It is a fertile, well-watered country. The raja resides at Trevandrum. The main chain of mountains runs southward for 150 miles to Cape Comorin, with occasional deep depressions, and terminates in a bold, precipitous mass 3000 to 4000 feet high, within three miles of the cape itself. They are loftiest at the extreme north of the district, where they stretch east and west for sixty to seventy miles, separating the districts of Dindigul and Madura, and rising into peaks of 8000 to 9000 feet, which overhang the plain of Coimbatore, and they retain an elevation of 5000 to 6000 feet throughout their extent to the southward. The southernmost peak of note is the sacred Agasteshwara Malai, the source of the Tambraparni river. At the head of the Travancore Hills stands Anaimudi (8837 feet), the highest peak south of the Himalayas, and near it are several other peaks of 8000 feet. South of this group is the lower region of the cardamom hills; even south of this, although the hills become lower and narrower, the country is thinly inhabited almost to Cape Comorin. Here, on the Paralai and Kodai, there are anicuts constructed by Pandiyan kings. There are eighty-two distinct castes in the State, including subdivisions, and Brahmans amount to about one-fiftieth part of the whole population, the Sudras forming nearly one-third of it. The agricultural class amount to about three-fourths of the entire population. 83 per cent. of the population speak Malayalam, 17 per cent. Tamil.

Travancore shares with Malabar the Marumakkatayam law of descent, and its many peculiar customs, social and religious. Among the Namburi Brahmans the eldest son alone marries and inherits; the other children have no claim to the family estate or a share of its produce. Their girls remain unmarried to any age, and even die unmarried. Nair girls are all married formally when children; but when they grow up they may choose men either of their own or the Brahman caste, and live with them, and the titular husband has no claim. The succession among the Nairs, as in Malabar, follows the line of sisters, and children by the sisters. A man without a sister is without a legal heir, and must adopt a sister to perpetuate the family. The succession to the throne of Travancore is governed by the same law, though the maharaja claims to be a Kshatriya. The children of a Nair are therefore heirs to their maternal uncle, performing the religious rites at his decease, and succeeding to his estate. The Namburi and Nair are very cleanly, and bathe several times daily. The Brahmans burn their dead, but the Nairs bury or burn their dead, according to the custom and means of each family. The burning or burial in all cases takes place in some corner of their own gardens. The tuft of hair, which among the people on the east coast is worn

on the back of the head, is here worn on the crown, and allowed to hang forward. There is the utmost liberty of conscience, and many immigrants. The native Christian population consists of 63 per cent. Syrians, part Roman Catholics of the Syrian rite, and the rest Nestorians; Roman Catholics of the Latin rite, 24 per cent.; the remainder Protestants. The large Christian population is a distinctive feature of the country. The Syrian Christians date from the earliest centuries of our era; the Roman Catholics of the Latin rite are the result of the European missions of the Jesuits and Carmelites during the last 300 years.—*Imp. Gaz.*

TRAVELLER'S TREE of Madagascar, Ravenala Madagascariensis, *Sonnerat.* Its leaves are about 15 feet long.

TREBECK, GEORGE, a companion of Moorcroft, died at Muzar, a town of 500 houses within the limits of the khanate of Balkh. He left a favourable impression amongst the people of the countries through which he passed. Moorcroft set off on his journey at the end of 1819.—*Moorcroft's Tr.* i. p. 24.

TREBIZOND is said to have been founded B.C. 707 by a colony from Sinope, the capital of Pontus. It derived its wealth from the munificence of the emperor Adrian. It was taken and pillaged in the first expedition of the Goths from the Ukraine in the reign of Valerian. Trebizond dates are the fruit of Elæagnus orientalis, *L. f.*, used in Persia as dessert.—*Vigne*, i. p. 6.

Age.—The ancient cypress tree of Soma in Lombardy is said to have been full grown in the time of Julius Cæsar. The oak of Ellerslie, the conqueror's oak in Windsor forest, and the cedars of Lebanon, the baobabs of Senegal, the dragon tree of Orotava, the Wellingtonia of California, and the chesnut of Mount Etna, have all been famed. The Wellingtonia rises 300 feet high, has a girth of 30 feet, and one of them was estimated to be 6000 years old.

An 'if' at Fortingall in Scotland is said to be 3000 years old. A tree at Foullebec on the Eure, in France, when measured in 1829, appeared to be 1100 or 1200 years old. The yew trees of Fountain Abbey are believed to be 1200 years old. The olives in the garden of Gethsemane were full grown when the Arabs were expelled from Jerusalem. Rashid-ud-Din, writing A.D. 1310, mentions the existence of a tree at the confluence of the Jumna and the Ganges, which is still there, enclosed by part of the fortifications. The planting of the Bo Tree in Ceylon, a ceremony coeval with and typical of the introduction there of Buddhism, is one of the most striking passages in the Mahawanso; and a tree of unusual dimensions, which occupies the centre of a sacred enclosure at Anaradapura, is still reverenced as the identical one which the sacred books record to have been planted by Mehinda 307 years before the Christian era, consequently in the year 1900 it will be 2207 years old. So sedulously is it preserved, that the removal of a single twig is prohibited; and even the fallen leaves, as they are scattered by the wind, are collected with reverence as relics of the holy place. On the altars at the foot of these sacred trees the Buddhists place offerings of flowers, and perform their accustomed devotions. Another account says, it was planted in the 18th year of the reign of king Devenipatissa, or B.C. 288. A Bo Tree is to be seen within the precincts of every Buddhist temple in Ceylon; one is frequently met with in deserted localities, or near the sites of ancient villages; but the occurrence of a solitary Bo Tree, with its circular buttress of stonework round the stem, indicates the existence, at some former period, of a Buddhist temple. It is the Ficus religiosa.

Mythic.—The tree which stood 'in the midst of the garden of Eden,' was emphatically styled 'the tree of life,' and another 'the tree of knowledge of good and evil.' It was under the oak of Mirah that Joshua (Joshua xxiv. 26) set up the great stone containing the written law; the oak near Bethel whichmarked the grave of Deborah (Genesis xxxv. 8) was significantly called Allon-bachuth; the palm tree (Judges iv. 5) under which another Deborah, the prophetess, dwelt; the oak under which sat 'the man of God' (1 Kings xiii. 14); the oak in Ophrah under which the angel of God appeared unto Gideon, and conversed with him; also the humble bush in which the Lord revealed himself to Moses in flaming fire on the mountain of Horeb (Exodus iii. 2). We read also in Genesis xviii. 1 that the Lord appeared unto Abraham in the oaks or at the oak of Mamre, for so the Hebrew text and the Greek Septuagint (προς τη δρυι τη Μαμβρη) exhibit what in the English text is rendered 'the plains of Mamre.' Abraham's terebinth at Mamre is mentioned by Eusebius to have been worshipped down to the time of Constantine, and is said to be still growing at Eshcol. Abraham planted a grove at Beersheba, to be witnesses to a solemn covenant and to constitute a sacred open-air temple. The trees have perished, but the wells he excavated are still called after him.

The Asherah, rendered groves in 1 Kings xviii. 19, 2 Kings xxiii. 7, was a wooden phallus. Amongst the Celts, the wychelm, elder, and mountain ash seem to have been regarded as possessing occult powers; and the date, pine, cedar, cypress, sycamore, banyan, Bo Tree, the oak of the Druids, the misletoe, the great ash tree Yggdrasil of the Celts and Teutons, the box, and the white thorn, have all been objects of reverence. Amongst the Romans, trees were consecrated to particular divinities (Virg. Ecl. vii. 61):

> 'Populus Alcidæ gratissima; vitis lacchо,
> Formosæ myrtus Veneri; sua laurea Phœbo.'

In Pliny's Natural History (lib. xii. cap. 1, 'de arborum honore') we read, 'Arborum genera numinibus suis dicata perpetuo servantur; ut Jovi esculus, Apollini laurus, Minerva olea, Veneri myrtus, Herculi populus,' etc. Wreaths and fillets, and chaplets or garlands, were often suspended from the sacred branches; whilst among some nations the practice prevailed of staining trees with blood which had just flowed from the expiring victim, not unfrequently human. Lucan gives a description of the sacred wood near Massilia or Marseilles (Phars. iii.):

'Lucus erat longo nunquam violatus ab ævo,
Omnis et humanis lustrata cruoribus arbor,' etc.

Ovid mentions (Metam. lib. viii. 689) the wreaths hanging from a sacred tree, and the addition of recent offerings:

——— 'equidem pendentia vidi
Serta super ramos; ponensque recentia dixi,' etc.

And his story of Eresicthon (Metam. lib. viii.), who impiously violated the ancient woods of Ceres, cutting down her sacred oak, which was in itself equal to a grove, and hung round with garlands, fillets, and other votive offerings:

'Ille etiam Cereale nemus violasse securi
Dicitur, et lucos ferro temerasse vetustos.
Stabat in his ingens annoso robore quercus,
Una, nemus; vittæ mediam, memoresque tabellæ!'
'Sertaque cingebent; voti argumenta potentis.'

Statius (Theb. lib. ii. 736, etc.) records a vow, promising that an hundred virgins of Calydon, who ministered at the altars, should fasten to the consecrated tree chaplets or fillets, white and purple interwoven:

'Centum ibi virgineis votæ Calydonides aris
Actæas tibi rite faces, et ab arbore casta
Nectant purpureas niveo discrimine vittas.'

And the same poet gives an account (Theb. lib. ix. 585) of the celebrated Arcadian oak, sacred to Diana, but itself adored as a divinity, and so loaded with rustic offerings that 'there was scarcely room for the branches:'

'Nota per Arcadias felici robore sylvas
Quercus erat, Trivia quam desecraverat ipsa
Ejectam turba nemorum, numenque colendum
Fecerat
Vix ramis locus,' etc.

Here may also be noticed the veternosis in arboribus tænias of Arnobius (Contr. Gent. lib. i.), and the arbor vittata of Prudentius (Contra Symmachum, lib. ii.); the sacred tree bedecked with fillets or garlands.

The earliest representations of the tree of life are the date palm, the fig, and the pine or cedar. The date palm is figured as a tree of life on an ancient Egyptian sepulchral tablet, now in the Berlin Museum, certainly older than the 15th century B.C. It is described in the Hebrew Scriptures as growing in a garden planted by the hand of God, and it was connected with Adam's abode in innocence and immortality; but of another tree of good and evil also growing there, he was forbidden to eat. The gardens of Alcinous and Laertes, of which we read in Homeric song, were supposed transcripts of that blissful region. It was the Mesamphalos of the earlier Greeks, and the Omphalium of the Cretans, dominating the Elysian fields, upon whose tops, bathed in pure, brilliant, incomparable light, the gods passed their days in ceaseless joys, and whither the disembodied spirits of the brave and good winged their way. It was the sacred Asgard of the Scandinavians, springing from the centre of a fruitful land, which, watered by the four primeval rivers of milk, severally flowing in the direction of the cardinal points, 'the abode of happiness and the height of bliss.' It is the Haramberezaitim of the Zoroastrian Parsee, upon which the golden throne of Ahrimano is set, and at the base of which are ranged the glorious mansions of his Azad or ministering spirits, and of the blessed whom they serve.

Tree and Serpent.—In the earliest record of Semitic thought, we find the tree and the serpent inseparable,—a tree of knowledge, and a serpent more subtle than any beast of the field.

In ancient Sarmatia and modern Poland, trees and serpents were worshipped by the peasantry up to the limits of the nineteenth century. A relic of the tree-worship, the Stock-am-Eisen, the apprentice tree, is still or was recently standing in the heart of Kenna. In Norse mythology, the Yggdrasil ash tree was represented with one of its roots over the well of knowledge, and with a serpent, Nidhog, gnawing its stem. The figure of the serpent on the pole in Numbers xxi. 8, 9, was the Caduceus of Esculapius.

Groves of trees were planted by the ancient Egyptians within the courtyards of their temples. The law of Moses (Deuteronomy xvi. 21) forbade the Hebrews to plant any tree near the altar of the Lord; but the Alexandrian Jews, in later times, planted groves near their synagogues. Tacitus mentions the sacred groves of Germany; those of the British Druids are known to all readers. De Brosses derives the word Kirk from Quercus, an oak. In the eighth century, St. Boniface found it necessary to cut down a sacred oak; and even recently an oak copse at Loch Siant, in the Isle of Skye, was held so sacred that no person would venture to cut the smallest branch from it.

The Ansariah of the Latakia mountains hold in great veneration the anemone, with its variety the adaryun (shaqaiq-wo-annomān) and the myrtle (as also rihān). This reverence has connection with the worship of Adonis, who at his death was changed by Venus into an anemone. They also reverence the bay tree, the Daphne of the Greeks and Turkish dafne, and this is in commemoration of the goddess Daphne, who, when flying from the enamoured pursuit of Apollo, was converted into a laurel tree. The Bohdda Tharanat of the Burmese is the Canna Indica. Its flowers are red, or sometimes white. Buddhist Burmese believe that it sprang from the Buddha's blood. His brother-in-law Dewadat, offended at not obtaining a separate assembly, rolled down a stone from a hill, which, however, broke into fragments, and only a small piece struck Gautama's toe, and the blood from it became this beautiful flower.

At the present day, also, Muhammadan belief is associated with the tauba tree (see Hosea iv. 13). It is their Sidrat-ul-mantaha of Paradise, the heavenly mansion of the angel Gabriel, which bears a leaf for every human birth throughout the universe, and loses a leaf for every death. The Hindus have their Kalpa tree; and in their mythology four shady trees grew on Mount Meru, —the Nauclea cadamba, Ficus Indica, F. religiosa, and a species of Eugenia. In Swarga, the heaven of the Vedic god Indra, there grows a tree called Kat-paga Veerutcham, which sprang from the ambrosia that was churned by the gods. Individual trees, throughout India, are regarded as habitations of spirits both good and bad, and noonday is the particular period at which their influence is exercised. The demons in whom the non-Aryan races believe, are supposed to take up their dwellings in trees, and this is shared in by many Muhammadans. Hindus invoke their deceased parents beneath the banyan or pipal. Each of the Dii majores of the Hindus claim a peculiar tree. The Ficus Indica is sacred to Siva, the Ficus religiosa to Vishnu, the Butea frondosa to Brahma. The Nerium odorum,

Guettarda speciosa, Calophyllum inophyllum, Chrysanthemum Indicum, Origanum marjoranum, and Artemisia astriaka, are sacred to Siva and Vishnu. The Tulsi is sacred to Vishnu, the Bel to Siva, the Shami and the Darlu to Ganpati. Hindus, as a religious act, plant the Ficus religiosa, Ficus Indica, Ægle marmelos, Jonesia asoca, Mimusops elengi, Ficus venosa, Ficus glomerata, Mangifera Indica, Tamarindus Indica, Dalbergia sissoo, Xanthochymus pictorius, Melia azadirachta, Michelia champaca, Mesua ferrea, Borassus flabelliformis. At the time of planting these trees, no religious ceremony takes place, but when they are dedicated to public or sacred uses, the prutisht'ha ceremony is performed. The Hindu who plants one ushwut'hu, one nimbu, two chumpuku, three nagukeshwuru, seven talu, and nine cocoanut trees, and devotes them with their fruit, shade, etc., to public uses, is promised heaven. In Europe, flowers are dedicated by Christians to the Virgin Mary, and lady's grass, lady's slippers, and others take her name.

Tree-worship prevails throughout Central Africa to the south of Egypt, and in Bruce's time the Shangalla worshipped trees, serpents, the moon, planets, and stars. Amongst the races on the Assam border, the Sij plant, Euphorbia ligularia, is worshipped as Manasa, the serpent goddess; and some of the wild tribes in the Chittagong Hills worship the bamboo (Phulhari bans), and use it in their human sacrifices. The Kayu Tojoak in Singapore is a dark-leaved small tree, to which superstition affixes a sacred character; most old and isolated trees are there held to be karāmat, or sacred. Small white flags are stuck up near them, and often propitiatory offerings made to the spirits supposed to reside on the spot. In some parts of Sumatra, the jawi jawi, or banyan, and some other old trees, are believed to be the dwelling or rather the material frame of spirits of the woods, like the dryades and hamadryades of the Greeks and Romans. Herodotus tells us that Xerxes, after crossing the river Meander, when proceeding on the road to the city of Callatebos, found a plane tree, which, on account of its beauty, he decorated with golden ornaments; and leaving to guard it one of his troops, called the Immortals, advanced on the next day to Sardis, the chief city of the Lydians. And so in Siberia, the Jakut have sacred trees on which they hang articles of iron, brass, copper, etc. The Ostyaks also, as Pallas informs us, formerly worshipped trees. In the seventeenth century, Chardin noticed at Isfahan an ancient plane tree all bristling with nails and points, and hung with rags, as votive offerings from darvesh. Throughout all Persia, he adds, these darakht-i-fazil are venerated by the multitude. Hanway mentions one of these near a caravansary, the rags being offered by persons ill with ague. It is not merely in case of sickness (though a very frequent occasion) that the modern Persians invoke the spirits supposed to dwell in certain trees, by hanging on the branches pieces torn from their garments, but on every undertaking which they deem of magnitude, such as a commercial or matrimonial speculation, the building of a new house, or a long journey; and now, as when Sadi wrote 600 years ago, offerings are daily made by votaries desirous of having children. The Persian Dev-daru tree bears in Arabic a name nearly equivalent. Shajarat al jin, or 'Tree of the Genii;' and even Shajarat Allah, or 'God's tree.' It is a kiud of sarv or cypress.

Morier, in the account of his Journey (i. p. 230), mentions that close to the tomb of a Persian saint was a small bush on which were fastened various rags and shreds of garments, which were generally fancied to have acquired, from their vicinity to the saint, virtues peculiarly efficacious against sickness. In Palestine also sacred trees are covered with rags. These rag trees are to be seen in every part of British India. The Japanese hang offerings on the enski tree, chiefly pictures of a mau and woman with their backs turned to one another. A decoction of its wood is given as a love philter.

Travellers from Point de Galle to Colombo, in driving through the long succession of gardens and plantations of cocoanut trees, will observe fruit trees of different kinds, round the stems of which a band of leaves has been fastened by the owner. This is to denote that the tree has been devoted to a deity or demon, and sometimes to Vishnu or to the Kattregam temple. Occasionally these dedications are made to the temples of Buddha, and even to the Roman Catholic altars, as to that of St. Anne of Calpentyn. This ceremony is called Gok-band'hna, 'the tying of the tender leaf,' and its operation is to protect the fruit from pillage till ripe enough to be plucked and sent as an offering to the divinity to whom it has thus been consecrated. It is similar to the taboo of Polynesia. After applying a few of the finest as an offering to the spirit, the remainder is appropriated to the use of the owner. When cocoanut palms are so preserved, the fruit is sometimes converted into oil, and burned before the shrine of the demon.

Rain, Humidity.—Dr. Priestley, St. Pierre, Studies of Nature, and Humboldt in his Personal Narrative, directed attention to the importance of protecting the forests of a country, alike as fuel preserves, and as a means of regulating the available rain supply. They were followed in the early part of the 19th century by M. Boussingault, who, while residing in South America, had opportunities for ascertaining the climatic influence exercised by trees. In India, the subject was followed up, in 1840 by Assistant-Surgeon Balfour, in 1846 by Surgeon Gibson. In the year 1847 the Court of Directors of the E. I. Company requested the Government of India to investigate the 'effect of trees on the climate and productiveness of a country, and the results of extensive clearances of timber,' and the British Association referred this subject to a sub-committee. Since then, General Cullen, Surgeon Smith of the Madras Presidency, Mr. Dalzell, the forest conservator of the Bombay Presidency, have continued the inquiry, one of the latest writers being Dr. Brandis, conservator of the Bengal forests. The literature on the subject has become extensive, but has been summarized by Mr. N. A. Daniell (1863), by Surgeon-General Balfour (1878), largely by Professor Rolleston (1880), who wrote on the modifications in the external aspects of nature produced by man's interference. Dr. Wellington Gray of Bombay also wrote; and now it may be said that all scientific men recognise that in a forest-clad region the air is more moist and cooler, the rainfall is more equal, the soil is preserved, springs and rivulets are regulated, and birds, the destroyers of insects, are protected.

The rainfall in British India fluctuates from year to year as much as 50 per cent. on either side of the average, but on the coast the annual average has not diminished. If the quantity falling in the mousoon months in Bombay city for the 60 years 1817 to 1876, averaging 76·1 inches, be arranged in four periods, the result is as follows:—

1817 to 1831 = 81·55 in.	1847 to 1861 = 77·44 in.
1832 to 1846 = 70·14 ,,	1862 to 1876 = 79·37 ,,

The range extending from 33·97 inches in 1824 to 121·98 inches in 1828.

If the Madras rainfall for 64 years be examined in four periods, we find—

1813 to 1828 = 51·53 in.	1845 to 1860 = 50·61 in.
1829 to 1844 = 44·88 ,,	1861 to 1876 = 46·61 ,,

Or if in three periods—

1813 to 1833 = 47·63 in.	1855 to 1875 = 47·04 in.
1834 to 1854 = 50·71 ,,	

Mr. Marsh says (p. 300), 'The forest's general effect is to equilibrate caloric influences, and moderate extremes of temperature.'

Boudin says (Geographie et Statistique Medieales, vi. p. 229), 'Enfin le deboisement doit être considere comme equivalent à la destruction d'un nombre de paratonnerres egal au nombre d'arbres qu'on abat; c'est la modification de l'etat electrique de tout un pays; c'est l'accumulation d'un des elements iudispensable à la formation de la grele dansun localité ou d'abord cet element se dissipait inevitablement par l'action silencieuse et incessante des arbres.'

Trees break the force and fall of raindrops, and prevent the over-rapid flowing off of (Rolleston, p. 31) rain-water, and the over-violent washing away of soil.

Professor Wellington Gray tells us (p. 10) that '3000 square inches of cabbage leaves will give off a pint of water daily.'

Professor Pfaff says (Ebermeyer, p. 186), 'From 18th May to 24th October, an oak with 700,000 leaves, each of a square surface of 2325 millimetres, evaporated 120 kilogrammes.'

Vaillant (ibid.) says, 'An oak 21 metres high gives off 2000 kilogrammes of watery vapour in a fine day.'

Hartig (ibid.) says, 'A German morgen (=2·3895 acres) carrying 1000 trees of nine different kinds of conifers and broad-leaved trees of 20 years' planting, exhales daily during the period of vegetation at least 3000 lbs. weight of water.'

Professor Prestwich (Water-bearing Strata, p. 118) says, 'The leaves of a tree of average size give off 2½ gallons of watery vapour daily.'

Mr. Lawes says, '3 plants of wheat or barley gave off 1½ gallon = 250 grains of water for every grain of solid residue in the adult plant.'

M. Fautrat (Observations Meteorologiques, 1877-78, pp. 14-16) has come to the following conclusions:—'1. That when it rains more rain falls over a wooded than over a non-wooded area, and that whilst trees of all kinds possess the power of condensing vapour, broad-leaved trees produce less effect than is produced by the narrow-leaved coniferæ. 2. That, as regards the hygrometric condition of the air, the air over a wooded area contains more watery vapour (p. 18) than an unwooded area, but that the coniferæ have more watery vapour in their circumambient atmosphere than the broad-leaved trees. If the vapour dissolved in the air was visible as are mists, we should see the forests surrounded with a vast screen of moisture; and around the coniferæ this envelope would be more marked than over the broad-leaved trees. What is the source of this vapour? Does it come from the soil; is it the result of evaporation from the leaves, or is it due in the coniferæ to the action of the thousands of points which the whorls of their leaves develope every year? This is a complex question, which the present data of physical science do not enable us to answer. . . . We must therefore ascribe to the soil, and to other unknown causes, this remarkable property which pines have of attractiug watery vapour.'

Rolleston says the leaves of the coniferæ wet readily, and intercept one-half of the rain which falls upon them, whilst the broad-leaved trees intercept but one-third (p. 37).

G. H. Rowell (Cause of Rain, 1839 and 1872, Brief Essay on Meteorological Phenomena, 1875) supposes that the molecules of watery vapour are completely enveloped in a coating of electricity, to which they owe their buoyancy. And he supposes this coating and buoyancy to increase and decrease in ratio with the temperature of these molecules. On this theory, efficient conduction of electricity will suffice to precipitate watery vapour either as rain, or as mist, or as dew.

Becquerel's view is that the plague of hail which has so often been observed to follow upon the destruction of the woods of a country, is to be ascribed to the loss of the lightning conductors, which the cut down trees represented while standing, and to the absence consequently of the incessant though insensible agency of the trees.

Professor Grandeau says (Chimie et Physiologie, p. 340), K. E. von Baer (Reden und Studien, 1864, 1873, and 1876), and Oscar Peschel (Neue Probleme. 1876), seem to regard as hopeless any attempt to clothe treeless districts with trees.

It seldom happens that the eore of trees is exactly iu the centre; they seem in Europe to thicken most rapidly in the direction in which they are most exposed to light and heat.

In Europe the thickening is always on the south side of the tree. In India, so far as it appears, it is in general mostly due west. In all likelihood the excess of solar heat furnishes the explanation in both cases. North of the tropics the sun always shines more or less from the south, and gives out more heat from this than from auy other direction. From the tropics to the line, the sun is so nearly vertical, that the mass of heat contributed to a tree or any other body perpendicular to the earth, is from east or west. But from dawn till noon the temperature of the sun is comparatively moderate,—it is from midday till sunset that the vast mass of heat is thrown off, the rays shooting from the westward. In this direction a tree thickens on the same principle that it expands iu Europe to the southward.

The teak tree often becomes in part petrified,—that is, the deposition of silica becomes so abundant as to turn a portion of the trunk into stone, usually resembling the petrified wood of Egypt, Sind, Gujerat, Burma, and Trevicary, etc. In Upper India this is not at all confined to the bamboo or the teak, both remarkable for their silieeous secretions, forming in the former a beautiful enamel all over the stem,

furnishing the sharp points of the leaves, and making the upper surface of the leaves of the latter eminently serviceable as sand-paper. The Ghunbhar wood found in the Nepal and Chittagong forests contains such quantities of silica, that the carpenter who contracts to saw it by the foot, makes it a condition in his bargain that it shall contain no stone. The ebony, the tamarind, the sissoo, and the sitsal or jungle rose-wood, contain these secretions, though in much smaller quantities. The most mysterious circumstance connected with the specimens from the petrified forests, is that for every atom of carbon or other organic matter that has been removed, an atom of silica has come in its room, the structure remaining so perfect that under the glass it could not be discovered whether it was a petrified or living specimen under inspection.

The extension of fruit-bearing trees amongst the people is one deserving special attention. Advantages must arise to the great mass of the population from increasing the capabilities of the country in this respect.

Throughout the central and western parts of Peninsular India, the chief cereals and pulses are grown in the cold season of the year. The cultivators regard hedges and trees as injurious to crops, which are annually enclosed by the branches of thorny trees; consequently, when the crops are off the ground, the whole territory has a treeless aspect, and in many places firewood bears a very high price. There are great tracts, however, which could be beneficially planted with trees.

The natives of Central Asia, even in their most sanguinary wars, have refrained from injuring the fruit trees. Deuteronomy xx. 19, 20, forbade the Israelites to cut down any fruit tree in their sieges. When the Khalif Abubakr sent his general Abu Sufian to invade Syria, his instructions were not to cut down any palm trees or burn any fields of corn, to spare all fruit trees, and to slay no cattle but such as were required for the use of his army. And at the present day the Afghans in their constant inter-tribal fights have never injured the mulberry trees, on the fruit of which they so largely subsist.

Nothing irritates Burmese people more than to cut down fruit trees planted by their ancestors; these are the only things they possess in the shape of family heirlooms, which descend from father to son, and from mother to daughter. Women weep over this kind of destruction. A sacred tree of Burma, the thah-byay-bin, seems to be the jack-tree. In cholera times its leaves are kept in a pot or are scattered about the house.

In many British colonies, so prodigal has been the destruction of timber that the authorities have been compelled to adopt measures of restriction. This has been the case notably in Natal (where the depredations of the natives have been considerable), in Victoria and Western Australia, Queensland (where an annual licence fee has been imposed on wood-cutters), and in Ceylon. The climate of Jamaica is said to have become drier of late years in that portion of the island where the greatest clearances have been made; while in St. Helena, where young plantations occupy old clearances, the island suffers less from drought than immediately after the colonization of the island and the wholesale felling of the trees.

The most ornamental flowering shrubs are those belonging to the genera Rosa, Rhododendron, Azalea, Kalmia, Andromeda, Vaccinium, etc. Among the evergreen shrubs are the holly, the ivy, the jasmine, the box, various heaths, etc. Shrubs are often planted together, forming what are called shrubberies, and when the kinds are judiciously selected and arranged, these collections add greatly to the beauty of the gardens and pleasure-ground where they are introduced.—*Fergusson, Tree and Serpent Worship; Rolleston; Eng. Cyc.* See Fruit; Timber.

TREE FERN. Several tropical plants receive this name, as several species of Cyathea, viz. arborea, dealbata, aculeata, and muricata; also Hemitelia horrida and Karsteniana, Alsophila armata of the West Indian Islands, Angiopteris pruinosa, Marattia, Blechnum Brasiliense, Alsophila excelsa of Norfolk Island, and A. Cooperi of Queensland. Abundance of root fibrils are thrown out from the lower portion of some of their stems, and in some species beautiful scales clothe the stem. Mr. A. R. Wallace (Malay Archipelago) met with species bearing their elegant heads of fronds more than 30 feet in the air.

TREPANG.

Sea-slug, ... Eng.	Holothuries, . . . Fr.
Beche-de-mer, . . . Fr.	Richode, . Mahr., Port.

This is one of the Holothuriadæ, an edible sea-slug, collected in large quantities throughout the Indian Archipelago, especially among the Eastern Islands. China is almost the only market. There are many varieties, which vary greatly in size, sometimes a foot in length, with a girth of three inches. Some sell at £9, 7s. 6d. per 133⅓ lbs.; the trepang (Lotong) of Borneo, at £4, 3s. 4d. per 133⅓ lbs.; the trepang (Buangakulit) of Singapore, £3, 15s. per 133⅓ lbs.; the trepang (Pandans) of Borneo, £5 per 133⅓ lbs. The inhabitants of Celebes, receiving advances from the resident Chinese, have been long in the habit of making annual voyages in their quest of trepang. Gutted, dried in the sun, and smoked, it is considered cured, and fit for its only market, that of China, to which many hundred tons are yearly sent for the consumption of the curious epicures of that country. The fisheries of the trepang for China resemble that of the anchovy to the people of Europe. See Holothuria.

TRETA YUGA, Sansk., from Tree, three, and Yuga, a definite period of time. The four yuga are numbered according to the quantity of religion in each; thus the satya has four parts; the treta, three; the dwapara, two; and the kalee, one. The Treta yuga is the Hindu silver age, and comprises a period of 1,296,000 years. See Yuga.

TREVACARRY. In the chain of mountains which pass by Gingi, fossils are found. Those of Trevaearry, a village 21 miles from Pondicherry, are worthy of observation.—*Sonnerat's Voyage*, p. 5.

TREVELYAN, Sir CHARLES EDWARD, K.C.B., of the Bengal Civil Service, wrote on the condition of the people of India, 1839. He served in the Home Treasury Office, in 1859 was Governor of Madras, subsequently Financial Secretary of India. Bold in design, energetic in execution, earnest in manner, thirsting for

learning and knowledge, in conversation he ever took for granted that all were equal to himself. —*Thurlow*, p. 34.

TREWIA NUDIFLORA. *Linn.*, *Roxb.*

Tetragastris ossea, *Gærtn.*	Rottlera Indica, *Willd.*
Trewia macrophylla, *Roth.*	R. Hooperiana, *Blume.*
T. macrostachya, *Klotzch.*	
Pitori, . . . Bombay.	Kat koombla, . S. Can.
Kanshi, . . . Maleal.	

A middling-sized tree, common throughout the plains of the Madras Presidency, also in Bengal, Ceylon, Java, and Sumatra; the timber is soft, and of no value; root used medicinally.—*Beddome*, *Fl. Sylv.* xxiv. p. 281.

TRE-YANG-DONG-YANG, a celebrated rock fortress of Burma. It is said once to have been used as a fortress by the Karens against the Burmese, and to have been held for a long time, until, the supply of water and provisions being exhausted, they were starved to death. (There is no spring in the basin.) From this incident arose the name of the place, Dong Yang, Rock of Weeping, and Tre Yang for the brook below, Brook of Weeping.

TRIAD. The triads of the nations are many. Geryon, the three-headed, is famous in classical antiquity:

'Qualis Atlantiaco memoratur littore quondam,
Monstrum Geryones immane tricorporis iræ,
Cui tres in pugna dextræ varia arma gerebant
Una ignes sævos.'

'Thus on the coast, from hoary Atlas named,
Stood triple Geryon: in his three right hands
Three weapons fierce he brandished, vengeful fire.'

The triad of the Greeks, so frequently referred to by Proclus, has been largely examined by Cudworth. The inhabitants of Northern Europe had various trinities. That of the prose Edda is Odin, Vile, and Ve; of the Voluspa, Odin, Hænir, and Ledur. The Scandinavians swore by Odin, Friya, and Njord.

The Nornir or Destinies were three. Among the Druids the number three was sacred and mystical; hence their writing-rods of three sides, and the fondness of the ancient British bards for the triad, tribanau, or triplet—

'Eiry mynydd—gwangeus Iar—
Gochwlban gwynt ar dalar—
Yn yr ing gorau yw'r Car.'

'Snow of the mountain! the bird is ravenous for food—
Keen whistles the blast on the headland—
In distress the friend is most valuable.'

The triad of the Babylonian and Assyrian was Ana, Bel, and Hea, lords, respectively, of the heavens, of the visible world, and of the sea and infernal regions. Ana was originally worshipped at Erech, but in later times the goddess Ishtar took his place at this city; Bel had his chief seat at Nipur, and Hea at the city of Eridu.

The triad among the Hebrews was represented by the three yod, or by the high priest extending the thumb and two forefingers as he stretched his right hand over the assembled multitude. The Pope of Rome adopts this form.

Trinity of Christians, God the Father, God the Son, and God the Holy Ghost.

The Egyptian triad was of three brothers.

The triad of the Southern Buddhists has Gautama as the chief, represented by three perpendicular lines, sometimes united at the bottom (tharagon). Buddha, Dharma or the Law, and the Church or Congregation, are represented by the Trisul or Triratna. San-she-Joo lae, the Tathagatha of the three ages, is the Buddhist trinity of China. The Hindu trinity is Brahma, Vishnu, and Siva.

The Chaldees had two triads, each god with a wife or female power, like the sakti of the Hindus. Their first triad was Il or Ra, the supreme; Ana; and Hea, the god of life. Their second triad was Sin or Hurki, the moon-god; San or Sansi, the sun-god; and Vul or Iva, the god of the atmosphere.

Secret triad societies have been formed all over the Chinese empire, the members of which have seen with impatience the Manchu domination, and cherished the idea of overthrowing it to obtain a national government.

The members are initiated with secret ceremonies. It has a religious character, with political aspirations. The members name it Tien-te-jin, Heaven, Earth, Man. In the reign of the emperor Kea King, it was styled Tien-te-hwuy, *i.e.* the Celesto-terrestrial Society, but the name by which they chiefly distinguish themselves is Hung Kea, or the blood family.

Three pure ones are recognised by the Taouist of China.

The Buddhist triad or mystic syllable A U M, is thus interpreted:—

A, the Vija mantra of the male Buddha, the generative power.
U, the Vija of the female Dharma or Adi Prajni, the type of productive power.
M, the Vija of Sanga, the union of the essences of both.

Three precious gems of the Buddhists are Buddha, Dharma, Sangha, the lord, the law, the assembly.

A triple god is described by Kircher among the Japanese; and the celebrated triad of the Hindus comprise Brahma, Vishnu, and Siva.

The Ansariah recognise Miaana, Ism, Bab, Spirit, Name, and Door. See Trimurtti.

TRIANGLE. This, in Hindu mythology, when the apex points downwards, is symbolical of Vishnu, considered as the principle of humidity; to descend being the property of water, and it naturally assumes that figure. When with the apex upwards, it is a symbol of Siva as fire, it being the unvaried form of the igneous element. —*Moor's Pantheon*, p. 23.

TRIANTHEMA CRYSTALLINUM. *Willde.*

T. triquetra, *Rottler.*	Papullaria crystallina, *For.*
Alethi, ... Hind.	Kooka-pal-koora, . Tel.

A plant of Arabia and India, used as a spinach. —*Roxb.* ii. p. 444.

TRIANTHEMA DECANDRUM. *Linn.*

Zallia decandra, *Burm.*

Gado bunya, . . Beng.	Swit punarnavi, Sansk.
Biskhopra, . . . Dukh.	Vallai sharunne, . Tam.
Gadabuni, . . . Hind.	Tella-galijeru, . . Tel.

A weed common in Peninsular India; its roots, size of a small finger, light brown outside, white within, are aperient. Four pagodas weight of bark of the root made into a decoction with one pound water, and boiled down to half a pound, will open the bowels.—*Roxb.*; *Ainslie*; *O'Sh.*

TRIANTHEMA INTERMEDIA. *Stocks.*

Marmay, . . . Panj.	Wah, Waho, . . Sind.

Seeds used for food in times of scarcity. Dr. Stocks notices the Waho of Sind, T. intermedia, *Stocks;* also T. micrantha, *Stocks*, the Choti lani or Teysur lani of Sind.

TRIANTHEMA OBCORDATUM. *Roxb.*

T. monogyna, *Roxb.*		T. pentandra, *D. C.*	
Sabuni,	Beng.	Sharvalay kiray,	Tam.
Lal and Swet-sabuni,	,,	Sharanne,	,,
Nasurjangi,	Dukh.	Ambati maddu,	Tel.
Warma,	Hind.	Yerra galijeru,	,,
Punarnavi,	Sansk.	Bodo-pail-kura,	,,

A troublesome weed, springs up everywhere; the young leaves used as spinach; when somewhat old, mixed with others, and used as greens. The root is found in bazars; colour pale, much wrinkled, bitterish, and rather nauseous to the taste; is considered cathartic, and given in powder to the extent of two teaspoonfuls twice daily with a little ginger. The fresh root also is given as a cathartic mixed with ginger.—*Jaff.; O'Sh.; Roxb.*

TRIAS OBLONGA. Many of the mango trees of Burma have this species of trias growing on them. It is the smallest plant of the orchid tribe in the Tenasserim Provinces.—*Mason.*

TRIBULUS, a genus of plants belonging to the natural order Zygophyllaceæ. T. alatus, T. lanuginosus, T. cistoides, *L.*, and T. terrestris occur in India. One or other species is common in the plains; some occur to from 3000 to 5000 feet in the Himalaya, and one is found to 10,500 feet in Tibet. T. cistoides grows in the gardens of India; it has some aperient properties.

TRIBULUS LANUGINOSUS. *Linn.*

T. terrestris Zeylanicus, *Burm.*

Khussuk-us-saghir,	Arab.	Gokru-khurd,	Pers.
Peh-tsih-li,	Chin.	Gokshuruka,	Sansk.
Woolly caltrops,	Eng.	Sudu mostra,	,,
Gokuru, Gokru,	Hind.	Sembu niringhi,	Singh.
Neringil,	Maleal.	Nerinji,	Tam.
Bakhra, Bhukri,	Panj.	Chiri palleru,	Tel.
Kokullak,	,,	Yerra palleru,	,,

The woolly caltrops grows throughout India. It has large, bright yellow, sweet-scented flowers, and angular, thorny fruits all the year round. The generic name is from the Greek τριβολος, three-spiked or three-pointed. This is often confounded with the Pedalium murex. The seeds and capsules are highly mucilaginous, and in China are used in spermatorrhœa.—*Roxb.; Stewart; Smith; Jaffrey; Ainslie; Riddell.*

TRIBUTARY STATES or Tributary Mahals, the designation of 19 Indian chiefships, between lat. 20° 3′ 55″ and 21° 57′ 40″ N., and long. 84° 21′ 41″ and 86° 48′ 41″ E. Their names are Angul, Athgarh, Bankigarh, Baramba, Baripada, Boad, Daspalu, Daspur, Denkanal, Hindol, Hondapa, Keonjhur, Khandpara, Lakara, Narsingapur, Nilgiri, Nyagarh, Ranpur, Talchir, and Tigaria. About 50,000 Mons or Peguans pay tribute to Siam; and between latitudes 3° and 7° N. the Malays in the principalities of Patani, Calantan, and Tringanu on the east, and on the west those of Queda and Perak, are subject, through the governor of Ligor, to the Siamese sovereignty; but that sovereignty is by no means undisputed by the inhabitants in the less accessible parts. Many of the chiefships of British India are tributary to the British, paying annually money, or sending shawls, horses, elephants, etc. In the year 1880-81, tribute, chouth contributions for the pay of local corps, and succession fees, amounted to £742,209.—*Bowring's Siam*, i. p. 83.

TRICHILIA EMETICA.

El-caja, Roka, . Arab. | Djous-el-kai (fruit), Arab.

Common on the mountains of Yemen and in Senegal. The fruit is used by the Arabs in powder, mixed with oil, against the itch, and also for washing the hair.—*O'Sh.*

TRICHINOPOLY, a large town in the Carnatic portion of the Peninsula of India, in lat. 10° 49′ 45″ N., and long. 78° 44′ 21″ E.; population, 84,449. Its Hindu name, Tri-Sira-pelly, or place of the three-headed, is from a tradition. Muhammadans call it Nathar-Nagar, from a holy man called Nutter. It is a British military cantonment, and gives its name to a revenue district in the Madras Presidency, lying between lat. 10° 37′ and 11° 30′ 30″ N., and between long. 78° 12′ and 79° 30′ E. Area, 3515 square miles; pop. according to the census of 1881, 1,215,033 souls. The river Kaveri (Cauvery), and its branch the Colerun, are the most important rivers in Trichinopoly. These rivers almost rejoin each other about 10 miles east of Trichinopoly city.

The Cauvery river enters the district in the west; it is 1200 yards wide. About 12 miles west of Trichinopoly it is intersected by the island of Srirangam, on which is a magnificent Hindu pagoda, and the northern branch takes the name of the Colerun, which flows on to the sea near Porto Novo, the Cauvery branch flowing to the Tanjore district, which it waters. The irrigation is secured by two dams or anicuts, the upper at Srirangam, 874 yards long, across the head of the Colerun, including two islands, erected in 1836 by Captain (Sir Arthur) Cotton; and a lower dam across the same river, 60 miles farther to the eastward, which supplies the Veranum tank, and irrigates the Chellumbrum and Manargudi taluks of S. Arcot. The grand anicut is an ancient work constructed by a former sovereign of Tanjore. It secures the irrigation of Tanjore, and allows the surplus water to go to the Colerun.

Trichinopoly fortress was besieged in 1751-55 by Chanda Sahib and the French. Inside the fort is the Trichinopoly rock, a mass of gneiss, which rises, like many others in the district, abruptly out of the plain to a height of 273 feet above the level of the street at its foot. The ascent to this rock (Tayumanaswami-Malai) is partly by a covered stone staircase, and partly by steps cut in the rock itself. Upon it is a Siva temple, and at the top a small temple dedicated to Pillaiyar (Ganapati). Every year (August) a festival at this temple attracts a crowd of pilgrims. In 1849 (22d August), owing to some confusion in descending, a panic occurred, and at least 250 persons lost their lives in the crush. In 1871, in the population, there were 1,115,776 Hindus, 32,024 Musalmans, 50,822 Native Christians, 1400 European and Eurasian Christians, and 143 Jains. The most numerous Hindu castes are the Villalar (200,853) and the Vannian (398,410). Brahmans number 31,428. The non-Aryan races are numerous.

TRICHIURUS, a genus of edible fishes of S. Asia seas. T. lepturus, *Linn.*, the silvery hair-tail, is one of the largest of the flattened, small-scaled fishes. It occurs at Shan-tung, in the gulf of Peh-chi-li in China, in N. China, and Corea, and is largely salted, dried, and eaten. It is captured near the surface.

TRICHODESMA INDICUM. *R. Br.*

Chota kulpha,	Hind.	Gao zaban,	Sind.
Rat-mandoo,	Kash.	Nila kai,	Tam.
Rati surkh,	,,	Guva gutti,	Tel.
Kowri booti,	Panj.		

It is used for purifying the blood, also as a diuretic, and a cure for snake-bites.—*Powell; O'Sh.*

TRICHODESMA ZEYLANICUM. *Brown.* Grows in Abyssinia, S. Asia, and extra-tropical Australia. It is a plant of Ceylon and the Peninsula, and is the Buro kulpha of Bengal, and the Borago Zeylanica of Linnæus. Dromedaries evince an extraordinary predilection for it. T. Africanum, *R. Br.*, and T. spinulosum, are found in the same region.—*Voigt; Von Mueller.*

TRICHODESMIUM ERYTHRÆUM, a filamentous alga which the Red Sea is supposed to have obtained its name from. It is of a blood-red colour, often covers large areas, and appears and disappears somewhat capriciously. It has as synonym, T. Ehrenbergii. During the year 1823. Ehrenberg spent several months on the borders of the Red Sea, at Tor, very near Mount Sinai, and there witnessed the surprising phenomenon of the blood-red coloration of the entire bay, which fronts the part of that town. The open sea, outside the coral reef, was of the ordinary colour, but the short waves of the calm sea bore to the shore, during the heat of the day, a mucilaginous matter of a blood-red colour, depositing it on the sandy beach, so that in the space of little more than half an hour, the entire bay was margined by a red border many feet in width. The coloration was owing to minute, almost invisible, flocci, some greenish in colour, others of an intense green, but mostly of a deep red. The water in which they floated was, however, perfectly colourless. This very interesting phenomenon was investigated at leisure, during several days, with every possible care. The colouring matter was examined with the microscope. The flocci were found to be composed of little bundles of oscillatoria filaments; they were in shape fusiform or elongated, were irregular, rarely more than a line long, and were invested with a kind of mucilaginous sheath. The flocci themselves did not exactly resemble one another, nor did they contain filaments. Whilst the sun was above the horizon, the flocci remained on the surface of the water in the glasses he had brought up; during the night they sank to the bottom, or when he shook the glass, though remounting to the surface some little time afterwards. T. Hindsii, also of a blood-red colour, has been found off the west coast of S. Ameriea.

Two minute species of Trichodesmium, which have been collected in the Atlantic, imparted a cloudiness to the water over a very large area, but were not coloured. They were so diffused that it was difficult to collect the excessively minute flocci, far smaller than those at Colombo, and colouring the sea there.

Dr. Collingwood mentions that he had never seen red Trichodesmium, or any tint of red. He had seen it yellowish-brown. He had seen the Indian Ocean red from myriads of minute red crustaceæ, and in the Formosa Channel from red gelatinous worms, but never by Trichodesmium. —*Ehrenberg on the Coloration of the Red Sea, in Poggendorf's Annals; Annals and Magazine of Natural History; Ceylon Observer.*

TRICHOGASTER FASCIATUS, the butterfly fish of the Bay of Bengal.

TRICHOGLOSSUS ENTELES, and T. iris are pretty little lorikeets of Timor. T. ornatus, of Celebes, and T. Swainsonii, are beautiful brush-tongued parrakeets.

TRICHOPODUS TRICHOPTERUS. *Pallas.* Like the rest of the family, this fish is capable of sustaining life out of water, particularly if kept in wetted fresh leaves, or occasionally sprinkled with water. At Penang it is numerous in streamlets and ponds, where it is eaten by the poorest classes. The exquisite beauty of the metallic iridescent colours makes these fishes acquisitions in garden tanks. Like Osphromenus olfax, they are very pugnacious among themselves. A species of Trichopodus was discovered by Dr. Campbell in the rivers of the Sikkim passes in the northern frontier of Bengal.

TRICHOSANTHES, a genus of plants belonging to the Cucurbitaceæ. Several East Indian species, anguina, bracteata, cordata, cucumerina, dioica, and heteroclita, are known; some are used as vegetables, but others contain a purgative principle. T. amara, of St. Domingo, has bitter and astringent seeds, sometimes emetic.—*O'Sh.*

TRICHOSANTHES ANGUINA. *Linn.*

Chichinga, Beng., Hind.	Galar tori, Pandol, Panj.
Jijinga, Jinga, ,, ,,	Pottola, ... Sansk.
Pai-len-mwæ, . . Burm.	Kadotri, ... Sind.
Snake gourd, . . Eng.	Rebhri, ... ,,
Chichunda, . . . Hind.	Podi-urilanga, . . Singh.
Purwar, ... ,,	Pudalunkai, . . Tam.
Petala ular, . . Malay.	Lingapotla, . . . Tel.
Petalri-ular, . . ,,	Pottlakaya, . . . ,,

This is generally cultivated for its long snake-like fruit, used in curries; is sown in the rains, and grown generally over a high pandall, in order that the fruit may have space to hang down; a small stone or weight is tied to the end to increase its length, which varies from a foot and a half to three feet or more. Raw, it resembles a cucumber in flavour, but is better dressed in a stew or curry, and often cut into lengths, and filled with a preparation of minced meat. This is peculiar to India, is of easy culture, and is to be seen on trellises around the doors of the native cabins; the fruit grows beautifully striped, small, and tapering, so that, hanging down from the trellis, they look like striped snakes suspended from the foliage of trees.—*Roxb.; Riddell; Jaffrey; Mason.*

TRICHOSANTHES BRACTEATA. *Lam.*

T. palmata, *Roxb.*	T. anguina, *Wall.*
T. kaki konda, *Roxb.*	Modecca bracteata, *Lam.*
T. laciniosa, *Wight.*	
Buro makal, . . Beng.	Abuva, Avva guda, Tel.
Anko-rute, . . . Tam.	Kaki donda, Abuba, ,,

This grows in both the Peninsulas of India, in Bengal, the Dehra Doon, and the Khassya mountains. It is a large climbing plant, with a globular fruit, which is regarded by the natives as poisonous, but the stem is much esteemed in diseases of cattle, and in inflammation of the lungs.—*Drs. Roxb., Voigt, Gibson.*

TRICHOSANTHES CORDATA. *Roxb.*

T. palmata, *Roxb.*	Bhooin-koomra, . Beng.

This plant grows on the banks of the Megna river, where the inhabitants use the root as a substitute for calumba root, and it has been sent to England as the true calumba of Mozambique. It has large white flowers. Its Bengali name is identical with that of the sweet potato, Batatas paniculata. The root is tuberous, perennial, growing to the size of a man's head.—*Roxb.; Voigt.; O'Sh.*

TRICHOSANTHES CUCUMERINA. *Linn.*

T. cordata, *Wall.* | T. palmata, *Roxb.*

Ban-potel, . . . Beng. | Podavalam, . . Maleal.
Tha-b'hot-kha, . . Burm. | Pepudel, Pudel, . Tam.
Bitter gourd, . . Eng. | Chend potla, Patola, Tel.
Jangli chuchinga, . Hind. | Adavi chedu, . . ,,

This plant grows in the valleys of the Himalayas, in hedges in Bengal, in the two Peninsulas of India, and in Tenasserim. Its unripe fruit is very bitter, but is eaten by the natives in their curries, and is reckoned anthelmintic.—*Roxb.; Voigt; Mason; O'Sh.*

TRICHOSANTHES DIOICA. *Roxb.*

Bun-putol, . . . Beng. | Pulwul, ... Hind.
Ko-lau, Kwa-lau, Chin. | Kommu potla, . . Tel.

This occurs wild in Bengal, but is cultivated there for its unripe fruit and tender tops, which are eaten in curries and reckoned very wholesome. An alcoholic extract of the unripe fruit is described as a powerful and safe cathartic in 3 to 5 grain doses, repeated every third hour till the desired effect is produced.—*Roxb.; Voigt; O'Sh.*

TRICHOSANTHES INCISA. *Rottl.*

Birme ke-jur, . . Dukh. | Chinna avagooda vayroo,
Sirroo corrutti-vayr, Tam. | Tel.

This has a light-coloured and very bitter-tasted root. Pounded small and mixed with margosa oil, it is applied to offensive sores inside the ears, and is also poured up the nostrils in cases of ozæna. The taste of the rind is singularly bitter, but in three-grain doses, thrice daily, it produced no sensible effect.—*Ains.; O'Sh.*

TRICHOSANTHES VILLOSA of Java, fruit acts like colocynth.—*O'Sh.*

TRIDACNA, a genus of molluses of the family Tridacnidæ, comprising the genera Tridacna and Hippopus, the shells of which are the largest known amongst acalephous molluscs. T. gigas is sometimes 4½ feet long, weighing 500 lbs. T. safrana is of a beautiful blue round the edges; a third species is T. squamosa. There are known six recent and one fossil species. Tridacna shells are used in some of the islands of the Pacific Ocean, at Lesson Island, at Ualan, at some of the Live Islands, and in New Guinea, to form adzes. —*Woodward; Figuier.*

Tridacna gigas, the gigantic clam shell, was formerly of such value, that the Republic of Venice presented one to Francis I., who gave it to the church of St. Sulpice in Paris, and it is still used there as a basin for holy water. It is the Benitier of the French. Its shell is transversely oval, with great imbricato-squamous ribs, the scales short, arched, and lying near together; the interstices of the ribs are not striated. The size and weight of this immense bivalve, the largest and heaviest known, combined with the beautiful marble-like appearance and whiteness of the inside of the valves, have always caused it to be sought for as an ornament for grotto-work or for garden fountains; and, indeed, the valve of a large individual forms a very picturesque basin for catching the clear falling water, and transmitting it through the deep interstices of its indented edge to the reservoir below. This species can hardly have been the Tridacna of Pliny (Nat. Hist. xxxii. 6), but his Pedalia or oysters, a foot long, from the Indian Sea, may have been one of the Tridacnæ of modern authors. At Carteret Harbour, New Ireland, the natives obtain many very large individuals, whose flesh they eat raw. This species occur at Tongataboo, at the Moluccas, at Timor, and at Waygiou, and appear to inhabit rather shallow water.

Hippopus maculatus, *Lam.*

Chama hippopus, *Linn.* | Tridacna maculata, *Quoy.*
Hippopus maculatus, *Lam.* | Bear's paw clam.

This well-known but beautiful species, now much used in the ornamental arts for inkstands, etc., has a traversely ovate shell, which is of moderate size, ventricose, ribbed, subsquamous, and white spotted with red or purple; the lunule is heart-shaped and oblique. The naturalists of the Voyage of the Astrolabe found this species at Carteret Harbour, New Ireland, and also at Vanikero, where they collected specimens left dry on the reefs. It spins a byssus.—*Eng. Cyc.; Woodward*, p. 453.

TRIDANDI, a Saiva mendicant, who carried in his hand three wands, to illustrate his command over his thoughts, words, and acts. This practice, however, has ceased to be observed. They are in habits like Gosains, and do not marry. Their bodies after death are buried, not burned.—*Wils.*

TRI-DASA. Sansk. 3 times 10; the 33 Hindu divinities, viz. 12 Adityas, 8 Vasus, 11 Rudras, and 2 Aswins.—*Dowson.*

TRIDENTS are affixed to taffrails of junks, to tops of houses, to ward off evil; with the same object three earthenware guns are placed in China on a house, also a cock.

TRIDODYA, in the Doab, a sort of finger-ring.

TRIFOLIUM, a genus of plants belonging to the natural order Fabaceæ. Many species are known. They are the trefoils or clovers so largely used in Europe as fodder for cattle. Dr. Irvine mentions T. Indicum, called in Hindi Bun-methar, Jhunjurie or Goolabi, as very common in Ajmir, Marwar, and Jeypore. Camels are fond of it; other cattle do not eat it. T. repens, the white or Dutch clover, is said to be the shamrock worn by the Irish as a badge. Leaves with three divisions have from remote times been regarded with superstitious reverence. T. pratense, *Linn.*, is the ordinary red clover of Europe, Asia, and Japan.—*F. Von Mueller; Voigt*, p. 210.

TRIGARTHA, lit. 3 strongholds, the modern Kangra and Jalandhar Doabs.

TRI-GARTTA, the modern Doab and Kangra.

TRIGLIDÆ, the gurnard family of fishes, of the order Acanthopterygii. The family is arranged into four groups.

First Group. Heterolepidina.

Gen. 8 Chirus, 2 Ophidion, 1 Agrammus, 1 Zaniolepis.

Second Group. Scorpænina.

Gen. 25 Sebastes, 21 Scorpæna, 1 Glyptauchen, 8 Pterois, 1 Pteroipichthys, 1 Tænianotus, 4 Centropogon, 2 Apistus, 1 Enneapterygius, 1 Pentaroge, 10 Tetraroge, 7 Agriopus, 8 Prosopodasys, 9 Aploactis, 1 Trichopleura, 1 Hemitripterus, 1 Amphiprionichthys, 2 Synancidium, 2 Synanceia, 2 Micropus, 3 Minous, 6 Pelor, 1 Chorismodactylus.

Third Group. Cottina.

Gen. 2 Podabrus, 2 Blepsias, 1 Nautichthys, 1 Scorpænichthys, 26 Cottus, 10 Centridermichthys, 1 Icelus, 1 Triglops, 2 Hemilepidotus, 2 Artedius, 1 Ptyonotus, 1 Polycaulus, 29 Platycephalus, 1 Hoplichthys, 2 Bembras, 8 Prionotus, 6 Lepidotrigal, 14 Trigla.

Fourth Group. Cataphracti.

Gen. 10 Agonus, 2 Aspidophoroides, 6 Peristethus, 4 Dactylopterus, 1 Cephalacanthus.

Dactylopterus volitans is of the Mediterranean, and D. orientalis of the East Indies. The flying

gurnards raise themselves into the air by means of their pectoral fins, and swing themselves forward for a hundred feet.

TRIGONA LÆVICEPS, *Smith*, of Burma and Singapore, the bee which buries the Vatica robusta and other dammer resins. It is the Kalliada of the Malealam hill-men. The Burmese call the resin Pwai-nyet.

TRIGONELLA, a genus of plants of the natural order Fabaceæ or Bean tribe. There are about thirty species. T. cœrulia, corniculata, fœnum-græcum, and ornithopodioides occur in India. T. corniculata, *Linn.*, T. elatior, *Sm.*, a native of France, but cultivated in India. It has small yellow flowers, and fruits in the cold season.

TRIGONELLA FŒNUM-GRÆCUM. *L.*

Halbeh, Shimlet, . ARAB.	Shemlit, ... PERS.
Mentia, ... CAN.	Uluwa, ... SINGH.
Fenugreek, . . . ENG.	Vendium, . . . TAM.
Methi, ... HIND.	Menti kura, Mentual, TEL.

This plant is a native of the south of Europe, but is cultivated in Asia Minor and in India. Mucilage, starch, fixed oil, and colouring matter constitute the greater part of its seed, which are used by the native practitioners in dysenteric affections, cough, and special diseases, and the Arabs employ it in poultices and fomentations. It is cultivated for a pot-herb, considered very wholesome. It imparts a very strong odour and taste to curries, and the seeds are said to be slightly tonic. They are also used as coffee after roasting, and to form a yellow dye, and are said to be emmenagogue.—*Powell.*

TRIGONOMETRICAL SURVEY of India was begun at Cape Comorin in 1800. Its originator was Colonel Lambton, who has been succeeded by Sir George Everest, Sir Henry Waugh, Colonel J. T. Walker, and Colonel Thuillier, and about three-fourths of the whole of British India has been surveyed. It is calculated that by the year 1886, the whole of the vast area of India, 1,382,624 square miles, will have been completed by the Grand Trigonometrical Survey, and by the Topographical and Revenue Surveys, though portions may require resurveying. In the triangulations of India, chains of triangles have been carried along the principal meridians and the course of the eastern and western frontier, and these were connected together by other chains, the northernmost of which followed the Himalayan frontier line, while others were carried along certain parallels of latitude at convenient intervals. Colonel Everest's meridional arc is the axis of the system. Base lines are measured at the extremities of the longitudinal chains, and at the points where the chains cross Colonel Everest's arc. The great quadrilateral figure which connects Dehra Doon with Kurachee comprises four base lines and about 2500 angles, appertaining to 8 chains of triangles.—*Ann. Ind. Admin.*

TRIGONOMETRY as known to the Hindus appeared to Professor Playfair to have been drawn up by one who was deeply versed in the subject, and who knew more than he thought necessary to communicate. It is probably a compedium formed by some ancient adept in geometry, for the use of others who were mere practical calculators.—*Elphinstone*, p. 128.

TRIGONOSTEMON LAWIANUS. *Nimmo.*

Dimorphocalyx glabellus, *Thw.*	Croton Lawianus, *Nimmo.*
	Welle wenne, . . SINGH.

A very common middling-sized tree in the dense, moist western forests of the Peninsula, from Canara down to S. Travancore, up to 3500 feet elevation on the Bombay Ghats and in Ceylon. —*Beddome, Fl. Sylv.*

TRIKALA, of the Cis-Sutlej, is wheat and barley sown together. It is called guji in the Panjab.

TRIKANDA, a Sanskrit vocabulary in three chapters.

TRIKUTA, SANSK., from Tri, three, and Kuta, a mountain peak. Tri-kuta-devi, three-peaked or trident goddess, a triple-peaked mountain in the Outer Himalaya, south of Chaneni, held sacred by the Hindus. It is a curious three-peaked hill, the last culminating point of the range separating the Chenab from the Ravi.—*Thomson's Tr.* p. 311.

TRI-KUTA. Colonel Tod tells us that the infant Bappa, son of Nagadit, when only three years old, was conveyed to the fortress of Bhandere, where he was protected by a Bhil of Yadu descent. Thence he was removed for greater security to the wilds of Parassur. Within its impervious recesses rose the three-peaked (tri-kuta) mountain, at whose base was the town of Nagindra, the abode of Brahmans, who performed the rites of the great god. In this retreat passed the early years of Bappa, wandering through the alpine valleys, amidst the groves of Bal and the shrines of the brazen calf. The most antique temples are to be seen in these spots,—within the dark gorge of the mountain, or on its rugged summit, in the depths of the forest, and at the sources of streams, where sites of seclusion, beauty, and sublimity alternately exalt the mind's devotion. In these regions the creative power appears to have been the earliest, and at one time the sole object of adoration, whose symbols, the serpent-wreathed phallus (lingam), and its companion the bull, were held sacred even by the children of the forest. In these silent retreats Siva (Mahadeva) continued to rule triumphant, and the most brilliant festivities of Udaipur were those where his rites were celebrated in the nine days sacred to him, when the Jain and Vaishnava mix with the most zealous of his votaries. But the strange gods from the plains of the Yamuna and Ganges have withdrawn a portion of the zeal of the Gehlot from their patron divinity Eklinga, whose dewan or vicegerent is the rana. The temple of Eklinga, situated in one of the narrow defiles leading to the capital, is an immense structure, though more sumptuous than elegant. It is built entirely of white marble, most elaborately carved and embellished; but, lying in the route of a bigoted foe, it has undergone many dilapidations. The brazen bull, placed under his own dome, facing the sanctuary of the phallus, is nearly of the natural size, in a recumbent posture. It is cast (hollow) of good shape, highly polished, and without flaw, except where the hammer of the Tartar had opened a passage in the hollow flank in search of treasure. Amongst the many temples where the brazen calf forms part of the establishment of Bal Cesar, there is one sacred to Nanda alone, at Naen, in the valley. This lordly bull has his shrine attended as devoutly as was that of Apis at Memphis; nor will Eklinga yield to his brother Serapis. The changes of position of the Apis at Naen are received as indications of the fruitfulness of the seasons, though it is not

apparent how such are contrived. There are perhaps in India millions of the idol Nandi, the bull or calf vahan of Siva, and it is always placed in a seated posture looking towards the lingam. —*Travels*, 136; *Tod's Rajasthan*, i. 222.

TRIKUTA, a mountain in Kashmir, forming part of the range bounding the valley of Srinuggur on the south; lat. 32° 58′ N., long. 74° 37′ E. The summit is covered with snow almost throughout the year. According to Thornton, on its northern flank a spring gushes from the rock in regular pulsations,—hot in winter, but cooled by intermixture of the melting snows during the summer months. The Hindus regard this spring as holy, and pay pilgrimages to it from considerable distances.—*Imp. Gaz.*

TRI-LINGAM, said to be the origin of the name Telinga. It means three lingams.

TRI-LOCHNA. SANSK. Three-eyed, a name of Siva.

TRILOKA, the three worlds, heaven, earth, and hell, or earth, sky, and heaven. In Hindu mythology, fourteen spheres are recognised. Triloka-Darpan, or Mirror of Three Worlds, a geographical tract of the Buddhas.—*As. Res.* iii. 299.

TRIMBAK, a small town in the Nasik district of the Bombay Presidency, in lat. 19° 54′ 50″ N., and long. 73° 33′ 50″ E., 20 miles S.W. of Nasik town; population (1872), 3763. Trimbak is visited by all the pilgrims who go to Nasik, and has a special fair in honour of Trimbakeswar Mahadeo, held on the occasion of the planet Jupiter entering the sign Leo, which event happens generally once every twelve years. The town is 4255 feet above the sea. The hill fort at Hursh, 3 miles W. of Trimbak, is 5659 feet. Otur, near Trimbak, is 4096 feet.—*Imp. Gaz.*

TRIMBUK JI, an officer under the last Peshwa of the Mahrattas, who was imprisoned by the British in Tannah, from which he escaped by the aid of a Mahratta groom. This servant had to groom a horse of the officer commanding. It was picketed under the window of Trimbuk Ji's place of confinement. While grooming, he sang songs containing directions for Trimbuk Ji of the following character:—

'Behind the bush the bowmen hide,
The horse beneath the tree;
Where shall I find a knight will ride
The jungle paths with me?
There are five and fifty coursers there,
And four and fifty men,
When the fifty-fifth shall mount his steed,
The Dekhan thrives again.'

Trimbuk Ji escaped, but was recaptured and confined in the fortress of Chunar.—*Heber*, ii. p. 335.

TRIMULGHERRY, a small hamlet eight miles N. of Hyderabad in the Dekhan, near which a cantonment for European soldiers has been located.

TRIMUL NAIK or Tirumulla Nayak, of the Naik dynasty, reigned A.D. 1621 to 1657. He erected a choultry at Madura for the reception of the presiding deity of the place in its periodical migrations. It is 333 feet long by 105 feet in width. It took 22 years to erect, 1623 to 1645, and is said to have cost a kror of rupees = a million sterling.—*Fergusson*, p. 362.

TRIMURTTI, SANSK., an idol of the Hindus, of one body with three heads, is the term employed to designate the triad of gods of the Hindu mythology, Brahma, Vishnu, and Siva, whose attributes are those of the Creator, the Preserver, and the Destroyer. The consort of Brahma is Saraswati; of Vishnu, Lakshmi, Padmi, or Sri; and that of Siva is Parvati, Bhawani, or Durga. The attendant vahan or vehicle of Brahma is a Hanasa or goose, that of Vishnu is a Garuda or eagle, and Nandi or the bull pertains to Siva. Meru is the station of Brahma, the sun that of Vishnu, and Jupiter that of Siva. The symbols of the three deities are respectively Time, Water, and Fire. Their common titles, A. U. M., are, for Brahma, Parameswara; for Vishnu, Narayana; and Mahadeva for Siva. Vishnu under the figure of the sun, by the saligram and the nine avatars, while the lingam and numerous epithets are the usual figures indicating Siva. Brahma of the Hindu theology is supposed to be the analogue of the Saturn of the west, while Jupiter represents both Vishnu and Siva. The trimurtti is known in the Peninsula as mu-murti (Mur, TAM., three). In the philosophy of Hinduism, Brahma, Vishnu, and Siva, god and the world, are one, nevertheless legends relate their fights and quarrels. Many Saiva Hindus believe in the three as triune, but Vaishnava Hindus are rarely in accord in this, and the bulk of the Hindu religionists regard Siva or Iswara, Vishnu, and Brahma, or his essence Parabrahma, as distinct deities.

Of this triad, the modern Hindus scarcely recognise Brahma, who has at present not a single temple throughout all India (or at least only one), although Saraswati, his female companion, continues to be reverenced. The worship of Vishnu seems to have come from Central Asia, and that of Siva from the basin of the Lower Indus through Rajputana, and both displaced the nature-worship of the Vedas. In the existing state of Hinduism, however, every Hindu has a separate belief, and Siva, Vishnu, with their avatars and various forms, their sakti or female powers, hero-worship, the worship of deified beings, devil-worship, and the worship of the lingam, are the prevailing cults. Indra, once regarded as the king of heaven, is almost unheard of and unknown. Amongst the earliest dissenters from Indra were the Yadu race, under Krishna's influence. The reasons leading him to this are not known, but the Mahabharata makes him say to Nareda, his father, 'Why worship Indra as the supreme god? O father, we are Vaisyas, and our cattle live upon the pastures; let us therefore cease to worship Indra, and pay our devotions to the mountain Govardhana.' Up to that time it was to the heaven of Indra that the good who died proceeded. Up to then the two gods, Indra and Agni, rain and fire, were the chief deities worshipped by the Vedic Aryans.

Indra, the sovereign of the gods, was the most powerful of the Vedic deities, the god of the firmament, the hurler of the thunderbolt, who smote the rain-cloud and brought down waters, who delighted in the soma juice, in eating, in drinking wine, and in war. Indra, according to Bunsen (iii. pp. 537, 538, iv. p. 459), is the prototype of Zeus, and was a personification of ether. Soma was offered to him in sacrifice.

Agni, the personification of fire, was worshipped as the destroyer of forests, as useful in the sacrifice and in the household. 'When generated from the rubbing of sticks, the radiant Agni

bursts forth from the wood like a fleet courser.' 'When excited by the wind, he rushes amongst the trees like a bull, and consumes the forest as a raja destroys his enemies.' 'Such as thou art, Agni, men preserve thee constantly kindled in their dwellings, and offer upon thee abundant food' (Rig Veda, i. 73).

Varuna was the Vedic god of the waters, and god of the ocean, but the name was sometimes applied to the sun, and sometimes used a personification of day. As with other gods, when addressed he was regarded as supreme, and capable of forgiving sin:—

'Let me not yet, O Varuna, enter the house of clay; have mercy, Almighty, have mercy!
'If I go along trembling, like a cloud driven by the wind; have mercy, Almighty, have mercy!
. . . . . .
'Thirst came upon the worshipper, though he stood in the midst of waters; have mercy, Almighty, have mercy!'

Surya, or the sun, called also Savitra, Mitra, Aryaman, and other names, was a Vedic god, who is still adored by Brahmans and Zoroastrians. The Solar race of Kshatriya, who appear in the Ramayana, derive their origin from the sun; but in the higher spirit, the sun is regarded as divine, as pervading all things, as the soul of the world and supporter of the universe. In a verse of the Rig Veda (iii. 62 and 10), this idea is supposed to be indicated. It is 'O'm! Bhūrbhuvāssuvāhā, O'm! Tatsa vit'hru varēnnyâm, B'hargo devâssyâ dhimahi dhiyo yonaha pracho dayath. O'm! Earth, air, heaven, O'm! let us meditate on the supreme splendour of the divine Sun; may he illuminate our minds.' Brahmans regard this verse as an invocation to the several deities who are implored by the worshipper, to aid his intellect in the apprehension and adoration of God.

In connection with the sun are the twelve Aditya, sons of Aditi, the universe. In the later Vedic age they were identified with the twelve signs of the zodiac, or the sun in its twelve successive signs.

Soma, also Chandra, the moon, is chiefly celebrated in the Vedas in connection with the soma plant, but in the Mahabharata is the mythical progenitor of the great Lunar race of Bharata.

The Aswini, apparently a personification of light and moisture, as sons of the sun, also as the sun's rays, and noticed as the physicians of the gods. They are described as young and handsome, and riding on horses.

Vayu or the air, and the Maruts or winds, are personified and invoked. The Maruts are depicted as growing amongst the forests, compared to youthful warriors bearing lances on their shoulders, delighting in the soma juice like Indra, and, like him, the bestowers of benefits on their worshippers.

Ushas or the dawn, the early morning, the first pale flush of light. Ushas is compared to a mother awakening her children, to a lovely maiden awakening a sleeping world, to a young married maiden,—'like a youthful bride before her husband, thou uncovereth thy bosom with a smile.' As a goddess, she is styled the (Rig Veda, i. 123, v. 2) mighty, the giver of light; from on high she beholds all things; ever youthful, ever reviving, she comes first to the invocation,—*Rig Veda; Bunsen's Egypt.*

TRINCOMALEE, on the E. coast of Ceylon, has the finest bays and harbours in that island. It has the most secure harbours in the Indian seas, but its present importance is not great. The country around is almost deserted. The town is built on the neck of a bold peninsula on the north side of the bay, stretching between the inner and outer harbours, rising at its southern extremity into lofty precipices covered to their summits with luxurious forest. The dockyard is in lat. 8° 33′ 30″ N., and long. 81° 13′ 10″ E. Trincomalee was taken by the British in the end of 1795, but Ceylon was incorporated after the peace of Amiens, 27th March 1802. Trincomalee wood is the Berrya ammonilla, *Roxb.*—*Findlay.*

TRINGA, a genus of birds common in Europe and Asia. T. sub-arquata, the curlew sandpiper of the northern regions to beyond the equator and Australia, is very common in India.

T. canutus, the knot of the northern regions; rare in India.

T. platyrhyncha, the broad-billed sandpiper of Europe, Asia, Sumatra, Borneo, and Timor; not uncommon in India; rare in the United States of America.

T. minuta, the little stint of Europe and Asia, is very common in India.

T. Temminckii, Temminck's stint of Europe, Asia, and N. Africa; common in India.

T. alpina, or T. variabilis, the dunlin of the arctic northern regions, Japan, Timor (Temminck), Guiana; is not rare in India.

TRINGANU, a fertile and well-wooded district, containing gold and tin, between the Malacca Straits and the Gulf of Siam, containing about 50,000 souls. Tiu is used as money. The raja has borne before him, as marks of royalty, six spears with gold ferules.

TRINGANY RIVER, on the east coast of the Malay Peninsula, in lat. 5° 21′ N., and long. 103° 4′ E., has a little trade in pepper and gold. The roadstead is safe from March to September.

TRINOMALY, a town in the S. Arcot district, in lat. 12° 15′ N., long. 79° 9′ E., celebrated for its beautiful and extensive pagoda, which stands to the east, and at the foot of the Trinomaly Hill. Pilgrims resort to it in November, and 78,000 persons are known to have been present. The town frequently changed hands in the 18th century. Between 1753 and 1791 it was besieged on ten separate occasions, and was six times taken, thrice by assault. From 1760 it was a British post, on which Colonel Smith fell back in 1767, as he retired through the Chengama pass before Hyder Ali and the Nizam. Here he held out till reinforced, when he signally defeated the allies. The last time it was taken was in January 1791 by Tipu. It submitted unconditionally to Tipu, but the devastation and outrage were horrible.

TRIONYX, a genus of reptiles of the order Chelonia and class Testudinata. T. Guntheri, *Gray*, is known; also T. Ægyptiacus, Euphraticus, and ocellatus. The following species occur in India:—

T. Sinensis, *Wiegm.*, China, Chusan, Formosa.
T. Gangeticus, *Cuv.*, Ganges, Penang.
T. Javanicus, *Sch.*, Ganges, Penang, Dekhan.
T. ornatus, *Gray*, Siam, Cambodia.
T. sub-planus, *Sch.*, Singapore, Penang.

TRIPASSOOR, a small decayed town in the Carnatic, in lat. 13° 7′ N., and long. 79° 52′ E., with a fort now in ruins. It was formerly a station for cadets, and afterwards a small number of Chelsea pensioners resided in it. It is 25 miles west of Madras. The level of the plain is 183 feet above the sea.

TRIPATUR or Tirupatur, chief town of Tirupatur taluk, Salem district, Madras, in lat. 12° 29′ 40″ N., and long. 78° 36′ 30″ E.; population (1871), 12,837. Tirupatur was captured by the British, and retaken by Hyder Ali in 1767.—*Imp. Gaz.* ix.

TRIPATTY or Tirupati, in lat. 13° 38′ N., and long. 79° 27′ 50″ E., a town, a hill, and a Hindu pagoda, 80 miles west of Madras, in the N. Arcot district. Tripatty is divided into two parts, the Upper Tripatty and the Lower Tripatty. The former is a small village, with a temple, situate on a fertile and elevated valley between two hills of moderate height. The construction of the temple above is very simple, but it is the richest shrine in Southern India. It has jewels and other things worth 50 lakhs of rupees, and in cash it has an equal amount. It is here that pilgrims of all creeds and castes flock every day from all parts of India. The number of pilgrims on ordinary days amounts to two or three hundred; but during the annual festival, forty or fifty thousand people gather together on the hill. The name of the up-hill idol is Streenivasen, and of the one below, Govindaraja Perumal. The pilgrims always first ascend to the Upper Tripatty Hill, perform their vows, and then come down, pay a visit to the idol below, and return to their homes. The principal part of the vow in the up-hill temple consists in shaving completely the heads of men and women indiscriminately. A very large part of the pilgrims who visit this place walk up the hill, but the rich go in small portable cots. The annual festival held here is very large, and to it (in 1772) is attributed the first recorded cholera epidemic in India. Up to 1843, the pagoda was under the management of the British Government, who derived a considerable revenue from the offerings. Now, however, the whole is given over to the mahant or abbot; and in 1873, at Surgeon-General Balfour's suggestion, the mahant established a dispensary at Lower Tripatty. In the year 1870, a party of police ascended the hill in search of a person accused of murder; and Mr. Gribble (Cal. Rev.) described it as a second-rate temple. The idol is of stone, about seven feet high, with four arms, holding in one right hand a chakra, and in the left a chank shell. The other right hand points to the earth, and the other left hand holds a lotus. Its early history is not known, but it is supposed to be of ancient date. Hindus visit it as pilgrims from great distances, usually in bands and of all ages under a leader, the members calling out 'Govinda,' a name of Vishnu. Offerings are made with every possible object and of every degree of value,—gems, jewels, gold and silver cloths, always the hair of the head, and from the lame a silver leg, from the blind a gold or silver eye. Its revenues are derived from offerings (kannikai), arjitum or receipts, for purifications (abishekam), offerings (naividium), and processions (wahanum), and there are villages and lands held by the officers of the temple. The chief period of pilgrimage is during the Brahmantsowin, or legendary nine days' celebration of the idol's nuptials with Padmavati, daughter of a king.

TRIPHASIA TRIFOLIATA. *D. C.*

T. aurantiola, *Lour.*	L. diacantha, *D. C.*
Limonia trifoliata, *Linn.*	
China naringi, . BENG.	Manilla lime-berry, . ENG.
China orange, . . . ENG.	

A very handsome shrub, with middle-sized, white, fragrant flowers, and a bright-red, pleasant fruit, like an orange in miniature; often found in Chinese preserves. Worth cultivation for the exquisite fragrance of its flowers. Its fruits are small but of pleasant sweetness.

T. monophylla, *D. C.*, occurs in Timor, and a species occurs in China and Cochin-China. The genus belongs to the natural order Aurantiaceæ, and the species are found in the East Indies, Cochin-China, and China; thorny shrubs with simple or trifoliate leaves. The fruit of T. trifoliata is acid in taste, and is both preserved and eaten as a fruit.—*Mason; Voigt; Von Mueller.*

TRIPITAKA. The sacred canon of the Buddhists is called the Tripitaka, *i.e.* the three baskets. On Buddha's death, 500 of his disciples assembled in a cave near Patna, and collected his sayings. This was the first council. They chanted the lessons of their master in three great divisions,—the words of Buddha to his disciples, his code of discipline, and his system of doctrine. These became the three collections of Buddha's teaching, and the word for a Buddhist council literally means 'a singing together.' The first basket contains all that has reference to morality, or Vinaya; the second contains the Sutras, *i.e.* the discourses of Buddha; the third includes all works treating of dogmatic philosophy or metaphysics. The second and third baskets are sometimes comprehended under the general name of Dharma, or law, and it has become usual to apply to the third basket the name of Abhidharma, or bye-law. The Sutras are ascribed to Sakya Muni. They consist of ethical and philosophical dialogues by Sakya, and they make mention of the gods Narayan, Jonardhan, Shib, Brahma, Petomah, Borun (Vorun), and Songkar, other names for Shib, Kubir, Sokr or Vasob, and Vissoo Kormo. The Chinese copy of the Buddhist Tripitaka in the library of the India Office, consists of 2000 volumes. Mahinda, son of Asoka, is supposed to have carried the Attha-katta, ancient commentaries in Pali, to Ceylon, and to have translated them into Singhalese, which Buddhaghosha, about A.D. 430, retranslated into Pali. According to another account, the doctrines were first reduced to writing by the Ceylon priests during the reign of king Vartagamani, B.C. 88–76, and by a synod assembled A.D. 10–40 by the Turushka king Kanishka. For the former the language used was the vernacular, from which in the 5th century it was translated into Pali. For the latter, Sanskrit. Hardy, in his Eastern Monachism, has discussed the views held of Buddha in Ceylon. Changes must have been made very early, for eighteen heresies are deplored in the Mahawanso within two centuries from Sakya Sinha's death. In Ceylon, this faith has not been subjected to much persecution. In the 16th century, the Tamil invaders made every effort to destroy the books, but the priests sent

missions to Siam, properly ordained priests were imported from Burma, and by the 18th century Buddhism had regained its ascendency. The priests latterly have been actively diffusing a knowledge of their creed. They have printing presses, from which tracts, pamphlets, and serials issue in great numbers. They present some new and ingenious arguments, but the defiant and blasphemous expressions which they contain against the sacred name of Jehovah, are probably the most awful ever framed in human language. —*Cal. Rev.*

TRIPNO in form is similar to the horoscope of almanacs, somewhat resembling the Muhammadan Takwim. The subject is the duration of the Yoga, Nakshatra, Tithi, Wara, and other astronomical divisions of time. The object of it is devotional. —*Burton's Scinde*, p. 400.

TRIPOLI, a mineral, first brought from Tripoli and Africa. It is composed of silica, alumina, and oxide of iron, and consists almost entirely of fossil deposits of the siliceous coats of diatoms, which from their hardness form an excellent means of polishing metals, marble, glass, etc. The town of Richmond, in the United States, is built upon a stratum of these bodies twenty feet in thickness; in California and America generally, in Bohemia, throughout Europe and Africa, and in Great Britain, are found similar deposits, varying in the different species present.—*Gosse's Natural History*, p. 27.

TRIPOLY, meaning three cities, is the name of a city of Syria — Tarāblus-ush-Sham, and of a city of Barbary—Tarāblus-ul-Gharb. The latter has a spacious, safe harbour. The Syrian Tripoli is also a seaport town on the Mediterranean, on a plain at the foot of a branch of Mount Lebanon. It has the remains of buildings erected by the Crusaders, who took it A.D. 1108. It had previously been a famed seat of oriental literature. The three Syrian cities are supposed to refer to three colonies from Tyre, Sidon, and Aradus, which settled in three neighbouring places, and subsequently joined one another. The present town is built at the foot of the lowest hills of Libanus, about half an hour's distance from the sea-shore. The river Kadesha (Holy), otherwise called Nahr-Abu-Ali, flows through it, dividing the town into two equal parts, of which that to the south is the more considerable. It is enclosed by walls of no great height or strength. It is called Tarāblus-ush-Sham, or Eastern Tripoli, to distinguish it from Tripoli in Barbary, which is called Tarāblus-ul-Gharb, or Western Tripoli.—*Robinson's Travels*, ii. p. 69; *Catafago.*

TRIPUNDRA. SANSK. A triple transverse line on the forehead of the worshippers of Siva. It is made with the vibhuti or ashes taken from the fire of an Agnihotra Brahman, or they may be the ashes of burnt cow-dung from an oblation offered to the idol. See Gop Chandana; Vibhuti.

Tripura, the district of Tiperah, from Tri, three, and Pura, a town. Tripura comprises the three towns of the three maternal uncles of Ravana.

Tripurari, the same with Mahadeva.

Tripureswari, a form of Durga.

Triratna, SANSK., three precious things of the Buddhist creed, the tree, the lion, and the wheel; also the three gems, Buddha, Dharma or the Law, and Sangha, the church or clergy; also the Buddhist triad.

Trisala, wife of Siddhartha, mother of Mahavira.

Trisanku, a prince of Oudh of the Solar line, elevated to heaven during his life by the sage Visvamitra.

Trishikha, SANSK., from Tri, three, and Shikha, the ascending flame.

Trisiras, SANSK., three-headed, the name of a son of Twashtri, also a name of Kuvera, god of wealth, also the same with Cerbura.

Trisul or Triratna, a Buddhist symbol, degraded at Jaganath to an idol.—*As. Res.* ix. p. 127, xvii. p. 252, iii. p. 409.

TRISUL, a triple-peaked hill in Kamaon, on the boundary of Garhwal; the east peak is 22,342 feet above the sea; the middle peak, 23,092 feet; and the west peak, 23,382 feet.

TRISULA, the trident of Siva. It is considered to be in continual motion over the face of the universe to guard and preserve its creatures. To oppose its course would be to incur immediate death. Its motion would appear to be regular, but varying according to the days in the week. Thus on Monday and Saturday, Siva is said to hold his trident from the east. No one should, on these days, travel in that direction. It is unlucky to proceed towards the westward on Sundays and Fridays, to the northward on Tuesdays and Wednesdays, to the eastward on Saturdays and Mondays, and to the southward on Thursdays. The trisula or trident symbol of Siva was once used on a copper paisa weighing 98¼ grains, for circulation in the province of Benares only. This special emblem of Siva constituted the banner of the Bhattaraka. Varieties of the trisul, bala, or trident continued to be emblematic on the coins of the early part of the 19th century in Mathura, Jalaor, Sagar, Srinuggur, Kalpi, etc.—*Prin. Ind. Ant.; Wilson.* See Trident.

TRITICUM, a genus of plants belonging to the Gramineæ. Several species are extensively grown in S.E. Asia. They furnish the wheat, a seed or grain largely used for food since the most ancient times. There are numerous sorts of cultivated wheat, from which must be distinguished the three primary varieties, viz.:—

Var. a. muticum, T. hybernum, *Linn.*, the winter wheat or unbearded wheat.
Var. b. aristatum, T. æstivum, *Linn.*, the summer wheat or bearded wheat.
Var. c. adhærens, T. spelta, *L.*, wheat with fragile axis and adherent grain.

Metzger enumerates as distinct kinds of cultivated wheat, T. dicoccum, durum, monococcum, polonicum, spelta, turgidum, and vulgare.

Wheat is grown largely as a winter crop in Coimbatore, Salem, Mysore, Berar, Sind, Oudh, Rajputana, Central India, and in the Panjab plains, T. æstivum being the common species, and T. durum the more frequent about Ludhiana and Multan, of many varieties, white or red, generally bearded; but beardless wheat is common in some parts. Twelve samples of red and sixty-two of white wheat were exhibited at the Lahore Exhibition. Red wheat holds a very much lower place in the estimation of the Panjab natives, and sells at a cheaper rate, than white, the former being consumed by the poorer classes and the bulk of the population, whilst the use of the latter is restricted to men of wealth. Several varieties of white wheat are also grown. The gilgit or paighambri, a small, round, fancy

grain, is also called Mullane or Rai Munir, from the places where it was first grown. There are also daud khani, ghoni, kabr, and vadanak (kanag dagar, Shahpur), the last-named being a particularly fine large grain.

Some kinds are grown to great heights in the Himalayas, wheat being one of the chief crops up to 9500 feet on the Chenab, and, according to Dr. Cleghorn, occurring to 15,000 feet on the Sutlej, good to 11,500 feet, and grown to 13,000 feet in Ladakh. At Ambala, wheat and also barley are sometimes sown as early as August and September, so as to be in flower in December; but in this plan it is frequently killed by frost.

The various kinds of wheat have been known from a very early period, and mention is made of wheat as a food in the earliest records of the history of man. Both the Egyptians and the Jews made use of wheat as an article of diet, and this food is early mentioned in the Bible. It was also used by the Greeks and Romans, and Theophrastus and Pliny make frequent mention of it. When the fruit is ground, the testa, or seed-coat, is separated from what is called the flour. This flour consists of the powdered albumen and embryo of the seeds. The proximate vegetable principles which this flour contains are starch and gluten. The starch is a highly carbonized vegetable principle, whilst the gluten is characterized by possessing nitrogen. Foods that contain carbonaceous matters are fattening, whilst those that contain nitrogen are strengthening. It is thus that wheat-flour has come to be the staple article of diet of the finest races of men in the world. The other cereal grasses contain the same principles, but the gluten or azotized principle is not in so large a quantity as in wheat, as the following analysis of 100 parts of the organic matter of wheat, rice, and barley will show:—

Wheat, . . .	70·00 starch.	23·00 gluten.
Rice, . . .	85·07 ,,	3·60 ,,
Barley, . . .	79·00 ,,	16·00 ,,

The chemical composition of wheat greatly varies, however, according to the soil in which it is grown. In 100 parts, the following was found to be the composition of eight samples:—

	Baroach.	Gujerat.		Bombay Bazar.			Madras.	Calcutta.
Moisture, . . .	12·40	10·88	13·28	13·41	13·32	12·56	10·80	11·78
Nitrogenous matter, ...	14·68	13·30	13·19	12·84	14·90	14·26	12·98	12·73
Starchy matter, .	69·78	73·23	70·87	70·99	65·84	70·26	73·51	72·58
Fatty or oily matter, ...	1·16	1·29	1·20	1·17	1·14	1·06	1·03	1·01
Mineral constituents, ...	1·98	1·30	1·25	1·59	2·10	1·86	1·68	1·90

—*Powell; Stewart; Dr. Cleghorn; Eng. Cyc.*

TRITICUM ÆSTIVUM. *Linn.* Summer wheat.

Burr, ... Arab.	Rozat, Zud, . . Ladakh.
Godhama, Gono, . Beng.	Shruk, . . . ,,
Marghoom, . . Bombay.	Tokar, Tomar, . ,,
Ghawat-ghoom, ,,	Kunuk, ... Panj.
Gyung-sa-ba, . . Burm.	Gandam, ... Pers.
Siau-meh, . . . Chin.	Soomuna, . . Sansk.
Kum'h, ... Egypt.	Kauk, Giho, . . Sind.
Gehun, ... Hind.	Godumbay arisi, . Tam.
Dro, Do, Tro, To, Ladakh.	God'humulu, . . Tel.

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 13,000 feet; highest limit, 15,000 feet. Both bearded and awnless varieties occur; kunuk denotes the flour, not the grain. Rice is not observed above 6000 feet. This variety is cultivated in many parts of British India. Two sorts are grown in Mysore, called Hot-te godhi and Jeve godhi, the latter being covered with husks like paddy. Jeve godhi is only grown in the lands bordering on the Pennar, and the gardens in the Bangalore division. The Hot-te godhi is largely cultivated in dry lands in the Chittuldroog division, and the vicinity of Hurrihur. This is the wheat usually employed for making loaf bread. It is exported to the Neilgherries.—*Roxb.; M. E. J. R.; Cleghorn, Panjab Report; Ainslie.*

TRITICUM DURUM. *Desf.* True bearded wheat. It is grown in Switzerland, Italy, Sicily, Spain, and in the Panjab, and it is frequent about Ludhiana, Multan, etc.—*Edgeworth.*

TRITICUM HYBERNUM. *Linn.* Lammas wheat, winter wheat. Is grown in the Panjab and in the N.W. Himalaya.—*Roxb.*

TRITICUM REPENS.

Meh-huh, ... Chin. | Couch grass, . . . Eng.

TRITRAN or Three Corners of the people of Sind, is the Katar of the Persians and Afghans. The latter people are very fond of it, especially the lower orders in the country villages.—*Burton's Scinde*, p. 294.

TRIUMFETTA ANGULATA. *Lam.*

T. rhomboidea, *Jacq.*, *Hook.*

A plant of Berar, belonging to the natural order Tiliaceæ, yields a fibre.

TRIUMFETTA LOBATA. *M'Clelland.*

Phet-wun, . . . Burm. | Po-lo-ma, . . . Chin.
Bet-won, ... ,, |

This fibrous plant is annual, and grows to a height of five or six feet. It presents a small yellow flower in December, consisting of five petals, and in February presents a small round capsule covered with stiff bristles.—*M'Clelland.*

TRIVANDRUM or Tiruvantipuram, the capital of Travancore State, in lat. 8° 29′ 3″ N., and long. 76° 59′ 9″ E. Within its fort are the residences of the maharaja and his relatives and officers; also the temple of Padmanabha (the Lotus-navelled), a name of Vishnu. The chief out of the 45 utparas (feeding-houses) maintained by the State is also at Trivandrum, and is known as the agarasala.—*Imp. Gaz.* ix.

TRIVENI, the triple braid, a name of Prayaga. It is the mystical union, at Allahabad, of the three sacred rivers, the Ganges, Jumna, and Saraswati, severally the consorts, or energies, of the three great powers, Siva, Vishnu, and Brahma. Triveni, or the three-plaited locks, is a mythological junction, a female triad, similar to that of the Trimurti of male powers. The Ganga or Ganges, Yamuna or Jumna, join near Allahabad, and the Saraswati, now a dry bed, is also supposed to join the other two underground. A Hindu dying near the imagined confluence of these three streams, or even those of the Ganga and Yamuna, attains immediate beatitude; consequently self, or self-permitted, immolations, sati, etc., were meritorious on this peculiarly holy spot. The junction of the three waters at Allahabad is a sacred prayag, and an annual mela is held in March for purposes of ablution. Junctions of any sort, especially of waters, are held sacred by Hindus, and above all, the union of these sacred rivers Ganga and Yamuna or Jumna near Allahabad, the latter river having previously received the Saraswati below Dehli, so that, in fact, all three do unite at this famed sangam or confluence. But the Hindu poet feigns a subterrene flow of

the Saraswati, and a mystical union at the sacred point, where bathing is deemed peculiarly efficacious, and where zealots are persuaded that suicide is of a most meritorious description. Major Moor once saw, at Poona, a well-modelled group in clay, where Radha's locks, tripartite, were plaited into the mystical Triveni by the amorous Krishna, who sat rapturously admiring the work of, and in, his hands. Other rivers are, however, held sacred by the Hindus, viz. the Godavery, the Sindhu or Indus, the Krishna or Kistna, and the Brahmaputra. — *Campbell; Tr. of Hind.; Cole. Myth.; Moor, Pantheon.*

TRIVENI or Tribeni, the Three Streams, is a village in the Hoogli district of Bengal, in lat. 22° 59′ 10″ N., and long. 88° 26′ 40″ E., at the junction of the Hoogli branch of the Ganges, the Saraswati, and the Jamuna. North of the Saraswati is the Tribeni ghat, a magnificent flight of steps. Tribeni was one of the four samaj or places famous for Hindu learning, the others being Nadiya, Santipur, and Guptipara. Formerly there were over 30 Sanskrit schools in Tribeni. At Tribeni, the Makara Sankranti or Uttarayan festival, the day on which the sun enters Capricorn, takes place in January, on the last day of the Hindu month of Paush, and the first day of the succeeding month of Magh. Offerings are made to progenitors, to the domestic genii, and to the universal gods. The ceremonies are performed in the house by the family priest. (1) The great bathing festival on Sangor Island is held at this time; (2) Bisuva Sankranti is held in honour of the sun at the vernal equinox, in February; (3) Varuni, the great bathing festival of Bengal, in honour of Varuna, the god of the waters, held in February or March; (4) Dasahara, held in June, in commemoration of the descent of the goddess Ganga from heaven to save the souls of the 60,000 sons of king Sagar, who were reduced to ashes for the crime of assaulting a Brahman sage; (5) Kartik, in honour of Kartikeya, son of the goddess Durga. All these gatherings are utilized for purposes of trade.

This very old place is spoken of by both Pliny and Ptolemy. It is a school of great repute for indigenous Sanskrit. The great pandit Jagganath Turkopunchanum, who was Sanskrit tutor to Sir William Jones, and who compiled the digests of Hindu laws under the patronage of Lord Cornwallis, was a native of this village.— *Statistical Account of Bengal*, iii. p. 322; *Tr. of Hind.* i. p. 16.

TRIVIKARY, a village in the South Arcot district, about 13 miles W.N.W. of Pondicherry. It has extensive fossil trees, silicified, around what seems to be a crater. About three or four miles E. and N.E. of Verdur, a village 10 miles W.N.W. of Pondicherry, are extensive fossiliferous limestone strata, containing molluses and fishes of the Squaloid family and Placoid order. Similar strata occur at Paroor, 10 miles W. of Verdachellum, and at Ootatoor, 25 miles N.W. of Trichinopoly. The deposits at the three places, Verdur, Paroor, and Ootatoor, are connected with each other geologically. The country around Trivikary consists of a coarse sandstone, containing remains of large trunks of fossil trees, to the westward of which the primitive gneiss formation of the Peninsula appears, and to the east extensive cretaceous beds, with numerous remains of ammonites and other chambered shells which stretch for some distance towards the sea, after which the sandstone again appears, and continues until covered by the alluvial formation of the valley of the Tembakam-nala, which reaches to the sea-shore at Pondicherry. In some very well-defined sections of the sandstone rocks in deep gullies cut by the supplying streams of the Usatari tank, four miles to the east of Pondicherry, are clear indications of cretaceous fossils underlying the sandstone. The Usatari sandstone beds, instead of being under the cretaceous rocks, rest very unconformably upon them. A careful comparison between the formations at Trivikary and those at Usatari has shown that the Trivikary sandstones are identical with those at Usatari, therefore newer than the cretaceous beds, and unconformable to them.

TRI VIKRAMA, a name of Vishnu. It means he who took the three steps, and alludes to the sun's rising, culminating, and setting. See Avatar; Vamana; Vishnu.

TROCHISANDRA INDICA. *Bedd.* A very handsome, lofty tree, with a beautiful foliage. It is very abundant in the dense, moist forests of the Animallays at an elevation of 3000 to 6500 feet. It is said by the natives to yield a valuable timber. It flowers in December and January, and ripens its fruit in April and May.—*Beddome.*

TROGLODYTES. Mr. Stanley, in crossing Africa near the sources of the river Congo, came upon a country occupied by a diminutive race. The Troglodytes of Herodotus were a small-sized race of men dwelling in Ethiopia, and their food is described as that of lizards, serpents, and other reptiles; their language like the screaming of bats. Sharpe, in his History of Egypt, is of opinion that the Troglodytic Arabs held a strip of country of about four hundred miles in length on the African coast of the Red Sea, separated from Ethiopia by mountains and deserts. They were a wandering, unsettled race, described by their neighbours as savages (Diod. Sic. lib. iii. p. 33), whose wars arose for right of pasture rather than for ambition or property. They fought with slings and darts, and outran horses in their speed; they lived in caves, and killed the aged, the lame, and the sick. Other tribes, however, more civilised (Pliny, lib. xii. p. 42), afterwards traded with the Sabæans of the opposite coast, and supplied the Egyptians with the myrrh, balsam, olives, topaz, and metals which their country or their trade produced. Like their neighbours the Egyptians, the Troglodytæ worshipped images and animals, particularly the turtles peculiar to their shores, while the more civilised tribes were worshippers of one God.— *Melp.* p. 341; *Tod's Travels*, pp. 84, 85.

TROLLIUS ASIATICUS, a flowering plant of the order Ranunculaceæ. T. Europæus grows throughout the north of Europe in moist pastures in sub-alpine districts. The flowers are large and handsome. In Scotland they are called luckengowans or cabbage daisies, and are gathered on festive occasions for making garlands and decorating the cottages of the peasantry.

Trollius Chinensis, *Smith*, Kin-lien, CHIN., is the golden lotus of Chinese writers. It grows to great perfection in Tai Chau in Shen-si. It has persistent yellow flowers.—*Smith, M. M. C.*

TROMBAY, in lat. 19° 2′ N., and long. 72° 56′

E., in the Konkan, N. of Bombay. Trombay is conspicuous for the mountain called Ncat's Tongue, which attains the altitude of 1000 feet. It is nearly connected with Bombay.

TROPÆOLACEÆ, the natural order of plants known as the Indian cresses, comprising genera several species of which are ornamental. The species of Tropæolum are climbing plants, T. aduncum is the hooked nasturtium, T. azureum is the purple nasturtium, the fruit of T. minus is pickled and eaten, and T. pentaphyllum and T. tricolorum are also known. T. tuberosum is cultivated in Peru for the sake of its tubers, which, though disagreeably acrid when fresh, are not amiss when cooked. After being boiled, they are allowed to freeze, and then eaten before thawing, and while crisp. T. majus, *Linn.*, the Indian cress or nasturtion, is a showy annual, flowers and leaves of which are eaten as salads, and the seeds pickled in salt and vinegar as a substitute for capers.—*R. Brown.*

TROPHIS ASPERA. *Retz.*

Achymus asper, *Soland.*	Epicarpurus orientalis, *W. Ic.*
Streblus asper, *Lour.*	
Sheora gach'h, . . BENG.	Barranki, Bari venka, TEL.
Dahya, ... HIND.	Sahadra, . . . URIYA.
Kurrera, . . . MAHR.	

This tree is very plentiful in Ganjam and Gumsur, attaining a height of 30 feet, and a circumference of 2 feet. In Gujerat the wood is reckoned of good quality for small purposes, for it will seldom square above 4 inches. It is said to be used in Ganjam for bandy wheels. Its scabrous leaves are used to polish horn and ivory, etc. The bark is used medicinally, the leaves and sap are used for wounds and for a disease of the eye termed jokia in Orissa, said to be peculiar to children. The berries are greedily eaten by birds. *Dr. Gibson; Captain Macdonald; Royle; Voigt; Ell. Fl. Andh.*

TROPIC BIRDS. Phaeton candidus, *Linn.*, is the white tropic bird, and P. phœnicurus, *Linn.*, the roseate or red-tailed tropic bird. The former has chaste and delicate satiny plumage. They are called by sailors the boatswain or straw-tails, from the two white or red projecting tail-feathers, which they name the marline-spike, and are used as ornaments in the Society Islands. The Spaniards call them rabijunco or rush-tails. They are interesting to sailors, because met with far from land, to which seamen believe they nightly return to roost. The red-tailed species is met with in the Bay of Bengal, the Indian Ocean, and throughout all the Indian-Australian tropics. The white tropic bird also occurs in the Bay of Bengal and tropical seas, and is said to breed in the Mauritius on trees. They have been seen 1000 miles from land (G. Bennett, Gather. pp. 88-91). They breed about the end of August or beginning of September; their nests are merely circular excavations. When sitting they are easily captured; and in the Mauritius and Polynesia, in the S. Pacific, the people catch them, pull out the two long tail-feathers, and then release the bird.—*Michelet on Birds; Jerdon's Birds.*

TROPIDONOTUS, a genus of innocuous snakes. Jerdon mentions T. monticolus, plumbicolor, piscator, schistosus, and stolatus. T. macrophthalmus, 39 inches long, has a large eye, is often mistaken for a cobra. T. quincunciatus, the dhone of Bengal, is very aquatic in its habits.

TROUT. A sort of carp is usually called the Himalayan trout. It has two long string-like appendages projecting on each side of the mouth. They can be caught with a hook baited with dough; the largest does not exceed 3 lbs. in weight. The flesh is soft, very pale, and almost tasteless.—*Adams.*

TRUBU, MALAY, is the roe of the Alausa troli, a fish of which the salted and dried roes form a very considerable article of trade in the western parts of the Malayan Archipelago. The fish seems to be local, and, like salmon and some other fish, to frequent rivers for the purpose of spawning. Its favourite resort is the muddy eastern coast of Sumatra, and more especially the narrow strait which divides Bancalis and some other low islands from the mainland, and into which the river of Siak disembogues. The river of Bukit-batu is a very small stream, close to the mouth of which stands the town of Bukit-batu or rock hill, which is a place of considerable trade, the grand staple being roes of the trubu fish or telur-trubu (trubu, roe, or egg). There, three or four hundred boats, with two and three men in each, often go out at a time to the fishery, which is outside the straits of the Tanjung-Jati, or teak tree promontory. The fishery of the trubu is referred to by De Barros as conducted, on the arrival of the Portuguese, just as it is at present. The rivers (of Sumatra), says he, contain a great variety of fish, and in some of them, such as that of Siaca (Siak), they catch small shads (saves), of which the people of the country use the roe only, and of these they have a greater abundance than we have of the fish themselves.—*Decade* 3, book 5, chap. i.; *Crawfurd, Dictionary*, p. 440; *Anderson's Mission*, p. 335. See Fisheries.

TRUFFLES, the Tuber cibarium, *Sibth.*, are found in the Panjab Himalaya towards Kashmir and above Kangra. Truffles are found in Europe by the aid of dogs, a few inches below the surface of the ground, in various parts of England, and on the Continent. The London supply is chiefly from Kent, Wilts, and Hants.

TSALAI. PUKHTU. A heap of stones piled over the graves of the Afghan holy men and martyrs.—*Bellew.*

TSALE or Tschalleh. TIB. Borax. Mentog, 'borax flowers,' is fine borax from Puga and Changthang, which needs no further refining.

TSAL-WEE. BURM. A chain of nobility, a badge of nobility among the Burmese, and it is supposed to be derived from the Brahmanical thread. The order consists of six classes, distinguished by the number of gold chains, united by bosses, that compose the order. 3 of fine open work is the lowest; 3 of twisted gold chain is the next; then 6, 9, and 12, the latter being the highest grade with the exception of that worn only by majesty, and which has 24 chains. The badge of the order is worn depending from the left shoulder across the breast and back under the right arm.—*Yule; Fytche*, p. 232. See Titles.

TSANDA, a goldsmith who gave Sakya the meal of rice and young pork which brought on diarrhœa, ending in death. Sakya died in a grove of sal trees (Shorea robusta) near the town of Kusinara.

TSAN-PE-NA-GO, a noble range of hills eastward from the town of Malé in Burma, which rise in bold and craggy peaks, and attain an ele-

vation of probably some 6000 feet. This range is also named Shwe-u-doung, and is sixteen miles to the westward of the ruby mines. Snow lies on them for five mouths in the year.—*Yule*, p. 181.

TSAN-PU or Sangpu, a river of Tibet, supposed to form the upper waters of the Brahmaputra. It rises on the uorthern side of the Himalayas, in about lat. 31° N., and long. 83° E., not far from the sources of the Indus and the Sutlej; thence it flows in an easterly direction through the whole length of Tibet, passing near the capital, Lhassa. The greater portion of its course has been explored. It is agreed that the Tsan-pu takes the name of the Dihang, under which appellation it enters Assam aud becomes one of the three swift rivers which unite to form the Brahmaputra, iu lat. 27° 50′ N., and long. 95° 50′ E.

TSAU-BWA. Burm. A chief of a clan; a lord, a ruler. The Kakhyen are divided into septs, each of which is headed by a Tsau-bwa, who is independent, except in so far as a dread of the Burman king can influence his conduct. The next in rank to the Tsau-bwa is called the Pawmyne. Both offices are hereditary. The Tsau-bwa of Ponlyne, a village to the north-east of Bhamo, was the first chief whom Major Sladen met.

TSAYA-DAU. Burm. The superior of a Buddhist monastery. Every kyoung or monastery has a tsaya-dau who regulates its affairs, and attends to the religious and moral training of its members. Over the kyoungs of a district is a gon-ok or bishop, aud at Mandalay is a patriarch styled Thathana-boing, who is supreme in all religious matters. These orders have fallen into abeyance in British Burma.—*Fytche*, ii. p. 195.

TSEANG-KEUN is the highest title bestowed on the Manchu; Te-tai is the highest military title.

TSE-FOU-YOUEN-KOUEI. Chin. A Chinese encyclopædia published under the dynasty of Song, in the year A.D. 1005.—*Huc's Christianity*, i. p. 78.

TSEH-LAN. Chin. A species of iris. In Ho-nan in China, the rhizomes of several kinds of iris are eaten, or added to the infused tea-leaf to flavour it.—*Smith.*

TSE-TSE, a fly of Africa, the Glossina morsitans, *Westwood*, is not much larger than the common house fly, and is nearly of the same brown colour as the honey bee, with three or four yellow bars across the hind part of the body. Its alertness enables it to evade dexterously attempts to catch it by the hand. Its proboscis is a slender glossy style. Its peculiar buzz is well known to the ox, the cow, the horse, and dog, for with them its bite is death,—they waste away and die; but man, game, and all wild animals, even sucking calves, the mule, ass, and goat, are all exempt. Its object seems to be to replete itself with blood. In the ox, a few days after the bite, the eye and nose begin to run, the coat stares, a swelling appears under the jaw, and perhaps auother at the navel; emaciation followed by flaccid muscles ends in death. It abounds on the banks of the Zambesi river of Africa. The Tsal-tsalya, or Abyssinian spear-fly, is mentioned in Isaiah vii. 18. It is the Tsee-tsee fly of Livingstone, the winged Tsal-tsal or spear-fly of Isaiah. It is the Zebud of the Chaldæan version of the Bible, the Zimb of the Arabian version, and the Tsal-tsalya in the Ethiopian version. The Negroes call it Tse-tse, and the Greeks give it the name of Cynomya. Nearly all the central countries of S. Africa are more or less infested with it. It usually frequents the bushes and reeds on the borders of marshes.—*David Livingstone, M.D., Travels.*

TSHAMPA, a population lying between the mouth of the Mei-kong and the frontier of Cochin-China.—*Latham.*

T'SHAT T'SIC, a Chinese festival held during the fifteen days' observance of the Shu-yee burnt-offerings for paupers. It is held on the seventh day of the seventh mouth, in honour of the seven stars, which the Chinese regard as goddesses, one of whom visited earth and was married to a cow-herd, with whom she lived for a time.

TSHEN, the third recorded Chinese dynasty, began B.C. 1050, lasted 269 years. The emperor Yeu-Yang began to reign B.C. 781. His sixth year was B.C. 776. Confucius lived uuder his dynasty, and he recorded the observations of the solar eclipses from B.C. 481 upwards to 720.

TSHEN-BYOO-SHENG. Burm. Lord of the white elephant, a title of the king of Burma.

TSIEN. Chin. A coin called Dehos by the Tartars, and Sapek by Europeans, is the only currency of the Chinese empire. Gold and silver are never coined, but circulate in ingots of different weights. Gold-dust and leaf-gold are also in use for commercial purposes. — *Huc's Journey*, p. 63.

TSIEN TANG, a river of China. The bore or eagre on this river, according to a Chinese proverb, is one of the three wonders of the world, the other two being the demons at Tang-chan and the thuuder at Lung-chan. See Bore.

TSIN, a name of the empire of China, taken from the dynasty of this name. Applied to this couutry, there has nearly always been some form of Sin, Chin, Siuæ, China. The region in question was known to the ancients as the land of the Seres; to the middle ages as the empire of Cathay. The name Chin has been supposed to have come to Europe through the Malays, like many another word and name connected with the trade and geography of the far east, and to have been applied by them to the great eastern monarchy, from the style of the dynasty of Tsin, which a little more than two centuries before the Christian era enjoyed a brief but very vigorous existence, uniting all the Chinese provinces under its authority, and extending its conquests far beyond those limits to the south and the west. There are, however, reasons for believing that the name of China must have been bestowed at a much earlier date, for it occurs in the laws of Menu, which assert the China race to have been degenerate Kshatriya; and the name occurs in the Mahabharata, compositions many centuries older than the imperial dynasty of Tsin. Marco Polo says, 'I shall take another occasion to establish that the statement in the laws of Menu is partially true, and that people from India passed into Shen-si, the westernmost province of China, more than one thousand years before our era, and at that time formed a state named Tsin, the same word as China.'—*Lassen*, i. p. 857; *Panthier; Marco Polo*, p. 449.

TSIN, fourth dynasty ruling in China, began

B.C. 255, and lasted to 207, 49 years. About B.C. 221, the prince of Tsin, one of the vassal states into which the till then feudally governed China had been divided, made himself sovereign of the empire, under the title of Chi-hwang, also written Chi-hoang-ti. He was a great conqueror, and was successful in opposing the inroads of the northern barbarians, the Heung-noo or Huns, one of his measures to withstand whom was the erection of the celebrated Great Wall. Prior to the emperor Chi-hoang, the country had been under numerous principalities and commonwealths, but that warrior emperor brought them all under subjection, and it is supposed to be from his time that the country was called China, from Tsin or Chin, the name of his dynasty. It was this emperor also who built the Great Wall to keep off the incursions of the Tartars. It was done by forced labour; every third labouring man was compelled to work for his bare food as a remuneration. It extends from the sea to the most westerly province of Shen-si, about 1500 miles. It was built of earth faced with brick; it crosses mountains, valleys, and rivers, and was finished in five years. Its breadth admits of six horsemen riding abreast, and it has a tower every hundred yards. It was Chi-hoang-ti who introduced yellow as the colour of the royal family's clothes. The Chin dynasty was overthrown by Linpang, of the Han province, who was the first of the Han dynasty. With the destruction of the Tsin dynasty, great injury resulted to the Chinese annals.

TS'ING-MA. CHIN. Fibre of Sida tiliæfolia, also of Boehmeria nivea.

TSING-SZE. CHIN. The third literary degree in China, meaning advanced scholar, equivalent to LL.D. The examiuation for this degree is held every three years at Pekin.

TSING TSING. CHIN. A Chinese salutation, meaning I pray you! I pray you! Corrupted by Europeans to Chin Chin.

TSO-GAM, a salt lake in Eastern Ladakh, Tibet, in lat. 33° 70′ N., and long. 78° 34′ E., and 14,580 feet above the sea.

TSO-KUL, or Salt Lake, in lat. 33° 33′ N., and long. 78° 44′ E., in Pankong (referred to Pangur), south of the salt lake Tso-mo-gna-la-ri, and 14,400 feet above the sea.—*Cumming.*

TSO-MAPHAN, Manasarowara lake. Gya-Tso, the great lake, the ocean.

TSO-MITBAL, a salt lake, in lat. 33° 25′ N., and long. 78° 40′ E., in Pankong, south of the salt lake Tso-mo-gna-la-ri. It is 14,167 feet above the sea.—*Schl. Herm.*

TSO-MO-GNA-LA-RI, a salt lake, in lat. 33° 39′ 8″ N., and long. 78° 38′ 5″ E., in Pankong near Takung. It is 14,010 feet above the sea. It is divided into two parts by a river delta, analogous to the lakes of Brienz and Thun in Switzerland. The two are about equal in surface, but, according to native information, they differ in height about 40 feet; the upper lake, which contains nearly fresh water, almost drinkable, being therefore 14,050 feet.—*Schl.*

TSO-MO-RI-RI, a salt lake, in lat. 32° 45′ 4″ N., and long. 78° 16′ 6″ E. (referred to Nama Bingbo, on its southern border), in Spiti. It is elevated 15,130 feet above the sea.—*Schl. Herm.*

TSONG-KHA-BA, a Buddhist priest of Tibet, born A.D. 1417, at Si-King in Tibet. In the 15th century, the Sakya priesthood, known as the Brug-pa, also Hung-Kiao or the Red Church, had introduced marriage, but Tsong-kha-ba preached the celibate views of Sakya Muni, and insisted on the adoption of yellow robes. Before his death, A.D. 1478, he was the recognised spiritual leader of the Lamaist majority, and was acknowledged by the Ming emperor, who gladly welcomed him, because the Red Hierarchy had favoured supporters of the descendants of Kublai. Tsong-kha-ba left behind him two eminent disciples, on whom he laid commands, enjoining upon them that they should be born again, generation after generation, as hubil'han, to practise the doctrines of the Great Conveyance (Ta-ch'eng), in Sanskrit Mahāyāna, the esoteric form of Buddhism. Hubil-'han, in Chinese Hwa-shen, means transformed body, transformation, re-embodiment.

The two disciples were designated respectively Dalai Lama and Panshen Lama. From that time the spiritual and a large portion of the temporal authority in Tibet, which had previously been engrossed by the Red Hierarchy, has been wielded by the successive re-embodiments of Tsong-kha-ba's disciples, whose identity, on their reappearance in human form, has been merged, according to the legends that have subsequently arisen, in the personality of the two most exalted and revered of the divinities proceeding from the essence of Buddha himself. In the senior of the two, the Dalai Lama, the Bodhisattwa Avalokit-eswara (the Chinese Kwan yin), is believed to appear on earth; and in the person of the second, the Bodhisattwa Manchusri is recognised, this deity having preliminarily occupied the form, it is also fabled, of Tsong-kha-ba himself. The second in succession of the Dalai Lamas, in the course of a long career, laid the foundation of the existing hierarchical system in Tibet, establishing his seat of ecclesiastical rule at Lhassa, and organizing a body of lesser spiritual dignitaries, under the designation Hut-ukht'u, who, like the two supreme religious chiefs, were to be continued by a series of re-embodiments. Like the Dalai Lama and Panshen Lama, these spiritual chiefs of the Tibetan priesthood became popularly known as Living Buddhas, in Chinese Hwoh Fu, a term by which they are at present commonly designated. During the latter half of the 17th century, the authority of the Dalai Lama gained entire predominance throughout the greater portion of Tibet; the Gialbo, or the descendants of the ancient kings, seem to have gradually faded into insignificance, whilst the authority of the Mongol princes grew more and more direct. Already, at a somewhat earlier period, Gushi Khan, the reigning prince of the Khoshot Mongols, had supported the Dalai Lama of the period against the claims of the reigning sovereign, and had been rewarded with the title of Nomen' Han, or Prince (Khan) of the Religious Law, an equivalent of the Sanskrit Dharma Raja. By the influence of Gushi Khan, the Dalai Lama aud Panshen Lama in A.D. 1642 were induced to despatch an embassy with tenders of allegiance to the Manchu sovereign, whose forces were then on the eve of effecting the overthrow of the Ming dynasty in China; and from this period relations of intimacy took their rise, developing themselves in time into the assumption, on the part of the Chinese emperors, of the sovereign tutelage of the Buddhist papacy

in Tibet. This consummation was hastened by the wars undertaken towards the close of the 17th and in the early part of the 18th centurics by the Sungar chieftains, for the subversion of the authority of the Dalai Lama. The temporal administrator who, as regent under the Dalai Lama, had long conducted the government of Tibet, with the title of Deba, ruler or chief, was invested by Kiang Hi, in A.D. 1694, with the title of Tupeh-t'eh-kwoh-wang, or king of Tibet. But the authority thus established was ere long attacked by an invasion of the Sungars; and the Chinese armies, which were despatched hereupon for the liberation of Tibet, remained as conquerors of the country.

For a time the government remained in the hands of puppet nominees of the Chinese emperor; but in 1725 an outbreak directed against one of these gave a pretext for the appointment of two High Commissioners to control the affairs of Tibet on behalf of the Chinese Government. Further attempts at revolt led, in 1750, to the entire suppression of the temporal sovereignty in Tibet, and the government of the country was placed, thenceforward, in the hands of the Dalai and Panshen Lamas, aided by a council of four laymen, entitled Kalon or Kablon, *i.e.* Ministers of State, under the direction in chief of the two Imperial Commissioners or Residents appointed from Pekin. The government has from that time forward continued to be conducted on this basis, the authority of the Chinese Government being rendered the more complete by the long minorities which are entailed at each successive re-embodiment of the two supreme ecclesiastical dignitaries.—*Mayer, Chinese Government.*

TSO-RUL, or Bitter Lake, in Ladakh, is about five miles to the north of Pankong; its waters are very bitter. It is about sixteen miles long and two broad.

TSUNG. CHIN. Any species of palm of the genera Livistonia, Chamærops, Caryota, Raphis. Tsung-tsing, a general term for several evergreen oleaccous trees on which the wax insect feeds.—*Smith.* See Wax Insect.

TSUNG-JIN-FU. CHIN. The imperial clan court, charged with the registration, payment, and jurisdiction of the imperial family. Tsung-shih, a court of justice taking notice of cases connected with the imperial family.

TSUNG LING. TIB. Literally Onion mountain, the Kara-korum or Kouen Lun mountains, which, as high as 17,000 feet, are covered with wild leeks.—*Cunningham.*

TSZE KOO. CHIN. A vegetable of China, which the people believe to be efficacious when married women desire female children.—*Gray.*

TUAR, a Rajput clan, who claim Anand Pal as one of their rajas. They were kings of Dehli while the Gahawar were rulers of Benares.

TUBA of Mindoro, or Tuac of Timor and the Moluccas, the sap of a palm, which is converted by distillation or fermentation into spirit or vinegar.

TUBA. MALAY. The seed of the Cocculus Indicus, used for stupefying and catching fish.

TUBER CIBERIUM.

Truffle, ...	ENG.	Paphor, ...	HIND.
Buinphal, . . .	HIND.	Kana kachoo, .	PANJ.

The common truffle grows in Europe, Japan, Kashmir, and Ladakh; found buried in the soil of woods, especially beech-woods, sometimes at the depth of ten or twelve inches or more. Truffle is known by its surface being warty, and of a black colour. It is one of the few species of the fungi that is an article of diet. They appear to have been used by the Greeks and Romans. The latter especially considered them a delicacy. The truffle when gathered for eating is about the size of a large walnut, and has a very peculiar smell. The flavour resembles in some measure that of the mushroom and morel.—*Eng. Cyc.; Stew.*

TUBE ROSE is called by the Malays the intriguer of the night. It emits its perfume after sunset, and in sultry evenings scintillations of electric flame.

TUEN NIN or Wa Shieu, a Chinese festival held on the 28th or 29th of the 12th month, in which thanks are given to the tutelary deity of the house.

TU-FEH. CHIN. Professional robbers, now merged into the word Tae-ping.

TUHFAH. ARAB. A rarity, a curiosity.

TUK. TURK. A flag or banner. Tukluk means one provided with flags, a standard-bearer. It is the Togluk of Weil, Hammer, and others.—*P. Arminius Vambery.*

TUKHARISTAN, a province of Balkh, lying east of the city of that name, and west of the Jihun. The chief town is Talikan. It received its name from the Tukhara, a northern tribe, probably identical with the Saka, by whom Bactria was taken from the Greeks.

TUKHM. HIND., PERS. Any seed.

Tukhm balangu, Lallemantea Royleana.
Tukhm-i-bunj-i-Rumi, Hyosciamus niger.
Tukhm dhalyan, rhus, *sp.*
Tukhm khatmi, Althea rosea.
Tukhm gandah, an astringent seed from Dehli.
Tukhm khiyarain, Cucumis sativus.
Tukhm-i-kutan, linseed.
Tukhm sipidan, Sinapis Chinensis.
Tukhm khurma, kernel of Phœnix dactylifera.
Tukhm-i-balsan, Balsamodendron Gileadense.
Tukhm-i-gawah-zimij, Berberis lycium, Asiatica, aristata.
Tukhm-i-kanaucha, Salvia Moorcroftiana.
Tukhm-i-karpas, astringent and stimulating seed of a plant.
Tukhm-i-kasus, Hyosciamus niger, Polanisia viscosa.
Tukhm-i-turb, Raphanus sativus.
Tukhm-i-wasma, Indigofera tinctoria.
Tukhm-i-zard alu, Prunus Armeniaca, stones.
Tukhm malanga, Lallemantia Royleana, Salvia pumila.
Tukhm tumma, Cucumis colocynthis.

TUKI. TAM., TEL. A peacock; Diospyros ebenaster.

TUKKORAY or Zer-bum. HIND. Small kettledrums; one is called zer, the other bum.

TUKKUL, a system of temporary clearing.

TULIPA STELLATA. *Clegh.*

Lallee waroon, .	HIND.	Nulkia, ...	HIND.
Myhoula, . . .	,,	Peperi, ...	PANJ.

This tulip is abundant in the Kangra valley and the Kamaon Hills, whence its bulbs, which are edible, are exported. Also found in the Sutlej valley between Rampur and Sungnam, at an elevation of 5000 to 6000 feet.

Tulip tree of Australia is the Telopea speciosissima, the Waratah of the natives. It grows to about six feet high. Another tulip wood of Australia is Harpulia pendula, *Planch.* The tulip tree of India is the Thespesia populnea.—*Cleghorn's Panjab*, p. 68.

TULJAPUR, in the Hyderabad dominions, has a noted Hindu temple.

TULPUT. Guj. Government lands, called Khalsa in Kaira and Ahmadabad.

TULSI. In Hindu mythology, Tulsi was a disciple of Vishnu. Desiring to be his wife, she excited the jealousy of Lakshmi, by whom she was transformed into the Ocimum herb. Ram tulsi is the Ocimum gratissimum ; Babuye tulsi, Ocimum pilosum, and Krishna tulsi is Ocimum sanctum ; only the last and the common tulsi, O. villosum, are held to be sacred to Vishnu, and used in his worship. The tulsi plant is employed in the funeral ceremonies of the Hindus. O. album is the safed or white tulsi, and O. basilicum is the kala or black tulsi. O. sanctum is regarded as sacred, and is made into a rosary by the Vaishnava Hindus ; and every Vaishnava household has a plant in its parterre, which is encircled daily in the morning and worshipped. In administering an oath to a Hindu, a few leaves of this plant, with some water from the Ganges, is held in the hollow of the hand of the deponent while the oath is being administered to him and repeated, and it is afterwards swallowed. Tulasi-ke-manke, Hind., are beads of the tulsi ; Tulasi ki jar, also Tulasi ver, Tam., the root ; and Tulasi patya, Mahr., is a tulsi necklace.

TULSI BAI was born at Mhysir, A.D. 1790, in the house of Ajibah, one of the Man Bhao sect. She grew up to be very beautiful, and was under the protection of a Brahman, when a Mahratta adventurer introduced her to the notice of Jeswunt Rao Holkar, maharaja of Indore. She was beautiful, handsome, and alike remarkable for her fascinating manners and quickness of intellect. Few surpassed her in fluent eloquence and her power to persuade those who approached her to promote her wishes. She quickly acquired a great influence over Jeswunt Rao, which continued until he became insane, when she was appointed regent, and, not having any children of her own, she adopted a son of the maharaja by another woman. But her cruelty, her profligate character, her appointment of her paramour Ganpat Rao to a high office, and having executed her prime minister, an old, popular, and faithful servant of the State, led to a conspiracy, and, being suspected of a desire to call in the aid of the British, the chiefs of the army caused her to be beheaded, on the morning of the 20th December 1817, on the banks of the Sipra, and her body thrown into the river. She rode with grace, and, when on horseback she was always attended by a large party of the females of the first families of the State. Tulsi Bai and Ganpat Rao had been inclined to the British alliance, but Roshan Beg at the head of the disciplined brigades, and Ram Din who commanded the Mahratta horse, were perseveringly urging hostilities. On the 19th December 1817, Ganpat Rao and Tulsi Bai were seized. Ganpat Rao was imprisoned, and the following morning Tulsi Bai was beheaded. Next day Ganpat Rao and Tantia Jog were engaged against the British in the battle of Mahidpur, on the 21st December 1817.—*Malcolm's Central India ; Elphinstone's India.*

TULSI DAS, a celebrated Hindu writer, who died at Benares in A.D. 1625. He was a follower of Ramanand, and wrote the Ramayana in Hindi, which the Oudh Rajput and the military Brahman accept as a religious book.—*Ough.* p. 118.

TULSIPUR, a pargana in the Gonda district of Oudh, bounded on the north by the lower range of the Himalayas. All along the northern hills stretches the reserved Government forest, which is succeeded by a strip of undulating ground interseeted by numerous hill torrents. The soil is fertilized by leaf-mould washed down from the forests, but the climate of this tract is very unhealthy. The most singular tribe in the pargana are the Tharu, with flat faces, scanty beards, and high cheek-bones. They claim descent from the Rajputs of Chitore, and with the advance of regular castes they retire farther northwards into the recesses of the forests. They are rapidly decreasing in number by emigration into Nepal, and now amount to barely 3000.—*Imp. Gaz.*

TULUKAN. Tam. Tulukkar, Malcal. A Muhammadan ; a dialectal variation from Turka.

TULUVA, an ancient dominion of Southern India, lying between the Western Ghats and the sea, and between the Kalyanapuri and Chandragiri rivers ; lat. 12° 27′ to 13° 15′ N., and long. 74° 45′ to 75° 30′ E., with a coast-line of about 80 miles. It is now merely a linguistic division of that part of British India. Tulu is spoken by about 446,011 inhabitants of the tract described above, the centre of which is Mangalore. It is considered one of the six cultivated Dravidian languages, though it has no literature, and is written either in the Malealam or the Canarese character. Tulu has been to a great extent displaced by Canarese, the language of the conquering power about the 15th century. It now prevails, though not exclusively, from the north border of Malabar (Kavai), where it is much mixed with Malealam, to Udapi in the north. Mangalore, Mulki, and Udapi are the chief places where it is spoken. It is a dialect of the Canarese, and closely allied to the Toda, Badaga, and Coorg dialects. Malealam is a dialect of Tamil. By dialect is here meant that many centuries ago Tulu was the same as Canarese, and Malealam the same as Tamil. Tulu, Toda, Badaga, and Coorgi are far more closely allied to Canarese, and Malealam to Tamil, than Canarese, Tamil, and Telugu are to one another.

The Tulu people are part of the Dravidian race. The law of succession prevailing amongst them is called Aliya Santana. This is in force amongst the Sudra tribes, and a tribe that follows it is probably Tulu. The race does not include Brahmans or low castes, who are mostly immigrants from the other parts of S. India, though in some cases they have imitated the Aliya Santana custom.

In S. Malabar descent to sons is the law ; but in N. Malabar, amongst the Nair, the artisan castes, carpenter, brass-smith, blacksmith, and goldsmith, also the Tiar, who are toddy-drawers, and the Mukwa, fishermen, are all polyandrists, and descent of property goes in the female line. In N. Malabar this law of descent is called Maruma-katayam, and the Muhammadan Moplah has conformed to this usage. In Canara a similar law, called Aliya Santana, or nephew inheritance, prevails, and is in practice more strictly carried out than in N. Malabar. In N. Malabar the adherents to Maruma-katayam form united family communities termed Tarwaad. The senior member of whatsoever branch is the head of the family, and is termed Karnaven ; the other mem-

bers are styled Anandraver. The remotest member is acknowledged as one of the family, and entitled to maintenance if living under subordination to the head of the family, and taking part in their religious observances. For the women there is nothing analogous to the state of widowhood as existing elsewhere. Whether in alliance with men or not, they reside in their own families. The Nair marries before he is ten years of age, but though he supports he never associates with his wife, who receives at her pleasure any caste men.—*Imp. Gaz.*

TUM, a weight in Mysore of 32 lbs., 2 irase.

TUMAN, in the Mongol language, signifies ten thousand. It was borrowed by the Persians and Arabs, and with them means a weight or sum of money, originally equal to ten thousand mithkals or Arab drachms of silver. In the year 1871 a tuman of Isfahan was equal to five rupees of British India.—*Yule, Cathay,* p. 117.

TUMAN of the Baluch, a village of tents. In Pushtu, a tribe.

TUMBA TREE BARK was used by the Juang women as a loin-covering.

TUMBIYA. Hind. A drinking-cup shaped like the gourd of this name; a vessel used in cupping.

TUMBUDRA, a river of the Peninsula of India formed by the junction of the two rivers Tunga and Bhudra. Both rise near the S.W. frontier of Mysore, on the eastern slopes of the high range of hills which border on South Canara. Their junction takes place in lat. 14° N., and long. 75° 43′ E., in Mysore, in front of the Brahman village of Kudali in Shimoga district. The total length of the Tumbudra is about 400 miles. The maximum flood discharge at Hurrihur is calculated at 207,000 cubic feet of water per second, the ordinary discharge at 30,000 cubic feet.—*Imp. Gaz.*

TUMBURA. Hind. A sitar (guitar) having catgut strings instead of wire.

TUMBURU. Hind. A celestial musician.

TUMIEN or Ta-men. Burm. The silk petticoat of the Talaing women. It is of bright hues.

TUMKEE, a small circular brass plate, played on by striking it with a piece of wood having a knob at the end.

TUMKOOR, a small village, the chief town of a district in the Nundidrug division of the Mysore kingdom, 44 miles from Bangalore, in lat. 13° 20′ N., and long. 77° 9′ E.

TUMMANUL, a Tamil book on omens, on divination by sneezing, crows, owls, asses, lizards. The Tamil people are great slaves to omens.

TUMMI. Tel. Leucas cephalotes, *Spreng.;* the Phlomis cephalotes of Roxburgh. The leaves are eaten; the flowers are sacred to Siva, and are offered in his temples. But there are many plants to which the term Tummi is indiscriminately applied.

TUMONGONG, amongst the Malays, a high officer of state, to whom the superintendence of internal police matters is entrusted. A hereditary elective officer of Johore.—*Journ. Ind. Arch.* p. 568.

TUMULUS. Tumuli are met with in Wales, Scotland, Ireland, France, Sweden, Russia, Tartary, and Africa. Those in Ireland and in the plain of Troy are precisely similar to others of the United States. In America they are scattered in profusion from Lake Erie to the Gulf of Mexico, and are found in Texas, New Mexico, and S. America; other antiquities also are found in the valley of the Mississippi. Tumuli are not numerous in Ohio, but are found in Kentucky, and more commonly in Tennessee and Mississippi. One of the largest is at Cahokia in Illinois, being a parallelogram 235 yards long by 170 broad, and 90 feet high. Cairns and tumuli are found on the peaks of the Neilgherries. They contain agricultural implements; and iron spearheads, bells, and sepulchral urns, with figures of coiled snakes, tigers, elephants, dogs, and birds, sickles and gold rings, have been found buried under the piles of stones. It is supposed that the Kurumbar race formerly interred in cairns.

Over vast wildernesses in the northern regions of Asia, along the banks of the Irtish, and beyond the remote Yenesi, innumerable tumuli are scattered, containing the remains of ancient art and long extinct races of men. Implements of silver, gold, and copper, girdles of the precious metals, bracelets decked with pearls, fragments of porcelain, have surprised the travellers who have seen a few of the tumuli excavated. Similar tumuli, spread over the north of Europe, contain the remains either of the same people or of races more barbarous than the Asiatics. Hundreds of these have been rifled by treasure-hunters, or by mere antiquaries little more enlightened, who have sought to make collections of curiosities without any view to promote science or history. See Barrow; Cairn; Cromlech; St'hupa; Tope.

TUNAOLI, a tribe of the Peshawur valley, who claim descent from the khalif Abbas.

TUNGA, river in Mysore, which unites with the Bhudra to form the Tumbudra. It rises beneath the peak of Gangamula in the Western Ghats, not far from the source of the Bhudra in Kadur district. The two rivers unite near Shimoga.

TUNGANI, a race of military settlers who came originally with conquerors from the west of Asia, and settled down in the country of Yarkand.—*Cayley.*

TUNG CHI, emperor of China, died from small-pox without issue, 12th January 1875.

TUNG-JIN-TANG. Chin. Hall of united benevolence in Shanghai.

TUNG-SHU. Chin. Several trees yielding wood-oils are so named, such as the Elæococca verrucosa, E. vernicia, and the Paulownia imperialis.—*H. and S.; Smith, M. M. C.*

TUNG-SI-LING, the eastern and western hills of China, the site of the imperial mausolea, those of the Manchu emperor T'ai Tsung, A.D. 1627-1643; Shun Che, 1644-1661; empress Shun Che; King Ling, 1662-1722; and others. —*Mayer's Chinese Government.*

TUNGUS, a general name applied to a population common to a vast area in Siberia and China. Their physiognomy connects it with the tribes of Northern Asia in general, and their language forms a transition between the monosyllabic and agglutinate forms of speech. These tribes under Chinese rule, in Manchuria, on the watershed of the Amur or Saghalin, are termed Manchu, and the Tungus, under the name Manchu, constitute the dominant population of China itself. The Manchu proper have a literature with an alphabet modified from the Mongol. They are agricultural

and industrial. With two exceptions, the tribes of the Amur belong to the Tunguzian stock. The language of the Gilyak, on the Lower Amur, differs from the Tunguzian dialects along the river, but the features of these Gilyak are still Mongol; they have small obliquely-set eyes, prominent cheek-bones, and scanty beards. With the Aino on Saghalin, the language differs both from the Tunguzian and Gilyak. Their features are decidedly not Mongol, and they are distinguished by a great profusion of hair. The Tunguzian tribes either are nomades, keeping herds of reindeer or horses, or they subsist upon the produce of their fisheries. The reindeer Tunguzians are called Oronchon or Oroke, a word signifying reindeer-keepers, and are met with on the Upper Amur and on Saghalin, and there is one tribe along the sea-coast still called Orochi or Orochon. The Manyarg, and the kindred Birar and Solon on the Nonni, who occupy the vast prairies above the Bureya mountains, keep large herds of horses. The Goldi, Olcha (Mangun), Gilyak, Orochi of the sea-coast, and Aino are fishermen and hunters; and the Goldi, especially those settled on the Sungari, cultivate; but the Manchu and Chinese, and the Daurian living amongst them, on the Middle Amur, till the ground to a larger extent.

Oronchon of the Upper Amur,	260
Manyarg and Birar,	3000
Daurian, etc.,	2000
Goldi on the Amur and Usuri,	3560
Olcha (Mangun) on the Amur,	1100
Negidal and Kile (Sanager),	1000
Orochi of the sea-coast,	1000
Oroke on Saghalin,	1000
Gilyak on Lower Amur and Saghalin,	8180
Aino on Northern Saghalin,	1000
Chinese on the Usuri, etc.,	1400

—*Ravenstein's Russians on the Amur; Latham.*

TUNIA JUM MAHALS, a forest tract in the hills of the Chittagong district, which the Chukma race occupy along with Mug, Reang, and Tiperah races, all more or less nomadic. Some one of these wild races till lately performed human sacrifices annually, and in the year 1852 several persons were tried for murder by sacrificing. The place of sacrifice was a cleared district in the jungle, and staked round with bamboos about 6 feet high. The sacrificial pole was a 'Phula bans' bamboo, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. During the celebration of these sacrifices at Agartollah, a gun was fired every evening at sunset, when every person hurried to his home.

TUNICATA, the Tunicaries, class VI. of the mollusca, viz.:—

Fam. I. Ascidiadæ.
Gen. Molgula.
Cynthia.
Pelonæa.
Chelyosma.
Poltenia.
Fam. II. Clavellinidæ.
Gen. Clavellina.
Perophora.
Fam. III. Botryllidæ.
Gen. Botryllus.
Botrylloides.
Didemnium.
Eucœlium.
Distomus.
Diazona.
Aplidium.
Polyclinum.
Pafascidium.
Armorœcium.
Synœcium.
Sigillina.
Fam. IV. Pyrosomidæ.
Gen. Pyrosoma.
Fam. V. Salpidæ.
Gen. Salpa.
Doliolum.
Appendicularia.

TUNKI. HIND. A very thin chapatti, or flour seone, or cake; or large wafer made with butter.

TUNKRA, a pass in Sikkim, in lat. 27° 38′ N., and long. 88° 56′ E. Its crest is 16,100 feet above the sea. The ascent on north-west side, gradual, is over a snow-bed and glacier; descent on north-east steep, but grassy.

TUN-SURANA. BURM. In Burmese Buddhism, the three most precious gems, Buddha, the sacred books, and the priesthood. They are regarded as the three refuges, viz. 'I take refuge in Buddha; I take refuge in the law; I take refuge in the associated priesthood.' A novice entering a kyoung repeats these three, also the ten obligations. See Triad.

TUOOZ. ARAB. Having recourse to God against evil.

TUPAIA, a genus of the mammalia, insect eaters. They closely resemble squirrels, are almost confined to the Malay Islands, as also are Ptilocerus Lowii of Borneo, and Gymnurus Rafflesii.

Tupaia Elliotti, *Blyth*, the Madras tree shrew, occurs in the hills west of Madras, and in Matheran. Male, above reddish, brown inclining to olivaceous grey on the head, limbs, sides, and tail; the hairs grizzled red and brown or olive-grey and brown. Chin, throat, breast, and lower parts yellowish-white, continued along the underside of the tail, and a rudimentary streak of the same on each side of the neck, reaching to the shoulder. Ears oval, large; eyes large, dark-brown; snout elongated. Length, 14½ inches, of which tail 7½. Native name, Karri.

Tupaia ferruginea, *Blyth*, of Arakan and the Malay Peninsula, is insectivorous and frugivorous. It dwells in rudely-constructed lairs in the highest branches of trees; it is very agile, and makes enormous bounds.

Tupaia Javanica occurs in Java. T. murina occurs in Borneo. T. Peguana, the Sikkim tree shrew, occurs in Pegu. T. tana occurs in Sumatra. —*Blyth; Jerdon*, p. 66; *Wallace*, p. 141.

TU-PEH-TEH, also Tu-Bod, names of Tibet.

TUPHA. SANSK. A college.

TUPHA. TURK. A horse tail; the tails of the horse and of the yak, used as standards amongst the Turkoman. Tupha, Tugha, or Tau, according to Remusat, is the Turkish name of the horse-tail standard, but is applied also by the Chinese to the yak-tail, which respectively with those nations mark the supreme military command.—*Rech. sur les Langues Tartares*, p. 303; *D'Ohsson*, i. p. 40, *in Yule's Cathay*, i. p. 174.

TUPOZ, in Manilla, the intermediate layers of the stem of the wild plantain, Musa textilis, of which are made web cloths and gauzes four yards long, of different degrees of fineness.—*Simmonds.*

TUPPA, a musical measure which belongs to the North-West of India, being indigenous as far as the Indus and the countries watered by its tributaries, and common in Rajasthan, but the prefix of Panjabi shows its origin. Colonel Tod says he has listened at Caen to the viola or hurdy-gurdy, till he could have fancied himself in Mewar. —*Tod's Rajasthan*, i. p. 648.

TUPPA, amongst the Bhot race, a probationer for the Buddhist religion of Tibet. The ordinary monk or priest in Tibet is the Gylong, above whom are Lamas or presidents, and below whom are the Tohba and Tuppa. The Tuppa is a probationer who is admitted into the establishment to which he would attach himself at the age of 8 or 10, and receives instruction accordingly. At 15 he becomes a Tohba, and at 24 a Gylong, provided

his acquirements be satisfactory. There are two sects, the Gyllupka, who dress in yellow, and the Shammar, in red, the Shammar Gylongs being allowed to marry. The Bhot of the Tibetans have been extending westward. As a general rule, the Himalayas divide Hindustan from Bhotland, but there are Bhot in several parts south of the crest of those mighty mountains in Garhwal and Kamaon.

TUR, a small seaport on the coast of the Gulf of Suez, inhabited by Arabs. To the north of the town, at the foot of the low hills, Jabl Hamām and Sidna Musa, are warm sulphur springs, 92° to 94° Fahr. The Bell mountain, Jabl Nakous, is about 12 miles from Tur. The Wadi Hebran and Wadi-us-Slah lead from Tur to the monastery of St. Catherine.

TURAN, the name of a region bordering on Iran, in the north and north-east, which in the remotest times was inhabited by a race who are now spread into different parts of the world, and are known to ethnologists as Turanians and Mongolians. Turan and Turanian are terms of Persian origin. In their simple system of ethnography, the inhabitants of Central Asia divide all the world between two races, Iran and Turan, Iran or Irani meaning themselves, and Turani meaning everybody else; or, as they express it, Iran and an-Iran, Aryan and non-Aryan. This was the practice also of the Jews, and of the Greeks and Romans, who classed all other races as Gentiles and barbarians, as the Hindus now reckon all non-Hindus as M'hlecha, and as the Chinese, who place all outsiders as Fan. In the Zend books, the Turanians are styled the foes or antagonists of the Aryans. They are Firdusi's Turiya. Turvasu means one who possesses the treasures of his enemy, and Turvasa, one who conquers when he pleases.

According to Cuvier, the probable cradle of the Mongolian or Japhetic race is the Altai mountains, whence they have spread over Northern and Central Asia, southwards as far as Hindustan north of the Ganges, and eastwardly to the Eastern Ocean, where the race is distinguishable in the Japanese, the Corean people, and those of Siberia, and their divisions are known in modern times as Tungus, Turk, Mongol, and Fin.

Chevalier Bunsen observes (Report Brit. Ass. 1847) that the researches of our days have made it more than probable that the Tartar, Manchu, and Tungus belong to one great stock; that the Turkoman, Chud, Fin, Lap, and Magyar (Hungarian) present another stock closely united; and that both these families were originally connected with each other. He proposed to call this whole group of their languages the Turanian, and in lieu of Indo-Germanic or Indo-European, he proposed the term Iranian, following the antithesis of Iran and Turan established by Heeren and Carl Ritter. In the vast region extending from the chain of the Altai to that of the Himalaya, are the pasture lands where, during immemorial ages, the nomadic tribes of High Asia have fed their flocks and multiplied those hordes which from time to time descended in immense swarms on the fertile regions of Asia and of Europe. Perhaps the earliest of these invasions of the civilised world was that of the Hiong-nu, expelled from the borders of China by the powerful dynasty of the Han. These were the people who, after their inroad on the Gothic empire of Hermanrieh, made their way, under Etzel or Attila, into the heart of France. Hordes from the same regions, under Toghrul Beg, and Seljuk, and Mahmud of Ghazni, and Chengiz, and Timur, and Othman, overwhelmed the khalifat and the empires of China, of Byzantium, and of Hindustan; and lineal descendants of the shepherds of High Asia still sit on the throne of Cyrus, and on that of the Great Constantine; while the branch which ruled in India under the title known to Europe as the Great Moghul, closed in 1862 by the death at Rangoon of the last emperor of Dehli, then a convict prisoner of the British. Until checked by the British in India and by the Russians in Central Asia, the race was predominant over the whole of the countries between China and the Mediterranean, and from the Caspian southwards to the Ganges and the Persian Gulf. But they seemed destined to partake only by conquest in the higher civilisation of the surrounding nations, older or younger ones, the Chinese presenting the one extreme, the Iranians the other. Little disposed to learn from them as neighbours or subjects, they become more or less civilised by being their masters. They cannot resist the inward force of the civilisation of their subjects, although they repel it as an outward power.

The Turanian people, but particularly the Turko-Tartar tribes, made themselves renowned in antiquity by their martial disposition, and by the wild, intractable rudeness of their habits, and they have appeared amongst surrounding nations as spoilers, destroyers, and plunderers. The Aryan tendency is to form national and political communities, marry one wife, and worship one supreme and spiritual deity. The Turanian tendency is to have little national or political cohesion, to marry one or more wives without much sentiment, and worship gods and heroes without much idea of a spiritual existence beyond that implied in the notion of ghosts and demons. Turanian races have a longing for spiritual excitements. Perhaps as the vividness of religious faith is common amongst mountaineers, the simple pastoral and secluded life common to most of the Turanian tribes may impart a tendency to reverie and visionary absorption. The great horse sacrifice is allowed to have been originally Turanian, whether derived directly from the Sakæ, or indirectly from Persia and Media, where the white horse was an important element in a campaign of Cyrus; and Mr. Atkinson found traces of this sacrifice still lingering on the southern borders of Siberia. See Aswa Medha.

Mr. Hodgson considers the Tamil, Tibetan, Indo-Chinese, Tungus, Chinese, Mongol, and Turk as so many branches of the Turanian family; and he regards the aborigines of British India as Northmen of the Scythic stem, but he remains undecided whether they owe their physiognomy to the Tungus, the Mongol, or the Turk branch of the Tartars or Scythians, and whether they immigrated from beyond the Himalayas at one period and at one point, or at several periods and at as many points. But all writers are of opinion that when the Aryans entered India, they found the country occupied by prior Scythic races, to whom their writers apply such contemptuous expressions as Dasya, M'hlecha, etc. These prior races seem

to have been pushed largely out of Northern India into and through the Vindhya mountains into the Peninsula of India and Ceylon, where their idioms, the Tamil, Telugu, Malealam, and Karnatica, are sister dialects of one speech; and Dr. Pritchard concurs in opinion with Professor Rask, who regards the languages of the mountain tribes of India, the Bhil, the Gond, the Toda, and others, as also of the Tartar stock, and mentions that some curious analogies have been observed between the Tamil and other dialects of the Peninsula and the languages of Australia.

Mr. Logan, however, who had great opportunities of contrasting and comparing the Dravidians from various parts of India, remarks that, physically, the population of Southern India is one of the most variable and mixed which any ethnic province displays. A glance at a considerable number of Kling (Teling) and Tamilar of different castes and occupations, shows that the varieties when compared with those of similar assemblages of men of other races, such as Europeans, Ultra-Indians, or Indonesians (including Negroes in the last two cases), are too great to allow of their being referred to a single race of pure blood. Some are exceedingly Iranian, some are Semitic, others Australian, some remind us of Egyptians, while others again have Malaya, Polynesian, and even Simang and Papuan features. This varied character of the races of the south of the Peninsula may be seen daily in Madras, to which all the races from the south of India resort.

Turanians now occupy Central and Northern Asia, and include, according to modern ethnology, the Tartar, Fin, Turk, and Magyar. Turanian languages are scattered over the whole of the northern part of Europe and Asia, from China to the Pyrenees, and from Cape Comorin across the Caucasus to Lapland. The Hungarian, Lapponian, and Finnish dialects are now classed as members of the great Turanian or Tartar family of tongues, which is spoken by all the tribes from the Himalaya to Okotsk and to Lapland, and includes the Hungarian, Crimean, and Turkish tongues. Farrar states that the terms Turanian, Nomadic, or Allophyllon of Pritchard, are names applied to all languages not belonging to the Aryan or Semitic, and which comprise all languages spoken in Asia or Europe not included under the Aryan and Semitic families, with the exception of the Chinese and its dialects. These are Tungus, Mongol, Turki, Samoyede, and Fin. The writers on this class are Rask, Klaproth, Schult, Castren, and Muller. The Turanian languages occupy by far the largest portion of the earth, viz. all but parts of India, Arabia, Asia Minor, and Europe; but except agglutination, there is not a single positive principle which can be proved to pervade them all.

The most characteristic feature of the Turanian languages is what has been called agglutination, or 'glueing together;' and what distinguishes the Turanian languages is, that in them the conjugation and declension can still be taken to pieces; and although the terminations have by no means always retained their significative power as independent words, they are felt as modificatory syllables.

The Turanian family of languages consists of two great divisions, the Northern and the Southern. The northern is sometimes called the Ural-Altaic or Ugro-Tartaric, and it is divided into five sections, the Tungusic, Mongolic, Turkic, Finnic, and Samoyedic.

The southern, which occupies the south of Asia, is divided into four classes, the Tamilic, the Gangetic (Trans-Himalayan and Sub-Himalayan), the Lohitic, the Taic, and the Malaic. These two divisions comprehend very nearly all the languages of Asia, with the exception of Chinese, which, together with its neighbouring dialects, forms the only representative of radical or monosyllabic speech. Japanese, the language of Corea, of the Koriakes, the Kamtskadales, and the numerous dialects of the Caucasus, etc., remain unclassed.

The Tungusic section of the northern branch extends from China northward to Siberia, and westward to 113°, where the river Tunguska partly marks its frontier. The Tungusic tribes in Siberia are under Russian sway. Other Tungusic tribes belong to the Chinese empire, and are known by the name of Manchu, a term adopted after they had conquered China in 1644, and founded the present imperial dynasty.

The original seats of the people who speak Mongolic dialects lie near the Lake Baikal, and in the eastern parts of Siberia, where we find them as early as the 9th century after Christ. They were divided into three classes, the Mongol proper, the Buriat, and the Olot or Kalmuk. Chengiz Khan (1227) united them into a nation, and founded the Mongolian empire, which included, however, not only Mongolic, but Tungusic and Turkic, commonly called Tataric, tribes.

In India, there are three or four distinct branches of this family of languages. In the north are the Himalayan dialects, of tribes from Upper and Lower Kanawar, on the Sutlej, to the Bhutani of the extreme east. Then we have the Lohitic class, comprising, with the Burmese and others of the Eastern Peninsula, the dialects of the Naga and Mikir tribes in Assam, and of the Bodo, Kachari, Kuki, and Garo in Eastern Bengal. Nearly related to this class is the Kol or Munda family, including the Kol, Santal, and Bhumij of Singbhum and Western Bengal, and the Munda of Chutia Nagpur. The fourth class is the Tamil or Dravidian, to which belong the Brahui of Baluchistan, the Gondi, the Tuluva of Canara, the Karnata of the S. Mahratta country, the Toda of the Neilgherries, the Malealam of Travancore, the Tamil, and Telugu. The Kur or Muasi, and the Korku in Hoshangabad, and westward in the forests on the Tapti and Narmada, until they come in contact with the Bhil of the Vindhya Hills, and the Nahal of Kandesh, belong to this Kol family; indeed, Mr. Hyslop held that the word Kur is identical with Kol.

According to Pritchard, the idiom of the islands comprised in the empire of Niphon, as well as that of the independent Liu-kiu Archipelago, bears some signs of affinity to those of the Ugro-Tartarian nations. Mr. Norris had assured him that the principle of vocalic harmony and other phenomena of the Tartar languages prevail in the idiom of the Japanese and Liu-kiu Islands. He also observed analogies between the Tamilian and other dialects of the Dekhan and the languages of Australia, with which we have obtained some acquaintance through the labours of Mr. Threlkeld and several other missionaries, and from the able researches of Captain Gray. Turkish is a Turanian dialect. Its grammar is purely Tataric or Turanian.

The Turks, however, possessed a small literature and narrow eivilisation before they were eonverted to Muhammadanism; but as the language of Mahomed was Arabic, a braneh of the Semitic family elosely allied to Hebrew and Syriae, this, together with the Koran and their law aud religion, the Tnrks learned from the Arabs, along with many of the arts and seieuces eonneeted with a more advaneed stage of eivilisation. Arabie beeame to the Turks what Latin was to the Germaus during the middle ages; and there is hardly a word in the higher intelleetnal terminology of Arabie that might not be used, more or less naturally, by a writer in Turkish.—*M. De Guignes; Sir W. Jones' Works*, iii. p. 72; *Report Brit. Assoc.; Wh. H.; Pritchard; Bunsen; Muller; Logan, in J. Ind. Arch.; Hyslop, Jour. Ant. Soc. Nagpur.*

TURANJABIN, Persian manna, produeed on the Alhaji maurorum, in Persia, Bokhara, and Afghanistan. See Mauna.

TURBAND.

Pagri, ... Hind. | Dustar, ... Hind.

The head-dress of the Muhammadans, from the two Persian words, Sir, the head, aud Band, a tie. A prineipal site of the mauufaeture of eotton turbands formerly was the town of Arnee, in the Chinglepnt distriet, but they are now made at Oopada in the Rajamundry distriet, and also in the Madras distriet. A prineipal site of the mannfaeture of silk turbands was Seringapatam in Mysore. These are of a pink colour, and are sold at from 10 to 25 rupees eaeh. Turband pieces in eotton, silk, eotton and gold, and silk and gold, are those usually manufaetured. In Afghanistan, conquered people pay homage by easting their turbands at the feet of the eonqueror; the ehiefs of tribes ofteu lessen the size of their turbands before appearing iu the presenee of their rnlers. Muhammadans of British India, when in great distress or in supplication, take off their turbauds, aud lay their heads on the ground, or in the lap of the person before whom they appear. For a stranger to take off the turband of either a Hindu or Mnhammadan, is an aet of great iudignity. A Muhammadan wife reeeives her husband, and plaees his turband in an honoured part of the house. An exehange of turbands is the symbol of fraternal adoption. In Turkish burial plaees, the tombs of men are indieated by the figure of a turband placed at the head of the grave.

TURBINELLA, a genus of gasteropodous molluses, family Murieidæ. About 70 recent aud 20 fossil speeies are known. T. rapa, the ehank shell, is used in India as a trumpet, is sawn iuto rings to form braeelets, anklets. It was the war-trumpet of the aneient Hindus; and the idol of the Hindu god Vishnu holds a ehank in one of his four hands.—*Tod's Rajasthan.*

TURBITH, Turpeth, or Tnrbud. Hind. The eortical part of the root of the Ipomœa turpethum. It is a longish root, about the thiekuess of the finger, resinous, heavy, of a brownish hue without, and whitish within. It is used iu medicine. —*Lewis' Mat. Med.*

TURBUZ. Hind. Cuenrbita eitrullus, watermelon, is grown in the beds of rivers in the hot season, but may be cultivated in gardens during the rains. Its fruit is esteemed by all classes.—*Riddell.*

TURFAN, on the borders of the desert of Gobi, is the most eastern of the distriets of Kashgaria. The Ush-Turfan distriet of Kashgaria lies N.E. of the Kashgar distriet. The Tian Shan mountains have for centuries maintained their charaeter for surpassing excellenee of Turfan wool.

TURI dwell in the t'huls of Dawudputra, Beejnote, Noke, Noakote, and Oodur; they own and hire out eamels, but, like the Bawuri and Khengar, are great thieves, and are ealled bhut or evil spirits and sons of the devil.

TURI, a martial tribe oeeupying a portion of the valley of the river Kurm; they can muster 5500 fighting men. They repeatedly leagued with other tribes to harass the Meeranzai valley. They would sow strife among the Meeranzai people, they would harbour fugitives from either party, they would encourage all to resist the British, they would attack some villages in forec; they frequently eommitted raids on the Bungush and Cnttack villages of the Kohat distriet. In August 1853, Captain Coke seized a Turi earavan on its way to the salt mines, taking the property as security for repayment of valne of plundered property, and the meu as hostages for their tribes. This measure was soon followed by an embassy from the tribe, and an agreement was concluded with the tribe from the comueneemeut of 1854. The value of plundered property was made good, the prisoners were released, and five Turi men were made over to the British as hostages; but within one month the tribe again gave way to evil eounsels, and in March 1854 a serious attack was made by the Turi with 2000 men (foot and horse) on a Meerauzai village.

During the wars with Kābul in 1878-1880, the Kurm valley was held by a large British forec, and the Turi kept quiet. See Kurm.

TURIVA-CARAY. The great Basava or bull at Turiva-earay, in Mysore, is a siugle block of Karikallu or blaekstone, proeured from a quarry at Caddapully. This stone is an amorphous hornblende eontaining minute rhomboidal lamellar eoneretions of basaltine. It is obtained from detaehed blocks of stone in this quarry; the solid roek contains many finer pieees.

TURK. Among the Arabs this word has been as vaguely applied as the word Scythian was among the Greeks. Turk, applied to an Osmanli, is dcemed derogative; but this name is given by the Tamil and Telugu people as the usual designation for all Muhammadans, as Turka-kara and Turka-vadu, aud their language the Turka-pesh and Turka-bhasha or Turka-mata. Arabs and Persians, when alluding to their northern neighbours, always style them Turk, applying that term as loosely as Europeans do the word Tartar.

The word Turk has the same root as that of Turan, the eountry of the restless, horse-riding, nomade tribes, the great Turanian and Mongolian family, in eontradistinetion from the Aryan, Iranian, or Indo-Enropean raee, and it is derived from the root To-ar, to fly.

Vambery divides the Turk into Burut, blaek or pure Kirghiz; Kirghiz, properly Kazak; Karakalpak, Turkoman, and Uzbak.

The region inhabited by Turkish raees at the preseut time eomprises two distinet traets of eountry, one stretehing southwards from the icy shores of the Aretie Oeean to the Hindu Kush, the other eastwards from the Adriatic, both merging into eaeh other in the eastern portion of

Asia, known as the desert of Gobi. The Turk in the furthest east claims relationship with his brethren in the extreme west. The simplest Turkoman is aware of the existence of kinsmen about Diarbekir.

Many of the Turk tribes of High Asia retained their pagan names when accepting Islam. Seljuk is said to have been a convert, but his sons were called Michael, Israil, Musa, and Yunus. His celebrated grandson, however, retained the name of Toghrul, and Toghrul's son was Alp Arselan. The names of most Turkish tribes and families are taken from animals: Mang-it means sick dog; Kira-it, grey dog; Oyur-at or Oir-at, grey horse; Kungr-at or Kinghur-at, chesnut horse.

Hiung-nu.—The most ancient name by which the Turk and other of the tribes of Central Asia were known to the Chinese, was Hiung-nu. These Hiung-nu founded an empire (B.C. 206) comprising a large portion of Asia west of China. Engaged in frequent wars with the Chinese, they were at last defeated in the middle of the 1st century after Christ. Thereupon they divided into a northern and southern empire; and after the Southern Hiung-nu had become subjects of China, they attacked the Northern Hiung-nu, together with the Chinese, and, driving them out of their seats between the rivers Amur and Selenga and the Altai mountains westward, they are supposed to have given the first impulse to the inroads of the barbarians into Europe. In the beginning of the 3d century, the Mongolic and Tungusic tribes, who had filled the seats of the Northern Hiung-nu, had grown so powerful as to attack the Southern Hiung-nu, and drive them from their territories. This occasioned a second migration of Asiatic tribes towards the west. Another name by which the Chinese designate these Hiung-nu or Turk tribes is Tu-kiu. This Tu-kiu is supposed to be identical with Turk; and although the tribe to which this name was given was originally but small, it began to spread in the 6th century from the Altai to the Caspian, and it was probably to them that, in 569, the emperor Justinian sent an ambassador in the person of Semarchos. The empire of the Tu-kiu was destroyed in the 8th century by the Hui-he (Chinese Kao-che). This tribe, equally of Turk origin, maintained itself for about a century, and was then conquered by the Chinese, and driven back from the northern borders of China. Part of the Hui-he occupied Tangut, and, after a second defeat by the Mongolians in 1257, the remnant proceeded still farther west, and joined the Uigur, whose tents were pitched near the towns of Turfan, Kashgar, Hamil, and Aksu. These facts, gleaned chiefly from Chinese historians, show from the very earliest times the westward tendency of the Turk nations. In 568, Turk tribes occupied the country between the Volga and the Sea of Azof, and numerous reinforcements have since strengthened their position in those parts.

Turkoman.—The northern part of Persia west of the Caspian Sea—Armenia, the south of Georgia, Shirwan, and Dagestan—harbours a Turk population, known by the general name of Turkoman. They are predatory nomades, and their arrival in these countries dates from the 11th and 12th centuries. East of the Caspian Sea, the Turkoman tribes are under command of the Uzbak khans of Khiva, Fargana, and Bokhara. They call themselves, however, not subjects but guests of these khans. Still more to the east, the Turkoman are under Chinese sovereignty, and in the south-west they reach as far as Khorasan and other provinces of Persia.

The *Uzbak*, descendants of the Hui-he and Uigur, and originally settled in the neighbourhood of the towns of Khotan, Kashgar, Turfan, and Hamil, crossed the Jaxartes (Syr-i-Darya) in the 16th century, and, after several successful campaigns, gained possession of Balkh, Kharism (Khiva), Bokhara, and Fargana. In the latter country and in Balkh they have become agricultural; but generally their life is nomadic, and too warlike to be called pastoral.

Nogai.—Another Turk tribe are the Nogai, west of the Caspian, and also north of the Black Sea. To the beginning of the 17th century they lived north-east of the Caspian, and the steppes on the left of the Irtish bore their name. Pressed by the Kalmuk, a Mongol tribe, the Nogai advanced westward as far as Astracan. Peter I. transferred them thence to the north of the Caucasian mountains, where they still graze their flocks on the shores of the Kuban and the Kama. One horde, that of Kundur, remained on the Volga, subject to the Kalmuk. Another tribe of Turk origin in the Caucasus are the Bazianes. A third Turk tribe in the Caucasus are the Kumiik, on the rivers Sunja, Aksai, and Koisu.

Bashkir.—The southern portion of the Altaic mountains has long been inhabited by the Bashkir, a race considerably mixed with Mongolic blood, savage and ignorant, subjects of Russia, and Muhammadans by faith. Their land is divided into four roads, called the roads of Siberia, of Kasan, of Nogai, and of Osa, a place on the Kama. Among the Bashkir, and in villages near Ufa, is now settled a Turk tribe, the Mescherak, who formerly lived near the Volga.

Karakalpak.—The tribes near the lake of Aral are called Karakalpak. They are subject partly to Russia, partly to the khans of Khiva.

Siberia.—The Turk of Siberia are partly original settlers who crossed the Aral and founded the khanate of Sibir, partly later colonists. Their towns are Tobolsk, Yeniseisk, and Tomsk. Separate tribes are the Uran'hat on the Chulym, and the Barabas in the steppes between the Irtish and the Ob.

In the north-east of Asia, on both sides of the river Lena, the Yakut form the most remote link in the Turkic chain of languages. Their male population has lately risen to 100,000, while in 1795 it amounted only to 50,066. Their original seats seem to have been north-west of Lake Baikal.

Southern Siberia is the mother country of the Kirghiz, one of the most numerous tribes of Turko-Tataric origin. The Kirghiz lived originally between the Ob and Yenisei, where Mongolic tribes settled among them. At the beginning of the 17th century, the Russians became acquainted with the Eastern Kirghiz, then living along the Yenisei. In 1606 they had become tributary to Russia, and, after several wars with two neighbouring tribes, they were driven more and more south-westward, till they left Siberia altogether at the beginning of the 18th century. They now live at Burut in Chinese Turkestan, together with the Kirghiz of the 'Great Horde,' near the town of Kashgar, north as far as the Irtish.

Kirghiz.—Another tribe is that of the Western Kirghiz or Kirghiz-Kazak, who are partly independent, partly tributary to Russia and China.

Of what are called the three Kirghiz hordes, from the Caspian Sea east as far as Lake Tenghiz, the Small Horde is fixed in the west, between the rivers Yemba and Aral; the Great Horde in the east; while the most powerful occupies the centre between the Sarasu and Yemba, and is called the Middle Horde. Since 1819 the Great Horde has been subject to Russia. Other Kirghiz tribes, though nominally subject to Russia, are really her most dangerous enemies.

The Turk of *Asia Minor* and Syria came from Khorasan and Eastern Persia, and are Turkomans, and remnants of the Seljuk, the rulers of Persia during the middle ages.

The *Osmanli Turk*, who form the ruling portion of the Turkish empire, have the same source. They are now scattered over the whole Turkish empire in Europe, Asia, and Africa, and their number amounts to between eleven and twelve millions. They form the landed gentry, the aristocracy and bureaucracy of Turkey; and their language, the Osmanli, is spoken by persons of rank and education, and by all Government authorities in Syria, in Egypt, at Tunis, and at Tripoli. In the southern provinces of Asiatic Russia, along the borders of the Caspian, and through the whole of Turkestan, it is the language of the people. It is heard even at the court of Teheran, and is understood by official personages in Persia. The ancestors of the Osman Turk are men as well known to European historians as Charlemagne or Alfred. It was in the year 1224 that Sulaiman Shah and his tribe, pressed by Mongolians, left Khorasan and pushed westward into Syria, Armenia, and Asia Minor. Sulaiman's son Ertoghrul aided, and then took service under, Ala-ud-Din, the Seljuk sultan of Iconium (Nicœa), and, after several successful campaigns against Greeks and Mongolians, received part of Phrygia as his own, and there founded what was afterwards to become the basis of the Osmanic empire. During the last years of the 13th century the sultans of Iconium lost their power, and their former vassals became independent sovereigns. Osman, after taking his share of the spoil in Asia, advanced through the Olympic passes into Bithynia, and was successful against the armies of the emperors of Byzantium. Osman became henceforth the national name of his people. His son Or-khan, whose capital was Prusa (Bursa), after conquering Nicomedia (1327) and Nicœa (1330), threatened the Hellespont. He took the title of padshah, and his court was called the 'High or Sublime Porte,' the Bab-ul-Makaddas. His son Sulaiman crossed the Hellespont (1357), and took possession of Gallipoli and Sestos. He thus became master of the Dardanelles. Murad I. took Adrianople (1362), made it his capital, conquered Macedonia, and, after a severe struggle, overthrew the united forces of the Slavonic races south of the Danube, the Bulgarians, Servians, and Croatians, in the battle of Kossova-polye (1389). He himself fell, but his successor Bayazet followed his course, took Thessaly, passed Thermopylæ, and devastated the Peloponnesus. The emperor of Germany, Sigismund, who advanced at the head of an army composed of French, German, and Slavonic soldiers, was defeated by Bayazet on the Danube in the battle of Nicopolis (1399). Bayazet took Bosnia, and would have taken Constantinople, had not the same Mongolians who in 1244 drove the first Turkish tribes westward into Persia, threatened again their newly-acquired possessions. Timur had grasped the reins fallen from the hands of Chengiz Khan; Bayazet was compelled to meet him, and suffered defeat (1402) in the battle of Angora (Ankyra) in Galatia. Europe now had respite, but not long. Timur died, and with him his empire fell to pieces, while the Osmanic army rallied again under Muhammad I. (1413), and re-attained its former power under Murad II. (1421). Successful in Asia, Murad sent his armies back to the Danube, and, after long-continued campaigns, and powerful resistance from the Hungarians and Slavs under Hunyad, he at last gained two decisive victories, Varna in 1444, and Kossova in 1448. Constantinople could no longer be held, and the Pope endeavoured in vain to rouse the chivalry of Western Europe to a crusade against the Turks. Muhammad II. succeeded in 1451, and on the 26th of May 1453, Constantinople, after a valiant resistance, fell, and became, as now, the capital of the Turkish empire.

In the region west of a line drawn from Constantinople to the mouth of the Gerenis Chai in Lycia, or the region of the six rivers, Bakor Chai, Gedoz Chai, Kychyk and Bojzk Menderes, Gerenis Chai, and Godchai Chai, the population is about 1,500,000, of whom 600,000 are Turks, 300,000 nomade mountain Yoruks, 400,000 Greeks, 40,000 Chepis (wood-hewers and charcoal-burners, without any religion, perhaps the remains of the aborigines of the country), 60,000 Armenians, 40,000 Jews, 15,000 Catholics, 10,000 to 15,000 gypsies, Arabs, Bulgars, Croats, etc., and 4000 to 5000 Europeans other than Greeks. These Turks seldom speak any other tongue but their own. Their chief occupations are agriculture, cattle rearing, carpet-weaving, saddlery, and other small industries, and they greatly delight to act as caravan guides. The strict seclusion of the women demanded by Islamism seriously hinders them from helping the men in their business. On them alone falls the whole burden of military service. At 18 years they marry, and at 21 or 22 they are taken as soldiers and separated from wedlock for long years. The women become immoral, and these are the chief causes of the gradual extinction of the race. The Greeks have got possession of nearly all the trade and shipping. The Greeks are energetic, diligent, and eager to learn. The Greeks are preferred as physicians, lawyers, teachers, and also as traders and workmen. They are intolerant, like the Turks, but without any inner religious feeling. Yet many Slavs, mostly Bulgars and Wallachs, join their Church, and soon assume the Greek language and Greek names, and become in all respects Greeks.

Tajak.—The modern distinction of Turk and Tajak, which in its application denotes men of military and men of civil pursuits, has existed from the most early ages in this extended country.

Uigur.—According to Vambery, the Uigur are the most ancient of the Turk tribes, and formerly inhabited a part of Chinese Tartary which is now occupied by a mixed population of Turk, Mongol, and Kalmuk. They were the first who reduced

the Turki language to writing, borrowing the characters from the Nestorian Christians, who came to their country as early as the 4th century of our era. The manuscripts of this language, written in the characters mentioned, afford therefore the most ancient and valuable data in investigating the history of Central Asia, nay, of the whole Turkish race. But these monuments are of great scarcity; he believes he has collected all that has been discovered of the Uigur language, though the Uigur had a literature and were very fond of books at a time when the western world was involved in ignorance and barbarism. The most valuable manuscript he obtained bears date 1069, and was written in Kashgar; it treats of ethics and political subjects, and forms a kind of manual of advice to kings how to govern with justice and success. It reveals the social condition of this people, and forms the basis of the later regulations by which all Turks are governed. —*Malcolm's Persia; Muller's Lectures; Ferrier's Journ.; Vambery, Bokhara.*

TURKANA amongst the Rajputs means tribute. It is derived from the word Turk, meaning Muhammadan, races who exacted tribute from the Rajputs.

TURKESTAN. The people of Central Asia who inhabit the countries which extend northwards to the Russian frontiers, westwards to the Caspian Sea, and southwards to Afghanistan, for the greater part are descendants of Turks, and it would be more correct to give to all these countries the general name of Turkestan, dividing it in the following manner:—

1st. Northern or Russian Turkestan, comprehending in it the three tracts of the Kirghiz nation, with Bokhara, Khokand, and part of Khiva.

2d. Southern Turkestan, inhabited by the Khivan, Turkoman, and Karakalpak, and including also Tashkend.

3d. Eastern Turkestan, comprising Little Bucharia, which is subject to China.

Turkestan races are the Uzbak, Karakalpak, Kara-Kirghiz, Kirghiz-Kazak, Turkoman, Tajak, Sart, Galcha, and Russians. The arable tracts, especially in Khiva, Bokhara, and Khokand (Fargana), from prehistoric times have been the joint home of races of Turki and Iranian blood.

Turkestan lowlands southwards are limited by the western continuation of the Hindu Kush as far as the Hari-Rud valley, and beyond that point by the Khorasan highlands as far as the Caspian.

Russian Turkestan is bordered on the west by the Caspian, the Aral river and mountains; on the east by the Pamir plateau, the Tian Shan and Altai ranges separating it from the Chinese empire; northwards by the low ridge crossing the Kirghiz steppes about the 51st parallel, and forming the water-parting between the Aralo-Caspian and Ob basins. For administrative purposes, part of Western Siberia, 40,000 square miles in extent, is attached to Russian Turkestan. Including this tract, Russian Turkestan has an extreme length from the Caspian to Lake Issukkul of 1400 miles west and east, with a breadth of nearly 1000 miles north and south, a total area of about 1,600,000 square miles, and a population of 6,500,000.

Western Turkestan is conspicuous for the high relief of the land. Nowhere on the surface of the globe are stronger contrasts to be seen than in the Aralo-Caspian depression and the Aralo-Caspian basin. In the latter region, the whole area of drainage consists of about even parts highlands and lowlands. While the lowlands fall in the Caspian as much as 85 feet below sea-level, the highlands in the culminating points of the Tian Shan and Great Pamir rise to 25,000 feet above it. The nucleus of the whole Central Asian highland system is formed by the Pamir, to which converge the Hindu Kush and Himalayas from the south-west and south-east, the Kouen Lun from the east, the Tian Shan from the north-east; whilst to the west the plateau itself merges in the snowy highlands and ice-fields about the sources of the Zar-afshan, between the Oxus and Jaxartes valleys. Between the eastern extension of the Tian Shan and the Balkash-kul stretches the broad Turkestan plain, bounded to the south-east by Kulja, the frontier province and long debateable land between the Russian and Chinese empires. By nature the richest land beyond the limits of China proper, this unhappy province bears witness, in its ruined cities and wasted plains, to the successive risings of Zungarians and Dunyans, the victims of which during more than a century are to be reckoned by millions.

Bokhara is an isolated kingdom in Turkestan of small extent, surrounded by a desert. It lies between lat. 36° and 45° N., and long. 61° and 67° E. It is an open champaign country of unequal fertility, and intersected by the Oxus on its southern border. Its rivers are the Amu or Oxus, the Syr or Jaxartes, the Kohik or Zar-afshan, and the rivers of Kurshi and Balkh. It is ruled over by an amir, now under Russia, whose sway is comprised between the parallels of latitude and the degrees of longitude above indicated. The Uzbak are undoubtedly the preponderating race in Bokhara, not so much from their number, as by the ties which bind them together. They are divided into stems and sections, like the Kirghiz, and have their elders or beys, who enjoy a certain consideration among them. The Uzbak branches, with some of their subdivisions, are enumerated in the work called Nassed Mameti Uzbakia.

The Russian acquisitions in Central Asia were directed to the Jaxartes in the first stage of their operations, and to the Oxus in the second. With the fall of Tashkend in 1865 the Russians completed the first part of their programme, and with the annexation of Khiva in 1873, the second. With the consummation of these conquests, and the subsequent absorption of Khokand, Western Turkestan was converted into a Russian province.

Eastern Turkestan, sometimes called Kashgaria, is a name for which there is no authority. European writers have called it Little Bokhara, a term quite unknown to the inhabitants or the neighbourhood. The Chinese call it the province of the Nan-loo, or province of the Southern Road, lying along the south of the Tian Shan range. The neighbouring Muhammadans call it Alti-shahr or Jeti-shahar, Turki-Persian words for the six cities and the seven cities, so designated according to the number of towns which it included at the time of speaking. It lies nearly due north of Kashmir. It is a gently undulating plain, about 250 miles across from N. to S. near its western extremity, where cultivation is the more abundant; open and gradually widening out to the east, where the great rainless desert of

Gobi extends, and from whence long arms of sand and shingle stretch back into the cultivated region up to the very walls of the cities and villages. Shut in on the S. by the mighty chain which forms the true backbone of Asia, various portions of which are known as the Kouen Lun, Kara-korum, Mustagh or Ice Mountain, Tagh-dung-bash or Head of the Mountains. On the west it has the extremely elevated plateau of Pamir, and on its north is the range known in Turki and Chinese as the Tengiri or Tian Shan range, both terms meaning heavenly, from the northern slopes of which the rivers of Siberia rise. The people, numbering about 1,500,000, are robust, industrious, frugal, of peaceful dispositions, and with strong desires to trade. The rainfall, even at the skirts of the hills, is limited to a few showers in the winter and spring, and the cultivation, which is limited to the artificial irrigation of the base of mountains and the banks of rivers, is carried on from the melting of the glaciers and the winter snows. The rivers ultimately unite in one, which disappears in a marsh far removed in the desert of Gobi. Wheat, barley, and Indian corn are produced; fruits are abundant, and of these the grapes are celebrated. Gold is found in the east of the Kouen Lun range. Jade, copper, lead, and sulphur are found in the Kara-korum and on the spurs of Pamir, and coal in the eastern parts of the Tian Shan mountains.

Eastern Turkestan was subject to China from the beginning of the Christian era to the time of Chengiz Khan; and after the middle of the 18th century, the Chinese regained possession of it. Eastern Turkestan is eminently Muhammadan, and its rulers had always been Muhammadan from the time of Taghalaq Timur, who was, we are told, the first Muhammadan sovereign of Kashgar of the lineage of Chengiz. Buddhism indeed was found still prevalent in the cities of Turfan and Kamil at the time of the embassy of Shah Rukh in 1419, and probably did not become extinct much before the end of the century. But, in the western states, Muhammadanism seems to have been universal from an earlier date, and maintained with fanatical zeal. Saintly teachers and workers of miracles, claiming descent from Mahomed, and known as Khwaja or Khojah, acquired great influence; and the sectaries attached to the chiefs of these divided the people into rival factions, whose mutual hostility eventually led to the subjugation of the whole country. For, late in the seventeenth century, Khojah Appak, the leader of one of those parties called the White Mountain (having been expelled from Kashgar by Ismail Khan, the chief of that state, who was a zealous supporter of the opposite party or Black Mountain), sought the aid of Galdan Khan, sovereign of the Eleuth or Kalmuk race of Dzungaria. Taking the occasion so afforded, that chief in 1678 invaded the states south of the Tian Shan, carried off the khan of Kashgar and his family, and established the Khojah of the White Mountain over the country, in authority subordinate to his own. Great discord for many years succeeded, sometimes one, sometimes another being uppermost, but some supremacy always continuing to be exercised by the khans of Dzungaria. In 1757, however, the latter country was conquered by the Chinese, who in the following year, making a tool of the White party, which was then in opposition, succeeded in bringing the states of Turkestan also under their rule.

Hoei Hoei.—The Chinese and the Manchu races call by the name of Hoei Hoei all the Muhammadan tribes who live under their dominion. This term, however, has ceased to designate a nation. As the Uigur Hoei Hoei, called simply Hoei Hoei under the Mongol dynasty of Yunan, were Muhammadans, this name is applied by the Chinese to all those of the same religion, in the same manner as the Russians are often called Greeks, because they are of the Greek Church. The inhabitants of the towns of Little Bokhara are in part descendants of the ancient Uigur Hoei Hoei, and consequently Turks, in part Sarti, or Bokharians, who are scattered as merchants all over Central Asia, and who are Persians. There are many of them at Pekiu, Hang-chu-fu, Canton, and the other commercial cities of China. Their mother-tongue is Persian, but they also speak the oriental Turki, which is the general language of Turkestan, and the most diffused in Little Bokhara.

Language.—The Uigur writing character was the original source of those still used by the Mongol and Manchu, and was itself almost certainly derived from the old Syriac character through the Nestorians. The modern Tartar characters are written (and, it is presumed, read) in vertical lines from top to bottom of the page, the lines succeeding each other from left to right. What Uigur meant with Mongol authors is doubtful, but the people and language so called by the Western Asiatics were Turkish. Captain Valikhanoff speaks of the language now in use at Kashgar as being Uigur, but it is not clear whether he means that this term is known to the natives.

Towns.—The three principal towns in Turkestan are Elchi, in lat. 36° 50′ N., and long. 78° 20′ E., 5500 feet; Yarkand, in lat. 38° 10′ N., and long. 74° E., 4200 feet; Kashgar, in lat. 39° 15′ N., and long. 71° 50′ E., 3500 feet. Elchi is represented to have the coldest, and Kashgar the hottest, temperature of the three towns throughout the year. Snow falls at Kashgar, but never remains longer than a few hours; but it is seen lying in Yarkand for three or four days together.

The *people* of these regions are from two distinct sources, viz. the settled races; descendants of Semitic and Iranian conquerors from the south; and the races who have been occupying the country from prehistoric times. The last part of the inhabitants have been styled Turko-Tartars, and are in their habits the same as they were 2000 years ago. Vambery divides the Turks proper into Burut, black or pure Kirghiz; Kirghiz, properly Kazak; Karakalpak, Turkomau, and Uzbak.

The *Burut*, pure or black Kirghiz, dwell on the eastern boundary of Turkestan, viz. the valley of the Tian Shan chain of mountains, and they inhabit also several points on the shores of the Issik-kol, close upon the frontier chain of mountains. They have powerful, thick-set, strong-boned figures, but are remarkably agile, and have acquired much warlike renown. Their face is less flat than the Mongolian and Kalmuk, and less fleshy; their forehead somewhat higher, and their eyes are less almond-shaped than the Kalmuk; few of them have red or fair hair or a white complexion. The Burut are in contact with

Kalmuk and Mongolians, and in consequence their language has many Mongolian words, and now and then they profess themselves more or less Muhammadans, but Shamanism largely prevails. The Burut is the wildest and most savage and most superstitious of the Turk, but less malicious than the Kirghiz and Turkoman.

The *Turkoman* is the fourth gradation of the Mongolian Turkish race, and in many respects they resemble the Kazak and Karakalpak. The pure Turkoman type, as met with in the Tekke and Chadar tribe in the centre of the desert, is of middling stature, small oblong head, not high cheek-bones, somewhat snub noses; longish chins, feet turned in, with the bright, sparkling, fiery eyes of the desert races, but more particularly the Turkoman. The blonde colour is common,—indeed, the Kelt race amongst the Gorgen Yomut are generally half blonde. The Goklen and other tribes near Persia evidence an intermixture with the Iranian Persian. The Turkoman are slender and agile, and they are hardy and enduring under privations. They early separated themselves from other Turko-Tartarian nations, moving from Mangishlak in the east to the north-west, and thence to the south. In their present country, the Salor and Sarik are the oldest tribes; after them the Yomut, who at one time ranged from north to south along the shores of the Caspian. The Tekke were transferred by Timur to Akhal. The Ersari, at the close of the 18th century, moved from Mangishlak to the shores of the Oxus, and recently many of the Chadar moved to the other bank of the Oxus. The chief avocation has been pillage. The men wear long locks till the close of the first year of their marriage. The women are handsome, and perfect beauties are to be seen, not inferior to the Georgians in figure and regularity of features. The young girls of all nomade tribes are good riders, but Turkoman women excel all others. Turkoman women, amongst the nomades, wear heavy silver ornaments. They are the labourers of the community, are virtuous, devoted, and much respected. Uzbak women go unveiled.

The *Uzbak*, though settled in Central Asia for centuries past, still meditates on robbery and war, and if no foreign enemy be found, they attack each other in bloody internal strife. The Uzbak is honest, upright, has much Turkish open-heartedness; they are proud of their education, and represent all the best side of the national character of the Turks.

The nomade Uzbak and Turkoman of Central Asia were largely engaged in a slave trade, stealing the Persians and selling them in Bokhara. The Uzbaks of Khiva practised it when driven towards Persia by the Turkoman; and of the Turkoman, the Tekke tribe captured the people of Khorasan, Herat, and Seistan, and the Yomut tribe, those along the southern shores of the Caspian, but the Salor, Sarik, Kara Chadar, and Alieli captured Shiah Persians from the territory of the Persians.

In January 1884, the Tekke Turkoman of Merv at their own request became Russian subjects.

The name by which Vambery designates these peoples is Turko-Tartar, from amongst whom came the warrior peoples known in the west as the Hun, the Avar, the Uigur, the Kutrigur, and Khazar. And the manner of living, the customs, and physical conditions, as then described, of the Tartar tribes, whose arms reached from the Jaxartes to the heart of Rome and Gaul, have much resemblance to those of the present inhabitants of Turkestan; and the people of Central Asia, particularly the nomade tribes, are in their social habits the same as they were two thousand years ago. In the tent of many a nomade chief a similar life is observable as that described by Priscus as prevailing at the court of the king of the Huns. Attila, Chengiz Khan, and Timur, in historical character resemble each other; and Vambery is of opinion that energy and good fortune could now almost produce on the banks of the Oxus and Jaxartes one of those warriors whose soldiers, like an avalanche carrying everything before it, would increase to hundreds of thousands, and would appear as a new example of God's scourge, if the powerful barriers of western civilisation, which has great influence in the east, did not stop the way. This is a correct view.

The *Turk*, wherever met with, is ever heavy and lethargic in his mind and body, but in his resolves firm and stedfast, not from principle, but from apathy and aversion to change; and it is from these characteristics that his appearance is earnest and solemn, a profound seriousness, a marble cold expression of countenance, with a great inclination to pomp and magnificence. An Uzbak or Turkoman has a proud bearing, as if possessed with a self-consciousness of greatness and power.

The Osmanli Turk's love of independence is boundless. He considers himself born to rule, that hunting and war alone are worthy of him, and husbandry is considered ignominious. In Central Asia, agriculture is exclusively in the hands of the Persian slaves,—commerce and business with the Tajak, Hindu, and Jew. The Turk is intellectually the inferior of the Iranian and Semitic nations. This defect is noticed by other nations, who apply to them the terms Turkluk (Turkdom), Kabalik (coarseness), Yugunluk (thickness), and Sadeluk (simpleness); and with these qualities, as the Osmauli is easily taken in by the Armenian, Greek, and Arab, the Turk is as easily so by the Tajak and Hindu. In transactions the Turks are regarded as possessing more honesty, frankness, and confidence, plainness, simplicity, and uprightness. Compared with the Persians, the Turk is a faithful servant, attached soldier, and upright man. They are more brave, persevering, and love more to rule than any other Asiatic people. They are unpolished, wild, and uncultivated, but seldom cruel out of malice. They crave riches, but only to expend them. They exact much labour from their subordinates, but protect and deal liberally with them. The Turk is innately a nomade, and, like other nomades, is distinguished for hospitality.

In Balkh and near Andkhui the harvest is at the beginning of June; in the oasis countries, in July; in Kungrat and in the north of Khokand, not till the beginning of August. Of the rivers, the Oxus is the most important, and the Zar-afshan, Shahar Sabz, and Jaxartes follow.—*Vambery's Sketches of Central Asia*, p. 283; *Russians in Cent. Asia; Yule, Cathay; Timkowski's Journey to Pekin.*

TURKEY, an empire in the east of Europe, south-west of Asia, and north of Africa, ruled by a race of Othmanli Turk, descended from Othman or Usman, who founded the empire in A.D. 1299. A pastoral band of 400 Turkish families was journeying westward from the upper streams of

the river Euphrates. Their armed force consisted of 444 horsemen, and their leader's name was Ertoghrul, which means 'the Right-Hearted Man.' As they travelled through Asia Minor, they came in sight of a field of battle, on which two armies of unequal numbers were striving for the mastery. Without knowing who the combatants were, the Right-Hearted Man took instantly the chivalrous resolution to aid the weaker party, and, charging desperately and victoriously with his warriors upon the larger host, he decided the fortune of the day. Such, according to the oriental historian Neschri, is the first recorded exploit of that branch of the Turkish race, which from Ertoghrul's son, Othman, Osman, or Usman, has been called the nation of the Ottoman Turks and the Osmanli. And in this their earliest feat of arms, which led to the foundation of their empire, we may trace the same spirit of haughty generosity that has been their characteristic down to our own times. The little band of Ertoghrul was a fragment of a tribe of Oghuz Turk, which, under Ertoghrul's father, Sulaiman Shah, had left their settlements in Khorasan, and sojourned for a time in Armenia. After a few years, they left this country also, and were following the course of the Euphrates towards Syria, when their leader was accidentally drowned in that river. The greater part of the tribe then dispersed; but a little remnant of it followed two of Sulaiman's sons, Ertoghrul and Dundar, who determined to seek a dwelling-place in Asia Minor, under the Seljuk Turk, Ala-ud-Din, the sultan of Iconium. The adversaries from whose superior force they delivered him were a host of Mongols, the deadliest enemies of the Turk race. Ala-ud-Din, in gratitude for this eminent service, bestowed on Ertoghrul a principality in Asia Minor, near the frontiers of the Bithynian province of the Byzantine emperors. The rich plains of Saguta along the left bank of the river Sakaria, and the higher district on the slopes of the Ermeni mountains, became now the pasture-grounds of the father of Othman. The town of Saguta or Saegut was his also. Here he and the shepherd-warriors who had marched with him from Khorasan and through Armenia, dwelt as denizens of the land. Ertoghrul's force of fighting men was largely recruited by the best and bravest of the old inhabitants, who became his subjects; and, still more advantageously, by numerous volunteers of kindred origin to his own. The Turk race had been extensively spread through Lower Asia long before the time of Ertoghrul. Quitting their primitive abodes on the upper steppes of the Asiatic continent, tribe after tribe of that martial family of nations had poured down upon the rich lands and tempting wealth of the southern and western regions, when the power of the early khalifs had decayed like that of the Greek emperors. One branch of the Turks, called the Seljukian, from their traditionary patriarch Seljuk Khan, had acquired and consolidated a mighty empire more than two centuries before the name of the Othmans was heard. The Seljuk Turks were once masters of nearly all Asia Minor, of Syria, of Mesopotamia, Armenia, part of Persia, the Western Turkestan; and their great sultans, Toghrul Beg, Alp Arselan, and Malik Shah, are among the most renowned conquerors that stand forth in oriental and in Byzantine history. But by the middle of the thirteenth century of the Christian era, when Ertoghrul appeared on the battlefield in Asia Minor, the great fabric of Seljukian dominion had been broken up by the assault of the conquering Mongols, aided by internal corruption.

Population.—Ravenstein and Behm and Wagner are the authorities chiefly relied on in enumerating the population of Turkey. Their calculations and the annual Sal-namahs, with information from the British consuls, would show 25,994,000 inhabitants in the empire. The Turkish Ministry of Finance issued in 1867 a statistical notice, in which the population of Turkey is placed at 18,500,000 for Europe; 16,500,000 for Asia, with Cyprus; and 5,000,000 for Africa; making a total of 40,000,000 for the empire. But Messrs. Ubicini and Courteille put the total population of the empire, exclusive of the tributary States, at 28,500,000. These are mere estimates. The empire of Turkey may contain about 11,500,000 of the conquering race, the remaining number being an agglomeration of races of different origin, language, and religion, some 6,000,000 of them being Muhammadans. In European Turkey, however, there are only about 2,000,000 of Osmanli, sparsely settled; whereas in Asia, and chiefly in Asia Minor, there is a compact mass of 9,000,000 to 10,000,000. To the same group belong some 300,000 Turkomans in Asia and some 200,000 Tartars in Europe from the Crimea. The Greeks do not seem to number more than 1,000,000 in Asia and 1,000,000 in Europe, chiefly along the coasts and in the islands. In European Turkey there are about 500,000 of Armenians, chiefly in Constantinople and a few large towns, whereas in Asiatic Turkey there are 2,000,000. To the same ethnographic group belong 1,000,000 of Ottoman Kurds in Asia, who are Muhammadan, but often hostile to the Osmanli. Lastly, there are in European Turkey about 200,000 Muhammadan gypsies and more than 100,000 Jews of Spanish descent, and in Asiatic Turkey about 1,500,000 of Arabs and others of the Semitic group.

TURKHANI or Turkolani, a tribe that came to Sind and were in power from A.H. 962 to A.H. 1021. On the death without issue of Mirza Shah Husain Arghun, who ruled over Sind, that province was divided by two chiefs,—Sultan Muhammad Bukri took Sehwan and all to the north, and Mirza Esa the remainder. Mirza Esa, the father of Mirza Baki Turkhan, was the first of the Turkhan who governed Lower Sind. He died A.H. 980, A.D. 1572. The tomb of Mirza Baki Turkhan is on the Muklee range of hills near Tatta. Mirza Baki assumed the government of Lower Sind on the demise of his father Mirza Esa. He died A.H. 993, A.D. 1585. The tomb of Mirza Jani Beg Turkhan was also built on the Muklee range, about A.H. 1009, A.D. 1680. He was son of Payand Beg Turkhan, and was the last Turkhan who governed Lower Sind, of which Tatta was the capital. He had succeeded to the government on the demise of his grandfather Mirza Baki Turkhan in A.H. 993, A.D. 1585, his father being insane. He ruled for seven years, till Abdul Rahim Khan, a general of Akbar, conquered Sind. Mirza Jani Beg visited Dehli, and was graciously received and the country was restored to him, but he was not allowed to return to Tatta. The government was carried on by his agents until his death, which took place in 1008 Hijira, A.D. 1599,

when his son Ghazi Beg was called to Dehli. Ghazi Beg remained there some years, after which he was appointed Governor of Kandahar, over which province he ruled until his death, which took place in 1020 Hijira, A.D. 1611. Both he and his father were, after death, carried to Sind, and buried in one tomb. The Turkolani tribe now inhabiting the valley of Bajawar (written Bajour) number about 10,000 or 12,000 families, and the other inhabitants of Bajawar are about 30,000. They are next to the Yusufzai, whom they resemble in food, lodgiug, and habit of life. They are brave, industrious, cheerful, and fond of amusement. They often meet to converse, sing, play on the guitar, and they have some of the active games of Khorasan.—*Lt.-Col. MacGregor*, iii. p. 220.

TURKISH ARABIA, a province of Turkey, has an area approximately of 140,000 square miles. Its population comprises Arabs, Kurds, Jews, and Christians. Baghdad, its capital, is situate ou both banks of the Tigris, and is the headquarters of the Wali in charge of the administration, assisted by a Muāwin, with a general officer, who is in direct communication with the War Minister at Constantinople. Two of the three districts into which Kurdistan is usually divided, fall more or less within the limits of Turkish Arabia. These two districts are Central Kurdistan and South-Eastern Kurdistau. The former extends north and south along the Turco-Persiau borders from Lake Vau to Sulimania; the latter comprises the Turkish districts of Sulimauia and Sharizor, the Persian provinces of Ardelan or Sehna aud Kermanshah, and a strip of country, including the plain of Zohab, from Kermanshah to the extremity of the Luristan Hills. The Turkish Kurds in the districts of Van, Mosul, and Sulimania may number 700,000 souls. They are of the Sunni sect of Muhammadans, and devoted followers of Abd-ul-Kadir Ghilani, the founder of the Kadria sectiou of darvesh, whose tomb is at Baghdad.

The country lying between the towns Kut-el-Amara and Amara, and inland as far as the Persian frontier, belongs to the Beni Laam, a powerful Arab tribe, and they and their neighbours, the Feili Kurds, are Shiah Muhammadans. Amara town is the S.E. limit of the Beni Laam territory, aud is just above the marshes of the Tigris where the river Hud flows out of the Tigris. The Tigris and Euphrates unite at Kurna to form the Shat-ul-Arab stream. The Turks claim the right bank of its whole course, but the left bank, from a point a few miles above Muhamera and thence to the sea, is occupied by the Kaab Arabs, who are in subordiuation to Persia.

Mesopotamia, or the doab between the right bank of the Tigris and the left bank of the Euphrates, is known to the Arabs as Jazirah, meaning island. Its inhabitants are Arabs. Those at its upper part are the Shammar Jarba tribe, who migrated from Nejd about the middle of the 18th century. They are of the Sunni sect, and are still nomade Bedouins, wandering over the whole of Northern Mesopotamia. In the summer their chief pasturage ground is at Shergot, on the Upper Tigris, a short distance below Mosul, and in the winter they approach Baghdad to buy supplies. They are at feud with the neighbouring tribes, the Anezeh, the Dilem, and the Montefik, the last a small population of many Fellah tribes.

In the lower part of Mesopotamia, the people are of the Shiah sect, especially in the neighbourhood of the holy cities Kazmaiu, Karbila, and Najaf.

British relations with Turkish Arabia date from the formation of the East India Company, a factory having been formed in Basra under the supervision of the Company's agent at Gambrun or Bandar Abbas in the Persian Gulf. Until A.D. 1833 the resident officers' duties were partly commercial and in part political, but since then wholly of the latter character, under the Politieal Agent at Baghdad.

The Tigris is navigable at all seasons of the year from Mosul, and iu the spring floods from Diarbekir. The Euphrates is navigable from Balis to Kurna, where the two rivers join. From Kurna to the sea there is water for vessels of very considerable draught.—*Tr. Chichely Plowden.*

TURKOMAN inhabit the desert country comprised by a line drawn through Astrabad, Herat, and Balkh on the south, the course of the Oxus from Balkh to the Aral on the east, the Caspian on the west, and the elevated plateau called the Ust Urt lying between the seas of the Caspian aud the Aral on the north. They must not be confounded with the Kirghiz or Kazak. They have never been under one head, but have tribes (khalk), branches (taifé), and tiré or clans. Some of them are nomades, and others are settled on the river valleys. Their tribes or khalk and their estimated numbers are as under:—

1. Chandor or Chooder, between the Caspian and Aral, 12,000 to 20,000 tents. They have seven taifé.
2. Erzari or Orzari, on the left bauk of the Oxus, 50,000 to 100,000 tents.
3. Alich or Andkhui, near Andkhui, 100 tents.
4. Kara, a savage, predatory tribe, between Andkhui and Merv, 1000 tents.
5. Salor, a brave, ancieut tribe, about the Murghab and Merv, 6000 tents.
6. Sarik, about Panjdeh, on the banks of the Murghab, 9000 or 10,000 tents.
7. Tekke, the most warlike and powerful of all the tribes. They range from N. of the Goklens up to Khiva, and beyond Merv Shah are found on the bank of the Oxus. Their two encampments are the Akhal Tekke to the E. of the Tajend swamp, and Merv Tekke at Merv. They have little of arable land, and lived by robbery and enslaving Persians. Their tents number 40,000 (Abbott) to 60,000 (Vambery), Marvin 50,000. Merv is the central position of this tribe, and in January 1884, at their own request, Russia annexed Merv.
8. Goklen, a pastoral and agrieultural tribe of 8000 or 10,000 tents in the valley of the Gorgben, for 90 miles, till they meet the Kurds. They are mostly subject to Persia. They are at inveterate feud with the Tekke to the N. They have ten clans.
9. Yomut are in two branches, the Gorghen Yomut on the Gorghen river under Persia, and the Yomut of Khiva in the desert on the left bank of the Oxus. They enslave Persians. They number 40,000 to 50,000 tents.

Population.—According to Major Abbott, the total tents of Turkoman are 91,700; according to Professor Vambery, 196,000, or respeetively 458,500 and 982,500 souls. The Turkoman have no shadow of government; eaeh is lord of his own

tent, but they show a little respect to old age and to valour, and highly prize purity of Tartar descent in the Ecg or free-born. Were the tribes to combine, Persia would be at their mercy. Their average height is 5 feet 7 inches; features irregular, beardless, eyes small and round, with a bold, penetrating glance, and a proud military bearing. They are honest amongst themselves, though predatory to strangers, and they are hospitable. The men attend only to their horses, listen to story-tellers. Their arms are a curved sabre and long spear, with gun or pistol, and the Tekke have cannons. The women are often good-looking, and are chaste. They marry early, occasionally before puberty, and have the show of attacking the bride's camp, to seize her, also the Kokburi (greeu wolf), where the bride, in bridal costume, rides off with the carcase of a lamb or goat. They are Sunni Muhammadans, but uneducated and barbarous. The modern travellers who have given accounts of the Turkomaus are General Petroosevitch, Major Butler, Colonel MacGregor, Major Burnaby.

TURKOMAN HORSES are a modification of the Arab breed. Timur introduced new blood by dispersing amongst the tribes 4200 marcs, which he had selected in Arabia from the very best breeds. Afterwards, Nadir Shah renewed this cross with 600 mares from Nejd, which he confided exclusively to the Tekke tribe, and the horses of this tribe are now held in the highest estimation in all Turkomania, especially those from the district of Akhal. The next in reputation after the Tekke horses are those of Merv Shah Jahan, the horses of Yomut and the Goklen, and the race of the Murghab, of the Hazara, the Uzbak of Maimana, Shibbarghau. The race dates back origiually, like the British thoroughbred, to the Arab, but it is now distinct; and, besides being much larger, they far excel the Arabs both in speed and endurance. In appearance they more nearly resemble the English thoroughbred or race-horse than any other type, and average about the same height, perhaps, if any thing, standing a little higher. Action is usually spoilt by the custom of tying the hind and fore leg of the colt on each side together, in order to make them 'tripple,' or walk 'disconnected' at the fast easy pace in which a Turkoman delights. It is at this pace, about five miles an hour, that they do their long, slow journeys, while the quick raids are made at a slow gallop. The steppes of Turkomania are very favourable to the development of the equine race, the pasturage and artificial grasses grow in dry soils, having no other nourishment than the winter snows. Green food is produced ou these steppes only in the spring; at that season the Turkoman refrain from making any expeditions, and this state of abnegatiou continues to the end of July. During this period they have time to gather in their crops, and their animals rest the limbs which have so well done their duty the previous season. From the month of August up to the winter they are kept on dry food; this consists of seven pounds of barley per diem, mixed with dry chopped straw, lucerne, sainfoin, or clover-hay, unless a chapaoul is coming off, in which case the horse is put upon half forage. They are most carefully clothed, but stand in the open air. They have thick felt coverings made, both as hoods and rugs, completely enveloping the whole body. The thick, heavy hoods wear away the mane, and prevent its free growth, and then the Turkoman trims or hogs it. A high-class Turkoman is nearly always followed by a yaboo, or pony, carrying his heavy clothings. Every horse is carefully tested, and his quality is exactly known by the tribe; and a horse of extreme merit is most closely guarded, and never sold except for a very large sum. They are raced over long distances, extending to as much as 40 and 50 miles; but they also have shorter races of 5 or 6 miles to test speed. The horses are sedulously prepared before being thus tried. Good, hardy, useful animals, averaging about 15.2 in height, can be purchased for from £15 to £20, whereas a very high-class horse will sometimes fetch between £400 and £500, or even more. The Turkoman is quite as gentle as the Arab, and generally more quiet and sedate in his ways and habits, whilst equally courageous. That they would prove as fast as the best English race-horses for very short distances, it is difficult to believe, for they have not been bred wholly for speed; but there is no reason to doubt that they would hold their own in very long races. Their stamina and general powers of endurance are certainly far in excess of those of the British thoroughbred horse.

Turmeric derives its name from 'terra merita.' Turmeric is the ground tubers of Curcuma longa, C. rotunda, C. angustifolia, C. viridifolia, and C. zedoaria. It is extensively grown throughout the East Indies, China, and the Archipelago, for home consumption and for export. The bulbs are small, and furnished with numerous long palmate tubers, internally of a deep-orauge colour. There are two descriptions of tubers, the one round, the other long, but both are yielded by the same plant. The odour is aromatic, somewhat analogous to ginger, but peculiar; the taste is aromatic. When chewed, it tinges the saliva yellow. Its powder is orange-yellow. Turmeric is used in dyeing a yellow colour, which is not, however, very permanent, and it is also largely used as a condiment in curries. In 1882–83, 63,570 cwt. were exported from India, value Rs. 3,72,077. The trade has rapidly decreased. Amba haldi is the term applied to the dyer's turmeric. Turmeric is grown like ginger from cuttings, or sets, which are little pieces of the fresh root cut up and planted. In India, amongst Muhammadans and Hindus, after betrothment and before marriage, the body is anointed with turmeric. Amongst Hindus, when they for the first time wear a new cloth or dress, they stain its four corners with turmeric, to ward off the evil eye and guard against malignant spirits. Turmeric is always emblematic of good tidings; for a soldier to smear his clothes with turmeric, denotes that he devotes his life as a sacrifice.—*Mason; Birdwood; M. E. Jur. Rep.; Poole; Simmonds; Powell.*

TURNER, Lieut. SAMUEL, went as ambassador to Tibet. Full particulars of this journey were published in 1783 in London, with an accurate map of the route. Captain Turner's route was from Rungpur in Bengal, to Tassisudon in Bhutan, and thence by the Chumulari pass across the Himalaya to Teshu Lumbu. He wrote, Embassy to the Court of the Teshu Lama in Tibet, containiug a Narrative of a Journey through Bhutan and part of Tibet, 1800. He also wrote on the Yak of Tartary in Asiatic Researches. He was deputed by Warren Hastings, in 1783, on a second mission to Tibet, but was preveuted reachiug Lhassa by the state of the government.

TURNIP, Brassica rapa, requires a free light soil. Turnips are cultivated in all parts of the Dekhan, at the commencement of the rains and the cold weather. They continue until the latter end of February, and go to seed easily. Among the varieties produced by long cultivation are the comuou turnip, the Swedish turnip, and another which is largely cultivated for the oil contained in its seeds, which under the name of colza oil is used for lamps.—*Riddell; Jaffrey.*

TURNOULI or Tarnawali. The village of Tarnawal is in the Mangal subdivision, Manscra division, of the Hazara district. It has a population of about 1498 souls, viz. 78 Jadun, 164 Syud, 248 Awan, and 1008 others. The Turnouli chiefly belong to Hazara, but they hold lands on both sides the Indus. They leagued with the Jadun tribe of the Mahaban, and with the Chagarzai, Hasanzai, and other northern Pathan tribes; they proved most formidable opponents to the Sikhs.

TURNOUR, GEORGE, son of the Honourable George Turnour, the first Earl of Winterton, was born in Ceylon in 1799, educated in England, and entered the Ceylon Civil Service in 1818. He wrote on the Buddhist History of Ceylon, and Indian Chronology, in vols. v. and vi. of Bengal As. Soc.; a series of essays on the Pali Buddhistical Annals. But his great work was his translation of the Mahawanso. He died at Naples, 10th April 1843.

TURNSOL, the Abd-us-Shams of the Arabs, also called by them Dawwar-us-Shams. The Ansariah tribe regard it as the emblem of the deity, the slave or servant of the sun, who is called Ilah-ul-Alihah, the God of gods.—*Catafago.*

TURPENTINE.

Ratenuj-rumi, Butum, Ar.	Kota, ... Nepal.
Kelon-ka-tel, . . Hind.	Zungbari, . . . Pers.

Turpentine is obtained in the north of Europe, in America, and in the Himalayas, from species of Larix, Abies, and Pinus, fir, pine, and larch trees, as also in Canada from trees of the genus Pistacea. Abies excelsa, the Norway spruce fir, yields the Burgundy pitch of commerce; Canada balsam is from the Abies balsamea; Venice turpentine is obtained from Larix Europæa; common turpentine is obtained from Pinus sylvestris, P. palustris, P. tœda, and other species of pine and fir, as also from the Pistacea terebinthus. Pinus morinda of the Himalayas yields spontaneously a very fine resin. Cedrus deodara is an elegant and lofty tree, hardy as the larch, and yielding valuable timber. Its turpeutine has been long employed in medicine by the Hindus, and was known even to Avicenna. It is the Kelon-ka-tel, and is in great repute in the N.W. of India, from its stimulant properties and power of healing deepseated ulcers, as in elephants and camels. Old and concrete American turpentine is often sold as frankincense.

Turpentine Oil.

Eau de raze, . . . Fr.	Acqua di rasa, . . It.
Huile de terebenthine, ,,	Aguarras, ... Sp.
Turpentinol, . . . Ger.	

The produce from the crude article is about from 14 to 16 per cent. Sweet oil of turpentine appears to be carefully rectified oil. The common oil contains some resin, which colours it. Camphene is rectified oil of turpentine. Turpentine is extensively employed, as the solvent of the other resinous bodies, in the formation of varnishes. The rectified oil has been much used as a solvent of caoutchouc. That distilled from the turpentine of the common long-leaved fir of the Himalayas, is of very superior quality.—*Royle, Productive Resources of India.*

TURPINIA NEPALENSIS. *Wall.*

Neela of Neilgherries.	Alla-kirilla, . . Singh.
Kon koombala, . Singh.	

A good-sized tree, common on the mountains of Ceylon, also all over Darjeeling, and in Hong-Kong; it is occasionally fouud in very low elevations not much above sea-level; it is particularly common about Ootacamund at 7000 feet; it is called neela.—*Beddome, Fl. Sylv.*

TURQUOISE. Eng., Fr.

Turkiss, ... Ger.	Turchina, ... It.
Firozah, ... Hind.	Turquesa, ... Sp.

This precious stone is found at Khojend, in Mawar-ul-nahr or Transoxiana, at Shebavek, in hills near Shiraz, in the Tibet hills, in Kirman, and in a mountain of Azerbijan, where the mine was discovered about fifty years before Ahmad bin Abd-ul-Aziz composed his Treatise on Jewels. He describes the mine about 30 miles from Nishapur as most celebrated from early ages for that particular kind of turquoise entitled Abu Ishaki, which, says he, averts evil from those who wear it, conciliates the favour of princes, augments wealth, preserves the sight, ensures victory over an adversary, and banishes all unpleasant dreams. The ancient sages, when first they beheld a new moou, immediately after fixed their eyes, says he, on the Firozah. The turquoise, from whatever source, is apt to change colour if brought in contact with acids, musk, camphor, or other scents, and possibly from the state of the weather. Small clear Persian stones found at Nishapur in Khorasan, sell at 6d. to 20s. each, whilst a fine ring stone will realize from £10 to £40; a perfect stone of the size of a shilling and of good depth has been sold for £400. It varies from white to fine azure blue, but it is only the fine blue stones that are of any value. From the Persian name Firozah is the colour called Firozah rang, turquoise blue. The best are from Nishapur, and are described by Ferrier as classed into eight kinds,—fatahi, azhani, sulimani, zanwi, asmani, abd-ul-hamidi, Indalisi, kanjinya. Turquoise of Badakhshan is of a blue colour, but is inferior to that of Nishapur. Turquoise is rather a favourite stone with the Muhammadans of India. Near Khojend is a turquoise mine, but the stones found there are of a greenish hue, and far less esteemed than those of Nishapur. There is another of insignificant note somewhere in Kirman. It is a hydrated phosphate of aluminum.—*Fraser's Khor-*

asan, p. 105; *Mrs. Harvey, Tartary, etc.*, i. p. 355; *General Ferrier; Ouseley's Travels*, i. p. 211; *Emmanuel; Tavernier; Markham's Embassy*, 108.

TURTLES are of two kinds,—of the family Trionycidæ or fresh-water turtles, and of the Chelonidæ or marine turtles, viz.:—

Fresh-water Turtles, Trionycidæ.

Emyda granosa, *Gunth.*, India.
E. Ceylonensis, *Gunth.*, Ceylon.
E. vitrata, *Peters*, Goa.
Trionyx Sinensis, *Wiegm.*, China, Chusan, Formosa.
T. Gangeticus, Nepal, Ganges, Penang.
T. Javanicus, *Schw.*, India, Java.
T. ornatus, *Gray*, Siam, Cambogia, Borneo.
T. Guntheri, *Gray*, India.
Chitra Indica, Nepal, Malay, and Eastern Archipelagos.

Marine Turtles, Chelonidæ.

Caouana olivacea, *Gray*, Indian seas.
C. caretta, Cape seas.
Chelonia virgata, *Gray*, Indian coasts.
Caretta squamata, *Gunth.*, Archipelago, Maldives, Ceylon.
Dermatochelys coriacea, *Gray*, all seas.

Marine turtles form an important article of food, and their scales are the tortoise-shell of commerce. Four different kinds are distinguished at Cape York and the Prince of Wales Islands. Three species of these can be identified as the green, the hawk's-bill, Caretta squamata, and the loggerhead, Caouana olivacea; and the fourth, a small one, which is said to be caught by a live sucking fish (Echeneis remora) being secured by a line passed round the tail, and thrown into the water in certain places known to be suitable for the purpose. The fish while swimming about makes fast by its sucker to any turtle of this small kind which it may chance to encounter, and both are hauled in together.

The green turtle is of so much consequence to the natives of the Archipelago, that they have distinguished it by a special name taken from the animal itself (Sulangi, from Sular). The season of the year when it is most plentiful at Cape York usually extends from about the middle of October until the end of November, but the limits are not constant. During the season they are to be seen floating about on the surface of the water, often in pairs, male and female together. A few are caught at night on the sandy beaches, but the greater number are captured in the water. The canoes engaged in turtling, besides going about in the day, are often sent out on calm moonlight nights. When a turtle is perceived, it is approached from behind as noiselessly as possible; when within reach, a man in the bow carrying the end of a small rope jumps out, and, getting upon the animal's back, with a hand on each shoulder, generally contrives to turn it and secure it with the rope before it has got far. This operation requires considerable strength and courage, in addition to the remarkable dexterity in diving and swimming possessed by all the blacks of the north-east coast of Australia and Torres Strait. There are some favourite look-out stations for turtle, where the tide runs strongly off a high rocky point. At many such places, distinguished by large cairns of stones, bones of turtles, dugongs, etc., watch is kept during the season, and when a turtle is perceived drifting past with the tide, the canoe is manned and sent in chase. At the islands of Talen-Talen many thousands could be easily procured. The Malays watch during the night, to ascertain where the turtle deposits her eggs, for as soon as she has finished her task, she covers them with her flippers with sand, and immediately retires into the sea. A piece of wood is then put up as a mark for the nest, which is rifled as occasion requires. It is said as a curious fact, that the male turtle never lands. On the south-western coast of Ceylon, at certain seasons, the flesh of turtle is avoided as poisonous. At Pantura, to the south of Colombo, twenty-eight persons who had partaken of turtle, in October 1840, were immediately seized with sickness. The hawk's-bill turtle, which supplies the best tortoise-shell, was at former times taken in great numbers in the vicinity of Hambangtotte during the season, when they came to deposit their eggs. This gave rise to the trade in tortoise-shell at Point de Galle, where it is still manufactured into articles of ornament by the Muhammadans, but the shell they employ is now almost entirely imported from the Maldives. If taken from the animal after death and decomposing, the colour of the shell becomes clouded and milky, and hence the cruel expedient is resorted to of seizing the turtles as they repair to the shore to deposit their eggs, and suspending them over fires till heat makes the plates on the dorsal shields to start from the bone of the carapace, after which the creature is permitted to escape to the water. At the period of breeding, the identical tortoise is believed to return again and again to the same spot, notwithstanding that at each visit she may have to undergo a repetition of this torture. In the year 1826 a hawk's-bill turtle was taken near Hambangtotte, in Ceylon, which bore a ring attached to one of its fins that had been placed there by a Dutch officer thirty years before, with a view to establish the fact of these recurring visits to the same beach. The finest tortoise-shell is exported from Celebes to China. The natives kill the turtle by blows on the head, and immerse the shell in boiling water to detach the plates. Dry heat is only resorted to by the unskilful, who frequently destroy the tortoise-shell in the operation. Mention is made of a carapace about seven feet in length.

The midas turtle is said to lay from ten to twelve dozen of eggs, and Dermatochelys coriacea from eighteen to twenty dozen at once; but many of the marine turtles lay from one hundred to two hundred and fifty. The eggs are generally hatched by the sun in three weeks. On escaping from the eggs, the young are of a white colour, and in size a little larger than a rupee, but few survive the attacks of sea-birds, herons, and storks in their way to the ocean, and the sharks and shark-toothed fishes when there.

The flesh of the hawk's-bill turtle is not held in esteem, but the plates of its shell being thicker, stronger, and cleaner than those of any other species, it is of great importance as an article of trade. When heated in boiling water, it softens, and by pressure can be made to assume any form, or two pieces can be made to adhere. In this state, gold, silver, and other metals are made to adhere to tortoise-shell.

The loggerhead turtle, Caouana caretta, is common in the Mediterranean and the Atlantic Oceans, less so in the Indo-Pacific. Of no commercial value, as its flesh is not esteemed, and its tortoise-shell of inferior quality. — *Jour. Ind. Arch.; Tennent's Ceylon; Gunther's Reptiles;*

Macgillivray's Voyage; Marryat's Ind. Arch.; Mr. J. Rohde, MSS.; Darwin, p. 547.

TURTUR, a genus of birds, the turtle doves, of the sub-family Turturinæ, and order Gemitores. Their generic name in the Urdu is Fakhta. The Indian species are—

T. rupicolus, *Pallas*, of N. and N.E. Asia, Himalayas.
T. meena, *Sykes*, all British India.
T. Cambayensis, *Gm.*, all British India.
T. Suratensis, *Gm.*, all British India.
T. risoria, *Linn.*, common ring dove, Africa, Malay Peninsula, Java, and Archipelago.
T. humilis, *Temm.*, British India, Archipelago.
T. bitorquatus, *Tem.*, of Java, Timor.
T. brevicaudatus, *Blyth.*
T. macrodactylus, *Strick.*
T. Dussumieri, *Tem.*, Archipelago.
T. ugrinus.
T. auritus.
T. orientalis.
T. Chinensis.
T. vivaceus.

TURTURATI, female, Chatway (Chatua), male hawks, natives of Sind, with black eyes; they are let loose after the season. See Hawking.

TURTURI. HIND. A musical instrument, a trumpet.

TURUSHKA, a name of the Scythi who, under Kanishka, invaded India. A Hindu name for the Muhammadans of India, Tartary, and Kābul.

TURVASA, son of Yayati by Devayani. He refused to bear the curse of premature senility passed upon his father, and so his father cursed him.—*Dowson.*

TURWEEAH, the eighth day of the Muhammadan month Zeehuj is so called.

TUS or Tuz. HIND. A bark upon which, in addition to leather, the ancient Persians wrote, and seems also to have been anciently used in Northern India. In Hiwen Thsang's time, the early Buddhist scriptures of Kasyapa's council were written on the leaves of the tala palm. In the 11th century, according to Alburini, paper was used. In the south of India the leaves of the palmyra are still (1884) used, but in the provinces of Central and Northern India they had long used the inner bark of a tree called tuz, and it was the bark of a tree of the kind called bhoj, a species of Morus or Betwa, with which they covered their vessels, supposed to be bark of the Betula bhojputra.

TUS, an ancient city of Khorasan, two marches N.E. from Nishapur, and a little to the north of the modern town of Meshed. It consisted of two towns, Tabaran and Nukan, and was once a place of considerable importance, but it was devastated by the Uzbaks in 996 A.H. (1588 A.D.), and its place has been taken by Meshed.

TUS or Tush. HIND. Wool, shawl-wool. The first quality of shawl-wool is called shah-tus or ash-tus. Tus khud rang or grey tus is the second quality of shawl-wool, its name meaning wool of natural colour. Raw pashm of the Tibetan goat, used in the manufacture of Kashmir shawls of the kind called tusha, is produced in Tibet.

Tusi is a fine cloth of Kashmir, used as a lining for shawls, also for stockings and gloves. It is woven from the soft under-fleece, called Asali Tus, of the Capra sibirica or Himalayan ibex, which are shot and snared in winter in Chini, near the Sutlej valley, and in the Balti valley and Ladakh. No wool is so rich, so soft, and so full.

TUSKI, a lake in Ladakh, about two miles long and half a mile in breadth; its waters are highly impregnated with soda. No fish are obtained in the lake, nor in the fresh-water streams which run into it. A mountain barometer makes the lake 15,000 feet above the sea-level. It is frequented by herds of mahoor or wild sheep, and several herds of kiang.—*Adams.*

TUSSAH, a silk cloth, prepared from the silk of a wild worm, and woven, in some districts in Bengal, into cloth of a fine description, much used for ladies' and children's dresses, and in most parts of India for native use, being worn by Hindus for certain ceremonies and while bathing. It is an article of export. In the Dekhan, the tussah worm-breeders are a class quite distinct from the weavers, and are either Telingas of low caste or Gonds; the former reside principally at Chilpore, Madapore, and Chinnore. At Madapore, which may be regarded as the centre and headquarters of the tussah breeders, there are at least seventy families. The tussah breeder never thinks of keeping up the breed of the insect throughout the year. When the leaf is off the tree about the middle of March, he deems his occupation gone, and he leaves the object of his former excessive care to shift for itself, thinking of nothing but the present ease, which may be summed up in a few words,—sloth, a bare subsistence, and an occasional debauch in his nectar, palm toddy. But with the rains returns his toil, and some little difficulty is experienced in procuring insects for a fresh campaign. If he can gather a dozen of promising cocoons, which his experience tells him are of females, he is quite satisfied. Carefully does he watch the bursting of the cocoon, and much care does he take of its winged inmate, having previously prepared for it a house of teak leaves dried. The male is not tardy in approaching. Impregnation takes place, the male dies, and in four days after laying her eggs, the female also. The eggs are in number about sixty; of these one-half prove abortive, while the others are hatched in ten days. The small insect is fed on the tender leaves of the Careya sphærica, and in six weeks spins its cocoon. The first brood are spared, and allowed to burst their cocoons to supply a sufficient quantity of ova for the tussah harvest. The same process as described is again gone through, with this exception, that the young worms are at this time fed on the leaves of the Pentaptera tomentosa, because those of the Careya sphærica are by this period of the season supposed to have acquired some influence noxious to the insect. It is during the progress of the worm from the egg to the formation of the cocoon that every energy of the tussah breeder is called into action for the preservation of his charge. Every animal, footed, winged, and creeping, is said to be the enemy of the tussah grub. Ants destroy them, kites and crows prey on them, snakes devour them, and squirrels are said to make a repast of them. To protect them first from their insect enemies, the tussah breeder ascends the 'muddy' tree (Terminalia tomentosa), the leaves of which are the insect's food, every branch he carefully clears of the different species of ants by which they may be infested, preventing the access of others by surrounding the trunk of the tree at its foot with ashes. The other enemies are kept off by shouting, throwing stones, firing guns, etc. Their life at this time would appear by their own

account to be one of the most unremitting toil, to devote themselves to which they forswear not only every indulgence but every comfort; and it rouses the apathetic peasant of Telingana to eloquence when he recounts what privations he undergoes, what pleasure he derives himself, and what incessant labour he incurs, while watching the rearing of the worm, and the perfecting of its work. The tussah butterfly is a species of Saturnia, probably the paphia, described by Dr. Helfer as the most common of the native species. From four to five hundred of the cocoons are sold to the banya and weavers for one rupee; the moth is killed by means of heat. There are three tussah harvests, one at the end of the rains, the other two in the cold season. The winding of the silk is accomplished by boiling the cocoons, separating the floss, of which no use is made, and twisting eight or ten filatures from as many cocoons on the middle of the thigh with the left hand of the workman, and to be wound on the instrument. This instrument, the middle bar of the wood, is held lightly in the hand of the workman, and made to move in a semicircle. An ounce and a quarter of silk is the average daily winding of a single workman. His wages are at the common rate of one pice for winding the silk of fifty cocoons, about three pice a day, as he cannot wind more silk than from a hundred and fifty cocoons. The piee, however, are large, and go there by eight to the rupee. The only dyes used for the tussah silk, so far at least as observation or inquiry has gone, are the flowers of the Butea frondosa and turmeric. By the former the usual familiar colour is produced; by the latter, golden-yellow is brought out after the threads are for some time immersed in a solution of ashes. The warp threads are stiffened with rice congee. Tussah is made into the saree, punchee, and searfs, at several towns of the Circar of Warangal. But in the Dekhan, the chief seat of the tussah manufacture is the town of Madapore, on the right bank of the Godavery, in the Ramghur Circar, where the moth that yields it is carefully reared, and from whence raw tussah silk is sent to other parts to be woven into cloth. The tussah cloths produced at Madapore are, in durability and fineness, very inferior to the cloths of the same kind manufactured in Bengal. They are dyed the same colour, and with the same materials as the silks, of which they are about one-half the price. The Saturnia, which is most commonly met with in Southern India, appears to be S. paphia. The caterpillar feeds on the leaves of the country almond tree, Terminalia catappa, whence it is often called the almond moth. It is also found on the leaves of the ber tree, Zizyphus jujuba, the casuarina, etc. The eocoons are ingeniously attached to the twiggy branches of the zizyphus by a long stalk terminating in a ring, encircling the branch. It does not appear that silk in any quantity has been obtained from this source in the Madras Presidency. There, the only use to which the cocoons appear to be turned, is that of a ligature for native matchlocks. They are cut spirally into long narrow bands, with which the barrels are tied to the stocks. Considerable quantities of the small silk cloths worn by Brahmans at their meals are imported into the Northern Circars from Cuttack. Dr. Roxburgh, in the 7th vol. of the Linnæan Transactions, described the preparation of the tussah silk of Bengal, derived there from two different species of Saturnia. One, called Bughy by the natives of Birbhum, appears to be the same as the Madras species (S. paphia), and is stated to feed on the ber tree and on the asana, Pentaptera glabra. The other, termed Jaru by the natives of the same province, is the S. cynthia, and is domesticated. The caterpillars are fed on the leaves of the eastor-oil plant (Ricinus), whenee it is called the arundy or arundi silk-worm, but it also eats the leaves of the zizyphus and Terminalia tomentosa. Colonel Sykes, writing in the 3d vol. of the Trans. Roy. As. Socy. Lond., on the cocoons of S. paphia found by him in the Dekhan, under the designation of the kaliswar silk-worm, stated that it is met with on the ber tree, Terminalia glabra, teak tree, and common mulberry. The Chinese tussah is said to be obtained from Saturnia atlas, which is also to be met with in Southern India. Another species of Saturnia (S. selene), the posterior wings of which are prolonged into a tail-like process, is common in Southern India. The caterpillar may be observed feeding in considerable numbers on the Odina wodier, or Be-sharm tree, in February and March. Its chrysalis is enveloped in a silky covering, so like that of S. paphia that it would probably be found to yield a strong and useful thread. It might be worth while to direct attention to the silk spun by several smaller specimens of Bombyx moths, found on different species of cassia, acacia, and phyllanthus. A gregarious caterpillar (a species of Lasiocampus) may be observed clustering in great numbers on the stem of the guava, the jamoon (Syzygium jambolanum), and probably other trees. The silky covering of these also seems deserving of examination.—*Tennent's Ceylon*, p. 427; *Dr. Walker in Madras Jour. Lit. and Science; Jury Rep. Madras Exh.*, 1855; *Mr. Rohde's MSS.; Major Cuth.; Davidson; Rapport du Science, Jury mixte International*, p. 54. See Silk.

TUSSAWOOF, the theology of the Sufi Muhammadans, also the Sufi sect, an order of religious devotees. Mysticism, contemplation.

TUSSILAGO FARFARA. *Linn.* Colt's-foot, Eng.; Watpan, Hind. This is not uncommon in many places in the Panjab Himalaya, at from 5000 to 11,000 feet. It grows also in Persia, in chalky soils in England, and is found in many parts of Europe. The plant is mucilaginous and slightly bitter, and may be employed as a demulcent possessed of a little tonic property. Its leaves are sometimes applied to wounds. It may be prescribed in the form of an infusion or decoction, one or two ounces to a pint of water.—*Royle; O'Sh.; Stewart.*

TU-TA-BAT. Burm. On the annexation of Pegu by the British, the king of Burma lost the royal garden, which is a few miles out from the village of Twantay, in which the celebrated tu-ta-bat tree grows. In that locality there are some dozen or more of these trees, which furnished the royal table with the tu-ta-bat fruit. The appearance of the tree is not unlike that of the common jack. It is said to be the Sapodilla plum, which grows in abundance in the West Indies, and has a most luscious taste. The Burmese tu-ta-bat is about the size of a large guava, and resembles it in shape. When ripe, it has a green-olive colour, and inside are four long

bean-like seeds of a dark-brown colour, which are surrounded by a mealy pulp. The taste of the pulp is not unlike a doorian, but it has none of the smell of that well-known fruit. It leaves a little astringency and pungency on the tongue and palate. The flavour is that of a ripe mellow plum. This fruit is scarce, and is presented mostly as offering to the Phoungyes. The keeper of the Twantay Garden and all his children were formerly charged not to eat a single plum, on pain of immediate execution. All the fruit was picked and sent up to the capital, by express boats, for use in the palace. If a Burman only pointed his finger at a tree, he would be severely punished for it. To point a finger at one was to spoil fruit intended to be eaten only by the king and members of the royal household.

TUTENAGUE, Shan-tung, CHIN., or China spelter, is an alloy of iron, copper, and zinc. It is harder than zinc, though less so than iron, sonorous, compact, and has some malleability. The fresh fracture is brilliant, but soon tarnishes. Till superseded by spelter from Silesia, it was clandestinely exported in large quantities (more than 50,000 cwt. annually) to India, but is now seldom or never shipped, spelter being, on the contrary, imported to compete with it in China. For boxes, dishes, household utensils, and other similar purposes, tutenague is well adapted. Its export price used to be about 14 dollars a pikul. One proportion is said to be 8 parts of copper, 3 of nickel, and 6½ of zinc, which gives a fusible alloy, very hard, and not easily rolled, but well adapted for casting.—*Simmonds' Dict.; Morrison.*

TUTI, HIND., is the long, silky, hemp-like fibre of three species of Abutilon, the A. tomentosum, A. polyandrum, and A. Indicum.

TUTICORIN, an important town on the Indian side of the Gulf of Manaar. Its neighbouring banks yield the pearl oyster and chank shells. Its harbour is sheltered by a line of low islands, but is only fit for small vessels. The Dutch obelisk light is in lat. 8° 47′ 17″ N., and long. 78° 11′ 17″ E. It is inhabited mostly by the Parawa race, who are fishermen. Trade has much increased since the opening, in 1875, of the South Indian Railway, of which Tuticorin is a terminus. The lighthouse on Hare Island was built in 1874. The pearl and chank (conch) shell fisheries have been noticed under Tinnevelly district. The port-master is superintendent of pearl fisheries.—*Findlay; Imp. Gaz.*

TUTIYA. HIND., PERS. A metallic salt. Nila-tutiya is the sulphate of copper, or blue vitriol. Hira-tutiya, also called Hira-kasis, is the sulphate of iron, or green vitriol; Safed-tutiya is the sulphate of zinc.

TUZAK-i-BABARI or Wakiat-i-Babari, commentaries of Baber.—*Elliot.* See Baber.

TWASHTRI, a deity of the Rig Veda, the analogue of Hephaistos and Vulcan, a skilful workman, the vivifier and bestower of long life, who imparts generative power, and bestows offspring. He developes the seminal germ in the womb. He has given form to all life. His son Viswa-rupa or Tri-siras was slain by Indra. His daughter Saranyu was married to Vivaswat, and was mother of the Aswins. It is also written Twashta.—*Dowson.* See Visvakarma.

TWEEDDALE. Arthur Hay, ninth Marquis of Tweeddale, was the second son of the eighth Marquis of Tweeddale. Born in 1824, and died in 1878. In 1841 he entered the Grenadier Guards. He served on the staff of Lord Hardinge in India, being aide-de-camp through the Sutlej campaign (1845–46), and was present at the battles of Ferozeshah and Sobraon, and after the peace he travelled in India, visiting Ladakh. He served with his regiment during the Crimean War, but in 1860 he obtained his colonelcy, and six years later he retired from the army, having exchanged into the 17th Lancers. By the death of his elder brother, Lord Gifford, in 1862, he became heir to the Marquisate of Tweeddale, but, in deference to the feelings of his brother's widow, he assumed the second instead of the senior title in the succession, and took the style of Viscount Walden. He brought together a fine collection of birds, and was reckoned among the foremost ornithologists of Europe. At his own expense he sent out collectors to the Malay and Philippine Islands; and in the Ibis and in the Proceedings of the Zoological Society, of which he was president, he published important memoirs. From 1870 to 1878 he was very constantly engaged in ornithological work, and he was always ready to give to others both advice and information.

TWENTY-FOUR PARGANAS form the metropolitan district of the Lieutenant-Governorship of Bengal. It forms the south-western district of the Presidency division. 1881, 1,618,420, exclusive of the town and suburb of Calcutta; or, inclusive of that city, 2,303,078 souls. The administrative headquarters of the district are at Alipur, a southern suburb of Calcutta. The seven principal rivers are the Hoogly, Bidyadhare, Piali, Kalindi, Jamuna or Ichhamati, Kholpatua, and Kabadak, all navigable by the largest native boats throughout the year; besides the great estuaries in the Sunderbans. The British obtained it from the Muhammadans by the treaty of the 20th December 1757, by which the Nawab Nazim of Bengal, Mir Jafar, ceded it to the East India Company. Rice forms the staple crop of the district.

TWICE BORN. See Dwaija.

TWINING, WILLIAM, a medical officer of Bengal, who was long employed in the General Hospital there, author of Clinical Illustrations of the more important Diseases of Bengal, with the Result of an Inquiry into their Pathology and Treatment, Calcutta 1832 and 1835; A Practical Account of Epidemic Cholera, and of the Treatment requisite in the various Modifications.

TWINS. The human female has usually one child at a birth. Twins occur once in 150 to 200 births. The Saliva Indians on the Orinoco believe that a woman who bears twins must have been guilty of adultery. In the island of Bali, twins are regarded as an unlucky omen, and all the family are placed outside the village for a month. Amongst the Khasiya race, one of the twins was immediately killed. The same custom holds amongst the Aino of Japan. At Arebo in Guinea, the mother and her twins are all killed. At Nguru, near Unyanyembe, one of the twins is killed.—*Peschel.*

TYCOON, Zeogun, or Kobo, the great temporal ruler of Japan. It was a title assumed by the ruling princes of Tokugawa Shoguns. Tai-kun signifies great or exalted ruler.—*Sir J. E. Reed.*

TYEB. Arab. That part of the Muhammadan creed containing the words, There is no deity but God, etc.

TYE-TINCO, the refuse of opium, used by the poorest Chinese in Singapore.

TYLOPHORA ASTHMATICA. *W. and A.*

Asclepias asthmatica, *Roxb.*	Cynanchum ipecacuanha, *Willd.*
A. vomitoria, *Koen.*	
A. pubescens, *Wall.*	C. vomitorium, *Sims.*
Tylophora pubescens, *Wall.*	Hova planiflora, *Wall.*
T. vomitoria, *Voigt.*	
Untamol, . . . Hind.	Kaka pala, . Tam., Tel.
Kodigam, . . . Tam.	Kukka pala, . ,, ,,
Kurinja, ... ,,	Verri pala, . . ,, ,,

Grows abundantly in the south of India and in Bengal. The root is of many long, thick, whitish fleshy fibres, issuing from a small woody head. The dried roots of this article afford an excellent substitute for ipecacuanha, if given in rather larger doses. It is said to be valuable in dysentery. This plant yields the kurinja fibre of Tanjore, which affords a good substitute for flax, is of fine quality, white, strong, and silky. Untamol, bark of the root of Tylophora asthmatica, must not be confounded with Ununtamul, the root of Hemidesmus Indicus.—*O'Sh.*

TYPHACEÆ. *D. C.* The bulrush tribe of plants, including marsh or ditch plants, comprising the two genera Sparganium and Typha, known in Sind as Pun and Buri. Of the former, one species occurs in Kashmir, and three species of Typha occur in India. At Trichinopoly, figures and architectural models are carved in the pith of the Typha elephantina. The attitudes of the figures are stiff, but the draperies are characteristic. There are pith models of the pagodas of Trichinopoly and Salem, and pith-work made from the rushes called Nultee in Tanjore, with a model of the pagoda. Cibotium Billardieri (the Dicksonia Antarctica of La Billardiere) contains an edible pith or bread-fruit, eaten by the natives of Australia. Typha bread is prepared in Sind from the pollen of the flowers of the Typha elephantina, and in New Zealand from another species of bulrush, Typha utilis. —*Powell; Voigt; Roxb.; Stewart; Royle.*

TYPHA ANGUSTIFOLIA. *Linn.*

Typha latifolia, *Willde.*

Boj, ... Beas.	Dipa, Dab, . . Panj.
Bulrush, Cat's-tail, Eng.	Kundar, Patira, . ,,
Reed mace, . . . ,,	Reree, ... Sind.
Pitz, Yira, . Kashmir.	Lukh, . Trans-Indus.

This species is common in marshes, etc., in moist parts of the Panjab plains, at about 4000 feet in Kullu, and up to the Kashmir valley (5000 feet). The roots are eaten in Kashmir; and on the Sutlej the lower succulent part of the stem is used for clearing the water of the swollen river, which it does speedily and effectually. In some places, also, they are made into boat ropes, which it is said will last a month; also the leaves are woven into mats and baskets. In Peshawur, and probably elsewhere, the down of the ripe fruit (not the flower, as mentioned by Vigne) is used to bind mortar for wall plaster. —*Stewart; Powell; Royle.*

TYPHA BUNGEANA, *Tatarinov*, Hiang-p'u, Chin., is a bulrush of the south of China.

TYPHA ELEPHANTINA. *Roxb.* Dib grass.

Hogla, ... Beng.	Putera, Dib, . . Sind.
Elephant grass, . Eng.	Bur, Buri, Bori, . ,,
Pun, ... Panj.	Jammu gaddi, . . Tel.

This bulrush grows along the river banks and margins of tanks; its leaves, called pun, are employed in making mats and baskets in North-West India, also rude boats (tirho). The pollen, like Lycopodium, is inflammable, and is collected in Sind, and there called Buri. The term Bori is, however, also given to a sweetmeat of Dehra Ghazi Khan, a curious substance in yellow lumps, consisting of the pollen of the dib grass, of the Typha elephantina, and of T. angustifolia collected and kneaded together, perhaps with the aid of a little treacle or sugar. Its long, tortuous, and strong roots penetrate the soil to the depth of 6 or 8 feet, and hold it together. Mr. Murray says the lower succulent part of the stem is used to clear turbid water.—*Murray; Powell; Royle.*

TYPHON, one of the Egyptian triad, brother of Osiris and Horus.

TYPHONIUM ORIXENSE. *Schott.*

Arum orixense, *Roxb.*	A. trilobatum, *Lour.*
Ghet-kuchoo, . . Beng.	Suri-kanda, . . . Tel.
Ghekool, ... Tel.	

Grows throughout the East Indies, common in the shady mango groves near Samulcotta, and where the soil is dry and fertile. The other species are T. divaricatum, T. flagelliforme, T. sylvaticum, and T. trilobatum. The root of T. flagelliforme (Ghas-kuchoo) is boiled in milk, and given in consumption. The roots of T. orixense are used in poultices as a counter-irritant. The tubers are exceedingly acrid while fresh, and are used as an application in snake-bites. They are likewise given internally in doses of from 20 to 30 grains. Roxburgh describes this Arum as a most powerful stimulant in proper hands. A poultice of this Orissa arum, bruised to pulp with tepid water, is a stimulant rubefacient and counter-irritant, applied to indolent buboes and tumours by the native practitioners, and with frequent advantage.—*Voigt; O'Sh.*

Typhonium sylvaticum, *Schott.*

Amorphophallus sylvaticus.	Arum sylvaticum, *Roxb.*
	Adavi chama, . . Tel.

TYPHOON, from Typhon, the north wind.

Tufan, . Arab., Hind.	Zephon, ... Heb.
Ti-fan, Ty-fung, . Chin.	Bagui, . . Philippine.
τυφως, ... Gr.	

The original meaning of the storm wind, Zephon, is north wind. Typhoon is, however, said to be a word of Chinese origin, from Ta, great, and Fung, tempest. It may, however, also be from the Arabic Tufan, a storm, and that from the Arabic root Taof, he did turn.

Typhoon is the European name of the frightful equinoctial gales which vex sea and land about the tropics, in the Eastern Archipelago, and down as far as to 10 degs. from the equator. The whole Malayan Archipelago is excluded from their sphere, while the whole of the Philippine is within it, the island of Mindano alone excepted. Typhoons, cyclones, and tornadoes are great rotatory winds that move along a curved line in increasing circles, sometimes centripetal. In the northern hemisphere, the rotatory movement follows a direction contrary to that of the hands of a clock; while the opposite takes place in the southern hemisphere. They occur in the northern part of the China Sea, along the southern and eastern coasts of China, near Formosa, the Bashee Islands, the north end of Lueonia, and to the eastwards of these islands, and betwixt

Formosa and the Japan Archipelago. They are dangerous tempests, seldom reach beyond lat. 14° N. They generally blow with the greatest fury near the land, and most violently in June and July. They occur in both monsoons; and though between December and May they are rare, furious gusts occasionally occur in November, and in August, September, and October they likewise occur. For several years, when the change or perigee of the moon has coincided with the 21st and 22d September equinox, violent ty-fungs occurred. They frequently commence without warning. The marine barometer affords the best indication, and its fall has been noticed to extend from 29·65° to below 27°. They usually commence between N.W. and N., and veer suddenly to N.E. and E., raising the sea in turbulent pyramids, which infringe violently on each other; as the wind veers to the south, the gale moderates. Near the coast of China a contrary motion often takes place, veering to the N.W. and W., changes to the S.W. In Keung-chow (Hainan) and the opposite peninsula called Lui-chew, or the region of thunder, temples are dedicated to the typhoon, the god of which they call Kew-woo, the typhoon mother.—*Horsburgh.* See Hurricane; Winds.

TYRE. The Hebrew writer, speaking of Tyre, says, 'Arabia, and all the princes of Kedar, they occupied with thee in lambs, and rams, and goats: in these were they thy merchants. The merchants of Sheba and Raamah, they were thy merchants: they occupied in thy fairs with chief of all spices, and with all precious stones and gold. Haran, and Canneh, and Eden, the merchants of Sheba, Asshur, and Chilmad, were thy merchants' (see Ezekiel xxvii. 21-23).

According to Justin, the ancient city of Tyre, the most celebrated of the cities of Phœnicia, and once the emporium of the world, the modern Sur, was founded by a colony of Sidonians, who fled thither when the king of Askelon captured their city, and the date of its foundation was the year before the sack of Troy. The prophet Isaiah calls her 'the daughter of Sidon.' 'Tradunt historiæ,' says St. Jerome, 'quod Tyrus colonia Sidonis sit.'

According to Herodotus (lib. 2, c. 44), Tyre was founded B.C. 2760. But the first year of New Island Tyre was B.C. 1254. Its total destruction, which had been foretold by the prophets with extreme minuteness, was effected by the Assyrians under Nebuchadnezzar, B.C. 573, after 13 years' siege, one of the longest recorded in history.

Subsequently, Alexander the Great made himself master of the whole of Syria and a part of Phœnicia, but Tyre (the insular town) still offered an obstinate resistance to his victorious arms. Irritated by several unsuccessful attempts to storm it by sea, he conceived the bold design of filling up the channel which separated it from the continent. This was effected by sinking piles into the sea, and throwing into the intervening space immense blocks of stone. The ruins of the ancient city afforded ready materials for the purpose. The whole was covered with sand, yet it was only after seven months' close siege that the inhabitants, attacked simultaneously by sea and by land, and the town being set on fire, surrendered to the Macedonian chief. When Tyre fell into the hands of Alexander (B.C. 332, and about 260 after the time of Ezekiel), that city was in full possession of the Indian commerce. It recovered its commercial importance, and was a flourishing city under the successors of Alexander. Nor did it cease with the Roman conquest. The emperor Hadrian repaired the fortifications, and made it the metropolis of a province, giving it all the advantages of a Roman colony. From the dominion of Rome it subsequently fell into the hands of the Saracens, about A.D. 639, who remained a long while in possession of it. It was taken by the Crusaders in 1124, after five months' siege, but they were forced to surrender it in their turn to the Mamluk of Egypt. Frederick the First, surnamed Barbarossa, was interred here. Tyre was the birthplace and residence of many persons celebrated in history. Hiram, one of its kings, was the friend of David and Solomon. He contributed to the construction of the great temple. The place is now known to the natives by its ancient Hebrew name of Sur, corrupted by the Greeks into Tyrus, and by the Romans into Serra.—*Robinson's Travels*, i. p. 260.

TZE-FAN, a district not far from Ta-li-fu. The Tze-fan tribe inhabiting it closely resemble the Chinese in feature, dress, and mode of life. Although industrious cultivators, they bear an evil renown as treacherous and martial banditti.

TZEREMISH are the original inhabitants of the provinces of Cazan and O-se-ta-our-han. After the Russians had made themselves masters of all these places, this people still continued to occupy the country to the left of Cazan, but they have been in subjection to the Russians for a hundred years. They resemble the Tartars in their external appearance, and they also wear their hair short, but their language is totally distinct, and they spring from a different origin. —*Staunton's Narrative*, p. 126.

U

U is the 21st letter and fifth vowel of the English alphabet. Its primary sound in Anglo-Saxon was the sound it still retains in most of the languages of Europe, as in the letters oo in cool, tool. This sound was changed to that of u in the words use, tube, etc., and it has now two other sounds, as in the English words but and bull. The sounds of the letters u and v are confounded in many languages. Dr. Gilchrist proposed for the Urdu and other tongues to use a short ŭ for the sound of the letter ă short. This has been followed by many writers on India and its products, but, though congenial to the practice in the English language, with many and great inconveniences, the greatest being that of employing the letter u to represent the a of other tongues. The English letter a, as representing this short vowel, constitutes a stumbling-block in the way of English articulation, which it is almost impossible to overcome. It is very difficult, almost impossible, to induce an English reader to pronounce Măn as if written Mun; Păn as Pun, Săb as Sub, Thăg as Thug; and the only mode of learning the correct pronunciation is to hear the tongue spoken. The English letter u is, of all the letters of that alphabet,

the most difficult to utilize in writing a foreign tongue, the sounds of ŭ being like ă, and of ū being like oo. In this Cyclopædia, therefore, being a book of reference, some words may be found given twice over, with the initials A and U, and medial letters a and u. Dr. Gilchrist's plan was by far the best, so far as pronunciation was concerned, but the worst in a scientific point of view.

UBALA CHAWAL or Oobala Chawal, HIND., lit. boiled rice, is rice which has been boiled in the husk, and then husked. All Muhammadans and many Hindus in the Peninsula of India use ubala chawal.

UBHATA, a Hindu physician who compiled a medical work, principally from the writings of Charaka and Susruta. It is known in the West Peninsula of India as the Ashtanga Hirudayam, and there his name is written Babhata. He was a native of Kashmir. His commentary is written in a clear style, and he gives explanations of obscure passages in the original authors. He is supposed to have lived in the 12th or 13th centuries A.D.

UBO. BURM. A worship day, of which in a month there are four, viz. at change and full moon, and at eighth of waxing and waning.

UCHH, an ancient town in Bahawulpur State, Panjab, situated on the eastern bank of the Panjnad river, 70 miles south-south-west of Multan, and 40 miles north-east of the present confluence of the Panjnad with the Indus at Mithankot, in lat. 29° 13′ N., and long. 71° 9′ E. (?) General Cunningham has identified Uchh with the city which Alexander the Great built near the meeting of the Panjab rivers. He believes that it is also the town mentioned by Rashid-ud-Din as the capital of one of the four principalities of Sind under Ayand, the son of Kafand, who reigned after Alexander. Uchh was captured by Mahmud of Ghazni, and by Muhammad Ghori, and was the chief city of Upper Sind under Nasir-ud-Din Kubāchah. Uchh is now an agglomeration of ruins representing successive cities built at widely different dates. It contains the tombs of many sanctified Muhammadans, from which it gets the title of Uchh-i-Sharif, and one of the ruined towns is styled Pir-ka-Uchh.—*Imp. Gaz.; Mohun Lal, Tr.* p. 453.

UCHWALA, a spirituous gruel of Sikkim, made from Eleusine coracana.

UD. ARAB. Any wood or timber frankincense, from species of the Aquilaria genus of plants, also the fragrant wood yielded by them, known as aloes-wood, eagle-wood.

Ud-i-farsi, Aquilaria agallocha, Persian eagle-wood.

Ud-i-Hindi, eagle-wood of India.

Ud-i-Kimari, agallocha-wood, eagle-wood of the hills.

Ud-i-Samudri, eagle-wood of the sea.

Ud-i-bukhoor, eagle-wood.

Ud-i-Chini, eagle-wood of China. Ud in India is the name applied to benjamin; and in Persia, to wood-aloes. Ud-batti are pastiles made of various fragrant vegetable substances, wood-aloes, sandal-wood, benjamin, Lichen rotundatus, patchouli, talisputree (Flacourtia cataphracta), gum mastic, sugar-candy, and gum, pounded fine and formed into pastiles. They are made in every large town, and burnt for the fragrance they give out. Ud-batti-ka-ekka, a metallic receptacle for pastiles. Ud-batti-ka-jhar, a tree formed of benjamin pastiles. Ud-dan, a box for holding frankincense.

Ud-i-balessan, HIND., is supposed to be the wood of Balsamodendron kafal, a tree of Arabia, an article of considerable traffic.

UDAI, the people known to the Binua of Jahore as the Oran Pago. See Kedah.

UDAIPUR (Oodeypore), capital of the Native State of Mewar, in Rajputana, in lat. 24° 35′ 19″ N., and long. 73° 43′ 23″ E. Udaipur means The City of the Sunrise. See Mewar.

UDAIPUR, a Native State in Chutia Nagpur, in Bengal, between lat. 22° 3′ 30″ and 22° 47′ N., and long. 83° 4′ 30″ and 83° 49′ 30″ E.; area, 1051 square miles, and a population (1872) of 27,708 souls. Udaipur is bounded on the north by Sirguja; on the east by the British district of Raigarh in the Central Provinces, and the State of Jushpur; on the south by Raigarh; and on the west by the district of Bilaspur. Gold and iron are found in small quantities; and within the boundaries of Udaipur lies a portion of one of the most extensive coal-fields in India. In 1860, the State was conferred on a brother of the raja of Sirguja, for good service during the mutiny.—*Imp. Gaz.*

UDAIPUR TOWN, in Hill Tiperah State, Bengal, in lat. 23° 31′ 25″ N., and long. 91° 31′ 10″ E., on the south or left bank of the Goomti, a few miles lower down the river than Old Udaipur, the former capital of the State, and the ancient residence of the rajas.—*Imp. Gaz.*

UDAIYAR. TAM. Generally written Waddiyar. A title borne by some Hindu tribes; it was that of the rajas of Coorg.

UDAKA-KRIYA. SANSK. The ceremony amongst the Hindus of offering a libation of water to deceased ancestors, as far as the fourteenth in affinity.

UDAKEA, a musical instrument of the Singhalese, the beating of which is prohibited, by a local ordinance, between the hours of 8 P.M. and 8 A.M.; the Indian tom-tom.—*Sirr's Ceylon.*

UDAN, sacred dialogues on the attributes of Buddhas.

UDANAVARGA is the northern Buddhist version of the Dhamma pada. It is in the Tibetan language, and has been translated into English in 1883 by Mr. W. W. Rockhill. It is well known in the Southern Canon under the name of Dhamma pada.

UDASI, SANSK., the dejected, a sect of devotees, one of the sects of the Sikhs, established by Dharmachand or Sri Chand, son of Nanak. The sect is widely diffused, and all are proud of their connection with the Sikhs, and are, among Sikhs, similar to Sanyasi among Hindus. They reside in monasteries, and eat what is cooked by other persons. The Udasi are recruited from all Hindu castes. The ceremony of discipleship is similar to that existing among gosains. Like bairagi and gosain, they have five akhara or placcs of assembly in Benares, known as Niranjani, Nirbani, Gudar, Sukhar, and Rukhar. Like them, also, some of their number are termed Naga (from Nanga, naked), because they go naked.—*As. Res.* xviii. p. 232; *Sherring's Hindu Tribes*, p. 268.

UDAYAGIRI and Khandgiri, two towns in

Cuttack, celebrated for their Buddhist caves, separated from each other by a narrow gorge. They are five miles W. of Bhuvaneswar, and contain numerous inscriptions. In the older inscriptions the language is Old Pali, and character Old Lat; they were prior to the 2d or 3d century, and make mention of Buddhist saints. The caves are stated to be excavated by Kalinga rajas. Five of the emblems found on the Buddhist coins are met with in these inscriptions, and a new form of the Bo Tree. Some of the more modern inscriptions are in Sanskrit, and are of the 5th or 6th century A.D. One of the 10th century, Samvat 9, which, if of the Gaur era, would be A.D. 1132. The character used in inscriptions is Kutila. The inscription of the 10th century, in Sanskrit, speaks of an equitable prince having the cave excavated within the sacred precincts of Jaganath for the holy ascetics. In the 10th and 11th centuries, therefore, Jaganath was worshipped. One cave at Udayagiri, known as the Tiger Cave, stands out from the hill in the form of a beast's jaw, with the teeth overhanging the entrance to the cell.—*Imp. Gaz.*

UDIKI or Wudiki. KARN. Marrying a widow, allowed by the low castes.

UDIPI, in South Canara district of the Madras Presidency, in lat. 13° 20′ 30″ N., and long. 74° 47′ E.; pop. (1871), 3857, is considered by Hindus to be the most sacred spot in the Canarese country, and is much frequented by pilgrims from Mysore. There are eight maths or Hindu monasteries; and the management of the temple, which is very ancient and largely endowed, is held by the heads of these maths in rotation, for two years each.—*Imp. Gaz.*

UDI-SAGAR, a lake of Rajputana. There are in reality three lakes, one at the villa of Suhailea-ki-bari, then the Peshola or inner lake, which is 80 feet above the Udi-sagar lake, the outlet of which is the Bairis river. The Peshola is fed from the little lake at Suhailea-ki-bari, and the Peshola is the feeder of the Udi-sagar. Both the Peshola and Udi-sagar are from 12 to 14 miles in circumference, and some places 35 feet deep, and, being fed from the perennial streams of the Aravalli, they contain a constant supply of water. It would be easy and inexpensive to lead a channel from the Udi-sagar to Chitore, as the fall is slight, and few locks would be required. The Bairis river issues from the Udi-sagar lake of Rajputuna, and passes within a mile of Chitore. There are thus two grand reservoirs within 6 miles of each other, the Peshola, or internal lake, having an elevation of 80 feet above the external one; and the Udi-sagar, whose outlet forms the Bairis. The Peshola may be called the parent of the other, although it is partly fed by the minor lake at the villa of Suhailea-ki-bari.—*Tod's Rajasthan*, ii. p. 627.

UGRADHANWA, one of Nanda's younger sons, who succeeded his father. He was cursed by a Brahman. He ordered all the brothers of Chandragupta to be put to death.—*As. Res.* v. 265.

UGRO-ALTAIC, a family of languages, which have been also designated Ural-Altaic, Ugro-Japanese (Logan), Ugro-Tartarian, Ugro-Turanian, and Turanian. Its limits are not settled. Dr. Edkins connects Chinese with Mongol roots. Others question the affinity of Mongol itself to the Tatar-Finnic languages.

The term Turanian is used in opposition to Iranian, and is applied to the nomadic races of Asia as opposed to the agricultural or Aryan races. The Turanian family or class consists of two great divisions. The northern is sometimes called the Ural-Altaic or Ugro-Tartaric, and it is divided into five sections —the Tungusic, Mongolic, Turkic, Finnic, and Samoyedic. The southern, which occupies the south of Asia, is divided into four classes,—the Tamilic, or the languages of the Dekhan; the Bhotiya, or the dialects of Tibet and Bhutan; the Taic, or the dialects of Siam; and the Malaic, or the Malay and Polynesian dialects.

By the term Ugro-Japanese, Mr. Logan designates the principal languages from the Fin and Magyar on the west to the Japanese on the east, and which have many phonetic characters in common, particularly that of vocalic harmony. They are the Fin, Hungarian, Turkish, Samoyede, Yenisian, Corean, Koriak, Tungusian, Kamtschatka, Mongol, Yukahiri, Japanese, Ainochukchi, Uigur, Manchu.

The Ugro-Tartarian languages of High Asia and other regions, which other writers style Turanian, are those of Dr. Pritchard's second group of nations belonging to the same great family, and include the various hordes who have been known under the names of Tartar, Turk, Mongol, Manchu, and Tungus. All these nations appear, from the result of late researches, to be allied in descent, though long supposed to be quite separate. In the vast region of High Asia, extending from the chain of Altai to that of the Himalaya, are the pasture lands where, during immemorial ages, the nomadic tribes of that region have fed their flocks, and multiplied those hordes which from time to time descended in immense swarms on the fertile regions of Asia and of Europe. Perhaps the earliest of these invasions of the civilised world was that of the Hiung-nu, expelled from the borders of China by the powerful dynasty of the Han. These were the people who, after their inroad on the Gothic empire of Hermanrich, made their way, under Etzel or Attila, into the heart of France. Hordes from the same regions, under Toghrul Beg, and Seljuk, and Mahmud of Ghazni, and Chengiz, and Timur, and Othman, overwhelmed the khalifat and the empires of China, of Byzantium, and of Hindustan; and lineal descendants of the shepherds of High Asia still sit on the throne of Cyrus, and on that of the Great Constantine. As a branch of the Ugro-Tartarian, Dr. Pritchard speaks of some of the insular nations to the eastward of Asia and near the coast of the Pacific Ocean. The idiom of the islands comprised in the empire of Niphon, as well as that of the independent Liu-kiu Archipelago, bears some signs of affinity to those of the Ugro-Tartarian nations; and he adds that Mr. Norris had assured him that the principle of vocalic harmony and other phenomena of the Tartar languages prevail in the idiom of the Japanese and Liu-kiu Islands. As a seventh group of his Ugro-Tartarian, he classes the aboriginal inhabitants of India, who, he supposes, were expelled from Hindustan by the Brahmans and the Aryan people who accompanied them across the Indus, and retired, as it is supposed, on apparently insufficient proof, into the Dekhan. They still occupy the greater part of

that peninsula, and a portion at least of the island of Ceylon. Their idioms—the Tamil, the Telugu, and the Carnatica of the Mysore—are sister dialects of one speech; and he considered it likely that the languages of the mountain tribes of India, the Bhil, the Gond, the Toda, and others, belong to the same stock. Dr. Pritchard adds that Professor Rask had conjectured that these nations are also of the Tartar stock. Their language has some of the peculiarities of structure which have been pointed out. He also observes that there are some curious analogies between the Tamilian and other dialects of the Dekhan and the languages of Australia, with which we have obtained some acquaintance through the labours of Mr. Threlkeld and several other missionaries, and from the able researches of Captain Gray.—*Sayce*, i. p. 57; *Logan*.

UIGUR, a tribe of Mongol Tartars, called Hiung-nu or Hioung-nou by the Chinese, and known in Europe as the Ouighour, Ougre, Hunigur, Hongre, or Hun. They are the present inhabitants of Kashgar. They dispossessed the Yu-chi about B.C. 200, but about B.C. 60 became subject to China. In A.D. 94 the Chinese annexed the country. According to Prof. Vambery (Bokhara, p. 81), the Uigur are the most ancient of the Turkish tribes, and formerly inhabited a part of Chinese Tartary, which is now occupied by a mixed population of Turk, Mongol, and Kalmuk. The great Uigur horde in Eastern Turkestan became Muhammadans in A.D. 966. The Chinese call them Hoieke, Oihor, and Hoai Hoai. Towards the close of the 8th century A.D., the emperors of the Tang dynasty deported about a million of Uigur families from the neighbourhood of Kashgar, and settled them at Kan-su and Shen-si. About A.D. 966, these families embraced Muhammadanism, and under their chief Satuk they conquered Transoxiana, and carried away captive an immense number of Turks of the Turghai tribe. In 972 the majority of these captives were allowed to return to their homes, but many remained, and they were styled Turghani or Tunghani, signifying remnant, and corrupted into Dungen, but known to the Chinese as Uigur or Hoai Hoai. They are all Muhammadans, but dress like Chinese. They are abstemious, religious, quarrelsome, using the knife, but honest and fond of trade.

The Uigur writing character was the original source of those still used by the Mongol and Manchu, and was itself almost certainly derived from the Old Syriac character through the Nestorians. The modern Tartar characters are written (and, it is presumed, read) in vertical lines from top to bottom of the page, the lines succeeding each other from left to right. Captain Valikhanoff speaks of the language now in use at Kashgar as being Uigur, but it is not clear whether he means that this term is known to the natives.

They were the first who reduced the Turkish language to writing, borrowing the characters from the Nestorian Christians, who came to their country as early as the 4th century of our era. The manuscripts of this language, written in the characters mentioned, are therefore the most ancient and valuable data in investigating the history of Central Asia,—nay, of the whole Turkish race. But these monuments are of great scarcity. Vambery believes he has collected all that has been discovered of the Uigur language, though the Uigur had a literature and were very fond of books at a time when the western world was involved in ignorance and barbarism. The most valuable manuscript he obtained bears date 1069, and was written in Kashgar; it treats of ethics and political subjects, and forms a kind of manual of advice to kings how to govern with justice and success. It reveals the social condition of this people, and forms the basis of the later regulations by which all Turks are governed.—*Vambery; Russians in Central Asia*, p. 67; *Yule's Cathay*, i. p. 206; *Timkowski's Journey to Pekin*, i. pp. 6, 378, 379; *Captain Valikhanoff*.

UJA, third son of Seoji, a Rahtor Rajput of Kanouj, in a foray on the Saurashtra peninsula, slew Bekumsi, the Chamara chieftain of Okamundal, and established himself there. From that act his branch of the Rahtor became known as the Badhail.

UJJAIN or Ujjaiyini, a town in the Native State of Gwalior, the dominions of the maharaja Sindia, in Malwa, situated on the right bank of the river Sipra, in lat. 23° 11′ 10″ N., and long. 75° 51′ 45″ E. Ujjain was in ancient times the capital of Malwa, was one of the seven sacred cities of the Hindus, and the spot which marked the first meridian of Hindu geographers. It is stated to have been the seat of the viceroyalty of the famous Asoka during the reign of his father at Pataliputra (circ. B.C. 263), but it is best known in history as the capital of Vikramaditya. The neighbourhood of the city was, in 1658, the scene of the decisive battle between Aurangzeb and his brother Dara. The ruins of the ancient city are situated about a mile to the northward. It is also called Visala and Pashpakarandini. It is the ancient Avanti, a city noted in verses 28 and 31 of the Meghaduta. Hindu geographers make it their first meridian, and calculate their longitude from it. But the present city was preceded by an older one, now in ruins. Hunter supposed it had been overwhelmed by a shower of earth, Malcolm suggested it had been destroyed by a flood, but in the tradition of the people it was overturned by an earthquake.

The surface of the hill (of the old city), where it has not been ploughed and picked, is strewed with fragments of stone, just as would be expected in a place which had once been covered with houses; the broken pieces of trap being parts of walls of which the larger pieces have been taken away as materials for other buildings.

The ruins furnish so large a quantity of antiques, that the natives call the place Roza-ka-Sadabirta, and it is in truth a never-failing charity for the industrious poor. In the idle days of the rains the digging begins. The principal things found are glass, stone, and wooden beads, small jewels of little value, seals, (agate and cornelian), and a few women's ornaments; copper coins are numerous; next in number are the debased silver Gujerati ones. Pure silver rupees seem scarce, and gold mohurs are either secreted and melted when found, or they but rarely reward the searcher. The pilgrims carry away with them as relics what has been dug out of the Junagarh, and merchants mix with the real antiques every old bead or piece of copper which has an ancient look, and pass them off as genuine on the unsuspicious natives.

There are caves in the neighbouring hills known as Raja Bhirtri's hermitage, and a well near known as that of Bibi Mako.—*Dr. Buist in Trans. of the Bomb. Geog. Soc.* pp. 139-767; *Jour. of the Asiat. Soc. of Beng.; Williams' Story of Nala*, p. 116; *Captain Warren; Imp. Gaz.*

UJLA, or pure white Bhil of Mewar, will eat no white animal, and their grand abjuration is by the white ram.

UKHARA, Saiva mendicants, who drink spirituous liquors and eat meat; they appear to be the refuse of the mendicant Gudara, Sukhara, and Rukhara sects, who are said to be in general of mild and inoffensive manners. See Udasi.

UKKU TUNDU. Can. The term applied to the steel ingots called wootz by Dr. Heyne.

ULEMA, plural Arabic of Alim, learned men; but particularly applied to a body of learned men of Turkey, who with a mufti are clergy and lawyers.—*Catafago.*

ULI and Uri is puri with p elided.—*Growse.*

UL-KUDI. Tam. Literally inside cultivators, whose ancestors had acquired a prescriptive right to their holdings.

ULMUS, the elm genus of plants of the natural order Ulmaceæ. Nearly 20 species of elms have been enumerated, of which 5 occur in India.

ULMUS ALTERNIFOLIA. *Roxb.* Tha-lai, Burm. One of the largest trees in the Pegu Province. It is found about towns and villages in the Prome district. Along with the rest of the class, this tree furnishes a valuable timber of a red colour, strong, and adapted for house-building. —*M'Clelland.*

ULMUS CAMPESTRIS. *L.*

U. Wallichiana, *Planch.*

Marun, Hembar, . Beas.	Brari, Breri, . Kashmir.
Marazh, Marari, Chenab.	Brankul, . . . ,,
Kain, Kai, . . Jhelum.	Imbir, Shko, . Sutlej.

This elm tree is common, wild, in many parts of the Panjab Himalaya, up to the Indus, from 3500 to 9500 feet. It grows to a large size. Dr. Stewart saw one more than 16 feet in girth; and Dr. Cleghorn says that there are many fine trees in the upper parts of Kulu, 30 feet in girth, and that the wood is esteemed, but not that of U. erosa. Dr. Stewart says the wood is not valued by natives; but it is tough, is used in Kanawar for ark poles; and in Hazara it is light, strong, and useful for the panels of dog-carts, etc. The bark is very tough, and is used for bed string, and sandals made from it will last for two days under hard work. The leaves are a favourite fodder, and the trees are often very severely lopped on this account.—*Stewart, Panj. Pl.; Cleghorn's Panj. Rep.*

ULMUS EROSA.

Manyi, Maunu, . . Beas.	Himburch, . . . Kulu.
Meru, Chipal, . Chenab.	Yumbok, . . . Ladakh.
Manu, Mannu, . Jhelum.	Maral, ... Ravi.
Bren, Bran, . Kashmir.	Maldung morun, Sutlej.

This elm tree of the N.W. Himalaya is frequently seen planted near villages, etc. It reaches up to 100 feet in height, and from 20 to 30 feet in girth, on the Beas. It grows at from 2500 to 10,500 feet in Ladakh; the wood has not any special use; spines project from the wood of the trunk into the inner surface of the bark, as in Populus Euphratica. In parts of the Jhelum basin, gun-fuse is made from the bark.—*Stewart, Panj. Pl.*

ULMUS INTEGRIFOLIA. *Roxb. Cor. Pl.*

Holoptelœa integrifolia, *Planch.*

Kacham . . of Ambala.	Dada-hirilla, . . Singh.
Khulen, Rajain, . Beas.	Aya maram, . . Tam.
Thalai, ... Burm.	Tambachi, Kanchy, ,,
Papri . . . . of Dehli.	Navili, ... Tel.
Wowlee, ... Mahr.	

This fine large elm grows in Ceylon, throughout the Peninsula of India, in Hindustan, in the Panjab and N.W. Himalaya, and in Burma to the latitude of Prome. Its wood is of a reddish colour, is strong, much used for building purposes requiring toughness and strength, for carts, door-frames, spoons, and roof planks. The wood yields a peculiar odour to boiling water, which, when mixed with boiling arrack, imparts to it the flavour of the more expensive palmyra arrack. The forks of the branches are used to protect straw from cattle.—*Roxb.* ii. p. 68; *Wight; Stewart; Thw.; Beddome; Fergusson.*

ULSOOR, an artificial lake in Bangalore. Water is pumped from the tank by steam power into filtering cisterns, and allowed to flow by gravitation into a pure water basin, whence it is again lifted to the summit of a stand-pipe on the Ulsoor rock, sufficiently elevated to command effectively all the points at which it is required to be delivered.

ULTRA-INDIA, a term applied by geographers to the countries east of British India; the Hinter Indies of Carl Ritter; also called Further India.

ULTRAMARINE.

Bleu d'outremer, . . Fr.	Oltramarino, ... It.
Ultramarin, Ger., Rus.	Ultramar, ... Sp.
Lajvurd, . . Guj., Hind.	

A very fine blue pigment made from the lapis-lazuli, and highly prized by painters. It is now artificially imitated in various ways.—*Faulkner; M'Clelland.*

ULUGH BEG, called Mirza Muhammad Targai, was a grandson of Timur. He was born A.D. 1394, killed 1449.

ULUS. Turk. A large family, a clan, a tribe, a sect. Applied in Afghanistan either to a whole tribe or to one of their independent branches. The word seems to mean a clanish commonwealth. An ulus is divided into several branches, each under its own chief, who is subordinate to the chief of the ulus. The chief of an ulus is called khan. He is always chosen from the oldest family of the ulus. In cases, the selection rests with the ruler of the country, who can remove a khan at pleasure, appointing one of his relations in his stead.—*Elphinstone's Caubul*, p. 159.

ULVA RETICULATA. *Forsk.* A very beautiful reticulated sea-weed of the Eastern Archipelago. See Algæ; Sea-Weed.

ULWAR or Alwar, capital of a Native State of the same name, in Rajputana, situated in lat. 27° 34′ 4″ N., and long. 76° 38′ 28″ E., nearly in the centre of the State. The area is about 3000 square miles; population (1871), 778,596, of whom 180,225 were Musalmans, 38 Christians, and the rest Hindus. Of agricultural castes, the Meos are by far the most numerous. Its subdivisions or districts are Raht, the Wal, with portions of Narukhand, of the Rajawat country, and of Mewat. Raht is the country of the Chauhan Rajputs, the head of whom claims to be the living representative of Prithi-raj. The Wal is on the west border, and is occupied by Rajputs of the Shekhawat clan, which is so important in Jeypore.

Ulwar State is composed of petty chiefships, which, till the middle of the 18th century, owed allegiance to Jeypore and Bhurtpur. The southern portion was usurped during the minority of the maharaja of Jeypore by Partab Singh, of the clan of Murookha Rajputs, about 1780. Macherry was conquered from Bhurtpur. Partab Singh was succeeded by his adopted son Buktawur Singh, with whom the first relations of the British Government were formed. Ahmad Bukhsh Khan, the Ulwar vakeel, joined Lord Lake at the commencemeut of the war with the Mahrattas, and received the grant of Loharoo from Ulwar, and of Ferozpur from Lord Lake, as a reward for his services. As a reward for the assistance which Ulwar rendered in the campaign, the districts which had been granted to Bhurtpur, and afterwards resumed, were conferred on thc maharaoraja by a sunnud from Lord Lake. In 1805 an exchange of territories was effected with Ulwar for mutual convenience. Thc State pays no tribute or contribution to local corps or contingents; it maintains an army of 2000 infantry and 1500 cavalry. Thc chief has received the right of adoption, and he is entitled to a salute of fifteen guns. It was decided in 1862 that Neemrana is a fief of Ulwar.—*Treaties*, iv. p. 141.

UMA, a Hindu goddess. In the Kena Upanishad, she is first mentioned as a mediatrix between Brahma and the other Hindu gods. She is called Uma Haimavati. It is supposed that she was the personification of divine knowledge, which came from Himavat, whcre scholars used to go and live to acquire this knowledge. Uma had several names. The Kumara Sambhava of Kalidasa gives an account of her birth and marriage. She was known as the Mountain Maid, and had takcn a strong likiug to Siva. She used to retire from the company of her parents, and, being sequestered in a 'bosky shade,' dedicated her soul to penance and prayer, in view to her uuion with Siva. On hearing of this, Siva sent a proposal to her father while she was seated with him. She blushingly consented to the proposal, and 'there were lotus pctals in sweet maiden's guile.' She is known as a model wife.

Uma is thc same with the Maya, Sakti, Prakriti of the Hindus, and with Io, Isis, Astarte, Ishtar, Myletta, Sara, Maia, Mary, Mariam, Juno, Venus, Diana, Artemis, Aphrodite, Hera, Rhea, Cybele, Ceres, Eve, Frea, Frigga of other nations, everywhere representing the female principle in creation, the universe, the mother of the gods, the spouse of god, the queen of heaven, and so forth, and the mother of god of the Mariolaters. One of the representations of Uma was as Kali, a nude female of a black complexion; and for her counterparts we havc Diana of the Ephesians, Isis, Hecate, Juno, Meles, Ceres, Cybele, and Vcnus Melainis, all of whom were represented black. In the cathedral at Moulins, at the chapel at Loretto, at the churches of the annunciation, St. Lazar's and St. Stephen's at Genoa; at St. Francisco at Pisa, at Brisen in the Tyrol, and one in Padua; in St. Theodore at Munich, in the cathedral and church at Augsburg, in the Borghese chapel of Maria Maggiore, in the Pantheon, and in a small chapel of St. Peter's,—are to be seen (in Augsburg as large as life) a black virgin and a black child (Inman, ii. p. 263). There is a close analogy between the conception of Uma, the mother of the universe, and that of the Egyptian and Grecian goddesses, as also that of the Gnostics, the Rosicrucians, Mariolaters, and other mystics, whose influence on Christianity is still manifest in the traces they have left on the Roman Church.—*Calcutta Review*, No. 109, p. 29; *Garrett*.

UMAR, the second khalif after Mahomed, Mahomed's successors having, according to the sect of Sunni Muhammadans, been Abubakr, Umar, Usman, and Ali. He conquered Syria, and in A.D. 637 he besieged and took Jerusalem, after a defence of several months. In 638 he led a powerful army into Egypt, the conquest of which country was completed by the taking of Alexandria, 640. He instituted the era of the Hijira, or flight of Mahomed, and Muhammadans now use it. It begau A.D. 16th July 622. He was assassinated by a Persian slave, A.D. 644, at Jerusalem, where his tomb is still shown. His memory is held in the highest veneration by the Sunni sect, but the Shiahs regard him as a usurper. It is Umar of whom the statement is made that he ordered the Alexandrian library to be burned.

UMAR II., graudson of Umar I., was the eighth khalif of the Ummiades. He succeeded the Khalifa Soliman, A.D. 717. He laid siege to Constantinople, but was forced to raise it, because of a violent storm which destroyed a great part of his fleet. He was poisoned A.D. 720.

UMAR-ibn-ul-FARID, a devout Muhammadan of Cairo. He was the author of many poems, which are remarkable both for their mastery of language and their subtle and beautiful thoughts. He was of moderate stature, but of very imposing presence; he was handsome, with a rather ruddy complexion, and when he took part in a zikr (*q.v.*), or became ecstatic, his features lit up, and a copious perspiration would cover his body. From early life he was accustomed to seek thc solitude of Mount Mokattam, near Cairo; but, yielding to a vision, he went to the vicinity of Mecca, with his headquarters at ten days' journey from it. His poems are said to have been composed while in the ecstatic state. When excited, he would rush naked into the streets and recite portions of them, dancing as he did so wildly along, joined at every step by votaries who imitated his excited cries and gestures.

UMAR KHAYYAM, the astronomer poet of Persia. Several editions of his writings have been printed. He held that the outward forms of religion are matters of indifference. He says,

> 'Kaba or idol shrine, 'tis His house of prayer;
> Even ringing bells invite us to His shrine;
> Mosque or church, He is present there;
> Crescent or cross, 'tis Allah's sign.'

UMARKHER, chief town of a pargana of the same name in Basim district, Berar, lat. 19° 36′ N., long. 77° 45′ E.; population (1867), 5753. It has a police station, a dispensary, and a good school. An action was fought here in 1819 between the Hatkar chiefs and the Nizam's army.—*Imp. Gaz.*

UMARKOT, a town in the Thar and Parkar district of Sind, lat. 25° 21′ N., long. 69° 46′ E. It lies on the confines of the sand-hills forming the eastern desert; and a canal, known as the Umarkot branch, leading out from the Nara, now reaches the town, tailing off into a large tank. Its historical importance is due to its position on the main route from Hindustan to Sind. Akbar, son

of Humayun, then on his way to Afghanistan, was born here, October 1543. The presumed spot of Akbar's birth is marked by a stone slab with an inscription. Akbar marched through this town in A.D. 1591, to conquer Sind. In 1813 Umarkot was captured by the Talpur Mirs from the raja of Jodhpur, in whose possession it had been for some time; and after their downfall in 1843, it came into the hands of the British.

This stronghold or kote of the Umar tribe, was the capital of the Soda dominions, which extended, in the 17th century, into the valley of Sind, and east to the Luni; but the Rahtor of Marwar and the Talpur family reduced the sovereignty of the Soda to a very confined spot, and thrust out of Umarkot (the last of the nine castles of Maru) the descendant of Sehris, who, from Arore, held dominions extending from Kashmir to the ocean. Umarkot, during the opulence of the Soda princes, contained 5000 houses, but in the beginning of the 19th century it hardly reckoned 250 huts. The old castle, to the north-west of the town, is built of brick, and the bastions, said to be eighteen in number, are of stone. It is a place of some strength, and was considered so inaccessible from the desert that surrounds it, that the amirs of Sind allotted it as a place of security to deposit a part of their treasures. The old Rajput family of Umarkot is stated by Tod (Rajasthan, i. pp. 92, 93) to have been Pramar or Powar Rajputs.—*Tod's Rajasthan*, ii. p. 313; *Pottinger's Trs.* p. 401; *Imp. Gaz.*

UMAT-SURI, a mercantile festival held about the middle of July. It is a procession of trades and an exhibition of their wares, amongst which the wax-workers are very prominent.

UMBALLA, properly spelt Ambala, a British district in the Lieutenant-Governorship of the Panjab, lying between lat. 29° 49′ and 31° 12′ N., and between long. 76° 22′ and 77° 39′ E. Area, 2627 square miles; population in 1881, 68,238. Umballa and its neighbourhood are intimately associated with the earliest dawn of Indian history. The strip of country included between the Sarsuti (Saraswati) and the Ghaggar is the holy land of the Hindu faith, the first permanent home of the Aryans in India, and the spot where their religion took shape. Its banks are everywhere lined with shrines, but the towns of Thanesar and Pihoia form the chief centres of attraction, and a tank filled by the Sarsuti at the former place is annually bathed in, as a religious purificatory rite, by some 300,000 persons. The country teems with traditions of the great conflict between the Pandava and the Kaurava, whose exploits are detailed in the Mahabharata. Hiwen Thsang, the Chinese Buddhist pilgrim of the 7th century, found it the seat of a flourishing and civilised dominion, having its capital at Srugna. Srugna continued to be occupied down to the time of the Muhammadan conquest of the country. In 1872, Jat numbered 175,335, of whom 161,967 are Hindus or Sikhs, and 13,368 Musalmans. In the N. parganas the Jat form the chief proprietary body, and keep up their usual reputation for industry and frugality. The Chamars, 125,638, Hindus; its members may be found in all menial positions. The Gujars (48,695) are almost equally divided between Hinduism and Islam. As elsewhere, they are fonder of cattle-breeding than of agriculture, and show the ancestral tendency towards a wild, lawless life. The other leading tribes are the Banyas, 39,093; Kambohs, 9847; Syuds, 8490; Khattris, 7893; and Pathans, 7377. The inhabitants of the Kotaha pargana, in the hill country, are a simple, quiet race, clinging almost without exception to the Hindu faith of their forefathers, deeply devoted to their homes, and seldom visiting the plains. A family may be absent for a hundred years, yet their name will be held in remembrance and their descendants may return at any time to reclaim their possessions without a remonstrance.

UMBELLIFERÆ. *Juss.* The Apiaceæ of Lindley, the celery tribe of plants, were called Umbelliferæ from the arrangement of the flower-stalks in head or umbels. There are about 1500 species, all herbaceous, and abounding in temperate climates. The products of the group vary much in character. Celery, fennel, parsnip, carrot, and parsley are all familiar esculents belonging to the order. Upwards of a hundred species occur in the mountains and plains of India. Some are acrid and virulently poisonous; some abound in resins, containing a large quantity of an essential aromatic oil, and act as aromatics and stimulants; others yield fœtid gum-resins.

The laser or silphion of the ancients is secreted by plants belonging to this order; and asafœtida, galbanum, gum-ammoniacum, oppoponax, and sagapenum are much used as stimulant medicines in nervous diseases at the present day.—*Voigt.*

UMBILICUS MALACOPHYLLUS. *Smith.*

Tsoh, Yeh-ho-tsau, CHIN. | Uh-yu, Wa-sung, . CHIN.

This kind of house-leek is found in China on the tops of old houses. Its juice is employed to wash the hair of the head.—*Smith.*

UMBRELLA.

Kettisol (paper umbrellas), CHIN.	Bawat, ... ,,
	Payung, . . . MALAY.
Parapluie, ... FR.	Kodayal, ... TAM.
Chatri, . . GUJ., HIND.	Godugulu, . . . TEL.

Umbrellas are employed as a shade against the heat of the sun and rain; a smaller kind, the parasol, being used chiefly by ladies, either while walking or riding in open conveyances. The kettisol or paper summer head is extensively manufactured in China, whence it is largely exported to various parts of the world. In India, palm leaves spread over bamboos are largely used. The umbrella of the Lepcha in Sikkim consists of a framework of bamboo enclosing broad leaves of Phrynium. The umbrella has been a symbol of rank in eastern countries from the most ancient times. Ch'hatra-pati, lord of the umbrella, one of the titles of the ancient Persian kings, is supposed to be the word from which the Greeks and Romans obtained the title of Satrap, the Ekach'hatra, the vaulted horizontal sunshades, being reserved for royalty. Carpini notices that umbrellas, Solinum vel Tentoriolum in hasta, were held over the Tartar nobles and their wives when on horseback, and this is still an Indian custom. Adrian speaks of the Skiadia.

In most eastern countries, the right to use an umbrella is bestowed by sovereigns. Until recently, no native of India would have presumed to keep his umbrella spread, or his slippers on, while approaching a European, nor pass a European sentry with it. Those bestowed by sovereigns are of various shapes, and have various names. To use an umbrella at all, amongst Malays, or rather

to have it carried over one, for no native carries an umbrella himself, is a mark of rank, and its quality implies the degree of that rank. The sovereign alone uses one which is gilt throughout. In Java, a small umbrella, called a bawat, is the special badge of the higher nobility, called by the Sanskrit title of bopati. This is not made use of to protect from sun or rain, but carried by a retainer before the party.

A white umbrella is the emblem of sovereignty in Burma. Its use is restricted to the king, and to being placed over the images of Gautama. The king is supposed never to move except with the white umbrella held over him.

Aftab-giri of the Muhammadans of India and Persia is a round vertical parasol, carried at native courts to shade the sovereign. It can be used by other persons there only by the special grant of the sovereign.

Umbrellas of state in ancient Buddhist monuments of India are represented. In the Bharhut tope, there is represented a relic casket, over which a seven-headed Naga raises its head, and over it an umbrella of state.

State umbrellas of the Chinese are worn by those to whom they are granted; they are variously marked. China people of humbler rank can use paper umbrellas only.

Mark Antony was censured for having united the eagles of Rome with the state umbrellas of Cleopatra.

> 'Interque signa (turpe) militaris
> Sol aspicit cornopeum.'

Umbrellas are imported into India to the number of two or three millions annually, of value 19 to 23 lakhs of rupees, two-thirds of them from the United Kingdom, and their price on the average is 12 annas.—*Fergusson.* See Titles, p. 899.

UMBRELLA TREE, a name applied to the Acacia planifrons, which grows straight and then spreads its branches horizontally; a few of these are growing in the cantonment of Bellary; the name is also applied to the Pandanus odoratissimus, which throws down aerial roots.

UMBRINA RUSSELLII. *Cuv., Val.*
Ikan gulama, . . MALAY. | Qualar katchelee, . TAM.

Total length, six inches to one foot? Inhabits sea of Penang, Malayan Peninsula, Singapore, Vizagapatam, Indian and China seas. Its isinglass is considered of good quality.—*Russell; Cantor.*

UMDAT. ARAB. A pillar, a support, a prop; part of a Muhammadan title; Umdat-ud-Dowla, Umdat-ul-Umra.—*Catafago.*

UMMIADES, a dynasty of khalifas who ruled A.D. 661–2 to 744–5. Abd-ul-Malik, the fifth khalif, reigned 21 years at the close of the 7th and beginning of the 8th centuries. He was very penurious.—*Catafago.* See Khalif.

UMM-ul-KHAIR, a title of Rabia, native of Basra, a holy Muhammadan woman who passed her life at Jerusalem. She died A.D. 752-753, A.H. 135.

UMRA, plural of Amir, means nobles; it forms part of the titles of Muhammadan courts, as Amir-ul-Umra, noble of nobles.

UMRER, town in Nagpur district, Central Provinces, lat. 20° 18′ N., long. 79° 21′ E.; 28 miles south-east of Nagpur city. The Umrer dhotis consist of very fine cotton cloth with embroidered silk borders from an inch to a foot and a half wide. —*Imp. Gaz.*

UMRITSAR, an administrative division of the Panjab, comprising three districts of Gurdaspore, Amritsar, and Sialkote. The district takes its name from the chief town, Amritsar, situated nearly half-way between the rivers Beas and Ravi, in lat. 31° 40′ N., and long. 74° 45′ E., and contains 151,896 inhabitants. It is 36 miles E. of Lahore. It is a holy city of the Sikh religionists.

UNAO, chief town and administrative headquarters of the Unao district, Oudh, situated 9 miles north-east of Cawnpur, on the road to Lucknow, in lat. 26° 32′ 25″ N., and long. 80° 32′ E. Except where the country falls as it approaches the Ganges, a uniform dead level prevails; rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren usar, the whole intersected by small streams. There are several large marshes and sheets of water (jhils) in parganas Jhalotar, Ajgain, Parsandan, Unao, and the northern parts of Harha and Mauranwan, in which fish abound, and water-nut (singhara) is grown. According to local tradition, Mauranwan, Purwa, and the northern part of Harha were occupied by the Bhar, and the rest of the district by low-caste tribes of Lodh, Ahir, Thathera, etc. The most numerous races are Ahir, 86,087; Chamar, 85,230; Lodh, cultivators, 83,118; Pasi, 55,139; Murao, vegetable-sellers, 35,683; Kori, weavers, 24,552; Nao, barbers, 22,430; Gararia, shepherds, 22,312; Teli, oilmen, 18,408; Kurmi, cultivators, 17,791; Dhobi, washermen, 13,670; Barhai, carpenters, 13,107; Mala, boatmen, 12,436; Kumbhar, potters, 10,944; and Kahar, palanquin-bearers, 10,763. The most important sections of the Muhammadans are Pathans (12,800) and Shaikhs (8121). Syuds number 2281.—*Imp. Gaz.*

UNCARIA GAMBIR. *Roxb.* Terra Japonica.
Tiau t'ang, . . . CHIN. | Unkoodoo, ... TEL.
Gambir, . . . MALAY. |

One of a genus of plants belonging to the natural order Rubiaceæ, a native of Penang, Sumatra, Malacca, and Ceylon. The extract from the leaves is called gambier, and is manufactured in Siak, Malacca, and Bitang. A gambier plantation has much the appearance of brushwood of three years' growth, with small, smooth leaves of a dark-green colour. The leaves are collected three or four times a year, and boiled in a caldron, from which a strong decoction is poured into square boxes, which, when cool, hardens, and is cut into small cubes of about 1½ inches. As brought to the market, it resembles in appearance and consistency little square blocks of yellow mud, hence one of its names, Japan earth. The plants at Singapore are 6 feet asunder. The cropping of the leaves may commence when about eighteen months old, but the plant is at its full growth when two years old, and its leaves and young branches may then be cropped once in two months. The croppings are thrown into a large caldron of hot water, and boiled for six or seven hours, till all the extract be inspissated into a thick pasty fluid. This is now poured into shallow troughs a little more than an inch deep, and allowed to cool and dry, when it is cut up into little inch blocks, and is then ready for the market of Siam, Cochin-China, China, and the Archipelago, where, along with betel-nut, in a leaf of the piper betel (Siri), it is largely chewed as a masticatory, as natives of India use the betel-nut of the Areca catechu. The

average size of the Singapore plantations are of thirty acres, and when in full bearing employ eight men. A plantation becomes exhausted and worn out in 15 years from its commencement.

As a preservative for timber, dissolve three parts of gambier in twelve of dammer oil over a slow fire. Then stir in one part of lime, sprinkling over the top, to prevent its coagulating and settling in a mass at the bottom. It must be well and quickly stirred. It should then be taken out of the caldron and ground down like paint on a muller till it is smooth, and afterwards returned to the pot and heated. A little oil should be added to make it tractable, and the composition can then be laid over the material with a common brush. As a protection against the teredo, black varnish or tar are substituted for dammer oil, omitting the grinding down, which would not answer with tar. Gambier is largely imported into Britain, and it is used in tanning. From 1846 to 1850, the average quantity entered was 1200 tons, priced at £13 to £14 the ton. It is duty free. Roxburgh (i. p. 517) describes also U. acida, U. cirrhiflora, U. ferruginea, U. lævigata, U. ovalifolia, U. pedicillata, U. pilosa, U. sessilifolia, U. sessilifructus, and U. sclerophylea.—*Thw. En. Pl. Zeyl.* p. 133 ; *Ainslie ; O'Sh.* p. 398 ; *Crawfurd ; Journ. Ind. Arch.; Poole.*

UNDAVILLI, on the south bank of the river Kistna, a mile from Bezwara, has a rock-cut temple, originally a Buddhist vihara, but now a Vaishnava shrine dedicated to Anantasena, a name of Narayana.

UNGIRA, father of Vrihaspati and Angirasa, was a Hindu philosopher, and author of a law treatise known by his name, and still extant.—*Ward*, iv. p. 25.

UNGULATA, an order of mammals, consisting of 1 sub-order, 3 tribes, 9 families. See Mammalia.

UNIONIDÆ, a family of molluscs, comprising the genera Ætherea, Anodon, Castalia, Iridina, Mulleria, Mycetopus, and Unio. Unio flavidens, *Benson*, and Unio marginalis, *Lam.*, are found at Bhandarda, a lake or jhil near Berhampur. They yield pearls.

UNJUN. Hind. Lamp-black, antimony ; also the term for one of the sorceries of the Muhammadans in India, in which the diviner applies lamp-black to the palm of a child or adult, and bids him stare well at it, and the person then divines. The Urt'h-unjun is used to discover stolen property ; the Bhoot-unjun, for ascertaining the state of the sick ; the Dhanna-unjun, to discover hidden treasure ; the Sarwa-unjun, for all purposes ; and the Alope-unjun, applied to the eyes or forehead of a person, renders him, wherever he be, invisible to others, while they remain visible to him.

UNONA, a genus of plants belonging to the natural order Anonaceæ. Several species are known to occur in South-Eastern Asia. U. longiflora of Sylhet is an elegant tree, with smooth, pointed, and undulate leaves, which is much cultivated in some parts of India to form avenues and to afford shade. It is sometimes called deodara, which is properly the name of the celebrated Himalayan pine, Cedrus deodara ; the U. odorata has large orange-yellow flowers. U. musaria has been so called from its bark being used for making musical instruments, as is indeed also that of another species. This is a rambling shrub, a native of Amboyna, etc.; the roots and bark are also used medicinally.—*Voigt ; Eng. Cyc.*

UNSRI. In the Hindi of Upper Sutlej, Rubus flavus, the blackberry ; in the Sutlej valley it is Rubus fruticosa, and R. flavus, yellow raspberry.

UPANAYANA, in the Hindu ritualistic ceremonials, is the investiture with the sacred thread, or Upaveta, which constitutes the second or spiritual birth. It is practised by the Brahman, the Kshatriya, and the Vaisya, who are from this called Dwija or twice born. With a Brahman, it should be carried out in the 8th and not later than the 10th year, for a Kshatriya in the 11th and not later than the 22d, and for a Vaisya in the 12th and not later than the 24th year. When five years old, the Hindu father fixes on an auspicious day, and entrusts his son to a teacher. The instructor writes the alphabet, or rather engraves it with an iron style, sometimes set in silver or gold, on a leaf of the palmyra tree, which is then coloured with turmeric. The leaf is placed on unhusked rice spread over the floor, and the teacher, whatever the sect or caste of the pupil be, invokes the god Vigneswara to smooth the difficulties in the way of the child's studies. Then, holding the boy's forefinger, he thrice traces with it the forms of the vowels in the rice, teaching the boy their sounds. The pedagogue is presented with a new cloth and some money, and dismissed, after which relatives and friends are entertained. On the seventh or ninth year, the Upanayanam is performed, on which occasion the family priest, Upa-d'hayya, Sansk., Upadhialu, Tel., causes the boy to offer a burnt-offering or Homa to the entire pantheon of gods, by pouring ghi (clarified butter) over the fire. He then invests the youth with the zandiyam, the zonar or sacred cord, letting it fall from over the left shoulder to the right side. He subsequently teaches the Gayatri to the boy, if he be of the Brahmanical order, as also the morning, noontide, and evening prayers, the due attention to which is considered sufficient to remove all sins committed during the day and night. The Gayatri or Gayatri-mantram of the Brahmanical or priestly order is never pronounced aloud ; and it is exceedingly rare that any Brahman can be induced to divulge it. Its literal translation is, ' Om ! earth, air, heaven, Om ! Let us meditate on the supreme splendour of the divine Sun ; may he illuminate our minds.' It is considered the most venerable text of the Vedas, and the common belief in and reverence for it is the bond of union amongst the entire Brahman order. With this ceremony the boy is considered to be born again, and he is of the Punar Janma or twice born. This is the spiritual birth of the Hindu, or his regeneration, for until this time the uninitiated youth, though of the Brahmanical class, is only, so far as his right to perform religious ceremonies is concerned, regarded in the light of a Sudra. If the youth who has now been initiated into the mysteries of the Brahmanical order, be set apart for the sacerdotal office of the priesthood, he is further marked on the muscular part of both arms by being branded with sanku or chank and chikram or disc of Vishnu. This is called the Chakrankitam. From this time, however, he is ranked as a Brahmachari, or of the order of bachelors, for he has now entered on his religious life, the whole of the days of a spiritual

Brahman being apportioned into four religious stages, viz. that of the Brahmacharyam, or bachelorhood; Grahastasramam, or the married state; Vanaprastam, the living in solitude with his family; and Sanyasam, or the abandonment of all worldly matters. A bachelor's dress differs from that of a married man in so far as he does not wear the dhoti, but only a wrapper round the lower part of the body; he is prohibited from eating betel, and continence is enjoined. Among other Hindu castes, the Brahmachari ceremony is performed at any time prior to the celebration of marriage, but their Gayatri is from the Puranas, not the Vedas.—*Wilson.*

UPANGA, holy books of the Hindus: Purana or history, comprising the 18 Puranas; Nyaya, logic and the principles of knowledge; Mimansa, religious principles and duties; Dharma Shastra, law, human and divine. See Vidaya.

UPANISHAD, a class of sacred books belonging to the Hindus, containing doctrines of the Vedas explained and enlarged according to the Vedanta. They are the best books after that school. Their theology is monotheistic, a pure theism, and Brahm, in the neuter gender, is used for the deity; the dogma of one Supreme Being, detached from matter, maya or sacred. The Upanishad, therefore, may be described as treatises on the unity of God and the identity of spirit. Some of the shortest were translated into English by Ram Mohun Roy, Dr. Carey, and Sir W. Jones. They were also rendered into Persian by order of Dara Shekoh, the son of Shah Jahan, and were thence rendered into Latin by Anquetil du Perron, a summary of whose works in the French has been published by M. Lanjuinais. In 1882, Mr. A. E. Gough, Principal of the Calcutta Madrassa, has treated on their philosophy and ancient Indian metaphysics, and the translations of five of them are given in Max Muller's Sacred Books of the East. The whole number of Upanishads known at present is 138, of which only 11 have been published. According to the theory laid down in the Mahavakya Ratnavali, there are 1180 Upanishad, equal to the number of Vedaic schools, one Upanishad belonging to each school. This theory, however, is fanciful. According to the received definition, the Upanishad are such parts of the Vedas as embody their metaphysical and theological views, which may be compressed into the formula that the finite soul is essentially the same with the infinite spirit or Brahma; and though the various Upanishads widely differ from each other, all maintain this identity of the finite and infinite spirit. Dr. Weber arranges the Upanishad into—(1) those which belong to the three first Vedas, as forming the Vedanta system; (2) those comprising all the Atharva Upanishad, and referring to the Vedanta system in its entire development; (3) the Upanishad in which the meditation has become crystallized, and is limited to the mystical word Aum; (4) those treating on the order of the Sanyasi; and (5) the last division, which includes the sectarian Upanishad, in which the Atma is worshipped as an independent deity.

The Talavakara Upanishad has the following fine thoughts concerning the nature of God:—

> 'Canst thou conceive the vast Eternal Mind,
> To rock and cave and Libyan waste confined?
> Is there a place which God would call his own
> Before a virtuous mind, his spirit's noblest throne?
> Why seek we further? lo! above, around,
> Where'er thou wanderest, there may God be found;
> And prayer from every land is by his blessing crowned.'

—*Thomas' Prinsep's Antiquities; Taylor; Hind. Th.* ii. p. 13; *Darwinism in Morals*, p. 200.

UPAPATAKA. Sansk. A crime in Hinduism, such as killing a cow, selling a daughter.

UPA-PURANA are 18 in number, viz. Sanatkumara, Nara-sinha, Naradiya or Vriha-Naradiya, Siva, Dur-vasasa, Kapila, Manava, Ausanasa, Varuna, Kalika, Samba, Nandi, Saura, Parasara, Aditya, Maheswara, Bhagavata, and Vasishtha. They are Hindu religious books.—*Dowson.*

UPARAVADA or Upera-Wandlu. Tel. Dravidian people who, along with the Wadra-wandlu or Waddar race, are employed in digging tanks, salt-making, and road-making. Their implements are the guddapara or crowbar, the mamotee, phaora or hoe; women make baskets and tattoo figures on the arms of Hindu women.

UPARICHARA, a Vasu or demigod king of Chedi. He had five sons by his wife, and by Adriki, an Apsaras, condemned to live on earth in the form of a fish. He had a son named Matsya, and a daughter Satyavati, who was the mother of Vyasa.—*Dowson.*

UPAS, in Japanese, poison or venom, is the term applied to the sap of some plants of the Malay and Philippine Islands yielding poisonous juices, which, by concentration, produce a poison of considerable activity, and is sometimes employed by the ruder natives to render their weapons deadly. The most potent of these plants in Java are the anchar, the Antiaris toxicaria, a large forest tree, and the chetek, Strychnos tieute, a climbing shrub. In all these cases, the poison, even when fresh, is far less active than that of the cobra snake, for the most powerful will take an hour to kill a dog, which the venom of the hooded snake would certainly accomplish in half the time. To effect a fatal purpose, too, it is necessary that the poisoned weapon should be left in the wound, and not withdrawn, so that the probability is that few human beings have ever lost their lives by means of these poisons.—*Crawfurd; O'Shaughnessy.*

UPASAMPADA, the rite of ordination into the Buddhist priesthood.

UPAS ANTIAR, the Upas tree or Anchar.

Antiaris toxicaria, *Lesch.* | Ipo toxicaria, *Pers.*

A native of Java, where it grows in the forests, often over a hundred feet in height. It was first described by Mr. Foersch, a surgeon of the Dutch E. I. Co., in vol. iv. of Pennant's Outlines of the Globe, and was then reprinted in the London Magazine for September 1785. Dr. Darwin celebrated it in poetry, where he says,—

> 'Fierce in dread silence, on the blasted heath
> Fell upas sits, the hydra tree of death.'

Dr. O'Shaughnessy mentions that the tree grows in Java in a valley filled with carbonic acid, into which it is therefore highly dangerous to descend; and he supposes that this probably originated the stories as to the deadly influence of the tree. The tree itself is often over 100 feet in height; its bark pale, smooth; its leaves oval, coriaceous, hairy. The poison is prepared by mixing the gummy resin (into which the bitter viscous juice concretes) with the seed of the Capsicum frutescens

and various other aromatics. This poison at first acts as a purgative emetic, then as a narcotic, causing death by violent fits of tetanic convulsions. The arrows are small and slight, and are discharged with accuracy from the sumpitan or blow-pipe by the mouth.—*Voigt; O'Sh.; Crawfurd; Eng. Cyc.; Wathen's Voyage*, p. 165.

UPA VEDA, religious books of the Hindus. There are four,—the Ayush or Ayur, medicine; Gandharva, music, dancing; the Dhanush or Dhanur, warfare; and the Sthapatya, mechanics, architecture. The third Upa Veda was composed by Viswamitra, and treats of the fabrication and use of arms and implements handled in war by the Kshatriya tribe. These are sciences which have no connection whatever with the Sruti or revealed Veda.—*Thomas' Prinsep.*

UPA-VITA. Sansk. The thread or cord worn by the three classes of Hindus over the left shoulder and under the right arm, and worn also by the five Kansala or artisan races. It is called Zandiam in Telugu and Punal in Tamil. That of the Brahman should be of cotton, the Kshatriya of flax, and the Vaisya of wool.

UPAZEN. Burm. The regular monks of a Burmese monastery, who are ruled by the Phoungye or superior.—*Yule*, p. 182. See Monks.

UPEI. Malay. The outer envelope of the stem of the pinang or Areca catechu palm, below the bunches of fruit. It is used in the Archipelago for making sifters (timba), for packing goods, making torches, etc.

UPPER GODAVERY, formerly applied to a separate British district in the Madras Presidency, bounded on the south and west by the Godavery and Pranhita rivers. Population, in 1872, 52,120; area, 1085 square miles. Cromlechs, kistvaens, and cairns scattered in forests and on hillsides, excite the curiosity of the inquirer. The most numerous of the aboriginal tribes are the Gonds (15,876); the remainder consist of Bhils, Bhilals, etc. The Gonds are subdivided into Gote and Koi or Koitor. Though identical in customs and in language, these do not eat together nor intermarry, and the Koi claim a superiority over the Gote. Among the Hindus, Brahmans numbered 705; the mass consist of Dher or Mhar, Dhimar, Kurmi, and other cultivating or inferior castes; native Christians, 236.—*Imp. Gaz.*

UPPER SIND, a frontier district, consists of a narrow strip of level plain, half of which is covered with jungle and subject to annual inundation. The Begari canal flows along the south of the district to Khera Garhi in the extreme west; total length, 85 miles; width at mouth, 57 feet. Five canals—the Nurwa, 40 miles long; Sonwa, 19 miles; Mirzawa, 9½ miles; and Budwa, 4 miles—branch from the Begari. The Desert canal, formerly known as the Maksudwa, runs 35 miles into the desert west of Kashmor. The border tribes are the Mazari, Burdi, Khosa, Jamali, Jatai, Dumki, Jakrani, and others. The predatory Mazari inhabit the country on the right bank of the Indus, between Mithankot and Burdika. The Burdi reside chiefly in the district called after them Burdika, which lies on the western bank of the Indus, between the Mazari district on the north and the Sind canal on the south. The habits of this tribe were formerly wholly predatory, and up to 1847 the tribe made frequent marauding inroads on their neighbours in Kachhi and in the hills, as well as in Sind.

UPPU SANAGA. Tel. Cressa Indica, *Retz*, so called from frequenting salt lands near the sea, where it has much the look of young chenna, the Cicer arietinum or Bengal gram.

UPPUTERU, a river flowing out of the Colair lake. There are several streams running into it, the principal of which is the Fummilair; there is but one river flowing out of it, the Upputeru or Salt River. It is a tidal river, and makes its way into the sea some miles south of Nursapore. The course of this river from the Colair to the sea, forms the boundary between the Krishna and the Godavery districts. This river being the only outlet to the Colair, there are great facilities for irrigation. For by throwing a bund across the river, the waters of the lake can find no exit, and consequently can flood an immense tract of country. This, however, cannot be done every year, as under certain circumstances it might do more harm than good. But when the ordinary cultivation has failed, this expedient may be resorted to with very great advantage both to the cultivators and to Government.

UPREE, a Mahratta revenue term to designate a tenant-at-will; a non-freeman of a Mahratta village, a sojourner, a temporary resident who has not earned a right of settlement.

UPUPA EPOPS. *Linn.* Upupa Indica, *Hodgs.*

Hoopoe, ... Eng.	Hudhud, ... Hind.
Epops, . . . Gr., Lat.	Kat-kuto, . . . Sind.

The hoopoe of Europe, Asia, and Africa is a common winter visitant in Lower Bengal, but is generally replaced by a nearly affined race in Upper Hindustan and South India. This bird was often alluded to by Greek and Latin authors, and Ovid makes Tereus be transformed into it. It belongs to the Upupidæ, a family of insessorial or perching birds. Its long crest of parallel rows of white, yellowish brown, and black feathers, is frequently erected, and when seen flitting in a dense forest, it looks a very handsome bird. It is easily domesticated, and flits about a room. Its long curved bill enables it to search for worms in the ground. It builds in holes in old walls. It is to all appearance a bird of fluttering and feeble flight, but it has repeatedly been observed, during its seasons of migration, at altitudes considerably above the limits of vegetation. 'On the western side of the Ladakh pass, about 16,500 feet, I saw a hoopoe,' writes Major Cunningham; and at Momay (14,000 to 15,000 feet elevation), under the lofty Donkia pass in Northern Sikkim, in the month of September, Dr. J. D. Hooker observed birds flock to the grass about Momay; larks, finches, warblers, abundance of sparrows (feeding on the yak droppings), with occasionally the hoopoe; and waders, cormorants, and wild ducks were sometimes seen in the streams, but most of them were migrating south.—*Hooker, Him. Jour.; Cunningham's Ladakh.*

UPUPA NIGRIPENNIS. *Gould.*

U. minor, *Sykes, Jerdon.*	U. Senegalensis, *Blyth.*
Indian hoopoe, . Eng.	Kukudeu guwa, . Tel.
Hudhud, ... Hind.	Kondah pitta, . . . ,,

The Indian hoopoe is found throughout India; its builds in old walls, and eats insects.

UQEEQA. Arab. A sacrificial rite amongst the Arab Muhammadans, consisting of an offering to God on the chutthee or chillah, the fortieth day

after delivery, of one, if a girl, or two he-goats, if a boy.—*Herk.*

UR, also Pura. HIND. A town, as Bangalore, Narsingapur.

UR of the Chaldees is the modern Mugheir; it lies between the eastern confluents of the Chaboras and Tigris. It was founded under the second ruling dynasty of Berosus, to which is assigned the date B.C. 2286. The great structures of Ur rose in terraces, the surfaces of the walls were decorated with blue enamel, polished agates, alabaster, pieces of marble, mosaics, copper nails, and gold plates. Rafters of palm-wood supported the roof, though there were also early attempts at arched vaults. The tombs contained sarcophagi, consisting of two earthenware vessels fitted together, and at the side of the dead are found polished flint utensils, bronze implements, gold ear-rings, and brass armlets. The cylindrical signet-ring of king Urech has been found, and has proved the existence then of a written character. Erech, the modern Warka, Nipur or Calneh, the modern Niffer, and Babel, now Hillah, and Borsippah were the oldest towns known to the writer of Genesis.—*Peschel*, p. 498.

URANIA SPECIOSIA. *Tr.* Traveller's tree. Ravenala of Madagascar. This elegant tree, a native of Madagascar, since 1802 has been cultivated in India for ornament. Its short, solid trunk resembles that of the palm tribe, but its leaves those of the plantain, and when growing it forms a perfect screen. It bears a small fruit like the drupe of a plantain, which is of a bluish colour. The juice of this plant has the property of rendering water or milk, either hot or cold, mucilaginous, without altering the taste, colour, or smell of the liquid in its former state. Butter-milk and water is often thickened with the juice of this plant. It is propagated by seeds and suckers. The plant attracts attention from the fan-like arrangement of its ample leaves, the sheathing bases of which contain, even during the most arid season, pure fresh water. Mr. Ellis says, 'One of my bearers struck a spear four or five inches deep into the thick firm end of the stalk of the leaf, about six inches above its junction with the trunk, and on drawing it back, water gushed out. It was cool, clear, and perfectly sweet.'—*Ellis, Madagascar; Roxburgh; Collingwood; Riddell; Mason.*

URAON is alike the name and the language of a race. Theirs is an uncultivated idiom, and contains so many Dravidian roots of primary importance, that it is considered by Dr. Caldwell as having originally been a member of the Dravidian family. The Uraon vocabulary of Colonel Ouseley (Hodgson's series) has so much resemblance to the Malé that it may safely be set down as a dialect of the same language. It frequently agrees with the Malé where it differs from the co-dialects with which it is now in contact in Chutia Nagpur. This may be considered as confirming the tradition of the Uraon that their original country was Rotas and parts of Rewah, or the hills along the northern bank of the Sone (to the southward of Benares). According to the tradition, they were driven across the Sone by the intrusion of Gangetic Hindus into their native land, and ultimately settled in Chutia Nagpur, the country of the Kol tribe of Munda or Ho. At a later period, Hindus pushed into this territory, reduced the more civilised Uraon to slavery, drove the wilder Kol into revolt, and eventually forced them to migrate to the southward and eastward into the land of the Bhuiyan. The more northerly of the eastern emigrants passed out into the low country, and, mixing with the Bhumij and Bhuiyan natives, formed the class of Tamaria. The more southerly moved into Singbhum and Kolehan, living at peace with the Bhuiyan pre-occupants until the intrusion of Hindus from Marwar, who first leagued with the Bhuiyan against the Kol and then with the Kol against the Bhuiyan, and finally appropriated Singbhum, leaving Kolehan or Hodesam to the Kol or Ho, as this southern tribe call themselves. Remnants of the Kol are still found to the northward nearer Chutia Nagpur, and they appear to be also spread to the northward towards Rajmahal. The Malé are now confined to the N.E. extremity of the Vindhya, where the Ganges washes and bends round the chain, and are separated from the south Dravidian nations by the Kol. The explanation is probably to be found in the circumstance of the Uraon and Malé originally forming an uninterrupted extension of the Gond tribes and dialects that extended from the Godavery to the north extremity of the Vindhya.

URARIA PICTA. *Desv.*

Doodia picta, *Roxb.* | Saukr-juta, . . . BENG.

A shrubby plant of Coromandel and Bengal, with small red flowers.

UR-BHUI, TEL., also called Ur-bhui-wanlu, are mercenary soldiers who serve native sovereigns. They are never found in the ranks of the British army. There are a few of them in every large town in the Peninsula of India. Their name is of Telugu origin, and means town-bhui.

URCEOLA ELASTICA. *Roxb.*

Vahea gummifera, *Roxb.* | Tabernæmontana elast. *Sp.*

The India rubber tree, or caoutchouc vine. In Sumatra and Pulo Penang, a large woody climber, yields caoutchouc of the finest quality in great abundance. Dr. Hooker mentions that a plant which grows in the forests east of Chittagong, the milk of which flows in a continuous stream resembling caoutchouc, is probably the Urceola elastica, which yields India rubber. The milky juice of the plant oozes out through wounds made in the bark; on exposure an elastic coagulum separates from a watery liquid; the coagulum is caoutchouc or India rubber.—*Roxb.*

URD'HA-BAHU. SANSK. From Urdha, above, and Bahu, the arm. A sect of ascetic Hindus, solitary mendicants, who extend one or both arms above their heads till they remain of themselves thus elevated. In some of the creeds of the Hindus, personal privation and torture is of great efficacy, and the Urd'ha-bahu are individuals who, urged by credulity or knavery, have adopted this mode of distorting their limbs. They also close the fist until the nails grow through the hand. They subsist on alms; many go naked, but some wear a wrapper stained with ochre. Under British rule all such classes have disappeared.—*Wilson.*

URDU. HIND., TART. Literally a camp. The term given to the new tongue generally styled Hindustani, which originated in the Moghul camp at Dehli. A basis of Sanskrit and Hindi, with a copious influx of Arabic, Persian, and Turkish words, but following the grammatical inflexion of the Hindi, with occasional slight modifications. Urdu poets are innumerable; to write Urdu

poetry is the fashionable accomplishment of every educated Muhammadan in India. Urdu is spoken by about 82,497,168. Urdu poetry follows the prosody of the Arabic and Persian. A verse is called a bait or house; the hemistich or half verse, a misra or door. A rubai is a poem in which the stanzas consist of four misra or hemistichs; a mukhammas, one of five hemistichs; and the musaddas, of six. Qafiya means to follow, and is used to designate rhyme. Dobaiti, or two-versed, is a short epigrammatic poem. Ghazl corresponds to the sonnet or ballad of the English language. Masnawi is the heroic poem. It has all its bait or verses composed of the same metre. Diwan is a collection of poems. Bahr is metre; Bahr-i-Mutagarih, pleasant metre; Bahr-i-Saria, rapid measure; Bahr-i-Khafif, short measure; Bahr-i-Kamil, perfect measure.

URENA LOBATA. *Roxb.*

Kangya, Kanguya, BENG.	Uren, ... MALEAL.
Ban-ochra, BENG., HIND.	Piliya, ... TEL.
Wet-khyæ-pai-nai, BURM.	Talia mankena, . ,,
Kat-sai-nai, . . . ,,	

This malvaceous plant, as also U. sinuata, is common in most parts of India, and along the coasts of Amherst and Tenasserim. The bark of U. lobata yields a strong and tolerably fine substitute for flax. It is an annual, flowering in December. It is the pest of Rangoon and its neighbourhood, springing up spontaneously wherever the jungle is cleared, and rapidly forming a dense mass of luxuriant vegetation. The fibre is manufactured by simple maceration, and afterwards beating the stalks. Very good gunny has been made from it, and it is believed that the fibre might, if treated with due care and skill, prove valuable. Any quantity of the plant may be had for the mere trouble of gathering it.—*Royle; Roxb.; Mason; M'Clelland.*

URGUJJA. HIND. A yellowish-coloured perfumed powder, made of several scented ingredients, sandal-wood, wood-aloes, rose-water, attar of roses, civet-cat perfume, and oil of jasmine.—*Herklots.*

URIAL or Oorial, the Panjab wild sheep, Ovis cycloceros, *Hutton.* The burhel or blue wild sheep is O. nahura.

URI KULURU KRADU. TAM. Sir J. E. Tennent (ii. p. 468) gives this as the Tamil name of a musical mollusc of Ceylon, and which he surmises to be Littorina lævis, or Cerithium palustre. The Tamil for crying shell, however, is Kuchilpodu-kira-kilinjal.

URIYA, a language which prevails in the N. part of the Ganjam district, as far south as Itchapore. In the southern division the Telugu prevails.

URMUK, a cloth of camel's hair, but occasionally made of shawl-wool. Also a product of the Kashmir looms resembling strong nankin.

UROOS. ARAB. Oblations, offerings to a saint, the anniversary of whose death is called his Uroos, as Kadir Wali ka Uroos, the festival day of Kadir, the saint.

URORA, a Muhammadan tribe on either side of the Indus, south of Kalabagh, and around Multan.

UROSTIGMA, a genus of plants, formed from the genus Ficus.

Urostigma Arnottianum, *Mig.*

Kappootoo-bo-gass, ... SINGH.

Grows in the hot, drier parts of Ceylon. It is not Ficus lucida.—*Thw.*

Urostigma Bengalense, *Mig.*

Ficus Bengalensis, *Linn.* | F. Indica, *Linn.*

Maha-nooga-gass, ... SINGH.

Grows all over India, and in the hotter parts of Ceylon, probably not indigenous.—*Thw.*

Urostigma Ceylonense, *Mig.*

Ficus infectoria, *Willd.*	U. tjakela, *Mig.*
U. ægeirophyllum, *Mig.*	Kirri-palla-gass, . SINGH.

Common in Ceylon up to an elevation of 2000 feet. The Singhalese sometimes use the bark of the tree instead of the areca nut, to chew with their betel leaf.—*Thw.*

Urostigma Mysorense, *Mig.*

Ficus Mysorensis, *Roth.* | Ficus citrifolia, *Willd.*

Boonooga-gass, ... SINGH.

A tree of the Peninsula of India, not uncommon in Ceylon up to an elevation of 2000 feet.—*Thw.*

Urostigma religiosum, *Mig.*

Ficus religiosa, *Linn.*

Ashwertha, . . . BENG.	Bo, Bo-gaha, . . SINGH.
Pipal, ... HIND.	Bo-gass, ... ,,
Arealu, ... MALEAL.	Arasam maram, . . TAM.
Pippula, ... SANSK.	Raya-manu, Raghi, . TEL.

The holy fig tree is to be seen in all parts of India. It is much admired by Europeans for its elegant form and the constant movement of its leaves. It is the Bo Tree of the Singhalese Buddhists, and is to be met with in that island wherever there is or has been a Buddhist temple; but the most famous Bo Tree is at the temple at Anaradapura. It was grown from a cutting sent from Hindustan, and in A.D. 1900 it will be 2200 years old. It is held in great estimation by Singhalese Buddhists. The frequency of F. religiosa and F. Indica depends very much on the proportion of Hindus among the population. In some parts, where the latter is almost entirely Muhammadan, these trees are very rare, even allowing for differences of climate.—*Roxb.; Thw.*

Urostigma retusum, *Mig.*

U. nitidum, *Mig.*	F. nitida, *Thunb.*
U. ovoideum, *Mig.*	F. Benjaminea, *Roxb.*
U. pisiferum, *Mig.*	F. pallida, *Wall.*
Ficus retusa, *Linn.*	

A frequent tree in India, and common in the Central Province of Ceylon up to an elevation of 5000 feet.—*Thw.*

Urostigma tsiele, *Mig.*

Ficus tsiela, *Roxb.* | F. amplissima, *Linn.*

Datira, ... MAHR.	Ichi maram, . . . TAM.
Eichie maram, . . TAM.	

A tree of India, common on the Bombay side, in ravines of the ghats, but not on open forest land. There is a noble specimen of this tree in the Royal Botanic Garden, Ceylon, whose branches spread over an area of ground 120 yards in diameter.—*Roxb.; Thw.*

Urostigma tomentosum, *Mig.* Ficus tomentosa, *Roxb.* A tree of India and Ceylon.—*Thw.*

Urostigma Vogelii, *Mig.* The African rubber tree of W. Africa.

Urostigma Wightianum, *Mig.* U. perseæfolium, *Mig.* Common in the Central Province, Ceylon, up to an elevation of 5000 feet.—*Thw.*

URSIDÆ, the bears, a family of carnivorous mammalia. The following are synonyms:—

Dub, . . ARAB., PERS.	Riksha, . . . SANSK.
Arktos, ... GR.	Karadi, ... TAM.
Rich, ... HIND.	Gudelgu, ... TEL.
Ursus, ... LAT.	

Four Indian species are known, viz. Ursus

Isabellinus of Horsfield; U. labiatus of Blainville; U. Malayensis of Raffles; and U. Tibetanus of Cuvier. U. Isabellinus is, according to Gray, the U. Syriacus of Hemprich and Ehrenberg, and is that known to Himalayan sportsmen as the brown, red, yellow, white, grey, silver or snow bear or Tibetan snow bear, and the harput of Kashmir, for it inhabits Tibet and the snowy regions of the Himalaya, and high Central Asia generally.

U. labiatus of Blainville, the black bear, is found all over India, Ceylon, and Assam, and is the Bhalu or Rich. It has received several scientific synonyms, attaching it to the genera Bradypus and Melurus, and its names in English, five-fingered sloth, sloth bear, and ursine sloth, have varied correspondingly. It is readily domesticated. When wild, it lives on roots and honey.

U. Malayanus occurs in Arakan, Malay Peninsula, Sumatra, Java, Borneo, and in Indo-Chinese countries generally.

U. Tibetanus, the black bear of Himalayan sportsmen, inhabits the forest region of the Himalaya, and is very rare in Tibet, though met with in its eastern forests. It seems identical with U. Isabellinus.—*Blyth, Cat.*

Ailurus fulgens, *F. Cuv., Blyth., Hard.*

Snow, brown, red, yellow,	Bhalu, ... Hind.
grey, or silver bear, Eng.	Harput, . . . Kash.
Barf-ka-ritch, . Hind.	Drin-mor, . . .Ladakh.

The brown bear inhabits the Himalaya mountains, but Dr. Adams says its distribution is not so general as that of the black species, Helarctos Tibetanus, which is spread over the whole extent of the lower ranges of the Indian Himalaya, whereas the brown bear is confined to districts, and prefers high and rugged mountains near the confines of perpetual snow; and nowhere is its fancy better gratified than among the noble chains which surround Kashmir, especially the secluded glens, such as the Wurdwun valley and its offshoots. Bears were at one time very abundant there, but every year shows marked diminution in their numbers, so that before long we may expect to hear of the almost complete extermination of the species in the Kashmir ranges. Dr. Adams says that if not a variety, it is certainly very closely allied to that of Europe, Northern Asia, and arctic America. In Asia, the bear of Siberia and the Altai, U. arctos, is called the brown bear; but this species is said to frequent the Himalayas only. Dr. Horsfield named it U. Isabellinus, from a single skin brought from Nepal, but in colour two specimens are seldom exactly alike.—*Drs. Adams, Jerdon.*

U. ferox, *Robinson.*	*Adams.*
Bhalu, Bhalak, . .Beng.	Himalayan black bear.
Thom, ...Bhot.	Sona, ... Lepcha.

The black bear's favourite haunts are in the woods and jungles of the lesser ranges of the Himalayas, where it lies all day, to issue forth at nightfall and feed in fields and gardens. The black bear is not uncommon along the foot of the barrier-chains of Kashmir, and during the fruit season may be found in the valley, where its depredations among the apple, walnut, and mulberry trees are frequent, and whole crops of Indian corn are sometimes completely destroyed by these unwelcome intruders. Although said to attack sheep at times, this species is eminently a vegetable feeder, and so expert in climbing trees, that it may frequently be seen on the topmost branches, standing erect, and seizing the branches with its fore paws.—*Adams.*

URTICACEÆ, the nettle tribe of plants, are trees, shrubs, or herbs; about 300 species of them are known to occur in the East Indies, in the following 16 genera, viz.:—

59 Urtica.	11 Boehmeria.	1 Antiaris.
1 Parietaria.	1 Cannabis.	1 Broussonetia.
2 Conocephalus.	13 Morus.	1 Dorstenia.
167 Ficus.	1 Lepurandra.	1 Epicarpurus.
14 Artocarpus.	2 Batis.	
2 Trophis.	21 Procris.	

Many of these plants are lactescent. The genera Urtica, Boehmeria, and Cannabis all furnish useful fibres; the genus Morus, the edible mulberry, and its leaves, are the favourite fruit of species of silk-worm; the bark of the Broussonetia is manufactured into a strong paper material; the genera Ficus and Artocarpus, the fig trees and jack trees, yield edible fruits. The cow tree belongs to this natural order, and apparently to the genus Bresimum. When wounded, a milky nutritious juice is discharged. It is described by Humboldt as being peculiar to the Cordilleras of the coast of Caracas, particularly from Barbula to the lake of Maracaybo, near the village of San Mateo, and in the vicinity of Caucagua, three days' journey east of Caracas. In these places it bears the name of Palo do Vaco or Arbol de Leche, and forms a fine tree resembling the star apple of the West Indies. Species of Urtica and Girardinia abound on the Neilgherries and other localities, and yield a long and silky fibre like the true rhea or China grass. The two plants of the Urticaceæ that grow on the Neilgherries are the Urtica heterophylla or common Neilgherry nettle, and the Girardinia Leschenaultiana of Dr. Wight's Icones, a superior kind of nettle, yielding a very fine strong fibre. The latter plant grows in abundance on the Animallay range, and in great quantities at the foot of the Cunur Ghat, at a level of only 1000 feet above the sea. In the Sikkim Himalaya the fibres of some of the various nettles are twisted for bowstrings, others as thread for sewing and

weaving; while many nettles are eaten raw and in soups, especially the numerous little succulent species. When preparing for the Great Exhibition of 1859, Dr. James Taylor named several plants in Bengal adapted for the manufacture of textile fabrics. A species of Urtica, of whose fibres the much admired grass cloth of China is made, is cultivated in Rungpur; and either it, or an allied species, the rhea, is grown in Assam and Cachar. It is now known as the Boehmeria nivea, *Gaudichaud*, and seems to be the U. nivea, *Linn.*, and U. tenacissima, *Roxb.*, and yields the Rami of Assam and Rhea of commerce. Endeavours have frequently been made to utilize the rhea plant of India for the production of textile fabrics, but without general success. The Indian Government have, within the past fourteen years, twice offered a price of £5000 for a machine to effect its profitable decortication. This prize has been twice competed for, and twice withdrawn in consequence of all the mechanical means submitted for trial having failed to meet the requirements of the Government. A machine has been constructed which effectually separates the fibre from the woody stem of the green rhea, and at the same time cleanses it from all extraneous adherent matter, producing it in good condition for the market, and this without any previous or subsequent treatment. This machine, which is the invention of Mr. H. C. Smith, consists of an iron framing about 3 feet high, 2 feet wide, and 3 feet deep from front to back, carrying a revolving drum about 18 inches in diameter and 12 inches wide. The drum is fitted with a series of beaters, which pass near to the edge of a small feeding-table about 12 inches wide, the drum being covered in with an iron hood. From beneath the feeding-table a thin sheet of water is made to play in a constant stream against the drum at a certain pressure and angle, and this constitutes the whole of the apparatus. The fibrous plants are fed in by hand on the feeding-table, and are simply held up to the beaters by a cushion or backing of water, by which means the whole of the extraneous matter is removed, and the fibre produced in a remarkably short time, and in excellent condition. In the tests, 115 stems of the French rhea were treated by the operator, and the fibre produced clean and free from all adherent particles in three and three-quarter minutes. Besides the foregoing, several varieties of fibrous plants were put through the machine, including the Fourcroya gigantea, an Indian aloe, the Sanseviera Zeylanica, or bowstring hemp as it is called by the natives, the yucca, and the Phormium tenax, or New Zealand flax. All these were successfully treated. There were shown some samples of fibre of the Fourcroya gigantea, and Moorva or Sanseviera Zeylanica. Rhea fibre has brought in England £80 the ton, and never sold under £45. The China grass-cloth, a beautiful fabric made in the Canton Province, is largely exported to Europe and America. The Boehmeria (Urtica) nivea plant, which is supposed to produce this, is abundantly grown in Kiang-si and other provinces. Fabrics of various degrees of fineness are made from this fibre, but none are so fine as that made about Canton; it is also spun into a very strong and durable thread. There are said to be two very distinct varieties of this plant common in Che-kiang,—one cultivated, the other wild. The cultivated variety has larger leaves than the other; on the upper side, they are of lighter green, and on the under they are much more downy. The stems also are lighter in colour, and the whole plant has a silky feel about it which the wild one wants. The wild variety grows plentifully on sloping banks, on city walls, and other old and ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its structure, than the other kind. The cultivated kind yields three crops a year. The best fibre is obtained from young shoots. Urtica argentea is a nettle of the Society Islands, the fibres of which are converted into cord. Urtica dioica, *Roxb.*, Sinma, CHIN. The plants are thrown into the streams to poison fishes.—*Smith; Roxb.; Hooker, H. J.* i.p. 293; *Jur. Rep. Exh.*, 1851; *Royle, Fib. Plants; Fortune; Williams' Middle Kingdom; Hogg, Veget. Kingd.*

URTICA CRENULATA. *Roxb.*

Chor-patta, . . . BENG. | Daoun-shaitan, . TIMOR?
Mialim-ma, . . SIKKIM.

A gigantic stinging nettle, a native of the hills and valleys on the east of Bengal, at Luckipur, Pundua Hills, and Assam. Dr. Hooker mentions that where the ground is swampy, this gigantic nettle abounds. It has an erect shrubby stem, with oblong acute leaves, having the margins crenulate or slightly dentate, both sides alike, the bark armed with acute burning hairs. The sting produces great pain, extending to the armpit; abates after two or three days, but does not disappear entirely for nine days. Major Hannay says of this and another gigantic stinging nettle, that they afford a quantity of fine white fibre, but apparently of no great strength, and, by report, not very lasting. Some of the hill tribes use the fibre for fabricating coarse cloths. According to Dr. O'Shaughnessy, it stings so terribly that it has sometimes occasioned very formidable symptoms. Another Urtica, the Daoun-shaitan, or demon nettle of Timor, is still more dangerous in its effects.—*O'Sh.; Royle, Fib. Pl.* p. 66; *Hooker, H. J.* ii. p. 339; *Roxb.* iii. p. 591.

URTICA HETEROPHYLLA. *Roxb.*

Urtica palmata, *Forsk.* | Girardinia Leschenaultiana, *Wall.*

Huru, ... ASSAM. | Alu, ... HIND.

Theng mah, . . . CHIN. | Karla, Bhabar, of SUTLEJ.
Neilgherry nettle, . ENG.

This is a fine tall nettle, with immense leaves and a vigorous sting. It is the most widely diffused of the large Indian nettles, being found in Burma, in Assam, in South Konkan, along the Malabar coast, in Mysore, the Neilgherries, in the valleys of the Himalayas, along the foot of the hills to the Dehra Doon, the northern valleys of the Himalaya, and in many places of the Panjab Himalaya as between Rampur and Sungnam, at 2500 to 7000 feet, where stems are often employed for making twine and ropes by the dry process; but in the N.W. Himalaya these are not prized, as they perish quickly from wet. It is an annual, with erect angular stems, marked with small white specks, in which are inserted stiff, most acute bristles, which produce intense

pain. The bark abounds in fine white, glossy, silk-like fibres, but these probably differ with the locality in which the plant is grown. To the Exhibition of 1851, specimens were sent by Dr. Wight, prepared in a rude way, by boiling, by the Todawar of the Neilgherry mountains. It was a beautifully fine and soft flax-like fibre, which the Todawar race use as a thread material, and, if well prepared, fitted to compete with flax for the manufacture of very fine textile fabrics. Mr. Dickson, by passing it through his machine and liquid, rendered it like a beautiful, soft, silky kind of flax, of which the tow would be useful for mixing with wool, as has been done with the China grass, and the fibre used for the finest purposes. Major Hannay says the Assamese use the fibre extensively in the manufacture of cloth. The Chinese prize it for the softness of its fibre, as well as for its strength. The plant grows wild all over the Neilgherries, it is well known to the natives, and its cultivation might be readily extended. The value put on the fibre was £70 to £80 the ton. As the seeds are quick of vegetation, the cultivation of this plant can be carried to any extent, and the supply might be largely increased, as the plant is abundant and widely distributed over the Indian Peninsula. The fibre from the bark of old wood was steeped in cold water for about six days. The bark of young wood was steeped in hot water for about 24 hours, when the fibre was found to separate readily from the pulp.—*Great Exhib. of* 1851; *Royle's Fib. Plants*, p. 67; *Stewart, P. Pl.; Cleghorn, P. Rep.* p. 68; *Mr. M'Ivor in M. E. J. Reports.*

URTICA HYPERBOREA. *Jacq.*

Zatud, Dzatsult, Stokpo, Tsodma, . . LADAKH.

A small species common in parts of Ladakh from 11,500 to 17,000, and occasionally to nearly 18,500 feet. Its young leaves are eaten as a pot-herb.—*Stewart*, p. 215.

URTICA INTERRUPTA. This large annual grows wild during the rains. The whole plant is covered with stinging hairs, like the common nettle.—*Riddell.*

URTICA JAPONICA. In Japan, its bark is made into lines, cordage, and cloth.

URTICA TUBEROSA. *Roxb.*

Chundur-muli, . BENG. | Chih ma, Tien ma, CHIN.

A nettle of Bengal, China, and the Moluccas, with very small greenish flowers. Its roots and shoots are eaten raw, boiled or roasted, and are nutritious.—*Roxb.* iii. p. 583; *Voigt*, p. 280.

URUMEAH. The very ancient city of Urumeah, Thebarma of Strabo, and supposed birthplace of Zoroaster, is situated in a noble plain fertilized by the river Shar, and on the south-west of the lake to which it gives its name. This town is 32 farsang from Tabreez, and contains a population of 12,000 souls.—*Malcolm's Persia*, ii. 138.

URUS. ARAB. The festival day of a Muhammadan saint, on which oblations are offered at the tomb; also oblations or offerings to a saint; also called Churaghan (lit. lamps or illuminations). Urus-i-baba budun, alias Hyat qalandar, Urus-i-bawa Fuqqur-ud-din, Urus-i-tabber-i-ālam, are Muhammadan ceremonies.

URUSAH-DAR PARDA. PERS. Lit. 'the bride in a veil.' The Indian gooseberry, Physalis Peruviana.

URUVILWA, or Budh Gaya, the town at which Gautama Buddha remained long in a state of abstraction under a Bo Tree.

URVA. The Aryans, in their migration, made their seventh settlement in Urva, the modern Kābul. The Record (in viii. verse 11) alludes to Urva, proved by Haug to be Kābul, the identity of which was previously unknown.

URVA CANCRIVORA. *Hodgs., Blyth.*

Gulo urva, *Hodgson.* | Viverra fusca, *Gray, Hard.*

The crab mungoose; it belongs to a genus of carnivorous mammals, of the family Viverridæ, and sub-family Viverrinæ. It inhabits Nepal, the S.E. Himalaya, Assam, and Arakan, and, according to Mr. Hodgson, it dwells in burrows and is carnivorous.—*Jerdon.*

URVA-PUNDRA. SANSK. An upright mark on the foreheads of the Vaishnava Hindus, made with bright red, yellow, and white colouring substances, to represent the footprint of Vishnu.

URVASI, a celestial nymph who incurred the displeasure of Mitra and Varuna, and descended to live with mortals. She became enamoured of Pururavas. Urvasi is the most famous among the courtesans of Deva-lokum, the heaven of the gods. She is the analogue of Daphne of the Greeks. Urvasi is the nymph of the drama Vikramorvasi by Kalidasa.—*Dowson.*

URYA, the language of Orissa. The original site of the Or or Ordu tribe appears to have had very narrow limits, viz. along the coast-line from the Rasikulia river near Ganjam, northwards to the Kans river near Soro, in lat. 21° 10′; but in the process of migration and conquest, under the Ganga Vansa line, the limits of Orissa (Or-des) were extended to Midnapur and Hoogly on the north, and to Rajamundry on the Godavery to the south. It is a tolerably pure dialect of Bengali. In the direction of Bengal, it follows the coast-line as far as the Hijilli and Tumluk divisions on the Hoogly. On the western side of the Midnapur district, it intermingles with Bengali near the river Subunreka. To the westward, the Gond and Urya languages pass into each other, and at Sonapur half the people speak the one and half the other language. About Ganjam the first traces of Telugu or Teling occur, though the Urya still prevails 45 miles south of Ganjam on the lowlands of the sea-shore, beyond which Telugu begins to predominate. At Chicacole the latter is the prevailing dialect; and in Vizagapatam, Telugu only is spoken in the open country, though Urya, in the mountains, runs farther down to the south. The Urya people are a tall, fair, somewhat slender race. Their country, Orissa or Or-desa, is bounded on the north by Bengal, on the south by the Northern Circars, on the west by Gondwana, and on the east by the Bay of Bengal.

USARA-REWAND, HIND., from Stalagmitis gambogioides, is real gamboge, imported into Ajmir via Pali; considered and used as a violent cathartic. The punsari or druggists suppose it to be the extract of Mirabilis jalapa root; the dose given is sixteen grains; one seer costs four rupees. —*Gen. Med. Top.* p. 148.

USHAS, in Hindu mythology, the dawn, by the ancient Hindus regarded and worshipped as a goddess, now supplanted by Aruna. As the dawn, the early morning, the first pale flush of light, Ushas is compared to a mother awakening her children; to a lovely maiden awakening a sleeping world; to a young married maiden

'like a youthful bride before her husband, thou uncovereth thy bosom with a smile.' As a goddess, she is styled the (Rig Veda, i. 123, v. 2) mighty, the giver of light; from on high she beholds all things; ever youthful, ever reviving, she comes first to the invocation:

'Hail, ruddy Ushas, golden goddess,
Upon a shining car thou comest, borne like
A lovely maiden by her mother decked,
Disclosing coyly all thy hidden graces
To our admiring eyes.'

Ushas, the dawn, the ἠώς of the Greeks and Aurora of the Romans, with the Hindus is the daughter of heaven and sister of the Adityas, and is called Ahana and Dyotana, 'the illumer.' She is one of the most beautiful myths in the Vedas. —*Dowson.*

USHIRA, a philosopher mentioned in the Padma Purana. His parents were Durvasa and Raka. He lived as a jogi at Sri Saila, and taught that the gods have no visible form, but are to be worshipped in the prayers and incantations of the Vedas.—*Ward*, iv. p. 44.

USHTERANI, an Afghan tribe, considered one of the most warlike of the tribes in the Sulaiman range. About the year A.D. 1840, they colonized in the skirt of the hills, where they hold perhaps 20,000 acres of arable land. They had been constantly engaged in feuds with the Kusrani, a tribe less warlike than themselves, but still by no means contemptible in spirit and enterprise.—*Records of Govt. of India*, No. 11.

USH-TURFAN, a small town, or properly settlement, consists of scattered habitations, possessing neither walls nor fortresses. Its district is said to have forty Yuz-Begi or centurion chiefs, consequently about 4000 houses; but according to other sources 6000.—*Russians in Central Asia*, p. 161.

USIJ, a handmaid of the queen of the Kalinga raja, with whom the sage Dirghatamas associated, and their son Kakshivat was born.

USITA, the father of Sagara, who, on being expelled by hostile kings of the Haihya, the Talajungha, and the Susuvindha races, fled to the Himvat mountains, where he died, leaving his wives pregnant, and from one of these Sagara was born. It was to preserve the Solar race from the destruction which threatened it from the prolific Lunar race, that the Brahman Parswa Rama armed, evidently proving that the Brahmanical faith was held by the Solar race, while the religion of Buddha, the great progenitor of the Lunar line, still governed his descendants. This strengthened the opposition of the sages of the Solar line to Vishwamitra or Buddha of the Lunar line obtaining Brahmanhood.—*Tod's Rajasthan*, i. p. 36.

USMAN, the third khalif successor of Mahomed, A.D. 644 to 656.

USMAN or Othman, founder of the dynasty ruling in Constantinople, was at first the chief of a small territory in Bithynia; but in A.D. 1299 he invaded the whole country of Nicæa, and subsequently extended his country as far as the Black Sea. He was styled Al-Ghazi. Born at Sukut in Bithynia A.D. 1259, died 1326.—*Catafago.*

USMAN KHEL. Towards the lower extremity of the Swat valley, a formidable range of hills bounding the valley runs for many miles from east to west, nearly parallel to the British frontier; and at the eastern extremity of this range stands the Mora mountain. Between this range and the frontier, however, intervene two tracts, named Ranizai and Lower Osman Khel, both quasi-dependencies of Swat. The best of the passes leading into Swat is one named Mullakund, which opens from Ranizai. A little farther to the eastward of Ranizai, also, there are some passes, leading into the Lunkhor valley, which belong to British Yusufzai. These latter passes are not available for passage from Swat to British territory, because, leading into Lunkhor, they can be stopped by any party holding that valley. The passes via Ranizai and Usman Khel, if the people of those tracts accord a passage, lead straight on to the British plains of Hashtnagar. Above the Lunkhor valley, just beyond the British frontier, is the strong village of Pulli. The subdivisions of the Peshawur district, adjoining the tribes above described, are Lunkhor or north-west corner of Yusufzai, and then Hashtnagar. Ranizai and Lower Osman Khel tribes are subordinate to Swat. —*Elphin. Caubul*, p. 353.

USNEA, a genus of plants belonging to the natural order of lichens. The Usnea plicata, in common with the Roccella tinctoria and other lichens, is used as a dye.—*Eng. Cyc.* See Dyes.

USTAD. HIND. A teacher, a schoolmaster; a master, especially in the shawl trade.

USTAGHFAR. ARAB. Deprecation. Ustaghfar Allah, God forbid.

USTUKHUDUS. HIND. An odoriferous labiate plant, which has generally been attributed to the Lavendula stœchas, but it is a species of Prunella.—*Powell, Handbook*, i. p. 320.

UTAKAMAND, Ootacamund, or Ontikalmanda, a municipal town in the Neilgherry Hills district, Madras, lat. 11° 24′ N., long. 76° 44′ E., containing 10,319 inhabitants. Ootacamund is the chief sanatorium of the Madras Presidency. It lies 7228 feet above sea-level; annual rainfall, 44·88 inches; mean temperature, 58° F. Botanical Gardens (51 acres) were opened during the governorship of the Marquis of Tweeddale (1842-48). It is approached by four ghats,—Coonoor, Seegoor, Kotagherry, Neddiwuttum, and Goodaloor. Ootacamund is nearly in the centre of the table-land of the Neilgherries at the foot of the western face of the peak of Dodabetta, and except to the N.W. the station is completely surrounded by grass-covered hills. Houses are scattered about, with gardens and plantations of Eucalyptus and Acacia, and the broad, excellent roads are bordered by Cassia glauca bushes, honeysuckles, foxgloves, geraniums, roses, and masses of the tall Lobelia excelsa. The population consists of Europeans, East Indians, but mostly migratory. Every European house has three or four fires daily. Ice forms in December and January mornings in the hollows and valleys, scarcely half an inch thick, but sufficiently consistent for all freezing purposes. On the Neilgherries, coffee, tea, and chinchona can be grown to any extent.

UTRARHI, a Sudra caste of Bengal, who at their feasts throw away all the food that is set before them.—*Ward*, iii. p. 977.

UTRASUM. TAM. Utrasum beads are seeds of Elæocarpus ganitrus and of Elæocarpus lanceolatus.

UTRICULARIA, a genus of plants of the natural order Pinguiculaceæ of Lindley. They are watery or marshy herbs, and about 22 species are known to occur in the E. Indies. In British India, U. diantha, fasciculata, nivea, reticulata, and stellaris. According to Walton, one species grows in the Philippine Islands, from the joints of which issues a tendril like that of a vine, at the extremity of which is placed a small receiver resembling a cruet with a neck, and on the top is placed a valve, which serves the place of a stopper. The receiver always stands erect, and is filled with a sweet and pleasant water, except at certain hours, when the valve naturally rises to give room for evaporation; otherwise the repletion could not take place. The contents of four or six of these little vessels are sufficient to quench the thirst of one person. This plant is found in the province of Bisaya, in the island of Luzon; it is evidently one of the pitcher plants.—*Roxb.* i. p. 143; *Walton's State*, p. 121.

UTRICULARIA BIFLORA. *Roxb.* Chota janji, Beng. A leafless floating plant, grows near Calcutta, at the end of the cold and beginning of the hot season, in stagnant water, along with U. fasciculata.

UTRICULARIA FASCICULATA. *Roxb.*
Janji, ... Beng. | Natsao, ... Tel.

Found floating in stagnant water in the vicinity of Calcutta, at the end of the cold and beginning of the hot season.

UTRICULARIA STELLARIS. *Linn.* Buro janji, Beng. A floating water plant of the still, sweet water lakes of Egypt, Ceylon, and of most parts of India. Its roots become distended with air, and these raise the plant to the surface till its flowering is over, when it settles dowu to deposit its seed in the ground.—*Roxb.* i. p. 143.

UTTARA NAISHADA CHARITA, a poem by Sri Harsha on the Life of Nala, king of Nishada, written about A.D. 1000.—*Dowson.*

UTTARA RAMA CHARITA, a drama by Bhava Bhuti, descriptive of the latter part of the life of Rama. The drama is based upon the Uttara Kanda of the Ramayana, and was probably written about the beginning of the 8th century. It has been translated twice, viz. by Professor Wilson, and by Professor C. H. Tawney.—*Dowson.*

UTTAR-PUJA. Hind. A Hindu ceremonial, dispossessing an image of the deity.

UTTARUKURU, the northern regions. According to Hindu geographers, the continent north of Maha Meru. See Aryans.

UTTFA. Arab. A large camel howdah, used by the Roala and Ibn Haddal and Ajman Bedouin tribes, when expecting a pitched battle. It is a huge cage of bamboo, covered with ostrich feathers. A girl is placed in it, who sings during the fight, and encourages the combatants. Formerly each large Bedouin tribe had one of these.—*Lady Anne Blunt*, ii. p. 146.

UTTHANAIKA-DASI. Sansk. The day on which Vishnu is supposed to arise from his four months' sleep, being the close of the rainy season. It is the 11th lunar day, which sometimes falls in Kartik, sometimes in Agrahayana.

UVARIA, a genus of plants belonging to the order Anonaceæ or custard apple tribe. About 42 species belong to the E. Indies; those growing in Burma, the Pad-da-gnan, the Ta-mot, the Tauka-dat-gnan, and Tha-myo-pra-tha, have not as yet beeu specifically determined. U. bicolor, *Roxb.*, aud U. bracteata, *Roxb.*, are trees of Sylhet; U. heteroclita is a plant of the Garo Hills; U. elongata, *Roxb.*, is a plaut of Chittagong; U. ventricosa, *Roxb.*, is found in Tiperah, and U. macrophylla in Sylhet and Chittagong. A species of Uvaria, Karee, Hind.? a tree of Jubbulpur, has wood used by natives for making toys. Another Uvaria, Beta-goonda, Can., grows in the Canara and Sunda forests, and in the jungles inland of Nilcoond, with wood of rather superior quality, being straight and tough. Another species of Uvaria, Thub-bor, Burm., a large tree of Tavoy, has a wood used for boat-building; and a fourth species of Uvaria, Hoom, Mahr., occurs in the Canara aud Suuda forests, in jungles east of Kursuli or Black River. It runs tall and straight, wood strong and useful, but is not much known. Dr. Roxburgh described 22 species, but several have since been referred to other genera. —*Dr. Gibson; Voigt*, pp. 14, 15; *Cal. Cat. Ex.*, 1862; *Mr. Blundell.*

UVARIA GRANDIFLORA. *Roxb.*
U. purpurea, *Bl.* | Unona grandiflora, *Lesch.*

A shrub of Burma, Tenasserim, and Sumatra, with large crimson flowers, changing to dark purple. Its fruit has the taste and appearance of the North Americau pawpaw, aud they are members of the same natural family.—*Roxb.* ii. p. 665; *Mason; Voigt.*

UVARIA NARUM. *Wall.*
Uvaria Zeylanica, *Lam.* | Unona narium, *D.C.*

Narum panel of Malabar, a greenish, sweet-smelling oil, which is used medicinally as a stimulant, is obtained by distillation from the roots. The roots are employed in the Mauritius in decoction as tonic and stimulant, and are externally applied for destroying vermin.—*Simmonds; Eng. Cyc.; O'Shaughnessy*, p. 193.

UVARIA ODORATA. *Lam.* Unona odorata, *Don.* A small tree of Burma, Martaban, the Tenasserim Provinces, Sunda, the Moluccas, and China.—*Voigt; Dr. Mason.*

UVARIA TOMENTOSA. *Roxb.* Pedda chilka dudugu, Tel. This has a very strong yellow wood, much similar, but superior, to Nauclea cordifolia. The carrying shoulder sticks or cowar are made from it, also used in house-building; it does not warp.—*Roxb.*

UVARIA TRIPETALA. *Roxb.* Unona tripetala, *D.C.* A tree of the Moluccas. Its largish, greenish-yellow, inodorous flowers appear in March, April, and May.—*Roxb.; Voigt.*

UVULARIA GRANDIFLORA, *Hoffman* and *Schultz*, the Pei-mu and Hiang-ming of the Chinese. A plant of China. Its corms are dug up in spring and in autumn, and are of two kinds,—a larger which is the cheaper, and a smaller, the latter named by the Chinese mother-of-pearl.—*Smith, M. M. C.*

UZBAK or Uzbek, a Turanian race found on the Oxus, in Balkh, Kunduz, Khost, Inderab, Talikhan, Huzrut-Imam, Andkhu, Shibbargan, and Bokhara. In all these districts the Uzbak are mixed with Tajak, the latter being the older inhabitants. The Uzbak are the resident civilised inhabitants of Central Asia. Their physical form has become considerably changed from being intermixed with ancient Iranians, and with many slaves from Persian Iran. The typical Uzbak in Khiva has a broad full face, low flat

forehead, large mouth; while those of Bokhara are less marked. In the neighbourhood of Kashgar and Aksu, the colour is from yellowish-brown to blackish; in Khokand brown, and in Khiva white. Timur was an Uzbak Tartar, but Uzbak power rose on the ruin of the Timur dynasty. The Uzbak considers himself more orthodox than the Afghan. As an ocular demonstration of God's blessing upon their nationality, he points out the numerous tombs of saints scattered all over Turkestan. He invites the Afghan to show him, in his turn, the number of his saints; to enumerate, if he can, how many men of his tribe have won the grace of God and become saints. He taunts the Afghans, who are Sunnis, with having no saints of their own, and being therefore obliged to go in pilgrimage to the Shiaite city, Mashed. They have 32 chief divisions, all known by names, many of them similar to those amongst the Kazak, and from this Vambery supposes the Uzbak to be a colonizing tribe. The Uzbak are Muhammadans. In Khiva and some parts of Chinese Tartary they are brave and warlike, and in this respect they are distinguished from all the other Central Asiatics. Although settled, they retain nomade customs, building houses for stables and granaries, but preferring the raised tent to dwell in. Uzbak men have pretty thick, but never long, beards. The women long retain their white complexion, and, with their large eyes, full face, and black hair, they are not displeasing. In Central Asia, they are highly renowned for their beauty. The Uzbak of Balkh are simple, honest, and humane. Uzbaks are fond of racing at festivals. The Uzbak horses and the horses in Bokhara and Maymena possess more strength than speed. The bride retires to a screened part of the tent, and is followed by the groom.

Mouravief supposes Uzbak to be derived from Uz, his or himself, and Bek, master, thus meaning master of himself, or independent. Klaproth derives it from the people called Ouz or Gouz. By the Arab historians, these were the same as Uigur, a Turkish tribe which formerly inhabited the countries to the south of the Celestial Mountain, that is, Little Bokhara. At the commencement of the 16th century, the Uzbak passed the Sihon or Jaxartes, proceeding westward. Everywhere they spread terror and desolation. They are at present in Balkh, Kharazm or Khiva, Bokhara, Fargana, and some countries in the neighbourhood of Mount Belur Tagh. The Uzbak tribes who inhabit Khiva are the Uigur, Naiman, Kangli-Kapchak, Kiat-Konkrad, and Noikious-mangood. Vambery says the term was in use among the ancient Hungarians as a titular term.

When Uzbak Khan was lord of Dasht-i-Kapchak, he introduced the religion of Islam into his dominions. On the death of Uzbak Khan in 1342, his son, and afterwards his grandson, followed him; but in 1360, Urus Khan, descended from a younger son of Jojy, became sovereign of Kapchak. The seventh in succession from Jojy was much revered by his subjects, and from that time, according to Abul Ghazi Khan, who is partly supported by Khondemir, they called themselves Uzbak; and eventually the Uzbak expelled the descendants of Timur from Mawur-un-nahar, and they still retain possession of Khiva, Bokhara, and Khokand.

Uzbak are the dominant tribe in Khiva. In the 16th century they came from the east of Bokhara, and wrested Khiva from the Sart. They are settled as agriculturists, gardeners, fishers, and fill the highest offices, own the little strongholds, and possess all the lands. The wealth of the Sart is in their houses; the rich Uzbak buy arms. The Uzbak wealth is in land and slaves. He is a hard master, of a sullen and joyless disposition, prone to gross and brutal indulgences. His intellect is dull. They have 32 taifé or tribes,—Akbet, Altchni, Atchmayli, Az, Balgali, Boikulak, Bugurlu, Dormen, Ichkili, Jagatai, Jelair, Kandji-galay, Kanli, Karakursak, Kenegoz, Kettekeser, Khitai, Kiet, Kipchak, Kulan, Kungrat, Manghit, Ming, Mitten, Nayman, Nogai, Noks, Sayat, Taz, Tyrkysh, Uigur, Ushun.

Mouravief estimated their numbers at 30,000 families, E. Kuhlivein, together with the Sarts, at 400,000, and Abbott at 100,000. The Kataghan tribe of Uzbak inhabit the Kunduz province of Afghanistan, north and south of the Oxus. They number 42,000 families.—*Collett, Khiva; Vambery, Bokhara*, p. 244; *Dr. Wolff's Bokhara*, i. p. 312; *Klaproth, Note; Mouravief, Bokhara*, p. 395; *Ferrier's Journey*, pp. 89, 90; *Markham, Embassy*, p. 35; *MacGregor*, p. 527.

V

V. In the English language this letter has only one sound, as in gave, give, love, dove; but in the oriental tongues the initial v is often changed into b or w, and the final v into u. In Sanskrit, v has the same sound as in English; but in Bengali and Uriya, the Sanskrit v is always changed into b, as bari for vari, barsha for varsha; and the same change often occurs in Hindi, as baras for varsha, sambat for samvat; in Bengali, also, which has no v, u is a usual substitute for v; in Gujerati this is reversed, and v is written for b, as vighu for bigha, vimo for bima. Also, in all dialects, particularly amongst the illiterate, there is a tendency to approximate the sound of v to that of w, or to substitute w for v. In Tamil, the change is not uncommon even in the written language, and varam is frequently written waram. The letter wau of the Persian is often pronounced vau; and in the Urdu or Hindustani the pronunciation of the wau is as often that of w as of v, as wakil, vakil; wazir, vizir; darwesh, darvesh; and all Hindus frequently change the wau into a b, as walaiti, balati; nawab, nabab, the nabob of the English. In Mahrati there are both sounds for the same letter, the one exactly like w, the other more like v.—*Wilson.*

VACCINATION, the process of inoculating with the virus from the pox of the cow, in Latin vaccus. The natives of India usually designate it as Tika dalna, to affix the tika, or Sitla nikalna, to remove the small-pox. The British Indian Government keep up great establishments to carry out vaccination, but it has not yet found general favour amongst the natives. Masson says that the camel in Baluchistan is liable to variola, and that the milkers who take this disease are exempt from small-pox attacks. Dr. Cullimore at Mandalay was informed by intelligent natives that a second inoculation is occasionally necessary, and that there are some who, from the hereditary influence

of the disease or some occult causes, are never susceptible to variolous inoculation. Dr. Huillet, late of Pondicherry, undertakes to show that vaccination was known to a physician, Dhanwantari, who flourished before Hippocrates.

VACCINIUM LESCHENAULTII. *Wight, Ic.*

V. arboreum, *Lesch.*	Agapetes arborea, *Dun.*
Andromeda symplocifolia, *W.*	Andoovan, . NEILGH.

A small or middling-sized very pretty tree, abundant on the Neilgherries at the higher elevations, and on the Animallays, Pulneys, and Ceylon mountains. The fruit is about as large as currants. It is an agreeable acid, and makes good tarts. The wood is rose-coloured, with a red heart, wavy-grained, and pleasant to work, and would be excellent for cabinet-work. The Vacciniaceæ, or bilberry tribe of plants, are small trees or shrubs, of which about 13 species are known to occur in the south and east of Asia, in the Neilgherry and Khassya mountains, Tavoy, and Java, in the genera Vaccinium, Gaylussaccia, and Thibaudia.—*Beddome, Fl. Sylv.*

VACH, the Hindu goddess of speech. She is variously described in the Brahmanas, Upanishads, the Mahabharata, and the Puranas, and is identified with Viraj, Satarupa, and Saraswati, styled the divine Vach, queen of the gods, mother of the Vedas, the daughter of Kama, spouse of Brahma, and mother of wisdom and eloquence. Vageswari, another name for the consort of Iswara, and the goddess of speech. Iswara, in this character, is called Vagiswara or Vagisa, the lord of speech. He is also called Siro Deva. —*Moor ; Coleman ; Garrett.*

VACHASPATI MISRA, author of the law book Vivada Chantamini, of the Mithila school.

VACHELLIA FARNESIANA. *W. and A.*

Mimosa Farnesiana, *Roxb.*	Acacia Farnesiana, *Willde.*
M. Indica, *Poir.*	A. Indica, *Desv., D.C.*
Jali mara, ... CAN.	Vaday valli maram, TAM.
Guya babula, BENG., HIND	Tumma, Kasturi, . TEL.
Iri babool, . . . MAHR.	Arimedamu, . . . ,,
Urimeda, Sami, . SANSK.	

This armed shrub grows throughout South-Eastern Asia, from Sind and the Himalaya to Malacca, is very common in the Dekhan, Mysore, and Coimbatore. It furnishes a good, hard, tough wood, greatly resembling that of the babool or Acacia Arabica, but the size is very small. It makes excellent ship knees and tent pegs, and it exudes a useful gum-arabic freely and in considerably quantity, from 5 to 12 lbs. annually. The small, deep-yellow, powerfully-smelling, globular-headed flowers, under the name of wattle-flowers, are much employed in perfumery for their delicious fragrance.—*Wight; M. E. J. R.; Voigt; Mason; Rohde.*

VADA, also Wara. GUJ., MAHR. A ward or quarter of a town, as Bahman-wara, the Brahma quarter ; Dher-wara, the Dher quarter.

VADA. TAM. North. Vadagalai, lit. the northern branch, a sect among the Tamil Vaishnava, the other sect being the Tenkalai or southern sect. (See Vaishnava.) The Vadagalai sect place two white oblong marks on each side of their foreheads, made of a white earth called teruman, to represent the feet of Vishnu, and in the centre of each mark a red spot or teruchurnam (holy powder) made of rice flour, to represent Lakshmi, the wife of Vishnu. The marks of the Tenkalai are similar but broader, and with a little spot over the root of the nose. The ceremonials of the Vadagalai are more numerous than those of the Tenkalai. Their religious teachers are not celibates. Their upper arms are branded with the chank (sanka) and disc (chakram). They travel with their families, visiting and instructing their disciples. See Left-Hand Caste ; Right-Hand Caste ; Vaishnava.

VAGHARI or Wagri or Bagri. GUJ. A race of fowlers who snare with nets.

VAHAN. SANSK. A vehicle of the Hindu gods. An animal is appropriated as the vahan or vehicle to each of the mythological personages of modern Hinduism. The swan, eagle, and bull appertain respectively to Brahma, Vishnu, and Siva, and are severally denominated Hanasa, Garuda, and Nandi. Ganesa, eldest son of Siva and Parvati, the elephant-headed god of prudence and policy, rides a rat, supposed to be a very sagacious animal. Kartika, their second son, the generalissimo of the celestial armies, mounts on a peacock. Indra, the powerful regent of the firmament, the Jupiter Pluvius of the Hindus, rides the elephant Airavata, symbolical of might. Varuna, genius of the waters, bestrides a fish, as doth also Ganga, the prime goddess of rivers. Kama Deva, the god of love, is carried by a lory or parrot. Agni, god of fire, has an ardent ram. The Hanasa of Brahma is a goose or swan ; Vishnu's Garuda is half man, half bird, and now, in Southern India, identified with the Haliastur Indus, *Bodd.*, or Brahmany kite ; Vayu or Pavana, an antelope ; Yama, a buffalo ; Mungula or Mars, a sheep ; Budh, a lion ; Shuni or Sani (Saturn), a vulture ; Rama, a monkey ; Durga or Parvati, a lion and bull ; and the other goddesses, the vahans of their respective lords. Kuvera has the horse ; Parvati as Durga and Kali rides on the lion and tiger.—*Coleman ; Moor ; Paterson ; As. Res.* vii. p. 48.

VAIJA YANTI, a law book, a commentary by Nanda Pandita on the Vishnu Smriti.—*Dowson.*

VAIKUNTHA or Vaibhra, in Hindu mythology, is the paradise or celestial abode of Vishnu, where he enjoys beatitude in the elysium of Lakshmi's lap. Vaikuntha has been located in the frozen ocean, and sometimes in a subterranean sea of milk. The heaven of Vishnu is described as entirely of gold, and 80,000 miles in circumference. Its edifices, pillars, and ornaments are composed of precious stones. The crystal waters of the Ganges form a river in Vaikuntha, where are lakes filled with blue, red, and white water-lilies, each of a hundred and even a thousand petals. On a throne, glorious as the meridian sun, resting on water-lilies, is Vishnu, with Lakshmi or Sri, the goddess of abundance, the Ceres of the Egyptians and Greeks, on his right hand, surrounded by spirits, who constantly celebrate the praise of Vishnu and Lakshmi, who are served by his votaries, and to whom the eagle Garuda is door-keeper.—*The Mahabharata; Ward, Hindoos*, ii. p. 14 ; *Moor's Pantheon*, p. 23.

VAIMANIKA, one of the four classes of divine beings reckoned by the Jains.—*As. Res.* xvii. 274.

VAIPEEN. In the year 1341, the sea threw up the small island of Vaipeen, on the north side of Cochin. The waters, breaking through the banks of the river Cocci, swept away the village, and formed a large river and backwater, and so spacious a harbour, that large ships can lie safely

at anchor in the river on the north-east side of the town of Cochin. Vaipeen is thirteen miles long, and one broad. The natives date their era from the period of its origin. It is called the Poodooveypa, from two Malealam words, Poodoo, new, and Veypa, foundation.

VAISAKHA. Sansk. The first month of the Hindu solar year (April—May), the second of the luni-solar.

VAISALI, a famous ancient city of Iudia, founded by Visala, son of Trinabindu. It is a place of Sakya's labours. Its site is now unknown. General Cunningham has supposed it to have been 27 miles N. of Patna, on the left bank of the Ganges. It has also been supposed to be the modern Allahabad. It is not Visala, which is the modern Ujjayini (Ujjain).

VAISAMPAYANA, a learned man who assisted Vyasa in arranging the Vedas.

VAISESHIKA, one of the two great divisions of the Nyaya philosophy established by Kanada, who taught that light is the visible form of God; that spirit and animal life are separate; that when the desire of creation arose in the divine mind, he first gave existence to water, and then to innumerable worlds floating on the waters like the mundane egg; that in these primeval eggs water was contained, on which lay Vishnu, from whose navel issued a lotus, in which Brahma was born, who, receiving instructions from God, created the world first from his mind, and then with the primary atoms.—*Garrett.*

VAISHNAVA, Hindu sectarians, followers of Vishnu. All Vaishuava sects identify Vishnu with Brahma. The subdivisions of the sect are the Bhakta, Bhagavata, Vaishnava, Chakrina or Pancha Ratrava, Vaikhanasa, and Karmahina; each of these again being divided into a practical Karma and a speculative Inyana or G'niana portion. The great teachers have been Ramauuja, Ramanand, Kabir, Asanand, Rai Das, Sena, Dhunna, Pipa, Sur Das, Tulsi Das, Harischandra, Vallabhacharya. Vishnu is believed to have become repeatedly incarnate. Vishnu is now but seldom worshipped, and the sects attach themselves to the worship of Rama and his wife Sita, and to Krishna with his mistress Radha, and to local deities whom the worshippers believe to be incarnations of this deity.

The four principal sects were founded by Ramanuja, Madhava, Chaitanya, and Vallabha. The Ramanuja sect was again divided into two sub-sects, Vadagalai and Tenkalai. The Vallabha sect hold that the way to salvation was through eating and drinking and enjoying the good things of life. In opposition to this sensual view of religion, a modern reformer, Swami Narayana, founded a new sect, and wrote his Sikshapatri, consisting of 212 precepts, which give a good idea of the purer side of Vaishnaism.

Amongst Vaishnava Hindus, in the south of India, the Suttuthavan, Tam., are rigid Vaishnavi; are to the Vaishnavi what the Vira Saiva are to the Saivavi. They are flower-selling minstrels and vagrant mendicants. They are said to have a communism of women, but if so, the practice is unknown to their neighbours.

In Bengal, one-fifth of the population are worshippers of Vishnu in the form of Krishna, and the followers of Ramanand and Kabir are the principal subdivisions of this sub-sect.

The Charan Dasi worship Krishna and Radha. It was founded by Charan Das, who lived in the reign of the second Alamgir, and was a merchant of the Dhusar tribe, a resident of Dehli. His followers are both clerical and secular. At Dehli is the Samadh or monument of the founder.

The division of Gocalast'ha, or worshippers of Gocal or Krishna, is subdivided into three:—

1. Exclusively worship Krishna as Vishnu himself; this is generally deemed the true and orthodox Vaishnava.

2. Exclusively worship Radha as the sakti of Krishna or Vishnu; this sect is called Radha Vallabhi.

3. Worship Krishna and Radha conjointly.

As the Saiva has a fourth undivided sect in the Ganapatya, so the Vaishnava has a fourth undivided sect in the Bhagavata, who recognise all divinities equally.

Most of these comprise a number of subdivisions, and besides these acknowledged classifications, many individual mendicants are to be found all over India who can scarcely be included within the limits of any of them exercising a sort of independence both in thought and act, and attached very loosely, if at all, to any of the popular schismatical sects.

In the south of the Peninsula of India, the Vaishnava have separated into the Tengala and Vadagala sects. The Tengala follow the precepts of Manavala Manumi or Ramyaja Matri, and the Vadagala claim Vedantacharya or Vedanta Desika as their expounder. Both of these holy men were pupils of the same teacher, Ramanuja-Charya. Both sections speak respectfully of the other; both sects worship Vishnu, and, with some minor differences, use the same rites; nevertheless occasionally, at the great festivals, disputes between the two sects often run high, with rioting and bloodshed; also, if of the same caste, they eat together and intermarry, so that the points of difference apparently cannot be of vital importance, but among no other sects have the quarrels been so frequent and so bitter. Since A.D. 1830, in Madras city, owing to the care bestowed by Mr. Edward Elliot, the chief magistrate of police, violence has been put a stop to. The words Tencalei and Vadacalei mean Southern Veda and Northern Veda, and it is surmised that the disputes originated from the assumption by Northern Brahmans of authority over the Southern Vaishnava, and attempts to interfere with their customs and rites. The sects themselves are unable to make the causes of dispute intelligible, but all castes of Hindus are accustomed, by marks on their foreheads, to indicate the sect to which they belong. Accordingly, all Vaishnava mark a trident-like longitudinal mark; but the Teugala commence the middle line a little way down the nose, and the Vadagala only from the root of the nose. Vaishnava women do not make a trident mark, but only a single upright line from the nose to the hair. The Tengala or Southern Veda sect are the most numerous in the southern provinces.

Vaishnava missionaries have largely taught in the women's apartments of Calcutta. The finest temples in Northern India owe their origin to this sect, who have come to regard themselves as a distinct caste. They are known in Bengal as the Baisnab, a dialectal change of Vaishnava, appertaining to Vishnu, but they are not a numerous

sect; in Bengal they have only 428,000 followers; in Southern India, the followers of Chaitanya are known generally as the Satani, which is supposed to be a variation from Chaitanya, or taken from Sanatana, one of Chaitanya's most celebrated disciples; in the southern part of India, they are almost all of the Teling-speaking people, but they have not become numerous.

The most deplorable part of the Vaishnava worship of the present day is that which has covered the walls of temples with indecent figures, and has filled their temples with licentious rites.

As a rule, the dead of the Vaishnava Hindus are burned. As death draws near, a lamp is lit at the bed-head, and a homa sacrifice performed with camphor and a cocoanut; and as life dies away, the five elements are dropped into the mouth of the moribund from a tulsi leaf. Within two or three hours the body is lifted, and this is done early, as none of the household nor any of the neighbours can partake of food until the remains be disposed of. The pile of wood or cow-dung cakes used is about two feet high, and on it are placed some tulsi leaves, a little sandal-wood; and the deceased is laid with his feet to the north. When laid on the pile, a cloth is placed over the face, and raw rice is placed on it over the mouth. The heir of the deceased places a charred bit of sandal-wood or a tulsi branch at each corner of the pile, and a Vityan sets fire to the mat, using fire taken from the sacred fire lit at the bedside of the dying man. On the following day the heir and friends visit the pile, remove the skull and the bones, on which he and all with him pour water and wash them,—wash them with the sikai, anoint them with oil and honey, and clean them with milk, and place them all on plantain leaves anointed with butter. A young cocoanut shoot is then placed on the skull, and the whole put into an unburned earthen pot, and taken or sent to a river or to the sea, the person who conveyed it returning to the temple, where he pronounces aloud the deceased's name, and adds 'pray for him.' Often they are sent to a holy river, even to the Ganges at Benares. The adult male relatives shave. The hair of the Brahman widow's head is shaved. The body is not always carried through the doorway of the house. If it be an inauspicious day, or if the house door be so placed that the courtyard has to be crossed, then the remains are carried through an opening broken in the wall. The remains are unclothed for the last rites. Children under eight years of age and unmarried girls are buried, as also are all who die of small-pox, as the belief is that this ailment is a manifestation of the presence of the goddess Ammun, Mariathi, or Kali, and the anger of the goddess would revert to the family if the body were burned.—*Wilson.*

VAISYA, also Vais, or Bais, or Vesia, the third of the four grand social divisions of Hindus; commonly merchants, traders, cultivators, but individuals of the three others are found practising the duties supposed to be exclusively allotted to the Vaisya. Their industry and economy is striking. The natural duty of the Vaisya is to cultivate the land, tend cattle, and buy and sell. Amongst the earliest dissenters from Indra were the Yadu race, under Krishna's influence. The reasons leading him to this are not known, but the Mahabharata makes him say to Nareda, his father:

'Why worship Indra as the supreme god? O father, we are Vaisya, and our cattle live upon the pastures: let us therefore cease to worship Indra, and pay our devotions to the mountain Govardhana.'

Up to that time it is to the heaven of Indra that the good who die proceed.

Vaisya comes from a Sanskrit root, which is found in many Aryan tongues,—Sanskrit, Vesa, a house; Oikos, Greek; Vicus, Latin; Veihs, Gothic; German, Wich. Dr. Hunter says the Vaisya caste, literally the vis or body of the Aryan settlers, were in ancient times the tillers of the soil. They have gradually abandoned this laborious occupation to the Sudra and mixed castes, and are now the merchants and bankers of India.—*Imp. Gaz.*

VAITARANI. Sansk. To be crossed; the river to be crossed before the infernal regions can be entered.

VAIVASWATA, Yama, or Dharmaraja, also Vaivaswata Menu, 'The man, son of the sun,' the seventh Menu. He was the son of Surya and father of Ikshwaku, the founder of the Solar race of kings.—*Tod's Rajasthan*, i. p. 24. See Deluge.

VAJRA. Sansk. The thunderbolt of Indra. It is a circular weapon, with a hole in the centre; others say two cross bars. Vajra-nabha, the discus of Krishna. Vajra-pani, bearer of the Vajra.

VAJRA SAKHA, the divisions of the Jains established by Dasapurni Vajraswami, the founder of the Mahanisitha sect.—*As. Res.* xvii. p. 287.

VAKIL, an attorney, an ambassador or agent. It is pronounced also Wakil, and in Baluchistan is a person who transacts every kind of business for another. In Persia, the Vakil is still an officer in the courts of justice, called Vakil-ur-Raya, or 'the advocate of the people.' In the justiciary courts of the British in India a Vakil is a pleader. —*Malcolm's Persia*, ii. p. 453; *Pottinger's Tr.*

VAKILA, a weight used in Arabia for spices, etc., consisting of 10 coffola and nearly $1\frac{1}{4}$ oz. English; in Bussora, the heavy vakila is 4833 lbs., and the light weight for spices, etc., 1166 lbs.—*Simmonds' Dict.*

VALAI. Tam. Silurus boalis of Hamilton, a fish of the Peninsula. The Valai takes equally well during all the months of the year; the best time to fish for it is from daylight until the sun gets hot, and from four in the afternoon till sun-down; but where weeds or water-lilies exist, the middle of the day is equally as good a time. This fish takes best of all, however, on moonlight nights. The most killing bait is a live bait of about four inches in length, and Kowlie (Hind.) are the strongest and liveliest among the many available sorts to choose from. The Valai is to be found in still, running, deep, and shallow water, but generally in the centre of the stream by day and near the banks at night. This fish, like many others, bites freely after rain when the water is coloured. Its mode of rearing its young differs from that of the cat-fish. The fry swim about near the top of the water while the parents keep watch about a foot below. The Valai is not the Silurus wallagoo of Russell, but the Silurus boalis of Hamilton. The Olai Valai is not the sword-fish; some of these fish are to be seen at any time in the different fish markets.

VALA KHILYA or Kharwa. In Hindu

mythology, 60,000 pigmy sages sprung from the hairs of Brahma. They are guards of the chariots of the sun. Professor Wilson supposes them to be connected with the character of Daumling, Thaumlin, Tamlane, Tom-a-lyn, or Tom Thumb. —*Dowson.*

VALANGANY, about six miles south of Negapatam, has a chapel dedicated to the Virgin Mary, and under the jurisdiction of the Goanese priesthood. According to tradition, an enceinte woman was wandering on the barren plains of Velangany. In her hour of need a lady appeared, and told her where she would find a tree thick with cool and shady foliage, on the brink of a pool of water. She found the shelter, and was delivered of a beautiful child. Some days after, the lady reappeared and told her that she would meet on her way an old man, to whom she was to mention that at the bed of the pool there lay a statue. She met the old man, and he found an image of the Virgin Mary. The chapel was soon after built, the image placed in it, and a prettily-devised altar erected by a Portuguese ship captain, in conformity with a vow made by him when caught in a storm off the port of Negapatam. The Velangany festival attracts a large number of people from Madras to fulfil their vows and present offerings. Many heathens take part in this festival, make their offerings as if they were Christians, and pray to the Virgin for her protection. Some of these people go through acts of bodily penance, such as rolling their naked bodies for a long distance over hot sandy plains under the noonday sun.

VALANKAI or Valangai, in the south of India, the right-hand caste of Hindus, of which there are 18 sections, viz. :—

1. Banijaga or trader.
2. Okhalaga, cultivator.
3. Jotiphana, oil maker, employing the bullock.
4. Rangijiva, dyer or calico-printer.
5. Ladaru, Muhammadan traders and artificers.
6. Gujerati, Gujerat merchants, bankers.
7. Komati, shopkeeper, traders of the Vaisya.
8. Jaina or Jain.
9. Kurubar, shepherd and wool-worker.
10. Kumbara, potter.
11. Agasa, washerman.
12. Besta, fisherman, palanquin-bearer.
13. Padma sholaysa, a kind of weaver.
14. Naindu.
15. Upparadu or tank-digger.
16. Chitragaru or painter.
17. Golla or cowherd.
18. Waliya, Pareyan, or Pariah, who is the fighter of the others.

These vary.—*Wilson's Glossary.*

VALENTIA, GEORGE, Viscount, author of Voyages and Travels to India in 1802–6. Along with Captains Keys, Court, and Maxfield, he aided in the survey of the coasts of the Red Sea. In July 1805, Mr. Salt, his secretary, was sent from Arkeeko on a mission to the ruler of Tigre at Antalo. Mr. Salt was accompanied by Captain Rudland of the Bombay army, by Mr. Carter, and two European boys, Pearce and Coffin; the latter rose to be an Abyssinian chief, and forty years later reappeared at Aden. The mission was successful. Captain Court died at Calcutta in 1823, as Marine Surveyor-General at Calcutta.—*E. I. Marine Surveys*, pp. 18–71.

VALENTYN, FRANCIS, the author of an Account of Netherland India, from the Cape of Good Hope to Japan. He was a Lutheran clergyman, born in 1660 at Dordrecht, arrived in 1686 at Batavia as a minister, resided at Japara near Samarang, and then at Amboyna for 12 years, and returned to Holland. He remained in Europe for 11 years, and sailed again for Java in 1705, stayed there 2 years, then in the Spice Island 7 years, and in 1714 he finally returned to Holland. From that time he was engaged arranging his notes, and his first volume, Oud en Nieuw Oost-Indien, appeared in 1724. This was followed by seven others, all fully illustrated, the last appearing in 1726.—*Bikmore*, p. 147.

VALERIAN, a Roman emperor who was conquered by Shahpur at Odessa in A.D. 260. Being taken prisoner, he is said to have been treated by Shahpur with great severity, and eventually flayed alive.

VALERIANACEÆ, *Lind.*, of the valerian tribe of plants in the East Indies, are species of Nardostachys, Valeriana, and Triptostegia. Nardostachys jatamansi, *D. C.*, is the true spikenard of the ancients. It is highly esteemed in India for its perfume, and for its medicinal properties as a remedy in hysteria and epilepsy. The jatamansi or balchur is an efficient substitute for the European article, and is a very useful stimulant and antispasmodic remedy, chiefly employed in hysteric cases. Dose, one to two ounces three times daily. The true valerian, Valeriana officinalis, is a remarkable feline stimulant. V. Celtica is largely employed by eastern nations as a substitute for Nardostachys jatamansi. Wight gives Valeriana, Arnottiana, Brunoniana, Hookeriana, and Leschenaultii, and a kind of valerian takes the place of Asarabacca. The V. Wallichiana is called dala, wala, bala, char-bala mushk, chargodar, also probably tagir or takar.—*Powell*, p. 354; *O'Sh.*; *Murray*; *Beng. Phar.* p. 305.

VALERIANA HARDWICKII. *Wall.*

Asarun, Bala, . .	Hind.	Nah'ani . . .	of Ravi.
Taggar, ...	,,	Char .	of Trans-Indus.

This valerian grows in various parts of the Panjab Himalaya and beyond the Indus, at from 6000 to 12,000 feet; the root is put among clothes to keep off insects.—*Dr. J. L. Stewart.*

VALERIANA WALLICHII. *D. C.*

Mushkw'ali, . .	Hind.	Bala, .	Hind., Jhelum.

Grows in the N.W. Himalaya at 5000 to 11,000 feet, up to the Indus. Its roots are exported to the plains to be used medicinally.—*Dr. J. L. Stewart.*

VALKYNE, the fatal sisters of the Suevi or Siebi, are the analogue of the twin sisters of the Apsarases, who summon the Rajput warrior from the field of battle, and bear him to the mansion of the sun, equally the object of attainment with the children of Odiu in Scandinavia, and of Budha and Surya in the plains of Scythia and on the Ganges, like the Elysium of the Heliadæ of Greece.—*Tod's Rajasthan*, i. p. 67.

VALLABHACHARYA was born A.D. 1479; he was the son of a Telugu Brahman, and originated the worship of the Bala Gopala, the infant Krishna, and the sect thus founded have the name of Vallabhacharya or Rudra Sampradayi. The worship of the Bala Gopala is widely diffused amongst all ranks of Indian society, particularly in the northern parts of India, but is perhaps best known as the religion of the Gokulastha gosains, the title of its teachers. He taught that privation and asceticism is not sanctity, and that it is the

duty of the teachers and their disciples to worship the deity, not in nudity and hunger, but in costly apparel and choice food; not in solitude and mortification, but in the pleasures of society and the enjoyments of the world. The gosains or teachers, like Vallabha, are always married men, always clothed with the best raiment, and fed with the daintiest viands by their followers, over whom they have unlimited influence. Zealous disciples devote to the guru, tan, man, dhan, body, mind, and means. The temples and houses of the sect have pictures, and metallic, often gold, images of Gopal, of Krishna, and Radha, and other deified forms connected with the incarnation. The idol is richly decorated and sedulously attended in daily ceremonies. Besides their public demonstrations of respect, this sect, before sitting down to any of their meals, take care to offer a portion to the idol. Those of the disciples who have performed the triple Samarpana, eat only from the hands of each other, and the wife or child that has not exhibited the same mark of devotion can neither cook for such a disciple nor eat in his society. This part of their tenets has been subversive of all morality, and in 1862 was notoriously brought before the public in a trial for libel instituted in Bombay by one of the teachers, when it was shown that the women of the wealthiest of this sect deemed it an honour to receive the priest's attentions, he selecting one in the midst of and from amongst hundreds of her fellow-worshippers, and allowing visitors to be present while associating with her. In 1868, in Bombay, during the Holi festival, indecent pantomimes were shown by this sect.

Vallabha was the author of the Bhagavat, also of a Bhashya, of one part of Vyasa's Sutras, and of other Sanskrit works, on which the worship of the sect is founded.

Vittala Nat'h, the son and successor of Vallabha, had seven sons, all of whom were teachers, and their followers, though in all essential points the same, form separate communities. Those of Gokul Nat'h, however, look on their own gosains as the only legitimate teachers of their faith. The worshippers of this sect are very numerous and opulent, the merchants and bankers, especially the Bhattia race from Gujerat and Malwa, belonging to it. Their temples and establishments are numerous all over India, but especially at Mathura, and many hundreds at Brindaban. But at Sri Nat'h Dwar at Ajmir is the most celebrated, the most highly venerated, and most richly endowed of all the Gosain establishments. It is a matter of obligation with members of this sect to visit Sri Nat'h Dwar at least once in their lives, and the head gosain presents them with a certificate to that effect. Gosains are constantly travelling over India under the similitude of pilgrims, but reconcile to themselves on these occasions the profits of trade with the benefits of devotion.

Bitthal Nat'h's descendants settled in Sambat 1535 at Mahaban or Gokula, a town 5 or 6 miles below Mathura. His descendants are now the gosains of the temple there. The law members are called Scvakan; their system of doctrine is called Pushti Mārg, or way of happiness; and its practice as Daiva Jan, or divine life.—*Growse*, p. 264.

VALLAITI ERA and the Bengal era were established by Akbar. That of Bengal began on the 1st of the month Baisakh 963 + 593 = 1556. The Vallaiti-san was used in Orissa, where it was called the Auel-san, and began on the 1st of the month Aswin 963 + 592 = A.D. 1555.

VALLAM, a small town in the Tanjore district, Madras, 7 miles from Tanjore city. Vallam was captured by the British under Captain Joseph Smith in 1771. The quartz crystals found here are made into spectacles.—*Imp. Gaz.*

VALLARIS DICHOTOMA. *Wall.*

Echites dichotoma, *Roxb.*	Pala malle tivva, . TEL.
Hapurmali, . . . BENG.	Putta podara yarala, ,,

A plant of most parts of India and of Burma, with white fragrant flowers.—*W. Ic.*

VALLARIS PERGULANUS. *Burm.*

Pergularia glabra, *L.*	Flos pergulanus, *Rumph.*
Echites hircosa, *Roxb.*	Emericia pergularia, *Rom.*

A plant of India and the Archipelago, flowers with the smell of a goat.—*Roxb.; Voigt.*

VALLISNERIA, a genus of water plants belonging to the natural order Hydrocharaceæ. They are diœcious; the male flowers are seated on a spadix; the corolla is monopetalous, with three segments. They grow at the bottom of the water, and yet the male and female flowers are separated, and the mode by which they are brought together affords a singular instance of adaptation. These plants generally grow in running waters, and thus render the difficulty of the contact of their flowers greater. The female flower has a long spiral prolongation, which, a few days before the flower is ready to be fecundated, rises to the surface of the water, where it floats. The male flower has a very short peduncle, which cannot extend, but the stamens are enclosed in small transparent globules, which detach themselves from the peduncle and become free. Small white pearls then rise to the surface of the water, which open near the flowers. When the fecundation is effected, the female flower again rolls up and sinks to the bottom of the water, where the seeds in the ovary mature.

VALLISNERIA SPIRÂLIS. *Linn.*

Vallisneria spiraloides, *R.*	Serpicula verticellata, *L.*
V. verticellata, *L.*	Udora verticellata, *Spr.*
V. Jacquiniana.	Huttonia serrata, *Will.*
Saivala, ... HIND.	Punatsu, . . . TEL.

A plant of America, Europe, and India. It grows in clear, standing, sweet water, flowers during the cold season, and consists of simple filiform roots, and a number of fine filiform-jointed shoots or stems, some creeping, some floating below the surface of the water; branches solitary, axillary. The sugar-refiners throughout India use this herb while moist to cover the surface of their sugar, as clay is used in the West India islands; and in two or three days the operation is finished exceedingly well. The Vallisneria is supposed to possess cooling powers. Thus Madhava says:

> 'The gentle pressure of her heaving bosom
> Has spread delightful coolness through my frame,
> As if combined upon my skin were strewed
> Sandal and camphor, Saivala and pearls,
> The lotus fibre on the moonstone's dew.'

Hydrilla verticellata also is employed by sugar-refiners to clarify sugar.—*Powell*, i. p. 306; *Roxb.* iii. p. 751; *Wilson's Hindu Theatre*, p. 71.

VALLUVA, also Valluvadu. TEL. A Pariah race, engaging as priests of Pariah families; the priests of the Pariah race of the south of India.

VALMIKI is supposed to have been born in the kingdom of Kosala, of which Ayodhya was the chief town. He is said to have resided on the banks of the Jumna, near its confluence with the Ganges at Allahabad. He is the reputed author of the Ramayana, a poem written in the Sanskrit language. The framework of the story relates to an exile from Hindustan named Rama, combined with a hero who fought in the south of India, aided by the people, who were delineated as bears and monkeys. Valmiki is said to have been of the predatory Badhak tribe, and some of his verses are thought to intimate that he was a robber, and explain the origin of his name. It is a current belief in many parts of India that he was a Thug; he is also said to have been converted when robbing a shrine, which is constructed into a story of considerable effect in the works of Chand. Valmiki is said to have settled at Chitrakuta at the time of the exile of Rama, but at one time to have resided at Bithul. Tradition has marked a hill in the district of Banda in Bundelkhand as his abode, where he eventually received Sita, wife of Rama, when banished by him, and where her two sons, Kusa and Lava, were born.—*Ward's Hindoos*, iv. 376; *Wilson's Hindu Theatre*, i. 313; *Tod's Rajasthan*, i. 29; *Garrett*.

VALONIA, the acorn cups of Quercus ægilops, or prickly-cupped oak, growing in the Morea. About 2 lbs. of valonia are required for the production of 1 lb. of leather, which is said to be less permeable to water than that made with oak bark, and so heavy as to make valonia the cheapest of all tanning materials except catechu or terra japonica. A mixture of valonia and oak bark may be used with good effect.

VALTA-KADEN, a subdivision of the Nair race.

VAMANA, the fifth incarnation of Vishnu in the form of a Brahman dwarf. The four first avatara are said to have occurred in the earliest, or Satya, age of the Hindus, corresponding in character with the golden or virtuous age of the fabulists of other regions. The fifth happened in the second or Treta-yuga. Maha Bali, though a virtuous monarch, was still so elated by his grandeur, that he omitted essential ceremonies and offerings to the deities; and Vishnu, finding it necessary to check the influence of such an example, resolved to mortify and punish the arrogant raja. He therefore condescended to become the son of Kasyapa and Aditi, and the younger brother of Indra, and assumed the form of a wretched Brahman dwarf. Appearing before the king, he asked a boon, which being promised, he demanded as much land as he could pace in three steps; nor would he desire further, although urged by Bali to demand something more worthy of a king to give. Vishnu, on obtaining the king's promise, required a ratification of it, which is performed by pouring water on the hand of the applicant. As soon as the holy stream had reached his hand, the form of the dwarf began to expand itself, and at length became so enormous that it appeared to extend itself up to heaven; then with one stride he encompassed the earth, with another heaven, and with the third was about to obtain patala, when Maha Bali, convinced that the pretended dwarf was no other than the god himself, fell prostrate in adoration before him, and yielded it up. From this incident of Vamana, Vishnu is also called Trivikrama or the three-stepper. It is maintained by other Vaishnava that the ratifying stream poured on the hand of Vishnu in this avatara was the river Ganga, which, falling from the hand of the miraculous dwarf, descended thence upon his, now Vishnu's, foot, whence, gushing as a mighty river, it was received on the head of Siva. In M. le Gentil's Voyage aux Indes, a rough map or plan is given, from a native original, of the course of the Ganges, in which it issues from the foot of Vishnu, and, falling on the head of Siva, flows in the style commonly seen through the cow's mouth. Vamana Purana, a Hindu religious book, about the 15th century, containing an account of Vishnu's incarnation as a dwarf. It divides its homage between Siva and Vishnu. — *Dowson; Moor*.

VAMBERY. Arminius Vambery, a traveller in Central Asia, and oriental scholar. He is a Magyar. He considers the Turanian nations as not less capable of improvement than their Ayran neighbours, but admits that, as a matter of fact, their cultivation has been chiefly derived from the latter. He altogether discredits the theory of an ancient Altaic civilisation, from which the refinement of Western Asia was derived. This question, as he intimates, has an important bearing on the theory which ascribes a Turanian origin to the people by whom the Accadian or original language of Assyria was spoken, and thus virtually refers the civilisation and mythology of Assyria to a Turanian source. His books of travels have all appeared in English, and had a wide circulation.

VAMPYRIDÆ, a family of mammals, comprising the bats, in the following sub-families:—

Sub-Fam. Megadermatinæ.

Megaderma lyra, *Jerdon*.
M. Carnatica, *Ell.* | M. schistacea, *Hodg.*, *Bly.*, *Horsf.*
Long-eared vampire bat, over all India.
M. spectrum, *Jerdon*, Kashmir vampire bat.
M. Horsfieldii, *Blyth*, of Tenasserim.
M. spasma, *Linn.*, Ceylon and Malayana.

Sub-Fam. Rhinolophinæ, Leafy-nosed bats.

Rhinolophus perniger, *Jerdon*, *Hodg.*, *Blyth*.
R. luctus, *Temm.* | Large leaf bat, . . ENG.
Nepal? Malabar? Java? Darjeeling.
R. mitratus, *Blyth*, Chybassa, Mussoori? Central India.
R. tragatus, *Hodg.*, *Blyth*, Nepal, Mussoori.
R. Pearsonii, *Horsf.*, *Blyth*, Darjeeling, Mussoori.
R. affinis, *Horsf.*, *Blyth*.
R. rubidus, *Kelaart.* | R. cinerascens, *Kelaart.*
Malabar? Ceylon, Burma, Malayana.
R. rouxi, *Tem.*, *Blyth*.
R. lepidus, *Blyth.* | Rufous leaf bat, . ENG.
Malabar, Calcutta, Colgong, Mussoori.
R. macrotis, *Hodg.*, *Blyth*, Himalaya, Nepal, Mussoori.
R. subbadius, *Hodg.*, *Blyth*, Nepal, Himalaya.
R. brevitarsus, *Blyth*, Darjeeling.
Several other species of Rhinolophus occur in the Malayan Islands, China, and Japan.
Hipposideros armiger, *Ham. Bn.*
H. nobilis, *var.*, *Blyth.* | Large horse-shoe bat, ENG.
Nepal, Mussoori, Darjeeling.
H. lankadeva, *Kel.*, Ceylon.
H. nobilis, *Cantor*, Burma, Ceylon, and Malay Peninsula.
H. speoris, *Bl.*, *Ell.*
H. apiculatus, *Gray.* | H. Dekhanensis, *Sykes.*
H. penicillatus, *Gray.* | Indian horse-shoe bat.
India generally, Ceylon, Archipelago.
H. cinerascens, *Blyth*, Panjab, Salt Range.

H. murinus, *Jerdon.*
Rhinolophus fulgens, *Ell.* | Little horse-shoe bat, ENG. S. India, Ceylon, Nicobars, Burma, Malayana.
H. larvatus, *Horsf.*, Burma, Malayana, Sylhet.
H. nobilis, *Cantor*, Malay Peninsula.
H. diadema, *Cantor*, Malay Peninsula.
H. galeritus, *Cantor*, Malay Peninsula.
Cœlops Frithii, *Blyth*, tailless bat of Sunderbans.
Rhinopoma Hardwickii, *Gray, Blyth*, the long-tailed leaf bat of all India, Burma, Malayana.
Nycteris Javanica, *Geoff.*, Java, Malacca.

VAN, a province of Asiatic Turkey, with a town, in lat. 38° 29′ N., long. 43° 10′ 35″ E., and a lake of same name. The population of the city of Van is about 12,000, chiefly Muhammadan and Armenian families. Van is the modern name of the town of Semiramis.

Lake Van, a salt lake about 40 miles long and 20 to 30 broad, surrounded by a beautiful outline of mountains, whose tops are covered with perpetual snow. The old, ruined, stone-built town of Ardische is situated on a narrow strip of land running into the lake. The borders of the lake about it are low and swampy, and abound in wild-fowl and various other kinds of game. On the N.W. and E. of Lake Van dwell the formidable Rewandoozi tribe. They amount to upwards of a hundred thousand families. In the winter they live amongst their embattled rocks, but in the milder months roam about, pitchiug their tents from valley to valley. The wild Amadi and Bitlisi tribes are their near neighbours. They and the entirely lawless Rewandoozi may be regarded as the most legitimate representatives of the ancient Carduchians, aud probably neither in manuers nor language are much changed since Xeuophon traversed their country on his way to Armenia. —*Porter's Travels*, ii. p. 471. See Iran; Kurdistan.

VANA. SANSK. A grove, a forest; hence Van, Wan, and Ban, wild. Vana-Chara (mas.), Vane-Chari (fem.), fauns, dryads, sylvan guardians, lit. wanderers of the woods. The names of the Banjari and of the Sunderbans are supposed to be from this word.

VAN ABASSI, a kind of moiré made in the province of Van.

VANA-BHATTA, author of the Kadam-bari, a highly-esteemed Hiudu poem.—*Ward*, iv.

VANAPRASTHA, in Hinduism, a man who has goue through his scholar and householder life, and has entered the third Asrama or hermit life, has gone prastha to the woods (vana). It is the Hylobios of the Greeks. According to Menu, when the father of a family perceives his muscles become flaccid, and his hair grey, and sees the child of his child, let him seek refuge in a forest, abandoning all food eaten in towns, and his household utensils; let him repair to the lonely wood, committing the care of his wife to her sons, or accompanied by her if she choose to attend him.—*Wilson.*

VANDA CŒRULEA. Near the village of Lernai on the Jaintia Hills are oak woods, on which Vanda cœrulea grows in profusion, waving its panicles of azure flowers in the wind. This is the rarest and most beautiful of all the beautiful orchids. The dry grassy hills which it inhabits are elevated 3000 to 4000 feet. The trees are small, gnarled, and very sparingly leafy, so that the Vanda which grows ou their limbs is fully exposed to sun, rain, and wind, and its roots sprawl over the dry, rough bark. The atmosphere is on the whole humid, extremely so during the rains, and at the flowering season the temperature ranges between 60° and 80°. There is much sunshine, and both air and bark are dry during the day. It is under these conditions that all the finer Indian Orchideæ grow, of which are to be found Dendrobium, Farmeri, Dalhousianum, Devonianum, etc., with Vanda cœrulea; whilst the most beautiful species of Cœlogyne, Cymbidium, Boblophyllum, aud Cypripedium inhabit cool climates at elevations above 4000 feet in Khassya, and as high as 6000 to 7000 in Sikkim. Wight gives V. pulchella, Roxburghii, spathulata, and Wightiana? Several are found in Borneo inferior to none of those from India. One gigantic species introduced into England Dr. Lindley named V. Lowii, the individual plant fetching a price varying from £3 to £10.—*Hooker, Jour.* p. 319; *Low's Sarawak*, p. 64; *W. Ic.; Mason's Tenasserim.*

VANGUERIA, a genus of plants belonging to the natural order Cinchoniaceæ, small trees or shrubs having ovate or oblong petiolate leaves with lanceolate stipules, solitary on both sides. The fruit of V. edulis is eaten by the natives of Madagascar and the Mauritius, where, as well as into the Peninsula of India and into China, it has been introduced. V. spinosa, Mayna, BENG., which is found in many parts of the plains of India and Chiua, is a distinct species, though united to the above by Sprengel in his Syst. Vegetabilium. The fruit is eaten. V. macrophylla occurs in Chittagong.

VANGUERIA EDULIS. *Vahl.*

V. cymosa, *Gœrtn.*	Vavanga edulis, *Vahl.*
V. Comersoni, *Desf.*	V. Chinensis, *Rohr.*
V. Madagascariensis, *Gmel.*	

A native of Madagascar, but introduced into Mauritius, India, and China.—*Eng. Cyc.; Roxb.; Voigt.*

VANGUERIA SPINOSA. *Roxb.*

Meynia spinosa, *Lamarck.*

Mayna, . BENG., HIND.	Pindi luka, . . . SANSK.

Bangari ki lakri, . HIND.	Vadanike, . . . TEL.
Voa vanguier, . MADAGA.	Chega gadda, . . ,,

A bush or small tree which grows to the height of 25 feet, with a circumference of 1½ feet. The bark is employed medicinally in fever. The dried berries are given to cattle, and the fresh berries are sometimes eaten by people.—*Genl. Med. Top.; Captain Macdonald; Roxb.; Voigt.*

VANILLA plant has been introduced into India, Bourbon, and Mauritius during the 19th century. It adapts itself readily to the climate, can be easily propagated and cultivated, occupies very little space, and the fruit is valuable. All the coffee districts are admirably adapted to the vanilla, but in Ceylon and in parts of the Neilgherries and the Wynad, the plant will not grow in the shade, as it does in Mexico and Brazil, and when trained on trees it soon gets out of reach, which is inconvenient, as the flowers require to be artificially impregnated.

Vanilla has grown well in the Lal Bagh, Bangalore. It was planted in a mixture of leaf-mould and sand, and trained to climb stone pillars seven feet high aud three feet apart, with cross pieces atop to form a lattice-work for branches to cling to. Rough bark trees, such as the mango, will also serve as supports for the plant. It

flowers the third year of planting, but does not produce fruit unless artificially fertilized.

In its native country the plant continues to bear from thirty to forty years, and yields, in ordinary seasons, from forty to fifty pods annually, or, say, half a pound weight, so that each plant may be considered equivalent in value to twenty rupees per annum.

M. Genève of the Mauritius found the plants grow better when supported by the Moringa pterygosperma, the Avocado or alligator pear, Persea gratissima, and the Bixa orellana.

The pods should be carefully dried, by exposing them on cloth to the sun's rays, and, while warm, they should be wrapped in woollen, which promotes evaporation, and at the same time absorbs the moisture. When thus treated, the pods blacken and put on a silvery lustre. On this appearing, they must be again exposed to the sun and thoroughly dried. A fully-developed and properly-ripened pod should be from six to seven inches long, about three-eighths of an inch in diameter, and of a very dark-brown colour, almost approaching to black. They should also be moist, and if properly ripened before being packed, they become after a time covered with a circular crystal, which adds to their appearance and marketable value.

VANILLA AROMATICA. *Swz.*
Epidendron vanilla, *Linn.* | Flore viridialbo, *Plum.*
Menaes geraes . . of BRAZIL.

Vanilla aromatica is said by Martius to yield the true vanilla, but the best Mexican vanilla is the produce of V. planifolia, of which Pereira mentions V. sativa and V. sylvestris as two varieties. It is used in confectionery to flavour chocolates, creams, liqueurs, etc. The vanilla genus of plants belongs to the natural order Orchiaceæ, of which V. aphylla, V. aromatica, V. planifolia, V. Walkeriæ, V. Wightii are grown in the East Indies. Dr. Falconer discovered a species while on his visit to the Tenasserim Provinces in 1849.—*Wight's Icones; Voigt.*

VANNAN, a caste of washermen in Malabar, who can only wash the clothes of inferior castes.

VANNIAR, of Telingana, oil-pressers.

VANNIO, a race in Gujerat, seemingly identical with the Banya or Banyan; they are of the Jain religion. It is the Vani or Wani of the Mahrattas, and is doubtless from the Sanskrit Vani. In Gujerat they are classed as Vaishnava, or as Jain Vannio, both of whom are shopkeepers, merchants, bankers.

VANSA or Bansa. SANSK. A race, a tribe, a family.

VAR or War, a Hindi syllable largely used in composition, meaning according to, after the manner of.

VA'RA or Va'sara. SANSK. A week of seven natural days, named after the planets, and arranged in the same order as they are in the European week. The names of each day (beginning with Sunday, and adding vara to each) are, 1. Ravi, 2. Soma, 3. Mangala, 4. Budha, 5. Gura, 6. Sucra, 7. Sani. The tabular notation of the feriæ, or days of the week, is 0 for Sunday, 1 for Monday, and so forth to 6 for Saturday, 7 being accounted zero.—*Warren's Kala Sankalita.*

VARAGON is an inferior sort of rice, cultivated largely in the French settlements, as well as in the interior of the Madras Presidency. It is round, and of a grey colour. When cooked, it becomes a paste, and is often made into an inferior kind of bread.

VARAHA, or the Boar. In this, the third avatara of Vishnu, he is generally represented four-handed, armed as usual, and with the head of a boar, on whose tusks rests a crescent, containing in its concavity an epitome of the earth, which had been immerged in the ocean as a punishment for its iniquities. So that this, as well as the first and second avatara, seems to be a repetition of the story of the deluge. The second combines with it a portion of astronomical allegory, and none of the other of the ten avatara have any apparent reference to the catastrophe, so pointedly indicated by the three first, which are understood to have occurred in the earliest ages. In Hindu legends, as well as in the mythological romances of Greece and Egypt, the boar is an animal very frequently introduced. In an ancient legend, relating to the destruction of the city of Mahabalipuram, and the seven pagodas, on the coast of Coromandel, by an earthquake and inundation, it is stated that Hirancheren, a gigantic prince or demon, rolled up the earth into a shapeless mass and carried it down to the abyss, whither Vishnu followed him in the shape of a boar, killed him with his tusks, and replaced the earth in its original position. See Boar.

VARAHA LANCH'HANA. SANSK. The boar signet, a symbol of royalty in use by the Chalukya dynasty whilst ruling at Kalian. It was the most celebrated of all their badges. It was the symbol invariably represented on their money and on their seals. Sometimes, in the latter, accompanied by the conch shell, the drum, the peacock fan, or a lotus, an elephant goad (ankus), candelabra, a seat or stool, the swastika cross 卐, and latterly a sword. Rajputs at the vernal equinox hunt the wild boar, and at a few places Hindus worship the image of the boar. In the south of India, the coin called by Europeans a pagoda, the hun of the Muhammadans, received its Hindu name from the people from having on it the figure of a boar, hence Varaha-mudra, boar-stamped. The boar was invariably stamped on all Chalukya coins.—*Tr. Hind.* i. p. 328. See Titles.

VARAHA MIHIRA, an astronomer, author of the Vrihat-sanhita and Brihaj-jatika, who was born at Ujjain A.D. 530, died A.D. 587 (Saka 509). He made some remarkable observations on the moon and on eclipses. He had, however, a strong taste for astrology, and fell into the error which Aryabhata had exposed. Telugu astronomers consider that Varaha Mihira flourished in the 3600th year of the Caliyug (A.D. 499), *i.e.* at the close of the second Padah of the Ayanansa, when the sun, moon, and equinoctial points (according to the doctrines of the Surya Siddhanta) were in the first point of the Hindu sidereal zodiac; or, in other words, when the Rishi were in the first point of the solar sign Mesha *r*, and in the same of the lunar mansion Aswini.—*Warren.*

VARAHA MIHIRA, another astronomer, thought by many to have been contemporary with the emperor Akbar, but whom writers are apt to confound with Varahacharya and others of the same name.

VARANES, also Varanus, the Roman designa-

tion of the name of Bahram, which was borne by five of the Sassanian kings.

Varanes I. A.D. 274 (Sm.), 271 (Mordt.), the 4th king.
Varanes II. ,, 277 (Sm.), 274 (Mordt.), the 5th king, styled Segan Shah.
Varanes III. ,, 294 (Sm.), 291 (Mordt.), the 6th king.
Varanes IV. ,, 390 (Sm.), 389 (Mordt.), styled Kerman Shah.
Varanes V. ,, 420 (Sm.), 420 (Mordt.), styled Bahram Gor.

See Bahram; Sassanian Kings.

VARANIDÆ, the varanians or water lizard family of reptiles of the order Sauria, comprising the two genera Varanus and Hydrosaurus, of which the following species are known to occur in the East Indies:—

Varanus Dumerilii (Monitor Dumerilii, *Muller*). Brown, with obscure cross-bands, with a black spot on side of neck. Shields of the head and over the orbit nearly equal, moderate. Scales large, convex. A native of Borneo.

Varanus heraldicus (Monitor heraldicus, *Gray*). Black, with cross-rows of pale-eyed spots, pale beneath, black-banded. Shields over the orbits small, sub-equal. It is a native of India.

Varanus lunatus. Nostrils large, nearly central, shields over the orbit small, sub-equal. Dark-brown, with lunate bands directed backward on the neck and forwards on the body, and with cross-bands on the tail; belly and under side of tail whitish. Found in India.

Varanus nebulosus (Monitor nebulosus, *Gray*; M. nebulatus, *Schlegel*), the coloured varan. Nostrils large, rather nearer the orbit than the end of the muzzle; orbital shield with a large series; back of neck with converging dark streaks. A native of India, Bengal, and Siam.

Varanus ornatus, the Philippine varan. Nostrils large, central; shields over orbit small, sub-equal. Olive; neck and front of the body with pale-spotted, broad, black cross-bands; the hinder part of the body and tail with pale spots. A native of the Philippine Islands.

Varanus rudicollis. Nostrils large, nearer the orbit than the end of the muzzle; shields over the orbits nearly square, the hinder central ones rather larger. Scales of the back triangular, keeled; of the neck large, prominent; muzzle elongated. Black, with white streaks on back of neck, and bands across the back. Found in the Philippine Islands.

Other Indian species are Varanus flavescens, *Merr.*, Ganges, Indus, Penang; V. dracæna, *L.*, Bengal to Ceylon; V. nebulosus, Bengal, Siam; Hydrosaurus salvator, *Lour.*, Ceylon, Siam, China. —*Gunther, Reptiles.* See Reptiles.

VARARUCHI, supposed to be same with Katayayana, a celebrated Brahman, son of Somadatta, distinguished for his wonderful memory, which enabled him to recite perfectly any discourse he had once heard. He instructed Nyadi, and both of them were writers of note on philological subjects. They were contemporaries of Nanda, who reigned at Patalaputra in the 4th century before Christ, and was one of the predecessors of Chandragupta. Vararuchi is one of the earliest commentators of Panini. He was one of the nine gems (Nava Khanda) of Vikramaditya's court.—*Garrett.* See Nava Khanda; Pali.

VARAVARAHA. Sansk. An outcaste, a man with curly hair, a barbarian, and supposed the source of the Greek Barbaros, the Roman Barbarus, and the Barbarian of the British.

VARENA. Ghilan is a district known to the ancient Aryans as Varena. It was their thirteenth settlement, and the curse of Ahriman there was irregular menstruation. Ghilan formed the nucleus of the ancient possessions of the Aryans in Media. 'Varena with the four corners,' Haug has shown to be Ghilan.

VARI. Hind. A turn, a man's turn to work; a joint-owned well.

VARNA. Hind., Sansk. Colour; hence a tribe, a class, a caste. Varna sankara, Sansk., the mixed caste of Hindus. Varna, colour, is the term used by Hindus to indicate the race.—*W.*

VARNISH. A varnish is a solution of a resin or of a gum-resin in a liquid, which being spread over a surface, evaporates, and leaves the solid in the form of a brilliant, transparent film. The principal substances used in varnishes and their solvents are the following:—

Solvents.	Solids.		Colours.	
Oil of nuts.	Amber.	Elemi.	Gamboge.	Annotto.
Oil of linseed.	Anime.	Benzoin.	Dragon's blood.	Red Sanders.
Oil of turpentine.	Copal.	Colophony.	Aloes.	Cochineal.
Oil of rosemary.	Lac.	Mastic.	Saffron.	Indigo.
Alcohol.	Dammer.	Resin.	Turmeric.	
Ether.	Sandarach.			

The resins or gums and the solvents may be used either singly or combined. One of the most desirable qualities in a varnish is durability, which depends greatly on the comparative insolubility of the resin employed, its hardness, toughness, and permanence of colour. The art of the varnish-maker requires, for its successful prosecution, a considerable amount of chemical knowledge, and the greatest care.

Amber resists the action of ordinary solvents, and requires to be fused at a high temperature. It is hard, and moderately tough, and its colour is scarcely acted on by the air. The objections to amber are its costliness, and the length of time required for amber varnish to dry. It does not become full hard under many weeks.

Those recognised by British varnishers are classed as cabinet, copal, carriage, wainscot, spirit and turpentine, white hard and brown hard varnish. Copal, mastic, and amber varnishes are much employed by the artist and by the photographer.

The Semecarpus anacardium yields a resinous juice, which is known as the black varnish of Sylhet. The black varnish of Malabar is from Holigarna longifolia. In China and Siam, Augia Chinensis yields a varnish; and in Japan, black varnishes are obtained from Rhus vernix, R. succedaneum, and R. verniciferum. In India, a varnish is obtained from the Buchanania latifolia, and another from the Odina wodier. The Martaban varnish is obtained from Melanorrhæa usitatissima. Stagmaria vernicifolia yields the Japan lacquer. Black varnish of Moulmein is used as first coat before gilding, on lacquered boxes and on pagodas.—*Local Committee, Moulmein.*

VARNISHED WARE. In the Burmese process of making this ware, a wooden frame, of wood covered with strips of bamboo woven together so as to form a basket, is the framework of the intended cup; the weaving is like that of a lady's work-basket, and care is taken that it shall be as thin and light as possible, as upon this matter the beauty and delicacy of the ware will

depend. Towards the edges, the weaving is of a coarser nature, and the bamboo is made as fine as hair. The varnish is named thit-tsi (wood-oil), and may be gathered at all times, but if taken during the flowering season, which is at the beginning of the year, it does not harden well. It appears to be in many of its properties analogous to China varnish, and it affects in a similar way the health of those who prepare it. Those unaccustomed to it frequently find their hands blistered, and their arms and faces swollen with its effects. All who use it take certain precautions against accidentally swallowing any portion, and they are careful to touch it with the right hand only, while they take their food with the left. Some persons are more seriously affected by the varnish than others, and its injurious effects appear in blotches so much resembling leprosy that the other Burmese refuse to hold intercourse with the affected person. The varnish is laid on with a brush, to spare the hand as far as practicable; but in all future operations on the same vessel, it is laid on with the hand, both in order to procure a fine surface, and to enable the workman to reject the minutest particles of dust. When first laid on, the varnish looks of a light-brown colour, but rubbing with the hand turns it to a fine black. When the cup is varnished, it must be carefully shut up in a box, to exclude the dust, and then deposited in a deep cold vault. This is said to be essential to its proper setting, and with one of which every manufactory is provided. The cup is kept in the vault at least three days.

In the third process, the cup is covered over with a thick black paste, which is intended to stop up all holes in the baskets, and to give the ware a body. Different pastes are used for this purpose, but all agree in being composed of some fine powder mixed up with thit-tsi; in one sort, the powder is that of calcined bones; in another, the fine sawdust of teak wood. In all cases the paste is dabbed on with the fingers, so as to hide the basket as far as the workman is able to do. After this process, as well as after every other in which the varnish is used in any shape, the cup is returned to the vault, where it must remain at least three days before any subsequent operation can be proceeded with.

In the fourth and fifth processes, the cup is ground smooth inside and outside. The operation is performed on a clumsy lathe, which is turned backwards and forwards with a stick and leather string like a drill-bow. The workman smears the cup with water mixed with an ochrey red earth, turns the lathe rapidly with his right hand, and presses a piece of pumice-stone held in his left hand against the inside of the cup; this process soon rubs down the rough surface of the paste, and is continued until it is quite smooth.

Sixthly, the cup is covered on the inside with an additional quantity of paste of finer quality, which is laid on by the workman after the outside is ground smooth, and dried, in order that it might receive an additional polish on a subsequent day.

In the seventh part of the process, the cup is covered with fine paste on the outside as well as on the inside. In this stage the cup is ground outside and in, and has also received a coat of fine varnish. This is the result of two successive operations with the interval of at least three days between them; the grinding is performed on the lathe, as in Nos. 4 and 5, but instead of pumice-stone the workman employs first a piece of smooth sandstone, then a rag with charcoal and water, and lastly a piece of moist cloth. The cup is dried well in the sun before the varnish is laid on, which is done with the finger.

In the next step, the cup receives a second coat of varnish, and is quite black and glossy, but not even on the surface. Thus far all the Burmese ware goes through the same processes, whatever may be the style in which they are to be finished, whether black or red, plain or figured.

In the ninth part of the process, the cup is simply polished in the lathe. This is performed by turning first against a piece of smooth stone as in No. 7, then by moistened rice husks held in the hollow of the left hand against the cup while turning; thirdly, by a rag dipped in well-pulverized teak wood; and lastly, by the hand smeared with a peculiar polishing powder, said to be made of the petrified wood of a tree. The ware thus furnished is like the black japanned ware used in Britain.

In red colour ware, the colour used is said to be superior to the best Chinese vermilion; it is moistened with an oil called shazi, extracted from the kunyen (Dipterocarpus turbinatus), and then mixed with thit-tsi varnish. The mixture is laid upon the cup after it has gone through the two first operations, and nothing more is required than giving it a polish with the hand, unless extraordinary lustre is desired, when a mixture of shazi and thit-tsi is applied.

Siamese.—In cups executed in Shan or Siamese style, the engraving is done with great ingenuity and rapidity, although the only tool is a needle tied to a stick and whetted on a bit of slate. The artist holds the cup on his knees with his left hand, and keeps his graver almost motionless in his right; he then dexterously turns the cup by the help of his knees to meet the graver. The Shan style consists in engraving a piece of black ware, and filling up the hollows with vermilion; if any figures are represented, they are left in relief, in the manner of wood engraving. The vermilion is laid on, and after drying several days is rubbed off on the lathe with wet bran held in the hollow of the hand. The operation is generally repeated to ensure a complete filling up of all hollows, and the cup is afterwards varnished and polished.

A more expeditious method, called the Burman style, consists in engraving upon a red cup, and filling up the hollows with different colours, usually yellow or green. Some specimens are engraved with grotesque Chinese-looking figures, and with the lines filled with yellow or primrose. The engraving is first prepared by being varnished over, and the colour is immediately rubbed in with the finger until it is quite dry. When the cup is finished, sometimes a small quantity of indigo is mixed with the orpiment, which produces a green colour. The beauty of the engraving consists chiefly in the contrast of bright colours, and the regular interlacing of minute lines, in which some specimens resemble our engine-turning; taste in drawing is totally out of the question.

Other modes of preparing the varnished ware are followed. The finer sorts are sometimes finished with gilding or with raised figures or mouldings.

These are formed of teak-wood paste, which is pressed when soft into tin moulds, and when dry it becomes as hard as the wood of which it was originally made. Europeans have found this paste an excellent material for making the raised work on picture frames and similar objects. Some articles are diversified by leaving portions of the basket-work uncovered by the varnish; in this case the weaving is of the finest quality, and the open parts being of different patterns, the effect is very good. Larger works are made of wood joined together with teak paste, and afterwards covered in the same way as the basket-work, the only difference between the processes being that in the wood-work the first varnishing is omitted, the solid and flat surface of the wood taking the paste at once without preparation.

Chinese.—Mr. Williams says that the beautiful appearance of the lacquered ware of China owes its lustrous colouring to a composition of lamp-black and the clarified juice obtained from a species of sumach called Rhus vernix or R. vernicia. Wood-oils are obtained from other plants of the same family, and the different qualities of lacquered ware are owing to the use of these inferior ingredients. The real varnish tree is about 15 feet in height, and when seven years old furnishes the sap, which is carefully collected from incisions in the trunk opened in summer nights. The body of the ware is wood partially smoothed, or pasteboard, upon which two or three coats of a composition of lime, paper, and gums are first laid, and thoroughly dried and rubbed. The surface of the wood is also hardened by rubbing coarse clay upon it, and afterwards scraping it off when dry. Two coatings of lamp-black and wood-oil, or, in the finer articles, of lamp-black and varnish, are laid upon the prepared wood, and after drying the clear varnish is brushed on, one coating after another, with the utmost care, in close and darkened rooms, allowing it to dry well between the several coats. The articles are then laid by to be painted and gilded according to the fancy of customers, after which a last coating is given them. The varnish is brought to market in brownish cakes, and reduced to its proper fluidity by boiling; it is applied to many purposes both as a varnish and paint, when it is commonly mixed with a red or brown colour. A beautiful fabric of lacquered ware is made by inlaying the nacre of fresh and salt-water shells in a rough mosaic of flowers, animals, etc., into the composition, and then varnishing it. Another kind, highly prized by the Chinese, is made by covering the wood with a coating of red varnish three or four lines in thickness, and then carving figures upon it in relief. The great labour necessary to produce this ware renders it expensive. A common substitute for the true varnish are the oils of the dryandra, jatropha, croton, and other members of the euphorbiaceous family, expressed from their seeds.

In *Peninsular India*, the varnish used by moochee men for palanquins, etc., is prepared by melting sandarus (a kind of copal or anime, called by Dr. Ainslie sandarach), and mixing it with boiled linseed oil, rendered dry by litharge; they do not usually add spirits of turpentine in the way prescribed for making copal varnish in England. Condapilly moochees, for ornamenting boxes, palanquins, etc., dissolve a little aloes in the varnish which is laid over it. A very good varnish is prepared by moochees with shell-lac and wood-oil heated in small quantities.

Wood varnish for teak and Chittagong wood may be prepared by melting three or four bits of sandarus of the size of a walnut or small egg, and pouring upon it a bottleful of boiling linseed oil previously rendered dry by boiling litharge or other drier, and after boiling them together for an hour, gently adding, while cooling, a teaspoonful of Venice turpentine. If too thick, it may be thinned with spirits of turpentine. It should be rubbed on the furniture, and after a little time, during which it may be exposed in the sun, rubbed off; the rubbing should be continued daily, and the polish should not be again applied for eight or ten days, after which it may be slightly applied every one or two months. Water does not injure this polish, and any stain or scratch may be rubbed over with the polish, which cannot be done with French polish.—*Rohde, MSS.; Fortune's Residence*, p. 146; *Williams' Middle Kingdom*, i. p. 121; *Journal Royal Asiatic Society.*

VARNISH TREE. This name is applied to the Dryandra cordata; that of China is the Elæococca vernicia; also Rhus acuminata, *D.C.*, R. succedanea, *Linn.* The black varnish tree of the Chinese is the Melanorrhæa usitatissima, *Wall.*, of Munipur, Pegu, Tenasserim, and Tavoy. It is very extensively used for paying the bottoms of river boats.

VARSHA. Sansk. The third season of the Hindu solar year, comprehending the months of Sravana and Bhadrapada, when the sun is in the signs Carcata and Sinha, answering to the Tamil months Adi and Avani.

VARSHA. Sansk. A region. Of these, nine are named as situated between the great mountain ranges of the earth, viz. Bharata-v-India, Kunpurusha or Kinnara, Hari, Ramyaka, Hiranmaya, Uttaru Kuru, Ilavrita, Bhadraswa, and Ketu-mala.

VARTHEMA. Ludovico di Varthema, a Bolognese, travelled in India and the Eastern Seas from A.D. 1503 to 1508. First he sailed to Alexandria, and, entering on the Nile, arrived at Cairo. Then, returning to Alexandria, he took ship to Baruti (Beyrut), and travelled by Tripoli to Aleppo. From Aleppo he went southward by Aman (Hamath) and Menin (near Helbon) to Damascus. On the 8th of April 1503, he set out from Damascus with the Haj caravan to Medina and Mecca, and he is the only Christian to this day who ever succeeded in reaching these holy places by that route. There he heard of the arrival of the Portuguese by the Cape of Good Hope, in the east, from a Moor who traded with Venice and Genoa, and who complained bitterly to him that articles of merchandise were not arriving at Mecca as usual, and of the king of Portugal as the cause. From Zida (Jiddah), the port of Mecca, he took ship and went on to Chameram, Gezan, and Aden, the strongest city that was ever seen on the level ground. It has walls on two sides, and on the other sides there are very large mountains. On these mountains there are five castles, and the city contained about five or six thousand families. Here some Moors who had escaped the barbarities of the Portuguese denounced Varthema as a spy. But he was sent to the Sultan at Rhada, who ultimately released him, and he re-embarked

at Aden for Diu Bandar in the Persian Gulf, and Diu in India. He visited Goa (Gogo ?), and thence returned to Gulfar in the Persian Gulf, and onwards to Muscat and Ormuz. He visited Eri under the ruler of Khorasan, and returned via Shiraz to Ormuz. Failing to reach Samarcand, he sailed from Ormuz to Cambay, and visited Chaul, Dabul, Gogo, Bijapur, and all the ports on the west coast, then up along the Coromandel coast to Covelong and Coromandel, and S. to Ceylon, and again N. to Pulicat and Bengal, Pegu, Malacca, Siam, Sumatra, Borneo, Java, and the Moluccas, and returned to Negapatam on the Coromandel coast, where he met twenty-two Portuguese. He went to Quilon and Calicut and Cannanore, where he entered the service of the Portuguese, and was present in their great sea fight in 1506 with the Zamorin fleets. Finally, he returned via the Cape of Good Hope to Lisbon, where he was warmly welcomed by Don Emanuel, king of Portugal.

VARUNA, one of the oldest of the gods of the ancient Hindus, of the times of the Vedas. He is the god of the waters, the analogue of Neptune. He is regent of the west, and lord of punishment, in which latter capacity he resembles Yama, and, like him, holds a snaky cord or noose with which he binds incorrigible offenders under the water. His vahana or vehicle is the fabulous fish called makara. Varuna is Uranos (Ουρανος) of the Greek mythology, the vault of heaven personified. Two hymns in the Rig Veda are addressed to him. He gave a son to king Harischandra, and required the same as a sacrifice. Varuna is rain, the sky, or hemispheric firmament, resting on the waters, and has obvious analogies with the Grecian Uranos. To this god, singly or associated with Mitra, are offered the rare and perfunctory prayers for protection from sin, which appear in one or two of the Vedic hymns. A common medium between the Grecian and Aryan mythology may be inferred, and that Mena and the Aswini, Anna and Varnna, were not (so to speak) indigenous.

VARUNI, a festival on the 13th of the latter half of Chaitra, in honour of Varuna. If it fall on a Saturday, it is of especial sanctity, and is termed Maha-Varuni.

VASANT'HI, amongst the Rajputs, is spring personified, as the consort of Har, and is worshipped by them. On the first spring day, the Rajput princes and vassals open the season with a great boar hunt. On that day personal danger is disregarded, as want of success is deemed an omen that, during the year, Oomia, the great mother, may refuse all petitions.

VASANTOTSAVA, Madhotsava, or Kamotsava is a festival held on the thirteenth and fourteenth of the Hindu month Chaitra, at which Kama Deva, the god of love, was formerly worshipped. The season was one of much merriment, and the general influence of returning spring was hailed with music and jollity. Part of the amusement of the people consisted in splashing each other, by means of syringes, with water or fine powder, coloured with saffron. A missile commonly used in some places is rose leaves, large baskets and trays of which are prepared for that purpose. The festival of Kama Deva holds its place in the calendar, but its observance is restricted to a few places. In fact, it seems to have merged into the Phalgunotsava or Holi, celebrated a month before, when the like merriment and affusion of coloured powder or water takes place. In the south of India, Kama is worshipped at this period also, which still further identifies the origin of the festival, although it has undergone some important modifications in date and purpose. — *Wilson's Hind. Theat.* ii. p. 268.

VASCO DA GAMA with three vessels sailed from Lisbon on the 8th July 1497, touched at Melinda, on the African coast, and anchored off Calicut on the 22d May 1498. On first landing, the Zamorin of Calicut received him with cordiality and kindness, but afterwards, on the representations of the Muhammadans, Gama was forced to set sail for Europe, and he re-entered the Tagus on the 29th August 1499, after an absence of 26 months. After him, Cabral commanded an expedition, and Da Gama, in 1502, again visited India. He called on the Zamorin for satisfaction for an insult to Cabral, and it being refused, he fired on the place, and went to Cochin, where he left Pacheo with a few men, and returned to Portugal.

VASHISHTA, a famous rishi or sage of the Vedic ages, one of seven rishi, husband of Arundhati, author of several of the hymns in the Rig Veda, also of a law book. He was the family priest of Nimi, son of Ikshwaku, who was the son of Manu Vaivasvata. Vashishta and Visvamitra are historical persons, and two modern schools were named after them. There are many legends regarding Vashishta in the Rig Veda, the Aitareya Brahmana, the Mahabharata, the Vishnu Purana, the Markandeya Purana.—*Ward's Hindoos*, iv. 19.

VASTU YAGA, a Vedic rite practised by Hindus to sanctify a new house ; without its performance, no house can be occupied. Each vastu or home is supposed to have a protecting snake, the Vastu sarpa. The rite consists of offerings of water, fruits, flowers, on a sacrificial altar or vedi, and prayers. On the morning of the day previously fixed for entering a new house, the Hindu owner performs the usual morning prayers and ablutions, and, having thus purified himself, he presents, according to his means, pieces of gold to Brahmans, a waterpot is filled with water, and on it are placed fruits, flowers, and mango leaves.—*Elliot, Sup. Glos.*

VASU, in Hindu mythology, a name of eight semi-divine beings, personifications of natural phenomena, whose names are variously enumerated. In the Vishnu Purana they are thus given :—1. A'pa, water, or, according to others, Ahar, day ; 2. Dhruva, the pole-star ; 3. Soma, the moon ; 4. Dhara, earth ; 5. Anila, the wind ; 6. Anala or Pavaka, fire ; 7. Pratyusha, dawn ; 8. Prabhasa, light. They are represented as always attendant on their leader, Agni or Fire, and in their relationship to this deity and to the worship of the sun and light, seem to belong to the Vedic period of Hindu mythology. — *Williams' Nala*, p. 215 ; *Wilson's Vishnu Purana*, p. 120.

VASU-DEVA, son of Sura, of the Yadava branch of the Lunar race. He was father of Krishna, and Kunti, the mother of the Pandava princes, was his sister. He married seven daughters of Ahuka, and the youngest of them, Devaki, was the mother of Krishna. After the death of Krishna and Bala Rama, he also died, and, according to the Mahabharata, four of his wives burned themselves with his corpse ; but the Vishnu Purana

says that he and Devaki and Rohini burned themselves at Dwaraka.

VASUKI, in Hindu mythology, a serpent which the Hindu gods used as a rope or thong when they churned the sea of milk to obtain the amrita. He was called also Sesha, also Ananta, and was king of the serpents who live in Patala.

VASUNDA, a festival for Andal, goddess of the Hindus, in the Natagasalai Teppakulam, Strivilliputur. In front of the tank is erected a pandal, decorated with plantains, sugar-canes, and garlands of flowers, and illuminated with lanterns, globes, and lustres. Early in the morning she is placed on the middle mantapum of the tank, and young and old come to worship the goddess. At night the goddess is taken to the temple in a long and pompous procession through the streets of the town, which are studded with pandals.

VATERIA, a genus of plant of the East Indies, of the order Dipterocarpaceæ. There are four species known, V. Zeylanica, *Wight*, of Ceylon; V. lanceæfolia, *Roxb.*, of Assam and the Khassya mountains; V. Roxburghiana, *Wight, Icon.*, a tree of the Peninsula of India; and V. Indica, of the western coast of Peninsular India and Mysore. A species of this genus, the Le-toak of the Burmese, is plentiful in the Tenasserim Provinces. It is a handsome wood, suited for cabinet-work, the purposes of the turner, and other purposes requiring a wood of dense structure.—*Major Benson; Wight's Icones; Roxb.; Voigt.*

VATERIA CEYLANICA. *W. Ill.* p. 88. Stemonoporus Wightii, *Thw.* A large tree in the forests between Galle and Ratnapura, and at Palmadolla near the latter place; wood not known.—*Thw. En. Pl. Zeyl.* p. 37.

This large and stately tree grows to the height of about 60 feet. It has entire, smooth, coriaceous leaves, and terminable panicles of white flowers. The young shoots and all tender parts, except the leaves, are covered with fine stellate pubescence. It is common in the hotter parts of Ceylon, up to an elevation of 2000 feet; it grows in Canara and all along the Malabar coast; it is found also in Mysore. Its wood weighs 26 lbs. to the cubic foot, and its timber is said to last ten years. In Ceylon, its timber is used for packing-cases, ceilings, coffins, etc.; on the western coast of India, it is said to be an excellent building timber, not liable to be attacked by the teredo, and much employed in ship-building. The dupada resin is used as a fragrant incense in temples; the quantity procurable is very considerable. It is obtained by wounding the tree, and in commerce occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell. It has a very cellular structure, which is attributable to the mode of collection. Notches being cut in the trunk of the tree sloping inwards and downwards, the resin collects in the cavity, and is either permitted to dry on the spot, or is collected and dried by the application of heat. It is of all shades, from light-green to light-yellow or white, and is usually translucent. Specimens are sometimes seen, in which, from the desiccation having been improperly conducted, the resin is more opaque, of a dull-green colour, and full of air bubbles, presenting the appearance of having undergone a partial fermentation. This resin may be recognised by its cellular appearance and balsamic smell; this latter, however (which is, of course, due to the volatile oil it contains), is gradually lost by long keeping or constant exposure to the air. What is called East Indian copal, and sold in England as gum-anime, exudes abundantly from this tree. Candles are made of this resin in Malabar, which Dr. Wight informs us diffuse in burning an agreeable fragrance, give a fine clear light with little smoke, and consume the wick without snuffing. These candles were at one time introduced into England, but a very high duty having been imposed, the trade ceased. A solid oil is prepared from the seeds, and is called piney tallow or dupada oil, Piney yennai, TAM., which is used for lamps, but is very suitable for soaps and candle-making. The oil from the seeds becomes perfectly solid even in hot climates, and is prepared by cleaning the seed, then roasting and grinding them into a mass. To 5 seers of seed add 12 seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated.—*Thw. Enum. Pl. Zeyl.; M. E. J. R.; Roxb. Flor. Indica; Voigt.*

VATERIA LANCEÆFOLIA. *Roxb.* This middling-sized tree is common in Sylhet, and grows in Assam and the Khassya mountains. It has entire, smooth, coriaceous leaves, and terminal panicles of white flowers. It flowers in April and May, and fruits in July and August. It is valuable as a timber tree. It exudes a clear liquid from wounds, etc., in the bark, which soon hardens into an amber-coloured resin. From this the natives distil a dark-coloured and strong-smelling resin called Chooa, also Chova, HIND., and sell it and gond or gum, which the Brahmans use as an incense. — *Roxb.* ii. p. 601; *Voigt; Royle's Him. Bot.; Eng. Cyc.; Mason.*

VATERIA ROXBURGHIANA. *Wight, Ill.* Common in some of our western coast forests, particularly in the South Canara jungles, and planted in avenues, etc., in Travancore; also indigenous in Ceylon, where it is called Mendora. Its timber is much valued in Ceylon, but is not in use in India; the tree produces a gum-resin.—*Beddome, Fl. Sylv.* viii. p. 95.

VATESWARA DATTA, according to some authorities, is the name of the father of Prithu, Prithwi, or Prithi-raj, but by other writers his father was named Someda or Vigraha Deva, and his grandfather Saruga Deva or Visala Deva. The term Datta is also more appropriate to a man of the Vaisya tribe than a Rajput, but then Vateswara is called a Samanta, a term especially implying a warrior and a chief, and, as in the case of the Jat, the agricultural tribes occasionally follow a military life. These considerations, however, leave the individuality of the author very doubtful.—*Asiatic Researches*, xv. p. 407; *Transactions of Royal Asiatic Society; Hindu Theatre*, ii. p. 154.

VATHEK, the hero of the tale by Mr. Beck-

ford, who is made to visit the Takht-i-Jamshid. According to the work called Khalassut-ul-Akhbar, Vathek died of dropsy in the month of Zehuj, 232 Hijira, or A.D. 846.

VATICA, a genus of plants of the East Indies, of the natural order Dipterocarpeæ. They are large trees of great economic value, and the recognised species are V. faginea, grandiflora, Helferi, and scaphula, *Dyer;* V. laccifera, obtusa, robusta, and tumbuggaia, *W. and A.* They are useful as timber trees and for their resins.

VATICA LACCIFERA. *W. and A., W. Ic.*

Shorea talura, *Roxb.*	S. robusta, *Roth.* not *Roxb.*
S. laccifera, *Heyne.*	Talura, ... TAM.

A large timber tree of Mysore and of the Balaghat mountains, Naikenary, Nundidrug, Palghat, where it blossoms during the dry winds, and ripens its seed in June. It is very abundant in the hill forests of Cuddapah and North Arcot, and is also found in the Mudumalli forests, Animallays, Wynad, Mysore, etc. Its timber is very useful for house-building, panels of doors, and various other purposes; it has a ready sale in the Cuddapah district, and is largely imported into Madras. A species of lac is procured from the tree.—*Beddome, Fl. Sylv.; Roxb.; Captain Puckle in M. Ex. of* 1862*; Useful Plants; W. and A.*

VATICA ROBUSTA. *W. and A.*

Shorea robusta, *Roxb.*

Its Resin.

Ral, Rala, Dhoona, HIND. | Guggala, ... TEL.

This valuable timber tree is allnded to in ancient Hindu writings. In the Hindu Theatre (ii. p. 100), Madhava, speaking of the coming rainy season, says—

. . . . 'The days approach
When the long line of clouds shall shed on earth
Their amaranthine drops, trembling in the breeze
That from the east comes powerful, and embued
With the rich odours of the Sal and Arjuna.'

Forests of it extend over a narrow belt from Kamaon to Assam, and the dammer of Bengal is the resin exuded from it. It grows in the Palghat mountains and to a limited extent on the west coast. West of Burhampore and Russelcondah, the sal forests are the most valuable tract of wood on the eastern coast of Peninsular India. In the taluk of Gumsur and in the zamindari of Bodogoda, the sal forests are important and accessible, for these districts are traversed by rivers, and during the short freshes timber can be rafted to the coast. Captain Beddome found it abundant on the Indrawati. Captain Sankey says that the sal of Nagpur, resembling bejasar somewhat in colour, differs peculiarly from it in the construction of its grain, and in its freeness from the faults to which the other is so subject. In strength, size, and all the qualities of good timber, it appeared to him to stand first of all those procurable in the Nagpur territories for a tie beam or rafter wood. The sal forests of Northern India, according to Dr. Falconer, extend in a nearly unbroken belt along the Terai from the Ganges at Hardwar to the Burhampooter; and it occurs also in the Morung Hills, and in Assam; but in many parts at the foot of the Himalayas, the forests are said to have become much exhausted.

Its seed has the utmost susceptibility of germination, with a vitality so limited in duration that it will not survive many days unplanted. It ripens at the commencement of the rains, and after the first shower falls actually sprouting from the tree. In consequence, young plants come up in the utmost profusion, forming patches of forest, which are literally impenetrable till thinned by the woodman. The tree Vatica robusta furnishes the best and most extensively used timber in the north of India. In Pegu, the tree is found chiefly on the Shan side of the Tounghoo district, and in the forests north of Tounghoo, and it is abundant inland in the Amherst and Tavoy provinces. Sal timber suffers much from exposure, splitting and warping greatly. The wood is hard, of a light-brown colour, and is in great repute; it is most valuable for house and ship building, as vats for liquids, door-frames, and for the rails and battens of doors. It is not suited for planks; it twists, shrinks, and warps whenever the surface is removed, even after many years' seasoning. This wood is in general use for building purposes in the Ganjam and Vizagapatam districts. Compared with teak, its strength is about 1121 to 869. In the Madras gun-carriage manufactory, it is used for beams of gun and howitzer carriages, light field axle-cases of all kinds, all parts of carts, transport carriage cheeks, handspikes of all sorts, perches of waggons, poles, short perches, braces, framing and splinter-bars of limbers, gun and waggon, and framing of all carts. The bark is employed by tanners, and yields an abundance of resin or dammer, which is used as a substitute for pitch, and burnt by the natives as incense, and an aromatic oil is procured from the resin by dry distillation. It is called Sal and Salwa in Gumsur, and Googul in the Godavery forests. Colonel Beddome is not sure that the Burmese tree called Eing-gyin is the same species.

VATICA TUMBUGGAIA. *W. and A.*

Shorea tumbuggaia, *Roxb.*	Sal tumbuggaia, *Roxb.*
Congo-wood tree, . ENG.	Tumbuggaia, . . . TEL.
Thambagam, . . . TAM.	

A large timber tree, a native of the Balaghat? mountains, which blossoms in the beginning of the hot season, and ripens its seed in June. In the Balpalli jungles, in the Cuddapah district, the tree abounds, particularly on the ridges of the hills from Balpalli to Yerra Gunta Cottah, and over all the ridges of the hills in the Cuddapah district, growing to a height of from 30 to 35 feet, and from 6 to 7 feet in circumference. It is there chiefly used for house-building purposes, being much prized by the natives of the district on account of its durability. Its wood is used for fuses; it is a strong, heavy wood, close-grained but splintery, superior in strength and finer in grain than sal, too heavy for gun-carriages, but would answer for all purposes where great strength is necessary. It yields a large quantity of the resin called dammer, which is employed in marine yards as a substitute for pitch, but used also as benzoin in temples for incense.—*Roxb.; Voigt.*

VATSYA, a learned Hindu who wrote in the Sanskrit language, about the beginning of the Christian era. His book is the Kama Sutra, or Aphorisms of Love, and is the standard work on love and on social and domestic life in that language. It was composed by him whilst a religious student at Benares. He alludes in it to the

writings of seven earlier authors. He inculcates the necessity of education and cultivation of the 64 arts. Dowson also says that he wrote the Nyaya Bhasha, and that he was known under the name of Malla Naga.

VATTEZ BATTU, an ancient Tamil writing character, still in use by the Moplah in South Malabar.

VAYPI, an island near Cochin, which was thrown up from the sea in the 14th century, and gave rise to a new era, Puduvepa, new introduction.

VAYU. SANSK. Air, wind, Æolus, the atmosphere; one of the gods of the ancient Hindus; the god of winds and the regent of the northwest.

VEDA. The religious books of the Hindus, known as the Vedas, are four in number,—the Rig Veda, the Yajur Veda, the Sama Veda, and the Atharva Veda, but the last of these belongs to a much later age than the rest. Of the four, the Rig Veda is the oldest, and the Yajur Veda, Sama Veda, and the Atharva Veda follow in succession.

Each Veda is subdivided into three parts,—Sanhita, Brahmana, and Sutra.

The Sanhita of the Rig Veda is purely a lyrical collection, comprising the store of songs which the Aryans had brought with them from their ancient settlements on the banks of the Indus, and which they had used in their invocations for prosperity on themselves and their flocks, in their adoration of the dawn, in celebration of the struggle between the god who wields the lightning and the darkness, and in rendering thanks to the heavenly beings for preservation in battle.

The songs are here classified according to the families of the poets to which they are ascribed. This is a purely scientific arrangement, irrespective of their date.

It is known that the sacred books known as Vedas were numerous, and the tradition is that their arrangement into their present form was made by a person who is designated Veda-Vyasa, literally Veda-compiler.

The Sanhita of the Sama Veda, and both the Sanhitas of the Yajur Veda, consist of verses relating to the Soma offering which have been extracted from the Rig Veda; and the extracts forming the Sama Sanhita seem to have been made prior to those of the Yajur Veda.

The object of the Brahmanas is to connect the sacrificial songs and formulas with the sacrificial rite, by pointing out, on the one hand, their direct mutual relation; and, on the other, their symbolical connection with each other.

The Sutras or Aphorisms are founded on the Brahmanas, and must be considered as their necessary supplement, as a further advance in the path struck out by the latter in the direction of more rigid system and formalism. They are the Kalpa Sutra or Srauta Sutra relating to ritual, and the Griha Sutra or Smarta Sutra relating to domestic ceremonial.

The Smarta Sutra exhibit the complete standpoint of Brahmanism.

The language of the Vedas is not Sanskrit in the strictest sense of the term, but there is not sufficient difference between it and classical Sanskrit to authorize its being called a separate language. The difference is not so great as between Anglo-Saxon and modern English, but it is greater than between Homer's and Demosthenes' Greek. The names of the rishi or composers are not always given in the body of the hymns, and there is nothing to guide the historian or chronologist as to their dates. Nevertheless, good scholars are of opinion that Vedic hymns were composed mostly about the fifteenth or seventeenth centuries before Christ, but not committed to writing, and therefore not collected, until the eighth century B.C.

The Veda offers one of the best illustrations of the manner in which ancient literature was preserved in early times. The art of writing was unknown in India before the end of the ancient Vedic literature, about B.C. 800. Now the oldest Sanskrit manuscript we possess cannot be much older than A.D. 1000; but the sons of the three higher castes were required to learn by heart the sacred text. At the present day, youths in some of the Brahmanic families can repeat the whole of the Rig Veda, learned, as their ancestors acquired it thousands of years ago, from the mouth of a teacher, so that the Vedic succession should never be broken. Various readings from these 'walking Rig Veda manuscripts' are being collected for an edition which is to be published in the Sacred Books of the East.

Veda is derived from Vedali, contracted Vetti, he knows, one of the verbs commonly used in Sanskrit, and from which several words are derived of frequent occurrence, as vidya, learning; vidivan, a learned man, etc. This verb, also, has been preserved as vidanti, SANSK.; eidonta, GR.; vident, LAT.; witon, ANGLO-SAXON; and wit, ENG. The body of Vedic literature is immense. In the Brahmana, moral recepts, religious instruction, and information are conveyed.

Their Age.—Good scholars are of opinion that the Vedic hymns were composed after the 17th century B.C., but not collected until later. Professor Wilson supposed them to belong to the 8th century before Christ. But another view has been that the Sanhita or hymns were collected about B.C. 1200 or 1300, and that the Brahmana was written about B.C. 700 or 800; while Professor Max Muller fixes the years 600 and 200 B.C. as the limits of that age during which the Brahmanic literature was carried on in the strange style of the Sutra. According to Colebrooke, at the epoch of the Vedas the summer solstice was in the middle of As'lesha, the 9th lunar mansion; therefore Regulus was half a lunar mansion + 9°, that is 15° 40′ east of the summer solstice, at that time. On 1st January 1859, the longitude of Regulus was 147° 52′ 30″, hence Regulus was at that date 57° 52′ 30″ east of the summer solstice. The summer solstice had therefore retrograded through 42° 12′ 30″ = 42° 20′ 8″ since the epoch of the Vedas. And as the equinoxes and solstices move backward on the ecliptic at the rate of 1° in 72 years, it must have occupied 70°×42° 20′ 8″=3039 years to effect the change. Hence the age of the Vedas was 3039 on the 1st January 1859, or their date is B.C. 1181, *i.e.* the early part of the 12th century before the Christian era.

Only a comparatively small portion of the Vedas has ever been translated, nor is it ever likely that the whole mass of Vedic literature will ever see the light in a modern language. Indeed, Roth calculated that the mere Sanhita or metrical

portion of the Vedas, as distinguished from the Brahmana or later ritual appended to each, contains not less than 30,000 couplets, of which 11,000 go to the Rig Veda. The Rig Veda comprises 1017 short poems, containing 10,580 verses.

Portions of the Rig Veda were translated by the late F. Rosen, the late M. Longlois, and by Professor H. H. Wilson; and Dr. F. Max Muller, who undertook to produce a complete one, has unweariedly devoted much of his useful life to this object. With all their difficulties, they furnish much information regarding the origin and early state of some of the races who are now called Hindus. From what has been published, it is known that during the period through which the Vedas were being produced, the people were progressing in moral culture and in social and political condition. In the earliest period of their migration, they had no money. Their wealth consisted of cattle, horses, sheep, goats, and buffaloes; the cow was the medium of barter. Cow-stealing was a great crime, but from the Rig Veda it is evident that the cow was not reverenced; they had apparently no temples nor images, and they were a cow-eating and spirit-drinking people. In later hymns there is mention of cities, of commerce, of weapons, of chariots, and even of the vices of primitive civilisation. Women throughout held a high social position. The rishi and his wife conversed on equal terms, went together to the sacrifice, and practised austerities together. Lovely maidens joined in processions, and grown-up daughters remained without reproach in their father's house.

The religion of the Aryans, as shown in the Vedas, differs in many very material points from that of the Hindus of the present day. The worship they prescribe is, with a few exceptions, domestic, consisting of oblations to fire, and invocations of the deities of fire, of the firmament, of the winds, the seasons, the moon, the sun, who are invited by the sacrificer, if a Brahman, or by his family priest, if he is not a Brahman, to be present, and accept the offering, either clarified butter or the fermented juice of the soma, Sarcostoma brevistigma, which are poured upon the sacrificial fire, in return for which they are supplicated to confer temporal blessings upon the worshipper, riches, life, posterity, which constitute the sum of heathen prayer in all heathen countries. The second hymn of the Rig Veda thus invokes the gods Indra, Mitra, Vayu, and Varuna:—

'1. Approach, O Vayu, be visible; this soma juice has been prepared for thee; approach, drink, hear our invocation.

'2. Those who praise thee, Vayu, celebrate thee with sacred songs, provided with store of soma juice, and knowing the season suitable for their oblations.

'3. Vayu, thy assenting voice comes to the sacrificer; it comes to many through the offering of the libation.

'4. Indra and Vayu, this juice has been prepared; come with benefits for us; verily the libation desires you.

'5. Vayu and Indra, observe the libations, being present in the offerings, come quickly.

'6. Vayu and Indra, mighty men, approach the priest of the sacrificer quickly, on account of his prayers.

'7. I invoke Mitra, the source of purity; I invoke Varuna, able to destroy; both cherishing earth with water.

'8. Mitra and Varuna, be pleased with this propitiatory offering; for to you, assuredly, do sacrifices owe their success, as the waters do their abundance.

'9. Mitra and Varuna, all-wise divinities, formed for the benefit of multitudes, and multitudinously present, give efficacy to our acts.'

Thus the hymns indicate primarily a worship of the elements, for other Deva named are Agni (Ignis), lord of fire; Surya, the sun; Marut, storms; Prithivi, the earth; Ap, the waters; Ushas, the dawn; Varuna (Ουρανος), the heavens; and to them the hymns are addressed.

Indra, as god of the firmament; Varuna, god of the waters; Yama, the judge of the dead; Agni, god of fire; Surya, the sun; Soma or Chandra, the moon; Vayu, the god of winds; the Marut, the Aditya,—all of them mere personifications of the powers of nature,—were invoked for aid or their wrath deprecated.

The gods of the Vedas were 33 in number, and some of them are not unknown to later systems, but at first perform very subordinate parts; whilst those deities who are the principal objects of Hindu worship of the present day, are either wholly unnamed in the Vedas, or are noticed in an inferior or different capacity. The names of Siva, of Durga, of Kali, of Rama, of Krishna, so far as research has gone, do not occur in the Vedas.

On the other hand, these sacred books contain many passages indicative of a purer thought. Sometimes they expand in glowing adoration of the attributes of the deity invoked, the 'one king of the breathing and awakening world,' whose greatness 'the snowy mountains and the sea proclaim,' 'whose shadow is immortality' (i. p. 29). Sometimes they embody the confessions of the penitent craving for forgiveness. 'Through want of strength, thou strong and bright God, have I gone wrong; have mercy, Almighty, have mercy!' (i. p. 39). 'Whenever we men, O Varuna, commit an offence before the heavenly host, whenever we break the law through thoughtlessness, have mercy, Almighty, have mercy!' They pray that the 'adorable light of Savitri may illumine (or rouse) the spirit of the worshipper.' Now, they recognise a power from whom no secrets are hid. 'If a man stand, or walk, or hide; if he lie down or get up; what two people sitting together whisper, king Varuna knows it; he is there as the third' (i. p. 41). They long for a site 'where life is free, where the worlds are radiant, there make me immortal.' But the Vedas yet fancifully play with the phenomena of nature. The dawn is a young bride, gold-coloured, daughter of the sky, mother of the cows (the mornings), leading the white and lovely steed (the sun). Sometimes their thoughts on the mystery of the universe clothe themselves in solemn words, as in the hymn which Mr. Colebrooke has translated:—

'Nor aught nor nought existed; yon bright sky
Was not, nor heaven's loved works outstretched above.
What covered all? What sheltered? What concealed?
Was it the water's fathomless abyss?
There was not death,—yet there was nought immortal;
There was no confine between day and night,
The only One breathed breathless by itself,
Other than it there nothing since has been.
Darkness there was, and all at first was veiled
In gloom profound, an ocean without light.
. . . . . .
Then first came Love upon it.'

The Vedic Aryans certainly had neither temples nor idols. Even now, in India, images of the deified elements are unworshipped, and, except images of the sun, they are never made. The personification of the divine attributes of creation, preservation, and regeneration, Brahma, Vishnu, and Siva, which are now almost exclusively recognised,

there is no reason, from the invocations addressed to them in common with the air, water, the seasons, the planets, to suppose that they were ever worshipped under visible types. Indeed, ministration to idols in temples is held by ancient authorities infamous. Menu repeatedly classes the priest of a temple with persons unfit to be admitted to private sacrifices, or to be associated with on any occasion; and, even yet, the priests who attend upon the images in public are considered as of a scarcely repntable order by all Hindus of learning and respectability. The worship of images is declared to be an act of inferior merit even by later authorities. It is almost certain, therefore, that the practice of worshipping idols in temples was not the religion of the Vedas. The dwelling-house of the honseholder was his temple; if qualified, he was his own priest; but as they more extensively engaged in secular avocations, it became almost universally the practice to retain a family priest. This is still the custom. Instead, however, of being a Brahman of learning and character, he is very commonly illiterate, and not always respectable. The office has also undergone an important modification. The family priest was formerly also the guru or spiritual adviser of the family. The priest now rarely discharges that function; he merely conducts the domestic rites; and the guru, to whom extravagant deference, such as is dne to deity alone, is paid, is very usually a member of some of the mendicant orders that have sprung up in comparatively modern times.

In 500 hymns translated by Professor Wilson, the following is the number of Sakta allotted to each, viz. Indra, 178; Agni, 147; Aswini, 28; Marut, 24; Varuna, 20; Mitra, 17; Ushas, 11; Vayu, 6; Surya or Savitri, 5; Rudra, 3; Vrihaspati, 2; Vishnu (none in the first Astaka), 2; and Saraswati, 1. In the Vedas, Rudra is the chief of the winds, collecting the clouds as a shepherd's dog does the sheep, and attending on his master Indra; but in the present day amongst the Hindus he is identified with Siva. In the Vedas, however, with the single exception of an epithet, 'Kapardi,' with braided hair, of doubtful significance, and applied also to another divinity, no other term applicable to Siva occurs, and there is not the slightest allusion to the form in which, for the last ten centnries at least, he seems to have been almost exclusively worshipped in India, that of the lingam, priapus, or phallus; neither is there the slightest hint of another important featnre of later Hinduism, the trimurti or triune combination of Brahma, Vishnu, and Siva, as typified by the mystical syllable O'm (a-u-m).

Indra and all the gods are everywherc represented as unable to perform any great exploit without the inspiration of the soma juice. 'Sit down, Indra,' says Viswamitra, 'on the sacred grass, and when thou hast drunk the soma, then, Indra, go home' (iii. p. 84). 'Drink, Indra, the soma that is effused for thy exhilaration,' sings rishi Bharadwaja; 'stop the friendly steeds, let them loose; sitting in our society, respond to our hymns' (iii. p. 454). 'Who buys this, my Indra, with ten milch kine? when he shall have slain (your) foes, then let (the purchaser) give him again to me' (iii. p. 107). 'The purifying soma, like the sea rolling its waves, has ponred forth songs, and hymns, and thought.' Such worship seems to explain the Greek story of Bacchus, and shows that it was not an invention merely to flatter Alexander.

Professor Max Muller says if we must have a general name for the earliest religion of the Vedic Indians, it would be neither monotheism nor polytheism, but only Henotheism, that is a belief in and worship of those single objects in which man first suspects the presence of the Invisible and the Infinite. This is unintelligible.

The Vedic, in common with other religions, was conservative, and the morality, the ethical conceptions, and social and political condition of the Aryans, moved in advance of the ideas in the earlier hymns. During the period embraced in the composition of the Vedas, Professor H. H. Wilson thinks (Rig Veda, i. 59, 65, i. xxiv.) 'it is inferable from some passages that human sacrifices were not unknown, although infrequent;' and the Satapatha Brahmana relates how men ceased to be the offered victims; first the horse, then other animals, and finally rice and barley and barley cakes, were snccessively substituted. The ninetieth hymn of the tenth book of the Rig Veda tells how all things were made out of the mangled limbs of Purusha (man). In the Purusha Sakta, a hymn of the Yajur Veda, the gods sacrifice Purusha. The Vedic conception of the creation of animal life is rude.

The Satapatha Brahmana discloses the wildest of cosmogonies,—how Purusha differentiated himself into husband and wife, and these into all forms of animal metamorphoses. There are two hymns in the Rig Veda describing the Aswa Medha rite, and which leave no doubt that in the early religion of the race, this sacrifice was had reconrse to as a burnt-offering to the gods. It was, even then, however, falling into disuse, and was existing as a relic of an anti-Vedic period, imported from some foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And, in still later times, the Aswa Medha consisted in certain ceremonies ending in the liberation of the horse, as throughout nearly all India is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of Siva or Vishnu or other Hindu god.

From the Vedas arc immediately deduced the practical arts of chirurgery and medicine, music and dancing; archery, which comprises the whole art of war; and architecture, under which the system of mechanical arts is included. Next in order to these are the six Vedanga or bodies of learning, three of which belong to grammar, one relates to religious ceremonies, a fifth to the whole compass of mathematics, and the sixth to the explanation of obscure words or phrases in the Vedas. Subordinate to these Anga (though the reason of the arrangement is not obvious) are the series of sacred poems, the body of law, and the six philosophical Shastra.—*As. Res.* iii., xvii.; *Oriental Linguistic Studies; Darwinism in Morals; Sonnerat's Voyages; Wilson's Hindu Sects; Calcutta Review*, No. 109; *Elphinstone's India*, p. 226; *Professor Muller, Lectures; Saturday Review*, 24th Feb. 1883; *Weber*, p. 12; *Archdeacon Pratt in Beng. As. Soc. Journ.* No. 1 of 1862.

VEDA-MATRI, mother of the Vedas, the Gayatri.

VEDAN, also styled Vedar, Veddah, Bedan,

Veddar, Beder, and Weden, a wild forest race in Malabar and the S. of India, engaged in hunting. Those of the Malabar forests are predial slaves, who cut timber, and do not cultivate. The Beder of Zorapur in the doab of the Kistna and Bhima are settled but predatory. There are many of the Beder race throughout Mysore, in parts of the Ceded Districts. Tipu Sultan employed them in his armies, and they followed in the wake of the Mahratta armies. It is from their name that the term Pindara was formed. See Veddah; Vettuvan.

VEDANGA, from Veda and Anga, the name of six Sanskrit books explanatory of the Veda, viz. Siksha or pronunciation, by Panini; Chandas or metre, by Pingala; Vyakarma or grammar, by Panini; Nirukta, a glossarial comment; Jyotisha or astronomy; Kalpa or Vedic ceremonial.

VEDANTA is a school of philosophy or psychology founded on scattered texts of the Vedas, and thence termed the 'Anta' or end or substance. The voice of Hindu antiquity ascribes the origin of the Vedantic system to the sage Badarayana, otherwise named Veda-Vyasa. The manner of his birth is thus described in one of the works attributed to him,—

'Of birth and death,
A multiplicity of souls is to be inferred.'

The germs of this philosophy, and even its principal doctrines, are, however, contained in the Brahmanas of the Vedas; then it is seen in a more complete form in the Sutras of Vyasa; and lastly, this philosophy is recorded in the great commentaries which eminent scholars have written upon the original authorities.

The Vedanta, Sankhya, Vaiseshika, Nyaya, and Yoga philosophers all appeal to the Upanishads in support of their tenets. The philosophy of Vyasa considers all existing beings and things to be an evolution of the deity.

Sankaracharya was the most distinguished expounder of Vyasa's theory, which he held with some modifications. As it inculcates the existence of one sole essence, it is often called the Adwaita or non-dual system. Ramanuja was one of its ablest antagonists. It would be difficult to find two sets of opinions more absolutely irreconcilable than Vedic hymns and Vedantic philosophy. The Sutra (aphorisms) or Brahma Sutra, the chief authorities of the pantheistic Vedanta school, though much later than the rest, are still mnemonics, as also is the Vaiseshika or Atomic school of Kanada.

The Vedanta system is the second great division of the Mimansa school of Hindu philosophy. It is chiefly engaged in the investigation of Brahm or the supreme spirit, and the relation in which the universe, and especially the human soul, stands to it; and, in contradistinction from the Purva-Mimansa or the investigation (Mimansa) of the former (Purva) part of the Vedas, viz. the Sanhita, and especially the Brahmanas, which contain the Dharma or religious law, it is called the Uttara-Mimansa, or the investigation of the latter (Uttara) part of the Vedas, viz. Aranyaka and Upanishad, which treat of (the neuter) Brahm or the supreme spirit (not to be confounded with [the masculine] Brahma or the god of the mythological Trimurti). Sometimes the name given to it is Sarira-ka-Mimansa, or the investigation of the soul. In its method, the Vedanta differs from the Nyaya by endeavouring to explain the universe as a successive development from one ultimate source or principle; whereas the Nyaya, in both its divisions, treats of the object of human knowledge, of which the universe is composed, under different topics, unconcerned about their mutual relation of effect and cause; and from the Sankhya it is distinct, inasmuch as that system is based on the assumption of a duality of principles, whence the universe derives its origin.

VEDANTA-SUTRA or Brahma-Sutra, aphorisms of Badarayana on the Vedanta philosophy.

VEDDAH, a wild, semi-savage race, about 400 in number, residing in the interior of Ceylon. The forest Veddah dwell in hollow trees or caves, subsist on game, which they kill with rudely formed bow and arrows, wandering from jungle to jungle as the game becomes scarce. Their language is said to be unintelligible to all others. The village Veddah dwell in certain districts, hold but slight intercourse with the other inhabitants of the island, and do not intermarry with them. They can make themselves understood to the Singhalese. Their sole clothing is a strip of cloth which is fastened by a coir cord passed round their loins. Their hair, beards, and whiskers are never shorn or cleansed, but hang down in matted masses. The forest Veddah are skilful in snaring the wild elephant. The two tribes do not intermarry, as they mutually distrust each other. They have their own headmen, whom they elect and obey. They use bows and arrows, and clubs of iron and wood. They occupy a district about 90 miles long and 45 broad in the south-eastern side of Ceylon, lying between the sea and the base of the Badulla and Oovah Hills. They are said to be a remnant of the Yakko, the aborigines of Ceylon, who, 2000 years ago, after the conquest of the island by Wijayo and his followers, returned into the wilds. Their language is a dialect of Singhalese, free from Sanskrit or Pali, but the vocabulary is very limited, and they have recourse to gestures and signs. They cover their dead with leaves in the jungle. Veddah is the Sanskrit Vyadha, a hunter.—*Davy's Ceylon.*

VEDI. SANSK. An altar, a seat for an image.

VEDYAVAN, 'the man of secrets of knowledge,' is the term used by way of reproach to the Buddhist and Jain sects, having the import of magician. Their opponents believe them to be possessed of supernatural skill, and it is recorded of the celebrated Amara, author of the Cosa or dictionary called after him, that he miraculously 'made the full moon appear on Amavus,' the ides of the month, when the planet is invisible.

VEERANROOSTY. The jangam religious mendicants, and those of the Veeranroosty caste, blow the chank shells as trumpets.

VEGETABLE-IVORY PALM (Phytelephas macrocarpa, *R. and P.*), of Central America and New Granada. It grows between the 9th degree of north and the 8th degree of south latitude, and the 70th and 79th of west longitude, and is found in narrow valleys and damp localities from the coast to 3000 feet above the sea. From the kernels or albumen of the fruit, turners fashion the knobs of walking-sticks, the reels of spindles, and little toys, which are whiter than animal ivory, and equally hard when dry, but soften when placed in water. The plant is supposed to belong to Endlicher's class Spadiciflora and Lindley's alliance Arales; but Martius regards it

as the type of a new natural order, and named it Phytelephanteæ, and is called the ivory palm.—*Seeman.*

VEGETABLE KINGDOM. This term is applied collectively to the various forms of plants, as the terms Animal Kingdom and Mineral Kingdom are applied to animals and minerals.

Extent.—Drs. Hooker and Thomson relate that all the main elements of the Indian flora exist in its surrounding countries, and that the families of plants peculiar to it are of very limited number. The Aurantiaceæ, Dipteraceæ, Balsamineæ, Ebenaceæ, Jasmineæ, and Cyrtandraceæ are the only orders which are largely developed in India, and sparingly elsewhere, and of these few contain one hundred Indian species. India contains representatives of every natural family on the globe, and it contains a more general and complete illustration of the genera of other parts of the world than any other country whatsoever. The Compositæ are, however, especially deficient, as also are the Gramineæ and Cyperaceæ in some regions, Leguminosæ, Labiatæ, and ferns in others; whilst Euphorbiaceæ and Scrophulariaceæ are universally present, and Orchideæ appear to form a larger proportion of the flora of India than of any equally extensive country. The total number of Indian species of plants were estimated by Drs. Hooker and Thomson at 12,000 to 15,000, but they are not generally diffused, and it is believed that no part of the whole area in India produces 2000 species of flowering plants in a radius of 10 miles. In the more humid jungles, many species may be gathered in an extensive area. In the dry arid tracts of Central India it would be difficult to collect 150 species in several miles. At 4000 to 5000 feet elevation in the Khassya, fifty species of Gramineæ and twenty to thirty species of Orchideæ have been collected in an 8 miles' walk. The mountains of India, when above 4000 or 5000 feet, present a temperate vegetation, which becomes wholly temperate at greater elevations, and passes into an alpine flora over a large extent of still loftier mountain country. In the humid parts of tropical India, as in the impenetrable green jungles of the equable and rainy Malay Peninsula, of Eastern Bengal, the west coast of the Madras Presidency, and of Ceylon, the flora contrast strongly with the drier parts of the intertropical zone, and still more so with the loosely timbered districts of Central India and of the base of the Western Himalaya. The drier tropical forests of India are much modified in luxuriance and extension by the winter cold in those extra-tropical latitudes over which they spread; hence many tropical genera and families, as most palms, Cycas, Dipterocarpeæ (except Vatica), Aurantiaceæ, Connaraceæ, Meliaceæ, Myrtaceæ, Rubiaceæ, Ebenaceæ, and many more, which are sensitive to cold, are comparatively local when found beyond the tropics; others which are indifferent to the cold of winter, as are many Leguminosæ (viz. Bauhinia, Acacia, Erythrina, Butea, Dalbergia, and Milletia), Bombax, Vatica, Nauclea, Combretaceæ, Verbenaceæ, Lagerstræmia, Grislea, Jasmineæ, and Bignonia Indica, are indifferent to the cold of winter, provided they experience a great summer heat; and they advance far beyond the tropics, and lend a more or less tropical aspect to the flora even of the base of the North-Western Himalaya in lat. 35° N. On the other hand, the perennially humid forests are uniformly characterized by the prevalence of ferns; and at elevations below 5000 to 7000 feet, by the immense number of epiphytal Orchideæ, Orontiaceæ, and Scitamineæ. They contain a far greater amount of species than the drier forests, and are further characterized by Zingiberaceæ, Xyrideæ, palms, Pandaneæ, Dracæna, Piper, Chloranthus, Urticaceæ (especially Artocarpeæ, and Fici), Araliaceæ, Apocyneæ, shrubby Rubiaceæ, Aurantiaceæ, Garciniaceæ, Anonaceæ, nutmegs, and Dipterocarpeæ. Besides species of the Gramineæ and Cyperaceæ, a vast number of annual plants vegetate only during the hot rainy season, and, neither exposed to drought or cold, the small Leguminosæ and Scrophularinæ occur amongst Sida, Corchorus, Nama, Blumea, and other Compositæ, some Labiatæ (as Leucas, Anisomeles, etc.), Amarantaceæ, Acanthaceæ, Convolvulaceæ, Ludwigia, Jussieua, etc. And these tropical annuals and perennial-rooted plants with annual stems, are not confined to the plains, but ascend the loftier mountain valleys as far as the well-marked rainy season extends, and only disappear where the accession of heat and humidity is not sufficient in amount, or regular enough in period, to stimulate their vegetative organs. Among the most remarkable of these extra-tropical examples of tropical genera are species of Bignonia, Osbeckia, Argostemma, Plectranthus, various Cyrtandraceæ, Scitaceæ, Araceæ, Commelynaceæ, and a few epiphytical Orchideæ. And during the cold months only, in the extra-tropical regions of India, numerous genera and species of annual plants of the north temperate zone flower when the tropical plants are torpid.

Besides the chenna, wheat, barley, and more rarely oats, with various kinds of pulse, which form the winter crops of the Gangetic plain of Central India, of Berar, of the Central Dekhan, of Mysore, and Coimbatore, there are of wild plants, Ranunculus sceleratus and R. muricatus, Capsella bursa-pastoris, Selene conica, Alsine media, Arenaria serpyllifolia, Euphorbia heleoscopia, Medicago lupulina and M. denticulata, Lathyrus aphaca, Gnaphalea, Xanthium, Veronica agrestis and V. anagallis, Heliotropium Europeum, various Polygona, Juncus bufonius, Butomus umbellatus, Alisma plantago, and very many Cyperaceæ, Gramineæ, and such aquatics as Myriophyllum, Potamogeton natans and P. crispus, Vallisneria, Zannichellia, Ranunculus aquatilis, Lemna, and many others.

In the regions at the base of the mountains in the perennially humid provinces of India, from the atmosphere being more loaded with moisture, the climate is more equable than that of the adjacent plains, and a warm temperate flora, unknown to the plains, commences at elevations of 2000 to 3000 feet, and prevails over the purely tropical vegetation which appears amongst it in scattered trees and shrubs. Amongst other orders may be mentioned Magnoliaceæ, Ternstrœmiaceæ, sub-tropical Rosaceæ (as Prunus, Photinia, etc.), Kadsura, Sphærostema, Rhododendron, Vaccinium, Ilex, Styrax, Symplocos, Olea, Sapotaceæ, Lauraceæ, Podocarpus, Pinus longifolia, with many mountain forms of truly tropical families, as palms, Pandanus, Musa, Clusiaceæ, vines, Vernonia, and hosts of others.

In the *Himalaya*, the truly temperate vegetation supersedes the sub-tropical above 4000 to 6000 feet; and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, longitude, humidity, and many local circumstances. In Ceylon and the Madras Peninsula, where mountains attain 9000 feet, and where considerable tracts are elevated above 6000 to 8000 feet, snow has never been known to fall. On the Khassya mountain, which attains 7000 feet, and where a great extent of surface is above 5000 feet, snow seems to be unknown. In Sikkim, snow annually falls at about 6000 feet elevation; in Nepal, at 5000 feet; in Kamaon and Garhwal, at 4000; and in the extreme West Himalaya lower still. In the mountains of Ceylon, on the Neilgherries, and on the Khassya Hills, the temperate forms of plants are more numerous than upon the Himalaya. Violent winds sweep over the broad, grassy, undulating tops of the Khassya Hills, and hundreds of species common to the Sikkim Himalaya and to the Khassya ascend higher in the warm forest-clad and sheltered Himalayan valleys at 5000 to 7000 feet in Sikkim than they do in the Khassya Hills. In the Himalaya, the genera Rhododendron, Monotropa, Pedicularis, Corydalis, Nepeta, Carex, Spiræa, Primula, Cerasus, Lonicera, Viburnum, and Saussurea, attain their maximum of development over all other parts of the world. Ephedra ranges from the plains of the Panjab up to 16,000 feet in the N.W. Himalaya; the genus Marlea ascends from 3000 to 8000 feet in Sikkim, and in the Western Panjab, at scarce 4000 feet, accompanies Celtis and a species of ash; sub-tropical Myrsine extend into Afghanistan. Juniperus excelsa, found as low as 5000 feet in Afghanistan, ascends to 15,000 feet in Tibet. Populus Euphratica, a Cynanchum, Chloris barbata, Cyperus aristatus, are tropical and sub-tropical plants which ascend to 11,000 feet in Ladakh, and Peganum harmala attains to 9000 feet. The alpine or arctic flora, on the alpine region of the Himalaya, commences above the limit of trees throughout a great part of the Himalaya, and hardly reaches its extreme limit at 18,500 feet (3½ miles) of elevation. It has a comparative paucity of cryptogamic plants, is poor in the luxuriant mosses of tall growth and succulent habit, and, though fully representing the flora of the polar regions, it partakes in its characteristic genera of the temperate flora, and contains so many types foreign to the flora of the polar regions (as Gentiana, Ephedra, Valerianeæ, Corydalis), and some which are even rare in Siberia, that it must rather be considered as a continuation of the alpine flora of Europe than a representation of that of the arctic zone.

The bulk of the flora of the perennially humid regions of India, as of the whole Malayan Peninsula, the Upper Assam valley, the Khassya mountains, the forests at the base of the Himalaya from the Brahmaputra to Nepal, of the Malabar coast, and of Ceylon, are of one type, which includes a very large proportion of the Indian genera.

The floras of the frontier provinces of India are identical with those of the countries which surround them, and there is even a decided affinity between the floras of areas separated by oceans, deserts, or mountain chains, which present many natural characters in common, for which neither migration nor climate will account.

Of the flora of Australia, Pittosporum and Scævola are found all over India and Africa; and of two species of Stylidium, one extends to Midnapur in the Gangetic delta, and one in the Malay Peninsula, along with several genera of Myrtaceæ (Leptospermum, Bœkia, Metrosideros), and the genus Tristania, which advances to Moulmein, in lat. 17° N. Also the Casuarina grows wild up to Ramree, Helicia in the Malay Peninsula, and the Lagenophora of N. Zealand and Australia has a representative in the Khassya and Ceylon. Many species of tropical plants of the Neilgherry and Khassya Hills, of Ceylon, and of the Himalaya, are identical with Javanese mountain plants. Gaultheria nummularia is found in the N.W. Himalaya, through the whole range into the Khassya, and also on the Javanese mountains 3000 miles distant. The Sedgwickia cerasifolia of Griffith (Liquidamber altingia of Blume), also the curious Cardiopteris lobata, several oaks and chesnuts, Antidesma, a willow, and Myrica, are common to the Khassya and Java; and Marlea is spread into China, throughout the Himalaya, and to the mountains south of Kashmir.

Amongst the Indian flora are many temperate genera and species which are common to N. America west of the Rocky Mountains, besides many tropical species that are also Malayan and West Polynesian.

The *Chinese* type is abundant in the temperate regions of the Himalaya, is fully developed in the Khassya, in Sikkim, and Butan, and extends westward to Garhwal and Kamaon. Chinese and Japanese species of Aucuba, Helvingia, Stachyurus, Enkianthus, Abelia, Skimmia, Bucklandia, Adamia, Benthamia, Corylopsis; and of those common to India and China are Microptelea parvifolia, a species of elm, Hamamelis Chinensis, Nymphæa pygmæa, and Vaccinium bracteatum, all of the Khassya; Quercus serrata of China, Nepal, Sikkim, and the Khassya; while species of Illicium occur in the Khassya, Thea in Assam, and Magnolia in Sikkim and Khassya, with species of Camellia, Deutzia, Hydrangea, Viburnum, several Corneæ and Houttuynia. Schizandreæ are peculiarly characteristic of the Chinese flora, but also extend into Java. Lardizabaleæ belong to the Himalaya, Japan, and China. The fern Bowringia is found in Hong-Kong and in the Khassya; and the genera Daphne, Bucklandia, Enkianthus, Henslowia, Scepa, Antidesma, Benthamia, Goughia, Myrica, and others are both Chinese and Indian. Euryale ferox is abundant in China, in the delta of the Ganges, and in Kashmir; and Nepenthes phyllamphora is a native of the Khassya, of Macao, and of the Louisiade Archipelago.

The *Siberian* type of plants is very fully represented in the upper and alpine regions of the Himalaya, and is most confined to the drier parts of the chain, but may be observed even in the most humid regions of the Himalaya, and occasionally on the mountains of tropical India. It approaches in many respects to the south European vegetation, but is characterized by the predominance of Fumariaceæ, Potentillæ, Leguminosæ (especially Hedysarum and Astragaleæ), of Umbelliferæ, Lonicera, Artemisia, Pedicularis,

and Borragineæ, and by the rarity or total absence of the European Cistaceæ, Rosa, Rubus, Trifolium, Erica, ferns, and other cryptogams. Artemisia and Astragalus of the Siberian type are abundant throughout Tibet and the interior Himalaya, are represented by a few species in the plains of the Panjab and on the Khassya mountains. Spiræa Kamtschatika, Chamædrifolia, and Sorbifolia, and Paris polyphylla are alike Siberian and Himalayan forms, while Corydalis Siberica and Nymphæa pumila are identical in Siberia and on the Khassya Hills.

European.—222 British species have been ascertained to extend into India, and a multitude of mountain plants, many of them the most conspicuous in Europe, range from the coasts of the Levant and the Black Sea to the Himalaya. This is the more remarkable, as the Himalaya range is, in idea rather than really, connected with the mountains south of the Caspian, or with the Caucasian Alps, or those of Asia Minor, for the mountain mass of Asia sinks to the westward of Afghanistan, rising again only in isolated peaks. The Corylus colurna (C. lacera, *Wall.*) ranges from the Levant and the Black Sea to the Himalaya. Quercus ilex, Ulmus campestris, Celtis Australis and orientalis, extend from Spain to the N.W. Himalaya; but the walnut, ivy, juniper, yew extend from Europe through the Himalaya, across Chiua, through Mexico, and throughout N. America, The yew, the juniper, Aquilegia vulgaris, Calla palustris, etc., are common to most parts of Europe, N. Asia, the Himalaya, and N. America. The Mediterranean flora, Celtis, Quercus ilex, Olea Europea, Myrtus communis, etc., are also Himalayan plants. The European plants, however, rapidly disappear to the east of Kamaon, but there is a blending of the European flora on the east of the Himalayan chain; as to the eastwards, there is a mixture of Chiuese and Malayan forms with that of the Himalaya.

Many *North African* or *Arabian* forms, such as Peganum, Harmala, Fagonia cretica, Balanites Ægyptiaca, Acacia Arabica, Alhaji, Grangea, Calotropis, Salvadora Persica, extend through the drier parts of India; and others, Cleome, Balsamodendron, Astragalus hamatus, Cucumis colocynthis, Berthelotia, Anticharis Arabica, etc., have a less extensive range, and there is a striking resemblance between the vegetation of tropical Africa and tropical Asia.

Zones.—In descending from Darjeeling, the zones of vegetation are well marked. At a little below 7000 feet, or between 6000 and 7000, by (1) the oak, chesnut, and magnolia. (2) Immediately below 6500, the tree-fern appears (Alsophila gigantea, *Wall.*), a widely-distributed plant, common to the Himalaya from Nepal eastward to the Malay Peninsula, Java, and Ceylon. Of this Dr. Hooker saw but one species in the mountains; a very similar, or possibly distinct species, grows at the foot of the outer range. (3) Palms, a species of Calamus, the rencul of the Lepchas. The fruit of all the Calami are eaten by the Lepchas, and the stems of larger species applied to various economic purposes. This, though not a very large species, climbs lofty trees, and extends some 40 yards through the forest; 6500 feet is the upper limit of palms in the Sikkim Himalaya, and one species alone attains so great an elevation. Four other Calami range between 1000 and 6000 feet on the outer hills, some of which are found 40 miles distant from the plains. Among the other palms of Sikkim is the Simong, a species of Caryota, which is rare, and ascends to nearly 6000 feet. Firing the forest is so easy in the drier months of the year, that a good deal of cultivation is met with on the spurs at and below 5000 feet, the level most affected by the Lepchas, Limbu, and Sikkim Bhoteas. The mountain slopes are so steep, that these spurs, or little shelves, are the only sites for habitations between the very rare flats on the river banks and the mountain ridges, above 6000 feet, beyond which elevation cultivation is rarely if ever carried by the natives of Sikkim. The varieties of grain are different, but as many as 8 or 10 kinds are grown without irrigation by the Lepchas, and the produce is described as very good (80-fold). Much of this success is due to the great dampness of the climate; were it not for this, the culture of the grain would probably be abandoned by the Lepchas, who never remain for more than three seasons on one spot. A large bamboo (Pao, LEPCHA) is the prevailing plant near the base of these valleys; it attains a height of 40 to 60 feet, and the culms average in thickness the human thigh; it is unarmed, deep-green or purplish, and used for large water-vessels. Besides this there are nearly a dozen kinds of bamboo known to the Lepchas, and all have been pointed out. A timber of the Himalaya, universally adopted for ploughshares and other purposes requiring a hard wood, is the Singbrang-kun of the Lepchas, which ascends 4000 feet on the mountains. In very dry soils it is replaced by sal (Vatica robusta), and more rarely by the Pinus longifolia. Sterculiæ, of two species, are common, as Pæderia fœtida, which, as well as many Cucurbitaceæ, peppers, Gnetum, Porana, a few Convolvulaceæ, and many Asclepioideæ, Hoya, etc., climb high. A troublesome dipterous insect swarms on the banks of the streams; it is very small, floating like a speck before the eye. The bite of this (the Peepsa) leaves a small spot of extravasated blood under the cuticle, very irritating if not opened. A white-flowered rue, Ruta albiflora, is sometimes cultivated, and very common; truly wild at elevations of 3000 to 7000 feet; it is commonly used for all diseases of fowls, mixed with their food. Two species of bamboo, Payong and Praong of the Lepchas, here replace the Pao of the foot of the hills. The former flower abundantly, the culms, 20 feet high, being wholly a diffuse panicle of inflorescence. The Praong bears a round head of flowers at the apex of the leafy branches.

Timbers.—A thousand feet above Punkabari in the Outer Himalaya, the prevalent timber is gigantic, and scaled by climbing Leguminosæ, as the Bauhinia and Robinia, which sometimes sheath the trunks or span the forest with huge cables joining tree to tree. Their trunks are also clothed with parasitical orchids, and still more beautifully with Pothos (Scindapsus), peppers, Gnetum, vines, convolvulus, and Bignoniæ. The beauty of the drapery of the Pothos leaves is pre-eminent, whether for the graceful folds the foliage assumes, or for the liveliness of its colour.

From one steppe, the ascent to Punkabari is sudden and steep, and accompanied with a change in soil and vegetation. The mica-slate and clay-

slate protrude everywhere, the former full of garnets. A giant forest replaces the stunted and bushy timber of the Terai proper; of which the Duabanga and species of Terminalia form the prevailing trees, with Cedrela and the Gordonia Wallichii. Smaller timber and shrubs are innumerable; a succulent character pervades the bushes and herbs, occasioned by the prevalence of Urticaceæ. Large bamboos rather crest the hills than court the deeper shade; and of the latter there is abundance, for the torrents cut a straight, deep, and steep course down the hill flanks; the gulleys they traverse are choked with vegetation, and bridged by fallen trees, whose trunks are richly clothed with Dendrobium Pierardi and other epiphytical orchids, with pendulous Lycopodia, and many ferns, Hoya, Scitamineæ, and similar types of the hottest and dampest climates. The forest is truly magnificent along the steep mountain sides. The proportion of deciduous trees is considerable, partly probably due to the abundance of the Dillenia, Cassia, and Sterculia, whose copious fruit is all the more conspicuous from the leafless condition of the plant. The white or lilac blossoms of the convolvulus, like Thunbergia and other Acanthaceæ, were the predominant features of the shrubby vegetation, and very handsome. All around, the hills rise steeply 5000 or 6000 feet, clothed in a dense deep-green dripping forest. Torrents rush down the slopes, their position indicated by the dipping of the forest into their beds, or the occasional cloud of spray rising above some more boisterous part of their course.

Trade.—British India is largely independent of all other countries for its supplies from the vegetable kingdom.

'The Indian nut alone
Is clothing, meat, and trencher, drink and can,
Boat, cable, sail, and needle, all in one.'

But its imports are also considerable; in 1882-83, as under:—

Imports.		Exports.	
Canes, rattans,	Rs. 2,46,476	Caoutchouc,	Rs. 12,59,165
Caoutchouc,	2,11,010	Coffee,	1,39,22,040
Coffee,	7,52,563	Coir,	14,20,884
Coir,	86,139	Cotton,	16,05,00,268
Corks,	2,35,797	Cotton goods,	2,57,20,616
Cotton, raw,	9,80,199	Drugs,	12,51,206
Cotton goods,	24,81,00,625	Dyes and colouring materials,	4,16,14,273
Drugs,	39,16,367	Fruits and vegetables,	2,80,222

—*Dr. Hooker; Hooker and Thomson; A. R. Wallace.*

VEGETABLE MARROW.

Squash gourd, . . Eng. | Suppara roomro, . Hind.

This very delicate vegetable of the gourd species is the Cucurbita ovifera, *Linn.* The crooked-necked variety, when about six inches long, is well flavoured, but soon gets hard and stringy. The pear-shaped is the best of any, but must be dressed when young. Propagation only by seed, and the plants should never be removed, but remain where sown, only thinning the weakly ones. The soil should be a rich loam, the same as for cucumbers. Train the plant on sticks. It is often necessary to fertilize the female blossoms, by approaching the anthers of the male flower when charged with pollen.—*Riddell.*

VEGETABLES OF INDIA.

Abelmoschus esculentus.
Achyranthes aspera.
Ærua lanata.
Æschynomene aspera.
Agati grandiflora.
Allium ascalonicum.

Vitis quadrangularis.
Webera tetrandra.
Zizyphus jujuba.

The Chinese raise a great abundance of vegetables, and their range in the vegetable kingdom is extended beyond that of the people of Europe, perhaps only equalled by the races occupying Burma and Cambodia. A process of preserving vegetables by desiccating them, has been successful. While the moisture is completely abstracted, the other matters are left perfectly untouched and unaffected. Apart from the power of being able to put upon the table at any season, and at a moment's notice, any vegetable that may be desired, it affects largely the utilization of much waste fruit and vegetables, and affords a new means of keeping our armies and navies supplied with a very necessary portion of their commissariat.

The following list shows the time needed for the ordinary plants to come to maturity :—

	Days.		Days.
Mustard,	10 to 12	Onions,	60 to 90
Cress,	,,	Maize,	90 to 105
French bean,	45	Spinage,	40
Double bean,	50	Lagenaria vulgaris,	60 to 90
Scarlet runner,	50 to 75	Cyamopsis psoraloides,	150 to 180
Amarantus tristis,	45 to 60	Sorrel,	42 to 60
A. oleraceus,	,,	Parpoo kiri (Portulaca ?)	42 to 56
A. campestris,	,,	Fenugreek,	42
Egg plant,	90	Soi kiri, TAM. ?	42
Momordica charantia,	60 to 90	Sakotti kiri, TAM. ?	42 to 60
Luffa acutangula,	90 to 105	Turnips,	90
Roselle,	150	Cucumber,	60
Snake gourd,	90 to 135	Water melon,	90 to 120
Radish,	42	Musk melon,	,,
Lettuce,	35 to 42		

VEGETABLE TALLOW is obtained from the China tallow tree or Stillingia sebifera. It has flowered and seeded at Amritsar and Lahore.—*Powell, Handbook*, i. p. 423.

VEGETABLE WAX is obtainable at Shanghai in China, in the northern parts of which and in Japan the plant is indigenous. From its high melting point and other physical characteristics, it has of late attracted a good deal of attention. It is admirably suited as a material for the manufacture of candles.

In India, in the middle of the 19th century, Mr. Loarer manufactured from castor-oil a solid oil, to which he gave this name, competing successfully, as regards cost, with the cheapest oil or fat now employed in England. It was thought that his process of converting the oil into wax, by enabling the ryot to store the solid substance far more easily than the seed or fluid oil, would lead to the oil being expressed from the seed whilst clear and free from impurities.—*Simmonds' Commercial Products*, p. 540. See Wax.

VEHAR LAKE, in Salsette Island, about 15 miles from Bombay, is an artificial reservoir formed to provide the town of Bombay with drinking water. The quantity of water supplied by the reservoir is about 8,000,000 gallons a day, or between 12 and 13 gallons a head for the population of Bombay.—*Imp. Gaz.*

VEIL. In the Koran, women are enjoined to be concealed. The Muhammadan women of Western Asia, Northern Africa, and Turkey in Europe appear abroad with veils (Burqa) so constructed as to conceal the lower part of the face. Their sisters in British India are almost all confined to their homes; the few of humble rank who appear abroad have no covering on their faces. The veil of the Hindu women is nothing more than the garment brought over the face, which is always very carefully used by the higher classes of women when they appear in the street.

VELAIYA TESIKAR was born at Kanjipuram, but studied under the head of the Mantam of Sindupunturai in Tinnevelly. He wrote the following works:—Nallur Puranam, Virasingkatanar Puranam, Ishdalingka Kaittala Malai, Namasivaya Lilai, Kirushna Saritiraparisata Lilai, and Mayilattiraddai Malai. The Kalatti Puranam, commenced by his brothers Siva Pirakasa and Karumai Pirakasa, was also completed by him. He died at Perumatur.

VELLALA or Vellazhar, Vellaler or Vellan. Amongst the Tamil races who have adopted Brahmanism, the Vellala, alike in numbers and in social rank, take the chief place. They are very largely agricultural, and in the northern part of the Tamil country take the honorific appellation of Mudali or first man, which seems to be from the same root as the word Mandal, the village headman of Bengal. In the southern districts they adopt that of Pillai. Their number in the Madras Presidency in 1881 was 1,770,669. The designation Vellala means charitable, and they claim to be Vaisya of the Bhu-vansa or agricultural section. They believe that they came from the north. They are shorter and darker than Brahmans, darker even than the Teling people; but they have, in general, well-formed countenances and graceful forms, though amongst them also occur the decidedly African lip and nose and forehead of which Mr. Logan makes mention. Under the native Tamil government this race alone was allowed to hold land in Tonda Mandalam. The Vellaler are, to the present day, said to be of foreign origin. They are called the Ganga Kula, and are said to have come to the country on the invitation of Adondai of Tanjore, after overthrowing the Kurumbar, and to supply the deficient population of Tuluva-desam (modern Canara). A broken tribe of this name are said to wander about in the jungles of the Puducottah estate. They are scantily clothed, and subsist on the produce of the jungles. Srivigundam town in the Tinnevelly district, in lat. 8° 38′ 20″ N., and long. 77° 57′ 20″ E., has a fort occupied by Natha Kothi Vellalers, a caste of Sudras who have peculiar customs. There is also a fine temple. The Vellala of Ceylon are chiefly in the low country.

VELLAR or Vasishthanadi river, in the Peninsula, formed by the streams of the Tinunda and Kalrayan Hills in Salem district. It flows through the Attur pass into the plain of South Arcot, and across the latter district into the sea at Porto Novo. Total length about 135 miles. Since 1870 the Vellar or Pelandorai anicut, in the South Arcot district, has been built across the Vellar river for the irrigation of the fifty villages in the Chellumbrum taluk.

VELLORE, a town and military cantonment in the Carnatic, on the right bank of the Palar, in lat. 12° 55′ 17″ N., and long. 79° 10′ 17″ E., 70 miles W. from Madras, and 695 feet above

the sea. It is known to the people as Rai Ellur or Stony Ellore, to distinguish it from Ellore on the sea-coast, which they name Uppu Ellur or Salt Ellore. It has a strongly-built fortress, which is overlooked by hills in the vicinity. It seems to have been built about the beginning of the 16th century by the Vijayanagar rulers, but in 1646 it fell to the four confederate Muhammadan kings, and in 1677 it and Ginji were captured by Sivaji. During the war of 1782 it was relieved by Sir Eyre Coote in the face of Hyder's army. After the fall of Seringapatam, the family of Tipu, consisting of 12 sons and 8 daughters, were located in Vellore. On the 10th July 1806, the sepoys of the garrison, incited by Tipu's descendants, mutinied and massacred most of the officers and European soldiers, but were subdued by Colonel Gillespie with a party of the 19th Dragoons from Arcot, 18 miles distant, and a remnant of the Europeans saved, after which all the family of Tipu were removed to Bengal. The Palar river runs about half a mile from the fort. Besides its imposing and picturesque fortress, which contains many interesting buildings, Vellore possesses a handsome Vishnuvite temple with some good carving.

VELMA, Ailma, Yelmi, or Velama, in the Northern Teling country, are a dominant agricultural tribe with military proclivities, who claim to be Rajputs, and of descent from the rajas of Warangal. They take the title of Rayadu. They are soldiers and agriculturists, brave and high spirited, and on points of honour will sacrifice themselves. In 1881 they numbered 348,063.

VELVET INSECT, the Bir-buti of the Hindus, about the size of the nail of the little finger. It appears in the rains, is of a bright red colour, and has a soft unctuous feel. An oil is extracted from the unctuous bodies, which is used as a vesicating agent and counter-irritant.

VEMANA, a Telugu author of a large collection of popular aphorisms and moral subjects, whom Dr. Caldwell supposes lived at the beginning of the 18th century.

VENCATES, a name of the idol of Balaji at Triputty, near Madras. The idol is also called Venkatramma Govinda, also Vencatachella, and Venkat Eswara. The god of Tripatty was brought into notice by Ramanuja Charya as an incarnation of Vishnu; and since then the names have been favourites amongst the Teling Hindus.

VENDIDAD, the book containing the religious code of the Parsee Zoroastrians. It has undergone three various processes of composition, of the Avesta, Zend, and Pa-zend. The Avesta is of very ancient date, and is the groundwork of the existing Vendidad, though all of it almost is post-Zertushtrian. In the course of time, several explanations and interpretations of the laws have been made, which acquired as much force as the original, and were incorporated with it. This is the Zend, and the incorporation of further explanations was styled the Pa-zend. Avesta means direct higher knowledge, divine revelation. Zend means the explanation of this, and Pa-zend the supplements to the Zend, or further explanation of the Zend doctrine. All the three steps exist in the present Zendavesta, or more properly Avesta-Zend. In recent years, the researches of Chevalier Bunsen and Professors H. H. Wilson and Max Muller and Mr. Wheeler seem to prove that much of the earlier history of two branches of the Aryan race are embodied in the Vendidad of the ancient Persians and present Parsees, and in the Vedas of the Hindus. According to Dr. Haug, the opening to the Vendidad, or Code of the Fire-worshippers of Iran, dates from the most ancient times, and its contents are the reminiscences of the passage of the old Aryans into India on the south and into Persia on the south-west. According to Ch. Bunsen, the Aryan emigration from Sogd to Bactria took place prior to B.C. 5000, consequently before the time of Menes; the immigrations into the Indus country about B.C. 4000; and the opening to the Vendidad describes the succession of the foundation of the fourteen kingdoms, the last and most southern of which was the land of the Five Rivers (the Panjab). Also, according to that writer, in the same way that political tradition represents that of the western aborigines, so does the Aryan one represent that of the eastern tribes in the primeval land. The vast climatic change which took place in the northern countries is attributed in the Bible to the action of water. In the other, the sudden freezing up of rivers is the cause assigned. Both may have resulted from the same cause, the upheaving of the land by volcanic action, elevating portions and depressing into basins such as the Caspian Sea. Ten months of winter is now the climate of Western Tibet, Pamir, and Belur at the present day, and corresponds with that of the Altai country, and the district east of the Kouen Lun, the paradise of the Chinese. The country at the sources of the Oxus and Jaxartes, therefore, is supposed to be the most eastern and most northern point whence the Aryans came. Wherever the Indians may have fixed the dwelling-places of their northern ancestors, the Uttarukuru, we cannot, he considers, venture to place the primeval seats of the Aryans anywhere but on the slopes of the Belur Tagh, in the high land of Pamir, between lat. 37° and 40° N., and long. 86° and 90° E. On this western slope of the Belur Tagh and the Mustagh (the Tian Shan or Celestial Mountains of the Chinese), the Haroberezaiti (Albordsh) is likewise to be looked for, which is invoked in the Zendavesta as the principal mountain and the primeval source of the waters. At the present day, the old indigenous inhabitants of that district, and generally those of Kashgar, Yarkand, Khoten, Turfan, and the adjacent highlands, are Tajak, who speak Persian, and who are all agriculturists. The Turkoman either came after them and settled at a later period, or else they are aborigines whom the Aryans found there. On this point Chevalier Bunsen likewise remarks that the opening of the sacred code of the Vendidad as certainly contains an historical tradition of the Aryans, as does the 14th chapter of Genesis an historical account of the oldest recorded war between Mesopotamia and Canaan. The Fargard is divided into two great parts, one comprising the immigration from the eastern and north-eastern primeval countries to Bactria, in consequence of a natural catastrophe and climatic changes, the other the subsequent extension of the Aryan dominions through Eastern Central Asia, which terminated in the Panjab. The following passage contains

a genuine description of the climate of the primeval land of the Aryans, Iran proper: —'There Ingromaniyus (Ahriman), the deadly, created a mighty serpent, and snow, the work of Deva; ten months of winter are there, two of summer.' The following passage, which is omitted in the Huzuresh or Pehlavi translation, and which Lassen considers an interpolation, is irreconcilable with the above :—'The warm weather lasts seven months, and winter five.' The fathers of the Aryans, therefore, originally inhabited Iran proper, the land of pleasantness, and they left it only in consequence of a convulsion of nature, by which a great alteration in the climate was caused. They did not follow the course of the Oxus, or they would have come in the first instance to Bactria, and not to Sogd. Their course, therefore, was more northerly. Its present climate is precisely what the record describes it to have been when the changes produced by the above commotion took place. It has only two months of warm weather. In the course of the Aryans after their expulsion from the primeval country between Sogdiana and the Sutlej, they formed, by the conquest of fourteen countries, as many kingdoms in the whole of the eastern part of Central Asia and India proper, in the country of the Indus and its confluents. In the intervening countries they passed amongst the Turanians (Scythians and Turkomans), and there is evidence that the inhabitants whom they found in India were likewise Turanians. The main direction of these travellers was southerly, and on the southern bank of the Caspian is a group the nucleus of the Aryan Media. Under the heading Aryan will be seen Professor Muller's list of the successive settlements of the race.—*Wheeler's History of India; Professor Muller's Lectures; Calcutta Review*, 1859; *Edinburgh Review; Bunsen's Egypt*, iii. iv.

VENERIDÆ, a family of molluscs of the class Conchifera, of the following genera:—

Venus, rec. 176 sp.; fossil, 260 sp.
? Volupia rugosa, fossil.
Saxidomus Nuttali, rec. 8 sp.
Cytheræa, syn. Meretrix, 80 sp. Dione, rec. 113 sp.; fossil, 80 sp.
Meroe, syn. Cuneus, Sunetta, rec. 11 sp.
Trigona, rec. 28 sp.; also fossil.
Sub-genus. Grateloupia, fossil, 4 sp.
Artemis, syn. Dosinia, rec. 85 sp.; fossil, 8 sp.
Sub-genera. Cyclina, rec. 10 sp.; fossil, 1 sp.
Clementia, rec. 3 sp.
Lucinopsis, syn. Dosinia, Mysia, Cyclina, rec. 10 sp.; fossil, 3 sp.
Tapes, syn, Paphia, Pullastra, rec. 78 sp.; also 6 fossil.
Venerupis, syn. Gastrana, rec. 19 sp.; also fossil.
Petricola, syn. Rupellaria, Choristodon, Naranio, rec. 30 sp.; fossil, 12 sp.
Glaucomya, syn. Glauconome, rec. 12 sp.

VENGI, the ancient name of Southern Telingana, the capital of which was situated 5 miles N.N.W. from Ellore on the road to Nagpur. Two modern villages have been built on the rivers, and called Pedda Vegi and Chinna Vegi. Buddhist princes reigned at Dara Nagara near Amaravati and at Vengipuram in Vengi-desam.

VENICE, capital of Venetia, now an important section of the kingdom of Italy, is built on 72 islands on piles in the midst of a salt lagoon or shallow lake. It is divided into two unequal parts by the Canalazzo, or Grand Canal, the course of which through the city follows the form of an inverted S; is 300 feet wide, crossed near the middle of its course by the Ponte di Rialto, a splendid marble structure of one spacious arch. In the midst of the labyrinth of canals and streets there are several large piazzas, nearly all of which are adorned with fine churches or palaces. The principal of these is the Piazza di San Marco, a large oblong area 562 feet by 232, surrounded by elegant buildings, and containing at its eastern extremity the metropolitan church of San Marco, a singular but brilliant combination of the Gothic and the oriental style of architecture. Before the discovery of the Cape of Good Hope by the Portuguese in 1486, Venice was one of the most powerful commercial and maritime states in Europe. The people of Venice had opened a trade route to India down the river Euphrates. Venetian merchants sailed from Venice to Tripoli, thence their goods were carried in caravans to Aleppo, which was a famous mart, whose reputation even Shakespeare did not fail to notice. From Aleppo the caravans made their way to Bir, on the banks of the Euphrates. Here the merchandise was transferred to boats, and conveyed down the river to a point near Baghdad on the Tigris. Baghdad being reached, the merchandise was then transferred to boats on the Tigris, and carried down to Bussora and the island of Ormuz in the Persian Gulf. In those days Ormuz was the greatest emporium in the east. There all the velvets, cloths, and manufactures of the west were exchanged for the spices, drugs, and precious stones of the east. The wealth acquired by the merchants of Venice in their trade with the east excited the envy of the whole of Europe. The Portuguese especially spared no expense in their endeavours to discover a new route to India, and, after nearly a century of the most indomitable exertions, they in the latter part of the 15th century found their way to Calicut by way of the Cape. The Indian trade of those days was revolutionized. In a very short time the trade routes by the Red Sea and the Euphrates were completely forgotten, and the cheapest and shortest route between Europe and India was the high sea; but, after making use of the sea route for 500 years, the route followed by the ships of king Solomon and Hiram, king of Tyre, is again found to be the best, and the great ships of the Peninsular Company make Venice their final port.

Venice was founded about A.D. 452 by those who fled from before Attila the Hun. So early as A.D. 525, it was importing silks from the east; and from A.D. 802 dates her great trade in eastern spices, drugs, and silks. Both Genoa and Venice co-operated in the Crusades, and both suffered by the capture of Constantinople by the Ottoman Turks, A.D. 1453; and Venice yet further in consequence of the annexation of Syria and Egypt to the Ottoman empire by Selim, A.D. 1516-17. When Venice, A.D. 1475-87, acquired possession of Cyprus, Famagusta became the emporium of its overland trade with the east, both through Egypt and Syria, and continued to be the first commercial city of the Levant, until taken by the Turks, A.D. 1570-71.

VENI SANHARA, the binding of the braid, a drama by Bhatta Narayana. The plot is taken from the Mahabharata, and relates how Draupadi was dragged by the hair of her head by Duh-

sasana into the hall of the Kaurava; she left it unbraided till the death of the Kaurava.—*Dowson.*

VENKATAGIRI, town and ancient zamindari estate in Nellore district, Madras. The town (lat. 13° 57′ 7″ N., and long. 79° 37′ 20″ E.) contained, in 1871, 7524 inhabitants. The estate pays to Government a pesh-kash or permanent revenue of £40,400.—*Imp. Gaz.*

VENKULLY, a town near Quilon. Its cliffs, about midway between Quilon and Trevandrum, are immediately on the sea-beach, and rise almost perpendicularly to 80 and 180 feet, capped by 25 to 40 feet of laterite. Immediately below the laterite are variegated sands 40 to 60 feet in thickness; and below all, generally at the base of the small cliffs, are the lignite and carbonaceous deposits. Where the cliffs rise to 130 or 160 feet, two, three, or more deposits of lignite occur. At Quilon, layers of lignite shell lie immediately above the shell limestone.

VENTILAGO ACALYCULATA, a native of the northern parts of India.

VENTILAGO MADERASPATANA. *Gært.*
Funis viminalis, *Rumph.*

Ruktupita, . .	Beng.	Surati pette-tige, .	Tel.
Erra chiratali, . .	Tel.	Suralatige, Surugudu,	,,

Grows throughout the E. Indies and Archipelago. The fishermen of Amboyna use the long climbing stems as substitutes for ropes. It is a very large climbing shrub, a native of forests and other uncultivated places amongst the mountains, flowering during the cold season.—*Roxb.*

VENUS, supposed to be from Vana, Sansk., the fair one, but the etymology of the word is also given from Banu or Benn of Eastern Asia; Hebrew, Benoth; Syrian, Benos; and the Greek and Latin forming Venus. Venus is the analogue of Bhawani. Venus in Sanskrit is also called Asphujit (Αφροδιτη); Maghabhava, son of Magha; Shodasansa, having 16 rays; and Sweta, the white.

In Assyria and Babylonia, Baaltis was the analogue of Venus, an active and independent power; Istar was the goddess of love and war, the patroness of the moon; and the planet Venus, the equal, and sometimes the rival of the male deities.

In the temple of Venus at Cyprus, the presiding divinity was placed in the porch, as in a kind of shrine or enclosure. The second book of Kings (xvii. 30), when recounting the idolatrous practices of the people transported by the Assyrian monarch into the Samaritan cities, observes that the 'men of Babylon made Succoth-Benoth,' which is literally rendered by Parkhurst, the tabernacle of the daughters, or the young women. Calmet, however, supposes that we are to understand Benoth as denoting a female idol, the Benos of the Syrians, and the Venus of the Greeks and Latins. The heathen strangers there made booths or tents in honour of the deity whom they worshipped, and representations of pavilions consecrated to Venus may be seen on many ancient medals. These tents of Venus, the Succoth-Benoth of the Babylonians, the tabernacle of Moloch, and the silver shrines of Diana, mutually illustrate each other. The procession of idols was of frequent occurrence in antiquity. The gods were carried in chariots, niches, or miniature temples, analogous to the shrines of the Ephesian idols. The image being in a small temple of wood, gilt, was carried out the day before to another building. Among the Egyptians, the shrine of Jupiter was annually transported over the river (Nile) into Libya, and after some days returned, as if the god himself were come from Ethiopia. The sacred procession of idols was also common among the Gauls, who, according to Sulpitius Severus, carried their gods into the fields, protected from the profanation of vulgar eyes by a white veil. Examples of the portable shrine are common in Russia, and in all the countries of the Greek Church. The ιερα of the Greeks, says Dr. Clarke, as well as the tabernacles of the eastern nations, were sometimes not only portable, but they were so small, that the κιστοφοροι used for enclosing them could also be carried. The idols of the Hindus are generally kept in the interior of temples, but during festivals the idol is placed in a car with or without wheels, or in a palanquin, and is carried out dressed up with all the jewellery of the temple, preceded by the deva-dasa and the Brahmans. When outside the temple, the worshippers burn camphor and present cocoanuts as offerings, and the dancing girls sing and dance before the god, and the Brahmans chant passages from the Puranas. If at night, fireworks are also exhibited. Some of the cars or rath are of great size, with large wheels. The village gods at stated periods are carried round the village boundaries. The Venus of the Hindus is Rati.—*Milner's Seven Churches of Asia*, p. 132.

VENUS FLOWER BASKET, a siliceous sponge of the Philippines, is the Enplectella aspergillum. Euplectella cucumer, *Owen*, occurs in the Comoro Islands, in E. Africa; Japan has the glass-rope sponge, Hyalonema Sieboldii; Rossella Philippinensis is a sponge of Cebu Island, Philippines; lace-work sponge of Cebu is the Meyerina claviformis; Geodia Japonica is the great vase-shaped sponge of S. Japan.

VERAJENDERPET, situated on the road leading to Cannanore from Mercara, 20 miles from the latter place. There is a cross-road from Mysore, which joins the road to Cannanore a few miles below Verajenderpet, and along this road passes all the direct traffic between Mysore and the coast.

VERAPOLI, a town in Travancore State, Madras, in lat. 10° 4′ N., and long. 76° 19′ 20″ E., 9 miles north-east of Cochin; the seat of a Carmelite mission and of the Vicar-Apostolic.—*Imp. Gaz.*

VERATRUM NIGRUM, Li-lu, Chin., black hellebore, takes its name from the dark colour of its roots. The flowers are mostly white, dark-purple, and green. It is cultivated in a rich garden soil by seed, or dividing the roots, which contain powerful medicinal properties.—*Riddell.*

VERBASCUM THAPSUS. *Linn.*

V. Indicum, *Wall.*		Vular, . . .	Kangra.
Ghidar, Phasruk,	Chenab.	Spin kharnar,	Trans-Ind.

This plant grows in Europe, in the Caucasus, Siberia, and in the Himalaya, up to 11,000 feet, a white-flowered variety occasionally occurring at the higher elevations. It is eaten by camels, goats, etc. In Bissahir the root is given as medicine.—*Roxb.; Voigt.*

VERBENACEÆ, *Juss.*, a useful order of plants in the East Indies, comprising the vervain tribe, consist of 19 genera, 153 species,—40 Clerodendron, 1 Ægiphyla, 14 Callicarpa, 36 Premna, 26 Vitex, 8 Congea, 1 Symphorema, 8 Gmelina, 2 Tectona, 1 Phryma, 1 Streptium, 3 Verbena, 1 Stachytarpheta, 2 Zapania, 5 Lantana, 1 Asaphes,

1 Glossocarya, 1 Hymenopyramis, 1 Avicennia. Of the genus Verbena, several exotics are cultivated; these are pretty little flowering plants which require shelter and good drainage. Species of the genera Clerodendron, Callicarpa, Premna, Vitex, and Gmelina furnish useful products.—*Jaffrey.*

VERBENA OFFICINALIS, common vervain, grows throughout Europe, America, Persia, and the Himalaya. It is the holy herb of Dioscorides, who ascribed great powers to it, especially in incantations. In most countries where it grows it seems to have been invested with extraordinary powers. It entered into the composition of various charms and love philters, and has even now a popular reputation for predisposing persons favourably towards those who administer a dose to them. This plant is described as astringent, febrifuge, etc., but has fallen into just neglect. Still among the ancient Greeks and Gauls it held the highest place in popular estimation; it was used to purify the altars, and formed the crowns of heralds and ambassadors. The Druids gathered it with the same marks of veneration as the misletoe, next to which it was revered. Formerly employed extensively as a medicine, it was also the base of numerous philters or love potions, and hence derived its name of Veneris vena, or source of love. It is well known for its strong aromatic lemon scent. It grows from cuttings or layers, and no doubt would also from seed, as it blossoms freely.

VERBENA TRIPHYLLA. *Leher.*

Aloysia citriodora.	Lemon-scented verbena.
Pila-bhungara, . DUKH.	Lemon-scented vervain.

This plant is a native of Chili. An infusion when cold is administered as a cooling drink in fevers, slight catarrhs, etc.

VERBESINA PROSTRATA. Bhangra, HIND. A small creeping plant growing in wet soil. A white variety is much used in medicine. Alchemists believe there is a black-flowered species, and eagerly search for it.—*Eng. Cyc.; Riddell; O'Sh.*

VERDDHAMANA, Mahavira, the 24th Tirthankara of the Jains; one of the four eternal Jinas, born in Behar.—*As. Res.* pp. 282, 292.

VERDIGRIS. ENG. Subacetate of copper.

Subacetate of copper, of a beautiful bluish-green colour, extensively used by painters and in dyeing.—*Ainslie; Rohde, MSS.; Faulkner; M'C.*

VERDITER, a blue pigment, made by decomposing a solution of sulphate of copper with the addition of chalk.

VERJUICE.

Verjus, ...	FR.	Agresto, ...	IT.
Agrest, ...	GER.	Agraz, ...	SP.

A kind of harsh vinegar, made of the expressed juice of the wild apple or crab. The term is also applied to the expressed juice of unripe grapes.—*Faulkner.*

VERMICELLI. ENG., FR., IT.

Fen-sze, Yin-sze, .	CHIN.	Save, ...	HIND.
Lock-soy, . . .	,,	Tagliolini, ...	IT.
Meelneepen, Proppen,	DUT.	Alterias, ...	SP.
Nudeln, ...	GER.	Seme, Saywian,	TAM., TEL.

Vermicelli or vermichelly is an Italian composition of various edible articles, reduced to a paste, and formed into slender worm-like pieces, from whence its name. The simian of India is made from wheaten flour. The Chinese make coarse kinds of vermicelli from rice flour, and they are used by both natives and foreigners in making soups. The Yin-sze or silver threads are vermicelli made from wheaten dough, drawn out on a frame and dried in the sun.

Lock-soy also is a kind of vermicelli prepared from rice at Cochin-China, and thence exported in considerable quantity to Japan and China, where it is much esteemed. It is transparent, and gives a consistence to soup. Chinese lock-soy is opaque, and less esteemed.

The natives of India usually prepare Saywian vermicelli between the hands instead of using a press. Saywian-ka-takhta, a board for making Saywian on. Vermicelli is also prepared by being run through sieve holes into hot water.—*Morrison's Comp. Des.; M'Cull.*

VERMILION.

Yin-chu, ...	CHIN.	Sulphide of mercury,	ENG.
Tsze-fen-shwang, .	,,	Red sulphuret of	,, ,,
Vermilioen, . . .	DUT.	Cinnabar, .	ENG., GER.

This substance is mentioned in Jeremiah xxii. 14, and Ezekiel xxiii. 14. In China this beautiful pigment is made by mixing together two catties of red sulphur and one catty of mercury, and subliming the mixture. The crystalline sublimate on the cover of the alembic is called cinnabar, whilst that on the sides is the vermilion. These bright red or dark orange acicular crystals are carefully powdered, levigated, decanted, and dried upon tiles, and then sifted, sorted, and packed in glazed black paper in quantities of about an ounce. The more patiently and thoroughly the vermilion is ground, the more beautiful is the red colour. The article is regularly exported to England, in boxes of some 50 catties, selling at an advance of some 25 per cent. upon the current cost of mercury. Foh-kien vermilion is the best, but it is made in other Chinese towns. It is often adulterated with minium or oxide of lead, and with sesquioxide of iron. Large quantities are used for colouring candles, and paper for stamping and writing purposes, and in the making of varnishes.—*Smith, Mat. Med.*

VERNAG, in Kashmir, is the source of the river Jhelum. It is a sheet of water, the reflections of which are from azure to turquoise and emerald.

VERNICIA MONTANA, *Lour.* (Elæococca montana), a tree of Cochin-China and China, yields a clear yellowish-coloured fatty oil.

VERNONIA ANTHELMINTICA. *Willd.*

Serratula anthelmintica, *R.*	Baccharoides anth. *Mœnch*
Conyza anthel., *Linn.*	Ascaridia Indica, *Juss.*

Chata koksun, . . Beng. | Sira-shengalnir, . Tam.
Kak-jangi, . . . Hind. | Nedsitu, ... ,,
Saha-devi, . . . ,, | Gariti kamma,. . Tel.
Puvanku runal, Maleal.

This annual plant grows in the Peninsula and in Bengal. Its seeds are used in medicine, and said to be a powerful anthelmintic. All the parts of the plant are very bitter, used as a diaphoretic in fever, and its ground seeds are used to destroy vermin in the hair. Dr. Wight gives V. conyzoides, multiflora, Neilgherrensis, pectiniformis, salviæfolia, and Wightiana, to which Voigt adds V. aspera, multiflora, vagans, and volkameriæfolia. — *Roxb.; Voigt; Waring; Ainslie; Powell, Handbook; Useful Plants; O'Sh.; Birdwood.*

VERNONIA VOLKAMERIÆFOLIA. *D.C.* This good-sized tree occurs on the South Travancore ghats, at about 3000 to 4000 feet elevation (Attraymallay Ghat), but has not been found on the Neilgherries, or anywhere north of the Palghat gap; but if it be the volkameriæfolia of D.C. (and Colonel Beddome's specimens were named at Kew), it also occurs in Nepal. Its timber is soft and worthless. It is the only compositæ known to Colonel Beddome in the Madras Presidency which grows to a tree, except Monosis; but Vernonia Javanica, a considerable tree, occurs in Ceylon, and is probably also found in S. Tinnevelly or Travancore.—*Beddome, Fl. Sylv.*

VERSOVA, a basaltic island, one of the numerous islands which fringe the Bombay Archipelago. It is in lat. 19° 7′ 40″ N., and long. 72° 47′ E., and now desolate; about 7 miles north of Mehim, north of Bombay.—*Findlay.*

VESADÆ or Bisadæ or Besadæ are alluded to in the tract of Palladius de moribus Brachmanorum, written about A.D. 400, and the same name is applied by Ptolemy to a similar race inhabiting Northern India.

VESPA MAGNIFICA. *Sm.* This enormous hornet, nearly two inches long, was brought to Dr. Hooker at Choongtam in Sikkim alive, in a cleft stick, lolling out its great thorn-like sting, from which drops of a milky poison distilled. Its sting is said to produce fatal fevers in men and cattle, which may very well be the case, judging from that of a smaller kind, which left great pain in his hand for two days, while a feeling of numbness remained in the arm for several weeks. It is called Vok by the Lepcha race, the common name for any bee. Its larvæ are said to be greedily eaten, as are those of various allied insects.—*Hooker, Him. Jour.* ii. p. 26.

VESPERTILIONIDÆ, the bat family of mammals, which may be thus shown:

Sub-Fam. Scotophilinæ.

Scotophilus serotinus, *Jerdon.*
Vespertilio noctula, *Geoff.* | V. serotinus, *Schr.*
Europe, Himalaya, Tyne Range beyond Mussoori.
S. Leisleri, *Jerdon.*
Vespertilio dasycarpus, *Blyth*, hairy-armed bat, Tyne Range, Himalaya.
S. pachyomas, *Jerdon*, the thick-muzzled bat of India.
S. Coromandelianus, *Jerd.* (Kerivoula Sykesii, *Gray, Ell.*), the Coromandel bat of all India.
S. lobatus, *Jerd.* (Vespertilio abramus, *Temm.*), the lobe-eared bat of India.
S. fuliginosus, *Jerd.* (Nycticejus atratus, *Blyth*), the smoky bat of Nepal.
S. fulvidus, *Ell.*, Tenasserim.
S. pumiloides, China.
Noctulinia noctula, *Gray.*
Vespertilio lasiopterus, *Sch.* | V. altivolans, *White.*
V. labiata, *Hodg., Blyth.*
The noctule bat of England, Nepal; flies high.
Nycticejus Heathii, *Horsf., Bl.*, large yellow bat, Southern and Central India.
N. luteus, *Blyth* (N. flaveolus, *Horsf.*), Bengal yellow bat, all India, Assam, Burma.
N. Temminckii, *Jerd.*
Vespertilio belangeri, *Geoff.* | V. noctulinus, *Is. Geoff.*
Common yellow bat of India, Burma, Malayana.
N. castaneus, *Gr., Bly.*, chesnut bat of Bengal, Burma, Malayana.
N. atratus, *Blyth* (Scotophilus fuliginosus, *Bly.*), sombre bat of Darjeeling.
N. canus, *Blyth* (Scotophilus Maderaspatanus, *Gray*), hoary bat of all India.
N. ornatus, *Blyth*, harlequin bat of Darjeeling.
N. nivicolus, *Hod., Hors.*, near the snows of Sikkim.

Sub-Fam. Vespertilioninæ.

Lasiurus Pearsoni, *Horsf., Bl.* (Noctulinia lasiura, *Hodgson*), the hairy-winged bat of Darjeeling.
Murina suillus, *Jerd.*
N. lasiura, *Hodg.* | L. Pearsoni, *Bl.*
The pig bat of Darjeeling, Malayana.
M. formosa, *Jerd.*, the beautiful bat.
Vespertilio, *Hodg.* | Nycticejus Tickelli, *Blyth.*
Kerivoula, *Gray.* | N. Isabellinus, *Horsf.*
Central India, Nepal, Sikkim, Darjeeling.
Kerivoula picta, *Jerd.* (Vespertilio kerivoula, *Bodd.*), all India, Burma, Malayana.
K. pallida, *Blyth*, the pale-painted bat of Chybassa.
K. papillosa, *Jerd.*, the papillose bat of Ceylon, Calcutta, Java, Sumatra.
K. tenuis? *Tomes* (Vespertilio tenuis), Java, Sumatra.
K. Hardwickii, *Tomes* (Vespertilio Hardwickii), Java, Sumatra.
Vespertilio caliginosus, *Tomes*, mustachoed bat of India.

VESPIDÆ, a family of insects belonging to the order Hymenoptera. It comprises the species of the genus Vespa of Linnæus, of which the common wasp and the hornet are familiar examples. They were formed into a family by Latreille, under the name of Diploptera, afterwards changed into Diplopteryga by Kirby. They form the third and last division of the first sub-section (Prædones) of the second section (Aculeata) of Hymenoptera in Westwood's revision of Latreille's arrangement. When at rest they fold their wings throughout their entire length, whence their distinctive appellation. The wings of all the insects of the family have a similar neuration, their eyes are lunate, and there are glands at the extremity of the labrum. The four wings have one marginal and three perfect submarginal cells, with an incomplete terminal submarginal cell. Among the wasps are insects of the most dissimilar habits; some solitary, others living in societies, some phytophagous, others carnivorous. Such as are social rival the bees in the complicated instincts which regulate their societies. Among the wasps, structure, and not economy, is the real source of essential character. Each species of the solitary wasps comprises males and females only, and constitutes the family Eumenidæ. The genera Eumenes and Odynerus belong to it. The habits of the solitary wasps are interesting. Odynerus murarius (Vespa muraria) of Linnæus makes a hole several inches deep in the sand, or in the sides of walls, constructing a tube of earthy paste, at first straight, and then curved at its entrance. In this burrow it constructs its cell, and deposits in the cavity of the interior cell from eight to

twelve little green caterpillars, arranging them spirally in layers above each other. In the midst of these it deposits its eggs, then closes the mouth of the hole with the materials of the tube, which it had used as a sort of scaffold. The larvæ when hatched feed upon the caterpillars. The social wasps constitute the restricted family of Vespidæ of Westwood, the Polistides of Saint Fargeau. They live in numerous societies, consisting of males, females, and neuters, which are temporary, being dissolved at the approach of winter. The mandibles of the Vespidæ proper are not longer than broad, and broadly and obliquely truncated at their extremities.—*Eng. Cyc.*

VESYA. Tel. The third of the three great sections of the Hindus, their third cast or caste. There are four castes,—the Brahman, the Chetria or Kshatriya, the Vaisya, and the Sudra. The pure Vaisya occupies himself in commerce and other peaceful avocations.

VETAKIRI MUDALIAR was born in 1795. He established a press in Madras, and published editions of several classical works. Besides four ethical poems, Manuniti Satakam, Manuvikkiyana Patakam, Niti Sintamani, and Sanniarkkassaram, he prepared the addendum to the Jaffna Tamil Dictionary, and composed the additions to the 11th part of the Nikandu, printed at Manepy in 1843.

VETAL, the demon-god of the non-Aryan races. Outside almost every Hindu village in the Dekhan is a circle of large stones, sacred to Vetal. Vetala, a goblin that haunts cemeteries and animates dead bodies. Vetala-Deva, king of the demons.—*As. Res.* ix. p. 120.

VETALA-PANCHAVINSATI. Sansk. The twenty-five stories of the Vetala, by Jambhala-datta. It is the Hindi Baital-Pachisi, and has been translated into all the languages of India.

VETUSTA or Betusta, the Jhelum or Hydaspes, one of the sacred rivers invoked by a Brahman when saying his daily prayers.

VETUVAR, a forest and hunter tribe in Malabar and Konkan. They are predial slaves. A subdivision of the Vetuvar is employed in agriculture, also as boatmen and salt-makers.

VI. Sansk. A privative term, as Viragi, without desire; the a privative of Latin.

VIBHISHANA, brother of Ravana, who sided with Rama, and was therefore seated on his brother's throne.

VIBHUTI, also Vibudi. Tam. The sacred ashes of burnt cow-dung with which the Hindu Saiva sect besmear their forehead, and sometimes their whole body. See Tripundra.

VIBURNUM, a genus of plants belonging to the natural order Loniceraceæ. The species consist of shrubs with opposite petiolate leaves and corymbose flowers. Drs. Wight and Voigt name 12 species. V. cotinifolium, *D. Don*, and V. fœtens, plants of Kaghan and the Himalaya.—*Stewart.*

VIBURNUM OPULUS. *Lindley.*

Siueh-k'iu, . . . Chin. | Snowball, . . . Eng.
Guelder rose, . . Eng. |

This ornamental shrub, called snowball, grows also in China, where its leaves are used as a purgative.

VIBURNUM PUNCTATUM, *Ham. in Don. Prod.* p. 142, the Viburnum aeuminatum of Wallich, W. A. Prod. p. 386, is a middle-sized or small tree, very common in many of the sub-alpine and alpine jungles from no great elevation up to 6000 feet; it is also found on the Himalayas and in Java.—*Beddome, Fl. Sylv.*

VIBURNUM STELLIONUM. *Rich.*

Aklu, Guch, Kuch, Kagh. | Thalin . . of Kotghar.

V. cotinifolium, V. fœtens, and V. stellionum form the underwood of forests in the N.W. Himalayan valleys. The wood is used chiefly for fuel. The berries of both V. fœtens and V. cotinifolium are edible. — *Mr. Powell; Cleghorn; Stewart.*

VICHITRA-VIRYA, son of Santanu, raja of Hastinapur, married Amba and Ambalika, daughters of the raja of Kasi, but he died without children. His widows were taken by his half-brother Vyasa, and were the mothers of Dhritarashtra and Pandu. Vyasa also begat Vidura out of a slave girl of Ambika. Dhritarashtra, Pandu, and Vidura were thus half-brothers.

Arrian gives the story thus: 'He (Hercules) had a daughter when he was advanced in years, and, being unable to find a husband worthy of her, he married her himself, that he might supply the throne of India with monarchs. Her name was Pandea, and he caused the whole province in which she was born to receive its name from her.' This, says Tod, is the very legend contained in the Purana of Vyasa (who was Heri-cul-es, or chief of the race of Heri), and his spiritual daughter Pandea, from whom sprang the grand race of the Pandu, and from whom Dehli and its dependencies were designated the Pandu sovereignty. Her issue ruled for 31 generations in direct descent, or from B.C. 1120 to 610, when the military minister, connected by blood, was chosen by the chiefs, who rebelled against the last Pandu king, represented as 'neglectful of all the cares of government,' and whose deposition and death introduced a new dynasty. Two other dynasties succeeded in like manner by the usurpation of these military ministers, until Vikramaditya, when the Pandu sovereignty and era of Yudishtra were both overturned. According to a writer in the Westminster Review, Vichitra-virya died childless, and Vyasa begot two sons by his two widows, and a third son by a slave girl, whom the third widow, Ambika, substituted for herself. This practice of a relative raising children for a deceased childless relative is sanctioned by Menu, who says: 'On failure of issue by the husband, the desired offspring may be procreated either by his brother or some other near relative, called Sapinda, on the wife, who had been duly authorized.' Pandu also, when lamenting his childlessness, says to Pritha, 'In distress men desire a son from the oldest brother-in-law.' Menu, regarding the choice of a husband, enjoins parents to select a handsome son-in-law; and adds, 'Three years let a damsel wait, though she be marriageable, but after that term let her choose for herself a husband of equal rank.' Another mode of ancient Hindu marriage was the Swayamvara or self-choice, where a girl chose her own husband. In the Mahabharata, the cases of Pandu with Pritha, Yudishtra with Devika, Sahadeva with Vijaya, Sivi and Devaki, Nala and Damayanti, Draupadi and Arjuna, are mentioned. Menu describes eight modes of marriage, viz. Brahma, Deva, Arsha, Prajapatya, Asura, Gandharva, Rakshasa, and the eighth and worst, Paisacha; the first six for a

Brahman, the four last for a warrior, and the same four, the Rakshasa excepted, for the third and fourth class.—*West. Rev.*, April 1868; *Prinsep by Thomas; Tod's Rajasthan*, i. p. 31.

VICIA, a genus of plants belonging to the natural order Fabaceæ. The species are usually climbing herbs with abruptly pinnate leaves, with many pairs of leaflets. About fifteen species are known.—*Riddell; Hogg.*

VICIA FABA. *Linn.* Faba vulgaris, *Mænch.*

Ful, ... Egypt.	Faba græca, . . . Lat.
Garden bean, . . Eng.	Faba major, . . . ,,
Bakla-kabli, . . . Hind.	Faba minor, . . . ,,

This plant, a native of the environs of the Caspian Sea, is cultivated in Iudia. Its flowers are large white, striped and dotted with black.

VICIA SATIVA, common vetch.

Luh-tau, ... Chin. | Akra, Ankra, . Hind.

Grows in fields under spring crops, creeping round the stalks of the young plants and checking their growth.

VICTORIA CROSS, a decoration established by the Queen-Empress Victoria for conspicuous gallantry in the field.

VICTORIA REGIA, one of the Nymphæaceæ, a beautiful water-lily of S. America, Guiana, and Brazil, is now to be found in many parts of India. It was first successfully raised in the garden at Calcutta from seed sent by Dr. Wallich from England on the 9th of September 1851. It was received and sown in the garden on the 6th of November following, where it lay in a dormant state until the 23d of April 1853. On the 13th of May, same year, the seedling had made a healthy growth, and was transferred on that date to the mound prepared for it.

In Guiana and Brazil, the leaves have been observed in deep water to measure 12 feet across; the expanded flowers are about one foot in diameter. The seeds are eaten by the Indians.

It was discovered by the botanist Hænke in 1801, was noticed at Corrientes by Bonpland in 1820, and again by M. D'Orbigny in 1827. Its seeds, mais del agua, are roasted like maize. Sir R. H. Schomburgh found it on his ascent of the Berbice river in British Guiana in 1837; but it was not successfully introduced into cultivation until 1849, after various fruitless attempts.

VIDDHAGAHA MADHAVA, a seven-act drama by Rupa. Viddha-salabhanjika, the Statue, a comedy of domestic intrigue by Raja Sekhara, probably earlier than the 10th century.

VID'HARBHA, an ancient territory, always identified with Berar, but the limits of the province included the adjoining district of Beder, in which the name of Vid'harbha or Bidcrbha is traceable. Local traditions also assert that the ancient capital, still called Beder, is the same as Vid'harbha.—*Hind. Th.* ii. p. 11.

VIDVAN-MODA TARANGINI, or Fountain of Pleasure, a philosophical work by Rama Deva.

VIDYA. Sansk. Learning. The Hindus have eighteen Vidya of true knowledge, or sciences, and some branches of knowledge, falsely so called. The first four are the Vedas, which are entitled in one compound word, Rigyajush-samat'harva, or, in separate words, Rig, Yajur, Sama, and At'harvana. The Rig Veda consists of five sections, the Yajur Veda of eighty-six, the Sama Veda of a thousand, and the At'harvana Veda of nine, with eleven hundred shac'ha or branches, in various divisions and subdivisions. The Vedas, in truth, are infinite, but were reduced by Vyasa to this number and order. The principal part of them is that which explains the duties of man in a methodical arrangement; and in the fourth is a system of divine ordinances.

From these are deduced the four Upa Veda (Upa Veda, Upanga, Upuran, are terms which infer a work deduced, respectively, from its principal; up, like to sub, implies inferiority), namely, Ayush, Gandharva, Dhanush, and Sthapatya. The first of these, the Ayur Veda, was delivered to mankind by Brahma, Indra, Dhanwantari, and five other deities, and comprises the theory of medicine, with the practical methods of curing diseases. The second, the Gandharva, treats of music, was invented and explained by Bharata; it is chiefly useful in raising the mind by devotion to the felicity of the divine nature. Dhanush, the third Upa Veda, composed by Viswamitra, was on the fabrication and use of arms and implements handled in war by the tribe of Kshatriya. Viswakarma revealed the fourth, in various treatises on sixty-four mechanical arts, for the improvement of such as exercise them. Six Anga, or bodi of learning, are also derived from the same source; their subjects chiefly are—1. of the pronunciation of vocal sounds; 2. detail of religious acts and ceremonies; 3. grammar; 4. prosody; 5. astronomy; 6. on the signification of difficult words and phrases in the Vedas. Lastly, there are four Upanga, called Purana, Nyaya, Mimansa, and Dharmashastra. Eighteen Purana (that of Brahma and the rest) were composed by Vyasa for the instruction and entertainment of mankind in general. Nyaya is a collection of treatises, in two parts, on metaphysics, logic, philosophy, etc. Mimansa is somewhat similar, divided into two parts; the latter, called Uttara, abounding in questions on the divine nature and other sublime speculations, was composed by Vyasa in four chapters and sixteen sections. It may be considered as the source of all the Anga; it exposes the heretical opinions of sophists, and, in a manner suited to the comprehension of adepts, it treats on the true nature of Ganesa, Bhaskara or the sun, Nilakanta, Lakshmi, and other forms of one divine being. The body of the law, called Smruti, consists of eighteen books, etc. etc., delivered for the instruction of the human species by Menu and other sacred personages. As to ethics, the Vedas contain all that relates to the duties of kings; the Puranas, what belong to the relation of husband and wife; and the duties of friendship and society (which complete the triple division) are taught succinctly in both. This double division of Anga and Upanga may be considered as denoting the double benefit arising from them in theory and practice. The Bharata and Ramayana, which are both epic poems, comprise the most valuable part of ancient history. Sanchya is two-fold, that with Iswara and that without Iswara, called Patanjala and Kapita: the latter, in six chapters, on the production of all things by the union of Prakriti, or nature, and Purusha, or the first male, etc. These books contain infinite contradictions. The Mimansa is in two parts, the Nyaya in two, and Sanchya in two; and these six schools comprehend all the doctrines of the theists. Lastly appears a work

written by Buddha; and there are also six atheistical systems of philosophy, entitled Yogachara, Sidhanta, Waibhashica, Madhyamica, Digambara, and Charvaka, all full of indeterminate phrases, errors in sense, confusion between distinct qualities, incomprehensible notions, opinions not duly weighed, tenets destructive of natural equality, containing a jumble of atheism and ethics; distributed, like all orthodox books, into a number of sections, which omit what ought to be expressed, and express what ought to be omitted; abounding in false propositions, idle propositions, and impertinent propositions. The Vedas consist of three Kanda, or general heads, namely, Carma, Gnyana, Upashasana, or Works, Faith, and Worship, to the first of which the author of the Vidyadesa, or View of Learning, a rare Sanskrit book, wisely gives the preference; as Menu himself prefers universal benevolence to the ceremonies of religion.—*Cal. Review; Wilford; As. Res.* ii. p. 302.

VIDYA-DHARA, with other names in Hindu mythology, inferior deities dwelling beneath the earth and sky; generally benevolent.—*Dowson.*

VIGHNESWARA, Siva Mahadeva's elder son; his image is often standing in the temples of the Gramma-devata or village deities, and is called Ganesa.

VIGNE, G. T., a traveller who wrote on Persia, India, Kashmir, the Panjab, Kābul, Ladakh, and Afghanistan; Personal Narrative of a Visit to Ghazni, Kābul, and Afghanistan, and of a Residence at the Court of Dost Muhammad, 1840; Travels in Kashmir, Ladakh, Iskardo, the Countries adjoining the Mountain Course of the Indus, and the Himalaya, north of the Panjab, 1842.

VIHARA. The Buddhist vihara or monasteries are of two kinds:—1st, Cave vihara, of which several magnificent specimens have been described by Mr. Fergusson; and 2d, Structural vihara, of which some specimens still remain at Sanchi, but in a very ruinous condition.

The vihara or monastery caves of the first class consist of—(1) natural caverns, or caves slightly improved by art; these are the most ancient, and are found appropriated to religious purposes in Behar and Cuttack; next (2) a verandah opening behind into cells for the abode of monks, as in Cuttack and in the oldest vihara at Ajunta; the third (3) has an enlarged hall supported on pillars. The most splendid of these caves are those of Ajunta, though the Dherwara at Ellora is also fine, and there are some good specimens at Salsette and Junnar. The word vihara is supposed by some to be the source of the name Behar. Bihar or Vihar, the Sanskrit term for monastery, occurs in Unao in the province of Oudh, and again in Partabgarh in the same province. Vihara are also called Bhikshu griha. Vihara were for the accommodation of Buddhist bhikhshus or mendicant monks living together in communities. The earliest form seems to have been one or more griha or cells with a verandah (padasala) or porch. Groups of caves are often called Lenas. There was usually a permanent spring or a cistern cut in the rock, beside or under the cell. In former times this term was applied differently from now. Hiwen Thsang named the great tower at Buddha Gya a vihara, and the Mahawanso applies the term indiscriminately to temples and residences. Modern writers restrict it to monasteries of the Buddhists. —*Ferg. and Burg. Cave Temples.*

VIJAYA or Vyjya, a Buddhist prince from Kalinga who made a successful expedition to Ceylon, B.C. 483. His title is taken from the Sanskrit word written similarly, meaning conquest. A system of caste was introduced by king Vijaya amongst the Ceylon Buddhists, which still prevails there, though directly opposed to Buddhist doctrines, and not existing in any similar form in other Buddhist countries.

Vijaya, one of the warders of Vishnu's palace.

Vijaya, the ever-victorious tree produced from the churning of the ocean.—*Fergusson.*

VIJIANAGAR, called also Vidyanagara, is the modern Bijanagar, in Bellary district, Madras, lat. 15° 18′ N., long. 76° 30′ E.; population (1871), 437. It is in ruins, on the right bank of the Tumbudra. The proper name of this village is Humpi, but Vijianagar was the name of the dynasty and the kingdom which had its capita here. The dynasty claimed descent from the Yadava race, and they seem to have founded it in the 14th century, about S.S. 1258 or A.D. 1336, after the overthrow of the kingdom of Warangal by the Muhammadans in A.D. 1323. It was founded in the reign of Muhammad Taghalaq, according to one account, by two fugitives from Telingana, but according to Prinsep, in 1338 by Bilal Deo of Carnata, who resisted Muhammad Taghalaq, and founded Vijianagar. The family genealogy deduces a descent in the direct line from Pandu of the Lunar dynasty, and imperfectly follows the Puranic lists to Chandrabija, the last of the Magadha rajas. The first in authentic history is Nanda, A.D. 1034, who founded Nandapur and Warangal. On the capture of Warangal, A.D. 1323, and the subversion of the Belala dynasty, two of its officers established a new government at Vijianagar on the banks of the Tumbudra. The city was completed A.D. 1343, Anagundi being a suburb on the opposite bank of the river. The rulers were designated Rayel or Rayer, and were Saiva Hindus. In 1490, Narsingha, a Vaishnava, founded a new dynasty; he extended his power into the Dravida country, erected strong forts at Vellore and Chandragiri, and in 1510 or 1515, a successor, Krishna Rayer, reduced the whole of Dravida, including the Chola and Pandiyan kings. In 1564, the Vijianagar army was defeated at Talikottah by the confederate Muhammadan kings of Bijapur, Ahmadnaggur, Golconda, and Beder? and Ram Raja, the 7th prince of the house of Narsingha, was slain. Vijianagar was sacked and depopulated, and the doab between the Kistna and Tumbudra partitioned amongst the conquerors. The successor of Ram Raja established himself in Pennakonda, 85 miles S.W. of Bellary, from which, in 1570, Timmah Raja removed to Chandragiri, about 11 miles W.S.W. of Tripatty, at which place and at Vellore in 1597 he was ruling with some magnificence over the Naiks of Ginji (Kistnapa), Tanjore, Madura, Chinnapatam (Jug Deo-rayer), Seringapatam (Trimulraj), and Pennakonda. The Dutch had been established at Pulicat, and persuaded this ruler to refuse the English a settlement. In 1599 two Portuguese missionaries visited Chandragiri, and were received by the ruler. About 1644, the Carnatic was invaded by an army from Bijapur, when Ginji and Chandragiri were reduced, and

Sri Ranga Rayel, after concealing himself in the Northern Circars in 1646, escaped to Bednore, where he was sheltered by the raja, formerly one of his own dependents. This is the last that is known of the old Vijianagar dynasty, though a branch of the family long resided at Chingleput, and continued for a time to assume a kind of state.

Abd-ur-Razaq, an ambassador from the grandson of Timur, visited the south of India in A.D. 1442. He describes Vijianagar in terms so glowing, that it is scarcely surpassed by that in the story of Prince Ahmad in the Arabian Nights. Nicolo di Conti (A.D. 1420) is so extravagant as to say it is 60 miles in circumference; Bartema says 7 miles, and adds that it is very like Milan.—*Elph.* p. 428.

VIJNANESWARA BHATTA flourished in the 10th century of the Christian era, author of the Mitakshara, a commentary on the law book of Yajna Valkya.

VIKRAMADITYA, meaning sun of might or sun of prowess, is a title which was assumed by more than one ruler in India. Mr. Fergusson gives the following names:—

	A.D.
Vikramaditya of Malwa,	490
Siladitya of Malwa,	530
Prabharakara of Kanouj,	580
Raja Vardhana,	605?
Pulakesi II. of Kalyan,	609
Sri Dharasena III. of Balabhi,	650
Vikramaditya of Kalyan,	660?
Vinayaditya of Kalyan,	680
Vijayaditya of Kalyan,	695
Vikramaditya II.,	733

At another place Mr. Fergusson (p. 731) names five Chalukya rulers of this title at Kalyan—

Vikramaditya I., the 10th of the line.
Vikramaditya II., the 13th, began to reign A.D. 733.
Vikramaditya III., the 20th, restored the monarchy A.D. 773.
Vikramaditya IV., the 22d, began to reign about A.D. 1008.
Vikramaditya V., Kali Vikrama, Tribhu vana Malla, A.D. 1076.

Vikramaditya, king of Ujjain, won his paramount place in Indian story by driving out Scythian invaders. An era, the Samvat, beginning in B.C. 57, was founded in honour of his achievements. He reigned at Ujjain in Malwa from A.D. 495 to 530. He was a liberal ruler, a patron of learning, encouraged art. He was a follower of the Brahmanical religion, a worshipper of Siva and Vishnu. His successor Siladitya seems to have returned to the Buddhist faith. Some modern works state that king Bhoja, ruler of Malwa, who about A.D. 1040–1090 dwelt at Dhara and Ujjayini, was the Vikramaditya whose court was enlivened by the nine learned, known as the nine gems, nawa-ratna,—Dhanwantari, Kshapanaka, Amarasinha, Sanku, Vetalabhatta, Ghata Karpara, Kalidasa, Varamihira, and Vararuchi. Dhanwantari wrote the Nirghanta on medicine, and two others; Kshapanaka wrote on the primary elements; Amarasinha, a Sanskrit dictionary, and a work on the Mimansa philosophy; Sanku, Vetalabhatta wrote on the Alankara, and a commentary on the Vaiseska philosophy; Kalidasa wrote the Sankhya tatwa Kumudi, the Kumara. Ragoba Moraba of Bombay translated into English the adventures of Vikramaditya of Ujjain.

The Vikramaditya, king of Kalyana, is supposed to have reigned from A.D. 1076 to 1127. His adventures have been written by the poet Bilhana. He was the son of the great king Ahavamalla, whose queen, after some time, bore to him three sons, Someswara, Vikram, and Jayasimha. Vikram ultimately succeeded to the throne. He twice made war against the Chola kingdom, and he took Kanchi. On Jayasimha revolting, 1077, he attacked and defeated him.—*Dr. James Fergusson, P. A. S. J.* iv., 1870, p. 94; *Weber*, p. 202.

VIKRAMADITYA ERA, or Samvat or Sambut era, B.C. 56, is in use throughout Telingana and Hindustan. The prince from whom it was named was of the Tuar Rajput dynasty, and is supposed to have reigned at Ujjain (Ujjayini) 135 years before Salivahana, the founder of the Saka era, south of the Nerbadda (Narmada). The Vikramaditya or Samvat era commenced when 3044 years of the Kaliyug had expired, *i.e.* B.C. 57 years, so that if any year, say 4925 of the Kaliyug, be proposed, and the last expired year of Vikramaditya be required, subtract 3044 therefrom, and the result, 1881, is the year sought. To convert Samvat into Christian years, subtract 57, unless they are less than 58, in which case deduct the amount from 58, and the result will be the date B.C. The era Vikramaditya is little used in the Peninsula of India, although its current year is generally inserted at the head of the calendar. In those provinces where it is current, it serves to number the lunisolar years, in the same manner as the era Salivahana in the Carnatic does for the solar ones.—*Cole. Myth. Hind.; Warren's Kala Sankalita; As. Res.* vi.; *Thomas' Prinsep*, p. 157.

VIKRAMCHARITRA, or the Adventures of Vikramaditya, king of Ujjain, is a celebrated book, in much favour with the Hindu races of British India. The author is not known. Further adventures of Vikram are related in a Prakrit poem by Haridas, whose era is not known.

VIKRAMORVASI, Vikrama and Urvasi, or the Hero and the Nymph, a story in a drama by Kalidasa, in which the hero is Pururavas, and Urvasi is an Apsaras who came down from Swarga, from having incurred the imprecation of Varuna and Mitra. On earth Pururavas and she fell in love with each other, and she bore him six or eight or nine sons. The story is in the Satapatha Brahmana, and in the Bhagavata and other Puranas. The myth is supposed to refer to the action of the sun (puru-ravas) on the morning mist (urvasi).—*Dowson.*

VIKRAMU. TEL. Any idol.

VILLAGE.

Hiang, ... CHIN.	Grama, . . . SANSK.
Basti, Gaon, . . HIND.	Bang, ... SIAM.
Kyong, . . . LEPCHA.	Thiong, ... TIB.

Go, Gao, Gon, Grama, Gama, Gramamu, Gramam, Gram, Gam, Ganw, Gaon are derived from the Sanskrit. In former times, in the whole of India, the property in the land resided in the village communities, and this is still the case with the greater part of it. The village community is not, however, co-extensive with the cultivating inhabitants of the village; it consists of the descendants or representatives of those by whom the village was, at some remote period, conquered or reclaimed from waste. In most cases these proprietors are a part, and in some the whole of the agricultural population of the village. Any remainder consists of the descendants of persons who have taken up their residence in the village

at later periods, with the permission of the proprietors, some of whom have remained tenants-at-will, while others have by grant or prescription acquired a fixity of tenure. The village proprietors formed prescriptively the municipal government of the village, and village government was the only institution, properly so called, which the Hindus possessed.

Corporate villages are still in many parts of India an institution of the country. They are municipalities governed by a headman, often hereditary, and the different trades and professions practised by individuals, who received a regulated remuneration. Village communes of India are little republics, having nearly everything they can want among themselves, and almost independent of any foreign relations. The village watchmen are called Pasban, Gorayet, Peik, Douraha in Hindustan; Tillari in the south of India amongst the Teling race; Paggi in Gujerat. There never was cultivation in common, but each man broke up as much land as he could, and it belonged to him who first tilled it. Local taxes for common expenses were rateably raised. By the term village is strictly meant, not merely the collection of dwellings which the cultivators inhabit, but the whole area which is in their occupation. Agriculturists in Northern India dwell in village communities, in Central India they are village proprietors, and in Southern and Western India they are ryots under the ryotwari system, much like the peasant-proprietors of Europe. Gujerat cultivators do not live, as those of European countries do, each upon his own farm, but are invariably concentrated into villages.

The village system of land assessment is current in the N.W. Provinces, the Panjab, Nagpur, and Oudh. In Cuttack is a mixed plan of the ryotwar and village system.

Land surrounding the village homestead in N. India is called bara, also in the Upper Doab, goind. The circle beyond the bara is called munda, majhola, or agla, and the outer circle jungle (jangal).

The Gramma-deva, the tutelar deity of a village, is sometimes one of the Hindu pantheon; sometimes, as in the south of India, it is Hanuman; sometimes one of the Ammun; often a shapeless stone or piece of wood. The Gramma-devata are generally on the outskirts of the villages, frequently beneath a tree, and are usually exposed to the open air without any covering temple. So long as the affairs of the community are ordinarily prosperous and no calamity threatens, they are content with the worship common to the sect to which they belong, but in seasons of trouble the Gramma-devata are largely resorted to. When the calamity is general, such as a drought or a pestilence, or a murrain amongst the cattle, the entire village will repair to the village deity, and seek by prayer and offerings to obtain release. All the Assamese regard high trees and sequestered groves as the haunts of spirits. — *Select Committee, House of Commons*, 1832; *Forbes' Rasamala*, ii. p. 241; *Wils.; Campbell*, p. 6; *Mor. and Mat. Prog.*, 1858.

VILLANOUR, a small native village, situate about 7 miles to the west of Pondicherry, containing a huge pagoda. Inside the pagoda is a large square tank.

VILLAPAKAM TANDAVARAYA, a Mudaliar, was a teacher in the College of Fort St. George, Madras. In 1825 he wrote a catechism of Tamil grammar, entitled Ilakkana Vina Vidai; he translated the Panchatantra stories into Tamil, and wrote a book of fables called Katamangsari. He likewise edited several Tamil lexicons. His prose style is greatly admired.

VILLARSIA, a genus of plants belonging to the natural order Gentianaceæ, named after Villars, a French botanist. There are about 16 species of this genus, either aquatic or marsh plants, with alternate entire leaves and yellow flowers, inhabitants of all parts of the world. One only is a native of Europe; Villarsia Indica, cristata, and nymphæoides occur in every part of India, and afford a good bitter.

Villarsia cristata, *Spreng.*

Menyanthes cristata, *Roxb.*	Chirialli, . . . TEL.
Ch'hoto-pan-chuli, BENG.	Autara tamara, . ,,

A common plant, with small white flowers, floating in sweet water ponds all over the East Indies.

Villarsia Indica, *Vent.*

Menyanthes Indica, *Linn.*	Indian buckbean, . ENG.
Buro-pan-chuli, . BENG.	Nedel ampel, MAL., TAM.
Chuli, . BENG., HIND.	Autara tamara, . TEL.

This fresh-water plant is found floating in lakes and tanks. Its tuberous roots are used medicinally. It has middle-sized flowers, with a yellow tube and a white-bearded limb.

Villarsia nymphæoides, *Vent.*

Kuru, ... KAGHAN.	Khair posh, . KAGHAN.
Gul jafari purnka, ,,	

A floating plant, found in ditches and slow-running streams in every part of Hindustan; in Kashmir it vegetates on the lakes, and is given as food to cows, in the belief that it increases their milk. It is a beautiful plant, and may be easily cultivated. It has a large yellow flower, which is curiously plaited.—*Honig.* p. 364; *Stewart; Roxb.; O'Sh.; Voigt; Hogg; Irvine.*

VILLI are a race dwelling in hamlets of five or six huts on the outskirts of most of the villages in the district of Chingleput, and sometimes called Yenadi. They are herbalists. They have Mongol features; the men have scant hair on the lip or chin, and no whiskers. They are polygamists. They eat all animal food except the flesh of the cow. They dig up the wild chay root. The average height of the men was 5 feet 5 inches, and weight 83 lbs. Other forest races are the Chenchuar, Irular, Kampani, Matraj or Muttaracha, and Yanadi.

VILLIPUTTURAR was a Vaishnava Brahman. Opinions differ with respect to the time he lived. He wrote an imitation in 3373 stanzas of the first ten Parvas of the Mahabharata.

VIMANA, the pyramidal tower of a Hindu temple, erected over the spot where the idol is placed.

VINA, the Hindu lyre, formed by a flat piece of wood with strings, having a gourd at one end, and sometimes one at both ends; seen in plates in the hands of Nareda, Saraswati, and the celestial choristers. See Krishna.

VINAGO AROMATICA, the Columbia aromatica of Latham, is of a mild and timorous disposition, and is generally seen in flocks or societies, except during the period of reproduction, when they pair, and retire to the recesses of the forest. The nest is simple, and composed of

a few twigs loosely put together, and the eggs are two.

VINAYA. Sansk. In Buddhism, morality or discipline. Vinaya-pitaka, Sansk., the Treasury of Discipline, one of the Tripitaka or Three Treasuries of the Buddhists.

VINCA, a genus of plants belonging to the natural order Apocynaceæ. V. herbacea, V. major, V. minor, V. pusilla, and V. rosea are known. Their English name periwinkle is derived from the French pervenche; but the French also call V. major the Violette des sorciers, and the Italians Fiore di morte, from the practice of making garlands of it in sorceries and incantations.

Vinca pusilla (V. parviflora, *Roxb.*), a small erect annual, common in the East Indies; stem smooth. Applied in India as an external stimulant in lumbago.—*Royle.*

Vinca rosea, *Linn.* Catharanthus roseus, *Don.*

Madagascar periwinkle. | Rattan jot, . . . Hind.
Gul-firingi, . . . Beng. | Billa ganneru, . . Tel.

A native of China, Cochin-China, common in Indian gardens, with large rose-coloured flowers. —*O'Sh.*

VINCENT, WILLIAM, author of The Voyage of Nearchus from the Indus to the Euphrates, London 1797; The Periplus of the Erythræan Sea: an Account of the Navigation of the Ancients from the Sea of Suez to the Coast of Zanguebar, London 1800–1805.

VINCETOXICUM CANESCENS. *Dne.*

V. vulgare, *Rœm. and Sch.* | Tranna . . . of Ravi.

Not uncommon in parts of the Western Panjab Himalaya, from 5000 to 9500 feet. In some places the natives commend its khushbu (perfume), which is really a rank heavy smell given out when it is bruised.—*Stewart.*

VINDHYA or Vindhyachala, also Bind'h and Bindhya, a great series of mountain ranges separating the Gangetic basin from the Dekhan, and forming a well-marked, although not quite continuous, chain across India. The name was formerly used in an indefinite manner to include the Satpura Hills, south of the Nerbadda; and indeed certain of the Sanskrit Puranas apply it specially to the Satpuras. The Vindhyas are now restricted to the ranges on the north of that river. The Vindhyas occupy a considerable place in the mythology of India as the great demarcating line between the Madhya-desha, or 'middle land' of the Sanskrit immigrants, and the non-Aryan Dekhan. They are still inhabited to a large extent by aboriginal races, and the name Vindhya in Sanskrit means also a 'hunter.'

The range separates Hindustan proper from Southern India, and forms the northern boundary of the valley of the Nerbadda river, extending from Gujerat on the W. to the basin of the Ganges on the E., and comprised between the 22d and 25th parallels of latitude. The average height, 1500 to 2000 feet. Chumpanir, lat. 22° 34′ N., and long. 73° 41′ E., 2500 feet; crest of Jam Ghat, 2300 feet; mountain in Bhopal, 2500 feet; Chindwarra, 2100 feet; and Patchmaree, vaguely stated to be 5000 feet, but this is probably an exaggeration; Dokgur, stated to be 4800 feet; Putta Sunka and Choura Doo, the highest, conjectured at 5000 feet; Amarkantak, a jungly table-land computed to be 3463 feet; Leela, a summit in Lanjhi Hills, lat. 21° 55′ N., and long. 80° 25′ E., 2500 feet; another of the same hills, in lat. 21° 40′ N., and long. 80° 35′ E., 2400 feet. The chain forms the southern buttress of the plateau of Malwa, Bhopal, etc. In the Saugor and Nerbadda territories its crest is but the brow of this table-land; but in the western part it rises a few hundred feet above the high land on its northern side. Connected with the western limits of the Vindhya range by a curved line of hills are the Aravalli mountains, which stretch almost to Dehli, and serve as a barrier between Central India and the western desert. The eastern portion of the Vindhya chain is a spreading table-land, from which spurs descend to the north and south, the latter separating the different valleys of Orissa. The table-land of Chutia Nagpur averages 3000 feet, and westwards near Sirguja is higher. Hazaribagh is about 1800 feet, and Parisnath Hill on the east is about 4500 feet; the most easterly spurs approach the Ganges at Monghir, Bhagulpur, and Rajmahal.

Geologically, few parts of India have excited more interest and attention than the districts adjoining the Nerbadda river; the great thickness of sandstones and associated beds, which form the mass of the Vindhya range, being the most striking and remarkable feature in that country. There is a great faulting, accompanied by much disturbance mechanically, and by much alteration chemically (more especially to the south of this fault), in the rocks which pass along the main line of the Nerbadda valley, along the continuation eastward of this line down the valley of the Sone, and thence across Behar, where the continuation of the same rocks forms the Gorakhpur Hills. It is considered a high probability that this line of dislocation was continued to the east by north up or towards the valley of Assam; its main direction being 15° E. to 18° N., corresponding with the main direction of the Vindhya range and the Khassya Hill range. South of this dislocation, the great group of sandstones, shales, etc., forming the Vindhya Hills, is almost entirely absent, unless the highly metamorphosed rocks there seen be the continuation downwards of the same series, greatly altered. This great group is altogether of a different character and of a more ancient epoch than the beds associated with the coals of Bengal and of Central India,—the latter resting quite unconformably on the former. Mr. Oldham gave the name Vindhyan to this great group, being best seen in the well-exposed scarps of the Vindhyan range; and to the subdivisions in ascending order, the names Kymore, Rewah, and Bundair; but he applied these names only provisionally, as he thought it possible that the Rewah limestone and Bundair sandstone are only repetitions of the Sone valley limestone and sandstone, produced by faulting. Resting unconformably upon the Vindhya formation, there is a considerable thickness of sandstones, shales, and coals in Central India, much disturbed and traversed by trap-dykes. The total thickness of this group in this district exceeds some thousand feet. In these beds occur numerous fossil plants, which thoroughly identify these rocks with the coal-groups of Bardwan, of Hazaribagh, and of Cuttack. Taking it as proved that the strata at Kotah, from which fish and Saurian remains had been obtained, are the same with those of

Kampti near Nagpur, the strong Permian analogies of the Saurians (Brachyops) ought not to be overlooked.

The Nerbadda is fed almost entirely from the south, as the watershed of the Vindhyan table-land stands but little back from its southern face. On both sides of the valley the high ground is often occupied by basaltic trappean rocks. On the north such rocks spread into wide patches over the country towards Bhopal, Saugor, and Damoh, in which direction they gradually die out; on the S. and S.W. the trap is found to cover considerable areas among the Gondwana Hills, and it becomes more and more the prevailing surface rock in this direction, towards the great trap area of the Dekhan. The prevalence of regularly-bedded, fine-grained grits, with a characteristic red colour, is the most striking lithological feature of the Vindhyan group; and, speaking of the formation generally, its most marked characteristic certainly is the persistency of this lithological aspect over great areas. This sameness of texture is strongly in contrast with the prevailing character of all the more recent sandstone formations to the south. Ripple-marking may be considered as a phenomenon characteristic of the Vindhyan series; almost totally absent in all the other groups of sandstone of Central India, it is almost everywhere throughout them found preserved in the most extraordinary perfection.

The Vindhya mountains form the southern limit of Hindustan, but, further south, separated by the deep valley of the Nerbadda, is a parallel chain called Injadri or Satpura, which must be crossed before we reach the next natural division in the valley of the Tapti. This small tract is low, but the rest of the Dekhan is almost entirely occupied by a table-land of triangular form about the level of that of Central India.

The Vindhyan languages, and particularly the Gond, have a closer agreement with the Carnatica and Tuluva, and even with the Kodagu and Todava, than with the adjacent Telugu. This is seen in the forms of many common Dravidian roots and particles. Gondi has also some special affinities with ancient Tamil. It is probable that the Telugu and Mahrati have spread inland from the east and west into the upper basin of the Godavery, and thus cut off the ancient connection between the Gondi and the Carnatica and the Malealam, which, with the Konkani, Tulu, and Tamil, prevail on the low country throughout the rest of the belt to Cape Comorin. The main portion of the South Dravidian land is occupied by three populous nations, speaking as many dialects.

Professor Max Muller is of opinion that when the Aryan tribes immigrated into the north of India, they came as a warrior people,—vanquishing, destroying, and subjecting the savage and despised inhabitants of those countries; but that, in the countries south of the Vindhya, their entry was in the way of colonization and instead of introducing their own Sanskrit language, they adopted those of the southern nations,—refined and improved them, till they even rivalled the Sanskrit in perfection, though there remain up to the present day, in some parts of the interior of the Peninsula, savage tribes never reached by the superior civilisation of the Aryan. These earlier inhabitants of India were considered by the Brahmans as impure and unworthy to partake of their religious sacrifices, and found a refuge in the thick forests of the mountain districts, and in the countries south of the Vindhya range, while some of them were tolerated by the Brahmans, so as to remain in a state of slavery.—*Imp. Gaz.; Williams' Nala*, p. 220; *Ritchie*, i. p. 6; *Hind. Th.; Prof. Max Muller, Rep. Brit. Ass.*, 1847, p. 330; *Elphinstone's India*, p. 3; *Dr. Oldham.*

VINDRA-VANA, the forests of Vindra, in which were placed many temples sacred to Kaniya. One is on the Yamuna, a few miles above Mathura. A pilgrimage to this temple is indispensable to the true votary of Krishna. See Bindraban.

VINDUSARA or Bimbasara, son and successor of Chandragupta, to whose court a second Greek embassy was sent, either by Seleucus, or by his son Antiochus Soter. The ambassador Daimachas was considered by Strabo the most lying of all the Greek historians of India. Vindusara died B.C. 263, and was succeeded by his son Asoka.—*Thomas' Prinsep.*

VINE. Of this order of plants, the Ampelideæ, the grape-vine (Vitis vinifera, *L.*), the most important plant of the order, may be taken as the type. They are all climbing, jointed shrubs, often with abortive flower branches serving as tendrils to lay hold of their support. None of the order are native in Europe; they are chiefly East Indian. The grape-vine, cultivated extensively in many parts of India, Persia, Afghanistan, France, Germany, South Europe, Atlantic Islands, United States, Cape, etc., was very probably native originally of Western Asia, and to the south of the Caspian. From its innumerable varieties, affected by different climates and soils, we have, besides grapes yielding the various wines of commerce, other sorts which are dried, forming the Valencia, muscatel, sultana, and kishmish (without seeds, from Turkey) raisins; also currants, the dried fruit of a small-fruited variety of the grape-vine (V. vinifera, *var.* Corinthiaca), cultivated in the Ionian Islands, Greece, Liparis, etc. These are quite distinct from any species of Ribes, the currant bush of orchards, to which they are not botanically related. See Wine.

VINEGAR. Acetum, Lat.

Khull,	Arab.	Vinagre,	Port., Sp.
Tsu, Nung,	Chin.	Ukzus,	Rus.
Azyn, Azyn zur,	Dut.	Ganchica,	Sansk.
Vinaigre,	Fr.	Eisel,	Sax.
Essig saure,	Ger.	Kadidia,	Singh.
Sirka,	Hind.	Kadi,	Tam.
Aceto,	It.	Pulla millu,	Tel.
Chuka,	Maleal.		

Vinegar is an impure acetic acid, and several varieties of it are known in commerce, such as wine, malt, wood, sugar, toddy, etc., vinegar, all extensively employed for pickling, in domestic cookery, etc. Acetic acid is the volatile principle, to the presence of which, diluted with variable proportions of water, vinegar owes its aroma and pungency. This acid exists, ready formed, in notable quantity in certain plants, as Sambucus niger, Phœnix dactylifera, and Rhus typhenus. It may be readily generated by the fermentation of various vegetable and animal substances, especially the former. For commercial purposes, vinegar is made from certain vegetable and spirituous infusions, as those of the grape, malt, and the sugar-cane; but any vegetable infusion capable of yielding alcohol will also, when exposed to the necessary conditions, furnish vinegar. In

most cases, and indeed whenever vinegar is manufactured on a large scale, and the vinous or alcoholic fermentation precedes the acetous, the vinegar is formed entirely at the expense of the alcohol. In India, vinegar is obtained from the Dolichos uniflorus, but is also made from the sediment of palm wine or toddy, and is coloured artificially. The juice of the gomuti palm, Arenga saccharifera, put into a jar for five days, is converted into excellent vinegar, equal in strength to that produced by the vinous fermentation of Europe. Large quantities of the palmyra toddy are converted into vinegar in Ceylon, and used for pickling gherkins, limes, the undeveloped leaves of the cocoanut and palmyra trees, and other substances. It is also prepared from the toddy of the cocoanut palm. The toddy is collected in fine weather, put into jars, and kept covered for a month; it is then strained and replaced in the same jars, with the addition of a little chilli (Capsicum frutescens), commonly called bird pepper, a small piece of ghorka, fruit of the gamboge tree, the red sort of which is to be preferred, being most acid, and the pod of the Hyperanthera moringa. At the expiration of five weeks or a month, it becomes very excellent vinegar. The vinegar obtained from sugar-cane juice is generally a poor stuff, and does not contain more than 2 per cent. of acetic acid; but at some places it is made well, especially at Dehli, and really excellent at Peshawur, made from grapes, quite fit for table use. Acetic acid can be distilled from vinegar, but the common country vinegar of the bazar generally contains only a very small portion of acetic acid, often not more than 2 per cent. If ten measures be taken of vinegar, it should be distilled till nine have passed over. It is made in China from rice and from all other grains, and is used in lieu of rennet in making cheese.—*Powell, Handbook*, i. p. 312; *Faulkner; M'Culloch; Royle; O'Sh.; Eng. Cyc.; Tennent.*

VINGORLA, a seaport town, with fort, in the Ratnagherry district, Bombay, situated 84 miles S. by E. of Ratnagherry town, in lat. 15° 51′ 30″ N., and long. 73° 39′ 45″ E. A lighthouse erected in 1870 is situated on an isolated rock in the west of Ratnagherry district, Bombay, Burnt Island, lat. 15° 53′ 30″ N., and long. 73° 27′ 30″. The bay is quite sheltered, except from the south.

VIOLA, a genus of plants of the natural order Violaceæ. About 19 species are known. The roots of most have an acrid, nauseous taste, and have emetic properties; and in Europe, V. arvensis, canina, odorata, and tricolor are so used. The Akukira and Banafsha plants of Kaghan are species of Viola; V. distans and V. serpens are of the Khassya; V. glaucescens is of the Peninsula; V. odorata is of Europe, Siberia, and China; V. Patrinii is of Siberia, the Neilgherries, and in Hazara, a dark-flowered variety has a particularly fine scent; V. Roxburghiana is of Bengal; and V. Wightiana is of the Peninsula. V. hirta, lactea, and lutea are other species. V. cinerea, *Boiss.*, grows in the plains, Trans-Indus, and in the Salt Range; and several species are found in the Himalaya up to 10,000 feet, perhaps the commonest being V. serpens, *Wall.* The plants of the species are found in the bazars of India, and considered diaphoretic and aperient. The Persian name Banafsha is given to several species. Dr. Royle figured three Himalayan species, V. serpens, V. reniformis, and V. Kanawarensis; the first of which is found in Mussoori, the second on the Chur mountain, the last in Kanawar.

Under the name of Bekh-banafsha, or violet root, and having precisely the smell of the fresh flower of V. odorata, the well-known orris root, or Iris florentiana, is also sold in the bazar. Excellent issue peas are made from this root.—*Royle; O'Sh.; Stewart; Murray.*

VIOLA ODORATA. *W.* Sweet violet.

Behussej, . . . Arab.	March violet, . . Eng.
Tsze-kin-hwa, . . Chin.	Banafsha, Hind., Pers.

This violet has no stem. It is native throughout the whole of Europe and in Siberia and China, and its delicious scent has made it a great favourite. In the dry state it is sold in all Indian bazars, and is prescribed in infusion by the hakims as a diaphoretic in the treatment of fever. It nauseates slightly, owing to its containing a very minute quantity of the principle termed violina, closely resembling the emetine on which depend the virtues of the ipecacuanha of Brazil. The V odorata, as sold in the bazar, has dry, thready, fibrous roots, a pale-yellow colour, knotty, some as thick as a quill. The leaves are heart-shaped, flowers blue. The entire plant retains slightly the delightfully sweet smell characteristic of this tribe.—*Royle; Riddell; O'Sh.; Jaffrey.*

VIOLA TRICOLOR, Heartsease or pansy; flowers vary much in size; some only are odorous. The colours are mixed and numerous, being from deep-purple and yellow to blue and white, crimson, etc. In Europe this flower has been brought to great perfection, by the mode of continual offsets. The flowers are not generally scented, but some are found so on the Neilgherry Hills. The seed should be taken as soon as the seed-vessels appear round and full; they may be dried in the house and the seeds preserved; if left on the plant, the capsules dry and open of themselves, fresh plants springing up from the seed that drops out. Requires a light, loamy, vegetable soil.—*Riddell.*

VIOLIN, or Fiddle.

Vioolen, ... Dut.	Violini. . . . . It.
Violons, ... Fr.	Violines, ... Sp.
Violinen, ... Ger.	

A stringed musical instrument.

VIPASA, the Sanskrit name of the river known to the Greeks as the Hyphasis; the river Beas.

VIPERINE SNAKES form the third sub-order of the Ophidia or poisonous snakes, and may be thus shown:—

3. Sub-order, Viperine Snakes.

1. Pit-Vipers—Crotalidæ.

Trimeresaurus gramineus, *Shaw*, eastern part of Asia.
T. erythrurus, *Cant*, Bengal, China, Siam, Java.
T. carinatus, *Gray*, Sikkim, Bengal, Rangoon.
T. purpureus, *Gray*, Penang, Singapore.
T. Animallensis, *Gthr.*, Animallay Hills.
T. monticola, *Gthr.*, Nepal, Sikkim.
T. Wagleri, *Schleg.*, Malayan Peninsula.
T. strigatus, *Gray*, Neilgherries, Dekhan.
T. trigonocephalus, *Merr.*, Ceylon.
T. mucrosquamatus, *Cant*, Assam.
Peltopelor macrolepis, *Beddome*, Animallay.
Calloselasma rhodostoma, *Reinw.*, Siam.
Halys Blomhoffii, *Boie*, Japan, Formosa.
H. Pallasii, *Gthr.*, Tartary.
H. Himalayanus, *Gthr.*, Tibet.
H. Ellioti, *Jerd.*, Neilgherries.
Hypnale nepa, *Lam.*, Ceylon, Southern India.

II. Vipers—Viperidæ.

Daboia Russellii, *Shaw*, Ceylon, S. India, Himalayas.
Echis carinata, *Schneid.*, Southern India.

—*Gunther's Reptiles.* See Reptiles.

VIR or Bir. SANSK. Man, the Latin Vir. Birbani, the term amongst the Jat for a man's own wife. A femme couverte.

VIR. PUKHTU. Lamentation.

VIRABHADRA or Ehrabadra, in the mythology of the Hindus, a terrible being, created by Siva for the purpose of destroying the sacrifice of Daksha. His image stands in the temples of the Gramma-devata, is by some called an avatar. Sculptures of him are in the caves of Ellora and Elephanta. Many Teling and Tamil Hindus take his name. As son of Siva, he is fabled to have been produced from the jatra, or plaited locks of that deity, which he cut off and threw on the ground in a moment of frenzy, on learning the death of Sati, caused by the curse of Daksha. Virabhadra immediately attacked Daksha and cut off his head, which fell into the fire prepared for a sacrifice, and was burned. He is represented armed with various instruments of destruction; and the representations of him are usually seen with the head of a goat (with which that of Daksha was replaced on his body) near them, or accompanied by a human figure with a goat's head.—*Cole. Myth. Hind.* p. 74. See Daksha.

VIRA CHARITA, tales by Ananta.

VIRAGI, Hindu religious devotees. They are ascetic religious mendicants, properly Vaishnava sectarians, especially in the form of Rama, and in relation to him of Sita and Hanuman. Some of these ascetics live in mat'hs, though others of them find employment in conveying, for purposes of worship, the holy water of the Ganges to many of the most distant parts of India, in pitchers slung on bamboos. The term is from the Sanskrit Vi, privative, and Raga, passion, implying a person devoid of passion, and is therefore correctly applicable to every religious mendicant who affects to have estranged himself from the interests and emotions of mankind. Virakta, the dispassionate, and Avadhuta, the liberated, have a similar import, and are therefore equally susceptible of a general application. They are, indeed, so employed in many cases, but it is more usual to attach a more precise sense to the terms, and to designate by them the mendicant Vaishnava of the Ramanandi class, or its ramifications, as the disciples of Kabir, Dadu, and others. The ascetic order of the Ramanandi Vaishnava is considered to have been instituted especially by the twelfth disciple of Ramanand, Sri Anand. They profess perpetual poverty and continence, and subsist upon alms. The greater number of them are erratic, and observe no form of worship; but they are also resident in the mat'h of their respective orders, and are the spiritual guides of the worldly votaries. It is almost impossible to give any general character of these Viragi, as, though united generally by the watchword of Vishnu or his incarnations, there are endless varieties amongst them, both of doctrine and practice. Those who are collected in the mat'h are of more fixed principles than their vagrant brethren, amongst whom individuals are constantly appearing in some new form with regard to the deity they worship or the practices they follow.—*Professor Wilson, Hindu Sects; Cole. Myth. Hind.*

VIRAJ, the primeval being, represented under a form half male, half female. The term is sometimes applied to Siva and Parvati. Viraj is the male half of Brahma, the type of all male creatures. Mr. Colebrooke informs us that, according to one account of the cosmogony of the Hindus, the primeval being felt no delight, for man delights not when alone. He wished the existence of another, and instantly became such as is man and woman in mutual embrace. He caused this, his own self, to fall in twain, and thus became a husband and wife; therefore was this body, so separated, an imperfect moiety of himself. This blank, therefore, is completed by woman; he approached her, and thus were human beings produced, etc. etc.—*Cole. Myth. Hind.* p. 100.

VIRAKAL and Maastikal. TAM. Monumental stones and trophies in various parts of India.

VIRA-KANKANAM. TEL. A bracelet worn by warriors; the mark that they were bound to vanquish or to die.

VIRAKTA, a class of the Dadhu Panthi sect of Hindus. They go bare-headed, and have but one garment and one water-pot.

VIRA-RAJENDRA-PET or Kukluru, a town in Yedenalknād taluk of Coorg, lat. 12° 12′ 34″ N., and long. 75° 51′ 6″ E.; pop. (1871), 3413. In 1805 a colony of native Christians, immigrants from the Konkan, settled here, under the charge of a Roman Catholic, who receives an annual allowance from the Government, also grants towards the restoration of the church.—*Imp. Gaz.*

VIRA-SAIVA, Hindu worshippers of the god Siva. They are divided into two sects, one semi-Brahmanical or High Church, called Aradhya; the other is anti-Brahmanical, and is called Jangam. The Aradhya claim to be descendants of Saivite Brahmans, and between them and the Smartta Brahmans there is a certain degree of reluctant intercourse, founded upon the rites of initiation (Upanayanam) which both parties use.

The Vira-Saiva form a subdivision of the Saiva, worshipping only the male energy. The other Saiva associate the Yoni, or female energy, with the linga. The origin of this sect is attributed to Basava, minister of a king of Kalyana, in the 12th century. He is fabled to have been an incarnation of the sacred bull Nandi, the vehicle of Siva. Allama Prabhu, afterwards regarded as an incarnation of Siva, was associated with him. The Vira-Saiva wear a small linga, enclosed in a metal case. Hence they are called Lingaet or Lingadhari. Vira is derived from a word denoting bravery. They nearly exterminated the Jaina in some parts of the Dekhan. Sometimes they are called Jangama, from Jangama, motion, claiming to be living symbols of deity. The mendicants often lead about a bull, the living type of the vahan bull of Siva.

Vedantists all bury the dead, also all the Gosai, all the Lingaet or Vira-Saiva, the five artisan castes, the Kansala, goldsmith, carpenter, iron-smith, brazier, and stone-cutter, all the Byragi and Sanyasi, and the gurus of the sects; likewise all the non-Aryan races, and tribes not admitted into Hinduism. The Vedantists' dead, and those of the Lingaet artisans, are all placed seated in a grave five feet square with a ledge on the south. As life becomes extinct, the body is made to

assume the attitude to be preserved in the procession and in the grave. It is placed against a wall, the legs are crossed underneath in the usual sitting attitude, and the head is fastened to a nail driven into the wall, and so retained till rigidity ensue. They are borne to the grave in a car, on the shoulders of relatives or friends. On reaching the burial-place, the Udwan reads prayers, and the body is seated on the side ledge with its face looking northwards; salt and ashes of cow-dung are placed on the head.

The Vira-Saiva are chiefly found where Canarese is spoken. A few of their books have been printed in Tamil,—Apisheka Malai, Nedungkalinedil, Kurungkalinedil, Nirangana Malai, and Kaittala Malai. These are by Siva Pirakasa Tesikar, who lived about the 17th century. They were printed in a small pamphlet by Saravana Perumal Iyer. The first treats of the anointing of the linga, specifying what articles may be offered. A small linga is often placed on the hand, considered as an altar. This is the subject of the last work. The others contain praises of Siva, for repetition during his worship.—*Brown's Essay on the Jangams.*

VIRATA, the modern town of Bairat, 105 miles S. of Dehli. Its raja sheltered the Pandava princes and Draupadi; he fought on the Pandava side, and was killed by Drona.—*Dowson.*

VIRGIN. Several races derive their descent from miraculously impregnated virgins. According to the Puranas, Ella, the earth, daughter of the sun-born Ikshwaku, while wandering in the forests was encountered by Budha (Mercury), and from the rape of Ella sprang the Indu race.

Yu (Ayu) was the first monarch of the Chinese. A star (Mercury or Fo) struck his mother while journeying; she conceived and bore Yu. Chengiz Khan was of this descent. The legend is that three sons were born of the queen from the visits of a ball of light that daily fell through the roof into her apartment, and on reaching the ground became transformed into a young man of an orange colour, with eyes of extraordinary beauty. The descendants of these three sons were called Niroun, signifying purity of descent. Chengiz Khan was eighth in descent from Boudantchar, the youngest of the three sons.

Amongst the ancient Mexicans Vitzli-putzli was the god of mercy. His name refers to the sun. He is said to have been the offspring of a virgin who was impregnated by a plume of feathers invested with all the colours of the rainbow, which descended from heaven into her bosom. The rainbow was a type of the reappearance of the sun.—*Fytche*, ii. p. 149.

VIRGIN OIL is the product of the perfectly recent fruit of the olive. It is of a greenish colour, and highly esteemed; common olive oil results from the expression of the fruits after they have undergone a slight fermentation; it is yellow, sweet, and well suited for culinary purposes. The oils inferior to this are consumed almost exclusively in the fabrication of soap, and are obtained by subjecting to the press a second time the crushed fruits which have already yielded the first and second qualities of oil. The finest olives and the worst oil are produced in Spain.

VIRIKA, amongst the Canarese race of Mysore and in the Southern Mahratta country, the ghost or evil spirit of unmarried or unchaste persons, or of those who have met a violent death. They are appeased by offerings.

VIRK or Birk, one of the most distinguished of the Jat tribes, is admitted among the Chalukya Rajputs by Tod.

VIRU PAKSHA, Sansk., or misformed eyes, a name of Siva.

VIS or Viss, or Passeree, an Indian weight. The Burmese viss or picktha is 140 tolas 100 tikals 40 pollams, or 3 catties=3 lbs. 2 oz.; 8 viss therefore make a maund of 25 lbs. The viss, however, varies in different localities. In Trichinopoly it is 3 lbs.; in Masulipatam, 3·515 lbs.; in some other places it is much more. Visary is a name in the Madras Presidency for the viss.—*Simmonds' Dict.*

VISABADI. Karn., Tam., Tel. A coparcenary village, of which the lands and profits are allotted by sixteenths and fractions of sixteenths.

VISA KANDRIKELU. Tel. Kandrika means a lot of land or portion of a village granted free of rent.—*Br.* p. 159.

VISAKHA DATTA, author of the drama Mudra Rakshasa.

VISAL DEVA, brother of Vira Dhavala of the Waghela dynasty, ruled at Patan from A.D. 1243 to 1261.

VISARJANA. Sansk. Liberating a bull; throwing images of divinities into the water at the conclusion of ceremonies to their honour.

VISCUM ALBUM. *L.*

Mistletoe, . . . Eng.	Jang, Ahalu, . Kaghan.
Banda, Bhangra, . Hind.	Kakbang, Ringi, Sutlej.
Bambal, Wahal, Kaghan.	Turapani, . . Tr.-Indus.

This parasite occurs at from 3500 to 9000 feet in the Panjab Himalaya up to the Indus, and in the Sulaiman Range. The plant was connected with Druidical superstitions; but the mistletoe of the Druids was exclusively that found upon the oak, and its appearance on that tree is now so rare that many persons have believed the mistletoe of the Druids either to have been some other plant, or to have had no real existence. Honigberger states that it is given in enlargement of the spleen, in cases of wound, tumour, diseases of the ear, etc. The fruit is covered with a viscid pulp, and is made by the Italians, and in Herefordshire, into a kind of bird-lime; and as it is a favourite food of the large or missel thrush, it is thought to have given rise to the proverb, 'Turdus malum sibi cacat.' The embryo curves its radicle down upon the bark, and then adheres firmly to it, and it is a twelvemonth before the plumule begins to extend. This may be to give the radicle time to pierce the bark and introduce itself below the liber, where it expands and acts the part of a root, by attracting thence the fluids which are necessary for the support of the parasite. This plant, and others of its order, offer the singular fact of the ovule not existing at the time of impregnation, nor appearing till from six weeks to two months later. Dr. Wight describes Viscum coralloides, moniliforme, orbiculatum, ramosissimum.—*Wight, Ic.; J. L. Stewart.*

VISCUM MONOICUM. *Roxb.* Kuchila ka mulung, Hind. It was accidentally discovered in 1836 that the Viscum found on the nux vomica trees of Cuttack possessed all the properties of the supporting tree. In 1837, Lieut. Kittoe, then at Cuttack, received information of the existence of a parasite on the nux vomica trees, which the natives

held to be an extremely powerful narcotic, and poisonous in small doses, and they used it in the treatment of agues and rheumatism. Mr. Kittoe having procured specimens of the leaves, sent them to Dr. O'Shaughnessy for experiment. Given in three-grain doses to dogs and kids, tetanic spasms set in in the course of from five minutes to a quarter of an hour, recurring at intervals, and proving fatal by fixing the diaphragm and causing asphyxia. A species is met with in China growing on the willow, called Liu-ki-sang.—*O'Sh.* p. 375 ; *Eng. Cyc.*

VISENIA VELUTINA. *W. Ic.*

Riedelia velutina, *D.C.*
Glossospermum velutinum, *Wall.*
Visenia umbellata, *Blain.*, *W. Ic.*

A considerable tree of Sumatra, Java, and Mauritius, of great beauty, with rose-coloured flowers and velvety leaves. It was introduced from Sumatra into the Calcutta Garden by Dr. Wallich.—*Voigt ; Dr. Cleghorn in M. E. J. R.*

VISH. Hind. Ativisa, Tel. Aconitum ferox, *Wall. Cat.;* also any poison, and variously pronounced bis, bish. The Sanskrit syn. Ati visha is from Ati, very, and Visha, poison. Wallich applies the term to a species of betula, which he states to be an antidote to poison ; and in like manner the word Nirvisha, an antidote, has been given to some kinds of aconite. But the Telugu word is always understood as designating an active poison, which is the character of the vish, bish, or bikh of Upper India.—*Royle ; Roxb. ; O'Sh. ; Elliot.*

VISHA, the poison ordeal. If the accused person swallow it with impunity, he is innocent. Another ordeal is the kusha, or drinking of holy water.

VISHAKALLU and Pamukallu, also Telukallu. Tam. Bezoars. The terms mean respectively poison-stone, snake-stone, and scorpion-stone.

VISHALGARH, a native state in the Bombay Presidency. Its central point is in about lat. 16° 52′ N., and long. 73° 50′ E. Area, 235 square miles ; population (1872), 32,414. The ruler of this state, with the rank of pritinidhi, or vicegerent, is a feudatory of Kolhapur, paying a yearly tribute of £598.—*Imp. Gaz.*

VISHNU, said in the Vedas to be called the unconquerable, and occasionally associated with Indra. In the Brahmanas he acquires new attributes. He is mentioned in Menu, the Mahabharata, and the Puranas. There is extant the anonymous Institutes of Vishnu, known as the Vishnu-Smriti, which Julius Jolly translated in 1883. But to ordinary Hindus, and their mythology, Vishnu is the second person in the triad or trimurti of Hindu deities, and is worshipped as the Supreme Being by about sixty millions of the people of India. He is a personification of the preserving power, and his worshippers are more numerous than all the other sects. He has on nine occasions assumed human and also other shapes (styled avatar), and has yet to appear in his last shape, that of a white horse. Of his avatars, the first four were as animals, and five have been in human shape. Vishnu is a personification of the sun, or, conversely, the sun is a type of him. This character, as well as that of time, he shares with Brahma and Siva. But Vishnu is sometimes the earth. He is also water, or the fluid and humid principle generally. Hence he is air; he is also space, and his colour is blue, its apparent tint. In pictures, Vishnu's ethereal character is indicated by mounting him, as his vahan, on a garuda composed partly of the eagle and partly of the man. Images and pictures of Vishnu either represent him in his own person, or in that of any of his avatara or incarnations, and such pictures may generally be distinguished from those of other deities by the chank shell and a wheel or disc, called a chakra, in his hands. When whirled by Vishnu, the chakra has a sharp edge, and irresistible fire flames from its periphery. Two other attributes appertain generally to Vishnu. Vishnu, regarded as time, corresponds with the Horus of Egypt. The legends of his sleeping, awaking, and turning on his side, evidently allude to the sun at the solstices ; also to the phenomena of the overflow and receding of the Ganges, so similar to that of the Nile in Egypt. On the 11th day (sometimes on the 14th, which is the day of the full moon) of the bright half of the lunar month Kartica, Vishnu is fabled to arise from his slumber of four months. A festival is held in honour of this day, and at an auspicious moment, astrologically determined, Vishnu is awakened by this incantation or mantra : ' The clouds are dispersed, the full moon will appear in perfect brightness, and I come in hope of acquiring purity to offer thee fresh flowers of the season ; awake from thy long slumber, awake ! lord of worlds.' This god is usually represented of a black or blue colour, with four arms, in which he holds a club, to show that he punishes the wicked ; the chank or wreathed shell, blown on days of rejoicing, and at periods of worship ; the chakra or discus, the emblem of his universal domination ; and the lotus or water-lily, the type of his creative power. He is sometimes described seated on a throne of the sacred lotus, with his favourite wife Lakshmi in his arms, or standing on a lotus pedestal between his two wives, Lakshmi and Satyavama ; at others, reclining on a leaf of that flower, or on the serpent Ananta or eternity, floating on the surface of the primeval waters, or riding on garuda, his celestial vahan or vehicle, which is represented as a youth with the wings and beak of a bird.

His successive avatars are now regarded as—

1. Matsya or fish.	6. Parasu Rama.
2. Kurma or tortoise.	7. Rama Chandra.
3. Varaha or boar.	8. Krishna.
4. Narasinha or man lion.	9. Buddha.
5. Vamana or dwarf.	10. Kalki or white horse.

These avatars are generally received, but the designations have not always been similarly described. In the Mahabharata the ten are thus—

1. Hansa or swan.	6. Vamana or dwarf.
2. Kurma or tortoise.	7. Parasu Rama.
3. Matsya or fish.	8. Rama.
4. Varaha or boar.	9. Satvat.
5. Narasinha or man lion.	10. Kalki.

The Bhagavat Purana enumerates 22 avatars of Vishnu, amongst them Prithu, Dhanwantari, and Kapila. Other Hindu writings have 24 avatars.

One of the various incarnations of this deity is mentioned in an ancient legend relating to the destruction of the city of Mahabalipuram, or the Seven Pagodas, on the coast of Coromandel, by an earthquake and inundation during an early period of Hindu history. It is stated that ' Hirinacheren, a gigantic prince or demon, rolled up the earth

into a shapeless mass, and carried it down to the abyss, whither Vishnu followed him in the shape of a boar, killed him with his tusk, and replaced the earth in its original position.' A large portion of the magnificent ruins of that city and pagodas is now covered by the sea; other parts of them (the sculpture of which is still in many places very little injured by the lapse of ages or the effect of the elements) extend over a space of several miles. One of the cavern temples, now used as a place of worship, is said to contain a fine figure of Vishnu in the Varaha avatar.

In the Rama avatar, Vishnu appears in the person of a courageous and virtuous prince, the son of the puissant sovereign of Hindustan (capital, Ayodhya), to punish a monstrous giant, Ravana, who then reigned over Lanka, or the island of Ceylon. The Grecians had their Homer to render imperishable the fame acquired by their glorious combats in the Trojan war; the Latins had Virgil to sing the prowess of Æneas; and the Hindus have had their Valmiki to immortalize the martial deeds of Rama and his army of monkeys in subduing the giant Ravana and his hosts of many-headed monsters. The Ramayana, one of the finest epic poems (in spite of its many extravagances) extant, beautifully describes the incidents of Rama's life, and the exploits of the contending foes. Rama, whose fame is thus celebrated, is, in the pictorial representations of him, usually described as a green man, seated beneath an umbrella, the emblem of sovereignty, on a throne. A quiver of arrows hangs at his back; in one hand he holds his destructive bow, and in the other a flower of the sacred lotus. By his side is placed Sita, who is depicted as a goddess of transcendent beauty, of a deep yellow complexion.

The second of Vishnu's ten grand avatara or incarnations was in the form of a tortoise, and hence called the Kurma avatara, the principal incident in which was churning the ocean with the mountain Mandara, the huge serpent Sesha serving as a rope to whirl the mountain round withal, and Vishnu, in the shape of a tortoise, sustained the vast load. The result was fourteen precious articles, called gems or Chaoda ratni (more classically Chatur desa ratna), and one of the fourteen was poison; but

'To soften human ills, dread Siva drank
The poisonous flood that stained his azure neck.'

Whence the epithet Nilakantha or blue-throated is a name of Siva, and with the Saiva sect now not an uncommon name of men.

In the eighth avatara, Vishnu is said by his sectaries to have manifested himself in a degree of power and glory far exceeding any other of his forms, in which he assumed only an ansa or portion of his divinity, while Krishna was Vishnu himself in mortal mould. Other tribes of Hindus call Krishna an impious wretch, a merciless tyrant, an incarnate demon, now expiating his crimes in hell. In the Bhagavata it is mentioned that his votaries say that in this, as in his former descents on the earth, the object of Vishnu's appearance had been the destruction of giants, and the overthrow of oppressive and irreligious kings. The Bhagavata relates that Krishna's mortal parents were Vasu-deva (meaning the giver of wealth) and Devaki. It mentions a miraculous escape of the infant over the Yamuna conveyed by his father, and protected by Sesha or immortality. The guards placed by Kansa over his pregnant sister having failed in their vigilance, Kansa, enraged, ordered all newly-born infants to be slain; but Krishna escaped his various snares, one of which was sending a woman named Patnia with a poisoned nipple to nurse him, and he was fostered by an honest herdsman, named Ananda or Happy.

The Vaishnava sect regard Vishnu as the Supreme. It is related in the Skanda Purana, that when the whole earth was covered with water, and Vishnu lay asleep on the bosom of Devi, a lotus arose from his navel, and its ascending flower soon reached the surface of the flood; that Brahma sprang from the flower, and, looking around without seeing any creature on the boundless expanse, he imagined himself the first born.

But the Vaishnava sect of the present day, though nominally worshippers of Vishnu, are in fact votaries of deified heroes. The Goculast'ha (one branch of this sect) adore Krishna, while the Ramanuj worship Rama Chandra. Both have again branched into three sects, one of which, the exclusive worshippers of Krishna, are deemed the only true and orthodox Vaishnava; another joins his favourite Radha with the hero; a third, called Radha-Vallabhi, adores Radha only, considering her as the active power of Vishnu. The followers of these last-mentioned sects are said to present to their own wives the oblations intended for the goddess, and those among them who follow the left-handed path are said to require their wives to be naked when attending them at their devotions. Among the Ramanuj some worship Rama only; and others, both Rama and Sita; and they all, like the Goculast'ha, as well as the followers of the Bhagavata, delineate on their foreheads a double upright line with chalk or with sandal wood, and a red circlet with red sanders wood or with turmeric and lime; but the Ramanuj add an upright red line in the middle of the double white one.

Vaishnava Sects.

1. Ramanuja or Sri Sampradaya or Sri Vaishnava.
2. Ramanandi, Ramawat.
3. Kabir Panthi.
4. Khaki.
5. Maluk Dasi.
6. Dadhu Panthi.
7. Raya Dasi.
8. Senai.
9. Vallabhachari or Rudra Sampradayi.
10. Mira Bai.
11. Madhavachari or Brahma Sampradayi.
12. Nimawat or Sanakadi Sampradayi.
13. Vaishnava of Bengal.
14. Radha Vallabhi.
15. Sakhi Bhava.
16. Charan Dasi.
17. Harischandi.
18. Sadhua Panthi.
19. Madhavi.
20. Sanayasi, Vairagi, and Naga.

Saiva Sects.

1. Dandi and Dasnami.
2. Jogi.
3. Jungama.
4. Paramahansa.
5. Urdhaba'hu, Akas-Muk'hi, and Nak'hi.
6. Gudara.
7. Ruk'hara, Suk'hara, and Uk'hara.
8. Kara Lingi.
9. Sanyasi.

Sakta Sects.

1. Dakshini.
2. Vami.
3. Kancheliya.
4. Kararia.

Miscellaneous Sects.

1. Ganupatya.
2. Samapatya.
3. Nanik Shahi, of seven classes, viz.—
   - *a.* Udasi.
   - *b.* Ganjbakhshi.
   - *c.* Ramrayi.
   - *d.* Suthra Shahi.
   - *e.* Govind Sinhi.
   - *f.* Nirmala.
   - *g.* Naga.
4. Jaina, of two principal orders—
   - *a.* Digambara.
   - *b.* Swetambara.
5. Baba Lali.
6. Pran Nathi.
7. Sadh.
8. Satnami.
9. Siva Narayini.
10. Sunyabadi.

Amongst other sectarians we have—

Aghori.	Bhakta.	Saurapata or
Avadhuta.	Brahmachari.	Saura.

The following are towns with celebrated Vaishnava temples :—

Tirupati (N. Arcot), Vencata Rama.
Conjeveram (Chingleput), Vurda Raja.
Triplicane (Madras), Parthasardy.
Seringham (Trichy), Runga Naika.
Seringapatam (Mysore), Runga Naika.
Sevasumudrum (Mysore), Runga Naika.
Malcotta (Mysore), Chellapilla Roya.
Therunarrayanapurum (Mysore), Yoga Narasimha.
Nursepurum (Mysore), Narasimha.
Near Guntur, Panka Narasimha.
Bilegory Rungan Hill (Mysore), Bilegori Runga.
Mondepollum (Coimbatore), Vencata Rama.
Sutheagal (Coimbatore), Guni Ramasawmy.
Striparamathur (Chingleput), Odayavur.
Tinanore (Chingleput), Baktha Vatchalasawmy.
Teruvellore (Chingleput), Viraragavu.
Chicacole (Ganjam), Chicacolusawmy.
Buthrachella (Ceded Districts), Rama.
Terupagudul (Chingleput).
Carur (Coimbatore), Thauthony Vencataramen.
Uduppy (S. Canara), Krishna.
Ulamalu Mungapurum (N. Arcot), Ulamalumunga.

Other localities famed for incarnations of Vishnu are—Ahabulum, Algherry, Anuntasainum, Bhudradry, Ghuteka Chellum, Janarthanum, Kovilady, Kristampet, Mylapur, Pundrapurum, Simhaudry, Srisailum, Strevullyputtur, Strivycuntum, Thenkasi, Tirmambur, Tirvuttur, Triputur, Virarymuly.

Obscenities disfigure many of the Vaishnava temples all over India, and at Khajurabo in Bundelkhand is a Saiva temple with gross obscenities.

Ashadi Ekadasi is the 11th of the light half of the month Ashad, and is dedicated to Vishnu. It falls about the 12th July, and refers to the summer solstice, and on this feast day commences the night of the god, during which he reposes for four months on the serpent Sesha.

The Battia are a Hindu sect who worship Vishnu and his incarnation as Balaji at Panderpur and Tripatty. They have a great reverence for their guru, whom they style maharaj, and place at his disposal tan, man, dhan, body, mind, and means; and recently in Bombay, scandalous immoralities, owing to their carelessness of their women, were shown. They are generally merchants.

Amongst the Vaishnava, Bhakta or Bhagat is now usually applied to a puritan or individual more devout than his neighbours. The Bhakta formerly were a sect who worshipped Vishnu as Vasu-deva, and the Bhakta Mala is a work in which is embodied the legendary history of all the most celebrated Bhakta or devotees of the Vaishnava order. It was originally written in a Hindi dialect, by Nabha Ji, about A.D. 1580, but was added to by Narayan Das, who probably wrote in the reign of Shah Jahan. This, termed the Mala, was added to in A.D. 1713 by Krishna Das, the additions being named the Tika. The sacrificial offerings to Vishnu are rice, flowers, curds, fruits. To Siva and Durga, the objects offered in sacrifice are goats, sheep, and buffaloes.

The tulsi plant is typical of a nymph beloved by Vishnu. The Chatanula, according to Wilson, are a class of Sudra who worship Vishnu exclusively, and whose occupation is the sale of flowers ; this seems to be the sect known in the Peninsula as the Satani or Sataniwanlu.

The Ananta-chaturdasi is a Hindu festival in honour of Vishnu.

The Bairagi or Viragi, meaning devoid of passion, are Hindu ascetic devotees, worshippers of Vishnu. In the south of India, Vishnu is considered by the Vaishnava to be the supreme being or the masculine power of the Parabaravastu, and he is one of the mummurti or triad.

The Banya race largely worship Vishnu, who is adored in some places as the four-armed, and is placed upon an altar clad in robes of his favourite colour (pandu or yellow ochre), whence one of his titles, Pandurang. At the intervals of the minor destructions of the world, Vishnu is represented as having reposed himself upon the serpent Sesha, amidst the waters by which the earth is overspread. He also sleeps for four months, from the 11th of Asharha to the 11th of Kartik, or from about the middle of June to the middle of October, or from the time the periodical rains usually commence till their termination. Vykuntha is the seat of Vishnu, the heaven which he quitted to assume the incarnate form of Rama. There sits the preserver of the world, enthroned with his consort Lakshmi, attended by Hanuman, Garuda, and watched by Drūve, the north star, the keeper of his royal gate. Nothing has yet turned up to give a clue for ascertaining the age in which Vaishnavism first originated. The most authentic fact of its earliest existence on record is furnished by the inscription on the iron pillar at Dehli, stating raja Dhava, who put up that pillar in A.D. 319, to have been a worshipper of Vishnu. The next fact is supplied by Fa Hian, who saw the Vishnupod at Gaya in the beginning of the 5th century. Vishnu worship is said to have been instituted at Kanchi in the Carnatic by Luchmanacharya, but it must have been by a learned Brahman either of Rajputana or Gujerat, places famous for the life and acts of Krishna, that Vaishnavism was modified to introduce the worship of that incarnation. The great textbook of the Vishnuvites, Streemut Bhagavat, is supposed to be the work of Bopdeva, a grammarian who lived in the court of the raja of Deoghur in the middle of the 12th century.

In Vaishnava Hinduism there are five stages of faith. The first and lowest is simply contemplative, like that of the rishis Sanaka and Yogendro ; the second is servile, like that of men generally ; the third is friendly, like the feeling with which Sreedama and the Gopin regarded Krishna ; the fourth is maternal, paternal, or filial, like that of Jushoda, Devaki, etc ; the fifth and highest is amorous or loving, like that of Radha.

From some cause or other, the worship of Vishnu declined in Bengal, but it was modified and revived in the 15th century by a celebrated religious teacher named Chaitanya. This eminent personage succeeded in reforming many religious and social abuses, and founded a sect of all classes without any distinction of caste ; and in so doing continued the great work of Jayadeva, which was commenced about a century previously. The Banya race of Bengal chiefly belong to the sect of Chaitanya, and acknowledge him an incarnation of Krishna, without, however, adopting any of those ascetic habits which distinguish many of the Vaishnava. The lay followers of Chaitanya are merely initiated in the mantra or invocation to the deity by their religious preceptors, who are

called gosains. These gosains are followers of Nityananda, the coadjutor of Chaitanya; and it was to this Nityananda that Chaitanya entrusted the task of spreading his religion after his retirement from his spiritual labours. Up to the beginning of the 19th century, the gosain were held in great veneration, but since then, in Bengal, they receive little respect excepting from Hindu females, being regarded amongst the more enlightened Hindu community as the main preservers of superstitious ideas and usages. The gosain are otherwise called guru, and as such are hereditary preceptors in a family. The utmost respect that is paid to the Bengali gosain by their followers consists in taking and kissing the dust of their feet; but the younger females are not permitted to appear before them, and no scandals have arisen in the community like those which, about the year 1867, obtained such unhappy notoriety in the Bombay Presidency.

Throughout Bengal, Nuddea is celebrated as the great seat of Hindu learning and orthodoxy, the most sacred place of Hindu retreat. The Chaitanya Bhagavat states: 'No place on earth is equal to Nuddea, because Chaitanya was there incarnated. No one can tell the wealth of Nuddea. If people read in Nuddea, they find the rās of learning, and the number of students is innumerable.' The brightest epoch in the history of Nuddea, however, dates from the era of Chaitanya. Regarded by his adversaries as a heresiarch, worshipped by his followers as an incarnation, he is now truly appreciated by the discerning generation of the 19th century as a reformer whose efforts produced a little good. The consort of Vishnu is Lakshmi, Padma, or Sri.—*Wilson's Hindu Sects; Wilson's Glossary; Travels of a Hindu; Coleman; Moor.*

VISHNU, a Hindu philosopher mentioned in the Padma Purana, born at Ekamra Kanana in Orissa, who lived at Kamagiri. His doctrines were substantially those of Vyasa. He wrote one of the Smriti and a book on Pushkara.

VISHNU-BALI, a sacrifice to Vishnu on the 7th month; a Hindu domestic ceremony for an enceinte woman.

VISHNU BHAKTA, a worshipper of Vishnu, more especially as Rama Chandra or as Krishna. This Vaishnava sect in the Mahratta Dekhan worship Vishnu under the names Panduranga and Vithoba.

VISHNUGUPTA DRAMILA, the Muni Chanakya who raised Chandragupta Maurya to the throne.

VISHNU-MUNDIRU is a flat-roofed building having one room, with a portico in front, erected either within or without the wall which encloses a Hindu house, or at a little distance from the owner's house.—*Ward's Hindoos*, ii. p. 3.

VISHNU PURANA, a religious book of the Hindus. It has less than 7000 stanzas in six books. It treats of five specified topics,—primary creation, secondary creation, Sarga, Pratisarga, genealogies of gods and patriarchs, reigns of the Menu, history. It was translated by Professor Wilson, and a second edition by Dr. F. Hall. The course of the elementary creation in all the Puranas is taken from the Sankhya philosophy. In the primitive dogmas of the Hindus, the distinctness of the deity and his works are enunciated. But the Vishnu Purana declares Vishnu to be Purusha or spirit, Pradhana or crude matter, Vyakta or visible form, and Kala or time. The Vishnu Purana is supposed by Professor Wilson to have been possibly written about A.D. 1045, in the Kali year 4146. The fourth book contains all that the Hindus possess of their ancient history. It is a tolerably comprehensive list of dynasties and individuals, but is a barren record of events. It can scarcely be doubted, however, but that much of it is a genuine chronicle of persons, if not of occurrences. The Veda, the Purana, and other works forming the body of Sanskrit literature, are all named; and so is the Mahabharata, to which therefore it is subsequent. Both Buddhists and Jains are adverted to. It was therefore written before the former had disappeared; but they existed in some parts of British India as late as the twelfth century at least, and it is probable that the Purana was compiled before that period. It is discredited by palpable absurdities in regard to the longevity of the princes of the earlier dynasties, and the particulars preserved of some of them are trivial and fabulous. Still there is an inartificial simplicity and consistency in the succession of persons, and it is not essential to its credibility or its usefulness that any exact chronological adjustment of its different reigns should be attempted. Deducting, however, from the larger number of princes a considerable proportion, there is nothing to shock probability in supposing that the Hindu dynasties and their ramifications were spread through an interval of about twelve centuries anterior to the war of the Mahabharata, and conjecturing that event to have occurred about fourteen centuries B.C., the commencement of the regal dynasties of India is thus carried to about 2600 years before that date. After the date of the great war, the Vishnu Purana, in common with those Puranas which contain similar lists, specifies kings and dynasties with greater precision, and offers political and chronological particulars, to which, on the score of probability, there is nothing to object.—*Professor Wilson*, pp. 64, 70, 71, *quoted in Thomas' Prinsep*, p. 235; *Dowson; Garrett.*

VISHNU-RATHA, the car of Vishnu. This is Garuda or Guruda, an eagle, now personified as a winged man.

VISHNU-SMRITI, also known as Vishnu-Sutra and Vaishnava Dharma-Sastra, a law book of the Hindus. It was translated by Julius Jolly, and printed as the seventh volume of the Sacred Books of the East.

VISHU SANKRANTI or Vishu Sankramanam, the sun's entrance into either of the equinoctial signs.

VISISHT'HA-DWAITA, a system of philosophy, founded by the Vaishnava reformer Ramanuja. See Sri Sampradaya.

VISS, a weight of the Peninsula of India of 3 lbs. 3 oz.

VISVA-DEVA. SANSK. A class of Hindu deities to whom sacrifices are daily offered; lit. all the gods.

VISVAKARMA, in Hindu mythology, one of the gods, son of Vasu Prabhasa, and his wife the lovely and virtuous Yogasiddha. He has several names, Deva, Karu, Sudhanwan, Takshaka, and Vardhika. He is the architect of the universe, the fabricator of arms to the gods, and presides over the arts, manufactures, etc. In paintings,

he is represented as a white man with three eyes, holding a club in his right hand. Some of the most grand and beautiful of the cave temples at Ellora, Nasik, etc., bear the name of this god. One at Ellora is hewn one hundred and thirty feet in depth out of the solid rock, presenting the appearance of a magnificent vaulted chapel supported by ranges of octangular columns, and adorned by sculptures of beautiful and perfect workmanship. In the sculptured representations of this deity, he is shown in a sitting posture, with his legs perpendicular, and holding with the fingers of one hand the forefinger of the other. Sir W. Jones considers Visvakarma to be the Vulcan of the Greeks and Romans, being, like Vulcan, the forger of arms for the gods, and inventor of the Agnyastra, or fire shaft, in the war between them and the Daitya or Titans. The Visvakarma cave at Ellora is a chaitya. Its age about A.D. 600.—*As. Res.* i. p. 264.

VISVAMITRA, a Kshatriya prince of the Lunar dynasty, who claimed the right to perform a great public sacrifice, and established his claim. He was opposed by Vasishta, who claimed that to be a province of the Brahmans only. Visvamitra was the son of Gadhi or Gathin (of the race of Kausika), king of Gadhipura, and contemporary of Umbareesha, king of Ayodhya or Oudh, the fortieth prince from Ikshwaku, consequently about two hundred years anterior to Rama, and probably about one thousand four hundred years before Christ. He is mentioned in the Rig Veda, Ramayana, and Mahabharata. He is author of one of the Smriti and of a book in praise of Jwala-Mukhi. He taught that the will and decrees of God are irresistible. There are many legends about him, but all of them relate to the success of his efforts to repress the ambitious strivings of the Brahmans, led by Vasishta. According to the Ramayana, he was the fourth from Prajapati, but the Bhagavat makes him the fifteenth from Brahma. They agree in calling him the son of Gadhi, who, according to the first, was the son of Kusanabha, and, according to the second, the son of Kusamba. Visvamitra was sovereign of Kanouj, and, according to the legend, engaged in war with the sage Vasishta for the possession of Surabhi, the all-bestowing cow. In this contest the cow produced all sorts of forces, particularly M'hlecha, or Barbarians, by whose aid Vasishta overcame his adversary. There can be little doubt that this legend is an allegorical account of a real transaction, and that by the cow we are to understand India, or the most valuable portion of it, possibly the valley of the Ganges, for the sovereignty of which either two princes or two tribes, the Brahmans and Kshatriyas, contended. One of the parties, calling to their aid the aborigines, the Persians, and not impossibly the Greeks, triumphed by their means. There are other obscure legends. —*Calc. Rev.; Ramayana*, i. sect. 41–53; *Mahabharata, Adi Parva; Bhagavat*, ix. 15; *Ward*, iv. p. 42.

VISVESVARA, a form of Siva worshipped at Benares.

VISWANADA, a Tamil author of the middle of the 19th century, who distinguished himself as a playwright, and whose death was a great blow both to the Brahmo cause and the theatre. His plays are exceedingly popular, and are in no sense copies of the Sanskrit productions. That which is esteemed the finest is called the Tahsildar Natakam. The word Natakam means a drama, and the whole title fitly introduces the piece, which is a satirical comedy, intended to rebuke and expose a tahsildar who obtains the favour of and promotion from the collector by aping European customs,—who wears boots, drinks beer and brandy-pegs, rides horses, swears loudly, professes the utmost contempt for native prejudices, but is withal a confirmed scoundrel. He takes bribes, oppresses the poor, persecutes his enemies, sets up a haram, gathers money by every means fair and foul, and then scatters it in coarse pleasures and brutal riot. Such is the man that Kasi Viswanada Mudelliar undertook to flagellate, and seldom has the lash been laid on more smartly. Of course in the end the villain hero comes to most irremediable grief, to the confounding of his imitators and the outrageous joy of the people. The play, wherever performed, gains all the aid of local feeling. Its hero is always identified with Tahsildar this, Deputy-Collector that, or Police-Inspector the other. Hence unfailing crowds always rush to its performance. The play styled Dumbachari Vilasam, or the Story of a Spendthrift, in Madras is almost as popular as the Tahsildar Natakam. The hero is truly identified with a person who rushed by native society a few years since with all the glory and sputter of a rocket, but who afterwards lived in well-deserved obscurity.

VISWANATHA. Sansk. Lord of all; a name of Siva.

VISWA-NATHA, author of the Sahitya-darpana, also of the Raghava-vilasa.

VITASTA, the Jhelum or Hydaspes or Behut.

VITEX, a genus of plants belonging to the natural order Vitaceæ, the vine tribe. The species known to occur in India are—V. agnuscastus, alata, altissima, arborea, haynga, heterophylla, incisa, leucoxylon, negundo, peduncularis, pubescens, saligna, trifolia. One species, a native of Kaghan, and called Bankahu, has a wood used for making large dishes. Another, Kjeyoh, Burm., furnishes one of the woods of Burma, used for tool-handles, and much prized; a cubic foot weighs 45 lbs. The ancients considered the Vitex antiaphrodisiac; the berries, from their warm aromatic taste, must be possessed of stimulant properties. Vitex agnuscastus, a native of the south of Europe, is the longest known species; in the month of February, in the tropical region below Darjeeling, it grows in profusion by the road-side, and the air is scented with its white blossoms. It forms a shrub of about 12 feet in height. The flowers are arranged in spiked whorls. The fruit is globular, rather smaller than black pepper, with an acrid and aromatic taste, whence it is called Petit Poivre Sauvage in the south of France. The seeds are inodorous when entire, but when bruised their odour is acrid and disagreeable, the taste acrid and pepperish, very persistent. They are very rich in essential oil, and possess powerful stimulating properties. At Smyrna the powder strewed over sliced onion and applied to the stomach is deemed a certain remedy in colic. In India the fruits of V. triphylla and V. negundo have the same properties ascribed to them, and are called Filfil Burree (large pepper). — *Rohde, MSS.; Hooker, H. Jour.* p. 374; *O'Sh.* p. 485.

VITEX ALATA. *Roxb.* Mel-elow, Maleal.

A small tree found in the Nagari Hills; leaves ternate, petioles winged. It occurs in the Bombay Presidency, but is rare. Both it and V. leucoxylon have a white compact wood, apparently good for turning, as well as for cabinet-work. Its leaves and bark are used in medicine.—*M. E. J. R.; Drs. Cleghorn and Gibson.*

VITEX ALTISSIMA. *Linn.*

Myrole, ... CAN.	Mililla-gass, . . SINGH.
Katu mellau mara, MAL.	Kat miella maram, TAM.
Meeyan mililla-gass, SING.	

This tall chaste tree, in Ceylon, is common in forests, up to an elevation of 3000 feet. In Coimbatore it is a large tree, of great beauty when in flower, and frequent on the slopes of the Western Ghats. The timber was reported to Dr. Wight as fit for cabinet purposes; but Dr. Gibson says he is not sure as to the species which Dr. Wight had in his eye when he remarked on this. In Ceylon, this tree produces one of the most valuable timbers in the island for building and other purposes; very hard, fine, close-grained, and heavy. —*Thw. En. Pl. Zeyl.* p. 144; *Drs. Wight, Cleghorn, and Gibson; M. E. J. R.; Mr. Mendis; Beddome.*

VITEX ARBOREA. *Roxb., Rheede.*

H'touk-sa, . . . BURM.	Busi, ... TEL.
Kattu mellalu, . MALEAL.	Nawel busi eragu, . ,,
Kat miella, . . . TAM.	Neval adugu manu, ,,

This chaste tree is a native of the mountainous parts of the Circars, of the forests of the Godavery, at Courtallum, growing in Sylhet and Chittagong; very common at Moulmein, and found at Tavoy, Penang, and Singapore, flowering in the hot season, and the seed ripens during the rains. In the Circars and Chittagong it grows to be a very large tree, and at Moulmein it furnishes a valuable small timber. Its wood is hard, of a yellowish-brown colour, and when old is chocolate coloured, very hard and durable, which renders it useful for various ordinary purposes.—*Roxb.; Voigt; Beddome; Dr. Mason; Cal. Cat. Ex.*, 1862; *Rohde, MSS.; M. E. J. Reps.*, 1855, 1857.

VITEX INCISA. *Smith.* Man-king, CHIN. A shrub of Peh-chi-li, Shen-si, and Cheh-kiang. Its berries are given in catarrh.—*Smith.*

VITEX LEUCOXYLON. *Roxb.*

Karril, . . . MALEAL.	Neva-ledi, ... TEL.

A large tree, a native of the hotter parts of Ceylon, of both Peninsulas, Assam, and the mountains of Chittagong, not uncommon by the edges of streams in the South Konkan, and the ghat jungles of the Bombay Presidency, very common in the plains of British Burma; wood grey, deserves attention for furniture, used for cart-wheels. A cubic foot weighs 42 lbs., and average girth measured at 6 feet from the ground is 12 feet. It sells at 8 annas per cubic foot. It flowers in April.—*Thwaites; Voigt; Gibson; Brandis; Cal. Cat. Ex. of* 1862; *Rohde, MSS.*

VITEX LITTORALIS is the Puriri or oak or teak or iron-wood timber tree of New Zealand, known as the Kauwere. It grows to the height of 25 to 30 feet, and 12 to 18 feet in circumference. It is hard and very durable timber, yellow when young, but dark-brown in full-grown trees.

VITEX NEGUNDO. *Linn.*

Vitex paniculata, *Lam.*

Marwa, . . SALT RANGE.	

A shrub or small tree, common in Ceylon on the banks of rivers up to 3000 feet, in the Peninsula of India, Bengal, the Dehra Doon, and the Moluccas; common in the Siwalik, tract and up to 3500 feet in the outer hills, and occasional in the Salt Range and out in the plains. The branches are used for wattle-work in Chumba. The leaves are given for colic, and used in poultices; also, the warm leaves are a useful application in rheumatism or sprains; and the Muhammadans are in the habit of smoking the dried leaves in cases of headache and catarrh. The root and fruit likewise are officinal; a decoction of the aromatic leaves is used as a warm bath for women after delivery. In medicinal qualities it is similar to, but weaker than, V. agnuscastus. The decoction of the root is a pleasant bitter, and is given in cases of intermittent fever. Fruit considered vermifuge in Behar.—*Roxb.; Voigt; Thw.; Cleg.; Stewart; O'Sh.*

VITEX TRIFOLIA. *Linn.* Indian prenet.

Kyoung ban, . . BURM.	Kara nuchi, . . MALEAL.

The Indian prenet is a small tree found in Southern Asia, not uncommon near the sea in Ceylon, much cultivated by the Burmans; it bears a little but pretty blue flower. Both leaves and flowers are rather agreeably heavy scented. In the Dekhan it is a common shrub, generally to be met with growing in patches in moist places, appearing in April and May, but more or less throughout the year. Young shoots round and villous. Leaves slightly bitter, but of delightfully aromatic taste and smell, are deemed powerful external applications in rheumatism, sprains, etc. The powdered leaves are used in intermittent fevers. The fruit in powder is given usually in electuary or decoction, for amenorrhœa and several other diseases. The leaves are used to stuff pillows, to cure catarrh and headache. The flowers are prescribed in Behar with honey, in fevers attended with vomiting and much thirst. In the Panjab it is used in special diseases, and after parturition, also to produce appetite and increase the bile.—*Buchanan; Powell; Mendis; Thw.; Mason; Riddell; Sir William Jones; As. Res.* iv. p. 293; *Ainslie; O'Sh.*

VITHAL or Vithoba, a deified sage, who with his early expounders are largely worshipped in the western parts of the Dekhan and the South Mahratta country as local divinities. He is the popular deity in the temple at Panderpur, on the left bank of the Kistna river. He has been celebrated by Tuka Rama, a Mahratta poet.

VITIS, a genus of plants of the natural order Vitaceæ. Species growing in the East Indies are —V. adnata, angustifolia, auriculata, carnosa, cordata, elongata, glandulosa, glauca, Indica, lauata, lanceolaria, latifolia, muricata, Neilgherrensis, pallida, parviflora, pedata, pentagona,

quadrangularis, serrulata, setosa, vinifera. They are climbing plants, found in many parts of Asia, Europe, and America.

VITIS CARNOSA. *Wall., W. and A., W. Ic.*
Cissus carnosa, *Roxb.*

Kassar, ... HIND. | Mandula mari tigei, TEL.
Kani-apa tige, . . TEL. | Mekamettavi chettu, ,,

Common in hedges and forests in Bengal, and flowers in the rainy season. Remarkably aerid; roots used in native medicine.—*O'Sh.; Ell. Fl. And.*

VITIS INDICA. *Linn.* Vitis rugosa, *Wall.*
Amdhuka, BENG., HIND. | Shembra vulli, . MALEAL.

A wild, shrubby climbing plant in the plains of India, and not uncommon in hot jungles, even at a considerable distance from the foot of the mountains; common throughout the Dekhan and in the Tenasserim Provinces. This is seen creeping over every hedge and bush, and has sometimes been mistaken by Europeans for the true grape vine, but in the plains the fruit is aerid, like all the indigenous species, and not edible. In the Himalaya, however, it produces beautiful clusters of round purple berries and a large grape, which is very fair eating. The origin of the common grape being unknown, it becomes a curious question to decide whether the Himalayan Vitis Indica is the wild state of that plant,—a hypothesis strengthened by the fact of Baechus, etc., having come from the east. Dr. J. L. Stewart has not distinguished between V. Indica, V. lanata, and V. vinifera; he says V. lanata, with velvety, white or red backed leaves, appears to run into the glabrous-leaved wild one. In the N.W. Himalaya they are generally found at from 3000 to 6000 feet, and appear to give both purple and green fruit; and Dr. Thomson says that specimens of V. vinifera are scarcely distinguishable from V. Indica, *L.—Stewart; Thomson's Tr.* p. 345; *Hooker, H. J.* ii. p. 187; *Riddell; Mason.*

VITIS LATIFOLIA. *Roxb., W. and A., Rh.*

Govila, ... BENG. | Shumambu valli, MALEAL.
Vallia-pira-petica, CAN. | Bedisa tivva, . . . TEL.

Grows in Bengal and in the hills of Southern India, and is used in medicine.—*Roxb.* i. 661.

VITIS QUADRANGULARIS. *Wall.*
Cissus quadrangularis, *Roxb.*

Harjora, Hasjora, BENG. | Pirandi kodi, . . TAM.
Jangelam parinda, MAL. | Nalleru, ... TEL.
Perunda, ... TAM. | Nalla ratiga, . . ,,

A trailing and creeping plant with four-angled and winged stems, cultivated about villages; used by the natives as greens, and in the preparation of chatni. Berries aerid.—*Jaffrey.*

VITIS RACEMOSA. Wild grape, the Angur, Haljar, HIND. Used in the Panjab by zamindars as bunds or ties for their fences.

VITIS SETOSA. *Wall.* Cissus setosus, *Roxb.*

Puli-naravi, . . . TAM. | Bara butsali, . . . TEL.

Grows in the Peninsula, and is used as a medicine; is in all its parts excessively aerid, and the leaves toasted and oiled are applied to indolent tumours to bring them to suppuration.—*Roxb.*

VITIS VINIFERA. *Linn.*

Kerm (vine), . . . ARAB. | Dips, Dibs, . . . EGYPT.
Draksha, BENG., SANSK. | Angur, ... HIND.
Dakhi, Dehla, . CHENAB. | Lanang, . . . KAGHAN.

The common vine or grape vine is largely cultivated all over the world, from near lat. 55° N. to the equator, but in south latitudes it only extends as far south as 40°. In middle Germany it ceases from about 1000 to 1500 feet above the level of the sea. On the south side of the Alps it reaches 2000 feet; in the Apennines and Sicily, 5000 feet; and on the Himalaya as high as 10,000 feet above the level of the sea. Although the maximum of summer heat is as great at Moscow as in Paris, yet the vine will not ripen its fruit in the former place; for although the greatest heat of the months of June and July are as high as that of Paris, the months of August and September are several degrees below. England, also, has a mean temperature as high as many parts of the world where the vine flourishes in the greatest perfection; but although England is warmer than these countries in the winter, it is not so warm in the months of September and October, at which time the vine is ripening its fruit. There can be little doubt of its being indigenous in the east, in the district between the Black and Caspian Seas. In the forests of Mingrelia and Imiretia it flourishes in all its magnificence, climbing to the tops of the highest trees, and bearing bunches of fruit of delicious flavour. In these districts no cultivation of the vine exists, and the inhabitants seldom harvest the abundance of fruit that is produced. In many spots in France, Germany, Portugal, and Italy, the vine is found wild, but the fruit is very generally of an inferior kind, and it may be doubted whether it is truly indigenous in any part of Europe.

From its innumerable varieties, affected by different climates and soils, we have, besides grapes yielding the various wines of commerce, other sorts, which are dried, forming the raisins Valeutia, muscatel, and sultana (without seeds, from Turkey), also currants, the dried fruit of a small-fruited variety of the grape vine (*var.* Corinthiaca), cultivated in the Ionian Islands, Greece, Liparis, etc.

In the Dekhan, the plants are reared from slips taken at the time of first cutting after the rains, and when ready to be removed are put about 7 or 8 feet apart. They are for the first 12 months trained on dry sticks; after that, a large straight branch of the pangrah, Erythrina Indica, with a fork left at the top to support the vine, is placed about 12 inches from it; if put at a greater distance it is apt to give a bend to the vine which is hurtful. The vine cannot be too straight, and the length of the prop should be about 5 feet. The fruit is cultivated in the greatest perfection in all parts of the Dekhan, and the finest flavoured are found in the gardens in the neighbourhood of Dowlatabad. Its agreeable, sweet-acid flavour, when ripe, has always rendered it a very desirable food when fresh. Grapes are dried for raisins, and this is generally effected by cutting half through the fruit-stalk whilst they are suspended on the tree. The different kinds of raisins in use in India, called monuka, kishmish, and bedana, are brought chiefly from Istalik. The grapes of Kashmir are not equal to those of Kābul, possibly from the little trouble taken in rearing them. In many parts of the Panjab, the vine thrives quite as well as in Europe; it seems to be indigenous in Hazara, and possibly also in the Salt Range. Its tendency is to grow too luxuriantly, so that it all goes to wood and leaves, and this might probably be counteracted by proper cultivation and by choosing a poor, rocky soil, and

selecting suitable varieties of vine. It is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 7000 to 9000 feet; but the grape is an uncertain crop. In Kanawar, a spirit prepared from the juice is compared to grape-brandy by Hoffmeister. This spirit is called by the usual Arabic term arrack, and a wine also (sheo) is made there. The circumstance that the Hindu name is applied to this and the barley-brandy of Lahoul, would seem to imply that the art of distillation has been introduced into these countries from below. In Afghanistan, Bellew states that a grape wine is prepared, which is consumed by well-to-do Muhammadans, and a raisin wine for Hindus.—*Roxb.; Wight; Voigt; Powell; Stewart; Cleghorn; O'Sh.; Royle, Him. Bot.; Riddell, Gardening; Mason's Tenasserim.* See Raisins.

VITRIOL, vitriolic acid, sulphuric acid, Acidum sulphuricum. Vitriol was once largely manufactured on the banks of the Sone, in Shahabad, from sulphate of iron, the product of the Kymore range. It is now only a native manufacture on a small scale.

VIVERRIDÆ, a family of carnivorous animals, whose place in the order may be thus shown :—

Sub-Fam. Viverrinæ, Civets.

Viverra civettina, *Blyth.*

V. Zibetha, *Water.* | Malabar civet-cat.

Found in the forests of the Western Ghats, and is destructive to poultry.

Viverra Indica, *Geof.*, the glossy genette, the civet of Europeans, is common in the northern province of Ceylon.—*Tennent's Ceylon*, p. 32.

Viverra Malaccensis, *Gm.*

V. Malaccensis, *Gmelin.*	V. Bengalensis, *Gray.*
V. rasse, *Horsfield.*	V. pallida, *Gray.*
V. gunda, *B. Ham. MSS.*	Genetta Manillensis, *Eydoux.*

Gando-gaula, . . ,,	Sayer, ... Nepal.
Punajin bek, . . Can.	Bug-nyul, . . . ,,
Musk-billi, . . . Hind.	Punajin pilli, . . . Tel.

Found throughout India and the Archipelago. It lives in holes in the ground or under rocks. It can be quite domesticated. The Indian civet-cats secrete an odoriferous substance identical with civet, though not the civet of commerce. This species is not infrequently found in the Tenasserim villages, and its secretion enters into the Burmese materia medica.—*Blyth; Mason.*

Viverra tangalunga, *Gray*, inhabits the Malay Peninsula and the islands of the Archipelago as far east as the Philippines.

Viverra Zibetha, *Linn.*, Zibeth civet.

S.E. Himalaya, Assam, Arakan.

VIZAGAPATAM, a district of 18,344 square miles, population 2,485,141, in the Madras Presidency, lying between lat. 17° 14′ 30″ and 18° 58′ N., and between long. 82° 19′ and 83° 59′ E. A portion of the district forms part of the Northern Circars. It is a beautiful, picturesque, and hilly country, but in the greater part most unhealthy. To the west of the Eastern Ghats is situated the greater portion of the extensive zamindari of Jeypore, which is for the most part very hilly and jungly. The north and north-west of the district, which is chiefly inhabited by Kandh and Saura, is also mountainous. In the extreme north, a remarkable mass of hills, called the Neilgherries, rises to a height of 4972 feet above the sea, and these hills are separated by valleys of not more than 1200 feet from the neighbouring ranges of ghats. The present district of Vizagapatam formed, in the early days of Hindu history, a portion of the ancient kingdom of Kalinga. It was subsequently conquered by the eastern branch of the Chalukya dynasty. Wild tribes, mostly of Dravidian race, chiefly inhabit the hill country of Jeypore and the uplands which stretch through the district into Ganjam. Several castes of Aryans from Orissa and the plains of the Northern Circars have settled in this tract, among whom are a great many Uriya Brahmans. The zamindars are of the Kshatriya caste, and their retainers are Paiks, who have largely settled as cultivators. The aboriginal tribes consist of Kandh, Gond, Gadaba, and Koi. Where they have come into contact with Hindus, the cultivating Kandhs call themselves Praja (or rayats). They are thrifty, hard-working agriculturists, undisturbed by the intestinc broils which agitate the more turbulent Kandhs of the north. They entertain an unconquerable love for their native soil, and regard themselves, and are regarded by the zamindars, as the owners of it. Other Dravidians are found in the extreme north of the district as Gond, farther south as Batia, Kondha Dora, Kondha Kapu (Telugu names signifying lords of the hills and cultivators), Matiya, and Koi. Their dialects are similar. The tribes who inhabit the more mountainous parts of the Jeypore country are more manly and civilised than the others, and when treated with respect soon throw off their wildness, and become hard-working members of society. The Kandhs formerly offered human sacrifices, which the British suppressed. Saura inhabit the hills and slopes behind Palkonda and to the east of Gunapur. Vizagapatam (Visakha-pattanam, 'city of Visakha,' *i.e.* Kartikeya or Subhramanya, the Hindu Mars) is the chief town of the district, in lat. 17° 41′ 50″ N., long. 83° 20′ 10″ E.—*Imp. Gaz.*

VIZIADRUG or Viziageriah is three miles S. of Rajapur, in lat. 16° 33′ 32″ N., and long. 73° 19′ 15″ E. The fort walls are strong. It was held by Angria, and was bombarded and taken in 1775 by Admiral Watson and Clive.

VIZIANAGRAM, one of the most ancient and extensive estates or zamindaris in India, included in Vizagapatam district. It has plumbago, manganese, garnets, iron-ore. The town of Vizianagram, in lat. 18° 2′ N., and long. 83° 32′ E., is 15 miles from the sea.—*Imp. Gaz.*

VODDU or Woddu, CAN., used for catching fish, is like a large hurdle, and is frequently thrown across a stream as large as the Thames at Richmond. The Coorg race annually place woddu at the heads of the Canara rivers to catch the fish returning from spawning.

VOHORO, Wohoro, or Ohoro, properly Bohra, of Gujerat and the west of India, are traders, shopkeepers, and bankers. They are of two sections, Sulimani and Dawdi.—*Wils.*

VOIGT, C. J., author of Hortus Suburbanus Calcuttensis, published at Calcutta in 1845.

VOITURNA, the Styx of the Hindus; the river Byturni.

VOLCANOES. In the south-west of Asia, south of the Hellespont, the mountains surrounding the plains of Troy present many traces of older volcanic action, and there are a string of volcanic islands in the Ægean Archipelago. Farther south is the great crater of Santorini, formed in a prehistoric age, with islands which were produced by eruptions in 1573 and 1707.

Eastward of these, in Asia Minor, the lofty Hassan Dagh rises from an elevated table-land to 8000 feet above the sea. At its base are several cinder cones that have given vent to streams of black vesicular lava which have flowed into the plain.

From Erzerum to Kars, and thence to Tiflis and Erivan,—indeed, through almost the entire space south of the Caucasus separating the eastern coast of the Black Sea from the Caspian, as well as the country surrounding the lakes Van and Ourmia,—volcanic formations predominate. In these countries six principal 'volcanic amphitheatres' have been described by M. Du Bois de Mont Pereux, viz. 1. That of Akaltsiké, reaching from Poti on the Black Sea eastwards to the sources of the Kour river; 2. That surrounding the Lake Sevan; 3. That of Armenia, including the Great and Lesser Ararat; 4. That of Lake Van; 5. That of Lake Ourmia; 6. That of the 'volcanic valley' of Kapan. To the south of the flat valley of the Araxes, on the borders of Armenia, rise the almost insulated twin cones of the Great and Lesser Ararat. The Great Ararat, whose peak is 17,250 feet above the sea, and 14,320 above the plain of the Araxes, presents on this side, according to Abich, an enormous horse-shoe-shaped crater, called the Valley of St. James.

The Lesser Ararat is separated from the Greater only by a flat plain or Col, half a mile in width. It has the figure of a very regular pyramid or cone, truncated at the summit by a crater, which, however, appears not to have been eruptive in recent times. To the north-west of Ararat, towards Kars, Abich speaks of a vast volcanic system, called the Tantoureck, west of Bajazid; also of two great mountains (magnifiques cratères de soulèvement), called Sordagh and Aslanlydagh, and other 'volcanic ranges, Synak and Parlydagh, surrounding the high lake Balykgoell.' All of these are visible from the Little Ararat, as well as vast basaltic platforms beyond the Araxes and north of Erivan.

In A.D. 341, the mountains of Armenia are said to have split open and vomited clouds of flame and smoke. A tremendous earthquake in the year 1841 shook the two Ararats to their foundation, toppling down vast rocks from their heights, together with avalanches of ice and snow, into the valleys beneath. The shock was felt with great intensity through the neighbouring provinces as far as Shusa and Tabreez on one side, and Tiflis on the other.

Elburz, the loftiest peak of the Caucasus, believed to be upwards of 18,000 feet in height, has a crater on the summit; its lavas are chiefly trachytic.

Over the chain of the Caucasus, towards the Caspian on the east, and the Sea of Azof on the west, are scattered vast numbers of mud volcanoes, *i.e.* cones of a ductile, unctuous clay, formed by the continued evolution of a sulphureous and inflammable gas, spurting up waves and lumps of liquid mud. Some of them are 250 feet high.

The great east and west range of Tian Shan, connecting the Altai with the Koueu Lun, and through this with the elevated plateau of Persia, is said to be chiefly volcanic. Flames are also described as rising from Ho-te-keou mountain, near Turfan, 420 miles farther eastward. In the beginning of 1884, the Turkestan Gazette stated that as many as 90 distinct shocks of earthquake had been felt at Oosh since November 14, 1883. Other shocks had also recently occurred at Viernoe and Tashkend.

Syria.—The coast of Syria presents numerous indications of volcanic action. It is very subject to earthquakes, in one of which, in 1759, 20,000 persons are said to have been destroyed. The Lake of Tiberias is partly encased in basalt; and on one side a stream of recent-looking lava, a league in breadth, has run into it from the flank of a mountain at a height of nearly 1000 feet. Farther south, on the eastern border of the valley of Akaba, which continues the hollow of the Jordan to the Red Sea, are several volcanic cones.

Red Sea.—Ancient chronicles report eruptions near Medina in the years 1254 and 1276 (Humboldt, Kosmos, iv. 337). Von Hoff found porous lavas south of Mecca, in various places down to Damar, in lat. 15° N. Jabl Tier (Bird Island), in the Red Sea (lat. 16° N.), sends out vapour continually, and is composed of volcanic rock. In May 7th to 11th, 1861, volcanic eruptions occurred at Edd, on the African coast of the Red Sea, in lat. 13° 57′ N., and long. 41° 4′ E. Earthquake shocks on the 7th and 8th continued for an hour. At sunrise fine dust fell, at first white, afterwards red; the day was pitch dark, and the dust was knee-deep. On the 9th the fall of ashes abated, and fire was seen issuing from Jabl Dubbeh, a mountain about a day's journey inland.

Aden promontory, just outside the Straits of Bab-ul-Mandab, is entirely volcanic. The town of Aden occupies the bottom of a well-defined breached crater a mile and a half in diameter, encircled by precipitous walls from 1000 to 1800 feet high, and backed by still higher masses of volcanic rock. Pumice is regularly mined for export. There is, however, no record of this crater being active.

Socotra, opposite Cape Guardafui, has a volcanic peak, called Jabl Hajier, 5000 feet in height.

Makran and Cutch.—Proceeding eastwards, on the littoral of the Arabian Sea, in Hinglaj, or Makran, the ancient Gedrosia, are a series of mud volcanoes in continuous action. They are known to the Hindus as the Rama Chandra Kup, and are visited by pilgrims, who regard as miraculous the periodical elevation of the semi-liquid mass.

Cutch is farther eastwards. In June 1819 it had a severe shock of an earthquake, by which some hundreds of the inhabitants perished. At sunset, the shock was felt at Sindri; its little brick fort was overwhelmed by a great wave, which converted a hard and dry tract into an inland lake, extending for 16 miles on each side of Sindri, while 5 miles north of that place there arose a mound of earth, about 10 feet high, extending nearly east and west about 16 miles, and crossing the Pharran river, which was cut off from entering the sea. The natives called the mound Allah Band. A flood of the Narra of 1826 partially reopened it.

The *Peninsula of India*, in its central and western portion, between lat. 17° and 21° N., has been overflowed in prehistoric times by waves of basaltic lavas, which alternate with a fresh-water deposit, usually calcareous. The basalt forms elevated plateaux of many miles in extent, and seems to have flowed horizontally, in repeated sheets, over the bottoms of shallow tertiary lakes; but from what particular vents does not now appear, as only one crater at the Lunar Lake has been traced. The basalt is often amygdaloidal, contains much augite, and is occasionally nodular in structure rather than columnar. It has altered many of the sandy beds on which it reposes, or among which its dykes have penetrated, into jasper and other metamorphic substances (Hislop and Hunter, Journ. Geol. Soc. xi. p. 370). Farther south, on the eastern side of the Peninsula, in the Ongole, Guntur, and Nellore districts, and towards Madras, slight shocks of earthquakes repeatedly occur, and noises are heard there and in the Vinukonda taluk.

Coast of India.—Along the littoral of the Bay of Bengal, about 10 feet below the surface are beds of tenacious black clay, embedded in lacustrine remains. In the year 1757, a volcanic island arose off Pondicherry, south of Madras, and, after remaining for several days above the water, throwing out smoke and flame, it disappeared. About the same time, Cheduba (lat. 18° 40′ N.) and the islands along the shores of the Arakan coast were suddenly raised about 10 feet, having twice before, at intervals, as is supposed, of half a century, sustained similar upheavals. In 1762, during a violent earthquake, a mountain had sunk and disappeared near Chittagong; another had sunk down until the summit alone remained visible, and 60 square miles of sea-shore were permanently submerged (Dr. Buist, Bombay Geog. Soc. Journ. for 1856, p. 8). The island of Ramree (lat. 19° N.) is said to have been in violent eruption in March 1839; and, on the 10th January 1869, districts a little farther northwards suffered greatly from an earthquake, of which Asoloo was the centre. Sand and hot water came up, forming cones in several places. Silchar, Wongong, and places as far up into the Gangetic delta as Monghir, suffered a good deal.

Barren Island, in the Bay of Bengal, east of the Andaman Isles, is a permanently active volcano, with a cone about 4000 ft. high, rising in the centre

of a circular cliff-range which entirely surrounds it except at one point, where the sea has broken in. The explosions of this volcano recur regularly at intervals of about ten minutes. North of this (lat. 13° 24′ N.), the island of Narcondam has shown volcanic activity. It is a cone 700 feet high, with streams of lava visible on its flanks.

In *Eastern Asia* a great volcanic band stretches from near the arctic circle at Behring's Straits to the antarctic circle at Victoria, and its focus may be regarded as lying between Borneo and New Guinea. From this centre there radiate a number of great lines, along which the volcanic forces are exhibited in the most powerful manner.

The first of these extends northwards through the Philippines, Japan, the Kuriles, and Kamtschatka, giving off a branch to the east which passes through the Aleutian Islands and the Peninsula of Alaska. This band is continued towards the S.E. in the New Britain and the Solomon Islands, Santa Cruz, New Hebrides, New Zealand, and South Victoria.

Also, east and west from the great central focus there proceed two principal branches. One of these extends easterly through the Navigators' Islands and Friendly Islands as far as Elizabeth Islands. Another passes westerly through Java, and then turns north-westward through Sumatra, the Nicobars, the Andamans, and along the coast of Burma and Arakan.

In this great band, besides the 150 or more volcanoes which are known to have been in a state of activity during the historical period, there are several hundred very perfect volcanic cones, many of which appear to have recently become extinct, or are merely dormant.

For long distances, these chains of volcanic action are almost continuous, the only considerable breaks being between New Zealand and New Hebrides on the one hand, and between New Zealand and South Victoria on the other.

The chains on the east of Asia form the most remarkable train of volcanic vents visible upon the surface of the globe. It extends through 60 degrees of latitude,—from the north of the peninsula of Kamtschatka, beyond the point where it meets the transverse chain of the Aleutians, threading the Kurile, Japanese, and Loo-Choo insular ranges, almost touching the coast of China in Formosa, then stretching due south through the Philippines, whence several loop-lines appear to branch off, through Borneo, Celebes, the Moluccas, and New Guinea, in sweeping and almost concentric curves. These again unite on the south in the great east and west chain of almost continuous volcanic heights, from Timor Laut, through Flores and Java, bending once more northwards in Sumatra and the Andamans. The interior of this grand curvature is occupied by the great peninsula of Cochin-China and island of Borneo, whose rounded coasts repeat it with parallel concentric outlines.

Pou-fai-gnai and Pou-fai-noi, the Great and the Little Fire Mountain, are two active volcanoes near Muong-Luoc, in the kingdom of Luang Parbanin, Northern Laos.

In the peninsula of Kamtschatka there are 12 active volcanoes; in the Aleutian Islands, 31; and 3 in the peninsula of Alaska. The chain of the Kuriles has at least 10; the Japanese Islands and the islands lying to the south of Japan, 25; and at the present time there are 50 active volcanoes in the great group of islands lying to the S.E. of the Asiatic continent.

There are four active volcanoes in New Guinea, one or more marine volcanoes; several vents in New Britain, the Solomon Islands, and the New Hebrides; three active volcanoes in New Zealand. In the direction of Victoria Land, within the antarctic circle, Sir John Ross observed two lofty fire-emitting volcanic mountains, appropriately named by him (after his ships) Mounts Erebus and Terror.

New Zealand has a considerable area covered by the products of very recent eruptions. In the northern isle, Mount Egmont (8960 feet high), a truncated cone, with a smaller ash-cone on its summit, is occasionally active; its mass consists of clinkstone, lavas, and scoriæ. So likewise are Tongariro (6200 feet), in the centre of the widest part of the island, and Ruapahu (9000 feet), rather more to the south. The lake of Taipu, at the foot of Tongariro, is surrounded by hills of pumice and ash; and thence, in a N.E. direction, a line of solfataras and hot springs extends to the coast of the Bay of Plenty, in the centre of which, White Island, a volcano of considerable activity, rises from the sea.

Bourbon, in its western half, consists of the skeleton of a great early volcano, with crateral cavities, nearly encircled by precipitous rocks of trachyte, clinkstone, and basalt. The principal summit, Gros Morne, rises 10,000 feet above the sea. At the eastern end of the island is a volcano, 7000 feet high, still active, with small lava cones on its summit.

The following are the more important of the active volcanoes in the regions noticed in the above outline:—

Ararat, Great, 17,250 feet, borders of Armenia.
Ararat, Lesser.
Elburz, in the Caucasus, 18,000 feet.
Tian Shan range has Peschan, an active volcano, also Ho-te-keou, near Turfan, 420 miles east of Peschan. In the Komp district, province of Kham, in 1820, a village was destroyed by the earth opening. At Kham, N.E. of Lhassa, in 1845, a great earthquake; about 3000 people were killed and a goomba destroyed by the earth opening.
Ægean Archipelago.—Santorini crater, with the Great and Little Kaimeni Islands, formed 1573 and 1707.
Asia Minor.—Hassan Dagh, elevation 8000 feet.
Red Sea, Jabl Tier.—Edd Island, lat. 13° 57′ N., in eruption 7th and 8th May 1861; Medina, volcano in eruption 1254 and 1276; Zebayer Islands, 6th to 14th August 1846, a violent eruption.
Aden, crater extinct.
Bourbon.—Pitou volcano.
Comoro Islands have an active volcano.
Nerbadda.—Dumoh pahar, 27th May 1846, an earthquake.
Kattyawar, off Porbandar, October 1849, a submarine volcano poured forth poisonous gas, manifest for 30 or 40 miles out at sea; myriads of fish poisoned by it were floating on the surface of the ocean.
Cutch.—Bhooj earthquake, 16th to 20th June 1819, and on latter date the Denodour volcano burst out.
Hinglaj, along the seaboard of Lus, W. of Kurachee, several mud volcanoes, called Chandra Kup, constantly active.
Cochin, off the coast, the island of Vaypi rose from out of the sea A.D. 1341.
Pondicherry, off the coast, in lat. 11° 55′ N. In July 1757, fires were seen to break out on the surface of the sea, 3 or 4 leagues from the shore, throwing up stones and pumice.
Arakan.—Cheduba Island, lat. 18° 50′ N., and long. 90° 40′ E.; its volcanoes emit hot water, mud, and

stones, with flames. Regwan Island, raised about 1757? or 1760. On 29th July 1843, a small island appeared, and in a month again sank.

Khyouk Phyoo, a small volcano constantly active. On the 6th January 1845, volumes of flames burst from the sea.

Chittagong.—April 18, 1672, 60 square miles of lowland were permanently submerged; the mountain Ceslung-toom disappeared, and another sank so that only its summits were visible.

Bay of Bengal, east coast from Akyab to Cape Negrais is rising.

Burma.—At Memboo village, nearly opposite Magh-We, on the Irawadi, and at Grobagan, are mud volcanoes 15 feet high.

Barren Island, in lat. 12° 16′, long. 93° 54′, 1800? feet high, constantly active.

Narcondam Island, in lat. 13° 22′ N.; its cone is 800 feet high.

Sumatra has four active volcanoes.

Priamang is 20 miles inland from Bencoolen.

Gunong Dempo, 12,000 feet high, constantly emits vapour.

Simo, one of the Batu group, on the W. coast of Sumatra.

Java, according to Dr. Junghuhn, has 45 volcanic cones, of which 28 are in activity, in continual or occasional eruption. See Java.

Gunong Guntur, in eruption in 1800, poured out torrents of white acid and sulphurous mud.

Mount Slamak peak, 11,330 feet.

Ungarung peak, 5000 feet.

Telaga Bodas, old crater.

Tengger Mountains, old volcano, 8700 (7500?) feet above the sea. It has four cones of elevation, all of them in eruption; Bromo in 1866.

Papandayang, 7034 feet high, in S. of Java, lat. 8° N., in eruption in 1772.

Galung-gong, a few miles N.E. of Papandayang, in eruption 8th July 1822.

Gunong Raon, 10,180 feet high.

Merapi and Kloet, in eruption 1864, and Merapi 15th April 1872; many perished. Ashes fell at Solo for three days. The cone of 9000 feet was reduced to 5000 feet.

Lombok, volcano 7500 feet high.

Bali, volcano in eruption 1803.

Sumbawa.—Timboro, eruption 5th April 1815; 12,000 people destroyed; sounds heard 1000 miles off, and Java obscured.

Sarawak.—Gunong Api.

Gilolo.—Volcano in 1673 threw up much pumice.

Celebes.—Peninsula of Mucado has six volcanoes.

Amboyna, wholly volcanic; fearful eruption in 1694, another in 1820, and now emits sulphurous vapours and hot mud.

Moluccas.—Sorea Island, in 1693, entirely desolated by an eruption.

Ternate, wholly a volcano, 5755 feet high, in eruption in 1608, 1635, 1653, 1673, 26th February 1838, 25th March 1839, 2d February 1840. In 1673 ashes fell at Amboyna. In 1840 nearly every house was destroyed.

Banda.—Gunong Api, S. of Ceram, 1800 feet high, is seldom at rest, was burning from 1587 to 1824.

Matchian, N. of Batchian, and 50 miles from Ternate, in eruption 1646, and rent open 29th December 1862, when ashes fell at Ternate.

Timor, in violent eruption 1638, and a lake formed and peak disappeared.

Pulu Batu, N. of Flores, in 1850 in eruption.

Flores has three active volcanoes. In 1836 in eruption.

New Guinea.—Tanna volcano, in 1871 in eruption.

Sanguir Island has Abo volcano at its northern part, in eruption in 1711, also March 1856.

Alaska Island.—Ilaman peak, Behring Strait, 11,600 ft.

Unalaska or Matusch Kui Island, 5474 feet.

Unimak, 8076 feet.

Tanaga Island.

Kamtschatka has a group of volcanoes—

Krestowik, in lat. 56° 4′ N.

Klutchewsk, 16,500 feet high, in violent eruption from 1726 to 1731, and again in 1767, 1795, and 1825.

Uschinskaja Sopka, lat. 56° N., is nearly connected with Klutchewsk.

Tolbatschi, lat. 55° 51′ N., is 8313 feet high; discharges smoke and ashes from frequently shifting vents.

Schiwelatsh, on the north of the group, in lat. 56° 40′ N., and 10,544 feet high, has two summits; was in great eruption in 1739, and between 1790 and 1810 and 1854.

Japanowa, lat. 53° 32′ N., and 9055 feet high, sends forth continuous smoke.

Koriatskaja, in lat. 53° 19′ N., and 11,210 feet high, has much obsidian.

Awatska, in lat. 53° 17′ N., and 8910 feet high, in violent eruption in 1837.

Kurile Isles, chain is 720 miles long.

Paramouchir contains an active volcano.

Alaid, on its east, 12,000 feet high, in violent eruption in 1770 and 1793.

Formosa Island has four volcanoes.

Tschy-kang or Red Mountain, often in eruption.

Japan.—Yedo or Jeddo Island has AsamaYama volcano, in lat. 36° 22′ N.; in 1783, disastrous eruption, and still active.

Jesso Island has 17 conical mountains; the Usugatali or Mortar Mountain and Kajo Nore are burning.

Fusi Yama, in lat. 35° 18′ N., and 12,443 feet high, uprose B.C. 286. It has been in eruption A.D. 799, 863, 937, 1032, and 1707, and since has been quiescent. It is visited by pilgrims.

Mitake Island, in the Bay of Kagosima; Ounga on the W. coast.

I'wo-sima is S. of Kiou Siaou, lat. 30° 43′ N.

Oho-sima, lat. 34° 42′ N., was seen in eruption in 1797. From Oho-sima a line of volcanic islands runs south to Fatsi Sjo, in lat. 33° 6′ N., and thence to Bonin Islands, in lat. 26° 30′ N.

Asama Yama, near Wada Toge, has two active craters near the town of Oiwake.

Koosima and Oosima are two small volcanic islands between long. 139° and 140° E., near Cape Sangar.

In Kamakatka are seven volcanoes.

In Risiri Island is Langle volcanic peak, 5100 feet high.

In Niphon there are nine craters, one of them 12,000 feet high. Jake-yama, in lat. 41° 20′ N., at the N.E. extremity of Niphon, and another of same name, in lat. 36° 33′ N., are active.

In Kiou Siaou, five active volcanoes. The greatest is Wun-sen-ta-ki, on which is perpetual snow; it is worshipped. In 1793 an eruption occurred which destroyed Sima-Bara, with nearly 53,000 inhabitants. It is in lat. 32° 4′ N., E.S.E. of Nagasaki, and 4110 feet high.

Aso Yama, in lat. 32° 45′ N., is E.S.E. of Nagasaki, and Kirisima is in lat. 31° 45′ N.

Philippines.—Tael, in Luzon, in 1716 a terrific eruption, more violent in 1754, 7th August, 3d November to 12th December; detonations heard 300 leagues distant.

Mayon Island, 3200 feet high, is constantly ejecting smoke and scoriæ, and was in eruption in 1767, with a stream of lava.

Luzon has eleven volcanoes, one 3200 feet high, in eruption 1800 and 1814. Banajao is 7020 feet high.

Mindanao Island, in eruption 1640; ashes fell in Borneo and throughout the Moluccas.

Aringuay, in the province of Iloco, on 4th January 1641 broke out terribly at the same time with the volcano of Iolo and the Sanguie in the south of Magindanao, and the noise was heard at Cochin-China.

Manilla.—In 1645, for two months a succession of fearful earthquakes; in Cagayan a mountain overturned, 3000 lives lost; overthrown by an earthquake 3d June 1863.

Sandwich Islands.—Hualalei, on the W. coast of Hawaii, is active. Mauna Loa, 13,370 feet high, is in frequent eruption. The eruptions in 1843, 1852, August 1855, and 30th December 1865, were very severe.

Hawaii has Mauna Roa, 4300 metres high, is active; in eruption in 1833, and 1843, and 1855.
New Hebrides.—Tauna Island, lat. 19° 32′ N., in eruption at 10 A.M. 10th January and 11th February 1878, accompanied with an earthquake and a tidal wave.
Ladrones have three or four active volcanoes.
Fiji Islands have several extinct craters.
Navigators' Islands are to the north of the Friendly group, and to the south of the Fiji. The peak of Tafua, 2138 feet high, is always burning. Two others, Assia, 2576 feet, and Upala, 3197 feet high, are surrounded by fields of lava.
Niua, or Good Hope Island, in lat. 16° 5′ S., and long. 176° W., is one of the Friendly Islands; about every second year fire and lava burst from several parts of its surface.
Galapagos.—Chatham Island, 1200 metres high, has an extinct volcano.
New Zealand.—Tangariro, 2000 metres high.
Victoria Land, discovered by Sir James Ross.—Erebus and Terror volcanoes, active.

—*Moresby; Bennett; Logan; Bikmore; Wallace; Mrs. S. Elders; E. K. Kane; Lt. Burnes; Dr. Buist; Scrope*, p. 468; *J. W. Judd, Volcanoes; De Carne*, p. 189.

VOLOGESES, a Parthian king, successor to Gotarzes. Josephus tells us that Vologeses, on his accession, made over the province of Media to his younger brother Pakores, and Armenia to Tiridates, another younger brother. The Vologeses of the Greeks is, however, supposed by Lassen to be the Abagasus or Abalgasius, one of the Greek successors to Alexander in Arian Abakhafasa, A.D. 70 or 80.

VONONES, B.C. 100, called Balahara, supposed to have been a Parthian satrap who asserted independence, and created a kingdom for himself out of the dominions of Azilises.

VOOCH, or Korah, a pass on the border of the Ushterani Hills, nearly opposite Dehra Futteh Khan, constituting the boundary line between the Pathan and Baluch tribes. The Baluch tribes extend along the lower half of the Dehrajat frontier.

VOPA-DEVA, a Hindu grammarian who lived at Devagiri about the 13th century A.D., author of the Mugdha-bodha.

VORKAY, an island of the Eastern Archipelago, of great importance for the pearl fishery. Eight miles eastward lie several small islands, between which and Vorkay the trepang banks are situated. At low water, families wade from Vorkay towards these isles, carrying baskets at their backs, and having in their hands a stick provided with an iron point with which to take up the trepang. When the water is deeper than this, they make use of canoes. For pearl fishing on the banks situated at a greater distance, the Alfoer race use a prahu in which they embark their entire families. These vessels have a great beam, and the stern runs up into a high curve, while two planks project forward from the bows. The family reside in three or four huts composed of atap or Nipa fruticans leaves, erected within the vessel, and a railing runs entirely round it, apparently to prevent the children from falling overboard. The prahu is propelled by a large sail made of rushes, which folds up like a fan (in a manner similar to the sails of a Chinese junk), set upon a tripod mast of bamboos, while it is steered with two rudders. Two other masts are also erected, which answer no purpose but that of displaying several small flags. The pearl fishery is thus carried on. The trader makes an agreement for so much a hundred oysters, paying in advance a certain quantity of arrack, cloth, etc. The oysters are mostly small and black, in from 24 to 30 feet of water. The blood often bursts from the nose and mouth of the diver, and numerous sharks are there. In engaging these people, it is necessary to pay off their debts, and, free from this encumbrance, they will readily proceed to any part of the Archipelago.—*Earl, Ind. Arch. Papuans.*

VOWS. Luke v. 14, 'Offer for thy cleansing, according as Moses commanded.' A Hindu, after recovering from sickness, presents the offerings he had vowed when in distress, as a goat, or sweetmeats, milk, or anything directed by the Shastras. In Bengal, rarely is a child sick, or a cow in parturition, but milk is vowed to the lares or penates. In Mysore, when a Hindu woman fulfils a vow to the idol of the Annumomia temple, she covers herself with margosa leaves, formerly it is said over her naked person, but now outside her clothes. The Vrata of the Hindus are unconditional vows to perform certain religious ceremonies. Mununu is a conditional vow, promising to present offerings on condition that the god bestow such or such a benefit. The Vrata is a vow or an obligation superadded to a religious or moral one.—*Ward's Hindoos*, ii. p. 75.

VOYSEY, H. W., Assistant-Surgeon H.M. 67th regiment. He was attached to the Trigonometrical Survey under Colonel Lambton. He wrote several valuable reports on the Geology of the Peninsula of India; on the Diamond Mines of Southern India (As. Res. xv. p. 120); on the Mosaic of Agra (ibid. p. 429); the Geology of Nagpur (ibid. xviii. p. 123); and on the Shells of the Gawilghar Range (ibid. p. 187).

VRIHASPATI, the planet Jupiter. Vrihaspati chacra, the cycle of 60 years, which gives a specific name to all the solar and luni-solar year. Vrihaspati mana, the year of Jupiter, during which he describes one sign of his orbit. The Telugu astronomers make no difference between this and the common solar year. Vrihaspativara, Thursday; Sukravara, Friday; and Sanivara, Saturday. In Hindu mythology, Vrihaspati is the guru or priest of the Devas, whom he once deprived of his blessing, in consequence of which they suffered greatly. The word is from Vrihat, great, and Pati, lord. See Graha.

VRIHAT-KATHA, the original Sanskrit book which is known to Europeans through the Arabic translation into the Alif Laila, or One Thousand and One Nights. The Sanskrit name means Great Story. It is a large collection of tales, from which also the Kathasarit-sagara was drawn.—*Dowson.*

VRIHAT SANHITA, an astronomical work by Varaha Mitra, who lived about the beginning of the 6th century of the Christian era.

VRIJ, the country of the Suraseni of the Greeks. In the tract of country lying between the Gandak and Mahanadi rivers, which is 300 miles in length by 100 miles in breadth, there are several ancient cities, some of which may possibly have been the capitals of the eight different clans of the Vriji, Vaisali, Kesariya, Janakpur, Navandgar, Simrun, Darbanga, Puraniya, and Motihari. In the time of Buddha, also, the Vriji were divided into eight clans, as the Lichhavi, the Vaidehi, the Tirabhukti, and others whose names are unknown.

Nothing presents so great a contrast, as the poor, slovenly appearance of the Vrij-bashi men, and the delicate features and the brilliantly fair complexion of the Vrij-bashini. The Vrij-bashi are a more pastoral people than their richer brotherhood of Muttra. There are about 5000 Vrij-bashi, out of which 200 families follow the profession of Panda. The Vrij-bashi are Dobay; their brethren of Muttra are Chowbay. The principal business of a Panda is to keep a look-out for pilgrims. In the midst of the town of Vrij is the handsome tomb of raja Ranjit Singh, who defended Bhurtpur so bravely against Lord Lake's army. Inside the dome of the tomb, the siege of Bhurtpur is represented. Lord Lake is dismounted, and standing before his white horse giving orders to his soldiers. On the opposite side of the dome, Ranjit Singh, in a plain white dress, is standing erect before his idol, at his devotions, with his ministers behind him. On the other two sides he is at his favourite field sports.—*Tr. Hind.* ii. p. 95; *Cunningham, India*, p. 448.

VRINDA-VANA, Sansk., from Vrinda, thick, and Vana, a forest, a village on the right bank of the Jumna, near Mathura, commonly called Bindraban. It is said to have been the site of a forest in which Krishna, as Gopala or the cowherd, passed his youth, associating with Gopin cowherds and shepherdesses grazing cattle. It is the original country of the Yadu. It is a holy Hindu town, and in a boat a most picturesque view may be obtained of it, presenting a panorama of great beauty. The circumstance which imparts most to the sacred character of Bindraban, is its having been the seat of the early revels of Krishna, the Apollo of the Hindus, Mathura or Muttra being his birthplace. Many a Hindu Anacreon courts the muses with lays dedicated to this youth, prominent in Hindu mythology, and minstrels and maids join in soft strains to his praise. Bindraban is noted for the manufacture of pretty toys made of a composition that may be mistaken for a mineral. Indeed, the vendors pass them off as such, and to enhance their value declare that they are brought from Jeypore, where articles of this description and marble toys especially receive a fine finish. The Vallabhacharya sect of the Vaishnava Hindus have many hundreds of their temples at Mathura and Bindraban. At Benares and Bindraban, the annual dances constituting the Ras Yatra, in commemoration of Krishna and the sixteen Gopi, are performed with much display.—*French, Tour of India*, p. 214.

VRISHA, Sansk., or Nandi, is the sacred bull of Mahadeva or Siva. It is his vahan, and by some described as the emblem of justice. In the Institutes of Menu, c. 8, v. 16, the divine form of justice is represented as Vrisha, or a bull; and the gods consider him who violates justice as a Vrishala, or one who slays a bull.

VRISHASPATI, son of Ungira, a Hindu philosopher who is said to have written several law books. The Skanda Purana describes him of a yellow complexion, and well dressed. His wife's name was Tara. This seems to have been the Vrishaspati who was the founder of a philosophical school of the Hindus. He asserted that the whole of the Hindu system was a contrivance of the priesthood to secure a means of livelihood for themselves. —*As. Res.* xvi. p. 5; *Ward*, iv. p. 24.

VRISHOTSARGA. Sansk. Letting a bull free at certain Hindu ceremonies, such as a marriage, a funeral, etc. The bull is considered sacred, and wanders about unmolested and unappropriated.

VRITRA, otherwise called Vritasura, also Ahi, in Hindu mythology, the personification of the rain-cloud, with whom Indra, the lord of thunder, battles. He is one of the deities of the Vedas. Vritra in the Rig Veda is described as a serpent-shaped demon, who stole the rain-producing clouds of heaven. It was destroyed by Indra. The Greek Apollo pierced with his lance the demon python; it is the sphinx of Œdipus, the dragon in the story of Perseus, the Zohak in the mythology of Persia, and the Ortheros of the Greeks, who guards the gates of Hades, attended by Cerberus, the Vedic Sarvara. He is the demon of drought and ungenial weather, with whom Indra, god of the firmament, is constantly at war, constantly overpowering, and compelling him to release the rain.—*Dowson; Garrett; Thomas' Prinsep's Antiquities.*

VUL or Iva, the Chaldee god of the atmosphere, the rain-giver.

VULPES, the fox.

Taaleb, ... Arab.	Nomri, ... Hind.
Shual, ... Heb.	Robur . . of Kandahar.
Lomri, ... Hind.	Kokri, ... Mahr.

Vulpes Bengalensis, *Jerdon, Shaw, Bly.*

Canis rufescens, *Gray.*	C. chrysurus, *Gray.*
C. kokri, *Sykes.*	C. xanthurus, *Gray.*
C. corsac, *Auct.*	
Konk, Kemp-nari, Can.	Khek-sial, . . . Hind.
Chandak-nari, . . ,,	Konka nakka, . . Tel.
Lumri, Lokri, . . Hind.	Gunta nakka, . . . ,,
Kokri, Khekar, . ,,	Poti-nara, ... ,,

This fox occurs throughout India and the adjacent countries, but varies both in size and colour in different localities, generally of a greyish-brown with a fulvous cast, passing in some cases to Isabella. It is always variegated above with the intermixture of whitish hairs. It is a very pretty animal, but much smaller than the European fox, with a short head, very sharp muzzle, oblique eyes, nut-brown irides, very slender legs, and very bushy tail trailing on the ground. Its principal food is rats, land crabs, grasshoppers, beetles, and fruit; the mango and custard apple are largely eaten. It always burrows in open plains, runs with great speed, doubling like a hare; but instead of stretching out at first like the hare, and trusting to its turns as a last resource, the fox turns more at first, and if it can fatigue the dogs it then goes straight away.

Vulpes ferrilatus, *Hodgs.* (Cynalopex ferrilatus, *Blyth*), a pretty, small fox of Tibet.

Vulpes flavescens, *Gray*, Silver fox.

Vulpes montanus, *Hodg.* | Bobur . of Kandahar.

This species is numerous in the valleys around Kandahar, hiding in burrows and holes in the rocks. It is about two feet long from the nose to the insertion of the tail, and the tail is about seventeen inches; height at shoulder about fifteen inches. Its tail is yellowish, back rather darker, inclining to brown, face and outer side of fore-legs and base of the tail pale-fulvous, spot on the side of the face just before the eyes, the chin (breast), the front of the fore-legs, a round spot on the upper part of the hind foot, and the tips of the hairs of the tail blackish, end of tail white, and ears externally bladic. The skins are soft, and are made into the neemchah and postin.

Vulpes fuliginosus, *Hodg.*, Thee-ke, TIB., is of Sikkim and Tibet.

Vulpes Griffithii, *Blyth* (V. flavescens, *Blyth*), is of Afghanistan.

Vulpes leucopus, *Blyth*, the desert fox of N.W. India, Cutch, Panjab.

Vulpes montanus, *Pearson*, Hill fox.

Canis vulpes montanus, *Pears.*	Vulpes montanus, *Gray.*
C. Himalaicus, *Ogilby.*	V. Nepalensis, *Gray.*

The hill fox of the Himalaya ranges up to the snow limit; and in winter, when the snow is on the ground, they are very numerous about Simla, coming close to the houses in search of offal. Its fur is exceedingly rich, dense, and fine, the longer sort measuring fully two inches upon the back, and the inner everywhere of considerable length and woolly character. General colour pale-fulvous, head mixed with white, tail bushy and white tipped. V. montanus was not seen by Dr. Adams beyond the wooded regions of Kashmir, and is evidently replaced by the silver fox, V. flavescens, which is not, however, partial to the barren regions of Ladakh, but is also to be met with on the tops of the Southern Panjab. V. montanus is generally distributed over the lower and middle regions of the Himalaya, up even to the limits of frost. Although often seen during the day, its depredations are chiefly at night, when it prowls about houses after poultry; and in the jungles, when it preys on kalij pheasants and other birds. This handsome species is readily recognised by the rufous on the back and pale-fulvous on the legs.—*Adams; Jerdon; Horsburgh.*

Vulpes pusillus, *Blyth* (V. flavescens, *Blyth*), Panjab fox. Salt Range.

VULTURE. Naturalists arrange the vultures variously. Jerdon classifies them as Vulturinæ or true vultures, Neophroninæ or scavenger vultures, Gypaetinæ or Lammergeyers, Sarcoramphinæ, American vultures, and the Gypohieracinæ or Angola vultures. The Indian birds are:—

Sub-Fam. Vulturinæ, True Vultures.
Vultur monachus, great brown vulture.
Olygyps calvus, black vulture.
Gyps Bengalensis, white-backed vulture.
G. fulvus, large tawny vulture.
G. Indicus, long-billed brown vulture.
Sub-Fam. Neophroninæ, Scavengers.
Neophron percnopterus, *Linn.*
Sub-Fam. Gypaetinæ, Bearded Vultures.
Gypaetus barbatus, bearded vulture.

The Egyptian vulture, Neophron percnopterus, also called Pharaoh's chicken, is a native of E. Europe, Asia, and Africa. In the temperate regions of the Himalaya it follows man wherever he congregates, and on the plains of India its gaunt, forbidding figure is seen stalking among all animal refuse. It is the smallest of the tribe found in the east, its total length seldom exceeding 26 inches. The vulture and crane, which soar high in the heavens, are sometimes called garuda and geed. Vultur monachus has been met with at Ambala. One shot there in 1866 weighed 17 lbs., and was 8 feet 2 inches in wing measurement.

VYAN MATA, the kula-devi or tutelary goddess of the house of Esupgol of Bunder-deva, whose daughter married Bappa.

VYASA in Sanskrit means distributor; in this Vyasa is kindred to the Greek Homeros, ἁμ and ἀρ. It is a literary title common to many old authors, but is especially applied to the Vyasa who arranged the Vedas, and who is also styled Saswatas, the immortal. His ordinary name is Krishna Dwaipayana. The name is also given to the compiler of the Mahabharata, to the founder of the Vedanta philosophy, and to the arranger of the Puranas; and the Puranas mention 28 Vyasas. The names given in the Kurma, Vayu, and Vishnu Puranas of the Vyasa are as under:—

Swayambhuva (Brahma).	Trivrishan.	Vena or Rajasravas.
Prajapati or Manu.	Bharadwaja.	Saumasushmyana or Trinabindu.
Usanas.	Antariksha.	Riksha or Valmiki.
Brihaspati.	Vaprivan.	Sakti.
Savitri.	Trayyaruna.	Jatukarna.
Marityu or Yama.	Dhananjaya.	Krishna Dwaipayana.
Indra.	Kritanjaya.	
Vashishta.	Rinajaya.	
Saraswata.	Bharadwaja.	
Tridhaman.	Gautama.	
	Uttama or Haryatman.	

the last of whom, Krishna Dwaipayana, was the most celebrated. He is said to have compiled the Vedas, written the Mahabharata, composed some of the Puranas and compiled the rest; but to have done all this was quite beyond any individual's power. Krishna Dwaipayana was the son of Parasara by Satyavati, a fisherman's daughter. Parasara met Satyavati when quite a girl, when crossing the river Yamuna (Jumna) in a boat. Their son Vyasa was called Krishna from his swarthy complexion, Dwaipayana because born on an island, and Kanina because of his illegitimacy. His mother afterwards married king Santanu, and had two sons; the elder was killed in battle, and Vichitra-Virya, the younger, died childless. Krishna Dwaipayana became the spiritual father or preceptor of his nieces, the daughters of Vichitra Virya, the son and successor of Santana. He preferred a life of religious retirement, but, in accordance with law, and at his mother's request, he took the two childless widows of her son Vichitra-Virya, and by them he had two sons, Dhritarashtra and Pandu, between whose descendants the great war of the Mahabharata was fought. Arrian gives the story thus: 'He (Hercules) had a daughter when he was advanced in years, and, being unable to find a husband worthy of her, he married her himself, that he might supply the throne of India with monarchs. Her name was Pandea, and he caused the whole province in which she was born to receive its name from her.'

One Vyasa was the propounder of the Vedanta philosophy or psychology. This Vedanta of Vyasa considered all existing beings and things to be an evolution of the deity in and throughout all beings and things. Sankaracharya went further, and declared that the soul of man is a part of the deity, not different, but confined in the body as a temporary prison, and on the death of the body flowing back to the deity.—*Rajasthan*, i. p. 30; *Rev. W. Taylor.*

VYAS RISHI, a sacred pool at the Rotang pass, the source of the Beas river, 13,000 feet above the sea. Endrasa is at the site of the confluence of the Beas and Sutlej rivers.

VYGAH, a river in Madura, lat. 10° 17′ N., long. 71° 37′ E., runs S.E. into the Bay of Bengal, after a length of 130 miles. The large anicuts upon it are Coonoor, diverting a stream of same name, Parea, Anai, and Chittanaik.

VYHRITIS. SANSK. These are the mysterious words Bhur, Bhuva, Swaha.

W

W, the twenty-third letter of the English alphabet, takes its shape from a repetition of the letters u or v. Few of the modern languages of Europe have the letter w. In the English language it is a consonant when at the beginning of words and syllables, as wail, forward; but is a vowel when at the end of words, as in new, row. Many races have a difficulty in pronouncing the consonantal w, and others interchange it with the letter v. In all the dialects and tongues of the East Indies there is a perpetual tendency to interchange the sounds of v and w, or to substitute the latter entirely. The misuse of these two sounds is, in India, like that of London. In Tamil this often occurs, so that varam becomes waram; and in the Persian wao, used in Hindustani words derived from the Arabic, it has the sound of v and w, as vakil, wakil; vazir, wazir. In Mahrati, for the same letter, are the two sounds of wau and vau, the latter especially occurring when before i or e, or when combined with ri or r. In Malealam it has usually the sound of v, but in composition that of w, as in swarga. In Gujerati, the uneducated people pronounce the sound as w, the educated as v. The letter w is unknown to the Devanagari alphabet, though the educated youth of Bengal make strenuous efforts to introduce it in their present faulty system of alliteration in writing their owu names.

WA. Burm.

Barish, ... Hind. | Wass, ... Singh.
Varsh or Warsh, Sansk. |

The Burmese Buddhist Lent. It is from July full moon (Wa-tso) to October full moon (Thadwg-ynot). The strict people only eat once daily, at daylight. Feasts do occur, but are discountenanced, and dramatic performances are energetically denouneed. During these three months, the wandering Buddhist mendicants were enjoined to remain in a fixed habitation. The monks are expected during this season to be doubly particular in abstraction from secular affairs, in abstinence and meditation. It is the great season for preaching to the laity.—*Yule*, p. 120.

WADA-GALLAI or Vada-Galli. Tam. A sect amongst the Tamil Sudra, commonly known as the right-hand caste, to distinguish them from the Ten-gallai, or the left-hand caste. The literal meaning of these words are northern sect and southern sect, but the points of difference are very obscure.

WADANG or Bayur, a light and tolerably durable wood of Java, employed for masts and spars of small vessels; but the surface must be covered with resinous substances to prevent it splitting.

WADARA, Waddar, or Waddiwar, the Wadara wanloo of the Teling people, are migratory, dwell in little huts of reed or fine grass, and move to any place where they can find employment. They are spread across the Peninsula of India from the valley of the Nerbadda to the south, all speaking Telugu. They are road-makers, tank-diggers, and labourers. The men and women vary greatly in size, though some of the men are stout and athletic. They all drink heavily. Wadara have two sections, one of them earth-diggers, who eat rats, the other quarriers and stone-cutters. The great increase in railroads and roads since 1860 ought to have made them wealthy, but they seem to live from hand to mouth.

WADE, JONATHAN, D.D., born in the State of New York, December 1798, died 1872, aged nearly 74. He laboured with Dr. Mason, Mr. Hough, and Dr. Adoniram Judson in teaching the Karen. He reduced the Karen language to writing, and was engaged with a Karen dictionary when he died.

WADHWAN, a Native State in Kattyawar, with an area of 238 square miles; population (1872), 45,431. The soil is black and light in about equal proportions. The ruler has power to try for capital offences, his own subjects only.—*Imp. Gaz.*

WADI. Arab. The Ouadi of the French, the channel of a stream or river, or any valley or ravine through which water flows, whether constantly or in the winter or cold seasons. Wadi-Araba, the valley connecting the Gulf of Akaba with Palestine, is in length 105 miles; its summit level is 495 feet, and Dead Sea extremity, 1146 feet below the Mediterranean. Wadi-al-Ghor, now called Wadi-Araba, is to the S. of the Dead Sea as far as Akaba. Wadi-al-Malh, Arab., the valley of salt, a salt lake about 18 miles S.E. of Aleppo, from which all North Syria is supplied with salt. The valley is 5 miles long, and 2 or 3 miles broad, and has a shallow lake of saline water. On this being evaporated by the sun's rays, the salt crystallizes on the exposed parts. Wadi Mojeb, the Arnon of Scripture, formerly dividing the Amorites from the Moabites. The ruins of Arayya, the ancient Aʀver, are on the edge of a precipice overlooking Wadi Mojeb. Wadi Musa is the site of Petra, the Edom of the prophecies, known to the Greeks as Ἀρκὴ while under the Nabatæi. The Nebatæi left Karak for this site, but when the line of commerce turned towards Egypt and towards Palmyra, Wadi Musa was deserted. It is now held by an Arab tribe of secluded habits. Wadi Tor is in the peninsula of Mount Sinai. During certain states of the wind, its sands, when put in motion, give out sounds like a bell. A similar mountain occurs near Kābul, described by Burnes in Bl. As. Trans., 1838, as Reg Rawan, or Moving Sand. Mounts Sinai, Horeb, Serbal, and Shomar have summits which rise to the height of about 8000 feet above the level of the neighbouring wadi or valleys. The view from the top of Sinai is that of a chaos of mountains.—*Newbold in As. Trans.* vii. p. 78; *Petterman in Geo. Trans.*, 1848, xviii. p. 89; *Wilson's Lands.* See Jabal-Nakoos.

WAG. Mahr. A tiger. Wag-Eswari, or tiger-goddess. Waghia, also Wagoba, is the tiger deity worshipped by the Bhil and Naikude Gond races, and, under the name of Bag Deo, by the Kurku. Waghia is worshipped by the Bhil in the form of a rude stone, at the edge of a forest or jungle, and sometimes in the form of a tiger. A recent writer says he overheard two village Bhil, Gopaji and Devaji by name, reviling their idol at the edge of the jungle in round terms. 'You fellow!' cried Gopaji, 'I gave you pulse and broth, and a chicken, yet you killed my buffalo!' 'Broth and a chicken!' screamed Devaji; 'I gave you three chickens and a goat, yet you carried off my child! What more do you want, you rascal?' The forest

races of the Sundur valley style the tiger their brother, and allege that their brother never hurts them. See Murli.

WAGHER, a race who occupy Dwarika. They and the Badhail were long the terror of the neighbouring seas. They were in rebellion in Kattyawar, until, on the 8th May 1868, Mulu Manik and four of his associates were killed.

WAGHORN, a lieutenant of the Royal Navy who advocated the Red Sea line for communication with India. Born 1801, died 8th January 1850. His widow was granted a small pension from the Royal funds. Count de Lesseps says that he owes to Waghorn the first conceptions of the Suez Canal, and has erected his bust on Waghorn quay at the south entrance. In 1825, Lieut. Johnson, R.N., steamed, via the Cape, in the *Enterprise* to Calcutta. Commander Wilson, of the Indian Navy, about 1830, steamed in the *Hugh Lindsay* in 21 days from Bombay to Suez.

WAGIRI, a dark-coloured wandering race in the Southern Mahratta country about Dhulagaon. They are fowlers and hunters, snaring birds and animals. They speak Gujerati amongst themselves. They worship Durga, do not eat the cow or its kind, nor the village pig, which they call Hag-Dukar. Some of them bury, some burn their dead. Hindus regard their flesh-devouring propensities with horror, and Muhammadans, however poor, loathe the men who track the wild boar to his reedy bed, and voraciously devour his carcase. The Wagiri has a bright, restless eye, and a wild and independent bearing; the expression of his features is strongly marked, evidencing the existence of more powerful passions in the individual than is common to the general character of the Hindu races. In character the Wagiri is daring and revengeful, ready to commit any act of violence for reward.—*Postan's Western India*, i. p. 203.

WAG-NAK. Malay. The Bag-nak or tiger-claw weapon of the Mahrattas, worn on the fingers. It was with one of these that Raja Sivaji clutched Afzal Khan, the Moghul general, at a conference, and slew him.

WAGUR, the most eastern part of Cutch, inhabited by the Wagila Rajputs.

WAH! Amongst Muhammadans and Sikhs, an exclamation, used like the English Bravo! Well done! Hear, Hear! Hurrah! The usual war-cry of the Sikhs is 'Wah! wah! Guru ji ka fattah!' 'Hurrah for the victory of the guru!'—*History of the Sikhs*, p. 143.

WAHABEE. Muhammad ibn Abd-ul-Wahab, a native of the province of Nejd, belonged to the pastoral tribe of Temin. He was born at El-Ayneh in 1691, and from him sprang a sect which assumed the name of Wahabee. The doctrines which they adopted were severe and puritanical. They acknowledged one God, and believed that the Koran was an inspired writing. They also acknowledged Mahomed to be the prophet of God, but deprecated any peculiar homage being paid to him, as they considered him a mortal like themselves, though gifted with a divine mission. These doctrines spread with amazing rapidity through the various tribes of Nejd, and the reformers soon obtained a preponderating influence in the north-east part of Arabia; while by his powerful servant, Sheikh Mekrani of Nerjan, Abd-ul-Wahab carried his victorious arms into Yemen. On his death he was peaceably succeeded in his temporal and spiritual power by his son Abd-ul-Azeez, during whose reign the doctrines of the new sect were received through the greater part of the Peninsula. Mecca and Medina were added to their conquests in 1803 and 1804, the treasuries were plundered, and all the holy tombs, which were an abomination to these reformers, were destroyed. The power of the Wahabees continued to increase until 1813, when Muhammad Ali Pasha took up arms against them, and restored the holy cities of Medina and Mecca to the nominal protection of the Porte, but virtually made himself master of the Hejaz, and during the years 1814-15 conducted operations with varied success. On his return to Cairo, he sent his son Ibrahim Pasha, and the campaign which followed, characterized by a series of the most barbarous cruelties, resulted in the conquest of Deria, and the capture of Abdulla-ibn-Saood, the Wahabee chief. Ibrahim returned to Cairo, embarking from Jedda for Cosseir on the 16th November 1819; but under another leader progress was made in bringing the rulers in Yemen, and particularly the Iman of Senaa, under the yoke of Muhammad Ali.

Muhammad ibn Abd-ul-Wahab was not an innovator but a reformer, whose aim was the restoration of Islam to its primitive purity and simplicity, by insisting that its fundamental dogma, 'There is no deity but God,' absolutely forbade all veneration to man, prophet, or apostle, living or dead, however highly distinguished by the divine favour. There can be no doubt that beyond this utter exclusion of human merit, the formula, as originally proclaimed by Mahomed, implied the doctrine of the absolute sovereignty of God in a sense which reduced all created beings to a mass of unconditional passiveness. Palgrave gives a splendid dissertation on the full import of this symbol of Islam. The great Wahabee appears to have grasped this theory, but it is highly probable that his efforts to explain it only added to its abstruseness, thereby giving some colour to the charge brought against his writings by the orthodox, that they consisted chiefly of 'sophisms and speculations.' It is equally reasonable to suppose that a very limited number of his disciples were capable of appreciating the more recondite views which his power of abstraction enabled him individually to entertain of the nature and attributes of the Supreme Being. Less difficult of general comprehension, however, was that part of his system which denounced all honours paid to saints and tombs as heretical innovations, detracting from the worship due solely to the Creator, and therefore to be regarded and dealt with as idolatrous. To say nothing of pagans and Christians, whom all Muhammadans hold to be polytheists, the doctrine thus revived placed Sunni and Shiah, Ibadhiyah and Rafidhi, alike in the same category, and, moreover, sanctioned their being dealt with as such, despite their negation of any deity save one, by a strict adherence to the orthodox formula. Hence it was that 'they legalized the despoiling of the Muhammadans, taking their wives in marriage before they are legally divorced from their husbands, and without observing the Iddh, and also the enslavement of their children.' All these outrages, from the Wahabee standpoint, were solemn duties imposed upon them by their obligations to God and

Islam, which they could not forego without risking their own salvation. Wahabeeism, in fact, apart from certain speculative notions respecting the Supreme Being,—in the main perfectly in accordance with the theology of the Koran,—may be defined as a politico-religious confederacy, which legalizes the indiscriminate plunder and thraldom of all peoples beyond its own pale.

Towards the latter part of the 18th century the sect became very numerous, powerful, and fanatical. In 1803 they laid siege to Mecca and Medina, and took them, slaughtering all who would not embrace their doctrines. They held these holy cities until the year 1809, when the legions of Egypt and Turkey were poured in against them. After many sanguinary engagements, the Wahabees were defeated, but not exterminated. It was against the political power of this sect that the Indo-British army and navy fought the battles of Ras-ul-Khyma and Beni-bu-Ali in 1819 and 1821. This sect has got adherents throughout all India, and some of its members seem early to have organized a conspiracy against the British Government.

In 1865 Faisal-ibn-Saood died, an old man, and blind. He was a saintly personage, and had been a powerful ruler. During his long reign he had restored the Wahabee power, and had become master of nearly two-thirds of the Peninsula. With his death there occurred one of those wars of succession which have always been the misfortune of Arabia. Their reforming views spread into British India in the early part of the 19th century, and agitated all the Muhammadans, as well as the Government, and many Europeans have regarded the presence of the sect as a cause of danger. In this they have merely adopted the opinions of the non-reformers, and Wahabee has come to be applied to any devout Muhammadan, even good, devout men, leading pure and holy lives, earnestly seeking for the truth, cultivating literature assiduously; but they are compelled by the multitude of ordinary people to retire into the peaceful shade, as the purity of their lives begets for them the objectionable name of Wahabee. The sect is simply an extreme form of Musalman puritanism. Its holy war is directed more against the supposed moral and ceremonial excrescences of modern Islam itself, than against the outside world of infidels. The supreme tribunals of Islam have unanimously and solemnly declared that India, under its present tolerant and equal government, is certainly not Dar-ul-harb ('the country of the enemy') upon whose rulers war should be waged by the faithful; and consequently no Indian Wahabee, who has not utterly broken with the orthodox portion of his church, can be disloyal on merely religious grounds. It is doubtless the case that the tendency of the Wahabee preaching is to encourage sedition, or at least a feeling of disloyalty; the history of the world teaches us that iconoclastic fanaticism is always apt to spread from religion into politics. But the Indian Wahabee who is disloyal to the British Indian Government would probably be equally disloyal if his sovereign were the Sultan of Turkey, the Khedive of Egypt, or the Grand Sheriff of Mecca. There are a good many Farazi in Eastern Bengal, who are to all intents and purposes Wahabees, and their ignorance has on occasion been roused into sedition, and even into open disturbance, by the combined action of fanaticism and poverty. It is true, however, that there has existed an active propaganda of fanatic Wahabee Mullahs at great Musalman centres. Still, these fanatics are distinctly regarded as such by the vast bulk of the Musalman community throughout India, who are generally peaceable and industrious citizens, and look on the fanatics with dislike tempered only by indifference. The Musalman community themselves would be the last to say that it does not behove the Government carefully to look after this fanatic organization.

In India the sect are undoubtedly the most intelligent of the Muhammadan races and sects, but the Wahabee are still numerous in Northern and Eastern Arabia.

Mr. William Tayler, in 1857, was the Commissioner of Patna at the very outset of the revolt, and he placed the leading mulvies (among whom was the notorious Ahmad-Allah) under precautionary surveillance, thereby paralyzing the entire body. Dewan Mowla Baksh, the deputy magistrate, devoted himself in loyal co-operation with him, and seven years afterwards received the Star of India. Wilayat Ali Khan, the most influential citizen of Patna, cast in his lot from the very first with the British authorities, and did inestimable service, for which he received neither commendation nor reward. Kazi-Ramzan Ali and many others behaved well. In the middle of the century, acting from Patna as their headquarters, the Wahabees engaged for many years in treasonable practices, sending men and arms and treasure beyond the frontiers for the purpose of raising and waging a jahad or religious war against the British. Notwithstanding the events of the mutiny, the Wahabee mulvies or preachers in Patna redoubled their exertions to collect recruits and money for a jahad. Emissaries were sent to all parts of the country to preach and induce men to join in the undertaking. Thousands of quiet villagers from Lower and Eastern Bengal flocked to Patna, where they were entertained for a few days at Sadikpur, and thence sent forward in bands of eight or ten through Ambala to the Mulka Sittana Hills. Then followed the Frontier War in 1863, under Brigadier Chamberlain, which cost the British Indian Government much trouble, no small amount of treasure, and many valuable lives, there having fallen in that short campaign 847 European and native officers and men. Even whilst the war was being waged, the Wahabee mulvies at Patna were sending, in large quantities, gold mohurs and hoondies for the support of the rebels; and although the rebellion was crushed, temporary failure but stimulated them to renewed exertions, openly preaching sedition in every village of the most populous districts, unsettling the minds of the Muhammadan population, and obtaining an influence for evil as extraordinary as it was certain. Generally they repudiate the name of Wahabee. Most of the beef-butchers of Hyderabad, Madras, and Bangalore are of this sect. Contrasting the practice of Islam in these days with the pure deism inculcated by the Koran, Sir John Malcolm justly remarks:—'The followers of the prophet of Arabia have relaxed from the principles of their religion, and have granted a species of adoration not only to him and his immediate descendants, but to a number of learned or pious men who have been canonized as saints. The feelings of gratitude and

veneration which the conduct of individuals first created, have grown by excessive indulgence, and by the ardour of passions excited by contrary opinions, into sacred reverence and devotion. Their very garments have become relics of inestimable value; and in the course of time the same properties have been assigned to them as are supposed to have belonged to their possessors.' From this common progress of superstition hardly one of the numerous sects into which the Muhammadan religion is divided, can be deemed exempt. —*Hist. of Persia*, ii. 377; *Niebuhr's Tr.* ii. 131; *Jahan Numa*, p. 523; *Wellsted's Tr.* i. 5; *Burton's Mecca*, iii. 272; *Playfair's Aden*; *Badger*, *Imams of Oman*, p. 63; *Palgrave's Arabia*, i. 365.

WAHAB SHAHI, or Kirmani Wool, the wool of a sheep found in Kirman, a tract of country in the south of Persia by the Persian Gulf. It is used for the manufacture of a spurious kind of shawl cloth, and for adulterating the wool used for Kashmir shawls.

WAHI. ARAB. Inspiration given to the prophets. Ilham, ARAB., inspiration given to the Wali or saints.

WAIGIOU, written also Waigyu, an island between New Guinea and Gilolo, in the Eastern Archipelago, and not far from Gilolo. The island is occupied by a Papuan race, with nose flat, the lips thick and projecting, the complexion a dark olive, the eyes deep-seated, and on an average the facial angle 77°, but as high as 81°. In Gebbe and Waigyu, and in some parts of the coast of New Guinea, the complexion is lighter, and the peculiar texture of the Negro hair is absent. The inhabitants of Waigyu islands are described by M. Du Perry as having more regular features. The language spoken at Waigyu is entirely Papuan, being that which is used on all the coasts of Mysol, Salwatty, the N.W. of Guinea, and the islands in the Great Geelvink Bay, Waigyu, Gebbe, Poppa, Obi, Batchian, between New Guinea and the Moluccas, as well as the S. and E. peninsulas of Gilolo. The Waigyu islanders barter trepang for cotton and woollen stuffs brought in the Chinese junks.—*Wallace*, ii. p. 216.

WAINGANGA, a river which rises in the Seoni district, a few miles to the east of the Nagpur and Jubbulpur road, near the Kurai Ghat. For a short distance it flows in a north-westerly direction, then turning to the north, it skirts the west of the Seoni district, and not far to the west of Chhapara, where it is crossed by a fine bridge with twelve arches of 50 feet span, it turns again and flows towards the east down to its junction with the Thanwar. At this point it changes its course to the south, and, after passing through a mountain gorge, enters the open country known as the valley of the Wainganga. For about 60 miles it flows nearly due south, forming the boundary between the Seoni and Balaghat district; it is then joined by the Bagh, and flows in a south-westerly direction through the Bhandara district, in lat. 19° 36′ 10″ N., and long. 79° 50′ E. At the junction of the rivers Wainganga and Wardha to form the Pranhita, commences that mass of rocks which is known as the Third Barrier of the Godavery. The Wainganga is navigable during the rains for about 100 miles above the junction with the Kanhan. Its greatest breadth is about 300 yards.

WAIRAGARH, the eastern pargana of the Brahmapuri tahsil in the Chanda district. It is bounded on the north by the Bhandara and Raipur districts, on the east by the Raipur district and Bastar, on the south by the Ambgaon pargana and zamindari, and on the west by the Wainganga. Wairagarh is very unhealthy during the autumn and early winter months, and its trade has consequently been almost wholly diverted to the neighbouring town of Armori, but the zamindars of the north and north-east still look upon it as their capital, and many of the surrounding landholders have residences here. Good sandstone and granite are obtained near the town, and mines of diamonds and rubies were formerly worked in the vicinity.

WAISH or Wesh. PUKHTU. A voluntary redistribution of lands amongst the tribes of the N.W. frontier of British India.

WAIST-BELT, are often gold embroidered, with pearls, emeralds, rubies; usually they are of white cloth, or of shawls. The waistbelt is a part of the dress, alike of Muhammadans and Hindus, when on duty or appearing before a superior. It is the kamrbāndhna or girding up of the loins of the Bible.

WAK, the supreme being of the Galla race of Shoa. Ateti, the female power of Wak. See Semitic Races.

WAKALU. KARN., TEL. A plural of Wakl or Waql, a farmer or agricultural race. The Wakaliga of Mysore have four sections,—Morasu, Hali Gangadikar or Gangahara, Nonabba, and Kongaru. Among the Canarese they are Hindu cultivators, whom the Abbe Dubois considered to be identical with the Tamil Vellalar. They are so merely as farmers. They eat flesh freely, and are not strict Hindus. They are indifferent soldiers, but serve locally. The women of several families of one of their clans or sects, that of the Morasu Wakaliga, follow the custom of having the fingers of the right hand amputated. There are about two thousand families in Mysore who believe in the duty of acting this practice of mutilation, which is forbidden by law; but so lately as the beginning of the year 1874, a woman had the operation performed secretly at Davanaholi, in the Bangalore district. Every woman of the sect, previous to piercing the ears of her eldest daughter, preparatory to her being betrothed in marriage, had to undergo the mutilation by the village blacksmith. The fingers being placed on a block, the blacksmith places a chisel over the joints, and chops them off at a single blow. The tradition connected with this rite is to the effect that Vrika, a rakshasha or demon, by a course of austere devotion, obtained from Mahadeva the power of consuming to ashes any person on whose head he might place his right hand. He then attempted to use this power to destroy Mahadeva, who fled and concealed himself in a grove, pursued by the demon. A farmer in a neighbouring field loudly denied having seen Mahadeva, but pointed with his finger to the grove. At this instant, to save Mahadeva, Vishnu appeared in the form of a beautiful Brahman girl, with whom Vrika became enamoured, but she withstood his advances until he should perform the Sandhya ceremony of applying the right hand to the breast, the crown of the head, and other parts of the body, and thus he reduced

himself to ashes. Mahadeva, issuing from the grove, resolved to deprive the farmer of the finger with which he had pointed to the grove, but the farmer's wife prevailed on Mahadeva to accept two of her fingers instead; and ever since then her female posterity, as a memorial of the transaction, sacrifice two fingers at Mahadeva's temple. The Wakalu cultivators in India number 665,215 souls.

WAKAMBA, a tribe about 70,000 in number on the Eastern Sohaili coast, formerly nomades, but now with some skill as farmers and traders, and have flocks, herds, and domestic ornaments. They wear a leather thong round their loins, and allow one end to fall behind like a tail. They have smooth, dark skins and slender forms. Their features are not those of the Negro, towards which race they feel a great contempt.

WAKHAN, a hill state north of Badakhshan; its chief lays claim to Grecian origin. Wood mentions a torrent in Wakhan, called Zar-zamin, gold ground. He says all the tributaries of the Oxus are fertile in gold.—*Wood's Oxus*, p. 382; *Yule's Cathay*, i. p. 236.

WALA. Arab., Hind. In composition, a person who does any act, as Rakh-wala, Gao-wala, Ghora-wala, a guard, a cowkeeper, a horse-keeper. In the Firozpur district, the addition of Wala is a common term in naming villages, such as Sultan Khan Wala, Buta-wala, Akbar-wala; and probably the name of Ferozeshah may have been Ferozeshah-wala, and from the length of the word the latter part may have been dropped or shahar (a city) substituted.—*History of the Sikhs*, p. 54.

WALA-JAH. Pers. The title granted by the Mogul emperors of Dehli to Muhammad Ali, nawab of the Carnatic, and the family are styled Wala-jahi.

WALAJAHBAD, in lat. 12° 58′ N., and long. 79° 39′ E., 40 miles south of Madras, and 30 miles inland from the coast. The Palar river passes by to the south, about 500 yards distant. It was formerly a military cantonment.

WALAN, the name of a large but rare and much-valued tree in Amboyna, which was first described and figured by Rumphius in his Herbarium Amboinense, and called by him Ichthyoctonos montana. The inhabitants of Amboyna use the powdered bark of the roots for catching fish. Throwing the powder upon the water and mixing it till it foams, they cast a net, and in the course of an hour the net is generally found full of half-dead fish. The fish will recover from the effect of the poison if thrown into fresh water, and are quite wholesome as food.—*Eng. Cyc.*

WALAYAT. Hind., Pers. An inhabited country, a foreign country, as Europe, Persia, and Turkey. See Balayat; Valayat.

WAL'D. Arab. He was born; son. Walid, father, therefore Maulud, born, birth, a mauludi. In the neighbourhood of Bombay, the Arab custom of adding the father's name is very generally followed, alike by Muhammadans and Hindus. An Arab, for instance, would be styled Ahmad bin Yakub, but in Bombay Ahmad wal'd Yakub. Ibn or bin and wal'd are both of them Arabic words, meaning Ahmad son of Yakub.

WALER, a term used by the British in India to designate N. S. Wales horses. The supplies from British India itself and the neighbouring inland countries have been insufficient to meet the demands and wants of India, and since A.D. 1840 small batches have been received from the Cape of Good Hope. These are horses of good figure and good temper, suitable for riding horses and for draught, but, like the Arab horse, high priced. Australia, however, has taken a hold on the Madras and Calcutta markets.

WALI. Arab., Pers. A ruler, a prophet; the title of the Turkish Viceroy in Turkish Arabia. It was the title of the chiefs of the Hawiza tribe. There are six sorts of governors in Persia, viz. Wali, Beglar Beg, Kol Beg, Wazir, Sultan, Darogha. There were formerly four Wali or tributary princes in Persia, viz. the prince of Georgia, Sinna, Luristan, and Hawiza; but the Wali of Sinna is the only one remaining. The prince of Hawiza was called Moula or holy, and was a Syud or supposed descendant of Mahomed. Kalb Ali Khan, the murderer of Messrs. Grant and Fotheringham, was descended from the Wali of Luristan, who was of the Feili tribe.—*Rich's Kurdistan*, i. p. 211.

WALI, the literary name of a celebrated poet, who wrote in Urdu or Hindustani in the middle of the 17th century. He has been followed by many others down to the present time; their compositions are in general mere imitations of the Persians. The best author in this branch of poetry is Sauda, who lived late in the 18th century.—*Elph.* p. 432.

WALID, the 6th of the Ummiad khalifs of Baghdad, ascended the khalifat in A.D. 708. He conquered Sind, and carried his arms to the Ganges. Three years thereafter, in A.D. 718, his general, Muhammad bin Kassim, overran Gujerat, and spread devastation in his progress. He advanced on Chitore, but he was met and completely defeated by Bappa, a descendant of Goho, who had founded Edur.—*Elliot's Hist. of India.*

WALI KUKUN, a wood of Java, equal to the kusambi in weight, and exceeds it in hardness. It is employed for anchors, naves of wheels, machinery.

WALKER, Lieut.-Colonel ALEXANDER, Resident in Cutch, made great efforts to suppress infanticide amongst the Jhareja Rajputs.

WALKERA SERRATA. *Willd.* The Gomphia angustifolia of Vahl., a native of Malabar and Ceylon, has serrate, crenate leaves. The roots and leaves are very bitter, and are used in decoction by the inhabitants of Malabar as a tonic and anthelmintic.

WALKESHWAR, near Bombay, has a tank called Ban Ganga, fabled to have been produced by Krishna firing an arrow at the spot.

WALKING FISHES of India are species of Ophiocephalidæ. The hissar, or walking fish of S. America, is a species of Callichthys.

WALKING-STICK, a staff or cane carried in the hand for ornament or support. There are numerous kinds, as Malacca cane, Penang lawyers, Wanghee, supple-jacks, and other fancy varieties. The bamboo furnishes useful walking-sticks, as also the various palm trees, the Licuala, cocoanut tree, sago palm, betel palm, palmyra palm, also the kumbha wood of the Gmelina arborea, and the Chittunkoodoo wood of the N. Circars (perhaps Chitankaloo or Wrightia tinctoria). The Chinese greatly object to any one carrying a walking-stick, and their absence is supplied by lengthening the

stem of an umbrella. Cabbage walking-sticks are the stems of a variety of the garden cabbage (Brassica oleracea, *L.*), grown in the Channel Islands; the growth in height is promoted by constantly stripping off the leaves.

WALKING STICK INSECT, species of Phasma.

WALLA, the modern name of the ancient city of Vallabhi.

WALLABHIPUR. In A.D. 770, Wallabhipur, the present Walleh, which had the most brilliant court in India, fell before an irruption from the north, supposed by Mountstuart Elphinstone to be Persians under Nushirwan the Great, by Colonel Tod to be Scythians, and by another authority to be Indo-Bactrians. The name of Gurjjara in the time of Hiwen Thsang was confined to Western Rajputana, and it was still a distinct country from Saurashtra in A.D. 812, when Karka, raja of Lateswara, recorded a grant of land. Between this date and A.D. 1310, there is a gap of five centuries, during which period we have no mention of Gurjjara in any contemporary records. General Cunningham has a strong suspicion, however, that the movement of the Gujar race towards the Peninsula must have been connected with the permanent conquest of Dehli, Kanouj, and Ajmir by the Muhammadans, which ejected the Chauhan and Rahtor tribes from Northern Rajputana and the Upper Ganges, and thrust them towards the south. The Rahtor occupied Pali to the east of Balmer in the Samvat year 1283, or A.D. 1226. This settlement of the Rahtor must have driven the great body of the Gujar from their ancient seats, and forced them to the south towards Anhalwara Pattan and Eder. This was actually the case of the Gohil, who, being expelled from Marwar by the Rahtor, settled in the eastern side of the Peninsula, which was named after them Gohilwara. In the time of Akbar, the Gujar had certainly not penetrated into the Peninsula, as Abul Fazl does not name them in his notice of the different tribes which then occupied the Circar of Surat; and even at the present day there is no large community of the Gujar in the Peninsula.

WALLACE, ALFRED RUSSEL, born at Usk, Monmouthshire, 1822, an eminent naturalist, who devoted many years of his life exploring and describing the regions which he had visited. He travelled in South America from 1848 to 1852, and subsequently dwelt for eight years amongst the islands of the Eastern Archipelago. His researches were embodied in his valuable works, Travels on the Amazon and Rio Negro, Palm Trees of the Amazon, The Malay Archipelago, Tropical Nature, Contributions to the Theory of Natural Selection, 1871. He also contributed largely to the scientific journals, 1869 to 1872; on Australasia, with Ethnological Appendix by A. H. Keane, 1878; on Island Life, 1880; and on Islands, as illustrating Geographical Distribution, 1876. Mr. Wallace (ii. p. 250) believes that the numerous intermediate forms which occur among the countless islands of the Pacific are not merely the result of an intermixture of their races, but are to some extent truly intermediate or transitional, and that the brown and the black, the Papuan, the natives of Gilolo and Ceram, the Fijian, the native inhabitants of the Sandwich Islands, and those of New Zealand, are all varying forms of one great Oceanic or Polynesian race. Professor Huxley, however, is of opinion that the Papuans are more nearly allied to the Negroes of Africa than to any other race. Mr. Wallace has given to Europe a very full knowledge of the birds of that extensive region.

WALLAGO ATTU and Saccobranchus fossilis are mud frequenters; an esteemed edible fish of the Bay of Bengal.

WALLAMPOORY, a chank opening to the right, called in Calcutta the right-handed chank, is so highly prized as sometimes to sell for 400 or 500 or even 1000 rupees.

WALLANCHOON, a pass in Nepal, in lat. 27° 52′ N., and long. 87° 14′ E. The crest of the pass is 16,775 feet above the sea. The path leading up the pass for 8 miles is a narrow, stony, and steep gorge. The top is a low saddle, between two ridges of rock.

WALLEROO, a Dhangar tribe in the northern division of the Madras Presidency. They are also styled Yerra-walleroo.

WALLICH, NATHANIEL, a medical officer of the Bengal army, an eminent botanist. He collected plants in the Calcutta Garden, in Nepal, Singapore, Penang, Oudh, Rohilkhand, the valley of Deyra, Martaban, Ava, etc., and had collections made in Sylhet by Francis de Silva, in Kamaon by Robert Blinkworth, in Srinaghur by Kamroop, in Tavoy and the Tenasserim coast by William Gomez. He had in addition specimens collected by Heyne in the Peninsula generally, by Noton in the Neilgherries, also by Moorcroft in the more elevated mountains bounding India on the north, in the Himalayan range by Dr. Royle, in Sirmur by Mr. S. Webb and Dr. Govan, in Sylhet and Chittagong by Bruce, in Pundua by Smith, and in Penang by Porter. His Plantæ Asiaticæ Rariores, 3 volumes folio, contains 295 coloured lithographic plates, with monographs by Professor Nees Von Esenbeck on Indian Laurineæ and Acanthaceæ, by Mr. Bentham on the Labiatæ, Professor Meisner on the genus Polygonum, and Von Martius on Restiaceæ. He was long in charge of the Government Gardens at Calcutta, having succeeded Dr. Roxburgh. He wrote on Indian Woods, in Bl. As. Trans., 1833, ii. 77; and besides editing a portion of the Flora Indica of Dr. Roxburgh, he commenced, in India, an illustrated work on Nepal Plants, Tentamen Floræ Nepalensis, which was the first specimen of lithography ever produced in India. Drs. Hooker and Thomson estimated his great collection at between 6500 and 7000 species.—*Wight's Prod.* i. p. 18.

WALLICHIA OBLONGIFOLIA, the Ooh of the Lepcha, a palm which grows in Sikkim. It affords an admirable fodder for horses, who prefer it to any other green food to be had in those mountains.—*Hooker*, i. p. 143.

WALL OF CHINA was built to check the inroads of the warlike pastoral tribes. The generals of the emperor Che-hwang-te having subdued the people in the south, nothing more remained to be done than to subdue these Tartars, or at least to put a stop to their inroads. Some of the northern states had eventually built a wall, to keep these unbidden guests out of their territories. Che-hwang-te therefore resolved to erect the Great Wall, which commences at Lin-teeaou, in the western part of Shen-si, in the mountains of Leaou-tung, and

terminates in the sea, a distance of more than 1500 miles. It runs over hills and rivers, through valleys and plains, and is perhaps the most stupendous work ever produced by human labour. He lined it with fortresses, erected towers and battlements, and built it so broad that six horsemen might ride abreast upon it. To lay the foundation in the sea, several vessels, loaded with ballast, were sunk, and upon this the wall was erected. Every third man in the empire was required to work on it, under the direction of Mung-teen, B.C. 240.

WALNUT.

Akrot, Jowz, Khusif, AR.	Starga, . . . LADAKH.
Than-than, . . CHENAB.	Okher, ... NEPAL.
Khor, Ka, Darga, ,,	Char-mughz, . . PERS.
Hu-t'au, Kiang-t'au, CHIN.	Girdighan, . . . ,,
Noix, ... FR.	Jouz-i-rumi, . . . ,,
Dun, ... KANGRA.	Ughz, Waghz, . TR.-IND.

The walnut tree, Juglans regia, grows wild in the N.W. Himalaya at heights from 8000 to 10,000 and 11,000 feet; but it does not ripen its fruit above 9000. It has long been cultivated in Persia and Turkestan, and has been taken westward to England and eastward to China. Honigberger states that a twig of the walnut tree, Juglans regia, is kept in a room as a means of dispelling flies. The Persian walnut kernels are eaten, or are made into pickles or ketchup. The Kashmirians use the walnut as a dye for black and green colours; the former, from the ripe fruit, is a 'fast' or permanent dye, and the latter is furnished from the walnuts which fall into the ground while they are still green. The latter colour is not permanent. From the kernel an oil is extracted, which is used not only for burning in lamps, but also for culinary purposes. It is said also to be made the medium for extracting the perfume of the jasmine, the yellow rose, and the narcissus. One-fourth of flower is added to three-fourths of oil, and the whole is well corked up in a jar or bottle. It is then exposed to the sun for five or six weeks, by which time the oil is found to be sufficiently impregnated. Walnut oil forms an extensive and profitable article of export into Tibet and Yarkand. Walnut wood was the chief cabinet-wood of Europe before the introduction of mahogany. Black walnut wood (Juglans nigra, *L.*) is much used in the United States for cabinet-work; also butternut wood (Juglans cinerea, *L.*) of the United States. —*Stewart.*

WALSURA GARDNERI. *Thw.* A small tree growing in the central provinces of Ceylon, at an elevation of 2000 to 4000 feet.—*Thw.*

WALSURA PISCIDIA. *Roxb.*

Joe-boe, ... BURM.	Wallurasi, ... TEL.
Walsura, . . . TAM.	

This tree grows in the Circars, is very plentiful in the Pegu, Tounghoo, and Tharawaddy forests. Its timber is large, heavy, and strong, white-coloured, and adapted for every purpose of house-building. In India the bark is thrown into ponds to stupefy fish, which, coming to the surface, are easily taken, and are not considered injurious to be eaten.—*Roxb.; Royle, Ill.; Voigt; M'Cl.*

WALSURA ROBUSTA, a tree of Sylhet; the bark is not employed as a fish poison.—*O'Sh.; Roxb.* ii. p. 386.

WALSURA TERNATA. *Roxb.*

Kaka walsura, . . TAM.	Chinna valasa, . . TEL.
Chinna wallurasi, . TEL.	Vada valasa, . . . ,,

A small tree growing on the sides of hills. It flowers during the hot season. Walsura villosa, *W. and A.*, is a tree of Moulmein.—*Roxb.*

WALUR LAKE, in Kashmir, is the largest sheet of water in the valley, formed by an expansion of the river Jhelum (Jhilam). The centre lies in lat. 34° 20′ N., and long. 74° 37′ E. Length from east to west, 21 miles; breadth from north to south, 9 miles. Celebrated for its picturesque beauty. Contains a small island, with extensive ruins of an ancient Buddhist temple. Subject to violent squalls.—*Imp. Gaz.*

WAMAN-DUADASI, from Waman, a dwarf, and Duadasi, the 12th day of the month Paksh, about the 10th September. It is a Hindu ceremonial in commemoration of the fifth incarnation of Vishnu, who assumed the form of a dwarf to prevent Bali by his austerities acquiring dominion over three worlds. The dwarf put his foot on Bali's head and crushed him to Patali.

WA-MEE, a Chinese bird kept for fighting. They are good songsters.

WA-MO. BURM. Bamboo fungus, an anthelmintic.

WANA. HIND. Divinities of the air, in opposition to Asa, pl. Asen, which, according to Bunsen, means existent, living ones.

WANA-GANA-KALOO, Curraganiea, and Puuchunganigaloo are dealers or shopkeepers of Telingana, and called in common parlance by the Hindi word Teli or oilman. They are petty traders and shopmen in the Ceded Districts.

WANDEROO., SINGH., is the name in Ceylon for the Presbytis ursinus, the P. thersites, P. cephalopterus, and other species, and it has also been applied, though erroneously, to the Silenus veter, *Linn.*, of the Malabar coast. The low country Wanderoo, P. cephalopterus, is replaced in the hills by the larger species, P. ursinus, which inhabits the mountain zone of Kandy. P. thersites is chiefly distinguished from the others by wanting the head tuft. Some are as large as an English spaniel dog, are of a darkish-grey colour, and black faces with great white beards round from ear to ear, which make them show just like old men. This sort does but little mischief, keeping in the woods, eating only leaves and buds of trees, but when they are caught they will eat anything. They are called Langoor on the continent of India and in Further India, where the species of Presbytis are P. albocinereus, entellus, Johnii, jubatus, obscurus, Phayrei, pileatus, priamus, and schistaceus. In Ceylon there are five monkeys, four of which belong to one group, the Wanderoo, and the other is the little graceful grimacing Rilawa, which is the universal pet and favourite of both natives and Europeans. The Tamil conjurors teach it to dance, and in their wanderings carry it from village to village, clad in a grotesque dress, to exhibit its lively performances. It does not object to smoke tobacco. The Wanderoo is too grave and melancholy to be trained to these drolleries.—*Tennent, Ceylon*, p 10.

WANDIWASH or Vandivasu, the chief town of a taluk of the same name in North Arcot district, Madras, lat. 12° 30′ 20″ N., long. 79° 38′ 40″ E., 20 miles north of Gingi. It was stormed in October 1752, by the sepoy soldiers under Major Lawrence. In 1757 the French garrison twice repulsed the British. A more energetic attack, under Monson, in 1759, was also unsuccessful.

Immediately after this, the French soldiers mutinied, and although they were speedily pacified, before the end of the year the fort surrendered to Coote. In 1760, Lally appeared before the fort; in a day or two he was joined by Bussy and 300 Mahratta auxiliaries. Before the siege had far progressed, Coote came up, and in the pitched battle which ensued the French were utterly routed, and Bussy was taken prisoner. This victory was in itself and in its consequence the most important won over the French in India. In 1780, Lieutenant Flint by a bold stratagem saved the fort from falling into the hands of Hyder Ali, and with very inadequate means held it for nearly three years against every device of the enemy. Twice he was relieved by Sir Eyre Coote, and twice at least he repelled most vigorous assaults.—*Imp. Gaz.*

WANI, a Lingaet or Jangam sect, numerous in the Canarese-speaking country, and extending in the direction of Poona and Bombay. They arrange themselves into the four sections, Rasot, Diksot, Melwant, and Tailwant, who eat together but do not intermarry. The Tailwant drink only tank water, which is first strained and carefully covered with a cloth to prevent injury to animal life. The Rasot have no guru, which the other three have. The Wani are shopkeepers and agriculturists. They marry girls when five to eight years old. The couple are placed sitting on a mat or bullock saddle, to which they are lifted on the crossed hands of four men, who put betel leaf in their mouths and complete the ceremony. Widows are remarried. They inter their dead in a sitting posture, and on the third day sprinkle rice and milk on the grave. Wania, also Vania, are pronunciations of the Banya name; the Banya of Bengal.

WANIKA, the general name given to the African tribes near the Suhaili coast. They fear an imaginary being called Muansa, which they suppose to be a wild beast in the woods, and an imaginary spiritual shade called Koma.

WANJARA or Banjara, a race of grain and cotton carriers, spread thoughout India. The name is supposed to be Vanachara, that is, wanderers in the forests.

WANKANER, a Native State in Kattyawar. Area, 376 square miles; population (1872), 28,750. A black marble is found within its limits. The nearest port is Joria.—*Imp. Gaz.* ix.

WANNIAH, a race in the Batticalao district of Ceylon, who have traditions about their queens, and show the remains of a bridge built for their use.—*Lee's Rebeyro*, p. 80.

WAQAF. Arab. Land or other property appropriated for religious or charitable purposes.

WAQIDI, a biographer of Mahomed, born at Medina, A.D. 747, A.H. 130, and died in Baghdad, A.D. 822, A.H. 207. He expended 2000 dinar in buying books, and left behind him 600 chests full. His secretary was Ibu Sa'd, and he had two slaves as amanuenses.

WAR in the Dravidian tongues is the dialectal variation of Varu, Sansk., an individual.

WAR. Mahr. Also written Wari, Bari, Badi, Bati, Vati, derived through the Hindi from the Sanskrit, means an enclosure, a garden, a house or dwelling, takes in the Mahrati the form of Warkuree, signifying a parterre, a yard around a house.

WAR. Syriac. The general term for a stony district. War-ed-djamous, the war or district of the buffaloes.—*Robinson's Tr.* ii. p. 127.

WARA, Wada, Vada, Vado, Varo of the Mahrati and Gujerati, meaning a ward or quarter of a town, occupied by people of the same avocation, is also from the Sanskrit. It is met with in everyday conversation, as Bahmanwara, the Dherwara, the Brahman and Pariah quarter; a common termination to towns and portions of towns, as Anhilwara, Dherwara, Bahmanwara.

WARA, a town in the Konkan near Bombay, from which was obtained a sculptured slab. The character used in its inscription is that of the Saurashtra coins and long-tailed Deva-Nagari. No gods are mentioned, but there is a trisula on the slab. The inscription is a fragment, and cannot be fully translated; but Mr. Prinsep says it may be as old as the Gujerat coins with Greek heads upon them. The trisula, without the mention of Hindu gods, would seem to indicate that it is not necessarily an exclusive emblem of Siva. —*Prinsep's Antiq.* v. p. 340.

WARANGAL, ancient town, 86 miles N.E. of Hyderabad city, lat. 17° 58′ N., long. 79° 40′ E. Warangal was the ancient capital of the Hindu kingdom of Telingana, founded by the Narapati Andhras. The kings of Andra, whose capital was Warangal, are said to have been connected with the Andra race of Magadha, but it must have been by country only, for Andra is not the name of a family, but of all the inland part of Telingana. The records of the inhabitants mention Vikrama and Salivahana among the earliest monarchs; after these they place the Chola rajas, who were succeeded, they think, about A.D. 515, by a race called Yavana, who were nine in number, and reigned as they say for 458 years, till A.D. 953. About this time the Ganapati rajas began, but the first authentic mention of them was in the end of the 11th century, under Kakati, from whom the whole dynasty is sometimes named. He was an officer or feudatory of the Chalukya kings of Kalyan, and gained victories over the Chola kings. The Ganapati rajas attained to greatest power about the end of the 13th century, when local traditions represent them as possessed of the whole of the Peninsula south of the Godavery; but Professor Wilson limits their rule to between lat. 15° and 18° N. In 1332, their capital was taken by Kafur, the general of Ala-ud-Din, and their importance, if not their independence, destroyed by a Muhammadan army from Dehli, and two of its officers settled at Vijayanagar. At one time subsequent to this they seem to have been tributary to Orissa. They merged at last in the Muhammadan kingdom of Golconda.

Warangal is said also to have borne the name of Arnabunda. A sculptured slab obtained there had an inscription in Telugu and Uriya, with Sanskrit slokas. Its date was Saka 1054, or A.D. 1132, being the year Chetrabhanu of the Vrihaspati Chakra, or sixty years' cycle of Jupiter. The inscription contains a long account of Rudra Deva's genealogy and of his battles. There are not any praises of Brahmans, or even mention of them. It is now famed for its manufacture of carpets. In the town of Hunnumconda are the ruins of a famous temple. The structure is composed of a hard black rock, elaborately sculptured. Four large columns, highly carved, support a roof of

solid slabs; although the legeud runs that a thousaud pillars once supported the fabric, but a few now remain standing. Inside the pavilion is a gigantic bull (couchant), sculptured out of black trap, highly polished, which is an admirable specimen of workmanship of its kind. The temple is entered upon wide steps of solid black trap-rock. The landing is in a porch supported by two advance columns, with elegantly-sculptured bases, having massive parapets between them. The capitals and entablatures are likewise exquisitely carved, with eaves hanging over them about five feet over their bearings. Thc building claims attention for its great antiquity, built, it is said, a thousand years ago by Raja Burthop Roothroo, to whom also is attributed the gigantic works scattered over the Warangal district, such as the great wall and fort of Warangal, and the embankment and masonry adjuncts of the Pakhall lakc, etc. In the road from Hyderabad to within forty miles of Warangal, barren rocks, which intensify the heat of the sun, and arid plains, are the prevailing features, and water is both scarce and bad. At Bouagherry, 26 miles from Hyderabad, is a hill fortress or drug, planted on the summit of a precipitous rock, rising abruptly from the plain to a vcry great height; the road extends only to Hunnumconda, a distance of 90 miles from Hyderabad.—*Elphin.* p. 221; *Cunningham*, *An. Geog. of India*, p. 527; *Fergusson.*

WARBLER, a name applied to several genera and species of birds. The pretty blue-throated warbler Cyanecula suecica, of the N.W. Himalaya, frequents the mustard fields and low scrub, frisking about like the robin redbreast. On bleak situations in the Himalaya, Mr. Adams met with the black-breasted warbler Calliope pectoralis. It is a solitary bird, and affects the stunted juniper bushes at high altitudes; it is about the size of the redstart, which in habits it much resembles. —*Adams*, *Naturalist.*

WARD. Sir Henry Ward, a civil servant, Governor of Ceylon, and who died of cholera while Governor of Madras iu 1860. In Ceylon he gave encouragement to settlers, removed the many difficulties which beset them; he constructed great trunk roads throughout the length and breadth of the island, and opened up thc districts by admirable branch communications. Rivers and streams were provided with temporary bridges until the finances increased, when they were replaced with permanent structures; aud ere he left the colony he had the satisfaction of opening the suspension bridge at Gampola and thc new bridges at Katugastututy, magnificent structures, which will remain lasting monuments of his rule, and will bear his name to posterity. Sir Edward Barnes may be said to have founded the colony, and Sir Henry Ward to have formed it.

William Ward, the missionary colleague of Carey in the Serampur Mission. He was born at Derby in 1769, and learned the trade of a carpenter. He arrived at Serampur on the 13th October 1799. He was fearless, fond of work, somewhat democratic, slightly opinionated, with a capacity for organization, and with that marvellous control over Asiatics which belongs to that temperament. The book he wrote, a View of the History, Literature, and Religion of the Hindus, with all its exaggerations and affected prudery, is still valuable as illustratiug thc popular habits, manners, and religious belief of the masses, aud as giving the manners and customs of the E. I. Company's servants at thc beginning of the 19th century. It went through three editions.

WARDHA, a river which rises in the Satpura Hills between Nagpur and Betul. It is a river of importaucc in the Central Dekhan. It flows south-east, separating the Nagpur, Wardha, and Chanda districts of the Central Provinces from the Berars and the Nizam's dominions. Its first great affluent is the Pain Ganga, which it receives on the Nizam's or right bank, about 190 miles from its source; 64 miles lower down (a little above Chanda) it joins the Wainganga, and the united stream, thenceforward known as the Pranhita, flows on in the same direction to join the Godavery at Seroncha. It is at the junction of thc Wardha with the Wainganga that the great obstacle to the Godavery navigation scheme, known as the 'Third Barrier,' occurs. The bed of the Wardha is throughout rocky and deep; in the monsoon it becomes a furious torrent, and carries a considerable body of water. The railway bridge which crosses it at Pulgaon is of iron, and consists of fourteen sixty-foot girders, resting on masonry piers. In the hot months, however, the stream is everywhere fordable. Timber rafts can be floated down this river. The valley of the Wardha is a rich tract of country lying between the river and a range of hills which, receding as the Wardha district is entered, leave a considerable open space, which widens gradually to the south. In general the country is well wooded, and in thc eastern portion of the Hinganghat subdivision the jungle predominates over the cleared and cultivated tracts. The plain of Hiuganghat and the plain and hill of Girar are spots of great geological interest. At the former place a fresh-water stratum may be traced, and silicified wood picked up in abundance at the latter; the hillside exposes the fresh-water stratum in all its varieties, while the plain is strewn with curious zeolitic concretions resembling betel-nuts or nutmegs, which have issued from the soft subjacent rock. The geologic formation is interesting. The trotting bullock of this part of the Central Provinces is famous. The breeding of horned cattle generally is carried on on a large scale in the northern and hilly part of the district, which affords excellent pasture in the cold season, but in summer most of the herds are taken to the jungles of Mandla and Chanda. The breed of buffaloes, too, is very fine.—*Madras Conservator's Reports*, p. 4; *Central Provinces Gazetteer.*

WARDHA, chief town of Wardha district, Central Provinces, lat. 20° 45′ N., long. 78° 40′ E. The district is in the Central Provinces, lying between lat. 20° 18′ and 21° 21′ N., and between long. 78° 4′ 30″ and 79° 15′ E. It forms a triangle with its apex towards the north-west. The base rests on Chanda district, while on the western side the river Wardha separates it from Berar. Population (1872), 354,720 souls. The great sheet of trap which covers the Berars, and spreads as far as the coast of the Arabian Sea, has flowed over the whole of the district. The black soil varies in depth from 10 feet to a few inches, the average thickness being about 2 feet.

WARING. Edward John Waring, M.D., F.R.C.P. Lond., F.L.S., Commander of the Indian Empire (1881), a medical officer of the

Madras army, 1849-59, author of two editions of a Manual of Practical Therapeutics (1854), also Bazar Medicines, three editions; editor of the Pharmacopœia of India (1868); author of the Bibliotheca Therapeutica, 2 vols. (1878-89), The Tropical Resident at Home (1866), Cottage Hospitals (1867), The Hospital Prayer Book (1872), and Statistics of an Enquiry into the Pathology and Statistics of Abscess in the Liver; Medical Notes on the Burmese, The Vital Statistics of the Madras Army, Statistical Notes on Tropical Diseases.

E. Scott Waring, author of Tour to Shiraz by the Route of Kazroon and Firozabad, with Remarks on their Manners, Customs, etc.; also History of the Mahrattas, 1810.

WARINGIN TREE, Anglo-Malay, is the Ficus Benjamina, very closely resembling the banyan tree of the continent of India, spreading in like manner over a large space of ground, the lateral branches sending down shoots, which take root, and become a supplementary trunk. The wilder Papuans delight in residing among the branches of the waringin trees, whose dense foliage and horizontally-spreading branches render them well adapted for the purpose. This tree is of peculiar interest in connection with the earlier history of the native races of the Far East, as it is regarded with a superstitious veneration by all the aboriginal tribes of the Archipelago, as well as by those of the northern coasts of Australia, aud by the lower classes, at least, of the Chinese.—*Mr. Earl*, p. 116.

WARK. Hind. A leaf of a book, a leaf of a tree. Wark-i-nukra, silver leaf. Wark-i-tila, gold leaf, etc.

WARKA-bin-NAUFEL, cousiu of Mahomed's wife Ayesha. He was skilled in Jewish learning, and is said to have translated the Scriptures from Hebrew into Arabic.—*Elphin.* p. 256.

WARKALLAI, between Cochin and Trevandrum, a spur of the W. Ghats, consisting of a ridge of laterite hills about six miles wide, with a summit level of 180 feet, ending abruptly in a line of cliffs washed by the sea. A tunnel through it has been planned.

WARREN, Captain JOHN, an officer who served in several parts of the Madras Presidency and in Mysore. He wrote an Account of the Petrifactions near the Village of Trevikera in the Carnatic, in vol. ii. of Asiatic Researches; also Account of Experiments made at the Madras Observatory for determining the length of the simple Pendulum beating seconds of time at that place. He edited the Kala Sankalita.

WAS, which occurs in Allungwas, in the Mahrati, a forsaken village; but in the Gujerati, a ward or quarter of a village occupied by the Koli race.

WASHERMAN'S EARTH, an impure carbonate of soda, on the surface of the ground in many parts of India. The soda is obtained by dissolving in water and evaporating, and the soda is sold under the name of sobbu. A washerman's well is deemed in the east the most impure of all receptacles. These wells are dug at the sides of streams, and give a supply of pure water filtering through the sand.—*Tod's Rajasthan*, p. 223.

WASHING OF FEET. In John xiii. 10, 'He that is washed, needeth not save to wash his feet.' The Hindus walk home from bathing barefoot, and on entering the house wash their feet again.

WASP. The mason wasp is a name given to several genera and species of hymenopterous insects of the family Sphegidæ. One of these, Pelopæus Spinolæ of St. Fargeau, distinguished by its metallic lustre, introduces its eggs into the body of the pupa of some other insect, which it thrusts into keyholes and other apertures of Indian houses, and encloses the whole with moistened earth. The young parasite, after undergoing its transformations, gnaws its way into light, and emerges a four-winged fly. The Ampulex compressa, which drags about cockroaches into which it has implanted its eggs, belongs to the same family.—*Sir J. E. Tennent's Ceylon*, p. 257.

WASSO, in Buddhism, the season of sacred rest. It is still celebrated at Bhilsa by the illumination of the shrine of Lohangi Pir, at his ziarat, on the full moou of Asarh.

WASTE LANDS are abundant in British India, but, owing to the prevalence of the village rights, the family rights, and those of copartnery, it is not easy for a stranger to purchase portions. Lord Stanley, in his despatch of 22d December 1858, ordered such to be sold in fee-simple, and this was agreed upon in resolution of 17th October 1861. On the plains, wherever they are fertile, especially in the provinces drained or watered by large rivers, the population is as high as 600 and 700 to the square mile. But iu the hills the population is too scanty to meet the present labour demand, comparatively trifling as it is. The figures refer to acres.

I. Hill Wastes.

Madras. — Coimbatore (Neilgherries), 1,385,845; Salem (Shevaroys), 409,046; Madura (Pulneys), 651,921.

North-West Provinces.—Kamaon, a limited extent suited for tea; Dehra Doon, 204,526; Mahadeo Hills, Gondwana, thousands of square miles; Jubbulpur, 25,180 square miles.

Bengal. — Cossya Hills, Chittagong, Mymensing, Garo Hills, Sylhet, Bhagulpur, Chutia Nagpur, North Cachar, very large area; Kamrup (Assam), 179,560; Nowgong (Assam), 1,205,600; Sibsagur (Assam), 1,471,728; Akyab, 3,152,000; Cachar, 200,000; Darjeeling, 250,000.

British Burma.—Tenasserim, 17,920,000; Martaban, 5,760,000; Pegu, about 40,000 square miles.

Panjab.—Simla, 22,995; Kangra, 16,136; Dehra Ghazi Khan, 24,349; Sealkote, 67,083; Jhelum, 3279; Dehra Ismail Khan, 474,880; Kohat, 16,479; Hoshiarpur, 15,000.

Mysore.—Astragram, 816,619; Bangalore, 547,139; Chittuldroog, 1,365,000; Nuggur, 188,597.

II. Wastes in the Plains.

Madras.—Ganjam, 12,461; Vizagapatam, 3100; Rajamundry, 172,259; Masulipatam, 2419; Guntur, 479,774; Nellore, 417,221; Cuddapah, 2,536,747; Bellary, 3,458,820; Kurnool, 379,434; Chingleput, 499,075; North Arcot, 426,128; South Arcot, 949,215; Tanjore, 145,316; Trichinopoly, 620,847; Tinnevelly, 785,933.

Bombay.—Sholapur, 414,433; Ratnagherry, 5902; Dharwar, 178,847; Poona, 141,192; Belgaum, 218,542; Satara, 331,315; Ahmadabad, 218,415; Kaira, 73,846; Baroach, 8000; Surat, 95,410; Tanna, 8552; Kandesh, 1,635,666.

North-West Provinces.—Saharunpur, 12,858; Bijnore, 124,368; Shahjahanpur, 56,000; Singrowlee, 34,452; Gorakhpur, 189,508.

Bengal.—Baraset, 5289; Sunderbans, 809,642; Bulluah, 2500; Ramree, 1,200,000; Sandoway, 8000; Bardwan, 680; Hoogly, 139; Midnapur, 3247; Dinajpur, 25,861; Murshidabad, 1189; Bogra, a large tract.

Panjab.—Ambala, 13,917; Jalandhar, 1136; Lahore, 225,057; Gujranwala, 174,357; Ferozpur, 399,414: Amritsar, 16,505; Gujerat, 64,196; Shahpur, 574,309;

Multan, 1,510,388; Jhung, 1,737,571; Gugaira, 1,636,242; Muzaffargurh, 17,134; Leiah, 1,750,000; Hissar, 1902; Jhujjur, 11,925; Sirsa, 467; Rhotuck, 2375.

Oudh.—Sitapur, 8500; Durriabad, 5731; Hurdui, 29,327; Baraitch, 98,300; Gunda, 98,340; Mahomdi, 188,045.

Hyderabad and Nagpur.—West Berar, 544,475; East Berar, 565,741; Nagpur, 8; Raepur, 493,384; Chanda, 32,707; Chindwarah, 2000.

The islands of the Mergui Archipelago, and much of the Malay Peninsula, are unpeopled.

WAT, SIND., is made of wheat boiled in milk, and seasoned with salt or sugar, and is the nashtah or morning meal of the peasantry in Sind, eaten as soon as they rise.—*Masson's Journeys*, i. p. 375.

WATCH. The Hindus and Muhammadans in India divide the day into four watches, and the night into the same number, the day being considered to extend from sunrise to sunset. The watches are again divided into ghurces, which are 24 minutes each in length, and which are usually called an Indian hour. As in the summer the days are longer than the nights, each day watch will then be longer than any watch of the night, though, from the necessity of each watch comprising an exact number of ghurec, there will generally be the difference of one ghuree between two watches of the same day. There is much variation in this respect; and although, in the latitude of India, the difference is not so great as it would be in a country more towards the north, it is still so inconvenient that the natives of India rarely understand their own method of dividing the day, and readily adopt the English mode.

WATER.

Water, with the Hindus, is used as a synonym for climate. Ab-o-howa, or water and air, is applied similarly by the Muhammadans. Civilisation, society, government, law, appear to have originated in countries which have certain watering-places or great rivers or perpetual springs, and wells have led men to congregate at particular watering spots. Fountains sacred to the sun and other deities were common to the Persians, Scythians, and Hindus, and both the last offered steeds to him in sacrifice. The Hindu races at the beginning of their religious rites made a preliminary offering of water, called Ankurapana. Few Hindu sects will take water to drink from each other. In Western Gujerat it is customary for Brahmans to use brass or copper vessels belonging to persons of other castes, after they have scrubbed them well with dust and water, and washed them. A leathern bucket need only be washed, because, having come originally from the house of the tanner, who is a person of very low caste, it is supposed that no further defilement can happen to it. Some strict Brahmans, however, will neither drink water which has been drawn in a leathern bucket, nor even use it for ablutions. In parts of Western Gujerat there is frequently but one well in a village, in which case the outcastes draw water on one side of it and retire, and when they are gone Brahmans and other castes come and draw water from the other side. It is usually the case that there are many wells in a village, and that one is specially set apart for out-castes. A well is defiled if a dog or other animal have fallen into it, and, for its purification, water must be drawn from it five times, and Ganges water or cow's urine poured into it. If a Brahman or Wania woman, returning home with water from a well, meet a funeral, she will sometimes throw away the water at once as defiled, sometimes veil herself and move aside, averting her face, and if the corpse be not carried within a few paces of where she stands, the water is preserved from defilement. The dead body of an animal defiles also, and if one happen to lie on the way to the well, no water is procurable until it has been removed, and the ground has been purified. Some women will throw away the water if a crow alight on the vessel and put his beak into it, but as the case is rather a common one, other women take no notice of it. The symbols of the three Hindu deities are respectively time, water, and fire. Besides the well-known worship of the holy Ganges, the tribes worship other rivers under the name of Gangamma, and in crossing them it is usual to drop a coin into the water as an offering and the price of a safe passage. In the Dekhan and in Ceylon trees and bushes near springs may often be seen covered with votive offerings. The Khond race also worship rivers and fountains. The people of Sumatra are said to pay a kind of adoration to the sea, and to make an offering of cakes and sweetmeats on their beholding it for the first time, deprecating its power of doing them harm. The offerings on the Ganges to Khaja Khizr are of this character.

In the Panjab four kinds of water are found in the Rewari wells, all of which are used in irrigation, but the produce of each varies. The first is Shirin or Mitha, *i.e.* sweet water, the irrigation from which, in common seasons, does not produce such remarkably fine crops as the other kinds; but this is infinitely more than compensated by the fact that, in drought years, the produce is certain and abundant.

Second, Matwalla or hard water, the land irrigated by which produces very fine crops, except in drought years, when they are rather inferior, though still good and certain.

Third, Malmalla or brackish water, with which good crops but inferior vegetables are produced in common years; in drought, however, both are inferior.

Fourth, Khari, Shor, or very brackish water. This irrigation is said to bear finer and more abundant produce than the others.

Wanklyn and Chapman state that all drinking waters may reasonably be required to be of such a degree of purity as not to yield more than 0·08 millegram of albumenoid ammonia per litre of water, equal to 0·08 parts per million. If not in this state naturally, all water that is to be used for drinking ought to be filtered until it becomes so.

The people of India, and Hindus in particular, have been highly careless of the wells and tanks from which their drinking and cooking waters have been obtained; but in 1883 they printed in 13 languages a lecture which Surgeon-General Furnell gave in Madras. That officer said that excellent laws and regulations had been laid down by ancient lawgivers. He pointed out that

in the Yajur Veda, the part called Arana contains the following commandments:—'Do not spit out with retching in the water. Do not pass urine or discharge excreta in the water. Do not drop blood in the water. Do not throw any hair, or nails, or bones, or ashes, nor dip dirty clothes into water. For to do so is to abuse a precious gift of the gods and disgrace them.'

Then, passing on to the Smriti, or the rules laid down by the lawgivers regarding the use and abuse of water, he showed that the Yagnya Valkya prohibits the drinking of eight kinds of water:—(1) water kept boiled by a stranger, (2) foaming water, (3) heavy dirty water, (4) water giving off offensive smells, (5) water rising in bubbles, (6) hot water, (7) muddy water, (8) salt water.

The sage Shatatapa prohibits bathing in a tank or pond defiled by the following persons by washing or bathing:—Those suffering from sore eyes or itch on the head or ear; those subject to epileptic attacks, or ulceration in the head running off through the nostril, or to consumption; or those affected by leprosy, or small-pox, or diarrhœa, cholera, or other contagious diseases.

In the second book of Ramayana, the Prince Bharata calls down upon himself a curse if he were guilty of something charged against him, by saying,—

> 'His sin, who deadly poison throws
> To spoil the water as it flows,
> Lay on the wretch its burden dread
> Who gave consent when Rama fled.'

In Uddhava Gita of the 11th book of the Bhagavata Purana or Krishna's legend, the divine Krishna advised to drink no other water but that filtered or strained through a clean cloth.

Again, the Yagnya Valkya prohibits the use of water that remains after washing one's feet or hands and other parts of the human body, or the remnant of what another person drinks, or the water near the dhobi's place for clothes, or where chandala or butchers, chucklers, and other outcastes wash themselves, or where women after child-birth or people under pollution bathe.

All these authorities are taken from the chapter headed Charukanda, or the use of water, in the book of the Hindu law by Vaidyandha, held in high esteem by the Hindu community of S. India.

Dr. Parkes, the greatest authority in hygiene, sums up the department of his manual which treats of water, with the following practical conclusions:—An epidemic of diarrhœa in a community is almost always owing either to impure air, impure water, or bad food; and if it extends over many families, almost certainly to water. Diarrhœa or dysentery constantly affecting a community, or returning periodically at certain times of the year, a very sudden and localized outbreak of either typhoid fever, malarious fever, or cholera, are almost certainly from bad water; and Dr. Macnamara says cholera could be warded off.

The Arabian littoral has a scanty supply of potable water, and at several places, sweeter water, obtained from springs under the sea, is used in preference. Of this a notable instance occurs at Katif town, 25 miles from Bahrein, where, in the open sea, in from 3 to 4 fathoms, are several of such springs.

There are at Bahrein also, in what is called the Inner Harbour, and elsewhere, several submarine springs, which are generally 10 to 12 feet from the sea-surface. But the island population is not dependent on them for its supply, as it has a perennial spring sufficient to keep the whole surface of the island under cultivation. Their fresh water is got by diving. The diver, sitting in his boat, winds a great goat-skin bag around his left arm, the hand grasping its mouth; then he takes in his hand, or stands on, a heavy stone, to which is attached a strong line, and, thus equipped, he plunges in and quickly reaches the bottom. Instantly opening the bag over the strong jet of fresh water, he springs up, at the same time closing the bag. The stone is then hauled up, and the diver, after taking breath, plunges in again. The source of these copious submarine springs is thought to be in the hills of Arabia some 50 or 60 miles distant. To facilitate the filling the water bag, a stone with an aperture in its centre is usually fitted over the mouth of the spring.—*Surgeon-General Furnell; Lubbock's Origin of Civil.* p. 200; *Forbes' Rasamala or Hindu Annals*, ii. pp. 239, 240; *Ward.*

WATER-CRESS, Nasturtium officinale.

Shui-kin-tsai, . . CHIN. | Shwui-kin-tsai, . CHIN.

Leaves—Loot putha. Seeds—Hurufs.

The water-cress is a native of Great Britain. It thrives best in running streams, and is to be had all the year round. It is grown from seed in beds near a water-course, and the supply may be kept up for any length of time. A small black caterpillar is very destructive to it. The only remedy is flooding the plants for a short time.—*Jaffrey.* See Nasturtium.

WATERFALLS. The principal cataracts or waterfalls in India are those near Simorri in Rohilkhand; at Gokak, on the Gutpurba; Yena, in Mahabaleshwar, 600 feet; Cauvery, 300 feet; cataracts of Subunreka, Chutia Nagpur, and Hurrori Ghat, the falls 15, 20, and 400 feet respectively. Waterfalls occur in the course of the rivers Mahanadi, Behur, and Tonse in Gondwana. That on the Mahanadi, 9 miles from Kaiouti, is a fall of 270 feet; the fall on Behur river, near Chechai, is 363 feet; and that on the Tonse, near Tahlurk Ghat, is 210 feet.

The Garsipa falls are on the river Sherwatty, about 15 miles up the W. Ghats from the town of Garsipa. From top of fall to surface of basin is 888 feet, and the depth of basin is 300 feet, and from 300 to 600 feet across during the rains. The country in the neighbourhood is extremely beautiful.

In the Lushai is a waterfall on the Kahu Doong (or Kowa Doong) stream about 1200 feet below Lall Shooma's village, from which it is reached by an easy bridle-path. Above the fall the Kahu Doong is a most beautiful stream, flowing placidly between high banks close to the water's edge, with the luxuriant vegetation peculiar to these parts. From the quiet stream above, the water is suddenly launched over a scarp of some 50 feet into a clear pool on a broad ledge of rock, which has been gradually worn away by the action of water, to receive it. From this pool the stream then plunges over a second ledge, and falls as a sheet of spray and foam into the bottom of an immense amphitheatre of cliffs, surmounted on all sides by high forest-covered mountains; the edge of the scarp, the great fissures which

rend it from top to bottom, the clefts between the strata, and indeed every available nook and cranny, being fringed with festoons of creepers, ferns, and orchids of every variety. The height of this second fall is 350 feet sheer drop without break, and the view from the sharp edge of the precipice, looking down into the great black rock-strewn basin below, is one of the most striking that can be imagined; and during the wet season, when there is a large flow of water, must be one of the finest waterfalls in India.—*Dr. Buist's Catalogue; Jameson's Ed. Jour.*, 1822.

WATER-HEN, Parra Sinensis. Plumes of inferior kinds are made from its feathers. It is met with in the north of India, running over the leaves of the lotus. The best plumes are, however, made from the feathers of the heron of the Panjab. See Wild-fowl.

WATER-LILY, the common name for the species of the family Nymphæaceæ. One of the most beautiful and the largest of the tribe is the Victoria regia.—*Roxb.* See Nelumbium; Nymphæa.

WATER-MELON, Cucurbita citrullus. Citrullus cucurbita, *Schræd.* Si-kwa, Han-kwa, CHIN. The red-fleshed water-melon is largely eaten in Chiua. Liquid night-soil is largely used in the cultivation of melons.

WATERSPOUTS are frequent in the Indian Ocean, the Bay of Bengal, and the Arabian Sea. They generally form a double cone. The upper portion with its apex downwards consists of a dense cloud, while the lower cone, the apex of which is pointed to the heavens, consists of water, which is thus sometimes raised to a height of several hundred feet. Waterspouts seldom last longer than half an hour. Their course and movements are irregular. They are more frequent near the coasts than in the high seas; the wind often prevents the formation of waterspouts. In their stead the windspout shoots up like an arrow, and the sea seems to try in vain to keep it back. The sea, lashed into fury, marks with foam the path along which the conflict rages, and roars with the noise of its waterspouts, and woe to the rash mariner who ventures therein! The height of the spouts is usually somewhat less than 200 yards, and their diameter not more than 20 feet, yet they are often taller and thicker. When the opportunity of correctly measuring them has been favourable, however, as it generally is when they pass between islands of the Eastern Archipelago, so that the distance of their bases could be accurately determined, they have never been found higher than 700 yards, nor thicker than 50 yards. In October, in the Archipelago of Rio, they travel from north-west to south-east. They seldom last longer than five minutes, generally they are dissipated in less time. As they are going away, the bulbous tube, which is as palpable as that of a thermometer, becomes broader at the base, and little clouds, like steam from the pipe of a locomotive, are continually thrown off from the circumference of the spout, and gradually the water is released, and the clouds whence the spout came again close its mouth. There never occur many waterspouts in the Archipelago of Bioun Lingen except during the changing of the monsoon, when almost daily one or more occur. The airspouts near the equator always appear to be more dangerous than the waterspouts. Mr. Jansen says he has seen waterspouts go up out of the water upon the shore, where they overthrew strong isolated frame houses.

WATER WAGTAIL of several kinds occur in India. The grey wagtail is the Motacilla boarula. The lark-toed wagtail, Budytes citreola, occurs in the irrigated fields. The spotted hill wagtail, Enicurus maculatus, is one of the most handsome denizens of the mountain streams. In S. India, the pretty little, clean-looking, sprightly water wagtail is usually the first and most welcome harbinger of the coming cold weather, and remaining in India abundantly whilst the cold season lasts. The pied wagtails of India, Motacilla Luzoniensis and M. Dekhanensis, are specifically different from those of Europe, M. alba and M. Yarrellii, however similar in appearance and habits; but the grey wagtail of Britain, Calobates sulphurea, is identically the same in India and Java, and a specimen has been seen in a collection from Australia. This delicate little bird, so clean and bright in its appearance, is of very general diffusion over Southern Asia during the cold season, being indeed much commoner than in Britain. An individual of the Motacilla boarula is occasionally to be seen. The great pied wagtail, the Motacilla Maderaspatana, is rare. The yellow wagtail lark is the Budytes viridis; the feathers on its head are blue-grey in spring and summer. — *Cal. Rev.; Blyth; Adams.* See Birds.

WATSON. Gheriah was the chief town and strongest port of Angria in 1756. It was attacked and taken by a British squadron of five British ships under Admiral Watson, and on land by an army under Clive. A Mahratta army held aloof.

WATTAL or Watui, in Kashmir, a tribe which supplies dancing girls and prostitutes. The women are among the handsomest of the valley, and are very beautiful. They have all the manners and appearance of gypsies. They live in tents, or rather small huts of thatch, and have no restriction as to food.—*Campbell*, p. 121.

WATTAM. TAM. In Tanjore, a district comprising three or more villages under one headman.

WATTAN. ARAB. A native country. In Western India, a patrimonial inheritance. Watandar, the holder of a hereditary right, a property or office.

WATTLE TREES of Australia are species of Acacia. A. decurrens, black wattle. A. pycnantha, *Benth.*, golden or green wattle.

WAUGH. Major-General Sir Andrew Scott Waugh, F.R.S., of the Royal Engineers, died at the age of 68. He entered the Bengal Engineers in 1827, and assisted in the making of the great Trigonometrical Survey of India in 1832. Three years later he became Astronomical Assistant in his department, and took a leading part under Sir George Everest in the measurement of the great Indian arc for determining the figure and dimensions of the earth. In 1843 he was appointed Surveyor-General of India and Superintendent of the Trigonometrical Survey, and he received the gold medal of the Royal Geographical Society in 1857-58.

WA-WEI, a vegetable poison, used by natives of the Somali coast and others in the interior of Africa for poisoning their arrows. It is an inspissated decoction of the root of a tree which is supposed to be one of the Loganiaceæ or Apo-

cynaceæ. It is used both in hunting and in war, and is said not to be poisonous if swallowed.—*Madras Museum; Captain Playfair.*

Wax is obtained from different sources, the chief of which is the beehive, where it is made by the bees for the formation of their cells. The insects proceed in a similar manner, and with such celerity, that in a new hive a comb 20 inches long by 7 or 8 inches broad will be constructed in 24 hours, and in 5 or 6 days the hive will be half filled. The wax thus produced is more or less yellow in colour, and has an odour resembling that of honey. The beautiful geometrical form in which it is arranged in the honeycomb is well known. The amount of wax produced in England is very large, but a considerable quantity is likewise imported from abroad. When the wax has served its purpose in the domestic economy of the hive, it is collected for manufacturing purposes by first allowing the honey to drain off or to be pressed out, and then, by repeated boilings and strainings, obtain the product. For obtaining a marketable wax from the combs by a single operation, without either straining or pressing, in an earthen vessel, much narrower at bottom than at top, is placed water and aquafortis, in the proportion of one ounce of the latter to every quart of the former. When these are well blended, as many good wax-combs are put in as will reach, when melted, to within a finger's length of the top of the pan. The pan is then set on a clear fire, and stirred while the wax is melting, and until it has boiled long enough to liquefy the whole completely. It is then removed from the fire, and allowed to cool gradually. The wax then forms into a cake at the top, and the impurities are underneath. These arrange themselves in two layers, the lowest of which consists almost entirely of dross, but the next contains a certain amount of wax. When the cake of wax is turned out of the pan, both these drossy layers are removed, leaving the cake pure; but the upper drossy layer is boiled over again with more combs, and with any scrapings which it may have been necessary to make from the upper surface of the wax in order to leave it quite free from extraneous matters. Old combs that have wax in them, or other descriptions of refuse that have been pressed, but yet retain a considerable portion of wax, are pressed down in a close tub or vessel in a house for five weeks. This causes the impurities to ferment and rot, without affecting the wax, which may then be treated as above described, and will yield a fine yellow wax, little inferior to that of the best combs. Where very great purity is required, the best empty virgin combs are put into the same kind of vessel employed in the preceding process, but with only a quarter of a pint of water, to keep the wax from burning. The pan is then set over a clear fire, and stirred until it boils. At this time a clear yellow froth begins to rise up, which froth is to be skimmed off into a pan placed close at hand. The fire must be so managed that this froth shall continue to rise without boiling over, and a succession of skimmings are thus obtained, which form a very pure description of wax. When no more froth will rise, the residue is turned out into a vessel of cold water, and can be boiled up again with other combs. This method is only available with a fine comb. By the above processes, beeswax is freed from impurities, but is not deprived of its natural yellow colour. For the greater number of uses to which the substance is appropriated, it is, however, necessary that the wax should be rendered perfectly white. This is effected by exposing it in thin ribands on a bleaching ground, where it is subjected to the action of light, air, and moisture, and loses both colour and odour. In India, wax is obtained from the west coast of Africa, Barbary, Malabar, Zanzibar; and in small quantities from the West Indies, United States, Germany, France, etc.—*Waterston; Faulkner; M'C.; Tomlinson; Smith, Chinese M. M.; Poole, Statistics of Commerce; Bagster on the Management of Bees.*

WAX INSECT, Chung-peh-lah and Shu-lah, Chin., the Coccus pela, *Westwood*, is of a whitish hue when small, but becomes of a dark-brown colour at the close of the season. They are found on certain oleaceous plants, Ligustrum Japonicum, L. lucidum, and L. obtusifolium, and it is the secretion of these insects that the Chinese call peh-lah or white wax. When this insect is fully developed, the trees seem as if covered with flakes of snow. The wax is an article of great value in Chinese commerce, and a portion is exported. From the time of the Mongolian dynasty, in Chinese works white wax is always to be understood as referring to the waxy secretion deposited upon the small branches of several oleaceous trees. The male insect is described in Hanbury's Notes as having large wings and an elongated anal point. The female insect appears to develope its body in such a way as to envelope the twigs of the tree. The Pen Ts'au describes them as about the size of a wood-louse. In the beginning of June they are found upon the small tender branches of the trees, around which they deposit the snow-like wax. In the latter end of August or thereabouts, the wax is carefully scraped off the trees, is melted in boiling water, strained whilst hot, and poured into cold water, when it immediately congeals into a white, opaque, crystalline mass, very much resembling the best spermaceti. If the collection be delayed, the raw wax, called Lah-cha, is inferior. In the autumn, the dark chestnut-coloured insect begins to make a nidus, something like that of the mantis. It is at first no larger than a grain of millet, the whole covering the tree something like fruit. As the spring comes on, these reddish round receptacles become as large as a fowl's head. Each one of these insects lays several hundred eggs. At the beginning of May these collections of eggs are gathered, and wrapped in the leaves of a reed called yoh, the same as the rice dumplings of the dragon-boat festival are wrapped in. They are put upon the proper trees, and by the early or middle part of June they are hatched, and have emerged from the leaves to enter upon their wax-making on the young branches of the trees. The insects have their enemies in the shape of the ants, who climb up the trees and eat their fat friends, unless lime be sprinkled frequently over the trunks of all the

wax trees. These trees are planted upon the banks between fields, or in clumps. Lu-chau-fu in Ngan-hoei, Kia-hing-fu in Che-kiang, Hing-hwa-fu in Foh-kien, Lip'ing-fu and Hing-i-fu in Kwei-chau, Chang-teh-fu, Kwang-chau-ting, Tsing-chau, Yung-shun-fu, Hang-chau-fu, Kwei-yang-chau, and other places in Ho-nan, with several districts in Yunnan and Sze-chuen, are known to supply this wax in large quantities. It is sold in large, flat, round cakes, sometimes carried without any packing; the trade is very extensive in Hankow. The insects and the trees are said to have been originally inhabitants of different parts of the country, until attention was directed to the culture of this wax. It is used in making candles, when mixed with vegetable tallow, also in very small quantities to harden the outer coat of Chinese candles, and is the basis of the black composition used in rubbing off visiting cards, or other simple impressions from small blocks. It is likewise used in making ointments for sores, cuts, and porrigo; a kind of bolus is brought from Canton, called Peh-lah-hwan, and is much prized as a vulnerary and pectoral dose. White wax is used in internal injuries, after accidents, in much the same way as spermaceti was in European pharmacy up to the beginning of the present century.

The insect is raised in Sze-chuen on the Nu-ching trees, L. Japonicum and L. obtusifolium, and also on the Shwai-lah-shu or L. ibota, or species of ulmus. Another tree on which the insect harbours is the Shwui-tung-ts'ing, supposed to be a species of Hibiscus; and a tree called Tien-chu, also called Cau-lih and Pent-sau, a native of Kiang-nang, supposed to be a species of Ornus or Fraxinus. The holly tree, Shwui-kiuh-shu, and the Yuen-chi-hwa tree, are also named as affording shelter to the wax insect.—*Fortune, Residence*, p. 140; *Smith, Mat. Med.; Hanbury.*

WAX TREES. Species of Myrica yield myrtle wax, especially M. cerifera of Louisiana, the berries of which are encrusted with wax. By boiling these in water, a quantity of hard, brittle wax of a pale-green colour is obtained, of the specific gravity of 1·015, the fusing point being 110°. A somewhat similar wax is obtained from M. cordifolia, a shrub of the Cape of Good Hope. The stems and leaves of palm trees also secrete palm wax, which is the hard, brittle, greenish-yellow wax obtained from Rio de Janeiro. It is soluble in boiling alcohol and ether; it fuses at about 163°.

In N. America, M. Pennsylvanica also furnishes a vegetable wax. A vegetable wax is obtained by scraping the trunk of the wax palm of the Andes (Ceroxylon Andicola, *H. B.*). One tree is said to afford about 25 lbs. It is used with tallow in making candles.

A wax is found upon a hard and ligneous variety of the sugar-cane, and is known as sugar-cane wax and cerosine. This is soluble in boiling alcohol, but sparingly so in boiling ether. By boiling the bark of the cork tree, Quercus suber, in alcohol, and distilling off the alcohol, a quantity of yellow crystals are obtained, which form cork-tree wax, which may be purified by repeated solution and crystallization. Nitric acid converts this substance into a peculiar acid, called cerinic acid.

The vegetable white wax of China, called Peh-lah, resembles spermaceti. About £400,000 worth is gathered annually. Baron Richthofen estimates the value of the annual crop, on the average, at about £650,000. In 1879, upwards of £81,000 worth was exported from the one port of Hankow alone. Towards the beginning of winter, small tumours appear on the Ligustrum lucidum trees, which it inhabits, and these increase to the size of a walnut. They are supposed to be the nests of the female insect; they are filled with eggs, which hatch in the spring, and the young insects disperse themselves on the leaves and pierce the bark. The wax they produce begins to appear about June, and is gathered at the beginning of September. It is found from the frontiers of Tibet to the Pacific Ocean, and reared with more or less success, but is chiefly cultivated in Shan-tung province.

In the Kin-chang district, the Ligustrum lucidum thrives in abundance. It was accidentally discovered that, by transporting the insects from their native districts to Keating-fu, in the north of the province, their capability of discharging wax was largely augmented, which was availed of by the Sze-chuen traders. The period between morning and evening is chosen for conveyance, because many hours of sunlight would precipitate the hatching. This should take place only after the females have been attached to the trees. Arrived at their destination, six or more of the mothers are tied, wrapped in a palm leaf, to a ligustrum. A few days later the young flies are swarming on the twigs, where they fulfil their mission by the month of August. Then they perish in the caldrons, where the results of their brief existence are collected. It is said that this peculiar industry requires the exercise of great care, forethought, and experience.

In China, a vegetable wax is obtained from the Stillingia sebifera. Dr. Rawes says the seeds are picked at the commencement of the cold weather, in November and December, when all the leaves have fallen from the trees. The seeds are put into a wooden cylinder, open at the top, but with a perforated bottom. This is placed over an iron vessel containing hot water, and when the seeds have steamed 10 or 15 minutes, they are thrown into a large stone mortar, and are gently beaten by two men with stone mallets, for the purpose of detaching the tallow from the other parts of the seed. They are then thrown upon a sieve, heated over the fire, and sifted; by which process the tallow is separated, or nearly so, although they generally undergo the process of steaming, etc., a second time, that nothing may be lost. The other part of the seed is ground and pressed for oil. The tallow now resembles coarse linseed meal, and derives its brown colour from the thin covering over the seed (between it and the tallow), which is separated by the pounding and sifting. In this state it is put between circles of twisted straw, five or six of which are laid upon each other, and thus forming a hollow cylinder for its reception. When this straw cylinder has been filled, it is placed in a press of longitudinal beams of considerable thickness, placed about 1½ or 2 feet asunder, with a thick plank at the bottom, forming a kind of trough, and the whole is bound together with iron. The tallow is pressed out by means of wedges driven in very lightly with stone mallets, and passes through a hole in the bottom

of the press into a tub, which is sunk there to receive it. It is now freed from all impurities, and is a semi-fluid of a beautiful white colour, but soon gets solid, and in cold weather is very brittle. The inside of the tubs which collect the tallow are sprinkled or dusted over with a fine red earth, well dried, which prevents the tallow from adhering to their sides. It is thus easily removed in a solid state from the tubs, and in this condition the cakes are exposed for sale in the market. As the candles made from this vegetable tallow have a tendency to get soft and to melt in hot weather, they are commonly dipped in wax of various colours, as red, green, and yellow. Those which are intended for religious purposes are generally very large, and finely ornamented with golden characters. The cake or refuse which remains after the tallow has been pressed out of it, is used for fuel or to manure the land, and so is the refuse from the other part of the seeds from which oil is extracted. Stillingia sebifera grows luxuriantly in the Dehra Doon and Lower Himalaya, and in the Kohistan of the Panjab. There is an interesting paper on it by Dr. Macgowan in vol. vii. p. 164 of the Journal of Horticultural Society of India. It flowers in June and during the rains. In addition to the tallow obtained from its seeds and used in making candles, a black dye is obtained from its leaves.

Dr. James Anderson, who lived early in the 19th century, is said to have written about a white wax occurring near Madras, but nothing of the kind is now known.

In Sumatra, a winged ant is said to produce a grey wax, which was exhibited at the French Exposition of 1855.—*Dr. J. L. Phipson; Voigt; Roxb. Ind.* iii. p. 693; *Dr. Rawes; Eng. Cyc.; Williams' Middle Kingd.* pp. 107–282; *Fortune's Wanderings*, p. 67; *Smith; Hanbury*, p. 64. See Dryandra cordifolia; Oils.

WAX, VEGETABLE. This term has recently been applied to solidified oils. Mr. Edward Loarer discovered a mode of fabricating a substance which he named vegetable wax, from its resemblance to that animal product, and he obtained a patent for it under Act vi. of 1856 of the Government of India. He manufactured about 200 tons, which brought various prices, but the latest selling price at Havre was about £43 per ton of 1000 kilogrammes, or 2200 English lbs.

Candles can be prepared of this material; and the power of bleaching it is possessed in Europe. The vegetable wax is made from the common lamp oil (castor-oil) of the country, the plant producing which is grown throughout the length and breadth of the Indian empire, springing luxuriantly even on bare, rocky soils; affording, therefore, exhaustless supplies of the raw material for the wax.

By one of Mr. Loarer's processes about 100 lbs. of oil were congealed in 8 hours; only one ingredient (sulphuric acid) was used, and that only in very small quantity, 16 ounces sufficing for obtaining 100 lbs. of vegetable wax. This process is admirably adapted to the country, and may be adopted by the ryots without any difficulty.

Another process, in which both nitric and sulphuric acids are used, is the best adapted for manufacture on a large scale; by this process, 400 lbs. of oil were congealed in a wooden trough in four days; and Mr. Loarer suggested an arrangement and described an apparatus which would make this process of preparing vegetable wax on any scale very simple. The manufacture of vegetable wax can be generally introduced into India, thus enabling the grower of castor and other similar oil-seeds to carry oil to market in a solid and consequently more portable state. At present the carriage of fluid oils is not only difficult but costly.

This vegetable wax has the advantage of being easily stored, and transported from the interior on the rudest conveyance and in the simplest and cheapest form; it can be loaded upon carts, on bullocks, or in any way best adapted to the habits of the people, and sufficiently protected from injury and from weather by the ordinary leaves and mats of the country, requiring neither casks, dubbers, nor boxes to convey it. It can further be solidified into any portions or shapes; and on board ship can be stowed in any convenient corner, requiring no protection against leakage or bilge water, and by its nature it can be packed so close that no danger from shifting of cargo or injury to the article from rubbing need be apprehended.

Illipoo oil produces with great facility a perfectly white substance of the consistency of good tallow. Illipoo oil is with great advantage mixed with castor oil for the manufacture of vegetable wax, and as illipoo oil has always fetched a very low price in the Madras Presidency, the discovery of this property renders it very valuable.

Margosa oil, the oil of species of Azadirachta and Melia, produces a vegetable wax as hard as any made from the best lamp oil, and of a light saffron colour. Margosa oil has always been sold in the Madras Presidency at a very low price, but its supply has never reached what it could attain should this oil become saleable. Margosa as well as illipoo oil, mixed with an equal quantity of cold-drawn castor oil, produces a hard vegetable wax of an agreeable roseate colour.

WAY-THAN-DARA, a Burmese story of one of the former existences of Gautama, in which he exemplified the great virtue of almsgiving. It is one of the most affecting and beautifully written compositions in Burmese. The prince Way-than-dara gives away all his possessions, and at length even his children.

WAZEEFA. Arab. A stipend; land allotted for the support of Muhammadan shrines.

WAZIRI, a brave, active, warlike, but aggressive and predatory race in the mountains on each side of Bannu and Dour. They occupy all the hill tract from Kuram and the Miranzai to the Gomal and Golcri pass, south of Tank. They hold both sides of this pass, which is the great route by which the trade of Afghanistan and Central Asia passes into India. Between the Miranzai and Bannu valleys, the hills of the Waziri project into British territory and approach the Bahadur Khel salt mines, from which they are separated by the Latammar pass. Its numerous tribes are estimated to muster 20,000 to 30,000 men. They had made repeated inroads on the Bannu valley, and in the cold weather of 1859–60 an expedition scoured their valleys to coerce them into submission. They are still, however, more or less independent. The Waziri are divided into three great divisions, or Usman Khel, Ahmadzai, and

Mahsud. Their country extends from the south of the Kohat district down to Tank, opposite Dehra Ismail Khan; towards the north they are bounded by the Afridi country, and towards the south by the tribe of Badranian; Bannu frontier is the habitat of the Ahmadzai. These are divided into six sections, which again are sub-divided into numerous smaller clans. One of these sections is called Sperkye; it has two divisions, the smaller of which goes by the name of Muhammad Khel, and numbers about 250 fighting men; they live in the hills on both sides of the river Kuram, and since A.D. 1850 a number of them settled in British territory. They till their lands in the cold season, and during the summer months the greater portion of them retire to the hills, leaving a few to look after their fields. The other sections of the Ahmadzai are located in British territory on the t'hul between Bannu and Latammar; they generally go by the name of T'hul Waziri. The Waziri country, in its southern part, has the lofty mountain Kussai Ghar, of which the Takht-i-Sulaiman is the highest peak. The Waziri, although notorious robbers, in common with other lawless tribes, regard the descendants of Mahomed with awe and a feeling of respectful reverence, and esteem themselves fortunate to receive their benediction, and other little aids their superstitions teach them to think essential. They are haughty and bloodthirsty towards strangers, prone to plunder, and careless about blood-shedding; are plain spoken; and though inclined to be boastful and rough in council, are true to their friends. They have never owned any allegiance to Kābul.—*Masson's Journey*, i. p. 101; *Vigne, A Personal Narrative*, p. 83; *Our Panjab Frontier; MacGregor.*

WAZU. ARAB., HIND., PERS. The Muhammadan legal washings of the face, hands, and feet. The Muhammadan purification before prayers.

WEASELS are arranged by naturalists under the genus Mustela, of the family Mustelidæ, and there are known in India M. kathiah, *Hodg.*, the yellow-bellied weasel of the Himalaya and Nepal; M. strigidorsa, *Hodg.*, the striped weasel of Sikkim; M. Horsfieldii, *Gray*, of Bhutan; M. temon, *Hodg.*, of Tibet; M. canigula, M. nudipes, *F. Cuv.*, of the Malay Peninsula and Java; M. sarmatica, *Pallas*, of N. and Central Asia and Afghanistan. Mustela subhemachalana, *Hodg.*, the Himalayan weasel, occurs throughout the Himalaya from Kashmir to Darjeeling. Its total length, including tail, is 19 inches; colour, a uniform light-brown, darker on the back; nose, mouth, and throat white; tail lax and tapering. This handsome little creature is not uncommon in the valley of Kashmir. M. erminra, the stoat or ermine, is stated to occur in Nepal and in the lower and middle regions of the W. Himalaya. M. Sibirica, *Pallas*, occurs in China.—*Adams; Jerdon.*

WEAVER BIRDS of India are of the genus Ploceus. P. baza hangs its pendulous dwelling from a projecting bough, twisting it with grass, often lemon grass, into a form somewhat resembling a bottle with a prolonged neck, the entrance being so situated as to baffle the approaches of its enemies, the tree snakes and other reptiles. Its large purse-shaped nest would fall an easy prey to its enemies, did not the little architect, with surprising intelligence, place it in situations not easily accessible; hence several may be seen suspended from the tips of branches overhanging deep wells, or on the topmost boughs of acacia and thorny trees. The weaver bird builds in societies, and is docile and familiar in its habits. The nests are used for stuffing elephants' pads.

WEAVING is an art that has existed in India in all its perfection from the earliest period of which there is any record. In the Institutes of Menu, compiled perhaps 1400 years before the Christian era, weaving is spoken of as a familiar handicraft. That the product was woven cloth of cotton or silk or wool, is shown by Menu (Institutes, ch. viii. ver. 30), who says: 'Let a weaver who has received ten palas of cotton thread, give them back increased to eleven by the rice water and the like used in weaving. He who does otherwise shall pay a fine of twelve panas.' It appears, therefore, that 'size' was used in the process as it is at present. And in ch. v. it is further directed that 'silk and woollen stuffs are to be washed or purified with saline earths, and cloths by washing or sprinkling.' We have thus evidence of the existence of silk, woollen, and cotton cloths; and in ch. x., among articles which Brahmans are prohibited to sell, 'all woven cloth dyed red, cloth made of Sana or Kshuma bark (whatever that may have been), and of wool, even not red,' are enumerated. No trace of linen cloth made from flax is to be found in Menu or any of the earlier works of the Hindus; and it is probable that flax had never been made from the linseed plant for the manufacture of yarn for weaving.

The great epic poem the Ramayana, possibly as old as 1200 to 1400 years B.C., affords very distinct evidence of the existence of silk cloths. It is mentioned that when the brides of Rama and his brothers returned home, their mothers-in-law, 'sumptuously clad in silk, hastened to the temples of the gods to offer incense,' etc.

Actual knowledge of the fabrics produced by the most ancient looms is gained from the specimens yielded by the mummy pits of Egypt. For burial purposes linen alone was there employed, on account both of its cleanliness and its lasting qualities. Linen formed the special dress of the priests, it being the symbol of purity, and not liable, like woollen garments, to be infested with insects or parasites. There are samples in the British Museum very fine in texture, the finest being found woven with threads of about 100 hanks to the pound, with 140 threads to the inch in the warp, and 64 in the woof. The Egyptian priests were also partial to cotton dresses, which were supplied to them by the Government, as the Rosetta stone distinctly mentions. Cotton and wool were worn by the upper classes of society; wool alone by the poorest. The garments of the priests and higher ranks among the Hebrews were of fine linen; the references to silk in the English version of the Bible being an undoubted mistranslation. There is no evidence of silk having been known to the Hebrews or Assyrians.

In the representations of the Egyptian loom at Thebes and elsewhere, the loom is vertical, and the weaver is seen throwing the weft through the warp by means of a rod, at the end of which there is a hook, probably for drawing back the shuttle with the weft. The Indian loom is very like this in principle, only horizontal; doubtless the same which has been in use from time immemorial, and

which probably passed through Persia or some other channel at an early period into Europe. Mediæval drawings, such as that copied by Montfaucon from the MS. Virgil of the Vatican, commonly assigned to the 4th century, show a modification of this pristine model. · The Chinese silk loom, however, presents a striking contrast to these simple machines in point of inventiveness and complexity, coming near the best specimens of the modern hand-loom. Aristotle gives the earliest historical notice of silk, which in all probability spread from China westwards, and came into extensive use concurrently with the growth of wealth and luxury in Greece and Rome.

The fabrics woven in India now are probably not much altered in character from what they were in the time of Menu; and the looms, simple and apparently rude in construction, are, under their wonderful power of manipulation and unwearying patience, capable of producing some of the finest, most elegant, and most costly fabrics in the world. The frame of the loom in Bengal is almost on the ground, and the weavers, sitting with their feet hanging down in a hole cut in the earth, carry on their work. A loom usually forms part of a Burman's household furniture, and it is worked by the women. The cloths are rough but strong, and some of the silk goods are of considerable value. Waistcoats for men, petticoats for women, and coverlets are usually woven.

The weavers of India are alike of the Hindu and Muhammadan religions, and in the rural parts of the country nearly all the aboriginal races and many of the Sudra Hindus occupy the slack season of their field work in weaving coarse cottons and woollen fabrics. An investigation by the Madras Board of Revenue in 1870 showed an increasing extent of weaving; and in the year 1881, workers in cotton, flax, silk, and wool, in India numbered 3,114,082 souls. The people of moderate means are now largely using the piece-goods of Europe and America, but the finest and coarsest products are still produced from the Indian looms. Yarns and twists are largely imported, and employed in the manufacture of the textile fabrics which meet the particular wants of the natives.

Divisions of the weaver caste in Telingana are Pursala wanloo, Sumsala wanloo, Puttanasala wanloo, and Sala wanloo.

Zunlozi, weavers of the wonderfully beautiful patterns of gold and silver tissues, plain and figured, with and without admixture of silk or cotton, in flowers and patterns; gold and silver tissue lace of all breadths and patterns, used for trimming scarfs and for bridal dresses; larger scarfs of muslin and tissue combined, as those of Benares; and that wonderful cloth of gold called kimkhab, which is without parallel in the ornamental manufactures of the world. People of all ranks indulge in raiment gorgeous according to their means. The poorest marriage trousseau has some tissue or trimming, and the wealthier people make great use of brocade and tissue scarfs, shawls, and turbands. The chief localities of manufacture are Benares, Burhanpur, Aurangabad, Murshidabad, Dehli, Arcot, and Mysore. The workmen are usually Muhammadans.

At Bangalore, the descendants of the old court weavers still manufacture a peculiar kind of cloth, printed in red and black with mythological designs. In the Bombay Presidency, Ahmadabad, Surat, and Baroach are the chief centres of the manufacture of printed sarees, for which Gujerat is celebrated; while Poona, Yeola, Nasik, and Dharwar produce the fabrics dyed in the thread, which are much worn by the Mahratta races.

Spinning of yarn for weaving is practised by all classes of women in India; even the highest at one time used to amuse themselves with the · spinning-wheel. Among the agricultural classes the occupation is constant, or fills up time not required for other household occupations. At the latter part of the 19th century, the imports of yarn into British India had increased enormously, and the weavers had also largely increased. The spindle in use is not much thicker than a stout needle. It is from 10 to 14 inches in length, and attached to it, near its lower point, is a ball of unbaked clay to give it weight in turning. The spinner holds it in an inclined position, with its points resting on a piece of shell, and turns it between the thumb and forefinger of one hand, while she at the same time draws out the single filaments of cotton from the roll of cotton in the other hand, and twists them into yarn upon the spindle. Dryness of the air prevents the filaments of cotton from being sufficiently attenuated or elongated, and is therefore unfavourable to the spinning of fine yarn. A certain degree of moisture, combined with a temperature of 82°, is the condition of the atmosphere best suited to the carrying on of this operation. The Dacca spinners usually work from soon after dawn to 9 or 10 o'clock, and from 3 or 4 o'clock in the afternoon till half an hour before sunset. The finest yarn is spun early in the morning, before the rising sun dissipates the dew on the grass; or, when this is wanting and the air is unusually dry, it is not unfrequently made over a shallow vessel of water, the evaporation from which imparts the necessary degree of moisture to the filaments of cotton, and enables the spinner to form them into thread. As a proof of the fineness of the yarn thus delicately spun, Mr. Tayler mentioned that one skein which was carefully weighed, proved to be at the rate of 250 miles in length to the pound of cotton.

Dr. Watson has given the result of microscopic examinations of French, English, and Dacca muslins in an elaborate table; and he reports that the diameter of the Dacca yarn is less than that of the finest European; that the number of filaments in each thread is considerably smaller in the Dacca than in the European yarns; that the diameter of the ultimate filaments or fibres of which the Dacca yarn consists is larger than the European; and that the superior fineness of the Dacca yarn depends solely on the fact that it contains a smaller number of filaments. These causes—combined with the ascertained result that the number of twists in each inch of length in the Dacca yarn amounts to 110·1 and 80·7, while in the British it was only 68·8 and 56·6—not only account for the superior fineness, but also for the durability of the Dacca over the European fabric. At Nandair on the Godavery, at Muktul, Dhanwarum, and Amarchinta in the Nizam's dominions, and at Arnee near Madras, muslin which rivals that of Dacca is made in considerable quantities. In these localities the process of spinning by the spindle is the same as that of Dacca; but as the climate is drier, the spinners, who are both men and women, work in partially

darkened rooms, the floors of which are watered to produce the necessary amount of moisture. The hand-spinning of fine thread used for Brussels lace, according to Mr. Palliser's account of it, is spun by women in darkened rooms.

The manufacture of muslins of such qualities as are produced at Dacca, and indeed in Europe, must necessarily be always of a very limited character, and their use confined to very rich purchasers. For the masses of the people, the British manufacturer sends to India the plain and striped duria, mulmul, aghabani, and other figured fabrics, which have established themselves there, and which, both from their good quality and moderate prices, are acceptable to the numerous classes who make use of them. Some of the chintzes of Masulipatam and of the south of India are as beautiful in design as they are chaste and elegant in colour. Printed cloths are worn occasionally, as in Berar and Bundelkhand, for sarees; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the lower classes in Upper India; but the greatest need of printed cloths is for the kind of bedcover called palampore, or single quilts.

In the costlier garments woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the sarees, or women's cloths, made at Benares, Pytun, and Burhanpur in Gujerat, at Narrainpet and Dhanwarum in the Hyderabad territory, at Yeokla in Kandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black shot with crimson and yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of or approach to glaring colour or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the country; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair—as a lady of England or France.

Another exquisitely beautiful article of Indian costume for men and women is the do-patta or scarf, worn more frequently by Muhammadan women than Hindu, and by the latter only when they have adopted the Muhammadan loongee or petticoat, but invariably by men in dress costume. By women, this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head; by men, across the chest only. Do-pattas, especially those of Benares, are perhaps the most exquisitely beautiful of all the ornamental fabrics of India; and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and ductile description imaginable, woven in broad rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns of the ribbon borders or broad stripes. How such articles are woven at all, and how they are woven with their exquisite finish and strength, fine as their quality is, in the rude hand-looms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colour: the creamy white, and shades of pink, yellow, green, mauve, violet, and blue are clear yet subdued, and always accord with the thread used and the style of ornamentation, whether in gold or silver, or both combined. Many are of more decided colours,—black, scarlet and crimson, chocolate, dark green, and madder; but whatever the colour may be, the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing; but the dyers and scourers of India have a process by which the former colour can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The do-pattas of Pytun, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Dekhan, not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares. Scarfs are in use by every one,—plain muslins, or muslins with figured fields and borders without colour: plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called 'sela' in India, are in everyday use among millions of Hindus and Muhammadans, men and women. They are always open-textured muslins; and the quality ranges from very ordinary yarn to that of the finest Dacca fibres.

The textures of the dhoti, saree, loongee, manufactured in Britain and sent to India, are in general too close, too much like calico in fact, which makes the garment hot, heavy in wear, and difficult to wash. The surface becomes rough and 'fuzzy' in use, from which the native fabric remains free. Comparatively few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But what all classes wear are coloured cloths,—black, red, blue, occasionally orange and green, violet, and grey. All through Western, Central, and Southern India sarees are striped and checked in an infinite variety of patterns. Narrainpet, Dhanwarum, and Muktul in the Nizam's territories; Gudduk and Bettigherry in Dharwar; Kolhapur, Nasik, Yeokla, and many other manufacturing towns in the Dekhan; Arnee, in the south, and elsewhere, send out articles of excellent texture, with beautifully-arranged colours and patterns, both in stripes and checks. For the costly and superb fabrics of cloths of gold and silver (kimkhab), and the classes of washing satins (mushroo and hemroo). the gold and silver thread is simply the result of skilful and delicate manipulation. The gold and silver cloths (kimkhabs) are used for state dresses and trousers, the latter by men and women; and ladies of rank usually possess petticoats or skirts of these gorgeous fabrics. Mushroo

and hemroo are not used for tunics, but for men's and women's trousers and women's skirts, as also for covering bedding and pillows; they are very strong and durable fabrics, wash well, and preserve their colour, however long worn or roughly used. They can hardly be compared with British satins, which, however, if more delicate in colour and texture, are unfitted for the purposes to which the Indian fabrics are applied. Many of the borders of loongees, dhotis, and sarees are like plain silk ribbons, in some instances corded or ribbed, in others flat.

The manufacture of Kashmir shawls is not peculiar to that province. Those formerly issued from that province were exquisitely woven, with unrivalled elegance and chasteness of design, softness and finish, in quality, arrangement of colours, and use of dyes which the finest Paisley and French shawls do not approach. The exquisite shawls of Kashmir grow rarer and rarer every year, and their place has been usurped by hand-embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Panjab and Dehli, of late years, workmen have commenced to embroider Kashmir cloth and net with floss silk and braid, but solely for sale to Europeans, who wear them as tunics, jackets, scarfs, and the like. In the hand-worked Kashmir shawls, as also in the Dehli work, wooden needles of hard wood are used, slightly charred, with a hole in the centre of the needle to receive the yarn.

The Muhammadan weavers of India produce plain muslins, such as turbands, scarfs, the loongees or waist-cloths worn only by Muhammadans, and coarse cloths, called jote and khadi. They seldom weave coloured yarn, except for loongees, and pieces of soussi, a fabric somewhat coarse but very durable, used by women for petticoats and trousers. They are strict in their religious observances. They marry among their own body. Hindu weavers are of different degrees of caste; those of Northern India are termed Kori or Koreya, and have several divisions who eat meat and drink spirits. The non-Aryan Koli also weaves a coarse cloth; as also the Julai, a Sudra race found all over India. They weave plain as well as coloured fabrics, fine goods, turbands, scarfs, bodices, or silk or cotton or mixed sarees, or women's cloths, and dhotis or men's cloths. The manner in which they arrange their colours and weave stripes and checks, with broad borders of figured silks, evince great practical knowledge of and perfection in their art.

The rumal, used as a cloth for the head, is of cotton or of silk.

The sarec of women is of silk, or of plain white, striped, and flowered muslins, with silk borders and ends, plain, or with gold thread. They are of comparatively loose, open texture, soft and pliable, and when worn as an entire garment, they fall gracefully to the shape, and are readily adjusted.

Ordinary cloths woven in India are the dhoti, do-patta, and loongee waist-cloths of cotton worn by Hindu men.

Soussi is a somewhat coarse cotton fabric, used by Muhammadan women for petticoats and trousers, also for covering cotton mattresses and other like purposes.

The thread or yarn from which the manufactures of Narrainpet, Dharwar, Muktul, Amarchinta, and Gudwal are woven, is spun in the adjoining districts. The spinners are Dhers, who are unrivalled in this branch of industry. They purchase the cotton in the seed, which is the produce of Shorapur and the country around, and it is cleaned entirely by the hand, as the use of a churka or other cleaning implement they allege breaks or injures the fibre. The spinning-wheel has a large circumference, and is in some instances worked by a treadle, and the spinning is carried on in a close room, from which wind is carefully excluded. The perfection of the cotton manufactures of Narrainpet, Dharwar, and Muktul, as well in regard to colour as texture, is attributed by the native weavers to the quality of the water, in regard to which they are most particular, and to the clays and earths obtainable near those places in which the thread is washed after its long oil process. The water is represented as hard and unfit for culinary purposes or washing, yet without salt, and which, in washing the thread, and brushing it as stretched on the loom, contracts the fibre and renders it clean and smooth in working. There can be no doubt of the permanency of the colours, and that all the madder reds and browns improve with washing. It is of essential importance to use none but permanent colours, as any others subjected to the rough treatment of Indian washermen would speedily fade or change. The silk dyes are perhaps less permanent than the cotton, but still they last many years, and bear frequent washing.

The Kori or Koreya are Hindu weavers of Northern India. The Tanti weavers are also Hindus. In the Chutia Nagpur province of Bengal there are about 50,000 of helot weaver races, besides whom are thousands of weavers in the Pan or Panwa, Ganda, and Chik of the southern Tributary Estates, and the Pab and Panika of the western districts have features rather of Hindu form than Kolarian or Dravidian.

Thoughout British India Hindu weavers are considered a low caste, and to escape from this position many of them have embraced Muhammadanism, and are called Julai or Julaha. Momin, in Arabic a true believer, is a name often applied to Indian Muhammadan weavers.—*Ed. Rev.*, July 1867; *Ward*, iii. p. 126; *Dr. Watson.* See Arts and Manufactures.

WEBERA CORYMBOSA. *Willd.*

Stylocoryne Webera, *Sch.* | Rondeletia Asiatica, *Linn.*
Kunkra, . . . BENG. | Terana pullum, . . TAM.

The fruit of this plant, a small black berry, is eaten by poor people. It is a beautiful shrub, which is rarely seen in low lands or in cultivated districts. Dr. Roxburgh, i. p. 696, described W. corymbosa, macrophylla, odorata, oppositifolia, and scandens.—*Ainslie; Roxb.*

Canthium parviflorum, *Lam.*

Kandan karra, MALEAL. | Sengarary, . . . TAM.
Naga valli, . . SANSK. | Balusu kura, . . . TEL.
Karai, ... TAM.

Found as a small shrub on many of the barren wastes of the Dekhan, and on hill ridges, with a dark-coloured, hard, and pretty wood, good for turning small objects. In a verse of the Bharata, where Krishna, having been fed by a hunter or savage, his attendant asks, 'Is the Balusu kura

which you received from Panchalikudu equal to salyodanam (fine rice) apupa (cakes), saka (vegetables), supam (pulse)?' It is a common proverb also, 'Whilst life remains, I can subsist on the leaves (kura) of the Balusu;' implying submission to any necessity however grievous. A decoction of the leaves and bark is prescribed in certain stages of flux cases, and the root is supposed to have anthelmintic qualities. The leaves and fruit are eaten as greens.—*Wight; Gibson; Beddome, Fl. And.*

This perennial plant grows in the south of India, has a slight turpentinous taste, and is used in medicine.—*Roxb.* iii. p. 440.

WEEK, this division of time is recognised by Jews and Christians and Muhammadans, their religions requiring them to set apart the Sabbath and the Sunday and Friday. The Arab and Persian Muhammadans reckon their days as first, second, etc., designating Friday as the Jama day of assembly, and Saturday as the Haftah or 'week.' The Urdu names are Aitiwar, Pir, Mangal, Charshambah, Jumarat, Juma, and Awal Haftah. Hindus, until comparatively recent times, reckoned their days by the increasing and the waning moon, but have copied the Christian (or Roman) mode, and translated the names into their respective tongues. Tamil speakers name the seven days of the week from the sun, the moon, and the five principal planets. They observe the order of the apparent distances of the planets from the earth:—

Saturn . . .	Sani	Saturday.
Jupiter . . .	Viyazam . .	Thursday.
Mars . . .	Sevval . . .	Tuesday.
Sol	Nyayarn . .	Sunday.
Venus . . .	Velli . . .	Friday.
Mercury . .	Budan . . .	Wednesday.
Moon . . .	Tingal . . .	Monday.

Each hour, according to Hindu notions, being ruled successively by a planet, by counting the 24 hours of a day by each planet belonging to it in the above order (which is that of their apparent distance from the earth), it will be found that each day is named by the planet which governs its first hour. The first 25th hour is the first hour of the first day of the week, Sunday (Nyayarn), and counting with the 25th as the first of the second series of 24 hours, the next 25th will give the moon for Monday (Tingal), and so on for the rest of the week.—*Indian Statesman.*

WEEPING WILLOW, Salix Babylonica, probably of West Asiatic origin, now everywhere in cultivation.

WEEVILS. The family of the weevils is one of the most extensive amongst the beetles, and in Europe many of its members do much injury to agricultural produce. Mr. Nietner had seen nearly the whole sweet potato (Batatas edulis) crop of the Negombo district of Ceylon destroyed by one of them, the Cylas sturcipennis. The common rice weevil, Sitophilus oryzæ, is another instance; and one of the cocoanut tree destroyers of the Ceylon low country, the Sphænophorus planipennis, belongs also to this family. The Arhines? destructor, a beautiful green weevil, Mr. Nietner had not found do any injury to coffee trees; but Mr. J. Rose of Matturatti, writing to him, says the mischief they do is plentiful, and if they were as plentiful as the bug they would be the planters' worst enemies. 'Five or six acres were completely covered with them, and they consumed almost every leaf. Year after year they appeared upon the same place. One year they appeared upon a neighbouring estate in great force, and overran at least 40 acres. The same thing occurred on three other estates.'

There are two corn weevils, of the order Coleoptera, family Curculionidæ, and genus Calandra, the Sitophilus of Schönherr. Calandra oryzæ, the rice weevil, infests also wheat. It has a pair of serviceable wings. C. granaria, *Linn.*, the granary weevil, injures stored corn; in Britain has no wings. They pair from April to August, the warmer it is the oftener they propagate. Heating the grain to 135° is said to destroy them. If unscoured wool be mixed with the grain, the insects are attracted into it and perish. Lime-washing the walls and frequent stirring are preventives.

The leaves of the Azadirachta Indica or nim prevent the weevil attacking grain. If a few leaves be put in the barn with each waggon load of corn, maize, or wheat, and some scattered between each tier of sacks of grain when loading a ship, the grain put up in it will be preserved for years. Half a bushel of black salt, mixed with a hundred bushels of wheat, rice, or other grain, prevents the black weevil.

WEI. CHIN. A term applied to several underground rhizomes. Wei-jui or Yuh-chuh, CHIN., is a drug used as an antiperiodic; it is the root of a leguminous plant.

WEIGHTS AND MEASURES.

Mikyal, Kayl, . . ARAB.
Waznat, Kal, . . ,,
Taul, Map, . . . HIND.
Aiyar, Kobin, . . PERS.
Peiman, ... ,,

The ancient linear measures of the Egyptians and the Jews were taken from a unit representing the human foot or arm. The cubit was the forearm, *i.e.* from the elbow joint to the tip of the long finger. The cubit was subdivided into two spans, or six hand-breadths (palms), or 24 finger-breadths (digits). The Jewish rod was 6 cubits. Several values have been assigned to the Jewish cubit, varying from 20 to 21 English inches. The Greeks and Romans measured by the foot (pes), the hand (palma), the palm (παλαιστη), and the finger (digitus), which mode passed down to the Romano-Germanic races. The Romans also had the pace, a military measure, and they and the Greeks had the cubit (cubitus), from the point of the elbow to the point of the middle finger, and the ulna; and a fathom, tesa, toise, is the outstretched arms across the body. Similarly in the E. Indies, the finger, the hand, the forearm, and the outstretched arms, also the foot, the pace, and the distance to which human voice can be heard, have suggested the linear measures in use.

A variety of nominal measures, and of values given to the same measure, exist in different parts of India, and even in the same district. Even in a single village a certain nominal measure will have half a dozen different values, according to which of as many different articles on the floor

of the vendor in the bazar is about to be sold. It is a very general custom that there should be two series of weights employed in each shop, according to the transaction. When the shopkeeper sells, he uses a maund of 24 lbs., but when he buys, this weight makes way for another of the same name of 28 lbs. In Azimgarh, for example, cotton and spice are measured by the seer of 80 tolas, ghi and salt by the seer of 95 tolas, while 96 tolas forms the rate for corn, sugar, and tobacco; the merchants themselves employing for their own purchases seers of 105 and 108 tolas. In Malda the seer has no less than fifteen different values,—50, 58, 60, 72, 75, 70, 80, 80⅝, 91, 92, 94, 96, 100, 101, and 105 tolas. In Dacca the relative values are 60, 70, and 82 tolas. Bhagulpur boasts of six different seers of 64, 67, 80, 88, 101, and 104 tolas respectively. The merchants of Juanpur employ in their own dealings a seer of 112¾ tolas, but retail to the people in seers of 80 and 96 tolas.

Cotton is sold in Madras in candies of 500 lbs., but in many of the cotton districts the candy is but 480 lbs. to the ryot. In Mysore, the same name represents 560 lbs., while in Pondicherry it sinks to 517 lbs., omitting fractions, and rises in the purchases of the merchants to 562 lbs.; while, as if further to complicate this measure, brass, copper, and zinc are valued according to candies of 450 lbs. In Kandesh, sesamum seed is sold by the candy of 560 lbs., mustard seed in Gujerat is measured by the candy of 612 lbs., while 580 lbs. is the value for mustard seed in Sholapur; and the territory of Goa measures its kokum by the candy of 784 lbs. The coffee grown in Mysore is estimated in maunds of 28 lbs. If bought by a Madras merchant, it is priced in maunds of 25 lbs., and transmitted to him by railway in maunds of 82 lbs.; but if bought for export from Calicut, it must be in maunds of 30 lbs. each.

The ordinary Madras maund is 25 lbs.; in Bengal it is 82 lbs.; while in Bombay it is 28 lbs. In some parts of the western coast of the Madras Presidency 30 lbs. is the value of the same nominal standard, while the indigo and other factory agents of Bengal reckon by a maund of nearly 75 lbs. In Bombay the bazar maund may contain 40 or 42 seers, while the candy may contain either 20, 21, or 22 maunds, and varies in weight from 500 to 560, 588, or even 616 lbs. In Surat and its neighbourhood, the maund may contain either 40, 41, 42, 43¼, or 44 seers, according to the article sold, or whether the transaction be wholesale or retail; and further, these seers themselves differ so much in value, that while the maund of 40 seers weighs 31 lbs. avoirdupois, that of 41 seers weighs 38 lbs.; that of 42 seers only 39 lbs.; that of 43¼ seers weighs 44 lbs.; and that of 44 seers only 41 lbs.! In Travancore the maund is 32 lbs. In Cuttack salt is sold in maunds of 100 lbs.; the duty is paid in the Panjab on maunds of 80 lbs., and in Calcutta of 82 lbs.

The original unit of weight in Southern India seems to have been the gold coin called by the English a pagoda. It is now uncurrent, but was about 52½ grains weight. 80 pagodas weight is, according to the native tables, a seer (cutcha) of 24 rupees weight. This corresponded with the average weight of the old native rupee of 175 grains; but since the introduction of the Company's rupee of 180 grains, the pagoda weight is 54 grains generally. The same confusion formerly existed in Bengal between a Sicca weight of 179¾ grains and a Sicca rupee of 192 grains. There are also seers both in Madras and Bombay of 84 rupees weight. A greater degree of confusion could not possibly exist, nor greater hindrances to internal trade and prosperity.

The question of the weights and measures has been before the several Governments of India ever since the early years of the 19th century. In a letter to the Madras Government from the Court of Directors of the E.I. Company, dated 6th July 1829, the Court forwarded standard weights and measures in accordance with Act v., George IV. cap. 74; and subsequently the Directors, in their despatch of 17th July 1833, expected the general adoption in India of the imperial measures. The Government of India, in Act vii. of 1833, furnished certain ponderary tables, but these did not make any allusion to measures of capacity, although by far the greater portion of the domestic transactions in India are in grain. The Calcutta Chamber of Commerce, on the 19th of May 1836, resolved to adopt the weights of the Government, but urged the introduction of the imperial gallon for liquids, and proposed that new measures of capacity for grain should be regulated by the weights; but they did not, however, show how this was to be done, and the Government declined to act on the recommendation of the Chamber.

The table of weights adopted by the Government of India for the use of their own offices, was in accordance with native usage in Bengal, and was approved of by the Chambers of Commerce in Calcutta and Bombay. It is as follows:—

1 tola	= 180 grains.	
5 tolas	= 1 chittak.	
16 chittaks	= 1 seer = 80 tolas = 2·075143 lbs. avoir.	
40 seers	= 1 mun (or maund) = 82⅔ lbs. exactly.	

By a proclamation of the Governor of Madras in Council, October 16, 1846, after the 1st of January 1847, the undermentioned weights, showing the equivalents in avoirdupois and troy weights, could be used in the revenue, commissariat, and other public departments throughout the Madras Presidency:—

Madras Weights.	Avoirdupois.			Troy.		
	lbs.	oz.	drs.	lbs.	oz.	dwts.
180 grains = 1 tola .	0	0	6·582⅔	0	0	7½
3 tolas = 1 pollam	0	1	3·748¾	0	1	2½
40 pollams = 1 viss .	3	1	5·942⅔	3	9	0
8 viss = 1 maund	24	10	15·542⅔	30	0	0

Thus—

40 pollams = 1 viss	= 120 tolas =	3·0857 lbs. avoir.
8 viss	= maund = 960 tolas =	24·6857 ,, ,,

This table was sanctioned for Madras by the Government of India, but was entirely different, with the exception of the tola unit, from the weights adopted for Calcutta.

The Madras Government in this notification promulgated also a table of measures to be used in Government transactions as follows:—

1 ollock	=	12½ cubic inches.
8 ollocks	= 1 measure (puddee) =	100 ,,
8 measures	= 1 marcal =	800 ,,

But these measures were not adopted by the people; and even in the town of Madras the Government had to authorize the stamping with

the Government seal, the customary measure or puddee of 104¼ cubic inches, which had been the real standard since 1802.

The *linear measure* unit of India is generally the distance from the elbow to the tip of the middle finger of a tall man. This length is known as the Hat'h, HIND., Mulum, TAM., Mora, TEL., and averages 19½ inches. It is always translated cubit, though invariably exceeding the English cubit of 18 inches by 1½ or 2 inches. In the Southern Carnatic, the adi or length of a tall man's foot is in use, and averages 10¼ inches.

Guz.—Akbar, after very considerable inquiry, introduced as the only legal measure, what is called the Ilahi guz. The Ayin Akbari informs us that this was taken as the mean of three chief guz then existing, the smallest about 28 inches, and the Ilahi guz between 33 and 34 inches. Mr. Duncan, after prolonged inquiry, estimated it at 33·6 inches, while others have valued it from 33 to 34·25 inches; a mean of these is 33·75 inches. Jervis thinks it was exactly 33·5 inches. Jonathan Duncan employed, when engaged in 'settling' the N.W. Provinces, a guz of 33½ inches. In the coast districts of the west, the most common guz is that of about 28 inches. In other parts there is a group whose average is about 39 inches. Frequently two or more of these are present in one locality for different transactions. Merchants will buy by the guz of 34 inches, and sell by that of 30; or silk will be measured by one, cloth (cotton or woollen) by another, while carpenters and bricklayers will use each a distinct measure. For instance, cotton cloth in Surat is measured by the guz of 27·8 inches, silk and other valuable stuffs by the guz of 34·7 inches, while the carpenter employs a guz of 27·2 inches. At Juanpur, the carpenter values his guz at 30 inches, the tailor estimates his at 34 inches, while the cloth seller employs one of 40 inches. The muslin seller at Farrakhabad uses a guz of 33¾ inches, the cloth seller one of 34 inches, while the seller of silk for turbands and full-dress coats uses no other than 38¼ inches. Similar cases might be adduced in infinite abundance. Wherever the cubit varies, the guz follows, usually in the proportion of 12 to 7, though this is by no means an invariable rule.

The guz in the Madras Presidency is from 26 to 39 inches. It is, however, very much superseded by the English yard measure. In the districts of Madura and Tinnevelly, the tutcha-kole or artificer's stick is 33 English inches.

In the south of India the guz is subdivided into 24 ungulum, each of which, taking the Tanjore guz of 33½ inches, is $1\frac{4}{10}$ of an English inch. The term ungulum in Tamil signifies the thumb, and in the above measure it is the distance from the thumb joint to the tip of the nail. This ungulum is considered equal to 2 virrul kuddei, or finger-tip breadths.

The term *ungulum* is, however, sometimes used to mean a thumb-breadth, and is then the same as the virrul kuddei or finger-breadth or digit, or the 24th part of a cubit (about ·82 inch), according to the following table:—

4 finger-breadths	= 1 palm.
12 finger-breadths	= 1 span.
24 finger-breadths	= 1 cubit.
4 cubits	= 1 fathom.

The *tutcha-mulum* or artificer's cubit (double) of Trichinopoly is 33 inches, or the same as the Tinnevelly tutcha-kole, and is subdivided into 24 ungulum.

The *bam*, translated *fathom*, in Salem and Coimbatore averages 6 feet 4½ inches, and in Guntur 6 feet $6\frac{8}{10}$ inches. It is generally, but not always, subdivided into 4 cubits. The bam or fathom is also used by native seamen on the lead line.

For distances of greater length, there is no defined measure in Southern India. A *nali-vulli* in Tamil is dervied from Vulli, a road or way, and Nali, a period of time, which is the 60th part of the 24 hours, or 24 English minutes, generally known as an 'Indian hour.' The distance that is usually walked in this time is called a nali-vulli, and is about 1½ English miles or somewhat less. Seven nali-vulli make a *kadum* of about 10 miles.

The *cos* is generally considered 2 English miles, but, according to Colebroke, as follows:—

4 cubits	= 1 danda or staff.
2000 danda	= 1 cos.

Taking the cubit at 19½ inches, the cos would be 2·46 miles.

Hat'h, in the linear systems of India, is the cubit or human forearm; and in oriental countries, as well as in the west, this unit is divided into two spans and 24 finger-breadths. Under the Hindu princes, the hat'h (in Sanskrit, hasta) was equal to two vitesti or spans, and to 24 angul (angula). The angul, finger, is divided into 8 jau (Sanskrit, yava) or barley-corns. 4 hat'h or cubits = 1 dauda or staff; 2000 danda make 1 krosa or cos, which by this estimation should be 4000 yards English, or 2¼ miles. The Lilavati states that 10 hat'h make one baus or bamboo, and 20 bans in length and breadth = 1 nirauga of arable land. Natives of India, in speaking of the hat'h or cubit, allude to the natural human measure of 18 inches, more or less, and it is practically used in measuring off cloths, ribbons, etc., and in taking the draught of water of a boat. In many places, also, in Bengal and in Southern India, the English cubit has been adopted as of the same value as the native measure.

In Burma, the people seemingly use a lineal measure of this name, consisting of the natural cubit plus a hand-breadth, which would be about 20 inches. The popular cubit in Birbhum is 15¾ inches in length; the Revenue Survey employed a cubit of $18\frac{4}{5}$ inches. In the Hoogly district, the cubit varies from 18 to 19¾ inches; at Sarum, 24 inches; while in Broach, Kaira, and Vijydrug it is respectively 19·2, 19·4, and 19·58 inches.

Jureeb, PERS., is a measuring chain or rope. Before Akbar's time it was a rope, but he directed it should be made of bamboo with iron joints, as the rope was subject to the influence of the weather. European surveyors use a chain. A jureeb contains 60 guz or 20 gant'ha, and, in the standard measurement of the upper provinces of India, is equal to 5 chains of 11 yards, each chain being equal to 4 gant'ha. A square of one jureeb is a bigha. Till the new system of survey was established, it was usual to measure lands paying revenue to Government with only 18 knots of the jureeb, which was effected by bringing two knots over the shoulder of the measurer to his waist. Rent-free land was

measured with the entire jureeb of 20 knots. A jureeb in Hebrew and Arabic signified originally only a measure of capacity, equal to 4 qufecz, or 384 mud (Latin, modius), and in course of time came to signify the portion of land which required as much to sow it as a jureeb would contain. The pat'ha and nalee of Garhwal and Kamaon have a similar origin.

At the cession of the Carnatic, besides the Chittur pollams in N. Arcot, there were the two large zamindaries of Calastry and Cavetnaggur, the latter also known as Bom Rauze's country. Throughout the latter country (Bom Rauze's) the foot of the village god of Nanaveram was always taken as the unit of land,

Measurement of which 64 = 1 gant'ha.
100 gant'ha in Pungi } = 1 cawni.
12 or 15 in Nungi }

Bigha.—For square measures, the bigha is the most widely-spread standard. It is based upon the guz or cubit, and therefore differs in at least an equal proportion; the name being applied to any decently large area varying from an acre to 1500 square yards.

In Calcutta, the value is said to be 1600 square yards, while according to a very careful calculation made by Mr. Holwell, and quoted by Major Jervis, the real content should be 1778 square yards, more than ten per cent. greater than is commonly believed.

In Orissa, to the south of Calcutta, the bigha is 4840 square yards; while in Behar, to the west, it is only 3025 square yards. In Tirhut, it may contain amongst other values, any one of the following quantities,—3025, 3567, 3600, 4225, 4549, and 4900 square yards! Such a measure can only be of use to confuse. At Saharunpur, the bigha contains in one village 824½ square yards; in another, 2317·4 square yards; in a third, 2456·2 square yards; while in a fourth it contains 2756 square yards. In Nuddea, it may contain either 6400 or 3025 square cubits. The Bogra bigha is 1406¼ square yards, while that of Dehli is 3025, and that at Ghazipur contains 2755¼ square yards. At Shahjahanpur it may either be 2916 or 3600 square yards, while at Hoshangabad it is 4865⅓, and at Benares 3136 square yards. On the western side of India, the variations are equally numerous. At Broach, the bigha contains 2477; at Surat, 2844; in other parts of Gujerat, 2994; while in the east it contains no less than 4013 square yards.

In Southern India, it appears to have been the custom in ancient times to name an area of land after the quantity of grain that it was thought would sow it, or the quantity it was thought it would produce. Thus, for instance, a candy of land was as much as would produce a candy of grain, and this was by estimate, and not by actual measurement; or if a measured area was considered a candy in one village, it would not be so in the next. Even where there is some defined superficial measure, commencing from a rod square, the number of cubits to the rod varies, though the term by which the square rod is known is the same.

Cawnie.—In some districts of the Madras Presidency the land measure is well defined, as in the case of the cawnie and the acre. The former no doubt formerly differed in different places, but its dimensions seem to have been determined and introduced by Royaji, the celebrated dewan of Muhammad Ali (Wallajah), nawab of the Carnatic. Wherever the cawnie exists, it is now 57,600 square feet, or 1·322314 acres, except in some of the taluks of Trichinopoly. The English *acre* was introduced by Sir T. Munro into Bellary and Cuddapah during the survey of 1802–1806, and, 1842, it was introduced on a similar occasion into Kurnool. In both cases the chain of 33 feet was used instead of Gunter's chain of 66 feet, so that the square chain was $\frac{1}{10}$th acre, thus introducing an awkward sub-multiple.

The term goonta or coonta is synonymous with culi and guli. The word seems to denote the land measure next below the maximum of the place; thus the pooty of Rajamundry, the cutty of Masulipatam, the coatchel of Guntur, the goontoo of Nellore, the cawnie of Chingleput, the acre of Bellary, and the mow of Tanjore, are all subdivided into goonta (coonta) or culi (guli). The goontoo, etc., of one district, is not at all necessarily the same as the goontoo, etc., of another.

Mani.—In Madras, Sir Thomas Munro established a measure (called a ground or mani) of 60 × 40, or 2400 square feet, of which 24 make a kani = 57,600 square feet = 6400 square yards, or exactly equal to four Bengal bighas.

The *Madras kani* is to the English acre as 1 to 1·3223, or as 121 to 160 nearly.

Adi.—In Chingleput, the adi or Malabar foot is used, which is 10·46 inches; 24 adi = 1 kali, and 100 square kali = 1 kani, or nearly an English acre. The common kani, however, is 26 adis, or 22⅔ feet, which makes the kani = 1 acre 28¾ perches.

Biswa, from Bis, HIND., twenty, is the twentieth part of a bigha, and besides being a measure of land, is also used to signify the extent of proprietary right in an estate. Each estate or village is considered an integer of the bigha, which is divided into imaginary biswa and biswansi, to show the right of any particular party. Thus the holder of 5 biswa is a holder to the extent of one-fourth of the entire village, precisely in the same way as the As was used amongst the Romans. Thus hæres ex summuncia, heir to one twenty-fourth; hæres ex dodrante, heir to three-fourths; hæres ex asse, sole proprietor. In the same manner, bes, bessis was used to express a biswa; berar,—socius ex besse; and thus in sound and meaning, for of course there is no real connection, there is a close resemblance between the words. Bes, when it was thus applied as a subdivision of the As, was the eighth part of a jugerum or acre; not, as is usually applied, two-thirds.

Cos, HIND., is the itinerary measure of India. The Ayin-i-Akbari lays down distinctly that the cos consists of 100 cords (tunab), each cord of 50 guz; also of 400 poles (ban), each of 12½ guz: either of which will give to the cos the length of 5000 guz. The length of the cos, as ascertained from the average distances of the old cos minar or cos pillars, is = 2 miles 4 furlongs 158 yards. In different parts of India, however, these vary, and in India the cos varies from about 1 mile to 3 miles.

The *Gujerati cos* is the greatest distance at which the ordinary lowing of a cow can be heard, which is determined to be 50 jureeb, or 15,000

guz. This eos resembles the Chinese lih, *i.e.* the distanee whieh ean be attained by a man's voiee, exerted on a plain surfaee, and in calm weather. Another, in Bengal, is estimated by plueking a green leaf, and walking with it till it dry. Another is measured by a hundred steps, made by a woman earrying a jar of water on her head and a ehild in her arms. All these are very indefinite standards.

Meel or .mile, league. — The same may be remarked of the oriental meel, as well as the European mile and league. The two former evidently derive their name from the Roman milliare, and the difference of the value proves that the mere name was borrowed without refer-enee to its etymologieal signification. Aecording to the Kamus, the oriental meel is a lax and vague measure, but it has been eonsidered by Dr. Lee to bc to the English one as 139 to 112. The league also, from the German Lugen, to see, and signifying the distanee that ean be readily seen by the eye on a plain surfaee, is as indefinite as a Gujerat gao and a Bengal or Dhuppea eos. Cos is an Indian word; the equivalent in Persian is kuroh, the same as the Sanskrit word krosa, of whieh four go to the yojan, about the preeise value of whieh different opinions are held,—4 English miles aeeording to Bopp; 4½, 5, and 9 miles aeeording to Professor Wilson; but, ae-eording to the distanees in Fa Hiau's route, the yojan in his time was equal to 7 English miles, and this agrees mueh better with what we find the yojan to be when we resolve it into its eomponeut parts,—

8 barley-corns = 1 finger.
24 ,, = 1 dund.
1000 ,, = 1 krosa.
4 ,, = 1 yojan.

And, estimating the finger-breadth at eight barley-corns, this makes the yojan equal to 6 miles 106 yards and 2 feet.

Dry and Liquid Measures.—India does not, properly speaking, possess dry or liquid measures. When these are employed, they depend upon, and in faet represent, the seer or man weight, and the value of a vessel of eapaeity rests solely ou the weight eontained in it. The mode in whieh this is effeeted for the dry measures of the south and west of India, is by taking an equal mixture of the prineipal grains, and forming a vessel to hold a given weight thereof, so as to obtain an average measure; sometimes salt is ineluded amongst the ingredients. The maund and seer measures of eapaeity are supposed to represent the equivalents of a maund and seer weight, although it is evident, sinee uo two artieles have exactly the same proportionate bulk, that no two measures need eorrespond. In the absenee of suitable standards of capaeity, almost every artiele is sold by weight, even ghi, oil, and milk. Grain is sold either by weight or measure, but with an understood proportion betweeu them; thus iu Madras the measure for paddy is exactly the bulk of a viss weight. There are, however, a few measures of a well-aseertaiued value, which appear to have been arranged in something like order around the eubie cubit. An old writer on arithmetie, Bhaskaraeharya, states explieitly that a measure called karika was the eubie eubit, or ghunuhustu. Above this was the eube of a double eubit, and ten times the half of this is

the garee, a measure well known through all Southeru India, aud formerly universal; so that the garee is 40 karika. The half of the karika is the parah. One-tenth part of the eubie eubit is the mereal. In Wcstern India there is the eaudy of 10 cubie eubits. The eube of one-fourth of a eubie eubit is the pyli. Iu Southern India there is the tūmi of four hundredths of the garee, and the paddaeu or one-fifth of the eubie eubit; while in the Telugu distriets there is the pūti of two eubie eubits, and another tūmi one-tenth of one eubit. Turning northwards to Ganjam we find the burnum of two eubie eubits, and the nawty of one-tenth of a eubie eubit, and the tūm of one-fortieth of the same measure.

On the other side of India, in Bombay, there is the khuudi, exaetly eorresponding with the garee. The cube of half the side of the garee, or the half of the cubie eubit, is the parah of the same value as in Southeru India, while the eube of one-fourth the side of the parah is the seer. In Malwan, the khuudi is greatly altered in value, and beeomes ten cubic eubits, proving that there is an uuderstood eonneetion between the eubit and measures of eapaeity. In the same distriet is the parah of half the eubic eubit. As an offieial reeognition of the relation between measures of capacity and the eubit, it may be mentioned that when the Government of Bombay ordered that the measures for salt throughout the Konkau should be rendered uniform, it was resolved to employ a parah of exaetly half a eubie eubit, estimated at 19·5 inehes. Redueiug the measures referred to into a table, we find the following in eubie eubits:—

Madras garee, . . .	40	Mereal, ...	$\frac{1}{20}$
Malwan khundi, . .	10	Tumi, ...	$\frac{1}{10}$
Puti or burnum, . .	2	Nawty, ...	$\frac{1}{20}$
Ghunuhustu, . . .	1	Tum, ...	$\frac{1}{40}$

We see here two kinds of divisiou besides the ordinary one of halves and fourths.

10 mercals = 1 cubic cubit.
10 ,, = 1 khundi.
Cube of ½ side of cubic cubit = pyli.
,, ,, ,, parah = seer.

If we eompare the lengths assigned to the eubit in different parts of India, omitting one or two of the smallest and plainly diminished eubits, we shall find the average to be from 19·5 to 19·7 inehes.

Triehinopoly is the only plaee where grain is said never to be sold by weight. The mareal (properly marakkal, from the Tamil) and parah are the eommonest measures; the latter is known throughout India. In Caleutta it is ealled ferrah, and is used in measuring lime, ete., which is still recorded, however, in the man weight. In its weights, Southern India retained, from the aneient metrology of the Hindus, most of the names and terms properly Hindu, پلا pala; تلا tula; ويسا visa; بهارا bhara; كهاري khari; كهاندي (khaudi); بابا baha. Throughout the Moghul empire, on the contrary, the seer and man were predominant. The word măn, of Arabic or Hebrew origin, is used throughout Persia and Northern India, but it represents very different values in different plaees. Thus the man of Tabreez is only 6⅓ lbs. avoir., while that of Palloda in Ahmadnaggur is 163¼ lbs.

The following is the scale of measures in use at Madras :—

				Cub. In.	
		1 olluk	=	11·719	
8 olluk	=	1 padi	=	93·752	
8 padi	=	1 marcal	=	0·750	= 27 lbs. 2 oz.
5 marcal	=	1 parah	=	3·750	= 2 dr. water.
400 parah	=	1 garce	=	300·000	

The Madras Revenue Board, on the 19th May 1883, furnished the revenue collectors with a statement, showing equivalents in Government seers of 80 tolas of local measures of different food-grains and of salt. The grains tested were four kinds of unhusked and husked rice, Oryza sativa; the horse-gram, Dolichos uniflorus; the jowari or cholum, Sorghum vulgare; the bajri or cumboo, Penicillaria spicata; the varagoo, Panicum miliaceum; the ragi, Eleusine coracana; the ulundu, Phaseolus mungo; and wheat, Triticum æstivum.

Tūm.— In the Ganjam district, the assumed normal contents of the tūm, in rice, ranged from 80 to 280 tolas, with measures of cubic capacity 64·88 to 231·82 inches.

Seven *seer* measures, in use in the Madras Presidency, some of them struck, some liberally or moderately heaped, the assumed normal contents ranged from 75 to 130 tolas, viz. 75, 78, 80, 86, 90, 92, 130.

The *tavva* of four taluks of Vizagapatam is 33 tolas.

The Bezwara *mercal*, liberally heaped, 260 tolas.

The *adda* of Gudivada in the Kistna district, 210 tolas.

The *manika* and padi manika measure is in use in the Nellore and Kistna district, and liberally heaped contains from 106 to 200 tolas.

The *measure* in use in Bellary, Kurnool, Cuddapah, Madras town, and Chingleput is of 75, 80, 114, 120, 128, 130, 132, 135, 144, 150, and 160 tolas; and there is a half measure of 75 at Madarpak, and one of 64 at the Neilgherries.

The *padi* is in use in the Tamil districts, where there are seven quantities of 75, 86, 116, 133, 140, 144, and 150 tolas; and from half padi of 65, 66·5, 70, and 72 tolas.

The *nali* of Cochin is of 43 tolas.

A *garce* is assumed to contain 3200 measures, the weight of a measure of each of the following grains being—rice, unhusked, 80 tolas; do. husked, 120; Sorghum vulgare, wheat, and Eleusine coracana, each 111; Penicillaria spicata and Panicum miliaceum, each 102; Phaseolus mungo, 115; Dolichus uniflorus and salt, each 120.

The *mercal* of the Madras grain market is equal to eight Madras struck measures of 120 tolas each.

Seer.—The most common grain measure, and one which is to some extent known in almost every part of India, is the seer measure; this is always understood to be a measure which, when heaped, will contain a seer weight of rice, or in some places, instead of rice, a mixture of the nine most common grains, known as the nou-daniam measurement. The nine grains used in the Madras Presidency are rice, chenna, culti, pessalu, minamalu, dholl, anamalu, gingelly oil-seed, and wheat. As only heaped measure is recognised by native usage, it is evident that there is no rule as to the cubic contents of the measures used; for vessels of very different cubic contents may contain the same when heaped, in consequence of having different diameters. It is on this account that the values given to Indian measures, in such tables as those of Major Jervis, or Dr. Kelly in his Cambist, being founded on the gauged cubic contents, do not represent the true quantities.

By Act xi. of 1870, the Government of India established the metric system as the standard for India. But the Secretary of State disallowed the provisions of Act xi. relating to measures of length, and another Act, xxxi. of 1871, was substituted. For weights, a seer was decreed to be the unit of weight; and for measures of capacity, a measure containing one such seer of water, at its maximum density, weighed in a vacuum. The smaller and the larger quantities have not as yet (1884) been formulated; and the Bombay Government, writing on the 13th July 1878, stated 'that the standard weights and measures in the divisions of the Presidency and in the town of Bombay vary locally,' and no standard has ever beeu declared of general application, and having them tested is a matter of custom rather than of law, as the Goverument of India has not framed or issued rules under Act xxxi. of 1871.

The following measures of weight, capacity, and length are iu use in the south and east of Asia :—

1 Indian imperial seer = avoir. 2·204,621,25 lbs. = 15,432·348,75 grains = 85·735,270,833 tolas. Avoir. 2 lbs. 3 oz. 4·383,04 drs. = 1 French kilogramme.

Avoir. 16 drs. = 1 oz.; 16 oz. = 1 pound (lb.); 14 lbs. = 1 st.; 28 lbs. = 1 qr.; 4 qrs. = 1 cwt.; 20 cwt. = 1 ton.

1 chittak = 5 tolas; 16 chittak = 1 seer; 40 seers = 1 maund; 1 maund = 37·324,195,385,3 imperial seers.

1 maund = troy, 100 lbs. = avoir. 82⅔ lbs.; 245 maunds = 9 tons.

1 Indian imperial seer = 32·150,726,562,5 troy oz. = apothecaries', 2·679,227,213,541,66 lbs.

10 rutti = 1 masha; 10 masha = 1 tola; 1 tola = troy, 180 grains.

1 imperial seer = 3·527,394 Madras seers = 3·149,458,927 Bombay seers.

10 imperial seers = 0·881,848,5 Madras maunds = 0·787,364,732 Bombay seer.

Madras weights—10 pagodas = 1 pollam; 8 pollam = 1 seer; 40 seer or 8 vis = 1 maund; 20 maund = 1 candy.

Bombay weights—9 tanka = 1 nowtuck; 8 nowtuck = 1 seer; 40 seer = 1 maund; 20 maunds = 1 candy.

Burmese weights—1 tikal = troy, 252 grains = 0·016,329,335 Indian imperial seer. 100 tikal = 1 vis = 140 tola = avoir. 3·60 lbs. = 1·632,933,548,1 Indian imperial seer.

1 Indian imperial metre = 39 British inches.

Ceylon.—Native Dry Measure.

4	cut chundoos	= 1 cut measure or seer.
19½	,,	= 1 coornie.
4½	cut measure	= 1 coornie.
2½	coornie	= 1 marcal.
2	marcal	= 1 parah.
8	parah	= 1 ammunam.
9⅜	ammunam	= 1 last.

Burma.—Major Burney, when Resident at Ava, mentioned vis, tikal, and moo as the general terms used in Burma in the trausactions of commerce and accounts. Their subdivisions and multiples are,—

1 pe or be.
2 = 1 moo.
2½ = 1 mat.
5 = 2 = 1 hkwe.
10 = 4 = 2 = 1 kyat or tikal.
1000 = 400 = 200 = 100 = 1 peiktha or vissom.

100 tikal are precisely equal to 140 tolas.

Singapore.—Commercial Weight.

16 tahil	= 1 catty =	avoir.	1⅓ lbs.
100 catty	= 1 pikul =	,,	133⅓ ,,
3 pikul	= 1 bhara =	,,	400 ,,
40 pikul	= 1 koyan =	,,	5333⅓ ,,

Straits Settlements.—Measures of Capacity.

4 pau = 1 chupah ; 4 chupah = 1 gantang ; 10 gantang = 1 parah.
16 gantang = 1 nalih ; 10 nalih = 1 kencha ; 5 kencha = 1 koyan.
800 gantang = 1 koyan ; 20 gantang of rice = 1 bag.

Straits Settlements.—Long Measure.

4 plempap	= 1 jengkal =	9	inches.
2 jengkal	= 1 hasta =	18	,,
4 hasta	= 1 depa =	72	,,
2 depa	= 1 jemba =	144	,,
20 jemba	= 1 orlong =	2880	,,

Opium Weight.

10 tee = 1 hoon ; 10 hoon = 1 chee ; 10 chee = 1 tahil.

Thuoc is the generic name for the measure of length in Cochin-China. Those more commonly employed vary from 0·405 to 0·649,68 metres, or from 15·945,255 to 25·578,551,28 English inches.

Siamese.—Long Measure.

1 niw	= $\frac{3}{16}$ English inch.		
12 niw	= 1 kup =	9¾	English inches.
2 kup	= 1 sawk =	19½	English inches.
4 sawk	= 1 wah =	78	English inches.
20 wah	= 1 sen =	130	feet.
400 sen	= 1 yot =	9⅞	statute miles.

Siamese.—Dry Measure.

1 tanan = 1⅓ pint ; 20 tanan = 1 tang.
25 tanan = 1 sat ; 100 tang = 80 sat = 1 keean or koyan.

Chinese Weights.

58⅕	grains = 1 mace.		
10	mace or 582 grains = 1 liang.		
16	liang or 9330⅕ grains or 1⅕ lbs. = 1 catty.		
1	tael = avoir. 1⅓ oz.		
16	taels = 1 catty = avoir. 2⅔ lbs.		
100	catties = 1 pikul = avoir. 133⅓ lbs.		
1	catty = avoir. 1⅓ lbs.		
1	pikul = 100 catties = 133⅓ English lbs.		
1	catty = 16 tael.		
1	tael = 1⅓ English oz.		
16·80	pikul = 1 ton.		
1 li or cash = avoir. ·0013 oz. ; 10 li = 1 fan or kandarin = avoir. ·0133 oz.			
10 fan	= 1 tsin or mace	= avoir. ·1333 oz.	
10 tsin	= 1 leung or tael	= avoir. 1⅓ oz.	
16 leung	= 1 kan or catty	= avoir. 1⅓ lb.	
100 kan	= 1 tam or pikul	= avoir. 133⅓ lbs.	
120 kan	= 1 shek or stone	= avoir. 160 lbs.	

Chinese Measures.

10 fan = 1 tsun or inch = 1·41 English inch.
10 tsun = 1 chek or foot = 14·1 English inch = 1·175 English feet.
10 chek = 1 ch'eung or fathom = 11 feet 9 inches English.

The treaty of Tien-tsin fixes the ch'eung at 141 English inches ; 1 li or mile = ½ English mile ; 10 li or 1 po or league = about 3 English miles ; 1 mau land measure = $\frac{2}{13}$ of an English acre.

China money.—From 1874 to 1882 the tael ranged in value from 5s. 0½d. in 1878 to 5s. 9½d. in 1880.

Hong-Kong.—Measure of Length.

1 ch'eung	= 141 English inches.
1 covid or chek	= 14$\frac{1}{10}$ English inches.
1 tsun	= 1⅓ English inches.
10 fan	= 1 tsun.
10 lip	= 1 fan.

Archipelago.—The weights and measures of the Malays, with their denominations, have not only extended over the whole Malay Archipelago, but are also prevalent in the Philippines. The original measures of the Malays and Javanese were evidently by capacity (takar), and not by weight, for which there are no words in their language except such as signify heaviness or balance. The lowest denomination for a measure of capacity among the Malays goes under the name of chupak, most probably taken from the shell of the cocoanut or the joint of the bamboo. Of this, 4 make a gantang, and 800 of the last a koyan. The measures of length are taken from the members or parts of the human body, as finger-length, span, foot, pace, fathom, with the length from the foot of one side to the tip of the outstretched hand on the opposite one. Javanese, in reference to their irrigated land, have for the largest measure a jong, which literally signifies a ship, and this divided into halves called kikil, or a leg, and into fourths called ban, which means a shoulder. Another admeasurement of land goes under the name of the chacha, of which gawe-ning-wong is the synonym, the first word signifying count or census, and the last a man's work, that is, the quantity of irrigated land that a family of peasantry can till. This last term is of the same nature as the English plough of land. The Chinese have introduced their own well-defined weights, although under native names. Thus we have the tael or weight of 23 drams avoirdupois, the catty consisting of 16 tael, and the pikul, which literally signifies a man's load or burden, composed of 100 catties, or 133⅓ lbs. avoirdupois.

10 cash	= 1 kandarin.	16 tael	= 1 catty.
10 kandarin	= 1 mace.	100 catties	= 1 pikul.
10 mace	= 1 tael.		

Labuan.—Commercial Weights.

10 kandarin = 1 mace ; 10 mace = 1 tael ; 16 tael = 1 catty.
100 catties = 1 pikul ; 40 pikul = 1 koyan.

Tables*, 1871 ; *Crawfurd's Dict.* p. 446 ; *Prinsep's Tables*, pp. 61, 62 ; *Kelly's Cambist ; Jervis' Metrology ; Mr. W. H. Bayley in* No. 4 *New Series of Madras Journal of Science for* July to September 1857 ; *Do. do. on the Land Measures of the Madras Presidency ; Gover, W. and M.*, 1865 ; *India Governments' Records ; Jervis, W. and M.*, 1826 ; *Müller, Ind. Tabs.*, 1836, *Statistical Abstract, Weights and Measures ; Woolhouse, W. and M.*, 1858.

WEIR, JOHN, a skilled gardener who was employed under Mr. C. R. Markham to collect cinchona plants in the Caravaya forests of S. America. He conveyed his plants to India in 1860.—*Markham, Per. Bark.*

WEI-YUEN, the chief compiler and composer of the Hae-kwoh-too-che, the Chinese work usually known as Lin's Geography. It is a work of 25 volumes, and in a few years went through five editions. Wei-Yuen did not long survive his more celebrated collaborateur, Lin-tseh-seu. Both were sincere enemies of Great Britain and the British, and carried out their enmity in acts and in their writings.—*Dr. Edkins.*

WELDI, a tributary tribe of Bedouins on the right bank of the Euphrates.

WELL.

Baori, Baoli, . .	Hind.
Bao, ...	Mahr.
Chab, ...	Pers.

Drawing water has ordinarily been the employ-

ment of females throughout the east from a remote antiquity. Some of the wells in India are constructed with much architectural embellishment, of great depth, and of considerable breadth. The more ancient are of a square form, those of recent date are frequently round. They are surrounded for their whole depth with galleries in the rich and massy style of Hindu works, and have often a broad flight of steps which commences at some distance from the well, and passes under part of the galleries down to the water. The deep wells have the descent from the brink by long flights of steps leading far down below the surface of the ground, relieved by landing-places and covered chambers, in which travellers may rest and take refreshment during the heat of the day.

In the alluvial lands of India, and in the beds of rivers, wells are frequently sunk by means of earthenware or iron rings, which are placed one over the other, and the inside earth or sand being scooped out, the rings sink down. These are called pot-wells, and in Bangalore cost about five rupees for a well eighteen feet deep. In Madras town a pot-well can be sunk at the rate of a rupee a foot.

Near Futtehpur, in sinking a well, the people build a hollow masonry tower, of the diameter required, and 20 or 30 feet high from the surface of the ground. This is allowed to stand a year or more till it become firm and compact; then they gradually undermine and promote its sinking into the sandy soil. When it has sunk to a level with the surface, they raise the wall higher, and go on throwing out the sand and raising the wall till they obtain water. Some of the wells of India are of several hundred yards in depth. In the Rajputana desert, water is only come to at depths up to 700 feet. But in the granitic tracts of India, the depth of wells ranges from 12 to 40 feet, according to the swell of the ground.

The importance of wells in an arid tropical country cannot be exaggerated, and the fame which is acquired by sinkers of wells has an illustration in John iv. 6, where the well of Jacob, sunk three thousand years before, was still distinguished. Even yet, among the Hindu people, to sink a well, or form a water reservoir or tank, is deemed an act of merit. In the Panjab, pucka wells are usually worked by the harth or Persian wheel. A broad-edged lantern wheel, whose axis lies horizontally over the centre of the well's mouth, carries, on its broad edge, a long belt of moonj rope made like a rope ladder, the ends of which, joined in an endless band, reach below the surface of the water. To this, at every step of the rope ladder, an earthen pot called tind is fixed. As the wheel revolves, the large rope belt descends into the water with its pots, the pots become filled with water, and are drawn up. As they reach the top of the wheel, they are, by the revolution of the wheel, inverted, and their contents poured out into a trough, which is ready to receive them, and which leads to the water-course of the fields to be irrigated. Wells are often sunk in the alluvial soils of India as foundations for architectural structures.

In the Persian method of cooling wells, the well is covered in with beams, mats, and earth, and thatch is built over it to shield the water from the sun. The well, having been filled during the cold weather, may be opened in May, and the water remains as cool to the taste as ordinary ice water throughout the hot season. The water may be purified by being withdrawn into an earthen reservoir adjoining the well, and allowed to flow back. Ali Razza Khan, a Kazzilbash, was the first to introduce these wells into the Panjab. Two may be seen at Lahore, one near the Lohari gate, the other in the Sultan Serai. There are also two in the town of Amritsar, and one at Peshawur. The people crowd to those wells during the hot season as to a fair. The ordinary mode of raising water in India is by the hand, but in the south of the Peninsula of India the pe-cottah is used. It is a lever balanced on a pole, from one end of which falls a bamboo with an iron pot, and a man walks from one end of the lever to another to raise and depress the respective ends.—*Powell, Handbook; Econ. Prod. Panjab*, p. 207; *Heber*, ii. p. 357. See Water.

WELLESLEY. Lord Mornington, afterwards Marquess of Wellesley, was Governor-General of India, 1798 to 30th July 1805. He acted on the view that the British must be the one paramount power, and that native princes could only retain the insignia of sovereignty by surrendering their political independence; and his governing idea was to frustrate the possibility of a French invasion of India. In 1798 he formed an alliance with the Nizam of Hyderabad. In 1799, aided by the Hyderabad contingent, he made war against Tipu, the sultan of Mysore, and Seringapatam was stormed, Tipu falling in the breach. In 1802 he formed an alliance with the peshwa, and with the armies of Sir Arthur Wellesley and General Lake. In 1803 he compelled Sindia and the Bhonsla of Nagpur to cede territory and sue for peace, but the operations against Holkar were unsuccessful. The records of his administration are contained in the Notes relative to the Mahratta War, with Appendix and Plans, 1804; Appendix to Notes on the Mahratta War, Calcutta 1804; Vindication of the Justice and Policy of the late Wars in Hindustan and the Dekhan, London 1806; Despatches, Minutes, and Correspondence during his Administration in India, edited by Montgomery Martin, 1836.

WELLESLEY PROVINCE, in the Malay Peninsula, has remains of Hindu temples, and mounds of shell-fish have been discovered.

WELLINGTON. Arthur Wesley or Wellesley, Field-Marshall the Duke of Wellington, was a distinguished soldier, and an illustration of the importance to a commander of an acquaintance with the civil occupation of a statesman. On the 7th of March 1787 he received his first commission as an ensign in the 73d Regiment of Foot. In May 1794, being then in his 26th year, in command of the 33d Regiment, he embarked at Cork for service on the continent of Europe. In the spring of 1796, the 33d received directions to embark for Bengal. In February 1797, Arthur Wellesley landed at Calcutta. Immediately on his arrival, Colonel Wellesley was despatched upon an expedition directed against Manilla, but by the time that the several vessels had arrived at their first rendezvous the war against Tipu Sultan was determined on, and they were overtaken by a peremptory recall. The 33d was transferred from Bengal and placed upon the Madras Establishment. And on this new scene

of duty Colonel Wellesley arrived in September 1798. The commander-in-chief at Madras was General, afterwards Lord Harris, under whose auspices Colonel Wellesley was stationed at Wallajahbad.

The whole force against Tipu by the end of February 1799 had penetrated into the dominions of Mysore. The first action of importance took place near Malavelly, within thirty miles of Seringapatam. The British commander received Tipu's attack with the right wing of the army, leaving the left, which was composed of the Nizam's contingent under Colonel Wellesley, to charge and turn the flank of the enemy opposed to it. Colonel Wellesley's dispositions for this assault were speedily made, and, having been approved by General Harris, were executed with complete success. He was then placed in command of a field force, with which he advanced to the north of the Peninsula of India, Ahmadnaggur. Pettah was taken by assault on the 11th August 1803, and the fort, long considered the key of the Dekhan, surrendered on the following day. He fought and won the battle of Assaye on the 23d September 1803; Berhampore surrendered 16th October 1803; Argaum on the 28th November 1803; then the Gawilgarh hill fort was taken by his officer, General Stevenson, on the 14th December 1803; and on the 30th December a treaty of peace with Sindia was signed.

Major-General Wellesley was created an extra Knight Companion of the Bath, many addresses were presented to him by various public bodies in India, a splendid gold vase, valued at 1000 guineas, was given to him by the officers of his division of the Indian army, and a sword, worth £1000, was presented to him by the inhabitants of Calcutta. Sir Arthur embarked for England on the 10th of March. On his arrival he was appointed to the command of the troops at Hastings; and on the death of the Marquis Cornwallis, on the 5th of October 1805, to the colonelcy of the 33d. On the 8th of April he was sworn of His Majesty's Privy Council, and on the 10th of April 1806 he married Catherine, third daughter of the second Earl of Longford. In 1807, Sir Arthur accepted in the Portland administration the situation of Chief Secretary for Ireland, under the Duke of Richmond, but in taking office he had stipulated that his ministerial duties should not interfere with his professional; and accordingly, in the summer of 1807, he was once more employed on active service. In the expedition to Denmark he held a post under Lord Cathcart. For his services during this campaign he was publicly thanked in the House of Commons.

The remaining part of his career was on the continent of Europe, and here he won higher honours, and he died 14th September 1852.

WELLINGTON, formerly Jakatala, a hill station and military cantonment in the Neilgherry district, Madras, situated in lat. 11° 22′ N., and long. 76° 50′ E. Jakatala Hill is about 1½ miles from Coonoor, and 9 miles from Ootacamund, and is 6100 feet above sea-level.

WELLSTED, Lieut. J. R., an officer of the Indian navy, author of Travels in Arabia, and author (London 1838) of Memoirs on the Southern Coast of Arabia; Memoir on the Island of Socotra, in Lond. Geo. Trans. v. p. 129; Vindication of the Accuracy of Bruce, ibid. vii. p. 402; Journey in various directions through Oman, in Bom. Geo. Trans. 1836–1838; Bombay reprint, i. p. 3.—*Dr. Buist.*

WELSH, Colonel JAMES, author of Military Reminiscences, extracted from a Journal of nearly forty years' Active Service in the East Indies.

WELWITSCHIA MIRABILIS. *Hook. fils.* A most extraordinary vegetable production discovered in 1859 by Dr. Welwitsch in tropical S.W. Africa, about half-way between the equator and the Cape. It is a dwarf tree, seldom rising more than a few inches above the ground, with a diameter often of several feet, and a single pair of leaves, which lie flat on the ground, usually torn to ribands, which spring from the margin of the trunk, and persist through the lifetime of the plant, which is estimated to reach 100 years.

WEN-CHANG, the Chinese god of literature.

WENDLANDIA NOTONIANA. *Wall.* W. bicuspidata, *W. and A.* This small tree is common in most of the alpine and sub-alpine jungles of the Madras Presidency, from 2000 to 7000 feet elevation. The timber is strong, and used for various purposes by the natives. Wendlandia cinerea, *D.C.*, is a timber tree of Darjeeling and Terai.—*Beddome, Fl. Sylv.*

WENGER. Dr. Wenger, a Swiss, came to India in 1839 as a missionary of the Baptist Missionary Society. He translated the historical and prophetical books of the Old Testament, and the Gospels and Acts, into Sanskrit, putting the poetical parts of the Old Testament into Sanskrit verse. In Bengali he executed revisions of the translation of the Bible, parts of it he translated afresh, and his version is used by all denominations of Christians in Bengal.

WER. Hind. This Hindi word desiguates a feud, and in it we have a striking coincidence in terms: wer is a feud, werce, a foe. The Saxon term for the composition of a feud is wergeldt. In some of the Rajput states the initial vowel is hard, and pronounced ber. In Rajasthan, ber is more common than wer, but throughout the south-west wer only is used. In these we have the origin of the Saxon word war, the Scotch weir, and the French guer or guerre. The Rajput wergeldt is land, or a daughter to wife. It seems to be the word found in many tongues, the Sanskrit vri, the Greek ἄρης, ἤρως, war, wehr, vir or virtus, indicating strength or protection, manly power.—*Tod's Rajasthan*, i. p. 181.

WERN, a wood of Java used for furniture, of a brown colour, of a close substance and light; abundant in some districts.

WESH. Pushtu. Periodical changing of lauds.

WESTERGAARD, N. L., professor of Indo-Persic languages in the University of Copenhagen; wrote Account of Caves near Carli, in Bom. As. Trans., 1842, i. p. 248; Letter respecting the Gabr, in Lond. As. Trans. xiii. p. 349; Radices Linguæ Sanskritæ, Bonn 1841; Sanskrit Reading Book, Copenhagen; on the Ancient Persian Cuneiform Inscriptions, Zeit. fur die k. des Morgenlandes, 1845; Decipherment of the Second Achæmenian Arrow-headed Writing, Mem. des Antiquaires du Nord, Copenhagen 1844; Zend-Avesta, with English Translation, Grammar, and Dictionary.—*Dr. Buist's Catal.*

WESTERN COAST of India includes Travancore, Cochin, and Malabar, and comprises a strip

of land of various width, lying between the sea on the western side of India, and the range of Western Ghats, which it includes. It is mostly undulating or hilly, almost everywhere covered with jungle of every description, from low bushes to the most lofty forest trees. Most of the roads here, too, are lined with splendid avenues of banyan, cashew, and various other fine trees. The climate is moist and comparatively cool. The Wynad district, and generally the wooded parts bordering the summit of the ghats, may also be included in this, which they resemble in climate and productions. The cardamom hills in Travancore are the southern continuation of the Western Ghats. Ghat is a term employed in India to designate a ferry or landing-place on a river, a range of hills, or the scarped wall of a table-land, or the defile or pass leading through or down such. The Western Ghat is the range of mountains which extend from the valley of the Tapti to the gap of Palghat, about 800 miles, and then, after an interruption, to Cape Comorin. The coast line from the sea to their base is generally flat and low, with occasional spurs or solitary hills, but the ghats rise abruptly almost scarped to an average height of 3000 feet; but Purunder is 4472, and Mahabaleshwara 4700, Matheran, a projecting spur, about 3500. The Eastern Ghats extend from Orissa to Coimbatore, along the eastern side of the Peninsula of India, at distances of 50 to 150 miles from the Bay of Bengal. They are steep, and well clothed with forests. The country lying between them and the sea is low, scarcely rising 100 feet above the sea. See Ghat.

WHALE BIRD, Prion pachyptila, also P. desolatus of Antarctic Ocean.

WHALEBONE, an elastic substance obtained from the upper jaws of the whale, which vary in size from three to twelve feet in length, and the breadth of the largest, at the thick end, is above a foot.—*Faulkner.*

WHALES, P, King, Ki-tian, Chin., are mammals which live in the ocean. They are included in the order Cetacea. They are the largest of existing animals, and furnish whalebone, spermaceti, and oil. Species of the whale genera occur in the Arabian Sea, Bay of Bengal, Indian Ocean, and Pacific Ocean. Several abound in those parts of the ocean lying between the Bonins and the coast of Asia, and are in great numbers in the neighbourhood of Japan. So large a creature could not escape observation, and the Greek sailors who accompanied Nearchus in his navigation of the Arabian Sea were terrified by the appearance of whales (Κητωα, Arrian, Hist. Ind. cap. 30). A whale was stranded on the Chittagong coast in August 1842, which measured 90 feet in length and 42 in diameter; and another on the coast of Arakan in 1851, which was 84 feet long. They have been variously classified by naturalists. One arrangement will be seen under the heading Cetacea; and Dr. John E. Gray, who was in charge of the Zoological Collections in the British Museum, gives details in that Museum catalogue. The following is a synopsis of Asiatic species of whales and dolphins:—

CETACEA.

Sec. i. Mysticete, *Gray.*
Sub-Order i. Balænoidea.
Fam. i. Balænidæ, *Gray.*
Balæna mysticetus, *Linn.*, N. Sea.
B. marginata, *Gray*, W. Australia.
Eubalæna Australis, *Gray*, Cape of Good Hope.
E. Sieboldii, *Gray* (B. Japonica, *Gray*, B. Australis, *Temm.*), Japan.
Hunterius Temminckii, *Gray*, Cape of Good Hope.
H. Swedenborgii, *Lillejeborg*, N. Sea.
Caperea antipodarum, *Gray*, New Zealand.
Macleayius Australiensis, *Gray*, Australian Seas.

Sub-Order ii. Balænopteroidea.
Fam. ii. Megapteridæ.
Megaptera longimana, *Gray* (Novæ Zealandiæ, *Gray*), N. Sea.
M. Kuzira, Japan.
Poescopia Lalandii, —? Cape Seas.
Eschrichtius robustus, *Gray*, N. Sea, Sweden.

Fam. iii. Physalinidæ.
Benedenia Knoxii, *Gray*, North Sea, Welsh coast.
Physalus antiquorum, North Sea, Greenland.
P. Duguidii, *Gray*, N. Sea, Orkneys.
P. Patachonicus, Rio Plata.
Cuvierius Sibbaldii, *Gray*, N. Sea.
Rudolphius laticeps, *Gray*, N. Sea.
Sibbaldius borealis, *Gray*, N. Sea.
S. Schlegelii, *Gray*, Java.
S. Antarcticus, *Gray*, Buenos Ayres.

Fam. iv. Balænopteridæ.
Balænoptera rostrata, *Gray*, N. Sea.
Swinhoa Chinensis, *Gray*, Formosa.

Sec. ii. Denticete, *Gray.*
Sub-Order iii. Physeteroidea, *Gray.*
Fam. v. Catodontidæ.
Catodon macrocephalus, *Gray*, Tropical Seas.
Meganeuron Krefftii, *Gray*, Australian Seas.

Fam. vi. Physeteridæ.
Physeter tursio, *Linn.*, N. Sea, Scotland.
Kogia breviceps, *Gray*, Cape of Good Hope.
K. Macleayii, *Gray*, Australia, India.
Euphysetes Grayii, *Macleay*, Australia.

Sub-Order iv. Susuoidea.
Fam. vii. Platanistidæ.
Platanista Gangetica, *Gray*, India.
P. Indi, *Gray*, Indus.

Sub-Order v. Delphinoidea.
Fam. viii. Iniidæ.
Inia Geoffroyii, *Gray*, Brazil, Amazon.

Fam. ix. Delphinidæ, *Gray.*
Tribe i. Stentonina.
Pontoporia Blainvillii, *Gray*, S. Atlantic.
Steno frontatus, *Gray*, Indian Ocean.
S. compressus, *Gray*, S. Sea.
S. Capensis, *Gray*, Cape of Good Hope.
S. lentiginosus, *Gray*, India.
S. Tucuxi, *Gray*, Brazil, Amazon.
S. attenuatus, *Gray*, India.
S. fuscus, —?

Tribe ii. Delphinina.
Delphinus longirostris, *Gray*, Malabar, Japan, Cape of Good Hope.
D. delphis, *Gray*, N. Sea, N. Atlantic, Mediterranean.
D. Moorei, *Gray*, S. Atlantic.
D. major, *Gray*, —?
D. Walkeri, *Gray*, S. Atlantic.
D. Janira, *Gray*, Newfoundland.

D. Forsteri, *Gray*, Pacific.
Clymenia stenorhyncha, *Gray*.
C. microps, *Gray*, Brazil coast.
C. alope, *Gray*, Cape Horn.
C. euphrosyne, *Gray*, N. Sea.
C. styx, *Gray*, W. Africa.
C. gudumu, *Elliot*, India.
C. pomeegra, *Elliot*, —?
C. normalis, —? —?
C. doris, *Gray*, —?
C. euphrosynoides, *Gray*, —?
C. dorides, *Gray*, —?
C. obscura, *Gray*, S. Pacific.
C. similis, *Gray*, Cape of Good Hope.
Sotalia Guianensis, *Gray*, British Guiana.
Delphinapterus Peronii, *Gray*, New Guinea.
Tursio truncatus, *Gray*, N. Sea, Mediterranean.
T. metis, *Gray*, —?
T. cymodoce, *Gray*, —?
T. eurynome, *Gray*, India, Bay of Bengal, S. Sea.
T. catalania, *Gray*, N.W. coast of Australia.
Eutropia Dickiei, *Gray*, S. Pacific, Chili.
E. Heavisidii, *Gray*, Cape Seas.
Orcaella brevirostris, *Gray*, Indian Ocean.

Tribe iii. Lagenorhynchina.
Electra obtusa, *Gray*, —?
E. Asia, *Gray*, —?
E. fusiformis, *Gray* (Delphinus fusiformis, *Owen*), India.
E. acuta, *Gray*, N. Sea.
E. clancula, *Gray*, S. Pacific.
E. thicolea, *Gray*, W. coast, N. America.
Leucopleurus Arcticus, *Gray*, N. Sea.
Lagenorhynchus albirostris, *Gray*, N. Sea.

Tribe iv. Phocænina.
Pseudorca crassidens, *Gray*, N. Sea.
P. meridionalis, *Gray*, Van Diemen's Land.
Phocæna communis, *Gray*, N. Sea.
Acanthodelphis spinipennis, *Gray*, Brazil.
Neomeris phocænoides, *Gray*, Indian Ocean, Bengal Bay, Japan, Cape of Good Hope.

Tribe v. Orcadina.
Orca gladiator, *Gray*, N. Sea.
O. intermedia, *Gray*, —?
O. magellanica, *Gray*, Buenos Ayres.
O. destructor, *Gray*, Peru.
O. Capensis, *Gray*, S. Ocean, Cape of Good Hope.

Fam. x. Globiocephalidæ, *Gray*.
Globiocephalus svineval, *Gray*, N. Sea.
G. Edwardsii, *Gray*, Cape of Good Hope.
G. Grayii, *Burmeister*, Buenos Ayres.
G. macrorhynchus, *Gray*, S. Seas.
G. Indicus, *Gray* (G. Sieboldii, *Gray*), Japan.
Sphærocephalus incrassatus, *Gray*, British Channel.

Fam. xi. Belugidæ.
Grampus Cuvieri, *Gray*, N. Sea.
G. Richardsonii, *Gray*, Cape of Good Hope.
Beluga catodon, *Gray*, N. Sea.
B. Kingii, *Gray*, Australia.
Monodon monoceros, *Gray*, N. Sea.

Sub-Order vi. Ziphioidea.

Fam. xii. Hyperoodontidæ.
Hyperoodon butzkopf, *Gray*, N. Sea.
Logenocelus latifrons, *Gray*, N. Sea.

Fam. xiii. Epiodontidæ.
Epiodon Desmarestii, *Gray*, N. Sea, Mediterranean.
E. cryptodon, *Burmeister*, Buenos Ayres.
Petrorhynchus Capensis, *Gray*, S. Seas, Cape Seas.

Fam. xiv. Ziphiidæ.
Berardius arnuxi, *Gray*, New Zealand.
Ziphius Sowerbiensis, *Gray*, British Channel, Irish Sea.
Dolichodon Layardii (Ziphius Layardii, *Gray*), Cape of Good Hope.
Diplodon Sechellensis, *Gray* (Ziphius Sechellensis), Seychelles.

Mr. Isaac Walton, a telegraphic officer in the Persian Gulf, in a report to the Bombay Government about the year 1877, says:—'The cable from Kurachee to Gwadur, about 300 miles long, was suddenly interrupted on the evening of the 4th, at a point estimated to be about 116 miles from Kurachee. The *Amberwitch* arrived at this place about two o'clock on the afternoon of the 6th, and the cable was hooked at a quarter of a mile from the point of rupture. In hauling in the cable an unusual strain was experienced, as if the cable had fouled a rock, but, on persevering for some time, the body of an enormous whale, entangled in the cable, was brought to the surface. It was found to be firmly held by two and a half turns of the cable, taken immediately above the tail. Sharks and other fish had partly devoured the carcase, which was rapidly decomposing, the jaws coming adrift on arriving at the surface. The tail, which was twelve feet wide, was perfectly preserved, and was covered with numerous shells at its extremities. Apparently the whale had rubbed itself against the cable for the purpose of ridding itself of parasites, and had with a stroke of the tail broken the cable, and at the same time so coiled itself up in it as to be strangled thereby.' Several cables have been destroyed by other creatures in which different seas abound. One of the most destructive is the Limnoria terebrans, a little creature only about as big as an ant. Yet, according to Dr. Carpenter, it has before now shown itself capable of imperilling the safety of bridges and harbour piers. Several cables off the coast of Ireland have been very seriously damaged by it. It is small enough to be able to squeeze in between the wires in the sheathing of a cable, however well it may be constructed.

The cachalot, Physeter macrocephalus, is the sperm whale; the male ranges in length from 38 to 76 feet, and is about 60 feet on the average, but the female does not exceed 30 or 35 feet. The cachalot is without symmetry, of a prevailing dull-black colour, occasionally marked with white, especially on the abdomen and tail. They propel themselves round by striking and pulling against the water with the flashes of their tails. The lower jaw is diminutive, slender, and in form not unlike the mandible of a bird; the teeth of the upper jaw, wholly ivory, in aged males are of great solidity, and weigh from two to four lbs. each. It spouts a thick watery mist from its nostrils at intervals of 10 or 15 minutes. Its

valuable sperm is a solid mass of soft yellow oily fat, weighing between two or three tons, in a hollow of the head. The cavity, called case, is situated to the right and beneath the spouting canal, and corresponds to nearly the entire length of that tube. It is filled with a very delicate well of cellular tissue, containing in large cells a limpid and oily fluid, which is liberated on the slightest force. The quantity, chiefly spermaceti, contained in this singular receptacle is often very considerable, and nearly 500 gallons have been obtained from the case of one whale. It has been noticed in the Mediterranean, and a stray individual in the Thames, but occurs in the Pacific, Indian, and Chinese seas. The liquid first drawn from the head of the animal is a mixture of spermaceti and sperm oil; from this the solid matter is separated by filtration through bags, and subsequent compression. After this it is melted in water, skimmed, and remelted with a little potash water, to remove the last traces of the oil; lastly, it is permitted to concrete slowly, during which it is crystallized in brilliant white masses. Pure spermaceti is white, tasteless, inodorous, crystalline, insoluble in water, slightly soluble in boiling alcohol; it forms a soap with potash. It is composed of carbon, 81·66; hydrogen, 12·86; oxygen, 5·47. Spermaceti was once much used internally as a demulcent and emollient, especially in troublesome catarrhs and ysentery. It is at present employed solely as an external application, being an ingredient in nnmerous cerates and ointments. Mr. Beale gives 84 feet as the length of a sperm whale of the largest size, and its diameter 12 or 14 feet. Of this huge mass, the head occupies about one-third of the entire length, with a thickness little inferior to that of the body; while, as this thickness is equal throughout, the front of the head terminating abruptly, as if an immense solid block had been sawn off, this part of the animal bears no small resemblance to an immense box. The appearance of a whale when disturbed, and going what seamen call 'head-out,' with his vast bluff head projected every few seconds out of water, has a most extraordinary appearance.

The pursuit of the sperm whale is attended with much greater danger than that of the Greenland whale, and Beale gives many instances in which, in his own experience, boats were stove in and men lost. Stories of fighting whales, he says, are numerous, but probably exaggerated; one, known as 'Timor Jack,' is said to have destroyed every boat sent against him, till at last he was killed by being attacked from several directions at the same time, thus diverting his attention from the boat which made the successful attack. Another, known as 'New Zealand Tom,' destroyed nine boats successively before breakfast, and when eventually captured, after destroying many other boats, many harpoons from the various ships which had attacked him were found sticking in his body. There is one well-authenticated instance of a vessel being attacked and destroyed by a sperm whale. The American whale-ship *Essex* was attacked by one, which, first passing under the vessel, probably by accident, came in contact with her keel and carried it away; then, turning and rushing furiously upon the ship, the whale stove in her bow; so serious was the breach, that the vessel speedily filled and went down. Most of the crew were away in their boats at the time, but those on board had just time to launch their one remaining boat before the vessel sank. The boats made for the coast of Peru, the nearest land, many hnndreds of miles distant; one of them was picked up drifting at sea, and three of the crew, who were found in it in a state of insensibility, were the only survivors of the ill-fated vessel.

In addition to the sperm and oil, this species yields another product, which is, or was, very valuable, although it is the result of disease, and one would imagine a very uninviting substance. It is the ambergris, a concretion of the indigestible portions of the cuttle-fish, which form the food of the sperm whale. The nucleus of the mass is generally the horny beaks of these creatures, and the substance itself is found in the intestines of the sperm whale, or on the shores of the seas frequented by this species. No other whale is known to be subject to these bezoars.

Although possessing a range greater than any other known species of animal, it is only open and deep waters which can be said to be the home of the sperm whale; and when found in shallow seas, its generally emaciated condition indicates the absence of its proper nourishment; and the readiness with which whole herds precipitate themselves stupidly upon the sands, shows how little they are acquainted with such objects.

Every favourite resort of the sperm whales, although not out of soundings, has claims to be considered the site of submerged land. The islands of the Polynesia, which are its special feeding-ground, are the beacons left by the submerged Pacific continent.

Seven species of whales are known to the Japanese, — the awo-sangi, iwasikura, kud-suri, mako, nagass, sebio, and sutukad-sura. The skin, which is black in most kinds; the flesh, which is red and looks like beef; the intestines, which from their remarkable length are called feakfirs, that is, an hundred fathoms long; and all the inward parts,—are eaten, pickled, boiled, roasted, or fried. The fat or blubber is boiled into train-oil, and even the sediments of the second boiling are eaten. The bones, such as are of a cartilaginous substance, are boiled when fresh, and cut or scraped, cleaned and dried for the use of the kitchen. Several little things are made of the jaw-bones, fins, and other bones, which are of a more solid substance, and particularly their fine steelyards for weighing gold and silver are made of them, and have borrowed their name from them.—*Williams' Middle Kingdom*, p. 258; *Tennent, Ceylon*, p. 68; *American Expedition*, p. 243; *Capt. WHAMPOA, a town built on Bankshal Island, in the Canton river. Two high islands, by Europeans commonly called Danes and French islands, form Whampoa anchorage, in lat. 23° 6½′ N.

WHANGHEE. Jap., Malay. A name derived from the Chinese Wang, yellow, and Hee, root, a species of cane exported from China. The whanghee cane has a pale, hard bark and flexible stem, with intervals of about an inch and a half or

two inches, and a number of little holes at the knots. These small canes, with short internodes, are imported from China into England as walking-sticks.

The geographical range of the wheat region along the Atlantic portions of the western continent, embraces the tract lying between the 30th and 50th parallels, and, in the country westward of the Rocky Mountains, one or two more degrees farther north. Along the west coast of South America, as well as in situations within the torrid zone, sufficiently elevated above the level of the sea, and properly irrigated by natural or artificial means, abundant crops are often produced. Wheat has, from time immemorial, been a staple crop in the plains of Northern India, and especially in the Panjab. The climate and soil are well fitted for this cereal, but, owing to defects and carelessness in the agriculture and harvesting, the crops, though excellent, fall short of what most corn-growing countries produce.

Wheat is grown to a great extent in Berar, in Coimbatore, and largely in Burma, and it is now largely and increasingly exported from India, viz.:

1874–75,	1,069,076 cwt.	Rs. 49,04,352
1875–76,	2,498,185 ,,	90,10,255
1876–77,	5,583,336 ,,	1,95,63,325

1882–83,	14,151,765 ,,	6,07,13,170

In 1883, Messrs. M'Dougall Brothers were requested by the India Office to take a given quantity of the four representative Indian wheats, viz. Indian 'fine soft white,' 'superior soft red,' 'average hard white,' and 'average hard red,' and manufacture them into flour by the ordinary process of grinding under millstones; also that similar quantities should be manufactured into flour by means of crushing between rollers, according to what is known as the Hungarian or roller system; further, that a given quantity of each flour should be manufactured into bread; that the qualities and other characteristics of the flours and offals thereof should be severally noted; and that the Indian wheats should be severally compared with all the leading varieties of home and foreign wheats. They reported that they all possess, in a marked degree, the same characteristics of great dryness and a distinct beany and almost aromatic flavour, inseparable from wheats grown in the climates and soils of the tropics. Also, that the flours are ricey, the texture of the bread is too close, and the crust is hard and brittle. But these characteristics do not detract from their usefulness in any important degree. A miller cannot show skill in his craft to greater advantage or profit than in the way he selects his wheats and mixes his grists, so as to produce to best advantage a flour from which bread can be made of the colour, bloom, strength, and flavour desired, and withal a good yield. Messrs. M'Dougall pronounced the Indian wheats to be exceedingly useful wheats,—in fact, hardly equalled, for what is deficient in the English market, by any other wheats. Their chief characteristics are just those in which wheats grown in the variable British climate are most deficient. Their great dryness and soundness render them invaluable for admixture with English wheats that are in any degree out of condition through moisture; and the great proportions of the wheat harvested here have been in that condition for years past,—a condition that must prevail in all other than that of wheats harvested and stored during fine and favourable weather.

In London the lowest points in the 19th century as respects the annual average price of wheat was 38s. 7d. in 1851; in 1835 it was 39s. 4d.; and in 1864, 40s. 3d. The following has been the yearly average price of wheat during the past 25 years:

Year.	s.	d.	Year.	s.	d.	Year.	s.	d.
1859,	43	9	1868,	63	9	1876,	46	2
1860,	53	3	1869,	48	2	1877,	56	9
1861,	55	4	1870,	46	11	1878,	46	5
1862,	55	5	1871,	56	8	1879,	43	10
1863,	44	9	1872,	57	0	1880,	44	4
1864,	40	3	1873,	58	8	1881,	45	4
1865,	41	10	1874,	55	9	1882,	45	1
1866,	49	11	1875,	45	2	1883,	41	7
1867,	64	5						

In India, several species and varieties of wheat are grown, viz.:

Triticum vulgare, *Var.* hybernum or winter wheat.
T. vulgare, *Var.* æstivum or spring wheat.
T. compositum, Egyptian wheat.
T. spelta, bere or spelt, much cultivated in France.
T. monococcum, remarkable for its single row of grain.

That which is chiefly cultivated in England is the T. vulgare. Of this there are two varieties,—T. æstivum or summer wheat, and T. hybernum or winter wheat; the former is sown in the spring, and the latter in the autumn. Of these varieties, again, there are several different modifications.

In India, wheat of all kinds is the growth of the rabi or spring harvest. The number of varieties in the Panjab is not in reality very great, though considerable difference of nomenclature exists. Wheat is sown in the months of Kartak and first half of Maghar, and is cut in Baisakh (April). Wheat is often sown mixed with barley; this is called goji in the Panjab, and trikala in Cis-Sutlej States; or with gram, Cicer arietinum, and then called bhera; or the red and white varieties are sown together under the name of jogyan. The principal difference observable in Panjab wheats is that some are bearded and some are awnless. There are two sorts of the bearded wheat, one with a dark-coloured beard, the other with a light-yellow beard.

Gerard speaks of wheat at 10,000 and Captain Webb at 12,000 feet on the southern slope of the Himalaya. The extreme limit is given at 13,000 to 15,000 feet. Wheat grows to a height of 13,000 feet at Lara and Ladang, above Dangk-kar in the Spiti valley. In the valley of the Indus, it appears at Ugshe and Chimra at 11,000 to 12,000 feet. A wheat, called daud-khani, with a large and very white grain, was introduced from the N.W. Provinces, and grown chiefly on the banks of the Sutlej, on alluvial and irrigated lands. It is much used by sweatmeat makers on account of its being so white. It sells, where grown, at about 31 to

32 seers per rupee, always cheaper than pamman, being considered inferior.

Multan wheat is beardless, and its grain long and heavy. It is exported in large quantities to Rajputana and to Sind.

Four kinds of wheat are grown in Oudh, called Safeda, Morilwah (which is awnless), Samodwah, and Lallia. The first two are the best kinds, and were sold from 16 to 40 seers per rupee, according to the abundance of the season. The other two kinds are those most generally sown. When the wheat crop is from 4 to 6 inches high, it is irrigated once, and then a second time when it begins to flower. It is grown on heavy soils, and generally near the banks of rivers. It is sown in October.

In Sumbulpur district, wheat is extensively cultivated. The flour made from it is excellent, as is the bread.

A beautiful wheat is produced in the Jubbulpur, Narsingpur, and Hoshangabad districts, all along the line of the railway to Bombay.

Wheat is grown largely in the Burmese territories. The soil of Pegu is too moist, and the climate too damp for it.

Wheat is grown to a considerable extent in the Bara-Mahal district of the Madras Presidency.

All kinds of wheat contain water in greater or lesser quantities. Its amount is greater in cold countries than in warm. In Alsace from 16 to 20 per cent.; England from 14 to 17 per cent.; United States from 12 to 14 per cent.; Africa and Sicily from 9 to 11 per cent. This accounts for the fact that the same weight of southern flour yields more bread than northern; English wheat yields 13 lbs. more to the quarter than Scotch. Alabama flour, it is said, yields 20 per cent. more than that of Cincinnati. And in general, American flour absorbs 8 or 10 per cent. more of its own weight of water in being made into bread than the English. The English grain is fuller and rounder than the American, being puffed up with moisture. To ascertain the amount of water in flour, take a small sample, say five ounces, and weigh it carefully; put it into a dry vessel, which should be heated by boiling water; after six or seven hours, weigh it; its loss of weight shows the original amount of water.

Bombay wheat is whiter and heavier than that from Kattyawar, and produces a greater quantity of soojie and flour. That of Kattyawar is smaller and darker, and produces good flour, though smaller in quantity, with less soojie.

Added to their dryness, the thinness of the skins of Indian wheats, and the consequent greatness of the yield of flour, must always place them in the front rank as a miller's wheat, whenever they are handled with reasonable intelligence and skill. Such unprecedented yields of flour as shown by these wheats, ranging (by ordinary grinding) from 77·46 to 80·52 per cent., against English 65·2, and American spring 72·2, speak volumes in their favour; and their value is still further increased by another point of merit of almost equal importance, viz. a larger percentage of bread may be obtained than from other flours. For the best of these Indian wheats (the fine soft white), on the day they were valued on Mark Lane Market, a price was offered as high as that for American 'winters,' New Zealand, or English. The beany flavour of the other three sorts is not a serious obstacle, as fair average deliveries, when well cleaned and properly dealt with, can be employed in the proportion of 25 to 50 per cent. along with home-grown or other wheats, such as Americans, possessing a fine sweet milky or nutty flavour. Glancing at all the facts, Messrs. M'Dougall think it is evident that these wheats afford a larger margin of profit, both to the miller and the baker, than any other.

Wheat is largely used in China. It is exclusively raised in the provinces of Ho-nan, Shen-si, Shan-si, Shan-tung, and Peh-chi-li. As a rule, it is sown in winter, although occasionally as a spring crop. It is usually sown broadcast.

India's best soils yield on the average ten bushels per acre, while England yields near 30 bushels the acre. Sir J. B. Lawes has raised 43½ bushels of 62 lbs. Each additional bushel to the acre of the present cultivated area of India is equal to the yearly maintenance of 22 millions of people.

WHEAT-MIDGE, Cecidomyia tritici, a fly and its caterpillar, infesting wheat.

WHEELER, J. TALBOYS, author of Madras in the Olden Time; The History of India from the Earliest Ages; The Geography of Herodotus; i. The Vedic Period and the Mahabharata, ii. The Ramayana and the Brahmanic Period; Rare and Curious Narratives of Old Travellers in India in the 16th and 17th Centuries.

WHIRLPOOLS.

Yay-way, ... Burm. | Gird-ab, ... Pers.

These occasionally occur in the Ganges and Irawadi. A native writing of one which he saw near Koostee, says he saw the water within two or three miles whirling into a cavity several yards deep, which, after an interval, disgorged that which it had previously taken into it.

WHIRLWIND.

Lay-boay, ... Burm. | Gird bad, ... Pers.
Devil wind, . . . Eng. | Peshash, ... Tam.

The whirlwinds which occur in the desert west of Kharan, near Ragan in Baluchistan, would perhaps be more correctly called by some other name. They are vast columns of sand, which begin by a trifling agitation with a revolving motion on the surface of the desert, and gradually ascend and expand, until the tops of them are lost to the view, in which manner they move about with every breath of wind like a pillar of sand. Lieut. Pottinger saw at the same time 30 or 40 of them of different dimensions, apparently from 1 to 20 yards in diameter. Those who have seen a waterspout at sea may exactly conceive the same formed of sand on shore. Whirlwinds are extremely common in the Panjab, and in the central parts of the Peninsula of India, and some of them are supposed to be owing to electric action. Dr. Adams, writing of them, observes that about noon, when the west wind sets in, clouds of sand sweep across the country, penetrating through the minutest chinks and crevices. Whirlwinds are then of frequent occurrence. At a distance they look like revolving clouds of smoke, shooting upwards fully 200 feet. These cycloidal movements often last for upwards of half an hour, and carry with them whatever light substance they may encounter; after gliding along for some distance they finally disappear. The meeting of two opposite currents of air is no doubt at times the cause, inasmuch as a whirlwind was always seen to commence at the corners of two ranges of buildings placed at

right angles to each other. The following note of the loss of polarity by the needle during a whirlwind is given in a letter in the Bombay Times, May 30, 1846:—

'There is a class of magnetic local perturbations apparently confined to these seas, one of which was experienced by the *Queen* on her late voyage from Aden, which we do not remember to have seen noticed by magneticians. When about three hundred miles from Bombay, the people on board the steamer observed the atmosphere get suddenly clouded all around with that strange lurid appearance which indicates the approach of a burst of rain or hurricane. By and by appeared overhead those strange and turbulent vapours commonly attendant on a whirlwind or waterspout, and a light whirlwind accordingly made its appearance. At this time the magnetic virtue of the compass appeared to vanish: the needle lost its polarity and traversed equally in all directions. A state of matters so surprising was of short endurance; the sky cleared without a tempest, and all went well again. It was, we think, about A.D. 1844, that an incident of this sort was met with by the H. C. schooner *Mahi* on her way from the Persian Gulf. She was surrounded by beautiful groups of whirlwinds and waterspouts ranging about her in all directions, when suddenly the needle lost its polarity, and continued for some time useless for the purpose of steering.'

Dr. Bradley has clearly established the fact that the lesser whirlwinds at all events are either due to direct electrical agency, or are characterized by the most striking electrical exhibitions.—*Pottinger's Tr.; Adams.*

WHITE ANTS, or Termites, literally build a cell round the great progenitrix of the community, and feed her through apertures. Whenever buildings are infested with the destructive white ants, their nests containing the queen ant will always be found in the immediate neighbourhood; and as the destruction of the queen ant destroys the colony, there is no reason why any building should suffer from this destructive insect; and instructions are now given generally for digging up the white ants' nests in the neighbourhood of all public buildings. As a royal cell not unfrequently contains two, and sometimes three queens, and several royal cells, containing one or more queens, may frequently be found in the same nest, the ground should be excavated until the entire destruction of the nest has placed the destruction of all the queens beyond doubt. Vegetable wax has been found efficient in checking the approach of the white ants. Cultivators of sugar-cane know how destructive are the ravages of these insects, and the following is said to be an efficacious, though rather tedious remedy:—

Asafœtida (hing), 8 chittak; mustard seed cake (Surson ki-khulli), 8 seers; putrid fish, 4 seers; bruised butch root, 2 seers; muddur, 2 seers. Mix together in a large vessel with water sufficient to make them into the thickness of curd; then steep each slip of cane in it for half an hour before planting; and, lastly, water the lines three times previous to setting the cane, by irrigating the water-course with water mixed up with bruised butch root, or muddur, if the former be not procurable. White ants can be completely extirpated from a cane plantation by manuring the soil well with mustard cake, and stirring it up constantly.

A mixture of quicklime, soap, and tar, smeared where the white ants appear, puts an effectual stop to their inroads. Tar, turpentine, kerosene oil, earth oil, and margosa oil are also valuable; wood-ashes also are of value, sprinkled about the orifices of the dwellings, and smoking them out with wet straw; the Acorus calamus, steeped in water, is said to be of use. Sarcostemma acidum is employed in the west of India to destroy them. The Poona Observer states that tobacco decoction was applied to a piece of ground where for eleven years the white ants had destroyed everything put down; their removal was most effectually secured by the sprinkling of the decoction. Solutions of salts, ashes, and quicklime prove temporarily efficacious; and if dry ashes be put into an ant-hill, and hot water poured in, the ants will be killed.

In existing buildings, auger holes from the top of the beams near the walls may be bored, and fish oil or the earth oil (naphtha) poured in, and allowed to find its way into the wood. In short, a process similar to creosoting extemporized. Fish oil is effectual, and is more readily diffused through the wood.

A coating of tar, creosoting, and impregnation with dilute sulphate of copper, by means of Boucherie's apparatus, appear effectually to preserve timber and other substances from the attacks of white ants.

Few timbers (unless they have gone through some creosoting or kyanizing operation) can be said to be quite impervious to the attacks of white ants. The wood of the Strychnos nux vomica is, however, quite proof against them, probably owing to the very bitter properties of the timber. The sal or Shorea robusta, also, as far as has been observed, quite withstands their attacks. The harder timbers of India, such as the iron-wood or mesua, the Soymida febrifuga, and the acha or Hardwickia binata, are the least susceptible of injury by this insect. The timbers which have proved least susceptible of injury by white ants are teak, pedouk, Trincomalee, and rose.

Like a species of the ant that secretes formic acid, so the white ant secretes termic acid, with which it softens and moulds the soil it excavates from the earth to build its mounds and nests. To the former it gives solidity when hardened by time; to the nest itself it gives some elasticity and a corrugated leathery appearance when moist or recently excavated. Should the nest be freely handled, it causes some irritation, and stains the fingers slightly. Owing to this acid property, the white ant earth is in use as an embrocation when applied to sprains or bruises in native medicine. In native veterinary practice, it is in general use for such purposes, when boiled with an equal portion of cow-dung and applied warm to the swollen part, under the name of Leep.

Kirby and Spence (Introduction to Entomology, p. 312) say of the Termes lucifugus, a variety of the white ant, 'These insects seem to be furnished with an acid of a very penetrating odour, which is perhaps useful to them for softening the wood.' This odour to a moderate extent exists in the fresh excavated nest of the common white ant or Termitidæ.

The frosted appearance of glassware covered with the mud of the white ant, is caused by the acid secreted by this insect, which Dr. Shortt named termic acid, in an essay submitted to the St. Helena Government through the Madras Government in 1862 or 1863, when the St. Helena Government had offered a prize for the detection and destruction of white ants in that colony, which was said to cause much destruction to houses and

property.—*Mr. Simpkins; Mr. Rohde; Mr. Smart; Col. Simpson; Dr. Hunter; Captain R. H. Beddome; Captain Dangerfield; Col. T. H. Campbell, in Proceedings, Madras Military Board; Poona Observer; Dr. Shortt.*

WHITE ELEPHANTS are reverenced by the Burmese and Siamese. All the white elephants now existing in Siam and Burma are of a light mouse colour, somewhat of the same tint as the pale freckles to be found on the trunk of almost every ordinary elephant. This light-grey is uniform all over, the spots on the trunk being white. The depth of the colour varies greatly. To be regarded as a white elephant, it must have five toe nails on its hind feet instead of four. These are white elephants debased by sin. The final test is to pour water on the elephant; if a white elephant, it turns red; while a black elephant becomes blacker. The colour of the present Sinpyoo-daw of Burma is a mixture of light-brown, and dingy, smoke-smirched cream colour. The iris ought to be yellow, with a reddish outer annulus. Buddhists, since the Christian era at least, have venerated white elephants. In the Tree and Serpent Worship (plate xxxiii.) there is a bas-relief containing a short epitome of the life of Buddha. It begins with Maya's dream. She is represented as lying asleep on her couch on the terrace of the palace, and dreaming that a white elephant, which is represented in the bas-relief, appeared to her, and, as she dreamt, entered her womb. This was interpreted by Brahmans learned in the Veda as announcing the incarnation of him who was to be in future the deliverer of the world from pain and sorrow. This was in the 1st century of the Christian era. About 30 years afterwards, in the sculptures of the tope at Amaravati (plates lxv., lxxiv., xci. of the same work), the same story is repeated, but with more detail, and carried still further. The white elephant is brought down from heaven in great state, borne in a canopied car carried by Devata, and accompanied by music and dancing. This occupies a whole panel by itself. In the next, Maya is represented as asleep, the white elephant above her, as in the former bas-relief. In the other sculptures she is represented standing, holding a branch of a sal tree, and the infant Buddha is delivered from her side and received by the god Indra and attendant Devata. In the great temple of Boro Buddor, in the island of Java, the same scene is represented (i. plate xxviii. fig. 25 of the great Dutch work on the subject). Maya is asleep on her couch, surrounded by numerous attendants, and the white elephant appears from heaven, not borne in state as at Amaravati, but resting on heavenly lotus flowers. He is, however, represented as worshipped, at least with the royal umbrella borne over him, in the next plate (xxix.). These bas-reliefs were executed about the 6th or 7th century A.D.—*Dr. James Fergusson.*

WHITE GRUB is the Aneylonycha, *sp.* See Bug; Coffee; Insects.

WHITE LEAD, Carbonate of lead.

Asfeidaj, ... ARAB.	Plumbi carbonas, . LAT.
Fen-yuen, Fen-sih, CHIN.	Suffedah, ... PERS.
Kwan-fen, Shwui-fen, ,,	Muthu vullay, . . TAM.
Plom carbonate, . . FR.	Sibaydu, ... TEL.
Bleiweiss, . . . GER.	Istibedsh, ... TURK.
Cerussa, ... IT.	

Is usually made by suspending thin plates of lead over heated vinegar, the vapour of which corrodes the metal, and converts it into a heavy white powder. Mixed with oil, it forms a common paint; it is also employed in medicine.—*Faulkner.*

WHITE PEPPER.

Safed mirch, GUJ., HIND.	Vella mellogu, . . TAM.
Piper album, . . . LAT.	Tella mirrialu, . . TEL.

The fruit of a slender climbing plant, Piper nigrum, gathered after it is fully ripe, and freed of its dark coat by maceration in water. It is smooth on the surface, and is milder than the black pepper. The plant is extensively cultivated in Malabar, Sumatra, Siam, Malacca, etc.—*Faulkner.*

WHITING. Kullengan mutchie, DUKH.; Kellunga meen, TAM. Two or three species of fish common in Calcutta are called whiting, from their resemblance, both in form and flavour, to the European fish of that name. Corvinus coitor, *Blyth*, inhabits the estuaries of the Ganges and Irawadi. Its air-bladder makes excellent isinglass. It is frequently seen in the Moulmein basin.

WIGHT, ROBERT, M.D., of the Madras Medical Service, a distinguished botanist, and long superintending the cotton experiments at Coimbatore. He wrote on the Medical Properties of Mudar, Madras Lit. Trans., 1835, ii. p. 70; on the Nuth Grass of the Ceded Districts, ibid. 1838; on the Flax of Courtallum, from the Coromandel Coast; on the Land-winds of Coromandel, ibid. iii. p. 32; on the Acclimation of Extra-tropical Plants, ibid. v. p. 39; on the Cultivation and Preparation of Senna, ibid. p. 358. In the year 1834 was published the first volume of Wight and Arnott's Prodromus Floræ Peninsulæ Indiæ Orientalis. His smaller work was named Contributions to the Botany of India. From 1838, he began to print the Illustrations of Indian Botany, which were soon after followed by the Icones Plantarum Indiæ Orientalis, and his Spicelegium Neilgherriensis; and in addition many papers appeared in the Madras Journal of Science and in the Calcutta Journal of Natural History. He died at Reading in England, about the 18th June 1872. His Icones Plantarum, in six quarto volumes, illustrated with valuable plates, is alone a monument of his untiring industry and great ability, upon which he expended a large amount of his private funds.—*Dr. Buist's Catalogue.*

WIJAO, a sovereign of Ceylon who introduced the caste system, and which still prevails amongst the Buddhist inhabitants, though condemned by the doctrines of their teacher. The Portuguese, Dutch, and British Governments have each tried to eradicate it. The Aggana Suttan, in the Dighanikuya section of the Pitaka, enforces the eligibility of all classes, however low, to the office of the priesthood, which commands the homage of the highest; and the same doctrine is repeated in the Madhura Suttan. The Wasala Suttan contains a stanza, beginning with 'Majachcha Wasala hotin,' which runs thus: 'A man does not become low caste by birth; nor by birth does one become high caste: high caste is the result of high actions, and by actions does a man degrade himself to a caste that is low.' It was found impossible, however, to eradicate it, and caste continued to be tolerated by Singhalese kings as a social institution. In other Buddhist countries, Burma, Siam, and Tibet, the caste system does not exist in any form.—*Tennent's Ceylon.*

WIKSTRÆMIA SALICIFOLIA. *Dne.*
Thilak, ... Beas. | Bhat-niggi, . . . Ravi.

A small shrubby plant, which occurs sparingly on some of the Panjab rivers in the Himalaya at from 5500 to 7000 feet up to near the Indus; paper inferior to that from the daphne is made from its bark in Kamaon, and it furnishes a strong rope at Naini Tal.—*Dr. J. L. Stewart.*

WILD BEASTS in India destroy numbers of human beings and domestic animals. In the seven years 1875 to 1881, the average number of persons annually killed by them was 20,608, viz. by snakes, 17,404; wolves, 636; tigers, 835; leopards, 234; hyænas, 31; bears, 98; elephants, 48; other wild beasts, 1337.

Of cattle, the average numbers killed annually in the same period was 51,718, viz. by tigers, 14,125; leopards, 16,392; wolves, 11,213; snakes, 2977; hyænas, 2101; bears, 613; elephants, 31; other wild animals, 4239.

In 1883, the number of wild beasts and venomous snakes destroyed were, — wolves, 4538; leopards, 3397; bears, 991; snakes, 254,968; tigers, 1557; hyænas, 1014; elephants, 2; others, 3780.

WILD-FOWL. Ducks, teal, etc., are largely brought to the markets of the principal towns of India at certain seasons of the year. An enormous quantity breed in Tibet, including many Indian species that migrate no farther north. The natives collect their eggs for the markets of Jigatzi, Giantchi, and Lhassa, along the banks of the Yaru river, Ramchu and Yarbru and Dachen lakes. Amongst other birds, the saras, or giant crane of India, repairs to these enormous elevations to breed, but the saras (Grus antigone) breeds also south of the Himalaya, and specimens too young to fly are occasionally brought for sale even to Calcutta. Eggs are two in number, about $3\frac{3}{4}$ inches long by $2\frac{1}{2}$ inches broad, of a bluish-white, with a few distantly placed rufous specks and blotches. Lake Ramchu is frequented by great abundance of water-fowl, wild geese, ducks, teal, and storks, which on the approach of winter take their flight to milder regions. Prodigious numbers of saras are seen there at certain seasons of the year, and any quantity of eggs may be collected; they are found deposited near the banks. Instances have been known of the saras breeding in captivity. The European crane, Grus cinerea, a common Indian bird, in Scandinavia breeds in extended morasses, far away from the haunts of men. It makes its nest, consisting of stalks of plants and the like, on a tussock, and often amongst willow and other bushes. Major Cunningham, in his Ladakh, etc., remarks that he shot the wild goose on the Thogji, Chanmo, and Chomoriri lake at 15,000 feet; and Colonel Bates and he shot three teals on the Suraj Dal, a small lake at the head of the Bhaga river, at an elevation of upwards of 16,000 feet. About two days' journey from Dehli is the Nujjufghur jhil, a great marsh covered with water-fowl. The method of capturing them there accords with the practice that obtains in other parts of Asia. Earthen vessels, wide enough to admit a man's head into them, and perforated with small holes, are allowed to float about for days on the surface of this jhil, until the ducks, teal, and water-fowl in general, seeing them daily, become quite accustomed to the sight, and fearlessly swim around and even approach and peck at them. This preparatory step is followed by the fowler supplying himself with a wooden float, strong enough to support him. Using it like a hobby-horse under him, he launches himself into the swamp with the earthen vessel over his head of a similar size and kind, and similarly perforated as those indicated above. The float is dispensed with in many parts of the marsh that are shallow. With a bag of network tied round his waist, he silently paddles himself along with his hands under water, until he gets among the earthen vessels and fairly amid the birds. He commences his task by quietly and patiently pulling them down one by one by their legs, and putting them into the bag, which is so well adjusted round his person that the struggles of the birds do not scare away the rest. Some use small baskets of wicker-work, with a lid of the same material, which answers the purpose better. When the bag or basket is full, the fowler recedes to the spot whence he set out on his aquatic expedition, and there empties the contents into a basket large enough to contain about four or five times the number of the small one, and then begins anew. Large nets are also laid out on favourable sites, towards which the ducks, etc., are driven, and are thus taken in great numbers.

In India may be seen, floating on the surface of the deeper waters, fleets of the Anatidæ, the Coromandel teal, the Indian hooded gull, the Caspian tern, and a countless variety of ducks and smaller fowl,—pintails, teal, red-crested pochards, shovellers, and terns; Fuligula rufina, *Pallas;* Spatula elypeata, *Linn.;* Sterna minuta, *Linn.;* Pelicanus Philippensis, *Gmel.* Pre-eminent in size and beauty, the tall flamingoes, with rose-coloured plumage, line the beach in long files. The Singhalese designate them the 'English soldier birds.' In China, the fenny margins of lakes and rivers, and the marshes on the sea-coasts, afford both food and shelter to innumerable flocks of water-fowl. The banks along the wide delta of the Pearl River and the islands in it are frequented by immense flocks of geese, teal, ducks, and other birds; and they are likewise very abundant and tame along the inland water-courses. Ducks are sometimes caught by persons who first cover their heads with a gourd pierced with holes, and then wade into the water where birds are feeding; these, previously accustomed to empty calabashes floating about on the water, allow the fowler to approach, and are pulled under without difficulty. The wild goose caught on the shores of the Pearl River, and the common goose of Chinese farmyards, do not differ much, both of them being a plain ashy-grey colour, with a large knob at the base of the upper mandible. This bird and the maudarin ducks are both considered as emblems of conjugal fidelity, and a pair of one or the other usually form part of wedding processions. The Yuen-yang, as the Chinese call this duck, is a native of the Central Provinces, and is reared chiefly for its beauty. It is one of the most variegated birds known, vying with the humming birds and parrots in the diversified tints of its plumage, if it does not equal them for brilliancy.—*Williams' Middle Kingdom,* p. 263; *Hooker, H. J.* ii. p. 161; *Tour of India by French,* p. 193; *Tennent, S. Nat. Hist.* p. 260.

WILFORD, Colonel, an officer of the East India Company's Bengal army. In the English

burial-ground at Sechole, the most interesting monument is that of Colonel Wilford. The Hindu nation has reason to venerate the memory of this indefatigable Sanskrit scholar, who had almost Hinduized himself by a residence in Benares from 1788 to 1822, and who at length mingled his dust in the soil of that great seat of Brahmanical learning. He wrote Remarks on the City of Tagara, As. Res. i. p. 369; an Essay on Egypt, iii. p. 295; Dissertation on Semiramis, iv. p. 363; Account of Ancient Inscriptions, v. p. 135; on Hindu Chronology, v. p. 241; on the Names of the Cabirian Deities, v. p. 297; on the Caucasus, vi. p. 455; on the Sacred Isles of the West, ix. p. 32, x. p. 27, xiii; Chronology of the Kings of Magadha, ix. p. 82; on the Eras of Vikramaditya and Salivahana, ix. p. 117.—*Tr. of Hind.* i. p. 285.

WILKINS. Sir Charles Wilkins was the first European who acquired a knowledge of the Sanskrit language. He translated the Hitopadesa from the Sanskrit. He translated also into English the Bhagavat Gita, from which it was translated into the French, Russian, and German, and Schlegel produced a Latin version; gave a Glossary of Oriental Terms in the Fifth Report of the Select Committee on India Affairs, London 1813; furnished a Translation of the Moughir Inscription, As. Res. i. p. 123; of Buddal Inscription, i. p. 131; of Buddha Gya Inscription, i. p. 284; Observations on the Sikhs, i. p. 289; and wrote an Account of Two Inscriptions from the Vindhya Mountains, ii. p. 167. Author of a Grammar of the Sanskrit Language, London 1808; and Sanskrit Radicals, London 1815.—*Rennell's Memoir*, p. 332.

WILKS, Lieut.-Col. MARK, author of Historical Sketches of the South of India, London 1817, 3 vols. 4to; Translation of an Inscription on a Tambu Paka, ibid. viii. p. 736; History of Mysore, London 1810.—*Dr. Buist's Cat.*

WILLOUGHBY, Lieutenant, of the Bengal army. On the 11th of May 1857, with a mind capable of conceiving, and a heart and hand resolute and steady to perform, he blew up the magazine at Dehli.—*Tr. of Hind.* ii. p. 361.

WILLOW TREES are species of the genus Salix; the weeping willow is S. Babylonica. Willow bark contains, according to Davy, 2·3 per cent. tannin, and that of the Leicester willow 6·8 per cent. Danish leather, which has a peculiar and agreeable odour, and is used for making gloves, is prepared from kid and lamb skin by means of willow bark, which is also used in the preparation of Russia leather, but the odour of that leather is produced by the oil of birch tree bark.

WILLUGHBEIA EDULIS. *Roxb.* Luti-am, Hind. A very large climber in the forests of Chittagong and Sylhet. Every part of the plant on being wounded discharges an abundance of fluid caoutchouc. The fruit is pulpy, soft, and yellow, and esteemed by the natives. Dr. Mason says that W. Martabanica of the forests of Tenasserim produces a fruit as large as an apple, which Europeans sometimes call a kind of fig. It has an agreeable taste, but abounds in a milky juice. Its colour is yellow, and it is about the size of an orange.—*Roxb.* ii. p. 57; *Mason; O'Sh.*

WILSON. Horace Hayman Wilson went to India in September 1808 as an Assistant-Surgeon on the Bengal Establishment, and was attached to the mint at Calcutta, in association with Dr. Leyden, then next to Henry T. Colebrooke, the most distinguished orientalist in India. His studies, consistently carried through more than half a century, placed him at last the highest authority of the day upon all questions of Sanskrit literature and of Hindu theology and antiquities, as well as of the customs and social habits of the races through which that literature and religion had come down to the present generation. In 1813 he published a poetical translation of the Megha Duta, an epic poem of Kalidasa, which obtained a world-wide reputation; and he undertook the laborious task of preparing for the press, from materials collected by Colebrooke, a dictionary of the Sanskrit language with English interpretations. This was completed in 1819, and a second edition was published in 1832. It has been the key by which, mainly, the learned of Europe have obtained access to this branch of literature. His earliest article in the volumes of the Asiatic Society of Bengal was published in 1825. It was on the History of Kashmir, from the Raja Tarangini and other authorities. It attracted much attention, and was speedily translated and republished in Paris. Every subsequent volume of the Researches of this Society contains more than one contribution from his prolific pen. He compiled, in 1827, a History of the first Burmese War. He was employed by the Government of India in preparing a catalogue of the manuscripts collected by Colonel Colin Mackenzie in the south of India. In 1834 he published, under the title of the Hindu Theatre, a translation into English, with preliminary essay, of four Sanskrit dramas of antiquity. The work was received with very general favour; for the dramas were found to possess much artistic merit in the combination of incidents and in the exhibition of character; one especially, the Mrichhakati, or Play of Toy Cart, is a representation of the manners and habits of thought and condition of society in Central India at a very remote period. These four dramas, with the Sakuntala, previously translated by Sir William Jones, are among the most curious relics of Indian antiquity. But his name will live in India, and especially in Bengal, for the part he took in promoting useful instruction. He introduced the study of European science and English literature into the education of the native population. He was the Secretary to the Committee of Public Instruction at Calcutta, and he devoted himself especially to directing the studies of the Hindu College from the date of its establishment. In 1833, the University of Oxford having, through the magnificent bequest of Colonel Boden, established a Professorship of Sanskrit, Dr. Wilson was selected for that liberally-endowed situation, and was appointed also to the office of Librarian to the East India Company, in succession to Dr. Wilkins. His separate works, published after his return from India, all aimed at the wider spread of knowledge in the lore which he had so thoroughly mastered,—like his essays and translations of the Vedas and Puranas; or like his Sanskrit Grammar and Glossary of Indian Terms, for the useful purposes of instruction; or like his edition and continuation of Mill's History of British India; or like his Ariana Antiqua, on the Antiquities and Coins of Afghanistan,—with the higher aim of producing a lasting record for the information of the world at large.

He translated from the Sanskrit into English

the Vishnu Purana; Mrichhakati, or The Toy Cart; Vikrama and Urvasi, or The Hero and the Nymph; Uttara-Rama-Charita, or continuation of the History of Rama; Malati and Madhava, or The Stolen Marriage; Mudra Rakshasa, or The Signet of the Minister; Ratna Vali, or The Necklace. His prose writings were—a Sketch of the Religious Sects of the Hindus; Notice of Three Tracts received from Nepal; on the Religious Practices and Opinions of the Hindus; on the Civil and Religious Institutions of the Sikhs; The Religious Festivals of the Hindus; on Human Sacrifices in the Ancient Religion of India; on the Supposed Vaida Authority for the Burning of Hindu Widows, and on the Funeral Ceremonies of the Hindus; on Buddha and Buddhism; on the Religious Innovations attempted by Akbar; Analysis of the Puranas; Hindu Fiction; on the Medical and Surgical Sciences of the Hindus; Introduction to the Mahabharata; Introduction and Extracts from the Dasa Kumara-Charita; Account of the Panchatantra; History of Mantragupta; History of Visruta; Review of Sir F. W. Macnaghten's Hindu Law; Review of A. W. Schlegel's Bhagavat Gita; Review of Max Muller's History of Ancient Sanskrit Literature; Preface to the Sanskrit Dictionary; Notice of European Grammars and Dictionaries of the Sanskrit Language. He also gave short accounts of the Sanskrit dramas, Mahavera-Charita; Veni Samhara; Malavikagni Mitra, or Agni Mitra and Malavika; Prachandu-Pandava; Hanuman-Nataka; Dhananjaya-Vijaya; Sarada-Tilaka; Anargha-Raghava, or Murari-Nataka; Yayati-Charita; Mrigankalega; Dutangada, or the Mission of Angada; Vidagdha-Madhava; Abhirama-Mani; Madhurani-Ruddha; Kamsa-Badha; Pradyumna-Vijaya; Sri-Dama-Charita; Dhurta-Nataka; Hasyarnava; Dhurta-Samagama; Chitra-Yajna; Kantuka-Sarvasva.

John Wilson, D.D., born in the Berwickshire burgh of Lauder, 1804, died at Bombay, 1st December 1878.

'From his cradle
He was a scholar, and a ripe and good one;
And, to add greater honour to his age
Than man could give him, he died fearing Heaven.'

He was the first English scholar to master the original Zend texts, and he was the first missionary to educate and admit to the Christian church two converts from the faith of Zoroaster. Native female education was commenced by himself and his family, and before 1839 there were native girls' schools established in Bombay and its neighbourhood, under Dr. Wilson's superintendence, attended by between three and four hundred pupils. He delivered lectures on Natural History, Early Church History, Early Indian History, Indian Antiquities, Indian Ethnography, and the Doctrines of the Bible. His work on the Religion of the Parsees was published in 1843. A few years later, his Lands of the Bible, a storehouse of Biblical research. His next works of importance were his History of the Suppression of Infanticide in Western India; Exposure of Hinduism, Bombay 1832; Lecture on the Vendidad Sadi, 1833; Refutation of Muhammadanism in Oriental Christian Spectator, 1833, Bombay 1834, 1840; Second Exposure of Hinduism, Bombay 1834; Letter to Jaina Priests of Palitana, Bombay 1835, 1837, 1852; Discourse on the British Sovereignty in India, 1835 and 1837; Translation of the general Sirozeh of the Parsees, Lond. As. Trans. 1837, iv.; Letter on Girnar Tablets, As. Trans. 1838; Note on the Worship of Vetal, Lond. As. Trans. v. 1839; Sermon to the Parsees, with an Account of their Settlement in India, etc., 1839, 1847; Notes on the Kissah-i-Sanjan, or Arrival of the Parsees in India, translated by Lieutenant E. B. Eastwick, in Bom. As. Trans. 1842, No. iv.; Vendidad Sadi, etc., in the Zend, with Framji Aspendiargi's Gujerati translation, 1842; Zarthusht-Namah of Zarthust Berham, in Persian, London 1842; Account of the Warahs and Katodis, two forest tribes, Lond. As. Trans. 1843, vii.; The Parsee Religion, as contained in the Zend-Avesta, etc., Bombay 1843; on the Sacred Literature of the Hindus, North British Review, 1844; Lands of the Bible visited and described, 2 vols., Edinburgh and London 1847; Brief Notes on certain Parthian, Bactrian, and Indian Coins, in Bom. As. Trans. January 1849; Memoir on the Cave Temples and Monasteries, and other Ancient Buddhist, Brahmanical, and Jaina Remains of Western India, in Bom. As. Trans. January 1850; on the Hazors of Scripture, with the Identification of Hazor of Kedar, Bom. As. Trans. 1852; Second Memoir on the Cave Temples, etc., ibid.; India Three Thousand Years Ago, Bombay 1858.—*Dr. Buist's Cat.*

WIND.

Bara, ... HIND.	Vaya, ... SANSK.
Ang, ... MALAY.	Gali, ... TAM.
Bad, ... PERS.	

In 1831, Mr. Redfield of New York established the fact that storms, seemingly the most violent and lawless, moved with precision in fixed paths, and executed their rotative movements with almost the regularity of the balance-wheel. He also demonstrated that hurricanes in the northern hemisphere revolve around their centre invariably in a direction contrary to that of the hands of a watch, and the knowledge of this physical law of storms, in countless cases has saved large vessels, and even whole squadrons, from probable destruction. Captain Douglas Wales of the Mauritius, a sailor of experience and great practical knowledge and skill, in a paper on the Converging of the Wind in Cyclones, argues that on the margin of these storms, whose diameter is often several hundred miles, the wind does not always blow around the central area of the storm in concentric circles, but frequently it converges or curves inward, in nearly radial lines, upon the centre of the gale. As it is in the centre that the verticose motion of the cyclone is most intense and deadly, it is of course of the first importance to give it a wide berth. According to the 'law of storms,' as first stated by Messrs. Redfield, Reid, Dove, and others, the winds within the entire area of atmospheric disturbance blew in perfect and concentric circles around the common centre. Captain Wales, however, after multiplied observations, shows that this rule is not strictly observed by the winds. This important fact does not, however, at all overthrow, but confirms Mr. Redfield's discovery. The converging of the wind towards the centre of the revolving gale, is of course due to the centripetal force being greater than the tangential force, which is the fact observed in tornadoes.

Dust storms of India sweep along the surface of

the ground sometimes for two or three hundred miles, and cause much inconvenience.

Land and sea breezes occur on the seaboard of all tropical countries, and on all islands in the tropics. Upon the northern coast of Java, the phenomenon of daily land and sea breezes is finely developed. There, as the sun rises almost perpendicularly from the sea with fiery ardour, in a cloudless sky, it is greeted by the volcanoes with a column of white smoke, which, ascending from the conical summits high in the firmament above, forms a crown, or assumes the shape of an immense bouquet that they seem to offer to the dawn; then the joyful sea breeze plays over the flood, which, in the torrid zone, furnishes with its fresh breath so much enjoyment to the inhabitants of that sultry belt of earth, for by means of it everything is refreshed and beautiful. The transparency of the atmosphere is so great there that they can sometimes discover Venus in the sky in the middle of the day. In the rainy season the land looms very greatly, and mountains which are from 5000 to 6000 feet high are visible at a distance of 80 or 100 English miles.

In the *Red Sea* the wind from May to November is northerly, and the other six months is southerly, but there are also land and sea breezes.

Monsoons, Trade-Winds.—Mountains which lie athwart the course of the winds have a dry and rainy side, and the prevailing winds of the latitude determine which is the rainy and which the dry side. The weather side of all such mountains as the Andes is the wet side, and the lee side the dry. Were the Andes stretched along the eastern instead of the western coast of America, we should have an amount of precipitation on their eastern slopes that would be truly astonishing; for the water which the Amazon and the other majestic streams of South America return to the ocean, would still be precipitated between the sea-shore and the crest of these mountains.

The same phenomenon, from a like cause, is repeated on the mountain sides in intertropical India, only in India each side of the mountain is made alternately the wet and the dry side by a change in the prevailing direction of the wind. From October to April the north-east trades prevail. They evaporate from the Bay of Bengal water enough to feed with rain during this season the western shores of this bay. After the north-east trades have blown out their season, which in India ends in April, the great arid plains of Central Asia, of Tartary, Tibet, and Mongolia become heated up; they rarefy the air of the north-east trades, and cause it to ascend. This rarefaction and ascent, by their demand for an indraught, are felt by the air which the south-east trade-winds bring to the equatorial doldrums of the Indian Ocean; it rushes over into the northern hemisphere to supply the upward draught from the heated plains, as the south-west monsoons. The forces of diurnal rotation assist to give these winds their westing. Thus the south-east trades in certain parts of the Indian Ocean are converted during the summer and early autumn into south-west monsoons. These come from the Indian Ocean and Sea of Arabia loaded with moisture, and, striking with it perpendicularly upon the ghats, precipitate upon that narrow strip of land between this range and the Arabian Sea an amount of water that is truly astonishing. There are thus not only the conditions for causing more rain, now on the west, now on the east side of this mountain range, but the conditions also for the most copious precipitation. Accordingly, when we come to consult rain gauges, and to ask meteorological observers in India about the fall of rain, they tell us that on the western slopes of the ghats it sometimes reaches the enormous depth of twelve or fifteen inches in one day.

These S.W. monsoon winds of India continue their course to the Himalaya, dropping moisture along their course, and in crossing this range they are subjected to a lower temperature than that to which they were exposed in crossing the ghats. Here they drop more of their moisture, in the shape of snow and rain, and then pass over into the thirsty lands beyond, with scarcely enough vapour in them to make even a cloud. Thence they ascend into the upper air, there to become counter-currents in the general system of atmospherical circulation.

The greatest rainfall occurs on the slopes of those mountains which the trade-winds first strike, after having blown across the greatest tract of ocean. The more abrupt the elevation, and the shorter the distance between the mountain top and the ocean, the greater the amount of precipitation.

Sudden storms are common throughout India in the spring. For an hour before sunset, clouds are gathered in the western horizon, which is illuminated with repeated flashes of lightning, accompanied with a continued muttering of distant thunder, the atmosphere becoming oppressively sultry. Suddenly the heavens are furiously agitated, a brightening space is seen on the horizon, and they appear rapidly diverging from it as from a centre. A few large drops of rain are dashed downwards with great violence, a whirlwind rises almost instantly, and blows as if it blew its last, with a violence to which Europe is a stranger. The rain then falls as if a deluge were commencing, sudden and terrific crashes of thunder are heard above and around, and hailstones such as we have read of are often precipitated with most injurious effect. The violence of the storm is generally exhausted in about half an hour.

Hailstorms are dreaded in India, as the hailstones are often very large, and sometimes kill man and beast, as well as destroy much of the crops.

Typhoon is the European name of frightful equinoctial gales which vex sea and land about the tropics, in the eastern seas, and down as far as to 10° from the equator. The whole Eastern Archipelago is excluded from their sphere, while the whole of the Philippines is within it, the island of Mindanao alone excepted. Typhoon is said to be a word of Chinese origin, from Ta, great, and Fung, tempest. It may, however, also be from the Arabic Tufan, a storm, and that from the Arabic root Taof, he did turn. Typhoons, cyclones, and tornadoes are great rotatory winds that move along a curved line in increasing circles, sometimes centripetal. In the northern hemisphere, the rotatory movement follows a direction contrary to that of the hands of a clock; while the opposite takes place in the southern hemisphere. In maritime language, typhoons are dangerous tempests which occur in the northern part of the China Sea, along the southern and eastern

coast of China, near Formosa, the Bashee Islands, the north end of Luconia; also to the castward of those islands, and betwixt Formosa and the Japan Archipelago. These tempests usually blow with the greatest fury near the land; as the distance is increased to the southward from the coast of China, their violence generally abates, and they seldom reach beyond lat. 14° N., although a severe gale has been experienced at times two or three degrees farther to the southward. They occur in both monsoons.

A *velocity* of 60 or 70 miles an hour is a tolerably severe gale, and a tropical hurricane rarely exceeds 100 miles an hour. On the 18th of August 1876? however, as the central vortex of storm approached Cape Lookout about half-past six in the morning, the anemometer was found to be registering 138 miles an hour. At this point the instrument gave way, the cups being violently torn from their stems. It is said, however, that an hour and a half after the break-down of the anemometer the wind was estimated to have attained a speed of 165 miles an hour, or some 30 miles an hour in excess of what rendered the Guadaloupe hurricane so famous in the annals of meteorology. This American storm is thought to have been the most violent ever recorded. A velocity of 100 miles an hour means a pressure of nearly half a hundredweight on a square foot.

In one of the most violent tempests that ever swept over London, a pressure of only 35 lbs. was registered. During a storm in Liverpool in 1863, every now and again the wind registered a velocity of 93 miles an hour, and in February 1868 it was thought to have attained 120 miles an hour, and did enormous mischief on the north-west seaboard.

The *desert* of Kharazm or Regan, from June to September, is liable to destructive hot winds, in which man and beast perish, even the hardy camel perishing miserably. The Baluchi call it Julot or Julo, the flame, also Bad-i-Simoom, or the poison wind. There is great heat of skin, quickly ending in death. The approach of the wind is ushered in by an oppressive calm in the air, and a degree of heat that affects the eyes; the precaution then adopted by travellers is to cover themselves over, and lie prostrate on the earth. A curious fact is established by this custom, that any cloth, however thin, will obviate the deleterious effects of the Bad-i-Simoom on the human body.

The hot winds on the Oxus at Hissar and in Khiva are called Tibbad. The hot wind of the sandy deserts of Central Asia, laden with fine dust, blows over Khojend and Khokand, where it is called Garm-sal, darkens the atmosphere, and kills the silk-worm. It blows through the Khojend opening into the Farghana valley. At Yarkand, in autumn, a fine dust sometimes for seven or eight days fills the atmosphere.

With the Hindus, the air, or Vayu, and the winds, or Maruts, are personified and invoked. The maruts are depicted as roaring amongst the forests, compared to youthful warriors bearing lances on their shoulders, delighting in the soma juice like Indra, and, like him, the bestowers of benefits on their worshippers.—*Maury's Physical Geography; Horsburgh; Vigne; Markham's Embassy; Reid; Capper; Piddington.*

WINE.

Vino, ...	It., Sp.	Sarayi, ...	Tel.

Wines used in the south and east of Asia are almost all imported from Europe, only to a small extent from Australia. The quantities received into British India of wines and liqueurs have been latterly as under:—

	Galls.	Rs.		Galls.	Rs.
1874-75,	564,921	47,46,951	1878-79,	487,787	41,41,744
1876-77,	464,242	40,69,585	1879-80,	443,978	39,27,310
1877-78,	496,733	43,60,198	1882-83,	418,173	38,45,719

Wine is mentioned as having been known to Noah (Genesis ix. 21), who drank of the wine, and was drunken. The allegory of the trees in Judges ix. 13, speaks of the vine which cheereth God and man; and St. Paul (1 Timothy v. 23) recommends the use of a little wine for the stomach's sake. Before his time Homer had said,—

> 'The weary find new strength in generous wines;'

and Martial had sung,—

> 'Regnat nocte calix, volvuntur biblia mane,
> Cum Phœbo Bacchus dividit, imperium,'

which has been rendered,—

> 'All night I drink, and study hard all day,
> Bacchus and Phœbus hold divided sway.'

In Europe, in the manufacture of wine ripe grapes are trodden by men or cattle in a vat, and the juice which is thus forced out is called must. The marc or solid parts being mixed with the must again in wooden tanks, fermentation soon takes place, much heat is developed, and carbonic acid gas is copiously disengaged; the marc now rises to the surface of the tank, and when the effervescence ceases, the subjacent wine is drawn off from below, and the marc then subjected to strong pressure.

If the wine be bottled before the fermentation has terminated, it has the property of foaming in the glass in consequence of the sudden liberation of carbonic acid; champagne is thus manufactured. In the preparation of white wines the marc is removed before fermentation.

According to Humboldt, the conditions of climate essential for the manufacture of good wine are, a range of temperature from 62° to 50° or even 47°, provided the winter heat is not lower than 38°, nor that of summer below 66° or rather 68°. At a higher mean temperature the juice passes too rapidly into the acid fermentation. The manufacture of wine thus becomes impracticable in the plains of India; moreover, the rains set in so soon after the ripening of the grape, that the manufacture of raisins by sun-drying is equally impossible. Dr. Royle informs us of the existence of luxuriant vineyards in Kanawar, between lat. 31° and 32° N. (or nearly that of Madeira), at an elevation of 9000 to 10,000 feet, the grape being of delicious flavour, and the climate exactly suited for both the wine and raisin manufacture. Grapes are also abundant in Kashmir, Kābul, and Bokhara, and afford both raisins and wine. The most celebrated of eastern wines, however, is the Shiraz, prepared in the districts of Khollar, near

the village of Bendamir. There are two varieties, red and white, the former containing 15½, the latter nearly 20 per cent. of alcohol.

The Mosaic law prescribes driuk-offerings of a particular measure of wine at the ordaining of priests, and also at harvest festivals and on other occasions of solemnity during the year. In the ancient Greek ritual, not ouly wine, but other drinks were used, and almost each god and each feast had its appropriate libation of liquids as well as its offering of flowers, fruit, cake, or flesh. Hardly a sacrifice was complete without the use of wiue. It was dashed over the brows of the horned victim when immolated, and poured over the cakes which were spread upon the altar. The wine to be used at every meal was first offered in libation to the gods.

Turks.—Timur and his ladies appear to have been confirmed wine-bibbers. Ruy Gonzalez de Clavijo, who visited their court as ambassador from the king of Castille and Leon in 1403, in describing a feast given by Hausada, the wife of the eldest son of Timur, says that when 'the ambassadors arrived, the ladies were drinking, and the way they drink is this: An old knight, a relation of the lord, aud two small boys, his relations, serve the cup, before Hausada, and before the other ladies, in this manner: they hold white napkins in their hands, and those who pour out the wiue, pour it into small golden cups, which they place on flat plates of gold. Those who serve the wine then come forward, with the pourers-out behiud, and when they have got half-way, they touch the ground three times with their right knees. When they come near to the ladies, they take the cups, with their hands wrapped in the white napkins, so that they may not touch the cups, and present them kneeling, to the ladies who are going to drink. . . . You must not think this drinking is of short duration, for it lasts a long time without eating. Cano, the wife of Timur Beg, came to this feast. After the drinking had lasted a long time, Cano called the ambassadors before her, and gave them to driuk with her own hand, and she importuned Ruy Gonzalez for a loug time, to make him drink, for she would not believe that he never touched wiue. The drinking was such that some of the men fell down drunk before her; and this was considered very jovial, for they think that there can be no pleasure without drunken men.' The ambassadors could not withstand the temptation. Neither the Jewish nor the Christian religion prohibited wine or strong drinks.

Muhammadans.—The use of wine is forbidden in the Koran under the word Khamar, which literally means anything intoxicating. Persian shiahs, however, have always been less strict in regard to indulgence in wine. Pietro della Valle mentions two ordinances of Shah Abbas, the one forbidding its use, showing that the religious precept had failed in effect; and the second anuulling the prohibition, upon finding that the people, especially the soldiers, had substituted for wine a liquid preparation of opium, by which their health was iujured. Wines, by the Persians, are valued for their intoxicating qualities, and not at all for their flavour. Mazanderan, bordering the south of the Caspian, and Khorasan, the eastern continuation of the former province, are the Lesbos and Chios of the subjects of the Shah, but the characteristics and reputation of their produce have become blended in the wine of Shiraz. An old Persian proverb declares that he 'who would live merrily should take his wine from Shiraz, his bread from Yesdecast, and a rosy wife from Yest.'

Shiraz is famed for its vineyards and pomegranate orchards, the former bending under the weight of the largest grape of any Persian vine, although the smaller imperial fruit of Tauris is most juicy and delicate. The principal gardens are situated at the foot of the Zagros mountain, having a fine exposure. 'Apertos Bacchus amat colles.' The vines are grown low, and sometimes trained over stone walls. At Kasvin the growers irrigate their gardens only once a year, about the middle of April, and there is a tradition that the clayey soil thus treated retains sufficient moisture for the season. The vines cultivated in the rising ground of Zagros may be divided into twelve varieties. First there is Kishmish, bearing a beautiful large bunch of white grapes, the berries being oval and without seed. This species serves both for wine-making and the production of raisins. Damas gives a black grape, from which the finest red wine, rich and of great durability, is made. The vines called after Samarcand differ; some yield bunches 12 lbs. in weight. Then there are the Rischbaba, Askeri, and Tauris varieties, supplemented by a vast number of white, grecu, yellow, violet, red, brown, blue, and black grapes. The juice is fermented in glazed earthenware vases, which are buried in cool cellars. The wine is bottled in glass flasks containing about five imperial pints, and sold by weight. Its taste to a foreigner is at first harsh, but after a few trials there are few who would not appreciate its good qualities. A German connoisseur highly praises the Shiraz produce, comparing it, indeed, to the best growths of Burgundy. Next to Shiraz, Teheran, Yezd, Kasvin, Tabreez, and Isfahan are the most important wine-producing places. They are all situated on the southern slopes of mountain ranges, and thus possess the chief requirement in viticulture. The modern Persian purchases his wine from the Parsee, Jewish, or Armenian growers, who mix it with arrack, saffron, or the extract of hemp.

Wine of a red colour is made by the Siah-posh, who export it in leather skins. The nobles of Kābul each has his own wine-press. The juice is trodden out into a large earthen vessel or masonry reservoir, from which the juice flows through a small hole into a narrow-mouthed earthenware receptacle, and the mouth closed for forty days, when a flagon of fine porous clay is poured in, and the mouth closed air-tight, with a luting of dough, and placed aside to ripen. In Afghanistan and in the British districts on the N.W. of India, the vine grows in wild luxuriance, and in Kashmir wine is made from the grapes of that favoured climate.

A wine called Kishmishi is made in Sind from dried grapes, and that called Anguri is made of the Sind grape at Hyderabad, Sehwan, and Shikarpur. They are sold pure, or strengthened with spirit made from raw sugar.

The *Chinese* in the cold weather drink a fair quantity of wine, but are seldom addicted to drunkenness. Their wines are crude spirituous liquors, almost altogether unrefined, distilled from rice, millet, barley, and other fermented grains,

and the process of distilling seems to have been perfected during the Mougol dynasty. Grape wine was originally brought from certain voleanic districts in Turfan, which has prejudiced the Chinese against it, as they consider it heating. A wine flavoured with sandal-wood, brought from Siam, was formerly in great repute in China. The eelebrated Cheh-kiang wine,called Shau-hing-tsiu, is wholesome and in grcat repute throughout China; it has a yellowish colour and sour flavour. The Yuen-hwa-tsiu is a weak white wine or spirit, flavoured with the flowers of the Passèrina chamædaphne, and reputed to be tonic. The Kwei-yuen-tsiu is a red wine. The Pih-luh-tsiu is a greenish coloured wine or spirit, resembling a cordial, made at Peh-chi-li and Hu-peh. The Feu-tsiu is a kind of strong whisky, originally distilled in Fu-chau-fu in Shan-si. The wines of China are takeu warm, very soon redden the face, and culminate in evanescent stimulatiou.

The wines known to Europeans in S.E. Asia are almost exclusively the product of Europe; little of the wines from the Cape of Good Hope, or from Australia, is used. The *palm wines*, the fermented sap of the several species of palms, are very extensively used by all classes of natives, but by Europeans they are untasted.

The wines best known in India are sherries of kinds, clarets, champagne, hock; the Sicilian marsala is scarcely ever seen under that name. The Rhenish wines are often put on the tables of the more wealthy, and the Hungarian, Italiau, and Greek wines are rapidly gaining ground. Port or Lisbon are vcry rarely seen, and the famed wine of Shiraz or Kerzerum is wholly unknown, though Ahmad of Andabul sang,—

> 'Bring the bowl and pass it round,
> Lightly tune the sportive lay;
> Let the festal hour be crown'd,
> Erc 'tis lost like yesterday.'

WINI. Sansk. Winaya, Burm. The Burmese book which regulates the life and conversation of thc Buddhist monks.

WINNOWING. Matthew iii. 12 says, 'Whosc fau is in his hand.' Thc common winnowing fan of the Hindus is square, made of split bamboos, and the corn is winnowed by waving the fan backwards and forwards with both hands.—*Yule*, p. 169.

WIRD. Arab. Repeating perpetually something out of the Koran; a supplication or blessing.

WIRGEL-COIL, a celebrated temple in Ceylon. It was pluudercd in 1839 by moormen (Muhammadans) from Batticaloa of jewellery to thc amount of Rs. 6000.

WISTARIA SINENSIS, *D.C.*, Glycine Sinensis, *Sims.*, is a twining plant, one of the Fabaceæ and of the section Phaseoleæ. In China, Mr. Fortune saw one which had all the appearanee of a tree in miniature. Every one of the branches was loaded with long racemes of pendulous lilac blossoms. At another place he saw a Wistaria evidently of great age. It measured, at 3 feet from the ground, 7 feet in circumference, and covered a space of trellis-work 60 feet by 102 feet. Thousands of long racemes hung down nearly half-way to the ground.—*Fortune, Japan and China.*

WITCHCRAFT is believed in by all the races of the south and east of Asia. It still lingers even in eivilised Britain. Amongst the Musalman we find the first distinct expression of the religious condemnation of all magic as a sin, because it is treason against God. But sorcery of all kinds is known and incessantly practised. Mueh business is done in amulets, charms, spells, exorcism, magie mirrors, cabalistie figures, divination, sortilege, aud the like. But all such proceedings and deviccs are opposed to the true spirit of Islam, and are condemned by Musalman divines. For the admission of other supernatural beings into any kind of partnership with God, in the exercise of miraculous powers, which are his attributes, or the performance of wonders without calling on God's name or ascribing the glory to him, are matters upon which Muhammadanism looks with a very unfavourable eye. The Banjara race are eonfirmed believers in witehcraft. In one of their Berar encampments near Khamgaum, a headman had lost some of his cattle by death in a most mysterious manner. He came to the conclusion that there was a witch in the encampment, and resorted to the priest for advice, and agreed to give him 60 rupees. The priest performed a number of mummeries, and then pointed out an old woman as the person who had caused all the destruction to the cattle. The woman was a wife of another headman, was seventy years of age, and was the mother of ten children. When thc husbaud of the woman was informed of thc revelations of the priest, he told his wife of the same, and although she protested most earnestly against what was said, she was not believed, and the husband and two of his sons led her to a lonely place in the juugle, and strangled her with a rope. The two sons then dug a grave and buried the poor woman. The father and his sous were condemned to death.

So late as the year 1863, an old man of 80 was swung for a wizard in the hill stream at Little Hedingham, in Essex, and died from it. In the wild tract in the extreme south-west of Udaipur, in 1871, the headman (Gounthee) of a Bhil village was taken ill, and one Lemba Bhaguri, a bhopa or witch-finder, was employed to discover the witch who had eaused his sickness. That man's account of what happened, given before the Political Assistant at Kotra, was as follows:— 'Dhuna Doongri took a handful of grain, and, having waved it over the body of the Gounthee Sukra, asked me to look at the grain. I looked at it, but I never spoke or said a word, nor did I show that any one was a witch. I remained perfectly silent. On this, Champa, Knolo, and the four sons of Sukra said to me, "Why are you silent and do not speak? Wc have already arranged everything: Deeta, Loi's wife, is the witch, and she has made the Gounthee ill; let us go and put her to the test." On this every one rose, wcnt and seized Deeta, and took her to thc water and put her to the water test (which is the following:— A bamboo is embedded at the bottom of any piece of water. The accused goes to the bamboo, holds it and by it descends to the bottom. In the meantime one of thc villagers discharges an arrow from his bow, and another villager runs to pick it up and bring it back to the place it was launched from. If the unfortunate woman is able to remain under water until this is done, she is declared innocent, but if she comes up to breathe before the arrow is returned to the bowman, she is a true witch, and must be swung as such). The bow-

man was Kumla Kasota, his father's name Nurhingh, of village Khara. The fetchers of the arrow were two of Sukra's sons, Kumla and Joyta. I was also present at the time of test. The woman failed in the test, and thus became a witch. At this a great outcry was raised, and the woman was seized and tied up and taken away. I returned to my home.' Other evidence, however, showed that, after looking at the grain, Lemba had declared Deeta the witch. What happened then may best be told in Deeta's own words:— 'Seven Bhils of Jhanjur and Kumla of another village came to my house and told me I was a witch, and that I had made Sukra Gounthee ill. They seized me, saying, "Come and undergo an ordeal." I agreed, and went with them. They put me to the test of taking out a rupee from heated oil. I twice took out the rupee from the burning oil without injury to myself, and was innocent. They allowed me to go home. At the time of undergoing the ordeal, my husband Deeta Loi and his elder brother Lalla were present on my part. A month after this the above-named seven Bhils again came to my house, seized me, and said they would put me to the water test. They took me to the river and told me to perform the test. I refused, and did not enter the water; they then took me to a tamarind tree behind Sukra's house, and applied a bandage of red chillies over my eyes, tied me to a rope head downwards from the tree, and began to swing me backwards and forwards. They swung me for two whole days; the third day they swung me till 12 o'clock A.M. They, thinking me then dead, undid the ropes, and left me there. Budda Paigee, who belongs to my father's village, and whom I call brother, took me to his house and attended to my wounds and my inanimate state. Having a little life in me, I recovered.' The rope, it appeared, had been tied round her ankles. During the swinging the Bhils kept on shouting and urging her to confess. They used to take her down at night, but not to untie the rope, and they gave her food. Two of the neighbouring Thakurs tried to stop the swinging, but the Bhils would not obey; but at last a period was put to further torture, either by the influence of the Mewar Vakil, or by the impression that its victim was already dead. The Political Assistant sentenced Lemba to five years' imprisonment in the Ajmir jail. The punishment of the villagers who swung the woman had been committed by the Durbar to a neighbouring chieftain, and he executed it in such a barbarous manner as to call for severe animadversion on the part of the British political officers.

In 1872, in the Bhil country, a Baniya of Kushulgarh, by name Fatta, was very ill, and he and his family fancied he was bewitched. The Baniya himself believed that his liver was being devoured by the woman Chundoo, described to be 70 to 80 years of age, whose cattle he had previously taken in satisfaction of a debt. He consequently summoned, from a neighbouring village, the witch-finder Vosta, who performed the usual incantations called Kajlee, and confirmed the Baniya's suspicions; and Badria Tarri, one of the Bhils present, recommended that Chundoo should be swung. Chundoo was sent for, taken to the kotwali, and confined there. After an interval of a few days, some Bhils were summoned, and paid to swing Chundoo as a witch at a little distance outside the city. The poor woman was taken to a banyan tree and swung from her wrists, her eyes, as is customary on such occasions, being bandaged with red chillies. The swinging was carried out under the direction of Ali Kotwal, the bhopa being also present on each day to obtain the witch's confession. She refused to confess or exorcise the Baniya, whom she upbraided for having taken her cattle. After swinging for four days, the unfortunate creature died, and orders were given to the Bhils to bury her. The swinging of alleged witches was of common occurrence in the Bhil tracts before the Mewar Bhil corps was raised at Khairwara, but rarely happens now-a-days. The belief in witches is widespread. Juvini tells us that from time immemorial women had been addicted to witchcraft in Turkestan and Transoxiana; witches were called in to sick people, and practised spells and incantations by which they pretended to drive away diseases. —*P. Arminius Vambery, Bokhara*, p. 143; *Pioneer.*

WITHANIA COAGULANS. *Dun.*

Panir, .	Hind., Panj.	Spin bajja, . .	Tr.-Ind.
Khamjaria, . .	Ravi.	Khumazare, . .	,,
Kulilana, . . .	,,	Makhazura, . .	,,

This plant grows in the southern parts of the Panjab near houses or fields, seldom in the desert. The Afghans use it for coagulating milk; its seeds in colic, and its bitter leaves as a febrifuge. It is also a veterinary medicine.—*Honig.; Stewart; Powell.*

WITHANIA SOMNIFERA.

Asgand nagori, . .	Hind.	Ashwa-gandha, .	Hind.
Isgand, ...	,,	Lal kuti, . . .	Panj.

Its long white root is used as a diuretic and a deobstruent; its leaves, bitter and narcotic, useful in special diseases and in swellings, and externally in carbuncle; it is said also to improve the complexion.—*Powell.*

WITTOBA or Vithoba, one of the many subordinate incarnations of Vishnu. It took place at Panderpur, a town about eighty miles to the south-east of Poona. The Brahmans speak of it as an event of not very ancient date, but say that it is recorded, perhaps prophetically, in the Bhagavata. A splendid temple is there dedicated to his worship. He is represented sculptured in stone, of the size of a man, standing with his feet parallel to each other, with his hands upon his lips, the fingers pointing forwards; he is covered with a sort of raised hat, crowned with a linga; his hair is plaited, and turned up. Wittoba is also worshipped at Alundi, but his principal shrine is at Panderpur, on the Bhima, to the westward of Sholapur. Wittoba is a god of very questionable orthodoxy, but he is very popular among the Mahrattas. The same is the case with Kandoba, who is yet more popular among the lower orders of Mahrattas, and, if possible, less orthodox; they are probably the ancient deities of the Mahratta race.

WOAD, a dye yielded by Isatis tinctoria, *L.*, said to have been used by the ancient Britons, prior to the Roman conquest, to stain their skin a blue colour.

WODALA, a seafaring race on the coasts of Gujerat and Cutch.

WODEN, supposed to be the Buddha of Hindustan. The name came from the east to Europe just when active missionaries were spreading

Buddhism on all sides; and the fourth day of the week is Wednesday in the west, and Budhbar in the east. Beyond these names, however, there is no similarity between the gentle ascetic Sakya Muni, to whom this appellation is given in Buddhist countries, and the fierce warrior who came to Europe.

WOFTANGIL. Kash. A grass of Kashmir, from which is prepared a yellow dye for shawl-wool.

WOLAR, a lake near Srinuggur in Kashmir.

WOLF.

Canis lupus, *Linn.*		C. palipes, *Sykes.*	
Deeb,	Arab.	Bherija, Landga,	Hind.
Tola,	Can.	Lupo, Lupa,	It.
Vulf,	Ger.	Lupus,	Lat.
Lukos,	Gr.	Vrika,	Sansk.
Zeeb,	Heb.	Lobo, Loba, Lupia,	Sp.

The wolf roams over British India, never singly, but always in large or small packs. If a single one appear, it may be assumed that others of the pack are near. They are bold even in the vicinity of towns, scarcely moving off from horsemen; and in Central India, Oudh, and the Panjab, they destroy large numbers of children, and even full-grown men and women. In this case two wolves would attack, one stealing up behind and seizing the victim by the neck, while the other, coming swiftly up, tears out the entrails in front. In the seven years 1875 to 1881, 4452 persons were destroyed by wolves in India. Their ordinary prey are deer and sheep, and in pursuit they display great sagacity, throwing out flanking parties on surrounding the game. Recently a sambur deer was seen to run close up to a railway train in Berar, but halted as the train moved on; looking beyond, a body of wolves were observed in its pursuit.

Wolves are numerous in the neighbourhood of Sultanpur, and, indeed, all along the banks of the Gumti river, among the ravines that intersect them; and a great many children are carried off by them from towns, villages, and camps. Hardly any of the Hindu population, save those of the very lowest class, who live a vagrant life, and bivouac in the jungles or in the suburbs of towns and villages, will attempt to catch or kill them. All other Hindus have a superstitious dread of destroying or even injuring them; on whose hand a drop of wolf's blood has fallen, believes himself doomed to destruction. The class of little vagrant communities above mentioned, who have no superstitious dread of destroying any living thing, eat jackals and all kinds of reptiles, and catch all kinds of animals, either to feed upon themselves, or to sell them to those who wish to keep or hunt them. Wolf-boy; Colonel Sleeman mentions instances of children brought up by wolves. —*Rajasthan*, i. p. 466; *Sleeman's Journey*, p. 206.

WOLFF, Reverend JOSEPH, a native of Germany, a Jew convert to Christianity, domiciled in England, who travelled as a missionary to the Jews through Central Asia, to Kābul, to Jedda, and to Bokhara; in 1844 he made a noble effort to release Colonel Stoddart and Capt. Conolly.

WOMAN.

Amraah,	Arab.	Aurat,	Hind.
Vifmann,	Anglo-Sax.	Donna,	It.
Wimann,	,,	Mulier,	Lat.
Wimman, Wemann,	,,	Zan,	Pers.
Femme,	Fr.	Muger,	Sp.
Frau, Weib,	Ger.	Pomli,	Tam., Tel.
Ishsha,	Heb.		

The respective numbers of men and women in the world are usually accepted as being about equal, but in the 1881 census of British India the women of that country are 5,991,881 fewer than the men, the respective numbers being 129,941,851 males and 123,949,970 females; and it has shown also that the proportion varies greatly in the several provinces, and that in Bengal, Madras, Mysore, and Travancore, the women preponderate—

	Males.	Females.		Males.	Females.
Bengal,	34,625,591	34,911,270	Mysore,	2,085,842	2,100,346
Madras,	15,421,043	15,749,588	Travancore,	1,197,134	1,204,024

This difference in the relative proportion of the sexes has been receiving the attention of the British Government during all the 19th century, and the surmise has been that it has resulted from neglect and murder of the infant girls, as all classes throughout Asia value male children, and some of the races are known to have been guilty of female infanticide. It was practised amongst the Arab tribes until forbidden by Mahomed. Several of the clans of Rajputs and Jat of India have notoriously destroyed their infant girls, and with the Chinese poor the new-born girls are not unfrequently deprived of life. Since the early years of the 19th century, the British in India have been endeavouring to suppress this crime, and in several of the suspected localities the numbers of women and girls have been increasing, but in the Census Report of 1881 an opinion has been suggested that amongst some of the Rajput clans more male than female children are born.

In the vast regions of Southern and Eastern Asia, the personal appearance, apparel, mental characteristics, and social position of women are as varied as the tribes and races of which they form a part. In the Sareda Tilaka, in a monologue of later date than the play of Mrichchakati (which was of the 1st century of the Christian era, but still of comparative antiquity), there is a description of various women of India. 'There goes the maid of Gurjara (Gujerat), blooming as with perpetual youth, having eyes like the chakora, of the complexion of the yellow rochana, and a voice musical as that of the parrot. She wears anklets of silver, large ear-rings set with pearls, and her bodice is buttoned below the hips with gems. The matron of Maharashtra proceeds yonder, her forehead stained with saffron, and with silver chains upon her feet; she wears a coloured veil, and a girdle round her loins. A Chola female (south of India) approaches, whose cheeks are tinted with saffron, and whose dress is embroidered with the buds of the lotus.'

In the south-west of Asia the Circassian and Georgian girls, and in British India the Rajputni, are the more famed for their personal appearance. The Circassian girls are not strikingly handsome, but they are well formed, and very clever and intelligent. This makes them engaging, attractive, gracious, and affable, and they soon acquire influence in a Turkish family. Georgian women are handsome, but much inferior to the Circassian in mental qualities.

At the present day, in countries where Muhammadan manners prevail, and now including India, the women in the streets have a much meaner appearance than the men, because women of the better class are so little abroad. Their more

common costume are bodice and gown, or cloth worn in the form of a gowu. Some of the Muhammadan women have trousers; and the women of all the races make a display of jewellery, often, as with the Marwari women, consisting of weighty anklets or bracelets, or, as with the Binjara women, of deer-horn riugs covering the forearm, and most of the races have rings for the fingers, toes, ears, and uose. The ta-mein wrapper of the Burmese women is so narrow that the left limb is exposed at every step. The Teyati women of Travancore and Malabar, and the Namburi women in their households, have no covering above the waist. Until 1871, the Juanga women of the Northern Circars had two bunches of leaves as their sole attire.

The Miri women on the N.E. frontier wear a small petticoat woven of filaments of cane, about a foot in breadth, and tight round the loins. The Abor women, also on the N.E. frontier, have often no other covering than three to twelve shell-shaped embossed plates of bell-metal suspended from a string round their loins; and lastly, the Mincopi men and women of the Andamans are nude.

In social life, the women of the Muhammadans are strictly secluded. In this respect the Asiatic races have had different customs from the most ancient times. Woman with the Accadians was deemed the equal if not the superior of the man. We learn from the book of Esther that amongst the early Persians ladies were even admitted to banquets and received strangers in their own apartments, whilst they resided habitually in houses separate from the dwellings of the men. Amongst the Hindus of the ancient Vedic times, the women seem to have freely moved about. The rishi and his wife are described as conversing on equal terms; go together to the sacrifice, and practise austerities together. Lovely maidens go in a procession, and grown-up daughters remain without reproach iu their father's house. In the Mudra Rakshasa, a Sanskrit drama, Chandragupta asks, 'Why are not all the citizens with their wives abroad and merry-making?' There must also, however, have been other habits in those days, and notices occur indicative of the seclusion of their women. Panini uses the term Asuryam Pasya, oue who never sees the sun, as an epithet for a king's wife. Iu the Ramayana occurs the word Avarodha, fenced or guarded place; it is used for the women's apartmeuts. And Rama says to Vibhishana, that in great calamities, or on the occasion of marriages, at the public choice of a husband by maidens, it is allowable for all the world to look upon women. The king, when within the palace, used to be attended by women, his guards, and other troops. Strabo says, 'Regis corpus mulieres curant, ea quoque de parentibus emptæ, qui regem custodient, et reliquis exercitus manent extra portas' (iv. 15, p. 228); and at the present day, in Hyderabad in the Dekhan, noble families still retain armed women as guards of their households, while nearly all the women of the Aryan and non-Aryan Hindus, and all those of the Mongoloid races of Further India, have their share of all the outdoor work of their establishments, and of all the amusements and sight-seeing. In Buddhist Burma, all the young move about unrestrainedly, dressed in their gayest and best, and their women engage largely in trade, and this is applicable to the eustoms of the Siamese, Chinese, and Japanese.

Iu Burmese Buddhism there is no difference between mau and man but that which is established by superiority of virtue, and hence it is that the state of woman among Buddhists is so very much higher than it is among orieutal peoples who do uot hold by that faith. Nevertheless, in India, amoug the Mer and Rabari, the wife is the head of the house, pays all accounts, and transacts business. The seclusion of the women practised by the Muhammadans is part of their religious law; it is laid down in the Koran that they are only to be seen by the nearest relatives, by children, or by eunuchs, and the custom has to some extent been copied by the wealthier Rajputs and other Hindu races. In Southern India, the female attendants of the Muhammadan ladies are designated Moghulani.

Many Hindu and Muhammadan women have taken a part iu the political life of India. At the preseut day the Begum of Bhopal is following in the footsteps of her mother, and is ruling her territory with justice and success. Their ancient Sanskrit dramas relate how Draupadi being insulted led to the war of the Yadava and Pandava; how Sita, being carried off by Ravana, led Rama to invade the Peniusula; how Nala in his love for Damayanti became an exile; how Raja Bharti in losing Pingala left the throne of Avanti. These may be only tales; but in historic times, A.D. 1175, the rape by Prithi-raj of the princess Sanjagata, the daughter of the king of Kauouj, led to the destruction of the Hindu rule; and iu the present century, Kishen Koour, a daughter of the Maharana of Udaipur, was celebrated for her beauty. The rajas of Jeypore and Jodhpur both demanded her hand in marriage, and for some years Rajputana was the prey of foreign invasion and civil war. To restore peace, her parents, in 1809, were obliged to consent that poison should be administered to her, which the victim, for the sake of her country, unhesitatingly drank. The sacrifiee, however, brought no peace to Rajputana. An easy cynicism has furnished even a recent Hindu writer with derogatory thoughts of women and the three most prolific sources of litigation are said to be chattels, women, and lands. A native couplet to this effect runs,—

'Zan, Zamin, Zar,
Tinon kazyah ka ghar.'

But modern Hindus consider that the good fortuue of a husband depends on that of the wife; hence a woman is considered as an emblem of Lucki or Lakshmi, the goddess of fortune, and Hindu poets almost invariably represent women as amiable and affectionate. In this they might have given a lesson to the bards of more lofty nations, and particularly to the Greeks, who both in tragedy and comedy pursued the fair sex with implacable raucour. Aristophanes is uot a whit behind Euripides, although he ridieules the tragedian for his ungallant propensities.

In the Sanskrit drama, the passion of Malati is equally intense with that of Juliet; but her unconquerable reserve, even to the extent of denying her utterance to him she loves more than life, is a curious picture of the restraint to which the manners of Hindu women were subjected, even whilst they were in enjoyment, as appears from the drama, of considerable personal freedom.

A Sanskrit drama says,—

'A woman's bliss is found, not in the smile
Of father, mother, friend, nor in herself;
Her husband is her only portion here,
Her heaven hereafter. If thou indeed
Depart this day into the forest drear,
I will precede, and smooth the thorny way.
. . . . . A gay recluse,
On thee attending, happy shall I feel
Within the honey-scented grove to roam,
For thou e'en here canst nourish and protect;
And therefore other friend I cannot need.
To-day most surely with thee will I go,
And thus resolved, I must not be deny'd;
Roots and wild fruit shall be my constant food.'

Another author makes a loving woman say to her husband,—

'But without thee e'en heaven would lose its charms.'

. . . . . .

'Pleased to embrace thy feet, I will reside
In the rough forest as my father's house.
Void of all other wish, supremely thine,
Permit me this respect,—I will not grieve,
I will not burden thee,—refuse me not.
But shouldst thou, Raghuvu, this prayer deny,
Know, I resolve on death.'

The Uttara-Rama-Charita, the Vikrama and Urvasi, and the Mudra Rakshasa, contain many illustrations of the Hindu woman's love and affection. In the latter piece occurs an example, in comparatively humble life, of the strong affection of a Hindu wife. Chandana Das, like Antonio in the Merchant of Venice, is doomed to die to save his friend. His wife follows him to the scene of execution, with their only child, and the succeeding dialogue ensues,—

'*Chand.* Withdraw, my love, and lead our boy along.
Wife. Forgive me, husband,—to another world
Thy steps are bound, and not to foreign realms
Whence in due time thou homeward wilt return;
No common farewell our leave-taking now
Admits, nor must the partner of thy fate
Leave thee to trace thy solitary way.
Chand. What dost thou mean?
Wife. To follow thee in death.
Chand. Think not of this,—our boy's yet tender years
Demand affectionate and guardian care.
Wife. I leave him to our household gods, nor fear
They will desert his youth; Come, my dear boy,
And bid thy sire a long and last farewell.
Thus could I sweetly pass a thousand years.'

Woman has ever been held in higher honour amongst the Teutonic nations than amongst those of the south of Europe or of the east, and has contributed, by the elevating influence she was permitted to enjoy, to their moral exaltation and martial superiority. Tales of the Hindus turn upon the wickedness of women, the luxury, profligacy, treachery, and craft of the female sex. The Pancha-tantra contains many stories of the objectionable character now mentioned, and these have been repeated in all the literature emanating from that ancient book; but the Hindu woman's attachment to her parents, her brothers and sisters, her husband and her children, is characterized by all the devotion and unselfishness of woman's love. As manager and mistress of a household, she exhibits an energy and concentration not always to be found amongst the more favoured mothers of the west.

The doctrines of the Hindu religion have been singularly careful to protect the female sex and infants from violence, and it has been declared unlawful to put a woman to death for any offence whatever. A Sanskrit sloka runs,—

'Shut gao wudhe vepra,
Shut vepra wudhe istreea;
Shut istreea wudhea balá,
Shut bala wudhe muresha.'

'To kill one Brahman is equal to one hundred cows; to kill one woman is equal to one hundred Brahmans; to kill one child is equal to one hundred women; to kill one hundred children is an offence too heinous for comparison.'

Tacitus tells us that the Germans deemed the advice of a woman in periods of exigence oracular. So does the Rajput, as the bard Chund often exemplifies, and hence they append to her name the epithet Devi (or, contracted, De), godlike. But notwithstanding the prevalence of this feeling amongst Rajputs, with this once martial race, from ancient times, leading the females captive appears to have been the sign of complete victory. Rajput inscriptions often allude to a conqueror beloved by the wives of his conquered foe, and in the early parts of Hebrew Scripture the same notion is referred to. The mother of Sisera (Judges ver. 31) asks, 'Have they not divided the prey; to every man a damsel or two?' To a German mind, says Tacitus, the idea of a woman led into captivity was insupportable, and to prevent this the Rajput performed the johura sacrifice, when every sachæ (branch) is cut.

Muhammad Kasim, nephew of Hejaj, governor of Basra, was sent with a force to take Sind, then under Dahir (about A.D. 711, A.H. 92). He took Dewal, defeated and took prisoner a son of Dahir, advanced on Nerun (the modern Hyderabad), and took Sehwan. He subsequently advanced on Alor, where he encountered Dahir, who was defeated and slain. His widow defended the city, but ultimately the women devoted themselves to the flames, which they lighted themselves. The Rajput garrison battled for the sacrifice of themselves, and perished fighting. The city was taken by assault. All the men in arms were slaughtered in the storm, and the women and children reduced to bondage.

Many of the Thugs attributed the discovery of their system by the British to some of their parties having occasionally murdered women; and with the predatory Mang race of the Dekhan the persons of women have been religiously respected in their dacoity expeditions, no violence being ever offered to them under any circumstances. On no occasion will the Mang lay hands on the sex, nor will they despoil them of such of their wearing apparel as may be on their persons, threats being mainly the means employed to induce them to give up the property in their possession.

Marriage.—Aryan and Turanian races, in the selection of their wives, follow very different customs. The one is exogamic, taking wives from other tribes than their own; and the other endogamic, taking them from their own tribes. The Warali tribes are divided into sections, and no man may marry a woman belonging to his own section. In the Magar tribes a section is called a thum, and the same rule prevails. The Ho, Munda, and Oraon are divided into clans or keli, and may not take to wife a girl of the same keli. Again, the Garrows are divided into mahari, and a man may not marry a girl of his own mahari. With Muhammadans, the selection is not restricted; but in India, amongst Muhammadans of Arab descent, a young man can claim to marry his

mother's brother's daughter as his right. Amongst the Kol of Central India the marriage by capture still continues, as amongst some of the Turkoman races and amongst some Mongoloid races in the Malay Peninsula; and young men amongst the Gond race occasionally serve for a wife.

The marriage customs of the races under notice, their polyandric, polygamic, and sati suicidal customs, will be found described under these headings; but it may be mentioned here that amongst the Semitic races the position of their women has varied. The Hebrew Scriptures show progress in the Jewish views as to women. At the outset, the right of woman to choose her lot seems to have been wholly disregarded. Abraham twice permitted Pharaoh to have Sarah, Judah condemned his daughter-in-law to be burned, and God is described as having threatened to give David's wives to his neighbour or to his son; Michal was transferred to Phaltiel from David by Saul, who had quarrelled with David, and kings habitually succeeded to their predecessor's wives. Sir William Muir says (Annals of the Early Caliphate, i. p. 271) that under the old chivalrous code of the Arabs, the wife of noble blood held a position of honour and supremacy in the household, from which she could not be ousted by any base-born rival, however fair or fruitful. But in the victorious wars waged in Umar's time, the baneful influence of polygamy was quickened by the vast multitudes of slave girls taken by the army and distributed or sold both among the soldiers and the community at large, and it was intensified by the husband's power of arbitrary divorce, and the unlimited licence of servile concubinage. The noble wife's position fell to be one among many, and if the slave girl bore the husband children she and the children became at once free.

Amongst some of the Mongoloid races whose daughters grow up unmarried, a courting, as is customary in Britain and its colonies, is common; but as most of the marriages take place while girls are of tender years, or where, as with the Muhammadan and the Kayasth races, the women are gosha, or secluded, and courting is inapplicable or impossible, the betrothal arrangements are made by the parents direct, or by means of agents called dilalah. The daughters of non-Aryan races are married later in life. Amongst the Burmese, courting is a loving custom, and the early hours of the night are designated courting time.

With several of the races their women when married are disfigured. Muhammadan wives of the south of India have their teeth blackened with missi, a vitriolic dentifrice made from gall-nuts, myrobalans, pods or gum of the keekur tree, a species of Acacia leucophlæa, sulphate of copper, and steel filings. Similarly, the women in Japan have their teeth blackened and their eyebrows shaved. The Khyen or Kayn or Chin, of the Yoma mountains and the Prome district of Burma, tattoo the faces of their women in a manner which gives them a most demoniacal appearance, but under British rule the practice is being discontinued. Their women are handsome, and many of them were captured for the kings, and the practice was originated to prevent this. In the large towns of China and Japan, concubinage seems to prevail to a greater extent than it is met with in the western countries of Southern Asia. In Japan, the practice, so soon as a woman is married, of staining her teeth black, and thus destroying one of woman's greatest ornaments, can only have the effect of making the wife less attractive to the husband, and forcing his affections elsewhere. And in the concubinage of China there is not found among the young women whom they select, any of the deformed feet which the richer classes of the people create for the girls who are to be the wives of their households.

The Burmese and some of the races of the Eastern Archipelago are not greatly restricted before marriage. The Nair women, and women in Malabar of the races following the law of descent in the female line, are their own mistresses. The Comanches, Aleutians, Eskimo, and Kamtschadales cede their wives to their guests, and the wives of the Hassaniyeh Arabs of Nubia have the free disposal of themselves every fourth day.

Occupation.—The wives of the Muhammadan, the Kayasth, and the Rajput afford no outdoor aid to their husbands; but the Kunbi and Kurmi women, the Jat women, the Vellalar, Reddi, Kapalu, and Okla, the shepherd dhangar and kurumbar women, and the women of nearly all the Mongoloid, Turanian, or non-Aryan races, engage in outdoor work along with their husbands; and with some of the Mongoloid races in the N.W. and N.E. borders of British India, the field labour is almost entirely carried on by the women.

Education.—In British India, since the middle of the 19th century, Dr. John Wilson of Bombay, followed by other Europeans, and by a few Hindus and Muhammadans, has been trying to educate Hindu, Parsee, and Muhammadan women.

There have always been Hindwani and Musalmani who have been educated, but writing is not looked upon with favour. There is a Tamil proverb that 'ignorance is the chief ornament of women' ('Ariyāmei mātharukku ābaranam'). Even Auvaiyar, the most popular Tamil poetess, echoes this saying ('Pethumei enbathu mātharku anikalam'). Hindus of all classes acquiesce in the statement enshrined in this barbarous verse. And it is curious to find that Pan-houi-pan, celebrated among Chinese writers, though a woman, endeavours in her works to humiliate her own sex by reminding them continually of the inferior rank they occupy in creation. The position of a Chinese woman is certainly very abject.

At the present day the Deva-dasa attached to the Hindu temples are almost the only educated Hindu women. A Hindu describing them says,—'The women of the Brahmans are very beautiful, but their total want of education or accomplishment makes dancing women sought after by all Hindus. They can sing, they can read; from their childhood they have been trained in the arts that captivate. Their black eyes know how to flash or languish; their feet have been taught what, to a Hindu, appears the poetry of motion. Many of them can play on instruments of music. They know the arts of painting the eyebrow, and of winding the gauzy robe elegantly round their slim persons. They are the only women in India who are familiar and easy in the company of men.'

The male population has been to a great extent educated, and the men have learned to admire that education in the temple women which cannot be found in their own wives. Hindu domestic life is thus a farce. A young Hindu enters life on his

own account. A few months have passed since the flowers were showered and the horus blown to celebrate his wedding. His eyes are now gradually opened to the fact that his young bride is an insipid child. She cannot read a line from the Ramayana to cheer him in a weary hour. Her stock of conversational powers is small; she cannot make herself half so pleasant as a girl with large anklets, who nods and laughs to him whenever he passes by the temple. His ideas of purity and the sacredness of the marriage tie are very misty. How many of his rich neighbours have several wives! How many of them have the temple Dasi! So, without a qualm of conscience, he slips away from the right path. He goes home to eat, and goes to the temple for recreation, not ashamed to be the avowed admirer of the Aspasias and Phrynes, from the same cause which attracted Socrates and made Pericles a slave, and which will continue until the united charms of the dance and the song are sanctioned to be practised in the Hindu homes. To improve the morality of Hindus, educate Hindu women. Education aiding immorality is the bane; education assisting morality must be the antidote. One of the greatest questions which can occupy the minds of the friends of India is, How can her women be reached, and their intellectual, moral, and religious condition be improved?

The Muhammadans also have bands of singing women, whose lives are similar to the Deva-dasa of the Hindu temples. It is said that Phryne offered to rebuild Thebes at her own expense, provided an inscription was placed on the walls, 'Alexander diruit sed meretrix Phryne refecit,' which was not allowed. Similarly, at the close of the 18th century, Chand, a famed cantatrice of Hyderabad, built a mosque, and asked a learned man for a couplet that would indicate the date, and he wrote, 'Pesh-i-īn mihrāb, sajūd-i-khas-o-ām ast, Falk gūft īn bait-ūl-harām ast,' which was not accepted.

In *Buddhist* countries women are more nearly the companions of the men, and the Tibeto-Burmans and cognate Indonesian tribes permit great licence to both sexes prior to marriage. In Burma, marriages are contracted after puberty. Their young people seem happy and contented, and women conduct much of their market and commercial transactions, yet their ambition is not satisfied. Wherever the Buddhist philosophy has spread the doctrine of metempsychosis, women hope that in their future changes they may be born as men; and Burmese and Chinese women frequently pray that their soul may, as a reward for virtue, on entering the world a second time inhabit the body of a man.

Reverence of Husband, etc.—At daybreak, the Hindu wife rises, tidies up the house, and then touches her husband's feet to awaken him. After bathing and worship and preparing the food,—and a Vaishnava woman does not allow any one but her husband to see her cooking,—she presents food to her husband, and in so doing turns around him (circumambulates), and prostrates herself before him. This practice of the wife worshipping the husband is very ancient. In the Sanskrit drama styled Ratna Vali, or The Necklace, Vasava-datta, after worshipping the image of the deity, her attendant says,—'The worship of the divinity concluded, be pleased, madame, to pay adoration to your lord.' Vasava—'Where are the flowers and unguent?' Kanch—'Here, madame.' On which Vasava-datta worships the king. This is conformable to the Bhavishyottara Purana, which directs: 'Having offered adoration to the mind-born divinity, let the wife worship her husband with ornaments, flowers, and raiment. Thinking internally with entire complacency, this is the god of love.' All Hindu women worship or reverence the cow, the tulsi plant (Ocimum basilicum), the lights of the lamps, and the gate or door entrance, of which the goddess Lakshmi is the guardian; and with Vaishnava women of the south of India, every Friday evening at lamp-lighting time, the house and utensils are cleaned, and the household god worshipped.

Names.—Women's names in China are taken from gems, flowers, personal appearance, or virtues. The names of Hindu women are usually those of their goddesses, with the adjunct Ma or Amma, meaning mother, or Bai, meaning lady. The names of plants are not unusually given, as Tulsi or Tulsi bai; and those of goddesses, as Durgamma, Lakshmi bai.

Muhammadan women of rank in the south of India have Nissa, Begum, Bi, Khatun, and Khanum as concluding, and their names or parts of their names usually represent some quality or condition, as Rahim-un-Nissa Begum. Of these, Nissa is the highest in dignity, Khatun is that added to the names of the Pathan women, as Rahmat Khatun; Bi to names of the Syudani and Shaikh women; and Khanum to the women of the Moghul race. The female servants have names indicating some personal peculiarity, or the mode of their acquisition, as Gūl-Andām, rose-bodied; Nargas or narcissus, etc.

In Hindu life a married woman is not allowed to utter the name of her husband, or of any of his relatives, male or female, except those who are younger than herself.

Suicide.—For a Muhammadan woman to destroy herself on the demise of her husband is an unheard-of thing, but with Hindu women it was frequent until the early years of the 19th century, and Chinese women continue it to the present day. See Suttee. About 1880, a daughter of the late Chinese Minister to London, Kwo Sungtaon, recently afforded an example of what a Chinese wife should be and do. According to the Pekin Gazette, at the age of seventeen she became the wife of the brother of Tso Tsung-tang, the conqueror of Kuldja. Not long afterwards her husband fell ill, and when ordinary nourishing food failed to revive him, she sliced a piece from her arm and mixed it with his broth. But her husband died. This event only opened a new field for the exercise of saintly duty. So to poison herself she refused to swallow anything but gold-leaf, with no result; and her friends besought her to throw away the poison. She consented, but took advantage of the first illness which overtook her to starve herself to death.

Many of the Buddhist women of Tibet become nuns; in China, also, among the Buddhists there are nunneries, and there is a Hindu sect in the Bombay Presidency with nuns. But amongst Muhammadan women such a condition is extremely rare. Zinat-u-Nissa, the spinster daughter of Aurangzeb, died unmarried. In the History of Ahmadnaggur, by Shahab-ud-Din, she is stated

to have loved raja Sahu, her father's prisoner. She is buried near Aurangabad. After the conditions affecting the young and the married, it remains to notice those of the widows,—

The widows of the various races of South-Eastern Asia are treated very variously. Amongst the polyandrist Nair race such a state as widowhood is an impossibility. With several of the Jat and Gujar clans, when a brother dies and leaves a widow, a younger brother marries her. Muhammadan law permits re-marriage of widows, and in Arabia, Persia, and Egypt such is common; but in British India Muhammadan widows rarely re-marry. Amongst the Jews of old the widow was allowed to re-marry; and amongst the Hindus re-marriage of widows is permitted by their great lawgiver Menu, but in practice it is rare, although legalized in 1856 by an Act of the Indian Government. Amongst a few of the non-Aryan races a widow is re-married by the pāt ceremonial, and if a Muhammadan woman marry it is by the nikkah form. The painfulness of the widowed state is alluded to in Lamentations i. 1, 'How is she become as a widow!' and this can be understood by no one so well as by a Hindu widow, who is considered as the most forlorn and desolate being on earth. Such a female has her hair cut short, she renounces all ornaments, eats the coarsest food, fasts frequently, and is all but an outcaste in the family of her deceased husband. In British India, until the administration of Lord William Bentinck, many of the widows of Rajputs and Brahmans burned themselves on the funeral pyres of their husbands; and to this day, in the island of Bali, the widows are stabbed with a kris, and their bodies burned with that of their husband. Widow burning is not authorized in the Veda. A widow is merely to accompany her husband to the funeral pile, and there is addressed with a Vedic verse, viz. 'Rise, woman, come to the world of life; thou sleepest nigh unto him whose life is gone: come to us. Thou hast thus fulfilled thy duties of a wife to the husband who once took thy hand and made thee a mother.' The Rig Veda, x. 18, 7, 8, requires the widow to leave the funeral pile before the fire is applied to it; and widows of the Hindus, according to the Atharva Veda, ix. 5, 27, 28, could marry again.

Up till the assumption of Mysore by the British, it was usual to sell widows convicted of unchastity. They were often redeemed by their relatives for 3 to 12 pagodas. Women who eat the sacrificial rice, Beli-anna, at certain pagodas became forfeited to the pagodas, and reside there, performing menial offices. They generally become prostitutes.—*Tod's Rajasthan*, i. pp. 312, 612, 613; *Correspondence relative to Hindu Infanticide*, p. 42; *Elph.* 262; *Lubbock, Orig. of Civil.* 96; *Max Muller, Chips*, p. 35; *Colebrooke's Essays*, i. p. 133; *H. WOOD. Lieutenant John Wood, of the Indian navy, was born in 1812, and educated at the Perth Academy. He joined the Indian navy when very young, and retired from it in 1842. He became managing director of the Indus Flotilla, and lived in Sind for many years. He died in London, 13th November 1871. From 1835 to 1836, while lieutenant of the navy, he was engaged in the survey of the river Indus, from the sea to Attock. From Attock he descended the river to Kalabagh, passing its falls and rapids. In 1836 he accompanied Sir Alexander Burnes in his mission to Kābul. He crossed the mountains to Kunduz, and was the first European, since Marco Polo, to reach Pamir, the Bam-i-Dunia. In 1838 he discovered the source of the Oxus, and received the gold medal of the Royal Geographical Society. His writings were—A Report on the River Indus, in Bl. As. Trans., 1841, x.; Notes on the Lower Part of the Indus and of the Craft thereon, in Bom. Geo. Trans., 1836-1838, reprint, i. p. 89; Journey into the Naga Hills, ibid., 1844, xiii. p. 17; Journey to the Oxus, Lond. 1841, i. 8vo; Journal of a Visit to the Laccadive Archipelago, in Lond. Geo. Trans., 1836, vi. p. 29.

Starting from the mouth of the Indus, Captain Wood accompanied Burnes' expedition up that classical river, and, after arrival at Kābul, was sent forward to Kunduz. Leaving his companion Dr. Lord there, he pushed on eastwards, and struck the Oxus at Fyzabad, passed thence to Jerm, making an expedition to the lapis-lazuli mines; was detained by winter storms at Jerm, in Badakhshan, from Christmas to the end of January, and then followed one of the chief streams which make the Oxus, along its frozen bed to its source in a lake on the great Pamir steppe. The snow lay thickly on the hills and river. During the last marches there was no wood to be found, and the only fuel was the dung of animals encamped in the summer on spots known to the wandering tribe from whom his escort was taken, and now dug out by the men from beneath the snow. Arrived at the lake Sir-i-Kol, as it is called, following Captain Wood, a night had to be passed at this enormous altitude, where the pulses of some of the party galloped 124 beats in a minute, the lowest being 110. In the morning Captain Wood and his followers sallied forth upon the lake, sounding it with great difficulty, for the ice, 2½ feet thick, had to be broken, and 'a few strokes of the pickaxe produced an exhaustion that stretched us upon the snow to recruit our breath.' There was only 9 feet of water, though the lake is 14 miles long by about a mile in breadth. The water was of a reddish tinge,

and 'emitted a slightly fetid smell.' The bottom was oozy and tangled with grassy weeds. At this height the human voice was sensibly affected, and conversation hushed for very weariness. Nature seemed to defy the power of man to search into her hidden mysteries. The sound of a human voice would have been music to the ear, but no one at this inhospitable season thinks of invading these gelid domains; yet Captain Wood made his observations, and returned in safety to give them to his countrymen.—*Dr. Buist; E. I. Marine Surveys.*

Sir Charles Wood, created Lord Halifax, for several years during the changes succeeding the Indian Mutiny of 1857, the Minister for India. His chief work was to amalgamate the Indian with the British army, and his plans needed many changes. His friends claimed for him credit for restoring the Indian finances, but in this he had no share.—*Howell-Thurlow*, p. 22.

WOOD-ALOES. Ak-yun, BURM. The aloes-wood, agallocha wood, or eagle-wood of the Old Testament.

WOOD-APPLE TREE. Feronia elephantum, *Cor.* Wood-apple gum, obtained from the Feronia elephantum, is very abundant, and forms the well-known East India gum-arabic. From its ready solubility without residue, it gives the best mucilage for making black ink.—*M. E. J. R.*

WOOD-ASHES. Tsau-hwui, CHIN.; Rakh, HIND. Used as a detergent remedy in disorders of the skin and hair.

WOODCOCK, Scolopax rusticola, *Linn.*

S. Indicus, *Hodgson.* | Tutatar, . . . HIND.
Sim-titar, . . . HIND. | Sim-kukra, . . ,,

This woodcock is a winter visitant to the more elevated wooded regions of India, the Himalaya, Neilgherries, Pulneys, Shevaroys, Coorg, and doubtless all the other high ranges of Southern India. During its periodical migrations north and south, individuals are occasionally killed in various parts of the country in the plains, near Calcutta, at Dacca, Tiperah, Noacally, Berhampur, Masulipatam, Kaladgi. It arrives about the middle of October, and leaves in February. Mountaineer says they breed in the hills near the snows in considerable numbers, and are seen towards dusk, about the open glades and borders of the forest on the higher ridges, flying rather high in the air in various directions, and uttering a loud wailing cry. The only other true woodcocks are S. saturata, *Horsfield*, and S. minor, *Gmelin.*

WOODFORDIA FLORIBUNDA. *Salisb.* A tree of the Panjab, in Kangra; flowers used in dyeing.

WOOD-MOTH, Wood-carrying moth.

Sacktrager, . . . GER. | Muluka rasari, . . TAM.
Dara-kattea, . SINGH. | Kundi puchi, . . ,,

There are five ascertained species of these in Ceylon,—Psyche Doubledaii, *Westw.*; Metisa plana, *Walker*; Eumeta Cramerii, *Westw.*; E. Templetonii, *Westw.*; and Cryptothelea consorta, *Temp.*

Their larvæ construct for themselves cases, which they suspend to a branch, frequently of the pomegranate, surrounding them with the stems of leaves and thorns, or pieces of twigs bound together by threads, till the whole presents the appearance of a bundle of rods about 1½ inches long. From the resemblance of this to a Roman fasces, one African species has obtained the name of Lictor. The German entomologists denominated the group Sacktrager, the Singhalese call them Dara-kattea, or 'billets of firewood,' and regard the inmates as human beings, who, as a punishment for stealing wood in some former stage of existence, have been condemned to undergo a metempsychosis under the form of these insects.

The male, at the close of the pupal rest, escapes from one end of this covering; but the female makes it her dwelling for life, moving about with it at pleasure, and, when alarmed, draws together the purse-like aperture at the open end.—*Tennent's Sketches of the Nat. Hist. of Ceylon*, p. 432.

WOOD-OIL.

T'ung-yu, Siu-yu, . CHIN. | Hung-t'ung-yu, . . CHIN.
Peh-t'ung-yu, . . ,, | Telia gurjun, . HIND.

Several articles met with in commerce are known as wood-oils, but wood-oil proper, in Further India, is obtained for the most part in Assam, Arakan, Burma, and the Straits, by tapping certain trees of the order Dipterocarpeæ, Dipterocarpus alatus, D. costatus, D. incanus, D. lævis, and D. turbinatus, but D. incanus is supposed to yield the best sort, and in the greatest quantity. In Burma, the mode of extraction is as follows:—About the end of the dry season, that is in March or April, several deep incisions are made with an axe into the heart of the wood, and a good-sized piece scooped out; into the hole fire is placed, and kept burning until the oil begins to run, when it is received into a bamboo, and allowed to run slowly drop by drop. In Malacca, also, it is obtained from one of the Dipterocarpeæ, very common in the dense jungles of the Malay Peninsula, and which grows to a great height. When not tapped too soon, the base of the trunk is often of immense girth. The oil which flows from the wound is a mixture of balsam and volatile oil, and when applied as a varnish to wood or other substance, the oil evaporating deposits a hard and durable coat of resin. They are chiefly used as natural varnishes, either alone, or in combination with coloured pigments, also as a substitute for tar in paying the seams of shipping, and for preserving timber from the attacks of white ants. They are said also to be useful as an ingredient in lithographic inks. The oils generally receive the names of the localities from which they are imported. Some of them differ considerably in colour and consistence, but they all possess the same balsamic odour. Dipterocarpus lævis is one of the commonest forest trees of Burma, growing to an enormous size, and yielding as much as 30 gallons of oil each season, without injuring the tree. The oil, when permitted to remain at rest, divides itself into two layers, the upper consisting of a clear, chestnut-coloured liquid balsam, and the lower being in appearance like flakes of granulated sugar, and consisting probably of the surplus resin deposited by the action of the atmosphere. The Telia gurjun wood-oil, as found in the bazars, generally occurs as a brown, oily-looking, semi-transparent liquid, in odour strongly resembling a mixture of balsam of copaiba with a small portion of naphtha.

Mr. Lowe found that the filtered balsam of the gurjun oil formed a brown transparent liquid, which yielded by distillation in 100 parts,—essential oil, 65; hard resin, 34; acetic acid and water, 1. According to Mr. Lowe, the volatile oil possesses all the characters of that of copaiba,

and the hard resin (which he regards as pure copaivic acid, exempt from the soft resin, which, according to him, exists in the greater part of the copaiba of commerce) appears to him indicative of superiority as a medicine. Mr. Lowe recognised in the new resinous balsam the singular property of becoming solid when exposed in a closed vessel to a temperature of 230° F. Copaiba presents no similar phenomenon.

The new balsam, distilled with the addition of a small quantity of an oxidizing agent, as chlorine, hypo-chlorite of lime, or bichromate of potash, yields an essential oil of a fine blue, whilst ordinary copaiba, containing soft resin, affords hardly any coloured essential oil; and cold sulphuric acid produces with copaiba a purple coloration similar to that obtained with cod-liver oil.

Wood-oil from Moulmein, when filtered, is a transparent liquid, of a somewhat dark-brown when seen by transmitted light, but appearing opaque and of an obscure green if viewed by reflected light. It possesses, therefore, in a very marked degree, the dichroism observable in all resin oils obtained by the action of fire. This character determines the nature of wood-oil, and shows that it is not simply a natural product like copaiba, but that it is in part the result of a liquid modification of the Dipterocarpus resin, effected by the agency of heat. Moulmein wood-oil is of somewhat greater consistence than olive-oil; it has a sp. gr. of ·964, and possesses an odour and taste very analogous to those of copaiba. It dissolves in twice its weight of absolute alcohol, with the exception of a minute residue which is deposited upon repose.

The most curious property of the Dipterocarpus wood-oil is that of solidifying when heated in a closed vial to 266° F.; at this temperature the oil becomes turbid, and so gelatinous that it is not displaced upon the inversion of the phial. After cooling, the solidification is yet more perfect; but a gentle warmth, assisted by slight agitation, restores its former liquidity. The resin of Vateria Indica is insoluble in alcohol, and very imperfectly so in ether; whilst the green resin of wood-oil is easily soluble in either of these menstrua.

Camphor wood-oil, from the Dryobalanops camphora, belongs to the class of volatile oils. It is used largely in Singapore as a substitute for turpentine, and sells at from 15 to 20 cents a bottle.

Wood-oil of China, the T'ung-tsze-yu of commerce, is obtained from the seeds of the Elæococcus verrucosa, which grows plentifully in the valley of the Yang-tse. In China, the cold-drawn wood-oil, Peh-t'ung-yu, is pale, and is used for lamps and for varnishing furniture and the better class of umbrellas. A darker thick oil, called Siu-yu, is obtained by heat and pressure from the seeds and fruits of the Elæococcus and Jatropha. It is used in making putty, and in caulking and painting ships and boats. There is a reddish kind called Hung-t'ung-yu. The best wood-oil of China comes to Hankow from Shin-chau-fu, one of the substances of which the well-known and much-prized China lacquer is made.

Deodar or shemanatahu oil, from the Erythroxylon areolatum, and *Sissoo wood-oil*, from Dalbergia sissoo, are empyreumatic medicinal products.

Teak wood-oil is a dull ash-coloured oil, procurable in most of the large bazars of India; when allowed to rest for some time, it separates into two layers, the upper one a dark-coloured clear stratum, and the lower a more solid deposit. Its chief use is for applying to wood-work of all sorts, either alone as a natural varnish, or in combination with certain resins.

Wood-oil from the species of Dipterocarpus is used for painting the beams and wood-work of native houses, and may also be mixed with paint when not exposed to the sun. It is an excellent solvent of caoutchouc; it has been used as a substitute for fish-oil in curing leather, and found to answer. It makes an excellent house varnish, and the Burmese employ it extensively in the manufacture of torches. It is a good substitute for copaiba balsam in the treatment of gonorrhœa, given diffused through almond mixture or gum water. Dose, 10 to 15 minims, repeated thrice daily, or as often as necessary. A compound tincture of gurjun is an efficient substitute for Frank's well-known specific for the treatment of gonorrhœa. Dose, 20 to 30 minims, in a little milk or sugared water.

Wood-oil is decomposed by nitric acid into a black spongy substance, hard and brittle, heavier than the liquid part of the oil into which it sinks; the liquid part assumes a colour nearly like that of port wine, and is about as fluid as water, much more liquid than the natural wood-oil. A thin coating of that liquid part applied to a board of deal wood formed in 24 hours a transparent varnish perfectly even and bright. The spongy matter above alluded to seems to possess the same properties as a mixture of resin and annotto. Two identical substances are obtained by dissolving with nitric acid the common asphalte used for pavements. A small quantity of sulphuric acid poured incautiously on the second day into the wood-oil which had been in contact with nitric acid, caused it to rush out of the glass with a violent effervescence and disengagement of smoke, aromatic fumes, and a heat of about 200° Fahr.; the aromatic smell was very sweet, and much like benjamin.—*Smith; Roxb.; Journal de Pharmacie*, 1856; *Pharmaceutical Journal*, xiv. xv.; *O'Sh.; Rohde, MSS.*

WOODPECKER, birds of the tribe Scansores, family Picidæ, of the genera Picus, Leiopicus, Hypopicus, Yungipicus, Vivia, Sasia, etc., of Eastern and Southern Asia, are numerous. See Birds, p. 375.

Wool is largely imported into India, and quantities of the imports as well as the fleece of Indian sheep are exported, but while the former are increasing in quantity and value, the exports are falling off.

The table-land of the Peninsula, commencing

with the Neilgherries, and proceeding along Mysore to the Dekhan, Kandesh, and Gujerat, presents large tracts of country affording a favourable climate and abundant pastures for numerous flocks of sheep. If from thence we proceed in a north-east direction, passing Berar, Malwa, Rajputana, to the district of Hurriana and the province of Dehli, we shall see, supported on the natural pastures of the country, immense herds of cattle, and numerous flocks of sheep, the latter affording wool utilized by the natives for making blankets (kumlee or cumblee) of different degrees of fineness, which form a considerable article of the commerce of these provinces, and one is possessed by every labourer and artisan. Again, the Himalaya, on their southern face, present a European-like climate, remarkable, however, for being influenced by the periodical rains. The temperature varies according to the elevation; but they afford everywhere rich pastures, and support a fine breed of sheep, of which the wool is employed by the mountaineers to form their clothing. The northern face of these mountains is as remarkable for its dryness as the southern is for its moisture; the cold is excessive, and the animals which are pastured there are covered with shaggy hair or with long wool, and a fine down. It is here that the shawl-wool goat finds its most congenial climate.

Sir A. Burnes says,—(1) The wool of Turkestan is obtained chiefly in the neighbourhood of Bokhara and Samarcand, and is more celebrated than that of Kābul. This is sent to Amritsar in the Panjab, where it is used to mix with the shawl-wool of Tibet in making what are called Kashmir shawls. It is the produce of the goat of Bokhara, and not of the sheep of Turkestan, and is called 'put,' in contradistinction to 'pashm,' which is used to express the fleece of the sheep. (2) The wool or put of the goat of Kābul was not then exported, being entirely consumed in the native manufactures. It is procured from goats, and chiefly from the hill country of the Hazara to the west of Kābul, and between that city and Herat, which has an elevation of about 6000 or 8000 feet above the level of the sea. (3) The countless flocks of fat-tailed sheep in Kābul produce an abundance of wool. The fleece is of a glossy white colour, and is in Kābul called 'pashm-i-burrak,' and the fabrics prepared from it 'burrak,' in contradistinction to 'puttu.' It sold at from 2 to 2½ Kābul rupees the seer, or sixteen pounds. It is brought in from all directions for sale in Kābul; and Sir A. Burnes states that he 'can scarcely put a limit to the supply, since the extent of pasture land in those countries is not overrated at four-fifths of the whole surface of the country, and a very large portion of the population, such as the Lohani and Ghilji, are shepherds, who remove from pasture to pasture, and rear their flocks with great care and attention. Nature, however, does as much as the people; for aromatic plants, in which sheep delight, are exceedingly abundant, and it is universally believed that they have considerable effect on the quality of the wool.'

Wool obtained from the fat-tailed variety of sheep is used in the manufacture of cloths and carpets, and is also exported to India. It is of wide distribution; the sheep abound at Peshawur, Kābul, Kandahar, Herat, and other places. Kelat and the surrounding country produces sheep's wool in great abundance. This sheep is apparently indigenous also to the Salt Range.

Kirman is a tract of country close by the Persian Gulf, to the south of Persia. Its wool finds its way into the Panjab in considerable quantities. It is a soft, delicate wool, but its principal use at present unfortunately appears to be the adulteration of genuine pashm. The Kirmani wool from the Persian Gulf finds its way to Amritsar pretty largely from both Kurachee and Bombay, and is one of the staples used in adulterating the pashm or genuine shawl-wool.

The *Lena* shawl-wool is the produce of the goats of the Tibetan Himalaya. It used to be a prevalent opinion that these goats were found in Kashmir, but that celebrated valley is far too warm and damp for them.

The best *shawl-wool* is produced in the vicinity of Garo, Manasarowara, and the elevated lands to the eastward. The shawl-wool is the fleece of the goat next the skin only; the outer coat is coarse hair, and the two colours are white and light brown. The dogs of Tartary have also a soft down below the hair, very little inferior to that of the goats.

Goat's hair is very commonly produced in almost every district of the Panjab, and called 'jat.' It is used for making ropes, also for matting, and for the strong bags wherein grain, etc., is carried on the backs of oxen. Grain dealers use rugs made of it in the shops in which the grain is poured out when being winnowed or weighed. At Dala and Gyani, in Hundes, four or five fleeces of wool, according to size, sold for one rupee, which averages 1½ to 2 annas or 3d. the pound. Shawl-wool is produced in a variety of districts in Tibet.

The wool of Eastern Turkestan is known as *Turfani* wool, so called from the city of Turfan. It is this exquisitely fine wool from which the finest shawls and other fabrics of Kashmir are made.

The following are the wools used in the Panjab:—

(*a*) *Pashm*, or shawl-wool properly so called, being a downy substance found next the skin and below the thick hair of the Tibetan goat. It is of three colours,—white, drab, and dark lavender (tusha). The best kind is produced in the semi-Chinese provinces of Turfan, Kichar, and exported via Yarkand to Kashmir. All the finest shawls are made of this wool; but as the maharaja of Kashmir keeps a strict monopoly of the article, the Panjab shawl-weavers cannot procure it, and have to be content with an inferior kind of pashm produced at Chathan, and exported via Leh to Amritsar, Nurpur, Ludhiana, Jalalpur, and other shawl-weaving towns of the Panjab. The price of white pashm in Kashmir is, for uncleaned, Rs. 3 to 4 per lb.; ditto, cleaned, Rs. 6 to 7 per lb.; of tusha, uncleaned, Rs. 2 to 3 per lb.; cleaned, from Rs. 5 to 7.

(*b*) The *fleece of the Dumba sheep* of Kābul and Peshawur is sometimes called the Kābuli pashm. It is used in the manufacture of the finer sorts of choga, an outer robe or cloak with sleeves worn by Afghans and other Muhammadans of the western frontier.

(*c*) *Wahab Shahi*, or *Kirmani wool*, the soft white wool of a sheep found in Kirman, a tract

of country in the south of Persia, by the Persian Gulf. It is used for the manufacture of spurious kinds of shawl-cloth, and for adulterating the texture of Kashmir shawls.

(*d*) The *hair of a goat* common in Kābul and Peshawur, called pat, from which a texture called pattu is made. (Qu. put?)

(*e*) *The woolly hair of the camel.* From this a coarser kind of choga is made.

(*f*) *The wool of the country sheep of the plains.*

A considerable and increasing quantity of wool is exported from India, mostly all of it, latterly, from Bombay, and chiefly to Great Britain, France, and America. Wool of Afghanistan from the white sheep has been increasing as an export, via Kurachee to Britain. The white and the rufous-coloured sheep are shorn twice a year. Sind is not a wool-producing country, though it is to be obtained in its western confines to a great extent, particularly in Cutchi and the Jalawan mountains of the Brahui. The Hindus of the country carry on the trade, and thus much of the article coming into the Bombay market through Sind is misnamed Sindian wool. Many districts, however, accessible through Sind and the Indus, yield this important article abundantly; that furnished by the Kelat territories finds its way to Bombay via the mountainous road to Sonmiani.

Mr. Powell mentions that all or most of the mammalia of the Himalayan regions and other similarly situated localities, at an elevation of 11,000 to 13,000 and 14,000 feet, which are consequently subject to severe winters and a high rarity of atmosphere, whether domesticated or wild, such as the dog, yak, karghan, etc., possess a wintry inner coat of 'pam,' of different degrees of fineness. The pashm of the goat is alone the marketable commodity; but the hair of the yak and Kirghiz camel is in parts cropped, and both in a cleaned and coarse state is made into cloth of different degrees of fineness, for Kirghiz (nomadic) tents, clothing, bedding, saddle-bags, ropes, etc. etc. The hair picked from marketable pam at Kashmir supplies material for a different branch of manufacture, viz. of ropes, saddle-bags, and haircloth of different kinds, qualities, and uses.

Antelope wool of Lahoul, called in Tibetan Tsodky-i-lena, or properly b-Rtsodky-i-lena, is very precious.

Ibex hair, or wool of the teringole or kin, the ibex, is the wool that makes the famous and rare ibex shawls.

Sheep's wool, black and white, of Lahoul, called luggi-bal, was selling in 1866 for 6 Cutchi seers per rupee; it is exported to Kullu and Kanawar.

Yak's wool of Rupshu and Zanskar, called Kullu, is the soft under-hair of the yak, used to make bags for sheep loads, and the felt soles of shoes.

The *Rampur chadr* is a soft wool fabric manufactured from the wool of the sheep of Rampur and Spiti, which are there the beasts of burden. The wool of the Dumba or large-tailed sheep of Peshawur and Kābul is called Kābuli pashm, and is manufactured into the choga or sleeved cloaks worn by the Afghans.

Pattu fabrics are made from the pat wool of Kābul.

The *pashm of Changtan and Turfan* are of the first class, and are monopolized by Kashmir.

The *pashms of Rodakh*, Ladakh, Spiti, Rampur, Bashahir are a second-class wool, and form the staple export to the shawl manufacturing cities of the Panjab.

Pasture.—The nature of the soil on which the sheep and goats are fed, has most influence on the texture and quality of their wool. There can be no doubt that the valleys of the Sutlej, Ravi, Chandrabaga (or Chenab), and other tributaries of the Indus, supply grazing grounds not to be surpassed in richness and suitableness in any part of the world. The population inhabiting them are chiefly pastoral, but, owing to sloth and ignorance, the wool they produce is but small in quantity, full of dirt, and ill cared for in every way. The Government of the Panjab have made efforts to improve the breed by the importation of Merino rams, but hitherto with little success. However, a truss of Merino wool produced in the Hazara Hill district, to the north-west of the Panjab, and sent to England in 1860, was there valued at 1s. 6d. per lb. Sheep whose pasture grows on calcareous poor soil have short, harsh wool, while those on rich loamy argillaceous soils have longer and softer hair. The same animal produces different kinds of wool. On a sheep the finest wool is on the spine from the neck to near the tail, including one-third of the breadth of the back. Rampur is a great mart for the reception and forwarding of wool.

Pashm is the chief article of trade in Khotan and Ladakh. It is cut once a year; the wool picked out is sent to Kashmir, but the hair is made into ropes, coarse sacks, and blankets. After the hair of the goat has been cut short with a knife in the direction of its growth, or from the head towards the tail, a sort of comb is passed in the reverse direction, and brings away the finer wool almost unmixed with the coarse hair. If not shorn as the summer commences, the animals themselves rub off the wool.

The goats are found domesticated all over the mountainous country of Western Tibet, particularly in the provinces of Ladakh, Rodakh, and Garo. Changthan is the name given to the elevated plateaux where innumerable flocks are pastured. Merchants bring down large quantities from Ghar-garo or Gurdokh in Changthan, where a large commercial fair is held annually in August (Bhadon). The Lahoul traders bring Changthan wool through Ladakh. In Changthan, at the Arghils cattle-sheds and Yaitaaks pasture-grounds, the usual price of the raw article or coarse pam is about 2 vuttees 14 seers pucka, or 8 lbs. (English) for Rs. 3, or about 6 annas the pound weight; and tobacco is bartered for about double its weight of coarse Changthan pam. So also green and red dyed goat-skins of Panjab manufacture, with shoes and boots of the same article (the latter made in Turki fashion) are bartered at Yarkand, Aksu, Ilchi, Turfan, etc., for treble and quadruple their weight of raw pam. In the same manner, not many years since, the glass beads and buttons of Birmingham were wont to be bartered for an equal weight of gold-dust or reg-i-zar throughout the entire country of Gilgit, Yarkand, Mazzhuji, Chitral, and along the south base of the Mustagh and Kara-korum.

The mountain paths between Rampur and Spiti are so precipitous, that sheep, more surefooted than larger beasts, are commonly used to carry burdens of from 16 to 20 lbs. The sheep are driven from village to village with the wool on, and as the required quantity is cut from their backs, they are laden with the grain which is received in exchange, and which, when the fleece is all disposed of, is carried into Chinese Tartary, and sold at a profitable rate. It is the custom for the shepherds of Chumurti to give an order, while the crops are yet green and on the ground, for any amount of grain they may require, which, when the crop is ripe, is stored up by the cultivator until the summer of the ensuing year. When the shepherd arrives with his flock, he gives the wool in exchange, and receives his grain, which he puts into small bags, and drives back his flock thus laden. About 2000 maunds of wool are annually brought to Rampur, and about half that quantity of pashm. The price of the wool averages about 4 lbs. for the rupee, and pashm, Rs. 2 to 4 for 2 lbs.

The beautiful pashms of Changthan and Turfan, and the soft white fleeces of Kirman, embrace three distinct kinds of wool, distinguished not only by the climate and soil where they are produced, but also by the fact that they are the produce of different animals.

These classes are—1st. The genuine pashms of Changthan, Turfan, etc., which are monopolized by Kashmir, and those second-class pashms, the produce of Rodakh, Ladakh, and even Spiti, Rampur, and Bashahir, which form the staple export to the shawl manufacturing cities of the Panjab, Amritsar, Ludhiana, Jalalpur, Nurpur. Included by analogy of locality only, are the wools of the ibex, so rarely seen, and the yak, the thick tails of which animals are prized for chauries (fly-flaps).

2d. The wools produced beyond the N.W. frontier, including those of Peshawur, comprise the Dumba sheep wool, the wools of Kābul, Bokhara, and that imported from Kirman; in fact, all classes of wool produced on or beyond the N.W. frontier. The trade in these wools is now extensive, both by the Peshawur and other routes. Second class of wools, produced at or about Peshawur, Kābul, Kandahar, and Persia or Kirman.

British Wools.—Since the middle of the 18th century there have been many fluctuations in the price of wool in Great Britain, from 14s. 6d. the tod about the year 1780, to 65s. in 1864 and 22s. 2⅜d. in 1883. Taking the wool produce of England at 5,500,000 tods per annum, the value of this produce in the year 1864 was £17,554,166, whereas the same quantity in the year 1883 would represent a value of £6,104,427,—that is, taking the mean average price of wool in 1864 at 63s. 10d. per tod, and in 1883 at 22s. 2⅜d. per tod. The difference in value between the produce of these two years is thus no less than £11,449,739.

Thull.—The wool produced in the Thull is shipped at Bukkur or Leia, and sent down to Bombay, and averages Rs. 10 a maund. In Ludhiana district pashmina is prepared from pashm, the fine hair of the Tartar goat. The hair is brought down on mules through Ladakh, Rampur, and Bashahir, and, in exchange, cotton piece-goods, brass, and iron are taken back. The price of pashm varies from Rs. 2 a seer. On receiving the pashm, the manufacturer's first business is to separate the coarser from the finer or underneath hair; out of each seer about 6 chitaks of the latter are taken. It is then washed in rice water, and made into thread. This sells at from 4 to 12 rupees per seer, according to quality. The thread made of the finest hair is woven into the well-known Rampur chadr, which are extensively manufactured. From the coarser thread are made shawls of sorts, and the cloth known as pashmina.

Woollen manufactures are largely produced in High Asia, in India, and in China; vast quantities of wool are woven into blankets of various degrees of fineness, for the use of the people, called kumlee or cumblee, also chadr. The numda or felts, both white and coloured, are used for tents, floorcloths, and quilts. The woven fabrics are made into shawls, choghas, and barani or overcoats, and the fine blankets known as Rampur chadr are prized, and Central Asia is famed for its carpets. The burruk fabric, the abra and looi blankets, are made of sheep's wool; the pattu and pattu malida (dressed pattu) fabrics are largely worn in Afghanistan, and at Herat kuruk is manufactured from goat's hair.

The jute carpet is indigenous to Persia and Turkestan, where the best are still made. In India, the foundation for the carpet is a warp of strong cotton or hempen threads; and the peculiarity of the process consists in dexterously twisting short lengths of coloured wool into each of the threads of the warp, so that the two ends of the twist of wool stick out in front. The projecting ends are then clipped to a uniform level, and the lines of work are compacted together by striking them with a blunt instrument (Birdwood). The historical seats of the industry are in Kashmir, the Panjab, and Sind, and at Agra, Mirzapur, Jubbulpur, Warangal in the Dekhan, Malabar, and Masulipatam. Velvet carpets are also made at Benares and Murshidabad, and silk carpets at Tanjore and Salem. At the Exhibition of 1851, the finest Indian rugs came from Warangal, the ancient capital of the Andhra dynasty, about 80 miles east of Hyderabad. Their characteristic feature was the exceedingly numerous count of the stitches, about 12,000 to the square foot. 'They were also perfectly harmonious in colour, and the only examples in which silk was used with an entirely satisfactory effect' (Birdwood). The price was not less than £10 per square yard. The common rugs, produced in enormous quantities from the jails at Lahore, Jubbulpur, Mirzapur, Benares, and Bangalore, sell in England at 7s. 6d. each.

The woollen fabrics produced by the Chinese are felts for the soles of shoes and winter hats, and a sort of rug or carpet. It is not woven in looms from the yarn, but is made in small pieces by a fulling process which mats the fibres together. The consumption of it by shoemakers is very great, and nearly as large for winter hats among the common people. The rugs are woven with coloured threads in rude imitation of figures, and are extensively used in the northern provinces; the pieces are a few feet square, and sewn together for carpets or bedding. Hair and wool are both employed in their construction.

Great Britain in 1883 exported woollen fabrics

to the value of £18,320,016, of which there was cleared for India, £370,545 value; to China, £242,456; to Japan, £62,455. India in 1882-1883 imported to the value of Rs. 77,52,049.—*MacGregor*, p. 50; *Powell, Handbook; Econ. Prod. Panjab*, 183; *Ann. Ind. Adm.* xii. 108; *Imp. Gaz.*

WOON. Burm. A Burmese governor or minister. This word literally signifies burden, as woon-gye, great woon; woon-donk, prop of the woon.—*Yule*, p. 3.

WOO-PEI-TZE. Burm. Galls imported from China, which are said to be produced by an aphis; they are more bulky than common galls, of very irregular shape, and hollow.

WOO-TAI-SHAN, a city of China to which the Mongols make pilgrimages, prostrating themselves all the way.

WOOTZ, or Indian Steel. Wootz is a term applied by Dr. Heyne to the steel ingots manufactured in the south of the Peninsula of India. It is supposed to be his variation of the word Ucha, meaning superior, high; Ucha kabbina, superior iron. The name in Mysore is Ukku tundu, also Ukkina tundu, also Ukku gatti, lumps of steel. See Steel.

WORAGALLI, a name of the town in maps called Warangal.

WORM. Several creatures receive this common name; a tailless batrachian, the Ichthyophis glutinosus, is an immense earth-worm, common in Sikkim. It is a native of the Khassya mountains, Singapore, Ceylon, and Java.

Amphitrite, or sea-worm of Java, lives in holes of the great solid madrepores. The gills of these lovely creatures are in the form of spiral ribbons of brilliant orange, green, and blue. These gaudy plumes are alternately extruded and retracted, and, seen through the pellucid water, present a very singular and beautiful appearance.—*Adams' Travels*, p. 51; *Hooker's H. J.* ii. p. 25.

WORMIA BRACTEATA. *W. Ic.* Dillenia bracteata, *W. Ic.* A very handsome tree of the Coimbatore Hills, in the Bolamputty valley, on hills near Coimbatore, and the Animallays, in Mysore, and on the North Arcot and Cuddapah Hills. It is well deserving of cultivation for ornamental planting, etc.—*Beddome.*

WORMIA TRIQUETRA. *Rottl.* Diyapara, Singh. A moderate-sized tree, common in the moist, warmer parts of Ceylon, up to an elevation of 2000 feet.—*Thw. En. Pl. Zeyl.* p. 4.

WORMWOOD.

Afsuntin, . . . Arab.	Artemisia absinthum, Lat.

Murwa, ... ,,	Dona, ... Sansk.
Domolo, . . . Jav.	Mashipattiri, . . Tam.
Gund-mar, . . . Kash.	

This European plant is found in the Indian bazars. The wormwood of the Old Testament is the Artemisia abrotanum.—*O'Sh. Disp.* p. 414.

WOTAY KOROSHANUM. Tam.

Wotay koroshenam, Tam. | Wontay koroshnam, Tel.

This is a bright yellow biliary concretion, found in the gall-bladder of certain camels. It is highly prized as a beautiful yellow paint, but is very expensive.—*Ainslie.*

WRESTLING in India is a favourite amusement for the rich, who keep largely overfed men for the purpose of being pitted against each other. These are so full of flesh, that their distinctive forms are almost hidden, though this is more owing to the development of muscle than to deposit of fat. On one occasion, to add to the interest of a mela, wrestlers of reputation from Agra, Muttra, Cawnpur, and other places were sent for, and for three mornings successively the rajas and others were entertained with some splendid wrestling matches. There was no cruelty or brutality exhibited, but fair, manly trials of strength and dexterity, which elicited applause, and which attracted on the last day a crowd of at least 50,000 people. Wrestlers of Japan, before engaging, challenge by placing a hand on each thigh, just above the knee; then stooping slightly, lifting each leg in turn, at the same time slap the thigh as the foot comes sharply to the ground.—*Dehli Gazette.*

WRIGHT, EDWARD, an eminent mathematician and engineer, who accompanied the Earl of Cumberland on his first voyage to the Azores. In 1616 he was appointed by the East India Company, on a salary of £50 a-year, to compile their charts.—*E. I. Marine Surveys.*

WRIGHTIA, a genus of plants belonging to the natural order Apocynaceæ, of which Wrightia coccinea is a large tree; flowers externally green, internally deep orange-red, having something of the perfume of the pine-apple. Wrightia Wallichii is found in the Tenasserim Provinces, and on the slope of the Neilgherries, from about the middle of the ascent to an elevation of between 4000 and 5000 feet.—*Mason; W. Ic.*

WRIGHTIA ANTIDYSENTERICA. *R. Br.*

Nerium antidysentericum, *Linn.*

La-thou, . . . Burm.	Veppala, ... Tam.
Conessi bark tree, Eng.	Kodaga pala, . . . Tel.
Inderjau, . . . Hind.	Pala chettu, . . . ,,
Cheeri, ... Sansk.	Kodisa pala, . . . ,,

A small tree of Malabar, Ceylon, the Isle of France, common in many parts of India, also in Tavoy. The bark was formerly in request under the name of Conessi, and is still esteemed by the natives in dysentery and bowel complaints. It appears to have lost its value in commerce, by not being distinguished from the bark of Wrightia tinctoria, which grows in the same places. The very bitter seeds are boiled in milk, and given in hemorrhoids and dysentery, and in decoction in fever and gout; also as an anthelmintic. The bark of the root is astringent and febrifuge, and is used as a specific in dysentery and bowel complaints. Its milky juice is also used as a vulnerary. The tree has peculiarly-scented flowers, with a form resembling those of the jasmine. The wood is white, of a fine grain, and susceptible of polish, and is used by the turner and cabinet-maker. The seeds are covered with a kind of downy tuft, somewhat resembling the down of the thistle. Two kinds of inderjau seeds are distinguished in Hindu medicine, the sweet and bitter. The former has a pleasant taste, not unlike that of oats, which they also resemble somewhat in appearance, but are longer and more slender. An infusion of this roasted seed is given as a safe and gentle restrainer in bowel complaints; the decoction is employed in fever cases. The latter, from W. antidysenterica, are intensely bitter, and used as a vermifuge. The bark was greatly lauded in the 18th century by Geoffroy, and it appears to be a remedy of no mean value. A new vegetable alkaloid ex-

tracted from the bark is resinous and uncrystallizable, of a powerfully bitter and somewhat acrid taste, insoluble in water, but very soluble in alcohol, ether, and chloroform; only one part procurable from one thousand parts of dry bark. It is supposed that the seeds contain it in much larger quantities.—*Cat. Ex.*, 1862; *Voigt; M. E. J. R.; O'Sh.; Ind. Ann. Med. Sci.*, Aug. 1856.

WRIGHTIA MOLLISSIMA. *Wall.*

Khilawa, . . . HIND. | Dudhia, . . . HIND.

Grows in the Nagari Hills, in Kamaon, Bijnour, and Garhwal, and is abundant in some moist forests. It grows in the Siwalik tract, near the Indus, up to 3500 feet. It grows to the height of 15 feet. Its wood is light yellow, soft, and white, not very durable, fine-grained, polishes well; used chiefly for combs.—*Drs. Cleghorn, Stewart; Mr. Thomson; M. E. J. R.*

WRIGHTIA TINCTORIA. *R. Br.*

Nerium tinctorium, *Roxb.* | W. Rothii, *D. C.*

Bhur-kuri, . . BOMBAY.	Pallay maram, . TAM.
Kala-kudu, HIND., MAHR.	Palava-ranu, . . ,,
Hya maraka, . . SANSK.	Chitti ankudu, . . TEL.

A small, pretty tree, found in the Coimbatore, Godavery, and other forests of the Madras Presidency, and very common in all the forests of Bombay. It affords a very beautiful wood, white, hard, and close-grained; coming nearer to ivory than any Dr. Roxburgh knew, and valuable for turning. Pale-green soft leaves; deciduous in the cold weather; flowers in March and April; white follicles in pairs, from 12 to 18 inches long, of which as they ripen the ends of each pair curiously join. It is a common tree in the Coimbatore jungles. The leaves afford an inferior kind of indigo, hence the Mahratta name. It is extracted by scalding.—*Wight; Roxb.; Gibson; Riddell; Cleghorn; Captain Beddome.*

All Asiatic races regard writing characters with a respect amounting to veneration. This feeling is earnest with Muhammadans, influenced by the possibility of the words representing the sacred name of God; and the Chinese in their towns employ people to collect expended manuscripts from houses, to secure them from desecration. Amongst Muhammadans of India, a holy man, to cure sickness, writes an invocation on a board or slate or paper, which is washed off and given to the sick person to drink. Writing has been brought to its present perfection by much labour. It has been in use from prehistoric times, and throughout 5000 years, at least, learned men have been inventing and improving alphabets.

The most recent writer is Dr. Isaac Taylor, in 1883, on the alphabet. He tells us that two kinds of writing are in use by the natives of the world,—alphabetic and non-alphabetic; that the Egyptian hieroglyphic writing is believed to have been the source of all existing alphabets; that every system of writing has begun with rude pictures of objects, and such pictures, more or less conventionalized, were gradually accepted as the representatives of words, and afterwards became the symbols of more or less elementary sounds. Learned men describe this process in saying that writing began with ideograms, pictures, or pictorial symbols, which afterwards developed into phonograms or symbols of sounds, either verbal signs, syllabic signs, or alphabetic signs.

There are known five great systems of picture-writing, which have been independently invented. These are (1) the Egyptian, which developed into the monumental hieroglyphic; (2) the cuneiform, which branched into nine forms; (3) the Chinese, of five forms; (4) the Mexican, with its two branches; and (5) the Hittite, which developed into the Carchemish hieroglyphics, the Asia Minor syllabary, the Lycian alphabet, and the Cypriote syllabary. The Chinese characters illustrate a graphic system which has never advanced beyond the most rudimentary stage of conventionalized picture-writing. It is a language of roots, and is monosyllabic. The people of Japan use the Chinese characters, but their language is polysyllabic; and the Chinese characters, which are verbal phonograms, have been used by the Japanese for the expression of the polysyllabic Japanese words by being treated as syllabic signs.

The diffusion of alphabets has been largely effected by trade routes, by conquests, colonization, and religion. In the 5th century B.C., Darius Hystaspes recorded in the Bchistun inscription his restoration of the forgotten text and commentary of the Zendavesta. Also Hermippus of Smyrna, who lived in the middle of the 3d century B.C., quoted and summarized the contents of the twenty books, each consisting of 100,000 lines, which, he says, had been composed by Zoroaster; and Masudi, an Arab historian of the 10th century A.D., says the Zendavesta was written on 12,000 cow-hides, in a character invented by Zertusht. It is believed that the character used by Zertusht was a variety of the Aramean.

Buddhism, a missionary religion, has eagerly availed itself of the art of writing for the propagation of its doctrines; but Aryan Hindus have preferred the oral transmission of the Vedas; and Kumarila Bhatta, of the 8th century A.D., mentions writing only to condemn its use. The sons of the three higher castes of Hindus were required to learn by heart the sacred text; and to the present day youths in some of the Brahmanic families can repeat the whole of the Rig Veda, learned, as their ancestors acquired it thousands of years ago, from the mouth of a teacher, so that the 'Vedic succession' should never be broken.

The Arabic letters and the Arabic numerals are, with some modifications, in use amongst the Muhammadans of Arabia, Persia, Turkey, Turkestan, Afghanistan, Baluchistan, and India, and the

writing forms receive the names of Toghra, Nashk, Talik, Nashk-Talik, Shafia, Raqm, and Shakastah. The Cufic alphabet is not now in use.

The Christian missionaries, also, have effected great things in establishing the best of the many dialects current amongst the tribes, as among the Malay of the Archipelago and the Hindi-speaking nations of Hindustan and the Panjab.

Pahlavi group.—The primitive Semitic alphabet has had three branches,—the Phœnician, the Joktanite, and the Aramean. From the Phœnician came the alphabets of Europe; those of India were from the Joktanite; while the Aramean became the source of the alphabets employed by the various non-Semitic races in the provinces of the Persian empire, and it exterminated the other Semitic scripts of Western Asia. This group is usually called the Pahlavi.

Iranian.—The four alphabets of the Iranian group have been designated the Indo-Bactrian, the Pahlavi, the Armenian, and the Georgian. The three Pahlavi alphabets are the Arsacidan, Sassanian, and Parsee.

The Arsacidan type was developed in Persia during the period of the Parthian empire, B.C. 256 to A.D. 226. The Sassanian or Pahlavi proper was formed during the Sassanian dynasty, A.D. 226 to 651.

The Parsee or Indian Pahlavi, often called the Zend alphabet, is that which was used by the Parsee fugitives after their flight to India. The Armenian and Georgian alphabets are the only living representatives of the Iranian alphabet, the Parsee being understood and used only by an ecclesiastical class. St. Mesrob, A.D. 400 (for he was canonized), had been a secretary at the court of the Armenian kings Varazdates and Arsaces IV., but resigned in order to follow a religious life. Moses of Chorene gives Mesrob the credit of constructing the Armenian alphabet, and Moses used it in his translation of the New Testament into the Armenian.

India.—The distinct alphabets employed in India outnumber all the other alphabets used in the remainder of the world. But the vernacular scripts divide themselves into four or five great classes, essentially coincident with divisions of race, language, or religion; and besides, there are in use the alphabets of Annam, Arabia, Armenia, Baluchistan, China, Afghanistan, and Syria (Karshuni), with peculiar local varieties of the Nashki alphabet, which have arisen in Bombay, Malabar, Sind, and Singapore.

There are nearly twenty alphabets descended from the Devanagari script, in which the Sanskrit literature is mostly conserved. Others have been derived from the Pali, the old alphabet of the Buddhist scriptures; about twelve belong to the Dravidian family of alphabets, nearly as many to the Gujerati or Western type, and others to the Eastern or Bengali class.

Mr. H. T. Prinsep gave the following list of transitions of the Indian alphabet from the time of Asoka, with some of the most marked local varieties at present in use, viz. those used in the sculptures of

- Asoka's edicts of the 3d century B.C.
- Western caves.
- Sah inscription at Girnar.
- Gupta inscription at Allahabad.
- Valabhi plates from Gujerat.
- Kutila inscription of the 10th century A.D., at Bareilly.
- Nerbadda.
- Kistna.
- Telinga, modern.
- Tibetan, modern.
- Square Pali.
- Gujerati.
- Panjabi.
- Kashmiri.
- Bengali.
- Devanagari.

And he gave the following ten modifications of the Sanskrit alphabet from B.C. 543 to A.D. 1200, viz.—

- Fifth century B.C., rise of Buddhism.
- Western caves.
- Third century B.C., Sanskrit inscriptions of Asoka, Junagarh.
- Second century A.D., Gujerat dated plates.
- Fifth century A.D., Allahabad inscriptions of the Gupta dynasty.
- Seventh century A.D., Tibetan alphabet formed from Sanskrit.
- Ninth century A.D., Kutila inscriptions from Bareilly, A.D. 992.
- Eleventh century A.D., Bengali alphabet as now modified. Adisur, A.D. 1065.
- Modern Devanagari alphabet.
- Old Pali alphabet of the Burmese, compared with A.D. 200.

Dr. Isaac Taylor, however, has since arranged the alphabets of India into two classes,—the ancient and the modern or vernacular.

From the 3d century B.C. to the 10th century A.D., thirteen *ancient* alphabets were in use in India. They comprise — (1) Maurya from the inscription of Asoka at Girnar; (2) the Andhra of the western cave temples; (3) that of the Sah or Kshatrapa at Girnar; (4) the Gupta on the Allahabad pillar; (5) the Valabhi from the Gujerat plates; (6) the Chalukya or Kistna from the Amaravati plates; (7) the Nerbadda from the Seoni plates; (8) that of the Assam inscription; (9) the Kutila alphabet of Bareilly; (10) the Kiousa or lapidary Pali; (11) the Tibetan; (12) the Passepa; and (13) the Devanagari.

The *vernacular* alphabets of the Peninsula of India are those of Assam, the Kutila, Gurumukhi, Nagari, Bengali, Orissa, Gujerati, Sindi, Multani, Telugu, Canarese, Grantha (Tulu), and Tamil.

The vernacular alphabets of Further India and the islands are the Kiousa, Burmese, square Pali, Singhalese, Pegu, Ahom, Battak (old), Battak (new), Rejang, Lampong, Tagala, Bisaya, Macassar, and Bugi. All these have originated from one single source, the alphabet used in the edicts of Asoka, the Buddhist king. He was zealous for his faith, and in the years 253 to 250 B.C. he promulgated edicts enjoining obedience to its ordinances. Between Peshawur and Ceylon seventeen versions of these edicts, engraved on rocks and pillars, have been discovered, and likewise several dedicatory inscriptions on caves or rock-cut temples constructed by him; and there are also six pillar inscriptions, of which the best known are those at Dehli and Allahabad. In the 2d and 13th edicts, Asoka mentions as his ally and contemporary the Yona-raja or Ionian king Antiyoke, and also refers to the Chatura rajane, or four rajas, Turamye, Antikini, Maka, and Alikasandare, who are known to be Ptolemy II. of Egypt, Antigonus of Macedonia, Magas of Cyrene, and Alexander II. of Epirus.

These inscriptions of Asoka are written in three local Pali or Prakrit dialects, and two wholly distinct alphabets are employed. An inscription at Kapurdigiri is in the Indo-Bactrian alphabet, an alphabet of Iranian origin; while that used in the other versions of the edicts was at first named the Lat or pillar character, but latterly the Indo-

Pali, and it is this one which is the source of the existing Indian scripts.

The Kapurdigiri alphabet is an isolated monument of a great Bactrian alphabet, in which the Zoroastrian books and an extensive literature had been in all probability conserved. The Kapurdigiri form was put aside during the time of Alexander of Macedon and his officers, but later on, in the time of Asoka, it was again utilized for this inscription. It has, however, been in use in Ariana (Herat), Margiana (Merv), Bactriana (Bokhara), Alexandria, Arachosia (Kandahar), and in India throughout the Panjab. The alphabet of the Kapurdigiri inscription has had several names,—Aryan, Bactrian, etc. It is now called the Indo-Bactrian. It is slanting, cursive, and irregular, singularly free from looped forms, and written from right to left. The Indo-Pali or Lat is written from left to right; it is regular, upright, and rigid, with numerous looped forms. The source of the Lat alphabet has been variously suggested.

In the 12 centuries between Asoka, B.C. 250, and the 10th century A.D., various vernacular scripts of India were formed. In three inscriptions of this epoch, namely, the Kutila or Bareilly inscription of A.D. 992, the Chalukya or Kistna inscription of 945, and a Kawi inscription of 919, the characteristic features of the three great alphabetic types of India, the Nagari, the Dravidian, and the Pali, can unmistakeably be recognised.

The Nagari or Devanagari group of alphabets are employed in Kashmir, the Panjab, the N.W. Provinces, Oudh, Rajputana, Gujerat, Central Provinces, Maharashtra, Behar, Bengal, and Orissa, and the Tibetan alphabets belong essentially to this group.

The Devanagari is the chief character employed for writing the ancient Sanskrit language. Devanagari is of comparatively modern origin.

The Gurumukhi character is used by the Sikhs.

Kashmir has two alphabets,—the Sarada, nearly identical with the Devanagari, and the Thakuri, inclining to the Gurumukhi type.

Mahrati is written in two characters; that used for books is called Bal-bodh, 'intelligible to a child,' and is nearly the same as the Devanagari; the other, called Modi, is cursive of the Gurumukhi type.

The Bengali prototype is to be seen in old Gauri inscriptions.

Uria of Orissa belongs to the same class, but has many archaic forms; it is now written on palm leaves with an iron style.

Nepal uses four scripts,—the Newari, which is nearly the same as the Devanagari; the Banjin Mola, belonging to the Bengali type; with the Kaiti-Nagari and the Ranja of intermediate character.

The Sindi and Multani alphabets have some old letters from the Indian, several characters borrowed from the Gurumukhi or Gujerati alphabets, overlaid by the Devanagari.

Three alphabets are used in Tibet, namely, the ecclesiastical Utshen or Dvoujam, primitive forms which are said to have been cut on wooden blocks for printing in the 7th century; the Umin, from the northern alphabet of India, is a cursive form; and the Khyugagi is still more so.

The Kchab or Passepa is said to have been inveuted by the Grand Lama Bachspa (Pa-sse-pa) in A.D. 1259, during the reign of Kublai Khan. Five of the letters added to the Mongol Galik alphabet are still used by the Kalmuks on the Lower Volga.

The *Dravidian* alphabets of Southern India were derived from the character of the western cave temples, and as early as the 4th century A.D. This gave birth to separate types. The first of these, represented by the inscriptions of the Vengi and Chalukya dynasties of the Dekhan, was the source of the Telugu and Canarese alphabets; while from the other, represented by the Cera inscriptions, proceeded the Tamil alphabet, the Tulu, the Malealam, and the Grantha or book alphabet, used by the Tamil Brahmans for the Sanskrit transcriptions of their sacred books. From it are derived two vernacular alphabets in use on the Malabar coast; one is the Tulu Grantha and the other the Malealam, from which several characters were borrowed by the Christians of St. Thomas in order to supplement the Syria (Karshuni) alphabet which they obtained from the Nestorian missionaries.

Several of the Tamil letters are supposed to have been obtained from the ancient Vatteluttu or Vattezbattu, which is still in use by the Moplah of S. Malabar.

Maldive alphabets are two. The old Dewehi Hakura is derived from the Dravidian alphabets of the mainland. It is written from left to right, and is still in use in the Southern Atolls. The newer alphabet of the Northern Atolls is called the Gabali Tana, and is written from right to left like the Nashki alphabets. Nine of its 18 letters are merely Gobar or Arabic ciphers with phonetic values assigned to them; the other 9 seem to be Telugu-Canarese numerals.

Singhalese has an isolated alphabet of the Pali class, but modified by early Grantha influences. It is confined to the southern half of Ceylon, Tamil occupying the northern.

Burma, Siam, Pegu, and Cambodia employ the Pali alphabet in conjunction with another character apparently of somewhat different origin.

There are three Burmese forms. These are essentially identical, but are very dissimilar in appearance. They are the Kyouk-tsa or stone writing. The square Pali is used in their sacred books; and the Tsa-lonh or round is their ordinary writing, and is scratched on palm leaves.

The Siamese use the square Pali for their sacred books, but have an elegant cursory character for ordinary use.

The Lao, a Siamese race, as also the Cambodians, have two alphabets,—an ecclesiastical and a secular.

The Lepcha or Rong alphabet, used by the people of Sikkim, is supposed to belong to the Ahom group.

The Annamese possess a script which has been adopted from the Chinese phonograms.

The Eastern Archipelago languages are very numerous. Mr. A. R. Wallace names 59 of them, but the writing characters are only eight or at most nine in number. The Javanese alphabet, like all others in the Archipelago, is written from left to right, each letter is distinct and unconnected, and the writing is perpendicular and not slanting. It is the character used for the Javanese proper, the Sunda, the Bali, and it is believed the Lombok, and including Palembang

in Sumatra; it is current among twelve millions of population.

In Sumatra, beginning from the west, the first evidence of a native written character is among the Battak, and it is singular that a nation of cannibals should possess the knowledge of letters. There was assuredly nothing of the kind in Europe or continental Asia until long after men had ceased to eat each other. The form of the Battak letters is horizontal.

The Korinchi alphabet, among the people of this name in Sumatra who border on Menangkabau, has 29 characters, and consists of horizontal or slightly raised scratchings.

The Rejang is the alphabet of Lemba and Pasummah on the western side of Sumatra. It consists of 23 substantive characters, formed of upright strokes.

The Lampung nation, which occupies that portion of the south-western side of Sumatra which lies opposite to Java, divided from it only by the Straits of Sunda, has an alphabet of 19 substantive letters with double or treble consonants, making them up to 44.

The Acheen and Malay of Sumatra are written in the Arabic character.

The Bima alphabet, formerly in use amongst the Bima people in the island of Sumbawa, east of Sumatra and Java, has now given way to the alphabets of the Celebes.

In Celebes are two distinct alphabets,—Bugi and Macassar. The Bugi, at present in use over the whole island, extends to Bouton and Sumbawa, and wherever the Bugi nation have settled or colonized. The modern Bugi has 23 substantive characters, consisting mostly of small segments of circles running horizontally. The Bugi letters have no resemblance to those of Sumatra or Java, or even to the obsolete alphabet of Sumbawa. The other alphabet of Celebes is now obsolete.

The last alphabet of the Archipelago is the Philippine, that of the Tagala nation of the great island of Luçon or Luçonia, and consists of 13 characters. It is the only one existing in the whole of this group, and seems at one time to have been used among the civilised tribes of the neighbouring islands, having spread even to Magindanao and Sulu. The forms of the letters are rather bold and more complex than that of the Sumatran alphabets.

Thus in the Archipelago are nine distinct alphabets, but Dr. Taylor says the Sumatra alphabets are degraded types of the old Kawi. He also says that the prototype of the Eastern Malay alphabets seems to be the Eastern cursive alphabet, which is represented by the Vengi and Chalukya inscriptions in the south, and by the Assam inscriptions in the north. The Tagala is a type of the Eastern Malay alphabets, and is the prototype from which the alphabets of Celebes and Macassar have been derived. The Tagala alphabet must have been conveyed by mariners from the Indian shores.

Javanese letters, also, are based on an alphabet of the Pali type, obtained through the old Kawi, known from copperplate grants of the 9th and 10th centuries. The ancient Kawi of Java is called there the Buddha's alphabet, Akchara Buddha. The modern Javanese has additional letters derived from an earlier alphabet, and is also used in Borneo.

The Corean is a primitive form of the Indian alphabet, supposed to be introduced by Buddhist teachers. It is from an ancient Pali or Tibetan type.

At present, in the south and east of Asia, the Roman and Italic characters, with slight diacritic points, are used everywhere by the British, French, Dutch, Portuguese, and Spaniards, alike in writing, printing, and engraving, and the simplicity and the facility of these forms commend them. The plan of transcribing oriental languages by Roman letters was first used in India and Japan by the Jesuits of the 16th century. Books printed by them at Goa about A.D. 1586, and at Amacosa (Japan), still exist.

Throughout all the south and east of Asia there are many races and numerous broken tribes who remain unlettered, though dwelling in the midst of civilisation. Such tribes affix their marks to documents, the implement or weapon in use with them, a dagger, a staff, a balance, a trowel, etc.; those of them who do write with letters have adopted one of the alphabets of the more advanced nations around them. The helot or predial slave races, known in the Peninsula as the Pariah, the Holar, the Mhang, the Mhar, have for two thousand years been dwelling as the village labourers, in hourly contact with people following the Buddhist and Brahmanical teachings, but they have not acquired either the religion or the learning of their masters. The Gujar and Chamar of N. India are all illiterate. The great Gond nation, now partly under Muhammadan rule, partly under British sway, have no written character of their own, and very few of them know how to read or write; the same remark is applicable to the Bhil, the Mundah, Ho or Kol, the Kond or Ku,—perhaps all the Kolarian races. The Ahir, the Med, Mer or Meena, the Gonds in Bustar, the forest or mountain races, the Chaura, Saura, Suar, Chensuar, the Yanadi, and the Korawa of the eastern side peninsula, the Toda, Kotah, Badaga, or Irular of the Neilgherry Hills, do not know how to read or write, nor is it known that any of the Kurb or Kurumbar race of the Peninsula of India can do either. This is remarkable, because with their great flocks they must have numerous sales, the written record of which would be useful to them; but this remark is equally applicable to many other races engaged in trading transactions, such as the Binjara or Lambara, who till recently were the chief carriers throughout India, the Chakili or Chamar, leather-workers; the Mali or gardener races; the Upuravar; the Beldar or Waddara, labourers, road-makers, tank-diggers, who take great contracts for roads and other public works; and the smaller broken tribes of Beder or Veddah of the Peninsula and Ceylon; the Rhodia of that island, the Yerkala, the Kaikara, the Baura, the Makwa, and many others.

The Mongol and Manchu of Central Asia have characters which they use in writing. It is not known whether the tribes near the Chinese frontier and Tibet, the Gyami, Gyarung, Tak-pa, Man-yak, Thochu, Sok-pa, Horpa, have any knowledge of letters; and the same remark is applicable to the broken tribes in Nepal, particularly to the languages of the Kiranti group in East Nepal. It is not known that any of the tribes near the valley of Assam, the Aka, Dofla, Abor, Bodo, Dhimal, Koch'h, Garo. Naga, Mishmi, Miri, Mikir, Singpo, Shendu, or Khassya have any written

tongue. The Rev. Dr. Mason and Mrs. Mason taught letters to the Karen, but the Ku-ki, Ku-mi, Ka-mi, Pwo, Khampa, Kam-ti, Shan, and other tribes in the north-east of Burma are not known to have any scriptory means of intercommunication.

The nations of Europe write and print from left to right.

The Chinese, Japanese, and Mongol write in perpendicular lines.

Some of the ancient Greeks used the double mode, called the boustrophedon or plough-wise, running from the right to left, and left to right in the alternate lines.

Machines called type-writers have been invented for printing Roman and Italic characters, and for figures. — *Dr. Isaac Taylor, M.A., LL.D., on the Alphabet; Professor Max Muller, Ancient Sanskrit Literature; Thomas' Prinsep's Antiquities; Professor A. H. Sayce; Lubbock's Origin of Civilisation; Crawfurd's Dictionary; A. R. Wallace, Malay Archipelago; Layard's Nineveh*, ii. p. 184; *Weber*, p. 15; *G. Rawlinson*, ii. p. 376; *Renan, Histoire des Langues Semitique.* See Languages.

WULUR, a lake 12 miles long, in Kashmir, through which the Jhelum flows; on its little island are the remains of one of the ancient temples of Martund.—*Adams.*

WUN, chief town of Wun district, Berar, in lat. 20° 3′ N., and long. 79° E.; pop. (1876-77), 4233. The greater part of the district consists of a wild and hilly country, formed by offshoots from the Ajunta chain, which runs from west to east across the south of Berar. The mass of the Hindu population consist of Kunbi, Bari, Mali, Dher, Kolam, etc. The Banjara number 36,948; while the hill tribes consist chiefly of 37,348 Gonds. In Wun district the Banjara form two distinct tribes, the Charans and the Mathura, while the mendicants are called Dhari. The women distinguish themselves by their deer-horn ornaments, and by the beautiful embroidery worked with their own needles on their skirts and bodices. They do not permit their daughters to marry before puberty. When grown up, the young girl is not allowed to sleep on a bed, and for a month after marriage the bride appears veiled before the rest of the community. Evidence of the occurrence of coal has been obtained throughout 13 miles of country, from Wun to Papur, and for 10 miles, from Junara to Chicholi, opposite Nokora.—*Imp. Gaz.*

WUNT. Sansk. The second titular honour given to a Hindu in India, as Raja Eshwara Doss, Dyawunt Bahadur, also Raja Indrawunt Bahadur. Wunt, maharaja, raja, raja-raian, rai-raian, bahadur, and rae are the titles granted by rulers to their Hindu civil officers; wunt being the highest, and rae the lowest in grade.

WURNA SANKRA. Sansk. Mixed castes, said to be employed in Northern India to include new castes admitted into the Hindu religion. The only mixed castes to be found in Southern India consist of illegitimate children, the offspring of the dancing girls attached to the temples, of whom the girls are brought up to their mothers' occupations, and the boys as temple florists and musicians.

WU-TSAU. Chin. Tiger poison. This is a well-prepared extract from a root grown in the interior of China, which presents all the appearance of Aconitum ferox. A very minute quantity of the Wu-tsau, when put on the tongue, produces intense tingling and numbness in the tongue and lips after it is chewed. The Wu-tsau is the name of the plant from the root of which the poison is prepared. It is used by certain tribes in the interior of China.

WUTTAN. Arab. A native country, a patrimony, a property. Wuttundar is a class of hereditary officers in Central India, and means there a holder of native or home rights. Properly Watu.—*Malcolm's Central India*, i. p. 176.

WUTTU, a Rajput race in the tracts along the Sutlej, about Pak-pattan.

WUZAET. Arab. A daily performance of duty.

WUZAR. Pukhtu. Lamentation.

WUZEEREE, one of the largest and most important tribes in Afghanistan, brave, warlike, but predatory. They hold the rugged and lofty hills adjoining the south-west portion of the Kohat district (that is, the western part of the Miranzai valley and the hills round Bahadur Khel), and the north-western border of the Dehra Ismail Khan (that is, the valley of Bannu, and the plains of Murwut and Tank). These hills run down to the point where the great Sulaiman range commences; near this point the Gomal pass debouches from the hills almost opposite Tank. The valley of the Gomal forms the Golari pass, through which a large portion of the traffic to and from Afghanistan and Central Asia enters into India, and scarcely inferior to the Khaibar pass of Peshawur or the Bolan pass of Sind. The hills on either side of this pass are held by Wuzeeree; the Wuzeeree Hills form the western limit of the Joorduk pass, which is the main line of communication between Bannu and Kohat. Just to the east of this pass lies Bahadur Khel, and also the villages of Kharra and Lutumur, at which three places the Trans-Indus mines are situated. The Wuzeeree Hills also command the outlets of the Kuram and Goombeli rivers into the Bannu valley. The Wuzeeree tribe are numerous, and subdivided into various sections. The birthplace of this race would seem to be the snowy range which runs to the south-east of Jalalabad and Kābul. From this range they appear to have moved downwards towards the Dehrajat border. They are noble savages, of pure blood, pastoral habits, fierce disposition, and wild aspect. They can muster, probably, 20,000 or 30,000 fighting men. But though they are less addicted to internecine contests than other hill tribes, they are yet not apt to join all these forces together against an external foe. As soldiers, they are not equal to the most martial tribes. Many of them live in tents, or in temporary dwellings resembling tents; in the winter frequenting the more genial clime of the lower ranges, and in summer retreating to feed their flocks in higher altitudes. Some of them have engaged in cultivation, and have encroached on the weaker tribes of the plains; of these, again, many will only cultivate during the cold months, and as the heat approaches will reap their crops and retire to the mountains. Some members of the clan who have taken up their abode as cultivators in the Bannu valley, have become British subjects.

WYNAD, the highland division of the Malabar district, Madras, lying between lat. 11° 27′ and 11° 58′ N., and between long. 75° 50′ 45″ and 76° 41′ E.; containing (in 1881) 16 amshoms or parishes, and 88,091 inhabitants, and covering an area of 1180 square miles. The Wynad consists of a table-land amid the Western Ghats, 60 miles long by 30 broad; average height above sea-level, 3000 feet. Bounded on the north by Coorg, on the east by Mysore (Maisur), on the south by the Neilgherries and Ernad taluk, and on the west by Calicut, Kurumbranad, and Kottayam taluks of Malabar. Gold seems to be almost universally distributed throughout the soils and quartz veins of the Wynad. Gold has always been washed for in the beds of the Wynad rivers, and from 1877 to 1881 there arose the wildest speculation in the form of 21 gold mining companies, with capital to the amouut of about three millions; but in 1882 the bubble burst. The forests contain much valuable timber. In the teak belt are several bands of Kurumbar, some of the Jani, and others of Mooly caste. They amount to about—Kurumbar, 200; Gurchea, 50; Panniar and Pooliar, 100; Chetty and squatters, 50. The former live entirely in the forest. They are the only axe-men, and without them it would be difficult to work a forest. The Kurumbar, through their headmen, are held responsible, and the Chetty are also responsible for their Panniar or farm slaves. The Kurumbar has no lack of labour. His services are constantly called for by the wood contractor and the planter. They will not leave their haunts in the forest for any time.—*Rep. Con. For.* p. 26, and 1861-62, p. 1.

X

X is the 24th letter of the English alphabet, and has been borrowed from the Greek; there is no such letter in any Asiatic language. At the beginning of words it has the sound of z; at the end of words and in the middle and end of some, it takes the sound of ks, as in lax, axis; but in the middle of other words it has the sound of gs, as in example, exhaust. It has been sometimes the practice to represent the Sanskrit ksh by the letter x, but ksh is an acknowledged compound of k and sh, and its representation therefore by a single letter is not advisable, nor is it necessary.

XAGANOS. Gr. The Khakan or Khan of the Tartar races.

XANADU, the seat of Chengiz Khan in China.

XANTHIUM ORIENTALE. *L.*

X. Indicum, *Kon.*

Bun-okra, . . .	Beng.	Paraswapu chettu,	Tel.
Arishta, . . .	Sansk.	Tala noppi chettu, .	,,

The Indian xanthium is of all India; its leaves are used as a yellow dye, and its prickly fruit as a demulcent. The prickly involucre is tied to the ear-ring to cure headache. The name means headache tree.

XANTHIUM STRUMARIUM.

Si-rh, Ts'ang-rh, .	Chin.	Khagarwal, . .	Hind.
Gokru, Kalan, .	Hind.	Lane-tsuru, . .	,,
Tsur, ...	,,	Wangan-tsuru, .	,,

This plant was formerly used in medicine in Europe, and its burs and the prickles on them are still employed in India and China; its seeds yield a lamp oil, and are made into a flour. An extract is prepared from the roots, and in China applied to ulcers.—*Smith.*

XANTHOCERAS SORBIFOLIA. Wan-kwang-kwo, Chin. A beautiful flowering tree, common in Pekin, the N. of China, at King-chau or Peh-chi-li.—*Smith.*

XANTHOCHYMUS PICTORIUS. *Roxb.*

Stalagmitis pictorius, *G. Don.*

Dampel, .	Beng., Hind.	Chikati mraku, . .	Tel.
Rata, .	Ghorka, Singh.	Tamalamu, . . .	,,
Iswaramamadi,	Sing., Tel.		

This beautiful tree is remarkable for its black flowers. It grows in the mountainous districts of S. India, and is very plentiful in the Rangoon, Pegu, and Tounghoo districts. It was formerly supposed to be one of the trees yielding gamboge, but the product is found not to possess the elements of gamboge. It is very abundant in the woods in Coorg, is also met with in Wynad, below Sisparah on the Neilgherries, S. Canara, the western slopes of Neilgherries, and other localities in the western side of the Madras Presidency and on the Bombay Ghats; and it is cultivated in gardens.—*Roxb.* ii. p. 633; *Rohde, MSS.*; *Hind. Theat.* ii. p. 101.

XANTHOPHYLLUM FLAVESCENS. *Roxb.* A large tree, a native of the hilly parts of the province of Chittagong.—*Roxb.* ii. p. 222.

XANTHOPHYLLUM VIRENS. *Roxb.* Gundi, Beng. A large timber tree of the forests of Sylhet; wood remarkably hard and useful.—*Roxb.* ii. p. 221.

XANTHORRHŒA, *sp.*, the yellow gum tree or grass tree of N. S. Wales. The natives produce fire by rubbing two pieces of the trunk together.—*Bennett*, i. p. 62.

XANTHOXYLACEÆ. *Lindl.* A natural order of plants, comprising the genera Brucea, Xanthoxylum, Blackburnia, Lacuris, Toddalia, Ailantus, Eurycoma, and Ptelea. All this order, to a greater or less extent, possess aromatic and pungent properties. The Ailantus are large trees, and their timber is used for various purposes in the countries in which they grow. A. glandulosa is a native of China and the Moluccas, where it is called Ailanto. It attains a height of 60 feet. When the bark is wounded, it gives out a resinous juice, which hardens in a few days. The wood is hard and heavy, and is susceptible of a very fine polish. A. Malabarica is a large tree, a native of Malabar. The wood is used for making sheaths for spears, etc. A resinous juice flows from the bark when wounded. The fruit is triturated with maize, and mixed with rice in decoction, and used as an application in ophthalmia. The cosmetic wood of Mergui is from one of the Xanthoxylaceæ, and is a useful, fragrant wood, sold in the bazar, which is said to come from Mergui, but Mr. Mason never saw the tree; and Brucea antidysenterica, the Woginos of Bruce, was long supposed to yield the false Angustura bark, and from which the alkali Brucia was obtained; but the former is ascertained to be the bark of Strychnos nux vomica. —*Eng. Cyc.*; *Mason*; *Royle.*

XANTHOXYLON, a genus of plants belonging to the Xanthoxylaceæ, of which the following are S. Asia species:—

X. alanthoides, *S. and Z.*, Japan.
X. alatum, *Roxb.*, Nepal, N. India.
X. Avicenniæ, *D. C.*, China.
X. budrunga, *D. C.*, Assam.
X. hostile, *Wall.*, Himalaya.
X. limonifolium, *Wall.*, Khassya.
X. nitidum, *D. C.*, China.
X. obovatum, *Wall.*, Khassya.
X. ovalifolium, *W.*, Shevagherry Hills.
X. piperitum, *D. C.*, Japan.
X. planispinum, *S. and Z.*, Japan.
X. rhetsa, *D. C.*, Peninsula of India.
X. schinifolium, *S. and Z.*, Japan.
X. sepiarium, *W.*, Pulicat Hills.
X. triphyllum.
X. violaceum, *Wall.*, Nepal.

Species of this genus occur in China and Japan; extend in India to Simla, in lat. 31° N., where X. hostile, differing little from X. alatum, is found. Species run southwards along the Himalaya to Nepal and Sylhet, then to the Malay and Indian Peninsulas, and to the islands on the east of the African continent. In India, X. budrunga, rhetsa, alatum, and hostile, are used wherever they are indigenous, for the warm, spicy, pepper-like pungency of their capsules, a property which is participated in by their bark and other parts. The capsules and seeds of X. hostile, called tejbul by the natives, are employed in Northern India for intoxicating fish, and chewed as a remedy for toothache; they are also given as the Faghureh of Avicenna, as X. piperitum and Avicenniæ are in China and Japan, and are considered an antidote against all poisons. Dr. Royle thought that in many cases they would be of considerable use as a stimulant remedy. The bark of Xanthoxylon ochroxylon and the pods of Acacia tortuosa are used for tanning in the West Indies.—*Roxb.; Royle, Ill. Him. Bot.* p. 157; *Murray.*

XANTHOXYLON ALATUM. *Roxb.*

Shuh-tsiau, . . CHIN.	Hwa-tsiau, . . . CHIN.
Ch'uen-tsiau, . . ,,	Pepper-wort, . . ENG.
T'sin-tsiau, . . . ,,	Durmur, . . . HIND.

A native of Nepal and the hilly countries north of Bengal, Rohilkhand, and Oudh, eastward to China; flowering in Calcutta in the hot and rainy seasons. Every part of the plant possesses a peculiar aromatic pungency, and the jet-black seeds are used medicinally by the natives.—*Roxb.; Smith.*

XANTHOXYLON AVICENNIÆ, Fagara Avicenniæ, *Roxb.*, a native of China, a powerful stimulant, and used as an antidote against poisons.—*Roxb.*

XANTHOXYLON BUDRUNGA. *D.C.*

Fagara budranga, *Roxb.*

Toung-than, . . BURM.	Young-tha-ji, . . BURM.

A small thorny tree of Assam, and in Sylhet is called budhrung. The seeds have a warm, spicy flavour, and the natives use them medicinally. The dry capsules are found in the bazars under the name of Kek-ka-la. The bark and large thorns of the trunk are used. The seeds abound in a rich aromatic oil, and are sold in the bazars under the term tejbul or tezbul. The tree is about 20 feet high in the Pegu and southern parts of the Tounghoo districts, where it grows upon the banks of streams. The fruit is about the size of a pea, and the outer coat contains an exceedingly fragrant balsam.—*Roxb.; M'Clelland.*

XANTHOXYLON HOSTILE. *Wall.*

Tirmal, Tezmal, CHENAB.	Timboor, Timbar, JHELUM.
Tezbul, ... HIND.	Timbroo, . . KANGRA.

This scandent shrub is common in N.W. India and the N.W. Himalaya up to near the Indus, also in Kaghan, in Kashmir, and Kamaon. It is strongly armed with prickles, hence its name hostile. Its twigs serve the natives as tooth-brushes. Thicker branches are useful in carving and turnery, are made into walking-sticks and clubs, and are used by fakirs to triturate the hemp plant in preparing their beverage. In using a triturator possessing pepper-like aromatic qualities, they save the pepper, which is usually added to hemp compounds. The capsules and seeds are chewed as a remedy in toothache, also the sharp prickles which are attached to the bark by large bases. The aromatic fruit is used as a condiment. The capsules and seeds are used for intoxicating fish, and are supposed to be the Faghureh of Avicenna.—*Honig.; Mr. Thompson; Stewart; Cleghorn.*

XANTHOXYLON PIPERITUM. *D.C.*

Fagara piperita.	Wu-chu-yu, . . CHIN.

It grows in India, in Japan, and in China. It furnishes a powerful aromatic, used by the Chinese in the room of ginger and pepper. The active principle resides chiefly in the fresh leaves, the dry bark, and the pericarp. Physicians, in sore throats, apply a poultice made of the bruised leaves and rice flour, and its powdered leaves are mixed with camphor, and applied to the Porrigo decalvans of children. X. budrunga, rhetsa, alatum, and hostile are used, wherever indigenous, for the warm, spicy, pepper-like pungency of their capsules.—*Roxb.; O'Sh.; Lindley's Fl. Med.* p. 215; *Royle*, p. 157; *Smith.*

XANTHOXYLON RHETSA. *D.C.*

Fagara rhetsa, *Roxb.*

Mulila, . . . MALEAL.	Rhetsa maram, . TAM.
Kattoo-keena-gass, SINGH.	Rachcha manu, . TEL.

Grows in the Central Province of Ceylon, and near Colombo, also on the coast hills of Peninsular India, the Circars, the Animallays, the western forests generally. It is a large tree, armed with sharp prickles; capsules have a strong aromatic taste; the seeds are used instead of pepper. In the Tamil language, Rhetsa maram means council tree, as it is under the branches of this tree that the hill people assemble to discuss all matters of public interest.—*Roxb.; Thw.* i. p. 69; *Voigt; Riddell.*

XANTHOXYLON TRIPHYLLUM. *Juss.*

X. Zeylanicum, *D.C.*	Loonoo-ankenda-
Evodia triphylla, *D.C.*	gass, ... SINGH.
Fagara triphylla.	

Very abundant in Ceylon up to an elevation of 5000 feet; a var. β occurs near Ratnapura. A resin is obtained from this tree, but in too small quantities to be useful in a commercial point of view.—*Thw.* i. p. 69.

XAVIER. Francis Xavier was born 7th April 1506, in Castle Xavier, at the foot of the Pyrennees, about 21 miles from Pampeluna, and derived his pedigree from the kings of Navarre. At college he became acquainted with Ignatius Loyola; and, as Father Francisco Xavier, he was a joint founder, with Loyola, of the order of Jesuits, and after his death was canonized by the Romish Church. Jesuit Christians have been the most politic of all proselyte makers. Everywhere theirs has been a career at least of temporary triumph, in China, India, and the regions of the South Pacific. He sailed for the east on the 7th April 1541, and, after a stay of six months at Mozam-

bique, he landed at Goa on the 6th May 1542. In April 1549 he embarked at Goa for Japan, sailing to the region of the further east with his Bible, to preach the gospel in the name of the Supreme Church. Xavier quitted Japan for China in 1551, and on the 14th April 1552 he again sailed from Goa for Malacca. He died on the 2d of December 1552, at Shan-Shan, on the Canton river, not far from Macao. The coffin was afterwards taken to Malacca, and then to Goa.

In 1547, the salvation of Malacca from the Achinese was ascribed to the sudden appearance of Saint Francis Xavier, who was then on his pilgrimage through the east, and had recently made 600 or 700 converts among the pearl fishers of Manaar. At the period of his arrival, Malacca was threatened by a formidable invasion from the opposite island of Sumatra, which was delayed, though not abandoned. He visited Ternate in 1546. He afterwards returned to Malacca, and visited Japan between the years 1547 and 1549, and by his efforts the Christiau religion was fairly established in Japan by 1550; but in the year 1597 their persecutions began, and numbers, variously stated at from 300,000 to 1,000,000, were massacred and hurled from rocks.

He was successful in his mission among the Paravar fishermen of the Tinnevelly coast. They had received protection from the Portuguese against the oppression of the Muhammadans, and many of them had already become Christians, but Xavier completed the work, and they acknowledge themselves his children or disciples. — *MacFarlane's Japan; St. John's Ind. Arch.; Hough, Christianity in India; Abbé du Bois; Bik.*

Padre Geronimo Xavier, author of a work, The Mirror of Holiness, a Life of the Messiah, written at the request of the emperor Akbar. He was a relative of St. Francis Xavier.

XENOPHON, with 10,000 Greeks, conducted by the younger Cyrus, marched from Sardis to the neighbourhood of Babylon. The object of Cyrus was to place himself on the Persian throne, in the place of his elder brother, Artaxerxes Mnemon; but as Cyrus fell at the battle of Kunaxa, within six months of the commencement of the expedition,—it set out in March or April B.C. 401, — after his death they commenced their retreat. This occupied them one year, and in October or November B.C. 400 they recrossed the Bosphorus of Thrace to Byzantium. The ferries of rivers in India and the south of Asia are crossed in various ways, but on the Tigris and Euphrates, the Upper Indus and its affluents, the practice of 3000 years still continues. Xenophon's 10,000 were ferried over on inflated skins, and three slabs in the British Museum show the representation of the king of Assyria crossing the Euphrates in this mode.

XERXES I., the Great, the Ahasuerus of Scripture, B.C. 485-465. Xerxes II., B.C. 424.—*Bun.*

XIMENIA ÆGYPTIACA. *Roxb., Juss.*

Balanites Ægyptiaca.

Pen-lay-hseè, . . Burm.	Garee, ... Tel.
Hingen, Hingot, . Hind.	

Grows in the Kotah district. The shell of the nut is used to make crackers in fireworks. Wight gives Ximenia olacioides, 1861.—*Roxb.*

XIMENIA AMERICANA. *Linn.*

Pen-lay-hsee, . . Burm.	Nakkera, . . . Tel.
Konda nakkera, . Tel.	Ura nakera, . . . ,,

This tree grows in the Godavery forests. Its fruit is used in medicine, and the powder of its yellow-coloured wood is used by the Coromandel Brahmans in their religious ceremonials. The fruit resembles the flavour of the peach, as does the kernel of the nut; the leaves also smell like the common laurel. In Masulipatam and Guntur the ryots distinguish two kinds,—this and a small stunted kind, which grows in their fields, and which they say never attains a larger size. They use the bark medicinally for their cattle. It is X. Russelliana, *Wall.—Roxb.; Elliot; Beddome.*

XIPHIAS GLADIUS, the sword-fish, has been renowned since the times of Ælian and Pliny for its courage in attacking whales, and even ships. Like the tunny and bonito, it is an inhabitant of the deeper seas, and, though known in the Mediterranean, is chiefly confined to the tropics. The dangerous weapon with which nature has equipped it, is formed by the prolongation and intertexture of the bones of the upper jaw into an exceedingly compact cylindrical protuberance, somewhat flattened at the base, but tapering to a sharp point. Its assaults upon the whale have been incontestably established.

Xiphias platypterus, the Indian sword-fish, is about 6 feet long. It swims swiftly, and makes rapid darts amongst a shoal of fish, and, after transfixing as many as possible on the beak or sword, it shakes them off by a retrograde movement, or by moving the sword violently from side to side, and eats them.

In the seas around Ceylon, sword-fishes sometimes attain to the length of 20 feet, and are distinguished by the unusual height of the dorsal fin. Those both of the Atlantic and Mediterranean possess this fin in its full proportions only during the earlier stages of their growth. The Indian species are provided with two long and filamentous ventral fins, and have been formed into the genus Histiophorus. Histiophorus immaculatus was previously known only by a single specimen, captured in the Red Sea by Ruppell.—*Tennent's Ceylon*, p. 328; *Bennett, Whaling Voyage*, i. p. 270.

XYLIA DOLABRIFORMIS. *Benth.*

Inga xylocarpa, *D.C.*	Acacia xylocarpa, *Willd.*
Mimosa xylocarpa, *Roxb.*	
Pyn-ka-do, . . . Burm.	Boja, . . . Godavery.
Tirwa, ... Can.	Irool, ... Tam.
Iron-wood, . . . Eng.	Konda tangadu, . Tel.

This large tree, the iron-wood or irool, is widely distributed in the forests of the Madras Presidency, in the forests at the foot of the South Canara and Malabar Ghats; it is often very gregarious, forming forests of itself to the exclusion of almost all other trees, but it is seldom of fine growth when found in this state. It flowers in March and April when destitute of leaves, and ripens its seed in August and September. The wood is of a very dark-red colour, fading to dark-brown, heavy, hard, close-grained, and not easily worked; when planed up, the surface has an unctuous feel and not very agreeable smell. A cubic foot unseasoned weighs 68 to 74 lbs., and 58 lbs. when seasoned, and its specific gravity is ·928. It is excellent for posts, railway sleepers, naves of wheels, and all purposes demanding great strength, and is in use for building purposes, for knees in shipbuilding, house and bridge posts, ploughs, boat anchors, the construction of carts, and other purposes.—*Beddome, Fl. Sylv.*

XYLOBALSAMUM of the ancients is the wood of Balsamodendron Gileadense, *Kunth.* M. Fee ascribes to B. Berryanum three distinct products, —balsam of Mecca, a wood called xylobalsamum, and fruits termed carpobalsamum. Tradition is rich in anecdotes relative to the origin of this balsam. The Muhammadans relate that it sprang from the blood of the slain in Mahomed's conflict with the tribe of Harb? and that the prophet used the balsam for the resuscitation of the dead. It is much used in medicine by the hakims as a stimulant, tonic, and somewhat astringent remedy, and as an external application to indolent sores. It is also employed as a perfume and cosmetic.—*Faulkner; Fee.*

XYLOCARPUS GRANATUM. *Kœn.*

Carapa Moluccensis, *Lam.*	Granatum littoreum, *Will.*
Pussoor, ... BENG.	Sea cocoanut, . . ENG.
Pen-lay-pyoun, . BURM.	Madahul, . . MALAY.
Pen-lai-ung, . . ,,	Kadul-gaha, . . SINGH.
Pen-lay-ung, . . ,,	Kandalanga, . . TAM.

This xylocarpus tree (from ξυλον, wood, and καρπος, fruit) grows in the south of Ceylon, in the Sunderbans, and in the forests of the delta of British Burma. Very abundant all along the seashore from Amherst to Mergui. It is used by the Burmese for all parts of houses, posts, flooring, walls, etc.; is strong, and splits with difficulty. A cubic foot weighs 47 lbs. Is recommended for handspikes, helves, spokes, and handles of tools, also for shot-boxes and packing-cases. Fruit ripens in June and July. This is not the cocos-de-mer of the Seychelles, but is common in the mangrove swamps; and, growing near the shore, its fruit falls into the water and floats out upon the sea, which gives rise to its name. The fruit is not edible, but is exceedingly astringent, and is regarded by the natives as a specific in cholera.—*Roxb.; O'Sh.; Mason; Brandis; Thw.; Captain Dance.*

XYLOCOPA TENUISCAPA. *Westw.*

X. latipes, *Drury.* | Carpenter bee, . ENG.

A hymenopterous insect which perforates large beams of timber, as also living trees, by boring holes through them. On one occasion, at Kurnool in the Ceded Districts, one of them was seen to kill a sparrow by a single thrust of its sting. Any intruder within the precincts of their nests instantly becomes an object of suspicion and attack, and as the unlucky sparrow was flying towards the corner of the hospital, the bee assailed it, struck it with its sting, and the bird fell dead. On raising the skin from the bone, a small reddened spot on the fore part of the skull indicated the point at which the fatal weapon had entered.—*Drury; Tennent's Ceylon.*

XYLOMELUM PYRIFORME, the wooden pear tree of Australia, grows 15 to 20 feet high, and 6 to 8 feet in circumference. Its wood is of a dark colour, prettily marked, and suited for veneering.—*G. Bennett*, p. 322.

XYLOPHYLLA ANGUSTIFOLIA, one of the small Euphorbiaceæ, shrubs growing to the height of three feet; the colour of the flower is yellow and red.—*Riddell.*

XYLOPIA PARVIFOLIA. *L.* Nattou, SINGH. This lofty, straight tree grows in the southern parts of Ceylon at no great elevation, and abundant in the moist forests about the foot of the Travancore Ghats in the vicinity of Colatoor-palay; flowering in August. Flowers and bark are used by the Singhalese for chewing with their betel. X. aromatica is the Ethiopian pepper.—*Thwaites; Beddome, Fl. Sylv.*

XYLOTRECHUS QUADRIPES. *Chevrolat.* In the Peninsula of India, Borer is a name given to the larvæ of certain coleopterous beetles, which injure coffee trees. There are two, the white and red borer, and the chief of these is the X. quadripes. The large and rapid introduction of coffee-growing into Ceylon and India has shown that the plant is liable to be attacked by many enemies, and ignorance of that has been the cause of much loss. Coffee trees in Coorg have also been injured by the rot, a disease resulting from improper pruning. The rot attacks and decays the centre of the stem. In Coorg, when the tree is attacked by the borer, the leaves become yellow and droop. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the females near the root of the tree, and the pupa bores a tunnel up the heart of the plant.—*Bidie on Coffee Planting.*

XYRIDACEÆ. *Lindley.* An order of plants with six species of Xyris in the E. Indies, viz. Indica, of all India; lappacea, of Coromandel; pauciflora, of both Peninsulas; robusta, of Sylhet; schœnoides, of Nepal. Properties unimportant.

XYRIS INDICA. *Linn.*

Dali doob, . . . BENG. | Kotsjelliti pullu, MALEAL.

A plant of China and India, with conspicuous yellow flowers on imbricated scaly heads, often seen in the Tenasserim paddy fields. It is said by Agardh to be used as a remedy in itch and leprosy. In Bengal it is valued for ringworm.—*Mason; Roxb.*

Y

Y is the 25th letter of the English alphabet; it derives its form from the Greek y, hence it is called in Spanish and French the Greek i. At the beginning of words and syllables it is a consonantal element; in the middle and end of words it is a vowel, being precisely the same sound as i. It is sounded as the English i long when accented, as in defy, rely; and as i short when unaccented, as in vanity, glory, synonymous. In a great number of English words derived from the Saxon, the Saxon letter g has become y, as gear into year; daeg into day; gealew into yellow. In Bengali, when uncompounded, its power is that of j, the reverse of the sound in the German alphabet, where j has the sound of y.

According to the laws which determine the change of sounds in the Turkish language, the change of y into t when it occurs at the end of a word is very frequent. Andkhoi, or Andakhud, or Andakhut is a Mongolian word meaning united happiness.—*Vambery, Bokhara*, p. 307.

YA. ARAB. The Oh! interjection of the Muhammadans, as Ya Karim, Oh Merciful! Ya Allah, Oh Lord! Ya Kabir, Oh Almighty!

YABOO, a small horse of the mountains near Kābul.

YADAVA, descendants of Yadu, the eldest son of Yayat and Devayani, a nomade pastoral

race of ancient India. The date of their arrival in India is unknown. At the time of Krishna's birth they were in the neighbourhood of Mathura, now called Muttra, a town on the banks of the river Jumna, and about 120 miles south of the site of the ancient city of Hastinapur. They dwelt on both sides of the river, on the western bank in the village of Vrindavana, and in the Gokula country on the opposite shore. They afterwards migrated to Dwaraka, on the western coast of the peninsula of Gujerat. Krishna belonged to this tribe, and he induced them to abandon the worship of Indra, and substitute the mountain Govardhana. Violence and disorder prevailed wherever the Yadava settled. Nearly all the tribe was destroyed at Prabhasa during a drunken affray, and others perished in Dwaraka when it was overwhelmed by a tidal wave.

Some of their branches have taken a prominent part in the history of Central Asia, in the valley of the Indus, in the countries now styled the Panjab, Rajputana, and Sind, known in ancient times as the Gete, the Yuti, and now represented by the Jat, Jut, Jet, or J'hut, and by the Yadu Bhatti of Jeysulmir, all dwelling along the valley of the Indus and to the east in Rajputana. A multiplicity of scattered facts and geographical distinctions warrant the belief that the Yadava race had dominion in Central Asia, and were again, as other races advanced, repelled upon India. Budh was an ancestor of a branch of the great Hiudu people of a time prior to authentic history. He is traced up to Brahma, from whom he descends through Atri, Samudra, Chandra or Soma, and Vrihaspati. Budh is said to have married Ila, daughter of Ikshwaku, with whom, therefore, he was a contemporary, and the descendants of this union were, in succession, Pururava, Ayu or Yaou, Nohas or Nohus, and Yayat. Ayu or Yaou is claimed by the Tartar and Chinese genealogists as their great progenitor; from Yayat sprang three great lines, the Yadu, Puru, and Ura or Urvasa, from each of whom came many dynasties ruling on the Indus, in Hindustan, Assam, Ava, and China. The great Hya was a branch of the Yadu; and five members of it formed Panchalika or Panchaldesa, and the seed of Bajaswa at one time occupied all the countries on the Indus. Of the three lines, the Yadu, Puru, and Ura, the Yadu became the most illustrious. The descendants of Budh and Ila were known as the Chandravansa, Somavansa, or Induvansa, all of these terms meaning the Lunar race; but the fame of the Yadu eclipsed the prior designations, and throughout India the Lunar race came to be styled Yaduvansa. The Yadu held territories in Hindustan about Allahabad, but seemingly in small republican states, some of which were staked and lost at play. The relatives then fought for dominion, for 18 days, on the field of Kuru Khet. There was no battle of armies, but a series of single combats, with treacherous, cruel surprises, during which nearly all of the Yadu fell, and at the close, of those remaining, several, amongst whom Krishna was one, emigrated. The story is told in the Mahabharata. After the combats, the Yadu seem to have left the Ganges, to have been expelled from Dwaraka, to have crossed the Indus, passed Zabulisthan, and founded Ghazni and Samarcand, but to have swept back on the Indus into Gujerat and the Indian desert, from which they expelled the Langaha, Johya, Mohila, etc., and founded successfully Tannote, Derrawul, and Jeysulmir, in S. 1212, the present capital of the Bhatti, the lineal successors of Krishna. They are now known as the Bhatti of Jeysulmir, the Jharijah of Cutch Bhooj, the tribes occupying Kerrowlee and Subbulghur on the Chambal, and the Sumaitcha on the Chambal. The great Tuar tribe are also said to have been of Yadu origin. The Bhatti and Jharijah trace their descent from Budh and Krishna, and they may be said to occupy the Indian desert from the Sutlej to the ocean. Budh seems to have been a descendant of the first man, Brahma, and to have been the first emigrant from Sakadwipa or Scythia, into Hindustan, viz. about B.C. 2400. Between Budh and Krishna was a period of 1200 years. But Budh was deified by his descendants; and in Hindu mythology he is described as of Lunar origin, the son of Soma or Chandra or Indu, the moon, by Rohini. The date of the apotheosis of Budh is not known.

There seem to have been 56 clans of the Indu or Lunar race, but the Yadu was at one time the most illustrious of all the tribes of India, and became the patronymic of the descendants of Budh.

The annals of the Bhatti of Jeysulmir, which give the early history of their founder, mix up in a confused manner the cause of their being again driven back into India. Bhatti was the exile from Zabulisthan, and, as usual with the Rajput races on any such event in their annals, his name set aside the more ancient patronymic Yadu. In the Further Doab of the Panjab is a cluster of hills called Yadu-ka-dang. The Bhatti subdued all the tracts south of the Garrah, but their power has been greatly circumscribed since the arrival of the Rahtor. The Jharijah is the most important tribe of the Yadu race next to the Bhatti. Its history is similar.

The most common epithet of Krishna, or Heri, was Shama or Sama, from his dark complexion. Hence the Jharijah bore it as a patronymic, and the whole race were Sama-putia (children of Sama), whence the titular name, Sambus, of its princes. The modern Jharijah, who from circumstances has so mixed with the Muhammadans of Sind as to have forfeited all pretensions to purity of blood, partly in ignorance and partly to cover disgrace, say that the origin is from Sham or Syria, and of the stock of the Persian Jamshid; consequently Sham has been converted into Jam; which epithet designates one of the Jharijah petty governments, the Jam Raj. The Bhatti and the Jharijah are the most conspicuous of the Yadu race; but there are others who still bear the original title, of which the head is the prince of the petty state of Kerrowlee on the Chambal. This portion of the Yadu stock would appear never to have strayed far beyond the ancient limits of the Suraseni, around Mathura, their ancestral abode. They held the celebrated Biana; whence expelled, they established Kerrowlee west, and Subbulghur east of the Chambal. The tract under the latter, called Yaduvati, has been wrested from the family by Sindia. Sri Mathura is an independent fief of Kerrowlee, held by a junior branch.

The Yadu are scattered over Northern India; many chiefs of consequence amongst the Mahrattas are of this tribe, and there are eight saca of the race, four of whom are,—the Yadu chief of Kerrowlee;

the Bhatti chief of Jeysulmir; the Jharijah chief of Cutch Bhooj; and the Sumaitcha Muhammadans in Sind. The rajas of Vijayanagar claimed to be of the Yadu tribe.

The Tuar, though acknowledged as a subdivision of the Yadu, is placed by the best genealogists as one of the 'thirty-six' royal Rajputs, a rank to which its celebrity justly entitles it. Colonel Tod supposes the Yadu to have been of Indo-Getic origin, as their habits of polyandrism would almost demonstrate, and as the best informed of the Jain sect assure us that Nemnath, the twenty-second Budha, was not only a Yadu, but the near kinsman of Krishna. He regards the Yadu to be the Yu-te, or ancient Gete of the Jaxartes, amongst whom, according to Professor Neumann, from Chinese authorities, one of the Shamanean sages sprang, 800 years before Christ. The term Nemeswar probably means the founder of this race, from Nema, foundation, and Iswara, lord. The traditions of the Jat claim the regions west of the Indus as the cradle of the race, and make them of Yadu extraction, thus corrohorating the annals of the Yadu, which relate their migration from Zabulisthan. The Yadu of Jeysulmir, who ruled Zabulisthan and founded Ghazni, claim the Chaghtai as of their own Indu stock, a claim which Colonel Tod deems worthy of credit.—*Tod's Rajasthan*, i. pp. 85, 163.

YADAVA. Sansk. Jadon, Hind. A tribe of Rajput landlords and cultivators dwelling in considerable numbers about Agra and Mathura, in the Central Doab, and in Eastern Malwa. The raja of Kerrowlee is of this tribe. They profess to be descendants of Krishna. Some of their subdivisions are held in little esteem, and are termed Bagri by their neighbours; but they are spirited farmers, and rising in wealth and consideration.—*Wilson, Glossary.*

YADU, founder of the fifty-six tribes (Cha-pan-kula-Yadu) who obtained the universal sovereignty of India, and was descended from Yayat, the third son of Swayambhuma Manu, also called Vaivasvata Manu, or the man, lord of the earth, whose daughter Ella (Terra) was espoused by Budha (Mercury), son of Chandra (the Moon), whence the Yadu are styled Chandravansi, or children of the moon. Budha was therefore worshipped as the great ancestor, Pitriswara, of the Lunar race, and previous to the apotheosis of Krishna was adored by all the Yadu race. The principal shrine of Budha was at Dwaraka, where he still receives adoration as Budha Trivikrama, the triple energy, like the Hermes Triplex of Egypt.

YAFFA, a district of Yemen, surrounded by the Lahej, Sanaa, and the Hadramaut provinces, and reaching inland to the Jabl Yaffai mountains, which rise 6500 feet above the sea-level. The Yaffai tribe is the most powerful in Yemen.

YAGHI. Turk. Rebellious; a term applied to such chiefs as refuse their obedience and homage to government, even though they accompany this refusal with no violent act of rehellion. It is best rendered, perhaps, by the English word refractory. It is the corruption of the Arabic word baghi. Yaghistan is a term applied by General Sir C. M. MacGregor to all the country on the N.W. frontier of British India, which owns no chief. All the tribes from the Ushtarana on the south to the Chagharzai on the north are independent. He says there is not one who ever obeyed any one.—*Fraser's Khorasan; Lieut.-Col. MacGregor*, iii. p. 279.

YAHIA-bin-AHMAD-bin-ABDULLAH SIRHINDI or Sihrindi was the author of the Tarikh-i-Mubarak Shahi, which embraces the period from the time of Muhammad Sam, founder of the Ghori dynasty, till A.H. 852 (A.D. 1448). It contains all that is known of the Syud dynasty, and is copied verbatim by Nizam-ud-Din Ahmad in the Tabakat-i-Akbari.—*Elliot, Hist. of India.*

YAHIA - bin - SERAPION - bin - IBRAHIM was an eminent Syrian physician, said to have heen born at Damascus, and supposed to have lived between A.D. 870? and 932. He finished in Syriac a complete view of the Greek system of medicine, particularly that of Galen, incorporating with it the principles and practice of the Arabs. Two works bearing his name were translated into Latin, and published in Venice in A.D. 1497, and again in 1550. He is often mentioned by the physician Rhazes, and Ali Abbas notices his brief account of the small-pox.

YA-HU. Ar. Jehovah; Yo-hu, O He, God; He who is, He who exists.—*Catafago.*

YAHYA-bin-ABD-ul-LATIF-al-HASAINI of Kazwin, author of the Lubh-ut-Tawarikh, the Marrow of History, a General Asiatic Chronicle. He composed it A.D. 1541. He was a theologian and philosopher. He was patronized by Shah Tahmasp Saffavi. He died at Sikri A.H. 971. His eldest son, Mir Ghias-ud-Din Ali, held a command under the emperor Akhar, and his grandson, Nakīb Khan, compiled the first portion of the Tarikh-i-Alfi and translated the Mahabharata.

YAIBANE, of the teak forests of Pegu, cultivate the mulberry tree, Morus Indicus, for feeding silkworms, which they rear, the hills being hetter adapted for the growth of the plant than the plains, besides which their plantations are not exposed to the trespass of cattle. The silk they produce appears to he of a coarse kind, more owing to the imperfect way in which it is wound off than to any fault of the cocoon. They are a most industrious people, young and old of both sexes being employed without interruption in some part of the process. The cocoons seem to be large and very fine, and are produced at the rate of 2000 for one rupee, and the silk when wound off is valued at five rupees per viss. The Yaibane are prosperous, with the reputation of being possessed of considerable hidden wealth, which for security they bury in the forest.—*Selec. Records, Govt. of India, Foreign Dept.*, No. ix. p. 13.

YAILA. Turk. Pasture lands.

YAILM WANLOO, Teling hawkers. These people follow the trade of clerks, painters, and indeed any but an occupation involving manual labour.

YAJANA. Sansk. A sacrifice, or its performance, as the offering of libations of soma juice or of butter. The five great sacrifices are named Brahma-yajna, sacred study; Pitri-yajna, libations to the manes; Deva-yajna, burnt-offerings to the gods; Bali-yajna, offerings to all creatures; Nri-yajna, hospitality. Later additions are Prajapati-yajna, propagation of offspring, and Satya-yajna, observance of truth. Yajana, from the Sanskrit Yaga, a burnt-offering, formerly made on a grand scale by kings. Yagna, from Yaja, worship of burnt sacrifices. Yagnaha, from Yagna, a sacrifice, and Han, to destroy.

Yajana Yajana, corruptly Jajan Jajan, offering prayers.

Yajna pasu, an animal offered in sacrifice.

Yajna pavita, the sacred cord or zonar worn by the Brahman, Kshatriya, Vaisya, and artisan Hindus.

Yajna - sala, the sacrificial hall of a Hindu temple.

YAJNA WALKYA, surnamed Vajasaneya, a Hindu learned man who is supposed to have written the White Yajur Veda, the Sathapatha Brahmana, the Brihad Aranyaka, and the Law Code called Yajna Walkya Smriti, which is later than Menu. He was a disciple of Bashkali and of Vaisampayana. He was at the court of Janika, king of Videha and father of Sita. He was a religious reformer, and the schism he effected gave rise to the writing of the White Yajur Veda, which he compiled. His authorship of the other books is very doubtful, but the Smriti, with its commentary by Mitakshara, is in authority inferior only to that of Menu, and is in force all over India except Bengal. Its date is supposed to be the 2d century A.D. He is described as an ascetic pupil of Vaisampayana, who officiated as one of the Hotri, and cooked the sacrifice at the great rajasaya of Yudishtra. He arranged the ancient Mantra and Brahmana, the Vajasaneya Sanhita, and the Satapatha Brahmana in their present form.—*Dowson.*

YAJUJ and Majuj of the Arab geographers is Gog and Magog of Ezekiel. See Gog.

YAJUR. SANSK. The name of one of the Vedas, religious books of the Hindus. It is the second of the four scriptural authorities of the Hindus, and is the sacrificial Veda. The Taittiriya, or the Black Yajur Veda, contains more of prayers to serpents and serpent-worship than the Rig Veda. In the Sanhita of this Veda are prayers to the Sarpa, who are addressed as inhabiting the heavens, the skies, the rays of the sun, the waters, the vegetables, etc. See Veda.

YAK, Bos poephagus, or B. grunniens, or Peophagus grunniens, is still in a wild state, but has been largely domesticated. The general aspect of the yak is distinctly bisontine, and it carries its head low, like the rest of the sub-group. The yak is indigenous to High Tibet, and especially to Eastern Tibet, where they are still tolerably numerous in the wild state. It is extensively domesticated, and is the ordinary tame cattle of that elevated portion of the globe. The wild animal is known as the Dong or Ban chour. In the Western Himalayas, the wild yak is called Brong or Dong, and the female hBrong-hBri, which is commonly pronounced Dond-di.

Vigne was informed that the yak is found wild on the northern slopes of the Himalaya, where they descend on Yarkand. The Messrs. Schlagentweit state that in Western Tibet, particularly in Ladakh, there are no more of the yak in a wild state at present.

Amongst all quadruped animals the yak is found at the greatest height; it stands best the cold of the Snowy Mountains, and is least affected by the rarefied air. But at the same time the range of temperature in which a yak can live is very limited; the real yak can scarcely exist in summer at heights of 8000 feet. The Schlagentweits found large herds of wild yak, from 30 to 40, on heights of 18,600 to 18,900 English feet; and on one occasion they traced them even as high as 19,300 feet,—a remarkable elevation, as it is very considerably above the limits of vegetation, and even more than 1000 feet above the snow line. Hermann and Robert Schlagentweit frequently found wild yak on both sides of the range which separates the Indus from the Sutlej, near the origin of the Indus and near the environs of Gaarto, but the greatest number of them was at the foot of the Kara-korum range, as well as at the foot of the Kouen Lun in Turkestan. It is the largest native animal of Tibet. It is, when wild, horridly fierce, falling on the hunter with horns and chest, and if he rasp with his tongue it is so rough as to scrape the flesh from the bones. It is hunted by large dogs, and shot with a blunderbuss. The wild yak does not come so far south as Rupshu, but a few are met with during winter and early spring on the Nubra ranges; they migrate, however, to the loftier slopes of the Kara-korum before the end of April. The yak wanders about singly or in small herds, preferring secluded valleys to open hillsides, passing the day among the snow, where, like deer and bears, it may often be seen at mid-day stretched out at full length asleep. The prevailing colour of the wild yak is black, with a greyish tinge on the head. In its native state it is shy and timid, and the same to some degree when domesticated. In winter flocks graze below 8000 feet, on account of the great quantity of snow above that height; in summer they find pasturage as high as 17,000 feet, consisting of grass and small tufted carices, on which they browse with avidity.

Its favourite pasturages are ascertained, and in the midst of these the hunters throw up circular stone enclosures a few yards apart, the hunter taking up his position in one of them. When a yak is within shot, the hunter fires, and instantly quits his enclosure for another; for so soon as the animal hears the shot, he, whether he has been hit or not, guided by the smoke of the discharge, rushes furiously on the enclosure, and commences knocking it to pieces. When the hunter gets another shot at him he retires again from his shelter to a fresh enclosure, and so on till he has killed his game. The ordinary size of the dong is four times that of the domestic yak; it is black all over, having occasionally a white streak in the forehead. The horns of a full-grown bull are said to be three feet long. It is used by grandees of Tibet at marriages and other feasts, when it is filled with strong drink, and handed round to the company. Nothing more commendatory of the host's joviality can be said, than that 'he regaled his guest out of the dong's horn.' The horns so used are finely polished, and mounted with silver or gold and precious stones.

It is common in Tibetan gumpas (Lamaserais) to see a stuffed dong standing in front of the image of Maha Kali, at whose shrine the animal is thus figuratively sacrificed; axes and other instruments of sacrifice are ranged around the image. Strange that Buddhists should preserve this feature of Hinduism in their places of worship.

The *domesticated yak* now takes the place of its half-breed, called zho. It is the chief beast of burden in Rupshu. It is often handsome, and a true bison in appearance. It is invaluable to the mountaineers of Northern India from its strength

and hardiness, accomplishing at a slow pace 20 miles a day, bearing either two bags of salt or rice, or four to six planks of pine wood slung in pairs along either flank. Their ears are generally pierced and ornamented with a tuft of scarlet worsted; they have large and beautiful eyes, long, silky black hair, and bushy tails. Black is their prevailing colour, but red, dun, party-coloured, and white are common.

Much of the wealth of the people in East Nepal consists in its rich milk curd, eaten either fresh or dried, or powdered into a kind of meal. The hair is spun into ropes, and woven into a covering for their tents, which is quite pervious to wind and rain, though in the dry climate of Tibet this is of little consequence. The bushy tail forms the well-known chauri standard or fly-flapper of the plains of India, and its hair is greatly esteemed by the women of the plains to add to their back hair. The female drops one calf in April, and the young yak are very full of gambols, tearing up and down the steep grassy and rocky slopes. Their flesh is delicious, much richer and more juicy than common meat; that of the older yak is sliced and dried in the sun, to form jerked meat, called schat-t-chew, dried meat, which is eaten raw, and is a palatable food. The yak loves steep places, delighting to scramble among rocks, and to sun its black hide perched on the glacial boulders which strew the Wallanchoo flat, and on which these animals always sleep. Their average value is from twenty to thirty rupees. The yak, though indifferent to ice and snow, cannot endure hunger so long as the sheep. Neither can it bear damp heat. The yak is ridden, and its pace is easy.

Yak are bred in Bussahir, whence they are sent for sale. In Spiti the people plough with it and carry loads; it furnishes their milk, and hair to make ropes. In the severest weather this animal appears to enjoy itself in the snow, and is often to be seen with icicles of several inches in length hanging to its nose, and a foot or more of ice hanging to the hair of its neck and shoulders. Long hairs hang over the eyes, and prevent their freezing. In Spiti they have also the ghoont, asses, sheep, goats, dogs, and cats. The Tibetan dzo, called chubu in the Himalaya, also zho and zo, is a mixed breed or hybrid from the bull yak or Bos grunniens and the Indian zebu cow. In Tibet, the Sauh is a cross between cow and yak; Sauh yak, produce of cow by yak bull; Ba sauh, produce of female yak by bull. Ya-niu, CHIN.; Sura-gai, HIND.; Yakmo, TIB., the female. The hybrid between the yak and the Indian cow is very fertile. The brothers Schlagentweit had occasion to see and examine the offspring of the hybrid as far as to the seventh generation, neither much altered nor deteriorated; and were informed that there was never found any limit as to the number of generations.

The yak even in the valley of Kashmir rapidly degenerates. The heat and insects are evidently its greatest enemies in the tame as well as wild state; and none of these animals, not even the goats, seem to care for the luxuriant vegetation of the lowlands, preferring whatever resembles their Tartaric furze and bent to the rich clover and grasses of Kashmir.

Steady and sure-footed, moving with a slow, easy, wriggling gait, rising over or descending obstructions with very little jar. They are led by a rope attached to a wood ring which passes through the nostrils.—*Adams; Vigne's Travels; Cunningham's Ladakh; Hook. Him. Journ.; Schlagentweit.*

YAKKA. BENG., HIND. A carriage drawn by one bullock, from Ek, one.

YAKKA. The malignant spirits of Ceylon are the Yakka, who are the authors of indefinite evil; and the Singhalese have a demon or Sanne for each form of disease, who is supposed to be its direct agent and inflicter, and who is accordingly invoked for its removal; and others, who delight in the miseries of mankind, are to be propitiated before the arrival of any event over which their pernicious influence might otherwise prevail. Hence, on every domestic occurrence, as well as every domestic calamity, the services of the Kattadia or devil-priests are to be sought, and their ceremonies performed, generally with observances so barbarous as to be the most revolting evidence still extant of the uncivilised habits of the Singhalese. Especially in cases of sickness and danger, the assistance of the devil-dancer is implicitly relied on; an altar, decorated with garlands, is erected within sight of the patient, and on this an animal, frequently a cock, is to be sacrificed for his recovery. Another kind of demon-worship in Ceylon is a debased form of Hinduism, where the priest or kapua is the performer.—*Tennent's Christianity in Ceylon*, p. 232; *Wheeler's History of India*, i. p. 30.

YAKKA, a race formerly occupying the interior of Ceylon. The Yakka, previous to the arrival of Gautama, were demon-worshippers; neither was their conversion general.—*Forbes' Ceylon*, ii. 82.

YAKONIN, in Japan, generally an officer with two swords; a Government officer of the police or customhouse; a paid officer of the Japanese Government.—*Hodgson's Nagasaki*, p. 21.

YAKSHA, in Hindu mythology, a kind of demigods, attendants on Kuvera, the god of wealth, and employed by him in the care of his gardens, etc., situated on Mount Kailasa. The Yaksha demigods were supposed to be much courted by the Apsarasas nymphs of Indra's heaven, but that they had wives of their own is clear from the Meghaduta. Their name is said to be derived from Yaksha, to worship, either because they worship Kuvera, or are themselves worshipped by men. The Yakshini female attends on Kuvera and Durga, but often holds intercourse with mortals. As with the brownies of Scotland, they are called Punya jana, good people, but they are sometimes imps of evil.—*Williams' Nala*, p. 203: *Dowson.*

YAKSHYO, in Ceylon, is a class of demigods who are supposed to inhabit the waters and dwell on the sides of Mount Meru, and who are distinguished not only for gentleness and benevolence, but even by a veneration for Buddha, who, in one of his earlier transmigrations, was himself born under the form of a Yakshyo.

YALE, ELIHU, became Governor of Madras about 1682. He was the father of the founder of Yale College, U.S.

YALI. TAM. In Sanskrit, Sarab'ha, a fabulous animal with the body of a lion, the trunk and tusks of an elephant, a sword or mace over its back, and a cross or flower under its feet. A monster of the lion type trampling on an elephant,

an architectural feature in the sacred buildings of Southern India.

YALKAMA, a name of Balkees, queen of Sheba. See Balkees.

YAM, Kan - chu and Chu - yu, CHIN., are the tubers of various species of Dioscorea, cultivated in nearly all tropical countries as important esculents. The tubers abound in farinaceous matter, and often reach a large size, weighing from 30 to 40 lbs. Their culture is considered to have spread from S.E. Asia and the East Indian Islands, where at present Dioscorea globosa and Dioscorea alata, *L.*, hold the first and second places, D. purpurea and D. rubella the third and fourth. Other edible species are—D. aculeata, atropurpurea, acutangula, anguina, bulbifera, belophylla, cirrhosa, fasciculata, lucida, pentaphylla, pulchella, sativa, sagittata, triphylla, tomentosa, transversa, verticillata, versicolor.

In the West Indies there are several varieties having distinctive names, according to quality, colour, etc. Their Indian yam is considered the most farinaceous and delicate in its texture, resembling in size the potato; most of the other sorts are coarse, but still very nutritive and useful. Common yam, D. sativa, is indigenous to the Eastern Islands and West Indies. The Guinea yam, D. aculeata, is a native of the east. The Barbadoes or winged yam, D. alata? has a widely-extended range, being common to India, Java, and Brazil. The yam species are climbing plants with handsome foliage, of the simplest culture; they succeed well in any light, rich, or sandy soil, and are readily increased by dividing the tuberous roots. If not bruised, they will keep, well packed in ashes, for nine and twelve months. From yams of all sorts, and particularly the buck yam, starch is easily prepared and of excellent quality.

Yams and sweet potatoes thrive well in the northern parts of Australia; the former constitute the chief article of vegetable food used by the natives. Dressed in milk or mashed, they are a delicacy. An acre of land is capable of producing 4½ tons of yams and the same quantity of sweet potatoes within the twelve months, or 9 tons per acre for both, being nearly as much as the return obtained in the cultivation of potatoes. The kidney-rooted yam, D. pentaphylla, is indigenous to the Polynesian Islands, and is sometimes cultivated for its roots. It is called Kawan in the Fiji Islands. D. bulbifera, a native of the Archipelago, is also abundantly naturalized in the Polynesian Islands, but is not considered edible. Two kinds in the Tartar country are of a remarkably fine flavour, one weighing as much as 18 lbs., the other 3 lbs. In the Fiji Islands, some of the yams, of which there are upwards of 50 varieties, grow to the enormous size of 50 to 80 lbs. in weight. Their general average, however, is from 2 to 8 lbs. Captain Hill states that the New Zealand yam, if boiled, is heavy and wet; cut into slices after boiling, and then fried with a little butter nearly dry, decidedly good, not exactly mealy, but nearly so.—*Smith; Voigt; Simmonds.*

YAM. CHIN. A post house. In the time of the embassy sent by Shah Rukh, every yam was situated opposite to a city or town, and in the intervals between the yam were many kargu and kidifu. The word kargu is applied to a tower of some 60 cubits in height, where two men are constantly on duty. The tower was so placed that the next kargu was in sight from it, and when any event of importance occurred, like the approach of an enemy's army, the men on watch immediately lighted a fire, and this being seen from the next kargu, they made haste to light another. A double system of horse and foot posts was also found by Ibn Batuta established in India in A.D. 1333. The posts of Timur are noticed by Clavijo (p. 105); and Baber describes his own post between Agra and Kābul, using the word yam, but adding that it was called in India dak-choki, the term in use in all India to this day. Pautheir thinks yam to have been taken from the Chinese yi-ma, horse-post. Burnes was told of the continued existence of both post and fire beacons between Yarkand and Pekin. The distance is more than five months' journey as usually travelled, but an express went in thirty - five days, and under very great emergency in fifteen. —*Marc. Pol.* p. 335; *Erskine's Baber*, p. 393; *Yule, Cathay*, i. p. 138.

YAMA. SANSK. He who is free from the influence of the passions, moral duties, five acts of restraint or self-government, viz. Ahinsa, freedom from any wish to injure others; Satya, truth in words and deeds; Asteya, honesty and integrity; Brahmacharya, chastity; and Apara-griha, disinterestedness.

YAMA. JAP. A hill, as Fusi Yama, O'Yama. Yama-taka and san or zan are the terms for the different classes of mountains.—*Sir J. E. Reed.*

YAMA, in Hindu mythology son of Vaivasvata and Saranyu, is called in the Persian legend Yima, and later Jamshid. Yama or Dharma-raja resembles both the Grecian Pluto, the king of the lower regions, and Minos, judge of departed souls, and in Hindu mythology he is the regent of the south or lower division of the world, mythologically called Patala. Yama is described as of a green colour, with red garments, having a crown on his head, his eyes inflamed, and sitting on a buffalo, with a club and pasha or noose in his hands; but as Dharma-raja he is described as of a divine countenance, mild and benevolent. The virtuous only see the latter; the wicked are judged by Yama. If the dead have been virtuous, they ascend to a place of happiness; if wicked, they are sent to a particular hell, to undergo the punishment appointed for their especial crimes. Yama is called Srad'ha deva, or lord of the obsequies, and presides over the ceremonies of the Srad'ha. At the time of offering the oblations to the manes of deceased ancestors, he is invoked by the priest under several names, of which Mr. Colebrooke has enumerated fourteen. The priest thus addresses him: 'Salutation to Yama! salutation to Dharma - raja! to Antaka, the Destroyer! to Vaivaswata, or Child of the Sun! to Kala, Time! to the Slayer of all Beings! to Andhambara or Yama,' etc. etc. Hindus make daily oblations of water to Yama. The second day of the month Kartik is sacred to him and his sister, the river goddess Yamuna or Jumna, who entertained him on that day; in consequence of which an annual festival is held, in which sisters entertain their brothers. On this occasion an image of him of clay is made and worshipped, and then thrown into the river. He is also worshipped on the 14th day of the dark part of the month Aswina. Some of the other names of

Yama are Pitripati, or lord of the Pitri; Andhambara, from a wood from which fire is produced by attrition; and Dandadhara, he who has the rod of punishment. The name of Yama occurs frequently in the sacrificial ceremonies of the Hindus, oblations and invocations to him forming a portion of several of those ceremonies. Minos of the Greeks has been supposed the same with Menu; with whom, especially with the 7th, Satyavrata, Yama also agrees in character as well as in name; both being called Vaivaswata, or offspring of the sun, and Srad'ha deva, or lord of the Srad'ha. Srad'ha is the ceremonial oblation in honour of deceased ancestors, which obsequies to the dii manes are attended with feasting and various observances. Mr. Wilford believes Yama or Pluto to be the same with Serapis; deriving the latter name from a compound Sanskrit word implying thirst of blood. The sun, in Bhadra, had the title of Yama; but the Egyptians gave that of Pluto, says Porphyry, to the great luminary near the winter solstice. Yama, the regent of hell, according to the Puranas, has two dogs; one of them named Cerbura, or varied; the other Syama, or black; the first is also called Trisiras, or with three heads, and has several other epithets signifying stained or spotted. Cerbura is indubitably the Cerberus of the Greeks. The dragon of Serapis is supposed to be the Seshnaga, which is described as in the infernal regions by the author of the Bhagavat. Yama, as the god of justice, presides over the different Naraka or hells. He is son of Surya, the sun. As the judge of departed souls, he is identified with death. His abode is in the infernal city of Yamapura, whither the Hindus believe that a departed soul repairs, and, receiving a just sentence from Yama, ascends to Swarga, or descends to Naraka, or assumes on earth the form of some animal, according to its deserts. Yama rides upon a buffalo as his vahan, and is armed with a ponderous mace.—*Oriental Linguistic Studies; As. Res.* iii. p. 409; *Moor*, p. 309; *Williams' Nala*, p. 205; *Hind. Theat.* ii. p. 62.

YAMADANSHTRA, Sansk., is literally Yama's teeth; the last eight days of Aswin and the whole of Kartik, considered a period of general sickness. Yama-dula, Yama's messengers.

YAMADWITYA, the second of the light half of Kartik, when brothers and sisters exchange gifts in honour of the attachment between Yama and his sister Yami. See Yama.

YAMALAYA. Sansk. From Yama, and Alaya, a dwelling. Yama-locum; the distance from the world to the Yama-locum is 99,000 yojna, or 1,485,000 miles.

YAMAPURI, of the Hindus, is the general rendezvous of the souls of the departed, from which they proceed to Dharmapuri in a body, with a proper guard composed of the Yama-dula, servants of Yama. The depot for the souls after death in Malacca or Maha Lanca.—*As. Res.* x. p. 142. See Dip-dan.

YAMBRE, also called Kuru, silver ingots used in trade in Central Asia.—*Caley.*

YAMBU or Yambu-ul-Bahr, the seaport of Medina, the entrance of the harbour being in lat. 24° 4′ 30″ N., and long. 38° 1′ E. It is the Zambia of Ptolemy. Here the sultan of Turkey's dominion is supposed to begin, while that of the pasha of Egypt terminates. The population is the most bigoted and quarrelsome in Hejaz.—*Findlay.*

YAMMAMBO, in Japan, austere hermits; literally, mountain soldiers.

YAMUN, generally called 'offices' of the mandarins; the official residence of all Chinese officials. The residence and public office of a mandarin.

YAMUNA or the Jumna river of Hindustan, in Hindu mythology is personified as the daughter of Surya or the sun, and sister of Yama; its other name being Kalindi, the sun, from the Kalindi mountain. To Yama, who is the son of the sun, the second day following the Amavus or ides of Kartika is held sacred; it is called the Bhratri divitya or the brothers, because the river goddess Yamuna on this day entertained her brother (bhratri) Yama, and is therefore consecrated to fraternal affection. At the hour of curfew, 'gaodaluk,' when the cattle return from the fields, the cow is worshipped, the herd having been previously tended. From this ceremony no rank is exempted; on the preceding day, dedicated to Krishna, prince and peasant all become pastoral attendants on the cow, as the form of Prithivi, or the earth. The Bhagavat relates that Krishna's mortal parents were Vasudeva (meaning the giver of wealth) and Devaki; mentions a miraculous escape of the infant over the Yamuna conveyed by his father, and protected by Sesha or immortality; the guards placed by Kansa over his pregnant sister having failed in their vigilance, Kansa, enraged, ordered all newly-born infants to be slain; but Krishna escaped his various snares, one of which was sending a woman named Patnia with a poisoned nipple to nurse him, and he was fostered by an honest herdsman named Ananda or happy.

YAMUT, a Turkoman race settled beyond the river Attrak, near the shores of the Caspian Sea, and between this and Khiva, consisting of 25,000 families. They are the least ugly of the Turkoman tribes. The Goklan, on the banks of the Gurghan and the Attrak, between Astrabad and the Attrak, consist of 12,000 families.

The Tekke, who are separated from the Kurd by a chain of mountains which extend from the sources of the Gurghan and the Attrak, near Sharaks, consist of 35,000 families. They migrate between the sources of the Attrak and the town of Merv.

YANADI, a race who dwell in the forests of the Sriharikottah muttah of the Chingleput collectorate. They are in a low state of civilisation, and hold little or no intercourse with their more civilised neighbours. Until the middle of the 19th century, their ordinary avocations were the gathering of the wild products of the forest, which the officers of the Madras Government bought from them at rates lower than the ordinary market prices, and paid them in kind with grain and clothes. Latterly, however, a few on the outskirts have taken to charcoal-burning and wood-felling, and they are now also paid partly in money, changes which all bring them more in contact with settled people around them. An effort was made in 1855 to induce them to engage in agriculture. In 1857, Government established a school for their children, for each of whom an allowance in grain is given. Government paid to them about Rs. 1800 a year. They are about 500 in number. Their ordinary locality was in the very depths of the forests,

beneath the shade of pendiug branehes. A few are of a dark bamboo colour, but ordinarily they are black. The men are not good-looking, but the women are positively ugly, though deeently clad. The men wear only the langoti. They have clear skins, but arc largely troubled with clephantiasis, for they suffer much from fever. Thcy seem to use warm earth baths in fever. Their food consists of wild fruits aud roots, particularly those of the Kanduri, HIND. (Bryonia grandis, *Linn.*), a few wild varieties of yams, and the leaves of Capparis horrida, rice, the wild bean, Canavalia virosa, molluscs, fish and flesh of every kind. They hunt with the bow and fish by torch-light. They are polygamists, have up to four or even seven children. They bury or burn their dead, and pour libations on the grave. The men average 5 feet $4\frac{3}{4}$ inches in height and 100 lbs. in weight. Thc women average 4 feet 6 inches in height and 82 lbs. in weight. They have little intelligence, cannot reckon up to ten, converse but little with each other, and are more taciturn with strangers, whose very presence even alarms them. The language they speak is said to be Tamil; and a similar race, it is stated, occupy the neighbouring forests on the hills at Naglawaram, and others are spread through Nellore, N. Areot, and Cuddapah. Indeed, the Yanadi in 1867, in the Nellore district, were estimated by Dr. Lloyd at 20,000; and the residents inland are more robust than those of the Sriharikottah jungles. The Collector of Chingleput, writing in 1835 to the Madras Board of Revenue, mentioned their numbers then were — adult men 49, boys 41; adult women 69, girls 40; total, 199. The Madras Governmeut has continuously endeavoured to improve their condition, and to this end Dr. Shortt made large exertions, between 1860 and 1870, and in the latter year about 40 of the Yanadi were employed at Vasarapad, near the snake temples, of which they are the priests.—*Proc. Madr. Govt.*, 1867; *Dr. Shortt.*

YANAON or Yanaun, a town in lat. 16° 44′ 10″ N., and loug. 82° 15′ 5″ E., 24 miles S.E. of Rajamundry, built on the spot where the river of Coringa and the Godavery separate. It is a French territory of 8147 acres, surrounded by British lands.

YANDABU or Yendaboo, a town iu Independent Burma, situated on the right bank of the Irawadi (Irrawaddy) river, lat. 21° 38′ N., and long. 95° 4′ E., about 40 miles west of Mandalay. The treaty of peace which concluded thc first Burmese war was signed here on the 26th February 1826.—*Imp. Gaz.*

YANG. The Shan word for Karen is Yang, softened into the Burmese Yen; hence several Karen tribes with Yen as their tribal appellation.

YANG. In Chinese mythological history, the male creative power, from which and the female Yin the universe primeval sprang. See Yiu and Yang.

YANG-CHEN, a great scholar of the time of the Han dynasty. He was an officer of high rank, but lived and died in poverty, a spotless official. The Yang family proudly worship in his ancestral hall.—*Giles*, p. 40.

YANGI-HISSAR, a district of Kashgar, along the river Shah-naz, N.W. of Yarkaud.

YANGMAI. CHIN. A scarlet fruit, not unlike an arbutus or strawberry, but having a stone like a plum in the centre.

YANG-TZE-KIANG is the largest of the Chiuese rivers. The entrance is very wide, but divided into two channels by the large island of Tsung-Min on the north. On the shore of its southern entrance is the town of Wosung. The Yang-tze-kiang river is called by the Chinese the Great River, also the Girdle of China; it traverses the whole of the ccutre of the empire, rolling its flood of water to the sea through the richest and most fertile part of the country. There is no river in the world which has on its banks so numerous a population, amounting at least to 100,000,000 of people, who are sustained by its waters in the pursuits of commerce and agriculture. There are more than 100 cities of the first, second, and third elasses, and 200 towns and villages, which could be approached directly from its water-way. From its origin in Tibet to its outlet at the sea, its course is about 3000 miles, the points being distant in a direct line 1850 miles, and the basin draiued by its channel nearly 800,000 square miles. Persons engaged in every variety of trade resort to Hankow, from Mongolia to Tibet and Sze-chuen, bring their wheat, riee, dried and salted vegetables of every kind, bamboo sprouts, horses, sheep, furs, skius, eoal, lead, jade or nephrite, gold in large quantities, rhubarb, musk, wax, and various drugs of northern growth. Unlike the Ganges, the whole volume of water does not lose itself in tidal creeks, but pours out into the Pacific in one vast stream 60 miles wide. By a ship which has once made the trip pilots are not required. Rising in the snows of Kouen Lun, it enters China proper not 300 milcs from Saddiya in the proviuce of Assam. Up to this point it is believed to be navigable by boats, for vast rafts of timber laden with hill produce pass down. Down the 1100 miles from I-Chang to Shanghai, the river rolls through provinces of virgin fertility, whence proceed teas and silks, which find their way to Canton and Shanghai. The plain of the Yang-tze-kiang was the gardeu of China. From it there runs north to Tien-tsin the Grand Canal, up which used to float the whole supplies of Northeru China. At a point higher up, the great trunk road from Pekin to Cantou crosses the river. Where the Yang-tze-kiang flows past the Poyang Lake it receives several navigable streams which run through the Black Tea districts to the west, while those from the eastward open up the Green Tea districts. The Poyang Lake and Kiu-kiang, the chief towu, are the centre of an extensive network of river and canal communication. What Kiu-kiang is at this point, Hankow is still more 200 miles farther up. It stands on high banks at the junction of the Hau and Yang-tze rivers, a little below the Tungting Lake. The rise and fall in the Yang-tze-kiang averages about 10 feet. The Tibetan distriet, the great plateau of Mid Asia, is centrical ethnically as well as geographically to all S.E. Asia and to Asianesia, abuts on the west on the eastern extremity of thc primitive Iranian region, and is connected with China and all the sea basins on the east of Asia by means of the Yang-tze-kiang and the Hoang-ho.

Thc Yang-tze-kiang forms, with the Hoang-ho, a twin basin, to whieh the most advanced and powerful eastern eivilisatiou owes its development. The Yang-tze-kiang is conneeted on the

west with the twin basius of the Salwin and Irawadi, which are themselves connected inland with the Tibetan district, and on the S. and E. to the Indian oceanic basin. It is undoubtedly one of the finest rivers in the world. It takes its rise in the mountains of Tibet, and, after traversing the Koko-Nor region, enters China at the province of Kan-su ; it then leaves it again to water the sandy plains at the foot of the Alechan mountains, surrounds the country of Ortous, and, after having watered China from south to north, and then from west so cast, goes on to throw itself into the Yellow Sea. The waters are pure and beautiful at their source, and only assume their yellow tint after passing the Alechan and the Ortous. The river rises almost always to the level of the country through which it flows; and to this is to be attributed the disastrous inundations which it occasions. These floods are very fatal to China, but they are of little consequence to the nomadic Tartars, who have only to strike their tents and move off elsewhere. — *American Expedition to Japan*, p. 166; *Local Newspapers.*

YANTRA, Yantri, or Jantri, a Hindu almanac, a dial, altitude and azimuth instruments.

Raj Yantra is used for ascertaining the altitude of the heavenly bodies and the longitude of places, referred to Lucknow (secular capital) and to Ajodhya (religious capital) as circles of first meridian. If the longitude of places, having Lucknow as a first meridian, are to be ascertained, then the circle marked 26° 51′, being the altitude of Lucknow, must be uppermost, and so for Ajodhya.

Dhruba Yantra is used to find the directiou of the poles. The instrument consists of a pointer, whose length is equal to the radius of the circle through whose centre it passes at right angles. The circle is divided into 60 equal parts. It is so placed at noon that the shadow of the poiuter may fall at the 45th part.

Pratod Yantra is used to measure time. This is an hour rod, whose horizontal section is a regular octagon, and the breadth of whose base is to the breadth of its top as 3 to 2. The rod is about 27 inches long, having near the top a groove on each of its sides to receive a stick attached to it, which is about 9 inches long. The length of the day varies from 26 to 33 dunda. The instrument is used thus: The length of the day being known, the little stick is made to pass through the groove marked with the length in dunda. The rod is then made to stand perpendicular to the horizon, facing the sun, so that the shadow may fall on the side which marks the length of the day. Before noon the shadows show the hours past, and after noon the hours remaining to sunset.

Khapru Kidhup-ghari, a universal sun-dial. The wire from south to north, representing the axis of the earth, is in the place of the gnomon of the common sun-dial; and the shadow cast by this wire on the concave semi-cylindrical surface, gives the time of day to within 5 minutes for a day of 12 hours. The graduated arc to the north is the brass meridian upon which the dial is elevated according to the latitude of the place. The shadow cast from the transverse wire in the plane of the equator tells the declination of the suu, and hence the month of the year. The vertical slip of brass to the south will give the time of day in a high latitude, where the sun rises at three and sets at nine. The dial is graduated for 12 hours, according to the European system, and likewise for 30 ghurees (equal to 12 hours), according to the Hindu system. The instrument is levelled by turning the foot screws until the threads of the two plummets respectively touch the edge of lines which are marked in the adjacent bars. This sun-dial is known as the Khapru kidhup-ghari, or tile sun time, from its resemblance to the shape of a tile.

Maun Yantra.—Equatorial altitude and azimuth instrument, used by Hindu astronomers. The mode of using it is described in Herschel's Astronomy, para. 182.—*Government of Oudh.*

YANYSHAHR, a town of 8000 houses, lies at about 47 miles S. of Kashgar. It is surrounded by a stone wall, has two gates, and two caravansaris. — *Russians in Central Asia, Capt. Valikhanof and M. Vemukof*, p. 154.

YAO. All the ancient traditions of the Chinese refer to their emigrations from the west. Their first settlement was in the northern portion of Chi-li, the province in which the present capital, Pekiu, is situated. The first portion of authentic Chinese history tells us that Yao or Yaou, who reigned about B.C. 2330, had his capital at the new district city of Tsin-chow, situated about 100 miles only to the south of the present capital, Pekin. From this most ancient location the people spread gradually westward and southward, thus steadily increasing its territory. The usual course of the process was, first, colonization of the new regions and displacement from them of whatever aboriginal inhabitants were found; and afterwards political incorporation with the older territory. At times, however, the process was reversed, and military conquest of the aboriginals preceded their displacement by an industrial occupation of their lands.

YARKAND is the most populous and extensive of all the districts of Kashgaria, the souls numbering 40,000. Its capital, Yarkand, the largest town of Eastern Turkestan, has populous suburbs, its principal iudustry being the leather trade. Yarkand stands on an open plain between the branches of the Yarkand river. The foreigners in it from Badakhshan carry on a trade in Kashmir slaves, and the Balti tribes from Little Tibet carry on all the work of labourers, drivers, and carriers. Goitre is very frequently met with in Yarkand, the natives of which attribute its prevaleuce to the property of the water; and it is also met with in Khokand. Gold is washed out at the Karja settlements; the inhabitants pay their dues in this metal, and dispose of it to private individuals. Sulphur, sal-ammoniac, alum, and saltpetre occur. The volcanic soil around the town of Kuchi is particularly rich in these materials. Sulphur is obtained at Ush-Turfan, iu the Yarkand district, and saltpetre at Ush-Turfan and at Sairam, 110 miles farther east. Salt mines are worked in the Yan-chi Shan mountains, east of Aksu. Among the more remarkable mineral productions of Turkestan must be included the jade, which is highly esteemed in China under the name of Yu. The nephrite fouud here is of two kinds; that from the mountains, called by the natives Loncha or Bishbargan, which is fouud in the mouutains of Mirdjai and Sutash, 74 miles from Yarkand; and the second obtained in the river

Ulgunkash (pronounced Yurunkash by the Chinese), under the special supervision of a Chinese officer.

The Khokand people obtain gold by washing in the upper course of the Syr, which takes its rise in the Tian Shan; and lead, mixed with silver, is also procured in the hills to the east of Andijan. The Bolor is particularly rich in minerals. Gold in nuggets forms the staple of trade between Karatagin and Khokand; and slaves, lapis-lazuli, turquoises, and rubies constitute that between Badakhshan and Yarkand. The river Karia, which is worked for gold, rises out of these mountains, and the name of Zar-afshan (auriferous), which some rivers flowing out of it bear, together with the tradition throughout Central Asia to the effect that the ruler of the Gildits keeps concealed in his cavern bars of gold, tends to strengthen the foregoing inferences.—*Russians in Central Asia, Capt. Valikhanof and M. Vemukof*, p. 133.

YASA, ordinances which Chengiz laid down for the guidance of his successors. These are given more or less in Petis de la Croix, D'Ohsson, Deguignes, in Von Hammer's Golden Horde, and in Univers Pittoresque Tartarie, p. 313. The word is said to mean any kind of ordinance or regulation.—*Yule, Cathay*, p. ii. 507.

YASAWUL, a Turkish word, means a guard or armed attendant at a court; an officer of the household, who acts in the capacity of usher in the families of chiefs. It has been adopted into Russia, and is there used to denote a major of Cossacks. In India, a foot soldier; a member of the body guard in China, from Yasamak, to order, to make ready. — *P. Arminius Vambery, Bokhara*, p. 12; *Fraser's Journey into Khorasan*, p. 25.

YASHM. Hind. Jade, also plasma or green silica. The knife handles of Shahpur are made of it. The Messrs. Schlagentweit found quarries of the true jade at Gulbagashen in the valley of Karakash, in their journey from Ladakh to Khotan. Yashmi, a colour like that of jade-stone. To dye this colour, a little turmeric first, then asbarg and alum are used. — *Mag. Survey*, 1857.

YASHTS, according to Martin Haug, were written about B.C. 450–350.

YASIN, a chapter of the Koran, read to a Muhammadan when about to die.

YASODA, wife of Nanda the cowherd, and foster-mother of Krishna.

YASODHARA, cousin and wife of Sakya Buddha. She was the daughter of the Koliyan raja ruling in a tract of country amongst the spurs of the Himalayas, along the banks of the Rohini, the modern Rohana. She bore one son. She and his foster-mother Praja Puti became the first Buddhist nuns.—*Hardy.*

YATAGHAN, Turk., is a long dagger, intended for thrusting rather than cutting, and has a curve, which has been copied in the bayonet of the Chasseurs de Vincennes.—*Burton's Mecca*, ii. p. 264.

YATHRIB, the name of the town of Medina prior to Mahomed's retreat.—*Sale's Koran.*

YATI or Jati. Sansk. An ascetic, the fourth order of the Hindus; also a religious teacher of the Jains.

YATRA or Jatra. Sansk. A pilgrimage, a periodical festival in honour of some idol, to which its worshippers resort; dealers also congregate and make a fair. The Ras-Yatra is a Hindu festival held in many parts of India in the month Kartik (October), and the aboriginal Santal and the Oraon have the circular Rasa dances.

YAU, a tribe who inhabit the skirts of the Arakan mountains westward of Pagan, and who speak a peculiar dialect of Burmese. The Yau country is the tract between the Arakan mountains and the Kyendwen river, at its junction with the Irawadi, between lat. 21° and 22° N., and long. 94° and 95° E.

YAVAN or Javan, the seventh son of Japheth. Colonel Tod says the Hericula also claim from Yavan or Javan, the thirteenth in descent from Yayat, the third son of the primeval patriarch.

YAVANA, a term applied by the Aryan Brahmans to conquering races who approached and invaded India from the north-west. The Bactrian Greeks were certainly so called, and the term seems to have been applied to the Sakæ Scythians, and perhaps to other races. The Yavana invaded Orissa repeatedly between B.C. 538 to A.D. 526 from Persia, Kashmir.

Bunsen supposes the meaning of the word Yavana to be doubtful,—that it may be traceable to times after Alexander, or that it may be an ancient inaccurate name of a people who pushed on towards the Mediterranean. According to Dr. Caldwell, it was a term applied to the Greeks, and subsequently to any race approaching India from the west of Asia. The name was derived from Javan, whose descendants, the Ionians, were the first Greeks with whom the Indians became acquainted, but it came afterwards to signify the Arabs. The Bactrian Greeks are usually termed Yavana in Sanskrit literature; but Colonel Tod warns us not to mistake them for the Yavana descended from Yavana, fifth son of Yayat, third son of the patriarchal Nahus, though the Ionians may be of this race. According to Colonel Tod, the Yavana or Greek princes, who apparently continued to rule within the Indus after the Christian era, were either the remains of the Bactrian dynasty or the independent kingdom of Demetrius or Apollodotus, who ruled in the Panjab, having as their capital Sagala, changed by Demetrius to Euthymedia. The term Yavana is in modern times applied by Hindus of Northern India to Muhammadans of every description; but in works prior to the Muhammadan era, some other people must be intended. The interpretation of the word by Sir W. Jones is Ionians or Asiatic Greeks, and there are some considerations in favour of this, although the chief argument in its behalf is the difficulty of attaching it to any other people. Doubtless, however, Yavana is certainly a term not exclusively applied to the Greeks. According to Professor Lassen, it was used to designate only the Semitic nations. In the Bactrian Pali inscriptions of king Priyadarsi, the word is written Yona, and the term Yona-raja is associated with Antiochus, probably Antiochus the Great, the ally of the Indian prince Sophagasenes, about B.C. 210. The Puranas describe them as wise and eminently brave. Yavana are mentioned as occupying Orissa for 146 years, when they were expelled, A.D. 473, by Yayati Kesari. Dr. Buchanan mentions a dynasty of Yavana (iii. pp. 97, 112) at Anagundi on the Tumbudra river in the 8th and 9th centuries.

The corrupted form of Jonakan is applied on the S.W. coasts of the Peninsula as a title of the Labbai race.—*Bunsen, Egypt*, iii. 555; *Prin. Ind. Ant.*; *Rajasthan*, i. 233.

YAVANI, a female atteudant in the women's apartments. Muhammadan princes had guards of African women in their harems, and female attendants also served in those of the Hindu sovereigns. The term Yavana has been applied by the later Hindus to the Muhammadans, and Yavani seems to have been a term used as distinction of a female servant. It is not likely that either Persian or Arabian women ever found their way into the inner apartments of Hindu princes as personal attendants or guards. Perhaps Tartarian or Bactrian women may have been so designated, as in Madras such women are, in 1872, all styled Mughulani.

YAYATI, fifth king of the Lunar race, was son of Nahusha. His wife Devayani was the mother of Yadu, who founded the Yadava line, and his wife Sarmishtha bore Puru, who founded the Paurava line. His other three sons were Druhyu, Turvasu, and Anu. The Mahabharata, Vishnu Padma, and Harivansa Puranas all tell of his senility, and exchanging it with the youthful vigour of Puru, to whom he again restored it, and made him his successor. Colonel Wilford in his Essays (As. Res. ix. pp. 91, 92) quotes a legend of Yayati dividing his empire among his five sons. To Puru, the youngest, he gave India, the middle part; to Yadu, the ancestor of Krishna, he gave the south or Dekhan; the north to Anu, and the west to Turvasu. The offspring of Turvasu, according to the Harivansa, settled in the south, and the tenth generation from him inclusive, consisting of four brothers—Pandya, Kerala, Chola, and Kola—divided the empire they inherited. Kola lived in the northern part of the Peninsula, and his descendants are called Kol or Koler to this day, and from them India was called Kolaria. —*Dalton, Eth. B.* p. 161.

YEAR.

San, Arab., Hind., Pers.	Annus, ... Lat.
An, Année, ... Fr.	Ano, ... Sp.
Jahr, ... Ger.	Varsha, ... Tam.
Baras, Sal, . . . Hind.	Samutsarum, . . Tel.
Anno, ... It.	

A year, as reckoned by Muhammadans, means the lunar year. Christians reckon the years of the Christian era from the birth of Jesus Christ, and call the Annus Domini, or year of the Lord, the year of Christ. Muhammadans reckon their Hijira year from the date of the hijira or flight of Mahomed from Mecca. The Hindus of India use the lunar year, with an intercalary month. They have various eras. The Hindu sidereal year, according to the Surya Siddhanta, is 365 days 6 hours 12 minutes 36·56 seconds, or 1·000045286 solar years, and is measured by the return of the sun to the same point in the zodiac, the beginning of the sign Mesha. Each month contains as many days as the sun continues in each sign, the civil only differing from the astronomical reckoning in rejecting fractions of a day. The civil year and month begin at sunrise instead of the instant of the sun's entrance into the respective signs. If the fractions exceed half a day, the civil year or month begins with the sunrise following. The months vary in length with the sun's angular motion.

The year of Christ 1867 corresponded to the year
6580 of the Julian period..
2642-43 of the Olympiads, or the 3d year of the 661st commenced July 1867.
2614 from the era of Nabonassar, which dates from Wednesday, 26th February 3967 Julian period, or 747 B.C.
2620 from the foundation of Rome, according to Varro.
From the Creation, 5871 according to the Hebrew text; 6172 according to the Samaritan; 7501 according to the Septuagint.
From the Deluge, 4215 according to the Hebrew text; 4865 according to the Samaritan; 5113 according to the Septuagint.
4968 of the Kaliyug, 1789 of the Saka, and 1274 of the Bengali San; in the sidereal account these three commenced Friday, 12th April.
1042-43 of the cycle of Parasu-Rama, which begins 15th September.
1923-24 of the (luni-solar) era of Vikramaditya, called Samvat, whereof the 1924th Maru year commenced on Friday, 5th April, and the Gujerat, Dekhan, and Konkan 1924th year on 24th August.
1788-89 of the Saka era of Salivahana, of which the 1789th year commenced on the 5th April.
1236-37 of the Parsee era of Yezdejird, of which the 1237th year of the Kadimi commenced 24th August, and of the Rasami on the 23d September.
1283-84 of the Hijira or Muhammadan era, the year 1284 commencing on 6th May.
1276-77 of the Fasli era, beginning 6th June.
1267-68 of the Shahur San, or Sanna Sitain-Miatin-o-alf, commencing on 6th June.
5627-28 of the modern Jewish era, of which the year 5628 commenced on 30th September 1867.

The year 1867 was the 1st year of the 22d cycle of Grahaparivritthi; the 1st of the 84th cycle of Vrihaspati, according to the Tamil account; and 13th of the 85th cycle, according to the Bengal account.

It was the year 2410 of the Buddhist era of India, Ceylon, Siam, etc.; and 1228 of the Burmese Vulgar era; and the 4th year of Chinese 77th cycle of 60 years, which begins about 14th February.

Ramadhan (the month of abstinence observed by the Muhammadans) commenced 8th January 1867; it is a moveable feast.

Yeast is a product of the fermeutation by which beer is made, upon the surface of which it swims from involving bubbles of carbonic acid gas. It may be obtained in the form of a firm paste. Mixed with moistened flour, it excites the panary fermentation, and is thus used for baking bread. Yeast is a plant belonging to the fungi in the state of sporules or thallus; or the true aerial tufts or heads of sporules, of a multitude of minute oval or circulating bodies or sporules, endowed, under certain favourable circumstances, with extraordinary powers of growth and multiplication. In Britain, three kinds, viz. brewer's, German, and patent yeast, are employed in the manufacture of bread. In the E. Indies, the yeast employed is the fermenting juice of the palms, known as toddy. The vitality of dry yeast is destroyed by falls, blows, bruises, or rough mechanical injuries, as also heat, cold, and chemical reagents. The presence of yeast in a substance containing sugar, or starch convertible into sugar and nitrogenized matter, induces certain chemical

ohanges comprehended under the term vinous or alcoholic fermentation. These changes in the making of bread consist in the conversion of sugar of flour into alcohol and carbonic acid gas; the latter, in its efforts to escape from the dough with which it is mixed, distends it, forming vesicular spaces in its interior, and so causing it to become porous and light. A genus and species have been constituted for the reception of this organism, under the name of Saccharomyces cerevisæ. This plant has been supposed to be the active cause of fermentation, and the carbonic acid given off during that process has been regarded as the result of the growth of the plant. In China yeast is used medicinally.—*Schleiden, Principles of Scientific Botany; Micrographic Dictionary; Smith; Poole, St. of Commerce.*

YEDDATURA, a town in Mysore, 18 miles N. of Yelwal. It has a pagoda on the banks of the Cauvery river, with a tank stocked with a species of carp so tame that they can be fed from the hand, and swim about among the natives when bathing.

YE DHARMA HETUH PRABHABAH, etc., a Buddhist formula, meaning whatever moral actions arisc from causc, the cause of them has been explained by Tathagata. Thus what is the check to these actions is set forth by the great Sramana.

YELLAMALA or Yerramala, a range of mountains in the Kurnool and Cuddapah districts, Madras, lying between lat. 14° 31′ and 14° 57′ 40″ N., and between long. 78° 10′ and 78° 32′ 30″ E. The range runs north-west across the Jammalamadugu taluk in Cuddapah, and thence north through Kurnool, nearly to the Domal valley; in some parts covered with thick forest. They are inhabited by the Chenchwar and Koracha races. —*Imp. Gaz.*

YELLAVADU. Tel. A village servant who looks after the village boundaries.

YELLOW.

Pila, ...	Hind.	Passapa-warnam, .	Tel.
Giallo, . . .	Lat., It.	Sari, ...	Turk.

A colour largely obtained by Indian dyers for dyeing cloth, chiefly from the safflower plant.

YELLOW GUM TREE, a term applied in Australia to several species of Eucalyptus. They are called black boys, and their resin black boy gum, of which an average tree will yield 55 lbs.

YELLOW SEA, a gulf of the North Pacific Ocean, which extends north between the provinces of Chang-tong and Peh-chi-li, in China, on the west, and the peninsula of Corea on the east. The coasts in general are low, and the water of a dirty yellow or green colour. In the south-east part are an immense number of small islands, called the Corean Archipelago.

YELLOW WOOD TREE of Moreton Bay is the Oxleya xanthoxylon. It grows to a height of 60 to 70 feet.—*G. Bennett.*

YEMEN, a province in the southern part of Arabia, washed on the west by the Red Sea, and on the south by the Indian Ocean. It comprises nearly 70,000 square miles, and consists of two natural divisions, the upper or mountain district, and the lower country called Tehama. The lower country has many desert and sandy tracts, but there are several towns and hamlets on its coast, and along the shore are numerous small islands, interspersed with coral reefs; that of Tarsen is celebrated for its grotto of pearls. In this district the Beni-Halal Bedouins are the principal tribe. They are very poor, and are predatory. In the north of Tehama is Lohaya, an Arab settlement. The harbour is good, and the trade in coffee considerable. The island of Kamran, lying about 18 miles south of Lohaya, has a better harbour than the latter place. Farther south is the town of Hodaida, with an excellent port, fortified by a small citadel. The principal coffee mart in Arabia is Bait-el-Fakih, situated at a moderate distance from Mocha, and near the mountain regions where the berry grows. The capital of Tehama, Zebid, near one of the most beautiful and well-irrigated valleys in the country, possesses many mosques and other public buildings, with a handsome aqueduct, and an academy where the youth of Yemen and Tehama receive a liberal education, and is besides one of the chief meeting-places where the merchants of Egypt, Arabia, and Persia assemble. Farther south is the town of Mocha, second in importance only to Zebid. Azia is celebrated for the bravery of its people, and the valley of Nejran renowned for the beauty of its site. A principal town is Hamdan, about 30 days' journey from Mecca. Of these subdivisions of Yemen, that of Sana is the most southerly, stretching even to the Arabian Sea, where it touches Aden.

The level tract of country called Balad Aden commences at Bab-ul-Mandab, and runs easterly along the coast a distance of 132 miles. At about 90 miles from the western extremity is the town of Aden, in ancient times a city, the depot of the trade carried on between India and Egypt. This city was destroyed by the Romans in the first century of the Christian era, prompted by the desire of keeping the Indian trade exclusively in Roman hands. In the 11th century we find it again enjoying all the advantages which its position affords; but on the discovery of the Cape of Good Hope route, all traces of commercial prosperity departed, and the Turks became masters of Aden. In 1839 Aden became a British possession; and the population, which in 1839 amounted only to 1000, had in 1842 risen to nearly 20,000, indicative of the readiness with which many of the oriental races can settle down to peaceful avocations so soon as they can find for their protection a stable government. The little island of Sira, lying on the east side of the town, forms a bay opposite Aden, and from this point the peninsula extends three miles westward, forming a commodious and safe harbour. The great monarch, Suliman the Magnificent, constructed an aqueduct at Aden, which commenced at a distance of eight miles from the town. Two caravan routes lead from Aden into the interior, but diverge considerably to arrive at Lahej, the capital of the Abdali Arabs. In the S.W. the straits of Bab-ul-Mandab separate Arabia from Africa. These straits are between 20 and 30 miles in breadth, and are celebrated amongst ancient writers for the dangers encountered by navigators who ventured within these gates of tears.

Perim Island lies about three miles distant from the Asiatic coast, thus dividing the waters of the strait into two channels, that on the Asiatic side

being narrower but deeper, and also free from the impediments offered by small islands, which are rather numerous on the African side.

Yemen means safety, felicity; the term Al-Yemen, the district of safety, is therefore correctly translated in the words Arabia Felix.—*Wellsted's Travels; Playfair's Aden; Niebuhr's Travels*, ii. p. 105.

YEMMI GUDA, the hill of buffaloes, and Yennai Guda, the hill of butter, indicate pastoral stations of the Peninsula.

YEN-YANG, a Chinese emperor who began to reign B.C. 781. Confucius lived under successors of his dynasty, and recorded the observations of the solar eclipses from B.C. 720 to 481.

YERAVER, predial slaves of the Kodaga proprietors of Coorg; tempted by the wages offered by the coffee-planters, they have refused to work for their masters. The peasant masters on one occasion came down in force upon one of the coffee estates where a party of Yeraver were working, and carried them off. The same state of things existed in Santalistan, where the bondsmen—the nexi or addicti of the Romans—were called Kumea. The railroad offered them work and wages, and Mr. Yule, the commissioner, at once refused to give decrees on the debt-bonds which their masters filed in court. He went further, and abolished all imprisonment for debt. The origin of this predial slavery is probably the same. If the Yeraver are bond-debtors, the Coorg will produce the bonds, and the judge may decide as to their legality. Otherwise they are free men. Prior to the British occupation of Coorg (1833), the Yeraver were sold for less than cattle. The British discontinued this state of things, but up to the latter part of the 19th century, in those Coorg families amongst whom they are well treated, they remain much as usual, though able to leave when they like. They are fed, clothed, their marriage expenses paid, and they get small patches of land on the farms, and they are reconciled to their position. They often desert, however, and go to the plantations. When the Contract Act came into force, a few made an attempt to make legal bond slaves of them, but the courts protect them, and do not allow long contracts. Some Yeraver are a migratory race in Coorg, of middle size, with coarse features, black and straight hair. They are labourers, and are believed to have come from Malabar. Their language is said to resemble Malealam. They worship demons, and have no priests.—*Friend of India*, December 9.

YERCAUD, a settlement on the southern part of the Shevaroy Hills, in Mutunaad, in Salem district, Madras, lat. 11° 51′ 38″ N., long. 78° 13′ 5″ E. It is the principal and oldest station in the Shevaroy Hills, 4828 feet above the sea-level. The distance from Salem is 14 miles, and from Shevaroy Hills railway station 12 miles. This railway station is 3 miles from the foot of the hills. The climate is mild and pleasant, the temperature averaging about 14° F. less than on the plains.—*Imp. Gaz.*

YERKAL VADU or Yera-kedi.

Yerkulle var, . .	TEL.	Yerakedi, Yerukellu,	TEL.
Eri-kuvadu, . .	,,	Kurshi-wanlu, . .	,,

A homeless race. In communities they style themselves Yerkal, and they give the same appellation to the language in which they hold communication with each other. Some of them seem to have been converted to the Brahmanical faith, and are now of the Vaishnava sect. With the exception of the cow, almost all animals are used by them as food. Their dead are burned. The Eruku, also called Yerkal, Yerkalvadu, Kurshi-wanlu, Yera-kedi, Yera-kellu, and Eri-kuluvadu, in the Canarese part of the Peninsula of India, occupy themselves ostensibly as basket-makers, and in fortune-telling. But they are notoriously predatory, and steal girls, whom they devote to prostitution. They are to be found in mat huts on the outskirts of most towns. The Yerkala of the Nellore district are migratory mat and basket makers, using the midrib and leaflets of the date palm. They also make wooden combs, work as labourers, and a few have settled and engaged in cultivation. They rear pigs, poultry, donkeys, and dogs, and eat the flesh of most animals. They are usually of a dark-brown colour, the men are of spare and light make, but hardy, with low foreheads and eyes, short nose. They wear only a strip of cloth, and they tie their hair in a knot above their brow.

The Yerukala of Nellore are divided into many subdivisions, and the more wealthy of their number engage in agricultural pursuits, and hold lands from the Government. Some tell fortunes, others make baskets, collect herbs and jungle roots, eat game, and work as coolies to the better classes of ryots. They wear little or no clothing. When they can they commit dacoities, highway robberies, and such offences. The god they worship is sacred to the Triputti Hills. Marriage ceremonies are performed, polygamy is rife, but widow marriages are permitted. All wives are bought from the parents, and a wife is usually valued at twenty pagodas. Among the Yerukalas in Venkatagherry only, the first wife costs the above sum, but in other places less than two pagodas. The language of the people is a Telugu idiom, considerably mixed up with Tamil and Canarese.

Amongst the Yerkala of Southern India, a custom prevails by which the first two daughters of a family may be claimed by the maternal uncle as wives for his sons. The value of a wife is fixed at twenty pagodas. The maternal uncle's right to the first two daughters is valued at eight out of twenty pagodas, and is carried out thus,—if he urge his preferential claim, and marry his own sons to his nieces, he pays for each only twelve pagodas; and similarly, if he from not having sons, or any other cause, forego his claim, he receives eight pagodas of the twenty paid to the girl's parents by anybody else who may marry them.—*Shortt, Trans. Ethn. Soc. MS.* vii. p. 187; *Balfour in Madras Jour. Lit. and Science*, xviii. p. 4; *Lubbock, Orig. of Civil.* p. 103.

YERLA. MAHR. A pent-house worn by ploughmen in the field. It is made of the leaves of the palmyra.

YESKAR. KARN. A village servant, the porter or gate-keeper, usually a Mahratta.

YEVARU, in Coorg, a tribe of predial slaves.

YEVU and Baikuri, CAN., are fish traps adapted to falls. The yevu is a platform made of bamboo, somewhat bellied, so as to lead ladderwise from the top to the bottom of a waterfall at an angle of 45°. The kunjal, another trap, is a rude sort of kuri.

YEW TREE, Taxus baccata, *Linn.*, grows in the Mehra forest near Abbottabad, Hazara. At Choongtam, in Sikkim, the yew appears at 7000 feet, whilst on the outer ranges, as on Tonglo, it is only found at 9500 to 10,000 feet; and whereas on Tonglo it forms an immense tall tree with long sparse branches and slender drooping twigs, growing amongst gigantic magnolias and oaks, at Choongtam it is small and rigid, and much resembling in appearance the English churchyard yew. At 8000 feet, the Abies Brunoniana is found, a tree quite unknown farther south. But neither the larch nor the Abies Smithiana (Khutrow) accompanied it. The yew, it is said, spreads east from Kashmir to the Assam Himalaya and the Khassya mountains; and the Japan, Philippine Islands, Mexican, and other N. and S. American yews belong to the same widely-diffused genus. In the Khassya (its most southern district) it is found as low as 5000 feet above the sea-level.

YEZD town has 30,000 souls, of whom 4000 are fire-worshippers, and 1000 Jews. They are engaged in the manufacture of silk, and their merchants visit Bombay, China, Java, and the Mauritius. Yezd is mentioned by Barbaro as a most industrious place, flourishing by its silk and cotton manufactures, and supplying with these a large part of Asia. These manufactures still continue. Many important caravan routes converge at Yezd, whilst the desert has given it security, and thus it has become a considerable mart. Yezd is regarded as holy by the Muhammadans, a sanctity perhaps borrowed from the fire-worshippers, who still linger here in degradation. The district of Yezd, if included within the limits of Khorasan, occupies the south-west corner of that province, being encompassed on all sides by salt desert, which separates it from Kerman and Fars upon the south, and from Isfahan of Irak upon the west. The town of Yezd, an oasis in the great Persian desert, is built on a large sandy plain, encompassed on most sides by hills. It is situated on the edge of a sandy desert, produces little of itself, but with infinite labour a tract of gardens and orchards has been cultivated near the base of the hills, where very fine apricots and melons are grown.—*Fraser's Khorasan; Pottinger's Tr.* p. 421; *Ramusio*, ii. p. 106; *J. R. A. S.* viii. p. 349, *in Yule*, *Cathay*, i. p. 52; *MacGregor*, iv. p. 604.

YEZDEJIRD III., the last of the Persian kings, who was defeated by Abdullah, son of the khalif Omar. His lieutenant Rustam opposed the Arabs in an obstinate battle, A.D. 636, at Kadesiah on the Tigris. Rustam was slain, and the leathern apron of the mythical blacksmith Caveh, the ancient standard of the Sassanians, was captured by the Arabs. This victory gave the conquerors the province of Assyria, since called Irak-i-Arabi, and was followed by the sack of Ctesiphon. A second battle at Yalula drove Yezdejird as a fugitive into the hills of Fars; but 150,000 Persians made a final stand at Nehavend, among the hills south of Hamadan, the site of the old Medean capital Ecbatana, and their defeat (A.D. 641) was the final overthrow of the native Persian power, and of the religion of Zoroaster. The standard of the Muhammadans was rapidly carried over the tableland of Iran, and beyond the Oxus.

Isfandiar, brother of Rustam, joined the Arabs, but Yezdejird fled south to Isfahan, then on to Kerman and Balkh, finally taking refuge at Merv. Here he sought the aid of the Khakan of the Turks, and of the emperor of China. The Khakan espoused his cause, and for several years a desultory war was waged in the neighbourhood of Merv, but in the end Yezdejird and the Turks retired across the Oxus, about A.H. 31, A.D. 651. Yezdejird perished miserably, A.D. 652, in the hut of a miller, whither he had fled for refuge (Sir W. Muir's Caliphate, pp. 259-297). His death occurred in the eighth year of the khalifat of Usman.

The era of Yezdejird III., or the Persian era, began on the 16th June A.D. 632. The year consisted of 365 days only, and therefore its commencement, like that of the old Egyptian and Armenian year, anticipated the Julian year by one day in every four years. This difference amounted to nearly 112 days in the year 1075, when it was reformed by Jalal-ud-Din, who ordered that in future the Persian year should receive an additional day whenever it should appear necessary to postpone the commencement of the following year, that it might occur on the day of the sun's passing the same degree of the ecliptic.—*Gibbon*, i. 299; *Prinsep's Antiquities by Thomas; Yule, Cathay*, i. 85; *Muir's Caliphate.*

YEZIDI have a tradition that they originally came from Basrah, and from the country watered by the lower part of the Euphrates; and that, after their migration, they first settled in Syria, and subsequently took possession of the Sinjar Hill and the districts they now inhabit in Kurdistan. Their principal strongholds were visited by Mr. Layard, at the Jabal Sinjar, a solitary mountain rising in the centre of the Mesopotamian desert to the north of Mosul. Below the cluster of buildings assigned to the people of Semil is a small white spire, springing from a low edifice, neatly constructed, and, like all the sacred edifices of the Yezidi, kept as pure as repeated coats of whitewash can make it. It is called the sanctuary of Shaikh Shams, or the Sun, and is so built that the first rays of that luminary should as frequently as possible fall upon it. Near the door is carved on a slab an invocation to Shaikh Shams; and one or two votive tablets, raised by the father of Husain Bey, and other chiefs of the Yezidi, are built in the walls. The interior, which is a very holy place, is lighted up by a few small lamps. At sunset, as Mr. Layard sat in the alcove in front of the entrance, a herdsman led into a pen attached to the building, a drove of white oxen. He asked a Cawal, who was near, to whom the beasts belonged. 'They are dedicated,' he said, 'to Shaikh Shams, and are never slain except on great festivals, when their flesh is distributed amongst the poor.' The dedication of the bull to the sun, so generally recognised in the religious systems of the ancients, probably originated in Assyria, and the Yezidi may have unconsciously preserved a myth of their ancestors. So far from Shaikh Adi being the scene of the orgies attributed to the Yezidi, the whole valley is held sacred, and no acts, such as the Jewish law has declared to be impure, are permitted within the sacred precincts. No other than the high priest and the chiefs of the sect are buried near the tomb. Many pilgrims take off their shoes on approaching it, and go barefooted as long as they remain in its vicinity. The Yezidi

recognise one Supreme Being, but, so far as Layard could learn, they do not offer up any direct prayer or sacrifice to him. When they speak of the devil, they do so with reverence, as Malik Taos, King Peacock, or Malik-ul-Kuwat, the mighty angel. Shaikh Nasr distinctly admitted that they possess a bronze or copper figure of a bird, which, however, he was careful in explaining was only looked upon as a symbol, and not as an idol. They believe Satan to be the chief of the angelic host, now suffering punishment for his rebellion against the divine will, but still all-powerful. They frequently pass their hands through the flame, kiss them, and rub them over their right eyebrow, or sometimes over the whole face.

They dwell in black tents of cloth made of goat's hair, which they surround with hurdles of reeds and thorns closely twisted together. The tents are square, or of the form of a parallelogram, the Turkoman tent being round and turret-shaped at top. Like the Arabs, the Yezidi move about in tribes for greater safety, and pitch their tents in a circle when they encamp, leaving its interior open for their cattle and flocks. Part of them dwell on the banks of the Tigris, in the pashaliks of Mojul and Baghdad. One large tribe occupies the valleys in the Sinjar mountain, which rises directly S. of Mardin, in the middle of an immense plain, and stretching towards the S.E., nearly parallel with the river Khabour, the ancient Chaboras, terminates a little to the east of Sakkat-ul-Abbas. They are cruel and inhospitable. — *D'Anville, Geographie du Tigre et de l'Euphrate; Layard, Nineveh; Burton's Scinde; Macdonald Kinneir's Memoir; Latham, Nationalities of Europe.*

YEZO. The Aino are the aboriginal races of Yezo, but their severe treatment by the Japanese has led them to other countries. They occupy the southern part of the island of Saghalien, which is in possession of the Japanese. The Aino are of short stature, with broad faces of the Mongol type. They are a timid race; their limbs are hairy; they have bushy beards and long tangled hair, large heads, and clumsy figures; the expression of their face is that of good nature combined with stupidity. According to M. Rosney, their language is dissimilar to Japanese, and that spoken in the Kuriles and in the island of Yesso, is also different from Japanese.—*Adams*, p. 240.

YGDRASIL, in Norse mythology, the tree of knowledge. See Odin; Tree.

YIH-KING, an ancient Chinese book. The annotation of Confucius to the ancient work Yih-King, states that Fu-he got the idea of his diagrams from a figure on the back of a 'dragon horse' which issued from a river. The same annotation states that, before Fu-he invented the Eight Diagrams, he observed the configurations and appearances in the heavens and the earth, and the marks on birds and beasts; also that he derived information from his own person and from things around him. These terse passages of an ancient author are, when taken literally, apt to give a ridiculous air to the Eight Diagrams. But a little examination shows the meaning to be that Fuh-he constructed the Eight Diagrams only after a careful and extensive survey of nature and its varied phenomena, as exhibited in the departments which we call astronomy, meteorology, physical geography, and natural history, and after reflection on his own nature, physical and mental, and on the nature of men generally as manifested in the events of the social life around him. The Eight Diagrams formed, in fact, an illustrative figure intended to elucidate Fuh-he's theory of the universe, a theory adopted after careful reflection on all animate and inanimate nature without his ken. They are in so far undoubtedly the foundation of Chinese philosophy, but it must not be assumed that learned Chinese conceive any occult power to lie in them. Much in the same way we might say that the Literary Prince, having been imprisoned (while he was still a vassal of the dynasty he overthrew) by his jealous suzerain, during the years B.C. 1144, 1143, 1142, made in the seclusion a different arrangement of the Eight Diagrams; and he, with one of his sons, Chow-kung, who laboured after the establishment of the family in the sovereignty, gave permanency to their joint development of the national philosophy, by attaching a few words of explication to each of the sixty-four doubled diagrams. Fuh-he's diagrams, as re-arranged, together with the short explications of the first monarch of the Chow dynasty and his son, form the basis or text of the first of the Chinese Sacred Books, the Yih-king. After an interval of six centuries, Confucius seems to have used the Yih-king in framing his own philosophical views.

YIN and Yang, with the Chinese, the male and the female principle. These are represented above the entrance doors of dwelling-houses, as charms to ward off calamities. They are also represented on the flag flying at the mainmast of the imperial war junks.—*Gray*, ii. pp. 44, 247.

YING-BAU, a tribe supposed to belong to the Red Karen, whose dress and language they use. They dwell about 100 miles north of Tounghoo, north of the Karen-ne or Red Karen.

YOGA, a school of philosophy.

YOGA, in Hindu astronomy, the leading or principal star of a lunar mansion, the position of which is given in the Hindu astronomical tables. There are 28 yoga stars (including Abhijit) in the lunar zodiac; but, with the exception of 16 or 17 of these (on the identity of which there can be little doubt), it is very uncertain to which of the stars in the European catalogues the remainder correspond. Harshana (which no doubt is the same as Spica Virginis) seems to be the yoga which drew most the attention of the ancient Hindu astronomers, probably on account of its convenient magnitude and declination, which at the beginning of the 9th century was 9° 38′ 13″ S. To this star they referred the beginning of the 7th month of their solar sidereal year, from which they concluded its beginning; and there is every reason to suppose that it was on the result of observations of Harshana that they established their Cranti-Pata-Gati or precessional variation; a surmise which, if correct, offers a singular concurrence of circumstances, for it was by observations of the same star that Hipparchus first discovered (in the 2d century before Christ) the motion of the fixed stars from west to east.

Yogu, a term so pronounced by the Telugu astronomers, but yoga as spelt by the Carnatic Sastri, is an astrological element, containing the same number of accidents as there are yoga in

the 27 regular mansions of the lunar zodiac, bearing the same names, and arranged in the same order, but having no sort of astronomical reference to them. A yoga is the time during which the sum of the motions of the sun and moon amounts to one nacshatra, or 13° 20′. Its mean duration is 59g. 29v. 21p. 75 Indian time (23h. 47m. 44·24s. European time), 17 of which are nearly equal to 16 days; which occasions an equation somewhat similar to that of the Cshaya tithi.—*Captain Warren, Kala Sankalita.*

YOGA, in Sanskrit, means union, junction, but in Hindu philosophy, re-union with spirit, union of separated with universal soul. The yoga is one of the schools of Hindu philosophy teaching the eternity of matter and spirit as well as of God, and the obtaining of final liberation from life by ascetic practices. The Yoga is the third degree in the Saiva systems, and is the practice of abstraction of mind. As commonly understood, the term means abstract devotion, by observing which superhuman faculties are supposed to be acquired admitting the practice of magical rites.—*Bunsen*, iii. p. 562; *Hind. Th.* ii. p. 13; *Warren, Kala Sankalita.*

YOGHOURT. Kurd. A preparation of sour clotted cream or milk.—*Rich's Kurd.* i. pp. 117, 235. See Youart.

YOGI, a follower of the Yoga philosophy, a practiser of ascetic devotions; one who, by the practice of the Yoga, has acquired supernatural powers. A devotee seeking the attainment of Yoga has to learn the rules of Yoga, to acquire perfect knowledge; to employ this knowledge practically, and overcome the material influence of the primary elements, and finally destroy all consciousness of personality and individuality (ahankara), and the soul thus becomes free from matter. In ordinary acceptation, a Yogi is a Hindu religious mendicant, of whom there are various orders.—*Wilson, Hind. Theat.* ii. p. 107.

YOGINI, a female devotee; also, in Hinduism, a female fiend, or a divinity of an inferior order, often associating with human beings, and usually working mischief. Eight of these demons, attendants on Durga, are named Bherunda, Marjani, Matali Nayaki, and Jaya or Subhachara, Malaya-gandheni, Kaumudika, Nayaki, Su-lakshana, and Su-Nanda.

YOGINI TANTRA, one of the books of the Hindu Tantra.

YOIDYU, the professed, though not the exclusive, medical men amongst the Bengali people. They study the Nidana, Rakshita, Drivya-goona, and other medical Shastra. Commonly known as the Bed or Ved.—*Ward on the Hindoos*, iii. 95.

YOJANA or Ved. Sansk. An astronomical and geographical measure, deduced from the ratio of the diameter of the earth to the circumference of its equatorial circle. The dimensions of the yojana, like those of any other measure, originate in an arbitrary division of extent, for which the Hindus have chosen a finger or angula as a standard to be found in nature. By that common measure they estimate not only distances and the dimensions of the earth, but even the distance of the planets, their parallaxes, and (when referred to particular points on the surface of the earth) the effects of their longitude and latitude as to time. The Hindu mathematicians divide the diameter of the earth into 1600 parts, whence they have this expression $\sqrt{10\times1600} = 50596$ yojana for the value of the equatorial circle. An angle of one minute of a degree is supposed to be subtended by 15 yojana, at the mean distance of the moon; so that, dividing the earth's semi-diameter (800 yojana) by 15, we have 53′ 20″ for the moon's mean horizontal parallax. It follows from this result that 53′ 20″ of the moon's orbit will measure 15 yojana, and that her whole orbit (360°) will measure 324000 yojana. Hence 5059 (the circumference of a great circle of the terrestrial globe in yojana) is to 800 yojana (its semi-diameter) as 324000 (the circumference of the moon's orbit in yojana) is to 51235 yojana, her mean distance from the earth, from which it follows that this distance (according to the estimate of Hindu astronomers) is about 64 semi-diameters of the earth. As the moon is supposed to complete 57753336000 sidereal revolutions in a calpa, this number drawn into 324000, gives 18712080864000000 yojana for her absolute motion during that time. It is a principle in Hindu astronomy that the absolute motion of each planet in a day, or any other time given, is equal to the absolute motion of the moon in the same time. Hence, if the absolute motion of the moon during a calpa be divided by the number of mean revolutions completed by any planet, during that period it will give the cacsha or circumference of the planet's orbit in yojana. To convert degrees of latitude and longitude into yojana, they use the following proportion: As 360 °to the proposed number of degrees, so 5059 yojana (the circumference of the equatorial circle) to the number of yojana sought. The Hindus subdivide the yojana into a great number of parts, in the following manner:—The yojana ÷ 4 crosa ÷ 1000 dhanush or danda ÷ 4 rcsta or cubits ÷ 2 vitisti or spans ÷ 2 pada or foot-breadths ÷ 6 angula or finger-breadths ÷ 4 yara. Some make the crosa = 2000, danda or half a yojana, which agrees better with that in which the distances are usually computed. The yojana is regarded in Ceylon as being equal to 16 English miles.—*Hardy's Eastern Monachism*, p. 443; *Warren, Kala Sankalita.*

YOJNA-GANDA, the mother of Vyasa. She was a fisherman's daughter, and king Santanu was the father of Vyasa. The name means a sweet fragrance (ganda) whose odour extends a yojna (4 miles). The names given by Muhammadans to the women of the harem are of a similar character,—Yasmin, Sosun, Jasmine, Lily.

YOMA, in Burmese, a peak, a great ridge, a backbone, and is applied to two mountain ranges. The mountain chain of the Arakan Yoma runs from the eastern end of Cachar, parallel with the coast, at an average distance of 40 or 50 miles, down to Cape Negrais, lat. 16°, and is of an average height of 4000 or 5000 feet. Starting from the Blue Mountain, in lat. 22° 37′ N., and long. 93° 11′ E., this range runs southwards for a distance of over 700 miles, dividing Arakan from Independent Burma in the north, and from the British province of Pegu in the south. The Blue Mountain rises to 7100 feet. The last bluff at Cape Negrais is crowned by the Hmawdan pagoda. Pyramid Hill is 3000 feet. The crest of Aeng pass is 4517 feet. The pass from Podangmew to Ramree is 4000 feet. Cape Negrais is about 300 feet high.—*Dr. M'Clelland, Govt. Selections*, ix. 6.

YONI. Sansk. The place or elements of birth, from Sanskrit root Yu, to mix. In the physiological religion or philosophy of the Hindus, the lingam and the yoni represent organs of the human body, and the symbols are to be seen in almost every street of every town of British India. The yoni is the symbol of the bhaga, and the lingam, priapus, or phallus, is that of the bija. It is a cosmic philosophy based on the union of the sexes, and Hindu writers represent Narayana moving (as his name implies) on the waters, in the character of the first male, and the principle of all nature, which was wholly surrounded in the beginning by tamas, or darkness, the chaos, or primordial night of the Greek mythologists. The chaos is called prakriti, or crude nature; and the male deity has the name of Purusha, from whom proceeded sakti or power; that power, in its first state, was an aptitude, and lay dormant or inert until it was excited by the bija or vivifying principle. This power or aptitute of nature is represented under the symbol of the yoni or bhaga, while the bija or animating principle is expressed by the linga. The symbols of the lingam and yoni are constructed of stone or metal of some kind, the lingam surrounded by the yoni. At the very extremity of Malabar Point, on the island of Bombay, is a cleft rock, to which pilgrims resort for the purpose of regeneration by the efficacy of a passage through this sacred type. This aperture is of considerable elevation, situated among rocks of no easy access, and, in the stormy season, incessantly buffeted by the surf of the ocean. The devotee, leaving his clothes and his sins at one side, passes through cleansed and regenerated.—*Moor; Coleman; Colebrooke; Wilford; As. Res.* ii. p. 471, iii. p. 365, iv. p. 366, vii. p. 256, viii. p. 274.

YORA-BANGALA, from Yora or Jora, a pair, and Bangala, a one-storeyed house; an idol-temple, made like two thatched houses or bangala placed side by side, and has a double-pitched roof, generally covered with tiles or bricks. The front is open without doors. These temples are dedicated to different gods, but now are not frequently built in Bengal.

YOUART. Pers. Curds and whey, the principal delicacy to be found amongst the wandering tribes near Syria.—*Eothen's Travels*, p. 50. See Yoghourt; Kurut.

YOUNG, Captain JAMES, I.N., author of Memoir of the Maldive Islands, Bom. Geo. Trans., 1836-1838, Bombay reprint, i. p. 54; Account of Famine in the Laccadives in 1841, in Bombay Times, August 13, 1851, October 1, 1847.

YOUNG, Captain JOHN, younger brother of Captain James Young, author of Currents in the Arabian Sea. See Orlebar's Account of, in Athenæum, 1847; Rep. Brit. Ass., 1848. His ship, the *Cleopatra*, was lost in a cyclone.

YU the Great is the first Chinese monarch of whose reality there is no doubt, and his accession occurred about 2000 years before the Christian era. Systematic Chinese history hardly goes back so far as B.C. 2000, *i.e.* to the reign of Yu. Yu was the founder of the dominion of the kings or princes of Shen-si in S. China, as far as the great river. He diverted the course of the Yellow River to fertilize the lands between the two rivers.

YUAN CH'AO PI SHI, or Secret History of the Mongol Dynasty, a history of Chengiz Khan and his ancestors, written in the Mongol language about A.D. 1240.

YUCCA, a genus of plants belonging to the section Aloe, of the natural order Liliaceæ, and called Adam's needles; natives of the southern provinces of the United States. They are conspicuous for their lily-like white flowers, as well as for their long sword-shaped leaves terminated by a thorny point. All abound in fibre of a fine quality, and strong in Y. aloifolia, Y. angustifolia, and Y. filamentosa. The Yucca fibres are amongst those which have received the name of silk grass. Y. gloriosa, *L.*, common Adam's needle, is a native of Peru and North America, blossoms in July and August, its panicle of elegant flowers attaining a height of 10 or 12 feet. Y. aloifolia, *L.*, aloe-leaved Adam's needles, has leaves with the edges bordered by fine callous notches. It is a native of N. and S. America, but it is grown in all parts of India; it produces a white, pliant, and strong fibre, resembling that of the agave in all respects, but is apt to be discoloured by steeping, which the agave is not.

Yucca gloriosa, Adam's needle, is sometimes called an aloe; has a strong, fine, but rather stiff fibre, suited for the manufacture of cordage; it very soon becomes discoloured by steeping, but is not so liable to rot as some of the other fibres of this kind. The plant is not abundant in Southern India, but grows easily and might be propagated to a great extent.—*Royle; Riddell; Roxburgh; Voigt; Mad. Exhib. Jur. Rep.*

YUCHI or Yuti appear to be the tribe whom the Greeks called Tochari. They formed part of the Barbaric kings of Bactria.

B.C. 126 Hermæus—rules over Parop., Nyssa, Gand., Peuk. (The Su-saka race obtain Arya, Drangia, and Arach. from the Parthians.)
Mauas—has Taxila, Por., Reg., Cath., Pattalene, Syrastrene, Larice.
,, 105 Kadphises—(Yuchi) takes possession of Hermæus' kingdom, and Taxila from Mauas (Kozola Kadaphes).
Vonones. } Paropamisidæ.
Spalygis. }
Spalirises. }
,, 110 Aras—succeeds Mauas, obtaining also in B.C. 90 Nyssa, Gand., and Peuk.
,, 80 Azilas—succeeds Azas in the three latter, adding Taxila and the Paropamisidæ.
,, 80 The Soter Megas—obtains the dominions of Azas, and subsequently those of Azilas.
,, 60 The Yuchi again possess Parop., Nyssa, and Taxila, etc.
,, 26 Gondophares—reigns in Ariana. Abdagasses (and Sinnakes or Addinigaus), ditto in ditto, less the Parop.
A.D. 44 Arsaces (Ornospades or Orthomasdes)—ditto, ditto.
,, 107 Pakores Monnesses—ditto, ditto (Hiatheleh), in Bactriana.
,, 207 Artemon—in Arya, Drangia, Arachosia.

The Yuchi are believed to have been of a northern race, who became known in the west as Indo-Scythians, and at a later date as White Hun. They were driven from their seats somewhere between China and Khotan, by the great Turkish race of Hiong-nu. After some intermediate halts, they arrived first in Tawan or Farghana, and afterwards in Tahia or Bactriana, where they destroyed the Greek dynasty, and settled themselves. The Chinese emperor was desirous of opening communication with them in order to excite a diversion against the Hiong-nu, the constant disturbers of the Chinese frontier, and

about B.C. 135 he sent for this purpose a party under an officer called Chang-kian. On their way they were caught by the Hiong-nu, and kept prisoners for ten years. Chang-kian then escaped with some of his comrades, but, adhering to his mission, succeeded in reaching Tawan, where he was well received by the people, who were acquainted by fame with the power and riches of China, though they had never had any direct communication with that country. Finding that the Yuchi had gone south to Bactriana, he followed them thither, but failed to induce them to quit their new seats upon the Oxus to return to their eastern deserts and battle with the Hiong-nu.

During the first century, the power of China had decayed, and the Hiong-nu recovered their ascendency. In A.D. 83, however, Panchao, one of the most illustrious commanders in the Chinese annals, appeared in the field, and in a few years recovered the Uigur country and all Western Tartary to the empire.

The Yuchi and other kindred tribes invaded Sogdiana about B.C. 127-126, and finally, about B.C. 120, conquered the whole of Bactria. They subsequently conquered Kābul, and occupied the country between that city and the Indus. Before the Christian era, they were firmly seated on that river, and, under the great king Kanishka, had become an Indian power of very considerable importance. Kanishka is variously supposed to have reigned from about A.D. 20 to 40, while another account makes him the founder of the Saka era A.D. 79. The power of these Turushka kings spread over all the Panjab, southwards as far as Muttra on the Jumna, in the first century of the Christian era. At the same time, another body, the Sah, who also used the Saka era, crossed the Indus lower down, and occupied the province of Gujerat. From the time of Kanishka, a continuous succession of tribes of Scythian origin poured across the Upper Indus into India, each more Turanian than the one preceding it, till the Moghul conquest of India in the 15th century. The western races distinguished as Yavana, who may have been the Bactrians driven by the Yuchi from their homes B.C. 150 or 130, and who appeared in Orissa before and about the Christian era; the Camboja, who joined in the advancing races, seem to have come from a country between Kandahar and Kābul; and the Saka, the classic Sacæ or Scythians, pressed on with the rest, and were formidable during the first four centuries of the Christian era, till defeated by king Vikramaditya.

According to Chinese authorities, the Yuchi retained their hold in India certainly till A.D. 222 (J. A. S. B. vi. p. 63), and probably for some time longer, but their power seems to have been then on the wane.—*Fergusson*, pp. 27, 28; *Walter Elliot; M. L. S. J.*, 1858, p. 77; *Yule, Cathay*, i. pp. 54, 55; *Cunningham, Ancient Geography of India.*

YUDISHTHRA, a prince of great celebrity, who, according to Indian authors, reigned about the beginning of the Kaliyug; some, however, fix the epoch of his reign 653 years later, or in the year 2448 before Christ. He is also said to have been contemporary with the astronomers Parasara and Garga. As the commencement of the Kaliyug was B.C. 3101, the true date seems to have been about B.C. 1400. Yudishthra was the eldest of the five Pandu princes. He was educated by Drona, at the court of his uncle Dhrita Rashtra, and his uncle declared him Yuvaraja or heir-apparent; but the jealousy that the Paurava felt from this drove the Pandava into exile to the city of Varanavata. When there Duryodhana set fire to their house in the hope of destroying them; and as the bodies of a woman and her five sons were found in the ruins, the Pandava were believed to have perished.

They, however, returned, and settled at Indraprastha, where Yudishthra ruled wisely, and the people prospered; but, gambling with the Kaurava, he lost his all, kingdoms, brothers, himself, and wife. Dhrita Rashtra ordered the Pandava to be released and sent away, but they again gambled, and by the terms of the play they had to go into exile for 13 years. At its close, Yudishthra sent a messenger to Hastinapura to obtain restoration; but this being refused, the great battle recorded as the Mahabharata was fought, in which the Kaurava were all slain. Yudishthra became king, but he abdicated in favour of Arjuna's grandson. Yudishthra and Baladeva, after the Mahabharata, returned to Saurashtra, and after the death of Krishna they went northwards, and are supposed to have reached Greece.

YUEN, a dynasty of China, which succeeded the Sungh in A.D. 1271. They were Mongols, immediate descendants of Chengiz Khan, who adopted Chinese civilisation only in a very slight degree, and were soon expelled. The first emperor of the native dynasty, the Ming, which succeeded them in A.D. 1368, though a promoter of literature, was himself illiterate, having been a servant in a monastery. But the third sovereign of the line, who began to reign A.D. 1403, had a splendid library formed and several encyclopædic works compiled. He published an edition of the Sacred Books, which is known by the affix to their title of 'Tatreuen,' in full completeness.

YUG, Yuga, or Yoga signifies properly the conjunction, and sometimes the opposition of the planets. It is, however, more generally used, for signifying a long period of years, at the expiration of which certain phenomena or circumstances recur. The principal series of the yug made use of in present times in astronomical computations, are the Maha yug, Satya, Treta, Dwapara, and Kali yug. It is generally admitted that ancient Hindu astronomers invented their yug with reference to some of Jupiter and the Sun's conjunctions, in the beginning of the zodiac; and that more recent ones, with a view to lengthen their periods, have referred them to those of Saturn and the Sun. Modern European commentators have made great alterations in the epochs and durations of these yug, without changing their names. Yuga dina (sometimes written yugadia) means the anniversary of the day on which the current Maha yug, and any one of the four lesser yug, began, which anniversary is always noticed in the calendar. Telugu astronomers use sometimes the term yugadia for ahargana. Kala or cala, time, in its natural acceptation, is a term applied to a great variety of mathematical and astronomical subjects.—*Captain Warren, Kala Sankalita.*

YUGA, an age of the world. Hindus in their mythical cosmogony divide the age of the world into four yuga,—the Krita or Satya yuga, extending to

1,728,000 years; the Treta yuga, to 1,296,000 years; the Dwapara yuga, to 864,000; and the Kali yuga, in which we now live, and which they consider will last 432,000 years. The world in 1878 was in the year of the Kali yuga 4979. Hindu cosmogony reekons four yuga in every Maha yuga. A Maha yuga comprises 12,000 years of the gods, equal, according to the Vishnu Purana, to 4,320,000 years of mortals. One thousand of these periods is a calpa or day of Brahma = 4,320,000,000 of human years, comprising under it 14 Manwantara, or periods presided over by 14 successive Menu, after whieh there is a universal collapse (Maha pralaya) of all creation. In the present calpa or æon, six Menu have passed away, of whom the first was Svayambhuva, the present or seventh being Vaivasvata.

Bunsen regards the four ages of Menu as four states with successive interregna, which the Aryan Hindu race really passed through. The first age contains only general mythical representations of divine progenitors. The second period commences B.C. 2400 (2300) prior to the old settlement in the Panjab, on the Saraswati, ending B.C. 1900 (1800). The commencement of the third period was B.C. 1606 (1486), corresponding to the first year of the Kuru, and may have lasted 500 years, or down to B.C. 1107 (987). And he estimates the beginning of the Aryan settlement in the Saraswati distriet as not later than B.C. 2600 or 2500.

YUGAT-PRABHU. Sansk. Lord of the world.

YUG-SADDAN, or Yug-brasht, or Yug-byasa, in Hindu belief are persons who, by extraordinary pious pains, obtain miraculous longevity, prolonging their lives to some hundreds of years. As far as can be gathered, it is regarded by them as the faculty of drawing, by degrees, all the breath (or perhapst he principle of life, or the soul) into the upper part of the head, and thus continue for any number of years the aspirant may have previously determined on, or, as others say, in proportion to his piety, in a state of insensible absorption, exempt from the destruetive operations of earth or water, but not of fire. The sect called Byragi or Viragi are apparently the most frequent and successful pretenders to this extraordinary power. Perhaps the following tale in Wilford's Egypt and the Nile may allude to the practice. On the banks of the Kali dwelt a Brahman, whose name was Lechayanasa, a sage rigorously devout, skilled in the learning of the Vedas, and firmly attached to the worship of Hari; but, having no male issue, he was long disconsolate, and made certain oblations to the god, which proved acceptable, so that his wife Sankriti beeame pregnant, after she had tasted part of the Charu, or cake of rice, which had been offered. In due time she was delivered of a beautiful boy, whom the Brahmans, convened at the jatakarma or eeremony on his birth, unanimously agreed to name Haridata, or given by the divinity. When the Sanskara, or institution as a Brahman, was eompleted by his investiture with the sacerdotal string, and the term of his studentship in the Veda was past, his parents urged him to enter into the second order, or that of a married man; but he ran into the woods, and passed immediately into the fourth order. Disclaiming all worldly conneetions, and wholly devoting himself to Vishnu, he continually praetised the Samadhi yoga, or union with the deity by contemplation, fixing his mind so intensely on God, that his vital soul seemed concentrated in the Brahma Randhra, or pineal gland; while his animal faculties were suspended, but his body still uncorrupted, till the reflux of the spirits put them again in motion. Hindus assert that some Yogi have remained in this state for years, and the fanciful gradations are minutely described in the Yoga Sastra, and even delineated in the figures called Shat-chakra, under the emblems of lotus flowers with different numbers of petals, aecording to the supposed stations of the soul in her mystical ascent.—*Coleman, Mythology of the Hindus*, p. 426; *As. Res.* iii. p. 456.

YUH. Chin. Jade, nephrite.
Yashm, ... Pers. | Sutash, ... Turk.

This mineral is found in the long narrow valley of the Ooroo or Oru, a tributary of the Ningthe or Kyendwen, some 50 or 60 miles west of Mogoung. It is dug up by the Shau and Kakhyen raees. It is found embedded in yellow clay. It is largely purchased by the Chinese in Burma for exportation to China, where it fetches au extravagant price, and is manufactured into cups, bracelets, etc. It is of the yuh stone that the Chinese form their waved emblem of longevity, specimens of which sometimes bring 100 dollars. Respectable Chinese at Amarapura represent this trade as amounting to from six to ten lakhs of tikals per annum. This is probably exaggerated. It is met with also in Fung-tien-fu (Shing-king), Lieu-chau-fu (Canton), in Shan-tung, near Khoten, Karakash, Yarkand, and other places in Turkestan and Mongolia, in the rivers amongst the Siansk mountains, to the S.W. of Lake Baikal, in E. Siberia, and other places in Central Asia; also in New Zealand, Polynesia, and the United States. It is of various colours, white, blue, yellow, and green, and the milk-white and light green varieties are the most valued. Its hardness, weight, sonoriety, and peculiar sombre tint are the points on which the Chinese found their estimate of its value. It consists chemically of the silicates of magnesia and alumina, with varying quautities of chromium, and perhaps other metals, according to the tint of the stone. Philosophers and physicians have ascribed all sorts of properties to this mineral, whieh, however, as a medicinal substance for any purposes of pharmacy, can have no other effect than so much steatite or soapstone. The Chinese suppose it to possess humane, just, intelligent, brave, and pure qualities, presumed to be conveyed to the wearer. Those who wear it are said to be relieved from the claims of gravitation. Chinese jade articles have been dug up in Europe in connection with very ancient remains.—*Smith; Porter, M.B.; Nat. History of China; Yule's Embassy*, p. 147.

YUH-HWANG-TE, the pearly emperor, is one of the Chinese deities who is invoked in seasons of drought. He was the son of one of the kings, Kwong-Yim-Mew-Lok, and was canonized.

YUJ and Majuj, or Gog and Magog. See Alliteration.

YULE, Colonel HENRY, an offieer of the Bengal Engineers, author of Fortification for Officers of the Army, 1851; Embassy to Ava, 1858; Cathay and the Way thither, 1866; Book of Ser Marco Polo, 1871 and 1875; Geography of the

Upper Waters of the Oxus, 1872. Henry Yule and Captain W. Gill, R.E., the River of Golden Sand, 1880. He was in charge of the Observatory at Aden in 1840; author of an account of the Khassya Hills, Bl. As. Trans., 1854; on Native Tree Bridges, Scandinavian Antiquities; Tremendous Falls of Raiu at Cherrapoonji, ibid.; Translation of the Canal Grant of the Emperor Akbar, with Notes on the Western Jumna Canal, ibid., 1839, x. p. 113.—*Dr. Buist's Catal.*

YU-MUH, nomade wandering herds. They and the Tosang fowlers are variously interspersed throughout the military jurisdictions of extra-provincial China, and are administered more or less by military functionaries. The Tosang are to be found in Kirin, and Tsitsihar of the Manchurian provinces, and Urianghai; the Yu-muh are at Chang-kia-kan, and in Ili, Jeh-ho of the map, Tarbagetai, Urianghai, Kobdo, and Tibet. There are also Yu-muh between Tibet and the Kan-suh frontier, under the minister residing at Si-ning-fu, and on the borders of Shan-si in the Kwei-hwa command.

YUNAM, also called Nam-tso, a glacier lake in Lahoul. Glacier lakes are accumulations of water formed by one glacier obstructing the outlet of a higher one, and are of frequent occurrence. At times the wall of ice breaks away before the pressure of the swollen waters, when the lower lands become suddenly inundated, and the torrent rushes on with uninterrupted violence for miles, exercising a marked influence even down to the lower parts of the rivers. Two of the most elevated glacier lakes are the Deo-Tal, in Garhwal (17,745 feet), and the Nam-tso or Yunam, in Lahoul (15,570 feet).

YUNAN. Hind., Pers. Greece. Yunani, a Greek; also in India a system of medicine.

YUNNAN, a province of China, bounded on the north by Sze-chuen, on the south by Laos and Tonquin, on the east by Kwan-se and Honan, and on the west by the Burman empire; a small portion of the N.W. is bounded by Tibet. The surface of this province is estimated at 57,000 square miles, and its population at seven millions. Yunnan is the most south-westerly of the provinces of China proper, and contains a large number of Muhammadans. Marco Polo, whose book was written in 1295, describes the inhabitants of the principal city as a mixed assemblage of idolators, Nestorian Christians, and Muhammadans. The Muhammadans are said to be descendants of a body of 10,000 soldiers who were subsidized in A.D. 757 from Baghdad, and then sent to colonize Yunnan. The Muhammadans of Yunnan are styled Pan-thay by the Burmese, and Quay by the Chinese. Pa-thi in Burmese means any Muhammadan. Yunnan is rich in gold, silver, lead, iron, copper (132 mines), tin, mercury, arsenic, and gypsum. The galena of the Khyto mines yields 104 oz. of silver to the ton of ore. In 1850, eleven thousand tons of copper were raised, and silver of value 2½ millions of francs. Its silver mines at Loosoonphoo are worked by Muhammadans, there also called Pan-thay. In 1854, the trade with Burma was valued at half a million sterling. A great traffic exists between China and the Laos States, the Siamese, the Burman Shan States of Limmai Moni, and conducted by great caravans of ponies, mules, and donkeys.—*Sirr's China.*

YURISH. Pers. Assault, storm, invasion, commonly supposed to give the English or Irish cry 'hurush.'

YUSSER, a species of kerotophyte, which abounds in the harbour of Jedda, and has a most singular effect under water, from its gently waving motion when agitated by the tide. It is of a deep-black colour. On being taken up it is flexible, but when dry it becomes very brittle. One species, if touched with the tongue, stings severely.—*Valentia's Travels*, iii. p. 320.

YUSUF and Zuleika, a romance by Ahmedi Jami, taken from the story of Joseph and Potiphar's wife.

YUSUF KHAN, the founder of the Adal Shahi dynasty at Bijapur, A.D. 1501, was the son of Amurath II. of Anatolia, born at Constantinople. After a varied career, he was purchased for the bodygnard at Beder, where he soon raised himself to distinction, and in 1501, on the defeat of Dastur Dinar, he assumed independence.

YUSUFZAI, an Afghan tribe on the N.W. frontier of India, partly within and in part beyond the British border. It comprises the independent districts of Swat and Buner to the north of the Hazarno and Mahaban range of mountains, and the level plains to the south of the mountains lying between the river Swat and the Indus. Its boundaries are Chitral and Yasin to the north, Bajawar and the Swat river to the west, the Indus to the east, and the Kābul river to the south. The southern half of Yusufzai to the south of the mountains Hazarno and Mahaban is under British rule, and corresponds with the ancient district of Peukolaitis or Pushkalavati, called also Pahkalaoti. Its inhabitants are about 140,000 Afghans and 125,000 other tribes. Water is entirely absent in the northern half.

The Yusufzai quitted their ancient habitations between Ghazni and Kandahar, and, after various unsuccessful attempts to obtain a settlement in Kābul (at the time when Mirza Ulug, surnamed Kābuli, ruled that kingdom), finally established themselves in Swat and Bajawar, which at the period were governed by a dynasty of princes styled Sultani, who derived their lineage from Alexander the Great. Bajawar is certainly the Bazira of Alexander, and the celebrated rock of Aornos ought to be situated either in Bajawar or Swat, or the adjoining country of Kuttor. The Yusufzai possess, in addition to Swat and Bajawar, the tract situated between those provinces and the rivers of Kābul and Indus.

The Yusufzai tribes now hold all the districts to the north of the Lauddaey Sind, or eastern half of the Kābul river, though they were in Baber's time new comers. Their Ranizai division all reside beyond the British border in the Sani and Bar or Swat districts. Sani Ranizai was a refuge for malcontent criminals who made inroads, and in 1852 a force under Sir Colin Campbell obtained their submission; since which they have fulfilled their engagements.

Few even of the scores of mounds which cover the plains of Yusufzai have yet been in any way investigated, much less opened; and still fewer have been the attempts to search the hills which abut on this plain, although every attempt in this direction has been abundantly rewarded. Amongst the art remains spared by the Muhammadans, with their traces of Greek origin, are such as the

nude figure in chain armour, with the Macedonian chlamys, and the Greek head of Buddha, the chin of which only is Indian, found at Jamalgarhi.

The Yusufzai are revengeful, envious, avaricious, and obstinate, fond of liberty, faithful to friends, kind to dependents.—*MacGregor*, iii. p. 43.

YUTHIA or Ayuthia, in lat. 14° 18′ N., about 72 miles up the Menam river, was formerly the chief city of Siam, but the Siamese were driven from it in 1767 by the Burmese. The country produces cotton, sugar, pepper, teak, rosewood, and other items.

YUZ BASHI. Turk. A commander of 100 horsemen.

YUZ-BEGI, a centurion chief in Ush-Turfan.

Z

Z, the twenty-sixth and last letter of the English language, is also found in most of the modern languages of Europe, also in Arabic, Persian, and Urdu. It is a sibilant consonant, and is merely a sonant or vocal s. It is quite a characteristic distinction between the Sanskritic and Semitic dialects of India, that the former are destitute of the symbol and the sound of z, whilst in the latter there are no fewer than five modifications. In the Arabic, three letters have individual powers, but, with the exception of zh, which has the sound of the French j in jour, no difference of pronunciation is made in India. The Hindu races who do not use z are not able to distinguish between z and j, so that zor, strength, becomes jor, union; roz, day, is pronounced roj, for there is not any letter corresponding to z in the Sanskrit, Hindi, Mahrati, Gujerati, Bengali, Uriya, Telugu, Carnata, Tamil, or Malealam. In the two Tamil dialects zh and l interchange, as in Pazham or Pallam, fruit.

ZAABUT. Arab. A large, bag-sleeved, black or brown coloured robe, made of home-spun woollen, the garb of the Arab peasant, the hedge priest, and the darvesh.—*Burton's Mecca*, i. p. 24.

ZAB, the Lesser Zab or Zei, is a river of Turkish Kurdistan. Its prineipal source is in the Legwin valley. It descends into the plains of Assyria. Athur, a ruined city near the mouth of the Upper Zab, now usually known by the name of Nimrud, is called Ashur by the Arabic geographers; and in Athur we recognise the old name of Assyria, which Dion Cassius writes Atyria, remarking that the barbarians changed the sigma into tau.

The Greater Zab is a river of Kurdistan, which is formed by several streams running through the Jawur mountains, and converging in the S. slope of the great Kurdistan chain. It enters the Tigris below Senn at Kushuf, in lat. 35° 59′ 30″ N. —*Muller's Lectures*, p. 233; *Malcolm's Persia*, i. p. 2; *MacGregor*.

ZA-BAING, a tribe in Burma. No trace of the Mon is left along the Yuma range, tribes of the Karen family being the exclusive holders of its inner valleys. Some of the very imperfectly described tribes on the eastern side of the Irawadi, to the north of the Ka-ren-ni, viz. the Za-baing, Khyen, etc., may belong to the older immigrants.

ZAB'H. Arab. With the Muhammadans, killing an animal for sacrifice or food. The manner prescribed is to invoke the name of God, and cut the vessels of the throat so as to exhaust the blood. It is then halāl or lawful food, and in India the term halāl karna is used. In killing wild animals or game by shooting this is not necessary. The Jews similarly make their food lawful, and a certificate of it is attached to the carcase.

ZABTI. Arabo-Hind. Resumed property, or distrained, attached, or under arrest; also, in the Panjab, crops of the more valuable kind,—poppy, sugar-cane, etc.,—on which a special acreage is charged. In the Panjab, opium is not made a Government monopoly as it is in Bengal. The people are free to cultivate it if they choose, only it ranks as a Zabti crop, and has certain higher charges made upon it.

ZABUL, also Zabulistan or Zawulistan, was a province south of Balkh and Kābul, including Seistan, and having Ghazni for its capital, but extending from Ghazni westward to the river Helmand as far as Bāst (now in ruins), with Peshin on its south, the Kach Tobah Hills on its east, Ghazni on the N.E., and the Siah Koh on the N. The name is not now current.—*Bellew*.

ZABULON. The valley of the Zabulon is narrow and well wooded. It is cultivated; but although the soil appears good, tillage is not very general. In a two hours' walk from Nazareth, Seppown is reached. It is a small town upon a height near the entrance to the vale of Zabulon. From its situation it had gained an unhappy distinction in the wars of the Holy Land. 600 Christian knights were massacred in front of it by Jappadin.—*Skinner's Journey*, i. p. 140.

ZADAH. Pers. Born, a child. It is compounded, as Shah-zadah, a prince; Shah-zadi, a princess, etc.

ZAFFAR-NAMAH, the Persian name of a work, purporting to contain a conversation between Aristotle and Buzurjmiher. See Ashraf.

ZAFRAN-i-HADID. Pers. A sesqui-chloride of iron made by burying for ten days in the ground a composition of iron filings and sal-ammoniac; the damp of the earth causes the sal ammoniac to act on the iron.—*Honigberger*.

ZAGHRITAH, a shrill cry with which Arab women welcome their wanderers home. The Egyptian word is generally pronounced Zaghrutah, the plural is Zagharit, corrupted to Ziralcet. The classical Arabic term is Tahlil; the Persians call the cry Ki. It is used by women, and is formed by raising the voice to its highest pitch, vibrating it at the same time by rolling the tongue, whose undulations express now joy, now grief. The sound so gladdening to the returner, sends a chill to the stranger's heart. —*Burton*, *Mecca*, iii. p. 197.

ZAGROS, a name given by Europeans to the main range of mountains separating the elevated table-land of Central Asia from the valley of the Tigris; but the people do not know such a name. The Zagros range, through the hills of Kurdistan, unite with the Armenian mountains on the north. On the south it extends by the mountains of Luristan and Khuzistan. The drainage of the Zagros range to the westward and southward flows to the Tigris, and the Shat-ul-Arab is formed by the junction of the Tigris and Euphrates, the two rivers of Mesopotamia.

ZAHAR MOHRA. Hind. Any bezoar stone.

There are several of these substances, all of them reputed amongst natives of India to be capable of extracting poison from a poisoned wound, from a snake-bite or arrow-wound. That from Khatai is more opaque and pale-yellow coloured than that from Ladakh. The zahar mohra of Ladakh and of Suket is serpentine, a hydrate of magnesia. Whether as a bezoar or as common serpentine, or as calcined bones, zahar mohra applied to a snake-bite will absorb a small quantity of the poison; but common earth, always at hand, will do better. In the Panjab, serpentine is made into cups or bowls, which are supposed to crack and split if poison is put in them. In Europe a similar superstition prevailed as to Venetian glasses, and in the middle ages opal was believed to lose its colour at the sight of poison. A compound of magnesia is dug near Iscardo, in Bultistan, and there cut and turned into cups, plates, etc. It is supposed to have a wholesome effect on any fluid put into it, and to break should poison touch it. Zahar-tor, HIND., identical with zahar mohra; its meaning is poison antidote, from Zahar, poison, Torna, to break.—*Powell.*

ZAHT. In Burmese Buddhism, religious dramas of the higher order are called the Zaht gyee Tsé-bwe. They are ten in number, and are designed to show how Buddha in turn overcame all the deadly sins. Of these the Waythandaya is an affecting story, and prized for the beauty of its composition. The Weezaya Zaht, a secular play by the late Oo Hpo Nyah, is acted by all the Pwes (Pooays).

ZAILA and Tajowra. In 1839, after the capture of Aden, it was deemed necessary to secure command of the harbours of Zaila and Tajowra on the Donkali coast, ports in Africa, nearly opposite to Aden, and the principal outlets of the trade of Southern Abyssinia. Tajowra is a dependency of Zaila, and both places were subject to the Imams of Senaa, but during the revolutions at Senaa the chiefs of Zaila and Tajowra had assumed independence. Treaties were made, but Zaila and Tajowra subsequently fell under the government of the Turks.—*Treaties.*

ZAINAB, wife of Zaid, taken to wife by Mahomed. As Zaid was a slave, the transaction was not in accordance with the customs of the people, and no Muhammadan will defend the act.

ZAKARIYA-al-KAZWINI, son of Mahomed, son of Mahmud, was a native of Kazwin or Kasbin in Persia, author of the Asar-ul-Balad and Akbar-ul-Balad, a geographical compilation from the works of Istakhri, Ibn Haukul, and others. His works were written after the middle of the 13th century A.D., about A.D. 1263, A.H. 661, or A.D. 1273, A.H. 674. He also wrote the Ajaib-ul-Makhlukat and Gharaib-ul-Maujudat.

ZAKAT. ARAB. A tenth or tithe, a legal alms amongst the Muhammadans. It is obligatory on every Muhammadan to give annually a tenth or more of his property. The descendants of Mahomed are not allowed to accept zakāt or sadaqa. They are to be bestowed on pilgrims to Mecca, religious mendicants, debtors, beggars, poor travellers, proselytes. According to the Muhammadan religion, an alms is required to be given annually to the poor, of camels, oxen, sheep, goats, horses, mules, asses, gold, and silver, provided the property be of a specific amount, as 5 camels, 30 oxen, 40 sheep, 5 horses, 200 dirhem, or 20 dinar. The proportion is generally one-fortieth, or 2½ per cent., which is to be paid in kine or in money or other equivalent. The term means literally purification, and is metaphorically applied to a tax, as its payment is considered to purify and render legal the property on which it is paid. There are many different opinions among Muhammadan doctors relative to the proportion and mode in which this tax should be collected on property of various kinds, and amongst Muhammadans it affords a constant subject for vilification. The zakat of Ism or name is the prescribed offerings, or the attributes of the deity.—*Malcolm's Persia*, ii. pp. 249, 334.

ZALACCA, a genus of palms occurring in Malacca, Penang, Assam, and the Tenasserim Provinces. The leaves are employed as thateh and for baskets, etc.

Zalacca affinis, found at Malacca near Ching, where it is known under the name of Salak batool, which means the true salak.

Zalacca Assamica, *Wall.*, is a plant of Assam.

Zalacca conferta flourishes in very shady wet places in the great forests of Malacca, as at Ching and Katawn. It is the Asam-komber of Penang, and the Asam-paiah of the Malays of Malacca.

Zalacca edulis, *Remusat.* Z. Rumphii, *Wall.*, Calamus zalacca, *Roxb.* This tufted, short-stemmed palm has leaves varying in size from 18 to 20 feet in length, common in swampy places about Malacca, the Tenasserim Provinces, as well as in Burma. It is the Salak-komber of Penang. Its red scaly fruit is eaten by the natives. The light Selung boat in which the maritime Selung race of the Mergui Archipelago shoot over their waters, owe their buoyancy to the stems of the edible zalacca, which form their sides. These stems are as light as, and of the consistency of, cork, for which they are often substituted; and the Selung are skilful in uniting them together to serve instead of planks, so as to make an unequalled sea-boat, that floats on the waves like a swan.

Zalacca glabrescens grows in Penang, where it is called salak.

Zalacca macrostachya grows in marshy, damp, and exceedingly shady places at Ching near Malacca. It is the Rungum of the Malays.

Zalacca secundia grows in forests about Kuju in Upper Assam, the Mishmi mountains, and on the lower ranges of hills on the borders of Upper Assam.—*Seeman; Voigt; Mason's Tenasserim.*

ZAMAN SHAH was the son of Timur Shah, and grandson of Ahmad Shah. He meditated expeditions against India, but he never advanced beyond Lahore. He was defeated and blinded by Shah Mahmud, driven from the throne of Kābul, and for nearly half a century afterwards remained till his death a pensioner of the Indian Government at Ludhiana.

ZAMBESI, a river of E. Africa, which rises towards the west coast. It is navigable for 300 miles to the Kebrabasa rapid, and for other 300 miles above the rapid. Its valley is very unhealthy. Its enters the Indian Ocean in lat. 18° 51′ 40″ S., and long. 36° 18′ 30″ E.—*Findlay.*

ZAMBURUK. HIND. Wall pieces or small cannon, mounted on camels, and worked from off their backs.

ZAMINDAR. HIND., PERS. A holder or occupant of a landed estate. Zamindar was a term originally applied to hereditary Hindu chiefs,

but Muhammadans extended it to independent princes, like those of Udaipur and Jodhpur. In comparatively modern times, it has included persons holding assignments of the Government revenue, as well as district and village officers, and collectors of land revenue. In 1793 the Government of India, by an Act known as the Perpetual Settlement, recognised the zamindars and independent talukdars of Bengal, Behar, and Orissa as actual proprietors so long as they paid the Government revenue of nine-tenths of the fixed nett proceeds of the lands (Beng. Reg. viii. 1793, iii. 1794, v. 1795, ii. xxvii. 1803), and the same principle was afterwards applied to Madras (Mad. Reg. xxv. 1802, ii. 1806, iv. 1822). The Bengal settlement has been considered not only a great financial error, but also an injustice to the country.

Village landholders are distinctly recognised throughout the whole of the Bengal Presidency, except in Bengal proper, and perhaps Rohilkhand. They appear to subsist in part of Rajputana, and perhaps did so at no remote period over the whole of it. They are very numerous in Gujerat, include more than half the cultivators of the Mahratta country, and a very large portion of those in the Tamil country. They are almost extinct in the country south of the Nerbadda, except in the parts just mentioned. In all the Madras Presidency north of Madras itself, in the Nizam's country, and most of that of Nagpur, in great part of Kandesh, and the east of the Mahratta country, there is no class resembling them. This tract comprehends the greater part of the old divisions of Telingana, Orissa, and Canara. They are not mentioned in Sir John Malcolm's Central India, and are not known in Malwa. In Hindustan they are commonly called village Zamindars or Biswadars; in Behar, Malik; in Gujerat, Patel; and in the Dekhan and south of India, Mirassidar. The rights of property in the land is unequivocally recognised in the present agricultural inhabitants by descent, purchase, or gift.

The zamindari estates in the Madras Presidency have a revenue of Rs. 1,40,60,000, of which Rs. 51,32,990 is payable to Government as pesh kush or tribute. Arranging them according to their revenues, there are Vizianagram, Venkatagherri, Pittapur, Shivaganga, Ramnad, Kavetnuggur, Kalastri, Bobbili, Ettiapuram, Nedavole, and Baharzalli, Devarakota, Wyvur, Jeypur, and others. About the middle of the 19th century the zamindar of Bobbili refused the maharaja of Vizianagram his title of Munney Sultan, and his appeal was made to the Privy Council. Bobbili has been a noted place in its time. It is a zamindari of about twenty square miles in the Northern Circars, in the vicinity of Vizianagram, Vizagapatam, and Chicacole, and the rulers have been amongst the leading men in that part of the country.

Zamindar is used in the Panjab only in the sense of a mere proprietor, and not, as in Bengal, to mean a wealthy landholder of a large estate. Also, in the Panjab and Sind, this is a designation of the ordinary cultivator. The zamindars or cultivators of the soil at Jell, as throughout Cutchi, are the Jat race, who there seldom moved abroad but on bullocks, and never unless armed. A Jat might generally be seen half-naked, seated on a lean bullock, and formidably armed with matchlock and sword; but to the north and west of Cutch Gandava, as also in Herat, Kandahar, and Kābul, the Jat are to be seen as itinerant artisans, like gypsies. — *Stirling; As. Res.* xv. p. 239; *Elphin. Hist. of India*, pp. 249, 422.

ZAMORIN, a titular chief of Calicut, the Samari, descendant of a royal family who ruled over territories now comprised in the greater part of the collectorate of Malabar. The title is also said to be a dialectal change from Sami Rama (Semiramis), also from Samudri or Tamudri, Sea-king. By a treaty of 18th August 1792, the zamorin agreed to act on the civil rules which the E. I. Company might introduce. Further changes were made by treaties of June 1793, in September 1794, and 15th November 1806, the last of which gave a consolidated allowance to the zamorin. Calicut town is on the Malabar coast; in lat. 11° 15¼′ N., long. 75° 47½′ E. The zamorin, in 1513, sent a deputation to Portugal, and his ambassador, who turned Christian, was knighted, under the name of John of the Cross, by John III. On returning to India, he was banished from the zamorin's court. In 1532 he appears to have been installed as the fishermen's chief, as he headed a deputation of 85 of them to Cochin, soliciting the assistance of the Portuguese against the Muhammadans. The whole of the embassy are said to have become converts to Christianity. A Portuguese fleet was sent to their relief, and 20,000 are said to have immediately consented to be baptized. Ten years subsequently, Xavier instituted a church for these people. Its name, Calicut, is from Colicodu, a cock crowing, as Cheruman Permal gave his sword and all the land within cock crow of a small temple to the zamorin, who attained considerable power in the 15th century; but in the early wars of the Portuguese, the British, and the Muhammadans of Mysore, that high place was lost. Tipu Sultan destroyed the flourishing trade. There are many of the Tiar and Moplah race here. Calicut was the first port at which Vasco da Gama arrived. It was visited in 1494 by Pedro da Covilham. — *Horsburgh; Bartolomeo's Voyage.*

ZAM-ZAM, a well near Mecca, 7 feet 8 inches in diameter, and 56 feet deep, which tradition traces to the time of Hagar and her son Ishmael, as the spring that gushed forth to relieve their thirst. Its water is exported in little tins, being considered holy. It is milky in appearance, and is heavy to the taste. When a Sindi is seen to be in the agonies of death (sakarat), all present recite the shahādat or confession of faith. If water from Zam-zam be procurable, it is dropped into the man's mouth, as a traditional saying of the prophet informs his followers that it is a meritorious deed. In 1883, Mr. E. Frankland analyzed the water, and found it to be of the most abominable character. In fact, it is sewage more than seven times as concentrated as London sewage, and it contains no less than 579 grains of solid matters per gallon. Knowing the composition of this water, and the mode of propagation of Asiatic cholera by excrementitious matters, it is not to be wondered at that outbreaks of this disease should often occur among pilgrims to Mecca, while it would scarcely be possible to provide a more effective means for the distribution of cholera poison throughout Muhammadan countries. He

received from the consul at Jedda:—'The well is in Mecca; the water is regarded as holy, and large quantities are annually sent as gifts to all Musalman countries. Most of the Muhammadan princes, especially those of India, have keepers of the well, whose duty it is to send them annually water from the well.'

ZAMZAMA, or Bhangiwala, a gun at Lahore, 14 feet 4½ inches long, cast A.D. 1761, by Shah Wali Khan. The gun on the ramparts of Bijapur, cast at Ahmadnaggur by Rumi Khan, is of huge dimensions, that on the top of Gawilgarh is 27 feet, and one on the ramparts of Beder is 21 feet.

ZAN. PERS. A woman; hence zanana, women's apartments, the women of a family.

ZANGARIA or Dzangaria derives its name from the Zangar, a branch of the Kalmuk or Western Mongolians, who suddenly acquired great power in the 18th century. Their empire stretched E. and W. from Hami to Lake Balkash, and they invaded Tibet, and sacked its capital in 1717. But in 1757 they were overthrown by the Chinese, and the whole nation perished. The Upper Ili valley is called Kulja, and it is rich land. It was occupied by Russia in 1871 to 1880, when the inhabitants were not more than 100,000. The Zangaria revolt was followed by revolts of the Dungan and Taranchi, and numbers perished. Zangaria is the natural boundary separating the Central Asiatic Kulan from the Djigitai of the Mongolian Gobi, and the limit of distribution of the Saigak, the antelope of the depressed wastes, as also of the Djeiran of the mountain table-lands. At the present time, Zangaria is inhabited by the Burut or Kirghiz proper, and the Kirghiz-Kazak of the Great Horde, known under the collective appellation of Uisun. Among these there is a tribe called the Red Uisun, who assert themselves to be the remnants of a great and powerful nation. The Buruts and Uisuns are two distinct races. The Great, Middle, and Little Kirghiz-Kazak hordes form one Cossack family, distinct from that branch of the Kirghizes called Buruts by the Chinese, and Dikokamenni by the Russians. These two family groups differ in language, extraction, and customs.—*Valikhanof.*

ZANJIRA, also written Janjirah and Jinjeera, a Mahrati form of Jazirah, an island, but applied to a territory which extends along the western sea-coast of the Peninsula of India, between the Reodunda and Bankut rivers. About the year 1489, a party of Abyssinians, in India known as Sidi and Habshi, serving the Nizam Shahi dynasty, disguised as merchants, obtained permission to land three hundred boxes, each of which contained a soldier, and by their means they obtained possession of Dhunda Rajpur. It afterwards formed part of the Bijapur Adal Shahi kingdom, under whom, in the time of Sivaji, the government of S. Konkan was held by the admiral of the Bijapur fleet, who with his crews were all Abyssinians. Being hard pressed by the Mahrattas, the officers of the fleet seem to have offered their services to Aurangzeb, then at war both with Bijapur and the Mahrattas. Since that time, up to the years 1810 or 1815, they were engaged in constant wars by sea and land. The Sidi were more dreaded than all others on the pirate coast. The town and district of Jafarabad on the Kattyawar coast is a colony from Jazirah, from which it receives a governor.—*Clune's Itinerary Treatise.*

ZANNAR, Zennar, or Jannar. ARAB., HIND., PERS. A belt, a zone; the sacred thread worn by the Brahmans, Kshatriya, Vaisya, and artisan races of Hindus.

ZANONIA CLAVIGERA. *Wall.* A trailing plant of the Khassya mountains. Z. Indica, *Linn.*, Kyee-aa, BURM. The fruit is obscurely triangular, and having the flavour of the cucumber. It climbs to the top of the loftiest trees at Alwaye, 14 miles from Cochin. Its leaves are used medicinally. Z. zehneria, *Endl.*, Kyee-aa, BURM., a plant of Tenasserim. — *Voigt; Useful Plants; Mason.*

ZANSKAR, tributary to Indus, rises on the N. declivity of Bara-lacha pass, lat. 32° 47′ N., long. 77° 33′ E., runs N.W., W., N.W., N.E., N.W., N.E., into the Indus, a few miles below Leh. Length, 150 miles; receives the Trarap, 42; Zingchan Tokpo, 22 miles. The Zanskar district of Ladakh lies along the two great branches of the river of the same name. Zanskar town, near the Indus river, occupies the north slope of the main Himalayan chain parallel with Kishtwar on the south. Padum, the capital, is 11,592 feet above the sea; the territory is in lat. 33° to 34° N., and long. 77° to 78° E.—*H. f. et T.* p. 224.

ZANZIBAR, an island on the E. coast of Africa, in lat. 6° 9′ S., and long. 39° 14′ 10″ E., which gives its name to a territory on the mainland adjoining. It and the greater part of the eastern coast of Africa were conquered by the Portuguese in the beginning of the 16th century. Driven to despair by the tyranny of their rulers, the inhabitants of Mombassa, in 1698, invited the assistance of the imam of Muscat, who expelled the Portuguese, and put many of them to the sword. It was not till 1784, however, in the time of Ahmad bin Said, that the Museat Arabs established a permanent footing in the island of Zanzibar; and even for many years afterwards, till the accession of Syud Said in 1807, the subjection of Zanzibar was little more than nominal. In 1746, the people of Mombassa threw off allegiance to Muscat, elected Shaikh Ahmad as their sultan, and maintained their independence till 1823, when, fearing the aggression of the imam, Soleiman bin Ali, the sultan of Mombassa, with the consent of the people, put himself under British protection. A treaty in 1824 to that effect, however, was not ratified. The Zanzibar dominions extend from Cape Delgado about 1100 miles northward along the coast. In 1844, Syud Said of Muscat appointed his son Syud Khalid as his deputy and successor in Zanzibar, and his son Said Thowayni in Muscat. On their father's death, after arranging for a payment for Zanzibar, a dispute soon arose regarding the nature of this payment, and whether it implied the dependence of Zanzibar on Muscat. The matter was referred to Lord Canning, who awarded the payment of 1000 crowns in perpetuity, but declared the independence of Zanzibar. In 1879, the population consisted of British, 24; Indian Muhammadans, viz. Khojah, 2974; Bohra, 1066; Mehman, 367; and Hindus, 954; Parsees, 26; Goa Portuguese, 240; French, 39; German, 13; American, 8, with other Asiatics and Africans under the protection of the British and French.

Zanzibar or Sangbar means Negro land, and was a term in early times applied to the coast of Africa, S. of the equator, but is now restricted to the island and littoral ruled by an Arab family

of the Shiah sect of Muhammadans. The Zanzibar dominions comprise that portion of the coast included between Magdashoa in 2° north latitude, and Cape Delgado in 10° 42′ south latitude. Beyond them, to the north, are the independent Somali tribes, which extend almost to the Red Sea, where they meet the Dankali race; and on the south they are bounded by Mozambique. The extent of coast under the dominion of the Sultan of Zanzibar is about 1100 miles, but the most valuable parts of his sultanate are the islands of Zanzibar (containing the capital of the same name), Pemba, and Monfia. The first is situated at a distance of from 20 to 30 miles from the mainland. It contains none but small streams. It is a lovely island, of unbounded fertility; the mango and other trees grow to an enormous size, oranges grow in profusion everywhere, and pine-apples of large size and good flavour grow wild all over the island. The Arabs grow cloves to the neglect of other produce. The soil is a rich vegetable mould, formed by decayed plants on a bed of coral. Many rare and valuable plants grow here wild; the sarsaparilla, the copal tree, spices of all sorts, sugar-cane of immense size, and rice. Zanzibar Island at its greatest breadth is 46 miles long by 18 miles wide, but its general breadth is 8 or 9 miles, with a general height of 100 feet. Mathurdas Khetsee, a Hindu merchant of Zanzibar, at the close of the year 1872, mentioned in the Rast Goftar that Kilva and the surrounding districts were the principal seats of the slave trade. In Zanzibar and the neighbouring places, the trade had been monopolized by Arabs, as British subjects are restrained there. At Mozambique, Vibu, and the Guja territories, under the Portuguese rule, the trade flourished. On the north, the trade was still moderately carried on between Burawa and Central Madagascar, and down to Soffala. British influence had succeeded in making this trade a matter of risk, but traders carried on the slave trade under cover of the ivory trade. Bhattia, Banya, Khojah, and Borah had the greatest share in the slave trade. A large number of Borah merchants reside at the principal towns. The Indian merchants go to Samu, Mombassa, Zanzibar, Kilva, Queelowa, Mozambique, Madagascar, Soffala, and Kurmani. In 1872 there were only from 5 to 10 Khojah, about 75 Bhattia, and a very large number of Damaun and Diu Banya in Mozambique. Madagascar, called Bookin by the natives, contained about 1000 Borah and Khojah. Up to 1872, they had their families with them. There were about five Parsees in Zanzibar, about the same number in Mozambique, two or three in Vibu, and one or two others here and there, all of Damaun and Diu. They put on Parsee dress, and were strongly suspected of having some participation in it. The Cutchi Banya generally reside in Mombassa and Lamu, while the Damaun and Diu Banya live in Mozambique and the southern territories. The vessels from Damaun and Diu proceed direct to the African coast with these merchants. They live for about 30 to 35 years, collect money, and return to their native country to get married. The Cutchi Banya and Bhattia also go to Africa without their wives or families, but they keep African mistresses with them in their houses. These women generally came from Bookin and central towns of Africa, where they were to be had for 100 or 150 dollars. They have white skins and handsome complexions. In Mozambique, Vibu, and other Portuguese towns, Portuguese women, and sometimes European women, live with these Hindu merchants. Native firms correspond with Hindu and Khojah firms in Bombay. Parents sent their children in their minority to Zanzibar to get an insight into the intricacies of trade. Indian merchants have pushed in so far that not a single town is without at least one of them. From 10,000 to 20,000 slaves were said to pass yearly through Kilva on their way to the various parts of the Sowahili, and to Arabia.

ZAPANIA NODIFLORA. *Linn.*

Lippia repens, *Spreng.*
L. sarmentosa, *Spreng.*
L. nodiflora, *Rich.*
Verbena cuneata, *Willde.*
V. nodiflora, *Linn.*

Chhoto okra, . . Beng.	Wukkun, . . . Sind.
Bhukokra, Beng., Hind.	Podu talli, . . . Tam.
Chota okra, . . . ,,	Bokkena, . . . Tel.
Baleia ithi kani, Maleal.	Nela pippali, . . ,,

An annual plant, one of the Verbenaceæ, native of the E. and W. Indies, N. America, Australia, and Polynesia, grows on streams and banks of rivers in South India. Its leaves and young shoots are used in medicine.—*Voigt.*

ZAPATOS. Sp. Shoes. A Spanish word which seems to have been derived from the same source as the Chappal, Hind., the Sapate, Tam.

ZAR-AFSHAN, literally gold scattering, is one of the principal rivers of the khanate of Bokhara, known also as the Kohik, and formerly Sogd Kuwan. It rises about 175 miles to the east of Samarcand, its principal source being an immense glacier, extending 35 miles up a ravine, and here called the Macha-darya. It flows westerly towards Samarcand, which it passes a few miles to the north. At the Chobanata Hill it separates into two channels, which re-unite near the Russo-Bokharian frontier. The island thus formed, called Miankal, is the most fertile portion of Russian Turkestan. Gold is washed for at Hissar, also at Urmitan. It receives the Fan-su, several brooks, the Kishtut-su. The Zar-afshan district is one of the subdivisions of the Russian province of Turkestan. It includes all the territory annexed by the Russians from the Amir of Bokhara, except the Jezikh district, and is divided into the Samarcand and Kata Kurghan districts, the head-quarters being at Samarcand.—*Trotter, Central Asia; Vambery, Bokhara*, xxxii.

ZARAFSHANI KAGHAZ. Hind. Gold-sprinkled paper, which the natives of India use when addressing people of rank.

ZARANG, the chief town of Sijistan, from which the lake formed by the Helmand and the Farrah is often called the lake of Zarang. It is the Zarrah of the maps. The Drangæ are supposed to be the Zarangæ. The vicinity affords good pasturage, and wheat and barley in sufficient quantities to be sent to Herat. Lat. 32° 15′ N., long. 61° 20′ E.—*Ferrier, Journey*, p. 429.

ZARATHUSTRA SPITAMA, the Zoroaster of Europe. According to Chevalier Bunsen, he appeared in the reign of Vistaspa, a Bactrian king, towards the year 3000 B.C. Firdusi, in the Shah Namah, gives his era as during the reign of Gushtaspi. Another author makes him a contemporary of Moses. Spitama was a Shoshyanto or fire priest, the son of Purushapa, and was born in Bactria, which he calls in his writings Berekdha

Armaiti. Ragha, now Rai, near Teheran, has been fixed on as his birthplace, but for no other reason than that it was a city governed by the priests alone. The only one of his children mentioned in his writings is his daughter Purudusta. He was a Zarathustra or high-priest, and hence was known to the Greeks as Zarastrades and Zoroastres, whence the Latin and English Zoroaster. The modern Parsees call him Zarodusht. He declared that he had a divine mission to expel all idolaters and promote the practice of agriculture, and he founded what is known as the Masdayasna or Parsee religion, which is simply the old faith of the primitive Aryan, reformed by his hymns and writings. He laid the foundation of that Zend literature which, Dr. Haug shows, required centuries for its growth, and was complete B.C. 400. He is expressly called 'the celebrated in Airyana Vaejo,' or Aryan home. To the supreme deity, whom his predecessors, the Shoshyanto sect, had worshipped as the Ahura or the living ones, who were opposed to the Deva of the idolaters, he applies the term Ahuro-Mazdao, 'that Ahura who is called Mazdao or almighty.' This name denotes a conception of the deity almost identical with the antediluvian Elohim or Jehovah. The word appears in the cuneiform inscriptions as Ahuramazada, in the times of the Sassanian kings as Ahurmazd, and in modern Persian as Ormuzd; and this one God not only rewards the righteous, but punishes the wicked. A separate evil spirit of equal power with Ahuramazda, and always opposed to him, is entirely strange to Zarathustra's theology, though the existence of such an opinion among the ancient Zoroastrians can be gathered from some later books, such as the Vendidad. 'Spentomainyus has created the light of the day, and Angromainyus the darkness of the night; the former awakens men to their duties, the latter lulls them into sleep. Life is produced by Spentomainyus, but extinguished by Angromainyus, whose hands, by releasing the soul from the fetters of the body, enable her to go up to immortality and everlasting life.' In course of time 'Spentomainyus was taken as a name of Ahuramazda himself; then of course, Angromainyus, by becoming entirely separated from Ahuramazda, was regarded as the constant adversary of Ahuramazda, and thus the dualism, God and Devil, was called forth.'

ZARBAFT. HIND. A thin fabric of silk and gold thread woven together.

ZARMANOCHEGUS, Zarmanochidus, or Zarmanochagus, a native of Broach or Cambay, who accompanied the embassy from the king of Pandiya to the emperor Augustus at Antioch. He went with Augustus to Athens, and there committed self-immolation by burning himself in the presence of the emperor. Zarmanochegus was, however, preceded by Calanus in the self-immolation. Until the time of Plutarch, the tomb of Zarmanochegus was to be seen, and was known as the Indian's tomb.—*Strabo*, lib. xv. p. 1048; *Pennant's Hindustan*, i. p. 69; *Barth.*

ZAYAT. BURM. A public shed or portico for the accommodation of travellers, loungers, and worshippers, found in every Burmese village, and attached to many pagodas. It corresponds to the dharm-sala of Northern,' and the choultry or chattrum of Southern India.—*Yule's Embassy*, 23.

ZAYDEE, BURM., a Buddhist pagoda, is from the Pali Chaitya, and is also called payah. The greatest of these religious structures are the Shoay-dagon in Rangoon, the lotus shrine Shoay Maw-daw at Pegu, Shoay San-daw for the sacred hair at Prome, and the Maha-Myat-Mune temple in Mandalay. A prominent part of the ritual in dedicating a payah is to pour water drop by drop on the ground.

The Kyaik-htee-yoh is on a hill 3500 feet high. On its summit are several rock boulders, surmounted by little shrines. The Kyaik-htee-yoh boulder is huge, and rests on a projecting rock separated from the rest of the hill by a deep chasm. The boulder stands on the extreme verge of the bare rock, and hangs over it as if a gust of wind or a few extra pounds added would make it topple over, and crash down the dizzy height far away into the green valley below.

The Maha-Myat-Muni payah has a huge brass image of Gautama, which in the year 1784 was brought from Akyab. Pagahn is said to have 9999 Zaydee. A memorial line says :—

'Hlè win-yoh than ta-nyan nyan
Pagahn payah poung.'

'The cartwheel's creaking strains
Pass Pagahn's storied fanes.'

The three great Buddhist works of perfection in Burma are—(1) assistance afforded to parents and relations; (2) great offerings made in this and former existence, coupled with strict observance of the different enactments of the law; (3) benevolent dispositions towards all beings indiscriminately.

The ten great virtues are, liberality, observance of the precepts of the law, retreat into lonely places, diligence, patience, fortitude, wisdom, benevolence, truthfulness, indifference.

The five renouncings are, the giving up, for holiness' sake, of wife, goods, life, one's self.

ZEA MAYS. *Linn.* Indian Corn, Maize.

Mokka, ... BENG.	Jagung, . . . MALAY.
Pyoung-boo, . . BURM.	Yavanala, . . . SANSK.
Bollah, ... CAN.	Muwa iringu, . . SINGH.
Mukka juari, . . DUKH.	Makka-cholum, . TAM.
Kukri . . . of KANGRA.	Makka-jonna, . . . TEL.

The Zea genus of plants belongs to the natural order Panicaceæ. The word is identical with the Greek Ζεια, but the Greek plant was a species of Tritieum or Hordeum, and Zea is entirely American. The Zea plants are monœcious. There are six or seven varieties of Zea mays, red and white. The American variety has been extensively distributed throughout the Himalaya hills, and the plains of the N.W. Provinces, and the Panjab; in parts of the Himalaya, to 7500 and even 8000 feet; on the Chenab and Ravi. In some parts of the Panjab it forms a staple food of the people, ground, and made into bread, but in India a large proportion of it is eaten roasted in the ear. The stalks of the plant contain a considerable quantity of sugar, which has been economically manufactured in the crystalline state in several of the South American provinces.

In the preparation of the soil for maize cultivation, plough and cultivate as for any other dry crop; the better the land is ploughed and worked the more satisfactory will be the results. Manure the soil freely, apply sheep and cattle dung, decayed leaves, ashes, brickyard dust, tank mud which has been thoroughly exposed, wild indigo, madder leaves, etc. No crop pays better for a

thorough manuring. The manure should be spread evenly over the land before the last ploughing takes place. To prevent crows, squirrels, etc., destroying the seed, tar it before sowing. Take $1\frac{1}{2}$ pints ($\frac{1}{2}$ Madras measure) of hot water, and add to it $\frac{1}{1\frac{1}{2}}$ of a pint ($\frac{1}{4}$ ollock) of tar, mix together, and after cooling, pour the solution through about 20 measures of seed. After dusting with sand, ashes, or sawdust, to prevent the seeds adhering together, the grain is ready for sowing. Sow 30 lbs. per acre, in rows 24 inches apart; plant the seed about two inches deep and about nine inches apart; during growth keep down the weeds; cultivate the rows with hand-hoes and ploughs. For harvesting, when the outer covering of the cob begins to open, and the seed is hard and glazed, it is time to commence gathering. If the season be favourable, do not be in a hurry to peel the cobs. If stored with the skins on, they must be frequently examined, lest they should heat or mould. The straw is excellent fodder, and should be carefully stored for consumption during the dry season. It is most economical to chaff or steep the straw before giving it to farm stock. The cobs may be shelled when dry, and the grain used as food; or it may be used in feeding horses, cattle, or sheep. Direct experiments have proved that, weight for weight, it produces better results than gram. Mr. Robertson thinks the maize crop is one worthy of much attention in British India. —*Jameson's Report; Eng. Cye.; Stewart, Panjab Pl.; Mason; O'Sh.; Madras Experimental Farm.*

ZEBAYER ISLANDS, in the Red Sea, comprise seven volcanic islets, viz. Jibbel Zebayer, about three miles long, the most easterly, has three hills, the central of them in lat. 15° $3\frac{1}{2}'$ N., and long. 42° 18′ E. It is about 600 feet high, and the southern hill is a cone. The other islands are, Centre Peak, Saba, Connected Island, Saddle Island, Table Peak, Rugged Island, and Haycock Island, each about half a mile in length, and of moderate height. In July and August 1846, Saddle Island was observed in action, dense masses of sulphurous smoke arising from it.—*Findlay; Dr. Buist; Bom. Geo. Trans.*, 1852.

ZEBU, the Bos Indicus of Linnæus, is the B. domesticus, B. Indicus, B. zebu, and B. Taurus zebu of authors, and has many English synonyms, but that of Brahmany bull is the most usual. They occur domesticated throughout India, all Southern Asia and the Archipelago, and are largely used for draught.

Naturalists have generally made two divisions of cattle, the humped kinds of tropical countries, the zebu or Bos Indicus of India, and the common unhumped cattle, the Bos Taurus. As with dogs and pigs, the domestic cattle are certainly from more than one stock. Humped cattle were domesticated in Egypt as early as the 12th dynasty, that is, B.C. 2100, and they have greater osteological differences from common cattle than the fossil species of Europe, B. primigeneus, longifrons, and frontosus, have from each other, and their habits also differ. The zebu of India seldom seeks the shade, and never goes to stand knee-deep in the water like the cattle of Europe. They run wild in parts of Oudh and Rohilkhand, and can maintain themselves in a region infested by tigers. They have given rise to many races. The European breeds of humpless cattle are extremely numerous, perhaps fifty in number. The genus Bos readily yields to domestication. The three fossil species are the parents of those of Europe; and the B. Indicus, the yak, the gayal, the arni, and the bubalus, have all been domesticated.—*Z. in Indian Field; Jardine, Mammals of India; Darwin, Eng. Cyc.* See Bibos; Bovidæ.

ZEB-un-NISSA BEGUM, daughter of the emperor Aurangzeb, was a poetess. She wrote a diwan. Her literary takhallus or nom de plume was Makhfi, meaning anonymous.

ZEDOARY, Zedoaria.

Zerukbad, Jadwar, ARAB.	Zerumbad, . . . PERS.
Shuthi, ... BENG.	Karchura, . . SANSK.
Tien-chuh-kan-kyang, CH.	Hinhura-pecallieulla, SIN.
Kutchur, ... DUKH.	Cedoaria, ... SP.
Zedoaire, ... FR.	Pulang-kalangu, . TAM.
Zittwer, ... GER.	Kichili-gadda, . . TEL.
Capur-cachary, . HIND.	

The zedoary of commerce is the root of a plant which grows in Malabar, Ceylon, Cochin-China, etc. There are three distinct kinds, supposed to be the roots of Curcuma zedoaria, *Roxb.*, and C. zerumbet, *Roxb.* The best zedoary comes from Ceylon, where C. zerumbet grows. The odour of zedoary is fragrant, and somewhat like that of camphor; the taste biting, aromatic, and bitterish, with some degree of acrimony; was formerly employed in medicine. Zedoary is imported into Bombay from China and the Malabar coast.—*O'Sh.; Faulkner; Powell; Milburn.*

ZEHNERIA CERASIFORMIS. *Stocks.* One of the Cucurbitaceæ, a plant with a climbing or creeping stem. It grows in Gujerat, the Panjab, and Sind; is good fodder for cattle, and acts as a lactagogue.—*Murray.*

ZEND is described to have been the Achæmenian or old Persian. Until recent years, orientalists have differed as to the existence of any such language as that called Zend; but the prevalence of this language is now universally admitted. The term Zend means commentary or explanation, and was the name of the comment which accompanied the Avesta, the law, or the word. What name the language was known by in ancient times has not been discovered. It is a twin-sister of Sanskrit; and the common source of the two languages is proved not only by an unmistakeable similarity, but by the many myths and semi-divinities which are common to the oldest writings in both these languages. In what country and from what language these two great Aryan tongues arose, is a matter for conjecture.

The original texts of the Avesta were not written by Persians, as they are in a language not used in Persia; they prescribe certain customs which were unknown to Persia, and proscribe others which were current in Persia. They were written in Media by the priests of Ragha and Atropatene, in the language of Media, and they exhibit the ideas of the sacerdotal class under the Achæmenian dynasty.

If grammars and lexicons of this language ever existed, they have not come down to modern times. Translators have nothing to work upon but the texts themselves. The traditional school seeks to explain them by the writings of later times in other languages; the comparative school approaches them through the old Vedic Sanskrit. According to this school, 'the Avesta and the Veda are two echoes of one and the same voice, the reflex of one and the same thought; the Vedas therefore are both the best lexicon and the

best commentary to the Avesta.' At the head of the former school stands Spiegel, and Burnouf was the great founder of the latter. Neither of these methods can be implicitly trusted. There is no disputing the close affinity of the Vedic Sanskrit and the language of the Avesta, but these two languages must have existed apart for a long time before the Vedas and the Avesta were composed. They show a great difference in the spelling of words which were once identical; and if the forms of words changed, their significations could hardly have been exempt from variation, of which two examples are convincing proofs,—Sanskrit, Deva, a god; Zend, Daeva, a demon; Sanskrit, Asura, a demon; Zend, Ahura, a god.

The period when the Zend texts were collected and formed into the Avesta has not been ascertained; but it seems possible to trace a Zoroastrian literature back to the 3d century before Christ; and although some portions of the Avesta are evidently later in time than the rest, 'no part of them can belong to a later date' than the 4th century A.D. The date of the collection must have been long posterior to the composition of the component parts. How and when these productions first made their appearance is a matter for pure speculation.

The Zend-Avesta is divided into two parts. The Avesta, properly so called, contains the Vendidad, the Vispērad, and the Yaçna. The Vendidad is a compilation of religious laws and of mythical tales; the Vispērad is a collection of litanies for the sacrifice; and the Yaçna is composed of litanies of the same kind, and of five hymns or Gathas written in a special dialect, older than the general language of the Avesta. The Khord-Avesta or small Avesta is composed of short prayers, which are recited at certain moments of the day, month, or year, and in presence of the different elements. The proper form of the name is Avesta Zend, a softened form of Avesta wa Zend, *i.e.* text and comment or explanation. Its Pehlevi form is Apistak, the Pastak and Pastakum of the Mahrati and Telugu.

A Pehlevi translation of the more important books, supposed to have been made under the Sassanidæ (A.D. 235-640), is extant, and a Sanskrit translation of the Yaçna, made about the end of the 15th century by Nerio Singh.

Anquetil de Perron in 1771 made a translation of it; Burnouf gave a version of the first and ninth chapters of the Yaçna in 1833; and Martin Haug, of the Gathas in 1858-60, and other fragments.

The Zend-Avesta was printed by Westergaard in 1852-54, and printed and translated by Spiegel in 1851-58, and translated in 1880 by Professor James Darmesteter.

The Gatha are songs; the Yaçna consists of prayers, hymns, etc., relating to sacrificial rites, and intended to be used during the performance of sacrifice. Several of the Gatha are ascribed to Zoroaster, who, according to Berosus, lived anterior to B.C. 2000. Haug supposed the Zoroastrian Gathas to be as early as the time of Moses. The first Fargard of the Vendidad must have been composed before the migration of the Medes southward from the Caspian region.—*G. Rawlinson*, ii. p. 322; *The Sacred Books of the East.*

ZENGABAD, the country of the tribe of Karim Khan, king of Persia, whose dynasty was overthrown by the Kajar tribe, that of the present king. When they came first into these parts, they were nomades, but they are now settled in villages. There are a great many besides established in Zengabad, and many in the Pasha of Baghdad's army. Their clans are—Kerwei of the Feili tribe, Lor, Sedeni, Goorzei.

ZENOBIA, queen of Palmyra, was wife of Odenathus. After her husband's death, A.D. 266, she assumed the throne as regent for her sons. She appeared in military attire at the head of her troops, and shared in their labours both on horseback and on foot; but she ambitiously endeavoured to subdue all Syria, Western Asia, and Egypt. The emperor Aurelian overthrew the city and took her prisoner, and in his triumph she was shown to all Rome, covered with costly jewels, fettered hands and feet with shackles of gold. She was led by a golden chain before the chariot of Aurelian along the Sacred Way. All Rome gazed on the Arab princess. She passed the remainder of her life with her sons, in the neighbourhood of Tivoli, near Hadrian's villa, on an estate which still bore her name when Pollio wrote her history. She is accused of having yielded to the promptings of jealousy, and of having consented to the death of her husband, because he seemed to prefer Herodes, his son by a former wife, to Herennianus and Timolaus, his children by herself. See Palmyra.

ZIARAT. Pilgrimage to a Muhammadan saint's shrine; also the visiting of the grave of a Muhammadan relative, or other deceased person, on the third day after burial, when the Koran is read, and prayers are recited and offerings made in expiation of the sins of the deceased. This visit is also called Tija, the third (day), and Phul-Charhana, spreading flowers. Places for these minor pilgrimages are the tomb of Ali, called Mash'hid-i-Ali, at Nejeff, near Kufa, the shrine of Imam Husain at Karbela, and that of Imam Raza at Mash'hid in Khorasan; but all the numerous Imam-zadehs and tombs of holy characters throughout the country are thus visited. The minor pilgrimage is termed a Ziarat, as distinguished from the Hajj, or great pilgrimage to Mecca.

ZIBELLINA, the Khatun Bulugan, became wife of Arghun Khan; she had been married to Abaka, but on his demise, according to the custom of the Mongols, she passed to the urda of her stepson, Arghun Khan, Kablai Khan's great nephew. Zibellina, the Khatun Bulugan, was a lady of great beauty and ability. On her death, Arghun sent Marco Polo for another wife out of the Mongol tribe of Bayaut, but Arghun died before the lady, Kuka-Chin, was brought, and she passed to Ghazan, the nephew of Arghun, for Arghun had been succeeded by Kai-Khatu, his brother.—*Quart. Rev.*, July 1868.

ZIEGENBALG, BARTHOLOMEW. Ziegenbalg was the first Protestant missionary in India. He sailed for India in 1705, and for a time returned to Europe in 1714. In 1719 he finished his Tamil translation of the Bible, which had occupied him 14 years. George I. of Great Britain wrote two letters to Ziegenbalg, on the 23d August 1717 and 23d February 1727, congratulating him on his success. He wrote a Genealogy of the South Indian Gods, printed at Madras 1869.

ZIFFAF. ARAB., HIND. Leading a bride home.

ZIFT-i-RATB and Zift-i-Yabis. Pers. Ratianaj and catrain are varieties of resin, colophony, and dried tar. Zift-i-Rumi, Hind., also dried tar; Zift-i-Ratab and Zift-i-Yabis, pine resin or tar, etc. Zift-Rumi, asphaltum or black bitumen, is a deep-black, pitch-like solid; hard, softens at 150°, and melts above that; highly inflammable, believed to be the result of the natural distillation of petroleum. It is produced in abundance in Barbadoes and Mesopotamia. It is a valuable lacquer for the protection of iron or tinned iron vessels. A lump rubbed over the heated metal, coats it with a hard, adhesive, brilliant coat, which resists most of the common corrosive agents.—*Powell.*

ZIKKIR or Zikr. Arab. Reminiscences; amongst Muhammadans, repeating the attributes of God or the creed, also devotion towards the deity; calling on the Lord; the term by which the Rafai darveshes designate their religious services. The zikkīr of the Maulavi darvesh commence their religious service with part of a mystic poem, using soft music and plaintive love songs. See Jalal-ud-Din.

ZILHUJ or Zilhujja, the last month of the Muhammadan year.

ZILLAH. Pers. In India, a district or local division of a country. In British India, each province is divided into zillahs or districts, under collectors and magistrates or deputy commissioners, with joint or deputy assistants, and extra-assistants. In the Bengal Presidency, these districts are in most cases grouped into divisions, each under a commissioner supervised by a revenue board or financial commissioner. English counties average 1000 square miles in extent. In India they are much larger. In Bombay, for instance, collectorates average about 6000 square miles, and Kandesh is supposed to be 15,000 square miles. Plural, Zillahjat.

ZIMB. Abyss. Dog-fly.

T'zirah, Zabub, Ar., Heb. | Glossina morsitans, Lat.

The zimb insect is translated hornet in Exodus xxiii. 28; Deuteronomy vii. 20; Joshua xxiv. 12. It is difficult to conceive that Isaiah could have in view any other insect when he says—'The Lord shall hiss for the fly that is in the uttermost part of the rivers of Egypt' (Isaiah vii. 18). The original word rendered fly in the translation is Zabub, and, as Bruce observes, 'the Chaldee version is content with calling this animal simply Zabub, which signifies the fly in general, as we express it in English. The Arabs call it Zimb in their translation, which has the same general signification. The Ethiopic translation calls it Tsaltsalya, which is the true name of the particular fly in Geer, and was the same in Hebrew.' Bruce has given a graphic account of this fly. The Latin Asilus and the Greek οἶστρος were probably only different pronunciations of the same term, Hatsirah, as this fly is called both by Moses and Joshua. Dr. Harris gives as names of flies, the Oreb of Exodus viii. 21; the Zebub of 2 Kings i. 2, 3, 6, 16, and Psalm cxviii. 12; the T-sira of Exodus xxiii. 28, Joshua xxiv. 12, Deuteronomy vii. 20.—*Kirby and Spence, Entomology; Harris, Nat. Hist. of the Bible,* p. 139.

ZIMMAY is the northernmost Shan State tributary to Siam, and lies about three weeks' journey from Moulmein, and forty days' from Bangkok. The prince or chief of Zimmay is nominally subordinate to the king of Siam, to whom a yearly tribute of very trifling value is paid. In reality, however, the control exercised from Bangkok has been of the slenderest kind, the Zimmay people accepting the suzerainty of Siam merely as one degree less objectionable than that of the Burmese, whom they dislike very strongly. Various reasons exist for the inefficient control exercised from Bangkok, not the least being the length and difficulty of communication between Bangkok and Zimmay, and the disturbed condition of Zimmay and the adjacent Shan States.

ZINAT-un-NISSA, daughter of the emperor Aurangzeb. Kazi Shahab-ud-Din, following Khafi Khan, states that in her young days she became attached to the young raja Sahoo, and the two young people having been allowed to grow up together, on one occasion, Aurangzeb, observing them in the same room, forbade all future intercourse. Aurangzeb died at Ahmadnaggur in the Dekhan, where he was provisionally interred (somp gya), and his remains were afterwards finally placed in a tomb on the hill at Roza near Dowlatabad, and over his remains is a very simple cupola or dome. At Aurangabad, however, is the splendid tomb of this daughter. The author of Travels of a Hindu states that the Zinat-Masjid, more commonly called the Kumari-Masjid, or Maiden's Mosque, was built by Zinat-un-Nissa, the virgin daughter of Aurangzeb, who, like Jahanara, remained unmarried. The princess who built it having declined entering into the married state, laid out a large sum of money in the above mosque, and on completing it she built a small sepulchre of white marble, surrounded by a wall of the same, in the west corner of the terrace. In this tomb, he says, she was buried, in the year of the Hijira 1122, corresponding with the year of Christ 1710.—*Tr. Hind.* ii. p. 312.

ZINC, Speltre.

Peh-yuen, Peh-t'ung, Chin.	Sang-fusri, . . It., Sp.
Sung busri, . . . Dukh.	Tambaga-putih, Malay.
Spelter, ... Dut.	Schpaater, . . . Rus.
Zinco, Chinck, . It., Sp.	Tutanagam, . . . Tam.

Zinc was first mentioned by Paracelsus in the 16th century, under the name of zinetum. Zinc is found in the state of an oxide, but principally as a sulphuret (blende), and an impure carbonate (calamine). From both ores it is first converted into an oxide by the process of roasting, and then reduced to the metallic form by the aid of carbonaceous matter, when it may either be fused or sublimed. Until purified by a second distillation, it contains as impurities, small portions of other metals, as iron, copper, arsenic, etc. In British India, zinc is used in forming alloys; of these, there are alloys with lead, chiefly used on account of the facility with which it can be turned or filed. 1 lb. of copper to 2 oz. yields a red-coloured ductile alloy; with 6 oz. is common pot-metal, brittle when warmed.

ZINGIBER CASSUMUNAR. *Roxb.*

Z. purpureum, *Roxb.* | Z. Cliffordii, *Andr.*

Ban ada, . . . Beng.	Karu allamu, . . . Tel.
Vana-adrakam, . Sansk.	Kura pasupu, . . ,,

Grows throughout British India, and has a strong camphoraceous smell. Rhizoma much larger than that of common ginger; smells camphor-like, tastes hot and bitterish; now very little used.—*Roxb.*

ZINGIBER OFFICINALE. *Roscoe.*

Amomum zingiber, *Linn.*

Zinjabil, Zingabil, ARAB.	Ischi, ... MALEAL.
Khyen-seing, . . BURM.	Zinjabil, ... PERS.

Sonth (dry ginger), ,,	Inji, ... TAM.
Alia, ... MALAY.	Allam, ... TEL.

The native country of the common ginger plant is not known; but it is cultivated in all the warmer parts of Asia and on the slopes of the Himalaya up to 5000 feet. Its flowers are small, whitish-purple, but it very rarely seeds; the roots are greatly increased. It is planted at the commencement of the rains in beds of about six feet square, and in a rich cultivated soil. The planting consists in dividing part of the green root, which the natives first soak in a mixture of cow-dung and water; it is then planted about two inches deep and about one foot apart. It requires a great deal of water, and to be kept clear of weeds. When the stalks dry, the ginger may be taken up; although it is sometimes left in the ground for a couple of years. It must be watered during the dry season, from October or November up to February and March.—*O'Sh.; Roxb.; Mason; Smith.*

ZINGIBER ZERUMBET. *Roscoe.*

Amom. zerumbet, *Willd.* | Zingiber spurium, *Kon.*
Butch, . . BENG., HIND. | Walinguru, . . SINGH.

Found in the island of Ceylon and in the woods about Calcutta; the taste of the root resembles that of ginger, but is bitter as well as aromatic. This plant is much used for cataplasms and fomentations, but is not taken internally. It is not used in medicine by European practitioners.—*O'Sh.* p. 648.

ZIRCON. Its pellucid varieties are gems; jargoon is of a dull green; hyacinch or jacinth has a peculiar red tint; and there are yellow and blue tints, but these are rare. The more pellucid and colourless zircon, from its exceptionally high refractive power, approaches even the diamond in brilliancy.

ZIZYPHUS, a genus of plants of the natural order Rhamnaceæ. Besides those noticed below, several species occur in S.E. Asia, viz.:—Z. albens, *Roxb.*, China; glabra, *Roxb.*, Chittagong; incurva, *Roxb.*, Dehra Doon; jujuba, *Lam.*, British India, Archipelago; lotus, *Lam., Pers.*, N. Africa; Mirzaporensis, *Royle*, Shergotti; nitida, *Roxb.*, China; Roxburghiana, —? Chittagong; rugosa, *Lam.*, British India.

This tree is found everywhere in the south and east of Asia. There are several varieties in the Panjab, Z. hortensis, Z. hysudricus. It is the Pomum Adami of Marco Polo. Its wood is tough, strong, and durable, is used for carpentry, well curbs, well wheels, and ploughs, and for making charcoal. By grafting and cultivation, it affords a large fruit. The fruit of the wild kind is dried and powdered, as was done with the lotus of the Lotophagi. This powder in Arabia is called Suve koon nebek, in Persian Arud-i-kinar, in Hindi Ber ehoonee. The bark is used in the Moluccas as a remedy for diarrhœa; the root, with some warm seeds, in infusion in fever. The lozenges, and thickened mucilage called jujubes by the confectioners, are prepared from this and from the Z. vulgaris, a native of Syria, Persia, and Hindustan. A variety with long fruit, described by Dr. Wallich, is called in Bengal Narikeli kool. Its reddish-coloured round fruit is about the size of a large olive, and is used in chatnies and pickles. The uncultivated fruit when nearly ripe tastes like a crab-apple; it is a small sour berry.

ZIZYPHUS NUMMULARIA. *W. and A.*

Birar, ... BEAS.	Malla, Kokni ber, PANJ.
Jar-beri, . . . HIND.	Karkanra, . . PUSHTU.
Jand-ber, . . JHELUM.	Birosa, . . SALT RANGE.
Jareri, ... PANJ.	

This small thorny shrub grows in N.W. India, and abundantly in the Panjab. It is used for hedges, and its bark as a tanning substance. It is eminently characteristic of a dry climate, being common in the most desert and rainless districts of the Panjab. Its fruit is a small red drupe the size of a pea, and considered by natives cool and astringent, useful in bilious affections.—*Powell; Thomson's Tr.* p. 305.

ZIZYPHUS ŒNOPLIA. *Mill.*

Zizyphus napeca, *Roxb.*	Erra-minya-wel, . SINGH.
Kan-hzee, . . . BURM.	Koattay maram, . . TAM.
Pen-lay-hzee, . . ,,	Paringi, ... TEL.

This shrub is common in Ceylon, in Bengal, and in the Peninsula of India. Dr. Gibson had never seen it in the Bombay Presidency, but as a climber; and Wight says if used at all at Coimbatore, it can only be for small ornamental work. The bark affords a good deal of kino, and dyes leather red. Fruit eaten by the natives, its taste being pleasantly acid, and a great favourite with the thirsty traveller, and mice are fond of it. Its leaves are eaten by the lac insect. A decoction of the bark of the fresh root is said to promote the healing of recent wounds.—*Roxb.*

ZIZYPHUS VULGARIS. *Lam.*

Kandika, ... BEAS.	Kokan ber, . . JHELUM.
Fitni, Pitni, Ber, HIND.	Amlai, ... SUTLEJ.

This common wild fruit tree grows in almost every jungle in British India. It is cultivated by

Muhammadans round their tombs. The fruit is astringent, but sometimes of a pleasant subacid flavour,—eaten chiefly by the poorer classes and wild animals. The fruit is oblong, containing a stone, and bears twice in the year, the best crop about January. After this is over, the tree is pruned, by cutting off nearly all the smaller branches. A second crop succeeds on the new wood in the rains, but, from being full of maggots, is not eatable; even in the cold weather very little of the fruit is free from this insect. The flavour is somewhat that of a fresh apple, and the fruit when large and fine is by no means to be despised. Dr. Riddell succeeded best by budding from a good tree on a common stock raised from seed. It will bear well in two or three years, but requires care and watering at first. A fine gum lac is produced from this tree. The cocoon of the wild silk-worm is often found attached to it. It is common at many places in the Panjab Himalaya, especially towards the west at from 2000 to 4000 feet, and in Kashmir to 6000 feet. It also occurs in the Salt Range, and is occasionally found in gardens in the Panjab. The fruit is small and sour, but is eaten.—*Stewart; Riddell.*

ZIZYPHUS XYLOPYRA. *Willd.*

Z. elliptica, *Roxb.*	Z. orbicularis, *Schult.*
Z. caracutta, *Roxb.*	Rhamnus xylopyrus, *Retz.*
Z. rotundifolia, *Roth.*	
Sooti, ... BOMBAY.	Gatte, ... TEL.
Gumun mara, . . CAN.	

This small thorny tree grows in the hot dry parts of Ceylon, and throughout the south of India, and can always be recognised by the pale colour and softness of the under-surface of its leaves. It is most common below the ghats in Canara and Sunda, but it never grows to a very large size. It is common in every forest on the coast of Coromandel. In a good soil it grows to be a pretty large tree, with a tolerably erect trunk; but in general it is found in the state of a large straggling shrub. Cattle eat the leaves, young shoots, and fruit. The kernels taste like filberts, and are eaten by the natives. The wood of the largest trees is much esteemed by the natives, being yellowish or orange-coloured, very hard and durable, and at the same time not very heavy. The wood is used for implements, and its round fruit is employed in the arts, being much used by shoemakers to blacken leather and to make blacking.

ZOBEIDAH, wife of Harun-ur-Rashid, authoress of the Arabian Nights. She is buried at Baghdad. A pine-apple spire rises over the tomb.

ZODIAC. The following are the Sanskrit names of the signs of the zodiac, with the months and the corresponding astronomical periods:—

Sign.	Hindu Month.	d.	h.	m.
Mesha (Aries),	Vaisakh,	30	22	12·8
Vrisha (Taurus),	Jyesht,	31	9	40·8
Mithuna (Gemini),	Ashadh,	31	14	39·2
Karkata (Cancer),	Sravan,	31	11	16·8
Sinha (Leo),	Bhadra,	31	0	52·0
Kanya (Virgo),	Aswin,	30	10	56·8
Tula (Libra),	Kartik,	29	21	38·8
Vrishika (Scorpio),	Margashirsh or Agrahayan,	29	12	9·6
Dhanus (Saggitarius),	Paush,	29	8	21·2
Makara (Capricornus),	Magha,	29	10	54·4
Kumbha (Aquarius),	Phalgun,	29	19	21·6
Mina (Pisces),	Chaitr,	30	8	8·4
Total (according to the Parasara Siddhanta), ...		365	6	12·54

The Hindu astronomers know the Greek names of the signs, which, however, have never been brought into ordinary use, viz. Kriya, Tauru, Jituma, Kulira, Leya, Parthona, Juka, Korpya, Tanxika, Akokero, Hridoga, Isthusi.

Hindu astronomers have divided the zodiac into 27 equal parts, called lunar mansions, of 13° 20′ each. Their names are—

Aswini.	Magha.	Mula.
Bharani.	P. Phalguni.	P. Ashadha.
Krittika.	U. Phalguni.	U. Ashadha.
Rohini.	Hasta.	Sravana.
Mrigasiras.	Chitra.	Dhanishtha.
Ardra.	Swati.	Sata-bhisha.
Punarvasu.	Visakha.	P. Bhadrapada.
Pushya.	Anuradha.	U. Bhadrapada.
Aslesha.	Jyeshtha.	Revati.

According to Mr. Colebrooke, at the epoch of the Vedas the summer solstice was in the middle of Aslesha, the 9th lunar mansion; therefore Regulus was half a lunar mansion + 9°, that is 15° 40′, east of the summer solstice at that time. On 1st January 1859, the long. of Regulus was 147° 52′ 30″. Hence Regulus was at that date 57° 52′ 30″ east of the summer solstice. The summer solstice had therefore retrograded through 42° 12′ 30″ = 42°·208 since the epoch of the Vedas. And as the equinoxes and solstices move backward on the ecliptic at the rate of 1° in 72 years, it must have occupied 70 × 42°·208 = 3039 years to effect the change. Hence the age of the Vedas was 3039 on 1st January 1859, or their date is B.C. 1181, *i.e.* the early part of the 12th century before the Christian era.—*Archdeacon Pratt in Beng. As. Soc. Journ.* No. 1 of 1862.

ZODIACAL LIGHT. This, in the Red Sea and in Bombay, is far brighter than in England. Flashes of light, coruscations of the aurora borealis, in pyramidal form, would exactly describe the phenomenon. It varies, however, greatly, and often for some days together is scarcely visible.—*Burton's Mecca*, i. p. 307.

ZOHAK, a ruined city 9 miles from Bamian, built solidly with great skill and taste, and of burnt bricks. Abul Fazl thinks it was a fortress. Masson regards it as a religious structure.—*MacGregor*, p. 728.

ZOHAK, a mythical king of Persia; according to tradition, he came from Arabia.

ZONAR. HIND., PERS.

Poita, Poitu, . . BENG.	Yajnopavita, . . SANSK.
Janeo, Janar, . . HIND.	Janavi, ... ,,
Janwez, ... MAHR.	Jhandiam, Zendiam, ,,
Pavitra, ... SANSK.	Yadnu-pavita, . ,,

The zonar is regarded by the Brahmans as of sacred import; and they do not consider an individual as fully member of his class until he has assumed this symbol. Some writers call this the Brahmanical, priestly, or sacerdotal cord; but it is worn by the Brahman, Kshatriya, and Vaisya castes, by the Bed or herbalists of Bengal, by the five komsallar or artisan castes of the Dekhan, carpenters, goldsmiths, coppersmiths, blacksmiths, and stone-cutters, and also by the Parsee Zoroastrians. The zonar, however, is different for each of the races who wear it. It is imposed with solemnity, whence the three castes are termed Dwija, or twice-born. The investiture, with its accompanying formulæ, is considered to indicate the regeneration of the individual. The rite is applicable to all the three superior castes, or the Brahman, Kshatriya, and Vaisya, to each of

whom the term Dwija is appropriate; although, as the two latter are considered to be extinct, it now signifies the Brahman only. The cord of the Brahman should be made of cotton, that of the Kshatriya of a kind of grass, and that of the Vaisya of woollen thread. The investiture of the first should take place between the ages of five and sixteen; of the second, between six and twenty-two; and of the third, between eight and twenty-four. If delayed beyond the latter period, the individual is considered degraded from his caste. An essential part of the ceremony is the communication of the Gayatri or holiest verse of the Vedas. Various ceremonies are attendant upon Hindu boys between infancy and the age of eight years. After that age, and before a boy is fifteen, it is imperative upon him to receive this sacred thread, which, after a variety of preliminary ceremonies, is thus performed. The priest first offers a burnt sacrifice, and worships the salagrama, repeating a number of prayers. The boy's white garments are then taken off, and he is dressed in yellow or red, and a cloth is brought over his head, that no Sudra may see his face; after which he takes in his right hand a branch of the vilva, Ægle marmelos, and a piece of cloth in the form of a pouch, and places the branch on his shoulder. A poita of three threads, made of the fibres of the suru, to which a piece of deer's skin is fastened, is suspended from the boy's left shoulder, falling under his right arm, during the reading of the invocations. The father of the boy then repeats certain formulas, and in a low voice pronounces three times the Gayatri. It is communicable to all three, and is the following: 'O'm! Bhurbhuvă ssuvâha, O'm! Tatsa vit'hru varennyâm; B'hargo devâssyâ dhimahi dhiyo yonaha pracho dayath. Om! earth, air, heaven, O'm! Let us meditate on the supreme splendour of the divine Sun; may he illuminate our understanding.' After this the suru poita is taken off, and the real poita, or sacred thread, put on. During this ceremony the father repeats certain formulas; the suru poita is fastened to the vilva staff, shoes are put on the boy's feet, and an umbrella in his hand. The receiving of the poita is considered as the second birth of a Hindu, who is from that time denominated twice-born. A boy cannot be married till he has received the poita. The sacred thread must be made by a religious Brahman. It consists of three strings, each 96 hands (48 yards), which are twisted together; it is then folded into three, and again twisted; these are a second time folded into the same number, and tied at each end in knots. It is worn over the left shoulder (next the skin, extending half-way down the right thigh) by the Brahman, Kshatriya, and Vaisya castes. The first are usually invested with it at eight years of age, the second at eleven, and the Vaisya at twelve. The period may, from special causes, be deferred; but it is indispensable that it should be received, or the parties omitting it become outcastes. Colonel Tod, describing a gift to the Saiva temple of Eklinga, mentions that in return, the donor, who was the prince of Mewar, received lessons of morality, was initiated into the mysterious rites of Siva, and finally was invested with the triple cordon of faith (tin purwa zonar) by the hands of the sage, who became his spiritual guide, and bestowed on his pupil the title of regent (dewan) of Eklinga. When the Carthaginian gained the battle of Canna, he measured his success by the bushels of rings taken from the fingers of the equestrian Romans who fell in that memorable field. Akbar estimated his by the quantity of cordons (zonar) of distinction taken from the necks of the Rajputs, and seventy-four and a half 'man' are the recorded amount. To eternize the memory of this disaster, the numerals 74½ are, amongst the Rajput race, tilae, or accursed. Marked on the banker's letter in Rajasthan, it is the strongest of seals, for the sin of the slaughter of Chitore is thereby invoked on all who violate a letter under the safeguard of this mysterious number. Something like the zonar was ordered in Numbers xv. 38, in the fringes to be attached to the Arba kamforth on his breast, and which every Jew still wears.—*Tod's Rajasthan*, i. pp. 225, 328; *Cole. Myth. Hind.* p. 154; *Wilson's Hindu Theatre*, p. 163; *Moor's Hindoo Pantheon; Chow-Chow.*

ZONARIA PAVONIA. *Ag.* The Turkey feathered zonaria is a beautiful sea-weed, one of the Fucaceæ. It grows in all seas, attached to rocks, shells, etc. It resembles the expanded tail of the peacock.—*J. A. Murray.*

ZOOLOGICAL GARDENS were formed in Madras by Surgeon-Major Balfour in 1856. The collection comprised an aviary, snakes, the orang-utang and others of the monkey tribe, lemurs, armadilloes, bears, hyænas, tigers, the last given by Lord Harris. It was in connection with the Government Central Museum which he established in that city. The animals were afterwards removed to the People's Park in that city.

ZOOPHYTE, from the Greek Ζωον, animal, and Φυτον, a plant. The characteristic example of this class of creatures is to be seen in the coral, and authors divide them into

I. Protozoa, including Infusoria, Foraminifera, and Spongiadæ.

II. Polypifera, including the Hydræ, Sertularia, and Pennatularia.

III. Echinodermata, or sea-urchins and star-fishes.

The Protozoa are subdivided into Rhizopoda and Infusoria. The Amibæ, Foraminifera, and Noctilucæ are three orders of Rhizopoda. The Infusoria exist in all waters. The Ganges annually transports them to the ocean, to the extent of six or eight times the size of the Great Pyramid of Egypt. And the waters at a depth of 22,000 feet between the Philippines and Marianne Islands yielded 116 species.

The Polypifera, the polypi, correspond with the polype of science and the acalephous zoophytes of Cuvier. In nearly all the polype, the sexes are separate. They are arranged into the classes Sponge, Alcyonidæ, Zoantharia, Diseophora, and Ctenophora.

The name is from the Greek πολυπους, meaning many-footed. The name is sometimes applied in a restricted sense for the genus hydra, but it usually comprises the animals of all zoophytes of the genera actinia, astrea, caryophyllea, corallium, hydra, isis, madrepora, meandrina, oculium, poeillopora, porita, sertularia, tubipora, and others.

The sponge animal lives at the bottom of the sea, and consists of a mass of light elastic tissue. Over three hundred species are known, amongst them are the feather, fan, bell, lyre, trumpet, distaff, peacock tail, and Neptune's glove sponge.

River sponges are irregular sandy masses, piled on plants and solid bodies in fresh water. The sea sponge is found in the Mediterranean, Red Sea, Mexican Gulf, and eastern seas, attached to rocks at from 5 to 25 fathoms deep. In the Red Sea, the Arabs dive for them and sell them in Egypt and at Aden. The Spongia, Calcispongia, Halispongia, and Spongilla constitute a group of which the constituent structure is known. The Geodia, Cœloptychium, Siphonia, Myrmecium, Scyphia, Endea, Halirrhoa, Happalimus, Cnemidium, Jerea, and Teuthium constitute another group, depending on characters of surface and general figure.

Some species of polypi live in large companies, and secrete a habitation or basis, to which the term polypidom has been applied; others live apart, like the hydra, floating about separately in the water, or, like the anemone, fixed one by one to the rocks. They have attracted the attention of the most learned naturalists from the time of Aristotle to the present day. The bright-red substance of the polypidom of the Corallium nobilis is the red coral of commerce, which, after pearls, for ornamental jewellery is the most precious product of the sea. It occurs chiefly in the Mediterranean, where it is dredged for. Sicilian coral has fetched as much as £10, 10s. the ounce.

The polyps are propagated by eggs, by buds, and by self-division. The polypidom of Tubipora musica of the Indian Ocean, is composed of a series of bright-red calcareous tubes, like those of an organ.

The Madrepora abound near the islands of the Indian and Pacific Oceans, and cover the banks and reefs near the Australian shores, particularly M. muricata, *Linn.* It is used for ornament, and is the Corne de Dame or Char de Neptune of the French.—*Newton's Levant*, p. 293; *Hatchett; Royle; Figuier; Madras Ex. Jur. Rep.*

ZORAPUR, a suburb of Kurnool, on the right bank of the Tumbudra river. General Cunningham supposed it to be the old town of Zora or Jora, as it answers to the Choliya or Joriya of Hiwen Thsang. In 1839, Alif Khan, the nawab of Kurnool, was dreaming of rebellion, and on being detected, he took up a position here with his mercenaries. He was defeated, and sent as a prisoner to Trichinopoly, where he was assassinated by one of his own dependents.

ZORAPUR, a town near the left bank of the Kistna river, usually called Beder Zorapur, because it is occupied by the Berder or Beder race. It is a feudatory chiefship of Hyderabad, in the S.W. part of the Hyderabad dominions. It is held by a Beder chief, with a portion of his tribe, and until the latter part of the 18th century the kingdom of Mysore contained several principalities of the Beder race. It is surrounded by rocky hills, and is a perfect site for a predatory race. The Beder chief joined in the rebellion of 1857-59, and, on being captured, he shot himself.

ZORAWAR SINGH, a Sikh general who commanded an expedition sent from Kashmir by Gulab Singh in 1839. After taking Ladakh and Iskardo, he marched up the valley of the Indus into Gnari, a province of Tibet, and captured Gurtok, its capital. His force was inconsiderable, and he wrote in vain for supplies and reinforcements. These were not easily furnished across the many intervening ranges of snow-capped mountains; winter was now approaching, and Zorawar Singh fortified for himself a cantonment near Gurtok, when a Chinese and Tibetan force surrounded him, and cut off his supplies. His detachment was thus overpowered, and himself slain. About 120 miserable Sikh fugitives found their way, half-frozen, across the Niti pass into the British province of Kamaon, and told the tale. This occurred in the winter of 1842, at the very time when the British force of Kābul was similarly overpowered by the Afghans.—*Prinsep's Tibet*, p. 22; *Cunningham's Sikhs*, p. 256.

ZOR-KHANAH, or Palaistra, where wrestling and athletic feats are practised, called in India talim khana.

ZOROASTER, the first of a dynasty that ruled in Babylon from B.C. 2235 to 2011, a period of 224 years, during which there were seven successors. From the Armenian edition of Eusebius, in the Chaldæan lists of Berosus, the name of one Zoroaster is known to us as a royal name. It is that of the Median conqueror of Babylon, who vanquished the realm and city of the Chaldees, and founded the second Babylonian dynasty in the year 2234 B.C. See Kissa-i-Sanjan.

ZOROASTER. See Zarathustra Spitama.

ZU, in Arabic means having or possessed with.

Zu-ul-Jalal, possessed of dignity.

Zu-ul-Faqār, the two-edged sword of Ali, which was said to have been given to Mahomed by the angel Gabriel. Zu-ul-Karnain, two-horned, a title adopted by Alexander the Great, who claimed descent from Jupiter Ammon. It was also adopted by Seleucus Nicator, but his reasons are not known. It was supposed to be meant to indicate that the power extended from east to west.

Zawi or Zui and Zi are the oblique cases of Zu. Sallatin Zui-ul-iqtadar, powerful princes. Zi-iqaida, the last month of the Muhammadan year.

Zu-l-Junna, the name of Husain's steed, meaning a winged wolf.

ZUHRA. ARAB. The planet Venus.

ZULIKHA, wife of Pharaoh. Her passion for Joseph is described in the Persian poems of Nizami and Jami.

ZU NAWAZ or Dhu Nawaz, surnamed the Lord of the Pit, from his throwing Arabs who refused to accept Judaism into a pit of fire.—*Sale's Koran.*

ZUTTU. TEL. The scalp-lock of hair worn by each man of the Hindus, called Kudami in the Tamil country.

ZYE. PUSHTU. A son, also written Zoe and Zai, answering to the Scotch Mac, the Irish O, the Arabic Ibn and Wald. All the Durani tribes have names ending in zye. According to Elphinstone, there are nine of these tribes,—the Populzye, which is the largest; Alleko-zye, Barukzye, Achik-zye, Nur-zye, Yusuf-zye, Husain-zye, Ali-zye, and Ishaq-zye, the two last being the smallest.

ZYGÆNA, hammer-headed shark, a curious shark with a head like a hammer, according to an Englishman's imagination, but like a buffalo's horned head, according to the Burmese. The genus Zygæna belongs to the sub-class of fishes Chondropterygii, Order II. Plagiostomata. First sub-order, Selachoidei, Fam. 1. Carchariidæ, Group B. Zygænina.

Zygæna Blochii, *Cuv.*, Archipelago.
Z. malleus, *Risso*, all seas.
Z. tudes, *Cuv.*, E. and W. Indies, Archipelago.
Z. tiburo, *Linn.*, Atlantic, Archipelago.
Z. mokarran, *Rappell*, Red Sea.

ZYGOPHYLLACEÆ, the bean capers, a natural order of useful plants, comprising in British India the genera fagonia, peganum, sectzenia, tribulus, and zygophyllum. Zygophyllum simplex, *Linn.*, and Z. coccineum, *Linn.*, camel-fodder plants of the Panjab, Sind, and Cutch, called in Sindi Aletthi and Putlani.—*J. A. Murray.*

ZYMOOSHT are a small but brave tribe of Afghans, numbering about 5000 fighting men, some of whom are well mounted. They inhabit a valley leading from Western Miranzai onward, towards the crest of a range called the Paiwar Kothul. Their country of right belongs to the Kābul kingdom. They were usually ready to combine for mischief with the Tooree and Orakzai, and to threaten Miranzai. They hold some land in the plains, which holding affords some pledge for their good behaviour. See Khyber.

GENERAL INDEX

FOR ALL THE THREE VOLUMES.

Detailed Indices for 'Birds,' 'Boats,' 'Ships,' and 'British India' are given at the end of this General Index, and at the end of the Second Volume are Indices for 'India,' 'Insects,' and 'Mammalia.'
