed in all the Decapods, but is either absent or rudimentary in the Octopods, in which it never consists of more than "two short rudimental styles encysted in the dorso-lateral parts of the mantle" (Owen). In the typical Decapods (such as *Loligo*, *Sepioteuthis*, *Enoploteuthis*, *Histioteuthis*, &c.), the skeleton is horny, and consists of a feather-shaped "pen" (*b*, fig. 3) composed of a central shaft and two more or less extensively developed lateral expansions or wings, the whole imbedded in the mantle in the middle line of the back. In some cases (*Onychoteuthis*, *Ommastrephes*, *Loligopsis*) the hinder end of the pen is developed into hollow conical appendix or cup, forming a rudimentary "splanchnoskeleton." In the genus *Sepia*, the internal skeleton (*a*, fig. 3) consists of a horny oval plate, strengthened by calcareous matter, which is deposited principally on its internal surface, and consists of numerous thin plates separated by vertical fibres. The "cuttle-bone," or "sepiostaire," is of a porous, spongy consistence, and is concave on its inner surface behind, terminating posteriorly in a small cone ("mucro"), from which a thin, wing-like margin is prolonged forwards on both sides. In the singular genus *Spirula* the internal skeleton (*c*, fig. 3) has the form of a calcareous and nacreous tube, coiled up into a flat spiral, the coils of which are not in contact. The internal cavity of the shell is partitioned off by a succession of pearly septa, which are perforated on the ventral or concave side of the shell by a tube ("siphuncle") running the whole length of the spiral. In its general construction, the skeleton of the *Spirula* is very like the shell of the Pearly Nautilus; but it is quite certain that its relations to the animal are quite different. Though the shell itself is exceedingly abundant in certain regions, the animal is at present only known by some very imperfect examples, and its connection with the shell is not precisely clear. The last chamber of the shell, however, is little or not at all larger than those behind it, and it is certain that the animal in no sense lives in the shell. On the contrary the last chamber simply lodged the extremity of the visceral sac, and the shell is to all intents and purposes an internal one, though possibly it is only partially concealed from view by folds of the mantle, and is not absolutely encysted.

Of the three types of internal skeleton characteristic of living cuttle-fishes—namely, the horny pen of the Calamaries, the calcareous "bone" of the *Sepiæ*, and the spiral chambered and siphunculate shell of *Spirula*—two appear under various forms in the Secondary and Tertiary rocks, whilst the third, comprising the *Spirulæ*, is so far unknown in the fossil condition. Thus, we find fossil "pens," in all essential respects identical with those of the ordinary living Decapods, to be by no means very rare in deposits of Secondary age, and such genera as *Teudopsis*, *Leptoteuthis*, *Geoteuthis*, and *Beloteuthis* have been founded on these remains. Similarly, the calcareous "cuttle-bones" from the Tertiary rocks, upon which are founded the genera *Spirulirostra*, *Beloptera*, and *Belemnosis*, appear to be referable to the *Sepiadæ*. In *Spirulirostra*, however, the skeleton consists partly of a spirally bent, chambered, and siphonate "phragmacone," protected by a pointed calcareous "guard," and it thus reminds us on the one hand of the living *Spirula*, and on the other hand of the extinct Belemnites. By far the most important of the fossil cuttle-fishes, however, are those which form the family of the *Belemnitidæ*, a group wholly Secondary in its distribution, which has a type of skeleton peculiar to itself. This skeleton consists of a conical chambered shell—the "phragmacone"—which is partitioned off by calcareous septa into distinct air-chambers, pierced ventrally by a tube or "siphuncle." The conical phragmacone is placed in a corresponding excavation in the anterior end of a longer or shorter, sub-cylindrical, calcareous, and fibrous structure, which is known as the "guard," or "rostrum," and which protects the delicate phragmacone from injury. The guard is the part of the skeleton which is most frequently found in the fossil condition, and in perfect specimens it is prolonged forwards anteriorly into a longer or shorter horny or shelly plate, which corresponds with the front portion of the "pen" of the Calamaries, and is known as the "pro-ostracum." The various genera of the *Belemnitidæ*—*Belemnites*, *Belemnitella*, *Xiphoteuthis*, *Conoteuthis*, *Acanthoteuthis*, *Belemnoteuthis*—are founded on differences in the nature of the internal skeleton. We know, however, from specimens preserved in such fine-grained deposits as the Oxford clay, that the cuttle-fishes of this family possessed lateral fins, and two "tentacles" in addition to the eight proper "arms;" that the suckers were provided with horny hooks; and that there was an ink-sac.

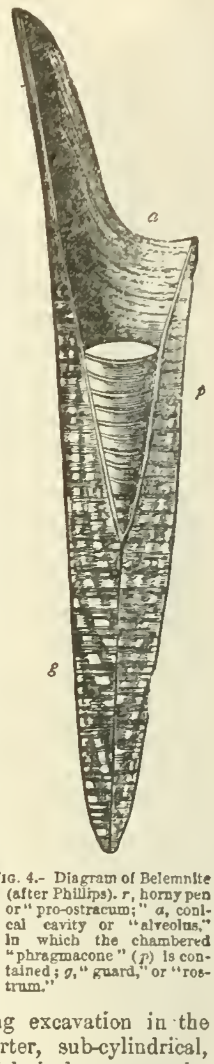

Fig. 4.- Diagram of Belemnite (after Phillips). *r*, horny pen or "pro-ostracum;" *a*, conical cavity or "alveolus," in which the chambered "phragmacone" (*p*) is contained; *g*, "guard," or "rostrum."

As before remarked, the only known Dibranchiate

Cephalopod in which an external shell is present is the Paper Nautilus (*Argonauta*). The shell, moreover, is only possessed by the female Argonaut—the male being shell-less—and it is in no way comparable as regards its mode of origin and its morphological significance with the shell of the ordinary testaceous Mollusks in general, or of the Tetrabranchiate Cephalopods in particular. The shell of the Argonaut is involute, one-chambered, and calcareous, of most graceful outlines and ornamentation. It is not secreted by the mantle, nor is the animal attached to it by any organic connection—hence the long controversy as to whether the Argonaut truly owned the shell it inhabited, or had not rather simply obtained it by plunder, as the Hermit-Crab seizes any empty shell which may be suitable for its temporary habitation. It is, however, now known that the shell of the Argonaut is secreted by the two dorsal arms of the female, which are expanded or webbed, aud closely embrace the shell which they produce. These two arms, in their natural position, are bent backwards, so as to allow the animal to inhabit the shell. The animal sits in the shell, with its funnel turned towards the keel, and the apex of the shell is empty, and is used simply as a receptacle for the clustered eggs.

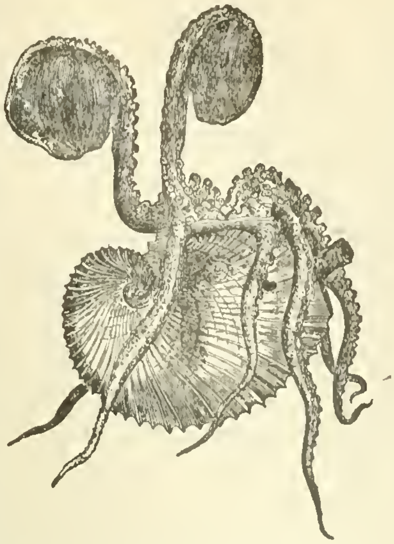

FIG. 5.—*Argonauta argo*, the "Paper Nautilus, female. The animal is represented in its shell, but the webbed dorsal arms are separated from the shell, which they ordinarily embrace.

The processes of *reproduction* and *development* in the cuttle-fishes are of great interest. The males and females are generally more or less unlike externally—this difference being most marked in the Argonaut, in which the male is very much smaller than the female, and in addition possesses no shell. The reproductive organs of the female consist of a single ovary, situated at the hinder end of the body, and inclosed in a pouch of the peritoneum, from which one or two oviducts are continued to open into the mantle-cavity, generally near the base of the funnel. The eggs are discharged into the peritoneal sac surrounding the ovary, and are then taken up by the oviducts and conveyed into the mantle-cavity. When finally extruded, the impregnated eggs are found to be inclosed, singly or many together, in special capsules, which are usually attached in bunches to some foreign body. These egg-capsules are produced by the so-called "nidamental glauds," which in some genera (*e.g.*, *Sepia* and *Loligo*) are of large size, and are appended to the proper generative organs. The reproductive organs of the male cuttle-fishes consist of a testis placed at the hinder extremity, like the ovary of the female, and inclosed in a peritoneal sac. The spermatozoids are discharged into this sac by the rupture of the secreting tubes, and are conveyed to the exterior by a tubular "vas deferens," which is dilated in its course into a "vesicula seminalis," and ultimately opens into the mantle-cavity by a papilliform "penis" situated close to the anus. Before the vas deferens finally terminates in this way, it is usually expanded into a special dilatation ("bursa spermatophorum"), in which are packed away the so-called "spermatophores," or "moving filaments of Needham." These singular bodies are whitish filaments, 6 or 8 lines in length, composed of aggregations of spermatozoids inclosed in a covering originally of an albuminous nature, but ultimately becoming developed into two membranes which have a complicated arrangement. When set free and moistened, the spermatophores exhibit active vermicular movements, and under suitable circumstances rupture and discharge their contained spermatozoa.

The reproductive act in the cuttle-fishes is only imperfectly known; but true intromission is certainly impossible. According to the observations of Aristotle, the poulpes and calamaries perform this act by clinging to each other, mouth to mouth, with the suckers of the arms in mutual apposition, the former seeking the bottom, whilst the latter move freely in the water. It is known now, in this connection, that one of the arms of the male cuttle-fishes is peculiarly modified, the arm thus affected being said to be "hectocotylized." In some forms, this hectocotylized arm—differing in its position in different cases—is not so conspicuously altered as to attract immediate attention, and it does not appear clear that it plays necessarily any part in the reproductive act, though the alteration of form is undoubtedly primarily sexual. In certain forms, however (viz. *Argonauta argo*, *Tremoctopus violaceus*, *T. Quoyanus*, and *Octopus carena*) the hectocotylized arm is the efficient agent in the act of reproduction. It is longer and thicker than the other arms, prolonged at its extremity into a long filament, and possessing posteriorly a sac which is filled with spermatophores. During the act of reproduction, the hectocotylized arm is detached by the male, and is deposited, with its freight of spermatophores, within the mantle-cavity of the female. The terminal filament is perforated by a tube, by which the spermatophores are conveyed to the ova, and impregnation is thus effected. When thus detached, the hectocotylized arm is capable of independent movement, and when first found in this free condition within the mantle-sac of the female Argonaut it was regarded as a parasitic worm. Under this belief Delle Chiaje described it as the *Trichocephalus acetabularis*, and Cuvier called it (in the *Octopus*) the *Hectocotylus Octopodis*. Both these names are in allusion to the suckers which the arm carries, and the name of "hectocotylus" is still applied to the detached arm, whereas the arm, if not detached, is simply said to be "hectocotylized." As before remarked, it is not absolutely certain that the hectocotylized arm is invariably employed as a reproductive agent; and certainly it is only occasionally detached. According to Steenstrup, however, the hectocotylized arm, when not detached, is employed by the male to transfer the spermatophores to the female during the act of reproduction, the spermatic filaments being either placed within the mantle-cavity, or fixed to the internal surface of the buccal cavity of the females. How the spermatophores are transferred from the seminal ducts of the male to the sac contained in the interior of the hectocotylized arm is still uncertain; but Leuckart has shown that the sac in question does actually communicate with the surface by a distinct aperture.

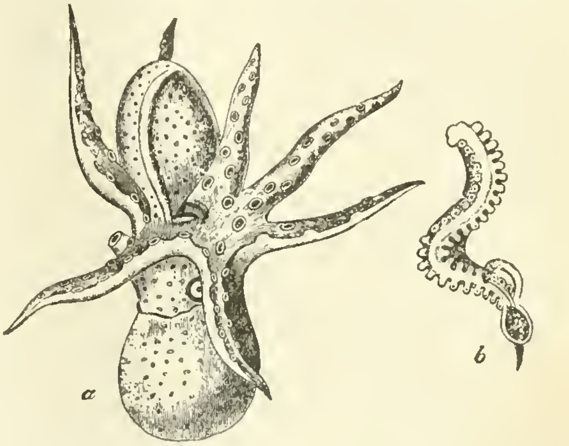

FIG. 6.—*a*, Male of *Argonauta argo*, with the hectocotylized arm still contained in its enveloping cyst, four times enlarged (after H. Müller). *b*, Hectocotylus of *Tremoctopus violaceus* (after Kölliker).

The *development* of the cuttle-fishes can be barely touched upon here. After fertilization the ovum undergoes a partial segmentation, as in birds and reptiles, and there is formed at one pole a germinal disc ("blastoderm"), which is at first divided into two parts by a primitive furrow, then into four by a secondary furrow intersecting the first at right angles, and then into eight. An inner germinal layer is then formed (according to the researches of Ray Lankester on *Loligo*) quite independently of the outer one; and the two layers then grow over the entire yolk and completely inclose it. The unsegmented portion of the yolk is gradually absorbed by the growing embryo, but obtains no direct connection with the alimentary tube, the latter originating from the primitive invagination of the outer layer of the blastoderm, instead of being formed, as in vertebrates, by its inner layer.

As regards their *distribution in space*, the cuttle-fishes are all marine, active, rapacious, and carnivorous in their habits, swimming vigorously by means of the jets of water emitted from the funnel, or in an opposite direction by means of fins, and creeping about the sea-bottom by means of the prehensile arms.

Some forms (such as the *Octopodidæ* and *Sepia*) are essentially littoral animals, frequenting shallow seas, living in the vicinity of the land, and specially affecting rocky bottoms. Others (such as *Tremoctopus*, *Sepiola*, *Argonauta*, *Spirula*, *Architeuthis*, *Onychoteuthis*, &c.) are pelagic animals, living in the open ocean, often far from land, and swimming at or near the surface. Though more varied as regards their specific and generic types in the warmer seas of the globe, cuttle-fishes are found in almost all seas, and are sometimes extremely numerous individually even in the colder oceans. It seems also certain that our present knowledge as to the pelagic forms is only very imperfect. As to their dimensions, none are extremely minute, and some attain truly gigantic dimensions. Not to speak of the fabulous accounts of colossal cuttle-fishes given by many of the older writers, such as Pontoppidan and Olaus Magnus, we are now acquainted through the observations and descriptions of scientific witnesses, such as Banks and Solander, Quoy and Gaimard, Steenstrup, Verrill, &c., with various huge cuttlefishes, inhabiting both the Atlantic and Pacific Oceans. Some of these; though only known by imperfect specimens, certainly attain a length of 15 feet or upwards to the body and head, and from 30 to 40 feet or upwards in the long tentacles. All these giant cuttlefishes appear to belong to the sub-order of the *Decapoda*.

As regards their *distribution in time*, the order of the Dibranchiate Cephalopods does not seem to have come into existence during the Palæozoic period. And in this case the negative evidence is of considerable value, seeing that so many members of the order are provided with structures capable of preservation in the fossil state. During the Mesozoic period the Dibranchiates attained a high development, being principally represented by the exclusively Secondary family of the *Belemnitidæ*, which began to exist in the Trias and survived to the Chalk. The genus *Belemnites* itself extends from the Upper Trias to the Upper Greensand, and its place is taken in the Chalk by the nearly allied *Belemnitella*, distinguished by a fissure in the side of the alveolus of the guard. The Secondary rocks have also yielded the pens of *Teuthidæ* (*Teudopsis*, *Beloteuthis*, &c.), and of *Sepiadæ* (*Sepia* itself, and *Coccoteuthis*). In the Tertiary rocks, the three curious extinct genera *Belosepia*, *Spirulirostra*, and *Belemnosis* appear to be referable to the *Sepiadæ*, and *Sepia* itself still continues to exist; whilst the *Teuthidæ* are not wholly unrepresented. The family of the *Spirulidæ* has no certain fossil representative; but two species of Argonaut have been detected in the later Tertiaries. With this last-mentioned exception, no remains certainly referable to the sub-order of the *Octopoda* have hitherto been met with.

BIBLIOGRAPHY.—The following list comprises some of the more important works and memoirs which may be consulted with regard to the living and fossil Dibranchiate Cephalopoda:—Aristotle, *Historia de Animalibus*; Meyer, *Aristoteles Thierkunde*, Berlin, 1855; Needham, *An Account of some new Microscopical Discoveries*, 1745; Monro (*secundus*), "On the Anatomy of the Sagittated Calamary," in *The Structure and Physiology of Fishes*, 1785; Cuvier, *Leçons d'Anat. Comparée*, and *Mémoire sur les Céphalopodes et sur leur Anatomie*; St. delle Chiaje, *Memoria su' Cefalopedi*, 1829; Meckel, *System der vergleichenden Anatomie*; Owen, "Cephalopoda," in Todd and Bowman's *Cyclopædia of Anatomy and Physiology*, 1835–36; Von Siebold, "Anatomy of Cephalopoda," in Siebold and Stannius's *Lehrbuch der vergleichenden Anatomie*, 1848; Milne-Edwards, *Leçons sur la Physiologie et l'Anatomie comparée*, 1857; Keferstein, "Cephalopoda," in Bronn's *Klassen und Ordnungen des Thierreichs*, 1862; Férussac and Alc. d'Orbigny, *Histoire naturelle des Céphalopodes acétabulifères vivants et fossiles*, 1835–48; Poli, "Anatomy of Argonauta," in his *Testacea utriusque Siciliæ*, 1826; Jeanette Power, "The Animal of *Argonauta argo*," *Archiv. f. Naturgesch.*, 1337; Van Beneden, "Mém. sur l'Argonauta," in *Nouv. Mem. de l'Acad. roy. de Bruxelles*, 1838; J. E. Gray, "The Animal of *Spirula*," *Ann. and Mag. Nat. Hist.*, 1845; Kölliker, *Entwickelungsgeschichte der Cephalopoden*, 1844, and "Observations on the Hectocotyli of *Tremoctopus violaceus* and *Argonauta argo*," in *Trans. Linn. Soc.* 1846; H. Müller, "Ueber das Männchen von *Argonauta argo* und die Hectocotylen," in *Zeitsch. f. Wiss. Zool.*, 1852; Verrill, "Colossal Cephalopods of the North Atlantic," in *American Naturalist*, 1875; Wagner, "Die fossilen Ueberreste von nackten Dintenfischen aus den Lithographischen Schiefer," in *Abhandl. d. Math. phys. Cl. der K. Bayer. Akad. Wiss.*, 1860; Owen, "Belemnites from the Oxford Clay," *Phil. Trans.*, 1844; Huxley, "Structure of Belemnites," in *Mem. Geol. Survey*, 1864; Phillips, *Monograph of the Belemnitidæ* (Palæontographical Society). 1865–69. (H. A. N.)

CUVIER, BARON (1769–1832). Georges Cuvier was born on the 23d of August 1769, at Montbéliard, in the department of Doubs, then belonging to Würtemberg. He was christened Léopold-Chrétien-Frédéric-Dagobert, but afterwards assumed, at his mother's wish, the name of Georges, which was that of an elder brother deceased. His father, a retired officer on half-pay, belonged to a Protestant family which had emigrated from the Jura in consequence of religious persecution. His mother, as in the case of so many eminent men, was a cultivated and high-minded woman, who took every pains to develop the nascent faculties of her son. He early showed a bent towards the investigation of natural phenomena, and was noted for his studious habits and marvellous memory. His higher education was carried out at the Academy of Stuttgard—the school of Schiller and other men of eminence—to which collegiate institution he had received a nomination from Prince Charles of Würtemberg. Devoting a year to the study of "philosophy," he was enrolled as a student in the faculty of political economy ("Administration," "Cameralwisseuschaft"); and after a brilliant university career he was thrown upon the world at the age of eighteen. A short interlude was passed as sub-lieutenant in the Swiss regiment of Châteauvieux, but this corps being disbanded, and his family being poor, he accepted the position of tutor in the family of the Comte d'Héricy, residing near Caen, in Normandy. He here spent the years from 1788 to the end of 1794—including the terrific epoch of the "Reign of Terror"—peacefully occupying his leisure in the ardent pursuit of his favourite sciences. About this time he attracted the attention of the Abbé Tessier, who was sheltering himself from the fury of the Revolution at Fécamp, and who wrote strongly in favour of his *protégé* to his friends in Paris,—with the result that Cuvier, after corresponding with the well-known naturalist Geoffroy Saint-Hilaire, was appointed in 1795 assistant to Mertrud, the aged professor of comparative anatomy at the Museum d'Histoire Naturelle.

The pre-eminent abilities of Cuvier as a naturalist and scientific observer were at once recognized in Paris, and the National Institute being founded this year (1795), he was elected a member, and was associated with Lacépède and Daubenton as the nucleus of the section of zoology. Detached memoirs on various zoological subjects had already been published by him, one of the most important being a joint memoir with Geoffroy on a new classification of the Mammalia. In this year he also published a number of researches, dealing with a very wide range of subjects, such as descriptions of new species of insects, the anatomy of *Helix pomatia*, the internal ear of the cetaceans, the circulation of the invertebrates, the classification of the invertebrates, &c. One of the most important of these, published in the "Décade philosophique" of the *Memoirs of the Natural History Society of Paris*, dealt with the internal and external structure and systematic affinities of the miscellaneous assemblage of lower invertebrates at that time grouped together under the name of "Vermes." In 1796 Cuvier commenced his course of lectures in the École Centrale du Panthéon, and published a number of contributions to comparative anatomy. He also read his first palæontological paper at the opening of the National Institute in the April of this year, which was subsequently published in 1800 under the title *Mémoires sur les Espèces d'Éléphants vivants et fossiles.* Throughout the years 1797 and 1798 his scientific activity continued unabated, as is implied by the production of various memoirs upon such subjects as the nutritive processes in insects, the structure of the ascidians, the anatomy of the bivalve mollusks, the nostrils of the cetaceans, the different species of rhinoceros, the fossil bones of the Gypseous series of Montmartre, &c. In 1798, also was published his first separate work, namely the *Tableau Élémentaire de l'histoire naturelle des Animaux.* This volume was an abridgment of his course of lectures at the École du Panthéon, and may be regarded as the foundation and first general statement of that natural classification of the animal kingdom, which his genius originated, and which is universally accepted by modern zoologists.

In 1799, by the death of Daubenton, the chair of natural history in the Collége de France was rendered vacant; and Cuvier was appointed to this responsible post. In this year an important memoir on the blood system of the leeches appeared from his pen. In 1800, in addition to various scattered contributions to zoology and palæontology, embracing observations on the *Siren lacertina*, the crocodilians of the Old and New Worlds, the fossil tapirs of France, the ornitholithes of Montmartre, &c., appeared the *Leçons d'Anatomie Comparée*, a classical work, in the production of which Cuvier was assisted by Dumeril in the first two volumes, and by Duvernoy in three later ones. In 1802 Cuvier became titular professor at the Jardin des Plantes; and in the same year he was appointed commissary of the Institute to accompany the inspectors-general of public instruction. In this latter capacity he visited the south of France; but he was in the early part of 1803 chosen perpetual secretary of the National Institute in the department of the physical and natural sciences, and he consequently abandoned the appointment just mentioned and returned to Paris. Shortly thereafter he married the daughter of M. Duvancel, a contractor for the public taxes, by whom he had four children, all of whom predeceased him.

Cuvier's scientific publications during the period posterior to the year 1801 covered a vast area, and can be but briefly alluded to here. In addition to memoirs on the teeth of fishes, on the "Vermes" with red blood (Annelides), on the crabs known to the ancients, on the Egyptian ibis, &c., Cuvier now devoted himself more especially to three lines of inquiry, one dealing with the structure and classification of the Mollusca, a second treating of the comparative anatomy and systematic arrangement of the fishes, and the third concerned with fossil mammals and reptiles primarily, and secondarily with the osteology of living forms belonging to the same groups. As regards the first of these fields of investigation, Cuvier published a long series of papers on the mollusca, which began as early as 1792, and dealt with almost all the groups now admitted into this sub-kingdom, with the exception of the *Polyzoa*. Most of these memoirs were published in the *Annales du Museum* between 1802 and 1815, and they were subsequently collected into the well-known and invaluable *Mémoires pour servir à l'Histoire et à l'Anatomie des Mollusques*, published in one volume at Paris in 1817. In the department of fishes, Cuvier's researches, begun in 1801, finally culminated in the publication of the *Histoire Naturelle des Poissons*. This magnificent work contained descriptions of 5000 species of fishes, and was the joint production of Cuvier and Valenciennes, its publication (so far as the former was concerned) extending over the years 1828–31. Palæontology was always a favourite study with Cuvier, and the department of it dealing with the Mammalia may be said to have been essentially created and established by him. In this region of investigation he published a long list of memoirs, partly relating to the bones of extinct animals, and partly detailing the results of observations on the skeletons of living animals specially examined with a view of throwing light upon the structure and affinities of the fossil forms. In the second category must be placed a number of papers relating to the osteology of the *Rhinoceros Indicus*, the tapir, *Hyrax Capensis*, the hippopotamus, the sloths, the manatee, &c. In the former category must be classed an even greater number of memoirs, dealing with the extinct mammals of the Eocene beds of Montmartre, the fossil species of hippopotamus, the *Didelphys gypsorum*, the *Megalonyx*, the *Megatherium*, the cave-hyæna, the extinct species of rhinoceros, the cave-bear, the mastodon, the extinct species of elephant, fossil species of manatee and seals, fossil forms of crocodilians, chelonians, fishes, birds, &c. The results of Cuvier's principal palæontological and geological investigations were ultimately given to the world in the form of two separate works. One of these is the celebrated *Recherches sur les Ossemens fossiles de Quadrupèdes*, in four volumes quarto, published in Paris in 1812, with subsequent editions in 1821 and 1825; and the other is his *Discours sur les Révolutions de la surface du Globe*, in one volume octavo, published in Paris in 1825.

Apart from his own original investigations in zoology and palæontology Cuvier carried out a vast amount of work as perpetual secretary of the National Institute, and as an official connected with public education generally; and much of this work appeared ultimately in a published form. Thus, in 1808 he was placed by Napoleon upon the council of the Imperial University, and in this capacity he presided (in the years 1809, 1811, and 1813) over commissions charged to examine the state of the higher educational establishments in the districts beyond the Alps and the Rhine which had been annexed to France, and to report upon the means by which these could be affiliated with the central university. Three separate reports on this subject were published by him. In his capacity, again, of perpetual secretary of the Institute, he not only prepared a number of *éloges historiques* on deceased members of the Academy of Sciences, but he was the author of a number of reports on the history of the physical and natural sciences, the most important of these being his celebrated *Rapport historique sur le progrès des sciences Physiques depuis* 1789, published in 1810.

No work of Cuvier, however, has attained a higher reputation than his famous *Règne Animal distribué d'après son Organisation*. The first edition of this appeared in four octavo volumes in 1817; the second, in five volumes, was published in 1829–30. In this classical work, Cuvier embodied the results of the whole of his previous researches on the structure of living and fossil animals, as giving confirmation and fixity to that system of classification of which he was the originator, and the main features of which still subsist. The whole of this work was his own, with the exception of the Insecta, in which he was assisted by his friend Latreille.

The rest of Cuvier's life, apart from his scientific labours, must be very briefly told. By the unanimous consent of the learned world, he was now regarded as the most eminent of living naturalists, and the scientific honours which he received are beyond enumeration. Nor did he fail to meet amongst his own countrymen—always ready to recognize ability, genius, energy, and perseverance—with that public acknowledgment of his merits which he had so richly deserved. Prior to the fall of Napoleon (1814) he had been admitted to the Council of State, and his position remained unaffected by the restoration of the Bourbons. He was elected chancellor of the university, in which capacity he acted as interim president of the Council of Public Instruction, whilst he also, as a Lutheran, superintended the faculty of Protestant theology. In 1819 he was appointed president of the Committee of the Interior, which office he retained until his death. In 1826 he was made grand officer of the Legion of Honour; and in 1831 he was raised by Louis Philippe to the rank of peer of France, and was subsequently appointed president of the Council of State. In the beginning of 1832, he was nominated to the Ministry of the Interior. but the end was now near. On the 13th of May in this year, after a brief illness, commencing in paralysis of the throat, and rapidly implicating the respiratory organs, Cuvier passed away, his last surviving child having preceded him no less than five years.

Eminent as he was in various departments of administration, it will be as a naturalist and palæontologist that the memory of Cuvier will be preserved. The results which he accomplished in the sciences of zoology and palæontology were, however, so vast and varied that it is only possible to indicate in a general manner the more important of them. These results fall naturally under three heads.

In the first place, as regards *systematic zoology*, he effected an entire revolution in the classification of the animal kingdom as previously understood, and as explicitly formulated in the system of Linnæus. For an artificial and arbitrary classification he substituted a natural arrangement, and he for the first time indicated the true principles upon which a natural classification is possible. He established the empirical laws of correlation of growth and the subordination of different systems of organs, and he showed that the primary laws of all sound classification are to be found only in the anatomical examination of the animals compared. In other words, for the loose, formal, and physiological analogies, which had previously been used as the basis of classification, he substituted the fundamental resemblances of morphological type and homology, and relegated the former to a subordinate place. In no department of systematic zoology were the reforms instituted by Cuvier more conspicuous than in the invertebrates. Linnæus classified the invertebrates simply by dividing them into the two classes of the *Insecta* and the *Vermes*. Cuvier divided the invertebrates into the three sub-kingdoms ("embranchements") of the *Mollusca*, the *Articulata*, and the *Radiata* or zoophytes, and split up these again into a number of natural groups or classes. It is true that modern zoologists have almost unanimously agreed on the partition of the Cuvierian "Radiata" into the two sub-kingdoms of the *Cœlenterata* and *Protozoa*; though some modern views would almost obliterate any line of demarcation between these, and would thus, in effect, re-establish the *Radiata*. It is also true that considerable changes have been made in the classes of the lower invertebrates as instituted by Cuvier. It is impossible, however, not to recognize the immense step in advance made by the Cuvierian system of classification upon that of Linnæus.

Cuvier's contributions to *comparative anatomy*, in the second place, can be merely glanced at here. Apart from the impulse given to the study of this science by the publication of his *Leçons d'Anatomie Comparée*, it may almost be said that we owe to Cuvier the general recognition that the really essential portion of scientific zoology is comparative anatomy. As regards special departments, his contributions to the comparative anatomy of the Mollusca and fishes, and to the osteology of the Mammalia, may be particularly mentioned. As an instance, further, of the manner in which Cuvier employed comparative anatomy as a guide in zoological classification, the sub-kingdom of the *Mollusca* may be specially singled out, or, if we prefer to a take a minor group, the class of the *Cephalopoda*.

Lastly, in the department of *palæontology*, Cuvier effected a great and notable advance upon his predecessors. The notion that fossils were merely *lusus naturæ* had been already formally abandoned by such men as Leibnitz, Buffon, and Pallas. Daubenton, and subsequently Pallas and Camper, compared the fossil bones of quadrupeds with those of living forms, and the last of these declared his opinion that some of these fossil bones belonged to extinct species of quadrupeds. It is to Cuvier, however, that the world owes the first systematic application of that science of comparative anatomy, which he himself had done so much to place upon a sound basis, to the study of the bones of fossil animals. It is to him that we owe the first complete demonstration that extinct animals could be "reconstructed" from fragmentary remains by availing ourselves of the law of the "correlation of growth;" though it is true, as pointed out by Professor Huxley, that he rested more implicitly and securely upon this law than its empiric nature and its now proved exceptions would justify at the present day. Cuvier, as a palæontologist, devoted himself principally to the study of the fossil Mammalia of the Tertiary period, and especially to those of the Eocene basin of Paris; and the flood of light which he was enabled to throw upon the structure and affinities of these lost forms was mainly derived from a careful and laborious comparison of the extinct types with their nearest living congeners. Whatever new victories may be in store for the science of palæontology, the *Ossemens Fossiles* will remain an imperishable monument of the genius and industry of one of the first and of the greatest of the pioneers in this region of human investigation.

(H. A. N.)

CUXHAVEN, or KUXHAFEN, a small seaport-town of Northern Germany, at the mouth of the Elbe, on its left bank, 58 miles W.N.W. of Hamburg, in the detached bailiwick of Ritzebüttel, which forms part of the territory belonging to Hamburg. It has nearly 3900 inhabitants, chiefly pilots and fishermen. The harbour is good and secure, and is much frequented by vessels delayed in the Elbe by unfavourable weather; it is also the starting point of the Hamburg steamers when the river is frozen over. There is regular communication by diligence with Bremerhafen, and by river with Hamburg. Though lying on a bare strand, the town is much frequented as a bathing place by Hamburgers.

CUYABÁ, or CUIABÁ, the capital of the Brazilian inland province of Matto Grosso, in 15° 20′ S. lat. and 56° W. long., or almost in the heart of the South American continent. It lies about a mile from the left bank of the Cuyabá river, one of the head streams of the Paraguay, at 250 miles by river from the confluence with the main stream, and about 2400 miles from the estuary of the Plata. Its churches, public buildings, and dwelling-houses are generally well-built of brick or of adobe, or of blocks of a conglomerate of pebbles and red clay, plastered and tiled. It is the seat of a bishop, and has a military station and depôt, and an arsenal for the construction of small vessels for the protection of the rivers. As early as 1722 a number of Portuguese, attracted by the discovery of gold, formed the settlement of Senhor Bom Jesus de Cuyabá, and two years later, such was the influx of population, it was raised to the rank of a city by the governor of São Paulo. Its prosperity dates, however, from 1856, when the navigability of the upper tributaries of the Paraguay had been demonstrated, and when the outlet by the rivers took the place of the former toilsome caravan passage overland to the Atlantic towns and ports. Now a regular fortnightly line of Brazilian steamers unites Monte Video and Rio with Curumba on the Upper Paraguay, whence, after the collection of custom duties, the goods are transshipped in smaller steamers and boats to Cuyabá. The chief import trade is in manufactured goods, hardwares, and salt; the exports are hides, cattle, ipecacuanha, vanilla, and some diamonds. Other products of the district of Cuyabá are manioc, rice, maize, sugar, cotton, tobacco, coffee, and beans. The population is estimated at from 18,000 to 20,000.

The Cuyabá river is navigable from 14° 49 S., and from its proximity at this point to the navigation of the Tapajos by its tributary the Arinos, is probably destined to form part of a great future highway between the Amazon and La Plata. Proof of the practicability of this route was afforded by the portage of large canoes, laden with merchandize from Pará, across the water-parting to the Cuyabá river in 1846.

CUYP, the name of a Dutch family which produced two generations of painters. The Cuyps were long settled at Dort, in the neighbourhood of which they had a country house, where Albert Cuyp was born and bred. The eldest member of the family who acquired fame was—

Jacob Gerritsz Cuyp (1575?—1649), born, it is said, at Dort, and taught by Abraham Bloemaert of Utrecht. It is difficult to find a greater contrast than that which marks the styles of these two painters, one of whom learned to imitate the mannerisms of the French school, whilst the other persistently clung to the sober reality of nature. J. G. Cuyp's pictures are little known, and are therefore said to be scarce. But he produced portraits in various forms, as busts and half-lengths thrown upon plain back-grounds, or groups in rooms, landscapes, and gardens. Solid and clever as an imitator of nature in its ordinary garb, he is always spirited, sometimes rough, but generally plain, and quite as unconscious of the sparkle conspicuous in Frans Hals as incapable of the concentrated light-effects peculiar to Rembrandt. In portrait busts, of which there are signed examples dated 1624, 1644, 1646, and 1649, in the museums of Berlin, Rotterdam, Marseilles, Vienna, and Metz, his treatment is honest, homely, and true; his touch and tone firm and natural. In portraying children he is fond of introducing playthings and pets—a lamb, a goat, or a roedeer; and he reproduces animal life with realistic care. In a family scene at the Amsterdam Museum we have likenesses of men, women, boys, and girls, with a cottage and park. In the background is a coach with a pair of horses. These examples alone give us a clue to the influences under which Albert Cuyp grew up, and explain to some extent the direction which his art took as he rose to manhood.

Albert Cuyp (1605-1691), the son of Jacob Gerritsz by Grietche Dierichsdochter (Dierich's daughter), was born at Dort. He married in 1658 Cornelia Bosman, a widow, by whom he had an only daughter. By right of his possessions at Dordwyck, Cuyp was a vassal of the county of Holland, and privileged to sit in the high court of the province. As a citizen he was sufficiently well known to be placed on the list of those from whom William III., stadtholder of the Netherlands, chose the regency of Dort in 1672. His death, and his burial on the 7th of November 1691 in the church of the Augustines of Dort, are historically proved. It has been said that Albert was the pupil of his father. The scanty evidence of Dutch annalists to this effect seems confirmed by a certain coincidence in the style and treatment of father and son. It has been likewise stated that Albert was skilled, not only in the production of portraits, landscapes, and herds, but in the representation of still life. His works are supposed to be divisible into such as bear the distinctive marks C. or A. C. in cursive characters, the letters A. C. in Roman capitals, and the name "A. Cuyp" in full. A man of Cuyp's acknowledged talent may have been versatile enough to paint in many different styles. But whether he was as versatile as some critics of this generation think is a question not quite easy to answer. It is to be observed that pieces assigned to Cuyp representing game, shell-fish, and fruit, and inscribed A. C. in Roman capitals (Rotterdam, Amsterdam, and Berlin museums), though cleverly executed, are not in touch or treatment like other pictures of less dubious authenticity, signed either with C. or A. C. or "A. Cuyp" in cursive letters. The panels marked C. and A. C. in cursive are portraits or landscapes, with herds, and interiors of stables or sheds, in which there are cows, horses, and poultry. The subjects and their handling are akin to those which strike us in panels bearing the master's full signature, though characterized, as productions of an artist in the first phase of his progress would naturally be, by tones more uniform, touch more flat, and colour more deep than we find in the delicate and subtle compositions of the painter's later time. Generally speaking the finished examples of Cuyp's middle and final period all bear his full signature. They are all remarkable for harmonies attained by certain combinations of shade in gradations with colours in contraposition.

Albert Cuyp, a true child of the Netherlands, does not seem to have wandered much beyond Rotterdam on the one hand or Nimeguen on the other. His scenery is that of the Meuse or Rhine exclusively; and there is little variety to notice in his views of water and meadows at Dort, or the bolder undulations of the Rhine banks east of it, except such as results from diversity of effect due to change of weather or season or hour. Cuyp is to the river and its banks what Willem Vandevelde is to calm seas and Hobbema to woods. There is a poetry of effect, an eternity of distance in his pictures, which no Dutchman ever expressed in a similar way. His landscapes sparkle with silvery sheen at early morning, they are bathed in warm or sultry haze at noon, or glow with heat at eventide. Under all circumstances they have a peculiar tinge of auburn which is Cuyp's and Cuyp's alone. Bürger truly says Van Goyen is gray, Ruysdael is brown, Hobbema olive, but Cuyp "is blond." The utmost delicacy may be observed in Cuyp's manner of defining reflections of objects in water, or of sight from water on ship's sides. He shows great cleverness in throwing pale yellow clouds against clear blue skies, and merging yellow mists into olive green vegetation. He is also very artful in varying light and shade according to distance, either by interchange of cloud-shadow and sun-gleam or by gradation of tints. His horses and cattle are admirably drawn, and they relieve each other quite as well if contrasted in black and white and black and red, or varied in subtler shades of red and brown. Rich weed-growth is expressed by light but marrowy touch, suggestive of detail as well as of general form. The human figure is given with homely realism in most cases, but frequently with a charming elevation, when, as often occurs, the persons represented are meant to be portraits. Whatever the theme may be it remains impressed with the character and individuality of Cuyp. Familiar subjects of the master's earliest period are stables with cattle and horses (Rotterdam, Amsterdam, Petersburg, and Brussels museums). Occasionally he painted portraits in the bust form familiar to his father, one of which is dated 1649, and exhibited in the National Gallery in London. More frequently he produced likenesses of ladies and gentlemen on horseback, in which the life and dress of the period and the forms of horses are most vividly represented (Buckingham Palace, Bridgewater Gallery, Louvre, and Dresden Museum). Later on we find him fondest of expansive scenery with meadows and cattle and flocks, or rivers and barges in the foreground and distances showing the towers and steeples of Dort. Cuyp was more partial to summer than to winter, to noon than to night, to calm than to storm. But some of his best groups are occasionally relieved on dark and gusty cloud (Louvre and Robarts's collection). A few capital pieces show us people sledging and skating or netting ice-holes (Yarborough, Neeld, and Bedford collections). A lovely Night on the Banks of a River, in the Grosvenor collection, reminds us that Cuyp's friend and contemporary was the painter of moonlights, Aart van der Neer, to whom he was equal in the production of these peculiar effects and superior in the throw of figures. Sometimes Cuyp composed fancy subjects. His Orpheus charming the Beasts, in the Bute collection, is judiciously arranged with the familiar domestic animals in the foreground, and the wild ones, to which he is a comparative stranger, thrown back into the distance. One of his rare gospel subjects is Philip baptizing the Eunuch (Marchmont House, Berwickshire), described as a fine work by Waagen. The best and most attractive of

Cuyp's pieces are his Meuse and Rhine landscapes, with meadows, cattle, flocks, and horsemen, and occasionally with boats and barges. In these he brought together and displayed—during his middle and final period—all the skill of one who is at once a poet and a finished artist; grouping, tinting, touch, harmony of light and shade, and true chords of colours are all combined. Masterpieces of acknowledged beauty are the Riders with the Boy and Herdsman in the National Gallery; the Meuse, with Dort in the distance, in three or four varieties, in the Bridgewater, Grosvenor, Holford, and Brownlow collections; the Huntsman (Ashburton); Herdsmen with Cattle, belonging to the marquis of Bute; and the Piper with Cows, in the Louvre. It is well known that the prices paid for Cuyp's pictures in his own time were comparatively low. In 1750, 30 florins was considered to be the highest sum to which any one of his panels was entitled. At the sale of the Clewer collection at Christie's in 1876 a small Hilly Landscape in Morning Light was sold for £5040, and a View on the Rhine, with cows on a bank, for £3150. Smith has catalogued 335 of Cuyp's works. It would be difficult now to find more than a third of them. (J. A. C.)

CUZCO, a city of southern Peru, the capital of a province of the same name, the ancient capital of the empire of the Incas, and still one of the most important cities of the republic, in 13° 31′ S. lat. and 73° 3′ W. long., 11,380 feet above the sea, and 350 miles E.S.E. of Lima. It stands at the head of a fertile valley, nine miles in length, running from south-east to north-west, and bounded by mountains of considerable elevation. Over the city on the north side rises the famous hill of Sacsahuaman, crowned with the old fortress of the Incas, and separated from the mountains by the deep ravines of the streams called the Huatanay and Rodadero. The chief portion of the city is built between the two streams, with its great *plaza* in the centre. To westward of the Huatanay are two more fine squares, those of the Cabildo and of San Francisco. The houses of the city are built of stone, the lower portion of massive masonry of the times of the Incas, with a light modern superstructure roofed with red tile; the streets are at right angles, and afford fine vistas. The principal buildings are the cathedral, the convent of San Domingo (on a part of the site of the ancient Inca temple of the Sun), the Cabildo or Government house, a university founded in 1598, the College of Science and Arts, the Library and Museum of Incarial Antiquities, and various churches. The trade of Cuzco is chiefly in linen, wool, cotton, gold and silver work, leather, and sugar. The population, estimated at about 50,000, is chiefly Indian. The roads from Cuzco to other parts of Peru, especially that one which leads towards Quito, are most remarkable for their frail suspension bridges over the deep chasms of the Andes. A railroad is projected to unite Cuzco with the line which has been completed from the coast through Arequipa towards Puno on Lake Titicaca.

The province of Cuzco, the limits of which were somewhat curtailed in the formation of the new province of Abancay in 1873, lies partly on the eastern cordillera of the Andes, and slopes thence into the forest plains of the interior, along the tributaries of the Ucayali and Marañon, to the frontier of Brazil and Bolivia.

CYBELE, or RHEA CYBELE, in Greek mythology, was the mother of Zeus and the order of deities of which he was the head. As such she was styled "mother of gods" (θεῶν μήτηρ), and her temple called Metroön. But though thus made to fit into the general system of deities, her worship was originally peculiar to Crete and Phrygia in Asia Minor, in both which places it was accompanied by wild orgiastic dances and music on the model of the rites which her first priests and attendants, the Curetes, Corybantes, and Dactyls had held in her honour. It was in Crete that the infant Zeus was secluded and brought up in the guardianship of the Curetes, and there also he was said to have been buried. But the belief in the death of Zeus in this case may have arisen from the tendency of her worship to dwell on the opposites of birth and death as seen in the Phrygian story of Atys, which again, like that of Adonis, seems to illustrate the change in nature from the bloom of spring to the decay of winter. (See ATYS). In Phrygia she was on the one hand the goddess of mountains, caves, and haunts of wild animals. Her name Cybele was the Phrygian word for caves. Her proper name there was Agdistis, and she was thought of as attended by lions and panthers. On the other hand she was a goddess of vine-growing, agriculture, and town-life, wearing a mural crown, and connected in early legends with Midas, Gordias, and Marsyas, who belong also to the cycle of Bacchus, whose nurse she is sometimes called. Marsyas perfected the flute which she had invented. Midas and Gordias owed their great wealth to her. The centre of her worship in Phrygia, and the most sacred place to her anywhere, was Pessinus, where in a cave in Mount Dindymon was an image of her in the form, as was said, of a meteoric stone, which was afterwards removed to Rome. There also was the grave of Atys. Her first temple at Pessinus had been built, according to tradition, by king Midas. In later times it was kept up by the kings of Pergamus and the Romans. From Phrygia her worship passed to Lydia, where she was called Cybebe and had a temple in Sardes, thence to the coast of Asia Minor, to the mainland of Greece, and lastly to Rome. She was figured seated on a throne with a lion on her lap or under her feet, or with a lion at each side, or drawn in a chariot by lions, with a mural crown on her head, and in her hands a sceptre and a cymbal.

CYCLADES, the southern group of islands in the Ægean Sea belonging to Greece, as distinguished from the northern Sporades of the Greek archipelago, and the southern Sporades of the Asiatic portion of the archipelago, belonging to Turkey. They were originally twelve in number, and derived their name from the fact of their lying in a circle round the sacred isle of Delos, which was the smallest of the group. The twelve were Andros (the modern Andro), Ceos (Zea), Cythnos (Thermia), Delos (Mikra Dili), Rhenea (Megali Dili), Myconos (Mykono), Naxos (Naxia), Paros (Paro), Seriphos (Serpho), Siphnos (Sipheno), Syros (Syra), and Tenos (Tino). The modern Greek nomarchy of the Cyclades includes the above islands and those of Amurgo (the ancient Amorgos), Nio (Ios), Antiparo (Oliaros), Iraklia (Heraclea), Kimolo (Kimolos), Milo (Melos), Polykandro (Pholegandros), Sikino (Sicinos), Santorin (Thera), Anaphi (Anaphe), and many other islets and rocks between these, forming together an area of 927 square miles, and having a population in 1870 of 123,299. The islands are generally high, several exceeding 2000 feet in altitude, and one or two points, as the summits of Andro and Naxia, exceeding 3200 feet; they have a varied climate and fertile soil, producing corn and fruits, wine and oil. Many of the inhabitants, who are less mixed in race than those of the mainland, are seamen and traders. Hermopolis, on the island of Syra, is the capital of the nomarchy.

CYCLONE. See ATMOSPHERE, CLIMATE, and METEOROLOGY.

CYCLOPES (Κύκλωπες), THE, in Greek mythology, worked with Vulcan at his forge in the heart of burning mountains, especially in Mount Ætna, the Lipara islands, and Lemnos. Their names, Brontes, Steropes, and Arges, indicate the noise and flash of a volcanic eruption. Finding them dangerous to his rule by their enormous strength, Kronos had confined them in the centre of the earth. In the war between the gods and Titans they were set free by Zeus, and furnished him with his thunder and lightning. Next they appear as the builders of walls of huge stones, such as those of Mycenæ, to build which they had been brought from Lycia, a volcanic country. But here they are seven in number, and seem to be of a different race. Different also are the Cyclopes of the *Odyssey*, in which they appear as a race living individually in caves,—with large herds of sheep and goats,—having only one eye, in the centre of the forehead, of enormous strength, and fearless of gods or men. The great strength and the one large round eye, from which their name is derived, they have in common with the volcanic Cyclopes, but as a race they seem to be connected with Neptune and the forces of the sea. Polyphemus was a son of the sea god.

CYNICS, a Greek sect, whose name is derived either from the fact that they originally met in the gymnasium called Cynosarges, or, in scorn of their habits and temper, from the word *κύων*, a dog. The founder of the sect was Antisthenes, a disciple of Socrates, who, adopting the Socratic doctrines that the sole aim of philosophy is to attain the knowledge of right conduct, and that the *summum bonum* is not to be found in pleasure but in virtue, pushed them to an extreme, teaching that both pleasure and theoretical knowledge are to be wholly despised, and that to be independent of outward circumstances is the highest good. All that is artificial was condemned; and the Cynic was marked by his intense scorn of all other men, and the insolence with which he expressed it. The later Cynics, losing the Cynic virtue of self-control, but retaining the Cynic maxim of living according to nature, sank into mere beggars and brutal sensualists. From the time of Socrates the succession of Cynic teachers was unbroken for about a century; and in the 1st century A.D. Cynicism revived. The leading earlier Cynics were Antisthenes, Diogenes of Sinope, Crates, and Zeno; and the chief later Cynics were Demetrius the friend of Seneca, and Œnomaus and Demonax, who were both alive in the time of Hadrian. For further details, see the biographies of the principal Cynics.

CY-PRES a principle adopted by the Court of Chancery in dealing with trusts. When the charitable purpose intended by a testator cannot be carried into effect, the court will apply the funds to some other purpose, as near the original as possible. For instance, a testator having left a fund to be divided into four parts—one-fourth to be used for "the redemption of British slaves in Turkey and Barbary," and the other three-fourths for various local charities—it was found that there were no British slaves in Turkey or Barbary, and as to that part of the gift therefore the testator's purpose failed. Instead of allowing the portion of the fund devoted to this impossible purpose to lapse to the next of kin, the court devoted it to the purposes specified for the rest of the estate. This doctrine is only applied where "a general intention of charity is manifest" in the will, and not where one particular object only was present to the mind of the testator. Thus a testator, having left money to be applied in building a church in a particular parish, and that having been found to be impossible, the fund will not be applied *cy-près*, but will go to the next of kin.

CYPRESS (*Cupressus*), a genus of the sub-order *Cupressineæ*, natural order *Coniferæ* or *Pinaceæ*, represented by evergreen aromatic trees and shrubs indigenous to the south of Europe, the East Indies, China, California, Mexico, Guatemala, and North America. The leaves of the cypresses are scale-like, overlapping, and generally in four rows; the female catkins are roundish, and fewer than the male; the cones consist of from 6 to 10 peltate woody scales, which terminate in a curved point, and open when the seeds are ripe; the seeds are numerous and winged. All the species exude resin, but no turpentine. *C. sempervirens*, Linn., the common cypress, is a native of the Levant and Persia. It is a tapering, flame-shaped tree resembling the Lombardy poplar; its branches are thickly covered with small, imbricated, shining-green leaves; the male catkins are about 3 lines in length; the cones are between 1 and 1½ inches in diameter, sessile, and generally in pairs, and are made up of large angular scales, slightly convex exteriorly, and mucronate in the centre. In Britain the tree grows to a height of 40 feet, in its native soil to 70 or 90 feet. In thrives best on a dry, deep, sandy loam, on airy sheltered sites at no great elevation above the sea. It was introduced into Great Britain before the middle of the 16th century. In the climate of the south of England its rate of growth when young is between 1 and 1½ feet a year. The seeds are sown in April, and come up in three or four weeks; the plants require protection from frost during their first winter. The timber of the cypress is hard, close-grained, of a fine reddish hue, and very durable. Among the ancients it was in request for poles, rafters, joists, and for the construction of wine-presses, tables, and musical instruments; and on that account was so valuable that a plantation of cypresses was considered a sufficient dowry for a daughter. Owing to its durability the wood was employed for mummy cases, and images of the gods; a statue of Jupiter carved out of cypress is stated by Pliny to have existed 600 years without showing signs of decay. The cypress doors of the ancient St Peter's at Rome, when removed by Eugenius IV., were about 1100 years old, but nevertheless in a state of perfect preservation. Laws were engraved on cypress by the ancients, and objects of value were preserved in receptacles made of it; thus Horace speaks of poems *levi servanda cupresso*. The cypress, which grows no more when once cut down, was regarded as a symbol of the dead, and perhaps for that reason was sacred to Pluto; its branches were placed by the Greeks and Romans on the funeral pyres and in the houses of their departed friends. Its supposed ill-boding nature is alluded to in Shakespeare's *Henry VI.*, where Suffolk desires for his enemies "their sweetest shade, a grove of cypress trees." The cypress was the tree into which Cyparissus, a beautiful youth beloved by Apollo, was transformed, that he might grieve to all time (Ovid, *Met.*, x. iii.). In Turkish cemeteries the cypress—

> "Dark tree, still sad when others' grief is fled,
> The only constant mourner o'er the dead"—

is the most striking feature, the rule being to plant one for each interment. The tree grows straight, or nearly so, and has a gloomy and forbidding, but wonderfully stately aspect. With advancing age its foliage becomes of a dark, almost black, hue. Gilpin calls the cypress an architectural tree; "no Italian scene," says he, "is perfect without its tall spiral form, appearing as if it were but a part of the picturesquely disposed edifices which rise from the middle ground against the distant landscape." The cypress of Somma, in Lombardy, is believed to have been in existence in the time of Julius Cæsar; it is about 121 feet in height, and 23 feet in circumference. Napoleon, in making the road over the Simplon, deviated from the straight line in order to leave it standing. The cypress, as the olive, is found everywhere in the dry hollows and high eastern slopes of Corfu, of the scenery of which it is characteristic. Its superior luxuriance in that island is attributed by Professor Ansted to the calcareous nature of the soil. As an ornamental tree in Britain the cypress is useful to break the outline formed by round-headed low shrubs and trees. The *berosh*, or *beroth*, of the Hebrew Scriptures, translated "fir" in the authorized version, in 1 Kings v. 8 and vi. 15, 2 Chron. ii. 8, and many other passages, is supposed to signify the cypress, which, according to Pococke, is the only tree that grows towards the summit of Lebanon. The common or tall variety of *C. sempervirens* is known as *C. fastigiata;* the other variety, *C. horizontalis*, which is little planted in England, is distinguished by its horizontally-spreading branches, and its likeness to the cedar. The species *C. torulosa* of North India, so called from its twisted bark, attains an altitude of 150 feet; its branches are erect or ascending, and grow so as to form a perfect cone. In the Kulu and Ladakh country the tree is sacred to the deities of the elements. It has been introduced into England, but does not thrive where the winter is severe. The wood, which in Indian temples is burnt as incense, is yellowish-red, close-grained, tough, hard, readily worked, durable, and equal in quality to that of the deodar. Another East Indian species, *C. lusitanica*, or *glauca*, the "Cedar of Goa," is a handsome tree, 50 feet in height when full-grown, with spreading branches drooping at their extremities; it has been much planted in Portugal, especially in the neighbourhood of Cintra. The species *C. Lawsoniana*, a native of the Shasta and Scott valleys in North California, where it attains a height of 100 feet, was introduced into Scotland in 1854; it is much grown for ornamental purposes in Britain. Other Californian cypresses are *C. macrocarpa*, which is 60 feet high when mature, and *C. attenuata*, *C. Goveniana*, and *C. Macnabiana*, shrubs varying from 6 to 10 feet in height. The Mexican species, *C. Knightiana*, grows to 120 feet. *C. funebris* is a native of the north of China, where it is planted near pagodas. *C. Nutkaensis*, the Nootka Sound cypress, was introduced into Britain in 1850. It is a hardy species, reaching a height of from 80 to 100 feet. See Gordon's *Pinetum*, 1875. (F. H. B.)

CYPRIAN [THASCIUS CÆCILIUS CYPRIANUS] (*c.* 200–258), bishop of Carthage in the 3d century, is one of the most illustrious names in the early history of the church, and one of the most notable of its early martyrs. He was born about the year 200; or, at least, this is the most reasonable conjecture as to the date of his birth, for there is no clear evidence on the subject, nor as to his age at the time of his martyrdom, which took place on the 14th September 258. He was of patrician family, and highly educated, and for some time occupied as a teacher of rhetoric in Carthage, in the neighbourhood of which he was born. He had either inherited or acquired considerable wealth. Of an enthusiastic temperament, accomplished in classical literature and the rhetorical art which he taught, he seems while a pagan to have courted discussion with the converts to Christianity. Confident in his own powers, he entered ardently into what was no doubt the great question of the time at Carthage as elsewhere. He sought to vanquish, but was himself vanquished by, the new religious force which was making such rapid inroads on the decaying paganism of the Roman empire. Cæcilius, a presbyter of Carthage, is supposed to have been the instrument of his conversion, and he assumed this name accordingly at his baptism, which seems to have taken place about 245 or 246.

Cyprian carried all his natural enthusiasm and brilliant powers into his new profession. He devoted his wealth to the relief of the poor and other pious uses; and so, according to his deacon Pontius, who wrote a diffuse and vague account of his "life and passion," "realized two benefits—the contempt of the world's ambition, and the observance of that mercy which God has preferred to sacrifice." The result of his charity and activity as a Christian convert was his unanimous call by the Christian people to the head of the church in Carthage. "His reluctant diffidence was overpowered by the acclamations of the whole city, who environed his house and compelled him by their friendly violence to assume the distinguished and, it might be, dangerous office. He yielded to preserve the peace of the city."

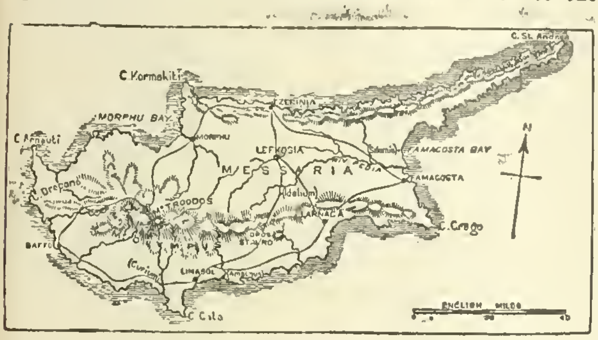
The time was still one of fierce persecution directed against the Christians according to the temper or caprice of the Roman emperors; and the head of the church at Carthage became a prominent object of attack. During the persecution of Decius in 250 he was exposed to imminent danger, and was compelled for a time to seek safety in retreat. Under Gallus, the successor of Decius, the persecution was relaxed, and Cyprian returned to Carthage. Here he held several councils for the discussion of the affairs of the church, especially for grave questions as to the rebaptism of heretics, and the re-admission into the church of the *lapsi*, or those who had fallen away through fear during the heat of the Decian persecution. Cyprian, although inspired by lofty notions of the prerogatives of the church, and inclined to severity of opinion towards heretics, and especially heretical dissentients from the divine authority of the episcopal order and unity of Christendom, was leniently disposed towards those who had temporarily fallen from the faith. He set himself in opposition to Novatian, a presbyter of Rome, who advocated their permanent exclusion from the church; and it was Cyprian's influence which probably guided the tolerant measures of the Carthaginian synods on the subject. This question plunged him into controversy, of which, as well as many other matters, we have an interesting glimpse in the numerous letters which he wrote during his episcopate, and which have been preserved to our time.

Among the early documents of church history there are few more interesting memorials then these letters of Cyprian, addressed to a great variety of friends, particularly to two bishops of Rome, Cornelius and Stephen, and dealing with many points of church discipline and doctrine. They show clearly the substantial equality of all Christian bishops at the time, who all equally received the name of "pope" (papa), and addressed each other as colleagues. The bishop of Carthage, for example, speaks of "his brother" the bishop of Rome, and does not hesitate to dispute his opinion when it does not seem to him a good or sound one. Stephen of Rome had espoused the cause of one Basilides, a bishop of Spain, who had been deposed from his see; but Cyprian manfully defends (*Epist.* lxvii.) the sentence pronounced against the latter, and does not hesitate to say in the same epistle that Basilides had gone to Rome and deceived there his colleague Stephen (*Stephanum collegam nostrum fefellit*). Some of the letters were written during his retirement under the Decian persecution—the forty, or nearly that number, which stand first in the series,—others belong to the later period of his life, and a few to a still earlier period. It is by no means easy to determine their several dates, as the first of the series (according to Migne's order, that usually followed), which is one of the most interesting of the whole, is without any chronological indication. We give a sentence or two from this letter, as showing the more human, poetical, and pleasing aspect of Cyprian's character. It is the vintage time when he writes to his "dearest Donatus," and both the season and the place, he says, invite to repose. "The pleasant aspect of the gardens harmonizes with the gentle breezes of a mild autumn in soothing and cheering the senses; . . . . . the neighbouring thickets insure us solitude; and the vagrant trailings of the vine branches, creeping in pendant mazes among the reeds that support them, have made for us a leafy shelter. Pleasantly here we clothe our thoughts in words."

Valerian followed Gallus upon the imperial throne in 253, and the persecutions of the Christians were soon renewed. Cyprian was at first banished from Carthage, but found refuge in a pleasant retreat at Ceribis, "near the sea-shore, in a spot shaded with verdant groves, beside a clear and healthful stream of water." But soon he was recalled, taken into custody, and finally condemned to death. The severity of Valerian spared the mass of the Christian people, and vented itself chiefly on the bishops, who refused to sacrifice to the emperor. When brought before the proconsul, the great bishop of Carthage was briefly interrogated: "Art thou Thascius Cyprian, the bishop of so many impious men? The emperor commands thee to sacrifice." Cyprian replied, "I will not sacrifice;" and, persisting in his refusal notwithstanding remonstrances, he was condemned to death. On hearing his sentence Cyprian only said, "God be thanked;" and, being conducted to a neighbouring field, he was beheaded.

Besides his letters, various brief treatises of Cyprian have descended to modern times, on such subjects as "The Lapsed," "The Unity of the Church," "the Lord's Prayer," "Works and Alms." But the characteristics of his time and of his own mind are chiefly to be sought in his letters. A general account of him will be found in any of the larger church histories, as those of Milman, Neander, Schaff. (J. T.)

CYPRUS, one of the largest islands in the Mediterranean, situated in the easternmost basin of that sea, at nearly equal distance from the coasts of Asia Minor to the



Island of Cyprus.

north and of Syria to the east. The headland of Cape Kormakiti in Cyprus is distant about 46 miles from Cape Anamur in Cilicia, and its north-east point, Cape St Andrea, is about 60 miles from Latakieh in Syria. It lies between 34° 30′ and 35° 40′ N. lat., and between 32° 15′ and 34° 35′ E. long., so that it is situated in almost exactly the same latitude as Crete. Its greatest length is about 145 miles, from Cape Drepano in the west to Cape St Andrea in the north-east, and its greatest breadth, from Cape Gata in the south to Cape Kormakiti in the north, reaches nearly 60 miles; while it retains an average width of from 35 to 50 miles through the greater part of its extent, but narrows suddenly to less than 10 miles in about 34° long., and from thence sends out a long narrow tongue of land towards the E.N.E. for a distance of more than 45 miles, terminating in Cape St Andrea. It is the third largest island in the Mediterranean, considerably exceeding in area both Corsica and Crete.

Mountains.—Great part of the island is occupied by two mountain ranges, both of which have a general direction from west to east. Of these the most extensive, as well as the most lofty, is that which fills up almost the whole southern portion of the island, and is generally designated by modern geographers as Mount Olympus, though that name appears to have been applied by the ancients only to one particular peak. The highest summit is known at the present day as Mount Troödos, and attains an elevation of 6590 feet. It sends down subordinate ranges or spurs, of considerable altitude, on all sides, one of which extends to Cape Arnauti (the ancient Acamas), which forms the north-west extremity of the island, while others descend on both sides quite to the northern and southern coasts. The main range is continued eastwards by the lofty summits known as Mount Adelphi and Mount Machera (both of them, however, considerably inferior to Troödos) until it ends in the somewhat isolated peak called Oros Stavro, or Hill of the Holy Cross. This mountain, which is evidently the one designated by Strabo as Mount Olympus, is only 2300 feet high, but is a conspicuous object from Larnaca, from which it is only 12 miles distant, and is well known from being frequented as a place of pilgrimage.

The northern range of mountains, which is not known by any collective name, begins at Cape Kormakiti (the ancient Crommyon) and is continued from thence in an unbroken ridge to the eastern extremity of the island, Cape St Andrea, a distance of more than 100 miles. It is very inferior in elevation to the southern range, its highest summits not attaining to more than about 3200 feet, while in the eastern portion they but rarely exceed 2000 feet. But it is remarkable for its continuous and unbroken character—consisting throughout of a narrow, but rugged and rocky ridge, descending abruptly to the south into the great plain of Lefkosia, and to the north to a narrow plain bordering the coast.

The Messaria.—Between these two mountain ranges lies a broad tract of plain, extending quite across the island from the Bay of Famagosta to that of Morphu on the west, through a length of nearly 60 miles, with a breadth varying from 10 to 20 miles. It is known by the name of the Messaria, and is watered by two streams, both of which descend from the mountains on the south; but, on reaching the plain, the one turns eastward and flows into the Bay of Famagosta, close to the ruins of Salamis; the other flows westward into the Bay of Morphu. The greater part of this plain is open and uncultivated, and presents nothing but barren downs; but corn is grown in considerable quantities in the northern portions of it, and there is no doubt that the whole is readily susceptible of cultivation. It is remarkable that Cyprus was celebrated in antiquity for its forests, which not only clothed the whole of its mountain ranges, but covered the entire central plain with a dense mass, so that it was with difficulty that the land could be cleared for cultivation. At the present day the whole plain of the Messaria is utterly bare and treeless, and it is only the loftiest and central summits of Mount Olympus that still retain their covering of pine woods. The disappearance of the forests has naturally affected the rivers, which are mostly mere torrents, dry in summer. The most considerable is that called in ancient times the Pediæus, which, as already mentioned, traverses the plain of the Messaria, and falls into the sea near Salamis. But even this does not reach the sea in summer, and its stagnant waters form marshes which contribute much to the unhealthy character of the plain.

Minerals.—Next to its forests, which long supplied the Greek monarchs of Egypt with timber for their fleets, Cyprus was celebrated among the ancients for its mineral wealth, especially for its mines of copper, which were worked from a very early period, and continued to enjoy such reputation among both Greeks and Romans that the modern name for the metal is derived from the term of Æs Cyprium or Cuprium by which it was known to the latter. According to Strabo the most valuable mines were worked at a place called Tamasus, in the centre of the island, on the northern slopes of Mount Olympus, but their exact site has not been identified, and no mines are at present worked in Cyprus. Besides copper, according to Strabo, the island produced considerable quantities of silver; and Pliny records it as producing various kinds of precious stones, among which he mentions diamonds and emeralds, but these were doubtless nothing more than rock crystal and beryl. But the mineralogy and geology of Cyprus have as yet been very imperfectly explored. Salt, which was in ancient times one of the productions for which the island was noted, is still made in large quantities, and there are extensive salt works in the neighbourhood of Larnaca and Limasol.

Vegetable Products.—Cyprus was noted among the ancients for its fertility and beauty; and under the Venetian rule it carried on an extensive trade in its various natural productions; but this has greatly declined in modern times. Besides corn, however, the island exports considerable quantities of wine, oil, madder, the fruit of the carob tree, silk, and wool. Tobacco and cotton are also grown in small quantities, and their cultivation might doubtless be largely increased. The small plains at the foot of the range of Mount Olympus, between the underfalls of the mountains and the sea, as well as the narrow strip of level land along the north coast, though limited in extent, are districts of great fertility; the latter especially is described by Colonel Leake as one of the most beautiful and best cultivated districts in Turkey. The great central plain, on the contrary, is in many parts marshy and unhealthy; and indeed the whole interior of the island suffers much from unhealthiness, and is subject to fevers of a peculiarly dangerous description.

Harbours.—One of the greatest disadvantages of Cyprus is the want of ports, there not being a good natural harbour in the whole island. Larnaca and Limasol, which are the chief places of trade at the present day, have nothing but mere roadsteads; and Salamis, which was the chief port of the island in antiquity, as well as Famagosta, which held that position under the Venetians, were only artificial harbours upon an open sandy coast. Tzerinia, on the north coast, which serves as the place of direct communication with the mainland of Asia Minor, has a very small and bad port, which, bad as it is, is the only one on this side of the island.

Towns.—The only towns in Cyprus worthy of notice are the following. 1. Lefkosia, or, as it is more commonly called, Nicosia, has since the time of the Lusignan kings been the capital of the island. 2. Famagosta, on the east coast, near the ruins of Salamis, also first rose to importance under the Lusignan dynasty, by whom it was fortified, and continued under the Venetians to be the chief port, as well as the strongest fortress in the island. It became celebrated by its heroic defence against the Turks in 1571. It still retains its external walls, but is a very poor and decayed place, with only a few hundred inhabitants. 3. Larnaca, on the south-east coast, on the site of the ancient Citium, is now the chief place of trade, and the most rising and flourishing town in the island. It contains from 5000 to 6000 inhabitants, and consists of two portions—the old town, a short distance inland, and the Marina, immediately facing the sea, where the foreign consuls reside, and foreign steamers touch, which gives a degree of life and activity to the place unknown to the rest of Cyprus. Recent excavations have discovered here many interesting remains of the ancient city of Citium. 4. Limasol, on the south coast, some miles west of the site of Amathus, is still a place of considerable trade, though partially eclipsed by the rising prosperity of Larnaca. It is the principal place of export of the wines of Cyprus, which enjoy a high reputation throughout the Levant. 5. Baffo, or Papho, on the site of the ancient Paphos, called for distinction's sake New Paphos, at the south-west angle of the island, has a small but insecure port, and is a very small place, though still the seat of a Greek bishop. 6. Tzerini or Tzerinia (the ancient Keryneia) has been already mentioned. It retains its old Venetian fortifications, and has therefore still the air of a town, but is a very inconsiderable place.

The *population* of the island, which is said to have amounted under the Venetians to not less than 1,000,000 (probably, however, a great exaggeration), is now estimated at about 135,000 souls, of whom about two-thirds are Greeks, the rest principally Turks.

History.—The early history of Cyprus is very obscure and imperfectly known. It is certain, indeed, that it was colonized at a very early period by the neighbouring Phœnicians, who introduced the worship of the goddess Ashtaroth (called by the Greeks Astarte, and identified by them with their own Aphrodite), for which the island always continued to be celebrated in ancient times. But nothing is historically known of the period or extent of these Phœnician settlements. Equally uncertain is the history of the Greek colonies in the island, which are found in historical times existing side by side with the Phœnicians. Their foundation was ascribed by popular legend and tradition to the heroic ages—Salamis, for instance, being supposed to have been founded by Teucer, the brother of Ajax—but there can be little doubt that they were in reality posterior to the Phœnicians. Of the relations between the two we know little, except from conjecture or inference; but it seems probable that the Greeks gradually established a political supremacy, while the Phœnicians continued to form an important element in the population, and exercised an influence over the manners and customs, arts, and religious rites of the inhabitants in general, wholly different from anything found in Crete, Rhodes, or the other islands of the Ægean. The first positive fact in the history of Cyprus is its conquest by the Egyptian king Amasis in the 6th century B.C. (Herodot., ii. 182). It did not, however, long continue subject to the Egyptian monarchy, having revolted on occasion of the invasion of Egypt by Cambyses (525 B.C.), when it declared in favour of the Persians, and became thenceforth a tributary province of the Persian empire.

On occasion of the Ionian revolt in 500 B.C. the Cyprians were persuaded to take part in the insurrection, but after a years interval were again reduced to subjection, and contributed a contingent of not less than 150 ships to the Persian fleet under Xerxes (Herod., vii. 90)—a striking proof of the power and prosperity they at this time possessed. During the subsequent wars between the Greeks and Persians Cyprus was frequently the scene of hostilities; and after the peace of Antalcidas (387 B.C.), Evagoras, king of Salamis, succeeded in extending his authority over the greater part of the island, as well as in rendering himself independent of the Persian monarch. This state of things, however, did not last long; and after the death of Nicocles, the son and successor of Evagoras, the island again became tributary to the Persian empire. But after the battle of Issus, when Alexander advanced into Phœnicia, all the cities of Cyprus declared in his favour, and sent their fleets to assist him in the siege of Tyre.

During this period, though the island was subject, with brief intervals, to Persia, the several cities enjoyed the privilege of local self-government. Their institutions, however, presented one marked difference from those of other Greek cities, that they were always governed by kings, of whom there were not less than nine in the island. The cities which were the seats of these petty monarchies were:—1. Salamis, on the east coast, the most important of the Greek colonies, which often held a kind of supremacy over the whole island; 2. Citium, on the same site as the modern Larnaca, originally a Phœnician settlement, and which always retained a predominant Phœnician character, and became only partially Hellenized; 3. Amathus, on the south coast, near Limasol, also a Phœnician colony; 4. Curium, some miles further west, at a spot now called Episkopi; 5. Paphos, at the south-west angle of the island, sometimes called New Paphos, in order to distinguish it from the more ancient Phœnician city of the name, called in the days of Strabo Palæ Paphos, which was one of the principal seats of the worship of Astarte, the Phœnician Venus; 6. Marium, afterwards called Arsinoë, on the north coast, at a short distance from the promontory of Acamas; 7. Soli, on the same coast, further east; 8. Kerynea, which still retains its ancient site and name as Tzerinia; 9. Lapathus, or Lapethus, on the same coast, intermediate between the two cities last mentioned. Others, however, assign this ninth place to Chytri, a town of the interior, on the road from Salamis to Kerynea, and it is likely that the sovereign cities were not always the same. Several other towns are mentioned by Strabo and Ptolemy, which were apparently in earlier times subject to those above enumerated. Idalium and Golgos, the names of which are celebrated from their connection with the worship of Venus, seem to have been merely sanctuaries or holy places, which had grown up around the temples of the goddess, and, in Greek times at least, were never towns of importance.

After the death of Alexander, the possession of Cyprus, so important from its position and on account of its inexhaustible forests, became an object of contention among his successors. After various vicissitudes it passed into the hands of Ptolemy, king of Egypt; but in 306 B.C. a great effort to recover it was made by Demetrius, the son of Antigonus, who reduced the whole of the rest of the island and laid siege to the capital city of Salamis. The attempt of Ptolemy, who arrived with a great fleet, to raise the siege, led to one of the most memorable naval battles in all antiquity, in which Ptolemy was utterly defeated; and Salamis, with all the rest of Cyprus, passed into the power of Demetrius. He did not, however, long retain his new acquisition; the island was recovered by Ptolemy in 295 B.C., and continued thenceforth to form one of the most valuable possessions of the Greek monarchs of Egypt. It was generally placed under the government of a man of the highest rank, who was often a kinsman of the Egyptian king; and, during the dissensions of the royal family which marked the declining period of the Ptolemaic dynasty, Cyprus was more than once held by one of the rival candidates as an independent sovereignty. In this manner it was governed as a separate kingdom by Ptolemy Lathyrus for not less than 18 years (from 107 to 89 B.C.), and it was held by a younger brother of Ptolemy Auletes, in 58 B.C., when it was determined by the Romans to dispossess him,—an act of shameless aggression, which was proposed by the tribune Clodius, and reluctantly carried into effect by Cato. From this time Cyprus became a Roman province; it was at first united with Cilicia, but afterwards was constituted as a separate government.

The most remarkable event in the history of Cyprus, while it was under the Roman empire, was a great revolt of the Jews, who had established themselves there in large numbers, in which they are said to have destroyed not less than 240,000 of the other inhabitants (117 A.D.). Christianity, which had been introduced into the island by St Paul, quickly rose to a flourishing condition, and not less than thirteen bishoprics were established in the island. After the division of the Roman empire Cyprus naturally passed, with all the neighbouring countries, into the hands of the Eastern or Byzantine emperors, to whom it continued subject, with brief intervals, for more than seven centuries. In 646 the Arabs under the caliph Othman made themselves masters of the island, and destroyed the city of Salamis, which had until that time continued to be the capital. But it was recovered by the Greek emperors two years afterwards; and, though again conquered by the Arabs under the reign of Haroun el Raschid (802), it did not long remain in their hands, and lapsed again into the power of the Byzantine empire. In 1184 Isaac Comnenus, the nephew of the reigning emperor, established himself in possession of Cyprus as an independent sovereignty; but during the third crusade (1195) it was wrested from his hands by Richard I., king of England, who bestowed it upon Guy de Lusignan, the titular king of Jerusalem, as some compensation for the loss of the holy city.

From this time Cyprus was governed for nearly three centuries by a succession of kings of the same dynasty, who introduced into the island the feudal system and the other institutions of Western Europe. During the latter part of this period, indeed, the Genoese made themselves masters of Famagosta—which had risen in place of Salamis to be the chief commercial city in the island—and retained possession of it for a considerable time; but it was recovered by King James II., and the whole island was reunited under his rule. His marriage with Catherine Cornaro, a Venetian lady of rank, was designed to secure the support of the powerful republic of Venice, but had the effect after a few years, in consequence of his own death and that of his son James III., of transferring the sovereignty of the island to his new allies. Catherine, feeling herself unable to contend alone with the increasing power of the Turks, was induced to abdicate the sovereign power in favour of the Venetian republic, which at once entered into full possession of the island (1487).

The Venetians retained their acquisition for about eighty years, notwithstanding the neighbourhood of the Turks. It was not till 1570 that the latter, under Selim II., made a serious attempt to conquer the island, in which they landed an army of 60,000 men. The greater part of the island was reduced with little difficulty; Nicosia, the capital, was taken after a siege of 45 days, and 20,000 of its inhabitants put to the sword. Famagosta alone made a gallant and protracted resistance, and did not capitulate till after a siege of nearly a year's duration (August 1571). The terms of the capitulation were shamefully violated by the Turks, who put to death the governor Bragadino with the most cruel torments. Since that time Cyprus has remained in the hands of the Turks, and its history has been almost a blank. A serious insurrection broke out in 1764, but was speedily suppressed; another in 1823 became the occasion of a frightful massacre of the Greek population. Meanwhile the prosperity of the island was continually declining, it is only of late years that the increasing commerce of the western nations of Europe with the Levant has given some stimulus to trade, and encouraged the cultivation of the natural productions of an island which, under more favourable circumstances, might be one of the richest in the Mediterranean.

Though Cyprus has been visited and described by several travellers—among others by Dr Pococke (*Description of the East*, Lond. 1743), by Mariti (*Viaggi per l'isola Cipro*, 1769), and more recently by M. Seiff (*Reisen in der Asiatischen Turkei*, 8vo, Leipsic, 1875)—there is no full and comprehensive account of it, such as we possess of Crete and many parts of Asia Minor. The work of Engel (*Kypros: eine Monographie*, 2 vols. 8vo, Berlin, 1841) is a diligent compilation of all that could be gathered from ancient authorities concerning the geography, history, and mythology of the island, but was not based upon any original researches. Its geology and natural history are still very imperfectly known, and its antiquities had, until lately, been almost entirely neglected. But within the last few years extensive excavations have been carried on in different parts of the island—especially at Golgos, Idalium, and Curium—by Mr Lang and General de Cesnola, which have brought to light a vast number of statues and other works of art of the highest interest, as throwing light on the religion and mythology of the inhabitants—which appear to have always presented a singular mixture of the Hellenic and Oriental elements—as well as displaying a peculiar style of art, in some degree intermediate between that of Assyria and continental Asia on the one hand and the early Greek sculptures on the other. Unfortunately these collections have been removed to New York, while no detailed description of them has yet been published. It is, however, announced that General de Cesnola is engaged in a comprehensive work giving an account of his researches and their results, which will doubtless throw much light on the ancient geography and history of Cyprus.[1] (E. H. B.)

CYRENAICA, or PENTAPOLIS, in ancient geography, a district of Africa, on the shores of the Mediterranean Sea, lying exactly opposite to Greece, at the distance of about 250 miles. It received the name of *Cyrenaica* from Cyrene, its chief city; and that of *Pentapolis* from the fact of its containing five principal cities, Berenice or Hesperus, Barce, Cyrene, Apollonia, and Arsinoë or Teucheira, now identified respectively with Benghazi, El Merdj, Grennah or Shahat, Marsoe, Sousah, and Tocra. The district extended inland about 80 miles, and included that portion of the African continent which stretched from the frontier of Egypt on the east to the borders of Africa Propria on the west which were marked by the tumuli of Aræ Philænorum. On its southern frontier Cyrenaica is protected from the scorching winds of the Sahara by a range of lofty mountains which descend in gradual slopes to the sea, and produce within a small compass a great variety of climate and temperature. Its vegetable products consequently comprised all the more important species to be found in the tropical and temperate zones; and, as its position was admirably adapted for commerce, nothing was wanting but an enterprizing population to make it one of the most valuable countries in the world. The people of Thera, under Battus, a native of that island, were the first to colonize Cyrenaica. After a slight opposition from the native tribes, they established themselves in the country, and founded Cyrene in 631 B.C. There soon sprang up in advantageous situations other cities which, while acknowledging Cyrene as the capital of the country, were really independent, and at length threw off its yoke altogether. After the invasion of Cambyses the regal form of government was entirely abolished, and the republican substituted in its room. Under the Ptolemaic dynasty of Egypt (with which country Cyrenaica was incorporated in 321 B.C.), Cyrenaica rose into great importance from the extent and value of its commerce. In 96 B.C. it was bequeathed by will to the Romans by Apion, the last lineal representative of the Ptolemies. Soon afterwards, but at what date is not absolutely fixed, it became a Roman province, and along with the island of Crete was governed by a Roman proconsul. The commercial prosperity of Cyrenaica, however, continued unimpaired till the revolt of the Jews in the province during the reign of Trajan. This revolt was quelled only after the most bloody atrocities had been perpetrated on both sides; and the population was so much diminished in the contest, that the native tribes recommenced their incursions, and overran the province up to the walls of the principal cities. In the middle of the 7th century the whole country passed into the hands of the Saracens. From that time till the present the country has been occupied by tribes of wandering Arabs, nominally subject to the pasha of Tripoli.

See Thrige, *Historia Cyrensc*, 1819; in which all the passages of the ancient writers about Cyrene are brought together; Gottschick, *Geschichte der Gründung und Blüte des Hellen. Staats in Cyrene*, 1858; Falbe and Lindberg's *Numismatique de l'Ancienne Afrique*; and Grote's *History of Greece*, vol. iv.

CYRENAICS, a Greek school of philosophers, so called from Cyrene, the birth-place of their founder Aristippus, who was a disciple of Socrates. They held that the one aim in life is to enjoy as many moments of as intense pleasure as possible. The pleasures of sense are to be preferred as the most intense, for duration and intensity are the only qualities in which pleasures really differ. For the wise choice of pleasures intellectual cultivation is needed; and there must also be self-control and power of resisting desire. According to Aristippus, what each is to seek is his own present pleasure, though he modified this teaching by his doctrine of self-control. But his follower Theodorus held, like the Epicureans, that permanent tranquillity and cheerfulness are to be sought rather than passing pleasures. The position of Hegesias, the advocate of suicide, who is counted among the Cyrenaics, is far apart from that of Aristippus; with him avoidance of trouble is the highest attainable good. Anniceris the younger differed from Aristippus in declaring that selfish pleasures are to be sometimes sacrificed to sympathetic. Other members of the school were Arete the daughter of Aristippus, Aristippus her son, Bio, and Euhemerus.

See, besides the histories of philosophy, and works on the various members of the school separately, Diog. Laert.; Wendt, *De Philosophia Cyrenaica;* H. v. Stein, *De Philosophia Cyrenaica;* Mullach, *Fragmenta Phil. Græc.*, vol. ii.

CYRENE, the capital of Cyrenaica, was situated on the northern slope of a lofty table-land nearly 2000 feet above the level of the sea, from which it was ten miles distant. It was the first town of Cyrenaica founded by Battus and his Therian followers (see CYRENAICA), and very soon rose into great importance as a commercial mart. The policy of Battus led him to conciliate the aboriginal tribes of Libya, with whom his subjects began at an early period to form matrimonial alliances. The natives, however, as in all colonies formed on the principles of Spartan policy, were scrupulously excluded from any participation in the government of the state. For eight generations, as had been foretold by the Delphic oracle, Cyrene continued to be governed by the original dynasty, whose kings ruled under the names of Battus and Arcesilaus alternately; and it maintained its prosperity till the time of the Ptolemies, who, carrying out their usual policy, fostered Apollonia, the port, to such an extent that the inland city soon fell into decay.

Cyrene was noted among the ancients for the intellectual life of its inhabitants. Its medical school was famous, and it numbered among its celebrities Callimachus the poet. Carneades, the founder of the New Academy at

[1] In 1868 Mr R. H. Lang discovered the site of a temple at Idalium (Dali), containing a large number of statues in calcareous stone, of which a selection was acquired by the British Museum along with a bilingual inscription—in Phœnician and Cypriote—found there also. From this inscription Mr George Smith obtained the key to the Cypriote language, which had not previously been deciphered, and which now proves to be a dialect of Greek written in a local character. With this key Dr Birch has published a reading of the Duc de Luynes tablet, known as the "tablet of Dali" in the *Transactions of the Soc. of Bib. Archæology*, vol. i. pt. ii. 1872. Dr Brandis in the *Monatsbericht* of the Berlin Academy, 1873, has given a full list of all the words of Cypriote that are now fairly made out, and since then a collection of Cypriote inscriptions (*Sammlung Kyprischer Inschriften*, Jena, 1876) has been published by Moritz Schmidt. An account of Mr Lang's excavations, and the sculptures discovered by him, will be found in the *Transactions of the Roy. Soc. Lit.*, 2d ser. xi. pt. i. At the same time excavations were being carried on at the various ancient sites of Cyprus by the American consul, General de Cesnola, and were continued up to 1876, the result being the discovery of an enormous quantity of sculpture, inscriptions, pottery, gold ornaments, gems, and other articles of treasure stored up in temples or in tombs. Those antiquities have been acquired by the Museum of New York. The most interesting part of his discovery was the treasure from the underground chamber of a temple at Curium, including a pair of solid gold armlets inscribed in Cypriote with the name of a King Eteandros, whose date is assigned to about 668 B.C. The engraved Greek gems and gold ornaments are of great beauty.

Athens, Aristippus, a pupil of Socrates and the founder of the so-called Cyrenaic school, Eratosthenes the polyhistor, and Synesius, one of the most elegant of the ancient Christian writers.

The ruins of the town cover a great extent of ground, but have been sadly defaced by the various races which have overrun the country. Cyrene and the district to the east, the north, and the west, is called Shahat by the Arabs; while the ancient designation, under the modified form of Ghrennah, is applied to the district to the south. The first account of the site in modern times seems to be that of M. Lemaire, who was French consul at Tripoli in the time of Louis XIV. Paul Lucas visited the spot in 1710, and again in 1723, and Dr Thomas Shaw in 1738; an Italian, Dr Cavelli, who was there in 1812, furnished some information to the Société de Géographie de Paris; and Della Cella published an account of his visit in his Travels, translated into English in 1822. In 1821–2 important explorations were made by Lieutenant Beechey, R.N.; and he was almost immediately followed by a French artist, M. Pacho, whose pencil preserved a number of interesting monuments that have since disappeared. M. Delaporte, French consul at Tangier, and Vattier de Bourville come next in order of time. Barth, the famous African traveller, published an account of his investigations in his *Wanderungen durch die Küstenländer des Mittelmeers*, 1849. In 1861 excavations were made on the site of the city by Captain Murdoch Smith, R.E., and Commander Porcher, R.N., the results of which are detailed in their valuable *Discoveries in Cyrene*, London, 1864. The principal buildings of which the plan can be more or less clearly distinguished are three theatres, a small Doric temple of Bacchus, a temple of Apollo (Beechey's temple of Diana), two temples hypothetically assigned to the worship of Venus, and a large many-chambered structure, supposed to be the palace of the Roman governor. All are composed of a friable yellow sandstone, containing a great number of shells. The temples are remarkable for the eastern position of the main entrance. Of the ancient sculpture of the city several fine specimens were exhumed and conveyed in safety to the British Museum—a statue of Bacchus, a colossal statue of Apollo playing on the Lyre, a bust of Cnæus Cornelius Lentulus Marcellinus, the first Roman proprætor of Cyrene, a fine portrait-head in bronze, &c. Far more imposing than the remains of its buildings are the long lines of tombs which occupy the scarped fronts of all the hill sides, and stretch out along the various roads leading from the city. These consist of two kinds—the excavated and the constructed,—the former being the best preserved, and, it would seem, the most spacious and elaborate. Many of the finer examples have large temple-like entrances with Doric columns cut out of the rock, and bear traces of internal decoration of the most costly and brilliant kind. On the walls of one which still preserved its colours at the time of its discovery in 1861 was depicted a procession of thirty-six individuals in various costumes, as well as hunting scenes and games. A favourite sepulchral ornament appears to have been a large scallop-shell sculptured in marble and placed above the sarcophagus recess. The city was furnished with water by means of a perennial fountain now known to scholars as the fountain of Apollo, and to the Arabs as 'Ain Shahat, remarkable for the artificial tunnel through which it passes. In 1864 Mr George Dennis, vice-consul at Benghazi, proceeded to examine the tombs of the Cyrenaica, and obtained a fine series of painted Greek vases of the red-figure and polychrome styles, which are now in the British Museum. An account of his excavations will be found in the *Transactions of the Royal Soc. of Literature*, 2d ser. ix. p. 135.

CYRIL [CYRILLUS], saint and bishop of Jerusalem. He was born probably at Jerusalem about 315, and died about 386. He was ordained a presbyter in 345, and had the instruction of the catechumens confided to him. In 350 he was elevated to the see of Jerusalem, and became deeply involved in the dogmatic controversies of his time. His metropolitan, Acacius of Cæsarea, inclined to Arianism, while Cyril strongly espoused the Nicene creed. The result was the temporary deposition of Cyril. On the death of the emperor Constantine, however, he was restored; but again, on the accession of Valens, an Arian emperor, he had once more to resign his post till the accession of Theodosius permitted him to return finally in peace in 379. He attended the second œcumenical council held at Constantinople in 381, where he was received with grateful acclamations for his sufferings in defence of orthodoxy. Cyril has left one important work — his 23 Catecheses (Κατηχήσεις) or lectures mainly addressed to those who were preparing for baptism; the last 5, under the name of the Mystagogic Catacheses, were addressed to newly baptized persons. These lectures are said to be "the first example of a popular compend of religion," and are particularly interesting for the insight which they give us both into the creed-forms of the early church and the various ceremonies of initiation constituting baptism in the 4th century. Other tracts and homilies have been ascribed to Cyril of Jerusalem, but they are of doubtful genuineness. The Catecheses of Cyril have been translated in the Oxford Library of the Fathers, vol ii.

CYRIL, of Alexandria (376–444), is a more distinguished father of the church than his namesake of Jerusalem. He was born in 376, and died in 444. Becoming patriarch of Alexandria about 412, he soon made himself known by the violence of his zeal against Jews, pagans, and heretics or supposed heretics alike. He had hardly entered upon his office when he closed all the churches of the Novatians and seized their ecclesiastical effects. He assailed the Jewish synagogues with an armed force, drove the Jews in thousands from the city, and exposed their houses and property to pillage. The prefect of Egypt, Orestes, who endeavoured to withstand his furious zeal, was in turn denounced himself, and had difficulty in maintaining his ground against the fury of the Christian multitude. It was during one of the violent commotions kindled by the strifes of these parties in Alexandria that the illustrious Hypatia, famed for her beauty and her eloquent advocacy of the Neo-Platonic philosophy in opposition to Christianity, was murdered. Her murder has been attributed to the direct instigation of the patriarch himself; but this charge is held unsupported by others, although there can be no doubt that "the perpetrators were officers of his church," and undoubtedly drew encouragement from his own violent proceedings. Hypatia was a friend of Orestes, and the hostility betwixt the prefect and the patriarch overflowed towards her, and undoubtedly led to her destruction.

But Cyril's violence was not merely confined to those who might be considered enemies of the church. He inherited from Theophilus, his uncle and predecessor in the see of Alexandria, a strong aversion to John Chrysostom, the noble bishop of Constantinople, and even after his death opposed for a time all attempts to remove the unjust sentence of condemnation which had been passed upon him. Afterwards he so far yielded to remonstrances, and allowed the name of Chrysostom to appear in the list of distinguished martyrs and bishops mentioned in the prayers of his church. These names were inserted in what were called "diptychs" (δίπτυχα νεκρῶν), or two-leaved tablets preserved in the churches—a usage which the Greek Church has preserved to this day. Nestorius, a succesor of Chrysostom in the see of Constantinople, received a still larger share of Cyril's intemperate opposition. Nestorius had refused to apply the title "Mother of God" to the Blessed Virgin. The patriarch of Alexandria denounced this heresy to Nestorius himself, to the emperor (the feeble Theodosius II.), and to the empresses, the mother and sister of Theodosius. The altercation grew in bitterness as it advanced, until at length Nestorius was excommunicated and driven from his see in 430. The two opponents met at the œcumenical council summoned at Ephesus in the following year to dispose of the intricate question raised by the use of the terminology in dispute. Each came "accompanied by a rabble of followers—Cyril by the bath men and a multitude of women from Egypt, Nestorius by a horde of peasants and some of the lower populace of Constantinople" (Milman's *Latin Christ.*, i. 160). The result was the condemnation of Nestorius, although Cyril also incurred the charge of heresy from the Oriental bishops. Satisfied, however, with the deprivation and exile of his opponent, he returned to Alexandria in triumph as the great champion of the faith, and thence continued, by the "unscrupulous use of all the means at his command," the theological strife for years.

Altogether Cyril presents a character not only unamiable, but singularly deficient in all the graces of the Christian life. He may, as Milman says (*Latin Christ.*, i. 145), be a hero or even a saint to those "who esteem the stern and uncompromising assertion of certain tenets the one paramount Christian virtue; but, while ambition, intrigue, arrogance, rapacity, and violence are proscribed as unchristian means—barbarity, persecution, bloodshed, as unholy and unevangelic wickednesses, posterity will condemn the orthodox Cyril as one of the worst of heretics against the spread of the Gospel." Baur, however, says that Cyril must be placed high as a theologian, and that he sought upon the whole to preserve faithfully the spirit of the Alexandrian school. He has left, besides commentaries, and homilies and letters chiefly relating to the Nestorian controversy, a treatise on the Trinity and the Incarnation, and an apologetic work in defence of Christianity against the attack of the Emperor Julian, also a definite treatise against Nestorius — Κατὰ τῶν Νεστωρίου· δυσφημιῶν πεντάβιβλος ἀντίῤῥητος.

CYRIL, a celebrated professor of the ancient law college of Berytus, and one of the founders of the œcumenical school of jurists (τῆς οἰκουμένης διδάσκαλοι) which preceded the succession of Anastasius to the Eastern empire (491 A.D.), and paved the way for Justinian's legislation. His reputation as a teacher of law was very great; and from the fragments of his works which have been preserved it may be inferred that his merit as a teacher consisted in his going direct to the ancient sources of law, and in interpreting the best writers, such as the Commentary of Ulpian on the Edict and the Responsa Papiniani. He wrote a treatise on definitions (ὑπόμνημα τῶν δεφινίτων), in which, according to a statement of his contemporary Patricius, the subject of contracts was treated with superior precision and great method, and which has supplied the materials for many important scholia appended to the first and second titles of the eleventh book of the Basilica. He is generally styled "the great Cyril," to distinguish him from a more modern jurist of the same name, who lived after the reign of Justinian, and who compiled an epitome of the Digest.

CYRUS THE ELDER. Like other national heroes, Cyrus, the founder of the Persian empire, has been surrounded with an atmosphere of myth. Already in the time of Herodotus (i. 95) four different stories were current among the Persians concerning his origin and his relation to the last king of Media. The one preferred by Herodotus is probably the most legendary of all four; at any rate it has the same source as the tales told of Perseus or Romulus, or other popular heroes who survived exposure and obscurity to revenge themselves upon the tyrant, and be restored to the royal dignity. Cyrus, Herodotus states, was the son of Cambyses, a Persian prince, and Mandane, a daughter of the Median king Astyages, in whose name we may see the *Azhi dahâka* ("the biting snake,") of Zend mythology, the Ahi or "serpent" of darkness of the Veda, the Zohak of Firdusi's epic; and of whom Moses of Chorene declared in the 4th century of our era that popular songs still spoke as Ajdahak, the wicked serpent. In consequence of a dream Astyages delivered Cyrus to Harpagus to be put to death. Harpagus transferred the order to the king's herdsman Mitradates, whose wife Cyno, "the bitch," persuaded him to bring up the child as his own instead of exposing it, and a still-born infant was sent to Harpagus in its place. At the age of ten Cyrus was discovered and recognized by Astyages, who punished Harpagus by making him eat the flesh of his own son. Cyrus returned to Persia; and some years afterwards Harpagus, who had never forgotten the injury he had suffered, induced him to raise the standard of revolt. Harpagus, appointed commander of the Median forces, went over to the enemy, the Medes were defeated, and Astyages taken prisoner. He was kept in prison till his death, while Cyrus made the Medes subservient to the Persians.

Xenophon in the *Cyropædia*, where the life of a model prince rather than of the historical Cyrus is depicted, agrees with Herodotus in making Cyrus the grandson of Astyages, though he calls his father Cambyses an independent king. Cyrus received, we are told, the simple and hardy education of a Persian up to the age of twelve, when he visited the luxurious and effeminate court of Media, and while there gained the admiration of his grandfather by repelling an unprovoked attack of Evil-Merodach, the son of Nebuchadnezzar. Astyages was succeeded by his son Cyaxares II., on whose death the Median empire passed peaceably into the hands of Cyrus, now forty years old.

A third account is given by Nicolas of Damascus. According to this Cyrus was the son of the Persian satrap Atradates, and spent the greater part of his youth in the court of Astyages at Ecbatana. Having escaped by a stratagem and evaded the pursuit of the Medes, he led the Persians into revolt, and attempted to stem the attack of the Median monarch. The Persians, however, were defeated in four great battles, in one of which Atradates was slain, and Pasargadæ, the Persian capital, was besieged. Here the tide of fortune turned, the insignia of royalty fell into the hands of Cyrus, and Astyages was overtaken and captured during his flight. The whole of Media at once submitted to the conqueror.

The version of Ctesias is totally unlike either of the preceding three. Like Nicolas of Damascus he denies that Cyrus was in any way related to Astyages, whose daughter Amytis was the wife of Spitaces, or Spitamas, a Mede. Cyrus, after his escape from Media, invaded the country and defeated Astyages, who fled to Ecbatana and was there concealed by Amytis. The Persian Œbaras, however, discovered his hiding-place; but Astyages was well treated by Cyrus, and died a natural death. Cyrus put Spitaces to death and married Amytis.

None of these versions can be regarded as satisfactory. The cuneiform inscriptions have proved that Persia could not have been a mere dependency of Media, as Darius declares that his eight ancestors had been kings like himself, while Cyrus calls himself, on a brick from Senkereh, "the son of Cambyses, the powerful king." The Persian conquest of Media, moreover, must have been a slow process. Xenophon (*Anab.*, iii. 4) describes Larissa and Mespila on the Tigris as strongly-fortified cities which had been built by the Medes after the overthrow of Nineveh, but ruined by the Persians during the Median war. Mespila had afforded refuge to a wife of the Median monarch

The conquest of Media and the consequent establishment of the Persian empire is fixed somewhat doubtfully at 559 B.C. According to Strabo (xv. p. 729) the earlier name of Cyrus was Agradates; if so, he must have changed it about this period, borrowing his new title perhaps from the River Cyrus, near Pasargadæ. In any case the name Cyrus (Old Persian, *Kurus*) cannot be connected with the later Persian *Khor* or *Khorshêd*, "the sun," which would be *uwara* in the Persian of the Achæmenian epoch (Zend, *hware*). The reduction of Media must have occupied a considerable time, as it was not until 546 B.C. that Cyrus found himself strong enough to face Crœsus of Lydia, who had entered into alliance with Egypt and Babylonia. Without waiting for his allies, however, Crœsus crossed the Halys, and a drawn battle was fought in Pteria. The Lydian king returned to Sardis and disbanded his forces, believing that Cyrus would not undertake a winter campaign. This belief proved illusive; Cyrus followed the enemy, defeated the Lydian army in spite of its bravery, besieged Sardis, and took it within fourteen days. A Greek legend accounted for the preservation of Crœsus and his future position as confidential counsellor in the Persian court.

The conquest of the Greek cities of Ionia followed, and a revolt that broke out in Sardis under Pactyes during the absence of Cyrus caused the general disarmament of the Lydians and the reduction of Lycia and Caria.

Cyrus now turned his attention to the East—Parthia, Sogdiana, Arachosia, and the neighbouring countries being added to the empire. According to Ctesias, Bactria had submitted on the marriage of Cyrus with Amytis; and the most formidable campaign Cyrus had to undertake in the East was against the Sacæ. According to one story, Cyrus was taken prisoner in this campaign; according to another, Sparetha, the queen of the Sacæ, gained important advantages over the Persians. Pliny states that Kapisa (perhaps the modern Kafshan), near the Upper Indus, was destroyed by Cyrus; and Arrian's assertion that a Persian army was lost in the desert of Gedrosia is confirmed by the fact that this country formed part of the Persian empire in the reign of Darius.

In 539 B.C. Babylonia was attacked. Nabonidus, the Babylonian king, called Labynetus by Herodotus, had been preparing for the invasion for years. Cyrus carried with him the water of the Choaspes for drinking, and delayed a whole summer and autumn on his march in order to dissipate the River Gyndes, in which one of the sacred white horses had been drowned. The Jews settled in Babylonia hailed the Persians as deliverers and monotheists, and it was doubtless in return for the assistance they had afforded that Cyrus permitted them to return to their country and restore Jerusalem and the temple. Nabonidus, defeated in the field, took refuge in Borsippa, while the Persians laid siege to Babylon, where Belshazzar, the son of Nabonidus, was in command. Babylon was taken during a feast; Nabonidus surrendered and was sent to Carmania, and the sceptre of Nebuchadnezzar passed to Persia.

Instead of reducing Phœnicia, which had resumed its freedom, Cyrus led his troops across the Araxes against the Massagetæ. At first victorious, he was afterwards defeated and slain (538 B.C.) by the Massagetic queen Tomyris, the double of Sparetha, after a reign of twenty-nine years (*Herod.* i. 208–214). According to Ctesias, however, this campaign was against the Derbices and their Indian allies, and Cyrus died of a wound received in battle three days after gaining a complete victory over them. The conquest of Egypt was left to a successor, Cyrus having made this side of his empire secure by restoring the Jews to Palestine.

The tomb at Murghâb cannot be that of Cyrus, as is often supposed. Murghâb, like Persepolis, is on the Araxes, while Pasargadæ (Persian, *Paisiyâuvâdâ*, "valley of springs"), where Cyrus was buried, was on the Cyrus (Kur). The cuneiform inscription at Murghâb points to a period subsequent to the accession of Darius, as does also the Egyptian head-dress of the figure below it. Andreas suggests that the Cyrus Achæmenides mentioned in the inscription is the viceroy of Egypt, brother of Xerxes, called Achæmenides by Ctesias, whose corpse was brought to Persia to be buried there. Pasargadæ, and the real tomb of Cyrus, must be looked for near Darabjerd, in south eastern Farsistân. (A. H. S.)

CYRUS THE YOUNGER was the son of Darius Nothus, and of Parysatis, and the brother of Artaxerxes Mnemon. He was sent by his father at the age of sixteen to assist the Lacedæmonians against the Athenians. Artaxerxes succeeded to the throne on the death of Nothus; and Cyrus, who deemed himself, as born after his father's accession to the throne, the legitimate successor, sought to dispossess him. His attempt would have been punished by his death, had not his mother Parysatis saved him by her tears and entreaties. This circumstance did not in the least check his ambition. He was appointed satrap of Lydia and of Asia Minor, where he secretly fomented rebellion, and levied troops under various pretences. At last he took the field with an army of 100,000 barbarians and 13,000 Greeks, under the command of Clearchus; and Artaxerxes met him near Cunaxa with a force said to have numbered 900,000 (401 B.C.). The battle was long and bloody, and Cyrus might perhaps have obtained the victory, had not his rashness proved his ruin. The two royal brothers met in person, and Cyrus was slain. Artaxerxes was so anxious to have it believed that his brother had fallen by his hand, though this does not seem to have been the case, that he put to death two of his subjects for boasting that they had killed Cyrus. The Greeks who were engaged in the expedition obtained much glory in the battle, and after the death of Cyrus they remained victorious in the field without a commander. Their homeward march in face of the vastly superior numbers of the enemy is known in history as the Retreat of the Ten Thousand, and forms the subject of Xenophon's most popular work, the *Anabasis*.

CYTHERA. See CERIGO.

CYZICUS, an ancient town of Mysia, in Asia Minor, on the coast of the Propontis or Sea of Marmora, occupying the narrowest part of a peninsula which was at one time an island, and was said to have been joined to the mainland by Alexander the Great by moles and bridges. During the Peloponnesian war, Cyzicus was subject to the Athenians and Lacedæmonians alternately, as the power of either state predominated; and at the peace of Antalcidas, like the other Greek cities in Asia, it was made over to Persia. The greatness and prosperity of the town did not commence till about 74 B.C., when the Cyzicenes, under circumstances of great difficulty, repelled Mithridates from their walls, and kept the town till relieved by Lucullus. For their bravery and devotion at this time they were rewarded with peculiar honours and privileges by the Romans, and presented with a large tract of the rich land adjoining their city. Seriously injured by an earthquake in the reign of Antoninus Pius, Cyzicus from that period gradually declined. The ruins of Cyzicus, which once boasted a very large number of splendid temples and public buildings, are still to be seen among the cherry orchards and vineyards that have overgrown its site. They are known by the Turkish name of Balkiz, which is probably a corruption of Παλαία Κύζικος. The principal buildings still clearly distinguishable are a Roman amphitheatre and a temple dedicated to Hadrian; but there are also remains of the city-walls and towers. Great damage has been inflicted within modern times by the spoliation of the Turks, who have carried off the ancient materials for the erection of public edifices in Constantinople. The coins of Cyzicus have been found in large numbers, and are of great interest to the numismatist for the light they furnish on the history of ancient coinage. They were current at Athens and other parts of Greece; and the device by which they were frequently distinguished probably gave rise to the proverb about bribery—There is an ox on his tongue, *βοῦς ἐπὶ γλώσσῃ*.

CZACKI, Tadeusz (1765–1813), a Polish statesman and author, who did much for the spread of education in Poland, was born at Poryck in Volhynia, of good family. After being educated at Cracow, he went to court and gained the favour of the king, Stanislas Augustus Poniatowski, by whom he has appointed to several high dignities. In the diet which sat from 1788 to 1792 he took a prominent place, and he was one of the advocates of the constitution which was passed in May 1791. Consequently his property was confiscated by the Czarina Catherine II. It was, however, restored by her successor Paul I.; and Alexander I. appointed him councillor. The great aim of Czacki's life was now to further education in Poland. In 1805 he opened a school at Krzemienietz, which was soon filled by about 600 pupils of both sexes, and he effected the establishment of a very large number of schools in other parts of the country. He also assisted in the foundation of the Scientific Society of Warsaw, and the Polish Commerical Society. He was twice examined by Russian commissions on a charge of having disseminated views hostile to Russia, but on both occasions he was acquitted. His chief school, that at Krzemienietz, was destroyed by the French invasion of 1812. In the February of the next year Czacki died at Dubno. A statue was raised to his memory, and placed in the library at Krzemienietz.

Among the works of Czacki, the treatise on Polish and Lithuanian law, which is full of valuable information on many subjects connected with these countries (Warsaw, 1801, Breslau 1835), and those on the Jews, gypsies, and the statistics of Poland, deserve special mention. See the lives of Czacki by his friends Polacki and Motowski (the latter of which appeared in the supplement to the *Biographie Universelle*), which, however, differ considerably as to the facts of his life; that by Osinski (Krzemienietz, 1816); and the *Dictionary of Learned Poles*, by Chokodynicki (1823).

CZARTORYSKI, Prince Adam George (1770–1861), a principal actor in the Polish revolution of 1830, was born at Warsaw, January 14, 1770. He was the eldest son of Prince Adam Casimir Czartoryski; and, after receiving a careful education in his father's house, he completed his studies in France and Great Britain, spending some time at Edinburgh University and in London. On his return to Poland he entered the public service, and in the war occasioned by the second partition of Poland he fought bravely against the Russians. In 1795 he was sent, with his brother Constantine, as a hostage to St Petersburg. Here he became the intimate friend of the grand duke (afterwards emperor) Alexander; and in 1797 he was appointed ambassador to the court of Sardinia. This office he held about five years; and in 1802 Alexander I. named him assistant at the ministry of foreign affairs. In this capacity he was present at the battle of Austerlitz, subscribed a treaty with Great Britain, and accompanied the czar in the campaign of 1807 and at the conferences of Tilsit. He then retired from public life; but in 1812 was again by the side of the emperor, and accompanied him to Paris in 1814. Prince Adam George had been named curator of the new university of Wilna in 1803, a post which he held for nearly twenty years; and during this period, while outwardly loyal to the Russian Government, his influence powerfully contributed to keep alive and intensify the patriotic spirit of his countrymen. In 1815 he was named senator palatine of the kingdom. He attended the first diet, and spoke bravely and hopefully in favour of constitutional government; but his efforts were fruitless, and his hopes vanished.

In 1821 charges of disaffection and sedition were made against the students of Wilna, and very severe measures were taken,—many being imprisoned, and others sent to Siberia, or compelled to serve in the army. Prince Adam George interceded for the young men, but was not listened to. He consequently resigned his office of curator, and for the next nine years he remained in retirement. The revolution of 1830 once more brought him to the front. He became president of the provisional government of Poland, convoked the diet, and when the throne was declared vacant was chosen head of the national government (January 1831). He continued to hold the presidency till the terrible and decisive days of August (15th and 16th), and then served as a common soldier in the final struggles, in which once more, by the overwhelming forces of Russia and the disintegrating forces of internal dissension, Poland fell. The prince patriot escaped to Paris. He was excluded by name from the amnesty of 1831, and his estates in Poland were confiscated. The large revenue of his Gallician estates, however, enabled him to maintain the position of a noble of the highest rank. He enjoyed the unbounded esteem of his countrymen, and was the recognized head of Polish society at Paris. In 1848 he granted freedom to the peasants on his estates in Gallicia, and gave them their lands in fee. He died at Paris, July 15, 1861.

CZASLAU, or Caslau, a town of Bohemia, the chief place of the circle of the same name, situated near the left bank of an affluent of the Elbe, in a fertile plain 48 miles E.S.E. of Prague, on the North-west Railway from Vienna. The church is surmounted by a lofty spire, the highest in Bohemia, and contains the tomb of the celebrated Hussite leader Ziska, who died in 1424. Here (or more accurately at the village of Chotusitz, 2½ miles north of this) Frederick the Great defeated the Austrians, May 17, 1742. Population in 1869, 5998, chiefly agriculturists.

CZECHS, or phonetically *Tchekhs*, a large branch of the Slavonic race, which includes the Bohemians or Czechs proper, the Hannacks or Moravians, and the Slovacks. Besides forming the predominant element in Bohemia and Moravia, where they are estimated respectively at 2,930,000 and 1,352,000, they contribute 614,000 to the population of Hungary, where they are mainly settled on the N.W. frontiers, 93,000 to Austrian Silesia, 60,000 to Prussian Silesia, and a considerable percentage to Austria proper, Bukowina, and Slavonia. See Bohemia.

CZEGLED, a market town or large village of Hungary, in the district of Pesth, and 38 miles south-east of that city, situated on the bare sandy and infertile plain which extends between the Danube and Theiss. Some parts of the surrounding country yield large quantities of red wine, and this, with the cultivation of maize and millet and beer brewing, gives the occupation and trade of the place. Population of commune in 1869, 22,216.

CZENSTOCHOVA, or Tschenstóchow, Old and New, two small contiguous towns of Poland, in the circle of the same name and the government of Piotrkov, on the left bank of the Warta, 130 miles S.W. of Warsaw, and on the railway between that city and Cracow. Population of the two (1867), 14,167. The towns derive their importance from a celebrated monastery situated on the eminence called the Jasno Gura above them. This monastery, which is surrounded by a small fortress, has a fine church with a chapel dedicated to the Virgin, containing a famous and much-venerated picture of the mother of Christ, which according to legend was painted by St Luke. Pilgrims from all parts of Poland visit the shrine in large numbers. In 1655 the monastery withstood a siege by the Swedes in the War of Succession, and another by the Russian troops in 1771, during the War of Independence.

CZERNOWITZ, or CZERNÂUZ, the capital town of the Austrian duchy of Bukowina, in 48° 26′ N. lat. and 25° 57′ E. long., picturesquely situated on a height above the right bank of the river Pruth, 140 miles S.E. of Lemberg, 720 feet above the sea. The line of railway from Cracow and Lemberg to Galatz on the lower Danube passes by Czernowitz. It is a clean, pleasant town, possessing for its chief buildings a Greek cathedral, a theological seminary, and several schools; and it is the seat of an archbishop, of an Oriental Greek patriarch, and of the metropolitan of Bukowina. A fine bridge of 720 feet in length crosses the Pruth, with six spans. There are manufactures of machinery and bronze work, and a considerable trade is carried on with Moldavia and Bessarabia in grain, brandy, cattle, hides, wood, wool, and potashes. Population with suburbs (1869), 33,884.

CZERNY, KARL (1791–1857), pianist and composer, was born at Vienna on the 21st February 1791. His father, who was a teacher of the piano, trained him for that instrument from an early age with such success that he performed in public at the age of nine, and commenced his own career as a teacher at fourteen. He was brought under the notice of Beethoven, and was his pupil in the sense in which the great master had pupils. It is perhaps his greatest claim to distinction as a performer that he was selected to be the first to play Beethoven's celebrated Emperor concerto in public. He soon became the most popular teacher of his instrument in a capital which abounded in pianists of the first rank. Among his pupils he numbered Liszt, Döhler, and many others who afterwards became famous. As a composer he was prolific to an astonishing degree, considering the other demands on his time. His works, which included every class of composition, numbered 849 at the time of his death. Comparatively few of them possess high merit, and none are destined to the immortality that belongs to the productions of genius. He had considerable skill in devising variations for the piano of the display type, and in this and other ways helped to develop the executive power which in the modern sensational school of pianoforte playing seems to have reached the limits of the possible. His various books of exercises, elementary and advanced, of which the best known are the *Études de la Vélocité*, have probably had a wider circulation than any other works of their class. To the theory of music he contributed a translation of Reicha's *Traité de Composition*, and a work entitled *Umriss der ganzen Musikgeschichte*. Czerny died on the 15th July 1857 at Vienna, which he seldom left, one of the few exceptions being a visit paid to England in 1836. Having no family, he left his fortune, which was considerable, to the Vienna Conservatorium and various benevolent institutions.

CZERNY GEORGE (? 1766–1817), or KARDJORDJE, or Black George, as he is always called, though his name was properly George Petrovitch, a Servian who freed his country from the domination of the Turks, born about 1766, was the son of a Servian peasant. He was about twenty when, having killed a Turk in some wild adventure, he was forced to flee into Austria. It said that he forced his father, or his stepfather or father-in-law, to accompany him; but the old peasant could not be persuaded to leave his country, and, to prevent his falling into the pitiless hands of the Turks, Czerny George put him to death with a pistol-shot. In the Austrian army Czerny George fought against the Turks from 1788 to 1791, and rose to the rank of sergeant; but, either unwilling to submit to discipline or disgusted by some slight, he left the service for the life of a *heyduc*, or bandit who preyed only upon the Mahometans. He afterwards, however, is said to have held an appointment as inspector of forests to a monastery in Austria.

For a time Servia was under the mild rule of Hadji Mustapha, and Czerny George lived on his farm in peace. But the Janissaries overran the country, killed the Pasha, and began to murder the Servian chiefs. Many escaped, however, and, headed by Czerny George, who was chosen commander-in-chief, summoned every male Servian to arms. The sultan sent troops against the Janissaries, who were overwhelmed, and their leaders executed. But the Servians now refused to receive again the yoke of the Turks, Russia supported their claim to independence, and war commenced. Czerny George commanded his countrymen with fiery enthusiasm, rough vigour, and considerable ability. Several victories over the Turks were won; and, in October 1806, the independence of Servia was recognized by the Porte, a tribute only being exacted, and the sign of Turkish sovereignty maintained by the residence at Belgrade of a Turkish officer with a very small force. The Turks refusing, however, to give up Belgrade and Schabaz, both towns were taken by Czerny George by assault, and the Janissaries and Turks in both were massacred in cold blood.

Czerny George, as commander-in-chief, now became the ruler of Servia; and till 1813, despite strong opposition in the Servian senate and constant danger from the Turks, he maintained his position. His elevation made no change in his habits. He continued during peace to cultivate his farm at Topola with his own hands, and he never laid aside his coarse peasant's dress. He had received no school education, and was never able to write. In general, he was moody and taciturn, though, when excited, he was fond of joining in the village dances. His passion was terrible; he killed his warmest adherent in a fit of anger. His execution of justice was stern and prompt; he hanged his own brother for assaulting a girl, and forbade his mother to make any signs of mourning. In war he displayed marvellous energy and valour, and he had the power of inspiring his followers with the fierce enthusiasm by which he was himself animated.

In 1809, on the outbreak of war between Russia and Turkey, Czerny George, who had formed the scheme of achieving the independence of all the Slavonic countries under the rule of Turkey, took up arms against the Turks, and, after attempting to excite a revolt in Bosnia, marched on Herzegovina. The Turks at this juncture invaded Servia; and Czerny George, though wishing to place the country under the protection of Austria, was forced to seek the aid of Russia. A vigorous attempt was now made to dispossess him of the supreme power; but he forced his opponents to submit or flee the country. The treaty of Bucharest (May 1812), however, while depriving the Servians of the protection of Russia, failed to claim for them sufficient guarantees from the Turks, in whose hands all the Servian fortresses were placed. In June 1813 the Turks again entered Servia, and Czerny George, in despair, with almost all the Servian chiefs, took refuge in Austria.

Four years after, having been persuaded that his countrymen were only awaiting his signal to burst into revolt, he ventured to return in disguise into Servia He discovered himself to Vuitza, an officer who had served under him, by whom he was basely murdered (27th July 1817), at the instigation of Milosch Obrenovitch, a Servian senator, who had come to a compromise with Turkey and obtained the chief power, and was jealous of the popularity of the old chief. See SERVIA, and Ranke's *Die Serbische Revolution*.

D

D in the English alphabet, the fourth letter, and the third consonant, represents the dental sonant sound, to which T is the corresponding surd (see B). It is the fourth letter also in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets. The form of our D is the same as that of the Latins; and the Latin D is no other than the Greek Δ; in old Latin, and in several of the Greek alphabets, including those of South-Western Italy, from which the Roman alphabet was borrowed, we find the form ⊳: the right hand corner was rounded for convenience of writing. The Greek symbol, again, is borrowed from the ancient Phœnician character, called in Hebrew *Daleth.* D is found in English (according to Grimm's law) where θ will be found in Greek, and *f* in Latin: thus our *deer* is the Greek θήρ, and Latin *fera.* In Old High German the corresponding word was rightly spelt with a *t* (*tior*); but this is now spelt *thier*, though the sound is the same. By the same law *d* appears in Greek and Latin where we find *t* in English and *z* in High German: thus we have δύο, *duo, two, zwei.* D sometimes became *l* in Latin; thus *Ulysses* represented Ὀδυσσεύς; sometimes it became *r*, as in *arbiter* for *ad-biter.* In prænomens D stood for *Decimus,* and in the titles of emperors for *Divus.* It is also a numeral letter, representing *five hundred.* This may arise from the circumstance that the letter D is analogous in form to IƆ, the half of CIƆ, which is the Roman numeral expression for *a thousand.* With a dash placed on the top thus, D̄, its value is increased tenfold, or, in other words, it stands for *five thousand.* Used as an abbreviation, D has various significations, for which see the article ABBREVIATIONS.

DACCA [DHAKA], the principal district in the division of the same name,[1] in Bengal, British India, situated between 24° 20′ 12″ and 23° 6′ 30″ N. lat., and between 89° 47′ 50″ and 91° 1′ 10″ E. long. It is bounded on the N. by Maimansinh, on the E. by Tipperah, and on the S. and W. by Bákarganj and Jarídpur. The district consists of a vast level plain, divided into two sections by the Dhaleswarí river. The northern part, again intersected by the Lakshmiá river, contains the city of Dacca, and as a rule lies well above flood-level. The soil is composed of red ferruginous *kankar*, with a stratum of clay in the more elevated parts, covered by a thin layer of vegetable mould, or by recent alluvial deposits. The scenery along the Lakshmiá is very beautiful, the banks being high and wooded. About 20 miles north of Dacca city, small ridges are met with in the Madhupur jungle, stretching into Maimansinh district. These hills, however, are mere mounds of from 20 to 40 feet high, composed of red soil containing a considerable quantity of iron ore; and the whole tract is for the most part unproductive. Towards the city, the red soil is intersected by creeks and morasses, whose margins yield crops of rice, mustard, and *til* seed; while to the eastward of the town, a broad, alluvial, well-cultivated plain reaches as far as the junction of the Dhaleswarí and Lakshmiá rivers. The country lying to the south of the Dhaleswarí is the most fertile part of the district. It consists entirely of rich alluvial soil, annually inundated to a depth varying from 2 to 14 feet of water. The villages are built on artificial mounds of earth, so as to raise them above the flood-level.

Rivers.—Dacca is watered by a network of rivers and streams, ten of which are navigable throughout the year by native cargo boats of four tons burthen. (1) The Meghná forms the eastern boundary of the district, separating it from Tipperah. (2) The Ganges, or Padma river, marks the western and south-western boundary, separating the district from Farídpur and Bákarganj. This river, here from three to four miles in width, is liable to frequent and extensive changes in its course; the old channel is now almost dry in the hot months. (3) The Lakshmiá, a branch of the Brahmaputra, flows through the north of the district and empties itself into the Dhaleswarí. (4) The Jamuná, or main stream of the Brahmaputra, only touches on the north-western corner of the district, where it joins the Ganges. (5) The Mendi-Khalí, a large branch of the Meghná, communicates with the old Brahmaputra. (6) The Dhaleswarí, an offshoot of the Jamuná, intersects the district from west to east, and falls into the Meghná at Munshiganj. It has two large navigable branches, both of which reunite with the parent-stream, viz., (7) the Ghází-khálí and (8) the Burígangá.

The wild animals comprise a few tigers, leopards, and wild elephants, deer, wild hog, porcupines, jackals, foxes, hares, otters, &c. The green monkey is very common; porpoises abound in the large rivers. Among birds are vultures, crows, several varieties of eagles, fish eagles, kites, falcons, owls, swallows, kingfishers, woodpeckers, *syámas*, green paroquets, spoonbills, *sáras*, *mánikjors*, herons, pelicans, *shill ibis*, adjutants, *bulbuls*, gulls, cormorants, coots, plovers, snipe, pigeons, doves, partridges, wild geese and ducks, &c. A trade is carried on in bird feathers, principally in those of the kingfisher tribe. The common fishes are the shark, ray, saw-fish, *anwári* or mullet, *tapsi máchh* or mango fish, *hilsá*, *chitál*, *katlá*, *rui*, *mirgal*, *kai*, *khalisá*, crabs, cray-fish, prawns, &c. Crocodiles are found in most of the large rivers. Among snakes are the cobra, *sanda*, *girgit*, *bamání*, *gosámp*, python, &c., and several varieties of tree and water snakes.

Agriculture.—Rice forms the staple product of the district. It is divided into three great classes:—*boro*, or spring rice, sown from December to February, and reaped in April and May; *áus*, or autumn rice, sown from March to May, and reaped from July to September; and *áman*, or winter rice (the great crop of the year), sown from March to May, and reaped in November and December. Wheat and barley are cultivated to a small extent; pulses are largely grown; also oilseeds, such as mustard, *til*, and linseed. Cotton was formerly a staple product, but since the decline of the fine Dacca muslins, due to the introduction of Manchester goods, its cultivation has almost entirely ceased. Jute cultivation has enormously extended of late years. The other crops raised are indigo, sugar-cane, *pán* or betel leaf, cocoa-nut, turmeric, ginger, tobacco, and safflower. Of the area of the district in 1870 (viz., 3217 square miles) 2245 are returned as cultivated, 24 as fallow land, 672 as cultivable waste land, and 276 as uncultivable. No statistics exist showing the cultivation of each kind of crop. But roughly speaking it may be said that in the rains three-fifths of the cultivated area is under rice, one-fifth is fallow or uncultivated, and one-fifth under jute; and that in the dry season, two-fifths is under oil seeds

[1] The Division or Commissionership of Dacca is under the Lieutenant Governor of Bengal, and comprises the districts of Dacca, Maimansinh, Bákarganj, Farídpur, and Tipperah (transferred from the Chittagong to the Dacca Division in 1875). It is bounded on the N. by the Gáro Hills, on the E. by Silhet and the state of Hill Tipperah, on the S. by the Bay of Bengal, and on the W. by Jessor, Páhná, Bográ, and Rangpur. The Division contains a total area of 18,276 square miles, with a population of 9,126,863 souls.

and pulses, two-fifths fallow or uncultivated, and one-fifth under other crops.

The *manufactures* consist of weaving, embroidery, gold and silver work, shell carving, and pottery. The weaving industry and the manufacture of fine Dacca muslins have greatly fallen off, owing to the competition of European piece goods. Forty different kinds of cloth were formerly manufactured in this district, the bulk of which during many years was made from English twist, country thread being used only for the finest muslins. Those of the most delicate texture were known by the name of *áb-rawán*, or "running water," and *shabnam*, or "evening dew." It is said that, in the time of the Emperor Jahángír, a piece of *ab-rawán* muslin, 15 feet by 3, could be manufactured, weighing only 5 *sikkás*, or 900 grains, its value being £40. In 1840, the finest cloth that could be made of the above dimensions weighed about 9 *sikkás*, or 1600 grains, and was worth £10. Since then the manufacture has still further decayed, and the finer kinds are not now made at all except to order. The manufacture of indigo is largely carried on with European capital. The great trading centres are Náráinganj and Madanganj, at the confluence of the Lakshmiá and Dhaleswarí rivers, on opposite banks. Náráinganj may be termed the port of Dacca, from which it is distant about 9 miles by land, and 16 or 18 by water. It constitutes the great south-eastern mart on the Jamuná, and has regular steam communication with Calcutta and the Assam districts. The general revenue of the district increased from £86,926 in 1860-61 to £111,620 in 1870-71; and the civil expenditure in the same period from £44,666 to £49,803. The land tax contributes about one-half of the general revenue, and amounted in 1870-71 to £53,672. There are 8 magisterial and 25 civil and revenue courts, besides 1 honorary magistrate's court, situated in the district. The regular police consists of a force of 430 officers and men, besides a municipal and rural police. For educational purposes, there is a Government college at Dacca city, together with 148 Government or aided schools, attended in 1871 by a total of 7155 pupils, besides numerous unaided village schools, for which no statistics exist.

Diseases.—Cholera and small-pox occasionally visit the district in an epidemic form. The principal endemic diseases are—intermittent and remittent fever, elephantiasis, bronchocele, enlargement of the spleen, dysentery and diarrhœa, rheumatism, catarrh, whooping cough, bronchitis, ophthalmia, cutaneous diseases, and intestinal worms. Cattle disease is also common. Five charitable dispensaries are maintained in the district, one of which, the Mitford Hospital, is the largest institution of the kind in Bengal out of Calcutta. There are also a lunatic asylum and an almshouse for indoor paupers.

Population.—The Bengal census of 1872 returned the population of Dacca district at 1,852,993 persons (males, 905,775; females, 947,218), distributed over 2897 square miles, and residing in 5016 villages or towns, and 290,593 houses. The population is thus classified according to religion:—Hindus, 793,789, or 42·9 per cent.; Muhammadans, 1,050,131, or 56·7 per cent.; Buddhists, 4; Christians, 7844, or ·4 per cent.; "others," 1225. The proportion of males in the district population was 48·9 per cent. Six towns contain a population of over 5000, viz.:—(1) Dacca city (*q.v.*) population 69,212; (2) Mánikganj, population: Hindus, 6381; Muhammadans, 5159; and "others," 2—total, 11,542; (3) Náráinganj, population: Hindus, 5200; Muhammadans, 5694; and Christians, 17—total, 10,911; (4) Sholaghai, population: Hindus, 4478; Muhammadans, 2047—total, 6525; (5) Hásárá, population: Hindus, 4807; Muhammadans, 900—total, 5707; (6) Narishá, population: Hindus, 2030; Muhammadans, 3570; Christians, 37—total, 5645. The material condition of the people particularly of the cultivating classes, has greatly improved of late years owing to the increased prices of produce, and the cultivation of more valuable crops.

DACCA CITY, the principal place in the above district, is situated on the left or north bank of the Burígangá river, in 23° 43′ 20″ N. lat. and 90° 26′ 10″ E. long. The city is bounded on the E. by a low alluvial plain stretching to the Lakshmiá river, and on the N. and N.W. by a tract of jungle interspersed with Muhammadan cemeteries, deserted gardens, mosques, and ruined houses. The streets, *bázárs*, and lanes extend four miles along the bank of the Burígangá, the breadth of the town being about 1¼ miles. The *chauk*, or market-place, lies at the west end, near the river bank. It is a square of considerable dimensions, surrounded by mosques and shops. The numerous streets which intersect the town are extremely crooked; and only a few are wide enough for wheeled conveyances. In parts of the city, inhabited by particular castes, such as the weavers' and shellcutters' *bázárs*, where building ground lets at a high rent, many four-storied houses have a frontage of only 8 or 10 feet, while the side walls run back to a distance of twenty yards. The opposite ends of these buildings are roofed in; the middle part is left open, and constitutes a small court. The ruins of the English factory, St Thomas's church, and the houses of the European residents lie along the banks of the river, and give the town a rather imposing appearance when viewed from the south. In the Armenian quarter are several large brick houses, for the most part now falling into decay. Of the old fort erected by Nawáb Islám Khán, in the reign of the Emperor Jahángír, no vestige remains; but the jail is built on a portion of its site. The principal Muhammadan public buildings, erected by subsequent governors and now in ruins, are the Katra and the Lál-bágh Palace,—the former built by Sultán Muhammad Shujá in 1645, in front of the *chauk*, or market place. Its extensive front faced the river, and had a lofty central gateway, flanked by smaller entrances, and by two octagonal towers rising to some height above the body of the building. The Lál-bágh Palace was commenced by Sultán Muhammad Azím, the third son of the Emperor Aurangzeb. It originally stood close to the Burígangá river; but the channel has shifted its course, and there is now an intervening space covered with trees between it and the river. The walls on the western side, and the terrace and battlement towards the river, are of a considerable height, and present a commanding aspect from the water. These outworks, with a few gateways, the audience hall, and the baths, were the only parts of the building that survived in 1840. Since then, their dilapidation has rapidly advanced; but even in ruin they show the extensive and magnificent scale on which this princely residence was originally designed. It appears never to have been completed; and when Tavernier visited Dacca, *circ.* 1666, the Nawáb was residing in a temporary wooden building in its court. The English factory was built about that year. The central part of the old factory continued to be used as a court-house till the present century, but owing to its ruinous state it was pulled down in 1829 or 1830; in 1840 the only portion that remained was the outward wall. The French and Dutch factories were taken possession of by the English in the years 1778 and 1781 respectively.

The trade of Dacca, which formerly was considerable, has steadily declined since the beginning of this century. In 1800 the population of the city was estimated at 200,000, while a census in 1830 returned only 66,989 inhabitants. The city still continued to decline, and in 1867 its population was estimated at 51,636 only. The rise, however, of the jute trade in late years, and increased prices for country produce, have now begun to compensate for the loss of its cotton manufactures. The census of 1872 showed that the population of the city had increased to 69,212 souls (males, 37,395; females, 31,817) made up as follows:—Hindus, 34,433; Muhammadans, 34,275;

Christians, 479; "others," 25. Sanitary improvements are being carried out; and a wealthy Muhammadan gentleman lately gave a donation of £5000 for the purpose of providing the city with a pure water-supply, and in 1875 it was proposed to light the main thoroughfares with gas. The principal local institutions are the Mitford Hospital and the Dacca Government College. Two English and several vernacular newspapers are published in the town.

History.—Dacca first attained political importance between 1608 and 1612. In order to check the depredations of Magh pirates from Chittagong, and the rebellions of the Afgháns, it was found necessary to remove the seat of government of Bengal from Rájmahál to Dacca, where the Nawáb Islmá Khán erected a fort and increased the strength of the fleet and artillery, and changed the name of the town to Jahángírnagar. Subsequently, in 1704, the capital of Bengal was removed to Murshidábád, and the government of Dacca and the eastern districts made over to a deputy of the Nawáb Názím. During the time of the Mughul government, the city was under the jurisdiction of a magistrate (*faujdár*) and six *amíns*, who, with the police, were maintained by rent-free grants of land. The fleet consisted of 700 war boats and state barges. Dacca was also a depôt for the Mughul artillery in Eastern Bengal, and possessed a mint. On the establishment of the British power the old officers and representatives of the native rulers were pensioned, but the title of Nawáb was continued in the family until 1845, when it became extinct on the death of the last incumbent without heirs. The only event of historical importance in late years was the mutiny of 1857, when two companies of the 73rd Native Infantry, which were stationed in the town, joined in the revolt, but were overpowered by a small European force and dispersed. (W. W. H.)

DACE, DARE, or DART (*Leuciscus vulgaris*), a fresh-water fish belonging to the family *Cyprinidæ*. It is an inhabitant of the rivers and streams of Europe north of the Alps, but is most abundant in those of France and Germany. It prefers clear streams flowing over a gravelly bottom, and deep, still water, keeping close to the bottom in winter but disporting itself near the surface in the sunshine of summer. It is preyed upon by the larger predaceous fishes of fresh waters, and owing to its silvery appearance is a favourite bait in pike-fishing. The dace is a lively, active fish, of gregarious habits, and exceedingly prolific, depositing its eggs in May and June at the roots of aquatic plants or in the gravelly beds of the streams it frequents. Its flesh is wholesome, but is not held in much estimation. In appearance it closely resembles the roach, usually attaining a length of 8 or 9 inches, with the head and back of a dusky blue colour and the sides of a shining silvery aspect, with numerous dark lines running along the course of the scales. The pectoral, ventral, and anal fins are white, tinged with pale red; and the dorsal yellowish, darkly clouded at its anterior edge. The dace feeds on worms, maggots, and other soft bodies. It is abundant in many of the streams of the south of England, but is unknown in Scotland and Ireland. See ANGLING, vol. ii. p. 42.

DACIA, or the country of the Daci, the ancient name of that district of Europe which lies to the N. of the Danube between the Theiss on the W. and the Dniester on the E. It thus comprehended the modern provinces of Transylvania, Wallachia, and Moldavia, the Bukowina, the banat of Temeswar and other parts of Hungary, as well as the southern portions of Galicia.

The first occupants of the district with whom we are made acquainted by history are the Getæ, a rude tribe of Thracian extraction, originally settled on the right bank of the Danube. They first appear in connection with the Scythian campaign of Darius, which nominally attached them for a moment to the Persian empire. By Philip of Macedon their friendship was considered of importance, and he married Medopa, the daughter of their king Cothelas; but they afterwards took part in the confederation of the Scythian tribes against the invasion by which Alexander the Great sought to secure his northern frontiers. About forty years later Lysimachus, king of Thrace, made an attempt to subdue them, but he was defeated and obliged to give his daughter in marriage to their chief; and a second expedition, by which he hoped to retrieve his fortunes, left him a prisoner in their hands, and brought him under obligation to his Dacian son-in-law, Dromichætes, for the restoration of his liberty. We next hear of the Getæ as being defeated by the Gauls, by whom many of them were sold as slaves to the Athenians and other Greeks.

The Getæ gradually retire from the foreground of history, and give place to the Daci, or Daoi, as they were called in Greek, a cognate race, who seem to have migrated from Rhodope, and about 90-57 B.C. attained a stable settlement and extensive influence under their leader Burvista. It has been usual to identify the Getæ and Daci as one, but though they continued to occupy the same country, and were, at least for a time, politically united, the allusions of the ancient writers seem to point to an essential difference. At the time of the war between Octavius and Antony, the Getæ sided with the former and the Daci with the latter; and during the fifty years after the formation of the province of Mœsia the Getæ continued to disturb the Roman frontiers, while the Dacians kept peacefully at home. After 73, however, the Getæ almost completely disappear, and the Dacians come forward as one of the most powerful enemies of Rome. Their reputation was heightened by the submission which they exacted from the tyrant Domitian, and the tribute by which he was obliged to purchase immunity from their attacks. In 101 A.D. Trajan, who had succeeded to the purple, set out against them in person, and defeated them with great slaughter at a place which is still called *Prat de Trajan* (Pratum Trajani), or Crossfield, near Thorda, in Transylvania. This was followed in 104 by another invasion, in which he advanced to the Dacian capital Sarmizegethusa (now Varhely), and routed Decebalus, who soon after committed suicide. The country was reduced to a Roman province, under the jurisdiction of a legate of prætorian rank; and colonists were brought from other parts of the empire, and more especially from southern Italy. In honour of the campaign of 104 the famous column of Trajan was erected at Rome; and to secure his conquests the victor constructed three great military roads and the bridge over the Danube, which ranked as one of the architectural wonders of the world. Under Hadrian (129 A.D.) the province was divided into two parts—Upper Dacia, which probably included the Banat and the mountain region of Transylvania; and Lower Dacia, situated in the Wallachian lowlands. Under Antoninus Pius the division became three-fold—Dacia Apulensis, so called from Apulum, the modern Carlsburg; Porolissensis, from Porolissum; and Malvensis, a name of unknown derivation. Dacia remained a Roman province till 272, when Aurelian adopted the line of the Danube as the frontier of the empire. The Roman legions and colonists retired to the southern side of the river and settled in the eastern part of Upper Mœsia and the district of Dardania; while their former territory was relinquished to the Goths and other Germanic tribes. The name of Dacia, sometimes with the addition of *Nova* or *Ripensis*, was applied to the new region along the Danube, and Dardania was distinguished as *Dacia Mediterranea*, or Inland Dacia. After the time of Constantine the designation, in its wider use, included Dacia Ripensis, Dacia Mediterranea, Mœsia Prima, Prævalitana, and a part of Macedonia Salutaris; in its narrower use it comprehended only the first two. Numerous traces of Roman occupation are found throughout the region, and in Roumenia the people pride themselves on their supposed descent from the Roman colonists, and use a dialect which bears a strong similarity to Latin. In features they are said to have a resemblance to the Dacians figured on Trajan's pillar. See Dierauer, *Geschichte Trajan's;* W. Froehner, *La Colonne trajane*, Paris, 1865; Roesler, *Romänische Studien*, 1871.

DACIER, André (1657–1722), a French classical scholar, was the son of a Protestant advocate at Castres, and was born in that town in 1651. His father resolved to give him a learned education, and accordingly sent him first to the academy of Puy Laurens, and afterwards to Saumur, to study under Tanneguy Lefèvre, who at that time enjoyed a considerable reputation as a teacher of classics. Such rapid progress did the young scholar make that, when Lefèvre sent away all his other pupils, he kept Dacier for another entire year. On the death of Lefèvre, Dacier removed to Paris; and he had the good fortune to be appointed one of the editors of the Delphin series of the classics. His marriage with the far more famous Anne Lefèvre, the daughter of his old teacher, took place in 1683. In 1685 he announced, in a letter to the king, the conversion of himself and his wife to Roman Catholicism. As a reward Louis bestowed on him a pension of 1500 livres, and on his wife one of 500 livres. In 1695 Dacier was elected member of the Academy of Inscriptions, and also of the French Academy (of which in 1713 he became secretary); and not long after, as payment for his share in the *Histoire de Louis le Grand par médailles, &c.*, he was appointed keeper of the library of the Louvre. He died, two years after his wife, on September 18, 1722.

Though endowed with none of the higher literary faculties, Dacier possessed great erudition. He was, as was wittily said, "un gros mulet chargé de tout le bagage de l'antiquité." The most important of his works were his editions of Pompeius Festus and Valerius Flaccus, and his translations of Horace, with notes, of Aristotle's *Poetics*, of the *Electra* and *Œdipus* of Sophocles, of Hippocrates, and of Plutarch.

DACIER, Anne Lefèvre (1654–1720), a famous French scholar and translator from the classics, was born at Saumur, probably in 1654. She was the daughter of Tanneguy Lefèvre, a self-educated scholar belonging to the Huguenots, who taught classics and edited classical authors with a liveliness and enthusiasm which brought him some degree of fame. At the age of eighteen Anne Lefèvre lost her father. She then removed to Paris, carrying with her part of an edition of Callimachus, which she afterwards published, and which obtained for her an engagement as one of the editors of the series of classical authors then being prepared *ad usum Delphini*. In this series she edited Florus, Dictys Cretensis, Aurelius Victor, and Eutropius. In 1681 appeared her prose version of Anacreon and Sappho, which, though it was successful at the time, is wanting in the delicate taste, the gaiety, and fire essential to a true translation. Within the next few years she also published prose versions of Terence and some of the plays of Plautus and Aristophanes, for the last of whom especially she cherished the most intense admiration. In 1683 Anne Lefèvre married André Dacier, once her father's favourite pupil. In the following year she accompanied her husband to his native town of Castres, whither they retired with the professed object of devoting themselves to theological studies. In 1685 the result was announced in the conversion to Roman Catholicism of both M. and Mme. Dacier, and of many of the townsfolk of Castres besides. The sincerity of this conversion, though it brought with it court favour, it would be uncharitable to doubt; indeed the tastes of Mme. Dacier and her husband were such as would render such a step most natural. In 1711 appeared the prose translation of the *Iliad* (followed five years later by a similar translation of the *Odyssey*) which, through the spirit and enthusiasm which she brought to the work, and the direct and simple strength of her sometimes homely language, gained her the position she occupies in French literature. The appearance of this version, which made Homer known for the first time to many French men of letters, and among others to La Motte, gave rise to a famous literary controversy. La Motte published a poetical version of the *Iliad*, which he took the liberty of greatly abridging and altering to suit his own taste, together with a *Discours sur Homère*, stating the reasons why Homer failed to satisfy his critical taste (1714). Mme. Dacier replied, in her work *Des Causes de la Corruption de la Goût* (1714), maintaining her opinions with a thorough enthusiasm for the ancients which allowed no merit to the moderns, and with occasional flashes of not unhappy banter. La Motte carried on the discussion with light gaiety and badinage, and had the happiness of seeing his views supported by the indisputable erudition of the Abbé Terrasson, who in 1715 produced two volumes, entitled *Dissertation critique sur l'Iliade*, in which he maintained that science and philosophy, and especially the science and philosophy of Descartes, had so cultured the human mind that, without doubt, the poets of the 18th century were immeasurably superior to those of ancient Greece. The reply to this treatise was undertaken by M. Dacier. In 1715 the dispute was settled. In that year, Père Buffier published *Homère en arbitrage* (two letters to Mme. Lambert, with a reply from her) in which he concludes that both parties are really agreed as to the essential point that Homer was one of the greatest geniuses the world has seen, and that, as a whole, no other poem can be preferred to his; and, soon after, in the house of M. de Valincourt, Mme. Dacier and La Motte met at supper, and drank together to the health of Homer. Nothing of importance marks the rest of Mme. Dacier's life. She assisted her husband, for whom she seems to have cherished a high admiration, in his editions and translations, and spent part of her latter years in writing notes on the Scriptures, which were never published. She died at the Louvre, where her husband was keeper of the library, on the 17th August 1720.

See Sainte-Beuve, *Causeries de Lundi*, vol. ix; Bodin, *Recherches historiques sur la ville de Saumur;* Burette, *Éloge sur Mme. Dacier; Mémoires de Mme. de Staal*. A *mémoire* containing stories to the prejudice of Mme. Dacier's character appeared a few years after her death, and may be found in the *Histoire littéraire de la France* (vol. i.); some of the stories are also repeated by Bayle. The scandal is with great probability attributed by Sainte-Beuve to the rancour of some Huguenot.

DA COSTA, Isaak (1798–1860), a Dutch poet and theologian, was born at Amsterdam on the 14th January 1798. His father was a Jew of Portuguese descent, through whom he claimed kindred with the celebrated Uriel D'Acosta. He studied at Amsterdam, and afterwards at Leyden, where he took his doctor's degree in law in 1818. Before this he had given evidence of poetical talent, and had become acquainted with Bilderdijk, who exercised the strongest influence over him both in poetry and in theology. He was in fact the imitator as well as the scholar of Bilderdijk. In 1822 he became a convert to Christianity, and immediately afterwards asserted himself as a champion of orthodoxy in his *Bezwaren tegen den Geest der Eeuw* (1823), which was an attack upon the prevalent latitudinarianism in doctrine. He took a lively interest in missions to the Jews, and towards the close of his life was a director of the seminary established at Amsterdam in connection with the mission of the Free

Church of Scotland. He died at Amsterdam on the 28th April 1860. Da Costa ranked first among the poets of Holland after the death of Bilderdijk. His principal poetical works were *Alphonsus I.* (1821), a tragedy; *Poesji* (1821); *God met ons* (1826); *Festliedern* (1828); *Vijf-en-twintig Jaren* (1840); *Hagar* (1852); *De Slag van Nieuwpoort* (1857), and *De Mensch en de Dichter.* He also translated the *Prometheus* of Æschylus, and edited the poetical works of Bilderdijk in 16 volumes. He was the author of a number of theological works, chiefly in connection with the criticism of the gospels.

DÆDALUS, from the identity of his name with δαιδάλλειν, "to carve," and δαίδαλα, "carved images," appears to have been, not a real person, but a legendary representative of the art of carving and sculpture in Greece in the time before Homer, who speaks of him (*Iliad*, xviii. 590) as having made a "chorus" for Ariadne in Crete, which Hephæstus took as the model of his "chorus," or dance, on the shield of Achilles. Works of art of an extremely early date, but especially wooden images of deities, were ascribed to Dædalus or his descendants, and there were many traditions of the wonders he had done in sculpture. Most of the tools used in wood carving and sculpture were believed to have been invented by him. He was the first to open the eyes of statues, so that they seemed to look at the spectator, and to separate the legs so that they seemed to walk. A statue of Heracles by him had to be tied to prevent its running away, when the hero, angry at its resemblance to himself, threw a stone at it. The greater freedom which early Greek artists introduced into their figures was always contrasted with the stiffness of Egyptian statues, and hence it was necessary for the legend to represent Dædalus as having been some time in Egypt. Two of the earliest centres of art in Greece were Crete and Attica, and in the legends of both, Dædalus is involved, the story being that he had fled from Athens after killing his skilful nephew Talus, had gone to Crete in the time of Minos, had there constructed the famous labyrinth, and made a "chorus" for Ariadne and a cow for Pasiphaë, and had been then thrown into prison, but escaped along with his son Icarus by means of wings. Icarus, however, fell into the sea and perished. Dædalus reached Sicily, where, protected by the king against Minos, who pursued him, he is said to have constructed several important works.

DAFFODIL, the name of a group of plants of the genus *Narcissus*, and natural order *Amaryllidaceæ.* The common daffodil, *N. Pseudo-narcissus*, is common in woods and thickets in most parts of the N. of Europe, but is rare in Scotland. Its leaves are 5 or 6 in number, are about a foot in length and an inch in breadth, and have a blunt keel and flat edges. The stem is about 18 inches long, and the spathe single-flowered. The flowers are large, yellow, scented, and a little drooping, with a corolla deeply cleft into 6 lobes, and a central bell-shaped nectary, which is crisped at the margin. They appear early in the year, or, as Shakespeare says, "come before the swallow dares, and take the winds of March with beauty." The stamens are shorter than the cup, the anthers oblong and converging; the ovary is globose, and has three furrows; the seeds are roundish and black. Double and other varieties of the flower are commonly cultivated in gardens. The bulbs are large and orbicular, and have a blackish coat; they, as well as the flowers, are reputed to be emetic in properties. The Peruvian Daffodil and the Sea Daffodil are species of the genus *Ismene.*

DAGGER, a weapon which, in relation to its comparatively short blade, may be considered a diminutive of the sword. Specially designed to inflict wounds by the act of stabbing, the dagger is sharp at the point, but it is equally adapted for cutting purposes with its keen edge. All savage races have highly valued the dagger in some modifications of its simplest type; while at certain periods it has been included among the military weapons of civilized nations, and, in our own time, is well known as the dirk. Early in the 14th century a dagger straight in the blade, and called a *misericorde*—either because the sight of it caused the vanquished to cry out for mercy, or from its use in mercifully ending the sufferings of the hopelessly wounded—became a companion weapon to the sword among the knights of Europe; and, accordingly, from about 1330 till the end of the succeeding century, in many knightly effigies it is often represented as attached on the right side by a cord or a chain to the sword-belt. The misericorde varied in size, the length of the blade sometimes causing it to appear almost like a second sword, while at other times the blade and the hilt were nearly of equal length. This weapon and its sheath were often elaborately adorned. It was customary to secure it from accidental loss by a guard-chain fastened to a mamellière of the breast-armour, of which chain the other end was secured to the hilt of the weapon by a ring either fixed on the apex of the pommel or travelling along the grip. Occasionally the misericorde was fixed to the body-armour by a staple; or, more rarely, it was connected with a gypcière or pouch. A similar weapon, with a longer blade than the ordinary misericorde, was habitually worn by civilians, including judges, during the Middle Ages; such weapons bore the name of *anlace* or *basilarde.* By nobles and knights the misericorde was worn when they had exchanged their armour for the costume of peace. It is recorded, besides, that when they appeared at a tournament, and on some other occasions, ladies at that time wore daggers depending, with their gypcières, from their girdles. Thus, writing of the year 1348, Knighton speaks of certain ladies who were present at jousts as "habentes cultellos, quos *daggerios* vulgariter dicunt, in powchiis desuper impositis." A sword having a blade much shorter than the principal knightly weapon of the same class, and distinguished as an *estoc*, which, like the civilian anlace or basilarde, may be considered to be a variety of the dagger, occasionally formed a part of the equipment of the mediæval man-at-arms; and it is the scabbard of such a weapon that hangs as a characteristic memorial above the tomb and the effigy of the Black Prince in Canterbury Cathedral. Much ingenuity and skill have been lavished on the adornment of daggers, and in rendering the blades more capable of inflicting severe wounds. Daggers also were sometimes made to poison as well as wound. Some Italian daggers, of stiletto type, have the blade made to expand laterally, by the action of delicate and powerful springs. Others, like the *cris* of the Malays, have wavy blades.

DAGHESTAN, a government in Asiatic Russia, on the eastern slopes of the Caucasus, bounded by Circassia, Grusia or Georgia, and the Caspian. As its name implies, it is of a very rugged and mountainous character, with the exception of a narrow strip along the sea-coast. It is watered by the tributaries of the Sulak and other streams that find their way to the Caspian. The district is geologically of great interest, and its strata have been investigated by Abich in his *Sur la structure et la géologie du Daghestan*, 1862. Lead, iron, and sulphur are worked to some extent. The chief town is Derbent. See CAUCASUS, vol. v. p. 254.

D'AGINCOURT, JEAN BAPTISTE LOUIS GEORGE SEROUX (1730–1814), archæologist and historian, was born at Beauvais on the 5th April 1730. He belonged to a good family, and in his youth served as an officer in a regiment of cavalry. Finding it necessary to quit the army in order to take charge of his younger brothers who had been left orphans, he was appointed a farmer-general by Louis XV. In 1777 he visited England, Germany, and Holland; and in the following year he travelled through Italy, with the view of exploring thoroughly the remains of ancient art. He afterwards settled at Rome, and devoted himself to preparing the results of his researches for publication. He died on the 24th September 1814, leaving the work, which was being issued in parts, unfinished; but it was carried on by M. Gence, and published complete under the title *L'Histoire de l'Art par les Monuments, depuis sa décadence au quatrième siècle jusqu' a son renouvellement au seizième* (6 vols. fol. with 325 plates, Paris, 1823). An English translation by Owen Jones was published in 1847. In the year of his death D'Agincourt published at Paris a *Recueil de Fragments de Sculpture antique, en terre cuite* (1 vol. 4to).

DAGON, a national god of the Philistines, spoken of in Judg. xvi. 23; 1 Sam. v. 2; 1 Chron. x. 10; 1 Macc. x. 83. The name is derived from *Dag*, a fish, with the suffix of endearment,—the older etymology from *Dagan*, corn, suggested by Philo Byblius, being generally regarded as untenable. The principal temples of the god were at Ashdod (1 Sam. v. 1), and Gaza (Judg. xvi. 1, 23), and the former existed until the time of the Maccabees, when it was destroyed (148 B.C.) by Jonathan, the brother of Judas (1 Macc. x. 84). Dagon was a fish-god of the male gender, as the form of the name indicates, the corresponding female deity being Atargatis. From 1 Sam. v. 4. it appears that his image was composed of the head and hands of a man and the tail of a fish. The words "the stump of" at the close of the verse are an interpolation of the translators; the original reads "only Dagon (*i.e.*, the fish) was left." Selden and Niebuhr identify the Philistine Dagon with the Dagon ('Ωδάκων) of the Babylonian mythology; but Rawlinson considers it "extremely doubtful" whether the two had any connection (Rawlinson's *Herodotus*, 3d ed. i. 614). The fish was worshipped as the symbol of fertility, both on account of its own fecundity and as representing water, the life-giving and fertilizing element.

DAGUERRE, Louis Jacques Mandé (1789–1851), a French painter and physicist, was born at Cormeilles, in the department of Seine-et-Oise, and died July 12, 1851, at Petit-Brie-sur-Marne, near Paris. He was at first occupied as an inland revenue officer, but soon betook himself to scene-painting for the opera, in which he ere long surpassed his predecessors Bibiena and Munich, and his teacher Degoti, more especially in his remarkable power of representing light and shade. Among the most admired of his productions were the Chapel of Glenthorn, at the Ambigu, and the Rising of the Sun in "Les Mexicains." He assisted M. Prévost in the execution of panoramic views of Rome, Naples, London, Jerusalem, and Athens, and subsequently (July 11, 1822), in conjunction with Bouton, he opened at Paris the Diorama (δίς, double; ὅραμα, view), an exhibition of pictorial views, the effect of which was heightened by changes in the light thrown upon them. As an example of these may be instanced the Midnight Mass at the Church of Saint-Étienne du Mont. An establishment similar to that at Paris was opened by Daguerre in the Regent's Park, London. On the 3d March 1839 the Diorama, together with the work on which Daguerre was then engaged, the Interior of Sainte-Marie-Majeure, was destroyed by fire. This reverse of fortune was soon, however, more than compensated for by the distinction he achieved as the inventor of the daguerreotype photographic process. Nicéphore Niepce, who since 1814 had been seeking a means of obtaining permanent pictures by the action of sunlight, learned in 1826 that Daguerre was similarly occupied. In the following year he communicated to Daguerre particulars of his method of fixing the images produced in the camera lucida by making use of metallic plates coated with a composition of asphalt and oil of lavender; this where acted on by the light remained undissolved when the plate was plunged into a mixture of petroleum and oil of lavender, and the development of the image was effected by the action of acids and other chemical reagents on the exposed surface of the plate. The two investigators laboured together in the production of their "heliographic pictures" from 1829 until the death of Niepce, July 3, 1833. Daguerre, continuing his experiments, discovered eventually the process connected with his name. This, as he described it, consists of five operations:—the polishing of the silver plate; the coating of the plate with iodide of silver by submitting it for about 20 minutes to the action of iodine vapour; the projection of the image of the object upon the golden-coloured iodized surface; the development of the latent image by means of the vapour of mercury; and, lastly, the fixing of the picture by immersing the plate in a solution of sodium "hyposulphite" (sodium thiosulphate). On January 9, 1839, at a meeting of the Academy of Sciences, Arago dwelt on the importance of the discovery of the daguerreotype; and, in consequence of the representations made by him and Gay Lussac to the French Government, Daguerre was on the 15th of June appointed an officer of the Legion of Honour. On the same day a bill was presented to the Chambers, according to the provisions of which Daguerre and the heir of Niepce were to receive annuities of 6000 and 4000 francs respectively, on the condition that their process should be made known to the Academy. The bill having been approved at the meetings of the two Chambers on the 9th of July and the 2d of August, Daguerre's process, together with his system of transparent and opaque painting, was published by the Government, and soon became generally known. The first great improvement upon it, due to Mr Towson of Devonport, was the use of enlarged lenses, with which Mr Draper of New York was the first to secure portraits from the life. Then followed Mr Goddard's introduction, in 1840, of bromine for increasing the sensitiveness of the plates, and Fizeau's method of strengthening the lights and shades by the application of chloride of gold in the fixing operation. Previous to the time of Daguerre both Wedgwood and Sir H. Davy had attempted, but in vain, to prevent the unshaded portions of pictures taken by means of the solar rays from becoming coloured by exposure to diffused light; this result Daguerre secured by the use of sodium thiosulphate, and thus became the chief pioneer of the modern art of photography.

Daguerre's *Historique et description des procédés du Daguerréotype et du Diorama* (Paris, 1839), passed through several editions, and was translated into English. Besides this he wrote an octavo work, entitled *Nouveau moyen de préparer la couche sensible des plaques destinées à recevoir les images photographiques* (Paris, 1844).

D'AGUESSEAU, Henri François (1668–1751), chancellor of France, illustrious for his virtues, learning, and talents, was born at Limoges on the 27th of November 1668. Under the careful supervision of his father, a man of great worth and ability, who held the posts of intendant of Languedoc and councillor of state, D'Aguesseau devoted himself to study with great ardour and with extraordinary results. When little more than twenty-one years of age he was, through his father's influence with the king, appointed one of the three advocates-general; and the eloquence and learning which he displayed in his first speech gained him a very lofty reputation, which was well sustained by his subsequent career. The chosen companions of his leisure hours were Racine and Boileau, the latter of whom frequently mentions him with high praise.

In 1700 he was appointed procurator-general; and in this office, which he filled for seventeen years, he gained the greatest popularity by his lenity in criminal cases, and by his care of the public hospitals. In 1717 he was made chancellor by the Regent Orleans; but it was only a year after that he was deprived of the seals, and exiled to his estate, on account of his steady opposition to the projects of the famous John Law, which had been adopted by the regent and his ministers. In 1720, however, on the failure of these schemes, he was recalled; and he contributed not a little, by the firmness and sagacity of his counsels, to calm the public disturbance and repair the mischief which had been committed. Law himself had acted as the messenger of his recall; and it is said that D'Aguesseau's consent to accept the seals from his hand greatly diminished his popularity. But his reputation was much more severely shaken by his conduct in connection with the bull "Unigenitus," a measure which, with distinguished bravery, he had himself opposed during the life of the late king. He allowed the Great Council to assume the power of registration, which legally belonged to the Parliament alone; and he assisted Dubois, the favourite of the regent, in his endeavour to force the Parliament to register the bull, though he refused to sanction the extreme measure of exiling the Parliament, which Dubois had contemplated. Dislike of the Jansenists, and desire to put an end to the religious controversies which were raging so bitterly, were probably the motives which, in part at least, influenced D'Aguesseau; but the people unjustly attributed his conduct to a base compliance with the favourite. He certainly opposed Dubois in other matters; and when Dubois became chief minister, D'Aguesseau was deprived of his office.

He retired to his estate at Fresnes, where he passed five years, of which he always spoke with delight. The Scriptures, which he read and compared in various languages, and the jurisprudence of his own and other countries, formed the subjects of his more serious studies; the rest of his time was devoted to philosophy, literature, and gardening.

From these occupations he was recalled to court, by the advice of Cardinal Fleury, in 1727; but the seals were not restored to him till ten years later. During these years he endeavoured to mediate in the disputes between the court and the Parliament. When he was at last reinstated in office, he completely withdrew from all political affairs, and devoted himself entirely to his duties as chancellor, and to the achievement of those reforms which had long occupied his thoughts. Besides some important enactments regarding donations, testaments, and successions, he introduced various regulations for improving the forms of procedure, for ascertaining the limits of jurisdictions, and for effecting a greater uniformity in the execution of the laws throughout the several provinces. These reforms constitute an epoch in the history of French jurisprudence, and have placed the name of D'Aguesseau in the same rank with those of L'Hôpital and Lamoignon. As a magistrate also he was so conscientious that Saint-Simon has complained that he spent too much time over the cases that came before him.

In 1750, when upwards of eighty-two years of age, D'Aguesseau retired from the duties without giving up the rank of chancellor. He died on the 9th February of the following year.

The published writings of D'Aguesseau form a collection of thirteen volumes quarto, of which the first was published at Paris in 1759, and the last in 1789. The far greater part relates to matters connected with his profession, but they also contain an elaborate treatise on money; several theological essays; a life of his father, which is interesting from the account which it gives of his own early education; and *Metaphysical Meditations*, written to prove that, independently of all revelation and all positive law, there is that in the constitution of the human mind which renders man a law to himself.

See *Histoire des hommes illustres des règnes de Louis XIV. et de Louis XV.* by the Duc de Saint-Simon; *Mémoires secrètes*, by Duclos; *Les loisirs d'un ministre d'état*, by D'Argenson; *Éloges* by Antoine Thomas (1760), by Marthon (1760), and by Boinvilliers (1848); and *Discours sur la vie de M. d'Aguesseau*, by his son, Aguesseau de Fresnes (1812).

DAHL, JOHANN CHRISTIAN (1778–1857), a landscape painter, born in Bergen, Norway, on the 24th February 1778. He began painting in his native town, and formed his style without much tuition, remaining there till he was twenty-four, when he left for the better field of Copenhagen, and ultimately settled in Dresden in 1818. He is usually included in the German school, although he was thus close on forty years of age when he finally took up his abode in Dresden, where he was quickly received into the Academy and became professor. German landscape-painting was not greatly advanced at that time, and Dahl contributed to improve it. He continued to reside in Dresden, though he travelled into Tyrol and in Italy, painting many pictures, one of his best works being that of the Outbreak of Vesuvius, 1820. What his works want is the careful expression of nature in its normal conditions. He was fond of extraordinary effects, as seen in his Winter at Munich, and his Dresden by Moonlight; also the Haven of Copenhagen, and the Schloss of Friedrichsburg, under the same condition. At Dresden may be seen many of his works; a large picture called Norway may be mentioned, and a Storm at Sea. He was received into several academic bodies, and had the orders of Wasa and St Olaf sent him by the king of Norway and Sweden. His death took place in 1857.

DAHL, MICHAEL (1656–1743), the only celebrated Scandinavian portrait painter of his time, was born at Stockholm in 1656. He received his first professional education from Ernst Klocke, who had a respectable position in that northern town, which, however, Dahl left in his twenty-second year. His first destination was England, where he did not long remain, but crossed over to Paris, and made his way at last to Rome, there taking up his abode for a considerable time, painting the portraits of Queen Christina and other celebrities. In 1688 he returned to England, with an established character, and became for some years a dangerous rival to Kneller. His portraits still exist in many houses, but his name is not always preserved with them. Nagler (*Künstler-Lexicon*) says those at Hampton Court and at Petworth contest the palm with those of the better known and vastly more employed painter. Some of his pictures have been engraved. He died in 1743, in his eighty-seventh year.

DAHL, or DALE, VLADIMIR IVANOVITCH (1802–1872), a Russian author and philologist of high reputation, was born of Scandinavian parentage in 1802, and received his education at the Naval Cadets' Institution at St Petersburg. He joined the Black Sea fleet in 1819; but at a later date he entered the military service, and was thus engaged in the Polish campaign of 1831, and in the expedition against Khiva. He was afterwards appointed to a medical post in one of the Government hospitals at St Petersburg, and was ultimately transferred to a situation in the civil service. The latter years of his life were spent at Moscow, and he died there on November 3 (October 22), 1872. Under the name of Kossack Lugansky he obtained considerable fame by his stories of Russian life,—*The Dream and the Waking*, *A Story of Misery, Happiness, and Truth*, *The Door-Keeper* (Dvernik), *The Officer's Valet* (Denshchik). His greatest work, however, was a *Dictionary of the Living*

Russian Tongue (Tolkovyi Slovar Zhivago Velikorusskago Yasika), which appeared in four volumes between 1861 and 1866, and is of the most essential service to the student of the popular literature and folk-lore of Russia. "It is impossible," says Mr Ralston, "to praise too highly this magnificent work—one to which he devoted during a great part of his lifetime what was truly a labour of love." It was based on the results of his own investigations throughout the various provinces of Russia,—investigations which had furnished him with no fewer than 4000 popular tales and upwards of 30,000 proverbs. Among his other publications may be mentioned *Bemerkungen zu Zimmermann's Entwurf des Kriegstheaters Russlands gegen Khiwa*, published in German at Orenburg, and a *Handbook of Botany*, Moscow, 1849. A collected edition of his works appeared at St Petersburg in 8 volumes, 1860–61.

DAHLGREN, KARL FREDRIK (1791–1844), the Swedish poet, was born at Stensbruk in Östergötland June 20, 1791. At the time when literary partizanship ran so high in Sweden, and the writers divided themselves into "Goths" and "Phosphorists," Dahlgren came over to the latter body, and made himself indispensable by his polemical activity. In the mock-heroic poem of *Markalls sömnlösa nätter* (Markall's Sleepless Nights), in which the Phosphorists bitterly, and with eminent success, ridiculed their opponents, Dahlgren, who was a genuine humourist, took a very prominent part. In 1825 he published *The Tower of Babel*, a satire, and in the same year, a comedy, *Argus in Olympus*. In 1828 he collected the scattered poems of his youth into two volumes. In 1829 he was appointed to an ecclesiastical post in Stockholm, which he held until his death. In a series of odes and dithyrambic pieces, entitled *Mollbergs Epistlar* (1819, 1820), he strove to emulate the wonderful lyric genius of Bellman, of whom he was a student and follower. From 1825 to 1827 he edited a critical journal entitled *Kometen* (The Comet), and he is also the author of a comic novel, *Nahum Fredrik Bergström's Chronicle*, which is said to be extremely witty. In company with Almqvist he founded the celebrated Manhems-förbund, a society of agricultural socialists, which had but a short tenure of existence. In 1834 he collected his poems in one volume; and in 1837 appeared his last book, a volume entitled *Steamboat Songs*. On the 1st of May 1844 he died at Stockholm. Dahlgren is one of the best humorous writers that Sweden has produced; but it was perhaps in realistic and idyllic description that his peculiar talents displayed themselves to most advantage. His little poem of *Zephyr and the Girl*, which is to be found in every selection from Swedish poetry, is a good example of his sensuous and ornamented style, as well as of his ease and vivacity. His works were collected and published after his death by A. J. Arwidsson.

DAHLIA, a genus of herbaceous plants of the natural order *Compositæ*, so called after Dr Dahl, a pupil of Linnæus. The dahlia is indigenous to Mexico, where it flourishes in sandy tracts at a height of 5000 feet above sea-level. Two cultivated species are distinguished by some botanists, *D. frustranea* and *D. superflua*, the outer involucre in the former being spreading, in the latter reflexed. The flowers have a chaffy receptacle, a double involucre, and no pappus. The roots or tubers are spindle-shaped, and grow in bundles; they were at one time used as food in France; but their acrid flavour occasioned their rejection as an esculent. They may be stored in winter in the same manner as potatoes. The flowers, at the time of the first introduction of the plant, were single, with a yellow disc and dull scarlet rays; under cultivation, since 1802 in France and 1804 in England, flowers of numerous brilliant hues, with the elements of the disc converted into ray-florets, have been produced. The flower has been modified also from a flat to a globular shape, and the arrangement of the florets has been rendered quite distinct in the ranunculus and anemone-like kinds. The ordinary natural height of the dahlia is about 7 or 8 feet, but one of the dwarf races grows to only 18 inches. With changes in the flower, changes in the shape of the seed have been brought about by cultivation; varieties of the plant have been produced which require more moisture than others; and the period of flowering has been made considerably earlier. In 1808 dahlias were described as flowering from September to November, but some of the dwarf varieties at present grown are in full blossom in the middle of June. The nature of the season has a marked effect upon certain kinds of dahlia, so that those which are good in one year may become decidedly bad in the next. In 1842 it was noted by one observer that every dahlia with a tendency to become of a scarlet hue had its petals deeply notched, in some cases to the depth of half an inch. A fine colour is an important requisite for a good flower; there should also be no sinking of the centre or eye, and the backs of the petals should not be visible. Dahlias may be grown in almost any kind of soil, but flourish best in a rich loam; on a light sandy mould they arrive early at maturity, and become dwarfed. The plants should be protected from north and east winds, and when watered the whole of their foliage should be wetted. They are propagated by cuttings and seed as well as by tubers. Experience has shown that the best plants obtained from cuttings are those planted in soil different from that on which the parent plants grow. The seeds are sown in pots early in March, under the protection of a hotbed frame or in a hothouse.

DAHLMANN, FRIEDRICH CHRISTIAN (1785–1860), a distinguished German historian and politician, was born on the 13th May 1785, at Wismar. He studied philology at the universities of Copenhagen and Halle, and at the age of twenty-five took his doctor's degree in that subject. He had already delivered lectures at Dresden; and in 1812 he was appointed professor of history at Kiel. His devotion to historical study had been caused by his wish to take a useful and intelligent part in contemporary politics. In 1815 he was made secretary to the permanent deputation of the prelates and nobles of Schleswig Holstein, in which position his influence was exerted against the policy of the Danish Government, and he henceforth took a prominent place among moderate liberals. In 1829 he was chosen professor of the science of politics in the university of Göttingen. Two or three years later he was engaged in drawing up the Hanoverian constitution of 1833. In 1837, when that constitution was abolished by Ernest Augustus, Dahlmann so strongly opposed the king's policy that he was banished from Hanover. He retired to Leipsic, and then to Jena, where he gave his time to the study of history and the production of his most important works. In 1842 Dahlmann became professor of history and the science of politics at Bonn. In 1848 he was chosen a member of the committee of seventeen which was appointed to draw up a new German constitution; and he was elected member of the National Assembly of Frankfort. He distinguished himself as an advocate of the election of the king of Prussia as emperor of Germany. He was indeed so much regarded as a leader that he was requested to form a ministry; but his attempt was unsuccessful. In March 1849, when the Parliament rejected the constitution, Dahlmann, who had been opposed to the armistice of Malmoe, retired, with many of his followers, from the Parliament, and joined the assembly of Gotha, in which he still advocated the unification of Germany under the king of Prussia. He also worked in the same cause in the assembly of Erfurt and the Prussian diet. When that cause appeared hopeless, he retired from politics; and the rest of his life was spent in study, and in fulfilling the duties of the chair which he still held at Bonn. He died on the 5th December 1860.

The chief works of Dahlmann are a valuable *Geschichte Dänemarks* (3 vols. 1840-3), *Geschichte des Englischen Revolution* (1845 and 1853), *Geschichte des Französischen Revolution* (1844 and 1853), *Forschungen auf dem Gebiete der deutschen Geschichte* (1822–3), *Chronik von Dithmarsen* (1827), *Politik auf den Grund und das Masz der gegebenen Zustände zurückgeführt* (1835 and 1847); *Quellenkunde der deutschen Geschichte* (1830 and 1875).
See Springer, *Friedrich Christian Dahlmann* (1870–2).

DAHLSTJERNA, Gunno (1661-1709), whose original surname was Eurelius, the Swedish poet, was born September 7, 1661, in the parish of Öhr, in Dalsland, where his father was rector. He entered the university of Upsala in 1677, and after gaining his degree, entered the Government office of land-surveying. He was sent in 1681 on professional business to Livonia, then under Swedish rule, and after some time took thence a scientific journey into Germany, in the course of which, being at Leipsic, he published and publicly read, in 1687, a dissertation, *De Electro*, which caused such a sensation that he was offered a professorial chair at the university of that city. He refused this honour, however, and busied himself, on his return to Sweden, with carrying out the numerous commissions in land-surveying directed by King Charles XI., and in 1699 he became head of the whole department. In 1702 he was ennobled under the name of Dahlstjerna. He spent his life in travelling, and wandered over the whole of the coast of the Baltic, Livonia, Rügen, and Pomerania, preparing maps which still exist in the office of Public Land-Surveying in Stockholm. He died in Pomerania on his forty-eighth birthday, September 7, 1709, just after the disastrous news of the lost battle of Pultowa had reached him. Dahlstjerna's life was, as it might seem, fully occupied with those practical mathematical studies in which he laboured so conscientiously for his country; but it is indisputable that his passion for poetry was still more absorbing. His patriotism was touching in its pathos and intensity, and during his long periods of professional exile he comforted himself by the composition of songs to his beloved Sweden. His genius was most irregular; at his best he surpasses all the Swedish poets of his time, and that with ease; but no writer of that country has sunk to lower depths of bombastic puerility. He formed his style after two thoroughly bad models,—the so-called Second Silesian School, of which Lohenstein was the leader, and the florid Italian pastoralists, Marini and Guarini. His best known original work is *Kungaskald*, an elegy on the death of Charles XI., published in 1697. It is written in alexandrines, arranged in *ottava rima.* The poem has faults enough; it is pompous and allegorical, but there are passages full of melody and high thoughts. The whole bearing of the work, judged from a national point of view, is noble and even sublime, and could only have been conceived at such a time, when Sweden was a great power in Europe. Dahlstjerna was a reformer in language, and it has been well said by Atterbom, that in this poem "he treats the Swedish speech just as dictatorially as Charles XI. and Charles XII. treated the Swedish nation." In 1706 he printed a volume of poems celebrating the victories of Charles XII., which, to the serious loss of Swedish literature, has unaccountably disappeared. In 1690 was printed at Stettin his translation or rather paraphrase of the *Pastor Fido* of Guarini, which was very much admired and often reprinted. But of all the works of Gunno Eurelius the one that has attained most living popularity is *The Goth's Battle Song concerning the King and Master Peter*, published in 1701. The king is Charles XII. and Master Peter is, of course, the czar of Russia. There is a proud maiden whom Peter will ravish from the king, and her name is Narva Castle. It is an exceedingly spirited and felicitous ballad, and lived almost until our own days on the lips of the people as a folk-song. In a more tasteful age, and with more leisure for poetic study, there can be no doubt that the vivid genius of Dahlstjerna would have produced works of a far higher order. As it is, there is no Swedish writer of his age who has approached him in his sublimer moments. The works of Dahlstjerna have been collected by Hansellius.

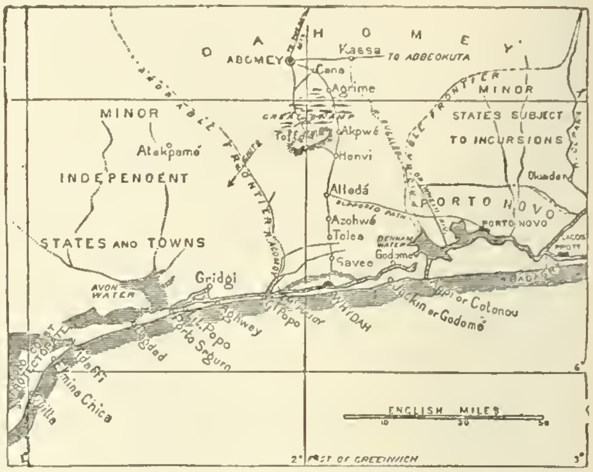

Chart of Dahomey.

DAHOMEY, a kingdom on the west coast of Africa, extending inland from the Slave Coast, in the Gulf of Guinea, and second only to Ashantee in power and importance. The territory of Dahomey has been described as extending from the Volta to the Niger, and from the Kong Mountains to the sea; but recent investigation has shown that the true limits of the state are much more closely circumscribed, Dahomey proper being probably not more than 120 miles from north to south, and the same, or perhaps less, from east to west, lying between 6° 15′ and 7° 30′ N. lat. and 1° 30′ and 2° 30′ E. long. or thereby. On the W. and N.W. are the semi-independent races of Aja and Atakpamé; on the N. the Mahees or Makhis, now completely subjugated; and on the N.E. and E. the Eyos and the Egbas, both the hereditary enemies of the Dahomans. On the S.E. is the kingdom of Porto Novo, a nation of kindred race, over which the king of Dahomey claims suzerainty. The southern portion of Dahomey is confined to the narrow tongue of dry land which lies between the Avon and the Denham lagoons and the swamps to the north of them, while the actual coast-line included in the dominion extends only from Mount Pulloy (near Great Popo) on the west to Cotonau on the east. The frontier is said to be marked for some distance inland by the River Agomey on the west and the Denham water and its tributary, the Ouellon or Whemi river, on the east. The seaboard is about 35 miles long, and forms a portion of the 120 miles of coast which intervene between the British possessions of the Gold Coast proper and Lagos. Between the Gold Coast and the Dahoman frontier occur several independent townships or coast settlements of mixed race, each under a separate chief. The principal centre of trade with the interior in this debateable land is the town of Gridgi, where a market is held every few days.

Physical Features.—The physical geography of Dahomey possesses some peculiarities. The ancient limit of the continent now lies about 50 miles inland, and the low ground intervening between the former coast-line and the present shore is protected from the ocean by a natural bank of sand, varying in width and height, but sufficient to prevent the incursions of the sea except at a few points, of which the channels of Great Popo and Lagos are well defined. Behind the sand-bank runs a lagoon affording carriage along almost the whole coast. A line drawn from the coast at Appi northwards to Abomey would represent roughly the almost imperceptible water-shed of the country, dividing the two systems of drainage which communicate with the sea at Great Popo and Lagos respectively. Recent charts show two vast lakes, the Avon and the Denham waters, extending many miles inland, and communicating with the lagoon which skirts the coast-line, but it is now certain that the extent of these lakes has been much exaggerated, and that the greater portion of what has been considered as navigable water is really low-lying land, more or less marshy according to the season of the year, and intersected by rivers and streams. The steamer "Eko" from Badagry ascended the Whemi river for a considerable distance in the autumn of 1876, and found plenty of water; while M. Guillevin, a French naval officer, who some years ago penetrated to the same river at Kassa near Abomey, not many miles further up in the month of April, that is during the dry season, reported that there was then little water in the stream.[1] The whole question of the geography of this coast is very fully discussed by the Abbé Borghero in a letter explaining the discrepancies between the English maps and his own. The letter is published in the *Bulletin de la Société de Géographie* of July 1866. The subject has considerable interest in connection with recent events on the Slave Coast, and in regard to the possible extension of the British protectorate over the interval of coast-line which now separates the two sections of the Gold Coast Colony. The sketch which illustrates this article is based upon M. Borghero's map, but it differs from it in the important particular of the position of Abomey. The latitude now assigned has been determined by a careful comparison of the itineraries of all the principal travellers, and the length of the route is found to correspond exactly with that given by Commodore Wilmot in 1862. It is a singular fact that the distance of Abomey from the coast, according to the accounts of successive travellers, has been gradually diminishing from 200 miles in 1724 to the present estimate. The longitude of Abomey is undetermined, but preference has been given to the English accounts which place it slightly more to the west than the French map.

Communication.—The interior of Dahomey is traversed by roads extending from Whydah to Abomey, the capital, a distance of 65 miles. The road, for the first 40 miles, lies through forest, gradually increasing in density to the edge of the Agrimé, or Great Swamp. Round the villages, and here and there in the forest, clearings are met with, cultivated in places, but in others now partially overgrown. The soil is naturally fertile, and there is evidence of former prosperity, but everywhere the process of depopulation is apparent, and the country is described as a luxuriant wilderness. The swamp which is supposed to connect the marshes at the head of the Avon and Denham waters is seven or eight miles broad. It is covered with stunted trees and its surface is rough and uneven. So far as any movement of its waters has been observed, it drains towards the west. The passage is attended by considerable difficulties during the rainy months, but in dry seasons it is scarcely distinguishable from the rest of the route. There are two known tracks across the swamp. The right is the more direct of the two; it passes through Akpwé and Agrimé. The left road, said to be slightly longer owing to the obligation imposed upon all travellers to halt at Cana, branches off at Henvi, and enters the marsh at Toffo; it is used in the rainy season, the passage of the swamp being less difficult at this point. The "koh," or swamp, once passed, the difficulties of the journey are left behind, and the character of the country undergoes a complete change; instead of dense forest and dismal swamps, a vast and gently undulating plain, with a gradual ascent towards the Kong Mountains, stretches out as far as the eye can reach. The approach to Cana has been described by several travellers as one of much beauty.

Port and Towns.—The principal seaport is Whydah. It is situated on the north bank of the coast lagoon about two miles from the sea. There is no harbour at the beach, and landing is effected in boats made expressly to pass through the surf, which is here particularly heavy. The town is two miles long and half a mile deep, and has about 12,000 inhabitants. There are five quarters, the English, French, Portuguese, Brazilian, and native, and the three first have the remains of once formidable forts.

Cana is the country residence of the king; the town straggles over three miles of ground, but the precincts include more field than habitation, the population being from 4000 to 5000. The distance from Cana to Abomey is eight miles; the road, apparently level, has an imperceptible rise the whole way; it is 20 yards broad and is kept carefully clear of grass.

Abomey.—The site of the capital is a rolling plain, nearly surrounded by marsh, and terminating in short bluffs to the north-west, where it is bounded by a long depression. Scattered over this hollow are the principal pans which scantily supply the city with water. For some reason visitors are not permitted to approach this quarter, and it was only by infringing the royal commands that Captain Burton, setting out at 4 o'clock one misty morning, was able to explore it. The city is about eight miles in circumference. The enceinte consists of a ditch 5 feet deep, filled with a dense growth of prickly acacia, the usual defence of West African strongholds. It is entered by six gates, which are simply clay walls, with two apertures, built across the roads leading into the town. Within the walls are several royal palaces, a market-place, a large square containing the barracks, &c., many cultivated farms and several large wastes; and outside the gates on the south there is a suburb with three other palaces. Notwithstanding the great area occupied by the habitations, the population is estimated by Burton at not more than 12,000, or about the same as that of Whydah, which only covers one-sixth of the area.

Mahee country.—From Abomey a road leads across a marsh northwards into the Mahee country, which is entered about 30 miles from the capital, and extends in a series of gradually rising terraces to the heart of the Kong Mountains. It is a rugged country of varied surface, and produces iron ore, which is smelted and worked up into agricultural and other implements. The mahogany tree and the African oak abound, and the much esteemed shea-butter tree is met with; the cotton plant is indigenous. The towns are built on the level summits of the hills with a view to defence.

Productions.—The soil of Dahomey proper is naturally fertile, and is capable of being highly cultivated. It consists of a rich clay of a deep red colour. Finely powdered quartz and yellow mica are met with, denoting the deposit of disintegrated granite from the interior. The principal

[1] More recently Mr Dumaresq, the late administrator of Lagos, who was on board the "Eko," when it explored the Whemi after the rains of 1876, has again ascended the river for 20 miles in an open boat for the purpose of ascertaining the depth of water during the dry season. He is reported to have found it to average 2 fathoms, but with a depth of $3\frac{1}{2}$ feet only on the bar at the entrance of the river. The breadth was 150 yards, and the stream was free from swamps. It must, however, be remarked that the character of the river in the latitude of the Agrimé swamp remains still undetermined.

product is palm-oil, which is made in large quantities throughout the country. The district of Toffo is particularly noted for its oil-palm orchards; these are chiefly owned by the officials of the capital, many of whom have houses and grounds there. Palm-wine, said to be superior to the finest cider, is also made, but the manufacture is prohibited excepting in the bush, as the process destroys the tree. Next to palm-oil the principal vegetable products are maize, guinea-corn, cassava (the substitute for bread), yams, sweet potatoes, plantains, cocoa-nuts, oranges, limes, and the African apple, which grows almost wild. The country also produces ground-nuts, Kola-nuts, pine-apples, guavas, spices of all kinds, ginger, okros (*Hibiscus*), sugar-cane, onions, tomatoes, and papaws. Cattle, sheep, and goats are scarce, and fowls are not plentiful.

The medium of exchange is the cowrie, which is imported from Zanzibar by the European merchants. At Whydah fifty cowries make a string, and fifty strings one "head;" a dollar is worth four heads; the head is 1s. 1½d., and a string therefore about a farthing. Inland, the value of the cowrie is enhanced by reducing the number in the string.

The *climate* of this part of the Slave Coast is the same as on the remainder of the Bight of Benin. Whydah is considered slightly more healthy than either Lagos or Badagry. Near the sea the heat is not excessive, the average temperature being about 80° Fahr. The year may be divided into four seasons:—summer, the rains, autumn, and the harmattan. During the summer, which continues from March to May, the heat is greatest, and dysentery prevails. The rains are ushered in by violent thunderstorms, and they last from May until August, with a break of fine weather in June; at the close of the rains thunderstorms are again prevalent. This is the coolest season of the year, but mosquitoes and sandflies abound. The autumn months are from September to November; thunderstorms and tornadoes occur at intervals; the climate assumes a more unhealthy phase, and Guinea worm is troublesome. The harmattan, so called owing to the prevalence of a cold dry wind which blows from the north and north-east, continues from December to February. It prevails for several days in succession, and alternates with winds from the south and south-west; its approach is generally foretold by a thick white fog known as "the smokes." During its continuance the thermometer falls about 10°, there is not the slightest moisture in the atmosphere, vegetation dries up or droops, the skin parches and peels, and all woodwork is liable to warp and crack with a loud report. This season is considered healthy, but in the intervals of the harmattan wind, when it is usually hot, mild fever may be expected. Tornadoes occur occasionally. During nine months of the year the climate is tempered by a sea-breeze, which is felt as far inland as Abomey. It generally commences in the forenoon, and in the summer it often increases to a stiff gale at sundown.

The *history* of Dahomey before the last 200 years is unknown. The country now occupied by Dahomey and Porto-Novo was, at the commencement of this period, comprised in the extensive kingdom of Ardrah, of which the capital was the present town of Alladá, on the road from Whydah to Abomey. About the beginning of the 17th century the state became dismembered on the death of a reigning sovereign, and three separate kingdoms were constituted under his three sons. One state was formed by one brother round the old capital of Alladá, and retained the name of Ardrah; another brother migrated to the east and formed a state also called Ardrah, but now known under the name of Porto Novo; while the third brother travelled northwards, and after some vicissitudes established the kingdom of Dahomey. The Western Ardrah, or Alladá, appears to have been subsequently further subdivided by the formation of the separate kingdom of Whydah to the south. About 1724–28 Dahomey, having become a powerful state, invaded and conquered successively Alladá and Whydah. Towards the north it was unable to extend its power, being hemmed in by the Mahees and the still more powerful Eyos or Oyos. The people of Whydah who escaped massacre or capture retreated along the coast to the west, and established themselves in the islands of the lagoon about Great Popo. The Whydahs from time to time made several attempts to recover their country, but without success, while on the other hand the Dahomans failed in all their expeditions against Popo. It is related that the repulses they met with in this quarter led to the standing order that no Dahoman warrior is to enter a canoe. The Dahomans have at several times penetrated along the beach towards the east as far as Badagry, but the king of Porto Novo became jealous of their incursions, and invoked the aid of the Eyos to put a stop to them. This was the state of affairs at the accession of Gezo about the year 1818. This monarch, who reigned forty years, raised the power of Dahomey to its highest pitch. He boasted of having first organized the amazons, to which force he attributed his successes. In 1825 he attacked the Eyos at Cana and abolished the tribute, thus freeing his country from the incubus on the north-east. He next (1840) overran Atakpamé on the west, and subjugated the Mahees on the north. Shortly after this began the quarrels with Abbeokuta, which continue to this day, and have proved one of the main causes of the decline of the Dahoman power. In 1848 Gezo fell unexpectedly on Okiadan and completely destroyed it. In 1851 he attacked Abbeokuta, the centre of the Egba power, but was beaten back. Gezo never recovered from this blow; he died in 1858, and was succeeded by his son Gelelé.

Gelelé's principal exploit was the capture of the Egba town of Ishagga in 1862. He slew the chief and carried off amongst the prisoners some native Christian converts and a native scripture-reader called William Doherty. This unfortunate man was crucified on a tree at Abomey, and his body was seen in this position by M. Euschart, a Dutch merchant of Whydah. In 1864 Gelelé attacked Abbeokuta and received an exemplary defeat, which will probably be sufficient to prevent him from again seriously attempting the capture of the place. Abomey has been frequently visited by representatives of the British Government. The later missions have had a threefold object—the suppression of the slave trade, the abolition of human sacrifices, and the dissuasion of the king from attacking Abbeokuta. Little result has ever been obtained from any of these visits.

From the time of Captain Burton's visit in 1863 there was little change in the political situation of Dahomey, until the spring of 1876, when in an evil moment Gelelé caused an Englishman resident in Whydah to be treated ignominiously. Brought to task by the commodore on the station the king refused to pay the fine of palm-oil awarded, and defied the British flag. Accordingly, for the fourth time in the history of Dahomey, a blockade of the coast was proclaimed.

Throughout the history of Dahomey, with very few exceptions, Europeans appear to have been treated with kindness, but they have often felt the inconvenience of placing themselves within the power of an uncivilized despot. It has always been an object with the king to secure the presence of white men at his "customs," and even casual visitors to Whydah have found themselves compelled to accept an invitation to visit the capital. Once there the length of their stay has depended on the caprice of the king, and even the envoys of European powers have found it impossible to break through the tedious etiquette of the savage court. As a notable instance of vexatious delay, Mr Skertchley, who visited Whydah in 1871, was induced to go to Abomey under promise of return to the port in eight days, and was compelled to remain eight months.

The "*customs*" consist of an annual festival which takes place about October, and lasts several weeks. During the saturnalia many human victims are put to death with great barbarity. At one stage of the customs the unfortunate wretches, chiefly captives taken in war, are dressed in white shirts and long white night-caps and tied into baskets. They are then taken to the top of a high platform, and paraded on the heads of amazons, together with an alligator, a cat, and a hawk in similar baskets. The king now makes a speech explaining that the victims are sent to testify to his greatness in spirit-land, the men and the animals each to their kind. They are then hurled down into the middle of a surging crowd of natives, and meet with a horrible death. At another stage of the festival human sacrifices are offered at the shrine of the king's ancestors, and the blood is sprinkled on their graves. The skulls are used to adorn the palace walls, and the king's sleeping-chamber is paved with the heads of his enemies. The skulls of the conquered kings are turned into royal drinking cups, and their conversion to this use is esteemed an honour.

Amazons.—But the most singular institution of this strange race is found in the treatment of the female sex. About one-fourth of the whole are said to be married to the fetish, many even before their birth, and the remainder are entirely at the disposal of the king. The most favoured are selected as his own wives or enlisted into the regiments of amazons, and then the chief men are liberally supplied. Of the female captives the most promising are drafted into the ranks as soldiers, and the rest become amazonian camp followers and slaves in the royal households.

With such an appropriation of the women it is not surprising that the population of Dahomey is found to be decreasing. No estimate can be formed of the number of inhabitants, but evidences of depopulation strike the traveller. It is a mistake to ascribe the diminution to human sacrifices, for the number of these is comparatively insignificant, and the victims are principally foreign captives.

The army of Dahomey was formerly held in high repute, but its prowess was probably overrated. The amazons form the flower of the army. They are marshalled in regiments, each with its distinctive uniform and badges, and they take the post of honour on the flanks of the battle line. Their number has been variously stated. Captain Burton had a good opportunity of judging, as he saw the army marching out of Cana on an expedition in 1862, and he computed the whole force of women troops at 2500, of whom one-third were unarmed or only half armed. Their weapons are blunderbusses, flint muskets, and bows and arrows. Whether their arrows are poisoned or not is a point on which there is difference of opinion.

A recent writer estimates the number of amazons at 1000, and the male soldiers at 10,000. The system of warfare is one of surprise. The army marches out, and, when within a few days' journey of the town to be attacked, silence is enjoined and no fires are permitted. The regular highways are avoided, and the advance is by a road specially cut through the bush. The town is surrounded at night, and just before daybreak a rush is made and every soul captured if possible; none are killed except in self-defence, as the first object is to capture, not to kill. The season usually selected for expeditions is from January to March, or immediately after the annual customs. The amazons are carefully trained, and the king is in the habit of holding "autumn manœuvres" for the benefit of foreigners. Many visitors have witnessed a mimic assault, and they are agreed in ascribing a marvellous power of endurance to the women troops. Lines of thorny acacia are piled up one behind the other to represent defences, and at a given signal the amazons, barefooted and without any special protection, charge and disappear from sight. Presently they emerge within the lines torn and bleeding, but apparently insensible to pain, and the parade closes with a march past, each warrior leading a pretended captive bound with a rope.

It is said that at the death of the king a horrid scene ensues; the wives, after the most extravagant demonstrations of grief and breaking and destroying everything within their reach, attack and murder each other, and remain in an uproar until order is restored by the new sovereign. The throne descends rightfully to the eldest son, but, as in the case of the present monarch, a younger brother is not unfrequently preferred, should the chiefs consider the heir unfitted to assume the reins of government. (W. K. E.)

DAILLÉ [DALLÆUS], JEAN (1594–1670), one of the most learned Protestant divines of the 17th century, was born at Châtellerault, in January 1594, and received his education at Poitiers and Saumur. For seven years from 1612 he was tutor to two of the grandsons of the illustrious M. du Plessis Mornay, and in 1619 he accompanied them in a tour through Italy, Switzerland, Germany, Flanders, Holland, and England, which lasted for two years. Having been ordained to the ministry in 1623, he preached for some time in the family of M. du Plessis Mornay; and on the death of his patron he devoted himself to the grateful task of drawing up his *Memoirs.* In 1625 Daillé was appointed minister of the church of Saumur, and in 1626 he removed to Paris. Of his works, which are principally controversial, the most important is the celebrated treatise *De vrai Emploi des Pères* (1631), translated into English by Thomas Smith under the title *On the Use of the Fathers* (1651). In 1656 it appeared in Latin. The work is a most effective attack on the views of those who made the authority of the fathers conclusive on matters of faith and practice. Daillé shows that their text is often corrupt, and that even when the text is correct their reasoning is often weak and inconsequent. He was greatly esteemed, even by his antagonists; and his mild and amiable disposition, united to his learning and genius, led Balzac to exclaim, "*Cum talis sis, utinam noster esses.*" In his famous *Sermons on the Philippians and Colossians*, Daillé has vindicated his claim to be ranked as one of the first of preachers, as well as one of the most able of polemics. Daillé was president of the last national synod held in France, which met in 1659. In the discussions which occurred he defended the universalism of Amyraut. His *Apologie des Synodes d'Alençon et de Charenton* (1655) was devoted to the same object. Among his other works were an *Apologie pour les Églises Reformées* and *La Foy fondée sur les Saintes Écritures.* Daillé's life was written by his son Adrien, who retired to Zurich at the revocation of the Edict of Nantes.

DAIMIEL, a town of Spain, at the head of a department of the province of Ciudad Real, and about 20 miles north-east of the town of that name, with which it is connected by rail. It is situated in a fertile plain on the Azuer, and is regarded as one of the most flourishing places in the La Mancha district. Linens and woollens are manufactured, and a purgative salt known as Sal de Inghilterra is extracted from the neighbouring marshes. Being of comparatively modern foundation, the town presents nothing very remarkable in its architecture. Population about 12,000.

DAIRY. Milk, either in its natural state, or in the form of butter and cheese, is an article of diet so useful, wholesome, and palatable, that dairy management, which includes all that concerns its production and treatment, constitutes a most important branch of husbandry. The physical conditions of the different countries of the world have determined in each case the most suitable animal for dairy purposes. The Laplander obtains his supplies of milk from his rein-deer, the roving Tartar from his mares, and the Bedouin of the desert from his camels. In the temperate regions of the earth many pastoral tribes subsist mainly upon the milk of the sheep. In some rocky regions the goat is invaluable as a milk-yielder; and the buffalo is equally so amid the swamps and jungles of tropical climates. The milking of ewes was once a common practice in Great Britain; but it has fallen into disuse because of its hurtful effects upon the flock. A few milch asses and goats are here and there kept for the benefit of infants or invalids; but with these exceptions the Cow is the only animal now used for dairy purposes in this country.

Breeds.—Cows of every kind are used for the dairy; but there are several of our native breeds of cattle which are called *par excellence* "the dairy breeds." An account of these has already been given in the article AGRICULTURE, vol. i. page 388. Whatever the breed, the quality is much influenced both by the age of the cow and by the way in which she is fed. So clearly is it ascertained that the milk of cows not exceeding four years of age yields a larger proportion and richer quality of curd than the milk of older animals, that it is customary in some of the cheese-making districts of England to draft off the cows to the grazier after they have borne two or at most three calves each.[1] Cows that are prized for their pedigree, however, are of course kept for longer periods, and few will part with a good cow so long as she continues to yield abundance of milk. In large well-conducted dairies, especially where, as in a yearly increasing number of cases, shorthorns are kept, the cows are fed so well that they are sold to the butcher at very nearly their original cost as milch cows.

Food.—The influence which the food of the cow exerts upon the amount and qualities of her milk has always been recognized; but at one time a large yield of milk, free from any unpleasant taste, was made the chief object of regard. It was accordingly the practice in new-milk dairies to feed the cows principally with soft sloppy food, such as boiled turnips, brewers' grains, and distillery wash. The milk produced from such food contains an undue proportion of serum, and is deficient in butter, caseine, sugar, and phosphates—the very elements which give to milk its value as an article of food, and fit it so peculiarly for building up the frame of young animals. When these elements are wanting in the cow's food they are to a certain extent supplied to her milk from her own system; and hence it is that cows which give a very large quantity of milk generally lose the fat and flesh which they had accumulated before calving. In order, therefore, to maintain the condition of the cow, and enable her to give milk of the best quality, it is necessary that her food contain an adequate supply of the requisites for good milk. Her food, in short, must be substantially the same as that found most useful in feeding cattle for the butcher. It is now pretty well ascertained that the fattening process is accomplished most economically by giving a moderate allowance of linseed or other cake, and of the meal of beans, Indian corn, and other grains in addition to the pasturage, green forage, roots, and fodder, which constitute the bulk of the food of such animals. The following approved dietary for milch cows is taken from a Report on Harvey's Dairy Company, Glasgow, by H. M. Jenkins, F.G.S., published in the *Journal of the Royal Agricultural Society of England* in 1871.

"During the seven winter months, when the cows remain entirely in the byre, the daily food commences with draff (distillery refuse) about four or five o'clock in the morning, mixed with bean, pea, or Indian meal, preferably the first-named, unless beans are too dear, when mixed kinds of meal are substituted. Linseed cake is occasionally given at this time to cows beginning to run dry, and also in spring to those that require a little laxative. After the first milking, viz., about seven in the morning, as much distillery refuse as they can take is freely given, and at eight o'clock either oat-straw or hay (if possible). The latter is generally rye-grass hay of the irrigated fields which are held by the Company. The next feed consists of raw turnips or cabbages, given about ten o'clock, and at eleven the cows are milked for the second time. The afternoon meal is given at two o'clock, and consists of steamed meal, turnips, and draff. At four o'clock some fodder, generally straw, is placed in the mangers, and between four and five more draff is run in. Some turnips are always put in the steamed food. At five o'clock the cows are milked for the third time, and are afterwards made up for the night.

"During the summer the cows get nothing in the byres but a little draff in the morning, when they come in to be milked, except towards the fall of the year. They are then allowed some fodder at mid-day; and in a bad season they get a little meal with their draff in the morning. They are kept on the pastures all day, but are brought up to the steading to be milked about eleven o'clock, as well as at night."

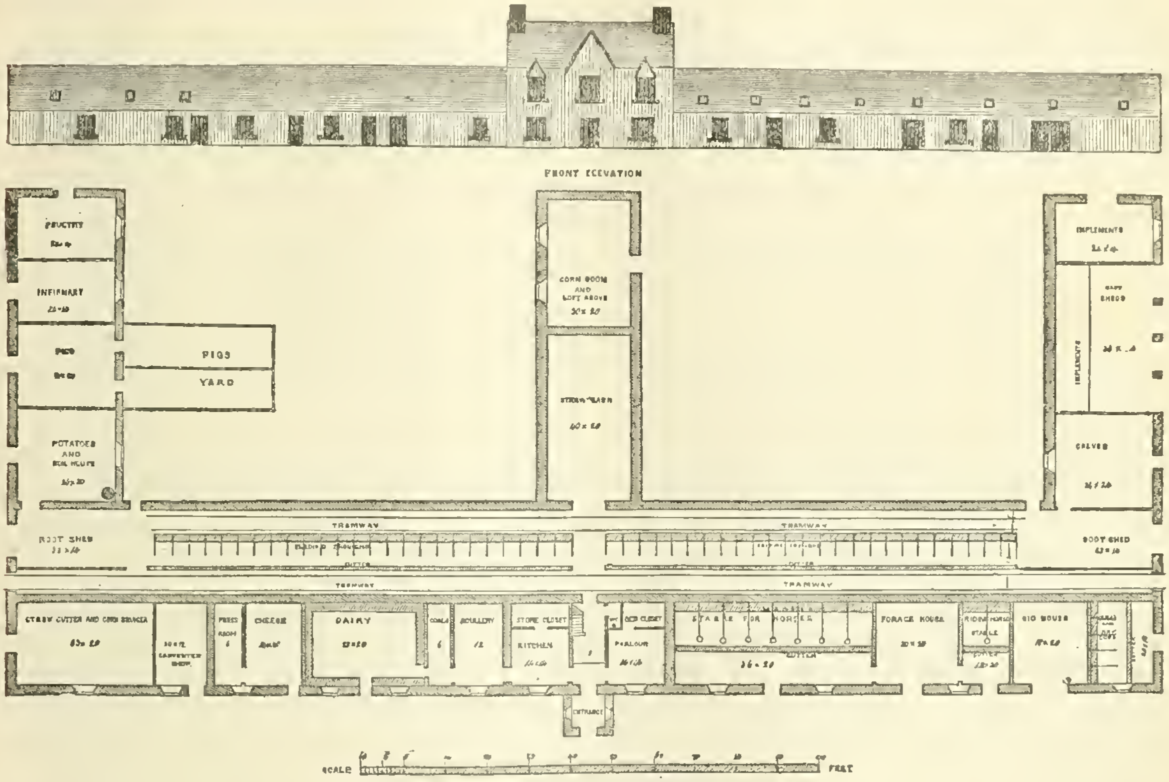
The ordinary management of cows in the cheese manufacturing districts is of a much more simple and less expensive nature than the above. In Ayrshire the cows generally begin to calve early in March, and they are all giving milk by the time when the pasture is ready for them. That time varies in ordinary seasons from the middle of April on fine early land to the middle of May on the colder soils of the uplands. The female calves from the best cows are reared on most farms. The calved cows get two meals of cooked food daily. The cooked food consists of chaff and turnips or mangold, boiled together, with bean and Indian corn meal added. The other food consists of hay or straw produced on the farm. The chaff and meal are frequently given, especially in backward seasons, for some time after the cows are on the pasture. On bare inland farms good managers use meal of some kind during a considerable part of the summer. In hot days, or cold boisterous nights, the cows are sometimes kept in the house and supplied with a little food. In August, when young grasses are failing, the cows are fed partly on second clover, or on vetches, and later in autumn cabbages and soft turnips come in to supplement the pastures. When the weather becomes inclement the cows are kept in at night, and get hay or straw with good supplies of turnips. The turnips are reduced in quantity when the cows are put dry, which may be from one to two months before the expected time of calving, and the dietary is improved again when that time approaches. Where butter is made, mangold or turnips have to be given in a judicious manner, on account of the flavour. With the turnips given soon after milking, and a little nitre put into the shallow vessels in which the milk is cooled, there is little danger of unpleasant flavour. Mangold is most valuable in the latter part of spring. Its feeding quality is then at the best, and turnips are not so good. But for quality of milk, carrots are the best food of all the so-called root crops.

Gorse, bruised and chopped, has been found a suitable kind of green winter forage for milch cows. On the large dairy farm of F. Leser & Co., near St Louis, Missouri, the daily winter food of a cow consists of about half a bushel of brewers' grains, 6 gallons of distillery slop, mixed with from 2 to 5 lb of ship stuff, malt sprouts, bran, and Indian or cot-

[1] In those districts it is usual to rear one heifer calf for each three cows, and to have the heifers to calve for the first time at 3 years old,—so that the young stock of all ages are equal in number to the cows. As many pigs are kept as suffice to consume the whey,—the proportion, in summer, being one pig to two cows.

ton-seed meal, and 6 to 10 lb of good hay, chiefly Hungarian. On another American farm, at Cumberland, Rhode Island, each cow receives in summer 2 quarts of cotton-seed meal daily in addition to pasturage, and in winter 4 quarts of cotton-seed meal, and from 2 to 4 quarts of Indian meal, with English and swale hay; neither Indian meal nor wheat shorts can be substituted for the cotton-seed meal without lessening the produce of a cow by a quart per diem.

The best pasturage for cows is that afforded by good old grass land, in sheltered inclosures of moderate size, where there is a constant supply of pure water. To have dairy produce of the best quality, the grass must be so stocked as to keep it always fresh grown and sweet. This is most easily secured by frequently changing the cows from one field to another; and hence the advantage of having small inclosures, one of which can be rested, while another is keeping the stock. When soiling is resorted to, Italian rye-grass is at once the cheapest and best forage that can be used; but it can be varied, as circumstances dictate, with clover, sainfoin, vetches, or green rape. When cows are kept entirely at pasture during the summer, from $1\frac{1}{4}$ to 2 acres of grass land is required for each animal; and if hay alone is given in winter (as is the practice in Gloucestershire), the produce of another $1\frac{1}{2}$ acre of meadow is required to supply their winter keep. As from 1 to $1\frac{1}{2}$ cwt. of green forage is an ample daily allowance for a cow, and as two cuttings of clover or Italian rye-grass, averaging 8 tons each per acre, can with suitable manuring be easily obtained, it is obvious that by soiling in summer and feeding on roots and cooked food in winter, half as much land will suffice to maintain a cow on the latter system as on the former. And, above all, the produce in milk, besides being of richer quality, is greater in quantity by fully one-fourth. The average yield per annum of milk of



Elevation and Plan of Dairy Farm-steading.

a cow in Gloucestershire is estimated at 525 gallons, and in Ayrshire at about 425 gallons. Under a generous house-feeding system an average of 680 gallons may be obtained. Salt ought always to be a constituent of the food of the dairy cow; to cows at grass it should be given daily, and in May and June it may be advantageously supplied twice per diem. Withholding it for five days has been found to occasion a loss of 2 per cent. in the quantity and 7 per cent. in the quality of the milk. All changes of diet must be made with caution. The utmost vigilance must also be used to insure regularity in the times of feeding and milking, in seeing that the latter process is thoroughly performed, and in guarding the cows from exposure to extremes of heat or cold. Through inattention to these particulars the flow of milk may easily be so diminished as to render the keeping of a dairy a profitless business.

Buildings.—The accompanying plan shows the general arrangement and dimensions of the different portions of a modern dairy farm steading for fifty cows. It has been drawn by Mr James Cowie, of Sundridge Hall, after the model introduced by him and approved of by the Highland and Agricultural Society of Scotland, an engraving of which was given in the last edition of this work. The interior of the steading is intended to have two roofs, and is so constructed as to facilitate with the least possible labour the supplying of the cattle with straw and roots, which latter are wheeled on a tramway. The dung, which is also removed by tramway, is deposited in an adjacent covered yard, where, if need be, cattle and pigs can be kept for treading down the dung. Sufficient ventilation can be obtained by very simple methods, and must be provided for in the course of erection. It is necessary only to add, that the principle on which the steading is constructed can be applied to either larger or smaller establishments as required.

Dairies are of three kinds, viz.—new-milk, butter, and cheese dairies.

1. *New-Milk Dairies.*—These, in or near towns, or amidst the dense population of mining and manufacturing districts, are to a large extent kept by persons who, with the aid of their families, undertake the management of from one to a dozen cows, and the delivery of the milk to customers. In our large towns there are also to be found gigantic establishments, in some of which as many as a thousand cows may be seen at one time. In these town dairies the cows are usually purchased when they have newly calved, or are at the point of calving, and they are retained till they cease to give a remunerative quantity of milk. The cows are commonly milked twice a-day, but sometimes thrice, as in the case of those owned by Harvey's Dairy Company, Glasgow. To ensure successful milking, quietness, comfort, and kindly treatment are essential to the animals. The udders and teats should be thoroughly cleansed before the commencement of the operation. The more expeditious the milker, the better the result. The left arm should be kept firmly pressed against the cow's right leg, in order to protect the pail. Towards the close of the process the hand should reach a little above the teat, and pull down gently upon it at each delivery of the milk, so as completely to empty the udder. The milk is conveyed at once to the milk-room, where it is strained, measured, and delivered over to retailers, or to servants of the establishment, by whom it is distributed to the customers. A portion, in some cases half, of the new milk is, however, retained in the dairy for twelve hours. It is then skimmed, and the cream either retailed or made into butter. This business requires the employment of a large capital, and is attended with much risk; but when well managed, is a remunerative one to those engaged in it.

Railways have occasioned the introduction of important changes in this branch of dairy business. Instead of the cows being kept in or near cities, where housing, food, and litter are costly, it has become a common practice to keep them on farms near railway stations, and to forward the new milk in suitable vessels twice a-day to retail tradesmen. It is obviously easier to carry the milk to the place where it is consumed, than first to convey thither the cows and their litter and food, and then to remove to the country the manure which they produce. There can be no doubt, also, that the air and pasturage of the country are of advantage to the cows.

2. *Butter Dairies.*—Wherever cows are kept some portion of the milk is used for the production of butter. The dairies, however, of extensive districts both in England and Scotland, on account of the attention given to this particular product, are appropriately spoken of as "butter dairies." In the midland and western counties of England, where the breeding of cattle is extensively carried on, the calves, two or three weeks after birth, are fed upon skimmed milk and a gruel of bruised linseed and oatmeal, so that the greater part of the new milk can be converted into butter. When the calves are all weaned, the skim milk is employed in fattening pigs. In many parts of the country buttermilk is much relished by the labouring classes. Wherever churned milk can be readily disposed of, dairy farmers direct their attention chiefly to the production of butter.

When new milk is allowed to settle, the fat globules, being lighter than the general mass, gradually rise to the surface in the form of cream. In the process of churning, these globules are broken by the mechanical agitation, aided by the action of the lactic acid which is formed from the sugar of the milk, and the contents cohere to form butter. The usual practice is to allow the cream, whether separated from the milk or not, to stand until it begins to become acid.

Butter is made either from cream only or from milk and cream together. The best butter is obtained from the cream which rises during the first twelve hours after milking, and the next best by churning the whole milk. In the former case the new milk, after being carefully strained, is poured into shallow vessels of glazed earthenware, glass, tinned iron, wood, lead, or zinc, of which the three first-named sorts are the best. Wooden vessels are objectionable from the difficulty of cleaning them thoroughly, and lead and zinc on account of the noxious salts produced by the action of the acid of the milk on the metal. Pans of about 10 quarts capacity, made, without seams, of well-tinned sheet iron, are in common use. Where milk is cooled by means of water the pails are made round, and about 18 inches in depth, or shallow and rectangular, with an exterior pan for containing the water. The deeper vessels are found to be most suitable in a cold, the shallower in a warm atmosphere. To obtain as much butter from the milk as possible, the first skimming takes place at the end of twenty-four hours, and one or more skimmings are made at further intervals. The cream is stored in jars, which should be kept in a place separate from the milk-room, that the milk in the coolers may not be too early acidulated by the proximity of the sour cream. The latter is either stirred repeatedly, or poured from one vessel to another, to prevent the formation of a tough coat upon it before enough is accumulated for a churning. In large dairies it is usual to churn daily. Three days is as long as the cream can ordinarily be kept for butter of good quality. In the New York butter factories the milk rooms are thoroughly ventilated; and are provided with tanks sunk in the ground, and having a depth of 18 inches of flowing water for cooling the milk whilst it is throwing up its cream. The temperature of the water should be between the limits of 48° and 56° Fahr. The uniform temperature of the cream is said to have a favourable effect on the churning. When a cow has recently calved, her milk is comparatively rich in butter and poor in curd; but by and by the relative proportions of these constituents are reversed, the cream diminishing and the milk becoming thicker. A very sensible change in the quality usually takes place when a cow becomes pregnant, so that in not a few cases double or treble the ordinary length of time is required to churn the cream, and the butter produced is of inferior quality. If cows are flurried and heated, either by gadding in the pasture, or by being overdriven in bringing them home for milking, their milk becomes peculiarly liable to corrupt, the yield of butter is sensibly lessened, and its quality is impaired. The success of the process of churning depends much on the temperature of the cream being nicely regulated. Experiments have shown that a temperature of from 54° to 59° Fahr., both of the air and of the cream, is the best for churning. The temperature of the cream usually rises about 10° during this process. Advantage is derived from rinsing the churn with cold water in summer and with warm water in winter. The addition to the cream of small quantities of cold or hot water, as the case requires, is also found beneficial. Box or barrel churns are preferred when the cream only is churned, the former being best adapted for small dairies, and the latter for large ones. When the whole milk and cream are churned together, it is indispensable that acidulation and coagulation should first take place, and the churnings should not be at longer intervals than every second day. When the milk is gathered for more than two days some of it is past the proper stage of acidulation at the time of churning, or part of it has not reached that stage. The time required to produce butter from whole milk is much longer than with cream alone, three hours being an average period. The plunge churn is most appreciated for this practice: and in large dairies it is usually worked by steam, water, or horse-power. Forty strokes of the piston per minute has been found a good rate of working, but, according to a report on American butter factories, the best rate is fifty strokes per minute. The most suitable dasher for the barrel churn is either circular or cross-shaped with broad wings, and should have a diameter equal to about three-fourths of that of the central portion of the churn. The speed of working is kept slow until the cream is thoroughly mixed; it may then be increased to the normal rate. When the butter begins to come, the speed, if rapid, should be slackened. The residual buttermilk is removed from the butter by kneading either with or without water. The water should be entirely free from sediment, and not very hard. Generally brine is preferable to water alone for washing. The method of churning introduced into America by Mr John Higgins of Speedsville, New York, consists in adding cold water twice or thrice at short intervals to the contents of the churn, so as to lower the temperature to about 55° Fahr. The dasher, which now does not rise above the surface of the cream, is worked at half speed, and the butter is produced quite pure, in large-sized, hard, and compact granules; the adherent buttermilk can be readily separated by rinsing a couple of times in water, and the butter is then ready for salting.

Clotted Cream.—In Devonshire a method of treating the milk has long been in use for the production of what is called clotted or "clouted" cream. The new milk is strained into shallow earthenware pans, in each of which half a pint of water has previously been placed to prevent the milk from adhering to the pan in the subsequent process of scalding; after twelve hours the pans are placed over a charcoal fire, or on a hot plate, or are immersed in cold water in a shallow boiler, which is then heated until the temperature of the milk rises to 180°, after which they are again replaced in the milk-room (great care being taken to preserve the surface of cream unbroken), and allowed to stand the usual time. The scalding effects the separation of the whole of the cream from the milk, and greatly facilitates its conversion into butter. This is readily accomplished by placing the cream in a small tub, and working it with the hand or a piece of flat wood. The butter made from it is said by some persons to be altogether superior to that made without scalding, and also to keep better; whereas others assert, and with good show of truth, that it contains an undue proportion of cheesy matter, and in consequence is more liable to rancidity than other butter.

Lancashire Method.—A mode of procedure in use in some Lancashire dairies has been much commended. The first drawn and larger portion of the new milk is set aside, and the cream obtained from it is mixed, at the time of churning, with the strippings or afterings, which contain the greater part of the butter obtained at milking. The labour of churning the whole of the milk is thus obviated, and a larger yield of butter is said to be obtained than when the cream only is churned.

The separation of the butter from the milk is not so complete as to secure the absence of some oily matter in the whey, and, on the other hand, of a portion of caseous matter in the butter. Cheese, being a nitrogenous substance, is peculiarly susceptible of putrefaction, and hence even the smallest portion of it present in butter is sure in a very short time to corrupt the whole mass and to impart to it a rancid flavour. Besides this liability to taint, butter, like other fatty substances, readily absorbs odours of all kinds; and if cream or butter is kept in the same apartment with tainted meat, or other decaying matter, or is stored in vessels that have previously contained any rancid substance, or is exposed to the exhalations of dung-heaps and stables, it is sure to become contaminated. By washing the newly-churned butter repeatedly in cold water, and at the same time working a little salt into it, not only the whey, but the greater part of the caseous matter above referred to, can be removed, and the tendency to rancidity is overcome. If the butter is to be used fresh, it is immediately made into rolls or pats; but if it is to be cured, half an ounce of fine salt is added for each pound of the butter, and thoroughly incorporated with it; and the mass, after lying a day, is again worked over, and then packed into a perfectly clean air-tight vessel. In domestic use the most convenient vessels are jars of glazed earthenware. Market butter is put into casks called half-firkins, firkins, and tubs, containing respectively 28 lb, 56 lb, and 84 lb. These should be of well-seasoned oak, and made perfectly tight, as otherwise the butter is sure to become tainted. Large quantities of butter are also now disposed of in sealed tins. From the facilities which railways afford for cheap and rapid carriage, a very great proportion of our home-made butter is sent to market in a fresh or only slightly salt state.

The average yearly product of butter per cow in the butter dairies is usually estimated at from 170 to 200 lb. This is in addition to the new milk used in rearing the heifer calves required to keep up the stock, and to the butter consumed in the farmer's family.

3. *Cheese Dairies.*—Cheese-making is by far the most difficult department of dairy management. Although the art is universally practised, and the raw material is everywhere substantially the same, there is perhaps no equally common product which varies so much in its quality and market value, from mere diversity in the skill with which it is made. The difficulty of producing really good cheese arises from the peculiar susceptibility of milk to be influenced by a great variety of external causes, and the extreme facility with which its component parts undergo chemical changes.

Casein, the chief ingredient of cheese, is held in solution in milk by means of an alkali. The effect of neutralizing this alkali is to produce insoluble casein, which when dried forms cheese. When milk is allowed to stand, coagulation takes place on account of the formation of lactic acid. There are various substances which, when added to new milk, promote speedy coagulation. The preparation which is invariably used for this purpose in British dairies is rennet, provincially called *steep* or *yearning*, which is made from the stomachs of sucking calves. To cure them, the stomachs, usually termed bags or vells, as soon as taken from the animal, are turned inside out, carefully freed from all impurities, and salted. They are then packed one upon another, with layers of salt between, into a deep earthenware vessel, and are covered over with salt, the air being excluded by a close-fitting lid. In the best English dairies the skins are invariably kept for a year previous to use. About a month before the rennet is needed, a sufficient number of the skins are taken out of the jar, and when the brine has drained from them, they are spread out upon a table, powdered on both sides with fine salt, rolled with a paste roller, distended with a splint of wood, and hung up to dry. The rennet is made the day before use by putting into a cup with half a pint of lukewarm water and a tea-spoonful of salt a square inch of the bag for each 10 gallons of milk to be curdled. The power of effecting coagulation is attributed to the minute globular germs existing in prodigious quantities in the steep. The production of these appears to be connected with a kind of decay in the skin, which, however, if it goes too far, causes the cheese made to corrupt prematurely, and renders it unwholesome. In some dairies as much of the rennet is infused at one time as serves for several weeks, or even months; but the practice of the best dairies is in favour of its daily or at most weekly preparation. To produce cheese of the best quality it is indispensable that the rennet be sweet and good, that only so much of it be used as will suffice to effect perfect coagulation, and that this take place at a proper temperature. Too much rennet makes a tough curd and a poor ill-flavoured cheese. The time the milk takes to coagulate varies with different modes of churning.

The cheese dairy comprises a milk-room, working-room, salting and drying room, and cheese-room. The working-room is provided with two boilers—a smaller one for heating water, and a larger one for heating whey. There are also lead tanks for containing the fresh whey, and a cistern in which, after being scalded, it is stored for the pigs. The cheese-tub is of wood or tinned iron—the latter being best, as it admits of being thoroughly washed, whereas a wooden vessel, being porous, is exceedingly apt to retain minute particles of milk or whey, which, souring in the wood, become a source of mischief to the future contents. The other utensils are lever presses, cheese vats of elm, turned out of the solid and hooped with wood, pans of tinned iron or brass for heating milk by immersion in hot water, a cheese ladder, a curd-breaker, a curd mill, and a thermometer.

In England the cows are milked twice a-day, at 5 A.M. and 5 P.M. The whole available hands are engaged at this work, that it may be accomplished speedily. Usually each person has seven or eight cows to his share, and occupies about ten minutes in the milking of each of them. The milk is carried to the dairy as fast as it is drawn from the cows, and is there consigned to the care of the dairy-maid, who proceeds in her treatment of it according to the variety of cheese to be produced. The kinds of cheese in best estimation and of greatest market value are Stilton, Cheddar, Cheshire, and Gloucester. The first variety is made in Leicestershire, and contains the cream of one milking, added to the new milk of the next. The Cheddar and Cheshire cheeses are made from new milk, or rather from milk in which all its own cream is retained. Gloucester cheese is usually deprived of a small portion of its cream. Double and single Gloucester differ only in the former being twice the thickness and weight of the latter, and consequently taking longer to ripen. The Scotch variety called Dunlop and the Gouda of Holland are full-milk cheeses. Cheddar cheese is now generally made in Ayrshire and the other cheesemaking counties in Scotland. The following is an abstract of a report presented by Mr Drennan to the Ayrshire Agricultural Association in 1854, describing the method followed in Mrs Harding's dairy in Somersetshire :—

Immediately after the morning milking, the milk is mixed with that of the preceding evening, the whole being brought to the temperature of from 80° to 82° Fahr. by heating a small quantity of the evening milk. In spring and towards winter a small quantity of arnotto is used to improve the colour of the cheese. It is put into the milk along with the rennet at 7 o'clock. After the rennet is added, an hour is requisite for coagulation. At 8 o'clock the curd is partially broken and allowed to subside a few minutes, in order that a small quantity of whey may be drawn off to be heated. This whey is put into a tin vessel and placed on a boiler in a separate apartment, to be heated in hot water. The curd is then most carefully and minutely broken with utensils called shovel breakers, and as much of the heated whey is mixed with it as suffices to raise it to the temperature at which the rennet was added. Soon after 9 o'clock the work is resumed. A few pailfuls of whey are drawn off and heated to a higher temperature than at 8 o'clock. The curd is then broken as minutely as before ; and after this several pailfuls of heated whey are poured into the mass. During the pouring in of the whey the stirring with the breakers is actively continued, in order to mix the whole regularly, and not to allow any portion of the curd to become overheated. The temperature at this time is raised to 100°, as ascertained by the thermometer, and the stirring is continued until, at length, the minutely broken pieces of curd acquire a certain degree of consistency. The curd is then left half an hour to subside. At the expiry of the half hour it has settled at the bottom of the tub. Drawing off the whey is the next operation. The greater proportion of the whey is lifted in a large tin bowl, and poured through a hair sieve into the adjoining coolers. When the whey above the mass of curd is removed, a spigot is turned at the bottom of the tub, and the remainder is allowed to drain off without the application of pressure. To facilitate this part of the work the tub is made with a convex bottom, and the curd is cut from the sides of the tub and heaped up on the elevated centre, and left for an hour with no other pressure than its own weight. It is then cut across in large slices, turned over once on the centre of the tub, and left in a heap as before for half an hour. The whey drips away toward the sides of the tub, and runs off at the spigot ; and, no pressure being applied, it continues to come away comparatively pure. After undergoing this treatment the curd is ripe for the application of pressure. If, as is usual, it be warmer than 60°, it is broken a little by the hand and thrown upon a lead cooler to bring it down to the desired temperature. It is then put into vats, and subjected to moderate pressure for about an hour ; after which it is broken finely in a simple curd mill, mixed with salt, and made up into cheeses. From 2 to 2½ lb of salt may be given to one cwt. of curd. The cheese is put into the lever-press at from two to three o'clock of the day on which it is made ; next morning it is reversed in the vat, with a calico cloth upon it to give it a smooth surface ; on the following morning another fine cloth is put upon it ; and after another day of the press it is laid upon the shelf.

Skilful management during the ripening of the cheese is now regarded as indispensable to complete success. To enable a cheesemaker to come to the front rank, he must have a good cheese-room, with means of regulating heat and ventilation. Great attention is now paid to this important matter in many of the Scotch dairies and still more in the cheese factories of America.

New-milk cheese, when skilfully made, consists not of the casein only, but includes nearly all the butter of the milk. A portion of the latter is, however, carried off in the whey, from which it is recovered by a simple process. The whey is heated in a boiler to 180°, at which point a small quantity of sour buttermilk is stirred into it, which has the instantaneous effect of causing all the buttery matter to rise to the surface, from which it is skimmed off and put into a jar. As soon as the buttermilk is put in, the fire is withdrawn to prevent the whey from reaching the boiling point. The whey thus deprived of its cream is run into a cistern, whence it is dealt out to the pigs. The whey-cream is kept for three or four days until it thickens, and is then churned like ordinary cream. About half a pound of this whey butter is obtained weekly from each cow. Its value is about three-fourths of that of cream butter.

According to the reports of 43 New York factories in 1869, from 9·14 to 10·11 lb of milk is requisite to make 1 lb of cured American cheese.

In the province of Parma, in Italy, the annual quantity of milk used in cheese-dairy farms was about the year 1872 estimated, in round numbers, at 1,540,700 gallons, yielding 855,400 lb of "grana" or Parmesan cheese, 253,530 lb of butter, and 524,700 lb of "ricotta," a fresh common cheese made after the butter and cream have been for the most part removed from the milk. In the hill district 1000 litres of milk will produce 18 kilogrammes more butter, cheese, and ricotta than in the plain. In the majority of the dairy-farms work is carried on during only six or eight months in the year.

The following is an estimate of the amount, description, and cost of the year's food of an average Ayrshire milch cow on a good farm in the cheese and butter producing districts, and the value of the produce :—

	£	s.	d.
1. Keep.—3½ to 4 tons of roots during 200 days in winter, given raw or cooked, at 12........	£2	5	0
40 to 50 stones of meal, cake, and bran, &c.	2	10	0
Summer's grass..........................	5	0	0
Straw given as fodder and litter over and above value of dung..........................	2	0	0
Expenses of attendance, feeding, and milking, as well as deterioration of value of cow, interest on its price, and various risks, estimated at........	4	5	0
Making outlay about........................	£16	0	0

Outlay, carried forward	£16	0	0
2. The produce of a cow treated as above may be estimated for the year at say from 500 to 600 gallons of milk, which if disposed of as new milk from the cow would give, at 9d per gallon, about	20	0	0
Profit	£4	0	0

When hay is used, as in Ireland in the neighbourhood of Cork, and in many districts where roots are not grown, the quantity estimated for the winter's keep of a cow is $1\frac{1}{2}$ tons.

If made into butter the milk would produce about 220 lb, which at 1s. 5d. a lb would amount to £15, 11s. 8d., to which must be added the value of buttermilk sold or used for feeding pigs, say £3, making in all as the produce of the year, £18, 11s. 8d. Again, if converted into cheese, the produce may be estimated at 550 lb at $7\frac{1}{2}$d. per lb, or about £17—which, with perhaps 25s. as value of whey, gives £18, 5s. as the result of this system. These calculations are made on the recognized standard that 1 gallon of milk produces 1 lb of cheese, and that $2\frac{1}{2}$ gallons produce 1 lb of butter.

DAISY, the name applied to the plants constituting the genus *Bellis*, of the natural order *Compositæ*, and sub-order *Corymbiferæ*. The flowers in this genus have a small, hemispherical, erect calyx; florets of the disk numerous and tubular; phyllaries strap-shaped and slightly notched; filaments hair-like and very short; anthers forming a cylindrical notched tube; achenes obovate and compressed; and no pappus. The common daisy, *B. perennis*, is the only representative of the genus in Britain and Ireland. It is a perennial abundant everywhere in pastures and on banks in Europe, except in the most northerly regions, where, as in America, it is a garden-plant. The stem of the daisy is short; the leaves are numerous, crenate or crenate-serrate, slightly hairy, obovate-spathulate, and arranged in a rosette; and the rootstock is creeping, and of a brownish colour. The flowers are to be found from March to November, and occasionally in the winter months. Their scapes bear single blossoms, with phyllaries in one row, and often red externally or at the tips; the florets of the disk are short and yellow. The size and luxuriance of the plant are much affected by the nature of the soil in which it grows. The cultivated varieties, which are numerous, bear finely-coloured flowers, and make very effective borders for walks. What is known as the "hen-and-chicken" daisy has the main blossom surrounded by a brood of sometimes as many as 10 or 12 small flowers, formed in the axils of the scales of the involucre. The daisy (Ang. Sax., *dæges eage*, day's eye) rolls up its florets on the approach of rain, and unfolds them once more on the return of bright weather; and, like the marigold, it "goes to bed wi' the sun, and with him rises weeping." Chaucer writes—

> "The daisie, or els the eye of the daie,
> The emprise, and the floure of flouris alle;

and again—

> "To seen this floure agenst the sunne sprede
> Whan it riseth early by the morrow,
> That blissful sight softeneth all my sorrow;"

and the flower is often alluded to with admiration by the other poets of nature. To the farmer, however, the daisy is a weed, and a most wasteful one, as it exhausts the soil and is not eaten by any kind of stock. In French the daisy is termed *la marguerite* (μαργαρίτης, a pearl), and "herb margaret" is stated to be an old English appellation for it. In Scotland it is popularly called the gowan, and in Yorkshire it is the bairnwort, or flower beloved by children. The Christmas and Michaelmas daisies are species of aster; the ox-eye daisy is the species *Chrysanthemum Leucanthemum*.

DAKOTA, a territory of the United States of North America, bounded on the N. by the Dominion of Canada, E. by Minnesota and a small part of Iowa, S. by Nebraska, and W. by Montana and Wyoming. It is situated between 42° 28′ and 49° N. lat. and 96° 20′ and 104° W. long.,—thus extending about 400 miles from E. to W. and about as much from N. to S., with an area estimated at 150,932 square miles. With the exception of a small portion drained by the Red River and the Minnesota, Dakota belongs to the basin of the Missouri, which enters at the N.W. corner as a navigable river, and proceeds with considerable meandering for upwards of 1000 miles in a S.E. direction across the territory, receiving from the right the Little Missouri, the Big Knife, the Cannon Ball, the Grande River, the Owl, the Big Sheyenne, the Bad River, and the White River, and from the left, besides a large number of small tributaries, one considerable affluent known as the James or Dakota River, which traverses nearly the whole length of the territory with a predominant southern direction, and joins the larger stream at the S.E. corner. There are no mountains of any importance in the territory except the Black Hills on the western frontiers, which attain a height of 6700 feet; but a plateau called the Coteau des Prairies, with a mean elevation of 1450 feet above the level of the sea, occupies a considerable area on the eastern borders, and another known as the Coteau du Missouri stretches south between the Missouri and the Dakota. A large district in the south-west between the White River and one of the main branches of the Big Sheyenne bears the descriptive designation of the Mauvaises Terres. In the Coteau des Prairies and several other parts of the territory there are a large number of lakes, the most extensive of which is the Minniwakan or Devil's Lake, a sheet of salt water 40 miles long by about 12 miles in breadth. Dakota has hitherto been only partially explored, but the military expedition of 1874 under the command of General Custer reports very favourably of the soil and the climate of the virgin districts. A large part of the surface consists of open prairie-land finely adapted for the raising of stock, and most of the river-valleys appear suitable for the plough. The experience of the settlers shows that Indian corn, wheat, barley, oats, and potatoes, as well as apples, plums, grapes, and hops can be successfully cultivated. The hills are covered with timber, mostly pine and spruce; while the banks of the rivers are in many places bordered with ash, elm, poplar, maple, and other trees. The mineral wealth of the region includes deposits of iron ore, extensive beds of limestone, gypsum, and sandstone, and a certain amount of plumbago and gold. Coal, lead, and petroleum have also been discovered. Buffaloes, bears, antelopes, and elks are still abundant in the remoter districts; and the beaver still builds his dam in many of the streams. The population of Dakota is mainly aboriginal,—the principal tribes being the Sioux in the south, who number about 26,000, and the Arickarees, the Gros-Ventres, and the Mandans in the north-west. The chief settlement of the whites, Yankton on the Missouri, had in 1870 a population of 737; and the whole amount of land under cultivation at the same date was 42,645 acres. The northern Pacific railroad passes through the territory from east to west, entering at Fargo on the Red River, crossing the Missouri at Burleigh City, and proceeding onwards to cut the Yellowstone River at Wolf Rapids in Montana. The territory is administered in the same way as the other territories of the United States. Dakota belongs to the ancient French district of Louisiana, which was purchased by the United States in 1803. It was not till 1861 that it was separated from Minnesota and received a separate organization; and its present boundaries only date from 1868, when it surrendered 89,665 square miles for the formation of the territory of Wyoming. It began to be colonized in 1859, and its first legislature met in 1862.

DALBERG, CHARLES THEODOR ANTON MARIA, PRINCE OF (1744–1817), was the son of a prince of Dalberg who was one of the chief councillors of the elector of Mainz. Having attended the universities of Göttingen and Heidelberg, he devoted himself to the study of canon law, and entered the church. In 1772 he was appointed counsellor and governor of Erfurt by the elector of Mainz, the duties of which position he fulfilled in the most exemplary manner, displaying the highest conscientiousness, and doing all that he could to promote the interests of his people. After other advancements, he became in 1802 archbishop and elector of Mainz. Being obliged by the terms of the peace of Lunéville to give up Worms and Constance, he received Ratisbon, Aschaffenburg, and Wetzlar. In 1804 he visited Paris in order to discuss with Pius VII. the affairs of the Catholic Church of Germany. The result was that he gave way to the wishes of Napoleon, and thereby considerably diminished his popularity at home. The emperor did not fail to reward him; and, on the formation of the Confederation of the Rhine, though he was forced to resign his post as archchancellor of the emperor, he received more than compensating dignities. These, however, on the fall of Napoleon, he was forced to resign; and he died, holding no other office than that of archbishop of Ratisbon (10th February 1817). The friend of Goethe, Schiller, and Wieland, Dalberg was himself a scholar and author.

He produced several works on art and philosophy, including *Grundsätze der Æsthetik*, *Betrachtung über das Universum*, *Von dem Bewusztsein als allgemeinem Grunde der Weltweisheit*, and two works on the social influence of art. See Krämer, *Karl Theodor von Dalberg* (Leip. 1821).

D'ALEMBERT, JEAN LE ROND (1717–1783), French mathematician and philosopher, was born at Paris in November 1717. He was a foundling, having been exposed in the market near the church of St Jean le Rond, Paris, where he was discovered by a commissary of police on the 17th November. It afterwards became known that he was the illegitimate son of the Chevalier Destouches and Madame de Tencin, a lady of somewhat questionable reputation. Whether by secret arrangement with one or other of the parents, or from regard to his exceedingly feeble state, the infant was not taken to the foundling hospital, but intrusted to the wife of a glazier named Rousseau who lived close by. He was called Jean le Rond from the church near which he was found; the surname D'Alembert was added by himself at a later period. His foster-mother brought him up with a kindness that secured his life-long attachment. When, after he was beginning to be famous, Madame Tencin sent for him and acknowledged the relationship between them, he said that she was only a step-mother, and that the glazier's wife was his true mother. His father, without disclosing himself, recognized his natural claims by settling upon him while still an infant an annuity of 1200 francs. Furnished in this way with enough to defray the expense of his education he was sent at four years of age to a boarding school, where he had learned all the master could teach him ere he was ten. In 1730 he entered the Mazarin College under the care of the Jansenists, who soon perceived his exceptional talent, and, prompted perhaps by a commentary on the epistle to the Romans which he produced in the first year of his philosophical course, sought to direct it to theology. They checked his devotion to poetry and mathematics, and in the science in which he was to achieve his greatest distinction he received no instruction at college beyond a few elementary lessons from Caron. His knowledge of the higher mathematics was acquired by his own unaided efforts after he had left the college. This naturally led to his crediting himself with the discovery of many truths which he afterwards found had been already established, often by more direct and elegant processes than his own.

On leaving college he returned to the house of his foster-mother, where he continued to live for thirty years. On the advice of his friends he made two successive efforts to add to his scanty income by qualifying himself for a profession. He studied law, and was admitted as an advocate in 1738, but did not enter upon practice. He next devoted himself to medicine, and in order to detach himself effectually from his favourite subject, sent all his mathematical books to a friend, who was to retain them until he had taken his doctor's degree. His natural inclination, however, proved too strong for him; within a year the books had all been recovered, and he had resolved to content himself with his annuity and give his whole time to mathematics. He led a simple regular life in the house of the glazier, whose circumstances he contrived somewhat to better out of his limited means. His foster-mother continued to show a warm attachment to him, though she took no interest in his pursuits, and professed something like contempt for his fame. "You will never," she said, "be anything but a philosopher. And what is a philosopher? A fool who plagues himself during his life that men may talk of him after his death."

In 1741 D'Alembert received his first public distinction in being admitted a member of the Academy of Sciences, to which he had previously presented several papers, including a *Mémoire sur le calcul integral* (1739). In this he pointed out some errors in Reinau's *L'Analyse démonstrée*, which was regarded as a work of high authority. In his *Mémoire sur la réfraction des corps solides* (1741) he was the first to give a theoretical explanation of the familiar and curious phenomenon which is witnessed when a body passes from one fluid to another more dense, in a direction not perpendicular to the surface which separates the two fluids. Two years after his election to a place in the Academy he published his *Traité de Dynamique*. The new principle developed in this treatise, known as D'Alembert's Principle, may be thus stated—"If from the forces impressed on any system of bodies, connected in any manner, there be subtracted the forces which, acting alone, would be capable of producing the actual accelerations and retardations of the bodies, the remaining forces must exactly balance each other." The effect of this is greatly to simplify the solution of complex dynamical problems by making them problems of statics.

So early as the year 1744 D'Alembert had applied this principle to the theory of the equilibrium and the motion of fluids; and all the problems before solved by geometricians became in some measure its corollaries. The discovery of this new principle was followed by that of a new calculus, the first trials of which were published in his *Réflexions sur le cause générale des Vents*, to which the prize medal was adjudged by the Academy of Berlin in the year 1746, and which was a new and brilliant addition to his fame. He availed himself of the favourable circumstance of the king of Prussia having just terminated a glorious campaign by an honourable peace, to dedicate his work to that prince in the following Latin lines:—

Hæc ego de ventis, dum ventorum ocyor alis
Palantes agit Austriacos Fredericus, et orbi,
Insignis lauro, ramum prætendit olivæ.

Swifter than wind, while of the winds I write,
The foes of conquering Frederick speed their flight;
While laurel o'er the hero's temple bends,
To the tir'd world the olive branch he sends.

This flattering dedication procured the philosopher a polite letter from Frederick, and a place among his literary friends. The king made repeated attempts to induce him to settle in Berlin without success. In 1754 he induced D'Alembert to accept a pension of 1200 francs a year, and in 1763 the philosopher visited Berlin, where he was received with great respect. He finally refused on that occasion the office of president of the Academy of Berlin, which had been already offered to him more than once. In 1747 D'Alembert applied his new calculus of partial differences to the problem of vibrating chords, the solution of which, as well as the theory of the oscillation of the air and the propagation of sound, had been given but incompletely by the geometricians who preceded him, and these his masters or his rivals. In 1749 he furnished a method of applying his principles to the motion of any body of a given figure ; and he solved the problem of the precession of the equinoxes, determined its quantity, and explained the phenomenon of the nutation of the terrestrial axis, discovered by Dr Bradley. In 1752 he published a treatise on the Resistance of Fluids, to which he gave the modest title of an *Essay*, but which contains a large number of original ideas and new observations. About the same time he published, in the *Memoirs* of the Academy of Berlin, "Researches concerning the Integral Calculus," a branch of mathematical science which is greatly indebted to him for the rapid progress it has made in the present century. In his *Recherches sur différents points importants du système du monde* (1754–6) he perfected the solution of the problem of the perturbations of the planets, which he had presented to the Academy some years before.

While the studies of D'Alembert were confined to geometry, he was little known or celebrated in his native country. His connections were limited to a small society of select friends ; he had never seen any man in high office except the Marquis d'Argenson. Satisfied with an income which furnished him with the necessaries of life, he did not aspire after opulence or honours ; nor had they been hitherto bestowed upon him, as it is easier to confer them on those who solicit them than to look out for men who deserve them. His cheerful conversation, his smart and lively sallies, a happy knack at telling a story, a singular mixture of malice of speech with goodness of heart, and of delicacy of wit with simplicity of manners, rendered him a pleasing and interesting companion ; and his company, consequently, was much sought after in the fashionable circles. His reputation at length made its way to the throne, and rendered him the object of royal attention and beneficence. He received also in 1756 a pension from Government, which he owed to the friendship of M. d'Argenson.

D'Alembert's association with Diderot in the preparation of the celebrated *Dictionnaire Encyclopédique* led him to take a somewhat wider range than that to which he had hitherto confined himself. He wrote for that work the *Discours préliminaire* on the rise, progress, and affinities of the various sciences, which he read to the French Academy on the day of his admission as a member, the 19th December 1754. Condorcet, in his *Éloge*, characterizes it as one of those works which only two or three men in a century could produce. Comprehensive in its plan, and clear in its statement, it deserves this often quoted praise ; but it is open to the criticism that the fundamental principle, adopted from Bacon, on which it classifies the sciences is untenable. D'Alembert distinguishes the human faculties into memory, reason, and imagination, and following out that distinction classifies all science under the three heads of history or the science of memory, philosophy or the science of reason, and poetry or the science of imagination. Now, it is obvious that even if these are in each case the faculties primarily concerned, which is not beyond question, no science is the product of any one faculty exclusively. D'Alembert wrote several literary articles for the first two volumes of the Encyclopædia, after which the work was suppressed for a time. To the remaining volumes he contributed mathematical articles chiefly. One of the few exceptions was the article on "Geneva," which involved him in a somewhat keen controversy in regard to Calvinism and the suppression of theatrical performances within the town. During the time he was engaged on the Encyclopædia he wrote a number of literary and philosophical works, which extended his reputation and also exposed him to criticism and controversy, as in the case of his *Mélanges de Philosophie, d'Histoire, et de Littérature*. His *Essai sur la société des gens de lettres avec les grands* was a worthy vindication of the independence of literary men, and a thorough exposure of the evils of the system of patronage. He broke new ground and showed great skill as a translator in his *Traduction de quelques morceaux choisis de Tacite*. One of his most important works was the *Éléments de Philosophie*, published in 1759, in which he discussed the principles and methods of the different sciences. He maintained that the laws of motion were necessary, not contingent. The work furnished occasion for a renewal of his correspondence with Frederick the Great. A treatise *Sur la destruction des Jésuites* (1765) involved him in a fresh controversy, his own share in which was rendered very easy by the violence and extravagance of his adversaries. The list of his more noteworthy literary works is completed by the mention of the *Histoire des membres de l'Académie française*, containing biographical notices of all the members of the Academy who died between 1700 and 1772, the year in which he himself became secretary. D'Alembert was much interested in music both as a science and as an art, and wrote *Éléments de Musique théorique et pratique*, which was based upon the system of Rameau with important modifications and differences.

D'Alembert's fame spread rapidly throughout Europe and procured for him more than one opportunity of quitting the comparative retirement in which he lived in Paris for more lucrative and prominent positions. The offer of Frederick the Great has already been mentioned. In 1762 he was invited by Catherine of Russia to become tutor to her son at a yearly salary of 100,000 francs. On his refusal, the offer was repeated with the additional inducement of accommodation for as many of his friends as he chose to bring with him to the Russian capital. D'Alembert persisted in his declinature, and the letter of Catharine was ordered to be engrossed in the minutes of the French Academy. A foreign honour of a different kind had previously been bestowed upon him. In 1755, on the recommendation of Pope Benedict XIV., he was admitted a member of the Institute of Bologna. A legacy of £200 from David Hume showed the esteem in which he was held by that philosopher.

D'Alembert continued to the end to lead the quiet and frugal life which his limited means, as well as his simple tastes, dictated. He was abstemious in his habits, and never tasted any alcoholic beverages. His later years were saddened by circumstances connected with a romantic attachment he had formed for Mademoiselle de l'Espinasse. He made the lady's acquaintance at the house of Madame du Deffand, a noted resort of literary men and savans. She nursed him assiduously during an illness he had in 1765, and from that period till her death in 1776 they lived in the same house without any scandal attaching to their intimacy. On her part there seems to have been from first to last nothing more than warm friendship, but his feelings towards her were of a stronger kind, and her death deeply affected him. He never recovered his elasticity of spirits, though he continued to occupy himself with his favourite pursuits, and to frequent the society of his brother philosophers. After the death of Voltaire (1778), whose friend and correspondent he had been for more than thirty years, he was regarded as the leader of the philosophical party in the Academy. He died on the 29th October 1783.

The chief features of D'Alembert's character were benevolence, simplicity, and independence. Though his income was never large, and during the greater part of his life was very meagre, he contrived to find means to support his foster-mother in her old age, to educate the children of his first teacher, and to help various deserving students during their college career. By his practice as well as by the work above referred to (*Essai sur la société des gens de lettres*, &c.) he did much to destroy the unworthy subserviency of literary and scientific men to the socially great and the politically powerful. If his manner was sometimes plain almost to the extent of rudeness it probably set all the better an example of a much needed reform to the class to which he belonged. The controversy as to the nature of his religious opinions, arising as it did chiefly out of his connection with the Encyclopædia, has no longer any living interest now that the Encyclopædists generally have ceased to be regarded with unqualified suspicion by those who count themselves orthodox. It is to be observed, moreover, that as D'Alembert confined himself chiefly to mathematical articles, his work laid him less open to charges of heresy and infidelity than that of some of his associates. The fullest revelation of his religious convictions is given in his correspondence with Voltaire, which was published along with that with Frederick the Great in Bossange's edition of his works.

The scientific works of D'Alembert have never been published in a collected form. The most important of them have been mentioned above, with the exception of the *Opuscules mathématiques* (1761–80, 8 vols. 4to). His literary and philosophical works were collected and edited by Bastien (Paris, 1805, 18 vols. 8vo). A better edition by Bossange was published at Paris, in 1821 (5 vols. 8vo). The best account of the life and writings of D'Alembert is contained in Condorcet's *Éloge*, presented to the Academy and published in 1784.

DALGARNO, George (*c.* 1626–1687), an ingenious but now almost forgotten writer, born at Old Aberdeen about 1626. He appears to have studied at Marischal College; and in 1657 he went to Oxford, where, according to Wood, "he taught a private grammar-school with good success for about thirty years," and where he died on August 28, 1687. In his work entitled *Didascalocophus, or the Deaf and Dumb Man's Tutor*, printed at Oxford in 1680, he has the merit of anticipating some of the most useful modern discoveries as to the education of the deaf and dumb, including the hand-alphabet. "In prosecution of his general idea," says Dugald Stewart in his "Account of a Boy Born Blind and Deaf" (*Trans. of Royal Soc. of Edinb.* vol. vii.) "he has treated, in one short chapter, of a *Deaf Man's Dictionary*, and, in another, of a *Grammar for Deaf Persons*, both of them containing a variety of precious hints, from which useful practical lights might be derived by all who have any concern in the tuition of children during the first stage of their education." Twenty years before the publication of his *Didascalocophus*, Dalgarno had given to the world a very ingenious piece entitled *Ars Signorum*, from which, says Mr Stewart, it appears indisputably that he was the precursor of Bishop Wilkins in his speculations concerning "a real character and a philosophical language." It is alleged that, although Wilkins does not refer to Dalgarno, it was from him that he took the hint of his celebrated work. Leibnitz on various occasions alluded to the *Ars Signorum* in commendatory terms. The works of Dalgarno, which had become exceedingly rare, have been reprinted by the Maitland Club.

DALHOUSIE, James Andrew Broun-Ramsay, Marquis of (1812–1860), in the peerage of the United Kingdom, the great administrator who was the last of the historic governors-general under the East India Company, and may be ranked with his two most distinguished predecessors, Warren Hastings and the Marquis Wellesley. The family was founded by Sir John Ramsay, who rescued James VI. in the Gowrie outrage; but there is mention in 1140 of Simon de Ramsay as witness to the grant of Livingston Church in West Lothian; and Sir Alexander Ramsay, whom David II. made sheriff of Teviotdale, was starved to death by the Douglas. The grateful King James made Sir John Lord Ramsay of Barns and Viscount Haddington, and his son obtained a change of the title to Baron Ramsay of Dalhousie. His son was created earl of Dalhousie. The ninth earl was a distinguished Waterloo officer, held high command in Canada, was commander-in-chief in British India previous to 1832, and was created a peer of the United Kingdom as Baron Dalhousie of Dalhousie. He married Miss Broun, the heiress of Coalstoun near Haddington, a woman of remarkable ability and force of character, which she transmitted to her distinguished son, who closely resembled her in features also. He was their third son, but the early death of his brothers, followed by that of their father, made him the tenth earl while yet a youth. For his long and brilliant services in India he received the thanks of Parliament, and the Crown made him marquis, a dignity that passed away with him, his only issue being two daughters, the Lady Susan, married to the Honourable R. Bourke, M.P., brother of the sixth earl of Mayo, and the Lady Edith, first wife of Sir James Fergusson.

Born in 1812, the boy was educated at Harrow, and entered at Christ Church, Oxford, where he gave bright promise of his future career. The two most remarkable of his fellow-students were Lord Canning and Lord Elgin, who both succeeded their younger rival in the viceroy's seat, and more than once in their public career alluded to the friendship that had united the three. When Lord Ramsay, he attempted, as a follower of Sir Robert Peel, to snatch the representation of Edinburgh from Sir John (afterwards Lord Chancellor) Campbell, and James Abercromby, afterwards Speaker and Lord Dunfermline. He was afterwards elected for the county of Haddington, which represented for a short time till called to the House of Lords on his father's death. The duke of Wellington was soon attracted by the industry and ability of the young peer, in whom, moreover, he felt an interest for his father's sake. When the Whigs went out of office under Lord Melbourne, Sir Robert Peel came into power with three colleagues who were successively to be governor-general,—Lord Ellenborough as president of the Board of Control, Sir H. Hardinge as secretary at war, and Lord Dalhousie as vice-president of the Board of Trade under Mr Gladstone, and in 1844 as president. It was in the Board of Trade that he sowed the seeds of that disease which carried him off in the prime of life. The time was that of the corn-law struggle and, still more to him, of the railway mania. Night and day the president had to work. In 1845 he organized that railway department of the Board of Trade, through which in one year he passed, after detailed personal study, 332 projects, involving a capital of £271,000,000, besides many foreign schemes which appealed to the English money-market. At the last hour of November for lodging applications no fewer than 600 schemes were deposited on his table. To him, more than any other man, Great Britain owes its railway system, and if the experienced warning of the over-worked president had been heeded, the disasters of 1847–48 would never have taken place. At the same time the duty of leading the corn-law debates in the House of Lords fell upon the wearied official. The defeat of Sir Robert Peel at the end of June 1846 gave him no respite, for Lord John Russell asked him to remain in office, and again the Whig premier offered the young Conservative peer the office of governor-general of India, from which Lord Hardinge was returning after the first Sikh war.

Never, since Clive, had any man so young been called to bear such vast responsibilities, and yet, like Clive, he nearly doubled the empire, and adorned his rule with the blessings of peaceful and material reform. Lord Dalhousie was only thirty-five years of age when, on the 12th January 1848, he assumed at Calcutta that high office which he held for upwards of eight years, or almost as long as the period during which Lord Hastings had been led by troublous times to fill it. Had he remained a cabinet minister, it is not difficult to predict what he might have become in the annals of British statesmanship, but he had even higher work to do in India. Lord Hardinge, guided throughout his policy by the good and great Henry Lawrence, had left the Punjab nominally at peace under a Sikh regency, but really seething with discontent and confusion. To use Lord Dalhousie's own words in reviewing the situation, the spirit of the whole Sikh people was influenced by the bitterest animosity against us, chief after chief deserted our cause, nearly the whole army and council of regency were openly arrayed against us, the Sikhs courted an Afghan alliance, and the question was no longer one of policy but of national safety. Moolraj, at Mooltan had, in April, murdered the British officers Vans Agnew and Anderson; Herbert Edwardes had in June shown how disaster could be retrieved; by September General Whish was before Mooltan with an avenging force; and on the 5th October the governor-general announced, at a military ball at Barrackpore, a general war against the Sikh Sirdars. Proceeding to the spot like another Clive he conquered, annexed, and reorganized the Punjab in six months. The crowning victory of Gujerat, on the 21st February 1849, followed by the fall of Mooltan, avenged the drawn battle of Chillianwalla, and on the 29th March the Punjab became a British province. Borrowing from administrative experiments on a small scale in Tenasserim and Sind, the governor-general created that non-regulation system, under which military officers and civilians combined have ever since brought up to the ordinary level of our civilized administration the warlike peoples of Northern and the more savage tribes of Central and Eastern India. In the brothers Henry and John Lawrence, assisted by Sir Robert Montgomery and Sir Donald Macleod, Lord Dalhousie found men to work out his plans with such success as to convert the Punjab into the base from which, in 1857, Delhi was taken and the empire was reconquered. He returned to the capital by Bombay, the Straits Settlements, and Burmah, surveying the coast-line of the magnificent dependency which he had thus carried up to its natural boundaries, to the Himalayas from the sea. The experience he thus gained was soon to be used. The king of Upper Burmah violated the treaty of Yandaboo by a gross outrage on certain British traders in the port of Rangoon, and refused atonement. Quoting Lord Wellesley's maxim, that an insult offered to the British flag at the mouth of the Ganges would be resented as promptly and as fully as at the mouth of the Thames, after every peaceful effort had failed, the Government of India fought the second Burmese war; and, as reparation was still scorned, took possession of the kingdom of Pegu, thus uniting the territories of Arakan and Tenasserim taken in the first war into what is now the compact and prosperous coast province of British Burmah.

From that time, in 1852, the completed empire has been at peace, save for the Mutiny and little frontier campaigns. Its consolidation now became the great work of the young and triumphant governor-general, who showed on as great a scale as history can present, in a few years, that peace has greater victories than those of war. While in the minute review of his $8\frac{1}{4}$ years' administration Lord Dalhousie devotes 177 paragraphs to these, he records in only 3 the conquest of territories and populations as large as those of France. With the foresight and caution that marked all his statesmanship he thus closes the narrative of his wars:—"Experience—frequent, hard, and recent experience—has taught us that war from without or rebellion from within may at any time be raised against us, in quarters where they were the least to be expected, and by the most feeble and unlikely instruments." The rising of the tribe of Sonthals, a non-Aryan race of simple and now half-Christianized savages in the Rajmahal hills, due to the oppression of Hindu usurers and landlords, illustrated this. But the mutiny, to which we shall afterwards allude, has still more light thrown on it by this warning.

Lord Dalhousie made additions to those portions of the empire under direct British administration, however, not only by conquest but by annexing native states which lapsed to the suzerain power on the failure of natural and even adopted heirs, or, as in the case of Oudh, for outrageous and hopeless misrule. No part of his policy has been more misrepresented than this. His own narrative of it, written as simple history and long before it was attacked, bears the stamp of the unflinching honesty which was the basis of his nature,—the sympathy with the people and horror of oppression which influenced all his career, and the strict regard for justice which made his Government the strongest India ever had, before or since. He has been charged with the lack of imagination; but he had that as Cromwell had it, where he cared for the many rather than for the self-seeking and self-pleasing few. The question is twofold—Is it the duty or the right of the paramount power (1) to escheat states the chiefs of which persist in anarchy that not only ruins their own people but threatens their neighbours, or (2) to allow states to lapse when the chiefs leave no natural heirs and have refused to adopt a successor? The first was illustrated in the case of the kingdom of Oudh, which for the crimes of its kings, committed in spite of all warnings, was ordered to be annexed by the British Cabinet contrary to the recommendation of Lord Dalhousie, who would have again tried the policy that failed after the first Sikh war. The second is the real point at issue in his case. Now the despatch of the 30th April 1860, in which Lord Canning urges the concession to the 153 Hindu and Mahometan princes who actually govern their estates of a distinct law of adoption and feudatory right, is based on the fact that no such law or certain usage was in existence before. Lord Dalhousie acted for the good of the natives and for the interests of the British Government, solely as their trustee, when he annexed states according to what has been called the doctrine of lapse. His regard for purely historic claims which could not affect the happiness of the people for evil is shown by his refusal to carry out the consent of the court of directors to extinguish the dynasty of Timur on the death of the king of Delhi. He rather perpetuated the titular sovereignty by recognizing the grandson of the king as heir-apparent, on the two conditions that he should reside at the Kootub palace, outside Delhi, and "should as king receive the governor-general at all times on terms of perfect equality." To the two kingdoms of the Punjab and Pegu, won by conquest, and to the kingdom of Oudh, annexed for misrule worse than that of the Ottoman Turks, Lord Dalhousie hence added the fourth of Nagpore, "in the absence of all legal heirs," refusing to bestow the territory in free gift upon a stranger. So also he added the province of Berar, ceded by the Nizam for the permanent maintenance of the Hyderabad contingent. In Nagpore and Berar, one day to be united to Bombay, he gave Lancashire the finest cotton field under the British Crown. So also the principality of Sattara and the chiefship of Jhansi reverted to the Indian Government. Writing in 1856 he showed that these four kingdoms and three provinces had raised the revenue of India from 26 to 30 millions sterling a year. In the twenty years since, no revenue-paying addition has been made to the empire as Dalhousie left it, for he reached the boundaries fixed by nature. But the income of the 12 provinces of British India, with the 153 native states, which cost the rest of India far more than the small tribute they pay and spend nothing on the people, has risen to 52 millions sterling a year. It has doubled since Lord Dalhousie landed at Calcutta. But, while caring for the people, he was not indifferent to the welfare and good-will of their chiefs. Himself a sincere Christian, while singularly reticent as to his personal faith, and strictly neutral as the ruler of millions of alien and opposed creeds, he thus wrote of the adoption of Christianity by Maharaja Dhuleep Singh, the last of the rulers of the Punjab :—"The act was voluntary on the part of the boy, and, under the guidance of God's hands, was the result of his own uninfluenced convictions. It is gratifying to be able to state that his life hitherto has been strictly consistent with the injunctions of the faith he professes." So he records the baptism of the Queen's ward, the princess of Coorg, at the desire of her father the ex-raja. And in his time there was passed the Toleration Act, which, completing the good work begun by Lord William Bentinck, removed from the statute book the last traces of the persecution of converts to Christianity, who had suffered the loss of all their goods as a penal consequence.

The catalogue of Lord Dalhousie's reforms is as interesting as it is long, but we must be content with a mere statement of those which remind us of Clive's work in his third visit to India. The Civil Service was opened to the competition of all the natural-born subjects of the Crown, black and white, and at the same time the civil and military services were reorganized in India itself to supply the new territories. In Bengal, the boards which had acted as "screens" for inefficiency were abolished or simplified, and personal government was introduced in a way which made the force of the governor-general's energy and influence felt throughout the empire. The Public Works Department, separated from the military administration, was organized in a style which has enabled it to grapple with the vast needs of the whole Peninsula. A legislative council was created which, far more effectually than the sham introduced by Lord Halifax afterwards, promised to represent both British and native opinion. Bengal, with its sixty millions, received a lieutenant-governor for itself. In a thousand details life was substituted for apathy or obstructiveness, till among all classes the genius and force of the "boy" governor-general were gratefully eulogized as had never before happened in the history of India. There was not a hostile critic. But these were small matters compared with the introduction of the four potent forces of the railway and the telegraph, cheap postage and the primary school. The triumph of physical and educational progress went hand in hand. The quondam president of the Board of Trade felt himself at his old work, but on a vaster scale, and with far more magnificent results. Every word he spoke or wrote, every act that he ordered or sanctioned, told on the civilization of the country. His it was, too, to push on and open the great Ganges Canal which has since saved Hindustan from famine; his to make roads from Delhi through the Punjab, from Simla and the frontier to Tibet, from Assam to Pegu. Trade and agriculture were ever before him as if he had no other work to do; cotton and tea, iron and coal, salt and other resources were carefully developed by him; and he created a forest department. When he did not think it politically expedient to make female education a care of the state, any more than even the early missionaries were prepared to attend to it, he supported the Bethune school out of his own pocket. Suttee in native states, and thuggee or strangling in our own, he kept down with an iron hand; female infanticide, and meriah or human sacrifice, he vigilantly suppressed; slavery and the slave-trade he made treaties from the Somalee coast of Africa to the Euphrates and the Irawaddy to put down. Finally, his care for the British soldier in a tropical climate was matched only by the improvement which he caused in the physical condition of the sepoys. No less a military than a civil administrator, his last act was to send home a series of minutes pressing for a reorganization and an increase of the army, in language not only unheeded, but deliberately repelled, with consequences which the mutiny soon displayed.

Such work as this, following the still greater strain of the Board of Trade during the railway mania, began to show itself even before Lord Dalhousie had completed the usual five years' term of service. He recorded, at the time, the bitter pang it was to him to be so ill as not to be able to accompany the first railway train which he officially sent forth in its course Bombay-wards from Howrah, the suburb opposite Calcutta. In 1855 the physicians solemnly warned him to leave, but as Her Majesty's Government laid on him the duty of annexing Oudh, he deliberately accepted the responsibility. "The ministry have asked me to stay; and I will do my duty," he replied to all remonstrances. He had, too, lost his wife, to whom he was devotedly attached—a daughter of the marquis of Tweeddale, who had been governor of Madras—and was soothed by the arrival of his eldest daughter. The hot season of 1855 he spent in the Neilgherry hills.[1] It was on the 6th March 1858 that he left Calcutta, amid the tears of many, both natives and Europeans, who accompanied the great proconsul, as he was lovingly called, to the Ghaut. He knew he had no more health to look for. Sadly did he write, in his formal reply to the citizens of Calcutta—"Nearly thirteen years have passed away since first I entered the service of the Crown. Through all those years, with but one short interval, public employment of the heaviest responsibility and labour has been imposed upon me. I am wearied and worn, and have no other thought or wish than to seek the retirement of which I stand in need, and which is all I now am fit for."

Lord Dalhousie retired not only amid the regrets of the people he had ruled so well, and of the services, civil and military, which he had attached to himself at once by the splendour of his administrative genius and by the kingly fascination of his personal character. He was honoured by Parliament and the Crown, while the press exhausted the terms of eulogy in reviewing the career of one who, like Clive, had proved equally great in peace and in war. The many months spent in Malta before he could brave the rigours of his native climate he devoted to a defence of his whole administration, which, unfortunately, is not now to be found. For already the outburst of the Bengal mutiny had led thoughtless or prejudiced and certainly ignorant persons to demand a victim, and they sought it in the dying governor-general. He could not take his place in the House of Lords and explain his acts and policy

[1] The appointment, as his successor, of Lord Canning, his old college companion, gave him great pleasure; and when, soon after, he was dying and was told of the eulogy that viceroy had passed on him when opening an extension of the railway to Rajmahal, he smiled saying, "I always knew Canning was a gentleman.

to unthinking and excited critics who personally knew nothing of either. In India itself, where the facts were known and he was known, he was defended as, on much less and lower grounds, Warren Hastings had been. So, appealing from his contemporaries to posterity, and moved at the same time by the unauthorized publication of other family papers, he dictated the following addition to his will, which we are permitted to publish for the first time:—

"Secondly, It is my wish that on my decease the whole of the letters and private papers of every description, wherever found, belonging to me, and not being legal documents connected with the Dalhousie family, should be delivered to my daughter Susan. I enjoin that at her decease, or sooner if she should think fit, all documents, journals, and letters illustrating the history of the Dalhousie family, or the career of those who have been successively its head, shall be delivered to the holder of the title of Dalhousie.—And as it has been the practice of my father and of myself to keep a full private journal during our lives, and to preserve papers of personal interest, and as there prevails in these days a mania for giving publicity to the correspondence of public men, however slight may have been their real importance in the annals of the period, or however valueless may be their written remains, I desire if possible to preserve these papers in privacy within the family to which they refer.—I direct, therefore, that when these documents shall be delivered to him who shall then be Lord Dalhousie, the delivery of them shall be accompanied by a request from me (to which I am confident he will conform, as to a request issuing from the grave) that no portion of the private papers of my father or of myself shall be made public until at least fifty years shall have passed after my death."

The papers are carefully preserved in Coalstoun till the year 1910. Lord Dalhousie retired to his old boy home, in Dalhousie Castle, to die, affectionately tended by his daughter, and on the 19th December 1860 he passed peacefully away. He was not forty-nine years old, an age when in England statesmen only begin their career, yet in England and India he had done a life-work surpassed by none, if equalled by any of his contemporaries. His marble statue, long opposite Wellesley's in the hall of Government House, Calcutta, now adorns the public institute in the public square, which both bear his name. His portrait by Sir John Watson Gordon, at Coalstoun, recalls the fine head, the brow of massive breadth and height, the large and lustrous eyes, the flexible and sensitive lips, the commanding attitude which made his middle-size look like the tallness of bigger men.

The panic which sought to fasten on Lord Dalhousie responsibility for the mutiny has long since been pronounced unreasonable. All the charges against the last of the Company's governors-general may be summed up in two, political and military,—he conquered and annexed many states; he ignored or misunderstood the condition of the sepoy army. As to the first, the despatch of Lord Canning, already alluded to—and he is identified with the opposite, or non-annexation policy, which Lord Dalhousie alone made possible for his successor—shows that there was no law or regular usage on the subject. Lord Dalhousie had certainly no passion for annexation, as the Oudh case proves, and each instance must be dealt with on its own merits. It is difficult to obtain reliable evidence to support any statement as to native opinion or feeling, even after the event, and we have none for the assertion that the series of acquisitions of territory had alarmed the native chiefs. But even if it had, we may maintain that it was the governor-general's duty to complete the empire, to care for the people, and to do this at all fair risks. To all such assertions we may reply that it was conquests like the Punjab that saved the empire when the crisis came, that it was annexations like Nagpore and Sattara which removed centres of discontent. Oudh, for which he was not responsible, and little Jhansi, which had a mad ranee, were the only malcontents. All the other native chiefs were loyal, actively or passively. The military argument is still less defensible, and has been abandoned ever since Sir Charles Jackson exposed it. Lord Dalhousie foresaw trouble in India as much as any man has ever done in a country where it is the unforeseen that happens. We have already quoted an instance of this. But these words in his farewell to India might, as has been said, have been written after the mutiny. "We have learned by hard experience how a difference with a native power, which seems at first to be but the little cloud no bigger than a man's hand, may rapidly darken and swell into a storm of war, involving the whole empire in its gloom. We have lately seen how, in the very midst of us, insurrection may rise like an exhalation from the earth, and how cruel violence, worse than all the excesses of war, may be suddenly committed by men who, to the very day in which they broke out in their frenzy of blood, have been regarded as a simple, harmless, timid race, not by the Government alone but even by those who knew them best, who were dwelling among them, and were their earliest victims. Remembering these things, no prudent man will venture to give you assurance of continued peace."

The first authority on the subject, Lord Lawrence, pronounced the cause of the mutiny purely military, and found it in the greased cartridges. It was social, not political,—an assault on caste, not on princes, though doubtless Mahometan and other intriguers took advantage of the mutinous spirit. But the opportunity for the mutiny was found in the reduction of the British garrison, already too low, to a point of danger which had led to Lord Dalhousie's alarmed but unheeded protests. When he wanted more troops to meet the increase of territory he found himself denuded of two cavalry and two infantry regiments for the Crimea. The strength of the white garrison was thus reduced to 22 regiments. That reduction completed what the Afghan policy of the home authorities had begun, by placing success within the grasp of the native army. In 1854 Lord Dalhousie thus wrote:—"We are perfectly secure so long as we are strong and are believed to be so; but if European troops shall now be withdrawn from India to Europe, and if further we should be called on to despatch an army to the Persian Gulf . . . . . then, indeed, I shall no longer feel, and can no longer express, the same confidence as before that the security and stability of our position in the East will remain unassailed." That is prophetic enough. But it is nothing to the nine minutes which, on the last day of his office, he laid before his council and sent home, all of which were pigeon-holed, and two of which cannot be found in the records. In spite of these admirable and earnest state papers, the two infantry regiments sent to the Crimea were not replaced, and five or six of the minimum of thirty-one on the India establishment were in the Persian war, as his excellency had feared. He sought to raise the number to thirty-seven, and to reduce the sepoy force by upwards of 14,000 men, but in vain. Had he been able to carry out his own military policy as he did in the case of purely political and administrative affairs, is it too much to say that there would have been no mutiny? In spite of the passing away of the school of political and military officers whom Lord Dalhousie created, represented now only by the venerable Lord Lawrence, every year's progress in the history of India reveals new reasons for recalling with gratitude and admiration the eight or nine years' administration of the last of the governors-general.

The detailed events of this period will be found in the volumes of the *Friend of India* and the *Calcutta Review* from 1848 to 1856 inclusive. Other and more compact sources are Marshman's *History of India*, volume iii., Sir Charles Jackson's *Vindication of the Marquis of Dalhousie's Indian Administration*, and the Duke of Argyll's *India under Dalhousie and Canning*. The "Minute by the Most Noble the Governor-General of India," dated the 28th of February 1856, was published as No. xiv. of the *Selections from the Records of the Government of India in the Home Department in* 1856. Those who are interested in that controversy with Sir Charles Napier, in which the Duke of Wellington supported the Marquis of Dalhousie, will find the facts in *Minutes of the Resignation of the late General Sir Charles Napier of the Command of the Army in India*, (John Murray, 1854). (G. SM.)

DALIN, OLOF VON (1708–1763), a Swedish poet, was born August 29, 1708, in the parish of Vinberg, in Halland, being the son of the incumbent. His mother was the daughter of a Dr Ausén, to whom Queen Christina had offered, during her exile in Rome, a cardinal's hat if he joined the Romish Church. He was also nearly related to a still more remarkable man, Rydelius, the philosophical bishop of Lund, and the young Dalin was sent at a very early age to be instructed by him, Linnæus being one of his fellow-pupils. The quick instinct of Rydelius instantly perceived the boy's extraordinary genius, and he assisted its development in every possible way. While studying deeply at Lund, Dalin had visited Stockholm in the year 1723, and in 1726 he proceeded thither for the purpose of entering one of the public offices. Under the patronage of Baron Ralamb he rapidly rose to preferment, and his skill and intelligence won him golden opinions. It was at the age of twenty-four that he commenced his literary career by the publication of a work that was entirely new at that time in Sweden, namely the famous *Argus*, a weekly journal, founded on the model of Addison's *Spectator*. For the two years 1733, 1734, Dalin issued his brilliant paper; at the end of 1733 he had thought to give it over, but he was forced to continue by the importunity of the public. It was not till 1736 that the secret was known, and Dalin confessed that he had been the writer of *Argus*. His reputation thereupon became immense. His next work was *Tankar om Kritiker* (Thoughts about Critics), the first really æsthetic book brought out in Sweden. With the avowed purpose of enlarging the horizon of his cultivation and tastes, Dalin set off, in company with his pupil, Baron Ralamb's son, on a tour through Germany and France, in 1739–40. On his return the shifting of political life at home caused him to write his famous satiric allegories of *The Story of the Horse* and *April-Work*, which were very popular, and provoked countless imitations. He now set himself to work on the most considerable of his writings, his didactic epos of *Svenska Friheten* (Swedish Liberty), which first appeared in 1742. Hitherto Addison and Pope had been his models; in this work he draws his inspiration from Thomson, whose poem of *Liberty* it emulated. In 1751 Dalin received the honourable post of tutor to the crown prince, afterwards Gustavus III., and gained the friendship of the literary Crown Princess Louisa Ulrika. His position at court gave rise to many personal inconveniences, and separated him to a vexatious degree from the studies in which he had hitherto been absorbed. He held the post of tutor to the crown prince until 1756, when he was arrested on suspicion of having taken part in the attempted revolution of that year, and tried for his life. He was acquitted, but was forbidden on any pretence to show himself at court. This period of exile, which lasted until 1761, Dalin spent in the preparation of his great historical work. He had been ennobled in 1751, and made privy counsellor in 1753; and now, in 1761, he once more took his place at court. During his exile, however, his spirit and his health had been broken; in a fit of panic he had destroyed some packets of his best unpublished works, and this he constantly brooded over. On the 12th of August 1763 he died at his house in Drottningholm. In the year 1767 his writings in *belles lettres* were issued in six volumes, edited by Bökman, his half-brother. Amid an enormous mass of occasional verses, anagrams, epigrams, impromptus, and the like, his satires and serious poems were almost buried. But some of these former, even, are found to be songs of remarkable grace and delicacy, and many display a love of natural scenery and a knowledge of its forms truly remarkable in that artificial age. His dramas also are of interest, particularly his admirable comedy of *The Envious Man*; he also wrote a tragedy, *Brynhilda, or the Unfortunate Love*, and a pastoral in three scenes on King Adolphus Frederick's return from Finland. During the early part of his life he was universally admitted to be *facile princeps* among the Swedish poets of his time; in his later days the extravagant reputation of the poetess Hedvig Nordenflycht somewhat eclipsed his glory. He possessed a singular mixture of the literary qualities which we attribute severally to Pope, to Voltaire, and to Thomson. As a prose writer, Dalin is chiefly memorable for his *History of the Swedish Kingdom*, which proceeds to the end of the reign of Charles IX.

DALKEITH, a burgh of barony and market-town of Scotland, in the county of Edinburgh, situated between the North and South Esk, 6½ miles south-east of Edinburgh. The town is for the most part clean and well-built. The principal church, an old Gothic edifice, was originally the castle chapel; in 1406 it was raised to the dignity of a collegiate church, and after the Reformation it became the parish kirk. A new church in the Early English style, with a steeple 167 feet high, was built by the duke of Buccleuch in 1840; and there is an Episcopal chapel within the palace grounds. Dalkeith has one of the largest corn-markets in Scotland, held every Thursday. There are extensive corn-mills, breweries, iron-foundries, a brass-foundry, brickworks, and tanneries. In the vicinity is Dalkeith palace, the principal seat of the duke of Buccleuch, surrounded by an extensive park. It was the temporary residence of Charles I. in 1633, of George IV. in 1822, and of Queen Victoria in 1842. Population in 1871, 6386.

DALLING AND BULWER, BARON (1801–1872). William Henry Lytton Earle Bulwer, better known during the chief part of his long and brilliant career in diplomacy, politics, and literature as Sir Henry Bulwer, was born in Baker Street, Portman Square, London, on Friday the 13th February 1801. Upon both sides Lord Dalling's lineage was illustrious; his father's house traced back their ancestry to the Vikings of the North, and his mother's claimed descent from the Tudors and Plantagenets. General Bulwer, when colonel of the 106th Regiment, had been married to Elizabeth Barbara Lytton, who—as the only offspring of Richard Warburton Lytton, of Knebworth Park, in the county of Hertford—was sole heiress of the family of Norreys-Robinson-Lytton of Monacdhu in the island of Anglesea and of Guersylt in Denbighshire. Her father, Warburton Lytton, was noteworthy in his generation. As an Oriental linguist he became the intimate friend of Sir William Jones; he was besides the favourite pupil of Dr Samuel Parr, who used to brag of him as inferior only to himself and perhaps Porson in classical erudition. Three sons were the fruit of General Bulwer's marriage with the heiress of the Lyttons. The second of those three sons, Henry, afterwards Lord Dalling, having been amply provided for by his selection as heir to his maternal grandmother, while the paternal estates in Norfolk went in due course, by right of primogeniture, to his elder brother William, the maternal property in Herts passed into the possession of the youngest of the three brothers, Edward, known first as Bulwer the novelist and dramatist, and afterwards as the first Baron Lytton of Knebworth.

Lord Dalling's father was so far notable in his military capacity that, as brigadier-general of volunteers, he was one of the four commanding officers to whom was intrusted the defence of England in 1804, when threatened with invasion by the great Napoleon. Three years afterwards, on the 7th July 1807, General Bulwer died prematurely at fifty-two at Heydon Hall. His young widow had then devolved upon her not only the double charge of caring for the estates in Herts and Norfolk, but the far weightier responsibility of superintending the education of her three sons, then in their earliest boyhood. She at once devoted herself with earnest solicitude to their instruction, and her qualifications for the duties of home instructress were certainly exceptional. For, besides having great natural gifts and instinctive refinement, she was a woman of cultured intellect and rare accomplishments. Henry Bulwer's first school was that of Dr Curtis in Sunbury, Middlesex. Thence, while yet a stripling, he was removed to Harrow, then presided over by Dr George Butler. His tutor there was the Rev. Mark Drury, a younger brother of the previous head master. At eighteen, Henry Bulwer was enrolled as an undergraduate at Trinity College, Cambridge, removing thence soon afterwards to Downing College, where his university career was completed. At that turning-point in his history his maiden work was published. It was issued from the press in 1822 as a tiny volume of verse, commencing with an ode on the death of Napoleon. It is chiefly interesting now for its fraternal dedication to Edward Lytton Bulwer, then a youth of nineteen, an inscription couched in terms of affectionate admiration.

On leaving Cambridge in the autumn of 1824, Henry Bulwer signalized his entrance into public life by an adventure. As emissary of the Greek Committee then sitting in London, he started for the Morea, carrying with him no less a sum than £80,000 sterling, which, immediately on his arrival at his destination, he handed over to Prince Mavrocordato and his colleagues, as the responsible leaders of the War of Independence. He was accompanied on this expedition by Mr Hamilton Browne, who, a twelvemonth before, had been despatched by Lord Byron to Cephalonia to treat with the insurgent Government. Shortly after his return to England in 1826, Bulwer published a record of this romantic excursion, under the title of *An Autumn in Greece*. Meanwhile, bent for the moment upon following in his father's footsteps, he had on the 19th October 1825, been gazetted as a cornet in the Second Life Guards. Within less than eight months, however, he had exchanged from cavalry to infantry, being enrolled on the 2d June 1826 as an ensign in the 58th Regiment. That ensigncy he retained for little more than a month, obtaining another unattached, which he held until the 1st January 1829, when he finally abandoned the army. The court, not the camp, was to be the scene of his successes; and for thirty-eight years altogether—from the August of 1827 to the August of 1865—he contrived, while maturing from a young attaché to an astute and veteran ambassador, to hold his own with ease, and in the end was ranked amongst the subtlest intellects of his time as a master of diplomacy. His first appointment in his new profession, at the date just mentioned, was as an attaché at Berlin. In the April of 1830 he obtained his next step through his nomination as an attaché at Vienna. Thence, exactly a year afterwards, he was employed nearer home in the same capacity at the Hague.

As yet, ostensibly, no more than a careless lounger in the *salons* of the Continent, the young ex-cavalry officer veiled the keenest observation under an air of indifference. His constitutional energy, which throughout life was exceptionally intense and tenacious, wore from the first a mask of languor. When in reality most cautious, he was seemingly most negligent. No matter what he happened at the moment to take in hand, the art he applied to it was always that highest art of all, the *ars celare artem*. His mastery of the lightest but most essential weapon in the armoury of the diplomatist, tact, came to him as it seemed intuitively, and from the outset was consummate. Talleyrand himself would have had no reason, even in Henry Bulwer's earliest years as an attaché, to write entreatingly, "*Pas de zèle*," to one who concealed so felicitously, even at starting, a lynx-like vigilance under an aspect the most phlegmatic. Endowed thus highly both in intellect and in temperament, he had hardly reached his new post in the capital of the Netherlands when he found and immediately seized his opportunity. The revolutionary explosion of July at Paris had been echoed on the 25th August 1830 at Brussels by an equally startling outburst of insurrection. During the whole of September a succession of stormy events swept over Belgium, until the popular rising reached its climax on the 4th October in the declaration of Belgian independence by the Provisional Government. At the beginning of the revolution, the young attaché was despatched by the then foreign secretary at Whitehall, Lord Aberdeen, to watch events as they arose and report their character. When he reached Ghent in the midst of the civil conflict, the commissionaire of his hotel was shot down at his elbow on the Grande Place. In the execution of his special mission he traversed the country in all directions amidst civil war, the issue of which was to the last degree problematic. Under those apparently bewildering circumstances, he was enabled by his sagacity and penetration to win his spurs as a diplomatist. Writing almost haphazard in the midst of the conflict, he sent home from day to day a series of despatches which threw a flood of light upon incidents that would otherwise have appeared almost inexplicable. Scarcely a week had elapsed, during which his predictions had been wonderfully verified, when he was summoned to London to receive the congratulations of the Cabinet. He returned to Brussels no longer in a merely temporary or informal capacity. As secretary of legation, and afterwards as chargé d'affaires, he assisted in furthering the negotiations out of which Belgium rose into a kingdom, and in so rising established for the first time on the European continent the adjusted fabric of a moderate constitutional sovereignty. Scarcely had this been accomplished when he wrote what may be called the first chapter of the history of the newly created Belgian kingdom. It appeared in 1831 as a brief but luminous paper in the January number of the *Westminster Review*. And as the events it recorded had helped to inaugurate its writer's career as a diplomatist, so did his narrative of those occurrences in the pages of the Radical quarterly signalize in a remarkable way the commencement of his long and consistent career as a Liberal politician. Shortly before his appearance as a reviewer, and immediately prior to the carrying of the first Reform Bill, Bulwer had won a seat in the House of Commons as member for Wilton, afterwards in 1831 and 1832 sitting there as M.P. for Coventry. Nearly two years having elapsed, during which he was absent from the legislature, he was in 1834 returned to Westminster as the representative of the metropolitan borough of Marylebone, which, as it happened, was his birthplace. That position he retained during four sessions, winning considerable distinction as a debater by his undoubted gifts of wit and oratory. Within the very year in which he was chosen by the Marylebone electors, he brought out in two volumes, entitled *France—Literary, Social, and Political*, the first half of a work which was only completed upon the publication, two years afterwards, of a second series, also in two volumes, under the title of *The Monarchy of the Middle Classes*. Through its pages he made good his claim to be regarded not merely as a keen-witted observer, but as one of the most sagacious and genial delineators of the generic Frenchman, above all of that supreme type of the race, with whom all through his life he especially delighted to hold familiar intercourse, the true Parisian. Between the issuing from the press of these two series, Henry Bulwer had prefixed an intensely sympathetic *Life of Lord Byron* to the Paris edition of the poet's works published by Galignani,—a memoir republished sixteen years afterwards. A political argument of a curiously daring and outspoken character, entitled *The Lords, the Government, and the Country*, was given to the public in 1836 by Bulwer, in the form of an elaborate letter to a constituent. At this point his literary labours, which throughout life were with him purely labours by-the-way, ceased for a time, and he disappeared during three decades from authorship and from the legislature. It was within that interval of thirty years, however, that he succeeded in building up what has ever since constituted the sum and substance of his reputation, securing to him his eminent and now historical name as a diplomatist. During the period of his holding the position of chargé d'affaires at Brussels, Bulwer had seized every opportunity of making lengthened sojourns at Paris, always for him the choicest place of residence. It was in the midst of one of these *dolce far niente* loiterings on the Boulevards that, on the 14th August 1837, he received his nomination as secretary of embassy at Constantinople. Although he held that position for little more than a year, he contrived within that brief period to make his mark upon the Ottoman empire. He did this by opening up single-handed its resources to Western Europe, through the negotiation of a commercial treaty that has ever since proved of the greatest importance, not to England alone, but in a more or less considerable way to all Christendom. Until then the mercantile relations subsisting between the Sublime Porte and the outer world were not merely unsatisfactory, they were simply intolerable. Recognizing, immediately upon his advent, the exceptional abilities of the new secretary, Lord Ponsonby, then ambassador at Stamboul, devolved upon Bulwer the responsibility of discovering some solution for this apparently insoluble problem. Dexterously overcoming difficulties which had heretofore appeared insuperable, the young diplomatist succeeded within an astonishingly brief interval in removing the barriers which hampered trade at the Golden Horn. So triumphant in their result were his negotiations that Lord Palmerston, in writing his congratulations to him from Windsor Castle, on the 13th September 1838, pronounced his treaty a *capo d'opera*, adding that without reserve it would be at once ratified. Shortly after this achievement he was nominated secretary of embassy at St Petersburg. Illness, however, compelled him to delay his northern journey—almost opportunely, as it happened, for in the June of 1839 he was despatched, in the same capacity, to the more congenial atmosphere of Paris. At that juncture the affairs of the Levant were threatening to bring England and France into armed collision. In 1839 and 1840, during the temporary absence of his chief, Lord Granville, the secretary of embassy was gazetted *ad interim* chargé d'affaires at the court of France. Opportunities were thus afforded him, of which he availed himself, for winning new distinction as a diplomatist. The reward earned by his devotion to his profession came to him at last towards the close of 1843. On the 14th November he was appointed ambassador at the court of the young Spanish Queen Isabella II. Upon his arrival at Madrid signal evidence was afforded of the estimation in which he was then held as a diplomatist. He was chosen arbitrator between Spain and Morocco, then confronting each other in deadly hostility. As the result of his mediation, a treaty of peace was signed between the two powers in 1844, their antagonistic interests having through his negotiations been adroitly reconciled. Two years had hardly elapsed after Bulwer's success in this way as a peacemaker when, in 1846, a much more formidable difficulty arose,—one which, after threatening war between France and England, led at last to a diplomatic rupture between the British and Spanish Governments. The dynastic intrigues of Louis Philippe were the immediate cause of this estrangement, and those intrigues found their climax in what has ever since been discreditably known in European annals as the Spanish Marriages. The storm sown in the Spanish marriages was reaped in the whirlwind of the February revolution. And the explosion which took place at Paris was answered a month afterwards at Madrid by a similar outbreak. Marshal Narvaez thereupon assumed the dictatorship, and wreaked upon the insurgents a series of reprisals of the most pitiless character. These excessive severities of the marshal-dictator the British ambassador did his utmost to mitigate. When at last, however, Narvaez carried his rigour to the length of summarily suppressing the constitutional guarantees, Bulwer sent in a formal protest in the name of England against an act so entirely ruthless and unjustifiable. This courageous proceeding at once drew down upon the British envoy a counter-stroke as ill-judged as it was unprecedented. Narvaez, with matchless effrontery, denounced the ambassador from England as an accomplice in the conspiracies of the Progressistas; and despite his position as an envoy, and in insolent defiance of the Palmerstonian boast, *Civis Britannicus*, Bulwer, on the 12th June, was summarily required to quit Madrid within twenty-four hours. Two days afterwards M. Isturitz, the Spanish ambassador at the court of St James's, took his departure from London. Diplomatic relations were not restored between the two countries until years had elapsed, nor even then until after a formal apology, dictated by Lord Palmerston, had been signed by the prime minister of Queen Isabella. Before his return the ambassador was gazetted a Knight Companion of the Bath, being promoted to the Grand Cross some three years afterwards. In addition to this mark of honour, he received the formal approbation of the ministry, and with it the thanks of both Houses of Parliament. Before the year of his return from the peninsula had run out Sir Henry Bulwer was married to the Hon. Georgiana Charlotte Mary Wellesley, youngest daughter of the first Baron Cowley, and niece to the duke of Wellington. Early in the following year, on the 27th April 1849, he was nominated ambassador at Washington. During his sojourn in the United States in that capacity he acquired immense popularity. Though possessing few popular qualifications as a speaker, he frequently roused American audiences to enthusiasm by his generous sentiments and impressive address. His principal success, as ambassador at Washington, was the compact known equally in the Old World and in the New as the Bulwer-Clayton treaty, which was in the main the fruit of his sustained labour as a diplomatist. This convention, ratified in May 1850, pledged the contracting Governments to respect the neutrality of the meditated ship canal through Central America, bringing the waters of the Atlantic and Pacific into direct communication. If it did no other good, it unquestionably for the time being allayed the jealousies which so often before then had sprung up between the two countries in regard to the British right of protection on the Mosquito Coast and in the Bay of Honduras. After having been accredited as ambassador to the United States for three years, Sir Henry Bulwer, early in 1852, was despatched as minister plenipotentiary to the small but stately court of the grand duke of Tuscany at Florence. Shortly after his retirement from that post in the January of 1855, he was intrusted with various diplomatic missions of an almost nomadic character, in one of which he was empowered as commissioner under the 23d article of the Treaty of

Paris, 1856, to investigate the state of things in the Danubian principalities, with a view to their definitive reorganization. Finally, as the crowning incident in his diplomatic career, he was installed, from May 1858 to August 1865, as the immediate successor, after the close of the Crimean war, of the "Great Eltchi," Viscount Stratford de Redcliffe, as ambassador extraordinary to the Ottoman Porte at Constantinople. In that capacity he fully sustained the high reputation he had acquired as a diplomatist.

When in the winter of 1865 Sir Henry Bulwer returned home from the Bosphorus it was to retire upon his pension to the lettered ease he had so well earned, and to revive for a brief space in the evening of his life the recollection of his earlier successes as an advanced liberal reformer in the House of Commons. He was elected member for Tamworth on the 17th November 1868, and retained his seat until gazetted as a peer of the realm on the 21st March 1871, under the title of Baron Dalling and Bulwer of Wood-Dalling in the county of Norfolk. Upon the eve of his return to his old haunts as a debater and a politician he had asserted his claim to literary distinction by giving to the world in two volumes his four masterly sketches of typical men, entitled *Historical Characters.* This work, dedicated to his brother Edward, in testimony of the writer's fraternal affection and friendship, portrayed in luminous outline Talleyrand the Politic Man, Cobbett the Contentious Man, Canning the Brilliant Man, and Mackintosh the Man of Promise. Two other kindred sketches, those of Sir Robert Peel and Viscount Melbourne, having been selected from among their author's papers, have since been published posthumously. Another work of ampler outline and larger pretension was begun and partially issued from the press during Lord Dalling's lifetime. The luxury of completing it, however, was denied to the hand of its author. This was the elaborately planned and vigorously opened *Life of Viscount Palmerston*, the first two volumes of which were published in 1870. A third volume appeared four years afterwards. Even then it left the story of the English statesman broken off so abruptly that the work remained at the last the merest fragment. Within little more than one year from the date of his elevation to the peerage Lord Dalling, on the 23d May 1872, breathed his last quite unexpectedly at Naples, whither he had gone to all appearance on a mere holiday excursion. Although he had been for some time a confirmed valetudinarian, his death occurred so suddenly that it came at last almost as a surprise. Yet he had by that time entered upon his seventy-second year, more than half his life having been passed in the service of his country. In his public career he enjoyed a three-fold success—as ambassador, as politician, and as man of letters. Winning his way in each character with a seemingly careless ease, he still improved the gifts of nature and fortune by personal effort, and bore his honours with an air of distinction expressive half of fatigue, half of indifference. His popularity in society was at all times remarkable, mainly no doubt from his mastery of all the subtler arts of a skilled conversationalist. The apparent languor with which he related an anecdote, flung off a *bon mot*, or indulged in a momentary stroke of irony imparted interest to the narrative, wings to the wit, and point to the sarcasm in a manner peculiarly his own. If as envoy he helped to mould the events of his time, he left among those who came within the range of his social influence the memory of one of the most gifted and charming of companions. (C. K.)

DALMATIA, a crownland of the Austrian empire, stretching in a narrow strip along the eastern shores of the Adriatic from Austrian Croatia on the N. to Albania in the S., and bounded towards the interior by Turkish Croatia, Herzegovina, and Montenegro. It has an area of 4937 square miles, and its population in 1869 was 456,961.

The boundary towards Austrian Croatia is marked by the Velebitch Mountains, which trend to the east and reach a height of 5350 feet in Vizeruna and 5774 in Sveto-Brdo, or the Holy Mountain; and the Turkish frontier coincides with the line of the Dinarian Alps, which run parallel with the Adriatic and attain an elevation of 5940 feet in Mount Dinara. The highest mountain in the country is Orjen, in the district of Cattaro, 6225 feet. The coast is for the most part steep and rocky, and fronted by a large number of islands. Towards the north, opposite the Croatian coast, are Pago and Arbe, of which the former rises to a height of 885 feet and the latter to 1338; next come Isola Grossa, Ugliana, Isola Incoronata, and others of less importance; then to the south of the promontory of Osorich, Brazza, with Monte St Vito, 2574 feet high; Lesina, with Monte St Nicola, 2078; and Curzola, with a maximum elevation of 1879, forming a prolongation of the promontory of Sabioncello. To the south of Curzola lies Lagosta, and to the south of Sabioncello, Meleda. The chief natural harbours are Tajer, Zara, Sebenico, Lesina, Lissa, Curzola, Sabioncello, Meleda, Gravosa, and Cattaro.

Dalmatia is not well supplied with water. The lakes are for the most part temporary rain-pools, and the only streams of importance are the Kerka (*Titius*) and the Cettina (*Tilurus*), which rise in the Dinara mountains. The former constitutes the boundary between Croatia and Dalmatia, and is interesting for its falls and the wildness of its scenery. The Narenta (*Naro*), which belongs mainly to Herzegovina, disembogues between the peninsula of Sabioncello and the mainland, and forms an extensive marsh.

The climate is warm and healthy, the mean temperature at Zara being 57° Fahr., at Lesina 62°, and at Ragusa 63°. The prevailing wind is the sirocco, or S.E.; but the terrible Bora, or N.E., may blow at any season of the year. The average annual rainfall is about 28 inches, but a dry and a wet year usually alternate. The greater proportion of the surface is devoted to pasture,—only 18 per cent. being under the plough, $5\frac{1}{2}$ per cent. in vineyards, and 22 per cent. in forest. Barley, wheat, maize, oats, rye, millet, beet-root, hemp, and potatoes are all grown, but in small quantities. Asses are largely used as beasts of burden; goats are strikingly numerous; and sheep are reared for the sake of their mutton, which is almost the only animal food freely consumed in the country. Asphalt, lignite, and bay-salt from Dernis and Sign are now the only mineral products of commercial importance; and there is no manufacturing industry except the distillation of liqueurs, oil-pressing, and tile-burning. The peasant still grinds his corn with his own hands, weaves his own cloth, and prepares his own furniture. The principal exports are olive-oil, wine, salt, and rosoglio.

Dalmatia is sparsely peopled, the neighbourhoods of Cattaro and of Ragusa being the areas of maximum density. About 89 per cent. of the inhabitants are the so-called Morlacks, or Dalmatians proper, who belong to the Servian race, and speak a Slavonic dialect usually distinguished as the Illyric; about $10\frac{1}{2}$ per cent. are of Italian origin; and the remainder consist mainly of Albanians and Jews. The prevailing religion is Roman Catholicism, to which no fewer than 82 per cent. of the population are attached; and the Greek Church comprises almost all the rest. The Roman Catholic archbishop has his seat at Zara; and Spalato, Ragusa, Sebenico, Lesina, and Cattaro are bishoprics. Education is still in a backward state, but has made considerable advances since 1862. The political constitution is based on the law of the 26th February 1861. The diet is composed of 43 members, including the Roman Catholic archbishop, the Greek bishop of Zara, and representatives of the chief tax-payers, the towns, and the communes. To the imperial diet Dalmatia furnishes five delegates. Zara is the capital of the country; and Benkovacz, Cattaro, Curzola, Imoski, Knin, Lesina, Macarsca, Ragusa, Sebenico, Sign, and Spalato give names to the administrative districts. With the exception of Zara, Spalato, and Sebenico, most of the towns are very small, and the great proportion of the population is distributed in petty hamlets.

History.—The history of Dalmatia may be said to begin with the year 180 B.C., when the tribe from which it takes it name declared their independence of Gentius the king of Illyria, and established a republic with its capital at Delminium or Dalminium, which was probably situated in Dalen in the Herzegovina. In 156 B.C. the Dalmatians were for the first time attacked by the Romans, and compelled to pay tribute, but it was not till the reign of Augustus that their country was made a Roman province. A formidable revolt was suppressed by Tiberius in 9 A.D. Under the later empire Dalmatia was thoroughly Romanized, and it had the honour of giving to the world an emperor in the person of Diocletian, who retired, after resigning the purple, to Salona, the new Dalmatian capital, where he erected those buildings which still bear witness to his magnificence. (See SPALATO). After the fall of the Western Empire, in which it was included, Dalmatia was successively in the hands of Odoacer, Theodoric, and Justinian; and in the 7th century it received the dominant element of its present population by the immigration of the Slavs, who had been invited by Heraclius. In the 9th century we find Croatian influence at its height, and Croatian princes recognized as kings of Dalmatia; but in the course of the 10th Venice extended her power over most of the towns, and about 1018 the doge took the title of duke of Dalmatia. During the 11th century the struggle went on between Croatia and Venice, till in 1091 the Hungarians took the place of the Croatians. Meanwhile the maritime cities Zara, Trau, Ragusa, &c., had each almost a separate history of its own, and, like the free cities of Northern Italy, attained no small prosperity through commerce and industry. As was natural from their position and affinities, they rather sided with Venice, and in fact were sometimes really under Venetian control; but the treatment they received from the great republic alienated their affection, and in 1357-8 they opened their gates to Louis of Hungary, who became for a time master of all Dalmatia. Venetian authority was, however, again restored through most of the country, and it was not till the treaty of Campo Formio, in 1797, that Dalmatia was finally incorporated with the Austrian dominions. Since that date, with the exception of the Napoleonic period from 1805-1814, the Austrian supremacy has never been questioned, though during a considerable time the feeling of the country towards its masters was extremely hostile, and in 1869 an insurrection had to be put down by force of arms.

The literature relating to Dalmatia is very extensive. See Lucius of Trau, *De regno Dalmatiæ et Croatiæ*, 1668; Gio. Louvich, *Dei Costumi dei Morlæcki*, 1776; Cattalinich, *Memorie degli Avvenimenti successi in Dalmazia*; A. Fortis, *Travels in Dalmatia*, 1778; Schmidl, *Das Königreich Dalmatien*, 1843; Cusani, *Dalmazia*, 1846; Wilkinson, *Dalmatia and Montenegro*, 2 vols., 1848; Paton, *Highlands and Islands of the Adriatic*, 1849; Kohl, *Reisen in Istrien, Dalmatien, &c.*, 1850; Neigebauer, *Die Südslaven*, 1851; Petter, *Compendio geografico della Dalmazia*, and *Dalmatien in seinen verschiedenen Verziehungen dargestellt*, Gotha, 1857; W. F. Wingfield, *Tour in Dalmatia*, 1859; Hecquard, "Géographie pol. et. phys. de la Dalmatia," in *Bulletin de la soc. de géogr.* 1862; Noe, *Dalmatien und seine Inselwelt*, 1870; Maschek, *Manuale del regno di Dalmazia per l'anno* 1875; Schiff, *Culturbilder aus Dalmatien*, Vienna, 1875.

DALRYMPLE. See STAIR and HAILES.

DALTON, JOHN (1766-1844), the celebrated physicist, and founder of the atomic theory of chemistry, was born September 5, 1766, at Eaglesfield, 2¾ miles south-west of Cockermouth, in Cumberland. His grandfather, Jonathan Dalton, was a member of the Society of Friends, and Dalton as well as his parents belonged to that body. His father, Joseph Dalton, who in 1755 married Deborah Greenup, had three children,—Jonathan, John, the subject of this sketch, and Mary. The occupation in which he was engaged, namely, that of weaving woollens, was not a lucrative one, and Mrs Dalton assisted in the support of the family by the sale of stationery. John received his early education from his father and from a Mr Fletcher, the teacher of the Quakers' school at Eaglesfield. At the age of twelve he himself began the work of school-teaching, in which he continued for two years; then, for a year or more, he worked occasionally on his father's farm. His principal study was mathematics, in which he received aid from a distant relative, a gentleman of the name of Robinson, living in the vicinity of Eaglesfield. In 1781 Dalton left his native village to become assistant to his cousin George Bewley, the master of a school for boys and girls at Kendal; and there he spent the next twelve years of his life in teaching, and in studying Latin, Greek, mathematics, and natural philosophy. During that period he became acquainted with the blind philosopher, Mr Gough, to whose influence and help his progress in scientific knowledge was in no small measure due. In 1785 Dalton became, through the retirement of his cousin, joint-manager with his brother of the school at Kendal, and in addition to his ordinary teaching he, in 1787 and 1791, gave courses of lectures in natural philosophy. The school was not generally popular, for its young masters were uncouth in manners, and kept aloof from society. Discipline was strict, and the elder brother Jonathan is said to have been stern and severe; John being milder and gentler, and continually preoccupied with mathematics, allowed faults to escape his notice, and was consequently preferred by the scholars. About the year 1790 Dalton appears to have been desirous to secure a larger sphere for his abilities by entering on the profession of law or of physic; but his projects meeting with no encouragement from his relations, he continued to live at Kendal, till in the spring of 1793 he obtained, mainly through Mr Gough, the appointment of teacher of mathematics and natural philosophy in the New College, Moseley Street, Manchester. That position he retained up to the time of the removal of the College to York in 1799, when he became a private tutor. In 1794 the number of his pupils at the College, in mathematics, mechanics, algebra, geometry, book-keeping, natural philosophy, and chemistry, was 24. It was in 1792 that he first visited London, which he described as "a surprising place, and well worth one's while to see once; but the most disagreeable place on earth for one of a contemplative turn to reside in constantly."

During his residence at Kendal Dalton had contributed solutions of problems and questions on various topics to the *Gentleman's* and *Ladies' Diaries*; but his first separate publication was his *Meteorological Observations and Essays*, published September 1793, a result of the study of natural phenomena during upwards of seven years previously. The book contained much original matter, but met nevertheless with only a limited sale, for, having been printed exclusively for the author, it never found its way in any large numbers into the hands of publishers. Another work by Dalton, entitled *Elements of English Grammar*, was published in 1801. On October 3, 1794, Dalton became a member of the Manchester Literary and Philosophical Society, before which, on the 31st, he read a communication entitled "Extraordinary Facts relating to the Vision of Colours." In this paper he gives the earliest account of that ocular peculiarity known as dyschromatopsis, chromato-pseudopsis (false vision of colours), Daltonism, parachromatism, or colour-blindness, and sums up its characteristics as observed in himself and others.[1] When a boy, being present at a review of troops, and hearing those around him expatiating on the gorgeous effect of the military costume, he asked in what the colour of a soldier's coat differed from that of the grass on which he trod; and it was the derisive laugh and the exclamations of his companions which this question called forth that first made him aware of the defectiveness of his eye-sight. Besides the blue and purple of the spectrum he was able to recognize but one colour, yellow; or, as he states in his paper, "That part of the image which others call red appears to me little more than a shade or defect of light; after that the orange, yellow, and green seem one colour, which descends pretty uniformly from an intense to a rare

[1] The subject is fully treated of in Dr G. Wilson's *Researches on Colour-Blindness*, 1855.

yellow, making what I should call different shades of yellow."

On March 1, 1799, Dalton read to the Manchester Society a paper on rain and dew, and the origin of springs, which was subsequently followed by various disquisitions—on heat, the colour of the sky, steam, the auxiliary verbs and participles of the English language, and the reflectibility and refrangibility of light. In May 1800 he was elected to the secretaryship of the society, an office which he held until 1808, when he became vice-president in the place of Dr Roget. In 1817 he became president, and remained so till the time of his death. On July 31, 1801, was read the first of four important essays by Dalton, "On the Constitution of Mixed Gases;" "On the Force of Steam or Vapour from Water and other Liquids in different Temperatures, both in a Torricellian Vacuum and in Air;" "On Evaporation;" and "On the Expansion of Gases by Heat." In the second of these he makes the striking remark,—"There can scarcely be a doubt entertained respecting the reducibility of all elastic fluids, of whatever kind, into liquids; and we ought not to despair of effecting it in low temperatures, and by strong pressures exerted upon the unmixed gases;" further, he describes experiments to ascertain the tension of aqueous vapour at different points between 32° and 212° Fahr., and concludes, from observations on the behaviour of the vapour of six different fluids, "that the variation of the force of vapour from all liquids is the same for the same variation of temperature, reckoning from vapour of any given force." In the fourth essay he observes—"I see no sufficient reason why we may not conclude that all elastic fluids under the same pressure expand equally by heat, and that for any given expansion of mercury, the corresponding expansion of air is proportionally something less, the higher the temperature . . . . . It seems, therefore, that general laws respecting the absolute quantity and the nature of heat are more likely to be derived from elastic fluids than from other substances." Dalton thus both enunciated the law of the expansion of gases, stated six months later by Gay-Lussac, and indicated the future employment of the air-thermometer.

But the most important of Dalton's numerous investigations are those concerned with the atomic theory of chemistry. The subject of chemisty seems to have first occupied his attention about the year 1796. In 1802 he had already arrived at some conception of the law of the multiple combining proportions of the elements, which was afterwards developed by him. Thus, in a paper "On the Proportion of the Several Gases or Elastic Fluids constituting the Atmosphere," read on the 29th of October in that year, he says—though, as it happened, his conclusions were based upon the incorrect supposition that the size of the vessels he employed affected the nature of the chemical union of the gases they contained—"The elements of oxygen may combine with a certain portion of nitrous gas, or with twice that portion, but with no intermediate quantity. In the former case *nitric* acid is the result, in the latter *nitrous* acid."

Dr Thomson states (*History of Chemistry*, vol. ii.)—"Mr Dalton informed me that the atomic theory first occurred to him during his investigations of olefiant gas and carburetted hydrogen gas." In 1850, however, in a notice of Wollaston, read before the Glasgow Philosophical Society, he remarks,—"Mr Dalton founded his theory on the analysis of two gases, namely, protoxide and deutoxide of azote. . . . . . The first of these he considered as a compound of one atom of azote with one atom of oxygen, and the second of one atom of azote united with two atoms of oxygen." Inasmuch as from the recognition of the law of definite and multiple combining proportions of the elements originated the establishment of that of their relative, Dalton may be said to have received assistance in the foundation of his atomic theory from the researches here alluded to by Thomson; but the latter part of the statement is manifestly erroneous, for the two gases referred to were invariably represented by Dalton as compounds respectively of two atoms and one atom of azote (nitrogen) with a single atom of oxygen. It is doubtless the earlier of Thomson's observations that is to be regarded as correct, more especially as Dalton himself says, in 1810, in his *New System of Chemical Philosophy*, with respect to carburetted hydrogen,—"No correct notion of the constitution of the gas about to be described seems to have been formed till the atomic theory was introduced and applied in the investigation. It was in the summer of 1804 that I collected, at various times and in various places, the inflammable gas obtained from ponds." As a matter of fact, the first germs of the atomic theory were Dalton's views of the separate existence of aqueous vapour in the atmosphere, which necessitated the assumption that gases were constituted of independent atoms; indeed they are represented as such, each atom having its distinguishing symbol, in the plate accompanying the paper "On the Constitution of Mixed Gases." Dalton appears already in 1803 to have pictured to himself the form of atoms, for in a paper "On the Absorption of Gases by Water" we read—"A particle of gas pressing on the surface of water is analogous to a single shot pressing on a square pile of them;" and five years later, he writes in his *New System*,—"Whatever, therefore, may be the shape or figure of the solid atom abstractedly, when surrounded by such an atmosphere [of heat] it must be globular; but as all the globules in any small given volume are subject to the same pressure, they must be equal in bulk, and will, therefore, be arranged in horizontal strata like a pile of shot." At the end of the paper on "Absorption" just alluded to, Dalton gives the following first table of the relative weights of the ultimate particles of gaseous and other bodies, which was constructed, he tells us, in order to test whether the solubility of gases in water was dependent upon the weight of their particles:—

Hydrogen	1	Nitrous oxide[1]	13·7
Azot	4·2	Sulphur	14·4
Carbone	4·3	Nitric acid	15·2
Ammonia	5·2	Sulphuretted hydrogen	15·4
Oxygen	5·5	Carbonic acid	15·3
Water	6·5	Alcohol	15·1
Phosphorus	7·2	Sulphureous acid	19·9
Phosphuretted hydrogen	8·2	Sulphuric acid	25·4
Nitrous gas[1]	9·3	Carburetted hydrogen from stagnant water	6·3
Ether	9·6		
Gaseous oxide of carbone	9·8	Olefiant gas	5·3

As this table contains the results of the analyses of olefiant gas and carburetted hydrogen made in the summer of 1804, it must have been completed after that date, and possibly was not added to the paper containing it till shortly before the printing of the latter in November 1805. It was in 1803, as we are informed in the preface to the *New System*, that Dalton "was gradually led to those primary laws which seem to obtain in regard to heat and to chemical combination;" and in a letter to his brother in that year he writes that he has been fully engaged in all his leisure hours in the pursuit of chemical and philosophical inquiries, "having got into a track that has not been much trod in before." Dr Bryan Higgins, in a little pamphlet composed about the year 1775, had treated of "atoms" which united with one another; but the fixity of the constitution of chemical substances had apparently formed no part of his ideas. "The matter of fire," according to him, "limits the quantity in which aeriform fluids, and bodies containing it, can combine chemically," and it

[1] The figures for nitrous gas (nitric oxide) and nitrous oxide should have been 9·7 and 13·9, *i.e.*, $5{\cdot}5+4{\cdot}2$ and $5{\cdot}5+4{\cdot}2\times2$.

is his belief that the forces of atoms measure the attraction of matter, yet he ventures on no deduction as to the comparative numbers of the attracting atoms. Upon these views we find an advance in the writings of William Higgins, who not only held that atoms combined to form molecules of compound bodies, but reasoned that they must unite singly or by twos and threes, there being no intermediate division of atoms; nowhere, however, does he attempt to elevate his conclusions into a general law. Next Richter, and after him Fischer, showed the existence of definite quantitative relations between the constituents of bodies, but for these relations they assigned no cause; and it was reserved for Dalton to give to the world a theory which linked together and reduced to order and simplicity the previously disconnected and unexplained phenomena of chemical combination. Till 1811 Dalton, who drew his deductions from his own rough experimental work, was unacquainted with the observations of William Higgins; and although Richter's determinations may have aided him in the proving of his laws, still, as Dr R. A. Smith has remarked, "they could never have given him fundamental ideas." Dalton makes the following clear distinction between his own researches with respect to the ultimate constitution of matter and those of other chemists (*New System*, pt. i. p. 213, 1808):—

"In all chemical investigations, it has justly been considered an important object to ascertain the relative *weights* of the simples which constitute a compound. But unfortunately the inquiry has terminated here; whereas from the relative weights in the mass, the relative weights of the ultimate particles or atoms of the bodies might have been inferred, from which their number and weight in various other compounds would appear, in order to assist and to guide future investigations, and to correct their results. Now, it is one great object of this work to show the importance and advantage of ascertaining *the relative weights of the ultimate particles, both of simple and compound bodies, the number of simple elementary particles which constitute one compound particle, and the number of less compound particles which enter into the formation of one more compound particle.* .

If there are two bodies, A and B, which are disposed to combine, the following is the order in which the combinations may take place, beginning with the most simple, namely:—

1 atom of A + 1 atom of B = 1 atom of C binary.
1 atom of A + 2 atoms of B = 1 atom of D ternary.
2 atoms of A + 1 atom of B = 1 atom of E ternary.
1 atom of A + 3 atoms of B = 1 atom of F quaternary.
3 atoms of A + 1 atom of B = 1 atom of G quaternary, &c., &c."

In 1810 appeared the second part of volume i. of the *New System*, in which the chemical elements are described. The first part of volume ii. was not published till 1827; it by no means represents the advanced state of chemical science at that time, and the appendix, giving Dalton's latest views, is the only portion of it that is of any special interest. A history of the development of the atomic theory since its first promulgation will be found under CHEMISTRY, vol. v. p. 465. By Dr Thomson, its first advocate, by Wollaston, and by Dr Henry, it was ably supported, and the analyses of Berzelius placed it on a stable footing. "The theory of multiple proportions," wrote Berzelius, "is a mystery without the atomic hypothesis." Strange to say, the conclusions of Gay-Lussac with regard to the combining volumes of gases, which afforded the strongest evidence in favour of the atomic theory, were distrusted, and perhaps never fully accepted by Dalton. The tenacity with which he clung to opinions once formed is further exemplified by his unwillingness to recognize chlorine as a chemical element, and his persistent use of the atomic weights first adopted by him, in spite of the later and more trustworthy determinations of other chemists. The memoirs of Dalton read before the Manchester Literary and Philosophical Society were in all 116. In one of these, read in 1814, he lays down the principles of the volumetric method of analysis, of which he is undoubtedly to be regarded as the originator, although its wide practical application is the result of the labours of numerous after-chemists. The earlier of Dalton's papers are the most important and complete; one of his latest, however, "On a New and Easy Method of Analyzing Sugar," describes a discovery of much interest, viz., that the volumes of highly hydrated salts when dissolved are equal to those of their volumes of water, the volume of the salt itself disappearing. Before Dalton had become known as the propounder of the atomic theory, he had already attained a considerable reputation by his scientific labours, and in 1804 he was chosen to give a course of lectures on natural philosophy at the Royal Institution in London. Subsequent discourses were delivered by him at the same place in the winter of 1809–10. He was, it would seem, deficient in many of those qualities that go to form an attractive public lecturer. His voice is said to have been harsh, indistinct, and unemphatic, and his manner of dealing with his subject ineffective; he is described, moreover, as an indifferent experimenter, and as "singularly wanting in the language and power of illustration." An imaginative or brilliant style of diction, it is to be supposed, can scarcely have been at the command of one whose hours of leisure from the routine of tuition were unceasingly devoted to laboratory work, and who eschewed, and even to some extent discouraged, literary pursuits. His library, he was once heard to declare, he could carry on his back, and yet he had not read half the books which constituted it. In the autumn of 1805 Dalton went to live in George Street, Manchester, with his friend the Rev. W. Johns, and with him and his family he continued to reside, in the greatest harmony, for the next twenty-six years. Engaged in his favourite studies, he passed a quiet and almost uneventful life, interrupted only by occasional visits to London and other cities, and by annual excursions to the Lake country Into society he rarely went, and amusement he had none, with the exception of a game at bowls on Thursday afternoons. In 1810 he was asked by Davy to offer himself as a candidate for the fellowship of the Royal Society, but he declined, possibly from pecuniary considerations. In 1822 he was proposed without his knowledge, was elected, and paid the usual fee. Four years later he received the king's medal of the society, "for the development of the chemical theory of Definite Proportions usually called the Atomic Theory, and for his labours and discoveries in physical and chemical science."

In the summer of 1822, in company with Mr Benjamin Dockray and Mr W. D. Crewdson, Dalton spent a short time at Paris, where he met Ampère, Arago, Berthollet, Biot, Brèquet, Cuvier, Fourier, Gay-Lussac, Laplace, Thénard, Vauquelin, and other distinguished men of science. Six years previously he had been made a corresponding member of the Academy of Sciences; and in 1830 he was elected by that body to fill the place of Davy as one of its eight foreign associates. Dalton was present at the first meeting of the British Association, held at York in 1831. On the occasion of the second meeting, at Oxford in 1832, the honorary degree of D.C.L. was conferred upon him. The scarlet hue of his doctor's gown was to him, he said, "that of nature," the colour of "green leaves."

In June 1833, Lord Grey's Government conferred upon Dalton an annual pension of £150, which in 1836 was raised to £300. In the former year a subscription list was opened in Manchester to obtain funds for providing that city with a lasting memorial of its great chemist; and the sum of £2000 having been raised, Chantrey was intrusted with the execution of a bust, which was eventually placed in the entrance hall of the Manchester Royal Institution. During his stay in London, whither he had gone in 1834 to sit to the sculptor, Dalton was presented at court, and in the autumn he received from the university of Edinburgh the degree of LL.D. He officiated as vice-president of the chemical section of the British Association at Dublin in 1835, and at Bristol in 1836. On the 18th April 1837, he was seized with an attack of paralysis, a disease of which his brother had died in December 1834. In the following year, on the 15th February, he had a second attack, after which, though still able to make experiments, he was manifestly much enfeebled, both physically and mentally, and required constant medical attendance. On May 20, 1844, he suffered from another fit. On the 26th of July 1844, he recorded, with trembling hand, his last meteorological observation, and on the morning of the 27th he fell from his bed, and was found lifeless by his attendant. He was publicly buried on the 12th of August at Ardwick cemetery, about a mile and a half from Manchester.

In person Dalton was robust and muscular, and his countenance was open, and expressive of the earnestness, simplicity, and truth of his character. His height was about 5 feet 7 inches; he stooped slightly; and his gait was stiff and awkward, but rapid. In dress he adhered to the mode of the Quakers. His manners were singularly free from pedantry and ostentation, and he had a grave, quiet demeanour. Generally he enjoyed excellent health. His medical attendant, finding him once greatly recovered from an attack of catarrh, attributed the improvement to a dose of James's powder prescribed on the previous day. "I do not well see how that can be," said Dalton, "as I kept the powder until I could have an opportunity of analyzing it." Dalton was somewhat silent in general company, but with his familiar friends he would often indulge in active conversation. His letters to his acquaintances evince no small power of observation. On religious topics he appears to have been peculiarly reserved, and his friends found it difficult to gain an idea of his doctrinal views. He "never had time" to get married, he said; but his correspondence, and the testimony of those who knew him, show that he delighted in the society of women of education and refinement; his pinched circumstances in early life were perhaps the chief cause why he remained single. He liked tobacco, and remarked of Davy, "the principal failing in his character as a philosopher is that he does not smoke." Dalton was careful, though not parsimonious, in his expenditure, and left at his death a small fortune; when occasion required he could show himself remarkably open-handed. Davy wrote of Dalton in 1829:—"He was a very coarse experimenter, and almost always found the results he required, trusting to his head rather than to his hands. Memory and observation were subordinate qualities in his mind; he followed with ardour analogies and inductions; and however his claims to originality may admit of question, I have no doubt that he was one of the most original philosophers of his time, and one of the most ingenious." Superadded to his natural talents, and "his almost intuitive skill in tracing the relations of material phenomena," there was in Dalton, to use the words of Professor Sedgwick, "a beautiful moral simplicity and singleness of heart, which made him go on steadily in the way he saw before him, without turning to the right hand or to the left, and taught him to do homage to no authority before that of truth."

Henry, *Life of Dalton*, Cavendish Society, 1854; Robert Angus Smith, *Memoir of John Dalton and History of the Atomic Theory*, 1856. A list of Dalton's papers and other publications is given on pp. 253–63 of the latter work. See also Roscoe, "On Dalton's First Table of Atomic Weights," in *Nature*, Nov. 19, 1874. (F. H. B.)

DAMAGES, the compensation to which a person is by law entitled who has been injured by another. The principle of compensation in law makes its first appearance as a substitute for personal retaliation. In primitive law something of the nature of the Anglo-Saxon *were-gild*, or the ποινή of the *Iliad*, appears to be universal.[1] It is a payment due from the offender to the person he has offended, or to his family or kin. The system relates to personal injuries. It marks out with great minuteness the measure of the compensation appropriate to each particular case. And there is sometimes a resemblance between the legal compensation, as it may be called, and the compensation which an injured person, seeking his own remedy, would be likely to exact for himself. In such a system the two entirely different objects of personal satisfaction and criminal punishment are not clearly separated, and even in modern law damages are still occasionally penal.

The object of legal compensation should be to place the injured person as nearly as possible in the situation in which he would have been but for the injury. In the law of England the two historical systems of common law and equity viewed this problem from two different points of view. The principle of the common law was that the amount of every injury might be estimated by pecuniary valuation. The object of equity was to place the injured party in the actual position to which he was entitled. This difference comes out most clearly in cases of breach of contract. The common law, with a few partial exceptions, would do no more than compel the defaulters to make good the loss of the other party, by paying him an ascertained sum of money as damages. Equity, recognizing the fact that complete satisfaction was not in all cases to be obtained by mere money payments, compelled the defaulter to *specifically perform* his contract. Again, in those injuries which do not fall under the head of breach of contract, equity, on satisfactory proof that a wrong was contemplated, would interfere to prevent it by injunction; while at common law no action could be brought until the injury was accomplished, and then only pecuniary damages could be obtained. Common law and equity are now so far fused by the Judicature Act of 1873 that the appropriate remedy can be awarded in any of the divisions of the High Court of Justice.

The assessment of damages is peculiarly the business of the jury, and the court will only interfere with their decision on strong cause being shown. Thus a verdict may be set aside on the ground that damages are excessive, or that they are palpably insufficient. And if it appear that the result was arrived at by mere hazard, as, for instance, by each juryman naming a sum and an average being struck, that would be an impropriety which would invalidate the verdict. There are, moreover, certain principles according to which the damages must be ascertained.

To take, first, cases of breach of contract. Here, it is said, the motive of the defendant is an irrelevant consideration. He has broken his contract, and all that has to be done is to fix the amount of the loss occasioned thereby. So wherever there has been a breach of contract, some damages, though they should be merely nominal, are recoverable. And when the contract was for a payment of a fixed sum of money, the damages recoverable for a breach thereof would be that sum with interest. Where, in other cases, the parties themselves have fixed the sum which should be due as damages in case of the contract not being fulfilled, such sum will be the proper damages to be awarded by a jury. On this point, however, the cases run rather fine. When a contract provides that a fixed sum shall be payable for breach, the law will ask whether it has been fixed as a *penalty* or as *liquidated* (*i.e.*, ascertained) *damages*. In the former case it will not allow the fixed sum to be awarded, but will require evidence to show what the amount of loss actually was. In Kemble *v.*

[1] The *were* was the price of a man's life—the fine a murderer had to pay to the family or relations of the deceased, as the *wite* was the fine paid to the magistrate.

Farren (6 Bingham, 141), a contract between a manager and an actor provided that for a breach of any of the stipulations therein the sum of £1000 should be payable by the defaulter, not as a penalty, but as liquidated and ascertained damages. Yet even here, the court observing that under the stipulations of the contract the sum of £1000, if it were taken to be liquidated damages, might become payable for mere non-payment of a trifling sum, held that it was not fixed as damages, but as a penalty only. On the other hand, when the damage caused by a breach of contract is of its own nature uncertain, and the parties have positively fixed a sum as liquidated damages, that sum will be the proper damages. Where no such arrangement is made, the general rule for the assessment of damages is that the aggrieved party is to be placed in the same position, so far as money can do it, as if the contract had been performed. Thus, in a contract for the sale of goods when the vendor makes default in delivery, the proper measure of damages is the difference between the contract price and the market price of the goods on the day when they ought to have been delivered; so that if the price has not risen in the interval, the vendor can only get nominal damages. If he has in the meantime resold the goods to a sub-vendor, he cannot claim against his own vendor any damages which the sub-vendor may recover against him for breach of contract, because he ought to have gone into the market and purchased other goods. Again, if a buyer refuses to accept the goods when tendered to him, the measure of damages will be the difference between the contract price and the market price at the time of his refusal, if the latter is lower than the former. But in such cases the trouble and expense of finding a new purchaser or other goods may be taken account of in assessing the damages. It has been held that in a breach of contract to replace stock lent, the measure of damages will be the price of the stock on the day when it ought to have been delivered or on the day of trial, at the plaintiff's option. Where goods inferior in quality to those contracted for are delivered, the difference between the value at the time of delivery of the goods contracted for and the value of those actually delivered will be the proper damages. The controlling principle, in fact, is that compensation should be determined by the amount of the actual loss. In an American case, where a person had agreed with a boarding-house keeper for a year, and quitted the house within the time, it was held that the measure of damages was not the price stipulated to be paid, but only the loss caused by the breach of contract. In contracts to marry, a special class of considerations is recognized, and the jury in assessing damages will take notice of the conduct of the parties. The social position and means of the defendant may be given in evidence to show what the plaintiff has lost by the breach of contract.

It is not every loss caused by the act or default complained of which can be taken in estimating the proper amount of damages. The remoteness of the consequences is a bar to their being recognized in the assessment, and it is a question of no little difficulty what damages are and what are not excluded for remoteness. The leading English case on this point is Hadley *v.* Baxendale (9 Exch., 341), in which damages were sought for the loss of profits caused by a steam mill being kept idle, on account of the delay of the defendants in sending a new shaft which they had contracted to make. The court held the damage to be too remote, and stated the true rule to be that

"Where two parties have made a contract which one of them has broken, the damages which the other party ought to receive in respect of such breach of contract should be either such as may fairly and substantially be considered as arising naturally, *i.e.*, according to the usual course of things, from such breach of contract itself, or such as may reasonably be supposed to have been in contemplation of both parties at the time they made the contract, as the probable result of the breach of it."

So also in cases of trust, the general rule is that the damages must be restricted to the "legal and natural consequences of the wrongful act imputed to the defendant." In an action by the proprietor of a theatre, it was alleged that the defendant had written a libel on one of the plaintiff's singers, whereby she was deterred from appearing on the stage, and the plaintiff lost his profits; such loss was held to be too remote to be the ground of an action for damages. The line of remoteness cannot probably be drawn with much greater precision than in the rule in Hadley *v.* Baxendale quoted above, vague and ambiguous as the language may seem to be. A subsequent case shows the limitations of the rule on the other side. In Smead *v.* Foord (1 Ellis and Ellis, 602), the defendant contracted to deliver a thrashing-machine to the plaintiff, a farmer, knowing that it was needed to thrash the wheat in the field. Damages were sought for injury done to the wheat by rain in consequence of the machine not having been delivered in time, and also for a fall in the market before the grain could be got ready. It was held that the first claim was good, as the injury might have been anticipated, but that the second was bad. When, through the negligence of a railway company in delivering bales of cotton, the plaintiffs, having no cotton to work with, were obliged to keep their workmen unemployed, it was held that the wages paid and the profits lost were too remote for damages. On the other hand, the defendant having failed to keep funds on hand to meet the drafts of the plaintiff, so that a draft was returned dishonoured, and his business in consequence was for a time suspended and injured, the plaintiff was held entitled to recover damage for such loss. The great difficulty of framing a rule which shall meet all cases is acknowledged by judges and legal writers. One judge declared that no rule could be made in the matter. Another declared that the rule in the majority of cases could have no application, because parties never contemplate the consequences of a breach of contract. The cases probably do not go beyond this, that, when from facts known to everybody, or from special facts proved to be known to the defendant, he ought to have anticipated the consequences of the breach of contract, he will be liable for them.

The rule that the contract furnishes the measure of the damages does not prevail in the case of unconscionable, *i.e.*, unreasonable, absurd, or impossible contracts. The old school-book juggle in geometrical progression has more than once been before the courts as the ground of an action. Thus, when a man agreed to pay for a horse a barley-corn per nail, doubling it every nail, and the amount calculated as 32 nails was 500 quarters of barley, the judge directed the jury to disregard the contract, and give as damages the value of the horse. And when a defendant had agreed for £5 to give the plaintiff two grains of rye on Monday, four on the next Monday,[1] and so on doubling it every Monday, it was contended that the contract was impossible, as all the rye in the world would not suffice for it; but one of the judges said that, though foolish, it would hold in law, and the defendant ought to pay something for his folly. And when a man had promised £1000 to the plaintiff if he should find his owl, the jury were directed to mitigate the damages.

Interest is recoverable as damages only when an agreement that it should be paid can be proved or inferred (as in the case of bills of exchange), and under the statute 3 and 4 Will. IV. c. 42.

[1] *Quolibet alio die lunæ*, which was translated by some *every Monday*, and by others *every other Monday*. The amount in the latter case would have been 125 quarters, in the former 524,288.000 quarters.

In American law interest is in the discretion of the court, and is made to depend on the equity of the case. In both England and America compound interest, or interest on interest, appears to have been regarded with the horror that formerly attached to usury. Lord Eldon would not recognize as valid an agreement to pay compound interest. And Chancellor Kent, and American lawyers generally, hold that compound interest cannot be taken except upon a special agreement made after the simple interest has become due. See INTEREST.

In actions of tort the discretion of the jury is not so strictly limited as in cases of breach of contract. The cases we have referred to show a general tendency to make the amount of damages a matter of legal certainty, and the jury can do little more than find the facts. If they travel beyond the contract the court will revise their verdict. But in estimating the damages for a civil injury, matter of aggravation may be taken into account. This position was strongly asserted in the cases arising out of the celebrated "General Warrants" in the time of Lord Camden, who is reported in one case to have said, "damages are designed not only as a satisfaction to the injured person, but as a punishment to the guilty, and as a proof of the detestation in which the wrongful act is held by the jury." In another case he mentioned the importance of the question at issue, the attempt to exercise arbitrary power, as a reason why the jury might give exemplary damages. Another judge, in another case, said, "I remember a case when the jury gave £500 damages for knocking a man's hat off; and the court refused a new trial." And he urged that exemplary damages for personal insult would tend to prevent the practice of duelling. The right of the jury to give exemplary or vindictive damages has been repeatedly confirmed in recent cases, and the same doctrine prevails generally throughout the United States. In Scotch law the distinction between compensation and punishment has been more carefully maintained. In Baillie *v.* Bryson (1 Murray's *Reports*), Lord Chief Commissioner Adams said that Lord Kenyon had "introduced into cases of this sort a principle as to damages extremely dangerous in its consequences. He considered such questions not merely as calculated to repair the injury done to the one party, but as a punishment of the other, and as intended to correct the morals of the country. The morals of the country have not been improved, and I am afraid its feeling has been much impaired. A civil court in matters of civil injury is a bad corrector of morals; it has only to do with the rights of parties."

When both parties are in fault, if the plaintiff's conduct has contributed to the injuries, his claim for damages will not be sustained. This has been carried so far that it has been held that, when a person in one carriage receives injuries from the management of another carriage, he cannot recover damages if any negligence, either on his own part or on the part of the owner or managers of the carriage in which he was, has contributed to the accident. (See NEGLIGENCE.) In the Court of Admiralty, where the question constantly arises in cases of collision, a different rule has been adopted. When both vessels are in fault the whole amount of loss is divided between them. And by a section of the Judicature Act, 1873, the Admiralty rule in such cases is to be adopted in all the courts.

In the old action of *criminal conversation*, exemplary damages might be given, and now the petitioner in a divorce suit may be awarded exemplary damages by the jury against a co-respondent. In this case, however, the disposition of the sum awarded as damages is in the discretion of the judge, who may apply it to the maintenance and education or otherwise to the benefit of children of the marriage.

Damages are said to be either *general* or *special*. The former are given for loses implied by law as the necessary consequences of the wrongful act. The latter are not implied by law, but are compensation for such loss as may be proved to have been in fact caused by the wrongful act. Thus, in an ordinary slander, special damage must be alleged and proved to entitle the plaintiff to pecuniary compensation. But if a slander touches a person in the way of his trade, the law will presume that it caused loss to the plaintiff, without calling on him to show what the loss actually was.

When a person was injured by the negligence of another, and died, the benefit of an action for damages did not survive to his representatives. But by the 9 and 10 Vict. c. 93 (commonly called Lord Campbell's Act), it is enacted that wherever the wrongful act is such as would have entitled the injured person to recover damages (if death had not ensued), the person who in such case would have been liable "shall be liable to an action for damages notwithstanding the death of the person injured, and although the death shall have been caused under such circumstances as amount in law to felony." Every such action shall be brought for the benefit of the husband, wife, parent, and child of the deceased. "Child" includes grandchild and step-child, but not illegitimate child.

Loss caused by an act which is not wrongful (*damnum absque injuria*) cannot be the ground of an action for damages; *e.g.*, if A's business is injured by his neighbour B starting the same business, this is not an actionable loss.

Reference may be made to Sedgwick on *The Measure of Damages*, or Mayne on the same subject. (E. R.)

DAMAN, or DAMAUN, in Portuguese DAMAO, a town of India. See DAMAUN.

DAMASCENUS, JOHANNES, an eminent theologian of the early Greek Church, derives his surname from Damascus, where he was born about the close of the 7th or the beginning of the 8th century. His Arabic name was Mansur, and he received the epithet Chrysorrhoas (gold-pouring) on account of his eloquence. The principal account we have of his life is contained in a narrative of the 10th century, much of which is obviously legendary. His father Sergius was a Christian, but notwithstanding held a high office under the Saracen caliph, in which he was succeeded by his son. Damascenus owed his education in philosophy, mathematics, and theology to an Italian monk named Cosmas, whom Sergius had redeemed from a band of captive slaves. About the year 730 he wrote several treatises in defence of image-worship, which the Emperor Leo, the Isaurian, was making strenuous efforts to suppress. Leo in revenge is said to have forged a treasonable letter, purporting to be from Damascenus, and to have sent it to his caliph, who ordered the traitor's right hand to be cut off. According to the narrative Damascenus immediately proceeded to prostrate himself before an image of the Virgin Mary, implored her intercession, and had the severed hand miraculously restored. The caliph was convinced by the miracle, and offered to replace Damascenus in his office, but the latter resolved to forsake the world, divided his fortune among his friends and the poor, and betook himself to the monastery of St Sabus, near Jerusalem, where he spent the rest of his life. After the customary probation he was ordained priest by the patriarch of Jerusalem. In his last years he travelled through Syria contending against the iconoclasts, and in the same cause he visited Constantinople at the imminent risk of his life during the reign of Constantine Copronymus. The date of his death is uncertain; the last notice of him is in 754. Damascenus is a saint both in the Greek and in the Latin Church, his festival being observed in the former on 29th November and 4th December, and in the latter on the 6th May. The works of Damascenus give him a foremost place among the theologians of the early Eastern Church, and according to Dorner, he "remains in later times the highest authority in the theological literature of the Greeks." Several treatises have been attributed to him that are probably spurious, but his undoubted works are numerous and embrace a wide range. The most important contains three parts under the general title Πηγὴ γνώσεως (the fountain of knowledge). The first part, entitled Κεφάλαια φιλοσοφικά, is an exposition and application to theology of Aristotle's *Dialectic*. The second, entitled Περὶ αἱρέσεων (of heresies), is a reproduction of the earlier work of Epiphanius, with a continuation giving an account of the heresies that arose after the time of that writer. The third part, entitled Ἔκδοσις ἀκριβὴς τῆς ὀρθοδόξου πίστεως (an accurate exposition of the orthodox faith), is much the most important of the three, containing as it does a complete system of theology founded on the teaching of the fathers and church councils, from the 4th to the 7th century. It thus embodies the finished result of the theological thought of the early Greek Church. Through a Latin translation made by Burgundio of Pisa in the 12th century, it was well known to Peter Lombard and Aquinas, and in this way it influenced the scholastic theology of the West. Damascenus himself has sometimes been called the "Father of Scholasticism," and the "Lombard of the Greeks," but these epithets are appropriate only in a limited sense. On the disputed question of Damascenus's authorship of the interesting Christian romance, *Barlaam and Josaphat*, see note to the article BARLAAM AND JOSAPHAT, vol. iii. p. 375. The works of Damascenus were edited by Le Quien, and published with a valuable introduction in 2 vols. fol., Paris, 1712.

DAMASCENUS, NICOLAUS, a Greek historian and philosopher, born at Damascus, from which he is named. He flourished in the time of Augustus and Herod the Great, with both of whom he was on terms of friendship. He enjoyed the intimate confidence of Herod, who studied philosophy along with him, and employed him on an important political mission to Augustus. Nicolaus survived Herod, and it was through his influence that the succession was secured for Archelaus; but the date of his death, like that of his birth, is unknown. Of his principal work, a universal history in 144 books, composed at the request of Herod, only a few fragments remain. He wrote also an autobiography, of which a good deal has been preserved, a life of Augustus, a life of Herod, and several philosophical works, which are known to us only through a few extracts in other writers. The first edition of the fragments of Nicolaus in a Latin version appeared at Geneva in 1593. The standard edition is that of Orelli (Leipsic, 1804) with a supplement (1811). The volume published in 1804 contains a notice of the life of Nicolaus by the Abbé Sevin.

DAMASCIUS, a celebrated Neo-Platonic philosopher, who was born at Damascus about the middle of the 5th century. He studied at Alexandria, and thence removed to Athens, where he taught philosophy till the close of the heathen schools during the reign of Justinian. Of his works, which consisted chiefly of commentaries on Plato and Aristotle, and of a biography of his teacher Isidorus, some fragments exist in the writings of Photius. What has been preserved of his work entitled *Difficulties and Solutions of the First Principles* has been published by J. Kopp (Frankfort, 1828), and is of considerable value for the account it contains of several ancient philosophers. See Kopp's preface to his edition.

DAMASCUS (Arabic, *Dimeshk esh-Sham*), the capital of Syria, and of a pashalik of the same name, an ancient town, 57 miles from the seaport of Beyrout, in 33° 30′ N. lat. and 36° 18′ E. long. It occupies a site of singular beauty. On the eastern side of the range of Antilibanus is a plain of vast extent, reaching far out into Arabia, and having an elevation of 2200 feet above the sea. The River Barada, the Abana of the Bible, rises in the centre of the mountain range, descends through a sublime ravine, enters the plain, flows across it eastward for 20 miles, and empties itself into a lake, which in the heat of summer becomes a morass. On the banks of the Abana, about a mile from the mouth of the ravine, stands Damascus. The river intersects the city, in a deep rapid current, averaging 50 feet wide. On its northern bank is a large and comparatively modern suburb; but the whole of the ancient walled city, and the principal buildings, are spread over the plain on the south. The Abana is the life of Damascus, and has made it perennial. By an admirable system of channels and pipes, many of them apparently of high antiquity, its waters are not only conveyed through every quarter, but into almost every house, supplying that first requisite of Eastern life and luxury. The river is also extensively used for irrigation. Canals are led off from it at different elevations above the city, and carried far and wide over the surrounding plain, converting what would otherwise be a parched desert into a paradise. The orchards, gardens, vineyards, and fields of Damascus cover a circuit of at least 60 miles, and they owe their almost unrivalled beauty and luxuriance to the Abana. The area irrigated and rendered fertile by it is upwards of 300 square miles in extent, and the River Awaj, the ancient Pharpar, irrigates nearly 100 more. There was truth, therefore, in the boastful words of Naaman (2 Kings v. 12), "Are not Abana and Pharpar, rivers of Damascus, better than all the waters of Israel?"

The view of Damascus from the crest of Antilibanus is scarcely surpassed in the world. The elevation is about 500 feet above the city, which is nearly two miles distant. The distance lends enchantment to the view; for while the peculiar forms of Eastern architecture do not bear close inspection, they look like an Arabian poet's dream when seen from afar. Tapering minarets and swelling domes, tipped with golden crescents, rise above the white-terraced roofs; while in some places their glittering tops appear among the green foliage of the gardens. In the centre of the city stands the Great Mosque, and near it are the gray battlements of the old castle. Away on the south the eye follows a long suburb, while below the ridge on which we stand is the *Merj*, the *Ager Damascenus* of early travellers—a green meadow extending along the river from the mouth of the ravine to the city. The gardens and orchards, which have been so long and so justly celebrated, encompass the whole city, sweeping the base of the bleak hills, like a sea of verdure, and covering an area more than 30 miles in circuit—not uniformly dense, but with open spots here and there. Beyond this circuit are large clumps of trees, dotting the plain almost to the horizon. The varied tints of the foliage greatly enhance the beauty of this picture.

The population of Damascus is estimated at 150,000. Of these about 19,000 are Christians, 6000 Jews, and the rest Mahometans. Of the Christians 8000 belong to the Greek or Eastern Church, and an equal number to the Catholic; and there are besides small communities of Syrians, Maronites, Armenians, and Protestants. In the plain round Damascus, watered by the Abana and Pharpar, there are 140 villages, with an aggregate population of 50,000, of whom about 1000 are Christians, and 2000 Druzes.

Until the capture of the city by Ibrahim Pasha of Egypt, in 1832, no foreign consul was permitted to enter it, and no Christian or Jew was suffered to ride through the streets. The massacre of 1860 showed that the spirit of the people had not changed, and was only kept in check by Turkish troops. A few of the Mahometans, however, are now more enlightened, and have gained a high position as merchants. The Christians are enterprizing and industrious, and a large proportion of the trade of the city is in their hands. Until the massacre they were rapidly advancing in numbers, wealth, and influence; but that event gave a fatal blow to their prosperity. The Jews are the leading bankers and money-dealers. Both Christians and Jews occupy distinct quarters of the city.

The manufactures of the city consist principally of silks, which are exported to Egypt, Baghdad, and Persia; coarse woollen cloth for the *abbas*, or cloaks, worn by the peasants of Syria; cotton cloths, chiefly for home use; gold and silver ornaments, arms, and household utensils. An extensive trade is carried on with the Bedouins of the Arabian desert. The bazaars are always crowded; and on Friday, the market day, it is difficult to pass through them. On the arrival of the great pilgrim caravan, in going to or returning from Mecca, the city presents a gay and animated appearance. Vast multitudes of Persians, Circassians, Anatolians, and Turks throng the streets, and each pilgrim is a merchant for the time being, buying or selling as the case may be.

The bazaars have long been celebrated, and are among the best in the East. They are narrow covered lanes, with ranges of open stalls on each side. Each department of trade has its own quarter or section, where may be seen Manchester prints, Persian and Turkish carpets, French silks, Sheffield cutlery, amber mouth-pieces for pipes, antique China, Cashmere shawls, Mocha coffee, Dutch sugar, Damascus swords, and tobacco from Lebanon and Baghdad.

The khans of Damascus are spacious, and some of them splendid buildings. They are public marts where the leading merchants meet, and expose their wares for sale. The largest is Khan had Pasha, situated in the Bizurîyeh, or "Seed Bazaar." It was erected about 125 years ago, and bears the name of its founder. The gate is a noble specimen of Moorish architecture. The interior is a quadrangle, with a gallery, and a domed roof supported on massive piers. Round it are ranges of small chambers, like cells, in which the goods are stored. All the khans are upon the same plan.

The private houses are the admiration of every visitor. No contrast could be greater than that between the exterior and interior; the rough mud walls give poor promise of splendour within. The entrance is usually by a low door, and through a narrow winding passage which leads to the outer court, where the master has his reception room. From this another winding passage leads to the harem, which is the principal part of the house. The plan of all is the same—an open court, with a tesselated pavement, and one or two marble fountains; orange and lemon trees, flowering shrubs, and climbing plants give freshness and fragrance. All the apartments open into the court; and on the south side is an open alcove, with a marble floor, and raised dais round three sides, covered with cushions; the front wall is supported by an ornamented Saracenic arch. The decoration of some of the rooms is gorgeous, the walls being covered in part with mosaics and in part with carved work, while the ceilings are rich in arabesque ornaments, elaborately gilt. A few of the modern Jewish houses have been embellished at an enormous cost, but they are wanting in taste.

Antiquities.—Although Damascus is one of the oldest cities in the world, its antiquities do not present such a striking appearance as those of many other places of far less note. This is in some measure owing to the fact that the old materials have been largely used in the erection of modern houses. The walls which inclosed the old city are about three miles in circuit, and their foundations are probably of the age of the Seleucidæ. Some of the Roman gateways are in tolerable preservation. Through the centre of the city, from the east to the west gate, ran the *Via Recta*, "the street called Straight," lined on each side with a double colonnade. It is now mostly built over, but many fragments of columns remain *in situ*.

The castle, which stands at the north-west corner, on the bank of the river, is a quadrangle 280 yards long by 200 wide, surrounded by a moat. The exterior walls are in good preservation, but the interior is a heap of ruins. It is not easy to determine the date of its erection, or to say whether Romans, Byzantines, or Saracens contributed most to it. The foundations are not later, and may be earlier, than the Roman age. A few vaults beneath the exterior battlements are used as magazines, and contain some pieces of old armour, with bows, arrows, and other weapons.

The Great Mosque is the most important building in the city. It stands near the castle, and is now, unfortunately, so closely hemmed in with bazaars and houses that its exterior is concealed from view. It occupies a quadrangle 163 yards long by 108 wide, facing the cardinal points. Along the north side is an open court surrounded by cloisters, resting on pillars of granite, marble, and limestone. The mosque itself extends along the whole southern side, and its interior dimensions are 431 feet by 125 feet. It is divided into three aisles of equal breadth, by two ranges of Corinthian columns 22 feet high, supporting round arches. In the centre is a dome resting on four massive piers. Underneath is said to be a cave in which the head of John the Baptist is preserved in a golden casket. The mosque has three minarets, one of which is 250 feet high, and upon it, according to Moslem tradition, Jesus will descend on the day of judgment.

The style and workmanship of three periods are distinguishable in the building. There are the massive foundations and exterior colonnades of a Greek or Roman temple. There are next the round-topped windows and ornamented doorway of an early Christian church. Over the door is an inscription in Greek to the following effect:—"Thy kingdom, O Christ, is an everlasting kingdom, and thy dominion endureth throughout all generations." Then there are the minarets, dome, and arcades of Saracenic origin.

Round the mosque are traces of a court, 1100 feet long by 800 feet wide, encompassed by colonnades similar to those of the temple of Herod in Jerusalem, and the temple of the sun at Palmyra. It seems highly probable that this was the site of the temple of Rimmon, mentioned in 2 Kings v. 18, and that it became in after times the seat of the worship of Jupiter. In the 4th century it was converted into a church, and dedicated to John the Baptist; and in the beginning of the 8th century it was seized by the Mahometans.

There are many other mosques in the city, some of them large and beautiful. Among them are the *Tekiyeh*, on the bank of the Abana at the western end of the city, founded by Sultan Selim, in 1516, for the accommodation of poor pilgrims, the graceful dome of which, flanked by two slender minarets, is seen from afar, and the *Senanîyeh*, in the centre of the city, distinguished by a minaret coated with green tiles, for the manufacture of which Damascus was once celebrated. It was built by Senan Pasha in 1581, and has a splendid cloistered court. There are also small and richly decorated chapels, connected with the tombs of Saladin, Bibars, and some other great princes. Among the traditional holy places of Damascus are the sanctuary of Abraham, at Burzeh, three miles north of the city; the house of Naaman, now a leper hospital; the scene of Paul's conversion, near the east gate; the house of Ananias; and the spot where the apostle was let down from the wall.

The *Haj*, or pilgrim caravan, is one of the great sights of Damascus. It starts for Mecca each year on the 15th of the month Shawall. The *muhmil*, a canopy of green silk containing the new covering sent by the sultan for the *Kaabah*, is carried on the back of a dromedary, and is followed by the pasha, and great dignitaries of the city, escorted by the military. The streets and house-tops along the line of the procession are crowded with people. The caravan returns after an absence of four months. It is rapidly declining in numbers and importance.

The *history* of Damascus reaches far back into the mists of antiquity. Josephus says the city was founded by Uz, the son of Aram; and the name of its territory, as given in the Bible, namely, *Aram Damesk* (2 Sam. viii. 6), is almost identical with its modern Arab name, which means "Damascus of Syria." It was already a noted place in the days of Abraham, whose steward was "Eliezer of Damascus" (Gen. xv. 2). Some centuries later, it became, under the rule of the Hadads, the rival of Israel (1 Kings xv., xx., and xxii.). During that period it was the scene of the romantic story of the leper Naaman (2 Kings v.). A change of dynasty took place in the time of the prophet Elisha, when Hadad was murdered by Hazael (2 Kings viii.); but it was soon afterwards captured by Tiglath-pileser, and its people carried away to Assyria (2 Kings xvi. 9; Isa. xvii. 1–3). Colonies from Assyria were then placed in the city, and it continued for many centuries a dependency of that empire. It was taken by Alexander the Great, and after his death was attached to the kingdom of the Seleucidæ. In 64 B.C. the Romans under Pompey captured it, and under their rule it remained till 37 A.D., when Aretas, king of Arabia, taking advantage of the death of the Emperor Tiberius, seized and held it during the time of St Paul's visit (2 Cor xi. 32; Acts ix.).

Christianity appears to have spread rapidly in and around Damascus, as its metropolitan, with seven of his suffragans, was present at the Council of Nice in 325 A.D. About seventy years later the great temple was converted into a Christian church. In 634 the city fell into the hands of the Mahometans; and a few years later it became for a short period the capital of the Mahometan empire. The caliphs who ruled it adorned the city with many splendid buildings, and changed the cathedral into a mosque. A stormy period of four centuries now passed over Damascus, and then an unsuccessful attempt was made to capture it by the crusaders under Baldwin. The reigns of Noureddin, and his more distinguished successor Saladin, form bright epochs in the history of the city. Two centuries later came Tamerlane. Arab writers call him "the Wild Beast," and he deserves the name. After the city had surrendered to him, and every male had paid the redemption money which he himself had assessed, he urged his soldiers to an indiscriminate massacre. Never had the city so fearfully experienced the horrors of conquest. Its wealth, its stores of antiquities, and rich fabrics were seized; its palaces were pillaged and left in ashes; its libraries, filled with the literature of the period of the caliphs, and with the writings of the fathers of the Eastern Church, were destroyed. Tradition says that of the large Christian population only a single family escaped.

A century later Damascus fell into the hands of the Turks under Sultan Selim, and has since acknowledged their supremacy. In 1832 it was taken by the Egyptians under Ibrahim Pasha, the celebrated general and son of Mehemet Ali, and this conquest is chiefly remarkable for the effect it produced on the inhabitants. The city was then opened for the first time to the representatives of foreign powers. The British consul entered it mounted, and in full costume, escorted by Egyptian soldiers; and the first effectual check was given to Moslem fanaticism. In 1841 the Egyptians were driven out by the English, and Damascus with the rest of Syria reverted to the direct sway of the Sultan.

A Protestant mission was established in Damascus in 1843, and has succeeded, chiefly by its schools and the distribution of books, in greatly advancing the cause of education in and around the city.

The only incident worthy of record since that time is the massacre of 1860. The Moslem population, taking advantage of disturbances among the Druzes in Lebanon, rose against the Christians on the afternoon of Monday the 9th of July, and on that and the two following days burned the whole Christian quarter, and massacred in cold blood about 3000 adult males. But no estimate of the numbers actually murdered can give any adequate idea of the terrible results of the massacre. Thousands who escaped the sword died of wounds, or famine, or subsequent privation. The Christian quarter has been mostly rebuilt, but many of the most eminent and enterprizing Christian merchants removed to Beyrout and Egypt. Yet notwithstanding the fanaticism of its people, and the misgovernment of the Turks, Damascus is progressing. Schools have been established; the streets have been cleared of rubbish, and widened; sanitary regulations are enforced; and the fine new road recently made by a French company over Lebanon to Beyrout has given a great impetus to trade and manufacture. (J. L. P.)

DAMASK is a technical term applied to several distinct manufactures or manufacturing operations, from the fact that such products or operations were intimately connected with Damascus when that city was a great manufacturing centre. The principal application of the term is to variegated textile manufactures; and at the present day it generally indicates a twilled linen texture richly figured in the weaving with flowers, fruits, or ornamental scrolls, or with large designs of any description. The texture to which the name, however, was originally applied was of silk, with patterns elaborately woven in colours and sometimes in gold thread.

"China, no doubt," says Dr Rock (*Catalogue of Textile Fabrics, South Kensington Museum*), "was the first country to ornament its silken webs with a pattern. India, Persia, and Syria, then Byzantine Greece followed, but at long intervals between, in China's footsteps. Stuffs so figured brought with them to the West the name 'diaspron' or diaper, bestowed upon them at Constantinople. But about the twelfth century the city of Damascus, even then long celebrated for its looms, so far outstripped all other places for beauty of design, that her silken textiles were in demand everywhere; and thus, as often happens, traders fastened the name of Damascen or Damask upon every silken fabric richly wrought and curiously designed, no matter whether it came or not from Damascus."

Linen damasks, which are employed principally for table-cloths, napkins, and towels, are manufactured at Dunfermline, Kirkcaldy, and some other places in Fifeshire, Scotland; at Lisburn and Belfast, in Ireland; and in Holland, Belgium, and Russia. The fabric is usually woven in from four to eight leaf twills, that is with the weft intersecting the warp from every fourth up to every eighth thread; and the pattern is produced by varying the intersections on principles which will be explained under WEAVING. Cotton damasks, in imitation of the linen manufactures, are now much woven and used for toilet covers and for similar purposes. Colours are frequently introduced in cotton damasks, manufactured in Glasgow and Paisley for dress purposes, and sent to the Indian and West Indian market. Silk damasks are manufactured for curtains and for other upholstery uses in all the great silk-weaving centres.

DAMASK STEEL, or Damascus Steel, has a peculiar watered or streaked appearance, as seen in the blades of fine swords and other weapons of Oriental manufacture. Several methods of producing the damask grain may be pursued successfully, one of which is described under Cutlery. The art of producing damask steel has been generally practised in Oriental countries from a remote period, the most famous blades having come from Ispahan, Khorasan, and Shiraz in Persia. With great brightness and ductility the metal combines peculiar elasticity, and a capacity for taking and retaining a very fine edge.

DAMASKEENING, or Damascening, is the art of incrusting wire of gold (and sometimes of silver) on the surface of iron, steel, or bronze. The surface upon which the pattern is to be traced is finely undercut with a sharp instrument, and the gold thread by hammering is forced into and securely held by the minute furrows of the cut surface. This system of ornamentation is peculiarly Oriental, having been much practised by the early goldsmiths of Damascus. It is still eminently characteristic of Persian metal work.

DAMASUS, the name of two Popes.

Damasus I. stands thirty-ninth in the roll of bishops of Rome. Every one of the first fifty-six Popes has been canonized; and the subject of this notice is entitled to the style of St Damasus. It is stated that he was by birth a Spaniard; but the more authentic account is that he was born at Guimaraens, in Portugal, in or about the year 304. Other writers have maintained that, though of Portuguese extraction, he was born in Rome. It seems certain that he went thither at an early age; and, though he was forty-eight years old when deacon's orders were conferred on him, he had at an early age been admitted to the ecclesiastical career as a "reader" and secretary of the church. And he is said in that capacity to have compiled the "Acts" of the martyrs Petrus and Marcellinus. The writer in the *Biographie Universelle* says that he succeeded St Liberins on the Papal throne, but this is an error. On the death of St Liberius, St Felix II. succeeded him, and reigned one year and three months; and on his death Damasus was elected, in 366. When St Liberius was exiled from Rome, Damasus accompanied him to Milan. He received priest's orders, was made cardinal during the pontificate of Felix II., and in 366 was elected by the Roman clergy to the Papacy in the sixty-second year of his age. He died in 384.

The most important event of his papacy was the publication of the law made by the Emperor Valentinian in 370, to restrain the clergy from influencing their penitents to enrich them. This law of 370 is most important and noteworthy from having been the first of the long series of attempts to effect the same object, which, revived by Frederick II. and by Edward I. of England, have occupied the attention of the legislators of so many generations from the time of Damasus even to the present day. Valentinian ordered that ecclesiastics and monks should not frequent the houses of widows and single women. Confessors were prohibited from receiving any gift or legacy from their penitents, and all donations or bequests made in contravention of this law were declared to be null and void. Catholic writers represent this law as having been suggested to the emperor by the Pope. Anti-Catholic authors say that it was imposed on the Pope by the emperor; and it is impossible to avoid feeling that the latter is by far the more probable statement. In any case the law in question furnishes a highly curious and suggestive picture of the church as it was under St Damasus. And St Jerome himself, who had been invited to come to Rome by Damasus, and acted as his secretary, confesses that the clergy had by their conduct merited a law which placed them under restraints such as were not found necessary for mimes, charioteers, and comedians.[1]

Damasus had to go through a severe struggle for his throne with an Anti-pope named Ursinus or Urasinus. Of course the ecclesiastical writers represent the successful one of the antagonists to have been animated by the most sincere and heavenly-minded desires for peace and concord. But the pagan historian Ammianus, as quoted by Gibbon, as well as another authority cited by him, would go to show that the two competitors for the position of vicar of Christ were equally savage and ferocious; and that the 137 dead bodies found in the Liberian Basilica (the church of St Maria Maggiore), after a struggle between the parties, were due to the ferocity of the orthodox Pope's adherents rather than to those of the Anti-pope.

Gibbon says that Damasus "had the good sense or the good fortune to engage in his service the zeal and abilities of the learned Jerome, and the grateful saint has celebrated the merit and purity of a very ambiguous character." The official ecclesiastical writers tell us nothing about the 137 dead bodies in the Liberian Basilica, but much of the sainted Pope's decisions as to the nature of the Trinity, and inquire learnedly whether or no it were he who first ordered the Hallelujah to be sung in the Roman churches at Easter. It seems more certain that it was to him that the pagan præfect of Rome, Prætextatus, replied, that he would become a Christian to-morrow if they would make him a bishop!

Damasus II. was a native of Bavaria, of the name of Papon, who became bishop of Brixen in Tyrol, and was elected the 155th Pope on the death of Clement II. in 1047, mainly by the influence of the Emperor Henry III. He reigned but twenty-three days, having died on the 8th of August at Palestrina, whither he had gone to escape the heat of Rome. The shortness of his reign, and the fact that previously to his election he was an obscure stranger, have been the causes that very little is known about him.

DAMAUN, a seaport town of Western India, in the Surat district, is a Portuguese settlement, although included within the geographical limits of the presidency of Bombay, in 20° 24′ N. lat. and 72° 53′ E. long. It is situated on the Damaungangá river, which rises in the Western Gháts, about 40 miles to the eastward. The river has a bar at its mouth, with only 2 feet of water at low spring tides and 18 or 20 feet inside. Outside the bar is a roadstead in which vessels may anchor in 8 fathoms. A rampart with 10 bastions and 2 gateways surrounds the town. The surrounding country is fruitful and pleasant except in the rainy season, when it is extensively inundated. Damaun was sacked and burnt by the Portuguese in 1531. It was subsequently rebuilt, and in 1558 was taken from the Indians by the Portuguese, who converted the mosque into a Christian church. From that time it has remained in their hands. The Portuguese territory surrounding the town is about ten miles in length from north to south, and about five in breadth.

D'AMBOISE, George (1460–1510), a French cardinal and minister of state, was born in the year 1460. He belonged to a noble family possessed of considerable influence, and he was only fourteen when his father procured for him the bishopric of Montauban, and Louis XI. appointed him one of his almoners. On arriving at manhood D'Amboise attached himself to the party of the duke of Orleans, in whose cause he suffered imprisonment, and on whose return to the royal favour he was elevated to the archbishopric of Narbonne, which after some time he

[1] Pudet dicere, sacerdotes idolorum, mimi, et aurigæ hereditates capiunt. Solis clericis ac monachis hac lege prohibetur. Et non prohibetur a persecutoribus, sed a principibus Christianis. Nec de lege queror, sed doleo cur meruerimus hanc legem."

changed for that of Rouen. On the appointment of the duke of Orleans as governor of Normandy, D'Amboise became his lieutenant-general; and he has the credit of having freed the province from the bandits which infested it, and of having diminished the oppression of the nobles, who consequently (during his absence in Italy) petitioned the king against him. In 1494 the duke of Orleans mounted the throne as Louis XII.; and D'Amboise was suddenly raised to the high position of cardinal and prime minister. His administration was, in many respects, well-intentioned and useful. Having the good fortune to serve a king who was both economic and just, he was able to diminish the imposts, to introduce order among the soldiery, to establish the Great Council for the trial of cases in which one of the parties possessed authority that overawed the ordinary courts, and otherwise to improve the execution of justice. He was also zealous for the reform of the church; and it is greatly to his credit that he did not avail himself of the extremely favourable opportunities he possessed of becoming a pluralist. He regularly spent a large income in charity, and he laboured strenuously to stay the progress of the plague and famine which broke out in 1504. His foreign policy was animated by two aims—to increase the French power in Italy, and to seat himself on the Papal throne; and these aims he sought to achieve by diplomacy, not by force. He, however, sympathized with, and took part in, the campaign which was commenced in 1499 for the conquest of Milan. Soon after he was made legate *a latere*; and on the death of Alexander VI. he aspired to the Papacy. He had French troops at the gates of Rome, by means of which he could easily have frightened the conclave, and induced them to elect him; but he was persuaded to trust to his influence; the troops were dismissed, and an Italian was appointed as Pius III.; and again, on the death of Pius within the month, another Italian, Julius II., was chosen. In 1508 France, still under the ministry of D'Amboise, joined the League of Cambray against Venice; and it was on his journey into Italy that he was seized at the city of Lyons with a fatal attack of gout in the stomach. He died there at the age of fifty on the 25th May 1510.

DAMIENS, Robert François (1715-1757), who attained notoriety by his attack on Louis XV. of France in 1757, was born in a village near Arras in 1715, and early enlisted in the army. After his discharge, he became a menial in the College of the Jesuits in Paris, and was dismissed from this as well as from other employments for misconduct. Indeed his conduct was such as to earn for him the name of Robert le Diable. During the disputes of Clement XI. with the Parliament of Paris, the mind of Damiens seems to have been excited by the ecclesiastical disorganization which followed the refusal of the clergy to grant the sacraments to the Jansenists and Convulsionnaires; and he appears to have thought that peace would be restored by the death of the king. He, however, asserted, perhaps with truth, that he only intended to frighten the king without wounding him severely. In January 1757, as the king was entering his carriage, he rushed forward and stabbed him with a knife, inflicting only a slight wound. He made no attempt to escape, and was at once seized. He was condemned as a regicide, and sentenced to be torn in pieces by horses in the Place de Grève. Before being put to death he was barbarously tortured with red-hot pincers, and molten wax, lead, and boiling oil were poured into his wounds. After his death his house was razed to the ground, his brothers and sisters were ordered to change their names, and his father, wife, and daughter were banished from France.

DAMIETTA, or, as it is called by the natives, Damiat, town of Lower Egypt, on the great eastern branch of the Nile, about six miles from its mouth (the ancient Ostium Phatniticum), and nearly 100 miles from Cairo, with which it is connected by rail. After the metropolis and Alexandria, Damietta is the largest town in Egypt, and contains a population of about 29,000, consisting for the most part of Egyptians, with a few Greeks and Syrians. The town, as a whole, is ill-built and straggling, and is only redeemed from meanness by the presence of some handsome mosques, bazaars, and public baths. The houses of the better classes are brick edifices situated on the water-edge, and furnished with terraces, on which the inmates enjoy the cool river-breezes of the evening. The general trade of Damietta was at one time considerable, but has in great part been absorbed by Alexandria. It has still, however, a considerable coasting trade with Syria and the Levant, and forms the outlet for the rice and flax grown in the surrounding country. The lake Menzaleh yields large supplies of fish, which are dried and salted, and furnish an important article of export trade. Coffee and dates are the other articles most largely exported. Mehemet Ali established a military school in the town with accommodation for 400 pupils, as also a cotton factory and an extensive rice-mill. Damietta is a corruption of the word *Thamiatis.* The original town was four miles nearer the sea than the modern city, and first rose into importance on the decay of Pelusium. When it passed into the hands of the Saracens it became a place of great wealth and commerce, and was therefore frequently attacked by the crusaders. The most remarkable of these sieges lasted eighteen months, from June 1218 to November 1219; another in 1249 was conducted in person by Louis IX. of France, who, however, was soon after taken prisoner and compelled to purchase his freedom by restoring the city to its Saracen owners. To obviate these attacks the Egyptian Sultan Bibars blocked up the Phatnitic mouth of the Nile (about 1260), razed old Damietta to the ground, and transferred the inhabitants to the site of the modern town. From this circumstance large ships cannot now sail up the Nile, and are obliged to discharge their cargoes outside the bar. The French took possession of the town in 1798, and in the following year beat the Turks in the neighbourhood; but they were expelled by the English under Sir Sydney Smith.

DAMÎRÎ (1341-1405), sometimes spelt Domaîrî, or, with the Arabic article, Ad-Damîrî, is really an adjective of relation applied to a person or thing belonging to one of the two contiguous towns of North and South Damîrah, near Damietta, in Egypt. Under this name is usually understood a well-known Arabian writer on canon law, who is at the same time the author of a treatise on natural history, which in the East has attained considerable celebrity. His full name and title is Kemâl ud-den Abu'l Bagâ Muhammed Ben Musa Ben Isa ad-Damîrî Ash-Skafeî. He was born in Cairo in the year 742 of the Hegira (1341 a.d.), and died there in the year 808 (1405). Damîrî's reputation, so far as the Western nations are concerned, is not based upon his work as a jurist, but wholly upon his natural history, which is entitled *The Life of Animals* (Hayât'ul Haiwân). In this treatise the author gives the names of 931 beasts, birds, fishes, and insects with which he was (probably rarely by personal knowledge) acquainted, arranging these alphabetically, and giving a longer or shorter account of their nature and peculiarities, according as the data, actual or fabulous, in his possession would allow him. As might have been anticipated, he is more especially copious and minute when he comes to treat of animals like the lion and the camel; but in all cases he defines the orthography and vocalization of the name, gives the forms of the plurals and feminines, and supplies the local or vernacular titles by which the animals were known. It is unnecessary to say that Damîrî does not treat natural history in the exact and systematic manner of the modern zoologist. Not only would that have been impossible at the time at which he lived, but he himself did not profess to be a scientific observer, and he was induced to prepare his work on natural history in consequence of the gross ignorance of this subject which was exhibited by many of the theologians of the period. His exposition of the natural history of his country is essentially the result of his interest in theological and legal matters, and his wide acquaintance with the learned culture of the Arabic language, and therefore is from a scientific point of view a mere compilation; and at the same time his literary knowledge induced him to interrupt the scientific continuity of his narrative by disquisitions of a totally irrelevant character. Thus, in the middle of his article on the Goose, he inserts a consecutive sketch of the history of the Caliphate, from the death of Ali to the accession of Al-Muktafi—a period of nearly 800 years—at the end of which historical interlude he resumes his article, as if it had not been interrupted. In spite, however, of its deficiencies, the *Life of Animals* has an interest of its own and a permanent value to scholars. All references in the *Sunna* to any particular animal are mentioned, anecdotes relating to it are introduced, its uses in supplying articles of the materia medica are pointed out, the means to counteract its noxious qualities are indicated, the lawfulness of using its flesh as food is discussed, the proverbs which allude to it are recounted, and citations from the poets who have noticed it are quoted. The amount of discursive reading shown in the work is very great, as it contains quotations from 560 prose authors, and from the divâns, or collected editions, of 199 poets. Upon the whole, therefore, the literary value of the treatise to scholars is by no means small, as it exhibits the natural history of his age and country surrounded by the associations with which the experience and literature of the Arabs had invested it.

After finishing his work on natural history, Damîrî reproduced it in a compendious form, and it has thus come down to us in a large and a smaller recension. Others, moreover, (such as Al-Usyûti) formed abridgments of it. Manuscript copies of the work exist in many public libraries, and the larger edition has been printed, in the original language, at Cairo, in 2 vols. folio, in 1278 A.H. (1861 A.D.) The European scholar who made the first and amplest use of this work was S. Bochart, in his *Hierozoicon*, which first appeared in 1663.

The other works of Damîrî have not obtained, even in the East, the popularity accorded to his *Life of Animals*. His most prominent work on legal subjects is a commentary in four volumes on the *Minhâj* of An-Nawawi.

Haji Chalfa, ed. Fluegel, vol. iii. p. 122; Nicoll, *Biblioth. Bodlei. MSS. Orient. Cat.*; Fluegel's *Arabische Hdss. der K. K. Bibliothek zu Wien*; Wuestenfeld's *Arabische Aerzte und Naturforscher*, &c.

DAMIRON, JEAN PHILIBERT (1794–1862), a French writer on philosophy, was born at Belleville in 1794. At nineteen he entered the normal school, where he studied under Burnouf, Villemain, and Cousin. After teaching for several years in provincial towns, he came to Paris, where he lectured on philosophy in various institutions, and finally became professor in the normal school, and titular professor at the Sorbonne. In 1824 he took part with Dubois and Jouffroy in the establishment of the *Globe*; and he was also a member of the committee of the society which took for its motto *Aide-toi, le Ciel t'aidera*. In 1833 he was appointed chevalier of the Legion of Honour, and in 1836 member of the Academy of Moral Sciences. Damiron died at Paris on the 11th January 1862.

The chief works of Damiron, of which the best are his accounts of French philosophers, are the following:—An edition of the *Nouveaux Mélanges Philosophiques de Jouffroy* (1842), with a notice of the author, in which Damiron softened and omitted several expressions used by Jouffroy, which were opposed to the system of education adopted by the Sorbonne, an article which gave rise to a bitter controversy, and to a book by Pierre Leroux, *De la Mutilation des Manuscrits de M. Jouffroy* (1843); *Essai sur l'histoire de la philosophie en France au XIX. siècle* (1828, 3rd ed. 1834); *Essai sur l'histoire de la philosophie en France au XVII. siècle* (1846); *Mémoires à servir pour l'histoire de la philosophie en France au XVIII. siècle* (1858–64); *Cours de philosophie*; *De la Providence* (1849, 1850).

DAMMAR, or DAMMER, a resin, or rather series of resins, of the copal kind, obtained from various trees in India and the islands of the Eastern Archipelago. The resin known as dammar in British commerce is the produce of a huge pine tree, *Dammara orientalis*, which grows in Java, Sumatra, Borneo, and other Eastern islands. It oozes in large quantities from the tree in a soft viscous state, with a highly aromatic odour, which, however, it loses as it hardens by exposure. The resin is much esteemed in Oriental communities for incense burning. Dammar is imported into England by way of Singapore; and as found in British markets it is a hard, transparent, brittle, straw-coloured resin, destitute of odour. It is readily soluble in ether, benzole, and chloroform, and with oil of turpentine it forms a fine transparent varnish which dries clear, smooth, and hard. The Kaurie gum, or Dammar of New Zealand, is closely allied, both in source and properties, being produced by *Dammara australis*. Much of the New Zealand resin is found fossil in circumstances analogous to the conditions under which the fossil copal of Zanzibar is obtained. Dammar is besides a generic Indian name for various other resins, which, however, are little known in western commerce. Of these the principal are Black Dammar (the Hindustanee Kala-damar), yielded by *Canarium strictum*, and White Dammar, or Piney Varnish (Sufed-damar), the produce of *Vateria indica*. Sal Dammar (Damar) is obtained from *Shorea robusta*; *Hopea micrantha* is the source of Rock Dammar (the Malay Dammer-batu); and other species yield resins which are similarly named, and differ little in physical properties.

DAMOCLES, one of the courtiers of Dionysius, tyrant of Syracuse. When he spoke in extravagant terms of the happiness of his sovereign, Dionysius is said to have placed him at a sumptuous banquet, with a naked sword suspended over his head by a single hair.

DAMON, a Pythagorean, celebrated for his disinterested affection for Pythias, or Phyntias, a member of the same sect. Condemned to death by Dionysius I. of Syracuse, Pythias begged to be set at liberty for a short time that he might arrange his affairs. Damon pledged his life for the return of his friend; and Pythias faithfully returned before the appointed day of execution. The tyrant, to express his admiration of their fidelity, released both the friends, and begged to be admitted to their friendship.

DAMPIER, WILLIAM (*c.* 1652–*c.* 1712), an English navigator, was born at East Coker, Somersetshire, about 1652. Having early become an orphan, he was removed from the Latin school, and placed with the master of a ship at Weymouth, in which he made a voyage to Newfoundland. On his return he engaged himself as a common sailor in a voyage to the East Indies. He served in 1673 in the Dutch war under Sir Edward Sprague, and was present at two engagements; but the declining state of his health induced him to come on shore, and remove to the country, where he remained some time. In the year following he became an under-manager of a Jamaica estate, but continued only a short time in this situation. He afterwards engaged in the coasting trade, and thus acquired an accurate knowledge of all the ports and bays of the island. He made two voyages to the Bay of Campeachy, and remained for some time with the logwood-cutters, as a common workman. Of this residence he published an interesting account in the work noted below.

Satisfied with the knowledge which he had obtained of the nature of the trade and country, he returned to Jamaica, and thence proceeded to England, where he arrived in 1678. About the beginning of the year following he went out to Jamaica as a passenger, with the intention of revisiting the Bay of Campeachy; but he was persuaded to join a party of buccaneers, with whom he crossed the Isthmus of Darien, pent the year 1680 on the Peruvian coast, and was occasionally successful in plundering the towns. After serving with another privateering expedition in the Spanish Main, he engaged with a captain named Cook for a privateering voyage against the Spaniards in the South Seas. They sailed in the month of August 1683, touched at the coast of Guinea, and then proceeded round Cape Horn into the Pacific Ocean. Having fallen in with a ship from London, which had sailed on a similar expedition, they joined company; and, touching at the island of Juan Fernandez, they made the coast of South America, cruising along Chili and Peru. They took some prizes; and with these they proceeded to the Mexican coast, which they fell in with near Cape Blanco. While they lay here Captain Cook died; and the command devolved on Captain Davis. Having separated from the London ship, they were joined by another commanded by Captain Swan. An attempt to plunder the town of Guayaquil was unsuccessful, but at the mouth of the river they took some vessels which had about 1000 slaves on board. They next attacked a Spanish fleet which was laden with the treasure of the Peruvian mines, but were unsuccesful, being ill supported by some French ships which had joined them.

The English ships, afterwards cruising along the coast of Mexico, landed, took the town of Puebla Nova, and burnt two others. Dampier, leaving Davis, went on board Swan's ship, and proceeded with him along the northern parts of Mexico, as far as the southern part of California. During this expedition they frequently landed for the purpose of plunder; but the loss of fifty of the party during one of these incursions so discouraged them that they relinquished all further attempts on these coasts. Swan then proposed to run across the Pacific Ocean, and return by the East Indies; and, in hopes of a successful cruise off the Manillas, the crew were persuaded, with a very slender stock of provisions, to risk this long passage. They started on the 31st March 1686. On reaching Mindanao the majority mutinied, and Dampier, joining them, sailed with the ship, leaving Swan and some others on the island. After cruising some time off Manilla, and having careened their vessel at Pulo Condore, in 1687, they were driven to the Chinese coast, made the circuit of Luzon and Mindanao, passed through the group of Spice Islands, and reached the coast of Australia in the beginning of 1688. In March they cruised along the west coast of Sumatra, and touched at the Nicobar Islands, where Dampier, at his own request, and two other Englishmen, a Portuguese, and some Malays, were set on shore. Dampier's object was to establish a trade in ambergris. He and his companions contrived to navigate a canoe from Achin to Sumatra; but the fatigues and distress of the voyage proved fatal to several of them, who were carried off by fever, while Dampier himself had scarcely recovered at the end of a twelvemonth. After making several voyages to different places of the East Indies, he acted for some time as gunner to the English fort of Bencoolen. In 1691, wishing to revisit his native country, he embarked on board a ship bound for England, where he arrived in September.

It appears that afterwards Dampier was engaged in the king's service. He had the command of the "Roebuck," a sloop of 12 guns and 50 men. This vessel was believed to have been fitted out for some voyage of discovery, for she had twenty months' provisions on board. He sailed from Britain in 1699, touched at the coast of Brazil, and then ran across to the coast of Australia, arriving there on 1st August, somewhere about 26°. lat. Proceeding northwards along the coast, he explored the country in different places where he landed. To procure provisions he found it necessary to direct his course towards Timor; and thence he sailed to the coast of New Guinea, where he arrived December 3. By sailing along to its easternmost extremity he discovered that it was terminated by an island, which he circumnavigated, and named New Britain.

Here it would appear from his own journal that he was prevented from prosecuting his discoveries by the small number of his men, and their eager desire to return home. In May he was again at Timor, and thence he proceeded homeward by Batavia and the Cape of Good Hope. In February 1701 he arrived off the island of Ascension, when the vessel sprung a leak and foundered; and it was with much difficulty that the crew reached the island. They remained at Ascension till they were taken away by an East Indiaman, and conveyed to England. This closes the account of Dampier's life and adventures as it is detailed by himself. It appears, however, from the preface to the third volume, that he was preparing in 1703 for another voyage. It is mentioned also in Woodes Rogers's *Voyage Round the World*, that Dampier had the command of a ship in the South Seas about the year 1705, along with Captain Stradling, whose vessel foundered at sea. Dampier accompanied Woodes Rogers in his voyage round the world in the years 1708–11 in the capacity of pilot. During this expedition Guayaquil was taken, and Dampier had the command of the artillery. The place and time of his death are unknown.

The works of Dampier are well known, and have been often reprinted. They consist of—*A Voyage round the World*, 3 vols. 8vo (1847); *A Supplement to it, describing the countries of Tonquin, Malacca, &c.; Two Voyages to Campeachy; A Discourse of Trade-winds, Seasons, Tides, &c., in the Torrid Zone* (1707); *and a Voyage to New Holland* (1709). His observations are curious and important, and are conveyed in a plain manly style. His nautical remarks show a great deal of professional knowledge. His knowledge of natural history, though not scientific, appears to be accurate and worthy of trust as a record of facts.

DAN, a town of ancient Judea, near the head-waters of the Jordan, inhabited at the time of the Israelitish conquest by a peaceful and commercial population whose name for their city was Laish, or Leshem. It appears to have been even at this early period a sacred city, and hence it was naturally chosen long after by Jeroboam as the seat of one of his golden calves. The Jewish name, which it derived from the tribe to whose lot it fell, became proverbial in the expression "from Dan to Beersheba." The town was plundered by Benhadad of Damascus, and appears from that time to have gradually declined. Its site is probably marked by the mound called Tell-el-Kady, "the hill of the judge," or "the hill of Dan."

DANA, the name of an American family, of which several members have attained eminence. Richard Dana (1699–1772) was a leading barrister of Boston, and a prominent opponent of the Stamp Act. His son, Francis Dana, born in Charlestown in 1743, also began life as a barrister. In 1774 he was chosen to represent Cambridge in the first provincial congress of Massachusetts; and in the following year he visited England, bearing letters to Dr Franklin from several of the patriot leaders. From 1776 to 1780 he was a member of the Massachusetts council; and in 1777 and 1778 he represented Massachusetts in the National Congress. He was also one of the committee appointed to administer military affairs. In 1779 he was appointed secretary of legation to John Adams, the ambassador to England; and for two years (1781–83) he was envoy to St Petersburg. He took an active part in politics till 1791, when, being appointed chief-justice of Massachusetts, he devoted himself to his judicial duties. He died at Cambridge, April 25, 1811. Francis Dana was the father of Richard Henry Dana, born in 1787, the author of *The Buccaneer and other Poems*, and a number of essays, many of which first appeared in the *North American Review*, of which Dana was one of the founders. His son, also named Richard Henry Dana, is an authority on maritime law, and the author of the popular novel *Two Years before the Mast*, which is founded on personal experience, and of *The Seaman's Friend*, or *The Seaman's Manual*.

DANAE, in Greek legend, is known only in connection with her son Perseus (*Iliad*, xiv. 319), and in particular from the circumstances of his birth. Her father Acrisius, king of Argos, having been warned by an oracle that his daughter would bear a son who would put him to death and rule in his stead, sought to prevent this by confining Danae in an underground chamber lined with bronze like the underground treasuries still visible at Mycenæ. But Zeus descended to her in a shower of gold, and she gave birth to Perseus, upon which Acrisius placed her and her infant in a wooden box and consigned them to the sea. After long floating about they were picked up by Dictys, a fisherman who lived with his brother Polydectes on the small island of Seriphus. There she remained till her son had grown up and returned from his expedition of cutting off Medusa's head, when, finding his mother persecuted by Polydectes, Perseus first turned her tormentor and those with him into stone by exhibiting Medusa's head, and then set out with her for Argos. From this point she has no more part in the Greek legend. In Latin legend she goes to Italy and marries Pilumnus or Picumnus. It has been pointed out that Perseus was a solar hero, and his birth in the dark chamber has been compared with the birth of Apollo from Leto, a goddess of the darkness of night. The wooden box in which mother and son floated safely is also compared with the boat of Helios, and the golden rain of Zeus may be the beams of sunlight.

DANAUS, in Greek legend, was the founder of Argos and of the race of Danai, by which name the Argives are designated in Homer. A local feature of Argos was the drought which in summer sealed its numerous small springs, and with this feature Danaus was identified as having made the first well, while his fifty daughters (Danaïdes), seem to represent the many springs of the district. In the lower world they had to carry water in broken vases. It was in searching for water that his daughter Amymone was pursued by a satyr and rescued by Poseidon, the god of that element, who struck out a spring for her with his trident. But while the legend of Danaus thus seems to have been of native Argive origin, he was, in accordance with the tendency at one time of tracing genealogies to Egypt, described as a son of Belus, king of Egypt, and Anchirrhoe, a daughter of the Nile, having a brother Ægyptus. This brother had fifty sons, while Danaus had fifty daughters, and because the latter would not marry their cousins, they were obliged to escape from Egypt with their father Danaus. The sons of Ægyptus pursued them to Argos and besieged them there, till it was agreed by Danaus that they should marry his daughters. But to each of his daughters he gave a knife with injunctions to slay her husband on the marriage-night. Except Hypermnestra they all obeyed, and it was for this that they had to carry water in the lower world. Afterwards he gave them in marriage to the noblest youths of the district who could prove their claims by the greatest speed in the race course.

DANBURY, a town of the United States, in Fairfield county, Connecticut, situated on the Still river, a tributary of the Housatonic, about 53 miles N.N.E. of New York, with which it is connected by rail. Besides the county buildings, it has two national banks, nine churches, a public library, and a high school capable of accommodating 600 pupils. There is a monument, erected in 1854 to the memory of General Wooster, who was mortally wounded in 1777, when the town was burned by the English under General Tryon, and another, of more recent date, to commemorate the other citizens who perished on the same occasion. The principal industry is the manufacture of hats, which was introduced in 1780, and is carried on by ten separate companies; shirts are also largely produced, and sewing machines are constructed. The town, which was incorporated in 1696, had in 1870 a population of 8753. Its Indian name was Pahquioque.

DANBY, FRANCIS (1793–1861), a painter of poetical landscape, who possesses some significance and importance in the English school, was born in the south of Ireland, November 16, 1793. His father farmed a small property he owned near Wexford, and Francis began life in the country, but the death of his father caused the family to remove to Dublin, while he was still a schoolboy, and there his bias to art very quickly developed itself, and superseded any other education. He began to practise drawing at the Royal Dublin Society's schools; and under a Mr O'Connor, an erratic youth of his own age with national peculiarities, he began painting landscape. The capital of Ireland has never shown very much interest in the arts, but there was a youth then rising who afterwards made his mark in archæology, if not in his profession of landscape painting, George Petrie, with whom Danby formed an acquaintance; and all three left for London together in 1813. This expedition, undertaken with very inadequate funds, and no aid, quickly came to an end, and they had to get home again by walking all the way. At Bristol they made a pause, and Danby finding he could get trifling sums for water-colour drawings, remained there working diligently and sending to the London exhibitions pictures of importance. There his large pictures in oil quickly attracted attention. They were very powerful in effect and imaginative in invention; and, had his Upas Tree and the Delivery of the Israelites from Egypt been produced before a greater man, John Martin, had shown the way to express multitude, vastness, and fabulous wonders in architecture, Danby would be properly considered one of the great men in modern painting. The Upas Tree (1820), his most independent and original picture, is, however, a very noble work, not only in invention but in execution; the poison tree, surrounded by the remains of slaves who have been sent to gather its gum, grows alone in a valley of rocks lit by a ghastly moonlight, which is itself a triumph of art. The Delivery of the Israelites (1825) is much more strictly a derivation from Martin. The Royal Academy, however, elected him into their body on the strength of it, thinking by his means to checkmate that master, who did not aspire to Academic honours. He now left Bristol for London, and in 1828 exhibited his Opening of the Sixth Seal at the British Institution, receiving from that body an honorary premium of 200 guineas; and this picture, which was admirably painted, was followed by two others from the Apocalypse, both productions of surprising power, though certainly indebted to the works of a similar species of invention appearing a few years earlier. These were the last of his important and large pictures. He suddenly left London, declaring that he would never live there again, and that the Academy, instead of aiding him, had, somehow or other, used him badly. Some insurmountable domestic difficulty overtook him also, and for eleven or twelve years he lived on the Lake of Geneva, a Bohemian with boat-building fancies, painting only now and then. He returned to England in 1841, when his sons James and Thomas, who have both followed the art with considerable advantage, were growing up. The only additional pictures it is necessary to mention are the Golden Age, and the Evening Gun, the first begun before he left England, the second painted after his return, when he had taken up his abode at Exmouth, where he died February 9, 1861, in his sixty-eighth year. His Upas Tree is now in the South Kensington National Collection by the Townshend bequest, and is held in general respect, but such of his other works as have been lately seen have not maintained his reputation. They have the hot tone and opacity of bronze, and reveal the secret that they have been produced in a darkened studio, and irrespective of the facts and even of the sentiment of living nature. Notwithstanding these drawbacks they must be always interesting from their imaginative motives, and undoubtedly play a noticeable part in the history of English landscape art.

DANCE. The term dancing in its widest sense includes three things:—(1) the spontaneous activity of the muscles under the influence of some strong emotion, such as social joy or religious exultation; (2) definite combinations of graceful movements performed for the sake of the pleasure which the exercise affords to the dancer or to the spectator; (3) carefully trained movements which are meant by the dancer vividly to represent the actions and passions of other people. In the highest sense it seems to be for prose-gesture what song is for the instinctive exclamations of feeling. Pantomime in the emphatic form of dancing scarcely exists in this century, but it has had an important history. Regarded as the outlet or expression of strong feeling, dancing does not require much discussion, for the general rule applies that such demonstrations for a time at least sustain and do not exhaust the flow of feeling. The voice and the facial muscles and many of the organs are affected at the same time, and the result is a high state of vitality which among the spinning Dervishes or in the ecstatic worship of Bacchus and Cybele amounted to something like madness. Even here there is traceable an undulatory movement which, as Mr Spencer says, is "habitually generated by feeling in its bodily discharge." But it is only in the advanced or volitional stage of dancing that we find developed the essential feature of *measure*, which has been said to consist in "the alternation of stronger muscular contractions with weaker ones," an alternation which, except in the cases of savages and children, "is compounded with longer rises and falls in the degree of muscular excitement." In analyzing the state of mind which this measured dancing produces, we must first of all allow for the pleasant glow of excitement caused by the excess of blood sent to the brain. But apart from this, there is an agreeable sense of uniformity in the succession of muscular efforts, and in the spaces described, and also in the period of their recurrence. If the steps of dancing and the intervals of time be not precisely equal, there is still a pleasure depending on the gradually increasing intensity of motion, on the undulation which uniformly rises in order to fall. As Florizel says to Perdita, "When you do dance, I wish you a wave of the sea" (*Winter's Tale*, iv. 3). The mind feels the beauty of emphasis and cadence in muscular motion, just as much as in musical notes. Then, the figure of the dance is frequently a circle or some more graceful curve or series of curves,—a fact which satisfies the dancer as well as the eye of the spectator. But all such effects are intensified by the use of music, which not only brings a perfectly distinct set of pleasurable sensations to dancer and spectator, but by the control of dancing produces an inexpressibly sweet harmony of sound and motion. This harmony is further enriched if there be two dancing together on one plan, or a large company of dancers executing certain evolutions, the success of which depends on the separate harmonies of all the couples. The fundamental condition is that throughout the dance all the dancers keep within their bases of gravity. This is not only required for the dancers' own enjoyment, but, as in the famous Mercury on tiptoe, it is essential to the beautiful effect for the spectator. The idea of much being safely supported by little is what proves attractive in the modern posturing ballet. But this is merely one condition of graceful dancing, and if it be made the chief object, the dancer sinks into the acrobat. These psychological principles have still to be applied to the phenomena presented by the dances of different nations (See Read's *Characteristic National Dances*, 1853).

We shall first consider the varieties of dance which without any apparent mimetic object seem to be suggested by the mere pleasure of movement felt by the performer or by the spectator. In Tigrè the Abyssinians dance the *chassée* step in a circle, and keep time by shrugging their shoulders and working their elbows backwards and forwards. At intervals the dancers squat on the ground, still moving the arms and shoulders in the same way. The Bushmen dance in their low-roofed rooms supporting themselves by sticks; one foot remains motionless, the other dances in a wild irregular manner, while the hands are occupied with the sticks. The Gonds, a hill-tribe of Hindustan, dance generally in pairs, with a shuffling step, the eyes on the ground, the arms close to the body, and the elbows at an angle with the closed hand. Advancing to a point, the dancer suddenly erects his head, and wheels round to the starting point. The women of the Pultooah tribe dance in a circle, moving backwards and forwards in a bent posture. The Santal women, again, are slow and graceful in dance; joining hands, they form themselves into the arc of a circle, towards the centre of which they advance and then retire, moving at the same time slightly towards the right, so as to complete the circle in an hour. The Kukis of Assam have only the rudest possible step, an awkward hop with the knees very much bent. The national dance of the Kamchadale is one of the most violent known, every muscle apparently quivering at every moment. But there, and in some other cases where men and women dance together, there is a trace of deliberate obscenity; the dance is, in fact, a rude representation of sexual passion. It has been said that some of the Tasmanian *corroborics* have a phallic design. The Yucatan dance of *naual* may also be mentioned. The Andamans hop on one foot and swing the arms violently backwards and forwards. The Veddahs jump with both feet together, patting their bodies, or clapping their hands, and make a point of bringing their long hair down in front of the face. In New Caledonia the dance consists of a series of twistings of the body, the feet being lifted alternately, but without change of place. The Fijians jump half round from side to side with their arms akimbo. The only modulation of the Samoan dance is one of time—a *crescendo* movement, which is well-known in the modern ball-room. The Javans are perhaps unique in their distinct and graceful gestures of the hand and fingers. At a Mexican feast called Huitzilopochtli, the noblemen and women danced tied together at the hands, and embracing one another, the arms being thrown over the neck. This resembles the dance variously known as the Greek Bracelet or Brawl, Ὅρμος, or Bearsfeet; but all of them[1] probably are to a certain extent symbolical of the relations between

[1] Compare the Chica of South America, the Fandango of Spain, and the Angrismene or la Fachée of modern Greece. See also *Renraunt de la Bosc* v. 776

the sexes. Actual contact of the partners, however, is quite intelligible as matter of pure dancing; for, apart altogether from the pleasure of the embrace, the harmony of the double rotation adds very much to the enjoyment. In a very old Peruvian dance of ceremony before the Inca, several hundreds of men formed a chain, each taking hold of the hand of the man beyond his immediate neighbour, and the whole body moving forwards and backwards three steps at a time as they approached the throne. In this, as in the national dance of the Coles of Lower Bengal, there was perhaps a suggestion of "l'union fait le force." In Yucatan stilts were occasionally used for dancing.

It seldom happens that dancing takes place without accompaniment, either by the dancer or by others. This is not merely because the feelings which find relief in dancing express themselves at the same time in other forms; in some cases, indeed, the vocal and instrumental elements largely predominate, and form the ground-work of the whole emotional demonstration. Whether they do so or not will of course depend on the intellectual advancement of the nation or tribe, and upon the particular development of their æsthetical sensibility. A striking instance occurs among the Zulus, whose grand dances are merely the accompaniment to the colloquial war and hunting songs, in which the women put questions which are answered by the men. So also in Tahiti there is a set of national ballads and songs, referring to many events in the past and present lives of the people. The fisherman, the woodsman, the canoe-builder, has each his trade song, which on public occasions at least is illustrated by dancing. But the accompaniment is often consciously intended, by an appeal to the ear, to regulate and sustain the excitement of the muscles. And a close relation will be found always to exist between the excellence of a nation's dancing and the excellence or complexity of its music and poetry. In some cases the performer himself sings or marks time by the clanking of ornaments on his person. In others the accompaniment consists sometimes of a rude chant improvised by those standing round, or of music from instruments, or of mere clapping of the hands, or of striking one stick against another or on the ground, or of "marking time," in the technical sense. The Tasmanians beat on a rolled up kangaroo-skin. The Kamchadales make a noise like a continuous hiccough all through the dance. The Andamans use a large hollow dancing-board, on which one man is set apart to stamp. Sometimes it is the privilege of the tribal chief to sing the accompaniment while his people dance. The savages of New Caledonia whistle and strike upon the hip.

The rude imitative dances of early civilization are of extreme interest. In the same way, the dances of the Ostyak tribes (Northern Asiatic) imitate the habitual sports of the chase and the gambols of the wolf and the bear and other wild beasts, the dancing consisting mainly of sudden leaps and violent turns which exhaust the muscular powers of the whole body. The Kamchadales, too, in dancing, imitate bears, dogs, and birds. The *Kru* dances of the Coast Negroes represent hunting scenes; and on the Congo, before the hunters start, they go through a dance imitating the habits of the gorilla and its movements when attacked. The Damara dance is a mimic representation of the movements of oxen and sheep, four men stooping with their heads in contact, and uttering harsh cries. The canter of the baboon is the humorous part of the ceremony. The Bushmen dance in long irregular jumps, which they compare to the leaping of a herd of calves, and the Hottentots not only go on all-fours to counterfeit the baboon, but they have a dance in which the buzzing of a swarm of bees is represented. The Kennowits in Borneo introduce the mias and the deer for the same purpose. The Australians and Tasmanians in their dances called *corrobories* imitate the frog and the kangaroo (both leaping animals). The hunt of the emu is also performed, a number of men passing slowly round the fire and throwing their arrows about so as to imitate the movements of the animal's head while feeding. The Gonds are fond of dancing the bison hunt, one man with skin and horns taking the part of the animal. Closely allied to these are the mimic fights, almost universal among tribes to which war is one of the great interests of life. The Bravery Dance of the Dahomans and the Hooleo of the Bhil tribe in the Vindhya Hills are illustrations. The latter seems to have been reduced to an amusement conducted by professionals who go from village to village,—the battle being engaged in by women with long poles on the one side, and men with short cudgels on the other. There is here an element of comedy, which also appears in the Fiji club-dance. This, although no doubt originally suggested by war, is enlivened by the presence of a clown covered with leaves and wearing a mask. The monotonous song accompanying the club-dance is by way of commentary or explanation. So also, in Guatemala there is a public *baile* or dance, in which all the performers, wearing the skins and heads of beasts, go through a mock battle, which always ends in the victory of those wearing the deer's head. At the end the victors trace in the sand with a pole the figure of some animal; and this exhibition is supposed to have some historical reference. But nearly all savage tribes have a regular war-dance, in which they appear in fighting costume, handle their weapons, and go through the movements of challenge, conflict, pursuit or defeat. The women generally supply the stimulus of music. There is one very picturesque dance of the Natal Kaffirs, which probably refers to the departure of the warriors for the battle. The women appeal plaintively to the men, who slowly withdraw, stamping on the ground and darting their short spears or *assegais* towards the sky. In Madagascar, when the men are absent on war, the women dance for a great part of the day, believing that this inspires their husbands with courage. In this, however, there may be some religious significance. These war-dances are totally distinct from the institution of military drill, which belongs to a later period, when social life has become less impulsive and more reflective.[1] There can be little doubt that some of the characteristic movements of these primitive hunting and war-dances survive in the smooth and ceremonious dances of the present day. But the early mimetic dance was not confined to these two subjects; it embraced the other great events of savage life—the drama of courtship and marriage, the funeral dance, the consecration of labour, the celebration of harvest or vintage;[2] sometimes, too, purely fictitious scenes of dramatic interest, while other dances degenerated into games. For instance, in Yucatan one man danced in a cowering attitude round a circle, while another followed, hurling at him *bohordos* or canes, which were adroitly caught on a small stick. Again, in Tasmania, the dances of the women describe their "clamber for the opossum, diving for shell-fish, digging for roots, nursing children, and quarrelling with husbands." Another dance, in which a woman by gesture taunts a chieftain with cowardice, gives him an opportunity of coming forward and recounting his courageous deeds in dance. The funeral dance of the Todas (another Indian hill tribe), consists in walking backwards and forwards, without variation, to a howling tune of "ha! hoo!" The meaning of this is obscure, but it can

[1] The Greek καρπεία represented the surprize by robbers of a warrior ploughing a field. The gymnopædic dances imitated the sterner sports of the palæstra.

[2] The Greek Lenaia and Dionysia had a distinct reference to the seasons.

scarcely be solely an outburst of grief. In Dahomey the blacksmiths, carpenters, hunters, braves, and bards, with their various tools and instruments, join in a dramatic dance. We may add here a form of dance which is almost precisely equivalent to the spoken incantation. It is used by the professional devil-dancer of the wild Veddahs for the cure of diseases. An offering of eatables is put on a tripod of sticks, and the dancer, decorated with green leaves, goes into a paroxysm of dancing, in the midst of which he receives the required information. This, however, rather belongs to the subject of religious dances.

It is impossible here to enumerate either the names or the forms of the sacred dances which formed so prominent a part of the worship of antiquity. A mystic philosophy found in them a resemblance to the courses of the stars. This Pythagorean idea was expanded by Sir John Davies, in his epic poem *Orchestra*, published in 1596. They were probably adapted to many purposes,—to thanksgiving, praise, supplication, and humiliation. It is only one striking illustration of this wide-spread practice, that there was at Rome a very ancient order of priests especially named Salii, who struck their shields and sang *assamenta* as they danced. The practice re-appeared in the early church, special provision being made for dancing in the choir. Scaliger, who astonished Charles V. by his dancing powers, says the bishops were called *Præsules*, because they led the dance on feast days. According to some of the fathers, the angels are always dancing, and the glorious company of apostles is really a *chorus* of dancers. Dancing, however, fell into discredit with the feast of the *Agapæ*. St Augustine says, "Melius est fodere quam saltare;" and the practice was generally prohibited for some time. No church or sect has raged so fiercely against the cardinal sin of dancing as the Albigenses of Languedoc and the Waldenses, who agreed in calling it the devil's procession. After the middle of the 18th century, there were still traces of religious dancing in the cathedrals of Spain, Portugal, and Roussillon,—especially in the Mussarabian Mass of Toledo. An account of the numerous secular dances, public and private, of Greece and Rome will be found in the classical histories, and in Mr Weaver's *Essay towards a History of Dancing*, London, 1712, which, however, must be revised by more recent authorities. The Pyrrhic (derived from the Memphitic) in all its local varieties, the Bacchanalia, and the Hymenæa were among the more important. The name of Lycurgus is also associated with the Trichoria. Among the stage dances of the Athenians, which formed interludes to the regular drama, one of the oldest was the Delian dance of the Labyrinth, ascribed to Theseus, and called Γέρανος, from its resemblance to the flight of cranes, and one of the most powerful was the dance of the Eumenides. A farther development of the art took place at Rome, under Augustus, when Pylades and Bathyllus brought serious and comic pantomime to great perfection. The subjects chosen were such as the labour of Hercules, and the surprise of Venus and Mars by Vulcan. The state of public feeling on the subject is well shown in Lucian's amusing dialogue *De Saltatione*. Before this Rome had only very inferior buffoons, who attended dinner parties, and whose art traditions belonged not to Greece, but to Etruria.[1] Apparently, however, the Romans, though fond of ceremony and of the theatre, were by temperament not great dancers in private. Cicero says, "Nemo fere saltat sobrius, nisi forte insanit." But the Italic Dance of the imperial theatre, supported by music and splendid dresses, supplanted for a time the older dramas. It was the policy of Augustus to cultivate other than political interests for the people; and he passed laws for the protection and privilege of the pantomimists. They were freed from the *jus virgarum*, and they used their freedom against the peace of the city. Tiberius and Domitian oppressed and banished them; Trajan and Aurelius gave them such titles as decurions and priests of Apollo; but the pantomime stage soon yielded to the general corruption of the empire.

The modern ballet seems to have been first produced on a considerable scale in 1480, at Tortona, before Duke Galeazzo of Milan. It soon became a common amusement on great occasions at the European courts. The ordinary length was five acts, each containing several *entrées*, and each *entrée* containing several quadrilles. The accessories of painting, sculpture, and movable scenery were employed, and the representation often took place at night. The allegorical, moral, and ludicrous ballets were introduced to France by Baïf in the time of Catherine de' Medici. Balthasar of Beaujeu appears also as a director of court ballets, in which amusement the royal families of France continued for long to take an active part. The complex nature of these exhibitions may be gathered from the title of one played at Turin in 1634—*La verita nemica della apparenza, sollevata dal tempo*. Of the ludicrous, one of the best known was the Venetian ballet of *La verita raminga*. Now and then, however, a high political aim may be discovered, as in the "Prosperity of the Arms of France," danced before Richelieu in 1641, or "Religion uniting Great Britain to the rest of the World," danced at London on the marriage of Princess Elizabeth to the Elector Frederick. Outside the theatre, the Portuguese revived an ambulatory ballet which was played on the canonization of Carlo Borromeo, and to which they gave the name of the Tyrrhenic Pomp. During this time also the ceremonial ball (with all its elaborate detail of *courante*, minuet, and saraband) was cultivated. The fathers of the church assembled at Trent gave a ball in which they took a part. Masked balls, too, resembling in some respects the Roman Saturnalia, became common towards the end of the 17th century. In France a ball was sometimes diversified by a masquerade, carried on by a limited number of persons in character-costume. Two of the most famous were named "au Sauvage" and "des Sorciers." In 1715 the regent of France started a system of public balls in the opera-house, which did not succeed. Dancing, also, formed a leading element in the *Opéra Français* introduced by Quinault. His subjects were chiefly marvellous, drawn from the classical mythologies; and the choral dancing was not merely *divertissement*, but was intended to assist and enrich the dramatic action of the whole piece. The ideas of military evolution and of magic incantation reappear. Although Lully wrote the music, and the representation was supported by splendid decoration and mechanical effects, the success of this new "tragedy" was short-lived, and since then the modern ballet has never been more than a lyrical interlude. In this humbler function, however, it was greatly improved by La Motte, whose piece *L'Europe Galante* (1697) is a sparkling and elegant production. The lyrical ballet draws much from Fairyland and Arcadia. The possibility of theatrical dance has been strenuously maintained by M. de Cahusac in his *La Danse, Ancienne et Moderne*, 3 vols., 1754; by M. de Noverre in his *Lettres sur les Arts Imitateurs*; and by Diderot in the *Encyclopédie Méthodique*, 1786. It was illustrated by the performance of *Pygmalion* by Mdlle. Sallé in London (1732).[2]

Among the antiquities of this subject chorography, or orchesography, the art of dancing notation, deserves a place. The idea is as old as 1598; but about 1700 M. Feuillet published a complicated system, which was twice translated

[1] The Pantomimus was an outgrowth from the *canticum* or choral singing of the older comedies and *fabulæ Atellanæ*.

[2] Among the last *demi-caractère* ballets may be mentioned the *Fille mal gardée* of Dauberval; among the anacreontic, the *Dansomanie* of Gardel.

into English at the beginning of the 18th century by Mr Weaver and Mr Essex. A separate sign was used for each position, bend, rising, step, leap, cabriole, falling, slide, turn, and cadence; and the track of the dance was represented by curved lines. These were sometimes printed along with the music. Such diagrams as still exist are interesting enough as visible history of extinct dances; but as a practical aid in teaching or composing dances chorography was entirely thrown aside as too cumbrous by Noverre, and by Sir John Gallini, the proprietor of the ancient concert rooms in Hanover Square, who wrote on this subject in 1726. The difficulty of the process may be seen by applying it to so comparatively simple a dance as the Scotch reel, which contains no less than 10 single steps—the ceum-siubhaile (forward step), the ceum-coisiche (footing step), the leum-trasd (cross-spring,—French, *sissonne*), the siabadh-trasd (chasing step), the aiseag-trasd (cross-passes), the fosgladh (open step), the euartag (turning step), and others. As may be seen from the technical language of dancing (assemblée, jetée, chassée, glissade, contre-danse, contre-temps, coupé, entrechat, bourrée, gaillarde, fleuret, &c.) it has undoubtedly been brought to greatest perfection in France. But space does not permit us to explain the steps or to describe the picturesque forms of dance which are still practised in town and country.

One sentence in conclusion upon dancing or musical gymnastics as an important branch of physical education. Long ago Locke pointed out (*Education*, secs. 67, 196) that the effects of dancing are not confined to the body; it gives to children, he says, not mere outward gracefulness of motion, but manly thoughts and a becoming confidence. Only lately, however, has the advantage been recognized of making gymnastics attractive by connecting it with what Homer calls "the sweetest and most perfect of human enjoyments." The practical principle against heavy weights and intense monotonous exertion of particular muscles is thus stated by Mr Smiles (*Physical Education*, p. 148):—"The greatest benefit is derived from that exercise which calls into action the greatest number of muscles, and in which the action of these is intermitted at the shortest intervals." It required only one further step to see how, if light and changing movements were desirable, music would prove a powerful stimulus to gymnastics. It touches the play-impulse, and substitutes a spontaneous flow of energy for the mechanical effort of the will. The force of imitation or contagion, one of the most valuable forces in education, is also much increased by the state of exhilaration into which dancing puts the system. This idea was embodied by Froebel in his *Kindergarten* plan, and has been developed by Jahn and Schreber in Germany, by Dio Lewis in the United States, and by Ling (the author of the *Swedish Cure Movement*) in Sweden. It is of course not merely on æsthetic grounds (though these are sufficient) that musical gymnastics, as distinguished from the process of manufacturing a shell of muscle, are invaluable. They are, according to the testimony of all competent persons, indispensable to complete development and general health.

For the old division of the *Ars Gymnastica* into *palæstrica* and *saltatoria*, and of the latter into *cubistica*, *sphæristica*, and *orchestica*, see the learned work of Hieronymus Mercurialis, *De arte Gymnastica*, Amsterdam, 1572. Cubistic was the art of throwing somersaults, and is described minutely by Tuccaro in his *Trois Dialogues*, Paris, 1599. Sphæristic included several complex games at ball and tilting—the Greek *κώρυκος*, and the Roman *trigonalis* and *paganica*. Orcheatic, divided by Plutarch into *latio*, *figura*, and *indicatio*, was really imitative dancing, the "silent poetry" of Simonides. The importance of the *χειρονομία* or hand-movement is indicated by Ovid:—"Si vox est, canta; si mollia brachia, salta." For further information as to modern dancing, see Rameau's *Le Maître à Danser*, 1726, and Querlon's *Le Triomphe des Graces*, 1774. In the earlier part of this article considerable use has been made of the "Æsthetic Products" of Mr Herbert Spencer's *Sociological Tables*.

DANCE, the name of a family group important in English art, at least in architecture, during the latter half of the last century.

George Dance, senior, the father of the two others, was born early in the century, at a time when neither Gothic nor classic architecture was properly studied in England, the former being looked upon simply as a barbarism, and the latter known only through the Italian. On his return from the continent, after a short period of study, he obtained the appointment of architect to the city of London, and immediately had a chance of distinction by building the Mansion-house. This was in 1739, and his plans gave great satisfaction. It was followed by the churches of St Botolph, Aldgate, and St Leonard, Shoreditch, and by other city works of some importance. He continued to practise till his death, January 11, 1768, at which time the former excise offices, Broad Street, were approaching completion, and his son George was installed in his place, both his sons being already in considerable repute. Of these the eldest was

Nathaniel Dance, born in 1734, who left his father's office and was placed under Hayman, the genre-historical painter. Here he showed great quickness, but principally in portraits, and after a few years he left that painter and went abroad. His residence in Italy, which was prolonged for many years, brought him in contact with Angelica Kauffmann, among whose devoted admirers he long remained, at first following her about in all her changes of abode, travelling as she did under the protection of her loving old father. From Italy he sent home historical pictures occasionally, of the quasi-classic sort,—Dido and Æneas in 1763, for example. These he continued to produce all through his career,—Paris and Helen (1771), Orpheus lamenting Eurydice (1774), Death of Mark Antony (1776),—all of which have long ago utterly disappeared. He was settled in London in 1768, as his name appears among the founders of the Royal Academy, and must have been in the country some time, as he exhibits two full-length portraits of George III. and the queen in the first exhibition of that body. These are now existing at Up Park, Sussex; and in the Greenwich Hospital picture gallery is a portrait of Captain Cook by him. Many of his pictures are known in family collections throughout the country, and some of his works, now lost sight of, are known by engravings. At the age of fifty-six, when he had himself made a large fortune, he married a widow possessing a jointure of £15,000 a year, entirely dropt his profession, and became a member of Parliament, representing East Grinstead. He even changed his name, and when made a baronet in 1800 he appeared as Sir N. D. Holland. He now lived at Carnborough House, near Winchester, his only practice in art being occasional landscapes in the manner of the day; and at that place he died suddenly on the 15th October 1811, leaving a private fortune of £200,000. His brother,

George Dance, junior, by far the ablest of the three, was born in 1740, and remained his father's pupil, succeeding him as city surveyor and architect in 1768. At that time the office, then as now somewhat lucrative, was purchasable, and it was in that way he acquired the appointment. He was then only twenty-eight, and had spent several years abroad, most of the time with his brother in Italy, yet he had already distinguished himself by designs for public works, particularly that for Blackfriars Bridge. He was associated with his brother in the foundation of the Royal Academy, and, living till 1825, he was for a number of years the last survivor of the original members. Knowing every one connected with art in London for a long period, he must have outlived a great many changes in taste, and seen many novelties pass away in all the divisions of art. In his own sphere the revolution from his father's style to the study of Gothic by the elder Pugin and others, following the period of Stuart and Revett, showed a wonderful development, especially in the precise knowledge of ornamental details. In sculpture, the passage from Carlini to Flaxman was even more rapid, and in painting he must have known all the important professors from Hogarth to Wilkie. That he was much interested in all these changes is proved by the series of portraits of his friends, principally artists, he drew from the life, which are now preserved in the library of the Academy. Seventy-two of these, engraved in imitation of chalk, were published in 1808–14, and form a very interesting collection. In his own profession his time was mainly occupied by his duties as city architect, and his principal works are such as came to him in that way. Of these, the prison of Newgate, rebuilt in 1770, a building unique in design, is the most conspicuous and able. The front of Guildhall is also his. He died January 14, 1825, and was buried in St Paul's.

DANCOURT, FLORENT CARTON (1661–1725), French dramatist and actor, was born at Fontainebleau on the 1st November 1661. He belonged to a family of rank, and his parents intrusted his education to Father De la Rue, a Jesuit, who made earnest but fruitless efforts to induce him to join the order. Preserving his freedom he studied law, became an advocate, and engaged for a short time in the practice of his profession. His marriage to the daughter of the celebrated comedian La Thorillière led him to adopt the career of an actor, and in 1685, in spite of the strong opposition of his family, he appeared on the stage of the Théâtre Français. His power of facial expression, vivacity of manner, and fluency of utterance gave him immediate and marked success, both with the public and with his fellow actors. The latter chose him for their spokesman on occasions of state, and in this capacity he frequently appeared before Louis XIV., who treated him with great favour. As a dramatic author Dancourt was exceedingly prolific, and as an almost necessary consequence somewhat unequal. His first play, *Le Notaire obligeant*, produced in 1685, was so well received as to lead its author speedily to repeat the experiment. *La Désolation des Jouenses* (1686) was still more successful; and *Le Chevalier à la Mode* (1687) is generally regarded as his best work, though his claim to original authorship in this and some other cases has been disputed. These were followed by others in constant succession till 1718, when he terminated his career both as an actor and as an author. Retiring to a chateau at Courcelles le Roi, in Berry, he employed himself in making a poetical translation of the psalms and in writing a sacred tragedy. He died on the 6th December 1725, and was buried in a tomb he had caused to be constructed during his lifetime in the chapel of his chateau. The plays of Dancourt are true in the main to nature. The characters have a vraisemblance that has led to his being styled the Teniers of comedy. He is most successful in his delineation of low life, and especially of the peasantry. The dialogue is sparkling, witty, and natural. Many of the incidents of his plots were derived from actual occurrences in the "fast" and scandalous life of the period, and several of his characters were drawn from well-known personages of the day. Most of the plays incline to the type of farce rather than of pure comedy.

The complete works of Dancourt were published in 1760 (12 vols. 12mo). An edition of his *Œuvres Choisies* in 5 vols. appeared in 1810.

DANDELION (*Taraxacum Dens Leonis*), a perennial herb belonging to the sub-order *Cichoraceæ*, of the natural order *Compositæ*. The plant has a wide range, being found in Europe, Central Asia, North America, and the Arctic regions. The leaves are smooth, of a bright shining green, sessile, and tapering downwards. The name dandelion is derived from the French *dent-de-lion*, an appellation given on account of the tooth-like lobes of the leaves. The long tap-root has a simple or many-headed rhizome; it is black externally, and is very difficult of extirpation. The flower-stalks are smooth, brittle, leafless, hollow, and very numerous. The flowers bloom from April till August, and remain open from 5 or 6 in the morning to 8 or 9 at night. The flower-heads are of a golden yellow, and 1½ inches in width; the florets are strap-shaped, and longer than the phyllaries. The achenes are olive or dull yellow in colour, and are each surmounted by a long beak; on this rests a pappus of white and delicate hairs, which occasions the ready dispersal of the seed by the wind. The globes formed by the plumed seeds are nearly 2 inches in diameter. The involucre consists of an outer spreading (or reflexed) and an inner and erect row of bracts. In all parts of the plant a milky juice is contained, the principle of which, *taraxacin*, has diuretic properties. On exposure to the air the juice coagulates, deposits caoutchouc, and turns of a violet-brown colour. The leaves are bitter, but when blanched are sometimes eaten as a salad; they serve as food for silkworms when mulberry leaves are not to be had. The root is roasted as a substitute for coffee, and its infusion, decoction, and extract are employed medicinally as a tonic and aperient, especially in disorders of the digestive organs and liver. Several varieties of the dandelion are recognized by botanists, in the commonest of which the leaves are broad and runcinate, and the outer bracts of the involucre have a downward flexure. The variety *T. palustre*, which affects boggy situations, and flowers in late summer and autumn, has nearly entire leaves, and the outer bracts of its involucre are erect.

DANDOLO is the name of one of the most illustrious patrician families of Venice. But the first doge of the name, Enrico Dandolo, who ruled the republic from 1192 to 1205, occupies the largest space in history of any of the name. He is the "blind old Dandolo" of Byron, whose passing mention of the well-nigh forgotten hero, in *Childe Harold*, has rendered the old name familiar to a larger number of ears than it ever was, even in the day when the prowess of the octogenarian doge changed the face of Europe. Enrico Dandolo was born of a family already illustrious, which had ruled in Gallipoli, Andros, Riva, and other places in Greece; and his uncle was patriarch of Grado. The story goes that he lost his sight from having been subjected by Manuel, the emperor of Constantinople, to whom he had been sent by Venice as ambassador, to the ancient punishment of "abbasination,"—to adopt a foreign word for a thing which, happily, is nameless in our language. This torture consisted in compelling the victim to gaze into a polished metal *basin*, which concentrated the rays of the sun till the excess of light destroyed the eye. Some of the Venetian historians, however, deny this story, and represent his blindness as having resulted from a wound received in fight. When he was elected doge, at the age of seventy-two, Venice was involved in a war with Pisa, which he brought in two naval battles to a successful conclusion. But the events which have made his name a marked one in history occurred yet nearer to the end of his long career. In 1201 the chivalry of Christendom was about to embark in the 4th crusade,—by some historians reckoned the 5th,—and a request was made to Venice to give the crusaders passage, and furnish them with vessels for transport. Dandolo received the messengers who came with those demands favourably. There is reason to think that the Venetian was not moved by any great degree of crusading enthusiasm; but Zara had thrown off the yoke of Venice; and, as Venetian writers add, the old doge had not forgiven the infamous treatment he had received at the hands of the Greeks. There does not, however, seem to be any necessity for supposing that any personal considerations of such a kind were needed to impel him to a policy which was doubtless animated by far larger and wider views. The old doge made a hard bargain with the emissaries of the crusaders for the use of the galleys of the republic; and when, at the moment of departure, it turned out, as he had expected, that they had not money enough to pay the stipulated price, he insisted that, in lieu of it, the expedition should first reduce Zara. Dandolo himself, on this being with some difficulty agreed to, took the cross and assumed the command of the fleet. Zara was besieged, taken, pillaged, and restored to the domain of the republic. The expedition then proceeded to the greater enterprize of attacking Constantinople, in which, led by Dandolo, it was equally successful. But it was not till the young Emperor Alexis had been murdered in a revolt of the Greeks of Constantinople that Dandolo opened to the crusading expedition a proposal that they should sieze on the city and on the Greek empire. The counsel was accepted, with a success due in a great measure to the conduct and valour of the blind octogenarian doge. Constantinople was pillaged, and booty to an incredible amount was divided among the Venetians and the French.[1] Dandolo might have been crowned emperor instead of Baldwin of Flanders. Whether he declined in accordance with his own judgment, or whether Venice would not permit a citizen of hers to become an emperor, is uncertain. At all events the old doge showed himself once again as good at a bargain as at a fight. He obtained for Venice a very full share of the plunder, both of dominions and of movable property, as well as of useful privileges exacted, with as hrewd and far-seeing eye, to future advantages. Among the booty secured for Venice were the celebrated four horses, now once more, after their journey to Paris, on the west front of the church of St Mark. Enrico Dandolo, first doge of the name, died in 1205, one year after the establishment of the Latin empire at Constantinople. (See Gibbon, *Decline and Fall*, ch. 60).

The eldest son of this Enrico, Fantino, was patriarch of Constantinople; and the second, Rainieri, was procuratore di St Marco. He was killed in Candia in 1213. Giberto, known in Venetian history as successful in naval warfare against the Genoese in 1260, was the son of Rainieri, and his son Giovanni, elected doge in 1280, ruled the republic till 1289, and was the father of that Andrea Dandolo of whom it is related, that having been unsuccessful in a naval fight against the Genoese, and being prisoner on board one of the enemy's galleys, he knocked his brains out by beating his head against the mast.

The Dandolo family gave two other doges to the republic. Francisco was elected in 1318, and died in 1339, and is known in history as Dandolo "Cane," "Dog Dandolo," not from having humiliated himself before Clement V., when imploring the pontiff to become reconciled to Venice, as Sismondi writes in the *Biographie Universelle*, but from "Cane" having been an old family name. Andrea Dandolo was elected doge in 1342 at the exceptionally youthful age of thirty-six, and ruled the republic till 1354. This Andrea was a student and a man of letters, and an intimate friend of Petrarch, some of whose letters to him are extant. He wrote two chronicles of Venice, one of which was published in the 12th volume of the *Rerum Italicarum Scriptores* of Muratori, while the other is extant in MS. He is said to have died of a broken heart, caused by the successes of Paganino Doria and the Genoese fleet in the Adriatic.

[1] The account of the taking of the city given by Ville Hardouin, who was one of the crusaders, is a very one-sided narrative. A more correct notion of the terrible details may be obtained by comparing the Frenchman's account with that of Nicetas Acominatus, the Greek historian.

DANDOLO, Vincenzo, Count (1758–1819), an Italian scientist, was born at Venice in 1758, of good family, though not of the same house as the doges above noticed, and commenced life as a physician in his native city. He was a prominent opponent of the oligarchical party in the revolution which took place on the approach of Napoleon; and he was one of the envoys sent to seek the protection of the French. When the request was refused, and Venice was placed under Austria, he removed to Milan, where he was made member of the great council. In 1799, on the invasion of the Russians and the overthrow of the Cisalpine republic, Dandolo retired to Paris, where, in the same year, he published his treatise *Les Hommes nouveaux, ou moyen d'opérer une régénération nouvelle.* But he soon after returned to the neighbourhood of Milan, to devote himself to scientific agriculture. In 1805 Napoleon made him governor of Dalmatia, with the title of *provéditeur général*, in which position Dandolo distinguished himself by his efforts to remove the wretchedness and idleness of the people, and to improve the country by draining the pestilential marshes and introducing better methods of agriculture. When, in 1809, Dalmatia was re-annexed to the Illyrian provinces, Dandolo returned to Venice, having received as his reward from the French emperor the title of count and several other distinctions. He died in his native city on the 13th December 1819.

Dandolo published in Italian several treatises on agriculture, vine-cultivation, and the rearing of cattle and sheep; a work on silk-worms, which was translated into French by Fontanelle; a work on the discoveries in chemistry which were made in the last quarter of the 18th century (published 1796); and translations of several of the best French works on chemistry.

DANIEL, according to the book which bears his name, was a Jew carried captive in the reign of Jehoiakim to Babylon, where, by his preternatural wisdom, and as the reward of his fidelity to his religion, he attained the highest rank in the state, and the presidency of the wise men of Babylon.

DANIEL, Book of. The controversy as to the origin and significance of this book has passed through so many phases, and the collateral arguments are so apt to obscure those on which the question really hinges, that a simpler mode of treatment than is customary in theological works seems to be here desirable. Instead of beginning with the second part of Daniel (vii.–xii.), which professes to contain circumstantial predictions, and is consequently difficult to treat without some reference to "burning questions" of theology, we shall first survey the narrative-portion (i.–vi.) from an historical point of view, and inquire how far the names, ideas, customs, and historical allusions in it agree with the facts known to us from other sources. Our chief guide will be a critical study of the cuneiform inscriptions.

(1.) As to the names. The writer of Daniel evidently supposes that Belteshazzar is compounded with the name of Bel, or Merodach, the favourite god of Nebuchadnezzar (see iv. 8). It appears, however, that the word has no connection with Bel, and it is most probably a corruption of Balatsu-usur, "his life protect." Ashpenaz, Shadrach, and Meshach are quite out of keeping with Babylonian scenery; they cannot be explained at all. Arioch, on the other hand, may be from the primitive Accadian name Erî-akû (Lenormant), though the revival of such a name is rather surprizing. Hamelsar (i. 11) may perhaps be a corrupt form of a Babylonian name, as Abed-nego (from Abed-nebo) certainly is. The form Nebuchadnezzar, for Nebuchadrezzar, is not peculiar to Daniel, and can hardly be used in argument. (2.) Traces of Babylonian ideas have been most industriously sought for by Mr Fuller, but they are too uncertain to be of any appreciable value. Who can believe that that fine appellation, "the Ancient of days" (vii. 22), is derived from the eternally self-begotten Hea (the god of the waters), when there is so obvious a source for the phrase in the second part of Isaiah, or that "like a son of the gods" (iii. 25) means, "like the divine fire-god Bar?" Nor is M. Lenormant much more fortunate in his supposed discovery of a reference to Nebuchadnezzar's equally supposed recognition of one supreme deity. The fact is that the greater gods of Babylonia at this period were two in number, viz., Maruduk (Merodach) and Nabu (Nebo), who are coupled, for instance, by Nebuchadnezzar in the great inscription translated by M. Oppert. (3.) There are in Daniel three undoubted points of agreement with Babylonian custom, viz., the punishment of burning alive (iii. 6), the description of the dress of the courtiers (iii. 21), and the mention of the presence of women at feasts (v. 2). On the other hand, there is (*a*) a striking inaccuracy in the use of the term "Chaldeans" for "astrologers." This use is directly opposed by the cuneiform inscriptions, and it is useless (in the face of Hebrew etymology) to meet this fact by an imaginary correspondence of the three names for the wise men in the book of Daniel to the three leading classes of magicians, &c., mentioned in the inscriptions. (*b*) There is also (as M. Lenormant has observed) an error in the use of the Assyrian *saknu* (reproduced in the Aramaic of ii. 48), which really means "a high civil officer," but is used in Daniel in the sense of arch-magician. (4.) The points of disagreement between the book of Daniel and Babylonian history have probably been exaggerated. It is true the former tells us many strange things of Nebuchadnezzar, who is only known in history as a great warrior, a great builder, and a great patron of learning. His lycanthropy is not mentioned in any historical documents as yet discovered; to quote Berosus (ap. Josephus, *contr. Ap.* i. 20) is entirely beside the mark, as Hilgenfeld and Mr Fuller have convincingly shown. The statements respecting Belshazzar have been in part confirmed. Bilu-sarra-usur is the name of the eldest son of Nabu-nahid or Nabonadius, and a dated tablet in the British Museum, recently obtained from Babylon, proves that the last king of Babylon was Maruduk-sarra-usur, which may be the same name as Belshazzar, since Maruduk is identical with Bel-Merodach. It must be confessed, however, that Belshazzar was not the son of Nebuchadnezzar, as appears to be stated in Dan. v. 2, 11, 18, 22. This has been met by the assertion that "son" in Dan. v. means "grandson;" but that Belshazzar was even the grandson of Nebuchadnezzar is still unproved, not to mention the strangeness of interpreting "thy father" in v. 11 as = "my father" (on the hypothesis that Belshazzar's mother was daughter of Nebuchadnezzar). The most puzzling discrepancy, however, relates to the name of the Medo-Persian king, who "received" from God's hands the "distributed" Babylonian empire (v. 28, 31). The book of Daniel states (v. 31) that this was Darius the Mede; profane history asserts that it was Cyrus the Persian. Many attempts have been made to reconcile these opposing statements. Some think that Darius the Mede was Astyages, but there is a chronological difficulty; others, Cyaxares II., but we are not certain that such a king existed; while Des Vignoles and M. Lenormant would make him a Median prince, rewarded by Cyrus for his fidelity with the vassal kingship of Babylon. Unfortunately this Median prince is at present even more shadowy than Cyaxares II. "The inscriptions," remarks Mr G. Smith, "have as yet afforded no information on this point." But this is not the only difficulty about Darius the Mede. In ix. 1 we are told that he was the son of Ahasuerus, who on philological grounds must be identified with Xerxes. This, when taken in conjunction with the facts concerning Belteshazzar, suggests that the author or editor fell into three errors, by supposing (1) that the conqueror of Babylon was not Cyrus but Darius I.; (2) that Darius I. came after, instead of before, Xerxes; and (3) that he was son, whereas he was really father, of that monarch. There are two "undesigned coincidences," to be mentioned presently, which appear to confirm this view.

Thus far the evidence preponderates against the theory that the narratives in the book of Daniel—or, to be quite safe, let us say the narratives in their present form—were written by a resident in Babylon. Two other historical inaccuracies ought not to be slurred over, though they are certainly unfavourable to the authorship of Daniel. One is the chronological statement in i. 1. It may fairly be urged (*a*) that, if the battle of Carchemish took place in the fourth year of Jehoiakim (Jer. xlvi. 2), Jerusalem cannot have been captured in the third; and (*b*) that our one certainly contemporary authority, the prophet Jeremiah, nowhere alludes to a captivity at this period. The other is the statement (vi. 1) that Darius the Mede appointed 120 satraps (so in the Hebrew), whereas Darius Hystaspis only mentions 23 satrapies (*Records of the Past*, vii. 88). A similar apparent confusion between satrapies and inferior governments appears in the Alexandrine translation of 1 Kings x. 15. This translation was made in the Greek period; presumably, therefore, the book of Daniel was written (or edited) in the Greek period. This, it should be added, is one of the "undesigned coincidences" which confirm a view mentioned above respecting "Darius the Mede."

We now go on to a class of arguments, which, even more obstinately than those based upon history, refuse to lend themselves to theological prepossession. From the Hebrew of the book of Daniel no important inference as to its date can safely be drawn. It is true, Aramaisms abound, but this feature is common to all the later books of the Old Testament. Nor, in spite of the assertions of controversial writers on both sides, can any argument be based on the fact (strange as it seems) that the book of Daniel is written in two languages or dialects, i. 1–ii. 4*a* and viii.–xii. being in Hebrew, and ii. 4*b*—vii. 28 in Aramaic (miscalled Chaldee). The philological data (which will be found collected in Dr Pusey's *Daniel the Prophet*, pp. lxvii. 44–57) have been most variously interpreted. Hitzig inferred that the Aramaic of Daniel was later than that of Ezra; Hengstenberg, Dr Pusey, and especially the late Professor McGill, that Ezra's was later than Daniel's. But the truth seems to be that the evidence is insufficient to determine the question. The Massorites aimed at making the language of the Old Testament (Aramaic as well as Hebrew) uniform, though they did not carry out their plan thoroughly, and allowed not a few vestiges of older stages of the language to remain. It is impossible therefore to decide *ex cathedra* that the later forms in Daniel or Ezra have not arisen from this levelling procedure of the Jewish critics. A similar controversy has arisen as to the relation of the Aramaic of the Old Testament to that of the Targums. Dr Pusey and others maintain that they are separated by a wide interval of time; but recent researches have shown that the official Targum, or Aramaic translation, of the Pentateuch, the earlier historical books, and the prophets, was thrown into its present form at Babylon on the basis of a work composed in Palestine. Now the Aramaic of Babylon was different from that of Palestine; still, on the whole, as Nöldeke rightly says, the Aramaic of the official Targum is only a rather later development of the Aramaic of Daniel and Ezra, which is therefore presumably Palestinian. It does not, however, follow that the whole book was written in Palestine. The correct translation of Dan. ii. 4 seems to be—"And the Chaldeans spoke unto the king (Aramaic);" *i.e.*, that which follows from this point to the end of chap. vii. is extracted from an Aramaic document. Now, considering the careless treatment extended to the book of Daniel (see the Septuagint version of it), it is quite possible, as M. Lenormant suggests, that the original Hebrew of Dan. ii. 4*b*–vii. 28 was lost, and its place supplied by the Aramaic translation. There is an exact parallel (not mentioned by M. Lenormant) in Jer. x. 11, which appears only to exist in an Aramaic version.

The remaining linguistic evidence is supplied by certain Persian and Greek words in the book of Daniel. This will retain its importance, even if we adopt M. Lenormant's theory of a substituted Aramaic translation, for a translator writing in a kindred dialect, would be tolerably precise in reproducing technical terms,—at any rate, would not succeed in expunging all traces of the original. (1) The book contains (see Mr Fuller's second excursus) at least nine words which are referred, in most cases with certainty, to a Persian origin. It must be remembered that no Persian words occur in Daniel's supposed contemporary—Ezekiel, nor even in Haggai, Zechariah, and Malachi. There are some, it is true, in Ezra and in Esther, but those books were written long after the beginning of the Persian rule. (2) The three Greek words in Daniel admitted by Delitzsch are all names of musical instruments—*κίθαρις, ψαλτήριον, συμφωνία.* The reproduction is (philologically) so exact that they must have been taken from the lips of a Greek, and this, according to M. Lenormant's presentation of the facts, was impossible before the age of the Seleucidæ, since the commercial intercourse between Greece and Babylonia was not "considerable nor consecutive enough" to admit of it at an earlier period.

The third class of facts to be reckoned with are the internal difficulties in the admission of the authorship of Daniel. Putting aside those which raise questions of theology, we may mention the two following as specimens:—(*a*) In ii. 25 Arioch speaks of Daniel as merely "one of the captives of Judah," and as personally unknown to the king. This seems inconsistent with chap. i., and consequently unlikely to have been written by Daniel. (*b*) No subsequent mention is made of the offices to which Daniel and his three friends, according to ii. 48, were promoted, not even in the narrative in chap. iii. The former of these seems the more important. An exact parallel occurs in 1 Sam. xvii. 55–6, where Saul professes himself entirely unacquainted with David, and this after the latter had been constantly playing the harp before him (chap. xvi. 23). Now, critics of such opposite opinions as Thenius and Nägelsbach agree that the solution of the difficulty in 1 Sam. is the reference of the respective passages to different documents. It has been urged, therefore, that the same theory will at once account for the inconsistencies in Daniel, and that the narratives at any rate were most likely written at different times, possibly by different authors, and certainly not by Daniel himself (as Mr Russell Martineau has cogently shown). These various narratives would naturally be connected by an editor, and to this editor we may be indebted for the second of the "undesigned coincidences" referred to above as confirming the supposition of a mistake as to the date and the acts of Darius the Mede; for the name of Cyrus only occurs in three passages (i. 21; vi. 28; x. 1), and may have been inserted by the editor (who knew that Cyrus, not Darius, conquered Babylon) with the object of bringing the book into somewhat closer accordance with profane history. It is gratifying to state that the fundamental principle of this theory has been conceded by such orthodox writers as Mr Fuller and M. Lenormant. "In its present form," says the former, "the book possesses peculiarities of an internal character which seem to suggest a certain extraneous aid perfectly compatible with the recognition of its unity and authority" (*Speaker's Commentary*, vi. 229). M. Lenormant's view has already been mentioned; we need only add that he puts down all the errors of the narrative chapters in Daniel to the copyists or translators, and that he finds a truthfulness of Babylonian colouring piercing through the injuries of time, which can only be accounted for by ascribing the original work to the prophet Daniel. Colder and more critical students will naturally go further. They will not perhaps deny the unity of authorship. The inconsistencies of the narratives are at most a proof of their separate origin; and the 12th chapter of Enoch (an apocalyptic work like Daniel) supplies a parallel which has been hitherto overlooked to the transition from the third person to the first in Dan. vii. 1, 28. There is, further, a general similarity of style between the Hebrew and the Aramaic portions, and (especially) a marked parallelism of contents between chaps. vii. and ii., which is not favourable to a diversity of authorship. But there is a growing feeling that the narratives in the book before us could not have been the work of a resident in Babylon. There may, it is allowed, be an element of historical tradition in them; but, if so, we have not at present the means of detecting it. The narratives, however, have quite sufficient merit regarded from the point of view of edification. If we only place ourselves in the position of the later Jews, we shall perhaps faintly realize the stirring effect they must have produced. We shall then no longer be surprized at the improbability of many of the details, which has given rise to so much unnecessary ridicule. Admiration will be our only feeling, when we consider the author's comparative success in reproducing a distant past. It is possible, no doubt, that he derived some part of these narratives from Jewish or Babylonian popular stories, for we find a Daniel already celebrated for his wisdom in Ezekiel (xxviii. 3, *cf.* xiv. 14, 20), and the Babylonian Abydenus has a legend distantly resembling Dan. iv. But even if we admit this conjecture, the historical setting, the moral purpose, and the skill in presentation are all his own, and reflect dimly as it may be the spirit and the power of the writers of the Pentateuchal histories.

We may now proceed to the next stage in the argument, and inquire which is the earliest period to which the narratives of Daniel can apply? The third chapter of the book suggests an answer. There (see ver. 5) we meet with a Greek musical instrument called symphonia (probably a kind of bag-pipe; A. V., wrongly "dulcimer"), which, as we learn from Polybius (*Athen.*, x. 52), was a special favourite of Antiochus Epiphanes, king of Syria, the notorious persecutor of the Jews. If, therefore, the period of this king (175–164 B.C.) suits the remainder of the work, the clue to the book of Daniel has been found. One reserve must, however, be made. If any historical evidence should be forthcoming in favour of M. Lenormant's view stated above,—if, in a word, an earlier recension of the book of Daniel should be discovered,—it will become necessary to revise or abandon the foregoing argument.

The difficulty of the second part of Daniel (vii.–xii.) is greatly increased by the necessity of making some assumptions with a view to its interpretation. Those of one class of critics are based upon a tradition, reaching back as far as the Christian era (see Josephus, *Antiq.*, x. 11, 7), that the statements of the book of Daniel are literally true; those of another class upon the theory, resulting from the study of the undisputed prophecies on the one hand and of the apocalyptic literature on the other, that the prominence of minute circumstantial prediction, and the absence of a moral, hortatory element, are the distinguishing marks of an artificial, apocalyptic imitation of prophecy. (See APOCALYPTIC LITERATURE.) The latter class of critics hold that the "analogy of prophecy" is an exegetical argument equal in importance to that of the "analogy of faith" in dogmatics. The only attempt to mediate between the two positions is that of Zöckler, who, while believing that the book as a whole is the work of Daniel, is of opinion that the most circumstantial passage (xi. 5-39) has been in some parts interpolated by a contemporary of Antiochus Epiphanes. He thus unintentionally supplements the theory as to the narrative-chapters held by M. Lenormant. The second part of Daniel is occupied with a series of visions and angelic communications, chiefly descriptive of the stages through which the empire of the world had passed, or was about to pass, between Nebuchadnezzar and the latter days. Of these visions, the last (x.-xii.) is the most important. In the form of prediction, the angel who discourses with Daniel communicates the history of the kingdoms to which Palestine was attached from the time of Cyrus to that of Antiochus Epiphanes. This is followed by a description of the deliverance and glorification of the Israelites in the Messianic period (using the word in a wide sense), which is here represented as immediately supervening on the Syrian persecution. The second vision (chap. viii.) has an equally clear reference to Antiochus Epiphanes (the "little horn"). What the writer can have meant by "2300 evening-mornings" is confessedly most obscure; and the statement that the "shameless king" (Antiochus, ver. 23) should fall by a sudden divine interposition (ver. 25, *cf.* Job xxxiv. 20) is one of those inconsistencies with profane history which mark the second as well as the first part of Daniel. To the second "beast" of the second vision corresponds, by its description, the fourth beast of the first (chap. vii.); consequently both signify the Greek empire of Alexander and his successors. This is now becoming the prevalent view; it is that of Delitzsch and Dr Westcott, no less than of Ewald and Bleek, but is opposed by the "traditional" theory still upheld by Dr Pusey, which makes the fourth empire that of Rome. Of the dream of the image in chap. ii., the interpretation of which depends on that of chap. vii., our limits preclude us from speaking. The 9th chapter is as instructive as it is difficult. At the very outset it suggests a very late origin for the book by the way in which the prophets are looked back upon (ver. 6, 10); and the minute study of the works of the prophets described in ver. 2 seems to many to point to a time when prophetic inspiration had ceased, and the prophetic writings (here called "the books") were already collected. Meditating, like one of the later scribes, over the letter of Scripture, Daniel (or the writer who assumed his name) came to the conclusion that the seventy years appointed by Jeremiah for "the desolations of Jerusalem" must have meant seventy weeks of years, *i.e.*, 490 years. The point from which and to which these "weeks" are to be reckoned is, however, keenly debated. Hengstenberg, following most of the fathers, takes the *terminus a quo* to be the 20th year of Artaxerxes (445 B.C.), and the *terminus ad quem* the public appearance of Christ. Dr Pusey prefers for the one the return of Ezra to Jerusalem, in 457 B.C., and for the other the martyrdom of St Stephen, 33 A.D. Dr Kuenen reckons the seventy weeks from the date of Jeremiah's prediction of the rebuilding of Jerusalem (604 B.C.) to the murder of the high priest Onias III. (170 B.C.). It is true that this does not produce exactly the required number of years, but we ought not, contends Dr Kuenen, to assume that the author was a perfect master of chronology. We need not, however, dwell further on this "perplexed subject," as it is more than probable that the Hebrew text is unsound. Our view of the second part of the book must be determined by the distinct, not by the obscure, passages. These show that the real centre of the thoughts of the author is Antiochus Epiphanes, and exonerate those critics from the charge of wilfulness, who suppose the book to have been written in the reign of that king. For why, these critics ask, should one of the Jewish exiles at Babylon single out the episode of Antiochus in preference to the far more important crisis of the struggle with Rome? And how is it that the revelation of future events ceases to be in accordance with history precisely when we come to the passage (xi. 40-45) which relates to the closing years of the Syrian king?

It would be unjust, however, to writers of the school of Dr Kuenen to slur over the fact that they can offer plausible historical proofs, unconnected with exegesis, which appear to favour a late date for the book of Daniel. Just as in reviewing the first part of the book we found philological evidence of a post-Babylonian origin, so in the second part there are (according to this school) references to beliefs confessedly post-Babylonian. The doctrine of angels in Daniel is developed to a degree which, it is said, implies a long continuance of Persian influences. In Zechariah we see this doctrine in a less advanced stage. Even the "accuser" angel in Zechariah is still an appellative ("the Satan"), whereas the book of Daniel not only contains a full system of "first princes" or angels, to whom the government of the world is intrusted, but gives names to two of them (Michael and Gabriel), which, as Dr Kohut has shown, correspond to those of the two Persian archangels, Vohumanô and Çraoshô. The book of Daniel, too, contains the first distinct prediction of a resurrection of the dead (See Cheyne's *Book of Isaiah Chronologically Arranged*, p. 130, par. 5), and the researches of Windischmann, Haug, and Spiegel appear to have shown that this is a genuine Zoroastrian doctrine, traces of it being found in the earliest portions of the Avesta. Now, it is both natural and right to look with suspicion on theories of the importation of foreign ideas among the Old Testament writers, for experience shows that they will rarely stand a critical examination. Still the evidence for a Persian origin (or share in the origin) of the doctrine of the resurrection is so strong as to unite the suffrages of the most opposite writers. Mr Fuller, it is true, has tried to make Babylonian influences equally plausible in the development of this doctrine. But his authority, M. Lenormant, candidly admits that the Babylonian literature only contains the "first germ" of the doctrine which in Daniel has attained an advanced degree of development (*La Magie chez les Chaldéens*, pp. 155-6).

We have thus endeavoured to give the leading facts on which the criticism and interpretation of this most interesting book depend. In the present phase of the controversy, two positions only would appear to be philologically tenable. One is that so confidently maintained by M. Lenormant, the eminent Assyriologue, for the first part, and to some extent by Dr Zöckler for the second part, which consists in assuming that the original book of Daniel has been interpolated by later hands. The other, that the work is still mainly in the form in which it was written, that its date is in the Maccabean period, and that, as in the case of Deuteronomy (according to most critics) in earlier times, and the apocalyptic writings which preceded and followed the rise of Christianity, the author, in the service of truth, assumed a name which would more than his own command the respect of his countrymen. "Such a writer," thought the late Professor Weir, "however much we may disapprove his procedure, yet, regarding him in the light of his age, we cannot so unhesitatingly condemn. It was not unnatural that the cessation of the voices of the old prophets should have been followed by what may be described as echoes waked up from time to time, and chiefly at critical periods of the national history, in the breasts of sympathizing and enthusiastic disciples" (*Academy*, vol. i. p. 70). From this point of view, we may perhaps say that the book of Daniel is in part an attempted echo of Jeremiah (see Dan. ix. 2).

Still if we accept this as the more natural alternative, we must not suppose that every detail in the narratives of the first part was planned with reference to the Syrian persecution,—Nebuchadnezzar is not a mere double of Antiochus. There is a parallelism, it is true, between the circumstances of the persecuted Jews and the pious friends at Babylon, but it must not be pressed too far. Nor need we suppose that the book was circulated at once as a whole or among all classes of the Jews. The two parts of the work are separable, and the former part displays perhaps too much antiquarian research to be perfectly suitable for general circulation. The "wise men," who formerly sat "in the gate," had withdrawn since the time of the Captivity to the student's chamber; and in the author of Daniel we behold the prototype of the scholar-martyrs and confessors of the Christian church.

Among the more important modern works on Daniel are Hitzig, *Das Buch Daniel*, 1850; Delitzsch, article "Daniel" in *Herzog's Real-Encyclopädie*, Bd. iii. 1855; Hilgenfeld, *Die jüdische Apokalyptik*, 1857; Zündel, *Kritische Untersuchungen*, &c., 1861; Pusey, *Daniel the Prophet*, 2nd ed., 1868; Perowne, review of Pusey, in *Contemporary Review*, vol. i.; R. Martineau, "Daniel," in *Theological Review*, 1865; Zöckler, "Der Prophet Daniel," in Lange's *Bibelwerk*, 1870; Lenormant, *La divination, &c., chez les Chaldéens*, (pp. 169-227), 1875; Fuller, "Commentary on Daniel" in *Speaker's Commentary*, vol. vi., 1876; Kuenen, *The Prophets and Prophecy in Israel*, 1877. (T. K. C.)

DANIEL, Gabriel (1649-1728), a French Jesuit historian, was born at Rouen in 1649. He was educated by the Jesuits, entered the order at the age of eighteen, and became superior at Paris. He is best known by his *Histoire de France depuis l'établissement de la Monarchie Française*, which appeared first in 1713, and has since been published in 1758 and in 1755-60, the last edition with notes by P. Griffet. Daniel published an abridgment in 1728; and another abridgment was published by Dorival in 1751. Though full of prejudices, which affect his accuracy, Daniel had the advantage of consulting valuable original sources, and his book has been praised by such authorities as Henri Martin and Thierry. Daniel also wrote a by no means successful reply to Pascal's *Provincial Letters*, entitled *Entretiens de Cléanthe et d'Eudoxe sur les Lettres Provinciales*; a *Histoire de la Milice française depuis l'établissement de la monarchie française jusqu'à la fin de la règne de Louis le Grand* (1721); two treatises on the Cartesian theory as to the intelligence of the lower animals, and other works.

DANIEL, Samuel (1562-1619), an English poet and historian, was the son of a music-master, and was born near Taunton, in Somersetshire, in 1562. In 1579 he was admitted a commoner of Magdalen College, Oxford, where he remained for about three years, and then gave himself up to the unrestrained study of poetry and philosophy. He succeeded in being appointed tutor to Anne Clifford, daughter of the earl of Northumberland, and thus commenced a life of not ignoble dependence on several of the great houses of that day. He was first encouraged and, if we may believe him, taught in verse, by the famous countess of Pembroke, whose honour he was never weary of proclaiming. His first known work, a translation of Paulus Jovius, to which some original matter is appended, was printed in 1585. His first known volume of verse is dated 1592; it contains the cycle of sonnets to *Delia* and the romance called *The Complaint of Rosamond*. It has been plausibly conjectured that an earlier edition of the latter at one time existed; if so, it seems to be lost beyond all hope. Several editions of the sonnets appeared in 1592, and they were very frequently reprinted during Daniel's lifetime. We learn by internal evidence that Delia lived on the banks of Shakespeare's river, the Avon, and that the sonnets to her were inspired by her memory when the poet was in Italy. To an edition of *Delia* and *Rosamond*, in 1594, was added the tragedy of *Cleopatra*, a severe study in the manner of the ancients, in alternately rhyming heroic verse, diversified by stiff choral interludes. *The First Four Books of the Civil Wars*, an historical poem in *ottava rima*, appeared in 1595. The bibliography of Daniel's works is attended with great difficulty, but as far as is known it was not until 1599 that there was published a volume entitled *Poetical Essays*, which contained, besides the "Civil Wars," "Musophilus," and "A letter from Octavia to Marcus Antonius," poems in Daniel's finest and most mature manner. On the death of Spenser, in the same year, Daniel received the somewhat vague office of poet-laureate, which he seems, however, to have shortly resigned in favour of Ben Jonson. In 1601 he published his *Epistles to Great Personages in verse*. Whether it was on this occasion is not known, but about this time, and at the recommendation of his brother-in-law John Florio, he was taken into favour at court, and published, in 1602, a *Panegyric offered to the King at Burleigh Harrington in Rutlandshire*, written in *ottava rima*, a second edition of which, in 1603, contained an elegant prose essay called *A Defence of Rime*, as against the classic measures proposed by Webbe and Gosson. In 1603, moreover, Daniel was appointed Master of the Queen's Revels. In this capacity he brought out a series of masques and pastoral tragicomedies,—of which were printed *A Vision of the Twelve Goddesses*, in 1604; *The Queen's Arcadia*, in 1606; and *Hymen's Triumph*, in 1615. Meanwhile had appeared, in 1605, *Certain short poems, with the tragedy of Philotas*, which latter was a study in the same style as *Cleopatra*. In 1604 the *Civil Wars* had been completed in eight books. In 1612 Daniel published a prose *History of England*, from the earliest times down to the end of the reign of Edward III. This work was afterwards continued, and published towards the close of Daniel's life, without a date. He was made a gentleman-extraordinary and groom of the chamber to Queen Anne, sinecure offices which offered no hindrance to an active literary career. He was now acknowledged as one of the first writers of the time. Shakespeare, Selden, and Chapman are named among the few intimates who were permitted to intrude upon the seclusion of a garden-house in Old street, St Luke's, where, Fuller tells us, he would "lie hid for some months together, the more retiredly to enjoy the company of the Muses, and then would appear in public to converse with his friends." Late in life Daniel threw up his titular posts at court and retired to a farm-house, which he rented at Beckington, in his native county of Somerset, where he died on the 14th of October 1619. The poetical writings of Daniel are very numerous, and, in spite of the eulogies of all the best critics, they have never yet been collected or reprinted. This is the more singular since, during the last century, when so little Elizabethan literature was read, Daniel retained his poetical prestige. In later times Coleridge, Charles Lamb, and others have expended some of their most genial criticisms on this poet. Of his multifarious works the sonnets are now, perhaps, most read. As second in date to none but Sidney's, they possess a special interest; they mark the first legalization of the great error of our sonneteers, in closing with a couplet, but they have a grace and tenderness all their own. Of a higher order is *The Complaint of Rosamond*, a soliloquy in which the ghost of the murdered woman appears and bewails her fate in stanzas of exquisite pathos. Among the *Epistles to Distinguished Persons* will be found some of Daniel's noblest stanzas and most polished verse. The epistle to the countess of Bedford is remarkable among those as being composed in genuine *terza rima*, till then not used in English. Daniel was particularly fond of a four-lined stanza of solemn alternately rhyming iambics, a form of verse distinctly misplaced in his dramas. These, inspired it would seem by like attempts of the countess of Pembroke's, are hard and frigid; his pastorals are far more pleasing; and *Hymen's Triumph* is perhaps the best of all his dramatic writing. In elegiac verse he always excelled, but most of all in his touching address *To the Angel Spirit of the Most Excellent Sir Philip Sidney.* We must not neglect to quote *Musophilus* among the most characteristic writings of Daniel. It is a general defence of learning, and in particular of poetic learning, addressed to Fulk Greville, and written, with much sententious melody, in a sort of *terza rima* or, more properly, *ottava rima* with the couplet omitted. Daniel was a great reformer in verse, and the introducer of several valuable novelties. It may be broadly said of his style that it is full, easy, and stately, without being very animated or splendid. It attains a high average of general excellence, and is content with level flights. As a gnomic writer Daniel approaches Chapman, but is far more musical and coherent. He is wanting in fire and passion, but he is pre-eminent in scholarly grace and tender, mournful reverie. (E. W. G.)

DANIELL, JOHN FREDERICK (1790–1845), an eminent chemist and physicist, was born in London on the 12th March 1790. From his father, a barrister, he received an excellent classical education; but having from his early years displayed a preference for natural science, he entered a sugar refinery, where he soon effected important improvements in the process. He studied chemistry under Professor Brande, in conjunction with whom he started in 1816 the journal which, shortly after its commencement, became favourably known to scientific men as the *Quarterly Journal of Science and Art.* To this he contributed numerous articles on chemistry and meteorology, including, under the latter head, an interesting account of the ingenious and delicate dew-point hygrometer which is known by his name. In 1823 he collected and published his *Meteorological Essays,* which excited much interest as one of the first attempts to explain the phenomena of the weather on the broad and sure basis of physical science. In 1824 he published an *Essay on Artificial Climate considered in its Applications to Horticulture,* which was the means of effecting a radical change in the treatment of tropical plants in colder regions, by showing the necessity of a humid atmosphere in hothouses. As managing director of the Continental Gas Company he interested himself in the manufacture of gas for illuminating purposes, and invented a method of extracting it from resin, which was in practical use for a time. He was one of the founders of the Society for Promoting Useful Knowledge, for which he wrote a treatise on chemistry. In 1831 he was appointed first professor of chemistry in the newly founded King's College, London. During the succeeding years he was engaged in a series of investigations on heat and electricity, which were of great value in their practical applications. For his register pyrometer, devised to measure high temperatures, he was awarded in 1832 the Rumford medal of the Royal Society. Soon afterwards he received the Copley medal for his invention of the sulphate of copper or constant battery, which, as a substitute for Wollaston's, effected an immense improvement in the apparatus of voltaic electricity. The Royal medal, the only other honour of the kind in the gift of the society, was bestowed upon him in 1842. In 1839 appeared his *Introduction to the Study of Chemical Philosophy,* which dealt very ably with the theory of molecular forces. Four years later the honorary degree of D.C.L. was conferred upon him by the university of Oxford. He had received in 1839 another honour of a different kind in being chosen foreign secretary of the Royal Society. He died suddenly of apoplexy while attending a meeting of the council of the society on the 13th March 1845.

DANIELL, THOMAS, WILLIAM, and SAMUEL. This family of landscape painters forms a group which has left one record, so to speak, in our annals of art, not by their pictures exactly, but by the three having been all travellers in the East, and publishing, by means of engraving, works illustrating the scenery of the countries they visited.

THOMAS DANIELL (1749–1840), to whom the others were indebted for everything, was a man of versatile ability and enormous energy. He was the maker of his own fortune, having been born at the Chertsey inn, kept by his father, in 1749, and apprenticed to an heraldic painter, a trade then dying out, like that of stay-maker or perukier at a later time. However profitable it had been, probably Daniell would not have adhered to it, as he was animated, at a time when the representation of natural scenery under atmospheric conditions of effect was merely struggling into existence, with a love of the romantic and beautiful in architecture and nature. The sentimental affectation for landscape, so cleverly satirized by Lord Macaulay, did not indeed influence him; his bias was towards archæology and botany, and led him at last to India. Up to 1784 he painted topographical subjects and flower pieces. By this time his two nephews had come under his influence, the youngest being apprenticed to Medland the landscape engraver, and the elder, William, was under his own care. In this year (1784) he embarked for India accompanied by the boy, and found at Calcutta ample encouragement. Here he remained ten years, and on returning to London he published his largest work, *Oriental Scenery,* in six large volumes, not completed till 1808. From 1795 till 1828 he continued to exhibit Eastern subjects, temples, jungle-hunts, &c., and at the same time continued the publication of illustrated works. These are—*Views of Calcutta; Oriental Scenery,* 144 plates; *Views in Egypt; Excavations at Ellora; Picturesque Voyage to China.* These were for the most part executed by an engraving process now almost forgotten, called aquatint, and, although they do not show the accuracy of detail now understood, are valuable authorities. He was made Royal Academician in 1799, fellow of the Royal Society about the same time, and at different times member of several minor societies. His nephews both died before him; his Indian period had made him independent, and he lived a bachelor life in much respect at Kensington till the age of ninety-one, dying 19th March 1840.

WILLIAM DANIELL (1769–1837), nephew of Thomas, was born 1769, and was therefore fourteen when he accompanied his uncle to India. His own publications, engraved in aquatint, were—*Voyage to India; Zoography; Animated Nature; Views of London; Views of Bootan,* a work prepared from his uncle's sketches; and a *Voyage Round Great Britain,* which occupied him several years. The British Institution made him an honorary award of £100 for a Battle of Trafalgar, and he was elected R.A. in 1822. He turned to panorama painting before his death, beginning in 1832 with Madras, the picture being enlivened by the Hindu mode of taming wild elephants. He died 16th August 1837.

SAMUEL DANIEL, William's younger brother, born 1775, was brought up as an engraver, and first appears as an exhibitor in 1792. A few years later he went to the Cape and travelled into the interior of Africa, with his sketching materials in his haversack. The drawings he made there were published, after his return, in his *African Scenery.* He did not rest long at home, but left for Ceylon in 1806, where he spent the remaining years of his life, publishing *The Scenery, Animals, and Natives of Ceylon.* Camping out and malaria from the swamps cut him off after a few days' illness in December 1811.

DANNECKER, Johann Heinrich von (1758–1841), one of the best German sculptors. He was born at Stuttgart, where his father was employed in the stables of the duke of Würtemberg, 15th October 1758. The boy was entered in the military school at the age of thirteen, and continued there two years, when, his bias and his talent having manifested themselves, he was allowed to take his own way, although there had been some idea of making him a dancer. Once freed from his juvenile difficulties his success was pretty secure, and we find him at once associating with the young sculptors Scheffauer and Le Jeune, the painters Guibal and Harper, and also with Schiller, and the much-admired musician Zumsteeg. His busts of some of these are good; that of Schiller is well known. In his eighteenth year he carried off the prize at the Concours with his model of Milo of Crotona, the strong man who died by having his hand caught in the rent stump of a tree, a favourite subject with young sculptors. On this the duke made him sculptor to the palace (1780), and for some time he was employed on child-angels and caryatides for the decoration of the reception rooms. This work did not please him very much, and in 1783, in his twenty-fourth year, he left for Paris with Scheffauer, and placed himself under Pajou for a time. His Mars, a sitting figure sent home to Stuttgart, marks this period; and we next find him, still travelling with his friend, at Rome in 1785, where he settled down to work hard for five years, during which his position in the future art history of his native land was securely made. Goethe and Herder were then in Rome and became his friends, as well as Canova, who was the hero of the day, and who had undoubtedly a great authoritative influence on his style. His marble statues of Ceres and Bacchus were done at this time. These are now to be seen in the Residenz-schloss, at Stuttgart. While in Rome his study of the antique was very careful and intelligent, although Canova was so much admired by him, and on his return to Stuttgart, which he never afterwards quitted except for short trips to Paris, Vienna, and Zurich, the double influence of these opposite forces is apparent in his works. We may mention some of these. The first was a Girl Lamenting her Dead Bird, which pretty light motive was much admired. Afterwards, Sappho, in marble for the Lustschloss, and two Offering-bearers for the Jagdschloss; Hector, now in the museum, not in marble; the Complaint of Ceres, from Schiller's poem; a statue of Christ, worthy of mention for its nobility, which has been skilfully engraved by Amsler; Psyche; Kneeling Water Nymph; Love, a favourite he had to repeat. These stock subjects with sculptors had freshness of treatment; and the Ariadne, done a little later, especially had a charm of novelty which has made it a European favourite in a reduced size. It is perhaps the contrast between the delicacy of the female human form and the subdued rude force of the panther she rides that attracts our admiration; but it is probable that this group, like Canova's Graces, will always retain its popularity. It was repeated for the banker Von Bethman in Frankfort, where it now appears the ornament of the Platz. Many of the illustrious men of the time were modelled by him. The original marble of Schiller is now at Weimar; after the poet's death it was again modelled in colossal size. Lavater, Metternich, Countess Stephanie of Baden, General Benkendorf, and others are much prized. Dannecker was director of the Gallery of Stuttgart, and received many academic and other distinctions. So far his life had been prosperous, but as the evening drew on his mind became troubled and at last obscured. His health had suffered while working very closely on a large monumental statue, and long before his final year he was altogether prostrated. During this sad period he rallied, but his memory and power of observation faded again, and his death was long expected. This took place at last in 1841, in his eighty-third year.

DANTE. Dante (or Durante) Alighieri (1265–1321) was born at Florence about the middle of May 1265. He was descended from an ancient family, but not one of the highest rank. His biographers have attempted on very slight grounds to deduce his origin from the Frangipani, one of the oldest senatorial families of Rome. We can affirm with greater certainty that he was connected with the Elisei who took part in the building of Florence under Charles the Great. Dante himself does not, with the exception of a few obscure and scattered allusions, carry his ancestry beyond the warrior Cacciaguida, whom he met in the sphere of Mars (*Par.* xv. 87, foll.) Cacciaguida there tells his descendant that he was born in the year 1106, that he married an Aldighieri from the valley of the Po, that he had two brothers, Moronte and Eliseo, and that he accompanied the Emperor Conrad III. upon his crusade into the Holy Land, where he died among the infidels. From Eliseo was descended the branch of the Elisei; from Aldighiero, son of Cacciaguida, the branch of the Alighieri. Bellincione, son of Aldighiero, was the grandfather of Dante. His father was a second Aldighiero, a lawyer of some reputation. By his first wife, Lapa di Chiarissimo Cialuffi, this Aldighiero had a son Francesco; by his second, Donna Bella, whose family name is not known, Dante and a daughter. Thus the family of Dante held a most respectable position among the citizens of his beloved city; but had it been reckoned in the very first rank they could not have remained in Florence after the defeat of the Guelfs at Montaperti in 1260. It is clear, however, that Dante's mother at least did so remain, for Dante was born in Florence in 1265. The heads of the Guelf party did not return till 1267.

Dante was born under the sign of the twins, "the glorious stars pregnant with virtue, to whom he owes his genius such as it is." Astrologers considered this constellation as favourable to literature and science, and Brunetto Latini, his instructor, tells him in the *Inferno* (xv. 25, foll.) that, if he follows its guidance, he cannot fail to reach the harbour of fame. Boccaccio relates that before his birth his mother dreamed that she lay under a very lofty laurel, growing in a green meadow, by a very clear fountain, when she felt the pangs of childbirth,—that her child, feeding on the berries which fell from the laurel, and on the waters of the fountain, in a very short time became a shepherd, and attempted to reach the leaves of the laurel, the fruit of which had nurtured him,—that, trying to obtain them he fell, and rose up, no longer a man, but in the guise of a peacock. We know little of Dante's boyhood except that he was a hard student and a pupil of Brunetto Latini. Boccaccio tells us that he became very familiar with Virgil, Horace, Ovid, and Statius, and all other famous poets; and that, "taken by the sweetness of knowing the truth of the things concealed in heaven, and finding no other pleasure dearer to him in life, he left all other worldly care and gave himself to this alone, and, that no part of philosophy might remain unseen by him, he plunged with acute intellect into the deepest recesses of theology, and so far succeeded in his design that, caring nothing for heat or cold, or watchings or fastings, or any other bodily discomforts, by assiduous study he came to know of the divine essence and of the other separate intelligences all that the human intellect can comprehend." Leonardo Bruni says that "by study of philosophy, of theology, astrology, arithmetic, and geometry, by reading of history, by the turning over many curious books, watching and sweating in his studies, he acquired the science which he was to adorn and explain in his verses." Of his teacher Brunetto Latini, of whom he speaks with the most loving gratitude and affection, but whose gross vices he does not hesitate to brand with infamy, Giovanni Villani has left us a graphic picture:—"He was a great philosopher, and a consummate master of rhetoric, not only in knowing how to speak well, but how to write well. He it was who explained the rhetoric of Tully and made the good and useful book called *Tesoro*, and the *Tesoretto* and the *Chiave del Tesoro*, and other works in philosophy and of vices and virtues, and he was secretary of our commune. He was a worldly man; but we have made mention of him because he both began and directed the growth of the Florentines, both in making them ready in speaking well and in knowing how to guide and direct our republic according to the rules of politics." Under this guidance Dante became master of all the science of his age at a time when it was not impossible to know all that could be known. He was a skilful draughtsman, and tells us that on the anniversary of the death of Beatrice he drew an angel on a tablet. He was an intimate friend of Giotto, who has immortalized his youthful lineaments in the chapel of the Bargello, and who is recorded to have drawn from his friend's inspiration the allegories of Virtue and Vice which fringe the frescoes of the Scrovegni Chapel at Padua. Nor was he less sensible to the delights of music. Milton had not a keener ear for the loud uplifted angel trumpets and the immortal harps of golden wires of the cherubim and seraphim; and our English poet was proud to compare his own friendship with Henry Lawes with that between Dante and Casella, "met in the milder shades of purgatory." Most dear to him of all were the companions Cino di Pistoia, Lapo Gianni, Guido Cavalcanti, and others, similarly gifted and dowered with like tastes, who lived in the lively streets of the city of the flowers, and felt with him the first warm flush of the coming renaissance. He has written no sweeter or more melodious lines than those in which he expresses the wish that he, with Guido and Lapo, might be wafted by enchantment over the sea wheresoever they might list, shielded from fortune and evil times, and living in such contentment that they should wish to live always, and that the good enchanter should bring Monna Vanna and Monna Bice and that other lady into their barque, where they should for ever discourse of love and be for ever happy. It is a wonderful thing (says Leonardo Bruni) that, though he studied without intermission, it would not have appeared to any one that he studied, from his joyous mien and youthful conversation. Like Milton he was trained in the strictest academical education which the age afforded; but Dante lived under a warmer sun and brighter skies, and found in the rich variety and gaiety of his early life a defence against the withering misfortunes of his later years. Milton felt too early the chill breath of Puritanism, and the serious musing on the experience of life, which saddened the verse of both poets, deepened in his case into grave and desponding melancholy.

We must now consider the political circumstances in which lay the activity of Dante's manhood. From 1115, the year of the death of Matilda countess of Tuscany, to 1215, Florence enjoyed a nearly uninterrupted peace. Attached to the Guelf party it remained undivided against itself. But in 1215 a private feud between the families of Buondelmonte and Uberti introduced into the city the horrors of civil war. Villani (lib. v. cap. 38) relates how Buondelmonte de' Buondelmonti, a noble youth of Florence, being engaged to marry a lady of the house of Amidei, allied himself instead to a Donati, and how Buondelmonte was attacked and killed by the Amidei and Uberti at the foot of the Ponte Vecchio, close by the pilaster which bears the image of Mars. "The death of Messer Buondelmonte was the occasion and beginning of the accursed parties of Guelfs and Ghibellines in Florence." Of the seventy-two families then in Florence thirty-nine became Guelf under the leadership of the Buondelmonte, and the rest Ghibelline under the Uberti. The strife of parties was for a while allayed by the war against Pisa in 1222, and the constant struggles against Siena; but in 1248 Frederick II. sent into the city his natural son Frederick, prince of Antioch, with 1600 German knights. The Guelfs were driven away from the town, and took refuge, part in Montevarchi, part in Capraia. The Ghibellines, masters of Florence, behaved with great severity, and destroyed the towers and palaces of the Guelf nobles. At last the people became impatient. They rose in rebellion, deposed the podestà, elected in his place a captain of the people, established a more democratic constitution, and, encouraged by the death of Frederick in December 1250, recalled the exiled Guelfs. Manfred, the bastard son of Frederic, pursued the policy of his father. He stimulated the Ghibelline Uberti to rebel against their position of subjection. A rising of the vanquished party was put down by the people, in July 1258 the Ghibellines were expelled from the town, and the towers of the Uberti razed to the ground. The exiles betook themselves to the friendly city of Siena. Manfred sent them assistance. The Florentines, after vainly demanding their surrender, despatched an army against them. On September 4, 1260, was fought the great battle of Montaperti, which dyed the Arbia red, and in which the Guelfs were entirely defeated. The hand which held the banner of the republic was sundered by the sword of a traitor. For the first time in the history of Florence the Caroccio was taken. Florence lay at the mercy of her enemies. A parliament was held at Empoli, in which the deputies of Siena, Pisa, Arezzo, and other Tuscan towns consulted on the best means of securing their new war power. They voted that the accursed Guelf city should be blotted out. But Farinata of the Uberti stood up in their midst, bold and defiant as when he stood erect among the sepulchres of hell, and said that if, from the whole number of the Florentines, he alone should remain, he would not suffer, whilst he could wield a sword, that his country should be destroyed, and that, if it were necessary to die a thousand times for her, a thousand times would he be ready to encounter death. Help came to the Guelfs from an unexpected quarter. Clement IV., elected Pope in 1265, offered the crown of Apulia and Sicily to Charles of Anjou. The French prince, passing rapidly through Lombardy, Romagna, and the Marches, reached Rome by way of Spoleto, was crowned on January 6, 1266, and on February 23 defeated and killed Manfred at Benevento. In such a storm of conflict did Dante first see the light. In 1267 the Guelfs were recalled, but instead of settling down in peace with their opponents they summoned Charles of Anjou to vengeance and the Ghibellines were driven out. The meteor passage of Conradin gave hope to the imperial party, which was quenched when the head of the fair-haired boy fell on the scaffold at Naples. Pope after Pope tried in vain to make peace. Gregory X. placed the rebellious city under an interdict; Nicolas III. in 1280 patched up a hollow truce. In 1282 the constitution of Florence received the final form which it retained till the collapse of freedom. From the three *arti maggiori* were chosen six priors, in whose hands was placed the government of the republic. They remained in office for two months, and during that time lived and shared a common table in the Public Palace. We shall see what influence this office had upon the fate of Dante. The success of the Sicilian Vespers, the vacancy of the Holy See, the death of Charles of Anjou, roused again the courage of the Ghibellines. They took possession of Arezzo, and threatened to drive out the Guelfs from Tuscany. The historian Ammirato has left us a lively account of the skirmishes against Arezzo in the year 1288, a prelude to the great battle of Campaldino in the following summer. Then it was that Dante saw "horsemen moving camp and commencing the assault, and holding muster, and the march of foragers, the shock of tournaments, and race of jousts, now with trumpets and now with bells, with drums and castle signals, with native things and foreign" (*Inf.* xxii. 1, foll.) On June 11, 1289, at Campaldino near Poppi, in the Casentino, the Ghibellines were utterly defeated. They never again recovered their hold on Florence, but the violence of faction survived under other names. Dante fought with distinction at Campaldino, was present shortly afterwards at the battle of Caprona (*Inf.* xxi. 95, foll.), and returned in September 1289 to his studies and his love. His peace was of short duration. On June 9, 1290, died Beatrice, whose mortal love had guided him for thirteen years, and whose immortal spirit purified his later life, and revealed to him the mysteries of Paradise.

Dante had first met Beatrice Portinari at the house of her father Folco on May-day 1274. In his own words, "already nine times after my birth the heaven of light had returned as it were to the same point, when there appeared to my eyes the glorious lady of my mind, who was by many called Beatrice who knew not what to call her. She had already been so long in this life that already in its time the starry heaven had moved towards the east the twelfth part of a degree, so that she appeared to me about the beginning of her ninth year, and I saw her about the end of my ninth year. Her dress on that day was of a most noble colour, a subdued and goodly crimson, girdled and adorned in such sort as best suited with her tender age. At that moment I saw most truly that the spirit of life which hath its dwelling in the secretest chamber of the heart began to tremble so violently that the least pulses of my body shook therewith; and in trembling it said these words, 'Ecce deus fortior me qui veniens dominabitur mihi.'" In the *Vita Nouva* is written the story of his passion from its commencement to within a year after the lady's death. He saw Beatrice only once or twice, and she probably knew little of him. She married Simone de' Bardi. But the worship of her lover was stronger for the remoteness of its object. The last chapter of the *Vita Nuova* relates how, after the lapse of a year, "it was given me to behold a wonderful vision, wherein I saw things which determined me that I would say nothing further of this blessed one until such time as I could discourse more worthily concerning her. And to this end I labour all I can, as she in truth knoweth. Therefore if it be His pleasure through whom is the life of all things that my life continue with me a few years, it is my hope that I shall yet write concerning her what hath not before been written of any woman. After the which may it seem good unto Him who is the master of grace that my spirit should go hence to behold the glory of its lady, to wit, of that blessed Beatrice who now gloriously gazes on the countenance of Him qui est per omnia sæcula benedictus." In the *Convito* he resumes the story of his life. "When I had lost the first delight of my soul (that is, Beatrice) I remained so pierced with sadness that no comforts availed me anything, yet after some time my mind, desirous of health, sought to return to the method by which other disconsolate ones had found consolation, and I set myself to read that little-known book of Boetius in which he consoled himself when a prisoner and an exile. And hearing that Tully had written another work, in which, treating of friendship, he had given words of consolation to Lælius, I set myself to read that also." He so far recovered from the shock of his loss that in 1292 he married Gemma, daughter of Manetto Donati, a connection of the celebrated Corso Donati, afterwards Dante's bitter foe. It is possible that she is the lady mentioned in the *Vita Nuova* as sitting full of pity at her window and comforting Dante for his sorrow. By this wife he had seven children, and although he never mentions her in the *Divina Commedia*, and although she did not accompany him into exile, there is no reason to suppose that she was other than a good wife, or that the union was otherwise than happy. Certain it is that he spares the memory of Corso in his great poem, and speaks kindly of his kinsmen Piccarda and Forese.

Dante now began to take an active part in politics. He was inscribed in the *arte* of the *Medici* and *Speziali*, which made him eligible as one of the six *priori* to whom the government of the city was intrusted in 1282. Documents still existing in the archives of Florence show that he took part in the deliberations of the several councils of the city in 1295, 1296, 1300, and 1301. Filelfo says that he served on fourteen embassies, a statement not only unsupported by evidence, but impossible in itself. Filelfo does not mention the only embassy in which we know for certain that Dante was engaged, that to the town of San Gemignano in 1299. From June 15 to August 15, 1300, he held the office of prior, which was the source of all the miseries of his life. The spirit of faction had again broken out in Florence. The two rival families were the Cerchi and the Donati,—the first of great wealth but recent origin, the last of ancient ancestry but poor. A quarrel had arisen in Pistoia between the two branches of the Cancellieri,—the Bianchi and Neri, the Whites and the Blacks. The quarrel spread to Florence, the Donati took the side of the Blacks, the Cerchi of the Whites. Pope Boniface was asked to mediate, and sent Cardinal Matteo d'Acquasparta to maintain peace. He arrived just as Dante entered upon his office as prior. The cardinal effected nothing, but Dante and his colleagues banished the heads of the rival parties in different directions to a distance from the capital. The Blacks were sent to Città della Pieve in the Tuscan mountains; the Whites, among whom was Dante's dearest friend Guido Cavalcanti, to Serrezzano in the unhealthy Maremma. After the expiration of Dante's office both parties returned, Guido Cavalcanti so ill with fever that he shortly afterwards died. The Blacks sought for vengeance. The journey of Charles of Valois to Rome gave them an opportunity. At a meeting held in the church of the Holy Trinity the Whites were denounced as Ghibellines, enemies of France and of the pope, and the French prince was invited to the town as peacemaker, to defend the Guelfs against their machinations. The priori sent at the end of September four ambassadors to the Pope, one of whom was Dante. He never again saw the towers of his native city. Charles of Valois marched from Pavia and took up his abode in the Oltr' Arno. Corso Donati, who had been banished a second time, returned in force and summoned the Blacks to arms. The prisons were broken open, the podestà driven from the town, the Cerchi confined within their houses, a third of the city was destroyed with fire and sword. By the help of Charles the Blacks were victorious. They appointed Cante de' Gabrielli of Gubbio as podestà, a man devoted to their interests. More than 600 Whites were condemned to exile and cast as beggars upon the world. On January 27, 1302, Dante with three others was condemned to pay a fine of 5000 lire of small florins. If the money was not paid within three days their property was to be destroyed and laid waste; if they did pay the fine they were to be exiled for two years from Tuscany; in any case they were never again to hold office in the republic. On March 10 Dante and fourteen others were condemned to be burned alive if they should come into the power of the republic. Similar sentences were passed in September 1311 and October 1315. The sentence was not formally reversed till 1494, under the government of the Medici.

Dante received the news of his banishment in Siena. The exiles met first at Gargonza, a castle between Siena and Arezzo, and then at Arezzo itself. They joined themselves to the Ghibellines, to which party the podestà Uguccione della Faggiuola belonged. The Ghibellines, however, were divided amongst themselves, and the Green Ghibellines were not disposed to favour the cause of the White Guelfs. They found a more sympathetic defender in Scarpetta degli Ordelaffi at Forli. From this place Dante probably went to Bartolommeo della Scala, lord of Verona, where the country of the great Lombard gave him his first refuge and his first hospitable reception. Can Grande, to whom he afterwards dedicated the *Paradiso*, was then a boy. Bartolommeo died in 1304, and it is possible that Dante may have remained in Verona till his death. In September 1303 the fleur-de-lis had entered Anagni, and Christ had a second time been buffeted in the person of his vicar. Boniface VIII. did not survive the insult long, but died in the following month. He was succeeded by Benedict XI., who did his best to give peace to his distracted country. Immediately after his accession he sent the Cardinal da Prato to Florence, who arrived there in March 1304. The people received him with enthusiasm; ambassadors came to him from the Whites; and he did his best to reconcile the two parties. But the Blacks resisted all his efforts. He shook the dust from off his feet, and departed leaving the city under an interdict. Foiled by the calumnies and machinations of the one party, the cardinal gave his countenance to the other. It happened that Corso Donati and the heads of the Black party were absent at Pistoia. Da Prato advised the Whites to attack Florence, deprived of its heads and impaired by fire. An army was collected of 16,000 foot and 9000 horse. Communications were opened with the Ghibellines of Bologna and Romagna. But the forces of the exiles, badly led, reached the gates of the city only to find themselves unsupported from within. They were driven to retreat, all hope of return became impossible, and Dante felt for the first time the full bitterness of exile. It was after the failure of this ill-conceived attempt that Dante's wanderings really began. Filled with contempt at the baseness and incapacity of his fellow-sufferers, he wished that, disdaining the support of their companionship, he had stood alone and made a party by himself. This, indeed, we must consider Dante to have done, if we would understand the real nature of his Ghibellinism. Dante had been born and bred a Guelf, and it was only under the pressure of inevitable necessity that he and his friends allied themselves with the other side. If we rise beyond the limits of mere local quarrels, we find in Italian history that the Guelf party was generally speaking favourable to liberty. The municipal privileges of the great Italian cities rose under the protection of the Popes, while the emperors only crossed the Alps to crush their ancient independence, and depress them beneath the yoke of some feudal representative. The horse of Barbarossa trampled upon the ashes of Milan, whereas the straw-built fortress of the Lombard league bore the name of Alexander. Had it not breathed the air of freedom the life of Florence could not have survived the period of its infancy, stifled as it afterwards was by the preponderance of the Medici. Dante could not have been indifferent or ungrateful to the cause which had given to his beloved Italy all that made it valuable to the world. But he saw that the conditions of the time were altered, and that other dangers menaced the welfare of his country. There was no fear now that Florence, Siena, Pisa, Arezzo should be razed to the ground in order that the castle of the lord might overlook the humble cottages of his contented subjects; but there was danger lest Italy should be torn in sunder by its own jealousies and passions, and lest the fair domain bounded by the sea and the Alps should never properly assert the force of its individuality, and should present a contemptible contrast to a united France and a confederated Germany. Sick with petty quarrels and dissensions Dante strained his eyes towards the hills for the appearance of a deliverer, who should hush the jar of discord, discipline into effectiveness the luxuriant forces of the peninsula, and, united in spiritual harmony with the vicar of Christ, show for the first time to the world an example of a government where the strongest force and the highest wisdom were interpenetrated by all that God had given to the world of piety and justice. In this sense and in no other was Dante a Ghibelline. The vision was never realized—the hope was never fulfilled. Not till our own day has Italy become united and the "greyhound of deliverance" has chased from city to city the "wolf" of the papacy. But is it possible to say that the dream did not work its own realization, or to deny that the high ideal of the poet, after inspiring a long succession of minds as lofty as his own, has become after five hundred years embodied in the constitution of a state which acknowledges no stronger bond of union than a common worship of the exile's indignant and impassioned verse?

It is very difficult to determine with exactness the order and the place of Dante's wanderings. Many cities and castles in Italy have claimed the honour of giving him shelter, or of being for a time the home of his inspired muse. He certainly spent some time with Count Guido Salvatico in the Casentino near the sources of the Arno, probably in the castle of Porciano, and with Uguccione in the castle of Faggiuola in the mountains of Urbino. After this he is said to have visited the university of Bologna; and in August 1306 we find him at Padua. Cardinal Napoleon Orsini, the legate of the French Pope Clement V., had put Bologna under a ban, dissolved the university, and driven the professors to the northern city. In May or June 1307 the same cardinal collected the Whites at Arezzo and tried to induce the Florentines to recall them. The name of Dante is found attached to a document signed by the Whites in the church of St Gaudenzio in the Mugello. This enterprize came to nothing. Dante retired to the castle of Moroello Della Spina in the Lunigiana, where the marble ridges of the Apennines descend in precipitous slopes to the Gulf of Spezzia. From this time till the arrival of the emperor Henry VII. in Italy, October 1310, all is uncertain. His old enemy Corso Donati had at last united himself with Uguccione della Faggiuola, the leader of the Ghibellines. Dante thought it possible that this might lead to his return. But in 1308 Corso was declared a traitor, attacked in his house, put to flight, and killed. Dante lost his last hope. He left Tuscany, and went to Can Grande della Scala at Verona. From this place we may believe that he visited the university of Paris, studied in the Rue Fouarre, became acquainted with the Low Countries, and not improbably crossed the Channel and went to Oxford, and saw where the heart of Prince Harry was worshipped upon London Bridge. The election of Henry of Luxembourg as emperor stirred again his hopes of a deliverer. He left Paris and returned hastily to Italy. At the end of 1310, in a letter to the princes and people of Italy, he proclaimed the coming of the saviour; at Milan he did personal homage to his sovereign. The Florentines made every preparation to resist the emperor. Dante wrote from the Casentino a letter dated March 31, 1311, in which he rebuked them for their stubbornness and obstinacy. Henry still lingered in Lombardy at the siege of Cremona, when Dante, on April 16, 1311, in a celebrated epistle, upbraided his delay, argued that the crown of Italy

Wanderings.

was to be won on the Arno rather than on the Po, and urged the tarrying emperor to hew the rebellious Florentines like Agag in pieces before the Lord. Henry was as deaf to this exhortation as the Florentines themselves. After reducing Lombardy he passed from Genoa to Pisa, and on June 29, 1312, was crowned in Rome. Then at length he moved towards Tuscany by way of Umbria. Leaving Cortona and Arezzo, he reached Florence on September 19. He did not dare to attack it, but returned in November to Pisa. In the summer of the following year he prepared to invade the kingdom of Naples; but in the neighbourhood of Siena he caught a fever and died at the monastery of Buonconvento, August 24, 1313. The hopes of Dante and his party were buried in his grave.

After the death of the emperor Henry (Bruni tells us) Dante passed the rest of his life in great poverty, sojourning in various places throughout Lombardy, Tuscany, and the Romagna, under the protection of various lords, until at length he retired to Ravenna, where he ended his life. Very little can be added to this meagre story. There is reason for supposing that he stayed at Gubbio with Bosone dei Rafaelli, and tradition assigns him a cell in the monastery of St Croce di Fonte Avellana in the same district, situated on the slopes of Catria, one of the highest of the Apennines. After the death of Pope Clement V. he addressed a letter, dated July 14, 1314, to the cardinals in conclave, urging them to elect an Italian Pope. About this time he came to Lucca, then lately conquered by his friend Uguccione, completed the last cantos of the *Purgatory*, and became enamoured of the courteous Gentucca, whose name had been whispered to him by her countryman on the slopes of the Mountain of Purification. In August 1315 was fought the battle of Monte Catini, a day of humiliation and mourning for the Guelfs. Uguccione made but little use of his victory; and the Florentines marked their vengeance on his adviser by condemning Dante yet once again to death if he ever should come into their power. In the beginning of the following year Uguccione lost both his cities of Pisa and Lucca. At this time Dante was offered an opportunity of returning to Florence. The conditions given to the exiles were that they should pay a fine and walk in the dress of humiliation to the church of St John, and there do penance for their offences. Dante refused to tolerate this shame; and the letter is still extant in which he declines to enter Florence except with honour, secure that the means of life will not fail him, and that in any corner of the world he will be able to gaze at the sun and the stars, and meditate on the sweetest truths of philosophy. He preferred to take refuge with his most illustrious protector Can Grande della Scala of Verona, then a young man of twenty-five, rich, liberal, and the favoured head of the Ghibelline party. His name has been immortalized by an eloquent panegyric in the seventeenth canto of the *Paradiso*. Whilst at the court of Verona he maintained in the neighbouring city of Mantua the philosophical thesis *De Aqua et Terra*, which is included in his minor works. The last two years of his life were spent at Ravenna, under the protection of Guido da Polenta. In his service Dante undertook an embassy to the Venetians. He failed in the object of his mission, and, returning disheartened and broken in spirit through the unhealthy lagoons, caught a fever and died in Ravenna, September 14, 1321. His bones still repose there. His doom of exile has been reversed by the union of Italy, which has made the city of his birth and the various cities of his wanderings component members of a common country. His son Piero, who wrote a commentary on the *Divina Commedia*, settled in Verona. His daughter Beatrice lived as a nun in Ravenna. His direct line became extinct in 1509; but the blood still runs in the veins of the Marcheri.Serego Alighieri, a noble family of the city of the Scaligers.

Dante may be said to have concentrated in himself the spirit of the middle age. Whatever there was of piety, of philosophy, of poetry, of love of nature, and of love of knowledge in those times is drawn to a focus in his writings. He is the first great name in literature after the night of the dark ages. The Italian language in all its purity and sweetness, in its aptitude for the tenderness of love and the violence of passion, or the clearness of philosophical argument, sprang fully grown and fully armed from his brain. The *Vita Nuova* is still the best introduction to the study of the Tuscan tongue; the astronomy and science of the *Divine Comedy* are obscure only in a translation. Dante's reputation has passed through many vicissitudes, and much trouble has been spent by critics in comparing him with other poets of established fame. Read and commented upon in the Italian universities in the generation immediately succeeding his death, his name became obscured as the sun of the renaissance rose higher towards its meridian. In the 17th century he was less read than Petrarch, Tasso, or Ariosto; in the 18th he was almost universally neglected. His fame is now fully vindicated. Translations and commentaries issue from every press in Europe and America. Dante societies are formed to investigate the difficulties of his works. He occupies in the lecture-rooms of regenerated Italy a place by the side of those great masters whose humble disciple he avowed himself to be. The *Divine Comedy* is indeed as true an epic as the *Æneid*, and Dante is as real a classic as Virgil. His metre is as pliable and flexible to every mood of emotion, his diction as plaintive and as sonorous. Like him he can immortalize, by a simple expression, a person, a place, or a phase of nature. Dante is even truer in description than Virgil, whether he paints the snow falling in the Alps, or the homeward flight of birds, or the swelling of an angry torrent. But under this gorgeous pageantry of poetry there lies a unity of conception, a power of philosophic grasp, an earnestness of religion which to the Roman poet were entirely unknown. Still more striking is the similarity between Dante and Milton. This may be said to lie rather in the kindred nature of their subjects, and in the parallel development of their minds, than in any mere external resemblance. In both the man was greater than the poet, the souls of both were "like a star and dwelt apart." Both were academically trained in the deepest studies of their age; the labour which made Dante lean made Milton blind. The "Doricke sweetnesse" of the English poet is not absent from the tender pages of the *Vita Nuova*. The middle life of each was spent in active controversy; each lent his services to the state; each felt the quarrels of his age to be the "business of posterity," and left his warnings to ring in the ears of a later time. The lives of both were failures. "On evil days though fallen and evil tongues," they gathered the concentrated experience of their lives into one immortal work, the quintessence of their hopes, their knowledge, and their sufferings. But Dante is something more than this. Milton's voice is grown faint to us—we have passed into other modes of expression and of thought. But if we had to select two names in literature who are still exercising their full influence on mankind, and whose teaching is still developing new sides to the coming generations, we should choose the names of Dante and Goethe. Goethe preached a new gospel to the world, the pagan virtue of self-culture, a sympathy which almost passed into indifference. There is no department of modern literature or thought which does not bear upon it the traces of the sage of Weimar. But if we rebel against this teaching, and yearn once more for the ardour of belief, the fervour of self-sacrifice, the scorn of scorn and the hate of hate which is the meed of the coward and the traitor, where shall we find them but in the pages of the Florentine? The religion of the future, if it be founded on faith, will demand that faith be reconciled with all that the mind can apprehend of knowledge or the heart experience of emotion. The saint of those days will be trained, not so much on ascetic counsels of Imitation, or in Thoughts which base man's greatness on the consciousness of his fall, as on the verse of the poet, theologian, and philosopher, who stands with equal right in the conclave of the doctors and on the slopes of Parnassus, and in whom the ardour of study is one with the love of Beatrice, and both are made subservient to lift the soul from the abyss of hell, along the terraces of purgatory, and the spheres of paradise, till it gazes on the ineffable revelation of the existence of God himself. which can only be apprehended by the eye of faith.

It only remains now to give a short account of Dante's separate works. The *Vita Nuova*, or *Young Life*, of Dante contains the history of his love for Beatrice. Like the *In Memoriam* of our own poet it follows all the varying phases of a deep and overmastering passion from its commencement to its close. He describes how he met Beatrice as a child, himself a child, how he often sought her glance, how she once greeted him in the street, how he feigned a false love to hide his true love, how he felt ill and saw in a dream the death and transfiguration of his beloved, how she died, and how his health failed from sorrow, how the tender compassion of another lady nearly won his heart from its first affection, how Beatrice appeared to him in a vision and reclaimed his heart, and how at last he saw a vision which induced him to devote himself to study that he might be more fit to glorify her who gazes on the face of God for ever. This simple story is interspersed with sonnetti, ballate, and canzoni, chiefly written at the time to emphasize some mood of his changing passion. After each of these, in nearly every case, follows an explanation in prose, which is intended to make the thought and argument intelligible to those to whom the language of poetry was not familiar. The book was probably completed in 1307. It was first printed by Sermartelli in Florence, 1576. The latest and best edition is that by Witte, published by Brockhaus, Leipsic, 1876.

The *Convito*, or *Banquet*, is the work of Dante's manhood, as the *Vita Nuova* is the work of his youth. It consists, in the form in which it has come down to us, of an introduction and three treatises, each forming an elaborate commentary in a long canzone. It was intended, if completed, to have comprised commentaries on eleven more canzoni, making fourteen in all, and in this shape would have formed a *tesoro* or hand-book of universal knowledge, such as Brunetto Latini and others have left to us. It is perhaps the least well known of Dante's Italian works, but crabbed and unattractive as it is in many parts, it is well worth reading, and contains many passages of great beauty and elevation. Indeed a knowledge of it is quite indispensable to the full understanding of the *Divina Commedia.* The time of its composition is uncertain. Dante mentions princes as living who died in 1309; he does not mention Henry VII. as emperor, who succeeded in 1310. There are some passages which seem to have been inserted at a later date. The canzoni upon which the commentary is written were clearly composed between 1292 and 1300, when he sought in philosophy consolation for the loss of Beatrice. The present text is very defective. The *Convito* was first printed in Florence by Buonaccorsi in 1490.

Rime di Dante.—Besides the smaller poems contained in the *Vita Nuova* and *Convito* there are a considerable number of canzoni, ballate, and sonnetti bearing the poet's name. Of these many undoubtedly are genuine, others as undoubtedly spurious. Some which have been preserved under the name of Dante belong to Dante da Maiano, a poet of a harsher style; others which bear the name of Aldighiero are referable to Dante's sons Jacopo or Pietro, or to his grandsons; others may be ascribed to Dante's contemporaries and predecessors Cino da Pistoia and others. Those which are genuine secure Dante a place among lyrical poets scarcely if at all inferior to that of Petrarch. The best edition of the *Canzoniere* of Dante is that by Fraticelli published by Barbéra at Florence. His collection includes seventy-eight genuine poems, eight doubtful, and fifty-four spurious. To these are added an Italian paraphrase of the seven penitential psalms in *terza rima*, and a similar paraphrase of the Credo, the seven sacraments, the ten commandments, the Lord's Prayer, and the Ave Maria.

De Monarchia. The Latin treatise *De Monarchia*, in three books, contains the creed of Dante's Ghibellinism. In it he propounds the theory that the supremacy of the emperor is derived from the supremacy of the Roman people over the world, which was given to them direct from God. As the emperor is intended to assure their earthly happiness, so does their spiritual welfare depend upon the Pope, to whom the emperor is to do honour as to the first-born of the Father. The date of its composition is almost universally admitted to be the time of the descent of Henry VII. into Italy, between 1310 and 1313, although attempts have been made to assign it to a much earlier period. The book was first printed by Oporinus at Basel in 1559.

De Vulgari Eloquio. The treatise *De Vulgari Eloquio*, in two books, also in Latin, is mentioned in the *Convito*. Its object was first to establish the Italian language as a literary tongue, and to distinguish between the noble speech which might become the property of the whole nation, at once a bond of internal unity and a line of demarcation against external nations; and secondly, to lay down rules for poetical composition in the language so established. The work was probably intended to be in four books, but only two are extant. The first of these deals with the language, the second with the style and with the composition of the canzone. The third was probably intended to continue this subject, and the fourth was destined to the laws of the ballata and sonnetto. This work was first published in the Italian translation of Trissino at Vicenza in 1529. The original Latin was not published till 1729 at Verona. The modern editions both of this work and of the *De Monarchia* by Fraticelli are very admirable. The work was probably left unfinished in consequence of Dante's death.

Boccaccio mentions in his life of Dante that he wrote two eclogues in Latin in answer to Johannes de Virgilio, who invited him to come from Ravenna to Bologna and compose a great work in the Latin language. The most interesting passage in the work is that in the first poem, where he expresses his hope that when he has finished the three parts of his great poem his grey hairs may be crowned with laurel on the banks of the Arno. Although the Latin of these poems is superior to that of his prose works, we may feel thankful that Dante composed the great work of his life in his own vernacular. These eclogues have also been printed with notes by Fraticelli.

The *Letters* of Dante are among the most important materials for his biography. Giovanni Villani mentions three as specially remarkable—one to the Government of Florence, in which he complains of undeserved exile; another to the Emperor Henry VII., when he lingered too long at the siege of Brescia; and a third to the Italian cardinals to urge them to the election of an Italian Pope after the death of Clement V. The first of these letters has not come down to us, the two last are extant. Besides these we have one addressed to the Cardinal da Prato, one to a

Florentine friend refusing the base conditions of return from exile, one to the princes and lords of Italy to prepare them for the coming of Henry of Luxembourg, another to the Florentines reproaching them with the rejection of the emperor, and a long letter to Can Grande della Scala, containing directions for interpreting the *Divina Commedia*, with especial reference to the *Paradiso*. Of less importance are the letters to the nephews of Count Alessandro da Romena, to the Marquis Moroello Malaspina, to Cino da Pistoia, and to Guido da Polenta. There are many other letters mentioned by early biographers which may yet be lying hidden in Italian archives.

A treatise *De Aqua et Terra* has come down to us, which Dante tells us was delivered at Mantua in January 1320 (perhaps 1321) as a solution of the question which was being at that time much discussed—whether on any place in the earth's surface water is higher than the earth. There is no doubt about its genuineness, and it affords us a valuable insight into Dante's studies and modes of thought.

We have reserved all mention of the *Divina Commedia* till the last. It would be useless in this place to attempt any account of the contents and scope of this wonderful poem. Those who would learn what it is without studying the poem itself could have no better guide than the *Shadow of Dante* by Maria Rossetti. It will be enough here to say a few words about the date of its composition. The time of the action is strictly confined to the end of March and the beginning of April 1300. It is not improbable that it was commenced shortly after this date. In the *Inferno*, xix. 79, there is an allusion to the death of Pope Clement V., an event which occurred in 1314. This probably marks the date of the completion of this cantica. The *Purgatorio* was completed before 1318, as we learn from the Latin poem addressed to Johannes de Virgilio, which speaks of the *Inferno* and *Purgatorio* as completed, the *Paradiso* as yet to be written. The date of the poem is 1318. The last cantos of the *Paradiso* were probably not finished until just before the poet's death.

A complete *bibliography* of Dante literature would require an article to itself. Of the many separate works on this subject perhaps the most complete is that in the fourth volume of the *Manuele Dantesco* by Professor Ferrazzi Bassano, 1871. The chief secondary authorities for the preceding biography have been the article in *Ersch und Gruber's Encyclopädie* by Blanc, the *Vita di Dante* by Fraticelli, *Dante Alighieri, seine Zeit, sein Leben, und seine Werke*; by Scartazzini, and the excellent treatise of Dr Theodor Paur *Ueber die Quellen zur Lebensgeschichte Dante's*, Görlitz, 1862. The edition of Dante, with Italian notes by Scartazzini published by Brockhaus at Leipsic, of which only two volumes have as yet appeared, promises to supersede all others. Grave doubts have of late years been thrown on the authenticity of the chronicle of Dino Compagni, which has hitherto been regarded as one of the chief authorities for the life of Dante. A summing up of the evidence by W. Bernhardi, who concludes against the genuineness of the book, is to be found in Von Sybel's *Historische Zeitschrift*, the first number for 1877. A more copious bibliography of Dante literature is subjoined, taken mainly from Scartazzini's German work.

Editions of Dante's Works.—Divina Commedia con l'espositione di Chr. Landino e di Aless. Velutello, 1 vol. fol., Venet., 1564 The same, *Giunta la lezione del Codice Bertoliniano*, 4 vols., Udine, 1823–27. The same, *l'ottimo Commento*, 3 vols., Pisa, 1827–29. The same, *col. comm. di G. Bagioli*, 3 vols., Mil. 1829. The same, *colla prefazione degli editori della Minerva*, 1 vol. 4to, Fir., 1838. The same, *col. comm. di Fr. da Buti*, 3 vols., Pisa, 1858–62. The same, *ricorretta sopra quattro dei più autorevoli testi a penna da Carlo Witte*, 1 vol. 4to, Berl., 1862. The same, *nuovam. riv. nel testo e dichiarata da Brunone Bianchi*, 1 vol., Fir., 1863. The same, *col. comm. di P. Fraticelli*, 1 vol., Fir. 1864. The same *il codice Cassinese*, 1 vol. fol., Monte Cassino, 1865. The same, *col. comm. di Anonimo Fiorentino, ed. P. Fanfani*, 1 vol., Bologna, 1866. The same, *col. comm. di G. A. Scartazzini*, Brockhaus, Leipzig. [The volumes containing the *Inferno* and *Purgatorio* are published; a fourth volume is to contain the life of Dante and Prolegomena.]

Opere Minori, con le Annotaz. di A. M. Friscioni, 2 vols., Venez., 1741. The same, *con note e illust. di P. Fraticelli*, 3 vols., Fir. 1861–62. *Vita Nuova e Canzoniere, commentati da G. R. Giuliani*, 1 vol., Fir., 1868. *Monarchia* (Liber i.), Carl Witte, 4to, Halis 1863. The same (Liber ii.), Carl Witte, 4to, Halis, 1867. *Epistole ed. e ined. per cura di Aless. Torri*, 1 vol., Livorno, 1842. *Amori e Rime di Dante*, 1 vol., Mantova, 1823.

Translations.—The principal translations into English are those of Carey (1806), Dayman (1843), F. Pollock, J. A. Carlyle (the *Inferno* only, 1849), and Longfellow, 1867. The best German translation is by King John of Saxony, under the name of Philalethes. Those of Witte, Blanc, and Kannegiesser are also to be recommended.

Of *Illustrative Writings* the principal are—the article by L. G. Blanc on Dante Allighieri in Ersch and Gruber's Encyclopædia; *Vocabolario Dantesco*, 1 vol., Leipzig, 1852; *Versuch einen blos philol. Erkl. mehrere dunklen Stellen d. Gottl. Kom.*, 2 vols., Halle, 1861–65; *Dante e il suo secolo*, 1 vol. fol., Fir., 1865; Fraticelli, *Storia della Vita di Dante A.*, 1 vol., Fir., 1861; Giuliani, G. B., *Metodo di comm. la Comm. di D. A.*, Fir., 1861; Ozanam, *Dante et la philosophie catholique au treizième siècle*, Par., 1845; Paur, Th., *Ueber die Quellen zur Lebens Geschichte Dantes*, Görlitz, 1862; Wegele, Fr. X., *Dante Al.'s Leben und Werke*, 1 vol., Jena, 1865; the various writings of Carl Witte, *Ueber Dante*, Breslau, 1831; *Quando e da chi sia composto l'ottimo commento a Dante*, Lips., 1847; *De Bartolo a Saxoferrato Dante Allig. studioso*, Halis, 1861; *Dante und die Ital. Fragen*, Halle, 1861; *Dante-Forschungen*, Halle, 1869; Scartazzini, *Dante Allighieri, seine Zeit, sein Leben, und seine Werke*, Biel, 1869. To these must be added the Jahrbuch of the Dante Gesellschaft founded in 1865. (O. B.)

DANTON, GEORGE JACQUES (1759–1794), one of the most conspicuous actors in the decisive episodes of the first French Revolution. He was born at Arcis-sur-Aube in 1759. His family was of respectable quality, though of very moderate means. They contrived to give him a good education, and he was launched in the career of an advocate at the Paris bar. When the Revolution broke out, it found Danton following his profession with apparent success, leading a cheerful domestic life, and nourishing his intelligence on good books. He first appears in the revolutionary story as president of the popular club or assembly of the district in which he lived. This was the famous club of the Cordeliers, so called from the circumstance that its meetings were held in the old convent of the order of the Cordeliers, just as the Jacobins derived their name from the refectory of the convent of the Jacobin brothers. It is an odd coincidence that the old rivalries of Dominicans and Franciscans in the democratic movement inside the Catholic Church should be recalled by the names of the two factions in the democratic movement of a later century away from the church. The Cordeliers were from the first the centre of the popular principle in the French Revolution carried to its extreme point; they were the earliest to suspect the court of being irreconcilably hostile to freedom; and it was they who most vehemently proclaimed the need for root and branch measures. Danton's robust, energetic, and impetuous temperament made him the natural leader in such a quarter. We find no traces of his activity in the two great insurrectionary events of 1789—the fall of the Bastille, and the forcible removal of the court from Versailles to the Tuileries. In the spring of 1790 we hear his voice urging the people to prevent the arrest of Marat. In the autumn we find him chosen to be the commander of the battalion of the national guard of his district. In the beginning of 1791 he was elected to the post of administrator of the department of Paris. This interval was for all France a barren period of doubt, fatigue, partial reaction, and hoping against hope. It was not until 1792 that Danton came into the prominence of a great revolutionary chief.

In the spring of the previous year (1791) Mirabeau had died, and with him had passed away the only man who was at all likely to prove a wise guide to the court. In June of that year the king and queen made a disastrous attempt to flee from their capital and their people. They were brought back once more to the Tuileries, which from that time forth they rightly looked upon more as a prison than a palace or a home. The popular exasperation was intense, and the constitutional leaders, of whom the foremost was Lafayette, became alarmed and lost their judgment. A bloody dispersion of a popular gathering, known afterwards as the massacre of the Champ-de-Mars (July 1791), kindled a flame of resentment against the court and the constitutional party which was never extinguished. The Constituent Assembly completed its infertile labours in September 1791. Then the elections took place to its successor, the short-lived Legislative Assembly. Danton was not elected to it, and his party was at this time only strong enough to procure for him a very subordinate post in the government of the Parisian municipality. Events, however, rapidly prepared a situation in which his influence became of supreme weight. Between January and August 1792 the want of sympathy between the aims of the popular assembly and the spirit of the king and the queen became daily more flagrant and beyond power of disguise. In April, war was declared against Austria, and to the confusion and distraction caused by the immense civil and political changes of the past two years was now added the ferment and agitation of war with an enemy on the frontier. The distrust felt by Paris for the court and its loyalty at length broke out in insurrection. On the memorable morning of the 10th of August 1792, the king and queen took refuge with the Legislative Assembly from the apprehended violence of the popular forces who were marching on the Tuileries. The share which Danton had in inspiring and directing this momentous rising is very obscure. Some look upon him as the head and centre of it. Apart from documents, support is given to this view by the fact that on the morrow of the fall of the monarchy Danton is found in the important post of minister of justice. This sudden rise from the subordinate office which he had held in the commune is a proof of the impression that his character had made on the insurrectionary party. To passionate fervour for the popular cause he added a certain broad steadfastness and an energetic practical judgment which are not always found in company with fervour. Even in those days, when so many men were so astonishing in their eloquence, Danton stands out as a master of commanding phrase. One of his fierce sayings has became a proverb. Against Brunswick and the invaders, "*il nous faut de l'audace, et encore de l'audace, et toujours de l'audace*,"—we must dare, and again dare, and for ever dare. The tones of his voice were loud and vibrant. As for his bodily presence, he had, to use his own account of it, the athletic shape and the stern physiognomy of the Liberty for which he was ready to die. Jove the Thunderer, the rebel Satan, a Titan, Sardanapalus, were names that friends or enemies borrowed to describe his mien and port. He was thought about as a coarser version of the great tribune of the Constituent Assembly; he was called the Mirabeau of the sans-culottes, and Mirabeau of the markets.

In the executive Government that was formed, on the king's dethronement, this strong revolutionary figure found himself the colleague of the virtuous Roland and others of the Girondins. Their strength was speedily put to a terrible test. The alarming successes of the enemy on the frontier, and the surrender of two important fortresses, had engendered a natural panic in the capital. But in the breasts of some of the wild men whom the disorder of the time had brought to prominent place in the Paris Commune this panic became murderously heated. Some hundreds of captives were barbarously murdered in the prisons. There has always been much dispute as to Danton's share in this dreadful transaction. At the time, it must be confessed, much odium on account of an imputed direction of the massacres fell to him. On the whole, however, he cannot be fairly convicted of any part in the plan. What he did was to make the best of the misdeed, with a kind of sombre acquiescence. He deserves credit for insisting against his colleagues that they should not flee from Paris, but should remain firm at their posts, doing what they could to rule the fierce storm that was raging around them.

The elections to the National Convention took place in September, when the Legislative Assembly surrendered its authority. The Convention ruled France until October 1795 Danton was a member; resigning the ministry of justice, he took a foremost part in the deliberations and proceedings of the Convention, until his execution in April 1794. This short period of nineteen months was practically the life of Danton, so far as the world is concerned with him.

He took his seat in the high and remote benches which gave the name of the Mountain to the thoroughgoing revolutionists who sat there. He found himself side by side with Marat, whose exaggerations he never countenanced; with Robespierre, whom he did not esteem very highly, but whose immediate aims were in many respects his own; with Camille Desmoulins and Phélippeaux, who were his close friends and constant partisans. The foes of the Mountain were the group of the Girondins,—eloquent, dazzling, patriotic, but unable to apprehend the fearful nature of the crisis, too full of vanity and exclusive party-spirit, and too fastidious to strike hands with the vigorous and stormy Danton. The Girondins dreaded the people who had sent Danton to the Convention; and they insisted on seeing on his hands the blood of the prison massacres of September. Yet in fact Danton saw much more clearly than they saw how urgent it was to soothe the insurrectionary spirit, after it had done the work of abolition which to him, as to them too, seemed necessary and indispensable. Danton discerned what the Girondins lacked the political genius to see, that this control of Paris could only be wisely effected by men who sympathized with the vehemence and energy of Paris, and understood that this vehemence and energy made the only force to which the Convention could look in resisting the Germans on the north-east frontier, and the friends of reaction in the interior. "Paris," he said, "is the natural and constituted centre of free France. It is the centre of light. When Paris shall perish, there will no longer be a republic."

Danton was among those who voted for the death of the king (January 1793). He had a conspicuous share in the creation of the famous revolutionary tribunal, his aim being to take the weapons away from that disorderly popular vengeance which had done such terrible work in September. When all executive power was conferred upon a Committee of Public Safety, Danton had been one of the nine members of whom that body was originally composed. He was despatched on frequent missions from the Convention to the republican armies in Belgium, and wherever he went he infused new energy into the work of national liberation. He pressed forward the erection of a system of national education, and he was one of the legislative committee charged with the construction of a new system of government. He vainly tried to compose the furious dissensions between Girondins and Jacobins. The Girondins were irreconcilable, and made Danton the object of deadly attack. He was far too robust in character to lose himself in merely personal enmities, but by the middle of May (1793) he had made up his mind that the political suppression of the Girondins had become indispensable. The position of the country was most alarming. Dumouriez, the victor of Valmy and Jemmappes, had deserted. The French arms were suffering a series of checks and reverses. A royalist rebellion was gaining formidable dimensions in the west. Yet the Convention was wasting time and force in the vindictive recriminations of faction. There is no positive evidence that Danton directly instigated the insurrection of May 31 and June 2, which ended in the purge of the Convention and the proscription of the Girondins. He afterwards spoke of himself as in some sense the author of this revolution, because a little while before, stung by some trait of factious perversity in the Girondins, he had openly cried out in the midst of the Convention, that if he could only find a hundred men, they would resist the oppressive authority of the Girondin Commission of Twelve. At any rate, he certainly acquiesced in the violence of the commune, and he publicly gloried in the expulsion of the men who stood obstinately in the way of a vigorous and concentrated exertion of national power. Danton, unlike the Girondins, accepted the fury of popular passion as an inevitable incident in the work of deliverance. Unlike Billaud de Varennes, or Hébert, or any other of the Terrorist party, he had no wish to use this frightful two-edged weapon more freely than was necessary. Danton, in short, had the instinct of the statesman. His object was to reconcile France with herself; to restore a society that, while emancipated and renewed in every part, should yet be stable; and above all to secure the independence of his country, both by a resolute defence against the invader, and by such a mixture of vigour with humanity as should reconcile the offended opinion of the rest of Europe. This, so far as we can make it out, was what was in his mind.

The position of the Mountain had now undergone a complete change. In the Constituent Assembly its members did not number more than 30 out of the 578 of the Third Estate. In the Legislative Assembly they had not been numerous, and none of their chiefs had a seat. In the Convention for the first nine months they had an incessant struggle for their very lives against the Girondins. They were now (June 1793) for the first time in possession of absolute power. It was not easy, however, for men who had for many months been nourished on the ideas and stirred to the methods of opposition, all at once to develop the instincts of government. Actual power was in the hands of the two committees—that of Public Safety and of General Security. Both were chosen out of the body of the Convention. The drama of the nine months between the expulsion of the Girondins and the execution of Danton turns upon the struggle of the committee to retain power—first, against the insurrectionary commune of Paris, and second, against the Convention, from which the committees derived an authority that was regularly renewed on the expiry of each short term.

Danton, immediately after the fall of the Girondins, had thrown himself with extraordinary energy into the work to be done. The first task in a great city so agitated by anarchical ferment had been to set up a strong central authority. In this genuinely political task Danton was prominent. He was not a member of the Committee of Public Safety when that body was renewed in the shape that speedily made its name so redoubtable all over the world. This was the result of a self-denying ordinance which he imposed upon himself. It was he who proposed that the powers of the committee should be those of a dictator, and that it should have copious funds at its disposal. In order to keep himself clear of any personal suspicion, he announced his resolution not to belong to the body which he had thus done his best to make supreme in the state. His position during the autumn of 1793 was that of a powerful supporter and inspirer, from without, of the Government which he had been foremost in setting up. Danton was not a great practical administrator and contriver, like Carnot, for instance. But he had the gift of raising in all who heard him an heroic spirit of patriotism and fiery devotion, and he had a clear eye and a cool judgment in the tempestuous emergencies which arose in such appalling succession. His distinction was that he accepted the insurrectionary forces, instead of blindly denouncing them as the Girondins had done. After these forces had shaken down the throne, and then, by driving away the Girondins, had made room for a vigorous Government, Danton perceived the expediency of making all haste to an orderly state. Energetic prosecution of the war, and gradual conciliation of civil hatreds, had been, as we have said, the two marks of his policy ever since the fall of the monarchy. The first of these objects was fulfilled abundantly, partly owing to the energy with which he called for the arming of the whole nation against its enemies. His whole mind was now given to the second of them. But the second of them, alas, was desperate.

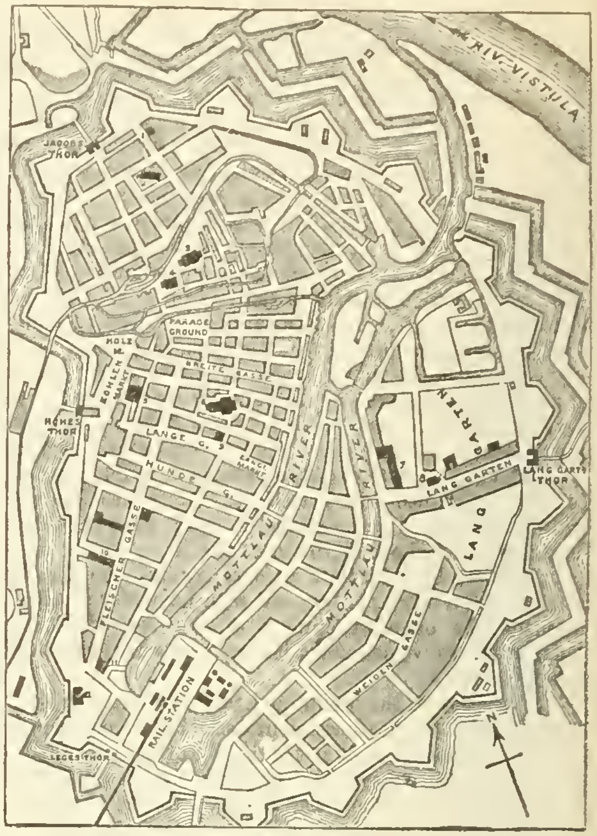
It was to no purpose that, both in his own action and in the writings of Camille Desmoulins (*Le Vieux Cordelier*), of whom he was now and always the intimate and inspirer, he worked against the iniquities of the bad men, like Carrier and Collot d'Herbois in the provinces, and against the severity of the revolutionary tribunal in Paris. The black flood could not at a word or in an hour subside from its storm-lashed fury. The commune of Paris was now composed of men like Hébert and Chaumette, to whom the restoration of any sort of political order was for the time indifferent. They wished to push destruction to limits which even the most ardent sympathizers with the Revolution condemn now, and which Danton condemned then, as extravagant and senseless. These men were not politicians, they were fanatics; and Danton, who was every inch a politician, though of a vehement type, had as little in common with them as John Calvin of Geneva had with John of Leyden and the Münster Anabaptists. The committee watched Hébert and his followers uneasily for many weeks, less perhaps from disapproval of their excesses than from apprehensions of their hostility to the committee's own power. At length the party of the commune proposed to revolt against the Convention and the committees. Then the blow was struck, and the Hébertists were swiftly flung into prison, and thence under the knife of the guillotine (March 24, 1794). The execution of the Hébertists was the first victory of the revolutionary Government over the extreme insurrectionary party. But the committees had no intention to concede anything to their enemies on the other side. If they refused to follow the lead of the anarchists of the commune, they were none the more inclined to give way to the Dantonian policy of clemency. Indeed, such a course would have been their own instant and utter ruin. The Terror was not a policy that could be easily transformed. A new policy would have to be carried out by new men, and this meant the resumption of power by the Convention, and the death of the Terrorists. In Thermidor 1794 such a revolution did take place, with those very results. But in Germinal, feeling was not ripe. The committees were still too strong to be overthrown. And Danton seems to have shown a singular heedlessness. Instead of striking by vigour in the Convention, he waited to be struck. In these later days a certain discouragement seems to have come over his spirit. His wife had died during his absence on one of his expeditions to the armies; he had now married again, and the rumour went that he was allowing domestic happiness to tempt him from the keen incessant vigilance proper to the politician in such a crisis. He must have known that he had enemies. When the Jacobin club was "purified" in the winter, Danton's name would have been struck out as a moderate, if Robespierre had not defended him. The committees had deliberated on his arrest soon afterwards, and again it was Robespierre who resisted the proposal. Yet though he had been warned of the lightning that was thus playing round his head, Danton did not move. Either he felt himself powerless, or he rashly despised his enemies. At last Billaud de Varennes, the most prominent spirit of the committee after Robespierre, succeeded in gaining Robespierre over to his designs against Danton. Robespierre was probably actuated by motives of selfish policy, which soon proved the greatest blunder of his life. The Convention, aided by Robespierre and the authority of the committee, assented with ignoble unanimity. On March 30 Danton, Desmoulins, and others of the party were suddenly arrested. Danton displayed such vehemence before the revolutionary tribunal, that his enemies feared lest he should excite the crowd in his favour. The Convention, in one of its worst fits of cowardice, assented to a proposal made by St Just that, if a prisoner showed want of respect for justice, the tribunal might pronounce sentence without further delay. Danton was at once condemned, and led, in company with fourteen others, including Camille Desmoulins, to the guillotine (April 5, 1794). "I leave it all in a frightful welter," he said; "not a man of them has an idea of government. Robespierre will follow me; he is dragged down by me. Ah, better be a poor fisherman than meddle with the government of men!"

Events went as Danton foresaw. The committees presently came to quarrel with the pretensions of Robespierre. Three months after Danton, Robespierre fell. His assent to the execution of Danton had deprived him of the single great force that might have supported him against the committee. The man who had "saved France from Brunswick" might perhaps have saved her from the White reaction of 1794. (J. MO.)

DANTZIC (or, according to the German form, which is often used, DANZIG), an important seaport of Prussia, the capital of West Prussia, is situated on the left bank of the Vistula, about three miles from its mouth, 253 miles north-east of Berlin, in 54° 21′ N. lat. and 18° 41′ E. long. In 1875 the inhabitants, most of whom are Protestants, numbered 98,181. The town is traversed by the Mottlau, a small branch of the Vistula. It ranks as a fortress of the first class, the fortifications including ramparts, bastions, wet ditches, and works for laying the surrounding country under water. There is a harbour in the town, but the principal port is at Neufahrwasser, at the mouth of the Vistula.

Dantzic is entered by four gates, one of which dates from the 16th century, and another from the 17th. The streets are narrow and winding, but in the Langgasse, the chief street, reaching from the Hohe Thor to the Langenmarkt, there are many interesting specimens of ancient architecture. The high gables, often elaborately ornamented, give the houses a very picturesque aspect. There are 13 Protestant churches, 5 Catholic churches, and 2 synagogues. Of these the most important is St Mary's, one of the largest Protestant churches in existence, begun in 1343, completed in 1503. It possesses a famous painting of the Last Judgment, known as the Dantzic picture, formerly attributed to Jan van Eyck, but probably by Memling. The town hall, founded in 1379, is a fine Gothic structure, the interior of which has recently been restored. Among other noteworthy buildings are the exchange, built in the 14th century, the citadel, built in 1605; and the theatre, of recent date. To the west of the town is a suburban district of considerable extent, with wide, pleasant streets.

The Government of West Prussia, and a Board of Commerce and of Admiralty, have their seat in Dantzic. It is also a naval station, with docks, magazines, and a marine depôt. The educational institutions of the town, besides providing amply for elementary education, include a gymnasium, founded in 1558, two real-schools of the highest class, a commercial academy, a technical school,



Plan of Dantzic.

1. Library.
2. St Bartholomew's Church.
3. St Bridget's Church.
4. St Catherine's Church.
5. Old Armoury.
6. St Mary's Church.
7. Government Buildings.
8. St Barbara's Church.
9. Town Hall.
10. Barracks.
11. New Armoury.

and a school of navigation. There are a public library, containing 50,000 volumes, a collection of paintings, chiefly modern, and several societies for the promotion of science art, and literature. The manufacture of arms and artillery is carried on to a large extent, and the imperial and private docks give employment to a great number of workmen. The town is still famous for its amber, beer, brandy, and the liqueur known as Danziges Goldwasser; and its transit trade makes it one of the most important commercial towns in the north of Europe. Its harbours are visited annually by about 2000 sea-going vessels, besides an immense number of smaller craft employed in river navigation. The chief exports are grain, especially wheat, which comes for the most part from Poland and is of excellent quality, and timber. The principal imports are herring, coal, petroleum, salt, and wine. The annual value of the imports by sea is from £2,500,000 to £3,000,000, by river about £2,250,000, by railway from £2,400,000 to £2,750,000; that of exports by sea from £2,500,000 to £2,750,000, by river from £750,000 to £1,250,000, by railway about £2,500,000.

History.—The origin of Dantzic is unknown, but it is mentioned in 997 as an important town. At different times it was held by Pomerania, Poland, Brandenburg, and Denmark, and in 1308 it fell into the hands of the Teutonic knights, under whose rule it long prospered. It was one of the four chief towns of the Hanseatic

League. In 1455, when the Teutonic Order had become thoroughly corrupt, Dantzic shook off its yoke and submitted to the king of Poland, to whom it was formally ceded, along with the whole of West Prussia, at the Peace of Thorn. Although nominally subject to Poland, and represented in the Polish diets and at the election of Polish kings, it enjoyed the rights of a free city, and governed a considerable territory with more than thirty villages. It suffered severely through various wars of the 17th and 18th centuries, and in 1734, having declared in favour of Stanislas Lesczinski, was besieged and taken by the Russians and Saxons. At the first partition of Poland, in 1772, Dantzic was separated from that kingdom; and in 1793 it came into the possession of Prussia. In 1807, during the war between France and Pussia, it was bombarded and captured by Marshal Lefèbvre, who was rewarded with the title of duke of Dantzic; and at the Peace of Tilsit Napoleon declared it a free town, under the protection of France, Prussia, and Saxony, restoring to it its ancient territory. A French governor, however, remained in it, and by compelling it to submit to the Continental system almost ruined its trade. It was given back to Prussia in 1814.

DANUBE (German, *Donau*; Hungarian, *Duna*; Latin, *Danubius*, or *Danuvius*, and in the lower part of its course, *Ister*), the largest river of Europe next to the Volga, traversing the southern part of Germany, Austria, Hungary, and the northern part of Turkey, and falling into the Black Sea after a course of about 1750 (or, including its windings, 2000) miles. Its basin, which comprises a territory of nearly 300,000 square miles, is bounded by the Black Forest, some of the minor Alpine ranges, the Bohemian Forest, and the Carpathian mountains on the north, and by the Alps and the range of the Balkan on the south. The Danube is generally considered to be formed by the union, at Donaueschingen, of the Brigach and the Brege, two mountain streams from the Black Forest; though a third stream, originating in a spring in the palace garden of Donaueschingen, at a height of about 2850 feet above the sea, is by some held to be the true source. It seems probable, according to the investigations of Professor Knop of Carlsruhe, that at Immardingen the infant river loses a good part of its waters in the fissures of the soil, and thus gives rise to the Aach, which flows south and joins the Rhine. After passing N.E. through the kingdom of Würtemberg and part of Bavaria to Ratisbon, it turns to the S.E., and maintains that direction till it approaches Lintz in Austria. From this town its course is in the main easterly to Hungary, which it enters a little above Presburg. From Presburg it flows S.E. through the lesser Hungarian plain to its confluence with the Raab, whence it runs E. to Waitzen. At Waitzen it turns S., and flows with a slow current and numerous windings through the greater plain of Hungary for nearly 2½ degrees of latitude. After its junction with the Drave it again takes a general S.E. direction to Orsova, where it leaves the Austrian territories by the famous pass of the Iron Gate, with once formidable rapids. From Orsova, its course is generally S. by E. to Kalafat, thence mostly E. by S. to Sistova; it there takes an E. by N. direction to Rassova, then turns N. to Galatz, and finally eastward to the Black Sea. Among its 400 tributaries, of which upwards of 100 are navigable, the principal are—on the right, the Iller, Lech, Iser, Inn, Ens, Raab, Drave, Save, Morava, Timok, Isker, Vid, and Jantra; and on the left, the Altmühl, Nab, Regen, March, Waag, Gran, Theiss, Temes, Chyl, Aluta, Jalomnitza, Sereth, and Pruth. The Danube communicates with the Rhine by means of the Ludwigs-Canal, which unites the Altmühl with the Main, with the Elbe by means of the Moldau and other canals, and with the Theiss, its own tributary, by means of the Franzens-Canal. The upper course of the river is regularly frozen over all winter; and even the lower reaches are usually closed for a considerable period. According to a British consular report in 1873, the river at Galatz during the thirty-seven years from 1837 to 1873 remained open all winter only eight times, namely, in 1839, 1846, 1852, 1853, 1854, 1860, 1867, and 1873; the date of the complete freezing over varied from Dec. 7 to Feb. 14; and the breaking up of the ice occurred as early as Jan. 18, and as late as March 21. This last event always causes great anxiety to the inhabitants; for, if the thaw begins in the upper part of the stream, the waters rush down with tremendous fury, and frequently do incalculable damage. When such a catastrophe is apprehended, watchmen are stationed on eminences along the banks of the river, to give notice by alarm guns when the ice is broken.

At Ulm the Danube receives the Iller, and thus, at a height of 1400 feet above the sea, becomes navigable for flat-bottomed boats of 100 tons. From Donauwörth to Passau it traverses the Bavarian plain, leaving which it intersects a mountainous region till it reaches Vienna. At Passau it is 800 feet above the level of the sea, and at Vienna 450. From Vienna to the mouth of the Drave it flows through an expanse of plain country, broken only in a few places, as at Presburg, Buda, and Waitzen. At Isakcha the channel is 1700 feet broad and 50 feet deep. At extreme low water the total current is 70,000 cubic feet per second, at ordinary low water 125,000, at ordinary high water 324,000, and during extraordinary flood 1,000,000, and thus, on a general average from the observations of 10 years, 207,000 feet per second. The total amount of alluvium annually carried down by the river is calculated at 67,760,000 cubic feet; and, according to M. Desjardins, the advance of the coast thus produced during the Christian era is about 9 or 10 miles. About 15 miles below Isakcha the river breaks up into two branches, of which the northern or Kilia branch forms an irregular network of channels on its way to the sea, and, after reuniting into one, gives rise to a secondary delta with nine or ten arms; while the southern or Tultcha branch subdivides before long into the central or Sulina branch and the southmost or St George's. The delta thus formed comprises an area of about 1000 square miles, almost totally destitute of cultivation, and broken in all directions by swamps and fresh-water lakes. Of the total burden of the river it was calculated in 1857 that the Kilia branch carried down seventeen twenty-sevenths, the Sulina branch two twenty-sevenths, and the St George's eight twenty-sevenths; but since that date the Tultcha St George's branch has grown shallower, and the volume of the Kilia has increased to about eighteen twenty-sevenths, or two-thirds of the whole discharge.

In the course of the present century a good deal has been done to render the Danube more available as a means of communication. In 1816 Austria and Bavaria made arrangements for the common utilization of the river; and since then both Governments have been liberal in their outlays for its improvement. In 1830 steam-boats were introduced between Vienna and Pesth, under the encouragement of Count Szechenyi, a steam-boat company having been started in 1828 by two Englishmen, Andrews and Prichard. In 1834 the boats descended as far as Orsova, and in 1835 they began to reach Galatz. About the same time the draining of the Donaumoos, between Neuburg and Ingolstadt, which had been commenced in 1791, was successfully prosecuted. In 1844 the Ludwigs-Canal was completed at a cost of 400,860,000 dollars; and in 1845 and 1853 the removal of the rocks which still, in spite of the labours of Joseph II., obstructed the river below Grein was finally achieved. In 1866 an imperial commission was established for the rectification of the river bed in the neighbourhood of Vienna; and the proposal to construct a new channel, supported by the engineers Abernethy and Sexauer, was ultimately chosen as the most promising scheme. In terms of the Peace of Paris, March 1856, the river not only was placed under the protection of international law, and declared free to the ships of all nations, but a commission was constituted in November of that year for the purpose of putting the deltaic portion in the best possible state for navigation. It took the title of "European Commission of the Danube," and consisted of the following representatives of the seven powers who had signed the treaty:—the Chevalier de Becke for Austria, Major Stokes, R.E., for England, Monsieur Engelhardt for France, Herr Bitter for Prussia, Baron d'Offenburg for Russia, the Marquis d'Aste for Sardinia, and Omar Fetzi Pasha for Turkey. Sir Charles Hartley was appointed engineer-in-chief. The commission fixed its seat at Galatz, and began its labours by establishing an engineering factory and depôt at Tultcha, and constructing a telegraph line between Sulina, Tultcha, and Galatz; but, after a discussion which lasted from December 1857 to April 1858, the delegates could not come to an agreement in regard to the relative claims of the St George's and the Sulina mouths, and had to refer the question to their respective Governments. A technical commission appointed by France, England, Prussia, and Sardinia decided unanimously in favour of St George's, but recommended, instead of the embankment of the natural channel, the formation of an artificial canal closed by sluices at its junction with the river, and reaching the sea at some distance from the natural embouchure. The choice of St George's made by this commission was adopted at Galatz in December 1858, and six of the seven representatives voted for the canalization; but, owing to various political and commercial considerations, it was ultimately decided to do nothing more in the meantime than render permanent and effective the provisional works already commenced at the Sulina mouth. These consisted of two piers, forming a seaward prolongation of the fluvial channel, and had been commenced in 1858, according to Sir Charles Hartley's plan calculated for a period of six or eight years. In their permanent form they were completed on 31st July 1861, having required for their construction 200,000 tons of stone, and 12,500 piles. The northern pier had a length of 4631 feet, the southern of 3000, and the depth of water in which they were built varied from 6 feet to 20 feet. At the commencement of the works the depth of the channel was only 9 feet, but by their completion it had increased to 19 feet. Ten years afterwards it was found expedient to make the total length of the piers 5332 and 3457 feet. Various minor rectifications of the channel were also effected, and in 1865 a lighthouse was established in 44° 51′ N. lat. and 29° 36′ 32″ E. long. The expenses of 1857, 1858, 1859, and part of 1860 were provided by the Ottoman Empire; but since that year the commission has been mainly indebted to a tax on the shipping of the river. Of what value the works of Sulina have proved may be shown by the fact that of 2928 vessels navigating the lower Danube in 1855, 36 were shipwrecked, while of 2676 in 1865 only 7 were thus unfortunate. By the treaty of March 13, 1871, signed at London by the seven powers, the commission is to exist for twelve years, and the works accomplished under its superintendence are declared permanently neutral. It is independent of the Roumanian Government, and has various sovereign powers over the Danube below Isakcha, such as the control of the police, the collection of taxes, and the disposal of its revenue. The same treaty authorizes the permanent commission of the riparian states (Austria, Bavaria, Würtemberg, Turkey, Moldavia, Wallachia, and Servia), which commenced its labours at Vienna in 1856, to collect a tax from all the vessels navigating the river, in order to pay the expenses of the proposed removal of the obstructions that still render dangerous the passage of the Iron Gate.

DANVERS, a town of the United States, in the county of Essex, in Massachusetts, about two miles from Salem and fifteen miles N.N.E. of Boston, with which it is connected by rail. The principal industry is the manufacture of boots and shoes, which employs a large proportion of the inhabitants, and annually puts into the market upwards of a million pairs; there are also brickyards, tanneries, and a carpet factory. The most interesting building is the Peabody Institute, with its library and art-collections, founded in 1852 by George Peabody, the philanthropist, who was born at Danvers in 1795. Population in 1870, 5600.

DANVILLE, a town of the United States, the administrative centre of Montour county, Pennsylvania, is situated on the north branch of the Susquehanna river, fifty miles north-east of Harrisburg. To its position in the neighbourhood of Montour Ridge, with its abundant supplies of iron-ore, anthracite, and limestone, it owes its prosperity as one of the principal seats of the iron trade. The railroad iron of the Montour Iron Works is specially celebrated. The town was founded about 1780. Its population in 1870 was 8436.

DANVILLE, a city of the United States, the administrative seat of Vermilion county, Illinois, on the Vermilion river, a tributary of the Wabash, about 125 miles south of Chicago. Situated in a rich and populous district, in the vicinity of an extensive coal-field, and well supplied with building materials and water, it forms a flourishing manufacturing centre with foundries, waggon works, locomotive works, and various other industrial establishments. It was founded in 1828, and in 1873 had about 7000 inhabitants.

D'ANVILLE, Jean Baptiste Bourguignon (1697-1782), a French geographer of the highest eminence, was born at Paris on the 11th July 1697. His passion for geographical research displayed itself from his earliest years. At the age of twelve, while reading the Latin authors at college, he amused himself with drawing maps of the countries which they described. While he was thus busily employing himself one day in the class, his master observed and was about to punish him; but upon casting his eye upon the performance, he immediately judged him to be deserving rather of encouragement. After leaving college he derived much instruction from intercourse with the Abbé Longuerue, the celebrated antiquarian. D'Anville from this time devoted himself entirely to geography, particularly that of the ancient world. His first map, that of Ancient Greece, was published when he was fifteen, and at the age of twenty-two he was appointed one of the king's geographers, and began to delineate maps which attracted the attention of the most eminent authorities.

The course of study on which D'Anville entered was of great extent. Works professedly geographical formed the least part of it; those of all the ancient and modern historians, travellers, narrators of every description, were assiduously examined. He studied also the philosophers, orators, and poets, but only for the sake of the occasional geographical lights which they afforded, for it was remarked that in perusing their works he was totally indifferent to everything which did not tend to fix a geographical position. The object of this immense labour was to effect a complete reform in the science of geography by banishing the system of copying blindly from preceding maps, and never fixing a single position without a careful examination of all the authorities upon which it rested. By this process he detected many serious errors in the works of his most celebrated predecessors, while his own accuracy was soon attested on all sides by the travellers and mariners who had taken his works as their guide. His principles led him also to another innovation, which was that of omitting every name for which there existed no sufficient authority. Vast spaces, which had before been covered with countries and cities, were thus suddenly reduced to a perfect blank; but it was speedily perceived that this was the only accurate course, and that the defect lay in the science, not in the geographer.

D'Anville was at first employed in the humbler task of illustrating by maps the works of different travellers, such as Marchais, Charlevoix, Labat, and Duhalde. For the history of China by the last-named writer he was employed to make an atlas, which was published by itself at the Hague in 1737. The question respecting the figure of the earth coming to be much agitated, he published in 1735 and 1736 two treatises, with a view to illustrate it. But this attempt to solve a geometrical problem by historical materials was eminently unsuccessful. Maupertuis having gone to measure a degree within the polar circle, the result was found directly opposite to D'Anville's prediction. Any loss of reputation which this failure might have occasioned was completely retrieved by his map of Italy, published in 1743. It was marked by a method of investigation often employed by D'Anville with peculiar success, which consisted in the application of ancient materials to correct the existing geography. By the diligent study of the Latin authors he was enabled to trace numerous errors which had crept into the delineation of that country. A trigonometrical survey which Pope Benedict XIV. almost immediately after caused to be made in the States of the Church confirmed, in a surprizing degree, all these alterations. On this occasion he first set the example of accompanying the map with a memoir exhibiting the data on which it had been constructed.

He now applied himself to ancient geography, always his favourite department, the aspect of which, under his hands, was soon completely changed. He illustrated successively, by maps, all the countries known to the ancients, among which Egypt attracted his peculiar attention. To render these labours more extensively useful, he published in 1768 his *Géographie Ancienne Abrégée*, of which an English translation, entitled *Compendium of Ancient Geography*, appeared in 1791. His attention was finally turned to the Middle Ages, which were illustrated by his *États formés en Europe après la Chute de l'Empire Romain en Occident* (1771), and by some other works equally learned. Entirely devoted to geographical inquiries, the appearance of his successive publications formed the only events by which his life was diversified. From causes which are not explained, he was late in being admitted into the literary societies. In 1754, at the age of sixty, he became a member of the Academy of Inscriptions and Belles Lettres, whose transactions he enriched with many papers. In 1775 he received the only place in the Academy of Sciences which is allotted to geography; and in the same year he was appointed, without solicitation, first geographer to the king. But these honours came too late to gladden a life which was now drawing to its utmost verge. His last employment consisted in arranging his collection of maps, plans, and geographical materials. It was the most extensive in Europe, and had been purchased by the king, who, however, left him the use of it during his life. This task performed, he sunk into a total imbecility both of mind and body, which continued for two years, and ended only with his death in January 1782.

D'Anville's published memoirs and dissertations amounted to 78, and his maps to 211. A complete edition of his works was announced in 1806 by De Manne in 6 vols. quarto, only two of which had appeared when the editor died in 1832. See Dacier's *Éloge de D'Anville* (Paris, 1802).

DAPHNE, in Greek mythology, was the daughter of a river-god, usually the Arcadian Ladon, sometimes the Thessalian Peneus, her mother being Gæa, the goddess of the earth. As usual with nymphs of springs or rivers she was pursued by lovers,—first by Leucippus, a son of Œnomaus, who disguised himself as a girl to be able to follow her better, but was discovered and killed by the nymphs with Daphne, and secondly by Apollo, from whom she escaped, being transformed into a laurel tree (δάφνη).

DAPHNEPHORIA, a festival held every nine years at Thebes, in Bœotia, in honour of Apollo, consisting of a procession in which the chief figure was a boy chosen on each occasion for his beauty and strength, who at the same time was of a good family and had both parents alive. He was styled Daphnephoros, "laurel-bearer." In front of him walked one of his nearest relatives, carrying an olive branch hung with laurel and flowers and having on the upper end a bronze ball from which hung several smaller balls. Another smaller ball was placed on the middle of the branch or pole, which was then twined round with purple ribbons, and at the lower end with saffron ribbons. These balls were said to indicate the sun, stars, and moon, while the ribbons referred to the days of the year, being 365 in number. This object was called the Kopo. The Daphnephorus, wearing a golden crown, or, as Pausanias (ix. 10, 4) says, a wreath of laurel, richly dressed and partly holding the Kopo, was followed by a chorus of maidens carrying suppliant branches and singing a hymn to the god. The Daphnephoros dedicated a bronze tripod in the temple of Apollo, and Pausanias (*loc. cit.*) mentions the tripod dedicated there by Amphitryon when his son Hercules had been Daphnephoros.

DARABJIRD, or DARAB-GHERA, a city of Persia in the province of Farsistan, 140 miles south-east of Shiraz. It is situated in a very fertile district at the foot of mountains, and is embellished by luxuriant orchards of orange, lemon, and date trees. Though greatly fallen from its former prosperity, it is still one of the most important cities of the province. Its name signifies the city or residence of Darius, and by Von Hammer it was identified with the ancient Pasargadæ. In the neighbourhood there are various remains of antiquity, the most important of which, 3½ miles to the south, is known as the Khaleh-Darâb, or citadel of Darius, and consists of a series of earthworks arranged in a circle round an isolated rock. Nothing remains, however, to fix the date or explain the history of the fortification. Another monument of the vicinity is a gigantic bas-relief carved on the vertical face of a rock, apparently representing the victory of Sapor I. of Persia over the Emperor Valerian. A full description of both will be found in Flandin, *Voyage en Perse*, vol. ii.

DARANG. See DURANG.

D'ARBLAY, MADAME (1752–1840). Frances Burney, daughter of Charles Burney, D.Mus., was born at Lynn Regis, in Norfolk, 1752. Her mother was a Miss Esther Sleepe, distantly of French descent. In 1760 the Burneys moved to London; and in 1761 Mrs Burney died, leaving six children, of whom Fanny, the third, was but nine years old. Her sisters were sent to school, but she, as she tells us herself, "never was placed in any seminary, and never was put under any governess or instructor whatsoever." At ten years old she had taught herself to read and write, and became an incessant scribbler both of prose and verse, and ardently fond of reading. Six years after his wife's death Dr Burney married again; and from her fifteenth year onwards Fanny lived in the midst of an exceptionally brilliant social circle, gathered round her father in his house in St Martin's Street, Leicester Fields, which included the chief musicians, actors, and literary men of the day, and not a few of his aristocratic patrons. Her father's drawing-room was in fact Fanny's only school, and not a bad one. Her stepmother, although a spirited and sensible woman, did not encourage Fanny's habits of scribbling, which she considered dangerously unfeminine. Fanny, therefore, when she was fifteen, solemnly burnt all her manuscripts,—among them *The History of Caroline Evelyn*, a story of which her first published novel, *Evelina*, was the sequel. At the same time she began her famous *Diary*, which extended over seventy-two years of her life. She was not much more than fifteen when she planned the story of *Evelina;* but it was not written till some years later, and was not published till the year 1778, when its authoress was six-and-twenty. Having, she tells us, an "odd inclination" to see her work in print, she confided her secret to her sisters, copied out part of her manuscript in a feigned hand, and persuaded her younger brother Charles to be her agent with the booksellers, the interviews being held at a coffee-house in the evening, and young Charles being disguised in a big cloak and hat for the purpose. Dodsley refused her MS. as anonymous, but Lowndes, after its completion, accepted it, and gave her £20 for it. Dr Burney was told of what was going on, and good-naturedly favoured his daughter's whim, without so much as asking the name of her book. *Evelina, or a Young Lady's Entrance into the World*, was therefore published quite clandestinely, and Miss Burney herself knew the event only through an advertisement in the papers; while it had been six months in print, and had been reviewed and praised everywhere, before her father held the three little volumes in his own hand. Dr Burney proudly told Mrs Thrale the secret of the authorship, and Miss Burney was at once taken to Streatham, and admitted into a coterie of which Johnson was the great centre. Her fame spread. Johnson had declared that there were passages in *Evelina* which might do honour to Richardson; Sir Joshua Reynolds could not be persuaded to eat till he had finished the story; and Burke had sat up all night to read it. Miss Burney was introduced to Mrs Montagu and the *Bas-bleus*, to Sheridan, who wanted her to write for the stage, and to her special admirers Mrs Cholmondely and the beautiful Mrs Bunbury. But the chief feature in her early literary life was Dr Johnson's friendship for her, which excited the jealousy of Boswell, and ended only with Johnson's death. The second story, *Cecilia, or Memoirs of an Heiress*, in five volumes, 1782, greatly increased her popularity, and brought her a letter from Burke, in which he said, "In an age distinguished by having produced extraordinary women, I hardly dare to tell you where my opinion would place you amongst them." In 1786, through the influence of the good old Mrs Delany, known as the correspondent of Swift and Young, Miss Burney obtained the post of second keeper of the robes to Queen Charlotte, consort of George III., with a salary of £200. For five years (from her thirty-fourth to her thirty-ninth year) it was her duty to attend at the Queen's daily *toilettes*, to take care of her lap-dog and her snuff-box, to read to her now and then, and to preside over the tea-table of the equerries. Her *Diary and Letters* of this time abound in amusing court gossip; but the post was an uncongenial one, and she resigned it in 1791 on account of ill health. The queen allowed her a pension of £100 a year, the king saying, "It is but her due; she has given up five years of her pen." In 1793 Miss Burney became the wife of M. D'Arblay, a French officer of artillery, who, with Madame de Staël, Talleyrand, and other refugees, lived at "Juniper Hall," Dorking. In the same year she published a pamphlet on the emigrant French clergy. Her only child, afterwards the Rev. A. D'Arblay, was born in 1794; and in 1795 appeared her third novel, *Camilla, or a Picture of Youth*, in five vols. This book was published by subscription, and brought her more than £3000. From 1802 to 1812 Madame D'Arblay was in France with her husband and son, and in 1814 she published *The Wanderer, or Female Difficulties*, another five-volumed story, a comparative failure, though at the time it realized £1500. Madame D'Arblay was in France and Belgium through the war 1814–15, her husband having regained the post of maréchal de camp, which he had formerly held under Louis XVI. They returned to England, and General D'Arblay died at Bath in 1818.

In Sir Walter Scott's diary for November 18, 1826, he describes his being taken to see Madame D'Arblay by Mr Rogers, and says, "I have been introduced to Madame D'Arblay, the celebrated authoress of *Evelina* and *Cecilia*,—an elderly lady with no remains of personal beauty, but with a simple and gentle manner, and pleasing expression of countenance, and apparently quick feelings." In 1832, when she was eighty years of age, Madame D'Arblay published the memoirs of her father, who died in 1814. This book, the rambling recollections of an old lady, is full of imperfections and extraordinary affectations of style Madame D'Arblay died at Bath, 1840, aged eighty-eight, and her *Journal and Letters* were edited by her niece, and published in seven volumes, 1842–6.

Madame D'Arblay was not remarkable for personal beauty. She was small, retiring, and rather prudish, delighting to be lionized, while she dreaded nothing more than to be thought unfeminine or eccentric. Her style in writing was considered remarkable for its sprightliness and humour. Some of her most vivid characters were extremely popular. "You are a perfect *Branghton*," exclaimed Dr Johnson when Boswell was about to quit Mrs Thrale's table before the guests had finished eating. And Miss Burney tells us how "the Doctor" was one day seen laughing to himself, and suddenly turned to her, quoting from *Evelina*, with "Only think, Polly, Miss has danced with a lord!" Her best character sketches and most spirited dialogues are, however, to be found, not in her novels, but in her *Journal and Letters*. The drawback of everything which she wrote of an autobiographic kind was her painful self-consciousness and astounding egotism. It was her great ambition to write for the stage. She made three attempts to write a play; and her tragedy, entitled *Edwy and Elgiva*, was acted by Mrs Siddons and Kemble at Drury Lane in 1795, but had to be withdrawn as a failure, and was never printed. (F. M.)

DARBOY, GEORGES (1813–1871), archbishop of Paris, was born at Fayl-Billot in Haut Marne on the 16th January 1813. He studied with distinction at the seminary at Langres, and was ordained priest in 1836. After filling a charge at St Dizier, near Vassy, he was appointed in 1839 professor of philosophy at Langres, and in 1841 he was transferred to the chair of dogmatics. A change in the direction of the seminary caused him to leave for Paris, where in 1846 he was appointed almoner of the college of Henry IV. and honorary canon of Notre Dame. The confidence thus shown in him by Archbishop Affre was continued by Archbishop Sibour, who appointed him editor of the *Moniteur Catholique.* In November 1854 the archbishop took Darboy with him to Rome and presented him to the Pope, who gave him the rank of protonotary apostolic. In 1855 he became titular vicar-general of Paris, and inspector of religious instruction in the various schools of the diocese. He was appointed bishop of Nancy in 1859, and in January 1863 he was raised to the archbishopric of Paris. The favour of the court was indicated by his appointment to the post of grand almoner to the emperor in 1866, and to that of grand officer to the Legion of Honour in 1868. The archbishop was a strenuous upholder of episcopal independence in the Gallican sense, and involved himself in a controversy with Rome by his endeavours to suppress the jurisdiction of the Jesuits and other religious orders within his diocese. At the Vatican Council he vigorously maintained the rights of the bishops, and offered a decided opposition to the infallibility dogma, against which he voted as inopportune. When the dogma had been finally adopted, however, he was one of the first to set the example of submission. Immediately after his return to Paris the war with Prussia broke out, and his conduct during the disastrous year that followed was marked by a devoted heroism which has secured for him an enduring fame. He was active in organizing relief for the wounded at the commencement of the war, remained bravely at his post during the seige, and refused to seek safety by flight during the brief triumph of the commune. On the 4th April 1871 he was arrested by the communists as a hostage, and confined in the prison at Mazas, from which he was transferred to La Roquette on the advance of the army of Versailles. On the 27th May he was shot within the prison along with several other distinguished hostages. He died in the attitude of blessing and uttering words of forgiveness. His body was recovered with difficulty, and having been embalmed was buried with imposing ceremony at the public expense on the 7th June. It is a noteworthy fact that Darboy was the third archbishop of Paris who perished by violence in the period between 1848 and 1871. Darboy was the author of a number of works, of which the most important are a *Vie de St Thomas Becket* (1859), a translation of the works of St Denis the Areopagite, and a translation of the *Imitation of Christ*.

DARDANELLES, the ancient Hellespont, and in Turkish *Bahr-Sefed Boghasi*, the strait uniting the Sea of Marmora with the Ægean, so called from the two castles by which the narrowest part is protected, and which preserve the name of the city of Dardanus in the Troad, famous for the treaty between Sulla and Mithridates in 84 B.C. Its shores are formed by the peninsula of Gallipoli on the N.W. and by the mainland of Asia Minor on the S.E.; and it extends for a distance of about 47 miles with an average breadth of 3 or 4 miles. At the Ægean extremity stand the castles of Sedil Bahr and Kum Kaleh, the former in Europe and the latter in Asia; and near the Marmora extremity are situated the important town of Gallipoli (Kallipolis) on the northern side, and the less important though equally famous Lamsaki, or Lampsacus, on the southern. The two castles of the Dardanelles *par excellence* are Chanak-Kalesi, Sultanieh-Kalesi, or the Old Castle of Anatolia, and Kilid-Bahr, or the Old Castle of Rumelia, which were long but erroneously identified with Sestos and Abydos, now located farther to the north. The strait of the Dardanelles is famous in history for the passage of Xerxes by means of a bridge of boats, and for the similar exploit on the part of Alexander. Nor is its name less widely known from the story of Hero and Leander, and from Lord Byron's successful attempt to rival the ancient swimmer. The passage of the strait is easily defended, but in 1807 the English Admiral Duckworth made his way past all the fortresses into the Sea of Marmora. In terms of the treaty of July 1841, confirmed by the Paris peace of 1856, no foreign ship of war may enter the strait except by Turkish permission, and even merchant vessels are only allowed to pass the castle of Chanak-Kalesi during the day. For details regarding the currents of the Dardanelles, see BLACK SEA, vol. iii. p. 797.

DARDANUS, in Greek mythology, is said to have crossed over from Samothrace to the Troad by swimming on an inflated skin, and to have there founded the kingdom of Dardania previous to the existence of Troy. Apparently this was invented to account for the existence in the Troad of a worship of the Cabiri similar to that of Samothrace. Dardanus is called a son of Zeus and the Pleiad Electra, and in the *Iliad* (xx. 304) Zeus is said to have loved him more than his other sons.

DARES, a Trojan priest of Hephæstus, who lived at the time of the Trojan war, and to whom was attributed an ancient account of that war which was extant in the time of Ælian. A work in Latin, purporting to be a translation of this account, and entitled *Daretis Phrygii de Excidio Trojæ Historia*, was much read in the Middle Ages, and was then ascribed to Cornelius Nepos; but the language is extremely corrupt, and it belongs to a period much later than the time of Nepos. It is commonly published together with the work of Dictys Cretensis. See the edition (which has an essay upon Dares) by A. Dederich, who is inclined to ascribe the work to a Roman of the 5th, 6th, or 7th century (Bonn, 1837).

DARFUR, or DARFOR, *i.e.*, the land of the Fur or For, a country of the Soudan in Africa, formerly an independent kingdom, but in 1874 conquered and incorporated by Egypt. It extends from 9° to 16° N. lat., and from 22° 30′ to 28° 30′ E. long., thus including an area of about 105,000 square miles, with a population roughly estimated at four millions. On the W. it would be conterminous with Wadai were it not for a strip of independent territory; on the N. it passes off into the desert of Sahara; on the E. it is separated from Kordofan by a barren steppe; and on the S. it is bounded by Darfertit and several petty states.

The centre of the country is occupied by the Marra Mountains, which lift their granite peaks to a height of 3500 or 4000 feet, and extend about 180 miles from north to south, with an average breadth of 70 miles. The northern portion of the range is also known as the Keraken Mountains, on account of the huge boulders with which their flanks are strewn; the southern portion turns to the west and takes the name of Jebel Zerlai. On all sides this mountain-mass is channelled by numerous wadis, which for the most part dry up in the hot season, but in many cases measure from 200 to 300 paces in breadth. Of these the most important (as the Sunot, and the Azum, with their numerous affluents) have a south-west direction, and ultimately contribute their waters to the Bahar-es-Salamat, which passes westward through Wadai. Some of those that rise in the eastern slopes seem to find their way to the Bahr-el-Arab; but the greater number are absorbed or stop short in their course.

The climate, except in the south, where the rains are unusually heavy and the soil is a damp clay, is regarded as healthy. The rainy season lasts for three months, from the middle of June to the middle of September. In the neighbourhood of the wadis the vegetation is fairly rich, but elsewhere it is rather scant and steppe-like. The prevailing trees are the acacias—more particularly the hazara and the *Acacia nilotica*—the hachub, the sayal, the kittir, the hommed, the jakjak, and the makhît; while the sycamore, the ochar, the hadjlidj, and, in the Marra Mountains, the *Euphorbia candelabrum* are also to be found. In the highlands the culture of wheat, elsewhere so rare in Central Africa, is pretty extensive; but doukhn

(*Penicillaria*) and durra are the usual cereals. In the south and west onions, pepper, bananas, citrons, and various fruits are grown freely; and in several places an indigenous kind of tobacco of great strength is cultivated. The deleb palm is abundant in the south, and on the eastern frontiers the monkey-bread or baobab compensates for the deficiency of water.

Copper is obtained in sufficient quantity to make it a matter of export; antimony was worked in the time of Mohammed-el-Fadhl; lead occurs in Gebel Kuttum in the Dar el Gharb; iron is wrought in the south-west province; and deposits of rock-salt are met with in various places.

Cattle, sheep, and camels are both numerous and of excellent breeds. Horses are comparatively rare; and, with the exception of those imported from Dongola, they belong to a small but sturdy native race. The elephant has been exterminated; but the ostrich is common in the east in the country of the Hamr Arabs.

The population of Darfur is of very varied origin. The *Fur* occupy the central highlands and part of the Dar Dima and Dar Uma districts, speak a special language, and are subdivided into numerous tribes, of which the most influential are the Dugunga, the Kanjara, and the Kera. They are of middle height, have rather irregular features, and display a disagreeable character. Dr Nachtigal found them proud, treacherous, and very ill-disposed to strangers; but it must be remembered that he had to encounter not only the religious antipathy of Mahometan bigotry against a Christian, but also the political antipathy of irritated national feeling against a supposed Egyptian. The *Massabât* are a tribe which, breaking off from the Fur some centuries back, are now largely mingled with Arab blood, and use the Arabic language; while, on the contrary, the *Tunjur* are an Arab tribe which must have arrived in the Soudan at a very early date, as it has incorporated a large Furian element, and no longer professes Mahometanism. The *Dadjo* formerly inhabited Mount Marra, but they have been driven to the south and west, where they maintain a certain independence in Dar Sula, but are treated as inferiors by the Fur. The *Zoghawa*, who inhabit the northern borders, are on the contrary regarded by the Fur as their equals, and have all the prestige of a race that at one time made its influence felt as far as Bornu. As holding a less important place in the population may be mentioned the Berti, the Birgirid, the Beraunas, the Fellatas, the Jellabas, and immigrants from Wadai, Baghirmi, &c. Genuine Arab tribes are numerous, and they are partly nomadic and partly fixed. The country was divided under the "Sultan" into the five provinces of Dar Tokoñavi or the northern province, Dar Dali or the eastern, Dar Uma or the southern, Dar Dima or the south-western, and Dar el Gharb or the western, each governed by a separate chief with the exception of the last, which stood directly under the authority of the king. Each province was subdivided into so many departments, and each department was under the control of a *shertaya* (plural, *sherati*). The central district of the Marra Mountains, called Dar Torra, was under a special shertaya, dependent on the king; and the western slopes, which form the most fertile tract in the whole country, belonged to the king and the members of the royal family. The most important towns are Kobe and Kabkabia, on the caravan-route across the north of the country.

History.—Of the Dadjo dynasty, which appears to have been dominant in the Marra mountains, no history has been left except a list of royal names. Next succeeded the Tunjur dynasty—Ahmed-el-Magur, Saref, Kuni, Baté, Rufa'a, and Shaou. From the marriage of Rufa'a with the daughter of the chief of the Kera tribe sprang Dali or Dalil, who founded the Furian kingdom, divided the country into provinces, and established a penal code, which, under the title of *Kitab Dali* or Dali's Book, is still preserved, and shows principles essentially different from those of the Koran. His grandson Soleiman (usually distinguished by the Furian epithet *Solon*, the Arab or the Red) reigned from 1596 to 1637, and was a great warrior and a devoted Mussulman. Soleiman's grandson Ahmed Bokr (1682-1722) made Islam the religion of the state, and increased the prosperity of the country by encouraging immigration from Bornu and Baghirmi. His rule extended as far east as the Nile, or even to the banks of the Atbara. The next occupant of the throne, Daura or Darut, is infamous for his cruelty; and the capture of his successor Omer Lele during a war with Wadai saved the country from an equally detestable tyrant. Abu-el-Ghassem, the next monarch, was lost in a battle against the same enemy, and when after a time he reappeared amongst his people, he was put to death by Mohammed Tirab, who had meanwhile ascended the throne. Abd-er-Rahman, surnamed el-Raschid or the Just, a poor priest of great learning and piety, was chosen king instead of Tirab's son Ishaga, and though revengeful and fond of intrigue, he proved himself on the whole not unworthy of the choice. It was during his reign that Napoleon was campaigning in Egypt; and the European potentate responded in 1799 to the congratulatory address of his barbarian ally by an order for the despatch of 2000 black slaves upwards of 16 years old, strong and vigorous. To Abd-er-Rahman likewise is due the present situation of the *Fasher*, or royal township, near the Rahat (or Lake) Tendelti. Mahommed-el-Fadhl, his son, was for some time under the control of an energetic eunuch, Mahommed Kurra; but he ultimately made himself independent, and his reign lasted till 1839, when he died of leprosy, leaving behind him the fame of a violent and blood-thirsty tyrant, who had been disgraced by the loss of the important province of Kordofan. Of his 40 sons the third, Mahommed Hassin, was appointed his successor. He is described as a religious but avaricious man. The chief events of his reign were his fourteen expeditions against the Kazagat Arabs, the whole result of which was that the last years of his life were spent in fairly peaceful terms with that restless tribe. He died in 1873, blind and advanced in years, and the succession passed to his youngest son Brahim, who soon found himself engaged in a conflict with Egypt, which resulted in the destruction of the kingdom. He was slain in the battle of Menovatchi, in the autumn of 1874, and his uncle Hassab Alla, who sought to maintain himself, was captured in 1875 by the troops of the Khedive, and removed to Cairo with his family.

Exploration.—The first European traveller who visited Darfur was James Browne, who spent two years at Kobeyh or Cobbe, at that time the capital. The next addition to our knowledge was due to the Sheikh Mahommed-el-Tounsy, who travelled in 1803 through the north of Africa in search of Omar, his father, and afterwards gave to the world an account of his wanderings, which was translated into French in 1845 by M. Perron. Dr Nachtigal in 1873 spent some months at Tendelti; and since the incorporation with Egypt, the country has been reconnoitred by Purdy and other Egyptian generals.

See Count D'Escayrac de Lautnre, *Notice sur le Darfur*, 1859; Nachtigal's communications to the *Bulletin de la Société de Géographie*, March 1846, and to Petermann's *Mittheilungen*, 1875; Behm's *Geographisches Jahrbuch*, 1876.

DARIEN, a district of South America, of special interest in the history of geographical discovery, which gives its name to the great inlet of the Colombian coast otherwise known as the Gulf of Uraba, and to the great neck of land more familiarly designated the Isthmus of Panama. It was first reconnoitred in the first year of the 16th century by Rodrigo Bastidas of Seville; and the first settlement was Santa Maria del Antigua, situated on the small Darien river, north-west of the mouth of the Atrato. In 1513 Vasco Nuñez Balboa stood "silent upon a peak in Darien," and saw the Pacific at his feet stretching inland in the Gulf of San Miguel; and ever since that date this narrow stretch of terra-firma has alternately seemed to proffer and refuse a means of transit between the two oceans. The first serious attempt to turn the isthmus to permanent account as a trade-route dates from the beginning of the 18th century, and forms an interesting chapter in Scottish history. In 1695 an Act was passed by the Scottish Parliament for a company trading to Africa and the Indies; and this company, under the advice of one of the most remarkable economists of the period,—William Paterson, a Scotchman, and the founder of the Bank of England,—determined to establish a colony on the Isthmus of Darien as a general emporium for the commerce of all the nations of the world. The project was taken up in Scotland with the enthusiasm of national rivalry towards England, and the "subscriptions sucked up all the money in the country." On the 26th of July 1698 the pioneers set sail from Leith amid the cheers of an almost envious multitude; and on the 4th of November, with the loss of only fifteen out of 12,000 men, they arrived at Darien, and took up their quarters in a well-defended spot, with a good harbour and excellent outlook. The country they named New Caledonia, and two sites selected for future cities were designated respectively New Edinburgh and New St Andrews. At first all seemed to go well; but by and by lack of provisions, sickness, and anarchy reduced the settlers to the most miserable plight; and in June 1699 they re-embarked in three vessels, a weak and hopeless company, to sail whithersoever Providence might direct. Meanwhile a supplementary expedition had been prepared in Scotland; two vessels were dispatched in May, and four others followed in August. But this venture proved even more unfortunate than the former. The colonists arrived broken in health; their spirits were crushed by the fate of their predecessors, and embittered by the harsh fanaticism of the four ministers whom the General Assembly of the Church of Scotland had sent out to establish a regular presbyterial organization. The last addition to the settlement was the company of Captain Campbell of Finab, who arrived only to learn that a Spanish force of 1500 or 1600 men lay encamped at Tubacanti, on the River Santa Maria, waiting for the appearance of a Spanish squadron in order to make a combined attack on the fort. Captain Campbell, on the second day after his arrival, marched with 200 men across the isthmus to Tubacanti, stormed the camp in the night-time, and dispersed the Spanish force. On his return to the fort on the fifth day he found it besieged by the Spaniards from the men-of-war; and, after a vain attempt to maintain its defence, he succeeded with a few companions in making his escape in a small vessel. A capitulation followed, and the Darien colony was no more. Of those who had taken part in the enterprize only a miserable handful ever reached their native land.

See J. H. Burton, *The Darien Papers* (Bannatyne Club, 1849), and *History of Scotland*, vol. viii., also the article "CANAL," vol. iv. pp. 793–4.

DARIUS I., the son of Hystaspes, was the true consolidator of the Persian empire. His administrative ability founded a new type of government, and organized the crude mass of conquered states bequeathed him by his predecessors. His military talents, though considerable, have been thrown into the shade by his legislative and financial ones. The originator of imperial centralization and unity, the inventor of a well-regulated system of taxation, and the introducer of an alphabetic system of writing, he found a half-dissolved amalgamation of discordant populations on his accession, and left a firmly-welded empire at his death.

In the great inscription on the rock of Behistun, where he has recorded his struggles and victories, Darius traces his descent from Achæmenes, through four ancestors all kings like himself. He seems to have stood next to the line of Cyrus in succession to the throne; and Cyrus, when setting out on his campaign against the Massagetæ, already suspected him of aiming at the crown. He accompanied Cambyses to Egypt, but was recalled by his father to the capital at the time the conspiracy was being formed against the Magian usurper Gomates, who professed to be Bardes (Smerdis in Herodotus), the brother of Cambyses. With six other Persian nobles Darius succeeded in overthrowing the Magian usurpation, and pursued the pseudo-Smerdis to Sikhyuvatis, a fortress in Nisæa, where he was put to death, April 2, 521 B.C. The friends of Gomates were massacred, the yearly festival of the Magophonia instituted, and the religion of Zoroaster, which had been suppressed in favour of the idolatrous worship of the Turanian (as opposed to the Aryan) Medes, was solemnly restored. Darius, now twenty-eight years old, was proclaimed king.

The first six years of his reign were occupied in suppressing the revolts which broke out throughout the empire, occasioned partly, perhaps, by the zeal with which the new monarch maintained the Zoroastrian faith, and which led him to look with special favour on the monotheistic Jews. Pretender after pretender appeared—Atrines and afterwards Martes, in Susiania; Nidintabel, who called himself Nebuchadrezzar son of Nabonidus, in Babylonia; Phraortes, who claimed to be Xathrites son of Cyaxares, in Media and Parthia; Tritantachmes, in Sagartia; Phraates, in Margiana; Œosdates, a second pseudo-Smerdis, in Persia itself; and an Armenian, Aracus, in Babylon; but they were all successively crushed by Darius or his generals. The most serious of these revolts were those in Media and Babylonia, and it was probably during the first Babylonian revolt that the long siege of Babylon mentioned by Herodotus took place, resulting in the attempted plunder of the image of Bel (518 B.C.) This siege may have introduced the otherwise unknown "Darius the Mede" into the book of Daniel (see article on DANIEL). The Median Phraortes, who probably belonged to the Turanian part of the population, proved more than a match for three generals of Darius, and the king had to leave Babylon, which he had just succeeded in capturing, and take the field in person, before the war was finished by the seizure and crucifixion of Phraortes at Ecbatana. The second capture of Babylon was followed by the execution of the Behistun inscription, 515 B.C., in which Darius declares that he had translated "the Ancient Book," "the Text of the Divine Law (*Avesta*) and a Commentary of the Divine Law and the Prayer (*Zend*)" from Bactrian into the old Persian, and had restored it to the nations of the empire (see Oppert's translation of the Median version of the Behistun inscription in *Records of the Past*, vol. vii.) It must have been for the sake of this translation that the Assyrian cuneiform syllabary was simplified into an alphabet of forty characters. A revolt of Iskunka, a chief of the Sacæ, was suppressed shortly after the inscription was engraved. Before this, Orœtes, governor of Sardis, who had murdered Polycrates of Samos, and aimed at making himself independent, had been put to death, as well as Aryandes, satrap of Egypt, who had issued a silver coinage of his own.

Darius now set about consolidating and organizing his empire. An elaborate bureaucratic system was instituted, and the empire divided into a varying number of provinces each under a governor or satrap (*khshatrapâva*), appointed by the king for an indefinite time, and responsible for a fixed tribute. The power of the satrap was checked by "royal clerks," who sent annual reports of the satrap and his actions to the king, by retaining the old chiefs or kings of the province by the side of the satrap wherever possible, and by sending members of the royal family to the satrapies. Except in the border satrapies, the military power was intrusted to a separate officer, and it was only in the border provinces, accordingly, that a revolt was to be feared. It is said that the chief fortresses had each an independent commander, while in Persia proper "royal judges" went on circuit. The satrap represented the king, and had the power of life and death. The money tribute, raised probably by a land-tax, amounted, according to Mr Grote's calculation, to £4,254,000,—7740 talents (£2,964,000) being paid in silver, and the rest in gold. The Indian satrapy contributed by far the most, and Persia proper paid nothing. Part of the tribute was paid in kind, Babylonia and Assyria furnishing one-third. There were, besides, water-rates, and taxes for the use of such crown property as fisheries and the like, but the amount to be paid to the imperial treasury was in all cases fixed. It was otherwise, however, with the exactions the satraps were allowed to make on their own account, and which must have pressed heavily on the people. The tribute enabled Darius to issue a coinage of extreme purity, and his gold darics were worth about 22s. of our money. An incised bar was the imperial stamp. The satrapies were connected with one another by high-roads and posting-stations, at which relays of horses were kept for the royal messengers.

After building a palace at Susa, the new capital of the empire, and founding the *Chehl Minar* at Persepolis, Darius overran the Punjaub, and had the Indus navigated by a naval expedition under Scylax of Caryanda. Under the guidance of Democedes, a physician of Crotona, the Greek seas were also explored as far as Magna Græcia, and the northern frontier was strengthened by a campaign against the Scythians. Ariamnes of Cappadocia first examined the northern shores of the Black Sea, after which Darius, with 600 ships and the aid of the Asiatic Greeks, crossed the Bosphorus by a bridge constructed by the Greek Mandrocles, conquered the Getæ, and threw a bridge of boats across the Danube. Leaving the defence of the bridge to the Greeks, he pursued the Scythians as far as the 50th parallel, burning Gelonus (perhaps the modern Voronej), and recrossed the bridge in safety, thanks to the fidelity of Histiæus of Miletus. Megabazus, or Megabyzus, next reduced Thrace and made Amyntas of Macedon tributary (506). In the following year Otanes subjugated Byzantium, Chalcedon, Antandros, Lemnos, and Imbros.

In 500 B.C. the Ionic revolt broke out. The allies of the Ionians from Athens and Eretria landed in Asia Minor and burnt Sardis, an event which led the Greeks of the Hellespont, as well as the Carians and the Cyprians, to join the insurrection. The revolt was crushed in 495 B.C. by the battle of Lade and the sack of Miletus; and a terrible punishment was taken upon the Greek cities on the coasts and islands of the Ægean. Miltiades, the tyrant of the Chersonese, escaped with difficulty to Athens, while Darius prepared to avenge the burning of Sardis. His son-in-law, Mardonius, was accordingly sent against Athens and Eretria with a powerful force. But after establishing democracies in the place of tyrants in various Greek cities, and capturing Thasos and its gold mines, Mardonius lost 300 ships and more than 20,000 men in a storm off Mount Athos, and, being further surprized by the Thracian Bryges, returned to Asia Minor. Two years afterwards (490 B.C.) Darius sent another expedition under Datis, which destroyed Eretria, but was ingloriously defeated at Marathon by the Athenians under Miltiades. Darius now made preparations for an attack upon a scale which the Greeks would have found it hardly possible to withstand while an able prince like Darius was at the head of the empire; but in the fourth year of the preparations (487 B.C.), just before everything was ready, Egypt broke out into revolt. Before the revolt could be put down Darius died, 486 B.C., in the sixty-third year of his age according to Herodotus, or the seventy-second according to Ctesias, who, however, curtails his reign by three years. Darius had already nominated Xerxes, his son by Atossa, the daughter of Cyrus, as his successor,—his eldest son, Artobazanes, whose mother was a daughter of Gobryas, being set aside as born before his father was king.

Long before his death Darius had excavated a richly-ornamented tomb with four pillars and other sculptures out of the rocks of Naksh-i-Rustam, about four miles from Persepolis. In an inscription on the façade of the tomb he enumerates 28 different countries or satrapies, including India and "the Scythians beyond the sea," over which he bore sway. His name Dáryavush is rendered ἐρξείης, "worker" or "organizer," by Herodotus; but the true meaning of the word is rather "the maintainer," from *darj* (Sanskrit, *dhri*, "conservare"). (A. H. S.)

DARIUS II., called Ochus before his accession, and Nothos after it (on account of his being one of the 17 bastard sons of Artaxerxes Longimanus), was ninth king of the Persian empire. He was made satrap of Hyrcania, and married to Parysatis, the daughter of Xerxes I., by whom he had several children, amongst them two daughters, Amestris and Artosta, as well as Arsaces or Arsicas, who succeeded him under the name of Artaxerxes (Mnemon), and Cyrus the younger. Sogdianus or Secydianus, the murderer of Xerxes II., was defeated in battle by Darius, through the desertion of the two satraps of Egypt and Armenia, and afterwards put to death, Darius assuming the diadem (424 B.C.). Darius was completely under the power of three eunuchs and his wife Parysatis, and his reign of 19 years was characterized by little except insurrections and revolts. The first of these was raised by his brother Arsites and Artyphius the son of Megabyzus, with the help of Greek mercenaries, and was only put down by a liberal employment of gold, the leaders of the insurrection being betrayed by their followers and burned alive. The next was raised by Pissuthnes, sartap of Lydia (414 B.C.), but was also crushed by the bribes offered to his Athenian mercenaries by his antagonist Tissaphernes. Amorges, the son of Pissuthnes, however, continued to maintain himself as a kind of independent monarch in Caria for many years afterwards. Another plot was formed by the chief eunuch, Artoxares, but quickly suppressed. In 411 B.C. Egypt rebelled under Amyrtæus, and Darius was compelled to recognize Pausiris the son of the latter as his successor in 401 B.C. Media, which revolted about the same time, according to Xenophon, was not so fortunate as Egypt in recovering its independence. With the revolt of Media may be connected the rebellion of Terituchmes, a son-in-law of the king. The latter part of the reign of Darius was occupied in supporting Sparta against Athens by means of Persian gold.

DARIUS III., surnamed Codomannus, the last of the Persian monarchs, succeeded Artaxerxes III. (Ochus) 336 B.C., after a short interval during which Arses was nominally king. He was the son of Arsames, a nephew of Artaxerxes II. according to one account, and his wife Sisygambis was a daughter of the same monarch. His powers in the war against the Cadisii had been rewarded by Artaxerxes III. with the satrapy of Armenia. The eunuch Bagoas had poisoned Artaxerxes, and placed his creature Arses on the throne, in order that he might rule in his name, but after two years he deposed him and put Darius in his place. Darius, however, soon got rid of Bagoas, whom he suspected of conspiracy, by making him drink poison. The character of Darius was mild and amiable, and he was famed for his personal beauty, but he did not possess the qualities necessary for the struggle with Alexander of Macedon which commenced shortly after his accession. In 343 B.C. Alexander crossed the Hellespont, and defeated the Persians, first at the river Granicus (now Ustvola), and then at Issus in Cilicia, where the mother and family of Darius fell into his hands. The death of the Rhodian Memnon, the best of the Persian generals, the conquest of Phœnicia, and the dissipation of the Persian fleet sealed the fate of Darius. He engaged in person, however, in the battle at Gangamela (or Arbela), October 331 B.C., but was defeated with immense slaughter, and fled to Ecbatana, while Babylon, Susa, and Persepolis opened their gates to the conqueror. In the following year Alexander marched into Media, where Darius had collected a new force. He fled towards Bactria, however, at the approach of the Macedonians, and was being pursued through the deserts of Parthia when he was murdered by Bessus, the satrap of Bactria, and his associates, in the 50th year of his age. His body was sent to Persepolis by Alexander, to be buried with the other monarchs of Persia, while Bessus, who had assumed the royal title, was taken prisoner, and barbarously put to death.

DÁRJÍLING, or DARJEELING, a district of British India, in the Rájsháhi Kuch-Behar commissionership, under the lieutenant-governor of Bengal, is situated between 26° 30′ 50″ and 27° 13′ 5″ N. lat., and 88° 2′ 45″ and 88° 56′ 35″ E. long. It is bounded on the N. by independent Sikkim, on the E. and S. by Jalpáigurí district, and on the W. by Nepál, and has an area of 1234 square miles. Dárjíling consists of two well-defined tracts,—viz., the lower Himálayas to the south of Sikkim, and the *tarái*, or plains, which extend from the south of these ranges as far as the northern borders of Purniah district. The plains from which the hills take their rise are only 300 feet above sea level; the mountains ascend abruptly in spurs of from 6000 to 10,000 feet in height. The scenery throughout the hills is picturesque, and in many parts magnificent. The two highest mountains in the world, Kánchanjangá in Sikkim, and Everest in Nepál, are visible from the town of Dárjíling. The principal peaks within the district are—Phalálum (12,042 feet), Subargum (10,430), Tanglu (10,084), Situng, and Sinchál Pahár (8607). The chief rivers are the Tistá, Great and Little Ranjít, Rammán, Mahánandá, Balásan, and Jaldhaká. None of them are navigable in the mountain valleys; but the Tistá, after it debouches on the plains, can be navigated by cargo boats of considerable burthen. Bears, leopards, and musk deer are found on the higher mountains, deer on the lower ranges, and a few elephants and tigers on the slopes nearest to the plains. In the lowlands, tigers, rhinoceroses, deer, and wild hogs are abundant. A few wolves are also found. Of small game, hares, jungle fowl, peacocks, partridges, snipe, woodcock, wild ducks and geese, and green pigeons are numerous in the *tarái*, and jungle fowl and pheasants in the hills. The *mahsír* fish is found in the Tistá.

Population.—The Bengal census of 1872 returned the population of the district at 94,712 persons (males, 53,057; females, 41,655), thus classified:—Hindus, 69,831; Mahometans, 6248; Buddhists, 1368; Christians, 556; others, 16,709. The inhabitants of the hilly tract consist to a large extent of Nepálí immigrants and of aboriginal highland races; in the *tarái* the people are chiefly Hindus and Mahometans. The Lepchás are considered to be the aboriginal inhabitants of the hilly portion of the district. They are a fine, frank race, naturally open-hearted and free-handed, fond of change and given to an out-door life; but they do not seem to improve on being brought into contact with civilization. It is thought that they are now being gradually driven out of the district, owing to the increase of regular cultivation, and to the Government conservation of the forests. They have no word for plough in their language, and they still follow the nomadic form of tillage known as *júm* cultivation. This consists in selecting a spot of virgin soil, clearing it of forest and jungle by burning, and scraping the surface with the rudest agricultural implements. The productive powers of the land become exhausted in a few years, when the clearing is abandoned, a new site is chosen, and the same operations are carried on *de novo*. The Lepchás are also the ordinary out-door labourers on the hills. They have no caste distinctions, but speak of themselves as belonging to one of nine septs or clans, who all eat together and intermarry with each other. In the upper or northern *tarái*, along the base of the hills, the Mechs form the principal ethnical feature. This tribe inhabit the deadly jungle with impunity, and cultivate cotton, rice, and other ordinary crops, by the *júm* process described above.

The agricultural products consist of rice, cotton, pulses, oil seeds, and jute, principally grown in the *tarái*, and Indian corn, *márua*, and rice in the hills. Tea cultivation is the great industrial feature of Dárjíling district,—conducted almost entirely by means of English capital, and under European supervision. This industry dates from about 1856. The first planters did not meet with success; but the past ten years have been a period of steadily increasing prosperity. In 1866 there were 39 tea gardens in Dárjíling, with a total cultivated area of 10,392 acres, and an out-turn of 433,715 ℔ of tea. In 1874 the gardens had increased to 113, the area under cultivation to 18,888 acres, and the out-turn of tea to 3,927,911 ℔. The cultivation of cinchona was introduced by Government about 1862, and the undertaking has now attained a point which promises success. The Government reserved forest extends to 44,800 acres, scattered over an area of about 700 square miles. India-rubber of excellent quality is obtained from these forests.

Coal of good quality seems to exist, but the supply has not hitherto been utilized. A little iron is manufactured, and copper mining is carried on to a somewhat greater extent; but the methods adopted by the natives are of a very primitive kind. Lime is obtained in large quantities, building stone is abundant, and slate is found. The principal line of communication is the imperial cart road to Dárjíling, which has a course of 48 miles through the district. The Northern Bengal State Railway, now (1877) in course of construction, will bring the district in closer connection with Calcutta, and materially promote the development of its resources.

In 1870–71 the Government revenue of the district amounted to £18,797, and the civil expenditure to £23,869. Three magisterial and three civil and revenue courts are at work in the district; the strength of the police force in 1872 was 213 men. The principal educational institution is St Paul's school, intended to provide good education at a moderate cost for the sons of Europeans and East Indians. The higher elevations of the district may be pronounced free from endemic disease of every kind except goitre, and this is by no means widely spread. In the *tarái*, however, and in the lower valleys, malarious fevers, often of a severe and fatal type, prevail.

The British connection with Dárjíling dates from 1816, when, at the close of our war with Nepál, we made over to the Sikkim rájá the *tarái* tract, which had been wrested from him and annexed by Nepál. In 1835 the nucleus of the present district of British Sikkim or Dárjíling was created by a cession of a portion of the hills by the rájá of Sikkim to the British as a sanatorium. A military expedition against Sikkim, rendered necessary in 1850 by the imprisonment of Dr Campbell, the superintendent of Dárjíling, and Dr Hooker, resulted in the stoppage of the allowance granted to the rájá for the cession of the hill station of Dárjíling, and in the annexation of the Sikkim *tarái* at the foot of the hills and of a portion of the hills beyond. In August 1866 the hill territory east of the Tistá, acquired as the result of the Bhután campaign of 1864, was added to the jurisdiction of Dárjíling.

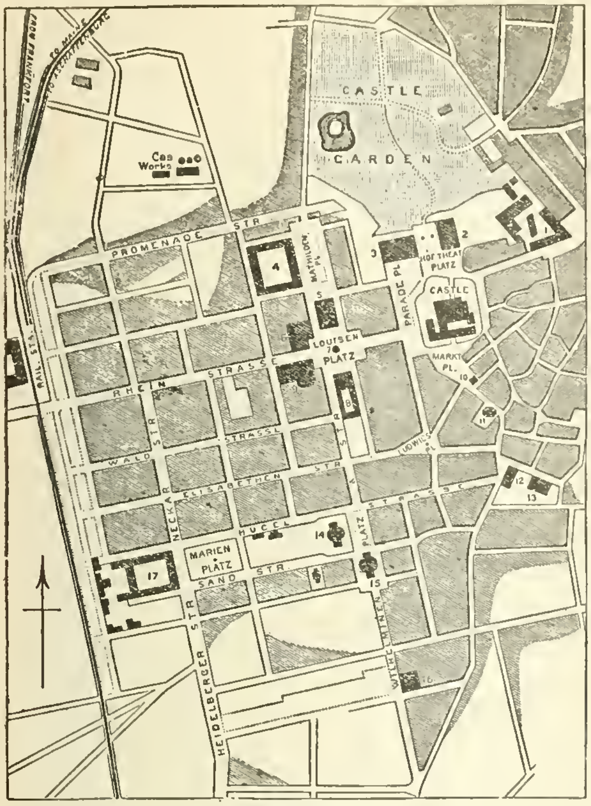
DÁRJÍLING TOWN, the well-known sanatory station, is situated in 27° 2′ 48″ N. lat. and 88° 18′ 36″ E. long., near the northern boundary of the district, and is 7167 feet above the sea-level. It contains an ordinary population of about 4000 souls, but being a great summer resort from the heat of the plains, the number fluctuates according to the season of the year. The mean temperature of the place is about 24° below that of Calcutta, and only 2° above that of London. (W. W. H.)

DARLINGTON, a parliamentary and municipal borough, parish, and township of England, in the southern division of the county of Durham, is situated on the main line of the North-Eastern Railway, 39 miles south of Newcastle and 235 miles north of London. The town extends east and west to a considerable distance from the River Skerne, a small tributary of the Tees, which traverses it from north to south.

The traditional history of Darlington commences about 1000 years ago, when, as is asserted, the monks who fled with the body of St Cuthbert from the invading Danes rested for a short time on the site of the present town. This circumstance led Styr the son of Ulphus, prince of Deira, to bestow upon St Cuthbert, early in the 11th century, "Dearnington with its appendages." At this early date Darlington passed into the hands of the church, and from that time till the middle of the 19th century its history and its government were closely connected with the see of Durham. The bishop appointed a borough bailiff to manage the affairs of the town until 1867, when the office was abolished by the Act of Incorporation. Towards the close of the 11th century a collegiate church was established in Darlington by Bishop Carilepho, and nearly 100 years later Bishop Pudsey built St Cuthbert's Collegiate Church, which is still deservedly esteemed the most notable ecclesiastical edifice in the county after the cathedral at Durham. The bishop of the diocese had a manor house at Darlington, and a deanery was established in connection with the church by Bishop Neville. So closely identified was the town with the church that it is not surprizing that its inhabitants looked with a scant sympathy upon the Reformation. In both the ill-fated attempts to restore the ancient rites, which filled the north with bloodshed, Darlington sided with the rebels. Apart from ecclesiastical affairs there is little of general interest in the early history of the town. Its later history is closely associated with that of the small but enthusiastic sect, in whose eyes all war is criminal. Under the later Stuarts, the Society of Friends, which had effected a settlement here, was subjected to an intermittent persecution; but after the Revolution the Friends laid the foundations of that prosperity which has enabled them for more than a century to occupy the most prominent position in Darlington. To them, and especially to Edward Pease, Darlington owes the distinction of having been the birthplace of the modern railway. The Stockton and Darlington Railway, a short line of twenty-seven miles in length, seven of which were worked by stationary engines on the summit of inclines, and the other twenty by locomotives and by horses, was primarily constructed to cheapen the cost of carrying coal from the Auckland pits to Stockton and Darlington. This railway, of which George Stephenson was the engineer, was projected in 1818, and opened on the 27th of September 1825. The latter date marks the new birth of Darlington. Prior to 1825 it was a small market town, chiefly remarkable for the manufacture of linen, worsted, and flax. After that date it rapidly increased in population and importance, and became the centre of the industrial district of south Durham, which it did much to develop. At the census of 1821, when the construction of the railway was commenced, the population of Darlington, including some outlying villages, was returned as 6551. Twenty-five years thereafter the population had nearly doubled, the return being 12,452. At the census of 1871 the population was 27,730, and when the fiftieth anniversary of the opening of the railway was celebrated in 1875, it was estimated that the population had increased to 34,000. The rateable value of property showed an even greater proportionate increase, having risen from £26,137 in 1829 to £125,017 in 1875. The government of Darlington—after having been vested in the hands of a borough bailiff, appointed by the bishop, a board of commissioners, and a local board of health—was in 1867 transferred by the Charter of Incorporation to a town council composed of 6 aldermen and 18 councillors. The streets of the borough are wide and well laid out. The gas and water supply are both in the hands of the corporation. The covered market, with the town hall and clock tower, occupies part of the spacious market place, where markets are held every Monday for the sale of agricultural produce, live stock, &c., and on Friday afternoon for butter. There are two spacious and tastefully laid-out cemeteries and a public park in the possession of the municipality, which also owns the public baths and the fever hospital. The union workhouse is situated in Darlington. Among the educational establishments may be mentioned a new grammar school, erected at a cost of £10,000 on a foundation which dates from the reign of Elizabeth, and the British and Foreign School Society's training college for female teachers. A mechanics' institute, a small theatre, a subscription library, and reading rooms are among the other local institutions. Including St Cuthbert's Collegiate Church already mentioned, the Church of England has five places of worship in the town, and there are numerous chapels belonging to the nonconformist denominations. Petty sessions are held here weekly, and the county courts monthly. In antiquities the town is not rich. Excepting the collegiate church, which dates from the beginning of the 13th century, almost the only relic of the past is the engine "Locomotive No. 1," the first that ever ran on a public railway, which stands on a pedestal of stone at the North Road station. There is a monument in the town erected to Joseph Pease, "the first Quaker member of Parliament." Before 1825 the Pease family were wealthy mill-owners, and they still own mills containing 270 looms and employing 700 hands; but their mining undertakings, which were not commenced until after that date, throw the mills completely into the shade. They employ 6500 workmen, and raise more than 3,000,000 tons of minerals per annum. The Darlington Iron Company, with a nominal capital of £350,000, employs 2000 hands, and turns out 90,000 tons of iron rails per annum. The Skerne Iron Company manufactures iron plates for shipbuilding, boilermaking, bridge construction, and other purposes. The South Durham Iron Works, with a capital of £130,000, are exclusively smelting works, producing from their three furnaces about 40,000 tons of pig-iron per annum. Among other industries of the town may be mentioned waggon-building, malting, and tanning.

DARMSTADT, the capital of the grand duchy of Hesse-Darmstadt, in the province of Starkenburg, is situated on the River Darm, fifteen miles south of Frankfort-on-the-Maine. It is the residence of the grand duke, and the seat of the Government of the province and of the grand duchy. In 1875 there was a population of 37,253; including the neighbouring village of Bessungen, it was 44,088. Darmstadt consists of an old and a new town, the streets of the former being narrow and gloomy. The latter, which includes the greater part of the city, contains broad streets and several fine squares, in one of which is a column surmounted by the statue of the grand duke Louis I., the founder of the new town. There are four churches, the Roman Catholic church being the most imposing, and a synagogue, recently built. Of the remaining buildings the most noteworthy are the two grand ducal palaces, the arsenal, and the theatre. The Grand Ducal Museum includes a library of nearly 500,000 volumes, with 4000 MSS., a gallery of 700 pictures, a valuable natural history collection, besides coins, drawings, engravings, &c. In the Cabinet Museum there is a library of 60,000 volumes. The town possesses a gymnasium, two Real schools, and a technical school;

and there are various societies, such as the Agricultural Society, the Historical Society, the Middle Rhine Geological Society, and the Society of Architects. Among the chief manufactures are carpets, hats, jewellery, and tobacco; and there is a considerable trade in seeds of different kinds,



Plan of Darmstadt.

1. Infantry Barracks.
2. Theatre.
3. Armoury.
4. Grand Duke's Stables.
5. Chancery.
6. Prince Alexander's Palace.
7. Statue of Grand Duke Louis I.
8. Grand Ducal Palace, Museum and Library.
9. Ständehaus.
10. Town Hall.
11. Town Church.
12. Gymnasium.
13. Polytechnium.
14. Palace of Prince Louis.
15. Catholic Church.
16. Palace of Prince Charles.
17. Cavalry Barracks.

and in wine. There are many pleasant walks in the neighbourhood, which is well wooded, and several of the palace gardens are open to the public.

Darmstadt is mentioned in the 11th century, but in the 14th century it was still a village, held by the Counts of Katzenellnbogen. It came by marriage into the possession of the house of Hesse in 1479, the male line of the house of Katzenellnbogen having in that year become extinct. The imperial army took it in the Schmalkaldic war, and destroyed the old castle. In 1567, after the death of Philip the Magnanimous, his youngest son George received Darmstadt and chose it as his residence. He was the founder of the line of Hesse-Darmstadt.

DARNÉTAL, a town of France, in the department of Seine-Inférieure, and $2\frac{1}{2}$ miles east of Rouen, on two small streams called the Aubette and the Robec. It has a fine Gothic church, and manufactures woollens, flannels, cottons, and paper. Population in 1871, 5636.

DARTFORD, an English market-town, parish, and local board district of West Kent, 16 miles east of London, on the Darent, which enters the Thames about $2\frac{1}{2}$ miles north of the town. The town lies low, flanked by two chalky eminences, called East and West Hills, and consists of one main street, crossed by two or three smaller streets. It possesses a town hall, a grammar school, and a county court-house. The most noteworthy building, however, is the parish church, repaired and restored, which contains a curious old fresco and several interesting brasses. The prosperity of the town depends on the important public works in its immediate vicinity, including powder works, paper mills, and engineering works. One of the first attempts at the manufacture of paper in England was made here by Spilman, who was jeweller to Queen Elizabeth, and that industry has been identified with the place ever since. Dartford was the scene, in 1235, of the marriage, celebrated by proxy, between Isabella, sister of Henry III., and the Emperor Frederick II.; and in 1331 a famous tournament was held in the place by Edward III. The same monarch established an Augustinian nunnery on West Hill in 1355, of which, however, almost no remains now exist. It was here also that Wat Tyler's outbreak occurred in 1377, and the house he resided in is pointed out by the townspeople. The area of the parish is 4251 acres; the population (1871), 8298.

DARTMOOR FOREST. See Devonshire.

DARTMOUTH, an ancient municipal borough and seaport town of England, in South Devon, 31 miles south of Exeter and 229 miles south-west of London by rail, is situated nearly opposite the town of Kingswear, at the mouth of the Dart, which here forms a secure harbour in the English Channel. The town stretches along the shore of the harbour, overhung by steep acclivities, and presents a picturesque appearance. Many of the houses belong to the Elizabethan period. Its principal building is St Saviour Church, a cruciform edifice of ancient date, containing a graceful rood-screen, a stone pulpit, and some interesting monuments. Dartmouth castle stands at the entrance of the harbour. As a seaport Dartmouth is now little used, but it occupied an important place in the early history of England. It was the rendezvous of the crusaders' fleet in 1190; and in 1346–47 it contributed 31 ships to the siege of Calais under Edward III. In later times several expeditions left its harbour for the exploration of the New World; and during the civil wars of the 17th century its occupation was hotly contested. The borough is governed by a mayor, 4 aldermen, and 12 councillors. It contains an area of 1847 acres (including part of the parish of Stokefleming), and in 1871 had a population of 5338 persons. Formerly it returned a member to Parliament, but it was disfranchised in 1868.

DARU, Pierre-Antoine, Comte de (1767–1829), a distinguished author and statesman of France, was born at Montpellier, where his father held the office of secretary to the intendancy of Languedoc. From the Oratorians of the military school at Tournon he imbibed an enthusiasm for study, and an admiration of the master-pieces of ancient literature, which remained with him for life. At the age of sixteen he entered the army; and in the following year, though under the legal age, he obtained the rank of commissary. In 1791, in spite of his attachment to the principles of the Revolution, he was accused before the "Club" of treasonable relations with the marquis of Bouzol; but the eloquence of his defence secured his acquittal. In the following year, however, while he was serving in Brittany, the senseless suspicion of the times was such that his use of the ironical expression *nos amis les Anglais* caused him to be thrown into prison. The eighteen months of durance spent at Rennes and Orleans were mainly devoted to the study and translation of Horace, in imitation of whose style he also produced an *Épitre à mon Sans-Culotte*, as he designates the keeper to whom he was intrusted. After his release he served under Pétiet and Massena in several important situations in the commissariat and in the office of the ministry of war. His generous love of justice was strikingly displayed by the appeal which he made in favour of Ferrand, whom he believed to have been wrongfully removed from a post to which he himself was appointed.

The first consul made him secretary to the ministry at war; and, the day after the battle of Marengo, nominated him one of the commissioners for the execution of the convention concluded between General Berthier and General Melas. In 1805 he was made a counsellor of state and intendant-general of the emperor's military household. In the following year he received the appointment of intendant-general of the Brunswick territory, and subsequently of commissioner for the execution of the treaties of Tilsit and Vienna, as well as minister plenipotentiary at Berlin. In 1806 he was elected a member of the Institute, and in 1808 an honorary member of the Berlin Academy. In 1811 he was appointed minister secretary of state; and shortly afterwards he received the portfolio of the war department. He accompanied Napoleon in his Russian campaign. When the retreat from Moscow had commenced, he had to assume the functions of intendant-general of the army; and his iron constitution, and capacity for labour, enabled him to fulfil, with apparent ease, duties which might have killed several men of ordinary strength. *C'est un lion pour le travail*, said Napoleon himself. After the restoration of the Bourbons he was made intendant-general to the king, an appointment which he received in December 1814. But on the return of Napoleon from Elba he joined the standard of his old master, subscribed a considerable sum for the purpose of arming the Parisian fédérés, and in his capacity of counsellor of state attached his signature to the celebrated declaration of the 25th March. His conduct towards the emperor displays a frank and simple independence of character combined with a genuine devotion to Napoleon's cause. "They don't speak well of my *arc de triomphe*," said Napoleon one day. "There are two persons whom I have heard praise it," replied Daru,—"your majesty and his architect." The second restoration found him compromised by his connection with the Government of the Hundred Days; and he retired for a time into private life, and devoted himself to literary pursuits. But in 1819 he was summoned by royal ordinance to the Chamber of Peers, where his rectitude of judgment and administrative knowledge signalized him as one of the most powerful defenders of the national liberties. In 1821 he published his *Histoire de Venise*, which is by far the most important of his works, and is regarded as the most complete and impartial history of that singular republic equally remarkable for its strength and duration. His subsequent work, the *Histoire de Bretagne* (3 vols. 1826), displays great labour and accuracy, but is devoid of interest except to historical antiquaries. His other productions consist of a poetical translation of Horace, which, in spite of the malicious epigram of Le Brun, *Je ne lis point Daru; j'aime trop mon Horace*, has enjoyed in France a well-merited reputation; a variety of occasional poems, discourses, and *éloges* pronounced in the Academy; and speeches delivered in the Chamber of Peers. He died at his residence near Meulan, September 5, 1829, aged sixty-two. His remains were deposited in the Cimitiere Montmartre, and five discourses were pronounced over his tomb by MM. Mirbel, Cuvier, Silvestre de Sacy, Ternaux, and Leroy.

See the "Notice" by M. Viennet prefixed to the fourth edition of the *Histoire de Venise*, 9 vols. 1853, and three articles by Sainte-Beuve in *Causeries du Lundi*, vol. ix.

DARWIN, Erasmus (1731–1802), man of science and poet, was born at Elton, in Nottinghamshire, on the 12th December 1731. Having studied at St John's College, Cambridge, and at Edinburgh, and taken the degree of M.D. at the latter university, he settled as a physician at Lichfield, and gained a large practice. While here he is said to have done much, both by his own example and by more direct effort, to diminish drunkenness among the lower classes. In 1781 he removed to Derby, where he remained till his death, which took place on the 18th April 1802. The fame of Erasmus Darwin as a poet rests upon his *Botanic Garden*, though he also wrote *The Temple of Nature, or the Origin of Society, a Poem, with Philosophical Notes* (1803), and *The Shrine of Nature* (posthumously published). The *Botanic Garden* (the second part of which—*The Loves of the Plants*—was published anonymously in 1789, and the whole of which appeared in 1791) is a long poem in the decasyllabic rhymed couplet. Its merit lies in the genuine scientific enthusiasm and interest in nature which pervade it; and of any other poetic quality—except a certain, sometimes felicitous but oftener ill-placed, elaborated pomp of words—it may without injustice be said to be almost destitute. It was for the most part written laboriously, and polished with unsparing care, line by line, often as he rode from one patient to another, and it occupied the leisure hours of many years. The diction is artificial to a degree which renders it in emotional passages stilted and even absurd, and which makes Canning's clever caricature—*The Loves of the Triangles*—often remarkably like the poem it satirizes; in some passages, however, it is not without a stately appropriateness. Gnomes, sylphs, and nereids are introduced on almost every page, and personification is carried to an extraordinary excess. Thus he describes the *Loves of the Plants* according to the Linnæan system by means of a most ingenious but misplaced and amusing personification of each plant, and often even of the parts of the plant. It is significant that botanical notes are added to the poem, and that its eulogies of scientific men are frequent. Darwin's mind was in fact rather that of a man of science than that of a poet. His most important scientific work is his *Zoonomia* (1794–6), which contains a system of pathology, and a treatise on generation, in which Darwin, in the words of his famous grandson, "anticipated the views and erroneous grounds of opinions of Lamarck." The essence of Darwin's views is contained in the following passage, which he follows up with the conclusion "that one and the same kind of living filaments is and has been the cause of all organic life:"—

"Would it be too bold to imagine that, in the great length of time since the earth began to exist, perhaps millions of ages before the commencement of the history of mankind,—would it be too bold to imagine that all warm-blooded animals have arisen from one living filament, which the great First Cause endued with animality, with the power of acquiring new parts, attended with new propensities, directed by irritations, sensations, volitions, and associations, and thus possessing the faculty of continuing to improve by its own inherent activity, and of delivering down these improvements by generation to its posterity, world without end!"

Observations on the Zoonomia were published by Thomas Brown, the psychologist (Edinburgh, 1798). In 1799 Darwin published his *Phytologia, or the Philosophy of Agriculture and Gardening* (1799), in which he states his opinion that plants have sensation and volition. A paper on *Female Education in Boarding Schools* (1797) completes the list of his works. A slight account of Darwin's life was published by Anna Seward in 1804.

DASHKOFF, Catherina Romanofna Woronzoff, Princess (1744–1810), was the third daughter of Count Roman Woronzoff, a member of the Russian senate, distinguished for his intellectual gifts. She received an exceptionally good education, having displayed from a very early age the masculine ability and masculine tastes which made her whole career so singular. She was well versed in mathematics, which she studied at the university of Moscow, and in general literature her favourite authors were Bayle, Montesquieu, Boileau, Voltaire, and Helvetius. While still a girl she was connected with the Russian court, and became one of the leaders of the party that attached itself to the Grand Duchess (afterwards Empress) Catherine. Before she was sixteen she married Prince Dashkoff, a prominent Russian nobleman, and went to reside with him at Moscow. In 1762 she was at St Petersburg and took a leading part, according to her own account *the* leading part, in the *coup d'état* by which Catherine was raised to the throne. (See CATHERINE II., vol v. p. 233). Another course of events would probably have resulted in the elevation of the Princess Dashkoff's elder sister, Elizabeth, who was the imbecile and unfortunate emperor's mistress, and in whose favour he made no secret of his intention to depose Catherine; but this fact, by inflaming the princess's jealousy, rather impelled her to the action she took than deterred her from it. Her relations with the new empress were not of a cordial nature, though she continued devotedly loyal. Her blunt manners, her unconcealed scorn of the male favourites that disgraced the court, and perhaps also her sense of unrequited merit, produced an estrangement between her and the empress, which ended in her asking permission to travel abroad. The cause of the final breach was said to have been the refusal of her request to be appointed colonel of the imperial guards. Her husband having meanwhile died, she set out in 1768 on an extended tour through Europe. She was received with great consideration at foreign courts, and her literary and scientific reputation procured her the *entrée* to the society of the learned in most of the capitals of Europe. In Paris she secured the warm friendship and admiration of Diderot and Voltaire. She showed in various ways a strong liking for England and the English. She corresponded with Garrick, Dr Blair, and Principal Robertson; and when in Edinburgh, where she was very well received, she arranged to intrust the education of her son to Principal Robertson. In 1782 she returned to the Russian capital, and was at once taken into favour by the empress, who strongly sympathized with her in her literary tastes, and specially in her desire to elevate Russ to a place among the literary languages of Europe. Immediately after her return the princess was appointed "directeur" of the St Petersburg Academy of Arts and Sciences; and in 1784 she was named the first president of the Russian Academy, which had been founded at her suggestion. In both positions she acquitted herself with marked ability. She projected the Russian dictionary of the Academy, arranged its plan, and executed a part of the work herself. She edited a monthly magazine; and wrote at least two dramatic works, *The Marriage of Fabian*, and a comedy entitled *Toissiokoff*. Shortly before Catherine's death the friends quarrelled over a tragedy which the princess had allowed to find a place in the publications of the Academy, though it contained revolutionary principles, according to the empress. A partial reconciliation was effected, but the princess soon afterwards retired from court. On the accession of the Emperor Paul in 1796 she was deprived of all her offices, and ordered to retire to a miserable village in the government of Novgorod, "to meditate on the events of 1762." After a time the sentence was partially recalled on the petition of her friends, and she was permitted to pass the closing years of her life on her own estate near Moscow, where she died on the 4th January 1810.

The *Memoirs of the Princess Dashkoff written by herself* were published in 1840 in London in two volumes. They were edited by Mrs W. Bradford, who, as Miss Wilmot, had resided with the Princess between 1803 and 1808, and had suggested their preparation.

DASS, PETTER (1647–1708), styled the Father of modern Norwegian poetry, was the son of Peter Dundas, a Scotch merchant of Dundee, who left his country about 1630 to escape the troubles of the Presbyterian church. He settled in Bergen, and in 1646 married a Norse girl of good family. Petter Dass was born in 1647 on the island of Nord Herö, on the north coast of Norway. Seven years later his father died, and his mother placed him with his aunt, the wife of the priest of another little island-parish. In 1660 he was sent to school at Bergen, in 1665 to the university, and in 1667 he began to earn his daily bread as a private tutor. In 1672 he was ordained priest, and remained till 1681 as under-chaplain at Nesne, a little parish near his birth-place; for eight years more he was resident chaplain at Nesne; and at last in 1689 he received the living of Alstahoug, the most important in the north of Norway. The rule of Alstahoug extended over all the neighbouring districts, including Dass's native island of Herö, and its privileges were accompanied by great perils, for it was necessary to be constantly crossing stormy firths of sea. Dass lived here in quietude, with something of the honours and responsibilities of a bishop, brought up his family in a God-fearing way, and wrote endless reams of verses. In 1700 he asked leave to resign his living in favour of his son Anders Dass, but this was not permitted; in 1704, however, Anders became his father's chaplain. About this time the old poet refreshed himself by a visit to Bergen, where he made the acquaintance of the poetess Dorothea Engebretsdatter, the most admired writer of the day, with whom he had been for many years in correspondence. He continued to write till 1707, and died in August 1708. The materials for his biography are very numerous; he was regarded with universal curiosity and admiration in his life-time; and, besides, he left a garrulous autobiography in verse. A portrait, painted in middle age, now in the church of Melhus, near Trondhjem, represents him in canonicals, with deep red beard and hair, the latter waved and silky, and a head of massive proportions. The face is full of fire and vigour. His writings passed in MS. from hand to hand, and few of them were printed in his life-time. *Nordlands Trompet* (The Trumpet of Nordland), his greatest and most famous poem, was not published till 1739; *Den norske Dale-Vise* (The Norwegian Song of the Valley) appeared in 1696; the *Aandelig Tidsfordriv* (Spiritual Pastime), a volume of divine pieces, was published in 1711. *The Trumpet of Nordland* remains, after nearly two centuries, as fresh as ever in the memories of the inhabitants of the north of Norway; boatmen, peasants, priests will alike repeat long extracts from it at the slightest notice, and its popularity is unbounded. It is a rhyming description of the province of Nordland, its natural features, its trades, its advantages, and its drawbacks, given in dancing verse of the most breathless kind, and full of humour, fancy, wit, and quaint learning. The other poems of Petter Dass are less universally read; they abound, however, in queer turns of thought, and fine homely fancies. The collected writings of Dass have lately been published at Christiania in a very handsome form, edited by Dr A. E. Eriksen.

DATE PALM. The dates of commerce are the fruit of a species of palm, *Phœnix dactylifera*, a tree which ranges from the Canary Islands through Northern Africa and the south-east of Asia to India. It has been cultivated and much prized throughout most of these regions from the remotest antiquity. In Arabia, indeed, it is the chief source of national wealth, and its fruit forms the staple article of food in that country. The tree has also been introduced along the Mediterranean shores of Europe; but as its fruit does not ripen so far north, the European plants are only used to supply leaves for the festival of Palm Sunday among Christians, and for the celebration of the Passover by Jews. The date palm is a beautiful tree, growing to a height of from 60 to 80 feet, and its stem, which is strongly marked with old leaf-scars, terminates in a crown of graceful shining pinnatisect leaves. The flowers spring in branching spadices from the axils of the leaves, and as the trees are unisexual, it is necessary in cultivation to fertilize the female flowers by artificial means. The fruit is an oblong drupe, which varies as much in size colour, and quality, under cultivation, as does the apple in temperate regions, while the recognized and named varieties of the one fruit are quite as numerous as those of the other. Regarding this fruit Mr W. G. Palgrave (*Central and Eastern Arabia*) remarks—"Those who, like most Europeans at home, only know the date from the dried specimens of that fruit shown beneath a label in shop-windows, can hardly imagine how delicious it is when eaten fresh and in Central Arabia. Nor is it, when newly gathered, heating,—a defect inherent to the preserved fruit everywhere; nor does its richness, however great, bring satiety; in short it is an article of food alike pleasant and healthy." In the oases of Sahara, and in other parts of Northern Africa, dates are pounded and pressed into a cake for food; and it is said that there, the fruit is the food of man and beast, and is eaten by horses and camels, and even by dogs. The dried fruit used for dessert in European countries contains more than half its weight of sugar, about 6 per cent. of albumen, and 12 per cent. of gummy matter. All parts of the date palm yield valuable economic products. Its trunk furnishes timber for house-building and furniture; the leaves supply thatch; their footstalks are used as fuel, and also yield a fibre from which cordage is spun.

Date sugar is a valuable commercial product of the East Indies, obtained from the sap or toddy of *Elate sylvestris*, a tree so closely allied to the date palm that it has been supposed to be the parent stock of all the cultivated varieties. The juice, when not boiled down to form sugar, is either drunk fresh, or fermented and distilled to form arrack. The uses of the other parts and products of this tree are the same as those of the date palm products. *Date palm meal* is obtained from a small species, *Elate farinifera*, growing in the hill country of southern India; it is occasionally resorted to in times of distress or famine.

DAUBENTON, LOUIS-JEAN-MARIE (1716–1800), a distinguished naturalist, was born at Montbar, in the department of the Côte d'Or, in France, May 29, 1716. His father, Jean Daubenton, a notary, who destined him for the church, after putting him through a course of instruction under the Dominicans of Dijon, sent him to Paris to learn theology. The secret study of medicine, however, and the lectures of Baron, Martinenq, and Col de Villars, of Winslow, Hunault, and Antoine de Jussieu, were more attractive to young Daubenton. The death of his father in 1736 set him free to follow his own inclinations, and he accordingly in 1741 took the degree of doctor at Rheims, and returned to his native town with the intention of following the practice of medicine. But fortune destined him for a more brilliant career. It was about this time that Buffon, also a native of Montbar, had formed the plan of bringing out a grand treatise on natural history, and in 1742 he invited Daubenton to assist him by providing the anatomical descriptions for that work. The characters of the two philosophers were opposed in almost every respect. Buffon was violent and impatient; Daubenton, gentle and patient; Buffon was rash in his judgments, and imaginative, seeking rather to divine than to discover truths; Daubenton was cautious, and believed nothing he had not himself been able to see or ascertain. From nature each appeared to have received the qualities requisite to temper those of the other; and a more suitable coadjutor than Daubenton it would have been difficult for Buffon to obtain. In the first section of the natural history Daubenton gave descriptions and details of the dissection of 182 species of quadrupeds, thus procuring for himself a high reputation, and exciting the envy of Réaumur, who considered himself as at the head of the learned in natural history in France. A feeling of jealousy induced Buffon to dispense with the services of Daubenton in the preparation of the subsequent parts of his work, which, as a consequence, lost much in precision and scientific value. Buffon afterwards perceived and acknowledged his error, and renewed his intimacy with his former associate. The number of dissertations on natural history which Daubenton published in the memoirs of the French Academy is very great. Zoological descriptions and dissections, the comparative anatomy of recent and fossil animals, vegetable physiology, mineralogy, experiments in agriculture, and the introduction of the merino sheep into France, gave active occupation to his energies; and the cabinet of natural history in Paris, of which in 1744 he was appointed keeper and demonstrator, was arranged and considerably enriched by him. From 1775 Daubenton lectured on natural history in the College of Medicine, and in 1783 on rural economy. He was appointed professor of mineralogy by the Convention at the Jardin du Roi; and he gave lectures at the Normal School during the ephemeral existence of that institution. He was likewise one of the editors of the *Journal des Savans*, and contributed to two encyclopædias. As a lecturer he was in high repute, and to the last retained his popularity. In the winter of 1799 he was appointed a member of the Conservative Senate, but at the first meeting which he attended he fell from his seat in an apoplectic fit. After a short illness he died at Paris, January 1, 1800.

DAUBENY, CHARLES GILES BRIDLE (1795–1867), an English chemist, botanist, and geologist, was the third son of the Rev. James Daubeny, and was born at Stratton, in Gloucestershire, February 11, 1795, and died December 12, 1867. In 1808 he entered Winchester School, and in 1810 he was elected to a demyship at Magdalen College, Oxford. The lectures of Dr Kidd at that university first awakened in him a desire for the cultivation of natural science. In 1814 he graduated with second class honours, and in the next year he obtained the prize for the Latin essay. From 1815 to 1818 he studied medicine in London and Edinburgh; and in the latter city he attended the lectures of Professor Jameson on natural science. At that time the rival theories of the Huttonians and Wernerians were occupying the attention of geologists. In 1819 Daubeny, in the course of a tour through France, made the volcanic district of Auvergne a special study. By subsequent journeys in Hungary, Transylvania, Italy, Sicily, France, and Germany he extended his knowledge of volcanic phenomena; and in 1826 the results of his observations were given in a work entitled *A Description of Active and Extinct Volcanoes*, a second edition of which was printed in 1848. An earlier treatise was *An Essay on the Geology and Chemical Phenomena of Volcanoes*, published at Oxford in 1824. Daubeny, in common with Gay-Lussac and Davy, held subterraneous thermic disturbances to be probably due to the contact of water with metals of the alkalies and alkaline earths. In November 1822 Daubeny succeeded Dr Kidd as professor of chemistry at Oxford, and twelve years later he was appointed to the chair of botany there. At the Oxford Botanic Garden he conducted numerous experiments upon the effect of changes in soil, light, and the composition of the atmosphere upon vegetation. In 1830 he published in the *Philosophical Transactions* a paper on the iodine and bromine of mineral waters. In the following year appeared his *Introduction to the Atomic Theory*, which was succeeded by a supplement in 1840, and in 1850 by a second edition. In 1831 Daubeny represented the universities of England at the first meeting of the British Association, which at his request held their next session at Oxford. In 1836 he communicated to the Association a report on the subject of mineral and thermal waters. In 1837 he visited the United States, and acquired there the materials for papers on the thermal springs and the geology of North America, read in 1838 before the Ashmolean Society and the British Association. In 1856 he became president of the latter body at its meeting at Cheltenham. In 1841 Daubeny published his *Lectures on Agriculture;* in 1857 his *Lectures on Roman Husbandry;* and in 1865 an *Essay on the Trees and Shrubs of the Ancients,* and a *Catalogue of the Trees and Shrubs indigenous to Greece and Italy.* His last literary work was the collection of his miscellaneous essays, published in two volumes, in 1867. In all his undertakings Daubeny was actuated by a practical spirit and a desire for the advancement of knowledge; and his personal influence on his contemporaries was in keeping with the high character of his various literary productions.

D'AUBIGNÉ, Jean-Henri Merle (1794–1872), was born 16th August 1794 at Eaux Vives, near Geneva. The ancestors of his father, François Merle, were French Protestant refugees; his paternal grandmother's name, D'Aubigné, which Jean-Henri Merle subsequently added to his own, was a name well known in the service of Henry IV. Jean-Henri was destined by his parents to a commercial life; but the new interests awakened by his course at college led him to fix his choice on the office of the Christian ministry. The influence of Robert Haldane, a Scottish evangelist sojourning in Geneva, told powerfully and permanently on the divinity student, and kindled in him a hitherto unknown zeal for the distinctively evangelical truths of the Christian faith. When in 1817 Merle went abroad to further his education, Germany was about to celebrate the tercentenary of the Reformation; and thus early he conceived the ambition to write the history of that great epoch. At Berlin he received stimulus from teachers so unlike as were Neander and De Wette. After presiding for five years over the French Protestant church in Hamburg, he was in 1823 called to become pastor of a congregation in Brussels, and preacher to the court. At the Belgian revolution, he preferred pastoral work at home to an educational post in the family of the Dutch king; and, shortly after his return to Switzerland, events rendered it impossible for those like-minded with him in religious matters to remain in the national Genevese church. The separation took place finally in 1833, and Merle D'Aubigné became one of the founders of the new evangelical church; and, whether as pastor or as professor of church history in its theological seminary, he continued to be till the last days of his life an unwearied and influential labourer in the cause of his church and of evangelical Protestantism. In him the Evangelical Alliance found a hearty promoter. He made many friends in other lands, and repeatedly visited England; he was made a D.C.L. by Oxford University, and received civic honours from the city of Edinburgh. His many labours never impaired his healthy frame. In his seventy-ninth year he still enjoyed perfect vigour of mind and body; sudden death during the night of the 20th October 1872 removed him from the midst of academic and literary work.

It was as their historian that Merle D'Aubigné was most powerfully to serve the cause of the Protestant churches. The first section of his *History of the Reformation,* having for its central subject the earlier period of the work in Germany, gave its author at once a foremost rank amongst modern French ecclesiastical historians, was translated into most European tongues, and was much more widely read and admired in English-speaking lands than at home. It is said that 200,000 copies of the English translation were sold in Great Britain alone, and about twice as many in the United States. The second series of volumes, dealing with reform in the time of Calvin, was not less thorough than the former series, and had a subject hitherto less exhaustively treated; but it did not meet with a success so marked. This part of the subject, with which the Genevese professor was most competent effectively to deal, was all but completed at the time of his death. Along with the great work of his life, he had written many minor treatises on the themes he had most closely at heart. Of these the most important are a vindication of the character and aims of Oliver Cromwell, and a sketch of the contendings of the Kirk of Scotland.

Dr Merle D'Aubigné was in many ways well fitted to be a powerful and popular expositor of history, and especially of that history to which he devoted the studies of a lifetime. Indefatigable in exploring and sifting original documents, he had amassed a vast wealth of authentic information; but a desire to give everywhere a full and graphic picture, assisted by a gift of warm and genial imaginative power, betrayed him into aiming at fulness of picturesque detail concerning events and processes necessarily hidden from the eye of a strict historiographer. In a few cases he seems by inference from his knowledge of a later period to have filled up a narrative not sustained by documentary evidence. He was able in a marvellous manner to identify himself with the Reformers; but while his sympathies enabled him to do justice to great aims of good men, he too frequently becomes their apologist. His expressed desire everywhere to trace the working of God's Spirit in the work of the Reformers leads him to pass too lightly over secondary but weighty influences, and in his heroes' opponents continually to discover the foes of God; and the devout purpose with which he confessedly wrote inspires his pages with much that is rather religious admonition than history, and causes a style otherwise simple and dignified to pass into fervid rhetoric. But his work remains a noble monument of painstaking sincerity and reverential love for a great subject. In the main it unquestionably brings us into direct contact with the genuine spirit of the most momentous period in the modern history of the Christian church.

Daubigné's principal works are—*Discours sur l'Étude de l'Histoire de Christianisme* (Gen. 1832); *Le Luthéranisme et la Réforme* (Par. 1844); *Germany, England, and Scotland, or Recollections of a Swiss Pastor* (Lond. 1848); *Trois Siècles de Lutte en Écosse, ou deux Rois et deux Royaumes; Le Protecteur ou la République d'Angleterre aux jours de Cromwell* (Par. 1848); *Le Concile et l'Infaillibilité* (1870); *Histoire de la Réformation au XVIème Siècle* (Par. 1835-53; new ed. 1861–62 in 5 vols.); and the *Histoire de la Réformation en Europe au temps de Calvin* (8 vols., 1862–1877).

D'AUBIGNÉ, Théodore Agrippa (1550–1630), French historian and poet, was born at St Maury, in Saintonge, on the 8th February 1550. In his childhood he showed a great aptitude for languages; according to his own account he knew Latin, Greek, and Hebrew at six years of age; and he had translated the *Crito* of Plato before he was eleven. His father, a Huguenot who had been one of the conspirators of Amboise, strengthened his Protestant sympathies by showing him, while they were passing through that town on their way to Paris, the heads of the conspirators exposed upon the scaffold, and adjuring him not to spare his own head in order to avenge their death. After a brief residence he was obliged to flee from Paris to avoid persecution, but was captured and condemned to death. Escaping through the intervention of a friend, he went to Montargis. In his fourteenth year he was present at the siege of Orleans, at which his father was killed. His guardian sent him to Geneva, where he studied for a considerable time under the direction of Beza. In 1567 he made his escape from tutelage, and attached himself to the Huguenot army under the prince of Condé. Subsequently he joined Henry of Navarre, to whom he rendered valuable service, both as a soldier and as a counsellor, in the wars that issued in his elevation to the throne as Henry IV. His career at camp and court, however, was a somewhat chequered one, owing to the roughness of his manner and the keenness of his criticisms, which made him many enemies, and severely tried the king's patience. In his tragedy *Circe*, which was played before the court, he did not hesitate to indulge in the most outspoken sarcasm against the king and other members of the royal family. Though he more than once found it expedient to retire into private life, he never entirely lost the favour of Henry, who made him governor of Maillezais. After the conversion of the king to Roman Catholicism, D'Aubigné remained true to the Huguenot cause, and a fearless advocate of the Huguenot interests. The first two volumes of the work by which he is best known, his *Histoire Universelle depuis* 1550 *jusqu' à l'an* 1601, appeared in 1616 and 1618 respectively. The third volume was published in 1619, and, being still more free and personal in its satire than those which had preceded it, was immediately ordered to be burned by the common hangman. The work is a lively chronicle of the incidents of camp and court life, and forms a very valuable source for the history of France during the period it embraces. In September 1620 its author was compelled to take refuge in Geneva, where he found a secure retreat for the last ten years of his life, though the hatred of the French court showed itself in procuring a sentence of death to be recorded against him more than once. He devoted the period of his exile to study, and the superintendence of works for the fortifications of Bern and Basel, which were designed as a material defence of the cause of Protestantism. He died at Geneva on the 29th April 1630. He had two sons, one of whom, Constant D'Aubigné, was the father of Madame de Maintenon.

The chief works of D'Aubigné besides those already mentioned are—*Vers funèbres sur la mort d'Étienne Jodelle* (Paris, 1574), *Les Tragiques donnes au public par le larcin de Prométhée* (1616), *Aventures du Baron de Fœneste*, and *La Confession Catholique du Sieur de Sancy*.

D'AUBUSSON, Pierre (1423–1503), a grand master of the order of St John of Jerusalem, celebrated for the zeal and ability with which he opposed the Turks, was born in 1423. He belonged to a noble French family, and early devoted himself to the career of a soldier; but his history is involved in obscurity till he entered the order of which he was to become the head. Having distinguished himself greatly against the pirates of the Levant, in 1458 he was chosen to conduct an embassy to Charles VII., a duty which he performed with much success. He was after this appointed to the most important offices in the order, and, finally, in 1476, was by an almost unanimous vote elected grand-master. It was the period of the conquests of Mahomet II., who, supreme in the East, now began to threaten Europe. In December 1479 a large Turkish fleet, under Misach Palæologus, appeared in sight of Rhodes; a landing was effected, and a vigorous attack made upon the city. But in July of the next year, being reinforced from Spain, the knights forced the Mussulmans to retire. D'Aubusson had been dangerously wounded in one of the numerous and severe fights which had taken place; but in a few weeks he had so far recovered as to be able to address to the emperor of the East an account of the siege, which raised his renown to the highest point throughout Europe. Soon after, Mahomet II. died, leaving his kingdom to be disputed between his sons Bajazet and Zizim. The latter, finding himself unable to achieve success, sought the aid of D'Aubusson, who, in 1482, received him with great display, but took advantage of his confidence to detain him a prisoner. He was afterwards sent to France, and finally handed over to the Pope, who rewarded D'Aubusson with a cardinal's hat, and with the power of conferring all benefices connected with the order without the sanction of the papacy, and also suppressed the orders of St Sepulchre and St Lazarus, and bestowed their wealth on the order of St John. For some years D'Aubusson devoted himself to regulating the affairs of his order, so that it might retain the spirit of lofty enthusiasm which originally animated it, and by which he was himself inspired, and defending its interests from the bad faith of the Popes; but in 1501, being appointed generalissimo of the Christian armies against the Turk, he sailed to attack Mitylene. The forces he commanded, however, he found it impossible to bring into agreement; and the expedition proved a failure. The measure to which the rest of his life was mainly devoted was an attempt to expel Judaism from Rhodes, by banishing the adult Jews and forcibly baptizing the children. He died in the summer of 1503.

See P. Bouhours, *Histoire de Pierre d'Aubusson* (1676); Rossio, *Dell' Istoria della Religione e Militia de S. Giovanni Gerosolimitano* (1594–1602), translated by Baudouin and Naberat (1643); Villeneuve Bargemont, *Monuments de l'ordre de Saint Jean* (1829).

DAUN, Leopold Josef Maria, Count von (1705–1766), field-marshal and commander-in-chief of the Austrian army during the Seven Years' War, was born at Vienna on the 25th September 1705. He was intended for the church, and studied in his youth at Rome; but his natural inclination for the army, in which his father and grandfather had been distinguished generals, proved irresistible. In 1718 he served in the war in Sicily, in his father's regiment; in 1734–5, having risen to the rank of major-general, he was engaged in the wars in Italy and on the Rhine. He continued to add to his distinctions in the war against the Turks (1737–9), and in the war of the Austrian succession. In 1745 he was placed in the supreme command of the artillery, and in the same year he confirmed himself in the favour of his sovereign, Maria Theresa, by marrying her protegé, the Countess Fuchs. In 1746–8 the held a command in the Netherlands. In 1754 he was elevated to the rank of field-marshal. During the interval of peace that preceded the Seven Years' War he was engaged in carrying out an elaborate scheme for the reorganization of the Austrian army; and it was chiefly through his instrumentality that the military academy was established at Wiener-Neustadt in 1751. During the Seven Years' War he was the most formidable opponent that Frederick the Great encountered. On the 18th June 1757 he inflicted a decisive defeat on the greatest general of the age at the battle of Kollin. In commemoration of this brilliant exploit the queen immediately instituted a military order bearing her name, of which Daun was nominated first grand cross. In December 1757 he succeeded Prince Charles of Lorraine as commander-in-chief, and he gained fresh fame by the victories of Hochkirchen (14th October 1758) and Maxen (20th November 1759). On the latter occasion he took General Fink and his whole army prisoners. These successes were counterbalanced by the defeat of Laudon at Liegnitz, which was attributed to the dilatoriness of Daun, and the defeat near Torgau (3d November 1760) by Ziethen's cavalry in a night surprize. In this engagement Daun was so severely wounded that he had to return to Vienna to recruit. He resumed his command in 1761, but did not again achieve any marked success. He retired finally in 1763, at the close of the war. In the previous year he had been appointed president of the Aulic Council. He died on the 5th February 1766. By the order of Maria Theresa a monument to his memory was erected in the church of the Augustinians, with an inscription styling him the Saviour of the State. As a general Daun has been reproached for the dilatoriness of his operations, but this was only the wariness required in opposing a general like Frederick, who was quick and unexpected in his movements beyond all precedent. A more indisputable fault was his inability to secure the full results of a victory.

DAUPHINÉ, an ancient province of south-eastern France, now forming the departments of Isère, Drôme, and Hautes Alpes. It was bounded on the E. by Piedmont, N.E. by Savoy, S. by Provence, S.W. by the Comté Venaissin, and N. and W. by the Rhone. The western portion was known as Lower, and the eastern portion as Upper Dauphiné,—the latter including the districts of Matesine, Champ-saur, Oisans, Diais, Gapençais, Embrunais, and Briançonnais; and the former, Gresivaudan, Viennais, Valentinais, Royannez, the Baronies, and Tricastinais. When it first appears in history the district was inhabited by the Allobroges, the Caturiges, and other Celtic tribes, who were gradually incorporated in the Roman Empire. It was afterwards successively comprised in the first Burgundian kingdom, the Carolingian empire, the second Burgundian kingdom, and the German empire. In the course of the 9th, 10th, 11th, and 12th centuries it was broken up into several small principalities, ecclesiastical and secular; of which the most important proved that of the lords of Albon, who, first as counts and afterwards as dauphins of Viennais, gradually extended their influence and possessions. The Burgundian line dying out in 1281, the lordship passed to the house of La Tour du Pin, which in the person of Guiges VIII. was offered the royal dignity by Louis the Bavarian. Guiges's successor, Hubert II., having lost his only son in 1335, made over his lands to Charles of Valois, the grandson of Philip VI., in return for an annual payment, and on condition that the independence and the privileges of the countship should be maintained. From this time the eldest son of the king of France bore the title of Dauphin. The history of Dauphiné down to the Revolution consists mainly of the struggles of its inhabitants to maintain their liberties against the gradual encroachments of the Crown. Louis XI. was the first to demand the payment of an annual tax. Richelieu abolished their estates; but the constitutional spirit of the people continued alive, and in 1788 displayed itself in violent resistance to the dissolution of the provincial *parlement* and in the convocation of the three orders in the castle of Vizille, where the popular rights were boldly asserted.

DAURAT, JEAN (or DORAT; in Latin, AURATUS), French poet of the renaissance, and founder of the Pléiade, was born at Limoges in 1507. He was of illustrious family, and, after studying at the college of Limoges, came up to Paris to be presented to Francis I., who made him tutor to his pages. He rapidly gained an immense reputation, especially for proficiency in classical learning. As private tutor in the house of Lazare de Baïf, he had J. A. de Baïf, afterwards famous as a poet, for his pupil. His son, Louis, was of a marvellous precocity, and at the age of ten translated into French verse one of his father's Latin pieces; his poems were published with his father's. Jean Daurat became the director of the Collége de Coqueret, where he had among his pupils, besides Baïf, Ronsard, Remy Belleau, and Pontus de Thyard. Du Bellay was added by Ronsard to this group; and these five young poets, under the direction of Daurat, formed a species of society for the reformation of the French language and literature. They increased their number to seven by the initiation of the dramatist Étienne Jodelle, and thereupon they named themselves "La Pléiade," in emulation of the seven Greek poets of Alexandria. The election of Daurat as their president proved the weight of his personal influence, but as a writer of French verse he is the least important of the seven. Meanwhile he collected around him a sort of Academy, and stimulated the students on all sides to a passionate study of Greek and Latin poetry. He himself wrote incessantly in both those languages, and was styled the Modern Pindar. In 1560 he was appointed professor of Greek at the Collége Royale, a post which he continued to hold until, in his extreme old age, he resigned it in favour of his nephew, Nicolas Goulu. Charles IX. gave him the title of *poëte regius*. His flow of language was the wonder of his time; he is said to have composed more than 15,000 Greek and Latin verses. What he considered the best of these were comprised in a volume of *Poemata*, published at Paris in 1586. He died at Paris on the 1st of November 1588, having survived all his illustrious pupils of the Pléiade, except Pontus de Thyard. He was a little, restless man, of untiring energy, rustic in manner and appearance. His unequalled personal influence over the most graceful minds of his age gives him an importance in the history of literature for which his own somewhat vapid writings do not fully account.

DAVENANT, SIR WILLIAM (1605–1668), poet and dramatist, was born in February 1605, at the Crown Inn, Oxford, where his father was a wealthy vintner. It was stated that Shakespeare always stopped at this house in passing through the city of Oxford, and out of his known or rumoured admiration of the hostess, a very fine woman, there sprang a scandalous story which attributed Davenant's paternity to the greatest of poets, a legend which there is reason to believe Davenant himself encouraged, but which later criticism has cast aside as spurious. In 1621 the vintner was made mayor of Oxford, and in the same year his son left the grammar-school of All Saints, where his master had been Edward Sylvester, and was entered an undergraduate of Lincoln College. He did not stay at the university, however, long enough to take a degree, but was hurried away to appear at court as a page, in the retinue of the gorgeous duchess of Richmond. From her service he passed into that of Fulke Greville, Lord Brooke, in whose house he remained until the murder of that eminent man in 1628. This blow threw him upon the world, not altogether without private means, but greatly in need of a profitable employment. He turned to the stage for subsistence, and in 1629 produced his first play, the tragedy of *Albovine*. It was not a very brilliant performance, but it pleased the town, and decided the poet to pursue a dramatic career. The next year saw the publication of *The Cruel Brother*, a tragedy, and *The Just Italian*, a tragi-comedy. Inigo Jones, the court architect, for whom Ben Jonson had long supplied the words of masques and complimentary pieces, quarrelled with his great colleague in the year 1634, and applied to William Davenant for verses. The result was *The Temple of Love*, performed by the queen and her ladies at Whitehall on Shrove Tuesday, 1634, and printed in that year. Another masque, *The Triumphs of the Prince D'Amour*, followed in 1635. The poet returned to the legitimate drama by the publication of three of his cleverest and most successful pieces, the tragi-comedy of *Love and Honour*, in 1635, and the tragi-comedy of *The Platonic Lovers*, and the famous comedy of *The Wits*, in 1636. The masque of *Britannia Triumphans* brought him into some trouble, for it was suppressed, as a punishment for its first performance having been arranged for a Sunday. By this time Davenant had, however, thoroughly ingratiated himself with the court; and on the death of Ben Jonson in 1637 he was rewarded with the office of poet-laureate, to the exclusion of May, who considered himself entitled to the honour. It was shortly after this event that Davenant collected his minor lyrical pieces into a volume entitled *Madagascar and other Poems*, 1638; and in 1639 he became manager of the new theatre in Drury Lane. The civil war, however, put a check upon this prosperous career; and he was among the most active partisans of royalty through the whole of that struggle for supremacy. As early as May 1612, Davenant was accused before the Long Parliament of being mainly concerned in a scheme to seduce the army to overthrow the Commons. He was accordingly apprehended at Faversham, and imprisoned for two months in London; he then attempted to escape to France, and succeeded in reaching Canterbury, where he was re-captured. Escaping a second time, he made good his way to the queen, with whom he remained in France until he volunteered to carry over to England some military stores for the army of his old friend the earl of Newcastle, by whom he was induced to enter the service as lieutenant-general of ordnance. He acquitted himself with so much bravery and skill that, after the siege of Gloucester, in 1643, he was knighted by the king. After the battle of Naseby, he retired to Paris, where he became a Roman Catholic, and spent some months in the composition of his epic poem of *Gondibert*. In 1650 he took the command of a colonizing expedition that set sail from France to Virginia, but was captured in the Channel by a Parliamentary man-of-war, which took him back to the Isle of Wight. Imprisoned in Cowes Castle until 1651, he tempered the discomfort and suspense of his condition by continuing the composition of *Gondibert*. He was sent up to the Tower to await his trial for high treason, but just as the storm was about to break over his head, all cleared away. It is believed that the personal intercession of Milton led to this result. Davenant, released from prison, immediately published *Gondibert*, the work on which his fame mainly rests, a chivalric epic in the stanza of *Nosce Teipsum*, the influence of which poem is strongly marked in its philosophical passages. It is a cumbrous, dull poem, but is relieved with a multitude of fine and felicitous passages, and lends itself most happily to quotation. During the civil war one of his plays had been printed, the tragedy of *The Unfortunate Lovers*, in 1643. He found that there were many who desired him to recommence his theatrical career. Such a step, however, was absolutely forbidden by Puritan law. Davenant, therefore, by the help of some influential friends, obtained permission to open a sort of theatre at Rutland House, in Charterhouse Yard, where, on the 21st of May 1656, he began a series of representations, which he called *operas*, as an inoffensive term. This word was then first introduced into our language. The opening piece was his own *Siege of Rhodes*, printed the same year, which was performed with stage-decorations and machinery of a kind hitherto quite unthought of in England. He continued until the Restoration to produce ephemeral works of this kind, only one of which, *The Cruelty of the Spaniards in Peru*, in 1658, was of sufficient literary merit to survive. In 1660 he had the infinite satisfaction of being able to preserve the life of that glorious poet who had, nine years before, saved his own from a not less imminent danger. The mutual relations of Milton and Davenant do honour to the generosity of two men who, sincerely opposed in politics, knew how to forget their personal anger in their common love of letters. Under Charles II., Davenant flourished in the dramatic world; he opened a new theatre in Lincoln's Inn Fields, which he called the Duke's; and he introduced a luxury and polish into the theatrical life which it had never before known in England. Under his management, the great actors of the Restoration, Betterton and his coevals, took their peculiar French style and appearance; and the ancient simplicity of the English stage was completely buried under the tinsel of decoration and splendid scenery. Davenant brought out six new plays in the Duke's Theatre, *The Rivals*, *The Man's the Master*, comedies translated from Scarron, *News from Plymouth*, *The Distresses*, *The Siege*, *The Fair Favourite*, tragicomedies, all of which were printed after his death, and not one of which survived their author on the stage. He died on the 17th of April 1668, and two days afterwards was buried in Poet's Corner, Westminster Abbey, with the inscription "O rare Sir William Davenant!" In 1672 his writings were collected in folio. His last work had been to travesty Shakespeare's *Tempest*, in company with Dryden.

The personal character, adventures, and fame of Davenant, and more especially his position as a leading reformer, or rather debaser, of the stage, have always given him a prominence in the history of literature which his writings hardly justify. His plays are utterly unreadable, and his poems are usually stilted and unnatural. With Cowley, he marks the process of transition from the poetry of the imagination to the poetry of the intelligence; but he had far less genius than Cowley, and his influence on our drama must be condemned as wholly deplorable. (E.W.G.)

DAVENPORT, a city of the United States, capital of Scott county, Iowa, is situated on the west bank of the Upper Mississippi, opposite Rock Island, about 110 miles above Keokuk (following the course of the river), and 160 miles west of Chicago. The city, which is regularly laid out, contains a city hall, a county court-house, an opera house, and a number of churches. Among the educational institutions may be mentioned Griswold College, belonging to the Episcopalian denomination, and the Catholic Academy of the Immaculate Conception. There is also an academy of natural science. The trade of Davenport is considerable, consisting chiefly of grain and domestic produce, while its manufactures are not unimportant, comprising waggons, agricultural implements, joinery and cabinet work, tobacco, &c. The city is governed by a mayor and 12 aldermen. It was first settled in 1836, and was incorporated as a town in 1842 and as a city in 1851. Population in 1860, 11,267; and in 1870, 20,038.

DAVID (Hebrew, דָּוִד *beloved*), son of Jesse, second king of Israel, and founder of the dynasty which continued to reign at Jerusalem until the Babylonian captivity. According to the usual chronology, he reigned 1055–1015 B.C., but the computations which produce this date by counting back from the destruction of Jerusalem, 588 B.C., or the fall of Samaria, 722 B.C., contain numerous precarious elements. Ewald puts the date ten years earlier, but recent investigations on the contrary make it not improbable that David flourished as much as from thirty years to half a century later than is usually assumed.[1]

David is the greatest of the kings of Israel, and his reign changed the whole face of Hebrew history. During the period of the Judges, the Hebrews were weakened by an exaggerated love of personal independence, divided by tribal jealousies, and oppressed by a succession of foreign enemies, of whom the latest and most dangerous were the Philistines, an immigrant people whose main settlements in the fruitful coastland of southern Canaan appear to have taken place after the Hebrews were established in the land. Forcing their way inland, the Philistines struck a decisive

[1] The admitted confusion in the chronology of the books of Kings can hardly be cleared up without the aid of synchronisms with the history of foreign nations, Egypt and Assyria. The Assyrian synchronisms seem to bring down the date of Jehu, and hence of all who preceded him, by nearly forty years. This is at least not contradicted by the only available Egyptian synchronism, the war of Shishak with Rehoboam. (See Schrader, *Keilinschriften und A. T.*, Giessen, 1872, and in control of his conclusious Wellhausen in the *Jahrbücher für Deutsche Theologie*, 1875, p. 607, *seq.*, and G. Smith's *Assyrian Eponym Canon*, 1875.) An additional element of uncertainty lies in the forty years' reign ascribed to Solomon. Forty is often used as an indefinite number, and the marriage of Rehoboam to Absalom's daughter seems inconsistent with so long a reign, as Rehoboam came to the throne at the age of forty-one.

blow in the battle of Ebenezer (1 Sam. iv.), when the collapse of the ancient hegemony of Ephraim, and the destruction of the sanctuary of the ark at Shilo, left the Hebrews without national leaders and without a centre of national action. Then arose Samuel, whose prophetic activity rallied the Israelites around Jehovah God of Hosts, and brought about a great national and religious revival. The struggle with the Philistines was renewed with better success, though without decisive issue, and at length the election of Saul as king embodied in a permanent institution the stronger sense of national unity which had grown up under Samuel. But Saul was not equal to the task set before him. He broke with the prophetic party, which was the mainstay of the national revival which the king was called to lead. He felt himself forsaken by Jehovah, and his last years were clouded by accesses of a furious melancholy which destroyed his vigour and alienated his subjects. When at length he was defeated and slain at Gilboa, the Philistines appeared to be absolute masters of the position. They even moved forward and occupied the cities in the plain of Jezreel and on the Jordan, which the Israelites forsook in terror—a movement which cut the country as it were in two, and apparently made it impossible for the Hebrews again to unite under a single head. From this humiliation David in a few years raised his country to the highest state of prosperity and glory, subduing his enemies on every side, and extending his suzerainty, as he expresses himself in Psalm xviii., even over nations that he had not known. To do this work other qualities than mere military capacity were required. David was not only a great captain,—he was a national hero, who united in his own person the noblest parts of Hebrew genius, and drew to himself by an unfailing personal attraction the best valour, patriotism, and piety of the nation; while his political tact and inborn talent for rule enabled him to master the old tribal particularism, and to shape at Jerusalem a kingdom which, so long as he lived, represented the highest conception of national life that was possible under the rude social conditions then existing. The structure erected by David was, in truth, too much in advance of the times, and too wholly the creation of unique genius to be permanent. Under a successor whose wisdom lacked the qualities of personal force and sympathy with popular feeling, the kingdom of David began to decay, and in the next generation it fell asunder, and lived only in the hearts of the people as the proudest memory of past history, and the prophetic ideal of future glory.

The books of Samuel, which are our principal source for the history of David, show how deep an impression the personality of the king, his character, his genius, and the romantic story of his early years had left on the mind of the nation. Of no hero of antiquity do we possess so life-like a portrait. Minute details and traits of character are preserved with a fidelity which the most sceptical critics have not ventured to question, and with a vividness which bears all the marks of contemporary narrative. But the record is by no means all of one piece. The history, as we now have it, is extracted from various sources of unequal value, which are fitted together in a way which offers considerable difficulties to the historical critic. In the history of David's early adventures the narrative is not seldom disordered, and sometimes seems to repeat itself with puzzling variations of detail, which have led critics to the almost unanimous conclusion that the First Book of Samuel is drawn from at least two parallel histories. It is indeed easy to understand that the romantic incidents of this period were much in the mouths of the people, and in course of time were written down in various forms which were not combined into perfect harmony by later editors, who gave excerpts from several sources rather than a new and independent history. These excerpts, however, have been so pieced together that it is often impossible to separate them with precision, and to distinguish accurately between earlier and later elements. It even appears that some copies of the books of Samuel incorporated narratives which other copies did not acknowledge. From the story of Goliath the Septuagint omits many verses—1 Sam xvii. 12–31, xvii. 55–xviii. 5. The omission makes the narrative consistent, and obviates serious difficulties involved in the Hebrew text. Hence some have supposed that the Greek translators arbitrarily removed passages that puzzled them. But this hypothesis does not meet the facts, and is inconsistent with what we know of the manner of this part of the Septuagint. There can be little doubt that both here and in other cases the shorter text is original, and that the disturbing additions came in later from some other document, and were awkwardly patched on to the older text.[1] So too the history of the gradual estrangement of Saul from David is certainly discontinuous, and in the opinion of most critics the two accounts of David sparing Saul's life are duplicate narratives of one event. Even in the earlier part of the history these minor difficulties do not affect the essential excellence of the narrative preserved to us; and for the period of David's kingship the accounts are still better. All that relates to personal and family matters at the court of Jerusalem (2 Sam. xi.–xx.) seems to come from some writer who had personal cognizance of the events recorded. It does not appear that the plan of this author included the history of David's foreign campaigns. The scanty account of great wars in ch. viii. is plainly from another source, and in general our information is less adequate on public affairs than on things that touched the personal life of the king. The narrative is further enriched with poetical pieces, of which one at least (2 Sam. i. 19–27) is known to be extracted from an anthology entitled *The Book of the Upright*. Several brief lists of names and events seem also to have been taken from distinct sources, and sometimes interrupt the original context (*e.g.*, 2 Sam. iii. 2–5). Some important lists were still accessible to the author of Chronicles in a separate form. 1 Chron. xi. 10–47 is fuller at the end than the corresponding list in 2 Sam. xxiii.; and 1 Chron. xii. contains valuable matter altogether wanting in Samuel. See also 1 Chron. xxvii. Besides the books of Samuel (with 1 Kings i. ii.), and the parallel narrative of the Chronicler, we have a few hints for the history of David in 1 Kings xi. and in the titles of Psalms (especially Pss. vii and lx.), and of course such psalms as can be made out to be really by David are invaluable additions to the Davidic poems incorporated in the books of Samuel.

Jesse, the father of David, was a substantial citizen of Bethlehem. He claimed descent through Boaz from the ancient princes of Judah (Ruth iv. 18, *seq.*), but the family connection was not of note in Israel (1 Sam. xviii. 18). As the youngest son of the house David spent his youth in an occupation which the Hebrews as well as the Arabs seem to have held in low esteem. He kept his father's sheep in the desert steppes of Judah, and there developed the strength, agility, endurance, and courage which distinguished him throughout life, and are referred to in Ps. xviii. 32, *seq.* (comp. 1 Sam. xvii. 34, xxiv. 2; 2 Sam. xvii. 9). There, too, he acquired that skill in music which led to his first introduction to Saul. Then he became Saul's armour-bearer, and in this capacity, according to the shorter and more consistent form of the narrative, David took part in the campaign in which he slew the Philistine champion Goliath, and became by

[1] The proof of this turns in good measure on arguments that cannot be reproduced here. But the discussion in Wellhausen's *Text der Bücher Samuelis*, Göttingen, 1871, appears to be conclusive.

one exploit a popular hero, and an object of jealousy to Saul. According to the Massoretic text of 1 Sam., Saul's jealousy leaped at once to the conclusion that David's ambition would not stop short of the kingship. Such a suspicion would be intelligible if we could suppose that the king had heard something of the significant act of Samuel, which now stands at the head of the history of David in witness of that divine election and unction with the spirit of Jehovah on which his whole career hung (1 Sam. xvi. 1–13). But there is not the least trace in the history that even David and David's family understood at the time the meaning that underlay his unction by Samuel, which would naturally be taken as a special mark of favour and a part of the usual "consecration" of the guests in a sacrificial feast.[1] The shorter text of 1 Sam. xviii., represented by the Septuagint, gives an account of Saul's jealousy, which is psychologically more intelligible.[2] According to this text Saul was simply possessed with such a personal dislike and dread of David as might easily occupy his disordered brain. To be quit of his hateful presence he gave him a military command. In this charge David increased his reputation as a soldier and became a general favourite. Saul's daughter Michal loved him; and her father, whose jealousy continued to increase, resolved to put the young captain on a perilous enterprize, promising him the hand of Michal as a reward of success, but secretly hoping that he would perish in the attempt. David's good fortune did not desert him; he won his wife, and in this new advancement continued to grow in the popular favour, and to gain fresh laurels in the field.

At this point it is necessary to look back on an episode which is found in the Hebrew text but not in the Greek—the proposed marriage of David with Saul's eldest daughter Merab, who at the time when the proposal was made was already the wife of a certain Adriel.[3] What is said of this affair interrupts the original context of chap. xviii., to which the insertion has been clumsily fitted by an interpolation in v. 21. We have here, therefore, a notice drawn from a distinct source, and of uncertain value. Merab and Michal are confounded in 2 Sam. xxi. 8, and perhaps the whole episode of Merab and David rests on a similar confusion of names.

As the king's son-in-law, David was necessarily again at court. He became chief of the body-guard, as Ewald rightly interprets 1 Sam. xxii. 14, and ranked next to Abner (1 Sam. xx. 25), so that Saul's insane fears were constantly exasperated by personal contact with him. On at least one occasion the king's frenzy broke out in an attempt to murder David with his own hand.[4] At another time Saul actually gave commands to assassinate his son-in-law, but the breach was made up by Jonathan, whose chivalrous spirit had united him to David in a covenant of closest friendship (1 Sam. xix. 1–7). The circumstances of the final outburst of Saul's hatred, which drove David into exile, are not easily disentangled. The narrative of 1 Sam. xx., which is the principal account of the matter, cannot originally have been preceded by chap. xix. 11–24, for in chap. xx. David appears to be still at court, and Jonathan is even unaware that he is in any danger, while the preceding verses represent him as already a fugitive. It may also be doubted whether the narrative of David's escape from his own house by the aid of his wife Michal (chap. xix. 11–17) has any close connection with verse 10, and does not rather belong to a later period.[5] David's daring spirit might very well lead him to visit his wife even after his first flight. The danger of such an enterprize was diminished by the reluctance to violate the apartments of women and attack a sleeping foe, which appears also in Judges xvi. 2, and among the Arabs.[6] In any case it is certain that chap. xx. must be taken by itself; and it seems safer to conclude that chap. xix. 11–24 are fragments which have been misplaced by an editor, than to accept the opinion of those critics who hold that we have two distinct and quite inconsistent accounts of the same events.

According to chap. xx. David was still at court in his usual position when he became certain that the king was aiming at his life. He betook himself to Jonathan, who thought his suspicions groundless, but undertook to test them. A plan was arranged by which Jonathan should draw from the king an expression of his feelings, and a tremendous explosion revealed that Saul regarded David as the rival of his dynasty, and Jonathan as little better than a fellow conspirator. The breach was plainly irreparable. Jonathan sought out his friend, and after mutual pledges of unbroken friendship they parted, and David fled. His first impulse was to seek the sanctuary at Nob, where he had been wont to consult the priestly oracle (chap. xxii. 15), and where, concealing his disgrace by a fictitious story, he also obtained bread from the consecrated table and the sword of Goliath. It was perhaps after this that David made a last attempt to find a place of refuge in the prophetic circle of Samuel at Ramah, where he was admitted into the prophetic cœnobium, and was for a time protected by the powerful, and almost contagious influences, which the religious exercises of the prophets exerted on Saul's emissaries, and even on the king himself. The episode now stands in another connection (chap. xix. 18, *seq.*), where it is certainly out of place. It would, however, fit excellently into the break that plainly exists in the history at xxi. 10 after the affair at Nob. Deprived of the protection of religion as well as of justice, David tried his fortune among the Philistines at Gath. But he was recognized and suspected as a redoubtable foe. Escaping by feigning madness, which in the East has inviolable privileges,[7] he returned to the wilds of Judah, and was joined at Adullam[8] by his father's house and by a small band of outlaws, of which he became the head. Placing his parents under the charge of the king of Moab, he took up the life of a guerilla captain, cultivating friendly relations with the townships of Judah (1 Sam. xxx. 26), which were glad to have on their frontiers a protector so valiant as David, even at the expense of the blackmail which he levied in return. A clear conception of his life at this time, and of the respect which he inspired by the discipline in which he held his

[1] The remarks of Samuel as the sons of Jesse passed before him were presumably not audible. The words "unto Jesse" in ver. 10 are not in the LXX. It is not therefore necessary to conclude with some critics that this story is to be taken as a mere figurative embodiment of the idea of David's election by God. When the true sense of the act was divined it is not easy to determine. David appears still unconscious of his destiny in 1 Sam. xviii. 23, but Abigail, 1 Sam. xxv. 30, knows that the prophetic word has marked him out as king. Compare 2 Sam. iii. 9, v. 2.

[2] From ch. xviii. the LXX. omits ver. 1 to the middle of ver. 6 inclusive, the first and last clauses of ver. 8, verses 9 to 11 inclusive, the reason given for Saul's fear in ver. 12, verses 17–19 inclusive, the second half of ver. 21. It also modifies ver. 28, and omits the second half of ver. 29 and the whole of ver. 30.

[3] This seems to be the true meaning of 1 Sam. xviii. 19.

[4] 1 Sam. xix. 9. The parallel narrative, ch. xviii. 10, 11, may refer to a different occasion. But as the text of ch. xviii. is disordered, and the verses are wanting in the Greek, this is not certain.

[5] The close of ver. 10 in the Hebrew is corrupt, and the words "that night" seem to belong to next verse. So the Greek reads.

[6] Wellhausen cites a closely parallel case from Sprenger's *Mohammed*, vol. ii. p. 543.

[7] An interesting parallel in Barhebræi *Chron.*, ed. Bruns et Kirsch, p. 222.

[8] The cave of Adullam is traditionally placed at Charatun, two hours' journey south of Bethlehem. But the town of Adullam, which has not been identified with any certainty, lay in the low country of Judah (Josh. xv. 35). The "cave" is also spoken of as a "hold" or mountain fortress, and perhaps "hold" is everywhere the true reading (Wellhausen, Nöldeke). Compare Theodotion in 1 Sam. xxiii. 15, xxiv. 1.

men, and of the generosity which tempered his fiery nature, is given in 1 Sam. xxv. His force gradually swelled, and he was joined by the prophet Gad and by the priest Abiathar, the only survivor of a terrible massacre by which Saul took revenge for the favours which David had received at the sanctuary of Nob. He was even able to strike at the Philistines, and to rescue Keilah, in the low country of Judah, from their attack. Had he been willing to raise the standard of revolt against Saul, he might probably have made good his position, for he was now openly pointed to as divinely designed for the kingship. But though Saul was hot in pursuit, and though he lived in constant fear of being betrayed,[1] David refused to do this. His blameless conduct retained the confidence of Jonathan (1 Sam. xxiii. 16), and he deserved that confidence by sparing the life of Saul.[2] But at length it became plain that he must either resist by force or seek foreign protection. He went to Achish of Gath, and was established in the outlying town of Ziklag, where his troops might be useful in chastising the Amalekites and other robber tribes who made forays on Philistia and Judah without distinction.[3]

At Ziklag David continued to maintain amicable relations with his friends in Judah, and his little army received accessions even from Saul's own tribe of Benjamin (1 Chron. xii. 1). At length, in the second year, he was called to join his master in a great campaign against Saul. The Philistines directed their forces towards the rich valley of Jezreel; and Saul, forsaken by Jehovah, already gave himself up for lost. It may be doubted whether the men of Judah took part in this war; and on his march David was joined by influential deserters from Israel (1 Chron. xii.). The prestige of Saul's reign was gone; and the Hebrews were again breaking up into parties, each ready to act for itself. Under such circumstances David might well feel that loyalty to his new master was his first duty. But he was providentially saved from the necessity of doing battle with his countrymen by the jealousy of the Philistine lords, who demanded that he be sent back to Ziklag. He returned to find the town pillaged by the Amalekites; but pursuing the foes he inflicted upon them a signal chastisement and took a great booty, part of which he spent in politic gifts to the leading men of the Judean towns.

Meantime Saul had fallen, and northern Israel was in a state of chaos. The Philistines took possession of the fertile lowlands of Jezreel and the Jordan; and the shattered forces of Israel were slowly rallied by Abner in the remote city of Mahanaim in Gilead, under the nominal sovereignty of Saul's son Ishbaal. The tribe of Judah, always loosely attached to the northern Hebrews, was in these circumstances compelled to act for itself. David saw his opportunity, and advanced to Hebron, where he was anointed king of Judah at the age of thirty, and continued to reign for seven years and a half. His noble elegy on the death of Saul and Jonathan, and his message of thanks to the men of Jabesh Gilead for their chivalrous rescue of the bodies of the fallen heroes, show how deeply he sympathized with the disasters of his nation; and even in northern Israel many now looked to him as their only helper (2 Sam. iii. 17). But David was not lacking in the caution and even craftiness proper to an Oriental hero; and he appears to have been careful not to irritate the Philistines by any premature national movement. As he retained Ziklag we must suppose that he had some agreement with his former suzerain Achish. Abner gradually consolidated the authority of Ishbaal in the north, and at length his forces met those of David at Gibeon. A sham contest was changed into a fatal fray by the treachery of Ishbaal's men; and in the battle which ensued Abner was not only defeated, but, by slaying Asahel, drew upon himself a blood feud with Joab. The war continued. Ishbaal's party waxed weaker and weaker; and at length Abner quarrelled with his nominal master and offered the kingdom to David. The base murder of Abner by Joab did not long defer the inevitable issue of events. Ishbaal was assassinated by two of his own followers, and all Israel sought David as king.

The Biblical narrative is not so constructed as to enable us to describe in chronological order the thirty-three years of David's reign over all Israel. Let us look at (1) his internal policy, (2) his relations to foreign nations, (3) other events.

1. Under the judges all authority was at bottom local or tribal, and the wider influence wielded by the more famous of these rulers took the form of a temporary pre-eminence or hegemony of the judge's own tribe. The kingdom of Saul was not radically different in character. There was no national centre. Saul ruled as a Benjamite from his paternal city of Gibeah (*cf.* 1 Sam. xxii. 7). At the risk of alienating the men of Judah, who in fact appear as the chief malcontents in subsequent civil disturbances, David resolved to break through these precedents, and to form a truly national kingdom independent of tribal feeling. The success of so bold a conception was facilitated by the circumstance that, unlike previous kings, he was surrounded by a small but thoroughly disciplined standing army, having gradually shaped his troop of freebooters into an organized force of 600 "mighty men" (Gibborim), always under arms, and absolutely attached to his person. The king began the execution of his plan by a stroke which at once provided a centre for future action, and gave the necessary prestige to his new kingdom. He stormed the Jebusite fortress of Jerusalem, which its inhabitants deemed impregnable, and here, in the centre of the country, on the frontier between Judah and Benjamin, he fortified the "city of David," the stronghold of Zion, and garrisoned it with his Gibborim. His next aim was to make Jerusalem the religious as well as the political centre of the kingdom. The ark of Jehovah, the only sanctuary of national significance, had remained in obscurity since its return from the Philistines in the early youth of Samuel. David brought it up from Kirjath-Jearim with great pomp, and pitched a tent for it in Zion, amidst national rejoicings. No action of David's life displayed truer political insight than this. (See Ark.) But the whole narrative (2 Sam. vi.) shows that the insight was that of a loyal and God-fearing heart, which knew that the true principle of Israel's unity and strength lay in national adherence to Jehovah (comp. Pss. xv and xxiv., one or both of which may refer to this

[1] 1 Sam. xxiii. 12, 19, Psalm vii., 1 Chron. xii. 17. 1 Sam. xxvi. 1 seems to refer to the same event as ch. xxiii. 19.

[2] We have seen that this act of generosity either was repeated or is twice recorded, 1 Sam. xxiv. and xxvi. Neither narrative suggests the existence of the other, and the two are not more divergent than the two forms of the story of Goliath. But it is hard to comprehend how Ewald can give the preference to ch. xxiv. The *tour-de-force* by which he changes Saul's cruse of water into a basin, and adduces legendary parallels, ignores obvious features of truthfulness in ch. xxvi. Compare Thomson's *Land and Book*, p. 367. The conversation in ch. xxvi. is full of antique and characteristic ideas wanting in ch. xxiv. That David is recognized by his voice is meaningless in xxiv. 16 (comp. ver. 8), but appropriate in xxvi. 17.

[3] 1 Sam. xxvii. 7–12, must be compared with ch. xxx. 14, 16. The Cherethites whom the Amalekites attacked were Philistines. It must not therefore be supposed, as ch. xxvii. might seem to imply, that David systematically attacked populations friendly to Achish, and then pretended that he had been making forays against Judah. Such a policy could not have been long kept secret, and as it is pretty plain that the Philistines acquiesced in David's sovereignty in Hebron, it is not easy to see that they ever had an interest in embroiling him with the men of Judah. They coveted the richer lands of northern Canaan (1 Sam. xxxi. 7), and it would be their wise policy to detach Judah from Israel. The details of the text and meaning of 1 Sam. xxvii. 7–12 are very obscure.

occasion). It was probably at a later period, when his kingdom was firmly established, that David proposed to erect a permanent temple to Jehovah. The prophet Nathan commanded the execution of this plan to be delayed for a generation; but David received at the same time a prophetic assurance that his house and kingdom should be established for ever before Jehovah.

In civil and military affairs David was careful to combine necessary innovations with a due regard for the old habits and feelings of the people, which he thoroughly understood and turned to good account. The 600 Gibborim, and a small body-guard of foreign troops from Philistia (the Cherethites and Pelethites), formed a central military organization, not large enough to excite popular jealousy, but sufficient to provide officers and furnish an example of discipline and endurance to the old national militia, exclusively composed of foot-soldiers.[1] In civil matters the king looked heedfully to the execution of justice (2 Sam. viii. 15), and was always accessible to the people (2 Sam. xiv. 4). But he does not appear to have made any change in the old local administration of justice, or to have appointed a central tribunal (2 Sam. xv. 2, where, however, Absalom's complaint that the king was inaccessible is merely factious). A few great officers of state were appointed at the court of Jerusalem (2 Sam. viii.), which was not without a splendour hitherto unknown in Israel. The palace was built by Tyrian artists. Royal pensioners, of whom Jonathan's son Mephibosheth was one, were gathered round a princely table. The art of music was not neglected (2 Sam. xix. 35). A more dangerous piece of magnificence was the harem, which, though always deemed an indispensable part of Eastern state, did not befit a servant of Jehovah, and gave rise to public scandal as well as to fatal disorders in the king's household. Except in this particular, David seems to have ventured on only one dangerous innovation, which was undertaken amidst universal remonstrances, and was checked by the rebukes of the prophet Gad and the visitation of a pestilence. To us the proposal to number the people seems innocent or laudable. But David's conscience accepted the prophetic rebuke, and he tacitly admitted that the people were not wrong in condemning his design as an attempt upon their liberties, and an act of presumptuous self-confidence (2 Sam. xxiv.).

2. David's wars were always successful, and, so far as we can judge from the brief record, were never provoked by himself. His first enemies were the Philistines, who rose in arms as soon as he became king of all Israel. We read of two great battles in the valley of Rephaim, westward from Jerusalem (2 Sam. v.); and a record of individual exploits and of personal dangers run by David is preserved in 2 Sam. xxi. and xxiii. At length the Philistines were entirely humbled, and the "bridle" of sovereignty was wrested from their hands (chap. viii. 1, Heb.) But the long weakness of Israel had exposed the nation to wrongs from their neighbours on every side; and the Tyrians, whose commerce was benefitted by a stable government in Canaan, were the only permanent allies of David. Moab, an ancient and bitter foe, was chastised by David with a severity for which no cause is assigned, but which may pass for a gentle reprisal if the Moabites of that day were not more humane than their descendants in the days of King Mesha[2]. A deadly conflict with the Ammonites was provoked by a gross insult to friendly ambassadors of Israel; and this war, of which we have pretty full details in 2 Sam. x. 1–xi. 1, xii. 26–31, assumed dimensions of unusual magnitude when the Ammonites procured the aid of their Aramean neighbours, and especially of Hadadezer, whose kingdom of Zoba seems to have held at that time a pre-eminence in Syria at least equal to that which was afterwards gained by Damascus. The defeat of Hadadezer in two great campaigns brought in the voluntary or forced submission of all the lesser kingdoms of Syria as far as the Orontes and the Euphrates.[3] The glory of this victory was increased by the simultaneous subjugation of Edom in a war conducted by Joab with characteristic severity. After a great battle on the shores of the Dead Sea the struggle was continued for six months. The Edomites contested every inch of ground, and all who bore arms perished (2 Sam. viii. 13; 1 Kings xi. 15–17; Ps. lx., title). The war with Ammon was not ended till the following year, when the fall of Rabbah crowned David's warlike exploits. But the true culminating point of his glory was his return from the great Syrian campaign, laden with treasures to enrich the sanctuary; and it is at this time that we may suppose him to have sung the great song of triumph preserved in 2 Sam. xxii. (Ps. xviii.). Before the fall of Rabbah this glory was clouded with the shame of Bathsheba, and the blood of Uriah.

3. As the birth of Solomon cannot have been earlier than the capture of Rabbah, it appears that David's wars were ended within the first half of his reign at Jerusalem, and the tributary nations do not seem to have attempted any revolt while he and Joab lived (comp. 1 Kings xi. 14–25). But when the nation was no longer knit together by the fear of danger from without, the internal difficulties of the new kingdom became more manifest. The inveterate jealousies of Judah and Israel reappeared; and, as has been already mentioned, the men of Judah were the chief malcontents. In this respect, and presumably not in this alone, David suffered for the very excellence of his impartial rule. In truth all innovations are dangerous to an Eastern sovereign, and all Eastern revolutions are conservative. On the other hand David continued to tolerate some ancient usages inconsistent with the interests of internal harmony. The practice of blood-revenge was not put down, and by allowing the Gibeonites to enforce it against the house of Saul, the king involved himself in a feud with the Benjamites (comp. 2 Sam. xxi. with chap. xvi. 8, which refers to a *later* date). Yet he might have braved all these dangers, but for the disorders of his own family, and his deep fall in the matter of Bathsheba, from which the prophet Nathan rightly foresaw fatal consequences, not to be averted even when divine forgiveness accepted the sincere contrition of the king. That the nation at large was not very sensitive to the moral enormities which flow from the system of the harem is clear from 2 Sam. xvi. 21. But the kingdom of David was strong by rising above the level of ordinary Oriental monarchy, and expressing the ideal of a rule after Jehovah's own heart (1 Sam. xiii. 14), and in the spirit of the highest teaching of the prophets. This ideal, shattered by a single grievous fall, could be restored by no repentance. Within the royal family the continued influence of Bathsheba added a new element to the jealousies of the harem. David's sons were estranged from one another, and acquired all the vices of Oriental princes. The severe impartiality of the sacred historian has concealed no feature in this dark picture,—the brutal passion of Amnon, the shameless council of the wily Jonadab, the black scowl that rested on the face of Absalom through two long years of meditated revenge,[4] the panic of the court when the

[1] For the manner in which this national force was called out compare 1 Chron. xxvii.

[2] David destroyed two-thirds of the Moabites—presumably of their fighting men (2 Sam. viii. 2). Mesha destroys every inhabitant of cities captured in honour of his god Chemosh.

[3] Hadadezer is also mentioned in 2 Sam. viii. in the general summary of David's wars, but we can hardly suppose that a different Syrian war is here meant.

[4] We owe this graphic touch to Ewald's brilliant interpretation of an obscure word in 2 Sam. xiii. 32.

blow was struck and Amnon was assassinated in the midst of his brethren. Three years of exile and two of further disgrace estranged the heart of Absalom from his father. His personal advantages and the princely lineage of his mother gave him a pre-eminence among the king's sons, to which he added emphasis by the splendour of his retinue, while he studiously courted personal popularity by a pretended interest in the administration of kingly justice. Thus ingratiated with the mass he raised the standard of revolt in Hebron, with the malcontent Judeans as his first supporters, and the crafty Ahithophel, a man of southern Judah, as his chief adviser. Arrangements had been made for the simultaneous proclamation of Absalom in all parts of the land. The surprise was complete, and David was compelled to evacuate Jerusalem, where he might have been crushed before he had time to rally his faithful subjects. Ahithophel knew better than any one how artificial and unsubstantial was the enthusiasm for Absalom. He hoped to strike David before there was time for second thoughts; and when Absalom rejected this plan, and acted on the assumption that he could count on the whole nation, he despaired of success and put an end to his own life. David in fact was warmly received by the Gileadites, and the first battle destroyed the party of Absalom, who was himself captured and slain by Joab. Then all the people except the Judeans saw that they had been befooled; but the latter were not conciliated without a virtual admission of that prerogative of kinship to the king which David's previous policy had steadily ignored. This concession involved important consequences. The precedence claimed by Judah was challenged by the northern tribes even on the day of David's solemn return to his capital, and a rupture ensued, which but for the energy of Joab, might have led to a second and more dangerous rebellion. The remaining years of David's life appear to have been untroubled, and according to the narrative of Chronicles the king was much occupied with schemes concerning the future temple. He was already decrepit and bed-ridden under the fatigues of seventy years, when the last spark of his old energy was called forth to secure the succession of Solomon against the ambition of Adonijah. It is noteworthy that, as in the case of Absalom, the pretensions of the latter, though supported by Joab and Abiathar, found their chief stay among the men of Judah (1 Kings i. 9).

The principles that guided David's reign are worthily summed up in his last words, 2 Sam. xxiii. 1 *seq.*, with which must be compared his great song of triumph, 2 Sam. xxii. The foundation of national prosperity is a just rule based on the fear of Jehovah, strong in His help, and swift to chastise wrong-doers with inflexible severity. That the fear of Jehovah is viewed as receiving its chief practical expression in the maintenance of social righteousness is a necessary feature of the Old Testament faith, which regards the nation rather than the individual as the subject of the religious life. Hence the influence upon his life of David's religious convictions is not to be measured by the fact that they did not wholly subdue the sensuality which is the chief stain on his character, but rather by his habitual recognition of a generous standard of conduct, by the undoubted purity and lofty justice of an administration which was never stained by selfish considerations or motives of personal rancour,[1] and was never accused of favouring evil doers, and finally by the calm courage, rooted in faith in Jehovah's righteousness, which enabled him to hold an even and noble course in the face of dangers and treachery. That he was not able to reform at a stroke all ancient abuses appears particularly in relation to the practice of blood revenge; but even in this matter it is clear from 2 Sam. iii. 28, *seq.*, xiv. 1–10, that his sympathies were against the barbarous usage. Nor is it just to accuse him of cruelty in his treatment of enemies. Every nation has a right to secure its frontiers from hostile raids; and as it was impossible to establish a military cordon along the borders of Canaan, it was necessary absolutely to cripple the adjoining tribes. From the lust of conquest for its own sake David appears to have been wholly free.

The generous elevation of David's character is seen most clearly in those parts of his life where an inferior nature would have been most at fault,—in his conduct towards Saul, in the blameless reputation of himself and his band of outlaws in the wilderness of Judah, in his repentance under the rebuke of Nathan, and in his noble bearing on the revolt of Absalom, when calm faith in God and humble submission to His will appear in combination with masterly command over circumstances, and swift wisdom in resolution and action. His unfailing insight into character, and his power of winning men's hearts and touching their better impulses, appear in innumerable traits of the history (*e.g.*, 2 Sam. xiv. 18–20; iii. 31–37; xxiii. 15–17). His knowledge of men was the divination of a poet rather than the acquired wisdom of a statesman, and his capacity for rule stood in harmonious unity with the lyrical genius that was already proverbial in the time of Amos (Amos vi. 5). To the later generations David was pre-eminently the Psalmist. The Hebrew titles ascribe to him 73 psalms; the Septuagint adds some 15 more; and later opinion, both Jewish and Christian, claimed for him the authorship of the whole Psalter (so the Talmud, Augustine, and others). That the tradition of the titles requires careful sifting is no longer questionable, as is admitted in such cases as Pss. lxxxvi., lxix., cxli. even by the cautious and conservative Delitzsch. The biographer must therefore use the greatest circumspection in drawing from the Psalter material for the study of David's life and character. On the other hand, the tradition expressed in the titles could not have arisen unless David was really the father of Hebrew psalmody. As a psalmist he appears in 2 Sam. xxii. xxiii. in two poems, which are either Davidic or artificial compositions written in his name. If we consider the excellent information as to David which appears throughout the books of Samuel, the intrinsic merits and fresh naturalness of the poems, and the fact that Ps. xviii. is an independent recension of 2 Sam. xxii., the hypothesis that these pieces are spurious must appear very forced, though it has received the support of some respectable critics, especially of Kuenen,[2] who maintains that the religion of David is far below the level of the Psalter. If we reject this position, which can hardly be made good without doing great violence to the narrative of the books of Samuel, we cannot well stop short of the admission that the Psalter must contain Davidic psalms, some of which at least may be identified by judicious criticism, such as has been exercised by Ewald with singular insight and tact in his *Dichter des Alten Bundes.* Ewald claims for David Pss. iii., iv., vii., viii., xi., (xv.), xviii., xix., xxiv., xxix., xxxii., ci., and probably this list should rather be extended than curtailed. Compare Hitzig's *Psalmen*, Leipsic, 1863.

Literature.—The earliest notices of David in profane history are found in the fragments of Eupolemus preserved by Eusebius [Müller, *Fragm. Hist. Græc.* iii. 225; Freudenthal, *Alexander Polyhistor* (Breslau, 1875), p. 120 p. 225] and in Nicolaus of Damascus as quoted by Josephus, *Arch.* vii. 5. 2. [Müller l.c. iii. 373]. Josephus, *Arch.* vi. 8—vii. 15, has no sources independent of the Bible. Modern discussion of the life of David was stimulated in the first instance

[1] That Kuenen still follows Bayle in assigning revenge as the motive of David's charge to Solomon in 1 Kings ii. 5, 8, 9, can only be matter of surprise. A young and untried sovereign could not afford to continue the clemency which his father was strong enough to extend to dangerous enemies.

[2] Historisch-kritisch Onderzoek (Leiden, 1865), vol. iii. § 140.

by the unfavourable judgment passed on his character by Bayle, the English freethinkers, and Voltaire. Chandler's Life of David is mainly directed against Bayle (first edition 1766). The history of David is one of the best parts of Ewald's *Geschichte*. Stanley's picturesque narrative (*Lectures on the Jewish Church*, second series, 1865), and Dillmann's lucid article in Schenkel's *Bibel-Lexikon*, rest mainly on Ewald. Stahelins *Leben Davids* (Basel, 1866), is valuable for the numerous parallels adduced from Oriental history. Compare also Grätz's *Geschichte der Juden*, vol. i., Leipsic, 1874, and Hitzig's *Geschichte des Volkes Israel*, Leipsic, 1869. (W. R. S.)

DAVID (Welsh, DEWI), ST, the patron saint of Wales, flourished in the 6th century. Various dates have been assigned for his birth and death, the earliest being that of Geoffrey of Monmouth, who fixes his death in 542, and the latest that of the *Annales Cambriæ*, which fixes it in 601. Many writers follow Ussher in stating that he died in 544, aged eighty-two; but the latest authorities, Jones and Freeman (*History of St David's*) and Haddan and Stubbs (*Councils and Ecclesiastical Documents*), accept the date of the *Annales Cambriæ*. The narrative of St David's life is overlaid with legendary matter to an unusual extent, and it is impossible to determine accurately what is historical and what is fictitious. Such stories as that he possessed the power of working miracles, even before his birth, that he was eighteenth in descent from the Virgin Mary, and that he was attended by an angel in his infancy, may obviously be referred at once to the latter category; but there are many other details which, even though not obviously improbable, must be regarded as extremely doubtful. According to the account given by Rice Rees (*Welsh Saints*) as historical, St David was the son of Sandde or Xantus, prince of Ceretica (Cardiganshire), and was born at Hen-Menen or Menevia (now St David's). After spending a number of years at the college of a celebrated teacher Paulinus, he founded a college or monastery in the Vale of Rhos, near his native place, which was distinguished for the severity of its rule. His fame as a theologian led to his being summoned to the synod of Brefi to confute the Pelagian heretics. So well did he acquit himself of this task that the synod elected him archbishop of Caerleon and primate of Wales,—Dubricius, the occupant of the see, having resigned to make room for him. Soon after his election St David found it necessary to convene another synod, which is styled in the annals the Synod of Victory, so complete was the triumph obtained over the Pelagians. Somewhat later the primate obtained leave to transfer his seat from Caerleon to Menevia (St David's). He died at an advanced age, and was buried in the church of St David's. His shrine is to be seen in the existing cathedral. Recent criticism, while admitting that St David founded a see at Menevia, and that he probably took an active part in the undoubtedly historical synod of Brefi, has discredited his archiepiscopal jurisdiction. This is almost certainly the invention of those in a later age who wished to maintain the independence of the Welsh church, and supremacy in that church of the see of St David's. It was the view that naturally commended itself to the author of the earliest life of St David, Rythmark, or Ricemarchus, bishop of St David's in the 11th century, who wrote at a time when the independence of the Welsh church was seriously threatened. His narrative is followed in the main by Giraldus Cambrensis and later authorities. St David was canonized by Pope Calixtus II., in the 12th century. His festival is celebrated on the 1st March.

DAVID, FÉLICIEN CÉSAR (1810–1876), a French composer, was born at Cadenet, in the department of Vaucluse, March 8, 1810. As a child he exhibited proofs of unusual precocity, and at the age of four had made considerable progress in his musical studies. Being early left an orphan, and totally unprovided for, he obtained, through the influence of relatives, admission to the choir of Saint-Sauveur at Aix. Subsequently he entered into the employment of an attorney, but quitted his service to become successively *chef d'orchestre* in the theatre at Aix, and chapel master of the church in which he had formerly appeared as a humble chorister. He next proceeded to Paris, where he subsisted for some time on a pittance of 50 francs a month, afforded him by a rich but miserly uncle. After pursuing diligently a course of studies at the Conservatoire under Fétis, Reber, and others, he cast in his lot with the Saint-Simonians, and on the dispersion of that sect in 1833 accompanied several of the brethren on a fruitless expedition to the East. The immediate result of this tour was the publication, on his return to Paris, of the *Mélodies Orientales*, which met with little encouragement. Nine years after this, however, the musical world was suddenly startled by the production of the *Désert*, a work abounding in graceful melodies, and affording proof of an extensive acquaintance with orchestral effects. This ode-symphony, as it was called, rapidly gained for the composer a widespread reputation. It was, after some vexatious delays, first performed at the Conservatoire in 1844, and quickly found a hearing in every European capital. Enthusiasts were not slow to predict for David a brilliant career, but their hopes were scarcely realized. Nothing the composer afterwards wrote at all equalled the *Désert*. In the *Christophe Colomb* (1847) there are noble passages, and the comic opera of *Lalla Rookh* possesses numbers graced by a captivating delicacy of orchestration, but neither for these nor for his other principal works—*Moïse au Mont Sinaï* (1846), *La Perle du Brésil* (1851), and *Herculaneum* (1859)—can a place be claimed in the foremost ranks of composition. They were of sufficient merit, however, to gain for him the biennial prize of the emperor, which was awarded by the French Institute in 1868. In the following year he was appointed to the post of librarian at the Conservatoire, vacated by M. Berlioz, whom he afterwards succeeded as a member of the Institute. He died on the 29th of August 1876, aged sixty-six.

DAVID, JACQUES LOUIS (1748–1825), historical painter, was born in Paris in 1748. His father having been killed in a duel, a maternal uncle first placed him in the Collége des Quatre-Nations and afterwards in an architect's office. An accidental visit to the studio of his great-uncle, Boucher, led him to leave his adopted profession; and Boucher, observing the boy's distaste for his own erotic style, sent him to Vien, who, having succeeded to the directorship of the French Academy in Rome just at the time his pupil had taken the grand prize (1775), carried the youth with him to that city. At this time Winckelmann was writing, Raphael Mengs painting, and the taste for classic severity was a necessary reaction on what had gone before. This is shown by Carstens and the younger Germans very shortly after following a quite independent movement of the same nature. David's classicism was directly derived from the antique, and easily understood. The spirit of the day made the first picture, "Date Obolum Belisario," painted according to his new principles, a complete success, and this was followed by others more perfect—The Grief of Andromache, The Oath of the Horatii, The Death of Socrates, and The Rape of the Sabine Women, now in the Louvre. In the French drama an unimaginative imitation of ancient models had long prevailed; even in art Poussin and Le Sueur were successful by expressing a bias in the same direction; and in the first years of the revolutionary movement, the fashion of imitating the ancients even in dress and manners went to the most extravagant length. At this very time David returned to Paris; he was now painter to the king, Louis XVI., who had been the purchaser of his principal works. It is not possible to overestimate the popularity of the young painter, who was himself carried away by the flood of enthusiasm that made all the intellect of France believe in a new era of equality and emancipation from all the ills of life.

Sent to the Convention in September 1792, by the Section du Musée, he quickly distinguished himself by the defence of two French artists in Rome who had fallen into the merciless hands of the sbirri of the Inquisition; and as the behaviour of the authorities of the French Academy in Rome had been in obedience to old slavish ideas, he had the influence to get it suppressed. In January following his election into the Convention his vote was given for the king's death. Thus the man who was so greatly indebted to the Roman Academy and to Louis XVI. assisted resolutely in the destruction of both. This line of action was no doubt a kind of self-sacrifice to him; it was in obedience to a principle, like the dreadful act of Brutus condemning his sons,—a subject he painted with all his powers. Cato and Stoicism were the order of the day. Hitherto the actor had walked the stage in modern dress. Brutus had been applauded in red-heeled shoes and *culottes jarretées;* but Talma, advised by David, appeared in the toga and sandals before an enthusiastic audience. At this period of his life Mdlle. de Noailles thought to make a good impression upon him by insisting on his painting a sacred subject, with Jesus Christ as the hero. When the picture was done, the Saviour was found to be another Cato. "I told you so," he replied to the expostulations of the lady,—"there is no inspiration in Christianity now!" He accordingly developed the scheme of the *Fête à l'Etre Suprême,* and he remained the master of pageants for a long period, escaping the guillotine only by the regard paid to his character as an artist. When Napoleon destroyed the new-found liberty, and expunged the novel gospel, David succumbed to the military spirit and well-nigh worshipped him. His picture of Napoleon on horseback pointing the way to Italy is now in Berlin.

We have mentioned the principal classic subjects painted by David. They are hard and dry in execution, painted on a white ground with opaque but splendid colour, which has, however, really little charm. The other class of works which came from his easel was commemorative of the Revolution. When Lepelletier was assassinated in the Palais Royal, after the vote for the death of the king, David painted the subject, and the picture was exhibited in the Convention with much emotion. Marat Dead in the Bath is a work of a very impressive kind. The Oath in the Tennis Court is another very important production, both historically and in relation to the artist. His extensive commissions from the emperor are still objects of attraction at Versailles. On the return of the Bourbons our painter was exiled with the other remaining regicides, and retired to Brussels, where he recommenced his classic series by the Loves of Paris and Helen. Here he remained till his death, 29th December 1825, at the age of seventy-seven, having rejected the offer made through Baron Humboldt of the office of minister of fine arts at Berlin. His end was true to his whole career and to his nationality. While dying, a print of the Leonidas, one of his favourite subjects, was submitted to him. It was placed conveniently, and after vaguely looking at it a long time, "Il n'y a que moi qui pouvais concevoir la tête de Léonidas," he whispered, and died. His friends and his party thought to carry the body back to his beloved Paris for burial, but the Government of the day arrested the procession at the frontier, an act which caused some scandal, and furnished the occasion of a terrible song of Beranger's. Gros, Girodet, and Gérard were David's best pupils.

DAVID, Jean Pierre (1789–1856), usually called David d'Angers, a much-admired French sculptor, and, like David the painter, to whom he was in no other way related, a demonstrative partisan of advanced ideas in politics and religion, was born at Angers, 12th March 1789. His father was a sculptor, or rather a carver, but he had thrown aside the mallet and taken the musket, fighting against the Chouans of La Vendée. He returned to his trade at the end of the civil war, to find his customers gone, so that young David was born into poverty. As the boy grew up his father wished to force him into some more lucrative and certain way of life. At last he succeeded in surmounting the opposition to his becoming a sculptor, and in his eighteenth year left for Paris to study the art upon a fund of eleven francs. As far as we know his works, the genius on which he relied was not very great; but after struggling against want for a year and a half, he succeeded in taking the prize at the Ecole des Beaux Arts. Energy and perseverance stood in the place of natural ability, and now fortune aided him in the shape of an annuity of 600 francs (£24), granted by the municipality of his native town, by the name of which he was proud to be called ever after. This was in 1809, and in 1811 his Epaminondas gained the prize of Rome, where he spent five years, rather too much impressed by the works of Canova.

Returning from Rome about the time of the restoration of the Bourbons, he would not remain in the neighbourhood of the Tuileries, swarming with foreign conquerors and returned royalists; he found his way to London, having made several English acquaintances in Rome. Here, if we are to believe the statement in his biography, he was offered the commission to erect a monument commemorative of Waterloo,—more probably he received an invitation to offer a design for some such work, which he might misunderstand from his ignorance of English. At the same time his resources were exhausted; and Flaxman and others visited upon him the sins of David the painter, to whom he was supposed to be related. With great difficulty he made his way to Paris again, where a comparatively prosperous career opened upon him. His medallions and busts were in much request, and monumental works also came to him. One of the best of these was that of Gutenberg at Strasburg; but those he himself valued most were the statue of Barra, a drummer boy who fell in the war in La Vendée, who continued to beat his drum till the moment of death, and the monument to the Greek liberator Bozzaris. This was a young female figure he called "Reviving Greece," of which his friend Victor Hugo says rather absurdly, "It is difficult to see anything more beautiful in the world: this statue joins the grandeur of Phidias to the expressive manner of Puget." His busts and medallions were very numerous, and among his sitters may be found not only the illustrious men and women of France, but many others both of England and Germany—countries which he visited professionally in 1827 and 1829. His medallions, it is affirmed, number 500. He died on the 4th of January 1856.

David d'Angers was respected for his consistency and benevolence. As an example of the latter may be mentioned his rushing off to the sickbed of Rouget de Lille, the author of the *Marseillaise Hymn,* modelling and carving him in marble without delay, making a lottery of the work, and possibly saving the poet's life by sending him the proceeds, £72, when in the extremity of need.

DAVID HA-COHEN, a learned Rabbin, was born at Lara, in Spain, about the beginning of the 17th century, and died at Hamburg in 1674. He was chief of the synagogue at Amsterdam, and he afterwards held the same office at Hamburg. From this he was deposed on a suspicion of an intention to become a Christian, which seems to have been unfounded. It probably originated in the fact that he held more liberal sentiments than those which prevailed in the Jewish community of his time. David was the author of several works of value in the department of rabbinical literature. The most important is the *Corona Sacerdotum* (Hamburg, 1667), a Talmudic and rabbinical dictionary, which was printed only as far as the letter *Yod*, though the author carried on the work to the letter *Resh* after forty years' labour. A small portion of the dictionary was printed at Amsterdam in 1648 as a specimen, with the title *Civitas David*.

DAVIDISTS, a name borne by two distinct sects in the history of the Christian church. 1. It is sometimes applied to the followers of David of Dinant, whose work entitled *Quaternarii* was condemned at the Synod of Paris in 1209. The works of Amalric of Bena were condemned at the same synod, but this is scarcely a sufficient ground for classing David of Dinant among his followers. Our information as to the views of the latter is derived from the *Summa* of Albertus Magnus and the *Summa* of Thomas Aquinas. He founded upon the Platonists and the Arabian philosophers his fundamental doctrine that the Deity alone has any real existence, being the *materia prima* of all things. 2. The name Davidists, or David-Georgians, is more commonly applied to the followers of David George, or Joris, who was born at Delft in 1501. In 1530 he was punished by whipping, the boring of his tongue, and imprisonment for obstructing a Catholic procession in his native town. In 1534 he joined the Anabaptists, but soon afterwards he founded a sect of his own. In 1542 he published his *Book of Wonders*, containing an account of visions and revelations he professed to have had. Two years later he settled down as a merchant at Basel, where he lived in prosperity for twelve years under the assumed name of Johann von Brügge. After his death his son-in-law, offended probably at the disposition he made of his property, instituted a process of heresy against him; and his body was exhumed and burnt by order of the senate of Basel. The Davidists, under the leadership of Henry Nicolas, afterwards became known in Holland and England as the Familists. They interpreted the whole of Scripture allegorically, and maintained that as Moses had taught hope, and Christ had taught faith, it was their mission to teach love. The service of love was the highest and best of the dispensations. The result was an extreme Antinomianism in practice, which attracted the notice of the civil authorities in both countries. The sect was suppressed or absorbed in other sects early in the 17th century.

DAVIES, Sir John (1569–1626), philosophical poet of the age of Elizabeth, was baptized on the 16th of April 1569, at Tisbury, in Wiltshire, where his parents lived in the manor-house of Chicksgrove. He was sent first to Winchester College, and afterwards to New College, Oxford. In 1585 he became a commoner of Queen's College, Oxford, and in 1587 entered at the Middle Temple. Bereft of both his parents at a very early age, he seems to have plunged into all the dissipations that London could offer in those days to a rich young man of fashion. It is amusing to find the future attorney-general of Ireland, and grave Christian poet, connected, beyond all concealment, with one of the worst literary scandals of the period. One would be very glad to know what circumstances led to the publication of the notorious and now excessively rare little volume that bears the title *All Ovid's Elegies, 3 Bookes, by C. M. Epigrams by J. D. At Middleburgh*, in which Marlowe had a share, and which was condemned by the archbishop to be burned. The *Epigrams* are far from edifying or promising, and we may, in the absence of a date, be permitted to put the earliest possible, 1592 or 1593, on their unseemly boisterousness. In 1593 was ready for the printer, though not, it would seem, published till 1596, a far more worthy work, the charming and singular fragment called *Orchestra*, a little epic written in praise of dancing, in fifteen consecutive days. The poet seeks to prove that every harmonious movement of nature, every action of the elements, every motion in the firmament, is a conscious and well-ordered dance; also that plants in growing, men in all their familiar and noble exercises, the angels themselves, and all the mysterious translunary world effect a solemn dancing in their motion. *Orchestra* was dedicated to the author's "very friend," Master Richard Martin, a riotous youth whom, in the winter of 1597, Davies, the friends having quarrelled, attacked with a cudgel in the hall of the Middle Temple. For this offence he was expelled and degraded. Rusticating at Oxford, he spent the first year after his expulsion in the composition of his great philosophical poem, *Nosce Teipsum*, which appeared in 1599. It is on this work that his fame mainly rests. The style was entirely novel in that age; and its force, eloquence, and ingenuity, no less than the modern and polished tone of the periods, made it at once extremely popular. It was to its own age all that Pope's *Essay on Man* was to the Georgian period. In the same year, 1599, there saw the light a little book of exquisite lyrics from the same hand, *Hymns to Astræa*, twenty-six acrostics on the words *Elisabetha Regina*, which all warble with the most delightful sweetness. In 1601 Davies was restored to his position at the bar, without loss of seniority. About the same time he sat in Elizabeth's last Parliament, as member for Corfe Castle. At Elizabeth's death he was instantly received with great favour by James I., and sent to Ireland as solicitor-general in 1603. On December 18 of that year he was knighted at Dublin. From this time forth he abandoned poetry in favour of the most active statesmanship. His activities in Ireland were almost ubiquitous. In 1606 he was further promoted to be attorney-general for Ireland, and created sergeant-at-arms. In the disordered condition of the country he was required to be stirring at all times, and his abilities seem to have been as conspicuous as his trustworthiness and uprightness. He married Eleanor, daughter of the earl of Castlehaven, but she unfortunately became insane. In 1612 Davies published his valuable prose work, *A Discourse of the True Reasons why Ireland has never been entirely subdued*. The same year he represented the county of Fermanagh in the Irish Parliament, and was elected speaker. In 1614 he represented Newcastle-under-Lyne in the English Parliament, and in 1619 he threw up his appointments in Ireland. In 1622 he issued a collected edition of his poetical works. In 1626 Davies was appointed lord chief justice of England, but ere he could enter on the office, he was found dead in his bed (December 8), the victim, it was supposed, of apoplexy.

The prose writings of this remarkable man were mainly posthumous, and no attempt was made to collect them, until they were republished in four volumes by the Rev. A. B. Grosart, in 1876, with a full and interesting biography. The poetical works have often been reproduced since the author's lifetime.

Sir John Davies is not to be confounded with John Davies of Hereford, a contemporary author of a great quantity of verse, of which *The Holy Roode* (1609), *The Scourge of Folly* (1611), and *The Muses' Sacrifice* (1612) are fair typical examples. Gifted with extraordinary volubility and self-confidence, but with no delicacy or taste, the writings of this John Davies have survived more by reason of their bulk and their accidental interest of reference or dedication than from any intrinsic merit.

DAVILA, Henrico Caterino (1576–1631), historian, was descended from a Spanish noble family. His immediate ancestors had been constables of the kingdom of Cyprus for the Venetian republic, from father to son, since 1464. But in 1570 the island was taken by the Turks; and Antonio Davila, the father of the historian, had to leave it, despoiled of all he possessed. He travelled into Spain and France, and finally returned to Padua, where, in 1756. his youngest son was born, whom he named

Henrico Caterino, in gratitude for the kindness received from Catherine de' Medici at the French court. At the age of seven the father took this son to France, where he became a page in the service of Catherine. In due time he entered the service, and fought through the civil wars till the peace in 1598. He then returned to Padua, where, and subsequently at Parma, he led a studious life, till on the breaking out of war he entered the military service of the republic of Venice, in which he served with distinction. But during the whole of this active life—many details of which are very interesting as illustrative of the life and manners of the time,—he never lost sight of a design which he had formed at a very early period, of writing the history of those civil wars in France, in which he had borne a part, and had so many opportunities of closely observing the leading personages and events. The manuscript of this work was completed in, or a little previous to, 1630, and was offered in vain by the author to all the publishers in Venice, and this city was then a great publishing centre. At last one Tommaso Baglioni, who had no work for his presses, undertook to print the manuscript, on condition that he should be free to leave off if more promising work offered itself. The printing of the *Istoria delle Guerre Civile di Francia*, was, however, completed, and the success and sale of the work were immediate and enormous. Many other editions rapidly followed, of which perhaps the best altogether is that of Milan, in 6 vols 8vo, 1807. Davila was murdered, while on his way to take possession of the government of Crema for Venice in July 1631, by a ruffian, with whom some dispute seems to have arisen as to the furnishing of the relays of horses ordered for his use by the Venetian Government.

The *Istoria* was translated into French by J. Baudoin, Paris, 1642; into Spanish by Varen de Soto, Madrid, 1651, and Antwerp, 1686; twice into English by W. Aylesbury, London, 1647, and by Charles Cotterel, London, 1666, and into Latin by Pietro Francesco Cornazzano, Rome, 1745. The best account of the life of Davila is that by Apostolo Zeno, prefixed to an edition of the history printed at Venice in 2 vols. fol. in 1733. Tiraboschi may also be consulted with advantage. Bayle is severe on certain historical inaccuracies of Davila. And it is true that Davila must be read with due remembrance of the fact that he was not only a Catholic but the especial protegé of Catherine de' Medici. Also it is not to be forgotten that Bayle was as strongly Protestant. As to the literary merits of Davila, his lucidity, purity of style, abundance of information, there has never been, and never can be, any difference of opinion.

DAVIS, John, a celebrated English navigator of the 16th century. The date of his birth is unknown; the place was Sandridge, about 3 miles N. of Dartmouth, in Devonshire. He made three voyages under the auspices of the English Government in search of the north-west passage to the Pacific. In the first, in 1585, he pushed his way round the southern end of Greenland, across the strait that now bears his name, and along the coast of what is now known as Baffin's Land, to the Cape of God's Mercy, which he thus designated in the fond belief that his task was practically accomplished; in the second (1586) he made but little further progress; in the third (1587) he reached the entrance to the strait afterwards explored by Hudson. Four years later he joined Cavendish in his second voyage to the South Sea; and after the rest of the expedition returned unsuccessful, he continued to attempt on his own account the passage of the Strait of Magellan; he was defeated, but became the discoverer of the Falkland Islands. The passage home was extremely disastrous, and he brought back only 16 of the 76 men whom he had taken with him. In 1598 he took a merchant fleet from Middelburg in Holland to the East Indies; in 1601 he accompanied Sir James Lancaster as first pilot on his voyage in the service of the East India Company: and in 1605 he sailed again for the same destination along with Michelbourn. On his way home he was killed by pirates off the coast of Malacca.

A Traverse Book made by John Davis in 1587, an *Account of his Second Voyage in* 1586, and a *Report of Master John Davis of his three voyages made for the Discoverie of the North West Passage* were printed in Hakluyt's collection. Davis himself published *The Worlde's Hydrographical Description, whereby it appears that there is a short and speedie Passage into the South Seas, to China, &c., by Northerly Navigation*, London, 1595, and *The Seaman's Secrets, divided into two Parts*, London, 1595.

DAVY, Sir Humphry (1778–1829), the eminent natural philosopher, was born on the 17th of December 1778, at Penzance, in Cornwall. After receiving there the rudiments of his education, he was in 1792 sent for a year to the grammar school of Truro, then under the direction of the Rev. Dr Cardew. There is little to record of Davy in early life except his retentive memory, facility in versification, and skill in story-telling. At the age of nine he went to live with Mr John Tonkin, who had formerly adopted Davy's mother and her sisters. In 1794 Davy lost his father, and in the following year he was apprenticed to Mr Borlase, then a surgeon-apothecary, and afterwards a physician in Penzance. During his apprenticeship he spent much of his leisure in a systematic course of self-education. While yet young he had exhibited an inclination for devising experiments, and for examining natural products. At the end of 1797, when in his nineteenth year, he turned his attention to chemistry, and read Lavoisier's and Nicholson's treatises on that subject. His experiments were conducted in the garret of his friend Mr Tonkin, who, alarmed by unexpected explosions would exclaim, "This boy Humphry is incorrigible!"—"Was there ever so idle a dog!"—"He will blow us all into the air!" One of his investigations at this time was the nature of the air contained in the vesicles of sea-weed. To supply the place of an air-pump in his experiments he had an old French injecting syringe, and this he actually employed in his first scientific paper "On the Nature of Heat and Light," published in 1799. Though Davy's natural talents would not have permitted him to remain long in obscurity, he was in some degree indebted for an early emergence into publicity to the accidental notice of Mr Davies Giddy Gilbert, who, learning that the strange-looking boy, whom he observed hanging over the hatch of Mr Borlase's house, was a son of Davy the carver, and fond of making chemical experiments, sought his acquaintance, and was ever afterwards his steady friend. Another early friend of Davy's was Mr Gregory Watt, who, having visited Penzance in 1797 for change of air, took lodgings at the house of Mrs Davy. By him and Gilbert he was introduced to the notice of Dr Beddoes, who in the autumn of 1798 engaged him to superintend a pneumatic medical institution, which he had just established at Bristol. Davy was now placed in a sphere where his genius could expand; he was associated with men of education and scientific attainments, and was provided with excellent apparatus; thus he speedily entered upon that career of discovery which has rendered his name illustrious. He had intended, after the termination of his engagement with Dr Beddoes, to study medicine at Edinburgh, but the all-engrossing interest of his chemical discoveries caused him eventually to abandon this scheme.

In an essay "On Heat, Light, and Respiration," written before he left Cornwall, but published soon after his removal to Bristol, in Beddoes's *West Country Contributions*, Davy endeavoured to prove the immateriality of heat, by showing its generation through the friction of two pieces of ice under an exhausted receiver. His first scientific discovery was that of the existence of silica in the epidermis of the stems of reeds, corn, and grasses. The intoxicating effects of nitrous oxide when respired were discovered by him on April 9, 1799; and in the following year he published a volume entitled *Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide and its Respiration.* Whilst the impression created by this publication was still fresh on the public mind, Davy was recommended to Count Rumford by Mr Underwood and Dr Hope as a suitable person to succeed Dr Garnet as lecturer on chemistry at the Royal Institution recently established in London; and accordingly, on February 16, 1801, he was chosen assistant lecturer to the Institution, and director of the laboratory; his appointment to the lectureship took place six weeks later. A minute on the records of the Royal Institution shows that he was appointed professor of chemistry on the 31st of May 1802.

The ungainly exterior and peculiar manner of Davy on his first appearance in London prejudiced Rumford and others against him; when, however, he began to lecture, he won the approbation of all. His ingenuity and happy facility of illustration gained him a high reputation; his company was courted by the choicest society of the metropolis; and soon his presence was regarded as indispensable in the soirées of the fashionable world. His style of lecturing was well adapted to command attention—it was animated, clear, and impressive, notwithstanding the naturally inharmonious tones of his voice; his experiments, moreover, were both ingeniously conceived and neatly executed. The young chemist was fortunate in the time in which he commenced his metropolitan career. Experimental chemistry was beginning to be the fashion of the day; and the discovery of the decomposition of chemical substances by voltaic electricity had excited the greatest interest amongst the votaries of science. The liberality of the committee of the Royal Institution supplied to Davy what few private individuals could afford—a battery of 400 five-inch plates, and one of 40 plates a foot in diameter. With these were conducted the brilliant investigations which resulted in his discovery of potassium and sodium.

The earliest of Davy's communications to the Royal Society, and the first of his contributions to electro-chemistry, was "An Account of some Galvanic Combinations formed by an arrangement of *single* Metallic Plates and Fluids," read in June 1801. In all hitherto constructed piles, plates of two metals, or one plate of metal and another of charcoal, and some interposed fluid had been employed. Davy showed in this paper that a battery might be constructed of a single metal and two fluids, provided one of the fluids was capable of causing oxidation on one of the surfaces of the metal. In addition to the duties of his situation in the Royal Institution, to which those of joint editor of the *Journal* had been added, Davy for ten successive years gave courses of lectures for the Board of Agriculture on the connection between agriculture and chemistry. In 1803 he was admitted a member of the Royal Society, of which he, in January 1807, became the secretary. The most valuable of all his scientific writings are his communications to the Royal Society, scarcely one of which does not announce some new and important fact, or elucidate some principle of experimental philosophy. In February 1803 he read to the society an essay "On Astringent Vegetables, and their Operation in Tanning;" and in 1805 "An Account of some Analytic Experiments on Wavellite," and a paper "On the Method of Analyzing Stones containing a Fixed Alkali, by Boracic Acid." This method is founded on the strong affinity of that acid for different substances at a high temperature, and on the ease with which borates are decomposed by mineral acids.

In his first Bakerian lecture, delivered to the Royal Society in November 1806, Davy showed that electro-chemical phenomena were explicable by one general law, and illustrated his theory of voltaic action by numerous happily-devised experiments. After pointing out that in all voltaic decompositions acids appeared at the positive and bases at the negative pole, he generalized his results by stating that hydrogen, the alkalies, earths, metals, and certain oxides are attracted by negatively electrified and repelled by positively electrified metallic surfaces, and that oxygen and acids are attracted by positively and repelled by negatively electrified metallic surfaces. He then proceeded to investigate the law of electro-chemical action, and concluded that electro-chemical combinations and decompositions are referable to the law of electric attractions and repulsions, and that both "chemical and electrical attractions are produced by the same cause, acting in the one case on the particles, in the other on the masses." For these researches the French Institute awarded him the prize of 3000 francs offered by the first consul for the experiment most conducive to the progress of science. Davy's discovery of the production of potassium and sodium by the electrical decomposition of their alkalies was made in October 1807, and an account of the new metals was given to the Royal Society on the 19th of November in the second Bakerian lecture. On the 23d of that month a severe fever attacked him, and he was unable to resume his professorial duties at the Royal Institution till March 12, 1808. In the meanwhile barium and calcium, the existence of which had been predicted by Davy, were discovered by Berzelius and Pontin. In 1808 Davy announced to the Royal Society his discovery of magnesium and strontium. Alumina, silica, and zirconia he was unable to decompose, but he showed it to be highly probable that they contained metallic bases. Various opinions as to the nature of the new metals of the alkalies and alkaline earths were at first entertained, some chemists considering them to be compounds of hydrogen with unknown bases. In the third Bakerian lecture, read in December 1808, and its appendix of next spring, Davy adduced conclusive evidence of the elementary nature of potassium; he discussed also the nature of sulphur, phosphorus, and carbon, and described the preparation of boron, which he then regarded as a metal. The original galvanic batteries used by Davy having become unserviceable through wear, a liberal voluntary subscription among the members of the Royal Institution, in July 1808, put him in possession of a battery of 2000 double plates, with a surface equal to 128,000 square inches. His electro-chemical discoveries had, however, all been made before this new power was provided. The fourth Bakerian lecture, read in November 1809, brings forward proofs that oxymuriatic acid, contrary to Davy's previous supposition, is a simple body, termed by him chlorine (see vol. v. p. 678), and that muriatic acid is a compound of that element and hydrogen.

Davy's reputation had now reached its zenith; and his audience in the theatre of the Royal Institution numbered little less than 1000. At the invitation of the Dublin Society he gave, in November 1810, a course of lectures on electro-chemical science, and, in the following year other courses on the elements of chemical philosophy and on geology. For the first of these he received £525, and for the two latter £750; and before he left Dublin, Trinity College conferred upon him the degree of LL.D. On the 8th April 1812 Davy was knighted by the Prince Regent; on the next day he gave his farewell lecture at the Royal Institution; and on the 11th he married Mrs Appreece, daughter and heiress of Charles Kerr of Kelso, with whom he had a considerable fortune. His usual employments were in great measure suspended during the winter of 1812 in consequence of an injury to an eye, resulting from an explosion of chloride of nitrogen, which he had begun to experiment upon after receiving intelligence of its discovery by Dulong. The first and, as it proved, the only volume of Davy's *Elements of Chemical Philosophy* appeared in 1812; and in 1813 he published his *Elements of Agricultural Chemistry*, the substance of his lectures delivered to the Board of Agriculture.

Having obtained from the French emperor permission to travel in France, Davy, on October 13, 1813, went thither with his wife and Faraday, the latter in the capacity of "assistant in experiments and writing." Faraday had been engaged on the 1st of March previous to help Davy in the laboratory of the Royal Institution. On the 29th of October, after a detention of six or seven days at Morlaix, Davy arrived in Paris, where he stayed two months, and began the course of investigations on iodine which enabled him to prove its elementary character. This body had hitherto been regarded as a compound by the French chemists. On the 13th of December Davy was elected a corresponding member of the first class of the Imperial Institute at Paris. From Paris he proceeded, in the end of December, to Montpellier, and thence to Italy. At Genoa and Florence he continued his experiments on iodine; and at the latter place he effected the combustion of the diamond by means of the great lens in the cabinet of natural history, and discovered that, when once ignited, it will continue to burn in pure oxygen. He next proceeded by Rome to Naples, where he collected specimens of the colours used by the ancients in their pictures, which formed the subject of a memoir presented to the Royal Society. After spending the winter in Italy, he returned to London on April 23, 1815.

The year 1815 is memorable in the history of Davy, as that in which he turned his attention to the frequent occurrence of accidents from explosions of fire-damp in coal-mines. At his request specimens of the gas were sent from Newcastle to London for him to examine. He ascertained that it would not explode when mixed with less than six or more than fourteen times its volume of air, with one-seventh its volume of carbonic acid gas, or with one-sixth its volume of nitrogen; that in tubes one-seventh of an inch in diameter explosive mixtures of air and fire-damp could not be fired; and that metallic tubes prevented explosions better than glass tubes. On November 9, 1815, Davy made known to the Royal Society these results of his experiments; and before the close of the year he had completed the invention of what has since been known as the Davy safety-lamp (see p. 72 of the present volume). In this a cage of wire-gauze, by its cooling action, prevents the flame from igniting an explosive atmosphere exterior to the lamp, even though the flame reach as far as the gauze. Of this invaluable aid to the miner the coal-owners of Newcastle and its vicinity were not slow in availing themselves; and on the 11th of October 1817 they testified their appreciation of the boon disinterestedly conferred upon them by Davy, who had taken out no patent for his invention, by presenting him with a suitably inscribed service of plate. In the succeeding year Davy was created a baronet. For his various communications to the Royal Society on the subject of fire-damp, and on the nature of flame, in 1815, 1816, and 1817, he received the Rumford medals.

In 1818 and 1819 he produced four memoirs, "On the Fallacy of the Experiments in which Water is said to have been produced by the Decomposition of Chlorine," "On some Combinations of Phosphorus," "Observations on the Formation of Mists over Lakes and Rivers," and "On Electro-Magnetism." In 1818 he was sent by the British Government to examine the papyri of Herculaneum in the Neapolitan Museum, his remarks on which are contained in a paper in the *Philosophical Transactions* for 1821. In 1820 Davy returned to England, and on the death of Sir Joseph Banks, in that year, he was elected president of the Royal Society; in this position, however, it cannot be said that he always appeared to advantage, or on every occasion acted in a manner calculated to render himself popular amongst the members. In 1821 he busied himself with electrical experiments, and in 1822 with the investigation of the fluids contained in the cavities of crystals in rocks. In 1823 he read before the Royal Society a paper "On the Application of Liquids formed by the Condensation of Gases as Mechanical Agents." In the same year he investigated the cause of the rapid destruction of the copper sheathing of sea-going ships. It occurred to him that, as sea-water acts only on positively electrified copper, the sheathing would be protected if he could render it slightly negative. He found that plates of copper having portions of iron or zinc attached remained unchanged after prolonged immersion in sea-water. In consequence of this discovery directions were given by the Government, after some preliminary experiments, to apply plates of iron, or "protectors" as they were called, to several ships of the royal navy; many merchantmen also were supplied with them. Experience, however, showed that the bottoms of the protected ships soon became extremely foul—seaweed and shell-fish accumulating in such quantities as seriously to impede sailing; so that in June 1825, much to the mortification of the inventor, orders were issued for the removal of the protectors.

In 1826 Davy's health had so far declined that he was with difficulty able to indulge in his favourite sports of angling and shooting; and on returning to London from Somersetshire he was unable to attend the anniversary dinner of the Royal Society. In January 1827 he published his six anniversary discourses, delivered on awarding the Royal and Copley medals. Early in 1827 he was seized with an apoplectic attack, which rendered his removal to the Continent advisable. After some short stay at Ravenna he removed to Salzburg, whence, on account of the continuance of his illness, he sent in his resignation of the presidency of the Royal Society. At the end of autumn he returned to England, and in the winter he published his *Salmonia*, a book of some interest, written in imitation of Izaak Walton's *Complete Angler*.

In 1828 Davy quitted England, and spent most of the summer and autumn at Laybach. In the winter he fixed his residence at Rome, whence he sent to the Royal Society, "Remarks on the Electricity of the Torpedo," written in Illyria in October. This, with the exception of a posthumous work, entitled *Consolations in Travel, or the Last Days of a Philosopher*, was the final production of his pen. While at Rome, he was attacked by paralysis, from which he had already suffered. His wife and brother having hastened to his assistance, he left Rome for Geneva, where he died on the 29th of May 1829. His remains were deposited on the 1st of June in the burying-ground outside the walls of that city.

Davy was of a sanguine, somewhat irritable temperament. To all his pursuits he devoted himself with a characteristic enthusiasm and firmness of purpose. His tone of mind, as indicated by his poems, was highly imaginative. "I attend Davy's lectures," said Coleridge, "to increase my stock of metaphors." The power and perspicacity of his intellect is sufficiently attested by his numerous and brilliant discoveries. He was not 21 years of age when he wrote —"It is only by forming theories, and then comparing them with facts, that we can hope to discover the true system of nature." As an experimenter he was remarkably quick; "with Davy," it has been remarked, "rapidity was power." Of the minor observances of etiquette he was careless, and his great frankness of disposition sometimes exposed him to annoyances which the exercise of tact and caution might have obviated. His manner in society, which gave to many the impression of a haughty consciousness of superiority, is ascribed by

Dr Paris to "an ungraceful timidity, which he could never conquer."

See Dr J. A. Paris, *The Life of Sir Humphry Davy*, 1831; Dr J. Davy, *Works of Sir Humphry Davy*, 1839. The former (vol. ii. pp. 450-456) contains a list of Davy's publications. (F. H. B.)

DAWLISH, a watering-place of England, on the south coast of Devonshire, situated a little beyond the mouth of the Exe, twelve miles south of Exeter. It lies in a cove of the English Channel formed by two projecting cliffs, and is admirably sheltered from the weather. A small stream, which flows through the town, is lined on both sides by pleasure grounds. The town is much resorted to during spring and early summer by the seekers after health. The parish contains an area of 5512 acres, and a population (1871) of 4241 persons, 2492 of whom are females.

DAX, formerly Ax, or Acqs, the ancient *Aquæ Tarbellicæ*, a town of France, at the head of an arrondissement in the department of Landes, situated in a fertile plain on the left bank of the Adour, 28 miles north-east of Bayonne, and connected by a fine stone bridge with the suburb of Sablar. It is still partially surrounded by its old tower-flanked walls, which present if not a genuine specimen, at least an interesting mediæval imitation, of Roman masonry; and it has a cathedral (rebuilt in the 18th century, but preserving a sculptured doorway and porch of the 13th), an old episcopal palace, a court-house, a prison, a mineralogical museum, and a training college. It manufactures earthenware, pitch, oil, chocolate, salt, and liqueurs, and carries on cork-cutting, ham-curing, and a trade in wine, brandy, grain, and timber. Its prosperity is further increased by its thermal springs, of which the most remarkable, rising in a great reservoir 20 feet deep in the Central Square, has a temperature of 155-166° Fahr., and sometimes discharges such volumes of steam as to envelop the whole town in a mist. Dax, as its ancient name implies, was the capital of the Tarbelii; and during the Roman period it ranked as the second town of Novempopulonia. For some time it was the seat of a viscount, and its bishopric was preserved till the Revolution. The church of St Vincent derives its name from the first occupant of the see, and is interesting for its connection with the more famous St Vincent de Paul. Population in 1871, 8154.

DAY. See ASTRONOMY and CALENDAR.

DAY, JOHN, a lyrical dramatist of the age of Elizabeth, of whose life no particulars have been transmitted to us, except that he was a student of Caius College, Cambridge. The first work which he is known to have produced is *The Isle of Gulls*, printed in 1606, a comedy founded upon Sir Philip Sidney's *Arcadia*. In 1607 he published a curious drama, written by him in conjunction with William Rowley and George Wilkins, *The Travels of Three English Brothers*, which detailed the adventures of Sir Thomas, Sir Anthony, and Robert Shirley. In the same year appeared *The Parliament of Bees*, the work on which Day's reputation mainly rests. This exquisite and unique drama, or rather masque, is entirely occupied with "the doings, the births, the wars, the wooings" of bees, expressed in a style at once most singular and most charming. In 1608 Day published two comedies, *Law Tricks* and *Humour out of Breath*. In 1610 there was licensed by him a comedy of *The Mad Pranks of Merry Moll*, which has not survived. It is not known when he died, but his works were frequently reprinted before the civil wars, and as late as 1659 one of them, *The Blind Beggar of Bethnal Green*, first saw the light. The six dramas by John Day which we possess testify to a talent somewhat out of sympathy with the main poetic current of his day. Except *The Parliament of Bees*, which is all in rhyme, his plays are in prose, with occasional rhymed passages of great lyrical sweetness. He preserved, in a great measure, the dramatic tradition of John Lyly, and affected a kind of subdued euphuism. It is, indeed, not impossible that the *Maid's Metamorphosis*, 1600, wrongly supposed to be a posthumous work of Lyly's, may be attributable to the youth of Day. It possesses, at all events, many of his marked characteristics. The beauty and ingenuity of *The Parliament of Bees* were noted and warmly extolled by Charles Lamb; but no effort has been made in our generation to revive his fame, and the works of this writer of very distinct and peculiar genius remain still unedited.

DAYTON, a city of the United States, the capital of Montgomery county, Ohio, situated on the east bank of the Great Miami, which is there joined by the Mad, 46 miles north of Cincinnati, and 135 miles south of Toledo. The Miami canal, which connects the Ohio river with Lake Erie, passes by the town; and this means of communication, along with that of the railroads which converge here from different points, has contributed greatly to the prosperity of the place. The city is very regularly laid out, and the houses and public edifices are better than in many other western cities, partly owing to the comparatively moderate price of the white limestone, or marble, which abounds in its neighbourhood. The principal public buildings are the county court-house—designed after the Parthenon at Athens, and erected at a cost of about £30,000—and the market-house, containing within its walls a city hall and the council chamber. There are, besides numerous churches, a high school, and the Cooper Academy, belonging to the Presbyterian body, for the instruction of females. Of charitable institutions the orphan asylum, the alms-house, and a lunatic asylum may be mentioned; and in the vicinity there is the Central National Soldiers' Home. A considerable manufacturing industry is carried on, which is facilitated by a copious supply of water conveyed from the Mad. There are several machine shops, and works for the manufacture of agricultural implements, railway carriages, paper, cotton, &c. The place, which was first settled in 1796, was incorporated as a town in 1805, and as a city in 1841. Population in 1850, 10,977; in 1860, 20,081; and in 1870, 30,473.

END OF VOLUME SIXTH.
