PUJA WIPU, a ceremony celebrated with splendour in Trevandrum. Kumarasamy (the son of Siva), who is kept at Kumara Coil, near Puttmanabapuram, is brought to Trevandrum for the celebration of the Dashara feast. It costs the State 3000 fanams annually in cash, exclusive of his travelling expenses. The god is supposed to receive these 3000 fanams in consideration of the difficult task he has to perform in crossing the three great rivers, Neyour of Neyattencuray, Tambrapurni of Culiteray, and the Caramanayaur of Trevandrum. This deity, having lost caste because he married a girl of the Curava caste, by name Vulley, and one of the Parava caste, by name Thaivayanay, is not allowed entrance inside Padhmanabaswamy pagoda, but is made to reside in a pagoda outside the fort near Chalay, called Ariya Chalay. After the close of the ceremony, for the celebration of which his presence is invited, the god receives the fee of 3000 fanams, and is taken back to his pagoda at Padhmanabapuram, escorted by a company of the Nair brigade, a good number of pagoda girls, the tahsildar, and some petty officials, and is not disturbed till the next feast. Dancing girls belonging to many of the pagodas in South Travancore also grace the occasion with their agreeable presence and remarkable dancing, creating during their short stay of ten days a great deal of disturbance by their immoral and obscene conduct, and thereby giving a good deal of trouble to the police authorities. On the day that this ceremony closes, his highness the maharaja proceeds in his royal car to Pujeperah.

PUKALENTI, said to have been a contemporary of Kambar, but he was one of the court poets of Varaguna Pandiyan, king of Madura. He wrote a history of Nala and Damayanti in Venpa metre, entitled Nala Venpa; also the Irallina Surukkam, enumerating the metaphors to be used in erotic poetry.

PUKAT, a Chinese trading vessel employed in the eastern seas; Prahu.

PUKEO, a mouey of account in the island of Lombok, equal to 5 attaks or 1000 cash; about 9 shillings.—*Simmonds' Dict.*

PUKHAWAJ. Hind. A kind of drum, a timbrel.

PUKHTUN-KHWA and Watan-khwa, names by which the Afghans designate their own country.

PUL or Pool. Abul Fazl says that the pool of olden days was equal to 4 tolas; Ferishta, again, gives 1 or $1\frac{3}{4}$ tolas.

PULAHA, a Hindu sage, is described in the Bramhauda Purana as a tall, aged man, in the dress of a mendicant, who lived as a hermit on Mount Mandara. He is said to have written one of the Smriti. One son, Variyana, is said to have introduced the Hindu custom of preserving the ancient fire; and another son, Sahishnu, originated the austerities practised by the Jogi ascetics.—*Ward*, iv. p. 18.

PULAIMAKAN, a Tamil term, applied to a Paraiya or Pulaya.—*Wilson.* See Pariah.

PULASTYA, one of the Smriti writers of the Hindus, and author of an astronomical work. He had two sons. He is described as a tall, dark man, and dressed as a mendicant.—*Ward*, iv. p. 17.

PU-LA-TE, a wandering tribe found on the island in the Baikal lake. Mr. Bell says the tribe are natives of Siberia, and are called by the Russians Brustky, but by themselves Buraty. They live in tents all the year; and, having large flocks of sheep and many cows and horses, they remove from place to place, as the convenience of grazing requires. Their language has a great affinity to that of the Kalmuks, and they have priests among them who can read and write that language.—*Staunton's Narrative*, pp. 51, 52.

PULAYAN or Pulian, of Malabar, is a low and servile caste, often slaves. The Tandu Pulayan section of this Travancore tribe are so named

because their women wore a dress of the leaves of the Tandu water plant. Its leaves were cut into lengths a foot long, and tied round the waist so that the strings unwoven reach to the knees, hanging like tails before and behind. The men wear the ordinary lower cloth of the Hindus. They are said to have been without cloths, and to have been compelled by an ancient king to clothe themselves, and the women adopted this. They are also called Kuri Pulayan, meaning Pit-Pulayan. They speak Malealam, worship the sun and heavenly bodies and their ancestors' spirits, which are supposed to dwell in the marine lagoons, and the phosphorescence of its waters is supposed to indicate their presence. The Pulayan eat fish, cooked in arrack, with roots of water plants. They drink largely. They dwell in the Malealam country south of Cochin, between the backwater and the sea; and a section of them is more south, near Aleppey, who are called Kanna Pulayan, and their wives on maturity wear a better kind of apron. They are virtually slaves.—*Rev. W. J. Richards' Indian Antiquary*, p. 120.

PULEETA. Hind. A lamp charm.

PULEX PENETRANS, or Dermatophilus penetrans, the Chegoe, a troublesome and noxious small flea of the W. Indies and S. America, which penetrates into and deposits its eggs in the skin of man.

PULGOONDHUN. Hind. The plaiting of a girl's side locks, a Muhammadan ceremony.

PULIAR and Kader, as also the Malai-Arasar and Muduwar, all inhabit the Animallay Hills. They all gather the rich natural products of the forest,—cardamoms, honey, wax, ginger, turmeric, resins, millets, soap-nuts, gall-nuts,—and exchange them in return for rice and tobacco. See Puller.

PULICAT, properly Paliyavarkadu, a small town 20 miles N. of Madras, on the Coromandel coast, in lat. 13° 25′ N., and long. 80° 21′ 24″ E., situated on the borders of a large island at the southern extremity of a marine lagoon, called the Pulicat Lake. The Dutch established themselves there in A.D. 1609. The lake is 37 miles from N. to S., and 11 miles across at its broadest part. Communication is open to Madras by Cochrane's canal, 14 miles long, which was excavated about the end of the 18th century. Pulicat is close to the village of Coromandel, which again gives its name to the coast of the eastern side of the Peninsula of India. The lake has many islets, one of them at Sriharikotta is covered with jungle. Off the coast here are the Pulicat shoals, lat. 13° 25′ N., and long. 80° 18′ E.

PULINDA, ancient dominant tribes in Central and Northern India, and on the Indus, alleged barbarians.—*As. Res.* x. p. 87; *Dowson.*

PUL-i-SIRAT, a bridge, according to Muhammadans, over which the dead have to pass. If in life the traveller have been good, he passes safely; if an evil-liver, the sword-like bridge cuts him in two.

PULLA. Hind. A kind of carp found in the Indus and Ganges rivers in the four months that precede the periodical swell of these rivers. The pulla, called by the Sindi 'pallo,' is the hilsha of the Ganges, the sable or black fish, also called the tamarind fish. The usual weight is about two pounds, and the body averages 20 inches in length. The finest are found ascending the Indus as far as Bukkur, between January and April, and are rare above the island of Bukkur. It is caught in abundance and by various methods, sometimes by fishermen perched on a narrow-necked earthenware pot, which serves the double purpose of support and a reservoir for his fish and tackle; others buoy themselves up by means of dogskins kept inflated from a mouthpiece. Some ten or fifteen fishermen are to be seen dropping slowly down with the current.—*History of the Panjab*, i. p. 8; *Burton's Scinde*, ii. p. 256.

PULLA PASSAONA, Hind., or spreading the cloth or scarf, is the figurative language of entreaty arising from the act of spreading the garment preparatory to bowing the head thereon in token of perfect submission.—*Tod's Rajasthan.*

PULLER. Tam. A race in the south-west of the Peninsula of India, supposed to have formerly been in a state of slavery, but their position now is solely dependent on their wealth. Both men and women work well, take part in all agricultural labour, the women in this particular vying with the men. The Puller women go about with their chests exposed, and as a rule cannot be induced to cover their breasts. Previous to British rule, the Puller, who inhabited the forests and mountainous districts of the Malabar coast, were regarded by the settled inhabitants as inferior to the beasts of prey, and were not even permitted to erect houses for themselves. A shed supported on four bamboos, and open on all sides, sheltered them from the rain, but not from the inclemency of the weather. They dared not venture on the public road lest their steps should defile it; and when they perceived any person approaching them from a distance, they were required to utter a yell or loud cry, and make a wide circuit to let him pass. The Puller in Tinnevelly are predial slaves of the wealthier classes. They are the lowest Hindu grades of the right-hand caste. They bury their dead, have pujaris of their own castes.—*Wilson; Campbell*, p. 133. See Puliar.

PULLIAR or Pulliyar, in the Tamil country, a form of the Hindu deity Ganesa.

PULLICATES, a commercial term for cotton checked handkerchiefs of various colours.

PULLICONDAH, a village 97 miles W. of Madras, near the right bank of the Palar river. It has a handsome pagoda, in front of which is a pagoda supported by four lofty pillars.

PULNEY, a small town that gives its name to a spur, called Kurragherry, of the western range of mountains which runs out boldly into the Madura district, and on which a sanatorium is growing up. Pulney is to the north of this range. A festival is annually celebrated there, and the worshippers of the idol Subramaniya crowd to the place. On approaching the town from the east is seen two massive rocks lying to the south, and about half a mile distant from the road and from each other. The elongated one to the east is named Idumba hill; the larger and rounder mass is Pulney rock, the summit of which is crowned by a temple, different parties moving up the rock to the shrine of the divinity, beating of drums and braying trumpets cry out Harakara—meaning O Siva! great Siva!—in praise of their deity. The local name of the god is Pulney Andi, also Dandaythapani (wielder of the spear), Arumugam (six faces), and Kartikeia (the god of war). His Puranic name is Skanda. He is the youngest son of the god Siva, and the hero of the Skanda Purana.

PULO BRANI, an island near Singapore, occupied by Bugis settlers employed as pine-apple planters and fishermen. The women manufacture gold and silk sarongs and coarser articles. They are Muhammadans, but drink the fermented juice of the pine-apple. Their features are regular and open, their faces inclined to an oval, eyes large and dark, and are much elevated. Women have oval faces and very perfect figures, but at puberty their teeth are filed close to the gum.—*Dr. J. S. A. Little.*

PULO CONDORE, from its proximity to the entrances to the river Mei-kong, in some measure commands the access to Saigon, and it is also situated in the direct course of vessels passing up and down the China Sea. In other respects Pulo Condore appears of little importance.

PULOMAN, in Hindu mythology, a Danava, and father of Sachi, wife of Indra.—*Dowson.*

PULO NYAS or Nias is the largest of the islands off the west coast of Sumatra, being 18 or 21 miles in breadth. In general, the land is high, well clothed with trees, and partly under rice cultivation. Many of the inhabitants were formerly purchased for the Dutch settlements at Batavia, the women being fairer than those of the adjoining coast.

PULP. When the coffee berry is picked from the tree it bears a close resemblance to a ripe cherry, both in size and appearance; and several processes have to be gone through before the article known in commerce as coffee is produced. In the first place, the pulpy exterior of the cherry has to be removed by the process of pulping, which separates the seed and its thin covering, called the parchment, from the husk. When the pulping process is completed, we have the parchment coffee by itself in a cistern, and the next process consists in getting rid of the mucilage with which it is covered. The pulp contains two seeds. They are covered by a viscous substance called gum, and integument known as the parchment, from its resemblance when dried to that animal product, and a pellicle named the silver, which is very like gold-beater's skin, and the grains of coffee, which are styled beans; sometimes there is only one bean in a cherry, which takes a more rounded form, and is called pea-berry. This is caused by only one of two embryos coming to maturity, whilst the other is abortive, the rudimentary form of which is always apparent.

PULPARRAH, a very sacred place, situated about six miles from Surat on the river Tapti, and usually preferred to the immediate locality of the city. Pulparrah abounds with altars, Hindu temples, and sacred trees, and possesses a solemnity of appearance in admirable accordance with its sacred character.—*Postans' Western India*, i. p. 283.

PULQUE. The saccharine and mucilaginous sap of the Agave Americana may be made to flow by incisions in the stem; it readily ferments, and in Mexico yields on distillation an agreeable ardent spirit, called vino mercal. The incisions are made just before the flower scape is ready to burst. The dried flowering stems of A. Americana also afford an almost impenetrable thatch; the fresh green leaves are cut up and given to cattle, and the centre of the flowering stem, split longitudinally, is by no means a bad substitute for a European razor strop, owing to minute particles of silica forming one of its constituents. The two products most deserving attention, however, are the extract which forms a lather like soap, and the fibre known in Southern India as the pita.

PULSES, species of the Fabaceæ or bean tribe of plants, are largely used in the E. Indies as food for man and beast. They are eaten with, and supply to rice and some other cereals, the nitrogenous or flesh-forming material in which these are defective. Bengal gram or Cicer arietinum, or chick-pea, occupies an important position. It is largely used by the people, and constitutes, besides, the chief horse food of Northern and Western India. It can be used for this purpose for a length of time without causing heating, or the other deleterious effects ordinarily produced by the too exclusive employment of peas and beans. Other pulses, known as dhal or dhol, are also very largely eaten in Northern India, along with rice. All the pulses occupy an important position in the food of the people of the interior plains. The generic name in Malay and Javanese for all leguminous plants is Kachang, by adding an epithet to which we have the name of the species.

The food species of the Fabaceæ most used and cultivated in the S. and E. of Asia are as under:—

Arachis hypogea, *L.*, earth-nut.
Cajanus Indicus, *Sprenger*, 2 varieties.
Canavalia gladiata, *D.C.*, 3 varieties.
Ceratonia siliqua, *L.*
Cicer arietinum, *Linn.*, chick-pea.
Cyamopsis psoraloides, *D.C.*, beans.
Dolichos uniflorus, *Lam.*, horse gram, 2 varieties.
D. Sinensis, *Linn.*, 4 varieties.
Ervum lens, *Linn.*, lentil, tare.
Faba vulgaris.
Lablab cultratum, *D.C.*, 6 varieties.
L. vulgare, *Savi.*, 7 varieties.
Lathyrus aphaca, *Linn.*, yellow vetchling.
L. sativus, *Linn.*, blue-flowered chickling.
Pachyrrhizus angulatus, *Rich.*, the root only.
Phaseolus aureus, *Roxb.*
P. lunatus, *L.*, country French beans, 6 var.
P. mungo, *L.*, green gram.
P. nanus, *L.*, common dwarf kidney bean.
P. radiatus, *L.*, green gram.
P. Roxburghii, *W. and A.*, 2 varieties.
P. trilobus, *Ait.*
P. vulgaris, *Linn.*, French bean, haricot, common kidney bean.
Pisum sativum, *Linn.*, common pea, 3 varieties.
P. arvense.
Psophocarpus tetragonolobus, *D.C.*, Goa bean, chevaux de frise bean.
Soja hispida, *Moench.*, soy.
Vicia faba, *Linn.*, garden bean.
V. sativa, *Linn.*, common vetch.
Wistaria Sinensis.

Several species are regular objects of cultivation, as Phaseolus lunatus and Roxburghii, Dolichos kachang, Lablab vulgaris, Soja hispida, Cajanus Indicus, and Arachis hypogea.

The ordinary pulses belong to the tribes Vicieæ and Phaseoleæ of the order Fabaceæ. All the cultivated varieties of beans have originated from Faba vulgaris; all the varieties of garden peas have originated from the Pisum sativum, a native of the south of Europe, and the field pea is the Pisum arvense. The flour of lentils contains more nitrogenous matter than any other of the leguminous plants.—*Cat. Ex.*, 1862; *Crawfurd's Dict.* p. 361.

PULUC-ODIAL. SINGH. A name in Ceylon for the young shoots of the palmyra palm boiled; when eaten raw, they are termed Odial; but are also called Kalinga or roots.—*Simmonds' Dict.*

PU-LU-SHA-PU-LO or Parshawar, capital of Gandhara.

PULUT. Malay. A kind of rice. It is boiled in a bamboo joint by the Malay and Dyak races of Borneo. Considered as a delicacy, and much prized for its nutritions qualities.

PULWAR is a smaller description of Ganges boat than the puteli, and of neater build. It is used by natives in travelling, by European travellers of humbler means, or as a cook-boat, or for servants. See Boats.

PUMICE-STONE.

Fan-shi, ... Chin.	Batu-timbul, . . Malay.
Pimpsteen, . . . Dan.	Pedra pomes, . . . Port.
Puimsteen, . . . Dut.	Pemza, ... Rus.
Pierre ponce, . . . Fr.	Piedra pomez, . . . Sp.
Bimstein, . . . Ger.	Pimpsten, ... Sw.
Pietra pomice, . . . It.	Poosa-rai, ... Tel.
Pumex, ... Lat.	

A light, spongy, vitreous stone, found usually in the neighbourhood of volcanoes, and supposed to be a lava or volcanic glass. It is used for polishing metals and marble, and smoothing the surface of wood and pasteboard. Pumice is quarried and exported in large quantities from Lipari and the Isles Ponxa, in the Mediterranean. Pumice-stone in small pieces and very hard is found on the sea-coast near Nizampatam. Numerous fragments of white pumice are found on the north-east point of Battam, and within the Singapore Strait or Pulo Sambo, called by Malays Batu-timbul, or floating stone, who say it is found floating on the China Sea, and scattered on the beaches of the eastern coast of Johore. It is from some of the volcanoes. Pumice-stone occasionally collects in the seas of the Archipelago so largely as to polish brightly the copper of ships passing through the masses. In 1883, an eruption occurred of a volcano in Java, and large quantities of pumice-stone were thrown out; ships sailed through it floating on the neighbouring seas. The pumice of the great Tomboro in Sambawa is blackish.—*Bennett, Whal. Voy.* ii. p. 67; *Faulkner; Rohde's MSS.* See Aden.

PUMMALO or Pumelo, or Citrus decumana, *Linn.*, Pumplemose, the shaddock. It has been ascertained that the mango, orange, pummalo, sweet lime, bilimbi, and guava all bear pruning of the old wood, and that they produce much more fruit in consequence. Old branches, if cut off the mango near its base, are apt to produce canker in the trees, unless the cut surface is protected from the air by tar or white paint.

PUMP.

Pompe, ... Fr.	Bomba, ... Sp.
Pumpe, ... Ger.	Tulunba, . . . Turk.
Tromba, ... It.	

In India, a number of trials have been made of different appliances for raising water, as belt lift, chain and rope lift pumps, hand, force, and garden-watering pumps; but on comparing the working of these with the ordinary Pe-cottah, it is ascertained that the belt lift pump only raises water to about 12 feet, and that steam power is requisite to keep up the velocity. The chain and rope lift pumps work satisfactorily to a depth of 30 feet, but in deep wells the labour of raising the water is considerable.

PUMPKIN, Cucurbita pepo.

Kaddu, ... Hind.	Labu pringi, . . Malay.
Mit'ha kaddu, . ,,	

This vegetable is grown in great abundance in all parts of the Dekhan. It is much esteemed both by the Europeans and natives. It is generally sown at the commencement of the rains, and requires no particular care: the soil should be light and good. When young, about the size of a goose's egg, if cut and boiled, it will be found to resemble the artichoke-bottom dressed in the same way. The Lagenaria vulgaris, *Ser.*, and the Benincasa cerifera, are sometimes called white pumpkin. B. cerifera is also called the white gourd or white pumpkin.—*Riddell.*

PUN. Sind. The leaves of Typha elephantina, used for making mats and baskets.

PUN, uncurrent money; nominal species of currency in India calculated by cowry shells,—in Hindustan, a handful, or about 80 shells, five pun or 400 cowries making an anna or 1½d.—*Simmonds' Dict.*

PUNA or Poon, commonly called Peon in England. It is used for masts and yards. See Poon.

PUNA. Hind. Ehretia serrata, a small tree with a white, hard, heavy, strong, durable wood, used by zamindars for their houses and implements. Leaves given as fodder to cattle. Wood not much valued.—*Powell's Handbook*, i. p. 451.

PUNAG, in Bombay, the female plant of Calysaccion longifolium, *Roxb.*—*W.*

PUNAK. Singh. Refuse of the cocoanut after expressing the oil, used for cattle, poultry, and manure.

PUNA KAD, in Salem, Kumari, Can., of Mysore and Canara, is the Pounam of Malabar, the Chena of Ceylon, and the Tungya of Burma. It is a rude system of culture followed in all these countries, wherein secluded tribes and others clear parts of the forest. The Irular races and Kurumbar on the Neilgherries, the Malai-Arasar on the Shevaroys, the Punam cultivators in Malabar, the Kumari cultivators of Canara, and the Karen in Burma, all endeavour to obtain a precarious subsistence by scattering grain after burning the jungle, and thus avoid, to them, the irksome restraints of civilised life. The Kumari cultivators earn a cheap but wretched subsistence, and live in miserable huts. A hillside is always selected, and at the close of the year a space is cleared. The wood is left to dry till the following March or April, and then burned. The ground is then sown with Italian millet, Panicum Italicum, as also with rice, Oryza sativa. In Canara, the seed is generally sown in the ashes on the fall of the first rain, without the soil being touched by a plough. It is fenced and weeded, and the crop gathered towards the end of the year. A small crop is taken off the ground in the second year, and sometimes in the third, after which the spot is deserted for 7, 10, or 12 years, until the jungle grow sufficiently high to tempt the tribe to renew the process. In Ceylon, the Chena lasts two years, and includes the culture of chillies, yams, sweet potatoes, cotton, hemp, etc. About the middle of the 19th century, in Bekal, the most southern taluk of Canara, 25,746, or one-sixth of the rural population, were engaged in it; but north of that taluk it was carried on by the jungle tribes of Malai Kader and Mahratai to the number of 59,500. Kumari was then prohibited in Mysore, and put under great restriction in the Bombay Presidency; and the Madras Government, in 1860, prohibited it in Government forests, without

special permission, which they commanded to be given sparingly, and never in timber spots. Mr. Cannan, a coffee planter of Wynad, says that in a spot thus treated, only plants re-grow unfit for any building purposes, and he had never been able to get coffee to grow on it.—*Dr. Cleghorn, Reports*, 1858; *Cleghorn's Forests*, p. 126.

PUNAL. Maleal. The sacred string worn by Brahmans, Kshatriya, Vaisya, and artisan castes.

PUNAM. Tam. The full moon, amongst Hindus, a holiday. The Punam, or last day of the month Cartica, is the Macara sancranti, or autumnal equinox, when the sun cnters the zodiacal sign Macara or Pisces. On this day the rana of Mewar and chiefs proceed in state to the Chougan, and play at ball on horsebaek. The entire last half of the month Cartica, from Amavus (the ides) to the Puuam, is sacred to Vishnu, who is declared by the Puranas to represent the sun, and whose worship, that of water, and the floating lights placed thereon,—all objects emblematic of fecundity,—indieate the adoration of the powers of nature.—*Tod.*

PUNATU, Singh, is the pulp of fruit of the palmyra tree, dried in the sun, then smoked in the houses, and eaten as cakes, for soup, or in curry. The centre and its top are soft and spongy, containing a kind of coarse farina, intermixed with the under fibre, and in Ceylon these parts are laid out to attract for the sportsmen hares and wild hog.—*Tennent's Ceylon.*

PUNAWA, a village 14 miles to the eastward of Gaya, between two hills of grey granite. To the north there is a fine old square tank called Budhokar-tal, and to the east another tank called Karamar-tal. The principal object is a pillared temple of Triloknath.—*Beng. As. Soc. Jour.* No. 32, 1864.

PUNCH or Pukli, a pass leading into Kashmir, which joins the Baramuli pass at Uri. Sce Kashmir.

PUNCH. Eng. From the Hindi Panch, five, was so called by the factors of the English E. I. Company at Surat, from the five ingredients used in it,—spirit, lemon or lime juice, spice, sugar, and rose-water. It was called Puntz by Mandelslo, and Paunch by Fryer. The Pentaploa of the Greeks was composed of wine, honey, cheese, meal, and oil. See Panch.

PUNEERIA COAGULANS. *Stocks.*

Halikabeem, . . . Lat.	Oosfadnoon, . . Yunnan.

A plant of Arabia and Sind, used to coagulate milk. Its fruit held in repute in dyspepsia.—*Birdwood's Vegetable Products.*

PUNG. Malay. A Java wood, equally hard with pilang, and uniformly employed by the natives for pegs in eonstructing their prahus.

PUNGA or Kurunj Oil.

Kurunj ka tel, . . Hind.	Kanugu nuna, . . . Tel.
Punga yennai, . . Tam.	

This oil is expressed from the seeds of Dalbergia arborea or Pongamia glabra. It is chiefly used as a lamp-oil by the poorer elasses.—*M. E. J. R.*

PUNGGI. Hind. A musical instrumcnt. Of this there are two varieties,—one made of leather, and sometimes accompanies the kunehnee-ka-taefa, or band of dancing girls; the other of pumpkin, usually played upon by jugglers and snake-dancers, etc.

P'UNG-WO-SHUH. Chin. Pendulous tubers of a scitamineous plant, a species of Amomum or Curcuma. It grows in Che-kiang and in the south of China. Its rhizome is used medicinally, but is capable of yielding a fecula like arrowroot. —*Smith.*

PUNGYI, Burm., written Phoungye, meaning great exemplar or great glory, is a name by which the members of the monastic rule of Buddhism are commonly known in Burma.—*Yule's Embassy*, p. 23. See Talapoin.

PUNICA GRANATUM. *Linn.* Pomegranate.

Ruman, Kilkul, . Arab.	Dalima, ... Malay.
Rana, ... ,,	Madala, . . . Maleal.
Dalim, Darim, . Beng.	Rumom paio, . ,,
Rimmon of the Bible.	Darim, . . . Murree.
Tha-lai, ... Burm.	Delumghedi, . . Singh.
Anar, ... Hind.	Madalam, ... Tam.
Gangsalan, ... Jav.	Dalim, also Dadima, Tel.
Daruni, . . . Kaghan.	Bulusitun ruman, Yunnan.

The pomegranatc, a native of the mouutainous countries from Syria to the north of India, and Kābul, through Bokhara, Masandaran, and Asia Minor generally, must always have been an object of attention. It is the rimmon of the Bible, the ruman of the Arabs, and was well known to the Greeks and Romans. It is common now in almost all warm climates. Excellent fruits are those of Balabagh, lying under the snowy hills near the Kābul river, and very large quantities are anuually imported into the north of India from Kābul and Kashmir. In the Himalaya and the plains, the pomegranate fruit is small, and is sold in the bazar under the name of darmi; the rind, nas pal, is used in medicine and in dyeing, on account of its great astringency. The flowers also are the balaustion of the ancients, and in India bulusitun is given as the Greek name of the double flowcr. They are devoid of odour, but have a bitterish and astringent taste, tinge the saliva of a reddish colour, contain tannin, and strike a black with ferruginous salts. It is of a reddish-brown colour, and smooth externally, but yellow on the inside; usually in irregular fragments, dry, hard, and leathery, of a very astringent taste. It contains of tannin 18·8 per ccnt., with 10·8 of extractive, and 17·1 of mucilage, and is used for tanning in some countries. The bark of the root was employed as an anthelmintic by Dioscorides and by Celsus, and still is so in India, and it was reintroduced into European practice by Drs. Buchanan and Anderson. The root itself is heavy, knotted, and of a yellow colour; its bark is often sold in strips, sometimes with parts of the root still adhering to it. On the outside, of a greyish-yellow colour; on the inside, yellow, sometimes like that of the barberry. It has little smell. When chewed, colours the saliva yellow; has an astringent taste, without any disagreeable bitterness. It has been analyzed, but the source of its peculiar anthelmintic powers has not been discovered. It contains tannin (about 20 per cent.), gallic acid, resins, wax, fatty matters, and mannite. An infusion yields a deep-blue precipitate with the salts of iron, a yellowish-white one with the solution of isinglass, and a greyish-yellow one with corrosive sublimate, and potash or ammonia colours it yellow. It is apt to be adulterated with

the barks both of box and of barberry. The former is white and bitter, but not astringent; the latter yellow, very bitter, and not thus affected by the above four re-agents. The rind of the wild fruit is useful in diarrhœa and advanced stages of dysentery; the flowers in infusion are slightly astringent; the bark of the root as an anthelmintic against tape-worm, may be given in doses of one scruple in powder, or a decoction may be formed by steeping for 12 hours fresh root-bark of pomegranate. The juice of the fruit is acidulous and sweet, and makes a pleasant sherbet for fever patients. The dried seeds, anardana, of the pomegranate, with their fleshy envelopes, are sold and used in sherbets; are considered cooling. The tree grows easily from seed; and large, fine, juicy fruit, where the soil is good, is often produced. By a continuation of layers from successive plants, the fruit becomes almost seedless.—*Royle; O'Sh.; Gen. Med. Top.; Riddell; Powell.*

PUNIR. Tam. A very light, white-coloured earthy matter, containing a great proportion of carbonate of soda, and from which, as well as from the Over Munnu, soda is prepared. Punir is employed in making glass, in dyeing blue and scarlet, and also by the chucklers in dyeing leather red.—*Ains. Mat. Med.* p. 192.

PUNISHMENTS. The Hindus subject themselves to more devotional austerities, penances, and mortifications, some of which are of a temporary and others of a permanent character, than perhaps any people in the world. In the performance of the tapas, the prescribed acts of devotion are termed mana, or the devotion that proceeds from the heart in profound silence; vauk, or devotion audibly pronounced; neyana, or devotion accompanied by religious ceremonies, purifications, etc. Arjun, in the performance of his tapas, took food, during the first month of his austerities, only once in four days.—*Cole. Myth. Hind.* p. 165.

PUN-JAY-RI. Hind. A caudle given to lying-in women.—*Herkl.*

PUNJI of Dharwar is a cotton cloth used by well-to-do people to dry themselves after bathing, and also worn as a waist-cloth by poor people. Price one rupee the piece.

PUNKI, Tel., Gyrocarpus Jacquini, grows in the Godavery forests, has a wood soft and light, much used for making cowry boxes and toys; takes paint and varnish well. Tella punki, the Givotea Rottleriformis, is used also for the same purposes.—*Captain Beddome.*

PUNKIR, or peacock and horse modelled yachts and pleasure boats on the Ganges.—*Tr. of Hind.*

PUN-KU-WONG, in Chinese mythology, the first parent, a division of the mundane egg. He breathed on gold and on wood, and from the vapour produced a son and daughter, Yong-yee and Cha Noee. He has many temples, and his images are in wood or clay. See Pu-an-ku.

PUNNAH or Panna, a Native State in Bundelkhand, Central India Agency. Area, 2555 square miles; population, 183,000. It is mostly situated on the table-lands above the Vindhyan Ghats, and contains much hill and jungle land. Its prosperity was due to its diamond mines. The diamonds are found in several places, but especially on the N.E. of the town. See Precious Stones. Diamonds of the first water, or completely colourless, are very rare, most of those found being either pearly, greenish, yellowish, rose-coloured, black, or brown. Captain Pogson mentions that the diamonds are classed as the motichal, which is clear and brilliant; the manik, of greenish hue; the punna, which is tinged with orange; and the banspat, which is blackish. In his time, the mines chiefly worked were at Sakariya, about 12 miles from Punnah. The chief of Punnah is descended from Hardi Sah, a son of maharaja Chhator Sal. The revenue is estimated at five lakhs of rupees. A small and fluctuating revenue is also derived from the diamond mines.—*Imp. Gaz.* vii.

PUNSAVANA, on quickening, a domestic ceremony of the Hindus to secure the birth of a male child.

PUNSIRY, a weight for grain in the Nizam's territory, Hyderabad, of 5 seers (panch-sir), or 9 lbs. 14 oz. 12 drs.

PUNT. Mahr. A prefix to the titles of the eight great officers of the Mahratta State under the old regime, as Punt Pratinidhi. When it follows a name, it signifies a Brahman who is not a Sanskrit scholar, but is a clerk or accountant.

PUNYANI, a river of the Malabar coast. The western or Malabar Ghats extend nearly north and south from Kandesh to Cape Comorin, or from 21° to 8°, and form a nearly unbroken chain, except at the chasm, nearly 16 miles in breadth, which opens into the valley of Coimbatore, and through which the river Punyani escapes into the sea.—*Royle, Ill. Him. Bot.* p. 6.

PUN-YET or Poey-ne-yet, a resinous substance from Burma, produced as a nest by the Trigona læviceps, a hymenopterous insect, in the ground and hollow trees. Indeed, the cellular structure of the specimens much resembles that of a wasps' nest. Investigation into the origin of the dammers of the western coast shows that a species of bee appeared exceedingly fond of the liquid dammer of the Canarium; this insect lives in holes in the ground, and it will probably be found on inspection that its cells are composed of a similar substance to that now under consideration. See Insects; Resins.

PUPA. In entomology, this term is applied to the third stage of existence of an insect, the egg being the first stage, and the larva or caterpillar the second.

PUPALIA GENICULATA, the Niusih of the Chinese, has knotted roots; used medicinally.—*Smith.*

PUPUT. Malay. Bellows made from the trunk of a large tree, hollowed out in the centre like a cylinder, into which a piston is inserted at each end. The piston is formed of a circular base of wood, with valves which fit into the cylinder of the bellows. In the centre of this circular base is fixed a long handle, by which it is worked. A piston being attached to each half of the cylinder, whilst one piston is drawing out another is being pushed in, and a constant stream of air kept up.—*Court*, p. 233.

PUR. Hind.; Pura, Sansk. A town, a city, a village, written pore, poor, pori; generally a suffix to other names, as Bijapur, Berhampore, Punderpoor; and in Carnatica, Malealam, Tamil, and Telugu changing r to l, and dropping the p for euphony, ur, ura, aura, oor, auri, uri, uru, uli, oli, aula, auli, ore, as Hastinapur, Avanoor, Tanjore, Trichinopoly, Maholi, Chacholi. It is the Greek polis and Celtic bal.

PUR. HIND. Literally full; a ceremony so called.

PURAD, a race in Amraoti.

PURALLI, a river of Baluchistan about 100 miles long. It rises in Jhalawan province, about lat. 27° 23′ N., long. 66° 21′ E., runs southerly through Las province into the Indian Ocean, in lat. 25° 23′ N., long. 66° 20′ E.; near Sonmeani. From the bund N. of Lyari, the river has no bed. As it fills during the rains, the bund is swept away, and the water inundates the plain, which is here about five miles broad.

PURAN, a Christian religious book, written by Estava of the Society of Jesus, said to have been an Englishman named Stephens.—*Cust.*

PURANA, literally old, is the name given to some sacred books of the Hindus. They are eighteen in number, and these have been supplemented by eighteen Upa Puranas or appendices. The eighteen Puranas are—

Brahma.	Brahma Vaivarta.
Padma.	Linga.
Vishnu.	Varaha.
Vayaviya.	Skanda.
Sri Bhagavata.	Vamana.
Narada or Naradiya.	Kurma.
Markanda or Markandeya.	Matsya.
Agni.	Garuda.
Bhavishya.	Brahmanda.

The names of the Upa Puranas are the Sanatkumara, Nara-sinha or Nri-sinha, Naradiya or Vrihan (old), Siva, Durvasasa, Kapila, Manava, Ausanasa, Varuna, Kalika, Samba, Nandi, Saura, Parasara, Aditya, Maheswar, Bhagavata, and Vasishtha. The Puranas are all in Sauskrit verse, and in the form of dialogue betweeu an exponent and an inquirer. The total number of couplets in the entire eighteen is 400,000.

They are all sectarian in their expositions, some of them putting forward the Saiva doctrines, and others advocating the Vaishnava belief.

The Saiva sect claim 10 of the 18 Puranas; but Vishnu holds pre-eminence in the Vishnu, Naradiya, Bhagavata, Garuda, Padma, and Varaha Puranas. The Matsya, Kurma, Linga, Siva, Skanda, and Agni Puranas are devoted to Siva; the others, viz. Brahma, Brahmanda, Brahma Vaivarta, Markandeya, Bhavishya, and Vamana, chiefly relate to Brahma, though none of these are exclusively devoted to one god.

The Puranas are also classed in three categories, viz. 6 Vaishnava or Sattwa or pure Puranas, are the Vishnu, Naradiya, Bhagavata, Garuda, Padma, and Varaha; 6 Tamas or Saiva Puranas, in which the quality of gloom or ignorance predominates, are Matsya, Kurma, Linga, Siva, Skanda, and Agni; 6 in which rajas or passion prevails, Brahma, Brahmanda, Brahma Vaivarta, Markandeya, Bhavishya, and Vamana.

Sectarian bitterness in many of them finds expression. In the last chapter of the Padma or Lotus Purana is a dialogue, in which it is stated that Siva is licentious, Brahma arrogant, and Vishnu alone pure and entitled to respect. They indicate the beliefs of the Hindus which followed on those of the Vedas, the Buddhists, and the Jains; but that of Siva has been supposed to be a revival of an ancient deity of Western Asia, and with that of Vishnu, as Krishna, some of the Christian doctrines are supposed to have been amalgamated.

It is believed that none of them are earlier than the 6th or 8th century of the Christian era, and that they were composed by different authors between the 6th and 13th or 16th centuries. Professor Wilson thinks that the Vishuu Purana was composed about the middle of the 11th century after Christ, and that the Bhagavata Purana is later. The Brahma Purana, called 'Adi' or the first, has a reference to the temples of Jaganath in Orissa. No part of the Padma Purana is older than the 12th century, and the last parts may be as recent as the 15th or 16th century of the present era. The Vaya Purana is the oldest of them, and may date as far back as the 6th century, and it is claimed by some Saiva authorities as upholding the belief in Siva. The Vishnu is best known; the Markandeya is the least sectarian; Vishnu and his incarnations occupy the largest space; and the Bhagavata, which describes the incarnations of Vishnu, and particularly with his form as Krishna, is the most popular. It is, however, in the Bhagavata, or 18th of the Puranas or old books, in which Krishna is described in his complete apotheosis, and in that he is represented as the eighth avatar of Vishnu.

Colebrooke and Wilson ascribe the authorship of the Srimat Bhagavata to Bop-deva in the 13th century A.D., after the appearance of the Vishnu Purana. The native tradition is strongly against this hypothesis. Babu Rajendralal Mitra, a distinguished oriental scholar, in noticing the Muktaphala, says, 'This work and another lately found by me, in which the same author gives an abstract of the contents of the Bhagavata, afford strong presumptive evidence against the opinion now generally received by oriental scholars, that the Bhagavata was written by Bop-deva.' A much stronger proof, however, is afforded by the Danasagara of Ballala Sena, king of Bengal, in which the Bhagavata is repeatedly quoted. That work also quoted from the Adi Purana, which Wilson supposed was composed within the last three centuries. Bop-deva, according to Colebrooke and Wilson, flourished in the twelfth and thirteenth centuries; Ballala lived in the eleventh century.

Most of the Puranas contain portions of historical as well as geographical knowledge. Every Purana treats of five subjects,—the creation of the universe; its progress, and the renovation of worlds; the genealogy of gods and heroes; chronology, according to a fabulous system; and heroic history, containing the achievements of demigods and heroes. Since each Purana contains a cosmogony, both mythological and heroic history, they may not unaptly be compared to the Grecian theogonies. In the present state of Hindu belief the Puranas exercise a very general influence. Some of them, or portions of them, are publicly read and expounded by Brahmans to all classes of people. Most Brahmans who pretend to scholarship are acquainted with two or more of them; and particular sections, as the Deva-Mahatmya, are amongst the most popular works in the Sanskrit languages. Prayers from them have been copiously introduced into all the breviaries; observances of feasts and fasts are regulated by them; temples and towns, and mountains and rivers, to which pilgrimages are made, owe their sanctity to legends for which the Puranas or the Mahatmyas—works asserted, often untruly, to be sections of them—are the only

authorities, and texts quoted from them have validity in civil as well as religious law.

The Vishnu Purana is the most complete in the five distinguishing topics, Pancha-lakshana,—the creation of the universe, its destruction and renovation, the genealogy of gods and patriarchs, the reigns of the manus, forming the periods called Manwantaras, and the history of the Solar and Lunar races of kings. The other Puranas all deviate from these.

That the Puranas represent in many instances an older and probably a primitive scheme of Hinduism, is no doubt true: they have preserved many ancient legends, they have handed down all that the Hindus have of traditional history, and they furnish authoritative views of the essential institutions of the Hindus, both in their social and religious organization. But in their decided sectarial character, in their uncompromising advocacy of the pre-eminence of some one deity, or of some one of his manifestations, in the boldness with which they assert his pantheistic presence, in the importance they attach to particular observances, as fasting on the 8th, 11th, and 14th days of each half month, in the holiness with which they invest particular localities, in the tone and spirit of their prayers and hymns, and in the numerous and almost always frivolous and insipid and immoral legends which they have grafted upon the more fanciful, dignified, and significant inventions of antiquity, they betray most glaringly the purposes for which they were composed,—the dissemination of new articles of faith, the currency of new gods.

There seem good reasons to believe that the Puranas in their present form accompanied or succeeded a period of considerable religious ferment in India, and were designed to uphold and extend the doctrines of rival sects, which then disputed the exclusive direction of the faith of the Hindus. It began, perhaps, in the 3d or 4th century of the Christian era, having for its object the extermination of the Buddhists, who were thus driven out of India to Ceylon, Siam, Java, China, and Tibet. When the Buddhists, whom all parties considered heterodox, were expelled, their enemies began to dispute amongst themselves. In the 8th or 9th century, a reformer named Sankaracharya is celebrated for having refuted and suppressed a variety of opposing professors, and established the preferential worship of Siva. He instituted in support of his doctrines an order of ascetic mendicants which still subsists, and he is in an especial manner regarded as the founder of a system of belief adhered to by Brahmans of learning, particularly in the south of India. The triumph that he obtained for the deity he exclusively upheld did not long survive him. Early in the 11th century, Ramanuja, a follower of Vishnu, set up that divinity, not only for the belief of the people, but for the more substantial benefits of temples and endowments. Tradition records that the great temple of Triveni, one of the largest and richest in the Peninsula, now dedicated to Vishnu, was wrested from the rival votaries of Siva by Ramanuja and his followers. The ascendency of the Vaishnava was not undisputed in the south, and a new Saiva sect, the Lingayites, sprang up in opposition to them; the contest was carried on with popular violence, and in one of the disturbances that ensued, the raja of Kalyan was killed and his capital destroyed. The Mahammadan invasion of the south crushed both the contending parties, and the predominance of the same power in Upper India prevented the like violence of collision. The Vaishnava belief there spread with little resistance under the followers of Ramanand, a disciple of Ramanuja, to whom or to whose pupils the greater proportion of the mendicant orders in Hindustan owe their origin, and under two Brahmanical families, one in the west sprung from a teacher named Vallabha, who established themselves as hereditary priests of the juvenile Krishna, and one in Bengal and Orissa, descended from Nityanand and Adwaitanand, two disciples of Chaitanya, a teacher with whom the popularity of the worship of Jaganath originated. A particular description of all the different divisions of the popular religion of the Hindus may be found in the 16th and 17th volumes of the Asiatic Researches.

These different religious orders and families are now almost exclusively the spiritual directors of the Hindus. Some of them are rich and of Brahmanical descent; some are poor, and composed of persons of all castes. They are almost all, whether rich or poor, illiterate, and several of them are profligate. Such literature as they occasionally cultivate—and it is one of the means by which they act upon the people—is vernacular literature, compositions in the spoken languages. These are mostly songs and hymns addressed to Vishnu, Krishna, or Radha; tales and legends of individuals celebrated amongst them as saints, always marvellous, mostly absurd, and not unfrequently immoral; and vague and dogmatical expositions of elements of belief, which, although in some degree discoverable in the Puranas, have assumed novel and portentous prominence in the doctrines of the Vaishnava teachers and the practices of the people. These elements are passionate devotion and all-sufficient faith.

According to the geography of the Puranas, the earth consists of a series of central circles and six other annular continents, separated from each other by as many oceans of different fluid substances.

The Puranas do not afford any reliable information as to the state of the early occupants of India. The account which these books contain of the periods, dynasties, races, genealogies, and kings of Vedic India, looks imposing, minute, and circumstantial. They describe two great dynasties of the sun and moon, branching off into separate kingdoms; four great ages of the world, with an accurately defined list of kings for each, and these lists all so framed as in appearance to strengthen and support each other. Containing also the very names found in the Vedas, with an elaborate system of dynastic change, and of intermarriages. But the Hindu of the middle ages had an immoderate speculativeness, a love of wild extravagance, fiction, and untruth. Colebrooke tells us (ii. p. 100) that the Raghiva-Pandivegam, an extraordinary poem by Kaviraj, is composed with studied ambiguity, so that it may at the option of the reader be interpreted as relating to the history of Rama and other descendants of Dasaratha, or that of Yudishthra and other sons of Pandu. It tells, in short, two distinct stories in the same words, as the following sentence will show:—

Succeeding in youth to the kingdom of his variously valiant father, who departed for heaven, he dwelt happily in the city of Ayodhya, which was adorned with elephants, and upheld the prosperity of his realm.

Succeeding in youth to the kingdom of his father Vichitravirya, he dwelt happily in the peaceful city of Hastinapura, auspiciously inhabited by Dhrita Rashtra.

Writers with such perverted imaginations issued the yogas and genealogies of the Puranas, the little leaven of truth in some of them being the names of a few Vedic kings, interspersed apparently at haphazard. The writer of the Vishnu Purana, in such a simple matter as writing out a list of rivers, puts down all he can remember, some twice over, and then adds to it the names of about a dozen rishis, taken bodily from the Vedas. The Puranas have not only added nothing to our stock of knowledge as to the state of ancient India, but have done much to retard research. For, partly from the skill and elaborateness of the fiction, and partly from the mutual support which the Puranic writers gave each other,—astronomy, poetry, legend, chronology, and history all helping on the deceit,—modern scholars received the dynasties and the historical eras of two or perhaps three of the yogas as having some reality. But the Rig Veda does not contain many of the Puranic names, nor even an allusion to them. It makes no mention of Solar or Lunar races. It knows nothing, and indeed can know nothing, of Ayodhya, and Kusi, and Mithila, and Vesali, and Magadha, or even of Indraprastha; while the Puranas, on the other hand, know nothing of dynasties in the Panjab or on the Indus.

The best known is the Vishnu Purana, which is referred to the 11th century by Professor Wilson. The Puranas have been thought by some to represent Egypt as the theatre of action, and the wars related of Brahma, Siva, and Vishnu to be the legend of the wars between Osiris, Horus, and Typhon; for Brahma, in his character of all-destroying time, corresponds with Typhon; Mahadeva or Siva, that of the productive principle, with Horus or Hara, who assumes each of his characters on various occasions either to restore the powers or to subdue the opponents of Vishnu, or active nature, from whom his auxiliary springs.—*Wilson's Hind. Theat.* ii. p. 58; *Wilson's Religious Practices and Opinions of the Hindus*, p. 24; *Calcutta Review*, No. 109, p. 52; *As. Res.* iii. p. 375; *Coleman; Moor*, p. 441; *Colebrooke's Sanskrit and Prakrit Languages*, *As. Res.* vii. p. 202; *Tod's Rajasthan*, i. p. 20.

PURANADHISTHANA, the old capital of Kashmir, the present Pandrethan. It possessed a tooth of Buddha.

PURANDHAR, a mountain, a town, and subdivision of the Poona collectorate of Bombay, in lat. 18° 16′ 33″ N., and long. 74° 0′ 45″ E., 16 miles south of Poona city. The highest point of the mountain of Purandhar is upwards of 1700 feet above the plain. Puraudhar was one of the first places which the Mahratta chief Sivaji brought under his possession by practising on the fears of its defenders.—*Imp. Gaz.*

PURAN-JAYA, a prince of the Solar race, son of Vikukshi, in the Treta age. With the aid of Indra, he took the city of the Daitya, situated in the west, and overthrew the enemies of the gods.—*Dowson.*

PURBHARA HAC. Mahr. Fees or remuneration received by village officials in the Ahmadnaggur collectorate, in addition to what they receive from Government; Purbhara meaning intermediate or indirect.

PURBIA. Sansk. A term applied to the natives of the eastern countries of India, or those lying in the east of the Ganges, beginning from Behar. At the commencement of the revolt of 1857, the Purbia of Oudh and Hindustan in general constituted three-fourths of the regular army of Bengal, and all of them, from community of country, although of different races, castes, and religions, had so strongly united together, that the army had become quite a close service, open only to the few favoured classes. The strength of this feeling only became known when the Government tried and failed to introduce 200 Sikhs into each regiment of the line. Purbia literally means a man from the east of the Ganges, from Oudh and Behar, from which districts the mass of the troops of the Bengal army, before the mutiny of 1857, were drawn.

PURCHAS. The Reverend Samuel Purchas abridged and published the voyages of the early navigators to India under the title, His Pilgrimes and Pilgrimage, 5 vols. fol., London 1624–26. He died A.D. 1626. He edited the journals of the first twenty voyages of the English E. I. Co.

PURI. Hind. A yellow pigment produced from the urine of the horned cattle fed on mango leaves. The urine of the elephant is also said to be a chief ingredient. It is brought to China in round lumps of various sizes, in colour like orpiment, with a strong urinous smell, and little or no taste.—*Morrison.*

PURI, a town in Orissa, which gives its name to a revenue district of Bengal, lying between lat. 19° 27′ 40″ and 20° 16′ 20″ N., and long. 85° 0′ 26″ and 86° 28′ E., with an area of 2472 square miles, and a population (in 1872) of 769,674 souls. The town of Puri is commonly known as Jaganath. It is situated on the coast, in lat. 19° 48′ 17″ N., and long. 85° 51′ 39″ E., being separated from the sea by low sandy ridges. In 1872 its population was 22,695. Puri, built upon its extreme south-eastern shore, and protected on the one side by the surf, and on the other by swamps and inundations, is the corner of Orissa which has been most left to itself, and Hindu religion and Hindu superstition have there stood at bay for eighteen centuries against the world. In the courts of Jaganath, and outside the Lion Gate, 100,000 pilgrims every year partake of the prasada, food offered to the idols.

Antiquaries are agreed that Puri was an ancient seat of Buddhism, and that some relics of the old cultus have descended upon the comparatively modern Hindu deity Jaganath, 'the lord of the world.' Jaganath is only a later form of Krishna, who was an incarnation of Vishnu. Once a year the idol and its two companions are dragged about on huge cars. No less than 4200 men enjoy rent-free lands upon condition of performing this service. Thousands of pilgrims eagerly lend their aid. In the vast multitudes assembled on these occasions, accidents happen, as in all tumultuous gatherings. Mr. Stirling witnessed the festival on four occasions, and only three cases of self-immolation occurred in them all; one of these cases was doubtful, and the other two victims

had long suffered from excruciating disorders. Another European, long resident in Puri, adds his testimony that 'the excess of fanaticism, which is stated in several missionary accounts to prompt pilgrims to court death by throwing themselves in crowds under the wheels of the car of Jagauath, has never existed or has long ceased.' Mr. Fergusson, who visited Puri in 1838, saw 'the pilgrims hurrying to the spot, talking and laughing like people going to a fair in England, which in fact it is;' but he found nothing to justify the highly-wrought picture of 'the hundreds of dead and dying pilgrims that strew the road, and of their boues that whiten the plaius.' He saw no victims crushed under the wheels, and 'none had been heard of for many years before that time.' The character of the idol is entirely averse to sanguinary sacrifices of every kind.

PURI. KARN. A grain store.

PURIFICATION, with the ancient Hebrews (Leviticus xi.-xv.), with the Hindus, and with the Muhammadans, has been a religious rite. Hindus and Muhammadans follow the Jews in their attention to outward purity. With Muhammadaus, before praying, it is necessary that he be undefiled. There are degrees of defilement, the least of which requires that the hands, arms, and feet be washed before praying, and for this purpose mosques are always provided with cisterns or tanks of water; in the desert, sand is used. After greater impurities, it is necessary that the whole body be washed, hence the longer they remain undefiled the purer their life. Wazzu expresses the ablution, and Hedas the state of defilement, during the continuauce of which they cannot pray. The Mulana Abu Ashah was said to use the water of purification twice in a month; that is, his life was so pure, that for a whole fortnight he was not so much defiled as to make necessary a total ablution. Vir præcipue emissione seminis fœdatur at mulier menstruorum. Amongst the Brahmans, sipping water is a part of the ceremony of purification. In the Mitakshara, on the subject of personal purification, the direction is, 'Let the twice-boru man (after evacuations) always perform the upasparsa;' *i.e.*, says the commentator, 'let him sip water.' According to Professor Wilson, the sense of the passage in Book vii. 4 is, 'that Nala sat down to evening prayer (as Menu directs, "he who repeats it sitting at evening twilight," etc.), after performing his purifications and sippiug water, but without having washed his feet; such ablution being uecessary, uot because they had been soiled, but because such an act is also part of the rite of purification.'

A Hiudu becomes unclean by various acts and circumstances, during which he is interdicted almost every religious ceremony, and forbidden to shave or cut his nails. In the act of purification the person shaves his head, bathes, and puts on clean apparel.

The customs of the Jews, as described in Mark vii. 3, 4, well illustrate the practice of the modern Hindus: 'Except they wash their hands oft, eat not. . . . Aud many other things there be, . . . as the washing of cups and pots, brazen vessels, and of tables.'

A Hindu becomes unclean after the death of persons related to him by blood. If a child die before it has teeth, the family bathe immediately, and become clean; or if a child die before its ears are bored, the family remain unclean one night. If a woman miscarry, the family become impure ten days. After a birth, all the members of the family in a direct line become unclean. A woman in her periods is unclean for three days; but on the fifth day, after bathing, she may again perform religious ceremonies. Every person is considered as in some measure unclean while in a state of sickness, and from some religious services a sick person is wholly excluded. A Brahman becomes unclean by the touch of a Sudra, a dog, a Muhammadan, a barbarian, etc.; and all castes, by touching a woman in her courses, a dead body, ordure, urine, the food of castes, etc.—*Ward's Hindoos*, ii. p. 147; *Journ. Ind. Arch.* v. No. 11; *Williams' Story of Nala*.

PURIHARA, one of the four Agnicula tribes. The Purihara, or Pritihara, are scattered over Rajasthan, but do not seem to have any independent chieftainship there. At the confluence of the Kohari, the Sind, and the Chambal, there is a colony of this race, which has given its name to a commune of 24 villages, besides hamlets, situated amidst the ravines of these streams. Mundawur (classically Muudodri) was the capital of the Purihara, and was the chief city of Marwar, which owned the sway of this tribe prior to the invasion and settlement of the Rahtor clan. The Purihara is the least of the Agnicula. They never acted a conspicuous part iu the history of Rajasthan.—*Tod*, i. p. 106. See Agni; Agnicula.

PURLA KIMEDY, a district in the hill tracts of Orissa.

PURLU, a substance used in dyeing black, with 'pasuta' (alum and sulphate of iron) as the mordant.—*Powell*, i. p. 453.

PURNAH, a tributary to the Tapti river. It rises in lat. 21° 35′ N., and long. 77° 41′ E., runs S. 65 miles, W. 25 miles into the Tapti; length, 160 miles.

PURNIAH, a town in Bengal, situated on the east bank of the Saura river, in lat. 25° 46′ 15″ N., and long. 87° 30′ 44″ E. Population (1872), 16,057. It gives its name to a district lying between lat. 25° 15′ and 26° 35′ N., and long. 87° 1′ and 88° 35′ E. Area, 4957 square miles; population (1872), 1,714,795. It is bounded on the north by the state of Nepal and Darjiling district; on the east by the districts of Jalpaiguri, Dinajpur, and Maldah; on the south by the river Ganges. Eastwards, the mass of the people are aborigines, being an outlying portion of the Koch or Kiranti race.—*Imp. Gaz.*

PURNIMA. SANSK. Full moon; softened into Punam.

PUROCHNA, in Hindu tradition, an emissary of Duryodhana, who failed in an attempt to burn the Pandava in their house, and was burned in his own house by Bhima.—*Dowson.*

PUROHITA or Purohit, a family priest of the Hindus of N. Iudia, who conducts all ceremonials at births, marriages, and funerals, and other solemn occasions. They are usually Brahmans, and also are astrologers. The name is Sanskrit, from Puras, to go before, and Hita, good. Every Brahman may perform the ceremonics of his religion. The priest, called a Purohita, is, however, called in to assist in the Srad'ha, the ten ceremonies called Sungskaru, and in those at the offering of a temple.—*Ward's Hindoos*, ii. p. 15,

PURPARUL, a close-grained wood from the Santal jungles, esteemed equal to box.

PUR-PATI. Sansk. In ancient India, a village head-man.

PURSH, the standard measure of the Rajputana desert, is from 6 to 7 feet, or the average height of a man to the tip of his finger, the hand being raised vertically over the head. It is derived from Purusha, man.—*Tod's Rajasthan*, ii. p. 307.

PURTUN. Mahr. A moderate-sized field, of convenient length.

PURU, the sixth king of the Lunar race. He was the youngest son of Yayati and Sarmishtha. He and his brother Yadu were founders of the two great branches of the Lunar race. The descendants of Puru were called the Paurava, and of this race came the Kaurava and the Pandava. Amoug the Yadava or descendants of Yadu was Krishna. In the time of Alexander there were two princely races belonging to the Puru or Paurava, both called Porus by the Grecks. When the Aryans had advanced southwards, and large portions of what is now termed India were under their sway, we read of one monarch with many names,—Divo Dasa, Atithigwa, Aswateha, Prastoka, Srinjaga, and Puru. Three of these are found in one verse (vol. ii. p. 34): 'For Puru, the giver of offerings, for the mighty Divo Dasa, through Indra, has destroyed ninety cities. For Atithigwa the fierce (Indra) hurled Sambara from off the mountain, bestowing (upon the prince) immense treasure.' Divo Dasa was a warrior and a conqueror; he is described as overcoming and destroying many cities of Sambara, reserving one for his owu use. He made a successful expedition as far as Parnaya (Query, the modern Purnia?). In his old age, at the head of a confederacy of twenty kings, Kusta and Ayu being the chief, he led au army of 60,000 against the mighty and youthful Sa-sravas, was defeated, and compelled to submit. Aud a writer in the Calcutta Review (No. 64, p. 432) views this war to be the historical foundatiou for the traditional great war of the Mahabharata. The era of Divo Dasa is estimated to have been about the time of Cyrus, and the engagement described to have been with some satrap (kshatrap) left by Cyrus when he was occupied with his great Median, Lydian, or Babylonian compaigns. It may, however, have beeu during the rebellions and troubles of the early days of Darius Hystaspes. And by a curious coincidence, Bentley places Garga (the bard of Divo Dasa) in B.C. 548, and the cautious Professor Wilson suspects an allusion to the Buddhists, which could not be earlier than B.C. 545. The Puru kingdom, according to Bunsen, was established B.C. 3000 by the Aryan immigrants, who afterwards made conquests of Matmaru, Tansu, and Iliva.—*Bunsen*, iv. p. 556; *Dowson*.

PURUDKUL or Pattadkal has a great temple covered with inscriptions, and is supposed to be of the 8th or 9th century. Its plan is almost that of the Kailas temple at Ellora.—*Fergusson*.

PURUM. Hind. of Dharwar. Narrow strips of coarse cotton cloths of various kiuds sewn together, and used as curtains for the front of shops and houses, and also as tents to protect goods on transit. This is made of the waste warp-ends of pieces of cotton cloth joined together. Purum, another description, is used more for making bags, etc.—*W. C. Anderson of Dharwar*.

PURU-RAVAS, a mythical person, noticed in the Rig Veda as son of Ila, and a beneficent and pious prince. But the Mahabharata says he was son of Budha by Ila or Sudyumna, daughter of Menu, and grandson of the Moon. He is also called Aila, Lailan Shah, Ninus, and Nilan. He is the hero of the story in the drama of Vikrama and Urvasi, or the Hero and the Nymph. Puru-Ravas is always called a Rajarshi (Raja Rishi or royal saint). In the classification of sages, there are three orders,—the Rajarishi or kingly sage, such as Janaka; the Brahmarishi or Brahman sage, as Vasishtha; and the Devarishi or divine sage, as Nareda.—*Hind. Theat.* p. 201; *The Hero and the Nymph; Dowson; As. Res.* viii. p. 256.

PURUSHA. Sansk. Man, miud; the male deity, a title of Narayana, the Supreme Being and soul of the universe; every male said to have sprung from him. Purusha-med'ha, sacrifice of a man, human sacrifice.

Purusha-sakta is a hymn in the Rig Veda in which the four castes are first mentioned, but is regarded by Sanskrit scholars as of late introduction. In it occurs the passage descriptive of the origin of Brahmans from Brahma: the Brahman was his mouth; the Rajanya was made his arms; the being (called) the Vaisya, he was his thighs; the Sudra sprang from his feet. Ver. 7 says, This victim Purusha, born primevally, they immolated ou the sacrificial grass; with him as their oblation, the gods, Sadhyas and Rishis, sacrificed. 8. From that universal oblation were produced curds and clarified butter. He produced the animals, of which Vayu is the deity, both wild and tame. 9. From that universal sacrifice were produced the hymns called Rich and Saman, the Metres, and the Yajus. 10. From that were produced horses, and all animals haviug two rows of teeth, cows, goats, and sheep. 11. When (or offered up) Purusha, into how many parts did they divide him? What was his mouth? What were his arms? What were called his eyes and feet? 12. The Brahman was his mouth, the Rajanya was made his arms, that which was the Vaisya was his thighs, the Sudra sprang from his feet. 13. The moon was produced from his mind (Manas), the sun from his eye, Sudra and Agni from his mouth, and Vaya from his breath. 14. From his name came the atmosphere, from his head the sky, from his feet the earth, from his ear the four quarters, so they formed the worlds. The comparatively late date of this hymn is evident from the mention of the Saman and Yajus Veda (ver. 9), but it is older than other accounts which are given us in Menu aud the Mahabharata, when the mystical significauce of the story disappears, and the castes are represented as literally proceeding from Brahma's body. Even when this origin of the castes had been received, and the supremacy of the Brahmans established, it was still considered possible to rise by means of mortification from the Kshatriya to the Brahmanical caste; and there have been also many instances of masses of the people being created Brahmans.—*As. Res.* iii. 358, xvii. 214.

PURUSHOTTAMA, literally best of men, a title of Vishnu as the Supreme God; also a name of Krishna as Vishnu. Purushottama-kshetra, the sacred territory round about the temple of

Jaganath in Orissa.—*As. Res.* iv. p. 364; *Dowson.*

PURVO, a class of Hindus in Bombay, almost exclusively employed as clerks and copyists. These, according to Colonel Tod, are descendants of the ancient Guebre. The Purvoe (Prabhu) of the north-west of the Peninsula of India is a clerking caste, who claim to be descendants of Chandra Sena, a raja of Malabar. Brahmans deny this claim, and assert that they are of menial origin. Maha Prabahu, softened into Maha-prahu, is a respectful form of address.—*Wils. Glossary.*

PUSHAN, a deity frequently mentioned in the Vedas, and supposed to represent Surya, the sun. He is the protector and multiplier of cattle and of human possessions in general.—*Dowson.*

PUSHKALAVATI or Peukelaotis, Pukkalaoti, Pukkala, stupa of the 'eyes gift.' According to General Cunningham, the ancient capital of Ghandara was Pushkalavati or Peukelaotis, which is said to have been founded by Pushkara, the son of Bharata, and the nephew of Rama. Its antiquity is undoubted, as it was the capital of the province at the time of Alexander's expedition. The Greek name of Peukelaotis or Peucolaitis was immediately derived from Pukkalaoti, which is the Pali or spoken form of the Sanskrit Pushkalavati. It is also called Peukelas by Arrian, and the people are named Peukalei by Dionysius Periegeti, which are both close transcripts of the Pali Pukkala. The form of Proklais, which is found in Arrian's Periplus of the Erythræan Sea, and also in Ptolemy's Geography, is perhaps only an attempt to give the Hindi name of Pokhar instead of the Sanskrit Pushkara. According to Arrian, Peukelas was a very large and populous city, seated not far from the river Indus. It was the capital of a chief named Astes, perhaps Hasti, who was killed in the defence of one of his strongholds, after a siege of thirty days, by Hephæstion. Upon the death of Astes, the city of Peukelaotis was delivered up to Alexander on his march towards the Indus. Its position is vaguely described by Strabo and Arrian as 'near the Indus.' But the geographer Ptolemy is more exact, as he fixes it on the eastern bank of the river of Suastene, that is, the Panjkora or Swat river, which is the very locality indicated by Hiwen Thsang. The river here mentioned is the Kophes, or river of Kābul; and the bearing and distance from Peshawur point to the two large towns of Parang and Charsada, which form part of the well-known Hashtnagar, or 'Eight Cities,' that are seated close together on the eastern bank of the lower Swat river. These towns are Tangi, Shirpao, Umrzai, Turangzai, Usmanzai, Rajur, Charsada, and Parang. They extend over a distance of 15 miles; but the last two are seated close together in a bend of the river, and might originally have been portions of one large town. The fort of Hissar stands on a mound above the ruins of the old town of Hashtnagar, which General Court places on an island nearly opposite Rajur. 'All the suburbs,' he says, 'are scattered over with vast ruins.' It seems to General Cunningham not improbable that the modern name of Hashtnagar may be only a slight alteration of Hastinagara or 'city of Hasti,' which might have been applied to the capital of Astes, the prince of Peukelaotis. It was a common practice of the Greeks to call the Indian rulers by the names of their cities, as Taxiles, Assakanus, and others. It was also a prevailing custom amongst Indian princes to designate any additions or alterations made to their capitals by their own names. Of this last custom we have a notable instance in the famous city of Dehli, which, besides its ancient appellations of Indraprastha and Dilli, was also known by the names of its successive aggrandizers as Kot-Pithora, Kila-Alai, Tughlakabad, Firozabad, and Shahjahanabad. It is true that the people themselves refer the name of Hashtnagar to the 'eight towns,' which are now seated close together along the lower course of the Swat river; but it seems to General Cunningham very probable that in this case the wish was father to the thought, and that the original name of Hastnagar, or whatever it may have been, was slightly twisted to Hashtnagar, to give it a plausible meaning amongst a Persianized Muhammadan population, to whom the Sanskrit Hastinagara was unintelligible. To the same cause he would attribute the slight change made in the name of Nagarahara, which the people now call Nang-nihar, or the 'Nine Streams.' In later times, Pushkalavati was famous for a large stupa, or solid tower, which was erected on the spot where Buddha was said to have made an alms-offering of his eyes. In the period of Hiwen Thsang's visit it was asserted that the 'eyes gift' had been made one thousand different times in as many previous existences; but only a single gift is mentioned by the two earlier pilgrims, Fa Hian in the 5th century, and Sung-Yun in the 6th century.—*Cunningham's Ancient Geography*, pp. 49-51.

PUSHKARA, a town and celebrated tank and place of pilgrimage, 5 miles from Ajmir in Mhairwara, in lat. 26° 30′ N., and long. 74° 40′ E. In Hindu legend, Brahma here performed the sacrifice known as Yajna, whereby the lake of Pushkara became so holy that the greatest sinner by bathing in it earns the delights of paradise. It has five temples, all modern, and dedicated to Brahma, Savitri, Badri, Narayana, Varaha, and Siva Atmateswara. Bathing ghats line the lake, and most of the princely families of Rajputana have houses round the margin. No living thing may be put to death within the limits of the town. Great fairs in October and November are attended by about 100,000 pilgrims, who bathe in the sacred lake. Large trade at that time in horses, camels, bullocks, and miscellaneous merchandise. Permanent population about 3750, chiefly Brahmans.—*As. Res.* xi. p. 121; *Imp. Gaz.*

PUSHKARAM. This Hindu feast only occurs every twelve years, takes place in Rajamundry, and lasts during twelve days. Its chief ceremonies consist in bathing. The Godavery is a sacred river, and is the delight of all Hindus, who come to bathe in it from places so far distant as Balasore, Calcutta, and even the holy city of Benares.

PUSHKARAS, the British Islands and Iceland so called.—*As. Res.* xi. p. 105.

PUSHKARA SHANTEE. Sansk. From Pushkara, the evil fortune attending a person who shall die when an unlucky day, an unlucky lunar day, and an evil planet all unite, and Shantee, to pacify or produce peace.

PUSHKARAVATI, an ancient city of the Gandharas, not far from the Indus. It is the Πευκελαωτις of Ptolemy, and the Pousekielofati of Hiwen Thsang.—*Dowson.*

PUSHPA-MITRA, the first of the Sunga kings who sueeeeded the Maurya, and reigned at Patali-putra. The grammarian Patanjali is supposed to have lived in his reign.—*Dowson; Fergusson and Burgess.* See Magadha; Sunga.

PUSHT. Baluch, Pushtu. A plateau.

PUSHTU. The term Afghan is applied to a multitude of tribes speaking the same dialeet, the Pushtu or Afghani, but the word itself has no eertain signifieation, and is borne by many people of very different origin, though the people are said to call themselves Pushtun. Aeeording to Captain Raverty, the people who dwell about Kābul and Kandahar, Sharawak and Pishin, are designated B'r-Pushtun or Afghans; and those oecupying the distriet of Roh, which is near India, are ealled L'r-Pukhtun or Lower Afghans. Persian is the official language of Afghanistan, but the Pushtu is alike the common tongue of the uneduеated people and of the dwellings of the Amir. There are said to be two divisions of the Afghans, termed Pushtun and Pukhtun, who speak Pushtu and Pukhtu respectively; the Pushtu being the western dialeet, with affinity to Persian, and the Pukhtu the eastern, with many Sanskrit and Hindi words. The Pushtu is spoken, with slight variation in orthography and pronuneiation, from the valley of Pishin, south of Kandahar, to Kafiristan on the north; and from the banks of Helmand on the west, to the Attoek, Sindhu or Indus river, on the east, throughout the mountainous distriets of Bajawar, Baujhkora, Swat, and Buner, to Astor, on the borders of Little Tibet, a traet of country equal in extent to the entire Spanish peninsula. Also, throughout the British distriets of the Dehra-jat, Banu, Tak, Kohat, Peshawur, and the Sama or plain of the Yusufzai, with the exception of Dehra Ghazi Khan, nine-tenths of the people speak the Afghan language. Sinee the invasions of Mahmud of Ghazni in the 11th century, there has been a eonstant influx into India of Afghans as eonquerors and settlers, and this has been so great from partieular districts, that some tribes have altogether disappeared from Afghanistan. In some localities in India, the Afghan settlers are said to have preserved the Pushtu almost in its purity up to the present day, having from the outset married amongst themselves. In some parts of Bundelkhand, and in the territory of the Nawab of Rampur, whole towns and villages may be found in whieh the Afghan language is still almost exclusively spoken, and is the medium of general communication. Captain Raverty considers that although in numerous points the Pushtu bears a great similarity to the Semitic and Iranian languages, it is totally different in construetion, and in idiom also, from any of the Indo-Sanskrit dialeets. Persian is met with all over Afghanistan; the great families speak it, and their eorrespondenee is earried on in that tongue; the people are aequainted with it, but they prefer speaking the Pushtu, the language of their tribes. They have a few works in this language, but they read Persian authors by preference, and have through them formed imperfect ideas of geography, astronomy, medieine, and history; but these works, full of fietions and defieieneies, have not materially assisted in developing their faeulties.—*Raverty's Afghan Language; Ferrier's Hist. of Afghans*, p. 290.

PUSILAWA, a valley in Ceylon, overhung on its south-eastern side by a ehain of wooded hills, the last of whieh, Munera-galla, rises upwards of 4000 feet above the level of the sea, and eommands a prospect of indeseribable beauty and magnifieence, embracing far and wide, mountains, forests, rivers, eataraets, and plains.—*Tennent.*

PUSK OLAY, palm leaves on whieh, in Ceylon, books are written.

PUSPUTNATH. The Bhagmutty is here erossed by two narrow Chinese-looking bridges, resembling those on the willow-pattern plates. It is at this sacred spot that devout Hindus wish to die with their feet in the water. Here it is that the bodies of the great are burned. Martabar Singh was reduced to ashes at the end of the bridge; and so was the rani, together with two favourite female slaves, whose society she did not wish to relinquish.—*Oliphant's Journey*, pp. 75, 77.

PUSPUTTY, qu. Pusapati, the family name of the maharaja of Vizianagram, near Vizagapatam, and perhaps was also that of Seetaram Raz.

PUT. Sind. Level plaees on the banks of the Hubb river, on whieh the Chuta tribe encamp; any level spaee traversed by a river.

PUT. Sansk. In Hinduism, a hell to whieh ehildless men are eondemned. Puttra, hell-saver. —*Dowson.*

PU-TA-LA, or great temple, near Zhe-hol, in Tartary. Smaller buildings surround this large fabrie, the habitations of the priests or lamas, about 800 of whom are attached to this temple.—*Baron Macartney's Embassy*, i. p. 27.

PUTELI, a boat of the Ganges. See Boats.

PUTERA. Sind. Typha elephantina, *Roxb.* The leaves are employed for making mats and baskets.

PUTHA, Pakhta, a mat grass.

PUTHEN or Puther, a title of the five artisan elasses of the south of India; also, in Travaneore, a title of Tamil Brahmans, ealled also Bhutter.

PUTKA or Patka. Hind. A eloth worn as a kamrband or waist-band.

PUTRA. Hind. A son. Su-put, Hind., means 'worthy,' or 'good issue' (putra). The old Hindu law recognises twelve objeets of affiliation.

PUTRANJIVA ROXBURGHII. *Wall.*

Nageia putranjiva, *Roxb.*, *Rh.*

Wild olive, . . .	Eng.	Karupale, . . .	Tam.
Jiya putra, . . .	Hind.	Kuduru jivi, . .	Tel.
Pongolam, . .	Maleal.	Kudura juvi, . . .	,,
Puta-jan, . . .	Panj.	Putra jivi, Yarala, .	,,
Putrajiva, . .	Sansk.	Mahaputrjivi, . . .	,,

An ornamental tree growing all over India, from the Himalaya to Ceylon. It is a large timber tree, with an ereet-growing truuk, aud a large spreading, shady head, eomposed of innumerable expanding braneles, with biferous braneblets. Flowering time March and April, and the fruit ripening in January. Wood white, elose-grained, and very hard. The Sanskrit name is eompounded of Putra, a son, and Jiva, life. The Hindustani name, Jiya putra, is similarly derived. The nuts are strung by parents round the neeks of their ehildren as eharms to keep them in health, aud are extensively sold in the bazars of Upper India.—*Roxb.; Royle's Ill.; Powell; Beddome; O'Sh.* p. 611; *Rohde's MSS.; Dr. Stewart*, p. 196.

PUTROTSAVAM. On the birth of a Brahman child, the eeremony called Putrotsavam is performed, and on the oeeasion the father presents sugar and sugar-candy to relatives and friends.

On the 11th day, the mother is anointed with the oil of the oriental sesamum. On the same day (11th), Punyahavachanam, or the purification rite for the mother and house, is performed. It is then that the child receives its name,—that of some one of its grand or great-grand-parents,—by the father writing it three times, with a golden ring, in unhusked rice, spread on a plate. This naming is called Namakaranam, and is followed by the guests bestowing blessings on the young one, as they scatter rice, coloured with turmeric, over it and the mother, who are seated in the midst of the assembly. The father then distributes money to the poor, and entertains relatives and friends. On this night, for the first time, the child is put into the cradle by the female guests, some of whom sing religious songs, while others rock the little one, and at the close the assembly are dismissed, after being presented with betel-nut, plantains, and boiled pigeon-pea, Cajanus Indicus. The birth of a girl is less a source of rejoicing, because of that part of the Hindu creed which lays down that parents and other ancestors attain Swargalocum or Indra's heaven through a son's efforts.

PUTTEN, a Cochin-Chinese coin of the value of ten pice (4d.), which has recently become the general circulating medium, available for all ordinary purposes. Eighteen putten and six pice should go to the rupee, but it varies two or three pice, according to local circumstances.—*Simmonds' Dict.*

PUTTI or Poodi. Tel. A measure of capacity equal to 20 tum, and containing 14,941·653 cubic inches, the same as the khandi or candy. In the Northern Circars, the putti consists of 3635·413 cubic inches.

PUTTU, a Rajput sovereign who perished in the defence of Chitore; he was only sixteen years of age, and had lately married. To check any compunctious reluctance that he might feel in leaving his wife behind, his heroic mother armed the young wife as well as herself, and with her descended the rock, and the defenders of Chitore saw her fall fighting by the side of her Amazonian mother.—*Tr. of Hind.* ii. p. 381.

PUTTUA or Juanga, a forest tribe inhabiting the Tributary Mahals of Cuttack to the south of Singbhum, in the mahals or killahs of Keonjur, Pal Leyra, Dhekenal, and Hindole. They are said to number 1500 persons of all ages, and to occupy fifteen different localities, thirty villages in Keonjur, and six or seven in Pal Leyra and Hindole. Their stature is diminutive,—men 5 feet 2 inches, women 4 feet 3 inches or 4 inches. The men dress like peasantry of the country; the women, however, only covered their persons in front and behind by a bunch of twigs with the leaves attached, kept up by a strip of bark or a string of beads. These leaves were changed daily. About the year 1871, the magistrate of the district distributed cloths among the women, and induced them to discontinue the leaf-covering. Patta, in Hindi, means a leaf. Their pursuits are chiefly those of the chase, in which they employ dogs and the bow and arrow.—*Ben. As. Journ.* No. 4 of 1856; *Dalton's Ethnology of Bengal.*

PUTU. Singh. A dish made by the Singhalese of a farina made from the young shoots of the palmyra palm, scraped cocoanut, and unripe jack-fruit, and steamed over a boiler.—*Simmonds' Dict.*

PU-TU ISLAND, about 40 miles from Chusan, is inhabited solely by celibate priests; no woman resides on the island, which is covered with temples of all descriptions, many of them very handsome, but one in particular, which was built by an emperor of China. The island is not large, and is laid out like a vast garden, with squares and walks, bridges, etc.—*Marryat's Archipelago*, p. 151.

PUTWURDHUN, a powerful family of Mahratta Brahmans, with estates near Kolhapur.

PWAI NGYET, Burm., is a resin found in the bazars throughout Pegu. It is yielded by the Shorea robusta, or the sal tree of India, which occurs plentifully in the forests on the Shan side of the Sitang, east of Tounghoo, and also, but to less extent, in the forests of the Prome district. The bee which produces it is small, but the material it prepares is very useful for caulking purposes for wood work. The Burmese prepare it readily by simply mixing it with wood-oil over a fire. The insect is the Trigona læviceps.—*M'Clelland.*

PWAN-HIA. Chin. Mid-summer root, root of Arum macrorum, *Tatarinov*, or of Pinellia tuberifera.

PWO. The Pwo occupy the same region as the Sgau, to a short distance above Sitang. They have generally adopted Buddhism. They are distinguished by wearing embroidered tunics. Eight tribes in Burma speak the Pwo dialect. The Pwo and the Sgau as we approach the seaboard, are found mingled more or less together from Bassein and the Sitang to Mergui, living in the same villages, but the Pwo apart from, though more numerous than, the Sgau. The Sgau call them Pwo, but their own name is Sho, and the Burmese call them Meetkhyen, or in some sections Telaing Karen. They are muscular, and prefer the plains. All the Pwo burn their dead.—*Mason*, p. 92. See Karen.

PWON, a tribe with Shans on their north and south, on the right bank of the Irawadi, in lat. 24° 30′ N.

PYAL. Anglo-Tamil. A verandah in front of a house. The pyal is often used as a school-room, or as a place in which a traveller may rest.

The pyal or indigenous elementary schools have existed from time immemorial. They form a very large proportion of the existing schools in the country. Of 671 schools in the town of Madras, 388 were pyal schools. The three R's are taught fairly. The apparatus used is generally nothing more than the sanded floor, on which the pupil writes with his fingers, a black board, and the cadjan leaf. The average attendance in Madras is about twenty pupils. The pyal, or verandah of a native house, affords sufficient accommodation. The masters are paid by small fees; but during the celebration of the principal Hindu festivals, especially of the Dashara, their small incomes are supplemented by gifts of cloth, oil, rice, etc.

In the Godavery district, which, according to the 1871 census returns, has a population of 1,584,200, 8000 boys have an elementary instruction given them by their means. The number of these schools in the district previous to the passing of the Local Funds Act was 489. Of these, 453 were supported solely by private exertions and fees paid by the scholars, while 36 enjoyed the results grant system. The masters are not very learned, but in every instance they

bear a good moral character, and are important personages in the village in which they live, owing to their superior education and intelligence. They chiefly belong to the Brahman caste. But there are some few Satani, Shastri, Karnams, Rumsalis, and Banyans.

The scholars belong to every class of the community except Pariahs, and no separation of castes is made in the schools. Besides reading, writing, and arithmetic, the boys are taught to repeat long pieces of poetry.

PYCNONOTUS HÆMORRHOUS. *Gmel.* The Condatchi bulbul, from the crest on its head, is called by the Singhalese the Konda curula, or tuft-bird. It is regarded by the natives of Ceylon as the most 'game' of all birds; and training it to fight was one of the duties entrusted by the kings of Kandy to the Curuwa, or head-man, who had charge of the king's animals and birds. For this purpose the bulbul is taken from the nest as soon as the sex is distinguishable by the tufted crown, and, secured by a string, is taught to fly from hand to hand of its keeper. It is the common Madras bulbul. Another bulbul, the Pycnonotus leucogenys, *Gmel.*, is one of the chief songsters of the vale of Kashmir. P. pygæus, *Hodgson*, is the common Bengal bulbul, and of the Himalaya. There are other species.

PYGATHRIX NEMÆUS. *Geoff.* Simia nemæus, *Linn.*, a rare monkey, perhaps the most remarkable of the whole tribe for the variety and liveliness of the colours with which it is marked, and which are the more striking from being distributed in large masses. The upper part of the head is brown, with a dark-reddish chesnut frontal band. The cheeks are clothed with very long and whitish or yellowish-white hairs. The back, the belly, the arms, and the sides are grey with a somewhat greenish cast; the tail is whitish, and so are the rump and the forearms; the anterior fingers are blackish; the hips and thighs are blackish, and the legs of a brightish-red chesnut; the more exposed parts of the face are of a reddish tint. Length, rather more than 2 feet when erect; length of tail, about 1 foot 7 inches. It is a native of Cochin-China.—*Eng. Cyc.*

PYGEUM CEYLANICUM. *Gærtn.*

Polyodontia? Walkerii, *W. Ill.*; P. acuminatum, *Coleb.*

Kaukumbala, . . SINGH. | Gal-moru, . . . SINGH.
Katteyagas, . . ,,

This tree is common on the hills of the south of India, and in Ceylon up to 4000 feet; it grows to an immense size, and occasionally has very large buttresses. Trees occur much over 20 feet in girth, with an enormous spreading head. Its timber is reddish coloured, and apparently adapted for cabinet purposes. The seed when bruised has a strong smell of prussic acid.—*Beddome, Fl. Sylv.* p. 59.

PYGEUM WIGHTIANUM. *Blume, Walpole.* *Var. β.* parvifolium, *Gært.* | Oonoonoo-gas, . SINGH.

A moderate-sized tree, growing in Ceylon at 8000 feet elevation.

PYRAMIDS built of great blocks of stone were a form of cairns in which were placed the bodies of the ancient rulers in Egypt. Subsequent dynasties have largely dismantled them in order to obtain building materials; but still, from the head of the delta of the Nile southward beyond Sakkara, where once existed the great cemetery of Memphis, there are 70 of these tomb-pyramids left, and three of the largest are near Cairo, on the left or western bank of the Nile. The pyramid of Maydoom is supposed to have been built about the middle of the fifth millennium before Christ, some 2000 years before Abraham came into the world. Many suppositions have been put forward as to their object, but it is recognised that they are cairns,—tombs of the great men of the past, who sought not only to perpetuate their memory, but also to preserve their own bodies for that return to the world which was promised by their religion. They are all built on rocky and sandy plains. The largest is near Gizeh, and is 461 feet in perpendicular height, with a platform on the top 32 feet square, and the length of the base is 746 feet. It occupies 11 acres of ground, and is constructed of such stupendous blocks of stone, that a more marvellous result of human labour has not been found on the earth. Here also are caverns containing mummies, or embalmed dead bodies, which are found in coffins ranged in niches of the walls, and are at least 4000 years old. The Great Pyramid was the mausoleum of Khufu or Cheops of Dynasty IV. There have been a variety of opinions as to its dimensions. According to General Vyse, the present perpendicular height of the structure is 450 feet 9 inches, and the side of its present base 746 feet; and he gives the former height at 480 feet 9 inches, and the side at the former base at 764 feet. Like all the other pyramids, it faces the cardinal points. As regards the manner of elevating the stones, no explanation seems so probable as that of Robert Stephenson. It was done, he maintained, by conveying the blocks on rollers up inclined planes of sand; and this theory has been confirmed by the most recent facts concerning the building of Nineveh.

All the pyramids, except one at Sakkara, face the four cardinal points of the compass. All have their entrance on the north side. All contain provision for a single king's burial. Many are identified with the names of kings of whom it is recorded that they did build pyramids in various places; and the Great Pyramid is, without any doubt which a reasonable man can entertain, the burial mound of one of a long line of kings, who all erected similar mounds.

They are built of soft calcareous stone, of the same nature as the rock on which they stand, but faced with granite or syenite, most of which has been carried off for other structures. Herodotus mentions a block at Sais, 21 cubits long, 14 broad, and 8 high, the transport of which, from quarry to site, employed 2000 men for three years. The stones were quarried out of the neighbouring hills, and some from the opposite side of the Nile, and are all of a great size, and carefully cut into shape.

First Pyramid, base,	767½ ft. sq.	Perp. height,	479 ft.
Second ,,	,, 690¾ ,,	,,	447 ,,
Third ,,	,, 354½ ,,	,,	203 ,,

The second pyramid is in some points of inferior workmanship to the great one. Pyramidal forms are ordinarily given to the temples of the non-Aryan races of India. All Fijian temples have a pyramidal form, and are often erected on terraced mounds, in this respect reminding us of the ancient Central American structures. We meet the same terraced mounds also in Eastern Polynesia, with

which Fiji and all other groups of the South Sea shares the principal features of its religious belief. The pyramidal sign △, with the apex upwards, was a symbol of fire; with the apex pointing down ▽, it indicates water.—*Sharpe's History of Egypt*, i. p. 24; *Cal. Rev.*, Sept. 1861; *Piazzi Smyth; Encyc. Britan.*

PYRETHRUM INDICUM. *H. Kunth.*

Anacyclus pyrethrum, *Dcc.*	Anthemis pyrethrum, *L.*
Indian fever-few, . ENG.	Akerkarra, . . . HIND.
Pellitory of Spain, ,,	Zoenil, . . . PANJAB.
Pyrethron, . . . GER.	Akarakarm, . TAM., TEL.

This root was known to Dioscorides, and is still employed in eastern medicine. The plant is a native of Kashmir and the north of Africa, whence it has been introduced into the south of Europe. The fresh root is fusiform and fleshy, about the thickness of the finger, brownish-coloured externally, and white within. When handled in this state, it produces first a sensation of cold, soon followed by heat. It is without odour, but has an acrid pungent taste, and causes a copious flow of saliva; an irritant sialagogue, sometimes used to relieve toothache, or as a masticatory in palsy of the tongue, and relaxation of the uvula. Pyrethrum roseum is a very efficient insect destroyer.—*Royle; O'Sh.*

PYROLIGNEOUS ACID is made in India from cocoanut shell. A variety is produced by the distillation of chips of wood in an iron retort, provided with a bent tube leading to a receiver. In Bengal, the jainti, Sesbania Ægyptiaca, is employed. It is allowed to settle 24 hours, and the acid separated from the oily matters is redistilled. It may be converted into pure acetic acid by adding sajji lota, the better kind of carbonate of soda (not the black kind), till all effervescence ceases.—*Powell*, p. 62.

PYROPE, a variety of garnet brought from Burma. It gives to transmitted light the colour of the ox's gall; and the Burmese name, in Pali, signifies ox-gall.—*Mason.*

PYROSOMA, a genus of molluscs, often spread over great tracts of the tropical oceans. These, like the compound Ascidians, consist of large colonies of small individuals, aggregated in the form of a cylinder open at one end, and often observed in shoals floating on the surface of the sea, emitting a bright phosphorescent light of a greenish lustre.—*Hart.*

PYROTECHNY as an art has attained considerable excellence amongst the natives of India and China, but in the manufacture and exhibition of their fireworks much depends on the combination of the materials and on the state of the weather.

For red and rose-coloured lights.

Strontia, chlorate, nitrate, sulphite, sulphate, carbonate, oxalate of.	Calcined blood.
	Chalk or carbonate of lime.

For green of various shades.

Tsunt, ...	,,		

The apple tree is found in the Panjab Himalaya, the Sutlej valley, between Rampur and Sungnam, in Persia, all over the Dekhan, Berar, Sind, and at Bangalore. The apples of Kanawar want flavour compared with those of Kashmir. The two sorts of apples commonly found in most native gardens in the Dekhan are said to have been first introduced from Persia. One, sweet and luscious, grows in bunches; the other, which is larger, has a rough taste, and is better adapted for tarts. The trees may be propagated by layers, suckers, and even cuttings. They should never be allowed to throw out branches at less than two or three feet from the ground; all the buds beneath must be rubbed off. Never plant them closer to each other than from nine to twelve feet, and if there be sufficient ground, keep them separate from other trees, so that they can either be wintered or watered as required. Remove all suckers round the stem of the tree, or from the roots, unless required for stocks, then cut them clean off with a sharp knife. The trees may be opened immediately after the rains, if not in blossom. Pluck off all the leaves carefully, and beware in so doing that the blossom buds are not injured, which native gardeners, in the careless manner of stripping the leaves, are very apt to do; then prune the tree. As soon as the blossom appears set, put plenty of old rich manure to them, and water well every third day until the fruit is nearly ripe. If you continue watering after this, it makes the fruit mealy and insipid. When the fruit is all gathered, cease to water the trees, and as soon as the leaves turn brown and dry, which will be in the course of a month, then open the roots for two or three days, cover with manure again, and water well as before, when you may probably get a second crop in April or May.—*Cleghorn's Report*, p. 65; *Riddell on Gardening; Roxb.* ii. p. 511.

PYRUS SINICIA, the sand pear of China. It is cultivated in Northern India.

PYTHAGORAS, a learned Grecian. He held the views of Plato and Susruta as to medicine. He introduced Brahmanical institutions into Greece, and followed Plato in the doctrine of transmigration. Pythagoras, Thales, Solon, Anaxagoras, Eudoxus, and Herodotus, all visited Egypt to learn the sciences. Democritus of Abdera was the first who recognised that the Greeks had nothing more to learn from the Egyptian geometricians.

PYTHON of the Greeks, the Peten of the Hebrew, and Bœten of the Arab, was a fabulous huge serpent. It had an oracle at Mount Parnassus. Apollo is said to have slain this serpent, hence his name Pythius. The Pythoness (πυθωνες) of the Greeks was a divining woman, as in Acts xvi. 16. See Krishna.

PYTHON, a genus of reptiles of the family Pythonidæ, known in India as rock-snakes. P. reticulatus, *Schneider*, is found in the Malay Peninsula, and P. molurus, *Linn.*, throughout India. They are commonly called boa or boa-constrictor, but the boa is a separate genus. Pythons of the Bhabar tract in Kamaon are up to 30 feet in length. Mr. St. John measured one in Borneo 26 feet long. Pythons are often observed hunting after frogs in damp situations; it is known to Muhammadans by the name of Azhda. The boa-constrictor is not a native of Asia.

Python molurus, *Linn.* P. trivitatus, *Schl.*, the boa or rock-snake of Europe, is found all over the country. One was killed in Travancore, after having swallowed a doe spotted deer. In British India they rarely attack man, though, in September 1883, a lad is reported to have been crushed to death. They could easily do so.

Python reticulata, *Gray*, attains a length of 20 feet. It is the anakonda of Ceylon, or Ceylon boa, and when full grown it is said to measure from 17 to 20 and even 25 feet long, with a circumference of 2½ feet.—*Sirr's Ceylon.*

PYU, the Burmese who occupied Prome, distinct from the Burmese proper.

PYXICEPHALUS ADSPERSUS of Dr. Smith, the Matla-metlo of the Bechuana of South Africa, when cooked, looks like a chicken. The length of the head and body is 5½ inches, and the hind legs are 6 inches long. During the dry months they conceal themselves in holes, which they make at the foot of bushes.

Q

Q is the seventeenth letter of the English alphabet, and has but one sound, somewhat similar to k or hard c, but formed near the root of the tongue. In English it never ends a word, as it does in French and other European languages. Its nearest sound in the Arabic, Persian, and Urdu is represented by the letter ق as in taluq, qillah; but it may be represented by the letter k. In English words it is always followed by the letter u, the two letters as initial being in general pronounced like kw, as quake, quack, quick, queen; in some words the u is silent, as in pique. But although the three consonants c, q, x are

called superfluous in English grammars, q historically represents a Hebrew and an Arabic letter; hence it has been generally so employed by the learned. In Qâl قال Arab., he said, the q is a deep soft k, formed at the root of the tongue.

QADAM. Hind., Pers. The foot. Qadam-bosi, or Zamin-bosi, a humble form of greeting, meaning kissing the foot or the ground. Qadam-i-Ibrahim, the footstep of Abraham; Qadam-i-Mubarik, the blessed or happy footstep; Qadam-i-Rasul, the footstep of the messenger, *i.e.* Mahomed.

QADIRI, an adjunct to names of a sect of fakirs. Qadiria is the order of devotees. Qadir Wallee, a celebrated Muhammadan saint.

QAF, a fabulous mountain in Muhammadan legend.

QAFILA. Arab. A body of travellers, a caravan.

QALANDAR, an order of the darvesh or fakir; they are cœnobites, shave the head and beard, abandon all family ties, and retire from the world. They are rarely seen in India.

QAMAT. Arab. Part of the Takbir of the Muhammadan creed and ritual. Qiam, Arab., the standing position in Muhammadan prayer.

QAZEE. Arab. A judge, civil, criminal, and ecclesiastic.

QIAS. Arab. In the Muhammadan theology, the analogical reasoning of the learned.

QIBLAH. Arab. The temple of Mecca; any object to which a Muhamman directs his attention, or person reverenced, as a parent, a person in high authority. Qibla-numa, a compass; Qibla-i-do-jahan, an object of desire for this and the next world. Muhammadans when praying, in whatever part of the world they are, direct their faces towards the Kaba in Mecca, as their Qiblah.

QORAN. Arab. The sacred book of Muhammadans. It was originally in Arabic, but is now in Persian, Hindi, Malay, Tamil, English. It was translated into English by Mr. George Sale.

QOWL-BEERA. Hind. The betel contract, a Muhammadan ceremony.

QUADRUMANA, Cuvier's name for his second order of mammiferous animals. It is the order Primates of later authors. It contains those forms among which will be found the nearest approach to man, and includes the families Simiadæ and Lemuridæ, and, with some authors, the Pteropodidæ, Vampyridæ, Noctilionidæ, and Vespertilionidæ of the sub-order Cheiroptera. The order Primates of Linnæus consisted of the genera Homo, Simia, Lemur, and Vespertilio.

QUAGGA, also written Couagga, is the Equus quaccha, *Gm.*, a native of Africa. It resembles the horse more than the zebra. Its voice is not unlike the bark of a dog.—*Cuvier.* See Equus; Kyang.

QUAIL. Mr. Gould recognises the common quail of India as distinct from the European quail. The quails of British India are arranged by Jerdon under the genus Perdicula, the dwarf partridges or bush quails, and the sub-families Perdicinæ, and the Coturnicinæ or true quails; also the sub-family Turnicinæ, or bustard quail, of the family Tinamidæ.

Perdicinæ, Bush quails.

Perdicula Cambayensis, *Latham*, jungle bush quail, all India.
P. Asiatica, *Latham*, rock bush quail, Dekhan S. of Nerbadda.
P. erythrorhyncha, *Sykes*, painted bush quail, ghats of S. India.

Coturnicinæ, Quails.

Coturnix communis, *Bonaterre*, large grey quail, or European quail, Europe, India.
C. Coromandelica, *Gmel.*, rain quail, black-breasted quail, all India, Burma.
C. Novæ-Zealandiæ, *O. and G.*, New Zealand.
C. pectoralis, *Gould.*
C. Realteni, *S. Muller.*
C. histrionica, *Hartl.*
Excalfactoria Chinensis, *Linn.*, blue-breasted quail, British India to Philippines.
E. Novæ-Guineæ, *Gmel.*, New Guinea.
E. Adamsoni, *Verreaux*, Celebes.
E. minima, *Gould*, Celebes.

Fam. Tinamidæ; *Sub-Fam.* Turnicinæ.

Turnix taigoor, *Sykes*, black-breasted bustard quail, Ceylon, British India.
T. ocellatus, *Scopoli*, hill bustard quail, Himalaya to Malayana.
T. Dussumierii, *Temm.*, larger button quail, all India.
T. Sykesii, *A. Smith*, button quail, all India.
T. maculosus, *Temm.*, Burma.

Coturnix communis, the common quail of Europe, Asia, Africa, is chiefly migratory, and is abundant in India, though M. Gould considers the race of British India to be distinct. The rain quail, Coturnix Coromandelica, is plentiful during the monsoon. The bush quail occurs in low jungle, now and then among the prickly shrubs by the margins of the fields.

The jungle bush quail, P. Cambayensis, is seen in coveys of from six to a dozen or more, and generally all rise at once with a loud whirring noise, uttering cries of alarm, and, after a short flight, drop down again into the jungle. The rock bush quail, P. Asiatica, in Hindi the Lowa, rises in a bevy of a dozen or twenty together with a startling suddenness and bustle, dispersing among the neighbouring bushes. This and P. Cambayensis, the Girza, are much trained to fighting by Muhammadans. The European quail, or barra batér, is largely netted; it is mostly migratory, coming across the Himalaya at the ripening of the autumn and spring crops.

The hen-birds of the gulu, or gundu, or salai gundru, Turnix taigoor, are very pugnacious, and this propensity is utilized for their capture; a decoy bird in a cage, with a concealed spring compartment, is placed in a covert, and its loud purring call attracts the neighbouring females, who strike at the cage, and break the string of the trap.

The button quail, Turnix Sykesii, is the most diminutive game bird of India. It is flushed with great difficulty, flies but a few yards, and then sometimes allowing itself to be caught by hand. Its Hindi name is the Dabki or squatter.

The Nepalese put a pair of imitation horns on their heads, and walk slowly about the stubble fields, twirling grass in their hands to imitate the champing of cattle, and thus drive any quail they may see under a small net which they drop. Quails are hunted in N. China. The hawk is loosed to the quail, which it seizes in its talons; the falconer then rushes up and takes all in a net. In China, quail-fighting is an amusement.—*Adams; Jerdon; Blyth.* See Birds.

QUAMOCLIT, a genus of climbing plants of the natural family Convolvulaceæ, chiefly found in the hot parts of America, but species are indigenous both in India and China.

Quamoclit coccineum, *Choisy.*
Ipomœa coccinea, *L.* | Convolvulus coccineus, *Spr.*
A native of West Indies.

Quamoclit pennatum, *Voigt.*
Convolvulus pennatus, *Des.* | C. pennatilius, *Salis.*
C. quamoclit, *Spr.* | Ipomœa quamoclit.

Crimson quamoclit, „
Jasmine rouge, . . FR.
Lal Kama-luta, . HIND.
Sweta Kama-luta, HIND.
Ishk pecha (love's ringlets), . . . PERS.
Surya ratnalu, . . TEL.

The French and Burmese call this beautiful little creeper red jasmine, the English name it China creeper, and the botanists quamoclit or dwarf bean. It has two varieties, red and white. It is quite naturalized throughout the Tenasserim Provinces; the French name is both more descriptive and euphonious than any of the others. It flowers in the cold weather, and of a most beautiful bright crimson colour; tube long, slender; in gardens pretty common. The crimson variety is Lal Kama-luta, or red ringlets of Kama, the Hindu god of love. Sweta Kama-luta, white, is the Persian Ishk pecha (love's ringlets).

Quamoclit Phœniceum, *Choisy.*
Ipomœa Phœnicea, *Roxb.* | Kasi ratnalu, . . TEL.

A very handsome climber with crimson flowers, tube long and slender; grows readily from seed.

Quamoclit vulgaris, the Indian forget-me-not, sometimes called the star creeper, from the shape of the flower, which is of a deep rosy red. — *Roxb.; Mason; Voigt; Genl. Med. Top.* p. 181; *Riddell; Jaffrey.*

QUANG-TONG, a province of China, abounding in gold, jewels, silks, pearls, tin, quicksilver, brass, iron, steel, saltpetre, sugar, ebony, and several sorts of odoriferous wood, besides fruit of all kinds. Quang-tung means broad east; Quang-si, broad west.

QUARANTINE LAWS are in operation in British India, and have been enforced relative to the plague of Egypt, and to some extent with cholera-morbus. The villages of the south of the Indian Peninsula strictly enforce it as regards the latter disease, by blocking up with hedges all the approaches to their hamlets.

QUARRYMEN or Masons, the Upera wanloo or Wadra wanloo of Telingana, are employed in digging tanks, making salt, and in road-making.

QUARTZ, Wuh-sih-shih-ying, CHIN., is nearly pure silica. It occurs both massive and in crystals of all sizes, and of a great variety of colours. Is much used in the bodies of pottery, and in making enamel and glass. Quartz rock has been found the richest in metals of all the Indian rocks. At Callastry it contains lead ore mixed with silver; at Nellore, copper; at Nagpur, manganese, lead ore, and copper. Micaceous iron ore is a very common product of this rock, and gold occurs in the western parts of the Peninsula of India. A quartz dyke, 50 to 100 feet in height, runs N. and S. to the W. of Hyderabad, in which crystals of amethyst occur.

Brown or *Smoky Quartz* occurs in fine crystals near Cairngorm in Aberdeenshire, and it is used for seals and ornaments when cut and polished.

Purple Quartz or *Amethyst* is found both crystallized and massive. It is of every shade of purplish violet, and the colour in the perfect amethyst is pretty equal throughout the crystal or mass; frequently, however, the summits of the crystals only are coloured. It is used for ornaments. Amethysts of the first quality are found in India, Ceylon, Persia, and Siberia.

Besides these colours, there occur blue quartz (siderite), green, red (hyacinthine), and yellow (Scotch topaz, Bohemian topaz), with the quartzose minerals and inferior gems, agate, avanturine, bloodstone, flint, jasper, chrysoprase, and opal.

The Chinese name includes several quartzose mineals, fluor spar, cairngorm, common quartz.

Beautiful regular crystals of quartz, called Kalabagh and Murree diamonds, are found in the gypsum of Murree, Kalabagh, and Sardi in the Panjab. They are transparent, milky, or red. They occur in the six-sided and dodecahedron form.

Hornstone and *Chert* are varieties of compact quartz. Cavernous quartz is termed spongiform quartz or swimming stone.

Green and *Red Quartzose Sandstone* of Vellore were used formerly by farriers, but are now replaced by sills of corundum and lac.

Yellow Quartzose Sandstone of Woodiagherry was used formerly for giving a first edge to swords, daggers, and implements; hard, rough, and well suited for grindstones. See Precious Stones.

QUASSIA is a bitter drug, the woods of Q. excelsa and Q. amara.

Quassia amara.
Bitter quassia, . . ENG.
Bois de quassie, . . FR.
Quassienholz, . . GER.
Lenode quassia, . . SP.

This native of Surinam, Guiana, Colombia, and Panama was introduced into Bengal by Lord Auckland. It thrives tolerably well in the Calcutta garden. Quassia wood is a very pure and simple bitter, and has been much employed in bilious and intermittent fevers, dropsies from debility, atonic gout. A decoction of quassia is much used as a poison for flies.

Quassia simaruba.
Bitter or mountain damson. | Simaruba amara, *Lindley.*
The bark is used medicinally.—*O'Sh.*

QUEDA, a small state and seaport on the west coast of the Malay Peninsula; lat. 6° N., long. 100° 27′ E. The water on the Queda coast is very shallow, and ships keep a considerable offing. The highest detached hill on the Queda main is Gunong Gerai, or Queda Peak, a mass of granite, whose summit is estimated at 5000 feet above the level of the sea. According to Dr. Ward, north of Queda Peak is an immense plain, almost level with the sea, covered near the coast with rising mangroves. The king of Queda about 1770 gave his daughter in marriage to Captain Light, and the island of Penang as her dowry, and the E. I. Company subsequently purchased the island.—*Newbold's British Settlements*, p. 4.

QUEEN.
Malikah, AR., HIND., PERS.
Reine, ... FR.
Rani, ... HIND.

QUEEN COCOANUT. The fruit is of a bright gold colour, and the blossoms, both of that and of the common kind, are very effective among the dark leaves.—*Frere's Antipodes*, p. 162.

QUEEN OF HEAVEN, a position allotted by the ancient Babylonians, the Phœnicians, and the Italians, also by the present Buddhists and others of China, and likewise by the modern Hindus, to a female divinity. The Babylonian queen of heaven was called Anatu, consort of Anu, lord of the heavens. The Phœnician deity was named

Astarte; she was the Ishtar of Babylon. In Jeremiah xliv. 15-17 and 19 (see also Judges x. 6; 1 Samuel vii. 3, xii. 10), Astarte or Ashtoreth or Baalith, the queen of heaven, was the great female divinity of the Phœnicians, the female power of Baal, whom the Greeks changed into Baaltis or Belthes. This goddess was worshipped in the chief city of Sidon, but her worship was extended to the east of Jordan. Physically, she represeuted the moon, hence her name in Genesis xiv. 5, Deuteronomy i. 4, Joshua xii. 4, Ashtaroth Karnaim, or the two-horned, from the crescent moon (see 1 Kings xi. 5, 33; 2 Kiugs xxiii. 13). The queeu of heaven mentioned in Jeremiah vii. 18, xliv. 15-19, was the goddess known to the Greeks and Romans as Astarte. This was the Phœnician Ashtaroth or Ashtoreth, a term which was used in combination with בעל, aud, aecording to Gesenius, appears to indicate the male and female powers. At Hieropolis in Syria, her emblem had a magnificent temple served by more than 300 priests. It was placed in the interior, and only the higher of the priesthood were permitted to approach it, and near it was the male emblem. Solomon (1 Kings xi. 4-8) built a temple for Ashtaroth on the Mount of Olives. The Romans and Greeks called her Astarte, and regarded her as the analogue sometimes of their Juno or Venus, or as the Cybele of the Phrygiaus, or the Ephesian Diana. Jeremiah tells us (vii. 18) that bread was one of the articles offered to Ashtaroth, and in his time, B.C. 588, the women of the Jews particularly seem to have been, almost all of them, devoted to the worship of this goddess. In chapter xliv. 17, 18, aud 19, on the people refusing to listen to him, the women announced that they would burn incense unto the queen of heaven, would pour out drink-offerings unto her, as their fathers and princes in Judah and Jerusalem had done, for then they had plenty of victuals, were well, and saw no evil. But since they had left off burning incense, they had wanted all things, and been consumed by the famine and the sword.

Astarte, one of the Syrian deities, corresponds with the Venus of the Greeks, the Isis of the Egyptians, and the Mithra of the Persians. She had a famous temple at Hieropolis in Syria.

Ishtar, daughter of Anu, king of heaven, was a goddess of the Babylonians. She was queen of Erech, and is sometimes represented as divine, sometimes as human. Her character resembles that of the Venus of the Greeks. Her first husband was Dumuzi, Tammuz, or Adonis (Ezekiel viii. 14), whose death was celebrated with great ceremony in the east, and women sat weeping for him.

Juno, the queen of heaven of the Greeks and Romans, was wife of Jupiter. She was a chaste goddess; she protected cleanliness, presided over marriage and childbirth, particularly patronised the most faithful and virtuous of her sex, aud severely punished incontinence and lewdness in matrons. At Rome, no women of debauched character was permitted to enter her temple or even to touch it.

Judges ii. 13, about B.C. 1401, says of the Israelites that they forsook the Lord and served Baal and Ashtaroth. 1 Samuel vii. 3 (B.C. 1056), Samuel urged the Israelites to put away the strange gods and Ashtaroth; in xii. 10 he showed them how, on a former time, the Lord had shielded them on their putting away Baalim and Ashtaroth; and in xxxi. 10, the Philistines, haviug routed the Israelites and slain Saul, they hung up his armour in the house of Ashtaroth; 1 Kings xi. 33 (B.C. 984), Ahijah warned Jeroboam that only one tribe of the Israelites would be left as subjects to Solomon, because Solomon had forsaken the Lord and worshipped Ashtaroth, the goddess of the Sidonians, Chemosh, the god of the Moabites, and Milcom, the god of the childreu of Ammon.

Yin and Yang, in Chinese philosophy, the two great female and male vivifying elements, from which have proceeded all material things. They are constructed by describing two equal semicircles with a circle round them, thus—☯—the yin or femalc side being dark with the eye bright, whilst the yang or male side is bright with the eye dark. This emblem has never been personified by the Chinese, whose queen of heaven is their Tien-How, called also Ma-tsoo-po; she is the goddess of the sea, and every ship is furnished with this idol.

Modern Hindus have had three deities, Brahma, Siva, and Vishnu, who have been regarded by their respective followers as Supreme; but Brahma is now neglected, and the latter two alone receive worship. All the believers in Siva entertaiu the male and female philosophy, of which the lingam and the yoni are the representatives. These emblems are in all the Saiva temples and households, iu stone or metal, and are always together. Neither of these emblems have ever beeu personified, though the lingam is the phallus and priapus of the Greeks and Romans. They are innumerable, exposed everywhere in Iudia to the open air.

Parvati, the mountain goddess, daughter of Himavat and wife of Siva, is with the Saiva sect Jagan-mata, mother of the world, a severe deity, addicted to austerities.

Lakshmi is wife of the Hindu god Vishnu, and mother of Kama. She is said, like Aphrodite, to have sprung froun the froth of the ocean in full beauty, with a lotus in her hand, when it was churned by the Daitya and Asuras. In the varied incarnatious of Vishnu, she has assumed the forms of Dharani, Sita, and Rukmini. She is the type of womanly beauty, and with the Vaishuava sect is Loka-mata, mother of the world.

Saraswati, wifc of Brahma, is goddess of speech and learning, inventress of the Sanskrit language and Deva-Nagari letters, aud patroness of the arts and sciences. As a river goddess, she is lauded for the fertilizing and purifying powers of her waters, and as the bestower of fertility, fatness, and wealth.

In the cosmogony of the modern Hindus, their philosophy has not advauced beyond the idea of the union of the sexes, and is evinced in their custom of marrying a new orchard to its well, of marrying vicariously a mau and woman to a tree, of reverencing thc juuction of rivers and the natural engrafting of trees.

The Buddhists of China have also a queen of heaven. Shin-mu, or the sacred mother, is frequently represented sitting in an alcove with a child in her arms, a glory round her head, and with tapers burning constantly before her.

QUEEN OF SHEBA. See Balkis.

The oaks and the chesnuts are well knowu for their rich and luxuriant growth, and are the ornaments of Enropean forests. The genus is found from the northern to the most southern and eastern parts of Asia; in the mountains of China, Japan, Nepal, Kamaon, Sylhet, Chittagong, Penang, and Taong Dong, and from moderate elevations to the limits of forest life. Though almost unknown in Ceylon, the Peninsula of India, tropical Africa, and South America, they abound in the hot valleys of the Eastern Himalaya, East Bengal, Malay Peninsula, and India Islands, where, perhaps, more species grow than in any other part of the world.

The barks of oaks, alders, birches, willows, and poplars abound in gallic acid and tannin, and all have therefore been frequently employed for tanning; also as tonics and febrifuges. Quercitron, the bark of Q. tinctoria, dyes wool yellow. Gall-nuts, called majoo phal, are imported into India, being produced by the puncture of Cynips quercusfolii on Quercus infectoria, a native of Asia Minor, Armenia, and Kurdistan. Q. ilex and Q. cerris afford inferior galls. The cupules of the glands of Q. Ægilops, called velonia and velani (a corruption of *βαδανι*) and velameda by the modern Greeks, are collected in Ceos, and used for the same purposes. The Kermes insect fixes itself upon Q. coccifera, hence called Kermes oak, a native of the S. of Europe and N. of Africa. Q. ballota, sweet-acorn oak, that probably described in Persian works under the names Shah-balloot and Balloot-ul-malik, is a native of Spain, N. of Africa, and of parts of Greece; this having acorns free from tannin, has been long used as food by the inhabitants of the above countries. It might very probably, as well as the cork trec (Q. suber), a native of the hot parts of Spain and France, be naturalized in the plains of Northern India, where Q. incana, from elevatious of 5000 to 7000 feet in the Himalaya, is perfectly at home. The acorns of this speeies are sold in bazars under the name balloot, being used by the natives in medicine.

Dr. Wallich found seven different species of oak iu Burma and on the Tenasserim coast, and all afford useful timber, though inferior to the English oak.

In Japan are—Quercus glabra, acuta, glauca, cuspidata, serrata, glandulifera, dentata, phyllyraoides, Sieboldiana, urticæfolia, canescens, variabilis, aliena, crispula, Burgerii, sessifolia, salicina, myrsinæfolia, gilva, grosse, serrata, lacera marginata, lævigata. The following occur in China: —Quercus cornea, Mongolica, dentata, Chinensis, Fabri, ilex, serrata. Many of the 23 Japanese species appear to be peculiar to the Indian Archipelago, or only occnr near the south-eastern angle of Asia, where they reach their most southern limits, being searcely known in a wild state in the southern hemisphere. The Indian and Burmese species are—Qnercns acuminata, Ægilops, Amherstiana, anuulata, ballota, balloot, bancana, Brandisiana, dealbata, dilitata, eumorpha, Falconeri, fenestrata, Griffithii, ilex, incana, lamellosa, lanceæfolia, lanuginosa, lappaeea, mespilifolia, mixta, occidentalis, oila, oxyodon, pachyphylla, pedunculata, polyantha, robur, semecarpifolia, semiserrata, serrata, sessiliflora, spicata, Thomsoniana, turbinata, velutina, and xylocarpa.

Captain Gerard tells us of three species of oak in Kanawar,—Monroo and Khursoo, which grow at 12,800 feet, and the Ban (Q. incana), which disappears at 8000 feet. Major Bensou, writing in British Burma, remarks that Q. fenestrata, Q. turbinata, and Q. velutina produce good, durable timber, resembling that of the Dilleuias in density and elasticity, though the trees do not grow of that size to make the timber of the same value as the Dillenias. Q. Chinensis, the Chinese oak, a beautiful spccies found in mountainous places in China, is said to have exaetly the habit and appearance of a Spanish chesnut. It grows to the height of 50 feet. Q. mannifera, of Kurdistan, is said to yield a sweet mucilaginous substance from its branches and leaves by steeping them in boiling water at the hottest season of the year, and afterwards evaporating the water. This substance is made iuto cakes, and sold in the markets of the town of Van under the name of Ghiok-Helvashee, 'the sweetmeat of heaven.' The species is very near Q. sessiliflora, especially a form of it which has been named Q. Mongolica. Q. regia and Q. rigida also occnr in Kurdistan.

Quereus aeuminata, *Wight Ic.*, *Roxb.*; Hunnee, Hind.

Quercus Amherstiana, *Wall.*, Tirbbæ, Burm. A large tree of Martaban, used in boat-building.

Qnercus annulata, *Sm.*

Bani, Bran, . Kotgarh.	Hunne, Phuliat, Pushtu.
Ban-kan, Bren, Pushtu.	Funiat, . . . ,,
Ban-kahoo, . . ,,	

The ring-cupped oak grows in the outer ranges of the Sikkim Himalayas, to the height of 10,000 feet; wood white, not valued.

Querens ballota, *W.*, the Barbary oak; Shah-balloot or Balloot-ul-malik of Persia is probably the tree mentioned by Theophrastus. It is a native of Spain and Greece.

Quercus cornea, *Loureiro*, an oak of Cochin-China, Hong-Kong, and S. China. The leaves are not given to silkworms.—*Smith.*

Qnercus dentata, *Thunb.*, Hoh, Chin., a large leafed oak of China and Japan. It has long feathery filaments ontside the acorn.—*Smith.*

Quereus dilatata, *Lindley.*

Quercus taxiflora.

Mohru, Here'u, Chamba.	Chora, . . . Kaghan.
Barungi, Parungi, Hazara.	Marghand, . Kanawar.
Kaliring, . . Jhelum.	Bar, Char, Murree Hills.

This fine evergreen oak is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6000 to 9000 feet. It yields an excellent heavy wood.

Qnercus fenestrata, *Roxb.*, grows in the Khassya Hills, is a native of the mountains in the vicinity of Sylhet, and grows in Burma and the Tenasserim provinces not 50 feet above the level of the sea. It affords useful timber.

Quercus floribunda, *Cleghorn*, Barcha, Hind., is found in the Sutlej valley between Rampur and Sungnam at an elevation of 9000 feet.

Quercus ilex, evergreen oak.

Charai, Chora, . Hind.	Iri, ... Pangi.
Chur, Jari, Kori, . ,,	Bre, ... Panj.
Chota, ... Lahoul.	Khar-paloo-chcrai, . ,,
Barungee, . . Murree.	Ghwara-cherai, . . ,,

This is found in Kaghan, the Sutlej valley be-

tween Rampur and Suugnam, at 5000 to 8000 feet elevation; it is the principal firewood in the hill stations. Charcoal is made of it. The English residents at Dharmsala use it for beams and rafters. The tree attains its full size in 100 years, and a very old tree yields a log or trunk to first branch from 16 to 20 feet in length (?), and 6 feet in circumference; wood of a red colour, hard, tough, and heavy, coarse-grained, liable to warp and to decay if exposed to wet; leaves given as fodder to cattle. Its acorns, Balut sil supari, are sold in the bazars of the N.W. Provinces under the name of Shah-balloot. Used for indigestion, diarrhœa, and asthma. Recommended for chronic diarrhœa in children, after burying in the earth to remove their bitter principle, then washing and grinding. *Stewart.*

Quercus incana — ? Himalayan ilex.

Ban, Banji, . . HAZARA.	Dyer's oak, . . . ENG.
Rin, Rinj, . . ,,	Majoo-phal, . . HIND.
Munroo . of KAMAON.	Maja-kanee, . . MALEAL.
Pyeen-ta-gar-nee-thee, . . . BURM.	Mazoo, ... PERS.
Maa-phal, . . DUKH.	Sper-cherai (white oak), ... PUSHTU.
	Vari, . of SALT RANGE.

A beautiful tree of Kamaon, very like the evergreen oak of Europe. Its leaves are much more woolly on the under side. The wood is coarse, but lasts well under cover, where it is not exposed. It is extensively used for fuel at the hill Sanatoria, where the tree grows abundantly at from 3500 to 8000 feet elevation.

Quercus infectoria, *Olivier*, gall oak.

Afees, ... ARAB.	

Asia Minor, Armenia, and Kurdistan, a shrub 4 to 6 feet high. A very common scrubby bush in Asia Minor, where its branches are attacked by an insect, the Cynips, which punctures them, and causes the formation of the oak-galls.

Quercus lanceæfolia, *Roxb.*, a tree of the Garo Hills and Assam. Wood light-coloured like the English oak, but harder, and reckoned, where it grows, one of the most durable timbers.

Quercus lappacea, *Roxb.*, a tree on the Khassya mountains. Wood strong, in colour like that of the common oak, but hard and more close-grained.

Quercus lucida and Q. muricata, *Roxb.*, are Penang trees.

Quercus Mongolica, *Fischer*, Tsoh-shu, CHIN., an oak of N. China, with small leaves, on which the silkworm is fed.—*Smith.*

Quercus pedunculata, its bark used medicinally.

Quercus prinodes, *Linn.*

Quercus serrata, *Roxb.* | Shingra, . . . HIND.

A tree of the Garo Hills, yields a useful timber.

Quercus semecarpifolia, *Wall.*

Alpine oak, . . . ENG.	Kharao, Khatao, PANJ.
Banchur, Banchar, PANJ.	Kharshu, ... ,,

This ascends above the range of pines, and is one of the most alpine trees of the North Himalaya. It is an evergreen species. Its acorns are named Shah-bālloot. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 9000 to 12,000 feet. No oak nor chesnut ascends above 9000 feet in the interior of Sikkim, where they are replaced by a species of hazel (Corylus); in the North Himalaya, on the other hand, at 10,000 and 12,000 feet, on the southern face of the Himalaya, as at Chur, Kedarkanta, and Changshel, the Quercus semecarpifolia generally forms the forests at their highest limits, though other species of Quercus are found below, with Taxus, Betula, Deodara, Pinus excelsa, and Morinda. Q. semecarpifolia is a magnificent tree, and its timber is much esteemed by the natives. Wood white and heavy; subject to insects and liable to warp; used for making charcoal, and by zamindars for ordinary house-building purposes; produces also good and large timber.

Quercus semiserrata, *Roxb.*, Thit-kya, BURM., a tree of the Garo and Khassya Hills and British Burma. Wood used for plugs or pins, to join together the three pieces which compose the body of a Burmese cart-wheel. Qu. Q. prinodes.

Quercus spicata, *Buch.*, a tree of Nepal, of the Garo, Khassya, and Chittagong Hills. Wood lighter coloured than English oak, but equally close-grained, and apparently as strong.

Quercus suber, the cork tree, of all the warm parts of Spain, but is most abundant in Catalonia and Valencia. In the property of forming a spongy soft substance on its bark, it surpasses all other European trees, and hence is of the greatest value for corks and for similar purposes. Quercus occidentalis, one of the varieties of Q. suber affording cork, in Southern France, Spain, and N. Africa. This species is confined to the Atlantic provinces, and is distinguished by its acorns ripening in the second year. The first gathering of the bark takes place when the trees are about 12 to 15 years of age. This is burned, being almost useless. There is a second gathering some 7 or 8 years later, of porous cork, and after a similar interval, a third or better quality, which may be used for corks. The harvest is continued at intervals of 7 to 10 years, the best cork being produced by trees on a poor soil.

Quercus turbinata, *Roxb.*, grows in Chittagong, in Burma, affords useful timber, though inferior to English oak. Roxburgh says it is only used for fuel.

Quercus velutina, Tha ghau, BURM., grows in Burma and the Tenasserim Provinces. It affords useful timber, though inferior to English oak.—*Capt. Gerard, Kanawar; Messrs. Barnes, Fortune, Gamble; Hodg. Nagasaki; Powell; Cal. Cat. Ex.*, 1862; *Messrs. Balfour, Cleg., Hook., Mason, O'Sh., Roxb., Riddell, Royle, Stew., Voigt, Wight, Thun.*

QUERQUEDULA, the teal genus of birds, comprising as under:—

Q. crecca, *Linn.*, common teal.
Q. circia, *L.*, blue-winged teal.
Q. glocitans, *Dallas*, clucking teal.
Q. Javana, *Budd.*, Java teal.
Q. Manillensis, *Gm.*, Manilla teal.
Q. numeralis, *Mull.*, eastern teal.

See Teal.

QUETTA, a town of Baluchistan in the valley of Quetta or Shawl. The valley is about 15 or 20 miles in length, and from 4 to 6 in breadth. It is bounded to the westward by the Chah'l Tan range, having a strike of S.S.W. by N.N.E. Quetta is about 5900 feet above the sea, and has about 4000 inhabitants. The mountainous table-land of Baluchistan extends from Cape Monze on the south to the Afghan mountains north of Quetta, or from 25° to 30° 40′ N. latitude, and is consequently about 340 miles in length. In breadth it extends from the level plains of Cutchi eastward, to Nooshky on the borders of the Seistan desert on the west, extending thus about 150 miles. But its breadth is by no means uniform; widest about the centre, it gradually narrows southward, until at Cape Monze it is only a few miles broad.

The fort or kot, in lat. 30° 12′ N., long. 66° 55′ E., is situated at the northern end of the valley, on the direct route from Jacobabad and Shikarpur to Kandahar viâ the Bolan pass. It is surrounded by a mud wall, and has two gates, the eastern and southern, or Shikarpuri gate. In the centre of the town, on an artificial mound, stands the miri or citadel, in which the governor resides, and from which there is a very extensive view of the neighbouring valley. The water is good, and there are many gardens and orchards in the suburbs. Quetta was occupied in the British wars with Afghanistan in 1838–42, and again from 1876 and during the Afghan campaigns of 1878–80, Quetta formed the base of operations of the southern column, and is now held by the British.—*Imp. Gaz.*

QUFL. HIND. Any lock; in Muhammadan divination, a lock for resolving mysteries.

QUICKLIME.

Ahak, ... ARAB.	Honnu, Hunnu, . SINGH.
Chunam, Chuna, HIND.	Chunambu, . . . TAM.
Calcium, ... LAT.	Sunnum, ... TEL.
Nureh, ... PERS.	

The common method of obtaining quicklime is by the process of burning, in which limestone mixed with wood, coal, or charcoal is exposed to a strong heat; in this way the carbonic acid is expelled, and the product called quicklime is the result. It is white, of a pale grey tint, opaque, inodorous, and its taste acrid and alkaline. When water is poured upon quicklime, it heats, crackles, swells, and a bulky white powder is obtained, called slaked lime. Lime is used as a manure and as an ingredient in mortar. In several metallurgic processes, it is used as a cheap and powerful flux; it is also extensively employed in soap-making, leather-dressing, dyeing, and medicine, besides many other purposes in common life and the arts. Chunam is applied to quicklime made from calcined shells.—*Faulkner.*

QUICKSILVER, Mercury.

Vif-argent, Mercure, FR.	Argento vivo, Mercurio, IT.
Quecksilber, . . . GER.	Azogue, ... SP.
Para, ... HIND.	Jewa, ... TURK.

Quicksilver is said to occur about six miles from Colombo and Trincomalee. While some excavations were making in the laterite on the sea-face of the fortress of Cannanore in 1857, globules of fluid mercury were found in the cells of the laterite, giving the appearance of its being of natural occurrence. The quantities and value imported into India have been as under:—

QUILON, a seaport town on the Malabar coast, in lat. 8° 53′ 28″ N., long. 76° 36′ 59″ E. It is in the Travancore State, and has been written Collam, Coulon, and Coilon, derived from the Tamil for a tank. Its population is about 15,000, and is occupied by a detachment of the Madras army. It has been known to western nations from very early times as a commercial town, and the Imperial Gazetteer says it is mentioned as Coilon in a letter of the Nestorian patriarch Jesu Jabus of Adiabene, who died A.D. 660. It appears in Arabic as early as A.D. 851, under the name Kaulam-mall, when it was already frequented by ships from China; and during the 13th and 14th centuries it continued to be the great port of trade with Malabar, from China and from Arabia. It is the Coilum of Marco Polo, and the Columbum of several ecclesiastical writers of that age, one of whom, Friar Jordanus, was consecrated Bishop of Columbum about 1330. It was a great port for pepper, Brazil wood, and for ginger, the best kind of which was known till late in the middle ages as Columbine ginger. In the beginning of the 16th century, Varthema speaks of it as a fine port, and Barbosa as 'a very great city,' and 'with many great merchants, Moors, and Gentoos, whose ships traded to all the eastern ports as far as Bengal, Pegu, and the Archipelago . . . Throughout the middle ages it appears to have been one of the chief seats of the "Saint Thomas Christians," and formed with Kayal (Koilpatam, Koel church, Patanam town), one of the seven churches ascribed by Indo-Syrian tradition to Saint Thomas himself' (Col. Yule's Marco Polo, ii. p. 365, ed. 1874).

In 1503 the Portuguese established a factory and fort, captured by the Dutch 150 years later. Besides these changes, the town was at different times subject to Cochin, Cully Quilon, and Travancore. In 1741 Travancore unsuccessfully besieged it, but the following year the Quilon raja submitted. The natives of the country begin their era from its foundation, in the same manner as the natives of Cochin begin theirs from the origin of the island of Vaipeen. In former days there were a great many weaving-looms and manufactures of cotton and stoneware here. Alexius Menezes, the first Archbishop of Goa, built an excellent fortress here, which afterwards fell into ruins, being neglected by the Dutch.—*Col. Heber Drury; Imp. Gaz.*

The quince is a native of the south of Europe, and grows in Persia; its fruit is stewed, and it makes good marmalade. In the Panjab there are three kinds of quinces—(1) Shakkar, or sweet; (2) Tursha, sour; (3) Miyana, or middling. The first is eaten fresh, and has a delicious perfume; the second is dried, candied, etc.; the seeds of all are demulcent, and used in sherbets and as a cooling drink in fever. They abound in mucilage, and constitute an important article of commerce, being highly valued as a demulcent tonic and restorative remedy by the Hindus and by Muhammadans all over the east. They are imported into Bombay and Calcutta from the Persian Gulf, and into Northern India they are brought from Kābul and Kashmir.—*Powell; Hogg; Faulkner.*

QUININE was discovered in 1820 by Pelletier and Caventou, French chemists; cinchonidine and quinidine in 1852 by M. Pasteur. It is a vegeto-alkali obtained from cinchona bark. The medicinal properties of the Peruvian barks are

due to these vegeto-alkalis. The refuse or mother liquor of the quinine manufacturers contains amorphous quinine, also called chinoidine or quinoidine. It is a yellow or brown resin-like mass, insolnble in water, but freely soluble in alcohol and ether, as also in dilute acids. Quinine is one of the easiest drugs to adulterate, as the substances mixed with it are of very similar appearauce and properties. Cinchona bark contains several alkaloids of more or less febrifuge properties; quinine, the principal, is accompanied by cinchonine, cinchonidine, and perhaps other minor alkaloids, all of which have a strong resemblance to quinine, but possess febrifuge properties more or less inferior to those of quinine, and often producing different symptoms. These alkaloids have always been separated by the European manufactnrer, as the mixed alkaloids would be unsaleable there, and they are disposed of separately, each at its own market price, the inferior alkaloids fetching often less than half the price of quinine. Barks vary in the proportion of alkaloids they yield; but it may be said that for every ounce of quinine mannfactured there are at least two ounces of iuferior alkaloid produced. The alkaloids find a certain outlet amongst private practitioners making up their own medicines, in the dispensaries of hospitals aud parish infirmaries, and other circumstances where the high price of qninine restricts its use; but much of these alkaloids is mixed with qninine intended for exportation. This mixture is a fraud, because these inferior alkaloids require a much higher dose (30 to 50 per cent. more) to produce the same febrifuge effects as qninine in mild cascs; they often completely fail in severe cases of ague, and generally causc nausea and other unpleasant symptoms. In France, pharmaceutical authorities who inspect druggists' shops, condemn all quinine found to contain more than three per cent. of cinchonine.

The cinchona plants, introduced into India by Mr. Clement Markham's (C.B.) devoted exertions, have been largely cultivated, and the Governmcuts of Bengal and Madras have been manufacturing the alkaloids, either separating them or keeping them combined, styling the latter condition the cinchona febrifnge or mixed cinchona alkaloids. 100 parts of it have been found to contain quinine, 15·5; cinchonidine, 29; cinchonine, 33·5; amorphous alkaloids, 17; and colouring matter, 5.

The Madras Governmeut, about the year 1882, forwarded to the Secretary of State consignments of cinchona barks, from the estates at Naddewatum, Dodabetta, and Pykara, from which qninine and other alkaloids were to be manufactured on their behalf. Mr. Whiffen's analysis of these yielded the following resnlts:—

Description.	Quinine sulphate p c.	Cinchonidine sulphate p. c.	Cinchona alkaloid p. c.
Renewed crown bark,	5·57 to 5·71	0·41 to 0·48	0·12 to 0·31
Mossed bark,	4·06 to 4·3	1·4 to 1·5	0·2 to 0·24
Natural bark,	3·6 to 3·42	1·02 to 1·21	0·15 to 0·23
Renewed red b.,	3·04	2·32	1·84
Mossed bark,	1·71 to 2·09	2·15 to 2·32	1·68 to 2·39
Natural bark,	1·28 to 1·2	2·8 to 3·57	1·14 to 1·63
Root bark,	1·3 to 2·09	2·1 to 2·15	2·39 to 2·57
Branch bark,	0·8 to 0·66	1·5 to 1·35	0·47 to 0·51
Renewed scraped crown bark,	4·34	0·37	0·21
Natural scraped,	1·81	0·75	0·06
Branch crown,	0·7	0·16	0·04

The total lbs. of products obtained by manufacture was as follows:—

Quinine sulphate,	1467	Cinchonine alkaloid,	208
Cinchonidine sulphate,	345	Febrifuge,	2236
Quinidine sulphate,	40		

Total charges on account of the bark sent amonnted to £3352, 0s. 9d., distributed as follows:—

Freight, agency, etc.,	£721	9	3
Manufacturing charges,	2604	11	0
Fire insurance of bark at factory,	26	0	0

Notwithstanding the increasing price of quinine, its import into India is increasing.

	Lbs.	Rs.		Lbs.	Rs.
1875–76,	3,925	1,91,619	1879–80,	7,500	8,60,072
1876–77,	4,648	3,34,437	1880–81,	3,964	4,29,515
1877–78,	5,025	6,58,509	1881–82,	10,615	9,98,631
1878–79,	5,940	6,50,005	1882–83,	7,585	6,48,912

Imports into India of quinine on account of Government have already (1883) practically ceased, and India will soon supply all its own wants from its cinchona plantations at Darjiling and the Neilgherry mountains. In 1882-83, India exported 641,608 lbs. of cinchona bark, value Rs. 7,90,861. When the home consumption of bark was one-fourth the present amount, quinine was only half its present price. The discovery of kairin may lead to a diminution of price. In February and March 1883, the Madras Government had two sales of 48,645 lbs. of 18 kinds of cinchona bark, which realized from 8 annas 8 pie per pound to Rs. 2.8.8, the latter being for mossed crown.—*Markham, Per. Bark.*

QUINTAL. Fr., It. 1·97 cwt. Eng.

QUISQUALIS CHINENSIS. *Smith.*

Sze-kiun-tsze, . . Chin. | Liane vermifuge, . . Fr.

A plant of Annam, Moluccas, Mauritius, Burma, Malay Peninsula, and China; fruit 1 or 1½ inch long. A safe and efficient vermifuge.—*Smith.*

QUISQUALIS INDICA. *Linn.*

Q. villosa, *Roxb.* | Da-way-hmi-ne, *Burm.*
Tot-chi-fa, . . . Chin. | Rangoon creeper, . Eng.
Chinese honeysuckle, Eng. | Sun sung aroos, Malay.

A scandent shrub, with beautiful flowers of various colonrs, from white to orange and deep-red; has a very powerful perfume towards night. It grows from layers or seed, but the latter are very difficult to find. It is seen trailing its long arms around bowers and verandahs, buried in thick lively foliage, and gracefully flinging out its thousands of sweet-scented flowers, which change their tint from white to rose, and, with the clouds at sunset, deepen into richest crimson. The flowers are scarlet outside and yellowish-white within, and hang in large clusters. The scent at night is unpleasant to some persous. It is a very common plant in the gardens of the Dekhan. Seeds vermifuge.—*Jaffrey; Mason; Riddell.*

QUIVER. Throughout South-Eastern Asia the bow and arrow have almost disappeared, the only people using it constantly in war and for the hunt being the Mincopi; but at the annual 'langar' of the Nizam of the Dekhan there are still to be seen a few soldiers in the procession armed with bows. Recently, too, in the beginning of 1870, the Editor met a small body of men, seemingly on some predatory excursion, one of whom was armed with the bow and a quiver full of arrows. In April 1863, a few days before the Editor arrived at the Andamans, a British sailor was killed by the arrow of a Mincopi.

QUOIN HILL, called Jibl Mia Ally, at the Straits of Bab-ul-Mandab, is 865 feet above the sea.

QUOIRENG, a tribe in N.E. India, with a language distinct from those of the Songbu and Puiron, but with a great similarity in all other respects. They inhabit all the hills north of the Koupui, between the high range that skirts the valley of Munnipore and the Barak, as far as the Angami tribe, from whose aggressions they have suffered much. From these aggressions and their own feuds, they have much decreased in number, but are still a very considerable tribe, possessed of much energy, which developes itself in trade with the Angami and the British frontier district.

QURBAN. Arab. A sacrifice; a victim; oblation.

QURNA. Hind. A straight or curved horn, twelve feet long; a musical instrument.

QUTUB SAHIB, or Quttub-ud-Din, lies buried at Qutub, near Dehli, named after him. The late Shah Alam and many members of the royal family of Dehli are buried there. His tomb is much frequented by pilgrims, he being one of the most renowned and venerated of the Musalman saints.

QUTUB SHAHI, a dynasty of the Dekhan, A.D. 1512–1580, whose principal stronghold was Golconda, near Hyderabad. Sultan Kuli Qutub Shah, the founder, was a Turkoman of Hamadan in Persia, and was in the service of the Bahmani kings when their power broke up. He was murdered at the age of 90 by his son Jamshid. The fourth and last king was Muhammad Kuli.

R

R, the 18th letter of the English alphabet, is a semi-vowel and a liquid, and in the English tongue has two distinct sounds, the one, as in ran, free, morose, and when at the beginning of words or syllables, produced by an expulsion of vocalized breath; the other sound when followed by a consonant, and when at the end of words, is formed by a vibration of the tongue near the root, as in her, ford, startling. In words derived from the Greek language, the letter h is usually written after r, as in rheumatic, rhapsody, rhetoric. R has various modifications in the languages of the East Indies. It is changeable into l; and the Chinese, who cannot pronounce r, always use l in its place, though the Mongol and Manchu have r. Usually it has the sound of r in round, run, ruin. In the Hindustani it has a rough sound as r or rh, which alternate with the cerebral letters d and db, and in Telugu, Canarese, and Tamil it has a harsher sound. The r of the Tamil and r of the Malealam are in some respects identical, and when doubled as rr, have the sound of tt. The Sanskrit vowel sound ri is modified in the Peninsula of India into ru. R in Sanskrit, when compounded with another consonant, is always elided; thus, varta, krosa, preman, Sansk.; bat, kos, pem, Hind. There are many Sanskrit words written indifferently with l or r, as in the Sanskrit urmi, Greek eluo; Sanskrit rak, Greek leukos; Sanskrit rik, Greek leipo. Just as the English Mary is domestically Molly, the Turki language frequently changes the letter r into a soft z or sh, as the Turki words dengiz, sea, and okuz, ox, are the same as the Hungarian tenger and okur. On the Indo-Scythian coins, also, we find the Turki names of Kanishka, Huvishka, and Kushkana changed to Kanerkc, Hoverke, and Korano in Greek. The l of the Kodum Tamil becomes zh in the Shen Tamil,—pallam, fruit, becoming pazham.

RA, a god of the ancient Egyptians, was worshipped separately from Osiris.

RAAMAH of Ezekiel xxvii. 22, is the modern Reima.

RABAB. Hind. A rebeck.

RABAN. Hind. A Panjab tree of moderate size; wood white, soft, light, used by agriculturists for their houses and implements. Bark used medicinally; leaves used for fodder.—*Powell.*

RABAN HORMAZ, a monastery of the order of St. Anthony, in the pashalik of Musal, 45 miles N. of Musal. The monks are of all trades. They eat meat at Easter and Christmas. Some of the cells are far up the mountains in steep places. —*MacGregor.*

RABB. Arab. Lord, master; the Rabbi of the Hebrews. In the plural, Arbab is a title of the Khalil and Mohmund chiefs of the Peshawur district. Rab-ul-Alamin, lord of the universe.

RA-BER. Pers. On the road; properly rahbur, corrupted by the Pindara to la-bour, the designation of their forays. Literally, take to the road.—*Rajasthan*, i. p. 19.

RABI. Hind. The spring time, the months March and April; also, in Northern India, the harvest grown in winter and reaped in spring, viz. of crops sown after the rains in October and November, reaped in the first three or four months of the year ensuing. It is pronounced and written Rabbi, and called by the people Hari, as the spring harvest crops sown in winter and cut by Har, early summer. They include wheat, barley, peas, gram, poppy, masur, sarson or mustard, linseed, tobacco, the manwa and radhia cotton; the arhar, Cajanus Indicus; the jethi dhan, a variety of rice; kusum, Carthamus tinctorius.

RABIA. Arab. A protector. One of the Kahtan branch of the Gara tribe accompanied a friend as Rabia from the mountains behind Dofar to the town of Silalah. On arrival there, two of Rabia's cousins approached the man he was protecting, and assailed him on account of a blood-feud. The Rabia, faithful to his charge, slew his cousins, and then sought the protection of a Syed, and got a party to convey him back to his village, while the friend he was protecting fled back to the hills. Rabia is a name of a Muhammadan woman. The favourite daughter of Aurangzeb was so called. She never married, according to Kazi Shahab-ud-Din of Ahmadnaggur, because she fell in love with Raja Saho. Her father erected a magnificent tomb over her remains at Aurangabad.—*Dr. Cantor.*

RABI-ul-AWAL and Rabi-ul-Akhir, the third and the fourth months of the Muhammadan year. The 12th day of the month is held by Muhammadans as a solemn festival, as on that day Mahomed died, 8th June 632.

RABKAB, chief village of Udaipur, a native state of Chutia Nagpur, Bengal, in lat. 22° 28′ 18″ N., and long. 83° 15′ 25″ E. Rabkab has gold mines which have their shafts sunk from 20 to 60 feet in depth. These are very close together, as

the miners are afraid to run galleries underground. The gold is separated from the soil by washing in wooden troughs. Also they cut small water-courses before the rainy season, and wash the deposit of soil carried down by the water.—*Imp. Gaz.*

RABNADAB ISLAND. Its southern extremity is in lat. 21° 50′ N. It is a large island, 18 or 20 miles to the eastward of the Hooringattah entrance of the Ganges.

RACACHON or Racachont. Arab. A substitute for chocolate; a preparation of roasted acorns, powdered with sugar and aromatics.—*Simmonds.*

RACA-VARU or Ratsa-varu. Tel. The old barons of Telingana.

RACE, a term used by ethnologists to distinguish different branches of the human family. The term is not in use amongst the Europeans in British India, by whom the people of the country are collectively called natives, and the several races castes, this being derived from Casta, a Portuguese word. The people themselves use the word zāt or jāt, meaning race, and distinguish their various divisions by the word varna or colour. These terms also indicate the religious denominations and race of the idol-worshippers and monotheists. The languages and physical conformation of the many nationalities show that the Brahman, Kshatriya, Khatri, Rajput, Vaisya, and Sudra Hindu, the Moghul, Syud, Shaikh, Persian, and Pathan Mahammadan, the Burman, Karen, Mon, Malay, Chinese, Mongol, Manchu, Papuan, and the Polynesian, the Jut, the Baluch, the Brahui, the Parsee, and the Bengali, are of varied descents, as also are many of the non-Aryan tribes of India, the Pariah, Dher, Mhar, Chakili, Mhang or Madhara, the Dom, and hundreds more. The Khatri is a race numerous in the Upper Panjab, and about Dehli and Hardwar, and found along the Ganges as far south-east as Benares and Patna. They divide themselves into three principal classes,—1. the Charjati, or four clans, viz. Seth, Marhota, Khunna, and Kuppur; 2. Barajati, viz. Chopra, Talwar, Tunnuhu, Seigul, Kukker, Mehta, etc.; 3. Bawun-jati, or fifty-two clans, amongst whom are Bundari, Meindrao, Sehti, Suri, Sani, Unnud, Buhseen, Sohdi, Behdi, Teehun, Bhulleh, etc. The Rupshu people, again, are of a different race from the Bhot, and winter and summer live in their black tents with their flocks and herds of sheep, goats, and yaks. They are very ugly, with Tartar faces, and the men let their coarse black hair hang in one pigtail behind.

Amongst the commercial communities of the south of India are British, French, Parsees, Armenians, and Persian, Labbai and Moplah Muhammadans; also the entire Vaisya Hindus known as Komati and Chetty, the Marwari of North-Western India, and the Gujerati. In Central Asia the martial Lohanna are the great traders.

On the N., India has been in contact with several races, which have advanced into it and affected its ethnic character. But races may blend without the different types being effaced, and while certain exclusive or excluded castes or sequestered geographical sections of the population may preserve one type better than another, all may continue for some thousands of years to be reproduced in softened and modified forms even in the least secluded positions. The physical characters of a race constitute the race; language is a mere acquirement. Races and languages must be classified independently of each other. Dolichocephalic and brachycephalic tribes are found among all races, nor are the peculiarities of the hair a sufficient foundation for a truly scientific classification. Friedrich Müller and Häckel, relying on trichological and glottological indications, proposed a division of the human race into 12 races, and of language into 100 families. But Lepsius showed, on the authority of A. B. Meyer, the absence of Büschelhaar among the Papuans, and the complete divergence of the grammars of the Hottentots and Papuans, which Friedrich Müller feels inclined to refer to one and the same class. Some of the races occupying the south-east of Asia have obtained their present positions as immigrants, others seem to have been thrust into them by wars, but of the origin of many of them there is no record.

The earliest political change to which we can go back in the history of the Indian Peninsula is the expedition of Rama into the forests of Dandakaranya, an event coeval with the hero-worship of the Pandava, and the myths of the Mahabharata and Ramayana. The Aryan expedition of which Rama was the leader, scattered the aboriginal races, styled Rakshasa or demons, driving some into the mountain and forest retreats, where we still find them living in barbarous freedom, and reducing others to the state of agrarian slavery in which we see the Pariah, Puller, Chamar, and other helot races residing in the plains. Each province has still its peculiar race of helots; each range of mountains and every tract of forests its own tribes of wild savages, either wholly independent, or partially subject to their more civilised neighbours in the open country. From the Pahari (undoubtedly a remnant of the great Dravidian family) of the Rajmahal Hills on the banks of the Ganges, through the extensive regions of Gondwana, embracing the Khond, Saurah, and Chenchwar of the Eastern Ghats, the Yanadi, Irular, Kurumbar (at one period apparently a numerous and powerful race) in the midland provinces, to the Bedar, Maravar, Kallar, and several tribes comprised under the general term of Maleali, or mountaineers, in the south, we find an infinite succession of races professing customs and speaking languages differing, and in many instances distinct, from those of the modern Hindus. The same peculiarities may be observed in several of the homeless castes roving over the plains in the more civilised portions of the country, such as the Korchewar, Waddewar, Yerkali, Dumar, Pardi, etc. A careful and systematic investigation of these remnants of the former population, of their customs and religious observances, etc., with the preparation of copious vocabularies of the peculiar dialects or jargons in use amongst them, are among the most important objects to which attention should be directed, because the study of these tribes, of their language, manners, and customs, form nearly the only available source from which we can glean a knowledge of the earlier inhabitants of India.

The various tribes inhabiting the Indian desert and the valley of the Indus would alone form an ample subject of investigation. Near the Indus, the Soda, the Kat'hi, and the Mallani afford, in

history, position, and nominal remembrance, grounds for inferring that they are the descendants of the Sogdi, Kat'hi, and Malli who opposed the Macedonian in his passage down the Indus; swarms of Gete or Yuti have assumed the geueral title of Baluch, or retain the ancient specific name of Numri; while others, in that of Jut, preserve almost the primitive appellation. There are remains of the Johya and Dahya, as well as of the Gete or Jut, and Hun, who hold places amongst the thirty-six royal races of ancient India, though these, with the Baraha and the Lohana, tribes who swarmed a few centuries ago in the Panjab, are now only to be discerned in small numbers in the Marust'hali or 'the region of death,' which has even preserved the illustrious name of Kaorwa, Krishna's foe in the Mahabharata. The Sahrai, or great robber of the western desert, the enemy of all society, is also there, and the Hindu Bhatti, Rahtor, Joda, Chauhan, Mallani, Kaorwa, Johya, Sultano, Lohana, Arora, Khumra, Sindil, Maisuri, Vishnuvi, Jakhur, Shiag or Ashiag, and Poona. Of the Muhammadan tribes there are two, Kullora and Sahrai, concerning whose origin doubt exists, and the Jut, Rajur, Oomra, Soomra, Mair or Mer, Mor or Mohor, Baluch, Lumrea or Looka, Sumaicha, Mangulia, Baggreah, Dahya, Johya, Kairooe, Jangurea, Oondur, Berowee, Bawuri, Tawuri, Chreudea, Khossa, Sudani, and Lohana are nyad, or proselytes, chiefly from Rajput or other Hindu tribes.

The Jut does not occupy Lower Sind, and they are not found in Gujerat. The Jut is, however, the prevailing population in all Upper Sind, aud their tongue is the language of the country. They were once the aristocracy of the land, but latterly have been dominated over by other races, and thus have lost somewhat of their position as the higher classes of the society. Iu the south and west of the Panjab, too, they have long been subject to Muhammadan rulers. But latterly, as the Sikh, they became rulers of the whole Panjab and of the country beyond as far as the Upper Jumna, in all which territories they are still in every way the dominant population.

In the earlier ages there were two chief Rajput races in Hindustan, viz. the Surya and the Chandra, to which were added the four Agnicula,—in all six. The other races were subdivisions of the Surya and Chandra, or the Sacha of Indo-Scythic origin, who, before the Muhammadau era, found no difficulty in obtaining a place, though a low one, amongst the thirty-six regal races of Rajasthan.

The Ganges valley seems to have been peopled by several races long before the Aryau Hindus arrived there, and all the conquerors who have entered India from the north-west have striven to occupy the fertile valley of this great river. Hindu poets have celebrated its praises in a multitude of songs; the river is fabled in their mythology to be the goddess Ganga; they long to see it, to bathe in its waters and be purified from their sins, and at last to die on its banks, or to have their bones conveyed to it from the most remote parts of India. No Hindu raises such a question as in 2 Kings v. 12, for the Ganges is recognised as the most efficacious of all the Hindu sacred rivers. On its banks have dwelt the chief of the religious reformers whom India has seen. Its valley was the cradle of Buddhism, which, from its rise in the sixth century before Christ, gradually spread over the whole of India, was extended by Asoka to Kashmir and Kābul shortly after Alexander's invasion, and now prevails amongst many millions of men. Numerous dynasties have ruled there. The Andra race was in power in the Gangetic province of India about the beginning of the Christian era, but the most enduring was the great Kshatriya family that long ruled at Indraprastha, and termiuated with Prithiraj in A.D. 1193, when overthrown and slain by Shahab-ud-Din, Ghori.

In the northern border districts of British India, into which intruding races have come, the distinctions of nationalities are very marked. In the vicinity of Darjiling are Muhammadan and Hindu uatives from the plains of India; the Bhutia from Bhutan, Tibet, and Sikkim; the Lepcha and the Mechi. The Lepcha have uo religious or race distinctions, but they speak of themselves as belonging to the clans Burphung phuho, Udding phuho, Thurjokh phuho, Sundyang, Sugut, Tungyeld, Lucksom, Therim, and Songme. Captain J. D. Herbert observes of them, that at his first interview with the Lepcha, he saw that they were the same people whom he had met with at Nialang, at Jahnabhi, at Shipchi on the Sutlej, in Hangrang, and at Lari in Ladakh. They are, in fact, the people who have beeu called Chinese Tartars, and of the same race as the Tibetans, being a family of the great division of Eleuth Tartars or Kalmuk.

The people of Nepal arrange themselves into many sections, viz. Gurrung, rear sheep; Gallia, rear buffaloes; Kami, blacksmiths; Sarki, tanners; Newad, shopkeepers; Domai, tailors; and the Murmi, Yakka, Mungar Brahman, Khumbhu, and Nimbhu, who are priucipally cultivators.

In the plains of the Darjiling district, the Rajbansi aud Bengali are in equal numbers. The Rajbansi are Koch or Cooch of the same descent as the raja of Koch-Behar. Hence they call themselves Rajbansi.

The Mechi inhabit that portion of the Terai which lies under the hills. They are migratory, and live by cultivating the virgin soil; they have no caste distinctions.

In the Assam valley on the N.E., and in Cutch, Gujerat, and Kattyawar on the N.W., are many tribes disclaiming all national or race connection with each other, neither intermarrying nor partaking of each other's meals, and following different avocations, each of them assimilating in their physical appearance to the types of the races of which they are offshoots.

The inhabitants of the Archipelago form three great races, different in their physical aspect and in their moral character,—the Malay, the Papuan, and Polynesian. Ethnologists have not yet fully agreed as to their origin, nor even as to the names by which they should be designated. The Polynesian race extend from Marianna to Easter Island, and from Hawaii to New Zealand, with no greater variety in the language than is to be met with iu European tongues derived from the same source. The Malay seem to have spread from Sumatra into the Malay Peninsula, and eastwards into the Archipelago, occupying much of the littoral of its more westerly islands. The physical conformation of the Papuan, and particularly the squareness of his head, distinguishes him from

the African Negro. The Papuans of New Guinea have, almost generally, the woolly hair, sometimes frizzled, and occasionally in pipe-like knots, thick lips, and squat noses; while their colour ranges from the sallow hue of the Sandwich islander to the dark copper of the Bornese. The face is suggestive of the Mongol type, being square and angular; and in many parts of the island of New Guinea the obliquity of vision common to the Chinese is apparent. Coming in all probability from one of the small western islands in the route from the north-west or the Moluccas (originally peopled from the Philippines), the Papuan race are found to spread over a large area, and extend round the Caroline Islands. Blaksland states that the geographical boundary of the Papuan is coincident with the north-west monsoon, which may be described as extending from the equator to 10° or 15° north latitude, and in longitude from Sumatra to the Fiji Islands, from which circumstance and their ignorance in navigation the inference is that they have travelled from the west into the Pacific only so far as the prevailing winds allowed.

Sturt thinks it is difficult to determine 'from what race the Australian sprang, for there is not one of the great families into which the humau race has been divided with which they may be properly classed.' Strzelecki, who mixed among the Australian tribes of the greatest diversity, says: 'In his physical appearance he does not exhibit any features by which his race could be classed or identified with any of the generally known divisions of mankind.' Perhaps the most practical account is that given by Wilkes, who, in his American Exploring Expedition, says: 'They differ from any other race of men in features, complex habits, and language; their colour and features assimilate them to the African type, their long black silky hair has a resemblance to the Malay, their language approximates to the American Indians, while there is much in their physical traits, manners, and customs to which no analogy can be traced in any other people; their most striking distinction is the hair.' The Chinese, the Malay, and the Celebians have for ages visited the south-eastern islands of the Indian Ocean, and had their stations on the Australian coast, trading with the inhabitants, and conveying from thence cargoes of trepang, shells, etc.

The Mongolian, whether Scythian, Turk, or Tartar, is without imagination or strong reasoning powers, but is intrepid in danger, steady in purpose, overcoming all opposition, despising his fellows, a great conqueror. Such has been his character as long as history has recorded his name; he appears to have been made to command and to oppress. We find him in the infancy of the human race, as well as at later periods, descending from his far-distant mountains, emerging from the great deserts in Central Asia, and overrunning the most wealthy, the most mighty, or the most civilised of nations. He exercises power as his peculiar privilege and right.

The Shemite, says Layard, whether Hebrew, Arab, or Syrian, has a brilliaut imagination, ready conception, a repugnauce to any restraint that may affect the liberty of his person or of his intellect. He conceives naturally beautiful forms, whether they be embodied in his words or in his works; his poetry is distinguished by them, and they are shown even in the shape of his domestic utensils. This race possesses in the highest degree what we call imagination. The best character of the Bedouin, says Burton (Pilgrimage, p. 44), is a gentleness and generosity. The Shemite, says Layard, shows a ready eloquence; his words are glowing and apposite; his descriptions true, yet brilliant; his similes just, yet most fanciful. These high qualities seem to be innate in him. The three great monotheistic systems which have divided the civilised world, came forth from nations of Shemite origin, among whom arose the priests or prophets of all those nations who hold the unity of God. In the south and east of Asia are representatives of those three great religions, Jews, Christians, and Muhammadans, as also a race, the Parsee, following the fire-worship, which seems to have been a corruption of the doctrines taught by Zoroaster.

Buddhists in Ceylon, in the Trans-Gangetic countries, and in those north of the great Himalaya, are very numerous, and follow several philosophies. Aryans of India, who pursue a worship of nature, of spirits, or demons, and have adopted physiological doctrines as revelatious, worshipping deified mortals and heroes, and believing iu many incarnations of Siva and of Vishnu, are spread all over India, and have imparted to its prior occupants a considerable acquaintance with their religious books. These prior peoples constitute the bulk of the inhabitants of British India, and have merely added on to their own nature and spirit and devil worship some of the legends and philosophical views of the Aryan Hindu; and amongst the professors of Hinduism are a multitude of sects worshipping Siva, or Vishnu, or Brahma, or all of these, or their incarnations, or the mere vikrama or idol of stone or wood or brass, with or without form. A body of religionists, the Sikh, considerable from their activity and their late political power, converts from the Jut or Gete races in the Panjab, have adopted doctrines partly obtained from the monotheistic Muhammadaus, and partly from the Aryan Hindu; but though their faith is only about 200 years in existeuce, they too have broken up into several sects. The great mass of the Indiau people are of non-Aryan origin, and follow religious rites and customs the origin of which is quite unknown.—*Tod's Rajasthan*, ii. 317; *Captain Herbert at* p. 939, *Gleanings of Science; Heber's Journal*, i. 195; *Mrs. Hervey, a Lady in Tartary*, ii. 5; *Gentleman's Magazine; Layard, Nineveh*, ii. 239; *Burton's Mecca*, iii. 44.

RACHA, also called Rachewar and Rachevadu and Rajwar, a martial race of the Northern Circars, who claim to be descendants from Kshatriya Hindus. They are a brave race, with a high sense of honour.

RACHENARA, in Coorg a sect of the lingaet religiouists.

RACKA NASTA. Can.? Stunted teak; a forest term.

RACONDA RUSSELLIANA. *Gray.* A fish of the Indiau seas, from 4 to 6 inches in length. At Penang, numerous at all seasons, although less so than they are at the Sandheads and the mouths of the Ganges. The Bengal fishermen denominate the species, Potassah, Fessah or Phasah. Fessah or Phasah in Bengal is a generic term, but particularly applied to Engraulis phasah, *Buch.*,

and E. telarah, *Buch.* It is a heavy swimmer, and, like the rest of Clupeoidæ, expires immediately on leaving its element. It is chiefly consumed in a dried state.

RADHA, the celebrated mistress of Krishna; she was the wife of Ayana-Gosha, a cowherd of Gokal, with whom she lived within a forest near the Jumna; she was one of Krishna's favourite mistresses, the chief of the Gopi or nymphs of Vrij. She has been deified by the Hindus, and her image is set up in the temples, and worshipped at the festivals with that of Krishna, being considered an incarnation of Lakshmi. In Hindu poetry Radha occupies a prominent place. Her parents were Vrisha-bhanu and Kiritidha. She is also called Kalavati. In the Indian Song of Songs, nothing can be more graceful and delicate than the shades by which Krishna is portrayed in the gradual process of being weaned by the love of

'Beautiful Radha, jasmine-bosomed Radha,'

from the allurements of the forest nymphs, in whom the five senses are typified. As he is playing with them in the deep green wood,

'In the early days of spring,
When every wind from warm Malay brings fragrance on its wing,'

suddenly glides Radha into the circle,

'And all among those damsels free and bold
Touched Krishna with a soft mouth, kind and cold;
And like the others leaning on his breast,
Unlike the others left there Love's unrest;
And like the others joining in his song,
Unlike the others made him silent long;'

she leaves in him the sense of a trouble, of a longing, which all the blandishments of his wood-nymphs cannot soothe away. He bids farewell to his more earthly pastimes:—

'We will play no more, beautiful shadows!
A fancy came solemn and sad,
More sweet with unspeakable longings
Than the best of the pleasures we had:
I am not now the Krishna who kissed you;
That exquisite dream,
The Vision I saw in my dancing,
Has spoiled what you seem.'

He is shamed and penitent at having declined upon a lower passion from an affection once within his reach, so infinitely more complete.—*Arnold.*

RADHA, wife of Duryodhana's charioteer, and nurse of Kerna, whom she reared as her son, after he was exposed on the banks of the Yamuna by his own mother.—*Tr. Hind.* i. p. 34.

RADHA-KUND, four miles from Govardhan, the hoary and holy mount connected with the richest associations of the Hindus, and beheld by them with an absorbing interest. The Greeks had their Olympus, and the Hebrews their Sinai; the Jain sect have their Parasnath, the Saiva Hindu their Kailasa, and the Vaishnava Hindu their Govardhan. The Christian pilgrim to Judea sees Bethlehem and Jerusalem, and then goes to Sinai. The Vaishnava pilgrim in Vrij sees Muttra and Brindaban, and then goes to Govardhan. Govardhan is the Parnassus of the Hindus. Indeed, taking Krishna for Apollo, the Gopini for the Muses, and the Mans-ganga—a large, beautifully infaced tank—for the fount of Castalie, it out and out justifies the comparison. The especial holiness of Govardhan is owing to its being the first scene of Krishna's apotheosis. It was upon this mount that the first image was raised to his worship under the name of Govardhannath. The great annual mela or religious fair of Ana-kut at Govardhan, first instituted by Vallabha, generally takes place in the month of Kartika, and not less than a hundred thousand people assemble. It celebrates a pastoral incident in the life of Krishna, and throughout all Vrij the horns of the cattle are painted red with vermilion, and those of a cow are occasionally seen covered with silver leaf. Radha-Vallabhi is the name of a sect of Vaishnava Hindus, literally the lord and lover of Radha, whose worship is paid to Krishna on account of his favourite mistress Radha. Radha is the object of adoration to all the sects who worship that deity, and not unfrequently obtains a degree of preference that almost throws Krishna into the shade. This sect was founded at Brindaban, in the 16th century, by Hari Vans. Radha Vallabhi are two Sanskrit words, from Rad'h, to accomplish, and Vallabha, beloved. Mr. Sherring, however, says the Radha-Vallabhi were founded by Vallabhacharya, and worship Krishna and Radha conjointly. They profess high ceremonial purity, do not eat fish or flesh, nor drink spirits, and worship Krishna frequently during the day, but taking great interest in all tales of the lila or sports of Krishna and the Gopins. They are termed Jhanki. They are burned when dead.—*Tr. of Hind.* ii. p. 111; *Sherring's Castes*, p. 251.

RADHANPUR is held by the Babi family, who, since the reign of Humayun, have always been prominent in the annals of Gujerat. It is stated formerly to have been in the possession of the Waghela, and to have been called Lunawara, after Waghela Lunâji of the Sardhara branch of that tribe. The first Babi entered Hindustan in the company of Humayun. Bahadur Khan Babi was appointed Faujdar of Tharad in the reign of Shah Jahan; and his son Sher Khan Babi, on account of his local knowledge, was sent to aid Prince Murad Baksh in the government of Gujerat. It is a native state in the Bombay Presidency, lying between lat. 23° 26′ and 23° 58′ N., and long. 71° 28′ and 72° 3′ E. The area comprises 150 villages in an area of 833 square miles, and has a population numbering (1872) 91,579, of whom 11,003 are Musalmans, and the rest Hindus.—*Imp. Gaz.* v. p. 11.

RADHI, a division of the Gaur Brahmans.

RADHOTSAVAM. TEL. Annual feast in honour of each local Hindu deity. It is a fair.

RAD-i-KUFR, part of the Muhammadan creed. Rad means repulsion, resistance, refutation. See Kalamah.

RADISH, Raphanus sativus.

Var. α. radiculata; *var.* β. niger.

This vegetable may be sown at the commencement of the rains, either in beds broadcast, or on ridges of beds where other vegetables have been planted. In the rainy season they grow better on the ridges. The seed should be trodden in or beaten down, and then a good watering given to

them. When about 3 inches high, carefully thin, leaving at least a space of five fingers' breadth between each plant. They take from three to five weeks to come to perfection, and require a good share of watering. The turnip radishes are of various colours,—white, red, Spanish black, round, purple; also long white, red, and purple. The red, white, pink, and purple turnip varieties succeed best on the plains, the black Spanish R. niger is of little value; the seed-pods when young make excellent pickles. The horse-radish is Cochlearia armoracea, *Linn.—Riddell; Jaffrey.*

RAE, Rae-Raian, Rao, Raja, Maharaja, Rana, Maharana, are Hindu titles.

RAEEN, a tribe following Muhammadanism in the Panjab, who are said to have come from Sind and Jeysulmir. They are skilful cultivators; they dress as Hindus. They are politically insignificant, but are to be found in the vicinity of all great cities. Unrivalled as market gardeners, they carry on an elaborate and perfect cultivation.

RAFAI, an order of Darvesh in Muhammadan countries. In Egypt they let their hair grow long, and dress in long-skirted outer coats. In their religious ceremonial services, called zikr, they whirl round and round, sway their heads to and fro, proclaim aloud the name of God and his unity, Allah, Allah, and exclaiming La illah il Allah, as they whirl round with a velocity such as to extend the garment with centrifugal force. In their services, the zikr occasionally become ecstatic or malbus, and occasionally epileptic seizures occur. From their cries, Europeans have styled them the Howlers, but their religious services are such as are alluded to in 1 Samuel x. 5–11. See Majzub; Malbus; Zikr.

RAFFICKEE, a plant; from the fibres of its bark the Lepcha near Darjiling make remarkably light and strong fishing-nets.

RAFFLES, Sir THOMAS STAMFORD, author of the History of Java, Lond. 1817, 2 vols. 4to, and other valuable works on the Malay Peninsula. He was one of the most remarkable of the many distinguished men who have risen from the ranks of the East India Company's Civil Service. He was the founder of Singapore, and one of the best and most astute of the governors of smaller Eastern British dependencies. He was born at sea near Jamaica, on the 5th of July 1781. From his infancy he was accustomed to an adventurous life. His father, Benjamin Raffles, was one of the oldest captains in the trade of those seas out of the port of London. Placed at an early age at a school in Hammersmith, at fourteen he was placed as an extra clerk in the East India House, but he did not abandon learning. His leisure hours were never idle; and when, in 1805, the Court of Directors resolved on consolidating the establishment at Penang, he was named Assistant-Secretary, and towards the close of that year he arrived in the Indian Archipelago. Whilst the whole E. Archipelago was under British domination, he was Governor-General, and resided near Batavia from 1811 to 1816, and from 1818 to 1824 he was Governor of the British possessions of Sumatra. During his visit to London, before coming to Sumatra, he founded the Zoological Society, and was its first president, and he began the Zoological Gardens. When he sailed from Bencoolen, the ship took fire when about 50 miles from land, and all his official and private documents, all the living and mounted animals of Sumatra, were destroyed. Lady Raffles, his widow, wrote a memoir of her husband. She was the second wife of Sir Stamford, to whom she was married in 1817. Her maiden name was Sophia Hull; she survived her husband 22 years, and died on the 12th of December 1858, aged 72, at Highwood, near Hendon, Middlesex, an estate purchased by Sir Stamford shortly after his return to England in 1824.—*St. John's Indian Archipelago,* ii. p. 44; *Bikmore*, p. 488.

RAFFLESIA, a genus of stemless parasitical plants of the natural order Rafflesiaceæ. In Sumatra and Java the species known are R. Arnoldi, R. Patma, R. Cumingi, R. Horsfieldii, R. Rochussenii, all deemed to have astringent and styptic properties. R. Arnoldi, *R. Br.*, is a gigantic parasite, growing upon the stems of some of the vine order, Cissus angustifolia, in Sumatra. The flower measures from 3 feet to 3 feet 6 inches, and weighs 14 lbs. It was discovered by Dr. J. Arnold in 1818, on Sir Stamford Raffles' first journey from Bencoolen into the interior of Sumatra. Writing from Sumatra, on the Manna river, he says: 'One of the Malay servants came running to me with wonder in his eyes, and he pointed to a flower growing close to the ground under the rushes. The whole flower was of a very thick substance, the petals and nectary being but in few places less than a quarter of an inch thick, and in some places three-quarters of an inch; the substance of it was very succulent. A swarm of flies was hovering over the mouth of the nectary, and apparently laying their eggs in the substance of it. It had precisely the smell of tainted beef. It measured a full yard across, the petels being 12 inches from the base to the apex. The nectarium could hold 12 pints; and the weight of this prodigy we calculated to be 15 lbs.'—*Dr. Joseph Arnold; Jameson, Ed. Journ.*

RAFU. Hind. Darning. Rafu Karna, to darn; Rafu Kari, darning. Rafugar, a needle-worker who darns and joins shawls, etc., with the utmost delicacy.

RAFZI. Arab. The Shiah Muhammadan sect, regarded by the Sunni sect as heretics. See Shiah.

RAG. Hind. A vein; a flaw in a precious stone.

RAGA. Hind. A melody, a piece of music; in Hindu mythology, the Hindu modes, or melodies personified, six or more in number, and the Ragini are their consorts.

RAGA. Malay. A basket, a grain measure of the Sulu and Sunda Isles, in weight 53¼ lbs.

RAGHA, in Northern Media, the eleventh settlement of the Aryans (xii. verse 16). Ragha with the three races is doubtless the Rhagæ of Strabo and Ptolemy, the greatest city in Media, south of Teheran. This north-eastern portion of Media includes the passes of the Caspian. The possession of these passes was a protection to the other Aryans, and at the same time the key to the whole of Media, and therefore Persia. The district is called also Choana (Qwan). Ahriman established here unbelief in the spiritual supremacy of Zarathustra,—another schism, or at all events another portion of ancient Aryan history. See Aryan.

RAGHAVA, a name of the Rama Raghava Vilasa, a poem by Viswanatha on the life of

Rama. Viswanatha also wrote the Sahitya Darpana.

RAGHAVANSA, a celebrated poem by Kalidasa on the life of Rama. It is in 19 cantos, and has been translated into several of the European languages.—*Dowson.*

RAGHAVA-PANDAVIYA, a modern poem by Kavi Raja, which is in high repute, celebrating the actions of Raghava, a name of Rama. It recounts at once in the same words the stories of the Ramayana and of the Mahabharata, and the composition is so managed that the words may be applied to Rama or the Pandavas.

RAGHUGARH, native state in Malwa. The Chauhan Rajputs of Raghugarh are known by the name of Kychi, and are one of the oldest families in Malwa. In 1780, Madhojee Sindia stripped the family of their possessions, and imprisoned the Raja Bulwunt Singh and his son Jye Singh. Jye Singh maintained the war with Sindia till 1818, when he died, leaving his title to be disputed by two claimants, Dhokul Singh and Ajit Singh. The matter was complicated by disputes in the family, and at last, in 1843, with the consent of the British Government, arrangements were made, and Chuttersal got 32 villages, yielding 9000 rupees. Ajit Singh received 120 of the 204 villages originally granted to his family.

RAGI, Eleusine coracana, and Sawi, Panicum miliaceum, millets, will produce something anywhere, but the quantity of produce is exactly in the ratio to the goodness of the soil. Ragi pays tolerably even on the black soil which cannot be given to rice, on account of its situation not permitting the water to rest upon it. — *Dr. Marshall.*

RAGINI, music. In Hindu mythology, the thirty Ragini, or female passions, are the nymphs of music.—*As. Res.* i. p. 264.

RAGONATH RAO, also called Ragoba, the second son of Baji Rao, the first Peshwa. He was at one time much connected with the British, and was the father of the last Peshwa.—*Elphin.* p. 640.

RAGS.

Rags are used in the manufacture of paper. Rags and other paper-making materials are exported from India annually, value Rs. 1,72,114.

RAH. Pers. A road. Rah-dari, a guide. Rahzan, a highway robber.

RAHAL. Arab. A camel-load, about five cwt. Rahil, a traveller. Rahilah, a caravan.

RAHAN. Burm. A perfected Buddhist saint; a Phoungye, a Talapoin.

RAHASYA. Sansk. A mystical doctrine.

RAHAT. Konkan. The Persian wheel; also a spinning-wheel.

RAHIM. Arab. Merciful, an attribute of the deity.

RAHLAT. Arab. Departure by death. Muhammadans speak of Rahlat Farmana, to take a journey; Intikal Karna, to make a change; and Guzr-jana, to pass away.

RAHT, the country of the Chauhan Rajputs in the state of Ulwar.

RAHTOR or Rhator, a dynasty originally of Kanouj, afterwards continued in Marwar. They commence authentic history in A.D. 300? by Yavanaswa, prince of Parlipur, supposed of Indo-Scythic origin. In A.D. 1381, Chonda assaulted Maudor, and made it his capital. In 1680 was murdered Ajit Singh, in whose reign occurred the Rahtor conflict at Dehli, 4th July 1679 (7th Sravan. S. 1716), and the thirty years' war against the empire. He was murdered by his son. The Charan are the sacred order of the Rahtor country; the warlike tribes esteem the heroic lays of the bard more than the homily of the Brahman, and they hold lands, literally, on the tenure of 'an old song.' In Colonel Tod's time, the genealogical roll of the Rahtor was about 50 feet in length, commencing as usual with a theogony, followed by the production of the first Rahtor from the spine (raht) of Indra, the nominal father being Yavanaswa, prince of Parlipur. Of the topography of Parlipur, the Rahtor had no other notion than that it was in the north. The genealogies trace their pedigree to Kush, the second son of Rama, consequently they would be Suryavansa. But by the bards of this race they are denied this honour; and although Kushite, they are held to be the descendants of Kasyapa of the Solar race, by the daughter of a Dyte (Titan). The progeny of Hirna Kasyapa is accordingly stigmatized as being of demoniae origin. They, however, succeeded to the Lunar race of Kushnaba, descendants of Ujamida, the founders of Kanouj. Indeed, some genealogists maintain the Rahtor to be of Kusika race. The first locality of the Rahtor was Gadhipura or Kanouj, where they are found enthroned in the 5th century; and though beyond that period they connect their line with the princes of Kosula or Ayodhya, the facts rest on assertion only. In the period approaching the Tartar conquest of India, we find them contesting with the last Tuar and Chauhan kings of Dehli, and the Balica-rae of Anhilwara, the right to paramount importance amidst the princes of India. The combats for supremacy destroyed them all. Weakened by internal strife, the Chauhan of Dehli fell, and his death exposed the North-West frontier. Kanouj followed; and while its last prince, Jye-Chand, found a grave in the Ganges, his son Seoji sought an asylum in Maroost'hulli, the regions of death. Seoji was the founder of the Rahtor dynasty in Marwar on the ruins of the Purihara of Mundor. Here they brought their ancient martial spirit, and a more valiant being exists not than can be found amongst the sons of Seoji. The Moghul emperors were indebted for half their conquests to the Lakh Talwar Rahtoran, the 100,000 swords of the Rahtor. In less than three centuries after their migration from Kanouj, the Rahtors, the issue of Seoji, spread over a surface of four degrees of longitude, and the same extent of latitude, or nearly 80,000 miles square. The Rahtor has twenty-four sac'ha. The Rahtor of Bikanir are unchanged in their martial qualifications, bearing as high a reputation as any other class in India. The Rahtor of the desert have fewer prejudices than their more eastern brethren; they will eat food without inquiring by whom it was dressed, and will drink either wine or water without asking to whom the cup belonged. They would make the best soldiers in the world if they

would submit to discipline, as they are brave, hardy, easily satisfied, and very patient; but in the inordinate use of opium, and smoking intoxicating herbs, are said to exceed all the Chatis Rajkula, the thirty-six royal tribes of India. The piala or cup is a favourite with every Rajput who can afford it, and is, as well as opium, a panacea for ennui, arising from the absence of all mental stimulus, in which they are more deficient, from the nature of the country, than most of their warlike countrymen.—*Tod's Rajasthan*, ii. pp. 115, 196, 242; *Thomas' Prinsep.* p. 258.

RAHU. Hind. A large fish of the Ganges, which attains to upwards of 25 lbs.

RAHU, in Hindu astronomy, the moon's ascending node. The word is derived from a verb, literally meaning to abandon, void, hence also black, darkness, shadow, etc., and is represented in Hindu mythology as having no body, the umbra of the astronomers. The umbra may be said to devour, as it were, the luminaries. In a physical sense the Hindus consider it as one of the obscure planets, which occasion eclipses; but, according to their mythology, Rahu is the head of a monster, of which Ketu, the descending node, is the trunk. It is supposed by some commentators to be the Typhæus of Hesiod. Rahu is fabled to have been translated to the stellar sphere, and became the author of eclipses by occasionally swallowing the sun and moon. The origin of the hostility of Rahu to the sun and moon is this: When the gods were drinking the amrita produced at the churning of the ocean, Rahu, a demon, assumed the form of a god, and began to drink, when the sun and moon, in friendship to the gods, revealed the deceit. His head was then cut off by Vishnu, but, being immortal by having tasted the amrita, the head and tail retained their separate existence, and were transferred to the sky. The head became the cause of eclipses by its animosity to the sun and moon, and the tail became Ketu, or the descending node. 'And now thou fall'st a prey to death, like the full moon to Rahu's jaws consigned.'—*Williams' Nala*, p. 209; *Wilson, Malathi and Madhava*, p. 115. See Graha; Ketu.

RAHULA, son of Sakya the Buddha.

RAI, a town in the pashalik of Baghdad, in Irak-i-Ajam or Turkish Arabia, the birthplace of Razi. See Razi.

RAI BARELI, in Oudh, a town which gives its name to a revenue division comprising the districts of Partabgarh, Rai Bareli, and Sultanpur. The town is situated on the banks of the Sai, 48 miles south-east of Lucknow, in lat. 26° 13′ 50″ N., and long. 81° 16′ 25″ E. The population of the division is about three millions. Brahmans form the most numerous caste, next come the Ahir, Chamar, and Kshatriya.

RAICHORE, a town and a doab or mesopotamia in the centre of the Peninsula of India, in the dominions of the nawab of Hyderabad. The doab has an area of 6600 square miles, and a population of 500,000.

RAI DAS, founder of a Hindu sect called Rai Dasi. It is a sect of Vaishnava Hindus. Rai Das was originally a Chamar, one of the aboriginal tribes of India, who are labourers, leather workers, shoemakers, and in Ch'hattisgarh, largely farmers. His religious views were in accordance with the doctrines of Ramanand, and his followers are known as the Rai-das Panthi, Rai Dasi, and Sad'h Nami. Throughout India there is no more despised race than the Chamar. In the distribution of occupations, nothing has been left for them but the, in Hindu eyes, degrading handicraft of skinning dead cattle, which is so insufficient for their numbers, that the great majority of them are driven to earn their bread from hand to mouth by ill-paid day-labour. In the great isolated plain of Ch'hattisgarh, where the jungle has not even yet been thoroughly mastered by man, hands cannot be spared from agriculture simply to gratify social prejudices, and the Chamars, who make up some twelve per cent. of the population, are nearly all cultivators.

The creed adopted by them is the Sad'hnami or Rai Dasi, a branch of one of the most celebrated dissenting movements in Indian religious history, namely that of the Ramanandi. No images are allowed; it is not even lawful to approach the Supreme Being by external forms of worship, except the morning and evening invocation of this holy name (Sad'hnam), but believers are enjoined to keep him constantly in their minds, and to show their religion by charity. Even if the creed be weak as a moral support, it is strong as a social bond; and, no longer weighed down by a sense of inferiority, the Sad'hnami hold together, and resist all attempts from other castes to reassert their traditional domination over them. They are good and loyal subjects.—*Wilson's Religion of the Hindus*, i. p. 113.

RAIDRUG, a town in Bellary district, Madras, in lat. 14° 41′ 50″ N., long. 76° 52′ 50″ E.; population (1871), 7729. Consists of a citadel and lower fort, the latter containing the town, which is regularly laid out. The lower fort is guarded by a triple line of works, and a narrow pathway hewn in the rock leads from it to the citadel. At intervals along this path are gateways of solid masonry and fresh lines of fortification. The earlier Palegars of Raidrug were of the Boya race. —*Imp. Gaz.*

RAIGAR, in Mherwara, workers in skins and leather, also labourers.

RAIGARH, an old chiefship or native state now attached to the Sumbulpore district of Central India. It lies between lat. 21° 45′ and 22° 35′ N., and long. 83° and 83° 35′ E., and is bounded on the north by the native states of Sirguja and Gangpur under Chutia Nagpur, on the south by the river Mahanadi and the Sumbulpore khalsa, on the east by the zamindari of Jeypore or Kolabira, on the south-west by the zamindari of Chandrapur, and on the north-west by the feudatory state of Sakti under Bilaspur. The principal castes are agricultural,—Kolta, Agharia, Kanwar, Saonra, Gond, and Bhumia; besides Brahmans, Rajputs, Mahanti, with a fair proportion of artisans. A chief of Raigarh, as a reward for his fidelity and services, was declared to be under the special protection of the British Government. Population in 1872 was 63,304.

RAIIDÆ, a family of plagiostomous cartilaginous fishes, of which the common ray is the type.

RAIL, the Rallidæ, a family of birds. Of the short-winged rails unable to fly are the Weka rail of the Pacific islands, the Ocydromus Australis; Earle's Weka is O. Earlei of New Zealand, O. sylvestris is the wood-hen of Lord Howe's

island, and O. Lafresnayanus is the N. Caledonia rail.

RAILS and pondhi or cisterns were frequently constructed by the Buddhists of India in connection with their religious structures. The former have in many instances disappeared. They were erected round sacred trees, pillars, and temples. A beautiful specimen of one is at Sanchi. The cisterns were cut in the rock near the cells of the mendicants, and were fed by small channels, also rock-cut, obviously for the purpose of supplying the monks with one of the necessaries of life.—*Fergusson.*

RAILWAYS were first attempted to be introduced into India in 1845, by two companies, termed the East India and the Great Indian Peninsular Railway Company, but the projectors found it necessary to apply to Government for aid, and Government guaranteed 5 per cent. for a term of 99 years, giving the land. Sir Macdonald Stephenson, a civil engineer of Great Britain, in 1843 had suggested railways for India, during the administration of Lord Ellenborough, and Mr. Bird, his successor, took up the subject. It was not encouraged either by the Court of Directors or the London mercantile community. Subsequently, during Lord Hardinge's administration and on his recommendation, the Court of Directors granted the land for a line from Calcutta to Dehli, with a guarantee of 4 per cent. of interest on five millions sterling, and this was the first of the guarantees which have since been extended to canals, irrigation channels, and other railroads. The first to progress were the East Indian and Great Indian Peninsular Railways, when contracts were signed in August 1849. During Lord Dalhousie's administration, the railway schemes made progress, and on the 18th November 1852, Bombay saw the first passenger train run. On the 20th April 1853, Lord Dalhousie, in a minute, urged their extension for strategic purposes, and on political and commercial grounds, and he mapped out certain trunk lines.

In 1880, the railways were as under:—

Indian, runs up the valley of the Ganges from Calcutta (Howrah) as far as Dehli, with a branch to Jubbulpur; (2) the Great Indian Peninsula, which starts from Bombay, and sends one arm north-east to Jubbulpur, with a branch to Nagpur, and another south-east to the frontier of Madras; (3) the Madras line, with its terminus similarly at Madras city, and two arms running respectively to the Great Indian Peninsula junction at Raichore, and to Beypur on the opposite coast, with branches to Bangalore and Bellary; (4) the Oudh and Rohilkhand, connecting Lucknow and Moradabad with Cawnpur and Benares; (5) the Bombay, Baroda, and Central India; (6) the Sind, Panjab, and Dehli, consisting of three sections, one in Lower Sind, another from Dehli to Lahore, and the third from Lahore to Multan; (7) the South Indian; (8) the Eastern Bengal.

The Indus Valley Railway starts from a point six miles west of Multan on the Panjab Railway, and runs through Shujabad and Bahawulpur to Sukkur, and thence to Kotree.

The most important engineering works connected with Indian railways were on the Thul Ghat, by an incline of nine miles and a quarter, in the course of which the northern branch of the G. I. P. Railway attains an elevation of 972 feet. The southern branch is taken through the mountains of the Bhor Ghat, by an incline nearly 16 miles long, with a total elevation of 1831 feet, by a serious of cuttings, tunnels, viaducts, and embankments, which are only rivalled by those on the Thul Ghat.

The most important section, completed in 1870, was from Sohagpur to Jubbulpur on the G. I. P. line, by means of which railway communication between Bombay and Calcutta was established. Next in importance was the completion of the Sutlej bridge, by which Lahore and Dehli were joined. The year 1871 saw Bombay city joined to Madras by the linking together of the Madras and the G. I. P. railways at Raichore. Thus the system of trunk lines, originally laid down by Lord Dalhousie, may be regarded as completed. Commencing at Negapatam, the most southern terminus of the present Madras system, and proceeding by Bombay, Jubbulpur, Allahabad, and Lahore to Multan, on the Indus, a continuous length of about 2800 miles of railway was formed.

The cost of the several Indian lines varied considerably. The East Indian, 1503 miles, including 410 of double line, cost £20,000 per mile; the Great Indian Peninsular, 1280 miles, including 325 miles of double line, cost £18,360, and the Bombay and Baroda cost £18,720; but the Madras line cost only £12,300, and the narrow gauge South Indian £6780. The guaranteed companies have raised £97,173,822.

The eight great lines may be thus shown, viz.:—

The occasional showers which fall throughout the year in Britain are unknown in most countries in S. Asia, and the first particular to attend to in examining their climates in connection with their agriculture, is the season and the quantity of the periodical rains. It is these which regulate husbandry, and on which the temperature and succession of the seasons in a great measure depend. The globe is wrapped in a layer of air about 40 miles high; and the manifold climates of the world are caused by the mutual relations of this layer of air and sea and land; and the changes of weather, heat and cold, drought and rain, cloud and sunshine, calm and tempest, all depend upon the movements into which it may be thrown. When its temperature is lowered, the moisture in the air falls in rain, hail, or snow. In the tropics the sun's rays fall more vertically on the air than elsewhere, and its rarefied particles constantly rising form a column ever moving towards the poles. To fill the vacuum thus caused, the denser air from the frozen poles rushes down over the surface of the globe towards the equator, and hence result the great polar and equatorial air currents, the direct courses of which, between the poles and the equator, are bent by the revolution of the earth on its axis, in the northern hemisphere into the north-east, and in the southern into the south-east trade-winds or vents alises. 'The wind goeth towards the south, and turneth about unto the north, it whirleth about continually, and returneth again according to its circuits.' The land becomes hotter and hotter more quickly under the sun's rays than the sea does, and the consequence is that when the sun becomes vertical over any portion of the land it draws the surrounding air to a focus there; and in this way in every latitude the great primary world-winds and rains are broken into secondary or local winds and rains, producing the differences in nature and time of the climates which prevail over the globe. Owing to the excess of land in the northern hemisphere, the constant belt of rain, where it exists between the trades, instead of corresponding with the equator, lies a little to its north, and the moisture gathered by the south-east trades only falls in rain when it reaches the tropic of Cancer, thus compensating the northern hemisphere for its want of evaporating surface. Similar modifications and compensations on a smaller scale occur in regard to each of the trades separately, as the sun successively traverses the north and southern ecliptic.

In the tropical zone, the chief rainfall season occurs shortly after the sun attains its greatest altitude; so that on and near the equator there are, as a rule, two seasons of maximum rainfall, and in the vicinity of the tropical circles the chief rain falls in the later summer months. In India, owing to its forming the southern extremity of a continent which extends far into the tropical zone, the periodical rainfall extends far to the north of the tropic of Cancer, with all its characteristic tropical features.

In the greater part of extra-tropical India, the rains of the later winter months, although much less copious, are scarcely less important to agriculture than those of the summer monsoon. This remark is especially applicable to the Panjab, the N.W. Provinces, and the Northern Dekhan. The cause of these winter rains of India is not well understood. They are supposed by Mr. H. F. Blandford to be brought from the sea by temporary winds.

In Assam and Bengal, and to a certain extent in the lower part of the N.W. Provinces, and in the Central Provinces to the east of Nagpur, as well as in the Peninsula farther south, some rain falls in the spring months. In the greater part of India proper these spring rains fall chiefly in little local storms, occasionally in the form of hail, but in Eastern Bengal and Assam the fall is more abundant and continuous. It begins in the latter part of March, and becomes more frequent and copious in the subsequent months, so that it eventually assumes the character of the monsoon rains; and it may be said that in the provinces of Eastern Assam and Bengal the monsoon rains set in six weeks or two months earlier than in the more western provinces. Lastly, in the Carnatic, the principal rainfall occurs at the close of the summer monsoon. But while the rains of this monsoon are falling heavily in N. India and on the west coast of the Peninsula, the plains of the Carnatic receive but a few occasional showers; and it is not until October, by which time the rains are over in Northern India and have almost ceased in Bengal, that the monsoon wind of the Bay of Bengal recurves, and, blowing as an east and north-east wind on the coast of Madras, carries to that part of the Peninsula the heaviest rain of the year. The amount of rain is very different in different parts of India, more so than in any other parts of the world. If it were equally distributed over the whole country, it would, omitting Lower Bengal and Assam, form a sheet of water about 35 inches in thickness (average rainfall 35 inches). In some parts of Cherrapunji the annual fall amounts to 400 inches; while at Jacobabad and Sehwan the average does not exceed four or five inches, and in Sehwan in 1880 it was less than one inch. In the southern slopes of the Himalayas it is about 75 inches, while in Western Rajputana, Sind, Cutch, and the Lower Panjab, it averages less than 15 inches in the year. In the western half of the Dekhan, on the Mysore plateau, and in the zone of country extending from Gujerat up the Aravalli mountains through Eastern Rajputana and the Gangetic Doab to the Panjab, the rainfall varies from 15 to 30 inches. But on some parts of the Western Ghats, as at Mahabaleswar and Matheran, the annual average is not less than 250 inches; while within a few miles to the castward the rainfall rapidly diminishes, so that at Poona it is only 31 inches, and the Western Dekhan plateau, which stretches away to Sholapur and beyond, has less than 30 inches.

On the N.W. frontier of British India, including the southern half of the Panjab and all Sind, there is an arid region, where the normal annual rainfall is less than 15 inches, and irrigation is indispensable to cultivation. It embraces the area between lat. 23° and 33° N., and from the mountains of Baluchistan in long. 60° across the Indian desert to near Lahore on the north, Dehli in the east, also Ajmir, the Aravalli mountains, and the Runn of Cutch on the south. On the N.E., E., and S.E. of that arid region is a belt of scant

rainfall from 100 to 200 miles wide, embracing the Safed Koh (14 in.), Lahore (16 in.), Dehli (24 in.), Agra (27 in.), Ajmir (18 in.), and Kattyawar, on which between 15 and 30 inches annually fall. And farther south, in the interior of the Peninsula, in the elevated tract from 1200 to 2400 feet above the sea, between the Eastern and Western Ghats, at a distance from the two seas, and extending from Nasik on the north to Cape Comorin, is a dry region with a rainfall of from 20 to 30 inches, embracing Bellary (22 in.), Bangalore (35 in.), Palamcotta (22 in.).

Along the upper part of the valley of the Ganges, in Central India, and on the eastern coast of the Peninsula, the rainfall ranges from 30 to 60 inches. In the deltas of the Ganges and Mahanadi, rain falls to the extent of 60 to 75 inches, and along the western coast of the Peninsula of India, between the Syhadri mountains and the sea, also on the southern slopes of the Himalaya, along the valley of the Brahmaputra, in Arakan, and the delta of the Irawadi, the rainfall ranges from 60 to over 200 inches.

The chief fall occurs between May and October while the S.W. monsoon is prevalent, except on the S.E. part of the Madras coast, where heavy rains fall from October to December while the N.E. monsoon blows, and showers occur from Christmas time to February in most parts of India. On the Western Ghats and in the tract between them and the sea, the fall is from 70 to 100 inches, and as much as 250 inches on the west face of the mountains. Along the east coast of the Bay of Bengal, in the eastern districts of the Bengal Presidency, and along the foot and outer slopes of the Himalaya, it is 100 inches or more.

It may be said generally that India east of the 80th meridian has a rainfall of more than 80 inches; but less than 30 inches falls in the Panjab, over a considerable part of the N.W. Provinces, over a large part of Rajputana and Kattyawar, and in almost all the Dekhan and Mysore.

In the southern portion of the Panjab, and in Sind and the most westerly part of Rajputana, the rainfall is less than 15 inches, and these are either actual desert, or agriculture is impossible without artificial irrigation.

The regions which suffer most from droughts and famines have average rainfalls between 20 and 35 inches, and in all of them seasons of scarcity or famine often recur. In these regions occurred the great famines of 1837–38 in the N.W. Provinces, of 1868–69 in Rajputana, and of 1876–77 over nearly the whole of the Peninsula of Southern India, and mainly due to failure of S.W. monsoon.

The eastern districts of Bengal and Assam, Burma, the strip between the Western Ghats and the sea, and the upper valley of the Nerbadda, have a rainfall sufficiently abundant to be exempt from all risk of drought, and Sind is protected by artificial irrigation from the Indus. On the other hand, droughts are of frequent occurrence—(1) in the west and the south parts of the N.W. Provinces, and that part of the Panjab east of the Sutlej; (2) in the west and north parts of Rajputana, and the central plateau which borders on the N.W. Provinces; (3) the districts of Bombay above the Western Ghats, and the districts of Madras above the Eastern Ghats, together with the southern and western region of Hyderabad and all Mysore, except the strip lying close along the Western Ghats; (4) the districts of Madras along the east coast and at the extremity of the Peninsula.

The rainfall in India proper fluctuates as much as 50 per cent. on either side of the average. In Madras, the average during the 66 years 1813 to 1879 was 48·51 inches, but in 1832 there fell 18·45 inches, and in 1827 the fall was 88·41 inches.

The rainfall at Bombay in the five months June to October during the 50 years 1817 to 1866 inclusive, ranged from 33·97 in 1824 to 121·98 inches in 1828.

In Calcutta the rainfall in the year averages 63 inches; but in 1837 only 43·61 inches fell, while in 1871 the quantity was 93·31 inches.

Bangalore, Mysore, Tumkur, and Shemoga are towns in the Mysore territories all of which are in the region of scant rainfall, and any failure of the rains involves dearth, even famine. In 1876 and 1877 the rains thus failed in Mysore, and upwards of a million of its people perished.

There is a rainless region about the Red Sea, because the Red Sea for the most part lies within the north-east trade-wind region, and these winds, when they reach that region, are dry winds, for they have as yet in their course crossed no wide sheets of water from which they could take up a supply of vapour.

In 1876-77, a year of a great famine in the Peninsula, there was an unusual northerly tendency on the winds all down the Peninsula. Cycles of variation are known to occur in the spottiness of the sun's surface, certainly one, the duration of which is about 11 years; and the inquiries of Mr. Meldrum have shown the probability that about the time when the sun is most spotted, the rainfall is about 15 per cent. greater than when it is least spotted. But inquirers have not been able to detect anything like a distinct cyclical variation amid the much greater variations that follow no such law.—*Famine Commissioners' Rep.; Madras Observatory Records; Moral and Material Progress; H. F. Blanford; Tennent's Ceylon; Hooker; Thomson's Travels; Maury's Phys. Geog.; Records of Trig. Survey.*

RAINBOW.

RAINI. HIND. A narrow bar of silver cast in a mould, designed to form a kandla.

RAIN-STONE, used by the Turk and Tartar tribes to conjure rain, is also known among the Kalmuk. This stone was called by the Turks Jadah (PERS. Yadah); perhaps the origin of the jade-stone? or may be connected with the Hindi word Jadu, conjuring, in common use in India.—*Quatremere on Rashid-ud-Din*, p. 428.

RAIN WATER.

Yu-shwui, . . . CHIN.	Ayer-sung-ei, . MALAY.

Rain falling in China during the dragon boat festival of the fifth day of the fifth month is called holy water, and is said to be cooling, sedative, and expectorant. Rain water falling at night is said to be anthelmintic. Spring rain water if drunk out of one cup by a man and his wife, they are said to bear many children. Snow water is deemed anthelmintic.

RAIPUR, a town in the Central Provinces of British India, in lat. 21° 15′ N., and long. 81° 41′ E., on a plateau 950 feet above the sea-level. It gives its name to a district extending between lat. 19° 48′ and 21° 45′ N., and long. 80° 28′ and 82° 38′ E., comprising the larger part of the tract known by the name of Ch'hattisgarh, together with a large area formerly attached to Sumbulpore, and a population of one and a half millions. It is about 150 miles in breadth from east to west, and 135 miles in length from north to south. Like the rest of Central India, Ch'hattisgarh seems to have been inhabited in the earliest times by Bhunjiya and other Kolarian races from the east. The population of Raipur has been recruited from all quarters; but the most important immigrants, and the earliest after the first great Gond invasion, came from the north. A few wild wanderers in the jungles came from the east, while from the south and west there has been a considerable influx of population. Of the immigrant tribes, the Kurmi, Teli, Lodhi, Chamar, Ahir or Gaira, Ganda, and Kanwar seem to have come from the north, though a large section of Teli and some few Kurmi have come from Nagpur. The greater number of immigrants from the south and west are the Halba from Bastar and Chanda, and the Mahratta race. The principal cultivating castes are Kurmi, Teli, Chamar, and Halba, though of these only the Kurmi and Teli are large landholders. The Brahmans in 1872 numbered 16,800; the mass of the Hindu population consisting of Teli, 161,276; Ahir or Gaira, 97,861; Chamars, 57,308; Dhimars, 53,212; Kurmi, 47,845; Native Christians in 1877, 319. The Kauwar, who supply the most trusted followers of the Haihai-Bansi kings, in 1872 numbered only 11,214. The Banjara in 1872 only amounted to 5474. The Satnami (113,786 in number) and the Kabirpanthi (64,979), Hindu sects who recognise no distinction of caste, are almost confined to Raipur and Bilaspur. They are recruited mainly from the Chamars, with whom the Satnami are often confused, but also from the Ahir and other castes. Like Rai Das, the founder of the Satnami, Kabir, whom the Kabirpanthi follow, was a disciple of Ramauand, and taught a similar doctrine. The Chamar lay claim to a very high antiquity among the inhabitants of the district. They have all joined the Rai Dasi sect formed by Rai Das, a Chamar or shoemaker, a reformer, and disciple of Ramanand, who is said to have lived about the fifteenth century in the country lying to the south of Oudh and in Rewa. The creed he preached seems to have been that adopted by Ghasi Das, the celebrated Satnami teacher, who started the great movement among the Chamar race about the beginning of the nineteenth century, and who seems rather to have revived the teaching of Rai Das than preached a new religion. The term of Satnami or pure name was that assumed by the followers of Rai Das. As Satnami, they are scrupulous about their eating, but slovenly and untidy in their habits, and the houses of even the wealthiest of them are usually hovels. They are generally industrious, though careless, cultivators, and frugal in the extreme, indulging in no extravagance in dress or jewellery. The dress of the men is commonly a single cloth, one end of which encircles their loins and another their head, and the women wear little or no jewellery; yet they rarely make money, and seem to want the talent of getting on in the world. Their villages are seldom prosperous, though some few malguzar form conspicuous exceptions to the rule. This apparent inability to improve their position is partly due to Hindu opposition, but one great cause seems to be their individual fickleness and want of perseverance. A very slight cause will send a Chamar cultivator away from his village, and though they generally return after a short interval, yet these migrations necessarily hinder the accumulation of property.

The *Ganda* or *Panka* are Kabirpanthi, or followers of Kabir, who is said to have appeared in the weaver caste, in the same country and at the same time as Rai Das, both being disciples of Ramanand, and their doctrines being similar in many respects. Though they cultivate the land, they are not generally esteemed as cultivators, while the few villages they hold as landholders are miserable in the extreme.

The *Kanwar* are usually looked upon as aborigines, and though their appearance and their

preference for the jungles to the cultivated tracts, as well as their abstinence from Hindu observances, would seem to point to this opinion, there is also some ground for supposing them to be Rajputs who settled in early times among the hills of the Vindhyan range, and so failed in becoming Hinduized like other warlike immigrants. They have always made a claim, though in a half-hearted way, to be considered as Rajputs connected with the Tuar tribe of the north-west, and their claim has certainly been recognised in one instance, as the first Kanwar chief of Narra received his estate as a dowry with the daughter of the Rajput chief of Khariar. The warlike traditions of the race are preserved in their worship of Jhagra Kandh or Jhagra Kandha, under the form of a sword, a form of worship not uncommon among Rajput tribes, and recalling to mind the sword which was the national deity of the Hun under Attila. The Kanwar of the present day are most peaceable and quiet, and when once fairly settled in a cultivated country, are industrious and good cultivators and landlords. In the jungles they have conformed generally to the customs of their neighbours, and worship Dula Deo and Burha Deo, as the Gond race also do; and they always seem to be ready to take up with the belief of those about them, though all of them, except the richer classes, who wish to be considered good Hindus, avoid Brahmans. They bury their dead, and marriages are performed before the elders of the village.

The *Halba* are immigrants from the south, and their principal colony is in the south-west, where they hold thirty-seven flourishing villages. They gain their living chiefly by distilling spirit, and worship deified distillers, at the head of whom is Bahadur Kalal. They are, next to the Teli, the best cultivators; except in the jungles, they have generally become Hindnized. All that is necessary for a good Halba is that he should sacrifice once in his life three goats and a pig,—one to each of the national deities, called Narayan Gosain, Burha Deo, Sati, and Ratna.

In the jungles also the old religion of the Gond tribe is disappearing, and while all the Gond worship Burha Deo and Dula Deo, the latter being the household god, they know little of Pauritola or Karitola, Barangasura, and Gumartola, who with Burha Deo form the distinctive gods of the Dhur Gond, to which tribe most of the Ch'hattisgarh Gond belong. They are all intensely superstitious, and worship local deities assiduously; though, except in the jungles, the Baiga or village priest, whose business it is to propitiate the evil spirits of the neighbourhood, is as often as not a Kewat, Teli, or Ahir, as a Gond.

The other aboriginal tribes are the Binjwar, Bhunjiya, Saonra, Nahar, and Kamar; of these the Binjwar are allied to the Baiga, who are found in the Mandla district. They chiefly live in the north-east of Raipur, and occasionally cultivate. The Bhunjiya are comparatively numerous all through the east of the district, and are particularly so in the Khariar and Bindra Nawagarh zamindaries, where they hold a good many fairly cultivated villages. The Saonra use only game. All these jungle tribes seem to have come from Orissa, and their dialects are all akin to Uriya. Except the Saonra, they all gain their livelihood more by collecting jungle produce than cultivation.

The *Beldar* of Uriya are tank-diggers by profession, and are all under the command of a chief called a jemadar, who holds three villages in the district. Under the jemadar are a number of naiks, each of whom has the command of a gang. These gangs have no settled home, but go wandering about the district wherever they can get work. —*Imp. Gaz.; Central Provinces Gazetteer.*

RAI RAIAN, a Hindu title next above that of rai. The third titular honour given to a Hindu. Rai raian and raja raian, meaning literally prince of princes, are titles bestowed on Hindu civil officers. See Rai; Raja.

RAIS. Arab. A ruler, a shipmaster, often written Reiss. Raisat means rule, dominion. The Raisani are the most respectable of the Saharawani tribes of Baluchistan.

RAISINS.

Raisins are grapes allowed to ripen and dry upon the vine. The sweet fleshy grapes which grow upon the sunny, sheltered slopes of hills are preferred. When the fruit is ripe, the grapes are thinned and the vine is stripped of its leaves. The sun then completes the saccharification, and drives off the superfluous water. When the bunches are plucked they are cleaned, dipped for a few seconds in a boiling lye of wood-ashes and quicklime; the wrinkled fruit is then drained and dried by exposure to the sun upon hurdles for 14 or 15 days. The finest sun-raisins are the plumpest bunches left fully to ripen upon the vine, after their stalks have been cut half through. An inferior kind of raisins is prepared by drying the grapes in an oven. They are distinguished by the places where produced or exported, as Malaga, Valencia, Persian, Smyrna, etc.; or from the variety of grape or mode of preparation, as muscatels, blooms, sultanas, be-dana, etc. Kismis sahz, or green raisins, are dried in the shade, and preserve a pale green colour; 4 seers or 8 lbs. are sold per rupee. Kismis sabz and kismis surkh are both varieties of the small raisin called in England the sultana, or seedless (be-dana) raisin. The Munakka of N.W. India are pudding raisins, large ordinary grapes, dried carefully in the sun, and sold at 3 seers per rupee. The Dagh are bloom raisins, prepared by dipping the finest bunches into a hot solution of lime and potash, and then dried in the shade.—*Waterston; Powell; Poole, St. of Com.; O'Sh.*

RAIVATA, king of Anarta, built the city of Kusasthali or Dwaraka in Gujerat, which he made his capital. He gave his beautiful daughter Revati to Bala Rama.—*Dowson.*

RAJ. Hind. A government, a kingdom, a principality, a rule, a dynasty.

RAJA, a title in India of independent Hindu sovereigns, but also bestowed on Hindu civil officers of rank. It is also held by the Malay chiefs of the Netherland possessions in the Archipelago. A lady of this rank is Raji. Amongst the Malay, Raja-muda is the heir-apparent to the throne. Raja Rajeshwari is from Raja-raj, king of kings, and Ishwari, a goddess. Rajarshi, from Rajan, a king, and Rishi, a sage. Raja Suya,

Sansk., from Rajan, a king, and Su, birth; and amongst ancient Hindu sovereigns was a sacrifice performed to indicate that the sovereign is supreme over other kings, is an emperor; a royal sacrifice performed as an assertion of sovereign supremacy, at a national banquet, combined with a religious significance, as a sacrifice to the gods. Maharaja, literally great ruler, is a titular distinction only applied to ruling Hindu princes of India. Rajadhi Raja, a supreme king of kings.

RAJAB. Arab. The seventh month of the Muhammadan year, also called Rajab-ul-Marajab, the sacred month, because during it, before the time of Mahomed, the Arab tribes ceased to war amongst themselves. Rajab salar ki Kundori, a Muhammadan ceremony.

RAJABANSI, in Rangpur, a low caste race engaged in agricultural pursuits.

RAJA DAKHINA RANJAN MOOKERJEE, one of the pioneers of female education in Bengal. The first Hindu female school in India for giving a liberal education after the European model, called the Victoria School, was established in Calcutta in April 1848, by J. E. D. Bethune, in Raja Mookerjee's house in Sukea's Street. Within a few weeks from the day of its commencement, there were enrolled among its pupils 70 daughters of the most respectable families in Calcutta.

RAJAGRIHA, or the Royal Residence, was the original capital of Magadha. It was also named Kusagarapura, and also Girivraja or the Hill Surrounded, which agrees with Hiwen Thsang's description of it as a town surrounded by mountains. On the death of Sakya, a synod of his disciples was held here; it consisted of 500 monks of a superior order. Its ruins are still visible in lat. 25° 0′ 45″ N., long. 85° 28′ E., between Patna and Gaya. The five hills surrounding the city are mentioned in the Mahabharata. The first, Baibhar, is the Webhars mountain of the Pali annals, on the side of which was the famous Sattapanni cave, where the first Buddhist synod was held in B.C. 543, after Sakya's death. The second hill, Ratnagiri, is the one called by Fa Hian the Fig-tree Cave, where Buddha meditated after his meals, identical with the Rishigiri of the Mahabharata and the Pandao of the Pali annals. A paved zigzag road leads to a small temple on the summit of this mountain, which is still used by Jains. The third hill, Bipula, is the Wepullo of the Pali annals, and the Chait-yaka of the Mahabharata.

Under the name Girivraja, Rajagriha is mentioned as the capital of Jarasndha, king of Magadha (B.C. 1426), mentioned both in the Ramayana and the Mahabharata. It is also described by Fa Hian and Hiwen Thsang, the Chinese Pilgrims; the latter gives an account of the hot springs found in this place. — *Fergusson; Cunningham, India*, p. 426; *Imp. Gaz.* See Rajgir.

RAJA-MARTANDA, an astrological work attributed to Raja Boja of Dhar.

RAJAMUNDRY, a town in the Madras Presidency, in lat. 16° 50′ N., and long. 81° 48′ 30″ E., on the left bank of the Godavery, 30 miles from the sea, and 565 miles to the north of Madras. Population (1871), 19,682. The district lies between lat. 16° 18′ and 17° 35′ N. The western parts are elevated and picturesque, and on the north-west are forest-clad mountains. Rajamundry was the capital of the junior or eastern branch of the Chalukya princes of Vengi, whose authority extended to the frontiers of Orissa. The kingdom of Vengi was established about A.D. 540, by the capture of the old capital of Vengipura, the remains of which still exist at Vengi, five miles to the north of Ellora, and 50 miles to the west-south-west of Rajamundry. About A.D. 750, Kalinga was conquered by the raja of Vengi, who shortly after moved the seat of government to Rajamundry. According to the chronicles of Orissa, the present town of Amaravati was founded or established as a subordinate seat of government by Surya Deva, raja of Orissa, in the 12th century. The name is connected with the worship of Siva as Amaranatha or Amareswara; and one of the twelve great linga of this god, which is assigned to Ujjain, almost certainly belonged to the holy city on the Kistna, as we know that Ujjain possessed its own famous temple of Mahakala, and that all the other shrines of Siva belong to different places. Chicacole and Rajamundry were the capitals of Andhra, and of a race of sovereigns anterior to the Christian era. The chief towns are Rajamundry, Samulcottah, and Coringa. The Godavery enters it through a gap in the chain, and passes through the district to the sea. At the village of Dowlaishwaram, in the delta of the Godavery, is a large anicut seven miles long.

RAJA PUTNI MULL built a bridge over the Caramnassa, the waters of which are deemed by Hindus injurious to their souls' safety. The same rebuilt a temple at Muttra which cost 70,000 rupees, made a stone tank there at a cost of three lakhs, a well at Jwala-Mukhi which cost 90,000 rupees; he spent 90,000 on a ghat at Hardwar, 60,000 on a serai at Brindaban. On these and other public works he spent eight lakhs of rupees, and Lord W. Bentinck made him a raja. He has recorded in four languages on this bridge the fact of his erecting it; the foundation had been previously laid by the prime minister of Poona, who spent three lakhs on it. The bridge was designed by James Prinsep.—*Cal. Rev.* No. 41; *Trav. of Hind.* i. p. 235.

RAJA-RAM, Bag'hel, protected the wife of Humayun, the emperor Akbar's mother.

RAJA'S CHOULTRY, immediately west of Madras, has extensive beds of clayslate, in which the brothers Schlagentweit discovered tertiary fossils. Underlying the sands and clays of Madras, and all along the sea-coast, is a bed of dark-blue tenacious clay, containing numerous fossils of existing species.

RAJA SEKHARA, a Sanskrit writer and dramatic author, who is supposed to have lived about the beginning of the 12th century. He wrote in Sanskrit the two dramas Viddha Salabhanjika and the Prachanda Pandava, also in Prakrit the Karpura Manjari.—*Dowson.*

RAJASTHAN or Rajputana is the collective and classical denomination of that portion of India which is ruled over by races who designate themselves Rajput or princes. In the familiar dialect of these countries it is termed Rajwarra, but by the more refined Raet'hana changed to Rajputana, the common designation amongst the British to denote the Rajput principalities. The chief divisions of this region are — Mewar or Udaipur, Marwar or Jodhpur, Bikanir and Kishengarh, Kotah, Bundi, or Harowtee; Amber or

Jeypore, with its branches, dependent and independent; Jeysulmir; the Indian Desert to the valley of the Indus.—*Tod's Rajasthan.*

RAJA TARANGINI, a history of the rulers of Kashmir, which commences with an account of the desiccation of the valley by Kasyapa muni, supposed to be Noah. It is in Sanskrit, and is the only Indian history of any antiquity. It contains the history of the princes of Kashmir for a period of 4000 years. A copy of it up to A.D. 1477 was presented to Akbar, who ordered it to be completed. The two words are Sanskrit, from Rajan, a king, and Tarangini, a river, a stream of kings. It is in four parts. The first was written by Kalhana, a pandit, and is the only truly historical work which any of the races of Hindus has produced. It is in Sanskrit metre. Kalhana is supposed to have lived A.D. 1158. He brings the history down to 1027. The two next portions bring the series down to about A.D. 1477, and are known as the Rajavali of Jona Raja and the Jaina Raja Tarangini of Sri Vara Pandita, a pupil of Jona Raja. A fourth portion was written so late as in the time of the emperor Akbar.—*Wilson's Kashmir; Tr. As. Soc.* xv. See Raj Taringini.

RAJAURI, Rajaori, or Rajapuri, a district in the Western Himalaya, lying between Kashmir on the north and Jammu on the south, between lat. 33° and 34° N., and long. 74° and 75° E. It is bounded on the N. by the Pir Panjal, on the W. by Punach, on the S. by Bhimbar, and on the E. by Rihasi and Aknur. In the 11th and 12th centuries it was an independent state. In the 15th century the Hindu family was dispossessed in favour of a son of the Muhammadan king of Kashmir; and his descendant was so reduced by Gulab Singh, that in 1846 he was glad to accept an estate in the British district of Kangra in exchange for his petty chiefship of Rajauri.—*Cunningham, India*, p. 130.

RAJAWAR, a widely-spread aboriginal tribe in Palemow, Singrowlee, and Rewa, westward in parts of Sirguja and Jushpur, and numerous to the N.E. in the parts of the plains adjoining the hills. They are the chief labouring class in the Gya district, near the hills. They live in villages as a kind of serfs and bearers of burdens, carry palanquins, and when out of employ are apt to be thieves and robbers.—*Mr. Campbell*, p. 37.

RAJAZ. ARAB. A kind of verse, a battle song or war song.

RAJ-BANSI is a title used by the people of Koch-Behar to designate themselves. They are Koch who have adopted many Hindu customs.

BAJ-BHAR, called Bharat and Bharpatwa, the Bhar of Northern India, an aboriginal race following the meanest of avocations, especially that of swine-herds. In the hills east of Mirzapore there are some Bhar rajas. Tradition ascribes to them the whole country from Gorakhpur to Bundelkhand, and many old stone forts. Professor Wilson supposes it possible that the name comes from Bharata, an ancient name of India.—*Wilson's Glossary.*

RAJ-CULA, the Chatees Raj-cula, are the thirty-six royal races of Rajputs.

RAJ-DWARA, SANSK., literally the royal gate, an allusion to the female apartments or Rajloca.

RAJECARIA. TAM., TEL. Compulsory labour. It was abolished in British India in A.D. 1833, but, subsequently, with modifications, reintroduced for the protection of the bunds of tanks and the public safety.

RAJENDRA LAL, a Hindu of Calcutta who wrote an account of Orissa.

RAJGARH, a Native State in Malwa, which produces opium and grain. In 1871, the Rawat, Moti Singh, became a convert to Muhammadanism, and took the name of Muhammad Abdul Wasih Khan. He received the title of nawab from the British Government in 1872, and is entitled to a salute of 11 guns. The military force consists of 240 cavalry, 360 infantry, 4 field and 8 other guns, with 12 artillerymen.—*Imp. Gaz.*

RAJGIR, the representative of the ancient Rajagriha. The name is repeated in numerous inscriptions on the temples in the Baibhar and Vipula mountains. The old city of Rajagriha is called Kusagarapura, or the city of the Kusa-grass, by Hiwen Thsang, who further describes it as the town surrounded by mountains. It has the two Son-Bhandar caves or Golden Treasury; also a natural cavern called the house of Deva-data, and the group of natural caves at Gridhara Kuta, three miles N.E. from the city where Sakya and Ananda dwelt.—*B. A. S. J.* No. 34, 1854. See Rajagriha.

RAJ-GURU or Raj-gur is the priest, spiritual adviser, tutor, or preceptor of a raja; but the term is applied in Kattyawar to the domestic Brahman of any family. The Katt'hi and even every individual of a Hindu caste has a Raj-guru. In the peninsula of Gujerat and Cutch, the Raj-guru form a distinct tribe.—*Cormack's Infanticide.*

RAJIAVARU. TEL. Sudra Hindus, armed peons in Mysore; also a class of people in Kamaon speaking Telugu. See Rachwar.

RAJIM. ARAB. Execrable; one to be pelted with stones, especially the devil, whom, in the ceremonies of the Haj pilgrimage to Mecca, Muhammadans suppose themselves to be pelting when they throw stones on Mount Arafat, intending by that action to express their utter detestation of him, and to devote him to infamy and destruction,—death by stoning, called rajm, being regarded as the most infamous mode.

RAJIN, a Muhammadan convert from the Bhatti; cultivators, shepherds, thieves, and evil-livers.

RAJ JOGI is the chief of the ascetic warriors of Mewar; the mahants are commanders.

RAJKOT, in lat. 22° 13′ N., long. 71° 7′ E., the capital of a Native State within the Political Agency of Kattyawar, Bombay. Area, 479 square miles, comprising 60 villages; population (1872), 36,770.

RAJKUMAR, a numerous and wealthy agricultural race in the N.W. Provinces, long notorious for the murder of their infant daughters. They claim descent from Prithi-raj, in whom ended, about the last days of the 12th century, the Chauhan dynasty of the princes of Dehli, and from whose stock the present race of the Rajkumar (who then also assumed this new family denomination) is claimed to be sprung. Their number, it is said, does not exceed 40,000, most of whom inhabit the N.W. Provinces in nearly one society. They exceed the whole of the Rajput races in the wildness of their notions and peculiarity of their manners.—*Cormack, Infanticide*, p. 1; *Wils. Gloss.*

RAJMAHAL, a town in the Santal Parganas district of Bengal, situated in lat. 25° 2′ 51″ N., and long. 87° 52′ 51″ E., on the right bank of the Ganges. The town gives its name to a subdivision of the Santal Parganas; area, 1343 square miles, and population, 332,194; also to the Rajmahal Hills. Man Singh, Akbar's Rajput general, after his return from the conquest of Orissa in 1592, selected Rajmahal (formerly Agmahal) as the capital of Bengal, on account of its central position with respect to that province and to Behar, and from its commanding the Ganges and the pass of Teliagarhi, through which the railway now runs; but its position has lately been changed. In 1860, when the loop-line of the railway was opened to this town, an arm of the Ganges ran immediately under the station, forming a navigable channel for steamers and boats of all sizes. In 1863–64, the river abandoned that channel, leaving an alluvial bank in its place. Rajmahal is now three miles distant from the main stream of the Ganges, and can only be approached by large boats during the rains. The Rajmahal people are known as Male. They are to the east of the Oraon, but are entirely different from their neighbours the Santal. They are better looking than the Santal. The skin is dark, face broad, eye small, and lips thicker than those of the men of the plains. Their language abounds in terms common to the Tamil and Telugu, and contains so many Dravidian roots of primary importance, though it also contains a large admixture of roots and forms belonging to the Kol dialects, that Dr. Caldwell considers it had originally belonged to the Dravidian family of languages. A brief vocabulary of the words of the tribe inhabiting the Rajmahal Hills in Central India, is contained in vol. v. of the Asiatic Researches, and Mr. Hodgson's more complete collections prove the idiom of this tribe to be in the main Dravidian. Test words show an identity of language among the Rajmahali on the east and the Maria Gond in the remote jungles down to the Godavery, and the Gond who live along the Satpura as far west as Nimar and Malwa. It was the Male race amongst whom Mr. Cleveland so successfully laboured, to impart to them settled habits. They are quiet cultivators, and formed the bulk of the corps known as the Bhagulpur Hill Rangers. Ghatwal estates are particularly numerous in the Bhagulpur and Birbhum districts adjoining the Rajmahal Hills on either side. Such estates pay no revenue, but are held on the condition of guarding the passes against hill robbers, murderers, and cattle-lifters.—*Geo. Soc. Journ.*, 1861; *Dalton*, *Beng.*

RAJMAHAL HILLS, the most important range in the Santal Parganas district, which abruptly rise from the valley of the Ganges, and are estimated to cover an area of 1366 square miles. Their height nowhere exceeds 2000 feet above sea-level. Rising about 20 miles S. of the Ganges, they stretch S. and S.W. to the Vindhya range and the high lands of the Dekhan. They terminate at the pass of Sikrigali. They are covered almost to their summits with dense jungle, but there are numerous passes through the successive ranges. They are quite detached from the Vindhya, and, physically, both the Rajmahal and Ramgarh Hills may be regarded as forming an isolated group, the north-eastern extremity of which constitutes the turning point of the Ganges. Geologically, the Vindhya range is composed of quartzite sandstone, limestones, and shales of great age, and the Rajmahal Hills of overflowing basaltic trap of comparatively recent age, which rests upon coal-measures and metamorphic (gneissose) rocks. — *Ball; Dalton*, *Ethnol. of Bengal*, p. 263.

RAJ-MALA, or Chronicles of Tripura, a Bengali poem.

RAJO GUNA. Sansk. In Hindu theology and philosophy, the property of foulness and error, from Ranj, colour, and Guna, a quality. See Guna.

RAJPIPLA is a Native State ruled by a Hindu sovereign. It is within the Bombay Presidency, between lat. 21° 23′ and 21° 59′ N., and long. 73° 5′ and 74° E. Area (comprising 591 villages), 1514 square miles; population (1881), 120,036, of whom about 60 per cent. are Bhils. Three-fourths of the state are occupied by a continuation of the Satpura range, known as the Rajpipla Hills, nowhere exceeding 2000 feet above the sea. Mines of quartzose minerals are worked at Ratanpur, a village about 14 miles above the town of Broach. The climate is exceedingly unhealthy, malarious fevers being prevalent from September to February. Its chalcedonies, agates, onyx, cornelian, and bloodstone are called Cambay stones, from the place where they are mostly cut, and from which they are almost wholly brought to Bombay. They are found in a bed of blue clay, the detritus, probably, of the adjoining rocks. Shafts are pierced in this to the depth of from 30 to 35 feet, and horizontal galleries run in any direction that suits the fancy of the miner; the pebbles are distributed promiscuously, and do not appear to lie in veins or lodes. The galleries seldom exceed 100 yards in length; they often run into those of other mines; they are generally five feet in height, and four across. To each mine there are 13 men attached, who work by turns. Each man must send up so many basketfuls of earth and stones before he is relieved. The stones are collected in baskets, and drawn up by a rope run over a roller or pulley. A group of people await them at the mouth of the shaft, and examine them one after another by chipping each on a piece of stone; the compact and fine-grained are the best, and the blacker the hue is at first, the redder it becomes after being burnt. There were at one time about 1000 miners employed, and each man carried home with him a basket of stones every evening. They were spread out on the ground, and for a whole year turned over every four or five days to the sun; the longer they are so exposed the richer become their tints. In the month of May they are burnt. This operation is effected by placing the stones in black earthen pots or chatties. The pots are placed mouth under, a hole being pierced in the bottom of each; over this is put a piece of broken pot. The pots are arranged in single rows; sheep's dung is the only fuel found to answer; the fire is always lighted at sunset, and allowed to burn till sunrise. If any white spot appear on the surface of the pot, the burning is reckoned incomplete and the fire continued some time longer. On being removed, the stones that have flaws are thrown aside as useless, those not sufficiently burnt are kept for next year's burning, and the remainder are sold for exportation. Nearly the whole of the stones are cut at

Cambay; the greater part of them are made into beads. In the process, the stones are first broken up into pieces of suitable size for the end they are desired to serve. An iron spike is stuck into the ground, point upwards; the stone is placed on this, and chipped with a hammer till nearly rounded; it is then passed on to the polisher, who seizes it in a pair of wooden clams, and rubs it against a piece of sandstone placed in an inclined plane before him, turning it round from time to time till it assumes a globular form. It is then passed on to the borer and polisher; a hole is drilled. Cambay enjoys celebrity for its agates, mocha-stones, cornelians, and all the chalcedonic and onyx family, all of them brought from Rajpipla, but worked up at Cambay into every variety of ornament,—cups, boxes, necklaces, handles of daggers, of knives and forks, seals, etc. Cambay stones, the akeek of the natives of Bombay, and by Europeans called agates, include all kinds of quartz minerals. They are also obtained from the amygdaloid trap rocks drained by the Nerbadda and Tapti. The principal varieties sold in Bombay are crystal, milk quartz, prase, a great variety of moss-stone, mocha-stone, fortification agate, chalcedony, cornelian, chrysoprase, heliotrope, onyx, obsidian, and very rarely amethyst. They pass in Europe and America for Scotch, Irish, Chamouni, Niagara, and Isle of Wight pebbles, according to the place in which they are sold. These stones, however, abound in all trap countries, the Brazils importing them as largely as India into Europe, where the terms Brazilian and Indian agates are used indifferently by the trade.

RAJPUR ALI, a Native State in Central India, lying between the Narbada (Nerbadda) river and the Vindhya mountains. Area, 800 square miles; population (1875), 29,000. The chiefs of Rajpur Ali are Sesodia Rajputs, connected with the Udaipur (Oodeypore) family. Rajpur Ali contributes £150 per annum towards the cost of the Malwa Bhil corps. Its military force consists of 2 guns, 31 horse, and 150 policemen.—*Imp. Gaz.*

RAJPUTANA stretches on the N.W. part of British India from lat. 23° 15′ to 30° N., and from long. 69° 30′ to 78° 15′ E. Its area is about 132,460 square miles, and in 1881 its estimated population was 10,729,114. Two small portions of this region, Ajmir and Merwara, of 2710 square miles, are under British sway, but all the remainder, with its 10,268,392 inhabitants, is under the rule of 20 native princes, of whom 17 are of Rajput descent, 2 are Jat, and one sovereign professes Muhammadanism.

A great part of Rajputana is sterile. A marked feature is the Aravalli mountains, which intersect it from N.E. to S.W., where they culminate in Mount Abu, but at the N.E. end the range breaks into detached hills and rocky eminences, all traceable in a general direction as far as the group of hills near Khetri. Amid these disunited hills stands the town of Ajmir, on the highest level of an open table-land, spreading eastward toward Jeypore, and sloping on all sides.

All the south-east of Rajputana is watered by the drainage of the Vindhya mountains, carried north-eastward by the Banas and Chambal rivers. North of Jhalra Patan is the Patar plateau, upon which lies all Kotah State, with parts of Bundi and of Jhalawar. This plateau falls by a very gradual descent to the Gwalior country and the basin of the Betwa river. The Chambal flows through the territory for about one-third of its course, and forms its boundary for another third.

The Banas rises in the south-west, near Kankraoli, in Merwara. It collects nearly all the drainage of the Mewar plateau with that of the south-eastern slopes and hill tracts of the Aravalli.

The salt lake at Sambhar is the only natural expanse of water, but there are artificial lakes in the eastern states about Bundi and Kotah, and in Ajmir. The largest of these are in the Mewar State, near Debar and Kankraoli. At the former place is a noble sheet of water 25 or 30 miles in circumference, constructed in A.D. 1681 by Rana Jye Singh, and named from him the Jye Samand, now known as the Rajsamand. It is a stupendous work of marble, and with an adjacent causeway dams the lake at Kankraoli. It cost upwards of a million sterling. The spectator who views this royal sea or Rajsamand on the borders of the plain, as also the pillar of victory towering over the plains of Malwa, erected on the summit of Chitore by Rana Mokul, or the palaces and temples in this ancient abode, and the regal residences erected by the princes, must be filled with astonishment at the resources of the Mewar State. They are such as to explain the metaphor of Zalim Singh, who said 'every pinch of the soil of Mewar contains gold.'

The rainfall throughout Rajputana is nowhere copious, and in several parts is scant,—Abu, 68 inches; Ajmir, 24; Bhurtpur, 32; Bikanir, N., 8; Bikanir, S., 20; Jhalra Patan, 40; and Mewar, 23. Even where the fall is greatest, the nature of the soil allows it to flow away or be absorbed, and only now are efforts being made to store it.

Ulwar, Jeypore, Kotah, Bundi, and Udaipur have very fair land, but Jeysulmir, Bikanir, and parts of Jodhpur or Merwara are particularly barren. Dearths have repeatedly occurred from scant rainfall, and 1848-1849 and 1868-1869 were famine years, the latter being followed by myriads of locusts. The region has four physical divisions, viz. (1) the desert regions, to the north and west of the Aravalli mountains, comprising more than one-half the entire territory, comprehend Merwara, Bikanir, Jeysulmir, and the Shekhawutti; (2) the hill region includes the greater part of Mewar and Banswara, Dungarpur, Partabgarh, and Serohi; (3) the S.E. division of Haraoti includes Bundi, Kotah, and Jhalawar; and (4) Eastern and Central Rajputana extends from Ulwar to Kerrowlee; also, upwards of 60,000 square miles of Bahawulpur are part of the great Rajputana desert.

Westward of the Aravalli there is a strip of soil along the banks of the Luni, which occasionally overflows, and on the subsidence of the waters an alluvial deposit remains which yields good crops of barley and of wheat.

The Great Desert is on the western side of the Aravalli; it separates Rajputana from Sind, extends from the edges of the Runn of Cutch beyond the Luni river northward. Eastward of this is a zone of less absolutely sterile country, consisting of rocky land cut up by limestone ridges, which to some degree protect it from the desert sands; and still farther eastward is 'the

Little Desert,' which runs up from the Luni between Jeysulmir and Jodhpur into the northern wastes. The character of the desert region is the same everywhere. It is covered with sand-hills, the Thull-ka-Tiba running in straight ridges, some of them two miles long, and rising to 100 feet in height. They are clothed with stunted shrubs and tufts of coarse grass in the dry season, and the light rains cover them with vegetation. The villages within the desert depend entirely on the supply of water in the wells, which is constantly failing or turning brackish ; on which occurring, the village has to shift. A little water is collected in small tanks or pools, which become dry before the stress of the heat begins; and in places there are long marshes impregnated with salt. This is the prevailing character of the whole north and north-west of Rajputana. The cultivation is everywhere poor and precarious. Nevertheless the principal towns within this region are well built, and fairly prosperous. Their position has given them immunity from predatory armies, and they have for ages managed the traffic across the desert. The most interesting object in this arid region is the Luni, with its many arms flowing from the Aravalli to enrich the best portion of the principality of Jodhpur, and distinctly marking that line of ever-shifting sand, termed in Hindu geography Maroosthuli, corrupted to Merwara. The Luni, after a course of more than 300 miles, terminates in the great salt marsh called the Runn, which is 150 miles in length, and about 70 in breadth. Dr. Govan described it as a dead flat, hardly elevated above the level of the sea, and he compared it to an arm of the ocean from which the water had receded, as it is covered with saline incrustations and marine exuviæ. This, Colonel Tod considers as having been formed by the deposits of the Luni, and equally saturated saline deposits from the southern desert of Dhat.

The main wealth of the desert lands of Merwara and Bikanir consists in the vast herds of camels, horned cattle, and sheep which roam over their sandy wastes, and thrive admirably in the dry climate. Camels and cattle are bred in such numbers that they supply the neighbouring provinces. What are called and sold as Gujerat cattle are often in reality Merwara cattle of the celebrated Nagar breed. The stock is yearly sold at great fairs. In Western Rajputana, camels are also bred in large quantities; and besides being ridden and used as beasts of burden, they are employed in agriculture.

Mr. Fergusson says, p. 473, the palace at Udaipur of the rulers of Mewar, those of Duttiah and Orcha in Bundelkhand, the Gwalior palace, and that at Amber in the Jeypore State, are all worthy of notice; and the palace at Deeg, which is quite a fairy structure, was the work of Suraj Mull, founder of the Bhurtpur dynasty, who began it in the year 1725, but was unfinished when he was killed in battle by Najif Khan, A.D. 1763. Every native capital in Rajputana, he tells us, has a cenotaph, or maha sati, where the sovereigns, their wives, and nearest relatives are buried. The most magnificent of these are in hundreds at Udaipur, all crowned by domes; and that of Singram Singh, to twenty-one of his wives, is the finest. He was buried A.D. 1733. He built that of his predecessor, Amera Singh II. The tomb of Bakhtawar Singh at Ulwar, erected in the 19th century, and the tombs of the Bhurtpur rajas at Govardhan, are also noteworthy.

The Census of 1881 shows as follows :—

State.	Area Sq. M.	Males.	Females.	Total.	Revenue.	Cavalry.	Infantry.	Guns.
Native Princes—								
Banswara,	1,500	53,498	50,502	104,000	£300,000	60	500	3
Bhurtpur (Jat),	1,974	350,475	295,065	645,540	210,000	1,460	8,500	38
Bikanir,	22,340	293,650	215,371	509,021	60,000	670	940	53
Bundi,	2,300	133,103	121,598	254,701	50,000	200	2,000	68
Dholpur (Jat),	1,200	138,342	111,315	249,657	60,000	610	3,650	32
Dungarpur,	1,000	44,568	41,861	86,429	75,000	57	632	4

The supposed number of Bhils, 166,343, at the Census 1881, in the four states are—

Udaipur,	51,076	Dungarpur,	66,952
Partabgarh,	270	Banswara,	48,045

The Rajputs are the dominant race, but, as will be seen, do not form a majority of the population. The Meo, and some Rajput clans, are converts to Muhammadanism. The Bhat and Charan are bards and chroniclers. The Mahajan mercantile caste are of Rajput descent, and mostly follow the Jaina religion. The Gujar and Jat are cultivators. The Mina, Mhair, and Bhil are the prominent aborigines.

Jeypore is the most modern of the Rajput capitals. It is laid out with spacious streets, and the ruling family have decorated and improved it for generations. It is the headquarters of the banking and exchange transactions, and its bankers have agencies in all the principal towns of India.

Jodhpur is a fenced city in the desert, and Bikanir and Jeysulmir are built upon islands of hard rock amid deep sand. Ajmir, Ulwar (Alwar), and Udaipur are all remarkable for picturesque beauty, and for excellence of situation. Bhurtpur, Tonk, Kotah, Bundi, and Jhalra Patan are the other important places.

The most remarkable of its forts are Taragarh, above Ajmir, Chitore, Kumalmir, and Gogunda in Mewar, Ulwar (Alwar), Jeypore, Khetri, Bhainsrorgarh, Mandalgarh, Indragarh, Jeysulmir, Bikanir, Jodhpur, Bundi, Kotah, Gagron, and Rinthambor. Rajputana yields cobalt, zinc-blende, copper, lead, iron, magnetic iron, pyrites (pyrrhotite). Raialo limestone, a fine-grained crystalline marble, quarried at Raialo in Ulwar, and at Makrana in Jodhpur, and the Jeysulmir limestone, are well known for their beauty and usefulness. The Makrana quarries supplied the chief portion of the stone for building the Taj at Agra, as well as the marble used in decorating many buildings in Northern and North-Western India. About 1000 workmen are employed at the present day in quarrying and working the stone at Makrana alone.

The Jat and Gujar are north of the Aravalli, and along the borders towards the Panjab and the Jumna from Bikanir round to Bhurtpur, and in Jeypore. The Ahirs, Lodas, Kachis, Malis, and Chamars all cultivate widely in the eastern districts. South of the Aravalli we find the Kumbis and Sondias as cultivators, immigrants from Central and Southern India; and in the south-west corner we meet with the Kolis, so common in Gujerat.

The *Charan* race, in Western and Central India, are mostly dwelling under Rajput rule, and are the bards, heralds, and genealogists of the Katth'i race. The Kachili Charan are carriers of grain, salt, and groceries. The Maru or desert Charan do not engage in trade. Their becoming personal security for an agreement is sufficient. They are analogous to the Bard.

The *Bhat* or *Bard* is the herald, genealogist, and chronicler. In Western India the Bhat has, like the Charan, the privilege of being security for agreements. In Upper India there are village communities of Bhat who do not take so high a place, and in Telingana the Bhatraj claim to be of Bhat descent.—*Tod's Rajasthan*, i. p. 224; *Census Returns; Imp. Gaz.; Ball's Geology of India; Wils. Gloss.*

RAJPUTS, literally sons of rajas or princes, is the name by which the clans of several tribes of India designate themselves, and who in ancient times became dominant in the N.W. of India, from which their branches extended southwards. They are in numerous tribes and clans, and have been supposed to be partly of Aryan, partly of Scythian descent; but the same religion governing the institutions of all the Rajput tribes, operates to counteract that dissimilarity in manners which would naturally be expected amidst so great a variety, from situation or climate. They have the same mythology, the same theogony, and the same festivals, though commemorated with peculiar distinctions.

The Rajputs claim, however, to have sprung from the ancient Solar and Lunar dynasties which ruled in India, and form themselves into the Suryavansa and the Indo or Chandravansa tribes; and there is also a race styled Agnicula, from having sprung from a sacred fire (ignis) which Agastya kindled on Mount Abu. The three Solar races are the Gehlot, Rahtor, and Kachwaha. The four Agnicula races are the Pnar or Pramara, with 35 saca; the Parihara, with 12 subdivisions; the Chalukya or Solanki, 16; and Chauhan, with 24 branches. Of the Pramara, the Mori are best known, and of the Chauhan, the Hara, who give their name to Haraoti, and have the two rajas of Kota and Bundi. The single Lunar race, or that of the Yadu or Jadu, descended through Krishna, has eight branches, of whom the Jharija with their raja of Cutch, and the Bhatti with their raja of Jeysulmir, are best known.

The three *Solar Dynasties* are:—

1. Grahilot or Gehlot, with 24 saca or branches, of which the Sesodia is the most distinguished. The rana of Udaipur or Mewar is a Grahilot.

2. Rahtor, said to be descended from Rama by Kusa, his second son. It has 24 branches, and the raja of Jodhpur or Merwara belongs to this tribe.

3. Kachwaha, also sprung from Kusa. The raja of Jeypore is of this tribe. It has 12 kotri or houses.

The *Lunar Dynasty* is sprung from the moon,

Soma or Chandra, through Yadu or Jadu, and is called Yadu or Jadu. It has eight branches, of which the Jharija and Bhatti in Cutch and Jeysulmir are the most powerful.

The *Agnicula* have 4 tribes and 87 branches, viz. :—

1. Pramara, 35 branches.	3. Chalukya, 16 branches.
2. Parihara, 12 ,,	4. Chauhan, 24 ,,

In the 36 royal tribes are others the origin of which is not known, such as—

Chaura or Chawara.	Sarwaya or Sari.	Sengar.
Tak or Takshak.	Aspa.	Sikharwal.
Jit or Jat of the Panjab, Junna, and Ganges.	Jetwa.	Bais.
Hun.	Kamari.	Dahia.
Kathi.	Dabi.	Johya.
Batta.	Gor.	Mohil.
Jhalamakwahana.	Doda.	Nikumba.
Gohil.	Garhwal.	Rajpati.
	Chandela.	Dahirya.
	Bundela.	Dahima.
	Birgujar.	

The Rajputs in the south and west of Malwa and in Mewar are called Rangari, a name the derivation of which is obscure.

Almost all Hindus who have taken to soldiering, Mahrattas, aborigines, and Jats, claim a Rajput origin, a recognition of the superior martial qualities of the Rajput race.

Rajputs of the N.W. hills are ethnologically a much purer and finer race than those on the plains, but even they assert that their ancestors came from Ayodhya or Oudh.

Agnicula Rajputs.—The four Agnicula or fire-born tribes, the Chauhan, Solanki, Powar or Pramar, and the Parihara, are now mainly found in the tract from Ujjain to Rewa near Benares. The unnamed progenitors of these races seem to have been invaders who sided with the Brahmans in their warfares, partly with the old Khetri, partly with increasing schismatics, and partly with Græco-Bactrians, and whose warlike merit, as well as timely aid and subsequent conformity, got them enrolled as fire-born, in contradistinction to the Solar and Lunar families, and Mount Abu is asserted to be the place of their miraculous birth or appearance. Vikramaditya, the champion of Brahmanism, according to common accounts was a Powar.

The *Chahuman* or *Chauhan* has been the most valiant of the Agnicula, and not of them only, but of the whole Rajput race. Its branches (saca) have maintained all the vigour of the original stem; and the Hara, the Kheechi, the Deora, the Sonigurra, and others of the twenty-four, have their names immortalized in the songs of the Bards. The derivation of Chauhan is coeval with his fabulous birth from the four-handed warrior Chatur-bhuja, Chatur-baha, Vira. The Chauhan trace their descent from Prithi-raj. They are found all over the N.W. Provinces, also in Malwa and Rajasthan, in Central India, in Rajor, Pratapnir, Chakarnagar, and Manchana, of which last the raja of Mainpuri is the head, and is one of the highest of the Chauhan clan.

The *Parihara* or *Pritihara* is scattered over Rajasthan, but do not seem to have any independent chieftainship there. At the confluence of the Kohari, the Sind, and the Chambal, there is a colony of this race, which has given its name to a commune of twenty-four villages, besides hamlets, situated amidst the ravines of these streams. Mundawur (classically Mundodri) was the capital of the Parihara, and was the chief city of Merwara, which owned the sway of this tribe prior to the invasion and settlement of the Rahtor clan. The Parihara is the least of the Agnicula. They never acted a conspicuous part in the history of Rajasthan.

It is the general opinion that the old warrior Kshatriya race of Hindus, described by Menu as forming the second of the four Hindu castes, had disappeared, and were not the ancestors of the present Rajputs, to whom, however, from their martial habits, the people accord the Kshatriya's position. And it is recognised that the Rajputs were dominant in the N.W. of India from the beginning of the era of Vikramaditya up to the advent of the Muhammadans in the 11th and 12th centuries. Prithi-raja, a prince who was reigning at Ajmir and Dehli on the second occasion of Shahab-ud-Din of Ghor invading India (A.D. 1193), was aided by the greater part of the Rajput rulers in the attempt to withstand the Muhammadan army, but the Rajputs were overthrown, Prithi-raja taken prisoner, and slain in cold blood, and since then successive invasions from Western Asia have scattered the greater portion of these ancient warrior tribes over the sandy plains of Central India, and have driven their more northern brethren into the fastnesses of the Himalayan range. Among these Rajputs of the Panjab Hills are the Kutoch tribe; they are mentioned by the Greek historians of Alexander's expedition, and spoken of by Ferishta as ruling in Kote Kangra in the days of the Kanouj dynasty, and among all the revolutions which time and war have since made in this country.

The Rahtors, whose seat of dominion was at Kanouj, were for a long time the family whose rule was strongest and most widely extended. In the 11th century, at the time of the conquests of Mahmud of Ghazni, the leading tribes were the Solunkhya of Anhilwara in Gujerat, the Chauhans of Ajmir, and the Rahtors of Kanouj; whilst the Gehlot clan had established itself in Mewar or Udaipur (still occupied by the Sesodias, a sept of the Gehlots), and the Kachwaha clan occupied the eastern tracts about Jeypore. The latter were, however, seriously weakened by the famous feuds between the Solunkhyas and the Chauhans, and between the latter and the Rahtors of Kanouj.

The headship of all the pure Rajputs of the hills, from the Sutlej to the Ravi, has always centred in the house of Kangra, from which many of the local tribes trace their descent. Across the Ravi to the north are other hill Rajputs, who look to Jummoo as their head, from whence they derive their generic name of Jumowal. They are somewhat inferior to those of Kangra, though recognised as the chief of the Rajputs in their own district.

When the Arabs invaded Sind, during the khalifat of Walid (A.D. 711), they overthrew Rajput princes of the Summa and Sumra dynasties who were ruling there, but who from that time recovered their position as the Muhammad power waned; and until a comparatively recent period, Rajputs were occupying Jhalawan, now one of the provinces of Central Baluchistan.

During the height of the Rajput supremacy, before their overthrow by the Muhammadans of

Ghor, a Rajput family of the Chalukya tribe reigned at Calian, west of Beder, on the borders of Carnata and Maharashtra. They are traced with certainty by inscriptions from the end of the 10th to the end of the 12th century. Those inscriptions show that they possessed territory as far to the south-west as Banawasi in Sunda, near the Western Ghats, and in one of them they are styled subjugators of Chola and Gujerat. Mr. (Sir) Walter Elliot has published a large collection of their inscriptions, and he is of opinion that they possessed the whole of Maharashtra to the Nerbadda. Professor Wilson thinks that they were also superior lords of the west of Telingana, a prince of which (probably their feudatory) defeated the Chola king, and this is probably the conquest alluded to in the inscription. Another branch of the tribe of Chalukya, perhaps connected with those of Calian, ruled over Kalinga, which is the eastern portion of Telingana, extending along the sea from Dravira to Orissa. Their dynasty certainly lasted through the whole of the 12th and 13th centuries, and, perhaps, began two centuries earlier. It was greatly reduced by the Ganapati kings of Andra, and finally subverted by the rajas of Cuttack.

For a short interval at the beginning of the 16th century came a brilliant revival of Rajput strength. The last Afghan dynasty at Dehli was breaking up, and Malwa and Gujerat were at war with each other, when there arose the famous Rana Sanga of Mewar, the chief of the Sesodia clan. The talents and valour of this chief once more obtained for his race something like predominance in Central India. Aided by Medni Rao, chief of Chanderi, he fought with distinguished success against both Malwa and Gujerat. In 1519 he captured the Musalman king of Malwa; and in 1526, in alliance with Gujerat, he totally subdued the Malwa State, and annexed to his own dominion all the fine eastern provinces of that kingdom, and recovered the strong places of the eastern marches. Rana Sanga was now not merely the chief of a clan, but the king of a country. The revival was, however, as short-lived as it was brilliant. A month before the capture of the capital of Malwa, Baber, with his Moghuls, had taken Dehli; and in 1527, Rana Sanga, at the head of all the chivalry of the clans, encountered the invader at Futtehpur Sikri, when his army was utterly defeated after desperate fighting, and the Rajput power hopelessly shattered. Next year, Medni Rao, with the flower of his clan, fell in the defence of the Chanderi, which was sacked by Baber. Akbar took to wife the daughters of two great Rajput houses. He gave the chiefs or their brethren high rank in his armies, sent them with their contingents to command in distant frontiers, and succeeded in enlisting the Rajputs generally. Under the early Moghul emperors, the chiefs constantly entered the imperial service as governors or generals,—there were at one time 47 Rajput contingents, — and the headlong charges of their cavalry became famous in the wars of the empire.

In the family wars which resulted in the accession of Aurangzeb, the Rajputs were generally found on the side of their unfortunate kinsman Dara; still even Aurangzeb employed them in distant wars, and their contingents did duty at his capital. He was, however, too bigoted to retain undiminished the hold on them acquired by Akbar. Though one Rajput chief governed Kābul for him, while another commanded his armies in the Dekhan, he is said to have had them both poisoned. Towards the end of his reign, he made bitter, though unsuccessful, war upon the Sesodias, and devastated parts of Rajputana; but he was very roughly handled by the united Rahtors and Sesodias, and he had thoroughly alienated the clans before he died.

From 1647 to 1680 the great Sivaji founded a dominion in the Dekhan. He claimed to be of Rajput descent, a claim which is now generally acknowledged, and his relatives ruled at Tanjore till 1855, and are still ruling at Kolhapur.

About A.D. 1756, the Mahrattas got possession of Ajmir, being called in by one of the Rahtor factions; and from this time Rajputana became involved in the general disorganization of India. In 1803, all Rajputana, except the remote states of the north-west, had been virtually brought under the Mahrattas, who exacted tribute, held cities to ransom, annexed territory, and extorted subsidies. The victories of Generals Wellesley and Lake permanently crippled Sindia's power in Northern India, and forced him to loosen his hold on the Rajput states in the north-east, with whom the British made a treaty of alliance against the Mahrattas. Upon Lord Wellesley's departure from India, the chiefs of Central India and Rajputana were left to take care of themselves, and in 1814 Amir Khan was living at free quarters in the heart of the Rajput states. The two principal Rajput chieftainships of Jodhpur and Jeypore had brought themselves to the brink of extinction in a claim for the hand of a princess of Udaipur; while the plundering Mahrattas and Pathans encouraged and strenuously aided the two chiefs to ruin each other, until the dispute was compromised upon the basis of poisoning the girl. But in 1817 the Marquis of Hastings was able to carry into action his plan for breaking up the Pindari camps. Amir Khan submitted and signed a treaty which constituted him the first ruler of the existing state of Tonk. By the end of 1818 all the Rajput states had executed treaties with the paramount power.

Individual families and small bodies of Rajputs are now found dispersed through all India proper, and into the Hindu island of Bali in the Eastern Archipelago. Many of the Hindu castes, like the Rachwar in the Northern Circars, claim a Rajput descent. But from Bhattiana northwards, Rajput villages are scattered about in considerable numbers amongst the Jat, and there are traces of more extensive Rajput possessions. The Rajputs seem to be here undergoing gradual submersion. But in the extreme north of the Bari and adjoining doabs of the Panjab, there is a strip immediately under the hills which may be classed with the adjoining hill country as still mainly Rajput. Even in Rajputana proper, though it has Rajputs for the dominant race, the population is much more Jat than Rajput, the Jat extending continuously from the Indus to the Ganges. The great seat of Rajput population and ancient power and glory was on the Ganges. Since vanquished there by the Muhammadans, the principal Rajput families have retired into the comparatively unfruitful country to which they give their name, but where, nevertheless, the Jat forms the most numerous part of the population. Before the Rajputs were driven back from Ayodhya and the

Ganges, Northern Rajputana was partitioned into small Jat republics. The more open parts of Rajputana are shared amongst the Mina, the remains of the Brahman population, the Jat, and the dominant Rajput, but the Jat possess the largest share in the cultivation. The southern and more hilly parts of Rajputana is much occupied by the Mina, the Mhair, and Bhil, and the province of Malwa is occupied by Rajput, Kunbi, and Jat. Rajputs and Jats occupy the plains south of the Salt Range, and seem later immigrants than the Brahmans.

Briefly, the Rajput race now occupy from the north and west of the Panjab, south-easterly to Behar and Benares, and southwards along the left bank of the Indus to Malwa, Gujerat, and Cutch, and give to their south-westerly holdings the name of Rajasthan or Rajputana.

In Rajputana, they are a numerous and dominant aristocracy, organized on the feudal principles necessary to domination. Rajputana lies in the centre of a circuit all round the edge of the more compact mass of the Jat people,—from the Salt Range, through the northern Panjab and adjoining hills, to Rohilkhand, Oudh, and the Central Doab; thence by Bundelkhand through Sindia's territory, Malwa, Mewar, Gujerat, and Kattyawar, into Lower Sind. They are not found in any numbers to the north of the Salt Range, nor are they in any of the hill country west of the Jhelum. But a small Rajput tribe, called Jan-jua, now Muhammadans, is found about the Salt Range. A large proportion of the Rajputs scattered about the Eastern Panjab, Cis-Sutlej territory, and Dehli districts, are now Muhammadans, as are occasional Rajput villages all over Hindustan and a good many Rajput rajas, their conversion having been influenced by the Moghul emperors. But cast of Dehli, conversion is quite the exception.

In the N.E. Panjab, near the hills, the Rajput population is more numerous, and Hindu Rajputs are the dominant race in the Jummoo and Kangra districts of the Himalaya. The Kangra and Jummoo rajas and their clans claim to be of very pure blood, and they are fine handsome men, the Kangra Rajputs in particular; they wear many jewels, and are very fair. The women of the hills are in deserved repute, and much sought after in the plains. The Jummoo men, called Dogra Rajputs, are less handsome than those of Kangra, but more robust and brave, quiet, stanch, steady, and reliable, without disagrecable Hindustani airs.

In the valley of the Ganges, the body of the Rajput population lies next to the Jat race to the east; in the Middle Doab, Rohilkhand, and Oudh, and still farther east, the country is shared with a Brahman population. In Lower Rohilkhand, where they are called Thakur, Rajput communities are strong and numerous, also numerous in Western Oudh; but they never largely entered the British sepoy army. In the Central Doab, in the districts of Mainpuri, Futtehghur, and Etawa, Rajputs are numerous, and many served in the British native army; but Eastern Oudh, especially most of the broad tract between the Gogra and the Ganges, is the home of the great Rajput population which supplied so large a portion of the Bengal native army. At home these Rajputs are a purely agricultural population. Baiswara, the country of the Bais Rajputs, lies almost parallel to the Brahman country of the Lower Doab, and furnished many sepoys.

To the east of Oudh, Rajputs are pretty numerous in Azimgarh and Ghazipur.

In the Gangetic valley, the Rajputs spread over a broad region into a large population, and are essentially the cultivators of that valley. Physically, the Rajput and Brahman of that region are not different. The modern Rajput is quite as strict a Hindu, and more prejudiced than many Brahmans, and upon the whole was the worst class in the rebellion of 1857-58.

The Rahtors are probably the most numerous of all the clans; they greatly predominate in the north-west, in the country of Merwara, Bikanir, and Jeysulmir, in the state of Kishengarh, and all about the central district of Ajmir. In Jeysulmir the Bhatti rule. In the north-east states is the Kachwaha clan, very strong in Ulwar and in Jeypore; some districts in the north of Jeypore being altogether in the hands of the Shaikhawat sept of the Kachwahas. The Chauhans, once famous in the history of the north-west of India, are now most influential in the eastern states, where the Hara sept has been long dominant; and the Deoras, another sept of the Chauhans, still hold Sirohi; while the Kheechi also belong to the same stock. In the north-west, the last trace of the ancient predominance of the Chauhans at Dehli is to be found in the petty chiefship of Nimrana, held by Chauhans who claim descent from Prithi-raj; and in the extreme north-west, the Rao of Kusalgarh in Banswara is the head of a Chauhan colony. All over Mewar and the north-western states of Rajputana, below the Aravallis, the Sesodia clan predominates, their head being the Maharana of Udaipur, the eldest family of the purest blood of the whole Rajput caste. Among other clans of high descent and historic celebrity which were once powerful, but have now dwindled in numbers and lost their dominion, may be named the Parihara, the Pramara, and the Solunkhya.

Rajput dominions run south of the Gogra, and thence across the Ganges into the Arrah district (Bhojpur). The chief Rajput districts are Bikanir, Jeysulmir, Merwara, Mewar, Ajmir, Jeypore, Bundi, Kotah, and Malwa.

The clans are of course the aristocracy of the country, and they hold the land to a very large extent either as receivers of rent or as cultivators. As united families of pure descent, as a landed nobility, and as the kinsmen of ruling chiefs, they are also the aristocracy of India.

There are four Rajput chiefs near the Colchan, viz. the rajas of Mohurbunj and Porahat, the Koer of Seraikilla, and the Thakur of Khursowan.

The Rajputs, under the Bengal government, are chiefly to be found in Behar.

Rajputs obtained a footing, and now occupy several estates in the Allahabad district. These incursions of the Rajputs seem to be the foundation of the present proprietary rights in the land. Each pargana has a separate and distinct tribe, although in a few estates other denominations of Rajputs are to be found. The Rajputs seem to have had their particular leaders, who, after locating themselves and their followers, displaced the original inhabitants by degrees, and extended themselves as far as they could. Thus in pargana Jhansi the Bais Rajputs trace their origin to two

leaders, viz. Bowani and Jutan; to the descendants of the former the large estate of Mowaya was allotted, and to those of the latter the nine estates. Some entire mouzahs in each of these taluks were subsequently assigned to different branches of the family, and the remainder held jointly by all, but as they are now divided into separate estates, the holdings are strangely intermixed, as in some of the villages nine taluks have shares, not, however, of any one distinct portion, but they are divided field by field; and as in process of time sales and mortgages took place, and some of the fields became the property of other estates, the intermixture has greatly increased. There are innumerable subdivisions of them in Malwa, and extending from Behar and Benares through the N.W. Provinces of India up to the Panjab.

Mr. (now Sir) George Campbell, writing of them, says they are no doubt of Aryan origin, and are part of a later movement than the branch who came down by the Saraswati, and up to the latest dates have shown themselves a brave people, delighting in war and in bloodshed; and they are not supposed by Mr. Campbell to be the old Kshatriya race, noticed in the early Brahmanical books as existing many hundred years before the Christian era, though they have taken the place assigned to the Kshatriya. They undoubtedly arrived in the north-west of India long after the country had been occupied by Dravidian, Kolarian, and Mongoloid races, and after the north-eastern Panjab and Cis-Sutlej districts seem to have first been a Brahman, then a Rajput country, and subsequently advanced upon by the Jat.

The *Baghel*, also Waghel, is a Rajput tribe in Rewa. The Baghel are a branch of the Sesodia Rajputs of Gujerat, who migrated to the east, and gave their name to Baghelcund or Rewa, but others of the tribe have spread through Bundelkhand, Allahabad, Benares, Cawnpur, Gorakhpur, and Farrakhabad.

The *Bais* has obtained a place amongst the thirty-six royal races, though Tod believed it to be a subdivision of the Suryavansi, as it is neither to be met with in the lists of Chund, nor in those of the Komarpal Charitra. It is now a numerous tribe, and has given its name to an extensive district, Baiswara in the Doab, or the land between the Ganges and Jumna.

The Bais intermarry with the Chauhan, Kachwaha, and others. They claim to have come from Manji Paithan in the Dekhan, and to be descendants of its king Salivahana, A.D. 78.

The *Bhatti* are of the Yadubansi race, and rule in Jeysulmir, and give their name to the Bhatti country between Hissar and Garhi. It is not clear whether the Bhatti of Bhattiana were originally Rajputs or really are Yuti or Jat.

The *Birgujar*, one of the thirty-six royal races of Rajputs, are settled along the Jumna from Rohilkhand to Matura; some are Muhammadans.

The *Bundela* is a Rajput tribe descended from the Garhwar of Kantit and Khairagarh, who settled in Bundelkhand in the 13th or 14th century, and gave their name to that province.

The *Chahil* or *Chahira* Rajput tribe is now for the greater part converted to Muhammadanism. There are a few in the Hissar district and on the borders of Bikanir. Though Muhammadan, they nevertheless retain charge of the tomb of Goga Chauhan, a Hindu prince now esteemed a saint.

The *Chandel* Rajput tribe are scattered in various parts of the N.W. Provinces, and for the most part came from Muhoba in Bundelkhand. Before the Muhammadan conquest, Muhoba appears to have been the capital of a principality that extended to the Nerbadda, and included the province of Chanderi, which is called after their name. They are styled Sombansi, but they are not considered to be of pure descent, and their sons are carefully excluded from marriages with the higher clans. This tribe expelled the Baland tribe from Ajori, Burhur, and Mirzapore. They have many divisions, and are supposed to have come from Muhoba in Bundelkhand. They claim to be of the Lunar race, and they give their name to the Chandeli or Chanderi district. There are four subdivisions of them in the Lower Doab, who suffix to their names the regal terms Rae, Rawat, Rao, and Rana.

The *Kachwaha* tribe are the ruling race in Amber of Jeypore. Its raja is a Kachwaha.

The *Dahia* was an ancient tribe whose residence was the banks of the Indus, near its confluence with the Sutlej; and although they retain a place amongst the thirty-six royal races, there is no knowledge of any as now existing. They are mentioned in the annals of the Bhatti of Jeysulmir, and from name as well as from locale, we may infer that they were the Daha of Alexander.

The *Dahima* has left but the wreck of a great name. Seven centuries have swept away all recollections of a tribe who once afforded one of the proudest themes for the song of the bard. The Dahima was the lord of Biana, and one of the most powerful vassals of the Chauhan emperor, Prithi-raja. The brothers of this house held the highest offices under this monarch, and the period during which the elder, Kaimas, was his minister, was the brightest in the history of the Chauhan, but he fell a victim to a blind jealousy.

Dahirya.—The Komarpal Charitra classes this with the thirty-six royal races. Amongst the princes who came to the aid of Chitore, when first assailed by the arms of Islam, was the 'lord of Debeil, Dahir, Despati.' Dahir was the ruler of Sind, whose tragical end in his capital, Debeil, is related by Abul Fazl. It was in the ninety-ninth year of the Hijira that he was attacked by Kassim, the general of the khalif of Baghdad, and treated with the greatest barbarity. Whether this prince used Dahir as a proper name, or as that of his tribe, must be left to conjecture.

The *Dogra* tribe in the N.W. of India are predatory and pastoral, following Muhammadanism, but claiming to be Chauhan Rajputs. The other converted Chauhan, however, believe them to have been Jat and Gujar. The raja of Kashmir is a Dogra. In the 18th century they occupied a considerable tract on the banks of the Sutlej, and made themselves formidable to the Muhammadan government of Dehli.

Jharija Rajputs are dominant in Cutch, but about A.D. 800, a branch of the family, in consequence of intestine feuds, crossed the Runn at the head of the Gulf of Cutch into Kattyawar, and established themselves upon the ruins of the Jetwa Rajputs, and a few petty Muhammadan chieftaincies. The lands appear to have been

divided in common among the whole tribe, the teelat or eldest branch of the family reserving to itself the largest portion, while the bhaiad or relatives (brotherhood) held their respective villages by a purely feudal tenure.

The *Joyha* race possessed the same haunts as the Dahia, and are always coupled with them. They, however, extended across the Gharra into the northern desert of India, and in ancient chronicles are entitled Lords of Jungul-Desa, a tract which comprehended Hurriana, Bhatnair, and Nagore. This tribe, like the Dahia, was in the beginning of the 19th century extinct.

The *Macheri* Rajput in Mewar were formerly turbulent.

Mohil.—All that can be learned of the past history of this race of Rajputs is that it inhabited a considerable tract so late as the foundation of the present state of Bikanir, the Rahtor founders of which expelled, if not extirpated, the Mohil. With the Malun, Malani, and Mallia, also extinct, it may claim the honour of descent from the ancient Malli, the foes of Alexander, whose abode was Multan (qu. Mohil-t'han?).

Nicoompa.—Of this race, to which celebrity attaches in all the Rajput genealogies, we can only discover that they were proprietors of the district of Mandelgarh prior to the Gehlot.

Raj-Pali.—This race, under the names of Rajpalica, or simply Pala, are mentioned by all the genealogists, especially those of Saurashtra, to which in all probability it was confined. This tends to make it Scythic in origin,—a conclusion strengthened by the derivation of the name, meaning 'royal shepherd;' it was probably a branch of the ancient Pali.

Sikerwal is a tribe which never appears to have claimed much notice amidst the princes of Rajasthan; nor is there a single independent chieftain now remaining, although there is a small district called after them, Sikerwar, on the right bank of the Chambal, adjoining Jaduvati, and, like it, now incorporated in the province of Gwalior, in Sindia's dominions. The Sikerwal was therefore in the early part of the 19th century reduced to subsist by cultivation, or the more precarious employment of his lance, either as a follower of others, or as a common depredator. They have their name from the town of Sikri (Futtehpur), which was formerly an independent principality.

Sirvi Rajputs, descendants of Sheopal, dwelling in Merwara, are a hardy race of agriculturists.

A Rajput even of the humbler people has a bold and dignified appearance, and their women are singularly beautiful. The tradition of common ancestry has preserved among them the feeling which permits a poor Rajput yeoman to hold himself as good a gentleman as the most powerful landholder. The Rajput proper is very proud of his warlike reputation, and most punctilious on points of etiquette. The Rajput who possesses but an acre of land has the proud feeling of common origin with his sovereign, and in styling him bapji (sire), he thinks of him as the common father or representative of the race. 'I am a Rajput,' literally 'I am of royal descent,' is a usual remark, and it is a reflection which lends an air of dignity to all their actions. But in their military organization their constitution is feudal. Each Rajput or Jat is a free citizen, and all are peers. The Panch or Kratisteuontes (κρατισ-τευουτες), or, as the British call them, Lambardars, are but the elected representatives of the body of the citizens, and the only general rule is that a village is always represented by a plural number of representatives.

Over great tracts the Rajput are a feeble minority. In some parts, however, the agricultural Rajput villages are strong and numerous, every Rajput is free and equal, the land is divided amongst them, and the commune is administered on democratic principles; wherever this is the case, their institutions resemble those of the Jat race.

One large section of them, chiefly of the Oswal tribe, have become the greatest financiers of India. The mercantile classes are strongest in the northern cities, where are the homes of almost all the petty bankers and traders, who have spread over Central and Western India under the name of Marwari. Perhaps the Oswal section of the Jains, which had its beginning in Rajputana, is the wealthiest among the merchants; and many of the hereditary officials belong to the commercial castes.

Rajputs have clan or tribal names, but too extensively distributed to take the place of family names. In the Lower Doab, the Rajput take the Hindu royal designations of Raja, Rao, Rana, and Rawat. Rajput, son of a raja, is not a term used by all Rajputs. In some parts of their country they call themselves Thakur, which means chief or noble. They are, however, frequently distinguished by the name of their tribe, as Chauhan, Rahtor.

Their practice is not to marry into their own, but into another clan, and this has assimilated the tribes to each other. A marriage within the clan is regarded as incestuous; each clan depends on the other clans for its wives, for no Rajput can take a wife elsewhere than from Rajputs. This has led to much celibacy and to infanticide. Their daughters are married to men of the best tribes, and their widows are not permitted to re-marry, and it is the point of honour as to their daughters' marriages that led to the practice of infanticide.

During the year 1871, an enumeration of the whole of the Rajput population in Oudh was made by native police officers in every village where even a single Rajput family lived. There were found 439 clans or divisions of clans, some of the divisions having only one or two living members. The clans and divisions were distributed over 13,066 villages, containing a total Rajput population of 559,699; and of this number 250,849 were males, and 184,623 females, above 10 years; and 84,200 male, and 60,027 female, children under 10 years. Of all the districts of the province, Roy Barcilly was supposed to be the one in which infanticide prevailed to the greatest extent. In 1075 villages, 10,643 boys under 10 years were living, and only 6619 girls. Roy Bareilly had 71,000 Rajputs in 1075 villages; Unao, 65,000 in 927; and Faizabad, 63,000 in 1565. The jurisdiction of Jugguteporc, Roy Bareilly district, with a total Rajput population of 7836 distributed over 145 villages, only had 14 per cent. of female children under 10; there were 3386 males, and 2844 females above 10 years; 1386 boys under 10, and only 238 girls. Here it was that infanticide was considered

to be most commou. But the 1881 Census Report inclines to the belief that the children born are largely of the male sex, and this is probable.

Rajputs had high notions of honour, and treated women with great respect. But in their haughty pride, the vices of female infanticide and sati rose to the highest pitch in Rajputana, and girls were destroyed even after attaining adolescence. Major M'Murdo, writing in 1818, mentions that amongst the offspring of 8000 Rajputs, probably not more than thirty females were alive.

In 1810, the rajas of Jodhpur and Jeypore became rival suitors for a princess of Udaipur, and supported their pretensions by waging war against each other, and the family of the unhappy girl at length terminated the contest by putting her to death.

A prince of Bundi had married a Rajputni of the Malani tribe,—a name now unknown; but a Bard repeating the 'gotra acharya,' it was discovered to have been about eight centuries before a ramification (sak'ha) of the Chauhan, to which the Hara of Bundi belonged; divorce and expiatory rites, with great unhappiness, were the consequences.

Their great desires are to marry their daughters into a clan of a higher rank, and to avoid misalliances. The court of Ranjit Singh furnished a most striking proof of the tenacity with which the Kutoch of Kangra asserts and maintains this superiority. Dhian Singh, the brother of the Maharaja Ghulab Singh, while the prime minister of Ranjit, sought an alliance for his son, Heera Singh, with one of the daughters of the raja of Kaugra, but the proud Kutoch deserted his hereditary kingdom rather than, as he thought, degrade his house by intermarriage even with a Mian, or prince of the Jummoo stock. Many chiefs of the clans are said to have wished their daughters married into the Rewa family, and sums up to five lakhs of rupees have been given as a daughter's dot.—*Elph. Hist. of India; Jour. of the Royal As. Soc.*

RAJSHAHI, in lat. 24° 3′ to 24° 59′ N., long. 88° 20′ 45″ to 89° 23′ 30″ E., is a revenue district of Bengal. The Ganges forms its southern boundary. Its population in 1872 was 1,310,729. The Muhammadans numbered 1,017,979; the Chandal, 28,762; the Koch or Rajbansi, 11,625; the Chain, 8802; the Kaibartta, 60,440; and the Jaliya, 16,992. Towards the east, the marshes increase in number and size until they merge in the great Cholan bil on the district boundary. The river system is composed of the network of streams and water-courses which anticipate the confluence of the main channels of the Ganges and Brahmaputra. The Cholan bil is, in fact, a great reservoir for the surplus water supply of the whole surrounding country. It has open connections with the rivers and water-courses, which here lose their identity, and during the rains it swells till it covers a total area of about 120 square miles.

RAJ TARINGINI, a work by Vedyadhar, which gives the various dynasties who ruled at Indraprastha, or Dehli, from Yudishtra to Vikramaditya. It was compiled under the eye of Siwai Jye Singh of Amber.

RAJUR, a Rajput tribe, said to be of Bhatti descent; they confine their haunts to the desert, or the borders of Jeysulmir, as at Ramgarh, Keallah, Jaraillah, etc., and the t'hul between Jeysulmir and Upper Sind. They are cultivators, shepherds, and thieves, and are esteemed amongst the very worst of the converts to Muhammadanism.

RAJ VULA, the chronicle of the reign of Raj Singh, a prince of Mewar.

RAJWAR, a predatory tribe in the Gya and adjoining districts. In Sirguja and the adjoining estates they are peaceably disposed cultivators, who claim to be of illegitimate Kshatriya descent from the Kurmi and Kol. They do not conform to Hindu customs, and they are skilled in the chailo dance, believed to be of Dravidian origin.

RAJWARA, the territory of the raja of Koch-Behar in Rungpur. Here, when the means of individuals prevent them from cultivating their own lands, it was not uncommou to hire out the whole with men and implements, for the use of which one-eighth of the produce was the established consideration.—*Rajasthan*, ii. p. 542.

RAK. SIAMESE. A tree which produces the beautiful varnish valued in the lacquer ware of China.

RAKBA. HIND. In Hindustan, the village area; lands comprised within the boundaries of a village or township.

RAKH. HIND. An uncultivated or waste tract bearing grass, firewood, and stunted jungle of capparis, dhak, jhand, etc.; also a reserved plantation, a shikargah, a rund, a chuk. Tracts of rakh are to be met with in portions of many districts of the Panjab. In the Lahore district there are no less than 86 such tracts, consisting of plots of uncultivated ground; the total area is 250,000 acres, but not all of this yields wood, a great deal is grazing ground, much of which is quite capable of being brought under cultivation. The great value of the wood-bearing rakhs consists in their being the source from which all the fuel for railway consumption is to be taken. Not only is the upper growth of wood valuable in this way, but the roots that remain in the soil after the stunted growth has disappeared from the surface, are equally capable of being utilized.—*Powell.*

RAKHA. HIND. A watcher or watchman. It is from Rakshan, protection. A village watchman; a person employed for the protection of a village. A hereditary payment, a stipendiary payment or haq, to descendants of former watchmen, in Gujerat called toda geras haq.

RA-KHAING, a race occupying Arakau, towards the embouchure of the Koladyn river, having the Sak, Kumi, and Khyen on their north-east and south. A settlement of Ra-khaing has been made on the Tenasserim coast in long. 98 E., from lat. 13° 40′ to 14′ 30″ N., east of the Moscos Islands. They are a branch of the Burmese who separated themselves from the main stock at a very early period. The people of India call them Mug, a name of Persian or Arabic origin, unknown to the Ra-khaing themselves. They call themselves Myama-gyi, or great Myama. They give their name to Arakan.

Bomzu or Bunzu, called also Bondu, are a tribe of the Ra-khaing who dwell north of the Koladyn river. They have on their north the Lungkta, Kungye, or Kuki in the highlands of Tiperah. The Bomzu and the Kuki seem to belong to the Burman race. The seaboard and the lower portions of the valleys opening

into it, form the country of the Ra-Khoung-tha, or Arakan tribe, of whom the Burmans are a branch. Some are found residing on the banks of the mountain streams, and are distinguished by the uame of Khoung-tha. Their lauguage proves that they do not belong to the Yuma group, but are intruders from the north; and their own traditions recognise the Ku-mi as the tribe in possession of the seaboard wheu they entered Arakan.

The Mrung, in the upper basin of the Mayu and towards the hill frontier of Chittagong, are a colony imported from the Bodo country by the kings of Arakan, at the period wheu their conquests extended far up Eastern Bengal.

On the south of Assam is the prominent Burmese race, who profess Buddhism, and south of them the British province of Pegu, containing Burmese, Mon, also called Talaing, Khe Karen, Karen-ni or Red Karen, the Khyen, whose women tattoo their faces, the Yet Baing on the Yoma range, and the Shan who form separate communities.—*Mason's Burm.* p. 62.

RAKHAJ, more properly Rakhkhaj, from which, preceded by the Arabic article (as al Rakhaj), comes the Arachosia of the ancient geographers. Rakhaj, one of the dependeucies of Sijistan, the chief town of which, bearing the same name, was situated on the Helmaud.

RAKHI. Hind. A bracelet consisting of a piece of thread, or silk, or tinsel, bound by Hindus round the wrist on particular occasions, especially on the Rakhi purnima, or full moon of the month Sravan (July—August), either as an amulet or a preservative against misfortune, or as a symbol of mutual depeudencc or of respect. A Rajput lady of rank or family sometimes sends it to a person of influence or power, whose protection she is desirous of securing, and whom she thus adopts, as it were, as a male relative or brother.

The Rakhi festival was instituted in honour of the good genii, when Durvasa the sage instructed Salone (the genius or nymph presiding over the month of Sravan) to bind on rakhi, or bracelets, as charms to avert evil. The ministers of religion and womeu alone are privileged to bestow these wristbands. When the ladies of Rajasthan, either by their handmaids or the family priests, send a bracelet as the token of their esteem to such as they adopt as brothers, these return gifts in acknowledgment of the honour. The claims thus acquired by the fair are far stronger than those of consanguinity. Sisters also present their brothers with clothes on this day, who make an offering of gold in returu.—*Tod's Rajasthan*, ii. p. 697; *Wilson.*

RAKHI TANEE. Hind. A douceur, a vail or vale, a perquisite, a retaining fee.

RAKHWAL or Rakhwar, a guard, a watch, a keeper of a field; watching the crops; a cow or cattle herd; also a person capable of counteracting the evil designs or practices of malevolent beings, or witchcraft and the like.

RAKM, a form of writing character used in enumeration. See Raqm.

RAKSHASA, a term applied by thc Aryan immigrants into India to the prior iuhabitants whom they found settled there. In the present day, according to thc Hindu superstitions, amongst thc evil genii of all India, is a being called Rakshasa, of giant bulk, terrible teeth, who feasts on dead bodies; a spirit, or demon, or goblin, who appears to be of various descriptions. As a kind of Titan, or enemy of the gods, of the Hindu mythology, he assumes a gigantic superhuman form, after the manner of Ravana and others. He is sometimes represented as the guardian of the treasure of Kuvera, the god of wealth; and sometimes as a cannibal, imp, or goblin, haunting cemeteries, devouring human beings, impeding sacrifices, and disturbing religious people in their devotions. In this last-named character the Rakshasa appear to have waged continual war with men, as the Daitya or Danava did with the gods.

RAKSHASA. Hind., Sansk. An ancieut form of marriage amongst the Hindus, where a maiden has been carried off by force after her kinsmen have beeu subdued or slain.—*W.*

RAKSHASA-LIPI, the running hand of the Mahratta character, meaning Rakshas writing. It is also called Mori.

RAKTA. Sansk. Blood. Raktoka dagi in Mysore is land given frec of reut to the family of a person killed in battle. Also the red colour of plants, their woods and flowers.

RAKTA-BALI, blood-offering, a blood sacrifice to an idol. The blood sacrifice of the Hindus and most of the non-Aryan races prevails all over the Peninsula of India, in Mysore, in Hyderabad, in thc Carnatic, and Northern Circars. It has different names, and is varied; but whether, as with the Khonds, a human being is sacrificed, or, as with the Pariahs and humbler non-Aryan classes, a buffalo, a bullock, with goats, sheep, kids, or fowls, thc rite is identical. The British Government has put down the Khond human sacrifice, and are discouraging the great sacrifices of cattle which occasionally occur. In 1859, 1400 sheep and 50 or 60 buffaloes were sacrificed at the village goddess festival of Ellore. The goddess was carried round the village in a car, at each corner was a sharp wooden spike, on each of which a lamb was impaled alive, and four sucking pigs in the middle.

Amongst the Mahrattas, it is conducted by the helot races,—Mhair, Mhang, and Parwari, and the Dhangar or shepherd,—and all village functionaries atteud. A bullock is thrown down before the village deity, its head is struck off by a single blow, and placed in front of the deity, with one fore leg thrust into its mouth. Around it are vessels containing grain, and uearer is a heap of mixed grains, with a drill plough in the centre. The carcase is then cut into pieces, and each cultivator gets a bit to bury in his field.

The blood and offal are collected into a basket containing cooked food, which has already been offered as a meat-offering to the idol (Nai-vedya), the Pot-raj, or worshippiug priest, cuts a live kid to pieces over it, as a Hari mariah, or plough sacrifice, and, mixing all together, the basket is placed on the head of a Mang, who runs through the town followed by Pariahs, and as he goes scatters handfuls of it to the spirits (bhut-bali).

That is the village offering, but 50 or 60 bullocks and goats may be offered by private persons. Women uude, but covered by leaves and boughs of trees, walk in fulfilment of vows.—*W. E. in J.E.S.*

RAKTA VIJA, an Asura who fought the goddess Chamunda, a form of Durga or Devi. It is celebrated in the Devi Mahatmya.—*Dowson.*

RAKUS TAL, or Tso Lanag, the Salt Lake, in lat. 30° 29′ E., and long. 81° 10′ N. (referred to Lagan Tunkan, on its southern border), in Gnari Khorsum, is 15,250 feet above the sea.—*Strachey.*

RAL, also Rala. HIND. Dammer, resin, rosin. A general Hindi term for all resin-like substances. The white rosin is the safed ral from the Shorea robusta. The black and yellow rosins are called kala ral and zard ral.

RALI. HIND. Red powder from fruit of Rottlera tinctoria.

RALLIDÆ, a family of birds, comprising the coots, the water-hens, the rails, the corn-crake.

SUB-FAM. Gallinulæ.

Porphyrio polyocephalus, *Lath.*, the purple coot.
Fulica atra, *Linn.*, the bald coot.
Gallicrex cristatus, *Latham*, the water-cock.
Gallinula chloropus, *Linn.*, the water-hen.
G. Burnesii, *Blyth*, small water-hen.
G. phœnicura, *Pennant*, white-breasted water-hen.
Podaca personata, *Gray*, Cachar, Burma, Malacca.

SUB-FAM. Rallinæ.

Porzana akool, *Sykes*, the brown rail.
P. maruetta, *Brisson*, the spotted rail.
P. pygmæa, *Naaman*, the pigmy rail.
P. fusca, *Linn.*, the ruddy rail.
P. Zeylonica, *Gmel.*, the banded rail.
P. striatus, *Linn.*, the blue-breasted rail.
P. Indicus, *Blyth*, the Indian water rail.
P. Japonicus, *Schlegel.*
Crex pratensis, the corn-crake.

—*Jerdon*, ii. p. 700.

RAM or Rimmon. HEB. The exalted.

RAMA, among the avatara of Vishnu, in the mythology of the Hindus, are recorded three favoured personages in whom the deity became incarnate, all named Rama. They are distinguished by the names of Bala Rama, usually called Balaram, Parasu Rama or Parasram, meaning Rama of the club, and Rama Chandra or Dasrat Rama, and are all famed as great warriors, and as youths of perfect beauty.

Bala Rama was elder brother to Krishna, and greatly assisted him in his wars; so that, in this instance, Vishnu seems to have duplicated himself, as indeed may be also said of the others, for Parasu Rama and Rama Chandra, otherwise called patronymically Dasrat Rama, were contemporaries. But it has been made a question whether they be not three representations of one person, or three different ways of relating the same history; and whether any or all of them mean Rama, the son of Kush, Sir W. Jones says (As. Res. ii. p. 132) he leaves others to determine. He deems Rama, son of Dasarat'ha, to be the same as the Grecian Dionysos, who is said to have conquered India with an army of Satyrs, commanded by Pan; and Dasrat Rama was also a conqueror, and had an army of large monkeys or Satyrs, the general or prince of whom was Hanuman, a name said by this author to mean, with high cheek-bones; others translate it, with bloated cheeks, alluding to his fabled origin from Pavan, regent of the wind. Dasrat Rama is also found to resemble the Indian Bacchus; he is a descendant of the sun, and the husband of Sita; and it is worthy of remark, that the Peruvians, whose Inca boasted of the same descent, styled their greatest festival Ramasitoa. Krishna, describing himself to Arjun as the first of all things, says, 'Among those who carry arms, I am Rama.'

Of Parasu Rama it is related that he was born near Agra, in the Tirtya yug, or second age. His parents were Jamadagni, whose name appears as one of the rishi, and Runeka. He seems to have been a warrior prince, who about B.C. 1176 overran the Malabar coast, introduced an Aryan race from the north, and gave his name to an era used still on the Malabar coast from Mangalore to Cape Comorin. Parasu means a club, and was probably applied to him from his carrying a mace.

In the Rama Chandra avatar, Vishnu appears in the person of a courageous and virtuous prince, the son of Dasarat'ha, the powerful sovereign of India (whose capital, Ayodhya, is said to have extended over a space of forty miles), and employed to punish a monstrous giant, Ravan, who then reigned over Lanka, or the island of Ceylon. The Ramayana contains the heroic description of the battles and lives of all the three Ramas, although it more particularly details the exploits of Rama Chandra, or Dasrat Rama, so distinguished from his royal father, Dasarat'ha. The name of this monarch means, whose car had borne him to ten regions, that is, to the eight cardinal and intermediate points, the zenith, and nadir. He was a descendant from Surya, or Heli, which is a name of the sun in Greek and Sanskrit; and one of his ancestors, the great Raghu, had conquered the seven Dwipas, or the whole earth. But it is not known why a Suryavansa, or descendant of the sun, should be styled Rama Chandra, the latter patronymic referring contradistinguishingly to the descendants of the moon, Chandravansa. In Hindu mythology, however, everything seems, directly or indirectly, to merge in, radiate from, or amalgamate with, the sun, or Surya, in one or other of its names or prototypes. All of the Vaishnava sects agree in stating that, with the exception of Krishna, the potentiality of the preserving power of the deity was never exhibited in such plenitude as in this avatara of Rama. In popularity, and in dramatic, historic, and poetic shapes, it rivals the avatara of Krishna. And as the Gocalastha sect adore Krishna as the deity himself, and draw rules for their religious and moral conduct from the Sri Bhagavata, so the Ramanuj sect similarly clothe Rama in almighty attributes, and deem the Ramayana a complete body of ethics and morality.

Rama Chandra, called also Dasarat'ha Rama, succeeded his father Dasarat'ha as king of Ayodhya. Rama was 34th in descent from Ikshwaku, son of Vaivaswata Manu, the son of the Sun. From Ikshwaku to Rama, of the Suryavansa or Solar race of the sun, was a period of 1200 years. Rama preceded Krishna; but as their historians Valmiki and Vyasa, who wrote the events they witnessed, were contemporaries, it could not have been many years. Rama, of the Solar line of Hindu chronology, is, however, placed by the Brahmans 867,102 B.C., between the silver and brazen ages; but this era was brought down by Sir William Jones to 2029 B.C., and reconciled to the Rama of Scripture. Rama's brothers were Lakshmana, Bharata, and Satroghana, but he has been variously supposed to have lived 2029 B.C., Jones; 950, Hamilton; and 1100, Tod; and according to Bentley, he was one year old in 960 B.C., born 6th April 961.

Rama possessed a powerful kingdom in Hindustan, and invaded the Dekhan, penetrating to the island of Ceylon, which he conquered. Sir William Jones places the subjugation of India by Rama about the year 2018 B.C. In his time and that of his father Dasarat'ha, astronomy was much cultivated; and it is supposed (not without much probability) that the first astronomical tables for computing the places of the planets were constructed on the observations made in Rama's time. There was an eclipse of the sun on the 2d of July of the year 940 B.C., which, according to Mr. Bentley, may be referred to with certainty as an epoch of Rama's reign.

Rama married Sita, daughter of raja Janaka, king of Mithila. He gained her by breaking the great bow, and their stories are told in Valmiki's epic, the Ramayana.

From Rama, all the Hindu tribes termed Suryavansa, or race of the sun, claim descent, as the present princes of Mewar, Jeypore, Merwara, Bikanir, and their numerous clans; while from the Lunar (Indu) line of Budha and Krishna, the families of Jeysulmir and Cutch (the Bhatti and Jareja races), extending throughout the Indian desert from the Sutlej to the ocean, deduce their pedigrees. Rama, king of Oudh, is almost the only person mentioned in the Hindu traditions whose actions have something of a historical character. He is said to have been at first excluded from his paternal kingdom, and to have passed many years in religious retirement in a forest. His queen Sita is said to have been carried off by the giant Ravana; for her sake he led an army into the Dekhan, penetrated to the island of Ceylon, of which Ravana was king, and recovered Sita, after a complete victory over her ravisher. In that expedition his allies are fabled to have been an army of monkeys, under the command of Hanuman, whose figure is frequently seen in temples, and who, indeed, is more worshipped in the Dekhan than any of the other Hindu gods. Rama's end, however, was unfortunate, for, having by his imprudence caused the death of his brother Lakshmana; who had shared with him in all his dangers and successes, he threw himself, in despair, into a river, and, as the Hindu say, was reunited to the divinity. He still, however, retains an individual spiritual existence, as is shown by the separate worship so generally paid to him. Rama is represented in his natural form, and is an object of general adoration. He is usually described as a green man, seated beneath an umbrella, the emblem of sovereignty, on a throne; a quiver of arrows hangs at his back; in one hand he holds his destructive bow, and in the other a flower of the sacred lotus. By his side is placed Sita, who is depicted as a goddess of transcendent beauty, of a deep yellow complexion.

The following passage, taken from the Uttara Rama Cheritra, affords an idea of the costume of the warrior race in ancient times. Janaka, the father of Sita, the heroine, is describing the hero Rama:—

> 'You have rightly judged
> His birth; for see, on either shoulder hangs
> The martial quiver, and the feathery shafts
> Blend with his curling locks. Below his breast,
> Slight tinctured with the sacrificial ashes,
> The deer-skin wraps his body, with the zone
> Of murva bound; the madder-tinted garb
> Descending vests his limbs; the sacred rosary
> Begirts his wrists; and in one hand he bears
> The pipal staff, the other grasps the bow.'

—*Prinsep*, p. 215; *Elph. India*, i. pp. 103, 389; *Warren*, *Kala Sanhita*; *As. Res.* i. p. 426, iii. p. 68, ix. p. 239, xiv. p. 382; *Gita*, p. 86.

RAMA-DASA, the religious preceptor (guru) of Sivaji.

RAMA DEVA, author of the Vidvan Moda-Tarangini, or fountain of pleasure.

RAMAGRAMA, a famous city between Kapila and Kusinagara, identified with Deokali. According to the Mahawanso, the relics at Ramagrama consisted of only one Drona measure, which, after being enshrined by the Nagas at Majerika, were carried off to Ceylon in the fifth year of the reign of Dutthagamini, 157 B.C., by whom they were enshrined in the Mahathupo or great stupa at Ruanuelli.—*Cunningham*, *India*, p. 535.

RAMAH, called by the natives Ramla, is situated in a fertile plain that formerly belonged to the Hebrew tribe of Ephraim. It is supposed to be the same as the ancient Arimathea to which that Joseph belonged, who, having begged the body of Jesus from Pilate, took it down from the cross, wrapped it in linen cloth, and laid it in his own new sepulchre. The monks there have a tradition that their chapel is built on the site of the house wherein he dwelt.—*Robinson's Syria*, i. p. 28.

RAMAL. Arab. Sand. The method of divination by it is scattering a quantity on a board, over which certain ceremonies have been performed, and then reading the characters. The person thus officiating is called Rummal. Ilm-ur-Raml, the divination by sand, in great vogue among Muhammadans, many elaborate treatises having been written on the subject. Many unequal lines are drawn on the sand, upon which are disposed a certain number of points, from the combinations of which they pretend to foretell future events. They claim for its founders, Enoch, Shem son of Noah, and Daniel. Qurua or Kuruh means a lot, and means a form of divination. It is practised in different ways, but most frequently by bones of a dead man cut in the shape of dice, and marked with hieroglyphic characters. These are thrown by the person wishing to know his destiny, and the fortune-teller explains the result. Raml-ul-Jumar, the Muhammadan ceremony of throwing gravel by the pilgrims near Meeca.—*Pottinger's Travels*, p. 154.

RAMA-LILA. Sansk. A dramatic epitome of the adventures of Rama. They are performed publicly in the month Aswin, and in some places with great splendour.—*W.*

RAMANANDA, a religious reformer of the Vaishnava sect, who is considered by some to have been an immediate disciple of Ramanuja, by others the fifth in descent from that religious teacher, and to have lived about the middle or end of the 14th (A.D. 1350) or beginning of the 15th century. He is said to have seceded from the Ramanuja sect, because of an accusation of laxity in their custom of taking meals. His residence was at Benares, at the Pancha Ganga Ghat, where a mat'h or monastery of his followers is said to have existed. The special object of their worship is Vishnu, in his incarnation as Rama Chandra and his consort Sita, either singly or jointly; but other forms of Vishnu are

worshipped by them, and the religious mendicants of the sect consider all forms of adoration superfluous, except incessantly invoking the names Krishna and Rama. He instituted no nicc observances, he admitted all classes of people as his disciples, and he declared that the truc votary was raised above mere social forms, and becamc free or liberated. He abolished the distinction of caste among the religious orders, and taught that a Viragi who abstains from the ties of nature and society, shakes off at the samc time all personal distinctions. The initiatory formula is Sri-Rama, blessed Rama. The sectarian mark on the forehead is almost the same as that of the Ramanuja sect. There arc various subdivisions of this sect, but all friendly with each other and with the Ramanuja. Most of the Vaishnava sectarians of Northern India follow the teachings of Ramananda; they are numerous in Gangetic India, and direct their worship to Rama Chandra and Sita. He was the first to admit low caste men as his disciples, amongst whom are mentioned Kabir, a weaver; Asanand; Rai Das, the Chamar; Sena, a barber; Dhunna, a Jat; Pipa, a Rajput; and the Ramawat poets, Sur Das and Tulsi Das. The rani of Chetori Jhali was a follower.—*Garrett; Oudh Census Report*, p. 116; *Cal. Rev.* No. 109.

RAMANANDI or Ramawat, a Hindu sect founded by Ramananda. Wilson, in his Hindu Sects, says they are usually considered a branch of the Ramanuja sect of Vaishnava, who worship Vishnu as Rama Chandra, and reverence all the incarnations of Vishnu, but maintain the superiority of Rama (hence their name, Ramawat) in this Kaliyug age. They worship, singly or collectively, Rama and Sita, or Sita Rama. In his Glossary he says the Ramanandi are a sect of Vaishnava ascetics, who dwell in mat'hs or monasteries. They are particularly numerous about Benares. They follow the teachings of Ramanuja, Ramananda, and Madhavacharya. They admit into their fellowship people of all castes, but the acolyte must first have adopted the views of those teachers, and have had his arms and body marked with the sankha or shell, the gada or club, the chakra or discus, and the lotus flower, symbols of Vishnu; the brass figures being heated for that object. The tilak with which they mark their foreheads is shaped so, ⊔, the outer red strokes being from the chandan (Pterocarpus Santalinus) or roli (Rottlera tinctoria). Sherriug says (p. 267) that only Brahmans and Kshatriyas are now admitted into the sect.—*Wilson's Hindu Sects; Wilson's Gloss.*

RAMANDROOG or Raman Mallay, a hill 37 miles west from Bellary, about 1½ miles long, ¾ of a mile broad, and 3190 feet above the sea-level. It is in lat. 15° 7′ N., and long. 76° 29′ E. Climate cool, invigorating, and healthful, 13° to 14° degrees cooler than Bellary; the table-land is 2735 yards long, by extreme breadth 996 yards. In 1846, Drs. Macdonald, Godfrey, and Balfour reported on it as a sanatorium, the latter unfavourably. A few officers and soldiers visit it in the hot weather, but as it is subject to the S.W. monsoon like Mahabaleshwar and Chikaldah, it is always deserted early in June. Ramandroog is situated in the Native State of Sandur, a small principality in the Bellary district. In 1846, permission was obtained from the raja to establish a sanatorium here, and a tahnamah was executed ceding to the collectorate of Bellary criminal jurisdiction to a limited extent on the Droog.

RAMAN PAAJ, the native name of the Great Basses, rocks of the Ceylon coast.

RAMANUJA, styled Sri Bhashyakar, a philosopher, the founder of the Sri Vaishnava sect of Hindus, is sometimes supposed to be identical with Yembara Manmar, the last of the Alvar. His philosophy is the so-called Visishtadwaita system. He was born at Stripermatur, 25 miles west of Madras, about the early part of the 12th century, and was educated at Kanchi or Conjeveram, where also he taught his system of the Vaishnava faith. He afterwards resided at Sri Ranga (near Trichinopoly), worshipping Vishnu as Sri Ranga Natha, and there composed his principal works. He then visited various parts of India, disputing with the professors of different creeds, overcoming them of course, and reclaiming various shrines then in possession of the Saivas for the worshippers of Vishnu, particularly the celebrated temple of Triputty. On one occasion, Ramanuja was compelled by persecution to flee to Mysore, where he converted Vitala Deva, the Jaina sovereign, and others to Vaishnavism. After twelve years' absence, on the death of the Chola king, his persecutor, Ramanuja returned to Sri Ranga, where he spent the remainder of his life. He was a voluminous writer. He is said to have been able to introduce the worship of Vishnu into Triputty in N. Arcot; to have founded 700 mat'hs or religious monasteries, one of which still exists at Mail Cottah in Mysore; he also established 74 hereditary offices of guru, the representatives of which still exist at Conjeveram. The followers of Ramanuja in Mysore still are to be seen as a separate class, speaking Tamil in their families and Carnatica in public. His followers are known as the Ramanuja or Sri Sampradayi sect. Their worship is addressed to Vishnu or to Lakshmi and their incarnations, and they assert that Vishnu is the supreme cause. They draw their doctrines from Vedanta works, the Vishnu, and other Puranas. They are scrupulously secret in the preparation and consumption of their meals.

RAMASANTIRA KAVIRAYAR was born at Rajanellur, but lived at Madras, where he died in the middle of the 19th century. He wrote the dramas Sakantati Vilasam, Parata Vilasam, Taruka Vilasam, Iraniya Vasakappar, and Irankum Sandai Nadakam.

RAMASAWMY, a Hindu name very common in the south of India; a silver cigar-lighter.

RAMA SITA, Rama's Bridge, Adam's Bridge, rocks between Ceylon and the Peninsula. Rama Sitoa, a title of the Inca of Peru.

RAMAYANA, the older of the two great epic poems of the Hindus, and that in which the principal hero is Rama. Three versions exist of this book, one supposed to have been composed by Valmiki, one by Tulsi Das, one by Vyasa. That of Vyasa is known as the Adhi Atma Ramayana. The story of the Ramayana has some resemblance to that of the Iliad. Sita, the beautiful wife of the hero Rama, is carried off by the giant Ravana to the island of Lanka or Ceylon, whither Rama follows him, and after a variety of adventures recovers his spouse, and subsequently recognises his two sons, Kusa and Lava.

The reef across the Straits of Manaar is called Rama's Bridge; and the legend says that Rama

Situ threw the rocks which compose it into the sea. The bare story of each epic is probably historical. Bentley assigned the Ramayana to the 4th century of the Christian era. The scene is laid in Ondh. It describes his youthful days, his education and residence at the court of his father, Dasarat'ha, king of Ayodhya, his marriage with Sita, and his inauguration as heir apparent; 2dly, the circumstances that led to his banishment, his exile and residence in the forests of Central India; 3dly, his war with the giants or demons of the earth for the recovery of his wife, Sita, who had been carried off by Ravana, king of Ceylon, his conquest and destruction of Ravana, and his restoration to the Oudh throne. The first two parts contain little of extravagant fiction, but in the third part there is the wildest exaggerations and hyperbole, the subject being the conquest of the parts then conquered and pertaining to Brahmanic India, and of the island of Ceylon. With its other subjects, the Ramayana describes the forest or wilderness of Dandaca as covering the whole extremity of the Southern Peninsula, and the rude inhabitants are designated Rakshasha (monsters), or Vanara (monkeys), the former meaning races or tribes hostile to the Aryans. The word Vanara is from Vana, a wilderness, and Nara, a man,—that is, a wild or uncivilised man; and to this sense, as to the wild races in the extreme south, the fable of Hanuman, the chief monkey, and that of his army, Mr. Taylor thinks may be reduced. He says that those who have seen the Colleri and Marava will readily consider them to differ from all family likeness of the Aryan Hindus, and as their visages often resemble baboons more than men, it would require even less than the ardent poetical imagination of a Valmiki to induce the employment of an equivalent word which would so aptly seem to convey the idea imparted by their appearance.

The name is from Rama, and Ayana, to go. Ramayana has seven kanda or books, and 24,000 sloka, or about 48,000 lines. Mr. Fergusson supposes that the events it details occurred 2000 B.C., and those of the Mahabharata about 1200 B.C.

RAMAZAN or Ramadan, the 9th month of the Muhammadan year, each daytime of which is observed as a strict fast, with abstinence from all sensual gratifications from the dawn of day to sunset, as also from chewing betel leaves, or taking snuff, or swallowing the saliva. The excellence of this month was much extolled by Mahomed, and it is undoubtedly a time of solemn trial of a believer's integrity. The sick, the infirm, pregnant or nursing women, the young who have not reached puberty, and travellers are exempt. The fast is extremely rigorous and mortifying, a drop of water, even the moisture of the mouth, must not be swallowed; the death of young persons even occurs from this austerity. The devout Muhammadans seclude themselves for some time in the mosques, abstaining from all worldly conversation, and reading the Koran. The 21st, 23d, 25th, 27th, or 29th of the month are sacred nights, and the 27th is the night of power, Lailat-ul-Kadr, during which 'all is peace till the breaking of the morn.' It is frequently confounded by writers with the Shab-i-Barat. The nights of the Ramazan, from sunset till dawn, may be passed in lawful enjoyments. Breakfast is from 2 to 4 A.M. Ramazan-ki-Eed or Eed-ul-Fitr (the feast of alms), the feast of the Ramazan, is held on the first day of the month Shawāl. Ali, son-in-law of Mahomed, is said to have died on the 20th or 21st of this month; and the 27th is the Lailat-ul-Kadr, or night of power, on which the Koran is said to have descended from heaven. It should be observed as a vigil. The Ramazan ends with the Eed-ul-Fitr.

RAMBHA. HIND. A sort of flat trowel or hand-hoe, like the khurpa of Hindustan. It is used in rice-fields; it is also the name of a chisel with slanting edge for leather cutting.

RAMBHA, in Hindu mythology, an apsaras or nymph produced at the churning of the ocean, and the type of female beauty.—*Dowson.*

RAMBODDE, near Newera Elia in Ceylon, presents superb cascades in the rainy season.

RAMBOWE, a Malay State, N. and E. of Nanning and Salangore. It has two divisions, Rambowe Ulu and Rambowe Ilir, each under its own four suku or heads of tribes, and all subject to the control of one panghula, who resides at Chembong. Besides Malays, are several aboriginal tribes inhabiting the slopes of the mountains and the forests, who subsist by hunting, to whom the resident population apply the general terms Orang Benua; they are the Udai, Sakkye, Jakun, and Rayet Utan. Their hair is sometimes straight like that of the generality of Asiatics, but more frequently curling, at the same time very different from the frizzled locks of the African. Their stature is short, but they do not differ much in features and complexion from the Malay. They bear little resemblance to the Semang in the interior of Quedah, or to the thick-lipped, woolly-haired Papuan. Malays entertain a high opinion of the medical skill of these tribes, who are to be found over the whole of the interior of this part of the Peninsula, particularly in Ulu-kalang, Sungi Ujong, Johole, Jompole, Jellabu, Ulu Muar, and Segamet. The tribes of Rambowe Ilir are Battu Ampar, Payu Kumba Barrat, Muukal, Tiga Nenik. Those of Rambowe Ulu are Paya Kumba Darrat, Battu Ballang, Sa Melongang, Sri Lummah.—*Newbold's Malacca*, ii. p. 122.

RAMBUTAN. MALAY. The fruit of Nephelium lappaceum, the name being from Rambut, MALAY, the hair of the head, in allusion to its villose covering. The fruits of N. litchi and N. longana are also prized. N. hypoleucum, N. rubescens, and N. stipulaceum are also known.

RAM CHANDAR KI KUP, mud volcanoes or mud wells in the bed of the Aghor river in Mekran. See Oritæ; Volcanoes.

RAM CHANDAR ROY, under the direction of H. T. Prinsep, compiled a General Register of the Honourable East India Company's Civil Servants on the Bengal Establishment from 1799 to 1842, Calcutta 1846.

RAMESES II. was the Pharaoh who oppressed the Israelites, but Menephthah was Rameses I., and was reigning at the Exodus. His tomb is in the valley of kings' tombs near Thebes. The name of his son and successor is variously written in the hieroglyphics. See Egypt.

RAMESWARA, one of the twelve great lingas of the Hindus; this one gives its name to Ramisseram, written Rama Iswara.

RAMGANGA RIVER, rises among the outer Himalayas, in lat. 30° 6′ N., and long. 79° 20′ E. Flows for about 100 miles through the hills of

Garhwal and Kamaon, with a very rapid fall; enters the plains at Kalagarh in Bijnanr district.

RAM GHAT, a ghat or pass through the mountains of the Western Ghats, leading from Belgaum to the Arabian Sea.

RAMI, also called Tali Rami. MALAY. The China grass, Boehmeria nivea or Urtica nivea, a nettle the bark of which furnishes a thread remarkable for strength and durability. Rami-China, *i.e.* 'Chinese Rami,' a name given by the Malays to the jute, Corchorius olitorius; also to the true hemp, and to the Urtica nivea.—*Royle.*

RAMISSERAM is a small island 8 miles long, situated between Ceylon and the continent of India, at the entrance of Palk's Passage in the Straits of Manaar, where there stands a very ancient pagoda, and formerly an observatory. It was found by Colonel Lambton's Survey to lie in lat. 9° 18′ 7″ N., and long. 79° 22′ 5″ E. Many Telugu and Tamil astronomers, as Baladityacaln and Mallicarjanadu, refer their computations to the meridian of Rameswara. It is in a line with the island of Manaar, near Ceylon, which forms the Adam's Bridge, and is famed throughout India as a place of Hindu pilgrimage. It is united by a bank of sand to the island of Manaar. Hindu pilgrims resort to Ramisseram from remote parts of India; its celebrated temple is sacred to Vishnu in his avatara of Rama called Rameswara, or in its neighbourhood is called Ramisseram, conformably with the Tamil and Canarese termination of names ending with a vowel or a liquid.

The pagoda in the island of Ramisseram is said to have been founded by Rama after his invasion of Ceylon. It has two lingams, one which Sita is said to have made, and one which Hanuman is said to have brought from Mount Kailasa. There is one complete goparum, abont 100 feet high, covered with figures relating to the Hindu mythology; it is on the west. Other three doorways are 19 feet high, composed of single upright stones, with others laid across at the top. Inside the gate is a magnificent colonnade. It runs along the four sides of the quadrangle, from N. to S. 353 feet, and E. to W. 671 feet, by 17 feet in breadth. It is the most remarkable structure of its kind in India. The ceiling is composed of large slabs of granite, supported by numerons carved granite pillars, each 12 feet high, raised on each side on a platform 5 feet high. Most of the pillars are single blocks of stone, all brought from a distance of 40 miles. The annual revenue of the pagoda is Rs. 40,000. The glory of the temple is in its corridors; these extend to a length of 1333 yards, from 20 to 38 feet broad, and from the floor to the centre of the roof about 30 feet in height. The inner prākaram or corridor is said to have been constructed by a Naik ruler of Madura, and the sokkatan or mantapam outside was raised by two of the Setupati of Ramnad. Each pillar is compound, and is richer and more elaborate in design than those of the Parvati porch at Chedambaram, and more modern in date.—*Moor; Fergusson.*

RAMJANI. In Benares, a Hindu tribe of professional musicians. They wear the sacred cord, and call themselves Kshatriyas, but in social position there is a great difference between them and the Kathaks. The Muhammadan dancing girls are often called Ramjani.

RAM KOMOL SEN, a native of Bengal, the author of a Bengali and English dictionary; obiit 1843.

RAM MOHUN ROY is the only great mind to whom modern Bengal can point. He was the first great modern theistical reformer of British India. He was born about 1774, at the village of Radhanagar, in the district of Murshidabad. His father was a Brahman, and his grandfather had held office under the Moghnl emperor. Brought up as a child in the popular Hindu faith and piety, he became as a boy disgusted with its extravagant mythology, and at sixteen composed a spirited tract against idolatry. He was persecuted, and fled, first to Benares, the stronghold of Brahmanism, afterwards to Tibet, that he might converse with the Buddhist priests, being determined to study each religion at the fountainhead. Probably he was the earliest earnest-minded investigator of the science of comparative religion that the world has produced. As he studied the Vedas in Sanskrit, so he was believed to have approached the Buddhist Bible, the Tripitaka, in the original Pali. He mastered Arabic that he might read the Koran; and later in life learnt Hebrew, and began Greek, that he might the better know the Old and New Testaments. Returning home at about twenty years of age, he seems to have been reinstated in the favour of his family, and returned to his Sanskrit studies and the examination of his ancestral religion. He was too logical to be deceived by Brahmanical sophistries, yet he was wont to say he found nothing elsewhere equal to the Hindu scholastic philosophy. Then, too, he learnt English, and shook off his prejudices against European society. After his father's death in 1803, he became bolder in his controversies with the Brahmans, and published various works against Hinduism, his antagonism to idolatry becoming more and more marked. He maintained that the worship of idols was not sanctioned by the oldest national sacred books, and aroused general attention by insisting on the absence of all Vedic sanction for the self-immolation of widows (sati). The agitation set on foot by him against sati ultimately led to its abolition by law throughout British India in 1830. Ostracised by his own social circle, he had retired to Calcutta in 1814, and there, having been joined by Jains and Hindus of rank, wealth, and influence, among them being Dwarkanath Tagore, formed in his own house in 1816 the Atmiya Sabha, or Spiritual Society. Becoming more and more impressed with the sayings of Christ, he published in 1820 a book called The Precepts of Jesus, the Guide to Peace and Happiness. Being shown a picture of Christ, he said the painter had falsely given him a European countenance, whereas Jesus was an oriental, and that the Christian Scriptures glowed throughout with rich oriental colouring. He strongly opposed the doctrine of the Trinity, arguing that it was polytheistic, and to the last his Unitarianism was strongly marked. His idea of inspiration was that it was co-extensive with the human race.

The beginning of January 1830 inaugurated a new era in the history of Indian religions thought, ushering in the dawn of the greatest change that has ever passed over the Hindn mind. Then was opened in Calcutta the first Hindu theistic church, called the Brahma Sabha, or Brahmiya Samaj,

that is to say, 'the assembly or society of God.' Ram Mohun Roy visited Britain in April 1831, being the first native of rank and influence to cross the 'black water.' Here he stayed until his death at Bristol, on 27th September 1833. His Brahmanical thread was found coiled round his person when his spirit passed away. His successor was the son of his friend Dwarkanath Tagore. This remarkable man, Debendranath Tagore, like his predecessor, aimed at being a purifier rather than a destroyer. It was not until 1843 that he formally joined the church founded by Ram Mohun Roy. He saw that organization was needed if the Samaj was to hold its ground as a permanent church in India, and he himself drew up the Brahma covenant, consisting of seven solemn vows, to form the bond of union among its members. They bound themselves to abstain from idolatry, to worship no creature, but to worship, through the love of God, and through the performance of the works God loveth, the Great God, the Creator, Preserver, Destroyer, the Giver of Salvation, the One only without a second; to lead holy lives, and to seek forgiveness through abandonment of sin. The year 1844 might be given as the date of the real commencement of the first organized theistic church of India, hence called the Adi-Brahma-Samaj. In three years the covenanted members numbered 767, and in three years more kindred societies had sprung up in not a few Indian provincial cities, though meanwhile controversies had broken out which led Debendranath to put forth a new theistic directory. —*Monier Williams on Indian Theistic Religion; Rajasthan*, ii. p. 642; *Marshman's Defence of the Deity and Atonement of Jesus Christ*, London 1822; *Calcutta Review*.

RAMNA. HIND. A park; a game preserve; grass lands. It is this word that the gypsies in Europe take to themselves as Rămnă-chăl, dwellers of the Ramna.

RAMNAD or Rama Natha-Puram, in lat. 9° 22′ 26″ N., and long. 78° 52′ 9″ E., gives its name to a large zamindari in the south of the Peninsula of India, situated between lat. 9° 3′ and 10° 2′ N., and long. 78° and 79′ 24″ E., covering an area of 1900 square miles, but half of it is sand, waste land, and water. It is the S.E. portion of the Madura district. It and Shiva-ganga are occupied by the Maravar race, to whose care Rama is believed to have delivered over the temple of Ramisseram. About A.D. 1380, the Ramnad chief declared himself independent, but during the contests for supremacy in the 18th century, Shivaganga was separated about A.D. 1729; and finally, in 1801, when the country was ceded to the British, it was declared a zamindari. Ramnad was stormed by General Smith in 1772. The district has gentle undulations. Near the sea-coast towns are extensive groves of palmyra and cocoanut palms. It has several rivulets and streams, and several tanks or lakes. The chank shell fishery yields a revenue. Population (1871), 15,442. Within the fort, the majority of the inhabitants belong to the Vallallar and Maravar castes. The Vaigar river, which waters Madura, supplies the large tank at Ramnad, capable of irrigating over 6000 acres of land. The total number of tanks in the zamindari is 1767.

RAM NAOMI is a nine-day festival in honour of the birthday of Rama Chandra at Oudh, B.C. 1400? and is held from the 1st to the 9th of Chaitra, about 12th April. During the nights of the nine days, Kirtan is preached, the Ramayana is recited, sprinkling with the red gulal powder, and uautching. Rama is said to have become incarnate at noon of the 9th day, the object being to destroy Ravana, the ten-headed tyrant of Lanka or Ceylon, and which he effected with the aid of Hanuman, the chief of the monkey tribe. On the Ram Naomi, the images of Rama in the temples are decorated with ornaments and brocade, and at noou the image is brought out, as if then incarnate, and put into a cradle, on which there is much rejoicing and throwing of gulal. Rama is commonly believed to be an incarnation of Vishnu, and the observances of the Ram Naomi are chiefly performed by worshippers of Vishnu.

RAMOTH GILEAD, a small town of 6000 people, the modern Es-Salt. It is in the most favoured district in Palestine.

RAMPUR is the chief town of the Rampur State, N.W. Provinces of India, in lat. 28° 48′ N., long. 79° 4′ E.; population (1872), 68,301. It is built on the left bank of the Kasila river, surrounded by a belt of bamboos, trees, and brushwood, with a low, ruined parapet. It is famed for damask and for its fine shawls, known in commerce as Rampur chadars. The Rampur State lies between lat. 28° 26′ and 29° 10′ N., and between long. 78° 54′ and 79° 33′ E. Bounded on the N. and W. by the Moradabad district, and on the N.E. and S.E. by the Bareilly district. Its area, 945 square miles; and population (1872), 507,004.—*Imp. Gaz.*

RAMPUR BEAULEAH, the chief town of the Rajshahi district in Bengal. It is situated on the north bank of the Ganges, in lat. 24° 22′ 5″ N., and long. 88° 38′ 55″ E.; population (1872), 22,291. The mean height of the station is 56 feet above the sea.—*Imp. Gaz.* vii.

RAM RAM, an exclamation, or salutation, or invocation. It is proper to be addressed to a Vaishnava ascetic. Amongst Mahratta Sudras, it is the usual exclamation of greeting, and is a Hindu salutation equal to the salam alaiakum in use amongst Muhammadans.

RAM RAZ, a Hindu author on architecture.

RAMRI or Yambie, or New Island, forms the N.E. side of Cheduba Strait. It is 40 miles long and 15 broad, of moderate height near the sea, and extends N.W. to Saddle Island in lat. 19° 26′ N., on the north side of which is the entrance to Khyouk-Hpyu harbour. From its southern point, the islands of Amherst or Juggu, Adam Hill, Wyndham, and Harrison project in a chain. Ramri town is in lat. 19° 6′ 36″ N., and long. 93° 53′ 45″ E. It has many wells of petroleum or earth-oil, generally situated near the bases of low hills, and of various depths. The deepest is said to be about 50 feet, having about 6 feet diameter at the mouth. The sides of this well have been ingeniously boarded by the natives, having diagonal cross bars, which not only secure the structure but serve as a ladder. There is no sort of machinery used to get up the oil. A young lad is first sent down, a man on the cross bars lets down to him earthen pots in succession, into which the contents of the well are filled, and then the pot is drawn up. The whole of the contents of the pot, as drawn up, is not oil, which is of a light bluish colour, and floats on water; there is sedi-

ment scooped up from the bottom. This takes place twice a day, and the yield is from four to six gallons per day. The oil sells in the bazar at a rupee per gallon. The deepest of the wells in the island is in the Laytoung Circle, and is said to have been productive for a great number of years. Natives have been known to dig wells of short depths for temporary purposes, after which the wells are abandoned, and soon choke up from the falling in of the earth. There is a fish found in these waters called Luckwa, the oil extracted from the liver of which is said to have the same properties as cod-liver oil. The island lying about two and a half miles to the westward of old Khyouk-Hpyu is called on old marine charts Saddle Island from its shape. When Khyouk-Hpyu was a military station, some of the officers, it is said, let loose thereon a pair of goats; these have increased to such an extent that the island now abounds with wild goats, and hence it is now called by natives Chy-Kysor or Goat Island.

RAMSANEHI, or Friends of God, a sect of Hindu schismatics in Western India.

RAM TCHU, a lake frequented by great abundance of water-fowl, wild geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of the saras, the largest species of the crane kind, are seen here at certain seasons of the year, and any quantity of eggs may there be collected; they are found deposited near the banks; they are as large as a turkey's egg.—*Turner's Embassy.*

RAMTEK, 24 miles N. of Nagpur, in lat. 21° 24′ N., and long. 79° 20′ E., population 7045, has ever been, amongst the Hindus, a chosen seat of religious veneration. Of the many old temples, the oldest appears to be one in a small dell on the north side of the hill. It is built of hewn stones, well fitted together without mortar. From its shape and structure it is probably of Jain origin, though local tradition would make it the work of one Hemarpanth, by some said to have been a Brahman, by others a Rakshasa, with whose name many remains of buildings in the Bhandara and Nagpur districts are connected.

RAMUSI or Ramoosi, a race who have crossed into the west of India, and there assumed predatory habits. They speak the Telugu tongue in their families, but have acquired Mahrati. They are in small numbers west to Bombay, southwards to Sholapur, and northwards towards Berar. In the Mahratta country, the low caste tribes are the humbler village servants, the Ramusi, Bhil, Gond, Mhair, and Mhang, all of whom serve as watchmen. The Ramusi, Kallar, Marawar, Beder, are sturdy, martial, predatory races. Below the ghats, near Bombay, the Dher are known as Parwari, which means outside the hamlet or village, they not being allowed to reside within its walls. As amongst the Dravidian races in the south of India, so the various Aryan or Hindu districts contain numerous small tribes, the supposed remnants of a prior colonization, and mostly supposed to be, like the Tamil, people of Turanian descent. Among these are the Ramusi of the Bombay Presidency.

RAN, also Ranwa. MAHR. Wild; a forest, a wood, a waste. Ran patti, a forest.

RANA, a genus of reptiles of the second subclass Batrachians, of the order of tailless Batrachians or Batrachia salientia. The following species occur in the E. Indies:—

Rana Kuhlii, *Schlag.*, Ceylon, Ningpo.
R. hexadactyla, *Less.*, Ceylon, Madras.
R. cyanophlyctis, *Schneid.*, Ceylon, S. India, Lower Bengal.
R. tigrina, *Daud.*, all India.
R. Liebigii, *Gthr.*, Sikkim, Nepal.
R. esculenta, S. China.
R. sylvatica, *Leconte*, Ningpo.
R. gracilis, *Wieg.*, from Madras to S. China.
—*Gunther.* See Frogs; Reptiles.

RANA, a title of the ruler of Mewar, a Rajput race whose capital is Udaipur, but it is also given to the chief of Porbandar, to the ruler of Dholpur, and to the chief of Jhalawur. A higher grade is maharana. A lady of this rank, or the wife of a rana or raja, is a rani or maharani, and these titles are applied to the Empress of India. Rana Singha, chief of Chitore in 1526, defeated the emperor Baber at Futtehpur Sikri, but shortly after, in 1527, Baber overthrew him and completely broke his power. Ranawat, in Mewar, descendants of Raja Oody Singh. They are also styled Purawat and Kanawat. See Mewar.

RANADITYA was a very powerful prince, whom native writers have accredited with the miraculous reign of 300 years. The period of his reign General Cunningham places between A.D. 480 and 555. The date, therefore, of the two smaller temples of Ranesa and Amriteswara may be assumed as about A.D. 500.—*Cole. Ill. Ancient Buildings of Kashmir.*

RANCHEE, the chief civil station of Lohardugga.

RANDIA, a genus of plants of the natural order Rubiaceæ. R. dumetorum, Dekhanensis, fragrans, Gardneri, rigida, speciosa, tetrasperma, nutans, and uliginosa grow in the E. Indies. One species, the Nalla Manga, TEL., is a good-sized armed tree of the Godavery forests, furnishing a very hard and close-grained wood, good for turnery.

Randia dumetorum, *Lam.*, Bush Randia.

Gardenia spinosa, *Linn.*	Randia longespina, *D. C.*
Posoqueria dumetorum, *Roxb.*	Canthium coronatum, *Lam.*
Cerisсus Malabaricus, *Gœrt.*	Gardenia dumetorum, *Retz.*
Jowz-ul-kueh, . ARAB.	Madana, . . . SANSK.
Jowz-ul-kowsul, . ,,	Wali kukuru-man, SINGH.
Pieralu, . . . BOMBAY.	Maru karang, . . TAM.
Muen-phal ka-jhar, HIND.	Madu karray, . . ,,
Gehela, . . . MAHR.	Manda, Manga, . . TEL.
Mindhal, Mendphal, PANJ.	

A shrub or small tree, thorny and branching, met with in the hotter parts of Ceylon; in Coimbatore and the Bombay forests, the wood is strong, hard, and close-grained. It grows also in Gujerat and northwards in the Dehra Doon and the Kheeree pass. The fruit is used in Malabar to poison or intoxicate fish, which are still considered good for eating.

Randia uliginosa, *D.C.*, Bog Randia.

Gardenia uliginosa, *Roxb.*	Posoqueria uliginosa, *Roxb.*
Devata malle, . . TEL.	Guahu peddamranga, TEL.
Nalla kakasi, . . ,,	

A native of Ceylon and British India, in moist places. The flowers are large, white, and fragrant, and in twos or threes at the top of the branchlets. The berry is about the size of a pullet's egg, ash-coloured or olive-grey, and two-celled. The seeds are flattish, nestling in the pulp. The unripe fruit is employed as a vegetable dye.—*Thw.; Wight; Roxb.; Beddome; Stew.*

RANG. Hind. Colour, dye. Singh., gold. Hence Rang-welle, golden sand; Rang-galla, golden rock.

RANGACHARYA, a great scholar who translated into Sanskrit the writings of Ramanuja. He was also author of two treatises defending Vaishnava doctrines.—*Growse*, p. 210.

RANGAR, a Rajput race in Malwa and Mewar; also disorderly persons in the N.W. of India, a slothful caste of agriculturists.

RANGAR amongst the Mahrattas is a term applied to all the Brahmans of Central India. Sherring says the Rangar are, to some extent, an agricultural class. Some of them have been employed as sepoys. They are numerous in Shekhawati and the Bhatti territory. Colonies of the caste are found in the Upper Doab and Rohilkhand. They have, as a class, the reputation of being turbulent and disorderly. Some of them have embraced the Muhammadan faith.—*Wilson; Sherring's Castes*, p. 329.

RANGARI. Hind. A dialect of the Hindi spoken along the south and west of Malwa and in Mewar. Its limits are the Indus on the west, Bundelkhand on the east, the Satpura Hills on the south, and Jeypore, Jodhpur, and Jeysulmir on the north.—*W.*

RANGAS or Rangi. Malay. Supposed to be the manchineel of the West Indies, but perhaps only from the noxious quality of its juices; is the Arbor vernicis of Rumphius, and is particularly described in the Batav. Trans. v., under the name of Manga deleteria sylvestris, fructo parvo cordiformi.

RANGBODDE or Rambodde, in lat. 7° 9′ N., and long. 81° 49′ E., in Ceylon, 10 miles N.W. of Nurelia. The old rest-house is 3187 feet above the sea. The flag-staff at the foot of the Rangbodde pass is 6586 feet.—*F. and S.*

RANGHA-AS. —? A Penang wood of a light-brown colour, used for furniture. — *Col. Frith.*

RANGOON, the chief town of British Burma. It was founded in the second half of the sixth century B.C. by a missionary body of Buddhists. It was rebuilt in 1755 by Alompra, and named by him the Yankon or 'Victory achieved,' in commemoration of his conquests. It is built on the left bank of the Hlaing river, at its junction with the Pegu and Pu-zwon-doung streams, 21 miles from the sea. It gives its name to a British revenue district in the province of Pegu, occupying the seaboard from the mouth of the river Tsit-Toung (Sit Tang) to the To or China Buckue, a branch of the Irawadi between lat. 16° and 17° N., and long 95° and 96° E., the area being 5691 square miles. The population of the town in 1872 was 98,745, and that of the district 332,324.

Burmese,	349,713	Muhammadans,	10,126
Mon or Talaing,	12,394	Europeans, Americans,	2,384
Karen,	27,830	Chinese,	3,718
Arakanese,	302	Others,	1,989
Shan,	6,396		
Hindus,	16,218		

In 1881 the town population had increased to 134,176, and that of the district to 602,223.

Gaspar Balbi visited Pegu in 1579-80. The English, Dutch, Portuguese, and French had factories at Than-ly-eng or Syriam. Difficulties occurred between the British and the Burmese in 1794, and after Colonel Sym's visit a British resident was appointed to Rangoon.

The Mon are supposed to have been prior occupants of Pegu, whom the Talaing (Teling) from the Peninsula found settled there, and the Talaing language is spoken in British territory. At the 1881 Census it was spoken by 154,553 souls. The principal pagodas in the district are the Shwe-dagon, the Bo-ta-h'toung, and the Tsulai, in Rangoon; the Kyaik-houk at Syriam, the Shwe-h'maw-daw at Pegu, and the Tshan-daw at Twan-te. The Shwe-dagon is the most celebrated object of worship in all the Indo-Chinese countries, as enshrining several hairs of Gautama Buddha. The Shwe-h'maw-daw is the great pagoda of the Talaings. They say the Shwe-dagon pagoda was founded by two brothers, who had met and conversed with Gautama Buddha in India. But the first notice of the country that can be considered as historical is given in the Singhalese Mahawanso, which mentions the mission of Sono and Uttaro, sent by the third Buddhist Council (B.C. 244) to Suvarna-bhumi ('Aurea Regio') to spread the Buddhist faith. Karens belong to the Pwo and Sgau families, and are industrious agriculturists. Many have been converted to Christianity. In a commercial point of view, it is the most important town of British Burma. Rise of tide at springs, and for two days afterwards, from 20 to 25 feet, and 13 and 14 feet on the neaps. The sands extend a long way to seaward, over which the bore rushes with the flood, which makes it very dangerous when near them; the same bore runs up the Sitang river 15 leagues east of Rangoon bar. It is very slightly felt in the delta of the Irawadi, and merely rushes over the extensive sand at the entrance of the Rangoon river and on to the Sitang. There is a bore in Bassein creek, which joins the Rangoon and China Buckue branch. Rangoon was twice taken by the British Indian armies, once on the 11th May 1824, and again on the 5th April 1852, and the British soldiers are now cantoned on the S.W. and W. of the Shwe-dagon pagoda.—*Winter's Burma*, p. 6.

RANGO PEAK, in lat. 33° 8′ N., and long. 78° 54′ E., in Ladakh, N. of Hanle. The top of the peak is 20,786 feet.—*Cunningham.*

RANGPUR, a small town in Bengal with about 14,000 inhabitants. It gives its name to a revenue district between lat. 25° 2′ 50″ and 26° 18′ 45″ N., and long. 88° 47′ and 89° 35′ 30″ E., in the Rajshahi and Koch-Behar division. Local traditions allege that the district has been ruled successively by Prithi-raja, the ruins of whose capital are pointed out at Jalpaiguri; the next was a Pal dynasty; and the third had three kings, each of whom had a separate capital, that at Kamatapur being the capital of Niladwaj, the first ruler. In the end of the 15th or beginning of the 16th century, the State was conquered by Husain Shah, the Afghan king of Gaur, under whom most of the people adopted Muhammadanism; and in 1872, 1,291,465 were professing that faith, the total population being 2,149,972. The Koch, Pali, and Rajbansi in Rangpur are the semi-Hinduized aboriginal tribes, numbering 407,658 persons,—the Chandal, 36,148; and the Khyen, 20,013; Teyar (fisherman), 141,213; and Kaibartta, 35,396. There are also 10,623 Brahmans of the Mithila and Kamrupi Vaidak clans; Kayasths,

10,387, including apparently many Kolita from Assam; and Rajputs, 2404.—*Imp. Gaz.*

RANGRI, in Cuttaek, a low servile class.—*W.*

RANGRI BHASHA or Bhaka, a Hindu dialect spoken in the central parts of Hindustan and on the western borders of Rajputana. In the schools of Central India the dialect of the Hindi termed Rangri is the common language taught, which, as well as aceounting, is learned by all the children who can afford it. The Rangri Bhaka prevails as far west as the Indus, east as far as the frontier of Bundelkhand, south to the Satpura Hills, and north to Jeypore, Jodhpur, Jeysulmir. There is, in different provinces, a variance in the pronunciation in many of the words, but the language is the same, and is written in the same charaeter. Many books and songs have been composed in this language. The word Rangar, the Rajputs say, is derived from Run, signifying battle, and Ghar, a fort, an epithet asserted to have been given them by one of the kings of Dehli, expressive of their bravery; but the Mahrattas say that the derivation is from Ran, which means a jungle or forest, and Gurree, a man, or metaphorically a barbarian.—*Malcolm's India*, ii. p. 191.

RANG-TANG. Bhoti. Lowlands.

RAN-HUN. The wild dog, Canis primævus, or Cuon rutilans, a native of the Kashmir ranges, and although not to say common, is by no means rare; it is so stealthy in its habits, that attempts to obtain specimens often prove abortive. They hunt in packs, and attack the largest deer. Even the Kashmir stag is said to be brought to bay and killed by packs of wild dogs. The wild dog seen by Dr. Hooker on the Khassya mountains, and known there by the names kulsam and khas, may be a different species, though Colonel Sykes considers it identical with the kolsum of the Dekhan, C. Dekhanensis.—*Adams.*

RANI, the consort of a Hindu raja or rana, a queen. The Queen-Empress of India is known in India by the Hindu title rani, and by the Muhammadan title malikah. As Queen-Empress, the title should be maharani. Many towns are called after the rani. Raniah was founded by Rai Singh of Bikanir, and named after his rani, to whom it was assigned. It was taken by Imam Mahmud. Several of the rani of India have been famed. The rani of Jhansi was the widow of a Bundela chief called Gungadhar Rao, who died in 1854, having adopted a son. But Lord Dalhousie declared the Jhansi State a lapse, and when the revolt and rebellion of 1857 occurred, she instigated the native regiments there to rise, and the British officers sought refuge in the fort. Unable to hold out, they capitulated on terms, but, with one exception, the sepoys destroyed man, woman, and child. The rani then reassumed sovereign power, dug up cannon, and assembled an army of 14,000 men, but Sir Hugh Rose opened fire against the place on the 25th April 1858. It was stoutly defended, even women aiding, but the town and fort fell on the second and third days; the rani fled to Calpee, Gwalior, and Sipri in succession, and fell in action at Morar on the 17th June 1858. She was energetic and able.

Rani Chanda, one of the inferior wives of Ranjit Singh, chief of the Sikh kingdom, and mother of the maharaja Dhuleep Singh. She was the sister of Juwahir Singh. She proclaimed Dhuleep Singh sovereign in 1843, and assumed regency. From this she was removed by Lord Hardinge, but she continued to intrigue, and she was removed to Benares, from which, however, she fled to Nepal, where she died.

RANIGANJ, a town which gives its name to a subdivision of the Bardwan district of Bengal, situated between lat. 23° 23′ and 23° 52′ 45″ N., and between long. 86° 50′ 30″ and 87° 37′ E.; area, 671 square miles. It has 678 villages, and a population in 1872 of 245,017 souls. The Raniganj coalfield is the largest and most important of the areas in which coal is worked in India. It extends a few miles east of Raniganj town to several miles westof the Barakhar river, or 39 miles long and 18 broad. A portion of the coal-bearing strata is enclosed between the Damoda and the Ajai, the former river receiving the principal drainage. Raniganj coal, like most Indian coals, is a non-coking bituminous coal. The price of Raniganj coal varies from £1, 2s. 3d. to £1, 5s. 7d. a ton in Calcutta. Ranigunge was so called from the rani of Bardwan, who had the proprietary rights vested in her name.—*Tr. of Hind.* i. p. 170.

RANIGHA, amongst the Mahrattas, a musician.

RANIGHAT, lit. Queen's Pass, or Queen's Rock, or Queen's Park, is an ancient fortress in the Peshawur district of the Panjab. It is a vast hill fortress, situated immediately below the small village of Nogram, about 16 miles north by west of Nogram, and in 1848 General Cunningham suggested that it corresponded in all essential particulars with the description of Aornos, as given by Arrian, Stabo, and Diodorus, excepting in its elevation. In 1854, General James Abbott had suggested the Mahaban Hill as the true identification; and in 1863, Mr. Loewenthal brought forward the claims of Raja Hodi's fort, opposite Attock, a site first suggested by General Court. But General Cunningham has again urged the identification of Ranighat with Aornos. The Queen's Rock is a huge upright block on the north edge of the fort, on which the rani of Raja Vara is said to have seated herself daily. The chief objection to the identification is the difference in height,—Ranighat being only about 1000 feet high, while the Aornos of Arrian was said to be 6674.—*Cunningham's An. Geog. of Ind.* pp. 58–78; *Imp. Gaz.* viii.

RANIKHET, a sanatorium in the Kamaon district, N.W. Provinces of India, in lat. 29° 39′ 50″ N., and long. 79° 33′ E.

RANI-NUR, or the Queen's Palace, is a rock-cave in the Puri district of Orissa. It is one of the most modern of a series of cave-temples with which Khandagiri and the neighbouring hill of Udayagiri are honeycombed. The earliest of these excavations exhibit what are believed to be the oldest memorials of Buddhism, and the oldest human dwellings yet discovered in India. The Rani-nur is the latest and most elaborate of these excavations, to which dates have been variously ascribed from B.C. 200 to A.D. 1000. It consists of two rows of cells, one above the other, shaded by pillared verandahs, with a courtyard cut out of the hillside. Two stalwart figures, in coats of mail down to the knees, stand forth from the wall as guards. One of them wears boots halfway up the knee; the other seems to have on

greaves, the feet being naked, but the legs encased in armour. The upper verandah of the Queen's Palace is adorned with a sculptured biography of its founder.—*Imp. Gaz.*

RANIPET, a town in the North Arcot district of the Madras territory, situated on the north bank of the Palar river, in lat. 12° 56′ N., and long. 79° 23′ 20″ E.; population (1872), 2838. Ranipet was the military cantonment of Arcot, and its pettah on the left bank of the Palar river, from which the cantonment is distant half a mile.

RANIZAI, towards the lower extremity of the Swat valley, a formidable range of hills, bounding the valley for many miles from east to west, nearly parallel to the British frontiers; and at the eastern extremity of this range stands the Mora mountain. Between this range and the frontier, however, intervene two tracts, named Ranizai and Lower Osman Khel, both quasi-dependencies of Swat. The best of the passes leading into Swat is named Mulla-kund, which opens from Ranizai. A little farther to the eastward of Ranizai, also, there are some passes leading into the Lunkhor valley, which belongs to British Yusufzai. These latter passes are not available for passage from Swat to British territory, because, leading into Lunkhor, they can be stopped by any party holding that valley. The passes via Ranizai and Osman Khel, if the people of those tracts accord a passage, lead straight on to the British plains of Hashtnagar. Above the Lunkhor valley, just beyond the British frontier, is the strong village of Pullee. The subdivisions of the Peshawur district adjoining the tribes above described, are Lunkhor or north-west corner of Yusufzai, and then Hashtnagar.

RANJAU. MALAY. Sharp stakes driven as a palisade around houses in Java.

RANJHA or Ranjhan is the name given to Leander by Hindu poets.—*Wilson.*

RANJIT, a river of Bengal, which rises in Independent Sikkim and enters Darjiling district from the west, forming part of the northern boundary. After a short course from west to east, it falls into the Tista, lat. 27 °6′ N., and long. 88° 29′ E. A little above the junction with the Kalhet, the level of the river is 1839 feet; two miles south of Tassidong, the level of the river is 2030 feet.—*Hooker.*

RANJIT SINGH (1780–1839), originally a petty chief, was appointed governor of Lahore by Shah Zaman, king of the Afghans. Favoured by the dissensions between this prince and his brothers, from 1801 he made himself entirely independent, and to the province confided to his care soon added Kashmir, Peshawur, Kohat, Dehra Ismail Khan, and Multan, which accessions of territory rendered his power equal, if not superior, to that of his former master. He did not extend his conquests to Kashmir, Multan, Peshawur, or even beyond the Jhelum, until he was assured of the pacific intentions of the British. He was the greatest leader of the Sikhs; his rise commenced after the departure of Shah Zaman. He made Lahore his capital. In 1806, he first entered into a vague but friendly alliance with the British. Before the close of his long life, in A.D. 27th June 1839, he had succeeded in moulding into one nation the various conflicting interests and peoples over whom his conquests extended. He was of small stature. When young he was dexterous in all manly exercises, but in his old age he became weak and inclined to corpulency. He lost an eye when a child by the smallpox, and the most marked characteristic of his mental powers was a broad and massive forehead, which the ordinary portraits do not show. From tracts of country which the Sikhs subdued, but did not occupy, Rakhi, literally protection money, was regularly levied. The Rakhi varied in amount from perhaps a fifth to a half of the rental or Government share of the produce. It corresponded with the Mahratta Chouth or fourth, and both terms meant black-mail, or, in a higher sense, tribute. He organized the Khalsa, or 'the liberated,' into an army under European officers, which for steadiness and religious fervour has had no parallel since the 'Ironsides' of Cromwell. He died 1839. —*Imp. Gaz.; Ferrier, Journ.* p. 347; *Cunningham's Sikhs*, p. 113.

RANKROOS, HIND., is a phrase embracing mental or physical infirmity.

RANSI, the Nara Sinha of the Chinese Pilgrim, is in the Eastern Panjab.

RANUNCULUS, a genus of plants belonging to the Ranunculaceæ or crow-foot family. R. aquatilis, *L.*, grows at Saharunpur; R. arvensis, *L.*, grows in S. Europe and on the mountains of Kamaon; R. bulbosus is a plant of Kanawar, Europe, and America; R. Indicus, *Roxb.*, of Europe, Siberia, Cochin-China, India, Serampur, Calcutta, etc., has small yellow flowers. It is a very acrid plant; when applied fresh, quickly producing a blister. Dr. Wight asserted that wherever, within the tropics, we meet with herbaceous forms of Ranunculaceæ, we may feel assured of jungle fever. Acridity, causticity, and poison are the general characters of this order, which, however, contains species in which these qualities are so little developed as to be innocuous. The genera of the Ranunculaceæ in India are the clematis, coptis, delphinium, naravelia, nigella, ranunculus, and thalictrum. — *Voigt; Wight, Ill.*

RAO, a Hindu title originally meaning a chief or prince, now in general use as a title of honour. It is of similar import to and of equal dignity with raja. It is the title of the Hindu ruler of Cutch; but all Mahratta Brahmans lay claim to and assume it as their birthright, adding to it any other titular designation they may possess. It is written rao, rae, rai, roy, and roya, and has been largely bestowed as a title on civil officers by Hindu, Muhammadan, and British rulers. Many Rajputs also adopt it as their hereditary right.

RAOTI. HIND. A kind of tent.

RAPE, Brassica napus, is the cultivated rape seed or cole seed plant, from the seeds of which is expressed the rape-seed oil, the Sarson-ka-tel, HIND., so extensively used for lubricating machinery; and the refuse is the rape-seed cake used for feeding cattle, for which also the green stalks are used.

Rape-seed.

Roefero, ... DAN.	Sursi, Surras, GUJ., HIND.
Graine denavette, . FR.	Shershape, . . SANSK.
Rapsaat, ... GER.	

The seeds are crushed for oil, and the leaves are used as food for sheep. In India the plant is extensively cultivated, and the seeds and oil are

largely exported to Europe. Rape-seed is being exported from India in increasing quantities.

RAPHANUS, the radish genus of plants of the order Brassicaceæ. R. caudatus, *Linn.*, or long-podded radish, Mugra, HIND., a curious plant, with enormously elongated seed-pods, which has excited attention in Europe. It is cultivated in Gujerat and the Panjab. The natives have an idea that this is only the R. sativus taken up, having all its roots cut close round and then re-planted. R. sativus, *Linn.*, is the muli of India, and the red variety is the Hung-lo-peh of the Chinese. It is grown in all the south of Asia, and up to 16,000 feet in the Himalaya.—*Stewart.*

RAPHIA, cloth of twisted thread made from the leaves of the Ruffia palm (Raphia ruffia, *Mt.*) by the Malagasy. Garments in common use in Madagascar are of this cloth.

RAPHISTEMMA PULCHELLUM. *Wall.* A handsome climber of the N.E. Himalaya.—*Gamble.*

RAPHO-CHE or Ra-chhe, and the female Ramo-chhe, of Tibet and Ladakh. Capra megaceros, *Hutt., Bly.* The name means the great goat, and is the Mar-khor or snake-eater of the Muhammadans. It is common in Balti, Badakhshan, and Chitral.

RAPTA, now Quiloa, near the oriental marsh of Ptolemy.

RAPTI, a river of Oudh and the North-West Provinces, which rises among the Outer Himalayan ranges of Nepal, in lat. 28° 19′ N., and long. 82° 53′ E., and flowing round a long spur of mountains, first southerly for 40 miles, and then north-westerly for 45 miles, enters British territory in Bahraich district, Oudh, in lat. 28° 3′ N., and long. 81° 55′ E.; frequent changes of its bed occur. Numerous lakes in the Basti district communicate with the Rapti, the chief being the Tal Bakhira, Tal Pathra, and Chaur Tal. It then enters Gorakhpur district, flows beside the town of Gorakhpur, and finally joins the Gogra (Ghagra), in lat. 26° 15′ N., and long. 83° 42′ E., after a total course of 400 miles.

RAPTORES, or birds of prey. In natural history, an order of birds comprising the families Vulturidæ, Polyboridæ, Serpentaridæ, Falconidæ, and Strigidæ. They are numerous in India. The peregrine falcon, the true hobby, the kestrel, the British sparrow-hawk, all the Indian harriers, and the short-eared owl, are true migratory birds. See Birds.

RAQM. PERS. The Persian term for the phonetic expression of the numerical powers of the Arabic letters. A kind of enumeration by the initial letters of the Arabic words for the numbers, used at Muhammadan courts and by the Kayasths. The following is an attempt to reduce the orthography of the Roman equivalents to as close an adherence to the literal definition of the original Kufic as the nature of the English system of writing will allow. In this case, the nine letters of the Arabic alphabet whose powers have been perverted in the utterance of foreigners, have been made to follow the Persian system of phonetic expression, and are severally represented by the following English pointed or accented equivalents:—

	1 ث s ‥	2 ح h ·	3 ذ d ·	4 ص s ·	5 ض z ·	6 ط t ·
The Arabic powers of these letters are severally .	th (thick)	h	th (this)	s	d	t
The Persian phonetic expression,	Adad.	Adadan.	Salasa.	Arba.	Khamsa.	Sitta.

	7 ظ z ‥	8 ع a, u, etc.	9 ق k ·
The Arabic powers of these letters are severally .	th (father)	a	k guttural
The Persian phonetic expression,	Sabá.	Samania.	Tissa.

—*Thomas' Prinsep.*

RAS. ARAB. The head; a head of cattle or horses. In Bengal, it is customary for a person to have two names, one his Ras name when engaged in religious rites, as Tarani Charan; the other his Dak name, as Kesav-Das.—*W.*

RAS. ARAB. A cape, a headland; hence—

Ras-Arah, the S. cape of Arabia, low, sandy, rounded, and dangerous; several vessels have been wrecked on its banks, which extend as far as Khor Amran.

Ras Asir or Assair, or Cape Guardafui of the old charts, the N.E. point of Africa, is a precipitous rocky cape 900 feet in height.

Ras Bab-ul-Mandab, the northern headland on the Arabian shore of the straits of that name.

Ras Jashk, in lat. 25° 50′ N., long. 57° 43′ 3″ E., is a low projecting cape, sandy, on the N. coast of the Persian Gulf.

Ras Mahomed, the extreme point of the peninsula of Mount Sinai, in lat. 27° 43′ N., long. 34° 15′ 30″ E. It is 50 feet high.

Ras Muari or Cape Monze is called Ras Jil by the Baluch. It is the frontier promontory between Sind and Baluchistan, at the S.E. extremity of the estuary of the Hab river, lat. 24° 50′ N., long. 66° 43′ E. This headland is well known to mariners, and forms the extreme southern offshoot of the hills which, under the name of Brahuik, Hala, etc., separate Sind from Baluchistan. The Hab river washes its eastern base, and on the Baluchi or western side of the Hab estuary rise the Jabal Pabb mountains, with peaks as high as 2500 feet. Cape Monze, with the Jabal Pabb on the Baluchi or western side of the river, form well-known landmarks for making Kurachee during the south-west monsoon.

Ras-Rahmat, called by British navigators Cape of the Wind's Death, is the western headland of that extensive bight on the Arabian coast whose eastern boundary is near the town of Gosierh.

Ras-ul-Khyma, in lat. 25° 48′ N., long. 56° 4′ E., a narrow sandy spit, known to historians as the scene of an expedition of the British Government of India against the Wahabee sect. It is an Arabic name, signifying the 'cape or head of the tent,' situate on the Arabian coast of the Persian Gulf. The Juasmi, a Wahabee tribe, having captured some of the East India Company's ships, and murdered the greater number of their crews, in 1820 an expedition was sent against them, which

completely effected the object of the expedition, by destroying Ras-ul-Khyma, the Juasmi capital, and above fifty large dows.

Ras Zeiti, Zeitiyah, on the Egyptian side of the Gulf of Suez, 16 miles S.W. by S. of Tur. The *Carnatic*, P. and O. steamship, was lost on a reef near Ras Zeiti.—*Imp. Gaz.* viii.; *Ouseley's Tr.* i. p. 3; *Findlay.*

RAS, a musical term. Rasdhari, a musician, applied to Hindu dancers, etc.

RASA. SANSK. The passions, of which, according to Ward, the Hindus reckon nine, viz. love, risibility, courage, terror, pity, peace, disgust, wonder, and rage. Colonel Tod says the nine nymphs, the Nao-Rasa, are also called Nao-Ragini, from Raga, a mode of song over which each presides, and No-rasa, or nine passions, excited by the powers of harmony; and to this he would trace the origin of Apollo and the muses.—*Ward*, iv.; *Tod*, i. p. 540.

RASA. SANSK. A circular dance in which Krishna joined with the shepherdesses. It is performed at the festival of Krishna by cowherds and worshippers of Krishna. The Ras Yatra is a Hindu festival held in the month Kartika (October—November), in honour of Krishna, when dancing and dramatic representations take place. The movements of those who personate the deity and his fair companions are full of grace, and the dialogue is replete with harmony. The Chobi of Mathura and Vindravana have considerable reputation as vocalists; and the effect of the modulated and deep tones of the adult blending with the clear treble of the juvenile performers, while the time is marked by the cymbal or the soothing monotony of the tabor, accompanied occasionally by the murali or flute, is very pleasing.—*Tod's Rajasthan*, i. p. 543. See Hooly or Hohli.

RASA, also Sutum, also Parada. SANSK. Mercury; also a savour.

RASAD. PERS. Supplies to an army on the march; provisions.

RASALAH, a pamphlet; a troop of horse. Rasaldar, a commander of a troop.

RASA-MALA. MALAY. Liquidamber altingia.

RASA-MANDALA, called Mandala Nritya, is a mystic dance, apparently analogous to the Pyrrhic dance, or the fire dance of the Egyptians, performed on the annual festival sacred to the sun-god Heri. He is represented with a radiant crown in a dancing attitude, playing on the flute to the nymphs encircling him, each holding a musical instrument. The Ras-mandala is typical of the zodiacal phenomena; and in each sign a musical nymph is sculptured in alto-relievo in the vaulted temples dedicated to the god, or in secular edifices by way of ornament, as in the triumphal column of Chitore. On the festival of the Janam, or 'birth-day,' there is a scenic representation of Kaniya and the Gopis, when are rehearsed, in the mellifluous accents of the Ionic land of Vrij, the songs of Jaya-deva, as addressed by Kaniya to Radha and her companions. A specimen of these was translated by Sir W. Jones.—*Tod's Rajasthan*, i. p. 540.

RASA-PUSPUM. HIND. One of the mercurial preparations of India. Rasayana, in Hindu medicine alteratives. Rasan, transmutation of metals.

RASAUT. HIND. The extract from the wood and roots of the Berberis aristata and other species of berberry.

RASA YATRA, an annual festival in various parts of India, held in the month Kartika, upon the sun's entrance into Libra, celebrated by nocturnal dances and representations of the sports of Krishna.

RASHANA or Roxana, mother of the child of Alexander the Great.

RASHID-ud-DIN, also named Fazl Ullah Rashid, author of the Jami-ut-Tawarikh, was born at Hamadan A.D. 1247, A.H. 645. He was son of Imad-ud-Daulah Abu-l-Khair. His enemies, in the latter part of his life, called him a Jew both by birth and religion. Quatremere is inclined to think that he was possibly of Jewish descent, as he shows an acquaintance with Jewish rites and customs singular for a Muhammadan statesman; and Ibn Batuta (ii. 116), who saw Rashid's son attending as wazir on Abu Said Khan at Baghdad, says that the father, Khaja Rashid, had been an emigrant Jew. He had studied agriculture, architecture, and mataphysics. He was acquainted with Hebrew, Arabic, Mongol, Turki, and Persian. His great work, the Jami-ut-Tawarikh, is a collection of histories, or historical cyclopædia. It contains histories of the Tartar and Turkish tribes, of Chengiz and his race, and of the Persian khans in particular, including his master, Ul Jaitu; of various dynasties of Western Asia, of Mahomed and his companions, of the prophets of Israel, the Cæsars, and several Christian princes; of China and of India. It was intended to conclude with a universal geography, but it is doubtful if this was ever written, though the existing portions of the work contain many geographical notices. It is in Persian. In 697 he became Grand Vizir to Ghazan Khan, and held the office under that monarch's brother and successor, Ul Jaitu. Accused of having poisoned the last mentioned, he was put to death by Sultan Abu Sadi in A.H. 718. The Jami-ut-Tawarikh was commenced by order of Ghazan in A.H. 700, and completed in 10 years (A.H. 710), A.D. 1310. It gives a picture of the knowledge regarding India which Muhammadans possessed at the close of the 14th century.—*Elliot's History of India; Yule's Cathay*, ii. p. 255.

RASHTRA KUTA, the Rahtor rulers at Malkher, the Balhara dynasty.

RASK, ERASMUS, an eminent oriental scholar, a native of Denmark. In 1826 he published a little treatise on the age and genuineness of the Zend Language and the Zendavesta, etc. He was a Sanskrit scholar, and a general linguistic investigator of rare talents and acquirements; he had travelled in Persia and India, and had brought home to Copenhagen a valuable collection of Avestan manuscripts. Professor Rask of Copenhagen and Dr. Caldwell are of opinion that the Dravidian languages are to be affiliated to the Scythian, Turanian, or Altaic.—*Oriental Linguistic Studies*, p. 175.

RASKHUT. ARAB. A pomade compound of antimony with galls, with which the ladies anoint the hair of their eyebrows and eyelashes.

RASOLNIKI, a fanatic sect in Kazan. A horrible practice reigns among some of the members of this sect,—that of condemning their persons to mutilation; the females also use violent means to obtain the same end. The greatest part of the money-changers in St. Petersburg are said to follow this custom. The severest persecution

has been from time to time employed against them. —*Turnerelli's Kazan*, i. p. 171.

RASORES, Gallinaceous birds or game birds; the Gallinæ of Linnæus, the Gallinacei of Vieillot, and the Pulveratrices of some authors. The order includes the Pteroclidæ family, also the Phasianidæ, Tetraonidæ, and Tinamidæ. See Birds.

RASPBERRY.

Hindbœr,	Dan.	Frambesia,	Port.
Flamboos,	Dut.	Malina,	Rus.
Framboise,	Fr.	Frambuesa,	Sp.
Himbeere,	Ger.	Hallon,	Sw.
Mora di rovo,	It.	Aghaj-chileghi,	Turk.

The raspberry of India or country raspberry is the Rubus lasiocarpus; the R. albescens and racemosus of Roxburgh, and the Mysorensis of Heyne, grow in most parts of India. See Rubus.

RASSAM, HORMUZD, born at Mosul, the modern town on the Tigris, opposite to which, and principally beneath the mounds of Kouyunjik and Nabbi Yunus, the ruins of ancient Nineveh have been unearthed. He began his connection with Sir Henry Layard's explorations in Assyria and Babylonia with his own important discovery, in the northern corner of the Kouyunjik mound, of the palace of Assurbanipal, the warlike Sardanapalus of Greek tradition. He secured for the British fine bas-reliefs, exhibiting with great spirit and truth the king's hunting and warlike expeditions, which are now in the British Museum, also the more precious contents of the royal record chamber and library, including Assurbanipal's Annals and the famous Deluge Tablets. In 1876, on the death of Mr. George Smith, Mr. Rassam was chosen to continue that eminent Assyriologist's explorations at Mosul, and he engaged several hundred workmen to dig for inscriptions and other antiquities in the ruins of the palaces of Assurbanipal and Sennacherib, and other discoveries attended his renewed excavations at Nimrud, the Calah of Genesis. He heard of a mound called Balawat, about 15 miles to the east of Mosul and 9 from Nimrud, in which some bronze plates with Assyrian figures and cuneiform inscriptions on them had been found by an Arab while digging a grave there. A sample had even been sent to him in England. Eager to secure the remainder of the monument, and aware that great difficulty would be encountered, he used every effort to obtain the requisite permission. The tablets were inscribed by the great conqueror's royal father, Assurnazirpal, and a translation of them was made by Mr. Ernest A. Budge. The tablets are dated in the reigns of Samas-sum-ukin and Kandalanu, the Chinladanus of the Greeks, who were contemporary with the latter half of the reign of Assurbanipal or Sardanapalus of Assyria, about B.C. 646. The tablets are from Abu-habba, the site of the ancient Sippara, the Sepharvaim of the Old Testament, which is mentioned by Sennacherib in his letter to Hezekiah as a city whose king had been unable to resist the Assyrians. Sippara, or Pantibiblon, as the Greeks called it, is mentioned by Berosus as having furnished five out of the ten Chaldæan kings of the time before the flood, and as the place where Xisuthrus, or Noah, buried the records of the antediluvian world at the time of the deluge, and from which his posterity afterwards recovered them. The Hebrew term Sepharvaim, which is the verbal equivalent of the 'two Sipparas, is applied to twin cities, one of which was situated on each side of the river. The Sippara from which these tablets were procured is the Sippara of Samas, Tsipar sha Shamas, or Sippara of the sun-god, as being the place where pre-eminently the sun was a chief object of worship. The other Sippara, or Sippara of Anunit, which is supposed in ancient times to name the Sepharvaim of Scripture history, is up to the present unknown to modern investigation.

RASSI-KA-MELA is a fair which since some years has been put a stop to through the Commissioner of Kamaon, who represented to the raja of Garhwal the loss of life which frequently took place during the spectacle. A rope is prepared several inches in circumference, and several hundred yards in length, made of Babur grass, which grows on these hills. When finished, it is tested. A few days before the fair takes place, and a locality has been fixed upon, this rope is stretched from the hill-top, or hill-side, to another, across some frightful yawning khud, some hundred yards in width; one end of the rope being fixed much higher than the other. On this rope is placed a large wooden horse, or imitation of one, generally painted red or blue, under which or through the horse's legs, it is so tied as to keep it in an upright horizontal position, so that it may slide from the higher to the lower end of the rope. On the day the fair comes off, thousands of hill folks collect together to witness the tamasha, music, and dancing, not forgetting hill whisky. As the hour of action approaches, the horseman gets astride of his charger, and, at a given signal, away go horse and rider, acquiring increased impetus as they proceed; the crash at the last is fearful, horse and rider being pitched with great violence to the ground. In former years, hill rajas, their ranis and retinue, used to be present. It was customary then to have a body of matchlockmen in attendance, and as the bold rider and horse slipped down the rope, a volley was fired at them, but seldom hit, but had a casualty occurred, the venturesome rider would have been handsomely paid, and the family pensioned. After the ride is over, all present contribute according to their means, so that a goodly sum is generally collected. A Rassi-ka-Mela took place at Laudour, a little above Claremont, a house half-way up the hill, and where some rocks stand at the turning of the road. One end of the rope was fixed in there, and then stretched across above the Butcher khana-khud to the hill opposite, several hundred yards. Away went the rider, obtaining a frightful impetus; with great force horse and rider were pitched against the hill-side. As they reached terra firma, the rider had his thigh and arm broken, in fact barely escaped being killed.—*Himalaya Chronicle.*

RASTOJI, a tribe of Vaisya Hindus in Benares, engaged extensively in trade; extensive bankers, wealthy and industrious.—*Sherring's Hindus.*

RASUL. Arab. A messenger, an ambassador, a prophet. Rasul Allah, the messenger of God, *i.e.* Mahomed. Of these Rasul messengers, Muhammadans recognise 224,000, or 124,000, amongst them 313 apostles. Six brought new laws,—Adam Sufi Allah, the chosen of God; Nuh (Noah) Nabi Allah, the preacher of God; Ibrahim (Abraham) Khalil Allah, the friend of God; Musa (Moses)

Kalim Allah, one who conversed with God; Isa (Jesus) Ruh Allah, the Spirit of God; Mahomed, Rasul Allah, the messenger of God.

RASUL NUMA (lit. displaying the messenger), a clan of fakirs. Rasulshahi, a clan of fakirs.

RASU - MUNCHU of the Hindus, a sacred edifice, so called, in which the image of Krishna is annually placed and worshipped. — *Ward's Hindoos*, ii. p. 3.

RAS YATRA, a Hindu festival, the annual commemoration of the dance of Krishna with the sixteen Gopi. Vast crowds, clad in their best attire, collect in some open place in the vicinity of the towns, and celebrate the event with music, singing, and dramatic representations of Krishna's sports. All the public singers and dancers lend their services on this occasion, and trust for a remuneration to the gratuities of the spectators. At Benares and Bindraban, this festival is held with much display.

RAT, amongst naturalists, the genus Mus. The coffee-rat is an insular variety of the Mus hirsutus of W. Elliot, found in Southern India. They inhabit the forests, making their nests among the roots of the trees, and feeding, in the season, on the ripe seeds of the nilloo. They do much mischief by gnawing off the young branches of the coffee plant, apparently to get at the tender pith; it is called Dadda-wedda by the Singhalese, is as large as a weasel, and of a greyish-black colour. Monkeys, squirrels, and the rat commit great depredations in fruit time; they are partial to the sweet pulp, which they digest, but evacuate the beans whole. The Mus rufescens, *Gray*, syn. of Mus flavescens, *Elliot*, and Mus nemoralis, *Blyth*, are tree rats, which make their nests on the branches of trees in the forest, and by turns visit the fields and dwellings of the natives, frequenting the ceilings in preference to the lower parts of houses. In Ceylon it is incessantly followed by the rat-snake, Coryphidon Blumenbachii, *Merr.*, whose domestication is encouraged by the servants, in consideration of its services in destroying vermin. One day a snake had just seized on a rat of this description, and both were covered by a glass. The serpent appeared stunned by its own capture, and allowed the rat to escape from its jaws, which cowered at one side of the glass in the most pitiable state of trembling terror. On setting them at liberty, the rat bounded towards the nearest fence; but quick as lightning it was followed by its pursuer, which seized it before it could gain the hedge, through which the snake glided with its victim in its jaws. In parts of the central province of Ceylon, at Ooreah and Bintenne, the house rat is eaten as a common article of food. The Singhalese believe that it and the mouse are liable to hydrophobia. The Golunda meltada, *Gray*, the soft-furred field rat, makes its dwellings in cultivated fields, in pairs or small societies; and great numbers perish annually when the rains fall. If the monsoon be deficient, this rat becomes a perfect plague. This occurred in 1826 in the Peninsula. After the famine of 1877–78, the Bombay Government gave one rupee for every hundred tails, and upwards of 11,000,000 were destroyed. In 1875–76, rats infested the watersheds of the Salwin and Sitang, and were journeying steadily southwards. In the spring of 1878, rats, mice, and other vermin made their appearance throughout parts of Bohemia in such vast numbers as to cause serious loss and damage. Rats are eaten by the Chinese.—*Tennent's Sketches of the Natural History of Ceylon*, p. 423. See Mammalia; Mus.

RAT. HIND. Night. Rat-din, day and night continuously. Rat Jaga, nocturnal vigils; a Muhammadan ceremonial on several occasions, particularly on the Lailat-ul-Kadar.—*Herkl.*

RATA. GHORKA. Xanthochymus pictorius.

RATAN or Rattan; Cane.

Beta, ... BENG.	Calamus rotang, . . LAT.
Bet, Bed, ... HIND.	Rotan, ... MALAY.
Panjalin, ... JAV.	Pirambu, ... TAM.
Kowe Sunda, JAV., SUNDA.	Bettam, ... TEL.

The rattan canes of commerce are obtained from Calamus rotang, *Linn.*, C. rudentum, *Lour.*, C. Royleanus, *Griff.*, and C. fasciculatus, *Roxb.* The Malay term Rotan is an abbreviation of Raotan, from the verb Raot, to pare or trim, that is, the object pared or trimmed. The plants which yield rattans are a genus of palms, which consists of many species, from the girth of a goose-quill to that of a stout walking-stick. They are abundant in all the forests of the Malay and Philippine Archipelagos, and are everywhere extensively used as cordage or ligatures, or in the manufacture of mats and basket-work. These singular plants creep along the ground or climb trees, according to the species, to the length of from 100 to 1200 feet. The principal places of production for the general market are Sumatra, Borneo, and the Peninsula of India. A valuable species is brought from Banjarmassin, on the southern coast of Borneo; in the market they are worth about 150 per cent. more than any others. A vast quantity of rattans are exported from the Malay Archipelago to Europe, Hindustan, and China, four or five millions of them being in some years shipped from the territories under the Government of British India. Amongst the plants producing them may be named the genus Calamosagus hariniæfolius (Wallichiæfolius), termed Rotang Simote; C. ochriger, Rotang Donam; with C. scapiger and C. laciniosus. The Calamosagi are all climbing plants. The rattan cane is used extensively in Burma and the Tenasserim Provinces instead of cordage. The stays of the masts in the native boats are usually made of rattans, and they are split up into strings for innumerable purposes, to which cord and twine are elsewhere applied. The Karen have different names for seventeen species or varieties. Rattans are manufactured into chairs, baskets, etc.; they also furnish material for the cables of Shakespearian bridges. One species, called country rattan, Pedda piramboo, TAM., Moti bet, HIND., Pedda bettam, TEL., grows to a great length in most districts of the Peninsula. When green, it is formed into cables for drawing the cars of the Hindu idols, and in some parts for suspension bridges. It answers better than bamboo for baskets and for strong fences, when interwoven between stakes. The rattan when burnt yields an ordinary black for paint. In Liverpool the selling price is from 1s. 6d. to 3s. per 100. The rattans of Borneo are exported to Singapore and Batavia in immense quantities from the Coti and Banjar rivers; on the south and eastern parts of the island they are collected and brought down these streams on rafts by the Dyaks; they are principally re-exported from Batavia and Singapore to India and China. The exports of

rattans from India are principally from Calcutta and Bombay to the Mauritius, Cape of Good Hope, and New South Wales, to the value of £3000 to £4000 annually.—*Seeman; Rohde, MSS.; Crawfurd's Dict.* p. 365; *Williams' Middle Kingdom*, ii. p. 402; *Low's Sarawak*, p. 42; *Mason's Tenasserim.*

RATAN KHAUR. HIND.? A tree of Chutia Nagpur, furnishing a hard, white timber.—*Cal. Cat. Ex.*, 1862.

RATANPUR, a town of the Central Provinces of India, in the district of Bilaspur, 12 miles N. of Bilaspur town. It was here that the ancient rajas held their court, and it was from this point that the early Hindu settlers, gradually acquiring strength, displaced the aborigines, reclaimed the wilderness, and spread over the plain their civilisation and faith. The township covers an area of 15 square miles, and contains within its limits a perfect forest of mango trees, amid the luxuriant shade of which are scattered an almost countless number of tanks and Hindu temples. The most prominent of these is near the old fort, where a large building, gracefully adorned on all sides with arches and minarets, proclaims that here, about the middle of the 17th century, twenty rani of raja Lachhman Sahi became voluntary satis (suttees).

Ratanpur is in lat. 22° 16′ 30″ N., and long. 82° 11′ E., in a hollow surrounded by the Kenda offshoots of the Vindhyan range. It was the capital of the Haihai Bansi kings of Ch'hattisgarh. Since the death of Raja Bimbaji Bhonsla, in 1787, the town has decayed.—*Cent. Prov. Gaz.; Imp. Gaz.* viii.

RATANS, GROUND. The excellent walking-sticks known to the English under this name, are made from the Rhapis flabelliformis, which grows in Lin-kin and Southern China. Much of the fibre used by the Chinese is made from the bark of the Rhapis flabelliformis palm, called tsung, which is stripped off in large sheets from the trunk of the tree. When steeped in water the fibres separate in short wiry threads, of a dark-brown colour, having all the properties of the cocoanut coir. It is the material from which the cordage in Chinese vessels, and sometimes the cables, is manufactured; brooms, rain-cloaks, sandals, hats, brushes for block printing, twine, and other articles are also made from it. The rhapis grows all over Southern China, attaining at times the height of 30 feet and upwards; the bark is stripped off every year. The price for the prepared coir is about four sp. dlrs. per pikul. Another kind of coir is also in extensive use in the Archipelago for rigging; it is called gomuti or eju, and the thread sells at sp. dlrs. 1·50 or sp. dlrs. 2 per pikul. It is the Arenga saccharifera. The best comes from Amboyna.—*Seeman; Morrison.*

RATH or Ratha. HIND. A car, an idol car, a four-wheeled carriage drawn by bullocks, from which, no doubt, has been derived the word chariot; the rath is sometimes ornamented, its scarlet screens and canopy hung with fringes. Rath is a term by which the Mahavellipuram temples are designated. Ratha or Padha Jatra is the procession of Jaganath in his car, a festival in much repute among the Hindus of Bengal and Orissa. Rathapa-yootapa-yootapa, SANSK., from Ratha, a chariot, and Yootapa, a chief; repeated it signifies chief of chiefs.—*Tr. of Hind.* ii. p. 39.

RATH SAPTAMI, from Ratha, a car, and Saptami, the 7th day of the month, is dedicated by Hindus to the worship of the sun. This is held about the 11th February, and is regarded as the beginning of the Manwantaram or period embracing the age of Menu. The Holi or Hutasavi festival, in Sanskrit Holikha or Phal gotsava, is called also Dola or Dolavatra, the swinging festival, and supposed to relate to the vernal equinox, and to be similar to the Persian New-year. It is held about the 19th March, or 15 days before the full moon of Phalgun. It is in honour of Krishua, and is quite a saturnalia; red powders are thrown and red fluids squirted at passers-by, and licentious songs sung. At the close of the festival, a pile is lighted, and a wheaten cake, or poli, offered on it.

RATI, the foot roller for cleaning Dharwar cotton. The iron is worked with two feet on a stone by a woman sitting, or rather balancing herself, on a low stool. The seeds are rolled out in front, and the cotton drawn away as fast as it is freed from the seed, and piled up behind under the stool.

RATI, the wife of Kama-deva, the Indian Cupid. Rati is the Hindu goddess of sexual enjoyment. She has several names, Mayavati, etc. etc., and is the analogue of Venus.

RATI, HIND., written Ruttee, the seed of Abrus precatorius; used as a weight. The seed averages 1·312 grains, but the artificial weight has been found to average nearly 2¼ grains, being one-eighth of a masha rated at 17·708 grains. As the masha in use, however, averages about 15½ grains, a rati will weigh 1·938 grains, or, according to Colonel Jervis, 1·953 grains.

RATL. ARAB. One pound troy, equal to 5760 grains, but varying from 12 to 16 oz. An Arab weight in Bangalore; 24 ratl make one maund of 25 pounds; in Travancore 25 rattl or rautel=the maund of 18 lbs. 12 oz. 13 grs.—*Simmonds' Dict.*

RATLAM, chief town of a Native State of the same name in Malwa, in Central India, in lat. 23° 21′ N., long. 75° 7′ E.; 1577 feet above sea-level. It is one of the principal seats of the opium trade in Malwa. The area of the state is 1200 square miles, and population about 100,000. The reigning prince is descended from a younger branch of the Jodhpur family, and ranks as the first Rajput chief in Western Malwa. He has a personal salute of 13 guns. His military establishment consists of 5 field guns, 58 artillerymen, 35 cavalry, and 300 infantry.—*Imp. Gaz.* viii.

RATNA. SANSK. A gem. In Hindu mythology, Chatur-desa-ratna are the fourteen articles, called gems, produced by the churning of the ocean. This event is fabled to have occurred in the second incarnation or avatar of Vishnu in the form of a tortoise or Khurma, when the ocean was churned by means of the mountain Mandara, the serpent Sesha being employed to whirl the mountain round. Ratna champaca is a topaz.

RATNAGIRI, a British district in the Konkan division of the Bombay Presidency, lying between lat. 15° 43′ and 18° 5′ N., and between long. 73° 3′ 30″ and 74° 2′ E. Area, 3789 square miles; population (1872), 1,019,136. Ten miles or so inland the country becomes more open, but advancing a little farther, it is occupied by spurs

of the Syhadri Hills. The coast inhabitants are largely sailors and fishermen, and the sardine and sharks are largely caught at certain seasons. They are of the Bhandari, Koli, and Gabit castes, some professing Hinduism and some Islam, and the Kunbi and Mhar are cultivators. Bankot has a large number of Konkani Musalmans, who have estates on the Sanchi river. They claim to be descendants of Arab settlers at Dabul, Chaul, and other towns in the Konkan. The features of many have a distinctly Arab caste. Many native Christians are to be found at Harnay, Malwan, Vingorla, and other coast towns. The Southern Konkan has always been the great recruiting ground of the Bombay army.—*Imp. Gaz.* viii.

RATNA-KARA, or house of gems, a Hindu poetical term for the ocean, which in Hindu fable was churned by the Devata and Asura, and produced fourteen gems.

RATNAKARA, author of the Vivada Tandava, a law book of the Benares school.

RATNA MALA, by Krishnaji, a Brahman. It was translated by Mr. Alexander Kinloch Forbes, of the Bombay Civil Service. The name means the necklace of gems, and each of the cantos are numbered the first to the eighth gems. It is a chronicle of Siddhraj Jayasinh. It is said to have consisted originally of 108 gems or cantos, of which eight only now remain. Nothing is known of the author Krishnaji. The language is the Bhasha, a dialect of the Prakrit, and his work is founded on the labours of preceding authors.

RATNAPURA, or the gem city, now called Ava or Ayn-wa, a town in Burma, in lat. 21° 50′ N., and long. 59° 95′ E. It is stated to have been founded in A.D. 1364, by Thaido-men bya, prince of Tagoung, who mastered the kingdoms of Panya and Sagain, into which the country was then divided. The first mention made of Ava by any European traveller, is that by Nicolo di Conti, who was there about 1440 (Ramusio, i. 340). It continued to be usually the royal residence, with some intervals, till the end of the 18th century. In 1526, the Shan races of Monyin and Mogoung took the city and overran the country, of which they held possession till 1554. In that year, the Tounghoo king of Pegu, Tshen-byoo-mya-yen (lord of many white elephants), conquered Ava, and destroyed the city. The king, Nyoung-men-ta-ra, who re-established the city and kingdom after the fall of Pegu in 1601, appears to have been a natural son of the conqueror. Ava was taken by the Peguers during their resumption of independence in 1752. They were speedily expelled by Alompra, but he always resided at Mout-sho-bo. In 1763, on the accession of Tshen-byoo-yen, Ava again became the seat of royalty. It was, however, abandoned on the founding of Amarapura in 1783, and reoccupied in 1823 by the king and queen, who entered in great state, accompanied by the white elephant, and by all the dignitaries of the court, only to be again deserted in 1837 by Tharawadi, who had vowed to make it a heap of ruins.—*Yule's Embassy*, p. 184. See Buddha; India.

RATNAPURA, in lat. 6° 42′ N., and long. 80° 17′ E., a town in Ceylon, 56 miles S.E. of Colombo. Mean height of the village above the sea is 77 feet. Gillemalle village is 112 feet. The great bulk of the gems of Ceylon come from Ratnapura, which means the city of gems. See Precious Stones.

RATNAVALI, or the necklace, a drama ascribed to Sri Harsha Deva, a king of Kashmir, written between A.D. 1113 and 1125. The subject of the play is the loves of Udayana or Vatsa, prince of Kausambha, and Vasava-datta, princess of Ujjayini. It was translated by Professor H. H. Wilson.—*D.*

RAT-SNAKE of Ceylon, Coryphodon Blumenbachii, is almost domesticated, and is often kept in households.—*Tennent's Sk.* p. 42.

RATTANAS, a species of coarse sacking, made of a long stout fibre in Madagascar, about five feet square, and largely used in the island of Mauritius to dry sugar on.—*Simmonds' Dict.*

RAUCHYA, in Hindu mythology, one of the 14 patriarchs who are supposed to preside successively over the 14 Manwantara of the calpa.—*Warren.*

RAUGHAN. HIND., PERS. Ghi, butter, grease, fat, oil, balsam, resin.

Raughan-i-badam, almond oil.
Raughan-i-baiz-i-murgh, oil of egg-shell.
Raughan-i-balsan, medicinal balsam, Balsamodendron Berryanum.
Raughan-i-bhirbuti, a medicinal blistering oil.
Raughan-i-gul, rose-scented oil.
Raughan-i-majmua, scented oil, compound scents.
Raughan-i-mom, wax oil, medicinal.
Raughan-i-motya and chambeli, jasmine oil.
Raughan-i-pin, Dehra Ghazi Khan, a medicinal oil, made of pelican's fat.
Raughan safed, ghi or clarified butter.
Raughan siya, coarse oil.
Raughal-i-turb, Balsamodendron Roxburghianum, gugal resin.

Raughan-i-bhirbuti, oil of the red velvet insect, bhirbuti, which appears in the rains; the oil is used only as an irritant and blistering agent.

Raughan-i-pin, pelican oil, is made from its fat; one bird yields a quarter of a seer. The Persian name of the bird is Fitan.

Raughan-i-baiz-i-murgh, oil from the shells of hens' eggs, obtained by dry distillation; used in native medicine.

Raughan-guna, a varnish used in gilding leather.

Scorpions' oil, made by steeping scorpions in oil; is used as a cure for scorpions' bites.—*Powell.*

RAUL, amongst the Mahrattas a low tribe who weave a coarse cloth and tape.—*Wilson.*

RAUTIA, a tribe numbering about 15,000 in Chutia Nagpur. They were at an early period introduced by the Nagbansi raja to aid him against his irrepressible Kol subjects, and they obtained grants of land as military colonists, which their descendants still hold. They resemble Gonds in feature and in disposition, but claim Aryan descent; and as they have lost all trace of their original language, and follow the customs of Hindu Sudras, it is impossible to be certain of their affinities.—*Dalton's Ethnology.*

RAUZAT US SAFA, by Mir Khond, who wrote in the 9th century of the Hijira, a vast compilation, consisting of seven books on the general history of the world, from the Creation to the author's time.

RAVANA, a king of Lanka or Ceylon, who ruled over a powerful and civilised state, comprising Ceylon and the whole of the southern division of India. He was the son of Visvarawa Muni by his wife Nikaksha or Naikasi, the daughter of Sumali, who, observing the splendour of Kuvera, a son of the sage by his wife Irvira, directed his daughter

to propitiate the sage, that she also might have children by him. Having succeeded in obtaining the good graces of Visrava, Naikasi had by him Ravana, Kumbhakerna, and a daughter, Surpanakha. Another wife of Visvarawa Muni was Brabira, daughter of Triuavindhu, a king of the Solar line of Vesala, descended from Srad'ha Deva. Ravana is described as like a demon and cruel. He carried off Sita, wife of Rama, also known as Rama Chandra and Dasrat'h Rama, and brought on an invasion of his island by Rama, in which Rama was assisted by the uncivilised races of the Dandacaranya or forests of the southern part of the Peninsula of India. Ravana and his brother were slain, and Sita was recovered. The story of the Ramayana recounts this war. A festival is celebrated in honour of Ravana by the Shanar race. In Hindu legend Ravana is described with numerous heads and arms, and is said to have become so potent, in consequence of an ill-judged promise (according to some of Siva, and according to others of Brahma), obtained by marvellous religious austerities and devotion, as to have brought all the gods under his subjection. As the promise of the deity could not be revoked, Vishnu found the means of evading the performances of it by becoming incarnate as Rama Chandra to effect this. Ravana is also called Dasagriva, the ten-necked; and Pulastya, and also Visravana as son of Visrava, the father also of Kuvera. His numerous heads and his twenty hands are the usual symbols of dominion.—*Moor*, p. 334; *Hero and Nymph*, p. 288.

RAVANA SURUNI MISALU. Tel. Spinifex squarrosa, *Spreng.* This curious diæcious grass, called the sea-pink, is found in great abundance along the Coromandel coast. When the seed is ripe, the spherical head of the plant is detached and blown about the sands by the wind, illustrating in a remarkable manner 'the rolling thing before the whirlwind' of Isaiah xvii. 13, and 'the wheel and stubble before the wind' of Psalm lxxxiii. 13.

RAVATA, in Hindu legend a mountain greater than Meru.

RAVEN, the Corvus corax, has the circuit of northern regions; rare in N. Africa, Panjab, Kashmir, Afghanistan; the Tibetan raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Canino seems to incline. It may be presumed to inhabit the lofty mountains of Bhutan to the north. The raven of Ladakh is a larger bird than that of the Northern Panjab, owing most likely to the climate being better adapted to its habits and constitution. Dr. Adams scarcely thinks there are sufficient grounds to consider this species distinct from C. corax, the differences in what Mr. Hodgson calls this variety C. Tibetanus being only in a somewhat larger size, the wing measuring 18½ inches, tail 11½, and the bill to gape 3 inches. The raven of Tibet has been called C. Tibetanus by Mr. Hodgson (An. and Mag. Nat. Hist. iii. p. 203) for the reason that it is somewhat larger than C. corax.—*Blyth; Adams.*

RAVENALA SPECIOSA or Urania speciosa, the traveller's palm of Madagascar, has been introduced into India.—*Tennent.*

RAVENSARA NUTS, the produce of Agathophyllum aromaticum, found in Madagascar, where they are used as a spice, and occasionally exported. The article imported into China from India under this denomination, is a nut of a dark-brown colour, the size of a nutmeg, in smell and taste resembling both cloves and pimento; internally it is divided into cells, and contains a kernel extremely hot and biting to the taste, with a strong spicy smell. Ravensara is also, however, the name given to the bark of the clove-cinnamon tree, growing in the Brazils and Madagascar, of which the foregoing is probably the fruit.—*Comp. Descr.; Simmonds' Dict.*

RAVERTY, Major H. G., of the 3d Regiment Bombay Native Infantry, author of a Grammar, Text-Book, and Dictionary of the Pukhto or Pushtu or Afghan Language, London 1860; also Thesaurus of English and Hindustani Technical Terms.

RAVI. Arab. A reciter of poems, stories, etc. Hammad Ravi lived in the time of the khalif Walid; his memory was great. He was a debauchee; khalifs Walid and Hisham each gave him 100,000 dirhem, and Mehdi 20,000; he improvisatrized and greatly altered ancient poetry.

RAVI. Its name in Sanskrit is Airavati, in the local dialect Iraoti (the Irawadi of the Ayin Akbari), which doubtless suggested the names of Hydraotes in Arrian, and Hyarotis in Strabo. Ptolemy calls this river Adris, it is called Rawa in Bara Banghal, and is one of the five great streams from which the Panjab derives its name. It rises in Kulu, on the declivity of a mountain called Banghal, and a short distance west of the Ritanka pass, about lat. 32° 30′ N., and long. 76° E.; is formed of several impetuous streams, issuing from beneath large glaciers, at an elevation of 14,000 feet. About 40 miles below its source it is joined by two large feeders, the Budhil and the Nai or Duna. It leaves the hills at Shahpur. At Madhupur the head-works of the Bari Doab canal draw off a large portion of its waters. Thenceforward the river, like other Panjab streams, flows in the centre of an alluvial valley, and has been altering its course past Chumli and Bisauli. In 1870 it carried away the Tali Sahib shrine near Dera Nanak, a place of great sanctity with the Sikhs, and still threatens the town. The Ravi next passes between Sialkot and Amritsar districts. The depth is here not more than a foot in March and April, swelling in June and September to 18 or 20 feet. Entering the district of Lahore, it runs within one mile of Lahore city. Finally, it falls into the Chenab (Chinab), lat. 30° 31′ N., and long. 71° 51′ 20″ E., after a total length of about 450 miles following its windings. It receives as affluents the Nai, 20; Sana, 36; Chakki, 50 miles. About 22,000 square miles are drained. It has a tortuous course, and is fordable in most places for eight months of the year.—*Imp. Gaz.*

RAWAJA, the head-man of a Chittagong Mugh village.

RAWAL, the titular appellation of the chief priest of the temple of Badarinath in the Himalaya. He is always a Namburi Brahman from Malabar. Rawal is also a title of some Rajput princes, as the Rawal of Bhownaggar; and the Rawal title, once that of the Mewar house, is yet borne as a princely title by the Aharya prince of Dongurpur, and the Yadu prince of Jeysulmir, whose ancestors long ruled in the heart of Scythia. Rawal seems to have been titular to the Scandinavian chiefs of Scythic origin. The invader of Normandy was Raoul, corrupted to Rollon or Rollo.—*Tod's Rajasthan*, i. 213, ii. 237.

RAWAL of the Wagri, Circaetus gallicus.

RAWALA, in Marwar, the palace of the queen. Tod says (i. p. 464) the Rawala of a Hindu prince is a world within itself, and resembles the Muhammadan haram. It is the labyrinth containing the strings that move the puppets which alarm mankind. Here intrigue sits enthroned, and hence its influence radiates to the world, always at a loss to trace effects to their causes.

RAWALIYA, in Gujerat, thread and tape makers.

RAWAL PINDI, lat. 33° 36′ 5″ N., and long. 72° 59′ 8″ E., in the Panjab, a large military station. Mean height of the cantonment, 1737 feet. It gives its name to a revenue district lying between lat. 33° and 34° N., and long. 71° 46′ and 73° 41′ E., with an area of 6218 square miles, and in 1868 a population of 711,256 souls. Its surface is everywhere cut up by mountain ranges; that on the east is known as the Murree Hills, on which a sanatorium has been formed, and one of the Lawrence Institutions established. It is clothed with forest trees, and in some places elevated 8000 feet. Its chief river is the Indus, and its tributaries the Sohan and Haroh. The district contains many of the towns connected with the events of Alexander's expedition, and its earliest inhabitants appear to have been the Takka, a Turanian race, who held the greater part of the Sind Sagar Doab, and gave their name to the town of Takshasila, the Taxila of the ancient Greeks. Its ruins have been identified in the site of Dehra Shahan or Shah Deri, which lie to the north of the Margala pass. Since then the district became subject to the king of Magadha, and Prince Asoka was employed to suppress a rebellion of the Takka. In the 11th century, the Ghakkar, a non-Aryan race, were dominant, and in the 12th century (A.D. 1193) 30,000 of them were in the Confederate Rajput forces under Pritwi Raja. In 1205, on the reverses of Shahab-ud-Din Ghori in Kharizm, the Ghakkar revolted, but were defeated, and compelled to adopt Muhammadanism, though on retiring he was surprised by a Ghakkar detachment, which swam the river, and killed him at night in his tent (A.D. 14th March 1206). They unsuccessfully revolted again in Baber's time, and again in the time of the Sikhs, and in 1849 the district fell to the British on the conquest of the Panjab. In 1843 and 1844 the country was devastated by locusts (Cal. Rev. 1871). Its revenue subdivisions are Rawal Pindi, Jhelum, Shahpur, and Gujerat. The town of Rawal Pindi is situated between the Indus and the Jhelum; population about 20,000. It is 1453 miles from Calcutta. Rawal Pindi produces gold from the washings at Attock, sandstone, limestone.—*Rob.; Schl.*

RAWANAH. Hind. An invoice, a custom-house permit or pass for a certain quantity of opium, spirits, etc.

RAWAT, also Raji, a small savage tribe in Gorakhpur, the Rohilkhand Terai, and also a wandering uncivilised tribe in Kamaon. 20 or 30 families are occupants of the forest of Kamaon, who claim to be descended from a prince of Kamaon, who was driven from his throne. Their language is dissimilar to the Hindi of Kamaon. The Rawat are considered to represent the aborigines of the district. The Rawat of Kamaon, under pretence of royal descent, abstain from offering to any individual, whatever his rank, the usual eastern salutation. The Raji and Kumaya languages are unintelligible to all but the respective races using them.—*Latham; Mr. Campbell*, 47.

RAWAT, a race of Northern India, are occupied as scavengers.

RAWAUN. Bassahir is a tributary state, giving Rs. 3945 as tribute. Rawaun, on the left bank of the Pabur, was transferred to Keonthul. The Thakurai of Kotegurh and Kumharsein were declared independent of Bassahir.

RAWLINSON, Sir HENRY CRESWICKE, K.C.B., an officer of the Bombay army, born 1810, who served there from 1826 to 1833, when he was appointed, with several other officers of his own standing, to the army of the king of Persia, in which he served until 1839. He was appointed Political Agent at Kandahar in 1840, and held that position through the first Afghan war,—a proof of his wise and just rule. In 1843 he was Political Agent in Turkish Arabia, where he subsequently became Consul-General and Ambassador to Persia. For his contributions to antiquarian and scientific research he was made a Fellow of the Royal Society, Honorary D.C.L. of Oxford, Chevalier of the Order of Merit in Prussia, Corresponding Member of the Institute of France, Honorary Member of the Academy of Munich, Member of the Geographical and Asiatic Societies of Germany, of numerous other literary and scientific associations, Knight of the First Class of the Persian Order of the Lion and Sun for his services in that country. His services in Afghanistan were recognised by the bestowal of the Knighthood of the Durani Empire, and he was made a Military Companion of the Bath for his services in Kandahar. He assisted Sir J. Gardner Wilkinson in a new translation of Herodotus, by his brother, the Rev. George Rawlinson, and is author of the Comparative Geography of Afghanistan. He wrote a series of papers on Assyrian Antiquities and the cuneiform character from 1850 to 1852; on the arrow-headed character found in the ruins of Persepolis, and on bricks and stones in the ruins of Babylon and Nineveh; and the celebrated inscription near Hamadan on the Behistun was deciphered by him, and another by Professor Grotefend. His deciphering of the cuneiform inscriptions of Assyria and Babylonia in 1858 placed him in the first rank of scientific discoverers, and the eminent success of his rule at Kandahar won for him the gratitude of the people and honours from his sovereign. Between 1851 and 1861 his writings appeared on the Cuneiform Inscriptions of Western Asia; 1846, on those at Behistun; 1857, on Tiglath Pileser I., king of Assyria; on the History of Assyria and Babylonia. In 1851 and 1861 he edited new editions of Herodotus; and in 1875 he gave his views on the relations of England and Russia; Journey from Tabreez to Ghilan; Journey from Zohab to Kirmanshah; On the Ancient Geography of Mahamra; On the Persian Expedition to Khuzistan.—*Ferrier's Afghans*, p. 371; *Geo. Trans.* 1842, xii. 2, p. 112; *Royal Geo. Journal; Jour. Ro. As. Society of London; British Museum Records.*

RAY, a genus of cartilaginous fishes in which, although the skeleton is not osseous, the development of organs is so advanced that they would appear to be the highest of the class. Raja

Narinari, *Bl.*, the Aetobates narinari, *Mull.*, a fish of the Indian seas. It has a produced snout, pointed and winged-like pectoral fins, and an exceedingly long tail, armed with a strong, serrated spine, which is always broken off by the fishermen immediately on capture, under the impression that wounds inflicted by it are poisonous. Like most deep sea fishes, the ray has a wide geographical range, and occurs not only in all the Indian Ocean, but also in the tropical tracts of the Atlantic.—*Tennent's Ceylon*, p. 328.

RAYA, in the dialect of the south of India, a prince, a captain; a usual name amongst the Telinga race, as Jesul Raya Pillay. The plural, Rayadu, is a title taken by the Velma of the Northern Circars, who claim to be Rajputs.

RAYAKOTTA, in lat. 12° 31′ N., and long. 78° 3′ E., in the Carnatic, 12 miles south of Saulgherri. It is 2449 feet above the sea.—*Scott.*

RAYANA. This tree (qu. Ficus religiosa) in Western India is sacred, and is dedicated by the Jains to their first Tirthankara named Reshabhanat'ha, the patron saint of Satrunjaya. His shrines have all a rayana tree overshadowing his charana or footprints.

RAYAT LAUT, a seafaring race of the Indian Archipelago, adventurous navigators. The Rayat Laut, subjects of the sea, or Orang Akkye, are unquestionably from the same stock as the Jakun. The two tribes are expert divers and fishermen, and frequently make long voyages in their fragile vessels. Otherwise they reside along with their families in their boats for months together, employed in fishing, collecting agar-agar, trepang, etc. The Rayat Laut have but faint ideas of the existence of a benignant supreme Being, and of a state of future existence. In appearance, they resemble the Jakun and Malay, allowing for the physical alteration always induced by difference of food, daily occupations, and habits, especially when continued through many generations. They are darker than the Malay, more savage and uncouth in aspect.—*Newbold's British Settlements.*

RAYAVATA, one of the 14 Hindu patriarchs who are supposed to preside over the 14 Manwantara of the calpa, and whose anniversaries are noticed in the calendar.

RAYMOND, a French officer in the service of Nizam Ali, nizam of the Dekhan. In March 1795, with 18,000 men, he met the Mahrattas at Kurdla with 130,000 horse and foot and 150 pieces of cannon, and was completely defeated. His tomb, to the east of the city, is a shrine to which annually great numbers resort, offering chaplets of flowers. The people first visit his house on the bank of the Musa river, and view his uniform, annually laid out on the day of his death, and then proceed to the tomb.

RAZAI. HIND. A counterpane quilted with cotton.

RAZAQ. ARAB. Food.

RAZI, JAV., qu. Rassi, ARAB. A ferment used in Java in the distillation of the fermented liquor called Badek.

RAZI, the literary name of Muhammad-bin-Zakariah Abu Baqr-ur-Razi, from which place he was known in Western Europe as Rhazes or Razes. He was a famous physician, born and brought up at Rai, in Irak-i-Ajami, now designated Turkish Arabia. He acquired great philological and philosophical knowledge, but until he was 30 years old, he was chiefly known as a musician. After his fortieth year, he applied himself exclusively to the study of medicine and philosophy, and studied under Ibn Zain-u-Tabari at Baghdad. He travelled to Jerusalem and Africa, and it is said also to Spain. He became the medical superintendent of an hospital at Rai, and afterwards of one at Baghdad. He died A.D. 923 or 932, at Rai or Baghdad. All his works were published in folio, A.D. 1516, and were translated by Dr. Meade into English, A.D. 1747.

RAZI-NAMA, an acquittal, literally a deed of consent or acquiescence.

RAZZIA BEGUM, known also as the Sultana Razzia, was the daughter of Shams-ud-Din Altamsh. On the death of Altamsh, his son Rukn-ud-Din was deposed after a reign of seven months, and his sister Razzia Begum raised to the throne (A.D. 1236, A.H. 634) under the title Sultana Razzia. She could read the Koran correctly; and her business talents were of so high an order, that Altamsh, when absent on his southern campaigns, twice left her in charge of his government in preference to his sons. She succeeded in sowing dissensions amongst the two factions that opposed her. She appeared daily on her throne in the usual habit of a sultan, gave audience to all comers, reformed abuses, revised the laws, decided suits of importance, and evinced all the qualities of a just and able sovereign. Ferishta says she was endowed with every princely virtue, and those who scrutinize her actions most severely will find in her no fault but that she was a woman. But she showed undue, though not criminal, partiality towards her Master of the Horse, an Abyssinian; allowed him to lift her up to her horse, and gave him the title of Amir-ul-Umra, which disgusted the nobles, as it placed him above all others. A rebellion followed, her army mutinied, and she was made prisoner, and committed to the care of Altunia, a Turki chief, while her brother Bahram was raised to the vacant throne. But she gained over Altunia, who married her, and, aided by her husband, she advanced to Dehli, but after two bloody battles they were both taken prisoners, and both were put to death. Her reign lasted 3½ years.—*Elliot's Historians; Elphin.* p. 324.

REA, a former subdivision of the rupee at Bombay; 100 rea = 1 quarter, and 4 quarters = 1 rupee.

READYMONEY. Sir Cowasjee Jahangir Readymoney, C.S.I., a highly liberal merchant of Bombay, whose gifts in charity during his life amounted to about £200,000. He died 19th July 1878.

REALGAR, red arsenic, red orpiment.

Hiung-hwang, . . CHIN.	Tu-hiung, . . . CHIN.
Hwang-kin-Shih, . ,,	Disulphide of arsenic, ENG.
Ming-hiung, . . ,,	

It occurs native in Yunnan, Kwei-chau, and Kansuh. It is used in soldering gold, also for the manufacture of ornamental vessels and medicine cups.—*Smith.*

REANA LUXURIANS has been introduced into the Madras Presidency. Mr. Whiteside planted the seed in clayey soil, well manured, and with water near the surface. The plants were 5 feet apart, and grew to a height of 12 feet. When half grown, the grass was eaten greedily by cattle and sheep, which fattened on it. Mr. H. T. Ross, when sub-collector of Bellary, fed a number of his own milch cows with it. He found that it doubled their yield of milk, and they were so fond of it

that they would break through any fence to get at it. The cultivatiou has been successful on the Neilgherries.

REANG, a mixed race or half-breed between the low Tiperah tribes and the Kuki.—*Cal. Rev.*, 1860.

REAUMURIA HYPERICOIDES is a plant of Syria and Persia, and R. vermiculata is a native of Sicily, Bombay, and Egypt. This plant resembles Salsola fruticosa. It is used at Alexandria as a remedy for the itch, being bruised and applied externally, and a decoction taken internally.

REBARI. Throughout Hindustan the Rebari rear and tend camels, and are in many places Muhammadans. Iu Rajputana they are a distinct tribe following Hinduism, employed entirely in rearing camels, or in stealing them, in which they evince a peculiar dexterity, uniting with the Bhatti in the practice as far as Daodpotra. When they come upon a herd grazing, the boldest and most experienced strikes his lance into the first he reaches, then dips a cloth iu the blood, which at the end of his lance he thrusts close to the nose of the next, and, wheeling about, sets off at speed, followed by the whole herd, lured by the scent of blood and the example of the leader. The Rebari of Gujerat are nomade shepherds, who rear camels, sheep, and goats, and subsist by the sale of the wool and milk, and not of the animals.—*Tod; Wilson.*

RECCAN or Rakan River, on the Sumatra coast, in lat. 2° 10′ N., and long. 100° 37′ E., is about 15 miles broad at its mouth. It has at its entrance two islands; Pulo Lalang Besar, the larger, is in lat. 2° 12′ N., and long. 100° 36½′ E.; and Pulo Lalang Kecheel. Its main branch, called the Tannah Putie river, takes a S.E. direction. The mouth of the river is almost dry at low water of spring tides; the tide enters it there at a speed of 7 miles per hour, producing a bore of 30 feet at spring tides.

RECORDER, the designation of the Chief Justice of Singapore, Rangoon, Moulmein.

RED.

Lal, ... HIND.	Deng, ... SIAM.
Abang, ... MALAY.	Erra, Yerra, . . TEL.
Surkh, ... PERS.	

Red is one of the primitive colours, of which the chief commercial varieties are fine venetian, red lead, orange and Indian red, and vermilion. The colour is esteemed sacred by several tribes, from China to Caucasus, from Tibet and Bhutan to the extremity of India, and to Ceylon.—*Ouseley's Tr.* i. p. 87.

REDANG ISLANDS, from lat. 5° 38′ N. to about lat. 6° N., on the east coast of the Malay Peninsula, in the Gulf of Siam, along which they form an extensive chain. Turtle and Kimor, or large scallops, are procurable on the N.E. side.

REDDI. TAM., TEL. In Southern India, an enterprising race of agriculturists who have migrated from their original seats near Rajamundry over the whole of Southern India, also into Maharashtra, being met with as far north as Poona, where they are considered the most thriving cultivators. The old rulers of the Telinga country were styled Reddi; and so late as 1846, Narsimma, a Reddi, on the borders of the Bellary and Kurnool collectorates, though surrounded by the Indian army, thought himself capable of opposing the British Indian Government, rebelled, and was put down by a military force. Among the Reddi of Southern India, a young woman of sixteen or twenty years of age may be married to a boy of five or six years of age. She, however, lives with some other adult male, perhaps a maternal uncle or cousin, but is not allowed to form a connection with the father's relatives; occasionally it may be the boy-husband's father himself, that is, the woman's father-in-law. Should there be children from these liaisons, they are fathered on the boy-husband. When the boy grows up, the wife is either old or past child-bearing, when he in his turn takes up with some other 'boy's' wife in a manner precisely similar to his own, and procreates children for the boy-husband. Reddi Bummala Wanloo, TEL., people of the Reddi caste.—*Shortt, Tr. Ethn. Soc., New Series*, vii. p. 194; *Lubbock, Orig. Civil.* p. 55.

REDFIELD, W. C., of New York, advocated the opinion that hurricanes are great whirlwinds.

RED FISH of the Pacific Ocean is the Holocentrus ruber. A red fish eaten by Captain Cook's crew proved poisonous to some who partook of it. Red fish is a condiment of the Malay Peninsula; fish roes and sardines are made into condiments, and the species of fish used in their preparation are Alausa toli (Ikan truboh), Engraulis Brownii (Bunga ayer or badah), Dussumieria acuta (Tamban-bulat), and Clupeonia perforata (Tamban-nepes or batuh). Engraulis Brownii, *Gmelin*, inhabits the sea and the estuaries of all seas. Total length, 6 inches. In Java, Sumatra, and the Straits of Malacca, large quantities are prescrved both for home consumption and exportation to China and India. The delicious condiment is famed under the denomination of red fish (Ikan merah of the Malays) or Malacca fish, and is used as a relish. At Bencoolen and Malacca, after the heads have been removed, the fishes (those of middling size are preferred) are clcansed, salted (in the proportion of one to eight parts of fish), and deposited in flat, glazed earthen vessels. In the latter they are for three days submitted to pressure by means of stones placed on thin boards or dried plantain leaves. The fishes are next freed from salt, and saturated with vinegar of cocoa palm toddy, after which are added vinegar with powdered ginger and black pepper (the latter mostly entire), and some spirits and powdered red rice. After having been kept for three days, a little more vinegar is added before placing the fishes in well-closed jars or bottles. They should be kept four or five months before being used. The expenses of a quart bottle of the condiment is about 30 cents, the selling price one Spanish dollar. Chinese settlers in the Straits prepare a similar red condiment with slices of Polynemus Indicus and P. tetradactylus, and also with prawns.—*W. T. Lewis, Esq., Penang; G. Bennett*, p. 21.

RED-HAIRED, Hang-Mao of the Chinese; British foreigners are so called.

REDIF. Padre Redif, a Christian priest, and a body of Muhammadan Mullahs, in the reign of the emperor Akbar, carried on a debate on religion before an assembly of the learned of all religions; a decided advantage, both in temper and argument, was given to the Christian. Akbar reproved the Mullahs for their violence, and expressed as his opinion that God could only be adequately worshipped by following reason, and

not yielding implicit faith to any alleged revelation. The disputants split on the divinity of their respective scriptures; and Abul Fazl says the Christians offered to walk into a flaming furnace, bearing the Bible, if the Muhammadans would show an equal confidence in the power of the Koran to protect them. To this, he says, the Muhammadans only answered by reproaches. The missionaries, on the other hand, say the proposal came from the Muhammadans, and was rejected by them, contrary to the wish of Akbar.—*Elph.* p. 470.

RED LEAD, vermilion.

Isreng, ... Arab.	Sada langgam, . Malay.
Minium, . . . Fr., Lat.	Temnearea, . . Maleal.
Minning, ... Ger.	Sandura, . . . Sansk.
Sandur, . . Guj., Hind.	Segapu sindoorum, Tam.
Minio, ... It.	Yerra sindoorum, . Tel.

Red lead is massicot finely ground and calcined. It is a red powder, but with a liability to become black, and is used in painting, in the manufacture of glass, in surgery, etc.—*Waterston; M'Culloch.*

RED MANGROVE or Paletuvier is the Rhizophora candel. Its branches, though they bend downwards, do not take root in the ground. The wood is heavy, of a deep red, and takes a fine polish. The bark is used in dyeing red, is astringent, and used in the West Indies for the cure of fevers, as well as of the bites of venomous insects.

RED RICE is the variety of Oryza sativa called glutinosa, the pulut or brasse pulut of the Malays. In the Straits Settlements, red rice is imported from China, and sells at the rate of 10 cents of a dollar per lb.

RED SAND of Cape Comorin is a kind of small garnet sand, much used by the natives for polishing gold and silver. Other sands from the same locality are objects of curiosity, the white resembling grains of rice. The whole beach to the westward of Cape Comorin, to the extent of several miles, is generally covered at different seasons with red sand, and immediately on the opposite side, to the eastward, almost entirely with black sand.—*M. C. C.*

RED SEA, the Arab Bahr-el-Ahmar, or Bahr-el-Hejaz, the ancient Sinus Arabicus, is an arm of the sea extending from the Arabian Sea towards the N.W. between Arabia and Africa to a distance of 1400 miles. It is entered at the south extremity by a strait, the Bab-ul-Mandab, 18 miles in width. At the broadest part (lat. 16° N.), it is 221 miles in width. Towards the north end it gradually contracts, and at length divides into two arms,—the Gulf of Akaba (Sinus Aelanites) and the Gulf of Suez (Sinus Heroopolites), the Bahr Suez or Bahr Kulzum (so called after the ancient Klysma). The sea averages 400–600, and is at places 1054 fathoms in depth, but the shores are flanked with a network of coral reefs and islands which often extend a long way from the coast. Its area is 123,500 square geographical miles. No rivers fall into the Red Sea, but a number of intermittent rain torrents descend from its banks.

The colour of the water changes with the depth. It is of a blue colour changing to pale green where there are shoals or reefs near the surface, but varies also with the changing winds and colour of the sky. No satisfactory reason for the modern name of the sea has yet been given. In the deep water, the colour does not vary more than in other seas. But the name has led to surmises. One suggestion has been the prevalence of the Oscillatoria rubescens of Ehrenberg, who, while sailing in this sea, observed that the occasional red colour of its waters was caused by enormous quantities of this animal, which seems to be the same with what Haller described as a purple conferva swimming in water. The alleged red colour is, however, also supposed to be from the Trichodesmium erythræum, a filamentous alga. It is described as of a blood-red colour, often covers large areas, and appears and disappears somewhat capriciously. It has as synonym T. Ehrenbergii. T. Hindsii, also of a blood-red colour, has been found off the west coast of South America. Under the microscope, the Trichodesmium seems like sheaves of minute fibres. Dr. Collingwood, however, mentions that he had never seen red Trichodesmium, or any tint of red. He had seen it yellowish-brown. He had seen the Indian Ocean red from myriads of minute red crustacea, and the sea in the Formosa Channel red from gelatinous worms, but never by Trichodesmium.

The difference between high and low tide is 3½ to 7 feet. The prevalent wind in the north part of the sea is from the north, and in the south part the S.E. wind in winter, and the N.W. in summer. The littoral consists of barren rock or sand. A little way inland the mountains rise to a height of 4000 to 7000 feet.

Much of the region is volcanic, and some of the islands still emit smoke. The island of Perim is trachytic; the culminating points of the island reach an elevation of 228 feet, and prove that the island itself is the result of a volcanic eruption under the sea. The lava had first raised up the large bank of Madrepore which covered the bottom, and had then forced its way through the interstices, and become visible over the water. This volcano, the vast crater of which embraced the bay of Perim, in course of time covered the new island with mud, ashes, trachytic blocks, etc., and then became extinguished.

The fauna and flora of its coasts and seas have been described by several naturalists, who have noticed the flights from shore to shore of locusts and quails and pigeons.

So far back as the time of Solomon, the navigation of the Red Sea was of importance, and several of the seaports, such as Berenike and Myos Hormos, were celebrated.

The commercial routes between the west and the east from pre-historic times had been three, viz. the Red Sea, by the Euphrates and Tigris, and Persian Gulf, all of them known to the ancients as the Erythrean seas. Political changes led to some one of these being preferred, the others being for centuries neglected, or even forgotten. Scylax had, by the order of Darius, dropped down the river Indus, coasted Arabia, and thence reached the Red Sea. It was the wish of Alexander the Great to recover the Indian trade from the Sabæans, and bring it through the Red Sea, but his early death prevented this being attained. Eudoxus of Cyzicus in Asia Minor went to Alexandria to persuade Euergetes to give him the command of a vessel for this voyage of discovery. A vessel was given him, and though he was but badly fitted out, he reached a country, which he called India, by sea, and brought back a cargo of spices and precious stones. He wrote

an account of the coasts which he visited, and it was made use of by Pliny.

From that time till the years 1838-1840, the Red Sea route remained neglected, but since then it has again become the great highway of commerce. For the rapidity that it has attained to its present magnitude, the world is largely indebted to the officers of the Bombay marine and Indian navy. In 1796, a chart was constructed by Lieutenant White. Some sailing directions were drawn up by Sir Home Popham during an expedition sent from India to Egypt in 1800. Captain Court, in whose ship Lord Valentia sailed, also made charts of some parts of the western coast of the Red Sea. But later on, from 1830, surveys of this and its neighbouring seas were made by Captains Moresby and Elwon, and under them were Captains Carless, who afterwards surveyed the coast of Sind; John and James Young, Pinching, Powell, Barker, the Abyssinian traveller; Christopher, the pioneer of the Indus, who fell at Multan; Wellsted, the accomplished author; and Felix Jones, a skilled draughtsman. The charts continued to be published until 1841. Subsequently Moresby, aided by James Young, Robinson, Barker, Macdonald, Riddle, Christopher, Michael, Lynch, and Felix Jones surveyed the Maldive Islands. In February 1837, Moresby proceeded to the Chagos Archipelago, and afterwards to the Seychelles, and returned to Bombay in September 1838. Captain Haines, in October 1833, commenced the survey of the south coast of Arabia, with Lieutenants Saunders, Grieve, Rennie, and Cruttenden, and Dr. Hutton, but it was discontinued in 1837. Most of these officers wrote memoirs of the countries surveyed.

The Red Sea was long supposed to be 36 feet higher than the Mediterranean, and the Persian Gulf rather less. The French engineers also, at the beginning of the present century, came to the conclusion that the Red Sea was about 30 feet above the Mediterranean; but the observations of Mr. Robert Stephenson, English engineer, at Suez; of M. Negretti, the Austrian, at Tineh, near the ancient Pelusium; and the levellings of Messrs. Talabat, Bourdaloue, and their assistants, between the two seas, proved that the low-water mark of ordinary tides at Suez is rather more than one inch lower, and the formation of the Suez canal followed. The formation of the Suez Canal has made the Red Sea again the great highway between Europe and the Indies, and large ships of all nations are now seen in it. It was planned by Count de Lesseps, and is the greatest work of man.

The traffic between the different places on the coast is carried on by coasting vessels (Katera Baye); Sambuk (vessel of medium size, with a short cut-water; Bagla, the same without cut-water; Dau or Dowrangah, the same, with a large stern and a long cut-water. Regular communication between some of the most important places is also kept up by the Egyptian steamers which ply fortnightly between Suez, Jedda, Sauaken, and Masaua. Steamers of the Austrian, Lloyds, and others also ply between Suez and Jedda at the time of the Mecca pilgrimage. On the African side of the Red Sea, there is not a single place of consequence between Suez and Koser (Cosseir).

Koser (1200 inhabitants) is the harbour of Upper Egypt, from which it is 4½ days' journey in a straight line. It was formerly one of the chief outlets for the products of Egypt, particularly grain; but since the opening of the Suez railway it has lost nearly all its importance.

Souakin (10,000 inhabitants) possesses a good harbour. It was ceded to Egypt by the Turks in 1865, and since that period it has rapidly improved. It was formerly an important depôt of the slave trade.

Masaua (5000 inhabitants), the seaport of Abyssinia, belonged to the Turks as early as 1557, and has recently been ceded to Egypt. The climate is very hot. On the Arabian side, the seaports of the province of Yemen are Mocha, Hodeda, and Lohaya. Mocha has fallen entirely to decay, and Hodeda nearly so. These places have been superseded as seaports by Aden.

The most important seaport in the Red Sea, the great focus of oriental trade, and one of the wealthiest towns in the Turkish empire, is Jedda, situated 46 miles to the west of Mecca, of which it is the port. Pilgrims from every Muhammadan country converge here, and the merchants transact business with the devotees on their arrival and departure. The inhabitants trade with the interior of Arabia, with Egypt, East Africa, as far as Mozambique, Mesopotamia, Persia, India, and the Malay Islands. Jedda is the chief market for pearls, mother-of-pearl, and black coral, and for the coffee, balsam, senna leaves, aromatic herbs, and horses and donkeys which Arabia produces. It is also a great depôt of oriental carpets, muslins, woollen and silken stuffs, spices, and other products, which are exported to the western Muhammadan countries. The imports are corn, rice, butter, oil, and not unfrequently slaves, The harbour lies at a considerable distance from the town, which can only be approached by small craft. The town was taken by the Egyptians in 1836, but since 1840 has again belonged to the Turks. In 1858, a massacre of the Christians took place, on which occasion the French and British consuls were murdered, and in consequence the town was bombarded by the British.

To the north of Jedda lies Yemba, the seaport of Medina, which lies about 92 miles to the east of it. It is called Yemba-el-Bahr, and has about 2000 inhabitants only, lies in a sterile region, while the larger town of Yemba-el-Nakhl, with about 5000 souls, situated nearly a day's journey inland, is surrounded with palms and other vegetation.

There are no harbours of note between this point and Suez, but El Wejj, opposite Koser, is an important quarantine station. Since the cholera was brought to Egypt by the Mecca pilgrims in 1865, the quarantine establishment has been annually fitted up for a month and a half or two months at the time of the return of the pilgrims after the great Bahram festival. Both the caravans travelling by land and vessels of every nation from Arabian ports must undergo quarantine here for five days, or for a longer period if the outbreak of an epidemic is apprehended.

The great Mecca caravan which travels via Akaba passes this way both in going and coming. The town itself has 600 to 800 inhabitants only. The north part of the Arabian coast, as far as El Wejj, is under the supremacy of Egypt.—*The Red Sea and its Coasts, by Dr. C.*, p. 13; *Klunzinger in Baedeker's Egypt; E. I. Marine Surveys; Asiatic Researches*, iii. p.

Royal Society*, 1855; *Collingwood's Naturalist.*

RED SPIDER, one of the plagues of the tea-plant, an extremely small red mite that eats the cellular tissues of old leaf, and has a marked effect in checking the growth, especially in young plant. This noxious insect infests the rogu tree, Nauclea cadamba.

REDUVIUS, a genus of bug insects belonging to the Reduviidæ. R. serratus of India produces slight electric shocks.

RED WOOD is a commercial term applied to several timbers; one is the Cæsalpinia sappan, *Linn.*; another red wood tree is the Adenanthera pavonina, a large and handsome tree, and well suited for planting in avennes; also the Pterocarpus Santalinus, *Roxb.*, and the red wood of the Andamans is said to be the product of Pterocarpus Dalbergioides, *Roxb.*

The red wood fig-tree is the Ficus racemosa.

The red wood of Japan, Fa-ang, Jap., also Tsiampan, Jap., is a product of Coy or Kiu, in Thunberg's time belonging to the king of Siam. It was also obtainable in Bambilisoi, on the coast of Cambodia, and from Bimen Island, between Bali and Timor. It was imported into Japan, where, Thuuberg remarks, 'this wood rubbed with some lime and water yields the finest violet colour we conld wish to see.'

The red wood used in Japan for dyeing, called Ubar, is a red wood of Sumatra, resembling log-wood. It is used by the natives in tanning twine for fishing-nets, and appears to be the okir or Tauarius major of Rumph. iii. p. 192, and Jambolifera rezinoso of Lonr. Fl. C. C. p. 231.

The red wood of Mergui is the Syndesmis Tavoyana.

The red wood of Penang is in general use for furniture. Its colour is red, and its specific gravity 1·000.

A red dye-wood occurs in the Vizianagram zamindari.—*Marsden's Sumatra*, p. 95; *Thunb. Japan*, i. p. 42; *Col. Frith; Roxb.*

REED.

Kalam, ... Arab.	Peru nanal, . . . Tam.
Baru, ... Hind.	Pedda rellu, . . . Tel.

Reeds of the best quality of which pens are made are imported into India from Arabia, but inferior descriptions, from Saccharum sara, abound on many hills, and on the banks of rivers in India. Reeds for weaving are formed of these, though used also for pens. In Peninsular India, reeds for weavers are prepared by a class of persons, who also practise as oculists. The materials used for reeds are strips of several descriptions of reed; for silk weavers they are made of the fine teeth of the mango fish.—*Rohde's MSS.*

REEF or Shoal. Sha'b, Arab. Darwin (Researches, p. 555) describes the lagoon islands, the encircling reefs, and the barrier reefs. Coral islands are arranged by Darwin into the atoll or lagoon island, a coral margin with a lagoon in the centre; barrier reefs, stretching along a vast extent of coast; and encircling coral reefs, which are merely fringes of coral along the margin of a shore. Von Birch is of opinion that the lagoon island is the margin of a submarine crater on which the coral animal has built its wonderful structure. The barrier reefs, according to Darwin, are due to subsidence. In a sheltered archipelago, they rarely rise to the surface. But in an open ocean, rolling waves and breakers throw up a barrier of broken coral far above the usual high water-mark.

In New Caledonia the encircling reef extends 140 miles beyond the island. At Vanikoro, the reef runs two or three miles from the shore, from which it is separated by a channel from 30 to 50 fathoms deep. Externally, the reef rises from an ocean profoundly deep.

The great barrier reef which fronts the N.E. coast of Australia for nearly 1062 miles, runs parallel to the shore, at distances ranging from 20 to 70 miles, the enclosed sea, 31,860 square miles in area, varying in depth from ten to sixty fathoms. Sir Charles Lyell and Darwin think (557) that the great depths of the marginal seas is caused by the subsidence of the land, the corals raising their structure as the lands subside.

There are innumerable coral reefs and coral islands, but Darwin has satisfactorily shown that atolls, or annular reefs, were originally fringing reefs constructed around islands that have since subsided. Coral reefs have thus been divided into three classes, according to their geological character,—the shore reefs fringe the shores of continents or islands; the encircling reefs or barrier reefs; the third, enclosing a lagoon, is called an atoll, or lagoon island, and is a ring or annular breakwater around an interior lake. In the Archipelago and the Pacific are many coral islands or atolls. An atoll differs from an encircling barrier reef only in the absence of land within its central expanse; and a barrier reef differs from a fringing reef, in being placed at a much greater distance from the land, with reference to the probable inclination of its submarine foundation, and in the presence of a deep water lagoon-like space or moat within the reef. Atolls sometimes constitute a great circular chain enclosing a deep basin, but opening by one or more deep breaches into the sea. Sometimes they surround a little island by a girdle of reefs; or form the immediate edging or border of an island or continent. Atolls occur in the Pacific, in the Chinese Seas, in the Marianne and Philippine Islands, Maldives, Laccadives, and Sunda group. —*Darwin on the Structure and Distribution of Coral Reefs; Hartwig.*

REEPERS are longitudinal sections of the palmyra palm, used for building purposes; the trunk of the tree is split into eight for reepers, and these are dressed with an adze. In Ceylon, they are made of the kittool palm, and known as Nipera reepers; these are dearer than any other kind, they last in many instances for 50 or 60 years.—*Simmonds' Dict.*

REFUGE CITIES, or Sanctuaries, cities where criminals and others obtain refuge. See Bast; Hebron; Kedish; Shechem.

REG. Pers. Sand; hence Registhan, a sandy desert, the Baloo-desa of India. Reg-rawan, the moving sand. Regi, a sandy soil.

REGENT BIRD, of Australia, is the Sericulus melinus. It builds its nest in bowers, like the satin bird and bower bird. It is also called the king honey bird. Bennett says it is the S. chrysocephalus.

REG MAHI, a small mottled lizard, Lacerta scincus, *Linn.*, from 6 to 8 inches in length, found in the sands of Sind, and occasionally in dry tracts of the Multan division. This reptile used to be formerly in the Materia Medica of Europe as a restorative stimulant and antisyphilitic. Even some modern physicians, however, have justified the use of these animals.

REG-RAWAN, or moving sand, is a small hill in the Kohistan, forty miles north of Kābul, remarkable for a bed of sand on its southern face. This is subject to sliding movements, which occasiou sonorous sounds. It is styled the Khwaja Reg-rawan. A whitish streak is observed, extending from the summit to the foot. It is mentioned by Baber. The natives say that it runs up again, and that it is never diminished; and that there is a cave at its foot where noises are heard.

Burnes describes the sounds as loud and hollow, very like those of a large drum; whilst Sultan Baber, in his Memoirs, speaks of the sounds of drums and nagarets, and the same instruments were specified by the Friar Odoric. A still more apt comparison is afforded by Captain Newbold's account of the like phenomenon in the Sinai desert, at the sand-hill known as Jabal Nakus, 'the hill of the bell.' Dr. Wallin also was told when crossing a wadi of the Sinai desert, called Hamade, near Wadi Araba, that sometimes very strange sounds, like those of kettle-drums or nakkara, were heard to rise from the earth, without any discoverable cause. Friar Odoric gives an account of a sandy hill, on which he heard the sound of invisible nakkara or drums. Mr. C. R. Markham, C.B., says the musical sounds caused by moving sand, which astonished Odoric, are heard also in the deserts of the west coast of Peru. Mrs. Markham and himself heard them when they halted amidst the medano or hills of light sand in the Arequipa desert. Another case was discovered by the late Hugh Miller in the island of Eigg (Cruise of the *Betsy*, quoted in Petermann's Mittheilungen, 1858, p. 405). Mr. Bollaert notices the Bramador or rumbling mountain of Tarapaca, which appears to be distinct from Mr. Markham's.—*J. G. S.* xxi. p. 104; *Yule, Cathay*, i. p. 244; *Burnes' Travels.*

REGULATION and Non-Regulation are terms employed in the administration of British India to indicate provinces and districts under different forms of laws. The Regulation Provinces, as a rule, are governed under the provisions of Acts of the Supreme Council of India, or by Acts of the British Parliament, and the administrative officers are designated judges and collectors. Non-Regulation Provinces, again, are under the control of Commissioners, who rule in accordance with local provisions, often founded on previous decisions, and the Chief Commissioners and Commissioners are sometimes civilians and sometimes military men.

REGULUS CRISTATUS, the golden-crested wren of Europe, N. Asia, Japan, W. Asia, Barbary, is partially migratory. It is replaced in the W. Himalaya by R. Himalayensis. The Reguloides proregulus (Regulus modestus, or Dalmatian regulus) of Asia is very rare in Europe,—one specimen obtained in Dalmatia, and another in England,—but it is common in India, with several affined species. See Birds.

REGUR. *Dec.* The black soil of the volcanic regions. See Soil.

REH has its origin in the decomposition of the elements of the rocks and soils under the action of air and water, and the rain-water washes out the soluble carbonates of lime, and alkaline chlorides, and sulphates, and carbonates, which are formed into carbonate of lime, carbonate of soda, sulphate of lime, chloride of soda, sulphate of soda, sulphate of magnesia, which effloresce on the surface of the ground.

Reh is thus not a special salt, or mixture of salts, but a very variable compound. It is really the most easily soluble salt in the earth water, remaining in solution after the decomposition of carbonate of lime, and on evaporation. The ingredients and their relative proportions are found to vary in different places, exactly as the well waters at different spots differ in saline contents, and in the same area there is a close relation between the two.

Deterioration of the land irrigated from the Ganges and Jumna canals attracted serious attention in the villages along the Western Jumna canal, and its branches, about Dehli, Paniput, Rohtak, and Kurnool. In 1857, Mr. Sherer, joint-magistrate of Aligarh, examined the tracts of country deteriorated, and the picture presented by him of the suffering in some of the villages was truly deplorable. Out of 580 canal villages, 59 or nearly 10 per cent. had been injured in degrees ranging from severely to partially, 6 per cent. being severely injured. The maximum appeared to be reached in Paniput, where 46 villages, or 19 per cent., were injured. Reh effloresces in several parts of the Panjab, where there are no canals at all; in these places it appears in land irrigated from wells where the water is very far from the surface. The efflorescing salt consists of sulphate of soda, with a variable proportion of chloride of sodium or common salt. As far as experience goes, lands near canals, like the Hasli, in the Lahore district, constructed at, but not below, the ordinary level of the watershed, are usually found to be free from reh efflorescence. Generally speaking, the farmers assert that fully impregnated reh land is incurable and valueless. In gardens and small plots, it has been found useful to dig out the soil to the depth of 2 feet or so entirely, and putting in fresh soil. Sluicing and irrigation has been recommended. Nitrate of lime is recommended as a probable chemical antidote for the salts of the reh. It has been known that the best remedy for reh is the saline efflorescence of old mortar on walls, or which appears on ground containing carbonate of lime and animal matter. In this substance nitrate of lime is found, and this salt would act by producing the insoluble carbonate of lime, and the sparingly soluble sulphate of lime, and the deliquescent nitrate of soda, instead of the efflorescent sulphate and carbonate of soda, which are the principal constituents of reh. Nitrate of lime is prepared by distilling shora or saltpetre with kahi safed, and neutralizing the acid liquor that passes over with chunam. The native cultivators, in some parts, have long been accustomed to employ chikna kullur, or earth which looks damp; this earth is found where animal remains are deposited, and usually contains nitrate of lime. The reh is composed principally

of sulphate of soda and chloride of sodium, with, in some places, carbonate of soda; the sulphate and carbonate of soda are very efflorescent salts, and melt partly in their water of crystallization at a temperature of about 98°, while they are rather sparingly soluble when the temperature falls below 60°. Hence during the hot weather the reh melts and percolates the ground to some considerable depth; but as the weather becomes cooler, crystals form in this soil and form a capillary network, upon which it travels till it arrives at the surface, where the salt gives off its water of crystallization, and falls into a dry powder by efflorescence. If to a solution of these salts, nitrate of lime be added, no change is produced by it on the chloride of sodium, but the sulphate and carbonate of soda are converted into nitrate of soda, a deliquescing salt, while the lime is changed either into the insoluble carbonate of lime, or the sparingly soluble sulphate of lime, neither of which are efflorescent or in any way injurious to vegetation.—*Powell's Handbook*, pp. 95, 112; *Records Govt. of India*, No. 42 of 1864, *Note on Reh, etc.*

REHAT, in Buddhism, a being entirely free from evil desire, and possessing supernatural powers.—*Hardy's Monachism*, p. 440.

REHMANNIA CHINENSIS. *Tatarinov.*

Sang-ti-whang,	CHIN.	Man-ti,	CHIN.
Shah-ti-whang,	,,	Man-yuen,	,,

A plant of the order Gesneraceæ. Its roots are sun-dried, and brought from Kwang-p'ing-fu in Peh-chi-li, from Yuen-chan-fu in Kiang-si, and very largely from Hwai-king-fu in Ho-nan. The root is deemed by the Chinese alterative and tonic.—*Smith's Mat. Med.*

REINHARD, WALTER, a native of the electorate of Treves, who came to India as a carpenter in the French navy. He took service with several native chiefs for brief periods, and then joined Gregory, an Armenian, who was in high employ under Mir Kasim, nawab of Bengal. After the fall of Monghir, he put to death all the English prisoners who had been collected at Patna. He next joined the Bharatpur chief, and from him finally went over to Najaf Khan. He died in 1778, and was buried at Agra. He was known as Sumru, and the Begum who had lived with him, and who is said to have been a Kashmir dancing girl, was recognised as his widow, and succeeded to all his Sardanha estates. In 1781 she was received into the Catholic Church, and in 1792 married M. le Vaisseau, a French adventurer. He was so unpopular that the people rebelled under Zafar Yab Khan, a son of Reinhard, and by an artifice of the Begum her husband was induced to commit suicide, and the disturbance was soon after quelled by her old servant George Thomas. In 1802, Zafar Yab Khan died, leaving a daughter, who was married to Mr. Dyce, an officer of her army. She had a son and two daughters. The son, David Ochterlony Dyce Sombre, was adopted by the Begum, and on her death in 1836 he succeeded to the estate. He married Mary Anne, daughter of Viscount St. Vincent, and died in Paris in 1851. His widow in 1862 married the Honourable George C. Weld Forester, now Baron Forester. The Begum by will left to schools and Romish churches, Rs. 3,74,400.—*Growse*, p. 41.

REJANG is the alphabet of Lemba and Pasummah on the western side of Sumatra. It consists of 23 substantive characters, formed of upright scratches or strokes, and on the whole it is more complete than either the Batak or Korinchi alphabets.

REJEEPAK, (lit.) pure veins, a term applied to Arabian horses of pure strain, many of which are bred on the Persian shore, with as much attention to preserve the original blood as imported from Arabia, as could be shown in first-rate studs in England.

RELIGION. Of the various religions in the world, according to Hassel, there are, in millions, Christians, 120; Jews, nearly 4; Muhammadans, 250; Hindus, 111; Buddhists, 315. Every religion, it has been remarked, 'even the most imperfect and degraded, has something that ought to be sacred to us, for there is in all religions a secret yearning after the true though unknown God.' Movers has illustrated the religious worship of Phœnicians and Carthaginians, from their temples; the religious idea of the Arab nomades, prior to the time of Mahomed, has been described by many; the idols and temples, the hieroglyphic inscriptions, the hieratic and demotic MSS., have afforded much information regarding the religion of Egypt. Further to the east, the monuments of Babylon and Nineveh have furnished materials for the study of the Semitic religions, and images of Bel and Nisroch have been produced, and something is now known of the religions of Mexico and Peru, and of the savage inhabitants of America, Africa, and Polynesia.

Of the religions of the S. and E. of Asia and the philosophies which take their place, the demon, and spirit, and nature worship of the ruder races is perhaps the most ancient; the monotheistic religion of the Jews, 4000 years old, may be the next, followed by the Buddhist philosophy, which seems to have been believed in since 3200 years, 850 years before Sakya gave it fresh vigour, and is the most extensive of all of them, with the Jaina faith, which is as old as that of the Buddhist.

The philosophy put forth by Kung-fu-tze or Confucius, was about 500 years before Christ, and it has been added to and altered by subsequent sages of China. The Christian religion, first established in Western Asia 19 centuries ago, and early taught in Africa, Arabia, and Central and Eastern Asia, has at present, in British India, but a comparatively small number of professors. If India and South-Eastern Asia be looked at in their religious aspects, four polytheist faiths will be seen,—Buddhism, the Jaina faith, Brahmanism, and Shamanism; three monotheistic faiths, viz. Jewish, Christian, and Muhammadan; a mixed faith, the Sikh, partly monotheistic, but believing in incarnations; and lastly the worship of fire as an element, by the little numerous but intellectual Parsees.

The canonical books of three of the principal religions of the ancient and modern world, viz. the Veda of the Brahman, the Zendavesta of the Zoroastrian, and the Tripitaka of the Buddhist, have disclosed the real origin of Greek and Roman, and likewise of Teutonic, Slavonic, and Celtic mythology. The Koran, and the literature connected with it, afford information regarding a Semitic religion, the doctrines of Mahomed.

Besides the Aryan and Semitic families of religion, there are in China three recognised forms of public worship,—the philosophy of Confucius, that of Tao-tze, and the religion or philosophy of Fo (Buddha).

The ancient history of India shows that it has had four great religious eras, — the *Vedic*, in which Agni, Indra, and other personifications of spiritual existences, with the worship of astral and natural phenomena, were propitiated with feasts, and invoked with the hymns of the Rig Veda, and in which maidens selected their husbands in the Swayamvara, and monarchs sacrificed the horse in the Aswa Medha. In the *Brahmanic* period, the Kshatriya feasts were converted into sacrifices for the atonement of sins against Brahmanical law, and divine worship was reduced to a system of austerities and meditations upon the Supreme Spirit as Brahma. It was in this era that the Brahmans assumed the character of a great ecclesiastical hierarchy, and established that priestly dominion which still extends over the minds and senses of the Hindus of India; 3dly, the *Buddhist* period, in which Sakya Muni appeared. And, 4thly, the *Brahmanical* revival, during which Brahmans abandoned the worship of their god Brahma, and reverted to the old national gods and heroes of the Vedic Aryans. In this era Vishnu came to be regarded as the Supreme Being, and Rama and Krishna as his incarnations, and it was accompanied and followed by a belief in a deity called Siva, whose worship, based on physiological doctrines, was earnestly inculcated by its missionaries during the 8th to the 14th century of the Christian era. Both of these sects of Brahmanism are accepted by the Hindus. But at present the largest number of the Hindus are followers of Vishnu and his wife, in some one of his several incarnations; a smaller number accepting Siva and his wife. Siva is mentioned in the book of Amos (v. 26), but when his worship was first introduced into India has not been traced. Tod supposes B.C. 900.

Since the 7th century of the Christian era, conquerors from the north-west, traders from Arabia, and zealous missionaries professing Muhammadanism, have been advancing into India, China, and the western islands of the Archipelago; and the numbers professing this faith in S. and E. Asia may now amount to about 200 millions of souls.

The Vedas of the Hindus are in Sanskrit. They do not seem to have been translated as a whole into any of the vernacular tongues of India, and there are but few Brahmans who can read and understand them, though they learn portions by heart. They are considered a revelation; and the laws of Menu, the Puranas or legendary histories of India, the Tantras, and the six orthodox Hindu systems of philosophy, all derive their authority from their agreement with the Vedas. It was the Vedas of which the Buddha Sakya Muni denied the authority. In the Vedanta philosophy, the beginning of all wisdom is said to be a desire to know God, who is the cause of the universe, and this is to be learned from the Scripture. The Nyaya philosophy acknowledges four sources of knowledge,—perception, induction, analogy, and the word or Veda. The Vaiseshika philosophy is an atomistic system, not favourably looked on by the Brahmans, nevertheless proclaims the absolute authority of the Veda. The Sankhya philosophy is atheistic; it maintains that a personal God cannot be proved, though it so far conforms as to admit the received doctrine of the Veda as evidence in addition to perception and induction. The Puranas, or old books, superseded the Veda. The Buddhist religion of Burma is likewise a philosophy. The British rulers of India have allowed the utmost religious freedom to all the races under their sway, and the Bible has never been used as a class-book in any Government school in British India. This has been denounced by earnest men as time-serving. However, the Koran and the Vedas are equally excluded; but the grant-in-aid rules of 1854 permit money allowances to every school in India where education up to a certain standard is imparted, and in these grants every Christian school can equally share. To gain a full knowledge of the Veda, the Zendavesta, the Tripitaka, of the Old Testament, the Koran, or the sacred books of China, would be the work of a long life.

Sir John Lubbock has pointed out that both in Aryan and Semitic races there have existed several minor creeds, which in process of ages have disappeared. In the Aryan race, for example, there have been the religions of Greece and Rome, Odin-worship, and Druidism. In the Semitic race, there have been the Assyrian, Phœnician, and sundry other idolatries. But in each race there has also been one great religion, which, beginning at the very dawn of history, has lasted to the present hour, namely, Vedic-Brahmanism among the Aryans, and Judaism in the Semitic race. And each of these great religions has had two vast offshoots or schisms, which also still survive, namely Zoroastrianism and Buddhism from Brahmanism, and Christianity and Islam from Judaism. Further, all six of these religions are possessed of a sacred literature, to which divine authority is attributed by their adherents, namely, among the Aryans—

The Vedas of the Brahmans.
The Zendavesta of the Zoroastrians.
The Tripitaka of the Buddhists.

And among the Semitic race—

The Old Testament of the Jews.
The New Testament of the Christians.
The Koran of Muhammadans.

Besides these Aryan and Semitic Scriptures, there only exist in the world two other ancient sacred books of any value, namely, the Kings of the Confucian Chinese, and the Tao-tze King of the Taoists of China; the Granth of the Sikhs being a comparatively modern work.

Lastly, as if to perfect the parallel, recent calculations tend to show that at the present hour, after 4000 years of development, the great religions of the Semitic and Aryan races are almost on an equality in point of numbers—Brahmanism and Buddhism, with the small remnant of Zoroastrians, counting together (according to an authority accepted by Professor Muller) about 44 per cent. of the human race; and Judaism, Islam, and Christianity numbering nearly 45 per cent. on the same calculation.

The great bulk of the races in Southern and Eastern Asia are of the Muhammadan, the Buddhist, the Brahmanical, and Sintu religions. The Muhammadans believe in God, in a future state, in a judgment for blessing or for condemn-

ation, in Mahomed as the last and greatest of the prophets of God; in the Koran as a divine revelation; in khalifas as successors of Mahomed, and in many saints and shrines. They believe, also, in the coming of a Mehdi, who is to be the last of the Imams, and who will inaugurate an era when Islam, now militant, will be finally triumphant. They designate their religion Islam, salvation, and style themselves Musalmān, of the saving faith. Muhammadanism is essentially a proselytizing religion; the craving of all its professors being to convert all mankind to a belief in God and in Mahomed as His prophet. But with this as the essential tenet, they have many diverse sects, of every shade of belief, from a pure monotheism to a recognised series of incarnations still in progress. They occupy parts of Europe and Africa, much of the south of Asia, and eastwards into the Archipelago. In the south-west of the Asiatic continent, Persia with its 7,658,000 inhabitants is almost exclusively of the Shiah form of Muhammadanism, with a mere sprinkling of Jews, Armenian Christians, and Zoroastrian fire-worshippers. But Persia is almost alone in this form of the faith. It is enclosed on three sides by races following the Sunni traditions,—by Arabs to the S.W. and W.; by Turks in Asia to the N.W. and N.; with Uzbak also on its north; Bokhariots and Turkoman to the N.E., and Afghan tribes, Makrani, Baluch, and Sindi, on its east; and the Turkoman make the sectarian difference in their belief a ground for considering Persia heretical. Until the present day they raid Persian territory, and steal and sell the captives as slaves. Persia is to them a hostile country, a dar-ul-harb, on which they may lawfully make war. In this region the Muhammadan population is estimated to be 36,000,000.

Persians,	7,658,000	Turkoman,	450,000
Arabs,	5,000,000	Afghans,	4,000,000
Turkey in Asia,	16,357,000	Sindi,	1,887,204
Khiva Uzbak,	700,000	Baluch,	409,200
Bokhariots,	2,100,000		

In India, the British Government, a Christian power, is ruling over a population of 253,891,821 souls, in diverse religious communities. A census taken in 1881 has shown their respective numbers to be as under:—

Hindus,	187,937,450	Kabir Panthi,	347,994
Muhammadans,	50,121,585	Nat worship,	143,581
Aboriginals, Non-Aryans,	6,426,511	Parsee,	85,397
Buddhist,	3,418,884	Jews,	12,009
Christian,	1,862,634	Brahmo,	1,147
Sikh,	1,853,426	Kumbhi Patia,	913
Jain,	1,221,896	Others and unspecified,	59,985
Satnami,	398,409		

The non-Aryan races of India have not advanced beyond the idea of demons who scourge the human race. Many of them have totems; others are Shamanistic, and are continually finding new objects of worship in the spirits of men and women who have died a violent death, or have lived lives of turmoil. Mari Amman, or death mother, of the Tamil race, is a recently acknowledged divinity who sends smallpox. She is a compound of their Amman or village goddess and of Kali, the consort of Siva. Since cholera has swept through the land, the people of Ujjain have formed a new goddess, Maha Kala, whom they believe sends that dread disease. A great number of the non-Aryan races are recognised to be of Turanian descent. Many of them are in a servile condition, and until the present day are almost in a state of predial slavery, in some parts bought and sold with the lands. Many are illiterate, have no sacred books, and worship spirits, ancestors, idols, and shapeless stones from the river beds. But even amongst the followers of the Brahmanical Hindu faith and the Jaina sect, all of whom possess sacred books, there is found every conceivable kind of worship, from the grossest sensualism to the most exalted spiritualism, and from the worship of stocks and stones to the most sublime conceptions of the omnipresent God.

The Muhammadans are descendants of Arab, Turk, Moghul, and Persian invaders, and of converts from Hindus and aboriginal races. They are largely of the Sunni sect, but the unity of their creed and the firmness of British rule have done much to make them one body. With Brahmanism it is different. Of very varied origin, largely from a nature-worship, with a belief in mythological personages, and some of their chief gods deified princes, their beliefs are greatly diversified. Great minds are constantly arising and forming new sects or are pondering over problems, moral, social, and political. The Sikh, the Satnami, the Kabir Panthi are all recent, and the Brahmo is of the 19th century. Brahmanism is proselytizing by millions among the aboriginal races, but is loosening its grasp on many of the educated classes. The tendency is to adopt some form of philosophy as a substitute for their old traditional religions, and this seems likely to embrace the majority of the educated classes throughout India.

The most recent philosophy was originated by Ram Mohan Roy, a Brahman, and its best expounder at present (1883) is Keshab Chander Sen. The name assumed by the most prominent among them is that of Brahmo, and ramifications of this sect have spread throughout the presidencies of Bengal, Madras, and Bombay. They renounce superstition, paganism, and absurdities of all sorts. They abjure atheism and materialism; they repudiate Buddhism, Hinduism, and Muhammadanism. They regard Christianity, not as a religion to be adopted, but as one of several paths leading towards pure and abstract truth, and they look towards the Vedas and Puranas, handed down from the Aryan Hindus, as constituting another of these ways. Theirs is a theism, including faith in a Supreme Being, in the immortality of the soul, and in a future state of rewards and punishments.

Sir Alfred C. Lyall thinks that in India there will, in two or three generations, be a wide and rapid transformation of its religion; that the old gods of Hinduism will die in their new elements of intellectual light and air. Some, he says, may think that Christianity will, a second time in the world's history, step into the vacancy created, and occupy the tracts laid open by the upheaval of a whole continent to a new intellectual level. But, he says, the state of thought in Western Europe hardly encourages conjecture that India will receive from that quarter any such decisive impulse as that which overturned the decaying paganism of Greece and Rome. Christianity has not yet spread sufficiently to have become an actual power in the country, but the Brahmoists admire Christianity in the main, as supplying a pattern for human conduct.

Under Hindu law, until 1850, a change of

religion by any Hindu involved loss of property; but an Act passed in that year by the Legislative Council of British India declared that change of religion did not involve loss of property.

East of British India, Buddhism has been favourably received by great nationalities. Tribes on the Assam borders, the people of Manipur, many broken tribes amongst the hills and the valleys of the Irawadi, the Mei-kong, and other great rivers, are following spirit and nature worship. The Malays of the Archipelago are now mostly Muhammadans, and the Spanish Indies in the Philippines almost all Christian; but Ceylon is partly Buddhist, partly Hindu; and Burma, Siam, Annam, Cochin-China, Cambodia, China, and Corea are chiefly Buddhist, though China largely follows the philosophy of Confucius or the corrupted Taoist philosophy of Meng-tze.

In the temples of Confucius in China, the only object of reverence is the monumental tablet before which the devout burn incense and pray. At the entrance of their Buddhist temples are colossal figures, supposed to be warders of the place; in all other temples are numerous idols, not only of Buddha in his three attitudes of contemplation, exhortation, and repose, but of many other deities, as the god of war, the god of agrieulture, and the queen of heaven.

A prominent feature of Japan society is the variety of religious beliefs. The State cult is the Sintu (Sin, the gods, and Tu, faith), an apotheosis of all great heroes and saints. The Buddhists are there the more numerous sect, but their priests had become so singularly unacquainted with the tenets of their religion, that some inquirers recently visited England to study its doctrines in the books of the public libraries. The populations dwelling in these south-east regions of Further Asia have been estimated as under:—

Assam tribes, .	200,000	Sunda Islands and Moluccas, .	28,867,000
Manipur, . .	126,000	Netherland India and part of N. Guinea, . .	27,962,000
Burma, . . .	4,000,000	N. Guinea and neighbouring Islands, . .	500,000
Siam, . . .	5,750,000	Philippines, .	6,300,000
Annam, . . .	21,000,000	Corea, . . .	8,500,000
French Cochin-China, . .	1,597,013	Japan, with the Kuriles, Loo-Choo, and Bonin Islands,	36,357,212
Cambodia, . .	890,000		
Malacca tribes,	300,000		
China proper,	350,000,000		
Eastern Turkestan, . . .			
Tibet, Manchuria, Mongolia, .	21,180,000		
Ceylon, . . .	2,606,930

Lyall, K.C.B., Asiatic Studies; Sir Richard Temple in Fortnightly Review*, Jany. 1883; *Albrecht Weber's Indian Literature*. See Sacred Books.

REMBOWAH. Burm. In Arakan used as food. This description of arrow-root is prepared from the Pembanoo root, obtainable in large quantities. Price, 4 rupees per maund.—*Local Committee, Akyab.*

REMORA, or sucking fish, attaches itself to sharks. The sucker is on the back of the head. Fishermen in the Mozambique Channel are said to pass a string through the tail, and allow the fish to swim away; it attaches itself to turtle and fish, which are then pulled in.

REMUSAT, ABEL, a learned Parisian sinologue; author of Description d'un Groupe d'Iles peu connu et situé entre le Japon et les Iles Mariannes.

RENAUDOT, Abbe, author of Auciennes Rélations des Indes et de la Chine, Paris 1718. It gives the notes of travel of Suleiman and Ibn Khurdadba, two Arab merchants, who visited India and China apparently in the 9th and 10th centuries, and are the first among western writers to make mention of tea (tcha) and porcelain. They also mention arrack and rice.

RENNELL, Major JAMES, author of a History of India. He was the first writer who gave any intelligible account of the countries now called British India, and has been styled the father of Indian geography. He was the author of a Bengal Atlas, containing Maps of the Theatre of War and Commerce on that side of Hindustan, London 1780; Atlas of Bengal and Behar, London 1780–81; A Description of the Roads in Bengal and Behar, 4to and 12mo, London 1778–99; Memoir of a Map of Hindustan, with an Account of the Ganges and Brahmaputra Rivers, London 1788; Marches of the British Armies in the Peninsula of India during the Campaigns of 1790 and 1791; Geographical System of Herodotus Examined and Explained, 4to, London 1800; Geography of Herodotus Examined and Explained, 2 vols., London 1830; Geographical Illustrations of the Expedition of Cyrus and the Retreat of the Ten Thousand Greeks, with the Plates, atlas folio, 2 vols. fol. and 4to, London 1816; A Treatise on the Comparative Geography of Western Asia, 2 vols. 8vo, London 1831.

RENNET. Masr, Arab.; Panir, Maya, Hind. The dried contents of the stomach of a calf, used for coagulating or curdling milk.—*Faulkner.*

RENUKA, daughter of king Renu, the wife of rishi Jamadagni, and mother of Parasurama; in S. India identical with the Gramma-deva, Ellammun.

REPOUSSÉ WORK in silver and gold is well made at Ahmadabad. It is beaten up first in small patterns, and holes are pierced to give effect to the pattern. At first sight, it might be mistaken for coarse filigree. Brass work of Nagpur, Jeypore, Moradabad, and in the south of the Peninsula has the body of the work in brass, and pure tin is hammered over it, leaving spaces of the ground as ornament. The white, bright tin resembles silver.

REPTILES are arranged by naturalists as the class Reptilia of the animal kingdom, and they are numerous in the south and east of Asia. The chameleons, the gecko, and others of them are interesting to all who would investigate the wonders of creation. The crocodile, the alligator, and the poisonous snakes cause great loss of human life; the marine turtles and their eggs, some of the frogs, some of the snakes, are used as food by several races; several of them, as the skinks, the iguanas, are used medicinally. The Greeks regarded snakes as good demons, and worshipped them; the emblem of their deified physician, Esculapius, is that of two snakes in congress; and from the earliest origin of Hinduism, its followers have worshipped the cobra, representing it in pictures and in sculptures with many heads as a protecting divinity overshadowing kings and deities and lingam idol. With Muhammadans, frogs, crocodiles, snakes, turtles, as also, indeed, crabs, are

not lawful food. The arrangement by naturalists of the reptiles of the South and East of Asia is as under :—

First Sub-class — Reptilia Proper.

The Order of Tortoises—Chelonia.

I. Land Tortoises—Testudinidæ.

Testudo elegans, *Schopff*, Peninsula of India, Ceylon.
T. Horsfieldii, *Gray*, Afghanistan.
T. elongata, *Blyth*, Cambodia, Arakan, Mergui.

II. Fresh-water Tortoises—Emydidæ.

Manouria emys, *M. and Schl.*, Penang, Arakan, Tenasserim.
Cuora Amboinensis, *Daud.*, Eastern India.
C. flavomarginata, *Gray*, China, Formosa.
C. trifasciata, *Gray*, China.
Cyclemys Oldhami, *Gray*, Mergui, Cambodia.
Pyxidea Mouhotii, *Gray*, Cochin-China.
Notochelys platynota, *Gray*, Singapore.
Geoemyda spinosa, *Gray*, Tenasserim, Pegu.
G. grandis, *Gray*, Cambodia.
Emys ocellata, *D. and B.*, Tenasserim, Pegu.
E. Bealii, *Gray*, Southern China.
E. Thurgi, *Gray*, Bengal, Penang.
E. mutica, *Cantor*, Chusan.
E. nigricans, *Gray*, Southern China.
E. Sinensis, *Gray*, Canton, Formosa.
E. crassicollis, *Gray*, Mergui, Malay Peninsula, Cambodia.
E. Reevesii, *Gray*, Cochin-China, Southern China.
E. trijuga, *Schweigg*, Peninsula of India, Ceylon.
E. macrocephala, *Gray*, Siam, Cambodia.
E. Hamiltonii, *Gray*, Lower Ganges.
Pangshura tecta, *Gray*.
P. tentoria, *Gray*, Dekhan, Indus.
P. flaviventer, *Gthr.*, Bengal?
P. Smithii, *Gray*, Panjab?
Batagur baska, *Gray*, Ganges, Irawadi, Penang.
B. lineatus, *Gray*, Nepal, Moulmein.
B. Ellioti, *Gray*, Kistna river.
B. affinis, *Cantor*, Malay Peninsula.
B. dhongoka, *Gray*, Nepal, Assam.
Platysternum megacephalum, *Gray*, China, Pegu.

III. Fresh-water Turtles—Trionycidæ.

Emyda granosa, *Schopff*, Hindustan, Sikkim, Bengal.
E. Ceylonensis, *Gray*, Ceylon.
E. vittata, *Peters*, Goa.
Trionyx Sinensis, *Weigm.*, China, Chusan, Formosa.
T. Gangeticus, *Cuv.*, Ganges, Penang.
T. Javanicus, *Schweigg*, Ganges, Dekhan, Penang.
T. ornatus, *Gray*, Siam, Cambodia.
T. subplanus, *Schweigg*, Singapore, Penang.
T. Guntheri, *Gray*.
Chitra Indica, *Gray*, Ganges, Malay Peninsula.

IV. Marine Turtles—Chelonidæ.

Caouana olivacea, *Eschsch*, Coasts.
Chelonia virgata, *Flem.*, Coasts.
Caretta squamata, *L.*, Coasts.
Dermatochelys coriacea, *L.*, Coasts.

The Order of Lizards—Sauria.

I. Crocodiles—Crocodilidæ.

Crocodilus palustris, *Less.*, Ganges, Peninsula of India, Ceylon.
C. Siamensis, *Schneid.*, Siam, Cambodia.
C. porosus, *Schneid.*, all rivers.
C. Pondicerianus, *Gray*, Pondicherry.
Gavialis Gangeticus, *Gm.*, Ganges.

II. Water Lizards—Varanidæ.

Varanus flavescens, *Gray*, Ganges, Indus, Penang.
V. dracæna, *L.*, from Bengal to Ceylon.
V. lunatus, *Gray*.
V. nebulosus, *Gray*, Bengal, Siam.
Hydrosaurus salvator, *Laur.*, China, Siam, Ceylon.

III. Land Lizards—Lacertidæ.

Tachydromus sexlineatus, *Daud.*, Rangoon.
T. meridionalis, *Gthr.*, Southern China.
T. septentrionalis, *Gthr.*, Northern China.
Cabrita Leschenaultii, *Edw.*, Coromandel.
Ophiops Jerdoni, *Blyth*, Mhow.

Acanthodactylus Cantoris, *Gthr.*, Ramnuggur.
A. Neilgherrensis, *Jerdon*, Kunur.

IV. Cordyles—Zonuridæ.

Pseudopus gracilis, *Gray*, Khassya.

V. Skinks—Scincidæ.

Tropidophorus microlepis, *Gthr.*, Chartaboum.
T. Cochin-Chinensis, *Cuv.*, Cochin-China.
T. aspris Berdmorreii, *Blyth*, Mergui.
Euprepes Chinensis, *Gray*, China.
E. rufescens, *Shaw*, from Afghanistan to China.
E. monticola, *Gthr.*, Sikkim.
E. olivaceus, *Gray*, Malay Peninsula.
E. macularius, *Blyth*, Rungpur?
E. trilineatus, *Gray*, Carnatic.
Mabouia quadrilineata, *Blyth*, Hong-Kong.
M. Chinensis, *Gray*, China.
M. maculata, *Blyth*, Assam.
Eumeces bilincatus, *Gray*, Neilgherries.
E. Himalayanus, *Gthr.*, Himalayas.
E. Schlegelii, *Gthr.*, Sikkim.
E. modestus, *Gthr.*, Ningpo.
E. Reevesii, *Gray*, China.
E. ladacensis, *Gthr.*, Tibet.
E. formosus, *Blyth*, Mirzapore, Wazirabad.
E. Indicus, *Gray*, Sikkim.
E. Taprobanensis, *Kclaart*, Ceylon.
E. chalcides, *L.*, Penang, Siam, Hong-Kong.
E. Siamensis, *Gthr.*, Siam.
E. Bowringii, *Gthr.*, Hong-Kong.
E. albopunctatus, *Gray*, Nellore, Mergui.
E. Hardwickii, *Gray*, Peninsula of India.
E. punctatus, *E.*, Peninsula of India.
E. isodactylus, *Gthr.*, Cambodia.
Hagria Vosmærii, *Gray*, Bengal.
Chiamela lineata, *Gray*.
C. anguis melanosticta, *Merr.*, Coromandel.

VI. Acontiads—Acontiadidæ.

Acontias Layardi, *Kelaart*, Colombo.
Nessia Burtonii, *Gray*, Ceylon.
N. monodactyla, *Gray*, Ceylon.

VII. Sand Lizards—Sepsidæ.

Sphenocephalus tridactylus, *Blyth*, Afghanistan.

VIII. Geckos—Geckotidæ.

Gecko guttatus, *Daud.*, from Southern India to China.
G. stentor, *Cantor*, Penang.
G. Smithii, *Gray*, Prince of Wales' Island.
G. monarchus, *D. and B.*, Malay Peninsula, Ceylon.
G. Japonicus, *D. and B.*, China, Chusan.
G. Swinhonis, *Gthr.*, Northern China.
G. subpalmatus, *Gthr.*, Chikiang.
Ptychozoon homalocephalum, *Creveldt*, Penang, Singapore.
Hemidactylus triedrus, *Daud.*, Ceylon, Pen. of India.
H. maculatus, *D. and B.*, from Ceylon to China.
H. Sykesii, *Gthr.*, Dekhan.
H. frenatus, *D. and B.*, from Ceylon to Siam.
H. Leschenaultii, *D. and B.*, Madras.
H. punctatus, *Jerdon*, Tellicherry.
H. coctæi, *D. and B.*, Penang, Bombay, Ceylon.
H. leiurus Berdmorreii, *Blyth*, Mergui.
Peripia Peronii, *D. and B.*, Penang, Ceylon.
P. Cantoris, *Gthr.*, Penang.
Nycteridium Schneideri, *Shaw*, Ceylon, Bengal, Assam, Siam, Penang.
Phelsuma Andamanense, *Blyth*, Andaman Islands.
Gymnodactylus triedrus, *Gthr.*, Ceylon.
G. pulchellus, *Gray*, Penang, Singapore.
G. frænatus, *Gthr.*, Ceylon.
G. Kandianus, *Kelaart*, Ceylon.
G. Mysoriensis, *Jerdon*, Bangalore.
G. Indicus, *Gray*, Neilgherries.
G. Malabaricus, *Jerdon*, Malabar.
G. littoralis, *Jerdon*, Malabar.
G. Dekhanensis, *Gthr.*, Dekhan.
G. variegatus, *Blyth*, Moulmein.
G. naultinus fasciolatus, *Blyth*, Subathu.
Pentadactylus Borneensis, *Gthr.*, Borneo.
P. felinus, *Gthr.*, Singapore.
P. Duvaucelii, *D. and B.*, Bengal.
Puellula rubida, *Blyth*, Andaman Islands.
Eublepharis Hardwickii, *Gray*, Peninsula of India.

IX. Agames—Agamidæ.

Draco volans, *L.*, Penang, Singapore.
D. reticulatus, *Gthr.*, Philippine Islands.
D. Timorensis, *Kuhl*, Timor.
D. cornutus, *Gthr.*, Borneo.
D. fimbriatus, *Kuhl*, Java.
D. maculatus, *Gray*, Siam, Penang, Tenasserim.
D. spilopterus, *Wiegm.*, Manilla.
D. Dussumieri, *D. and B.*, Peninsula of India.
D. quinquefasciatus, *Gray*, Penang.
D. tæniopterus, *Gthr.*, Siam, Tenasserim.
D. hæmatopogon, *Boie*, Java.
D. bimaculatus, *Gthr.*, Philippine Islands.
D. lineatus, *Daud.*, Amboyna, Celebes.
D. rostratus, *Gthr.*, Borneo?
Otocryptis bivittata, *Wiegm.*, Ceylon.
Lyriocephalus scutatus, *L.*, Ceylon.
Ceratophora Stoddartii, *Gray*, Ceylon.
C. Tennentii, *Gthr.*, Ceylon.
C. aspera, *Gthr.*, Ceylon.
Cophotis Ceylanica, *Peters*, Ceylon.
Japalura variegata, *Gray*, Sikkim.
J. Swinhonis, *Gray*, Formosa.
J. polygonata, *Hallowell*, Loo-Choo.
Sitana Pondiceriana, *Cuv.*, Western India.
S. minor, *Gthr.*, Madras, Ceylon.
Dilophyrus grandis, *Gray*, Rangoon.
Bronchocela cristatella, *Kuhl*, Malay Peninsula.
B. Smaragdina, *Gthr.*, Cambodia.
B. jubata, *D. and B.*, Pondicherry.
Calotes versicolor, *Daud.*, Ceylon, continent of India.
C. nemoricola, *Jerdon*, Neilgherries.
C. mystaceus, *D. and B.*, Pegu, Siam, Mergui, Ceylon.
C. Rouxii, *D. and B.*
C. ophiomachus, *Merr.*, Ceylon, Southern India.
C. platyceps, *Blyth*, Cherra Punji.
C. nigrilabris, *Peters*, Ceylon.
C. emma, *Gray*, Mergui.
C. maria, *Gray*, Himalayas.
Salea Horsfieldii, *Gray*, Neilgherries, Ceylon.
Oriocalotes minor, *Gray*, Himalayas.
Acanthosaura armata, *Gray*, Eastern India.
A. capra, *Gthr.*, Chartaboum.
A. coronata, *Gthr.*, Chartaboum.
Oriotiaris Ellioti, *Gthr.*, Sikkim.
Tiaris tiara subcristata, *Blyth*, Port Blair.
Physignathus Cochin-Chinensis, *Cuv.*, Cochin-China.
P. mentager, *Gthr.*, Chartaboum.
Liolepis guttatus, *Cuv.*, Eastern India, China.
Uromastix Hardwickii, *Gray*, Hindustan.
Charasia dorsalis, *Gray*, Southern India.
Stellio tuberculatus, *Gray*, N. Hindustan, Himalaya.
Trapelus megalonyx, *Gthr.*, Afghanistan.
Phrynocephalus Tickelii, *Gray*, Afghanistan.
P. caudivolvulus, *Pall.*, Tibet.
P. brachysaura ornata, *Blyth*, Sagur.

Family of Chameleons—Chamæleonidæ.

Chamæleo vulgaris, *Daud.*, Pen. of India, Ceylon.

The Order of Snakes—Ophidia.

First Sub-order. Innocuous Snakes.

I. Blind Snakes—Typhlopidæ.

Typhlina lineata, *Boie*, Penang, Hong-Kong.
Typhlops nigro-albus, *D. and B.*, Penang, Singapore.
T. Horsfieldii, *Gray*, Khassya, Assam, Tenasserim, Cochin-China.
T. bothriorhynchus, *Gthr.*, Penang.
T. striolatus, *Peters*, Bengal.
T. Siamensis, *Gthr.*, Siam.
T. Braminus, *Daud.*, Indian Continent, Ceylon.
T. pammeces (tenuis), *Gthr.*, Madras.
T. mirus, *Jan.*, Ceylon.
Onychocephalus acutus, *D. and B.*, Pen. of India.

II. Short-tails—Tortricidæ.

Cylindrophis rufus, *Laur.*, Cambodia, Singapore, Tranquebar.
C. maculatus, *L.*, Ceylon.

III. Xenopeltides—Xenopeltidæ.

Xenopeltis unicolor, *Reinw.*, Malay Peninsula, Cambodia.

IV. Rough-tails—Uropeltidæ.

Rhinophis oxyrhynchus, *Schneid.*, Ceylon.

R. punctatus, *Mull.*, Ceylon.
R. Philippinus, *Cuv.*, Ceylon.
R. Trevelyanus, *Kelaart*, Ceylon.
R. sanguineus, *Beddome*, Wynad.
R. Blythii, *Kelaart*, Ceylon.
R. Pulneyensis, *Beddome*, Pulney Hills.
Uropeltis grandis, *Kelaart*, Ceylon.
Silybura macrolepis, *Peters*, Peninsula of India.
S. Beddomii, *Gthr.*, Peninsula of India.
S. ocellata, *Beddome*, Neilgherries.
S. Ellioti, *Gray*, Madras, Dekhan.
S. bicatenata, *Gthr.*, Dekkan.
S. Shorttii, *Beddome*, Shevaroy Hills.
S. brevis, *Gthr.*, Animallay Hills, Neilgherries.
Plectrurus Perrotetii, *D. and B.*, Madras, Neilgherries.
P. Guntheri, *Beddome*, Neilgherries.
Melanophidium Wynadense, *Beddome*, Wynad.

V. Dwarf Snakes—Calamaridæ.

Calamaria Siamensis, *Gthr.*, Siam, Cochin-China.
C. quadrimaculata, *D. and B.*, Java.
C. albiventer, *Gray*, Penang.
C. nigro-alba, *Gthr.*, Penang.
C. leucocephala, *D. and B.*
C. catenata, *Blyth*, Assam.
C. reticulata, *Blyth*, Assam.
Macrocalamus lateralis, *Gthr.*
Oxycalamus longiceps, *Cantor*, Penang.
Geophis microcephalus, *Gthr.*, Madras.
G. (Platypteryx Perrotetii), *D. and B.*, Neilgherries.
Aspidura brachyorrhos, *Boie*, Ceylon.
A. Copii, *Gthr.*
A. trachyprocta, *Cope*, Ceylon.
Haplocercus Ceylonensis, *Gthr.*, Ceylon.

VI. Oligodontes—Oligodontidæ.

Oligodon subgriseus, Peninsula of India.
O. spilonotus, *Gthr.*, Madras.
O. Ellioti, *Gthr.*, Madras.
O. subpunctatus, *D. and B.*, Malabar coast.
O. spinipunctatus, *Jan.*
O. fasciatus, *Gthr.*, Dekhan.
O. sublineatus, Ceylon.
O. affinis, *Gthr.*, Animallay Hills.
O. Templetonii, *Gthr.*, Ceylon.
O. modestus, *Gthr.*
O. dorsalis, *Gray*, Afghanistan?
O. brevicauda, *Gthr.*, Animallay Hills.
Simotes venustus, *Jerdon*, Peninsula of India.
S. Russellii, *Daud.*, Ceylon, Pen. of India, Himalayas.
S. binotatus, *D. and B.*, Peninsula of India.
S. albiventer, *Gthr.*, Ceylon.
S. signatus, *Gthr.*, Singapore.
S. cinereus, *Gthr.*, Cambodia.
S. Swinhonis, *Gthr.*, Amoy.
S. tæniatus, *Gthr.*, Cambodia, Bankok.
S. trilineatus, *D. and B.*
S. punctulatus, *Gray*, Himalayas.
S. Labuanensis, *Gthr.*, Borneo.
S. bicatenatus, *Gthr.*
S. albocinctus, *Cantor*, Assam.
S. fasciolatus, *Gthr.*, Pachebone.
S. Cochin-Chinensis, *Gthr.*, Lao Mountains.
S. trinotatus, *D. and B.*, Penang, China.

VII. Colubrides—Colubridæ.

Ablabes baliodirus, *Boie*, Penang.
A. tenuiceps, *Blyth*, Nepal, Darjiling.
A. fuscus, *Blyth*, Himalayas.
A. Rappii, *Gthr.*, Himalayas.
A. bicolor, *Blyth*, Khassya.
A. olivaceus, *Beddome*, Neilgherries.
A. sagittarius, *Cantor*, Penang, Bengal, Himalayas.
A. Humberti, *Jan.*, Madras, Ceylon.
A. collaris, *Gray*, Khassya, Nepal.
A. melanocephalus, *Gray*, Malacca.
Cyclophis major, *Gthr.*, China.
C. frænatus, *Gthr.*, Afghanistan.
C. calamaria, *Gthr.*, Ceylon, Peninsula of India.
C. nasalis, *Gthr.*
C. monticola, *Cantor*, Assam.
Odontomus nympha, *Daud.*, Vellore.
O. semifasciatus, *Gthr.*
O. gracilis, *Gthr.*, Madras Presidency.
Nymphophidium maculatum, *Gthr.*
Elachistodon Westermanni, *Reinh.*

Coronella orientalis, *Gthr.*
Coluber rufodorsatus, *Cantor*, China.
C. mandarinus, *Cantor*, Chusan.
C. porphyraceus, *Cantor*, Khassya, Assam.
Elaphis dione, *Pall.*, Northern China.
E. sauromates, *Pall.*, Ningpo.
E. tæniurus, *Cope*, China, Siam.
Compsosoma radiatum, *Reinw.*, Eastern India.
C. melanurum, *Schleg.*, Bengal, China.
C. reticulare, *Cantor*, Himalayas, Assam.
C. Hodgsonii, *Gthr.*, Himalayas.
Cynophis Helena, *Daud.*, Ceylon, Madras.
C. Malabaricus, *Jerdon*, Peninsula of India.
Ptyas mucosus, *L.*, all over the continent, Ceylon.
P. korros, *Reinw.*, Eastern India.
Xenelaphis hexahonotus, *Cantor*, Arakan, Penang, Singapore.
Zamenis diadema, *Schleg.*, Afghanistan, Sind.
Z. ventrimaculatus, *Gray*, Western India.
Z. gracilis, *Gthr.*, Dekhan, Sind.
Z. fasciolatus, *Shaw*, Peninsula of India, Bengal, Province Wellesley.
Zaocys fuscus, *Gthr.*, Borneo.
Z. carinatus, *Gthr.*, Borneo.
Z. dhumnades, *Cantor*, Chusan, Ningpo.
Z. nigromarginatus, *Blyth*, Himalayas.
Herpetodryas Sieboldii, *Gthr.*, Sikkim.
Tropidonotus quincunciatus, *Schleg.*, all over India.
T. annularis, *Hollowell*, China.
T. trianguligerus, *Reinw.*, Penang.
T. macrophthalmus, *Gthr.*, Himalayas.
T. dorsalis, *Gthr.*, Chikiang.
T. macrops, *Blyth*, Darjiling.
T. platyceps, *Blyth*, Himalayas.
T. subminiatus, *Reinw.*, Eastern India.
T. Himalayanus, *Gthr.*, Himalayas.
T. angusticeps, *Blyth*, Assam, Arakan.
T. stolatus, *L.*, all over the Indian continent.
T. monticola, *Jerdon*, Animallay Hills.
T. junceus, *Cantor*, Penang, Chikiang.
T. Ceylonensis, *Gthr.*, Ceylon.
T. Beddomii, *Gthr.*, Neilgherries.
T. nigrocinctus, *Blyth*, Pegu? Tenasserim.
T. flavipunctatus, *Hollow.*, Hong-Kong.
T. zebrinus, *Blyth*, Mergui.
T. tigrinus, *Boie*, Northern China.
T. leucomelas, *Gthr.*, Penang.
T. plumbicolor, *Cantor*, Madras Presidency.
Atretium schistosum, *Daud.*, Ceylon, Malay Penin.
Xenochrophis cerasogaster, *Cantor*, Malay Peninsula, Bengal, Assam, Khassya.
Prymnomiodon chalceus, *Cope*, Siam.

VIII. Fresh-water Snakes—Homalopsidæ.

Fordonia unicolor, *Gray*, Penang.
Cantorio elongata, *Gthr.*, Singapore.
Cerberus rhynchops, *Schneid.*, from Ceylon to Siam.
Hypsirhina plumbea, *Boie*, Eastern India.
H. enhydris, *Schneid.*, Bengal, Eastern India.
H. Jagorii, *Peters*, Siam.
H. Bennettii, *Gray*, China.
H. Chinensis, *Gray*, China.
Ferania Sieboldii, *Schleg.*, Bengal, Province Wellesley.
Homalopsis buccata, *L.*, Malay Peninsula, Cambodia.
Hipistes hydrinus, *Cant.*, Penang.
Herpeton tentaculatum, *Lacep.*, Siam.

IX. Desert Snakes—Psammophidæ.

Psammophis condanarus, *Merr.*, Peninsula of Indian.
Psammodynastes pulverulentus, *Boie*, Eastern India.

X. Tree Snakes—Dendrophidæ.

Gonyosoma oxycephalum, *Boie*, Penang, Tenasserim.
G. gramineum, *Gthr.*, Khassya.
G. frænatum, *Gray*, Khassya.
Phyllophis carinata, *Gthr.*, China.
Dendrophis picta, *Gm.*, all over India.
D. caudolineata, *Gray*, Penang, Singapore.
Chrysopelea ornata, *Shaw*, all over India.
C. rubescens, *Gray*.

XI. Whip Snakes—Dryiophidæ.

Tropidococcyx Perrotetii, *D. and B.*, North Canara.
Tragops prasinus, *Reinw.*, Eastern India.
T. dispar, *Gthr.*, Animallay mountains.
T. fronticinctus, *Gthr.*

Passerita mycterizans, *L.*, Ceylon, Peninsula of India.
P. purpurascens, *Gthr.*, Ceylon.

XII. Dipsades—Dipsadidæ.

Dipsas cynodon, *Cuv.*, Malay Peninsula.
D. Forsteni, *D. and B.*, Animallay mountains.
D. boops, *Gthr.*, Bengal.
D. dendrophila, *Reinw.*, Malay Peninsula.
D. bubalina, *Klein.*, Assam, China?
D. multimaculata, *Schleg.*, Bengal, Eastern India.
D. trigonata, *Schneid.*, Peninsula of India, Bengal.
D. multifasciata, *Blyth*, Subathu.
D. gokool, *Gray*, Penang, Bengal.
D. Ceylonensis, *Gthr.*, Ceylon.

XIII. Lycodontes—Lycodontidæ.

Lycodon aulicus, *L.*, Ceylon and continent of India.
L. Laoensis, *Gthr.*, Cochin-China.
L. striatus, *Shaw*, Peninsula of India.
L. Animallensis, *Gthr.*, Animallay mountains.
L. rufozonatus, *Cant.*, Chusan.
Tetragonosoma effrene, *Cant.*, Penang.
T. atropurpureum, *Cant.*, Mergui.
Leptorhytaon jara, *Shaw*, Pen. of India, Bengal, Assam.
Ophites subcinctus, *Boie*, Penang.
O. albofuscus, *D. and B.*, coast of Malabar.
Cercaspis carinata, *Kuhl*, Ceylon.

XIV. Blunt-heads—Amblycephalidæ.

Amblycephalus boa, *Kuhl*, Penang.
Pareas carinata, *Reinw.*, Cochin-China.
P. monticola, *Cant.*, Assam.
P. lævis, *Kuhl*, Cochin-China, Khassya.

XV. Rock Snakes—Pythonidæ.

Python reticulatus, *Schneid.*, Malay Peninsula.
P. molurus, *L.*, Peninsula of India, Bengal, Nepal.

XVI. Sand Snakes—Erycidæ.

Gongylophis conicus, *Schneid.*, Pen. of India, Sikkim.
Cursoria elegans, *Gray*, Afghanistan.
Eryx Johnii, *Russell*, Pen. of India, Panjab, Sikkim.

XVII. Wart Snakes—Acrochordidæ.

Acrochordus Javanicus, *Hornst.*, Penang, Singapore.
Chersydrus granulatus, *Schneid.*, eastern coasts of S. India, Malay Peninsula.

Second Sub-order. Venomous Colubrine Snakes.

I. Terrestrial—Elapidæ.

Naja tripudians, *Merr.*, over nearly entire India.
Ophiophagus elaps, *Schleg.*, over nearly entire India.
Bungarus cæruleus, *Schneid.*, Peninsula of India, Bengal, Assam.
B. fasciatus, *Schneid.*, continent of India.
B. Ceylonicus, *Gthr.*, Ceylon.
B. semifasciatus, *Kühd.*, China, Formosa.
Xenurelaps bungaroides, *Cantor*, Assam.
Megærophis flaviceps, *Reinh.*, Penang.
Callophis bivirgatus, *Boie*, Malay Peninsula.
C. intestinalis, *Laur.*, Malay Peninsula.
C. gracilis, *Gray*, Panang and Singapore.
C. Macclellandii, *Reinh.*, Himalayas, Nepal, Assam.
C. annularis, *Gthr.*
C. trimaculatus, *Daud.*, Tenasserim, Bengal.
C. maculiceps, *Gthr.*, Malay Peninsula.
C. nigrescens, *Gthr.*, Neilgherries.

II. Sea Snakes—Hydrophidæ.

Platurus scutatus, *Laur.*, Indian Ocean, Pacific.
P. Fischeri, *Jan.*, Indian Ocean.
Aipysurus anguillæformis, *Schmidt*, Australia seas.
A. lævis, *Lacep.*, Northern Australia.
A. fuscus, *Tschudi*, Australia.
Disteria doliata, *Laceps.*
Acalyptus superciliosus, *D. and B.*, S.W. Pacific.
Hydrophis Jerdonii, *Gray*, Madras, Penang.
H. Stokesii, *Gray*, Northern Australia.
H. major, *Shaw*, Indian Ocean.
H. robusta, *Gthr.*, Indian Ocean.
H. Belcheri, *Gray*, New Guinea.
H. cærulescens, *Shaw*, Indian Ocean.
H. aspera, *Gray*, Singapore.
H. spiralis, *Shaw*, Indian Ocean.
H. cyanocincta, *Daud.*, Indian Ocean.
H. melanosoma, *Gthr.*
H. subcincta, *Gray*, Indian Ocean.

H. nigrocincta, *Daud.*, Bengal.
H. elegans, *Gray*, Australia.
H. torquata, *Gthr.*, Penang.
H. chloris, *Daud.*, Madras, Bengal, Penang.
H. Lindsayii, *Gray*, China, Siam, Malabar.
H. atriceps, *Gthr.*, Siam.
H. latifasciata, *Gthr.*, Mergui.
H. coronata, *Gthr.*, Bengal.
H. diadema, *Gthr.*
H. gracilis, *Shaw*, Madras, Java.
H. fasciata, *Schneid.*, Vizagapatam.
H. Cantoris, *Gthr.*, Penang.
H. lapemoides, *Gray*, Ceylon, Madras.
H. longiceps, *Gthr.*, Indian Ocean.
H. stricticollis, *Gthr.*, Indian Ocean.
H. ornata, *Gray*, Indian Ocean.
H. Ellioti, *Gthr.*, Siam, Madras, Ceylon.
H. pachycercus, *Fisch.*, East Indian Archipelago.
H. viperina, *Schmidt*, Madras, Java.
H. ocellata, *Gray*, Australia.
H. anomala, *Schmidt*, Samarang.
H. curta, *Shaw*, Madras.
H. Hardwickii, *Gray*, Penang.
H. loreata, *Gray*, Borneo, Philippines.
Enhydrina Bengalensis, *Gray*, Indian Ocean.
Pelamis bicolor, *Schneid.*, Indian and Pacific Ocean.

Third Sub-order. Viperine Snakes.

I. Pit Vipers—Crotalidæ.

Trimeresurus gramineus, *Shaw*, E. parts of continent.
T. erythrurus, *Cant.*, China, Bengal, Siam, Java.
T. carinatus, *Gray*, Sikkim, Bengal, Rangoon.
T. purpureus, *Gray*, Penang, Singapore.
P. Animallensis, *Gthr.*, Animallay Hills.
T. monticola, *Gthr.*, Nepal, Sikkim.
T. Wagleri, *Schleg.*, Malay Peninsula.
T. strigatus, *Gray*, Neilgherries, Dekhan.
T. trigonocephalus, *Merr.*, Ceylon.
T. mucrosquamalus, *Cant.*, Assam.
Peltopelor macrolepis, *Beddome*, Animallay Hills.
Calloselasma rhodostoma, *Reinw.*, Siam.
Halys Blomhoffii, *Boie*, Japan, Formosa.
H. Pallasii, *Gthr.*, Tartary.
H. Himalayanus, *Gthr.*, Tibet.
H. Ellioti, *Jerdon*, Neigherries.
Hypnale nepa, *Laur.*, Ceylon, Southern India.

II. Vipers—Viperidæ.

Daboia Russellii, *Shaw*, Ceylon, S. India, Himalayas.
Echis carinata, *Schneid.*, Southern India.

Second Sub-class—Batrachians.

The Order of Tailless Batrachians—Batrachia Salienta.

Oxyglossus lima, *Tschudi*, Siam, Cambodia, China.
Dicroglossus Adolfi, *Gthr.*, Himalayas.
Rana Kuhlii, *Schleg.*, Ceylon, Ningpo.
R. hexadactyla, *Less.*, Ceylon, Madras.
R. cyanophlyctis, *Schneid.*, Ceylon, Southern India, Lower Bengal.
R. tigrina, *Daud.*, Sikkim, Nepal.
R. Liebigii, *Gthr.*, all over India.
R. esculenta, *L.*, China.
R. sylvatica, *Leconte*, Ningpo.
R. gracilis, *Wiegm.*, from Madras to Southern China.
Hoplobatrachus Ceylanicus, *Peters*, Ceylon.
Pyxicephalus breviceps, *Schneid.*, S. India, Himalayas.
P. rufescens, *Jerdon*, coast of Malabar.
Megalophrys montana, *Kuhl*, Penang, Ceylon.
Xenophrys monticola, *Gthr.*, Khassya, Sikkim.
Cacopus systoma, *Schneid.*, Carnatic.
C. globulosus, *Gthr.*, Russelconda.
Diplopelma ornatum, *D. and B.*, S. India, Ceylon.
D. pulchrum, *Hollow.*, Siam, China.
Bufo vulgaris, *Laur.*, China, Himalayas.
B. calamita, *Laur.*, Tibet.
B. Kelaartii, *Gthr.*, Southern Ceylon.
B. galeatus, *Gthr.*, Cambodia.
B. melanostictus, *Schneid.*, all over India.
B. asper, *Schleg.*, Mergui.
Hylorana macrodactyla, *Gthr.*, Hong-Kong.
H. erythræa, *Schleg.*, Malay Penin., south coast of Siam.
H. macularia, *Blyth*, Ceylon.
H. Malabarica, *D. and B.*, coast of Malabar.
H. temporalis, *Gthr.*, Ceylon.

Polypedates maculatus, *Gray*, all over the continent of India and Ceylon.
P. quadrilineatus, *Wiegm.*, Penang, Singapore.
P. microtympanum, *Gthr.*, Ceylon.
P. pleurostictus, *Gthr.*, Madras Presidency.
P. reticulatus, *Gthr.*, Ceylon.
P. eques, *Gthr.*, Ceylon.
P. Afghana, *Gthr.*, Afghanistan.
Ixalus variabilis, *Gthr.*, Ceylon.
I. temporalis, *Gthr.*, Ceylon.
I. femoralis, *Gthr.*, Ceylon.
I. leucorhinus, *Martens*, Ceylon.
I. schmardanus, *Kelaart*, Ceylon.
Rhacophorus maximus, *Gthr.*, Nepal, Sikkim, Afghanistan.
Hyla Chinensis, *Gthr.*, Southern China, Formosa.
Callula pulchra, *Gray*, Ceylon, Eastern India, China.
C. obscura, *Gray*, Ceylon.
Bombinator Sikkimensis, *Blyth*, Sikkim.

The Order of Tailed Batrachians—Batrachia Gradientia.

Cynops Chinensis, *Gray*, Ningpo.
Plethodon persimilis, *Gray*, Siam.

The Order of Burrowing Batrachians—Batrachia Apoda.

Epicrium glutinosum, *L.*, Ceylon, Southern India, Khassya, Siam, Tenasserim.
E. monochroum, *Blkr.*, Singapore.
Cœcilia oxyura, *D. and B.*, Malabar coast.

The reptiles of Southern and Eastern Asia have been described by Dr. Gunther in a volume published by the Ray Society, from information obtained from the museums in London, and from drawings and descriptions by Sir W. Elliot, Mr. B. H. Hodgson, Sir A. Smith, Sir J. E. Tennent, Captain Beddome, and Mr. L. S. Dillwyn; and the labours of Mr. Blyth, Drs. Jerdon, Kelaart, Cantor, Mason, Hooker, Shortt, Ewart, and Sir Joseph Fayrer have also been great. Notices will be given here of the more important species.

Reptiles are oviparous or ovo-viviparous vertebrate animals, with red, cold blood, with three cavities of the heart, breathing by lungs either during the whole period, or at least in the later stages of their growth. They are naked; but frequently the skin shows scale-like folds, or is tubercular, or forms osseous scutes.

The first sub-class, or Reptilia proper, have only one ventricle of the heart, incompletely divided; two atria; never possessing branchiæ at any period of life. One occipital condyle. Skin with scale-like folds, or tubercular, or forming osseous scutes. This sub-class comprises the order of tortoises (Chelonia), that of the lizards (Sauria), and that of the snakes (Ophidia).

The order of *tortoises*, or *Chelonia*, are reptiles with the bones of the thorax united into a carapace. The family Testudinidæ are the land tortoises, but only one species, Testudo elegans, the starred tortoise, occurs in India.

Emys, the Pond Tortoises, Terrapens, a genus of the Emydidæ, or fresh-water tortoises. The species of this genus inhabit all the temperate and tropical regions, except Australia. Formerly (between the latest geological and the historical periods) the genus had even a still greater geographical range than now, a species in a semi-fossil state being found in England and in other European countries, where it is extinct at present. The species undergo great changes in external appearance with age. The Terrapens abound in still waters and tanks in the southern parts of India; perfectly motionless, they rest on the

water, with the shell and the snout raised above its surface, suddenly disappearing at the approach of danger, and darting away with the swiftness of a fish. Their pointed claws enable them to crawl easily over slippery and steep places, and to dig little holes for a small number of elongate ovate, hard-shelled eggs, which in some species require as long a period as from 18 to 20 months before they are hatched. They are chiefly carnivorous, and the flatter the shell, the broader the interdigital web, the more denticulated the jaws, the more aquatic and carnivorous are the habits of the pond tortoises. The food of the carnivorous species consists of water insects, frogs, small fishes, small aquatic birds, and mammals; whilst, on the other hand, they are persecuted by crocodiles and large fishes, and the young and eggs are eaten by numerous other animals. They are not used as food by man, the flesh of most species having a very disagreeable smell, which is also perceptible when first taken out of the water in a net or by a hook baited with meat. Pegu, Sitang, Schwe Gyn, Tenasserim. 7½ inches long.

Batagur baska, the Batagur, another of the Emydidæ of India, is found in the Ganges and Irawadi, abounds at the mouth of the Hoogly; great numbers are brought to Calcutta, where they are eaten by particular castes, and are even kept for sale in tanks. Dr. Cantor caught one in the sea off Penang, with a small hook baited with a shrimp.

Emyda Ceylonensis, *Gray*, *Shield*, *Rept.* p. 64, tab. 29 A., is one of the Trionycidæ, or fresh-water turtles. Generally distributed in the lower parts of Ceylon, found in lakes and tanks. Several were kept alive for months in a tub filled with fresh water, fed freely on animal food, and also on bread and boiled rice. A large female laid three eggs, globular, about 1 inch in diameter, with a hard calcareous shell. This and Emys trijuga are put into the wells to act the part of a scavenger. Shell, in fresh specimens, smooth; in drying, the granular surface of the bony shell is apparent.

Trionyx Gangeticus, *Cuv.*, *Regne*, *Anim.*, is found in the Ganges and its tributaries, upwards to Nepal; at Penang, in rivers and on the sea-coast. It is of fierce habits, defending itself desperately by biting, and emitting, when excited, a low, hoarse, cackling sound. It appears to be far less numerous at Penang than T. Javanicus and Chitra Indica. Shell 23 inches long.

The great Seychelles tortoise is miscalled Tr. Indica by Gmelin, but under that name Mr. Gray unites no fewer than seven of the supposed species admitted by MM. Dumeril and Bibron. According to Dr. Schlegel, the Indian tortoise, probably indigenous to Madagascar and the neighbouring isles, has been acclimated in the Gallapagos Isles, in California, and on several other points on the western coast of South America. But Blyth had been assured, on good authority, that numerous specimens kept in gardens in the Mauritius, have all been brought from the Seychelles Islands in the first instance, that they are still commonly brought from those islands to the Mauritius, and thence we believe the few in India have been imported. The largest seen in India measures 4 feet 4 inches in length over the curve of the carapace, or 3 feet 5 inches in a straight line; transversely 4 feet 2 inches over the high arch of carapace, or in a diameter line 2 feet 2 inches high; when not raised upon the legs, *i.e.* height of shell, 20½ inches; when walking, the shell is lifted fully 6 inches from the ground, if not more; circumference of hind foot, 17½ inches.

Chitra Indica, *Gray*, *Shield*, *Rept.* p. 70. Grows to a very large size, and, like the Trionyx, is eaten by the natives of S. Asia, particularly the Chinese. Found in the Ganges and in its tributaries, upwards into Nepal; frequent in the estuaries of the Malayan Peninsula, and said to be found in the Philippine Islands. Specimens weigh 240 pounds; they are very powerful, and of ferocious habits. Shell measures 37 inches.

The fourth family, or Chelonidæ, are Marine Turtles. Marine turtles are at once distinguished by long, compressed, fin-shaped, non-retractile feet, the toes being enclosed in a common skin, out of which only one or two claws project. The carapace is broad and much depressed, so that when these animals are on shore and are turned over on their backs, they cannot regain their natural position. They are thoroughly marine animals; their pinnate feet and their light shells render them the best swimmers in the class of reptiles; they sometimes live hundreds of miles distant from shore, to which they periodically return, in order to deposit from 100 to 250 soft-shelled eggs, which are buried in the sand. The food of some species consists exclusively of algæ; others subsist upon fish and mollusca. They are found in all the intertropical seas; sometimes they travel far into the temperate regions. The flesh and eggs of all the species are edible, although the Indian turtles are much less appreciated in this respect than those of the Atlantic. At certain seasons, the flesh of Chelonia virgata acquires poisonous qualities, and instances of death have been ascribed to its use.

Caouana, *Gray*, has 15 vertebral and costal shields, which are thin and not imbricate. The genus is carnivorous, eating fishes, mollusca, and crustacea; comprises an Atlantic species, the loggerhead, which does not appear to extend into the Indian Ocean; and C. olivacca, confined to the East Indies.

Caouana olivacea, Indian loggerhead. This species is distinguished from its Atlantic congener by the presence of only a single small claw to each of its feet. It is abundant at the mouth of the Hoogly, found in the Bay of Bengal, on the coasts of Malabar and Penang, and in the seas of the Philippine Islands and of China. Its flesh, though relished by the Chinese, is unpalatable to Europeans.

Chelonia, *Flem.*, *Gray*, *Shield*, *Rept.* p. 74. Herbivorous, feeding on algæ. Species of Chelonia extend over nearly all the seas between the tropics. Ch. maculosa occurs on the Malabar coast.

Chelonia virgata, the Indian turtle or green turtle, is found on all the coasts of the East Indies. It is at all seasons plentifully taken in fishing-stakes in the Straits of Malacca; in size it equals the Atlantic turtle, which it rivals in flavour. About December and January the female lands to deposit her eggs in the sandy beach of some sequestered island, and then the fishermen watch during the moonlight nights to 'turn turtles.' The eggs are of a spherical shape, about 1 inch in diameter, covered by a soft semi-transparent membrane of a pale-yellow colour. The

expert eye of the fisherman baffles the pains with which the turtle conceals her eggs, and prodigious numbers are disinterred. They are very rich-flavoured, like marrow, and will keep for weeks although exposed to the air. The flesh of this species is sometimes found to be poisonous.

Caretta squamata, hawk-bill turtle, or caret. The hawk-bill turtle, so named from its rather elongated and compressed, curved upper jaw, does not attain to the same size as the other turtles; a shell 2 feet long is considered as extraordinarily large. It is found throughout the Eastern Archipelago, is plentiful only on parts of the coasts of Ceylon (Hambangtotte, Matura), of the Maldives, of Celebes, etc. As, however, turtles always resort to the locality where they were born, or where they have resorted to propagate their kind, and as their capture is very profitable, they become scarcer and scarcer at places where they are known to have been abundant formerly. Some specimens sell in Ceylon for as much as £4, the price depending on the quality of the shell. If taken from the animal when decomposition has set in, the colour of the shell becomes clouded and milky, and hence the cruel expedient is resorted to of supending the turtle over fire till heat makes the shields start from the bony part of the carapace, after which the creature is permitted to escape to the water, where they live; but reproduction of the epidermal shields to a great extent is improbable. At Celebes, whence the finest tortoise-shell is exported to China, the natives kill the turtle by blows on the head, and immerse the shell in boiling water to detach the plates; dry heat is only resorted to by the unskilful.

Dermatochelys coriacea. This turtle, although scarce, appears to be spread throughout almost all the seas of the tropical and temperate regions, having been found in the Mediterranean, on the south coast of England, in the West Indies, at the Cape of Good Hope, on the coasts of the United States, in Chili, in Japan, and in India. A female was caught on the coast of Tenasserim, of entire length 6 feet 2½ inches.

In the *Sauria*, or order of *lizards*, the integuments are with scale-like folds, or osseous scutes, or granular. The greater portion of the saurians are easily distinguished from the other orders of reptiles by their elongate form, by their moveable thorax covered with skin, by the presence of legs, and by their general integuments, which are either folded into scales, or granular, or tubercular, or shielded. Still there are many saurians which at a superficial glance might easily be taken for members of the order of snakes, and there is a gradual transition between both these orders. Many lizards have several layers of cells loaded with several pigments; the animal spreads or compresses these layers by more or less inflating its lungs, whereby the changes in the coloration are effected. Saurians are oviparous; a few ovo-viviparous. They have been divided by naturalists into many families.

The first family comprise the *Crocodiles*, or Crocodilidæ. Fresh-water saurians are found between the tropics wherever the country is watered by sufficiently large rivers or lakes. The most conspicuous characters of the crocodiles refer to their thoroughly aquatic life; but these characters are combined with an extremely powerful development of those organs which render the crocodiles the most formidable of all the carnivorous fresh-water animals. The back, the tail, and the belly are protected by a dermal armour composed of quadrangular shields, which are arranged in regular longitudinal and transverse series. A considerable proportion of the food of the crocodile is fish, the proverbial swiftness of which is of little avail when pursued by these reptiles. They fall an easy prey, especially to the young animals; the active old animals, requiring a greater quantity of food, attack every large animal which accidentally approaches them, and, in overpowering it, the whole of their powerful organization is called into requisition. Seizing the victim between their capacious jaws, and fastening their long, pointed, conical teeth into its flesh, they draw it, in one moment, by their weight and with a stroke of the tail, below the water, and drown it. Their gullet, however, is much too narrow to allow of the passage of the entire body of the victim; and their teeth being adapted for seizing and holding fast only, and not for biting, they are obliged to mangle the carcase, tearing off single pieces by sudden strong jerks. This is performed chiefly by lateral motions of the head and front part of the body; and the bones of the head of the crocodile are much more firmly united with one another, and the processes of the cervical vertebræ much more developed, than in any other saurian. Indian crocodiles inhabit rivers and estuaries, also the sea-coasts, and in calm weather may be seen floating at a distance of two or three miles from shore. Those inhabiting small inland waters which are dried up during a drought, are compelled to wander about in search of water, in which alone they can procure their food; they do this during the night. Some of them, however, especially large individuals, bury themselves in the mud, as many fresh-water tortoises and fish do, and remain in a state of torpor below the hard crust during the time of the drought. It is during that period shortly after they have been released from the state of an enforced fasting, that they are most formidable. A man seized by a crocodile has only one way of saving his life, if not his limb, namely, to force his fingers into the eyes of the beast, which immediately lets go its victim,—a practice equally known to the Indian of South America, to the Negro of Africa, and to the Hindu. It is not difficult to catch a single depredator by a hook baited with flesh or entrails, and made fast by a bunch of strong, thin cords, which it cannot gnaw asunder, as they sink into the spaces between the teeth. It is not easy to kill them on the spot, except by a ball sent through the eye into the brain, or through the neck to the spinal cord. Of course a severe injury to any of the vital parts will prove fatal to them, but not before days or weeks have elapsed. All the crocodiles are oviparous; the eggs have a hard shell, and resemble in size and shape those of a goose; from 20 to 60 are deposited in a hollow near the banks, and slightly covered over with mould or sand. The young crocodiles are of a rather rapid growth. One hatched at Madras in 8 years increased to the length of 8 or 9 feet, and was so powerful as to destroy a full-grown buck antelope, which had come to drink water at the tank to which it usually resorted. Alligators are

found only in the New World, but the British in India almost universally apply this name to the Indian crocodiles. Crocodiles are found in America, Africa, Asia, and Australia.

In rivers a single crocodile will often appropriate to himself a limited district, which, if it happen to be in the vicinity of a village, will soon be perceived in the loss of the grazing cattle. Instances are on record of Malays who, to avenge the loss of a relative, have watched the crocodile, and, by diving from below, plunged a kris into its heart. The eggs are white, the shell hard, of a cylindrical form, upwards of 3 inches in length, and about 1½ inch in diameter.

Crocodiles are numerous in all the tide-water streams of Burma. During a two hours' pull up a small river, Mr. Mason once counted 14 sunning themselves on the mud banks. They often carry off the natives; and a single animal, emboldened by his successes, will usurp dominion over a particular portion of a river, where he becomes the terror of every boat's crew that passes. The steersman occupies the most dangerous position, for the crocodile's mode of attack is to glide up silently to the bow or stern of a boat, then turn suddenly, when with one stroke of his powerful tail, close to the top of the boat, he sweeps into the water whoever is within its reach, and the stunned victim becomes an easy prey. A Karen chief, with whom Mr. Mason was acquainted, perished in this way at a point in the river Gaing which had previously been known as the demesne of one of these river monarchs. Persons sleeping on their boats moored to the shore, have sometimes awoke in the jaws of these monsters, and one carried off a Burman from the back of a buffalo that he was riding across a small stream, under the very shadow of the walls of Tavoy.

Crocodilus porosus, *Schn.* This, the larger and fiercer of the two crocodiles, is found in various localities both on the east and west coasts of the Peninsula of India.

Gavialis Gangeticus, the gavial or nakoo. The length of the snout equals that of 9 or 10 of the dorsal shields. Old male specimens have a large cartilaginous hump on the extremity of the snout. Ælian noticed that the Ganges is inhabited by crocodiles which have a horn on the end of the snout, perforated by the nostrils, and containing a small cavity for the reception of air, so that the males are enabled to remain under water for a longer time than the females. The gavial attains to a length of 20 feet. The correct term is garial.

The family of the Water Lizards are the *Varanidæ*. The family contains the largest species of lizards; the greater part of them live in the neighbourhood of large rivers, and are excellent swimmers, their long, compressed tail serving as a propeller; they are carnivorous, feeding on all different water animals and on the eggs of birds, and likewise on those of other large reptiles. Their movements on land are not much less rapid than in the water. Several species climb trees; they are active during a part of the night. They are found in tropical Africa, Asia, and Australia.

Varanus Bengalensis. The Karen are extravagantly fond of their flesh; they steal up the trees with a noose at the end of a bamboo, and often noose them while leaping for the water, or catch them in the boat, which is brought under the tree. The head of this species, the natives say, is venomous, and they discard it altogether; but the flesh of the other parts, which smells most odiously, is deemed by the Karens much preferable to fowls.

Varanus dracæna, common water lizard. A most common species in all British India, Bengal, Nepal, Southern India, and Ceylon. It is called in India the Iguana, is found in great abundance in all the maritime provinces of Ceylon, rarely in the higher Kandyan districts. This species of the water lizards can climb well both trees and walls, and it is popularly believed that thieves make use of it to effect an entrance into a building or over a wall, by allowing their guana to get hold by its fore-claws of the window-sill or wall, and pulling themselves up by it. It is caten by the natives, who consider it highly nourishing and aphrodisiac, and many Europeans use it for soup, imagining it allied to the West Indian guana. It can always be procured in the Madras market.

Varanus salvator, *Laurenti.* During the day it is commonly observed in the branches of trees overhanging rivers, preying upon birds and their eggs and smaller lizards, and when disturbed, it throws itself from a considerable height into the water. When attacked on level ground, it attempts its escape by running, if possible towards the water. Its quickness, however, is not so great as to prevent a man from overtaking it, when it will courageously defend itself with teeth and claws, and by strokes of the tail. The lowest castes of Hindus capture these lizards commonly by digging them out of their burrows on the banks of rivers, for the sake of their flesh, which by these people is greatly relished. Some individuals attain to nearly 7 feet in length, but the majority are smaller.

Hydrosaurus salvator, *Gray*, ocellated water lizard, is an inhabitant of the Archipelago, East Indian continent, China, Siam, Ceylon. It is very numerous in hilly and marshy localities of the Malayan Peninsula. It is commonly, during the day, observed in the branches of trees overhanging rivers, preying upon birds and their eggs and smaller lizards, and when disturbed it throws itself from a considerable height into the water. It will courageously defend itself with teeth and claws and by strokes of the tail. Low castes in India dig them out of their burrows on the banks of rivers, their flesh being greatly relished. Some attain to nearly 7 feet in length.

The fifth family comprises the Skinks, or *Scincidæ*. The species of this family are exceedingly numerous, and inhabit almost every part of the tropical regions, some extending into the temperate zones. They are thoroughly land lizards, preferring dry ground, and hiding themselves in the sand, under stones, etc. None of them enter the water. They do not attain any considerable size.

Euprepes Chinensis. This is one of the most common and most widely-spread lizards of the East Indies. It occurs in almost every part of the continent as well as of the Archipelago, from Afghanistan to China and the Philippine Islands; it is even said to inhabit the Sandwich Islands. It is not found beyond an elevation of 8000 feet. Cantor says that it is exceedingly numerous in

the hills and valleys of the Malayan countries. They may be seen basking in the sun, in bamboo hedges, or on trees; and they fearlessly enter houses in pursuit of insects, in which they display great agility. The female deposits 6 to 12 yellowish-white, oval, cylindrical eggs, half an inch in length.

The eighth family are the Geckos, or Geckotidæ. The limbs are stout, of moderate length, with at least four of the toes well developed. They are found in almost every part between and near the tropics, frequenting houses, rocks, and trees; and some of the species are so numerous around and within human dwellings, that they are most familiar objects to the inhabitants. All the Indian species, with the exception of Eublepharis, are able to run up and along the surface of a wall or of any other perpendicular object, the lower surface of their toes being provided with a series of moveable plates or discs, by the aid of which they adhere to the surface over which they pass. No gecko has imbricate scales on the back. The geckos do not attain to any considerable size, the largest species being from 10 to 14 inches long. They are carnivorous animals, destroying insects, moths, and even the younger and weaker members of their own species. Geckos have even been seen devouring their own tail. They are of fierce habits, fighting between themselves, particularly when one has caught a larger insect than he is able to swallow at once. They make a spring at their victim. Their greediness has developed some intellectual faculties in the house geckos; accustomed to be fed at a certain time with rice, etc., these little lizards will punctually make their appearance, and fearlessly take proffered food. Another peculiarity of the geckos is that they are endowed with voice. In Gecko guttatus it is a shrill cry, sounding like 'to-kee;' in Gecko monarchus it resembles the monosyllable 'tok,' repeated six or eight times with increased celerity; in Hemidactylus frænatus it is a sharp, quick call, like 'chic, chic, chit,' etc. They have several vernacular names in imitation of these sounds, as Too-kai, To-kee, Cheecha, Gokee, Keko, Gecko.

Gecko monarchus, *Gray*, *Lizards*, p. 161, possesses the power of changing its ground colour in a greater degree than any other gecko. It is very numerous at Penang, swarming at night in rooms. They are pugnacious among themselves, two or more sometimes fighting for an insect.

Ptychozoon homalocephalum, the flying gecko, attains to a length of 7 inches, of which the tail takes one-half. It is found chiefly in Java and in a few other islands of the Eastern Archipelago. Penang, Singapore, and the island of Ramree appear to be the only other places where it has hitherto been found in India. The expansions of the skin have the same purpose as the wings of the dragons and of the flying squirrels. In leaping, these membranes are expanded by the pressure of the air from below, and act as a parachute. When the gecko is at rest, they are kept in close contact with the body by muscles attached to their interior surface. Like other geckos, they have in some degree the power of changing the ground colour from a darker to a lighter shade.

Hemidactylus coctœi, the common gecko or small gecko. The spider of the English Bible, Proverbs xxx. 28, was undoubtedly a small gecko represented by this species, and the word was so rendered in the Syriac version made in the 2d century, and in the Vulgate Latin made in the 4th century. Jerome translated, 'Stellio manibus nititur, Et moratur in ædibus regis,' into

> 'The gecko taketh hold with her hands,
> And dwelleth in kings' palaces.'

Hemidactylus frænatus is the cheecha of Ceylon. It scarcely ever exceeds the length of 4 to 5 inches, and is one of the most common house geckos; seen soon after sunset in search of prey, which consists of flies and other insects. It does not reject boiled rice aud crumbs of bread, always returning to the spot where it has been thus before fed. It is also frequently met with on trees and on rocks. The female lays three or four eggs, in crevices of old walls or in the hollows of trees. This small species is of fierce habits, like several other Geckonidæ, destroying its own species.

The ninth family are the Agames, or *Agamidæ*. The agames are land lizards, spread over almost every part of the Old World and of Australia, being much less numerous in the temperate parts than in the tropical, — some with a compressed body, and with a long, more or less compressed tail, live on trees or bushes; whilst others, with a depressed body, and with a shorter tail, inhabit rocks or plains. The most slender and the most gaily-coloured forms belong to the former division, the heavier ones, with duller colours, to the latter. They do not attain to any considerable size, and none of the Indian species exceed a foot in length, the tail not included. The greater part are insectivorous, but many feed on vegetables (seeds, fruits, leaves), as well as on animals.

Draco, *Linn.*, the dragons, a genus of the Agamidæ, have a semicircular membrane, supported by the five or six posterior (false) ribs, which are much prolonged, forming a sort of wing or parachute on each side of the body. A vertical appendage is suspended from the middle of the throat; a smaller horizontal fold of the skin on each side of the gular appendage. The dragons are entirely confined to the East Indies; they are more numerous in the Archipelago than on the continent; they have not yet been found in Ceylon. The character by which they are at once recognised is the peculiar additional apparatus for locomotion formed by the much-prolonged five or six hind ribs, which are connected by a broad expansible fold of the skin, the whole forming a sub-semicircular wing on each side of the body. The dragons are tree lizards, and in jumping from branch to branch they are supported in the air by their expanded parachutes, which are laid backwards at the sides of the animal while it is sitting or merely running. If the hind extremities of a dragon were cut off, it would lie helpless on the ground; but it would still move with great velocity if it were merely deprived of its wings. The locomotion of the dragons is a series of leaps, and not a continuous running; they are the anoles of the Old World. The transcendent beauty of the colour of Draco volans baffles description. As the lizard lies in the shade along the trunk of a tree, its colours, at a distance, appear like a mixture of brown and grey, and render it scarcely distinguishable from the bark. Thus it remains,

with no signs of life, except the restless eyes, watching passing insects, which, suddenly expanding its wings, it seizes with a sometimes considerable unerring leap.

Sitana ponticeriana, *Cuv.* This common ground lizard is distributed over all India, but is rare in the wooded districts, frequenting the open country, field, and low copses. On the approach of danger, it runs with great rapidity, tail erect, and conceals itself in any crack in the ground or hole, or under a stone or bush. Notwithstanding its activity, it is the common prey of harriers, buzzards, hawks, and eagles.

Calotes are true tree lizards, some having the tail rather compressed at the base. C. versicolor is the blood-sucker. The ground colour is generally a light-brownish olive, but the lizard can change it to bright red, to black, and to a mixture of both. The bright changeable colours are peculiar to the male during the breeding season, in the months of May and June, and it then may be seen seated on a hedge or bush, with the tail and limbs black, head and neck yellow picked out with red, and the rest of the body red. This is one of the most common lizards, extending from Afghanistan over the whole continent of India to Ceylon and China; not extending into the temperate zone of the Himalaya. Ceylonese specimens are generally somewhat larger; one of them measured 16 inches, the tail taking 11 inches. It is found in hedges and trees. The name of blood-sucker, in the opinion of Kelaart, was given from the occasional reddish hue of the throat and neck.

A tenth family are Chameleons, or *Chamæleonidæ*. Africa is inhabited by numerous species; they extend to the northern shores of the Mediterranean and into South-Western Asia, into Hindustan and Northern Ceylon. The inflexibility of the neck is compensated by the wonderful structure of the eyes, which are so prominent that more than one-half of the ball stands out of the head; and not only can they be moved in any direction, but each has an action independent of the other, — one eye may be looking forward, whilst an object behind the animal is examined with the other. The faculty of changing colour possessed by the chameleons, although common to numerous other lizards, has become proverbial, and is so much developed that one side may assume a colour different from that of the other. They are oviparous, depositing under leaves from ten to twelve oval eggs with calcareous shells. The species have been left together in one genus; only one species is found in British India.

Most of the Indian specimens are of a green colour, uniform, or irregularly spotted and banded with dark green or brown; whilst in African species the ground colour is greyish, olive, yellowish, or brownish. This, however, does not appear to amount to a specific difference. In the Peninsula of India and northern parts of Ceylon it attains to a length of 10 inches, the tail taking more than one-half.

The *Ophidia* comprise the order of Snakes. There is no sharp boundary line between the order of saurians and that of snakes. Certain ophidians remind us, by several characters, of the saurian type; such as the snakes forming the first four families, which are distinguished by polished, closely-adherent, rounded, sub-equal scales, much resembling the smooth scales of some sciucoids. A peculiar mobility of the jaw-bones enables snakes to extend the gape in an extraordinary degree, and to work their prey down through the collapsed pharynx. The Pythonidæ and Erycidæ have rudiments of hind limbs. Generally the snakes are provided with numerous teeth, which are elongate, conical, thin, and pointed like a needle, and more or less bent backwards. Non-venomous snakes' teeth are either entirely smooth, or only the last of the maxillary series is provided with a faint longitudinal groove, which is not intended to convey a poisonous saliva into a wound, as the saliva of these snakes has never been proved to be poisonous; the groove appears to increase the strength of the tooth. The poisonous snakes are armed with a long canaliculated tooth in front of the upper jaw; the channel terminates in a small slit at the extremity of the tooth, and is in connection with a duct which carries the poisonous fluid from a large gland to the tooth. At the moment the snake opens its mouth to bite, these muscles compress the gland, and force its contents through the excretory duct into the channel of the venom-tooth, whence it is injected into the wound. The structure of the venom-tooth is not the same in all poisonous snakes; in some it is fixed to the maxillary bone, which is as long, or nearly as long, as in the non-venomous snakes, and generally bears one or more ordinary teeth on its hinder portion. The poisonous snakes with such a dentition have externally a more or less striking resemblance to the non-venomous serpents, and on this account they are designated as venomous colubrine snakes, forming the second sub-order of snakes (cobra, bungarum, sea-snakes, etc.). In the other venomous snakes, the third sub-order, the maxillary bone is extremely short, and does not bear any teeth except an exceedingly long fang, with a perfectly closed, externally invisible, channel in its interior. Although this tooth also is fixed to the bone, the bone itself is very mobile, so that the tooth, which is laid backwards when at rest, can be erected the moment the animal prepares to strike. This tooth, like all the other teeth, is not only occasionally lost, but appears to be shed at regular intervals. The greater part of the snakes are oviparous, the eggs having an oblong form, and a soft, leathery shell. The pythons alone incubate their eggs, whilst all the other oviparous snakes leave them to the heat of the place where they have been deposited. Other snakes (the fresh-water and poisonous species) are viviparous, the embryos being developed in the oviduct of the mother. There may be distinguished—

Burrowing snakes, living under ground, only occasionally appearing above the surface.

Ground snakes live above ground, and only occasionally climb bushes or enter the water.

Tree snakes, or species passing the greater part of their life on bushes and trees, which they climb with the greatest facility.

Fresh-water snakes, distinguished by the position of the nostrils, which are placed on the top of the snout, and by a tapering tail. They inhabit fresh waters, and are excellent swimmers and divers.

Sea-snakes, distinguished by a strongly compressed tail, and by the position of the nostrils,

which are placed as in the last group. They live in the sea only, occasionally approaching the land, feed on marine fish, are viviparous and venomous.

Tropical India surpasses every other part of the globe in the number of ophidian forms.

The degree of danger from a bite by a poisonous snake depends but little on the species which has inflicted the wound, but rather on the bulk of the individual, on the quantity of its poison, on the temperature, and on the place of the wound. If a large blood-vessel be pierced by the fang, the poison is carried instantaneously into the mass of the blood, and sudden death is almost always the result. Although it is always possible to recognise the venomous nature of a snake from external characters only, yet this requires such a knowledge of snakes as can be attained only by a special study of them. The wound itself speaks for or against the venomous nature of a snake which has bitten. When there are numerous punctured wounds disposed in two lines, the snake is not poisonous. If the wound is on some part of the hand, arm, or foot, one or two ligatures should be made as tightly as possible at a short distance above the wound, to prevent the absorption of the poison. The ligature is left until the proper means are taken to destroy the virus in the wound, and until medicine is taken internally, or until great pain or swelling necessitate its removal. Punctured wounds should be enlarged by incisions at least as deep as the wounds, to cause a free efflux of the poisoned blood, and to facilitate its removal by sucking. The wounds should be suckcd either by the patient himself or by another person whose mouth is free from any abrasion or wound; cupping-glasses answer the same purpose in cases where they can be applied. The wound should be washed with ammonia, and its vicinity rubbed with it. Cauterization with a red-hot iron, or with sulphuric acid, butter of antimony, nitrate of silver, etc., are of great advantage, if done before the virus has spread far beyond the place of the bite. Internally, ammonia should be taken in large doses,—one, two, or three wine-glasses of the eau-de-luce. Brandy may be taken at short intervals. Dr. Shortt believes that ammonia is useless, and has strong faith in liquor potassæ. To prevent a complete collapse, it is necessary to use these strong excitants, and to repeat them until the alarming symptoms are allayed. It would be a great risk in such a case to trust to the remedies of a snake-charmer.

The *Colubridæ* family comprises the greater part of the non-venomous snakes, namely, all those which do not present any striking character either in their general habit, in the shields of the head, in the dentition, or in any other part of their organization. They have numerous teeth in the jaws and on the palate, but no fangs in front or in the middle of the maxillary. Numerous species of Coluber, *sp.*, *Linn.*, are found in North America, Europe, and Asia; those in British India belong to the northern parts of this region, scarcely extending southwards into the tropical region.

Ptyas mucosus, *Cope*, is the Indian rat snake. It is light brownish-olive, scales with darker margins, is one of the most common species on the continent and in Ceylon, and appears to occur everywhere; it is scarce in the Archipelago, as its occurrence has been recorded in Java only; on the other hand, it is not rare in Chusan and Formosa. In the Himalaya it ascends to only 5240 feet above the level of the sea. It is a powerful snake, attaining to a length of 7 feet, the tail being one-third, or rather more. Its food consists of mammals, birds, and frogs; it frequently enters the dwellings of man, in search of mice, rats, and young fowls. It is of fierce habits, always ready to bite, and old specimens brought to Europe never become tame. Cantor says that it utters, when irritated, a peculiar diminuendo sound, not unlike that produced by a gently struck tuning-fork.

Tropidonotus junceus, *Cantor*, inhabits Penang, and, like most of the Asiatic species of this genus, is of fierce habits.

Tropidonotus quincunciatus and T. umbratus. The former is the most widely-spread species of the East Indies, ranging from Mesopotamia into the southern parts of China, and inhabiting most of the islands of the western half of the Archipelago. It abounds near rivers and pools, feeding on frogs and fishes; it attains to a length of 3 feet, and is of fierce habits. The ground colour of the upper parts is generally greyish or brownish-olive.

Tropidonotus macrophthalmus. This species may be at once distinguished by its large eye, and by its dilatable neck, the scales of which show an arrangement very similar to that of a cobra, for which it is frequently taken. Found in Khassya and Sikkim,—in the latter country at an elevation of 4000 feet. Attains to 39 inches, the tail measuring 7 inches.

Tropidonotus stolatus, *Boie*, *Isis*. This is perhaps the most common species of snake on the East Indian continent, ranging from Ceylon through the Peninsula, along the southern slope of the Himalayas to Southern China (Formosa); it is scarcer in the Malayan Peninsula and the northern parts of Siam, and appears to be entirely absent in the Archipelago. It is of very gentle habits, feeding on small frogs; it attains to a length of 2 feet, but generally smaller.

Another family are Fresh-water Snakes, the *Homalopsidæ*. All the Indian fresh-water snakes of this family have a grooved fang at the hinder extremity of the maxillary bone. They are aquatic, and are only occasionally found on the beach; several of them even enter the sea, and in several points of their organization approach the truly marine snakes, with which they have been associated in Gray's system. They may easily be recognised by the position of the nostrils on the top of the snout, which enables them to breathe by raising but a very small part of their head out of the water; it is the same arrangement as that in the crocodiles, sea-snakes, and other aquatic animals. Many have a distinctly prehensile tail, by means of which they hold on to projecting objects. Their food consists entirely of fish, and, in a few species, of crustacea also. All of them appear to be viviparous, and the act of parturition is performed in the water. They do not grow to any considerable size, are of a gentle disposition, and their bite would be by no means dangerous. They will not feed in captivity, and therefore die after a short time.

Psamnodynastes pulverulentus, *Gunth.*, is one of the family *Psammophidæ* or Desert Snakes.

This one has a very repulsive aspect; its dark, undefined colours, short and thick head, and swollen lips, caused by large hidden fangs, give it the appearance of a venomous snake.

The tenth family are Tree Snakes, or *Dendrophidæ*. They are diurnal species, living in trees, and feeding chiefly on tree lizards; they are found in all the tropical regions.

The Whip Snakes, or *Dryophidæ*, are the eleventh family. Asiatic species have a long fang-like tooth in the middle of the maxillary, and all provided with a posterior grooved tooth.

The twelfth family are the Dipsades, or *Dipsadidæ*. All the Indian species with a grooved fang behind; and several, moreover, with fangs in front. The Indian dipsades are nocturnal tree snakes, with a vertical pupil, a short, broad head, and compressed, elongate body.

The thirteenth family are Lycodontes, or *Lycodontidæ*. Lycodon aulicus is one of the most common snakes of the Indian continent and Ceylon; it does not extend northwards to China, and becomes scarcer on the coasts of the south-eastern parts of India. It occurs in only a few of the islands—in the Philippines and in Timor.

The *Amblycephalidæ*, or Blunt-heads, is the fourteenth. Amblycephalus boa is one of this family. The head of this singular snake resembles much that of a mastiff, the lips being arched and tumid; it climbs with great facility, frequenting the roofs of the huts of the natives in pursuit of its food, which consists of insects. It belongs properly to the fauna of the Archipelago, inhabiting Java, Borneo, and the Philippine Islands. Cantor found it at Penang. It does not appear to be common anywhere. It readily bites; and attains to a length of 3 feet, the tail being one-third.

Rock Snakes, or *Pythonidæ*, are a fifteenth family. The rock snakes are found in the hottest parts of Africa, Asia, the East Indian Archipelago, and Australia. They climb as well as they swim; most of them prefer the neighbourhood of water. This family contains the largest snakes. Only one genus, the python, is found in British India.

Python reticulatus and P. molurus, two species of Indian rock snakes, are among the largest of living reptiles. Of snakes, only their African congeners and the American Eunectes murinus can be placed beside them. Their dimensions and their strength, however, have been much exaggerated; specimens of 18 to 20 feet in length are very rare, although isolated statements of the occurrence of individuals which measured 30 feet are on record and worthy of credit. Rock snakes from 15 to 20 feet long have the thickness of a man's thigh, and will easily overpower a small deer, a sheep, or a good-sized dog. The rock snakes must attain to a considerable age. A Python reticulatus lived in the menagerie of the Zoological Society of London for 15 years; when brought to England it was about 11 feet long, and in ten years it had attained to a length of 21 feet, after which no further growth could be observed. The males remain smaller than the females. The rock snakes will propagate in captivity,—the Indian P. molurus having bred in Paris, and the African P. sebæ in London. In both cases the eggs were incubated by the mother, and in the former successfully hatched.

Python reticulatus, *Gray*. It often takes up its abode in outhouses, preying at night, and is thus useful in destroying vermin, although plunder is occasionally committed in poultry yards. When kept in captivity, it is of importance to supply it with a small tank of water, in which it will frequently remain for days. Individuals of 16 feet in length are not of rare occurrence, and some about 30 feet long are on record. This species of the pythons of South-Eastern Asia is very numerous in the Malayan hills and valleys, feeding upon quadrupeds and birds. Dr. Montgomerie had seen in George Town, Penang, a young one which the inhabitants suffered to retain unmolested possession of the rice stores, in order to secure them against the ravages of rats.

Python molurus, *Gray*. The ground colour is light greyish-brown. This python, commonly known under the name of rock snake, and by some misnamed boa, is almost peculiar to the continent of India. Common in the Southern Peninsula and in Bengal, it extends northwards into the sal forest at the foot of the Himalaya, and probably to Southern China.

The Herpetodryas oxycephalus of Reinwardt has in a remarkable degree the power of laterally compressing the neck and the anterior part of the body, when the greyish-blue skin becomes visible between the separated scales. In such state of excitement, it raises nearly the anterior third vertically from the ground, continues fixed during several seconds with vibrating tongue, and bites. It then throws itself down, to rise to a renewed attack.

The seventeenth family are Wart Snakes, *Acrochordidæ*.

Chersydrus granulatus is found in the rivers and on the sea-coasts of numerous islands of the Archipelago, extending to New Guinea and the Philippines. It inhabits also the eastern coasts of Southern India and the Malayan Peninsula, and sometimes it may be seen three or four miles distant from the shore. It is not venomous, as has been stated by writers.

The terrestrial family of Elapides, or *Elapidæ*, are venomous colubrine snakes; the fang is grooved, with a foramen at its extremity; one or two small ordinary teeth at a short distance behind it.

Naja tripudians, *Merr.*, has eight varieties, forming but one species, which is widely spread all over the E. Indies. Its chief enemies are the jungle-fowl, which destroy the young brood, and the herpestes or ichneumons, which will attack and master the largest cobra. In districts where the cobras or other venomous snakes have too much increased in number, the most efficient way of destroying them is to protect their natural enemies. The cobra is the most common venomous snake of the East Indies.

Ophiophagus elaps. This remarkable snake is easily recognised by the large shields surrounding the occipitals. Although rather rare, it has a very wide geographical range: in almost every part of the Indian continent, the Andaman Islands, Java, Sumatra, Borneo, the Philippine Islands, and, according to Dumeril, also in New Guinea. It is one of the largest and most deadly venomous snakes, attaining to a length of more than 12 feet, of which the tail is about one-fifth. It inhabits hollow trees, and is sometimes found resting between the branches; it feeds on other snakes.

Bungarus species are not numerous in the Malayan countries, but B. candidus and B. fasciatus are of no uncommon occurrence in Bengal and on the Coromandel coast, where, however, it should be observed, a class of the natives ('serpent charmers') earn a livelihood by capturing and exhibiting serpents; this craft is unknown among the Malays. B. flaviceps, B. candidus, and B. fasciatus, like the rest of the venomous serpents, are very ferocious when attacked, but unprovokedly they are not known to attack man; on the contrary, when met in the jungle, they attempt to escape. When trod upon, or struck, their rage is instantly excited; in self-defence they will even turn from their retreat, and then their habitual sluggishness is roused to furious activity. Preparing to attack, the head is, by a short curve of the neck, brought closely to the body, and drawn far backwards, when, suddenly darting the anterior part of the body obliquely upwards, they bite. The height of the place where the wound is inflicted of course depends on the length of the serpent, which is capable of darting nearly the anterior half of the body. Notwithstanding the circular pupil, they appear to shun the light, hiding the head under the folds of the body; and they are singularly uncertain in their movements, often suddenly jerking the head or tail without any apparent object. Like all serpents of tropical Asia, they seldom expose themselves to the sun; when during the day they leave their hiding-places, they select the shade. The genus Bungarus is terrestrial, feeding on rats, mice, serpents (Col. mucosus, *Linn.*), and toads. Like other venomous serpents, when the venom has been inflicted on their prey, they disengage it from the fangs, sheath and place them as horizontally as possible, in order that they may offer no resistance to the introduction into the mouth of the lifeless prey, which is now seized head-foremost. The innocuous serpents bite or strangle their prey, which, when life is extinct, is either swallowed at once, or, if it happen to have been killed in a position likely to render the deglutition difficult, is often disengaged from between the teeth, and seized a second time by the head. In captivity these serpents refuse food, but greedily lap up and swallow water. A fowl, four minutes after it had been bitten on the inner side of the thigh by a Bungarus fasciatus, fell on the wounded side, and was shortly after seized with slight purging. The eyes were half closed, the pupils alternately dilated and contracted, immobile. In 17 minutes slight spasms occurred, under which the bird expired 43 minutes after it had been wounded. Another fowl, wounded in the same place as the former, by the same serpent, but after an interval of seven hours, expired under similar symptoms, only more violent spasms, in the course of 28 minutes. Venom taken from another serpent, the fangs of which had been extracted, was inoculated by a lancet-incision in the right thigh; four minutes after, the fowl was seized with trembling, fell, and remained lying on the wounded side, with the eyes closed, but it gradually recovered, and rose, apparently recovered, 30 minutes after the inoculation of the venom. Other fowls were killed by different serpents of this species in 20 to 31 minutes. Fowls bitten by Bungarus candidus expired under similar symptoms, within 30 to 45 minutes; dogs from within 1 hour 10 minutes to 2 hours, under symptoms noted in Russell's Experiments. The venom of Naja lutescens, *Laurenti*, was carefully obtained, so as to avoid any admixture of saliva, by compressing the venomous glands. It issued from the lower aperture of the fangs in viscid drops of a syrupy consistency, and was received as it fell from the fangs in platina capsules. The serpents operated upon were an adult cobra di capello, Naja lutescens, *Laurenti*, and one of its varieties, Naja kaoutdia, *Belanger*. In every instance the venom readily changed the blue of litmus to red, and restored the bright yellow to turmeric paper that had been reddened by the application of caustic alkali,—an unequivocal proof of acidity. When left to spontaneous evaporation, it dried into a varnish resembling mucilage, or the glair of an egg, cracking in all directions; and on being heated, it deposited an abundant coagulum, apparently albuminous. In either instance, when redissolved it retained its acid property.

What the nature of this acid may be, it was impossible to determine from the small quantity operated upon; nor was Dr. Cantor prepared to say that the poison itself is an acid, although, if it be not so, it is certainly associated with one. The poison itself probably consists of some compound, which would be wholly disorganized under any attempts at detection by chemical means.

The *Hydrophidæ* are a family of Sea-snakes. The sea-snakes are inhabitants of the tropical parts of the Indian and Pacific Oceans, extending from the coast of Madagascar to the Isthmus of Panama; they are most numerous in the East Indian Archipelago, and in the seas between Southern China and North Australia, being represented on the outskirts of the geographical range we have mentioned by only one species, and that the most common, viz. Pelamis bicolor. The most striking feature in the organization of the sea-snakes is their elevated and compressed tail, the processes of the caudal vertebræ being much prolonged and styliform. The food of the sea-snakes consists entirely of small fish; all the species are viviparous, bringing forth, without leaving the sea, from four to nine young ones. They have very formidable and very numerous enemies in the sea eagles (Haliætus), in the sharks, and other large raptorial fishes. There is no other group of reptiles, the species of which are so little known, and the synonymy of which is so confused, as that of the sea serpents. Our present knowledge of the geographical distribution of most of the species is extremely vague.

The *Crotalidæ* are a family of Pit Vipers. The pit vipers are found only in Asia and America; those of the New World surpassing the Asiatic species in size, and therefore they are much more dangerous.

The *Trimeresures* are Tree Snakes, as is indicated by their prehensile tail and by their green or varied coloration. In general they are sluggish, not attempting to move out of the way; and as they very closely resemble the branch on which they rest, they are frequently not perceived until they prepare to dart, vibrating the tail and uttering a faint hissing sound, or until they have bitten the disturber of their rest. The bite of larger specimens, from 2 to 3 feet long, is more dangerous, and has occasionally proved fatal. When roused,

these snakes are extremely fierce, striking at everything within their reach; and Cantor says that in the extreme of fury they will fix the fangs in their own bodies.

Trigonocephalus Sumatranus, *Raffles*. In Malayan countries this variety is not of so rare occurrence as the species appears to be in Sumatra. Tr. puniceus is in general sluggish, but when roused is of ferocious habits; Tr. gramineus, Tr. Sumatranus, and Tr. puniceus resemble the genus Bungarus; their mode of attack is also similar; like Vipera Russellii, *Shaw*, when it prepares to dart, they vibrate the prehensile tail, and utter a faint hissing sound. As the pupil is vertically contracted by the light, they frequently miss their aim, and, like Bungarus, Naja, Vipera Russellii, and Hydrus, in the extreme of fury they will fix the fangs in their own bodies. In Bengal, most terrestrial serpents keep to the water during the hot season, but the rains send them abroad in search of dry localities. Although this genus has venomous organs as highly developed as Crotalus or Vipera, the effects produced by wounds of two species at least appear to be less dangerous.

Hydrus schistosus is incredibly numerous in the Bay of Bengal, at Penang, and Singapore, far more so than any known terrestrial serpent. The fishing-nets are hardly ever worked but that one or more are among the contents. The large individuals are very ferocious; the young ones are less so. Fortunately for the fishermen, the light blinds these serpents, which when out of their proper element become very sluggish and soon expire. This accounts for the safety of the class of men whose daily calling brings them in immediate contact with animals the wound of which is fatal. The fishermen in the Straits of Malacca are aware of their danger, and therefore take care to avoid or destroy these reptiles while landing the fishes. The Malays denominate them Ular Laut, *i.e.* serpents of the sea; among which, however, the innocuous Acrochordus granulatus, *Schneider*, is also comprised as an inhabitant of the coasts.

The incantation of serpents has usually been attributed to the power of music, and a late writer remarks that 'it is so strange that many have denied the fact, while others have asserted it to be a deception.' The general belief, however, 'is that serpents are extremely sensitive of impressions from musical notes or modulations, under the influence of which they wreathe their bodies from feelings of pleasure, while to these graceful contortions and undulating movements, the charmer, who plays on a pipe or some simple instrument, adapts the time.' This is the common theory,—that serpents are rendered docile by music; but Mr. Mason has seen the cobra dance in imitation of its Burmese master, while he sat upon his haunches before it, making the motions with his body and hands that he wished the snakes to imitate, and which it did perfectly without any music whatever, or any other sound except an occasional authoritative hay! A pair of cobras kept perfect time with their master, while no sounds were uttered, and allowed him to handle them as he wished. At his command they danced, and at his command they lay gracefully down as if asleep. The Burmese usually put a wild one, which they secure when half or two-thirds grown, with a practised tame one. These will dance and wreathe themselves at their master's pleasure. Sometimes darting at him, but at that moment he straightens himself up, with his eyes fastened upon the snake's eyes, and in a gruff voice commands them to perform. Following his motions, they stand almost upright with their hoods dilated and their colours all in play as they dance; now swift, now slow, now approaching, now receding; and he has seen the younger in his receding movements give unequivocal tokens of desiring to make his exit, but on hearing his master's call he turned again, though evidently with more reluctance than the old actors. The power of effecting all this is certainly attributable neither to magic nor music. It must, he thinks, be ascribed to fear, and to a very simple principle, the power of imitation,—a power possessed by different animals in different degrees. Serpents are by no means the least docile of the animal kingdom; nor are cobras the most intractable of serpents, the cobra and the bungarus being the favourites with the snake-charmers.

A large python, usually called a boa, is not uncommon in Tenasserim. Mr. Mason had seen the head of one that was killed by a drove of hogs, whose whole length measured 18 feet, and the natives say they grow much larger. The Karens have an apothegm that the largest python can swallow a full-grown buck rusa or sambur deer, horns and all, without inconvenience. They are often seen coiled up among the branches of trees on the banks of streams in the interior, where they are frequently noosed by Karens, who regard them as valuable food. He has seen a Karen seize one 9 feet long by the tail in the water, and with the aid of his associates succeed in capturing him.

Hypnale nepa. Found in Ceylon, but also in the Peninsula of Southern India, the Animallay mountains. The carawala is much dreaded, although its bite is but exceptionally fatal to man, and in such cases death does not occur before the lapse of some days.

The Vipers, or *Viperidæ*, inhabit the Old World and Australia, and are thoroughly terrestrial snakes.

Daboia Russellii is a native of Ceylon and of the Peninsula of India, the Animallay mountains, Waltair, Bombay, and Almora (5500 feet elevation), the Himalayas, in Kulu, at 3400 feet. Length 50 inches, tail measuring 7 inches; it is thoroughly terrestrial, feeding chiefly on mice. It is one of the most common venomous snakes, and, on account of its size and nocturnal habits, more dangerous than the Trimeresures and Hypnales. The far-famed, dreaded Cobra monil, or Cobra manilla of some, seems merely the young of this species. The old orthography is monil, which simply means a chain or necklace; and whoever looks at the markings of this snake, especially of the young one, must be struck with the resemblance thereof to a necklace.

Vipera echis, *Schlegel;* V. noratta, *Shaw*, *Russell*. Kuttavyrien, Tam. This little snake is very common in the Carnatic. Jerdon doubts that its bite would prove fatal to man. A dog bitten by one recovered. Of all the venomous land-snakes met with in Southern India, the only ones at all common are the cobra, the chain viper (Vipera Russellii), the Bungarus candidus, and the little Vipera echis. Most of the others

are peculiar to the forests of India. Trigonocephali are not usually fatal. Jerdon had known several cases of bites by Trigonocephalus Malabaricus and Tr. nepa, and none proved fatal.

Batrachians are a sub-class of reptiles. Moisture is as necessary for batrachians as food and air, hence they are found only in damp places or in the neighbourhood of water. When they dive, the lungs are emptied, and the respiration remains interrupted for one or two hours, after which time the animal is compelled to rise to the surface in order to breathe. Many batrachians live at some distance from water; all, however, as far as is known at present, enter it at the season of propagation. The males have also generally a distinctly more slender form than the females. The eggs are impregnated the moment they are deposited by the female in the water. The young ones, or tadpoles, have a thick ovate body without legs, terminating in a long, strong, compressed tail, which serves as an organ of locomotion in the water. The development is about a hundred days in the European Rana temporaria, but several years elapse before the young perfect batrachian attains its full size. None are poisonous.

REPTONIA BUXIFOLIA. *St.* Gurgura, Gurgara, Garar of Salt Range. The wood is small, but hard, fine-grained, and useful. It is common in the Trans-Indus districts. Exclusively a Panjab wood.—*Stewart.*

RESERVOIRS are common in many parts of India, and where water is far from the surface, usually a bold flight of steps 20 to 40 feet wide leads down to the water; they are in the form of tanks, and of wells known as baories or baolies.

RESIDENCY, in British India, a Political Agency at a native court; the political officer holding it is styled the Resident. In Netherland India, a province.

RESINS.

Ratinij, ...	Arab.	Gugal, ...	Hind.
Samgh, Sanawbar,	,,	Ral, Rala, . . .	,,
Sung-chi, . . .	Chin.	Gugalam, . . .	Tam.
Sung-hiang, . . .	,,	Gugalamu, . . .	Tel.
Doona, Dammar, .	Hind.		

Gums and resins are exported from India to a considerable extent, but cutch (catechu) and gambier, alike in quantity and value, far exceed those of other kinds.

	1880-81.	1881-82.	1882-83.
Cutch and gambier, .	320,756 cwt.	198,897 cwt.	246,506 cwt.
Other sorts, . . .	899 ,,	1,841 ,,	1,722 ,,
Cutch and gambier, .	Rs. 42,66,415	Rs. 25,30,840	Rs. 30,52,434
Other sorts, . . .	,, 11,814 ,,	15,056 ,,	14,371

These products are very abundant throughout the East Indies, and are largely utilized by the people, but they are carelessly collected and packed, and are presented to European commerce in unattractive forms. Also, in the course of trade, cutch and gambier, rosin, pitch, tar, and dammer, are imported into India and re-exported. Since the second edition of the Cyclopædia of India was published, Mr. E. J. Atkinson, in 1876, described the gums and gum-resins of the N.W. Provinces of India, and Dr. M. C. Cooke of the Indian Office in 1874 reported on all those of British India, referring several times to this Cyclopædia. He classed them as gums, gum-resins, true resins, and oleo-resins, but in commercial returns these substances are usually placed under one heading.

i. Gums, trees yielding them.

a. True gums.

Acacia Arabica, *Willd.*
A. catechu, *Linn.*
A. ferruginea, *D.C.*
A. leucophlæa, *Willd.*
A. modesta, *Wall.*
A. speciosa, *Willd.*
A. sundra, *D.C.*
A. vera, *Willd.*
Adenanthera pavonina, *L.*
Ægle marmelos, *Cirr.*
Amygdalus Persica, *Linn.*
Anacardium occidentale, *L.*
Andersonia, *sp.?*
Anona squamosa, *L.?*
Armeniaca vulgaris, *P.*
Artocarpus integrifolia, *L.*
Azadirachta Indica, *Juss.*
Barleria prionitis, *Linn.*
Bassia longifolia, *Linn.*
Bauhinia emarginata, *Roxb.*
B. parviflora, *Ham.*
B. retusa, *Wall.*
B. Vahlii, *W. and A.*
Borassus flabelliformis, *L.*
Buchanania latifolia, *Roxb.*
Calyptranthes caryophyllæfolia, *Willde.*
Careya arborea, *Roxb.*
Cathartocarpus fistulata, *Pers.*
Cedrela toona, *Roxb.*
Celtis orientalis, *Linn.*
Chickrassia tabularis, *Juss.*
Citrus decumana, *Linn.*
C. limetta, *Risso.*
C. medica, *Linn.*
Cocos nucifera, *Linn.*
Conocarpus latifolius, *Roxb.*
Cordia Rothii, *Rœm.*
Elæodendron paniculatum, *W. and A.*
Elate sylvestris, *Linn.*
Emblica officinalis, *Gært.*
Erythrina Indica, *W. and A.*
Feronia elephantum, *W. and A.*
Garuga pinnata, *Roxb.*
Gossypium herbaceum, *L.*
Grislea tomentosa, *Roxb.*
Gyrocarpus Jacquini, *Roxb.*
Heritiera littoralis, *Dry.*
Jatropha curcas, *Linn.*
Melia azedarach, *L.*
M. sempervirens, *L.*
Michelia champaca, *L.*
Mimusops elengi, *Linn.*
M. kaki, *W.*
Morus Indica, *Willd.*
Nerium suaveolens, —?
Odina wodier, *W. and A.*
Poinciana elata, *W. and A.*
P. regia, *Bojer.*
Pongamia glabra, *Vent.*
Prosopis spicigera, *L.*
Prunus domestica, *Linn.*
P. puddum, *Roxb.*
Punica granatum, *Linn.*
Sapindus acuminatus, *Wall*
S. emarginatus, *W. and A.*

Thespesia populnea, *Cor.*
Tricosanthes cucumerina, *L.?*
Vachellia farnesiana, *W. and A.*
Wrightia antidysenterica, *Br.*
W. tinctoria, *Br.*
Zizyphus flexuosa, *Wall.*
Z. jujuba, *Lam.*

b. Pseudo-gums.

Ailantus excelsa, *Roxb.*
Cochlospermum gossypium, *D.C.*
Cycas circinalis, *Linn.*
Eriodendron anfractuosum, *W. and Arn.*
Grevillea robusta, *Cunn.*
Macaranga Indica, *W.*
M. tomentosa, *W.*
Moringa pterygosperma, *Gærtn.*
Opuntia rubescens, *Salm.*
Salmalia Malabarica, *W. and A.*
Sterculia urens, balanghas, campanulata, colorata, fœtida, and populifolia.
Uvaria tomentosa, *Roxb.*

c. Astringent gums.

Agati grandiflora, *Dees.*
Butea frondosa, *Roxb.*
B. parviflora, *Roxb.*
B. superba, *Roxb.*
Calyptranthes caryophyllæfolia, *Willde.*
Mucherus? Salmalia Malabarica?
Pterocarpus Indicus, *Willd.*
P. marsupium, *Roxb.*

ii. Gum-Resins.

a. Emulsive gum-resins.

Gamboge plants.
Garcinia cambogia, *Desr.*
G. cowa, *Roxb.*
G. Griffithii, *And.*
G. mangostana, *Linn.*
G. morella, *Desr.*
G. pictoria, *Roxb.*
G. pedunculata, *Roxb.*
G. Travancorica, *Bedd.*
G. Wightii, *And.*
G. xanthochymus, *Hooker.*

b. Fœtid gum-resins.

Dorema ammoniacum, *Don.*
D. aureum, *Stocks.*
Ferula galbaniflua, *Buhse.*
F. hooshee, *Royle.*
F. orientalis, *Linn.*
F. Persica, *Willde.*
F. alliacea, *Boiss.*
F. Lehmanni, *Boiss.*
Galbanum Persian.
Gardenia lucida, *Roxb.*
G. gummifera, *Roxb.*
Narthex asafœtida, *Falc.*
Opoponax chironium, *Koch.*
Sagapenum ferula, *sp.?*
Sarcocolla, —?

c. Fragrant gum-resins.

Balsamodendron mukul, *Hooker.*
B. myrrha, *Ehr.*
B. Roxburghii, *Arn.*
B. pubescens, *Stocks.*
Boswellia Bhau-dajiana, *Birdw.*
B. Carteri, *Birdw.*
B. Frereana, *Birdw.*

B. thurifera, *Coleb.*
Calamus draco, *Willde.?*
Dracæna draco, *Linn.?*
Mangifera Indica, *Linn.*
Myrrh.
Nagdana.
Olibanum.
Pterocarpus draco, *Linn.?*
Styrax benzoin, *Dryand.*
Terminalia angustifolia, *W. and A.*

iii. True Resins.

a. Copalline resins.

Canarium Bengalense, *R.*
C. strictum, *Roxb.*
Copal.
Dammara orientalis, *Lam.*
Dammar daging, rose dammer.
Dammer of Andamans.
Dammer of Borneo.
D. or Salangan putih, white dammer.
D. hitam or black dammer.
Diospyros glutinosa, *Roxb.*
Hopea micrantha, *Hook.*
H. odorata, *Roxb.*
H. parviflora, *Bedd.*
Pistacia Cabulica, *Stocks.*
P. Kbinjuk, *Stocks.*
P. lentiscus, *Linn.*
Poon-yet or Pwai-gnet.
Shorea robusta, *Roxb.*
S. sericea, *Dyer.*
S. tumbuggaia, *Roxb.*
Trachylobium Mozambicense, *Peters.*
Vateria acuminata, *Heyne.*
V. Indica, *L.*
Vatica lanceæfolia, *Blume.*
V. Roxburghiana, *Wight.*

b. Elemi or soft resins.

Ailantus Malabarica, *D.C.*
Calophyllum calaba, *Jacq.*
C. inophyllum, *L.*
C. other species.
Canarium commune, *Linn.*
Cassia auriculata, *Linn.*
Dammar kejie.
Gutta Runghas.
Kunnee.
Maeshaksee.

iv. Oleo-Resins.

a. Balsams.

Balsamodendron Berryii, *Arn.*
Chloroxylon Swietenia, *W. and A.*
Dipterocarpus alatus, *Roxb.*
D. incanus, *Roxb.*
D. tuberculatus.
D. turbinatus, *Gært.*
Dryobalanops camphora, *Coleb.*
Hardwickia pinnata, *Roxb.*
Liquidambar altingia, *Bl.*
L. orientale, *Miller.*
Melaleuca minor, *Smith.*
Mesua ferrea, *Linn.*
Mohal balsam of Cachar.
Melanorrhœa usitatissima, *Wall.*
Odina wodier, *Roxb.*
Rhus succedanea, *D.C.*
R. vernicifera, *D.C.*
Semecarpus anacardium, *Linn.*
S. Travancorica, *Bedd.*

b. Natural varnishes.

Buchanania latifolia, *W. and A.*
Holigarna longifolia, *Roxb.*

c. Turpentine and tar.

Abies Smithiana, *Loudon.*
Cedrus.
Pinus excelsa, *Wall.*
P. Gerardiana, *Wall.*
P. Khassyana, *Brandis.*
P. Latteri, *Mason.*
P. longifolia, *Roxb.*
P. Massoniana, *Sieb. and Zuch.*
Sethia Indica, *W. and A.*
Tectona grandis, *Roxb.*

The gums of the East Indies have already been noticed under that head, and the following remarks will be restricted to a notice of the chief commercial resins.

Resinous substances are found in greater or less abundance in most plants. Many of the resins of commerce exude naturally from fissures in the bark or in the wood, or they are obtained from incisions made in the stems of certain trees and shrubs. As they exude they are commonly mixed with an essential oil, which either evaporates on coming in contact with the air, or is resinified by the action of oxygen. Such mixtures of volatile or essential oil with resins are sometimes called balsams. When gum is mixed with resins, another class of substances is produced, called gum-resins.

Resins soluble in spirit of turpentine are used for the most part in preparing dyes, varnishes, lacquers, sealing-wax, etc.

The rosin or common resin of Europe is obtained as a residuary matter in the process for obtaining oil of turpentine,—an oleo-resin by distillation of American turpentine with water.

Ammoniacum is the product of Dorema ammoniacum, *Don*, and an identical gum-resin is obtained from D. aureum, *Stocks*, of Sind.

Asafœtida is from the Narthex asafœtida, Ferula alliacea, *Boiss.*, F. Lehmanni, *Boiss.*, and it is said the F. Persica, *Willde.* It is used medicinally and as a condiment.

Balm of Gilead is an oleo-resin from the Balsamodendron Berryi, *Arnott*, a tree of N. Africa and Arabia, and is called by the Arabs Balsam Israeli. It is of syrupy consistence, limpid, and yellowish, but thickens and solidifies by age. It is used in surgery, but is rarely found pure. Mr. J. A. Murray says it is a product of B. Gileadense, *Kunth.*, and calls it Ood-i-Balisan and balsam of Mecca.

Myrrh, yielded by the Balsamodendron myrrha, *Ehr.*, of Africa and Arabia. The commercial varieties are Turkey myrrh, myrrh in tears, East Indian myrrh, and East Aden myrrh. B. Roxburghii, *Arn.*, of India, is supposed by Dr. Royle to yield part of the myrrh of commerce.

Googul of the bazars of India, the b'dellium of commerce, is obtained from Balsamodendron mukul, *Hooker*, also from the Balsamodendron pubescens, *Stocks*, and from the Boswellia glabra.

Ganda feroza, from Boswellia thurifera, is largely used as an application to indolent ulcers and wounds, and supposed to form the chief ingredient of Wroughton's ointment. Mr. J. A. Murray says it is produced from Boswellia papyrifera, *Hoch.*, gives it as names Luban and Ood, and says it is frankincense and olibanum.

Benzoin, the Ood or Luban of the Indian bazars, is obtained from the Styrax benzoin, *Dryand*, a tree of Borneo, Java, Siam, and Sumatra, in the form of tears, lumps, and translucent masses. That of Siam appears to be superior in fragrance to the Sumatra product, although both possess a delightful aroma.

Copals are known as soft Indian copal and orienta copal, also East Indian copal, Bombay anime, East Indian anime, and gum anime. These are names of the resin of the Trachylobium Mozambicense, *Peters*, which grows in Madagascar, on the E. coast of Africa, and in Zanzibar, and is known also as Hymenæa Mozambicensis, *Kleine.* It is a large tree, its average length is 30 feet, with 5 to 6 feet of girth, but canoes 60 feet long have been hollowed out of a single stem. The value of the copal exported from Zanzibar in 1863-64 amounted to 163,353 dollars, about six pounds being sold for one Austrian dollar. Nearly all of it was sent to British India, Great Britain, and Hamburg. The Arabs and Africans recognise two kinds, viz. the raw copal (copal vert of the French market), and called Sandarusiza miti, 'tree copal,' or chikaji, corrupted by Zanzibar merchants to 'jackass' copal. This chikaji is either picked from the tree or is found shallowly embedded in the loose soil. This is the only kind in Zanzibar island. And 'true or ripe copal,' called Sandarusi, the product of vast extinct forests, and found at depths beyond atmospheric influences, and has, like amber and similar gum-resins, been bituminized in all its purity.

Dammer.—The most important of all the solid resins produced in the East Indies are those which are included under the general Malay name of Dammer. The dammers are obtained from trees of the genera Vateria, Canarium, Shorea, and Vatica. Vateria and Canarium yield by far the largest part (if not the whole) of the dammers produced on the western coast of the Peninsula, whilst the Shorea and Vatica trees yield the greater part of that collected in the northern and eastern districts, and those of Further India and the Archipelago are chiefly from species of Canarium.

White Dammer of the western coast of India, called also Piney resin, is from the Vateria Indica. It is the Doopada resin of Mysore, and the Payanee or Piney of the Malabar people. Dupa maram, CAN.; Safed damar, HIND.; Vellai kundrikum, TAM.; Payanee, MALABAR; Piney maram, TAM.; Chadacula, TAM. This is a very large and stately tree, a native of Malabar and Mysore. The young shoots, and all tender parts except the leaves, are covered with fine stellate pubescence. The Piney resin occurs of all shades of colour between pale green

and deep yellow; the finest pieces are called kahruba or amber, and are sold as amber in the bazars of Bengal. Candles are made of this resin in Malabar, which diffuse, in burning, an agreeable fragrance, give a fine clear light, with little smoke, and consume the wick without snuffing.

One variety of it is the *Compact Piney Resin*, or first sort white dammer of the western coast, and occurs in large lumps of all shapes, and varying in colour on the outside from a bright orange to a dull yellow, bearing evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard, and bears a great resemblance to amber. Its colour (internally) is of all shades, from a light green to a light yellow, the green tint predominating in the generality of specimens. It is more soluble in alcohol than black dammer, and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its colour, and amber-like appearance.

A second variety, the *Cellular Piney Resin*, or second sort white dammer of the western coast, occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell, and has a very cellular structure, which is attributable partly to the mode of collection, and partly to the age of the tree. Notches being cut in the trunk of the tree sloping inwards and downwards, the resin collects in the cavity, and is either permitted to dry on the spot, or is collected and dried by the application of heat. It is of all shades, from light green to light yellow or white, and is usually translucent. Specimens are sometimes seen in which, from the desiccation having been irregularly conducted, the resin is more opaque, of a dull green colour, and full of air-bubbles, presenting the appearance of having undergone a partial fermentation. This kind of resin may be recognised by its cellular appearance and balsamic smell; this latter, however, which is of course due to the volatile oil it contains, is gradually lost by long keeping or constant exposure to the air. On splitting open old and decayed trees, portions of a dark-coloured resin are often found, having the solid consistence of the first variety, but the inferior quality of the second. The inspissated juice of the Vateria Indica tree is used for mixing with beeswax in making candles. In Malabar, the fresh resin is called piney varnish. It is of a light grey colour, with a strong balsamic odour. The resin which first exudes is called Chengilium (this is white); that which flows subsequently is termed Coongilium (darker than the above), and when dried it is called dammer (black). The Vateria lanceæfolia of the Khassya mountains and Assam yields a similar resin, which is used as incense. V. acuminata yields the piney resin of Ceylon.

The dammers of the northern and eastern districts are from the sal tree, Shorea robusta, and other species. Shorea robusta is a native of Morung, the Palghat mountains, and Northern Circars. The sal tree of Northern India and its resins is called Guggilam in Telugu, and Tala-gotso in Uriya. It is the Rala, Doona, and Gugulam of Indian commerce, and occurs in brittle, stalactitic pieces. Shorea robusta yields abundance of dammer, the superior kinds of which are efficient substitutes for the pine resin of the European pharmacopœia. It occurs perfectly transparent and colourless, but in the bazars the colour ranges from pale amber to dark brown. It is devoid of taste and smell. Sp. gr. 1·097 to 1·123, easily fusible, partially soluble in alcohol (83·1 per 1000), almost entirely in ether, perfectly in oil of turpentine and the fixed oils; sulphuric acid dissolves and gives it a red colour. Two parts of colourless dammer and 2½ parts of oil of turpentine, make the best varnish for lithographic drawings. This occurs in sticks much resembling in shape the black dammer, but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown, the two colours being frequently blended in the same lump, and giving it the appearance of having a regular 'grain.' It is friable, and differs from the white dammer of the western coast in its inferior hardness, its opacity, and its peculiar form, and from the black dammer in its colour. There are extensive tracts of shorea forest in the Gumsur and Cuttack provinces. The Khond and Uriya races living in and near these jungles, wound trees in several places; the resin issues, and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark colour. The Khond and Uriya races make the leaves into plates, from which they eat their food, and also roll up tobacco in them to smoke like a cheroot. In time of famine, the above tribes live on a soup made from the fruit of this tree.

Shorea tumbuggaia grows on the western coast, but does not appear to produce much, if indeed any, of the resin collected for sale.

Poon-yet and *Pwai-ngyet* dammer of Burma is found on several different trees, sometimes also in a hollow among rocks, sometimes in the ground, and occasionally even in the hollow post of an old house, amongst them the Dipterocarpus lævis and Hopea odorata. The Rev. C. S. Parish says it is a combination of various gums and resins, probably also of oils gathered by the Trigona læviceps bee, and built up and moulded very much as wax is moulded, except that the wax formed by the honey bee is in cells of perfect and uniform symmetry, while the cells of Pwai-ngyet have no regular form. When it builds its nest in the hollow of a tree, the aperture is lined with Pwai-ngyet, and its rim is sometimes prolonged to a somewhat flattened trumpet-mouth shape, of a perpendicular diameter a foot or so, and 3 or 4 inches of transverse diameter. From 19 lbs. to 38 lbs. are obtained from one nest. Some of it is very like the dammer of the Hopea odorata. For caulking it is mixed with earth-oil or petroleum. One kind which this bee collects is very like the resin of Bursera acuminata, a tree of Canara.

Canarium Bengalense is a native of Sylhet and the adjacent mountainous countries, also Malabar, Tinnevelly, and Courtallum. It flowers in May and June, yields a large quantity of very pure, clear, amber-coloured resin, which soon becomes hard and brittle, and is not unlike copal. In the Calcutta bazar it sells at 2 to 3 rupees per maund of 86 lbs. C. nigrum, *Roxb.*, of the Amboyna and Molucca islands, yields a reddish, soft, viscid substance from wounds in its bark. C. strictum, *Roxb.*, of the alpine forest of Courtallum and Tinnevelly, is regularly rented for its dammer. When adhering to the tree it has a bright shining black appearance. From this the tree is called the black dammer tree, to distinguish it from the white dammer tree, Vateria Indica. The Canarium strictum is the Carpoo coongilium of Ainslie, the Dammara nigra legitima of Rumphius, and the Canari of the Malays. Its resin occurs in large stalactitic-shaped masses, of a bright shining black colour when adhering to the tree and viewed from a distance, but translucent and of a deep reddish-brown when held in thin laminæ between the eye and the light. It is perfectly homogeneous, and has a vitreous fracture. Its shape appears to be due to the fact of the balsam having exuded in a very fluid state, and trickled down the trunk of the tree, where it gradually hardens by exposure to the sun, the fresh resin continuing to flow over that already hardened, gives rise to the stalactitic appearance of the huge lumps of resin, the outside of which much resembles the guttering of wax caused by placing a lighted candle in a draught. It is insoluble in cold, but partially soluble in boiling alcohol on the addition of camphor; when powdered it is readily soluble in oil of turpentine. Powdered and burnt on the fire, it emits a more resinous smell, and burns with more smoke, than white dammer. The size of the lumps of this resin, together with its colour and the peculiarity of shape already mentioned, suffice to distinguish it from other Indian resins. Mr. Brown of Trevandrum says the black dammer of Canarium strictum seems to be a great favourite of several species of insects, especially of one resembling a bee, called

by the hill-men Kalliada, which lives in holes in the ground.

Under the names of elemi, also E. Indian elemi and Manilla elemi, a concrete resinous exudation is imported into Great Britain from Manilla. It is said to be from the Canarium commune, but this is doubtful. It is of a yellowish white colour.

Others of the dammers are obtained from the Hopea micrantha, yielding the Damar mata kuching and Damar batu of the Malays, and H. odorata, yielding the Thengan-tsi of the Burmese, the last named greatly resembling the E. I. dammer from Dammara orientalis.

Dammara orientalis, a huge tree of the Archipelago, bas been designated by seven names by different botanists, viz. Abies dammara, *Poir.;* Agathis dammara, *Rich.;* Ag. loranthifolia, *Salisb.;* Dammara alba, *Rumph.;* Dammara loranthifolia, *Spach.;* Pinus dammara, *Lamb.;* and P. Sumatrana, *Hort. Belv.* It yields the Damar puteh (wbite) and Damar katu of the Malays. It hangs from tbe tree like icicles, and is sold in Great Britain as East Indian dammer, to be used by varnish makers. Externally it is whitish from the powder; below that, it is of a straw colour or pale amber.

Cassia auriculata gum is prized in India for its medicinal value.

Camphor and *Camphor Oil* of commerce are obtained from the Dryobalanops camphora of Sumatra and Borneo. The oil is employed in rheumatism and as a varnish.

Dragon's blood, in lump and in reed, is used as a pigment. It is supposed to be derived from Calamus draco of S. China, Java, Sumatra, and perhaps of Burma.

Galbanum is a product of the Ferula galbaniflua, *Buhse*, a plant of Persia, but other species are also indicated as yielding both it and sagapenum.

Gamboge.—Several of the Garcinia yield the gamboge of commerce, but G. morella, pictoria, and Wightii, of the best qualities, and the most abundantly.

Gardenia.—The Dika malli or Kumbi pisin of India, a resin valuable in native surgery, is from the G. gummifera and G. lucida.

Garjan oils, from the Dipterocarpus alatus, D. incanus, and D. turbinatus, are known also as wood-oils. They are large trees, natives of Burma and the islands in the Straits of Malacca. At the end of the dry season, in March or April, several deep incisions are made with an axe into the trunk of the tree, and a good-sized piece scooped out. Fire is placed into the cavity, and is kept burning till tbe oil begins to run. This when allowed to rest, separates into two layers, the upper consisting of a clear cbesnut-coloured liquid balsam, and the lower, which is a flocculent deposit of the more solid resin, of a light ash colour. They are much used as natural varnishes for in-door work, but wben dry are very brittle, and require constant renewal. The wood-oil of the D. tuberculatus, a tree of Chittagong and Burma, is known to the Burmese by tbe name of Eng.

Doona Zeylanica, Thwaites, yields Doona dammer. In colour and appearance it much resembles pine resin.

Gab, tbe resin of the Diospyros glutinosa, is used for caulking boats and canoes.

Hardwickia.—The dark red balsam of the Hardwickia pinnata is exactly like copaiba in appearance and properties. It is a tree of the Travancore Ghats and of S. Canara.

Liquidambar genus has two species, L. altingia and L. orientale, both of them furnishing useful balsamic products. That of tbe former, a tree of Tenasserim and tbe Archipelago, is the Rose Maloes of commerce, the Rasa-mala of the Javanese, a fragrant balsamic fluid. It is obtained by putting fire around the tree. The L. orientale of Anatolia and Asia Minor yields the liquid storax, an oleo-resin which is imported into India. It is not the storax of the ancients. Its liquid storax is obtained by pressing the inner bark. The outer bark is burned as a perfume.

Melanorrhœa usitatissima of Manipur and Burma yields a valuable natural varnish, which is extensively used.

The black varnish of Ceylon is from a species of Semecarpus. It is equal to the black varnish of China for lacquering.

Olibanum, also known as Luban, has been shown by Dr. (Sir George) Birdwood to be a product of Boswellia Carterii, B. Bhau-Dajiana, and B. Frereana. Indian olibanum is from B. thurifera, and its varieties glabra and serrata. The Nagdana tree, one of the Burseraceæ, yields also a luban of the bazars. B. thurifera, *Coleb.*, of the Coromandel hills, S. Konkan, Belgaum, and Bundelkhand, is a gum-resin used as a grateful incense, but is used in medicine for its stimulant, astringent, and diaphoretic properties.

Turpentine of good quality is obtained by incisions in the trunk of the Pinus longifolia of the Himalayas. It is the Ganda-baroza of Indian commerce. It is used medicinally, internally, and oil of turpentine is extracted from it. Tar is obtained by burning chips of the wood. Tar is obtained also from chips of Pinus excelsa and of Cedrus deodara. Pinus Massoniana of Burma and Japan yields a crude turpentine.

The oleo-resin from the Cedrus deodara is the Kelon-ka-tel of the natives of Northern India.

Sarcocolla has been by some supposed to be a product of Penæa mucronata, but others think it is from an umbelliferous plant.

Ceylon fishermen pay their boats' bottoms with a tar obtained by the smothered combustion of chips of the Sethia Indica, a tree of S. India and Ceylon.

REUNION, formerly called Bourbon, an island in the Indian Ocean, discovered in 1545 by Mascarenhas, a Portuguese. It is 49 or 50 miles long, and 27 broad. Its highest peak, a volcano, Piton des Neiges mountain, is 10,334 feet; Grand Bernard, 9743 feet; Piton de Fournaise, 7217 feet high. The lighthouse on Bel-air Point is in lat. 20° 53′ 20″ S., and long. 55° 39′ 25″ E.

REVACHIL is the ancient designation of an important range in the geography of Saurashtra.

REVALENTA ARABICA, a meal from the Ervum lens, a pulse grown all over India, and eaten as a dal in food, but is said to be heating, and to cause eruptions if too much indulged in. The flour of this plant was highly extolled as a farinaceous aliment. By a slight change, Ervum lens became the Ervalenta; and another person, by another little change, sold the same article as Revalenta, adding the term Arabica to denote its Asiatic origin.—*Dr. J. L. Stewart; Hassal.*

REVATI, daughter of raja Raivata, was married to Balarama, the elder brother of Krishna, to whom she bore two sons.—*Wh. H. of I.*

REVATI, in Mysore, rain in the spring months, 28th March and 11th April. The land is ploughed at this time.

REVATI DULAGONDA or Dula Gondi. TEL. Tragia cannabina, *L.* Dulagonda is a term used generally for a stinging plant, and the addition of revati more particularly refers to tragia, while Pedda dulagondi is more properly applied to Mucuna pruriens.

REVENUE BOARD, in British India, in Calcutta and Madras, a Board of three members who superintend the revenues of the country. There is no Revenue Board in Bombay, but there are two Revenue Commissioners, between whom the collectorates are divided, and who correspond immediately with Government, and are also Police Commissioners of their respective divisions.

During the occupation of India by the British, the land revenues have been superintended by its ablest officers; for even yet it is one of the three chief items to meet the expenditure, the other two being from salt and opium. In the south of

India, at the close of the 18th and beginning of the 19th century, Sir Thomas Munro reported at length on the land revenue; and in Northern India, reports on the settlement of the land revenue in the North-Western Provinces, under the thirty years' regulation IX. of 1833, were drawn up by men, many of whom obtained a name for themselves as administrators. Thomason reported on his settlement of Azimgarh, Edward Thornton on Saharunpur and Muzaffarnagar, H. M. Elliot on Meerut, John Thornton on Aligarh, R. Money on Moradabad, R. H. P. Clarke on Rudaon, W. J. Conolly on Bareilly, J. W. Muir on Shahjahanpur, G. F. Edmonstone on Minpuri, C. G. Mansel on Agra, M. R. Gubbins on Etawa, H. Rose and W. Muir on Cawnpur, R. Montgomery on Allahabad, and E. A. Reade on Gorakhpur. Garhwal and Kamaon were reported on by J. H. Batten, Dehra Doon by A. Ross, Hamirpur by C. Allen, and the Calpee Parganas by W. Muir. Traces remain of the office of lord of a thousand villages, described in Menu as the head of the Hindu revenue system, but chiefly in the Dekhan and other southern parts. These are called in Maharashtra, Sir-Desmukh, their districts are called Sirkar or Prant, and their hereditary register is the Sir-Despandi. Below the pargana division is the lordship of ten or twenty towns, called Naikwari, Tarraf, etc., and the chain ends with individual villages.

REWAH, a town in Baghelcund, in Central India. It is in lat. 24° 31′ 30″ N., and long. 81° 20′ E., and gives its name to a feudatory state; area, 13,000 sq. miles; population, 2,035,000. The founder of this principality was Bilagar Deo or Biag Deo. Leaving his own country in Gujerat in 580 A.D., ostensibly on a pilgrimage, he made himself master of the fort of Murpha, and eventually of most of the country from Kalpi to Chendalgarh, and married the daughter of the raja of Perhawan. In 1847, the ruling maharaja abolished sati throughout his dominions. For his services during the mutiny of 1857, the tracts of Sohagpur and Amarkantak, with the distinction of K.C.S.I. and a salute of 19 guns, were conferred in sovereignty on Raghuraj Singh. He holds a sanad of adoption. The state is rich in minerals and forest produce. The principal landholders are Brahmans, Thakurs, Kurmi, and Gond.—*Imp. Gaz.*

REWAKANTA forms the chief of a political circle in the Bombay Presidency. Total area, 4793 square miles; population (1872), 505,732.—*Imp. Gaz.*

RHABDOMANCY. Tacitus informs us that among the ancient Germans, who were originally Scythians, the prototype of Rhabdomancy was engraven on rods. The Chinese had also rods with similar inscriptions. The Arabs, before the birth of Mahomed, divined by bundles of arrows in the Kaba. Mahomed destroyed this practice.

RHACOPHORUS, the flying frog of Borneo, a species of Rhacophorus, has very long and fully webbed toes, which it spreads out when leaping. It is a tree frog, and by spreading out its membrane can descend from very high trees to the ground.—*Wallace.*

RHADIA, also Rhadika, mistress of Krishna.

RHAIRA GARH, the most important of the Ch'hattisgarh feudatory states. It consists of four parganas or subdivisions, with 585 villages, mostly lying in the richest part of the Ch'hattisgarh plain.

RHAMNEÆ. *Lindl.* The buckthorn tribe of plants, comprising the genera Zizyphus, Berchemia, Sageretia, Ventilago, Rhamnus, Scutia, Hovenia, Colubrina, Gouania, Apteron, Helinus, Smythea. Hovenia dulcis, *Thunb.*, is cultivated in the Himalayas for its edible fruit, and it has a light-coloured wood. Ventilago maderaspatana, *Gært.*, is valued for the red dye obtained from its root, and for the fibre of its bark. The genus Rhamnus furnishes both woods and dyes, and fruits and timber are obtained from Zizyphus. Several species of rhamnus grow in the Himalaya and China. In Europe the juices of the unripe fruits of Rhamnus infectorius, catharticus, and virgatus, known as Turkey or French berries, are used for dyeing leather yellow. When mixed with lime and evaporated to dryness, it forms the colour called sap-green. M. Rondot's Notice du Vert de Chine contains specimens of calico and silk dyed with green, and engravings of two plants, Rhamnus utilis and Rhamnus chlorophorus, from which it is derived. These plants were new to European cultivators; they are, however, allies of the Rhamnus theezans, which has long been known as a tree from which the poorest class of Chinese pluck the leaves to use as a substitute for tea. The colour of the dyed silk is remarkably bright, a blue green,—one of that class of colours which increase in brilliance in the light. It contains, in fact, some immediate principle which can only be developed by light, and it was a nice task for chemists to discover what this is. M. Persoz says that light will have to be more and more regarded as an industrial agent; and of the Chinese green he remarks that it is sui generis, containing neither yellow nor blue. By experiments made at Lyons, it appears that six species of the European rhamnus will yield a green dye. See Dyes.

Rhamnus chlorophorus, *Lindley*, a superior green pigment, called Lo Kao, is prepared from the bark.

The bark of R. utilis, also from China, is similarly employed. It is particularly used for silk.—*Von Mueller.*

Rhamnus incanus, *Roxb.*, a tree of the Moluccas, with small, greenish-yellow flowers.—*Roxb.* i. p. 603.

Rhamnus nabeca, *Forsk.* The fruit, called Nebek, is eaten, and the leaves are used for the purpose of washing dead bodies.—*Burton's Mecca*, ii. p. 105.

Rhamnus pauciflora and R. staddo in Abyssinia, yield an ardent spirit.

Rhamnus Persicus, *Boiss.*

Sherawane, . . PUSHTU.	Kukai, Wurak, TR.-INDUS.
Jalidar, . RAVI, SUTLEJ.	Nikki Kander, Nar, ,,

A common shrub at 2000 to 5000 feet on the Salt Range and the low hills beyond the Indus. Its small black fruit is said to be sweet, but when eaten in excess to affect the head.

Rhamnus purpureus, *Royle.*

Kari, Tadru, . CHENAB.	Kunje, Tunde, . . RAVI.
Memarari, . . . ,,	Tunana, Madana, . ,,
Bal, Sinjal, . . JHELUM.	Chaterni, . . SUTLEJ.

This small tree is common up to near the Indus at from 4500 to 9500 feet. In Hazara its fruit is used as a purgative.—*Dr. J. L. Stewart*, p. 42.

Rhamnus utilis, affording a green dye in China.

Rhamnus virgatus, *Roxb.* i. p. 604.

Reteon, Sindrol, . BEAS.	Nar, Tadru, Dadur, KANG.
Mamral, . . . CHENAB.	Muttu, Romusk, SUTLEJ.
Phipni, Dadru, JHELUM.	Niar, Chattr, . . ,,
Tudur, Seta pajja, ,,	

A small tree of Kaghan, common on all the Panjab rivers up to near the Indus at from 4000 to 9500 feet; grows along the Himalaya and on the Neilgherries. Fruit bitter; and when eaten, causes diarrhœa.—*Voigt; Cleghorn.*

Rhamnus Wightii, *W. and A.*, is the Rugtrorar of Bombay.

RHAPIS FLABELLIFORMIS. *Ait., Linn.* An exceedingly slender palm of China and Japan, grows to a few feet in height. It is excellent for decoration.—*Von Mueller.*

RHAZES, the literary name of Muhammad-bin-Zakaria, Razi.

RHAZYA STRICTA. *Dne.*

Sanwar, ... Hind.	Gandera, . . Tr.-Indus.
Vena, . Sutlej, Ravi.	Ganera, . . ,,

Grows all over the hill-sides at Attock; fruit applied to boils.—*Powell; Stewart.*

RHE, Rhei, Re, or Rey, the Rhages of the Apocrypha. Its ruins are a few miles south of the city of Teheran. They cover a vast extent of ground, and have supplied materials for the modern capital of Persia. The scriptural accounts of Rhe, Rhei, or Rhages, during the captivity of the Jews in this part of the Babylonian empire, fully prove that Rhei was a very considerable city at least two hundred years before the Jews' deliverance. All oriental writers agree upon its antiquity, and it is called 'the mother of cities.' It was once a very large place, the capital of the Jabbal (the hills), and very rich and flourishing. In A.D. 906, Rhages was taken by Ismail, founder of the Samanee dynasty. It ceased now to be a seat of empire, and in A.D. 967 became the capital of the house of Shemgur, a race of petty princes who maintained a kind of independence, while the dynasties of Samau and Dilemee divided the empire of Persia. In A.D. 1027, Rhages was the last conquest of Mahmud of Ghazni.—*Porter's Tr.* i. p. 357; *Markham's Embassy*, p. 99; *Smith's Dic.; Malcolm's Persia; Ferrier's Journeys.*

RHEA of Assam, China grass.

Kankhora, Gamb, Beng.	Rami, ... Malay.
Inan of Bonoa, . . ,,	Sidziafi, Marian Islands.
Goon, ... Burm.	Poah, ... Nepal.
Chu-ma, Tchou-ma, Chin.	Calooee . of Sumatra.
China grass, . . . Eng.	Keperit, Kapierit, Sunda.

The plant yielding this valuable fibre is the Urtica nivea, *Linn.*, the Urtica tenacissima, *Roxb.*, the Boehmeria nivea of later botanists, and the Ortie blanche sans dards de la Chine of French writers. The specific names characterize the snow-white, strong fibre, and the non-stinging nettle. It seems to be also known as the Boehmeria sanguinea, from the circumstauce that although when growing the back of the leaf is white, with green veins, at maturity it assumes a reddish-brown hue. It is a native of Assam and of China, seemingly also of Japan, Java, and Borueo, and from it the China grass fibre is obtained, called in China Chu-ma or Tchou-ma. The preparation of the fibre is tedious, and is what causes the difficulty of sending the fibre at a cheap rate into market.

In 1869, the Governmeut of India offered two prizes, of £5000 and £2000, for the best and second best machines for cleaning the fibre, but only £1500 was awarded for an inferior one. In 1872, out of thirty-two machines entered, only two were actually brought forward, and one of these was withdrawn. The remaining machine, belonging to Mr. J. Greig, jun., of Ediuburgh, was worked during a period of three weeks before Colouel Hyde, the judge, in the presence of the owner, who had brought it to Saharunpur in person. The couditions were that the machine should turn out a ton of fibre at au expense not exceeding £15, including all items, such as interest, wear and tear, etc., and that the prepared fibre should be equal in value to at least £50 per ton in the English market. The machine was valued at £200. There are now two machines and two processes that claim to treat green fibre successfully. The cultivation of rhea has been successfully introduced into the south of France, Algeria, and the Southern States of America.

In the native process, Major Hannay writes, 'when the stalks have become brown for about 6 inches above the roots, the top is seized with the left hand, and the leaves are stripped off by passing the right hand to the ground, near which the stalk is cut. The outer bark has first to be scraped off with a blunt-edged knife, when the exposed fibre still attached to the woody part of the stalk is exposed to the hot sun to dry. On the third morning, after being exposed to the dew for several hours, the fibre is drawn off. This is doue by breaking the woody stalk right through towards the thicker end, and then separating the fibre therefrom, drawing it off slowly towards the small end, and repeating the process as often as necessary, though much of the fibre remains, aud may be taken off at a second breaking. The fibres now require to be carefully washed. The hanks of fibre are then separately twisted at the upper end, and tied up in bundles. When the threads are required for spinning, they are prepared by drawing the single hanks several times with a blunt-edged slip of bamboo held in the right hand, when they are easily opened out to the required fineness with the fingers and thumb nails.' Dr. M'Gowan of Ningpo states that in China the last cutting is made in September, from which the finest cloth is made, the first being inferior, coarse, and hard. On being cut, the leaves are carefully taken off on the spot, the stalks taken to the house and soaked in water for an hour. In cold weather the water should be tepid. After this the plant is broken in the middle, by which the fibrous portion is loosened and raised from the stalk. Into the interstice thus made, the operator thrusts the finger nails, and separates the fibre from the centre to one extremity and then to the other. The stripping process is very easy. The next process is scraping the hemp, to facilitate which the fibre is first soaked in water. The strips of hemp are drawn over the blade of a small knife or scraper from within outwards, and, being pressed upon by the thumb, the fibrous portion of one surface, and the mucilaginous part of the other, are thus taken off. The hemp is then wiped dry, and the whitest selected for fine cloth. It is afterwards bleached.

The following directions for peeling the Chu-ma or Tchou-ma iu China, are translated from the Chinese. When the stems are all got in, they are split longitudinally with knives of iron or of bamboo. The bark is first removed, then the lower layer (which is white, and covered with a shrivelled pellicle which comes off by itself) is scraped off with a knife. The interior fibres are then seeu; they are to be removed and softened

in boiling water. If the Tchou-ma be peeled in winter, the stems must be previously steeped in tepid water, in order that they may be the more easily split. The first layer of Tchou-ma is coarse and hard, and is only good for making common materials; the second is a little more supple and fine; the third, which is the best, is used for making extremely fine light articles.

In China, this plant is of great value, in the Southern States of N. America the plant has flourished, but the 1880 Report on the Calcutta Botanic Garden doubts whether rhea fibre can be produced cheaply in that part of India.

In China, fields of rhea are said to last, with care and manure, for 80 to 100 years. It grows with the greatest vigour in damp warm climates. In the islands of the Indian Archipelago it is cultivated under shade. It requires a light but fertile soil, but it must be well drained. It is propagated from the separated roots, from layers, slips, or cuttings; in this way five cuttings of grown stems can be expected in the year after planting; from seed, no crop can be expected before the third year.

M. Favier describes the plant as giving out several stems, of which the number increases in proportion to the development of the root, which forms a kind of tuft or bush. The stems are woody, and have the appearance of thick, strong rods, the height varying from 5 to 12 feet. The roots, slips, or layers should be planted 18 inches apart, and after the first crop the alternate rows should be transplanted into new fields, leaving the remainder, about 3500 plants per acre, to spread and cover the ground. The yield in Java is said to be 44 stems per year from each stool, taken in four cuttings. Each stem in its green state weighs about 1 lb.; 100 lbs. weight of green stems yields 5 lbs. of a raw fibre or filament, which, by Muspratt's analysis, as quoted by M. Favier, contains 66 per cent. of pure cellulose. In the official reports to the India Office, with native hand treatment the crop is said to be 1000 lbs. of raw fibre per acre, taken in four cuttings. M. Favier states that in Algeria 1400 lbs. of fibrous thongs was the crop per acre, as calculated by Mr. Hardy, ex-Director of the Botanical Gardens there; while in the south of France as much as 1600 lbs. of filament have been obtained to the acre.

Mr. P. L. Simmonds, in 1873 (Journal, xxi. p. 762), stated that the crop gathered in Jamaica amounted to 300 lbs. per acre at each cutting, and that there had been five cuttings in the year, making the yield three-fourths of a ton per acre per year. While Mr. Bainbridge, in the discussion on Mr. L. Wray's paper, in 1869, stated that the result of his own experience in Assam was 750 lbs. green nettles, which gave 45 lbs. weight of fibre in each of three cuttings, making only 135 lbs. per acre per year (Journal, xix. p. 453). The yield appears to depend on soil, climate, and treatment. The properties of the rhea fibre place it in the first position among vegetable fibres; it is second to none in strength, while the fineness or attenuation of the fibre places it before flax, and it is equalled only by the pine-apple fibre. It can be used for any textile purpose, having been mixed with cotton, wool, and silk to advantage; it is in special demand for sailcloth, table napery, curtains, and tapestry; but from the very limited supply as yet available, the applications of this beautiful fibre are yet in their infancy.

Ban rhea, or Bun rhea, or Bon rhea is the jungle rhea of the Lepcha of Nepal, and is supposed by some to be the Dom rhea or China nettle in an uncultivated or wild state. But of this there is no proof, and it is more than probable that it is a distinct species of Boehmeria, possessed of many of the same properties as the ramee or rhea nettle. It grows very common in all the Assam province, but it is cultivated largely by the hill tribes on the west of Yunnan, and to a small extent by the Singpho and Dhoannea tribes of the North-Eastern Frontier of India, to be fabricated into a coarse cloth, but chiefly for nets. A five-inch rope of rhea fibre and one of Bon rhea each broke within a few pounds of each other, after sustaining a weight of more than nine tons. It is reported to be all that can be desired for either canvas or lines, and only requires to be known to be generally used for that purpose. The Bon rhea thrives best in the vicinity of water or of running streams. When unmolested, it grows into a tree, but by proper management of it any quantity of young shoots can be obtained; and as the divided roots of the plant afford numerous shoots, it can be propagated by slips as well as by the seed. This fibre is about 5 feet in length, brown in colour, strong and flexible.—*Roxb.; Voigt; Royle's Fib. Plants; Dr. M'Gowan; Theophile Moerman on Ramie*, 1874; *Dickson's Fibre Plants; Cal. Bot. Garden Report*, 1880; *Society of Arts Jo.* See Jute; Musa.

RHEA AMERICANA, the ostrich of the New World, is abundant in the pampas of La Plata and the adjoining states of South America, where it forms one of the most characteristic features of the scenery. It differs essentially from the true ostrich of the deserts of the Old World in its smaller stature, and in having three toes instead of two. Its habits in a state of nature have been well described by Mr. Darwin and other naturalists. There are now known three distinct species of this form of Struthious birds.

RHEEDE. Henry Van Rheede was Governor of the Dutch Possessions in Malabar. The Hortus Malabaricus, a botanical work in 12 vols. folio, was undertaken at his suggestion. The specimens were collected in 1674 and 1675 by Brahmans, and sent to Cochin, where drawings of them were executed by Mathæus, a Carmelite missionary; corresponding descriptions were at the same time made in the Malabar language, which were afterwards translated into Portuguese by Emanuel Carneiro, a Cochin interpreter, and from that into Latin by Hermann Van Douep, the secretary to the city of Cochin; the whole was under the superintendence of Casearius, a missionary there. The work was published at Amsterdam between 1686 and 1703, in 12 volumes folio, with 794 plates, and was edited by Commelyn, who added occasional remarks on the plants.—*Wight's Prodromus Floræ*, i. p. 7; *H. et Th.* p. 45.

RHEMBA, in Hindu mythology, one of Indra's court, who corresponds with Venus, the goddess of beauty. Rhemba was produced from the froth of the churned ocean.

RHENIUS, an eminent Protestant missionary, who arrived in A.D. 1813, and laboured in the Tamil-

speaking parts of the Peninsula of India during the early part of the 19th century. In 1815 he engaged in revising the version by Fabricius of the Bible, and in 1816 completed his translation of the New Testament, completing a second revision in 1827, and a third revision in 1831. He revised also the translation by Fabricius of the Old Testament, and died A.D. 1837.

RHEUM, a genus of plants belonging to the natural order Polygonaceæ. Several species grow in the N.W. Himalaya, and the roots of some of the species, known as rhubarb, are valuable in medicine. One species grows in Kaghan, where it is known under the name of Chotial. R. capsicum, *Fischer*, is a plant of the Altai; R. compactum, *Linn.*, grows in Tartary and China; R. crassinervium, *Fischer*, has heart-shaped leaves; R. leucorrhizon, *Pallas*, a plant of Tartary, is supposed to yield some of the best rhubarb of commerce; R. palmatum, *Linn.*, grows near the great wall of China and in the Himalaya; R. rhaponticum, *L.*, grows north of the Caspian; R. ribes is the Riwash of Persia; R. spiciforme, *Royle*, grows in Kanawar and in the N.W. Himalaya; R. undulatum, *Lam.*, is a plant of China and Siberia; R. Webbianum, *Royle*, grows at 12,000 feet on the Chur mountain. Dr. J. L. Stewart says that at least two species of rhubarb are frequent in parts of the Panjab Himalaya, from 6200 to 14,000 feet, R. Moorcroftianum occurring still higher, from 15,000 to 17,000 feet. The officinal ribas of the Panjab drug-sellers consists of the dried stalks from Kābul, which may partly be produced by the Rivas, or R. ribes, *Gron.*, a native of Carmel, also Eastern Persia, and the Hindu Kush. In Afghanistan the plant is always wild, and appears to grow abundantly in many parts. When green, the leaf-stalks are called riwash, and when blanched by heaping up stones and gravel round them, are called chukri; when fresh (in which state they are sometimes brought to Peshawur in spring), they are eaten either raw or cooked, and they are also dried for use to be eaten with other food, and are sometimes made into a preserve. The root is imported into Afghanistan and India, to be used as a purgative. It is stated by Moorcroft that the Bhotia of Garhwal apply the powdered root to wounds and bruises, and that they use it with Rubia cordifolia and potash for dyeing red. R. emodi, *Wall.*, R. Moorcroftianum, *Meisn.*, R. spiciforme, *Royle*, yield the officinal rhubarb root. The genus has many useful plants.

Rheum australe, *Don.*

R. emodi, *Wall.* | R. Webbiana, *Royle.*

A plant of the N.W. Himalaya up to 16,000 feet. It is less active as a purgative, and more spongy in texture. Honigberger mentions that it vegetates in wild luxuriance on the Kashmir mountains, is considered as one of the best rhubarbs, notwithstanding the coarse appearance of its exterior, and it can be had fresh and cheap in any quantity, and at any time.

Rheum Moorcroftianum, *Meisn.*, was found by Moorcroft near the Niti pass in the Himalaya at an elevation of 12,000 feet. The root yields a valuable medicine (chukri), while the leaf-stalks are agreeably acid and cooling; 'tror' are eaten as a vegetable.

Rheum officinale, *Boullen*, W. China and E. Tibet, Turkey.

Rheum palmatum, *L.*, rhubarb.

Khagi, ... Arab.	Chukri, Ribas, . . Panj.
Ta-rok-tsha, . . . Burm.	Variatu kalang, . Tam.
Rewand Chini, . . Hind.	

The stalks are extensively eaten in Kābul. The root is used by Europeans as a stomachic and astringent in small doses, and as a purgative in larger ones, especially in dyspepsia and strumous affections. A variety from the Tanqut country yields the Kiakhta or Kan-su rhubarb of Maximowicz.

Rheum rhaponticum, *Linn.*, R. tataricum, *L. f.*, and R. undulatus, *Linn.*; their acidulous leaves and unexpanded flower mass are used for culinary purposes.—*Powell; Honigb.; Cleghorn, Report; Stewart; Royle's Ill.; Moorcroft's Tr.; Von Mueller.* See Rhubarb.

RHI of the Byansi or Hiunra, an avalanche.

RHINACANTHUS COMMUNIS. *Nees.*

Justicia nasuta, *Roxb.*

Jui pani, Jui pona, Beng.	Pul-colli, . . . Maleal.
Tong-pang-chong, . Chin.	Puekolli, . . . ,,
Palek julu, . . . Hind.	Naga mulli, . . . Tam.
Kabutar ka-jahr, . ,,	Pilkolu, ... Tel.

Grows throughout British India, where it is used as a remedy in snake-bite, and the root as an excitant. A tincture of the fibrous root is used in ringworm.—*O'Sh.; Riddell; Irvine.*

RHIND, a great race of 44 clans dwelling in Gandava in Baluchistan. They are not of the Brahui stock, and their traditions allege that they immigrated ages ago from Damascus and Aleppo. Their language is the Jetki, in common with that of the other inhabitants of Cutch Gandava, and Mard-i-Rhind means a brave man. Gandava is a great level tract, inhabited by three very distinctly marked races, the Jet or Jat; the Rhind, including the Maghazzi; and the Brahui. The Jat seem the original race, and they occupy the centre of the province. The Rhind, with their lawless subtribes the Jakrani, Dumki, Bugti, and Murree, are a more recent intrusive race dwelling on the skirts. The Doda, a division of the widely dispersed great Murree tribe, have, for the last three centuries, occupied the hill ranges east of the plain of Cutchi. The Murree are a brave race, and have long been distinguished as daring depredators. Harand and Dajil, in Cutch Gandava, but bordering on the Indus, are inhabited by the Gurchani tribe of Rhind, and have the Mazari on their south. The Rhind of Cutch Gandava are of the Utanzai division. The Rhind clans reside as under:—

Utanzai, at Suran.	Homorari, at Tambu.
Dumki, at Lehri.	Pushkh, at Johan.
Jakrani, at Lehri.	Jamali, at Rojan.
Doda Murree, at Kahan.	Kallui, at Lup.
Mandarari, at Rodbar.	Kuchik, at Kirta.
Bugti, hills E. of Lehrat.	Pugh, at Kajuri.
Sing Soloh, at Teriki.	

The Dumki, Jakrani, Bugti, and Doda Murree were always distinguished by their rebellious and predatory habits; they indulged these in attacks on the British armies west of the Indus. The Murree tribe is considerable, and inhabit the eastern hills of Cutch Gandava, and a peaceful and obedient portion of the tribe are in the hills west of the province below Jell. A large portion are at Adam Murree, on the S.E. frontier of Sind. The Murree of Cutch Gandava were notorious for their lawless habits, and for making frequent inroads on the plains. They and the Maghazzi seem to have

emigrated from Makran to Cutch Gandava at different periods, and to have become incorporated with the Jat cultivators. The minor Rhind tribes residing in the north-eastern hills of Saharawan are the—

Kallui, at Lup.	Mandarari, at Rodbar.
Kuchik, at Kirta.	Pugh, at Kajuri.
Pushkh, at Johan.	

The Gurchani inhabit Harand, and south of these are the predatory but nearly independent Mazari tribe. The Maghazzi are subdivided into four principal families or clans, of which the Butani of Jell are the most important, and give the chief or sirdar to the whole. They boast of being able to muster 2000 fighting men, and between them and the Rhind a blood-feud long existed. The Maghazzi and Rhind are alike addicted to the use of ardent spirits, opium, and bhang. The Bugti are on the west bank of the Indus near Shikarpur in the east of Lehrat.

RHINIDÆ, a family of fishes. Rhina squatina, *L.*, occurs in all seas.

RHINOBATIDÆ, a family of fishes, as under:

Rhynchobatus ancylostomus, *Bl., Schn.*, E. Indies.
R. Djeddensis, *Forsk.*, Red Sea, Indian Ocean, Archipelago.
Rhinobatus thouini, *Lacep.*, Archipelago.
R. spinosus, *Gthr.*
R. halavi, *Forsk.*, China, Red Sea.
R. granulatus, *Cuv.*, E. Indies, Archipelago, Australia.
R. Philippi, *M. and H.*
R. obtusus, *M. and H.*, E. Indies.
R. Schlegelii, *M. and H.*, Japan and China Seas.
R. Banksii, *M. and H.*, Australia.
R. columnæ, *M. and H.*, Indian and Atlantic Ocean, Mediterranean.
R. Blochii, *M. and H.*, Cape.
R. brevirostris, *M. and H.*, S. Australia.
Trygonorhina fasciata, *M. and H.*, Australia.

RHINOCEROS, a genus of mammals belonging to the family Rhinocerotidæ, of which four or five species occur in Africa and in the East Indies,—R. Indicus, the great Indian rhinoceros; R. Sondaicus, the lesser Indian rhinoceros; and R. Sumatranus of Assam, Sandoway, and Sumatra. The rhinoceros was in Sind and the Panjab at least as late as Jordanus' time, and in Peshawur province 200 years later, to the time of Baber. The rhinoceros has been found fossil in Ava and Perim. Rhinoceros' hide is made into shields, sword handles, and ramrods, and its horn into goblets and drinking cups. Mr. Blyth has identified the two-horned rhinoceros of the Tenasserim Provinces with Rh. Crossii, *Gray*, and he refers the species to Rh. Sumatranus, auctorum, which attains a development of horn hitherto unsuspected. The skull of a one-horned rhinoceros shot by Dr. Hook near Tavoy Point, where there is a small isolated colony of the species, is that of Rh. Indicus and not Rh. Sondaicus. Seemingly all the species of rhinoceros attack the watch-fires of travellers. Fine horns of the Asiatic two-horned rhinoceros are difficult to procure, as they are bought up at extravagant prices by the Chinese, who call them Si-koh and Si-niu-koh, and their skins Si-pi. The inhabitants of the forests of Chantaburi chase wild beasts with firearms and nets; but they attack the rhinoceros armed with solid bamboos, of which one end has been hardened by exposure to the fire and sharpened. By loud cries and clapping their hands, they invite the animal to meet them, which he is wont to do by rushing violently upon them, opening and closing his wide mouth; they attack him in front, and drive the bamboos violently into his throat with surprising dexterity, taking flight on all sides. The animal, in its agony, throws itself on the ground, and, becoming exhausted by the effusion of blood and the extremity of its suffering, it soon becomes the prey of its courageous assailants. In their hunting expeditions, all the passages to a district are closed with nets, and, fire being applied to the jungle, the wild animals are destroyed as they seek to escape. The hairy-eared rhinoceros is the Rhinoceros lasiotis. A nearly adult female specimen, 'Begum,' as she is called, was captured near Chittagong, in British Burma, by some officers employed in the Kheddah department for the capture of elephants. In January 1872 she was brought to England by Mr. W. Jamrach, a well-known dealer in living animals, and purchased by the Zoological Society for the sum of £1250. The skin of the rhinoceros is made into a jelly by the Chinese.

Rhinoceros horn is the Si-koh and Si-niu-koh of the Chinese. Cups are made of the horn, which are imported from India, Cochin-China, Siam, Sumatra, Sze-chuen, Kwei-chau, and Kansuh. The black and pointed horns are most esteemed.

Rhinoceros Indicus, *Cuv.*, *Blyth.*

R. unicornis, *L.*	R. Asiaticus, *Blume.*
R. inermis, *Lep.*	
Gor, ... ASSAM.	Ganda, Genra, . . HIND.
Genda, Gonda, . HIND.	

The unwieldy great Indian rhinoceros, or small-horned rhinoceros, has one horn; it is found in the forest swamps and dense jungles at the foot of the Himalaya, in the Terai from Rohilkhand, in the Nepal Terai and Sikkim Terai from Bhutan to Nepal, but is most abundant in Assam and the Bhutan Doar. Its length is from 9 to 12 feet, and its height 4½ to 5 feet; horn occasionally 2 feet. It is herbivorous.

Rhinoceros Sondaicus, *Sol.*, *Muller*, *Blyth.*

R. Javanicus, *F. Cuv.*	Lesser Indian rhinoceros.
Warak, ... JAV.	Badak, ... MALAY.

This species has one horn, and is 7 or 8 feet long, and 3½ to 3¾ feet high. It inhabits the Bengal Sunderbuns in the forest tract along the Mahanadi river, and extending northwards towards Midnapur and on the northern edge of the Rajmahal Hills near the Ganges. It occurs also abundantly in Burma and through the Malayan Peninsula to Java and Borneo.

Rhinoceros Sumatranus, *Raffles.* R. Sumatrensis, *Cuv.* The Sumatran rhinoceros is not confined to that island, but occurs in the Indo-Chinese territories, in Assam, and from Sandoway, in lat. 23° N., to Sumatra. It has two horns. Dr. Oldham, while with the embassy to Ava, shot one which attacked his watch-fire.—*Blyth in J. B. As. Soc.; Jerdon's Mammals; Horsfield*, p. 195; *Wallace's Archipelago; Ibn Batuta*, iii. p. 100; *Baber*, pp. 292, 316; *Journ. Asiat. Soc.* i. tom. ix. p. 201; *Petis de la Croix, Timur*, p. 158; *Yule, Cathay*, i. p. 194; *Bowring's Siam*, i. p. 26; *Gray, P. Z. S.* 1854; *Phil. Tran.*, 1793; *Smith's Chin. Mat. Med.*

RHINOLOPHUS, a genus of bats of the subfamily Rhinolophinæ. Several species occur in

the East Indies. Drs. Jerdon, Kelaart, and Horsfield mention the following :—

R. affinis, *var.* rubidus, *Kel.*, Ceylon.
R. brevitarsus, *Blyth*, Darjiling.
R. fulvidus.
R. macrotis, *Blyth*, Nepal, Mussoori.
R. mitratus, *Blyth*, Central India, Mussoori.
R. Pearsoni, *Horsf.*, Darjiling, Mussoori.
R. per-niger, *Hodgs.*, Malabar, Himalaya?
R. Rouxi, *Blyth*, all India.
R. sub-badius, *Hodgs.*, Nepal, Himalaya.
R. tragatus, *Hodgs.*, Nepal, Mussoori.

These bats are said to hang with their body rolled up in their wings like a mantle. Their nose is furnished with a complicated apparatus, consisting of a cordate or semi-orbicular leaf.

RHINOPOMA HARDWICKII, *Gray, Blyth*, the long-tailed leaf bat, is found over almost all India, in Burma and Malayana, in old ruins, caves, and clefts of rocks.—*Jerdon.*

RHIO, a Dutch settlement on the eastern side of the Malay Peninsula, was obtained by them about the year 1817, from the king of Johore, for a monthly payment of 4000 guilders. Rhio Island, bordering the Straits of Rhio, is about eight or nine miles in circumference, and being separated from the mainland of Bintang by Rhio Strait, a very narrow channel, appears to form part of it. The town of Rhio stands on its north-west point, and was formerly a port of great trade, and seems still to enjoy a considerable traffic by small vessels. The little trade enjoyed by the settlement is chiefly with Java, several native vessels arriving annually from that island, which bring rice for the supply of the inhabitants, gambier being taken in exchange. The population in 1882 was 87,767, of whom 22,925 were Chinese.

RHIPIDURA ALBOFRONTATA, one of the fly-catchers of India. In habits it resembles the broad-tailed species, but the clearness of the white on its body and forehead suffices to distinguish it from the broad-tailed fly-catcher. Rh. fuscoventris is plentiful in gardens and wooded localities. It is not shy for its size, but is bold and fearless, and will attack birds much larger than itself. The song of the male consists of a few loud and pleasing notes, uttered while the little creature is dancing along the branch with tail and wings expanded like a fan.—*Adams.*

RHIZOPHORACEÆ, *Lindl.*, the Rhizophoreæ or mangrove tribe of plants, consists of trees, rarely shrubs, natives of salt swamps and marshes of the tropics, where they root in the mud, forming dense, most unhealthy, jungles down to the very edge of the ocean. The mangrove tribe comprises the genera Rhizophora, Ceriops, Kandelia, Bruguiera, Carallia, Anisophyllea, Gynotroches, Weihea, and Blepharistemma. The coasts of the Bay of Bengal and of the Indian islands, also the mouths of the Indus, abound in mangrove. The bark has been used for tanning purposes, for which it is probably more suitable than for cordage. The bark of Kandelia Rheedii is used by the Tavoy women in dyeing red, but Mason thinks only as a mordant. A species, called Kadol by the Singhalese, is found in the western and northern provinces of Ceylon, chiefly near the mouths of the rivers. Its wood weighs 65 lbs. to the cubic foot, and is used for common house-building purposes. A dye is extracted from the bark, and used for colouring leather, nets, sails, etc. Another Ceylon species, Hiri-koddol, SINGH., grows in the western and northern provinces of Ceylon, and it also is used for common house-building purposes. A cubic foot weighs 49 lbs. A dye is extracted from the bark.—*Royle's Fib. Pl.; Mason; Mr. Mendis; Roxb.; Voigt; Gamble.*

RHIZOPHORA CONJUGATA. *Linn.*

Rhizophora candelaria, *W. & A.* | Pyu, . . . BURM.

A small tree of Ceylon, Malabar, Tenasserim, and Java. Fl. middle-sized, white, faiutly scented.

RHIZOPHORA GYMNORHIZA. *Rheede.*

Hendeb kakora, . . BENG. | Kayu-api-api, . . MALAY.

This tree grows to a considerable size where the spring tides rise over it, as in the delta of the Ganges. The pith of the wood, boiled in palm wine or with fish, is used as food. The wood is of a yellowish colour, hard, and durable. Its chief use is for fuel and for posts with which to construct the native houses. The seeds of Rh. gymnorhiza and Rh. mangle germinate on the branches, and, after increasing to a considerable length, fall into the mud, where they stick with their sharp point buried in the mud, and soon take root. The roots of these trees, springing from the trunk and lower branches, form a complicated series of loops and arches from five to ten feet high, making an incomparable breakwater. The bark and roots of both these species serve for tanning leather and as a black dye.

RHIZOPHORA MANGLE. *Reede.*

Oopoopoma, Bhora, BENG. | Pee-kandel, . TAM., TEL.
Manggi-manggi, . MALAY.

This, the common black mangrove, is abundant on the shores of the ocean, within the delta of the Ganges, and in plenty at Arakan, Malabar, Singapore, and the Archipelago. The wood is dark-red, hard, and durable. In the Archipelago, a belt of it as deep as the reach of the tide wherever there is a shallow and muddy shore, rising to the height of 40 or 50 feet, and constituting a dense, almost impenetrable, forest. Each tree stands in a cradle of its own roots from five to six feet high, bare at low water, but at high water covered so as to give the appearance of trees growing in the sea. A mangrove jungle is the favourite resort of mosquitos and crocodiles, and affords a convenient and almost inaccessible retreat to the pirates. The bark is used to dye chocolate colour. This was one of the colours introduced by Dr. Bancroft, and for the exclusive use of which he obtained an Act of Parliament. The great length of the seed of this species gives, in a very short time, a young tree, for if the apex from which the root issues is only stuck a little way into wet soil or mud, the leaves quickly unfold at the opposite end.

RHIZOPHORA MUCRONATA. *Lam.*

Rh. mangle, *Linn.*	Rh. macrorrhiza, *Griff.*
Rh. candelaria, *W. and A.*	
Bhora, ... BENG.	Pukandel, ... TAM.
Uppu-ponna? . . ,,	Adavi ponna, . . . TEL.
Manggi-manggi? MALAY.	Pukandel, ... ,,
Kayu api api? . ,,	Uppu ponna, . . . ,,

Grows in Madagascar, Mauritius, Arabia, at Trincomalee, Calpentyn, Negumbo, and other parts of the Ceylon coast, along with Rh. conjugata, also in Malabar, the Sunderbuns, and Java. The wood is dark-reddish, hard, and durable. Weight, 70 to 75 lbs. per cubic foot. The flowers are large, white, and sweet scented. Bark used for tanning. —*Roxb.; Voigt; Thw.; W. Ic.; Crawfurd, Dict.; Rohde, MSS.; Gamble.*

RHIZOSTOMA, one of the Acalephæ, used by the Chinese as food. They solidify it by rubbing it over with alum.

RHODIA, an out-caste race in Ceylon, little numerous, forbidden to approach a temple or any of the higher castes. According to one tradition, these scarcely civilised beings were hunters who, on the eve of a solemn occasion, failing to obtain game, etc., murdered a child and sent its dismembered body to the king; but another tradition is to the effect that this caste persisted in eating beef after its use as food had been prohibited. The native laws forbade a Rhodia to approach a temple of Buddha or the gods, to build houses, or to live in any abode enclosed within walls,—and even to this day their dwellings are mere sheds,—nor even to cultivate the soil or possess land. They were forbidden to approach, much less to touch or breathe upon, a caste man; and all things they touch are unclean. The men wander about in parties or tribes seeking their precarious subsistence. Their women perform feats of legerdemain, and tell fortunes, their want of chastity being proverbial. Their numbers do not exceed a thousand, and they are principally in the Kandyan province, at Saffragam, Dombera, Wallepane, etc. Nominally Buddhists, they are also devil-worshippers. Rodeya or Rodda, in Singhalese literally means filth. In their social degradation, they resemble the Cagots and Caqueax, who from time immemorial have been held in abhorrence in the valleys of the Pyrenees and the plains of Bretagne, Poitou, and Guienne. They are living in small communities in kuppams or hamlets in different parts of Ceylon, but their language, customs, and observances are identical. They were formerly compelled to remain aloof from all other inhabitants, and even yet their very shadow is avoided, and held to contaminate and render impure any object on which it may happen to fall. They are mat weavers, beggars, thieves, and scavengers, and fall on their knees with uplifted hands before any Singhalese.—*Sirr's Ceylon*, ii. p. 215.

RHODODENDRON, a genus of plants belonging to the Ericaceæ. There are many species in the mountainous regions of the E. Indies, the better known being Rh. anthopogon, arboreum, campanulatum, Aucklandii, Blandfordiæflorum, Campbelli. Edgeworthii, Falconeri, grande, formosum, Hodgsoni, Maddeni, puniceum, and purpureum. Perhaps the most gorgeous of the native plants of Borneo are the various species of rhododendron, which there assume a peculiar form, being found epiphytal upon the trunks of trees. A species known as Brah in the N.W. Himalaya bears a bright red flower. Its wood is soft, used for charcoal and in zamindars' buildings. At Laghep, near Tumlung, Dr. Hooker gathered, in two days, seeds of 24 kinds, in the following order in ascending:—

Commencing at 6000 feet—Dalhousiæ, vaccinioides, camelliæflorum, arboreum.
Above 8000 feet—argenteum, Falconeri, barbatum, Campbelliæ, Edgeworthii, niveum, Thomsoni, cinnabarinum, glaucum.
Above 10,500 feet—lanatum, virgatum, campylocarpum, ciliatum, Hodgsoni, campanulatum.
Above 12,000 feet—lepidotum, fulgens, Wightianum, anthropogon, setosum.

Several species occur a little north of Cherra. On the hill above Choongtam village, in Sikkim, Dr. Hooker gathered, at 5000 to 6000 feet, Rh. arboreum and Dalhousiæ, which do not generally grow at Darjiling below 7590 feet. Dr. Hooker collected here ten kinds of rhododendron, which, however, are not the social plants that they become at greater elevations. Still, in the delicacy and beauty of their flowers, four of them, perhaps, excel any other; they are Rh. Aucklandii, whose flowers are five inches and a half in diameter; Rh. Maddeni, Rh. Dalhousiæ, and Rh. Edgeworthii, all white-flowered bushes, of which the two first rise to the height of small trees. In the Tonglo mountains, in Sikkim, the trees in order of prevalence were—the scarlet Rhododendron arboreum and barbatum, the latter 30 to 40 feet high, as large as bushy trees, both loaded with beautiful flowers and luxuriant foliage; Rh. Falconeri, in point of foliage the most supurb of all the Himalayan species. Next in abundance to these were shrubs of Skimmia, Laureola, Symplocos, and Hydrangea, and there were still a few purple magnolias, very large Pyri, like mountain-ash, and the common English yew, 18 feet in circumference, the red bark of which is used in Nepal as a dye and for staining the foreheads of Brahmans.

Rhododendron anthopogon. Poh, BHOT. It flowers in June; the whole plant is very fragrant, and is exported to Hundes for the Lamas, who use it for incense. This and Rh. setosum are two dwarf species with strongly scented leaves, and occur at an elevation of 12,000 feet near Wallanchun in East Nepal.

Rhododendron arboreum, *Sm.*

Mandal . . . of CHEN.	Urvail, . . . JHELUM.
Brah, Bras, Broa, DEAS.	Chiu, Dru, . . . RAVI.

Tree rhododendron, ENG.	Bilbe, Poo-maram, TAM.
Buraus, ... HIND.	Trikh, . . TR.-INDUS.
Ardawal, . . JHELUM.	Gandere, . ,,

This very gorgeous tree grows up to 8000 feet in the alpine Panjab, and in the mountains in the south of India. It has lanceolate leaves, acute silvery beneath, tapering to the base. It is one of the most beautiful of all trees, but too delicate to bear the open air in England. It is very common all over the Neilgherry Hills, either forming small clumps or dotted about. It grows 20 feet high, having a gnarled trunk and deep crimson flowers, in masses. The variety roseum, of Rh. arboreum, grows to the height of thirty and forty feet, in Sikkim, bears bright red, sub-acid flowers, which are made into jelly; wood brown, soft, used for charcoal and in zemindars' buildings; tree gives posts 6 inches in diameter.

Rhododendron argenteum, the white-flowered rhododendron, is found in Sikkim at an elevation of 8671 feet. It is a tree 30 feet high, having leaves very beautiful in the leaf-buds, erect and silky. The flowers are 2 to 3 inches long, 2 to 2½ inches in diameter, always white. The scarlet rhododendron (Rh. arboreum) is outvied by the great Rh. argenteum, which grows as a tree forty feet high, with magnificent leaves twelve to fifteen inches long, deep green, wrinkled above and silvery below, while the flowers are as large as those of Rh. Dalhousiæ, and grow more in a cluster. Few plants exceed in beauty the flowering branch of Rh. argenteum, with its wide-spreading foliage and glorious mass of flowers.

Rhododendron aromaticum. Its leaves, called Talesfur, are highly fragrant and stimulating; they are brought from Kābul.

Rhododendron barbatum, *Royle*, a tree from 40 to 60 feet high, branched from the base. It is one of the most beautiful of the Himalayan species, and is readily distinguished by its having bristly petioles and numerous branches floriferous at their apices. Dr. Adams observed the hill-sides covered with the scarlet-flowered Rhododendron barbatum in full blossom.

Rhododendron campanulatum, *D. Don.*

Leaves.

Tamaku, ... HIND.	Barg-i-Tibet, . . KASH.
Hulas, ... KASH.	Patti, Patr, . . ,,
Talespatr, Nik, . ,,	

Is found in the Sutlej valley between Rampur and Sungnam at an elevation of 10,000 to 14,000 feet. It vegetates on the Kashmir mountains; its leaves are officinal in Kashmir and Lahore, where they are administered as errhine, to produce sneezing. The leaves are imported from Tibet and Kashmir, under the names Barg-i-Tibet and Hulas-i-Kashmiri, and are used by the Kashmir natives as a snuff. Its bark is used for paper-making; the plant is very abundant.

Rhododendron cinnabarinum, the Kema Kechoong of the Lepcha (Kema signifying Rhododendron), is said to be poisonous, and when used as fuel it causes the face to swell and the eyes to inflame; of this Dr. Hooker observed several instances.

Rhododendron Falconeri, a white-flowered species, never occurring at less than 10,000 feet above the level of the sea, is one of the most striking and distinct of the genus. It occurs in East Nepal, and in point of foliage this is the most superb of all the Himalayan species, with trunks forty feet high, and branches bearing at their ends only, with leaves nineteen inches long. These are deep green above, and covered beneath with a rich brown down.

Rhododendron Hodgsoni. Its foliage is of a beautiful bright green, with leaves sixteen inches long. Its bark is as delicate as tissue paper and of a pale flesh colour.

Rhododendron epidotum, alpine rhododendron.

Tsuma . . . . of BHOT.	Talsur, ... PANJ.
Talesfar, . . N. INDIA.	Tsaluma, ... ,,

This is found in the Sutlej valley between Rampur aud Sungnam at an elevation of 10,000 to 14,000 feet. Leaves highly stimulant.

Rhododendron nivale spreads its small rigid branches close to the ground. It is the most alpine of woody plants, and was found by Dr. Hooker at an elevation of 17,500 feet.

Rhododendron puniceum, a common tree on the lower ranges of the Himalaya; the bark, called Kaephul, is brought to Ajmir from Dehli and Mirzapore, and is used as a rubefacient and sternutatory. Dr. Irvine found Kaephul and pounded ginger, mixed, the best substance with which to rub cholera patients to promote reaction; one maund costs five rupees. The fresh flowers are pleasantly acid, and are eaten by the hill-men to quench thirst during their ascent of the hills; the flowers are also made into a jelly.

Rhododendron Wallichii is a very distinct and handsome species, with lilac-coloured flowers. Its leaves are quite unlike any Indian species, and the flowers in colour and size resemble those of the much-cultivated Rh. ponticum.—*Royle, Ill.; Hooker, Journ. and Sikkim Rhodod.; Adams, Naturalist; Cleghorn, Rept.; J. L. Stewart; Eng. Cyc.; Honig.; Beddome; Irvine; Voigt; Low's Sarawak*, p. 65.; *W. Ic.*

RHODYMENIA JUBATA. *Grev.* One of the sea-weeds, a genus of the order Ceramiaceæ.

RHUBARB, Rheum radix.

Rewund Sini, . AR., PERS.	Reon, . . . GR. of Dios.
Ta-hwang, . . . CHIN.	Rewundchini, . . HIND.
Hwang-liang, . . ,,	Rewen, ... RUS.
Ho-san, ... ,,	Variattu kalangu, TAM.
Tahoan, . COCH.-CHIN.	

The rhubarb of commerce is obtained from a wide extent of country, from Ladakh, in long. 77½° E., to the Chinese province of Shen-si, 29 degrees farther east, and it receives distinguishing names according to the country from which it is exported. The names given to it by the European nations are modifications of rhubarb. About 50 tons are annually imported into Britain.

The Turkey rhubarb of commerce is called also Russian rhubarb, but in Russia is called Chinese rhubarb; it is imported into the frontier town of Kiachta, thence into Moscow and St. Petersburg, whence it is distributed to the rest of Europe.

Bucharian rhubarb makes its way to Vienna by Brody and Nischny, and is supposed to be the inferior sorts of Turkey rhubarb.

Chinese rhubarb, called also East India rhubarb, is produced in the mountains of Kan-su, but comes into the market in the three forms of Dutch trimmed or Batavian rhubarb, half-trimmed or Chinese rhubarb, and Canton stick rhubarb.

Siberian rhubarb, called also Siberian rhapontic root, is supposed to be the product of R. rhaponticum.

Himalayan rhubarb is a product yielded by R. Moorcroftianum, *Royle*, by R. Webbianum, *Royle*, and R. spiciforme, *Royle*. A variety of rhubarb, termed riwash, is more or less plentiful in all the hills from Kalat in Baluchistan to Kandahar, and again from that place to Kābul. Attention is paid to its growth only by the inhabitants of Lughman, who supply the bazars of the city of Kābul. They surround the choicer plants with conical coverings of stones, so as to exclude light and air, and thereby produce that whiteness of stem so much prized. The unblanched plant is called chukri, and is also exposed to sale. It makes an excellent preserve, by being first saturated in a solution of lime and then boiled with shirar, or the inspissated juice of grapes, losing, however, in this case, its characteristic flavour. Rhubarb grows in abundance and to a large size in Barmor, and the valley through which the Ravi and its tributaries flow before reaching Dalhousie. A smaller variety, deemed by the natives to be superior in quality, grows in the crevices of the gneiss rocks forming the peaks above Dharmsala. The common dock, Rumex obtusifolius, is not so conspicuous in the waste places of a highland glen as is the officinal rhubarb on the bare rocks in the valley of Asrang. It extends five or six miles down the valley, and ascends the slope to 500 feet above the river's bed. Captian Houchen and the Lama of Asrang said that it is equally abundant in the adjoining valley of Dingering. The following

are four Himalayan species:—R. emodi, *Wall.*, Pindree glacier, etc.; B. Webbianum, *Royle*, Chur mountain; R. spiciforme, *Royle*, Werang pass; R. Moorcroftianum, *Royle*, Niti pass, and yield part of the Himalayan rhubarb. The Pen-ts'au, a Chinese work on medicines, places rhubarb at the very head of poisonous plants, and undoubtedly Chinese rhubarb, in China, is a very poisonous drug, causing severe purging and some prostration. It grows in Kink-chau-fu, in Hu-peh-li; Sui-teh-chau, in the N.E. of Shen-si; Lung-si-hien, in Kan-suh; Mau-chau and Ching-tu-fu, in Sze-chuen. —*Voigt; Smith's Mat. Med.*

RHUS. Of this genus of plants some species are poisonous, as R. venenata, perniciosa, radicans, and toxicodendron; but they are much cultivated as ornamental shrubs, especially on account of the beautiful red colour of their leaves in autumn. Many of them are used for the purposes of dyeing and tanning, as an astringent principle, to which is frequently added an acid, is common to the whole genus. R. suaveolens and R. aromatica exhale a pleasant odour; and some have acid berries, as R. coriaria and R. Buckiamela. Rhus cotinus has wood, called young fustic, which, as well as the berries, is astringent, and R. coriaria, known by the name of sumach, is a powerful astringent, chiefly employed in tanning leather. The seed of R. parviflora, tuntereck, is frequently substituted in India for that of the sumach. R. glabra is considered a febrifuge. Rhus vernix, a Japanese tree, exudes a whitish resinous juice, which soon becomes black in the air. R. succedanea and R. vernicifera, both common to the Himalaya and Japan, are said, in the latter, to yield a similar product. Species of other genera, as of Schinus, contain a resinous matter. A Rhus, the Coongilliya maram of the Tamils, grows in Coimbatore, very nearly allied to Roxburgh's R. Buckiamela, but distinct. Its outer sap-wood is white, fine-grained, and heavy, apparently very good. In the N.W. Himalaya, titar, titri, and tatri are generic names for most of the species. Other species are R. Griffithii, insignis, Khassyana, Mysorensis, and paniculata.—*Royle's Il.* p. 179; *Wight in M.E.J.R.; Thun.*

RHUS ACUMINATA. *D.C.* Sumach tree.

Arkhar, Rikhul, . Beas.	Kurku, . . Kanawar.
Lakhar, Titar, . . Chen.	Kakur-singi, . ,,
Kakkar, . . Kanawar.	Arkhol, . . Kangra.

This tree is not uncommon in the Kashmir valley, and occurs more sparingly to the eastward from 4000 to 7000 or 8000 feet. Vigne states that the juice of the fresh leaves blisters the skin, and the Kashmirians said the same to Dr. Stewart, but on his showing that his had not been blistered, they declared it only affected those who feared it. The wood is not valued. Bears are said to eat its fruit, which seems to be the officinal Habat-ul-khizra administered in phthisis.

RHUS BUCKIAMELA. *Roxb.*

R. amela, *G. Don.*; R. semialata, β Roxburghii, *D.C.*

Titri, ... Hind.	Hulashing, . . . Kash.
Rashin, . . Kanawar.	

Grows in Kamaon, Srinuggur, and the Peninsula of India.—*Roxb.; Voigt; Wight.*

RHUS CORIARIA. *Linn.* Sumach.

Tumtum, ... Arab.	Tatri, ... Panj.
Mutchlee h'sot, . . Hind.	Shumuk, Mahi, . Pers.

A native of Persia, Syria, Palestine, and the south of Europe, about 8 or 10 feet high, divided into numerous irregular branches. All parts of this plant have a styptic taste; to the abundance of tannic acid it owes its properties and value in the arts. The leaves are extensively used in Britain for tanning purposes. M. Tromsdorf found in the berries a large quantity of bi-malate of lime. Used by natives in cholera and indigestion.—*O'Sh.; Powell.*

RHUS COTINUS. *L.* Venus sumach.

Baura, Tung, . . Chen.	Ban, . Jhelum, Kangra.
Titri baghuna, . ,,	Tung, ... Ravi.
Paan, Jhelum, Kangra.	Larga, ... Sutlej.
Bhan, Bana manu, ,,	

A shrub of Kaghan, Himalaya, Salt Range, from 2300 to 6000 feet; grows three feet in girth. Wood yellowish, resembles that of Pistacia integerrima, used by the modern Greeks for dyeing wool; small twigs used for baskets, leaves and bark in tanning.—*Cleghorn; Stewart.*

RHUS DECIPIENS. *Wight.*

Pehunbive, . . . Singh.	Kattu puvarasu, . . Tam.

Grows in the central province of Ceylon and in the south of India. Dr. Wight says it yields a very fine, close-grained, light-coloured wood, and, if procurable of good size, the wood must be of considerable value.—*Wight; Mr. Mendis; M.E.J.R.*

RHUS PANJABENSIS, *Hooker*, is a moderate-sized tree of the N.W. Himalaya, growing up to 8500 feet. Weight, 36 lbs. to the cubic foot.

RHUS PARVIFLORUM. *Roxb.* Kakur and Tung, of the Panjab; found in the Sutlej valley between Rampur and Sungnam at an elevation of 5000 feet. Wood hard and yellow. Both this and R. acuminata yield beautiful wood, the native name, 'Kakur-singhee,' is from the long curved excrescences. The fruit of this species is called tantarik, and is used as medicine by the Hindus.—*Roxb.; Cleghorn.*

RHUS SEMIALATA. *Murray.* Sumach.

Hulug, Butairi, . Panj.	Tung, Titar, Titri, Panj.

A scarce tree of the N.W. Himalaya. Not so ornamental as other woods of this family.—*Cleghorn.*

RHUS SUCCEDANEA. *Linn.*

Choklu, Halashi, . Chen.	Hala, Halai, Halashi, Ravi.
Nu-ching, . . . Chin.	Kakrin, Kulashing, ,,
Titar, Tatri, . Jhelum.	

This tree appears to be found on most of the great rivers of the Panjab, from 3000 up to 8000 feet. It does not grow to a great size, nor is its wood valued. The juice of its leaves is stated to blister the skin. Its seed yields, on being pressed, an oil which soon congeals to the consistence of tallow, called Japan wax, from which in Japan candles are prepared. It is a substance of medium consistence between beeswax and the ordinary vegetable tallows. It is softer, more brittle and fatty than beeswax, is easily kneaded, and melts between 40° and 42° C. It contains twice as much oxygen as beeswax, and has a different composition, consisting of palmitic acid united with oxide of glycerile. It has been used in England as a substitute for wax and for hard neutral fat, and, after conversion with the acid, both for candles and night lights.—*Roxb.* ii. p. 98; *Cleghorn's Report; Oliphant; Thunberg, Tr.* iv. p. 93; *Smith's Mat. Med.*

RHUS VENENATA. *D.C.* The poison sumach, or swamp sumach of North America and Japan, is so exceedingly poisonous that it is said to affect some persons by merely smelling it; a touch will

sometimes produce violent inflammation. It is a beautiful shrub, and well worthy of cultivation, but great care should be taken to prevent its being carelessly handled.

RHUS VERNICIFERA. *D.C.*

Rhus juglandifolia, *Wall.*

Akhar, Rikhali, . BEAS. | Orrosino-ki, . . . JAP.
Gudambal, . . . CHEN. |

The varnish tree of Japan, is common in the Himalaya, in Kamaon, Nepal, and Garhwal. Its leaves are very large and beautiful, rendering it one of the handsomest of shrubs. Rhus vernicifera of Japan is met with all over the main island, but it is from Tokio northwards that it principally flourishes, growing freely on mountains as well as on plains. Sowing the seed one year, on the following spring the young trees are transplanted about six feet apart, and in ten years an average tree should be ten feet high, the diameter of its trunk 2½ to 3 inches, and its yield of lacquer enough to fill a three-ounce bottle. A more speedy method is, however, often adopted. The roots of a vigorous young tree, in pieces six inches long, and the thickness of a finger, are planted out in a slanting direction, a few inches apart, one inch being left exposed above the ground. These cuttings throw out a strong shoot of from 18 to 20 inches the first year, and are likewise planted out the following spring. Under equally favourable circumstances these trees would in ten years be nearly 25 per cent. larger in girth, and would yield nearly half as much more sap as the trees raised from seed. The usual age at which a tree is tapped for its lacquer is ten years; but occasionally a tree is tapped when only three or four years old. The best lacquer for transparent varnish is obtained from trees from 100 to 200 years old, as their sap has more body and is more glutinous. The whole country produces at present on an average about 120,000 to 140,000 gallons per annum. The first tapping takes place about the middle of June, the standard number of trees allotted to a tapper for the season being 1000, if the trees are about ten years old. The trees are first notched, the notches being about half an inch long, and seven or eight inches apart. After four days the tapper goes round again provided with the bark scraper, the ordinary scraping sickle, a summer spatula, and the pot to hold the lacquer, and first smoothing the bark where required, gives one cut above and one cut below the two lower marks, and one cut above the remainder of the other marks, the cut being in each case about an inch and a half long. After giving the cut the instrument is reversed, and the knife is run along the incision to insure the bark being entirely cut through. This process is repeated every four days, each incision being made a little longer than the preceding one, up to the fifth tapping inclusive, after which the remaining incisions are made of the same length. At each round, when all the requisite incisions have been made on the tree, the workman gathers the sap which has exuded with the spatula, beginning with the two lowest incisions, and so on to the uppermost cut. Twenty-five is considered the normal number of cuts, which, at the rate of one incision at each place every four days, occupy 100 working days. The branches are afterwards tapped, and the last operation is to make a number of incisions completely encircling the tree wherever the workman perceives a likely place. All the branches are cut off, and any sap which may remain in the larger ones extracted, the small branches which have not yet been tapped being tied in bundles and steeped in water for ten days. When taken out and dried, the bark is cut with a knife, and the sap which exudes is collected. These operations kill the tree in one season, but frequently the tree is made to last two years or more, by giving only half the number of incisions, and reserving the final cuts for the second or third year. The roots of the young trees throw out from three to five shoots the following spring, and these can be used in six or seven years.

RHYNCHOCINETES TYPUS, a shrimp of the Indian Ocean.

RHYSICOSIA VESTITA, a beautiful purple-flowered leguminous plant with small tuberous roots, cultivated to some extent in the Khassya Hills.—*Hooker's Jour.* ii. 287; *Oliphant*, ii. 136.

RHYZOMYS CHINENSIS, the Chinese bamboo rat or chuck-shu, is found in the western part of Kwang-tung.—*Williams' Mid. King.* 257.

RI. JAPAN. A long measure of 2·442 miles; about 30 go to a degree of latitude.

RIAL, in Turkish Arabia and Persia, a silver coin, nearly equivalent to two French francs, or about twenty pence English.—*Ouseley, Tr.* ii. 218.

RIBBON.

Ruben de soie, . . . FR. | Nastro di seta, . . . IT.
Band, ... GER. | Cinte de seda, . . . SP.
Pheet, . . GUJ., HIND. | Kordela, Sherid, . TURK.

Silken bands of various widths and colours, both plain and flowered, and distinguished into sarsenet, satin, etc., according to the manner in which they are made; used for trimming bonnets, caps, and other purposes.—*Faulkner.*

RIBBON FISH. One of these is the silvery hair-tail, Trichiurus lepturus, *Linn.*, of China and Corea. It averages 5 feet; it is edible.

RIBES, a genus of plants belonging to the natural order Grossulariæ, including the gooseberry, the currants. Among the species known in the East Indies are—

R. glaciale, *Wall.* | R. leptostachyum, *Dne.*
R. grossularia, *L.* | R. nubicola.
R. Griffithi, *H. and Th.* | R. rubrum.
R. laciniatum, *H. and T.* | R. villosum.

R. nubicola, R. glaciale, and R. grossularia, the currant and gooseberry, grow in N.W. Himalaya at 10,000 and 11,000 feet, but the fruit is tasteless. Dr. Cleghorn also mentions a small, sour, woolly gooseberry called bilitsi in Lahoul. To these species add the gwaldakh, or gooseberry of Kaghan, and the rasta, or currant of Lahoul, also R. nubicola and R. acuminata. R. leptostachyum, *Dne.*, the yellow currant, and R. nigrum, the black currant, are not uncommon from 7000 to 14,000 feet in the Himalaya, and the former at least grows in Tibet, and was found by Dr. Bellew at about 10,000 feet near the Safed Koh. The fruit of the latter is very like the cultivated black currant, and very fair eating. Ribes nigrum is used in preparing the liquor called ratafia.

Ribes glaciale, *Wall.*, Mangle, BHOT., is found in the Sutlej valley between Rampur and Sungnam at an elevation of 11,000 feet. Several varieties occur, but the fruits are without flavour.

Ribes Griffithii, *H. and T.*, grows in the N.W. Himalaya at 10,000 to 13,000 feet elevation. Its berries are austere.

Ribes grossularia, *L.*, gooseberry.

R. Himalensis, *Royle.*	Pilsa, Teila, . . CHEN.
Amlanch, Kansi, CHEN.	Sur-ka-chup, . SUTLEJ.

This is found on the Upper Sutlej, Chenab, and Jhelum; in Tibet, in the Sutlej valley, between Rampur and Sungnam, at an elevation of 8000 to 12,000 feet. Also near the Safed Koh at 10,000 feet.

Ribes rubrum, *Linn.* (R. Himalense, *Dne.*).

Hadar, Khadri, . BEAS.	Red currant, . . ENG.
Rade, Ans, . . . CHEN.	Dak, Dagh, . . JHELUM.
Phulanch Nangke, ,,	Warawane, . TR.-INDUS.

Occurs frequently in the Panjab Himalaya from 5800 to 11,000 feet, up to the Indus and probably beyond; it has a sweet, acid, nearly worthless fruit.—*Royle; Stewart; Cleg.; Powell.*

RIBEYRO. Juan Ribeyro, a captain in the Portuguese army, who went to Ceylon A.D. 1640, and returned to Portugal by an order of the court in 1680, after 40 years' residence there and in other parts of the East Indies. He was engaged in all the wars between the Dutch and Portuguese, was taken prisoner when the Dutch took Colombo in A.D. 1656, and was in the small remnant of 140 Portuguese whom the Dutch transported to Batavia on the 24th June 1658. He wrote a history of Ceylon, which he presented to the king of Portugal in 1685. It was translated into French by Abbe Le Grand, and from that into English in 1847 by George Lee, Postmaster-General of Ceylon. The work was first published in Portuguese in 1836.—*Tennent.*

RIBHU, in the Vedas, celestial artists; analogue of the Greek Orpheus.

RIC, an ancient title applied to the highest class of Hindu priests. Ric, Ricsha, Riciswara were even applied to royalty in old times. It is in accordance with the peculiar rules of Sanskrit euphony that the stem ric (more properly rc) becomes rik when standing by itself, and rig before a sonant letter.—*Oriental Linguistic Studies*, p. 9.

RICCI. Matthew Ricci was born at Macerata in the March of Ancona, in 1552. He entered the Jesuit Society in 1571. He reached Goa in 1578, but speedily left it for Macao, on being chosen by Father Valignan, the founder of the Jesuit Mission in China, as one of his aids. Ricci reached Pekin in 1597, but was obliged by an accidental excitement among the Chinese to withdraw to Nankin. In 1600 he was enabled to revisit it, carrying presents which had come from Europe for the emperor. Having acquired the emperor's favour, he devoted himself to the mission at the capital. Some striking conversions were made, and Ricci's science and literary works in Chinese gained him much esteem among the most eminent persons at Pekin. He died 11th May 1610, leaving Adam Schall to succeed him. The chief literary men of the city attended his funeral. His name appears in the Chinese annals as Lu-mateu. The principles of Ricci as a missionary appear to have been to stretch conciliation as far as possible, and to seek the respect of the educated Chinese by the display of superior scientific attainments. As regards the former point, he is accused of having led the way in those dubious concessions which kindled the disputes that ended in the downfall of the missions. He was the first European to compose books in Chinese. His works of this kind were fifteen in number, and one of them is said to have been included in a collection of the best Chinese writers ordered by the emperor Khian-lung.—*Remusat in Biog. Universelle; Yule, Cathay*, i. p. 536.

This is one of the most extensively diffused and useful of grain crops, and supports a great number of the human race.

The exports from British India, and the imports into Great Britain, have been rapidly increasing. The imports into Great Britain from 1847 to 1857 ranged from 38,529 to 78,658 tons. In 1882, Britain imported 412,486 tons, value £3,297,414. In the eleven years 1850-51 to 1860-61 inclusive, the quantity of rice exported from British India varied from 777,572 quarters, value £672,438, in 1850-51, to 32,014,220 quarters, value £2,598,746, in 1855-56. In 1878-79, after India began to recover from a famine, the total export of rice was 2½ million tons, valued at Rs. 12,66,000. An export duty is levied on rice in India at the rate of 3 annas per maund, or about 6d. per cwt. A similar duty on wheat was repealed in 1873. The exports of rice from British India were—

1878-79, . .	2,692,000 tons	Rs. 12,66,000
1879-80, . .	4,362,480 ,,	,, 24,36,000
1880-81, . .	3,468,930 ,,	,, 4,82,124
1881-82, . .	4,148,000 ,,	,, 14,24,017
1882-83, . .	7,420,000 ,,	,, 12,14,128

Three species and numerous varieties of the rice plant are enumerated by botanists, but they may be resolved into the lowland or aquatic rice (Oryza sativa), and the upland or mountain rice (Oryza Nepalensis). Oryza is the name by which rice was known to the ancient Greeks and Romans, and has been adopted by botanists as the generic name of the plant that yields this valuable grain. The term paddy is applied to the rice in its natural state—that is, before it is separated from the outer husk. In this state the natives of Hindustan call it dhan, as well as the plant; the clean rice they distinguish as chawul. The common or aquatic rice (O. sativa) is a native of the East Indies, and, unlike many cultivated grains, is still found growing wild in and about the borders of the lakes in the Rajamundry Circars. A kind with broader leaves (O. latifolia) is indigenous in Brazil, and Bates mentions having seen it growing wild in abundance on some of the tributaries of the Amazon. The common rice is cultivated in tropical countries, wherever there is a plentiful supply of water for irrigation, and succeeds well on land that is

too low and moist for the production of other useful plants. Although grown principally within the tropics, it flourishes well beyond them, yielding even heavier and better filled grain. Under favourable conditions, it will mature in the east as high as the 45th parallel of north latitude, and on the Atlantic seaboard of North America as far north as 38°. On the west coast it will grow as high up as 40°. It does not necessarily require a very great degree of heat, but it must have moisture so abundant that the fields on which it grows require to be repeatedly laid under water by irrigation. Without its due degree of moisture it proves almost wholly unproductive. But the dry or mountain rice of Cochin-China and Nepal is raised upon a comparatively dry soil, without irrigation. It has been introduced into the United States, and grows several degrees farther north than the Carolina rice; it has also been cultivated with success in Hungary and Westphalia. At the London Exhibition there were displayed many curious specimens and varieties of rice grown without irrigation, at elevations from 3000 to 6000 feet on the slopes of the Himalayas, where the dampness of the summer months compensates for the want of artificial moisture. The upland rice flourishes on high and poor land in the United States, and produces more than Indian-corn on the same land would do, giving 15 bushels per acre where the corn yields but 7. The swamp rice is more prolific, often yielding in that region as much as from 30 to 70 bushels per acre.

This grain was first introduced into Virginia by Sir William Berkeley in 1647, who received half a bushel of seed, from which he raised 16 bushels of excellent rice, most or all of which was sown the following year. It is also stated that a Dutch brig from Madagascar came to Charleston in 1694, and left about a peck of rice in the husk with governor Thomas Smith, who distributed it among his friends for cultivation, from the produce of which no less a quantity than 60 tons was shipped to England in 1698. It soon after became the chief staple food of the colony. Its culture was introduced into Louisiana in 1718. The present culture of rice in the United States is chiefly confined to South Carolina, Georgia, Florida, Alabama, Mississippi, and Texas. The average yield per acre is from 20 to 60 bushels, weighing from 45 to 48 lbs. when cleaned. Under exceptionally favourable circumstances as many as 60 bushels per acre have been realized. The American rice, although originally introduced from the Old World, is now the finest in quality. That imported from Patna is more esteemed in Europe than any other kind of eastern rice. The low estimation of Java rice was not attributable to any real inferiority of the grain, but to the careless method of preparing it for the market.

The common rice being an aquatic plant, is best grown in such low, moist lands as are most easily inundated. The ground is first ploughed superficially, and divided into squares of from 20 to 30 yards each way, separated from each other by dykes of earth about a foot high, and sufficiently wide for a man to walk upon. These dykes are for the purpose of retaining the water when required, and permitting it to be drawn off when no longer necessary. So soon as the ground is prepared, the water is let on, and the several compartments of the rice fields are thus flooded into a depth of about 6 inches. The rice that is to be used as seed must remain in the husk, it having previously been put into sacks, and kept under water until the grain has swelled and begun to show signs of germination. The sower, walking through the inundated field, scatters the seed with his hands, as he would do if he were sowing wheat; being rendered heavy by its previous soaking, it immediately falls to the bottom, and even sinks a little way into the mud. After the lapse of about a fortnight, the young crop begins to show itself above the surface of the shallow water. As the plant grows, the depth of the water is increased, so that the stalks may not bend with their own weight. When they become stronger and less flexible, the water is drawn off for a few days to allow of hoeing, after which it is again let on, and maintained to about half the height of the plant, until the crop ripens and the straw begins to turn yellow. Then the water is emptied, and the harvest commences, the crop being reaped with a sickle. It is then bound up into bundles, and thrushed or trodden out and winnowed. The husk of the grain is removed in some countries by means of a mill constructed of two large cylinders of very hard wood, and obliquely furrowed, which are turned by the hand. Americans employ a rice-threshing mill with steam-engine attached. The rice in sheaf is taken up to the thresher by a conveyer; it is threshed, the straw removed, then thrice winnowed and twice screened, and the result in some cases exceeds a thousand bushels a day.

Paddy, as it comes from the ear, has a rough, silicious outer covering or husk, which is impervious to water, and is used in America for horse-beds, and for packing crockery-ware and ice, being far better than sawdust for the latter purpose.

At the mouths of the river Indus, large patches of alluvial deposit accumulate, consisting of very muddy, swampy soil, almost on a level with the sea, and exposed equally to be flooded both by it and the fresh water of the river. These swamps form the principal rice fields of Lower Sind. There is little doubt but that the extensive mud flats, covered with flags and bulrushes, that border the lower portion of the river Murray in South Australia, might easily be made available for the culture of rice. The delta of the Mississippi is remarkably adapted to the growth of this grain, the river being always available for the purposes of irrigation, and two crops of rice a year can be reckoned upon in that region.

The wild rice found in the Madras Presidency, in and on the borders of lakes in the Circars, on the marine lagoons of Travancore, near Allepey, and other places, is never cultivated, though the richer classes near Rajamundry gather and eat it as a great dainty. It is white, palatable, and wholesome, and sells at a high price.

Rice cultivation prevails in all the river valleys and on all the coasts of Eastern and Southern Asia, in the Japan Islands, on all the sea-coasts of China, the Philippine and other large islands of the Eastern Archipelago, in Ceylon, Siam, India, on both shores of the Red Sea, in Egypt, on the shores of the Mozambique Channel, in Madagascar, on the shores of the Mediterranean, in some parts of Western Africa, South Carolina, and Central America. Throughout the greater part of British

India and China rice is preferred as food by nearly all classes, and the Negro domiciled in the New World similarly appreciates it. But it is essentially the food of the well-to-do classes. The races of Northern India, and the Chinese of the provinces of Ho-nan, Shen-si, Shan-si, and Shan-tung, prefer wheat, and in India the millets and pulses form the food-grains of all the labouring people, with whom rice is a luxury.

Rice is always substituted by the physician, when practicable, as the food best adapted to the digestion, in diarrhœa and other similar diseases; and if the clean rice be ground and bolted, a meal is produced which can be made up into various forms of cake and other bread forms of unrivalled sweetness and delicacy.

Rice possesses the advantage attending wheat, maize, and other grains, of preserving plenty during the fluctuations of trade, and is also susceptible of cultivation on land too low and moist for the production of most other useful plants.

Where inundation is practised, ordinarily the ground is squared off in beds, generally 30 to 40 yards in length and breadth, separated by small dykes 2 feet high and 1 foot broad. This bed, after being thoroughly saturated with water, is ploughed up and manured with wood-ashes, or from dung-heaps, or green herbs or shrubs are ploughed in, the most favourite being the Calotropis gigantea, which is eagerly sought after by the cultivator at the ploughing season. The ground thus prepared is flooded with water, 2 to 4 inches deep, thoroughly to dissolve the soil, and a few days afterwards it is again ploughed into a deep muddy mixture. A piece of wood, tied on to the yoke of a pair of bullocks, is drawn over the puddle to level it, after which it is ready to receive the seed, which is then sown broadcast. The following day, so soon as the seed has settled into the soil, the flood water is let off, and the soil allowed to dry for three or four days, during which the seedlings will have sprung up about 2 inches high, on which the field is irrigated, and the water allowed to stand a couple of inches above the soil, and is so maintained until the harvest.

With some varieties of rice the field is ploughed up after rain, and the seeds sown. When the sprouts are between four and six weeks old, the field is irrigated for the first time, and the water supply maintained until the grain ripens and the stalks are ready for the sickle, which is seen by the whole field lying down. Nurseries are frequently prepared in the manner previously described, and the seed sown. Six or eight weeks afterwards, the plants are transplanted into fields prepared in the same way to receive them.

During the first and second months, the fields are hand-weeded by women and boys; any crowding or failure is remedied by transplanting, so as to leave 4 to 6 inches of space between each plant. If the plants shoot up in a lanky manner, 8 or 10 inches of the tops are cut off by the sickle, which makes them more fruitful. In the Tamil-speaking countries, the varieties called Kado Kaluthan, and Vellai, Sirumani, Pompalni, Esarakova, Pall, Thiruvarangam, and Nirvala Sumbah are sown in July or August, and cut in January or February, taking six months to ripen. Vaday Sumbah, August to December, five months; Vallai kar, August to November, four months.

American rice is of two kinds,—the red and the white, from the colour of the pellicle which encloses the seed, on the removal of which both are alike white. The former was accidentally introduced in 1694 by a ship captain from Madagascar, and the latter was transmitted in 1647 to America by Mr. Doubois, treasurer of those days to the E. I. Company.

The growth of rice in North America is almost wholly confined to two States, nine-tenths of the whole product, indeed, being raised in the States of Carolina and Georgia. A little is grown in North Carolina, Florida, Alabama, Texas, Louisiana, and Mississippi.

The cultivation is carried on in South Carolina in the marshy flats, which are periodically covered by the floodings of the rivers, and for such culture that State possesses peculiar advantages, which not only enable the cultivator to produce his grain at a trifling cost of labour, but also of a much finer quality than in those lands which are artificially irrigated. Carolina rice has a finer, handsomer grain than that which is grown in the country of its original production.

The yield per acre varies in South Carolina from 20 to 60 bushels, weighing from 45 to 48 lbs. when cleaned. Under favourable circumstances, as many as 90 bushels to an acre have been raised.

A variety of rice, discovered in South Carolina in 1838, was called the big-grained rice. It proved to be unusually productive. One farmer, in 1840, planted not quite half an acre with this seed, which yielded 49½ bushels of clean winnowed rice. In 1842 he planted 400 acres, and in 1843 he sowed his whole crop with this seed. His first parcel when milled was 80 barrels, and netted half a dollar per cwt. over the primest rice sold on the same day. Another cultivator also planted two fields in 1839, which yielded 73 bushels per acre. The average crop before, from the same fields of 15 and 10 acres, had only been 33 bushels per acre.

Rice in Carolina is sown as soon as it conveniently can be after the vernal equinox, from which period until the middle, and even the last of May, is the usual time of putting it in the ground. It grows best in low marshy land, and should be sown in furrows 12 inches asunder; it requires to be flooded, and thrives best if 6 inches under water; is occasionally drained off, and turned on again to overflow it, for three or four times. When ripe the straw becomes yellow, and it is either reaped with a sickle or cut down with a scythe and cradle, some time in the month of September, after which it is raked and bound, or got up loose, and threshed or trodden out, and winnowed in the same manner as wheat or barley.

In the south of India, and along the sea-coasts, rice is the favourite food, but from the expenses attending the necessary irrigation, it is dearer than other cereals, and the labouring people live on dry grains, millets, and pulses. But these again take more time to prepare, more firewood to cook, and so strongly are the people of Southern India impressed by the superiority of rice as food, that it indicates their well-to-do or impoverished condition by their telling that they can have rice twice or only once daily, or once weekly. Nevertheless, for the labouring man, the value of the

dry grains, wheats, pulses, and millets, is far above rice as food.

Rice should be six months old before being used, new rice causing diarrhœa in many people. It is simply husked, or is half-boiled and dried in the sun. The former by the English in India is called table rice, and it is whiter than the boiled rice.

In *Kashmir* rice is the staple of cultivation. It is sown in the beginning of May, and is fit to cut about the end of August. The grain is either sown broadcast in the place where it is intended to stand till it is ripe, or thickly in beds, from which it is transplanted when the blade is about a foot high. About the 21st of March the land is opened by one or more ploughings, according to its strength, and the clods are broken down by blows with wooden mattocks, managed in general by women with great regularity and address; after which water is let in upon the soil, which, for the most part of a reddish clay, is converted into a smooth soft mud. The seed grain, put into a sack of woven grass, is submerged in a running stream until it begin to sprout, which ordinarily takes place in three or four days. This precaution is adopted for the purpose of getting the young shoots as quickly as possible out of the way of a destructive small snail, which abounds in some of the watered lands of Kashmir. When the farmer suspects, by the scanty appearance of the plants above the water in which the grain has been sown, and by the presence of the snail drawn up in the mud, that his hopes of a crop are likely to be disappointed, he repeats the sowing, throwing into the water some fresh leaves of the Prangos plant, which either poison the snails or cause them to descend out of the reach of its influence. The seed is for the most part thrown broadcast into about 4 or 5 inches of water, which depth is endeavoured to be maintained. Differences of practice exist as to watering, but it seems generally agreed that rice can scarcely have too much, provided it be not submerged, except for a few days before it ripens, when a dried state is supposed to hasten and to perfect the maturity, whilst it improves the quality of the grain. In Kashmir it is customary to manure the rice lands with rice straw rejected by the cattle, and mixed with cow-dung. It is conveyed from the homestead to the fields by women in small wicker baskets, and is set on the land liberally. Many of the rice lands are high, but yield good crops, through the facility with which water is brought upon them from the streams which fall down the face of the neighbouring hills. In common seasons the return of grain is from thirty to forty for one, on an average, besides the straw.

In the *Panjab* rice is grown in many of the plain districts, especially along the banks of the rivers. The rice of the Kangra valley and that of Peshawur are celebrated. And the varieties of it are very numerous, the best being the odorous kind called bas-mati or bas-marti. It is abundantly grown up to 6000 and 7000 feet in the Siwalik tract and up the valleys. In Kullu and Lahoul a kind of beer is stated to be prepared from rice, and on the Sutlej it is mixed with the Hordeum hexastichon barley for making beer.

In *Lower Sind* the bhull rice is grown. Like all large rivers which flow through an alluvial soil for a very lengthened course, the Indus has a tendency to throw up patches of alluvial deposit at its mouth; these are in Sind called bhull, and are in general very valuable for the cultivation of the red rice of the country. The bhull are large tracts of very muddy, swampy land, almost on a level with the sea, and exposed equally to be flooded both by it and the fresh water; indeed, on this depends much of the value of the soil, as a bhull which is not at certain times well covered with salt water, is unfit for cultivation. They exist on both sides of the principal mouths of the Indus, in the Gorabaree and Shahbander parganas, which part of the province is called by the natives Kukralla, and was in olden days, before the era of Gulam Shah, Kalora, a small state almost independent of the amirs of Sind. On the left bank of the mouths of the river these bhulls are very numerous, and form by far the most fertile portion of the surrounding district. They bear a most dreary, desolate, and swampy appearance, are intersected in all directions by streams of salt and brackish water, and are generally surrounded by low dykes or embankments, in order to regulate the influx and reflux of the river and sea. Yet from these dreary swamps a very considerable portion of the rice consumed in Sind is produced; and the cultivators who hold them are esteemed amongst the most respectable and wealthy in Lower Sind. To visit a bhull the only way is to go by boat, the mud being generally two or three feet deep, and it is only here and there that a footing can be secured on the embankment surrounding the field. Should the river during the high season have thrown up a bhull, the cultivator selecting it for cultivation first surrounds it with a low wall of mud about three feet in height. These bhulls being formed during the inundation, are often considerably removed from the river branches during the low season. When the river has receded to its cold-weather level, and the bhull is free of fresh water, advantage is taken of the first high spring tide, to open the bund, and allow the whole to be covered with salt water. This is generally done in December. The sea water remains on the land for about nine weeks, or till the middle of February, which is the proper time for sowing the seed. The salt water is now let out, and as the ground cannot, on account of the mud, be ploughed, buffaloes are driven over every part of the field, and a few seeds of the rice thrown into every footmark; the men employed in sowing being obliged to crawl along the surface on their bellies, with the basket of seed on their backs; for were they to assume an upright position, they would inevitably be bogged in the deep swamp. The holes containing the seed are not covered up, but people are placed on the bunds to drive away birds, until the young grain has well sprung up. The land is not manured, the stagnant salt water remaining on it being sufficient to renovate the soil. The rice seed is steeped in water and then in dung and earth for three or four days, and is not sown until it begins to sprout. The farmer has now safely got over his sowing, and as this rice is not, as with other varieties, transplanted, his next anxiety is to get a supply of fresh water; and for this he watches for the freshes which usually come down the river about the middle and end of February, and if the river then reach his bhull, he opens his bund,

and fills the enclosure with the fresh water. The sooner he gets this supply the better, for the young rice will not grow in salt water, and soon withers if left entirely dry. The welfare of the crop now depends entirely on the supply of fresh water. A very high inundation does not injure the bhull cultivation, as here the water has free space to spread about. In fact, the more fresh water the better. If, however, the river remain low in June, July, and August, and the south-west monsoon sets in heavily on the coast, the sea is frequently driven over the bhulls and destroys the crops. It is, in fact, a continual struggle between the salt water and the fresh. When the river runs out strong and full, the bhulls prosper, and the sea is kept at a distance. On the other hand, the salt water obtains the supremacy when the river is low, and then the farmer suffers. Much bhull crop is destroyed in the monsoons and during the heavy gales. The rice is subject to attacks, also, of a small black sea-crab, called by natives Kookaee, and which, without any apparent object, cuts down the growing grain in large quantities, and often occasions much loss. If all goes well, the crop ripens well about the third week in September, and is reaped in the water by men, either in boats or on large masses of straw rudely shaped like a boat, and which, being made very tight and close, will float for a considerable time. The rice is carried ashore to the high land, where it is dried, and put through the usual harvest process of division, etc.; and the bhull is then, on the fall of the river, again ready for its annual inundation by sea water.

Oudh.—Very many varieties of rice are grown in Oudh. A heavy soil and plenty of water suits them best. There are five kinds which are considered among the best; Mihee and Bansee are foremost. The peculiarity in the cultivation of these two kinds is that they are transplanted and placed about five inches apart. And by this method, if the soil be good, they grow to the height of an ordinary-sized man, and produce a much larger quantity than if otherwise treated. The odour and flavour of these two kinds, when cooked, are superior to those of any other kind. They are only used by those who can afford to buy them. As the labour in cultivating them makes them dearer than the other sorts, the other three varieties are considered good, as the Bateesa and the Phool Birinj. They are sown broadcast in June, and left so, and they are the kinds mostly used by natives. The first two mentioned, when new, sell for 10 or 12 seers per rupee, and become dearer according as they become older. The other three kinds sell for about 19 seers per rupee, and are dearer if older. Some consider Phool Birinj the best, as it swells in boiling, and has an agreeable odour.

The rice of *Bengal*, by the exercise of some care and skill, had been, by the middle of the 19th century, so far improved as nearly to equal that of the Carolinas. Dr. Falconer introduced the numerous and fine varieties of rice cultivated in the Himalaya; of these, some of the best sort were, at his suggestion, distributed to cultivators along the Doab canal. The early or *aous* rice is sown generally on high, light, and sandy soils from March to May, as showers may be favourable. It is cut variously from the end of July to the middle or end of September, and in six weeks' time it is succeeded by what is known as cold-weather crop, which may be mustard, vetches, pulse, millet, sola, or gram, barley, oats, and the like. The *aumon* rice is sown in rich, deep, and loamy soils from April to June, and is reaped any time between the beginning of December and the end of January. It is a richer, stronger, and every way a better crop than the aous, but it is more exposed to inundation, and is not followed by any second crop within the year. Occasionally the early and the late crops are sown on the same land, and cut without injury to each other at different periods. A large part of the late rice is planted with the hand in rows, on land carefully ploughed, cleaned, and smoothed for the purpose. It is everywhere known as the roa, and yields an abundant harvest. A third kind of rice, unknown in high and dry tracts of country, but very common in extensive marshy districts, is called the *boru*, and from its proximity to water is sown and grown from the month of January to the end of May. It is cultivated in places where there is too great a depth of water during the heavy rains, and consequently abundance to keep the plant moist during the fierce heat of summer. The early rice, in the most favourable season, from both grain and straw, cannot give more than five rupees per bigha. In bad seasons it may not yield more than one rupee. As much as ten or even fifteen rupees may be got from the aumon crop in good seasons; but when heavy rains, or unexpected inundations from large rivers, drown the young plants, as was the case during 1855 and 1856, and may be the case again at any time, the return is positively nothing. The boru rice may be expected to yield seven or eight rupees per bigha. And on these three crops, over some hundreds of miles, the hopes and anxieties of some millions hang for a large part of the year.

Cuttack has three crops. The early crop is grown on somewhat high ground; it is sown for the most part in June, and reaped in August or September. The second is the main crop, and is sown in June or July, and cut from November to January; it requires much moisture, some varieties growing in several feet of water. The third is a dwarf crop, cultivated in the months of March, April, and May, on low-lying land, generally on the sides of marshes and pools, where irrigation is easy; the ratio of productiveness is said to be in a good season as 1 to 35.

Ganjam.—The exclusive culture of rice in Ganjam, Cuttack, and northwards into Lower Bengal has been a cause of much misery and great loss of lives from famines occurring through the failures of the periodical rains; and Mr. Thornhill in 1872 counselled the partial culture of other cereals, pulses, and millet. In the Teling Circars the two crops are designated Poona or early, and Pedda worloo or great. Near the Colar Lake there are two kinds of rice, called sarva and dalva respectively. The former is the ordinary rice with a light-yellow husk, which is planted about July or August, and is cut about December or January. The dalva husk is of a dark-brown colour, and is planted about January or February, and cut about April or May. The sarva takes six months to ripen, but the dalva ripens in about three months. When the husk is peeled off the dalva, the seed looks much the same as that of

ordinary rice, and though at first the dalva sells for less, towards the end of the year almost the same price is given for it as for the sarva. The dalva is said to be unwholesome, except for those who live in the neighbourhood of its cultivation and are accustomed to eat it. But even they not unfrequently say that it causes derangements of the system.

In *Ceylon*, a variety of coast paddy, called Mottoo samboo, was introduced into the Kandyan Province in 1832, which was found to produce a more abundant crop, by one-third, than the native. It is of six months' growth.

Dr. Marshall, Statistical Reporter in the Dekhan, found five modes of planting rice common in Kalanuddi. The most productive was by transplanting (Rop) from a nursery. A second mode was to sow it by the drill called Kooree or Koorgee, from the Mahratta name of the drill, and this mode can be adopted only when very little rain has fallen; the outturn is small. The third process was to sow the grain in the furrow made by the common plough. The fourth, termed Mullik, is resorted to when any of the former has failed; in it the grain is wetted, put in a sack, and kept warm, and made to germinate, and then thrown broadcast on the place where there has been failure. The fifth process, Sardi, is to transplant any of the superfluous mullik plant.

In *South India* generally, there are two great crops, the Kaar and the Sumbah or Peshamm. The latter is reaped in February and March, and its produce is preferred to that of the Kaar crop, which is reaped in October.

In *Travancore* and *Tinnevelly*, the rice fields are manured with cow-dung, ashes, and tree leaves. Rice seed is usually sown broadcast, thickly, and about 40 days or upwards transplanted, and the usual time from the planting out to the reaping season is about 60 days. When sown broadcast, thinly, to remain in the same field, that is generally done about 15 days before the rains set in. It is generally supposed that while growing the plants cannot have too much water, but as the ears come to maturity, the water is drawn off and the crop lies down under the weight of the ears.

Further India.—In the Assam valley, in the seaboard of Chittagong, Arakan, Pegu, the valleys of the Burma and Pegu rivers, in Amherst, the Tenasserim Provinces, Province Wellesley, Siam, Cochin-China, Cambodia, China, and the great islands of the Archipelago, rice is the chief grain food.

Arakan soil is fit for the culture of nearly all tropical productions; rice, however, is alone cultivated to any great extent, the low alluvial soil which extends over the whole country, from the foot of the mountains to the sea, being admirably suited for its growth.

In *Burma* and *Tenasserim* cultivation has produced many varieties; the Karens have distinctive names for more than forty. Karen mountain rice is preferred by many to that which is raised by the Burmese on the low lands; yet it is said not to be so nutritious, and on this account bears a less price in the bazar. It is of all colours, from ivory-white to coal-black. Of the black rice the Karens prepare a kind of bread, which to them supplies the place of ginger-bread. A portion of seethed rice is poured into a large mortar, with a prodigious quantity of sesamum seeds. Two women then take their strong ebony pestles and pound it, striking alternately until it becomes a light bounding mass. It is then thrown upon the eating stand, when the whole family seat themselves around it in oriental style, and dissever it with their swords. The Karen have another mode of preparing this kind of rice, which is particularly convenient for travellers. A quantity unboiled is thrust into joints of small bamboos, a little water added, and the orifice closed up. It is then roasted, and if eaten with a little butter and salt it is delicious. The Karen select only two varieties of bamboo for this purpose, and these impart to the rice a sweet, delicate flavour.

The Burmese rear nearly a hundred varieties of rice, but the principal distinctions between the different kinds are—hard grain, soft grain, and glutinous rice. The Natsieng is the hardest, and is the rice which is principally exported to Europe. The Meedo is the chief of the soft-grain varieties; it is much preferred by the Burmese to the hard-grained sorts, and it is certainly superior in taste when cooked; but the hard-grained rice is chiefly purchased by the merchants for export, as it keeps better, and the soft-grained rice is too much broken by European machinery in cleaning. The Tounguyeen, or hill rice of Burma and Tenasserim, is called glutinous rice by Europeans, from the property it possesses when cooked of the grains all adhering in a thick glutinous mass. It is the chief article of food with the Karen and other hill tribes, but is not much eaten by the inhabitants of the low swampy plains, where the common rice is grown. Price of rice in the husk, 50 rupees per 100 baskets of 52 lbs.; cargo rice, 95 rupees per 100 baskets of 63 lbs.; cleaned rice, 150 rupees per 100 baskets of 70 lbs.

Burmese rice is known in the export trade as five parts cargo rice, being but imperfectly husked before shipment, so that it contains about one part in five of paddy or unhusked rice. The greater part of the Burman rice exported is used in the countries to which it is sent for distillation or for making starch. It is a thick, coarse grain, which, when boiled, is repulsive in appearance to persons unacquainted with it, and its flavour is not equal to that of Bengal rice proper.

Siam.—Rice is the main aliment of the Siamese poor; by the opulent, it is an accompaniment to their meals, as bread is in Europe. Glutinous rice is employed either in flour or grains. A favourite cake is thus prepared: The rice is cooked without water or steam; it is then sprinkled with condiments consisting of ginger and other spices; it is divided into small parcels, which are wrapped up in plantain leaves, and in twenty-four hours a sweet and vinous liquor exudes, when the cake is fit for eating; if kept longer they become intoxicating, and if distilled produce arrack, which, subject to redistillation, gives a strong and fragrant drink.

In *Cochin-China* rice is the 'staff of life,' and forms the main article of culture. There are six different sorts grown: two on the uplands, used for confectionery, and yielding only one crop annually; the other sorts affording only from two to five crops a year, but generally two, one in April and another in October; or three when the inundations have been profuse. Siam and

Cochin-China supply the wants of China and the Straits Settlements.

China.—In the southern and well-watered provinces, it is anything but uncommon to take two crops of rice, one of wheat and one of pulse, from the same land in a single season. Rice is the only article the Chinese ever offer a bounty for; the price fluctuates according to the season, from $1\frac{3}{4}$ to 8 dollars per pikul ($133\frac{1}{3}$ lbs.). Siam and the Indian islands, particularly Bali and Lombok, supply the empire occasionally with large quantities. The price of rice in China varies according to the state of the canals leading to the interior; if they are full of water the prices rise; if, on the contrary, they are low, prices fall in proportion at the producing districts. The amount of consumption is controlled in a considerable degree by the cost of transit; during the growth of the rice the fields are always kept flooded when water can be obtained. The terraces near the base of the hills are supplied by the mountain streams, and the fields which are above the level of any adjoining river or canal are flooded by the water-wheel. These machines are of three kinds. The principle in all of them is the same, the only difference being in the mode of applying the moving power; one is worked by the hand, another by the feet, and the third by an animal of some kind, generally a buffalo or bullock. The rice lands are kept flooded in this way until the crops are nearly ripe, when the water is no longer necessary. It is advantageous during the summer to stir the soil up well amongst the roots, at the same time removing any weeds which may have sprung up. In the island of Chusan, and over all the rice country of Che-kiang and Kiang-su, manure plants are scattered in April in a fresh state over the surface of the ground. The fields are flooded, and the plough and harrow are employed to turn up and pulverize the soil. The manure thus scattered over the ground and half-buried amongst the mud and water, begins to decay immediately, and gives out a most disagreeable putrid smell. A great portion of the straw, cotton stalks, and grass which would go to manure the fields, is used for firing, and therefore the plan of growing manure for the land is forced upon the farmers by necessity. The glutinous rice of the Chinese contains much dextrine, and is preferred for making conjee, dumplings, and wine. The Chinese of Ho-nan, Shen-si, Shan-si, and Shan-tung prefer wheat to rice.

Java is the granary of plenty for all the Eastern Archipelago. Rice is cultivated there in three systems. The name of Sawah is given to the rice fields which can be irrigated artificially; tepar or tagal are elevated but level grounds; and gagah or ladang are cleared forest grounds. The two last only give one crop; a second crop may be obtained from the sawah, which then most commonly consists of katjang, from which oil is extracted, in kapas or fine cotton, and in ubie, a kind of potato.

Archipelago. — Two distinct descriptions of rice are cultivated throughout the Indian islands, —one which grows without the help of immersion in water, and another for which that immersion is indispensably requisite. In external character there is very little difference between them. The marsh rice generally brings a somewhat higher price in the market. The great advantage of this latter consists in its superior fecundity. Two very important varieties of each are well known to the Javanese husbandman,—one being a large, productive, but delicate grain, which requires about seven months to ripen, and the other a small, hardy, and less fruitful one, which takes little more than five months. The first is constantly found cultivated in rich lands, where one annual crop only is taken; and the last in well-watered lands, but of inferior fertility, where the two crops may be raised. Both of these, but particularly the marsh rice, is divided into a great number of sub-varieties, characterized by being awned or otherwise, having a long or round grain, or being in colour black, red, or white.

Celebes.—Rice is grown to some extent in the Dutch portion of Celebes.

In the *Philippines*, nine varieties of rice are cultivated,—Binambang, Lamuyo, Malagcquit (*a*), Malagcquit (*b*), Bontal Cabayo, Dumali, Quinanda, Bolohan, Tang-i. The lamuyo forms the principal article of food of the inhabitants of the coast; the malagequit (*a*) is glutinous, and used for making sweetmeats and fancy dishes.

The varieties of the hill rice are named O. mutica and O. glutinosa, and it has been recommended to introduce them into all the mountain ranges of India. The Oryza glutinosa of Rumphius is never used as bread, but commonly prepared as a sweetmeat. Red rice is the variety of Oryza sativa called glutinosa (pulut or brasse pulut of the Malays). In the Straits Settlements, red rice is imported from China, and sells at the rate of 10 cents of a dollar per lb. O. mutica has been reared successfully on the banks of the Thames near Windsor; and if well up and firmly rooted it will grow through snow. They are grown in the Himalaya, in Ceylon, Arakan, Burma, Cochin-China, Java, and Japan. The mountain rices of India are grown without irrigation, up to elevations of 6000 to 7000 feet on the Himalaya, where the dampness of the summer months compensates for the want of artificial moisture; also on the Siwalik tract and up the valleys of the N.W. Himalaya, their elevation securing them from the great heat to which the other varieties are exposed. In Kanawar, the greatest height at which rice that requires water has been observed, is 6600 feet. The other kinds, which are not watered, grow at 8000 and 9000 feet.

In India generally, rice is produced in every variety of soil, at every altitude and in every latitude. To name a tithe of the varieties grown would prove a tedious and be a useless task, for they vary with every district in which they grow. The finest is the Bengal table rice; it is inferior to the Carolina produce, and the great bulk of the Indian varieties would be unmarketable in Europe, from their poverty of body and the slovenly manner in which they are prepared. Up to the present year (1883) Carolina rice fetches the highest price in the London market, and after that is the rice of Patna. Carolina rice is very much superior to any other rice known in commerce, and it fetches more than double the price of the best Bengal rice.

Rice cultivated in a virgin soil, where the wood has been burned off, will, under favourable circumstances, give a return of twenty-five and thirty fold. Of mountain rice, cultivated in ordi-

nary upland arable lands, fifteen fold may be looked upon as a good return. In fertile soils, when one crop only is taken in the year, marsh rice will yield a return of twenty-five seeds. When a double crop is taken, not more than fifteen or sixteen can be expected. Mr. Crawfurd says he had seen lands which had produced, from time beyond the memory of any living person, two yearly crops of rice. When this practice is pursued, it is always the five months grain which is grown. The rapid growth of this variety has indeed enabled the Javanese husbandman, in a few happy situations, to urge the culture to the amount of six crops in two years and a half.

The rudest and probably the earliest practised mode of cultivating rice, consists in taking from forest lands a fugitive crop, after burning the trees, grass, and underwood. The ground is turned up with the mattock, and the seeds planted by dibbling between the stumps of trees. The period of sowing is the commencement of the rains, and of reaping that of the dry season. The rice is, of course, of that description which does not require immersion. The second description of tillage consists also in growing mountain or dry land rice. This mode is usually adopted on the common upland arable lands, which cannot conveniently be irrigated. The grain is sown in the middle of the dry season, either broadcast or by dibbling, and reaped in seven or five months, as the grain happens to be the larger or the smaller variety. The culture of rice by the aid of the periodical rains forms the third mode. The grain being that kind which requires submersion, the process of sowing and reaping is determined with precision by the seasons. With the first fall of the rains the lands are ploughed and harrowed. The seed is sown in beds, usually by strewing very thickly the corn in the ear. From these beds the plants, when twelve or fourteen days old, are removed into the fields, and thinly set by the hand. They are then kept constantly immersed in water until within a fortnight of the harvest, when it is drawn off to facilitate the ripening of the grain. The fourth mode of cultivating rice is by forcing a crop by artificial irrigation at any time of the year; thus in one field, in various plots, the operations of sowing, ploughing, transplanting, and reaping may be seen at the same period.

The growing rice in the Monghir Province of Bengal in 1880 was attacked by a species of Cecidomyia, which Mr. Wood Mason named C. oryzæ, the rice-fly.

Rice flour, Mi-fen, CHINESE, is ground rice. The seeds of rice contain a much less proportion of nitrogenized compounds than the other cereal grains, and particularly wheat, viz. about 7 per cent. The quantity of fatty matter is also less; and though much difference of opinion has prevailed in reference to the value of rice as an article of diet, analysis clearly proves that it is the least nutritious of all the cereal grasses. This difference of opinion has probably arisen from the fact that rice is seldom eaten by itself, but is partaken of usually with milk, butter, or sugar, the nutritious properties of which substances have been attributed to the rice itself. The Chinese prepare a flour, Mi-fen, by boiling rice and drying it in the sun, and the clear grains are ground into a flour, which makes an excellent gruel.

Prime rice, after being cleaned and well milled, will keep a long time in any climate, only when about to be used (if old) it requires more careful washing to get rid of the must which accumulates upon it. All persons prefer for table use, rice a year old to the new.—*Ainslie; Archipelago Journal; Bowring's Siam; Bonynge's America; Calc. Rev.; Calc. RICE BIRD, of America, is the Emberiza oryzivora, *Linn.* That of the Archipelago is Loxia oryzivora, *Linn.*, and is also called paddy bird, also Java sparrow. Its colour is bloomy lead-coloured; head and tail black, bill red, belly obscurely rosy, cheeks in the male snowy, legs flesh-coloured. In Java it is called Glate. There, and in the other parts of Asia where it is found, it has a very bad reputation on account of the ravages which it commits in the rice fields with its powerful and sharp bill. In Sumatra the name of the bird is Burong Peepee. Its song is short and monotonous.

RICE GLUE, or Japanese cement, is made by mixing rice flour intimately with cold water, and boiling the mixture. It is white, and dries nearly transpareut; hence its use in making many articles in paper. When made with a smaller quantity of water, models, busts, etc., may be formed of it.—*Tomlinson.*

RICE MILL. Various machines have been contrived for cleaning rice. One in use in most parts of S.E. Asia for hulling paddy, is similar to those used 4000 years ago. It consists of two circular stones, two feet in diameter, resting one on the other; a bamboo basket is wrought around the upper one so as to form the hopper. A peg is firmly set into the face of the upper stone, halfway between its periphery and centre, having tied to it by one end a stick three feet long, extended horizontally, and attached by the other to another stick pending from the roof of the shed under which the mill is placed. This forms a crank, by which the upper stone is made to revolve on the other set firmly on the ground. The motion throws the rice through the centre of the stone, and causes it to escape between the edges of the two stones.

At Rangoon, since 1860, a mill is in use which was invented by Thomas Sutherland of Melbourne. By it 350 tons can be turned out in the 24 hours, and nearly all the work is done by machinery. The value of rice produced by this company's mills was at once valued at 1s. a cwt. over native cleaned rice.

About the year 1830, the planters of America began experiments with rice mills, and about that year saw the first working of a small mill. The rice threshing-mills, steam-engine attached, of Carolina and New Orleans, have become splendid operative machines. The rice in sheaf is taken up to the thresher by a conveyer; it is threshed, the straw taken off, then thrice winnowed and

twice screened, and the result in some cases exceeds a thousand bushels of clean rough rice, the work of a short winter day.

RICE PAPER PLANT.

Aralia papyrifera, *Hk.* | Fatsia papyrifera, *Dcne.*

This plant, the Tung-to-mu of the Chinese, grows at Yoksun, in Sikkim, also in Formosa and Japan. It is largely consumed in the provinces of Canton and Foh-kien, and it is estimated that 30,000 dollars' worth of it are annually made use of in Fu-chu-fu alone, where every lady wears artificial flowers made of it. One hundred sheets, each about three inches square, can be bought for three halfpence. Rice pith is sometimes 1½ inches in diameter, not grown from seed, but from young shoots. When these appear above ground early in spring, and are a few inches high, they are carefully separated from the parent roots, and transplanted into pots, in which they remain until about a foot high, when they are removed to land prepared for them. They are said to attain their full growth of 10, or 12 feet at their tenth month. They are cut down, the twigs and leaves removed, and the stems left to soak for some days in water to loosen the bark and wood, and facilitate the removal of the pith. This last, after being cleared and made into a cylindrical shape, is cut into convenient lengths, and is now ready for the hand of the paper-cutter, who, with a sharp, broad-bladed knife, makes a slight longitudinal incision in the cylinder of pith, which is then turned round gently and regularly on the edge of the knife, until the whole available material is planed off in thin even slices. Much care and dexterity are requisite to produce sheets of even thickness.—*Bennett*, pp. 299–304; *Hooker's Jour.* p. 359; *Faulkner; Fortune's Res. among the Chinese*, p. 197; *Dr. Smith's Mat. Medica of China; Sir John Bowring in New Garden Miscellany*, vii.

RICE SPROUTS are the Kuh-ya and P'ih-mi of the Chinese. In China, rice in husk is called Kuh. Rice germinated and dried is used as a peptic and tonic remedy, having much the same effect as the germinated barley or malt. The sprout is sometimes rejected, sometimes retained.

RICE STARCH. Starch is more abundant in rice grain than in wheat. Jaconnet obtained from Carolina rice 85·07, and from Piedmont rice 83·8 per cent. of starch. Vogel procured from a dried rice no less than 98 per cent. of starch. For purposes of ordinary starching, the people in the E. Indies use the water in which rice has been some time boiled, called Conjee or Gunji in India, and in Chinese Mi-t'ang. Their Mi-tsiang-fen is the Mi-t'ang mixed up with powdered gypsum, the product cut up in thin rectangular cakes, and dried in the sun. There are several patent processes in existence for the manufacture of rice starch, which are accomplished chiefly by digesting rice in solutions, more or less strong, of caustic alkali (soda), by which the gluten is dissolved and removed, leaving an insoluble matter composed of starch, and a white substance technically called fibre. Under Jones' patent, the alkaline solution employed contains 200 grains of real soda in every gallon of liquor, and 150 gallons of this liquor are requisite to convert 100 lbs. of rice into starch. In manufacturing rice starch on a large scale, Patna rice yields 80 per cent. of marketable starch, and 8·2 per cent. of fibre, the remaining 11·8 per cent. being made up of gluten, gruff or bran, and a small quantity of light starch carried off in suspension by the solution. Jones' process may thus be described: 100 lbs. of rice are macerated for 24 hours in 50 gallons of the alkaline solution, and afterwards washed with cold water, drained, and ground. To 100 gallons of the alkaline solution are then to be added 100 lbs. of ground rice, and the mixture stirred repeatedly during 24 hours, and then allowed to stand for about 70 hours to settle or deposit. The alkaline solution is to be drawn off, and to the deposit cold water is to be added, for the double purpose of washing out the alkali, and for drawing off the starch from the other matters. The mixture is to be well stirred up, and then allowed to rest about an hour for the fibre to fall down. The liquor holding the starch in suspension is to be drawn off, and allowed to stand for about 70 hours for the starch to deposit. The waste liquor is now to be removed, and the starch stirred up, blued (if thought necessary), drained, dried, and finished in the usual way.—*Pharmaceutical Journal*, iii. p. 188.

RICE STRAW, Tau-kan, CHIN., is used in China for paper-making, and in Europe serves to make straw plats for women's bonnets. In China the ashes of rice straw are used as an alkaline remedy in urinary and febrile affections.—*Hogg's Vegetable Kingdom*, p. 816; *Smith*, p. 186.

RICE WINE, rice beer, and rice spirits are alcoholic fluids. In the Himalaya, both a beer and a wine are made. In Kullu, Lahoul, and in the Sutlej valley, a kind of beer, and in Nepal a spirit, is distilled from the grain, also a beverage called Phaur, very much resembling ale, and procured in the same manner. In the S. of the Peninsula, in the preparation of arrack spirit, rice forms an ingredient.

The Lau spirit of the Burmans and Siamese is prepared from rice.

In Java two spirits are prepared from it. One of these, called Badek, is made by first boiling and stewing the rice with a ferment called Razi, consisting of onions, black pepper, and capsicum, and mixing and forming the whole into small cakes, which are daily sold in the markets. After frequent stirring, the mixture is rolled into balls, which are piled upon each other over a high earthen vessel, and when fermentation has commenced, the badek exudes, and is collected at the bottom. The remainder, after fermentation is completed, is sold as a dainty in the markets under the name of Tafe. The other rice spirit is called Brom, and is made from retan or glutinous rice, and is of a brown, yellow, or red colour, according to the colour of the rice used. This is boiled in large quantities, and, being stirred with razi, remains exposed in open tubs until fermentation takes place, when the liquor is poured into close earthen vessels. It is generally buried for several months in the earth, by which means the fermentation is checked and the strength of the liquor increased. It is sometimes made stronger by boiling.

The Saki of the Japanese is a beer which a little resembles wine. It is of an unpleasant taste, but it is drunk at every meal, and sold at all the taverns. Before use, it is warmed in a tea-kettle, and drunk warm out of flat lacquered ware cups. It intoxicates rapidly, but the inebria-

tion speedily vanishes, leaving behind a disagreeable headache.

The Chinese prepare from rice different sorts of wines of a red, white, yellow, or pale colour. The best, called Mandarin wine, is strong, and will keep for many years. It is wholesome, but expensive, and is only used by the higher classes. Some of the rice wines are highly perfumed. A strong spirit like brandy is distilled from the lees, and is called Sam-su and Shou-chu.—*Stewart, Panjab Plants; Hogg's Veg. King.; Smith's Mat. Med. of China.*

RICH, CLAUDIUS JAMES, born 28th March 1787, near Dijon in Burgundy; died of cholera at Shiraz on the 5th October 1821. He was brought up at Bristol. While only eight or nine years of age he was attracted to Arabic, and by the age of fifteen he had made progress in Hebrew, Syriac, Persian, and Turkish. He travelled in Asia Minor, and became assistant to Colonel Missett, Consul-General in Egypt, and joined via Cyprus. Disguised as a Mameluk, he travelled over much of Palestine and Syria, and from Aleppo he proceeded to Mardin and Baghdad to Bussora, and on to Bombay, which he reached in September 1807, and was then appointed Resident at Baghdad, where he remained till his death. His remains were interred without the city walls; but, to the disgrace of the prince Husain Ali Mirza, the Persians could not allow them to repose undisturbed, and in 1826 the envoy to the Persian Court removed them to the Armenian burying-ground at Isfahan. He travelled in Kurdistan. He was the first to engage in a series of examinations of the ruins within the limits of ancient Assyria. The remains near Hillah, in the immediate vicinity of Baghdad, first engaged his attention. His discoveries amongst the ruins of Babylon were of considerable interest, though in results far behind what has since been published. They consisted chiefly of fragments of inscriptions, bricks, engraved stones, and a coffin of wood; but the careful account which he drew up of the site of the ruins was of greater value, and has formed the groundwork of all subsequent inquiries into the topography of Babylon. The results of his examination and researches at Hillah and Babylon, with an able dissertation on the topography of ancient Babylon, and the position of its principal buildings, appeared at Vienna in an oriental literary journal called the Mines de l'Orient. This memoir was translated and published in London, and was followed by a second memoir, called forth by some remarks in the Archæologia by Major Rennell. The two have since been republished by his widow, entitled, Narrative of a Journey to the Site of Babylon in 1811; Memoirs on the Ruins, and Journey to Persepolis, 1839.—*Mignan's Travels*, p. 90; *Layard's Nineveh*, i. pp. 22, 23.

RICHARDSON, Sir JOHN, a native of Leith, and a medical officer of the British navy, who was present in one of the polar expeditions. He described the fishes of Japan.

RICINUS COMMUNIS. *Linn.* Palma christi.

A Sanskrit proverb, in the first book of the Hitopadesa, says 'that where there are no trees, even the castor-oil plant ranks as a forest tree.' Nevertheless it grows sufficiently large to produce wood, but it is chiefly remarkable for the beauty of its large spreading leaves, and the value of its seeds, which yield castor-oil. Two varieties, one bearing small and the other large seeds, are produced all over India. The small-seeded variety yields the better product, and is employed in preparing the oil exported for medicinal purposes.

Castor-oil of smaller fruit.

Jarak, ... Malay.	Sitti-amunaku, . . Tam.
Tangan tangan, . Phil.	Chittamindialu, . . Tel.

The fresh seeds of the castor-oil plant, after having been sifted and cleaned from dust, stones, and all extraneous matters, slightly crushed between two rollers, and freed by hand from husk and coloured grains, are enclosed in clean gunny. They then receive a slight pressure in an oblong mould, which gives a uniform shape and density to the packet of seed. The bricks, as they are technically called, are then placed alternately with plates of sheet-iron in water in an ordinary screw or hydraulic press. The oil thus procured is received in clean tin pans; and water, in the proportion of a pint to a gallon of oil, being added, the whole is boiled until the water has evaporated; the mucilage will be found to have subsided and encrusted the bottom of the pan, whilst the albumen, solidified by the heat, forms a white layer between the oil and the water. Great care must be taken to remove the pan from the fire the instant the whole of the water has evaporated; which may be known by the bubbles having ceased; for if allowed to remain longer, the oil, which has hitherto been of the temperature of boiling water, or 212°, suddenly rises to that of oil, or nearly 600°, thereby heightening the colour and communicating an empyreumatic taste and odour. The oil is then filtered through blanket, flannel, or American drill, and put into cans for exportation. It is usually of a light straw-colour, sometimes approaching to a greenish tinge. The cleaned seeds yield from 47 to 50 per cent. of oil, worth in England from 4d. to 5d. per lb.

This oil is chiefly used as a mild purgative. Soap of good quality may be made of it, but the cost and disagreeable smell which it communicates preclude its general use. The clearness, limpidness, and absence of any offensive smell are qualities that do not arise from any superiority of the seed or care in extraction, but from repeated decolorization with animal charcoal, and exposure to the sun's rays, which, in the opinion of many eminent medical men, considerably detracts from its strength and efficacy. When manufactured in the ordinary native mill, this pure oil is sometimes used by the richer classes in lamps. Castor-oil extracted hot differs from the preceding only in the mode of preparation. The seeds are boiled for two hours in water, dried for three days in the sun, freed from the shells, pounded, and then boiled in fresh water, until the whole of the oil has risen to the surface. Five seers of the seeds, or 13⅛ lbs., should by this process yield a quart of oil. This is the sort generally used in medicine by native practitioners; it is straw-coloured, and free from any unpleasant taste or smell.

Castor-oil or lamp-oil, larger fruit.

Chiragh-ka-tel, . HIND. | Ped amidum, . . . TEL.
Vullak ennai,. . TAM. |

This is obtained from the large-seeded variety. It is sometimes drawn cold, and is then scarcely distinguishable in quality from the oil of the small-seeded variety. It is, however, more usually extracted by heat, and forms the common lamp-oil of the bazar of S. India. The seeds having been partially roasted over a charcoal fire, both to coagulate the albumen and to liquify the oil, are then pounded and boiled in water until the oil rises to the surface. The roasting process, however, gives it a deep red colour and an empyreumatic odour. The price of this oil varies in different parts of the country from Rs. 1.10 to Rs. 3.13.6 per maund of 25 lbs. The average of 19 large stations in all parts of the Madras Presidency for the quarter ending 31st October 1854, was Rs. 2.3.6 per maund.

Besides the value of the castor-oil for internal use, the oil applied externally over the glands of the body, or dropped into the ear, largely increases their natural secretions. The leaves are applied to swellings as a discutient remedy. A decoction of the leaves, and the expressed juice of the leaves, administered internally, have decided galactagogue properties; and for increasing the breasts' secretion, the application of the warmed leaves, fomentation with the decoction of the leaves, and poultices of the fresh leaves, are of decided value.—*Lt. Hawkes; M. E. J. R.; Cleghorn; Powell's Handbook.* See Castor-Oil.

RICINUS DICOCCUS. *Roxb.* Taw-the-din-bin, BURM. This tree grows in Amboyna and in British Burma, but in the latter it is scarce, and found only on the banks of streams in the Pegu and Tounghoo districts. It yields a very tall, large timber. The wood is red, and adapted to cabinet-making. R. mappa, *Linn.*, is a tree of the Moluccas. —*Drs. Voigt, M'Clelland.*

RICINUS TANARIUS — ? Ubar, MALAY. A tree of Sumatra. Sails and nets are dyed, and perhaps also tanned, with its wood. The mordants used are rice-bran, alkalies from the combustion of some vegetable matters, as the fruit-stalks and midribs of the cocoanut palm, and alum brought from China.

RIDDELL. Dr. Riddell, M.R.C.S., born at sea in March 1798, became a medical officer of the Bombay army in 1825, but resigned in 1828, and entered the Nizam's service, in which he rose to the rank of Superintending Surgeon. He wrote a Manual of Gardening for Western and Southern India; also, in 1851, Medical Topography and Statistics of the Nizam's Stations and Army.

RIFF, a race on the N.W. coast of Africa, from Ripa, a bank. See Semitic Races.

RIFLE BIRD, Ptilorhis Alberti or Pt. paradiseus, the Australian bird of paradise.

RIGHT-HAND CASTES.

Dakshina-bhakta, SANSK. | Tengale, . . TAM., TEL.

In South India, a sectarian division amongst the Vaishnava Hindus; much animosity and quarrels occurring between the two sects styled the right and left hand, the Tengali and Idagai, the causes of which, or the points of difference, the disputants themselves are generally unable to state. The distinction of right and left hand castes is peculiar to the south of India. It is supposed by Professor Wilson to be of modern origin, and to have been introduced at Conjeveram as a part of civil policy to divide the people and undermine their powers. But Sir Walter Elliot is of opinion that the separation into right and left hand castes had its origin in the violent conversion of the ancient races from Buddhism to Hinduism; and he has been shown a figure of Buddha, which the artisan caste worship. At present they seem to worship Viswakarma, but the bulk appear to recognise Siva as their supreme deity. In the year 1872 the figure worshipped by the goldsmiths of Madras was called Samunday-Eswara, and his pictures represent a green-coloured man with four hands, seated on a lion, one paw of which has struck down a dark-coloured warrior armed with a sword and shield. The god has a mugra cap; he has a long trident, supported between his breast and arm; in one hand he holds a lotus flower, in another a chank shell, and the other two hands are in the position usually given to those of the figures of Vishnu and Gaudama when preaching.

The artisans all bury their dead in a sitting posture, like that of Buddha, seated, with the head of the dead close to the surface, and looking to the north; and their dislike to the Brahmans is intense. Caste has, in the Peninsula, certainly nothing to do with religion, but relates solely to race. It is amongst the Tamil people that the right and left hand sections appear. The Idan-kai or Idau-gai are the left-hand caste, and the Valan-gai are the right-hand caste. According to Professor Wilson, the names and appellations of right-hand castes vary in different parts of Peninsular India, but are usually supposed to be 18 in number, viz.—

Banijaga, traders.
Okhaloga, cultivators.
Jotiphana, oilmaker, employing one bullock.
Rangajiva, dyer or calico printer.
Ladaru, Muhammadan traders, artificers.
Gujerati, bankers from Gujerat.
Komati, merchant shopkeepers of the Vaisya.
Jaina, Jains.
Kurubar, shepherd.
Kumhar, potter.
Agasa, washerman.
Besta, fishermen, palanquin bearers.
Padma Shalaysa, weaver.
Naindu, barber.
Upparavu, tank-digger.
Chitragara, painter.
Gaolla, cowherd; and the
Wallia, or Pareyan, or Paria, who is the champion for the right-hand caste, as is the Madaga or Sakoli that for the left-hand caste.

Of the left-hand castes,—Edagai, Edagai kula, Eddayai, CARN., and Idan-gai, Idam, Idakai, TAM., —the Carnatic enumerations furnish—

Panchala, artisans.
a. Kammaranu, blacksmith.
b. Badage, carpenter.
c. Kansagar, brazier.
d. Kallurtiga, stonecutter.
e. Akasale, goldsmith.
Berisethi, trader.
Devangada, weaver.
Ganigar, oilmaker.
Gollur, money-carrier.
Paliwan and Palawan, cultivator.
Beda, hunter, fowler.
Madiga, tanner, currier, shoemaker.

Right-hand caste and left-hand caste have other applications as to the worshippers of the female energies of the Hindu deities. Professor Wilson says that when the worship of any goddess is performed in a public manner, and agreeably to the Vaidik or Pauranik ritual, it does not comprehend the impure practices which are attributed to a different division of the adorers of the sakti, and which are particularly prescribed to the followers of that system. In this form it is termed the Dakshina or right-hand

form of worship, to distinguish it from the Vami or Vamachari, the left-hand worshippers, or those who adopt a ritual contrary to that which is usual, and to what, indeed, they dare publicly avow. He says the left-hand sect worship Devi, Lakshmi, Saraswati, the Matri, the Nayika, the Yogini, and even the fiend-like Dakini and Sakini are admitted to a share of homage. Siva with the two hands is an object of veneration, especially in the form of Bhairava, with which modification of the deity it is the object of the worshipper to identify himself. The worship of the Vamachari is derived from a portion of the Tantra. It resolves itself into various subjects, apparently into different sects, of which that of the Kaula or Kulina is declared to be pre-eminent. The object of the worship is, by the reverence of Devi, who is the sakti or female power of Siva, to obtain supernatural powers in this life, and to be identified after death with Siva and his sakti. All the forms of this impure worship require the use of some or all of the five Makara, Mansa, Matsya, etc., flesh, fish, wine—'women and wine are the five-fold Makara, which take away all sin.' There is nothing of all this in the Peninsula of India; nor, it may be safely said, anywhere now in British India.

RIG VEDA, Sansk., from Ric or Rich, an incantation, and Veda, from Vid, knowledge. It is one of the first or oldest of the inspired Vedas, the sacred books of the ancient Aryans, and still recognised by all Hindus. Rig signifying the science of divination, of which it principally treats, it also teaches astronomy, astrology, natural philosophy, and gives a particular account of the formation of matter, and the creation of the world. It contains 1017 hymns and 10,580 verses, doubtless the work of many men at long intervals of time. The language is archaic, involved, and elliptical; the hymns contain very little poetry of an agreeable or elevated kind, a few mixed with the most ignoble and unsuitable allusions.

The deities which the Rig Veda invoke are elemental, *i.e.* personifications of earth, fire, and water, and the winds, etc. In the 3d Ashtaka, Agni has 44 hymns addressed to him; the next to him in number comes Indra with 48; and after them, the Marut, or the personified winds, have the largest number of hymns.

Roth calculated that the mere Sanhita or metrical portion of the Vedas, as distinguished from the Brahmana or later ritual appended to each, contains not less than 30,000 couplets, of which 11,000 go to the Rig Veda.

The Rig Veda is the chief of the four Vedas, the others, the Sama Veda, Yajur Veda, and the Atharva Veda, come after it. The hymns of the Rig or Rich Veda are repeated entirely in a disjointed form in the Sama, and with little alteration in the Atharva also. The Yajur Veda contains principally forms of prayer. The Atharva Veda evidently belongs to a much later age than the rest. Each hymn is called a sakta, of which there are about 1000, arranged into 8 ashtaka or khanda of unequal extent. Another division is into 10 mandala, subdivided into 100 anuvaka. Each hymn has a rishi or inspired writer for its author. Portions of the Rig Veda had been translated by F. Rosen, M. Langlois, and Professor Wilson; but Professor Max Muller rendered the whole of it into English, and published the text, mantra. In the hymns of the Rig Veda the Brahmanical or East Aryan tribes are shown advancing step by step along the rivers of the Panjab into the plains of the holy land, Brahmavarta, often at war with mighty kings, or engaged in hostilities with each other, each immigrating tribe pushing those in advance of them farther and farther to the south.—*Garrett; Max Muller; Rep. Brit. Ass.* 1847. See Sanhita; Veda.

RIGYAL, Tibetan, lit. mountain king, is the origin of Plutarch's Mount Argillos (De Fluviis), the name of the mountain on which Bacchus was born. Riga, Tibetan, a mountain, is the same term as Mount Righi in Switzerland. Rigyal is one of the Trans-Himalayan range. The peaks of this range are from 20,786 to 21,000 feet in height. Its general direction is from south-east to north-west, and its extreme length is upwards of 850 miles. It forms the natural boundary of Ladakh, Balti, and Rongdo on the north, and Rukchu, Purik, Dras, and Astor on the south. Its passes on the eastern half of the range are from 16,495 to 18,746 feet in height, and on the western half from 12,000 to 16,000 feet.

RIHL. Arab. A book-stand, used for supporting a Koran or prayer-book in mosques.

RIJAZ. Arab. A war song.

RIKAB. Hind. The second note of the musical scale, 'Re.'

RIKSHA. Sansk. A bear. In Hindu astronomy the general term for a constellation. Maha-Riksha may therefore be understood either as the constellation of the Great Bear, or as the great constellation. Whether the former denomination (which is the same as the name given by Europeans to the asterism called the Great Bear) be merely accidental, or whether by that term both Europeans and Hindus mean the same object, is uncertain.—*Warren, Kala Sanhita.*

RIKSHAVAT. Name of a mountain—literally, bear-having (from Riksha, a bear, and Avat, suffix of possession)—part of the Vindhya chain, separating Malwa from Kandesh and Berar.—*Williams' Nala*, p. 131.

RINCHOR, from Rin, the field of battle, and Chorna, to abandon. Hence Rinchor, one of the titles under which Krishna is worshipped at Dwarica, is most unpropitious to the martial Rajput. Kal-Yamun, the foe from whom he fled, and who is figured as a serpent, is doubtless the Tak, the ancient foe of the Yadu, who slew Janmeja, emperor of the Pandu.

RIND, a section of the Baluch race. See Baluch.

RING.

Mahbas, Khatim,	Arab.	Anello,	It.
Khal-khal,	,,	Circulo, Anillo,	Sp.
Bague, Anneau,	Fr.	Moderam,	Tam.
Ring,	Ger.	Ungaram,	Tel.
Angotha,	Hind.	Halka, Yuzuk,	Turk.

Rings are used in Southern and Eastern Asia as signet rings, with a seal engraved, or for ornament, worn on the fingers, toes, wrists, ankles, or in the nose and ears. A ring is used as a marriage token in Europe; and amongst all nations and in every age the ring has been chosen as the aptest emblem of time, and such names as 'annus,' ενος, ετος, ενιαυτος, and year, from Yar, to surround, mark the most recurrent period known to men.

Medicinal rings were at one time very seriously believed in. Physicians were wont to wear finger-

rings in which stones were set, and these stones were credited with the possession of many virtues. Sometimes the patient was simply touched with the ring; sometimes he put it on his finger for awhile. Many a patient has worn such a ring to stop a hæmorrhage, which sedatives, absorbents, and astringents had alike failed to allay; if the desired result followed, the ring was unreservedly regarded as the healing agent; if the cure did not follow, we are told nothing about it, for in these matters 'what is hit is history, but what is miss'd is mystery!' A wine-coloured amethyst, set in a ring, was a specific against intoxication and its consequences; a hyacinth stone, similarly set, acted as a charm to produce sleep; an agate had wonderful power in curing amaurosis and other diseases of the eye; a jasper showed its value in cases of dropsy and fever; while a coral was an antidote against nervousness and causeless fears.

The ring, with the title or name on it of the owner, is used throughout the South and East of Asia to be applied to documents in the place of a signature; this is mentioned in chapter viii. 2 of Esther, where the king Ahasuerus took off his ring, and gave it to Mordecai. It is so used by Hindus and Muhammadans, even though they can write.

RINTIMBUR, a fort in the Jaipur (Jeypore) State of Rajputana, in lat. 26° 2′ N., and long. 76° 30′ E. It is situated on an isolated rock, the summit of which is surrounded by a massive stone wall, strengthened by towers and bastions.—*Imp. Gaz.*

RIPPLES occur in the Bay of Bengal, the Banda Sea, and other seas of the Archipelago. Also in the tract between the Nicobar Islands, Malacca, Penang, and Acheen Head, they have been seen 2 to 5 miles long, 200 to 400 yards broad. In their general appearance they resembled the waves of the sea breaking on a shallow, sandy shore. Some seen in 1814 by H.M. ship *Minden* advancing from the west were very gentle, so that the surface of the sea was scarcely whitened by them, their approach being indicated only by a faint noise. Others were heard several miles off, and advanced towards the ship boiling and foaming in an extraordinary manner; some of them not only dashed the water many feet up the side of the ship, but actually shook the ship. In the Straits of Singapore they presented the appearance of a shallow stream rippling over a stony bed.—*Jameson's Ed. Journ.*, 1820, ii. pp. 7–9.

RISALA-i-KHAIRATIYAH, or the Charitable Treatise. It contains a diatribe against Sufiism, and especially against the great Sufi teacher of the 12th century.

RISALDAR. HIND. A native officer in the native army of India.

RISAM and Rejam, Pharaoh's magicians, called by the Jews Jannes and Jambres.

RISHABHA. SANSK. A bull, vehicle of Siva. Rishabha signifies excellent. Rishabanatha, 10 miles S. of Prasad, on the Udaipur and Ahmadabad road, a place of pilgrimage.

RISHI, a priesthood of Muhammadans in Kashmir who do not marry, and who abstain from animal food.

RISHI, an important term in Hindu astronomy, which, in its scientific sense, means a line or great circle passing through the poles of the ecliptic, and the beginning of the first solar sidereal sign and first fixed lunar mansion of the respective zodiacs, and which said circle is supposed to cut some of the stars in the Great Bear, which most commentators take to be Dhube, or β Ursæ Majoris, and ζ Piscium, although in reality no such circle could be made to intersect exactly these three points. This line or circle being thus invariably fixed, and the four (fixed and moveable) zodiacs conceived to coincide at a particular epoch, the variation of the moveable ones may easily be reckoned by its means, as if it were an index. Thus, suppose that the line of the Rishi should have intersected the beginning of the fixed lunar mansion Magha, as was supposed to be the case in the 1910th year of the Caliyug (1192 B.C.), and that at the beginning of the said year the line of the Rishi was found by observation to intersect the middle of the moveable mansion Magha, then it would be said truly that the Rishis had got into $6° 40' \left(\frac{13° 20'}{2}\right)$ of the moveable Magha, and these 6° 40′ would mark the absolute precessional variation which had accumulated at that epoch since the time that the fixed and moveable Maghas coincided. The above explanation of the term Rishi is clearly justified by all the Hindu treatises of any weight which have hitherto fallen into the hands of Europeans; and here it may not be out of the purpose to observe that when Hipparchus (later than the 135th year B.C.), on comparing his observations of Spicæ Virginis (the Harshana of the Indians) with those that Simocharis had made at Alexandria about a century before, and perceived by the results that the stars appeared to have advanced (though slowly) from west to east relatively to the equinoctial points, he was far from imagining that Indian astronomers (perhaps several centuries before his time, and in all probability by observations of the same star) had already noticed the same variation, on which, in after ages, Sir Isaac Newton resolved and established the great problem of the equinoctial precession. The celebrated Indian astronomer Aryabhatta, probably puzzled how to account for the change of the position of the line of the Rishis, which, he admitted, had intersected the middle of the moveable lunar mansion Magha in the year of the Caliyug 1910, and which he pretended to cut (when he wrote) the beginning of Aswini, imagined a curious system on the seven stars of the Great Bear, to which he supposed a proper motion to the eastward, at the rate of 13° 20′ (a lunar mansion) in 100 years, which amounted to 159,999 revolutions in a calpa, and which squared his account. But this absurd doctrine has long since been abandoned by all manner of Indian astronomers, many of whom in existence in 1810 had never heard of it.—*Lt.-Col. J. Warren, Kala Sankalita*, pp. 85, 245.

RISHI, amongst the Hindus, a sage, a seer, an inspired poet. In the epic period of the Hindus, a Rishi is merely a title for a historical personage; in the Puranic period, the Rishi are seven primeval personages, born of Brahma's mind, and presiding, under different forms, over each manwantara. They correspond to the Prajapati, or progenitors of the human race. Three lists of Rishis are given in the Upanishad of the Yajur Veda, called 'Vrihad Aranyaka,' each list differing from the other. Other names are given

later in the Sathapatha Brahmana, Mahabharata, and the Vayu and Vishnu Puranas—

Agastya.	Jamadagni.	Pulastya.
Angiras.	Kanwa.	Valmiki.
Atri.	Kasyapa.	Vashishtha.
Bharadwaja.	Kratu.	Vibhandaka.
Bhrigu.	Manu.	Visvamitra.
Daksha.	Marichi.	Vyasa.
Gautama.	Pulaha.	

The names of several of the Rishi are prefixed to the hymns of the Vedas. Vashishtha is the reputed author of some of the most touching hymns of the Vedas, simple, genuine utterances, confessing sin, and yearning after an unknown God. On the other hand, Visvamitra, son of Gathi, was a king, a powerful soldier, and is alleged to be the originator of the great religious ceremonies. According to Hindu mythology, by his devotion he became a Rishi and capable of creating as well as Brahma. These two men became typical in ancient Hindu story, and they are made to reappear in the long subsequent Ramayana.

The term Rishi is also applied to the Vanaprastha Brahmans, or inhabitants of the desert. Of these the most ancient and celebrated were the seven great Rishi, or Maha Saptaite Rishi astadha, who had retired in the territory washed by the Indus; and it was to them, it is supposed, that Alexander the Great applied for instruction after invading their country.

Astronomically the Rishi are the husbands of the six Pleiades, but how six and seven can accord it may be difficult to understand, yet they have had the honour of becoming the seven bright stars in the Great Bear; and in Hindu mythology they are fabled to be married to the Pleiades, are worshipped at the festival of Shashti, and at the sacrifice called Chitra Ketu, Swar Yaga, and a drink-offering is poured out to them at the Magha bathing festival.—*Ward*, iv. p. 20.

RIVEA FRAGRANS. Boodthee-kecray, TAM. A beautiful variety of the convolvulus tribe, found in hedges, called the clove-scented creeper by Europeans; transparent white flowers, opening at sunset, and perfuming the air with a very pleasant odour; leaves used as greens. Wight gives R. cuneata, cymosa, hirsuta, ornata, pomacea, speciosa, and tiliæfolia.—*Jaffrey; Wight.*

The principal rivers of the S. and E. of Asia flow into the Caspian Sea, the Persian Gulf, the Arabian Sea, the Indian Ocean, the Bay of Bengal, and the Chinese Sea. The valleys of the Oxus, the Jaxartes, the Indus, and nearly the whole of that of the Euphrates, being at the extremities of Iran, that territory, in addition to the Tigris and Araxes, with their tributaries, has only the advantage of the Salyan, the Aji, Jeghetu, and Safed-Rud towards the north; the Zend-Rud, Indian, and Bendamir in the centre; the Helmand, with its tributary, and the Farrah-Rud, more eastward. Besides these, there are some inferior streams, which after a short course are either lost by absorption or become saline. The Bay of Bengal receives the Ganges, Brahmaputra, Mahanadi, Godavery, Kistna, Pennar, Cauvery, Irawadi, Salwin, etc.

Rivers of India, the areas of their basins and the lengths of the main streams, are as under; area in English square miles, and length in English statute miles:—

	Area.	Length.

The Persian Gulf and the Arabian Sea receive the rivers Shat-ul-Arab, Indus, Lunee, Nerbadda, Myhie, Tapti, and numerous streams and torrents from the Western Ghats. The Himalaya gives

forth five great rivers,—the Ganges, Brahmaputra, Indus, Sutlej, and Kurnali or Gogra. These are called by the Tibetans, Tam-jan-khamba or Horse's Mouth, Shingh-gi-khamba or Lion's Mouth, Lang-chan-khamba or Bull's Mouth, and Mabja-khamba or Peacock's Mouth. The last four rivers drain the Kailas group of mountains. They rise close to the great Kailas Purbut.

The *Euphrates*, the Forat or Forath of the Hebrews, and the Perath or Phrath of the Arabs, rises near the shores of the Black Sea, and joins the Tigris after a course of 950 miles. It has two great sources in the Armenian mountains, the more northern of which is the Anti-Taurus, 25 miles N.E. of Erzerum.

The *Tigris* river is known to the people as the Dijlah. It is formed of three main branches,—the Diarbeker stream or true Tigris, the Myafarckin river, and the Bitlis-chai or Centrites of Xenophon. It enters on the low country near Jazirah; at Argunna is but a little brook; whilst the Euphrates, even at Malatea, is a very noble river, about a hundred yards wide. The Tigris varies as much in the rapidity as in the depth of its stream, both being governed by the periodical waters that rush from the mountains of Armenia, where its sources are about 50 miles north-west of the valley of Diarbeker. It flows thence with a swiftness that gave it the ancient Persian name of Tir, the arrow, which is descriptive of its course. The average rate of its current is about seven knots an hour. It begins to rise in March, is highest in May, and in June returns to its natural level. Its first swell is produced by the melting of the winter snows in the mountains; its second appears towards the close of October or the beginning of November, and rises immediately after the annual rains in those high regions. But it is only during the spring torrents that a complete inundation covers the land, and the city of Baghdad stands like a castellated island in the midst of a boundless sea. It has an average width of 200 yards from Mosul to Baghdad, with a current in the high season of about 4¼ miles per hour. The country is highly cultivated from Mosul to Nimrud on both sides of the river, but from the latter place to Tekrit all cultivation nearly ceases; and it is but partially found in the tract along the river between Tekrit and Baghdad. The Tigris is navigable for rafts at certain seasons from the bridge of Diarbeker to Mosul, a distance of about 296 miles. Below the latter place it is more or less so throughout the year, and the descent to Baghdad is performed with ease and speed. Large rafts, supported by 200 or even 300 inflated skins, are much in use for the transport of goods, and when the merchants are on board, a small room is raised on the raft in order to give shelter from the sun and rain. Since the middle of the 19th century a steamship company has been trafficking on the Tigris. The lands on either side of these two rivers are occupied by nomade tribes of Arabs. The two rivers unite near Kurnah, and form the Shat-ul-Arab, which disembogues into the Persian Gulf.

The *Kum Feroz* river, across which Amir Azan Delemi built the Band-i-amir (Bend-amir). It is the Aras, a modern name of the ancient Araxes, the Awerma of the Puranas. It laves the foot of the rock Istakhr. The snowy Ardegan mountains are the same with those which presented so formidable a barrier to Alexander's progress, and by whose slopes he descended into Persia in his advance on Persepolis. The sources of the Aras and those of the north branch of the Euphrates are about ten miles from one another. Pliny stated that those sources are in the same mountain, and 600 paces asunder. This river at its commencement, owing to its many affluents, bears the Persian appellation of Hazara. It springs from the side of the Bin Gol, or Mountain of a Thousand Lakes, about 30 miles south of Erzerum, and nearly in the centre of the space between the eastern and western branches of the Euphrates. Its course, from its first spring near Jabal Seihan, is almost north-east for about 145 miles through Armenia, when it turns eastward, being then near the frontier of Kars. This proximity continues for 110 miles. In modern times, the north-eastern districts, along the banks of the Araxes, intervening between Aderbijan and Georgia, have been in general subject to the sovereigns of Persia.

Central Asia, between India and Tartary, is one broad mountain range, the Himalaya forming the southern crest, and the Kouen Lun the northern. The interior has some lovely valleys like Kashmir, but it is more usually broken into rocky ravines, through which affluents of the Indus force their way towards the plains; or else stretches away in those vast treeless uplands, which are one of the chief characteristics of the range through its whole extent. The direction of this range is from east to west, trending slightly to the north, while the parallel chain that bounds Siberia to the south, and the outer crest of which is the Tian Shan, trends somewhat to the south; so that at a short distance to the west of Yarkand and Kashgar, the great interior depression of Chinese Tartary terminates, and the boundary ranges coalesce in the elevated table-land of Pamir. The ascent from Yarkand and Kashgar westward to the table-land of Pamir is almost imperceptible; and when that lofty position is gained, where the average elevation is probably as much as 15,000 feet above the sea, a vast open plain is seen, which stretches from the valley of the Jaxartes (Syr Darya) in one direction, across the head-streams of the Oxus (Amu Darya), to the top of the Kashgar or Chitral valley in another. This plateau may be 700 or 800 miles in extent. It is studded throughout with lakes, and from it descend four great river systems. The Narym, which is the main stream of the Jaxartes, runs through a long, luxuriant valley, between the culminating ridge and outer range of the Tian Shan, and drains all the northern range of the plateau. The Oxus, rising in the Sari Kul or Yellow Lake of Pamir, at least 300 miles to the south of the Jaxartes, receives from its right bank a multitude of small streams, which run to the south through rugged valleys, on the south-western face of the Pamir uplands. The western face of Pamir between the Jaxartes and the Oxus is far more precipitous than the eastern. Ridges run out as far as Samarcand and Karshi, and the streams from the upland which twine amongst these ridges form the Zar-afshan and Karshi part of the water system of the Oxus, though before they reach that river they are entirely consumed in irrigation.

The Indus water system is formed on the

south-eastern extremity of Pamir, where the table-land is lost in the rocky summits of Muz Tagh, and a number of streams drain off to the southward, forming two subsidiary Indus systems. A culminating ridge, Pusht-i-khar, or Ass's Back, which runs out from the south-east corner of Pamir, is the true watershed between Tibet and Kābul, the streams flowing to the southward being separated by the shoulder which joins the Hindu Kush from the streams descending through Vakkan and Badakhshan to the Oxus, and forming the Kābul river, which falls into the Indus at Attock; while those that flow to the south-east and are divided by the Muz Tagh range from Tartary, descend through a series of rocky valleys and precipitous gorges into the Upper Indus at Little Tibet.

From the eastern face of the Pamir, again, which slopes off very gradually into the plains of Tartary, is supplied a fourth water system, in the form of a series of small streams, which, passing by Yarkand and Kashgar, are ultimately lost in the sandy desert, or in some cases reach the central lake of Lob Nor.

The basins of the Amu and Syr Darya are partly in Russian, partly in Persian territory, and partly in that of Afghan Turkestan, under chiefs subordinate to the Amir of Kābul, and are largely occupied by Turk, Turkoman, and Iranian races, the two former being almost all of them nomades and predatory. The sources of these rivers are in the table-land of Pamir, and those of the Amu, first seen by Lieutenant Wood in the early part of the 19th century, have since been visited by other explorers.

The *Indus* is a magnificent river; it rises in the Kailas or Gangri range, in lat. 31° 20′ N., and long. 80° 30′ E., 1700 feet above the sea, and has a course of about 1977 miles. It is known in the Tibetan of Ladakh as the Tsang-po, the Sam-po-ho of the Chinese Pilgrim Hiwen Thsang. A few miles from Leh it receives the Zanskar river, and its bed at Pitak below Leh is 10,500 feet above the sea. At Mittunkot, the Indus is often 2000 yards broad, and near this place, in lat. 28° 55′ N., and long. 70° 28′ E., it is joined without violence by the Panjnad, a large navigable stream, the collected waters of the Sutlej, Beas, Ravi, Chenab, and Jhelum, after which its bed never shallows in the dry season to less than fifteen feet, and seldom preserves so great a breadth as half a mile. The whole length of its mountain course from its source to Attock is about 1035 miles, and the whole fall is 16,000 feet, or 15·4 feet per mile. From Attock to the sea, the length is 942 miles. Its maximum discharge, above the confluence of the Panjnad, occurs in July and August, when it is swollen by the seasonal rains, and it then reaches 135,000 cubic feet, falling to its minimum of 15,000 in December. Up to this confluence it is known by various names, viz.:

Sam-po-ho, . . . CHIN.	Saind'hava, . . SANSK.
Sin Tow, . . . ,,	Sing-ge-chu, . TIBETAN.
Tsang-po, . . LADAKH.	Sin'h-ka-bab, . ,,
Aba Sin, . . ,,	

Sing-ge chu means the lion river, and Sin'h-ka-bab the lion's mouth. From the confluence, in its route through Sind, it is known as the Sar, Siro, or Sera, down to Sehwan; as the Wicholo or central from Sehwan to Hyderabad; and as the Lar from Hyderabad to the sea. The races occupying the countries near are the Bhot, the Afghan, the Jut, the Baluch, the Brahui, the Rajput, and the Lar. The Indus guards the western frontier of British India, and in all the military operations of the British since 1834, in Afghanistan and Sind, the Indus has been of great value as a means of communication. During the war of 1845–1846 in the Panjab, a bridge of boats was carried up the river as far as Bahawulpur, and thence despatched up the Gharra to Ferozpur; and another branch of the river, the Chenab, was in a subsequent war navigated up to Multan.

The *Tarim* debouches into Lob Nor, an inland sea, into which the waters of several rivers flow. The Tarim is about 800 miles long; the lake is in a considerable depression, not more than 2000 feet above sea-level.

Three large rivers flow through Kafiristan from north to south, and augment with their waters the river of Kābul and Jalalabad, which ultimately falls into the Indus. The two westerly rivers unite at Tirgari of Lughman, and the joint stream, after a short course of eight or ten miles, falls into the Kābul river at Lergah, in the same district, about a mile to the east of Mandarawar. The easterly river, known as that of Kameh, falls into the Kābul river east of Jalalabad, and at a distance of about twenty-five miles from Kergah. The Kameh flows through Chitral, and its source is more remote. On the east it may be considered the boundary of the Siahposh territory, as the river of Nadjil and Alishang forms the boundary on the west. The sources of the Nadjil river are said to be not very distant, and it is the smallest of the three rivers.

From the central axis of the Himalaya, a succession of secondary ranges take their origin, which descend on the one hand towards the plains of India, and on the other towards the northern rivers. These secondary chains on the Indian side separate great rivers which flow towards the plains of India, and which, successively uniting in their courses through the plains, ultimately discharge their waters into the Indus and Brahmaputra, from which they are at first separated by the whole breadth of the Himalaya. The great rivers from west to east in succession are the Jhelum, the Chenab, the Ravi, the Beas, the Sutlej, the Jumna, the Ganges, the Gogra, the Gandak, the Kosi, the Tista, the Monas, and the Subansiri. All these are separated by chains at first of great elevation, but which terminate at last abruptly in the plains of India.

The rivers of Northern India are shallow, turbulent streams, traversing a vast extent of more or less level country, the bottom usually of sand or mud, which as a mass is constantly on the move towards the sea, the channel consequently always shifting its position, and the depth very uncertain. The navigable channel, although deep enough, is often difficult to discern in a wide expanse of waters, or among sandbanks intersected in every direction by blind channels, among which the open one is undistinguishable. The current often presents whirls or eddies running contrary to the stream, which frequently shoots from an abrupt turning at such an angle to the course of the stream as to deprive the rudder of its command, and throw a boat violently across the stream, or even turn her round.

The richest and altogether most important part

of British India is that which extends from Calcutta to Peshawur, and comprises the whole valley of the Ganges and the Panjab. The course of the great rivers through this region marks the prevailing slope of the land, which falls on every side from the Himalayas, the Rajputana uplands, and the Vindhyan plateau towards the seaward opening of the Arabian Sea and of the Bay of Bengal.

The chief rivers of the N.W. Provinces are the Ganges, the Jumna, and the Gogra. Among minor streams, the E. and W. Kali Nadi and the Hindan flow through the Doab. The Chambal intersects the Trans-Jumna tract in Etawa. The Betwa and the Ken are the principal streams of Bundelkhand. The Ganges, with its tributary the Jumna, collects the rainfall from the southern slopes of the mountain wall, and pours it down upon the plains of Bengal.

Towards the delta of the Ganges and Brahmaputra, when the volume of water, increased by the Himalayan snows, is swelled by ordinary or abnormal rains, all channels are united in one huge expanse of water, miles in breadth. The surrounding country is an inland sea, over which communication is maintained in skiffs and canoes between one village and another. By the month of October the waters subside. In the dry season huge masses of earth can be seen falling under the action of an undermining current, and the noise can be heard several hundreds of yards off. Owing to the annual overflow of its network of rivers, the level of the plains of Lower Bengal is gradually rising.

The *Jamuna* or Jamoona river of Northern Bengal in Rennell's time joined the Brahmaputra, whereas it now joins the main stream of the Ganges near the railway station of Goalundo. On the Jamuna is situated the important mart of Sirajganj, perhaps the richest of all the centres of trade in the interior of Bengal. Till about 1840 this capital of the trade in jute stood on the banks of the river. In 1848 the floods carried the town clean away, whereupon the traders formed a new bazar on the new bank, five miles from the original spot. When the stream, in another sudden caprice, went back to its old bed, the traders, warned by experience, preferred remaining where they were. Huge boats are now moored in the mid-stream miles from the bank, and business is done by merchants and brokers, who move about in small boats, or traverse what, in the hot season, is a blinding waste of sand some miles in extent. The real Sirajganj has been happily described as a town without houses. But it has a population of 18,000, and an aggregate trade, imports and exports, of $3\frac{1}{4}$ millions.

The *Tista* rises in Independent Sikkim or in Tibet, or in both countries. Its upper reaches display rocky pools, huge boulders, wooded banks, and picturesque scenery. When it descends to the plains, these peculiarities are exchanged for a fine channel often 800 yards wide, which, even where the volume is least, will float boats of three and four tons burden. The history of the freaks of this stream is very suggestive. In the survey by Major Rennell, the Tista flowed due south, joined another river in Dinajpur, and finally emptied itself into the main stream of the Ganges. In 1787 the Tista was choked by excess of silt, and burst its banks, when the accumulated waters forced their way into a small branch, which, after flooding the country and causing immense damage, they gradually so enlarged as to form a junction with the Brahmaputra, which still exists.

The *Mahanadi*, in the province of Cuttack, rises in a mountainous and wooded region, and, after a tortuous course between ridges of hills and over ledges of rocks, divides into two or more main channels, and has often threatened to sweep away the town of Cuttack. But the volume of waters has been confined and utilized by engineering skill. A series of canals, at a considerable outlay, will guarantee the province against a recurrence of the terrible famine of 1866.

Except the Nerbadda and Godavery, unless great engineering skill be applied, there are none of the rivers of the Peninsula of India likely to prove navigable. The waterfalls on the Nerbadda river are those of Kapila-dhara and Dudh-dhara near its source,—the former of 78 feet. The next is at Umaria in the Narsinghpur district, of about 10 feet. At Mandhar, 90 miles below Hoshangabad, and about 25 below Handia, there is a fall of 40 feet; at Dadri, near Punasa, 25 miles below Mandhar, there is another fall of 40 feet.

The British Indian Government tried to make the Godavery navigable. The rivers embraced under the Godavery navigation project are the Godavery, Wardha, Pranhita, Wain - Ganga, Indrawati, Sabari, and Pain - Ganga. The three first, however, are the principal streams. The Wardha takes its rise in the Baitul district, west of Nagpur, and, after flowing for some distance in a south-east direction, is joined by the Wunna, which, passing under Hinginghat, falls to the south, and forms its junction with the Wardha, at a place called Sweet, 18 miles south of the latter place. At this confluence are the falls of Zoouratc, and under them is the village of Chuhmunder, which was supposed to be the limit of the contemplated engineering operations. The Wardha flows on to the south-east, until, a little before reaching Chanda, it is joined by the Pain - Ganga, when, losing the names of Wardha and Pain - Ganga, the united stream continues under the name of Pranhita to its junction with the Godavery, a few miles below the station of Sironcha. Midway between these confluences is situated the third or Dewalamurry barrier, extending round in a curve for about 50 miles, and midway down this barrier the Wain-Ganga discharges itself into the Pranhita. From the confluence of the Godavery and Pranhita below Sironcha to the sea, the river carries the former name, although joined at intervals by the Indrawati and other tributaries above specified. Thirty miles below Sironcha is the second or Enchampally barrier, and eighty miles below this again is the first or Sinteral barrier.

The *T'san-pu*, or Brahmaputra, like the Sutlej, rises near to the sacred lake of Manasarowar. Indeed, the Indus, the Sutlej, and the Brahmaputra may be said to start from the same water-parting. After receiving several tributaries from the confines of the Chinese empire, the river (Brahmaputra) bends round a lofty eastern range of the Himalayas, and enters British territory under the name of the Dihang, near Saddiya in Assam. A few days' journey from Saddiya, the frontier town of Assam, there is a station called Bonga, where Roman Catholic missionaries have their

solitary home. Here is the meeting-place of the frontiers of India, Burma, China, and Tibet, Taking our stand at this spot, and looking south, we have five great rivers, all destined to play a great part in the future trade of Europe, and in the regeneration of the people who swarm on their banks. To the west is the Brahmaputra, which bears the tea of Assam to its destination; to the extreme east is the Yang-tse, the great river of China; and flowing directly south and almost parallel at distances of about 200 miles from each other are, in order from the Yang-tse, the great Mei-kong or Cambodia river, the Salwin, and the Irawadi. On the delta of the first the French have planted themselves, and already their steamers have sailed up towards China and Burma, till stopped by the rapids.

The T'san-pu river rises close to the sources of the Indus and Sutlej at a height of 16,000 feet. Running eastward it falls to 14,200 feet at Tadum, 11,800 feet at Shigatze, and 11,300 feet near Lhassa. It is almost certain that this river joins the Brahmaputra in Assam under the name of the Dihang. This mighty river runs from the N.E. of India, from Brahmakund to Goalpara, for a mean length, exclusive of its numerous small curves, of more than 400 miles. The level of the Brahmaputra at Saddiya is 210 feet. A little to the south of the entrance of the Tista begins that part of the river where the stream branches off in the shape of a delta, and shortly joins with that of the Ganges. The ebb and flood of the tide extend, in the season when the river is low, upwards beyond Dacca; the fall from Saddiya to the delta consequently amounting to half a foot per mile. The Brahmakund is a very deep basin-shaped enlargement of the river, just before it emerges from the mountains to descend into the plains of Assam. The velocity of the current, which both above and below the Brahmakund is very great, suffers a great diminution at this point. In this S.W. course, along the whole length of the left shore of the Brahmaputra, and nearly parallel to the broad valley through which it runs, we meet with a longitudinal range of secondary hills, inhabited by the various scattered tribes of the Naga, Khassya, Jaintia, and Garo. It disembogues into the Bay of Bengal through three mouths, after a length, in the plains, of 933 miles. It receives in its long course the T'san-pu, 1000; Dihang, 140; Noa Dihang, 100; Buri Dihing, 150; Subansiri, 180; Manas, 189; Bagni, 150; Guddala, 160; Dharla, 148; Tista, 313; Barak, 200; Gumti, 140 miles.

The delta branches of the Brahmaputra and Ganges intersect Lower Bengal in such a variety of directions as to form a complete system of inland navigation. The Brahmaputra begins to rise in April, owing to the melting of the snow at its alpine sources. About the 1st July it is at full flood, and all the level country is submerged, herds of buffaloes, deer, and hogs then swim for refuge to the hills. The Brahmaputra drains Assam in every direction. It is known in Assam by the name Hiranya or golden. In the rainy season it rises 30 or 40 feet above its lowest level, overflows its banks, and inundates the country like an inland sea. In the dry season it is a labyrinth of half-filled channels, rendering the navigation intricate and fit only for steamers of light draught. It is not navigable higher than Dibrughar. As seen from Ogri Hill near Tezpur, the river is sweeping along in a bed of from ten to twelve miles in breadth, with numerous islands covered with canes and shrubs. The chief towns on the banks of the river are Bishnath, Durrung, Gowhatty, Goalpara, Nasseerabad. It is navigated from the Bay of Bengal to Dibrugarh, near the head of the Assam valley, within 500 miles of Pengshaw, on the Yang-tse-kiang river. Of these 500 miles 300 are known. Megna and Brahmaputra are names of the same river in different parts of its course; the Megna falls into the Brahmaputra, and though a much smaller river, communicates its name to the other during the rest of its course.

The Aryan Hindu and the non-Aryan races who occupy British India continue to worship springs and fountains and other natural objects. This has been a custom with many races. The fountain of Egeria, the Fontinalia Romana, the Aquæ Ferentinæ, and the sacred wood where the Feriæ Latinæ were celebrated, were under the especial protection of some divinity. Pansanias says that at Phocis in Achaia, there was a fountain called Hama, consecrated to Hermes, near which thirty enormous straight stones had been erected at a very remote period, when instead of images the Greeks adored blocks of stone. Such was also the religion of pagan Ireland.

And still the Ganges river by Hindus is esteemed sacred. Many persons, whose relations die at a distance from the Ganges, at the time of burning the body preserve a bone, and at some future time send or bring this bone and commit it to the river. The work called Kriya-yogasara contains the following curious story:—'A Brahman, who had been guilty of the greatest crimes, was devoured by wild beasts; his bones only remained. A crow took up one of these bones, and was carrying it over Ganga, when another bird darting upon it, the crow let the bone fall. As soon as the bone touched Ganga, the Brahman sprang to life, and was ascending to heaven, when the messenger of Yama, the judge of the dead, seized him as a great sinner. At this time Narayana's messengers interfered.'

The confluence of rivers, called Sangam by Hindus, is held sacred by these religionists; the forks of the Ganges and Jumna at Allahabad, of the Ganges and Gandak at Patna, may be mentioned, and pilgrims visit them in large numbers. The tongue of land where the Ganges unites with her great sister river the Jumna, is the true Prayag, the place of pilgrimage to which hundreds of thousands of devout Hindus repair to wash away their sins in her sanctifying waters. A legend tells us that at Allahabad or Prayag the clear and undimmed glance of Hindu faith can discern a third stream, besides those visible to ordinary mortals, the Jumna and the Ganges, which there unite just below the fort. But the Ganges at her estuary is not less sacred than her source. Saugor Island, at her mouth, is annually visited by a vast concourse of pilgrims, in commemoration of her act of saving grace, when, in order to cleanse the 60,000 damned ones of the house of Saugor, she divided herself into a hundred channels, thus making sure of reaching their remains, and so forming the delta of Bengal. Devout Hindus make a six years' pilgrimage from

the source of the Ganges to the mouth and back again. It is known as a pradakshina, or a circumambulation, and is still performed by many; and a few of the devotees may be seen wearily accomplishing the meritorious penance of measuring their length along certain parts of the route. To die and be buried on the river bank is the last wish of millions of Hindus. Even to exclaim Ganga! Ganga! at the distance of 100 leagues from the river, say her more enthusiastic devotees, may atone for the sins committed during three previous lives.

Karnafuli, a river of Chittagong, which discmbogues into the Bay of Bengal.

Irawadi.—The sources of this great river are between lat. 27° and 28° N., and long. 97° 30′ E. The transverse range, which separates the upper part of the western branch of the Irawadi from the valley of Assam, is of moderate elevation, varying probably between 5000 and 6000 feet. The slope of its valley is greater than that of the Indus or Ganges. The valley of Hukum is said to be 1000 feet above the level of the sea. The central branch of the Irawadi at Manchi, in lat. 27° 20′ N., is 1800 feet; at Bhamo, in lat. 24°, about 500 feet. Along its bank, hills frequently approach, and some of them close to the river are 3000 or 4000 feet high. Amongst the high mountains at its source the rainfall is considerable; at its centre, the fall of rain is comparatively small, but much rain falls at its delta. The valley of Manipur is drained by the westerly tributary of the Irawadi. The valley of the Irawadi at its lower end unites with that of the Sitang to form an extensive plain stretching from Cape Negrais on the west to Martaban on the east. The water-parting between these two streams is the Pegu Yoma range, which, running north and south, terminates in low hills at Rangoon. The valley is about 80 miles broad at the frontier line, counting from chain to chain. It flows for 660 miles before reaching the British possessions, and thence its waters roll on for 240 miles to the sea in a S.S.W. direction. As it nears the coast it divides, converting the lower portion of the valley into a network of tidal creeks. A little above Henzadah, about 90 miles inland, it sends off its first branch to the westward, which, flowing past Bassein, receives the waters of the Panmawadi and of the Penglaygalay, and, bifurcating, enters the Bay of Bengal by two main mouths, the Bassein and the Thekkay-thoung rivers. The waters of the Irawadi commence to rise in March, and continue to rise till September, when, or in October, they commence to fall again, having risen 37 or 40 feet. Just below Rangoon it is joined by the Pegu and Puzundoung rivers, flowing from the east and north-east. The Pegu and the Puzundoung rivers rise close together in the Yoma range, about 58 miles above the town of Pegu, the capital of the ancient Talaing kingdom conquered by the Burmese under Alompra, and which gives its name to all this portion of the country.

The *Sitang* river rises far north of British territory, which it enters just above Tounghoo. Here it is narrow, and navigable with difficulty for large boats during the dry season.

The *Menam* river empties itself into the bottom of the Gulf of Siam. It washes Bankok, the capital of Siam.

Mei-kong, or Cambodia river, empties itself in the China Sea, at the entrance of the Gulf of Siam.

The *Hoang-ho* of China rises in the Kouen Lun range, from springs which the Chinese figure to themselves as the starry sea. After bursting through several water-partings, making wonderful bends near the base of the Mid Asia plateau, it traverses Northern China, and confers agricultural prosperity on 120 millions of souls. Its course within the plateau is about 400 miles, and its water-supply is there perpetually snow fed.

The *Yang-tse* of China has its source in the Kouen Lun. It is undoubtedly one of the finest rivers in the world; it takes its rise on the north-eastern edge of the plateau of Tibet, and, after traversing the Koko-Nor, enters China at the province of Kau-su; it then leaves it again to water the sandy plains at the foot of the Alechan mountains, surrounds the country of Ortous, and, after having watered China from south to north, and then from west to east, goes on to throw itself into the Yellow Sea. The waters are pure and beautiful at their source, and only assume their yellow tint after passing the Alechan and the Ortous. The river rises almost always to the level of the country through which it flows; and to this is to be attributed the disastrous inundations which it occasions. These floods, so very fatal to China, are of little consequence to the nomadic Tartars, who have only to strike their tents and move off elsewhere.

After quitting the plateau of Mid Asia, it passes through provinces of China so thickly peopled that they have been estimated to hold 120 millions of people, supplying the means of irrigation and water traffic; and, after a course of 700 miles, enters China proper. Its water-supply is immense and unfailing, obtained largely from the snow-clad and ice-bound regions at its source. It forms, with the Hoang-ho, a twin basin to which the most advanced and powerful eastern civilisation owes its development.

Ho T'u Loh-Shu of the Chinese means the plan (or diagram) of the Yellow River, and the writing (or book) of the river Loh. By this phrase are designated the systems of diagrams and arrangement of the ordinal numbers. These, according to ancient tradition, were revealed to the sages Fuh-hi and Yu in a supernatural manner. Kung Ngan-Kwui gave form to the legends, which relate that a dragon-horse with symbols on its back, and a tortoise with a scroll of writing on its back, came out of the river, which Yu interpreted and made the basis of his ninefold division of philosophy.—*Schlagentweit, General Hypsometry of India*, ii. p. 98; *Rennell's Memoir*, pp. 337, 361; *Fraser's Himalaya Mountains*, p. 468; *Herbert; Hodgson; Tod's Rajasthan*, i. p. 16; *Rep. Royal Com.; Ward's Hindoos*, i. p. 275; *Pliny*, lib. vi. c. 9, in *Malcolm's Persia*, ii. p. 212; *Journal Royal Geo. Soc.* vi. part ii. p. 200; *Kinneir's Geographical Memoir*, p. 9; *Porter's Travels*, ii. p. 258; *Maury's Physical Geography*, p. 308; *Imp. Gaz.; Trelawney Saunders' Mountains and River-basins.*

ROADS have existed in India from the most ancient times, but since artillery has been used in war, and since parts of India have been in the possession of the British, the French, the Dutch, the Portuguese, and the Danes, efforts have been made to extend them. Roads were made by the

Greeks and Romans, but never by the Arab or the Jew. The British, on assuming the government of the country, found that the roads which the Moghul emperors were said to have made had not been paved. In 1850, Lord Dalhousie commenced a road from Hindustan to Central Asia, from which, even in an unfinished state, benefits have arisen. The original idea was that the road should be available for wheeled carriages through its entire length. The Grand Trunk Railway, the Via Appia of India, runs for 1200 miles, from Calcutta to Lahore. The Simla, Naini Tal, Ranikhet, and Darjiling roads scale the steeps of the Himalayas; and the Ganges, Bari Doab, and Kistna canals are triumphs of engineering skill. India is traversed by railroads from side to side, and from sea to sea, by several almost parallel lines. Each of the seaports of the Peninsula is the terminus of at least one line, and within the whole length and breadth of the land there will not be two places of prime importance from one to the other of which passengers and merchandise may not be carried by rail.

ROALA, an Arab tribe in Syria, who have a war cradle, a car composed of ostrich feathers, in which the most beautiful of their maidens is carried before them in their fights.

ROBERTS, an American missionary who, in 1830, with an earnest Chinese disciple, kindled the great evangelical movement amongst the Chinese, which the Tae-ping blended with a national struggle.—*Bunsen, God in Hist.* i. p. 270.

ROBERTS, Major-General Sir FREDERICK, G.C.B., V.C., C.I.E., Bart., a highly-distinguished officer of the Royal (Bengal) Artillery, who earned great fame in Hindustan and Afghanistan. He served throughout the Indian Mutiny of 1857-58 as Dy. At. Qr.-Mr.-General of Artillery, including the siege and capture of Dehli from the 28th June to the 20th September (wounded 14th July, horse shot 14th September), in the actions of Balandshahr (horse shot), Alighur, Agra, Kunoj (horse sabred), and Bandhara; present in the skirmishes prior to and throughout the operations connected with the relief of Lucknow by Lord Clyde; operations at Cawnpur from 28th November to 6th December 1857, and defeat of the Gwalior Contingent; action of Khudagunge, re-occupation of Futtehghur, storm of Meangunge, action of Koorsee, and the various operations ending with the capture of Lucknow (thanked by the Governor-General, Victoria Cross, brevet of major, medal with three clasps). Employed on special service with the expedition of 1863 against the tribes on the N.W. Frontier of India, and was present at the storming of Laloo, capture of Umbeyla, and destruction of Mulkah (medal with clasps). Served in the Abyssinian campaign from January 1868, as Assistant Quartermaster-General with the Bengal Brigade; and as Senior Officer of the department at Zoulla, superintended the re-embarkation of the whole army; was selected by Sir Robert Napier as the bearer of his final despatches (brevet of Lt.-Colonel and medal). Served as Assistant Quartermaster-General and Senior Staff Officer with the Cachar Column, Lushai expeditionary force in 1871-72; and was present at the capture of the Kholel villages, and attack on the Northlang range. Commanded the troops engaged at the burning of the village of Taikoom, 26th January 1872 (C.B.). Has been twenty-three times mentioned in despatches. Commanded the Koorum field force from the commencement of the Afghan war in 1878, and was present at the storming and capture of the Peiwar Kotal, and the pursuit of the Afghan army to the Shutargardan, at the affair in the Maugaor pass, and during the operations in Khost (received the thanks of both Houses of Parliament, and K.C.B.). Commanded the Kābul field force during the advance on and occupation of Kābul in the autumn of 1879; and present in the engagement at Charasiab, and throughout the operations at Sherpur during the winter of 1879-80. Commanded the Kābul-Kandahar field force which marched from Kābul to Kandahar in August 1880, relieved the Kandahar garrison, and on the 1st September defeated and dispersed the army under Ayub Khan (G.C.B., baronet, medal with four clasps, and bronze decoration). He was appointed Commander-in-Chief of the Madras army.

ROBIN. The Indian black robin, or dayal bird, Thamnobia fulicata, *L.*, is generally distributed over most parts of Hindustan, and always found near the habitation of man. In manner and habits it is the oriental representative of the red-breast, just as the migratory thrush takes the place of the thrush with the Canadian emigrant. In the elevations of the Kandyan country there are a few birds, such as the robin of Newera ellia, and the long-tailed thrush, whose song rivals that of their European namesakes; but, far beyond the attraction of their notes, the traveller rejoices in the flute-like voices of the oriole, the dayal bird, and some others equally charming, when at the first dawn of day they awake the forest with their clear reveillé. The Ceylon dayal bird, Copsychus saularis, *Linn.*, is called by the Europeans in Ceylon the magpie robin, but is not to be confounded with the other popular favourite, the Indian robin, Thamnobia fulicata, *Linn.*, which is never seen in the unfrequented jungle, but, like the cocoanut palm, which the Singhalese assert will only flourish within the sound of the human voice, it is always found near the habitations of men.—*Tennent's Ceylon; E. L. Layard.*

ROBINIA 'AMARA. Ku-san and Ti-hwai, Chin. A plant of Ho-nan in China; roots medicinal. R. macrophylla, Ganj., Hind., is a huge climber, common a little to the west of the Jumna.

ROC, Rukh, or Rokh, a bird of gigantic stature, supposed, if not wholly fabulous, to be now extinct, and to have inhabited Madagascar; mentioned in Sinbad and Ibn Batuta's voyages. It has been said to be the Si-murg'h, and has been supposed to be the same as the Garuda of the Hindus. It may have been the Dodo of the Mauritius. Madagascar has furnished from very modern strata the leg-bones and two eggs of an extinct wingless bird, named Epyornis, probably larger than an ostrich. The egg of this bird is 2½ feet in girth and 3 feet in its longest circumference, and its liquid contents equal more than two gallons. New Zealand had many species of the Moa or Dinornis. Professor Owen has described eighteen, and D. elephantopus, *Owen*, D. giganteus, *Owen*, and D. didinus, may be named, varying in size from 3 to 10 feet in height.—*India in the 15th Century.*

ROCELLA, a genus of lichens of the natural order Lichenaceæ. These are largely exported from Ceylon, Bombay, Mozambique, Angola, Lima, and Cape Verde, under the term orchella-weed.

They are used in dyeing, and are popularly called orchill or archill, terms derived from the oricello of the Italians or the Spanish orchella, often corrupted in commerce into rochilla-weed. Rocella fuciformis, the flat-leaved orchill, is found on maritime rocks, or on dry-stone walls exposed to the influence of the sea breeze, as well on the coast of Britain as on the shores of the Mediterranean and the East Indies. The more arid the situation, the better is the quality of the lichens. The presence of the colouring matter is ascertained by steeping the weed broken into small pieces in diluted solution of ammonia, in a bottle half filled with liquid, which should be kept corked, but frequently opened in a temperature not exceeding 159° Fahr. Rocella tinctoria, *D. C.*, the dyer's rocella or orchill, when good, has a mealy white powder on its surface towards the centre; the under surface is of a grey colour, and is not hairy; if wetted, it does not turn of an orange colour; its edges are flat and thin. Various lichens, from Tenasserim and other parts of India, were introduced into Britain by the East India Company. Lichens used in the manufacture of cudbear, orchill, and litmus, and of the dye substance obtained from them, were shown in the Exhibition of 1851.—*Simmonds; Hogg.*

ROCK-CRYSTAL.

Shwin-tsing, Shwi-shih-ying,	CHIN. ,,	Koreh, Balur,	HEB. HIND.

Rock-crystal is the common name for the transparent crystals of quartz, of which it is the purest form, being composed of 99·34 per cent. of silica, with a trace of alumina. The crystal alluded to in Genesis xxxi. 40 as frost, and in Job vi. 16 as ice, and the Persian word Balur, seem to be applied indifferently to ice and rock-crystal. Rock-crystal occurs abundantly in many parts of India, and that of the south of the Peninsula is known as Vellum stone, from the place of its occurrence. Near Tanjore the mines are of great value, and the stone is cut into a great variety of ornamental objects.

The districts in British India richest in quartzose minerals are those of Dowlatabad, along the banks of the Seena river, and the neighbourhood of Rajpipla. It is found at Madagoolah.

The village of Aurangpur is situated in a small valley surrounded by hills, and the roads leading to it from all sides are, for a distance of three miles at least from the village, impassable to any but foot passengers and cattle, from their rocky and precipitous character. Its mines of rock-crystal are situated about two or three miles to the south-west of the village, and can only be approached by paths like those just described. The deposit of crystal occurs in a small valley or basin among these hills, about two or three miles to the south-west of the village of Aurangpur. The valley is about 500 yards long, and from 50 to 100 yards broad, and dips towards the north. The only part of the deposit which has been worked is the south end. If made red-hot, and plunged repeatedly into the tincture of cochineal, it assumes a ruby colour; if into a tincture of red sandal, it takes a deep red tint; into tincture of saffron or a tincture of turnesol, a yellow like the topaz; into juice of nerprum, it takes a deep violet like the amethyst; and into a mixture of tincture of turnesol and saffron, it becomes an imitation of the emerald. Steeping the crystal in oil of turpentine saturated with verdigris or spirits of wine, holding dragon's blood or other coloured resins in solution, depth of tints are produced proportioned to the time of steeping. Crystals can be coloured if heated in a crucible with orpiment and arsenic. Crystal coloured red, as false rubies, are known in France as rubaces.—*King*, p. 178. See Precious Stones.

RODA. ARAB. Literally a garden. In Persia and Hindustan pronounced Roza, a burial ground; also an island in the Nile near Cairo. The Nilometer is at its southern extremity.

RODENTIA, the gnawing tribe of mammals.

Fam. Sciuridæ, Squirrels.
5 gen. Sciurus, 28 sp.; Mustela, 1 sp.; Rhinosciurus, 1 sp.; Pteromys, 8 sp.; Sciuropterus, 12 sp.

Sub-Fam. Arctomydinæ; Marmots, 1 gen., 2 sp. Gen. Arctomys, 2 sp.

Fam. Muridæ, Rat tribe, 2 sub-fam., 9 gen., 45 sp.
Sub-Fam. Murinæ, Rats, Mice, 7 gen., viz. Gen. Gerbillus, 2 sp.; Nesokia, 6 sp.; Mus, 23 sp.; Leggada, 4 sp.; Platacanthomys, 1 sp; Golunda, 2 sp.; Rhyzomys, 5 sp.

Sub-Fam. Arvicolinæ, Voles, etc., 2 gen., 2 sp. Gen. Arvicola, 1 sp.; Neodon, 1 sp.

Fam. Hystricidæ, 1 sub-fam., 2 gen., 4 sp., viz.
Sub-Fam. Hystricinæ, Porcupines, 2 gen., 4 sp., viz. 2 gen. Hystrix, 3 sp.; Atherura, 1 sp.

Fam. Leporidæ, Hares, 2 gen., 10 sp., viz. Gen. Lepus, 7 sp.; Lagomys, 3 sp.

RODUNG. HIND. In the trade lists of the N.W. frontier of India, are two kinds of madder, one called rodung kuhree, grown at Kandahar, which is superior, and the other kind, rodung phurreah. The plant is stated to require three years to come to maturity. The value of madder brought through the Baluch and Afghan mountains is stated to be £12,228. Multan is a great emporium for madder. The Kābul merchants come thither direct from Dehra Ismail Khan, viâ Leia, and exchange their madder for cotton and indigo.—*Powell's Handbook*, i. p. 463.

RODYAH, a forest race amongst the Kandyans. They are skilful in the manufacture of rope from the black fibre of the leaf-stalk of the Caryota urens. Physically speaking, they are much the finest race in Ceylon, but they are looked upon by the rest as out-castes, unfit to be communicated with. At one time they were liable to be put to death if they touched or approached the higher castes.—*Egerton's Tour in India*, i. p. 121.

ROE, SIR THOMAS, was sent as ambassador from James I. of England and VI. of Scotland, to the Emperor Jahangir. He sailed from Gravesend 24th January 1615, and landed at Surat with great pomp, with eighty men-at-arms in his train, and arrived at Ajmir on the 23d December, and was received at the court with unusual honour on the 10th January 1616. After a residence of two years, he obtained permission of the emperor for the English to trade at Surat. He accompanied the emperor to Mandu, and left him in the end of 1618. He praises the magnificence of the court, speaks in high terms of the courtesy and hospitality of the nobility, and he was treated by the emperor as a friend, joining the emperor's drinking parties. He says the great men, as a class, were all open to corruption. His Journal of his Voyage to the East Indies, and Observations there during his Residence at the Moghul Court in 1615-18, was published in Paris in 1663.—*Elphinstone*, pp. 490-92.

ROE. Fish roe, red fish, and sardines are

Malay condiments, and the species used in the preparation are Alausa toli (Ikan trubok), Engraulis Brownii (Bunga ayer or badah), Dussumieria acuta (Tamban-bulat), and Clupeonia perforata (Tamban-nepes or batub).—*Cantor.*

ROE-BALL of Europeans in Bengal is their name for species of Polynemus, P. uronemus, *Cuv.*, P. tetradactylus, *Shaw*, and P. teria, *Buch.*

ROH. Pushtu. A mountain. Rohilla, a mountaineer, a highland and highlander, a dialectal change from Koh; applied to the Suliman and Khaibar range. Brahui is said to be a term from the two words Buan and Roh. Kala Roh is a distant range of hills, literally black hill; Baga Roh, a near range, literally white hill. Roh is a district bounded on the east by Swat and Kashmir, west by the Helmand, north by Kashgar or Chitral and Kafiristan. Roh-coj of Sanskrit writers is Arachosia; it includes Ghazni and Kandahar. Roheyl, in the Heerthur Hills, is N.W. of Sehwan.—*As. Res.* vi. p. 517, viii. p. 336.

ROHILKHAND, a division or commissionership for administrative purposes of the N.W. Provinces of British India, comprising the districts of Bareilly, Bijnour, Badaon, Moradabad, Shah Jahanpur, and the Terai. Area, 11,805 square miles; population (1872), 5,436,314. Lat. 27° 35′ to 30° 1′ N., and long. 78° 1′ to 80° 26′ E. Rohilla Afghans had held a large tract in those provinces ever since Ahmad Shah's desolating invasion in 1761. The Rohillas were foreigners, and had cruelly lorded it over the peasantry. The Pathan race form only a small part of the population. The first settlers of the Rohilla Afghans were two brothers, Shah Alam and Husain Khan. The son of the first of these, Daoud Khan, achieved some distinction in the earlier part of the 18th century. But the rise of the family is owing mainly to his adopted son, Ali Muhammad Khan. On the cession of Rohilkhand to the British in 1801, the family were continued in their possessions. Ahmad Ali Khan died in 1839. The succession of his only daughter was rejected, and the next heir, Muhammad Sayed Khan, the eldest son of Gholam Muhammad Khan, was put in possession of the estate. For his services during the rebellion of 1857, the nawab received a grant of land yielding 1,04,400 rupees on the Moradabad and Bareilly frontier. He also received the dignity of Knight of the Star of India. In Rohilkhand, the Muhammadan landlords rose in the revolt of 1857, and not the Hindu. The *Boksa* are a forest tribe in Western Rohilkhand, and in part of the forests of the Siwalik Hills of Dehra Doon. They are of short stature and spare habits, with broad faces, depressed noses, prognathous jaws, thick lips, very scanty beard and moustaches, but not darker in colour than the ordinary Hindus of the country. They are reputed to be skilful in witchcraft. They are very ignorant and indolent, but simple, inoffensive, and good-humoured. They have a scanty, rude cultivation, and collect forest produce and wash gold, but they have no caste, and eat almost anything. They have no separate language. They are supposed to be dying out. They are said to enjoy a wonderful immunity from the effects of malaria. The *Bhihar* are an aboriginal tribe of the Upper Doab, called in the Doab, Bheimhar, and in Rohilkhand, Behar. They were expelled from Nirauli and the neighbouring districts by the Bir Gujar Rajput. The *Bhar* of Northern India, called also Bharat, Rajbhar, and Bharpatwa, are an aboriginal race following the meanest of avocations, especially that of swineherds. In the hills east of Mirzapore, there are some Bhar rajas. Tradition ascribes to them the whole country from Gorakhpur to Bundelkhand, and many old stone forts. Professor Wilson supposes it possible that the name comes from Bharata, an ancient name of India.

Aharwarah is a territory which contains many districts in the north-east frontier of Malwa. The tribe or caste are the *Ahar*, from whom the territory derives its names of Aharwarah, and the Aharat are spread through Rohilkhand and other districts in the N.W. Provinces, following pastoral pursuits. They claim to be descended from the Yadu race of Rajputs.—*Aitcheson; Imp. Gaz.*

ROHILLA. Pushtu. A term by which Afghans in N.W. India are known. From Roh, a mountain; hence Rohilla, an inhabitant of the mountain, also Rohilkhand. They were fine gallant men, and when managed by good officers, as Colonel Skinner, made excellent and orderly soldiers. The Rohilla, who conquered the extensive territory in which the city of Bareilly stands, and bestowed on it the name of Rohilkhand, were a tribe of Afghans. Their intolerance drove the greater part of the Hindu inhabitants from the tract; but successive swarms from Afghanistan supplied the place of the fugitives, and kept the country in a high state of cultivation. The restless and enterprising character of the Rohillas led to constant encroachments by them on the possessions of the Nawab Vizir of Oudh. The latter, wearied with resistance, claimed British aid as his allies; and the Governor-General, Mr. Hastings, undertook the war. The Rohillas were subdued, and their country was made over to the Nawab Vizir; a portion of it, containing the city of Rampur, with some dependent towns, being assigned to the heir of Hafiz Rahmat as a jaghir, which was to be held of Oudh on feudal conditions. Subsequently the provinces in question were ceded to the British by the Nawab Vizir, and the fealty of the nawab of Rampur was transferred to the British Government.—*Rennell's Memoir*, p. 19; *Marquis of Hastings' Journal*, ii. p. 114; *Wilson's Gloss.*; *Mr. G. Campbell*, p. 47; *Malcolm's Centr. Ind.* i. p. 325; *Tod's Rajasthan*, i. p. 672.

ROHINI. In the ancient Hindu times, there were several women of this name, one the mother of Bala Rama, one a wife of Krishna; also a constellation personified as one of the wives of Soma, the moon.

ROHITA, the son of king Harichandra, was given by Varuna, but subsequently required as a sacrificial victim by the same. A deified person mentioned in the Atharva Veda.

ROHRI, written also Rori and Lohri, a town on the left bank of the Indus, in lat. 27° 42′ N., and long. 68° 56′ E. It is built on an anciently occupied position, a rocky eminence of limestone, terminating abruptly on the western side by a precipice 40 feet high, rising from the bank of the river. It gives its name to a sub-district forming part of Shikarpur collectorate, lying between lat. 27° 7′ and 28° 32′ N., and between long. 68° 52′ and 70° 15′ E. Area, 4258 square miles; pop. (1872), 217,515 souls. Bounded on the north-east and east by the states

of Bahawulpur and Jaisalmir (Jeysulmir), and on the south by Khairpur. The Muhammadans are chiefly of the Kazi, Sayyid, Bhuta, Kori, Patoli, Muhana, Khati, Memon, Shaikh, and Shikari tribes. The Sayyids of Bukkur and Rori have held lands in gift from about 1290 A.D. Grants of land were also made to them in 1712 by Jahandar Shah, on condition to pray for their imperial masters, and to guard the country from marauders.

The War-Mubarak, a building about 25 feet square, situated to the north of the town, was erected about 1545 by Mir Muhammad, the reigning Kalhora prince, for the reception of a hair from the beard of Mahomed. This hair is set in amber, which again is enclosed in a gold case studded with rubies and emeralds, the gift of Mir Ali Murad of Khairpur. The relic is exposed to view every March, when the hair by some mechanical process rises and falls, which the devotees are led to believe proceeds from supernatural agency.

Rori is sometimes distinguished as Rori Bukkur. When a locality is designated by two names mentioned together, it is either because there are two places bearing these names respectively close to each other, as Hoti Mardan, Taru Jabba, or else, where there is a river, because they are on the opposite banks of the river, as Rori-Bukkur, Thut-Naka, Daghi-Banda, etc.

Bukkur, a fortified island in the Indus river, is in the centre of the stream, nearly opposite the town of Rori, which is on the eastern bank, and on the western bank is Sukkur. Near these places is the site of Arore or Alore, a capital of Sind in remote antiquity. On its site the shepherds of the desert have established an extensive hamlet, on a ridge of silicious rock, 7 miles east of the insular Bukkur, and free from the inundations of the Indus. The Soda, a powerful branch of the Pramara race, ruled in these countries from remote antiquity, and, to a very late period, they were lords of Omra-Soomra, in which division was Arore. Sehl and his capital were known to Abul Fazl, who thus describes it: 'In ancient times there lived a raja named Sehris (Sehl), whose capital was Alore, and his dominions extended north to Kashmir, and south to the ocean.' Sehl or Sehr became a titular appellation of the country, its princes, and its inhabitants, the Sehrai. Alore appears to have been the capital of the kingdom of Sigertis, conquered by Menander of Bactria. Ibn Haukul, the Arabian geographer, mentions it as Azore. D'Anville, quoting Abulfeda, says, 'grandeur d'Azour est presque comparable à Multan.'—*Imp. Gaz.*; *Masson's Journeys*, i. p. 362.

ROHTAK, a town of 14,153 inhabitants, in the Rohtak district of the Panjab, and 42 miles N.W. of Dehli. Rohtak district has an area of 1823 (or 1811) square miles, and a population over 536,959. There are 30,831 Banya traders, a large number of whom profess the Jain creed. Jats, 186,646 of the Hindu faith, and 1458 converted to Islam. They are divided into two principal clans, which entertain towards one another a singular animosity; Gujar (2909), Pathans (5521), and Baluch (2225). Scarcity pressed upon the district in 1824, 1830, 1832, and 1837, a severe famine in 1860–61, and the season of 1868–69 was one of the most disastrous on record. During the mutiny of 1857, Rohtak was for a time completely lost to the British Government. Its Muhammadan tribes united with others in Gurgaon and Hissar, under the nawabs of Farrakhnagar, Jhajjar, and Bahadargarh, and the Bhatti chieftains of Sirsa and Hissar, and they plundered the Rohtak civil station. But before the fall of Dehli, a force of Panjab levies was brought across the Sutlej, and order was restored with little difficulty. The nawabs of Jhajjar and Bahadargarh were captured. The former was executed at Dehli; his neighbour and relative escaped with a sentence of exile to Lahore; their estates were confiscated, and portions were assigned to the rajas of Sind, Patiala, and Nabha as rewards for their services during the mutiny.

ROHTANG, a mountain pass in the Kangra district of the Himalaya, in lat. 32° 22′ 20″ N., and long. 77° 17′ 20″ E., between Koksar in Lahoul and Palchian in Kulu. Its crest is at an elevation of 13,000 feet above the sea.—*Imp. Gaz.*

ROHTAS, the ancient Rohita, so called from its having been the chosen abode of Rohitaswa, son of king Harichandra of the Solar dynasty. It is a hill fort in the Shahabad district of Bengal, in lat. 24° 37′ 30″ N., and long. 83° 55′ 50″ E. An image of Rohitaswa was worshipped here, until destroyed by Aurangzeb.—*Imp. Gaz.*

ROHU. Hind. Labeo rohita, *Ham. Buch.* The Ro-hoo and the Mirgah resemble each other in size and habits; they are very much like the salmon, but have tiny little mouths with no teeth. The ro-hoo in season has very pretty red fins, and both have ash-coloured backs, with silvery bellies; they attain to the weight of 20 lbs., and afford the angler excellent sport at bottom fishing, sometimes engaging him for an hour before he can attempt to land his fish.

ROHUN, also Rohuna and Rohitaka. Hind. Soymida febrifuga, *Juss.* Its bark, Rohun-ke-chilke, is not spotted with rusty patches, and the inside is dark, reddish brown; nitric acid does not stain it of a bright scarlet. These tests distinguish it from the poisonous bark of the nux vomica tree (Kuchila), which is commonly sold for it in the bazars of Bengal.—*Beng. Phar.*

ROLA. Hind. A powder made of the Trapa bispinosa flour, coloured with kussumba and kamila, etc. It is used by Hindus during the holi festival to throw at one another. Roli is also a compound of rice, turmeric, alum, and an acid, used to make the tilak or sectarian mark on the foreheads of Hindus; powder of the chandan or sandal-wood is also used.—*Powell.*

ROLLER, the name of Indian birds of the family Coracidæ, viz. Coracias affinis, garrula, and Indica. They are large, showy, handsome birds, with rich blue colours.

ROLLERS, waves which occur in the South Atlantic, at St. Helena, Fernando, Noronho, and Ascension Island. All is tranquil in the distance, the sea-breeze scarcely ripples the surface, when a high swelling wave is suddenly observed rolling towards the island, to break on the outer reefs with a violence as great as if a furious tempest raged. Their cause is unknown. See Ripples.

ROLONG, the hard central part of wheat-grains, callen also soojie. When rolong is crushed in a smooth, suitable vessel, such as an agate mortar, and examined with a power of about 350 diameters, it is seen to contain a very large proportion of small cells running down to one-fourth

the size of those of rice, and which appear to exist embedded in cellular tissue, which is seen broken up, and to portions of which the cells are still attached. In fine flour the cells are very considerably larger, if anything more tenticular, and much more clearly marked. See Bread; Soojie; Wheat.

ROMA-KA-SIDHANTA, an astronomical treatise by an ancient Hindu, supposed to be from the Greeks of Alexandria.—*Elph.* p. 131.

ROMAN, a name applied to the rulers and people of ancient Rome, who succeeded the Greeks in their Asiatic territories. The Romans conquered most parts of Europe, the northern part of Africa, Syria, and Palestine, and left lasting improvements in the roads and education of the countries which they occupied. The official language was Latin, and the modern Romance languages, viz. Italian, Wallachian, Provençal, French, Spanish, and Portuguesc, are closely related to each other, all derived from Latin. According to the author of the Periplus of the Red Sea, Aden had been destroyed by the Romans shortly before his time; and Dean Vincent is of opinion that the Cæsar in whose reign this event took place was the emperor Claudius. The object of destroying so flourishing a port is not difficult to determine. From the time that the Romans first visited Arabia under Ælius Gallus, they had always maintained a footing on the shores of the Red Sea, and it is probable that Claudius, being desirous of appropriating the Indian trade to the Romans, sought a pretext of quarrel with Aden, in order that he might by its destruction divert the Indian trade to the ports of Egypt. Valerian, a Roman emperor, having been conquered by Shahpur in a fort near Antioch, was led into Susiana, where the Persian monarch, undertaking some extensive structures (at Shushter), obliged his captive to assist in the work, by procuring experienced artists from Rome or Greece, and he promised that liberty should be the reward of the co-operation. The task was performed, and Shahpur observed his promise, but first cut off the Roman emperor's nose, to brand him with an indelible mark of captivity.

Among the Hindus of India are many social customs similar to those of the ancient Romans. Among the religious rites of the ancient Romans, their lustral ceremonies and their worship of Priapus were the same with those of the modern Hindus. The village community of India, also, is at once an organized patriarchal society and an assemblage of co-proprietors. The personal relations to each other of the men who compose it are indistinguishably confounded with their proprietary rights, and to the attempts of British functionaries to separate the two may be assigned some of the most formidable miscarriages of British Indian administration. So soon as a son of a Hindu is born, he acquires a vested interest in his father's substance; and the domain thus held in common is sometimes administered by an elected manager, but more generally by the eldest representative of the eldest line of the stock. The village community, however, is more than a body of co-proprietors; it is an organized society, having its staff of officers for internal government. This seems the type of the Gens or House of the ancient Romans; and although both in India and at Rome each community was assumed to have sprung from two common ancestors, the fact was that these houses and villages were recruited by new members, who were admitted by adoption, or by some analogous process. The researches of Haxthausen and Tengoborski have lately proved that the Russian villages are organized communities of a similar character. And the same principle seems to prevail in Servia, in Croatia, and the Austrian Sclavonia—in fact, wherever feudality has had small influence, and wherever there is the nearest affinity between the western and the eastern world. The colonists of New Zealand have been long engaged in disputes with the natives, which turned upon the precise point under discussion. While the Colonial Government insisted that any member of a tribe is entitled to sell his land to whomsoever he pleases, the natives insist that although one member may transfer it to any other member of the same tribe, he cannot transfer it to any person who is not a member without the consent of the whole tribe, because of the existence of what has been called a tribal right. Thus showing that in the mind of a New Zealander the idea of joint ownership precedes that of separate ownership. By the Roman law, the father was certainly regarded rather as a steward than a proprietor of his goods, and accordingly was not, at first, permitted to dispose of his property as he pleased after his death, and on many of these points the Roman law and the Hindu law assimilates. The Romans generally burned, but they sometimes buried their dead, as Hindus now do; children who died in infancy were interred in the immediate neighbourhood of their former homes. Their sepulchral urns with the ashes of the dead were commonly buried about two feet below the surface, and their memorial stones were often inscribed. They used the sarcophagus or massive stone coffin, and also the tumulus or barrow. The Romans bore their dead with much lamentation to the funeral pile, on which, after being lighted, they cast the robes and arms of the deceased, as well as the slaughtered bodies of his favourite animals. The Romans had peculiar modes of divination,—their dies fasti, nefasti, their auguries, etc. Amongst the Hindus are the village gods, of which each village adores two or three, as its special guardians, but sometimes as its dreaded persecutors and tormentors. They bear some resemblance to the penates or lares of the Romans; and, like them, they are sometimes the recognised god of the whole nation, either in their generally received characters, or in local incarnations, but much oftener they are the spirits of deceased persons, who have attracted the notice of the neighbourhood.

The writing character of the ancient Romans is now used by most of the people of Europe, and by the British and their colonies. It is one of great value, and should be everywhere introduced. With much in common, in several of the Indian tongues it at first seems an easy matter to become acquainted with them. But at the first step there is this difficulty, that every language has its separate alphabet, and every province has six or eight alphabets in use. The various nationalities cannot use each other's books, nor write to each other. Even were it possible, out of the fourteen current alphabets of India, to select one for universal use, there is not one of them which it is not extremely difficult to read, difficult to write,

and difficult to print. The natives themselves cannot read them fluently. Even pandits and moonshis are continually obliged to pause for the purpose of spelling the words. A fluent reader of any of the native characters is almost unheard of; but a mere boy who is taught the Roman characters, will, in the course of a few months, read without stopping anything that is given to him. As a general rule, it is impossible to write fast in any of the native alphabets without making so many blunders and omissions that the manuscript becomes an unintelligible scrawl. The greatest difficulty of all, however, occurs in printing. For one language a fouut of type is required consisting of not less than 700 letters, simple and compound; another requires 900 letters; a third, 1000, and so on; the cost of preparing such a fount, and the difficulty which a compositor has to contend with in having a 'case' before him with this prodigious collection of characters, are great. With one character in common use, it would be comparatively easy to frame two dictionaries,—one with words common to the Aryan family, the other with Dravidian words; but the many written characters has rendered that impossible, and before the end of the 19th century, if no unexpected change occur, the English language will have become the chief medium of intercourse between the various races in British India.—*Muller's Lectures*, p. 163; *Ouseley's Travels*, i. p. 287; *Ed. Jour.*, July 1867; *Elphinstone's India*, p. 179; *Kennedy on the Origin of Languages*, p. 16.

ROMAN CATHOLIC, a sect of Christians who recognise the Pope of Rome as their spiritual, and many of the sect regard him also as their temporal, chief. They form in India the largest body of the native Christians. Their total number in British India in 1881 was 963,058. The priests of the Portuguese Roman Catholics and of the Society of Jesuits are spread from Goa over all the Peninsula of India. The Italians occupy Hyderabad and Native Burma; the French occupy Mysore, and they have missions in Siam, Cambodia, China, and Japan. The greatest of all their missionaries was Saint Francis Xavier, who laboured in India, the Malay Peninsula, and Japan. Beschi, a great writer, laboured in the south of the Peninsula and Mysore; and in 1871 there were upwards of half a million Roman Catholics in the Tamil country, and only about 24,000 in the vicariates of Eastern and Western Bengal. In 1881, of the total number, there were, in Bombay districts, 115,515; in Cochin, 120,919; in Travancore, 153,815; and in Madras, 473,352; leaving only 99,457 for all Northern India. The dates of Romish doctrines are—

Indulgences introduced n the 15th century, but not sanctioned by a council till 1563.—*Churchman's Magazine for Jan.* 1846.

ROME, a city of Italy, formerly renowned, and styled the 'Mistress of the World.' It is situate in the Campagna di Roma, and is the residence of the Pope. It is built on seven hills and the intermediate valleys along the banks of the Tiber, over which it has bridges; there are squares, fountains, or obelisks in their area. The church of St. Peter, which was finished in 1621, is entirely covered, both within and without, with marble. The length is 730 feet, the breadth 520, and the height, from the pavement to the top of the cross that crowns the cupola, 450. The Pantheon, erected above 120 years before the Christian era, to the honour of all the gods, is the most perfect of the Roman temples that now remain; but the Colosseum is the most stupendous monument of antiquity. The Pope has three superb palaces, of which the principal is the Vatican, near St. Peter's Church; the library of this palace is deemed the largest and richest in the world. Besides the university, which consists of several colleges, there are numerous academies, literary societies, etc.

RONDELETIA TINCTORIA. *Roxb.*

Ta-ma-yok, . . Burm. | Toora lodh, . . Hind.

A small tree of the Kotah and Mewar jungles; wood dark-brown. The bark is used in dyeing red.—*M'Clelland; Irvine.*

RONGDO, meaning the district of defiles, is an elevated district on the bend of the Indus, and on the frontier of the Gilghit and Hasora countries. It is to the westward of Balti, and has an area of 1440 square miles. It is about 8000 feet above the sea, the mean of its villages being 6200 feet. The people are of Tibetan habits.

The Rongdo villages are mostly small; they have abundance of fruit-trees, of which the apricot is the commonest. All over the Rongdo Hills the juniper is rather common, and seemingly quite at home both on the higher ridges and in the bottom of the ravine close to the river. Pinus excelsa grows there. The fields are largely manured.—*Thomson's Tr.* p. 256.

RONG-GENG. Burm. Burmese dancing girls.

RONGUEDUE, Ronkedor, or Runkedor. Singh. A rogue or solitary elephant.

ROOSA OIL, Grass Oil, or Ginger Oil is obtained from the Andropogon calamus aromaticus, *Royle* (A. Martini, *Roxb.*), a native of the low hills at the base of the Himalaya; also found at Asirgarh, in Malwa, Gujerat, and the Dekhan. Twenty seers of the grass are mixed with two seers of sesamum oil, and then slowly distilled. The oil thus becomes highly impregnated with the peculiar roosa flavour, and is sold as such at Rs. 4 a seer. Grass oil is never taken internally by natives, but they have a great faith in it as a stimulant to the functions of the several organs, when rubbed on externally. They also use it as a liniment in chronic rheumatism and neuralgic pains, but its expense prevents its being used generally. It has a fragrant, aromatic smell, persistent, and very agreeable at first, but after a time the odour becomes unpleasant, and gives many people a feeling of sickness with headache. They use it for slight colds; also to excite perspiration, by rubbing in a couple of drachms on the chest before the fire or in the heat of the sun. The pure oil has been used by many European officers with wonderful effect in cases of severe rheumatism, but two good rubbings produced such severe burning as to render a third application impracticable. The oil is chiefly imported into Bombay from Surat, and is re-exported in considerable quantities to England, China, and the

Arabian and Persian Gulfs. This oil differs but little either in appearance or quality from the lemon grass oil; it is a good substitute for the more expensive cajaputi oil.—*Faulkner; M.E.J.R.*

ROPE.

Habl, Khoit, . .	Arab.	Rasan, ...	Pers.
Corde, ...	Fr.	Cuerda, Soga, . .	Sp.
Scil, ...	Ger.	Cordel Sarta, . . .	,,
Doodab, ...	Guj.	Kaur, ...	Tam.
Rassi, ...	Hind.	Daram, ...	Tel.
Corda, ...	It.	Khalat, ...	Turk.
Talikalat, . . .	Malay.		

Ropes are made of fibrous materials, spun into thick yarn, of which several strands are twisted together, usually by means of a wheel. In commerce all the different kinds of rope, from a fishing-line or whipcord to a cable, go by the general name of cordage. Among the cordage sent to the Great Exhibition of 1851 were ropes of excellent quality made of Jubbulpur hemp, at least equal, if not superior, in strength to that of Russian hemp. When a Petersburg hemp broke with 160 lbs., one of Jubbulpur hemp did not break with less than 190 lbs.

In India the mode of making ropes is singularly simple. One man sits on the ground and lets out the yarn; another retires half-bent, and spins it by means of a spindle, the yarn being passed through a wooden hoop hung round his neck. He gives the spindle a jerk betwixt the palms of his hands, and keeps its motion up at a very considerable degree of speed indeed. When several plies of fine yarn are to be twisted together, a man with a spindle is placed at the end of each. The whole series are supported at intervals by frames of bamboo; a spinner at the further extremity twists all the strands into one, while a light piece of board is being passed along, where the cords are meant to be hard plaited and strong, to keep them from running too rapidly together. In the case of ropes, after the single strands are laid together, the rope is made up by men twisting the larger strands by a stout piece of wood,—a much stronger and longer piece being used for the entire rope, a man sitting by a board with holes through which the several strands pass, to see that all go properly together.

Mandel straw rope is made from Elcusine coracaria. The straw is flat and excessively tough, so much so that in gathering the crops the heads are pulled off by hand, leaving the whole straw standing.

Manilla rope is made of plantain fibre, and used for running rigging for ships, or tackling for land purposes.

Hemp rope from the Cannabis sativa is used for standing rigging for ships, or for use in water.

Rope of Sesbania aculeata is used as running rigging for ships, and tackling for land purposes.

Coir rope from the cocoanut fibre is used for boats' and ships' running gear, and for hawsers and cables, also for all tackling purposes when exposed to wet, especially salt water.

Ropes made of Crotalaria juncea are employed as tackling in dry places without exposure to wet.

Ropes are made at Lahore of a fibrous plant called Chuyan, from Sunn Okra, from the Dib and the Putta, from a fibre called Bugar, from palm leaves, Dah grass, and plantain leaves.

Rope of Saccharum moonja is made near the Ganges, Jumna, and Indus. Twine is made from the fibre of the leaf-sheath; a little thicker kind is used for towing boats; when dry it does not possess much strength, when wet it is strong and durable. The moonja is used also for thatching, etc.

A rope is made at Balasore of Sealee fibre.

Rope of rattan made at Penang, Malay Peninsula, used for drawing water, and as halters for cattle.

Cotton rope is used for hanging and pulling punkahs and tent ropes.

The principal cordage plants of British India are enumerated under the heading Fibrous Plants, *q.v.*, to which the following may be added, viz.:—

Æschynomene cannabina.	Saccharum spontaneum.
Ailanthus Malabaricus.	Smilax ovalifolia.
Aloe vulgaris.	Sterculia fœtida.
Arenga saccharifera.	S. ramosa.
Arundo donax.	Strychnos potatorum.
Bignonia coronaria.	Urtica heterophylla.
Boehmeria argentea.	U. atrofusca.
B. dichotoma and other *sp.*	U. crenulata.
Broussonetia papyrifera.	U. dolabriformis.
Calamus rotang.	U. heptandra.
Celtis caucasica.	U. filiformis.
C. capsularis.	U. funicularis.
Cordia myxa.	U. longispina.
C. angustifolia.	U. nivea.
C. Rothii.	U. paniculata.
Crotalaria tenuifolia.	U. pentandra.
Eleusine coracana.	U. reticulata.
Leptadenia, *sp.*	U. tenacissima.
Morus Indica.	U. virulenta.
Nussiessya hypoleuca.	

ROR. Hind. Kunkur, or broken brick, used in Bengal for gravelling roads.

RORI BAROLLI has a grand temple 58 feet in height, and in the ancient form peculiar to the temples of Siva. The body of the edifice, in which is the sanctum of the god, and over which rises its pyramidal sikr, is a square of only 21 feet; but the addition of the domed vestibule (munduf) and portico makes it 44 by 21. The whole is covered with mythological sculpture, without as well as within, emblematic of Siva as Mahadeo, who in Saiva Hindu belief is the giver as well as the destroyer of life. In a niche outside, to the south, he is armed against the Dytes (Titans), the roond mala or skull-chaplet reaching to his knees, and in seven of his arms are offensive weapons. His cap is the frustrum of a cone composed of snakes interlaced with a fillet of skulls; the cupra is in hand, and the victims are scattered around. On his right is one of the Jogini maids of slaughter, drunk with blood, the cup still at her lip, and her countenance expressive of vacuity; while below, on the left, is a female personification of death, mere skin and bone; a sickle (koorpi) in her right hand, its knob a death's head, completes this group of the attributes of destruction.

To the west is Mahadeo under another form,—a beautiful and animated statue, the expression mild, as when he went forth to entice the mountain-nymph Mera to his embrace. His tiara is a blaze of finely-executed ornaments, and his snake-wreath, which hangs round him as a garland, has a clasp of two heads of Sehesnag (the serpent-king), while Nanda below is listening with placidity to the sound of the damroo. His cupra and kharg, or skull-cap and sword, which he is in the attitude of using, are the only accompaniments denoting the god of blood. The northern compartment is a picture disgustingly faithful of death and its attributes, vulgarly known as Bhooka Mata, or the personification of

famine, loud and bare; her necklace, like that of her lord, is of skulls. Close by are two mortals in the last stage of existence, so correctly represented as to excite an unpleasant surprise. The outline is anatomically correct. The mouth is half open and distorted, and although the eye is closed in death, an expression of mental anguish seems still to linger upon the features. A beast of prey is approaching the dead body, while by way of contrast a male figure, in all the vigour of youth and health, lies prostrate at her feet.

Such is a faint description of the sculptured niches on each of the external faces of the mindra, whence the spire rises, simple and solid. In a Hindu temple is the mindra or cella, in which is the statue of the god; then the munduf, in architectural nomenclature, is the pronaos; and third, the portico. Like all temples dedicated to Bal-Siva, the vivifier, or sun-god, it faces the east. The portico projects several feet beyond the munduf, and has four superb columns in front. The ceilings, both of the portico and munduf, are elaborately beautiful; that of the portico, of one single block, could hardly be surpassed. The exterior is a grand, wonderful effort of the silpi or architect, one series rising above and surpassing the other, from the base to the urn which surmounts the pinnacle. The sanctum contains the symbol of the god, whose local appellation is Rori Barolli, a change from Balrori, from the circumstance of Balnath, the sun-god, being here typified by an orbicular stone termed rori, formed by attrition in the chooli or whirlpools of the Chambal, near which the temple stands, and to which phenomena it probably owed its foundation. This symbolic rori is not fixed, but lies in a groove in the internal ring of the Yoni; and so nicely is it poised, that with a very moderate impulse it will continue revolving while the votary recites a tolerably long hymn to the object of his adoration. The old ascetic, who had long been one of the zealots of Barolli, amongst his other wonders, gravely told Colonel Tod that with the momentum given by his little finger, in former days, he could make it keep on its course much longer than now with the application of all his strength.—*Tod's Rajasthan*, ii. p. 706.

ROSARIES.

Tasbih, Masbaha, . ARAB.	Rosenkrans, . . . GER.
Rosaire, ... FR.	Rosario, ... IT.
Rosenbeet, . . . GER.	Rosaro, ... SP.

Rosaries are used by Buddhists, Christians, Muhammadans, and Hindus. The Muhammadans, as each bead passes through their hands, recite one of the hundred attributes of the Creator. Their rosary has 100 beads; that of the Burmese Buddhists, 108. The thousand names of Vishnu and Siva are strung together in verse, and are repeated on certain occasions by Brahmans, as a litany accompanied sometimes with the rosary. As each name is mentally recited, with the attention abstractedly fixed on the attribute or character of which that name excites the idea, a bead is dropped through the finger and thumb; such operation is supposed to assist or promote abstraction, an attainment which enthusiastic Hindus think exceedingly efficacious. Brahmans and pious men of other castes are often seen with rosaries in their hands. These are composed of amber or of the rough seeds of fruits which are sacred to the gods. Images and pictures of Brahma and of Siva are frequently to be seen with a rosary in the hand, and the hand is sometimes seen enclosed in a loose bag. There is no authority for supposing that the Jews or the earlier Christians used rosaries. The Christian rosaries are of beads and seeds. The seeds of the Abrus precatorius and of the olive, and beads of wood made by the turner, are used. Muhammadans use beads made of quartzose minerals. Rosaries and charms are made at Kandahar from chrysolite, a silicate of magnesia quarried from a hill at Shahmaksud. It is generally opaque, and varies from a light-yellow to bluish-white.—*Bellew; Moor's Pantheon*, p. 24.

ROSCOEA, a genus of showy plants belonging to the Zingiberaceæ; species occur up to 9000 feet in the Himalaya and on the Neilgherry mountains, viz.:—

R. alpina, *Royle*, Simla, Chor, Landour, Neilgherries.
R. capitata, *Sm.*, *Wall.*, Nepal.
R. elatior, *Sm.*, Nepal, Kamaon.
R. lutea, *Wight Ic.*, Neilgherries.
R. exilis, *Sm.*, Nepal.
R. purpurea, B. procura, *Wall.*, Shivapur mountain.
R. spicata, *Sm.*, *W. Ic.*, *Voigt*, Nepal.

The Rosaceæ, or rose tribe of plants of Lindley, comprise the genera Agromonia, Dalibarda, Fragaria, Geum, Hotelia, Neillia, Potentilla, Rosa, Rubus, Schizonotus, Sibbaldia, Sieversia, and Spiræa. Rose trees grow in India, both wild and cultivated, and the flower is much prized. Wild yellow roses are found in Kashmir, Lahoul, and Tibet. Lowther states they are sometimes double, and Thomson mentions double yellow roses at 11,000 feet in Ladakh. The yellow Persian rose finds its eastern limit in Lahoul, but Fortune saw a China yellow rose in the gardens of the mandarins during the early months of the year. The colour had something of buff in it, which gave the flowers an uncommon appearance. It was a most beautiful double yellow climbing rose from the more northern districts of the empire. Another rose, which the Chinese call the 'five-coloured,' was also found in one of these gardens at this time. Sometimes it produces self-coloured blooms, being either red or French-white, and frequently having flowers of both on one plant at the same time, while at other times the flowers are striped with the two colours. The rose was known in early times, and was as great a favourite among the nations of antiquity as it is in modern times. It is found in almost every country of the northern hemisphere, both in the Old and New World. All the species are included between lat. 70° and 19° N. It is found more generally on dry and free soils than on those which are wet and tenacious. In the north of Europe it occurs with single flowers, but in Italy, Greece, and Spain more frequently double. The flowers of the rose have a great variety of colours, from the deep-red to pale-yellow and white, with every intermediate shade. In India, the easiest mode of propagation is by layers at almost all seasons, or by cuttings at the

commencement of the rains. The Persian varieties, red and white, require to have their roots opened and the plants cut during the early part of the cold season, after which they must be watered well every second or third day. The roots must then be covered up with manure, when they will throw out flowers. The Rose Edward, which blossoms a great part of the year, requires pruning about a month after it ceases to blossom, and should be allowed to rest a short time without watering, when a fresh supply of water and manure round the roots will cause it to bear flowering shoots immediately. This rose, and the Egyptian, are amongst the few that give seed-hips, being perfectly formed on both. Some of the roses in China are peculiar from having transparent dots on their leaves, resembling those of the myrtles, and with the Chinese the roots and fruits of rose trees are officinal.

Rosa brunonis, *Lind.*

Kujo, Kuji, Gangari, Beas.	Gulab-ghuri, . . Pushtu.
Karar, ... Chen.	Kajer, Kui, Kajri, Sutlej.
Phuliari, Chal, . Jhelum.	Gulab-ghurei, Tr.-Indus.
Phulwari, Krur, Kangra.	

This fine wild white rose climbs luxuriantly over bushes and even tall trees. It is common in the outer Himalaya from 2400 to 7000 feet, up to and probably beyond the Indus. It furnishes a small-sized wood, which makes walking-sticks. In Murree they call it 'chal;' but this they also apply to the jasmine.

Rosa canina, the dog rose, Kin-ying-tsze, Chin., is common in Kiang-si and other provinces of China; fruits large and astringent, formerly used in medicine.

Rosa centifolia, *Linn.*

R. provincialis, *Miller.*	R. centifolia muscosa.
Wurd, ... Arab.	Hundred-leaved rose, Eng.
Kanta gulab, . . Beng.	Gul-i-surkh, . . . Hind.
Gulab-ka-phul, . . Dukh.	Mawar, . . . Malay.
Cabbage rose, . . Eng.	Gul-i-sad-barg, . . Pers.

This, a native of Syria, is cultivated throughout Europe, British India, Persia, and China, and from it rose-water and atr or otto of roses are prepared. The stem or kubjak is used by the Hindu physicians in medicine. Its fragrance is but partially destroyed by desiccation, and according to M. Chereau is remarkably augmented by iodine. It is less astringent than the Provence rose, and more laxative. The petals are used as laxatives for children, and also made into the conserve of roses or gul-khand. The petals of this as well as of the R. gallica are preserved with salt by the European apothecaries for the preparation of the distilled water.

Rosa damascena, *Mill.*, the damask rose, is cultivated in gardens in India for the sake of its flowers; it is supposed to have been originally brought from Damascus, and to be a native of Syria. It has many varieties. The essential oil of the petals sells at 2 rupees per tola.

Rosa eglanteria, *L.* Native country unknown.

Rosa gallica, the French rose, Provence red rose, is supposed to be the species to which Pliny refers (Hist. Nat. xxi. pp. 18, 25, 72, 73). Is a native of Persia, found wild about Montalbanum, Walzenberg, and Geneva, in Austria, Piedmont, and the Caucasus; it has equal small prickles, erect flowers, ovate sepals, and globose fruit. Hundreds of varieties of this rose are found cultivated in gardens. A great number of varieties of them are hybrids between R. gallica and R. centifolia. They mostly combine the long graceful shoots of the latter with the rich crimson hues of R. gallica. Hybrids are also produced between R. gallica and R. Indica, but differ from the last in not being perpetual. The petals contain tannic and gallic acid, essential oil, oxide of iron, and other unimportant principles. The petals are gathered before becoming quite ripe; they are deprived of the calyx and central attachments, and dried before the sun or in a stove. When dried they are sifted in order to separate the stamina and pistil. They are then gently compressed and kept in a dry place. From the cabbage rose, a variety of this species, a very fragrant distilled water is prepared in England.

Rosa glandulifera is the Gul seoti or Sewati of the Panjab.

Rosa inserta is the Nasrin kubjak.

Rosa macrophylla.

Gulab jikjik, . . Chen.	Ban-kujru, Yal, . Sutlej.
Phulwar, Phulian, Hind.	Trind, Tumbu, . ,,
Ban-gulab, Akhiari, Ravi.	

This great red rose tree grows over a wide range in the N.W. Himalaya up to the Indus from 4500 to 10,500 feet. Its fruit is eaten, and is stated by Madden to become very sweet when black and rotten. In Kanawar, a perfume is extracted from the flowers for export towards the plains. It is one of the most beautiful Himalayan plants. Its single flowers are as large as the palm of the hand.

Rosa moschata, the musk rose, is found native in the north of Africa, and in the temperate and warm provinces of Spain.

Rosa rubiginosa, sweet-briar or gul-nasrin, is met with in many Indian gardens; it sometimes blossoms, if budded on the Persian rose stock. The general mode of propagation is by layers, but a much quicker and easier method is to bud it on the stock of a rose. Tenasserim residences are often filled with sweet odours from the graceful eglantine or sweet-briar, but the plant is kept alive with difficulty when exposed to the south-west monsoon.

Rosa semperflorens, the Yueh-ki-hwa of the Chinese, is the Chinese monthly rose, a common scrambling shrub bearing a regular profusion of red flowers, mostly barren, but used medicinally.

Rosa sericea is an erect, white-flowered rose, and is the only species occurring in Southern Sikkim. It is very abundant. Its numerous inodorous flowers are pendent, apparently as a protection from the rain, and it is remarkable as being the only species having four petals, instead of five.

Rosa Webbiana, *Wall.*

Sikanda, Manyar, . Chen.	Sia, Sea, . . . Ladakh.
Shawali, Chua, . . ,,	Ringgal, Kugina, Sutlej.
Kantyan, . . . Kaghan.	

This rose is found chiefly in the rather arid tracts of the Panjab Himalaya from 5000 to 9500 feet, up to near the Indus, and in Ladakh it reaches 13,500 feet. Its fruit is eaten, and in parts of Spiti the stems are largely used for fuel.—*Cleghorn; Fortune's Wanderings*, p. 311; *Hooker, Journ.* i. p. 168, ii. p. 43; *Mason; O'Sh.; Powell; Riddell; Smith.; Stewart; Roxb.* ii. p. 513.

ROSE, HUGH, Lord Strathnairn, a distinguished politician, commander, and administrator. In Europe public attention was directed to the affairs of Syria, where Lord Palmerston, at the

hazard of a war with France, effectually checkmated Thiers, drove Ibrahim Pasha back into Egypt, and restored Syria to Ottoman rule. The part taken by Sir Hugh Rose in that brilliant line of policy was prominent, and as a reward for his services he received from Great Britain the Companionship of the Bath, from Prussia the Cross of St. John of Jerusalem, and from the Sultan a sword of honour. After passing many years in the diplomatic service, he acted as British ambassador at Constantinople, in the absence of Stratford Canning, and at a critical moment he ordered the British fleet to the mouth of the Dardanelles, for which he received the thanks and support of the British Government. Subsequently, and throughout the whole of the Crimean war, Sir Hugh Rose served as Commissioner with the French army, and gained the respect of the British authorities, and also of the principal officers in the French army. For his services in the war with Russia, he was created K.C.B., and received the Crimean medal and clasps, the rank of Commander of the Legion of Honour, the third class of the Medjidi, and the Turkish medal.

When he landed at Bombay in the autumn of 1857, Lord Elphinstone at once gave him the command of the force to which was confided the duty of crushing rebellion in Central India, and of marching to join Sir Colin Campbell's army in Bengal. He took command of the field force in December 1857, captured Ratgurh 29th January 1858, Garrakota 13th February, and Chandaree 17th March; defeated Tantia Topee at the Betwa, 1st April; stormed Jhansi, 3d April; defeated the mutineers at Golowlie, 22d April; captured Calpee, 23d April; defeated the Gwalior contingent, 16th June; restored the Maharaja Sindia, 20th June 1858; and became Commander-in-Chief of India, 4th June 1860.

This small column, few in numbers, was constantly engaged with vastly superior forces of the enemy, and marched for months from victory to victory, suffering fearfully from overexertion, terrific heat, and constant combats, until finally it joined Sir Colin Campbell's troops upon the banks of the Jumna at Calpee.

Leaving Indore at the end of 1857, Sir Hugh Rose first encountered the enemy at Ratgurh, which fort he captured in a few days, and again defeated the raja of Banpore on the Bina. This opened to him the road to Saugor, the garrisons of which had long been hemmed in by the enemy, and which he relieved in February 1858. Still advancing, Sir Hugh Rose's column again met the rebels at the fort of Gangakota, which he took, and he then closely pursued the enemy with loss to the Beas. His next operation was in storming the pass of Mudunpore, and by his success there, several smaller forts fell into his possession, the road to Jhansi was opened, and the territory of Shahgurh annexed. Sir Hugh Rose then marched on Jhansi, and on his way took the strong fort of Chandaree by storm. Arriving before Jhansi on the 21st of March, he found himself in the presence of a fortified city defended by a large army of rebels. His siege guns were few, and his troops were constantly engaged and much overworked. During seventeen days the cavalry and artillery invested the fort and guarded the ground round it, and never took off their clothes, saddles, or harness. In the meantime, whilst the siege progressed and the artillery were endeavouring to make a breach, Tantia Topee, with an army of 20,000 men and 20 guns, appeared on the Betwa. Still maintaining his investment of the city, and withdrawing as few troops as possible, Sir Hugh Rose drew up his small force in two lines in order of battle, and by a masterly flank attack utterly defeated and routed the rebel army in the field, capturing all their artillery, and pursuing them for sixteen miles. In two days after the battle of the Betwa, he assaulted and captured Jhansi by storm and escalade, with a loss to the enemy of 5000 men. In April, giving the rebels no rest, Sir Hugh again advanced towards Calpee, which was their great depot and arsenal on the Jumna. On his way there he again met the rebels at Koonch at daylight, defeated and pursued them throughout the day, capturing fifteen guns. The force, however, was becoming perfectly prostrate from constant marching, fighting, over-exertion, and heat. The thermometer stood at 120° in the shade. Many men dropped down dead from sunstroke. Although to avoid the excessive heat, the marches were made at night, the men were so utterly exhausted that even during short halts the whole force would fall down into a deep sleep, from which they were aroused with difficulty. In this jaded condition the column arrived, in May, at the banks of the Jumna near Calpee, when the enemy attacked them at noon on the 23d, but after a severe encounter were repulsed, a portion of the Rifle Brigade Camel Corps from the other side of the Jumna having come to the assistance of Sir Hugh Rose at a critical moment. The success of this day made Sir Hugh Rose master of Calpee, with its arsenal and material of war. Soon afterwards it was announced that Sindia had fled from his capital, and that Gwalior was in the hands of the rebel army. Rapidly retracing his steps, Sir Hugh Rose again met the enemy in a battle under the walls of that great fortress, and by his victory on that occasion restored the maharaja to his throne.

ROSE-ATTAR, the Atr of Asiatics and Otto of the English. In India, the perfumed oils or attar are obtained in the following manner. The layers of the jasmine or other flowers, four inches thick and two inches square, are laid on the ground and covered with a layer of sesamum or any other oil-yielding seed. These are laid about the same thickness as the flowers, over which a second layer of flowers like the first is placed. The seed is wetted with water, and the whole mass covered with a sheet held down at the ends and sides by weights, and allowed to remain for 18 hours in this form. It is now fit for the mill, unless the perfume is desired to be very strong, when the faded flowers are removed and fresh ones put in their place. The seed thus impregnated is ground in the usual way in the mill, the oil expressed having the scent of the flower. At Ghazipur the jasmine and bela are chiefly employed; the oil is kept in bottles of hide, called dubbers, and sold for about four shillings a seer. The newest oils afford the finest perfume. In Europe a fixed oil, usually that of the bean or morunga nut, is employed. Cotton is soaked in this, and laid over layers of flowers, the oil being squeezed out so soon as impregnated with perfume. Dr. Jackson thus describes the culture of the rose in India, and manufacture of rose-attar or rose-water. Around the station of Ghazipur, there are about 300 bighas

(or about 150 acres) of ground laid out in small detached fields as rose gardens, most carefully protected on all sides by high mud walls and prickly-pear fences, to keep out the cattle. These lands, which belong to zamindars, are planted with rose trees, and are annually let out at so much per bigha for the ground, and so much additional for the rose plants,—generally 5 rupees per bigha, and 25 rupees for the rose trees, of which there are 1000 in each bigha. The additional expense for cultivation would be about 8 rupees 8 annas; so that for 38 rupees 8 annas you have for the season 1 bigha of 1000 rose trees. If the season be good, this bigha of 1000 rose trees should yield 1 lakh of roses. Purchases for roses are always made at so much per lakh. The price, of course, varies according to the year, and will average from 40 to 70 rupees. The rose trees come into flower at the beginning of March, and continue so through April. Early in the morning the flowers are plucked by numbers of men, women, and children, and are conveyed in large bags to the several contracting parties for distillation into rose-water. The cultivators themselves very rarely manufacture. The native apparatus for distilling the rose-water consists of a large copper or iron boiler well tinned, capable of holding from 8 to 12 gallons, having a large body with a rather narrow neck, and a mouth about 8 inches in diameter; on the top of this is fixed an old pot or deghchi, or cooking vessel, with a hole in the centre to receive the tube or worm. This tube is composed of two pieces of bamboo, fastened at an acute angle, and it is covered the whole length with a strong binding of corded string, over which is a luting of earth to prevent the vapour from escaping. The small end, about two feet long, is fixed into the hole in the centre of the head, where it is well luted with flowers and water. The lower arm or end of the tube is carried down into a long-necked vessel or receiver, called a bhubka. This is placed in a pot of water, which, as it gets hot, is changed. The head of the still is luted on to the body, and the long arm of the tube in the bhubka is also well provided with a cushion of cloth, so as to keep in all vapour. The boiler is let into an earthen furnace, and the whole is ready for operation. There is a great variety of rose-water manufactured in the bazar, and much that bears the name is nothing more than a mixture of sandal oil. The best rose-water, however, procurable in the bazar may be computed as bearing the proportion of 1000 roses to a seer of water; from 1000 roses most generally a seer and a half of rose-water is distilled, and perhaps from this even the attar has been removed. The boiler of the still will hold from 8000 to 12,000 or 16,000 roses. On 8000 roses from 10 to 11 seers of water will be placed, and 8 seers of rose-water will be distilled. This, after distillation, is placed in a carboy of glass, and is exposed to the sun for several days to become puckah or ripe; it is then stopped with cotton, and has a covering of moist clay put over it; this becoming hard, effectually prevents the scent from escaping. This is the best that can be procured, and the price will be from Rs. 12 to 16.

To procure the attar or otto of roses, the roses are put into the still, and the water passes over gradually, as in the case of the rose-water process; after the whole has come over, the rose-water is placed in a large metal basin, which is covered with wetted muslin tied over to prevent insects or dust getting into it; this vessel is let into the ground about two feet, which has been previously wetted with water, and it is allowed to remain quiet during the whole night. The attar is always made at the beginning of the season, when the nights are cool. In the morning the little film of attar which has formed upon the surface of the rose-water during the night is removed by means of a feather, and carefully placed in a small phial; and day after day, as the collection is made, it is placed for a short period in the sun, and after a sufficient quantity has been procured, it is poured off clear, and of the colour of amber, into small phials. Pure attar, when it has been removed only 3 or 4 days, has a pale greenish hue; by keeping, it loses this, and in a few weeks' time it becomes of a pale yellow. The first few days' distillation does not produce such fine attar as comes off afterwards, in consequence of the dust or little particles of dirt in the still and the tube being mixed with it. This is readily separated, from its sinking to the bottom of the attar, which melts at a temperature of 84°. From one lakh of roses it is generally calculated that 180 grains, or 1 tola, of attar can be procured; more than this can be obtained if the roses are full-sized, and the nights cold to allow of the congelation. The attar purchased in the bazar is generally adulterated, mixed with sandal oil or sweet oil. Not even the richest native will give the price at which the purest attar alone can be obtained, and the purest attar that is made is sold only to Europeans, selling at from 50 to 90 rupees the tola.

In India, native stills are let out at so much per day or week, and it frequently occurs that the residents prepare some rose-water for their own use as a present to their friends, to secure their being provided with that which is the best. The natives of India never remove the calyces of the rose flowers, but place the whole into the still as it comes from the garden. The best plan appears to be to have these removed, as by this means the rose-water may be preserved a longer time, and is not spoiled by the acid smell occasionally met with in the native rose-water. It is usual to calculate 100 bottles to 1 lakh of roses. The rose-water should always be twice distilled; over 10,000 roses, water may be put to allow of 16 or 20 bottles coming out; the following day these 20 bottles are placed over 8000 more roses, and about 18 bottles of rose-water are distilled. This may be considered the best to be met with. The attar is so much lighter than the rose-water, that previous to use it is better to expose the rose-water to the sun for a few days, to allow of its being well mixed; and rose-water that has been kept six months is always better than that which has recently been made. At the commencement of the rose season, people from all parts come to make their purchases, and very large quantities are prepared and sold. There are about 36 places in the city of Ghazipur where rose-water is distilled. These people generally put a large quantity of sandal oil into the receiver; the oil is afterwards carefully removed and sold as sandal-attar, and the water put into carboys and disposed of as rose-water. At the time of sale, a few drops of sandal oil are placed on the neck of the carboy to give it a fresh scent, and to many of the natives it appears perfectly immaterial whether the scent arise solely

from the sandal oil or from the roses. Large quantities of sandal oil are every year brought up from the south of India and expended in this way.

The chief use the natives appear to make of the rose-water, and the sandal-attar or sandal-oil, is at the period of their festivals and weddings. It is then distributed largely to the guests as they arrive, and sprinkled with profusion in the apartments. A large quantity of rose-water is sold at Benares, and many of the native rajas send over to Ghazipur for its purchase. Most of the rose-water, so soon as distilled, is taken away, and after six months from the termination of the manufacture there are not more than four or five places where it is to be met with. The value of the roses sold for the manufacture of rose-water may be estimated at 15,000 to 20,000 rupees a year; and from the usual price asked for the rose-water, and for which it is sold, there may be a profit of 40,000 rupees. The natives are very fond of using the rose-water as medicine, or as a vehicle for other mixtures, and they consume a good deal of the petals for the conserve of roses, or gul-kand, as they call it. The delightful fragrance from the Ghazipur rose fields can be scented at 7 miles distance on the river Ganges. The most approved mode of ascertaining the quality of attar is to drop it on a piece of paper; its strength is ascertained by the quickness with which it evaporates, and its worth by its leaving no stains on the paper. The best otto is now manufactured at Constantinople, and it is largely made in France.—*O'Shaughnessy*, p. 326.

ROSE CHAINS, made of gold at Trichinopoly, are perfect marvels of the goldsmith's art. So minute is the chasing of the pattern of the rose in each link, that, unaided by a magnifying power, the eye is unable to trace its delicate outline and beauty of form. In some, the little links are drawn so close together as to be only visible on the closest inspection. It is difficult at first to believe that it is anything but a mere length of solid gold wire, and only when examined in the hand does its perfect flexibility betray its manner of construction. Waistbands are made, consisting of eight and sixteen of these fairy-like chains, which appear as bunches of golden thread, and they are fastened with gold clasps, set with emeralds and rubies for ornamental purposes.

ROSELLE.

Kaserica, . . . Hind.	Pulchay kiray, . Tam.
Hibiscus subdariffa, Lat.	Yerra gogu, . . . Tel.

This plant is cultivated in most gardens all over India, for its fleshy calyces, which have a pleasantly acid taste, and make excellent tarts and jelly; and in the West Indies, for refreshing drinks. The stems, if cut when in flower, and the bark stripped off and steeped immediately, a mass of minute fibres is displayed, of a fine silky nature.

ROSE MALOES. Anglo-Malay.

Non-t'yok, . . . Burm.	Liquid storax, . . Eng.
Su-hoh-you, . . Chin.	Storax, ... ,,
Su-hoh-you-hiang, ,,	Rasa-mala, . . Malay.

This semi-fluid resin is the product of the Liquidamber altingia, which grows in Tenasserim. The resin sold in China is a thick, scented, gummous oil, of the consistence of tar; it is brought from Persia viâ India to China, and when good has a pearly appearance. The price has declined much of late years; it used to sell for 30 dols. per pikul. It is used for medicinal purposes. —*Morrison's Compendious Description; Williams' Mid. King.* ii. p. 406; *Smith.*

ROSEMARY, the tops of Rosmarinus officinalis, *Linn.*, the Aklil-ul-Jabl or the mountain crown of the Arabs, a translation of Libanotis coronaria, its former European name.

ROSEN, FREDERIC, obiit 1837, aged 32 years. He was the editor and translator of the first book of the Rig Veda.

ROSE OF JERICHO.

Kaf Mariam, . . Arab.	Rose de Jericho, . . Fr.
Mary's Hand, . . Eng.	Jerore hygrometrique, ,,

The rose of Jericho (Anastatica hierochuntina, *L.*), growing in the deserts of Arabia, Palestine, Barbary, and Egypt, is an annual; after withering, its hygrometric stems roll themselves up in a ball, are loosened, and blown about by the wind, expanding again with the first rainfall. The winds hurry the round ball from place to place until it is left in some moist situation, generally the seashore, where it is driven to and fro by the land winds along with the sand which forms the barriers of the beach. Here the seeds are expelled from the contracted seed-vessels on the plant recovering its original form, and receive sufficient moisture for germination, and when blown back to the deserts it puts out its shoots and grows luxuriantly. The people believe that if put in water at the time when a woman's labour pains begin, it will expand the instant that the child is born. They say that it first blossomed on Christmas eve to salute the birth of the Redeemer, and paid homage to his resurrection by remaining expanded till Easter.—*Lind. Murray.*

ROSETTA STONE, a stone discovered on the redoubt of the town of Reshid, by an artillery officer of the French army, when digging the foundations of Fort St. Julian at Rosetta, in August 1799. It is of a dark syenitic basalt, and contains an inscription, the upper part in hieroglyphics, the enchorial or common Egyptian, and Greek. It was first in part translated in 1813 by Dr. Thomas Young, a physician of Great Britain. It is in the British Museum.

ROSETTA WOOD is a good-sized East India wood, imported into Europe in logs 9 to 14 inches diameter; it is handsomely veined, the general colour is a lively red-orange (like the skin of the Malta orange) with darker marks, which are sometimes nearly black; the wood is close, hard, and very beautiful when first cut, but soon gets darker. —*Holtz.*

ROSE-WATER.

Siang-wei-lu, . . Chin.	Ayar mawar, . Malay.
Gulab-ka-pani, . Hind.	Ab-i-gul, ... Pers.

The water distilled from roses, and put for sale into large glass bottles of about three imperial gallons capacity each, called carboys. A large quantity is annually exported from the Persian Gulf to Bombay; that sold in Benares is obtained from Ghazipur, where it is largely distilled. Rose-water is much esteemed on account of its great fragrance, and is chiefly used by the natives at the periods of their festivals and weddings. See Rose.

ROSEWOOD.

Tze-tau, ... Chin.	Lignum Rhodium, Lat.
Chinese rosewood, Eng.	Aspalathus, . . . ,,
E. Indian blackwood, ,,	Pao de rosada, . . Port.
Bois du rose, . . . Fr.	Leno de rosa, . . . Sp.
Bois de Rhode, . . ,,	Biti-maram, . . . Tam.
Rosen-holz, . . . Ger.	Yerra gudda-chava, Tel.
Legno rodie, . . . It.	Gunga ravi, . . . ,,

Like to ironwood, blackwood, redwood, etc., rosewood is a commercial term given to the timbers of several trees. Those used in Britain are produced in the Brazils, the Canary Isles, the East Indies, and Africa. They are imported in very large slabs, or the halves of trees, which average 18 inches wide. The best is from Rio de Janeiro (Dalbergia, *sp.*), the second quality from Bahia, and the commonest from the East Indies; the last is called East India blackwood, although it happens to be the lightest and most red-coloured of the three; it is devoid of the powerful smell of the true rosewood, which latter Dr. Lindley considers to be from a species of mimosa. The pores of the East India rosewood appear to contain less or none of the resinous matter from which the odour, like that of the flower of Acacia armata, arises. One of the rosewoods contains so much gum and oil, that small splinters make excellent matches. The colours of rosewood are from light hazel to deep purple, or nearly black; the tints are sometimes abruptly contrasted, at other times striped or nearly uniform. The wood is very heavy; some specimens are close and fine in the grain, whereas others are as open as coarse mahogany, or rather are more abundant in veins. The black streaks are sometimes particularly hard, and very destructive to the tools employed on it. Next to mahogany, it is in England the most abundant of the furniture woods. A large quantity is cut into veneers for upholstery and cabinet work, and solid pieces are used for the same purposes, and for a great variety of turned articles of ordinary consumption. Mr. Poole, in his Statistics of Commerce, describes it as a highly-esteemed, dark-brown coloured fancy wood, principally used in veneering and making costly furniture. That delivered in England, he says, is imported chiefly from Bahia and Rio de Janeiro, into London and Liverpool. It is in the form of the halves of trees averaging 18 inches wide, and in weight 2½ cwt., called planks, of which the import in 1851 was 2000 tons. Price, ordinarily, £9 to £19, but rising occasionally to £90 per ton. The rosewood of the Tenasserim Provinces is a very beautiful, hard, compact timber, resembling Andaman wood, and is occasionally seen in the bazar of Calcutta. From Siam and other places, a rosewood is largely exported by the Chinese. These woods are generally esteemed according to the degree in which the darker parts are distinct from the purple red, which form the ground. One rosewood was called Lignum Rhodium, Aspalathus, whence the Oleum Rhodii is obtained; heavy, oleaginous, somewhat sharp and bitter to the taste, of a strong smell, and purple colour. The Chinese rosewood, called Tze-tau, is odorous, of a reddish-black colour, streaked, and full of fine veins, which appear as if painted. The manufactures of this wood are more valued in China than the varnished or japanned. There are baser kinds of rosewood of inferior value. East Indian blackwood or rosewood, from the Dalbergia latifolia and D. sissoides, is an excellent heavy wood, suited for the best furniture. It can be procured in large quantities, and of considerable size; the wood contains much oil. In large panels it is liable to split.—*Faulkner; Morrison's Compendious Description; M. E. Jr. Rep.; Mason's Tenasserim; Holtzapfel; Poole's St. of Commerce; M'Culloch.*

ROSIN.

Ral, Rala, Ralla, . Hind. | Coongilium, . . . Tam.
Damar, ... Malay. | Gugalam, ... Tel.

The rosin or common resin of Europe is obtained as a residuary matter in the process for obtaining the oil of turpentine. Turpentines are oleo-resins. In their natural state they are either solid or semi-fluid, the oil of turpentine being obtained by distillation of American turpentine with water, and is from the Pinus palustris; partly also from the Pinus tœda, and perhaps some other species inhabiting the Southern States, from North Carolina and the south-eastern part of Virginia. A hollow is cut in the tree a few inches above the ground, and the bark removed for the space of about eighteen inches above it. The turpentine runs into this excavation from about March to October; more rapidly, of course, during the warmer months. It is transferred from these hollows into casks. Old and concrete American turpentine is often sold as frankincense. Its imports into India are diminishing. See Dammer; Resin.

ROSMARINUS OFFICINALIS, Rosemary.

Aklil-ul-Jabl, . . Arab. | Hasalban-achsir, . Arab.

A shrub three to four feet high, densely leafy, an inhabitant of the south of Europe and parts of Asia Minor. Eau de la reine d'Hongrie is the essential oil of this plant, stated most positively to possess the power of encouraging the growth of hair and of curing baldness. It is the colouring ingredient of green pomatums.—*O'Sh.*

ROSS, DANIEL, a naval officer who rose to the rank of captain in the Indian navy. Between 1828 and 1840, he surveyed the east coast of the Bay of Bengal, from the mouths of the Hoogly to the Straits of Malacca. He succeeded Captain Court in 1823 as Marine Surveyor-General at Calcutta, where he introduced a really scientific method of survey, and earned the title of the Father of the Indian Survey. He was succeeded by Captain Lloyd, on his resigning the office in 1833, and he became Master Attendant at Bombay until before his death.—*E. I. Marine Surveys, P.P.* 1871.

ROSS. Captain Sir James Clark Ross, an officer of the British navy, who discovered the north magnetic pole. He left in September 1839 with the *Erebus* and *Terror*, and voyaged along the antarctic continent, naming Mount Erebus, 12,400 feet, and Mount Terror, 10,900 feet. The former is volcanic, hurling columns of smoke 1500 and 2000 feet above the crater. He made other two voyages, and in the last discovered the south magnetic pole.

ROSTELLARIA PROCUMBENS. *Nees.*
Justicia procumbens, *Linn.*

Nireiputi, ... Tam. | Naka puta, . . . Tel.

A shrub common on the Coromandel coast of India, used in medicine. There are other species.

ROT, a name given to a disease in the coffee plant. In this disease the young coffee leaves and shoots turn black and wither, caused generally by too much wet and cold, and is to be remedied by draining the ground well, laying down also, if possible, mana grass two to three inches thick. When grubs attack the tap-root, the coffee trees are observed to die off, and on digging round, grubs will be found about the tap-root. Grasshoppers (locusts?) cut down young trees close to the ground, and saw off the branches of the older trees.—*Hull*, p. 274.

ROTANG, a pass in the Himalaya, in lat. 32° 24′ N., and long. 77° 10′ E., is 13,200 feet above the sea. The Rotang pass near Dharmsala leads to the heart of Central Asia. The Beas river rises in a sacred pool, called Vyas Rikhi, in the Rotang pass, at the head of Kulu valley. The scenery of the river valley is very beautiful, and is unlike that of the Chenab or Sutlej. The river is fringed with trees, and studded with green islands. There is a good riding path close along the bank, which does not exist upon any other river in the Panjab. Besides deodar in the Upper Beas valley, kail, P. excelsa, elm, maple, oak, and walnut are abundant; on the Parbati, box occurs; also olive and the twisted cypress (C. torulosa) are found in small quantity.—*Powell's Handbook; Lord Elgin.*

ROTH. Several prominent learned men of this name have had relations with India.

A. W. Roth, author of Novæ Plantarum Species, præsentim Indæ Orientalis.

Heinrich Roth, a German missionary, about A.D. 1650, resided in India. He was able to dispute in Sanskrit with the Brahmans.

Rudolph Roth, in 1844 published three dissertations on the literature and history of the Vedas. He was editor of the Atharva Veda.—*Sayce*, i. 44.

ROTHIA TRIFOLIATA. *Pers.*

Trigonella Indica, *Linn.*

Nurrey pithen kiray, TAM. | Ubbukada, ... TEL.

An annual, native of the Coromandel coast, with small yellow flowers. It is a small procumbent weed with trifoliate leaves, used by the natives as greens; abundant everywhere.—*Jaffrey.*

ROTI. HIND. Any bread; the chapatti or flat cake. Leavened bread is called nan, also roti. Roti is also sweetened wheaten cakes besmeared with sandal, but is properly unleavened bread. Roti raughandar are wheaten cakes with a superabundance of ghi in them. See Bread; Sooji; Rolong.

ROTTBŒLLIA EXALTATA. *Linn.*

Stegosia Cochin-Chinensis, *Lour.* | Buru-Shunti, BENG.

A plant of British India, Cochin-China, and N. Holland.

ROTTBŒLLIA GLABRA. *Roxb.* Buska, Buksha, BENG. A grass of the family Panicaceæ, acceptable to cattle.—*Roxb.*

ROTTEN-STONE, a mineral, occurring massive; colour greyish, reddish, or blackish brown; dull, earthy, and opaque. Soft, soils the fingers, and is fetid when rubbed or scraped. It is employed in polishing metal, etc.; in 100 parts, alumina 86, silica 4, carbonaceous matter 10. Very fine silicious and magnesian earths, such as rotten-stone, alkaline loam, and Armenian bole, occur near Sundur, Bangalore, and Cuddapah.—*Eng. Cyc.; Mad. Ex. Jur. Rep.*

ROTTLER, Dr. A., a Danish missionary long resident at Tranquebar, in the south of India, who wrote a Tamil dictionary and collected a herbarium. He was esteemed the father of Indian botany.

ROTTLERA, a genus of plants, named in honour of Dr. Rottler. Its species are found in the tropical parts of Asia and throughout India, and contain handsome moderate-sized trees. R. tetracocca grows in Sylhet, and yields a hard and valuable timber; R. digyna, *Thw.* (Chloroxylon digynum, *Wight Ic.*), is a small tree growing at Caltura in Ceylon; R. eriocarpa, *Thw.*, grows in the hot and drier parts of Ceylon, but is not very common; and R. fuscescens, *Thw.*, another small Ceylon tree, is not uncommon up to an elevation of 2000 feet. In Ceylon, also, are found R. muricata, *Thw.*, R. oppositifolia, *Blume*, and R. rhombifolia, *Thw.*, all small trees. Other defined species of India are R. alba, barbata, ferruginea, Indica, laccifera, and peltata. Some botanists have arranged the species under the genus Mallotus, and name above twenty of them. One of undetermined species, the Ya-gi-ne of the Burmese, is a moderate-sized tree, common on the low ground near streams; breaking weight from 153 to 170 lbs. A cubic foot weighs 35 lbs.; average girth, 6 feet. The Mimasko, qu. Mimasho? is a Tavoy species, furnishing a timber. The Keoun-lae, BURM., is a large tree in Tavoy, the timber of which is used for rudders. The Otte of the Singhalese, another species, is used for common house-building purposes; the tree grows in the western province of Ceylon. It weighs 36 lbs. to the cubic foot, but is little durable, lasting only 10 years.—*Dr. Wallich; Thw.* p. 272; *Dr. Brandis, Cal. Cat. Ex.*, 1862.

A large tree, with alternate, ovate, oblong leaves, of a ferruginous colour beneath; flowers in the cold weather. It is common in many parts of

British India, from Peshawur, Assam, to Ceylon, Burma, Java, Philippines, and China. The stellate pubescence covering the 3-coccus capsule of this large tree is collected for sale for dyeing silk. The colouring matter does not require a mordant, all that is necessary being to mix it with water containing about half its weight of carbonate of soda. The colour imparted is a rich flame or orange tint of great beauty and extreme stability; the material supplied by commerce contains 78 per cent. of colouring matter, and the powder consists of hairs obtained from the outer part of the first capsule, and when the fruit is ripe it is brushed off and collected. It is also found sparingly on the leaves, petioles, and flower-stalks of the plant. The powder is of a dark brick-red colour, with a peculiar heavy odour, increased on its being rubbed between the fingers. Two varieties of it are sold in the bazars in the Panjab, the one having been passed through coarse cloth to free it from impurities, such as portions of the withered flowers, dust, or insects, but the only appreciable difference is that this finer quality is cleaner than the other. To cold water the powder does not impart its yellow colour, but either floats on the surface or falls in small quantities to the bottom. Boiling water becomes slightly tinged by it. If the powder be boiled in water to which any of the alkalies have been added, a complete solution of the colouring matter takes place, and it is by means of this property that the natives of India avail themselves of it as a dye. Alcohol and ether dissolve it with equal facility. All these preparations of the powder have a dark-red colour, and the yellow colouring matter is only separated on the addition of certain re-agents. Thus, when the mineral acids are added to the alkaline decoction or infusion, a thick flocculent precipitate of a gamboge yellow colour is thrown down, and the same effect is produced on the alcoholic and ethereal tinctures on the addition of water or the mineral acids. Contact with the atmosphere seems to cause the development of this yellow deposit, as on exposing on glass a thin film of either of the tinctures, before evaporation of the fluid is completed, the previously transparent coating becomes opaque and of a light-yellow colour. The process of dyeing seems also to bear on this idea, as silk or cloth is merely dipped in a hot alkaline solution which is of a dark-red colour, and on the drying of the cloth the characteristic yellow colour is developed. The resinous deposit, on which the active properties of the plant both as an anthelmintic and a dye depend, is obtained in a large quantity from an alkaline decoction of the powder by boiling eight ounces of the powder in two pints of water, along with one ounce of the bicarbonate of soda. Filter when cool, and to the filtered liquid add nitric acid till the solution becomes neutral. A considerable quantity of yellow matter then forms in the fluid, which is again filtered, and this yellow residue, when dry, is found to weigh one and a half ounces, is of a dusky yellow colour, and adheres in lumps of considerable consistence. The substance probably exists in the plant as an essential oil, and the formation of the yellow-coloured deposit, on the neutralization of alkaline solutions, and the addition of water or the acids to the alcoholic and ethereal solutions, or by the action of air, consists in the change of the essential oil to a resin, by the loss of hydrogen and the absorption of oxygen. The silk dyers of Southern India use the following method:—4 parts of the powder, 1 part of powdered alum, 2 parts of salts of soda, rubbed well together with oil of sesamum and then boiled in water; it is sufficient, however, to mix it with water containing half its weight of carbonate of soda. The powder, as found in the bazars, is much adulterated, but some collected carefully by the Madras Forest Department, realized a high price in the English markets. In the process of dyeing, as pursued in Amritsar, where a large trade in silk is carried on, barilla, a coarse preparation of carbonate of potash, obtained by burning a herbaceous species of salsola common in the uncultivated portions of the Panjab, is mixed with water, in the proportion of one ounce of barilla to four ounces of water. To this solution, when filtered, the kamila is added, and they are then boiled together. When the boiling has been continued long enough to extract all the colouring matter, a small quantity of lime is dissolved in the fluid. The dye is then ready for use, with the exception of the addition of few grains of alum, in order to fix the colour. In some parts of India, gum is occasionally mixed with the fluid, but in the Panjab this is never considered necessary. The characteristic yellow colour is not developed in silk, etc., until after two or three immersions in the dyeing fluid. The kamila dye is sold in the drug mart of Amritsar at Rs. 18 a maund for the first quality, and Rs. 10 for the second. (This is at the rate of 2 lbs. for 6d.) It contains a yellow resin, rottlerine, soluble in carbonate of soda, and precipitated by acids. It acts as a purgative and very sure anthelmintic in cases of tapeworm, in doses of from one to two drachms. It is in some districts used as an application to cutaneous diseases, especially for itch and fevers, and it is said to be also an aphrodisiac.—*Cleghorn; Ind. Annals Med. Sc.* i. 85; *Irvine's Med. Top.; Hooker*, i. 14; *Ains.; Honigb.; Powell; Riddell; Ex. Jur. Rep.; Thwaites; Stewart; Beddome.*

ROTTO or Rotti and Lando are islands near Timor. Rotto is about 45 miles long, and of moderate height, with undulating hills, and its S.W. end extends to about lat. 11° 2′ S., and long. 122° 51′ E.

ROUGE. Yen-chi, CHIN.; Carmine, ENG. Rouge is a pigment of a beautiful rose colour. The Chinese rouge is wholly of vegetable origin; safflower is made into a paste, from which the colouring matter is extracted by repeated washing with acidulated water. For toilet purposes, the colouring matter is spread upon squares of paper, or laid on the surface of little saucers, the constant accompaniment of a Chinese lady's toilet. The lips and cheeks are coloured with this, the face is dusted with white powder, and the outline of the eyebrows and front of the wiry hair are often brought out with Chinese ink. The higher officers of the Chinese provinces use safflower rouge, to distinguish them from the ordinary vermilion stamp of the inferior officers.

The common rouge of the theatres of Europe is prepared by pounding benzoin, red sandal-wood, Brazil wood, and alum in brandy. The mixture is then boiled until three-fourths of the

liquid has evaporated; a paint of an intense red colour remains, and this is applied to the face with a piece of soft cotton. Vinegar is sometimes substituted for the brandy; but as both fluids injure the skin, the colouring matter is sometimes extracted from the dye-woods, and unguents formed therewith, by means of balm of Mecca, butter of cacao, or spermaceti. If the colour be too intense it is mixed with chalk.

Rouge dishes are small saucers containing a layer of dry rouge. Those which are prepared in Portugal probably contain genuine carmine; clumsy imitations of these dishes are prepared in London. Spanish wool and oriental wool are also rouge vehicles. Wool is impregnated with the colour, and formed into cakes about the size of a crown piece by the Spaniards, and somewhat larger by the Chinese; the latter is most esteemed. Beautifully painted and japanned colour-boxes are imported from China. Each box contains 24 papers, and in each paper are 3 smaller ones, namely, a lovely blushing red for the cheeks, an alabaster white for the face and neck, and a jet black for the eyebrows. Rouge, used by jewellers for brightening gold, is a peroxide of iron.—*Smith.*

ROUMIA HEBECARPA. *Poit.* Katambilla, Singh. A moderate-sized Ceylon tree, at Condasallc, Maturatte, etc.; prized in Colombo on account of its fruits, which are about the size of large cherries, somewhat acidulous, with a very agreeable flavour.—*Wight's Ill.* i. p. 37; *Thw.*

ROUSHANAI, a Muhammadan sect which made a great noise among the Afghans in the 16th century, but by the beginning of the 19th century it was almost extinct. It was founded in the reign of the emperor Akbar, by Bayazid Ansari, who was called by his enemies the Pir-i-Tarik (or Apostle of Darkness), in derision of the title of Pir-i-Roushan (or Apostle of Light), which he had himself assumed, Roushanai meaning the Enlightened. He held the same tenets with the Sufi sect, but as he added a belief in the transmigration of souls, it is probable he derived his creed from the Yogi sect of Hindu philosophers, who add some of the dogmas of the religion in which they were educated to those of the Sufi school. On this, however, he ingrafted some doctrines of his own. Bayazid was a man of great genius, and his views spread rapidly among the Bardurani, till he was able to assemble armies, and to enter on a regular contest with the government.—*Elphinstone's Caubul*, p. 210.

ROVUMA, a river which disembogues on the east coast of Africa; its mouth, in lat. 10° 27′ 40″ S., and long 40° 29′ 39″ E., is a mile wide, but its navigable channel is narrow.

ROXANA, a Turkomani wife of Alexander the Great.

ROXBURGH, WILLIAM, M.D., a medical officer of the Madras army, in the service of the E. I. Company, who was their botanist in the Carnatic, and subsequently in charge of the gardens in Calcutta. He entered the Madras Service 1766, and died in 1815. He was author of Coromandel Plants, and of the Flora Indica. The former work was published by the order of the E. I. Company, in three folio volumes, under the direction of Sir Joseph Banks, Bart., in 1793 and 1816, with three hundred coloured plates, and it was the first contribution of the British Indian Government to the illustration of botanical science. His Flora Indica remained in manuscript for some years after his death. Two editions of it have since that event been published; one, which is incomplete, was edited by Drs. Carey and Wallich; it extends to the end of Pentandria Monogynia, but contains many additional plants not contained in Roxburgh's manuscript; the other, which is an exact reprint of the manuscript as left by its author, is in three volumes, and was published in 1832. A new edition of this appeared in 1878? He also published the Hortus Beugalensis and Catalogue of the Calcutta Garden. He was the first to describe fully, accurately, and reduce to the form of flora, according to the Linnæan system, the botanical riches of the east. During the earlier part of his career he resided in the Peninsula, particularly about Samulcottah, where he had ample opportunities of examining the botany of the neighbouring Circar mountains. In the autumn of 1793, he was removed to the superintendence of the Company's Botanic Garden in Calcutta. Herc he remaiued till 1814, adding new descriptions to his manuscript, when illness compelled him to return by the Cape and St. Helena to England. During his lifetime there appeared from his pen,—Plants of the Coast of Coromandel, fol., 3 vols., Lond. 1795-1819; Hortus Bengalensis, or a Catalogue of the Plants growing in the East India Company's Botanic Garden at Calcutta, edited by Wm. Carey, 8vo, Serampur 1814: and in the Asiatic Researches—Essays on the Lac Insect (ii. p. 361); on the Butea Plant (iii. 369); on the Prosopis Aculeata (iv. p. 405); on the Spikenard of the Ancients (iv. p. 432); on the Caoutchouc of Penang (v. p. 167); on a New Species of Delphinus (vii. p. 170); on the Monandrous Plants of India (xi. p. 318). And after his death, there were published, his Flora Indica, or Descriptions of Indian Plants, with Descriptions of Plants more recently discovered, edited by N. Wallich and Dr. Carey, 2 vols. 8vo, Serampur 1820; Flora Indica, or Description of Indian Plants, 3 vols. 8vo, edited by Dr. Carey, Serampur 1832.

ROXBURGHIACEÆ, a natural order of plants, natives of the hot parts of India. There is but one genus—Roxburghia. The roots of one of its species are prepared with lime-water, candied with sugar, and taken with tea. The flavour is insipid. Dr. Wight gives R. gloriosoides.—*Lindley; Eng. Cyc.*

ROYLE, JOHN FORBES, M.D., F.R.S., of the Bengal Medical Service. Author of the Geographical Description of the Flora of India, Rep. Brit. Ass., 1846, part iii. p. 74; Illustrations of the Botany, etc., of the Himalayan Mountains, 1839; Productive Resources of India, Lond. 1840; on the Culture of Cotton in India, Lond. 1852, 1 vol. 8vo; on the Fibrous Plants of India. In 1820 Dr. Royle commenced his Indian career, and died at Acton, 2d January 1858. Shortly after his appointment as Assistant-Surgeon on the Bengal Establishment, he was placed in charge of the Botanic Gardeu at Saharunpur, where he remained for nearly nine years. On his return to England in 1832 or 1833, he commenced the publication of his work on the Botany of the Himalayan Mountains, which contains also an accumulation of valuable information respecting the economical, medicinal, and other vegetable

products of India. In 1838 or 1839, he was appointed Botanical Adviser to the E. I. Company, after which he published a work on the Productive Resources of India, which contains a great amount of useful information culled from various sources, combined with his own experience and research; and in 1851, a work on the Culture and Commerce of Cotton in India and elsewhere.

After the breaking out of the Russian war of 1853, Dr. Royle, in 1855, wrote on Fibrous Plants of India fitted for Cordage, Clothing, and Paper.

In addition to these, he published on the Antiquity of Hindu Medicine; an Essay on Medical Education; a Manual of Materia Medica and Therapeutics; besides contributions to Kitto's Cyclopædia, Holtzapfel's Turning and Mechanical Manipulation, to the Catalogue of the Great Exhibition of 1851; on the Hyssop, and on the Mustard Plant of Scripture; on the Culture of the China Tea Plant; and very shortly before his death, a pamphlet reviewing the measures which have been adopted in India for the improved culture of cotton. The districts investigated by Dr. Royle and by his collectors were chiefly the Jumno-Gangetic Doab, the upper part of the Gangetic plain, and the mountains of Garhwal, Sirmore, Kanawar, and Kashmir. His Illustrations of the Botany of the Himalayan Mountains, in two volumes quarto, with 100 plates, is still the only book, except Dr. Wallich's Tentamen Floræ Nepalensis, devoted to the rich flora of the mountains; and it further contains the first attempt to demonstrate the prominent features of the geographical distribution of Northern Indian plants in reference to the elevations and climates they inhabit, and to the botany of surrounding countries.—*Hooker and Thomson's Flor. Indica; Indian Field.*

ROYLEA ELEGANS. *Wall.*

Ballotta cinera, *D. Don.* | Phlomis calycina, *Roxb.*

A shrub of the Himalaya valleys, with small, white, pale rose-coloured flowers. It is deemed a febrifuge by the people of the Himalaya, like some species of Teucrium in Europe.—*O'Sh.* p. 492; *Voigt.*

ROZA, a fast. Roza-ka-fittra, fast offerings. Roza Rak'hna, keeping a fast, a duty in the Muhammadan religion. Roza Kholna, to terminate a fast.

ROZAH, Rodah, or Rawdat. ARAB. Any garden, applied in India by Muhammadans to a burial-place. There are many of these. The most known is that on the hill eight miles from Dowlatabad, where the Emperor Aurangzeb is interred. Those of Bawa Alisar and Ganja Baksh, at Maqraba, in Ahmadabad, are admirably built. The island opposite Old Cairo, known as Roda, is the Egyptian form of the Arabic sound of d given to the letter zwad. This name is given also to a part of the southern portion of the Great Mosque of Medina, because the prophet said, 'Between my tomb and my pulpit is a garden of the gardens of Paradise.' It is a frequent term for a book, as Rawzat-ul-Athar, Rauzat-us-Safa, and Rauzat-us-Shahada, the book of martyrs.

RUBIA CORDATA is used in Japan by the country people for dycing.—*Thunberg's Tr.* iii. 63.

RUBIA CORDIFOLIA. *Linn.* Indian madder.

Rubia munjistha, *Roxb.* | R. secunda, *Moon.*
R. munjith, *Desv.*

Rubia cordifolia is a native of Siberia, but is cultivated largely in China, Assam, Nepal, Bombay, Sind, Quetta, etc., for its dye-stuff. A small quantity is exported from China and India. It fetches in the London and Liverpool markets from 20s. to 30s. per cwt., duty free. In 1851, at the Great Exhibition, the jury remarked that some of the colours dyed with it are quite as permanent as those dyed with madder, and even more brilliant. Botanists have been inclined to regard R. cordifolia and R. munjistha as distinct in habit, form of stem, etc.; there are differences sufficient to make them distinct species. R. munjistha, Dr. Gibson observes, is not such a large climber as the other; Bancroft was informed by Dr. Roxburgh that the stem of R. munjistha, unlike the stem of R. tinctorum, seemed to be preferred to the roots for dyeing; Roxburgh, in his Flora Indica, adds that, not only the roots and the stems, but the large branches also, are used to dye red with. It is imported into Bombay, of an apparently inferior quality, from Muscat, and into the Panjab from Afghanistan, forming a considerable part of the large annual investments of the Lohani merchants. From the Panjab, as well as from Afghanistan direct, it goes to Sind, and thence to Bombay, where it realizes 40 per cent. more than the Muscat article, and is re-exported to England. It is extensively used in the Panjab, in Sind, and in the North-Western Provinces, as a dye-stuff, and is found in every bazar of any extent.

The munjit brought from Afghanistan answers exactly to the description given in Ure's Dictionary of Arts. It is either the true madder of Europe, or is produced by a species of rubia found in almost all parts of India distinct from R. munjistha.

An infusion of it is given as a grateful and strengthening drink to weakly women after lying-in. Camel loads of madder are brought from Banu and Tonk, on the west side of the Indus, to Lahore.—*Roxb.; Smith; Stewart; Mason; Irvine; Ains.; Honig.*

RUBIA TINCTORUM. Madder. This tree has a diffuse brittle-branched stem, angular, very rough, with sharp hooks, and madder is the product of the long slender roots. The tree is only known in its cultivated state in Asia. Dr. Brandis first found it being grown in small quantity on the Sutlej at about 8000 to 8500 feet, for home consumption to dye wool red. Dr. Stewart found it in Kanawar. Irvine mentions that a little is collected in Gandaya, Baluchistan, and parts of Turkestan, but that the chief tract for its cultivation is from Kābul to near Kandahar. According to Cleghorn, madder has been grown in the Panjab from French seeds.

It is a native of Europe and Asia Minor, is extensively cultivated in Holland and France; the culture has likewise been successful in Great Britain, but it is largely imported, though cochineal has become cheaper, and is much used for

the same purposes. The principal supplies are obtained from Holland, Belgium, France, Turkey, Spain, and the Balearic Isles, the Italian States, India, and Ceylon. The plant is generally raised from seed, and requires three years to come to maturity. It is, however, often pulled in eighteen months without injury to the quality; the quantity only is smaller. A rich soil is necessary for its successful cultivation, and when the soil is impregnated with alkaline matter, the root acquires a red colour; in other cases it is yellow. The latter is preferred in Britain, from the long habit of using Dutch madder, which is of this colour; but in France the red sells at two francs per cwt. higher, being used for the Turkey-red dye. Madder does not deteriorate by keeping, provided it be kept dry. It contains three volatile colouring matters,—madder purple, orange, and red. The latter is in the form of crystals, having a fine orange-red colour, and called alizarin. This is the substance which yields the Turkey-red dye. The slender creeping roots are the thickness of the little finger, very long and branching, provided with numerous articulations, and tough fibrils; epidermis thin, pale brown; bark and meditullium intensely red. The odour is weak and peculiar, taste bitter and styptic. According to Kuhlman's analysis, the roots contain red colouring matter (alizarin, *Robiquet*), yellow do. (xanthine, *Kuhl.*), woody fibre, mucilage, gum, sugar, bitter matter, resin, salts, albumen, etc. Alizarin occurs in orange-red crystals, tasteless, inodorous, little soluble in cold, but soluble in boiling water, also in alcohol, ether, the fixed oils, and alkalies. The alcoholic solution is rose-coloured, the ethereal golden, the alkaline violet or blue. A solution of alum added to a solution of alizarin, and precipitated by potash, gives a rose-lake of the most charming tint. Xanthine is yellow, very soluble in water and alcohol, slightly in ether; the solution passes to orange-red by contact with alkalies, to lemon-yellow by acids. It is devoid of odour, but has a sweetish-bitter taste. The red-colouring matter of madder tinges the bones, milk, and urine of animals if fed on the roots. The great consumption of madder is as a dye-stuff for giving a red colour to wool, silk, and cotton. In pharmacy the roots are sometimes used for colouring ointments.—*O'Shaughnessy.*

RUBINA, once the most celebrated tribe in Arabia, is now a small broken clan. The Anazah Arabs come of this race.—*Rich's Kurdistan.*

RUBRUQUIS, WILLIAM DE, made a journey in A.D. 1253-1256 to Kara-korum, in the reign of Louis IX. of France, and of Mangu Khan, the grandson of Chengiz Khan.

While St. Louis of France was engaged in the seventh crusade, A.D. 1248-50, and the lieutenants of Octai or Okkadai Khan were at the same time attacking the Saracens from the side of Persia, the Tartars and the Crusaders became united in a common interest. To cement their connection, the general who commanded the Tartar forces in Persia sent an embassy to the French king, expressing the respect he felt for Christianity, and recommending that they should make common cause against their Saracen enemies. A French embassy was at once sent into Persia; and at the same time the pious St. Louis, anxious to lose no opportunity, sent the Minorite Friar William de Rubruquis to the Tartar chief Sartakh, whose territories bordered on the Black Sea. From Constantinople, Rubruquis sailed to Soldaia in the Crimea, one of the entrepots at that time of the Black Sea trade in Russian furs, and Indian spices, drugs, and silks, through Constantinople, with the rest of Europe; and thence he journeyed northward through the region of Comania, until he came to the camp of Sartakh, by whom he was sent on to the court of his father Batou at Sara or Sarai. Here he was furnished with a guide to the court of Mangu, who had succeeded his cousin Kuyuk as Khakan or Great Khan at Kara-korum, on the verge of the great Mongolian desert. From the Mongol capital he returned to the court of Batou on the Volga, and thence to Europe, not by the Crimea, but over the Caucasus, through the country of the Lesgi (Lesghis) and Gurgi (Georgians), Armenia, and Iconium, where he had an interview with the Ottoman Sultan, and by the Cilician port of Ayas to Cyprus, where, at Nicosia, he found his provincial.

Rubruquis described Turkey (*i.e.* the kingdom of Iconium) at this time as having 'no treasure, few warriors, and many enemies.' He also strongly deprecated the system of sending poor friars like himself as ambassadors to the Great Khan, without office, presents, or any of the things that command the favour and respect of the profane. From his report, Nestorian Christians abounded at the courts and in the territories, as well of Batou Khan as of his superior Mangu Khan; that they had great influence with many at court, especially with the wives and daughters of these and other chiefs. Rubruquis relates that the reply of Mangu Khan to the letter of king Louis was written in the Mongolian language, but in the character of the Jugures or Chakars, which had been introduced by Nestorian Christians, and was derived from the Syrian, but written in lines down the page, commencing from the left. Mongolian is so written at the present day.—*Prinsep's Tibet, Tartary, and Mongolia.*

RUBUS, a genus of plants of the order Rosaceæ. The following East Indian species are the better known, viz.:—

R. asper, Nepal.
R. biflorus, *Sm.*, Panjab.
R. ellipticus, *Sm.*, Nepal.
R. distans, Nepal.
R. gowreephul, *Roxb.*, Neilgherries and other mountains of India.
R. gracilis, *Roxb.*, Nepal.
R. hexagynus, *Roxb.*, Peninsula.
R. micranthus, Nepal.
R. Moluccanus, *L.*, Tavoy, Moluccas, Khassya.
R. lasiocarpus, *Sm.*, Neilgherries.
R. paniculatus, *Sm.*, Nepal.
R. parviflorus, *L.*, China, Nepal.
R. pauciflorus, *Wall.*, Nepal.
R. rugosus, *Sm.*, Peninsula, Mahabaleshwar.
R. Wallichianus, *W. and A.*, Peninsula.

Griffith says there is a species of rubus in the Tenasserim Provinces, and Wallich found one on the Irawadi.—*Roxb.* ii. p. 517; *Voigt; Mason.*

Rubus biflorus, *Sm.*

Ankren, ... Beas.	Karer, ... Ravi.
Kantanch, . . Chenab.	Bumbal, Insra, . Sutlej.
Khariara, ... „	Batang, Kalkalin, „

Common from 5000 to 10,500 feet up to the Indus in the Panjab Himalaya. It has a red-coloured, palatable fruit. Its stem is covered by a white pulverulent epidermal layer, looking as though whitewashed.

Rubus flavus, *Ham.*

Bramble, ... ENG.	Unsri, . . . PANJABI.
Punkana, Guracha, JHEL.	Akhi, Kimachi, . . RAVI.

This yellow-fruited bramble is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 5000 to 7000 feet up to near the Indus. The fruit is very pleasant, used for preserves.

Rubus fruticosus, *Linn.*

Akhi, ... BEAS.	Shali-dag-ganch, KANGRA.
Hiuen-tiau-tsze, . CHIN.	Unsri, ... SUTLEJ.
Bramble, Blackberry, ENG.	Karwarei, . . TR.-INDUS.
Alish, . . . KANGRA.	

Rubus fruticosus, like R. idæus, grows at Kashmir, and in the N.W. Panjab from the plains up to 5000 feet, and in China in the Yang-tze valley. It has dark-purple fruit, used to make a preserve, on the hills.

Rubus gowreephal, *Roxb.*, Wild raspberry.

R. Indicus, *Rottler.*	Gowreephal, . . HIND.

A plant with small white flowers, grows in Ceylon, the Neilgherries, Kamaon, Khassya, Assam, Taong Dong, common amongst the woods betwixt Hardwar and Srinuggur; also grows pleutifully in Mysore and Wynad.

Rubus idæus, Mount Ida bramble.

Fuh-pw'an-tsze, . . CHIN.	Si-kwoh-tsau, . . CHIN.

This wild raspberry grows in Kan-su, Ho-nan, Shen-si, and Hu-peh. It is inferior to the cultivated plant. It is a native of woods in Europe from Norway and Sweden to Spain and Greece. It is found also in Asia on the Himalayas, in the north of Africa, and in America from Canada to Pennsylvania. It is found abundantly in almost every part of Great Britain and Ireland.

Rubus lasiocarpus, *Sm.*, Country raspberry.

R. albescens, *Roxb.*	R. Mysorensis, *Heyne.*
R. racemosus, *Roxb.*	
Gowreephal, . . DUKH.	Pukuna, . . . HIND.
Blackberry, . . . ENG.	Pakania, . . KAGHAN.

A plant of Neilgherries, Mysore, Ceylon, the Himalaya up to 8000 feet, now cultivated generally in the Dekhan. It grows easily from seed; a few of the ripe fruit rubbed on a sheet of paper, and dried in the sun, will enable one to forward the seed to friends at any distance. The same with the strawberry. The plants should never be nearer than four or five feet, and may be cut down at the commencement of the rains, when they will throw out fresh shoots, and bear fruit in abundance. As it requires little care, and only an occasional supply of water, this bramble forms a very perfect and secure hedge to a kitchen garden. The finest fruit is very inferior to a common raspberry.

Rubus purpureus, Himalayan raspberry. Akhi of Kulu.

Rubus tiliaceus, *Sm.*, Pulla of Kangra. A black-fruited species, not uncommon from 4500 to 8500 feet, up to the Indus. The fruit is black, and not much prized.—*Ainslie; Cleghorn; Eng. Cyc.; Honigberger; Riddell; Powell; Stewart; Voigt.*

RUBY.

Yakut, . ARAB., PERS.	Merah, Manikam, MALAY.
Rubin, . DA., GER., SW.	Rubim, . PORT., RUS.
Robijn, ... DUT.	Lanka-ratti, . . SINGH.
Rubis, ... FR.	Kembu kallu, . . TAM.
Lal, ...HIND., RUS.	Kempu rai, . . . TEL.
Rubino, ... IT.	

The true oriental ruby, the sapphire, the topaz, and the emerald, though differing greatly in appearance, are chemically the same substance, pure alumina; but jewellers give this name to several other minerals possessing brilliant red colour. The oriental ruby is the most valuable of all gems when of large size, good colour, and free from flaws. The ruby in colour varies from the highest rose tint to the deepest carmine, but the most valuable tint is that of pigeon's blood, a pure, deep, rich red, and generally occurs in 6-sided prisms.

The best come from India, Burma, and Ceylon; Bohemia furnishes an inferior article. They are found in Ava, Siam, the Cupelam mountains, ten days' journey from Syrian a city in Pegu, Ceylon, India, Borneo, Sumatra, on the Elbe, on the Espailly in Auvergne, and Iser in Bohemia. The ruby and sapphire mines of Burma are 25 miles south of Moongmeet. Many of the rubies and other precious stones that the Shans bring with them in their annual caravan from the north of Burma, are made of rock-crystal, coloured artificially. These are heated and plunged into coloured solutions. Fine rubies have from time to time been discovered in many of the corundum localities of Southern India, associated with this gem, particularly in the gneiss at Viralimodos and Sholasigamany. It occurs also in the Trichingode taluk and at Mallapollaye, but it is, comparatively speaking, rare.

In Ceylon, at Badulla and Saffragam, and also, it is said, at Matura, rubies, sapphires, and topaz are found. Badakhshan has been famed since the time of Marco Polo as the country producing the true balas ruby. Its ruby mines are in the Gharan district, 20 miles from the small Tajak state of Ishkashm, on the right bank of the Oxus. They have not been worked since the Kunduz chief took Badakhshan. Irritated by their small yield, he marched the inhabitants of the district, 500 families, to Kunduz, where he sold them as slaves.

Of the accounts of the ruby mines of Burma, one was written by Père Giuseppe D'Amato, an Italian Jesuit missionary to Burma, a translation of which appeared in the Journal of the Asiatic Society of Bengal in 1833; and another account by Mr. Bredmeyer, who about 1870 was in charge of some minor ruby mines within 16 miles of Mandalay. The mines visited by Père D'Amato are said to be 60 or 70 miles distant from Ava in a north-east direction, and separated from the Irawadi valley by the Shoay-doung or Golden Mountain range, which are only occasionally visible from the town of Male, owing to the constant fogs and mists that hang around, and snow lies on them for four months of the year, beginning with the middle or end of November. They are situated north-east from Mandalay, and distant about 60 or 70 miles. The principal road to them leaves the Irawadi at Tsinguh-Myo, and passes through Shuemale. There are other roads, from Tsampaynago and other villages to the north. The mines lie nearly due east from the village. The villages in the immediate neighbourhood of the mines are Kyatpen, Mogouk, and Katheyuwa. The gems are procured over an area of probably 100 square miles. The mode of seeking for them is simply sinking pits until the gem-bed or ruby earth is met with; this is then raised to the surface and washed. The gem-bed is met with at various depths, sometimes not more than two or three feet from the surface, and occasionally not at all.

When the layer of earthy sand containing the rubies is met, lateral shafts are driven in on it, and the bed followed up, until it either becomes necessary to sink another pit in it, or it becomes exhausted. It varies in thickness from a few inches to two or three feet. The rubies are, for the most part, small, not averaging more than a quarter of a rati, and when large are generally full of flaws. Well-marked crystals occasionally occur, but the vast majority of stones are well rounded and ground down. It is very rare to find a large ruby without flaws; and Mr. Spears states that he had never seen a perfect ruby weighing more than half a rupee. The same authority mentions that sapphires are also found in the same earth with the rubies, but are much more rare, and are generally found of a larger size. Stones of ten or fiftcen rati without a flaw are common, whereas a perfect ruby of that size is hardly ever seen. The largest perfect sapphire he ever saw weighed one tikal. It was polished, but he has seen a rough one weighing 25 tikal. For every 500 rubies, he does not think they get one sapphire. You see very small sapphires in the market, while small rubies are abundant and cheap. The value of the gems, rubies, and sapphires obtaiued in a year may be from £12,500 to £15,000. They are considered the sole property of the kiug, and strictly monopolized, but, notwithstanding the care that is taken, considerable quantities are smuggled. There are about 20 lapidaries or polishers of these stones at Amarapura; they are not allowed to carry on their trade at the mines. For polishing, small rubies and worthless pebbles brought from the mines, being pounded fine and mixed up with an adhesive substance, and then made into cakes some ten inches long by four broad, are employed to rub down the gem. After it has been brought to the form and size required, another stone of finer grain is employed. The final process is performed by rubbing the ruby ou a plate of copper or brass until it is thoroughly polished, when the gem is ready for the market. Rubies of Burma are not exported to any large extent, and then only stones of inferior value. But a pink spar found in the ruby district is a more important item of export. It is believed to be used for one of the classes of distinctive mandarin cap-knobs. Great numbers of these gems are brought down to Rangoon for sale, but a heavy price is always demanded for them, and it requires an experienced eye to purchase them with a view to profit. Topazes are also found in the vicinity of the rubies and sapphires, but they are scarce, and fetch a higher price in Burma than they would realize in England. Rccently, rubies and sapphires have been found in Siam, about four days' journey from Bankok, in a very feverish locality. The stones, though inferior to those obtained in Upper Burma, are said by the Burmese to be so plentiful near Bankok, that even women are anxious to proceed to the mines. Ceylon ruby is a term applied in England to the garnets and carbuncles which come from Siam through Ceylon, and also to peculiar tinted almaudines. The stones are of a rich red tinged with yellow. They are superior to those of the miue of Zobletz in Silesia, from the Tyrol, and from Hungary. Under the designation Ceylon rubies, jewellers obtain a large pricc for them from the ignorant. A stone of a fine rich tint, free from flaws, of a certain size, will range from £8 to £10.

Balas ruby is a term used by lapidaries to designate the rose-red varieties of spinel. Spinel is seen of all shades.—blood red, the proper spinel ruby; rose red, the balas ruby; orange or red rubicelle; and voilet-coloured or almandine ruby.

Red tourmaline is sometimes mistaken for the ruby, and the pink topaz for the balas ruby. Spinel and balas rubies are found in Ceylon, Ava, Mysore, Baluchistan; the spinel ruby is comparatively of little value, but they are often sold for a true ruby, and the true ruby is occasionally parted with as a spinel ruby.

Tavernier gives the figures of a ruby that belonged to the king of Persia. It was in shape and bigness like au egg, bored through in the middle, deep coloured, fair, aud clean, except one flaw in the side. They would not tell what it cost, nor what it weighed; only it had been several years in the treasury. He likewise gives the figure of a balas ruby, sold for such to Giafer Khan, uncle of the Great Moghul, who paid 9,50,000 rupees = 1,425,000 livres for it. But an old Indian jeweller affirming afterwards that it was no balas ruby, that it was not worth above 500 rupees, and that Gaifer Khau was cheated, and his opinion being confirmed by Shah Jahan, the most skilful in jewels of any person in the empire, Aurangzeb compelled the merchant to take it again, and to restore the money back. Tavernier gives also the figure of a ruby belonging to the king of Visapur. It weighed fourteen mangelin, or seventeen carats and a half, a Visapur mangelin being but five grains. It cost the king 14,200 new pagodas or 74,500 livres. Also, he figures a ruby that a Banya showed him at Benares; it weighed 58 rati or $50\frac{3}{4}$ carat, being of the second rank in beauty, in shape like a plump almond bored through the end. He offered 40,000 rupees or 6000 livres for it, but the merchant demauded 55,000 rupees.

The largest oriental ruby known was brought from China to Prince Gargarin, governor of Siberia; it afterwards came into possession of Prince Menzikoff, and now constitutes a jewel in the imperial crown of Russia.—*Eng. Cyc.; King*, p. 56; *Emmanuel; Tavernier's Tr.* p. 149; *Ainslie, Cal. Cat. Exh.*, 1862; *Newbold in Madr. J. L. and Sc.; Mason; Ferrier's Jour.; Davy's Ceylon.*

RUDHI, also Vriddhi, Tel., are two different names of the ashta varga or eight roots, celebrated in the Indian Materia Medica. They are only from Nepal or Northern India, and have never been identified.—*As. Res.* xiii. 410.

RUDIKI, about the close of the 9th century, translated the fables of the Pancha-Tantra of Bed-pai from Arabic into Persian, and received 80,000 dirhams for his labours. He was a celebrated poet. See Abul Hasan.

RUDOK, a district in the neighbourhood of Lake Tso Mognalari, lat. 33° N., and long. 80° E.

RUDRA, in the Rig Veda, is spoken of as an inferior god, the god of storms, from Rud, to cry; one of a kind of semi-divine beings (eight in number), who, in the Vedic ages of Hindu mythology, were connected with the worship of Vayu or the wind. Brahmanical Hinduism cousiders Rudra to have been the god Siva, and he is first called Mahadeva in the White Yajur Veda; and the Vishnu Purana says the god Rudra sprang from

the forehead of Brahma, and multiplied himself. Eight Rudra enumerated in the Vishnu Purana are—Rudra, Bhava, Sarva, Isana, Pasupati, Bhima, Ugra, Mahadeva, most of which are regarded now as merely other appellations for Siva. Brahma is fabled to have assigned to them as their respective stations, the sun, water, earth, air, fire, ether, the ministering Brahman, and the moon. These are their types or representatives in this world. In other places the Rudra are described as eleven in number, and as children of Kasyapa and Surabhi.—*Williams*, p. 40; *Vishnu Purana*, p. 58.

RUDRA BHATTA, author of Sringara Tilaka, the mark of love, on the emotions and sentiments of lovers, as exhibited in poetry and the drama.—*Dowson.*

RUDRA BHUMI. Tel. The place of incremation of deceased Hindus.

RUDRAKSHA, the fruit of the Elæocarpus tuberculatus, also of E. ganitrus, made into a rosary, and worn by the Saiva Hindus.

RUDRA PRAYAG, a temple in the Garhwal district of the N.W. Provinces of India. It is at the junction of the Alaknanda with the Mandakini, which drains the southern slopes of the Kedarnath and Badarinath peaks. It is one of the five sacred prayag or confluences of the Hindus, and a halting-place for pilgrims to Himachal. A dome-shaped rock, 30 feet in height by 15 in diameter, bears the name of Bhim-ka-chūlha, or the kitchen of Bhim, a famous giant of Hindu mythology. It is completely excavated, and has apertures at the top, where they believe that Bhim used to place his cooking utensils.—*Imp. Gaz.* viii.

RUDRA SAMPRADAYI, a sect of Vaishnava Hindus, founded by Vallabhacharya, who originated the worship of Bala Gopala, the infant Krishna. This worship is very widely diffused amongst all ranks of Indian society, but is perhaps best known as the religion of the Gokalastha Gosains, the title of its teachers. Vallabha was the son of a Telinga Brahman. He taught that privation was not sanctity, and that it was the duty of the teacher and his disciples to worship their deity, not in nudity and hunger, but in costly apparel and choice food; not in solitude and mortification, but in the pleasures of society and the enjoyment of the world. The gosains or teachers, like Vallabha, are always married men, always clothed with the best raiment, and fed with the daintiest viands by their followers, over whom they have unlimited influence. The followers of the order are especially numerous amongst the mercantile community, and gosains are constantly travelling over India under the pretence of pilgrimage, but reconcile to themselves on these occasions the profits of trade with the benefits of devotion. Zealous disciples devote to the guru the threefold Samarpana, Tan, Man, Dhan, or body, mind, and wealth. The temples and houses of the sect have metal, often gold, images of Gopal, of Krishna, and Radha, and other divine forms connected with the incarnation. The idol is richly decorated and sedulously attended in daily ceremonials. Besides their public demonstrations of respect, this sect keep pictures and images of Gopal in their houses; and before sitting down to any of their meals, they take care to offer a portion to the idol. Those of the disciples who have performed the triple Samarpana, eat only from the hands of each other; and the wife or child that has not exhibited the same mark of devotion, can neither cook for such a disciple nor eat in his society. Vitala Nat'h, the son and successor of Vallabha, had seven sons, all of whom were teachers, and their followers, though in all essential points the same, form separate communities. Those of Gokalnath, however, look on their own gosains as the only legitimate teachers of the faith. The worshippers of this sect are very numerous and opulent, the merchants and bankers, especially those from Gujerat and Malwa, belonging to it. Their temples and establishments are numerous all over India, but particularly at Muttra, and many hundreds at Bindraban. But at Sri Nat'h Dwar, at Ajmir, is the most celebrated, most highly venerated, and most richly endowed of all the gosain establishments. It is a matter of obligation with members of this sect to visit Sri Nat'h Dwar at least once in their lives, and the head gosain presents them with a certificate to that effect. The indecent and immoral character of this sect was notoriously brought before the public of India in a trial for libel instituted in 1862, at Bombay, by one of the teachers of the sect, and known as the 'Maharaja case.' It was shown by the evidence then adduced that the women of the wealthiest of this sect deemed it an honour to receive their priest's attentions, for which the priest withdrew with the woman of his selection, selected in the midst of and from amidst hundreds of her fellow-worshippers, and it was also in evidence that the maharaja allowed people to see him associating with his selection. In 1868, in Bombay, during the holi, indecent pantomimes were shown by this sect before a concourse of men and women. It is the Banya and Bhattya races who chiefly support this sect.—*Rev. Dr. Wilson; Times of India.*

RUDRAYA-MALA and Jati-mala, a book containing an enumeration of castes and professions.

RUE, Ruta. It., Lat.

Raute, ... Ger.	Ruda, ... Sp.
Sadab, Saturi, . . Hind.	Arooda, ... Tam.

In India, this name is given to the herbs of Ruta angustifolia, R. graveolens, and R. Indica. R. graveolens, an evergreen shrub, grows freely in any good soil, propagated by cuttings in damp weather, used for fowls in the roup. Leaves dried and burnt are much used in Southern India for the purpose of fumigating young children suffering from catarrh; also used fresh, bruised and mixed with arrack, as an external remedy in the first stages of paralytic affections. When dried in the shade and powdered, the vytians prescribe this substance in conjunction with certain aromatics in cases of dyspepsia; they entertain the same notion regarding it that Dioscorides did of old, viz. that it is inimical to the fœtus in utero when given together with camphor and the sugar of the palmyra toddy. In making confection of rue, the herb of dried rue, the sadab of the bazars of N.W. India, may be substituted.—*Jaffrey; Ains.; O'Sh.; Beng. Phar.*

RUELLIA, a genus of plants of the natural order Acanthaceæ. From one wild species, called in Assam Room, a very valuable dye is prepared after the manner of indigo. This plant (or a species very nearly allied to it) is also cultivated with the same object in all parts of Burma, under the name of Mai-gyee. It is believed that the

room contains indigo allied to that produced by species of Isatis and Wrightia. The source of this dye has been referred to Ruellia comosa, also to R. indigotica. That produced at the hills occupied by the Murree and Dofla tribes of North Assam, and produced at the hills occupied by the Mishmi and Abor tribes, Suddiya, Luckimpore, Upper Assam, is of value R. 1½ per lb. The room is employed in its raw state by the Khamti and Singpho to dye their clothes of a deep blue. It was described by Griffiths as a valuable dye, and highly worthy of attention. It might perhaps be usefully employed as the ground for black dye. Ruellia cernua, *Roxb.*, grows in Mysore; R. comosa, *Roxb.*, is a plant of the Moluccas; R. hirta, *Vahl*, grows in Telingana; R. indigofera, *Griff.*, is the Mai-gyee of the Burmese.—*Roxburgh; Voigt; Wall.; Hooker.*

RUELLIA INDIGOTICA. *Fortune.* The Room of Assam and Tien-ching of China. In one part of the Che-kiang province of China, and also amongst the Fung Hwa mountains to the westward of Ningpo, large quantities of a blue dye are produced, which is, in fact, the indigo of that part of the country. Fortune (Wanderings, 1846) gives an account of a valuable kind of indigo, made from a species of woad (Isatis indigotica), which is cultivated extensively in the level country a few miles to the westward of Shanghai. The kind in Che-kiang is equally valuable, if not more so. It is made from a species of Ruellia, which until it gets a better name may be called Ruellia indigotica. The same plant apparently has been discovered in the Assam country in India, where it is also cultivated for the blue dye it affords; alongside of the Chinese kind, they bear a most striking resemblance. This Ruellia seems to be easily cultivated, it grows most luxuriantly, and is no doubt very productive. In the province of Che-kiang it is planted, in the highland valleys, in the end of April or beginning of May, after the spring frosts are over, and is cleared from the ground in October before those of autumn make their appearance. During this period it attains a height of a foot or a foot and a half, becomes very bushy, and is densely covered with large green leaves. When the stems are cut down for the manufacture of indigo, a sufficient quantity have their leaves stripped off, and are afterwards taken into a house or shed to be properly prepared. The leaves thus stripped from the cuttings are thrown into the tanks with the stems and leaves, so that nothing is saved except what is actually required for the purposes of propagation. The stems are now tied up firmly in large bundles, each containing upwards of 100, and the ends of each bundle are cut across, so as to leave them perfectly neat and even both at top and bottom. These bundles are each about a foot long, and, of course, nearly round. They are carried to a dry shed or outhouse, where they are packed closely and firmly together, and banked round with very dry loam. A portion of the dry soil is also shaken in between the bundles, and this being done the operation is complete. Should the winter prove unusually severe, a little dry straw or litter is thrown over the surface of the cuttings, but nothing else is required. During the winter months, the cuttings remain green and plump; and although no leaves are produced, a few roots are generally found formed, or in the act of forming, when the winter has passed and the season for planting has come round. In this state they are taken to the fields and planted. The weather during the planting season is generally showery, as this happens about the change of the monsoon, when the air is charged with moisture. A few days of this warm showery weather is sufficient to establish the new crop, which now goes on growing with luxuriance, and requires little attention during the summer; indeed none, except keeping the land free from weeds. In the district where this dye plant is grown, there are numerous pits or tanks on the edges of the fields. These are usually circular in form; one measured eleven feet in diameter and two feet in depth. About 400 catties of stems and leaves are thrown into a tank of this size, which is then filled to the brim with clear water. In five days the plants are partially decomposed, and the water has become lightish green in colour. At this period the whole of the stems and leaves are removed from the tank with a flat-headed broom made of bamboo twigs, and an admirable instrument for the purpose. When every particle has been removed, the workmen employed give the water a circular and rapid motion with the brooms just noticed, which is continued for some time. During this part of the operation another man has employed himself in mixing about thirty catties of lime with water, which has been taken out of the tank for the purpose. This is now thrown into the tank, and the rapid circular motion of the water is kept up for a few minutes longer. When the lime and water have been well mixed in this way, the circular motion is allowed to cease. Four men now station themselves round the tank, and commence beating the water with bamboo rakes made for this purpose. The beating process is a very gentle one; as it goes on the water gradually changes from a greenish hue to a dingy yellow, while the froth becomes of a beautiful bright blue. During the process the head workman takes a pailful of the liquid out of the tank, and beats rapidly with his hand. Under this operation it changes colour at once, and its value is judged of by the hue it presents. The beating process generally lasts for about half an hour. At the end of this time the whole of the surface of the tank is covered with a thick coating of froth of the most brilliant colours, in which blue predominates, particularly near the edges. At this stage, it being desirable to incorporate the froth with the liquid below it, there is made a most beautiful chemical operation. A very small portion of cabbage oil, only a few drops, is thrown on the surface of the froth, the workmen then stir and beat it gently with their flat brooms for a second or two, and the whole disappears as if by some enchanter's wand. So small a quantity of oil is necessary for this purpose, that even when the cup has been emptied, and has only the oil that is necessarily adhering to its edges, it is thrown into another tank, and produces the desired effect. The liquid, which is now darker in colour, is allowed to stand quiet for some hours, until the colouring matter has sunk to the lower stratum, when about two-thirds of the surface is drawn off and thrown away. The remaining third part is then drawn into a small square tank on a lower level, which is thatched over with straw, and here it remains for three or four days. By this time

the colouring matter has separated itself from the water, which is now entirely drained off, the dye occupying three or four inches of the bottom, in the form of a thick paste, and of a beautiful blue colour. In this state it is packed in baskets, and exposed for sale in all the country towns in that part of China, at rates varying from 50 to 100 cash a catty, say from 2d. to 4d. per lb. Some is sold as low as 30 cash, but this is very inferior; the greater part produced is sold at from 60 to 80 cash a catty, and it must be of a very superior quality if 100 cash is paid. Like the Shanghai indigo made from Isatis indigotica, it is called Tien-ching by Chinese. During the season of its preparation every mountain stream is coloured and polluted with the refuse liquid drawn off from the tanks, and the stench which fills the air is almost unendurable.—*Fortune's Residence*, p. 189; *Fortune's Wanderings.*

RUELLIA RINGENS. *Linn.* Upu-dala, MAL The juice of the leaves of this plant, boiled with a little salt, is supposed, on the Malabar coast, to correct a depraved state of the humours. Ruellia intrusa, *Vahl*, R. secuuda, *Vahl*, R. Zeylanica, *Roxb.*, are syns. of Asystasia Coromandeliana.—*Nees.*

RUELLIA STREPENS. *Ainslie.*

Grendio tagarum, SANSK. | Kirendinyagum, . TAM.

The small purple-coloured leaves and berries of this low-growing plant are sub-acid and bitterish to the taste. When bruised and mixed with castor-oil, they form a valuable application in cases of children's carpang.—*Ains.; Rheede's Hort. Malabar.*

RUG, this kind of carpet is in extensive use for the carpeting of rooms and for individual use throughout all Central and Southern Asia, those of cotton being usually styled Bisat, Shatranji, and Dhurri, and the woollen fabrics Gallicha. The dhurri or dharri of Shahabad are made wholly of cotton, and almost invariably striped. They are cool and pleasant, and are in invariable use by the richer natives of India, and by all Europeans. The smaller kinds are used as quilts for beds, and European soldiers use them for that purpose. The manufacturers are called Kalleeun Bap, and are almost invariably Muhammadans, who make carpets of any size and pattern given, and also in stripes. The two local seats of manufacture in Shahabad are Bubbooah and Sasseram. In the former place, from Rs. 10,000 to 12,000 worth are yearly manufactured and sold, and in the latter from Rs. 30,000 to 40,000. The dhurris generally made for sale are either 6 yards long and 2 yards broad, thick, and strong, of any colour, sold at from Rs. 6 to 6.8 each, or a small kind used as quilts, or to spread in lieu of any other bedding on the ground. They weigh from 2 to 3 lbs. each, and are 1¼ to 1½ yards broad, by about 2 yards long; they sell at from 14 annas to 1 rupee 8 annas each, according to thickness and quality.

The Hauzhassica is a better kind of carpet, and often displays much taste in the arrangement of the striped colours. It is made of any size to fit any room, and is always sold by weight. The price varies according to quality from Rs. 1.4 to 1.12, and sometimes as high as Rs. 2.4 per seer. It is sold in all the fairs and in all the large cities around, and no merchant or banker's shop, and no rich native's reception room, is complete without these being spread. This kind is generally used by Europeans for their drawing and public rooms.

The Dhurri panch rangha is a small kind for use in small cutcherries, and much used from its portability. It is from 3 to 4 yards long, and from 1½ to 2 yards broad, and sells at from Rs. 3 to 4 each carpet.

Gallicha carpets are almost always woollen, of florid but neat patterns, in imitation of the Persian carpet. They are used to a considerable extent by the rich natives in their zananas, and by Europeans also. The size usually manufactured is 2 yards long by 1 yard broad, and they sell at from Rs. 2 to 4.8 per carpet. Any other sizes and patterns can be made, and some of the patterns are extremely pretty. The wool costs but little; the coarse local wools, which would not pay for exportation, answer for carpet work, and the native dyes answer admirably. The colours are harmonious. A principal site of the manufacture of the woollen rugs was long the town of Ellore, but they are made in the Dekhan and in Mysore, of any size, to order. They are usually 3 feet broad and 6 feet long, and much used as sleeping rugs, and rugs for the drawing-room. They have been exported largely to Europe, where they are employed as hearth-rugs; they are of various colours, prettily arranged, and sell at from Rs. 4 to 14, according to size. With some felted rugs the patterns are produced by laying on the coloured wools and felting them into the substance of the carpet.

Serviceable and cheap woollen rugs and very substantial cotton rugs can be got at Multan. Many carpets are made at the jails at Lahore, Agra, Allahabad, Bhagalpur, Tanna, and Mirzapore. Warangal was long famous for its silk carpets, and the harmony of colours and speciality of pattern are notable. The woollen carpets from the same place are also peculiar. The craftsmen at Warangal claim Persian descent, and their patterns seem to be of Persian origin.

RUGTRORA, in the Bombay side of India, a vernacular name of several plants, the Tecoma undulata, *Don;* Rhamnus Wightii; Soymida febrifuga; Maba nigrescens, *Dalz.;* and Polygonum glabrum.

RUH. ARAB. The spirit, the soul, the countenance. Ruh Allah, the spirit of God, Jesus Christ. Ruh-ul-Qadas, the Holy Spirit, supposed to mean the angel Gabriel, whom Muhammadans call also Ruh-ul-Amin, the faithful spirit. Ruh-i-siflin is lower spirit; Ruh-i-Jari, travelling spirit; Ruh-i-Moqeen, a resident spirit; Ruh-i-Aowlee, the lofty spirit.

RUKAIAH BEGUM, Akbar's first wife. She died at 84 years of age, about a year and a half before Jahangir's death.—*Cal. Rev.*, Jan. 1871.

RUKCHU, in lat. 33° 14′ N., long. 77° 50′ E., in Ladakh, a pasture ground in an old lake basin between the Lacha Lung and the Takelang pass. The mean height of the lake basin is 15,764 feet above the sea. Rukchu is the most elevated district of Ladakh, and one of the loftiest inhabited regions of the known world, the mean height of its plains being 15,634 feet.—*Schl.*

RUK-HARA, a Saiva religious sect of mendicants, similar to the Ukhara, but do not carry a stick nor wear the Rudraksha ear-rings, but in their place metallic ones. See Ukhara.

RUKHENG, the name given to the language of Arakan.

RUKMINI, the only lawful wife of Krishna. According to the Harivansa, Rukmini was the daughter of Bhishmaka, king of Kundina, and was solicited in marriage by Krishna, of whom she was enamoured; but the son of Bhishma, Rukmi, jealous of Krishna's fame, and being incensed by the death of Kansa, his friend, was hostile to the match, and negotiated his sister's marriage with Sisupala, king of Chedi, likewise inimically disposed towards Krishna. All the kings of India were invited to the wedding, and amongst them came Krishna, who, seeing Rukmini proceed to offer her devotions at a temple, waylaid her on her return, and, with the assistance of his brother Bala Rama and his kinsmen, carried her off to Dwaraka. A hot pursuit followed, and an engagement took place, in which Rukmi was struck to the ground by Kesava, but his life was spared at his sister's intercession, and Krishna remained possessed of his prize. The marriage was solemnized at Dwaraka, and Rukmini remained the chief of Krishna's wives. He had ten sons by her, of whom Pradyumna is the most celebrated. The rape of Rukmiui is also narrated nearly in the same words as in the Harivansa, in the 5th section of the Vishnu Purana, and more in detail in the tenth book of the Bhagavat, and in the Krishna Janma Khanda of the Brahma Vaivarta Purana. —*Cal. Rev.* p. 41; *Hind. Theat.* ii. p. 82.

RUKNABAD, a brook near Shiraz, celebrated by Hafiz. It is an insignificant stream.

RUKSAT. Arab., Hind., Pers. Dismissal of a visitor; permission to depart; the Muhammadan etiquette being for a visitor to await dismissal, on the principle that he came at his own pleasure, but should await his host's time to depart.

RUKU. Arab. Plural, Rukat, prostrations in Muhammadan prayer ritual; the stooping posture in prayer. Ruku-ki-tasbeeh, beads held in the hand at prayers. In Muhammadan ritual, reading or repeating a number of prayers from the Koran, accompanied with prostrations and genuflections. Rukat dogana, two rukat prayers.

RUM, a spirit distilled from the sugar-cane. The best is made from molasses, and it is preferred when well kept, of good age, considerable body, smooth oily taste, and a brownish transparent colour. Bengal, the West India Islands, and Guiana are the countries chiefly distinguished for the produce of rum.—*Faulkner.*

RUM or Room. The Persians designate Asia Minor by this term. The Muhammadans of India apply it to the Turkish dominions generally, also to Constantinople. Kaisar-i-Rum, the 'Cæsar of Rome,' always meant the Byzantine emperor, and the title was transferred to the Turkish Sultan.

RUMAL, a pocket-handkerchief (Ruh, the face, Mal, wipe); also a square shawl, used as veils in Peshawur by women. The term applies to any handkerchief, the soft silk one of Bokhara, etc., and to square shawls. A rumal is used in the place of a turban by all the poorer natives of India.

RUMEX ACETOSA. *Linn.* Sorrel.

Swan-mo, . . . Chin. | Chuka, Kautli, . Hind.

It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6000 to 8000 feet, also in Kaghan. It is widely distributed. It is cultivated in Ajmir; the seed is considered cooling and astringent.

Rumex Alpinus (Swan-mo, Chin.), or Monk's rhubarb, is found on the European Alps, the Crimea, and Mount Caucasus. The roots are large and purgative like rhubarb, and the whole plant so resembles the rheum that Linnæus himself mistook one for the other.

Rumex dentatus, *W.*, is the Gul-Hamaz of Persia; R. hydrolapathum, *Smith*, is the Chinese Yang-ti and Ye-ta-hwang; and R. undulatus, *Royle*, is the Hamaz or Pulki. One species is known to Europeans as Indian red sorrel. From the decoctions of the dried roots of various sorts of sorrel, by the addition of alum, a fine red colour can be obtained at a low price, and valuable to painters.

Rumex obtusifolius vegetates in Kashmir, and is eaten by the natives. Its root, under the name of Radix spathiacuti, was formerly used as a purifier of the blood in chronic cutaneous diseases, but is now obsolete both in India and in Europe; its active principle, Lapatin, must, however, have peculiar properties.

Rumex vesicarius, *Willde.*

Hamaz, ... Arab.	Tursha, Hamaz, . Pers.
Humbæjt, . . . Egypt.	Shutavedhi, . . Sansk.
Sorrel, Bladderdock, Eng.	Suri, ... Singh.
Chuka, Chok, . Hind.	Sukh gu kire, . . Tam.
Chuko, ... ,,	Sukan kire, . . ,,

Cultivated for greens, etc., but it grows plentifully about Madras in the fields during the rains. It has obtained the name of sorrel from the British in India, owing to its great resemblance to the Rumex acetosa in taste and other natural qualities. It is an article of diet, and is considered by the natives as cooling and aperient. This, where water is abundant, may be had for eight months in the year; it is sown in drills, or on the edges around other beds; the leaves are sold in bundles from one to two pice a seer.—*Cleghorn; Irvine; O'Sh.; Riddell; Ains.; Honig.* p. 338.

RUMI KHAN, a Turk of Constantinople, who was commandant of the artillery of Bahadur Shah of Gujerat. He afterwards served under Humayun at the siege of Chunar, which he conducted. The Portuguese early endeavoured to obtain possession of Diu. Their first effort was defeated by Rumi Khan, commander of the Gujerat army. In 1535, however, Bahadur Shah of Gujerat permitted them to erect a fortress there. It was completed in 1538, from which time the Portuguese became the terror of the sea, and were able to resist the efforts made to subdue them by the emperor of Turkey, the kings of Bijapur and Ahmadnaggur, and the Zamorin of Calicut. He afterwards served under the Nizam Shah dynasty at Ahmadnaggur, and is buried there. He cast there the great gun now on the ramparts of Bijapur.

RUMINANTIA, the ruminants or ruminating animals, such as camels, deer, horned cattle, and sheep. The ruminants are a tribe of mammals of the order Ungulata, which comprise the families Bovidæ and Cervidæ, *q.v.*

RUMPA, a tract of country situated on a part of the northern frontier of the Rajamundry district. It is very thinly populated, wild, and mountainous, and the climate during most part of the year unhealthy. It formed part of the old Kottapille taluk, which, under the new territorial arrangement of the district, was included under

Rajamundry, with a snb-magistrate, however, resident not far from the Rumpa border.

RUMPH, GEORGE EVERHARD, native of Hanau in Hesse Cassel, was born in 1626, and died in Amboyna in 1693. He stndied medicine, and went to Batavia when 28 years old, and entered the service of the Dutch East India Company at Amboyna, where he passed the remainder of his life. At the age of 42, when contemplating a visit to his native country, he suddenly became blind, and therefore never left his island home. But he continued to prosecute his favourite studies in natural history till his death in 1693, when he had attained the age of 67. His great work on the shells of Amboyna was not published till 1705. His chief work, however, was the Hortns Amboinense, which was only rescned from the Dutch archives and published some years after his death. D'Amboinische Raritertkammer, fol. 1705, has passed through several editions. It has never been translated into English. It contains all connected with the plants of that region. Drs. Hooker and Thomson say that having become blind, he obtained the assistance of some young men in completing the work, and translated the descriptions into Dutch; it was finished in 1690. The manuscript remained upwards of thirty years in the possession of the Dutch East India Company, but was at length rescued from oblivion by Professor John Burmann of Amsterdam, who edited it between the years 1741 and 1754, and illustrated it with several remarks and synonyms, besides giving a translation into Latin, for Rumphius' original one appears to have been lost. This work consists of six volnmes, with a supplemental or seventh one not published till 1757, and contains 696 plates, representing more than twice that number of plants. The plates are mnch less valuable than those of Rheede, but the descriptions, on the contrary, are much superior. A most elaborate commentary on the Herbarium Amboinense was commenced by the late Dr. Francis Buchanan Hamilton in the Transactions of the Wernerian Society of Edinburgh; what is printed only extends to the middle of the second volnme, but the remainder of the manuscript was presented to the Society before his death. He had at the same time prepared a commentary on the Hortus Malabaricus of Van Rheede, which is in the possession of the Linnæan Society of London; that on the four first volumes is all which has yet appeared in their Transactions.—*Wight's Prodromus Fl.* i. p. 8.

RUNDUR or Kyampo, lawless tribes of robbers in the middle districts of Tibet.

RUNGIA REPENS. *Nees.*

Justicia repens, *Linn.* | Dicliptera repens, *R. et S.*
Dicliptera retusa, *Juss.* | Kadag saleh, . . TAM.

A plant used in medicine growing in Peninsular India. Its leaves resemble those of thyme in taste and appearance. R. parviflora, *Nees*, also grows throughont British India.

RUNN, a flat tract lying between Sind and Cntch, which is inundated with brackish water during the three monsoon months, and is covered by salt incrustations when dry. Salt is manufactured on it at Janjorra and Patri. The Runn or Rin is a remarkable feature of the Rajputana desert. It is 150 miles broad; into it the Loni or Looni or salt river enters, and then runs on to the sea. The Looni rises in the Aravalli, and in Marwar it separates the fertile land from the desert, afterwards runs through the Chohan territory, dividing it into the eastern part called Raj-Bah or Sooi-Bah, and the western part called Park'har or 'beyond the Khar or Looni.'

The word Runn or Rin is a corruption of Aranya, or 'the waste;' nor can anything in nature be more dreary in the dry weather than this parched desert of salt and mud, the peculiar abode of the khar or wild ass, whose love of solitnde has been commemorated in Job. That this enormous depository of salt is of no recent formation, we are informed by the Greek writers, whose notice it did not escape, and who have preserved in Erinos a nearer approximation to the original Aranya than exists in our 'Rin' or 'Runn.' Although mainly indebted for its salt to the Looni, whose bed and that of its feeders are covered with saline deposits, it is also supplied by the overflowings of the Indus, to which grand stream it may be indebted for its volume of water.

The Runn of Cutch has been subjected to repeated upheavals and depressions within even historic times. A vast space from the Indus eastward, which is now dry land, was, in the time of Alexander, covered by the waves. The ruins of Balabhipura, near Bhownaggar, are 10 to 15 feet below the surface of the soil. On the 16th June 1819, the Rnnn was partly submerged during an earthquake, and is now in part a lake and in part a salt-water marsh.

North of the Runn, in the collectorate of Ahmadabad, are the Null and Bohe, two hollows some distance apart, containing salt water, which they receive from rivulets, but give off none.

The Runn extends from the Indus to the western confines of Gujerat, a distance of full 200 miles. In breadth, from the islands, it is about 35 miles, and, taking into consideration its different belts, its area, exclusive of the elevated tracts called Bunni and the islands, is about 7000 square miles; including Bunni and the islands of Pacham, Khnren, etc., it is 9000 square miles. It is a dry, sandy flat, without herbage, and dnring a great part of the year a few tamarisk bushes alone are seen on it. Fresh water is only to be had on its islets. The mirage is there witnessed in all its surprising beauty. So long as the sun shines, the Runn resembles a vast expanse of water, which only those accustomed to it can distinguish from the reality. Its islands are Carir and Pacham. Bunni, south of Pacham, is a tract of grass land. Lieut. M'Murdo, writing in 1815, and Lieut. Burnes, writing shortly afterwards, pointed out that the Runn had formerly been an inland sea; and about the middle of the 18th century a vessel was found at Wawania sunk 15 feet deep in the mud.

During the S.W. monsoon, water is driven up its eastern inlet from the Gnlf of Cutch, and up the eastern branch of the Indus, and covers its whole surface, augmented by the freshes which come down the Looni and Banas rivers.

The Runn of Cutch is called the Great Runn. The Small Runn commences near the Great Runn in the N.E., and continues to the Gnlf of Cambay, and in the N.W. a narrow Runn separates the district of Okhamandnl from the rest of the peninsula of Kattyawar, connected only by a narrow bank of sand at Mudhe.—*Tod's Rajasthan;*

Memoirs of Lieut. M'Murdo, 1815; *Lieut. Burnes*, 1827–28; *Captain Grant, Geol. of Cutch; Capt. G. Le Grand Jacob.*

RUPA, author of Vidaydha Madhava, a drama in seven acts on the loves of Krishna and Radha, written A.D. 1533.

RUPA. HIND. Silver, but generally means alloyed silver, debased by the addition of copper or zinc, or both.

RUPA-MATI was born at Sarungpur, a town in Malwa, 55 miles N.E. of Ujjain and 80 miles west of Bhilsa. Malcolm describes her as a dancing girl, and famed more for her good sense than her beauty. Malwa, for a short time in the middle of the 16th century, became independent under Baz Bahadur, and he made Rupa-mati one of his wives, and they passed through seven years of great happiness, hawking in the day, with poetry and music at night. But in A.D. 1560 Akbar sent Adam Khan to re-occupy Malwa, and Baz Bahadur, deserted by his soldiers, fled. Rupa-mati destroyed herself by poison or the dagger. Her songs are in the Hindi dialect of Malwa. Their style is simple and natural, and are the outpourings of a fervent heart, and many of them are still sung by professional songsters and musicians all over the province of Malwa. She had more than a common share of the poet's power.—*Tr. of Hind.* ii. p. 198.

RUPAR, a municipal town in the Ambala district of the Panjab, in lat. 30° 57′ N., and long. 76° 33′ E.; pop. (1868), 8700. The Sirhind canal draws its waters from the Sutlej at this point. A Muhammadan fair is held at the tomb of Shah Khalid, in the month of Jaishtha, attracting 50,000 persons; and another fair at a Hindu bathing festival on the banks of the Sutlej.—*Imp. Gaz.* vol. viii.

RUPA SIDDHI, a work by Buddha Priya. See Pali.

RUPEE, a coin of India, value under 2s. The Sicca rupee, the Madras or Arcot rupee, and the Bombay rupee, have been displaced from British India by the Indian rupee of 1835. The following are the assay reports of Shah Jahan, Multani, Kābuli, and Duraniwall rupees:—

Description of Coin.	Weight.		Touch.		Pure Metal.		Value of 100 in Company's Rupees.	
	Grs.	Dec.	P. c.	Dec.	Grs.	Dec.	Rs.	Dec.
Shah Jahan, .	177	15	97	76	173	181	104	958
Multani, . .	171	89	94	90	163	123	98	862

Rupee of Nepal is worth 13 annas; it is called after an ancient dynasty, the Mahendra Mally, and commonly Mohāri.

The Bhoti rupee is called the Kala Mohāri, and ought to be the same as that of Nepal. The Nanak Shahi rupee had a pipal leaf as a symbol.

The purchasing value of the rupee has latterly greatly diminished. In Madras, from under 3 rupees the maund of rice in 1859–62 to under and above 4 rupees from 1863 to 1868; in the Panjab, from over 3 rupees in 1853 to under and over 5 rupees since 1861. From 1835 to 1854, paddy per maund in Madras sold from a half to three-quarters of a rupee, and since then till 1868 has ranged up to 2 rupees. Wheat per maund in Dinapur has risen from over 1 rupee to above 2 and 3 rupees; in the Panjab, from above 1 rupee to above 2 rupees; and in Bombay the average from 1842 to 1855 was Rs. 1.9.8 per maund; and from 1856 to 1868 it was Rs. 3.12.

RUPNATH, a famous place of pilgrimage at the foot of the Kaimur Hills, 35 miles N. of Jubbulpur. It has one of Asoka's rock inscriptions.

RUPPELL, a botanist who described the Hortus of the Red Sea, and southwards to Mozambique, and the fishes near the Cape.—*Dr. Smith.*

RURKI, a small modern town of 10,778 inhabitants, in the Saharunpur district of the Meerut division of the N.W. Provinces. It is situated on one of the most elevated sites in the Doab between the Jumna and the Ganges, in lat. 29° 52′ 25″ N., and long. 77° 55′ 40″ E.; distant 68 miles N. by E. of Meerut, 1000 miles from Calcutta. The districts of Meerut division are Aligarh, Bulundshahr, Dehra Doon, Muzaffarnagar, and Saharunpur. It has a college organized by Mr. James Thomason and Colonel Maclagan, at which the subordinate engineers of the Bengal Presidency are trained. It was opened in January 1848. It has a museum of economic geology, 997 feet above the sea, a lithographic and typographic press. Rurki stands on an elevated ridge overlooking the bed of the Solani river, 22 miles east of Saharunpur city.—*Imp. Gaz.*

The different Indian names of Hippelaphus, Aristotelis, Equinus are applied to the sambur stag, the great Indian stag, originally described by Aristotle under the designation of Hippelaphus, and discriminated as such by M. Duvaucel in the Asiatic Researches, xv. p. 174. The horns of different individuals present great diversities of form. The only common characters are those of a basal antler, springing directly and equally with the beam from the burr; and the beam terminating in a bifurcated extremity, formed by a branch or snag separating posteriorly, and pointing obliquely to the rear. But Mr. Elliot met with instances of medial antlers with trifurcated extremities, and in one case with the extremities showing a fourfold division. The size of the rusa is large, sometimes exceeding 14 hands in height. The colour varies from dark greyish-black or

slate-black, with the chine, the inner sides of the limbs, the under part of the tail, and the space between the buttocks yellowish-white, passing into orange-yellow, but never extending into a large circular disc on the buttocks. In several instances he met with hinds of a pale yellow or light chesnut colour. These were young individuals, but the shikaris always declared them to be the same as the common kind, and no other difference was perceptible. The cranium of one of these light-coloured females presents no structural differences from that of a young black female. Both sexes have canine teeth in the upper jaw, springing from the suture between the maxillary and inter-maxillary bones. The neck and throat are clothed with a long mane. The suborbital sinus is very large. When the animal is excited, or angry, or frightened, it is opened very large, and can be distended at pleasure. The new horns are soft and tender during the monsoon from June to September, about which time the rutting season commences. The stags are then fierce and bold. Mr. Elliot had seen one, when suddenly disturbed, face the intruder for a moment, shaking his head, bristling his mane, distending the suborbital sinus, and then dashing into the cover.—*Tennent's Ceylon*, p. 59.

RUSHES, grasses, and sedges are extensively used in India for the manufacture of mats, ropes, baskets, and thatching. The Cyperus textilis, and a finer kind of grass called kooray or koaray, are used for making mats. The celebrated mats of Palghat and Cochin are of several species of typha, juncus, and saccharum, which abound, and are applied to useful purposes. The Phrynium dichotomum of Bengal is used for making the sital patee mat.

Dutch rushes (Equisetum hyemale, *L.*) are used for scouring and polishing. Their roughness is due to a deposit of silicious particles in the epidermis. A species of rush called sweet rush or camel's bay is sometimes brought into China from Turkey and Arabia, tied up in bundles about a foot long. The stalk, in shape and colour, resembles a barley straw. It is full of fungous pith, like the British rush; leaves like those of wheat. When in perfection, it has a hot, bitterish, not unpleasant taste, and a very fragrant smell. It was formerly used in medicine.—*M. E. J. R.; Comp. Descr.*

RUSOT. Hind. Extract of the bark and wood of the barberry (Berberis), several species; deep yellow colour, totally soluble in water. It is the Lykionendikon of Dioscorides.—*Beng. Phar.*

RUSSELCONDAH, 736 miles from Madras, and 50 miles from Ganjam, in lat. 20° 56′ N., and long. 84° 37′ E., a military cantonment, named after Mr. Russell, who was Commissioner during the Gumsur war of 1835-36-37. It lies at the foot of a hill.

RUSSELL, Dr. PATRICK, a Madras medical officer who succeeded Koenig as botanist to the E. I. Co. He devoted much time to the investigation of snakes and fishes, and edited Roxburgh's Coromandel Plants. In 1802, there appeared Dr. Patrick Russell's book in two volumes, containing the descriptions and figures of 200 fishes collected at Vizagapatam, on the coast of Coromandel; and 1796 to 1801, Account of Indian Serpents collected on the Coast of Coromandel, 2 vols. folio.

RUSSIA, a great dominion in Europe and Asia, ruled by an autocrat emperor from St. Petersburg. The historical and geographical future of Russia impels her farther and farther towards the south, in spite of all obstacles; and, yielding to these natural impulses, she has advanced, on one side, from the Irtysh to the upper courses of the Syr Darya or Jaxartes and Amu Darya or Oxus; on the other, from Orenburg to the Sea of Aral, thus incorporating within her boundaries the greater portion of the steppes dividing Europe from Asia proper. A necessity arose for connecting her Central Asia settlements firmly together, and with this object roads were contructed, stations erected, steamers introduced, as on the Amur and Syr Darya, and telegraphic lines established from the Chinese frontier to St. Petersburg. The Amu Darya (Oxus) is for many reasons of greater importance to Russia than even the Syr Darya. It disembogued at one period into the Caspian, and its bed to that sea still remains. Many are of opinion that the course of the river can be again directed to its ancient bed. The importance of this connection will readily be understood when it is remembered that a water route, in continuation of the Volga, will be thus created, which will extend for 3000 versts into the interior of Asia, and that the extreme points of this uninterrupted water-way will be St. Petersburg and the northern slopes of the Hindu Kush, almost reaching the boundaries of the British possessions, and very closely approaching the Indus. The number of Turkoman, Kirghiz, Kazak, and other nomade hordes in Central Asia is computed at 3 millions, and the settled population at more than 5 millions.

Russia's Asiatic dominions are estimated at $6\frac{3}{4}$ million square miles, with 18,000,000 of population. Russia has pushed forward her outposts to within 300 miles of the British frontier on the north. But there intervenes between the Russia in Asia and British India the barriers of the Hindu Kush and Kouen Luu, which rise like a wall, 17,000 feet high, with scarcely a crest or depression throughout their entire extent,—none certainly practicable for an army with the material and appliances of war as waged by the 19th century civilisation. In the far east, a settlement of the Amur was effected in much the same manner as Muhammad Toghluk once attempted to transfer the population of Dehli to Dowlatabad in the Dekhan, but with a more successful issue. Whole colonies of Cossacks, men, women, children, and household goods, were moved from their homes, and settled at distances varying from 100 to 500 miles.

In Europe, the people ruled by Russia are of various races. In Finland, the people are Scandinavians, if not altogether by blood and language, at least by long-cherished traditions, by culture and habits. In Esthonia, Livonia, and Courland — the Russian Baltic provinces — the native races exhibit engrafted, far-advanced German civilisation. In St. Petersburg, there is an amalgam of all European nations, with little, if anything, in its trade, in its various social ranks, in the court itself, that is not of alien birth, or at least descent. On the Volga, Tartar, Kalmuk, and other Asiatic tribes mix everywhere with the crowds of the cities, and are still at home throughout a vast extent of the country. In the Caucasus, what has been rescued from its savage tribes is either a desert, or is being seized by Arme-

nians, everywhere superseding the less energetic and thrifty Georgians. In the Crimea and the adjoining mainland, what has been taken from the Tartars belongs in a great measure to German, Bulgarian, Greek, and other settlers. Odessa is a cosmopolitan commercial town, formerly Greek and Italian, now mainly Jewish. Between Odessa and Kief the Polish element preponderates. According to Russian official statistics, the population of the empire amounted at the last census, in 1872, to 86,952,347, which may at the present time have risen to 98,323,000. Of these, 55,000,000 is assigned to the 'ruling race,' the East Slavs, divided into 'Great' and 'Little' Russians.

'Great Russia,' or Russia proper, extends from the walls of Smolensk to the neighbourhood of Viatka, from the Gulf of Onega to the Kazak settlements on the Don. It covers an empire fifteen or sixteen times as large as France, the empire of Ivan the Terrible, that Russia which lay around the four ancient capitals,—Novgorod the Great, Vladimir, Pskow, and Moscow.

South of these boundaries, in Southern Russia, is 'Little Russia,' the ancient Ukraine or borderland, Kief, Chernigoff, Poltava, Charkoff; and farther south are the provinces of 'New Russia,' Bessarabia, Kherson, Tauris, or, as the Russians call it, Taurida, comprising the Crimea and the adjoining mainland, and Ekaterinoslaf. West of Little Russia, again, is the 'Black Earth country,' Podolia, Volhynia, and part of Kief.

In Great Russia, the ruling race is thoroughly modified by the admixture of at least 3,000,000 Fins (exclusive of those in Finland) in the north, and of 2,500,000 Tartars in the east, the former rapidly blending with the Slavs, who have squatted among rather than invaded or conquered them; the latter, as Muhammadans, resisting amalgamation with the Christians in recent ages, but have left deep traces of their features and character among the Slavs at the time of their all-sweeping inroads, at the end of which the court, the army, and the nobility of the victorious Ivan the Terrible were more than half Tartarized; when the king and his Boyars kept their wives and daughters shut up in their harams, some of which may still be seen in some odd wings of old Russian mansions, and buried them in separate cemeteries. Even in Russia proper, the population is, Scandinavia alone, perhaps, excepted, a mixture of various Slavo-Finnish-Tartaric races. But the mixing is far more observable in the other two divisions of European Russia: in Little Russia, the mass of the people are Ruthenes or Russines, long swayed over by the West Slavs, the Poles, and Lithuanians, who still constitute the aristocracy of the land; and in New Russia, where the Tartars are still at home, at peace with Germans, Greeks, Roumanians, Bulgarians, and other colonists, flourishing among them; while over both roam the Kazak, exhibiting the features and roughly adopting the habits and manners of the various peoples among whom their lot is cast,—nomades among Tartars, wasteful husbandmen in settled districts, wild marauding soldiers whenever their old trade is allowed to them.

The Statesman's Year Book for 1872 gives the estimated population of Russia in Europe, including Finland and Poland, at 68 millions and a quarter. That empire in 1722 stood at 14 millions; in 1803, at 36 millions; in 1829, at about 50 millions; and in 1863, at 65 millions. In the time of John III., that is to say, in the second half of the 15th century, its area occupied only 18 million square miles. In the reign of Alexis, in 1650, its extent had already reached 237 millions; under Peter the Great, 280 millions; under Catherine II., 335 millions of square miles; and now the area of the Russian empire, including Finland, Poland, Russia, and Siberia, is very nearly 370 millions of square miles. Siberia and the Caucasus add nearly 9 millions to the population of the entire empire, which thus stands, as nearly as possible, at 77 millions.

Russia in Central Asia has a population of $2\frac{3}{4}$ millions, including in this the Kirghiz steppes, $1\frac{1}{4}$ million, and Russian Turkestan, $1\frac{1}{2}$ millions; Siberia has $3\frac{1}{3}$ millions, Russian Caucasus, under 5 millions; total, 12 millions.

In 1879, the entire dominion in Europe and in Asia was—

	Sq. kil.	Pop.		
European Russia,	4,888,713	74,493,809		
Poland, . . .	127,310	7,104,760		
Finland, . . .	373,603	2,028,021	Sq. kil.	Pop.
Sea of Azof, . .	37,496		5,427,124	83,626,590
Russia in Asia—				
Caucasus, . . .	472,666	5,546,550		
Trans-Caspian Territory, . .	327,068	203,000		
Siberia, . . .	12,495,109	3,911,200		
Central Asia, .	3,017,760	5,036,000	16,312,604	14,696,750
		Grand total,	21,739,728	98,323,000

Russia has been conquering to the east since the latter part of the 15th century. In A.D. 1487, Kasan was made subject to Ivan IV., who reigned from 1533 to 1584, subdued the Tartar khanates to the south, with the exception of the Crimea. Astracan fell in 1554; the Bashkirs in 1556. Peter the Great, in 1727, conquered the provinces to the west of the Caspian Sea, which Russia lost again in 1734. In 1806, the great territory of Darbend came into her possession; in 1813, two Caspian provinces, Daghestan and Shirwan, were restored to her. In 1828, she acquired Arran, and by 1868 she had advanced in Central Asia till conterminous with the Chinese empire. To secure her Asiatic conquests over a population of 12 millions, she requires to keep an army of 163,759 men,—one soldier for every 70 of the population. Britain garrisons India with its 250 millions of souls by an army of 180,000, of whom 60,000 are British, being one to every 1400 souls.

Asiatic Russia is bounded on the north by the Arctic Ocean, in a coast line of 7333 English miles. On the east the shores of the Pacific, from Cape Chukotst to the mouth of Tumen ula, are 6067 miles. The shores of the Caspian and Aral Seas extend 1167 miles. The land frontier on the south, from the Caspian and Aral Seas to the mouth of the Tumeu ula, is about 6667 English miles, viz. 2200 along the course of the Jaxartes, Charyn, Argun, Amur, and Usouri, about 2233 by the Celestial, Alatau, Altai, and Sayan mountains, and an equal part of open land frontier.

Russia in Asia has about 3,768,000 miles unfitted for a settled life, and only 1,930,000 square miles of culturable land. The unsuitable steppes in W. Siberia and in the Orenburg region are 753,000 square miles. The tundra or marshes and frozen land in W. and E. Siberia are 2,584,000 square miles, and the mountainous country and

highlands in the Tian Shan, Alatau, Sayan, Altai, Yablonoi, and Stanovoi mountains, 431,000 square miles. There are numerous lakes, the largest of which are—

Baikal, . .	12,400 sq. m.	Piasino, . .	2,410 sq. m.
Balkhash, .	8,530 ,,	Zaisau, . .	1,490 ,,
Hinkai, . .	1,420 ,,	Alakul, . .	600 ,,
Chany, . .	1,270 ,,	Dengiz Citter,	560 ,,

The northern half of Central Asia consists of the Kirghiz desert, which is mountainous and rugged on the east, and full of saline steppes on the west. In the midst of the southern half lies the Sea of Aral, on the western side of which, up to the Caspian Sea on the west, there stretches a broad tract of desert. But it is in a fertile tract that the conquests of Russia were made between 1864 and 1868. After long years spent in fortifying posts, in 1864 Russia made a sudden irruption into the upper valley of the Jaxartes or Syr Darya, and in that year took three forts of Khokand, viz. Aoulietta, Turkestan, and Chemkend. In the spring of 1865, the chief of Khokand fell in battle, and in June 1865 the city of Tashkend was stormed. On the 20th May 1866, they fought and won the battle of Irdjar, against the Bokhariotes, and later in the year captured the forts of Oratepe and Juzak, within 40 miles of Samarcand. On the 13th May 1868, a great battle was fought under the walls of Samarcand, and the city surrendered, and later in the year Bokhara yielded.

Great Britain has so recently become paramount throughout India, that this approach of Russia to its borders may inspire hopes among martial races there who would welcome any change from the uncongenial quiet of civilised settled life. Circumstances may drive Russia on, as, in 2500 years, Scythic Getæ, Alexander, Arabs, Shahab-ud-Din Ghori, Chengiz Khan, Timur, Baber, Ahmad Shah, and Great Britain have been. The only possible routes for Russia would be from Balkh by way of Kābul and the Khaibar pass, or through the Kara-korum pass, or to establish her base at Herat, march via Kandahar and the Bolan pass. But this may be a dream for many centuries to come.—*Russians in Central Asia, Capt. Valikhanof and M. Vemukof; J. R. Mitchell*, p. 4.

RUSSIA LEATHER.

Cuir de Russie, . .	Fr.	Jachta, ...	Pol.
Juften, ...	Ger.	Juft, Youf, . . .	Rus.
Balghar, ...	Hind.	Moscovia, . . .	Sp.
Cuojo di Russia, .	,,		

The tanned hides of oxen, manufactured in a peculiar manner. The leather is soft, has a strongly prominent grain, a great deal of lustre, and a powerful and peculiar odour. The colours are principally red or black; the former is much esteemed for binding books and making articles where a fine durable leather is required; the latter is chiefly in demand in Russia for sboe and boot making. It is occasionally brought to Peshawur. Another kind of leather, having a metallic lustre, called kimsana, is imported also from the north-west; also a beautiful leather, used in the manufacture of the bright blue-green shoes from Kashmir and Peshawur, which is called kimakht. This is not made in the Panjab. Peshawur sword scabbards are often covered with a black leather, looking like morocco; it is probably an imitation. Russia leather is said to be made of horse's skin; it is thick but pliant, and of most grateful fragrance. The skins are much valued for the preservation of merchandise, as insects will not attack them.—*Faulkner.*

RUST, red rag, red robin, red gum, Uredo rubigo and U. linearis, are fungi which attack wheat in England.—*Hassel.*

RUSTAM, a king of Persia, who was born in Segistan, B.C. 1072; established the Seoraja dynasty at Kanouj, where the worship of the sun was introduced. The dynasty survived 286 years. —*Prinsep*, p. 283.

RUSTUM, a hero famed in Persian romance. Felamorz, son of Rustum, was defeated by Behram near the fort of Fessa, between Shiraz and Darab. Behram caused Felamorz to be hanged, and his tomb existed in the village until, it is said, a European traveller removed it away as a relic.

RUTA ALBIFLORA, white-flowered rue, is common on the Himalaya, at an elevation of 5000 to 8000 feet; is sometimes cultivated, and very common, truly wild, at elevations of 3000 to 7000 feet. It is generally used for roup and all diseases of fowls, mixed with their food. The rue tribe of plants, Rutaceæ, comprise—3 Ruta, 2 Cyminosma, 1 Aplophyllum, 1 Evodia, 1 Dictanonus.

Ruta graveolens, *Linn.*, Rue.

Sudab, ...	Arab.	Sadab, . . .	Malay.
Peganon of Scripture,	Eng.	Sudap, ...	Pers.
Herb of grace, . .	,,	Somalata, Brahmu,	Sansk.
Rue of Luke xi. 42,	,,	Aruda, ...	Tam.
Satari, Aruda, . .	Hind.		

This rue is a plant of Europe; its variety, Ruta angustifolia, *Pers.*, is met with in gardens in India, and used medicinally, its seeds being officinal and given in colic; those of Euphorbia dracunculoides? are sometimes substituted. The leaves contain a quantity of an acrid volatile oil and bitter extractive matter. Used by natives in a peculiar rheumatic pain, called rhi, caused by exposure to draught. It also acts as an emmenagogue, and in pregnancy causes abortion. R. tuberculata grows wild in Sind.—*Stewart; Powell; J. A. Murray.*

RUTNAGHERRY, in lat. 16° 18′ N., and long. 87° E., is a straggling open town 160 miles S. of Bombay. Rutnagherry, on the Konkan coast, in lat. 16° 59′ N., and long. 73° 15¼′ E., is a fortified neck of land, on the south side of which is a large bay into which a river disembogues.

RUY GONZALEZ DE CLAVIJO. The account of his journey in his embassy to the court of Timur, at Samarcand, is the oldest Spanish narrative of travels of any value. These ambassadors were present at the battle of Angora, between Timur and the Turk Bayazid, in the year 1402.—*Markham's Embassy*, p. 3.

Secale cereale, . .	Lat.		

The grain of Secale cereale comes nearer in its properties to wheat than any other grain. It is the bread corn of Germany and Russia; being of less value to the English farmer than barley, oats, or peas, it is in consequence very little cultivated

in Great Britain. The seeds are met in the market, deprived of husk. Rye flour is said to be somewhat laxative. The roasted grains are not unfrequently employed in the adulteration of coffee. Rye flour does not form a paste like wheat flour.—*Hassel; Faulkner; M'Culloch.*

RYOT. Arab., Hind., Pers. A cultivator, a client, subject, but is more especially applied to the agricultural population; properly Raiat, plural Riaya.

RYOTWARI, a revenue term applied to a system under which the land taxes are collected, in all those parts of India in which the village communities have been broken up by the distracted state of the country for generations, or in which the exclusive title of the representatives of the old proprietors has been superseded by the prescriptive rights acquired by the actual cultivators.

In Madras and Bombay, generally, the normal state of the ryot is to hold under the Government.

In Coorg, the janam or hereditary ryot pays direct to Government at a light rate, but on condition that he shall not alienate or sublet the land or even cultivate it otherwise than by his own household or by his slaves.

In Coimbatore and south of Madras generally, the Nutamkar or Gour ryot is recognised as the absolute proprietor of the soil.

In Tanjore, the mirasdars have a transferable right of property in their holdings, and they have sub-tenants, called parakudi, who cultivate on their own stock, but are liable to be ousted.

In Malabar, the janam tenure is a fee-simple or hereditary right of possession, which can be leased or mortgaged. The janam kār assigns a portion of land to be fenced and stocked, in consideration of which the holding is enjoyed free of charge for twelve years. If resumed, which is seldom done, compensation for improvements is given, otherwise the tenure is maintained on easy terms. Kai kanum patum, or a usufructuary tenure by labour, also prevails.

In Canara, the mulgueni or proprietory tenants are of the two classes,—Nair Mulgueni, whose tenure is by ancient prescription; and Shud Mulgueni, by purchase. The Chailgueni is the tenant-at-will, from whom the landlords may get additional rent whenever there is a higher offer.

In Peddapur and Cuttamur a right is vested in the ryot, which partakes more of what is termed in the southern provinces the Pashangary tenure, in which no sale of the right of occupancy is customary, than of the Adhkari tenure, under which the right of occupancy is considered transferable, subject to the obligations annexed to the possession of it.

In the Tamil country, under the mirasdar, there are non-proprietary tenants, who are divided into oolcoody or permanent, and paracoody or temporary, cultivators. The oolcoody farmer has rented the same farm at a given rent (in money or grain) for several generations, and enjoys a right by prescription; he cannot be ousted so long as he pays the rent, which cannot be raised. The tenure is hereditary, and can be mortgaged, but not sold.

The paracoody farmer has no privileges beyond the terms of his contract.

Where there are no mirasdars, the ryots are considered as ool-paracoody, holding from Government.

The Pycary tenure is of two kinds,—resident where there is a continuing interest, and non-resident where there is no such interest, and where the stranger is tempted by low rents. The tenure of the first of these is like that of the copyholder of England. It is hereditary by prescription, but they cannot alienate, for the right extends to the use of the soil only, and not to the substance.

The Pariah, Puller, and Pulli of the Tamil country, who are predial slaves and serfs under the Hindu landowners, claim hereditary private landed property as the incident of their villeinage, and it is generally allowed to them and their descendants on proving former residence in the village.

In Bombay, there are three classes of ryots—(1) Mirasdars or landed proprietors, possessed of watans, which are privileged holdings that command a price in proportion to the lightness of the assessment. Half the produce is the full Government rent of an ordinary cultivator. (2) Oopree or permanent tenants; and (3) Warwunda-kurri or temporary tenants. The first of these can be traced to the remotest antiquity. It may be conferred by the heads of villages, and implies a hereditary right so long as the rent by village usage is paid. The second, bating some privileges, is almost as valuable.

In Sind every man in the south who holds a few acres, is called a zamindar. In the north there is a class of hereditary cultivators called marusihari, who pay lapa to the zamindar over and above the Government assessment.

In Malwa there are three classes—(1) the Janmi or Watani Kursan, (2) the Sukbasi, and (3) Pykashti. The first of these can sublet and possess a title to the fields their forefathers cultivated, which is never disputed so long as they pay the Government share. The second are new settlers, who at first have no immunities, but after two or three generations their descendants merge into the first class. The third are non-resident, and have no rights beyond their contract.

In Nimar, cultivating occupancy resembles that of other Mahratta districts, but is weaker, as in Oudh, under native rule; the ryot, if not well treated, moves off to an adjoining village under another farmer, and cultivates there.

In Mewar the ryot is proprietor of the soil. He compares his rights to Dubh grass (Cynodon dactylon), which no vicissitudes can destroy. He calls his land his bapota, which is the watau of the Mahrattas, and the miras of the south of the Peninsula. The military vassal in Rajputana is called bhumia, the caniatchy of Malabar.

In the Himalaya, besides the proprietors, there are khaekur, with rights of occupancy so long as they pay the Government share of the revenue, and a few serthan who hold a lease.

In Orissa the ryots are divided into—(1) Thanee, who seldom hold under a patta or lease, and (2) Pahee, who always do so. The Thanee hold a hereditary non-transferable right of occupancy, and their rent is usually restricted to that portion of the Government demand that remained due when the Pahee payments had already been appropriated to its liquidation.

In Benares are resident and non-resident ryots, and the farmer or proprietor could not disturb the former, so long as they paid the stipulated rent; but the latter were cultivators-at-will.

In Saharunpur right of occupancy prevails, and the rent could not be raised above the customary rates; the reuts on non-proprietary cultivations are adjusted according to the different kinds of produce.

In Moradabad rents in kind are the rule, money rents the exception, and the only real Khud-Kasht ryots were of the zamindar's family, and could uot be dispossessed.

In Bareilly, ou the expiration of a lease, the landlord was generally considered free to let the land to whom he pleased, but it was generally relet to the last tenant.

In Shahjahanpur, if a higher rent be offered than what the resident ryot may choose to pay, he may be ousted.

In Muttra the proprietor has the rights of ousting the tenant if he refuse to pay the estimated value of rent.

In Agra the proprietor cannot oust a cultivator possessing the right of iuheritance in the soil; but those who have no such hereditary right can be dispossessed in favour of another willing to pay more.

In Mynpuri, Farrakhabad, Etawa, Gorakhpur, aud Allahabad, the proprietor canuot dispossess auy persou having a right by inheritance iu the soil; but those who have only a tenancy can be put out in favour of another person willing to pay more, no matter how regularly the tenaut may have paid his rent.

In Bundelkhand the cultivators are all proprietors, and (apparently even if sold out) have a right of occupaucy at customary rates.

In Cawnpur the ryot is a tenant-at-will, cultivating from year to year; popular opinion preveuts exaction.

A tenant is also called in the Mahratta districts, Sukar, Kunbawa, or Kul. They are distinguished by their holdings as Thulwaluk, Mundwaluk, Oopri, and Owundkari. Cultivators of Central Oudh who enjoy rent privileges are styled Amnek. A family or relatives cultivating their own lands are called Bhaiyachara or Bhayad. Ordinary cultivators are called ryot, plural ryaya, or arzal, meaning humble or common.

In the Bengal Presidency, during the administration of Lord Cornwallis, in the provinces of Beugal, Behar, and Benares, the Government settled, permaneutly, the persons' names, and the amount of tax to be raised, solemnly engaging never to increase it. The persons thus raised to a social position similar to the landlords of Britain, were termed zamindars. There is no doubt that many of them were persons of hereditary influence aud status in the country, and that their connection with the land, of which they were then recognised as the proprietors, had in general been of a permanent character. But their position, nevertheless, was essentially that of middlemen, collectiug the revenue, not for themselves, but for the Moghul government, accounting to that government for their receipts, and remunerated by a perceutage of the collectious. It is now, however, universally admitted that they never had the power of disposing arbitrarily of the laud. There were everywhere at least large classes of tenants whom they could not lawfully eject, except for non-payment of revenue, and from whom they could not lawfully exact more thau the customary payments.

The ryotwar system of Madras was principally followed out by Colonel Reade and Sir Thomas Munro. Uuder this system, the peasant himself, the cultivator or farmer, is regarded as the proprietor of the soil, subject to the payment of the Government demand. The position which the Madras ryot holds is somewhat similar to that of the feuars of Scotland, whose feu is held in perpetuity, subject to a permanent feu-duty; with this difference, that in Scotland the rent or tax or feu is permanent, or for a long lease of 999 years, but in Madras the amount charged is settled auuually. And this has given rise to the term Annual Settlements in Madras, as the system introduced by Lord Cornwallis has been named Permanent Settlements, the latter leaving the farmer entirely at the mercy of the landlord, as was the case until after the middle of the 19th century, when Government passed Acts to protect the ryots. The Madras ryot can increase or diminish his holding annually, aud has thus all the benefits of a perpetual lease, without its respousibilities, inasmuch as he can at any time throw up his lands, but he cannot be ejected so long as he pays his dues. He also receives assistance by remission of assessment in unfavourable seasons. The practical disadvantages of the ryotwar system consist in the annual meddling and supervision required on the part of Government for valuation of cultivated lands. The advantages are this, that as the land furnishes in India the great bulk of the revenues, and as the taxes of a country must ever be regulated by the wants of the State, the annual collection affords the best opportunity for realizing moneys for State purposes.

In the North-Western Provinces the lands were acquired principally in consequence of Lord Wellesley's Mahratta wars, but the settlement of their land revenues was commenced aud completed between 1834 and 1844, principally by Mr. Robert Mertens Bird. It is called the village system or settlement, and has been acted on, in the belief that the village community consists of the descendants or representatives of those by whom the village was, at some remote time, conquered or reclaimed from waste. In most cases these are a part, and in some form the whole, of the agricultural population of the village; but the ordinary peasants or cultivators are descendants of persons who have settled in the village with the permission of the proprietors. But some of them have by grant or prescription acquired a fixity of tenure, while others have remained tenants-at-will. The village proprietors formed prescriptively the municipal government of the village,—a fact of great importance, village government being the only institution properly so called which the Hindus possessed. The time occupied in thus settling the N.W. Provinces was about ten years, and the expeuse incurred in it was upwards of £500,000. It comprehended a detailed survey of a country about 72,000 square miles in extent, containing a population of more than 23,000,000, producing a land revenue exceeding £4,000,000. The proprietary rights, as ascertained and recorded at the survey, were confirmed in perpetuity; but the Government assessment was fixed for twenty, and in some cases for thirty years.

The Panjab Settlemeut was on leases for terms of years, usually shorter than iu the N.W. Provinces, and the cess does not exceed oue-fifth of the gross value of the produce in rich tracts, and one-sixth or

one-eighth, or even less, in poor. In the Bombay Presidency the Madras ryotwar system was introduced after the Mahratta wars terminating in 1818; but since a recent survey, the land, cultivated and waste together, is divided into fields of an extent cultivable by one yoke of bullocks, and on each field the Government demand is fixed for a period of years, at a very moderate rate. While the contract is binding on the Government, the ryot, on his side, can throw up his engagement at pleasure, and he is not required to pay the assessment for any year on any field which he has not cultivated or undertaken to cultivate in that year. This assessment holds good for a term of thirty years. The ordinary rates vary in different districts, from 4s. 6d. an acre in the rich black-soil lands of Gujerat, to 10d. an acre in the hills of the Konkan. In the Madras Presidency, a great improvement was introduced in the year 1837, by ruling that the land tax should not be increased because on such land a more valuable article was cultivated; and in 1855 an entire revision of the Madras cess was undertaken and carried out during the administration of Lord Harris.

Nearly two-thirds of the revenue of India consists of the rent, or cess, or tax on land; the second in amount is from opium, a third is from salt.

The land in the south of India belongs firstly to the family, secondly to the village community. Joseph bought up the whole land of Lower Egypt for the king; every man sold his field, and the whole soil, except that which belonged to the priests, into which class he had himself been adopted by marriage, then became the property of the crown. He then made a new division of the land, allotted out the estates to the husbandmen to cultivate, and gave them seed to plant, and required them for the future to pay one-fifth part of the crop, as a rent, to the royal treasury. Thus did that Asiatic minister, copying the customs of the east, make the king the landlord of the whole country except the estates of the priests; and the land was then held by what is now known in Asia as the ryotwar tenure. In Asia, generally, the landholders are tenant-proprietors at a changeable rack-rent of about one-half of the crop; whereas the Egyptians paid a fixed and low rent of one-fifth. The Egyptian landholder was therefore rich enough to have peasants or slaves under him, while the Indian ryot is himself the peasant-proprietor. This rent was in the place of all direct taxes.

Throughout the Bundi territory by far the greater part of the land is the absolute property of the cultivating ryot, who can sell or mortgage it. There is a curious tradition that this right was obtained by one of the ancient princes making a general sale of the crown land, reserving only the tax. In Bundi, if a ryot become unable, from pecuniary wants or otherwise, to cultivate his lands, he lets them; and custom has established four annas per bigha for irrigated land, and two annas for gorma, that dependent on the heavens, or a share of the produce in a similar proportion, as his right. If in exile, from whatever cause, he can assign his share to trustees; and the more strongly to mark his inalienable right in such a case, the trustees reserve on his account two seers on every maund of produce, which is emphatically termed 'huk bapota ka bhom,' the dues of the patrimonial soil.—*Tod's Rajasthan*, ii. p. 540; *Sharpe's History of Egypt*, i. p. 36; *Carnegy; Imp. Gaz.* iv.

RYTINIA STELLERI, the sea-cow of Behring Straits. It lives on sea-weed. The Kolush tribes have nearly exterminated it.

S

S, the 19th letter of the English language, is a sibilant consonant, and has a hissing sound. It has two uses,—one generally at the beginning or end of words, to pronounce a mere hissing, as in Sabbath, sack, sin, etc.; the other a vocal hissing, precisely like that of z, as in muse, music, wise; but its sound in the middle and end of words can only be learned by practice. In a few English words it is silent, as in isle. The simple sibilant of Europe occurs in Arabic, Sanskrit, and in all Indian alphabets. The palatal s of the Nagari alphabet, in use in words of Sanskrit origin, is commonly pronounced as sh somewhat softened. The Arabic alphabet has two letters to which, in India, is given the sound of s. One of these, called in India sad or swad, has, amongst the Arabs, the sound of dad or dhad; the other Arabic letter is called in Arabia, say or thay, but in India it has only the sibilant sound of s. The Persian letter sin has the simple sound of the English letter s. The Persian and Nagari letter sh has the sound of sh of the English alphabet. On the western districts of British India, and along the line of the Indus river, the letters h and s are interchangeable, so that Sind becomes Hind, and sing'h, a lion, is changed into hing, garlic. S, t, and th are interchangeable letters, also s and t in all Turanian, Turki, and Dravidian tongues are interchangeable,—sri or shri becomes tiri, sar-band or head-dress, head-tie, becomes tarband. Dion Cassius remarking on the term Assyria or Atyria, noticed that the barbarians change the sigma into tau,—Ashur becomes Athar. Tiri or tira is the recognised Dravidian pronunciation of the Sanskrit sri or shri, sacred or holy. Ss was pronounced as th by the ancient northern races, who wrote Sol or Sor, the sun, as Thor. In Tamil y and s are constantly interchangeable. Thus uyir or usir is life; uyaru and usaru is to be exalted or lifted up; in Canarese usar is life, power. S of the Sanskrit changes into h in most of the Hindi dialects, and also in the Greek. In the Zend, the Sanskrit s, as in asura, changes to h, as in ahura.

SA. Kol. A grove.

SAA. Arab. A grain measure of 7 lbs. or 8 lbs.

SAAD ALLAH KHAN, vizir of the emperor Shah Jahan, died about the year 1653. He was the most able and upright minister that ever appeared in India. He makes a conspicuous figure in all the correspondence of Shah Jahan, and is constantly referred to as a model in the correspondence of Aurangzeb, during the long reign of that monarch. Khafi Khan says that in his time the descendants of Saad Allah Khan, near a century after the death of their ancestor, were still distinguished for their virtues and intelligence, and he contrasts the respectability of their conduct with the frivolity and effeminacy of the other nobles of that era.—*Elphin.* p. 518.

SAADAT, Arab., pl. of Syud, lords, descend-

ants of Mahomed through his daughter Fatima and his son-in-law Ali.

SABA, of Ezekiel xxvii. 22, an ancient town in the district of Balad-ul-Jahaf in Yemen, and the capital of the ancient Sabæans, and to this day the district is termed Ard-es-Shaba, or 'land of Sheba.' It is doubtless identical with the realm whence the queen of the East came to visit Solomon. Mareb, the present capital of the district, is built on the site of the ancient Saba. It contains about three hundred small houses and several ruins, which are attributed to Queen Balkees. A dyke or dam of masonry, famous in Arab history, was drawn across the valley, between two hills called Balak, six hundred paces asunder. (See Sail-el-Arim or Sedd Mareb.) Haram Balkees, the palace of the queen of Sheba, is west of the town of Mareb. About one-fourth of the wall is still standing, and covered with Himyaritic inscriptions. The ancient residence of the queen of Sheba, who formed the city, is about a mile and a half in diameter. At the time of the Periplus of the Erythræan Sea, the Sabæans monopolized the commerce of India, and acted as intermediate agents between the merchants of India and Egypt. In the reign of Ptolemy Phileter (A.D. 177), the Greek sovereigns in Egypt had not traded directly to India, but imported their Indian commodities through Saba, the capital of Arabia Felix. The port of Berenice was not used for that commerce, but Myos Hormos or Arsenoe was still the emporium, and the only trade down the coast of Africa was for elephants' teeth. The trade to the east had been monopolized by the merchants of Sabæa, from the patriarchal days of Job. The period at which the kingdom of Saba or Himyar flourished was the golden age of Arabic poetry. The religion of the Himyarites, in their devotion, was directed to a multitude of deities, of which the principal were represented by the sun, moon, and planets. Saba, surnamed Heber, was the father of Kahtan (Joqtan), father of Yoorab, father of Yahsab, father of Abd-us-Shams. Abul Fada ascribes the construction of the Mareb-dam to Abd-us-Shams, but other historians ascribe it to Loqman, king of that remnant of the Adites who renounced idolatry on the preaching of the prophet Hud, and who are usually styled the second Adites. Saba was also a name applied to Abd-us-Shams, founder of Mariaba. Amongst his sons were Himyar, Amru, Kahtan, and Ashaar.—*Playf. Aden; Early Chris.*

SABA, said to signify a host, particularly the host of heaven, or the celestial bodies, in the adoration of which the Sabæan ritual is believed to have consisted; the celestial bodies, the planets and constellations, were personified in the genii of good and evil.

SABAB, a mountain of Siam, near which and on the frontiers of the Xong tribes, precious stones, consisting of rock-crystal, cat's-eye, topaz, garnet, sapphire, and rubies, are found.

SABADILLA, fruit of Veratrum sabadilla, of Asagræa officinalis, and of several other of the Melanthaceæ.—*Ben. Phar.*

SABÆAN or Sabean, the people of Saba in Yemen, the traditioual descendants of Saba or Sheba, the rulers of the Cushite kingdom in Southern Arabia, now known as the Himyarite. They are quite distinct from the Sabians mentioned in the Koran. Sabæan is a term which has been variously applied to the ancient inhabitants of Southern Arabia; also to the philosophical sectaries of Haran; and likewise also to the pseudo-Christian remains of Babylonian astrolatry. The Arabian writers, on the other hand, apply it to the pagans of all parts of the world, to all who are neither Jew, Zoroastrian, Christian, or Muhammadan. The true Sabæans of to-day are the 'Subba' of Mesopotamia. They are descendants of the Nabathæans, the Chaldæaus. They have a great reverence for the planets; they call themselves Maudæans (Mando-Yahya, disciples of John), and they have various sacred books; but though called Christians of St. John, they are Chaldees in speech and religion. They have 360 divinities, amongst whom are Yahya, also Bab-ram Rabba and God, whom they style Alaha. In the environs of Babylon they retain a great number of Babylonian religious traditions; they designate the tree of life in their Scriptures as Setarvan. Sabæism was formerly re-introduced in Kuseem by Darim, about the year 1200, and prevailed till the Wahabee revival. In the Vedic Sabæanism only the elemental powers are invoked. Sabæan worship once extensively prevailed in South America. There is a curious passage in Tavernier concerning the aversion of the Sabæans to blue; and there exists a similar antipathy among the Kurdish sect of the Yezdi (who appear to have been once Christians) for that colour, grounded on a different, although not less absurd, reason. Tavernier makes mention of another peculiarity of the Sabæans, and calls it the ceremony of the fowl, which their priests alone have the right to kill; but he does not explain in what this ceremony consists, so that we cannot now judge whether it has any connection with a custom prevalent among the Yezdi. Arabian authors who lived with the Sabæans state unanimously that they worshipped the seven planets (Masudi, i. p. 218), and that their faith did not materially differ from that of the Chaldæans. It resembled that of the idolatrous nations around them; they addressed their devotions to numerous deities, of which the principal were represented by the sun, moon, and stars; but there were many who acknowledged one deity as the supreme Lord of the universe. They believed in the immortality of the soul, and a future state of rewards and punishments, while many held the doctrine of transmigration. The Sabæan, called Sabi by Muhammadans, who are known to Europe as the Nazarenes, also Christians of St. John, designate themselves Mandæan. They are in two small tribes of artisans, about 4000 in number, one tribe settled in Haran and one in Babylonia; those of Haran only took the name of Sabæan in A.D. 830, during the khalifat of Mamun, in order to bring themselves within the 5th Sura of the Koran, which recognised as people of the faith, Jews, Sabæans, and Christians. Those of Haran have a confused belief framed of biblical legends, Jewish ceremonial laws, Greek gods. Those of Babylonia speak an Aramaic dialect closely allied to Syriac and Chaldee. They have two Scripture books,—one the Sidra Rabba, also Ginza or Treasure, and the other the Qolasta hymns. John the Baptist is their lawgiver. They have frequent baptizings and purifications by ablutions.—*As. Res.* ii. p. 374. See Ali Ilahi; Veda; Yezdi.

SABAGRÆ, according to Orosius, a people who made their submission to Alexander the Great during his halt at the confluence of the Panjab rivers. According to Curtius, they were called Sambracæ or Sabraeæ; and according to Diodorus, who placed them to the east of the river, Sambastæ. They were a powerful nation, second to none in India for courage and numbers. Their forces consisted of 60,000 foot, 6000 horse, and 500 chariots. The military reputation of the clan suggested to General Cunningham the probability that the Greek name may be descriptive of their warlike character, just as Yaudheya means warrior or soldier. He thinks therefore that the true Greek name may have been Sambagræ, for the Sanskrit Samvagri, that is, the united warriors, or Συνμαχοι, which, as they were formed of three allied tribes, would have been an appropriate appellation. In support of this surmise, he mentions that the country of which Bikanir is now the capital was originally called Bagar-des, or the land of the Bagri or warriors, whose leader was Bagri Rao. The word Bhati also means warrior or soldier, and thus at the present day the tribes calling themselves warriors form a large proportion of the population in the countries to the east of the Sutlej, namely, the Johiya or Yaudheya along the river, the Bagri in Bikanir, and the Bhati in Jeysulmir. All three are of acknowledged Lunar descent. He thinks it possible that the name Sambagri might have been applied to these three clans, and not to the three tribes of the Yaudheya, but he thinks that the Yaudheya have a superior claim, on account of their undoubted antiquity. To them he attributes the foundation of the town of Ajudhan or Ayodhanam, the battlefield, which is evidently connected with their own name of Yaudheya or Ajudheya, the warriors, and he thinks the latter form of the name is most probably preserved in the Ossadii of Arrian, a free people who tendered their allegiance to Alexander at the confluence of the Panjab rivers.—*Cunningham's Geog. of Ind.* p. 246.

SABAKHIA, a predatory race in Orissa.

SABAKTAGIN, the second ruler over the southern tribes of modern Afghanistan. In the reign of Abdul Malik, the fifth prince of the house of the Samani, Alptegin, A.D. 961, A.H. 350, rose to be governor of Khorasan. He had been a Turki slave of Abdul Malik, but, having incurred the ill-will of his successor, he retreated with 3000 disciplined slaves to Ghazni, and till his death held the strong tract between the Suliman mountains and the Indus, against all attacks. He died A.D. 976, A.H. 365, fourteen years after assuming independence. He was succeeded by Sabaktagin, a Turki slave, who had married the daughter of Alptegin. Raja Jeipal of Lahore advanced into Laghman to oppose him, but entered into agreements, which he subsequently refused to fulfil, and formed a combination with the rajas of Dehli, Ajmir, Kalinjar, and Kanouj. Sabaktagin advanced to meet their army, which he defeated and pursued with great slaughter to the Indus. He found a rich plunder in their camp, and took possession of all the country up to the Indus, and occupied Peshawur. The Afghan and Khilji of Laghman immediately tendered their allegiance. He subsequently twice carried a large force to the aid of Nuh or Noah, the seventh of the Samani kings, whom Bogra Khan of the Hoie-ke Tartars had forced to fly across the Oxus. Sabaktagin on the second occasion totally defeated them (A.D. 995, A.H. 387) in the neighbourhood of Tus, now Meshid. Sabaktagin made Ghazni his capital. He died on his way to Ghazni. The name is also written Sabaktaghi. He was succeeded by his son Ismail, but Ismail after a few months was put aside by his younger brother Mahmud. Mahmud, who died A.D. 1028, enriched Afghanistan with the spoils of India. In the reign of the cruel Bahram, one of the Tartar's descendants, the Sabaktagin dynasty were deprived of all but the Panjab, and this too, in A.D. 1160, they lost.—*Elphin.* pp. 274–76; *Ferrier's Afghanistan*, p. 14.

SABALA, one of the two dogs of Yama.

SABALIA, in Gujerat, a low caste, employed in tending cattle; a cowherd race.

SABAL UMBRACULIFERA, the West Indian fan-palm, growing in Jamaica to a height of 60 to 80 feet, bearing leaves 4 to 6 feet in diameter; it might be introduced into India.

SABAR, wash-leather, soft leather of the sambur deer in the Kangra and Hoshiarpur districts.

SABARÆ of Ptolemy are the Suari of Pliny, and both have been identified with the aboriginal Savara or Suari, now a wild race of wood-cutters who live in the mountainous parts of the north-eastern districts of Peninsular India. The Savari or Saharia of the Gwalior territory occupy the jungle on the Kotah frontier to the westward of Marwar and Guna.—*Cunn. Geog. of Ind.* p. 509. See Chensuar; Suar.

SABAT, amongst the Dyak race, adoption of a brother.

SABA'TA-AHRAF. Arab. The seven dialects current in Arabia in the time of Mahomed,—the Quraish, Tai, Hawazin, Ahl-i-yaman, Saqif, Huzail, and Bani Tamin.

SABATHU, in lat. 30° 51′ N., and long. 76° 58′ E., a military station a few miles N.E. of Simla. The cantonment is 4205 feet, and the fort is 4283 feet, above the sea.—*Ger.*

SABERNARIKA, properly Suvarnarika, a river that separates Bengal from Orissa, and opens into the Bay of Bengal.

SABHA. Sansk. A committee, any court, an assembly, a club. Sabha-mandap, Hind., a portico, or an erection in front of a Hindu temple where people assemble; the open space of a temple in front of the apartment of the idol; an audience hall, an assembly room; a sacred place or apartment in a Hindu temple. Sabhapati of Chilambara, a name of Siva.

SABLE.

Zobel, . Da., Ger., Sw.	Sohol, ... Rus.
Zibelline, . . . Fr., It.	Cebellina, . . . Sp.
Zibelina, ... Por.	

One of the weasels, Mustela zibellina, a native of Northern Europe and Siberia, with a fine fur, the hairs of which turn with equal ease in every direction. Its colour is generally of a deep glossy brown or black, and sometimes, though very rarely, yellow and white. Throughout the severity of a Siberian winter it retains its rich brown fur. It subsists on fruits and berries in winter, and on small birds. Bargouzine is famed for its sables; no skins have yet been found in any part of the world equal to them. The fur is of a deep jet-black, with the points of the hairs tipped with white,

and this constitutes their peculiar beauty. For a single skin a hunter demanded the sum of £18.—*Faulkner; Bingley; M'Culloch.*

SABLE FISH of Europeans, the Willam-min of the Tamil, a species of Clupea.

SABZAH. Arab., Hind. The large leaves and capsules of the hemp plant; also an intoxicating beverage prepared from them by washing them, and after drying, reducing them to powder with black pepper, cardamoms, and sometimes poppy, coriander, and melon seeds, and sugar, and then infusing the mixture in milk and water, or in cold water alone. Another recipe for this intoxicating liquor is Cannabis sativa or hemp leaves, with black pepper, cardamoms, poppy seeds, Cucumis utilissimus, and C. sativus. It exhilarates without injurious consequences.

SABZAWAR. The town and district of Sabzawar lies between that of Turbut-i-Hyderee and Irak; since the death of Nadir Shah it has been in the possession of a chief of a Turkish tribe.—*Malcolm's Persia*, ii. p. 230.

SABZ-MITTI. Hind. An earth used to wash the hair.

SACÆ, Gete, Aswa, and Takshak are names which have crept in amongst the thirty-six royal Rajput races, common with others also to early civilisation in Europe. Sacæ are supposed by Professor Lassen to be the Szu Tartar who were expelled about B.C. 150 from the Ili valley by the Yue-tchi or White Huns, whom he supposes to be the Tochari. After occupying Tahia or Sogdiana for a time, they are stated by the Chinese to have been driven thence, also, by the Yengar some years afterwards, and to have established themselves in Kipen, in which name Lassen recognises the Kophen valley in Kohistan. The Sacæ country was Turkestan, and they seem to have been one of the Central Asia tribes to whom the vague term Scythian was applied. Little is known of the Sacæ and their migrations, but they seem to have been widely diffused, occupying and colonizing countries remote from Central Asia. It is well known to geographers that the Segistan of the Arabs, whence Seistan, is the same as the Sakestane or country of the Sacæ of the Greeks. The Sacæ are located by Strabo and Ptolemy on the north of the Himalaya, but they were also on the south. The Sacæ were known as Sakko on the banks of Cheban, in Assyria, and Sacæ are mentioned in the Behistun inscription. Tod states that Sacæ in Sanskrit has the aspirate, Sac'hæ, meaning literally the branches or tribes. This name frequently occurs in Hindu annals, and Colonel Tod believes that the Saka of the Hindu annals cannot be other than the Sacæ or Sakai of classical geography. They seem to have been known on the borders of India or in its western districts in the first century preceding Christianity. Vikramaditya, king of Ujjain, became known as the Sakari or conqueror of the Sacæ; and as his era dates B.C. 56, it would appear that about his time some northern tribes had settled themselves along the Indus, constituting the Indo-Scythi of Arrian. Their attempt to penetrate farther to the east, by way of Malwa, was not improbably arrested by Vikramaditya, whence the epithet Sakari. Some tribes penetrated early into India, making their way in force from the Hindu Kush into Orissa. They have been supposed to give their names to the Sassani, Saxani, or Saxons. Sacæ or Buddhii took possession of Kashmir, B.C. 340; some tribes opposed Alexander; others of the Sacæ overran India in the reign of Asoka, who, according to the Ain Akbari, were expelled by his successor Jaloka. The following passage occurs in D'Anville's Eclaircissemens Geographiques sur la carte de l'Inde, p. 42: 'On ignore le temps auquel les Scythes sont venus occuper le Sindi. Dans le Périple de la mer Erythrée, la ville de Minnagra, le même que Monsora, est qualifiée de capitale de la Scythie. Denys Périegete dit que les Scythes meridionaux habitents sur le fleuve Indus. Eustathe les nomme Indo-Scythes; et ce que Ptolémée appele Indo-Scythie, remonte le long de l'Indus jusqu'á un fleuve Coos.'

A tribe bearing the name of Sacæ is still found in Jhalawan. It is supposed that they are the descendants of Sacæ from between the Paropamisan mountains and the Sea of Aral who accompanied Alexander, and, returning with Craterus through the Moolla pass, settled in their present position.

Strabo says, 'All the tribes east of the Caspian are called Scythic, — the Dahæ next the sea, the Massagetæ (Great Gete), and Sacæ more eastward; but every tribe has a particular name. All are nomades, the best known being the Asi, Pasiani, Tachari, Saccaranli, who took Bactria from the Greeks. Sacæ made in Asia irruptions similar to those of the Cimmerians; they possessed themselves of Bactria and the best district of Armenia, called after them Sacasenæ.' Of the first migrations of the Indo-Scythic Gete, Takshak and Asi, into India, that of Sehesnag (Takshak) from Sehesnagdes (Tacharisthan?) or Sehesnag country, six centuries, by calculation, B.C., is the first noticed by the Hindu Puranas. About this period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia; not long after, the Asi and Tachari overturned the Greek kingdom of Bactria, and the Romans felt the power of the Asi, the Catti, and Cimbri from the Baltic shore. The Asi and Tachari are the Aswa and Takshak, or Toorshka races of the Puranas of Saca-Dwipa. 'C'est vraisemblablement d'apres le nom de Tachari, que M. D'Anville aura cru devoir placer les tribus ainsi denommées dans le territoire qui s'appele aujourd'hui Tokarist'han, situe, dit ce grand geographe, entre les montagnes et le Gihon ou Amou.' Bryant gives the following as a passage from Chærilius in the history of the Sacæan Cuthites, of whose ancestry he speaks with great honour in describing the expedition of Alexander the Great:

> 'Next marched the Sacæ, fond of pastoral life,
> Sprung from the Cuthite nomades, who lived
> Amid the plains of Asia, rich in grain;
> They from the shepherd race derived their source,
> Those shepherds who in ancient times were deemed
> The justest of mankind.'

A branch of the Sacæ on one occasion invaded the inhabitants on the borders of the Pontic sea; whilst engaged in dividing the booty, the Persian generals surprised them at night and exterminated them. To eternize the remembrance of this event, the Persians heaped up the earth round a rock in the plain where the battle was fought, on which they erected two temples, one to the goddess Anaitis, the other to the divinities Omanus and Anandate, and then founded the annual

festival called Sacæa, long celebrated by the possessors of Zela. Such is the account by some authors of the origin of Sacæa. According to others, it dates from the reign of Cyrus only. This prince, they say, having carried the war into the country of the Sacæ (Massagetæ of Herodotus), lost a battle. Compelled to fall back on his magazines, abundantly stored with provisions, but especially wine, and having halted some time to refresh his army, he departed before the enemy, feigning a flight, and leaving his camp standing full of provisions. The Sacæ, who pursued, reaching the abandoned camp stored with provisions, gave themselves up to debauch. Cyrus returned and surprised the inebriated and senseless barbarians. Some, buried in profound sleep, were easily massacred; others, occupied in drinking and dancing, without defence, fell into the hands of armed foes; so that all perished. The conqueror, attributing his success to divine protection, consecrated this day to the goddess honoured in his country, and decreed it should be called the day of the Sacæa. This is the battle related by Herodotus, to which Strabo alludes, between the Persian monarch and Tomyris, queen of the Getæ. Amongst the Rajput Sachæ, all grand battles attended with fatal results are termed Saca. When besieged, without hope of relief, in the last effort of despair, the women and girls are immolated, and the warriors, decorated in saffron robes, rush on inevitable destruction. This is to perform saca, where every branch (sacha) is cut off. Chitore has to boast of having thrice (and a half) suffered saca. Chitore sac'ha ka pap, 'by the sin of the sack of Chitore,' is the most solemn abjuration of the Gehlot Rajput. If such is the origin of the festival from the slaughter of the Sacæ of Tomyris, it will be allowed to strengthen the analogy between the Sacæ east and west of the Indus. The Sakai who settled in Armenia were named Sacassani (lib. vi. c. 19), Saxons, the Sacosena of Strabo (lit. xi. pp. 776–788).

Sacasenæ, the ancestors of the Saxon race, dwelt in Armenia, on the confines of Albania. 'La Sacasene,' says a French author, 'etoit une contree de l'Armenie sur les confins de l'Albanie ou du Shirvan' (note 4, tome i. p. 191, Strabon).

This Scythic race adored the solar divinity under the name of Gæto-Syrus, the Surya of the Sacha Rajputs.—*Rennell's Memoir*, p. 185; *Isodore Char. in Hudson's Geog. Memoirs*, ii., *quoted in Ed. Ferrier Jour.* p. 428; *Hind. Theat.* ii. p. 179; *Tod's Rajasthan*, i. pp. 70, 164, *quoting Strabo*, lib. xi. p. 254; *Indian Infanticide*, p. 16; *Turner's Anglo-Saxons; Hallam.* See Afghan.

SACAM, or the White Island, mentioned in the Puranas, is England. It is mentioned in the Varaha Purana as in the possession of the Sacæ. —*Wilford.*

SACAMBARI or Sacambhari, a goddess, the tutelary divinity of the Chauhan tribes, whose statue is in the middle of a lake. Colonel Tod derives Sacambhari from Sacam, the plural of Sachæ, 'branch or race,' and Ambhar, 'covering, protecting.' The invocation is Om! Sacambhari Mata! Om!—*Tod's Rajasthan*, i. p. 95.

SACCHARUM, a genus of plants of the natural order Panicaceæ and section Sacchareæ. There are many species of the genus, all growing in warm countries, and those better known may be thus enumerated:—

S. canaliculatum, *Roxb.*, of Bengal.
S. cylindricum, *Roxb.*, Ajmir.
S. fuscum, *Roxb.*, Ajmir.
S. munja, *Roxb.*, Hindustan, Sind.
S. officinarum, *Linn.*, E. Indies, China, W. Indies, Africa.
S. procerum, *Roxb.*, Bengal.
S. sara, *Roxb.*, Bengal.
S. semi-decumbens, *Roxb.*, Bengal.
S. Sinense, *Roxb.*, China, India.
S. spontaneum, *Linn.*, S. Asia.
S. violaceum, *Tussac*, Polynesia.

Some of the species, owing to the silex in their cuticle, are so durable that they are employed in India for thatching, such as S. canaliculatum, S. cylindricum, and S. spontaneum, which also make good mats. The natives of Bengal make their pens of the narrow stems of S. semi-decumbens, S. sara, and S. fuscum. The last, as well as the culms of S. procerum, are also used for screens and other economical purposes. S. officinarum is the sugar-cane, from which is produced a large quantity of the sugar used by man. It is a native of the south and west of Asia, and was introduced by the Saracens into the south of Europe. It has several varieties, of which one is the—

Saccharum commune, or native cane of West Indies,

β S. purpureum, Kajuli, of Bengal.
γ S. giganteum, Khuloa, of Bengal.
δ S. Tahitense, Otaheite cane.

Two other species yielding sugar are—

Saccharum violaceum, *Tussac*, said to be identical with the Otaheite cane.

Saccharum Sinense, *Roxb.*, cultivated in China.

Saccharum cylindricum, *Roxb.*

Saguerus cylindrica, Horse's tail grass.

Oola, ... Hind. | Baroom biss, . . . Tel.

Grows on the Ajmir plains, and flowers early in the rains; also all over Bengal.—*Roxb.* i. p. 234.

Saccharum fuscum, *Roxb.*

Khori, ... Beng. | Ishwalika, . . . Sansk.
Pati kori, . . . ,, | Kandu rellu gaddi, . Tel.

Grows in Bengal. Natives make their pens of its culms, and also use it for screens and light fences. The best dark-coloured reeds with which the natives write are made from this species.

Saccharum munja, *Roxb.*

Sur-pata, . . . Hind. | Sirki, ... Sind.
Surr, ... Sind. | Ponika, Munja gaddi, Tel.

This grass grows throughout India, but in the Panjab it covers immense tracts of inundated lands, and forms the chief difficulty of the agriculturist, as it rapidly encroaches on the cultivation. Ropes made from its sheathing petiole are possessed of great tenacity, and used as rigging in all the vessels above Sukkur, also as tow-ropes for tying up cattle, for drawing water, and for tying on the buckets of Persian wells. The twine made from it is used for the bottoms of bedsteads. The plant grows at Benares, all over Oudh, and in Northern Circars; is common at Ajmir, in the valleys, and very abundant, along with S. procerum, near Jeypore. The best munj rope is made from the floral leaves of this plant, and the best sirki rope from the culms. The plant is distinguished from S. procerum by its inferior height, the fineness of the culm, and narrowness of the leaves. Two-inch ropes, often 50 fathoms

in length, are made of its fibres, being sufficient for dragging the largest 1200-maund boats up the Indus, and consequently against the full force of the stream, even round projecting points. The rope is light, bears without injury alternate exposure to wet and to subsequent drying. Plants growing beyond the range of the overflowings of the river, or of the influence of the tides, are best. The upper leaves, about a foot or so in length, are preferred and collected. They are made up into bundles, and are kept for use. When required for twisting into rope, they are first moistened in water, then, two men sitting opposite to each other, take one of these moist bundles and beat it alternately with mallets, until the loose cellular are separated from the fibrous parts. These are then ready for twisting into the ropes which are so extensively employed on the Indus. A continuation of the same process, or the employment of the dhenki, would afford a very ample supply of half-stuff for paper-makers, and at a cheap rate. If the rope is not occasionally wetted, and allowed to become too dry, it easily breaks when used. The prepared fibre costs two rupees per maund. It was latterly being exported from Kurachee, and brings £5 to £8 per ton.—*Roxb.; Voigt; Irvine*, p. 175.

Saccharum officinarum, *Linn.*, Sugar-cane.

Kusseh-us-sukr, .	Arab.	Kamand, Paunda,	Panj.

To,	Marquesas, Tahiti.		

This species of the sugar-cane is supposed to be a native of the East Indies, and to have spread from there to other countries, into Africa, the south of Europe, the Canaries, N. and S. America, and the West Indies. A considerable portion of the sugar of commerce is manufactured from this species, but the S. violaceum is now extensively cultivated, and in the tropics the juices of the palmyra and phœnix palms are also largely converted into sugar. In Europe, from beet-root.

The sugar-cane was introduced by the Saracens into the south of Europe, but the period is not well ascertained. Gibbon says they introduced it into Sicily soon after they got possession of the island. About the year 1420, it was much cultivated by the Portuguese in Madeira. In 1503 we read of sugar being imported from the Canaries, and in 1506 sugar-canes were carried thence to Hispaniola in the West Indies. But besides the Indian cane, another, and a much more prolific kind, that of Otaheite, was introduced into the West Indies about 1794; and about the same time, or in 1796, the China sugar-cane was introduced into India. The Chinese and Indians seem both, therefore, to have had distinct plants from which they could extract sugar; and, as history shows, they did so at very early periods. The Otaheite sugar-cane has been introduced from the Mauritius into India, and rapidly spread through the country. It is no doubt the same species that was introduced into the West Indies in 1794. It is probably the Canne de Haitc of Tussac, or S. violaceum. S. officinarum, in the United States, is profitably cultivated up to lat. 32° N.; in China, to 30° N.; in Japan, up to 36° N. The yield in Japan of raw sugar is 3300 lbs. an acre.—*Roxb.; Voigt.*

Saccharum procerum, *Roxb.*

Sirkunda, . . .	Hind.	Sarkara, Sirki, .	Hind.

Grows 20 feet high in India, and is very abundant everywhere on the sandy ridges and plains. In November, when in full flower, it is highly ornamental. The leaf (sarpat) is used for thatch; the lower part of the stem (sentha, also sirkunda) is used for screens (chik) and low stools (mondha); the upper and tapering portion of the stem (sirki) is made into fans, mats, sieves, and for thatch, and to cover carts in the rainy season; the sheaths (munj) are dried and beaten, and made into twine and ropes; the flower, tied in bunches, is the house broom. The floral leaves are made into 'munj,' separating the fibres by beating the leaves; this is very much used to make string and rope.—*Roxb.* i. p. 243; *Irvine.*

Saccharum sara, *Roxb.*, Pen reed.

Shur, Sura, Sar, .	Hind.	Gundra, .	Sansk., Tel.
Sara, Gundra, .	,,	Sarut, .	Sutlej, Ravi.
Sar-pat, Sarar, .	,,	Kanda, . .	,, Panj.
Sarkara, . . .	,,	Kura, Karre,	,, ,,
Jhund, ...	Panj.	Sacha, Darga,	Tr.-Indus.

Common in the plains of India. Its culms are finer and stronger than those of S. procerum, and when obtainable are used to make arrows of in preference to the other species; it is also used for the common 'kalm' or reed pen with which in India Arabic, Persian, and other characters are written; it is said to be beaten into a rude fibre and then twisted into a rope. Mr. Henly informed Dr. Royle that the pen-reed grass is employed as a tow-line by the boatmen about Allahabad and Mirzapore, and esteemed there for strength and durability, even when exposed to the action of water.—*Roxb.; Irvine; Voigt; Royle.*

Saccharum semi-decumbens, *Roxb.*

Khori, Khuree, .	Beng.	Tat, Neja, . . .	Hind.
The Grass—Mora,	Hind.	The Culm—Kelik,	Hind.

The culms are used for screens and pens. It is a native of Bengal, where it delights in low, wet places, blossoms about the close of the rains and the beginning of the cold season.—*Roxb.*

Saccharum Sinense, *Roxb.* A plant introduced from China, named by Dr. Roxburgh. It was extensively distributed throughout India, and still is grown to some extent, as the canes are large, rich in juice, and hard enough to resist the attacks of the white ants. Its culms are from 6 to 10 feet high. Leaves flat, with margins hispid.—*Roxb.*

Saccharum spicatum is the Mau-ken of the Chinese.

Saccharum spontaneum, *Linn.*, Thatch grass.

S. biflorum, *Forsk.* | Imperata spontanea, *Trin.*

Kash, Kashiya, .	Beng.	Kan, . .	Manil., Panj.
Thek-kay-gyi, . .	Burm.	Kahu, ...	Sind.
Kasa, Kus, . . .	Hind.	Relu-gaddi, . . .	Tel.
Kasha, Kagara,	,,	Kaki veduru, . . .	,,

This grass grows in every part of India; is common on islands, etc., and when in blossom in the rains has a beautiful silvery appearance. Brooms are made of the culms, string of its leaves, and the whole is used to thatch with. Elephants, horses, and horned cattle do not object to it as fodder. It grows from 3 to 15 feet high,

and it flowers in great profusion after the rains. A familiar couplet, in which the hunger and avarice of Brahmans are sportively alluded to, shows the correct pronunciation, as well as the season of its flowering—

'Aye kunagut phoole cas
Bamhan buet'he choolhe pas.'

'The time (kuar) for performing the ceremony in honour of deceased ancestors has arrived, the cas is in flower, and Brahmans surround the fireplace.'—*Stewart; Mason; Irvine; Roxb.; Elliot.*

Saccharum violaceum, *Tussac.*

The sugar-cane plant of Polynesia is grown in India, and is abundantly cultivated in the Saharunpur district; it gives a larger percentage of sugar, but it is objected to by the natives as being too hard for the pressure of the native mill; it is therefore principally cultivated for eating. In the Dehra Doon it has with much advantage been extensively cultivated for making sugar, but it is there pressed with European mills. —*M. E. J. R.; Royle, Ind. Fibres; Cal. Cat. Ex.*, 1862; *Powell; J. A. Murray; Smith; Von Mueller.*

SACCOLABIUM, a genus of Asiatic plants belonging to the natural order Orchiaceæ; found in the Indian Archipelago, the Malay Peninsula, and thence extending north along the Himalayan mountains to lat. 30° 4′ N., where S. guttatum is found on trees, as well as in more southern latitudes. The genus consists of caulescent epiphytes, with two-rowed coriaceous leaves, which are often oblique at the apex. The flowers are axillary, and either racemose or solitary. The following species are known:—

S. calceolare, *Lindl.*, N. E. India.	S. papilosum, *Lindl.*, Burma.
S. carinatum, *Wall.*, Khassya.	S. retusum, N. E. India.
S. guttatum, *W. Ic.*	S. Rheedii, *W. Ic.*
S. micranthum, *Lindl.*, N. E. India.	S. rigidulum, *Wall.*, Khassya.
S. niveum, *W. Ic.*	S. rubrum, *W. Ic.*
S. paniculatum, *W. Ic.*	S. speciosum, *W. Ic.*
	S. Wightianum, *W. Ic.*

These orchids are largely cultivated for their beauty. Their generic name has been applied to them from their lip forming a bag or spur.

Saccolabium papilosum, *Lindl.*

Cymbidium præmorsum, *Swz.*
Epidendrum præmorsum, *Roxb.*
Aerides undulatum, *Sm.*

Grows in the Circars and in Burma.

Saccolabium retusum.

Epidendrum retusum, *L.*	Aerides retusum, *Swz.*
Limodorum retusum, *Swz.*	A. guttatum, *Roxb.*
Sarcanthus guttatus, *Lind.*	Mo ma khan, . . BURM.

This, one of the noblest orchids in the Tenasserim Provinces, is profusely multiplied in the neighbourhood of Moulmein; grows in Java, Peninsula of India, Chittagong, Dacca, Khassya, Nepal, Burma, Tenasserim. The flowers are numerous, white, spotted with rose-violet, and stand on little pedicles all around the stalk, so as to form an elegant plume sometimes a foot long, which gives the trees on which they grow a most princely appearance.—*Mason; W. Ic.; Voigt.*

SACCOPETALUM TOMENTOSUM. *H. f.*

Uvaria tomentosa, *Roxb.*	Kirna, ... HIND.

A tall, handsome, good-sized tree of very straight growth, of the order Anonaceæ, not uncommon about the foot of the Ghats on the western side of the Madras Presidency, and also found in Chanda, Ccutral Provinces, the Konkan, Behar, Orissa, and Nepal. Another species, S. longiflorum, *H. f. et T.*, occurs in Eastern Bengal. —*Beddome, Fl. Sylv.*

SACHIN, a Native State in Gujerat; area about 300 square miles; pop. (1872), 18,061; gross revenue, £15,983. The nawab of Sachin is of African descent, known in India as Sidi and Habshi or Abyssinian. His ancestors were known as the Sidi of Dauda, Rajapur, and Janjira. They were the admirals of the fleets of the Ahmadnaggur and Bijapur dynasties, and subsequently of the emperors of Dehli, being appointed to that office by Aurangzeb about the year 1660, with an annual assignment of £30,000 on the Surat revenues. On the decline of the Moghul power, the Sidis of Janjira became notorious pirates, plundering the ships of all nations except those of the English, whose friendship they appear to have early cultivated. They held the island of Janjira during the wars between Sivaji and the Moghuls, also during the war between the Peshwa and the British Government. Towards the end of the 18th century, the heir, Balu, had been expelled from his dominions by a younger branch of the family (1784–91). He appealed for aid to the Mahrattas and British, and an arrangement was come to in 1791 by which Balu ceded Janjira to the Peshwa in return for Sachin. Balu duly got possession of Sachin; but when the Peshwa claimed Janjira, the Sidis who held it succeeded in maintaining their independence. Sachin has remained in the hands of Balu and his descendants, while Janjira is still held by the younger branch of the family who had ousted Balu. Janjira is reckoned a maiden fortress to this day. — *Imp. Gaz.; Aitcheson's Treaties*, iv. p. 324, ed. 1876.

SACHUQ-ke-MATKIAN. HIND. Earthen pots painted, in which the barri or bridal apparatus are conveyed in a Muhammadan marriage ceremony.

SACKCLOTH, a coarse cloth from any coarse fibre. 'They would have repented long ago in sackcloth and ashes,' says Matthew xi. 21. Many Hindu mendicants cover themselves with coarse cloth and ashes, after renouncing a secular life.

SACONTALA, or the Lost Ring, by Kalidasa, is a Sanskrit drama, first translated into English in 1789, and again translated in 1855 into English by Mr. Monier Williams from the Sanskrit of Kalidasa.

SACRED.

Maqaddas, ARAB., HIND.	Sacro, Sacrato, . . IT.
Sacré, ... FR.	Sagrado, ... SP.
Heilig, ... GER.	

Terms synonymous with this English word are applied in Asia to individuals, animals, books, places, stones, and plants.

Sacred books of the East is a title under which, towards the latter part of the 19th century, several of the orientalists of Europe published translations of books relating to the religions of the Eastern Asiatic races,—Hindus, Buddhists, Zoroastrians, Chinese, and Muhammadans. These have been edited by Professor F. Max Muller, who translated the Hindu Upanishads and the Dhammapada.

Georg Bühler translated the Apastambha and

Gautama, also the Vasishtha Baudhayana, the sacred laws of the Aryas.

James Legge translated the texts of Confucius, the Shu-king, the religious portions of the Shih-king, and the Hsiao-king.

E. W. West translated Pahlavi texts, Vendidad and Zendavesta were translated by James Durmesteter, Julius Jolly translated the Institutes of Vishnu, and T. W. Rhys Davids translated Buddhist Suttas from the Pali. V. Fausboli translated the Sutta Nipata, Julius Eggeling the Satapatha Brahmana, K. T. Telang the Bhagavat Gita, Sanatsugatiya, and Anugita.

At the same time has been appearing translations of other sacred books. Of these may be mentioned the Udanavarga from the Tibetan by W. W. Rockhill,—it is the Northern Buddhist version of Dhammapada; Le Pantheon Egypten, by Paul Picrret, conservator of the Egyptian Museum of the Louvre; the Clarendon Society published a catalogue of the Buddhist Scriptures; lectures on Buddhist literature in China were delivered and published by Samuel Beal; A. P. Sinnett wrote on Esoteric Buddhism.

Dr. H. Oldenberg wrote on Buddha, his life, his doctrine, and his order.

Mr. Rhys Davids issued a volume on Buddhist birth stories or Jataka tales. It was a translation of the Jattakatt'havannana, the oldest collection of folk-lore extant.

T. W. Rhys Davids and H. Oldenberg translated the Vinaya texts, viz. Patimokha, Mahavagga, and Kullavagga.

The Yi-king or Yh-king, the oldest book of the Chinese, was translated by Terrien de la Couperie.

A. E. Gough, M.A., wrote on the philosophy of the Upanishads and ancient Indian metaphysics.

Dr. C. P. Tiele wrote a history of the Egyptian religion, which James Ballingal translated from the Dutch.

Samuel Beal translated the Fo Sho Hing Tsan-king. E. H. Palmer translated the Koran.

The Vedas and the Puranas are the sacred books of the Hindu religion. The sacred books of the Christian religion are designated the Old and New Testament, or, collectively, the Bible. The Old Testament inculcates monotheism, and gives a history of the Hebrews for about 2000 years, to B.C. 500. The New Testament gives a history of John the Baptist, and of Jesus, the Christ, the Messiah or Anointed, of His teachings, His doctrines, and those of His disciples. It was written in Greek, but was early rendered into Latin. Protestant missionary bodies have translated the Old and the New Testaments into nearly all written tongues, and into many languages which previously had no scriptory character, and millions of copies have been published. In many instances these sacred books have given a form to the various spoken dialects of a language without a literature.

The *Sacred cities* of the Hindus, sacred rivers, and sacred sites are exceedingly numerous, and at most of them they have erected the temples for their religion. Sacred cities of the Brahmanical Hindus, twelve in number, are—

1. Bhimasankar, at the source of the Bhima, N.W. of Poona.
2. Ellora.
3. Kedareswar, in the Himalaya.
4. Mahakala, at Ujjain.
5. Malikarjuna, on Srisaila mountain, in the S. of India.
6. Omkara, on an island in the Nerbadda.
7. Naganath, E. of Ahmadnaggur.
8. Rameswara, on an island opposite Ceylon.
9. Trimbuk, near Nasik.
10. Somnath, in Kattyawar.
11. Vaidynath, in the Bombay Dekhan.
12. Viswanath, in Benares.

Besides these twelve, Srirangam, near Trichinopoly, Benares, Puri, where Jaganath is, Badrinath in the Himalaya, Conjeveram and Tripati in North Arcot, with Dwarka, Gaya, and Mathura, may be indicated as sacred towns; and the Ganges, Brahmaputra, Godavery, Kistna, and Cauvery among the rivers, and hundreds of thousands annually visit them. Govardhana mountain is sacred to the Hindus, and Palitana to the Jains. Mount Meru and Mount Kailasa of the Himalaya are famed in Hindu mythology.

Sir George Birdwood mentions, in particular, other sacred cities of the Hindus,—Ayodhya or Oudh, the city of Rama; Mathura or Muttra, the city of Krishna; Maya or Buddha Gaya; Kasi or Benares, the city of Siva as Visveswara; Kanchi or Conjeveram; Avanti or Avantika or Ujjaiyini and Dwaraka or Dharawati; Gao-karna or Cow's Ear, near Mangalore; Rameswaram; Somnath and Pathan.

Jerusalem is sacred to Jews, Christians, and Muhammadans, and the last-named designate it Bait-ul-Maqaddas; with them Mecca is called Bait Ullahi'l-harām, the holy house of God; and with them Karbala, Medina, and Meshid also are holy cities, which are resorted to by pilgrims from all Asia and Africa.

Sacred fires are kept up by the Agnihotra Brahmans of India, and by the Parsee or Zoroastrian religionists. The Brahmanic families who keep up the sacred fires are supposed descendants from the seven Rishi,—Bhrigu, Angoras, Visvamitra, Vasishta, Kasyapa, Atri, Agastya; but Jamadagni, Gautama, and Bharadwaja are also enumerated.

Sacred plants among the Hindus are numerous; their flowers are offered up to their idols, their seeds are used for rosaries, etc., and their gums as incense.

The Sij plant, Euphorbia, is the god of a race in Assam.

The Jews, about the 12th to the 3d century B.C., largely followed surrounding nations in their worship in the groves.

The sacred grove of oaks at Dodona, supposed to have been planted by the Pelasgi, existed till the time of Constantine. Their branches were hung with bells, sacred pigeons rustled amidst the leaves. The laurel of Apollo at Delphi was sacred like the oak at Dodona. Under the laurel's shade the python took refuge.

Modern Hindus restrict their reverence to individual plants, some of them being sacred to Siva and some to Vishnu and their avatars; and the following are those chiefly regarded:—

Achyranthes aspera.
Ægle marmelos.
Æschynomene sesban.
Afzelia bijuga.
Antenaria, *sp.*
Aplotaxys gossipina.
Artemisia astriaka.
Aucklandia costus.
Barringtonia acutangula.
Bauhinia variegata.
Betula bhojputra.
Borassus flabelliformis.
Buchanania latifolia.
Butea frondosa.
Calophyllum inophyllum.
Calotropis gigantea.
Cedrus deodara.
Chamerops Ritchiana.
Chrysanthemum Indicum.
Clitorea ternatea.
Cupressus torulosa.
Cynodon dactylon.

Dalbergia sissoo.
Dapbne cannabina.
Datura fastuosa.
Delphinum brunonianum.
Dolomiea macr.
Echites caryophyllata.
Erytbrina fulgens.
Euphorbia, *sp.*
Ficus Indica.
F. glomerata.
F. religiosa.
F. venosa.
Gardenia florida.
Gærtnera racemosa.
Guettarda speciosa.
Helianthus annuus.
Hernandia sonora.
Hibiscus Phœniceus.
H. rosa Sinensis.
Jasminum, *sp.*
Jonesia asoca.
Justicia adhatoda.
Juniperus communis.
J. excelsa.
Kupatieus, *sp.*
Limonia scandens.
Melia azedarach.
M. sempervirens.
Menispermum glabrum.
Mesua ferrea.
Michelia champaca.
Mimusops elengi.
Morinda multiflora.
Murraya exotica.
Nauclea cadamba.
Nelumbium speciosum.
Nerium odorum.
Nymphœa esculentum.
Ocimum sanctum.
Origanum marjoranum.
Poa cynosuroides.
Poinciana pulcherrima.
Polianthus tuberosa.
Populus balsamifera.
Prosopis spicigera.
Pterospermum acerifolium.
Pt. suberifolium.
Putranjiva Roxburghii.
Rbododendron arboreum.
Rosa, *sp.*
Saussurea obvallata.
S. sacra.
S. sorocephala.
Senecio laciniosus.
Tagetes erecta.
T. patula.
T. populnea.
Tabernæmontana coriarea.

SACRED BEETLE, Ateuchus sanctus. See Insects.

A sacrifice is an offering of any consecrated thing to a deity, whether an animal, anything of the mineral or vegetable world, a manufactured article, or in the form of a libation or an oblation. All nations seem to have had a stage in their history in which to make offerings in sacrifice formed a part of their mode of worshipping the deity whom they reverenced. The earliest extant record of sacrifices are those recorded in Genesis iv. 3, 4, in the cases of Cain and Abel, where Cain, a cultivator, brought of the fruit of the ground an offering to the Lord, and Abel, who was a nomade, a keeper of sheep, brought of the firstlings of his flock and of the fat thereof, and it is mentioned that the Lord had respect unto Abel and to his offering, but unto Cain and to his offering he had not respect; so even in those early days in the history of the human race, the blood sacrifice, the oblation, and immolation of animals was deemed by the offerer more worthy of the deity's acceptance than the fruits and flowers of the earth. The contest marks the jealous rivalry and strife between the powerful, over-bearing dwellers in cities who bear arms and till the ground, and the nomade shepherds. The first victim was Abel, but the struggle runs through the whole history of Asia, and continues amongst the races and sects of India at the present day. The view seems to have been that the most precious thing should be offered, with the object of propitiating a wrathful being, and there followed on this the offering up of human beings, of the children of the sacrificer, the children of kings, though criminals, captives taken in war, slaves, and even women were also sacrificed.

The duty of offering to the Lord of the first of every product has had almost a universal hold on man. Exodus xxii. 29 commands the offer of the first fruits; the same is enjoined in Deuteronomy xxvi. 2; Leviticus ii. 12, and numerous other places. Genesis iv. 4 tells us that Abel brought the first of his flock, and Exodus xiii. 12 and other places enjoin this, and to the present day in the villages around Chingleput the first-born daughters in the Hindu weaver families are devoted as deva-dasa to the gods of their temples. A conscientious Hindu, before he eats, offers his food to his guardian deity, using some such words as these, 'This food, O God, I present to thee.' A Hindu shopkeeper, also, gives his god credit in his daily accounts for a sum which may amount to the twentieth of a halfpenny.

Dr. Milman considers that in the Hebrew religion the rite of sacrifice was regulated with three distinct objects. Every morning and every evening the smoke from the great brazen altar of burnt-offerings ascended in the name of the whole people. On the seventh day, two animals instead of one were slain, and the offering of the poorest was acceptable. The sacrifices were partly voluntary acts of reverence in order to secure the favour of God to the devout worshipper; partly expressive of gratitude for the divine blessings. Of this nature were the first fruits, and whether reaping the harvest or gathering in the vintage, the Israelite made an oblation of thanksgiving to the gracious Being who had bestowed His bounty. Lastly, the Hebrew sacrifices were piacular or expiatory; every sin either of the nation or the individual had its appointed atonement. The tenth day of the seventh month was set apart for the solemn rite of national expiation. First a bullock was to be slain and the blood sprinkled, not only in the customary places, but within the Holy of Holies itself. Then two goats were chosen, and lots cast upon them; the one assigned to the Lord was sacrificed; on the other, by the imprecation of the high priest, the sins of the whole people were heaped, and it was then taken beyond the camp and sent into the desert to Azazel, the spirit of evil to whom Hebrew belief assigned the waste and howling wilderness as his earthly dwelling. But in the fanatic zeal of the Jews, great excesses occurred. In the time of Solomon an instance (2 Chronicles vii. 5) is recorded of the sacrifice of 22,000 oxen. It was left to Isaiah (i. 10-14) openly to denounce the sacrifice of animals as an atonement for sin: 'Hear the word of the Lord, ye rulers of Sodom; give ear unto the law of our God, ye people of Gomorrah: to what purpose is the multitude of your sacrifices unto me? saith the Lord: I am full of the burnt-offerings of rams, and the fat of fed beasts; and I delight not in the blood of bullocks, or of lambs, or of he-goats. When ye come to appear before me, who hath required this at your hand, to tread my courts? Bring no more vain oblations; incense is an abomination unto me; the new moons and Sabbaths, the calling of assemblies, I cannot away with; it is iniquity, even the solemn meeting. Your new moons and your appointed feasts my soul hateth: they are a trouble unto me; I am weary to bear them.'

As might be supposed from the sacrificial rites amongst the Jews, allusions to such are to be found in the New Testament (Mark vii. 11): 'But ye say, If a man shall say unto his father or

mother, It is Corban (that is to say, a gift), by whatsoever thou mightest be profited by me; he shall be free.' This word is equivalent to Sadqa or Tasaduq or Fida, and is often used by Muhammadan men or women addressing a superior, in which case it means merely, I am your Kurban. The word is Arabic, derived from the Hebrew, has allusion to an approaching to God, and means a sacrifice, a victim, an offering, an oblation, for which also we have the Greek Καρπομα. The other words, in the Arabic, Sadqa, Fida, and Tasaduq, mark the continuance of the sacrificial rite. Sadqa, ARAB., properly Sadaqa, from the Hebrew, means alms, propitiatory offerings, and sacrifice. The words are continued into Hindustani, in Sadqe-jana or Sadqe-hona, to become a sacrifice for the welfare of another, and Sadqe-karna, to sacrifice for the welfare of another.

Animal sacrifices seem to have been a usual rite amongst all the Scythian races. Some branches of this great stock appear to have wandered so far from their northern seats as the Peninsula of India, in the most southern parts of which are found great numbers of cromlechs, kistvaens, and cairns. All around Hyderabad, in the Dekhan, these are to be seen, and at one place about 12 miles from that city is a vast site of these ancient dead. In all the cairns that have been opened there, sepulchral urns have been found, and in their neighbourhood human bones and bones of animals. Of the race who adopted that form of burial nothing is now known; but they were nomades, dwelling in tents, the stone wall enclosures for each tent being perfect, and within the enclosures there are no mounds of ruined houses, but in all merely a level space.

Professor Max Müller reminds us of what we read in Herodotus (v. 5), that amongst the Thracians it was usual after the death of a man to find out who had been the most beloved of his wives, and to sacrifice her upon the tomb. Mela (ii. 2) gives the same as the general custom of the Getæ line. Herodotus (iv. 71) asserts a similar fact of the Scythians, and Pausanias (iv. 2) of the Greeks.

Amongst the Aryan races who went to the north-west, there are no grounds for believing that the Saxons continued to offer human sacrifices after their settlement in Great Britain, but in their own land the immolation of captives in honour of their gods was by no means uncommon. The great temple at Upsal, in Sweden, appears to have been especially dedicated to Odin, Thor, and Friya. Its periodical festivals were accompanied by different degrees of conviviality and licence, in which human sacrifices were rarely wanting, varied in their number and value by the supposed exigency. On some occasions even royal blood was selected that the imagined anger of the gods might be appeased.

The Massageta, the Scythian, the Gete, the Sarmatian, all the various nations upon the Baltic, particularly the Suevi and Scandinavians, held it as a fixed principle that their happiness and security could not be obtained but at the expense of the lives of others. Their chief gods were Thor and Woden, whom they thought they could never sufficiently glut with blood. They had many very celebrated places of worship, especially in the island of Rugen, near the mouth of the Oder, and in Zeeland. Some, too, very famous among the Sumnones and Nahanvalli. But the most reverenced of all, and the most frequented, was at Upsal, where there was every year a grand celebration, which continued for nine days. During this term they sacrificed animals of all sorts, but the most acceptable victims and the most numerous were men. Of these sacrifices none were esteemed so auspicious and salutary as a sacrifice of the priuce of the couutry. When the lot fell for the king to die, it was received with universal acclamations and every expression of joy, as it once happened in the time of a famine, when they cast lots, and it fell to the king Domalder to be the people's victim, and he was accordingly put to death. Olaus Triliger, another prince, was burnt alive to Woden. They did not spare their own children. Harold, the son of Gunild, the first of that name, slew two of his children to obtain a storm of wind. 'He did not let,' says Verstegan, 'to sacrifice two of his sons unto these idols, to the end he might obtain of them such a tempest at sea as should break and disperse the shipping of Harold, king of Denmark.' Saxo Grammaticus mentions a like fact; he calls the king Haquin, and speaks of the persons put to death as two very hopeful young princes.

Tacitus takes notice of the cruelty of the Hermunduri in a war with the Catti, wherein they had greatly the advantage, at the close of which they made one general sacrifice of all that were taken in battle. The poor remains of the legious under Varrus suffered in some degree the same fate.

Human sacrifice, Bunsen says, was abolished by the Egyptians, in the very earliest times, declaring it to be an abomination to the gods. Whereas in Palestine, in Syria, and in cultivated Phœnicia and Carthage, such sacrifices continued to be offered to Moloch as the very climax of religious worship. Even Rome, in the time of her Cæsars, buried her Gallic prisoners alive, in order to appease the wrath of their gods. Many of the kings of Judah and Israel caused their children to pass through the fire. The Greeks also were not free from these atrocities. Chap. xi. of Judges tells how Jephthah, when he invaded the country of the Ammonites, vowed a vow unto the Lord, and said, 'If thou shalt without fail deliver the children of Ammon into mine hands, then it shall be, that whatsoever cometh forth of the doors of my house to meet me, when I return in peace from the children of Ammon, shall surely be the Lord's, and I will offer it up for a burnt-offering. . . . And Jephthah came to Mizpeh unto his house, and, behold, his daughter came out to meet him with timbrels and with dances. . . . And he said, Alas my daughter! . . . I have opened my mouth unto the Lord, and I cannot go back. . . . And it came to pass, at the end of two months, that she returned unto her father, who did with her according to his vow which he had vowed: and she knew no man.' Jeremiah xix. 4, 5, shows, says Dr. Milman, that in later times human sacrifices were offered by the Jews to Moloch and to Baal. Abraham, when commanded to cut off that life on which all the splendid promises of the Almighty seemed to depend, he obeys and sets forth with his unsuspecting child to offer the fatal sacrifice on Mount Moriah. Besides the common worship of Moloch, the Book of Kings names the Sepharvites as making these human sacrifices

(2 Kings xvii. 31), and the king of Moab (2 Kings iii. 27). It was a Babylonian and Assyrian rite. Filial sacrifices were doubtless of rare and extraordinary occurrence, either to expiate some dreadful guilt, to avert the imminent vengeance of an offended deity, or to extort his blessing on some important enterprise. But Hannibal sacrificed 3000 Grecian prisoners on the field of Himera, where his grandfather Hamilkar had been slain 70 years before.

Sale's Koran contains evidence of the practice of infanticide, but assimilating more than in any other case with the custom of the Jahreja race of Cutch and Kattyawar. This barbarity seems to have been confined to the female infants, as is the case with the Jahreja; and it is remarkable that the difficulty of providing for them in marriage, or the apprehension of their conduct disgracing their parents, is assigned in both cases as the cause of this inhuman custom. One benefit which resulted to mankind from the success of Mahomed has been the relinquishment of that inhuman practice amongst his numerous followers.

Abbe Domenech says that some branches of the Scythic stock undoubtedly crossed to America in the early centuries of our era, and they seem to have carried with them the sacrificial customs which have been a peculiarity of all their offshoots. The Comanche and the Nachez, Indian tribes of North America, formerly buried the wives of a deceased chief along with him. The Ottawa offered a horse in sacrifice on the tomb of the dead. With the Nachez, the victims placed themselves on mats and danced the death-dance with their executioners, who formed a circle around them. The Pawnee tribes, supposed to be descendants from the ancient Mexicans, also offered human sacrifices, though the rite latterly fell into abeyance. These sacrifices took place more particularly in the month of April, that is, at sowing time, with a view to obtaining abundant harvests from the Great Spirit. The preparation lasted four days; on the fifth the victim was bound to three stakes, placed above the funeral pile. He was painted red or black, and his breast burned and pierced with arrows, and after his heart was reached it was torn from his breast and devoured all bleeding. This barbarous ceremony was terminated either by setting the pile on fire, or by eating the victim, whose blood served to water the seeds about to be committed to the earth. Many Indian nations of the northern and western parts of North America celebrated annually solemn festivals when the leaves of the willow had attained their full size. These solemnities were in commemoration of a great event,—in propitiation of the superior powers; or were offered in expiation. Among the Mandan, these were prolonged four days, and the greatest cruelties were practised on the tortured victims.

The pouring out of water as a libation is a very ancient rite. In Genesis xxxv. 14, Jacob is mentioned as setting up a pillar, and he poured a drink-offering thereon, and he poured oil thereon; and to the present day, throughout British India, the lingam, the priapus or phallus, in its daily worship by the Saiva Hindus is washed with oil and milk. Wine was occasionally used, as in Numbers xxviii. 7, causing the strong wine to be poured unto the Lord for a drink-offering; also 1 Samuel vii. 6, Israel gathered together to Mizpeh, and drew water, and poured it out before the Lord. David, when pressed by the people of Palestine, craved for a drink from the well at the gate of Bethlehem, and afterwards would not drink it when brought by three men, 'but poured it out unto the Lord.' And to the present day, all Hindus offer water libations to the earth deity.

The sacrifices of the Zoroastrians were never of human beings. The ordinary victims of the Aryans were the horse and mare, oxen, sheep, and goats.

A little after the time of Isaiah, Buddha appeared, objecting to all animal sacrifices. But from the times of the Vedas until now, the Homa, an offering of ghi to the fire, from the dhenkna or sacrificial ladle; also the Pasaya, sacred food of rice and milk, cooked in sacrificial kettles, have been oblations of Hindus. In the Hindu sacrifices, the sweet-smelling kusa grass seems to have been employed, from the most ancient dates, and also an alcoholic fluid which they called the soma juice, and the ancient Persians called hom. What this fluid was is doubtful, but it had stimulating and intoxicating qualities, for the Rig Veda (ix.) says, 'the purifying soma, like the sea rolling its waves, has poured forth songs and hymns and thoughts.' It has been said to be the fermented acid juice of the Sarcostemma acidum, the shom-luta of Bengal; and the fierce exultations which are noticed in the Rig Veda could only have been produced by a strong alcoholic drink.

The ordinary Vedic offerings were of cooked food, delicious food and drink; the Janemajaya, however, was a sacrifice of snakes (qu. the Snake race), and the Rajasaya was a royal sacrifice to the gods in acknowledgment of sovereignty and supremacy. Originally it was a great national feast.

The ancient history of India shows that it has had four great religious eras. *First*, The Vedic, in which Agni, Indra, and other personifications, invoked with feasts and with the hymns of the Rig Veda, and in which maidens selected their husbands in the Swayamvara, and monarchs sacrificed the horse in the Aswa Medha. *Second*, The Brahmanic period, when the Kshatriya feasts were converted into sacrifices for the atonement of sins against the Brahmanical law, and divine worship was reduced to a system of austerities and meditations upon the supreme spirit as Brahma. It was in this era that the Brahmans assumed the character of a great ecclesiastical hierarchy, and established that priestly dominion which still extends over the minds and senses of the Hindus of India. *Thirdly*, The Buddhist period, in which Sakya appeared. And *fourthly*, the Brahmanical revival, during which Brahmans abandoned the worship of their god Brahma, and have clothed with new attributes some of the old national gods and heroes of the Vedic Aryans. In this era Siva is worshipped by one great portion of Hindus as supreme, and styled Iswara and Mahadeva, Lord and Great God, while by a larger part Vishnu came to be regarded as the supreme being, and Rama and Krishna as his incarnations. The Buddhist philosophies do not authorize or favour the sacrifice of animals, but Du Carne tells us that a Buddhist of his camp made an offering of one of his fingers at a Buddhist shrine in Annam. Also, Mr. Wade remarks, that at the Chinese court, in the middle

of the 19th century, some Manchu and Mongol, in the five banners, had the prefix tsai-sang, which declares them to be employed in slaying the victims used in sacrifice. The flesh of victims is offered in the Hwan-ning-kung, the portion of the palace appropriated to the empress, every morning at 4 o'clock, and at the same hour in the afternoon; at the monthly sacrifice performed on the second of the first moon, and the first day of all succeeding; and at the sacrifice of the morrow, performed on the third of the first, and the second of all succeeding moons. The morning daily sacrifice is to Buddha, Kwan-yin, and Kwan-ti (the Mars of China); the evening, to nine Tartar divinities bearing long unintelligible appellations. The monthly sacrifices appear to be the same with that on 'the morrow,' *i.e.* of the monthly sacrifice. The flesh of the victim is boiled and placed before the idols above enumerated, on the right and left of the shrine of heaven; when removed, it is partaken of by the emperor or empress, if officiating in person, or by those to whom his majesty may direct the nobles, his proxies, to distribute it.

There are two hymns in the Rig Veda describing the rite of the Aswa Medha or sacrifice of the horse, and which leave no doubt that in the early religion of the race this sacrifice was had recourse to as a burnt-offering to the gods. It was even then, however, falling into disuse, and was existing as a relic of an ante-Vedic period, imported from some foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And in still later times, the Aswa Medha consisted in certain ceremonies ending in the liberation of the horse, as throughout Southern India is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of the gods Siva or Vishnu.

In the Mahavira Charita, Vasishtha, addressing Jamadagni, says, 'The heifer is ready for sacrifice, and the food is cooked in ghi. Thou art a learned man, come to the house of the learned, favour us by waiting and participating in the sacrifice.' Also, the Uttaram Charita says (Cal. Rev. 109, p. 30)—

'Why, know ye not
The Vedas, which enshrine our holy law,
Direct the householder shall offer those
Who in the law are skilled, the horned animal,
And with it flesh of ox, or calf, or goat;
And the like treatment shall the householder
Receive from Brahmans learned in the Vedas.'

The Institutes of Menu contain the following paragraph:—'The sacrifice of a bull, of a man, or of a horse, in the kali age, must be avoided by twice-born men; so must a second gift of a married young woman, whose husband has died before consummation; the larger portion of an eldest brother, and procreation on a brother's widow or wife.'

The *Vaishnava* sect have four kinds of sacrifices, viz. the Vaiswadeva, Varuna-praghasa, Sakamedha, Sunasiriya, to be offered up in the months Asharh, Kartik, and Phalguna. The attributes of these are roasted cakes of flour, with figures of sheep made of dough to Vaiswadeva and Varuna, with vegetables to Agni and Indra.

Bloody sacrifices form no part of the ordinary worship now paid to Rama, Krishna, Hanuman, and other modern deities of the Vaishnava sectarians, nor to Vigneswara, Subrahmaniya, etc., of the Saiva sect, or of their respective goddesses.

It is usually supposed that all Vaishnava Brahmans abstain from offering living creatures in sacrifice. But in Southern India, at the present day, the Vadaghala Vaishnava sect offer living creatures in sacrifice, while the Tenaghala Vaishnava and Madhava substitute dough for animals. In the sacrifices of Saiva Brahmans the victim's head is never cut by the Sudra pujari, but it is strangled by him, so that the life is lost without spilling blood. Saiva Brahmans sacrifice living creatures in Southern India, and never use dough images as a substitute. Amongst the Smartha, and also Madhava Brahmans, each household keeps a tulsi plant in the middle of the courtyard for worshipping. Each new moon, as also on the occurrence of an eclipse, either of the sun or moon, also at the summer and winter solstices, their Utrayanam and Datchanayanam, every caste Hindu, whether Brahman, Kshatriya, Vaisya, or Sudra, offers the Tharpanam, or water-sacrifice, in the names of his deceased father, grandfathers, great-grandfathers, and their wives, seeds of the oriental sesamum being mixed with the water. It is as a means of continuing this Srad'ha ceremony that Hindus long to have a son born to them, as in their creed it is taught that the manes of ancestors are gratified by the Tharpanam. This is a particular part of the sacrifice, called yugnu, but at present it is often performed separately. The things offered are clarified butter, sesamum flowers, boiled rice, rice boiled in milk and sweetened with honey, durba grass, vilva leaves, and the tender branches, half a span long, of the ushwutthu, the doomvuru, the pulashu, the akun-du, the shumee, and the khudiru trees. Clarified butter alone is sufficient, but any or all of these things may be added.

The *Saiva* Brahmans likewise, annually in some towns, Conjeveram for instance, perform the bloody rite to the Vedic gods, Indra, Varuna, Yama; and both in 1859 and 1860, the Saiva Brahmans in Madras so sacrificed. Several Brahmans are employed in this rite. One Brahman, assisted by his wife, the couple being styled the Soma Yaji and Soma Devi, commences the rite by performing the fire sacrifice by pouring ghi into a large fire. The pujari, a Sudra, then strikes the head from the victim, and large portions of its flesh being thrown into the fire and reduced to ashes, portions are distributed to the assembly. This being a Prasad'ham, or food offered to the gods, all castes can partake of it. Many partake of it.

Throughout India generally, at the present day, in almost all the household sacrifices, in which the husband or head of the house is the priest, the oblation is used as food. In North America, the animals sacrificed were killed and eaten or buried; sometimes the horse, instead of being killed, was simply set at liberty, in the presence of the warriors of the tribe. Sonnerat relates that the Syrians at the feast of the torches or funeral pile, and the Hebrews at the feast of the Passover, made arbours before the temples, and carried their gods round them in procession, whom they afterwards burned. The people then presented their offerings, which commonly were lambs and sheep; and after the priest had made the first libation upon them, each person carried

his victim home to eat it. Some texts of Menu would seem to authorize the eating of animal food at all seasons, observing merely the preliminary ceremony of offering a portion of it to the gods or manes, like the heroes of Homer, with whom the sacrifice was only the prelude to a feast.

The grand festival to Friya was in spring; then boars were offered up to her by the Scandinavians, and boars of paste were made and eaten by the peasantry. So, at the present day, 'Vasanti,' or spring personified, is worshipped by the Rajputs, who open the season with a grand huut, led by the prince and his vassal chiefs, when they chase, slay, and eat the boar.

Self-destruction.—The Rev. Mr. Ward, writing in the early part of the 19th century, says it was difficult to form an estimate of the number of Hindus who perish annually, the victims of superstition; but he conjectures 10,500 as the number of victims annually sacrificed,—Widows burned on the funeral pile, in Hindustan, 5000; pilgrims perishing on the roads and at sacred places, 4000; persons drowning themselves in the Ganges, or buried, or burned alive, 500; children immolated, including the daughters of the Rajputs, 500; sick persons whose death is hastened on the banks of the Ganges, 500.

A great change has been made in this respect, through steady repression by the British Government of India. Up to the year 1802, Hindus drowned their children at the mouth of the Ganges, but the rite was then prohibited. Until later times, men and women drowned themselves in the sacred river, and frequently at the junction of the Jumna and the Ganges. They fastened earthenware pots to their bodies, and walked calmly into the river beyond their depth, filled the pots by turning them to one side, and as the pots filled they sank. As the century advanced, the Government ascertained that the sacred books of the Hindus gave no sanction to widows immolating themselves, as sati, along with the bodies of their deceased partners, and it was prohibited in 1829, during Lord William Bentinck's administration, and rulers of the Feudatory States were induced to issue a similar prohibition. Akbar had endeavoured to put a stop to this practice, and on one occasion he rode about 80 miles to prevent the widow of the Jodhpur raja's son destroying herself, but was not listened to. Instances still occur from time to time, but the people generally avoid it.

Men, from time to time, bury themselves alive. The practice is known as Samad'h, and is had recourse to alike by fanatics as by persons incurably afflicted with leprosy or other severe diseases. Scarcely a year passes by without an occurrence of this kind, and, being done stealthily, the police are often baffled. Up to the early years of the 19th century, instances occurred of individuals being crushed under the wooden wheels of the huge cars in which their idols are carried in procession. It is now admitted that the statements about the frequency of self-immolations and accidents in that manner were exaggerated; but by the care taken by the constabulary, these occurrences are now unheard of.

According to former accounts, writes Malcolm, self-destruction among men, by casting themselves during public festivals from a rock at Onkar Mundattah, and from a precipice near Jawad, was once common. The sacrifices have of late years seldom occurred. The men who sacrificed themselves were generally of low tribes, usually the Bhil, Dher, or Chamar. One of the leading motives by which they were said to be actuated, is a belief that they will be re-born as rajas in their next state of transmigration.

In 1883, the Indian papers reported the self-sacrifice of a Banya family of twelve persons in Kattyawar, to propitiate the gods.

About the year 1877, in the month of May, Soomar Bhartee, a Sanyasi Gosain from Benares, settled in a linga temple in the village of Mulkapur, in the Vishalghur territory of the Kolhapur State, and along with a lingayat Wani, sacrificed Ballya, a little boy, 12 years of age, as an offering to Siva (Mahadeo), to obtain a revelation where hidden treasure was to be found.

The British Indian authorites have been unceasing in their efforts to check infanticide. It has been practised chiefly by the Rajput races, who destroyed their newborn daughters to avoid the great expenses of their marriages. Several of the tribes acted thus, but the Jhareja of Cutch exceeded all the others. The Indian Government in 1871 ascertained the villages in which the male children exceeded the girls in number, and placed such places under strict supervision, with compulsory registration of births. In the census of 1881, in the entire population of British India, there were 129,941,851 men and boys, and 123,949,970 girls and women; but in Rajputana the males were 5,544,665, and the females 4,723,727, fewer by 820,938.

It has been customary, from unknown times, along the banks of the Ganges, for ailing, dying men, particularly the aged, to be taken to the river side to expire. They would sometimes for days be there awaiting death, and repeated instances occurred of their death being caused by the relatives filling the mouth with water from the river, or the clay of its banks. With all Hindus it is usual at the death-agony to fill the mouth of the dying person with the fluid of the panchagavya, but the exposure of their sick on the river banks could only hasten the fatal event.

The Charan and the Bhot (Bard), semi-religious tribes of Rajputana, until recent years were employed as guarantees for the safety of individual travellers, and also as convoys for caravans of merchandise. Their sacred character gave them the influence which they exercised in behalf of those under their care, but if pushed to extremity they would wound and even destroy their families aud themselves, so that their death might be on the robbers.

Until British supremacy, the Hindus of Northern India, in order to extort a debt, would erect a pile of wood, called a Koor, placing on it a cow or an old woman, and set fire to the pile, and sacrifice the victim. The sacrifice was supposed to involve in great sin the person whose conduct forced the constructor of the Koor to adopt this mode of obtaining his money.

During the religious convulsions from which the Aryan Hindus have suffered, the writings of some of their sects have put forward quite opposing views as to human sacrifices.

In the Brahma Purana, every Naramedha, or man-sacrifice, is expressly forbidden; and in the fifth book of the Bhagavat, Sir William Jones

has pointed out the following emphatic words: —'Whatever men in this world sacrifice human victims, and whatever women eat the flesh of male cattle, those men and those women shall the animals here slain torment in the mansions of Yama; and, like slaughtering giants, having cleaved their limbs with axes, shall quaff their blood.'—*As. Res.* iii. p. 260.

In the Acharya Brahmana, translated by Roth, it is related that 'Harichandra had been married to a hundred wives, and yet there was no man-child born to him. At the suggestion of Narada, a sage, he went to Varuna, and promised that if his prayers were heard, and a son granted to him, he would offer him up in sacrifice to the king. Accordingly, in due time, a son was born, who was called Rohita. Varuna wanted to keep Harichandra to his promise, but the latter put forth various excuses till Rohita grew up. And then Rohita objected, and fled to the woods, where he wandered for six years, until he fell in with the rishi Agastya. The rishi had three sons, and he promised to Rohita his second, Sunasepha, on receipt of 100 cows. But another difficulty occurred, for no one would bind the victim until Rohita gave 200 cows more. Sunasepha, unwilling to be sacrificed, interceded first with Prajapati, then with Agni, and was released, but not before Sunasepha was bound to the sacrificial post, and his father whittling his sword approaching to kill him, on which Sunasepha exclaimed, 'They will really kill me, as if I was not a man.'

No religious rite can be more minutely ordered and detailed than this is in the Kalika Purana, the sanguinary chapter of which has been translated by Mr. Blaquiere, and given in the fifth volume of the Asiatic Researches, Art. xxiii., and as well as the ceremonies, the implements, prayers, etc., used on these horrid occasions, are minutely described and recited. In this article, premising that Siva is supposed to address his sons, the Bhairava, initiating them in these terrible mysteries, occurs: 'The flesh of the antelope and the rhinoceros give my beloved' (*i.e.* the goddess Kali) 'delight for 500 years.' 'By a human sacrifice, attended by the forms laid down, Devi is pleased 1000 years, and by a sacrifice of three men, 100,000 years. By human flesh, Camachya, Chandica, and Bhairava, who assume my shape, are pleased 1000 years. An oblation of blood which has been rendered pure by holy tests, is equal to ambrosia; the head and flesh also afford much delight to the goddess Chandica.' 'Blood drawn from the offerer's own body is looked upon as a proper oblation to the goddess Chandica.' 'Let the sacrificer repeat the word Kali twice, then the words Devi-Bajreswari, then Lawha Dandayai, Namah! which words may be rendered —Hail, Kali! Kali! hail, Devi! goddess of thunder! hail, iron-sceptred goddess!' 'Let him then take the axe in his hand and again make the same by the Calratriya text.' Different mantra are used in reference to the description of the victim to be immolated: females are not to be immolated, except on very particular occasions; the human female never.

The *Bali* is any offering to an idol, such as that of flowers or the presentation of food to all created beings, by throwing grains up into the air, or offering goats and other animals in sacrifice. The presentation is called bali-dan or bali-danam. The offerings to Vishnu consist of rice, milk, curds, fruits, flowers, and inanimate forms; but to the terrific forms of Siva, or his consort Durga, living creatures, sheep, goats, buffaloes, and human beings are offered up, in which case the heads are given to the sacrificial priests, and the bodies are carried away. The Ostyak, when they kill an animal, rub some of the blood on the mouths of their idols. Even this seems at length to be replaced, as Mr. Taylor has suggested, by red paint, and the sacred stones in India, as Colonel Forbes Leslie has shown, are everywhere ornamented with red lead. In many cases it seems to be a necessary portion of the ceremony that the victim should be eaten by those present. Thus in India, when the sacrifice is over, the priest comes out and distributes part of the articles which had been offered to the idols. This is received as holy, and is eaten immediately.

The terms used for the sacrifice are Bali, Tam.; Gavu, Tel.; Yagnya Magha, Sansk. When an ox, lamb, or fowl is offered up in sacrifice to a Devi or Mari female deity by the Sudras, the first two words are used. The words Yagnya Magha are used to indicate a sacrifice celebrated only by the Brahmans on occasions in which they offer goats and not any other animals. In the present day, the cow is not offered in sacrifice by any Hindu sect or race, but in the marriage ceremony of some parts of the country, where a milch cow, surābhi, is released on the intercession of a barber, sufficient remains to show that the rite was formerly practised at marriages for the sake of hospitality. The male buffalo is, however, frequently sacrificed, sometimes in considerable numbers; and only in 1859, the government of Madras ordered the magistrate of the Krishna division to forbid the cruel rite to Ammavaru, wherein buffaloes were impaled alive to appease that angry goddess, and avert cholera. On that occasion, in a small village, 12 to 24 buffaloes were sacrificed, as also several hundred sheep, and the heads of the sacrificed buffaloes were carried in procession on the heads of men.

Every hamlet of the southern parts of the Peninsula has its own object of adoration, village deities, always supposed to be a goddess. Amongst names given to it are—

Ankal Amma.	Tripura-sundari, or the beautiful of three cities.	Karikatta.
Poni Amma, or gold mother.	Osuramma.	Tanthoniamma.
Kani Amma.	Sellamma.	Dandumari.
Yegata, or sole mother.	Yellamma.	Mallamma.
Mutialamma, or pearl mother.	Padavettu Amma	Chinnamma.
Paleri Amma, or great goddess.	Tulukan Amma.	Ammanamma.
	Muttumari.	Choundeswari.
	Poteramma.	Vadivatta.
		Nagattamma.

They are called Amman, Amma, Amani, and Ai, all of them meaning mother. The villagers believe that these goddesses protect them from sickness and losses, and that their worship averts such or mitigates them. A pujali or pujari, a worshipping priest, of the Sudra caste, is appointed for her daily worship. He anoints her daily, and puts ashes on her head, really on the top of the stone, for it is not an image, being entirely without shape. In a small pot he cooks rice, which he collects from the villagers in turn, presents it to the idol, and then takes it to his own home. He breaks a cocoanut in front of

the idol, to which he offers it. But the one-half he keeps for himself, and gives the other to the families from whom he collected the fruit. The villagers make vows to their goddess to offer up to her fowls and sheep in sacrifice, if she will fulfil their desires. Once a year, the villagers collect money by subscription, and celebrate a feast in honour of their goddess, during which sheep and fowls are largely sacrificed. Many of the Sudra, and the entire servile tribes in the south of India, have the fullest faith in their respective village goddesses. When they or their children are overtaken by sickness, they seek the idol, and consult the pujari, who sings songs, affects to hear the Amman's voice, and then announces to the worshipper the offering that must be presented. If cholera break out, it is not unusual for some neighbouring village deity suddenly to rise into great importance, and the sacrificial rite is then almost unceasingly performed. The Hindus, too, have even personified this pestilence into a goddess, whom they have named Maha-Kali, the Great Kali, also Mari-Ai, the Death Mother, and believe that if they neglect her worship she destroys them by the disease. Indeed, gods are still in process of establishment, and smallpox and cholera have thus been personified. Maha-Kali of Ujjain being the goddess of cholera, and Mari Amman of the Tamil people, the Sitla Amman of Western India, a smallpox deity. When a person is attacked with smallpox, they believe that the goddess has taken possession of the sick man. They entertain a great dread of this goddess. While in the house, the sexes remain apart until recovery, and until the sick has been purified by ablution. They place the leaves of the margosa tree beside the sick person, because the goddess is supposed to delight in this tree. They give cooling food, but employ neither internal nor external remedies, in reverence for the deity. The women of the household offer rice flour mixed with jagari, or coarse sugar, and black gram (Pairu, TAM., Pesalu, TEL.), before the patient, in honour of the goddess, and afterwards distribute offerings to Sudras and others. On the seventh day, *i.e.* what medical men call the 15th day, the invalid is bathed in cold water, and the whole body rubbed with a pasty mixture of leaves of the margosa (Azadirachta Indica) mixed with turmeric, and on the same day rice mixed with curds are distributed to Sudras. If in the virulence of the disease an eye be lost, it is attributed to something having been done displeasing to the goddess. The goddess indeed is supposed to appear in three forms, as Tattu-ammavaru or Chinnamavaru, *i.e.* little small goddess; Peddammavaru, or great goddess; and Pairammavaru, or goddess of green gram, the two last of which are most feared.

The Amman worshippers almost all practise and believe in the efficacy of demon or devil or evil spirit rites, amongst which sacrifices always form a part. The sacrifice of the cock to the demon Peisachi, in this respect similar to the devil-worshippers in Kurdistan, is practised by all the non-Aryan people in the south of India, whether of the Brahmanical Hindu persuasion, or of the servile non-Hindu people.

Madan is very little known, but with a class of Tamil magicians is deemed a very great and powerful demon. He is generally courted by the Pariah, Chuckler, Lubbai, and uneducated Muhammadans, who offer beef and arrack to obtain his good-will and favour.

Living sacrifices of animals are an essential part of the worship of all the tutelary village goddesses in Southern India, as also of the goddesses of cholera, smallpox, etc. Their names are various amongst the several Tamil, Telugu, Canarese, and Mahratta nations. Ammun, Amoor Amma, Bal Amma, Poch Amma, Yellamma, Marri Ammun, Ai, Satwai Devi, Sitla Devi, and others, amongst whom, everywhere, Bal Amma and her worshippers seem dreaded the Pariahs who worship other of the Ammun goddesses refusing to intermarry with her devotees. The Yelm worshippers also are dreaded as sorcerers, and their wives are distinguishable by the mode in which they attire themselves with their saree, which they bring from behind, and from left to right. Satwai, amongst the Mahrattas, is a great goddess, to whom children's hair is devoted, the front part offered to her, the back part being retained till some other goddess possess the body (ang bharave), such as the smallpox goddess or cholera goddess Marri-ai.

In the bloody sacrifices of these non-Aryan races, the goat is the usual victim. The rite is ordinarily performed only once a year, when friends join to offer a goat, and make a feast of its flesh afterwards. At all the sacrificial oblations, bread and cereal grains are also offered, and used in the after-feasting. Thousands of sheep and fowls are annually sacrificed at Periya-palayam, a village about 30 miles from Madras, and multitudes of people attend from that city and the neighbouring villages, to celebrate the yearly festival, which takes place in the bright half of the month of Adi. Large numbers of buffaloes were, until the middle of the 19th century, offered at the funeral rites of the Toda of Ootacamund, but the Madras Government put a stop to such wholesale massacre, and restricted the rite to the killing of only two animals at a time,—a measure which the Toda race viewed with unaffected alarm and dislike, as likely to decrease their children and cattle. In 1883, a race at Kotagherry applied for permission to sacrifice a sambur. The Irular race of the Neilgherries sacrifice to their deities a he-goat or cock, by cutting the victim's throat, and throwing it to the idol. This is a winnow or fan, which they call Mahri, and is evidently the emblem of Ceres; and at a short distance in front of the rude thatched shed, which serves as a temple, are two rude stones, one called Moshani, the other Konadi Mahri, but which are subordinate to the fan occupying the interior of the temple. Human sacrifices are still, in Southern India, deemed to be requisite to mollify goddesses and demons who guard hidden treasure, and who are believed to have a partiality for the blood of a pregnant woman, especially of one who is conceived of twins, and to the firstborn of the goldsmith caste; indeed, in popular belief, in the year 1860, one of the latter was supposed to have been very recently offered. There is a shrine of Vatrappa-nachiyar, the tutelary goddess of Tiruvattur, a village to the north of Madras, on the road to Ennore; this is situate in a part of the great and much-frequented pagoda of Tiyagaraia Sami, for which the village is celebrated in ancient Hindu

books. The sacrifice now offered there is that of a male buffalo, but is conducted with great secrecy, and people are not generally admitted to witness it. Indeed, the dread of witnessing the sacrifice and its attendant ceremonies are so great, that pregnant women are, if possible, kept out of the village for fear of abortion, which is believed to be the certain result should the shrieks of the men who carry the raktabali fall on their ears. This raktabali (Rakta, blood; Bali, sacrifice) is assumed to be the food for devils and the attendant spirits of the goddess, and consists of rice mixed with the sacrificial blood. It is carried only during the last day of the annual festival of the goddess, after midnight, in an earthen pot of a peculiar shape and design, by men specially allotted to the duty. They run and shriek and howl in the street to scare away the devils and evil spirits, and halt at the corners and windings, and throw balls of this blood-mixed rice to the demons, etc. It is considered to be an evil omen for any man to meet them in their rounds, as fever, madness, and disease might befall him.

All treasure concealed underground for a length of time is said to become the property of demons, who take charge of and only part with it to those who satisfy their desire for blood; the greater the demon, the higher is the kind of sacrifice he demands.

The Gond worship many deities, to whom they offer fowls, goats, fruit, rice, grain, spirits, and whatever the country affords.

The Woon district in East Berar came under the care of the British about the middle of the 19th century, when Berar was assigned by the Nizam of Hyderabad. Before the assignment, searchers for treasure used to offer human beings in sacrifice, but the victims there are now confined to buffaloes, sheep, goats, and fowls. A buffalo is sacrificed in every village in the Dasserah festival, to the goddess of kine, Gaodevi, and the buffalo is led up to the house of the head-man of the village, who makes to it oblations of flowers, etc. He then strikes it on the muzzle with a sword, and allows the blood to fall on the ground as a libation to the goddess, to appease her anger. It is then led to the door of every house in the village; each householder makes a money present to the leader; in the evening the victim is killed by its throat being cut, and at the south boundary of the village a drop of its blood is applied to the foreheads of the head-man, of the potail, the deshpandi, and deshmukhs. Outside of every Woon village is a shrine of the smallpox goddess, called there Sitla Devi. It is merely a few stones coloured with red lead; and after recovery from this ailment, the family in which the disease has been visit the shrine, offer a goat as a victim, and prepare food for this oblation.

With the Kol, one or two of the Hindu gods are reverenced, but they have many of their own non-Aryan deities, to which they mostly resort. They sacrifice fowls, and pour libations before eating. Colonel Tod describes a lofty three-peaked mountain in the Vindhya range on which is a temple dedicated to Aya-mata, also called Isani, the tutelary divinity of the Kol, and he mentions that Isani and the effigy of the horse are the only objects worshipped among this aboriginal race. He mentions that Isani means mother-earth, from Isa, goddess, and Anani, earth. The chief divinity of the Larka Kol is the sun, suraj; and next to the sun ranks the moon, chanda; and then the stars, which they believe to be the children of the moon. Besides the sun and moon, there are spirits called bhonga which inhabit the trees and groves in and around the village, and those trees are never denuded of their branches or cut down. When labour-pains come on, the women are shut up in a lonely hut, offerings are hung up near to propitiate the bhonga, and no one ventures to approach till the labour is over.

The Kandh had long been addicted to sacrifice human beings to the earth goddess. The victim was always purchased, and was destroyed with much ceremony, in the midst of assembled Kandhs, each of whom tore off a portion of the body to bury in his field as a propitiation.

The Indian Government became aware of the Kandh custom about the year 1834, and took immediate measures to induce them to discontinue it, and the year 1860 passed by without a single meriah. Captain MacViccar and Colonel Campbell exerted themselves to suppress it. Among the Kandhs, when performing this meriah sacrifice, which was quite common up to the year 1850, a stout stake was driven into the soil, and to it the victim was fastened, seated, and anointed with ghi, oil, and turmeric, decorated with flowers, and worshipped during the day by the assembly. At nightfall the licentious revelry was resumed, and on the third morning the victim got some milk to drink, when the presiding priest implored the goddess to shower her blessings on the people, that they might increase and multiply, prosperity attend their cattle and poultry, fertility their fields, and happiness to the people generally. The priest recounted the origin and advantage of the rite, and concluded by stating that the goddess had been obeyed and the people assembled. Other softening expressions were recited to excite the compassion of the multitude. After the ceremony, the victim was taken to the grove where the sacrifice was to be carried out; and to prevent resistance, the bones of the arms and legs were broken, or he was drugged with opium or datura. The Janni wounded his victim with his axe, and this act was followed up by the crowd, who pressed forward to obtain a piece of his flesh to bury in their fields, and in a moment he was stripped to the bone.

At Bombay, Kali is worshipped at Sitali, and at other places, as Devi, Mata, and Amoor Amma. At Chanda and Lanji she has temples in which human victims were offered almost up to the middle of the 19th century. The victim was taken to the temple in the evening and shut up, and in the morning he was found dead, the dread goddess having 'shown her power by coming in the night and sucking his blood.' At Dantewada, in Bastar, about 60 miles S.W. of Jagdalpur, near the junction of the Sankani and Dankani, tributaries of the Indrawati, is a shrine of Danteswari, at which, about A.D. 1830, it is said that upwards of 25 full-grown men were immolated on a single occasion by a raja of Bastar. Since then, adds Mr. Hislop, numerous complaints reached the Nagpur authorities of the continuance of the practice, up to the time of the annexation by the British. Captain Clune, writing in 1828, says

that when a rana of Mewar had occasion to pass the Mahi river, an individual from a tribe descended from a Chauhan Rajput and a Bhil mother was sacrificed, his throat being cut and his body thrown into the river. This sacrifice had been once performed in the lifetime of the rana then reigning. Dr. Mason relates that when, about A.D. 1780, the gates of the new city of Tavoy were erected, a criminal was put into each post hole, and the massive posts thrown in upon him, so that his blood gushed up at the sides. His spirit was supposed to become a Nat, that would hover about the post, inflicting evil on all who came near, thereby contributing to the defence of the town.

Human sacrifices and the ornaments of the victim are alluded to in the Toy Cart or Mrich-chi-kati, and in the Malati and Madhava, two ancient Sanskrit dramas. Madhava comes on the scene when the Aghora Ghanta is preparing to offer Malati, and he exclaims:

> 'What luckless chance is this, that such a maid
> With crimson garb and garland, like a victim
> Adorned for sacrifice, should be the captive
> Of impious wretches!'

In like manner, the ordinary victims of the Greeks were adorned with crowns and garlands, as thus, in the Clouds, in the scene between Socrates and Strepsiades:

> '*Socr.* Now take this chaplet—wear it.
> *Strep.* Why this chaplet?
> Would'st make of me another Athamas,
> And sacrifice me to a cloud?'

So also in the Heraclidæ, Macaria, when offering herself as a victim to secure the triumph of the Athenians, exclaims:

> 'To the scene of death
> Conduct, with garlands crown me!'

The translator of Euripides also observes that human sacrifices at their first origin appear to have consisted of virgins or young men in the state of celibacy, and in this respect the selection of Malati offers another analogy. The words translated above impious wretches, Pashanda and Chandala, mean aboriginal races, heretics, and out-castes. These epithets indicate little respect for the worshippers of Durga, and their application so publicly declared would lead us to infer that the author's sentiments were those of his age. Jagaddahara states that in the rite two legal prohibitions are violated, of which he gives the text; they are, 'Let him not eat from the leaf of the asclepias, nor slay a female nor child;' also, 'Females of every description of being, it is well known, are not to be slain.'

In addition to the village deities noticed, the only goddess who requires victims is the Sakti of Siva, defined by her votaries to be the visible energy of the divine essence symbolized as a female. She is highly venerated during the nine days of the Dassera or Navaratri (the nine nights), at the close of which a sheep is generally offered in the houses of Rajputs and Mahrattas. The sacrifice of buffaloes on the occasion is very rare, and when it is offered, the ceremony takes place in temples sacred to this goddess, but sometimes in jungles and unfrequented parts. The goddesses and demons of the Sudras all accept bloody sacrifices, which are generally accompanied with the offering of spirituous liquors. As a general rule, the offering of such sacrifices among the houses of educated Hindus, and in the superior temples, is observed with great secrecy.

Man, as a victim, is still being offered up in many other parts of the world.

Human sacrifices of the most extensive character, and ancestral worship, still prevail in Dahomey, and in all Africa a serpent-worship prevails. So many as 600 victims have been offered up at Dahomey at one time.

At Quendendes village in South Africa, Dr. Livingstone found human sacrifices frequent; and when a chief dies, a number of his servants are slaughtered, to form his company in the other world, a custom which the Barotse also follow. Also, in many of the Polynesian islands, up to the present date, human beings are sacrificed on commencing to build a war-canoe, a chief's house, or on the death of a chief.

In a chapter on human sacrifice in Dr. Norman Chever's book on Medical Jurisprudence, the author writes of human sacrifice by decapitation as an existing practice (pp. 408, 410), and says there are 'strong reasons for believing that there is scarcely a district in India in which human sacrifice is not still practised occasionally as a religious rite.' Doubtless, the old sanguinary expiatory ideas still lurk in the breasts of the masses, and in face of impending famine or pestilence, when men's apprehensions are most deeply stirred, the offering of a human victim to the power which can inflict hunger or disease, instead of the usual goat or buffalo, is not a violent or unnatural step. Ideas of this nature, formulated under the terms sacrifice and atonement, are essential axioms in comparative religion, and their abandonment is only to be hoped for as part and parcel of a refinement of national thought and habit. To this end, general education, and more particularly education in the physical sciences, and the fostering of a belief in general laws and a benevolent God, are the great means, and the increasing power of the British in India may lead to the discontinuance of such barbarities.

The Reverend Mr. Ward, writing regarding Bengal in the early part of the 19th century, mentions that at a village called Ksheeru, near the town of Bardwan, human sacrifices were offered to the goddess Yoogadya, a form of Durga; at Kirectukona, near Murshidabad, to Kali; and at many other places. The discovery of murders in the name of religion was made by finding bodies with the heads cut off near the images; and the natives well knew that these people had been offered in sacrifice. At the village of Serampur also, near Kutwa, before the temple of the goddess Tara, a human body was found without a head; and inside the temple, different offerings, as ornaments, food, flowers, spirituous liquors, etc. All who saw it knew that a human victim had been slaughtered in the night, and search was made after the murderers, but in vain.

On the N.E. frontier of British India, several Mongoloid races sacrifice human beings till now. The object of the Kuki inroads on the plains is not plunder, for which they have never been known to show any desire, but they kill and carry away the heads of as many human beings as they can seize, and have been known, in one night, to carry off fifty. These are used in certain cere-

monies performed at the funerals of their chiefs, and it is always after the death of one of their rajas that their incursions occur.

In Manipur, Cachar, and Assam, according to the Calcutta Review for 1860, the offering of human sacrifices was still continued. By the records of the Sudder Nizamat Adalut of Chittagong for 1852, some men of the Toonia Joom Mahals were tried for murder by sacrificing. This is a forest tract in the hills, and inhabited by the Mug, Chukma, Reang, Tiperah, and other races, all more or less nomadic. The place of sacrifice was a cleared spot in the jungle, and staked round with bamboos about 6 feet high. The sacrificial pole, the Phula bans, are bamboos scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. These sacrifices generally occur once a year. During its celebration at Agartollah, a gun is fired every evening at sunset, when every person hurries to his home. The Kuki and all the hill tribes worship local deities, said to be 14 in number.

According to Dr. W. W. Hunter, the Hadi are a helot race spread over all Bengal, who take their name from the original Santali word for man, 'Had,' and who have supplied such terms as hadd, base, low-born; hadduk, a sweeper; hunda, hog, blockhead, imp; hudduka, a drunken sot, etc.; also hadi, in low Bengali hadikath, is the name of a rude fetter or stock, by which the landholder used to confine his serfs until they agreed to his terms. It means literally the helot's log; it was also used for fastening the head of the victim in the bloody oblations which the Aryan religion adopted from the aboriginal races, especially in the human sacrifices to Kali, to which the low castes even now resort in times of special need. In an account of the last human offerings to Kali, during the famine of 1866, it was mentioned that the bleading head was found fixed on the harcat, *i.e.* helot's log.

In a war between two Arab chiefs, in the time of Belisarius, but which was carried on without the interference of either Persia or Rome, the son of Horeth fell into the power of the Mondar of Hirah, who sacrificed him to Uzza, the deity worshipped by his tribe. Al-Azu of the ancient Arabs, is the same with the lingam of the Hindus, and to this emblem human sacrifices still occur.

Human sacrifices till lately were common with the Garo as offerings to the manes of deceased chiefs. The Burmese stopped the practice amongst the Chutia. It was annual, and the victims had to be provided by a particular tribe, who were rewarded by being exempted from service and taxes. The Koo Karen are reputed to torture human victims in the same manner as they torture the Gayal, by despatching it with numberless spear wounds. The Bhuiya of Keonjhur Hills, in the Tributary Mahals of Bonai and Gangpur, and Bamra, so late as 1st May 1868, performed a human sacrifice.

So late as 1859, the July number of the Calcutta Review (p. 423) remarks that 'in Bengal, in the worship of the bloody Kali, all castes mingle together, and, after a libation of ardent spirits to the goddess, drink spirits and eat flesh, as their fathers did in the Vedic times. It is practised also to this day in the foul and secret rites of the Tantra. A festival held in honour of Kali is called also Kali-puja, as the Dasra in honour of the same deity, under the name of Durga, is called also Durga-puja and Durgotsava.'

The body of a man, named Rama, resident of the village of Narsipur, in the Shimoga district, was found in a small temple on the 18th of February 1875. He was a lingayet worshipper of Siva, aged about 22 years, of a retiring disposition, and given to reading religious books. The temple is a small, low building cut into the hill, and consisting of three rooms: first the outer one supported on pillars, then an inner square one, and inside this again the very small one or sanctum, containing the lingam. In the middle room the body was found lying on a blanket, on its right side. The arms were crossed on the chest, the last joints of the five fingers of the left hand were cut off, and were in front of the idol, between it and the door, arranged in a line; and still nearer the door, in front of the idol, blade toward it, was found a kudigol or sickle-shaped knife, besmeared with blood. Two days previous to the discovery of the body, two pujali came to the temple, and on attempting to open the door, they were warned by a voice from within to be off, that there were scenes of wonder being enacted inside which it would not be well for them to witness, and so they left.

A correspondent sent the following report to the Madras Times, of a case of human sacrifice which occurred in the Patna Feudatory State, in the Central Provinces. The chief of the Gonds of the Alardu ground of villages was sitting by the side of a road during the Dusserah festival, talking to his uncle, a chowkidar, and a liquor-seller. Presently a strolling minstrel appeared on the scene, and salaamed to the chief, who asked him if he drank liquor. The minstrel replied that he did, so the chief caused him to be served with some toddy, which the party had with them. The Gond chief and the liquor-seller then went into the jungle, the remainder of the party stayed talking by the side of the road. When the chief and the liquor-seller returned, the latter went up to the minstrel, and, seizing him by his hair, pulled him down. The Gond chief said to his uncle, 'Take your axe and cut the minstrel's throat.' Accordingly the chief's uncle sat astride the minstrel's chest, and cut his throat with an axe, the Gond chief in the meantime holding a lota belonging to one of the party to catch the blood which gushed out. The minstrel died at once, and the chowkidar and the liquor-seller chopped up the body, and, taking it a little way into the jungle, buried it there. The whole party then proceeded to the temple of the goddess Duarini, which they reached about 10 P.M. The chief, leaving the others outside, went in and woke up the pujali, saying, I have brought an offering of liquor for the goddess, do you pour it over her image. The pujali at first refused, but afterwards, yielding to the earnest solicitations of the chief, took the lota and poured its contents over the stone image of the goddess. Seeing the contents were blood, he inquired from whence it came. The chief said it was the blood of a buffalo bull. He then went outside, and joining his party, they all returned home. About ten days after the murder, the minstrel's relatives, finding that he did not return, gave information to the police, and on an investigation being held, the chowkidar confessed fully, and on his confession,

the chief, his uncle, and the liquor-seller were brought to trial before the commissioner of the Ch'hattisgarh division, and were sentenced by him to be hanged.

Captain Postans, writing on Western India, tells us that Brahmans of the Dekhan long preserved the custom of yearly sacrificing an aged woman, on the occasion of the raja of Sattara's visit to the fort of Partabghur. There is, toward the close of the 19th century, a numerous tribe of Brahmans who are still accused of the practice. They are the Kurrada, and are inhabitants of the Konkan. They were noticed in 1808 by Colonel Walker, Resident of Baroda, and subsequently by Sir John Malcolm in his History of India, and the latest reports from that neighbourhood show the belief that the practice of sacrificing human beings still continues amongst them. The goddess of their worship is Maha Lakshmi, to whom they believe human sacrifices are acceptable, and the more so if the victim is a Brahman learned in the shastras. Kurrada Brahmans are accused of effecting, by the secret operation of poison, that object. Colonel Walker knew several Kurrada Brahmans who, admitting the former prevalence, most strongly denied its present practice, but many people would decline to eat of food prepared by a Brahman of this tribe, of which he himself should not at the same time partake. Sir John Malcolm also states of the Kurrada Brahmans that they had a custom at Poona of annually sacrificing to the Sakti a young Brahman; and as, according to the sacred books, if the victim is unwilling, the sacrifice is forbidden, to prevent the possibility of such an occurrence, the unsuspecting but devoted one is frequently the stranger, who for months, or perhaps years, had shared the hospitality of his murderer. On one such case occurring, orders were issued for the apprehension of a Kurrada Brahman and his family, who themselves were put to death, whilst every priest of the sect was expelled from the city of Poona, and their return forbidden by the heaviest penalties.—*Milman's Hist. of Jews*, 4th edit., i. pp. 24, 154; *William Howit, The Supernatural; Bunsen, Egypt; Georgic*, lib. iii. p. 5; *Sharpe's Egypt*, i. p. 163; *Early Christianity in Arabia; Colonel Forbes Leslie; Lubbock, Origin of Civil.; Kenrick's Phœnicia; J. SACRIFICE ROCK, on the W. coast of the Peninsula of India, lies 4½ miles off the nearest shore, 15¼ miles from Tellicherry. It is whitish in appearance, 40 feet high, and has edible birds' nests on it. Dr. Fryer, who visited India in 1673, says that at Mangalore the Dutch had a fort, and, 6 miles to the north, the French had a flag flying; within a league of which a grey rock extols its hoary head eight fathoms above water, navigable on all sides, justly called by us Sacrifice Island, in remembrance of a bloody butchery on some English by the pirate Malabars, who are the worst pickeroons on this coast, going in fleets, and are set out by the great men ashore, the chief of whom lives at Durmapatan.—*A New Account of East India and Persia, etc.* p. 55, Lond. 1698; *Ouseley's Travels*, i. p. 68.

SADA, Hindu Unitarians, which their name Sada or Sad'ha, HIND., pure or puritan, implies. They originated in A.D. 1658 with a person named Birbhan. They have no temples.

SADACHARAS. SANSK. Fixed religious observances of the Hindus.

SA-DANG, also Saundang. BURM. A measure of length in Pegu = 0·601 yards.

SADARO, a shirt assumed and worn by the Parsee race as a token of admission to their faith.

SADASHEGHUR, a small seaport town on the west coast of India in the N. Canara district of the Bombay Presidency, in lat. 14° 51′ 25″ N., and long. 76° 10′ 55″ E. The prevalence of heavy breakers outside and across the mouth of the bay, from Carwarhead to Deoghur Island, and also throughout its interior (except close under the Head), during the height of the S.W. monsoon, render it dangerous at such times for inward-bound vessels to make the anchorage, and impossible for those outward-bound to put to sea.

SADASHYA. SANSK. Bystanders at a council, whose business it is to notice and correct mistakes. The Sadashya regulates the ceremonies of worship, but is not employed on all occasions.—*Ward's Hindoos*, ii. p. 17.

SADAT, ARAB., plural of Syud. This word in the northern Hejaz and in British India is applied indifferently to the posterity of Hasan and Husain, sons of Ali and Fatima, and grandsons of Mahomed. The descendants of Ali by other wives are styled Alavi Sadat.—*Burton's Mecca*, ii. p. 263.

SADA-VART or Sada-bart, a poorhouse for distributing alms to the poor, in the form of food or money, and daily or periodically.

SADDAIMUNI is said to have been a Saiva devotee, who lived at the same time as Agastya. A Vedantic treatise, Gnana Nuru, a work on medicine, Kalappa Nuru, and one on alchemy, Vata Nikandu, are attributed to him; but they are forgeries.

SADDLE.

Sarj, ... ARAB.	Sela, ... MALAY.
Selles, ... FR.	Zin, ... PERS.
Sattel, ... GER.	Sadla, ... RUS.
Zin, Koghir, GUJ., HIND.	Selles, ... SP.

Kakapa, Palana, MALAY.	

The saddles of Europe are made with a wooden framework covered with leather of different kinds, and with intervening padding. Those in use in Asia are made of cloth or felt (namdah), with or without a wooden framework, and the different races in Sind, in Kattyawar, Tibet, and Hindustan

have each their own peculiar forms. Their saddle-cloths are often embroidered. At the Exhibition of 1851, the saddle-cloths and matchlock accoutrements from the raja of Kotah had a pattern produced with gold-headed nails fixed into green velvet. The effect of this was so good as to be greatly admired by some of the best judges.—*Royle's Arts, etc., of India*, p. 508.

SADDLE ISLAND, in the Red Sea, has active volcanoes.

SAD-GOP, a cowherd race of the N.W. Provinces. They have no connection with the other Gowalla of Bengal, and neither intermarry with them, nor follow the same pursuits.—*Cal. Rev.*, No. 110.

SAD'H or Sad'hu. SANSK. Pure, pious, virtuous, good; a person leading a pious or religious life, an ascetic, a mendicant, a monotheist sect of Hindus, whose chief seats are Dehli, Agra, Jeypore, Farrakhabad, but there are several of the sect scattered over other parts of the country. The Sad'h utterly reject and abhor all kinds of idolatry. They say Sad'h, the appellation of the sect, means 'servant of God;' its real meaning is pure, from Sad'ha, pure. They are pure deists, and their form of worship is most simple. Sad'hs resemble the Quakers, or Society of Friends in England, in their customs in a remarkable degree. Ornaments and gay apparel of every kind are strictly prohibited. Their dress is always white. They never make any obeisance or salutation. They will not take an oath, and they are exempted in the courts of justice, their asseveration, like that of the Quakers, being considered equivalent. The Sad'hs profess to abstain from all luxuries, such as tobacco, betle, opium, and wine. They never have exhibitions of dancing. All violence to man or beast is forbidden; but in self-defence resistance is allowable. Industry is strongly enjoined. Their nuptial rite is simple, all unnecessary expenses being scrupulously avoided. Polygamy is never allowed, and even widows are forbidden to unite with a second husband.—*Cole. Myth. Hind.*

SADHAN, a devout Hindu butcher of Benares who lived in the 17th century, and was fervent in the observances of his religion. He is fabled to have miraculously weighed all his meat with a saligram, and without dying to have ascended to heaven.—*Sherring*, p. 266.

SAD'HI RAM DAS was the first Sikh guru of the Sad'hi tribe, and hence was named Ram Das, Sad'hi. The Sad'hi were numerous about Muckawal about the middle of the 19th century.—*MacGregor's Sikhs*, i. p. 29.

SADHUA PANTHI, a Vaishnava sect of Hindus in the N.W. Provinces of India; originated by Sadhua, a butcher.

SAD'HWIA, a Hindu female saint. Sad'hya, SANSK., is from Sad'h, to perfect.

SADI, a Persian poet, a beautiful writer in his own peculiar way. Though inferior to Hafiz in lyric poetry, his works are much more voluminous and diversified, embracing all kinds of composition in prose and verse. Sadi was his literary takhallus or title, given, it is said, because he lived in the reign of Sad-bin-Zangi, king of Persia. His name was Shaikh Masalah-u-Din. He was born at Shiraz A.D. 1194, and died there A.D. 1292, at the age of 98 solar years. He was a man of much learning and great piety, real or pretended. He travelled as a darvesh during the greater part of his life, and made the pilgrimage to Mecca no less than 14 times.

SADID-ud-DIN GAZERUNI, author of Ul-Moghni-fi-Sharh-ul-Mujiz, a commentary on the Commentary of Ala-ud-Din Ali on Avicenna's Qanun fi't Tibb.

SADIYA, village in Lakhimpur district, Assam, in lat. 27° 49′ 45″ N., and long. 95° 41′ 35″ E., on the right bank of the Brahmaputra, about 100 miles above Dibrogarh, and 210 feet above the sea. Sadiya is the extreme N.E. frontier outpost of British India. The river is navigable thus far in the rains. In 1839, the Khamti tribe rose in rebellion. They cut off the outpost at Sadiya, and killed Major White, the commandant and political agent, together with the detachment of sepoys. In order to promote friendly relations with the neighbouring hill tribes of Khamti, Mishmi, and Singpho, a fair is held in February. The hillmen bring down caoutchouc, wax, musk, cloth, mats, daos or hill-knives, and ivory.—*Imp. Gaz.; A. Schlagentweit.*

SADOZAI, a title of the Daurani Afghans. They ruled in Kābul from A.D. 1747 until they were put aside by Dost Muhammad Khan, a chief of the Barakzai.

SADQA. ARAB. Sacrifice. Sadqe-hona or Sadqe-jana, to become a sacrifice for another. Sadqe-karna, to sacrifice for the welfare of another.

SADR. ARAB. Chief, principal. Sadr adalat, the chief court of justice; Sadr Diwani adalat, the chief civil court; Sadr foujdari adalat; Sadr Nizamat adalat, the chief criminal court. Sadr-amin, a judicial functionary; Sadr mal guzar, in the revenue system, the head-man of a village who collects and pays the land-tax. The Sadr-amin of the British is a subordinate judge with limited civil and criminal jurisdiction.

SADRAS, correctly Satranja-pataua, a small seaport town on the Coromandel coast, in lat. 12° 31′ 15″ N., and long. 80° 12′ E. Population, about 1144. Sadras first became a trading settlement of the Dutch in 1647, and was long famous for the fineness of the muslin produced by its looms. The British captured it in 1795. It was temporarily restored to the Dutch, but has been an English possession since 1824.—*Imp. Gaz.*

SADRPUR, a pargana in the Sitapur district of Oudh; Muhammadans form the principal proprietary body, owning 119 villages; Raikwars hold 11; Seths, 5; Janwar Kshatriyas, 4; Panwars, 4; Kashmiri Brahmans, 4. The remaining 23 are chiefly held by Kayasths.—*Imp. Gaz.*

SADULLAPUR, a village in Maldah district, Bengal. The chief descent or ghat to the holy stream of the Bhagirathi is at this place, to which the dead bodies of Hindus are brought from great distances to be burned.—*Imp. Gaz.* viii.

SADWAR. HIND. Pikemen in the Northern Circars.

SAFA. HIND. A small, close-fitting, coloured turband, worn under the dastar.

SAFDAR ALI, a Muhammadan chief who was engaged in the contest for supremacy, and was for a short time a nawab in Arcot, but was murdered there by Pathans and Abyssinian slaves. He left a posthumous and only son.

SAFED KOH, a range of mountains in Afghanistan, which commences from a few miles west of the Shutargardan pass, between Kuram and

Logar. Its highest point is the Sita Ram mountain, 15,622 feet above the sea, whence the range is perhaps nowhere less than 12,500 feet, until it again culminates in a double-peak mountain, whose summits average 14,800 feet. It throws out to the north a spur which forms the east watershed of the Logar river, and, dividing it from the Khurd Kābul river, ends at Bhutkhak. Another spur separates the Khurd Kābul and the Tezin rivers, and over it run the Haft Kotal and Lata-band passes. Another spur, after running north for about 30 miles to the north of Jagdalak, turns to the east, parallel with the Kābul river, and ends at the junction of the Surkhab with that river. Other north spurs run between the streams which flow down from it into the Surkhab or the Kābul river. Of these the principal are, commencing from the west, the Gandamak, Karasu, Chiprial, Kisarak, Kote, and Mohmand. On the south of the range is a spur which runs out from the Shutargardan pass, and drains on the north and east into the Hazardarakht and Hariab streams, and on the south into another source of the Kuram; and a second south spur is the Peiwar Kotal, which comes out from the Sita Ram peak, 15,622 feet, and ends at the Kuram, draining into the Keria and Hariab rivers on the west and the Peiwar on the east.—*Walker; Moorcroft*, ii. p. 355; *Mohun Lal's Tr.* p. 339; *MacGregor's Afghanistan*, p. 686; *Imp. Gaz.; Bellew.*

SAFFAVI, a dynasty which ruled in Persia. See Khalifs.

SAFFLOWER, Bastard saffron.

Usfar, ... Arab.	Kussum, Kussumba, Hind.

Two species yield the safflower of commerce, viz. Carthamus tinctorius, which has small leaves and an orange flower; and C. oxyacantha, with larger leaves and a yellow flower, a native of Caucasus. The former is cultivated in every part of the E. Indies, in China, America, Spain, some of the warmer parts of Europe; is indigenous to the whole of the Indian Archipelago, and a large quantity is grown in and exported from Bali.

It has been noticed under its Latiu name Carthamus tinctorius, also under Dyes, but it may be mentioned here, that though still largely used throughout the East Indies, and exported from British India, the aniline dyes are being preferred to it even in the places of its growth. The safflower exported from India was—

	Cwt.	Rs.		Cwt.	Rs.

Safflower oil, Poliyan of the Panjab, and Karirma safir of the Persians, is a light-yellow, clear oil, obtained from the seeds when properly prepared. It is used in India for culinary and other purposes. This oil deserves more attention than it has hitherto received. It is used in some of the Government workshops as a 'drying oil.' It is believed to constitute the bulk of the celebrated Macassar oil.

SAFFRON.

Rootla saffron, Ang.-Hd.	Asafran, ... Fr.

Safran, ... Dut.	Khohun, . . . Singh.

Crocus sativus, the saffron plant, has been noticed under that head. It is a native of Asia Minor, naturalized in many parts of Europe, and cultivated in Persia and Kashmir. The Chinese obtain it from Tibet. It is brought to India from Great Britain, the seaports of the Red Sea, Persia, and Kashmir. The dried stigmata of the flower are picked out, dried on paper either in a kiln or by the sun. If compressed into cakes, it is called cake saffron. Hay saffron, that usually met with, consists of the stigmas, each about an inch and a half long. One grain of good saffron contains the stigmata and styles of nine flowers, so that one ounce of saffron is equal to 4000 flowers. The dried pistils, compressed into firm cakes or masses, are termed in India rootla saffron. Cake saffron, as now met with, is prepared from the florets of the safflower. Saffron is used in medicine, and as a dye, and in India also by women to tinge the skin of the body of a light-yellow colour, but the aniline dyes are everywhere displacing it. To put on the saffron robe is the sign of 'no quarter' with the Rajput warrior. It is employed as a seasoning in cookery, also to colour confectionery, liquors, varnishes, and it is used to a small extent by painters and dyers. The colouring ingredient is a peculiar principle, to which the name of polychroite has been given. It possesses the properties of being totally destroyed by the action of the solar rays, colouring in small quantity a large body of water, and of forming blue or green tints when treated with sulphuric and nitric acid or with sulphate of iron. In the Arabian and Hindu schools of medicine, it continues to be used. The Arabians class it amongst their Mosébetat (Hypnotica), Mokewyat (Cardiaca), and Mufettchat (Deobstruentia).

SAFI are a widely-spread people occupying Dara Nur, Dara Mazar, Dara Pech, and the valleys opening on the Khonar river, also in a district called Surkh Khambar, south of Bajur, and they inhabit Taghow. They speak the Afghan dialect, but also Pashai. In the emperor Baber's time, they were styled Kafir, and they were subsequently expelled by the Ghilzai from the lands to the south of Taghow, and between Kābul and Jalalabad. Nadir Shah cultivated a friendship with them. South of the Safi, at Bahi, the first march from Goshter, on the Jalalabad river, towards Bajur, are a people called Yeghani, who consider themselves Afghans, but are probably converted Kafir, for they speak a dialect which no Afghan can understand.—*Masson's Journeys.*

SAG. Beng., Hind. Greens; green vegetables; any vegetable pot-herb. Corchorus olitorius, gogi sag, is Malva parviflora; Jau sag is Chenopodium album; Phapru sag is Pharbitis nil; Rin sag is Phytolacca decandra.

SAGA. Siam. The red seeds of Abrus precatorius, 32 of which make a phainung, worth about ¾d.; a gold and silver weight used in

Malacca, the 12th of the mayam, and = 4·33 grains.—*Simmonds' Dict.*

SAGAH BARK. Anglo-Malay. A bark of Singapore, resembling mangrove bark in appearance, and employed as a dyeing material.

SAGAI. Hind. Betrothal; from Saga, also Sagawat, relationship.

SAGALA was the capital of the Bactrian dynasty that ruled in the Panjab, and its name was changed by Demetrius to Euthymedia. Bayer says that according to Claudius Ptolemy, there was a town within the Hydaspes yet nearer the Indus called Sagala, also Euthymedia, but he scarcely doubts that Demetrius called it Euthydemia, from his father, after his death, and that of Menander. Colonel Tod supposes Sagala to be the Salbhanpura of the Yadu when driven from Zabulisthan, and that of the Yu-ti or Yu-chi, who were fixed there from Central Asia in the 5th century, and if so early as the 2d century when Ptolemy wrote, they may have originated the change to Yutimedia, the Central Yu-ti.—*Hist. Reg. Bact.* p. 84. See Bactria.

SAGAPENUM.

Sugbinuj, Sakbenuj, Arab.	Sagafiun, . Gr., Pers.
I-sus, ... Bombay.	Kundil, Sagbenuj, Hind.
Sagapenummi, . . Ger.	Sagapeno, ... It.

A concrete gum-resin, supposed by some authors to be from the Ferula Persica. It is obtained from Smyrna, Alexandria, etc., in masses formed of soft, adhesive fragments, the size of the thumb or more, somewhat transparent, reddish-yellow externally, pale within, of a waxy or brittle consistence, often mixed with impurities and seeds. Its odour resembles that of garlic and asafœtida; its taste is hot, nauseous, and rather bitter. Its medicinal uses are the same as those of asafœtida, but it is considered less energetic, and is but little employed. It is sometimes adulterated with bdellium, gunda birosa, and other similar gum-resins or turpentines. It is collected in the same manner as asafœtida.—*O'Sh.* p. 363.

SAGAR or Sagara, an ocean, a sea, any inland sea or artificial lake; also the low lands at the mouths of the Delta of the Ganges where the Hoogly branch falls into the sea. Ganga Sagara, the place where the Bhagirathi leaves the Ganges to the ocean.

SAGAR, a town of the Central Provinces of British India, in lat. 23° 49′ 50″ N., and long. 78° 48′ 45″ E., with a population in 1872 of 45,655 souls. Sagar stands 1940 feet above sea-level, on the N.W. borders of a lake nearly a mile broad, and said to be an ancient Banjara work. A Bundela raja built a small fort on the site of the present city in A.D. 1660, and founded a village, called Parkota, now a quarter of the modern town. Sagar town is the headquarter station of a district of the same name, lying between lat. 23° 4′ and 24° 27′ N., and long. 78° 6′ and 79° 12′ E. Area, 4005 square miles; population in 1872, 527,725 persons. Sagar district occupies, with that of Damoh, the high Vindhyan table-land which stretches out on the north-west corner of the Central Provinces. The cultivators are the Kurmi and the Lodhi. The Gond, 24,217, comprise about 4·63 per cent. of the population, and the predatory criminal Khangar and Kohri are non-Aryan races. The Kohri dwell on the borders, near Native States, to which they resort if pressed by the police.

In the beginning of the year A.D. 1818, by a treaty concluded between the Peshwa Baji Rao and the British Government, Sagar, with the greater part of the present Sagar district Damoh, Jubbulpur, and Mandla, were made over to the British.—*Imp. Gaz.*

SAGAR or Saugor Island is at the mouth of the Hoogly river, Bengal, in lat. 21° 35′ 30″ to 21° 56′ 30″ N., and long. 88° 4′ 30″ to 88° 14′ E. Its lighthouse is in lat. 21° 38′ N., and 88° 1′ E. long. It is 21 miles in length and 6 in breadth, and is low, but as it lies upon the extreme edge of the deltaic basin, it is consequently higher than the centre of the delta. The remains of tanks, temples, and roads are still to be seen, showing that it was once more densely populated than it is now, and native history informs us that Saugor Island has been inhabited for centuries. During the operation of clearing Saugor Island in 1822 to 1833, and later when clearing away the jungle for the electric telegraph in 1855-56, remains of buildings, tanks, roads, and other signs of man's former presence were brought to light. Again, upon the eastern portions of the Sunderbuns, where the country has been cleared of forest, mud forts are found in good numbers. Mug, Malay, Arab, Portuguese, and other pirates, about A.D. 1581, depopulated the country so far to the westward between the river Horinghatta and the Rabnabad channel. The delta is intersected from north to south by many broad rivers, and by endless creeks running one into the other, filled for the most part with salt water when near the sea. This tract of land occupies approximately 28,080 square miles of superficial area, or double the area of the delta of the Nile; measuring from west to east, or from the right bank of the Hoogly river opposite to the Saugor tripod on the south-west point of Saugor Island, to Chittagong, it is 270 miles in width, presenting to the Bay of Bengal a series of low, flat mud banks covered at high water and dry at low water; a few miles from low-water mark commence mangrove swamps; a little farther inland trees appear, and lastly cultivation, the nearest cultivation in the central portion of the delta being 47 miles from the sea. In the sea front of the delta there are nine principal openings having a head-stream, that is, having water flowing direct from the Ganges, or from the Megna or Brahmaputra. They are—1. the Ganges; 2. the Megna or Brahmaputra; 3. Horinghatta; 4. Pussur; 5. Murjatta or Kagga; 6. Barapunga; 7. Mollinehew; 8. Roymungul or Juboona; 9. Hoogly. Besides these large rivers, there are numerous openings having no head-stream, being mere salt-water tidal estuaries; these openings or headless rivers are the deepest, as no silt or deposit is poured into them from the higher lands. The tides in the Hoogly run with a rapidity in the springs of 7 miles an hour between Saugor and Calcutta. At Calcutta it is high water about 2h. 30m. on full and change of the moon. The bore is of not unfrequent occurrence in this branch of the river.

A fair is held on the island in the beginning of January, to which pilgrims from all parts of India, but especially from Bengal, resort to wash away their sins in the waters of the holy stream. A writer in the Calcutta Review states that, in 1688, two years before the foundation of Calcutta, it contained a population of 200,000 persons, who

in one night were swept away by an inundation. A cyclone of 1864 caused enormous destruction and loss of life. The storm-wave, 11 feet above the level of the land, swept over the island with resistless force; 1488 persons survived out of a population of 5625. The island, when surveyed in 1812, was found to contain 143,265 acres of dry land. The island is now covered with dense jungle, and infested by tigers and other wild beasts. Many attempts have been made to cultivate it, but with small success.

SAGARA, in Hindu legend reputed son of Bahu or Bahuka. He is said to have warred with and conquered the Saka, the Yavana, the Kamboja, the Parada, and Pahlava. Sagara had two wives, Sumati, daughter of Kasyapa, and Kesini, daughter of Raja Viderbha, both of whom had children, all bad men, who were destroyed.—*Garrett; Dowson.*

SAGE.

Kiug-kai, Tan-san, CHIN.	Satvia, ... IT., SP.
Sauge, ... FR.	Salbei, ... PERS.
Weise, Salbei, . GER.?	Seys-elle, . . . TAM.
Salbia, ... HIND.	Ada chayi, . . . TURK.

A perennial, native of the south of Europe, of Central Asia, and China; grown in all the gardens, and is propagated by seeds, layers, and slips. It is used for seasoning. The sage of Bengal, Murtoo, BENG., are the leaves and herb of Meriandra Bengalensis.—*Ben.* p. 223; *Smith.*

SAGERETIA BRANDRETHIANA. *Aitch.*

Ganger, Kanger, JHELUM.	Koher, . RAVI, SUTLEJ.
Bhandi, Bajan, . KANGRA.	Mumani, TRANS-INDUS.
Maimana, ... PANJ.	

The Sageretia genus of plants, belonging to the natural order Rhamneæ, is found in S. and N. America, Java, China, and in India along the foot of the Himalaya. S. Brandrethiana is a large shrub of Kaghan; abounds in places, Trans-Indus, from 2000 to 3500 feet, and in the Salt Range, and occurs low in the Jhelum basin. The fruit is well known in the bazars of Peshawur and Afghanistan; it is small and black, and is very pleasant eating when fresh and in sufficient quantity, the flavour being not unlike that of the bilberry. In the Salt Range, a chatni is made of the fruit; wood very hard and close-grained.

SAGERETIA HAMOSA. *Brongn.*

Rhamnus trigynus, *Don.*	Zizyphus hamosa, *Wall.*

A trailing plant of Nepal.—*Voigt.*

SAGERETIA OPPOSITIFOLIA. *Brongn.*

Berchemia oppositifolia, *W.*	Rhamnus trigynus, *Don.*
Zizyphus oppositifolia, *W.*	
Girthan, ... BEAS.	Gidarnak, . . KAGHAN.
Kanak, . . . KAGHAN.	Drange, . . . RAVI.

A plant of the Dehra Doon, and in the N.W. Himalaya at from 2000 to 3000 feet in the outer hills. Its fruit is eaten.

SAGERETIA THEEZANS. *Brongn.* A large shrub employed as a substitute for tea in China, where the poor make use of the leaves in the same manner as those of the true tea, and for which it makes a good substitute from its astringency and fragrance; wood very hard.—*Drs. Voigt, Cleghorn, Stewart; Eng. Cyc.*

SAGITTARIA SAGITTIFOLIA, *Linn.*, of Europe, N. and Mid Asia to Japan. It is one of the handsomest of British aquatic plants, whether as regards the elegant spear-leaved canes of glossiest green, of the flower-spikes rising in pyramidal form from the surface of the water. It is extensively cultivated among the Chinese for the sake of its edible rhizome, which fixes itself in the solid earth below the mud, and constitutes an article of food. S. Sinensis, *Tatarinov*, Ts'ze ku, CHIN., is mentioned by Tatarinov as growing in China, but is also applied to the Chinese tulip species of amaryllis or tulip, the Chinese name.—*Art. Jour.* p. 108, April 1857; *Smith.*

SAGO.

Sagu-dana, . . . BENG.	Sagu, Sagu-chawal, HIND.
Kwang-lang-mien, CHIN.	Sagu, JAV., MALAY, MALE.
So-muh-mien, . . ,,	Show-arisi, . . . TAM.
Si-kuh-mi, . . . ,,	Zow-bium, . . . TEL.

Sago, and starchy substances allied to it, are obtained from many palms. Sago starch is contained in the cellular tissue of the stem, and is separated by bruising and elutriation. The finest is procured from the stems of Sagus lævis, *Rumph.*, a native of Borneo and Sumatra; and Arenga saccharifera, *Labillardiere*, furnishes a large supply of sugar, and when exhausted of its saccharine sap, yields sago of good quality.

In Java, the Arenga saccharifera is the only source of sago, which is used in considerable quantity in the western and poorer districts of the island, and is offered for sale in all the markets. It is smaller in quantity than in the pith of the true sago tree, more difficult to extract, and inferior in quality, possessing a certain peculiar flavour from which the farina of the true sago is free. Some trees will produce five or six female spadices, before yielding a single male one; such trees are considered unprofitable by the toddy collectors, but in this case it is said that they yield sago equal in quality, though not in quantity, to the Cycas circinalis, from which, both in the East and West Indies, a kind of sago is procured. One tree yielded about 150 lbs. of good sago meal.

In the Moluccas, large quantities are obtained from the Sagus lævis and Arenga saccharifera. The Malays prefer that of Sagus lævis, but the Sagus farinifera, *Gærtn.*, of the eastern islands of the Indian Ocean, also yields a sago.

Sago, sugar, and palm wine are procured from the Caryota urens. The farinaceous part of the trunk of old trees is manufactured into sago, equal to the best farina, being highly nutritious. It is said, indeed, to be equal to that of the true sago palm, and is much used as sago meal in Canara and Cochin. The best sago is made at Cochin from October to June, as in its preparation bright sunshine is required to mature the operation. The first sort may be delivered on the sea-coast at Rs. 4½ per maund (25 lbs.), the second sort Rs. 2¼ per maund. C. obtusa, *Griffith*, of the Mishmi Hills, and C. sobolifera, *Wall.*, of the Andamans, are also known.

A farina is prepared in Brazil from the inside of the trunk of the Carnauba, Copernica cerifera.

The pithy portion of the trunk of the gebang palm, Corypha gebanga, *Blume*, yields a sort of sago, as also that of the Sabal Adansonii, the sago palm of New Ireland and New Guinea.

Sago is made in Malabar and Ceylon from the pith of the talipot palm, the Corypha umbraculifera.

Cochin-China sago seems from Loureiro's account to be obtained from the Arenga saccharifera and Cycas inermis. According to Thunberg, it is from the Cycas revoluta that the Japanese manufacture it. From the soft stem of Cycas

circinalis, a kind of sago is produced both in the East and West Indies.

Metroxylon filare, *Mart.*, a native of China, yields an inferior sago of commeree.

In India, a sago is obtained from the Phœnix farinifera, *Roxb.*

In China, sago is obtained from Rhapis flabelliformis, from which, also, it is made for native use in Travancore, Mysore, and Wynad, in the Peninsula of India.

Mergui sago is manufactured from the Tacca pinnatifida, and may be seen in every bazar in the Tenasserim Provinces, the plant abounding along the sea-shores. The same plant is common in the South Sea Islands, and its tubers there supply to the inhabitants the place of bread. A spurious kind of arrowroot has long been made at Mergui from the same plant as that which yields the sago, but medical men have decided that it contains properties which render it unsuitable for the sick, and chemical analysis has developed that it contains only half the nutritious qualities of genuine arrowroot.

Sago occurs in commerce in two states,—pulverulent and granulated. (1) The meal or flour, in the form of a fine amylaceous powder, whitish, with a buffy or reddish tint; odour faint, but somewhat unpleasant and musty. (2) Granulated sago of two kinds,—pearl and common brown. The former occurs in small hard grains, not exceeding in size that of a pin's head, inodorous, and having little taste. They have a brownish or pinkish-yellow tint, and are somewhat translucent. By the aid of a solution of chloride of lime they can be bleached, and rendered perfectly white. The dealers, it is said, pay £7 per ton for bleaching it. Common brown sago occurs in larger brownish-white grains about the size of pearl barley.

Sago in its granulated form is that usually exported. The best sago is the produce of Siak, on the north coast of Sumatra. This is of a light-brown colour, the grains large, and not easily broken. The sago of Borneo is the next in value; it is whiter, but more friable. The produce of the Moluccas, though greatest in quantity, is of the smallest estimation. The cost of granulated sago, from the hands of the grower or producer, was, according to Mr. Crawfurd, only a dollar a pikul of 133⅓ lbs. It fetches in the London market—common pearl, 20s. to 26s. the cwt.; sago flour, 20s. the cwt. The Chinese of Malacca and Singapore invented a process by which they refine sago so as to give it a fine pearly lustre.

In most parts of the Archipelago, two kinds of alluvial soil are found in greater or less abundance, one consisting chiefly of sand, often thrown up in long banks, and the other principally of decomposed vegetable matter. The latter is often a consequence of the production of the former, which serves to keep out the waves of the sea, and allow a rank vegetation to flourish. In process of time, by the elevation of the surface and the extension of a similar formation seaward, the older marshes are no longer subject to tidal invasion, and become gradually filled up by the decay of fresh-water plants. For these two descriptions of soil, nature has provided two kinds of palm adapted in a wonderful manner to the necessities of man. On the barren sand she has planted the cocoanut, and in the morass the sago tree.

Along the immense alluvial tract of the Sumatra coast, from Siak to the Lampongs, and in the large plains of the rivers of the Peninsula, such as those of Rio, Formosa, and the Muar, are hundreds of miles of sago land unoccupied and unproductive, every acre of which is capable of yielding at the rate of about twenty thousand pounds of meal yearly.

One or other of the kinds of the sago tree is found throughout the whole length of the Archipelago, from the islands off the west coast of Sumatra to New Guinea. It is probably capable of flourishing with complete vigour across nearly its entire breadth wherever its natural soil occurs, and certainly within ten degrees north and south of the equator, a band which includes all the Archipelago save the Philippines. The only countries, however, where it is found growing in large forests are New Guinea, the Moluccas, Celebes, Mindanao, Borneo, and Sumatra, being widely spread over the Moluccas, but confined to particular parts of the others.

In the eastern parts of the Archipelago, it forms in many places the chief portion of the inhabitants' food. The sago palms do not appear to be indigenous in Sumatra and the Malay Peninsula.

It is from palm trees of the Archipelago that the sago of commerce is usually obtained. In most of the islands of the Archipelago the sago palms are private property, and sell at about seven shillings a tree. In making sago meal, a tree is cut down close to the ground, the leaves and leaf-stalks cleared away, and a broad strip of the bark taken off the upper side of the trunk. This exposes the pithy matter, which is of a rusty colour near the bottom of the tree, but higher up pure white, about as hard as a dry apple, but with wooden fibres running through it about a quarter of an inch apart. This pith is cut or broken down into a coarse powder by means of a club of hard and heavy wood, having a piece of sharp quartz rock firmly imbedded into its upper end. By successive blows, narrow strips of the pith are cut away till it falls down into the cylinder formed by the bark, leaving only a skin not more than half an inch in thickness. These pith strips are then put into a washing-trough made of the large sheathing vases of the leaves, and the strainer is the fibrous covering from the leaf-stalks of the young cocoanut. Water is poured on the mass of pith, which is pressed against the strainer, and kneaded until all the starch is dissolved, and passes through into a trough with a depression in its centre, into which it is deposited, the surplus water trickling away. When the trough is nearly full, the mass of starch, which has a slightly reddish tinge, is made up into cylinders, neatly wrapped in sago leaves, and in this state is sold as raw sago or sago meal. When this is boiled with water, it forms a thick glutinous mass, with a rather astringent taste, and is eaten with salt, limes, and chillies. When sago bread is to be made, raw sago is broken up, dried in the sun, powdered, and finely sifted. A small clay oven with 6 or 8 slits, ¾ of an inch wide and 6 or 8 inches square, is heated over a clear fire of embers, the powder is finely sifted, the openings are covered with a flat

piece of sago bark, and in about five minutes the cakes are turned out sufficiently baked. They are pleasant to eat. When not wanted for immediate use, they are dried for several days in the sun, and tied up in bundles of twenty. They will then keep for years, can be eaten in that state, or soaked in water and toasted or boiled. A tree 20 feet long, and 4 or 5 feet in circumference, will produce 900 pounds, and a pound weight will produce three cakes, and two of these cakes are sufficient for a man for a meal. Two men will finish a tree in five days, and two women will bake it all in five days more, so that for about 12 shillings, one man's food for a year will be had.

In the Moluccas, the pith of the sago palm is prepared for use and exportation. It constitutes the principal food of the natives of the Moluccas, especially during their sea voyages. It is cooked by simply dipping the cakes into warm water, which softens them and renders them easily masticated. It is also made into a sort of soap.

The sago palm of the Spice Islands is the most plentiful but least esteemed, that of Siak, on the north coast of Sumatra, being the best, and that of Borneo second in estimation. Sago meal furnishes the principal food of the Javanese, being baked into cakes.

The process of extraction differs among many of the islands, as that of Mindoro from that of the Moluccas; so also does the size of the cake, those of Amboyna being four inches broad and six long, while those of Ceram are much larger. The people of many of the islands live habitually on this substance. The mass of medulla extracted is immense; 600 pounds is not unusually afforded by a single tree; the refuse, after the bread is made, is thrown in heaps, from which a delicate edible mushroom springs up, and in the heaps, as well as in the decaying wood, are generated worms of a white colour, held in great estimation among the epicureans of the Molucca Islands. Certain wood-worms were in the same manner prized by the ancient Romans; and the taste of the Amboynese has been shared by Europeans, after a struggle with prejudices, which are indeed mere matters of custom.

The sago tree of Sumatra, according to Sir Stamford Raffles, is found in Java only in a few low marshy situations, all of them being deep bogs next to impassable. From seven to ten years is the time it takes for the tree to bear fruit, when planted from the seed in the first instance; the pith commences generally at about the age of six or seven years; after this period, it gradually loses its moisture, and is no longer fit for sago when the tree comes into bearing. One person is sufficient to clear the underwood away, as it grows up, in every lot of 100 fathoms square. The whole family are, however, fully occupied when they cut down the trees for manufacture, which is always done on the spot where the tree is felled. They prepare the number of tampin or measures required for the reception of the sago in the first instance, and put them out to dry; they then fell the tree, and split it in halves by means of wedges, build a temporary house over it, and dig out the pith with hoes made from the rind of the tree. They then carry the pith up into the house, the floor of which is latticed so close as just to allow the finer parts of the medulla to pass through on being wetted with water and trodden by the feet. Into this house the produce of two or three trees is brought at a time, and all the finer parts are carried down by the water into the trunks of the trees, troughs three or four feet in diameter, which are cleanly hollowed out, and left below to receive it. In order that no wastage may take place, they lead a mat, made also of the leaves of the palm, from the floor of the workshop down into the shells of the trees, and this carries the water without spilling any. They trample it until the water passes through clear of the farina, and then throw away the refuse, merely keeping sufficient to stuff the ends of the tampin. By the next day, the medulla has settled in the trunks of the trees, leaving the water at the top; this is drawn off, and the sago flour thrown in its wet state into the tampin already prepared, and left to strain itself; some refuse pith is then put on the end, before left open, of the base of the cone, and the work is done. The shell of the tree is cut up for firewood, or in slips, and thrown into the marsh, to facilitate its carriage down to the boats waiting for it. This is always the seller's duty. Sago once made is obliged to be kept wet, or it would spoil in a few days; again, kept constantly wet, the tampin leaves soon rot; cultivators cannot therefore keep a stock ready, but at great risk. They have a method of frying the meal over the fire, called there sago randang, which sells for a real, or 82 cents of a Spanish dollar, for 16 of their gantong are equal to 20 of Singapore, or one pikul. This, however, will not keep long, as damp throws it all into a glutinous mass, and in a short time spoils it.

The natives of the Moluccas prepare the meal in different ways, chiefly, however, as a hard bread, which, if kept dry, may be preserved as long as ships' biscuits, and is called sago lemping. The meal, after having been dried for two or three days, is sifted until it becomes tolerably fine, but remains somewhat adhesive. It is then formed into small flat cakes, which, to the number of seven or eight, are placed in a mould of red earth, and baked to the proper degree.

The sago *bornek* or *borne*, the granular sago, is dried for a shorter period, then sifted and shaken by two men in a piece of cloth until it granulates. It is then smeared with fresh cocoanut oil, and heated in an iron pan (tatyu) until it attains a certain degree of hardness, after which it is placed in the sun to dry.

For sago *tetu-pala*, the meal is aired until it becomes red, when it is sifted and stuffed into an entire fresh bamboo, which is placed in different rows above a fire until it bursts and the sago is roasted. Sago thus prepared may be preserved a long time if kept dry.

For the sago *buksona*, the meal is mixed with grated santang kalapa, sagar, and a little pepper and salt, enveloped in young sago leaves, and boiled in water.

To make the sago *bagea* or *kwee bagea*, the meal, after being dried in the air to redness, is sifted, mixed with fresh kanari kernels, and then baked in young sago leaves. Sago baruwa are small sago cakes of different forms. The sago sinale is the meal baked to a cake in a pot. The sago uha is the meal enveloped in fresh sago leaves and baked on the fire. Sago kalapa, like the lemping, is baked in moulds and mingled with much grated santang kalapa; the outside is smeared

with gula areng, and it is eaten warm. Sago kalapa is even preferred by Europeans to bread at breakfast, and ranked as a dainty. Papeda, sago bubur or pap, is prepared in the same way as arrowroot.

In Amboyna, the native mode of preparing sago was taught to the Amboynese by Rumphius. Before his time, the Amboyuese, like the natives at this day at various places on Ceram and Buru, and also elsewhere, as on the west coast of Sumatra, used the sago mixed with the ela. The recollection of Rumphius amongst the Amboynese was long continued, accompanied by a true recognition of the value of this most necessary mode of preparing an article of food which nature has so bountifully bestowed.

The Papua oven for sago flour is made of earthenware. It is generally nine inches square, and about four deep; it is divided into two equal parts by a partition parallel to its sides. Each of those parts is subdivided into eight or nine, about an inch broad; so the whole contains two rows of cells, about eight or nine in a row. When the cell is broad, the sago cake is not likely to be well baked; the best sized cell is such as would contain an ordinary octavo volume upon its edge. When they are of such a size, the cakes will be properly baked, in the following manner:—The oven is supposed to have at its bottom a round handle, by which the baker turns the cells downward upon the fire. When sufficiently heated, it is turned with the mouths of the cells up, and then rests upon the handle (which is now become the bottom) as on a stand. When the oven is heating, the baker is supposed to have prepared his flour, by breaking the lumps small, moistening it with water if too dry, and passing it once or twice through a sieve, at the same time rejecting any parts that look black or smell sour. This done, he fills the cells with the flour, lays a bit of clean leaf over, and with his finger presses the flour down into the cell, then covers all up with leaves, and puts a stone or piece of wood at top, to keep in the heat. In about ten or twelve minutes this will be sufficiently baked, according to their thickness; and bread thus baked will keep several years; kept for twelve months, vermin did not affect it. It may not be amiss to mix a little salt with the flour.

Sago bread, fresh from the oven, eats just like hot rolls. If the baker hit his time, the cakes will be nicely browned on each side. If the heat be too great, the corners of the cakes will melt into a jelly, which, when kept, becomes hard and horny, and if eaten fresh, proves insipid. When properly baked, it is in a kind of middle state, between raw and jellied. A sago cake, when hard, requires to be soaked in water before it can be eaten; it then softens and swells into a curd, like biscuit soaked; but if eaten without soaking (unless fresh from the oven), it feels like sand in the mouth.

Sago is not an article which can ever displace the cereals, or which should be anywhere substituted for them, but it ought to be produced in an exportable state at such a price as to be within reach of the poorer classes whenever a diminution in the supplies of rice or corn deprives them of a sufficient quantity of their ordinary food.

According as we allow 7 or 15 years for the growth of a tree, an acre of sago is equal in annual produce to 23 or 10 acres of wheat.

The sago palm of Ceram, probably S. farinifera, has a midrib 12 to 15 feet long, which is used in lieu of bamboo. The lower part is as thick as a man's leg; entire houses are built of them; they form admirable roofing poles for thatch; when split and well supported, they do for flooring; and when selected of equal size, and pegged together side by side to fill up the panels of framed wood houses, they have a very neat appearance, and make better walls and partitions than boards, as they do not shrink, require no paint or varnish, and are not a quarter of the expense. When carefully split and shaved smooth, they are formed into light boards, with pegs of the bark itself, and are the foundation of the leaf-covered boxes of Goram. The leaflets, when folded and tied side by side on the smaller midribs, form the atap or thatch in universal use; while the product of the trunk is the staple food of some hundreds of thousands of men.

Pearl Sago.—Raw sago having been made ready for the manufactory, the first process to which it is subjected is that of a thorough washing. The moist sago being poured into a strainer of coarse thin cloth, and there broken and bruised by the hand, is agitated until all its fine particles pass through the cloth and descend to the bottom of the tub. The sago is then stirred about with an oar for about an hour, after which it is left to stand for about twelve hours, when the water is ladled out, and the sago is removed to undergo the last purifying process which precedes the granulation. This is performed in a mode at once simple and ingenious. Two tubs are placed at a distance of ten or twelve feet from each other, and connected by two troughs raised by a framework above them. A man now stirs up a portion of the sago with an oar till the water obtains a milky appearance, when he pours it into the troughs. When the milk in the upper tub begins to grow shallow, it is again filled up with water and more sago stirred up and mixed with it. The water in the troughs has occasionally time to deposit all its contents, the last being a fine fibrous matter, which, if not removed, would leave a thin yellow layer. The surface is washed with the hand until this layer is effaced and held in suspension. When the troughs have been gradually filled up in the manner described, the sago is left to consolidate for twelve or fourteen hours. In order to give it the degree of dryness required, it is removed from the troughs and exposed for one day to the sun in lumps about a cubic foot in size, which are placed on tables standing in the open air. Large kajang mats, made of the leaf of the mang-kwang, are kept in readiness to cover it when a shower of rain falls. It is next carried to the large shed, where it is thrown in a heap on a long table, and broken down into a pulverulent state. It then passes through an oblong sieve, 30 inches by 20 inches, of which the bottom is formed of parallel fibres from the stem of the cocoanut leaf, kept in their positions by strings which cross them at distances of about two inches. The lumps which do not pass through the long interstices between the fibres, are thrown back into the heap. The granulation or pearling now takes place. The sifted sago is placed in a cloth, of which the ends are tied to a long stick, and which is kept expanded in a bag shape by a short cross stick. A horizontal vibratory motion is given to this, the whole mass being kept in constant agitation, and

every part successively driven along the sides of the bag. If under-dried or over-dried, it will not granulate. This lasts for about a minute, when the new granular sago is again passed through a sieve similar to the last, but the smaller grains which pass through are those which are now rejected. Those that remain are transferred to a circular sieve, of which the bottom is formed of fine stripes of bamboo crossing each other. The grains that pass through the square holes thus produced, form the pearl sago of commerce in the unroasted state. Those that are larger than the holes are thrown back into the heap, to run through the same course again. To assist the men, the oblong sieves and granulating bag are sometimes suspended by rattans from the rafters of the shed.

The roasting takes place in a row of iron pans, each about 2½ feet in diameter, which are built into a platform of masonry about 15 feet long and 4 feet in breadth, covered with flat tiles. The pans rest in an inclined position, partly against the back of the platform, which rises about a foot above its level, and partly on a small prop of brickwork on the right side, an offshoot from the wall. Into the top of this prop a plate is sunk, in which a cloth saturated with wood oil or miniak-krueng is kept. Behind each pan is an open furnace mouth, and a man constantly attends to the fires, keeping them supplied with a few billets of bakau wood, and regulating them with a long two-pronged iron fork, so as to maintain a moderate heat. The pan being gently rubbed with the cloth, a man who sits in front of it on a low stool placed on the platform, pours into it a quantity of granular sago. This he slowly stirs for a short time with a wooden implement called weah, having a sharp curved edge. More sago is poured in, until it amounts to about two chupa, when, as it hardens, he uses the weah more freely. After about three minutes' roasting, it is removed to a table and passed through a round sieve similar to that before described. The grains that adhere to each other are thrown aside, and those that pass through form a smoking heap, which is allowed to lie undisturbed for about twelve hours. The grains are about the same size as they were before roasting, and some retain wholly or partially their white and mealy appearance, but the greater part have become translucent and glutinous, and all have acquired a certain degree of toughness, although still soft. This change appears to be brought about in this way: The water contained in the granules being heated, first converts the mealy starch into a jelly, and then escapes by evaporation, leaving the jelly tough. The second tumefaction drives out the remainder of the water. The final process is another roasting, which renders them hard and tough, and greatly reduces their size. The pearl sago thus prepared and fit for exportation, is put away in large open bins ready to be transferred to boxes or bags when sold.

This method of making pearl sago was introduced into Singapore in 1819. It was taught to the first Chinese who tried it there, by a woman who came from Bukit Batu, a place on the coast of Siak, facing the large island of Bencoolen, and famous for its great fishery of the trubu, the roe of which is so extensively used. In Malacca, however, manufactories had existed for many years before the establishment of Singapore. It is certain, however, that Malacca derived the art from Bukit Batu. In Singapore it appears almost from the first to have been conducted without any attempt at concealment.

Sixteen men would suffice for a manufactory such as described above, and they would produce about 450 pikuls per month. The original outlay is probably from 300 to 400 dollars. There were, about the year 1840, fifteen Chinese manufactories in Singapore.—*Jour. Ind. Arch.*; *Bennett's Ceylon*; *Low's Sarawak*; *Forrest's Voyage to New Guinea*; *Crawfurd*, *Hist. Ind. SAGRI, an Afghan tribe in the country between the plains of Peshawur and the Salt Range at Kalabagh. The Sagri Patan tribe dwell below the Khattak. The tribe continued entirely independent of the Sikhs. They hold the country on the west bank of the river for nearly 30 miles above Kalabagh, and also possess it on the opposite bank as high as the plain commencing at Hasan Abdal. They are shepherds, and have numerous flocks. The number of the Khattak tribe is variously stated at 6000 and 8000 armed men.—*Burnes' Cabool*, p. 105; *E. I. Papers*, *Cabool*, 1859, p. 21; *MacGregor.*

SAGUEIR, palm wine of the Arenga saccharifera. It is as intoxicating as ordinary beer or cider.

SAGUN. Hind. First payment of the year, first ploughings, first sowings, are all called sagun by Hindus, and are followed by festivities.

SAGUS FARINIFERA. *Gærtn.*

Sagus Rumphii, *Willde.* | Metroxylon sagus, *Konig.*
S. spinosus, *Roxb.* |

This sago palm is a native of the peninsula of Malacca and of the Eastern Archipelago. The seeds are generally abortive, and it propagates itself by suckers from the roots of the old trees. This palm is one of the smallest of its tribe, seldom reaching to more than 30 feet in height, and growing chiefly in a region extending west to Celebes and Borneo, north to Mindanao, south to Timor, and east to Papua. Ceram is its chief seat, and there large forests of it are found.

It is grown in great perfection in some parts of Borneo, and its sago meal is exported in large quantities from the west coast to Singapore, and also by the Bugis boats from the eastern and southern sides of the island.

The stem, before maturity, and previous to the formation of the fruit, consists of a thin hard wall, about two inches thick, and of an enormous volume of tissue (commonly termed the medulla or pith), from which the farina or sago is obtained. As the fruit forms, the farinaceous medulla disappears, and when the tree attains full maturity, the stem is no more than a hollow shell. The edible farina is the central pith, which varies considerably in different trees, and as to the time required for its attaining proper maturity. It is eaten by the natives in the form of pottage.

In Borneo, the natives prefer rice, and the Milanowe, who live on the rivers Egan, Hoya, Mocha, and Bintulu, and who are the principal cultivators of the sago tree, always import considerable quantities of grain for their own consumption.

The pith producing the sago is seldom of use till the trec is fourtecn or fifteen years old; and the tree does not live longer than thirty years.

The farinaceous matter afforded by each tree is very considerable, 500 lbs. being a frequent quantity, while 300 lbs. may be taken as the common average produce of each tree. Supposing the plants set at a distance of ten feet apart, an acre would contain 435 trees, which, on coming to maturity in fifteen years, would yield, at the before-mentioned rate, 120,500 lbs. anuually of farinaceous matter. Sago meal, in its raw state, will keep good about a month. The Malays and natives of the Eastern Islands, with whom it forms the chief articlc of sustenance, partially bake it in earthenware moulds into small hard cakes, which will keep for a considerable time.

Cossus saguarius, a large lamelliform beetle, found in the pith of this sago palm, is considered by the natives a great delicacy.—*Roxb.; Voigt; Hartwig.*

SAGUS LÆVIS. *Rumph.* Truc sago palm.

Sagus inermis, *Roxb.* | Rambiya, . . . MALAY.

This is a native of Sumatra, Borneo, and the Moluccas. The stem, which is from 15 to 20 years in attaining maturity, is as thick as that of the cocoanut tree. The petioles and spathes unarmed. This palm furnishes most of the sago sent to Europe.—*O'Sh.; Roxb.; Voigt.*

SAH, a dynasty, according to Mr. Thomas, who ruled from B.C. 180 or 170 to about 50; but Mr. Newton says that they ruled in Gujerat from about B.C. 60 or 70 to A.D. 235. They were succeeded by the Gupta Valabhi kings, and the Indo-Sassanians succeeded to the Valabhi line. Mr. Fergusson gives the following dates of the Sah kings of Saurashtra:—

COIN DATES.	A.D.	COIN DATES.	A.D.

Dr. Hunter gives the following as the relations of these three Indian dynasties, the Sah, Gupta, and Valabhi, to the successive hordes of Scythians. He says two Vikramaditya Sakari, or vanquishers of the Scythians, are required for the purposes of chronology, and the great battle of Korur near Multan, in which the Scythian hosts perished, has been shifted backwards and forwards from A.D. 78 to 544. The truth seems to be that, during the first six centuries of the Christian era, the fortunes of the Scythian or Tartar races rose and fell, from time to time in Northern India. They more than once sustained great defeats; and they more than once overthrew the native dynasties. Their presence is abundantly attested during the century before Christ, represented by Vikramaditya (B.C. 57); during the first century after Christ, represented by the Kanishka family (B.C. 2 to A.D. 87); and thence to the time of Cosmas Indicopleustes, about A.D. 535. The latest writer on the subject believes that it was the White Huns who overthrew the Guptas between A.D. 465 and 470. He places the great battles of Korur and Manshari, which 'freed India from the Saka and Huna,' between A.D. 524 and 544. Cosmas Indicopleustes, who traded in the Red Sea about A.D. 535, speaks of the Huns as a powerful nation in Northern India in his days. The Nandas, whom Chandragupta succeeded in Behar, were a Sudra or non-Aryan dynasty, and according to one account, Chandragupta and his grandson Asoka came of the same stock. In almost every district throughout Oudh and the N.W. Provinces, ruined towns and forts are ascribed to aboriginal races who ruled at different periods, according to the local legends, between the 5th and 11th centuries.—*Mr. Newton in Jo. Bombay As. Soc.*, 1867-68, p. 18; *Fergusson*, p. 719; *J. Bo. As. Soc.* viii. pp. 27, 119, 238; *Imp. Gaz.*

SAH. HIND., SANSK. Saha and Sahukar, commonly Saucar, a banker.

SAHAI or Sahi is added to the name of a Brahman tribe of Oudh.

SAHAJ RAM, a celebrated Nanakshahi fakir. His sangat or shrine is tended by a mahant, who has a large establishment of disciples living upon the revenue drawn from one or two endowed villages for Sahaj Ram. Hasanpur, town in the Sultanpur district of Oudh, is four miles west of Sultanpur town, lat. 26° 16′ N., long. 32° 3′ E. Bandhua, a small village immediately adjoining Hasanpur, is notable as containing the tomb and having been the residence of Baba Sahaj Ram.—*Imp. Gaz.*

SAHA-MARANA. HIND. Burning of a widow at the same time and place as her husband's body.

SAHAN, a cottou cloth manufactured at Santipur, Chandrakona, and Kopamow, in sizes of 1 to 16 yards.

SAHAN. HIND. Hematite, used as a drug.

SAHAR or Suhurgahee. HIND. Dawn of day; breakfast during Lent, so called.

SAHARAWAN, a district of Baluchistan of about 10,000 square miles. The population does not exceed 50,000. The borders of this elevated plateau, the more northern of the Baluch confederate provinces, runs with the Afghan districts of Peshing and Toba, dependent on Kandahar, and is separated on the east by a range of hills, from Dadar and Cutch Gandava. It has only the Bolan river and a few rivulets, but the climate is cool, and the rains ensure good grain harvests. The Raisani, the most respectable of the Saharawan tribes (from Rais, ARAB., a ruler), are able to raise 500 fighting men. The Brahui tribes in Saharawan and Jhalawan, whose great chief is the Khan of Kalat, ethnologists consider to be of the same Scythic stock as the Dravidian races in the south, and infer from this that the passage of some of the Dravidian tribes from Turan was along the valley of the Indus.

The Bolan pass, on the border of Saharawan, leads from the Dasht-i-be-Daulat to Dadar, and is the great route of communication between the western Afghan provinces and the countries opening on the Indus. It is a continuous succession of ravines and gorges. The air in the lower part of the pass is in summer oppressively hot and unhealthy. It extends from lat. 29° 30′ to 29° 52′ N., and long. 67° 4′ to 67° 40′ E.—55 miles; or half a mile wide at entrance. The entrance is 800 feet;

Ab-i-gum, 2540; crest, 5793 feet. Average ascent, 90 feet per mile. The Bolan pass with the Moolla pass, far to the south, are the only level routes intersecting the great chain of mountains, defining, on the east, the low countries of Cutch Gandava and the valley of the Indus; while westward it supports the elevated regions of Kalat and Saharawan. There are many other passes over the chain, but all of them from the east have a steep and difficult ascent, and conduct to the brink of the plateau or table-land. Such are the passes of Takari and Nagow, between the Bolan and Moolla routes, and there are others to the north of the Bolan. This pass is no less important, as occurring in the direct line of communication between Sind and the neighbouring countries with Kandahar and Khorasan. It also constitutes, in this direction, the boundary between the Sard-sehl and Garm-sehl, or the cold and hot journeys (sard sair, garm sair). The natives here affirm that all below the pass is Hind, and that all above it is Khorasan. This distinction is in a great measure warranted, not only because the pass separates very different races from each other, speaking various dialects, but that it marks the line of a complete change of climate, and natural productions.

The Bolan river is about 70 miles long; the Sir-i-Bolan pass, in lat. 29° 51′ N., and long. 67° 8′ E., is 4494 feet above the sea. It is remarkably sinuous, but runs generally south-easterly, from a junction with the Nari river. It is liable to inundation; and as its bed in some parts occupies the whole breadth of the ravine, travellers are frequently overtaken by its torrents. It falls 3751 feet in 54 miles from its source to Dadar.—*Masson's Journeys*, i. p. 338.

SAHARUNPUR, a town and district in the Meerut division of the N.W. Provinces of British India. The town is situated in lat. 29° 58′ 15″ N., and long. 77° 35′ 15″ E., on a low site on both sides of the Damaula Nadi. Population (1872), 43,844. Elevation above the sea-level, 902 feet. The district lies between lat. 29° 34′ 45″ and 30° 21′ 20″ N., and between long. 77° 9′ and 78° 14′ 45″ E. Area, 2219 square miles; population in 1872, 884,617 souls. Saharunpur forms the most northerly portion of the Doab or alluvial table-land which stretches between the valleys of the Ganges and the Jumna. The Siwalik Hills rise above it on the northern frontier. The Rajputs are reckoned at 27,420, of whom only 10,564 are females. They are suspected of infanticide, and in many villages the provisions of the Infanticide Act are strictly enforced. The Chamars number 158,859, and the Gujars 53,576.

SAHASARAM has one of Asoka's edicts on a rock. It is at the extreme N.E. end of the Kaimur range of hills, 70 miles to the S.E. of Benares, and 90 miles S.W. of Patna.

SAHASRARJUNA, a Hindu ruler, famous in Hindu legendary traditions.

SAHAWEL. Arab. Plural of Sahil, the maritime region on the N.E. of Africa, about 600 miles long, between the river Jub and Cape Delgado, with the Somali on the north and the Kafir to the south.

SAHET MAHET (or Sravasti), a vast collection of ruins in Gonda district, Oudh; situated in lat. 27° 31′ N., and long. 82° 5′ E., on the south bank of the Rapti river, 10 miles from Balrampur, and 6 from Ikauna. These ruins have been identified by General Cunningham as the remains of the ancient city of Sravasti. Its ruler, Vikramaditya, in the middle of the 2d century A.D. overthrew the Ghavahana of Kashmir, and as his dominion stretched from Peshawur to Malwa, and from Malwa to Bengal, he assumed the title of emperor of Jambudwipa, or the Indian continent.

SAHH-DHARI, one mile N.E. of Kisarai, the modern city of Taxila.—*Dowson*.

SAHIB. Arab. The respectful term employed by natives of India, and by Europeans themselves, to designate a European of rank. Sahibah, a lady. In Mewar, the title of the rani is simply Mahji; at Jeypore, where they have long used the language and manners of Dehli, they affix the Persian word Sahibah, or lady-mother. Sahib-i-Qaran, a Muhammadan titular term for a sovereign ruler, meaning Lord of the Graud Conjunctions. It was a title of Timur. Sahib-i-Tassaruf, in speculative Muhammadan theology, persons in the world holding supremacy over souls of men. Sahib kran, a Persian coin, rather less than a shilling.

SAHL. Arab. A plain, level country. Sahl Antakia, the plain of Antioch. Sahl-ul-Baqa, the plain situated between Lebanon and Anti-Lebanon, called by the ancients Cœle-Syria. Sahl-ul-Kabir, also called Sahl Jabal-ut-Tur, the great plain, or the Plain of Mount Tabor, commonly called the Plain of Jezreel or of Esdraelon, the Armageddon of the Apocalypse. Here Barak discomfited Sisera; here Josiah fell in battle with Necho, king of Egypt; here Nebuchadnezzar fought with Arphaxad. Here Jews, Gentiles, Saracens, Crusaders, French, Egyptians, Persians, Druse, Turk, and Arab have fought.

SAHO, also Sahocar. Hind. In India, a Hindu who deals in money as a banker, or in exchanges. See Sah; Sahu.

SAHO, son of Sumbaji, ruler of the Mahrattas, in early youth was taken prisoner, and was a captive in the camp of Aurangzeb for about 17 years. He was released by prince Azim about February 1708, and in March he got possession of Satara, and proclaimed himself king. During his captivity, the Mahrattas had placed his uncle Raja Ram on the throne, and on the death of Raja Ram, his widow, Tara Bai, carried on the government in the name of her infant son. When Bahadur Shah returned to Dehli (1708), Daoud Khan Paimi concluded an agreement with Saho, consenting that the chouth or fourth part of the revenues should be paid, and this arrangement kept the Dekhan quiet during the brief reign of Bahadur Shah. But in the time of Ferokhsir, bands of Mahrattas ravaged the Moghul territories as before, and individuals seized on villages within its limits, and turned them into forts, from which they plundered the adjoining districts. Dabari, a chief who occupied a line of fortified villages on Kandesh, defeated a very strong detachment sent against him, and, influenced by Balaji Wiswanath, Husan Ali Khan, A.D. 1717, made peace with Saho, agreed to pay the chouth or fourth over the whole of the Dekhan, and to make a further payment of one-tenth on the remaining revenue under the name of Sir Desmukhi, and to acknowledge Saho's claim to the whole of the territory formerly possessed by Sivaji, with the addition of the later conquests. In return, Saho was to pay a tribute of ten lakhs of rupees, to furnish 15,000 horse, to

preserve the tranquillity of the country, and to be answerable for any loss occasioned by depredations from whatever quarter. Saho would never, however, have recovered his superiority, but for the abilities of his minister Balaji Wiswanath, the founder of the Brahman dynasty of Peshwa. He was joint commander of the Mahratta troops that went to Dehli along with Husan Ali Khan, and ultimately obtained a ratification of the treaty by Muhammad Shah, A.D. 1720. This established the ascendency of Saho over his rival; and Balaji before his death, in October 1720, had the satisfaction of seeing him placed above the assaults of enemies either foreign or domestic. Balaji Wiswanath was succeeded by his son Baji Rao, the ablest of all the Brahman dynasty, and of all the Mahratta nation, except Sivaji. He pointed out the tottering state of the Moghul empire, and urged Saho to permit him to carry his standard into the territories beyond the Nerbadda. Saho caught up his enthusiasm, and exclaimed, 'You shall plant it on Himalaya!' Saho died in 1748, after a long reign of 50 years. By the road-side near Satara is a cenotaph with a dog carved on it in a sitting posture, said to be the burial-place of a favourite dog of raja Saho which had once saved him from a tiger. He was eccentric, and was called the Veda Raja. He kept a palanquin establishment for the dog, and on one occasion dressed it in gold brocade and placed it in full darbar.

SAHRA. ARAB. A desert, a sandy plain, the sandy desert of Africa and Central Asia. The intense heat and cold of deserts is owing to the circumstance that among crystalline bodies, rock-crystal, or silica, is the best conductor of heat. This fact accounts for the steadiness of temperature in one set district, and the extremes of heat and cold presented by day and night on such sandy wastes as the Sahra. The sand, which is for the most part silica, drinks in the noonday heat, and loses it by night just as speedily. The influence of the hot winds from the Sahra has been observed in vessels traversing the Atlantic at a distance of upwards of 1100 geographical miles from the African shores, by the coating of impalpable dust falling upon the sails.

SAHRAI, a numerous Muhammadan tribe of the Indian desert, of which he was the terror. The Sahrai is a Muhammadan family from Sind, who governed at Kalat, until expelled by the Hindus, who subsequently were expelled by the Brahui. Sahrai is from Sahara, a desert, hence also Sarrazin or Saracen, from Sahara, desert, and Zaddan, to strike, contracted. The Khossa is a branch of the Sahrai, whom in habits he resembles, plundering on camels, but they are cowardly and faithless. —*Curiosities of Science.*

SAHREE. SIND. An earth found near Sehwan, in Sind, and sold at Hyderabad for a rupee a maund of 80 lbs. It is dissolved and soaked for 12 hours in water, and the paste formed is used for pottery.

SAHYADRI, the mountain range usually known as the Western Ghats. Throughout the Konkan the Sahyadri form a continuous chain of hills, interrupted, however, by deep depressions. In the latitude of Daman, 20½° N., the chain begins to sink abruptly in the Tapti valley, and changes its course, or sends off a spur of considerable elevation in an easterly direction, as the Chandor Hills. The range thus runs from the Tapti river to Cape Comorin. The highest summits, such as the Mahabaleshwar, 4717 feet, are flat topped; the Neilgherry and the Pulney, also, which rise over 8000 feet, are plateaux. The southernmost portion is entirely separated by the broad Gap of Palghat. At Mahabaleshwar the rainfall amounts to 248 inches annually. In the Southern Konkan, especially in the Sawantwari district, the rains are as heavy as in Canara. At Bombay, the rains last from June till the end of September, and the fall is only 80 inches, which is considerably less than any point farther south on the coast. At Tanna, however, the average fall is more than 100 inches.

SAIFALI, a section of the Kābul Khel Waziri, inhabiting the independent hills to the westward of the Bunnu t'hul. They entered into an agreement or treaty with the British to do all in their power, as far as their own tribe is concerned, to check and prevent the robbery or murder of British subjects, and to cause stolen property from British territory to be returned. This section of the Waziri is said to have been long unfavourably distinguished as receivers of stolen cattle and other property from the Bunnu district.—*Lahore Courant.*

SAIGA TARTARICA is the Antilope colus, *Smith.* It inhabits the open steppes and deserts from the Danube to the Irtish eastward, and as far north as 54° of north lat., found in Poland, Moldavia, about the Caucasus and the Caspian Sea, in Siberia, and in Northern Persia. Their eyesight is said to be defective from the reflection of the dry arid plains upon which they mostly reside.—*Eng. Cyc.* p. 235.

SAIGON, called Luknooi by the Cochin-Chinese, is in lat. 10° 15′ N., and long. 106° 43′ E. The surrounding country abounds with timber and other necessary articles for ship-building. See Kobo.

SAIL. HIND. Slate or schist; a slate; a slab of stone.

SAIL. ARAB. A flood. Sailab or Sailaba, a flood of the great rivers, or overflow of waters from other sources. Sailabi, land watered by flood. Sail-al-Aram, also called Sail-ul-Mareb, the flood of Aram, a great calamity which befel the Arabs of Yemen, soon after the time of Alexander the Great. Abid-Shams, surnamed Saba, built the city of Saba, afterwards called Mareb, and made a great dam to form a reservoir. The water was 20 feet deep, and was utilized for irrigation; but one night it burst and carried away the whole city with the neighbouring towns and people. Mahomed mentions it in the Koran. See Arim; Balak; Mareb; Saba; Yemen.

SAILOR FISH, or Fan Fish of the Archipelago, is a species of Histiophorus. It is the Ikan layer of the Malay, the Zeyl fish of the Dutch.

SAIN, in Sind, is the Sahib of India, the Sir of England.—*Burton's Scinde*, i. p. 143.

SAINGRI or Sangri. HIND. The seed-pods of jhand, the Prosopis spicigera, one of the common shrubs of the rakh or preserves.

SAINHIKEYA. In Hindu mythology, an asura or giant, who stole amrita or nectar when the gods churned the sea of milk, for which Vishnu cut him into two pieces, called Rahu and Ketu, which are said to cause the eclipses.

SAINT HELENA, a volcanic island 2700 feet high in the S. Atlantic, with an ancient crater.

It has a peculiar, though limited flora. It belongs to Great Britain, and is in the tract of sailing ships from the Cape of Good Hope to Europe and America. The emperor Napoleon I. was detained here after the battle of Waterloo. It was formerly clothed with trees, but these have been destroyed; the soil being washed off, the island is now a bare barren rock.

SAINT HILAIRE, M. BARTHELEMY, a French author of great fame, the first historian of Buddhism; author of a Life of Buddha.

ST. JOHN'S ISLAND or Seberget, in lat. 23° 36′ 20″ N., and long. 36° 10′ 15″ E., is a small, circular, barren island on the African side of the Red Sea, with remarkably sharp peak of volcanic origin. It is said to have been once famous for its emeralds.—*Findlay.*

ST. JOSAPHAT. See Jataka.

ST. MARUTHA was a grandson of Oda, a pagan priest of Mesopotamia. He obtained from Yezdejird, to whom he was accredited by Theodosius as an ambassador, the alleviation of the Christian persecution, and persuaded him to make an alliance with Theodosius the younger.

ST. SIMON STYLITES, a Christian ascetic, who lived for many years on a pillar, the remains of which are still shown to pilgrims. The monastery of St. Simon is about 18 miles N.W. of Aleppo, and in the 6th and 7th centuries was famous from the sanctity of this saint. Mount St. Simon is called by the people Jabal Shaikh Barakat, the mount of the blessed, holy man.

ST. THOMAS. Gibbon says, 'According to the legend of antiquity, the gospel was preached in India by St. Thomas. At the end of the ninth century, his shrine, perhaps in the neighbourhood of Madras, was devoutly visited by the ambassadors of Alfred, and their return with a cargo of pearls and spices rewarded the zeal of the English monarch, who entertained the largest projects of trade and discovery. When the Portuguese first opened the navigation to India, the Christians of St. Thomas had been seated for centuries on the coast of Malabar, and the difference of their character and colour attested the mixture of a foreign race. In arms, in arts, and possibly in virtue, they excelled the natives of Hindustan; the husbandmen cultivated the palm tree, the merchants were enriched by the pepper trade, the soldiers preceded the Nairs or nobles of Malabar, and their hereditary privileges were respected by the gratitude or the fear of the king of Cochin and the Zamorin himself. They acknowledged a Gentoo sovereign; but they were governed even in temporal concerns by the Bishop of Angamala. He still asserted his ancient title of metropolitan of India, but his real jurisdiction was exercised in fourteen hundred churches, and he was entrusted with the care of two hundred thousand souls. Their religion would have rendered them the firmest and most cordial allies of the Portuguese; but the inquisitors soon discerned in the Christians of St. Thomas the unpardonable guilt of heresy and schism. Instead of owning themselves the subjects of the Roman Pontiff, the spiritual and temporal monarch of the globe, they adhered, like their ancestors, to the communion of the Nestorian Patriarch; and the bishops whom he ordained at Mosul traversed the sea and land to reach their diocese on the coast of Malabar. In their Syriac liturgy, the names of Theodore and Nestorius were piously commemorated; they united their adoration of the two persons of Christ; the title of Mother of God was offensive to their ear, and they measured with scrupulous avarice the honours of the Virgin Mary, whom the superstition of the Latins had almost exalted to the rank of a goddess. When her image was first presented to the disciples of St. Thomas, they indignantly exclaimed, "We are Christians, not idolators!" and their simple devotion was content with the veneration of the cross. Their separation from the western world had left them in ignorance of the improvements or corruptions of a thousand years; and their conformity with the faith and practice of the fifth century would equally disappoint the prejudices of a papist or a protestant. It was the first care of the ministers of Rome to intercept all correspondence with the Nestorian Patriarch, and several of his bishops expired in the prisons of the holy office. The flock, without a shepherd, was assaulted by the power of the Portuguese, the arts of the Jesuits, and the zeal of Alexis de Menesez, Archbishop of Goa, in his personal visitation of the coast of Malabar. The synod of Diamper, at which he presided, consummated the pious work of the reunion, and rigorously imposed the doctrine and discipline of the Roman Church, without forgetting auricular confession, the strongest engine of ecclesiastical torture. The memory of Theodore and Nestorius was condemned, and Malabar was reduced under the dominion of the Pope, of the Primate, and of the Jesuits who invaded the see of Angamala and Cranganore. Sixty years of servitude and hypocrisy were patiently endured; but as soon as the Portuguese empire was shaken by the courage and industry of the Dutch, the Nestorians asserted with vigour and effect the religion of their fathers. The Jesuits were incapable of defending the power which they had abused; the arms of forty thousand Christians were pointed against their falling tyrants; and the Indian archdeacon assumed the character of a bishop, till a fresh supply of episcopal gifts and Syriac missionaries could be obtained from the Patriarch of Babylon.'—*Gibbon, Ch.* 47; *La Croze Christianisme des Indes; Geddes' Church History of Malabar.*

SAINT THOMAS' MOUNT, a military station of the British, ten miles south-west of Madras. It is famed amongst eastern Christians as the site of the martyrdom of St. Thomas, and the church on the summit of the hill is visited by pilgrims even from Syria. It is the Romanist Portuguese Church of the Expectation of the Blessed Virgin, and is built over the spot where the Portuguese in 1547 discovered a cross. According to Dr. Burnell, the date of the cross tablet and its Pehlavi inscription is probably about the 8th century. Population in 1874 was 15,480, Europeans, East Indians, Muhammadans, Pariahs, Vallalar, and Idagai (Idagen). It was plundered in 1752 by the troops of Chunda Sahib, under his son Raja Sahib, and the advanced force of Hyder Ali later in the century again plundered it. The Little Mount is on the right bank of the Adyar river, three miles nearer Madras.

ST. THOME, or Mylapore, in lat. 13° 1′ N., a southern suburb of Madras, in the district of Chingleput, and about three miles from Madras to the south. St. Thome was one of the most

important stations of the Portuguese on the Coromandel coast. It subsequently belonged successively to the French, the Dutch, the king of Golconda, the nawab of Arcot, and has been in British possession since the wars in the Carnatic. Its native name is Mailapur, often in travellers' accounts written Meliapore.—*Calcutta Rev.*, 18th Jan. 1871.

SAIR. Arab., Hind. Transit duties; a due or tax levied on certain wild products, other than cultivated lands; such as on date trees, fisheries, and grass, etc. In revenue accounts, all receipts other than land revenue is sair.

SAIR-ul-MUTAKHIRIN, by Gholam Husain, a work of surprising industry. A translation in three quarto volumes was published in India in 1789 by Mustafa, a renegade Frenchman, but a large portion of the impression was lost on the voyage to England. General Briggs translated a sixth part of it. Sir Charles Trevelyan while Governor of Madras reproduced part of the original in Roman character.

SAIVA, a sectarian Hindu, follower of Siva. Many Saiva Hindus believe in the three Hindu gods, Brahma, Vishnu, and Siva, as triune, and many Saiva are essentially polytheists; but Vaishnava Hindus are rarely in accord in this, and the bulk of the Hindu religionists regard Siva, Vishnu, and Brahma as distinct deities. The Saiva sect far outnumber the Vaishnava. The essential element in the Saiva faith is a reverence for, or deification of, the reproductive power with the emblems of the lingam and the yoni, and their philosophy seems to be a simple physiological idea of creation, made to assume a religious form. It has also, however, been supposed to represent the Buddhist doctrine of gradual perfectability (raising man almost to the rank of a god). The Vaishnava creed is one of a separate creation of a god and his occasional incarnation in the form of man and animals.

The Saiva are worshippers of Siva, in one of his many forms.

The Ganapatya worship Ganesa.

The Sakta exclusively worship the sakti or female energy.

The Ganapatya and the Sakta are subdivisions or ramifications of the Saiva, of which may be traced these distinctions,—1. Saiva proper, meaning the worshippers of Siva and Parvati conjointly; 2. Lingi or Langaet, the adorers of Siva, or his phallic type, separately, and these are a very strict and rigid sect; 3. Sakta, the adorers of the yoni of Bhavani, or her symbol, separately; 4. the Ganapatya, the exclusive worshippers of Ganesa, the first-born of Mahadeva and Parvati. The Ganapatya adore Ganesa as uniting in his person all the attributes of the deity. The Vira Saiva are very numerous in all the Canarese-speaking countries, and are distinguishable by their wearing the lingam in a silver or gold casket fastened round their arm or suspended from the neck.

The Avadhuta or Abd'hut of the south of India, is a religious mendicant of the Saiva Hindus, who, similarly to the Virakta Vairagi, has subdued the passions and estranged himself from the interests and emotions of mankind, abandoning religious observances and worldly restraints. The Sakta have two classes of these,—one the Vyakta-vadhuta, or professedly free; the other, Gupta-vadhuta, who privately throw off the usual restrictions of caste.

The Akas-mukhi is a Saiva devotee, who retains his head so long in the position of looking to the sky, that he cannot restore the neck to its proper position.

Saiva sectarians of S. India worship 63 deified heroes, designated Adiyars.

SAJADA. Arab. In the ritual of Muhammadan prayer, a single prostration with the forehead touching the ground. It is performed from a sitting position, after the Dua or supplication that concludes the two prostration prayers. Some of the Ulema, especially those of the Shafei school, permit this 'Sajada of thanks' to be performed before the prostration prayer, if the visitor have any notable reason to be grateful.—*Burton's Mecca*, ii. p. 67.

SAJJI. Hind. Impure carbonate of soda, prepared from the alkaline soil called dhobi's earth, and also by burning the Caroxylon Griffithii and other plants growing on the shores of the salt lakes which are scattered through the Indian deserts. In the Panjab, the castes principally employed in the manufacture of sajji are the Chura, Dhobi, Nunari, and a few Arura. Sajji matti, or soda earth, is found in many parts of India. Sajji is made in considerable quantities in the districts of Multan, Jung, Jhelum, and Thanessur, by burning plants of the genus Salsola, a few of the Chenopodiaceæ, species of the genera Caroxylon and Salicornia, also Sueda fruticosa. It is extensively used in soap-making and calico-dyeing.—*J. A. Murray.*

SAK. Hind. Bark of the kikar and other barks, put into the fermenting mass in spirit distilling.

SAK or Thoek or Thak, called Chatu or Chat by the Bengali, a small tribe who inhabit the eastern branch of the Naf river in Arakan, in lat. 21° 20′ N., and long. 21° 30′ E., about 25 miles east from Elephant Point near the Koladyn river.

SAKA. Arab. A water-carrier.

SAKA or Sak'ha. Sansk. A branch, the branch of a tree; a tribe, a clan.

SAKA. Sansk. Any era; the era of prince Salivahana, commencing in the 77–78th year of the Christian era, and to be identified with that by adding 78¼; thus the Saka year 1800 began towards the end of March (A.D.) 1878. It is said to have been called after Sakaditya, brother of Vikramaditya. Dr. Bhau Daji supposed the Saka king to be the Kshaparata Nahapana. The oldest Sanskrit works and the copperplate grants extant are dated in this era. The Vikrama Samvat is coeval with the defeat of the Saka by Vikramaditya. The Saka Nripa Kala, identical with the Salivahan era, is coeval with the conquest of Malwa by the Saka.

Saka Kala, or the era of the Saka, has been confounded even by native writers, sometimes with the first and sometimes with the second event, leading to a mistake of 135 years in their calculations.—*Dr. Bhau Daji.*

SAKA, a race mentioned in the Mahabharata, Puranas, and other religious works, also in the rock inscriptions and on copperplate grants, and generally recognised to be Scythians; other Scythian tribes in India being the Hun and the Naga. The races whom the Greeks call Scythæ, called themselves Scoloti according to Herodotus,

and the Persian equivalent of Scythæ was Sakæ. The Scythians east of the Caspian were called by the Greeks Saka and Massagetæ, the last probably the Maha-Jat or Great Jat of the Panjab. The Saka overthrew the Græco-Bactrian kingdom in Afghanistan, and other branches extended their possessions towards the south, occupied Sind and the countries of the lower Indus under Mayes and his successors Azes and Azilaus. Once their progress was checked by Vikramaditya, the Hindu king of Malwa, who, B.C. 56, signally defeated them, assumed the title of Sakari, and established an era which still bears his name. In Prakrit works Saka is written Saga. From between the parallels of lat. 30° and 50° N., and from long. 75° to 95° E., the highlands of Central Asia, migrated the Sacæ or Scythic races, which passed into Europe and within the Indus. The Takshak, the Gete, the Kamari, the Katthi, and the Hun came from Sakitai or Sakadwipa, and from the Dasht-i-Kapchak, crossed the Jaxartes or Jihun, and crossed the Paropamisan range into the plains of Hindustan.

SAKADWIPI, a tribe of Brahmans, chiefly remarkable for their great numbers, and for the fact that they will drink from a vessel from which another person has already drank.—*Cal. Rev.*, No. 110.

SAKAI, a pagan population in the Malay Peninsula divided into the Sakai Jina and Sakai Bukit, the latter being hill-men and mountaineers, the former more settled and civilised. They are worshippers of the elements. Sakai is the Pahang word for an aboriginal. The Halas is a branch of the Sakai population of the Malay Peninsula, They tattoo their face and breast, pierce their ears and nose, and insert porcupine quills. The Orang Sakai, of Siak, manufacture sago meal. The sago plantations belong to Malays, who employ the Sakai, allowing them one-half of the produce. On this and wild animals the Sakai subsist, and the sago which they do not require they dispose of to Malays in barter for cloth, tobacco, etc.

SAKALA or Sangala, an ancient town in the Panjab, the She-kie-lo of Hiwen Thsang. It was the capital of Raja Milinda, was subject to Raja Mihirkul, is the Sangala of Alexander, and has long ago been recognised in the Sakala of the Brahmans and the Sagal of the Buddhist. It was visited by the Chinese pilgrim Hiwen Thsang in A.D. 630. Both Arrian and Curtius place Sangala to the east of the Hydraotes or Ravi; but the itinerary of Hiwen Thsang shows that it was to the west of the Ravi, and as nearly as possible in the position of the present Sanglawala-Tiba or Sangala Hill. Wilford three times described its position in the Asiatic Researches. When Hiwen Thsang visited the city there was a monastery of 100 monks who studied the Hiuayana, or exoteric doctrines of Buddhism, and beside it there was a stupa, 200 feet in height, where the four previous Buddha had left their footprints. The Brahmanical accounts of Sakala have been collected from the Mahabharata by Professor Lassen in his Pentapotamia Indica. According to that poem, Sakala, the capital of the Madra race, who are also called Jartika and Bahika, was situated on the Assaga rivulet to the west of the Iravati or Ravi river. The country is still well known as Madr-des, or the district of the Madra, which is said by some to extend from the Beas to the Jhelum, but by others only to the Chenab. The Buddhist notices of Sakala refer chiefly to its history in connection with Buddhism. There is the legend of the seven kings who went towards Sagal to carry off Prabhavati, the wife of king Kusa. But the king, mounting an elephant, met them outside the city, and cried out with so loud a voice, 'I am Kusa! that the exclamation was heard over the whole world, and the seven kings fled away in terror.' This legend may have some reference to the seven brothers and sisters of Amba-Kapa, which is only 40 miles to the east of Sangala. Before the beginning of the Christian era, Sagal was the capital of Raja Milinda, whose name is still famous in all Buddhist countries as the skilful opponent of the holy Naga-Sena. The territory was then called Yona or Yavana, which might refer either to the Greek conquerors or to their Indo-Scythian successors; but as Naga-Seua is said to have lived either 400 or 500 years after Buddha, the date of Milinda is uncertain.—*Cunningham's Ancient India*, p. 179.

SAKALELI, dancing parties of birds at their pairing season, practised by the turkey of North America, the seven brothers of India, and the paradise birds of the Aru Islands.

SAKALI or Sakaliga, a homeless tribe in the Ceded Districts, and in Mysore itinerant grain dealers.

SAKAR. SIND. An embankment. This gives the name to Sakar or Sukker, a town on the Indus opposite Rori, where is a natural limestone mound about 100 feet high.

SAKAR, of Shahpur, a huge clay vessel for strong grain.

SAKARI, a title of Vikramaditya, king of Ujjain, given to him because of his successful opposition of the Sacæ, an Indo-Scythic tribe who settled along the Lower Indus.

SAKATAI or Chaghtai, the Sakadwipa of the Purana, corrupted by the Greeks to Scythia, whose inhabitants worshipped the sun.

SAKHA, in Hindu music, a notation. Only three Sakha are now known to Hindus in India,—the Rānāyanīya, Kauthuma, and Jaiminiya. The first two are common, and only differ a little in the way of chanting; the Jaimini text appears to agree with the others except in a few details; the notation of the chant is totally different.—*Dr. Burnell.*

SAKHALIN is the Aino name, Isoka of the aborigines, Oku Yesso of the Japanese, Schalien of the Russians, the Karapto of old writers; also Ula-hata; also Augo-hata, or Island of the Black River; also Amur. Siebold and Keith Johnston call it Tarakai, but the usual name is Sakhalin, from Sugaun, one of the names of the river Amur. The lips of the women are tattooed of a pale-black colour; they part their hair down the middle. They have metal ear-rings, and those on the coast wear silver-grey or spotted sealskins, with long boots of the same materials. They have a leather waist-belt as a cestus veneris.—*Arthur Adams' Travels.*

SAKHI BHAVA, a sect of Vaishnava Hindus in Northern India, who adopt Krishna and his mistress Radha for their special worship. They assume the female garb, and the dress, ornaments, manners, and occupations of women. See Hindu.

SAKHI SARWAR, a famous Muhammadan shrine in Dehra Ghazi Khan district, Panjab; lat. 30° N., long. 70° 10′ 30″ E. The shrine crowns the high bank of a hill stream at the foot of the Suliman range, in the midst of arid desert scenery. Founded in honour of Saidi Ahmad, afterwards known as Sakhi Sarwar, the son of Zain-ul-Abidin, an immigrant from Baghdad, who settled at Sialkot, 12 miles east of Multan, in the year 1220. Zain-ul-Abidin was a descendant of Ali, and dreamt that Mahomed stood by his side, commanding him to proceed to India to convert the idolators. Accordingly he reached Sialkot, where he married a daughter of Rahan Khan, Afghan, and had two sons, Syed Dhoda and Syed Ahmad. Ahmad became a devotee, and, having performed a very remarkable series of miracles, was presented by the Dehli emperor with four mule-loads of money, with which the Sakhi Sarwar shrine was erected. A handsome flight of steps leads from the bed of the stream to the building, constructed at the expense of two Hindu merchants of Lahore. The buildings include—the mausoleum of Sakhi Sarwar himself; a monument of Baba Nanak; the tomb of Massamat Bibi Bai, wife of Sakhi Sarwar; and a thakurdwara. They thus comprise a curious mixture of Hindu and Muhammadan architecture, and are frequented by devotees of all religions. The guardians of the shrine are the descendants of Sakhi Sarwar's three servants, always miraculously limited to the number of 1650, among whom the revenues accruing from the offerings are equally divided. Throughout the year, the shrine forms the resort of numerous mendicants, Hindu and Muhammadans.—*Imp. Gaz.* viii.; *MacGregor*, iii. p. 61.

SAKI or Sake is the general name given in Japan to the alcoholic liquid prepared by the fermentation of rice. There are many kinds of it, each receiving a specific name. Saki beer has 11 to 17 per cent. of alcohol. At an entertainment there, a pair of chop-sticks was placed at each corner of every table, in the centre was an earthen pot filled with saki, surrounded with four acorn cups, four large coarse china cups, with clumsy spoons of the same material, and four tea-cups of tea. Cups of tea were first handed round, these were followed by very small cups of saki, which had the taste of French liqueur.—*American Exped.* p. 218.

SA-KING of Siam. Sir R. Schomburg saw, at the building sheds of the first king, a log of this wood, which was being prepared for the construction of a war canoe, measuring 135 feet, and perfectly sound and without a flaw. It possesses the property of being easily bent by artificial means.

SAKLA PAKSHAM. Sansk. The light half of the month.

SAKLAWIA, a canal which leaves the Euphrates 5¾ miles N.W. of Felujia. It crosses Mesopotamia by a tortuous eastern course on the N. side of Akar Kouf, and enters the Tigris at a point 5 miles below Baghdad, after a course of 45 miles. It is the ancient I'sa canal.—*MacGregor.*

SAKRANT, also Sankrant, also Makar-Sankrant, a Hindu festival, held on the day that the sun enters the sign of Makar at the winter solstice. On this night, in ancient India, a horse was sacrificed to the sun or Bal-nath, the god Bal. Hindus now bathe in the sea, rub their bodies with sesamum seeds, and entertain friends. The festival of the sun, with the Getæ and Aswa nations of the Jaxartes, as with those of Scandinavia, seems to have been the winter solstice, the Sakrant of the Rajput and Hindu in general. The ceremonial of the horse's return after a year evidently indicates an astronomical revolution, or the sun's return to the same point in the ecliptic. The return from his southern declination must have been always a day of rejoicing to the Scythic and Scandinavian nations, who could not, says Gibbon, fancy a worse hell than a large abode open to the cold wind of the north. To the south they looked for the deity; and hence, with the Rajputs, a religious law forbids their doors being to the north. —*Tod's Rajasthan*, i. p. 676. See Astronomy.

SAKTA, a sect of Hindus who worship the female principle according to the ritual of the Tantra. Of these there are two divisions,—the Dakshina Chari or right-hand ritualists, and the Vama Chari or left-hand ritualists. The worship of the right-hand division is public, and is addressed to the goddesses, in the forms of Durga, Bhavani, Parvati, Lakshmi, Maha Lakshmi, and others. The left-hand ritualists worship, in preference, the Tantrica impersonations of Durga, as Devi, Kali, Syama, etc., or a woman representing the Sakti. Their worship is private and unavowed, and is much talked about as the oriental form of the Eleusinian mysteries. Wilson thus describes the left-hand sect (i. p. 257): 'All the principal ceremonies comprehend the worship of Sakti, and require for that purpose the presence of a female as the living representative and the type of the goddess. This worship is mostly celebrated in a mixed society, the men of which represent Bhairavas or Viras, and the women Bhairavis and Nayikas. The Sakti is personated by a naked female, to whom meat and wine are offered and then distributed amongst the assistants, the recitation of various Mantras and texts, and the performance of the Mudra, or gesticulations with the fingers, accompanying the different stages of the ceremony, and it is terminated with the most scandalous orgies amongst its votaries.' The Rev. J. Burgess, writing in 1874, mentions that at Jamnagar, in Kattyawar, there was a Nanak-panthi ascetic who dressed in silks and satins, physically a magnificent man, and that Saktaism was secretly practised there. Mr. C. P. Brown, whose means for information were very great, and who lived through a great part of the 19th century, said that Sakta puja had never extended into the Madras Presidency. The Editor also never heard there of any of the alleged impurities. In the district of Tinnevelly the Saktas will not admit that they do more than eat flesh and drink toddy together. The theory of the Saktas is said to be the following: The extinction of desire is the great aim of Hinduism. The other sects seek it by the mortification of the passions; the Saktas by their gratification.

The Hindu worshippers of the Sakti, the power or energy of the divine nature in action, are numerous amongst all classes of the Hindus. In their mythology, this active energy is impersonated in the forms of the three female deities, —Lakshmi, Parvati, and Saraswati, the consorts respectively of Vishnu, Siva, and Brahma. The worship of the female principle, as distinct from the divinity, appears to have originated in the literal interpretation of the metaphorical language

of the Vedas, in which the will or purpose to create the universe is represented as originating from the Creator, and co-existent with him as his bride and part of himself. Thus, in the Rig Veda, it is said 'that divine spirit breathed without affiation single, with (Swadha) her who is sustained within him, other than him nothing existed. First, desire was formed in his mind, and that became the original productive seed.' Also, the Sama Veda, speaking of the divine cause of creation, says, 'He felt not delight, being alone, he wished another, and instantly became such. He caused his own self to fall in twain, and thus became husband and wife. He approached her, and thus were human beings produced.' It is probable that these legends may relate to the primitive tradition as to the origin of mankind, but there is in them also a figurative representation of the first indication of wish or will in the Supreme Being. Another set of notions of some antiquity, which contributed to form the character of the Sakti, whether general or particular, were derived from the Sankhya philosophy. In this system, nature, Prakriti, or Mula Prakriti, is defined to be of eternal existence and independent origin, distinct from the Supreme Spirit, productive though no production, and the plastic origin of all things, including even the gods. In the Puranas, especially in the Brahma Vaivartta Purana, Prakriti or Maya bears a prominent part, for from the Sankhya philosophy, Prakriti has come to be regarded as the mother of gods and men; whilst as one with matter, the source of error, it is again identified with Maya or delusion, and as co-existent with the Supreme as his Sakti, his personified energy or his bride. According to the Prakriti Khanda section of the Brahma Vaivartta Purana, Brahma, or the Supreme Being, having determined to create the universe, became two-fold, the right half becoming a male, the left half a female, which was Prakriti. She was of one nature with Brahma. She was illusion, eternal and without end; as is the soul, so its active energy,—as the faculty of burning is in fire. It is from the Tantras that the rites and formulæ of the worship of Prakriti or Sakta are obtained. They are numerous, of great extent, and in the form of a dialogue between Siva and his bride. The earliest record of Sakti is in the Periplus.

It is related that the energy of each god, exactly like him, with the same form, the same decorations, and the same vahan (vehicle), the Sakti of Brahma, girt with a white cord and bearing a hollow gourd, arrived on a car yoked with swans; her title is Brahmani. Maheswari came riding on a bull, and bearing a trident with a vast serpent for a ring and a crescent for a gem. Kumara, bearing a lance in her hand, and riding on a peacock, being Ambica in the form of Kartikeya, came to make war on the children of Diti, the giants, or Asura. The Sakti named Vishnaivi also arrived sitting on an eagle, and bearing a conch, a discus, a club, a bow, and a sword in her several hands. The energy of Hari, who assumed the form of the boar, likewise came there, assuming the body of Varahi. Narasinhi, too, arrived there embodied in a form precisely similar to that of Narasinha, with an erect mane reaching to the host of stars. Aindri (Indrani) came bearing the thunderbolt in her hand, and riding on the king of elephants, and in every respect like Indra, with a hundred eyes. Lastly came the dreadful energy named Chandica, who sprang from the body of Devi, horrible, howling like a hundred jackals. She, surnamed Aparajita, unconquered goddess, addressed Isana, whose head is encircled by his dusky braided locks.

Eight of these Sakti are more particularly recorded, their names are the following:—

Maheswari, Sakti of Mahesa, or Siva.
Brahmi, or Brahmani, Sakti of Brahma.
Narayani, Sakti of Narayana.
Aindri, Sakti of Indra.
Kumara, Sakti of Kartikeya.
Varahi, Sakti of Vishnu of the Vahar avatara.
Narasinhi, Sakti of Vishnu in the Narasing avatara.
Aparajita, a form of Bhavani, Sakti of Siva.

Mr. Paterson (As. Res. viii. p. 68) remarks that Aparajita may be the Aphrodite of the Greeks, and Maheswari, or the female Siva, riding on a white bull, may have given rise to the story of Europa's rape; while Brahmi, or the female Brahma, with the swan, may in like manner have been the origin of the fable of Jupiter and Leda. Bhavani is, however, oftener seen on a lion or tiger than on Nandi, the vahan bull of her spouse. In some places they are thus enumerated,—Brahmi, Maheswari, Aindri, Varahi, Vaishnavi, Kumara, Chamunda, and Kartika. Some reduce the number to seven; omitting the two latter, and adding Cauveri. The worshippers of these Sakti are called Sakta. The emblem of worship is the yoni. One branch of the Sakti worshippers has been said to be so grossly licentious that they are held in detestation by other sects, and even by a large portion of their own; but this statement cannot be verified.

The Hindu goddesses are uniformly represented as the subordinate powers of their respective lords; thus Lakshmi, the consort of Vishnu, the preserver, is the goddess of abundance and prosperity; Bhavani, the wife of Siva or Mahadeva, is the general power of fecundity; Uma and Gauri, also, are gentle forms of the Sakti of Siva; while Durga and Vali are the severe forms.

Chamunda and Chandika are hideous goddesses, who attend upon Siva as Bhairava, the terrific, destructive deity, who is propitiated by offerings of wine and flesh.

Saraswati, whose husband was the creator Brahma, possesses the powers of imagination and invention, which may justly be termed creative. She is therefore adored as the patroness of the fine arts, especially of music and rhetoric; as the inventress of the Sanskrit language, of the Devanagri writing characters, and of the sciences which writing perpetuates; so that her attributes correspond with those of Minerva Musica of Greece or Italy, who invented the flute, and presided over literature.

Lakshmi or Maha Lakshmi is the Sakti or consort of Vishnu.

Dr. Hunter says (Imp. Gaz. iv. p. 304) left-hand worship is an organized five-fold ritual of incantation, lust, gluttony, drunkenness, and blood. The Vami or Vama Chari worship comprises the five-fold Mukara, which takes away all sin, viz. Mansa, flesh; matsya, fish; madya, alcoholic fluids; maithuna, sexual intercourse; and mudra, mystical gesticulations. There is nothing of this kind in the south of India.—*C. P. Brown; Wilson's Hindu Sects; Wilson's Gloss.;*

Paterson and Colebrooke in v. viii. *As. Res.; Coleman, Mythology of the Hindoos*, p. 121; *Raya Mucuta on the Amaracosha; Moor's Pantheon; Hind. Theat.* ii. p. 52.

SAKTA. Sansk. A division of a hymn. The worship of the Vedic race is briefly but comprehensively described by themselves, where it is said, 'The standers around associate with (Indra) the mighty (sun), the indestructive (fire), the moving (wind), and the lights that shine in the sky.'

SAKTA BHAKHTA, worshippers of the female energy, who make the universe to be developed by an inherent power in matter. They use feminine terms and symbols, and practise the magical rites of the Atharvana Veda, which has been termed the black Veda; and the whole is sometimes termed the Tantrica system.—*Taylor.*

SAKTI NATH, the lord of Sakti, or the divine energy under a female personification. In this sense Sakti is applicable to every goddess, but it is more especially the name of Bhavani, and her lord or husband in Siva. Sakti-puja, or Sakti-worship, a Hindu form of worshipping the Sakti.

SAKUNA of Vasantaraja, a Sanskrit poet of the twelfth or thirteenth century, is a poem on the auguries to be derived from the cries and general demeanour of birds. It is important philologically, and as an illustration of Hindu habits of mind. Dr. Hultzsch's Prolegomena include several specimens of the text.

SAKUNTALA, or the Lost Ring, an ancient Sanskrit drama by Kalidasa; translated by Sir William Jones and by Professor H. H. Wilson, 1827. In the drama Sakuntala is described as the daughter of the rishi Visvamitra by the apsara Menaka, who was sent from heaven by Indra to allure the sage. Sakuntala was the offspring, and was brought up by the rishi Kanwa in a forest hermitage south of Hastinapura. King Dushyanta, the reigning monarch, beheld her on one occasion when hunting in the forest, and persuaded her to marry him, giving her his ring as a token. Dushyanta then returned to his own city, and Sakuntala continued in her father's cottage. Durvasa, a sage, visited her home, but he did not receive sufficient attention from her, her thoughts being with her husband. This irritated the sage, who prayed she might be forgotten by the man she loved; but relenting somewhat afterwards, he said her husband on seeing the ring should recognise her. Finding herself enceinte, she set off for her husband's palace, but while bathing on the way, the ring fell from her finger and was lost, and the king failed to recognise her. Her mother took her back to the forest, where she bore a son, whom they called Bharata. But it so happened that a large fish was caught, and Dushyanta's ring was found in its belly, and taken to him. When he saw it all his recollection of the lovely Sakuntala returned, and he hastened to the forest, where he saw Bharata playing with young sucking lions, and putting aside their mother. Presently Sakuntala appeared, and he recognised her, and knew that the boy was his son. He took them to his city, made Sakuntala his chief queen, and declared Bharata his successor. The poet Kalidasa dramatized the story in Sanskrit under the title of Sakuntala, or the Lost Ring. Buddhism still exists among the characters of the piece, but had lost its ascendency, and Siva is the chief object of worship.—*Garrett; Dowson.*

SAKYA, the tribal name of Buddha. Hairs of his head are said to be in the Shoay-dagon at Rangoon; his thorax bone (breast bone?) in the dagoba at Bentenne near Kandy in Ceylon; a canine tooth, after several changes, was taken to Ceylon, A.D. 311; another tooth was placed in a tope on the island of Salsette in Bombay harbour,—it was opened by Dr. Bird, but tooth not found; another at Nagrak in N. India.—*Fergusson*, pp. 59, 60.

SAL. Hind. A year. Sal-girah or Barasganth is the anniversary of a person's birth, on which a knot is added on a string kept for the purpose. A girl's years are numbered by a silver loop or ring being added yearly to the gardani or silver neck-ring.—*Herkl.*

SALABAT JUNG, son of Nizam-ul-Mulk. His brother Nasir Jung in 1750 brought him into the Carnatic a prisoner, but in February 1751, on the death, at Cuddapah, of Muzaffar Jung, he was released and proclaimed Subah. He took Kurnool, and advanced to Hyderabad, where he pacified the French troops, and then in May advanced to Aurangabad, which he reached on the 18th June. In July he purchased a peace with the Mahrattas, and proceeded against the Nirmul raja, whom he defeated, and after this he sent to the Marquis Dupleix a sunnud of nawab of the Carnatic. In 1755, he proceeded to Seringapatam, and exacted 52 lakhs of rupees as tribute. In 1756, he came to a rupture with the French under M. Bussy, dismissed and pursued them, and sought the aid of the British from Madras.—*Orme.*

SALAB MISRI. Hind. Salep, the root of Orchis mascula, Eulophia, and other plants.

SALAGRAMA, fossil ammonites, reverenced and worshipped by the Hindus; supposed by some to be the ætiles or eagle stones of the ancients. The principal sorts are the Lakshmi Narayani, the Vamuna, the Demodura, the Narasingha, etc. Their abundance in the beds of mountain torrents, especially the Gandak, has been long known. They form an indispensable article in the sacra of the Hindus, and are used in propitiatory oblations to Vishnu, as well as in funeral and other ceremonies. They are black, mostly rounded, and are commonly perforated in one or more places by worms, or, as the Hindus believe, by Vishnu, in the shape of a reptile. According to the number of perforations and of spiral curves in each, the stone is supposed to contain Vishnu in various characters. For example, such a stone perforated in one place only, with four spiral curves in the perforation, and with marks resembling a cow's foot and a wreath of flowers, contains Lakshmi Narayani. The salagrama is fossilized with iron, clay, and pyrites, strikes fire with steel, but scarcely at all effervesces with acids; some very heavy, commonly black, but sometimes violet, oval or round, a little flat, nearly resembling a touchstone, and hollow, with only one small aperture; within it has spiral lines terminating towards the middle. Some are supposed to represent the gracious incarnations of Vishnu, and are then highly prized; but when they border a little on the violet, they denote a vindictive avatara, such

as Narasingha, when no man of ordinary nerve dares keep them in his house. The possessor of a salagrama preserves it wrapped in clean cloth. It is frequently perfumed and bathed; and the water thereby acquiring virtue, is drunk, and prized for its sin-expelling property. It is always placed near persons when they are about to die. A garden or plantation is consecrated by the Hindus by marrying the salagrama stone carried by one man to represent the groom, to a branch of the tulsi tree carried by another to represent the bride. It is the usual marriage ceremouy, somewhat modified; and after this consecration, the fruit can be eaten. Mr. Dunlop found two extensive lias beds at Takuli Shem, in Hundes, with numerous salagram, which are thence taken to Badrinath and Kailas. Hindus are averse to show them. The Grihadeva or household deity is sometimes represented by a waterpot, a rude figure, a salagrama, or a tulsi plant. The stones, called Ban-ling, found in the Nermada, are similarly considered as types of Siva, but they are not fossils, merely stones rouuded by attrition.—*Sonnerat; Gerard*, October 1830; *As. Res.* iii. p. 24; *Cole. Myth. Hind.; Moor's Pantheon; Wilson's Gloss.*

SALAH-ud-DIN, the Saladin of English writers, a distinguished Kurd soldier of the twelfth century, who opposed the Crusaders led by Richard Cœur de Lion. Salah-ud-Din, the son of Ayyub, a Kurdish chief, early became attached to the service of his uncle Asad, usually called Shirkuh, who commanded the army of Nur-ud-Din, king of Aleppo, a stroug upholder of the Abbasside khalifs. Salah-ud-Din Yussuf was still very young, when two vizirs of Egypt, the ministers of the Fatimite khalif, residing at Cairo, quarrelled, and one of them succeeded in banishing the other. The exile Shawer betook himself to Aleppo, and Nur-ud-Din offered him the help of Shirkuh and his Kurds to reiustate him. But Shawer soon quarrelled with the wild mercenaries, and made an alliance against them with Amaury or Amalrich, the crusader king of Jerusalem. Shirkuh, with the help of his nephew, defcated them both; and, taking Cairo, put Shawer to death, and annexed Egypt to the possessions of his master, Nur-ud-Din. The Fatimite khalif, a mere puppet, conferred on him a robe of honour, and gave him the title of Malik-al-Mansur, or Victorious King. He was thus serving Nur-ud-Diu of Aleppo and both the rival khalifs. His servitude did not hinder him, however, and his nephew from establishing their power in Egypt. Shirkuh lived long enough to secure his nephew a firm hold upon Egypt, and the title of Malik-al-Nasr—which means nearly the same as Malik-al-Mansur—from the Fatimite khalif in his palace or state prison. Nur-ud-Din sent word to Saladin from Aleppo that he must not receive these favours from a heretic, and ordered him to proclaim the Sunni khalif. Saladin desired the preachers in the Cairene mosques to omit the name of the Fatimite khalif from their prayers, and to replace it with that of the Sunni Commander of the Faithful, and Al Aadad, buried in the recesses of his palace, knew nothing about it. Saladin's life after this was one of uninterrupted prosperity. Nur-ud-Din died just when he might have become troublesome; so did Nur-ud-Din's little boy. As king of Egypt, and of Syria all but Palestine, Saladin turned his attentiou next to the Crusaders and their little kingdom. After the fatal field of Hattin, Jerusalem itself fell into his hands. This was the culminating point in his life, and he died himself in 1193, having exercised undisputed power for five years. His family quarrelled among themselves; his own descendants were dethroned, and those of his brother formed the Eyubite dynasty of Egyptian sovereigns, which reigned with varying fortunes for eighty years, one of the last being another Salah-ud-Din, whose army, when he himself was dying or dead, took St. Louis prisoner at Damietta.

Salah-ud-Din built a fortress on the modern town of Ajlun, and near the Wady Yabees; also Es Salt, where is the tomb of the prophet Hosea, 30 feet long and 3 fcet wide. The Christian women of Ajlun are of the purest Grecian type,—eyes large and lustrous; nose, mouth, and chiu classical, and complexion pure olive.—*Osborn's Islam.*

SALAI. Tam. An idol.

SALAJIT. Hind. A mixture of sulphuret of aluminium, sulphate of aluminua, and sulphate of iron. Its composition is very uncertain.

SALAM. Arab. Peace, a Muhammadan salutation, of which there are several kiuds, viz.—

Salam Bandugee.
Salam Kurnish.
Salam Tasleem or Tasleemat.
Salam Qadambosee or Zameenbosee.
Salam Sashtung (prop. Hashtang).
Salam Gallay-milna, or embracing.

Us-salam-oon-alei-kum-Rahmat-Oolahe, *i.e.* The peace and mercy of God be with you all.

It is iucumbent upon all Muhammadans to return the words Alaik-us-salam to the salutation 'Salam-alaikum' of a true believer, whatever be his rank.

Salam-alaikum, peace be unto you; O alaikus salam, and unto you be peace! Salam bolo, say unto him peace, touching the breast and forehead or lips aud forehead; kissing of the lips is not known with men, only the cheeks and shoulders. The right cheek first, then the left, and sometimes the cheeks alone are kissed, but generally the shoulders, also as Genesis xxxiii. 4, xlv. 15, Luke xv. 20. Kissing of the hands is common, as in Matthew xxiii. 7, Mark xii. 38; and rising to receive, as in Job xxix. 8.

One of Lane's useful allies was, he says, a bookseller. Ahmad, a descendant of the prophet, brought him a mushaf (a copy of the Koran), which he wished him to purchase; but he thought it necessary to offer an excuse for his doing so. He remarked that 'by my following or conforming with many of the ceremonies of Muslims, I tacitly confessed myself to be one of them; and it is incumbent on him to regard me in the most favourable light.' 'You give me,' says he, 'the salutation of "Peace be on you!" and it would be impious iu me, aud directly forbidden in my religion, to pronounce you au unbeliever; for he, whose name be exalted, hath said in the excellent Book, "Say not unto him who greeteth thee with peace, Thou art not a believer" (chap. iv. v. 96).'

The not returuing Salam is a sign on the part of the Bedouins that they are out to fight, and not to make friends. In India, after the

first salutation of peace, in conversation you say, 'Is your illustrious disposition well?' and the reply is, 'Al hamd ul illah,' Thanks be to God, or 'Ap ki mihrbani se,' By your favour, and if assenting to a proposition, 'Insha ul illah,' If it please God. Salam-alaikum is the Hebrew Shalom Alechem, Peace be to you, of Luke x. 5. Give my peace to So-and-So, on parting, where one says good-bye, or God be with you. With peace, go in peace, Exodus iv. 18.—*Fraser's Khorasan*, p. 81; *Burton's Mecca*, i. p. 340.

SALAMANDER, the water-salamander of Japan (Sieboldia maxima), the largest of existing species of the order of Batrachians. These are dull, sluggish animals, said to be endued with an extraordinary amount of vitality, and to live to a great age. They feed principally on fishes. Their native home is in the clear mountain streams of the Japanese empire, in the valleys of Niphon, between lat. 34° and 46° N. They reside in rivulets and lakes formed by the rains at a height of from 4000 to 5000 feet above the level of the sea; they grow to about 3 feet in length. A very extraordinary aquatic salamander is found in the lakes of Central Mexico,—the Siredon Mexicanum or Axolotl,—which in its ordinary state possesses naked external gills.

SALAMI. HIND. Tribute, quit rent; Act vii. of 1863 imposed a quit rent in Bombay Presidency of two annas per rupee on all unadjudicated alienated lands.

SALAMLIK, also Salamji. TURK. The place of assembly in a house where the Muhammadan greeting Salam-alaikum is pronounced.

SAL-AMMONIAC.

Urmena, ... ARAB.	Sadar, ... MALAY.
Nung-sha, Nou-sha, CHIN.	Nowsadur, . . SANSK.
Tung-sha, . . . ,,	Vayvagarra lunu, SINGH.
Peh-ting-sha, . . ,,	Navacharum, . . TAM.

Sal-ammoniac is a hydro-chlorate of ammonia. The substance from which this salt was first obtained was the soot of camels' dung, by sublimation, in Egypt, near the temple of Jupiter Ammon, whence its name. Since the establishment of gas-works, it has been chiefly derived from the liquor obtained during the preparation of coal-gas. It is found native at Etna and Vesuvius, in some of the Tuscan lakes, in Persia, Bokhara, in Mongolia and Ile, from lakes and the vicinity of extinct volcanoes. That in use in China was formerly obtained from Lan-chau-fu and Ning-hia, in Kan-su; but the country of the Tih or Sijung and Turfan formerly yielded it, also the fissures in the volcanic mountain of Peh-ting in Turfan. It is met with in commerce as large cakes of a semicircular form, translucent, and colourless, with a sharp, saline, cool taste, but no smell. It forms a considerable article of trade in Karnal, where the manufacture has been known for ages. It is important as a source of most of the compounds of ammonia; and is used at Lahore for the manufacture of solution of ammonia, for snake-bites, to a considerable extent. It is extensively employed in the arts, in the preparation of aqua regia, in soldering some of the metals, in tinning iron and copper, in the preparation of dyes, liquid ammonia, and in various chemical manufactures.—*O'Sh.*; *Smith's China*; *Powell.*

SALANGORE, in lat. 3° 20′ N., and long. 101° 12′ E., lies on the south side of the entrance of the river of the same name. This place was formerly frequented for tin and other articles of trade. Salangore is separated from Perak by a small river called the Runkup, a little north of the Birnam stream. The Bugi occupy the coast. —*Newbold*, ii. p. 27.

SALARIAS ALTICUS. Near the rocks of the Ceylon coast are multitudes of this curious little fish, which possesses the faculty of darting along the surface of the water and running up the wet stones and across the sand with the utmost ease and rapidity. Mr. Gosse had seen a species of Antennarium similarly running quickly to and fro on the surface of the great beds of floating sea-weed in the Gulf-stream, progressing with the utmost facility by means of its pectorals and ventral fins, quite out of water. By aid of the pectoral and ventral fins and gill-cases, they move across the damp sand, ascend the roots of the mangroves, and climb up the smooth face of the rocks in search of flies, adhering so securely as not to be detached by repeated assaults of the waves. These little creatures are so nimble that it is almost impossible to lay hold of them, as they scramble to the edge and plunge into the sea on the slightest attempt to molest them. They are from three to four inches in length, and of a dark-brown colour, almost undistinguishable from the rocks they frequent.—*Gosse*, p. 122; *Tennent's Ceylon*, i. p. 332, ii. p. 493.

SALAR JUNG, a successful financier, for many years minister of Hyderabad in the Dekhan. He was grandson of Mir Alam, who also had been the minister of that State. His titles from the Nizam were Mukhtār-ul-Mulk, and the Queen-Empress of India made him a Knight Grand Cross of the Star of India. He died A.D. 1883.

SALATAH. ARAB. A favourite Arab dish made as follows:—Take a cucumber, pare, slice, and place it on a plate, sprinkling it over with salt. After a few minutes, season it abundantly with pepper, and put it in a bowl containing some peppercorns, and about a pint of curds. When the dish is properly mixed, a live coal is placed upon the top of the compound to make it bind, as the Arabs say. It is considered a cooling dish, and is esteemed by the abstemious as well as by the toper.—*Burton's Mecca*, i. p. 198.

SALATHI. HIND. A kind of cotton floor-cloth.

SALATURA, the So-lo-tu-lo of the Chinese pilgrim Hiwen Thsang, the birthplace of Panini, the grammarian. Hiwen Thsang says it was 20 li or $3\frac{1}{3}$ miles to the north-west of Ohind. At the village of Lahore, which is exactly four miles to the N.E. of Ohind, General Cunningham in January 1848 procured several Greek and Indo-Scythian coins, from which it may be inferred, with some certainty, that the place is at least as old as the time of Panini himself, or about B.C. 350. He therefore identifies Salatura with Lahore. The loss of the first syllable of the name is accounted for by the change of the palatal sibilant to the aspirate, according to the usage of the people of Western India, by whom the Sindhu river was called Hendhu, and the people on its banks Hindus. Salatura would therefore have become Halatura and Alatur, which might easily have been corrupted to Lahore; or, as General Court writes the name, to Lavor.—*Cunningham's Ancient India*, pp. 5–8.

SALEM, a town of Southern India, in lat.

11° 39′ 10″ N., and long. 78° 11′ 47″ E., which gives its name to a revenue district of the Madras Presidency, extending between lat. 11° 2′ and 12° 4′ N., and long. 77° 33′ and 79° 6′ E. The town is prettily situated on the Terumani mattar, 900 feet above sea-level, in a long valley, with the Shevaroy Hills towering above, six miles distaut. The area of the district is 7483 square miles, and population 1,966,995. The district is hilly, and is largely cultivated by the Maleali race in villages at heights of 2230 to 4150 feet above the sea. The chief ranges are the Shevaroys (highest point 5410), the Kalrayan (about 4000), the Melagiri (4580), the Kollimalai (4663), the Pachamalai (about 4000), the Yelagiri (4441), the Jevadi (3840), the Vatthalamalai (about 4000), the Erivani and Valasaimalai (about 3800), the Bodamalai (4019), the Thopur Hills, the Thalaimalai. Dharmapuri is about 1500 feet, and Krishnagiri from 1500 to 2000 feet above sea-level.

The chief river is the Kaveri (Cauvery), from the left bank of which a large area in Tiruchengod and Namakal is irrigated. The Palar, Pennar, and minor streams fertilize the district. The district contains three palaiyams or zamindaris,—Sulagiri, Bagalur, and Berikai, all in the Osur taluk. A large portion of the Shevaroys is clothed with middling-sized jungle. Sandalwood is found, and the Jevadi and Yelagiri Hills contain some valuable timber. Magnesite veins occur chiefly at the chalk hills (so miscalled) near the foot of the Shevaroys. Potstone is found in several places. Magnetic iron-ore occurs in practically inexhaustible quantities. Corundum and chrome iron-ore are also obtainable. The Pennar and some other rivers yield gold. Hindu pilgrims crowd to the sacred springs on the Tirthamalai, to Hanumatirtham on the Pennar, to the pagoda at Osur, to the Adipadinettu at the falls of the Kaveri (Cauvery), and to the festivals at Dharmapuri, Mecheri, and other places. The chief shrines where the Malayalis worship are on the Shevaroys and the Chitterimalai Hills near Harur.—*Imp. Gaz.*

SALEMOTE, a silk scarf of Singapore, sometimes embroidered with gold thread. The Salendong and Salemote, with and without gold thread and silk, are in use throughout the Archipelago from Sumatra to Timor. Timor is the most remote of the eastern islands in which textile fabrics are manufactured, the countries beyond producing no other cloths than those of bark beaten out. The texture of the cotton cloths manufactured in Timor and the adjacent islands closely corresponds with those of the Batta of Sumatra and the Dyak of Borneo. The manufacture is evidently of great antiquity, and must have been introduced before that of Java of the present time, which is of Hindu origin. Cotton and dyes are grown in Timor. The silk threads introduced are made from raw silk imported from China and the continent of Asia.—*Cat. Ex.*, 1862.

SALENDONG, a silk scarf of Singapore. It is a woman's head-dress thrown over the head and shoulders.

SALEP. Salep misri, Arab., Hind., Pers. Oriental salep is probably obtained from Eulophia vera and E. campestris. European salep is obtained from Orchis mascula, *W.*; O. latifolia, O. morio, *W.*; O. militaris, *W.*; O. papilionacea, *W.*; O. coriophoira, *Pers.*; and O. undulatifolia; and Tacca salep from Tacca pinnatifida. The tubers of the orchis are compressed, ovoid, rather transparent, and composed chiefly of bassorine, soluble gum, and a large proportion of amylaceous matter or starch. One drachm of the powdered root requires 60 drachms of boiling water to effect its solution; two drachms afford a sufficient meal for an invalid. Good salep carefully prepared is one of the best articles of diet a convalescent can use. In India the salep of Kashmir from E. vera is reckoned the best. It is also imported from the Persian Gulf. From the peculiar shape of the tubers, it has gained immense, but most unmerited, celebrity as an aphrodisiac. The same circumstance has given the orchis plant its name both in the Greek and Arabic language. Native practitioners prescribe it in conjunction with mastic and some other ingredients, in such cases as require tonics. In England it is supposed the chocolate-makers grind it up with cocoa; by Europeans it is frequently used for children as an easily digestible form of farinaceous food, consisting mostly of bassorine. Residents of Simla and Ootacamund (in the Neilgherries) are in the habit of collecting the tubers of several orchids for family consumption. Tacca plant abounds in certain parts of Arakan, and the Mug race prepare the fariua for export to the China market. After removing the peel, the root is grated on a fish-skin, and the pulp having been strained through a coarse cloth, is washed three or four times in water, and then dried in the sun. Mr. Nuttall (American Journal of Pharmacy, ix. p. 305) says the Otaheite salep is obtained from a new species of Tacca, which he names the T. oceanica.

SALEP-i-SHAITAN. Pers. Conium maculatum; Cicuta virosa.

SALI, in Berar, silk-weavers of saree and choli.

SALIBAH, an Arab race in the northern part of the Peninsula and southern parts of Mesopotamia, who take their name from Salib, a cross. Lady Anne Blunt describes them (ii. p. 110) as short of stature, well made, engaged in hunting, and clothed in gazelle skins. They have donkeys and goats, but no camels or horses; they beg from the Arabs; they eat hedgehogs. Their women are beautiful, but no Bedouin, however poor, would marry one of them. She supposes them to be of Indian origin. Lieut.-Col. Pelly saw some men of this tribe at Koweit and elewhere. They are said to worship the cross (Salib), and perform many ceremonies, more nearly allied to the corruptions of Asian Christianity than to Islamism. Men and women dance round a sort of May-pole. They wear a carter's smock, coming down to the feet, and which, like a boy's pinafore, ties behind. They possess a beautiful breed of donkeys, which they ride, without girths, upon a saddle made like a cottage wooden chair bottom. They squat on this seat, and twist their legs over a pummel peak, crossing them over the donkey's neck. They seem to prize their saddles as an Arab does his mare, and would not sell them. They appear a merry, quick-witted, disreputable lot, with retrousse noses and Irish features. They stood, with eyes twinkling (legs and hands always on the fidget), and pelted him with the peelings of their fun. This strange people live on the flesh of the gazelle, which they shoot, and dress

themselves in its skin. They wander about amongst, and are friends with, all the Arab tribes, and yet remain entirely distinct. They adopt some of the forms of the Mnhammadan faith, but at feasts and marriages they raise the cross as a sign of rejoicing. They are the best guides for the descrt, knowing whcre water is to bc found, and the position of the various tribes. Those whom he saw seemed much more intelligent than the Arabs, and they havc more of a European than an Asiatic cast of countenance.

SALICACEÆ. *Lindl.* The willow tribc of plants, comprising species of the genus Salix. Salicine is a crystallizable bitter principle, obtained from the leaves and young bark of the poplar, willow, aspen, etc.; used in rheumatism. It forms small white silky needles, and in some respects resembles the vegeta-alkalies, cinchona and quina, having febrifuge properties; but it differs from them in containing no nitrogen, and not forming salts with acids.—*Tomlinson.*

SALICORNIA ARABICA. *Wight.*

Ushman, . . . ARAB. | Chook, ... HIND.
Chubuck-sowyeh, HIND. | Ghasul, ... PERS.

Grows in the Sunderbuns and on the Coromandel coast, and barilla is made from it.

Salicornia brachiata, *Roxb.;* Koiloo, Koyala, TEL., a perennial plant, very abundant in thc dclta of the Ganges and on the Coromandel coast, on low wet grounds overflowed by the tides. It yicldls a barilla for soap and glass.—*W. Ic.; Roxb.*

Salicornia Indica, *Roxb., W. Ic.*

Jodu palung, . BENG. | Koyya pippali, . . TEL.
Jidu palung, . . ,, |

A very common plant on such salt grounds as are inundated by the spring tides on the Malabar coast; it is burned for barilla. The value of barilla has been much depreciated by the progress of chemical science in Europe, where the purest alkali is manufactured by decomposing common salt by sulphuric acid, and at thc low rate of £10 the ton of 30 maunds. Salicornia, Salsola, and Sneda genera cover every patch of saline land in the Panjab.—*Eng. Cyc.; Roxb.; W. Ic.; Voigt.*

SALIK. ARAB. A traveller, a class of devotees, a pilgrim on the Tarikat or path of salvation of the Muhammadans.

SALINE SOILS occur in many parts of British India, in Hindustan, in the Dekhan, and in the Ceded Districts. In Northern India they are known as reh (*q.v.*), and salts of soda are largely manufactured from them.

Impure carbonates of soda, known as rasi and sajji, are manufactured from reh soil. Rasi is obtained by lixiviating the reh and concentrating the brine by solar heat. Sajji is the fnsed solid obtained by mixing reh with water, and exposing it in a furnace to artificial heat. The products from both processes are crudc carbonate of soda, and these are largely used in the manufacture of soap and tobacco.

Reh soil tracts have intermixed patches of salt soil and saltpetrc soils, and if these soils are intermixed with thc reh in the manufacture of sajji or rasi there will be no formation of salt. Reh soil, however, where genuine or pure, differs from the other soils containing sulphate of soda and saltpetre, as it contains no common salt.

An ordinary factory worked by fivc or six men will, in onc season, prodnce over 250 British man or maund of crude carbonate of soda.

Glauber's salt is known in N. India as Khari, also Khari-nun. Its manufacture is by filtration and solar heat. The machinery requisite consists of a filter (channa), reservoirs (hauz or hauda), a shallow masonry pan (patta) 14 yards by 12 yards and from 5 to 6 inches deep, made of consolidated kankar, with a thick surfacc coating of lime-plaster. Thc patta or masonry pan is subdivided into four or five compartments (kyari) on different levels to facilitatc transfer of the fluid. These arc constructed on a tract of khari soil, whcre water is conveniently at hand, and in thc early part of March work is commenced. The soil is gathered and takcn to the factory, passed through the filter, and the compartments filled with the brine, and exposed to the action of the sun. On the second or third day, the contents of onc compartment arc run off into the others; one after another is thus emptied, until all the concentrated brine is collected in one compartment for the Glauber's salt to precipitate. The empty compartments are filled with fresh brine.

In the soil there is always a percentage of common salt, and during thc evaporation thc sulphate of soda first precipitates; secondly, thc chloride of sodium. It is thus an easy matter to remove thc upper layer of salt from the glauber beneath, and this is usually done.—*Carnegy.*

SALINE SPRINGS are found in Sind and in the higher portion of the Panjab; they usually contain common salt with some sulphate of soda and small quantities of other salts, when they are not simply brine. Traces of iodine are found near Kangra. Throughout Rajputana and in some parts of the Panjab, the wells are abundantly impregnated with soda. Some of the springs in Kamaon contain mineral impregnations, but scarcely to an extent to be considered saline. Scarcely any strong saline springs are thermal. The few thermal salines are chiefly calcareous, and one or two silicious. There are many saline springs in Turkish Arabia and in Persia; also springs in Salt Range, Peshawur; a hot fountain in Kattyawar, with saline and sulphur springs within high-water mark; sulphurous well near Somnath; saline springs in the Konkan; saline and sulphurous springs in Lukee pass; sulphuretted hot springs at Badrachellum on the Godavery; hot springs at Rair and Urjunah, and at Byorah in the Dekhan.—*Jour. B. A. S.* iii., 1856. See Reh; Salt; Saltpetre.

SALISBURIA ADIANTIFOLIA. *Sm.*

Gingko biloba, *Linn.* | Pa-hwo, ... CHIN.
Yin-kwo (fruit), . CHIN. | Gingko, Jinko, . . JAP.

A tree of Japan, much cultivated in China, and found in many gardens in Europe. Iu congcnial climatcs it attains thc size of the walnut. Its leaves are wedge or fan shaped, deeply bilobed, and finely striated with veins, having some resemblance to the leaves of some species of Adiantum, whence it is commonly called maiden-hair trec in England. The pnlp of the fruit is austere tasted, but the large kernel is sweet, with somc degree of bitterness when raw, but agreeable as a dessert when roasted like chesnuts. They are much eaten in China. The Chinese are fond of dwarfing it, and it is often seen in that state in their gardens. Its fruit is sold in the markets in all Chinese towns by the name of Pa-hwo, and is not unlike dried almonds, only whiter, fuller, and more round. It is rarely eaten by Europeans.

—*Eng. Cyc.*; *Fortune's Wanderings*; *Roxburyh*; *Smith.*

SALITAH. Hind. A canvas sheet used to contain the articles composing a camel's load. In cold weather it is converted into a blanket.—*Burton's Scinde*, ii. p. 43.

SALIVAHANA was the son of a potter. He headed a successful popular movement, and became the chief of a powerful monarchy in Maharashtra. He ruled at Munji-Paithan. The ruler whom he overthrew is said to have been Vikramaditya, king of Malwa, but there are 135 years between the era of the historical Vikramaditya and that of Salivahana. He gave origin to a new era, which is still current in India. The era reckons from A.D. 78, the supposed date of his death. It numbers the solar years, as the era of Vikramaditya numbers the luni-solar years. Tod describes Salivahana as of the Takshak race, and states that the Salivahana era set aside that of the Tuar in the Dekhan. Salivahana had 300 wives, from whom the Beis Rajputs are descended.—*As. Res.* p. 121; *Elphinstone*, p. 224.

SALIX, the willow genus of plants. There are about 50 species in Eastern and Southern Asia. The earliest mention of the willow tree is in the Pentateuch, where the Israelites were directed at the institution of the feast of tabernacles to 'take the boughs of goodly trees, branches of palm trees, and the boughs of thick trees, and willows of the brook, and to rejoice before the Lord their God seven days.' At a later period, the Psalmist describes the captives as lamenting—'By the rivers of Babylon, there we sat down; yea, we wept, when we remembered Zion. We hanged our harps upon the willows in the midst thereof. For there they that carried us away captive required of us a song; and they that wasted us required of us mirth.' Willows are valuable for economic purposes. S. Babylonica and S. Ægyptiaca occur in gardens in Upper India. S. Lindleyana, or dwarf willow, occurs at 12,000 to 13,000 feet on the Himalaya; S. chita and S. rotundifolia in Kanawar. In Tibet, the whole plough exeept the point, which is iron, is generally made of willow. In Afghanistan willow wood is generally used for building, as insects do not attack it. On the Chenab, pails, etc., are rudely cut from single blocks of the willow; and, according to Moorcroft, combs to remove the fine goat's hair from the animal's back are made of this in Ladakh. The wood in Tibet and Spiti is employed for boarding. The small twigs are used for basket-work, and the leaves are highly valued in winter as food for sheep. One of the substances known as manna, the bed-khisht, used as a laxative, is said to be a product on a species of willow of Khorasan and Turkestan. S. flabellaris, *Ands.*, S. hastata, *L.*, and S. oxycarpa, *Ands.*, are found at various elevations in the Panjab Himalaya and Ladakh from 6000 to 15,000 feet; and the leaves, etc., of several are used as fodder. In Kashmir the willow is used largely for basket-making; in Tibet many of the houses are made of willow wattle and daub. Twig bridges of willow are mentioned in Spiti, Zanskar, and Ladakh, where Parrotia is not found. In Kashmir, willow twigs are employed as tooth-sticks. There also, and still more on the Chenab and in Ladakh, the trees are severely and systematically lopped, the young shoots and bark of the larger removed by hand, being used as fodder.—*Cleghorn*; *Royle*; *O'Sh.*; *Hooker*, *Him. Jour.*; *Stewart*; *Honig.*

Salix aemophyalla, *Boiss.*

Bisu, . . Hind., Panj.	Budha, . . . Sindi.
Bedh, ... Pushtu.	

A moderate-sized tree of Persia, Afghanistan, N.W. Himalaya, and Upper Sind. Wood tough and elastic, used in small carpentry; weight, 37 lbs. to the cubic foot. Leaves as fodder.—*J. A. Murray.*

Salix Ægyptiaca, *Linn.*

Bed-i-musk, . . . Pers.	Khagawla, . . Pushtu.

Cultivated at Lahore for the distillation, from the palm, of an aromatic water, which is much used in the hot season.

Salix alba, *L.*

Bushan, . . . Chenab.	Kalchang, . Ladakh.
Yur, Chung, . ,,	Walchang, . ,,
Chaugma, Chen., Ladkh.	Shan, Madanu, . . Panj.
Bis, ... Jhelum.	Kharwal, . Trans-Indus.
Vwir, ...Kaghan.	

Dr. J. L. Stewart says that there is considerable doubt as to this species, but it or an allied one appears to be common in Kashmir, Pangi, Lahoul, and Ladakh, etc., occasionally in the last from 5000 up to 14,500 feet, and it seems to occur in Trans-Indus; height to 80 feet. It reaches 8 and 9 feet in girth when well protected. Moorcroft mentions one of 16 feet, but the largest trees are very often hollow. It is planted round almost every village, and along the water-courses of the Chenab. The slender branches and leaves serve as food for sheep and goats. Its timber is the lightest of all woods, and is used for bungs.

Salix Babylonica, *L.*, Weeping willow.

Bada, Baint'h, . . Beas.	Bisa, Giur, . . Kangra.
Baida, ... ,,	Chung, ... Panj.
Mo-ma-kha, . . Burm.	Bed-i-majnun, . . Pers.
Bidai, ... Chenab.	Laila, Kutira, . . ,,
Pani-Jumma, . Hind.	Willa, Khar-Willa, Push.
Sail-i-majnun, . ,,	Wala, . . Trans-Indus.

A small tree of Greece, Asia Minor, common on the sides of all the rivers and canals, as well as in the gardens of the Chinese; is cultivated in gardens in Northern India, throughout the Panjab, and to 5500 feet in the hills and Kashmir. Near Chumba Dr. Stewart saw trees of 12 feet girth. It grows rapidly, and is easily raised in moist places by cuttings, up to stakes of considerable size, which are often planted to consolidate the banks of watercuts, etc. Its branches and twigs are largely used for baskets, wattles, weirs, etc. Good cricket bats have been made from it. The leaves are reckoned tonic; contain a neutral principle called salicine, and tannic acid; some consider it nearly equal to cinchona; it is also said to be anthelmintic. The small twigs are used for kiltas, baskets, and rope bridges.

Salix caprea, *Linn.*

Bed-i-mushk, . . Pers.	Khagawala, . . Pushtu.
Khilaf-i-balki, . . ,,	

Cultivated at several places in the Panjab plains. The large yellowish catkins of flowers appear in February, and are collected and sold at about 6 or 8 rupees per maund to perfumers, who distil a scented water from them. This, mixed with water, is drunk as a sherbet, which has a rather pleasant though somewhat medicinal taste.

Salix tetrasperma, *Roxb.*

Bheh, ... Assam.	Bhainsa, Baishi, . Hind.
Pani-juma, . . . Beng.	Bhumtas, . Jallandhar.
Mo-ma-kha, . . Burm.	Gud-byns, . Kamaon.
Bed, Laila, Safeda, Hind.	Walloonj, . . . Mahr.

In the Panjab this is planted in the plains, but is occasionally seen in the outer hills to 4000 feet, and to 5000 or 6000 feet on the banks of the hill streams of Kamaon. It is common at Rangamally, in the Terai, in the Kheeree pass, and along the foot of the mountains; is very common throughout the Madras Presidency from the sea-level up to 7000 feet; is absent from Ceylon, but extends to Burma and Java. Its wood is small but tough and elastic, but is not used in Burma or India. A cubic foot weighs 37 lbs. It is readily raised by cuttings, and grows rapidly to a considerable size. Dr. Stewart had seen trees of 6 feet girth. The names of all these plants, as laila and majnun, are allnding to the well-known eastern love story.

SALKH. The custom of the Arabs, called by them As-Salkh, *i.e.* scarring, appears to be a mode of establishing their manhood and courage. The father and friends go out into the open air, where they surround the lad, who sits down.

SALLY MAN, Velella mutica, a hydrostatic acalepha of a very beautiful and interesting structure. Also V. limbosa and other species.

Rakta-sembal, .	Hind.	Buraga, ...	Tel.

This is a large tree, with flowers of a beautiful red colonr, common in the warmer parts of Ceylon, and from one end of India to the other, particularly along the foot of the Himalaya mountains, and is one of the most abundant of the forest trees of Tenasserim. The tree grows rapidly, and is occasionally found 30 to 40 feet in girth. The tree is sometimes called S. pentaphyllum, when the lobes of the leaves are 5 instead of 7, but there is no difference in species, for the trees frequently carry both kinds of leaf. When very large, their appearance is magnificent; the thick stem spreads ont towards the base at intervals into buttress-like projections, strengthening and supporting the main stem; and in the spring season the tree is covered with huge magnolia-shaped scarlet blossoms. The silky down that envelopes the seed is used to stuff mattresses and pillows, and has occasionally been made into cloth; the young trees and branches have short flat thorns. The young flower-buds are cooked and eaten in some places; its white, soft, light, brittle wood, though not strong, is used for boxes, scabbards, doors, and water-conduits; white ants readily attack the wood. Leaves used as fodder; its gum is the mooche-ras of the bazar, and the roots of young trees produce the safed musli, which is used to make a cooling beverage.

SALMA SITARA, of gold and silver, a manufacture of Bengal.

No trout or salmon inhabits any of the rivers that debouche into the Indian Ocean (the so-called Himalayan tront is a species of carp). Salmonidæ are, however, found in the Oxus, and in all the rivers of Central Asia that flow north and west; and the Salmo orientalis, *M'Clelland* (Calcutta Jour. Nat. Hist. iii. p. 283), was caught by Griffith (Journals, p. 403) in the Bamian river, which flows into the Oxus, and whose waters are separated by one narrow mountain ridge from those of the feeders of the Indus.

S. orientalis, *Pallas*, according to Adams, p. 187, occurs in the Gulf of Pe-chi-li. The nature of the tropical ocean into which all the Himalaya rivers debouche is no doubt the proximate cause of the absence of Salmoninæ. Sir John Richardson (Fishes of China Seas, etc., in Brit. Ass. Rep., etc.) says that no species of the order has been found in the Chinese and Eastern Asiatic seas.

SALON, Manchu tribes on the Upper Saghalin.

SALONES are a tribe of sea-gypsies, living in the dry weather in their boats, and during the monsoon seeking a temporary shelter in huts built on the lee side of the islands of the Mergni Archipelago. They are said to be divided into several clans, which have each a recognised right to fishing-grounds within certain limits. Formerly they were much exposed to the predatory attacks of Malay pirates, but these troubles have almost ceased, and during the fine weather Salones may be seen in their peculiar wicker-work boats at Mergui, whither they come to dispose of their fish and beche-de-mer. In personal appearance they are between the Malays and the Burmese. Their language has affinities with the tongue of the former, and belongs to the Malay-Polynesian group of agglutinating languages. 894 were counted in the Mergui district living in various islands of the Archipelago.

SALOO, a cloth of Banda; it is dyed with alkanet root, with a mixture of castor-oil, in the proportion of one pâo to every piece of cloth, each piece of cloth being eight yards. Besides castor-oil, Russee, a kind of earth, is also mixed, and goats' dung and alum. The cloth is first rubbed for ten days in the castor-oil, Russee, and goat's dung, and then dried in the sun. After ten days it is well washed and dried, and then steeped in the oil for five days; afterwards washed and dried in the sun; and after a third application of soap and water, the cloth is ready for sale. The cost of dyeing different kinds of cloth is as follows:—Nynsook cloth sells at 1 anna per yard; mulmul at $\frac{3}{4}$ anna per yard; and that used for the pagri or turband at $\frac{1}{2}$ anna per yard.

It is not easy to ascertain the extent and value of the quantity of saloo cloth annually manufactured. It is exported to other parts of India, and its use is general, and not limited to particular castes. The wholesale market value is about 1 rupee 6 annas 6 pice per piece, according to the quality of the cloth dyed.—*Cal. Cat. Ex.*, 1862.

SALOTAR. A work is extant on veterinary mediciue; it is said to be by Salotar, who is stated to have been the tutor of Susruta. It was translated from Sanskrit in the year 1831. But Professor Max Müller mentions that Salotar is not known as the author of such a work, and he adds that Salotariya is a name of Panini, and that the teacher of Susruta is said to have been Devodasa. Salotar, also Salastri and Salotri, Hind., is a veterinary surgeon.—*Müller's Lectures*, p. 142.

SALSETTE is supposed to be derived from She-aste, meaning, in Mahratta, eighty-six, it having formerly contained, it is said, that number of villages. Mr. Burgess says (p. 349) it is called Shatshashthi. It is 150 square miles, and much

the largest of the many islands near the island of Bombay, and the islets of Dravee and Versova are just off the shore of Salsette. Salsette and Bassein were taken by the British on the 28th December 1774, and Salsette, Bassein, aud the revenues of Broach were ceded by Raghoba on the 6th March 1775. Its northern point is in lat. 19° 7′ 40″ N., and long. 72° 47′ E. It is connected with Bombay by a causeway and bridge at Sion, 2 miles E. of Mahim. Between Mahim and Bandora are a fine causeway and bridge, constructed at the joint expense of Sir Jamsetjee Jejeebhoy and Government. It is beautifully diversified and well peopled. It has many ancient rock-temples at Kanheri, Marol, Magathaua, Mandapeswar, and Jogee, and at Kanheri, about one hundred, mostly small, excavated in a large, solitary, bare hill, some of them covered with sculpture of the Mahayana type. The chaitya at Kanheri has been pronounced by Dr. Fergusson to be merely a copy of the Karli cave. It belougs to the beginning of the 5th century, but nine of its viharas seem to be of earlier date.—*Burgess*, p. 349.

SALSOLA, Kontee-lanee and Kharu lanee, SIND. A genus of plants belonging to the natural order Chenopodiaceæ, named from Salsus, salt, in consequence of many of the species, S. kali, S. sativa, S. soda, and others, yielding kelp and barilla. The species are chiefly found on the sea-shore in temperate climates, but also in hot parts of the world where the soil is saline, or where there is salt water in the vicinity. Various species of Salsolaceæ abound in the more saline dry parts of the doabs of the Western Panjab. The Salsola kali of Europe and the colder parts of Asia is mostly found on saudy shores or arid deserts; an annual bushy plant, with stiff, thorny, channelled leaves. The dried plant, when reduced to ashes, yields 25 to 30 per ccut. of carbonate of soda; used in India in soap-making, calico-dyeing, washing, etc.

SALSOLA INDICA. *Willde.* Oomari-keeray, TAM.; Ella-kura, TEL. This, with species of Salicorneæ, and other of the Chenopodiaceæ, are natives of the salt marshes and grounds near the sea, flowering the greater part of the year. The green leaves are universally eaten by all classes of uatives who live near the sea, and are reckoned very wholesome. The leaves of this plant alone saved many thousand lives during the famine in India of 1791–92–93. It is a small procumbent weed, with linear-shaped leaves, is used as greens, and is a very pleasant vegetable. This, being naturally salt, has given rise to the Teling saying, 'The carping husband (finding fault without cause) says to his wife, There is no salt in the Ilakura.' In Malabar, barilla is made from it.

SALSOLA NUDIFLORA. *Willde.* Ravakada, Reyyi-kada, TEL., is a native of salt barren lands near the sea, and flowers during the greater part of the year. The stems are perennial, many spreading close upon the ground, and often striking root, ramous extremities of the branches ascending. The plant is only used for fucl, but Roxburgh believed it would yield excellent soda. —*Roxb.; O'Sh.; Voigt; Jaffrey.*

Four kinds are distinguished,—rock-salt, sea-salt, lake-salt, and earth-salt. Wheu found native in immense masses, which only require to be dug and reduced to powder, it is termed rock-salt; when obtained by the evaporation of sea water, common salt or sea-salt; and when manufactured from the saline soil, it is known as earth-salt. Sea-salt is extensively mauufactured on account of the Indian Government at many places along the coast. The process is not everywhere exactly the same, but generally, the sea water being raised by means of levers, called pakottas, is run into shallow beds or paus, and evaporated, additional water being added as the evaporation goes on. The salt is raked to the side, and conveyed to platforms or raised places, where it is heaped in quantities of 10 or more garce. In some places a proportion of the salt water is obtained from wells dug near salt creeks; iu others the salt water is dammed up in the mouths of rivers, where it is partially evaporated for some time before being run into the crystallizing pans. In some parts of Ceylon, of the adjoining coast of the Peninsula of India, where the beach is long and shelving, also on the shores of the Runn of Cutch, salt is formed naturally on the sea-shore, by the sun's rays evaporating the tidal waves.

All round the coasts of Ceylon and the Peninsula of India, but chiefly on the east coast, salt is locally made in great quautities, and at a cost defying all foreign competition. For this reason, in British India, Ceylou, aud Netherland India, salt mauufacture is a monopoly of the respective governmeuts in India, and yields a large part of the revenue.

In Bengal, the monopoly of salt iu one form or other dates at least from the establishment of the Board of Trade there in 1765. The strict monopoly of salt commenced in 1780, under a system of agencies. The system introduced in 1780 continued in force with occasional modifications till 1862, when the several salt agencies were gradually abolished, leaving the supply of salt, whether by importation or excise manufacture, to private enterprise. Since then, for Bengal proper, the supply of the condiment has been obtained chiefly by importation, but in part by private manufacture under a system of excise.

The Indiau Salt Act xii. of 1882 was passed by the Governor-General on the 10th March. It repealed the Inland Customs Act viii. of 1875, and the Salt Act xviii. of 1877; also section 9 of the Bengal Salt Act vii. of 1864, clauses *b* and *c* of section 39 of the Burma Laud Act ii. of 1876, and sections 36 and 37 of the Ajmir Laws Regulation iii. of 1877.

Act xii. of 1882 embraced the N.W. Provinces, Panjab, Oudh, Ajmir, Mairwara, Sind, the Patna Division, and Central India, and fixed Rs. 50 as the fee for a licence to manufacture aud refiue saltpetre and to separate and purify salt; also Rs. 10 for a licence to manufacture sulphate of soda (Khari-nuu) by solar heat in evaporating

pans; and Rs. 2 each for a saltpetre licence, for making Khari-nun by artificial heat, and for the manufacture of other saline substances; and by chapter iii. power was given to impose a duty not exceeding three rupees per maund of 82⅔ lbs. avoirdupois on salt manufactured in or imported by land into any part of British India, and with power to fix the minimum price at which salt, excavated, manufactured, or sold by or on behalf of the Government of India, shall be sold.

Further, by chapter vi., the excise duty payable under the Madras Act vi. of 1871 was not to be demanded until the salt was to be removed from the place of storage.

The duty was fixed in 1878 at Rs. 2.8 per maund, in most parts of British India; in the Lower Provinces of Bengal, Rs. 3.2 per maund; and in the Upper Provinces, Rs. 2.12 per maund.

In British India, in the 10 years 1871–72 to 1880–81, the salt revenue collected averaged £6,484,268, and the charges of collection £453,917.

	Collected.	Charges.		Collected.	Charges.
1872,	£5,966,595	£477,368	1877,	£6,304,658	£488,480
1873,	6,165,630	476,680	1878,	6,460,082	539,858
1874,	6,150,662	478,245	1879,	6,941,120	404,743
1875,	6,227,301	462,168	1880,	7,266,413	340,687
1876,	6,244,415	507,410	1881,	7,115,988	363,537

Salt imported into British India—

1879–80,	. .	352,238 tons,	Rs. 76,25,321
1880–81,	. .	373,376 ,,	,, 66,55,174
1881–82,	. .	357,227 ,,	,, 56,90,671

In *Ceylon* the manufacture of salt is conducted by solar evaporation and by artificial heat. The best article is formed naturally in the Southern and in parts of the Northern Provinces. In the Northern Provinces the evaporation is chiefly from salt pans. Between the years 1865 and 1870 the production ranged from 121,146 cwt., costing £11,000, and 791,503 cwt., costing £20,502, the revenue averaging £71,381.

In *Netherland India* the manufacture is carried on by the Government on its own account, by solar evaporation from salt pans, of which there are several in process, and their contents are drawn off from one to another. The salt is obtained in 30 to 40 days. The monopoly is in force through nearly the whole of Java and Madura, throughout the west coast of Sumatra, Bencoolen, Lampongs, Palembang, Banca, the east and west coast of Borneo. But in Riouw, Billeton, Celebes, Amboyna, Ternate, Banda, and Timor, the Netherland India Government does not interfere with the supply. In 1871, the quantity sold at the places where the monopoly exists, was 32,599 coyangs.

On the *Continent of India*, the only lake from which salt is obtained is the Sambhar Lake of Rajputana. Its waters are highly saline, and its efflorescing salt is greatly prized, as also is that of the Runn of Cutch.

Salt beds in *Sind* are in the vicinity of the Allah Band. In 1847, Lieutenant Burke estimated the quantity in the Goongra at 1,500,000,000 tons.

In *Orissa*, two kinds of salt are made, one called Pungah, by evaporating highly concentrated brine by artificial heat. The other, Kurkutch, is preferred; it is obtained by the solar heat evaporating sea water, is cheaper, and it is the only kind allowed to be used in the temples.

Salt is manufactured on the west bank of the *Hoogly* river, above Kedgeree, and on either side of the rivers Huldi, Tengree-Khally, and Roy-Khally, and in the numerous canals and creeks which are fed by them, to the extent of 9 lakhs of maunds, employing about 17,000 people.

Salt wells are sunk along both banks of the *Purna* river. When the depth of 90 feet is attained, the water suddenly gushes up to a height of 15 or 20 feet, like the jet from an artesian well.

The *Great Salt Range* in the N.W. frontier of India runs through the Jhelum and Shahpur districts, and its vast deposits of rock-salt are practically inexhaustible. The principal beds occur in the southern slopes of the range, and are from 150 to 200 feet in thickness. At Kalabagh the salt is quarried in open mines, but in other places the mines are led to by galleries, as in the Mayo mine at Kheora, the Sardi mines in the Jhelum district, and the Warcha mine in Shahpur.

Salt of the *Kohat* district is obtained near the surface, from five quarries in the chain of hills running from the Indus towards Bahadur Khel. It is of a black or dark-green colour. Nowhere else in the world are there salt deposits of such vast extent and purity.

To the east of Lahore, at Bureng and Gomi, near Mandi, are two mines, and at Kotri rock-salt was discovered.

During the progress of Mr. Wynne's survey, three mines were being worked on the eastern side of the Indus, and the open quarries of Kalabagh on the other side. The largest mines are the Mayo mines at Kheora. In these, vast but dangerous chambers had been opened up by the old Sikh workmen, who were so careless in their method of excavating, that two heavy pillars supporting the roof of one chamber were left resting on a thick crust of salt spanning another large chamber below. This eventually gave way in 1870, and the ruins of the fallen mass were so great that quite a crater was formed on the hill in which the mines are situated. Since the advent of British rule a better system of working has been introduced; and instead of gaining entrance to the mines by a slippery incline, one can now drive in upon a tramway through a spacious passage, in which due provision has been made for ventilation. The old chambers still remain to be contrasted with the new ones, and when illuminated with coloured or magnesium lights the effect of the brilliant crystal facets and stalactite masses in them is very picturesque. Gunpowder is now used in these mines for blasting purposes. Dr. Warth estimated that 300 lakhs of maunds, or more than a million tons, have been removed from the Mayo mines, but they show as yet no signs of becoming exhausted.

The Sardi and Warcha mines are of less importance. The Kalabagh or Trans-Indus quarries are all open workings in a thick group of salt beds, ranging from 4 feet to 20 feet in thickness. They run along the right side of the Lun or Gossai Nallah, the salt extending from the base of the hill as high up as 200 feet. The outcrop runs for some two miles up the glen, and there are 14 working-places or quarries. The value of the receipts from the four Salt Range mines for the four years ending 1870–71, averaged £388,144 annually. Where the workings have been most carefully surveyed, the salt has been found in zones, consisting of several distinct beds, within distances of about 600 feet, 200 feet, and less of

the top of the marl and gypsum. There seems to be a larger development of so-called bad salt in the western than in the eastern part of the district, but it may be mentioned that this bad salt would in other districts be extremely valuable. A very wasteful system of carriage had prevailed. The salt was reduced to rough spherical lumps to prevent the corners from being rubbed off during its transport in open nettings or hair-cloth bags, and an enormous quantity of it was thus wasted.

Earth-salt is produced from tracts of saline soil. These occur in many parts of British India, and are called namaksar, dawanah, nonarah, and aihri.

In N. India the saline tracts are distinguished into Sichan, from the verb Sichna, to moisten or bedew, and Goran, from Gorna, to dig or scrape.

In the Sichan tracts, the soil has no saline particles, but the saline water from wells being spread over it, the action of the sun causes the saline particles to effloresce, and from this the salt is manufactured. If these Sichan soils be left for a year or two, they again become fit for cultivation.

The soil of the Goran tract is wholly saline and unculturable, and except after heavy rain, edible salt can be made from them at any season by solar or artificial heat. Water poured on the saline earth passes through, carrying with it the saline particles in solution, which is afterwards evaporated by the sun's rays or by artificial heat. When the salt soil is strong, about five seers of dry earth will yield from 8 to 10 chittak of salt.

Salt occurs in several parts of *Mysore* in considerable abundance, usually on the red soil, and it was manufactured in almost every village on the south side of Chittuldroog. It effloresces on the surface in the dry season, and the people sweep it together, and, after dissolving it, crystallize it.

In *Asia Minor*, between lat. 37° and 39° N., and long. 30° and 34° E., are a number of valleys or depressions filled with saline waters, having no outlets, the chief being Tuz Gol, Murad Su Gol, Ak Shahr Gol, Bey Shahr, Lake Chardak; and Lake Van, less saline, is 240 miles in circumference. El Sabahkah, near Aleppo, is a salt lake. In Palestine is the Dead Sea, or Bahr-ul-Lut. It is 1300 feet below the level of the Mediterranean, and its waters contain 12·11 per cent. of chloride of sodium, 7·8 of magnesium chloride, 2·4 calcium chloride, and 1·2 potash. To the south-west of the lake are deposits of rock-salt, forming the chief portion of the hills of Usdom or Sodom, where a pillar of rock-salt was pointed out as Lot's wife.

Rock-salt abounds from the neighbourhood of *Mount Ararat* westward along the mountain chains bordering the upper courses of the Euphrates and Araxes, to the mountains to the west of the Kizil Irmak. It is particularly pure at Beli Bagh, near Kankari, 2500 feet above the sea. At Ulash, and near Amasia, salt is found, and there are salt mines in the valley of the upper portion of the Kizil Irmak, and also at Kulpia in the valley of the Araxes. The whole of the upper course of the Araxes, especially in the neighbourhood of Mount Ararat and Nakhitschevan, abounds with rock-salt.

The greater part of *Kurdistan* is supplied with salt from the Lake Urumiah, south of Mount Ararat. It is 80 miles long by 20 miles broad, and its shallow waters are intensely saline.

Rock-salt also occurs in the valley of the *Oxus* and its tributaries, and mines are worked near Bokhara, at Guzar, Nerak, Altanin Dara, Samgar, and Khulm.

In *Arabia*, rock-salt is found near Loheia, and in two districts east of Loheia, also in the hills of Al-Kasym, and in the hills near the coast, in the vicinity of Bahrein Island; and salt is manufactured on all the Arabian coasts, in quantities sufficient to admit of exportation.

At *Hit*, near Baghdad, are saline wells; also small salt lakes at Al Mihl and the neighbourhood, and salt abounds at Toz Khurmate, to the east of the Tigris.

Near *Shiraz*, there are several salt lakes, which furnish the neighbouring country with salt. The chief of these are Mahlnja or Lake of Shiraz, Lake Bakhtigan, and Lake Kazarun.

The mountains of *Kirman* and *Laristan* abound in rock-salt. The hills in the island of Ormuz are almost wholly composed of rock-salt, which is mined and exported. The neighbouring island of Angar is also noted for its rock-salt.

A few miles to the north of Neshapur, rock-salt is mined, and there are brine springs at Puli Nika to the south of the Caspian, and rock-salt to the east of that place.

Baluchistan has salt works at Lyari, in the south, and rock-salt of a red colour occurs in the mountains between Cutch Gandava and Kalat.

In *Further India* and in the south-east of Asia salt is obtained on the coasts by evaporating the sea water, and inland, from saline wells, saline soils, and deposits of rock-salt.

Salt fields are extensive at Shimpagah, a short distance above Mandalay, on the right bank of the Irawadi, and at other places in smaller quantities.

China.—Rock-salt occurs in the island of Tsung-Ming, in *Yunnan*, and Sze-chuen, and is freely worked; and brine, nearly saturated, is found at great depths in wells, sometimes 1800 feet. But the great mineral salt district of China lies along the foot of the mountains forming the eastern barrier of the great central plateau of Asia.

Salt wells and springs of China and springs of inflammable gas occur in the districts of Young-Hian, Wei-Yuan-Hian, in the department of Kia-Ting-Fu, in Szu-Tchouau on the borders of Tibet. In the neighbourhood of the town of Ou-Thouang-Khiao are several thousands of these salt wells in a space of ten leagues by five. The wells are mostly half a foot in diameter, 1500 to 1800 French feet in depth.

Salt mines are worked in the mountains of *Corea*, and the sea-shores and lagoons of Avadsi furnish salt to the Japanese.

In *High Asia*, a lake bed occupies the lowest part of the whole of Ala Shan, and is 3100 feet above the sea; it is about 33 miles in circumference, and encrusted with a layer of pure salt 2 to 6 feet thick.

Ladakh.—Salt Lake of the Rupshu district is seven square miles in area. At its northern shore are a series of small lagoons, the water of which drying up leaves a deposit of common salt.

Tibet obtains its salt from the saline waters of its lakes,—the Pangong Lake (100 miles), in Western Tibet; Lake Nam-Cho, or Tengri-Nor, in E. Tibet, 15,000 feet above the sea, 50 miles

long, and 16 to 25 miles broad. Another salt lake, Bulcho, is to its north; and to its south the lakes Dalai Dabasun, Dulan Nor, and Sir-ho-Nor contain saline waters. Near the north bend of the Hoang-ho are several deserts with salt lakes, and Djaratai Dabasun, a dried-up salt lake to the west of the great bend of the Hoang-ho, supplies all the neighbourhood.—*Province of Sind; Bombay Selections*, No. xvii., 1855; *Panjab Correspondence*, 1860, iv. No. 4, 1869, No. 3; *M. and M. Pr.; Heyne; Captain Strover*, 1873; *M. Imbert; Klaproth in Jam. Ed. Jour.*, 1830, p. 108; *Drew, The Northern Barrier*, p. 305.

SALT, BLACK.

Kala namak, . . Hind. | Sonchal namak, . Hind.

To make this medicinal substance, take 1 maund of Sambhar or Dindwa salt, ½ seer of the fruit of Terminalia bellerica, ½ seer of the fruit of T. chebula, ½ seer of Aonla or Emblica officinalis, ½ seer of black sajji or impure carbonate of soda; all these are put into an earthen pot over a fire, and kept there till scorched; when about 35 out of 41 seers remain, the pot is taken off, and the black salt is made. About 2 maunds of wood are used. The price is Rs. 3 per maund. It is used as medicine in India and China. In China it seems to contain a little sulphuret of iron, and is given in enlargements of the spleen and liver.—*Smith, Mat. Med.; Powell, Handbook Econ. Pro.*

SALT FISH is largely used in India by the people as a condiment. In 1882, the Government of India acted on Surgeon-Major Day's recommendation that the tax on salt used in the preparation of salt fish should be remitted. In 1879-80, it was imported into India to the value of 6 lakhs of rupees, and from 1877-78 to 1879-80, the quantities imported ranged about 2500 tons.

SALT, HENRY, author of a Voyage to Abyssinia, and Travels into the Interior of that Country, in 1809-1810, London 1814.

SALTPETRE, Nitrate of Potash.

The saltpetre of commerce is obtained from the East Indies, chiefly from Oudh, Bengal, and Nellore. Saltpetre exported from India was, in

	Cwt.	Rs.		Cwt.	Rs.
1874–75,	553,330	50,14,678	1878–79,	382,405	36,17,660
1875–76,	415,080	34,89,487	1879–80,	509,372	46,97,968
1876–77,	466,218	38,17,060	1881–82,	354,860	35,94,367
1877–78,	389,002	37,90,017	1882–83,	399,565	38,87,662

It is manufactured in India by lixiviating nitrified earths, and evaporing the liquor thus obtained either by artificial heat or by the solar rays. Saltpetre soil is found abundantly on the surface of nearly all the uncultivated soil in most old towns and villages, within or in the immediate vicinity of the town or village, also on the sides of roads, and encrusting the walls of houses. The nitrous efflorescence is most abundant during the dry weather from January to June, and is not procurable during the rainy months, or after rain showers. Saltpetre soil always contains more or less common salt, and in Oudh is often intermixed with patches of purely salt earth. The processes of lixiviating, filtering, running off from one compartment to another, and collecting the crystallized saltpetre, are similar to those followed in the manufacture of Glauber's salt.

It generally occurs as a white incrustation on the soil, being also mixed with it to a considerable depth. The earth is scraped and boiled with water. The solution is then concentrated by the heat of the sun, and the water afterwards evaporated by artificial heat. From this the salt appears in impure crystals, which are exported in coarse bags of sacking. In this state the salt is known as rough saltpetre. The empty bags are soaked and boiled to extract the salt they may have imbibed, and then sold to the makers of coarse wrapping paper. Its ordinary price is £38 to £40 the ton, but during the mutinies in Northern India in 1857 and 1858, it rose to £59. It is refined by boiling and cooling, the pure crystals forming in the cold solid solution, leaving the impurities still dissolved.

The soil of the Bellary, Ongole, and Nellore districts is very favourable for the manufacture of saltpetre.

Burma.—Saltpetre is manufactured in several places in Upper Burma to about 50 tons annually. It is found in some of the caves of Tenasserim, and is imported from Rangoon. It is manufactured in China from the natural efflorescence of the soil, but it is largely imported.

In *Cuttack* nitre is known locally as Kehai jabkhai.

The commercial saltpetre examined in Madras has, generally speaking, been very pure, and especially free from sulphates. It is made at Moganore and Errode, also of a very fine quality at Ellore.

Panjab.—A saltpetre is made in most of the plain districts of the Panjab, particularly in Multan, Dehra Ghazi Khan, Jhang, and Gugara, where it effloresces spontaneously about old ruins, and is collected and purified by boiling and re-crystallization. It forms a considerable article of export, both inland, beyond the frontier, and also to the seaports. Saltpetre is found naturally in the soil, in many parts of the Panjab, efflorescing near old buildings. It is not to be confused, however, with the white efflorescence often observed on the reh, or barren uncultivated lands, and which is usually a sulphate of soda.

Saltpetre and salt are produced abundantly in some parts of Shahabad, and crude saltpetre is prepared at from 6 to 7 rupees per local maund, by the Nooneah workmen; this, in its crude state, would be £15 to £18 per ton, while the salt produced with the saltpetre is of a coarse kind.

Marsden, in his Sumatra Researches, referring to the saltpetre caverns in the country of Caltown, near the land of the Davi river, states that these caves are filled with nests of innumerable birds of the swallow kind, which abound the more the further one advanced into the cave, and that it was their dung forming the soil (in many places from 4 to 6, and even from 15 to 20 feet deep) which affords the nitre. A cubic foot of this earth produced on boiling 7 lbs. 14 ounces of saltpetre, and a further experiment gave one-ninth more.—*Quarterly Review*, July 1868; *Rohde, MSS.; Cat. M. E. of* 1857; *Cat. Ex.*, 1862; *Burckhardt*, p. 114; *Robinson's Travels*, ii. p. 135; *Marsden's Sumatra; Mason's Tenasserim.*

SALT RANGE, a range of mountains between lat. 32° and 33° 20′ N., and running east and west from the base of the Suliman Mountains to the river Jhelum, in the Shahpur and Bunnu districts of the Panjab. The Bunnu portion of the range runs north-westward towards the Indus. The main chain commences in the lofty hill of Chel, 3701 feet above the sea, which is formed by the convergence of three spurs rising up from the Jhelum river, and divided from the Himalayan outliers only by the interposition of the river valley.

The Salt Range of mountains seems to be the Mons Oromenus of Pliny and the Sanskrit Raumaka. The range occupies historic ground, —one extremity resting upon the Hydaspes or Jhelum, and the other upon the Indus or Aba-sin, while its eastern extension overlooks the battle-field of Chillianwalla. It is one of the most interesting and important regions of British India, chiefly on account of its highly fossiliferous rocks and enormous deposit of rock-salt, which, for extent and purity, are unequalled in the whole world, and it is from this that the range is named.

The Salt Range proper lies entirely on the eastern side of the Indus, forming a somewhat elevated border to the Rawal Pindi plateau (lying to the north); and throughout its whole length of about 150 miles, its steep declivities and lofty scarped cliffs, rising to an average height of 2200 feet, abut on the vast semi-desert plain which spreads southward to the Arabian Sea. Mr. Wynne considers that it is an error to speak of the range as extending across the Indus, and up to the Safed Koh in Afghanistan, as the salt there is believed to be of an entirely different age and position. In different parts of the range are to be found brine springs, hot springs (in the Bakh ravine), the water of which is covered by a thin film of gypsum, and deposits a black tenacious mud, used by the natives as a dye for cotton cloth. Petroleum springs have been found, and the range yields magnesian limestone, fire-clay, marble, lithographic stones, sandstone, coal, sulphur, gypsum, brown and red iron-ore, copper-ore, gold, and alum slate. The lower beds contain no organic remains, but the upper abound in them. Sandstone abounds, with the exuviæ of enormous animals, either saurians or sauroid fishes. The hills at Kalabagh contain great quantities of aluminous slate, from which alum is manufactured. The slate, well sprinkled with water, is laid in alternate strata with wood, until the pile reaches a height of 25 to 30 feet; it is then lighted, and the combustion continued for about twelve hours, in which time the colour of the slate is converted from greyish-black to dark-red. This change of colour indicating that the process has been carried to a sufficient extent, the mass is thrown into a tank holding as much water as it is computed the alum is competent to saturate. After three days, the water, which becomes of a dark-red colour, is drawn off, mixed with a due proportion of potash, and boiled down; the residuum on cooling becoming a solid mass of alum. The coal occurs in oolitic strata at Kalabagh, and is employed as a fuel for the Indus steamers, and in tertiary strata between Jalalpur and Pind Dadan Khan. It is of inferior quality, consisting of a brown lignite, difficult to set on fire, and yielding a very large proportion of ash. The principal beds of salt occur in the red marls and sandstones of the Salt Range. They are from 150 to 200 feet in thickness, but masses of salt are also found interspersed among the marls, and detached from the main beds. There are three principal varieties of salt, viz. red, white, and crystal salt. The red is preferred for merchandise, as it does not break up so readily as the others. The white variety not unfrequently passes into a grey or greenish and purplish colour. The Bahadur Khel Trans-Indus mine yields black salt, and this is shipped at Esa Khel for export, having specific uses of its own.

SALU, narrow coarse cotton cloth dyed red with madder.

SALUER. Malay. Trousers of silk or cotton, or silk and cotton mixed.

SALUNG. Siam. A money of account, the fourth of the tikal, and worth about 7½d.—*Simmonds.*

SALUNKHA, Hind. ? is the top of the linga altar.

SALUP. Malay. A weight used in Sumatra, of 2 lbs. avoirdupois.—*Simmonds.*

SALUTATIONS amongst the various races of Asia differ in form. Genesis xxxiii. 4 says, 'And Esau ran to meet him, and embraced him, and fell on his neck.' Hindus have five forms of saluting, viz. (1) the Ashtanga, in which the person prostrates himself, and makes eight parts of his body touch the ground, viz. knees, hands, temples, nose, and chin; (2) Panchanga, five parts, the forehead, temples, and hands; (3) Dandavata, in which the forehead touches the ground; (4) Namaskara, in which the palms of the hands are joined and raised to the forehead, which is touched with the outstretched thumbs; and (5) Abhivadana, in which the right hand is raised to the forehead.

All the races of Southern and Eastern Asia meet persons of distinction a mile or two before they enter a city, and a visitor is received according to his rank at the outer gate of the house, at the door of the room, or by merely rising from the seat. It is customary for all relations and friends to call upon the traveller the very day he returns, that is to say if amity is to endure.

A Hindu, when he meets a friend after absence, throws his arms round him, and his head across his shoulders, twice over the right shoulder, and once over the left, and uses other ceremonies, according to the rank of the parties. Salutation is alluded to in Matthew v. 47, xxiii. 7, Mark xii. 38. The usual way of kissing the knee is to place the finger tips on it, and then raise them to the mouth. It is an action denoting great humility, and the condescending superior who is not an immediate master returns the compliment in the same way.

2 Samuel xiv. 20 says, 'My lord is wise according to the wisdom of an angel of God.' This is very much like the hyberbolical language of India. Hindus will often say, 'Sahib can do everything.' No one can prevent the execution of Sahib's commands. Sahib is God.

Visitors are seated with strict attention to their rank, which, on public occasions, it often takes much time to settle.

Brahmans are saluted by joining the palms and raising them twice or thrice to the forehead, or the Brahman's foot is touched with the hand,

which is then raised to the forehead. Brahmans have a peculiar phrase of salutation for each other. The very humble, or persons in great distress, bow their heads or bodies, or prostrate themselves with their turbands off and their heads in the dust.

Hindus and Muhammadans usually salute with their hands, or by prostrations, in silence. But with the Rajputs, an inferior salutes a superior with Jye-Deva, Victory, my Lord! Some Hindus on meeting repeat twice the name of Rama, Ram-Ram; this and N'mo N'ma are Mahratta forms, and Sri-nat'h, a Canarese form. As a visitor approaches a Muhammadan prince, the attendants exclaim Paon-bā-ādab, approach with respect, and when the prince may rise or sit down, the Mir-dih will exclaim, Umr-o-Daulat-ziada, may years and fortune be prolonged. Occasionally a Muhammadan will say Salam Sahib to a European. A Muhammadan servant on receiving an order will reply, Jo-hukm, whatever your order; or Ba sar o chasm, on my head and eyes be it.

The antiquity of the eastern salutation Salām is shown by an epitaph of Meleager, which addresses the passer-by, and concludes thus:—

'If thou art a Syrian say Salom, but if a Phœnician
Say Audonis, if a Greek, Xaire (χαιρε).'

Salom is the Hebrew Selah; Audonis, a Punic word, is uncertain.

Amongst the Bhot race, in the Ladakh frontiers, the people salute by raising the back of both hands to a height even with the forehead, and then, repeatedly describing a circle in the air with them, end by drooping the fingers downwards and turning the palm inwards. There is a similar Muhammadan practice of Billain lena, where a woman is supposed to take upon herself all the evils which would befall the person whom she addresses and thus encircles.

In salutation, the Persians say, Afiyat bāshad, may it be health to you; or Nosh-i-jan, may it be a drink of life. The Arabs say, Hania, may it be good to you; the person addressed bows and returns, May Allah be your preserver. Amongst Muhammadans in India the ordinary salutation at meeting is Salam-alaikum, peace be unto you, and the return is Alaik-us-salam; but a servant will exclaim Daulat-ziada, may your wealth increase; Umr darāz, may your life be prolonged; Umr-o-Daulat-ziada, may your years and your dignity increase. A person of high rank, as in Europe, first addresses a visitor by asking Khariat? are you well? to which the reply will be, Is your highness well? The salutations in India amongst Muhammadans often assume the form of a blessing or prayer, as May your life be long; May you live a century and a quarter. A Muhammadan makes a salutation ordinarily with the right hand; it is raised either to the breast or to the forehead, with or without the words, as Salam-alaikum, the peace of God be with you.

Pupils kiss the hand or sleeve of their teachers. Homage is paid by kissing the feet of the ruler, or by kissing the ground or carpet, or by laying the turband at a conqueror's feet.

All visits end by the head of the house presenting betel leaf with areca nut, etc., to the guest, and sprinkling on the guest's handkerchief some essential oil or attar (otto) of roses, sandal-wood, etc., or rose-water, and this is the signal for leave-taking.

Burmese bend the head three times to the ground.

In China, when friends meet, they each fold their hands in silence. If anything be said, it is Tsing! Tsing! meaning I pray you! I pray you!

O-hio is a friendly salutation of the Japanese.

The people of New Zealand press their noses against those of the friends whom they salute.

In Fiji the hands are clapped to show respect to a chief or superiors. In Japan it is a ceremony of respect to superiors. In Fiji the mountaineers in expressing astonishment shake backwards and forwards and transversely once or twice the right hand.—*Ward*, iii. p. 189; *Burton's Mecca*, i. p. 292; *Burton's Scinde*, ii. pp. 20, 21. See Musafiha; Salam.

SALVADORA OLEOIDES. *Dne.*

Van, Vani, . . . Panj.	Jal, Jhal, ... Panj.
Mithi-van, Wannah, ,,	Plewane, . Trans-Indus.
Fruit.	*Dried fruit.*
Pilu, Peelu, Pil, . Panj.	Khokar, Tak, . Tr.-Ind.

This tree is very abundant in the Panjab and as far east as the Jumna, fringing the sandy tract as the jhao, the Tamarix dioica, does the river. Wood close-grained, much used for fuel; in the Multan division its wood is used for rafters and as knee timbers for boats. In some arid parts of the Panjab, it forms the only vegetation; it occurs in Sind, and trees are met with of 11 to 14 feet in girth. It flowers in April, and when its abundant, sweetish, red fruit ripens at the beginning of the hot weather, it is very largely eaten by the people, who go in numbers to gather it. A gall occurs on this tree used in dyeing, and the root is ground and applied as a blister.—*Stewart; Cleghorn; Col. Lake.*

SALVADORA PERSICA. *L.* Tooth-brush tree.

Kauri-van, Kauri-jal, ,,	Ghunia, ... ,,
Kabbar, Kharijhar, Sind.	Chinna vara-gogu, ,,

This, supposed to be the mustard tree of Scripture, grows in Arabia, the Persian Gulf; is very common in Ajmir and Marwar; is not a common tree on the Bombay side of India, except at Muhammadan durgas and places of worship; but it grows wild on the coast in the Hubshee's country of Janjirah, and in the Southern Mahratta country, though it seldom reaches any size. In Sind it is more common, and grows considerably larger. It thrives well in every soil, and is in flower and fruit all the year round. The bright green of the leaves is very refreshing to the eye, as the tree grows in very barren places; it is generally semi-recumbent on the ground, and affords little shade. The leaves and bark are very acrid, smelling very strongly of cresses; the freshly-pounded bark of the roots is an active epispastic. Trunk generally crooked, from eight to ten feet high to the branches, and one foot in diameter. A decoction of the bark of the stem is said to be tonic, and the red berries eatable. Dr. Gibson was inclined to think that the wood of this tree is well worthy of an extended trial, as it seems rather strong and of compact grain.—*Irvine; Roxb.; Gibson; Royle; O'Sh.*

SALVADORA WIGHTIANA. *Planch.*

S. Indica, *Wight, Illus.*	S. Persica, *Roxb.*
Opa, ... Tam.	Pedda, Waragu-wenki, Tel.

This middling-sized tree is common throughout

the Madras Presidency, in low lands in the plains, and particularly in saline soil; the berries have a strong aromatic smell and taste like garden cress; the bark of the root is very acrid, and if applied to the skin raises blisters, for which purpose the natives use it, and as a stimulant it might be of considerable efficacy. It or an allied species is said to be the mustard tree of Scripture; it is in flower and fruit all the year round.—*Thw. En. Pl. Zeyl.* p. 190; *Beddome, Fl. Sylv.* xxi. p. 247.

SALVIA BENGALENSIS. *Rottler.*

Meriandra Bengalensis, *Bentham.*

Murtoo, ... Beng. | Saya elley, . . . Tam.
Valaiti Kafur-ki-pat, Duk. |

A straggling shrub with a trunk often as thick as a man's arm; common in Bengal and Coromandel, much stronger than the officinal sage. It is cultivated in European gardens. Hindus think this a very impure plant.—*O'Sh.; Irvine.*

Salvia hæmatodes, *W.*, Behen, Arab., Lalbehman, Beng., is the bloody-veined sage.

Salvia Moorcroftiana, Kanocha, Hind., a plant of Kaghan, growingly plentifully in the valley of Kashmir; its seed are officinal.—*Honig.*

Salvia multirrhiza, Tan-san, Chin., a sage grown in Shen-si, Shan-si, and Shan-tung.—*Smith.*

Salvia officinalis, *W.*, Garden Sage.

Salbia, ... Hind. | Sefa kas? . . . Tam.

Of somewhat bitter, hot, aromatic, and slightly astringent flavour. These qualities are retained on drying. It affords on distillation with water a large quantity of essential oil, containing 26 per cent. of camphor. Sage is used for stuffings and flavouring various dishes.

Salvia plebeia, King-kai, Chin., is used medicinally.—*O'Sh.; Jaffrey.*

SALWIN or Salween, a river of Tenasserim, British Burma, with a general north and south course. The source of this river has never been explored; but the best authorities agree in stating that it is in proximity to the source of the Irawadi (Irrawaddy), far up in the snowy range which lies eastward of Assam, in lat. 28° N., and forms part of the Himalayan system of mountains. After traversing Yunnan, a Chinese province, and the Shan and Kareng-ni States, lying south of it, the Salwin enters British Burma at its extreme north-eastern corner, and for some distance, as far as the Thoungyeng river, marks the eastern limits of the province. At Moulmein the Salwin receives from the eastward the Gyaing, formed by the junction of the Hlaing-bhwai and the Houngtharaw, and the Attaran, which joins the Gyaing at its mouth. Here the Salwin splits into two mouths,—the northern, flowing between Bhi-lugywon and the old town of Martaban, is unnavigable now by reason of sandbanks, but some centuries ago was the principal entrance. The southern branch flows past Moulmein, and falls into the sea at Amherst by a mouth 7 miles wide. By this channel vessels of the largest size can reach Moulmein, but navigation is rendered difficult by the shifting of the sands. The area of the Salwin basin is 62,700 square miles; it is 800 miles in length, but seldom more than 100 miles in breadth.

SALWIN HILL TRACTS, a British district in Tenasserim division, British Burma. The population in 1872 was returned at 26,117; in 1877, at 26,649. The inhabitants are almost entirely Karens; a few Shans are settled in the neighbourhood of Pa-pwon. The eastern portion of the hill tracts was formerly inhabited by Rwon Shans, whence the name Rwon-za-leng; but the larger number of these were brought away by Alounghbura to what is now the Syriam township of Rangoon.—*Imp. Gaz.* viii.

SALYA, a raja of Madra, sold his sister Madri to be the second wife of raja Pandu. His country was probably on the southern slopes of the Himalaya, or in Butan, and the customs of the people were barbarous. He was present at the battle of Kuru-kshetra, was the generalissimo of the Kaurava on the last day of the war, and was then slain by Yudishthra. During a dispute in the midst of the battle, Karna, when advancing to meet Arjuna, angrily twitted Salya with the customs of his country, where wives, mothers, sisters, daughters, brothers, and uncles all commune together in a medley.—*Wheeler, Hist. of India.*

SAMADERA INDICA. *Gærtn.*

S. pentapetala, *Gærtn.* | N. tetrapetala, *Wall.*
Niota pentapetala, *Poir, D.C.* | N. Lamarckiana, *Blume.*
| Vittmanniaelliptica, *Vahl.*
Karin gota, . . Maleal. | Samadara-gass, . Singh.

A large tree of the south of Ceylon, the south of India, and common in the Konkans and on the Malabar coast; its bark is the Niepa bark of commerce. The bark, root, and fruit of the plant are intensely bitter, like other plants of the quassia family, and are used as a medicine by the Singhalese.—*Eng. Cyc.; Useful Plants; Thw.*

SAMADERA LUCIDA. *Gærtn.* Niota lucida. Ka thay, Burm. The low grounds near the sea-coast of Tenasserim are ornamented with this handsome shrub, which bears a rather curious flower; its leaves are most intensely bitter; it is cultivated in the gardens about Batavia.—*Mason; Wall. Pl. As. Rar.*

SAMADH. Sansk. The spiritual throne of the founder of a Hindu sect, the gaddi or pillow at the seat of the original site of the sect.

SAMADHI, silent abstraction and contemplation of the Supreme Being. This in Hindu belief is a power that enables its possessor to exercise an entire control over all his faculties, and keep them in perfect restraint. In that performed by Jogis, they pretend to be able to suspend the connection between the soul and body.

Also, the self-immolation of a Jogi mendicant, by burying or burning himself alive; also, the ceremony of sinking in water or burying the corpse of a deceased Jogi; a small or low shrine or tomb erected over the grave of a Jogi, commonly surmounted by a standing place for a tulsi plant.

Burying alive with Hindus receives religious sanction, on the ground that where there is no remedy, the prolongation of hopeless misery is not demanded by the divine ruler, and its termination may be left at the option of the wretched sufferer. It was therefore permitted to those who were slowly wasting under such loathsome and incurable disease as leprosy, to put a period to their days when life became intolerable; and it was feared that if death in the ordinary course of nature were awaited, there would be none to carry the polluted corpse to the grave. A deep hole is dug in a retired spot, where there is little chance of interruption; the sufferer drags himself to the place as best he can, and descends into the hole. His friends throw the loose earth over him, and in a few short moments

it is all over. The Pioneer newspaper tells of a leper who had lost his hands and feet under the ravages of the horrible disease, and belonged to a family of lepers. His father and some of his brothers and sisters had already fallen victims to it, and his immediate descendants were afflicted with the malady. He had no hope of recovery, no wish for further life; so he asked his son to dig his last resting-place, and, dragging himself there, put an end to his sufferings.

Cases yearly occur in one part or other of British India. The Atit of Anjar in Cuteh say that their patron saint was a Chauhan king of Ajmir, who ended his days by a voluntary death; Jaisal, a Jhareja Rajput of Kedana, near Tuna, and his wife Turi Kathiana, about the 15th century, voluntarily perished, and are worshipped.

Samad'h was practised in Rajputana up till 1868. The Political Agent of Serohi furnished a list of instances in the course of six years that had come to his knowledge, chiefly in the neighbourhood of Motagaon, a border village. Out of nine cases of Samad'h reported, eight of the victims were lepers, the others having been sacrificed, no doubt at their own desire, on account of old age and poverty. The Rao of Serohi issued a proclamation forbidding the practice, under the penalty of ten years' imprisonment; but in many of the cases the persons who dig the pit and cover up the unfortunate wretch are themselves lepers, and to them death itself would be welcome, and the Rao would hardly care to introduce any of them into his prisons in Serohi.

In the Rajput State of Bikanir, a Samad'h or burying alive occurred at a village called Upni, sixty miles from the chief town of the state. It came about in this way: The Thakur of Sandhwa sent his vakeel to the above-named village to collect revenue. The Siddhs of the place, however, refused to pay, and, in order to intimidate the Thakur, 150 of them collected before his door, squatted down there, and threatened to commit suicide unless he gave way. As the Thakur held out, they selected two of their number, —a man aged seventy-five, and a woman aged sixty-five,—and buried them alive on the Thakur's premises. The village lumberdars tried to prevent this crime, and were soundly punished for their good intention. Twenty-nine Siddhs were taken into custody, and nineteen sentenced to various terms of imprisonment.

Near Ahmadabad, a Brahmacharya Bawa, residing at a place called Beit Sankheidhar, is said to have been a Pardesi who lived in a hut on the verge of the Dhingaishwar Mahadeo tank in the place above mentioned. For twelve years he was in the habit, it is said, of praying for a couple of hours daily, all the while gazing intently at the sun without turning his eyes from its scorching rays. At last he called his creditors together and paid off every pie of his debts. He then repaired to the temple known as Dwarka's Mundir, for his last hymn of praise, and thence straight to an out-of-the-way place, where he had previously improvised for himself a sort of funeral pyre with his own hands. He ascended the pyre with alacrity, performed his own funeral rites by lighting it with his hands, and thus voluntarily burned himself to death. Information of this self-immolation was given by a barber to a police-officer, who, on proceeding to the place, found that he was too late, for the Bawa's body was by that time nearly all consumed.—*Eastern Monachism*, p. 441; *W.; Friend of India*, May 1868; *Pioneer*.

SAMADHIKA, a sect who preceded Sakya Muni; they placed the attainment of everlasting bliss on the continued practice of Samadhi, or of deep and devout abstraction.

SAMANA, in the Sanskrit, Shramana, literally hermit; whence is derived the name Samanæans, applied by Clement of Alexandria to the adherents of Buddha; hence also the title Shaman or Sraman, given in Northern Asia to the Buddhist priests.

Samanaros is the designation, in Ceylon, of the Buddhist priests who have attained the first rank of ordination. This name, preserved to the present day as the designation of the Buddhist priesthood in Siam and Ceylon, is identical with the Samanæans or Buddhists of Behar, described by Megasthenes, who, B.C. 300, was an ambassador from Seleucus to their king, and whose last work, on the state of India at that period, is quoted by Strabo and Pliny. The same designation for the priesthood, Samana, is applied equally by Clemens Alexandrinus, in the 2d century, and by Porphyry in the 4th.

A Buddhist novice must be eight years old, and have the consent of his parents. His vows are not irrevocable.—*Bunsen, God in Hist.* i. p. 355; *Tennent's Christianity*, p. 216.

SAMANDAR KHAG. HIND. Literally sea-foam, the dorsal plate of the sepia or cuttle-fish. It is used medicinally as an absorbent and antacid, and to rub down paint-work. It is now in Europe only valued as a tooth-powder, and in the arts considered refrigerant; used in eye ointments, also in mesalihs.—*Gen. Med. Top.* p. 150.

SAMANGARHA or Simroun, a dynasty who reigned from A.D. 844 to A.D. 1323, in the Terai south of Nepal.

SAMANI, a dynasty ruling in Bokhara, Khorasan, and Persia (A.D. 874-75-999). The origin of their name is not known. By order of Mamun, three of the sons were appointed to governments beyond the Oxus, and one to that of Herat. They were continued under the Taherides, and retained Transoxiana, after the fall of that dynasty, till the death of Yakub Leis; when they passed the Oxus at the head of a large army of cavalry, made Umar Leis prisoner, and took possession of all the territory he had conquered, and governed it, really independent, till deprived of it by the Delmites.

The Samani, however, remained masters of Khorasan and Transoxiana, and gave rise to the dynasty of Ghazni, who were the founders of the Muhammadan empire of India, which lasted under several dynasties for above 800 years.

The Samani are generally reckoned Turk; but their founder was presented to the Khalif Mamun at Merv in Khorasan, and was neither a Turki chief nor a slave. The family claimed a Persian ancestor, at a time when a descent from the Gabr race would not have been an object of ambition to men of another race. They were the first encouragers of Persian literature.—*Elph.* pp. 71, 300.

SAMAPATTI. SANSK. In Buddhism, silent abstraction and contemplation of the Supreme Being. See Samadhi.

SAMAR. Amber is frequently gathered in considerable lumps in the vicinity of Samar and the other islands of the Bissaya group of the Eastern Archipelago, as well as mother-of-pearl, tortoise-

shell, and red and black coral; of the latter kind, shafts are obtained as thick as the finger, and six or eight feet long.—*Walton's State*, p. 38.

SAMARANG RESIDENCY and town in Java has 1,278,244 of population, exclusive of the military, viz. Europeans, 5159; Natives, 1,255,441; Chinese, 1592; Arabs, 717; others, 1006. Near Samarang is the headquarters of the army of Netherland India. It is strongly fortified. Samarang anchorage is exposed in the western monsoon; the town is built on both sides of a small river. —*Bikmore*, p. 56.

SAMARCAND, in lat. 39° 38′ 45″ N., and long. 64° 38′ 12″ E. of Paris, is a town 2150 feet above the sea, was the capital of the ancient Sogdiana. It is 2 miles distant from the left bank of the Zar-afshan river, 235 miles from Bokhara, 247 from Khokand, and 139 from Tashkand. It has eight gates, is 8⅔ miles in circumference, and has a population of about 70,000 souls, viz. 40,000 in the Russian quarter, and 30,000 in the Asiatic quarter. The area of its ark or citadel is 91·87 acres. It has 165 mosques, 24 colleges, 24 cemeteries, 33 caravansaries, 3000 shops, and 1000 factories and establishments. The Talar-i-Timur, or reception-hall of Timur, contains the Kok-tash, a colossal mass of stone of a greenish or bluish colour, 10 feet long, 4 feet broad, and 4½ feet high, on which the throne of Timur used to be placed. Each amir of Bokhara, on his accession, took his seat on this stone.

European goods of every kind are largely imported, and skins, knives, carpets, silks, embroidered saddles, etc., are exported. The citadel, which is defended by a strong wall thirty-six feet high, and nearly two miles in circumference, is one of the finest in Central Asia. This city has been subjected to many reverses. It was known in the time of Alexander the Great by the name of Marakanda Regio Sogdianarium.

Shammir Yerash, the son of Yashir, the successor of the Balkees of the Christian era, was one of the greatest warriors who ever held the throne of Yemen. He carried his arms into Irak, Persia, and the neighbouring countries, attacked and nearly destroyed the ancient capital of Sogdiana, which thenceforth took the name of Samarcand. Remains of Himyaritic inscriptions were long found there, and one mentioned by Abul Fada began thus: 'In the name of God, this building was erected by Shammir Yerash, in honour of the Lord the Sun.' Shammir afterwards perished with his army in the deserts of Tibet, in an invasion of China. To revenge the death of his grandfather, Tobba-ul-Akran, who occupied the throne of Yemen for about fifty years, from A.D. 90 to A.D. 140, marched and rebuilt Samarcand; carried war into China, where he founded a city which Thaalebi called El-Beit, and where he left a colony of 30,000 Arabs, who continued a distinct people when Hemedoun wrote in A.D. 553. Samarcand in the time of the Samanides was the largest city beyond the Oxus, and only began to decline from its former importance when Ismail chose Bokhara for his own residence. Under the Kharezmians it is said to have raised itself again, and become much larger than its rival, and under Timur, to have reached the culminating point of its prosperity. Timur marched from Samarcand in A.D. 1397, into India, but returned the following year and proceeded against Syria, Egypt, and Constantinople. With the fall of the Timurides, its decay commenced; Bokhara became from this time the only official capital, and the princes of the house of the Sheibani, the Ashtarkhani, and the Manghits, only visited Samarcand as a summer excursion for the sake of its natural beauties.—*Vambery, Bokhara*, p. 27.

SAMARITANS have been inhabitants of Nablus, the ancient Shechem, near Jerusalem, since the time of Nehemiah. Samaritan history is detailed in 2 Kings xvii. It had been attacked by Sargun, B.C. 746, 745, was besieged and taken B.C. 719, and the people carried away to Assyria and Medea. According to the Samaritan traditions, it was on the rock surface of Mount Gerizim that Abraham prepared to sacrifice his son Isaac. This was the Bethel of Jacob, and to this day the Samaritan priest takes off his shoes as he nears the spot, because it is holy ground. Samaritans are Christians since Jesus planted it amongst them, John iv. 5-42. In the rites of the Yom-kippoor, or day of atonement, of the Samaritans, they make in their responses avowals of their belief in Jehovah and in Moses, and are accompanied by constant sudden prostrations, and by frequently rubbing down the whole face and beard with the right hand, a gesture frequently used by Muhammadans when any sacred name or form of words is said, and seems to be an attempt actually to catch the grace of the words residing in the breath of the speaker himself, and communicate it to his beard and countenance.

SAMASAN, HIND., also Samsan and Smsan, a place of cremation of Hindus; a burning ground.

SAMASTANAM. TAM. A metropolis, the residence of a family of rank; a house, a family.

SAMAVARTHANUM, the ceremony of a Brahman returning home at the termination of his studentship.

SAMBA. TAM. A fine kind of rice with white and well-flavoured grains. It is sown in July, transplanted in October, and reaped in February.

SAMBAH amongst the Malay means obeisance, homage, etc., and is used for the ordinary words 'to speak' by inferiors to a king; Salam is the simple Arabic salutation, 'peace;' subjects or inferiors addressing a king are said to sambah, not to chakap or kata, or other words in common use —*Jour. Ind. Arch.* v. No. xi.

SAMBAL. JAV. Cooked vegetables mixed with capsicum; a Malay sweetmeat.

SAMBALPUR, a town in the Central Provinces of British India, on the left bank of the Mahanadi river. It is the headquarters of a district of the same name, lying between lat. 21° 2′ and 21° 57′ N., and long. 83° 16′ and 84° 21′ E. The Bara Pahar Hills are covered with dense jungle. The Mahanadi, near Padmapur, contains large masses of granular limestone, resembling marble. Gold dust is washed for in the Mahanadi and the Ib, and diamonds are found at the junction of these rivers, near Hirakhuda island.

During native rule, 15 or 20 villages were granted rent-free to a class called Jhira, in consideration of their undertaking the search for diamonds. When the country lapsed in 1850, these villages were resumed; and though an attempt was made to lease out the right to seek for diamonds, the farm only fetched some Rs. 200 per annum for a short time. Under the native government it was the practice to give the jhira diamond-seekers a

village rent-free, if they produced a good-sized diamond, land being of little or no value then. The smaller diamonds they used to secrete and sell. So far as can be learned, the best stones ever found here were thin and flat, with flaws in them, but they were admirably suited for setting in native jewellery.

The most numerous of the aboriginal tribes are the Savara (53,603 in 1872), and the Gond (43,687), with Kol, Bhil, Binjwal, Khond, etc. In 1872, Brahmans numbered 17,552; the mass of the Hindu population consisting of Gaur (60,026) and other cultivating or inferior castes. The Kolta, the Agharia, and the Brahman are the largest cultivators. The labourers are the Pab, Saoura, Ganda, Gond, Mali, and Gaoli races.

The Uriya Brahmans came from Cuttack and Puri within comparatively recent times, while the Jharwa Brahmans settled here many hundred years ago. The Uriya will not eat with the Jharwa. The Jharwa or jungle Brahmans are careful, hard-working, and intelligent, cultivating the soil, engaging in trade, and turning their hand to anything useful and profitable. The Mahanti are the clerks of Orissa; they are immigrants from the districts to the east, and take occupation as clerks in government offices, schoolmasters, etc. They are an intelligent but somewhat effeminate race. The Bhulia are weavers of cotton cloths, not celebrated for fineness of texture, but for brilliancy of colour and variety of pattern they can hardly be excelled among coarse native fabrics. Cotton cloths are also made by the Mehra. The Koshti are weavers of tasseh silk cloth. Their manufacture is justly celebrated, the texture is very even, and the silk has a lustre which never fades, however long it may have been in wear. The Sunar or goldsmith manufacture all the ornaments worn by the women; these are very peculiar, unlike those used in other parts of India. The prettiest ornaments made here are the kanthu, or necklaces of large gold-fluted beads, worn often by Brahman and Rajput sepoys of the Native army. The Kewat, fishermen and boatmen, are a numerous and hardy race, and sometimes engage in small ventures of trade. Ghasi are grass-cutters and grooms; they will also perform the duties of sweepers. The aboriginal tribes of the Khalsa are Gond, Pab, Saoura, Binjwal or Binjawar, and Kol or Dhangar; the latter came from the Chutia Nagpur direction; they are, as a class, hard-working, honest, and light-hearted, and when not engaged in cultivating either for themselves or for others, they will take service of any kind. Road-making, palkee-bearing, gardening, punkah-pulling, all come alike to them, and the women work equally hard with the men; they are fond of strong drink, but apparently only give way to it on festive occasions. At certain periods of the year, women and men dance all linked together in a circle, pace round in a monotonous but perfectly regular measure, swaying at the same time their bodies backwards and forwards, occasionally almost touching the ground with their heads; they are all decked out in their best, the women ornamenting their hair fantastically with feathers and flowers. Ghes is a chiefship attached to the Sambalpur district, situated some fifty miles west, and a little south of the town of Sambalpur. The chief's family are Binjwal (Binjawar), and were much mixed up in the Surendra Sai rebellion — *Central Province Gazetteer.*

SAMBAN, meaning deity, the tribal title of the Pariah race in the Tamil country.

SAMBARTTA, a Hindu philosopher, born at Benares, who adopted the views of the Maimansa school. He is mentioned in the Yoga-Vashishta Ramayana.—*Ward*, iv. p. 29.

SAMBAWA ISLAND, the third in a direct line east of Java, is about three times the extent of Bali or Lombok, and divided by a deep bay into two peninsulas. It has three languages,—the Sambawa, the Bima, and the Tambora. The natives of Sambawa are little inferior in cultivation to the most improved nations of Celebes. The Sambawa and Bima languages are written in the Bugi character, but there exists in this island a singular and curious obsolete alphabet. It is ascribed to the Bima nation, but the characters do not generally correspond with the simple sounds of the Bima language, as exhibited in the specimen given of it.

SAMBHAR LAKE, a sheet of salt water in Rajputana; when full, is 20 miles long, from 1½ to 7½ miles broad, and 1 to 4 feet deep. It is on the borders of the Jeypore and Jodhpur States. The country around is arid and sterile, with rocks abounding in limestone and salt, and belonging to the Permian system, and are supposed to yield the salt of the lake. The average yearly out-turn of salt is 900,000 maunds (between 3000 and 4000 tons), and the cost of storage and extraction about 6 pice (three farthings) a maund (82⅔ lbs. av.). As soon as the salt is formed, native labourers of both sexes, belonging chiefly to the Barrar caste, wade out to it through the mud, and, placing their hands under the salt crust, lift it off in good-sized cakes into baskets. A man brings to shore in this way about half a ton of salt a day. The salt is of three colours,—blue, white, and red; the varieties being said to be due to the presence of microscopic algæ. The bluish-grey salt is commonest, and is much esteemed, particularly in the North-Western Provinces, whither it is largely exported. The white salt is most valued in Rajputana, particularly in Jeypore; while in the Muhammadan state of Tonk the red is the favourite colour. The lake supplies nearly the whole of the chief salt marts of the Panjab, North-Western Provinces, and Central India.—*Imp. Gaz.*

SAMBUCUS, the elders, a genus of small trees of the order Caprifoliaceæ. S. Javanica, *Reinw.*, grows in the Eastern Himalaya and Khassya; S. Thunbergii, in Northern Burma; S. adnata and S. ebulus (dwarf elder) grow in the Himalaya as well as in Kashmir. The roots of the latter, it is said, have purgative properties, and, as also the berries, are used in dropsy.—*Honig.*

SAMBUK, a coasting vessel of 15 to 50 tons burden, trading in the Red Sea.

SAMBUR of India. Rusa hippelaphus, *Cuv.*

Cervus Aristotelis, *Cuv.*	C. niger, *Blainville.*
C. equinus, *Cuv.*	C. jarai, *Hodgson.*
C. hippelaphus, *Cuv.*	C. heterocercus, *Hodgson.*
C. Leschenaultii, *Cuv.*	C. saumur, *Ogilby.*
Ghous or Gaoj, . E. Beng.	Jarai, Jerrao, . . Him.
Bhalonji (female), ,,	Jerrow, ... ,,
Kadavi, Kadaba, . Can.	Meru, . Mahr. of Ghats.
The sambur stag, . Eng.	Kannadi, ... Tel.
Ma-ao, . . of the Gonds.	Maha, in parts of Terai.

The numerous synonyms will show that natural-

ists have found it difficult to recognise the sambur stag at its several sites in India; but Jerdon, after seeing them in the Himalaya, in Central and Southern India, considers them all to designate one species. It is a noble animal, from 14 to 15 hands in height, with antlers often a foot in circumference and 4 feet long; it is found on the banks of the Jumna and Ganges in their mountain courses; a few stray along the sub-Himalayan valleys, and have been shot and seen near Simla on the Kashmir ranges. It is found in all the large forests from the Himalaya, through Central India, to the south of the Peninsula. Its horns and colour differ somewhat, and have led to the different names. It is a favourite pursuit of Indian sportsmen. Rusa tunguc, *Vigors*, is a stag of Sumatra; C. Molluccensis, *Muller*, is of the Molluccas; and C. Peronii, *Gray*, is from Timor. See Rusa.

SAMIDA-DANAM, a Brahman's offering of fuel to the sacred fire.

SAMI-RAMA, or Samu Rama, Semiramis. It is, however, supposed that the term Samarim, as used in India, did not relate to one person but to many; and it seems particularly to have been adopted by princes. The Cuthites settled about Cochin and Madura in India, and the great kings of Calicut were styled the Samarim; and the titular prince of the vicinity of Cochin is still called Zamorin. Sami-Rama is also a name of the Hindu goddess Devi worshipped on the tenth Badi of Aswina.—*An. Anc. Myth.* iii. p. 144.

SAMI STONE, or god stone, seems to be applied to two or three minerals, to samada stone or corundum, to a variety of agalmatolite or pagodalite; and pot-stone, or a variety of steatite, in much demand in China and some parts of India for the manufacture of images and figures; and much used, also, in putting a finishing polish on steel and other metals, and brightening sword blades, bridle bits, etc.—*Bl. A. Trans.* 1845, xvi.

SAMI TREE, Acacia suma, worshipped by Hindus at the festival of the Dassera. See Sama.

SAMLAJI, a famed idol on the border line between Mewar and Mahikanta.

SAMMA. There seem to have been two Samma dynasties, an earlier and a later, ruling in Sind. The earlier seem to have been the Sambus and Sambastæ of Alexander's historians, the Abestani of Arrian, and Sabarcæ of Quintus Curtius, whose capital was the Sindonalia, Sindimon, or Sindomanna of authors. One Samma dynasty was a Rajput race of Lunar origin, the opponents and successors of the Sumra. The Jharija race in Cutch are of Samma extraction. After expelling the Sumra race from Sind in A.D. 1351, the Samma retained power till they were, in their turn, expelled by the Arghun, A.D. 1521. The Samma were either of the Buddhist or Brahmanical faith. They form unquestionably a branch of the great stock of the Yadava Rajputs, and their pedigree is from Samba, the son of Krishna, who is himself known by the epithet of Syama, indicative of his dark complexion; and their first capital was Samma Nuggur on the Indus, probably the modern Sihwan, then it was Samni, and finally was established in Thatta. The Samma seem to have become proselytes to Muhammadanism about A.D. 1391; since which event their name, though it still comprises several large erratic and pastoral communities, is less known than that of their brethren or descendants, the Sameja, and the half-Hindu Jharija of Cutch, who do honour to their extraction by their martial qualities.—*Elliot*, p. 497.

SAMOHI, in Arcot, also Samudayam, TAM., the lands of a village community, held severally under periodical distribution. The Afghans on the N.W. of India call this exchange Waish.

SAMOOM, Samiel, or Bad - i - Simum, from the Arabic Sam, a poison, a pestilential wind which occurs in the desert tracts between Arabia and India. The people say it does not come in continued long currents, but in gusts at different intervals, each blast lasting several minutes, and passing along with great rapidity, but the accounts seem very greatly exaggerated. No one, they say, stirs from their houses while this flame is sweeping over the face of the country. Previous to its approach, the atmosphere becomes thick and suffocating, and appearing particularly dense near the horizon, gives sufficient warning of the threatened mischief. Though described as hostile to human life, it is so far from being prejudicial to the vegetable creation that a continuance of the Samiel tends to ripen the fruits. Porter inquired what became of the cattle during such a plague, and was told they seldom were touched by it. It seems strange that their lungs should be so perfectly insensible to what is said to be instant destruction to the health of man; but so it is said, and they are regularly driven down to water at the customary times of day, even when the blasts are at the severest. The people who attend them are obliged to plaster their own faces, and other parts of the body usually exposed to the air, with a sort of muddy clay, which in general protects them from its most malignant effects. The periods of the wind's blowing are generally from noon till sunset; they cease almost entirely during the night, and the direction of the gust is always from the north-east. When it has passed over, a sulphuric and indeed loathsome smell, like putridity, remains for a long time. The poison which occasions this smell is said to be deadly; and if any unfortunate traveller, too far from shelter, meet the blast, he is said to fall immediately, and in a few minutes his flesh becomes almost black. The Bad - i - Simum blows in Cutch Gandava during the summer months, and many people lose their lives by it.—*Pottinger's Tr.* p. 322; *Porter's Tr.* ii. p. 229.

SAMPAN, a Chinese boat, remarkable for its swiftness both with sails and oars. When skilfully managed, they are exceedingly safe, and are sometimes employed on short coasting voyages. Two Malay rowers, each pulling a single broad-bladed oar, could in these sampans beat the fleetest gig. Chinese rowers stand up abaft their oars, and face forward. The form of the sampan and junk is of the model of a good broad-toed, broad - heeled, broad - soled slipper. — *Osborn's Quedah*, p. 4.

SAMPANDER, one of the three most famous Saiva poets and devotees.

SAMPHIRE, Crithmum maritimum, *Linn.*, is the real samphire. Its young leaves are pickled.

SAMPRADAYA, a sect of Vaishnava Hindus.

SAMRU, a name by which Walter Reinhardt was known, a native of Luxemburg, who came to India as a soldier in the French army. See Reinhardt.

SAMSAM, a Malay race in Kedah in the Malay Peninsula, who have adopted the religion and the language of the Siamese.—*Newbold*, i. p. 420.

SAM-SHU. CHIN. A spirituous liquor prepared by fermentation and distillation from rice.

SAM-SING. CHIN. Wax figures of men, sold in the lantern markets of China.

SAMTHAR, Sampthar, or Sumpter. Native State in Bundelkhand. Area, 175 square miles; estimated population (1875), 108,000; estimated revenue, £40,000.

SAMUDRA. SANSK. The sea, the ocean; a lake or large river.

SAMUR, a snow-white Russian fur, imported from Kābul.

SAMURAI, retainers of the Japanese daimio, who formerly wore two swords; also called Shizo-ku.

SAMVAT. SANSK. From Samvatsaranam, the genitive plural of Samvatsara, a year. Samvat, Sambat, or Sumbut is the luni-solar years of the era of Vikramaditya, used in Hindustan, Bengal, and Telingana. It commences with the year of Kali, age 3045, or 57 years before Christ, which latter number is to be added to any A.D. year to find the Samvat. There is nothing to show whether it dates from Vikramaditya's birth, or from some achievement, or from the year of his death. The Samvat era is supposed by Mr. Newton to have been founded by Nahapana, B.C. 56.

SAN. PERS. A year, the year of an era; San-i-jalus, the year of a king's reign. Bengali-san, beginning on the 1st of the month Baisakh 963 + 593 = A.D. 1556. The Valaita-san or Amli-san, beginning on the first of the month Aswin 963 + 592 = A.D. 1555. These eras were introduced by Akbar. San-i-jalus, the year of a king's accession, and is marked on his coins. San-Hijira is the year of Mahomed's flight from Mecca. San-Isawi is the Christian era.

SAN, a polishing wheel used by cutlers; the lapidary's wheel.

SAN. BENG., HIND. The fibre of Crotalaria juncea; also written Sun. This plant is often confused with the Sankokra (called Sanni in some parts), Hibiscus cannabinus, to which it is much superior in strength. The name is also applied to Cymbopogon iwarancusa. —*Powell's Handbook*, i. p. 507.

SAN, the Chaldee sun-god. Ai-Gula or Ananit was the female power of San. See Baal; Sun.

SANA or Sanaa, the most southerly division of Yemen, extending to the Arabian Sea, where it touches Aden. The Sana district includes the country round the city for half a day's journey north, south, and east. Sanaa city is situated in a deep valley, surrounded by four mountains, about 20 or 30 miles in length, and 6 or 7 miles in breadth, and about 4000 feet above the level of the sea. It is called Uzal in Genesis x. 27, and exhibits a magnificent spectacle to the eye; has the loveliest of gardens, with pomegranates, grapes, and cherries. The houses are of stone, four storeys high, with terraces to walk on in the cool of the day. A very ancient house, in ruins, is called Kasr Saum, the college of Shem, the son of Noah. The imam or prince resides in a splendid palace, built in a Gothic style, resembling a fortress. He has other palaces. Jews, in Yemen, amount to 20,000. Wolff baptized in Sanaa 16 Jews, and left them all New Testaments. —*Wolff's Bokhara*, i. p. 59.

SANA-BHOGA. KARN., MAHR. Corruptly, Shanbogue; in revenue accounts, the village clerk who keeps the accounts of the cultivation. He is paid by a grant of land and by portions of the crop. The Sana-bhoga in the south of India are mostly Brahmans, and as village officers their office is hereditary; in some places paid by holding rent-free or lightly-taxed land, with fees from the ryots in money or in kind.

SANĀKADI SAMPRADAYI, a sect of Vaishnava Hindus, founded by Nimbaditya, alias Bhaskara Charya, a Vaishnava ascetic. The objects of their worship are Krishna and Radha conjointly. —*Wilson, Hindu Sects.*

SANATORIA, in British India, is a term usually applied to designate military stations on the mountains or table-lands with climates suited to the health of British soldiers. A range of hill stations or sanatoria extend from Murree in the Panjab to Almora in the Kamaon district. These are Murree and Abbotabad, near Hazareh, in the Sind Saugor Doab; Dalhousie, on the Chamba Hills, at the head of the Bari Doab; Dharmsala, near Kaugra; Simla, with its adjacent stations of Dugshai, Subathu, and Kussowlee; Mussoori and Landour, overlooking the valley of the Doon; Almora and Naini Tal, in the province of Kamaon. In the Eastern Himalaya, in Sylhet, some sites are spoken of favourably. Mount Abu is west of Rajputana; the Mahabaleshwar Hills, south-east of Bombay; Ramandrug, near Bellary; the Neilgherry and Pulney Hills in the south of the Peninsula, and Neuera Elia in Ceylon.

Almora, in lat. 29° 35′ 2″ N., and long. 79° 41′ 16″ E. is in Kamaon, 30 miles N.N.E. of Naini Tal; and the several houses are at heights up to 5607 feet above the sea.

Chikaldah Hill in E. Berar, in about lat. 21° N., and long. 77° E., is a small, undulating table-land, 20 miles from Ellichpur, is conveniently situated for the soldiers at Kamptee; and in its vicinity, and still more suitable, is Gawilgarh Hill, 3600 feet above the sea.

Chindwara, in the Nagpur province, has been resorted to by considerable numbers of soldiers in the hot weather, and has extensive barrack accommodation.

Dugshai, 8 miles E. of Kussowlee, and 10 miles S. of Subathu; ranges from 5000 to 6000 feet.

Kussowlee, in lat. 30° 53′ N., and long. 77° E., 45 miles distant from Ambala and 32 miles from Simla, is about 6400 feet above the sea; there is no table-land, and the peaks are rather steep, and pretty densely clothed with fir trees. There is a plentiful supply of excellent spring water, 700 feet below the barracks; the meat and vegetables are plentiful. The climate is temperate and agreeable, unless during the rainy season, when dense fogs make it gloomy and depressing.

Lohooghat, in the Almora Hills; unsurpassed in India for salubrity of climate and picturesque scenery.

Mussoori or Masuri adjoins Landour on the west, and consists of a series of ridges about 5 miles in extent, running almost east and west, with frequent peaks, and with spurs or shoulders issuing irregularly down to the valley of Dehra Doon on the south, and to the river Uglar or Uggulwar on the north, with deep wooded gorges

between. It was first resorted to as a sanatorium in 1823. Banog mountain, to the west, in lat. 30° 28′ 29″ N., and long. 78° 3′ 23″ E., rises 7545 feet above the sea. The Mussoori climate has proved advantageous in all cases of debility from climate, in dyspepsia, rheumatism, and cachectic children.

The *Neilgherries* in the Coimbatore district has several well-settled stations, at heights rising 5000 to 8000 feet above the sea,—Ootacamund, Wellington or Jakatalla, Coonoor, and Kotagherry. It has many settlers, and promises to be occupied by a European colony, but Wellington is the sole military station, and detachments from the plains are constantly located. The climate of these mountains is not useful, is even injurious, in organic diseases, in venereal affections, obstinate ulceration; in diarrhœa it is not beneficial, but is useful in debility from climate, length of residence, and to phthisical subjects.

Pulney Hills in Madura are resorted to occasionally by families from Trichinopoly.

Ramandrug or Raman-malai, 34 miles from the town of Bellary, is not above a mile square; is within the territory of the raja of Sundur, to whom belongs the revenue of the place, derived from the land, quit-rent, and abkarry, to the extent of Rs. 757 per annum. The native population is not numerous.

The *Shevaroy Hills* in the Salem district are largely resorted to by private families, but have never been utilized as a site for troops, probably from the vicinity of the higher Neilgherry mountains in the Coimbatore district. The Shevaroy Hills rise to between 5000 and 6000 feet above the sea, and have an area of 840 square miles.

Simla, which is the chief hot-weather retreat of the Bengal civil and military officials, is in lat. 31° 6′ N., and long. 77° 11′ E., has a series of heights varying from 6500 to 8000 feet.

Subathu, 9 miles from Kussowlee, on the road to Simla, is at 4000 feet of elevation.

SANCHI, a small village situated on a low ridge of a sandstone hill, on the left bank of the Betwa, 20 miles to the N.E. of Bhopal, and about 5½ miles S.W. of Bhilsa. About the beginning of the Christian era, it was the capital of a kingdom called Sanaka-nika, and is famous as the site of some of the most extensive and remarkable Buddhist remains in India, the centre of the great group described by General Cunningham under the name of 'The Bhilsa Topes.' The principal buildings which now remain occupy only the middle part of the level top, and a narrow belt leading down the hill to the westward. They consist of one great stupa or tope with its railing and other adjuncts; about ten smaller stupas, some now showing nothing more than the foundations; a stone bowl, 4½ feet in diameter and 2½ feet deep, supposed to have once contained Buddha's holy nettle, and other objects of antiquarian interest.

It is narrated in the Mahawanso, that Asoka when on his way to Ujjain, of which place he had been nominated governor, tarried some time at Chityagiri, or, as it is elsewhere called, Wessanagara, the modern Bisnagar, close to Sanchi. He there married Devi, the daughter of the chief, and by her had twin sons, Ujjenio and Mahindo, and afterwards a daughter, Sanghamitta. The two first named entered the priesthood, and played a most important part in the introduction of Buddhism into Ceylon.

The ruins at Sanchi are those of a stupa, and not a dhagoba. The ruins called No. 2 tope contained the remains of ten Buddhist teachers who took part in the third great convocation held under Asoka, and some of whom were sent on missions to foreign countries to disseminate the doctrines then settled; No. 3 tope contained two relic caskets. One of these enclosed relics of Maha Moggalana, the other of Sariputra, friends and companions of Buddha himself, and usually called his right and left hand disciples. The Buddhist tope is believed to have been erected by king Asoka B.C. 250, an age when the use of stone in buildings was in its infancy, beginning to replace wood, whose forms of construction the tope was made to imitate.

Three forms pervade all the monuments of both Sanchi and Amravati:—(1) Topes or stupas, mound-like buildings erected for the preservation of relics; (2) Chaityas, which, both in form and purpose resemble early Christian churches; (3) Viharas, residences of priests and monks attached to the topes and chaityas. The topes at Sanchi form part of a great group of such monuments, extending over a district of 17 miles, and numbering 40 or 50 tumuli. The great tope consists of an enormous mound, built in the following manner:—First, a basement 121 feet in diameter and 14 feet high; on the top of this a terrace or procession path 5 feet 6 inches wide; within this rises the dome, a truncated hemisphere 39 feet high, originally coated with plaster. On the top of the dome is a level platform measuring 34 feet across; within this was a square relic box, of sixteen square pillars with rails, and, over all, a circular support for the umbrella which always crowned these monuments. But the most remarkable feature of the building is the rail, which surrounds it at the distance of 9 feet 6 inches from the base, and consists of 100 pillars 11 feet high, exclusive of the gigantic gateways. These gateways are covered with the richest and most fantastic sculptures, both in the round and in bas-relief. About one-half of their sculptures represent the worship of trees or of dhagobas (relic shrines); others represent scenes in the life of Buddha, and others again ordinary events, feasting, concerts, etc. Mr. Fergusson considers these sculptures superior in merit to those of Egypt, but inferior to the art as practised in Greece. The sculpture at Sanchi are the more rude and vigorous. Those at Amravati are on a scale of excellence, 'perhaps nearer to the contemporary art of the Roman empire under Constantine than any other that could be named, or of the early Italian renaissance.'

Two races may be readily distinguished as depicted in the sculptures. First, the Hindus, originally pure Aryans, though of mixed blood at the age of the sculptures, evidently the dominant race. The men wear the dhoti and turband; the women are covered with jewels, but otherwise nude. This last is a feature found elsewhere. The second race wore kilts and cloaks, and (most marked peculiarity) are represented with beards, which the Aryans never wear. The women wear neat and decent dresses and no ornaments. These would appear to be the aborigines of the country. —*Imp. Gaz.* viii.

SANCTUARY, a place of refuge or safety. These have been established in most countries, to allow of alleged criminals and debtors escaping from immediate punishment, and so admit of leisurely examination into the merits of their case. In one of these, in Rajputana, whatever life, whether man or animal, passed their abode for the purpose of being killed, was saved (amra). 'Traitors to the state, robbers, felons escaped confinement, who may fly for sanctuary (sirna) to the dwellings (upasra) of the Yati, shall not there be seized by the servants of the court.' In Persia, Turkish Arabia, the Muhammadans have several sanctuaries. In most of the cathedral towns of Europe there were until lately places of this kind, and the Broad Sanctuary of Westminster in London still bears the name. See Bast.

SANCU. Sansk. A gnomon for astronomical purposes. The pillars which are erected in front of every pagoda are real gnomons.

SAND.

Raml, ... Arab.	Arensi, ... It., Sp.
Zand, ... Dut.	Arena, . . Lat., Pers.
Sable, ... Fr.	Areia, ... Port.
Balu, Reti, . . . Hind.	Pesok, ... Rus.

Showers of sand fell in China on the 26th March 1850, and lasted several days; about ten grains to the square foot collected in one day, or about eighteen tons per square mile. Such showers are frequent,—three occurred in 1850; the natives believe that the dust comes from the desert of Gobi. Mr. J. Alexander mentions that on the 29th March 1821, when in lat. 11° 3′ N., and long. 22° 5′ W., 300 miles from the African coast, sand was blown on to the rigging of the ship.—*Jam. Ed. Journ.* vii. p. 494.

SAND. Hind. A bull liberated by Hindus on ceremonial occasions, and allowed to wander at will.

SANDA, a sort of lizard in Ajmir. It is distilled, and the product applied by Muhammadans to the penis; the reptile is also eaten as an aphrodisiac.—*Gen. Med. Top.* p. 151.

SANDACRES, districts in Ceylon which differ from those called Patuna in being studded with groups of timber trees of majestic dimensions.—*Tennent.*

SANDAL, a ceremony; an embrocation of sandal-wood.

Many of the synonyms for this wood have been derived from the Sanskrit, the letters ch of that tongue being converted into s and ts. One kind is the produce of a small tree, Santalum album, growing in India and Ceylon, which gives its title to the natural order of plants called Santalaceæ or sandal-worts. The sandal-wood of the Sandwich Islands is from two other species of the same family, S. Freycinetianum and S. paniculatum; but S. Freycinctianum has been so recklessly cut down in the islands of the South Seas that it has almost disappeared. The Myoporum tenuifolium, or spurious sandal-wood tree, grows in elevated situations, attains to 15 or 20 feet in height and 3 or 4 feet in circumference. Its scented wood varies from yellow to red, according to the age of the tree, and is used for planes. A white sandal-wood, termed lava or lawa, is imported into Bombay from Zanzibar, and is applied to the same purposes as Mysore sandal-wood.

Another spurious kind is from the Exocarpus latifolia of the Percy Islands, Cape Upstart, the Palm Islands, Repulse Bay, etc., and in India the wood of the Plumieria alba is fraudulently mixed with the billets of the true sandal-wood. In the year 1881-82, the value of the exported sandal-wood from India was Rs. 3,98,284, and in 1882-83, Rs. 4,02,031.

Coorg sandal-wood sells at Rs. 180 to Rs. 425 the ton. That of Mysore is of excellent quality, and there the tree has been strictly conserved since the middle of the 19th century. Up to 1875-76, five sandal-wood plantations had been formed in Mysore. The Mysore revenue from sandal-wood (1055 tons) in that year was Rs. 2,87,132. Good wood was sold at Rs. 372, and inferior wood at Rs. 14½ per ton. The tree is cut down when about 9 inches in diameter at the root; it is then cleared of its bark and cut into logs, which are buried for six weeks or two months in order that the white ants may clear off the outer wood; this they do most effectually, without touching the heart of the tree, which is the only valuable part. Two kinds of this wood are, however, known in commerce,—the white and the yellow; both are from the same tree, the former being the outer layers of the wood.

The odour of sandal-wood is very strong, rose-like, and enduring; its taste slightly bitter. The odour is due to the presence of an essential oil, heavier than water, readily congealed, and having a peculiar sweet smell. The deeper the colour, which is of a yellow-brown, and the nearer the root, the better is the perfume. The Chinese imported an amount of sandal-wood in 1838 worth about 150,000 dollars. From Timor and the Fiji islands China derives her chief supply. The natives of Yap, the Isle of Pines, and Maree traffic with ships for the sandal-wood. Timor is the only country in the Eastern Archipelago which produces it in any quantity. That of Bonin Island is of excellent quality.

The oil is employed by the European perfumers, and in India is very extensively used for the adulteration of attar of roses. The wood in powder is given by the native physicians in ardent remitting fevers, and is supposed to be sedative and cooling; with milk it is also prescribed in gonorrhœa. The Chinese consume it largely as a fancy wood, and by them it is often elegantly carved. By the Chinese it is ground into powder and used as a cosmetic. The powder is rubbed on the skin to allay the irritation of mosquito bites, of prickly heat, and other cutaneous disorders. The wood is a preservative against insects, and is much used in making work-boxes, walking-sticks, pen-holders, and other small articles of fine ornament. It is much used in

India and China for burning in temples, is extensively employed as a fuel in the funeral ceremonies of the Hindus. Its bark gives a most beautiful red or light claret-coloured dye, but it fades almost immediately when used as a simple infusion. In the hands of the experienced dyer, it might, it is supposed, be very useful. — *G. Bennett*, p. 419; *Tomlinson; Tredgold; Ainslie; Crawfurd; M. E. J. R.; Macgillivray's Voyage*, i. p. 97; *Bombay Forest Reports; Report of Madras Forests; Poole, St. of Comm.*

SANDARACH, Sandrac, Sandarac.

Sundroos, Zoos, . ARAB. | Yun-hiang, . . . CHIN.

A resinous substance met with in round or elongated tears, of a whitish or pale-citron yellow; brilliant, transparent, and limpid, brittle under the teeth, burns with a clear flame, and emits a pleasant odour; taste resinous, and slightly balsamic. It is used as an ingredient in varnishes and incense; when reduced to a powder, it forms the article term pounce. Sandarach is obtained from Morocco, according to Brongniart and Schousboe from the Callitris quadrivalvis, a coniferous tree, which in Barbary is called the arar tree, and attains a height of from 15 to 20 feet. It was discovered by Desfontaines on Mount Atlas in 1796. Dr. Lindley had seen a plank two feet wide of this sandarach tree. The wood is considered by the Turks indestructible, and they use it for the ceilings and floors of their mosques. The citrus wood of the Romans, extravagantly prized for tables, is supposed to have been the Callitris quadrivalvis, *Vent.*, or jointed arbor vitæ. The wood was distinguished as striped, tigrinæ; spotted, pantherinæ; or speckled, apiatæ. Cicero gave £9000 for a citrus wood table. The common junipers secrete a similar resin.—*Faulkner; Tomlinson; O'Sh.; Poole; Hogg; Smith.*

SAND-BINDING PLANTS are growing naturally all along the sea-shores of British India, and in the tracts on the margin of the Indian desert; but more could be done to prevent the sands being blown from the deserts and from the gulf between Ceylon and Peninsular India, and from the shallow beds of its many rivers. Bremontier, by planting the Landes of Gascony with the cluster or pouch pine (Pinus pinaster or P. maritima of botanists), recovered 100,000 acres from the blown sand.

This class of plants has been largely utilized in Australia, and Baron von Mueller enumerates sixty genera, which he recommends to be so employed; among them species of aloe, carex, casuarina, cynodon, opuntia, spartina, spinifex, stipa, tamarix, and yucca.

Spinifex squarrosus, *Linn.*, known to Europeans by the designation of ground rattan and sea pink. The Tamil name, Ravan mise or Maha Rawana and Rævula, *i.e.* whiskers of Ravana, is a descriptive epithet. It comes near to the sand carex of England in its habit of growth, creeping along horizontally, sometimes above, sometimes below the surface of the earth, emitting roots and shoots at intervals of a few inches. It is extremely tenacious of life, the shoot at every node being capable of renewing the existence of the individual as fast as destroyed, and the whole plant offers a resistance to the effects of a storm, which is rarely overcome. This species would be nearly as indestructible from natural causes as couch grass, and would speedily colonize the sand tracts spontaneously, if it were only left unmolested for a year or two.

Ipomœa pes-capræ, *Sweet.* Mosul taylie, TAM. Goat's-foot-leaved ipomœa, or rabbit weed, is perennial, creeping to a very great extent. Stems rooting at distant intervals. Leaves smooth, long-petioled, two-lobed, like those of Bauhinia, tipped with a neacro. Flowers large, reddish-purple, very handsome. This fine creeper is equally abundant in both Peninsulas of India, is also a native of Mauritius, Macao, etc., occupying the place of C. soldanella of the British coast, and a more striking and beautiful species of the tropical bindweeds is rarely seen. Rabbits, goats, and horses eat it, so do cows, but their milk is tainted. Great difficulty occurs in raising this plant in the vicinity of houses, as the inhabitants tread it down, and cattle nibble the tender shoots. It naturally takes a higher position on the sand-band than the spinifex, and suffers less injury during a storm; but they often grow together, and conjointly effect much benefit. The spinifex arrests the drifting sand, and the ipomœa secures what the former collects. Mr. Caddell planted it extensively along the canal banks near Tranquebar.

Canavalia obtusifolia, *D. C.* Koyli avaree, TAM. Common on the sea-shore, frequently entwined with the Ipomœa pes-capræ. It is a very useful plant, very abundant at the Adyar, Ennore, the mouth of the Godavery, and between Quilon and Anjengo.

Hydrophylax maritima, *Linn.*, the Mudugaeta kola of the Singhalese, literally jointed sea-shore plant, a straggling herbaceous plant, native of the shore of Coromandel, where it shows its pale lilac blossoms great part of the year. The branches run over the sand, sometimes under the surface, and strike root at the joints. It answers well when the sand is moist.

Microrhynchus sarmentosus, *Wight Ill.*, is a widely-diffused humble plant, common along the sea-beach, with long flagelliform runners.

Pupalia orbiculata, *Wight.*

Achyranthes orbiculata, *Heyne.* | Adai yotti, . TAM.
Cyathula orbiculata, *Moquin.*

Grows on sandy soils near the sea-beach, abundant at St. Thome and near the mouth of the Adyar river. It is an extensively-spreading procumbent plant, the branches being often several feet long; bristles attaching themselves to the clothes of passengers, cling to them with tenacity.

Pandanus odoratissimus, *Linn.*, the kaldera bush, Taylie maram, TAM., is a large spreading ramous shrub, often planted in belts, but takes up much room, forms dense thickets, and harbours venomous reptiles. The lands in which chay root is cultivated are often protected from drift sand by means of this shrub. It is a very strong binder, but is objectionable from its raising sand-hills.

Ehretia arenaria, *Griffith*, is found between lat. 12° and 28° N., binds together loose sand in a minor degree. It may be the same as Ehretia cuneata? *W. Icon.* iv. t. 1385, which grows on sandbanks in the beds of all the rivers of the Western Peninsula of India.

Pedalium murex, Ipomœa pes-tigridis, and Sesamum prostratum, etc., co-operate in the work of conservation to a minor extent, but are less widely diffused along the coast; also Fagrœa Coromandellia. Trees such as the cashew

(Anacardium occidentale), the Alexandrian laurel (Calophyllum inophyllum), and the wild date (Phœnix sylvestris) grow well, and render a double service by preventing a further encroachment of sand, and rendering the land useful. In Ceylon, the glass-worts, Salicornia Indica, and salt-worts, Salsola Indica, are the first to appear among the newly-raised banks. Ipomœa pescapræ abounds on the shores, also Canavalia obtusifolia, Dolichos luteus, and the Hydrophylax maritima. A little above high-water mark is, likewise, the Aristolochia bracteata, the Hedyotis umbellata, Sayan; also Choya, SINGH.; Gloriosa superba, Vistnu karandi, TAM., or Lippia nodiflora.—*Dr. Cleghorn; Sir J. E. Tennent; Von Mueller; Prof. Rolleston*, p. 16.

SAND-BOX TREE, Hura crepitans. Chiefly remarkable for the violence with which the ripe fruit opens to discharge its seeds, often with a report like that of a pistol.

SANDERS-WOOD. Red Sanders-wood.

Sundun, ...	ARAB.	Ruttunjee,	GUJ., HIND.

Santale rouge, . .	FR.	Ku-chandanum, .	TEL.
Sandal-holz, . .	GER.		

The sanders-wood or red sanders-wood of commerce is the product of a large useful timber tree, the Pterocarpus Santalinus, found in Malabar, Mysore, Ceylon, near Madras, in the Pulicat and Tripaty Hills, Malay Peninsula, and Timor. The wood is extremely hard, of a fine grain, and a bright garnet-red colour, which brightens on exposure to the air. It is employed to dye lasting reddish-brown colours, the concentric circles being divided by dark lines. It communicates a deep-red to alcohol, but gives no tinge to cold water. It is principally shipped to England from Calcutta in logs from 2 to 10 inches diameter, generally without sap, and sometimes in roots and split pieces; it is very hard and heavy; it is very much used as a red dye-wood, and often for turning. The logs are often notched at both ends, or cut with a hole as for a rope, and much worn externally from being dragged along the ground; other woods, as also indeed ivory tusks, are sometimes thus perforated for the like purpose. With different mordants, it yields various shades of red; these are said to be little permanent. This wood is largely exported from, but little used in, Madras. The Madras exports for 1854 amounted to 47,431 cwt., value 59,570 rupees.—*M. E. J. R.; Tredgold.*

SAND-GEMS, or Ava gem sand, comes from the neighbourhood of Ava, and is sometimes one of the Shan articles of merchandise. It consists of small fragments of nearly all the precious stones found in the country; but garnet, beryl, and spinel are its principal constituents, more especially the last, which seems to constitute nearly three-fourths of the whole mass. A single handful will contain specimens of every shade,—black, blue, violet, scarlet, rose, orange, amber-yellow, wine-yellow, and white.—*Mason.*

SAND GROUSE, the Syrrhaptidæ, *Blyth*, and Pteroclidæ, *Jerdon*, are also known as the rock grouse and rock pigeon. They are birds of rapid and powerful flight. The Indian species are Pterocles arenarius, *Pallas*, Pt. fasciatus, *Scopoli*, Pt. alchata, *Linn.*, Pt. exustus, *Temm.*, and Pt. Senegallus, *Linn.*, the last being of Africa and Arabia, and it is said also of Sind. The Tibetan sand grouse, Syrrhaptes Tibetanus, *Gould*, repairs in large flocks to drink at the fresh-water springs. The plumage of both sexes is much alike, but the long tail of the male is distinctive.—*Adams.*

SANDHARA. HIND. Cutlers in Hindustan, who profess to have come originally from Marwar, and to be related to the Rajputs. Muhammadans who pursue the same avocation are called Saikalgar.

SANDHEADS, a maritime term applied to the seaward islets of the delta of the Hoogly, nearest the Bay of Bengal.

SANDHI, a form of conjunction of words in Sanskrit, and in those words of the Telugu language derived from Sanskrit, and is a systematic element in grammar.

SANDHI or Sandhya. SANSK. The twilight or crepuscle. The Sandhya of Brahma consists of 1,728,000 solar sidereal years, the same duration as the Krita or Satya-yug, which quantity is used in its double capacity for constructing the Kalpa. Pratas sandhya, the morning twilight; Sayam sandhya, the evening twilight. The twilight of each yug is equal to 1-6th part of the same.

SANDHYAVANDANUM, three prayers by Brahmans, at sunrise, noon, and sunset.

SANDILYA, a celebrated Hindu teacher of the doctrine that the self within our heart is Brahma.

SANDLASA. HIND. A flat circular stone on which sandal-wood is ground.

SANDORICUM INDICUM. *Cuv.*

Trichilia nervosa, *Vahl.*		T. venosa, *Spr.*	
Melia koetjape, .	BURM.	False mangosteen, .	ENG.
Theit-to, . . .	,,	Wild mangosteen, .	,,

This elegant timber tree grows to a large size in Burma, the south of India, Mysore, Penang, the Moluccas, and Philippines. It is scarce in the forests of British Burma, but is large and plentiful near all villages both in the Rangoon and Tounghoo districts, where it is cultivated by the Burmese for its fruit, which is of the size of an orange, and has a fleshy acid pulp. The wood is white-coloured, and adapted to every purpose of house-building. The pulp of its fruit is eaten raw by the natives of Tenasserim, who esteem it as excellent. It is watery and cooling, and makes a good jelly, but this has a peculiar odour. Its root is bitter, and used in medicine in bowel complaints.—*Roxb.* ii.

SANDOWAY (Than-dwai), a British district in the Arakan division, British Burma. Area, 3667 square miles; population (1872), 54,725 souls. The town is situated in lat. 18° 27′ 35″ N., and long. 94° 24′ 36″ E., on the Sandoway river, about 15 miles from its mouth.

SANDRACOTTUS of the Greeks, king of Magadha, was a contemporary of the early successors of Alexander. He was the Chandragupta of the Indians, who founded a new dynasty, and he was grandfather of the Asoka who reigned B.C. 250, the Constantine of Buddhism, the first who gave that religion supremacy in India.

SANDSTONE ROCK occurs in most countries, an aggregation of sand by a sort of semifusion, as in quartz rock and in common gritstone, adjoining trap dykes or great faults. In many of the white sandstones the grains merely cohere together. Some sandstones are in the laminæ, plane, waved, or slightly concentric; these admit

of being readily split. The freestones are not distinctly laminated, the grains being so arranged as to present equal resistance in every direction. They work freely under the stone saw and the ordinary picks and chisels. They can also be turned into balustrades, pedestals, and vases. In the East Indies, sandstones occur of different qualities, from the coarsest soft grit to the hardest freestone, the most compact snakestone, and the toughest chert.

The sandstones of the Kymore range in the Vindhya have a high commercial value at Partabpur, Chunar, and Mirzapore, being used as flagstones and for ornamental purposes. The proximity of the Ganges affords an easy river carriage. They are in general fine-grained, and of reddish-yellow or greyish-white colours.

In the upper Bhanrer series are two varieties of excellent building stone,—one dark-red, sometimes quite unspotted, sometimes streaked and dashed with yellowish-white spots; the other is a yellowish-white, very fine-grained rock, perfectly homogeneous both in texture and colour.

Flexible sandstone is found in Ulwar, at Dadri, in Jheend, and at Jubbulpur. It is called Sang-i-larzan, *i.e.* shaking stone, and is obtained from the Kalyana Hill in the pargana Dadri; it is used for roofing and for ornamental pillars. Sandstones also occur at Sahi Balabgarh, in the hills to the south-west of Dehli, also at Kulceana at Rohtuk; and the palace at Dehli and great mosque are of red sandstone.

The monoliths known as lat'hs afford the earliest examples of the uses to which the sandstones of N. Hindustan were applied (see Lat), and the first stone temples seem to have been erected about the 2d century B.C.

The millstones of Chynepore, Sasseram, and Tilowlhoo, perhaps also Akbarpur, are famous. The Sone causeway and the Koylwan railway bridge are built of the dense sandstone of Sasseram, and little quantities of it are found in the higher portions of the range towards Rohtas. The best stone, while easily workable, is almost as hard as granite, and may be had of any colour, viz. white, crystalline, blue, grey, and all shades to a dark red.

The ghats of Benares, its palaces, walls, minarets, and many temples, are built of sandstone, and St. John's Church, Calcutta, is built of Chunar stone. The Vindhyan sandstones near Gwalior have been used to construct forts, temples, etc.; and on the cliffs are some figures of Titanic dimensions.

The upper Bhanrer formation has quarries to the south of Bhartpur, Futtehpur Sikri, and Rupas. Portions of the Taj at Agra, Akbar's palace at Futtehpur Sikri, the Jaina Masjid at Dehli, and buildings generally in Agra, Dehli, and Mutra (Mathura), and the palace of the raja of Bhartpur, have drawn on these quarries for the materials used. The Jain temples and railway bridges at Barakar are built of sandstones of the Gondwana series. The caves of Sirguja and Chang Bakhar are in the Gondwana sandstone. They have inscriptions in the old Pali character.

The Tawa viaduct is built of sandstones of the Bagra group of the upper Gondwana series. In the Jubbulpur station is a very dense sandstone which has been largely used locally, and the viaduct over the Nerbadda below Jubbulpur has been built with it. The sandstones and flag-beds of the Rajmahal series are occasionally employed for local building purposes. The jurassic rocks of Cutch, the cretaceous sandstones of the Bagh beds, those of the eocene series at Dagshai, Kasaoli, Subathu, and Dharmsala, afford good building material, at the latter place of a grey colour. The quartzite of the Satuma Hill in Manbhum, has been used in Calcutta for paving and coping.

The compact sandstones at Conjeveram are easily dressed. The whole of the valley of the Kistna and great parts of the valleys of its affluents, the Gutpurba, Malpurba, Bhima, Tungabudra, and Tumbudra, and much of the valley of the Godavery and of the valleys of its northern affluents, have limestone, clayslate, and sandstone rocks, and the houses and more extensive buildings are all built of these. The limestone of Kurnool, west to the Bhima, is an excellent building material. Soft sandstones resembling bathstone and tripoli abound near Nellore, Bellary, Cuddapah, and Hurryhur. Sandstones suited for grinding purposes are obtained in Cuddapah; at Chellamacoor, a greyish-brown schistose granular sandstone; near Cuddapah there is bluish-grey compact magnesian limestone, suited for fine sharpening stones; from Woontimitta, fine-grained schistose sandstone, suited for a ragstone. In Guntur, at Palnaud, are purple and lilac-slaty sandstones fine in grain, honestones, black limestones, and lithographic marbles. From Gootemookoola and Dyda, hones from Koopokoonda, 8 miles west of Vinacondah, below the signal pond; rough sandstone glistening with mica. From Matoor Hill, schistose ragstone.—*Powell's Handbook*, pp. 35-56; *Mad. Ex. Jur. Report; Reports and Catalogues of Govt. Cent. Museum, Madras; Tomlinson.*

SANDUR, an independent Native State in the Ceded Districts of the Peninsula of India; area, 140 square miles. The founder of the family was Malaji Rao Ghorpara, an officer in the army of the Bijapur king. The sanatorium of Ramanmalai is 3150 feet above the sea. On the plateaux there is a tribe of Bedars, and the temple of Kumaraswami is on an adjoining hill. The hills are about 15 miles long, running from south-east to north-west, ending abruptly near Hospet. This range forms the greater part of the western boundary of the native state.

SANDWIP ISLAND, in the Bay of Bengal, is situated off the coast of Chittagong and Noakhali, in lat. 22° 24′ to 22° 37′ N., and long. 91° 22′ to 91° 35′ E. It is the largest of many chars or islets formed by the Megna as it enters the sea. From its low-lying position, Sandwip is peculiarly exposed to inundation from storm-waves, and suffered severely in loss of life and property by the cyclones of 1864 and 1876. On the latter occasion, the number of deaths was officially estimated at 40,000, out of a total population of 87,016, and cholera set in soon after the cyclone had passed over.

Cæsar Frederick, the Venetian traveller, in 1565 described the inhabitants as 'Moors,' and stated that the island was one of the most fertile places in the country, densely populated, and well cultivated. Purchas (circ. 1620) states that most of the inhabitants near the shore were Muhammadans. Sir Thomas Herbert (circ. 1625) describes it as one of the fairest and most fruitful spots in all India.

In 1616, Sandwip was taken from the Portuguese by the Arakanese. In 1665, Shaista Khan, the Muhammadan nawab of Bengal, determined to reconquer the island, and an interesting account of his expedition has been given by the French traveller Bernier.—*Imp. Gaz.* viii.

SAN-FA-SHI, the name applied by the Chinese pilgrim Hiwen Thsang to the Vrij'h country, which he also calls Fo-lo-shi. San-fa-shi or Samvaji is the Pali form of Samvriji, or the 'United Vriji,' from which General Cunningham infers that the Vriji were a large tribe which was divided into several branches, namely, the Lichhavi of Vaisali, the Vaidehi of Mithila, the Tirabhukti of Tirhut, etc. Either of these divisions separately might therefore be called Vriji, or any two together might be called Vriji, as well as Samvriji, or the 'United Vriji,' as is the case with the warlike tribe of the Bagri or Sambagri of the Sutlej, which consisted of three separate divisions. He is of opinion that Vaisali was a single district in the territories of the United Vriji or Wajji. Kesariya is an old ruined town, 30 miles to the north-north-west of Vaisali. The place possesses a mound of ruins with a lofty stupa on the top, which the people attribute to Raja Vena Chakravarti. In the Puranas also, Raja Vena is called a Chakravarti, or supreme monarch. General Cunningham found his name as widely spread through Northern India as that of Rama or the five Pandu.—*Cunn. India*, p. 446.

SANG. Pers. A stone; but used as a prefix to designate mineral earths, stones, minerals, gems, fossils, compounds used in the arts or in medicine.

Sang-i-abri, a mottled brown and yellow stone.
Sang-i-akik, cornelian.
Sang-i-asshar, a form of silica.
Sang-i-assyum, millstone grit.
Sang-i-basri, a slag or dross of copper in tubular pieces; from Bassorah (Basrah), where it is collected at the mouths of the chimneys of copper furnaces.
Sang-i-birinj, of the Dizful, an important stream in Khuzistan. The bed of an occasional torrent in ancient Susiana, called Ab-i-bald, falls into the Dizful, is covered with a pebble filled with little fossil shells resembling grains of rice. These stones are also found in the river at Shuster, but of an inferior quality, and they are in much request throughout Persia for the head of the Nargil pipe, which is almost invariably composed of this material set in silver.
Sang-i-chamak, massive magnetic iron-ore.
Sang-i-dallam, fire-clay procurable at Streepermatur, Tripasur, Chingleput, Metapolliam, and Cuddapah, and in many parts of India; and bricks can be made that resist the action of great heat. A clay is found at Beypore 20 to 30 feet below the surface, and is used for fire-bricks and for lining furnaces.
Sang-i-irmali, a fossil.
Sang-i-jahanam, lunar caustic?
Sang-i-jarahat, sulphate of lime, steatite, and other minerals.
Sang-i-kara, hornblende rock.
Sang-i-kharus, fossil encrinite.
Sang-i-larzan, flexible sandstone.
Sang-i-marjan, coral.
Sang-i-marmar, marble.
Sang-i-mehtab, also tambra, garnet.
Sang-i-misri, a red and white stone, imported via Pali, is used as an aphrodisiac; one tola for one anna.
Sang-i-musa, hard clayslate, syenite, granite.
Sang-i-palan, French chalk or steatite, used for making crucibles; qu. sang-i-dalan?
Sang-i-patbani, bloodstone.
Sang-i rasak, copper-dross, a mixture of metallic copper with organic matter; obtained during the process of melting copper and brass.
Sang-i-sabz, green earth.
Sang-i-sar-i-mahi, small fossil shells; also a concretion from the head of a fish, comes from Dehli, used as an aphrodisiac. Sold at 8 annas a tola.
Sang-i-shadnaj, fossil nummulite.
Sang-i-sitara, avanturine.
Sang-i-Sulaiman, onyx.
Sang-i-yamani, bloodstone.
Sang-i-yashm, jade.
—*Genl. Med. Top.* p. 152; *Chesney; Powell.*

SANG, in Baluchistan, a reciprocal contract or promise. In the wedding ceremonies, a few days after the conclusion of the Sang, a prepared entertainment is made sufficiently large to include the whole khel, provided the young man's condition in life will admit of his going to that expense. It happens not unfrequently that the Sang is entered into before the girl is marriageable. So soon as the girl arrives at proper age to take upon herself the duties of a wife, the Uroos or marriage ceremony is performed by a Mullah.—*Pottinger's Tr.* p. 68.

SANG, a spear or javelin, formed wholly of iron, carried by fakirs; also a war lance, 10 feet long, covered with plates of iron about 4 feet above the spike. A sirohi is a sword made at the town of that name, famous for its temper.—*Tod's Rajasthan*, ii. p. 118.

SANGA. Hind. A breastwork; also a wooden bridge in the Himalaya, made by projecting timbers from the banks, one above another, until they nearly meet, on which they are connected by a plank laid across. In the N.W. Himalaya, and in Afghanistan, the Sang or Sangara is a stone parapet erected for defence.

SANGALA, ruins in Jhang district, Panjab, standing on a small rocky hill upon the border of Gujranwala district, now known as Sanglawala Tiba, and identified by General Cunningham with the Sikala of the Brahmans, the Sagal of Buddhism, and the Sangala of Alexander's historians. The earliest notice of the locality occurs in the Mahabharata, where Sakala figures as the capital of the Madra situated upon the Apaga rivulet, west of the Iravati or Ravi, and approached from the east by pleasant paths through the Pilu forest. The neighbourhood bears the name of Madr-des to the present day. Arrian, Curtius, and Diodorus all notice Sangala, 'a great city, defended not only by a wall, but by a swamp,' which was deep enough to drown several of the inhabitants who attempted to swim across. Alexander seems to have turned out of his direct line of march to punish the Kathœans of Sangala, who had withheld their allegiance. He stormed the outpost of Munda-ka-puro, crowded with fugitives from other cities, and then, breaching the walls by means of a mine, captured the town by assault. The Arashtra were the republican defenders of Sangala. They are the Adraistæ of Arrian, who places them on the Ravi. They were known by the several names of Bahika, Jartikka, and Takka, from which last is the name of their old capital of Taxila or Takka-sila, as known to the Greeks. The people still exist in considerable numbers in the Panjab Hills, and their alphabetical writing characters, under the name of Takri or Takni, are now used by all the Hindus of Kashmir and the northern mountains from Simla and Subathu to Kābul and Bamian.—*Elliot.*

SANGAM. Sansk. The fork or point of confluence of two or more rivers, always sacred to Siva Mahadeva; also a union, wedding, or marriage.—*Tod's Rajasthan*, i. p. 16.

SANGARA, the occupants of the island of Beyt in the time of Alexander. They were even then daring, reckless pirates.

SANGATHAR. Tam. A syndicate, a collegiate body.

SANGCHA. Hind. Nummulites, obtained on the Mazari Hills, at Dehra Ghazi Khan, and at Imam Bakhsh Khan. They are priced at 32 seers per rupee. See Sang.

SANGERMANO, an Italian priest of the Romish Church, who was a missionary in Burma in the early part of the 19th century; author of a cosmography.

SANGHA, with Buddha and Dharma, the Buddhist triad.

SANGHAMITTA, daughter of king Asoka. She followed her brother Mahinda to Ceylon, where he had preceded her a few years as the first Buddhist missionary to that island. She brought with her from Buddha Gya, B.C. 245, a cutting of that Bo Tree, Ficus religiosa, which is still growing in Ceylon.

SANGHAYA. Singh. A Buddhist priest of an inferior order.

SANGI. Tamil. An honorary titular designation, equivalent of Iyer, but added after that title.

SANGIR or Sangney, an island on the N.E. of Celebes, extending from lat. 3° 21′ N. to lat. 3° 16′ N. Sangir and the numerous islands of its group in the Celebes occupy a superficies of 13 square leagues; the Tolant and the Meangis islands united are 18 square leagues. These archipelagoes, formerly subject to the authority of the Sultans of Ternate, now make part of the Dutch residency of Menado. Several extinct volcanoes, and some still in full action, are found in the Sangir group; the devastations which they commit from time to time have often been fatal to the inhabitants. The eruption of Duwana in 1808 completely annihilated the village of Tegalando, destroyed all the surrounding forests, and suddenly deprived the inhabitants of all means of livelihood by the destruction of their fields. The Gunong Api or fire mountain causes numerous ravages in the island of Siau. Its peak, 6000 feet above the level of the sea, forms the culminating point of this group. Gunong Api covers with its base all the northern part of Sangirbesar; in 1812, the torrents of lava which it poured out destroyed the extensive forests of cocoanut trees with which this part of the island was covered, and caused the death of many of the inhabitants. These islands furnish more than twenty-five kinds of wood suited for building and furniture. Two harbours, sheltered from all winds, exist in the larger Sangir, one in the Bay of Taruna, the other, called Midelu, on the eastern side.—*Jour. Ind. Arch.*

SANGLI, a Native State in the Southern Mahratta country; area, 896 square miles, and population (1872), 223,663 persons. The portion watered by the Kistna is flat, and the soil particularly rich. The chief is a member of the Patwardhan family, whose founder, Hari Bhat, a Konkan Brahman, rose to military command under the first Peshwa, and received grants of land on condition of military service.—*Imp. Gaz.*

SANGSKARA, also Sungskritta, Sansk., from Sang, prep., and Kree, to do.

SANHITA. Sansk. A collection of hymns in the Vedas.

SANI, the planet Saturn, whose influence is supposed by Hindus to be malignant; also a deity of the Hindus. Sanichar, Saturday. In Maurice's Indian Antiquities is an engraving of Sani, taken from an image in a very ancient pagoda, which represents the deity encompassed by a ring formed of two serpents. Hence it is inferred that the ancients were acquainted with the existence of the ring of Saturn.—*Curiosities of Science.*

SANI, a light camel or dromedary, trained especially for the riding of native chiefs.

SANJAB. Hind. The sable fur; but furs sold as sanjab are generally marmot skins.

SANJAF. Hind. A border or edging of brocade, etc., inside the lining of a coat.

SANJAYA, the minister and charioteer of king Dhrita Rashtra, who went on an embassy to the Pandava prince Yudishthra.

SANKARA, Sarva, Sadasiva, or Sambhu, Sansk., are auspicious names of Siva.

SANKARACHARYA, who lived about the 8th or 9th century A.D., was a religious reformer. He is said to have been a Namburi Brahman of Cranganore, in Malabar or Kerala; but another account describes him as having been born at Chedumbaram, in S. Arcot, and afterwards residing in Malabar. He seems to have engaged in acrimonious controversies with other Brahmans of the Saiva and Vaishnava sects. The Sankara Charitra, the Sankara Kat'ha, the Sankara Vijaya, and Sankara Dig Vijaya, are books descriptive of his successes. He himself wrote numerous works, including commentaries on the Upanishads, Vedanta, Sutra, and Bhagavat Gita. He opposed the Naiyayika, the Sankhya, and the Mimansa philosophies, the last as represented by Madana Misra, with whom he held a long and acrimonious discussion. He led an erratic life through India and Kashmir, where he sat on the Pitha or throne of Saraswati, which is still shown to visitors. He then went to Badarikasrama (Badarinath), and finally to Kedarnath, in the Himalaya, where he died at the early age of 32. A Malabar Brahman is still the officiating priest at Badarinath.

He has been accused of having headed the general persecution against the Buddhists which was the main cause of the disappearance of that sect in Southern India.

The local persecution is recorded by Ananda Giri, a disciple of Sankara, about the 8th or 9th century A.D., and the author of the Sankara Vijaya. The magnified version appears in the Sarva Darsana Sangraha of Madhavacharya in the 14th century. In the course of Sankara's peregrinations he established several maths or convents, under the presidence of his disciples, particularly one still flourishing at Sringiri, on the Western Ghats, near the sources of tha Tungabndra. The influence exercised by Sankara in person has been perpetuated by his writings, the most eminent of which are his Bhashyas or commentaries on the Sutras, or Aphorisms of Vyasa. He wrote also the Atma-Bodha or Knowledge of the Soul, which has been translated by Taylor in 1812, afterwards by Kearns, and into French by Neve.

His philosophic views are adopted by the Smartta Brahmans, a numerous and prominent sect in the south of India.

Sankara taught that there was one sole and supreme God, Brahma Para Brahma, the ruler of

the universe, and its inscrutable first cause, who was to be worshipped by meditation. The Smartta Brahmans follow this philosophic side of his teaching. Sankara moulded the later Mimansa or Vedantic philosophy into its final form, and popularized it into a national religion. He addressed himself to the high-caste philosophers on the one hand, and the low-caste multitude on the other. He left behind, as the twofold results of his life's work, a compact Brahman sect and a popular religion.

Weber (p. 51) doubts if he was a follower of Siva, but Sankara is the first great figure in almost every Hindu hagiology, or book of saints, from the Sarva Darsana Sangraha of Madhavacharya downwards; and some of the Saiva sects believe that he was an incarnation of Siva. He was undoubtedly monotheistical, and since his short life in the 8th or 9th century, every new Hindu sect has had to start with a personal God.

The literature relating to this reformer is contained in the Sankara Charitra, Sankara Kat'ha, Sankara Vijaya, and Sankara Dig Vijaya. The Sankara Vijaya was written by Ananda Giri, published in the Bibliotheca Indica, and critically examined by Kashinath Trimbak Telang in vol. v. of the Indian Antiquary. The Sankara Dig Vijaya is a polemic work by Ananda Bhima Deva. There are many Saiva sects in India who believe that Sankaracharya was their founder. He was the most renowned master of the school of Vedanta philosophy. He says—

'A drop that trembles on the lotus leaf,
Such is this life, so soon dispelled, so brief.
. . . . . .
The eight great mountains and the seven seas,
The sun, the gods who sit and rule over these,
Thou, I, the universe, must pass away,
Time conquers all: why care for what must pass away!'

The term Dandi means any one who bears a staff, but is applied especially to a numerous order of religious mendicants founded by Sankaracharya, many of whom have been eminent as writers on various subjects, especially on the Vedanta philosophy. They are divided into ten classes, Das-nami, each of which is distinguished by a peculiar name, as Tirtha, Asrama, Vana, Aranya, Saraswati, Puri, Bharati, Giri or Gir, Parvata, and Sagara, which is added to the proper name of the individual,—as Purushottama Gir, or Badendhra Saraswati. They are hence known collectively as the Das-nami, or ten-name Gosain. Of these, only the classes named Tirtha, Asrama, Saraswati, and part of Bharati, are now considered as pure Dandi; the others are of a more secular character, and are more usually termed Atit.—*Wils. Gloss.; Tr. of Hind.* i. p. 275; *Bunsen's God in History*, i. p. 332; *Dowson; Weber; Imp. Gaz.*

SANK'H or Sank'ha. SANSK. A pearl shell, any shell; a chank or conch shell, the war trumpet of Vishnu. The chanks are large species of Turbinella, from 6 to 7 inches long, and of a pure white colour. They are imported into Calcutta from Ramnad and South India, opposite to Ceylon, and from the Maldive Islands. Sankhadwara, a chank locality, is the island of Beyt, still renowned for its shells, and one bank uncovered at low water, whence they are obtained, is close to the landing-place. But the rin-sank'h or war-shell, with which the Rajput was wont to peal a blast, the onslaught to battle, no longer graces the hand of the Rajput, and its use is now restricted to the Brahman, wherewith 'to awake the gods in the morning!' to let the world know when he dines; or to form churi or bracelets for the arms of the Hindu fair. Chanks are made into trumpets, rings, beads, armlets, bracelets; and the Sankasari of Dacca are famed for their skill in the chank or sank'h work. The skill is remarkable with which the unyielding substance of a hard thick shell is converted into necklaces for men and into bracelets for women. The manufacture of shell bracelets is one of the indigenous arts of Bengal. At an early part of the 19th century, an entire street was occupied in the city of Dacca by Sankasari shell-cutters. In Colonel Tod's time, the banks at Beyt were farmed of the Gaekwar government by a Parsee merchant of Bombay, who contracted with the Kharwar, at the rate of twenty koree (from five to six rupees) per hundred, and loaded them for Bombay, whence they were shipped for Bengal. Frequent allusion is made in the martial poetry of the Rajput to the 'blast of the shell,' which is as common as the charge of the brazen trump of western chivalry. Pre-eminent mention is made in the Great War of two of these. The chank shells worked up into ornaments have latterly been obtained from Ceylon. The chank shell is frequently used by devotees, also as an accompaniment to the tumkee. Sometimes they play trios and quartettos on the shells alone.—*Tod's Tr.* 432.

SANKHYA, a Hindu system of philosophy, teaching the eternity of matter and spirit independent of God, and apparently the earliest of all the systems that preceded the really philosophic age of the Hindu schools. Its author is said to have been Kapila, who is now fabled to have been a son of Brahma, and an incarnation of Vishnu; he is numbered among the seven great saints, and many marvels are ascribed to him. While using Vedic notions, he in the main departed from Vedic theories, and in all important particulars comes to conclusions diametrically opposed to what the Vedas teach. The Sankhya system contains two grand divisions, which differ on the vital question of the existence of a God. One is termed the Seswara Sankhya, that which owns a God; the other is called Niriswara Sankhya, or that which denies the very existence of a God; the latter was Kapila's system, a system at that time entirely new. It taught that there were two primary agencies, nature or matter and souls, but that there was no Supreme Being. He asserts as follows: 'Souls have existed in multitudes from eternity; by their side stands nature or matter; for eternal ages the two remained separate; at length they became united, and the universe in all its forms was developed from their union.' The object of the Sankhya, as well as of the other branches of the Hindu philosophy, is the removal of human pain by the final and complete liberation of the individual soul. The Sankhya system has 25 principles, to which the soul must apply itself as objects of knowledge, and in respect to which true wisdom is to be acquired; they are—

1st. Nature, termed 'Pradhan' or chief, from being the universal material cause, the prime cause of all things.

2d. Intelligence, the first product of nature; increate, prolific, itself productive of others,

3d. Self-consciousness; its peculiar function is the recognition of the soul in its various states; it is the product of intelligence, and itself produces.

4th to 8th. Five principles, subtle particles or atoms of things. These are imperceptible to the gross senses of human beings, but may be known by superior intelligence. Then follow—

9th to 19th. The organs of sense and action, of which ten are external and one is internal. The organs of sense are five; the organs of action are five. The mind serves both for sense and action.

20th to 24th are five elements produced from the five subtle particles, viz.—

1. Ether; this has the property of audibleness, being the instrument of sound.
2. Air, which has two properties; it is audible, and it can also be touched.
3. Fire; this has three properties, — audibility, tangibility, and colour.
4. Water, possessed of four properties,—audibility, tangibility, colour, and taste.
5. Earth, possessed of five properties, — audibility, tangibility, colour, taste, and smell.

25th. The last principle is soul; like nature, it is not produced but is eternal; but unlike nature, it produces nothing from itself. It is multitudinous, individual, sensitive, eternal, immaterial.

The great error that lies at the root of the Sankhya system is, that the products of matter and mind are blended and confounded together. Its text-books are the Sankhya Pravachana and the Tattwa Samasa, both attributed to Kapila himself, and the Sankhya Karika to his disciple, Eswara Krishna. It consists of 68 aphorisms. Asuri and Pancha-shika are also mentioned as the earliest followers of this system.

The next Hindu system of philosophy is that attributed to Gautama, namely, the *Nyaya* system, which considers by means of subtle and logical argument, the true mode of inquiring after truth; and has surveyed the whole field of this argument more exactly and completely than any other of the Hindu systems. The first inquiry of this system is, What is the way to attain perfect beatitude? And the answer given is, 'That deliverance is only to be secured by a knowledge of the truth.' It then proceeds to examine what instruments are best adapted for the acquisition of that deliverance, and comes to the conclusion that they are four in number, namely, perception, inference, comparison, and testimony. It then minutely examines the various objects of knowledge which are required to be proved and known, which objects are 12 in number,—soul, body, sense, object, knowledge, the mind, activity, fault, transmigration, fruit, pain, and beatitude.

The *Vedanta* system thereafter made its appearance, in three stages of development. The germs of this philosophy, and even its principal doctrines, are contained in the Brahmana books of the Vedas; then it is seen in a more complete form in the Sutras of Vyasa; and lastly, this philosophy is recorded in the great commentaries which eminent scholars have written upon the original authorities. The voice of Hindu antiquity ascribes the origin of the Vedanta system to the sage Badarayan, otherwise named Veda Vyasa. The manner of his birth is thus described in one of the works ascribed to him:—

'Of birth and death, a multiplicity of souls is to be inferred.'

The fact of transmigration none of the Hindu philosophical systems dispute; it is allowed by all. As a man casts off his old garments, and puts on new ones, so that soul having left its old mortal frame, enters into another, which is new. One soul, and not another.

The *Yoga* system, called Seswara or theistic, founded by Patanjali, whose Yoga-Sutra is its text-book, and followed by the author of the Bhagavat Gita.

The *Puranic* school, a corrupt mixture of the two.

These philosophies are subjects of study for the learned of the Hindu people. Brahmanism is, at present, synonymous with Hinduism, and the Brahmanical religionists are of three classes,—the worshippers of Vishnu, of Siva, and the Sakta, or those who worship the female energies of gods. But their views seem to have been gradually brought to the present condition, and, as with the Hindu, is in some places a nature-worship, in others an idolatry, in others a hero-worship, in others a physiology or a philosophy, perhaps, in all, a spirit-worship. Bunsen says (iii. p. 516) the forms of worship followed by the Aryan immigrants, and the institution of castes, seem to have commenced after they crossed the Sutlej river, and the original seat of this worship extended from the Indus to the Ganges and to Bengal (Behar). He adds that Brahmans, after crossing the Sutlej, introduced Siva and other deities, and threw those of the Vedic period into the shade. According to Bunsen, it was about the year 3000 B.C. that the schism took place amongst the East and West Aryans, when all India east of the Sutlej adopted Brahmanism, and the religious views, forms, and habits of Bactria were for ever abandoned. According to Menu (the first book of which Bunsen thinks was composed but little antecedent to the Christian era), the world had passed through four yoga when Brahmanism was introduced; and the Brahmanism of the Sanskrit books is the mythico-pantheistic form of Vedic naturalism. Brahmanism is usually understood to be the later development and corruption of the ancient Vedic faith. Bunsen, however, expressed the opinion that the region of the Indus still retains the nature-worship of Vedism, while Southern India and the banks of the Ganges have long fallen into Brahmanism. But such is not the case; the worship of the bulk of the Aryan races is divided between the physiological views entertained by those who believe in Siva and the hero-worshipping followers of Vishnu. Brahmanism is accommodating to anything that partakes of idol-worship. Similarly as a Roman would worship Isis and Osiris, so a Hindu makes offerings to apotheosized Muhammadans, such as Shaikh Sadu, Ghazi Mian, and Shiak Madar in Northern India, and Bawa Adam in the Peninsula, the last of these being the lingam. Brahmanism is at present divided into several branches, each of which has many subdivisions; the three principal branches are —1st. Vedantism, so named after the Vedanta of Vyasa. It has few adherents, consisting of some philosophical Brahmans. Of the thousands of temples in India consecrated to various deities, only one is consecrated to this doctrine, in which Brahma is worshipped alone. 2d. Vishnuism. This doctrine raises Vishnu to the highest place, and adores his different avatars, together with a multitude of other deities, powers of nature, and mythical persons. Its professors are styled Vaishnava. 3d. Saivaism. This doctrine places Siva

highest in the rank of the gods. The professors of this doctrine call themselves Saiva, and their number amounts to many millions more than the professors of Vishnuism. Although Siva is the god of destruction, he is also the god of production, considered with respect to the idea, which ever pervades the philosophical doctrine, namely, that death is but the recommencement of a new life. — *Elph. Hist. of India ; Bunsen's Egypt's Place ; Tod's Rajasthan*, i. p. 26 ; *Tennent's Christianity in Ceylon*, p. 199 ; *Hind. Th.* ii. p. 13 ; *Cal. Review ; Garrett ; Dowson.*

SANKHYA, Safed. HIND. Arsenious acid ; S. bilauri, vitreous arsenic ; S. pili, yellow arsenic ; S. siya, impure bisulphide of arsenic ; S. surkh, bisulphide of arsenic. Sankhya karika, a book containing the system of the Sankhya philosophy taught by Kapila. It consists of sixty-eight aphorisms.

SANKISA or Kapitha, an old city in the Gangetic Doab, near the town of Kanouj. It is in the Etah district, N.W. Provinces, and has been identified by General Cunningham with the capital of a considerable kingdom in the 5th century B.C. It was visited by Fa Hian about A.D. 415, and by Hiwen Thsang in A.D. 636, when it was still a celebrated place of Buddhist pilgrimage, being the spot where Buddha descended again upon earth by three staircases of gold, silver, and crystal, after a residence of three months in the Triyastrinshas heaven, preaching the law to his mother Maya. King Asoka afterwards erected a pillar to commemorate the event, but no remains of it can now with certainty be discovered.— *Imp. Gaz.*

SANKRANTI. The winter solstice, the sun's entry into Capricorn, is called the Maha-sankranti or great Sankranti, and at this season, in the south of India, the Pongal festival is held. The Makar Sankranti festival is held about the 12th January, on the occasion of the sun entering the tropic of Capricorn or Makar. On this day the Hindu people bathe, and anoint the body with sesamum oil, listen to the prayers of Brahmans, to whom they give presents. The prayers on this day are only to the sun. They have friends to dinner at night, and put on new clothes.—*Wils. Glos.*

SANORIA, a predatory tribe in Bundelkhand.

SANPAKAVA DIVI, a poetess, daughter of one of the maid-servants of Karikal Chola. She was very beautiful, and had many admirers.

SAN-PU, or Ya-ru-tsang-po-chu, is the great river of Southern Tibet, and is supposed to be the Brahmaputra river, and to take its rise on the north face of the Himalaya, in lat. 30° 25′ N., and long. 82° 5′ E. Winding its way through Tibet, and washing the borders of the territory of Lhassa, it then turns suddenly south, and falls into the Brahmaputra, under the name of Dihang. A native, G—m—n, sent by Lieutenant Harman to Tibet to trace the San-pu to the eastward, returned after having followed the river to a point where its course turned southward nearly north of the spot where the Dihang emerges from the mountains into the Assam valley. All therefore tends so far to support the view that the San-pu and Dihang are identical. At the same time the question cannot be considered settled until the two rivers are actually traced into connection with each other. If the San-pu be the Dihang branch of the Brahmaputra, then it has a fall of about 7000 feet in about 160 miles, or 40 feet per mile, which is not a very great fall for Himalayan rivers. The explorer was told that the river, after flowing through the Gimuchen country, entered a land ruled by the British. The Dihang river has at its mouths a discharge, at minimum level of the year, of 55,000 cubic feet per second, or four times that of the Subansiri river, and twice that of the Brahmakund branch of the Brahmaputra river. The wild Abor, who live in the Dihang valley, trade with Assam and Tibet ; the more wealthy among them wear Tibetan woollens. They say their river comes from the far north-west ; and survey operations in Assam have shown there is a great gap in the snowy ranges through which the Dihang passes, and that thereabouts (to N.W. of the mouth of the Dihang) is much low-lying country. G—m—n states that from Gyatsa Jong to Gyala Sindong the river is of very variable width, and is in places very narrow ; at Gyala Sindong it is but 150 paces wide, though deep and with moderate current. One of Major Montgomery's pandits passed round Mount Everest northwards to the San-pu river, and thence south-west over the Dingri Maidain, the broadest plateau on the south of the Himalayan watershed that is drained by streams flowing direct into India. Besides determining the position of many peaks invisible from India, he threw light on the geography of the basin to the Arnu, the largest feeder of the Kosi, which drains the whole of Eastern Nepal.

SANSEE or Sansi, a thieving race of the Panjab. In 1863 efforts were made to reform them by inducing them to undertake agriculture.

SANSEVIERA ZEYLANICA. *Thunb.*

Marool, Murle, . . HIND.	Dant saga, . . . HIND.
Moorva, Munga, . ,,	Chaga laga, . . . SINGH.
Moorghabi, . . . ,,	

This plant grows along all the coasts of Southern Asia ; has smooth, oblong-acute, flat, and linear-lanceolate, channelled glaucous leaves. It resembles the agave in some of its characters, but produces finer fibres, which are easily separated from the pulp, and have been long known as a useful material for cordage, being soft, silky, and pliant when well prepared ; about equal to the agave fibre in point of strength ; but as it is a finer material, it might be applied to a better description of manufactures. The plant is easily propagated, and yields a good crop under cultivation. It was tried against Russian hemp on board the *Thalia* East Indiaman, when commanded by Captain Biden, and was highly approved of. It has also been made into fine cloth, thread, twine, rope ; and cords are made from this fibre. The zonar, the sacred thread of the Hindu, was ordered by Menu to be made of the fibre, and the fine cord on which modern Hindus string their neck-ornaments is made of it. The fibres are commonly used to make bowstrings, and the plaited leaves form an excellent soft mat. The root is in a slight degree warm to the taste, is not of an unpleasant odour, and is prescribed by the native practitioners, in the form of electuary, in consumptive cases, and coughs of long standing. The juice of the tender shoots of the plant is given to young children for the purpose of clearing their throats of viscid phlegm.—*Roxb. ; Voigt ; Eng. Cyc. ; M. E. J. R. ; Ains.* p. 88 ; *Royle.*

SAN-SHE-JOO-LAE, the Tatha-gatha of the three Ayes, is the Buddhist trinity of China.

SANSIO. Jap. A middle-sized tree of Japan, with prickles. They make use of its bark and husks instead of pepper or ginger, and they eat the pleasant-tasting aromatic leaves.—*Amæn. Ex.* p. 892; *Thunberg's Japan*, i. p. 115.

SANSKARA. Sansk. In Hinduism, essential rites, social and domestic, of which the Hindu religion has about 40, but the more important are as under:—

1. Garbhadhana, worship on a woman's evincing signs of pregnancy; sometimes on attaining maturity.
2. Punsavana, worship on quickening, to obtain a male child. The Mahrattas perform this.
3. Anavalobhana, to obviate miscarriage.
4. Simantonnayana, parting the hair of the head of a pregnant woman, on the 4th, 6th, or 8th month.
5. Vishnubali, amongst the Mahrattas a sacrifice to Vishnu, on the 7th month.
6. Jata karma, ceremonies at birth, amongst others putting of ghi into the child's mouth with a golden spoon, before cutting the navel-string.
7. Nama-karanam, naming the child on the 10th, 11th, 12th, or 101st day after birth.
8. Nishkramanam, taking the child out of the house when three months old to see the moon in the third light fortnight.
9. Suryanilokanam, showing the sun to the child when four months old.
10. Annaprasana, feeding the child with its first rice, on 6th or 8th month.
11. Karnavedha, boring the ears.
12. Chudu or Chula karanam, on the 1st or 3d year and not later than the 5th year, shaving all the head save one lock, called the Chuda or crest.
13. Upanayana, investiture with the sacrificial thread, which falls from the left shoulder to the right hip; for a Brahman on the 8th to the 16th year; for a Kshatriya on the 11th and not later than the 22d year; and for a Vaisya on the 12th and not later than the 24th. This constitutes the Dwija or second birth of these three races.
14. Savitri maha namya, at the time of or four days after the Upanayana, when the Gayatri is taught and repeated.
15. Samavarrttana, the ceremony on the student's completion of his studies and return home.
16. Vivaha, marriage.
17. Swargarohana, ascending to heaven; funeral ceremonies.

Of these, the 3d, 9th, 11th, 14th, and 15th are either local or modifications of others, and 17 is not a purification ceremony; and if these and others be excluded, the number is reduced to 10. Women have also the Sanskara of marriage.—*Wils. Glos.; As. Res.* xvii. p. 309; *Ward's Hindoos*, iii. p. 71; *Barth*, p. 51.

SANSKRIT, according to Professor Muller, is not the mother of Greek and Latin, as Latin is of French and Italian; but Sanskrit, Greek, and Latin are sister tongues, varieties of one and the same type, though Sanskrit is the older sister. It was Mr. Colebrooke's opinion that Sanskrit drew its origin from a primeval tongue, which was gradually refined in different climates, and became Sanskrit in India, Pehlavi in Persia, and Greek on the shores of the Mediterranean. The discovery and the study of Sanskrit have revealed to us the origin and the roots of the classical languages, and have enabled us to seize the relations existing between the idioms now designated by the name of Indo-Germanic or Indo-European. All the most readable Sanskrit Hindu works, the drama, the lyric, the sentimental and philosophical Kavya, as Nala and the Bhagavat Gita, the romantic histories and historical romances, the fables, Hitopadesa, Vetala, Panchavinsati, and so forth, and most of the works on science, are supposed to belong to the first ten centuries of the Christian era. It had ceased to be a spoken language at least 300 B.C. At that time the people of India spoke dialects standing to the ancient Vedic Sanskrit in the relation of Italiau to Latin. Of these dialects there were more than one in various parts of India, from the inscriptions which the famous king Asoka had engraved on the rocks of Dhauli, Girnar, and Kapurdigiri, and which have been deciphered by Prinsep, Norris, Wilson, and Burnouf. We can watch the further growth of these local dialects in the Pali, the sacred language of Buddhism in Ceylon, and once the popular language of the country where Buddhism took its origin, the modern Behar, the ancient Magadha. We meet the same local dialects again in what are called the Prakrit idioms, used in the later plays, in the sacred literature of the Jaina, and in a few poetical compositions; and we see at last how, through a mixture with the languages of the various conquerors of India,—Arabic, Persian, Mongolic, and Turki,—and through a concomitant corruption of their grammatical system, they were changed into the modern Hindi, Hindustani, Mahrati, and Bengali. During all this time, however, Sanskrit continued as the literary language of the Brahmans. Like Latin, it did not die in giving birth to its numerous offspring; and even up to the middle of the 19th century it has been said that an educated Brahman would write with greater fluency in Sanskrit than in Bengali. But this must be accepted with grave doubts. Sanskrit was what Greek was at Alexandria, what Latin was during the middle ages. It was the classical, and at the same time the sacred, language of the Brahmans, and in it were written their sacred hymns, the Vedas, and the later works, such as the laws of Menu and the Puranas. Sanskrit and its congeners are inflectional languages, after the manner of the languages of Europe; while the Turki, Mongol, Tangus, and Ugrian in the north and west, and the Tamil in the south, are agglutinate tongues. The Tibetan, Burmese, and all the Nepalese dialects are monosyllabic tongues. The Sanskrit differs from the Tamil of the south, and much more so from the Tibetan, Nepalese, and Burmese on its north and west. It has no relations with the Arabic. Armenian and Persian are modern dialects of sister languages to Sanskrit.

Inscriptions in the Aryan and Lat characters are engraved on the rocks at Kapurdigiri in Afghanistan, and at Cuttack, at Dehli on a pillar, also on pillars at Allahabad, Betiah, Muttiah, and Radhya. Later inquirers have agreed upon the contrasted terms of Aryan Pali, *i.e.* Bactrian, and Indo-Pali, *i.e.* the Asoka, Lat, and rock inscriptions, or the home-created writing of the Indian continent, before Semites or Sanskrit Brahmans entered Iudia. Though the Sanskrit and Pali languages have ceased to be spoken in any part of India, both of them are in use as the sacred languages of the Brahmanical Hindus aud the Buddhists.

Of European tongues, the nearest congeners to the Sanskrit are the Sarmatian languages of the Russian empire, then the classical tongues of Rome and Greece, then those of Germany and

the Keltic, this class of languages being called the Indo-Germanic. Of the Sclavonic and Lithuanian, the two branches of the Sarmatian, the affinities of the Sanskrit are closer with the Lithuanian than with any other known tongue. Sanskrit, next to Lithuanian, is most like the Sclavonic. It will thus be observed that the Aryan or Sanskrit-speaking races of India seem to have been closely connected with the Zend-speaking, Greek-speaking, Latin-speaking, German-speaking, and Sclavonic-speaking races, and not at all with the Arabic, Phœnician, and Hebrew families.

Sanskrit philosophy has been greatly advanced by eminent writers of Europe, — Colebrooke, Wilson, Max Muller, Burnouf, the two Schlegels, W. von Humboldt, Bopp, Lassen, Sir Charles Wilkins, James Prinsep, Dr. Mill, Mr. Norris, Professor Dowson, Edward Thomas, Dr. J. Muir, Mr. Bayley, Bhau Daji, Babu Rajendra Lal Mittra, Dr. Burnell, General Cunningham, Barth, Williams, and Weber.

The Sanskrit language is flexible, ductile, polished, expressive, and copious. Its vast literature embraces law, philosophy, and logic, and boasts of old poems which reveal much that is curious in the adventures of hermits, princesses, warriors, and kings, as well as of dramas remarkable for originality and skill of plot and delicacy of poetic sentiment. But even in the works of the greatest of Indian poets there are occasional fanciful conceits, combined with a too studied and artificial elaboration of diction, and a constant tendency to what a European would consider an almost puerile love of alliteration and playing upon words.

SANSTHANA. Sansk. Corruptly Sanvasthan. A monastery, a place where a Hindu deity is said to have become manifest; a place sanctified by the residence of eminent Hindu teachers or holy men; the site of any sacred event.

SANTALACEÆ. Eight genera of Indian trees are recognised to belong to this order,—Henslowia, Osyris, Pyrularia, Santalum, Scleropyrum Wallichianum, *Arn.*, Sphærocarya edulis, *Wall.*, Octarillum, and Thesium. They are trees, shrubs, or herbaceous plants, with round or irregularly-angled branches. Found in Europe and North America. In Australia, the East Indies, and the South Sea Islands they exist as large shrubs or small trees. The most valuable genus in this order is its type the Santalum, of which the species S. album forms the true sandal-wood of commerce.

SANTAL PARGANAS form a British district in Bengal, lying between lat. 23° 48′ and 25° 19′ N., and between long. 86° 30′ and 87° 58′ E. Area, 5488 square miles; population, according to the census of 1872, 1,259,287 souls. In the east a belt of hills stretches for about 100 miles from the Ganges to the Nanbil river. West of this is a rolling tract of long ridges with intervening depressions, covering an area of about 2500 square miles. The third type is exemplified by a narrow, almost continuous, strip of flat alluvial land about 170 miles in length, lying for the most part along the loopline of the East Indian Railway. The Ganges forms the northern and a large part of the eastern boundary of the Santal Parganas, and all the rivers of the district eventually flow either into it or into the Bhagirathi. The Santal people have been known to the British since the latter part of the 18th century. In 1832 two Government officials were deputed to demarcate with solid masonry pillars the present area of the Daman-i-Koh or skirt of the hills. The permission to Santals to settle in the valleys and on the lower slopes of the Daman stimulated Santal immigration to an enormous extent. Since the beginning of the 19th century they have intruded themselves into some of the Rajmahal districts, which therefore now contain two populations, allied to each other, but speaking languages said to be mutually unintelligible. And, in 1855–56, in attempting to revenge themselves on the Hindu money-lenders, who had taken advantage of their simplicity and improvidence, the Santals rose in arms. The insurrection was not repressed without bloodshed,—indeed, half their numbers perished; but it led to the establishment of a form of administration congenial to the Santal immigrants; and a land settlement has recently been carried out on conditions favourable to the occupants of the soil.

The Goalas, cowherds and milkmen (of whom there are 74,529), form by far the most numerous caste in the Santal Parganas; the artisan castes number altogether 83,722 persons, of whom 27,954 are Telis (oilmen). The total number of persons belonging to aboriginal tribes is 557,277, of whom the great majority (455,513) consist of Santals. The Paharias number 68,336. The other principal aboriginal tribes represented in the district are Naiyas (9179), Kols (8894), and Mals (8820). The total number of Santals throughout the whole of the Bengal Provinces is returned in the census report of 1881 at 210,661, of whom 203,264 are found in the districts of Bengal. Manbhum comes next with 132,445; Midnapur has 96,921; the Native States of Orissa, 76,548; Singbhum, 51,132; Hazaribagh, 35,306. The Santals form 3 per cent., or more than one-third of the total number of the aboriginal races under the Lieutenant-Governor of Bengal, and are the best known to Europeans.

The Santal, Mundah, Bhumij, and Ho races speak languages nearly identical. The Santal are a simple, industrious people, honest and truthful, tractable, free from caste prejudices, and are much sought after and prized as labourers by the Bengal indigo planters, and on the railways and other works of Western Bengal, and in the Assam tea plantations. The Santal are a branch of the Mundah Kol. They seem to have separated when the Mundah fell back on Chutia Nagpur from the Damuda river, which the Santal call their sea, and they preserve the ashes of their dead until an opportunity occurs of throwing them into that stream or burying them on its banks. Lieutenant-Colonel Dalton thinks that they left their chief settlements on the Damuda river from having been pressed by the Kurmi. The Santal, Bhumij, and Mundáh tribes have long been known to be intimately connected, and they have affinities with the wild clan of the Korewah of Sirguja and Jushpur, the Kheriah tribe of Chutia Nagpur, and the Juanga of the Cuttack tributary mahals.

The Santal and Bhumij races have suffered in esteem in consequence of the human sacrifices offered, up to 1835, at the shrine of Kali, as Runkini; but these races personally do not much care for this goddess, at whose shrine the establishment and ritual are essentially Brahmanical. The

Santal and Paharia or Rajmahali are markedly different in habits, appearance, manners, and national characteristics, and on the Chutia Nagpur plateau these differences are very marked. The Santal are a very ugly race, with flat, broad-nosed features. They are a more simple, mild, and industrious race than the Rajmahali, Gond, or Khond, are truthful and kind-hearted.

In 1881 they again became uneasy, the cause having a religious mixed with a political element. The movement is said to have been started in 1875 by one Bhagrit Mangi, who gave out that he was commissioned by heaven to deliver the Santals from British rule. He acquired great influence, his orders were implicitly obeyed, and he himself received both royal and divine honours, being crowned as king of the Santals, and having a shrine set up for his worship. Eventually he was convicted and imprisoned, and his shrine demolished, but his religion continued to spread, being preached throughout the country by his disciples, the Kherwar. The most influential of these, Dhubia Gosain Babagi, was arrested, and sent to Lucknow as a state prisoner about 1881. The Kherwar stirred up an agitation against the 1881 census, using it for their own purposes, and spreading wild tales as to the intentions of the Government, which were readily believed by the credulous Santal. The Santal believes in Chandabunga, to whom, once in three or five years, he sacrifices a goat on a Sunday. They have four gods of the woods (Dryads), called Jaihirira, Monikoh, Marungburu, and Gosaira, represented by four stones buried in a clump of trees called the Jairthan, and no Santal village can be settled till the Jairthan is established. Manjiharam, a deity in the shape of a stone, is buried in the centre of the village in a small open shed called Buddhathan, for Manjiharam is also called Buddah Manji, a Manji and Santal being synonymous. The panchayets of the Santal assemble here. In the mouths of April and May, when the leaves are bare, 2000 to 4000 Santals assemble with bows and arrows, for their great Seudra or hunting expedition, during which they make wide circles to enclose and kill all the smaller game. They eat the flesh of every animal. Their most solemn oath is taken when touching a tiger's skin. They dance in bodies of one or two hundred to the monotonous music of flutes and drums. The men go round one way, while the women circle the other. The men step in time without much action, but the women drop their heels and toes in a double shuffle, and bend their bodies forward to a half-kneeling position, as though paying homage to the men. The houses of the Santal are in enclosures made with the green boughs of the Sakua, planted in the ground and tied together; they keep each family distinct from its neighbours.—*Dalton*, p. 154; *Campbell*, p. 33; *Travels of a Hindoo; Lubbock, Or. of Civil.*

SANTALUM ALBUM. *Linn.* A small evergreen tree rising to 30 feet in height and 4 feet in girth. It grows in a wavy tract from S. Canara southwards into Mysore and Coimbatore; is most abundant almost throughout the dry Denkenacotta taluk of Salem, less abundant on other hill tracts in the Salem, Trichinopoly, and N. Arcot districts, such as the Shevaroys, Kollay Mallays, Putche Mallays, Javadies, etc., and on the Pulneys in Madura. In these places it is found up to about 4000 feet elevation. It also thrives well in North Canara; freely without any cultivation in all parts of the Bombay Dekhan; may be seen there in quantities in waste gardens, even in some of the grass preserves, and in numbers of the hedges along the water-courses in Western Kandesh. But the Northern Bombay sandal-wood has not the high qualities of that found in the more southern provinces.

The Madras Forest Department have now large plantations of this valuable tree. It grows readily from seed if slightly shaded. Two or three seeds are sown in the pit where the tree is to stand, and at the same time a few chili seeds round them; the latter grow up before the sandal seedlings, and give them the necessary amount of shade whilst young; eventually the strongest of the two or three seedlings only is left in the pit, the others being removed.

It is only the heart-wood that is scented and of any value, and trees grown slowly on rocky and dry poor soil produce the maximum of this; where the tree is found in rich alluvial soil on the banks of rivers, etc., it is of very fine growth, but produces no heart-wood, and is consequently valueless. The heart-wood is yellow, and deliciously fragrant; when unseasoned it weighs 72·75 lbs., and when seasoned 58 lbs., and its specific gravity is ·924. It finds an immediate sale at Rs. 4 or 4.8 per maund of 28 lbs., and it is chiefly employed for making all sorts of ornamental articles, such as small tables, work-boxes, glove-boxes, card-cases, etc. A valuable oil, used as a perfume, is distilled from the roots and chips or pieces of the heart-wood. The heart-wood of the tree yields the oil, and one pound of the wood will yield about two drachms. In North Canara there are many stills for making sandal-wood oil. The wood is burned as a perfume in houses and temples, both in India and China; is used in the funeral ceremonies of the Hindus; is employed for trunks, almirahs, etc., as a preservative against insects; is much used in making work-boxes, walking-sticks, pen-holders, and other small articles of fine ornament. Its powder is a favourite cosmetic with Hindu, Chinese, and Burmese ladies, and Hindus use it to form the sectarian marks on their foreheads. It is much used among the Chinese in cabinet-work, and in the manufacture of fans and other ornamental articles.

In Mysore, foresters are employed to destroy the strong creepers which tend to choke the young plants, springing from seed dropped in hedgerows by birds. It is their duty also to cut, annually, all the ripe trees, 20 years old, and to take care that the billets are properly prepared and sorted, and brought into the sandal godown.

Sandal-wood is very liable to the heart-shake, which decreases its value 20 to 30 per cent. It bears a small black berry, which, if planted, grows without any trouble. The seeds of the sandal-wood tree yield by expression a thick and viscid oil, which is burned by the poorer classes in lamps. The attractive nature of the sandal tree is described in the Sanskrit sloka, 'Round the stem of the Chandana dwell serpents; on its top birds; on its branches monkeys; on its flowers bees,—so the riches of a good man are beneficial to all.'—*Roxb.; Bennett, Gatherings; Gibson; Cleghorn;*

M'Gillivray; Wight; Mason; M. E. J. R.; Wilson, Hindu Theatre; Beddome.

SANTALUM CYGNORUM, *Miquel*, of S.W. Australia, yields scented sandal-wood. S. Preissianum, *Miquel*, of the desert country in extra-tropical Australia, yields the Quandong or edible native peach. S. yasi, *Simmonds*, of Fiji, yields scented sandal-wood.

SANTALUM FREYCENETIANUM, *Gaudi.*, grows up to 3000 feet elevation in the Sandwich Islands. The sandal-wood of the Sandwich Islands is from S. Freycenetianum and S. paniculatum, and the name of sandal-wood is also given to the wood of the Exocarpus latifolia, which grows in the Percy Islands, Repulse Bay, Cape Upstart, Palm Islands, etc. etc.; but it is useless as a substitute. These grow in the South Sea Islands, at Hawai, Fiji, and New Hebrides, but have been nearly extirpated by the avidity of traders.—*Bennett's Gatherings*, p. 419.

SANTALUM MYRTIFOLIUM, *Roxb.*, is a strongly-marked variety of S. album, found by Dr. Roxburgh in the mountains of the Rajamundry Circar. It is distinguished by its opposite lanecolate leaves. The wood is of little value, according to Dr. Roxburgh; but Dr. Wallich says it is 'certe odoratissimum.'—*Roxb.; Wall.; O'Sh.*

SANTANU, a king of the Lunar race, 13th in descent from Kuru, who gives the designation of Kaurava to Duryodhana and his brothers. Santanu had four sons,—Bhishma, Chitrangada, Vichitravirya, and Vyasa. The first never married, the second two had no children, but Vyasa begat a child from each of their widows, the children's names being Dhritarashtra and Pandu.—*Garrett.*

SANTAPILLAY ROCKS, on which is a lighthouse, in lat. 18° 4′ N., and long. 83° 39′ 30″ E., 13 miles N.E. from Bimlipatam, form one of the most dangerous shoals in the Indian Seas. They are under water 10 feet, 5 or 6 miles off the coast.—*Findlay.*

SANT'HA, a small tribe occupying a dozen villages on and skirting the Mainpat, a lofty tableland in Sirguja, and found also amongst the inhabitants of the villages. They do not number more than 100 families, but they consider themselves a separate tribe.

SANTI-NATHA, the 16th Tirthankara of the Jains.

SANTIPUR, the most populous town in Nadiya district, Bengal; situated on the river Hoogly, in lat. 23° 14′ 24″ N., and long. 88° 29′ 6″ E. The Ras-jatra festival in honour of Krishna, is celebrated at Santipur on the day of the full moon in Kartik (October — November). The fair is visited by about 25,000 or 26,000 persons. In the Santipur women are observed that light female form, that slender and delicate make, that graceful shape and elegance of proportions, and that smooth, soft body, which constitute the native beauty of Bengal.—*Tr. of Hind.* i. p. 22.

SANWAK, a class of hereditary slaves; in Chutia Nagpur the Banda Sanwak is a slave for life, but whose children are not slaves, and the Chuta Sanwak is described as a slave for debt. Also in Chutia Rangpur, Ramgurh, and Hazaribagh, there are Sanwak life-slaves, generally from the hill tribes. In Oudh, on a petty loan of Rs. 10 or 20, the Halwaha ploughman binds himself and his heirs to his security until principal and interest has been paid to the last cowrie, often 24 or 37½ per cent. per annum. In the Trans-Gogra districts, ploughmen receive loans, the interest of which they repay in labour, receiving one-sixth of the grain, called bhata, which he helps to rear, and a blanket. His wife is also employed in grinding grain, husking rice, and feeding animals, etc., and receives the huskings, bran, etc., and a dhoti. Under British rule, the son is only responsible for the father to the extent inherited.

SANYAL PEN or Sanalk, the spirits of the departed, amongst the Gond, worshipped or propitiated for a year after death; but persons of note, headmen of villages or priests, are treated as gods for years or generations, and sacrifices are usually offered at their Sthapana or shrines of earth.

SANYASI. Amongst the rules prescribed for Hindu men, those of the Brahman, the Kshatriya, and the Vaisya have to pass through four stages (asrama) in life, viz. the Brahmachari or religious student, the Grihashta or householder, the Vanaprastha or hermit, and the Bhikshuka or Sanyasi, religious mendicant, who has renounced the world; but this term is now applied to a variety of religious mendicants, some of whom wander singly about the country, subsisting on alms, or collected in maths under a spiritual head. The Sanyasi is most usually a worshipper of Siva. The Sanyasi is a professed ascetic, but some of them marry, an instance of which, in 1868, was the Sanyasi family at the temple of Mahadeo at Rainapur, near Mominabad. Amongst the Vaishnava, the terms Sanyasi and Vairagi are in a great measure restricted to peculiar classes; but amongst the Saiva, all the sects, except the San-yogi Atit, are so far excluded from the world as not to admit of married teachers,—a circumstance not uncommon amongst the more strict followers of Vishnu. In general, the Brahmachari or student, and the Avadhuta or Avdhauta and Alakhnami, express all the Saiva class of mendicants, except perhaps Jogi. The Brahmachari or students are also regarded as Sanyasi; and where the term is used in a definite sense, the twelve classes, viz. the Dandi, Brahmachari, and ten Das-nami orders, are implied. Thus Sanyasi and Vairagi are terms applied generally to all the erratic mendicants of the Hindus of all religious orders. The terms signify a man who has abandoned the world or overcome his passions. Occasionally, however, the people distinguish between a Sanyasi and a Viragi, in which case the term Sanyasi implies the mendicant followers of Siva, and Viragi those of Vishnu. The distinction thus made requires a peculiar exception, for besides the indiscriminate application of the term Sanyasi to the Vaishnava as well as other mendicants, there is a peculiar class of them to whom it really pertains, these are the Tridandi or Tridandi Sanyasi. These are such members of the Ramanuja or Sri Vaishnava sect as have passed through the two first states of the Brahmanical order, and entered that of the Sanyasi or the ascetic life. Their practices are in some other respects peculiar; they never touch metals nor fire, and subsist upon food obtained as alms from the family of Brahmans of the Sri Vaishnava faith alone. They are of a less erratic disposition than most other mendicants, and are rarely met with in Upper India, but are found in considerable numbers, and of high character, in

the south. In their general practices, their religious worship and philosophical tenets, they conform to the institutes and doctrines of Ramanuja. The Asiatic Researches (v. p. 49) mention a Sanyasi at Benares who had, for 35 years, slept on a bed of iron spikes.—*Wilson, Hindu Sects.*

SANYOGI, a married mendicant, Byragi or Sanyasi.

SAPAN-WOOD, Cæsalpinia sapan.

Lolan, . . . Amboyn.	Samya, Roro, Moluccas.
Su-fang-mu, Su-muh, Ch.	Patonga, ... Sansk.
Puttung, Bukkum, Hind.	Sibukas, . . . Tagala.
Sachang, ... Jav.	Isiapungum, . . Tam.
Sapan, . . . Malay.	Vattanghy, . . . ,,

The product of Cæsalpinia sapan, a thorny tree indigenous to Siam, Pegu, the Philippine Islands, Tenasserim, Bengal, throughout the Archipelago, in the south of India, in Tanjore, Travancore, Goa, and Cuddapah, and abundant in the Western, Southern, and Central Provinces of Ceylon. It is fit for cutting when about five years old, at which time it attains a height of 10 or 12 feet. The valley of the Tenasserim, between the latitudes of Tavoy city and the mouth of the Tavoy river, and the hills that border the valley on the eastern side, abound in sapan-wood. The tree has a wide range, the Karens say, on the Meinam side of the mountain in Siam, and is abundant in the island of Sumbawa, and in the provinces of Ilolo in Panay, and Pangasinan in the great island of Luzon. In Siam it sells at 5s. 6d. per 133⅓ lbs.; in the Philippine Islands at 9s. 5d. per 133⅓ lbs. Sapan-wood is the logwood of the Archipelago, whence it was formerly exported in large quantities to Europe and America. A red dye is made from an aqueous extract of the chips, but it is not reported to be a fast colour, and is principally used for common and cheap cloths. It is precipitated dark brown with iron, and red with alum. The wood contains much gallic and tannic acids, and is a substitute for logwood, though weaker.—*Faulkner; Simmonds' Dict.; Tredgold; M. E. of* 1855; *Mason; Crawfurd.*

SAPEC, in Japan a cash, about the 5200th of a dollar. A Tartar money of account, equal to about 5d. sterling.

SAP-GREEN. Luh-kiau, Luh-kau, Chin. This beautiful and permanent dye-stuff is made in Europe from the Rhamnus catharticus, the common buckthorn, by the action of lime. That of China is the product, in great part, of the Rhamnus infectorius. It is made in Shan-tung, Hu-peh, Che-kiang. That of Hankow is expensive, and is sold in the form of thin, dry, bluish scales, which when rubbed up produce a bluish-green pigment, used to colour shark skin for covering spectacle cases. It has the purgative properties of the buckthorn in the crude state, and makes excellent marking-ink when mixed with lunar caustic. Lime is present in the sap-green of China, as it is added to neutralize the acetic acid which is apt to form in this as well as in the syrup of buckthorn.—*Smith.*

SAP'HARA, a palanquin carried on the shoulders of Nambi Brahmans.—*Taylor.*

SAPI. Malay. A wild breed of the genus Bos. The Sapi has much the general appearance of the Bali cattle, but has not the white patch on the buttock; the horns are small, curved inward, white tipped with black; the forehead is flat, with a tuft of long hair on it, particularly on the bulls; the back is curved, the highest point being about the centre; the spines of the vertebra are usually long. The total height of an animal killed, from foot to spines of dorsal vertebra, was 6 feet 2 inches; the hair was smooth and silky, of a brown colour, except on the feet, which were of a dirty white; a mane about 2 inches long runs the whole length of the spine. There is no dewlap. The fibre of the flesh is fine, well mixed with fat, a most delicious meat for flavour, tenderness, and juiciness that ever could be tasted. The other species of wild cattle is the Saladang. A Malay guide, Inchi Basow, stated that the meat was coarser than the buffalo, and not good eating, but that the animal was much larger than the Sapi, some of the bulls growing to seven 'asta or cubits.' This is the doubtful height of 10½ feet.—*Journ. Ind. Archip.*, 1850, p. 355.

SAPINDACEÆ. *Juss.* The soap tribe of plants or soap-worts; trees or shrubs with erect or climbing stems. The order is divided into four tribes, viz. Sapindeæ, Acerineæ, Dodonæeæ, and Staphyleæ. The chief plants of the East Indies genera and species may be thus shown:—

Cardiospermum halicacabum, *L.*, all India.
C. canescens, *Wall.*, Burma.
Sioja sanguinaria, *Buch.*, Goalpara, Sylhet, Ava.
Schmidelia serrata, *D.C.*, Peninsula of India, Bengal.
S. aporetica, *Roxb.*, Sylhet.
S. glabra, *Roxb.*, Chittagong.
S. villosa, *Wight*, Chittagong.
S. dentata, *Wall.*, Assam.
S. cobbe, *Bedd.*, S. India.
Sapindus sapinaria, *L.*, West Indies.
S. laurifolius, *Vahl.*, Peninsula of India.
S. emarginatus, *Vahl.*, Peninsula of India.
S. detergens, *Roxb.*, Bengal.
S. rubiginosus, *Roxb.*, both Peninsulas of India.
S. polyphyllus, *Roxb.*, Pegu.
S. undulatus, *Wall.*, —?
S. acuminatus, *Wall.*, Nepal, Himalayan valleys.
S. fruticosus, *Roxb.*, Moluccas.
S. danura, *Roxb.*, Sunderbuns.
S. angustifolius, *Wall.*, Khassya.
S. attenuatus, *Wall.*, Assam.
Cupania canescens, *Pers.*, Circars, Kandalla.
C. lævis, *Pers.*, Bourbon, Mauritius.

Staphylea emodi, *Wall.*, N.W. Himalaya.

The leechee and the longan are produeed by the genus Nephelium. These fruits are sweet, with a sub-acid flavour; they are considered a great luxury in China, and are sent at a great expense from the provinees of Foh-kien and Kwang-tung, where they grow, to Pekin, for the consumption of the emperor. Sapindus is remarkable for bearing a pulpy fruit, the outer part of which has been used, on account of its detergent properties, as a soap. In China, the seeds of a Sapindus, besides their value in cleansing, are worn as beads, 'because,' say the Buddhists, 'all demons are afraid of the wood;' one Chinese name means preventive of evil. The leechee succeeds well in most parts of India. N. longan and N. lappaceum, the Rambutan of the Malayan Archipelago, yield edible fruits, as well as N. rimosum and N. rubrum, both inhabitants of the Sylhet district. So are those of Melicocca trijuga, called even in the distant parts of India where this tree is indigenous, kusoombha and kusum, and where, as in the Doon in April, it may be readily recognised at a distance by the red colour of its young leaves. All its parts of fructification are liable to considerable variation. The pulpy sub-acid aril forms a grateful fruit; the wood is hard, and used as timber. Schmidelia serrata, of which the root is said to be astringent, yields also an edible fruit. The wood of several species is close-grained and hard, and forms valuable timber, as of Sapindus rubiginosus, and of the longan and N. lichi, the latter also one of the most ornamental of trees.—*Royle; Roxb.; Voigt; Eng. Cyc.; Williams' Midd. Kingd.* p. 286.

SAPINDANA in Hinduism is an ancestral srad'ha performed at the expiration of twelve months after the death of a person, who then becomes included in the race of ancestors. Hence relations connected by offerings of cakes to common ancestors are called Sapinda. All who are Sapinda to the same deceased are Sapinda to eaeh other, by offerings of the Pinda or funeral cake.—*Garrett.*

SAPINDUS, a genus of plants of the natural order Sapindaceæ,—names derived from 'Sapo Indicus or Indian soap,—the berries of several of the species, the S. saponaria in Java, S. rarak in India, S. acuminatus, S. laurifolius, S. emarginatus, and S. detergens (the last, according to Dr. Roxburgh, nearly allied to S. saponaria), being all used for the purposes of soap; owing, it is now ascertained, to the presence of the vegetable principle called saponine. This has been traced in many other vegetables, which have the property of forming a lather with water. S. laurifolia, *Roxb.*, is a stout, very shady tree, of various parts of India; S. squamosus, *R.*, is a native of the Malay Archipelago and of the island of Nassau-laut. S. longifolia and S. fruticosus, *R.*, and S. serratus, *R.*, are trees of the Moluccas. S. acuminatus, *Wall.*, is a tree of the valleys of the Himalaya, of Nepal, and the Khassya mountains. S. fruticosus, *Roxb.*, a shrub of the Moluccas, has pretty, rose-coloured, small flowers, in racemes in March, and fruiting in May. Introduced into the Dekhan. S. unijugus, *Thw.*, a large tree in the Hewahette district of Ceylon, at an elevation of 3000 to 4000 feet. S. attenuatus, *Wall.*, the Lal-koi-pura of Sylhet, has a hard, white wood. S. danura (the Scytalia danura, *Roxb.*) of N. India, the Sunderbuns, and Andamans, is used for boat and house building.—*Voigt; Thw.; Gamble; Riddell.*

SAPINDUS CHINENSIS. *Smith.* The Wuhwau-tsze and Fei-chu-tsze of the Chinese, is a large tree with round berries like those of the melia. They are sometimes used as a detergent; they are occasionally roasted and eaten by the Chiuese. They are made into rosaries. Sticks of the tree are used by the Taoist sectarians to exorcise demons.—*Smith.*

SAPINDUS DETERGENS. *Roxb.*

Soap nut tree, . . ENG.	Aritha, Haritha, . HIND.
Soap berry tree, . . ,,	Arishta, ... SANSK.
Do-dan, Ritha, . HIND.	

A small but handsome tree of India, attaining 20 feet of height; berries used for washing woollens and silks, also for the hair of the head. They form a soapy admixture with water. In medicine, applied externally to pimples and abscesses, internally in cases of headache, also in epilepsy, and as an expectorant; if pounded and thrown into water, it destroys fish. It is also recommended for the cure of chlorosis, also to stop epileptic fits by placing its powder in the mouth.—*Roxb.; Voigt; Lt.-Col. Lake; Stewart; Powell, Handbook.*

SAPINDUS EMARGINATUS. *Vahl.*

Buro ritha, . . . BENG.	Rarak, . . . MALAY.
Hseik-khyæ, . . BURM.	Penela-gas, . . . SINGH.
Thaly marathu, . CAN.	Puvandi, Ponnanga, TAM.
Rithi-ka-jhar, . . HIND.	Kunkudu, . . . TEL.
Areeta, ... MAHR.	

This handsome middling-sized tree grows in the Peninsula of India, in Bengal, Ceylon, and Burma. Its fruit is sold in all bazars as a detergent, and in many cases yields a more profitable return than any other fruit tree. The wood is occasionally used by the natives for ordinary purposes, such as posts, door frames, and the construction of carts. It is pale yellowish, close and prettily grained, hard, but not durable, and cracks if exposed, and is said not to work easily. Unseasoned it weighs 75 to 80 lbs. the cubic foot, and 64 lbs. when seasoned; its specific gravity is ·928. Mr. M'Ivor says the wood is elastic, strong, and durable. Its semi-solid oil, extracted from the kernel, is used medicinally. Its cost prevents its general use. When the soap nut is mixed with water it froths like soap, and is used instead of that substance for washing woollens, silks, and hair. Dr. Sherwood has mentioned that the seeds pounded with water often put an end to the epileptic paroxysm, a small quantity being introduced into the patient's mouth.—*Roxb.; Wight; Gibson; Cleghorn; O'Sh.; Beddome.*

SAPINDUS LAURIFOLIUS. *Vahl.*

Sapindus acuta, *Roxb.* | S. trifoliata, *Linn.*

This tree, Purinsji or Uriuji, MALEAL, grows in the Peninsula of India, where its fruit and leaves are used in medicine. Its berries are saponaceous and used by all.—*Roxb.* ii. p. 278.

SAPINDUS RUBIGINOSUS. *Roxb.*

S. fraxinifolia, *D.C.*	Moulvisia rubiginosa, *Don.*
Hseik-kyi, . . . BURM.	Isakarasi manu, . TEL.
Rusty soap nut, . ENG.	Ishi-rashi, . . . ,,
Rithi ka-jhar, . . HIND.	Undurugu manu, . ,,
Mani pungum, . . TAM.	

This large timber tree grows in both the Peninsulas of India, in the mountainous tracts of the

Circars, in the Pegu district, where it attains a girth of 3 or 4 feet, growing tall in proportion and straight. Its wood is white coloured, large, straight, strong, and durable, and useful for a great variety of purposes. When dry it has something the appearance of teak, but towards the centre it is chocolate coloured. Its Tamil name is derived from the quantities of silex or sand it contains, particularly near the bark, and which injures tools used in working it.—*Roxb.; Voigt; Mr. Rohde; Dr. M'Cl.; Flor. Andh.; Ains.*

SAPIUM, a genus of plants belonging to the natural order Euphorbiaceæ. S. baccatum, *Wight*, a tree of Assam, with minute greenish flowers.

Sapium Indicum, *Willd.*

Huruga, ... Beng. | Kirri nakulu, . Singh.
Benjieri, . . . Maleal. |

A small tree of the warmer parts of Ceylon, the Coromandel coast, South Konkan, the Sunderbuns, and Assam, with minute greenish flowers, and in fruit all the year round. Capsule or nut globular, size of a nutmeg, and exceedingly hard; juice very poisonous, taste exceeding nauseous; seeds used for intoxicating fish.—*Cal.; Roxb.; O'Sh.; Thw.*

SAPOR or Shahpur, the second sovereign of the Sassanian dynasty of Persian kings. It was this sovereign who captured the Roman emperor Valerian. He succeeded the Artaxerxes of the Greeks and Romans, that being their mode of pronouncing Ardeshir. Ardeshir Babegan, the son of Sassan, was an officer of the Parthian king Arsaces Artobanus v., and assumed the Persian throne as the first of the Sassanian dynasty in A.D. 226. His successor was the Shapur or Sapor who captured the emperor Valerian. There were other Artaxerxes, the first in A.D. 381, and the second in A.D. 629, and the Sassanian dynasty ended in A.D. 641, when Yezdejird or Izdejerd III. was overthrown by the Arabs. Artaxerxes Longimanus was the Kai Bahman or Adashir darazdast of the Kaianian dynasty of Persian kings. Artaxerxes Mnemon, a Persian king, B.C. 426, at whose court Ctesias resided for some years. After Scylax, Ctesias was the next historian in India, and in his Indica, cap. iv. p. 190, he mentions that Artaxerxes Mnemon and his mother Parasatys presented him with two iron swords, which when planted in the earth averted clouds, hail, and strokes of lightning. This is the first notice of the lightning conductor.—*Prinsep by Thomas.*

SAPOTACEÆ. *Endl.* The Sappodilla tribe of plants comprise genera which may be thus shown:—

Achras sapota, *Linn.*, East and West Indies.
A. sessiliflora, *Poir.*, Mauritius.
Lucuma mammosa, *Juss.*, America, China, E. and W. Indies.
Chrysophyllum cainito, *L.*, E. and W. Indies, S. America.
C. Roxburghii, *G. Don*, Assam, Khassya.
Imbricaria Commersonii, *G. Don*, Bourbon, Mauritius, Java.
Payena lucida, *D.C.*, Cachar, Tenasserim.
Isonandra Wightiana, *D.C.*, W. Ghats, Ceylon.
I. obovata, *Griff.*, Tenasserim, Tavoy.
Sarcosperma Griffithii, *Hooker f.*, E. Himalaya.
S. arborea, *Hook. f.*, E. Himalaya.
Dichopsis polyantha, *Benth.*, Cachar, Chittagong, Assam.
Mimusops Indica, *D.C.*, S. India.
M. littoralis, *Kurz*, Andamans.
M. elengi, *Linn.*, Moluccas, Ceylon, both Pen. of India, Bengal, Sylhet.
M. obtusifolius, *Lam.*, Mauritius.
M. kauki, *L.*, Malabar, Gour, Malay Islands, New Holland, Moluccas.
M. hexandrus, *Roxb.*, Circar mountains, Bombay.
M. erythroxylon, *Bojer*, Bourbon, Mauritius.
Bassia longifolia, *L.*, Ceylon, Malabar, Coromandel.
B. sericea, *Bl.*, Java.
B. latifolia, *Roxb.*, Peninsula of India, Malwa.
B. cuneata, *Bl.*, Java.
B. butyraceæ, *Roxb.*, Nepal, Almora.
B. Parkii, *G. Don*, West Africa.
Sideroxylon inerme, *L.*, —?
S. elengioides, *D.C.*, W. Ghats.
S. regium, *Wall.*, Pegu.
S. cinerium, *Lam.*, Mauritius.
S. tomentosum, *Roxb.*, Ghats.
S. Wallichianum, *Wall.*, Penang.
Isonandra lanceolata, *Wight*, Peninsula of India.
I. villosa, *Wight Ic.*, Peninsula of India.
I. gutta, *Wight Ic.*, Malay Peninsula, Java, Borneo.

The Indian Sapoteæ spread from the islands of the Indian Archipelago along the Malayan Peninsula to Sylhet, and from that to Nepal. The Achras sapota has delicious fruit with very bitter seeds, believed in Martinique to be powerfully diuretic; the bark is deemed a substitute for cinchona. The barks of other species are astringent, the fruits pulpy, acidulous, and edible. The seeds contain an oil rich in stearine. Bassia butyracea is found in the neighbourhood of Almora and Nepal Hills. The butter is of a delicate white colour, and of the consistence of fine lard, but without any disagreeable smell. It is highly esteemed as a liniment in rheumatism, contraction of the limbs, etc., and when used by natives of rank is frequently impregnated with some fragrant attar. The tree very much resembles B. latifolia, but may be distinguished by its much less fleshy corols and more numerous stamens; flowering in January, and ripening its fruit in August. The kernels are about the size and shape of almonds, are easily extracted from the smooth chesnut-coloured pericarps, when they are bruised and rubbed up to the consistency of cream, and subjected to a moderate pressure in a cloth bag. The oil concretes immediately it is expressed, and retains its consistency at a temperature of 95°.—*Lindley, Fl. Med.* p. 388; *O'Sh.* p. 427; *Royle, Ill. Him. Bot.* pp. 262, 263; *Roxb.*

SAPOTA ELENGIOIDES. *A. D. C.* A large tree of the hot, drier parts of the island of Ceylon, common on the Neilgherries. Bark rough and cracked; fruit edible, used in curries; wood strong and elastic like the hawthorn, burns well when green.—*Thw.; M'Ivor.*

SAPPHIRE.

Sufir, . . . Arab., Sw. | Sapphirus, . . . Lat.
Saphir, . . Dan., Fr. | Safira, ... Port.
Saffierstin, . . . Dut. | Jachant, Sapfir, . Rus.
Sapphir, ... Ger. | Nil, ... Singh.
Nilam, Hind., Malay., Tam. | Safiro, Safir, . . . Sp.
Zaffiro, . . . It., Sp. |

Corundum, if translucent, when red is the oriental ruby, when blue a sapphire, when green it is the oriental emerald, and when yellow a topaz. Sapphire is usually dark-blue, but also occasionally colourless, and the green variety of corundum is the rarest of all gems. But Sapphirus with the ancients was a generic term for all blue gems. It was on sapphirus tablets that the Ten Commandments were engraved. In the arts, other minerals are also styled sapphire, the names being dependent on their colours. Chemically, sapphire is 92 per cent. of a pure alumina; it occurs in six-sided prisms, often with uneven surfaces; it

also occurs granular. When the surface is polished, a star of six rays corresponding with the hexagonal form, is in some specimens seen within the crystal.

Corundum, sapphire, ruby, emerald, and topaz are found in great abundance in the Peninsula of India, but not with sufficient translucence to be valuable as precious stones. At the Madras Exhibition some small fragments of sapphire and of spinel, with the matrix in which it occurs, were exhibited from Masulipatam. Sapphires, in colour, vary to the deepest blue and black, and stones are often of varied hues. If held in water with forceps, these coloured and uncoloured stones will be seen. A very good blue sapphire of one carat weight would bring £20.

Occasionally very valuable stones are met with, but the great bulk are of comparatively little worth, the larger among them being generally full of flaws. Sapphires of good quality are also found in the same beds in the proportion, it is said, of one sapphire to about 500 or 600 rubies. In an appendix to Yule's Ava (published 1857), Mr. Oldham, superintendent of the Geological Survey of India, estimated the value of the gems found in these mines, rubies and sapphires, about £15,000 per annum. The mines are considered the sole property of the king, who maintains a strict monopoly of them, and employs his own lapidaries to polish and prepare the best of the stones.

Sapphires have been discovered in the territory of the maharaja of Kashmir.

Sapphire occurs in Ceylon in dolomite. A piece dug out of the alluvium near Ratnapura, in 1853, was valued at £4000. In Burma, sapphires are found in the same earth with rubies, but are much more rare, and are generally of a larger size. Sapphires of 10 or 15 rati without a flaw are common, whereas a perfect ruby of that size is hardly ever seen. The value of the gems, rubies, and sapphires obtained in a year may be from 1¼ to 1½ lakhs. A Karen informed Dr. Helfer that precious blue stones are to be had, which the Shan people collect and carry to Bangkok. He described the place as eight days' distant. Some valuable sapphire mines were discovered in 1878 in the Siam provinces of Chantaboon and Battambong, and throughout 1879, thousands of British subjects went from Burma to the mines. One sapphire was offered for sale at Chantaboon for Rs. 1000. The owner finally sold it in Calcutta for Rs. 3000. The largest which the Government has yet heard of weighed 370 carats in the rough, and 111 carats when cut. The mines are said to be very unhealthy. In Mr. Hope's collection is a blue sapphire which cost £3000. A valuable sapphire of 133 carats, now in the Museum of Natural History at Paris, is said to have come from Bengal. It was sold for £6800. Lady Burdett Coutts had two of them, valued at £30,000.—*Emmanuel; Tomlinson; Mason.* See Precious Stones.

SAPRIA GRIFFITHII, a plant closely allied to Rafflesia, which was discovered in the Assam mountains by Griffith, is the most remarkable form known to occur there.

SAPTA. SANSK. Seven. Saptag, the octave in music. Sapta Matri, a name of Brahmi or Chamunda. Saptaswa, the seven-headed horse that draws the chariot of Surya, the sun. Sapt-Gandak, the feeders of the Gandak, and Sapt-Kausika, the Nepalese term for the seven alpine feeders of the river Cosi. Sapta Sindhava, the seven rivers, applied to the Panjab, but also to other rivers and seas of India. Virgil says (Æneid, ix. p. 30), 'Ceu septem surgens sedatis amnibus altus per tacitum Ganges.'

SAPU TANGANG. MALAY. A kerchief for the head. Sapu-Tangan Siri, a handkerchief.

SAR. HIND., PERS. The head, chief, principal; often employed to form compound words. Sardar, a chief; Sar-kar, a government, a head servant; Sarhad, a boundary; Sarrashtadar, the head of a department; Sar-band, head-binder, is the source of the turband, the s being changed into t.

SAR. BALUCH. The Northern Indus, from the junction of the Panjab rivers to the town of Sihwan. It is also a Slavonic word. Gatterer and Niebuhr mention that Sauromatæ means Northern Medes, and north of the Caucasus were the province and tribe of Siracene.—*Elliot, Hist.*

SARACA INDICA. *Linn.*

Thaw-ka-hpo, . . BURM.	Jassundi, . . . MAHR.
Ashunkar, . . . CAN.	Diyera tembela, . SINGH.

The Jonesia asoka, *Roxb.*, the asok tree, is a small tree cultivated throughout India and Burma for its handsome flowers. Its wood is light and of a reddish-brown colour. S. lobbiana, *Baker*, is a tree of Martaban, and S. triaudra, *Baker*, of Tenasserim.

SARACEN, a name given by the older Christian writers to the Arabs. It is from Sahra, the desert, and Zadan, to traverse.

SARAF. HIND. A money-changer or banker.

SARAI. HIND. A caravansary, a building for the shelter and accommodation of travellers. Sarai, as in Ak-sarai, means a palace, a large edifice. It is a purely Persian word, and has been adopted into the English language under the word Caravansary (Karawan sarai). There are many Sarai throughout British India, but few of them have gathered towns about them. The Tamil term Chattram corresponds with the Sarai in Anglo-Tamil Choultry.

SARAKHS, an ancient city of Khorasan, situated about midway, or six days' journey, between Merv and Naishapur.

SARAN, a district in Bengal, lying between lat. 25° 40′ and 26° 38′ N., and between long. 83° 58′ and 85° 14′ E. The chief aborigines, Bhar, number 7647; the Chamar, 94,844; the Dasadh, 73,046; and the Bind, 18,429. The most numerous caste is the Goala, herdsmen. They bear a bad character for turbulence and dishonesty. The Koeri (141,209) are the best cultivators in the district, holding most of the opium lands, from which they raise first-rate crops; and the Kurmi (100,790) are also an agricultural caste.

SARANGI, a stringed musical instrument of Hindus and Muhammadans; a violin.

SARANJAM. PERS. Utensils, furniture; remuneration for services.

SARANYU of the Vedas, Varuna of the Hindus, is the Greek Erinys and Ouranos.

SAR-a-PA. PERS. A suit of garments presented by Muhammadan princes to those whom they intend to honour; literally, from head to foot.

SARAS, HIND., also Surhuns, Grus antigone, occurs all over British India. They may be seen in pairs, now plunging their bills into the shallow waters, now scattering pearly drops from their

throats. The natives of India strongly object to shooting these birds, about which they have a multitude of curious stories. There is a prevalent idea that if one of a pair be killed, the survivor will return again and again to the spot to hover over it. It is perhaps less exclusively a grain feeder than some other species, and is generally met with not far from water. Its fine trumpet-like call, uttered when alarmed or when on the wing, can be heard a couple of miles off. In many parts of the country it is so confiding and fearless in its habits, as to prevent the sportsman from shooting it, and in the territories of Holkar it is said to be esteemed so highly as to be held sacred from the shikaris. In Australia the place of the Saras is occupied by the Australian crane, the Grus Australis.—*Burton's Falconry*, p. 58; *Jerdon.*

SARASWATA, a tribe of Brahmans who originally dwelt on the banks of the river Saraswati, and are now met with in the Panjab and other parts of Northern India. They are usually fair complexioned, tall, and handsome men. They seem to take their appellation from a rishi named Saraswata, and the Hindu tradition is that during a famine the Vedas became forgotten by all but Saraswata, to whom, at the close of the scarcity, Brahmans repaired, and 60,000 disciples again acquired a knowledge of the Vedas. This legend seems to indicate the introduction or a revival of Brahmanism.—*Garrett.*

SARASWATI. In India there are three rivers of this name.

Saraswati or Sarsuti, a sacred river of the Panjab, frequently mentioned in the Vedas. It rises in lat. 30° 23′ N., long. 77° 19′ E., in the low hills of Sirmore State; emerges upon the plain at Zadh Budri in Ambala, a place esteemed sacred by all Hindus; passes by the holy town of Thanesar and the numerous shrines of the Kurukshetra, a tract celebrated as a centre of pilgrimages; enters Karnāl district and Patiala State, and finally joins the Ghaggar in Sirsa district (lat. 29° 51′ N., long. 76° 5′ E.). In ancient times the united stream below the point of junction appears to have borne the name of Sarsuti, and, undiminished by irrigation near the hills, to have flowed across the Rajputana plains, debouching into the Indus below its confluence with the Panjab rivers. The Hindus identify the river with Saraswati, the Sanskrit goddess of speech.

On the banks of the Caggar Saraswati the Aryan race came into contact with others, caste became recognised, but their descendants on the banks of that river have never adopted the high Hinduism of the Brahmans of the Gangetic valley, and continue agricultural.

Saraswati of the Sanskrit writers, in Zend became Haraquaiti, and in Greek Ἀραχωτος, all of which agree in the last two syllables with the Chinese Tsaukuta.

Another Saraswati river, rising in Mount Abu, Rajputana, flows through the Palanpur and Radhaupur States of the Mahi Kanta Agency.

Saraswati river of the Hoogly district, Bengal, was formerly the main stream of the Ganges, and navigable by large vessels as far as Satgaon. It has silted up and become a foul shallow creek.—*Imp. Gaz.* viii.

SARASWATI, a Hindu goddess, the wife, or sakti, or female energy of Brahma, is analogous in western mythology to Minerva, the patroness of learning, etc. Saraswati is the Hindu goddess of learning, music, and poetry, and is also called Brahmi or Brahmini, the goddess of the sciences; and Bharadi, the goddess of history. She is sometimes represented as a white woman standing on a lotus or water-lily, holding a lute (or vina) in her hand, to show that she is also the goddess of music; at others, riding on a peacock, with the same emblem in her hand. Although the worship of Brahma has fallen into disuse, the annual festival of Saraswati, in the fifth day of the month Magha, is highly honoured. This day is called Sri-panjami, and Saraswati or Sri, the goddess of arts and eloquence, is worshipped with offerings of perfumes, flowers, and dressed rice; even implements of writing and books are treated with respect, are not used on this holiday, and are presented to the image of this goddess. Saraswati is, among other deities, especially propitiated in the marriage ceremonies of the Brahmans. The following hymn is chanted in her honour: — 'Charming Saraswati! swift as a mare, whom I celebrate in the face of this universe, protect this solemn rite. O thou! in whom the elements were produced, in whom this universe was framed, I will now sing that hymn' (the nuptial text), 'which constitutes the highest glory of women.'—*Colebrooke*, *As. Res.* vii. p. 303; *Moor*, *Hindu Pantheon*, p. 128; *Cole. Myth. Hind.* p. 10; *Menu*, ch. iii. v. 121.

SARATH, Buddhist ruins in the Benares district of the N.W. Provinces, distant 3½ miles north of Benares city; Sakya Muni first preached his doctrines here.—*Imp. Gaz.*

SARAWAK, in Borneo, is situated in a bay to the eastward of Point Api, at the foot of a range of mountains from 1500 to 3000 feet high, extending towards the interior of the island. The Sarawak government acquired the coast territory from Cape Datu to the river Barram. The banks of the river of Sarawak are everywhere covered with fruit trees; the mangosteen, lansat, rambutan, jambou, and blimbing are all abundant, but the durian is most so and most esteemed. A beautifully resplendent sand, the particles of which resemble amethysts and topazes, is found at Lingah, a branch of the great Batang Lupar river, not far from its mouth. Sago is manufactured at Muka, and antimony is found at Basseiu in Borneo.—*Low's Sarawak.*

SARAWAN, a province in Baluchistan. The great central mountain range or table-land running north and south comprises the provinces of Sarawan, Jhalawan, and Lus. See Baluchistan.

SARAWI, a sect of the fakirs of India.

SARCOCEPHALUS CORDATUS. *Roxb.*

Nauclea cordata, *Roxb.* | N. coadunata, *Sm.*

This tree, the Bakmee of the Singhalese, is very common in the southern parts of Ceylon on the banks of streams; it flowers in May and June. The wood is light and tough, and in use for saudals, common furniture, doors, etc. An Australian tree is described under this name in Bentham's Fl. Aust. iii. p. 402, but it must be a different species. The size of the larger cordate leaves of S. cordatus are often about one foot long, and upwards of 8 inches broad.—*Beddome, Fl. Sylv.*

SARCOCHLAMYS PULCHERRIMA. *Gaud.*

Urtica pulcherrima, *Roxb.* | Tsa-tya, Sap-sha, BURM.

A large handsome shrub of E. Bengal and

Burma. Its liber gives a good fibre for ropes.—*Gamble.*

SARCOCLINIUM HOOKERI. *Thw.* Maha-bairoo-gass, SINGH. A moderate-sized tree near Eknalagodde, in the Ratnapura district of Ceylon, at no great elevation.

Sarcoclinium longifolium, *W. Ic.* Bairoo-gass, SINGH. A tree of the Central Province of Ceylon, growing at an elevation of 4000 to 6000 feet. The leaves are of a firm consistence, do not rapidly decompose, and are used by the Singhalese for thatching.—*Thw.*

SARCOCOCCA PRUNIFORMIS. *Lind.*

S. trinervia, *Wight Ic.* | Shial, Shila, . . HIND.

A tree of the central province of Ceylon, very abundant at an elevation of 5000 to 8000 feet. It is extremely variable in the shape of the leaves, which differ from nearly orbicular to narrow-lanceolate acuminated. S. trinervia, or Neilgherry boxwood tree, very common on the Neilgherries; wood hard, durable, might be used as common boxwood in the arts. S. Hookeriana, *Baill.*, is of Sikkim; and S. saligna, *Mull.*, of Kamaon, has a white wood used for walking-sticks.—*Thw.; M'Ivor.*

SARCOCOLLA. Auzarut, ARAB. Ruujudeb, PERS. A sub-acid, sweetish, and somewhat nauseous gum-resin, produced in North Africa, Persia, and Arabia by the shrubs Penæa sarcocolla, P. mucronata, and other species. It is yellow or reddish, like gum-arabic, in oblong globules the size of a pea or of grains of sand, friable, opaque or semi-transparent, softeuing but not melting by heat; sp. gr. 1268. Sarcocolla was once deemed a powerful healer of wouuds (σαρξ, flesh, and κολλα, glue), but this idea has been long abandoned. It is rarely met with in India, and then only brought from Persia and Arabia.—*O'Sh.; Powell; Faulkner.*

SARCODACTYLIS ODORATA. *Smith.*

Kau-yuen, . . . CHIN. | Huing-yuen, . . CHIN.
Fu-kau-shan, . . ,, | Buddha's citron, . ENG.

A tree of several parts of China. Its yellow fruit in some place attains a very large size, and the capsules of the fruit separate naturally.—*Smith.*

SARCOSTEMMA, a genus of plants of the order Asclepiaceæ, of which S. acidum and S. viminale occur in India. The name is from σαρξ, flesh, and στεμμα, a crown, in reference to the leaflets of the inner corolla being fleshy.

Sarcostemma acidum, *W. Contr.*

S. brevistigma, *W. Contr.* | Asclepias acida, *Roxb.*
Brami, Shomluta, BENG. | Pullatige, Soma luta, TEL.
Som, Soma, . . HIND. | Tige jemudu, . . . ,,
Muwa kiriya, . . SINGH.

This leafless plant grows in rocky, sterile places all over India. The plant yields an abundance of a mildly acidulous milky juice, and travellers suck its tender shoots to allay thirst. This is the Soma or Som plant of the Vedas, and it obtained this name from the ancient Hindus because they gathered it by moonlight, carried it to their homes in carts drawn by rams, and a fermented liquor was prepared by mixing its juice, strained through a sieve of goat's hair, with barley and ghi. This wine was drunk at all their religious festivals, and was used by the rishi as an intoxicant. The rishi continued it at their meals with beef. The Rig Veda, ix., says, the purifying Soma, like the sea rolling its waves, has poured forth songs, and hymns, and thoughts.—*Roxb.; W. Ic.; Voigt; Birdwood.*

Sarcostemma viminale, *R. Brown*, the Soma or Soma luta, is a plant of all British India, Sind, and Baluchistan. It is a leafless plant, resembling the Euphorbia tirucalli; flowers white in the rains. The natives tie the stems up in a bundle, and place them in the water-course of their wells for the purpose of preventing the attack of white ants.—*Riddell; Voigt.*

SARCOSTIGMA KLEINII, its oil, long known under the name of Poovana and Poovengah, is used largely on the western coast of the Peninsula of India as an external applicant in rheumatism. —*M. E. J. R.*

SARDAB. PERS. An underground room which the people of Baghdad occupy in the hot weather. Except in British India, most houses in the hot countries of the east are provided with subterranean chambers, called sardab (literally cold water), to which the family retire during the heat of the day. They are often furnished with the greatest luxury, and their refreshing coolness is increased by the play of fountains, and punkahs or large fans hung from the ceiling. This is the favourite place for the ladies' afternoon siesta.—*Ed. Ferrier, Journal*, p. 292.

SARDANAPALUS, of the Roman historians, was Assur-banipal, the son of Esarhaddon, and the greatest of the Assyrian monarchs, who reigned B.C. 671 to about 626.

SARDHANA, a town in the Meerut (Mirath) district of the N.W. Provinces of British India, in lat. 29° 9′ 6″ N., and long. 77° 39′ 26″ E.; pop. (1872), 12,466. Walter Reinhard, a soldier of fortune, better known by the name of Samru or Sombre, was a butcher by his trade, and a native of Luxemburg. He came to India as a soldier in the French army, and desertiug that service, took employment with the British, where he attained to the rank of sergeant. Deserting again, he rejoined the French service at Chandernuggur, and on the surrender of that settlement accompanied M. Law in his wanderiugs throughout India, from 1757 to 1760. For the latter year, Law's party joined the army of Shah Alam in Bengal, and remained with the emperor until his defeat in 1760 at Gaya, by Colonel Carnac, in his attempt to recouquer Beugal from the nawab. Samru took refuge with a succession of new masters, and was ultimately presented with Sardhana, where he died in 1778, leaving the Begum Samru as his widow and heir. This lady, in 1834, devoted £15,000 to the foundation of a clergy fund and poor fund; and her name now stands first in Archdeacon Pratts' Endowments of the Diocese of Calcutta. The litigation connected with her property was not finally settled till more than a third of a century after her death.—*Imp. Gaz.*

SARDINE. ENG., FR., IT.

Sardellen, . . . GER. | Sardinas, ... SP.

The sardine fish of commerce is found in the Mediterranean, where its fishery employs a great number of people. In the Asiatic seas there are fishes of the same or allied genera. Engraulis meletta? is a small fish of the herring family at Tavoy and Mergui, which is nearly related to the common sardine.

The sardine of Penang is the Dussumieria

aeuta, *Cuv. and Val.*, the Tambat Bulat of the Malays, also the Clupeonia perforata, the Ikan tambau of the Malays.

Sir J. E. Tennent mentions that Sardinella Neohowii, *Val.*, frequents the southern and eastern coast of Ceylon in sueh profusion, that in one instanee, in 1839, 400,000 were taken in a haul of the nets in the little bay of Goyapanna, east of Point de Galle. As this vast shoal approached the shore, the broken water beeame as smooth as if a sheet of ice had been floating below the surfaee. S. lineolata, *Cuv. and Val.*, and the S. leiogaster, *Cuv. and Val.*, are found at Trineomalee, also off the eoast of Java. Another Ceylon fish of the same group, a Clupea, is known as the poisonous sprat. The sardine has the reputation of being poisonous at eertain seasons, and aeeidents aseribed to eating it are reeorded in all parts of Ceylon. Whole families of fishermen who have partaken of it have died. Twelve persons in the jail of Chilau were thus poisoned about the year 1829; and the deaths of soldiers have repeatedly been aseribed to the same eause. An order passed by the Governor in Council in February 1824, after reeiting that, 'Whereas it appears by information eonveyed to the Government that at three several periods at Trineomalee, death has been the eonsequence to several persons from eating the fish ealled Sardinia during the months of January and Deeember,' enaets that 'it shall not be lawful in that distriet to eatch sardines during these months, under pain of fine and imprisonment.' This order is still in foree, but the fishing eontiuues notwithstanding. The poisonous fish of this family which oeeurs in the Asiatie seas, is, however, the Meletta venenosa.—*Tennent's Ceylon*; *Mason*; *Jour. Ind. Arch.*

SARD-SAIR. Pers. A term in use amongst the nomade raees of Persia to iudieate the loeality to whieh they drive their herds in summer; the garm-sair is their winter quarters. In the south of Persia, a huge wall of mountains separates the garm-sair, or low region, from the sard-sair. Sard-sair signifies the cold region, but it is also termed the Sarhada, a word literally signifying boundary or frontier, but generally applied to any high land where the climate is cold, as on the high table-land of Persia. Oue of the most eonspieuous of these is an abrupt lofty hill, named Hormooj, where eoal oeeurs.

SAREE. Hind.

Shiali, ...	Can.	Pudawi, ...	Tam.
Lugra, ...	Mahr.	Chira, ...	Tel.

The saree is the lower garment worn by most of the Hindu and non-Aryan women in India. It is, in faet, the national eostume of almost all Hindu women. The Muhammadan women of Hyderabad in the Dekhan, Oudh, Rajputana, the N.W. Provinees, and the Panjab, and many Hindu women, whether seeluded or otherwise, wear the voluminous pettieoat, or gown, introduced by the Muhammadans; but from Rajputana southwards to Cape Comorin, Bengal, aud Orissa, all adhere to the aneient national eostume of the saree, and this artiele of woman's dress only varies with loeal taste as to eolour, length, and breadth, and fineness or eloseness of texture. It is an entire eloth, in many cases 18 yards long and about a yard broad; and the texture varies from the finest and most open eharaeter of muslin in Bengal and the south of India, to the still fine but eloser texture of the Dekhan, Central India, and Gujerat. Sarees are of all qualities, to suit the very poorest as well as the very richest classes of society, the ordinary labourer and the prineess, and are obtainable for 2s. eaeh up to £100 of value. In the manner of tying and wearing this garment there is little differenee anywhere. The eloth, whieh has one plain end, is passed around the loins, and the upper border tied in a strong knot; the eloth is then passed two, three, or even four times round the waist, to form a petticoat. A portion is then plaited neatly into folds, and tucked in before, so as to hang down in front to the instep, or even lower. The remainder of the eloth is passed across the bosom over the left shoulder and head, on whieh it rests, the ornamented ends falling partly over the right arm below the waist. In the south of India, however, the end does not pass over the head; it is drawn tightly over the left shoulder and bosom, and tucked in to the waist behind, or on the right hip. The ancient female eostume of Egypt, a saree or single robe, appears to have been put on and worn in precisely the same manner without a bodiee. Well-to-do women of the Dekhan and the south frequently wear a gold or silver zoue, aeeording to their eireumstanees, whieh, passing over all, eonfines the drapery to the waist in graeeful folds. This zone appears unknown to the northward, but in many cases it is beautifully wrought, and extremely ornamental. The sarees are largely made of silk in Benares; but the multitude have them of eotton, some of eotton and silk, with borders of gold or silk. Eaeh woman of a household usually gets a new saree onee a year. The sarec, with a small sleeved bodice, completes a lady's attire; the higher the elass of the lady, the lower her saree will hang. Women of the labouring easte seldom wear the saree below their knees. In the Nagpur eountry every modest Hindu woman drapes one fold of her saree over her head, whereas, in the Konkan, respeetable ladies have their heads uncovered. Gond women always keep the head uneovered; some of them wear chignons, and all wear jungle flowers in their hair on festivals.

The Mahratta women, and women engaged in labour, often make the saree take a very ungraeeful form, by passing it between the legs, in whieh it assumes the appearanee of tight trousers. Viseountess Faulkland (Chow-Chow, p. 7) deseribes a group of Bombay women, with their heavy anklets making a tinkling with their feet (Isaiah iii. 16), eaeh with their sarec folded over their heads and persons, and earrying little chubby children on their shoulders, or astride on their hips; and now these are lost to sight, and a fresh group appears, consisting of Hindu women of various castes, elothed in jackets and the sarees of divers eolours, and wearing the chains and the braeelets, the ear-rings, the rings, and the nose-jewels (Isaiah iii. 19–21); one end of the saree forming a very voluminous kind of skirt or pettieoat, the other end being drawn over the head and shoulders, somewhat in the style or form of a Maltese faldetta.

SARGASSUM BACCIFERUM, *Agh.*, or gulf-weed, eovers all the Gulf Stream from lat. 22° to 36° N., and long. 35° to 65° W. It is in enormous quantity, floating in an eddy of the

Atlantic to the west of the Azores, from lat. 20° to 36° N., and again west of the Bahamas. It is often thrown up on the shores of S. Asia. Its name is from Sargasso, Sp., weed. Midway in the Atlantic between the Azores, Canaries, and the Cape de Verde Islands, are vast masses. Oviedo calls them Praderias de Yerva. It is of a greenish-yellow colour, is abundant on the Florida reefs, but continues to vegetate as it floats about in the circular currents after it has been torn from its attachment. The masses give shelter to a great number of fish, molluses, and crustacean animals,—the pipe fish, Syngnathus acus: the elegant Cranchia scabra and Scytlœa pelagica; also Loligo laticeps, *Owen;* Octopus semipalmatus; numerous crabs; the paper nautili, Argonauta hians, with their inhabitant Ocythoe Cranchii of Leach, and its eluster of ova.—*G. Bennett*, p. 36.

SARGUJA, the largest of the Native States of Chutia Nagpur, Bengal, lies between lat. 22° 37′ 30″ and 24° 6′ 30″ N., and between long. 82° 32′ 5″ and 84° 7′ E. Area, 6103 square miles; pop. in 1872, 182,831. The Mainpat is a magnificent table-land 18 miles long, from 6 to 8 broad, and 3781 feet above sea-level; and the Jamirapat is a long winding ridge, about 2 miles wide. The chief peaks in the State are Mailan, 4024 feet; Jam, 3827; and Partagharsa, 3804. The Gonds and Uraons number 73,256, or 40·1 per cent.; the Kolarian tribes, 39,416, or 21·5 per cent.; Hindus, 68,789, or 37·6 per cent.; Muhammadans, 1370, or 0·8 per cent. of the total population. The Gour race on the east of the Gond extend into the borders of the Chutia Nagpur Agency in Udaipur and Sarguja, and the Sarguja raja is supposed to be a Gour, though claiming to be a Rajput. They are much Hinduized.

SARHAD, the principal range of mountains in the Kohistan of Baluchistan, situated between lat. 29° and 30° N., and visible from a distance of 80 or 90 miles. It is occupied by tribes of Kurds. —*Pottinger's Tr.* p. 140.

SARHIND. The present ruins of Sarhind consist almost entirely of Muhammadan buildings of a late period; but it must have been a place of some consequence in the time of the Hindus, as it was besieged and captured by Shahab-u-Din Gori, the first Muhammadan king of Dehli. The name of Sarhind, or frontier of Hind, or perhaps Northern Hind, is popularly said to have been given to the city at an earlier period, when it was the boundary town between the Hindus and the later Muhammadan kingdom of Ghazni and Lahore. But the name is probably much older, and seems to mean Northern India, as the astronomer Varaha Mihira mentions the Sarindha immediately after the Kuluta, or people of Kullu, and just before Brahmapura, which, according to the Chinese pilgrim Hiwen Thsang, was the capital of the hill country to the north of Hardwar. But the geographical list of Varaha Mihira is copied almost verbatim from that of the still earlier astronomer Parasara, who is believed to have flourished not later than the first century after Christ. The town called Band, or Bando, was probably the contracted form of Bhatasthala, and General Cunningham is inclined to think that Sarhind must be the place indicated by the pilgrim as the capital of the ancient district of Satadru.—*Cunningham's Ancient Geog. of India.*

SARI, also Sarri. Sind. A necklace of gold beads worn by Hindu mendicants.—*Burton's Scinde*, p. 393.

SARI, an old city of Masandaran, which is celebrated in the legends of Afrasiab. In the 18th century, there were still to be seen at Sari four ancient circular temples, each 30 feet in diameter and 120 feet high. In the time of the kings of Persia, Sari had been the seat of an officer called the Great General of the East.—*Malcolm*, p. 42; *Yule's Cathay*, i. p. 88.

SAR-i-PUL is 100 miles S.W. of Balkh and 300 miles N.E. of Herat, a confused collection of houses and tents, with 18,000 souls, two-thirds of them Uzbaks, the rest Hazara. The chief is an Uzbak.

SARIPUTRA was the right-hand disciple of Buddha. We learn from Hiwen Thsang that Sariputra was born at Kalapinaka, about half-way between Nalanda and Indra-Sila-Guha, or about 4 miles to the south-east of the former place. The new town of Rajagriha is said to have been built by king Srenik, otherwise called Bimbasara, the father of Ajatasatra, the contemporary of Buddha. Its foundation cannot therefore be placed later than B.C. 500, according to Buddhist chronology. The remains at Baragaon consist of numerous masses of brick ruins, amongst which the most conspicuous is a row of lofty conical mounds running north and south. These high mounds are the remains of gigantic temples attached to the famous monastery of Nalanda. The great monastery itself can be readily traced by the square patches of cultivation amongst a long mass of brick ruins, 1600 feet by 400 feet.—*Cunn. Anc. Geog.* p. 467.

SARKA, Sarkanda, Sarkara, Sara. Hind. A grass growing in moist places; the flower-stalk of the moonj grass, Saccharum munja, used by weavers, and made into rope.

SAR-KAR. Hind. The State, the Government of a country, also a province or revenue division, as the Northern Circars, comprising the districts of Ganjam, Vizagapatam, Godavery, Kistna; also, in Bengal, a native servant who keeps the household accounts. Sar-karkun is the head revenue or custom-house clerk.

SAR-KAT. Hind. A reed used to make coarse screens or chiks. The Bhils make good arrows from it.

SARKHI SARWAR, a large village in the Dehra Ghazi Khan district, where there is a tomb of a Muhammadan saint, Sarkhi Sarwar, whose father was an attendant at the tomb of Mahomed at Medina. Many pilgrims visit the shrine. —*MacGregor*, iii. p. 62.

SARNA, amongst the Kol, a sacred grove.

SARNAI, a bagpipe; an inflated goat-skin for swimmers.

SARNATH, in the Benares district of the N.W. Provinces, has Buddhist remains. In 1835-36, Major Cunningham excavated numerous Buddhist images here. He found quantities of ashes also, and there could be no doubt that the buildings had been destroyed by fire. Major Kittoe, who subsequently made further excavations, was of the same opinion. The Buddhist religion had evidently assumed the form of the heresy of a weaker party, who were forced to hide their images under ground, and were ultimately expelled from their monasteries by fire. Inscriptions

on images of Buddha from the temple at Sarnath, at Benares, and on an image from Bakhra, in Tirhut, are in Sanskrit, but not pure. The date is after A.D. 800, and that of Sarnath probably of the eleventh century. From copper-plate inscriptions found near Sarnath, it is conjectured that the Buddhist temple was erected by the sons of Bhupala, a raja of Gaur, in the eleventh century. The Choukandi, or Luri-ka-kodan, in the town of Sarnath, is so called from the leap from its top of an Ahir, by the name of Luri. It is a lofty mound of solid brickwork, surmounted with an octagonal building. Hiwen Thsang describes this tower to have been no less than 300 feet in height.—*Tr. of a Hind.* i. p. 295.

SARNESWARA, lit. the lord over all; a name used for the true God by the Roman Catholics.

SARONG. MALAY. A petticoat, 6 feet long and 5 feet broad, used by both sexes; serves as a complete wrapper; often the sole article of dress. It is of cotton, or silk, or of cotton and silk. It is wrapped round the lower part of the body as a petticoat. Javanese women draw figures on their sarong to express their thoughts and emotions. The sarong is worn by men and women, only that of a woman is deeper. The sarong when united is called a salendang, a woven or printed fabric imported into the Dutch ports of the Eastern Archipelago. There are imitation Battik sarongs, and Turkey-red sarongs.—*Bikmore; Simmonds.*

SAROSANTHERA LASIOPETALA. *Thw.*

Cleyera lasiopetala, *W. Ill.* | Eurya lasiopetala, *Gardner.*

A moderate-sized tree, common in the forests of the central province of Ceylon at an elevation of 6000 feet and upwards.—*Thw.*

SAROSH, an angel of the Parsees. Sarosh-baz, a prayer recited in his name.

SARPA, the serpent, so called in Sanskrit because it was conceived under the general idea of creeping, an idea expressed by the word Srip. It is referred to the root Sar. This root is the origin of the general term serpent, and it is found in the name of the mythical hero Sarpedon, the Lycian chieftain in the Iliad, and also in the Vedic Sarama, which again is the dawn as spreading over the heaven with its broad flush of light. But the serpent was also called Ahi in Sanskrit, in Greek Echis or Echidna, in Latin Anguis; this is derived from Ah in Sanskrit, or Anh, which means to press together, to choke, to throttle. Here the distinguishing mark from which the serpent was named was his throttling, and Ahi meant serpent, as expressing the general idea of throttler. This root Anh still lives in several modern words. But in Sanskrit it was chosen with great truth as the proper name of sin. Evil no doubt presented itself under various aspects to the human mind, and its names are many, but none so expressive as those derived from the root Anh, to throttle. Anhas in Sanskrit means sin, but it does so only because it meant originally throttling,—the consciousness of sin being like the grasp of the assassin on the throat of his victim.—*Muller's Lectures*, p. 366.

SAR-PECH or Sarpesh. HIND. An ornament worn on the turband of Indian nobles. It consists of a band 2 or 2½ cubits long of square pieces of gold plates threaded together, each plate being set with precious stones. It encircles the turband two or three times.

SARPUN, in Hundes, a Chinese officer, a captain of police. The Shib chid is a Chinese official in Hundes, residing in the province of Bood, a month's march from Gartok.

SARSAPARILLA.

Oshba, Muckwy, . ARAB.	Shariva, . . . SANSK.
Ku-ku, Chin-a h'po, BURM.	Erramasumul, . SINGH.
Salsepareille, . . FR.	Irimusa, ... ,,
Mugrabu, . . . HIND.	Nunnarivayr, . . TAM.

Sarsaparilla is from the Spanish words Zarz, a bramble, and Parilla, a vine. The sarsaparilla in use in medicine is composed of various species of Smilax. S. officinalis is a native of South America. Varieties of this root are also found in the south of Europe. East Indian sarsaparilla belongs to the Hemidesmus Indicus; it is abundant and cheap, partakes largely of the qualities of the true sarsaparilla, and is extensively employed as a substitute, as also is S. China. This and Ichnocarpus frutescens, also used as sarsaparilla, are common on the slope of the Neilgherries. Dr. A. J. Scott forwarded to the Madras Exhibition a crystallized principle called Hemidesmine, exhibiting a remarkable indifference both to acids and alkalies, crystallizing in a peculiar manner in hexagonal plates, which are subject to rapid efflorescence. The only ascertained solvents are alcohol and ether. It is perfectly insoluble in water, both cold and hot.

SART. ARABO-HINDI. A gig or buggy, corruption of Arabic Shart, a wager, a bargain, a horse race.

SART, the name applied by the Turks to the Tajak aborigines of Trans-Oxiania. The Sart or Tajak from time immemorial have occupied the tract in Central Asia which has as boundaries Siberia, India, Persia, and China. The Tajak is Iranian. He is met with in largest numbers in the khanate of Bokhara and in Badakhshan, but many have settled in the towns of Khokand, Khiva, Chinese Tartary, and Afghanistan. The Tajak is of a good middle height, has a broad, powerful frame of bones, and especially wide shoulder-bones, but they diverge from the Iranian; they have the Turanian wider forehead, thick cheeks, thick nose, and large mouth. The Tajak originally came from the sources of the Oxus, in the steppe of Pamir. The term is from Taj, a crown, the fire-worshipper's head-dress. But the Tajak does not so style himself, and regards the term as derogatory. The Tajak is covetous, unwarlike, and given to agriculture and trade; fond of literary pursuits, and polished, and it is owing to their preponderance in Bokhara that that city has been raised to the position of the headquarters of Central Asiatic civilisation, for there, from pre-Islamic times, they have continued their previous exertions in mental culture, and, notwithstanding the oppressions which they have sustained from a foreign power, have civilised their conquerors. Most of the celebrities in the field of religious knowledge and belles-lettres have been Tajaks, and at the present day the most conspicuous of the mullah and ishan are Tajaks, and the chief men of the Bokhara and Khiva court are Tajak, or, as the Turks style the race, Sart. Vambery considers the Tajak and Sart identical, but he recognises that in their physiognomic peculiarities the Sart differs greatly from the Tajak, being more slender, with a larger face and a higher forehead; but these changes Vambery attributes to frequent intermarriages

between Sart men and Persian slaves. In Khiva they number 20,000 families, all engaged in trade, industrial pursuits, and rearing silk-worms. They have fine beards, but are unwarlike, unacquainted with the management of horses or the use of arms.—*Collett, Khiva; Cent. Asia; Vambery.*

SARUN, a district in the Patna division of Bengal, lying between lat. 27° 29′ and 35° 40′ N., and long. 83° 55′ and 85° 30′ E., bounded on the N. and N.W. by Nepal, on the E. by Tirhut, on the S.W. by the Ganges, and on the W. by Gorakhpur. Its area, 6394 square miles; population, about 1,000,000. Its chief civil station is Chupra, a town built on the left bank of the Ganges, in lat. 25° 45′ N., and long. 84° 48′ E., and 370 miles from Calcutta.

SASA. Tel. Pl. Sasalu. Grains of rice mixed with turmeric or other colouring ingredients, which is cast over the heads on auspicious occasions.

SASALADALA. Singh. Literally the shaking leaf; one of the names of the Bo Tree, the Ficus religiosa. Its leaves are almost constantly tremulous.—*Forbes.*

SASANA. Sansk. Shasana, Tam. A stone or brass or copper plate on which memorial inscriptions, grants to religious bodies, temples, etc., are engraved; title-deeds, a royal grant.

SASARKUND is a pool in the Mahur jungle, where the Pain Ganga is said to be engulfed. The Naikude Gond repair there in pilgrimage, in the month Chaitra, to a huge stone that rises in a gorge, and goes by the name of Bhim Sen, before which the Naikude Gond mingle with Raj Gond and Kolam in worship. Towards evening the worshippers cook a little rice, and place it before the god, adding sugar. Then they smear the stone with vermilion, and burn resin as incense, after which all offer their victims, sheep, hogs, and fowls, with the usual libations of arrack. The pujari appears to be inspired, rolls his head, leaps wildly about, and finally falls down in a trance, when he declares whether the god has accepted the services or not. At night, drinking, dancing, and beating tomtoms goes on, and in the morning they return home after an early meal. Those unable to leave home perform similar rites beneath a Mahwa tree.

SASSAFRAS PARTHENOXYLON is a lofty timber tree growing in the forests of Sumatra. The bark is rough and brown. The fruit has a strong balsamic smell, and yields an oil, considered useful in rheumatic affections. An infusion of the root is used in medicine. Sassafras bark of Tasmania (Atherosperma moschata, *Lab.*), used in remote parts of the colony as tea, also affords an essential oil.—*Eng. Cyc.*

SASSANIAN KINGS of Persia. The following are the dates given in Dr. Smith's Dictionary, with Dr. Mordtman's latest determinations of the genealogical history of this race, who ruled in Persia A.D. 226 to 632.

Smith. A.D.	Mordt. A.D.	
226	226	Ardashir Babegan bin Sassan, or Artaxerxes.
240	238	Shappuhr, Shahpur, or Sapor, captured Valerian.
273	269	Hormuzd or Hormisdas.
274	271	Bahram or Varanes I.
277	274	,, ,, II.
294	291	,, ,, III., Segan Shah.
294	291	Narse or Narses, conquered Armenia and Galerius.
303	300	Hormuzd or Hormisdas II.
310	308	Shahpur or Sapor II.
381	380	Ardashir or Artaxerxes II.
385	383	Shahpur or Sapor III.
390	389	Bahram or Varanus IV., Kerman Shah.
404	399	Yezdejird or Izdejerd I.
420	420	Bahram Gor or Varanes V., visited India.
448	440	Yezdejird or Izdejerd II.
458	457	Hormuzd or Hormisdas III.
458	458	Firoz or Perose, allied with Khakan of Huns.
484	485	Balas, Palash, or Balasces.
488	491	Kobad or Caodes.
498	498	Jamasp (Kobad recovers kingdom 502).
531	531	Khosru, Kesri (Nushirvan), or Chosroes.
579	571	Hormuzd or Hormisdas IV.; deposed by his general, Varanus VI. A.D. 590; M., A.D. 591.
591	591	Khosru Parvez, Kesri, or Chosroes II., put to death by
628	623	Kobad Shiruyieh or Siroes.
	629	Ardashir III., anarchy.
	629	Shariar or Sarbazas.
	629	Puran Dukht.
	631	Azermi Dukht.
	631	Ferokhzad Bukhtyar.
	632	Yezdejird or Izdejerd III., overthrown by Muhammadans 641.

This monarchy commenced in Persia in the year A.D. 226, when Artaxerxes overthrew the Parthian dynasty, and it continued until itself overturned by the Muhammadan khalifs in the year A.D. 632. The founder of the Sassanian dynasty died in 240. In his latter days a certain Arpog was king of China, one of whose sons, Mamkon by name, fled from home on account of a charge brought against him, and took refuge in Persia.—*Prin. Ind. Ant.* p. 13; *Thomas' Prinsep*, i. p. 302; *Yule, Cathay*, i. p. 84.

SASSETTI. Philip Sassetti, an Italian, visited India at the end of the 16th century. He studied Sanskrit, and noticed the resemblances between Sanskrit and Italian.—*Sayce*, i. p. 43.

SASTRA. Hind. An order, a command, a Hindu scripture, a religious work; Dharma Sastra, the code of Menu, or any book on law or science, religious books of the Hindus in general, and more especially certain philosophical systems, six in number. Also, as Sastri, a Hindu skilled in the Sastras, the literary title of a learned Hindu, as Ranganadam Sastri. It is written and pronounced Shastri, and in the south of India is the equivalent of pandit.

SATA, a clan of bards of Central India who are genealogists.

SATADRU or Sutudri, the river Sutlej.

SATAN, an evil spirit of the Jews, Christians, and Muhammadans. Shaitan, the Sathanos or Satan of Europe, was recognised by the Chaldees.

SATANI, 714,000 in number, are a sect of Hindus who to a great extent ignore caste distinctions. They are followers of Chaitanya, a religious teacher of the 15th century, and of his disciple Sanatana. They have views similar to those of the Baisnab reformers of Bengal. Many of them in Southern India worship Permalu, an incarnation of Vishnu, perambulate the street morning and evening, and accept alms from all but the lowest castes, often exacting the same by threats of burning themselves with a lamp. The temple servants are generally taken from the Satani. They are skilled in weaving flowers into

beautiful garlands. They are generally attached to the Vishnu temples; while the Pandarums are attached to the Siva temples. One of the Satani sects burn their dead; the other bury their dead in a sitting posture up to the head, then burst the head by throwing cocoanuts on it, and heap it over with earth.

SATARA, a town of the Bombay Presidency, in lat. 17° 41′ 25″ N., and long. 74° 2′ 10″ E., which gives its name to a revenue district, with an area of 5378 square miles. Early in the Christian era, Satara formed part of the dominions of the great Salivahana, whose capital was at Paitan, on the Godavery river. The Chalukya Rajputs next ruled the country, rising to their greatest power in the 10th century, and becoming extinct at the end of the 12th. The Jadhav rajas of Dowlatabad succeeded them for about a hundred years. The first Muhammadan invasion took place in 1294, and the Jadhav dynasty was overthrown in 1312. Two-thirds of the population consist of Mahrattas and Kumbi, who during the period of Mahratta ascendency (1674–1817) furnished the bulk of the armies. The Mawala, Sivaji's best soldiers, were drawn from the Ghatmatha (hill top) portion of the district. Brahmans, employed as priests or Government servants, are found in large numbers in the towns of Satara and Wai. Besides these, Vani, Dhangar, Ramusi, Mhar, and Mang are among the principal castes met with throughout the district. Satara was taken by the Indian army on 11th February 1818.

SATARUPA. Sansk. In Hindu mythology, the female half portion of the androgyne form of Brahma, framed out of one-half of Brahma's body; the type of all female creatures. The consort of Swayam-Bhuva.

SAT-DHARA, said to mean literally the hundred streams, is a group of Buddhist topes on the left bank of the Besali river, just below the junction of the Ghora-pachar river. The topes are two miles W.S.W. of the small village of Ferozpur.

SATHWARA, a humble tribe of the Bombay Presidency, similar in their habits and pursuits to the Kacheea.

SATI. Sansk. Good, pure; hence suttee, a good woman who immolates herself with the body of her deceased husband. The term is applied to a true and chaste wife.

SATI, a Hindu goddess, Siva's first wife, a daughter of Daksha. The gods whom Sati contained in her womb burst out; her limbs were scattered all over the world, and the places where they fell are become sacred. Her breasts fell near Jalandar in the Panjab, the yoni into Assam, and the guhya (podex) into Nepal, where they are worshipped to this day. The last is a small cleft in a rock, with an intermitting spring; it is called Guhyast'han.—*Wilford; As. Res.* vi. p. 477; *Moor*, p. 108.

SATIN.

Atlass, ...	Ger.	Atalas, Intalas, .	Malay.
Raso, ...	It.	Setim, ...	Port.

A silken fabric manufactured in Europe. A soft, closely-woven, twilled silken fabric, with a glossy surface. Satins are either plain or figured, and are made of all colours.—*Faulkner.*

SATIN-WOOD. The Swietenia chloroxylon furnishes this cabinet-wood. It is hard, and when polished is very beautiful, with a satiny lustre. It is much used for picture-frames, rivalling bird's-eye maple of America. It is occasionally used by cabinet-makers for general furniture, but it is liable to split. Satin-wood grows chiefly in mountainous districts of Southern India and Ceylon. It is abundant in the hills of the Vizagapatam and Ganjam Circars, though logs seldom exceed eight inches diameter. Very fine satin-wood occurs at Kutapatti, in the Tengrikottah taluk of Salem. It is used for mallets, also for the naves of gun carriage wheels, and is the best suited of all the Indian woods for fuses. The price is nearly the same as that of teak and black-wood. Colonel Frith mentions a satin-wood of Penang, of a straw colour, and a beautiful wood for ornamental furniture, etc.; but it is not known what satin-wood tree grows there. The best variety is the West Indian, imported from St. Domingo in square logs and planks from 9 to 20 inches wide; the next in quality is the East Indian, shipped from Singapore and Bombay in round logs from 9 to 30 inches diameter; and the most inferior is from New Providence, in sticks from 3½ to 10 inches square. The wood is close, not so hard as boxwood, but somewhat like it in colour, or rather more orange; some pieces are very beautifully mottled and curled. It was much in fashion a few years back for internal decoration and furniture; it is now principally used for brushes, and somewhat for turning; the finest kinds are cut into veneers, which are then expensive. The Nassau wood is generally used for brushes. The wood has an agreeable scent, and is sometimes called yellow sanders-wood. —*M.E.J.R.; Mr. Rohde, MSS.; Cleghorn; Col. Frith; Tredgold.*

SATNAMI, a monotheistic sect in the Central Provinces, who worship the Creator under the designation of Satnam, the pure name. The sect arose among the Chamars of the Ch'hattisgarh, Bilaspur districts, by the influence of Ghasi Das, one of their own number, who disappeared for six months, and on returning he explained to them how he had been miraculously sustained in the wilderness, how he had held communion with a higher power, and how he had been empowered to deliver a special message to the members of his own community. This message absolutely prohibited the adoration of idols, and enjoined the worship of the Maker of the universe without any visible sign or representation, at the same time proclaiming a code of social equality.

The movement occurred between the years 1820 and 1830, and nearly the whole Chamar community of Ch'hattisgarh now call themselves Satnami.

He died in the year 1850, at the age of eighty, and he was succeeded in the office of high-priest by his eldest son, Balak Das. They ignore Hindu festivals. As a rule, they are monogamists, though polygamy is not specially prohibited. Some forms of prayer collated from Hindu authors are said to exist among the teachers, but these are quite unknown to the people, and the only act of devotion which a Satnami practises is to fall prostrate before the sun at morn and eve, and exclaim, 'Satnam, Satnam, Satnam!' They will not even drink water except from one of their own caste, and liquor is prohibited. They are divided into two grand sections, the 'smokers' and 'non-smokers.' There is no class more loyal and

satisfied with British rule than this community. This movement had its origin at Girod, a small hamlet in the Bilaspur district, on the south bank of the Mahanadi, and on the borders of the Sonakhan estate. This class of deistical Chamars now numbers at least a quarter of a million. They are a thriving and industrious people, occupying a very important position as cultivators and village headmen in the Bilaspur district.

SATNARAMI, a religious sect of Hindus who settled near the town of Narnol, and about A.D. 1676, A.H. 1087, rose in insurrection in the time of Aurangzeb. They were principally engaged in trade and agriculture, and though generally peaceable they carried arms, and were always ready to use them in their own defence. In a quarrel with the police, one of their sect was beaten by a police soldier; his comrades retaliated, the affray spread till several thousands assembled, who defeated a body of troops sent against them, and took possession of Narnol. Two other bodies sent against them from Dehli were also worsted, and the belief arose that they were possessed of magical powers and bullet proof, while their enchanted weapons dealt death at every blow. Many of the neighbouring zamindars joined them, and the whole provinces of Ajmir and Agra were thrown into such confusion, that Aurangzeb, to restore order, thought it requisite to take the field against them, ordered his tents to be pitched, wrote verses of the Koran to be fastened to the standards as a protection against enchantment. The exertions of some chiefs at last induced the royal troops to make a stand, when the insurgents were defeated, and dispersed with great loss.—*Elphinstone*, 561.

SATPURA. This name is now generally applied to the mountain range or table-land which, commencing eastward at Amarkantak, runs nearly 600 miles up to the western coast of India, though the appellation seems to have been formerly restricted to that portion of the range which divides the Nerbadda and Tapti valleys. The Satpura range is known to Hindus as three portions, the most easterly being the Mykal, the centre is the Mahadeo, and only their western portion as the Injadri or Satpura. Chouragarh, 4200 feet above the sea, is the highest peak of the Mahadeo range. The Mahadeo portion culminates in the Pachmarri peaks, sacred to Mahadeo. From Rajpipla to Asirgarh consists of a belt of mountainous country, 40 or 50 miles in breadth, and of an average height at the crest of the chain, but little under 2000 feet above the sea, while many peaks rise above 3000, and some (and even some table-lands, as Turan Mal) are as high as 4000 feet. Nearly the whole of this range, both hills and valleys, consist of trap; but towards the west, along the northern boundary of Kandesh, a series of craggy peaks are met with, such as are but rarely seen in the trap region. Elsewhere the summit of the range is more or less a table-land. Just east of Asirgarh there is a break, through which the railway from Bombay and Kandesh to Jubbulpur passes, the highest part of which is only 1240 feet. This break leads from close to the junction of the two alluvial plains in the Tapti and Purna to a flat tract lying between the two Nerbadda plains. East of this break the trap hills continue till south of Hoshangabad, where sandstone and metamorphic rocks emerge and form a great portion of the hills of the Pachmarri and Betul country. There is a table-land of considerable extent round Betul, which extends far to the eastward beyond Chindwara and Seoni, and joins the high plateau of Amarkantak. Upon this plateau trap still predominates, and a great spur from it extends between the Tapti and the Purna, forming the northern boundary of Berar as far as the confluence of those rivers. This range is also of considerable height, in places nearly 4000 feet. Like most other ranges, it has no definite name, and is generally looked upon as a portion of the Satpura. The Satpura Hills divide the valleys of, and form the watershed between, the Tapti and Nerbadda, and the Satpura plateau is the true barrier between Northern and Southern India, and is the line on which the settlers from Hindustan met the emigrants from the Dekhan and Maharashtra, each of them pressing the prior non-Aryan races into the great natural fastnesses of Central India. In Hoshangabad are Bharia, Chamar, Gond, Gujar, Kunbi, Kurku, Lodhi, and Maria. In Maudla, Ahir, Baiga, Dher or Mhar, Dhimar, Gaoli, Gond, Kol, Kurmi, Lodhi, and Teli. In Nimar are Bhil, Bhilal, Dher, Gond, Kunbi, and Kurku; and in Seoni, Ahir, Bharia, Dher, Gaoli, Gond, Kurku, Mali, and Ponwar.

SATRAP. This term is familiar to the reader of the Grecian history of ancient Persia, with merely a softening of the initial letter, as Satrapa, the prefect of a province under the Persian system of government. It is an obsolete Persian title for the governor of a province. In Sanskrit it is a term obtained from one of the insignia of royalty, the royal umbrella, the Eka-ch'hatrya, the possessor of it being the Ch'hatra-pati, lord of the umbrella, a vaulted, horizontal umbrella, the exclusive privilege of royalty. It was under this title that the Persians, at a very early period, were in the habit of governing their numerous tributary provinces. The same system and the same denomination of satrap was adopted and retained by the Macedonian conquerors, alike when Greek or native officers were employed. And instances are frequent enough of the satraps assuming to themselves independence and a regal title. The satraps of the ancient Persian monarchy are not supposed to have extended across the Indus. It was in Alexander's time this limit was first transgressed; it was not long prior to the time when the Bactrian Greeks or the Parthians made themselves masters of Sind, Cutch, and Gujerat.—*Prin. Ind. Ant.* ii. p. 64.

SATR-SOWA, Myrtus communis, the myrtle; its leaves are eaten with black pepper to cure emissions that occur from debility.—*Genl. Med. Top.* p. 152.

SATRUNJAYA, or Palitana, a sacred mountain of the Jains in Kattyawar, about 30 miles from Gogo. Its name means victorious over the foe. From the earliest period of the Jain religion, spreading in Kattyawar, Satrunjaya has been one of the places held most holy by the followers of the Tirthankara. Rising in the midst of a vast plain, near the independent city of Palitana, in the S.E. corner of Kattyawar, this city of temples is reached by a difficult narrow road, and many stairs, on the side of which are built several small resting-stations and tanks. It is surrounded by fortifications, on which a few old guns are still mounted, and has ever been kept in such a state of constant repair, that it is now almost impossible

to trace remains which can safely be considered of the original structures. From the earliest mention of the place, embellishing and restoring seems to have been the work of its proprietors and projectors, and at the present date the same spirit animates Jains from all parts of India, and great care and labour are bestowed upon its numerous temples. One of the curious features of these restorations, is the application of a brilliantly white polished chunam to the outer side, and over every part of the stone-sculptured edifices, giving them the appearance of marble. Many of these temples are beautifully painted inside. Satrunjaya illustrates the Jaina custom of grouping their temples. They are in hundreds there, covering over the summits of two extensive hills. The smaller shrines line the streets; the larger temples are enclosed in 'tuks' or separate enclosures, surrounded by high fortified walls. A few yati or priests and a few servants are there to perform the daily services and keep the place clean, but there are no other residents there. The pilgrim goes up and returns. It is a city of the gods. The shrines are almost all the gifts of single wealthy individuals. Some are as old as the 11th century, but the largest number have been constructed since the early part of the 19th century. See Architecture.

SATTAN, a name of the Hindu god Ayenar, and not identical with Satan of the Bible.

SATTATHAVAN, a Vaishnava sect of the south of India, who are to the Vaishnava what the Vira Saiva are to the Saiva. They are flower-sellers, minstrels. See Satuni.

SATTU or Saktu. HIND. The flour or farina of parched grain of roasted barley or of pulse.

SATURN, in the sidereal theology, was represented by Bel.

SATURNIA. *Schrank.* A genus of insects belonging to the order Lepidoptera and the family Bombycidæ. The antennæ are fringed in the male; the head is small; the wings are very broad and entire; the palpi and trunk are wanting. The genus Saturnia includes now the Pavonia of Hubner, the Phalæna attacus, *Linnæus*, and part of the genus Bombyx of Fabricius. To this genus, also, some of the largest of the Lepidoptera belong; but S. atlas, the giant atlas moth, which has wings measuring 7 or 8 inches across, is now named the Attacus atlas. This species also, with S. cercropia and A. lunula, have their wings produced into a tail. The cocoons of A. cynthia and S. mylitta are used in India for the production of silk. Latreille states that these are the wild species of silk-worm of China. A. cynthia is the Arrindi silk-worm of India. S. promethia, a North American species, forms its cocoon within the leaf of a sassafras tree, having previously fastened the stalk of the leaf to the stem by a strong silken web, whereby it is prevented from falling with the other leaves.—*Westwood; Linn. Trans.* vii. See Silk-worm.

SATYA-GUNA. SANSK. The quality of truth, purity, and wisdom. Satya-loka, the region of truth, or Brahma. See Guna; Loka.

SATYASI, Chourasi, groups of 87 and 84 villages, resembles the English 'hundreds.' Satyasi, or 87, is a very frequent group; 84 is supposed to be the number of solar months in the year by the number of days in the week, $12 \times 7 = 84$.

SATYAVAMA and Lakshmi, wives of Balaji, an incarnation of Vishnu. These two, as his sakti, are generally seen with him as well as in his avatara of Krishna.

SATYAVATI, mother of Krishna Dwaipayana, and wife of king Santana. Bhishma was the son of king Santana by the holy river goddess Ganga, and hence called Santanava, Gangaya, and Nadi-ja or river born, also Tala Ketu or palm banner. His life was one of self-denial, devotion, and fidelity. He adopted a bachelor life, and abandoned his right of succession to the throne, in order to allow of his father's marriage with Satyavati. She bore two sons to his father, each of whom succeeded to power.

Bhishma obtained for the younger, Vichitra Virya, two daughters of the king of Kasi, but he died young and childless, on which Bhishma arranged that Krishna Dwaipayana, who had been born of Satyavati prior to her marriage with king Santana, should raise up seed to his half-brother. Two children were born, Pandu and Dhritarashtra, whom Bhishma brought up, and acted for them as regent of Hastinapura, and he also directed the education of their respective children, the Pandava and the Kaurava. In the war of succession which followed, he took a part, and on the tenth day of the fight he was unfairly wounded by Sikhandin, and pierced with many arrows from the bow of Arjuna, and died 58 days afterwards.—*Dowson.*

SATYAVRATA or Satyvrata is the Noah of the Hebrew writers. He is mentioned in the first Puraña as having received a warning of the coming deluge, in the form of an injunction to take with him into an ark, seven rishi or saints, all medicinal herbs, every variety of seeds, and pairs of all brute animals. Satyavrata acted on this, and when the flood abated, Vishnu descended to the earth in the form of a tortoise, and taking Mount Mandara on its back, the gods churned the ocean, and obtained the fourteen precious products, and amongst them medicines and the health-bestowing Dhanwantari.—*As. Res.* iii., vi., viii., ix.

SATYAYOGA, or Golden Age of the Hindus, is thus described:

'O lovely age, by Brahmans fam'd,
Pure Setye yug in Sanskrit nam'd!
Delightful! Not for cups of gold,
Or wines a thousand centuries old;
Or men, degenerate now and small,
Then one and twenty cubits tall.
Not that plump cows full udders bore,
And bowls with holy curd ran o'er:
Nature then reigned, and Nature's laws,
When females of the softest kind
Were unaffected, unconfined;
And this grand rule from none was hidden,
What pleaseth hath no law forbidden.'

SATYRIUM CUCULLATUM. *Thunb.*

S. bicorne, *Thunb.* | Orchis bicornis, *Linn.*

A plant of the Cape of Good Hope introduced into Bengal. S. Nepalense is the Phung of the Bhot race.

SAUDA, a celebrated poet who wrote in Hindi. He was born at Dehli about the end of the 18th century. His name was Mirza Rafai. He lived at Lucknow in the times of nawabs Saadat Ali and Asof-u-Dowlah, and had the literary title of Malik-us-Shura.

SAUR. HIND. A bull liberated. See Brikhotsarg.

SAURA, a drink in use in the Nicobars, obtained from one of the palms.

SAURA or Saora, a forest race on the mountains of the Eastern Ghats. Saura is supposed to be derived from Surya, identical with Sol, the sun; a sun-worshipper.

SAURAPATA or Saura, Hindu worshippers of Suryapati, the sun-god. A sect of limited extent and total insignificance.

SAURASHTRA, an ancient name of the peninsula of Gujerat, which is supposed by General Cunningham to have been lost in A.D. 319, when the successors of the Sah kings were supplanted by the Vallabhas, and the capital changed from Junagarh to Vallabhi. In ancient times, however, the peninsula of Gujerat was only known as Saurashtra, and under this name it is mentioned in the Mahabharata and in the Puranas. It is called Surashtrene by Ptolemy and the author of the Periplus, and its people are most probably intended by Pliny under the corrupt name of Suarataratæ or Varetatæ, properly Suratæ.

Okamandil is a sterile jungly tract in the extreme north-west of the Saurashtra peninsula, and contains about 13,000 inhabitants. These are the Wagher. Their only important places are the holy Hindu site of Dwaraka on the west coast, and Beyt, a small island a few miles to the north, with shrines boasting of scarcely inferior holiness. Okamandil, as also Umreyli in Kattyawar proper, and Korinar in South Kattyawar, are under the direct rule of the Gaekwar. In 1803, 1858, and in October 1859, they repulsed British troops, but in 1860 they seemed entirely dispersed or surrendered. Kattyawar is rich in jungle fastnesses. On one occasion, the rapidity and severity of the vengeance, in the escalade of the stronghold of the Wagher pirates of Dwaraka by the British force under the Hon. Colonel Lincoln Stanhope, induced Singram, the chief of the Badhail of Beyt, to sue for terms, and he agreed to surrender Beyt and to live at Aramra on a stipend furnished by his suzerain, the Gaekwar.

The Wagher of Dwaraka, who, with the Badhail of Aramra, were so long the terror of these seas, are a spurious branch of the Jhareja family of Bhooj, one of whom, called Abra, with the cognomen of Muchwal or the whiskered, from a tremendous pair of these adjuncts to the face, came from Cutch in the time of Rinua Sowa, in whose family he intermarried, and from whom he held in charge the tha'na or garrison of the castle of Goomti or Dwaraka. His son had offspring by a woman of impure caste, and they assumed the name of Wagher, with the distinctive office of Manik or gem. The last four chieftains of this race were Mahap-Manik, Sadul-Manik, Sameah-Manik, and Mulu-Manik, who, with all his kin and motley company of Wagher, Badhail, Arab, etc., after a desperate defence, was slain in the storm or attempted retreat. Throughout the sea-coast of Saurashtra, at Gogo and Mandavie, are seamen who call themselves Hiudus, but who keep entirely distinct from all other classes. Some of them claim a descent from the mariners of the Arabian shores, but still as Hindus. The Badhail fixed themselves in the district of Oka (Okamandala) on the migration of Seoji from Kanouj.—*Tod's Travels*, pp. 220, 440, 441; *Rajasthan*, ii. p. 14.

SAUSSUREA, a genus of plants of the order Compositæ; 13 species occur in the Himalaya and plains of India.

S. gossypina. In East Nepal, at the summit of the Wallan Choon pass, at an elevation of 16,748 feet above the sea, the plants gathered by Dr. Hooker near the top of the pass were species of Compositæ, grass, and Arenaria; the most curious was S. gossypina, which forms great clubs of the softest white wool, six inches to a foot high, its flowers and leaves seeming uniformly clothed with the warmest fur that nature can devise. Generally speaking, the alpine plants of the Himalaya are quite unprovided with any special protection of this kind; it is the prevalence and conspicuous nature of the exceptions that mislead, for the prevailing alpine genera of the Himalaya, Arenarius, primroses, saxifrages, fumitories, ranunculi, gentians, grasses, sedges, etc., have almost uniformly naked foliage.—*Hooker, Journ.* i. p. 225.

S. lappa, *Bentham*, is the Haplotaxis lappa, *Decaisne*. It is a perennial plant of Kashmir, and its aromatic root has been supposed to have formed part of the costus of the ancients.

SAVA or Saveh, a town in Persia lying between the towns of Kazvin and Isfahan. This is supposed to be the ancient Saba, whence the three magi took their departure when they proceeded to adore the infant Jesus at Bethlehem.

SAVA, eldest son of Rama, the ancestor of the Balla, a Suryavansa race of Rajputs.

SAVANDRUG, a hill fort in the Bangalore district of Mysore, locally known as the Magadi Hill, 4024 feet above sea-level; lat. 12° 55′ N., and long. 77° 21′ E. It consists of an enormous mass of granite, standing in a base 8 miles in circumference.—*Imp. Gaz.*

SAVANORE or Sanore. Its chief is a Pathan, whose ancestor, in 1750, was one of the three Pathan Muhammadans who conspired against Nasir Jung.

SAVINGS BANKS. The Indian Government sanctioned a scheme for the transfer of savings banks from local treasuries to the post-offices. Thus, 3800 savings banks will be established throughout India.

SAVU ISLAND. Its S.E. point is in lat. 10° 37′ S., and long. 122° E., and is 18 miles long. Savu and Rotti are small islands to the west of Timor, and very remarkable as possessing a handsome race, with good features, resembling in many characteristics the race produced by mixture of the Hindu or Arab with the Malay. They are certainly distinct from the Timorese or Papuan race, and must be classed in the western rather than the eastern division of the Archipelago.—*Wallace*, ii. p. 277.

SAWUNTWARI, a Native State about 200 miles south of Bombay city. Area, about 900 square miles, and population 190,814 in 1872, and 174,433 in 1881, mostly Hindus. A dialect of Mahrati, known as Kurauli, is spoken. The Mahrattas and Mhars are favourite recruits for the Bombay native infantry regiments. This state is ruled by the Sawants, hereditary deshmukhs of Wari, near Goa; they are of the Bhonsla family. In 1709, the British opened relations with Phond Sawant, nephew of Khem Sawant, who in 1707 received from Sahoji a deed confirming him in full sovereignty. In 1730 the British and Phond concluded a treaty against Kanoji Angria, the piratical chief of Kolaba. In 1738 Phond was succeeded by his grandson, Ramchandra; in 1755 Ramchandra's

son Khem succeeded, and his 48 years' rule, till his death in 1803, was one long war with various Mahratta chiefs, and with the Portuguese. In 1765 the British sent a force against him, and he ceded Vingorla and Fort Reree. Being childless, his widow adopted Ramchandra Bhao, who was murdered in 1807. He was succeeded by Phond, who died in 1812, and the regent, Durga Bai, forcibly seized districts belonging to Kolhapur, and during the war with the Peshwa, she supported his cause; but a British force was sent to reduce the country, and in 1819 a treaty was agreed upon, ceding the whole line of the sea-coast. In 1830, and again in 1832, the British had to aid Khem Sawant to suppress rebellions.

SAWUR. Malay. A very beautiful and useful wood of Java; the colour resembles that of mahogany, but the grain is closer, and it is more ponderous; its chief use is for handles of tools for carpenters and other artificers, for machinery, especially for the teeth of the wheels of mills, and other purposes where a hard and durable wood is required. On account of its scarcity, it is uniformly cut down in Java before it arrives at the necessary size for cabinet-work. Forests of it grow on the hills of Bali, opposite the Javan shore, whence it is brought over by boat-loads for sale.

SAXIFRAGACEÆ. *D. C.* The saxifrage tribe of plants, comprising the genera Hydrangia, Ciamitis, Adamia, Saxifraga, Chrysosplenium, Tiarella, Astilbe, and Vahlia. A saxifrage, the Shih-hu-wei and Ngo-puh-shih-ts'au of the Chinese, an acrid plant, grows near water; it has small yellow flowers, and is recommended in all diseases of the senses and great orifices of the body; it acts as an emetic and diaphoretic.

Saxifraga ligulata, *Wall.*

Makhan, . . . Beas.	Bat pia, . . . Jhelum.
Shap rochi, . . Chenab.	Popal wat phula, Kangra.
Kurgotar dharposh, ,,	Saprotri, . . . Ravi.
Banpatrak, . . . ,,	Til kachalu, Shiblack, ,,

Cultivated in the Himalaya. Root given in honey to teething children; leaves used by Hindus as food platters.—*J. A. Murray.*

Saxifraga stenophylla, *Royle.*

Fairy-hair, . . . Eng. | Mu-i-pari, . . . Pers.

So named from its numerous thread-like stolons, in which and its general appearance it closely resembles the Saxifraga flagellaris of Melville Island.

SAYANA, the headman of a hill village in the N.W. Himalaya.

SAYANACHARYA, a man of high station and a deservedly celebrated scholar, who wrote a commentary of the Vedas. He was brought up at the court of Vira Bukka Raya, raja of Vijayanagar, in the 14th century A.D.

SAYANI CHANDRA SEKHARA, author of the Madhurani Ruddha, a drama in eight acts; the style has considerable merit.—*Wilson.*

SAYER. Arab. Literally travelling; but in the fiscal system of India applied to the transit duties levied on goods passing from one district or one territory to another. It was finally abolished in 1834, 1837, and 1844, in the three presidencies of Bengal, Bombay, and Madras. The transit duties in Madras amounted to £310,000 sterling a year.

SA-y-NORONHA. Constantine de Sa-y-Noronha and all his army of 1500 Portuguese and 20,000 natives were destroyed by the king of Kandy in the early part of the year 1632.

SBANGJA. Hind., Tib. Moss tea, a substitute for real tea.

SCABBARD. For these, the people of the East Indies set a great value upon the skin of a fish which is rougher than a seal-skin. Upon the back of the fish there are six little holes, and sometimes eight, somewhat elevated, with another in the middle, in the form of a rose; and the more those holes grow in the form of a rose, the higher value they put upon them. Tavernier had seen ten thousand crowns given for a skin.—*Tavernier's Tr.* p. 151.

SCÆVOLA TACCADO. *Roxb.* Grows on the Coromandel coast and deltas of Indus and Ganges. It is eaten as a pot-herb. Artificial flowers from the pith of its stem and branches are made by the Malays.

SCALIE, of Cuttack, the fibre of a gigantic twining plant, common throughout the forest jungles of the district. It is used for cordage, and is made into twine for mat-making and roofing purposes.

SCALLOP. Jula, Hind., Kashkul, Pers. The fakir's dish, made of a half sea-cocoanut shell. Speaking of a child of unknown parentage, the phrase is, Fakir-ke-jhulay men tukra kon dala? Who threw the portion into the fakir's scallop, who can tell?

SCALPING. All Hindus retain only the tuft of hair on the crown of their heads, which is familiar to Europeans from the pictures and descriptions of the Indians of North America, as the scalp-tuft, the most glorious trophy, if not the sole reward of their victor. The Hindu practice of wearing this scalping tuft, Shik'ha, Sansk., d'Zutu, Tel., Kudi mai, Tam., was doubtless brought with them from Scythia; for, like the Indians of North America, the Scythians cleaned the scalp and hung it to their horses' bridles. Scalping is generally supposed to be a peculiarly North American practice that originated in High and North-Eastern Asia. But the father of history says, 'Of the first enemy a Scythian sends down, he quaffs the blood; he carries the heads of all that he has slain in battle to the king; for when he has brought a head, he is entitled to a share of the booty that may be taken,—not otherwise; to skin the head, he makes a circular incision from ear to ear, and then, laying hold of the crown, shakes out the skull; after scraping off the flesh with an ox's rib, he rumples it between his hands, and, having thus softened the skin, makes use of it as a napkin; he appends it to the bridle of the horse he rides, and prides himself on this, for the Scythian that has most of these skin napkins is adjudged the best man, etc. They also use the skulls for drinking-cups.'

The Abbe Em. Domenech (Seven Years' Residence in the Great Deserts of North America, xxxix.) quotes the decalvare of the ancient Germans, the capillos et cutem detrahere of the code of the Visigoths, and the annals of Flude, which prove that the Anglo-Saxons and the Franks still scalped about A.D. 879. Abbe Domenech relates a conversation between two warriors. Is it a chief who speaks to Mahto-totia? See the scalp which hangs from the bit of my horse, answered the Scheyenne. The scalp fastened to the extremity of a pole was placed in the conqueror's cabin; and

on days of parade or battle, in front of the cabin. The chiefs suspend it to their horses' bridles.

SCAMMONY.

Sukmoonia, . . ARAB.	Purgirwinde, . . GER.
Scammonium, DA. DU. SW.	Scammonea, . . . IT.
Scammonee, . . . FR.	Pessya smert, . . . RUS.
Skammonien, . . . GER.	Escamonea, ... SP.

Scammony, the Sukmoonia of the Arabs, is found in the bazars of India; it is the product of Convolvulus scammonia, a native of Syria, the Levant, and Gujerat. The most abundant harvest of scammony is in Smyrna and Aleppo. There are several modes of collection, which give rise to corresponding commercial varieties.

SCARFS of fine muslin form part of the dress of most of the Hindu castes, and are worn suspended from the neck to about the middle of the thigh. They are largely manufactured in many parts of India. Dehli scarfs are of Kashmir cloth or net, embroidered with silks of various colours. Those of black cloth, black net, embroidered with white or gold-coloured floss silk, are the most chaste and beautiful. The art was introduced into Lahore and Dehli by Kashmir artisans, and Muhammadans are employed on it.

SCARLET MITE, or Red Spider, is the Acarus telarius or Gamasus telarius, an insect which envelopes the leaves of the coffee plant in a delicate, closely-woven web, which so checks the respiration that the plant becomes dry and withered.

SCEPTRE, the Ch'hari of the Hindu rulers, a long rod with an iron spike on it, often placed before the gadi or throne. Ch'hari mazbut t'ha, his rod was strong, is a familar phrase, which might be rendered, his sceptre is firm.—*Tod's Rajasthan*, i. p. 410.

SCHIEFNER. F. A. von Schiefner was an authority on Finnish, edited Castren's grammars of Samoyedan and similar languages, and translated the northern epic, the Kalewala. He worked with great results among the mysterious languages of the Caucasus, and helped General von Uslar in his discoveries in the ethnology and philology of that region. But his speciality was Tibetan. The Russian Government became possessed of copies of two editions of the Kah-gyur, one of the two collections of sacred books of Tibet, which run to 100 or 108 volumes folio; the companion encyclopædia, the Tan-gyur, consisting of 225. From the first of the seven divisions of the former group, Professor Schiefner extracted all the legends and stories. They correspond to the stories of the Panchatantra, of the Russian collections of folk-lore, of Æsop, and of the Brothers Grimm. Thus the opening tale of King Mandhatar and his immoderate wishes is the same as Grimm's Fisherman and his Wife; that of Kusa is much like Beauty and the Beast; the Clever Thief is a variation of the well-known story told by Herodotus of the treasure of Rhampsinitus. One of the best stories is that of Visakha, a clever and virtuous girl, whose ways of helping people out of difficulties are innumerable. Among her decisions is one between two wives who are claiming possession of a son, an exact counterpart of the Judgment of Solomon. The story of Susroni and her magic lute is akin to those of Orpheus, Amphion, and the Pied Piper of Hamelin; and the humiliations of Madri, the wife of the princely Visvantara, are an anticipation of those of patient Griselda. The similarity of the short animal stories to Æsop and other western collections, is apparent, the chief differences being purely local, the jackal taking the place of the fox, the lion of the wolf, and so forth. Most of them, however, deal with monkeys, who live in bands of five hundreds under a chief, wise or foolish.

SCHIMA WALLICHII. *Choisy.* A valuable timber tree of Darjiling, India, growing up to 5000 feet. It attains to 100 feet in height.

SCHIZODACTYLA MONSTROSA. *Westwood.* The great cricket or carpenter insect, the Jheengoor, HIND., is about 1½ inches long and the thickness of a man's little finger; bores cylindrical passages in garden grounds, and issues at night, filling the air with a whizzing kind of chirp. It nips off the stems of the plants near its hole. It is destroyed by pouring water in, and killing it as it is escaping.

SCHIZOSTACHYIUM BLUMEI. *Nees.* A lofty bamboo growing in Java at 3000 feet. Other species occur in Madagascar, China, the Philippine Islands, and in the S. Sea Islands. S. brachycladum, *Kurz*, of the Sunda Islands and Moluccas, has stems 40 feet high and very hollow. S. elegantissimum, *Kurz*, of Java, from 3000 to 6000 feet, grows to 25 feet, and flowers in the third year. S. Hasskarlianum, *Kurz*, of Java, and S. serpentinum, Gigantochloa aspera, alter, maxima, and robusta, afford the best kinds of bamboo vegetables, in the young shoots as they burst out of the ground.

SCHLAGENTWEIT, three brothers, Herman, Robert, and Adolphe, who were employed from the year 1855, to report on the physical geography of India and High Asia. They collected and published a vast amount of information. Adolphe, the youngest, was murdered at Kashgar by its fanatic ruler, Wali-Khan. At the time of his journey, Yarkand was occupied in force by a Syud chieftain of one of those predatory bands with whom the Chinese are continually at war, named Dilla Khan or Zullat Khan. Soon after reaching the city, Dilla Khan met with a severe defeat from the Chinese forces, and was obliged to retire. A. Schlagentweit finding himself disappointed in this direction, took the resolution of going to Kashgar, at that time occupied by another Syud chieftain, named Wali-Khan. This man was possessed of considerable power on the borders, and was honoured by the title of Pir. On arrival near the camp of this chief, Adolphe pitched his tents at the distance of a cos, and sent forward Muhammad Amin to notify his advent. In a little time a person came over, who forthwith proceeded to take an inventory of the traveller's property. His arms were also demanded, and surrendered. He was then compelled to go to Wali-Khan's camp, and on remonstrating appears to have been summarily beheaded with a sword. This was about the 26th August 1857.

SCHLEGEL, A. W. VON, a Sanskrit scholar, who in 1823 published an edition and Latin version of the Bhagavat Gita, and in 1829-38 two volumes of the Ramayana, with a translation of the first volume.

SCHLEGEL, FRIEDRICH, a poet and learned Sanskrit scholar, in 1808 published The Language and Wisdom of the Indians. He laid down that the languages of India, Persia, Greece, Italy, Germany, and Slavonia form one family.—*Sayce*, i. p. 49.

SCHLEICHERA TRIJUGA. *Willd.*

Melicocca trijuga, *Juss. DC*

Ghuntiah-koosoomoo, ,,

This tree grows in the warmer parts of Ceylon, also in Coimbatore; common in Canara and Sunda, is not uncommon in the Dundele forest and in the forests of the South Konkan, is common in those of the North Konkan, is said to be very abundant in the Govavery forests, and abundant in Burma. It is found in greatest perfection on the banks of the Sitang in the Karen forests above Tounghoo; but is also found throughout the Pegu and Tounghoo forests in abundance, more particularly the latter. It is also found along with teak in Tharawaddy and Prome forests. A cubic foot there weighs 70 lbs.; grows in all the valleys and outer ranges of Kamaon. It occurs rarely, wild, in the Siwalik tract up to the Beas, and on the eastern verge of the Panjab. It produces a red, strong, hard, and heavy wood, which is used to make pestles, spokes for cart-wheels, and other purposes where much strength in small space is required, and as crushers for sugar, rice, and oil mills, screw rollers for sugar mills, cotton presses, etc., and the axle-trees of carts and ploughs. The seeds yield an oil which is used for burning, and from the young branches a considerable quantity of lac is gathered. The fruit is sometimes quite smooth, but occasionally armed with prickles. It ripens in May, and its pulpy aril is of a very agreeable acid taste. The bark is astringent, and is used rubbed up with oil by the natives to cure the itch. —*Roxb.; Voigt; Wight; Gibson; Brandis; Thw.; Thomson; Cat. Ex.*, 1862; *Mr. Rohde; Beddome.*

SCHMIDELIA, a genus of plants of the order Sapindaceæ; several species occur in the E. Indies. Sch. acuminata, *Thw.*, a small tree of Galagama, in Ceylon, on the banks of streams, at an elevation of 2000 to 3000 feet. Sch. allophylla, *D. C.*, a small tree, a variety of which grows at Ambagamowa and Hinidoon districts of Ceylon, up to an elevation of 3000 feet; another variety grows in the Central Province, at an elevation of 2000 to 5000 feet. Sch. hispida, *Thw.*, a small tree, grows in the Ambagamowa district of Ceylon at an elevation of 1000 to 2000. Sch. dentata, *Wall.*, occurs in Assam and in Chittagong, and Sch. glabra, *Roxb.*, and Sch. villosa, *Wight.—Roxb.; Voigt; Thw.*

SCHMIDELIA SERRATA. *D. C., W. and A.*

Ornitrophe serrata, *Roxb. Cor. Pl.*
Rakhal phul ka jhar, Hind.
Korra chettu, . . Tel.
Tantisa, Tualike, . Tel.

A straggling shrub or small tree with ternate leaves. It grows in the Peninsula of India and Bengal. Timber very small. Its small red ripe berries are eaten, and the astringent root is employed to check diarrhœa.—*Roxb.; Voigt; M. E. J. R.; O'Sh.; Thw.*

SCHOLASTIKOS, the Thebæan, travelled in India a few years before the Chinese missionary Fa Hian, and was detained a prisoner for six months in the pepper districts of Malabar. Some account of his journey is given by Palladius.

SCHORL is found in Madura in great abundance, also in quartz near the mouth of Tavoy river on the east side, and also at the foot of the eastern mountains, near the headwaters of the Dahgyaine, north-east of Moulmein. In both localities in Tenasserim the crystals are numerous, and in Tavoy they are large.

SCHOUTEN. Cornelius Schouten was one of the earliest Dutch voyagers by the west to the Spice Islands. He discovered Cape Horn in 1606, naming it after Hoorn on the Zuyder Zee, his own and Tasman's birthplace. Staten Island, near it, was called after the States of Holland, and Strait Lemaire from the projector of Schouten's voyage.

SCHREBERA SWIETENIOIDES. *Roxb.*

Weavers' beam tree, Eng.
Moka, Noka, . . Hind.
Makkam of Nullamallay?
Mava-linga maram, Tam.
Moga-linga maram, ,,
Makadoo chettu, . Tel.

A large timber tree, a native of the valleys of the mountainous parts of the Rajamundry Circars, the Nullamallay range, the Balaghat mountains, the Thull Ghat near Bhewndy, Jowar, the Central Provinces, and the Hala mountains, west of the Indus. Its wood is of a grey or yellowish colour, very close grain, heavy, and durable. It is much employed by weavers for beams and for many other purposes of their looms. It is said not to be liable to warp or bend; and was recommended by Roxburgh as a substitute for box, in the scales of mathematical instruments.—*Roxb.; Beddome; Mr. Rohde, MSS.; Major Pearson.*

SCIÆNA, a genus of fishes. S. aquila (Maigre of the French, and Umbrina of the Romans), etc., is found in the Mediterranean. S. pama or Bola pana of Buchanan resembles the maigres, but has a singular natatory bladder. When twelve or fifteen inches long, it is called whiting at Calcutta, and furnishes a light diet. It is caught in great abundance at the mouths of the Ganges, but never ascends higher than the tide.

SCILLA COROMANDELIANA. *Roxb.* A plant of the sandhills of the Coromandel coast.

Scilla Indica, *Roxb.*, Indian squill.

Iskil, ... Arab.
Kanda, Koondree, Beng.
Pa-daing-khyet-thwon, Bu
Jungle Piaz, . . Hind.
Nurri vungajum, . Tam.
Adavi tella-gadda, . Tel.

This plant occurs on the sea-shores of the Indian Peninsula. When in blossom, the plant is entirely destitute of leaves; the bulbs are round, white, the size of an orange. Its root is bitter and nauseous, like that of squill. It is extensively used in place of the officinal squill. Few plants are so much influenced by climate and circumstances as the squill.—*Voigt; O'Sh.*

Scilla maritima, *Linn.*

Urginea maritima, *Steinh.*
Ornithogalum maritinum, *T.*
O. squilla (*a*), *B. M.*
Iskil, ... Arab.

This European plant furnishes the squill used in medicine as a diuretic.

SCINCIDÆ, the skinks, a family of reptiles of the order Sauria or lizards, and sub-class Reptilia.

SCINDAPSUS. *Schott.* A genus of plants of the order Araceæ, sect. Calleæ, sub-sect. Callinæ. The following are East Indian species:—

S. caudatus, —? Penang.
S. decursivus, *Schott*, Sylhet.
S. giganteus, *Schott*, Penang, Singapore.
S. glaucus, *Schott*, Khassya, Paras, Nepal.
S. officinalis, *Schott*, all British India, Burma.
S. pcepla, *Endl.*, Sylhet.
S. pertusus, *Schott*, Coromandel, South Konkan.
S. pinnatifidus, *Roxb.*
S. pinnatus, *Schott*, Malayana.

Scindapsus officinalis, *Schott.*

Pothos officinalis, *Roxb.*

Gaj pipal, BENG., HIND. | Ati tipili, ... TAM.
Ouna tipili, . . MALEAL. | Gaja pippali, . . TEL.

This perennial plant grows at Calicut, in Bengal, the Monghir mountains, Rangoon, Moulmein, Cochin-China; its dried fruit is used medicinally, and it is cultivated for this purpose at Midnapur.

Scindapsus pertusus, *Schott.*

Pothos pertusus, *Roxb.* | Iletadi maravara, MALEAL.

A climbing plant growing on the Coromandel mountains and on the western coast of India, in the S. Konkans. The pericarp is used in leprosy and scabies.—*Roxb.; Voigt.*

SCIRPUS, a genus of plants of the order Cyperaceæ. Dr. Roxburgh (i. 200-202) described 41 species of India, most of which have been transferred to other genera. Sc. junciformis, *Necs*, Sc. juncoides, *Roxb.*, grows in Bengal. Sc. kysoor, *Roxb.*, Keshar, BENG., a plant of Bengal.

Scirpus capsularis, *Smith*, Tang-sin-ts'au, CHIN., is grown in Kiang-nan and Shen-si, in China, for making mats and lamp-wicks; for the latter purpose the consumption is enormous. The Chinese watch the growth of the flower like snuff of lamps and candles, and draw omens from the appearance. The stalks are steamed and the cuticle peeled off, leaving the central white pith, which is used as a tent in surgery. It is used as a ptisan or menstruum for other drugs; its ashes are given to children to prevent them crying at night.—*Smith.*

Scirpus tuberosus, *Smith.*

Eleocharis tuberosus.

Wu-yu, Puh-tsi, . CHIN. | Water chesnut, . ENG.
Pi-tsi, ... ,, |

This sedge plant grows wild in watery places in Hu-peh in China. The tubers, called Ti-lik by the Chinese, meaning ground chesnuts, are called by the English water chesnuts; an arrowroot is prepared from it.—*Smith.*

SCIURIDÆ, a family of mammals belonging to the order Rodentia. The East Indian genera and species are as under:—

Fam. Sciuridæ, or Squirrels.

Sciurus Malabaricus, *Schintz.*, Malabar squirrel.
S. maximus, *Blyth.*, *Horsf.* | Jangli gilhri, . . HIND.
Malabar, Wynad, Neilgherries, Travancore.

Sciurus maximus, *Schr.*, *Ell.*, *Bly.*, red squirrel.
Kat herral, . . . BENG. | Kairat, ... HIND.
Rasu, Ratuphar, . ,, | Kondeng, . . . KOL.
Per-warsti, . . . GOND. | Bet-udata, . . . TEL.
Central India.

Sciurus Elphinstonei, *Sykes.*

S. Bombayanus, *Sch.*, *Ell.*

Red squirrel of BOMBAY. | Shekra, ... MAHR.
Kes-annalu, . . . CAN. |
Western Ghats, Malabar, Mahabaleshwar.

Sciurus macruroides, *Hodgs.* Black hill squirrel.
S. bicolor, *var.* Indica, *Bly.* | S. giganteus, *M'Clelland.*
Shingsham, . . BHOT. | Le-hyuk, ... LEP.
S.E. Himalaya, Nepal, Sikkim, Assam, Burma.

Sciurus macrourus, *Forst*, *Blyth*, *Horsf.*, *Hardw.*
S. Ceylonensis, *Bodd.* | Grizzled hill squirrel, ENG.
Ceylon, S. India.

Sciurus ephippium, *Muller*, Borneo.

Sciurus lokriah, *Hodg.*, *Blyth.*

S. subflaviventris, *M'Clelland.*

Zhamo, ... BHOT. | Killi, ... LEP.
Orange-hellied grey | Killi-tingdon, . . ,,
squirrel, . . . ENG. | Lokria, . . . NEPAL.
S.E. Himalaya, Nepal, Sikkim, Bhotan.

Sciurus lokrioides, *Hodg.*, *Blyth.*

S. lokriah, *Gray.* | Hoary-bellied grey squirrel.
S.E. Himalaya, Nepal, Sikkim, Bhotan.

S. Assamensis, *M'Clell.*, Sylhet, Dacca.
S. ferrugineus, *F. Cuv.*, N.E. India.
S. erythræus, *Pallas*, N.E. India.
S. erythrogaster, *Blyth*, N.E. India.
S. hyperthrus, *Blyth*, N.E. India.
S. chrysonotus, *Blyth*, N.E. India, and also in Tenasserim.
S. hyperythrus, *Is. Geoff.*, N.E. India.
S. Phayrei, *Blyth*, N.E. India.
S. Blanfordi, *Blyth*, N.E. India.
S. atrodorsalis, *Gray*, Tenasserim.
S. palmarum, *Gm.*, *Bl.*, *Ell.*

S. penicillatus, *Leach.*

Beral, Lakki, . . BENG. | Kharri, ... MAHR.
Alalu, ... CAN. | Vodata, ... TEL.
Gil'hri, ... HIND. | Urta, . . . WADDAR.
Common striped squirrel, Peninsula of India.

Sciurus tristriatus, *Waterhouse.*

S. palmarum, *Ell.*, *Bl.* | S. Kelaarti, *Layard.*
S. Brodiei, *Layard.* |
Striped jungle squirrel, Ceylon, Pen. of India, is the most common species of palmist squirrel in Ceylon.

Sciurus Layardi, *Blyth*, Travancore striped squirrel of Ceylon, Travancore. It has a parachute.

Sciurus sublineatus, *Water.*, *Blyth.*

S. Delesserti, *Gervais.* | Neilgherry striped squirrel.
Ceylon, forests of S. India, Travancore, Neilgherry.

Sciurus insignis, *Horsf.*, Java.

Sciurus M'Clellandi, *Horsf.*, *Blyth*, *Hod.*

S. chikhura, *Blyth.* | S. Pembertoni, *Blyth.*
Small Himalaya squirrel. | Kalli gangdin, . . LEP.
N.E. India, Himalaya, Sikkim, Bhotan, Khassya.

Sciurus Barbei, *Blyth*, Tenasserim.

Sciurus plantani, *Horsf.*, Java.

Sciurus bicolor, *Blyth*, Tenasserim.

Sciurus Brodiei, *Blyth*, Jaffna.

Sciurus Rafflesii, *Vig. and Hors.*, S. Prevostii, *Desmarest*, Malay Peninsula.

Sciurus redimitus, *Vander Boon.* S. rufogularis, *Gray*, Borneo.

Sciurus Berdmorei, *Bly.*, Mergui.

Sciurus Europæus, *Linn.*, North and Central Asia, Europe.

Pteromys petaurista, *Pallas*, *Blyth.*

P. Philippensis, *Ell.* | P. oral, *Tick.*
Brown flying squirrel, ENG. | Pakya, MAHR. of GHAT.
Orai . . . . of KOL. | Para-chaten, . . MALAY.
Forests of Ceylon, Pen. of India, Central India.

Pteromys inornatus, *Is. Geof.*, *Jacq.*, *Blyth.*

Pt. alhiventer, *Gray.*

Rusi-gugar, . . KASHM. | White-bellied flying squir.
N.W. Himalaya, at 6000 to 10,000 feet.

Pteromys magnificus, *Hodg.*, *Bly.*

P. chrysothrix, *Hodg.* | Sciuropterus nohilis, *Gray.*
Red-bellied flying squirrel. | Biyom, ... LEP.
S.E. Himalayas, Nepal to Bhotan, Khassya Hills, Assam Hills.

Pt. cinerascens, *Blyth*, Burma.
Pt. nitidus, *Geoff.*, Malay Peninsula.
Pt. elegans, *S. Muller*, Java.
Pt. Philippensis, *Gray*, Philippines.

Sciuropterus caniceps, *F. Cuv.*, *Gray*, *Blyth.*

Pt. senex, *Hody.*

Grey-headed flying squir. | Biyom chimbo, . . LEP.
Nepal, Sikkim.

Sciuropterus fimbriatus, *Gr.*, *Blyth.*
P. Leachii, *Gray.* | Grey flying squirrel.
N.W. Himalaya, Simla to Kashmir.

Sciuropterus Baberi, *Blyth*, Afghanistan.

Sciuropterus alboniger, *Hod.*, *Blyth.*
S. Turnbulli, *Gray.*
Piam, Piyu, . . BHOT. | Khim, ... LEP.
Black and white flying squirrel, Nepal, Bhotan.

Sciuropterus villosus, *Blyth.*
S. sagitta, *Walker.* | Hairy-footed flying squirrel.
Bhotan, Sikkim, Assam, at 3000 to 6000 feet.

Sciuropterus fusco-capillus, *Jerd.*, *Bly.*, small Travancore flying squirrel.

Sciuropterus Layardi, *Kel.*, *Blyth*, Ceylon.

Sciuropterus spadiceus, *Blyth*, Arakan.

Sciuropterus Phayrei, *Blyth*, Pegu, Tenasserim.

Sciuropterus sagitta, *Linn.*
Pteromys sagitta, *Geoff.* | Sciurus sagitta, *Linn.*
Sciurus maximus volans, seu Felis volans, *Brisson.*
Grand Ecureuil volant, *Bu.* | Le Taguan, . . . FR.
This squirrel has a small rouuded head. Length, from nose to tail, 18 inches; tail, 15 inches (Pennant). It inhabits Java and islands. It leaps from tree to tree as if it flew, and will catch hold of the boughs with its tail.

Sciuropterus Horsfieldii, *Waterhouse*, Malayana.

Sciuropterus genibarbis, *Horsf.*, Malayana.

Sub-Fam. Arctomydinæ, Marmots.

Gen. Arctomys bobac, *Sch.*, *Bly.*, *Pal.*
A. Tibetanus, *Hodg.* | A. caudatus, *Jacq.*
A. Himalayanus, *Hodg.*
Bhibi, ... BHOT. | Pot sammiong, . . LEP.
Lrin, ... KASHM. | Kadia-piu, . . . TIBET.
Cho, ... LEP.
Tibet marmot, white marmot of E. Europe, Central Asia, Snowy Himalaya, Kashmir to Sikkim, at 12,000 to 16,080 feet.

Arctomys hemachalanus, *Hody.*, red marmot.
A. Tibetanus, *Hodg.*
Chipi, ... BHOT. | Sammiong, . . . LEP.
Drun, ... KASHM.
Kashmir, N.W. Himalayas at 8000 to 10,000 feet.

SCLAVE nations comprise the old Sclavonic, Russian, Servian, Croatic, Wendic, Slovak, and Pole. They were the Sauromata of the Greeks, and the Sarmatæ of the Romans; a nation living on the Don and near the Caspian Sea. They spoke a faulty Scythian dialect.

The Scythic warrior of Central Asia, the intrepid Getæ, admitted no meaner representative of the god of battle than his own scimitar. He worshipped it, he swore by it; it was buried with him, in order that he might appear before the martial divinity in the other world as became his worshipper on earth. And to the present day the sword of the Rajput contiuues to be worshipped.

SCLERIEÆ. *Nees.* A section of the Cyperaceæ or sedges. Two species of Scleria occur in British India. One, a very long sedge, grows by the water in the river Surma near Sylhet, and is used for thatching. Boat-loads of it are collected for the Calcutta market, also immense rafts of bamboo 100 feet long.

Scleria lithosperma, *Willd.*
S. tenuis, *Retz.* | Scirpus lithospermus, *Linn.*
A sedge of Ceylon, the Peninsula of India, and Bengal.

Scleria tesselata, *Willd.*; S. biflora, *Roxb*, a sedge of Ceylon, Peninsula of Iudia, Bengal, and Nepal.—*Hooker's Him. Jour.* ii. p. 327.

SCLEROSTYLIS ATALANTIOIDES. *W.*
Limonia bilocularis, *Roxb.* | Arawi-nim, . . . TEL.
This small tree or shrub, one of the Citraceæ, is found in the Circars. Its wood is yellow, and is always very small, but is very hard, and might be used as a substitute for box.—*Roxb.*; *Beddome.*

Sclerostylis Ceylanica, *W. Ill.*
Scl. Arnottiana, *W.* | Rissoa Ceylanica, *Arn.*
The Yucca-uaara-gass of the warmer parts of Ceylon.—*Thw.*

Sclerostylis rotundifolia, *Thw.*, a small and not common tree, growing in Ceylon at an elevation of 4000 feet and upwards.—*Thw.*

SCLEROTIUM STIPITATUM. *Berk. et Curr.* The Puttu kai or Puttu manga of the Tamils, from Puttu, a white ant-hill, and Manga, a mango, and Kai, fruit. Mail manga, TAM., from Mail, dry, like sticks, leaves, etc., and Manga, a mango. On the western coast, where it rains for at least six months in the year, this fungus is occasionally to be met with in dark crevices, and in the recesses of rocks and caves; also in old and deserted ant-hills, and frequently after the insects have become winged. They are found only in the peripheral and more superficial caverns, springing from their roof, occasionally from the floor, never from the cells occupied by the ants. Some grow with long stalks, others are sessile; in those having stalks they can in a few be traced beneath the soil, while the sessile ones seem simply to lie over the soil. They attain the greatest perfection during, or immediately after, the rains. They take on a variety of forms, being oval, oblong, pyriform, irregularly rouud, etc. The external rind is black aud slightly wrinkled; on cutting into it, the interior is found to be white aud pithy, and is compared by the natives to the kernel of a tender cocoanut. It is tasteless and inodorous. The Malayalam Vythians believe it to be manufactured by the insects themselves, by a kind of accretive process, and that snakes are very fond of it, and devour it greedily. Snake-charmers collect the Puttu manga, and take it round for sale, and they give out that they keep a supply always on hand with which to feed their snakes. The Vythians eagerly seek it, and use it as a remedy in cholera, syphilis, and a variety of other diseases. In cholera it is prescribed as a specific, by rubbing it up with a little water and fresh ginger juice or country arrack; and the dose is repeated after every motion or act of vomiting.—*Dr. John Shortt.*

SCOLOPACIDÆ, a family of birds of the order Grallatores or waders, comprising 16 genera and 33 species, as under:—

1 Ibidorhyncus, curlew.	1 Calidris, sanderling.
4 Totanus, greenshank.	1 Philomachus, ruff.
3 Actitis, sandpiper.	1 Phalaropus, stint.
6 Tringa, stints, knot.	1 Scolopax, woodcock.
1 Terekia, sandpiper.	1 Macrohamphus, godwit.
2 Limosa, godwit.	6 Gallinago, snipes.
2 Numenius, curlew.	1 Rhynchæa, painted snipe.
1 Eurinorhyncus, stint.	

This family of birds is interesting to the Indian sportsman. The woodcock is everywhere very scarce on the plains of India. It is found on the Neilgherries, occasionally on the plains of the Peninsula, and has now and then been met with near Calcutta. Some incline to the opinion that woodcocks may not be so rare, being commonly overlooked in their jungle haunts. The birds called woodcock seen at the dinner-table are

generally greenshanks (Totanus glottis), and occasionally the black-tailed godwit (Limosa ægocephala). Two distinct species in the Himalaya are commonly confounded under the name 'solitary snipe,' and both are very different from the Gallinago major of Europe and Northern Asia, which has not been observed in the East Indies. Of the other Indian kinds, one, Gallinago solitaria of Hodgson, is peculiar to the Himalaya, and to this species the designation 'solitary snipe' should be restricted. It is readily known by its white belly and yellowish legs, wings longer, straighter, and more acuminated than in the other, and the upper plumage more minutely speckled, with the pale linear markings on the back narrower, and the tail also longer. Average measurement, 12½ inches by 20 in expanse of wings; closed wing, 6½ inches; and tail, 3 inches. Weight, 5 to 6 oz., or even more. The other, G. nemoricola of Hodgson, should be distinguished as the wood-snipe, and is more of a woodcock in appearance and habits, though keeping to the outskirts of the jungle. Though principally a Himalayan species, it is not rare in the Neilgherries, and it has been met with in various parts of the country, and in the Calcutta provision bazar. This species has blue legs, and the under parts are uniformly barred throughout; the general colouring dark, and the markings bold; the wings more bowed and rounded than in the other, and the tail shorter. It is only found, remarks Mr. Hodgson, in the haunts of the woodcock, with this difference in its manners, that it is averse to the interior of woods. Length, 12½ inches by 18 in expanse of wings; closed wing, 5½ inches; and tail, 2¼ inches. Weight, 5¼ to 6½ oz. and upwards.

The 'grass snipe,' also known as the pin-tailed snipe (G. stenura), is distinguished by a duller plumage than the common British snipe, and especially by the curious series of pin-feathers on either side of its tail; whereas the other has a fan-shaped tail, altogether different in form. The pin-tailed is the common snipe of the Malay countries, but not of Australia, the Australian (G. Australis) being a much larger bird, with intermediate form of tail, as in the solitary and wood snipes of British India. In Bengal G. stenura is the more abundant species, early and late in the season, as the common or British snipe is during the height of the cold weather; but so early as on the 30th August, one was bought from the bazar in a bundle of pin-tailed snipes, and subsequently the pin-tailed only, in considerable abundance. Nothing is more easy than to distinguish the two species by the shape of the tail, and a practised eye will generally tell them at the first glance; yet very few sportsmen in India are aware of the difference.

The little jack-snipe (G. gallinula) is much later in its arrival, though numerous species of small waders arrive from their breeding haunts before the end of August. The jack-snipe has a tail quite different from that of any of the others; in brilliancy of plumage it excels all the rest.

There is a small and distinct species of woodcock in the Malay Archipelago, the Scolopax saturata of Horsfield.

The woodcock, identical with the British, has been obtained in the Tenasserim Provinces; it abounds in the Himalaya, is less common in the Neilgherries, and is considered a rare bird in the mountains of Ceylon. On the Bombay side it is said to be far from common in the Mahabaleshwar.

Of the sub-family Scolopacincæ or snipes, the East Indian genera and species are as under:—

Gallinago gallinula, *Linn.*, *Sykes*, *Jerdon*, *Blyth*, *Gould*, is the jack-snipe. It breeds in the northern regions; it is found in most parts of India, in the cold weather coming later and departing earlier than the common snipe. It prefers thicker coverts, lying very close, and is difficult to flush.

Scolopax rusticola, *Linn.*, *Jerd.*, *Blyth.*

The woodcock is a winter visitant to the more elevated wooded regions of India, all the higher ranges of the south of India, Coorg, Shevaroy, Pulney and Neilgherry Hills, and the Himalaya Mountains, and is occasionally seen in the plains of the Peninsula and Bengal, at Madras, Kaladgi, and Masulipatam.

Scolopax saturata, *Horsf.*, Java.
Gallinago nemoricola, *Hodgs.*, *Jerdon*, *Blyth.*
Nemoricola Nepalensis, *Hodgs.*

The wood-snipe or solitary snipe is rare, but is occasionally found on the Himalaya, Neilgherries, Coorg, Wynad, Ceylon, also in the Saharunpur district below Hardwar.

The common snipe breeds in the northern regions, but is a winter visitant to India, arriving in small numbers in the N. of India early in August, and in numbers by the end of September and through October. They are occasionally seen in the Calcutta market early in August, and in that of Madras by the 25th of that month. In Upper Burma, Dr. Jerdon noticed them towards the middle or end of July. Dr. Adams says it breeds there, which Dr. Jerdon doubts. They frequent marshes, rise with a hissing call, fly against the wind, and occasionally alight in a ploughed field.

Gallinago solitaria, *Hodgson*, *Blyth*, the Himalaya solitary snipe, found as yet only in the Himalaya, in winter, up to 3000 to 6000 feet, but probably belongs to Tibet.

The pin-tailed snipe.

This so closely resembles the common snipe that sportsmen and even naturalists often mistake it.

Rhynchæa Bengalensis, *Linn.*, *Sykes*, *Jerdon.*

R. Capensis, *Linn.*	R. picta, *Gray.*
R. orientalis, *Horsf.*, *Hardw.*	

The painted snipe is a permanent resident in some parts of India, breeding in June and July in thick marshy ground, but is found through-

out Africa, British India, Ceylon, Burma, and Southern China.—*Jerdon, Birds of India; Horsfield and Moore, Cat.; Indian Field.*

SCOLOPENDRIUM, one of the filices or ferns used in medicine in India. Its rhizomes or dried leaves are sold under the altered name, Iskoolikundrioon. Those of Polypodium are called Bulookunboon. The Asplenium radiatum, mohrpunkhee, or peacock's fan, is employed by the natives probably as an anthelmintic.—*O'Sh.*

SCOLOPIA CRENATA. *Wight, W. A. Prod.*

Phoberos crenatus, *W. A.*	Flacourtia crenata, *Wall.*
P. lanceolatus, *Wight, W.*	Hillerloo of the Badaga.

This tree is very common on the Shevaroys, Neilgherries, etc. It is a first-rate wood, and, although white, is very hard and dense. It resists the saw, and injures tools; planks are said to twist. Phoberos lanceolatus, *W.*, has the leaves narrower and more shining, but does not differ otherwise.—*Beddome, Fl. Sylv.*

SCOMBRIDÆ, a family of fishes of the section Acanthopterygii, of which the common mackerel may be regarded as a type. The tunny, sword-fish, dory, boar-fish, pilot-fishes, and the king-fish also belong to this group. The body is generally covered with small scales; the tail is usually very powerful and deeply cleft. In most of the species the pectoral fins are long, narrow, and pointed; the dorsal fins are two in number, the foremost of them being composed of bony rays; the hinder dorsal is chiefly supported by soft rays, and is often divided into numerous small false fins. They are provided with numerous cœca, and these are often united in clusters. The sword-fish, Xiphias gladius, *Linnæus*, is an inhabitant of the Mediterranean and Atlantic, occasionally visiting the British coast. It measures from 10 to 15 feet in length. Its body is lengthy and covered with minute scales, the sword forming three-tenths of its length. On its back it bears a single long elevated dorsal fin; there are no ventral fins. The tail is keeled. The lower jaw is sharp; the mouth without teeth. The upper part of the fish is bluish-black, merging into silver below. The sword-fish is said to attack the whale, wounding it with its beak. There are many well-authenticated instances of the planks of ships being perforated by the upper jaw of this powerful creature, which, it has been supposed, occasionally attacks the hulls of ships by mistake for the whale. Specimens of ships' timber penetrated by its sword are preserved in many museums. The Xiphias is mentioned by Aristotle (Hist. Anim. viii. p. 19), who notices the fact of its striking vessels. The young fish is said to be good eating. When very young, the body is covered with small tubercles, which disappear before it attains the length of three feet. Naturalists arrange the family Scombridæ as under:—

First Group.—Scombrina.

12 Scomber.	13 Thynnus.	5 Pelamys.
12 Auxis.	9 Cybium.	1 Naucrates.
1 Elacate.	10 Echeneis.	1 Hypsiptera.

Second Group.—Nomeina.

1 Gasterochisma.	2 Nomeus.	2 Cubiceps.
1 Neptomenus.	1 Platystethus.	1 Ditrema.

Third Group.—Cyttina.

6 Zeus.	2 Cyttus.	? Oroeosma.

Fourth Group.—Stromateina.

9 Stromateus.	3 Centrolophus.

Fifth Group.—Coryphænina.

6 Coryphæna.	4 Brama.	1 Taractes.
4 Pteraclis.	3 Schedophilus.	1 Diana.
1 Ausonia.	1 Mene.	1 Lampris.

Scomber pelamys, *Linn.*, the bonito, one of the mackerel tribe, inhabits the southern seas, and is often caught by hook and line. Its flesh resembles that of raw beef, and when cooked is not inviting.

Scomber thynnus, *Linn.*, the albicore, is in length from 3 to 6 feet, is an inhabitant of the southern seas; the back is bright purple, with a golden tint; eyes large and silvery, belly silvery, with a play of iridescent colours.—*Bennett*, p. 22; *Eng. Cyc.*

SCOPARIA DULCIS. *Linn.* Native of every part of the world within the tropics; common in India, particularly near the sea. Used in infusion in ague.—*Voigt*, p. 507.

SCOPOLIA PREALTA. *Dun.*

Belenia prealta, *Dne.*

Sholar bajar bang, Chen.	Lang, Tang, . . Ladakh.
Nandru, Dandarwa, ,,	Khardag, Trans-Indus.

Common in waste ground in parts of the Chenab basin from 6800 to 9500 feet in Zanskar and Spiti, and to 16,000 feet in Tibet, and apparently found sparingly in Trans-Indus, in the plains, and perhaps the same plant in one place near Lahore. In the hills the leaves are applied to boils, but are also said to be poison, the mouth swelling from their touch, and the head and throat being affected when they are eaten. A man was poisonously affected by eating the plant gathered in the Lahore habitat; and the Negi of Lahoul, when at Leh in 1867, suffered from its narcotic effects for two or three days, some of its leaves having been gathered by mistake with his sag or greens. At the same time they can hardly be very poisonous to all animals, for in Lahoul they are browsed by cattle. Dr. Christison states that this has the same property of dilating the pupils as belladonna.—*Stewart; Powell; Cleghorn.*

SCORODOPRASUM BORNŒNSE, Bawang-utan, the wild onion fruit of Borneo. It is like a walnut.—*Burbidge.*

SCORPÆNA RUBER, or great fire-fish, is eaten by the native fishermen. Its flesh is white, solid, and nutritive.

SCORPION. Eng., Fr.

Aqraba, Am-aryat, Arab.	Scorpio, . . . It., Lat.
T'siuen-hieh, . . Chin.	Escorpion, ... Sp.
Okrab, ... Heb.	Teru, Telu, . Tam., Tel.
Bichu, ... Hind.	

The scorpion is one of the Arachnida, order Pedi Palpi and family Scorpionidæ, eight-legged, air-breathing, articulate animals, comprising newts, spiders, scorpions. In some parts of the Dekhan scorpions are very numerous in open plains, living in holes about nine lines in diameter. On one occasion the plain at the Gor-Nuddi, used as a parade ground for the Poona Horse, was found pierced in every direction with scorpion holes; perhaps not a foot of ground but had one of these, and in every one was a scorpion. It was a very curious sight, perhaps not rare in India, though unseen or unnoticed. The boys tapped the ground near, to cause a few particles of sand to fall down on the scorpion, on which it would appear at its opening, and the sharp end of a deer's horn was thrust below to prevent its retreat. They were then tied together and made to fight. The scorpion has a curved sting at the end of its

tail. If the sharp point of the sting be cut off, the animal cannot wound or hurt. Scorpions inhabit the hot countries of both hemispheres, live on the ground, conceal themselves under stones and other substances, most commonly in ruins, dark and cool places, and often in houses. They run with considerable swiftness, curving the tail over the back; this they can turn in every direction, and use for the purposes of attack and defence. When irritated, they draw back the clawed palpi for the purpose of defending the head, and at the same time curve the tail on the back, prepared to strike at any moment. Most Asiatics have a quite unnecessary dread of their sting. May you be stung by a scorpion of Cashan, is a common malediction in Persia. With their forceps they seize various small insects, on which they feed after having pierced them with their sting, and they are particularly fond of the eggs of spiders. The pain suffered from the scorpion's sting seems to depend more upon the temperament of the sufferer than any other cause; some suffering much agony, occasionally terminating in death, while others become only slightly agitated. The remedies employed are the volatile alkali, chloroform used externally and internally, and, externally, ipecacuan in form of a paste. The favourite remedy now in the United States is the 'whisky cure,' which, under the form of arrack, combined in the case of a scorpion sting with a poultice of chewed tobacco, was known for the last fifty years to the British soldier in India. Buthus afer, *Linn.*, the great black scorpion of Ceylon, is as large as a little cray-fish; its sting occasions a little inflammation. Small birds wounded by a scorpion tremble, stagger, soon fall down, become convulsed, and die. It is said that a scorpion, if surrounded by fire so as to be prevented escaping, stings itself to death. Infested spots seem to have been common in Palestine and Mesopotamia, as in Numbers xxxiv. 4; Joshua xv. 3; Judges i. 36; 1 Maccabees v. 3. The males are smaller than the females; the penis is double, and placed near the combs; the females have two vulvæ; during copulation they are placed upon their backs. They are ovoviviparous, eggs 40 or 60 in number, and gestation lasts for a year.—*Eng. Cyc.; Burton, The City of the Saints*, p. 193; *Wallace.*

SCORPION FISH, Saccobranchus fossilis.

SCORPION SPIDER. Species of the genus Galeodes, or scorpion spiders, occur in Central Asia, Tartary, and in the Himalaya. The scorpion spiders common on the steppes, are the Galeodes aranoides (Phalangium aranoides of Pallas). The Galeodes (or Solpuga) are dreaded for their bites, reputed to be envenomed; but this is now denied by naturalists. This very formidable and most voracious spider is a terrible pest on the Astracan steppe, where its bite is much dreaded by the Kalmuks, who call it the 'black widow (belbussan charra). They harbour chiefly under the tufts of wormwood, and about the bones which are always to be found near a Kalmuk habitation, and also at the mouth of the deserted nests of the Spermophilus citillus, where they collect a sort of bed of leaves. Camels seem to suffer most from these spiders, because they are most addicted to lying on the ground.

Galeodes vorax, *Hutton*, of Northern India, feeds at night on beetles, flies, and even large lizards, sometimes gorging itself to such a degree as to become almost unable to move, and remaining torpid and motionless for about a fortnight. A sparrow, as also a musk-rat (Sorex Indicus), put along with it, were killed by it. It was seen to attack a young sparrow half-grown, and seize it by the thigh, which it sawed through, then caught the bird by the throat, and put an end to its sufferings by cutting off its head. Dr. Baddeley confined one under a glass wall-shade with two young musk-rats (Sorex Indicus), both of which it destroyed. In neither instance did the galeodes devour its prey after killing it. Capt. T. Hutton, in the eleventh volume of the Asiatic Society's Journal, p. 860, makes mention of a lizard bitten by one being allowed to escape with only a severe wound on the side, and as it lived for some days before being permitted to run off, the bite of the galeodes would not appear to be poisonous.—*Gosse*, pp. 237, 238; *Tenn. Ceylon*, p. 470; *Capt. Hutton, in Jour. As. Soc. of Ben.* xi. part ii. p. 860.

SCORPION, TAILLESS. Three species of the tailless scorpions have been noticed in Ceylon, all with the common characteristics of being nocturnal, very active, very minute, of a pale-chesnut colour, and each armed with a crab-like claw. They are Chelifer librorum, *Temp.*, Ch. oblongus, *Temp.*, and Ch. acaroides, *Herm.* The latter species has certainly been introduced from Europe, in Dutch or Portuguese books.—*Tennent's Ceylon.*

SCORZONERA HISPANICA, *Linn.*, is an annual from the south of Europe, sown in India either in beds, broadcast, or planted out in rows at a distance of a foot apart; has a long milky-juiced root; grows without any difficulty after the rains. The root when boiled and dressed is rather a delicate vegetable. It comes to perfection in three or four months. Salsafy, the black scorzonera, requires the same treatment. Two species occur in the Himalaya. In China, the Meh-men-tung is a species of scorzonera, called viper's-grass; its root is eaten as a vegetable.—*Jaffrey; Smith.*

SCOTLAND is supposed to be mentioned in the Puranas. On the east coast of Scotland are many megalithic monuments, several of which bear sculptures of serpents, while others, apparently of almost equal antiquity, bear the cross.—*Darwinism in Morals*, p. 189.

SCOTOPHILUS, a genus of bats, of which the species are Sc. Coromandelianus, falcatus, fuliginosus, fulvidus, Hodgsoni, leisleri, lobatus, pachyomus, pumiloides, serotinus. They are of the family Noctilionidæ.

Sc. Coromandelianus, *Fr. Cuv.*, is a very small bat, not much larger than the humble bee, and of a glossy black colour.

SCOURING-LEAVES, of the Actæa aspera and A. spicata of China, are used for cleaning pewter vessels.

SCREENS, the tatti of Europeans in India, are made of fragrant or other grasses, and are suspended over the house doors and windows, and wetted with water, to cool the interiors. In China, glazed and varnished papers are largely used for screens. In Japan, the Ama-do is an outside sliding shutter. Fu su-ma are sliding paper screens. The shoji is a sliding screen with translucent paper.

SCREW PINE, Kaldera bush, Umbrella tree.

Vacoa of Mauritius, Fr.	Thaium, Thalay, . Tam.
Keora, ... Hind.	Thalay mazali, . . ,,
Sithay nar, . . Tam.	

The screw pine, the Pandanus odoratissimus of botanists, grows in Africa, Madagascar, Bourbon, the Mauritius, Ceylou, in the Peninsula of India, Burma, and Malayana, being very common along the sea-coast. The leaves are used for making mats, baskets, and hats; there are extensive manufactories of these articles at Pulicat, Cuddalore, and several other localities. The leaves, as soon as gathered, have the spines stripped off their edges, the dorsal nerve is stripped off, and the leaf divided into slips of the breadth proper for the use for which they are required. The fibre of the leaf is white, soft, and pulpy, but possessed of little strength. It appears to be a good material for the preparation of paper, but ill suited for cordage. The aerial roots are much used as coarse brushes for whitewashing houses; when beaten with a mallet they open out like a soft brush. The tender white leaves of the flower yield a delightful fragrance.—*M. E. J. R.*

SCROPHULARIACEÆ. *Lind.* The fig-worts, a natural order of plants, very widely diffused over the surface of the earth, being found in the whole range of climate between the poles and tropics. 36 E. Indian genera and 166 species are known:—

1 Vebascum.	Scoparia.	5 Linderbergia.
1 Celcia.	12 Linaria.	12 Stemodia.
8 Scrophularia.	1 Antirrhinum.	7 Limnophila.
3 Mazus.	5 Pterostigma.	3 Buchnera.
3 Mimulus.	3 Bonnaya.	1 Sutera.
5 Herpestis.	9 Vandellia.	7 Buddlea.
Curanga.	6 Torenia.	1 Hemiphragma.
3 Dopatrium.	2 Artanema.	Gerardia.
2 Peplidium.	8 Striga.	

SCULPTURES. Monuments, decorated buildings, and sculptured texts have been the principal modes which the various rulers and their wealthy subjects have adopted to perpetuate their edicts, their names, and fame. The history of the ancient races in all the south of Asia is to be read in their sculptures, and that of Egypt, Assyria, Babylonia, and British India is being daily added to by means of relics which are being exhumed after an interval of 2000 or 3000 years. The Jews were forbidden to make the likeness of anything in the heavens above, or on the earth beneath, in order to bow down and worship it. But with the Egyptians of old, and with the Hindu and Buddhist religionists now, the art of sculpture is the very pillar of their religion; the priests in every temple first made (and still make) their god, and then worshipped it; as in Exodus xx. 4, the Egyptians worshipped figures of the sun as Ra, and of the stars as the other gods, as also images of men, beasts, birds, and fishes; but the earliest examples of Indian sculpture are to be seen in the rails of Budh Gaya and Bharhut of the age B.C. 250 to 200. Elephants, deer, and monkeys are better represented there than in any sculptures known in any part of the world; so too are some trees, and the architectural details are cut with an elegance and precision which are very admirable. The human figures, too, are truthful to nature, though differing from the European standard of beauty and grace, and where grouped together combine to express the action intended with singular felicity.

In the first century of the Christian era, there arose in the extreme N.W. of India, in the Panjab, and to the W. of the Indus, a school of sculpture strongly impregnated with the traditions of Greek art, and which coutinued to flourish there for the first five centuries of the Christian era. What the Buddhists were to the architecture of Northern India, that the Greeks were to its sculpture. Greek faces and profiles constantly occur in ancient Buddhist statuary, and particularly pure in the Paujab. Proceeding southwards from the Panjab, the Greek type begins to fade. Purity of outline gives place to lusciousness of form. In the female figures the artists trust more to swelling breasts and towering chignons, and load the neck with constantly accumulating jewels. Nevertheless the Grecian type long survived in Indian art. It is perfectly unlike the coarse conventional ideal of beauty in modern Hindu sculptures, aud may perhaps be traced as late as the delicate profiles on the Sun Temple at Kanarak, built in the 12th century A.D. on the Orissa shore. Borrowing an impulse from Greek models, the Buddhist sculptors, at the commencement of the Christian era, freed themselves from the oriental tradition, which demands only the gigantic and the grotesque, and imitated nature with some success. But with the revival of Brahmanism, Hindu sculpture again degenerated, and it possesses a religious rather than an æsthetic interest.

In the 4th and 5th centuries, at Amraoti, a school of sculpture was developed partaking of the characteristics both of those of Central India and of the west, and the degrec of art displayed by sculpture there may be regarded as the culminating point attained by that art in India. In the subsequent sculpture of the early Hindu temples and later Buddhist caves, it has lost much of its higher æsthetic and phonetic qualities, and frequently resorts to expedients of doubling the size of principal personages, and of distiuguishing gods from men by giving them more heads and hands than ordinary beings. This is done with considerable vigour and richness of effect in the temples of Orissa and Mysore; and in the south of India some of the most remarkable groups and statues continued to be executed down to the middle of the 18th century. But though the technic art of architecture continues to be practised with considerable success, their paintings and sculptured decorations excite only feelings of dismay, the result of the deterioration of moral and intellectual power.

Many of the Vaishnava temples all over India are disfigured by obscenities, and those in the temples of the Lingaet sect, between the Tumbudra and the Godavery, are unexampled; but the Saiva shrines are generally free from all such, though at Khajuraho in Bundelkhand is one with gross obscenities.

General A. Cunningham bclieves that the Buddhist sculptures of the Indo-Scythic period, found in the Eastern Panjab at Shahbazgarhi, show traces of Grecian art. In all Indo-Greek sculptures, whenever a face is partly turned to one side, that side is invariably cut away to nearly flatness, so as to give a deeper shadow to it and a greater prominence to the unaverted side. There are also fine specimens of Indo-Corinthian pillars. He thinks the great mass

of them belong to the most flourishing period of Indo-Scythic rule under Kanishka and his immediate successors, or from B.C. 40 to A.D. 100. The beauty of some specimens is great. Athene with spear and helmet, now in the Lahore museum, may date as early as B.C. 80.

The Indo-Persian style prevailed over the whole of Northern India, both before and after the Christian era. Its prototype is to be found in the famous pillars of the Achæmenian palaces at Persepolis and Susa. In the N.W. of India, it was supplanted by the three different styles of Greek architecture, by the Indo-Corinthian in the Kābul valley, by the Indo-Ionic in Taxila, and by the Indo-Doric in Kashmir. But no specimens of these styles have been found to the east of the Sutlej, whereas the Indo-Persian style was spread over the whole of Northern India, from Kābul to Orissa, and from the banks of the Ganges to the source of the Godavery. Numerous specimens of it may be seen in the sculptures of Bharhut, Gaya, and Sanchi, and in the actual pillars of Mathura, Nasik, Bedsa, and Orissa.

The Hoisala Bellala temple at Somnathpur is triple, the cells with their sikras being attached to a square pillared hall; elegance of outline and marvellous elaboration of detail characterize these shrines. The great temple at Baillur has a very solid vimana, with an antcrala or porch, and stands on a terrace about 3 feet high and 10 to 15 feet wide. It was erected by Vishnu Verddhana, to commemorate his conversion by Ramanuja from the Jain to the Hindu faith.

At Hullabid is the small shrine of Kait Eswara, covered with sculptures of the very best class of Indian art. The great double temple there rises 25 feet from the terrace, but was left uncompleted. It is built of indurated potstone, erected in a block, and sculptured afterwards. On the terrace stands a frieze of elephants, above it a frieze of the Sherdala conventional elephants, the emblems of the Hoisala Bellala; then comes a scroll of infinite beauty, and over it a frieze of horsemen and another scroll, over which is a bas-relief about 700 feet in length, of scenes from the Ramayana, representing the conquest of Ceylon, and all the varied incidents of that epic. At another part are figures of all the Hindu Panthcon; Brahma occurs three or four times, Siva with Parvati on his knee is repeated fourteen times, Vishnu and his avatars still oftener. All that is wild in human fancy, or warm in human feeling, is found portrayed on these walls.

In the architecture of Southern India, a sculpture of frequent occurrence are groups of the Yali; a monster of the lion type is represented trampling on an elephant, or a warrior sitting on a rearing horse, his feet on the shields of foot soldiers, sometimes slaying men, sometime tigers, —both of them barbarous monstrosities.

Paliya stones over the graves of those who have fallen in battle, and Sati stones, are common in Gujerat and Cutch, and the Paduka or foot sculptures on the monuments of Sadhus, are very numerous. The older Paliya are sculptures showing the style of dress and warlike accoutrements of olden times,—chain armour, horses in mail, bows and arrows, swords of various shapes, shields, javelins, etc. etc., and not unfrequently the names of the reigning princes with dates, as that of Lakha Phulani at Adkot.

The sculptures in Kashmir, at Sanchi, Benares, Amraoti, Madura, Trichinopoly, Tanjore, and Mahaballipuram have attracted much notice, as also have those in the cave temples at Ellora, Ajunta, Elephanta, and the edicts of Asoka at Girnar and other places.

The Amraoti sculptures belong to a period of 300 years later than those of Sanchi, and the topes illustrate the faith at their date. In the Amraoti sculptures are numerous priests and other signs of a clerical order segregated from the laity and of an established ritual. Sanchi is illustrative of the Hinayana Buddhist philosophy, 500 years before the oldest Buddhist book; and Amraoti illustrates the Mahayana philosophy, 800 years after its promulgation.

The sculptures on every ancient temple in India throw some light on the subject of old costume. These are probably considerably within the Christian era, and they furnish specimens of the local costumes of 1000 years ago; but many temples in the south and west of India, as also in Gujerat and Orissa, etc., are known to belong to periods as early as A.D. 500. But although groups of figures are numerous beyond description, their attire seems to be entirely conventional. Men for the most part wear head-dresses in the form of conical crowns richly covered with ornaments; their bodies are naked, and their breasts and arms show necklaces and armlets of very ornate patterns. From the loins to the knee or middle of the thigh, they have in most instances kilts, as it were, also composed of ornaments; and many are altogether nude, both male and female, with a girdle of ornamental pattern round the loins. These figures abound among the sculptures of Ellora and to the 13th century; also upon the Cholla temples at Conjeveram and elsewhere, probably of the same era. In the Jain sculpture the male and female figures are invariably naked, but ornamented in general with necklaces, bracelets, armlets, and zones of exceedingly intricate and beautiful patterns, in imitation, probably, of the chased gold work of the period.

Some of the men's figures on the temples of the south of India are clothed with defensive armour, and there is no trace of a sewn garment. The men's figures have short waist-cloths or dhotis, like kilts, with an end in some cases cast over the shoulder; the women are in the same costume; but both in the earlier memorial stones and on some of the profuse sculpture on the temple at Hullabid in Mysore (Dhara Samudra, 10th to 12th century A.D.), they wear bodices, tied in front, as Hindu women wear them at present.

The best representations of ancient costume in India are the celebrated fresco paintings in the caves of Ajunta. In the Buddhist caves of Ellora some paintings in a similar style had been executed; but they were destroyed by the Muhammadans when they invaded the Dekhan early in the 14th century, and it is extraordinary that those of Ajunta escaped their iconoclastic and fanatic zeal. They did escape, however, and for several years Major Gill, of the Madras army, was engaged by Government in copying them on their original scale. It is difficult to decide the date of the Ajunta paintings, which represent scenes in Buddhist history; and the series may extend from

the first or second century before Christ to the fourth and sixth century of our era. In either case they are upwards of 1000 years old. One very large picture, covered with figures, represents the coronation of Sinhala, a Buddhist king. He is seated on a stool or chair, crowned with a tiara of the usual conventional form; corn, as an emblem of plenty and fertility, is being poured over his shoulder by girls. He is naked from the throat to the waist. All the women are naked to the waist; some of them have the end of the cloth, or saree, thrown across the bosom, and passing over the left shoulder. Spearmen on foot and on horseback have short waist-cloths only. In another large picture, full of figures, representing the introduction of Buddhism into Ceylon and its establishment there, all the figures, male and female, are naked to the waist. Some have waist-cloths or kilts only, others have scarfs, or probably the ends of the dhotis thrown over the shoulders. Female figures in different attitudes around, are all naked, but have necklaces, ear-rings, and bracelets; and one, a girdle of jewels round.

Later structures have been raised by Muhammadans. In Northern India the best buildings date from the 12th to the 16th century (A.D. 1193–1554). They were erected during the Pathan domination, and are contemporaneous with the best period of European art, that is of the Christian era. The epoch which witnessed the art-glories of Rouen and Chartres, of Paris under Philip Augustus, of Rheims, Loan, and Noyon, of Troyes and Dijon, participated in the triumphs—only tempered by a low degree of civilisation—of Pathan warriors, who, justly ambitious to perpetuate the conquest of the Hindus, employed their subjects to erect for them a series of buildings in the capital of Dehli, which are among the most remarkable in India. No isolated monument, at least of the 13th century, exists anywhere to equal in beauty, strength, or dimensions the celebrated Kūtub Minar; and the magnificent range of arches which form part of the ruins of the Great Mosque, as the Kūtub, are only less beautiful, from certain defects of construction, than the pointed openings of Christian cathedrals, which, however, they rival in colossal proportions. The 14th century—in France almost barren of art reminiscences, owing to foreign invasion and intestine wars—is remarkable as the epoch when English art first acquired its individuality. At the same period, a like individuality was growing out of the many buildings erected by the Hindus for their Muhammadan masters. In striking contrast with the delicate ornament of Netley, Tintern, and Melrose, with the fortifications of many an English city, and the spires of many an English church, are the mausoleum of Taghalaq Shah, the city he erected and called after his name, the villages of Kirkhee and Begampur, the Jumaat Khana mosque, and the tombs around it, all of which display a stern simplicity, more characteristic of the Anglo-Saxon than the native mind, as well as knowledge of construction and power of execution, combined with mathematical precision in the application of building materials to their logical uses. The arrangements introduced to supply the wants of the ruling race, and the skilful adaptation of an indigenous method of building to the manners and customs of the Muhammadan, are as astonishing as they are successful. In the 14th century neither European nor Asiatic sacrificed utility to beauty; they sought to adorn the parts of their construction, never to construct their ornament. To them a dome was the outward and visible expression of its internal shape; if a kiosk was introduced, it was to crown a staircase, add weight to an angle, or to serve some other useful purpose. Marble was legitimately employed to cover a dome or a kiosk, to form a border to an archway inscribed with sentences from the Koran, or in perforated screens exquisitely carved. It is possible to 'read' such buildings; they are sermons in stones, they are works of art. The plains of Dehli disclose little to mark the 15th century. A mosque full of details of marvellous originality, and other buildings created by Humayun, the gateways of Arab ki serai, and many a nameless sepulchre, fairly represent the 16th; though Humayun's tomb discloses a falling off in knowledge of constructive principle. The works of Akbar, in the 17th century, present a host of ideas to inquiring men astonished to find so many proofs of bodily vigour and masculine intellect such as it seems difficult to ascribe to an Indian population.

But the era of the European renaissance exhibits in the north-west of India a still more remarkable spectacle. There rose in the city of Agra a building of white marble, which, viewed at sunrise or sunset, in the heat of the day or by chill moonlight, conveys to the eye impressions of grace and beauty such as no photographic skill can seize, no painter or architect delineate. Forgetting that the dome is as false as it is useless, that a so-called symmetry is obtained at the expense of propriety and sense, and that a species of mosaic which should serve to decorate a lady's boudoir is unfitted for the exterior of a colossal mausoleum,—the Taj Mahal remains the most magnificent architectural effect to be found in the whole world. The men of the 17th century who created it were artists in the highest sense of the word, but they were content to please the eye, while their predecessors of the 14th aimed at satisfying the mind also.

A raised platform, 313 feet square and 18 feet high, faced with white marble, has at each corner a minaret 133 feet in height. In the centre stands the mausoleum, a square of 186 feet, with 33 feet 9 inches of its corners cut off. The centre of this is occupied by the principal dome, 58 feet in diameter and 80 feet in height, under which is an enclosure formed by a screen of trellis-work of white marble. Within this, in its centre, is the over tomb of Mumtaz Mahal, and on one side that of Shah Jahan, the tombs being in vaults immediately below. In every angle of the building is a small domical apartment, two storeys in height, 26 feet 8 inches in diameter. All the spandrels, all the angles and more important architectural details, of pure white marble, and the tombs and screens are inlaid with agates, jaspers, bloodstones, combined in wreaths, scrolls, and frets, exquisite in design and beautiful in colour.

Aurangzeb ordered a structure over his daughter Rabia at Aurangabad, and in the beginning of the 19th century an imitation was erected at Lucknow.

The black-ground mosaics at Dehli are similar

to the Florentine mosaics, and are thought to have been introduced by Austin of Bordeaux, a jeweller who was much employed by Shah Jahan. The mosaics on a white ground are to be seen in the buildings of Lahore, Dehli, Agra; the Taj Mahal and the palace of Shah Jahan, at Agra, contain the most numerous and finest examples. They resemble the white ground mosaics of Europe, as seen in trays, tables, and fancy-work.

Austin or Augustin de Bordeaux executed a mosaic of Orpheus or Apollo playing to the beasts, after Raphael's picture, which was in the throne-room there. It was brought to London to the India museum.

The Indians owe their knowledge of the pietro-duro art of inlaying in precious stones to Florentine artists. Up to the erection of Akbar's tomb at Sikandra, in the first ten years of Jahangir's reign, A.D. 1605–1615, there are numerous mosaics of coloured marble, but no sample of inlay. In the tomb of Itimad-ud-Dowlah, A.D. 1615 to 1628, both systems are in perfection. In the Taj and the palaces at Agra and Dehli, built by Shah Jahan, A.D. 1628–1668, the mosaic has disappeared, being entirely supplanted by the inlay.—*Fergusson*, pp. 33, 362, 388, 405, 588, 596; *Cunningham*, v. viii; *Burgess; Mor. and Mat.*, 1868–89.

SCUTELLARIA, a genus of plants of the family Lamiaceæ, section Scutellarieæ. Handsome plants when in flower, adapted for the front of borders; the colours are purple, yellow, red, or blue. S. viscidula is the Hwang-k'in of China; its roots and seed are used medicinally.

S. Colebrookiana, *Wall.*, Peninsula of India.
S. discolor, *Coleb.*, Khassya and Nepal.
S. Indica, *Linn.*, Mahabaleshwar, China, Japan, Moluccas.
S. rivularis, *Wall.*, Nepal and China.
S. scandens, *Buch.*, Nepal and Kamaon.
S. violacea, *Wight*, Peninsula of India.

—*W. Ic.; Riddell.*

SCYLAX, B.C. 550, was the first European who is known to have visited India. He was sent by Darius to explore the Indus, and wrote an account of his journey. The next historian of India was Ctesias, who lived for some years at the Persian court of Artaxerxes Mnemon, B.C. 427. Herodotus, however, followed Scylax as an authority, but it was not until the expedition of Alexander, B.C. 327, that a body of able observers, trained in the school of Aristotle, were able to give accurate ideas to Europe of the condition of India; and of these writers, Megasthenes is far the most important. He lived at the court of Chandragupta, at Palibrotha, as an envoy from Seleucus I. According to him, the military force of Chandragupta consisted of 600,000 infantry, 30,000 cavalry, and 9000 elephants. India seems to have been known to the Greeks only as a country that, by sea, was to be reached by the way of the Euphrates and the Persian Gulf; and though Scylax had, by the order of Darius, dropped down the river Indus, coasted Arabia, and thence reached the Red Sea, this voyage was either forgotten or disbelieved, and in the time of the Ptolemies it seems probable that nobody thought that India could be reached by sea from Egypt; and Eudoxus of Cyzicus in Asia Minor came to Alexandria to persuade Euergetes to give him the command of a vessel for this voyage of discovery. A vessel was given him; and though he was but badly fitted out, he reached by sea a country which he called India, and brought back a cargo of spices and precious stones. He wrote an account of the coasts which he visited, and it was made use of by Pliny. But it is possible that the unknown country, called India, which Eudoxus visited, was on the west coast of Africa, for Abyssinia was often called India by the ancients, and all east of the Euphrates was also known as Hind or India.—*Perry's Bird's-eye View of India*, p. 52; *As. Res.* x. p. 113.

SCYLLIIDÆ, a family of fishes, of which the following species occur in the Indian Ocean:—

Scyllium marmoratum, *Benn.*, E. I. Archipelago.
S. maculatum, *Bl., Schn.*, Australian Seas.
S. Capense, *M. and H.*, Cape, India.
S. Burgeri, *M. and H.*, Japan, E. I. Archipelago.
Ginglymostoma Mulleri, *Gthr.*, India.
G. brevicaudatum, *Gthr.*, Zanzibar, Seychelles.
G. concolor, *Rupp.*, Red Sea, Indian Ocean, Archipelago.
Stegostoma tigrinum, *Gm.*, Indian Seas.
Chiloscyllium malaisianum, *Less.*, Archipelago.
C. Indicum, *Gm.*, Cape to Japan.
C. punctatum, *M. and H.*, Java.
Crossorhinus barbatus, *Gm.*, Australia and Japan.
C. dasypogon, *Blkr.*, Archipelago.

SCYTHIA, Sakadwipa, also Sakatai, the country of the Sakæ, was a term in use by the ancient Greeks and Romans, of a very indefinite character, but it was generally understood to mean the territories occupied by the nomadic tribes who roamed over the regions from the north of the Black and Caspian Seas, eastwards into the countries now known as Mongolia and Tartary. Ancient European literature further distinguishes Scythians into those of Europe and those of Asia; the former are supposed to have occupied the country from the Danube to the sources of the Dniester and the Dnieper, in the neighbourhood of the Don, and along the northern shores of the Black Sea. The portion between the Danube and the city of Carcinitis was called Old Scythia; and the peninsula (Taurida) to the Borysthenes was called Little Scythia; and in the time of Strabo, Little Scythia included the country as far as the Danube, previously occupied by the Thracians. These European Scythi seem to have been colonists from Asia.

Of the migrations into India of the Indo-Scythic Getæ, Takshak, and Asi, that of Sehesnag from Sehesnagdes (Takshak from Tacharisthan), six centuries before Christ, is the first noticed by the Puranas. About the same period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia; and subsequently the Asi and Tachari overturned the Greek kingdom of Bactria. The Romans felt the power of the Asi, the Katti, and Cimbri from the Baltic shore; and the Scythic tribes who have entered India as conquerors, are the Getæ, the Takshak, the Asi, Katti, Rajpali, Hun, and Kamari.

Colonel Tod supposes the Asi and Tachari to be the Aswa and Takshak or Toorshka races of the Puranas of Sakadwipa, and the Dahæ to be the Dahya, one of the 36 royal Rajput tribes, now extinct.

The martial tribes whom Alexander encountered in the Panjab, were of Scythian descent. During his two years' campaign in the Panjab and Sind, Alexander captured no province, but he made alliances, founded cities, and planted Greek garrisons. At Taxila (Deri-Shahan) and Nikaia (Mong) in the Northern Panjab, at Alexandria (Uchh) in the Southern Panjab, at Patala (Hyderabad) in

Sind, and at other points along his route, he established military settlements of Greeks or allies.

During the next 700 years, Scythic tribes of the Su, the Saka, the Hun, Naga, and the Getæ, made contiuuous and several successful efforts to sctlle. About B.C. 126, the Tartar tribe of Su are said to have driven out the Greek rulers from Bactria. The Græco-Bactrian settlements in the Panjab were overthrown by the Tue-Chi; and duriug the rule of Kanishka, who held the fourth Buddhist council about A.D. 40, Scythic settlements were formed as far south as the districts now kuown as the Central Provinces.

Scythian races more than once overthrew the prior rulers, and more than once sustained great defeats; but some of the Rajput dynasties, and also the Jat, the ancient Getæ, retained a permanent hold on the country east of the Indus and southwards to the month of that river, and one Jat prince is now ruling in Bhurtpur, another in Dholpur.

The Sah of Saurashtra (B.C. 60–70), the Gupta of Kanouj (A.D. 319–470), and the Valabhi of Cutch (A.D. 480–722), seem to have opposed successive hordes of Scythians. But Mr. Fergusson believes that it was the White Hun who overthrew the Gupta dynasty between A.D. 450 aud 475, and that the Saka and the Hun were finally overthrown at the great battles of Karur, near Multan and Maushari, which that learned writer supposes to have been fought between A.D. 526 and 544.

During these struggles for dominion, Vikramaditya, a king of Ujjain, about B.C. 57, drove back one Scythic invasion, and his victory gave rise to the Samvat era still current in India. Salivahana, another king of Southern India, is supposed to have successfully checked another Scythic invasion, A.D. 78, from which event the Saka era is reckoned; but the victory did not secure permanent advantages, for Cosmos Indicopleustes, who traded in the Red Sea about A.D. 535, speaks of the Hun as a powerful nation in Northern India in his day.

The Jat divide with the Takshak the claim of being the parent name of the various tribes called Scythic invaders of India; and Colonel Tod possessed an inscription of the 5th century, applying both epithets to the same prince, who is invested moreover with the Scythic quality of worshipping the sun. It states likewise that the mother of this prince was of the Yadu race; strengthening their claims to a niche amongst the thirty-six Rajcula, as well as their Yadu descent. The fifth century of the Christian era, to which this inscription belongs, is a period of interest in Jat history. De Guignes, from original authorities, states that the Yu-chi, or Jat, established themselves in the Panjab in the 5th and 6th centuries, and the inscription alluded to applies to a prince whose capital is styled Salindrapura in these regions, and doubtless the Salivahanpur, where the Yadubhatti established themselves on the expulsion of the Tak. How much earlier than this the Jat penetrated into Rajasthan, must be left to more ancient inscriptions to determine; but in A.D. 440 we find him in power.

The evidence of coins and the names of Indian tribes or reigning families, such as the Saka, the Hun, and the Naga, point to Scythian settlements as far south as the Central Provinces of India.

The Jat, who form nearly one-half of the inhabitants of the Panjab, are identified with the Getæ, and their great subdivision the Dhe, with the Dahæ, whom Strabo places on the shores of the Caspian. The existing division between the Jat and the Dhe has been traced back to the contiguity of the Massa-Getæ and the Dahæ, who dwelt by the side of each other in Central Asia. A similar descent has been traced to certain of the Rajput tribes, and until the 5th century A.D., the Jat and the Rajput intermarried.

The northern or Tibetan form of Buddhism, represented by Kanishka and his council in A.D. 40, made its way south to the plains of Hindustan, and during the next six centuries competed with the earlier Buddhism of Asoka. The Chinese Pilgrim, in A.D. 629–645, found both the northern or Scythic and the southern forms of Buddhism in full vigour in India.

As Chandragupta, who freed India from the Greeks, is celebrated in the drama Mudra-rakshasa, so Vikramaditya, the vanquisher of the Scythians, forms the central royal personage of the Hindu stage.

Another popular era, the Saka, literally the Scythian, takes its commencement in A.D. 78, and is supposed to commemorate the defeat of the Scythians by a king of Southern India, Salivahana. During the seven centuries which followed, three powerful monarchies, the Sah, Gupta, and Valabhi, established themselves in Northern and Western India. The Sahs of Saurashtra are traced by coins and inscriptions from B.C. 60 or 70 to after A.D. 235. After the Sahs come the Guptas of Kanouj, in the N.W. Provinces, the middle land (Madhya-desha) of ancient Brahmanism. The Guptas introduced an era of their own, commencing in A.D. 319, and ruled in person or by viceroys over Northern India during 150 years, as far to the south-west as Kattyawar. The Gupta dynasty was overthrown by foreign iuvaders, apparently a new influx of Huns or Tartars from the north-west (A.D. 450-470). The Valabhi succeeded the Gupta, and ruled over Cutch, Surat, Broach, Kaira, and part of Baroda and Malwa, from A.D. 480 to 722. Hiwen Thsang, 630-640, gives a full account of the Valabhi and of the prevailing Buddhist religion. The Valabhis seem to have been overthrown by the early Arab iuvaders of Sind in the 8th century.

Mat-Wan-lin, on the authority of Chinese historians, says the Yue-Chi or Scythians invaded India about B.C. 26, and remained in India till A.D. 222. According to Dr. Bhau Daji, these Yue-Chi appear to have been the Abhira.

In the time of Ptolemy, the geographer, a large part of North-Western India was occupied by the Indo-Scythians. In the Nasik cave inscriptions, Ushavadata, the son-in-law of Nahapana, is called a Saka, and a Saka Sena is mentioned iu the Kenheri caves. The prophetic chapters of the Puranas mention 16 Saka kings, 8 Yavana, 7 Abhira, and 10 Gardabhilla kings.

The Scythians who occupied the Yuzufzai country were the Sakæ and Tochari.

The Takka or Takshaka were a Scythian migration about the 6th century B.C. Their settlements in the 4th century B.C. seem to have extended from the Paropamisan range in Afghanistan, to deep into Northern India, and are supposed to have been the great serpent race, the Naga, often mentioned in Sanskrit literature; both Naga and

Takshaka mean snake; and they were tree and serpent worshippers. The Greek invaders, B.C. 327, found the Takka settled in the Rawal Pindi district, for which, from the 12th century, another Scythic race, the Ghakhar, had been fighting.—*Elphinstone's India; Tod's Rajasthan*, i. p. 35; *J. A. S. B.* vi. p. 677; *Imp. Gaz.*

SEA.

Mer, ... Fr.	Samandram, . . . Tam.
See, ... Ger.	Samudra, ... Tel.
Darya, . . Hind., Pers.	Dengiz, ... Turk.

Sea of China, Bahr-ul-Mahit; Indian Ocean, Bahr-ul-Akhsar; Red Sea, Bahr-ul-Ahmar; Mediterranean, Bahr-ul-Rum; Dead Sea or Sea of Lot, Bahr-i-Lut; sea flow and ebb, Madd-o-Jazr; sea breeze, Nasim-i-Bahr; sea chart, Kinar-Namah; sea-coast, Kinar, Sahilah-Ripa; sea compass, Kiblah-Nooma; sea ear, Darya gosh; sea-horse, Faras-ul-Bahr, Hippocampus; seaport, Bandar; sea-shell, Sadf, Sipi.

As wavelets dash upon a reef, they are lit by what the Arabs call the 'jewels of the deep,' and the superstition is, that these flashes of light are jewels made to adorn the necks and hair of the mermaids and mermen. When removed from their native elements, the gems fade and disappear. There are some ideas similar to this among the Scotch and other northern people. The colour of the sea greatly varies in different parts of the globe. It is white in the Gulf of Guinea, black around the Maldives, vermilion off California (caused by the red colour of the infusoria it contains), and green in the Persian Gulf and over all coral rocks. In the Arctic Sea it undergoes rapid transitions from purity to opacity, from ultramarine to olive-green, the green colour being caused by myriads of minute insects which prey on each other. The sea-shore residents in tropical countries wait every morning with impatience the coming of the sea-breeze. It sets in about eleven o'clock. Then the sultry heat of the oppressive morning is dissipated, and there is a delightful freshness in the air, which seems to give new life to all in their daily labours. After sunset there is again another calm. The sea-breeze is now done, and in a short time the land-breeze sets in. This alternation of the sea and land breeze, a wind from the sea by day and from the land by night, is so regular in intertropical countries, that it is looked for by the people with as much confidence as the rising and setting of the sun. The oppressive heat of the sun and the climate of the sea-shore is mitigated and made both refreshing and healthful by the alternation of those winds, which invariably come from the coolest place,—the sea, which is the cooler by day, and the land, which is the cooler by night. About ten in the morning, the heat of the sun has played upon the land with sufficient intensity to raise its temperature above that of the water. A portion of this heat being imparted to the superincumbent air, causes it to rise, when the air, first from the beach, then from the sea, to the distance of several miles, begins to flow in with a most delightful and invigorating freshness.

SEA-BEAVER, Enhydra marina, the Kalan of the Kamtschadales; Mustela Lutris of Linnæus; Lutra marina of Steller. Captain Cook in his last voyage says that this animal haunts sea-washed rocks, lives mostly in the water, and approximates to the seals more than to the otters in its habits. Their food is fish. The female brings forth on land, and notwithstanding the general marine habits of the animal, it has been occasionally seen very far from the shore. It is found in the North Pacific from Kamtschatka to the Yellow Sea on the Asiatic side, and from Alaska to California on the American coast (Richardson). The fur was eagerly sought after, and is still prized, but not so highly as formerly.

SEA-COCOANUT.

Cocotier de Maldives, Fr.	Zi-calappers, . . Singh.
Cocos-de-mer, ... ,,	Kuddal tayngai, . Tam.
Darya-ka naril, . Hind.	Samutrapu tainkaya, Tel.
Ubdie narikaylum, Sansk.	

This is the fruit of the Lodoicea Seychellarum. It resembles two cocoanuts fastened together; it is convex on one side, and almost flat on the other, oblong, and somewhat pointed at both ends. The shell is dark-coloured, and contains a kernel not unlike that of the ordinary cocoanut, but drier, harder, and more insipid. They are often seen floating in the sea off the coasts of Arabia and Africa, whence they are brought to Bombay; and also from the Laccadive and Maldive Islands, where the tree grows. The shells are made into drinking-cups and scallops, which are used by the Indian devotees. The kernel is used medicinally by native practitioners in cases of typhus fever, etc.

Sea-cocoanut of Tenasserim is the fruit of the Xylocarpus granatum, *Kon.*, the Carapa Moluccensis, *Lam.*, very common in the mangrove swamps, and growing near the shore; its fruit falls into the water, and floats out upon the sea, which gives rise to its name. The fruit is not edible, but is exceedingly astringent, and is regarded by the natives as a specific in cholera. —*Faulkner; Mason.*

SEA-COW of Behring Straits is the Rytinia Stelleri, a sirenian. It lives on sea-weed.

SEA-EAGLES are species of Pandion, Policætus, Haliætus. See Eagles.

SEA-EAR, species of the Haliotis, a genus of the Haliotidæ of the mollusca.

SEA-ELEPHANT of Tristan da Cunha and Kerguelen's Land, Morunga elephantina. It attains to 12 feet in length.

SEA-GYPSIES, a name by which sailors designate the Baju-laut, a seafaring people of the E. Archipelago, and also the Selones of the Mergui Archipelago.

SEA-HAWK, or frigate bird, the Atagen aquilus, is also called the man-of-war bird and the boatswain. It has short feet, and cannot swim or dive. It is intermediate between the predaceous sea and land birds. It attacks the smallest birds, and makes other fishing birds abandon their prey. It is of immense endurance, takes great flights, and rises to vast heights in the air. It ranges through all tropical seas, and hovers over the tropical waters. It has been seen 400 leagues from land. Its expanded pinions measure 14 feet from end to end.—*Bennett.*

SEA-HORSE, a fish of the genus Hippocampus, one of the Syngnathidæ, the head of which assumes a bent position like the head and neck of a horse.

SEA-HORSE, a mammal of the Arctic seas. Their teeth are brought from California and

other parts of Western America, and are used by the Chinese in the same manner as ivory. They are the teeth and tusks of the walrus and other cetaceous animals.—*Morrison.*

SEAL, the name of a family of amphibious animals, valued for the oil obtained from the fat or blubber, and also for their skin, which is used for a variety of purposes, largely for ladies' cloaks.—*Faulkner.*

SEAL.

Khatm, ... Arab.	Sigillum, ... Lat.
Cachet, ... Fr.	Nagin, ... Pers.
Petchafte, . . . Ger.	Sellos, . . . Port., Sp.
Mahr, Hind., Pers. Turk.	Mutra, Mudra, . . Tam.
Sigilli, ... It.	Muhurle, ... Turk.

The seals of oriental nations are used for ornament, and as signet-rings. The Anguliya mudra, or finger-ring seal or signet, has from the earliest periods been commonly used in the east. Ahasuerus takes his signet off his hand, and gives it first to Haman, and again to Mordecai; and Herodotus notices that each of the Babylonians wore a seal-ring. The Greeks and Romans had their rings curiously engraved with devices, and that cast by Polycrates into the sea was the work of an engraver whose name the historian has not thought unworthy of commemoration. The seal is alluded to also in the Demagogues of Aristophanes.

Seals in the form of signet-rings are in general use amongst the Muhammadans of Arabia, Persia, Afghanistan, and India, for affixing the names of their owners, instead of writing their names, although many of them could write. When the document is finished, he takes the signet-ring from off his finger, generally the little finger, and, smearing it with ink, stamps it on the document. The putting on the wedding-ring by a bridegroom amongst many Christian nations seems to betoken an endowment by him of all his worldly goods, as in the case of Jezebel in 1 Kings xxi. 8, and Esther viii. 8-10. The seal of Solomon, Mahr-i-Suliman, is the Swastika.—*Hind. Theat.*

SEA-LEAF INSECTS or sea-spiders, species of Phyllosoma.

SEA-LEMONS, the Doridæ family of mollusca, comprising ten recent genera.

SEA-LEOPARD of Kerguelen's Land, is the Stenorhynchus leptonyx, *Gray.* It resembles the seal of the British coasts.

SEALING-WAX.

Cire d'Espagne, . . Fr.	Lak, ... Malay.
Cire de cacheter, . . ,,	Surgutsch, ... Rus.
Seigellack, ... Ger.	Lacre, ... Sp.
Chap-ka-mom, . Hind.	Arakku, ... Tam.
Cera lacca, ... It.	Lakka, ... Tel.

This is a composition of gum-lac, melted and incorporated with resin, and afterwards coloured with some such pigment as vermilion, ivory-black, etc. It is used for sealing letters, legal instruments, etc.

SEA-LION, Otaria jubata, and the Cape eared-seal, O. pusilla, are known also as eared-seals and sea-bears. They form a very distinct group of marine carnivorous animals, and are readily distinguished from the true seals by their small external ear.

SEA-LIZARD, Glaucus hexapterygius, *Cuv.* It is about an inch long, with brilliant colours.

SEA-NETTLE, species of medusæ. Ships often meet vast numbers of young sea-nettles drifting along with the Gulf Stream. They are known to constitute the principal food for the whale, but the habits of the right whale are averse to the warm waters of the Gulf Stream.—*Maury*, p. 43.

SEA-SLUG, Holothuria, *sp.*, the trepang of the Malays, and the attei of the Tamil people; from 9 to 12 inches long, and 3 or 4 broad; are collected on the Ramnad and Tinnevelly coasts. This animal is abundant on the banks of the Aru Islands. The greater portion is caught in shallow water, where it can be picked up off the bank without diving. They are largely exported to China.

SEA-SNAIL, species of the Ianthina mollusc, I. fragilis.

SEASON. In Oudh, the seasons (rit) are divided into six periods of about two months each,—Sard, Sisir, Him, Basant, Grikham, Pawas. The Vedic races, who seem to have occupied several countries before entering N.W. India, divided the year into six seasons,—Vasanta (spring or flowery), Grishna (the hot season), Varsha (the rainy), Sarada (the sultry season), Hemanta (the frosty season), and Sisira (the dewy season). These divisions indicate their residence in a colder country than British India, and where the seasons were more numerous and more marked.

Throughout almost all British India, there are three seasons, cold, hot, and rainy, and in Sind only two, the Siyaro or the cold season, which lasts from Ashwina to Phalgun, a period of six months; and the hot season in the other six months.

Hindus of Northern India divide the year into three seasons, viz. Chou-masa or Burk'ha, constitutes the four months of the rainy season. The rest of the year is comprised in Seeala, Jara or Mohasa, the cold season; and Dhoob-kala or Khursa, the hot season.

Amongst the Hindus, as amongst other races, many of the religious festival days or holidays relate to the changes in the seasons, at the new year, when the sun turns northwards, and at the vernal and autumnal equinox. In illustration may be mentioned the Ganesh Chaturthi or Chauth, which falls about the beginning of September. On this day was born Ganesh, called also Ganpati, made from the turmeric and oil off the body of Parvati. He is the god of wisdom, who removes obstacles, and is invoked at the commencement of all undertakings. Ganpati has a man's body, with the head of an elephant. His head is said to have been cut off or destroyed by Siva, when Ganesh tried to prevent Siva entering the chamber of Parvati while bathing. Clay images are made and worshipped for from one to nine days, and then thrown into water. The Chin Chor or Chinchwad, who resides at a village of that name near Poona, is believed to be an incarnation of Ganesh, who promised an ascetic named Meroba, who lived in Sivaji's time, that he would be incarnate for seven generations in his family. The earth image of Ganesh is one of three forms, in which the earth deity Mrittika is worshipped by Hindus,—the first, the Nagapanchami, on which feast a snake of clay is worshipped; the second is Gokul Ashtami, when a clay image of the infant Krishna is worshipped; and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The vahan or carriage of Ganesh is

a rat. The feast in honour of his birth is held on the 4th of the month Bhadrapad, falling on the first days of September. Ganesh is brought to the house with much pomp.—*Jaffrey; Elliot.*

SEA-URCHIN of the Philippines, of the genus Asthenosoma, *Grube*, has short spines, hollow and tubular at their extremities, containing poison. When these spines penetrate the flesh, a sharp stinging pain is felt like that of a wasp-sting.

SEA-WEEDS, or Algæ, are cellular flowerless plants belonging to the class Thallogens of botanists. Algæ are found both in salt and fresh water, have a wide geographical range, and in the domestic economy and manufactures of man they are of no little importance. Chondrus crispus, the Carrageen moss, supplies a nutritious article of diet as a demulcent, in the form of decoction or jelly. The tangles Laminaria saccharina and L. digitata, also the dulse and species of Porphyria and Ulva, known as the green and purple lavers, are used as food; and nearly all the species of Lamiuaria, Alaria, and Fucus are used as manure, or are burnt for kelp, an impure carbonate of soda, and iodine is extracted from them.

Of the Confervaceæ in the seas of the south and east of Asia, are to be found the Ulva latissima, *Linn.*, and U. crispa, *Lightfoot*, and Porphyra vulgaris, *Ag.*, lavers valued in scrofulous cases. The last named is gathered by the Hakims of Sind just before the monsoon, and given along with emulsion of almonds. Ulva reticulata, *Forsk.*, is a very beautiful reticulated sea-weed of the Eastern Archipelago.

Of the Fucaceæ or sea-wracks, the Sargassum bacciferum, or sea-grapes, occurs in all seas. Fucus distichus, *Linn.*, F. nodosus, *L.*, and F. vesiculosus, *Linn.;* the tangles, Lamiuaria bulbosa, *Ag.*, L. digitata, L. saccharina, *Lam.*, with Zonaria pavonia, *Ag.*, Dictyota dichotoma, *Lamour.*, also Chorda ria flagelliformis, *Ag.;* Bryopsis plumosa, *Ag.*, Codium bursa, *Ag.*, and C. tomentosum, *Stackhouse.* Of these Fucaceæ, F. vesiculosus is supposed to be the basis of the popular Anti-Fat; its vesicles, and their tincture, and the calcined powder, are given in glandular swellings and in rheumatism. F. distichus is a deobstruent. Laminaria saccharina, *Lam.*, is brought to India from the Caspian Sea, and it is said from the Tibetan lakes, and in the form of a syrup, with a decoction of quince seeds, is a favourite remedy in syphilitic eruptions; it is also burned into kelp. When dried in the sun, a whitish manna-like substance exudes.

Of the Ceramiaceæ the rose tangles, several genera occur, viz. Callithamnion corymbosum, *Ag.*, C. plumula, *Lyngbye*, with Ceramium pedicellatum, *Ag.*, and C. rubrum, *Ag.;* also Chondrus crispus, *Lyngbye*, and Rhodymenia jubata, *Grev.;* and the Chondrus crispus is employed instead of isinglass for making blancmange and jellies.

To the Siphonaceæ, or green algæ, belong Udotea, Halimeda and its allies.

To the Corallinaceæ, or red algæ, belong Lithothamnion and allied genera.

Sea-weeds commonly eaten by the Burmans are the Gigartina spinosa, *Grev.*, which is the Agar-agar of the Malays, and the Sphærococcus lichenoides, *Ag.*, the Ceylon moss of commerce. These are usually called by the Burmans Kyoukpuen.

The whole coast from Shan-tung to the south of China, and all the coasts of Corea and Japan, furnish large quantities of sea-weed, species of Laminaria, Rhodymenia, Iridæa, etc., which by the Chinese are made into size, jelly, and many excellent dishes of their food. The sea-weed known in British India as Gillur-ka-patta (Hind.) is supposed to be gathered at the mouth of the Saghalin river. The Chinese regard a diet of sea-weed as cooling but debilitating. The Kwan-pu or tangle is given in dropsics. The Yang-tsai of the Chinese is a clarified sea-weed; is made in Japan, and exported to China, and is said to be classed as isinglass.

The Japanese go out in their small boats to the rocks, and with long sticks, to which is attached a piece of iron to serve as a knife, they sever the weed from the rock or bottom of the sea. The instrument may be 20 feet long, the blade about 18 inches. This weed is a valuable export from Japan; it is edible, and, with rice, constitutes part of the Chinese cuisine. It is exported to China, and then sent up to those countries where salt is dear, being lighter as merchandise, and well adapted for cooking.—*Hodgson's Nagasaki*, p. 63; *Smith's M.M.C.; Murray.*

SEB, a divinity of the ancient Egyptians, analogous to the Chronos of the Greeks and Latins. With them the egg of the goose was the emblem of Seb. Seb, also Seo and Sev, a mode of pronouncing the name of the Hindu god Siva, whose emblem is the conical-formed lingam. —*Bunsen.*

SEBASTIAN DEL CANO, commander of the *Vittoria*, one of the ships which formed Magellan's fleet. He returned round the Cape of Good Hope, and arrived at San Lucar on the 6th September 1522, the only survivor of the fleet which had sailed from the same port on the 20th September 1519, and thus completed the circumnavigation of the globe.

SEBESTAN, Sebestena, Sebestens, also Lobesteu; Lesura, Hind.; Buhooari, Beng., are dried fruits, distinguished as smaller and larger, of Cordia angustifolia, C. myxa, and C. latifolia. The fruits are edible, but seem only to contain mawkish mucilaginous pulp. These were formerly used in Europe, but now by the native practitioners of the east only. The dried fruits are very glutinous, and are esteemed expectorant. The seeds of Cordia myxa are called Chakoon ki binj, and deemed an infallible remedy in ringworm, the powder mixed with oil being applied to the eruption.—*O'Sh.; Honig.* p. 343.

SECAMONE EMETICA. *R. Br.*

Periploca emetica, *Retz.* | Asclepias angustifolia, *R.*
Asclepias pseudosarsa. | Shada-boori, . . Beng.

Grows common in the southern parts of the Peninsula of India at the foot of mountains. Roots acrid and emetic.—*Roxb.*

SECHIN, the same with Ekhor, the place of burial of the emperors of China.—*As. Res.* vi. p. 484.

SECRET SOCIETIES exist in China and Japan. The Komoso Society of the latter country is a semi-monastic institution not unlike the Order of Templars. Its existence was formally recognised by the government in the early part of the 17th century, and certain lands were granted to it by the Tokugawa dynasty of Shoguns. The society was filled from the ranks of the samurai

class alone. by assuming the white robe of the Komoso. None were admitted into the ranks of the brotherhood who had been guilty of the meaner crimes. The chief was invested with a priestly character, and usually resided at the chief temple in the province of Owari. He had power of life and death over his fellows, and was so far independent of the Government that he could put any of the brethren to death, provided he formally reported to the authorities that he had punished an offender against the laws of Komoso, according to its recognised rules. He was not required to specify the offence for which punishment had been inflicted. The society has never, it seems, been a large one, as, after a man had availed himself of the privileges of asylum which the fraternity afforded, he often retired to his own province, using the Komoso as a sanctuary. Men have been known to join the society with a view to carry out in safety plans of revenge on the murderer of a relative, taking refuge in the same temple in the dress of the brotherhood. The tragic climax of such a situation is reached, when the avenger carries out the vendetta by killing the man he sought, in spite of all oaths and bonds of union. The triad society of the Chinese seems to have been partly political, partly religious.

SECUNDERABAD, in lat. 17° 26′ 30″ N., long. 78° 33′ E., is the military cantonment of the Subsidiary Force provided by the British for the defence of the Hyderabad territory. It extends from 4 to 10 miles north of the city of Hyderabad, and is 1830 feet above the sea. It is the largest military cantonment of British India, the troops of all arms being about 5000 in number. The cantonment bazar, formed in Secunderabad town, had 7938 houses in 1868, with an estimated population of 32,000. Adjoining the Secunderabad cantonment to the north is the Bolarum cantonment, one of the stations of the Hyderabad Contingent, under the immediate authority of the British Resident at the court of His Highness the Nizam. About two miles south of Secunderabad cantonment, between it and the city, are the regimental lines of the Hyderabad Reformed Troops, belonging to H.H. the Nizam, comprising artillery, cavalry, and infantry, under the command of a European officer. About 8000 soldiers of all arms are located on that portion of the plateau.—*Imp. Gaz.*

SECUNDER BEGUM. In 1817, Nazir Mahomed, minister of Bhopal, married the daughter of the previous nawab of Bhopal, and concluded a treaty with the British Government which guaranteed the country to himself. On his death, the widow, Kudsia Begum, then 17 years of age, became regent, and a marriage was arranged for his only daughter, Secunder Begum, with his nephew, Jahangir Muhammad Khan. In 1837, Kudsia Begum was pensioned, and Jahangir Muhammad was duly invested as nawab. But from Jahangir's misconduct, Secunder Begum left him, and went to reside with her mother, till his death in 1847, when she was appointed sole regent for her only child, a daughter. She was formed to rule, from her abilities, her resolution and lofty aspirations, and she brought the State into perfect order. During the revolt of the Bengal army, and the rebellion in Northern India in 1857-59, she sheltered British officers, put down her own mutinous contingent, and gave peace and order to her territory and help to the British, and the British rewarded her with additional territory, and in 1863 with the Grand Cross of the Star of India. She died 30th October 1868, after a rule as regent and queen of 21 years. She left one child, a daughter, Shah Jahan Begum, who at once succeeded. She too had one daughter, Sultan Jahan Begum, who was installed 16th December 1868, and was married 1st February 1875 to Mir Ahmad Ali Khan Bahadur, a nobleman of Afghan descent.

SECUNDRA, a town in Northern India; its name is probably from Secunder Lodi. In Secundra was laid the great Akbar. The quadrangle of his mausoleum is enclosed by high embattled walls, to break the monotony of which there are four octagonal minarets at the four corners, and four colossal gateways on the four sides. The space within is laid out in walks, flower-beds, orangeries, and groves of mango.—*Tr. of Hind.* ii. pp. 9, 10.

SECUNNY. Anglo-Hind. A steersman, from Sukhan, a helm.

SEDASHEGHUR, a village on the western side of India, lying between two hills, on the banks of the Kali Nuddi. The lighthouse on the Oyster Rocks in the bay is in lat. 14° 49′ 15″ N., and long. 74° 2′ 45″ E.—*Findlay.*

SEDASHEO RAO BHAO, briefly designated in India the Bhao, was the cousin of the Peshwa Balaji Rao. Sedasheo Rao fell in the battle of Panipat, fought on the 6th January 1761.

SEDGE, plants of the natural order Cyperaceæ, a large tribe of grass-like plants with solid though slender stems, and the sheaths of the leaves not split in front as in grasses. Growing in every country, and some of the species widely distributed, are found on the sea-shore, on the tops of mountains, in marshes, ditches, and running streams, on meadows and in forests, and several of them furnish useful products. Hassocks, mats, brushes, etc., are made of the wiry stems and leaves of species of sedge (Carex). A few secrete fecula in their tuberous root-stocks, as the water-chesnut of the Chinese, etc.; others secrete a little volatile oil, as Cyperus longus and C. rotundus. The creeping rhizomes of Carex arenaria, and of a few allied species, are sometimes used medicinally under the name of German sarsaparilla. An Indian species, Cyperus tegetum, *Roxb.*, called Papyrus pangorei by Nees von Esenbeck, the Madoorkati of the Bengalese, and which is extremely common about Calcutta and in Bengal, is very extensively employed for making the elegant, shining, and useful mats for which the capital of India is famous, and which are frequently imported into Europe. The culms or stalks of the plant when green are split into three or four pieces, which in drying contract so much as to bring the margins in contact, in which state they are woven into mats, and thus show a nearly similar surface on both sides. The strips are tied up in bundles about 4 inches in diameter and 4 feet in length, and seem also well adapted for making paper and ropes. The papyrus of the Egyptians belongs to this order, and is still called Babeer in Syria. It is about 15 feet high; the exterior tunic of the stems, cut in bands and pressed, formed the paper of ancient Egypt and Europe; the leaves, which are several feet long, served for the

same purpose, but were of inferior quality. This paper is but little liable to decay. Pliny, for instance, relates that the book of the laws of Numa Pompilius was found in Rome in a high state of preservation, after having been buried nearly six centuries in the earth.

The cotton grass, Eriophorum of Europe, is a conspicuous ornament of tuft-bogs and marshy moors, from having its seeds clothed at the base with a silky or cotton-like substance. With this pillows are sometimes stuffed, and wicks of candles, as well as paper, made. There is a species of the genus very common in the Himalaya, both in low valleys and at considerable elevations. This, Dr. Royle named Eriophorum cannabinum, in consequence of his finding it everywhere employed in making ropes for all ordinary purposes by the mountaineers. Its name, bhabhur and bhabhuree, has a considerable resemblance to that of the papyrus, considering that the b and p are letters so frequently interchanged for each other. All who have scrambled up the steeps of the Himalaya will remember the great support they have received from the toughness of the tufts of the bhabhur. Specimens of the dried leaves are made up into bundles about 3 feet in length; twine is made from it; this, though rough, is strong and well fitted for ordinary purposes. In the Himalaya the bhabhur holds a conspicuous place, from its extensive use and most abundant supply throughout the whole of the hills, affording a most economical substitute as an article of cordage, in lieu of others of a more costly and durable nature. All the jhula or rope bridges, which are erected over the large rivers where the sanga or wooden-planked bridges cannot be made, on all the principal thoroughfares of the Garhwal district, are constructed of this silky species of grass, the cables of which are of a considerable thickness. These rope bridges are a very safe means of communication over the large and rapid rivers intersecting different parts of the country, both for travellers and men with loads, and, where the footway and sides are properly laced with brushwood, afford an easy enough roadway for loaded sheep, but neither ponies nor cattle can travel over them. This grass grows abundantly in all the ravines of the sides of the mountains, and is to be had only for the cutting, but it is not of a very durable nature, though pretty strong when fresh made into ropes. It lasts about a twelvemonth only, or a little more, and the people in charge of the rope bridges are constantly employed in repairing and annually renewing the ropes and stays. The chinka, or temporary bridges of a single cable, upon which traverses a seat in the shape of an ox-yoke, are also sometimes made of this grass. There are few of them useful for fodder.—*O'Sh.* p. 628; *Royle's Ind. Fib.* p. 85; *Trans. Agric. Soc. of India*, viii. p. 272; *Cat. Ex.*, 1851; *Captain Huddleston on the Fibres of Garhwal.* See Cyperaceæ.

SEDIL or Chedil. TAM. An apparatus used for suspending men and swinging them in the air in honour of the goddess Mari-amma, as in the Charkh Puja of Northern India.

SEDUM ACRE, Fuh-kiah-ts'au of the Chinese, a pretty plant of Europe and China; the juice is used in China for burns and scalds. The Chinese name means Buddha's nails.—*Smith.*

Til or gingelly,	2,308,242 ,,		1,46,45,453
Other sorts,	370,749 ,,		16,72,943

SEEHOO, a lake of China. On its borders stands the wealthy and extensive city of Hang-chu-fu. The surrounding scenery is accounted one of the grandest as well as the most beautiful in all China. The Lui-fung-ta, or tower of the thundering winds, standing on the point of a promontory jutting into the lake, forms a bold object. It is said to have been built in the time of Confucius. In the Vale of Tombs, the variety of monuments is almost infinite.—*Macartney's Embassy*, i. p. 28.

SEEKHAN, a piece of iron about a cubit long, with which fakirs pierce their necks and cheeks. Also an Arab musical instrument, used by the Arabians who frequent the Malabar coast.

SEEMANTONNAYANA. SANSK. From Simanta, the place on the head where the hair divides, and Oonayana, a raising up. Amongst Hindus, during the marriage ceremony, the bridegroom first pulls the veil over the face of the bride, and then, turning it up again, draws a line with red lead down the centre of her forehead. To this ceremony this word alludes.

SEEOORSAT, in Persia, provisions supplied to travellers of rank, from the villages that they pass through; possibly from Sair, a journey, Rasad, provision.

SEER or Ser. HIND. A measure used in all retail dealings, but it varies according to the article sold, from 25 to 84 rupees weight, *i.e.* from 4500 to 15,120 grains.

SEERANO, an allowance given to the town shepherds of India.

SEER-FISH of Europeans, in Ceylon, is the Cybium guttatum. The Singhalese call it the tora-malu. Seer-fish frequently migrate to fresh waters to breed, or for prey.

SEET-SEEN. BURM. In Amherst it is a red, compact, very ponderous, and highly valuable wood, used for the construction of religious houses.—*Cal. Ex.*, 1851.

SEEUL GUDA. TEL. The torpam pillu grass of the Tamils; the stalks used in pinning together, for food-platters of the Hindus, the leaves of the Butea frondosa, Ficus Indica, and F. religiosa.

SEGHALIN, Seghalien, or Tarakai, is an island lying between lat. 45° 54′ 2″ and 54° 24′ N., and long. 141° 40′ and 144° 46′ E. It is about 600 miles in length, and from 20 to 100 broad. It is well wooded and fertile, and coal is found in many

places, especially about Jonquiere Bay. Two-thirds of the northern part belong to Russia, and is peopled by Ghilak. The aboriginal races of Yezo, whose severe treatment by the Japanese led them to other countries, occupy the southern part of Seghalin.

SEGHUR or Sigur, a mountain pass running down the north face of the Neilgherry Hills, from Mutinad to near the village of Seghur, lat. 11° 29′ to 11° 31′ 40″ N., and long. 76° 43′ 30″ to 76° 43′ 35″ E. It is practicable for laden carts and other wheeled conveyances, and is the most frequented of all the Neilgherry Ghats.—*Imp. Gaz.*

SEHESNAG. The Takshak race entered Hindustan, led by a conqueror termed Sehesnag, from Sehesnagdesa. He ascended the Pandu throne, and after 360 years his line terminated in ten descents, with Mahananda, of spurious birth. This last prince, who was also named Bykyat, carried on an exterminating warfare against the ancient Rajput princes of pure blood, the Puranas declaring that since the dynasty of Sehesnag the princes were Sudras. A fourth dynasty commenced with Chandragupta Mori, of the same Takshak race. The Mori dynasty consisted of ten princes, who are stated to have passed away in 137 years. See Takshak.

SEHESRA ARJUNA, of the Lunar race, called also Sehesra Bahu, was of the Hi-hya tribe. He founded Mahesvati on the Nerbadda, still existing in Maheswar. In the Bhavishya Purana, Sehesra Arjuna is termed a chakravarta, or paramount sovereign; also that he conquered Kurkotaka of the Takshak, Toorshka, or Snake race, and brought with him the population of Mahesvati, and founded Hemanagara in the north of India, on his expulsion from his dominions on the Nerbadda. Traditionary legends yet remain of this prince on the Nerbadda, where he is styled Sehesra Bahu, or 'with a thousand arms, figurative of his numerous progeny.' He was expelled from Mahesvati by the Solar race.

SEHL, one of the princes of the Bharat, who founded Aror.

SEHWAN, the ancient Sindomana, is built on the extremity of a spur from the Baluchi range. The pass of Sehwan has a picturesque appearance from the river, with its rocky mountains rising in terraces along the bank, and its old ruined castle, supposed to have belonged to the Alexandrian age. Sehwan town is in lat. 26° 26′ N., and long. 67° 54′ E., and gives its name to a sub-district of Kurachee in Sind; of area 3646 square miles; pop. (1872), 162,836 souls. It contains the Manchhar or Manchur Lake; the Laki Range, an offshoot from the Khirthar mountains, and the Jatil Hills; the principal canals being the Western Nara, the Aral, the Phito, and the Karo. There are several hot springs. The people are largely supported by the offerings of pilgrims at the shrine of Lal Shahbaz, whose tomb is enclosed in a quadrangular edifice, said to have been built in A.D. 1356. It is covered with a dome and lantern, and has beautiful encaustic tiles with Arabic inscriptions. Mirza Jani of the Tarkhan dynasty completed a still larger tomb to this saint in A.D. 1639. The gate and balustrade are said to have been of beaten silver, the gift of Mir Karm Ali Khan Talpur, who also crowned the domes with silver spires. Sehwan fort, ascribed to Alexander the Great, is an artificial mound 240 or 270 feet high, measuring round the summit 1500 by 800 feet, and surrounded by a broken wall. The remains of several towers are visible. Tradition asserts that the town was in existence at the time of the first Muhammadan invasion of Sind by Muhammad Kasim, Safiki, about A.D. 713; and it is believed to be the same place which submitted to his arms after the conquest of Nerankot, the modern Hyderabad.—*Imp. Gaz.*; *Postan.*

SEIR ABONEID, in lat. 25° 14′ N., and long. 54° 22′ E., an island 2½ miles long and 2 miles broad, on the south side of the Persian Gulf, contains large quantities of sulphur, and has some mineral springs.

SEIR-i-MUT'AKHERIN, or Latter Review, a work on the history of the British in India in the middle and close of the 18th century, by Seid Gholam Husain Khan, Calcutta 1789.

SEISTAN, Sejistan, or Nimroz, between lat. 30° 30′ and 32° N., and long. 60° 30′ to 64° E., is the country on the S.W. corner of Afghanistan, between Bast and Girishk. Seistan proper is the basin of the Helmand. It is a flat country, with low hills here and there, and is surrounded, except on the north, by wide deserts. One-third of its surface is moving sand, and the other two-thirds are composed of compact sand and clay, covered with thickets of tamarisk and abundant pasture. The Helmand, which is by far the finest river between the Tigris and the Indus, flows through Seistan, and runs into the lake of Zurrah. The river banks are clothed with luxuriant vegetation, and the lake, which is about 90 miles long by 60 miles broad, is bordered by forests of reeds, beyond which there are pastures and tamarisk thickets. The country has long been occupied by savage tribes.

Ferrier (p. 425) says the population of Lansh, a district forming the extreme eastern and northern limit of Seistan, are of mixed Baluch, Afghan, Arab, Turk, Kakar, and Kurd descent, from families thrown there by the waves of revolution and intestine feuds; and the Zarangæ or Dranghes, the Agriaspes or the Arrachoti of the time of Alexander, cannot now be traced. In recent times, it has repeatedly changed hands between Persia and Afghanistan.

The only parts which still retain their fertility are those on the banks of the Helmand and Farrah-Rud, and of the lake which is formed by those rivers. This celebrated lake is termed by geographers the Sea or Darya of Zereng. In Persian books, it is said sometimes to be called the Sea of Loukh, and by the people of the country the Sea of Zoor or of Khaujek; in the neighbourhood, it is merely called the lake or the sea, and it is at least 150 miles round. The water is brackish and hardly drinkable. The edges of the lake, for a considerable breadth, are choked with long rushes and reeds; the shores also are overgrown with the same sort of vegetation, and, being liable to inundation, are full of miry places and pools of standing water. These marshes and thickets are frequented by herds of oxen, whose owners are men distinct from the other inhabitants of Seistan; they are said to be tall and stout, but black and ugly, with long faces and large black eyes; they go almost naked, and live in hovels of reeds. Besides their occupation of herdsmen, they fish and fowl on rafts among the rushes of the lake.—*Bellew.*

SEJ-BAND. Hind., Pers. A cord and tassels of silk, for tying down the coverlet of a bed at the corners; they are of different kinds, Sej-band pinjri wala, Sej-band penchi wala, Sej-band sada wala. Its parts are the nati or stem, the tukhm or hollow bulb, and kalghi tassel and jhabba or jhallar fringe. The bulb is filled with kasturi, musk.

SEKHARA, Raja Sekhara, author of the comedy, Viddba Salabhanjika.

SEKONG, a prahu boat with long outriggers. It is made of one log of wood, very sharp fore and aft.

SELABAH, Selaib, or Selīb, an Arab race who receive their name because on certain festivals, and particularly on occasions of marriage and circumcision, they fix at the door of the person to be married or circumcised, a wooden cross, dressed in red cloth, and adorned at the top with feathers, and people collect and dance around the cross. They dwell in tents. They are good sportsmen, and eat anything. They are said to believe in one God.

SELACHE MAXIMA is the great basking shark; attains 30 feet in length.

SELARI is a cloth half silk and half thread, with brilliant edging and borders of silk and gold thread, mostly in the form of sarees and do-pattas.

SELENITE. Hiuen-tsing-shih, Chin. It occurs in the Chinese provinces of Shan-si, Pe-chi-li, and Kiang-si. The occurrence of selenite invariably indicates the presence of sodalite.

SELEUCIDÆ have been noticed under the heading Greeks of Asia; they got their name from the first of the dynasty, Seleucus surnamed Nicator, who ruled from B.C. 312 to 280, but the dynasty had other five of this name. The death of Alexander had occurred in the spring of the year B.C. 323. His colonies, and their institutions, manners, and language had a lasting action in Central Asia, the effects of which were felt for at least 500 years after his decease. But though he left his brother Aridæus and the posthumous child of Rashana or Roxana, called Alexander, neither of these succeeded him, for his commander and lieutenant, Seleucus surnamed Nicator, succeeded to the sovereignty of Afghanistan and the other Asiatic conquests.

In B.C. 315 Antigonus had assumed the regal title of king of Asia. In B.C. 305 Seleucus gained a great victory over Nicanor, a lieutenant of Antigonus, and followed it up by seizing and adding to his own government the whole of Media, Hyrcania, Parthia, Bactria, and Aria, and all the countries as far as the Indus. In B.C. 303 he crossed that river to make war on Chandragupta, who during these contentions had expelled the Grecian garrisons from the Panjab, and had so recovered that country for the native sovereigns of India. Seleucus, being called to a final struggle with Antigonus, made a hasty peace with Chandragupta, ceding the Panjab as far as the Indus. According to Strabo, Arachotia was also ceded, but this seems doubtful. Cutchhi to the Bolan pass, with the valley of the Indus, may have been the region ceded. Seleucus drove Antigonus into Phrygia, where he was defeated and slain in B.C. 301.

Seleucus Nicator subsequently was assassinated in B.C. 280 by Ptolemy Ceraunus, from which date the whole of Asia to the Indus and Jaxartes was under the Syrian king, Antiochus Soter, who from B.C. 280 to 261 reigned undisturbed over the same territory, and left it to his son, Antiochus Theos.

The expedition of Seleucus to the Panjab is related by Justin (lib. xv. c. 4), and by Pliny (Nat. Hist. lib. vi. c. 17). Seleucus Nicator is said to have penetrated to the mouth of the Ganges, and it had been sailed up by the Romans as far as Palibothra, before the time of Strabo. Armandi notices the fact that the elephants figured on the coins of Alexander and the Seleucidæ invariably exhibit the characteristics of the Indian type, whilst those on the Roman medals can at once be pronounced African, from the peculiarities of the convex forehead and expansive ears. He founded 35 cities in Greater and Lesser Asia, 16 of which he named Antioch, from Antiochus, his father; 9 Seleucia, from his own name; 6 Laodicea, from Laodice, his mother; 3 Apamea, from Apama, his first wife (of which the city of Kurnah was the chief); and 1 Stratonicea, from Stratonice, his last wife. According to Dean Prideaux, he was a great protector of the Jews, and the first who gave them settlements in those provinces of Asia which lie on this side of the river Euphrates. As they had been faithful and serviceable to him in his wars and in many other respects, he granted them great privileges in all the cities which he built.

Under his grandson, Afghanistan was taken from the Seleucidæ by the aboriginal chiefs, and soon after formed with Bactria an independent state, which existed during 150 years. After the death of Seleucus Philopater, Antiochus Epiphanes assumed the reins of power in the empire that included Armenia and Parthia. Alexander had been favourable to the Jews, but Antiochus Epiphanes the reverse. The first seven years of his reign were still endurable, but after that every confessor of Jehovah who could not be bribed or seduced over, was subjected to the most cruel forms of martyrdom. But relief came, in the uprise, in B.C. 167, of the valiant Mattathias; and B.C. 165 the temple was purified and the worship of God restored.

Antiochus Epiphanes died B.C. 164, in the year 143 of the era of the Seleucidæ. But there are two eras of the Seleucidæ, the one reckoned from the date of Alexander's death, A.A.C. 323; the second has its epoch 311 years and 4 months B.C., and is used in the Book of Maccabees. These Seleucidæ eras were also called Syro-Macedonian. The people of the Levant and the Jews adopted it, the Jews calling it Tariq-zu'l-karnain, and it is still in use amongst the Arabs.—*Prinsep; Elphinstone; As. Res.* v. 285, ix. 100; *History of the Panjab*, i. p. 55; *Prideaux's Connection of the Old and New Testament; Mignan's Travels*, p. 4.

SELJUK, a Turkoman race, who ruled in Iran A.D. 1037 to 1175; also in Kerman, A.D. 1041 to 1169, and in Rum or Anatolia, the capital of Iconium, A.D. 1077 to 1283. The Seljuk Turks were once masters of nearly all Asia Minor, of Syria, of Mesopotamia, Armenia, part of Persia and Western Turkestan; and their great sultans, Togrul Beg, Alp Arslan, and Malik Shah, are among the most renowned conquerors that stand forth in oriental and in Byzantine history. Long settled in Persia, they adopted the colloquial dialect, and brought it with them on their expul-

sion by the Kharazmian kings, whose unremitting enmity forced vast hordes of them to fly from Persia, after they had been colonized there for many years.

The death of Mahmud, which occurred A.D. 1228, was followed by a period of anarchy, during which Togrul Beg, in the beginning of the 5th century of the Hijira, appeared in Khorasan, and in the short space of ten years wrested that kingdom from the house of Ghazni. It was ceded to Alp Arslan, and constituted a part of the Seljuk dominions until the extinction of that race, about 150 years posterior to Togrul Beg having assumed the title of emperor. By the middle of the 13th century, Ertogrul appeared on the battlefield in Asia Minor, and his more renowned son, Othman, is regarded as the founder of the Ottoman empire.

SELUNG, Salong, or Selones, occupy the islands of the Mergui Archipelago, to the south of Tavoy. They are fishers for the sea slug, Holothuria; reside in their boats, which are good; are decently clad and intelligent; and are inclined to settle in villages and cultivate. They dig up the slug at the low water of spring-tides during the N.E. monsoon. They are supposed by some to be descendants of slaves from the Malay Peninsula.

SELYA, in the south of India, is a sheet or body covering in use amongst the poorer classes, cultivators and labourers, wrapped round their shoulders and body when employed in the fields. Its usual cost is about $1\frac{1}{4}$ to $1\frac{3}{4}$ rupees. In Dharwar one is always presented to the bridegroom by relations of the bride, together with a turband.

SEM, the ancestor of the Semitic race, dwelt in Arphaxad, the primeval land of the Kasdim or Chaldees, the frontier mountains of Armenia towards Assyria. Of the four branches of this Semitic race,—Elam, Assur, Lud, and Aram,—Helam or Elam, the Elymæi, formed the stem of the Babylonian empire, east of the Tigris, in Susiana (South Babylonia); Assur was the stem of the empire of Ninus on the Upper Tigris; Lud, the Lydi, were the original inhabitants of Asia Minor, Pontus, and Cappadocia, as far as the Halys, where the Lydians of history were seated. Aram, the original highlands S.W. of Armenia (Ar Minn), the country between the sources of the Euphrates and Tigris, Mesopotamia proper, is Aram-Nahrain, and Aram became the latest name for Syria. The Aram race branched into Uz or Huz, which is Nejid or North Arabia. It was to Ur of the Chaldees that Nahor went. His son Terah left it and went to Haran (Karra), a day's journey south of Edessa. According to Bunsen, the Semitic race invented theogony for other peoples, and especially for the Hellenes; and the Hebrews abandoned all mythological religion in the time of the patriarch Abraham.—*Bunsen*, iii., v. pp. 71, 365.

SEMANG is a Malay word, applied by the Muhammadans of Kedah, Perak, Tringanu, and Salangore to the pagan tribes of the interior. The Paya reside on the plains or borders of morasses; the Semang Bukit on the hills; the Semang Bakow frequent the sea-shore, and occasionally in the mangrove jungles; and the Semang Bila have been somewhat reclaimed from their savage habits. According to Mr. Earl, the Semang are a woolly-haired race, and a mere remnant of tribes which, according to native tradition, occupied a considerable portion of the interior of the Peninsula at a comparatively recent period. At the present time the race is only known to exist on the mountain Jerci in the Kedah territory, a little to the north of Penang, in the neighbourhood of the mountain range which lies immediately opposite to the latter settlement, and in the uplands of Tringanu, on the east coast of the Peninsula. The Sakai and Allas tribes of Perak have hitherto been classed with the Semang, or woolly-haired race of the neighbourhood of Penang, have curly but not woolly hair, and they retain the Papuan custom of boring the septum of the nose, and also mark their skins with cicatrices, but their language and leading characteristics would show them to be wild tribes of the Malayan race. The Semang, however, who are identical in every particular with the Pangan of the interior of Triuganu, are Papuans in all their purity, with woolly and tufted hair in every respect similar to other unmixed tribes of the race. The Semang of Kedah have been described by Mr. Anderson in the fourth number of the Journal of the Indian Archipelago. Of the origin of the Semang race, the Malays possess no tradition. Certain it is, however, that the tribes of them which inhabited various parts on both sides of the Peninsula were much more numerous before many of the present Malayan colonies were founded by emigrants from Sumatra. A similar race of people are said to have formerly inhabited all the islands of the Archipelago, and nations and remnants of them, under the names Aheta, Aeta, Negrito, and Papua, occupy, or are still to be found on, many of them.

In the remoter portions of Asianesia, some of the black tribes possess all the traits of the Guinea Negro, but the Semang and the Mincopi of the Andamans appear, like the greater number of the Asianesian Negro tribes, to have been partially modified by mixture with other races. This is certainly the case with the Semang, some of whom are Australo-Tamilian in appearance, while others differ little, save in their frizzled or spiral hair and dark complexion, from some of the adjacent Binua.

The average height of the adults of a party of Semang Bukit on the Ijan, a feeder of the Krian, was 4 feet 8 inches, the highest 4 feet 10 inches. Head small, ridged, that is, rising above the forehead in an obtuse wedge shape, the back rounded and markedly narrower than the zygomatic or middle zone; the face generally narrower and smaller than the Malay; eyebrows very prominent, standing out from the forehead and projecting over the ocular furrow, which extends across the face, the root of the nose sinking into it and forming a deep angle with the base of the superciliary ridge. The nose short and somewhat sharp at the point, and often turned up, but the alæ spreading. Eyes fine, middle-sized, and straight; iris large, piercing; conjunctive membrane yellow; the upper eyelashes, owing to the deep ocular depression or prominent ridges, are compressed or folded, the roots of the hair being hidden. The cheek-bones generally broad, but in some cases not remarkably prominent, save with reference to the narrow forehead. Mouth large or wide, but lips not thick or projecting; the lower part of the face oval or round, but not square. The deep depression at the eyes and

sinking in at the root of the nose give a very remarkable character to the head, compared with the Malay. The projecting brow is in a vertical line with the nose, mouth, and chin, and the upper jaw is not projecting or prognathous. The person is slender, the belly protuberant, owing to their animal life in the jungle and precarious food. This induces them to cram themselves whenever they can, and the skin of the abdomen thus becomes flaccid and expansible like that of an ape. The skin generally is fine and soft, although often disfigured by scurf; and the colour is a dark brown, but in some cases lighter and approaching to the Malay. The more exposed hordes are black. The Semang of Tringanu are not of such a jet-black, glossy colour as the Kedah tribe. The hair is spiral, not woolly, and grows thickly on the head in tufts. They have thick moustaches, the growth being much stronger than in the Malay race. The head is neither Mongolian, nor Negro of the Guinea type; it is Papua-Tamilian. The expression of the face is mild, simple, and stupid. The voice is soft, low, nasal, and hollow or cerebral. A line of tattooing extends from the forehead to the cheek-bones. The adjacent Binua also tattoo. The practice is Indian, among the Konds, higher Abor tribes, etc., also Ultra-Indian and Asianesian. The right ear is pierced, the orifice being large. The hair is cropped, save a ring or fringe round the forehead. The Semang of Perak resembles those of Kedah in personal appearance, but speak a different dialect. They possess the same curling black hair, are a little darker in colour, and have not the thick lips of an African.

The Semang eat elephants, rhinoceros, monkeys, and rats. They are very expert with the sumpitan, a blow-pipe for projecting small darts, and poison the darts with ipoh, procured from the juices of various trees. It is seldom they suffer by beasts of prey, as they are extremely sharp-sighted, and as agile in ascending the trees as the monkeys. Elephants descend a hill usually at a slow pace, plucking the branches as they move along, and while the hind legs are lifted up, the Semang, cautiously approaching behind, drives a sharp-pointed bamboo or a piece of nibong, which has been previously well hardened in the fire and touched with poison, into the sole of the elephant's foot with all his force, which effectually lames the animal, and most commonly causes him to fall, when the whole party rush upon him with spears and sharp-pointed sticks, and soon despatch him. 'Badak tapa,' the recluse rhinoceros, towards the close of the rainy season, are said to bury themselves in the marsh, and upon the dry weather setting in, the mud becomes hard and crusted, and the rhinoceros cannot effect its escape without considerable difficulty and exertion. The Semang prepare themselves with large quantities of combustible materials, with which they quietly approach the animal, who is aroused from his reverie by an immense fire over him, which being kept well supplied by the Semang with fresh fuel, soon completes his destruction, and renders him in a fit state to make a meal of. The projecting horn on the snout is carefully preserved, being supposed to be possessed of medicinal properties, and highly prized by the Malays, to whom they barter it for their tobacco, etc.—*Logan, Jour. Ind. Archipelago*, iv. p. 427; *Earl's Indian Archipelago; Newbold's British Settlement*, ii. pp. 369, 370.

SEMAO, also called Savu, an island, 15 miles long, fronting the south-west end of Timor. The village of Oeassa is remarkable for its soap springs, one of which in the village rises like a small volcano. The water contains alkali and iodine. The natives of this Semao Island have been named by Mr. Crawfurd the Negro-Malayan race. The people are like those of Timor, with frizzly or wavy hair, and a coppery-brown colour. Semao Island has abundance of monkeys; one of them is the Macacus cynomolgus, or hare-lipped monkey, which is found all over the western islands of the Archipelago.—*Bikmore*, p. 116; *Wallace*, p. 186.

SEMECARPUS, a genus of plants of the S.E. of Asia, of the sub-order Anacardieæ of the order Anacardiaceæ. The genus Semecarpus comprises moderate-sized or large trees, and many furnish wood and other useful products. S. acuminata, *Wall.*, *Thw.*, is a middle-sized tree in the forests of the Ratnapura, Galle, and Ambagamowa districts of Ceylon at no great elevation, and it grows also in Chittagong. S. cassuvium, *Roxb.*, the Cassuvium sylvestre of Rumphius, is a tree of the Moluccas, where its tender leaves are eaten, and the acrid juice of its stem is employed to varnish shields, canes, etc. S. coriacea, *Thw.*, is a moderate-sized tree of the Central Province of Ceylon, at an elevation of 5000 to 7000 feet. S. Gardneri, *Thw.* (Badulla-gass, SINGH.), is a moderate-sized tree, very common in the Central Province of Ceylon up to an elevation of 3000 feet. S. humilis, *Wall.*, occurs at Prome. S. Moonii, *Thw.*, is a moderate-sized tree of Ceylon, in the south of the island, at no great elevation. S. nigro-viridis, *Thw.*, is a moderate-sized tree in the Central Province of Ceylon, at an elevation of 2000 to 4000 feet. S. odoratus, *Wall.*, in the Royal Garden, Ceylon. The S. oblongifolia, *Thw.*, called Badulla-gass, SINGH., is a moderate-sized tree, common in the hot, drier parts of the island of Ceylon up to an elevation of 3000 feet. S. obovata, *Moon*, is a moderate-sized tree of Ceylon, growing at Caltura, and near Ratnapura. S. obscura, *Thw.*, a moderate-sized tree, growing at Deltotte, in the Central Province of Ceylon, at an elevation of 3000 feet. S. parvifolia, *Thw.* (Hin-badulla-gass, SINGH.), is a small-sized tree of Ceylon, in the Hinidun Corle, in the Galle district. S. pubescens, *Thw.*, is a small-sized tree of the Ratnapura district in Ceylon, at no great elevation. S. subpeltata, *Thw.* (Maha-badulla-gass, SINGH.), is a large tree of Ceylon, 30 to 40 feet high, in the Singhe-raja and other forests between Ratnapura and Galle.—*Roxb.; Thw.; Voigt.*

SEMECARPUS ANACARDIUM. *Linn.*

A. latifolium, *Lam.*		A. officinarum, *Gært.*	
Beladur,	ARAB.	Bhalataka,	SANSK.
Bhela,	BENG.	Kiri, Badulla,	SINGH.
Chai-bin, Khyæ,	BURM.	Shayng-cottay,	TAM.
Ghera mara, Gheru,	CAN.	Bhallatiki,	TEL.
Bhalawan,	DUKH.	Bhallatamu,	,,
Marking nut tree,	ENG.	Jidi chettu,	,,
Bibua,	MAHR.	Tummeda mamidi,	,,
Kampira,	MALEAL.	Bhalleah,	URIYA.
Arushkara,	SANSK.		

This small tree is common throughout British India, Ceylon, and Burma. As an ornamental tree, either in full foliage or before the fall of the leaf, it merits observation.

The acrid and vesicating oil found between the two laminæ of the pericarp of the marking nut, is collected and used as a preventive against the attacks of white ants, and by native practitioners in rheumatic and leprous affections. By boiling the whole nut not divested of its pericarp, an oil is obtained which acts as a blister. The preparation or collection either of the oil or acrid juice is liable to cause much irritation and inflammation of the hands, face, etc., of those engaged in the work. The nuts are black, shining, and flattened on both sides.

The acrid viscid oil which the nut contains, when used as an escharotic and counter-irritant, creates great pain, leaves often very intractable sores, and a mark for life. It is given in medicine in small doses, and is considered a stimulant and narcotic; is much used in the mesalih of elephants; given in large doses, it renders these animals furious; is considered good in venereal diseases, especially of women. The farina of the anthers of the flowers is very narcotic and irritating; people of a peculiar habit accidentally sleeping under the tree when in blossom, or even going near the flowers, are stupefied, and have their faces and limbs swollen, and the use of the bhalawan nut as a counter-irritant very frequently causes the whole body and face to swell with erythematous inflammation and much constitutional disturbance. The mature corolla and the receptacle are fleshy and sweetish sour, and are eaten roasted or boiled as a vegetable, and are deemed, along with cocoanut and chironji, aphrodisiac. The bhalawan nut is worn on the arm as a charm in guinea-worm.

The acrid, black, resinous juice of the nut is employed by the natives externally to remove rheumatic pains, aches, and sprains, by rubbing a little over the affected part. It is also universally used for marking cotton cloth, whence its name of marking nut, the colour being improved and prevented from running by being mixed with lime-water. The green fruit, well pounded, makes good bird-lime; the fleshy receptacle below the nut is sometimes roasted and eaten, and the kernels are also occasionally eaten. A brown-coloured, tasteless gum exudes from the bark.—*Gen. Med. Top.* p. 127; *Beddome, Fl. Sylv.*

SEMECARPUS TRAVANCORICA. *Bedd.* Natu shengote, Tam. This is a very large tree, and, on account of its shining, dark-green foliage, exceedingly handsome; it is very common in the moist forests on the Tinnevelly and Travancore mountains (elevation 1000 to 3000 feet); it abounds with the same caustic, black juice as S. anacardium; it flowers in August and September, and ripens its fruit in the cold season. Another tree of the Travancore Hills is S. auriculata, *Bedd.* —*Beddome, Fl. Sylv.*

SEMEN CONTRA. Sahibi, Hind. The undeveloped calices of Artemisia Judaica, a much-esteemed anthelmintie, especially in the round and long worm of children (Lumbricus teres). The action is heating and stimulant; dose 10 grs. to half a drachm finely powdered, in electuary with honey, or diffused through milk, and taken when the stomach is empty. In infusion or decoction the bitterness is quite disgusting; cathartics should either follow or accompany its use. The use of moxa, or of actual fire, to the surface of the body, is a favourite practice in all savage and even half-civilised nations. In China, the down of the Artemisia Chinensis is set on fire, and the burning end applied directly to the part. In India, a red-hot gul or hookah pastille is usually employed. In Italy a small flame of hydrogen has been lately tried; and in Germany it is a common practice to place a particle of phosphorus on the skin, and then ignite it. The object in all is to effect counter-irritation, and the usual cases in which it is applied are chronic rheumatism, sciatica, neuralgia, deep-seated diseases of the bones, cartilages, or ligaments. In India, guls are used by the native empirics for almost all diseases, especially for enlargements of the spleen and liver.—*O'Sh.* p. 417.

SEMIRAMIS, a great Assyrian queen, wife of Ninus, who extended her conquests into Bactria, which is now represented by the modern Balkh. Semiramis marched on India B.C. 1230. She fitted out her armament in Bactria. She captured on the Kophen (the Kābul river, the Kubha of the Rig Veda) the city of the same name, but was opposed by Jarasandha of Bagadah, the Barhsatide. Semiramis crossed the Indus with a great strength, but Jarasandha, with a formidable force of archers and elephants, drove back the Assyrians in total disorder to the river, which they re-crossed with immense loss, Semiramis herself wounded; she concluded an armistice, and retreated into Bactria with a third of the army she had brought against India. Semiramis was said to have been changed into a dove; she was afterwards worshipped as a dove. The Roman Juno and Chaldæan D'iune were derived from one and the same original, this far-famed queen. Mr. Maurice thinks that Ninus and Semiramis are Vishnu and Siva. C'tesias and Isadore mention a statue and pillar of Semiramis at Baptane; but the sculptures of Semiramis and the inscription in the Syriac character have wholly disappeared. Baghistan is traditionally described as the pleasure-grounds of the queen. The possibility has been surmised of another queen of this name in the 9th century B.C. She is known in India as Sami-Devi. Others point to Sami Rami, suppose it to be the title Zamorin of Calicut.—*Bunsen*, iv. 417; *Sonnerat's Voyages*, p. 5.

SEMITIC LANGUAGES. Hebrew, Chaldee, Syriac, Arabic, Ethiopic, and Amharic are all but dialects of one original language, and constitute one family of speech, the Semitic. The following nations form a compact mass, and represent one physiologically and historically connected family, viz. the *Hebrews*, with the other tribes of Canaan or Palestine, inclusive of the Phœnicians, who spread their language, through their colonization, as that of the Carthaginians; the *Aramaic* tribes, or the historical nations of Aram, Syria, Mesopotamia, and Babylonia, speaking Syrian in the west, and the so-called Chaldaic in the east; finally, the *Arabians*, whose language is connected (through the Himyaritic) with the Ethiopic, the ancient (now the sacred) language of Abyssinia. The language spoken by Abraham when he left Mesopotamia closely resembled the Hebrew, and his own name was Semitic. Moreover, a dialect of the same tongue is still spoken by the Kaldi (Chaldæans) of Kurdistan, who, there is good reason to suppose, are the descendants of the ancient Assyrians. The common origin of their languages, is, however, the only connecting bond

which unites the widely-separated Semitic nations,—Hebrews, Babylonians, Phœnieians, Carthaginians, and Arabs. The Arab, the Hebrew, and the Palestine descendants of Terah were nomade tribes. The Phœnieian, the Syrian, and the people of Mesopotamia and Yemen formed civilised nationalities. In Semitie words the root remains always distinet and unmistakeable. In Aryan, on the eontrary, it soon beeomes altered and disguised. Hence Semitie dictionaries are mostly arranged aeeording to the roots, a method whieh in Aryan languages would be most ineonvenient, the root being often obseure, and in many eases doubtful. The *Amharic*, as also the Hebrew and Syriae, is derived from the Western Aramozi. Eiehhorn adopted the term Semitic from Shem; the language is the oriental language of some author, the Syro-Arabian of Farrer, and the Arabic of Leibnitz.

The Semitie family of languages is divided by Professor Max Muller into three branches,—the Aramaic, the Hebraie, and the Arabie. The Aramaie oeeupies the north, including Syria, Mesopotamia, and part of the ancient kingdoms of Babylonia and Assyria. It is known to us chiefly in two dialects, the Syriae and Chaldee. The former name is given to the language whieh has been preserved to us in a translation of the Bible (the Pcshito) ascribed to the 2d century, and in rieh Christian literature dating from the fourth. It is still spoken, though in a very eorrupt form, by the Nestorians of Kurdistan, near the lakes of Van and Urumia, and by some Christian tribes in Mesopotamia; and an attempt has been made by the Ameriean missionaries stationed at Urmia to restore this dialeet to some grammatieal correetness by publishing translations and a grammar of what they eall the Neo-Syriac language. The name of Chaldee has been given to the language adopted by the Jews during the Babylonian eaptivity. Though the Jews always retained a knowledge of their saered language, they soon began to adopt the dialect of their eonquerors, not for eonversation only, but also for literary eomposition. The book of Ezra eontains fragments in Chaldee, eontemporaneous with the cuneiform inscriptions of Darius and Xerxes, and several of the apoeryphal books, though preserved to us in Greek only, were most likely eomposed originally in Chaldee, and not in Hebrew. The so-ealled Targums, again, or translations and paraphrases of the Old Testament, written during the eenturies immediately preeeding and following the Christian era, give us another speeimen of the Aramaic, or the language of Babylonia, as transplanted to Palestine. This Aramaie was the dialeet spoken by the Lord Jesus Christ and his diseiples. The few authentie words preserved in the New Testament as spoken by our Lord in his own language, sueh as Talitha kumi, Maranatha, Abba, are not in Hebrew, but in the Chaldee or Aramaic, as then spoken by the Jews.

The second braneh of the Semitie family is the *Hebraic*, with whieh is eonneeted the Carthaginian, Phœnieian, and Arabie. This third or *Arabic* braneh sprang from the Arabian peninsula, where it is still spoken by a eompaet mass of aboriginal inhabitants. Its most aneient doeuments are the Himyaritie inscriptions. In very early times the Arabie braneh was transplanted to Afriea, where, south of Egypt and Nubia, on the coast opposite Yemen, an ancient Semitie dialeet has maintained itself to the present day. This is the Ethiopie or Abyssinian, or, as it is ealled by the people themselves, the *Gees* language. Though no longer spoken in its purity by the people of Habesh, it is still preserved in their sacred writings, translations of the Bible, and similar works, which date from the 3d and 4th eenturies. The modern language of Abyssinia is called *Amharic*. These three braneheS, the Aramaie, the Hebraie, and Arabic are elosely related to eaeh other. Besides these, Egyptian, Babylonian, Assyrian, and the Berber dialects are now eonsidered to have a Semitie eharaeter, by Champollion, Bunsen (Egyptian), Lassen, Eugene Bornouf, Dr. Hineks, Sir H. Rawlinson (Assyrian), and Professor F. Newman (Berber). Their language in one form was that of the Judaic portion of Christianity in the Old Testament, the Talmud, and the Syrian fathers. In another form it was that of the Koran or Muhammadanism. It was the language of the earliest alphabet of Phœnicia and the Punie colonies. It fell into the Aramæan, the Arabie, and the Ethiopie divisions. The Aramæan eontained the Hebrew, the Samaritan, and the Syriac of Edessa, Palmyra, Damaseus, and other important cities, and the people who spoke it were enterprising merehants, bold mariners, and monotheist priests.

The Arabic language, as written in the Koran, is the most developed and riehest of the Semitic tongues. It is not now spoken in any part of Arabia, as there written. Probably it never was so, any more than the Latin, the English, the German, or Italian have ever been spoken as written in their respeetive bounds; and Burton quotes from the Arabie Grammar of Clodius that the dialeetus Arabum vulgaris tantum differt ab erudita, quantum Isocrates dietio ab hodierna lingua Græea. Indeed, the Arabs themselves divide their spoken and even written language in two orders, the 'Kalam Wati,' or vulgar tongue, sometimes employed in epistolary correspondenee; and the 'Nahwi,' or grammatieal or elassieal language. Every man of education uses the former, and ean use the latter. And the Koran is no more a model of Arabie (as it is often assumed to be) than Paradise Lost is of English. Inimitable, no man imitates them.

Terah, the father of Abraham, served other gods. But in the book of Job, it is God who ean number the elouds in wisdom, who ean stay the bottles of heaven (xxxviii. 37), who hath divided a water-eourse for the overflowing of waters, and a way for the lightning of thunder (25), who hath begotten the drops of dew (28); and in Proverbs (xxx. 4), who hath bound the waters in a garment, who hath established all the ends of the earth. Abraham, indeed, was inspired with a knowledge of the one true God, but his family had images, the teraphim which Rachel stole from her father Laban (Genesis xxxi. 17–35); and when Jaeob fled from Esau into Padan-aram, and dreamed the dream at Bethel, he evidently had belief in many gods, for he endeavoured to make a bargain with the deity, saying, 'If God will be with me, and will keep me in this way that I go, and will give me bread to eat, and raiment to put on, so that I come again to my father's house in peace, then shall the Lord be my God' (Genesis xxviii. 20, 21). Such expressions show a belief that there were other gods,

one of whom might be Jacob's own protector. The same principle is invoked in the commandment later proclaimed by Moses to have none other gods but the Lord God; and even more lately Joshua has to urge the people to put away strange gods (xxiv. 15–23), to put away the gods which their fathers served on the other side of the flood. 'Choose ye this day,' he says, 'whom ye will serve; whether the gods which your fathers served on the other side of the flood, or the gods of the Amorites, amongst whom ye dwell: but as for me and my house, we will serve the Lord.' Later still, the Psalmist says (lxxxvi. 8), 'Amongst the gods there is none like unto thee, O Lord; neither are there any works like unto thy works.'

The early Arab religion was Sabæanism, a worship of the heavenly bodies, mixed with idolatry; but with Mahomed commenced the Arab conquests, the creed, science, and literature. At present the Arabic alphabet is in use amongst the Turks, Persians, Malays, some of the people of India and Africa. It was, however, of Syrian origin. The Arab family is Muhammadan, except the Christian Arabs of Malta.—*Max Muller, Sanskrit Literature; Langues Semitiques, par Ernest Renan*, 1858; *Peuples Semitiques, par E. Renan*, 1859; *Wellsted's Tr.; Walk through Algiers; Fontanier; Latham; Bunsen's Egypt; Burton's Mecca*, p. 41; *Pelly; Rawlinson*, i. p. 36; *Sale's Koran*, p. 11; *Lubbock's Origin of Civil.; Muller's Lectures*, p. 263; *Mignan's Travels; Die Abstammung der Chalduer, Prof. Eb. Schrader; Semitische Culturentlehung, Dr. A. von Kremer; Della Sida Primitiva, Prof. Ignazio Guidi.*

SEMITIC RACES. The subject of the primeval country of the Semitic races and of their languages has engaged the pens of Bunsen, Professor Ignazio Guidi, Dr. Fritz Hommel, Dr. A. von Kremer, Professor Max Muller, M. E. Renan, Professor Sayce, Professor Eberhard Schrader, Professor Spiegel. The Semitic populations in Asia are the Arabians, Syrians, Samaritans, with about ten millions in British India; in Africa, Abyssinians of Tigre and Amhara, Agow, Falasha, Gafat. During the last 3000 years, conquest and commerce, but chiefly the former, has greatly diffused this race. In various inroads, the Arab Semites have gone northward and eastward into Persia, India, and China, and smaller parties are to be found located in Burma, in Malaya, the Archipelago, and Polynesia. Many of them have likewise conquered and migrated westerly along the north of Africa and into Europe, where, as in Spain, they ruled for 700 years, but were again driven back into Africa. They are now found in Africa, as fetish-worshippers, Christians, Muhammadans, and Jews.

Abyssinia is Christian, being acquainted with the chief truths of the Bible, but all much blended with merely human notions. The latest polemics there have been as to the two or three births of Christ,—born of the Father before all worlds, made man, and in the baptism at Jordan receiving the Holy Spirit. As regards the two natures of Christ, they are extreme monophysists. Monogamy is their church law, but concubinage is universal.

The *Adal*, also said to be a Semitic race, are tribes on the west of the Red Sea, who call themselves Afer, but by the Arabs they are called Danakil, from their chief tribe Ad Alli. Dr. Krapf is of opinion that this Afer is the Ophir of Scripture. He thinks that Ophir, in Job xxviii. 16, simply means gold dust.

The *Galla* race, inhabiting Shoa, and one of the finest in Africa, are strong, well-limbed, and of a dark-brown colour, living in a beautiful country, extending from lat. 3° S. to 8° N., with a climate not surpassed by that of Italy or Greece. Speaking a language as soft and musical as pure Tuscan, cultivating the soil, and rearing cattle. They are from 6 to 8 millions in numbers. Their religion, like that of all African savages, is fetish. They acknowledge a supreme being, whom they call heaven (Mulungu), and have a notion of a future state. There seem to be three natures or attributes in their deity,—Wak or Waka, Supreme; Ogli, a masculine, and Ateti, a feminine embodiment. They have two holy days,—Saturday, which they call Saubatta kenna, or little Sabbath; and Sunday, Saubata gudda, or greater Sabbath.

The *Kabila*, south of Algiers, are Berbers, the old Numidians, and differ in language, form, and habit of mind from the Arabs of the plains, being matter of fact in mind, and but little gifted with the glowing imagination of the Arab. The unsubdued portion dwell in the mountainous tract, with bare precipitous peaks, to the south of the Little Atlas and of Algiers. They are spare but robust; and of smaller stature than the nomade, for the Kabila are dwellers in houses or huts (hence their name), are laborious tillers of the soil, and handicraftsmen clever in winning metals from their hills, and even in forging arms. They are wonderful horsemen, and terrible in a foray as in the days of Sallust, and are always at war with the Arabs. The slopes and valleys of their mountain country are all rich, cultivated lands, covered with olive trees and corn-fields, and the rocks are said to contain minerals. Their number is about 700,000, possessing some millions of acres of the very best land of Africa, watered by three rivers, and teeming with rich harvests. They approach to within 120 miles of Algiers, which they separate from Constantine. They are a federal republic, and elect their own chiefs. They are the old Quinquegentes, who gave so much trouble to the Romans, who tried the soldiership of Maximinian, and sixty years afterwards again revolted. Tu ferocissimos Mauritaniæ populos, inaccesis montium jugisset, naturali munitione fidentes, expugnasti, recepisti, transtultisti. By Maximinian's system of transtultsi these five nations were reduced to four. The Kabile have feuds amongst themselves.

The Tonareng is a nomade race, dwelling in the Great Desert, very fair, with long hair, aquiline noses, high foreheads, and thin lips. They say prayers in Arabic, and speak a Semitic tongue. Their arms consist of a long lance with a broad head, javelins 6 or 7 feet long, jagged hooks at the pointed end, a round buckler (Darega) of buffalo or elephant hide from Soudan, a poniard, and a broad-bladed scimitar.

If we proceed west to *Morocco*, we find its entire population, computed at 8 millions, to consist of—

Berber, . . .	2,300,000	Jews, ...	340,000
Shellok, . . .	1,450,000	Negro and Abd, .	120,000
Moor, . . .	3,550,000	Christian, ...	300
Arab, . . .	740,000	Renegades, ...	200

The *Berber* and *Shellok* are untamed, fighting

tribes dwelling in the mountains. When possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection. They are the same race whom the French call Kabyle and Zouave.

The *Moors* are lowlanders, traders, and dwellers in cities. They are little idle men, who grow fat from indolence; avaricious, perfidious, cowardly, cringing, and insolent. They are said to be descendants of the Carthaginians.

The *Arabs* of Morocco are the Moors of Spain, the Saracens of France, tall, graceful sons of the Arabian desert, courteous, brave, hospitable, and confiding, descendants of the conquerors who in the first ages of the Hijira propagated the religiou of Mahomed, crossed the Straits of Gibraltar, destroyed the Gothic chivalry, reigned in Spain for 700 years, invaded France, devastated Italy, and pillaged the suburbs of imperial Rome. When the last Arab king submitted to Ferdinand and Isabella, and the Moorish palaces of Grenada were surrendered to the Christians, the old conquerors went back to Africa and resumed their nomade life. In Tripoli, the Arab has monopolized the country. In Tunis, the native re-appears in a smaller proportion, and iu Morocco he is very scarce.

The *Jews* of Morocco are partly urbau, partly mountaincers, the latter dating their arrival prior to the nativity. They live in friendship with the Berber, but at hostility with another strange race, who declare themselves descendants of those Philistines whom Joshua drove out of Syria, aud who fouud a refnge in this remote portion of Africa.

The *Riff*, dwellers of Kalhiya (Cape Tres Forcas), were formerly much engaged in piratical expeditions, which were put down by Muli Abdur Rahmau in 1817. Er Rif means shore or bank (Ripa, PORT.), and so long ago as Leo the African was used to designate all the sea-coast between Tetuan and Mililla. It is the country of the chaiu of the Atlas, and is about 200 to 300 miles long. The word is synonymous with the Arabic Sahila. Thus the inhabitants of the Algerinc coast are called Sahali (plural Suahili); those of Morocco Rifi.

The *Arabs* are sprcad from Syria to the Indian Ocean, and castwards into the Archipelago. In Arabia, they are chiefly in tribcs, aud those who occupy the country around Jerusalem are the Anazeh, Shammar, Mowali, aud Salhan.

The *Assir* tribe oecupy between Mecca and Medina. They have six Kabyla,—Bin-ul-Asmar, Bin-ul-Akhmar, Charaan, Assir, Roufeida, and Abida—aud muster about 44,500 fighting meu.

The *Cha'ab Arabs* occupy the lower part of Mesopotamia. They are a tall, martial race, strong-limbed and muscular, active and healthy.

It is necessary, when considering the Arabs, to distinguish betweeu a series of grades towards civilisation, in which they may at present be found.

The *Bedouin* is wandering, pastoral, tent-loving, disdaining to trade, yet avaricious, and willing to sell his ghi, his mutton, or his horse, and always found in wide and open wastes, unpressed upon by adequate exterior power. Yet even the Bedouin bends to circumstances. He aeccpts the region allotted for his pasture-grounds. Plunder has its laws, and vengeance its chivalry. If he will not tradc, he still has wants, and suffers the presenee of a Jew or Salebah, as the Afghan suffers that of the Hindu. A little higher in the scale, as with the Cha'ab, is the original wandering pastoral Arab, in a district where he is pressed upon from without, and where boundless plunder and roaming are restrained by exterior force. The Arab then partly turns to agriculture, and for this he must in some degree settle. Society harmonizes to this level. Trade is possible; corn is sold; the abba cloaks are woven and exported; dates are planted. Huts of rceds replace tents; and one sees in their feeble efforts at reed-oruamentation, and in their rough twisting of their recd-rope for their bunds, the possible germ of some architectural efforts. Yet higher in the scale is the Arab flourishing as an experienced and wealthy merchant in a town, or administering a well-ordered and comfortable rural district. Passing among these people, society is seen in its transitional state towards civilisation.

The present *Arabians*, according to their own historiaus, are sprung from two stocks,—Kahtan, the same with Joktan or Yoktan of the Bible, the son of Eber, whose descendants occupy the south; and Adnan, descended in a direct line from Ishmael, the son of Abraham and Hagar, who occupy the north. Yoktan, according to Ch. Bunsen, was one of the two sons of Nimrud, and was the chief of the first Arabian emigration that proceeded southwards. Tradition points to the mountains of Armenia as the birthplace of the Arab and Canaanitish races. It is supposed that they travelled along the banks of the Tigris into Mesopotamia, from which a portion of them commeneed a great migration southwards, the result of which was the foundation of the primeval kingdoms of Southern Arabia, the kingdoms of the Adites in Yemen, who believe that they came from the sacred North, and once lived in a glorious garden of the earth which they are to restore.

It has not been unusnal to describe the Semites as essentially monotheistic, but their tribes and nations were worshippers of El, Elohim, Jehovah, Sabaoth, Moloch, Nisroch, Rimmon, Nebo, Dagon, Ashtaroth, Baal or Baal-peor, Baal-zebub, Chemosh, Milcom, Adra-Melek, Anna-Melek, Nibhaz, Tartak, Ashima, Nergal, Succoth-benoth, the sun, the moon, the planets, and all the host of heaven. Amongst the nomade branch, there seems early to have been a monotheistic belief, but the great bulk of the Hebrew nation continued to worship idols of their own manufacture; and the prophet, when ordered by iuspiration to proceed to the wilderness of Damascus, was told that there were only in Israel 7000 people who believed in the one God. Some branches of the Semitic race, ignorant of science theocratic, have devoted themselves to the expression of religious instincts and intuitions,—in one word, to the establishment of monotheism. The doctrine of a future life and retribution, which in oue form or other was inwoven with the religious ideas of Egypt, appears to have been unknown to the Semitic nations. The Assyrians were Semites. The names of the Assyrian gods, as Baal or Belus (the supreme deity amongst many of the Semitic races), Nisroch and Mylitta (known by a nearly similar name to the Arabians), of members of the family of the king, such as Adra-Melek (son of Senuacherib), and of many of the principal officers of state mentioned in Scripture, such as Rabsaris, the chief of the eunuehs, and Rabshakeh, the chief of the cup-bearers, are

purely Semitic. Phœnicians, Carthaginians, Syrians, Assyrians have presented forms of worship as gross and sensuous as those of Greece or India. Until the return of the Jews from Babylon, the people generally were ever prone to fall into a worship of gods many and lords many, like the nations around them, which the few thinking minds amongst them could not prevent. Their entire history shows that the people fell into the lower forms of thought and speech, their very worship of Jehovah became polytheistic, even fetish in its nature, and it was in protest against this that their lawgivers, prophets, and psalmists spoke; and when Mahomed appeared with a monotheism the most rigorous and exclusive that the world had witnessed, he was one of a Semitic race who were polytheists and fetish-worshippers. The Jews' belief had as a basis, not monotheism, the belief in a deity numerically one, but in a living God, the Father and the King of men. But when Mahomed proclaimed that the Lord was One, he did so as reviving the faith of Abraham, who derived his knowledge through a special revelation of God.—*E. H. Plumptre, Review of Max Muller's Science of Religion; Contemporary Review*, January 1868.

SEMNAI, a name by which Clemens of Alexandria designates the Buddhist nuns of his day. He mentions Buddhist pyramids, and the habit of depositing bones in them; their practice of foretelling events; of their continence, and of the Buddhist Semnai or holy virgins; and he names their god Bouta. Porphyry tells us that the Brahmans were born to their dignity, while the Semnai were elected. Cyril of Alexandria states that there were Samans in Bactria.

SEMOLINO. It. Semoule, Gruau, Fr.; Soojie, Hind. The fine, hard, inner part of wheat, rounded by attrition in the mill-stones, is used exclusively in India for making loaf-bread. It is imported into England from Italy. The best semolino is obtained from the wheat of the southern parts of Europe. In France the name of semolino is given to the large hard grains of wheat retained in the bolting-machine after the finer parts have been pressed through its meshes. Semola, It., is bran, but often employed by grocers and other vendors to designate semolino. See Farina; Soojie.

SEN, in Bengal, a patronymic of persons of the medical caste, as Ram Komal Sen, author of a Bengali and English dictionary.

SENA, a dynasty of kings who ruled in Eastern and Deltaic Bengal, and afterward in all Bengal, from A.D. 986 to 1142. They were of the Hindu faith. Adisur was the founder of the Sen dynasty; he brought from Kanouj five Sagnic Brahmans, of the tribes or gotra Sanhila, Kashyapa, Vatsa, Saverna, and Bharadwaja; also five Sudra families, Ghose, Bhose, Dutt, Guha, and Mittra, accompanied them, and these take the position of Kulin Kayasths. In the reign of Bullal Sen, about 284 years before the Muhammadan invasion, all these Kulin Brahmans and Kulin Sudras had greatly increased, and Bullal Sen ennobled these Brahmans by giving to them the title of Kulin, and though degenerated in learning they arrogated to themselves a position above all the Sapta-sali or prior Brahmans. The Kulin Brahmans subsequently consented to marry the daughters of the aboriginal Brahmans, who now eagerly seek alliances with the Kulin, and the Kulin have taken advantage of this, and have established a scale of premiums for condescending to accept a daughter of an inferior. They marry gold. Of the Kayasths who came from Kanouj, Bhose, Ghose, and Mittra were ennobled by Bullal Sen into Kulin Kayasths. Das, Day, Dutt, Guha, Kar, Paulit, Seu, and Sing hold a second rank. Kulin Brahman women are married with difficulty, and generally to aged men. In A.D. 1868, there were 11 Kulins in Hoogly and 1 in Bardwan, each of whom had contracted 50 to 80 marriages; 24 in Hoogly and 12 in Bardwan, who had contracted from 20 to 50 marriages; and 48 in Hoogly and 20 in Bardwan, who had contracted between 10 and 20 marriages. Kulinism is thus a great polygamic institution, and a few women have become prostitutes. In A.D. 1867, the abolition of this polygamy was contemplated, and will doubtless some day be carried out.—*Calcutta Review*, May 1868.

SENA, the barber disciple of Ramanand, founder of a separate sect; the Seua Panthi, an extinct Hindu sect of Vaishnavas. Sena was barber of the raja of Bandhagurh.—*As. Res.* xvi. p. 85.

SENA. Sansk. An army. Sena-pati and Sena-dhipati, general commanding, lord of the army.

SENAA, a town in the mountains in the S.W. part of Arabia. After the expulsion of the Turks in A.D 1630, the whole of Yemen came under the government of the Imams of Senaa; but at the time of Carsten Niebuhr's visit to Seuaa in 1763, the native Arab tribes of the provinces of Aden, Abu Areesh, Taez, and others had thrown off allegiance to the Imams. In 1799, when the British Government took measures to oppose the expected invasion of India by the French, and to revive the lost trade of the Red Sea, Dr. Pringle obtained facilities for trade, but Sir Home Popham subsequently lost these. At the beginning of the 19th century, Imam Ali Mansur suffered severely at the hands of the Wahabee sect, who overran and wrested from him some of the best districts of his dominions. In 1816, Muhammad Ali Pasha, after he destroyed the Wahabee power, restored the districts to Imam Ali. In 1817, in consequence of a dispute in which an Arab had been temporarily detained at the factory at Mocha, the Residency was attacked and plundered, and a British officer was dragged before the Governor, by whom he was subjected to the most brutal insults. In 1840, a commercial treaty was concluded with the Governor of Mocha by Captain Moresby, similar to that concluded in the same year with the chief of Zaila. For some years the country of Senaa fell into absolute anarchy. In 1832, Mocha and all the sea-coast fell under the suzerainty of the Turks. It was afterwards recovered for a time, but again finally lost in 1848. Ali Mansur, who succeeded his father as Imam of Senaa in 1834, was deposed three years after. During the internal revolutions in Senaa and the desultory warfare with the Turks, the Imams repeatedly endeavoured to enlist the aid and advice of the British Government in their cause. A rigid abstinence, however, was maintained from all interference in their affairs.—*Playfair's Yemen; Papers in the Foreign Office; Treaties, Engagements, and Sunnuds.*

SENAN, a Sabæan physician, astronomer, and mathematician of the 10th century. His full name was Abu Said Senan.

SEND'HI. HIND. The tuft of hair or scalp-lock which Hindus leave at the top of their head. In Tamil it is called kurmi, and in Telugu, juttu.

SENDOBAD. This book was, like the Pancha Tantra, originally written in Sanskrit, from which it was translated into Persian, and thence into Arabic. From the Arabic it passed into Syriac, and from the latter arose a Greek version under the title of Syntipas. A Hebrew version, supposed to have been made from the Arabic, was translated into Latin by Dam Jehans, a monk, at the end of the 12th or beginning of the 13th century, and was named Historia Septem Sapientum Romæ. Of this last, various translations appeared in English, French, and other modern languages, under the titles of 'The Seven Wise Masters,' 'Dolopathos,' 'Eurastus,' etc.—*Des Longchamps Essai sur les Fables Indiennes.*

SENGAR-CHAORI. HIND. The nuptial hall, from the purpose to which it is applied. Sengar means ornament; Chaori is the term always applied to the place of nuptials.—*Tod's Rajasthan*, ii. p. 709.

SENG-MUNG, among the Abor an interchange of meat as food; on any engagement so cemented their action is inviolate.

SENJERO, a race of Eastern Central Africa. Like the old Romans, they elect their king by the flight of birds, and choose the individual on whom a vulture alights. They sell their women into slavery, and sacrifice their first-born to secure a propitious harvest.—*Krapf.*

SENNA, Cassia senna.

Sanai, Suna, . .	ARAB.	Sunna-muki,	GUJ., HIND.

The leaves of Cassia elongata, C. acutifolia, C. lanceolata, and C. obovata all agree in certain properties,—the odour of the leaves is heavy and peculiar, taste bitter, nauseous, and glutinous, powder yellowish-green, and all yield the purgative senna of commerce. At least eight varieties of senna leaf were known in commerce in Europe. —Senna palthe, Senna of Sennaar or Alexandria, of Tripoli, of Aleppo, of Mocha, of Senegambia, false or Arguel, and the Tinnevelly. The Senna palthe is known to have contained Cynanchum oleæfolium, and in this variety of the drug the poisonous leaves of Coriaria myrtifolia were found by M. Dublanc. The Mocha senna is common in all the bazars of India. The Tinnevelly drug is in species identical with the Mocha. Tinnevelly senna is that most esteemed by the professiou, and is known by the size of the leaflets, which are much larger than those of any other variety; they are also less brittle and thinner, and are generally found in a very perfect state; while the other varieties, especially the Alexandrian, are more or less broken. Senna grown in the southern provinces of the Madras Presidency is highly esteemed in Britain, and is preferred by many to all other sorts, as being both cheaper and purer. Senna raised at Dapuri from Tinnevelly seed, has been found equal to the best Arabian senna. The picking of senna leaves in Gujerat of sowings in August, is made in September; and Dr. Burn states that the virtues of the leaf depend greatly on the time of the picking.

SENNACHERIB, king of Assyria, son of Sargon, ruled in Nineveh. He was coeval with the latter years of Hezekiah, and contemporary with Nabonassar. Sennacherib reigned B.C. 705, and was slain by his two sons B.C. 681. His chief wars were with Babylon, with the mountain races north of Elam, against the Chaldæans of Elam, with Hezekiah king of Judah, Lulia king of Tyre, overrunning all Palestine. He was worshipping in a temple when assassinated by his two sons, Adra-Melek and Sharezer.

SENSITIVE PLANTS. The best known is Mimosa pudica. A knock upon the ground at a short distance from the plant is sufficient to produce an influence on its leaves. Bichloride of mercury, sulphuric acid, caustic potash, etc., applied to the knots of the joints set the leaves in motion. The removal of the plant to a higher temperature, as well as exposing it to a lower temperature or a draught of cold air, produce the same result. They are destroyed by the application of chloroform and other anæsthetic agents. Its leaflets rapidly fold together and droop when touched, and its leaf-stalk, to its base, droops downwards. On the approach of eveuing, the foliage of this plant assumes the same appearance. Besides M. pudica, the M. sensitiva, M. viva, M. casta, M. asperata, M. quadrivalvis, M. Pernambucana, M. pigra, M. humilis, M. peltata, M. dormieus, possess the same property, though not in so remarkable a degree. Species of other genera of the Leguminosæ exhibiting these movements are Smithia siusitiva, Æschynomene Indica, Æ. pumila, and Desmanthus stolonifer. The locust tree, when its branches are roughly shaken, closes up its leaves, and the same has beeu observed of Gleditschia triacantha. Oxalis sensitiva, called by De Candolle, on account of its sensitive properties, Biophytum, has long been known to possess this property. Oxalis stricta, if hit smartly on a warm day, will contract its leaves and assume a position as in the ordinary sleep of the leaves of these plants; and the same movements occur in O. acetosella, O. corniculata, and many other species. The movements in these plants consist in the folding up of their leaves, so that the two halves of the leaf approach each other by their upper surface. The midrib is also slightly bent, so that its inferior surface presents a convexity; and the petioles of the leaflets bend downwards, so that the leaf, when irritated, becomes dependent. Averrhoa bilimbi and A. carambola fold their leaves on the application of a stimulus. The leaves of Dionœa muscipula or Venus fly-trap contract upon insects that may happen to alight upon their surface. The surface of their leaves is covered with long hairs, which secrete a viscous matter. When any insect settles upon the leaf, it is entangled with the viscous secretions, and before it has time to escape, the hairs exhibit a considerable degree of irritability, and, curving round, pin the animal down on the surface of the leaf. Other instances of vegetable irritability occur in the Berberis vulgaris, Mimulus, and Stylidium. In the Desmodium gyraus, one of the Fabaceæ called the telegraph plant, a native of the East Indies, the large terminal leaflet when

exposed to the bright light of the sun, forms a direct and continuous line with its leaf-stock, but is manifestly depressed if placed in the shade for a few minutes. Its position varies with the increase or decrease of light during the day.—*Bulletins de l'Academie Royale de Bruxelles*, vi. *in Eng. Cyc.; Chambers' Journal*, 1863.

SEO-JI, in the Bhaka tongue, is a title of Siva; the Ji is merely an adjunct of respect.

SEONI, in lat. 22° 5′ 30″ N., and long. 79° 35′ E., a town in the Central Provinces of British India which gives its name to a revenue district. The beauty of its scenery, the fertility of its valleys, the elevation of its plateau, its salubrity and moderate temperature, make it attractive. The plateaux of Seoni and Lakhnadon have a varying height of from 1800 to 2200 feet. They are well cultivated, clear of jungle, and their temperature is always moderate. The most numerous of the aboriginal tribes are the Gond (148,183 in 1872), the remainder consisting of Kurku, Bharia; Dher or Mhar (40,207), Ponwar (30,305), Ahir or Gauli (26,907), Mali or Maral (24,873), and other cultivatiug or inferior castes. The Ponwar supply the most industrious and enterprising agriculturists. Their appearance in Seoni dates from the middle of the 18th century, their first settlements being about Sangarhi and Partabgarh, whence they ultimately spread into Katangi. The pastoral Ahir or Gauli occupy the fiue grazing ground to be found in most parts of the district, and the rocky strip of Dongartal in the south-west.—*Imp. Gaz.*

SEORI or Siviri, a race in Ghazipur, Gorakhpur, Behar, Benares, and Mirzapore, whom Buchanan thinks distinct from the Kol aud the Cheru. The Cheru aborigines in Ghazipur, a part of Gorakhpur, the southern part of Benares and Mirzapore, and of Behar, are sometimes said to be a branch of the Bhar, but Buchanau considers them distinct.

SEPIADÆ, a family of mollusca of the class Cephalopoda, order Dibranchiata, and section Decapoda, including the genera belemnosis, beloptera, helicerus, sepia or cuttle-fish, and spirulirostra. Belemnosis, beloptera, aud spirulirostra are fossil, and sepia has 10 fossil and 30 living species, of which the type is the eommon cuttle-fish, whose bone is so often thrown up by the waves on the beach. The ink (uigræ succus loliginis), common to this and other species of eephalopods, is uot only ejected as a defence to colour the water in order to favour the escape of the auimal, as was well known to the ancients (Oppian, Halient, iii.; Pliny's Nat. Hist. ix. p. 29), but as a direct means of annoyance. The fluid was used by the ancients as ink, as shown in the lines in the graphic description of the idler by Persius (Sat. iii. liu. 10, et seq). The flesh of the naked cephalopods was rather esteemed of old, as it is, indeed, now in Italy and easteru countries. Mr. F. D. Bennett states that the Fe, or cuttle-fish, is considered a luxury by all classes of the Sandwich islanders, and that when fresh and well cooked it is an exeellent food, and iu consistence and flavour uot unlike the flesh of a lobster's claw. Its shell, called cuttle-fish bone, is sometimes 1½ feet long; it is used for rubbing down paint.—*Bennett, Whaling Voyage*, Loud. 1840; *Woodward.*

SEPOY. Anglo-Hind. Sipahi, Pers. A native soldier of the Indian army.

SEPSIDÆ, the family of sand lizards, one of them, Sphenocephalus tridactylus, *Blyth*, occurs in Afghanistan.

SEPTACANTHIS WALKERI, one of the Acanthacea (quere, Nillhoo of Ceylon), perfumes by its fragrance the jungles, especially around Needuwattum aud paths leading to Gudalur.

SEPTARIA. Shih-pieh, Chin. Nodular stony concretions used in Chinese medicine.

SEQUIN, a Venetian coin known iu the S. of India as Shanar kassu. The figure of the Pope, with a tall crozier, is supposed to be a Shanar toddy-drawer about to ascend a cocoanut tree.

SEQUOIA GIGANTEA. *Decaisne.* The Wellingtonia gigantea, *Lindley.* A huge tree of California, some of which measured 420 to 470 feet, average height 275 feet. It might be introduced into India. Sequoia sempervirens, discovered by Menzies in 1796, in California, is nearly as tall as the Wellingtonia. One tree, known as the Giant of the Forest, was 270 feet high, and 55 feet in circumference at 6 feet from the ground. This species is interesting as being the nearest living representative of a sequoia which, during the tertiary period, enjoyed a very wide distribution in Europe, where no congener is now indigenous.

SER. Hind. An Indian weight of varying quantities from 25 tolas to 2 lbs. 2 oz.

SERAI. Hind. A lodge for travellers.

SERAJGANJ, Narainganj, and other N.E. districts of Bengal, are the chief seats producing the jute fibre. The yield is 2000 to 4000 lbs. of fibre, and 1000 to 1200 lbs. of seed per acre. The common or desi sort yields only 600 to 1000 lbs. of fibre, but an increase of seed, viz. 1500 to 1600 lbs. Jute is sown broadcast, 22 to 28 lbs. of seed per acre. In the N.E. districts it is planted in February and March, and cut in June aud July; the commou kind in July and August, and cut in August and September.

SERAMPUR, a town in the Hoogly district of Bengal, lat. 22° 46′ N., long. 88° 24′ E., 13 miles from Calcutta, on the right bank of the river Hoogly. The town gives its name to the Serampur subdivision of the Hoogly. It is famed as the residence of a body of Protestant Baptist missionaries from England who made this the centre of their Christianizing efforts. Amongst them were the celebrated William Carey, Ward, and Marshman. Carey set up his missionary press there, and printed the Bible iu 40 different Indian tongues. He founded here a college, which has fallen into decay. Until the middle of the 19th century, Serampur and Negapatam belonged to the Danes. The mission still flourishes, and its founders have established a church, school, college, and noble library in connection with it; there is also a dispensary here.—*Imp. Gaz.*

SEREGIUS, a Manichæan who appeared in the character of Christ and Paraclete.—*As. Res.* ix. pp. 217, 218.

SERES, a term which Horace and the ancients use, seems to have been strictly applicable to some nation in the west of China. The western term China is not traceable, but many authors have surmised that it was given to the country when the Tsin dynasty carried their arms to the west. Whatever may have been its origin, the term China (Cheena) was that early given by the people of the N.W. of India to the race whom Europe now calls the Chinese. There are two mentions of the Seres which may be much earlier.

One is in a passage ascribed to Ctesias, which speaks of the Seres as a people of portentous stature and longevity.—*Yule, Cathay*, i. p. 39.

SERIATOPORA SUBULATA, a coral reef-building polypifer at the Mauritius.

SERINGAPATAM, in lat. 12° 25′ 33″ N., and long. 76° 43′ 8″ E., in Mysore, is built on an island in the Cauvery river, 3 miles long and 1 mile broad. The mean height of the station is 2558 feet; the level of the Cauvery is 2321 feet. The fort is placed at the upper end of the island. It is a large irregular fortification, protected on two sides by the river; the complete Hindu name is Sri-ranga-patana. One canal is carried across the western branch of the river Cauvery 40 feet above its level. The existing fortifications were almost entirely constructed by Tipu. In 1791, Lord Cornwallis, the Governor-General, commanding in person, advanced up to the walls, but was compelled to retire through want of provisions. In the following year, 6th February 1792, he won a decisive victory in the field, and had invested the city on all sides, when Tipu purchased peace by the cession of half his dominions. Finally, the fort was stormed, led by Sir David Baird under General Harris, 4th May 1799, and Tipu fell in the breach. The siege was begun in April of that year with a powerful battering train, and the assault was delivered after a bombardment of nearly one month's duration. The place is malarious, which the natives attribute to the destruction of the sweet flag, a plant to which they assign extraordinary virtue as a febrifuge. The fort stands at the upper or western end of the island. At the eastern end is the Lal Bagh, containing a mausoleum built by Tipu Sultan for his father Hyder Ali, in which Tipu himself also lies. It is a square building, with dome and minarets, surrounded by a corridor, which is supported by pillars of black trap. The double doors, inlaid with ivory, were the gift of Lord Dalhousie. The inscription on the tombstone of Tipu relates how he died a martyr to Islam. Each of the two tombs is covered with a crimson pall, and the expenses of the place are defrayed by the British Indian Government.—*Imp. Gaz.*

SERONCHA, the chief station of the Upper Godavery district of the Central Provinces.

SEROW. Hind.? Nemorhœdus bubalina, *Jerdon.*

SERPA, a Bhot people in Nepal and Sikkim, who speak a dialect of Tibetan.

SERPENT.

Serpents or snakes are alluded to in the most ancient of the writings and traditions of the world. They are very numerous in many parts in the south of Asia, admired yet dreaded by many, but protected and worshipped by other, of the races. The colours of the backs of such as creep on the ground are generally of a brownish hue, much resembling the soil on which they move. The colours of the Dendrophidæ, or tree snakes, are of various shades of green, so that, aided by their quiet gliding motion, snakes, though numerous, unless looked for, are seldom seen by any person. But a search in the least promising places will always produce to the naturalist some specimens. The backs of the water-snakes, the Hydridæ, are also usually of a brownish colour, from which in the green sea water, or in that of quiet lakes or tanks, they are detected as readily as the tree and land snakes escape observance. All snakes have a long bifid tongue, which, usually retracted in a sheath below the windpipe, is capable of rapid and vibrating protrusion through a chink in the rostral shield; it is moved by means of two long elastic bones extending along the greater part of its length in the form of a long V, with the tongue rising perpendicularly from the angle of the V; muscles convert these bones into levers, which jerk the tongue up and down with great celerity and freedom of play. This form of tongue is not peculiar to snakes; the large water lizards (Varanus), for instance, have this bifid organ still more developed. Harmless snakes have a row of about six to sixteen teeth in each upper jaw, besides generally two rows of palate teeth. In the venomous kinds the maxillary teeth are generally replaced by a single tubular tooth of variable length, but hardly exceeding a quarter of an inch in an adult cobra, and half an inch in an adult chain-viper (Daboia elegans). The erection of the fang takes place to a very slight extent in the cobra, which is unprovided with any special erective apparatus; the fang is always recurved backwards at an angle of about 45°, and received into a depression in the lower lip. In some of the vipers there is a special erective muscle, but in every case the uncovering of the fang is a passive act as regards the snake, being effected by the gingival envelope being pushed up mechanically by the object bitten. The fang is at the anterior extremity of the upper jaw-bone, while the poison gland is situated on the cheek behind the eye; the poison, on being ejected either by direct muscular action, or by a reflex nervous action similar to that excited in the human mouth by the idea of eating lemon, proceeds along a duct, which passes below the eye over the jawbone, and terminates at the bottom of the gingival envelope of the fang, and just in front of the superior orifice of its canal. There is no continuity between the orifice of the poison duct and that of the poison fang. They are merely in apposition, and the poisonous salivary secretion is directed into the fang by the retraction of the gingival envelope round the fang in the act of biting. Every tooth in the snake's mouth, whether simple tooth or poison fang, is enveloped more or less in a gingival envelope, which contains at its base the matrix of a series of other teeth; these young teeth are constantly growing, and the eldest of them periodically replaces the fixed tooth, and becomes fixed until it is shed in its turn. This shedding is a gradual process compared to the shedding of the epidermis, but the two operations coincide in time, and take place about once in two months. The common exceptions are the cobra and the bungarus. In India the usual snake of the latter genus is Bungarus arcuatus, the white-arched bungarus; it has a white belly, from which pairs

of white arches cross the black back. In Burma this is replaced by Bungarus fasciatus, the yellow and black-banded bungarus; it has alternate complete rings of black and yellow. The Hamadryad, Ophiophagus elaps, a member of the Elapidæ family, is extremely rare; it resembles a huge cobra. This family is also distinguished from the rest of the shield-headed or harmless colubrine snakes, by the absence of the loreal-shield, a small shield usually separating the antocular shield from the posterior nasal, so that there are but two shields instead of three between the eye and the nostril The sea-snakes which have shielded heads are also an exceptional family, being all or nearly all venomous. They are known from other aquatic snakes by their perpendicularly-flattened tail. A scaly head (that is, the crown covered with scales as on the rest of the body) is generally the sign of a poisonous snake. The scaly-headed snakes are usually vipers. The Viperidæ have usually a high flat head, very distinct at the neck, and broad behind the jaws. They have long, more or less erectile fangs, with an erect pupil. The only one fatal to human life is the chain-viper, Daboia elegans, known by a triple chain of oval black links, and an indistinct yellow on its head. The green tree viper, Trimesurus, is a short, stout snake, very different in build from the long, slender green tree snake; it is venomous in a very slight degree. As exceptions to these general remarks, however, the Erycidæ and Acrochordidæ have also scaly heads; a common sand snake, Eryx Johnii, might possibly be mistaken for a viper, but its small head is very different from that of the vipers. It is a popular belief that the male and female cobra are very different in appearance. The origin of this error appears to be as follows: The Ptyas (mucosus or korros), dhamau in Hindustani, sarai or sara pamboo in Tamil, chera pamboo in Malayalam, lem-we in Burmese, is generally supposed by natives of the south of India and of Burma, to unite with the cobra, producing a very venomous hybrid offspring, of doubtful identity; hence it is frequently called the male cobra. Ptyas, the dhaman, is indifferently known as the whip snake, the rat snake, the rock snake in Madras; whilst in Bengal the name rock snake is usually given to the python. Any snake found near or in the water is usually called a water snake, from ignorance of the fact that nearly all snakes can swim, and will readily take to the water if necessary. Indeed, a snake which rejoices in the highly terrestrial name of Psammodynastes pulverulentus, the dusty king of the desert, was captured whilst it was swimming across the Rangoon lake. Also, if any word could be more inappropriate and deceptive than another, it is the term 'hood' as applied to the broad expansion produced by the elevation of the cervical ribs of Naga tripudians and Ophiophagus elaps. The native terms used to describe it, putum in Tamil and Malayalam, meaning a cloth, a picture, a map, and phun in Hindustani, both give an idea of breadth and expansion entirely wanting in the terms capella and hood.

Naturalists arrange the order of snakes into the two sub-orders, innocuous and venomous colubrine snakes, and the names of these will be found detailed under the Reptiles. Though the non-scientific world regard all snakes as poisonous, and though many deaths do occur from snake-bite, the numbers of poisonous snakes are not great, and comprise species of the genera Aipysurus, Acalyptus, Bungarus, Callophis, Daboia, Disteria, Calloselasma, Echis, Hydrophis, Enhydrina, Halys, Hypnale, Megærophis, Naja, Ophiophagus, Platurus, Pelamis, Peltopelor, Trimeresurus, Xenurelaps; 18 genera, and about 80 species. Deaths frequently occur from them in the south and east of Asia, because of the difficulty of avoiding them. In the six years 1875 to 1880, the deaths from snake-bites in British India were as under. In 1861 they were 18,670:

1875, . . .	17,070	1878, . . .	16,812
1876, . . .	15,946	1879, . . .	17,388
1877, . . .	16,777	1880, . . .	19,150

Yet they have many enemies. Mr. Bennett, who resided much in the south-east of Ceylon, ascribed the rarity of serpents in the jungle to the abundance of the wild pea-fowl, whose partiality to young snakes renders them the chief destroyers of these reptiles. It is likely, too, that they are killed by the jungle-fowl, for they are frequently eaten by the common barn-door fowl in Ceylon. This is rendered the more probable, by the fact that in those districts where the extension of cultivation and the visits of sportsmen have reduced the numbers of the jungle-fowl and pea-fowl, snakes have perceptibly increased. The deer also are enemies of the snakes, and the natives who have had opportunities of watching their encounters, assert that they have seen deer rush upon a serpent, and crush it by leaping on it with all its four feet.

Snakes are said to avoid the fennel plant, as well as all places where the fennel seed (Nigella sativa) is strewed.

In some parts of the country are serpents of great length, up to 26 feet long. They feed on all the smaller animals, but they can exist an indefinite time without food.

Snakes cast their skins periodically, and the Chinese and Hindu physicians use the skins medicinally.

Most serpents or snakes can move by springs or leaps, often of considerable extent. The Editor has seen a large snake cross the high-road in the flats at Bombay by two leaps.

Nearly all with a hood are poisonous; the Composososoma radiatum and Tropidouotus macrophthalmus are exceptions.

Naja tripudians, cobra, cobra di capello, occurs in several varieties, to each of which the natives give a name. They are all poisonous. The Gokurrah has spectacles on the hood. Those with one ocellus or other mark on the hood, are called Keautiah.

Ophiophagus elaps is the Hamadryad of Gunther, the Sunkerchor of Bengal, and Ai Raj of Orissa. One variety, olive-green above, is found in Bengal, Assam, Malay Peninsula, and S. India. The brownish-olive is found in Bengal, the Philippines, and perhaps in Burma; and the black variety is a Borneo reptile. The genus is widely distributed in Cuttack, Bengal, Sunderbuns, Rangoon, in the Andamans, Philippines, Java, Sumatra, Borneo, N. Guinea. It is the most aggressive of all the Indian poisonous snakes. It lives upon snakes.

Bungarus fasciatus is the Sankni or Raj Samp of Bengal, the Bangaraw pamu of S. India, and

the Koklia Krait of the N.W. Provinces. It is from 4 to 8 feet long. It occurs in Hindustan, S. Iudia, and Burma. Its bite is very dangerous; dogs die in 4 to 28 hours.

Bungarus cæruleus.

Dhomun chiti, . BENG.	Krait, ... HIND.

Gedi Paragoodoo, TEL., of Russell. It occurs throughout India, N.W. Provinces, Rajputana, Gujerat, Dekhan, Madras. It has three varieties, one of them, B. lividus, *Cantor*, is blackish-brown above; another variety has a series of vertebral white spots; and a third, the B. arcuatus, *Dum. and Bib.*, has narrow white streaks in pairs on its upper parts. It is from 2 to 4½ feet. The Lycodon aulicus, an innocent snake, and it, are frequently mistaken. All the species of Bungarus and Hamadryas are fierce snakes.

Callophis M'Clellandiâ has two varieties from Nepal and Darjiling, and a third variety from Assam.

Daboia Russelli.

D. elegans; Russell's viper; Chain viper.

Jessur, ... BENG.	Tic-polonga . of CEYLON.
Siah-chunder, . ,,	Katuka, Rekula, . TAM.
Amaiter, . . . ,,	Poda, ... ,,

It is to be found in most parts of India, in the plains aud hills, also in Kulu up to 5000 feet, and in Kashmir 2000 to 6000 feet. It is of a greyish-brown colour, 3½ feet loug; it is less deadly than the cobra. Its size and nocturnal habits render it more dangerous than the Trimeresures and Hypnales.

Echis cariuata.

Afae, ... HIND.	Horatta pamu, . . TAM.
Kuppur, . . . SIND.	

Occurs in most parts of India. It is brown or brownish-grey, 22 inches long; it is very active, is fiercely aggressive, is always ready to attack, and throws itself into a double coil, the folds of which as they rub against cach other make a rustling sound. It can dart a foot or more to strike its prey.

Trimeresurus carinatus, one of the Crotalidæ or pit vipers, found in Bengal, Sikkim, and Burma; 36 inches long, and grass-green above.

Trimeresurus Animallensis, 27 inches loug, yellowish-green in colour, occurs in the Animallay Hills in S. India.

Trimeresurus erythrurus occurs in the Nicobars, Moulmein, Penang, and Java. It is 33 inches long, and of a grass-green colour.

Trimeresurus monticola occurs in the Sub-Himalaya, Darjiling, Nepal, Sikkim, Khassya, Neilgherries, and Animallay. It is 33 inches long, of various shades of dark-brown.

Mr. Theobald describes two others, viz. Trimeresurus Andersonii, *Theobald*, found in Assam, and Trimeresurus obscurus, *Theobald*, of a uniform black colour, also of Assam.

Trimeresurus strigatus, of a brown colour, is 14½ to 19 inches long, is found in the Dekhan, the Animallays, and Neilgherries.

Halys Himalayanus, 23 inches long, occurs in the Hatu mountaiu near Kotgurh, is very commou in the N.W. Himalayas. It is brownish-green to brownish-black above.

Hypnale nepa, Kara willa, TAM., a much-dreaded snake, 19 inches long, fouud in Malabar, Animallay, Ceylon; colour brown, or grey, or reddish-olive.

Pelamis bicolor, a sea-snake, with four varieties,—α. black above, sides and belly brownish-olive; β. a second, back black, belly and sides brown; γ. a third, black of back narrow; δ. fourth, yellow, with 50 brown bands. It abounds in all the eastern seas. It is very poisonous.

Euhydrina Bengalensis, a very virulent sea-snake, common in the tidal waters of the Sunderbuns and Bay of Bengal; 36 to 48 inches long. One killed a fowl in seven minutes.

Platurus Fischeri, a sea-snake, 30 to 48 inches long, found in Tollys nullah, a tidal stream near Calcutta.

Hydrophis Jerdonii, *Anderson*, 36 inches long.

H. robusta, *Fischer*, 70 inches, occurs on the coast of India and in the Archipelago.

H. crassicollis, *Anderson*, 51 inches long, is found in the tidal streams near Calcutta.

H. cyanociucta, 69 inches long, is common in the Bay of Bengal, the Archipelago, and China, and Japan seas.

H. Stewartii, *Anderson*, is 38 inches long, occurs at Puri, Cuttack.

H. nigra, *Anderson*, is of a uniform dense black, occurs at Puri, Cuttack.

H. nigrocincta, 23 inches long, colour yellow, with complete rings of a black colour.

H. coronata.

H. chlorosis. See Reptiles, pp. 386, 393.

SERPENT EAGLE, Circaetus gallicus, *Gmel.*

Common serpent eagle.	C. brachydactylus, *Meyer.*
Sap-maril, . . . BENG.	Pamula gedda, . TEL.

Pambu prandu, . TAM.	

This serpent eagle is found in the south of Europe, North Africa, common all over India and Asia; has been killed iu Denmark, but never in the British Islands; prefers the open ground, questing like a harrier. It eats any creatnre, but snakes and lizards are its chief food. Hoveriug in the air, and suddenly like a stone pouncing down, it seizes with its talons the snake by the back of the head, aud the snake often twines its body around the bird and encumbers it.

The crested serpent eagle is found all over India, in Assam, and Burma. It lives on snakes, lizards, rats, frogs, and insects.

S. bacha, *Daud.*, from Java and Sumatra; is the Falco bido of Horsfield.

S. spilogaster, *Blainv.*, from Ceylon and Southern India.

S. holospilus, *Vigors*, is from the Philippines.

SERPENTINE is a term which has been applied to diallage, to crystallized and fine-grained green-stone, and also to a magnesian limestone, and when of the latter composition is called verd antique marble. It is found iu the form of dykes and thick beds in the schistose rocks of Salem, also near Bezwarah on the Kistna. A serpentine of great beauty occurs at Turivacary in Mysore. It is composed of a dark-grey or black talcose paste imbedding numerous small black crystals of a mineral containing a large proportion of iron, being strongly attracted by the magnet. It takes a high polish, and is said to be the material of the beautiful pillars of the

mausoleum of Hyder Ali at Seringapatam, which Buchanan Hamilton, Benza, and Malcolmson designated basaltic greenstone.

A beautiful serpentinous marble is obtainable in the eastern part of the Cuddapah district, and in the Kurnool district. The serpentine of the Panjab is made into cups.

Precious serpentine exists in the Hukong valley, north-west of Ava, whence it is exported to China, and brought into the southern parts of the empire. It is also found in the country of the Singpho, about 8 or 9 miles to the north of a large lake, the Eng-dan-gyi, over a hilly country of 18 or 20 miles in length. At particular seasons, about a thousand men—Burman, Chinese, Shan, and Singpho—are at work in the serpentine mines.—*Waterston; Faulkner; Mason; Walton's State; Tomlinson.*

SERPENT'S EGG.

Glain naider, . . Celt.	Serpent's gem.
Glaine nan Druidhe, ,,	Druid's head.
Ovum anguinum, . Lat.	

It was held in high estimation by the Druids.

Serpent Gem is a superstition still lingering in Scotland, and amongst the ruins of Tadmor.

SERPENT STONE. Shi-hwang, Chin. The bezoar. Tavernier says (Tr. p. 155) some are almost oval, thick in the middle, and thin about the sides. 'The Indians,' he says, 'report that it is bred in the head of certain serpents, but he supposed it rather to be a story of the idolaters' priests, and that the stone is rather a composition of certain drugs. Whatever it be, he says it is of excellent virtue to drive any venom out of those that are bit by venomous creatures. If the person bit be not much wounded, the place must be incised, and the stone being applied thereto, will not fall off till it has drawn all the poison to it. To cleanse it, you must steep it in woman's milk, or for want of that, in cow's milk; after the stone has lain ten or twelve hours, the milk will turn to the colour of an apostemated matter.' The Archbishop of Goa, carrying Tavernier to his cabinet of rarities, showed him one of these stones, and after he had assured him of the rare qualities it had, gave it to Tavernier. Once as he crossed a marsh in the island of Salsette, where Goa stands, one of the men that carried his pallequis, being half-naked, was bit by a serpent, and healed at the same time. He bought several, but there were none but the Brahmans that sold them, which made him believe that they compound them. 'There are,' he says, 'two ways to try whether the serpent stone be true or false. The first is by putting the stone in your mouth, for then it will give a leap, and fix to the palate. The other is, by putting it in a glassful of water; for if the stone be true, the water will fall a-boiling, and rise in little bubbles up to the top of the glass. There is another stone, which is called the serpent stone with the hood. This is a kind of serpent that has a kind of hood hanging down behind the head. Behind this hood the stone is found, many times as big as a pullet's egg.' There are some serpents both in Asia and America of a monstrous size, 25 feet long; as was that, the skin whereof is kept in Batavia, which had swallowed a maid of ten years of age. These stones are not found in any of those serpents that are not at least 2 feet long. This stone being rubbed against another stone, yields another flime, which being drunk in water by the person that has the poison in his body, powerfully drives it out. These serpents are nowhere to be found but upon the coasts of Melinde; but for the stones you may buy them of the Portuguese mariners and soldiers that come from Mozambique.—*Tavernier's Tr.* 155.

SERPENT WORSHIP and Spirit Worship are the prevalent cults in the East Indies; and throughout British India, spirits, snakes, stones, shells, trees, and fossils are worshipped. The last is the saligramma of the Hindus, and is found in the river Gandak. Also the ban-lang, or rude lingam of the Hindus, is a stone rounded by attrition, found in the rivers of Rajputana. According to the Earl of Roden, a stone at Mayo was carefully wrapped up in flannel, periodically worshipped, and supplicated to send wrecks on the coast. Stones were till recently worshipped in Fiji, New Hebrides, and related to the lingam worship of other races. The chank shell, species of Turbinella, is found in abundance in the Pambaum Channel, between Ceylon and Tinnevelly; some fetch great prices. Psalm lxxxi. 3, says, 'Blow up the trumpet in the new moon, in the time appointed, on our solemn feast-day.' And Hindus similarly announce some of their festivals by the sound of this sacred shell.

Snakes have been worshipped by many races; the Jews, 2000 years B.C., adopted this worship. At Lanuvium, 16 miles from Rome, was a dark grove sacred to Juno, and near it the abode of a great serpent, the oracle of female chastity.

The naga snake of India, cobra di capello, is revered by all Hindus, and Hindu women resort to the white ant nests in which the cobra generally takes up its home. If a cobra be killed, the Hindus give it a funeral, as if it were a human being; their gods and deified warriors, and the lingam, are figured shadowed by the outspreading hoods of 3, 5, 7, 9, or 11 cobras.

In all mythological language the snake is an emblem of immortality; its endless figure, when its tail is inserted in its mouth, and the repeated renewal of its skin and vigour, afford symbols of continued youth and eternity. In Hindu mythology serpents are of universal occurrence and importance, and the fabulous histories of Egypt and Greece are also decorated with serpentine machinery. The accepted explanation of the traditions of the Garuda, and his victories over the snakes, is that Garuda is the type of the religion of Vishnu, and the snakes alluded to are the naga or snake race who followed the Buddhist faith of Sakya Muni. There is ample proof to show that at one time the ophite or snake worship extended all over India; and everywhere throughout the Peninsula and Ceylon, snakes are to this day worshipped. In the holy books of the Hindus, the destruction of the entire serpent race by the raja Janamejaya, the son of Parieshit, is chronicled as a historical event, but probably it is merely a typical and emblematical shadowing forth of the actual fact, *i.e.* that the faith of the Vedas was founded on the ruins of the original and local superstition of the nagas, when Janamejaya subverted the ancient ophite worship. At all events, there is no doubt whatever that this singular superstition existed originally in Kashmir, as snakes and snake deities play an important part in the legendary history of the valley. Abul Fazl (alluding to an epoch about 350 or 400

years B.C.) mentions 'that there are 700 places where carved snakes are worshipped in the province.' The Hindu races worship three classes of deities, — the gramma deva, or village god; the kula deva, or household god; and the ista deva, the personal or patron god. Snake-worship is general throughout peninsular India, both of the sculptured form and of the living creature, invariably the nag or cobra, and almost every hamlet has its serpent deity. Sometimes this is a single snake, the hood of the cobra being spread open. Occasionally the sculptured figures are nine in number, and this form is called nao-nag; but the prevailing form is that of two snakes in the form of the Esculapian rod. Whatever be the origin of the adoration, throughout Southern India the worshippers resort to the snake's residence, called in Urdu the Samp-ki-hut, which they ornament with streaks of vermilion, and daubs of turmeric and of wheat flour mixed with sugar, and they hang garlands of flowers near, strung on white cotton thread, and placed over wooden frames. The Mahratta women go a number together to the snake's hut, and, joining hands, for five times circle round and round it, singing songs, praying for their desires, and then prostrating themselves. Also in the month Sravan, which falls in the rainy season, the Nag-panchami festival occurs, on which Hindus go in search of snakes, or have them brought to their houses by the Sampeli snake-charmers. The snakes are then worshipped, and offerings are made to them of milk, and nearly every house has figures of snakes drawn on wood or on paper, which are fixed on the walls and worshipped. Alike in the several vihara and the chaitya at Ajunta are sculptured figures of snakes. The gramma deva of Assaye, where Sir Arthur Wellesley defeated the Mahrattas, is a figure of Hanuman with a lingam, and the Nanda or Basava, the vahan bull of Siva, and the tulsi plant growing near; but on the western wall of the village chatram a cobra snake is sketched, in white colours, in the wavy form which snakes assume when moving on the ground. The worshippers believe that it is travelling to Lanka (Ceylon), but they smiled on it being remarked to them that it would be a long time on its journey. Figures of the cobra snake are often drawn on paper and in sculpture, with the hood spread like a canopy over the lingam, the emblem of Siva; and this deity is often represented sitting on a tiger skin with a cobra snake wound around his head. Siva is fabled to have drunk up the poison produced in the churning of the ocean, and, in his agony, wrapped snakes around his neck to cool himself. Vishnu, in his prolonged sleep, while passing from one avatar to another, is shaded by the canopy of a cobra's head.

In Southern India, the deity under whose name the snake is worshipped is Subramani, whose shrine is in the western part of Mysore, and the image there is described as a shapeless lump of earth. At Ahmadnaggur, in 1841, in a clear moonlight night, five pairs of cobras, one after another, dropped into the garden, from over the thatched roof of the house, and stood erect on their tails. They were all cobras, and were in congress. A military officer, to whom the Editor showed these remarks, mentioned in reply that he once in broad daylight, in the jungles, saw pythons in the attitudes here described. Natives of India recognise it as the serpent's Laq, believe that it is most fortunate to witness snakes so engaged, and that if they can throw a cloth at the pair to touch them with it, the cloth becomes a representative form of Lakshmi, of the highest virtue, and is taken home to their houses and preserved as such. The snakes when in congress rise on the tips of their tails and approach each other, not twining as represented in the Esculapian rod, though, at a little distance, they seem to be twining.

Ordinarily no Hindu will kill a snake, but turns aside on seeing it. Young men who have been educated at English schools, however, have no such great reserve, and a Mahratta Brahman so educated, informed the Editor that he had killed three of them. Snakes are kept in houses in Ceylon and Gujerat, partly, seemingly, as objects of worship and partly to destroy rats. In Gujerat no one will kill a snake, but it is taken outside the town and released. Esculapius, amongst the Greeks and Romans, was the god to whom the care of medicine and health pertained. Esmun, the snake-god of the Phœnicians, is identified by Bunsen with the Egyptian Hermes, called Tet and Taautes in Phœnician. Esmun Esculapius is strictly a Phœnician god. He was especially worshipped at Berytus. At Carthage he was called the highest god, together with Astarte and Hercules. At Babylon, Bel corresponded with him. According to Jamblicus and the Hermetic books, the Egyptian name of Esculapius was Kameph. The Aswini Kumara, the sons of Surya, amongst the Hindus, correspond with the western Greek and Roman Esculapius, but they do not have the twining snake rod. Mr. Fergusson has expressed his belief that serpent-worship mixed with Buddhism must have prevailed all through the Nizam's country and Berar, from at least the 4th to the 10th or 12th centuries. A great serpent is said to have been worshipped at Sumbulpore on the Mahanadi ever since the world began. The snake-worship of the Takshak travelled from Scythia to Kashmir and thence to Hindustan.

Few subjects have more occupied the notice of the learned world than the mysteries of ophite-worship, which are to be traced wherever there existed a semblance of civilisation, or indeed of humanity; have in general been associated with tree-worship, and attended by human sacrifices. Serpent-worship has been supposed by Mr. Bathurst Deane to have been the only universal idolatry. In Asia evidence of serpent-worship has been found in Africa, Palestine, Chaldæa, Babylon, Persia, Kashmir, Cambodia, Tibet, India, China (traces), Ceylon, and among the Kalmuks. It has been found among the races of Europe, among the tribes in America, and is practised to the present day in Africa. The only part of Asia which seems to have remained free from it is China; but throughout all the S. of British India snake-worship still prevails amongst all classes of Hindus. The naga, or serpent-genii of the Rajputs, have a semi-human structure, precisely as Diodorus describes the snake-mother of the Scythæ; and Olaus Magnus, writing in the sixteenth century, speaks of serpents as still kept as household gods in Sweden. The origin of this form of worship is lost in antiquity. One possible surmise has been obtained from the known love of many races for totems, animal or vegetable gods, after which they

are named. The American Indians all possessed them, as also the Australian tribes. In Central Asia, most of the Kirghiz tribes trace their origin back to some animal which they venerate and worship; and amongst the Tartar races, who designated their septs after some beast, as the naga or snake, the langaha or wolf, the lumri or numri or fox, the sessu or hare, cutchwah or tortoise, etc., the sept reverenced the creature from which they took their name. If the totemic origin of serpent-worship be the correct one, the serpent, like other totemic deities, would, from its origin, have a benevolent character. M. Boudin says, 'Le culte du serpent est independent de toute influence ethnique;' and M. Lajard says, 'Dans la plupart des langues dites Semitique, le mot que signifie la vie, hayy, ou hay, haya, heyo, hayya signifie egalement le serpent.' In several of the ancient religious systems the serpent presides at the creation of the world, and is the god of life or health.

The Chiun mentioned in Amos v. 26 is supposed to be the deity Siva. Professor Sayce thinks it is the planet Saturn. Givun is a Phœnician word signifying serpent. Cabrera thinks Chivun has the same signification as Givun or Hivim, *i.e.* descendant of Heth, son of Canaan. The Giviun or Hivites were descendants of Cadmus and Hermione, his wife, who, according to Ovid's metamorphosis, were changed into serpents and had divine honours paid to them. Tripoli was formerly called Chivun; Votar says, I am a serpent because I am a Chivun, which can also be rendered, 'I am a Hivite from Tripoli.' In Egypt, both tree and serpent worship prevailed, as parts only of the general animal and vegetable worship. The serpent was honoured in Tyre from an early period down to the time of Alexander. Solomon says 'they worshipped serpents void of reason.' It seems to have been repressed, but it again cropped up amongst the same people in the Christian sects of Ophites, Nicolaitans, and Gnostics. According to Tertullian, De Præscript. Hereticorum cxlvii., the Ophites even preferred the serpent to Christ. They kept a living serpent in a chest, as, or to represent, the god. Serpent-worship does not seem to have been known in Germany, though the tree was worshipped there, as also in Gaul. In ancient Sarmatia and modern Poland both trees and serpents were worshipped by the peasantry, even to the limits of the 19th century.

The totem cult may explain why with most races the serpent has been regarded as a protecting deity, an agathos demon, and would also explain the claims made by races and individuals to be of snake or naga descent.

Scipio Africanus is said to have believed himself the son of a snake; and Augustus allowed it to be understood that his mother Atia had received him from a serpent. Alexander the Great, before he undertook to prove himself the son of Jupiter-Ammon, was supposed (apparently by Philip himself) to be the son of a serpent, who actually appeared to him in a dream in later years to save the life of his general Ptolemy. In the Turanian form of Buddhism, Sakya and Buddhist kings are invariably represented under the protection of the hooded snake, or of three or more snakes, which are figured as rising behind, and with the hood shadowing the seated image. This form of protection has been transferred to the lingam (phallus, priapus), the emblem of modern Saiva Brahmanism; and everywhere are to be seen, throughout all the south of India, the sculptured figures of one, three, or nine naga heads, overshadowing this symbol of reproduction.

In the earliest records of the Semitic thought, the serpent and the tree take a prominent position. Adam and Eve are taught by the serpent more subtile than any beast of the field, and the tree of knowledge supplies the fruit to enlighten them. Moses' rod was turned into a serpent, but pressure by the thumb on the back of a serpent's neck produces temporary catalepsy, and Moses and Aaron, and afterwards the Egyptian magicians, imitated this. An image of a snake was made for the Jews, and snake-worship continued amongst that race for seven hundred years; and in the days of Hezekiah 'the children of Israel did burn incense' to the self-same brazen serpent, which was actually preserved in the very temple (2 Kings xviii. 4). The reformer king at the same time 'cut down the groves, and brake in pieces the serpent,' thus combining in common ruin the two ever-parallel idolatries.

The serpent was worshipped in Chaldæa, where, as in Egypt, it was called Oub, hence the Greek ὄφις. This word, as Oboth, is translated familar spirit in Leviticus xx. 6, 27. (See also 1 Samuel xxviii. 3, 7, 9; 2 Kings xxi. 6, xxiii. 24; 2 Chron. xxxiii. 6.) The woman of Endor is called a mistress of Ob; and Jotham, king of Israel, built much on the wall of Ophiel, *i.e.* the serpent-god, for the worship of snakes. Obi men and Obi women, the designation of the pretended diviners amongst the negroes of the West India colonies, is the same word, and probably brought with them from Africa. The pethen of the Hebrews, the python of the Greeks, and læten of the Arabs, from which we have the words python and pythoness, is that form alluded to in Acts xvi. 16, as the damsel with the spirit of divination. In the theology of Zoroaster, Dahaka or Zohak was an evil being created by Ahrimanes. In Persian mythology, Zohak is a king who reigned at Babel for 1000 years, having two serpents growing between his shoulders, and daily devouring men, until his own destruction by Faridun, the servant of Hormazd.

Persius speaks of the custom of painting certain conventional figures of serpents on walls, to indicate the sanctity of the spot, a practice of which there are several examples at Herculaneum and Pompeii. The serpent is seen as 'genius loci' upon the coins of many of the towns of Asia Minor,—Cyzicum, Pergamos, Marcianapolis, in Mysia, Aboniteichos and Amastris in Paphlagonia, Nice and Nicomedia in Bithynia, Tomos in Pontus, and Mindus in Criaa, all exhibit the serpent as their ensign. In Epidaurus, down to the time of Pausanias, serpents were kept and fed in the grove attached to the temple of Esculapius. The Greeks had myths regarding the python and hydra, the echidna and the dragon of the garden of the Hesperides; but in historic times the Athenians kept a serpent in the Erectheum, and its escape warned them to fly from the Persians; and Pausanians tells us that the Epidaurian serpents held their place amongst the gods of Greece till long after the age of Christ. Livy (x. 47), Valerius Maximus (i. 8, 2), Aurelius Victor (xxii. 1), and Ovid (Met. xv. 5) mention

the serpents of Esculapius kept at Epidaurus, which the Roman Senate sent an embassy to obtain. A plague ravaged Rome in the year of the city 462; a living serpent was solemnly fetched from Greece to Italy, and received with divine honours, on the banks of the Tiber, by the Senate and people of Rome, and Esculapius received honours similar to those alluded to in Numbers (xxi. 8, 9) as occurring in the Arabian desert. After that occasion a serpent, in a conventional attitude, was, in the Roman world, the recognised type of a sacred place. In India, in the centuries preceding and following the Christian era, serpent-worship and tree-worship seem to have had repeated revivals, and the serpent-emblazoned topes of Sanchi and Amravati are the existing monuments of the fact.

Buddha died B.C. 543. Buddhism was in India only a struggling, lingering sect till the time of Asoka, whose edicts, B.C. 255, remain engraved on rocks. In the inscriptions of Asoka, Buddhism appears as a system of pure abstract morality, no trace being exhibited of the worship of Buddha himself, or of the serpent or tree. About the beginning of the Christian era, however, a Naga or Turanian revelation became incorporated with it. It had at this time fallen into a state of decadence, and was represented by no fewer than eighteen different sects. The Buddhist school of this time was known as the Hinayana. At this time Nagarjuna appeared. The sayings of Sakya Muni had been during his lifetime recorded by the Nagas, from whom Nagarjuna obtained the documents, and he proclaimed them in A.D. 410. The gateways of the Sanchi tope belong to the first half of the 1st century of the Christian era, and though subsequent to the Naga revelation the sculptures scarcely indicate its existence. Buddha does not appear on the Sanchi sculptures as an object of worship. The serpent is there, but rare. The dhagoba or depository of the relics of saints is there, as also are the tree, the wheel, and other emblems, and the whole of the sculptures on the Sanchi tope may be illustrative of the Hinayana school of Buddhism, at the period when other doctrines were about to be introduced. The Amravati sculptures, again, belong to a period 300 years later than that of Sanchi, and in them the new school of Mahayana Buddhism may be studied. In these Buddha is an object of worship, but the serpent is his co-equal. The dhagoba, tree, and wheel are reverenced, and the sculptures contain all the legends of the later books, though in a purer form. Hindus, Dasya, and other men, women, and animals, especially monkeys, appear in the sculptures worshipping the serpent and other gods. The serpents are all divine, five and seven headed, and representations are numerous of the Naga angelic orders, the female Naga, with one serpent only springing from the back, the male Naga with three.

At Sanchi the serpent-worship had been in the background, and the tree-worship prominent. At Amravati, in the oldest part, the tree flourishes as usual; but in the later portion the serpent appears ten or twelve times as the principal object of worship; twice he shields the head of Buddha, and forty or fifty times he appears spreading his protecting hood of heads over rajas and persons of importance.

This may be reckoned the culmination of Buddhistic serpent-worship in India. Four centuries later, Brahmanism revived, and Buddhism was banished to Further India, Ceylon, China, and Tibet; but tree-worship has been more openly adhered to by the Buddhists in the island of Ceylon than that of serpents.

In the temple of Nakhon Vat in Cambodia, now in ruins, every angle of the roof, every cornice, every entablature, bears the seven-headed serpent, and there are tanks in which the living serpents dwelt and were adored. With the disappearance of Buddhism from Hindustan, and the rise of modern Brahmanism under the leadership of Sankaracharya, about the beginning of the 9th century A.D., the erection of such Buddhist buildings ceased, but the worship of trees and snakes has been continued under other forms. Dynasties have ruled claiming to be of Naga descent; but now Vasuki and Sesha are kings of the serpent deities who live in Patala. The serpent-goddess is worshipped in the Euphorbia antiquorum. This goddess mother of the serpents, and goddess presiding over them, is Manasa, the object of love and devotion, and, as the name implies, an allegorical creation. Her brother, the chief of the serpents, is Ananta or Sesha, eternity, literally endless, of which the universally acknowledged symbol is a coiled snake. Though represented as the support of Vishnu while floating on the fathomless sea of chaos before creation (God in eternity), he is, in the Puranas, described as having the form of Vishnu, meaning, perhaps, the eternity of Vishnu.

The Cheru of Hindustan declare themselves to be descended from the great serpent, and are supposed to be the remnant of the Nagbansi of Magadha. The crest and signature of the raja of Chutia Nagpur is the head and hood of a snake called Nagsanp. The god of the raja of Munipur is the Paknng-ba snake, from which the royal family claim descent. When it appears, it is coaxed on to a cushion by the priestess in attendance, who then performs certain ceremonies to please it.

Many legends are told by the people relating to snake beliefs. Two guests, says an author, came once on a time to the house of a Shrawuk Waneeo. The master of the house was at the market, and his wife, after she had made her friends sit down, was obliged to go away to the well for water. While the guests sat waiting for the master of the house, a large snake made its appearance. One of them jumped up and pinned it to the ground with a stick, while the other set to work to find a split bamboo, which people keep ready in their houses for securing snakes. Meanwhile the woman came back with the water, and seeing the snake pinned to the ground, cried out, 'Let him go, let him go; he is our Poorwuj Dev; he used to get into my mother-in-law's head, and set her a-trembling, and then he would mention the name of my father-in-law, who died some time ago, and say that it was he. He said also that his soul had been wrapped up in his property, on which account he had become a snake, and was going to live in the house. One day he bit a neighbour of ours, and the Jutee came to cure the man. Poorwuj Dev then set the neighbour a-trembling, and said he had bitten him because he fought with his son, and that he would quit him when he got security that there should be no more quarrelling. In this way he quitted him. From that day forth

if the snake go to our neighbours' houses no one molests him. If at any time we were to set him down at a place twenty miles off, he would come back to this very spot. He has often touched my foot, but he never bit me; and if I happen to be gone to draw water, and the child cry at home, he will rock him in his cradle. This I've seen him do many a time.' In this way she prevented their interfering with the snake, and, releasing him, paid him obeisance. The guest, too, who had seized him, took off his turband, and said, 'O father snake, forgive my having pinned you to the earth. I am your child!' After a short time, a cat having killed the snake, the people of the house took the pieces of it and burned them on a pyre, offering, in fire-sacrifice, a cocoanut and sandal-wood, with clarified butter. This was to perform the snake's funeral rites, and is customary at the present day.

A Brahman, having purchased premises in the ancient town of Dholka, set to work to make excavations for a new building, and in so doing came upon a subterranean chamber, which contained a great deal of property. There was, however, a large snake stationed there to protect the treasure, which snake appeared to the Brahman by night in a dream, and said to him, 'This property is mine, and I live here for its protection; therefore you must not injure the chamber, nor covet the treasure which it contains. If you do so, I will cut off all your posterity.' In the morning, the Brahman poured a vessel of hot oil into the chamber, so that the snake died. He then destroyed the chamber, having first removed the treasure, and burned the body of the snake in due form in the yard of his house. With the treasure he had thus obtained he erected splendid buildings; but he never had a son, and his daughter remained childless, and whoever received any part of the property, or became his servant, or acted as his agent or as his family priest, was childless too. These things happened, it is said, about A.D. 1830, and it is the general belief in India that serpents are always to be found wherever a hoard is buried.

Leprosy, ophthalmia, and childlessness are supposed by Hindus to be the punishment of men who in a former or present birth may have killed a serpent, and to be relieved of these the worship of the serpent is enjoined. The idea of their curative virtues is very old, and is still believed in India. A Hindu attacked by fever or other diseases, makes a serpent of brass or clay, and performs certain ceremonies to its honour, in furtherance of his recovery. Such ceremonies are particularly efficacious when the moon is in the nakshatra (mansion, sign, or asterism) called Sarpa or the serpent; called also Aslesha. The 11th day of the bright half of the month Ashada commences with the summer solstice. In Hinduism it is the night of the gods; nine days thereafter, that is, on the fifth after the full moon, is a festival in honour of Devi, the goddess of nature, surnamed Manasa, who, while Vishnu and all the gods were sleeping, sat in the shape of a serpent on a branch of a Euphorbia (Snuhi) to preserve mankind from the venom of snakes. The 5th day of the bright half of the month Sravana is called Naga-panchami, and is sacred to the demi-gods, in the form of serpents, who are enumerated in the Padma and Garuda Puranas. Doors of houses are smeared with cow-dung and leaves of the nim tree (species of Melia and Azadirachta), as a preservative from poisonous reptiles. Both in the Padma and Garuda Puranas is mention of the serpent Kaliya, whom Krishna slew in his infant hand, and which is also worshipped on this day. The feast of Naga-panchami, from Naga, serpent, and Panchami, five, is celebrated, as the name implies, on the 5th day of the bright half of the month of Sravana; but some hold it on the 4th day also, when the day is called Naga-chauti (Naga, serpent, and Chauti, four). This day is observed chiefly among the Brahmans and other Hindus of Northern India, Maharashtra, and Telingana. Tamil Brahmans and Sudras do not observe it. On this day the women bathe and adorn themselves in their best clothes and jewels, and proceed to the places where the figures of the nagas or cobras are consecrated and established, or to ant-hills, supposed to be the abode of snakes, where they pour milk and place garlands of flowers, but especially of cotton, and the usual accompaniments of Hindu worship, such as betel-nuts, fruits, cakes, etc. Some worship at their own home the figure of the naga (or cobra) made in gold or silver; and others send for a living cobra to their homes, feed it with milk, and give small presents to the snake-charmers who frequent the streets on this day. Men and women having no children, and others who are troubled with ailments of the ear, make anew, or fulfil their old, vows on this day, should the object of their desires have been obtained.

The enemies of the cobra, mythologically as well as in fact, are the Garuda, the bird-vehicle of Vishnu, and the Mayil or the peacock, which is the favourite vehicle of Subramaniya, the second son of Siva. In the south of India, the accepted type of Garuda is the common Brahmany kite (Haliastur Indus), which is held in respect, and fed with goat's or sheep's flesh on Sunday mornings, by those who consider it a favourable omen to see a Garuda on the morning of that day, or on the evening of Thursday. This bird pounces upon and carries off the cobra in its claws, and kills it. Garuda is also the proverbial, but not the utter, destroyer, for he spared one, they and their archetype being, in reference to created beings, eternal. His continual and destined state of warfare with the serpent, a shape mostly assumed by the enemies of the virtuous incarnations or deified heroes of the Hindus, is a continued allegory of the conflicts between vice and virtue, so infinitely personified. Garuda at length appears the coadjutor of all virtuous, sin-subduing efforts, as the vehicle of the chastening and triumphant party, and conveys him on the wings of the winds to the regions of eternal day. Destroyer of serpents, Nag-antaka, is one of his names. Some mythical Hindu legends make Garuda the offspring of Kasyapa and Diti. Diti laid an egg, which it was predicted would produce her a deliverer from some great affliction. After a lapse of five hundred years, Garuda sprang from the egg, flew to the abode of Indra, extinguished the fire that surrounded it, conquered its guards, the devata, and bore off the amrita (ambrosia), which enabled him to liberate his captive mother. A few drops of this immortal beverage falling on the Kusa grass (the Poa cynosuroides), it became eternally consecrated; and the serpents, greedily licking it up, so lacerated their tongues with the

sharp grass, that they have ever since remained forked; but the boon of eternity was ensured to them by their thus partaking of the immortal fluid. This cause of snakes having forked tongues is still popularly, in the tales of India, attributed to the above greediness. The poison of the cobra—perhaps an innocuous substance in the stomach—is eaten by old opium-eaters, and cast-off skin is used for magical purposes, and some say for keeping out vermin. In the district of North Canara, in the taluk of Cumpta, is a place called Naga Tirtha. There is a small well-built tank, around which are small artificial caves containing thousands of serpent images. In almost every village throughout India are to be seen, some beautifully carved, others in the rudest style, figures of the Naga or cobra di capello set up as objects of worship, and two are occasionally represented twining round a rod as in the figures in the mythology of Greece.

In the immediate neighbourhood of Madras, at Trivetoor, Washermanpetta, and Perambore, are several snake temples, but one at Vasarapadi is the most famed. There are many sculptured snake stones, either of single snakes or of the two snakes intertwining in the form of the Esculapian rod, called amongst the Tamil people Naga-ga-Jendram, also the Nao-naga, or nine-headed snakes; there likewise are many cobra serpents living in the numerous ant-hills; and every Sunday morning, two or three hundred men, women, and children attend there to worship, to return thanks, to offer milk, raw rice, camphor, the red lead, and cradles. All classes of Hindus come, but Brahman and Vaisya women are the most numerous. There, also, is a local deity named Rangam, whose chief priest, styled Kuri-chuli-kiravin, is a Yenadi.

The temple at Subramaniya, one of the highest peaks of the Western Ghats, is celebrated in the Hindu world. It is a square in form, with open cloisters on the four sides, and the sanctuary containing the idol Subba Rao is in the centre. Like most of the pagodas in Canara, it falls short of those in the Carnatic in point of architecture, but is substantial and neat, being built of laterite, sandstone, and granite. Many reptiles have taken up their residence within it, in holes made for the purpose. People from all directions resort to this sacred place during the December festival, to perform their vows, and make purchases at the extensive cattle fair held at the same time. Such persons as have made vows roll around the quadrangle of the pagoda, while others roll up to the pagoda from a river about a mile distant. These fanatics on their return home bring with them some earth taken out of the sacred holes within the temple. This earth is said to possess the virtue of rendering a barren woman fruitful if she daily puts it into her mouth; and the leper rubs with it the part of the skin affected.

'Snakes,' remarks Viscountess Faulkland, 'are really sensible to the charms of music. Educated snakes, who have been for some time in the hands of a snake-charmer, are of course more susceptible than wild ones. But all have a taste for music, and will pay attention to any rather monotonous tune played on a flute or flageolet. This taste, by the way, is shared by many of the lizard tribe, by some pigeons, and very generally by hedgehogs; at least,' she says, 'I have known three or four instances of it on the part of a hedgehog, kept in the lower storey of a house as an exterminator of black beetles and cockroaches. If after nightfall, when the hedgehog generally awakes and runs about in search of prey, he heard the sound of a violin or piano, he would always endeavour to make his way to the place whence the sound came, and if admitted into the room where the instrument was, he would stand entranced as long as the music continued.'

In many parts of India, after killing a cobra, the non-Aryan races give it all the honours of a cremation, assuring it, with many protestations, that they are guiltless of its blood, that they slew it by order of their master, or that they had no other way to prevent its biting the children or the chickens. A snake visiting a house is always looked on as a sign of luck; and when a snake discovers how to get at the eggs and milk in the larder, no native will on any account kill what he regards as the good genius of the house.

In Ceylon, the rat-snake's domestication is encouraged by servants, in consideration of its services in destroying vermin. One day Sir J. E. Tennent had an opportunity of surprising a snake that had just seized on a rat of this description, and of covering it suddenly with a glass shade before it had time to swallow its prey. The serpent appeared stunned by its own capture, and allowed the rat to escape from its jaws, which cowered at one side of the glass in the most pitiable state of trembling terror. The two were left alone for some moments, and on his return to them the snake was as before in the same attitude of sullen stupor. On setting them at liberty, the rat bounded towards the nearest fence, but quick as lightning it was followed by its pursuer, which seized it before it could gain the hedge, through which he saw the snake glide with its victim in its jaws.

The land-snakes often enter the water of lakes and tanks, and quest round their borders for frogs and other prey. Hydridæ or sea-snakes are venomous. They appear to live on sea-weed. They lay their eggs on the shore, and coil themselves up on the sand. They are found at sea all along the coast, within soundings, and their appearance always marks the approach to land. They are often thrown ashore by the surf, and they are occasionally carried up rivers by the tide, but they cannot live in fresh water. Fishermen greatly dread these snakes. But they are unable to open the jaws widely, and they rarely inflict a wound. Dr. Cantor believes that they are blinded by the light when removed from their own element, and he adds that they become sluggish and speedily die. Those found near the coasts of Ceylon are generally small, from one to three feet in length, and apparently immature, and it is certain that the largest specimens taken in the Pacific do not attain to a greater length than 8 feet. In colour they are generally of a greenish-brown, in parts inclining to yellow, with occasionally cross bands of black.

The tangli snake of Assam causes much anxiety from its fierceness; a pair of them in possession of a bamboo clump in the rear of a house, kept the whole family in a state of great alarm for days. Unable to move about their house but with the greatest precaution, they applied for relief, which was afforded by shooting the pair. The tangli is quite as active in the water as on dry land. Whilst pursuing in a canoe,

over inundated ground, a large deer, it happened to pass one of these snakes, which, when first noticed, must have been at least 30 yards off, but, raising his head, he made for the canoe with such velocity, that though it was paddled by four strong men, it overtook the canoe, and would inevitably have been aboard, if it had not been prevented by a shot.

Snakes breed in captivity. A Russell's viper (Daboia elegans), which Dr. Shortt had kept for some seven weeks, measuring 3½ feet in length, on the 30th July 1872 produced thirty-nine young. Each little one measured 8½ inches in length, and one out of these, when about six hours old, in an experiment, killed in ten seconds a young partridge weighing nine and a half tolas, or 1710 grains.

Lady Faulkland mentions the case of a half-witted boy of the wild tribe of Bhils, in Kandesh. He was found by his relations playing with wild snakes, and had the power of attracting and taming them. He had numbers of all kinds of snakes in the jungle, near the hut where his parents lived, and these snakes would come to him and allow him to handle them with impunity. After some months he began to be known to the people round about as a prodigy, but as the part of the country where he lived was very remote, it was long before his fame spread to any distance; and soon after he had been heard of by the Government officials, and official inquiry had been made to an extent sufficient to verify the main facts of the story, the poor boy was bitten by one of his favourites, and died. Another case occurred in the Satara territory about A.D. 1815. It was noised abroad that the son of a Brahman, not far from Waee, had the power of attracting the most venomous snakes, and handling them with impunity. Numbers visited him, and, seeing the story was true, spread his fame; and his relations finding that his reputation was likely to be profitable to them, added all sorts of marvels to the current tales. He was one of the promised avatars of the god Krishna, which are yet to come. He was to restore Hinduism in its purity, and re-establish Brahmanical superiority in the Dekhan. Thousands flocked to see him, and pay their respects, and bring oblations; and so great was the excitement, that the raja of Satara and the English Government officials got alarmed. The poor boy, however, like the Kandesh Bhil, was bitten, and died just when his village had become the point to which every devotee in the Dekhau was hastening, and the excitement subsided as quickly as it arose.

Mr. Fergusson regards tree-worship, in association with serpent-worship, as the primitive faith of mankind. He considers it to be established that wherever human sacrifices existed, there also was the serpent au object of worship; and where they have been most frequent and terrible, as in Mexico and Dahomey, there also has serpent-worship been the typical form of the popular religion. Dahomey is the present chief seat of serpent-worship, where it is now practised with more completeness than anywhere else, and where this most ancient of idolatries may probably have remained from the earliest times almost unchanged. The chief god of the national triad is the serpent, the second the tree god, and the third the ocean. The first of these, called Danh gbwe, has 1000 female votaries, and is worshipped with all the splendour that savage people can afford. The customs of Dahomey, with their sacrifices of 500 or 600 victims at the death of a king, or of 30 or 40 as an annual slaughter to the honour of ancestors, are here seen in that unaccountable connection with a worship of which they form no part.

The existing influence in India of the snake-worship may be illustrated by mentioning that in Madras, in A.D. 1872, a daughter born to a Brahman gentleman of rare intellect, was named Nagamah, or snake-mother, because a snake was supposed to have been seen at conception.—*Macgillivray's Voyage*, i. p. 66; *M'Cul. in Records, G. SERRANUS, a genus of fishes of the family Percidæ. Several species occur in the Eastern seas. Those about Macao are called shilipan and garoupa.

SERRAO. Joao Serrao and Odoardo Barbosa, officers of Magellan's fleet, who were elected to the joint command on the death of Magellan, who was slain by the natives at one of the Philippines. Serrao was an old Portuguese, on whose knowledge of the east, and especially of the Moluccas, Magellan placed great reliance. On Serrao's death, Carabello was elected commander-in-chief.

SERRATULA ANTHELMINTICA. *Roxb.*

Vernonia anthelmintica, *Linn.*

Blue fleabane, . . ENG.	Nalwa bakshi, . . HIND.
Worm saw-wort, . ,,	Kali-jiri, Bakchi, . ,,
Somraj, Sumraj, . HIND.	Kakshama, . . . SANSK.

All parts of this plant are bitter. The powdered seeds are used as a worm medicine. Dr. Honigberger, at p. 261, states that Conyza anthelmintica, Vernonia anthelmintica, Serratula anthelmintica are officinal at Lahore. It is said that when the fleabane is roasted, flies take to flight, and when the powder of the fleabane is sprinkled on the floor, fleas disappear. It acts as a bitter tonic and anthelmintic, and is recommended in the treatment of skin disease, especially in porrigo and lepra.—*O'Sh.* p. 419; *Powell.*

SERTIP comes from Ser and Tip, a clump of spears; Topc, a clump of trees; Tepe, a heap of earth—Sanskrit root.—*Ed. Ferrier's Journ.* p. 36. See Tope.

SERVAKAREN, meaning captain, is a title of the Idaar or pastoral race in the southern districts of the Tamil country.

SERWATTY ISLES, or Sea-way Isles, in the Eastern Archipelago, consist of Wetta, Kissa, Lette, Moa, Roma, Nusa, Midka, Damma, Lakor, Luan, Baba, Semata, Zeon, and Nila, etc. They are situated a little to the S.W. of Timor, directly N. of Cambridge Gulf in New Holland. They extend about 105 miles in an easterly direction, from the east end of Timor towards the south end of Timor Laut, in the Arafura Sea.—*St. John's Arch.* ii. p. 87; *Earl in Jour. Ind. Archipelago.*

The Oil, Gingelly Oil.

Jiritch, ... ARAB.	Manchi noonay, . TEL.
Mitha tel, Til ka tel, HIND.	Kurit, Sehuk, . . ?
Nal-yennai, . . . TAM.	

There are two strongly-marked varieties of this plant under cultivation, — black sesamum and white or yellow or red sesamum, which possess the same properties, and in commerce are met with both in a mixed and separate state. It is an annual plant growing all over India, but both are cultivated there, also in China, Egypt, the Levant, W. Indies, and S. America. In a good soil it grows generally to be about three or four feet high. In the Dekhan, it is a common plant springing up in waste places, and flowering towards the close of the rains. The white variety is sown in Bengal in Febrnary, and the crop got in three months afterwards, so that the dews and the little remaining moisture of the earth are the only sources of hnmidity by which it can benefit, as this is generally a period of drought. The black variety is sown on high places, about the beginning of the rains (July), and the crop cut down in September.

First sort gingelly, in the Northern Circars, is the produce of the plant, which is sown in the month of March, after the rice crop, and is irrigated twice, once at sowing and once afterwards. The seed is black, and is called first sort gingelly from its yielding the largest percentage of oil; it ripens in May, and the seed sells at the rate of Rs. 60 per candy of 500 lbs. The oil obtained from both varieties sells at the same price, viz. Rs. 1.5 to Rs. 6 per maund of 25 lbs., according to quality and locality.

Second sort gingelly, of the Northern Circars, is sown in June, and produces a red seed. The plant, although a little larger, resembles in most respects the former; it has, however, a somewhat longer leaf, and the flower differs a shade or two in colour. A candy of 500 lbs. of this seed sells at Rs. 57·8. The price of the oil is the same as that of the first sort. About A.D. 1845 this seed began to be exported to France, in consequence of which the price donbled.

The black-sceded variety has a deep red or deep rose-coloured blossom; while the flower of the white-seeded variety is of a pale-purple or whitish-rose colour.

The seeds are slightly oval, small, tasteless, and inodorous, are sometimes added to broths, frequently made into cakes by the Jews in the east. It is about the same size as mustard seed, only not round. The expressed oil is as clear and sweet as that from almonds, and probably the Behens oil, used in varnish, is no other. It is called by the Arabs Jiritch, and the seed Bennie in Africa. In Mysore, after being cut, it is stacked a week, then exposed to the sun for three days, but gathered into heaps at night; and between every two days of such drying it is kept a day in the heap. By this process the pods burst and shed their seeds without threshing. Any disparity of colour observed in this oil is to be attributed to the mode of preparation. The method sometimes adopted is that of throwing the fresh seeds, without any cleansing process, into the common mill, and expressing in the usual way. The oil thns becomes mixed with a large portion of the colouring matter of the epidermis of the seed, and is neither so pleasant to the eye, nor so agreeable to the taste, as that obtained by first repeatedly washing the seeds in cold water, or by boiling them for a short time, until the whole of the reddish-brown colouring matter is removed, and the seeds have become perfectly white. They are then dried in the sun, and the oil expressed as usual. This process yields 40 to 44 per cent. of a very pale straw-coloured, sweet-smelling oil,—an excellent substitute for olive oil.

In India the oil is chiefly used in cookery, in anointing the person, for making soap, and for burning in lamps. In England it is chiefly used for the manufacture of soap, and for burning in table-lamps, for which it is bettersnited than cocoanut oil, owing to the lower temperature at which the latter congeals. The value in England is about £47, 10s. per ton. In Egypt, India, Kashmir, China, and Japan it is used both for cooking and burning. It will keep for many years and not acquire any rancid smell or taste, and in the course of a year or two becomes quite mild, so that when the warm taste of the seed, which is in the oil when first expressed, is worn off, it is used for all the purposes of salad oil. If divested of its mucilage, it competes with olive oil. It is sufficiently free from smell to admit of being made the medium for extracting the perfume of the jasmine, the tubcrose, narcissns, and of the yellow rose. The process is managed by adding one weight of flowers to three weights of oil in a bottle, which being corked is exposed to the rays of the sun for forty days, when the oil is supposed to be snfficiently impregnated for use. Gingelly oil is used in India to adulterate oil of almonds. The flonr of the seed, after the oil is expressed, is used in making cakes, and the straw serves for fuel and manure. The oil is much used in Mysore for dressing food, and as a common lamp oil. It is largely cultivated in Tenasserim by the Karen, who bring the seeds to market and sell them to the Bnrmese, and they express the oil. The Negroes cnltivate it for food, using the parched seeds with their meals. In Arabia the oil (Jiritch, ARAB.) is much used as an article of diet, for frictions, and lighting. The oilcake, mixed with honey and preserved citron, is esteemed a lnxury. The leaves of the plant are used as poultices.—*Voigt; Riddell; Roxb.; M.E. of* 1856; *Eng. Cyc.; Ag. Rep. for* 1854 *of Com. Patents*, p. 226; *O'Sh.; Gen. Med. Top.; Ainslie; Malcom's Travels.*

SESARMA, the genus of painted crabs. S. tetragona, *Edws.*, Indian Ocean; S. Indica, *Edws.*, Java; S. quadrata, *Edws.*, Pondicherry.

SESBANIA, a genus of plants of the natural order of Leguminosæ, which derives its name from the Arabic name of S. Ægyptiaca, indigenous in Egypt. S. procumbens, *W. and A.*, and S. uliginosa, are plants of Bengal. See Agati.

This hardy plant grows in the two Indian Peninsulas and Bengal, growing rapidly from 6 to 10 feet high; and is considered an ameliorating crop. About 30 lbs. of seed is allowed to the acre. It may be sown in poor, low, wet soil, without preparation. The fibres are from 6 to 7 feet long, but unless cut at a very early period, they are coarser and more harsh than hemp. In Bengal, the fishermen make drag-ropes for their nets, on account of its strength and durability in water. It was valued in England at £35, and would probably always fetch £30 to £35. It is an excellent fibre for common cord and twine purposes, and certainly superior to jute in strength and durability.—*Roxb.* iii. p. 332.

SESBANIA ÆGYPTIACA. *Pers.*

A very elegant, rapid-growing shrub or small tree of Ceylon and British India, suitable for hedges. The var. S. bicolor has orange flowers and a vexillum purple on the outside, while the var. S. concolor has a vexillum yellow speckled with black dots and lines. It is used as a substitute for the bamboo; its wood makes excellent gunpowder charcoal, and its leaves are used as a cataplasm to promote suppuration. Commonly cultivated in gardens as a hedge, and for its bunches of flowers, particoloured, yellow, and occasionally white. It is a ready and quick grower, and the wood sometimes attains 2 feet in girth.—*Roxb.; Mason; Voigt; Stewart.*

SESHA or Sesha-naga, in Hindu mythology, a great serpent with a thousand heads. He is very variously represented, sometimes as Ananta, the endless, eternity, sometimes distinct from, sometimes the same as, Vasuki. Sesha is sometimes represented as supporting the world, sometimes upholding the seven Patalas, king of the serpent Naga race, and of the lower regions called Patala. He is fabled to have aided Nanda to cross the Jumna when flying with the infant Krishna, and to have persuaded the king of the Naga race to give the jewel which was to restore Arjuna to life. It has probably some untraceable connection with the Scythic-Naga race. It was the serpent Sesha under the shade of whose hood, while resting on the Chira Samudra or Sea of Milk, that Vishnu reposed for four months, and Vishnu reposes on Sesha in the intervals intervening between one calpa and another creation or formation. It was Sesha that the Sura and Asura used as a thong around Mount Mandara when churning the Sea of Milk to recover the lost 14 products, viz. Amrita, Dhanwantari, Lakshmi, Sura, Chandra, Rambha, Uchsravas, Kaustubha, Parijata, Surabhi, Airavata, Sankha, Dhanus, and Visha. Sesha's hood is called Mani-dwipa, island of jewels; his palace Mani-bhitti, jewel-walled, also Mani-mandapa, jewel-palace.

SES-NAG or Saisu-naga, a dynasty who reigned 360 years, and we find amongst them, B.C. 415, Nanda, Mahapadama (B.C. 1602, Jones; 364, Wilson), regarding whom it was said he will bring the whole earth under one umbrella; he will have eight sons, Sumalya and others, who will reign after Mahapadma. He and his sons will govern for 100 years. The Brahman Kaulilya will not root out the nine Nanda. See Magadha.

SESOSTRIS. About 900 years after the deluge, and previous to the destruction of Troy, Sesostris, king of Egypt, started the brilliant idea which M. de Lesseps in A.D. 1869 worked out satisfactorily. The Egyptian monarch caused a canal to be cut from the Red Sea to a branch of the Nile, and had ships built for carrying traffic, but for some reason or other the enterprise did not succeed, possibly because the canal was not made deep enough, or because it was connected merely with a branch of the Nile instead of the main stream. He is said to have sailed through Bab-ul-Mandab, and to have founded a colony, to check the irruptions of the Scythian hordes. See India.

SET. MAHR. Arable land in and around a village.

SETH, Sethi, Set, Sete, Setti, Shet'h, Chetty, and Chettiar are variations of the same Sanskrit word, and are applied reverentially to many of the races engaged in trade or financial transactions, to the Zoroastrian Parsee, the Muhammadan Bora, and to Hindus in the north and south of the Madras Presidency, engaged as bankers, merchants, and shopkeepers; to the Gajoola balija, bangle makers; the Vaniar, oil-pressers; the Ela Vaniar, cloth merchants; Komati, grocers and general dealers. In the Tamil country, it is allowed to the Nattoo-Kottayar, keen, enterprising general merchants, and to the Kusaven or potters. Set is a primeval name of God.—*Buns.* iv. p. 33.

SETH, fourth son of Adam. See Abu-kubays.

SETHA-PATI, Lord of the Causeway, a title of the chief of Ramnad, who protects the road to Ramisseram.

SETHIA ACUMINATA. *Arn.* Batta-kerillagas of the Singhalese. A Ceylon tree in the Ambagamowa and Saffragam districts, at an elevation of 1000 to 2000 feet.—*Thw.*

Sethia Indica, *D.C.*

Erythroxylon monogynum, *Roxb.*

Deodaru, ... DUKH.	Devadaram, . . . TAM.
Sembu linja maram? TAM.	Thavadaram, . . ,,
Sembu-linga maram? ,,	Adavi gorenta, . . TEL.
Simi natti, ... ,,	

A small tree of the drier parts of Ceylon, with timber resembling sandal-wood, which takes a good polish. An empyreumatic oil or wood-tar, used for preserving timber employed in the construction of native boats, is obtained from the wood.

Sethia lanceolata, *Wight*, a Ceylon tree growing on the banks of streams at Galagama, at an elevation of 2000 to 3000 feet.

Sethia obtusifolia, a tree of the central province of Ceylon, growing at an elevation of 2000 to 4000 feet.—*Thw.; Roxb.; Wight; Ainslie.*

SETHU, a former name of the island or peninsula of Ramisseram was The Bridge or Causeway, from which the chiefs of the adjoining territory of Ramnad or Marawa derived their title of Sethu-pati or Lord of the Bridge, and perhaps

this name is disguised under the form Sitia.—*Yule, Cathay*, i. p. 218.

SETIPINNA, bristle-finned sprat, a small fish of the herring tribe; two species in Burma seas. A long filament or bristle is attached to each pectoral fin. Both species are often called sprats by Europeans, and they belong to the same tribe.

SETODES, a genus of the family Leptoceridæ; the caddis-worm insects.

SEV. Mahr. A portion deducted from fruit, flowers, or vegetables brought to market; an octroi.

SEVA or Siva-desa-paradhi, the circumferenee of a eirele of longitude in any point on the globe of the earth, removed from the equator, or, as Europeans would say, which has latitude. The degrees of these small circles of the sphere arc taken by the Hindus to be in the direct ratio of the cosines of the latitudes, and dissolved into assignable quantities from the dimensions of the equatorial circle, which they take to contain 5059 yojana. Siva-desa-madhya-paradhi is the circumference of the terrestrial equator. Siva-desa-wydia is a term (it seems obsolete) for the oblique ascension of a planet. This element is important in the resolution of all gnomonic problems, and for fixing the longitude of places.—*Capt. E. Warren's Second Memoir*, p. 90.

SEVEN is a frequently recurring quantity in the social and religious customs of several races. Amongst the Chaldæan it seems to have had its origin in the seven-day periods of the lunar changes, but there are other septenarian numberings not reconcilable by this astral system. Amongst the Egyptians were the seven Kabiri genealogies. The race of Kronos and Rhea had seven sons, the seven primeval forces of the visible creation, perhaps identical with the seven Pleiades. The race of Kronos and Baaltis had seven daughters, not supposed to be connected with the Tartars. The Jewish records write of 7, 70 times 7, and 7000. There were seven worlds; in Persia, seven climates; in Hinduism, seven Patala or hills; in Arabia, seven states or degrees; with Muhammadans, seven heavens; with the Parsees, seven Amshaspends; Rama, with an arrow, pierced seven palm trees. There are seven steeds of the sun, seven Muni or Rishi, seven spheres, seven seas, seven continents, and seven mothers of the gods.—*Bunsen.*

SEVEN PAGODAS, an interesting series of monolithic temples, 34 miles south of Madras, by the natives called Mahabalipuram, the city of the great Bali. Here is the spot where the haughty Kehama and Loriuite the enchantress imprisoned the Glendover.

'The sepulchres
Of the ancient kings, which Baly in his power
Made in primeval times; and huilt above them
A city, like the cities of the gods,
Being like a god himself. For many an age
Hath Ocean warr'd against his palaces,
Till overwhelm'd they lie beneath the waves,
Not overthrown, so well the awful Chief
Had laid their deep foundations.'

The traditional character of Bali was in some respects not unlike the poet's representation of the great raja Kehama. Like Kehama, the giant Bali had nearly raised himself to a dominion over the lower gods; like him, he had nearly driven the Devata from heaven, and seized for himself the Swarga throne,—when Vishnu became incarnate in the form of a Brahman dwarf, and humbled the giant to the dust. Unlike Kehama, however, Bali repented and humiliated himself before the deity, and the old tradition is well told by Southey, who says—

'Their talk was of the city of the days
Of old, earth's wonder once, and of the fame
Of Baly its great founder . . . he whose name
In ancient story and in poet's praise,
Liveth and flourisheth for endless glory,
Because his might
Put down the wrong, and aye upheld the right,
Till for ambition, as old sages tell,
At length the universal monarch fell;
For he too, having made the world his own,
Then in his pride, had driven
The Devatas from heaven,
And seized triumphantly the Swarga throne.
The Incarnate came before the Mighty One,
In dwarfish stature, and in mien obscure;
The sacred cord he hore,
And ask'd, for Brahma's sake, a little hoon,
Three steps of Baly's ample reign, no more.
Poor was the hoon required, and poor was he
Who hegg'd, . . . a little wretch it seem'd to be;
But Baly ne'er refused a supplicant's prayer.
He on the dwarf cast down
A glance of pity in contemptuous mood,
And bade him take the hoon,
And measure where he would.
Lo, son of giant hirth,
I take my grant! the Incarnate power replies.
With his first step he measured o'er the earth,
The second spann'd the skies.
Three paces thou hast granted,
Twice have I set my footstep, Vishnu cries;
Where shall the third be planted?
Then Baly knew the god, and at his feet,
In homage due, he laid his humble head.
Mighty art thou, O Lord of Earth and Heaven!
Mighty art thou! he said;
Be merciful, and let me be forgiven.
He ask'd for mercy of the Merciful,
And mercy for his virtue's sake was shown.
For though he was cast down to Padalon,
Yet there, by Yamen's throne,
Doth Baly sit in majesty and might,
To judge the dead, and sentence them aright.
And forasmuch as he was still the friend
Of rightcousness, it is permitted him,
Yearly, from those drear regions to ascend,
And walk the earth, that he may hear his name
Still hymn'd and honour'd hy the grateful voice
Of all mankind, and in his fame rejoice.'

See Mahabalipuram.

SEVEN WISE MASTERS, or the Book of Sandabad, an ancient book of fables, that found its way from India to Europe.

SEVERNDRUG, a low island off the coast of Konkan, in lat. 17° 47½′ N., and long. 73° 5′ E. Severndrug Fort, on the small island, is 8 miles north of Dubul and 10 miles S.S.E. of Bankot. It was one of the Mahratta forts erected in 1662. It is connected with the shore by a reef of rocks. Conaji Angria took it from the Mahrattas when he revolted, as also three forts on the mainland; but in March 1755 all these were retaken by Commodore James, and restored to the Mahrattas. —*Orme; Findlay.*

SEWAR. Mahr. From Seo, a boundary; the entire lands of a village.

SEWARA, a Saiva Hindu sect in Benares, mentioned by Mr. Sherring, who affect great sanetity, but eat with Hindus and Muhammadans. They let the beard grow, smear their bodies with cow-dung ashes, wear the gerua-vastra or ochre-yellow cloths, and some are celibates.

SEW-TSAE. Chin. The first educational

degree, equivalent to B.A., and meaning 'adorned talent.'

SEXTANT. The eastern navigators' sextant consists of a small rectangular thin board or piece of teak-wood, measuring $3\frac{1}{6}$ inches long by $2\frac{1}{6}$ inches broad, and is about $\frac{1}{10}$ inch thick. Through the point of intersection of the diagonals a fine cord is passed. The small rectangular board is held firmly in the left hand, while the cord from its centre is stretched from it to the eye, where the fingers of the right hand are held. As this cord, or the distance from the eye to the small rectangular board, is increased or diminished, so is the angle subtended by the opaque board lessened or enlarged. Marks or notes on the circle record the results of the observations. The principle in optics upon which the use of this simple instrument depends is, that the latitude of any place is, roughly, the same as the angle of elevation above the horizon of the polar star, and that any opaque object held vertically before the eye subtends an angle, which varies inversely as the distance of the object from the eye. If this distance be constant, and the size of the opaque object constant, the angle subtended by it must be constant also. By this simple instrument Asiatic coasters are generally guided.

SEYCHELLES ARCHIPELAGO consists of 29 islands, 700 miles N.N.E. of Madagascar, rising over a shallow sub-marine bank of coral and sand 100 fathoms deep. The larger islands are of granite, with mountains rising from 1000 to 3000 feet. They were discovered in A.D. 1502 by Vasco di Gama, but were first taken possession of in 1742 while Mahé de la Bourdonnais was governor of Mauritius. They are the nearest habitable land to Zanzibar and East Africa, Northern Madagascar, and the Suez Canal collectively. They lie about midway between Aden and Mauritius and Reunion. The island of Mahé is about 19 miles long by 6 miles wide. It has 10,000 inhabitants. It has a cathedral and chapels and schools. There are many cascades and limpid pools among the rocks. The two best harbours are Fort Victoria at Mahé, and Curieuse Bay at Isle Curieuse. The Aldebra Islands, near North Madagascar, have an extraordinary lagoon, where the giant land tortoise (weighing from 500 to 1000 lbs.) rules in almost impenetrable jungles. The Seychelles are the only locality where the celebrated coco-de-mer (Lodoicea Sechellarum), the Seychelle or double cocoanut tree, is found. This graceful palm attracts the stranger's attention on landing at Mahé, where several may be seen in the centre of the town. The Stevensonia and Verschaffeltia of the Seychelles are both eminently suited for decorative purposes; the former is spoken of in a horticultural journal as Roi de la Famille, the second as its worthy rival, tant par le majesté de son port que par la richesse du feuillage.

SGAU are found from Mergui in lat. 12° N. to Prome and Tounghoo in lat. 19° N.; a few have passed westerly into Arakan, and on the east they have wandered to the east of Zimmay over the watershed that separates the Meinam from the Selwin. They are the most numerous of all the Karen tribes. They wear a white coat, with a few horizontal bands of a red colour near the bottom, and from this they are called White Karen. Where the population is sparse, they cultivate the most favourable spots, first, before hewing down the trees, abjuring the departure of all evil, and then dibbling in the rice seed, which they do not sow broadcast like the Burmese; planting also cotton, capsicum, Indian corn, and Job's tears between the rows. They also fish largely, for they eat all creatures, lizards, snakes, deer, wild hog, elephant, rhinoceros, wild ox, buffalo; they gather the wild cardamom, and wash for tin. They have no mechanical art, but some of the women weave and embroider. Their betrothals are in infancy, and the married couple early associate, but there are frequent separations. All the Sgau and the Pwo burn their dead, but a bone is taken from the ashes, and in the dry season it is buried, with a festival, with music and dancing. The bone is placed in a booth, and around it the articles belonging to the deceased are hung, with a torch at the head and another at the foot to represent the morning and evening stars. The Sgau Maunepgha occupy the hills between the Youk-tha-wa and Meet gnan creeks; their dialect is different from the Sgau.

SGURMA, a sweetmeat of Little Tibet, made from sprouting wheat, dried, pounded, and boiled, and the strained liquor added to almond or apricot oil.

SHA, TIBETAN, Ovis montana, of Ladakh, browses in large flocks on the left bank of the Indus below Leh. It is of the size of a stag, with large wiry hair of a reddish-brown colour on the back, gradually changing to white on the stomach. The chest is covered with a long fringe of dirty black hair. Its horns are massive, and touch at their bases.

SHAB. PERS. Night. Shab-Bedari, watching all night, vigil, repeating marseea, elegies, etc. Shab-Gasht, nocturnal peramhulation, a ceremony practised by the Muhammadans in India on occasions of marriages, circumcision, etc. Shab-i-Barat, or night of record, a Muhammadan religious festival, held on the eve of the 14th of the month Shaban; it is a solemn vigil, with fasting and prayers and illumination. In Northern India lamps are lit, and prayers are said in behalf of deceased ancestors, and the Koran read. Muhammadans believe that the actions of men and their fate for the ensuing year are recorded on this night.—*Herk.*

SHABAN, the eighth month of the Muhammadan year; also a feast, called the Shaban feast of Shab-i-Barat, on the 14th day of that month.

SHABGEZ. Every caravansary and halting-place between Danghan and Sharud is infested with a bug of this name. Its venomous bite is well known to travellers; it causes severe illness. *Ferrier's Journ.* p. 76.

SHAB-NAM. HIND. A fine kind of Dacca muslin, literally night-dew.

SHAD-ANGA. SANSK. Six subjects necessary to be studied for the reading, understanding, and proper sacrificial employment of the Vedas, viz. Siksha, phonetics; Ch'handas, metre; Vyakarana, grammar; Nirukta; Jyotisha, astronomy; and Kalpa or ceremonial, known as the Kalpa sutra or Srauta sutra.—*Dowson.*

SHADDOCK, also Pumplemose and Pummalo. Hiu, Yu, CHIN. Citrus decumana, *Linn.*, cultivated in the East and West Indies for the sake of the subacid, juicy pulp with which the fruits abound. The larger are called pompoleon; the smaller form the forbidden fruit of the English

markets. It was named after Captain Shaddock, R.N., who introduced it into the West Indies. It is the Hiu or Yu of the Chinese, and has been cultivated since the time of the great Yu, who mentions it in his tribute roll. It flourishes near Amoy, and much pains are taken in grafting the tree upon other species of citrus, so that the character of the fruit has been greatly improved. Its peel is bitter, but aromatic.—*Smith; Faulkner.*

SHADEE. HIND. Lit. rejoicings, marriage. In British India, the most respectable form of Muhammadan marriage. It is not the Muhammadan binding form; that is the Nikah.

SHADUK. HIND. Six-lettered. Om Ma-ne Pad-mi Hom is styled a six-lettered mantra, Shaduk shari mantra.—*Hooker's Him. Jour.*

SHAEBE, pl. Shaeban. ARAB. Flat rocky banks in the Red Sea, which rise to the surface of the water, but are always covered by it. Shab or Shaab is a reef.

SHAFI, a commentator of the Koran, who is one of the four learned doctors of the Muhammadan faith, the others being Abu Hanifa, Ibn Hanbal, and Al Baidawi. Each of these gave rise to the schools which bear their respective names. Shafi was born at Gaza in Palestine A.D. 767–68, A.H. 150, and he died in Egypt A.D. 820, A.H. 204, nearly 52 years old.

SHAGOO or Abir. HIND. A red powder scattered about by Hindus during their holi festival, made of the flour of Curcuma zedoaria, tinted with the powder of Cæsalpinia sappan.

SHAGREEN.

Chagrin, ... FR.	Schagrim, ... RUS.
Schagrin, ... GER.	Schagren, ... ,,

It is an oriental manufacture of leather, and the method of preparing it was long kept secret. It is employed in the manufacture of small cases and boxes. The leather is prepared in Poland, Astracan in Russia, and various parts of the Levant. Shagreen differs from leather in not being tanned or tawed. It bears some resemblance to parchment, but the grain or hair side is granulated or covered with small round rough specks. It is said to be prepared from the skins of horses, wild asses, and camels, those portions being preferred which cover the chine. The fillets of skin are steeped in water until the hair is sufficiently loosened to be scraped off; the skins are then stretched upon a board, and are unhaired and fleshed with a knife. Each fillet is then stretched in a frame, as in the preparation of parchment, and is moistened from time to time and gradually distended. While still moist, the grain or hair side is sprinkled over with the seeds of a kind of Chenopodium; they are hard, of a shining black colour, and about the size of poppy seed. These seeds are forced into the surface of the skin by the pressure of the feet or by means of a simple press, a piece of felt or thick stuff being laid over the seeds. In this state the skin is left to dry in the shade, and when the seeds are shaken out by beating the skin, the surface of the latter is pitted with small hollows corresponding with the forms of the seeds. The skin is now stretched on an inclined plane by attaching its upper end to hooks, and fastening weights to its lower end; it is thinned off with a half-moon knife, care being taken not to cut so far as the bottom of the little pits occasioned by the seeds. On macerating the skins in water, they swell, and they become prominent over the shaven surface. The process is completed by steeping the strips in a warm solution of soda; salt brine is then used, and the skins are ready for the dyer.—*Tomlinson; M'Culloch.*

SHAH. HIND., PERS. A king, also royal. The Sikhs also applied this title to their founder, Shah Nanak, whom also they style Nanak Narinkar, Nanak the Omnipotent. Shah is the equivalent of the Arabic and Turkish Sultan. Shahin-shah is an emperor. Shah was the reigning title taken by the emperors at Dehli, descendants of Baber, known to Europe as the Grand Moghul. It is also assumed by the sects of fakir or darvesh, as Madar-Shah, etc., addressed as Shah Sahib; but the Dehli emperors sometimes prefixed it, adding Padshah, as Shah Alam Padshah. The names of women of the Syuds sometimes end with Shah, sometimes begin with it, as Shah-ji-Begum. Shah-Bandar, a harbour-master, a governor. The Gond converts to Muhammadanism add Shah to their names. Shah-Zadah, a prince; Shahi, royalty; Shah-bash, bravo.

SHAHA, cultivators of Bengal. They are a section of the Suri or spirit sellers.

SHAHABAD, a district lying between lat. 24° 31′ and 25° 43′ N., and long. 83° 23′ and 84° 5′ E.; area, 4385 square miles, and 1,723,974 inhabitants in 1872. Its chief rivers are the Ganges and Son, with a series of canals from the Son. Aboriginal tribes are represented principally by the Bhars or Rajbhars, of whom there are 5679, and the Karwars, who number 5673. Among the low castes or semi-Hinduized aborigines, the most numerous are the Chamars, shoemakers and workers in leather, of whom there are 91,777. The Bhars claim to be Purihar Rajputs, and at one time occupied a large part of the district. They are now almost entirely confined to the Buxar subdivision, and are one of the most degraded races, most of them being swineherds; the Dosadhs (77,927), many of whom serve as village watchmen. Of the higher classes of Hindus, Brahmans number 198,631, and Rajputs 185,652. The Koeris, the chief cultivating caste of the district, number 130,394. The town of Arrah in this district is invested with a special historical interest, as being the scene of a stirring episode in the mutiny of 1857. A small body of Europeans held Arrah for eight days, till relieved by Major Vincent Eyre. On the 2d August, before sunset, the siege was at an end, and on the following morning the gallant garrison welcomed their deliverers, Major Vincent Eyre, with 150 men of the 5th Fusiliers, a few mounted volunteers, and 3 guns, with 34 artillerymen. Major Eyre had dispersed Kuar Singh's forces on his way to Arrah, and they never rallied.—*Imp. Gaz.* vii.

SHAHAB-ud-DIN GHORI, the first Muhammadan emperor of India, ascended the throne of Ghazni (A.D. 1192, A.H. 599) on the demise of his brother Ghaias-ud-Din Ghori. He had, however, conducted the military operations from the accession of Ghaias-ud-Din (A.D. 1157, A.H. 552), and latterly also had carried on the active duties of the civil government. The two brothers had defeated their uncle, who was governor of the principality of Bamian, and they reduced the eastern parts of Khorasan. In A.D. 1176, A.H. 572, Shahab-ud-Din took Uch at the fork of the

Indus and Panjab rivers. In two expeditions to Lahore (A.D. 1178, A.H. 574) he broke the strength of Khusru Malik, the last of the Ghaznavi. His next expedition (A.D. 1178, A.H. 575) was to Sind, which he overran to the sea-shore. On his return he had again to subdue Khusru Malik, who had allied himself with the Ghakkar tribe. Khusru and his family (A.D. 1786, A.H. 582) were sent prisoners to a castle in Ghirjisthan, where, many years afterwards, they were put to death by one or other of the contending parties during the war with the king of Khorasan. Shahab-ud-Din's next efforts were against the Rajput Hindus. Shortly before his time, the four great kingdoms, Dehli, Ajmir, Kanouj, and Gujerat, combined, and his first battle was A.D. 1191, A.H. 587, with Prit'hi, raja of Dehli and Ajmir; but Shahab-ud-Din was wounded, and his army signally routed between Tanesar and Karnal at Tirouri, and was pursued for forty miles. He returned to India A.D. 1173, A.H. 589, with an army of Turk, Tajak, and Afghan, and was again met by Prit'hi with a vast army, swelled by the union of the forces of other Hindu princes whom Prit'hi's former success had attracted to his support. For a time the result was doubtful; but Shahab-ud-Din, seeing the Hindu troops advancing in disorder, charged them at the head of 12,000 chosen horse, and the great Hindu army was lost in its own ruins. The viceroy of Dehli and many other chiefs fell on the field, and Prit'hi raja was taken in the pursuit, and put to death in cold blood. After this victory, Shahab-ud-Din took Ajmir, put some thousands of the inhabitants to the sword, reserving the rest for slavery, and made over the country to a relation of Prit'hi, and returned to Ghazni, leaving Kutub-ud-Diu Aibak as his viceroy in India. Kutub-ud-Din took Dehli and Koel. Next year (A.D. 1194, A.H. 591), Shahab-ud-Din returned to India, defeated Jya Chandra, raja of Kanouj, in a battle on the Jumna, north of Etawa, and took Kanouj and Benares. Shahab-ud-Din went back to Ghazni, but next year returned to India (A.D. 1195, A.H. 592), took Biana, west of Agra, began the siege of Gwalior, which fell to Kutub-ud-Din after Shahab-ud-Din's return to Ghazni. Kutub-ud-Din took also the forts of Kalinjar and Kalpi in Bundelkhand; Muhammad Bakhtiar Khilji conquered Oudh, N. and S. Behar, Gour or Luknouti, and Bengal; and Shahab-ud-Din was engaged in contests with the king of Kharizm. He was between Tus and Serakhs in Khorasan when he heard of his brother's death (A.D. 1202, A.H. 599), and returned to Ghazni to take possession of the throne.

After his accession he moved (A.D. 1203, A.H. 600) against Khorasan, and at first obtained some success; but the king of that country obtained the aid of the Khitan Tartars, and Shahab-ud-Din destroyed his baggage, and retreated to Andkhui, where he surrendered on condition of being allowed to depart on payment of a sum of money. On this defeat and the rumour of his death, Taj-ud-Din Eldoz, one of his favourite slaves, shut the gates of Ghazni against him; another chief seized on Multan; the Ghakkar took Lahore, and devastated the whole province; but Kutub-ud-Din remained faithful in India, as also did Herat and other western countries, where three of his nephews were governing. Shahab-ud-Did recovered Multan, received the submission of Ghazni, and pardoned Eldoz, and afterwards, in concert with Kutub-ud-Din, recovered the Panjab, and induced the Ghakkar to become Muhammadans. He set out on his return to his western provinces, but when encamped with his tent pitched close on the bank of the Indus, a band of Ghakkars at midnight swam the river, and despatched him with numerous wounds, on the 14th March 1206, or 2d Shaban 602 A.H. His body was conveyed in mournful pomp to Ghazni, and his nephew Mahmud succeeded, and reigned till A.D. 1215. Shahab-ud-Din left prodigious treasures. His conquests in India far surpassed those of Mahmud. He was an enterprising soldier, but had neither the talents nor prudence of that great prince, and his name is scarcely known beyond the countries over which he ruled. He had no son, but brought up several Turki slaves, of whom Kutub-ud-Din Aibak ruled in India, Taj-ud-Din Eldoz at Ghazni, Nasir-ud-Din Kubachi in Multan and Sind, and Altamsh was another rising slave. Kutub-ud-Din Aibak ruled in India independently for four years till A.D. 1210, A.H. 607, but he had been conducting the military operations there during the reign of Shahab-ud-Din Ghori. He had been brought to Nishapur in his infancy, and purchased by a wealthy person, who had him instructed in Persian and Arabic. On his owner's death he was sold to a merchant, who presented him to Shahab-ud-Din Ghori, under whom he rapidly rose to command. He was a just and virtuous ruler. His son Aram succeeded him, but within a twelvemonth was dethroned by his brother-in-law Altamsh.—*Elph.* pp. 318–320.

SHAHAB-ud-DIN SOHURWARDI, a famous Muhammadan murshid or religious teacher of Baghdad, one of whose disciples was Shaikh Baha-ud-Din Zakaria, of Multan.

SHAH ALAM II., emperor of India, 1759-1806. He was son of Alamgir II. After the battle of Panipat, the Muhammadan dynasty of Dehli never afterwards formed a stable government, and the nominal sovereign, Shah Alam, placed himself under the protection of the British. He resided at Allahabad until in 1771 the Mahrattas replaced him on his throne at Dehli, and he remained their prisoner until released by Lord Lake in 1803. Shah Alam was long blind. Gholam Kadir, a Rohilla, the son of a former prime minister, made Shah Alam prisoner, and, after treating him and all his family with great ignominy, demanded from him a treasure which was supposed to be hidden. The old emperor, with perfect truth, replied that if there was any such, he for one was in total ignorance of it. 'Then,' said Gholam Kadir, 'you are of no further use in the world, and should be blinded.' 'Alas,' replied the old man, 'do not so; you may spare these old eyes that for sixty years have grown dim with the daily study of God's word.' The spoiler then ordered his followers to torture the sons and grandsons of the emperor, who had followed and now surrounded their parent. This last outrage broke down the old man's patience. 'Take my sight,' he cried, 'rather than force upon it scenes like these.' Gholam Kadir at once leaped from the throne, felled the old man to the ground, threw himself upon the prostrate monarch's breast, and, as some historians relate, struck out one of his eyes with his own dagger. Then rising, he ordered a by-

stander to complete the work. On his refusing, he slew him with his own hand. The emperor was, however, completely blinded, and removed amid the shrill lamentations of women, and the calmer, but not less passionate, curses of men. Fifteen years afterwards, the blind old emperor became a pensioner, at the age of 86, of the British Government, and ended his days in peace, though shorn of all his imperial dignity.

SHAH-BAZ. HIND. Limnaetus cristatellus, *Temm.* In Sind the baz or shah-baz is the female, and the zorru or jurrah is the male. It is a native of Khorasan. The shah-baz gulab or yellow-eye hawk is a noble bird. In Persia the shah-baz or hawk-king is a large grey goshawk with yellow eyes, caught in the hills of Afghanistan and its surrounding regions, brought down to the plains, and sold, when well reclaimed, trained, and in good condition, for £5 or £6. The tiercelet or male, is, as usual, much smaller than the female, and is called jurrah in Persian, the active. Both are uncommonly strong and brave. They are accounted the noblest birds; the sher-baz, lion-hawk, is the falcon or peregrine of Bokhara and the snowy regions.

SHAHBAZ GARHI in the Sudam valley of the Yusufzai district, famed as possessing one of the rock inscriptions of Asoka. It is 40 miles E.N.E. of Peshawur, and 25 miles N.W. of Attock on the Indus.

SHAHDHERI, the site of the ancient Taxila, which Arrian, Strabo, and Pliny described as so magnificent, and in the treasury of which the celebrated Asoka found nine millions sterling.

SHAH DOLA, a Muhammadan saint, at whose shrine oblations are offered. Shah Dola died in the seventeenth year of the reign of Alamgir. At first a slave of Kumayandar Sialkoti in Lahore, he seems afterwards to have attained great affluence as well as fame; for, having settled at Ch'hoti Gujerat (Little Gujerat), he built tanks, dug wells, founded mosques and bridges, and embellished the city. Though his contemporaries came to visit him from far and near, and made him presents of gold, money, and other objects, he returned to each three or four fold more than he received.

SHAHID. PERS. A martyr for the faith, a Muhammadan who has fallen in battle against non-believers. In Muhammadanism there are 20 grades of martyrs. Shahādat-ka-roz is a solemn festival day, in commemoration of the martyrs.

SHAHIN, *i.e.* the Royal Bird, is the female of the Falco peregrinator, *Sundevall*, the F. shahin, *Jerdon*, and F. sultaneus, *Hodgson*. The male bird is the Kohi or Koela. It is found in all Western Asia, Afghanistan, all India from the Himalaya to the extreme south. It is highly prized for hawking, being esteemed the first of all the falcons or black-eyed birds of prey. When caught, it is trained for what in the language of falconry is called a standing gait, that is, made to hover and circle high in the air over the falconer and party, and when the game is started, it makes its swoop with amazing speed.—*Jerdon.*

SHAHINSHAH. PERS. An emperor. It is the modern Persian form of Khshaythiya Khshayathiyanam, the title assumed by Darius, and to be read in the cuneiform inscriptions.

SHAH ISMAIL, one of the first of the Suffavean kings of Persia, reigned about A.D. 1500. He was supported by seven Turkish tribes, one of whom, the Baharloo, are part of the Kazzilbash. See Kajar; Kazzilbash.

SHAH ISMAIL GHAZI, styled Ghani Lashkar, a Muhammadan saint buried at Bithurgarh in Bardwan.

SHAH JAHAN, emperor of Dehli from 26th January 1628 till deposed by his son, Aurangzeb (Alamgir I.), 16th August 1658. Shah Jahan had reigned for thirty years, and he was sixty-seven years of age, but lived for seven years after he was thus rudely set aside, and died A.H. 1076, 26th Rajab, at the age of 74. His reign was perhaps the most prosperous ever known in India. His conduct in his youth was unamiable, but his treatment of his people was beneficent and paternal, and his personal conduct when on the throne was blameless. He continued to exercise an unremitting vigilance over the internal government, was judicious in his choice of ministers, introduced important improvements, and expended with a liberality indicating great public and private wealth. In twenty years he concluded a revenue survey of the Dekhan; he founded a new city at Dehli, built on a regular plan; he constructed a throne in the form of a peacock with a spread tail, at a cost above six millions sterling; and at Agra he erected a magnificent tomb over his queen, Mumtaz Mahal, which is known to Europeans as the Taj Mahal, a mausolcum of white marble, decorated with mosaics. And all he did was with such economy, that he left a treasure estimated at from six to twenty-four millions sterling. His palace was a noble structure, raised on a spacious esplanade, but protected by a deep moat and strong walls. It was approached by a wide street, through which flowed a canal, excavated by Ali Mardan Khan, a Persian, and bringing the waters of the Jumna from the mountains to Dehli, a distance of 120 miles. He formed the gardens of Shahlimar, at Kashmir, which he annually visited. His pearl Mosque, the Moti Masjid, within the Agra fort, is perhaps the purest and loveliest house of prayer in the world. He planned the re-transfer of the seat of government to Dehli, and equipped that city with buildings of unrivalled magnificence. Its great mosque, or Jama Masjid, was commenced in the fourth year of his reign and completed in the tenth. The Diwan-i-Khas, or court of private audience, overlooks the river, a masterpiece of delicate inlaid work and poetic design.—*Imp. Gaz.*

SHAHJAHANPUR, a municipal town which gives its name to a district in the Rohilkhand division of the N.W. Provinces. The town is built on the left bank of the Gurra, 95 miles N.E. from Lucknow. . District between lat. 27° 35′ and 28° 28′ 15″ N., and between long. 79° 23′ and 80° 25′ 45″ E.; 1744 square miles; population, 949,471 souls. Shahjahanpur town was founded in the reign of Shah Jahan, by Nawab Bahadur Khan, a Pathan, who named it in honour of the emperor. During the mutiny, the Shahjahanpur massacre occurred on the 31st May 1857.

SHAH-JI BHONSLA, son of Malaji Bhonsla, was born A.D. 1592. He was the father of Sivaji. Shah-ji had married a daughter of Lukji Jadu Rao, and rose to considerable rank in the time of Malik Ambar, distinguishing himself as a partisan during the wars in which the Nizam Shahi dynasty of Ahmadnaggur were engaged. Shah Jahan in A.D. 1635 marched from Agra to the Dekhan, and

in the first instance sent an army to recover Ahmadnaggur, which drove Shah-ji from the open country, and reduced many of his principal forts. After the fall of Dowlatabad, Shah-ji drew off to the rugged country in the west of the Dekhan, and subsequently set up a new pretender to the throne of Ahmadnaggur, and in time recovered possession of all the districts of that kingdom, from the sea to the capital. After the peace between Ahmadnaggur and Bijapur (A.D. 1636, A.H. 1016), Shah-ji gave up his pretended king and entered into the service of the king of Bijapur. He was afterwards employed in the conquest of the south of India, and obtained as jaghir the towns of Serah and Bangalore, in addition to his Poona jaghir. About the year 1664, when seventy-two years old, he was killed by a fall when hunting. He had restored his jaghir to perfect order, and had extended his conquests to the southward (under the name of the king of Bijapur) until they comprehended the country near Madras and the principality of Tanjore.—*Elphinstone*, pp. 512, 552.

SHAH KHURSHAH, author of the Tarikh-i-Elchi-i-Nizam Shah. He died A.H. 972, A.D. 1564.

SHAHLIMAR, gardens and pleasure-ground in Baghampur, five miles east of Lahore. They were laid out by Ali Mardan Khan, the engineer of the emperor Shah Jahan, in imitation of the garden planned by Jahangir at the sources of the Jhelum in Kashmir. The buildings fell into ruin during the latter period of the Moghul empire, but were restored by Ranjit Singh, who substituted stucco for the original marble of the central pavilion.—*Imp. Gaz.* viii.

SHAH MADAR, or Zindah Shah Madar, are names of Shah Buddee-ud-Din, a Syrian who came to India in the early period of Muhammadan sway, and, having selected Mukhunpur as a place of residence, he died there. He is regarded as a wallee or saint; thousands of pilgrims visit his shrine. His followers believe he still lives (zindah). See Dam-i-Madar.

SHAH MAMA or Shah Muma is the name of the smaller of the idols at Bamian. The words are supposed to be a corruption of Shak-muni. See Bamian.

SHAH NAMAH, by Firdusi, one of the longest poems in the world, contains not less that 120,000 lines. It is the great Persian epic of the east; is a historical poem, comprising a romantic history of the kings of Persia, from the commencement until the conquest of the country by the Muhammadans. See Jamshid.

SHAHNASHIN. HIND. A large cotton dhurri or carpet, with a 'chaupar' board woven in the centre.

SHAH NIZAM-ud-DIN AOLIA, by some supposed to have been born at Ghazni, A.H. 630 (A.D. 1232-3), and by others in A.H. 634 (A.D. 1236), at Badaam, a town in the province of Dehli, where he lived. He died A.H. 725 (A.D. 1325), and was buried near Dehli, hard by the tomb of Kutub-ud-Din. He is considered one of the most eminent saints of Hindustan, and oblations are offered to him.

SHAHPUR or Sapor I., son of Ardeshir, is famous for his conqest of Armenia, and his victory over the Roman emperor Valerian. Shahpur II. was a posthumous child, whose reign of seventy-two years (A.D. 308-380) is only paralleled in history by that of Louis XIV. In A.D. 337-363 he was occupied in a war with Rome, marked by the episodes of the defeat of Constantine at Singara (A.D. 248) and the death of Julian, whose successor, Jovian, by the peace of Dura gave up Armenia (A.D. 363) and the greater part of Mesopotamia.

SHAHR-i-RUD, a large canal in the khanate of Bokhara. Its water is drawn from the Zar-afshan river.—*Trotter, C. As.*

SHAHR-i-SABZ, Timur and Baber's name of Kish, is a small Uzbak State, forming part of the dominions of the khan of Bokhara, with a population of 50,000 to 70,000, mostly Kanagas and Uzbaks, and famed for their valour. The Shahr-i-Sabz Hills rise to a height of 7000 feet.—*Trotter, C. As.*

SHAHR-ROGHAN are rock excavations, seemingly dwelling chambers, about nine miles from Beyla in Lus, on the sides of a ravine, bounded by steep cliffs 400 or 500 feet high. They are on either side of the ravine. It may be described as comprising generally an open room 15 feet square, with an inner room. The legend relating to Syf-ul-Mulk and the fairy Buddul Jamāl, refers them to the time of Solomon.

SHAH-RUKH, son of Timur, succeeded to his father's empire, and reigned forty-two years. In A.D. 1419 he sent Sadi Khaja on an embassy to China; and in A.H. 823-25 (A.D. 1440) he sent Abd-ur-Razzaq and his son Jamal-ud-Din on a mission to the king of Vizianuggur; subsequently to Ghilan, and then to Egypt, and to Ching-tsu, the third emperor of the Ming dynasty. Of this embassy, a narrative, written by Khaja Ghaias-ud-Din, surnamed Nakkash, or the painter, a member of the mission, has been preserved in Abd-ur-Razzaq's History of Shah-Rukh, and has been translated by M. Quatremere.—*Yule, Cathay*, i. cxl.

SHAH-RUKHI, a coin current in the time of Baber, value 10d. or 11d. After the taking of Agra, A.D. 1526, Baber gave one to every man, woman, or child, slave or free, in the kingdom of Kābul. The Kalandar darvesh do not retain any money, and Kalandar or calendar was given as a nickname to Baber, from the circumstance of his giving away so great a sum of money.—*Elph.* p. 374.

SHAH SHAMS-ud-DIN DARIAI is a Muhammadan saint buried at the town of Lahore. He is stated to have had even a pious Hindu among his disciples. The latter having expressed a wish to go and bathe in the Ganges, the saint directed him to shut his eyes, when lo! the Hindu found himself among his relations and friends on that sacred stream, in which (as he supposed) he bathed with them. On opening his eyes again, he straightway found himself beside his spiritual guide in Lahore. His tomb is guarded by Hindus, who will not resign their posts to the Muhammadans. It is also related that some carpenters, having proceeded to cut down a tree which grew near his tomb, split it into many pieces for use. Suddenly a dreadful voice was heard, the earth shook, and the trunk of the tree arose of itself, the workmen fled terrified, and the tree did not fail to resume its flourishing condition. Oblations are offered to him.

SHAH SHUJA, an Afghan monarch of the Saddozai clan. He was a younger brother of Zaman Shah; and on hearing of Zaman Shah's defeat and blinding when at Peshawur, he proclaimed himself king, and in September 1801 marched upon Kābul, with an army of 10,000

strong. He was at first victorious, but was eventually defeated by the Daurani, under Futteh Khan. He was seized at Peshawur, in 1812, by Jahandad Khan, governor of Attock, and was carried prisoner to Kashmir, from which he was subsequently permitted to proceed to Lahore. Ranjit Singh treated him harshly, and compelled him to give up the Koh-i-Nur diamond. He at length escaped disguised as a mendicant, but again failing to obtain Kashmir, he joined his family at Lodhiana in September 1816. In 1818 he made another attempt from Lodhiana, and failed. On the 28th January 1833, he set out on another attempt, defeated the Sindians in a hard battle, but was defeated before Kandahar. After having been twice driven from the throne of Kābul, during Earl Auckland's administration, on the 7th August 1839 he was replaced in Kābul by the aid of a British army. After a brief supremacy he was assassinated, and Dost Muhammad Khan, who by this time had become a prisoner in Calcutta, was restored. But during the interval the Afghans had driven the British from Kābul. Sir Alexander Burnes and his brother Lieutenant Charles Burnes were assassinated; then Sir William MacNaughten fell by the hands of Akbar Khan, Dost Muhammad's favourite son; and on the morning of the 6th January 1842, the E. I. Co.'s forces issued through an opening in the ramparts that the engineers had made during the night, and commenced their retreat from Kābul towards Hindustan, accompanied by a large number of women and children. By the evening of the next day, the force had gone a distance of but ten miles, and halted on some high ground at the entrance of the Khurd Kābul pass, where the great mass of men, women, and children, horses, ponies, and camels lay down, to find a winding-sheet in the snow, there being neither shelter, nor firewood, nor food. On the next day they halted, in expectation of promised supplies of food, which never arrived. The women and children and married officers were handed over to Akbar Khan's protection on the following morning. The retreating force resumed its march through the pass towards Jalalabad, but when toiling in the narrow defile, the Afghans destroyed great numbers. Not a single sepoy was left, and all the baggage was gone. Soon after daybreak, the remnant of the force, still ten miles from Jugdulluk, pushed on with an energy which at the commencement of the retreat might have saved it from destruction. The retreating soldiers contested every inch of ground to Jugdulluk, where they halted all night and throughout the day. About 8 o'clock on the evening of the 12th, the remaining soldiers, now reduced to about 120 of H.M. 44th Regiment and 25 artillerymen, resumed their march. Though impeded by unarmed camp followers, whom the Afghans, knife in hand, destroyed, the soldiers bravely fought their way. Between the steep walls of the Jugdulluk pass there is a hilly road, up which the men struggled, exposed to the fire of the Afghans, till, on nearing the summit, they found the mouth of the pass closed by a barricade of bushes and branches of trees, at the foot of which, though bravely fighting, officers, soldiers, and camp followers were stricken down; and on the 13th January 1842 the sun rose at Gundamuk on the twenty officers and forty-five European soldiers who had cleared the barricade, and struggled on to that place,—all that was left of the many thousands of that army. A captain and a few privates were taken prisoners; the rest were massacred. A few had pushed on from Surkh-Ab. One by one they had fallen by the way, until the number was reduced to six,—three captains, one lieutenant, and two medical officers. When they reached Futtehabad, 16 miles from Jalalabad, some peasants came out, spoke to the fugitives, and offered them bread, whilst eating which one of the captains and the lieutenant were cut down; the others rode off, but were pursued and taken, and three of the remaining number were slain. So out of a host of 16,000, or if women and children be included, about 26,000, of the army of the Indus, one man, Dr. Brydon, alone survived to reach Jalalabad, where, wounded, exhausted by famine, worn out by fatigue, and borne by a jaded pony, he told his dismal tidings to General Sale, who held that fortress.

Lord Ellenborough relieved the Earl of Auckland, and during his administration General Nott, at the head of one brigade, marched towards Ghazni, and General Pollock, at the head of another, towards Kābul. Ghazni was taken easily by assault, and General Nott united his force with that of General Pollock, who had marched through the Khaibar pass to Kābul. Here the troops of Akbar Khan were defeated, and the place as far as possible desolated. The officers and their families who had surrendered to Akbar Khan, by whom they had been imprisoned, were released, and soon afterwards the army retired from Afghanistan to India, where it was received with honours by the Government at Ferozpur.

SHAIKH, in India, a division of the Muhammadans who class themselves according to their Arab origin,—Ansaria, Faruki, Koreshi, Mahaji, and Sadiki; the Koreshi, Muhammad's tribe; the Sadiki, Abu Bakr's tribe; and the Faruki or Oomar's tribe. Shaikh is the title generally applied to the principal teachers among the Sufi. In Arabia and Syria, the hereditary or elected chief of a tribe is also called Shaikh, and the Shaikhs of the small tribes are subordinate to the greater Shaikhs of the potent tribes. In India this title is conceded to all who are not Syuds, Moghuls, or Pathans, and to all descendants of Muhammadan converts. The Shaikh therefore are of the most varied origin, and are engaged in all avocations, military and civil, as soldiers, in regular and irregular armies, as police, shopkeepers, and a sprinkling of them in learned professions or occupations requiring prior education.—*Malcolm's Persia*, p. 413.

SHAIKH ABU ISHAK, of Kazerun, was patron saint of the mariners in the India and China trade, who made vows of offerings to his shrine when in trouble at sea, and agents were employed at the different ports to board the vessels as they entered, and claim the amounts vowed, which generally came to large sums. Applicants to the shrine for charity also used to receive circular notes payable by parties who had vowed. When the recipient of such a note met any one owing an offering to the shrine, he received the amount on presenting his bill endorsed with a discharge.—*Ibn Batuta*, ii. pp. 90, 91; *Yule*, *Cathay*, i. p. 253.

SHAIKHAWATI or Shekhawati, a province of Jeypore State in Rajputana, situated between lat. 27° 20′ and 28° 33′ N., and long. 74° 40′ and 76° 5′ E. A salt lake in the province, called Kachor-Rewas, yields about 6000 tons yearly. Near Khetri are copper pyrites ores, mixed, it is said, with grey copper-ore (fahlertz or tetrahedrite); some carbonates also occur, and native copper has been found. Near the surface, also, in the shales, blue vitriol is produced by the decomposition of the pyrites. In the same mines cobalt is also obtained, the ore occurring in small veins.—*Imp. Gaz.* viii.

SHAIKH BAHA-ud-DIN ZAKARIA was born at Cotcaror, in Multan. He was a great traveller, having, it is said, traversed Persia and Turkey, and was a disciple for some time of Shahab-ud-Din Sohurwardi, at Baghdad. He died on the 7th Sufur, A.H. 665 (7th September 1266 A.D.), and was buried at Multan.

SHAIKH BUDIN, a hill in the district of Bannu and Dehra Ismail Khan. It is a bare limestone rock, with a few stunted wild olives and acacias.

SHAIKH MUHAMMAD ALI, HAZIN, JILANI. His tomb is at Buxar, where he died in A.H. 1180 (A.D. 1766–67), distinguished for his science, learning, and literary talents. He wrote in both prose and verse with equal skill.—*Herkl.* p. 432.

SHAIKH MIRZA, chief of Farghana, father of the emperor Baber.

SHAIKH MUBARAK was born at Nagor. He was one of the most learned men of his time, and was conspicuous during the reign of Akbar for his great erudition and his liberal opinions on religious matters. He had several sons; the eldest, Shaikh Abul Faiz, known as Faizi, was the most popular poet of his time, a great favourite and constant companion of Akbar, who gave him the title of prince of poets. The second son, Abul Fazl, was born 14th January 1551, and as a learned man was known by the takhallus or literary title of Alimi (the learned). He rose to be prime minister of Akbar, and distinguished himself in peace and war. On the instigation of Prince Selim, he was waylaid and killed by Bir Singh, a Bundela raja, six cos from Narwai, 12th August 1602.—*Elliot.*

SHAIKH OTHMAN, a village near Aden, situated about six miles beyond the isthmus line of works, and commanding all the roads leading to Aden, was purchased from the Sultan of Lahej by the Indian Government for 50,000 dols. The village possesses some copious wells. The place was captured by the British in 1841, when an attempt was made by the combined Abdali and Fadhli tribes to recapture Aden; and subsequently, in 1858, in consequence of several outrages on British subjects committed by the Abdali, under the Sultan of Lahej, on which occasion the fort was blown up with the ammunition found stored there.

SHAIKH SHARIF BOO ALI QALANDAR, born at Panipat, a town thirty cos north-west of Dehli, to which capital he came at forty years of age, and became a disciple of Kutub-ud-Din. He devoted himself for twenty years to external sciences; after which he threw all his books in the Jumua, and began to travel for religious instruction. In Asia Minor he profited greatly by the society of Shams Tabriz and Mulvi Rumi. He then returned home, lived retired, and worked miracles, and is said to have died A.H. 724 (A.D. 1323–24?)

SHAIKH-ul-ISLAM is the chief mufti (or doctor of the law) of Turkey, the mufti of the capital. D'Ohasson states that this title was first conferred by Muhammad II. when he conquered Constantinople in 1453, and there established the seat of his empire.—*Lane's Notes.*

SHAIKH-ul-JABAL, a name by which Hasan-us-Sabah was known to the crusaders. See Assassin; Hasan-us-Sabah.

SHAIKH ZAIN, author of the Tabakat-i-Babari, written A.H. 998 (A.D. 1589–90). Shaikh Zain was Baber's secretary, and wrote the Farman, which was translated by William Erskine. It is a paraphrase in a pompous style of Baber's own memoirs.—*Elliot's History of India.*

SHAIKH ZAIN-ul-ABIDIN, a resident of Kirbala, entitled Mujtahid-i-Hai, that is, one who can make Ijtihad, or an analogical deduction from the Koran and the Hadis or tradition. The Shaikh sect of S. India pay great attention to his teaching.

SHAITAN. Arab. Satan, according to Muhammadan belief he has four khalifa or deputies,—Muliqua, Hamoos, Mubloot, Yusuf.

SHAKAR-GANJ. Hind. Farid-ud-Din, a Muhammadan saint, born at Ghanawal, near Multan. He was so holy, that by his look clods of earth were converted into lumps of sugar. He was therefore surnamed Shakarganj, which means the treasury of sugar.

SHAL. Hind., Pers. A shawl. Do-shala, a double shawl. Shal-dori-dar, a shawl having a dori, the dhour of Moorcroft, qu. embroidered. Shala phiri, a fabric made of the seconds of shawl wool (Kashmir). Shal kitani kar, a shawl woven of twisted thread, giving it a peculiar regular and serrated texture. Shal sada, a plain shawl of pashm thread without embroidery.

SHALIMAR, several gardens of this name are known. The term is derived, by Vigne, from Shah-ul-Imarat, or royal gardens, but it may be Shahi-mari, royal-house. Mohun Lal says its original name was Sholah Mah, or the flame of the moon. One near the capital of Kashmir is famed in Lalla Rookh. It contains a building of polished black marble at the upper end of a walled garden. The streams of water running at its four corners give an idea of the Mahtab Bagh, a palace of Dehli. The gardens of Shalimar, made by the emperor Shah Jahan, were begun in the fourth year of his reign, and finished in the thirteenth, on which occasion the emperor gave a grand festival to his court. These gardens were laid out with admirable taste, and cost the enormous sum of a million sterling. At present their appearance does not give cause to suppose such an immense sum had been laid out upon them, but great part of the most valuable and costly materials has been carried away. Shalimar, in Hindustan, 6 miles north-west of Dehli. Shalimar, a garden formed by the emperor Shah Jahan at Lahore. It is about half a mile long, with three successive terraces rising one above another, and contains 450 fountains, which throw up water subsequently received into marble tanks. Ranjit Singh removed some of the marble ornaments to Amritsar.—*Mohun Lal's Tr.* 14; *Tr. of Hind.* ii. 308; *Schlagentweit's Hypsometry*, ii. 115.

SHALL, a district of Baluchistan, where snow lies for two months of the year, but in spring and summer numerous Brahui toman range over its plains. Its capital, called Shall by the Baluch, by the Afghans is called Quetta, an equivalent for kot or fort. It is surrounded by a slight mud crenated wall, and its houses were at the base of a huge mound, on which stands a citadel. The bazar is tolerably well supplied, and is a fair one for a provincial town. There are the vine, the fig, the pomegranate, the plum, the apple, and pear; mulberries and apricots are plentiful, as are also melons in their season. The valley of Shall may be about 12 miles in length, with an average breadth of 3 or 4 miles. It is well supplied with water; and besides good wheat and barley, yields much lucerne, with, it is said, some madder. The neighbouring hills—the native region of the wild sheep—provide ample pasture for very numerous flocks of the domestic animal, and Shall is proverbially celebrated for the excellency of its lambs. The valley of Shall was originally held by the Kassi Afghans, who still dwell in the town and immediate vicinity. Having passed under Brahui rule, the Sherwani tribe have intruded themselves into the southern parts of the valley; and some of the villages bordering on it, and included in the district, as Kuchilak on the road to Peshin, and Berg on the road to Mastung, are wholly or chiefly held by Khaka. Since 1878 it has been held by the British.—*Masson's Journey*, i. p. 328.

SHALLOT.

Allium ascalonicum, *L.* | Gundhuna, . . HIND.

Shallots are the mildest of the onion tribe, seed seldom; propagated by the young bulbs like the chive; used in sauces, salads, etc. — *Riddell; Jaffrey.*

SHAL-MULI. BENG., HIND., SANSK. The roots of Bombax heptaphyllum, supposed by natives of India to have great power in preventing the access of old age, if taken daily, and no acid swallowed.—*Powell*, i. p. 333.

SHAM, BALUCH, also Shamol, PUSHTU, a watershed between two rivers; also a plain, any plain or series of plains, as the Chat, Phailawar, Bohr, Siah Tank, and Kalchat, lying west of the Rajanpur border, where the Gorkhar or wild ass, wild hog, ravine deer, and large numbers of horses are found; also the Oryal (Ovis Vignei) on the Kup, Mir Dost, and Siah Koh ranges.—*Lt.-Col. MacGregor*, iii. p. 94.

SHAMA. HIND. Cercotrichas macrourus, the Indian nightingale. It is common to India and the Malay countries, and is undoubtedly their finest song-bird. There is a second species (C. Luzoniensis) in the Philippines, and a third (C. erythropterus) in Africa. The esteemed Indian songster is le merle tricolor de longue queue of Levaillant. The Orocetes cinclochyncha is termed Shama in the Madras Presidency.—*Oiseaux d'Afrique*, p. 114. See Bulbul.

SHAMAKA, SANSK., also Shamak'h, DUKH. Panicum miliaceum. This millet in N.W. India is used, in the kharif crops, as an offering to the lares or household gods, in the Arwan ceremony. In the rabi crops, barley is the grain used in the Arwan, as it is called in Rohilkhand and the Upper Doab, but it is also called Nuwan, from Naia, new, and corn. When the Arwan is brought home, the grain is taken out of the car, mixed up with milk and sugar, and every member of the family tastes it seven times; the season is one of festivity. 'Phoola-phoola kyun phiré? G'har arwun aya,' 'Why walk you so gladly? The Arwan has been brought home.' The Dit'hwun is a similar ceremony. When cutting the sugar-cane, part of it is brought home and spread before the saligram, the officiating Brahman declares the fortunate moment for beginning operations, and the cutting is commenced. The whole village is a scene of hilarity, and dancing and singing are the order of the day:—

> 'Et cererem clamore vocent in tecta; neque ante
> Falcem maturis quisquam supponat aristis,
> Quam Cereri tortâ redimitus tempora quercu
> Det motus incompositos, et carmina dicat.'

What the ceremony of Dit'hwun is to the sugar-cane, that of Arwan is to the Shamak'h and barley grain.—*Ell. Supp. Gloss.*

SHAMAL. ARAB. Literally the north, but in Aden a name given to the hot sandy north winds which occur there between the months of April and September. It is extremely oppressive; and Vandon Broeck, who visited Aden in 1614, described one vividly.

SHAMAN, a Tunguz word, meaning exorciser of spirits, supposed by Bunsen to be a corruption of Sramana, a term applied to Buddha and to Buddhist priests in general. Shamanism found its way from India to Siberia via Tibet, China, and Mongolia. Rules on the formation of magic figures, on the treatment of diseases by charms, on the worship of evil spirits, on the acquisition of supernatural powers, on charms, incantations, and other branches of Shaman witchcraft, are found in the Strangyour or Tanjur, the second part of the Tibetan canon. Shamanism means a deification of the powers of nature and a spirit worship. According to Dr. Latham, Saman is the name given by the Turk population of the Lena, called the Yakuts, to their highest divinity. Megasthenes in B.C. 295, in his embassy from Seleucus to Sandracottus (Chandragupta), divided the philosophers of that country into the Brahman and the Sarman, Sraman, or Saman. Of these latter, the most famous were such as lived a life of asceticism in the woods, clothed in the bark of trees, and feeding upon seeds and fruits. In Shamanism, magic and ritualism of every form must be included. The modern Shaman affects a peculiar intimacy with the divinities of the stream, cave, and forest, and acts as a medium between them and their believers. He fashions rude images of what he calls deities, and in his exorcisms he works himself into a strange mixture of trance and epilepsy. Shamanism exists undisguised amongst the Shanar of Ceylon, among many of the less civilised races of India, and mixed with Hinduism in almost every village. It is found amongst the races of Scythic or Tartar origin who occupied India prior to the arrival of the Aryan Hindus, and to the present day branches of the Tamil race in the extreme south of India continue to practise fetish and shaman rites. Shamanism amongst the Turanians was evinced by ecstatic excitement. In Shamanism, the superior deities are far more powerful than man, and of a different nature. Their place of abode also is far away, and accessible only to Shamans. As totemism overlies fetishism, so

does Shamanism overlie totemism. Colonel Dalton states that the paganism of the Ho and Mundah in all essential features is Shamanistic. In Siberia the Shamans work themselves up into a fury, supposing or pretending that in this condition they are inspired by the spirit in whose name they speak, and through whose inspiration they are enabled to answer questions and to foretell the future. From Sloudenka to Koultouk the distance is only 20 miles, but a part of this station is very bad, till the road descends to the shore of the Baikal, which it reaches near a mass of rocks named Shaman Kamen. Formerly the religious fanatics executed their criminals here. Their religion and its ceremonies are founded on sorcery; they believe in good and evil spirits, and sacrifice parts of the maral to their god, whom they name Bour-khan. They give themselves little trouble about the good spirit, but for the evil one they have a great reverence. They believe him an inhabitant of our earth, that he has his abode in dense forests and rugged mountains, and that he is ever active in the midst of terrific storms. They also think that he has the power to transform man into whatever shape he pleases. With the Shamans, the priesthood is hereditary; it is a rare instance that a stranger is admitted into it. The Shaman Kamen is held sacred by all of the Shaman creed, and they never pass it without offering up their devotions. Rude figures have been sculptured upon its surface, and formerly men, women, and children have been sacrificed upon its summits.

SHAMBAH. PERS. A day of the Muhammadan week, the day Saturday, to which the words ek, do, sih, char, panj, and shash are prefixed from Sunday to Friday.

SHAMIANA. HIND. A square tent or a canopy open at the sides, supported at the four corners by poles.

SHAMLA. HIND. A large turband formed by coils of muslin twisted together; a scarf shorter than a loongee or kamrband, made for wear as a turband.

SHAMLU, or the Sons of Syria (Sham), are one of the most numerous of all the Turkish tribes in Persia. The Karaguzulu, the Baharlu, and several other tribes in Persia, are branches of the Shamlu, who were brought into Persia from Syria by Timur. Ismail took full advantage of the enthusiasm of his disciples, to cherish feelings so essential for the political greatness of the empire he governed. The seven Turkish tribes who had been the chief promoters of his glory and success, were distinguished by a particular dress. They wore a red cap, from which they received the Turkish name of Kazzilbash, or golden heads, which has descended to their posterity. The swords of these tribes were consecrated by these distinctions to the defence of the Shiah religion; and a sense of that obligation has survived the existence of the family by whom it was first created. The names of these tribes were the Ustajalu, the Shamlu, the Nikallu, Baharlu, the Zu-l-Kaddar, the Kajar, and the Affshar. Each of these had seven subordinate tribes under them, but this probably refers not to the il or tribes, but to subordinate teerah or branches. —*Malcolm's Persia*, i. pp. 390, 502.

SHAMMAR, the 24th king of Himyar, extended his conquests to Mosul. He defeated the Tartars at Azerbijan, subsequently he subdued Khorasan, passed into Balkh and Sogd, which he rebuilt and called Shammar-kand, *i.e.* Shamar destroyed it. He passed into Tibet, in one of the deserts of which he with his army was destroyed by thirst. This expedition is placed in the reign of Gushtasp, as also in that of Bahman of Persia.

SHAMPOO, to press the different parts of the body by the hand. The most common mode of shampooing is to knead, as it were, the body all over, squeezing and stretching the joints at the same time. There are, however, many other ways of its being done. A writer says, a man lay down, and three or four people came and patted every part of him (not even missing his face), until he went to sleep.

SHAMS. ARAB. The sun. Shamsi sal, a solar year. Shamsi mahaina, a solar month, in opposition to Kamri, lunar.

SHAMSHIR BAHADUR, an illegitimate son of the first peshwa of the Mahrattas, Baji Rao. His mother was a Muhammadan woman, and he was brought up in his mother's religion. Baji Rao left him all his possessions in Bundelkhand, and all his pretensions in that locality.—*Elphin.*

SHAMSHIR KHANI, PERS., is a prose abridgment of the Shah Namah, into which are introduced some of the finest passages of Fardusi's poetry.

SHAM-SHU. ANGLO-CHIN., from the Chinese words San-shau, meaning thrice distilled, also called Shau-tsiu, meaning distilled wine. It is distilled from all sorts of cereal grains, and millet is largely used. Yuen-tsiu means absolute alcohol. Like the mahwa flower arrack, the Chinese Sham-shu has a disagreeable flavour caused by the presence of fusil and other alcohols, which, however, could be separated.—*Smith.*

SHAMSI. The most northern district of the range, extending to the neighbourhood, of Tripoli, is occupied by a sect of idolaters called Ansari. A spacious plain, open to the sea on the west, extends north as far as Tortosa, and is bounded on the east by the Ansari mountains. This chain is a lower branch of the Libanus, but is less known than most parts of this celebrated mountain, being inhabited by the lawless Ansari tribe, who have never been brought into actual subjection by any of the Pashas. Of their sects, the Shamsi are said by some to worship the sun, but the origin of this people and their religion are still unknown. Like the Druses, they may possibly be a Muhammadan sect. Burckhardt mentions the Ansari sects, calling them Kelbye, Shamsye, and Mokladjye. The Ansari are the least numerous of the Lebanon tribes, their number in 1840 not exceeding 20,000 souls.

SHAMS-i-TABRIZ, a Sufi philosopher, was the teacher and spiritual guide of Jalal-ud-Din. It is related that Jalal's father, Baba Walad, had a disciple, who for some reason gave offence to Shams-ud-Din; the latter in punishment inflicted a deafness on both the disciple's ears. After a time Shams pardoned the offender, and restored his hearing. But the man bore him a grudge in his heart nevertheless. One day Shams said to him, 'Friend, I have pardoned thee: wherefore art thou still cast down? Be comforted.' Notwithstanding this, his rancour remained. One day, however, he met Shams in the midst of a market. Suddenly he felt a new faith glow

within him, and he shouted out, 'There is no deity save God; Shams-ud-Din is the apostle of God!' One of the market people came forward to cut him down, but Shams uttered so terrific a shout that the man at once fell down dead. The rest of the market people submitted. Shams now took the disciple by the hand and led him away, remarking to him, 'My good friend, my name is Mahomed. Thou shouldst have shouted, "Mahomed is the apostle of God." The rabble will not take gold that is not coined.' Shams-ud-Din's arrogance and violence at length brought him into difficulties, for he was arrested during a tumult which his followers had raised, and removed by the police. All his pupil Jalal's miraculous powers failed to find out his whereabouts after this. He is said to have been flayed alive at Multan, and over his supposed remains a magnificent shrine has been erected. Tradition ascribes the intense heat of Multan to his prayer, from which the sun descended from the heavens to cook his food. Burton says the Multan people slew him in order to have his body among them.

SHAMS-ud-DIN ALTAMSH was purchased by Kutub-ud-Din Aibak for 50,000 pieces of silver. He rose through different offices to be governor of Behar at the time of the revolt, A.D. 1211, A.H. 607. Taj-ud-Din Eldoz gave him investiture unasked, but subsequently made an attempt to establish himself in India, and was defeated and taken prisoner (A.D. 1215, A.H. 612), ending his days in confinement. His reign was marked by the approach of the Moghuls under Chengiz Khan, but after withdrawal he conquered Sind to the south of Tatta (A.D. 1225, A.H. 622), also Behar and Bengal. In the next six years (A.D. 1226, A.H. 623, to A.D. 1232, A.H. 630) he was employed reducing Hindustan, taking Rintambor, Mandu, Gwalior, Bhilsa, and Ujjain. He died at Dehli, April 1236, 20th Shaban 633. He had received investiture from the khalif of Baghdad. The author of the Jama-ul-Hikayat resided at his court. The Kutub Minar near Dehli was completed in his reign. He was succeeded by his son Rukn-ud-Din, and then his daughter, Razzia Begum.—*Elphin.* p. 322.

SHAN. The Shan, or Tai, or Thai, as they call themselves, are the most extensively diffused, and probably the most numerous, of the Indo-Chinese races. Their tribes and clans are distributed from lat. 25½° N. to the Gulf of Siam, in lat. 13½ N., in the valleys of the Munipur river, the Kyendwen river, the Irawadi, the Salwin, and the tributaries of the Menam. Thai is the native name of the Siamese, and their chief divisions are Laos, Shan, Ahom, and Khamti. The race swarm in many tribes over the countries stretching from the valleys between China and Tibet on the north, to the Gulf of Siam in the south. They occupy all the territories between the Irawadi and the mountains of Annam, and if united would form a most formidable state in Eastern Asia.

Lapping the Burmese round, from N.W. by N. and E. to S.W., from Assam and the Brahmaputra to the Gulf of Siam, they are found from the borders of Manipur to the heart of Yunnan, and from the valley of Assam to Bankok and Kamboja, everywhere Buddhist, everywhere to some extent civilised, and everywhere speaking the same language with little variation. Their traditions, as also those of Siam, speak of a great kingdom held by this race in the north of the present Burmese empire, but the race is now split into a great number of unconnected principalities, and the kingdom of Siam is now perhaps the only independent Shan State in existence. All the others are subject or tributary to British India, Ava, China, or Cochin-China. In lat. 24½° to 25½° north-east of the Kakhyen, the Shan tribe occupy the left bank of the Nam Kathe or Munipur river, between the 23d and 24th degree of north latitude, south of the Kathe or Moi tai tribe, and west of the Kubo valley; also, near Bamo on the right bank of the Irawadi, with the Kakhyen on the north and on the east, mixed up with the Pwo and with the Kadu on the south. Shan States are extensive at the forks of the rivers which in lat. 18° N. form the sources of the Menam river; and in lat. 15° N., and between long. 99° and 100° E., they dwell in the mountains on which grow the sappan-wood forests. The Shan, who are tributary to the Burmese empire, consist of twelve petty states, the hereditary chiefs of which, called Tsawbwa, hold from Mandalay. Of the twelve states, seven are on the west and five on the east of the Salwin. Mobye and Mohmo, the states nearest to the Red Karen, pay tribute to them. The other states are named Nyung-yu-we, Myelat, Mone, Legya, Theinne, Mormeit, and Thung-bain, Kaingma-Maing-maing, Maingleng-gye, Kiang-hung, Kiang-tung, and Kiang-khen. The Shan are called Kabu in the Munipur language.

The Shan country is the Laos of geographers. Leaving out of view the intruding and partially interspread Shan or Lau tribes, the Burmans march on the north with rude tribes of their own family, collectively termed Singpho (properly Sing Phol), who occupy the Upper Irawadi. On the extreme north, the linguistic boundaries of the Singpho are unknown. It is possible that they march with the Khampa or ruder Tibetans of the S.E., unless the snowy mountains which there form the watershed between the Irawadi and the Tsang-po cut them off, as is more probable, from all intercourse with their northern neighbours. The Shan or Tai, the powerful Siamese, on the extreme south-east, are the youngest, but the most powerful, member of the Shan family. They trace their origin to an offshoot from the Laos, whom they formerly denominated Great Tai, while they called themselves Little Tai. They were originally tributary to Cambodia, but became independent in A.D. 1350.

About the 13th century, the Lau were a powerful and conquering people in the upper portion of the basin of the Irawadi, where their capital was at Mo-gaung (Muang-gaung or Mung Khong), and whence, in A.D. 1224, they sent an expedition which subjugated Assam and established Ahom rule. Their native country was a portion of the basins of the Mei-kong and the Menam, including Yunnan.

The Ahom, on the extreme north-west, came into Assam about the beginning of the 12th century, about the same time that the Siamese went south.

Before the 13th century, the Tai formed a compact body on the east, and perhaps north of Burma, probably pressed on by the Moghuls in China, Kablai Khan having fixed himself in Assam in the time of the first Ahom chief.

The exact position of the Great Tai, the Láos of geographers, is unknown.

In A.D. 1228, Chukupha, king of Pong, assumed for himself and people the title of Ahom, the peerless, now softened to Assam. About the same time, they took possession of a higher portion of the upper basin of the Mili, where their chief seat was at Khamti, whence the name by which this branch is still known.

In the basin of the Irawadi, the Shan are intermixed with the Tibeto-Burman tribes, amongst whom they have intruded; but in large portions of it they are the principal population, and in the N.E. corner of the empire the Khamti may be considered as independent. It is probable that the Siamese, with the tribes of the Upper Menam and of the Mei-kong, are directly connected with those of Yunnan, and are not offshoots from the colony of Muang-gaung. The Siamese have advanced more than half-way down the Malay Peninsula, and but for the check given to them towards the close of the 18th century, by the establishment of Penang as a British settlement, their sway would now have embraced Perak, and probably have extended to the confines of Malacca. The northern clans almost everywhere retain their independence, although owning a nominal allegiance, and in some instances paying tribute, to Burma, to China, or to Siam, those on the frontiers of Yunnan propitiating both the Golden Foot and the Son of Heaven, by an acknowledgment of fealty, and some sending a triennial offering to the latter.

The Phaki or Phakial race on the Dihang river, the Kamjang of Sadiya, and the numerous settlements of the Khamti race, are all colonies of this Shan race, retaining the costume, customs, and religion they brought with them into the Assam valley. Of these the Khamti are the most numerous and important. Whatever may have been the original seat of the Khamti people, they immigrated to Assam, since the middle of the 18th century, from the country known to the British as Bor-Khamti, near the sources of the Irawadi, which was visited by Wilcox in 1826.

At present the Lau, under the names of Shan and Khamti, are found in Upper Assam, and scattered over a large portion of the northern half of the basin of the Irawadi, near to the confluence of the Kyendwen with the principal stream. Scattered villages are even found in Arakan, on the eastern side.

Their general complexion is light-brown, their hair black and abundant, nose not flattened.

Those residing in Burma are generally smaller than the Burmese, from whom they are readily distinguished by their black jackets of glazed calico and short blue breeches. The Siamese may be considered as having a remarkable modification of the Burma-Chinese head, with a peculiar tendency to elongation and verticality. They have large straight faces, flat occiputs, lowness of the hairy scalp, comparatively small and firm mouth, hard staring eye, and a grave expression. Siamese appears by far the most widely-spoken language of Ultra-India. It was at one time the lingua franca of Kidah, almost as much as the Malay, and even that wandering Negro tribe the Semang, spoke it in some places. It was also current in Assam and Yunnan, at the opposite extremities of Ultra-India.

At Bhamo, to the north, east, and south-east of which they are numerous, the language of the Shan corresponds with that of the Siamese.

The Lau, on the borders of China, differ little from the Chinese of Yunnan, and their stock was probably the same. Where they are in contact with the old races they have considerably altered. In the valley of the Menam, their height is about 1½ inches less than the average Chinese, but the average stature of the French is the same, viz. 5 feet 3 inches.

The Lau or Shan race speak a language which was primarily East Himalaic, like Mon, Kambojan, Annam, and Pa-long. Like them, it was carried at some remote period into the Brahmaputra Gangetic province, and received some Dravidian roots. Subsequently it shared in the great eastern movement of Himalaic dialects from the basin of the Ganges into that of the Irawadi, where it was intimately connected with some of the intrusive West Himalaic or Tibeto-Burman dialects. It was then pressed further into the east, into the basin of the Upper Mei-kong and Tonkin, and became the language of Yunnan. During the Han dynasty, Chinese colonies began to occupy the valleys of Yunnan, and from that time Lau was exposed to the influence of Chinese, and began to receive the modified form it possessed when the pressure of that great race on the older tribes of Yunnan caused the Lau to swarm to the westward and southward. When they re-entered the basin of the Irawadi, they had acquired from their partially Chinese civilisation, a superiority over the Tibeto-Burman tribes of northern Ultra-India, which made the Lau clans predominant along the central belt of Ultra-India, from the Himalaya to the mouth of the Menam.

The Shan are great workers in silver, and the art of embossing on different utensils of silver seems to be known to the Kathay Shan, of whom there were in the middle of the 19th century 20,000 or 25,000 between Ava and Amirapura. Tin exists in the Shan States to the south-west of Mandalay, but the mines have never been worked. The tin consumed in the country now is all imported. Iron abounds in the Shan States, and the district of Pagan, to the south of Mandalay, is noted for it. A manufactory exists on a rough-and-ready scale in this district at Ponpah Toung, but the out-turn is inconsiderable. To the west of Sagaing, for miles up the Irawadi river, the ore abounds—a rich hæmatite.—*Yule, Jour. Geog. Soc.* xxvii., 1857; *Mason, Tenasserim; Latham's Ethnology*, pp. 157-257.

SHANAR or Sanan, a race in the south of India, about Tinnevelly, Madura, and Travancore, who are toddy-drawers, merchants, traders, shopkeepers, some of whom have been very successful in business. They are also styled Nadan, and they append to their names the term gramani as a tribal title. They are a dark-skinned race, with low foreheads, sunken eyes, and prominent cheek-bones, timid and superstitious. They are not so good-looking even as the Maravar. They are largely worshippers of evil spirits (see Devil-Worship), but since the middle of the 19th century many have accepted Christianity.

SHANAR CASSOO, a Venetian sequin.

SHAN-BAF, a cotton fabric made at Dacca.

SHAND. Hind. of Kohat. A third quality of

land; it is allowed to be fallow, and is cultivated for paddy.

SHANDUSE, a cotton scarf, coloured border and ends, used in Khyrpur.

SHA-NE. Burm. A bast of Arakan, of a reddish-brown colour, rough and coarse.

SHANG, the second dynasty of China, began B.C. 1559, lasted 509 years to 1050. Twenty-eight reigns in fifteen generations.

SHANGHAI is the most northerly and most important of the Chinese ports that have been opened to foreigners. It is a heen, a district city of Sun-kiang-fu, in the province of Kiang-si, is situate on the right bank of the Woo-sung river, lies in lat. 30° 25′ N., and in long. 120° 32′ E., being distant from Chusan about 100 miles, in a north-westerly direction. The Woo-sung, its river, flows into the Yang-tze-kiang (child of the ocean), which is called by many, and most appropriately, the main artery of China, as it flows through many provinces, and some of the most wealthy cities of China are built upon its banks. The Woo-sung, or Shanghai river, is deep, and easily navigable when the bearings are understood. Cannel coal is found in abundance near Shanghai.

SHANGRI or Sangri. Hind. The seed-pods of the jhand, Prosopis spicigera, one of the common shrubs of the rakh or waste lands of the Panjab.

SHANG-TI. Chin. A title which some Chinese scholars apply to designate the God of the Christian Scriptures, but which others render supreme ruler, supreme emperor, or ruler or emperor on high, Le Seigneur and Le Souverain Maitre of Gaubil. The discussion on this point has been going on since the 16th century, the Jesuit missionary Matteo Ricci on the one side, and Lingobardi on the other; Drs. Medhurst, Legge, Edkins, and Chalmers on one side, and Bishop Boone, with Drs. Bridgmans and Williams and the Archimandrite Palladius, on the other.

SHAN OIL, used in Burma for mixing with paints; made by the Shan from, it is said, the fruit of the wood-oil tree, a species of Dipterocarpus.

SHAN-SI and Shen-si, two provinces of Northern China, separated by the Hoang-ho or Yellow River. Shan-si is one of the smallest provinces in China. It resembles in form an oblong lozenge, and is bounded on the north by Tartary, on the south and south-west by Ho-nan, on the east by Peh-chi-li, and on the west by Shen-si.

SHAN-TUNG is a long peninsula, extending towards Corea, dividing the Gulf of Peh-chi-li from the Yellow Sea. It is bounded on the north-west by Peh-chi-li, on the south-east by Ho-nan, and on the south by Kiang-si. It means east of the hills. Its surface is estimated at 56,000 square miles, and the population is nearly 29 millions. Besides grain, this province supplies large quantities of fish, a great portion of which, packed in ice, is sent to Pekin by the Imperial Canal. Among the vegetable oils imported into Ningpo and other Chinese ports from Shan-tung, Leatong, and Teisin, are oil of teuss, obtained from green and dried peas, black oil of the fruit of the tree kin (?), and oil from the pea of Suchau. —*Fortune.*

SHA-PHYU, a bast of Arakan; long, thin, smooth layers, light-coloured, tough, and flexible.

SHAPOO, or wild sheep of Ladakh. Moorcroft in his Travels mentions seeing one killed near Lameru.—*Adams.*

SHARBAT. Hind. A beverage made of lime-juice or pomegranate juice, or merely sugar and water, the French Eau-sucré. When a Bedouin prepares coffee, he drinks the first cup; the Sharbat-i-kajari of the Persians, and the Sulaymani of Egypt, render this precaution necessary. The Sharbat-i-kajari is the Acqetta of Persia, and derives its name from the present royal family. It is said to be a mixture of verdigris with milk, more probably a poison of more activity. In Egypt and Mosul, Sulaymani (the common name for an Afghan) is used to signify poison. The banks of the Nile are infamous for these arts, and Muhammad Ali Pacha imported, it is said, professional poisoners from Europe. Sharbat, Arab., is from Sharb, he did drink. Those esteemed are Sharab-ul-Laimun, lemon sherbet; Banafshah, violet sherbet; Toot, mulberry sherbet; Hommeyd, sorrel sherbet; Zebeed, raisin sherbet. Sherbets are favourite beverages, made with the juice of fruits, mixed with water and sugar, with the addition of rose-water, or some other fragrant ingredient. The Persian sharbets are most esteemed. —*Burton's Mecca*, iii. 43; *Faulkner.*

SHARIF. Arab., Hind., Pers. Noble; the tribal title of the offspring of a Syud and woman of another Muhammadan tribe; also the title of the hereditary ruler of Mecca.

SHARK.

Kalb-ul-bahr (sea-dog), Ar.	Pesce-cane, . . . It.
Goulu de mer, . . Fr.	Jyu, Yu, . . . Malay.
Hai-fisch, ... Ger.	Tiburon, ... Sp.
Auwal, ... Hind.	

Sharks belong to the cartilaginous fishes; they abound in numbers and species, and are remarkable for their wide geographical distribution. They enter rivers to a considerable distance from the sea. The name for the shark in Malay and Javanese is Iyu, or, abbreviated, Yu, and is even found in some dialects of the islands of the Pacific. The Carcharodon Rondelettii is the shark of Australia; one of them measured 36½ feet. The great basking shark is the Selache maxima. The shark of the Tigris river, of Indian rivers, and Fiji river is Carcharias Gangeticus.

The hammer-headed shark, shuang-chi-sha, is caught on the coasts of China and Formosa. The fins are considered a great delicacy, and in their dried state sell at 60 dollars a pikul; when skinned, cleaned, and cooked, often as much as 200 dollars a pikul. The fins of species of Carcharias and Zygæna are the most prized. The meat is tolerably good.

The white shark, or sha-mu-lung of the Chinese, grows to 20 feet in length; its fins are of less value.

The lung-men-sha is the shovel-nosed sucker. Its fins and flesh are more esteemed than any other.

The saw-fish of China, also called shark saw-fish or sha-chu-yu, grows to 15 feet in length. Its meat is eaten, and fins are esteemed. The saw is kept as a talisman to ward off evil spirits.

The fishermen of Auping, in Formosa, distinguish sixteen sharks. The most dangerous to man is the ta-yuan-t'ou-sha, or big round-headed shark. Its fins are of second quality, and flesh indifferent. Chinese say that the cat-bird shark, shih-niao-sha, simulates death, and floats on the

surface of the water. Sea birds thinking it dead, alight on it, and are caught by the shark sinking its tail, on which the birds move towards its head.

Shark skin is used by the native workmen for polishing wood and ivory; and shark-fins are largely exported to China. In the Gulf of Manaar they are taken for the sake of their oil, of which they yield such a quantity that shark's oil is a recognised export. A trade also exists in drying their fins, for which, owing to the gelatine contained in them, a ready market is found in China, whither the skin of the basking shark is also sent, to be converted, it is said, into shagreen. Sharks are said to attack the fair-skinned races more frequently than men of darker hues, and the pearl-divers of the Persian Gulf used to blacken their skins with a view to avoid these monsters.

In the South Pacific and Sandwich Islands sharks were formerly worshipped. When the king or the priests of this divinity imagined that the shark wanted food, they sallied forth with attendants, one of whom carried a lasso, which they threw at random amongst any crowd, and whoever was caught was strangled, cut in pieces, and thrown into the sea.

There are many large boats, with crews of twelve men each, constantly employed in the shark fishery in Kurachee. The value of the fins (Paak, Duk., Guj., Hind.; Iyu sirap, Yu sirap, Malay; Soora meen sepputay, Tam.) sent to Bombay varies from Rs. 13,000 to Rs. 18,000 a year. Of this a portion only passes directly into the hands of the fishermen, each boat earning perhaps Rs. 1000 annually, or Rs. 100 for each man. From this falls to be deducted the cost of material and other charges. This trade was noticed by Dr. Royle in 1842. It affords on some occasions to Bombay alone, taking fish-maws and shark-fins together, as much as four lakhs of rupees (£40,000), and furnishes the chief means of support to at least 3000 fishermen, or, including their families, to probably not less than 15,000 human beings. One boat will sometimes capture at a draught as many as a hundred sharks of different sizes, but sometimes they will be a week, sometimes a month, without securing a single fish. The fishermen are very averse to revealing the amount of their captures. Inquiries of this sort are supposed by them to be made exclusively for the purpose of taxation. The great basking shark, or mhor, is always harpooned. It is found floating or asleep near the surface of the water, and is then struck with a harpoon 8 feet long. The fish once struck is allowed to run till tired, and is then pulled in and beaten with clubs till stunned. A large hook is now hooked into its eyes or nostrils, or wherever it can be got most easily attached, and by this the shark is towed in-shore. Several boats are requisite for towing. The mhor is often 40, sometimes 60 feet in length; the mouth is occasionally 4 feet wide. All other varieties of shark are caught in nets in something like the way in which herrings are caught in Europe. The net is made of strong English whip-cord, the mesh about 6 inches; they are generally 6 feet wide, and are from six to eight hundred fathoms, from three-quarters to nearly a mile in length. On the one side are floats of wood about 4 feet in length, at intervals of 6 feet; on the other, pieces of stone. The nets are sunk in deep water from 80 to 150 feet, well out at sea. They are put in one day and taken out the next, so that they are down two or three times a week, according to the state of the weather and success of the fishing. The lesser sharks are occasionally found dead,—the larger ones much exhausted. On being taken home, the fins are cut off and dried on the sands in the sun; the flesh is cut up in long stripes and salted for food, and the liver is taken out and crushed down for oil. The head, backbone, and entrails are left on the shore to rot, or thrown into the sea, where numberless little sharks are generally on the watch to eat up the remains of their kindred. The fishermen themselves are only concerned in the capture of the sharks. So soon as they are landed they are purchased by Bania merchants, on whose account all the other operasions are performed. The Bania collect them in large quantities, and transmit them to agents in Bombay, by whom they are sold for shipment to China. Not only are the fins of all the ordinary varieties of shark prepared for the market, but those also of the saw-fish, of the cat-fish, and of some varieties of ray or skate,—the latter, indeed, merges almost insensibly into the form of those of the shark. The cat-fish, known in India by the same name as in Britain, has a head very like that of its European congener, from which it differs in all other respects most remarkably. Its skin is of a tawny yellowish-brown, shading from dark-brown on the back to dirty-yellow on the belly. It is beautifully covered all over with spots of the shape and size of those of the leopard, similarly arranged. The value of sharks' fins annually exported from Bombay amounts to betwixt a lakh and a half and two lakhs of rupees. The largest fishery at any given port is probably that of Kurachee, which affords nearly one-tenth of the whole, but the shark fishery is conducted all along the Bombay coast. In Fiji they are said to be caught by means of a curiously-formed piece of wood, about 4 feet long, and in shape very much like a whale boat, but solid. From a hole in the centre descends a strong cord of twisted rattan, forming a running noose.

Sharks of the south of Asia are a regular article of trade for the market of China, where they are prized for their restorative qualities. They are sought for from every maritime country between the Arabian Gulf and the East Indian Islands.

The shark fins of commerce are not exclusively selected from sharks (Squali), but equally from Raiæ. Quantities examined at Penang were composed of fins of the genera Stegostoma, Carcharias, Sphyrna, Pristis, Rhinobatus, Trygon, and Myliobatis. But of all fishes, sharks and rays are the most valued by the Chinese. The fish and entrails of all, not even the electric rays (Torpedinideæ) excepted, are eaten either fresh or dried. The skin is used for polishing, or converted into shagreen. Gelatine is obtained from the larger fins, glue from the smaller. All, except the caudal fins, are cut at the root so as to leave as little flesh as possible. The root is dipped in wetted lime (chunam), in the erroneous belief of preventing attacks of insects, and then the fins are dried in the sun. Those imported in the Straits Settlements are packed promiscuously in gunny bags, each containing from one-half to one pikul. According to the value in the Chinese market, the fishmongers assort the fins in two

kinds, white and black. The white consists exclusively of the dorsal fins, which are on both sides of a uniform light colour, and reputed to yield more gelatine than the other fins. In China, the lovers of gelatinous soups pay from 30 to 40 Spanish dollars per pikul for white fins. The pectoral, ventral, and anal fins pass under the denomination of black fins. The colour, however, varies, according to the species, from buff to grey or brown, and most of them are of two different colours, the upper surface being dark, the lower light. The black fins, for obvious reasons the most numerous, are supposed to yield a comparatively small quantity of gelatine, and sell in China from 15 to 20 Spanish dollars per pikul.—*Montgomery*, i. p. 422; *Tennent's Ceylon*, p. 325; *Keppel's Ind. Arch.* ii. p. 205; *Low's Sarawak*, p. 89; *Bombay Monthly Times; Royle on Isinglass.*

SHARRA. Arab. Law, equity, the precepts of Mahomed; religion, faith, justice. Written properly Shar'a. In the Muhammadan religion, the law, as the precepts of Mahomed derived from the Koran, is sometimes classed as (1) Itikādat, articles of faith; (2) Ibādat, religious worship; (3) Muamalat, civil law or social transactions; (4) Muzajar, criminal law, punishment; and (5) Adāb, moral conduct.

The fakir or darvesh act in accordance with religion (Ba-sharra) or differently (Be-sharra). The Ba-sharra are family men, and living according to the laws of the Koran.

The Be-sharra, without the law, are majzub, celibates, whose sanctity places them above the laws of the Koran.

In India, the chief fakirs are—Kadaria or Banawa, whose founder lived at Baghdad; Chistia, followers of Banda nawaz, whose shrine is at Kulburga; Shuturiah; Tabkatia or Madria; Malanej; Rafai or Gurzmar; Jalalia; Sohagia; Nakshbandia; Bawapiari ka Fakir.— *Wilson's Gloss.*

SHART. Arab. Employed by Muhammadans in Southern India to indicate a horse conveyance, either buggy or palanquin carriage. In Bombay, the Tamil words Sikram-po, literally go quickly, are applied to the latter conveyance.

SHASTHI. Hind. The sixth day of the new moon; in Hindu belief is dugdha, or unpropitious for any good work. (2) A Hindu goddess, protector of children.

SHASTRA. Sansk. The holy books of the Hindus. Of the six Vedanga or bodies of learning, three belong to grammar; one relates to religious ceremonies; a fifth to the whole compass of mathematics; and the sixth to the explanation of obscure words or phrases in the Vedas. Subordinate to these Anga (though the reason of the arrangement is not obvious) are the series of sacred poems, the body of law, and the six philosophical shastras. Shastra, Sansk., is from Shas, to rule.

SHASTREE or Shastri, a Brahman learned in the religious books of the Hindus.

SHATATAPA, a Hindu ascetic mentioned in the Markandeya Purana. He was one of the Smriti writers, and wrote the Karma Vivaka.—*Ward*, iv. p. 27.

SHAT-u-DIJLAH, a name of the Tigris as far as Kut-ul-Amarah, a small town on the left bank nearly midway between Baghdad and Koornah, being about 178 miles by water from the former city, and 97½ miles directly S.S.E. from the latter. Lower down, after passing for about 40 miles through marshes, and coming near the tomb of Ezra, the river resumes it former size and character, as it winds in the general southern direction to Koornah, which place is 232 miles from Kut-ul-Amarah by the windings, and 144½ in direct distance.

SHAT-ul-ARAB is the united stream of the Tigris and Euphrates, the two rivers of Mesopotamia. It is called by British sailors the Basrah or Euphrates. It is a fine river, about 1200 yards wide at its mouth, and is navigable for large vessels drawing 18 feet to beyond Basrah, a distance of 80 miles from its bar, in lat. 29° 46′ N., and long. 48° 40′ E. The rise and fall at spring-tides ranges from 8 to 10 feet. It disembogues into the Persian Gulf.

SHAT-ul-HAI, a canal which leaves the Tigris nearly opposite the town of Kut-ul-Amarah, and runs to the Euphrates about 80 miles above Koornah.—*MacGregor.*

SHAWL GOAT, Capra hircus, *L.*, the shawl goat of Spiti, yields inferior wool to that of Tibet. Shawl goats' hair is called Pashm in Hindi, and Kashmiri lena in Tibetan. The common domestic goat of Ladakh is the well-known shawl goat, of which there are said to be two varieties. One is a large animal with great horns, called Rappoo; the other, smaller and with slender horns, is called Tilloo. It thrives only in the most elevated districts. It is bred in Nubra, Zanskar, and Rukchu, but the finest wool is brought from Ruthog and Gnari, which formerly belonged to Ladakh, and from Chang-Thang, or the southern and mountainous districts of Khotan. It is only shorn once a year, and the wool is at once separated from the coarser hair. The hair is pulled out, and is manufactured into blanketing, for tents, coarse sacking, and ropes for home consumption. The wool is shorn, and is exported to Kashmir, and to Nurpur, Amritsar, Lahore, Ludhiana, Ambala, Rampur on the Sutlej, and Nepal. To Rampur and Nepal, the wool is exported direct from Ruthog and Gnari, but Leh is the entrepot between the other shawl marts and the wool-producing countries. The fine shawl-wool is called Lena (Lana, Lat.), the common wool Bal, and the hair Pu. In Kashmir, the wool is sold to the merchants at Kashmiri Rs. 4.8 or Company's Rs. 2.10 per seer. The average quantity of shawl-wool exported from Ladakh to Kashmir and other places is about 16 loads or 6400 maunds of 16 seers each, half of which goes to Kashmir alone. The average price in Ladakh is about two rupees per seer, or £20,400 a ton. Each shawl goat yields about half a seer. The goats are about 80,000 in number, and their value £32,000, each goat being priced at four rupees. The Kashmirian merchants purchase the wool at Leh, at the rate of 80 pul (small handfuls) for a small rupee. Shawl-wool is produced most abundantly and of the finest quality in the steppes between the Shayuk and the main branch of the Indus. About £10,000 worth may be carried down the Sutlej to Ludhiana and Dehli. Mr. Moorcroft estimated the importation into Kashmir alone at £75,000 of value, and the annual value of the shawl manufacture of Kashmir at £300,000.—*Vigne; Cunningham; Hooker's Journal*, ii. p. 88.

SHAWLS.

Chals, Chales, . . . Fr.	Chales, ... Port.
Schalen, ... Ger.	Schavalos, ... Sp.
Shal, Guj., Hind., Pers.	Saluvaigal, ... Tam.
Shavali, ... It.	Saluvalu, ... Tel.
Kayin-rambut, Malay.	

In eastern countries the shawl is considered the most essential and graceful part of ornamental dress, and in India it was by no means unusual to pay 10,000 rupees (£1000) for one of the finest Kashmir shawls, which in all probability had cost the labour of a whole family for a lifetime. Those by far the most valuable are taken by native rulers.

In the 11 years 1850-61, the Kashmir shawls exported from India were valued as under:—

1850-51, £171,709	1854-55, £197,890	1858-59, £310,027
1851-52, 146,270	1855-56, 209,279	1859-60, 252-828
1852-53, 215,659	1856-57, 290,640	1860-61, 351-093
1853-54, 170-153	1857-58, 227,618	

Of the above, 80 per cent. was shipped to the United Kingdom, Suez, the Arabian and Persian Gulfs,—America, France, and China taking the remaining part. The imports and exports in latter years were as under:—

	Imports.		Exports.	
	No.	Rs.	No.	Rs.
1875-76, . .	321,284	10,14,939	30,053	16,12,980
1876-77, . .	255,262	7,55,823	28,385	16,69,132
1877-78, . .	271,460	7,09,037	32,970	15,08,535
1878-79, . .	427,412	9,85,341	26,113	12,40,116
1879-80, . .	446,582	9,23,554	21,498	8,88,432
1880-81, . .	499,896	5,93,818	26,601	15,01,786
1881-82, . .	678,824	7,59,331	16,652	12,41,640
1882-83, . .	813,585	8,19,310	12,090	7,71,718

Although in many branches of textile manufacture Europe has outstripped her oriental teacher, there is still found among the workmen of the east a degree of taste in the adjustment of their designs, an amount of skill applied to the getting up of the fabric and the blending of patterns, and colours so aptly combined, as to leave nothing to be desired, but rather to show that what Europe is now arriving at in arts design by the aid of scientific teachings, has been practised amongst those ancient races during the last thousand years. The correct principle which science has laid down in the schools of the west, that the patterns and colours of woven goods should diversify plain surfaces without disturbing the impression of flatness, has evidently been known to them from the earliest times. Nor is it in this alone that the workmen of the east excel; they are equally celebrated for the rich and varied beauty of their patterns, and the strict appropriateness of these to the colours employed. Foremost amongst the woven fabrics are the world-famed shawls, the finest of which, in spite of many imitations in Europe, are still produced in the vale of Kashmir. From the neck and underpart of the body of the wool goat is taken the fine flossy silk-like wool, which is worked up into those beautiful shawls with an exquisite taste and skill, which all the mechanical ingenuity of Europe has never been able to imitate with more than partial success.

From the Ayin Akbari, written in the 16th century, we gather that the emperor Akbar encouraged the manufacture of these shawls by every means in his power, even designing some himself, and introducing a greater and richer variety of colours in their patterns. The same work informs us of the extension of this manufacture to the State of Lahore, where it is said there were then 1000 manufactories employed on them. A mixture of wool and silk for turbands is also spoken of. Akbar was very fond of woollen stuffs, especially of shawls. He ordered four kinds to be made. First, Toos Assal, which is wool in general grey, inclining to red, though some are perfectly white, and these shawls are incomparable for lightness, warmth, and softness. Formerly they were always made with wool in its original state, but His Majesty had some of them dyed, and it was said that they will not take a red colour. Secondly, Safed Alcheh, which they also called Terehdar. The natural colours of the wool are white and black, and they wove three sorts of them,—white, black, and grey. Formerly there were not above three or four different colours for shawls, but Akbar had them made of various hues. Third, Zerody, Gulabatun, Kishydeh, the Bundhenun, Cheet, Alcheh, and the Purzdar, which were of His Majesty's invention. Fourth, from being short pieces, he had them made long enough for Jamahs. His Majesty introduced the custom of wearing two shawls, one under the other, which is a considerable addition to their beauty. By the attention of Akbar, the manufacture of shawls in Kashmir was in a very flourishing state, and in Lahore there were upwards of 1000 manufacturers of this kind. They also made an imitation of shawls with the warp of silk and the woof of wool, and this kind were called Mayan. Of both kinds were made turbands, etc.

This is now by far the most important manufacture in the Panjab; but it was almost entirely confined to Kashmir, until about 1820; a terrible famine visited Kashmir, and, in consequence, numbers of the shawl-weavers emigrated to the Panjab and settled in Amritsar, Nurpur, Dinanagar, Tilaknath, Jalalpur, and Ludhiana, in all of which places the manufacture continues to flourish. The best shawls of Panjab manufacture are made at Amritsar, which is also an emporium of the shawl trade. But none of the shawls made in the Panjab can compete with the best shawls made in Kashmir itself, —first, because the Panjab manufacturers are unable to obtain the finest kinds of wool; and, secondly, by reason of the inferiority of the dyeing, the excellence of which in Kashmir is attributed to some chemical peculiarity in the water there. On receipt of the raw pashm or shawl-wool, the first operation is that of cleaning it; this is done generally by women. The best kind is cleaned with lime and water, but ordinarily the wool is cleaned by being shaken up with flour. The next operation is that of separating the hair from the pashm; this is a tedious operation, but the value of the cloth subsequently manufactured varies with the amount of care bestowed upon it. The wool thus cleaned and sorted is spun into thread with the common churka or native spinning machine. This is also an operation requiring great care. White pashmina thread of the finest quality will sometimes cost as much as £2, 10s. a pound. The thread is next dyed, and is then ready for the loom.

Plain shawls are simply woven with a long, narrow, and heavy shuttle, but variegated shawls are worked with wooden needles instead of a

shuttle, there being a separate needle for each colour.

The shawls are made both long and square, the former generally measuring 54 inches wide and 126 long, the latter 63 to 72 inches square. In some parts of Asia these shawls are worn just as they come from the loom; but all those destined for India are carefully washed and packed near Lahore.

About A.D. 1860, the maharaja of Kashmir, to check the deterioration in the quality of shawls manufactured in his dominions, issued the following circular:—

Be it known that in the city of Sirec Nugger, alias Kashmir, a paradise on earth, the number of men and women employed in the occupation of shawl-weaving aggregates 70,000, and, in fact, nearly all the inhabitants of this far-famed city are connected with the trade. That owing to the dulness of the market in England and France, caused chiefly by the inferior description of shawls manufactured, many tradesmen and merchants have been subjected to heavy loss and some to bankruptcy, and a large proportion of the weavers have been thrown out of employ. On the maharaja's late tour through Kashmir, the circumstance occupied his chief attention, and from the information he obtained he ordered the following rules to be established in order to serve both manufacturers and traders:—

1. Shawls to be uniform in size as follows:—Ladies' shawls, $3\frac{1}{2}$ yards by $1\frac{1}{2}$; turbands, 2 yards by 2; jamawar, $4\frac{1}{2}$ yards by 3.

2. Any shawl badly wove to be destroyed—the value to be recovered by the proprietor from the weaver. Should the fault lie with the proprietor, he will be punished by the Government.

3. A designer is at liberty to dispose of his designs, but should he attempt to conceal any part of a design which is purchased from him, he will be severely punished.

4. Any person convicted of robbing a firm of a design will be severely punished.

5. One designer is not at liberty to transfer designs to another, and as the Government has now relinquished the tax, it is hoped that there will be considerable improvement in the art.

6. Not more than six shawls are to be wove from one design, or a heavy fine will be inflicted.

7. The seller of a design is not to retain a duplicate or attempt to form another exactly like the one sold; in such case a fine will be levied equal to $\frac{1}{4}$th its value.

8. In future, duty will be levied by measurement of wool and worsted, and not by weight as heretofore; this will induce spinners to produce a finer description of the material, and will be more profitable to the wearer.

9. His Highness, taking into consideration the distressed condition of all manufactories for want of sufficient funds, and seeing that tradesmen are not disposed to assist them with advances, has placed in the hands of Pandit Hunna Nundjoe and Hajee Mooktiar Shah, a sum of Rs. 1,00,000 for the purchase of raw material, the same to be delivered proportionately to manufacturers, the value of which is to be refunded to Government on the sale of shawls.

10. His Highness the maharaja is greatly indebted to Dewan Kirparam, who, from his experience, had assisted greatly in framing these rules, and encouraging this important branch of manufacture.

A weaving-shop may be occupied with one shawl, provided it be a remarkably fine one, above a year, while other shops make six or eight in the course of that period. Of the best and most worked kinds, not so much as a quarter of an inch is completed in one day by three people, which is the usual number employed at most of the shops. Sometimes, in order to hasten the process, a shawl is made in separate pieces in different looms, and the pieces are afterwards sewed together. This is done with great dexterity, so that it is not immediately detected. It very rarely happens that the pieces, when completed, correspond in size. The shops consist of a framework, at which the persons employed sit on a bench; their number is from two to four. On plain shawls, two people alone are employed, and a long, narrow, but heavy shuttle is used; those of which the pattern is variegated are worked with wooden needles, there being a separate needle for the thread of each colour; for the latter no shuttle is required. The operation of their manufacture is, of course, proportionate to the quantity of work which their patterns may require. The Ustad, or head workman, superintends, while his journeymen are employed near him immediately under his directions. If they have any new pattern in hand, or one with which they are not familiar, he describes to them the figures, colours, and threads which they are to use, while he keeps before him the pattern on which they happen to be employed, drawn upon paper. During the operation of making, the rough side of the shawl is uppermost on the frame, notwithstanding which the Ustad never mistakes the regularity of the most figured patterns. The wages of the Ustad (the employer furnishing materials) are from six to eight pice per day; of the common workmen, from one to four pice in Kashmir may be about three halfpence.

The shawl bafs, or weavers, of the Panjab, according to their means, keep up an establishment of from 300 to 400 Shagird or apprentices of children from five years of age, to old men and women of eighty; or else they supply a certain number of overseers, called Ustad, with yarn, delivering to them at the same time instructions as to the quality, colour, patterns, etc., of the goods, and these men carry on the manufacture at their own houses, with the help of ordinary weavers.

Though the shawl-weavers of Kashmir are thus scantily rewarded, the fabric they produce has often been sold in London at from £100 to £400 the shawl. But it is fair to state that the manufacture of a remarkably fine and elaborate shawl will sometimes occupy a shop for a whole year, two or three or perhaps four persons being constantly engaged on it.

The shawls are divided into two great classes, viz. woven shawls, called Teliwala, and worked shawls. Shawls of the former class are woven in separate pieces, which are, when required, sewn together with such precision that the sewing is imperceptible. These are the more highly prized. In worked shawls, the pattern is worked with the needle upon a piece of plain pashmina or shawl-cloth.

Many shawls are made up of pieces, sewn together by a rafugar with such delicacy that the suture is imperceptible. Merchants take advantage of this. When they buy a shawl which they think only partly good, they cut out of it such parts as displease them. They then draw on paper a design for a new piece to fill up the gap, and give it to a shawl-weaver to execute. As soon as the new piece is completed, it is sewn into the shawl, which is entirely changed in appearance, and often immensely increased in value by the process. Shawls are often purchased with indifferent borders, and improved by putting new ones on. The border is always worked on a web

of silk, as this gives it weight and solidity, and causes the whole fabric to set well.

In Kashmir, when a shawl is about to be made, a small square piece showing the design, by way of pattern, is made and carried to the maharaja's inspector. On approval, the piece is worked into the shawl.

Great complaints have been made by European firms of the adulteration of the texture of Kashmir shawls, and there is no doubt that such adulteration was practised, especially by mixing up Kashmir wool with real pashm. In order to provide some guarantee against this, it was proposed that a guild of respectable traders should be formed, who should be empowered to affix on all genuine shawls a trade-mark, which should be a guarantee to the public that the material of the shawl is genuine pashm. At a meeting of merchants connected with the shawl trade, held at Amritsar in 1861, to consider the then depressed state of the shawl trade in the Panjab, and its causes, taking an average of ten years, the transactions in shawl goods amounted to nearly £500,000 per annum, of which a large proportion belonged to Amritsar and its shawl dependencies, and the proportion of the Panjab trade to that of Kashmir was then stated to be as 3 to 6. The chief shawl-brokers in London and Paris had urgently impressed upon the Amritsar merchants the suicidal policy of sending to the market shawls made of adulterated wool, for unless the manufacturers abstained from mixing sheep's wool with the pashm, or from using inferior pashm, the trade would undoubtedly die out. Adulteration was caused by the fraudulent admixture of coarse sheep's wool, such as Kirmani, Tibet, and even country lamb's wool. The beauty of a Kashmir or Amritsar shawl depends as much on the brilliancy and durability of its unrivalled colours, and their being carefully harmonized, and the material of which it is made, as on the quality of the workmanship. Sheep's wool, however fine, never does assume that permanent brilliancy of colour which is the peculiar character of the pashm. Kirman, the ancient Carmania, has been celebrated from the days of the Persian empire for its woollen shawls, though they never were able to compete with the Kashmir manufactures in softness or brilliancy. The wool obtained from the Kirman sheep is long and somewhat thick and silky, but it does not retain the bright colours which distinguish a genuine Kashmir shawl. It is somewhat cheaper than the best shawl pashm, and, being thicker, is more economical for the manufacture. The merchants, attracted by the apparent advantages of the Kirman wool, and knowing nothing of the hidden dangers in its use, largely adopted this wool as an admixture with the genuine pashm.

Colonies of Kashmiri settled in the Panjab are known by their fair complexion, their peculiar dialect, their way of closely shaving the head, and wearing small skull-caps. These people have emigrated at various times from Kashmir. They are divided among themselves into several gradations, and, like all Musalman races, have no restrictions on marriage, except immediate relations; marriages with first cousins are not only allowable, but frequently occur. They are almost exclusively employed in the shawl trade. There are two classes in the profession, the master workmen or Ustads, and the apprentices or Shagirds. The former supply the capital, and the apprentices earn their livelihood by task-work. The more opulent Kashmiri not only keep large manufactories for shawls, but trade in wool and other produce of Ladakh and Chinese Tartary. The rooms devoted to the workmen are long apartments with looms placed in the centre, and benches ranged parallel for the weavers; they are well lighted and airy; the workmen, all males, sit hard employed the whole day, and sometimes enliven the labour by singing choruses. They are a discontented and quarrelsome race, very deficient in personal courage, but so litigious, that their disposition for law has become a proverb.

They speak a dialect intelligible only to themselves, though they are also conversant with the vernacular. The shawls of Nurpur and Tilaknath are not much prized; the work is inferior, but the great cause of inferiority is the hardness of the water, which communicates a roughness to the shawls, greatly detracting from their marketable value. The Kashmiri themselves say that there is no water like the river Jhelum, and that the superiority of the shawls of the valley is mainly ascribable to the virtue of the water. The weavers of Kashmir possess also greater artistic qualifications, since none but the worst, who fail to get a livelihood in their native country, would consent to leave the charming valley for the heats of the Panjab and the discomforts of a strange country. The present population consists almost entirely of the descendants of original emigrants, and are now acclimated. They still retain the dress and dialect of Kashmir, and are constantly reinforced by new arrivals from the valley. In the cold winter months, the women adopt a peculiar custom of carrying under their frocks little pans of heated charcoal, over which they warm their hands, and maintain the circulation, like English ladies with their muffs.

The shawls of Nurpur are scarcely ever found in the foreign market, while those of Amritsar and Gujerat are sold in London and in France in considerable numbers.

The Deputy Commissioner of Gujerat, writing in August 1864, reported that at the last sale in London, the Gujerat shawls had sold at a loss of four annas in the rupee, and those of Amritsar at a loss of eight annas, or 50 per cent., the Kashmiri genuine shawls realizing a profit of 25 per cent.

In Ludhiana there are as many as 500 shops of pashmina workers, giving occupation to more than 1000 persons; the regular pattern shawl is much less woven than plain pashmina alwan, gloves, and stockings, etc., of pashmina thread. Of these fabrics about Rs. 70,000 worth are annually exported, but by far the largest manufacture is that of the shawls and chadars made of soft Rampuri wool, and which is often passed off as pashmina or genuine shawl-wool. Of these fabrics no less than Rs. 1, 30,000 worth are annually made and exported. The import of real pashmina wool from Rampur amounts to about Rs. 30,000 or 40,000 a year, that of Rampuri wool about Rs. 20,000. A number of Rampur chadars are, however, made of real Kashmir pashm.

The Amritsar shawl-weaving approaches nearest in excellence to the Kashmir valley. In this city several European merchants and agents have been supervising the manufacture and furnishing designs. In the Amritsar district, according to

Mr. Cust, the total number of houses of Kashmiri shal baf is 6493, of which 5111 are in the city itself.

Amritsar, besides being the seat of manufacture, is also an emporium of the Kashmir shawl trade. At one time the shawl manufacture of Amritsar had so deteriorated, from the use of mixed or adulterated pashm, that the trade was threatened with extinction in Europe, and in 1861 large meetings were held at Amritsar with a view to the adoption of measures to prevent adulteration, — a considerable and fraudulent admixture of coarse sheep's wool. On the other hand, it was maintained that the difficulty of ascertaining, by the most experienced judges, before shawl goods are washed and exposed for a while to the action of the air, the amount of admixture, if any, that may have taken place in the weaving of shawls ;—and it may be here mentioned that the length of the staples of sheep's wool offering great facilities in spinning the thread is the chief inducement to its being used, the pashm being very short, and consequently more difficult to spin ; secondly, the total indifference of the manufacturers to the frequent and urgent remonstrance of the dealers against practices which they were assured would lead to the discovery of frauds that must affect all interested in the trade and manufacture of shawl-wool goods.

The principal kind of wool used in adulteration was a soft white wool imported from Kirman. A shawl even of adulterated pashm still sells for double what a shawl of sheep's wool would, though the work would otherwise be the same.

The shawls designated in India are—

Shal-kitani-kar, a shawl woven of twisted thread, giving it a peculiar, regular, serrated texture.

Shal-sada, a plain woollen shawl without embroidery.

Shal-doridar, a shawl having a dori or edging.

Do-shala is a double shawl.

Formerly, Kashmir shawls were exquisitely woven, with an elegance and chasteness of design, softness and finish in quality, arrangement of colours and use of dyes, which the finest Paisley and French shawls do not approach. These exquisite shawls of Kashmir became rarer, and their place was usurped by hand-embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Panjab and in Dehli, also, workmen commenced to embroider Kashmir cloths and net with floss silk and braid, for sale to Europeans, who wear them as tunics, jackets, scarfs, and the like. In the hand-worked Kashmir shawls, as also in the Dehli work, wooden needles of hard wood are used, slightly charred, with a hole in the centre of the needle to receive the yarn. The scarfs of brocaded gold and silver, laid upon red, white, and green grounds, and worked in and interspersed with beetles' wings and other ornaments, are admired by Europeans. One of the causes of deterioration in this manufacture has been in Europeans inducing the weavers to produce fabrics of a style far inferior to the artistic articles of the Kashmiri.

Paris shawls are principally of the kind known as French Kashmir, in which, by the aid of the draw-loom and of the jacquard, a surface appearance is given precisely similar to that of the oriental shawls. The figures and colours of Indian shawls are faithfully copied, and the yarns of the weft are not only equal in number to the colours of the pattern, but there are also as many little shuttles or pirns filled with these yarns as there are colours to be repeated in the breadth of the piece. Each of these small pirns or bobbins passes through only that portion of the flower in which the colour of its yarn is to appear, and stops on the one side and the other of the cloth exactly at its limit; it then returns upon itself, after having crossed the thread of the adjoining shuttle. From this reciprocal interweaving of the various yarns of the shuttles, it happens that, although the weft is made up of a great number of different threads, yet they form a continuous line in the whole breadth of the web, upon which the lay or batten acts in the usual manner. The great art consists in avoiding confusion of the shuttles, and in not striking up the lay till all have done their part. A woman, assisted by two girls, is able to conduct the whole operation. But this close imitation of the oriental shawl is a very slow process, and therefore the shawls must be necessarily costly. Lyons is famous for its 'Tibet' shawls, the weft of which is yarn, with a mixture of spun silk. The shawls of Nismes are celebrated for their low price, and the ingenuity with which spun silk, Tibet down, and cotton are all worked up together.—*Powell, Panjab; Moorcroft, Tr.; Watson; Tomlinson; M'Culloch; Cal. Cat.*, 1862 ; *Faulkner, Kashmir and its Shawls; Times of India.*

SHAYUK, a valley and river in the N.W. Himalaya. The river rises near Kara-korum pass, runs S.E. to N.W. into Indus near Iskardo ; length 300 miles. It receives the Chang-chen-mo 58, and Nubra river 66 miles. Floods have at different periods devastated the whole course of the Shayuk valley, from the glaciers of Sassar. These floods appear to be due to the blocking up of the upper course of the river by the ice, and have been most destructive to the prosperity of the valley. An encamping-ground on the plain of the Shayuk river is called by the Turki merchants Murgai, by the Tibetans Murgo-chumik.—*Thomson's Tr.*

SHEA BUTTER is a solid oil obtained from the nuts of Bassia Parkii or Pentadisma butyracea, a tree of the interior of W. Africa. The nuts are allowed to ripen on the tree, and are gathered from the ground in the morning by women and children. The pulp surrounding the nuts is rubbed off, and generally eaten. As a fruit it resembles an over-ripe pear; but it is too sweet to be much relished by Europeans. The nut is next dried by exposing it to a slow heat in large clay caldrons with perforated bottoms. This, besides carrying off moisture, causes the nut to shrink in its shell, of which it is divested in the next operation, viz. threshing. This is done on floors, or sometimes it is done in large wooden mortars instead. The nut, now free, is next thoroughly pounded with pestle and mortar, then ground between stones ; at this stage it looks just like black mud in paste. This mass is washed in cold water, then boiled till the butter rises white, and is skimmed from the surface. Shea butter remains hard at a high temperature when well prepared, and does not become rancid with age. It has a slightly smoky taste, acquired during its preparation. Some people dislike it. It has been used in cooking ; and Mr. Barter lived on it and yams without inconvenience. It is also called Galam

butter.—*Letter from Mr. Barter to Sir William Hooker.*

SHEBA, mentioned in Ezekiel xxxviii. 13. 'The merchants of Sheba and Raamah,' etc.; 'Haran and Canneh and Eden, the merchants of Sheba, Asshur, and Chilmad,' etc., Ezekiel xxvii. 22, 23. The Balad-ul-Jahaf, a district of Yemen, is the land of Sheba, the Ard-us-Shaba, so called to the present day by the Arabs. There are two hills of Balak in the district, 600 paces apart, between which a queen of Sheba built a masonry dam, which burst, and the bursting is famed as the Sail-ul-Arun. Balkees, queen of Sheba, was stated to Solimau to have hairy legs; the Koran (ch. xxii.) mentions the plan he adopted to ascertain the fact.—*Ouseley's Tr.* i. p. 336.

SHECHEM, the modern Nablus, has in its neighbourhood the two mountains, Gerizim and Ebal, each about 2500 feet high, with Joseph's tomb and Jacob's well at the eastern end of the valley, the former near the foot of Ebal, and the latter near the foot of Gerizim. One Tur is the mountain mass near Sinai. Another Tur, the Et Tur, is Mount Gerizim near Nablus. Shechem was made the metropolis of the conquering Israelites. Jerusalem only became of importance after the vision of David in 2 Chronicles iii. 1. It was from Gerizim and Ebal that Moses ordered the law to be read. It was here that the field was bought by Jacob (Genesis xxxiii. 19). Shechem of Samaria (Josh. xx. 7) was a refuge city. See Bast.

SHEEP.

Gosfand,	PERS.	Koyun,	TURK.

The shawl goat, and a dwarf variety (black, with short horn), also a race of blackfaced sheep, and the dumba or broad-tail, are reared in Ladakh in great numbers. Four-horned varieties of this sheep are not uncommon. The blackface, or hunniah, stands high, and is a handsome animal. Moorcroft says (Tr. R. As. Soc. i. p. 51) the Purik sheep of Ladakh gives two lambs in a twelvemonth, and is twice shorn in that period. Good ewes appear to be obtained in Coimbatore and Baramahal; but Jalna and Beder used to be the best places whence to obtain the white-woolled breed. The results obtained both at Bangalore and on the Neilgherry Hills, from crossing the white-woolled sheep of the country with Saxon, Merino, and Southdown rams, have been satisfactory, both as to quantity and quality of wool, and size of carcase. At the Madras Exhibition of 1855, of specimens of woollen manufactures, the most remarkable were those from Hoonsoor, comprising white and coloured blankets of various textures made in the native loom, some being imitations of English articles, and a decided improvement upon the country cumbli, and cheap in price. In Mysore, the wool is largely used in carpet manufacturing. In the Mysore country sheep thrive well. About the year 1840, General Cubbon collected a flock at a farm about 60 miles west of Bangalore, and imported three or four rams annually from Sydney; these amalgamate so well with the country sheep, both in figure and size, that in the fourth cross it was not possible to distinguish farm-bred from the imported ram. (See Ovis.) Sheep skins are employed for purposes for which a thin cheap leather is required, such as for common bookbinding, leathering for common bellows, whip-lashes, bags, aprons, etc. Sheep skins also form the cheaper kinds of wash-leather for breeches, gloves, and under-waistcoats; as also coloured and dyed leathers and mock morocco, used for women's shoes, for covering writing-tables, stools, chairs, and sofas, lining carriages, etc.

SHEETALA. SANSK. Cold. In Hindu mythology the goddess who cools the body when afflicted with the smallpox; she receives many honours from the lower orders of Hindus.

SHEETALA-PATI, from Sheetala, cold, and Pati, a mat, from Pat, to move. The mat is from the Maranta dichotoma.—*Ward's Hindoos.*

SHEFTAH or Shafta, called in Syriac Agal, is a skein of camel's wool thread, about nine feet long, bound at distances of about twelve inches with silk and gold thread. It is wound round the kufia, forming a large turband, and is principally worn by the Anazeh.—*Hamilton's Sinai*, 183.

SHEKHAWATTI. This province extends about 80 miles from north to south, and less from east to west. It has the extensive dominions of the raja of Jeypore on the south, on the east the dependencies of the British Government, on the west the territories of Bikanir, and on the north-west it has the barren country of the Batti clan, formerly a plundering tribe, remarkable for carrying on their depredations on foot, and still more so for the length and rapidity of the incursions thus made. On the north is Hurriana, the scene of the exploits of George Thomas.—*Elphinstone's Caubul*, p. 3.

SHEK-U. CHIN. A mineral substance used in China as a dentifrice, also as a tisan in fevers. It is brought from the north of China, and is said to be gypsum or alabaster.—*Bennett.*

SHELL.

Sadaf,	ARAB.	Sipi,	HIND.
Ecaille,	FR.	Conchiglia,	IT.
Coquille,	,,	Cascara,	SP.
Schale,	GER.	Kabuk,	TURK.

The ordinary shell is the protective covering of the molluscous class of animals, in most cases large enough to enclose the whole body of the mollusc, but in some cases it is interior, and only of sufficient size to protect the heart and lungs. The snail affords a familiar instance of an external shell. Shells are called univalve or bivalve, according as they consist of one part, or of two parts joined together by a hinge. The snail is univalve, the oyster is bivalve. The generality of the bivalve shells, including various oysters, mussels, etc., are termed nacreous shells, from Nacre, the French for mother-of-pearl. The so-called shell of the tortoise is a horny covering, and it is obtained from Ceylon, the Eastern Archipelago, France, Trinidad, etc. The glistening lining of oyster shells, known as mother-of-pearl, is manufactured into articles of great beauty. Most of the univalve shells are of the character called porcelanous, from their brittleness, translucence, and the resemblance of their fracture to that of porcelain.

The trade in shells is one of extreme antiquity in Ceylon. The Gulf of Manaar has been fished from the earliest times for the large chank shell, Turbinella rapa, to be exported to India, where it

is sawn into rings, and worn as anklets and bracelets by the women of Hindustan, Dacca being the chief place of manufacture. Another use for those shells is their conversion into trumpets, which are sounded in the Hindu temples on all ritual occasions. A chank, in which the whorls, instead of running from left to right, as in the ordinary shells, are reversed, and run from right to left, is regarded with such reverence that a specimen formerly sold for its weight in gold, but one may now be had for £4 or £5. Abu Zaid, an Arab, who wrote an account of the trade and productions of India, speaks of these shells by the name they still bear, which he states to be Schenek. In general, shells are more prized for their beauty than valued for their rarity, though Argus cowries have been sold as high as four guineas a pair.

One of the principal sources whence the Ceylon supplies of shells are derived is the beautiful Bay of Venloos, to the north of Batticaloa, formed by the embouchure of the Natoor river. The scenery at this spot is enchanting.

Shells are used as a flux in the furnaces instead of lime, and along the coast, near Madras, the finest plaster is made from calcined shells. The Placuna placenta or window shell is still used as a substitute for glass.

The chanks and large ornamental shells imported into India are between 7 and 8 millions annually, valued from about two to four lakhs, and from 21 to over 28 million cwt. of cowries, valued about a lakh.

Shell middens occur at the mouth of one of the rivers of Perak.—*M'Nair*, p. 23 ; *Tomlinson ; J. Ind. Arch.*, 1847 ; *Tennent's Ceylon ; Cosmas Indicopleustes, in Thevenot*, i. p. 21.

SHELLAC or Shell-lac, Chapta-lac, Hind., is the most common form in which lac is generally known ; it is the substance liquefied, strained, and formed into thin transparent laminæ.—*Faulkner.*

SHEMSAQ, an inferior deity of the Kuki. A rude block of wood put up in every quarter of a village ; to it a goat is offered, and they place before it the heads of the slain in battle, or the heads of animals killed in the chase.

SHEN. Sansk., Tam. Meaning fine, beautiful, the Schöne of the Germans. It is applied in several ways. The Shen Tamil (Sen Damir) is that in which Tamil classical poetry is written, and differs considerably from what is termed Kodun Tamil, common Tamil, the spoken language of the people.

SHENDOO, a Burmese tribe, who call themselves Heu-ma, and dwell in the mountains north of Arakan. The Khyoung-tha, or children of the river, are of Arakanese origin, speak the old Arakan dialect, and conform to Buddhist customs. The Toung-tha, or children of the hills, are of mixed origin, if indeed they are not aborigines of the country. They speak numerous dialects, and worship the deities of the elements and spirits of the hills and streams. The Shendoo occupy the very remote mountainous country at the heads of the several rivers. They are said to comprise twelve powerful clans, whose habitations extend from the Blue Mountain to Cachar and Burma proper. They are much feared, but little or nothing is known respecting them. Captain Lewin describes them as much taller than ordinary hillmen, and of much fairer complexion ; and the faces of those he saw bore no signs of that Mongolian type of physiognomy which generally prevails amongst the Toung-tha tribes. Both males and females are more decorous in their dress than the other hill tribes, and field labour as a general rule is performed only by the men, and never by the women, excepting in the case of poverty. The Shendoo possess muskets which do not appear to be of European manufacture ; the stocks are painted red, black, and yellow, and are highly varnished. Their powder-flasks are made of gyal horns, and are polished and beautifully inlaid with silver and ivory. Captain Hughes, in charge of the Arakan hill tribes, writing in 1872, mentioned that they have no Ka-mi, or Koo-mee, or Quay-mee ; Koon, or Mru. The Shendoo tribe divides itself into five or six branches, who each speak a different dialect, the most powerful of whom are the Shaing Tee and Tna-krai-mi, the latter approaching Burma proper, Chyn or Khyn. Dr. Mason never before A.D. 1872 heard of the Tee and Tna-krai-mi, but thought it probable the names only are new.—*Dr. Mason in literis.*

SHENG-KWANG, a Chinese pupil of Ta-mo, the Indian patriarch Bodhidharma. At the town of Yu-hwang he is represented standing before Ta-mo, holding his own left arm in his right hand, which he had just cut off near the shoulder as a sign of his devotion and dominion over the body. This is said to have taken place in the 5th century. —*Dr. Edkin.*

SHEN-SI, one of the most extensive Chinese provinces, but the western part of it has been erected into a province under the name of Kan-su.

SHENSOY. The Parsees in India have two sects, the Shensoy and Kudmi, whose only dissimilarity arises from their different mode of computing, since 1746, the era of Yezdejird, which occasions a difference amongst the two sects as to the time of celebrating their festivals. The numbers of the Shensoy ten times exceed those of the Kudmi.

SHEORANEE HILLS, a little south of the Goomul river, stretch from the latitude of Dehra Ismail Khan, downwards to nearly the latitude of Dehra Futteh Khan, a distance of fifty miles. In these hills is the lofty square-shaped mountain, Takht-i-Suliman, which gives its name to the Sulimani range, running parallel for 300 miles to the Indus, and forming the western frontier of British India. At the base of this mountain runs the important Zerkunni pass, the high-road for caravans to and from Kandahar. The Sheorance tribe are of Pathan lineage, are of inferior stature to the Waziri ; they are warlike and predatory, and quite independent. The number of their fighting men has been set down at 10,000 ; but this is high. They can muster 1000 men within a day's notice ; in the course of three or four days they will muster 3000 more. They adjoin the British tracts of Tak (partially) in the north, then Kolachee, then Durrabund, and lastly Choudwau, —all in the Dehra Ismail Khan district, and forming the border plains of the Upper Dehrajat. With all the above tracts, the Sheorance, up to A.D. 1850, had been at feud.

SHEPHERD. Most of the nomade races of Asia are shepherds. The Israelites largely herded sheep. Moses herded the flock of his father-in-law Jethro, a priest of Midian. David tended his father's sheep. The chief shepherds of the S. of India are the Kurumbar race, their name being from Kuru, a sheep. Oree golla wanloo, Koraba galla wanloo,

Huude koraba wanloo, are divisions. In the Tamil country, shepherds are divided into many classes, as Manyakarar, Kuruku, Pavalangattee, Sambar, the Sival Idyar, etc. They are called Pillay and Kouar. The Dhangar shepherd race are a very numerous body. There are 55,947 Dhangar in the Berars, a quiet race, who wander in search of pasture for their herds and flocks, but often return to their settled homes on the plains or mountains. The temples in which they worship their deities are piles of large unhewn stones, resembling the places of worship of the old Druids. These people render great service to cultivators, who invite them with an offer of a reward to pen their flocks in their fields, so that they may leave behind them valuable manure. The founder of the Holkar family of Malwa sprang from this race. The shepherds of India have a custom, which is purely Asiatic, of preceding their flocks to pasture. 'He shall feed me in a green pasture, and lead me forth beside the waters of comfort,' said the Psalmist; and the daily custom of the shepherd tribe of Hindustan proves that this poetical and beautiful simile was drawn from the practice of common life. The Ahir of Northern India now rear cattle, though seemingly in former times shepherds. Near Benares there are sixteen clans. The Ahar of Moradabad and Rohilkhand seem identical with the Ahir. The Gadariya of Hindustan rear sheep and goats. The Rewari of the Rajputana oases rear camels.

SHEPHERD'S PURSE, Capsella Bursa Pastoris. Tsai-tsai, Ti-mi-tsai, CHIN. In China the plant is largely eaten as food by the poor. The root is used in ophthalmia.—*Smith.*

SHER. PERS. A lion, a tiger. The title Sherwa-Khurshid (lion and sun) was devised in 1808 by Fat'h Ali Shah, to decorate foreign envoys and Europeans who had rendered important service to Persia. It is never conferred on any Persian officials.

SHER AFKUN, a famous athlete. His victory over a tiger is a recorded fact in Moghul history. He lies buried in old Bardwan, far away from the place of his birth in Turkomania.—*Tr. of Hind.* i. p. 157.

SHER-DALA, in Hindu sculpture, conventional lions, the emblems of the Hoisala Bellala dynasty.

SHERIF. ARAB. Noble; in British India, a lineage social title of a Muhammadan whose father was a Shaikh and mother a Syudani; also the title of the ruler of Mecca. Hamilton, an old writer, describes the Sherif of Mecca of this day as having three slashes on each side of the face, called masha-ly, which though then falling into disuse, had been the mark of all persons born within the sacred territory. In his hand he carried the mashab, the camel-stick of almond-wood, which is undoubtedly the original of the jackal-headed wand with which some of the Egyptian deities are represented, and which is here almost regarded as the symbol of royal power. In his Kashmir waistband was stuck a poniard with a gold and jewel-studded handle.—*Hamilton, Sinai*, p. 116.

SHER KHAN, an Afghan who raised a large force in Bengal and drove the emperor Humayun from the throne. He reigned about five years, and was killed by the explosion of a magazine. He was an able soldier. He was succeeded by his son Selim, who reigned nine years.

SHERKI. ARAB. The east wind of Scripture. Rich notices an exclamation, 'The sherki is come!' As soon as this wind came on, the thermometer rose ten degrees, from 80° to 90°. The so-much-dreaded sherki seems to blow from any quarter from E. to N.E. It resembles the Italian sirocco, pronounced scirocco, and no doubt the same word as sherki, *i.e.* easterly. The Kurds calls it Baya Rish, or black wind.—*Rich's Kurdistan*, i. p. 125.

SHERKIST. HIND. A sort of manna found on the Hedysarum alhagi, one of the Leguminosæ, produced principally in Kābul. It occurs in unequal, dark-brown pieces, of a bitter-sweetish taste, and is mixed with the stalks of the plant on which it is produced. It is used by the natives as a laxative and refrigerant in fever, in doses of ℥j. It is imported into India from Kābul and Khorasan.

SHERKUN, a six-pointed diagram, for which the Brahmans have several mysterious names; but it is generally called sherkun, which means little else than six-pointed. If it have five points, it is also replete with mythological allusions; Siva and Brahma have, or had, five heads. The diagrams have also mathematical properties of a mysterious description; and they serve, like the fox and goose or solitaire boards, for a game, played with cowries or with dice, guiding the movements of the men. It is a popular game, and the instruments of play are always at hand; the lines drawn in the dust with the finger, and a few stones picked up, can furnish the means of gaming. Cowries being used as money, two or three of them are rarely wanting to a party disposed to play. The triangle is called trikun, which it literally means, and has been explained by a Brahman as the symbol of certain deities or powers, and the type of triune coequality; and hence applied by some to the three great deities conjointly. A point, called purm, represents the deity, having neither length nor breadth, self-existing, containing nothing. A circle is Brahm, eternity; having neither beginning nor end; unity, perfection.—*Moor*, p. 404.

SHERLEY. Three brothers of this name, Sir Thomas, Sir Anthony, and Sir Robert, who travelled in Persia, Russia, Turkey, and Spain, in the latter part of the 16th and beginning of the 17th centuries.

SHERRY, a wine, principally produced in the vicinity of Xeres in Spain, of a deep or light amber colour, and fine aromatic odour; its taste is warm, with some degree of the agreeable bitterness of the peach kernel. It is extensively used as a dinner wine.—*Faulkner.*

SHER SHAH. His tomb is on a square terrace in the middle of a large tank near Sasseram in Shahabad.

SHERWATTY, a river on the western side of India, in the Dharwar collectorate, which falls 1000 feet, near the village of Garsipa.

SHEVA GANGA, a large zamindari in the Madura district, 1460 square miles. It contains 2070 villages and 1265 hamlets. It formed part of the Ramnad chiefship until 1729.

SHEVAROY HILLS, Survarayar Malai, a hill range in Salem district, Madras, situated between lat. 11° 43′ and 11° 55′ N., and between long. 78° 13′ and 78° 24′ 30″ E., are a mass of densely-wooded flat-topped hills, the mean height being 4600 feet, and the highest peak 5260 feet. These hills are an irregular mass of mountains, separated by deep valleys. Their entire length from north

to south is about 17 miles, and their breadth 10 or 12 miles. The superficial area of the higher plateau has been estimated at 100 square miles. They form the northern boundary of the valley in which the town of Salem lies. The Shevaroyen or Green Mountain is about 5200 or 5300 feet of elevation. Yarkaud (Yerkadu) is the largest European settlement in the hills. It is situated on that portion of the plateau nearest to the town of Salem. The land in the valleys is under coffee cultivation.

SHIAH, Muhammadan sectarians. The only material point of faith in which the Shiah differ from the Sunni, is their belief that Ali, the companion, son-in-law, and cousin of Mahomed, ought to have immediately succeeded the prophet, instead of Abubakr, Omar, and Osman. They recognise twelve Imams, or heads of the faith, in Ali and his successors, of whom the twelfth Imam, Mahdi, is believed by one sect to be still alive, and expected to reappear. These are known as the Mahdawi. Another sect believe that Mahdi has appeared and gone, and are styled the Ghair-Mahdi. The Shiah sect are chiefly in Persia, a considerable number in Oudh and Hyderabad. The bigoted amongst them, on the 18th Zihaj, make three images of dough filled with honey, to represent Abubakr, Omar, and Osman, and stick knives into them. The Shiah Muhammadan often marry by the mita ceremony for a brief period.—*Wilson's Gloss.*

SHIBARGHAN, a town in Afghan Turkestan, 250 miles N.E. of Herat, and 60 miles W. of Balkh. It contains 12,000 souls, Uzbak and Parsivan. The people are brave. Across the Murghab, and towards Balkh, lie the small states of Andkhui, Maimuna, Shibarghan, Siripool, and Akchee. They have undergone various political changes, and have been described by Burnes, Pottinger, Ferrier, and Wheeler, and have latterly formed part of Afghan Turkestan. In A.D. 1830, all of them were engaged in the slave trade, and independent, though they sent presents of horses both to Herat and Bokhara.

All of these chiefships are situated in the plain country, which in general is well watered by rills or canals, and has an abundance of forage for camels and horses, which are numerous. The soil is dry, but there are many gardens near the towns. The style of building, from a scarcity of wood, is that of the beehive shape. There is a good open caravan road from Meshed to Balkh, which is a journey of sixteen days; thus, from Meshed to Shurukhs, four; to the Monghul, three; to Maimuna, four; and to Balkh in five days. This is much the nearest route to Kābul from the west.

Andkho or Andkhui, in 1840 was ruled by Shah Wali Khan, an Afghan Turk, who settled here,—others of his tribe in the time of Nadir. They were then of the Shiah sect, but are now Sunni. The 'il' of the chief, besides his own race, are Arabs. Wheat is here a triennial plant. Andkhui was the place where Moorcroft died. Akchee is a dependency of Balkh, 42 miles distant.

Maimuna is the most important of the whole; the chief in 1840 was Mirza Khan, an Uzbak of the tribe Wun, and his country extended from Maimuna to the Murghab, and adjoined that of Sher Muhammad Khan, Hazara. Maimuna itself is an open town, or rather village, of about 500 houses; but the strength of the chief consists in his 'il,' or moving population, who frequent Ulmur, Jaukira, Sorbagh, Kaffir-Killa, Khyrabad, Kusar, Chuckaktoo, Takht-i-Khatoon, and other sites, which can scarcely be called villages. He also numbers Arabs among his subjects, many of that tribe having been long settled here. Pop. 40,000.

Shibarghan is considered to be a very ancient place, being given to the days of the Kaffir (Greek), and it is still the strongest fort in these parts. The ark or citadel is built of brick and mortar, and surrounded by outer walls of mud. Kalik Ali Beg, a chief of Balkh, besieged it for seven years without success; but it must only be understood to be strong against Uzhaks, who are badly supplied with artillery. Water is conducted to it from the rivulet of Siripool.

Siripool.—In 1840, an Uzbak of the tribe of Auchmuelee governed Siripool. His 'il' were in Sungcharuk, Paogan, Goordewan, and Daghdrab. Siripool itself is as large as Maimuna.—*Burnes; East India Papers; MacGregor.*

SHIBWALA or Shivalai is the local name of the range separating the Dehra Doon from the plains east of the Jumna, and this has given the term Siwalik. It was in the Siwalik Hills that Captain (now General) Sir Proby T. Cautley, in the early part of the 19th century, discovered the presence of fossils; and the collections made by him and Dr. Falconer were described by the latter in the Fauna Antiqua Sivalensis and Palæontological Memoirs. The great fossiliferous deposit of the Siwaliks is near the valley of Markanda, westward of the Jumna, and below Nahun. By the joint labours of Captain Cautley and Dr. Falconer, and of Licutenants Baker and Durand, a sub-tropical mammalian fossil fauna was brought to light, unexampled for richness and extent in any other region then known.

SHIELD.

Daraq, Turs,	ARAB.	Tarbil, Dadap,	MALAY.
Dhal,	HIND.	Salukong,	,,
Tameng, Paris,	MALAY.	Siphar,	PERS.
Prisai, Otar-otar,	,,		

The use of the shield or buckler was universal over all the Malay and Philippine Archipelagos before the introduction of firearms, and is still continued by all the ruder tribes. There are seven different Malay names for its forms, four of which are native,—two taken from the Javanese, and one from the Telugu. Wherever the sword, the javelin, the spear, the bow and arrow, and blowpipe are used as weapons, the shield is still carried for protection.—*Crawfurd's Dict.* p. 379.

SHIGNAN, a hill state on the right bank of the river Amu, to the N. of Darwaz. Inhabited by the Galcha, who are Shiahs. Like all the Tajak, they speak an old form of Persian. Population, 300.—*Trotter, C. As.*

SHIGRI, a river of Spiti in the N.W. Himalaya, with a great glacier, which about A.D. 1830 burst, and a vast inundation ensued, destroying much life and property. See Glacier.

SHIHIYYIN, a tribe occupying Amsandam Islands (lat. 26° 22′ 30″ N.). They profess Muhammadanism, but are grossly ignorant and regardless of its forms. The tribe also possess the country, with five towns, from Cape Musseldom to Ramse, a pirate port. The more civilised part of the tribe are engaged in the pearl fishery, in trade and agriculture, and as fishermen; their pearl fishery being worth 3000 tomans yearly. The tribe have

14,000 men, and they are the constant enemies of the Joasmi. Near Amsandam Island is Khasab Bay, occupied by fishermen who are said to be descendants of the Portuguese.

SHIKAR. Hind., Pers. Game, prey, field-sports. Shikargah, or hunting-places, Bela, as the Sindians call them, formed a peculiar feature in the face of Sind. The Talpur Amirs of Sind calculated that every head of deer killed cost them £80, and this is no exaggeration, duly estimating the loss of revenue occasioned by converting valuable land into hunting forests. They were entangled thickets of tamarisk and babul, extending for three miles along the river-side, and a mile deep, and were numerous below Sehwan.

The Shikari (huntsmen), or Dapher race of Sind, are, if possible, an even more degraded race than the Bale-Shahi. Their second name is probably derived from the dapho, a broad-headed javelin with a shaft six or seven feet long, their favourite weapon. The Shikari are neither Muhammadans nor Hindus. They were numerous about Amerkot and the Thur, where they subsist by manual labour, agriculture, and hunting. In these regions there is something remarkably wild and savage in their appearance. The only garment worn is a cloth round the waist, except in winter, when a tattered blanket preserves them from the cold. Armed with his usual weapons, the Shikari generally seeks the wildest part of the country, where he can find the greatest number of hogs, jackals, lynxes, and a kind of lizard called Giloi.—*Burton's Scinde.*

SHIKARI. Hind. A hunter, a sportsman. In the centre of the Peninsula of India is a hunter race who style themselves Bhowri, but are known as Hirn Shikari and Hirn Pardi.

SHIKARPUR, a town in Upper Sind, in lat. 27° 57′ 14″ N., and long. 68° 40′ 26″ E., 20 miles due W. of the Indus, connected by good roads with Jacobabad, from which it is distant 26 miles south-east. It gives its name to a revenue district lying between lat. 27° and 29° N., and between long. 67° and 70° E. Area, 8813 square miles; pop. (1872), 776,227. Shikarpur is a great central entrepot, trading with Central Asia, Afghanistan, and Bokhara. Its Hindu merchants have the whole commerce of Central Asia in their hands, through an extensive agency. It is especially the home of these bankers, where their families are fixed, and where are detained those of the gomastah or agents located in foreign countries. Shikarpur, no doubt, attained its high rank under the Durani monarchy of Afghanistan, and much of the prosperity of its bankers was due to the vicious operations of that dynasty. Between the domain of Shikarpur and Baluchistan stretches a barren, naked tract, known as the 'pat' of Shikarpur. It is between 30 and 40 miles across. Not a tree or shrub vegetates on this expanse.

SHIKHOE. Burm. A Burmese obeisance. The shikhoe consists in the Burman squatting on the ground and at the same time raising his clasped hands, with fingers extended, to his forehead two or three times, while he simultaneously bends his body forward. This is the customary Burmese mode of addressing a superior, and the monks or phoungyes are always approached in this fashion.—*Yule*, p. 82.

SHI KING, the sacred books of the Chinese, were translated into Latin by Father Lachartre, a Jesuit missionary of China.

SHILLONG, mountain range in the Khassya and Jaintia Hills district, Assam, overlooking the station of the same name, situated in lat. 25° 32′ 39″ N., and long. 91° 55′ 32″ E., on a table-land 4900 feet above sea-level, and 67 miles south by road from Gauhati (Gowhatty). It is a fine open station, with a view of the snowy Himalayan range.

SHIMBEAMS, in Madras, are planks 20 to 30 feet long, 3 inches to 2 feet in breadth, and from 4 to 8 inches thick.

SHIMOGA, the chief town of a district forming the north-western portion of the Nuggur division of Mysore, lying between lat. 13° 30′ and 14° 38′ N., and between long. 74° 44′ and 76° 5′ E.; area, 3797 square miles. Of its population, the Wokliga (56,584) are agricultural labourers; Idiga (49,987), who are toddy-drawers; and Sadars (44,881), cultivators. The Lingaets, who have always been influential in this part of the country, number 52,701. Out-castes are returned at 60,358; wandering tribes, 18,001; wild tribes, 5558.—*Imp. Gaz.*

SHIMR, a native of Sham or Syria, the murderer of the Imam Husain, son of Ali. His name is held in detestation.

SHINA. Pushtu. Shirna, Hind. An inflated hide of the ox or goat, closed by a wooden plug, commonly used on the Indus for crossing rivers. Two are usually lashed together. The rider strides across them, passes each leg through a loop of strapping hanging like a stirrup on each side, and, holding each vent-plug in either hand, and then plunges out into the foaming torrent, paddling with arms and legs as in the act of swimming. Much dexterity and skill are required to prevent a capsize.

SHIN-BUNG, a deity of the Chinese, in honour of whom they hold an agricultural festival.

SHINGLE, a long, flat board of wood, used for roofing houses.

SHING WONG, a Chinese deity, the protector of walled cities. He is worshipped annually on the second day of the year; but his great festival is on his birthday, on the 24th day of the 7th month.—*Gray*, p. 150.

SHIN-NUNG, a mythical emperor of China, who, the people believe, instituted agriculture.

SHINTIYAN is the common sword-blade of the Bedouins; in Western Arabia it is called Major (from the Magyras?), and is said to be of German manufacture. Good old weapons of the proper curve, marked like Andrew Feraras with a certain number of lines down their length, will fetch, even in Arabia, from £7 to £8. The modern and cheap ones cost about 10s.—*Burton's Mecca*, i. p. 365.

SHINWARI, an Afghan tribe; besides their portion of the hills, have the lands immediately west of them, and some of the valleys of the Safed Koh range. More westerly still, under the same hill range, they are found south of Jalalabad, and are the neighbours of the Khogani. They are highly predatory.

SHIP.

Safika, Markib,	Arab.	Vascello,	It.
Grab, Zoraq, Kosal,	,,	Navis,	Lat.
Navire, Vaisseau,	Fr.	Jahaz, Kishti,	Pers.
Schiff,	Ger.	Nave, Navio, Bazel,	Sp.
Nao, Jahaz,	Hind.	Buque,	,,
Nave, Naviglio,	It.	Ghemi, Tekne,	Turk.

Notices of the various kinds of ships will be found under the head of Boats. On the eastern side of the Peninsula of India, the ship is built with her keel parallel to the shore, and, as it may happen, from 200 to 300 feet from low-water mark. When completed, she is placed on two strong pieces of timber, called dogs (in the nature of a sledge of enormous dimensions), and on these a sort of moveable cradle is constructed to keep the vessel upright. Two long palmyra trees, a lever of the second kind, are then applied to the ends of the dogs, and by means of these powers, they, together with the vessel that rests on them, are gradually pushed forward over a platform of logs until they arrive at the lowest pitch of low water, or as far beyond it as the levers can be used. Tackles are applied to the ends of the levers to increase the power; the fulcrums are wreaths of rope, fastened to the logs on which the vessel slides, and are removed forwards as she advances. Two cables from the land side are fastened to the vessel to prevent her from sliding too rapidly, and these are gradually let out as she advances. It is commonly the work of two days to transport the vessel to the margin of low water. If the tide does not rise high enough to float her from thence (which it seldom does if the vessel be of any considerable burden), part of the cradle is taken away, and the ship left chiefly to the support of the cradles till high water, when they are suddenly let go, and the vessel falls on her side, and with the fall disengages herself from the remains of the cradle, and at the same time plunges into deeper water. A ship of 500 tons has been launched in this manner. — *Rennell's Memoir*, p. 245.

SHIRAR, the inspissated juice of grapes.

SHIRAZ, the capital of the province of Fars, was founded A.D. 622. It was taken by Timur A.D. 1380. It is in lat. 29° 37′ 56″ N., and long. 52° 40′ 22″ E.; is 4850 feet above the sea, in the centre of a plain 25 miles long and 10 or 12 miles broad, amidst mountains. It has a low wall of mud and six gates, surrounded by gardens, some of them, as the Jahan Numa, beautiful. It has 7780 houses. The tomb of the poet Hafiz is in a garden 1½ miles from the city. The climate is agreeable, but not favourable to Europeans in the summer months. The tomb of Sadi stands by itself in a recess, but that of Hafiz requires to be pointed out from a multitude of others around it. The wine of Shiraz is a fine, powerful, dry wine, not so dark as brown sherry. Near the Jahan Numa in Shiraz is a building called Chahal Tan, 'the forty bodies or persons.' Another, the Haft Tan, or 'seven persons,' so named from the number of holy men there buried. At Shiraz, Hassa, and in India, African slaves are distinguished by flowery names or epithets, expressing beauty and fragrance, in proportion to their natural ugliness or offensive smell, — as Yasmin, the jasmine; Sumbul, the hyacinth; Jauhar, the jewel; and Makbul, the pleasing or agreeable.— *Vigne; Ouseley's Tr.; Morier; Fraser; Chesney; Abbott; Rich; Henell; Taylor; Clerk; Pelly; Kinneir.*

SHIRHAWTI RIVER falls into the Arabian Sea; at its embouchure it is about 400 yards in width, and in the rainy season some 30 feet in depth. This immense body of water rushes down a rocky slope for 300 feet at an angle of 45°, at the bottom of which it makes a perpendicular plunge of 850 feet into a black and dismal abyss, with noise like the loudest thunder. The whole descent is therefore 1150 feet, or several times that of Niagara, but the volume of water in the latter is somewhat larger than in the former.

SHIR KHISHT. HIND. Manna from Fraxinus, *sp.* Khorasan manna, from Khorasan, is supposed to be the produce from an olive.

SHIRNA. HIND. Shinaz, PUSHTU. The inflated large buffalo or bullock skin used for crossing streams in the Himalaya hills. In Kashmir these large skins are not used, but small ones tied two together. See Shina.

SHIRWAN, in lat. 38° 31′ to 40° 44′ N., a province of Georgia, about 135 miles long and 20 to 40 miles broad, with an area of 10,386 square miles. It was the finest province of Persia, but was ceded to Russia in 1724, and again in 1826. Its people are Armenians, Muhammadans, and Tartars.—*MacGregor.*

SHIRZY RAO GHATGAY, a Mahratta leader and minister of great notoriety. He was the father of Baiza Bai, who married Dowlat Rao Sindia.

SHISHAK. According to Professor Duncker, the first fixed starting-point in Egyptian chronology is the invasion of Palestine by Shishak, who appears as Sesonchis, the first king of the 22d dynasty of Manetho, and whose reign in his lists begins in the year B.C. 934. But according to the Hebrew chronology this date would be too late by perhaps a generation. In his belief, five centuries had passed from the expulsion of the Hyksos before Shishak began to reign. If we allow, as he thinks we ought to allow, another five centuries for the occupation of these nomadic intruders, the end of the old monarchy will be synchronous with the beginning of the second millennium B.C. Calculations of a like kind would lead to the conclusion that the pyramids of Memphis were built about B.C. 2500; nor can a less period than that of five more centuries be allowed for the growth of a civilisation which should render the erection of such stupendous monuments possible. In support of this conclusion, we have the indubitable fact 'that the oldest monuments of Egypt—and they are also the oldest in the world—exhibit the Egyptians in possession of the art of writing;' and when we remember that all writing must proceed from pictures, we may well be staggered at the length of time which must pass while the first actual imitative drawings were being rubbed down until they were reduced to a form approaching that of mere phonetic characters.

SHITTIM TREE, mentioned by Isaiah and also in Exodus, is supposed to have been an acacia. Hippocrates speaks of the Egyptian acacia and of the white acacia, distinguished, he says, by its white bark, white wood, and white flowers; and from this tree his 'white fragrant ointment' was probably made.

SHIVE-u-DOUNG, a great mass of mountains which runs parallel to the Irawadi as far as Amarapura; one peak is estimated to be 6000 feet in height.

SHOA. In 1840, Sahela Selassie, king of Shoa, in Southern Abyssinia, expressed a desire to cultivate the friendship of the British Government, and wrote to the Government of Bombay

asking to be furnished with guns and warlike stores. Shoa was then one of the most powerful and important provinces in Abyssinia. It is inhabited by the Galla tribe. At the time when Sahela Selassie made these advances, the steam navigation of the Red Sea had given an exaggerated importance to the tribes of Abyssinia, and a mission was sent to Shoa, with which country the French also appeared anxious to establish friendly connections. A commercial treaty was concluded with the king on 15th November 1841. —*Treaties*, vii. p. 310.

SHOES.

Kasut, Sapatu, .	Malay.		

The sandal was doubtless the foot-clothing of all ancient times, and the flinging of one on a territory was a symbol of taking possession. The Psalmist says, 'Upon the land of Edom do I cast my shoe.' In Ireland, after the chief took the white rod, the sub-chieftain placed sandals on his chief's feet, retained one as an honourable perquisite, and threw the other over his chief's head as an augury of good luck. The sandal is still worn by the Hindu and Muhammadan nations in the south of Asia. Shoes, as articles of covering for the feet, are generally made of leather, but cloth of kinds is also used, and in the Panjab Himalaya, straw and grass. The shoes, or rather slippers, worn by the natives of Southern India are generally of red leather if for men. The patterns are called Appa-shahee, Chandduru, Chappal, and Nokdar. The rich natives use a buff-coloured cloth. The slippers of females are ornamented with spangles. Their price is from four annas to a rupee. Thunberg says that in his time the shoes of Japan were always the shabbiest part of the dress of the Japanese, and being of straw they lasted but a little time. But they were made in immense numbers, and cost but a trifle. Dignitaries sometimes wore slippers made of fine rattan slips neatly plaited. In Exodus iii. 5, the Lord commanded Moses, saying, 'Put off thy shoes from off thy feet; for the place whereon thou standest is holy ground.' The natives of British India never go into their own houses, nor into the houses of others, with their shoes on, but always leave them at the door. It is a great affront not to attend to this mark of respect in visiting; and to enter a temple, mosque, or kyoung without pulling off the shoes would be an unpardonable offence. A shoe-bearer is a very humble office; and in Matthew iii. 11, John says of Christ, 'He that cometh after me is mightier than I, whose shoes I am not worthy to bear.' Luke xv. 22 says, 'And put shoes on his feet.' In Bengal, shoes of a superior quality make one of the distinguishing parts of a person's dress. Some of these shoes cost as much as a hundred rupees a pair, but are put off the feet before entering a room.—*Faulkner; Herklots; American Expedition to Japan*, p. 65; *Thunberg*.

SHO-GUN or Tycoon, in Japan, until the revolution of 1868, was the chief noble of the Mikado, and was called by foreigners the Temporal Emperor. The full title was Sei-i-Tai Sho-gun, *i.e.* barbarian-quelling generalissimo, and it was bestowed by the Mikado on his son Ya-ma-to Da-ke-no-mi-ka-to, who B.C. 86 conquered the aborigines of the N. and W. of the main island. The first hereditary Sho-gun was Mi-no-mo-to Yo-ri-to-mo, A.D. 1190. The greatest of all the Sho-gun was Iye-ya-su, the founder of the To-ku-ga-wa dynasty of the 17th century. The last of these temporal sovereigns was Kei-ki, who was set aside in 1868, when the Mikado assumed direct rule, and he was still living at Shid-zu-o-ka in A.D. 1883.

SHO-JIN. Chin. Pigmies, fabulous beings.

SHOLA or Sola, Hind., is the root of the Æschynomene aspera. It is made into toys, artificial flowers, birds, garlands, floats for nets, or in bundles for crossing rivers. When charred it answers for tinder. Phool-sola or Bhendi is *Æ. aspera*, *Æ. Roxburghii* is the Bhat-sola, *Æ. paludosa* is the Kat-sola. The skill of the Indian carver is conspicuously shown in the beauty of the figures and buildings in the pith-like *Æ. aspera*.

SHOLA, in the S. of Peninsular India, a grove, a copse, a small forest in a valley or on the slope of the hills; in Wynad, a ravine filled with tree thickets. The whole of the sholas or woods in the reserved woods at the neighbourhood of the Ootacamund station are absolutely reserved, not only for their beauty, but also from fear of injuring the water-springs. Their limits are marked; no private cutters are allowed inside; old trees to be felled are brought outside, and sold by public auction. Trees to be planted where required in vacant places.—*Madras Conservator of Forests*, 1859-60.

SHOLAGUR, a hill race who lived in the jungles of the Kollegol taluk of Coimbatore.

SHOLAPUR, a town and fortress in the Dekhan part of the Bombay Presidency. It is in lat. 17° 40′ 18″ N., and long. 75° 56′ 38″ E., in the valley of Seena river; and the surrounding lands have been formed into a revenue district, with an area of 3925 square miles, and a population in 1872 of 662,986 souls, that of the town being 53,403. The people are largely Mahrattas, and on its east, south, and west are the estates of the Akalkot, Patwardhan, Phaltan, and Panth Pratinadhi chiefs. In 1818, on the downfall of the Peshwa, it fell to the British. In 1877 it suffered from famine.

SHOLASAGAMANY. Fine rubies have from time to time been discovered in many of the corundum localities, particularly in the gneiss at Viralimodos and Sholasigamany; also in the Trichingode taluk, and at Mallapollye, but are, comparatively speaking, rare.

SHOMIYO, in Japan, a territorial noble, with an annual revenue of less than 10,000 koku of rice. The words mean small name.

SHOOAY-DAGON, a great Buddhist pagoda at Rangoon in Burma, and the most venerated object of worship in all the Indo-Chinese countries. It is in lat. 16° 46′ 40″ N., and long. 96° 13′ 50″ E., and stands upon a mound, partly natural and in part artificial, in the angle formed by the junction of the Rangoon and Pegu rivers. This mound has been cut into two terraces, the upper of which is 166 feet above the level of the ground, and 900 feet long by 685 wide. On the east side is a bell, 7 feet 7½ inches in diameter at the mouth, which was presented by Bhodaw Bhura. The legend concerning its erection assigns it to the year 588 B.C. The pagoda has been several times

added to and regilt,—the last time in 1871, when, with the sanction of the British Government, the king of Burma sent a new H'tee from Mandalay, valued at £62,000. The name Shooay-dagon is derived from the Talaing word Takun, meaning a tree or log lying athwart, which has been corrupted in Burmese into Dagon or Dagun. The Burmese word Shooay or Shwe means golden. The hill on which it stands has been strongly fortified. It is said to contain relics of all the four Buddhas of the present kalpa (Buddha-gabba), viz. the staff of Kakusanda, the water-dipper of Konagamma, the bathing garment of Kasyapa, and eight hairs from the head of Sakya Sinha, Gautama Buddha.—*Hough's Great Bell at Rangoon; Imp. Gaz.*

SHOOAY-GYENG, the chief town and headquarters of Shooay-gyen district, Tenasserim division, British Burma, in lat. 17° 55′ N., and long. 96° 57′ 30″ E., on the left bank of the Sitang (Tsit-toung) river. The Poung-loung range, at the Tsik-le Hill, opposite Shooay-gyeng, attains a height of about 4000 feet, and terminates above Keng-rwa in Ke-la-tha, a peak crowned by a conspicuous pagoda. The Sitang river rises in Independent Burma. It enters Shooay-gyeng at its northern end, and, after an exceedingly tortuous course, falls into the Gulf of Martaban by a funnel-shaped mouth seven or eight miles wide, up which the spring-tides rush with great violence. A chopping sea follows the rolling crest of the bore, and sometimes wrecks a boat in a few minutes. The population in 1872 was 129,485. Karens, 43,475; Burmese, 41,562; Talaing, 35,401; Toungthu, 4887; Shans, 3189; Muhammadans, 421; Hindus, 291; Chinese, 157. The Karens are most numerous in the tract east of the Sitang, and belong to two great families, Sgaw and Pwo. Many of them have been converted to Christianity by the American Baptist missionaries. The Talaings chiefly inhabit the plains; the Burmese, the country lying north of the Sitang. The Yabaings, who are engaged in the rearing of silk-worms, are found mainly on the eastern slopes of the Pegu Yomas in Bhawni.

SHOOAY-HMAW-DAW, literally golden great god, a pagoda in the old fortified town of Pegu, Rangoon district, British Burma. It is a pyramidal, solid brick building, rising to a height of 234 feet from an octagonal base, each side of which is 162 feet long. It stands upon two terraces, the lower one being a parallelogram, with its sides 1390 feet long. The pagoda is surrounded by two tiers of smaller temples; the lower tier contains 75, and the upper 53. Shooay-hmaw-daw, in common with most of the sacred edifices in Burma, is connected with a visit of Gautama, though there can be no doubt that he never came so far as Burma. In June 1852, on the outbreak of the second Burmese war, the pagoda was the scene of some sharp fighting previous to the capture of the town of Pegu by the British.—*Imp. Gaz.*

SHOOAY-TSHAN-DAW, a pagoda in Prome town, Prome district, Pegu division, British Burma. It is situated on a hill about half a mile from the bank of the Irawadi, and gives its name to a quarter of the town. The building is gilt all over, and is solid. Its height is 180 feet, and it occupies an area of 11,025 square feet. It is surrounded by 83 small gilt niches, called Zedi-yan, each containing an image of Gautama. Tradition alleges that when Gautama arrived near Prome, and was walking on the island of Zengyan, he was accosted by a naga or dragon, who begged for some sacred hairs to enshrine in a temple.—*Imp. Gaz.*

SHOONDOAH is a tiny ship which Hindus launch on the Ganges, ornamented with garlands of flowers, and illuminated with lamps. It is a ceremony performed by Hindu mothers to propitiate the goddess in behalf of their sons. The goddess resembles Amphitrite. It is supposed to be a propitiatory rite handed down from times when the Hindus were engaged in maritime avocations. It is held on the day on which, according to Hindu astronomy, the sun turns back from Capricornus to resume his northern ascension, and when the steady N.W. wind blows favourably for outward bound voyages. Feastings are held on that day, and farewell entertainments are given to the voyagers.

SHORABAK lies due east of Seistan, on the banks of the Lora, and is occupied by the Baraich Afghans, great camel-breeders, and acknowledging the supremacy of the amir of Kābul.

SHORAPUR, a tributary state of the Nizam, situated on the south-west corner of the Hyderabad territory. Its chief and their people are of the Beder race, parties of whom are scattered southwards into Mysore, and eastwards into Bellary. Their race name is the source of the word Pindara.—*Imp. Gaz.* viii.

SHORE, Sir JOHN, afterwards Lord Teignmouth. He arrived in Calcutta on the (12?) 14th September 1786, along with Lord Cornwallis. He succeeded Lord Cornwallis as Governor-General on the 28th October 1793, and retained the office till he embarked for England on the 12th March 1798. On the death of Sir William Jones he was nominated President of the Royal Asiatic Society of Bengal. He wrote an account of Nepal in the Bengal Asiatic Researches.

SHOREA, a genus of plants of the order Dipterocarpeæ, which many botanists arrange under the genus Vatica, *q.v.* The species named are Assamica, floribunda, gratissima, laccifera, obtusa, robusta, Siamensis, stellata, talura, and tumbuggaia. S. robusta is the sal tree; S. laccifera, *Heyne*, is a timber tree of Madura; S. obtusa, *Wallich*, is of Prome; and S. stipularis, *Thw.*, is a great tree of Ceylon, between Ratnapura and Galle.—*Thw.* i. p. 36.

SHORTT. Deputy Surgeon-General John Shortt, a Madras medical officer, a voluminous writer, and original investigator; author of a Report on the Medical Topography of the South-West Political Districts, 1853; Essay on Indigo, 1860, for which he received from Government a prize of Rs. 800; Essay on Cotton Culture, prize Rs. 1000, and gold medal from the Manchester Cotton Supply Association; Handbook to Coffee Planting, 1864; Treatise on Vaccination, 1865-66, translated into Canarese, Hindustani, Tamil, Telugu, Uriya; on the Hill Ranges of S. India. He wrote also on the Medical History of Women, 1864; on the Leaf-Wearing Rite; and on the Hanging Festivals of the Hindus.

SHOTRIANDAR. Tam. A person holding land on easy rent, or for a number of lives; generally as a reward to Brahmans only for public services; also written Shrotriyandar.

SHOUNG, a tributary of the Sitang, on the northern boundary of Tounghoo. It is occupied by a tribe who call themselves Shoun-khi-pho, or sons of the headwaters of Shoung.—*Mason*, *Burma*, p. 92.

SHOWERS OF FISH. Prinsep on, Journal, 1833, p. 34: Grant on, Trans. of Civil Engineers; Naut. Mag. 1838; Bombay Times, 1840, p. 652. Showers of Blood in Kandesh in 1828, Rep. Brit. As. 1839. Showers of Grain, Ibid. Showers of Pearls, Bombay Times, Jan. 1847. Showers of Sand in China, Dr. MacGowan, in Chinese Rep. Bl. As. Trans., 1851, p. 172. See Sand.

SHRADDHA, Sansk., from Shraddha, firm faith. It is the Latin Credo and English Creed. The Shraddha is a Hindu ceremonial for the repose of the dead. The oblation consists of rice, flowers, water to the manes of the deceased. There are three shraddha for the dead,—one eleven days after death, another every month, and another at the close of the year after a person's decease. During the ten days of mourning the relations hold a family council, and consult on the means of performing the shraddha. On the last of these days, after making an offering for the dead by the side of the river, they are shaved. This offering consists of boiled rice, sugar, curds, sweetmeats, milk, plantains, etc., made into ten balls, and presented with prayers. Menu says, 'What sort of oblation given duly to the manes is capable of satisfying them for a long time, or for eternity, I will now declare, without omission. Brahmans are unclean for ten days after the death of a relation; Kshatriyas, twelve; Vaisyas, fifteen; and Sudras, thirty.' The next day, after bathing, the family prepare an open place for the ceremonies. If it be the shraddha of a rich man, all the learned Hindus and respectable people of the neighbouring villages are invited. The company being seated under an awning, the sons and other relations of the deceased, dressed in new garments, place themselves in the midst of the company with their faces eastward, having near them sixteen different gifts, as brass cups, candlesticks, umbrellas, shoes, etc. Next are brought seeds of sesamum, a small piece of gold, and another of a different metal, wrapped up in new cloths. The son of the deceased now puts a piece of new cloth across his neck, and offers an atonement for the sin of having killed insects, in sweeping the room, in cooking, grinding spices, and in moving the water jar; then follows an offering to the sun; then, rising and bringing his hands forward in a supplicating posture, he solicits leave from the company to make the offering, after which he offers the sesamum, gold, and metal for the happiness of the deceased; takes the kosha, and sprinkles the sixteen gifts with water; then, placing a flower on each, and repeating prayers, he offers them in the presence of the shalgrama or saligrama, one by one, in the name of the deceased, that he may obtain heaven. The son after this, if in circumstances sufficiently affluent, presents large gifts to the Brahmans, as elephants, horses, palanquins, boats, etc., the receiving of which, however, is not honourable. A Brahman then marks the foreheads of all present with sandal powder, and puts round the neck of each a garland of flowers. To the Ugrudanee Brahmans and others are now given, amidst much confusion among the receivers, the sesamum, the morsel of gold, the metal, a large basin full of cowries, and a conch or two, as well as the sixteen different gifts; after which the assembly breaks up. The son then goes into the house, and, placing a Brahman and his wife on a seat, covers them with ornaments, worships them, and, adding a large present of money, dismisses them. After this the son of the deceased requests five Brahmans, of some note for learning, to offer a male calf; in doing which they take two cloths each, four poita, four betel-nuts, and some cowries provided for the purpose, and go with the company to a spot where an altar has been prepared, one cubit high and four cubits square. Four of the Brahmans sit on the four sides of the altar, and then worship certain gods, and offer a burnt sacrifice. Near the altar are placed the saligrama, four female calves, a male calf, and a vilva post. The fifth Brahman reads certain parts of a Purana, to drive away evil spirits. The female calves are tied to four vilva posts, and the male calf to a vrisha post. To the necks of the female calves four small slender baskets are suspended, in which are placed, among other things, a comb, and the iron stilette with which the Hindu women paint their eyebrows black. A sheet of metal is placed under the belly of the male calf; on the back a sheet of copper; the hoofs are covered with silver, and the horns with gold, if the shraddha be performed by a rich man. On the hips of the male calf marks of Siva's trident are impressed with a hot iron. After this the son of the deceased washes the tail of the male calf, and with the same water presents a drink-offering to his deceased ancestors, and afterwards marries the male calf to the four female calves, repeating many formulas, in which they are recommended to cultivate love and mutual sympathy. The son next liberates the female calves, forbidding any one to detain them, or partake of their milk in future. In liberating the male calf, he says, 'I have given thee these four wives to live with them. Thou art the living image of Yama; thou goest upon four legs. Devour not the corn of others, go not near a cow in calf,' etc. The female calves are generally taken by Brahmans; the male calf is let loose, to go where he pleases. To this succeeds what is peculiarly termed the shraddha. The river side, or the cow-house, or some retired place, is chosen; after cleansing which, they collect all kinds of eatables, cloth, sesamum, flowers, etc., and place them into dishes made of the excavated trunks of the plantain tree. The son then washes his feet, and sits with his face towards the east, with a saligrama before him, and repeats many prayers to purify himself. He then worships the saligrama, presents to his deceased parent the seven dishes placed to the east, repeating various prayers, and worships Ganga, Vishnu, and the household gods, adding an offering to the ancestors of the king as an acknowledgment for using the king's land at worship.

SHRAVAN or Purnima, a Hindu feast which occurs about the middle of August, on the 15th of Shravan Shukla. It is attended, on the western coast of India, about Bombay, with much ceremonial. The S.W. monsoon is supposed to be ended. Cocoanuts and flowers are thrown into the sea to obtain favour for those who are to trust themselves on the ocean.

SHRAVAN-BELGOLA, meaning tank of the Shravans or Jains, is a village in the Hasan district, Mysore; situated in lat. 12° 51′ 10″ N., and long. 76° 31′ 31″ E., between two rocky hills called Chandra-betta and Indra-betta. Population (1871), 1697. On the summit of Chandra-betta stands a colossal statue of Gomateswara, 60 feet high, surrounded by numerous buildings. The hill itself is 3250 feet above sea-level. An inscription on the foot of the statue states that it was erected by Chamunda Raya, whom tradition places about B.C. 60. The statue is nude, and stands facing the north. The face has the serene expression usually seen in Buddhist statues; the hair is curled in short spiral ringlets over the head, while the ears are long and large. The statue must either have been cut out of a rock which projected above the hill, or the solid summit of the hill may have been itself cut away. The workmanship is still as sharp as if the stone had been newly quarried. Within the enclosure are 72 small statues of a similar description in compartments.—*Imp. Gaz.*

SHRIKES, the popular name of birds of the family Laniadæ, which Jerdon arranges as under:

Fam. Laniadæ, shrikes.
Gen. Lanius, 11 species.
Sub-Fam. Malaconotinæ, wood shrikes.
Gen. Tephrodornis, 6 species.
Gen. Hemipus, 1 species.
Sub-Fam. Campephaginæ, cuckoo shrikes.
Gen. Volvocivora, 2 species.
Gen. Graucalus, 1 species.
Gen. Pericrocotus, 7 species, red shrikes or minivets.
Sub-Fam. Dicrurinæ, Drongo shrikes.
Gen. Dicrurus, 4 species.
Gen. Chaptia, 2 species.
Gen. Bhringa, 1 species.
Gen. Edolius, 2 species.
Gen. Chibia, 1 species.
Sub-Fam. Artaminæ, swallow shrikes.
Gen. Artamus.

The grey wood-shrike is Tephrodornis Pondiceriana. The bay-backed shrike, Lanius Hardwickii.

SHRIMPS.

Burghut-ul-Bahr,	Arab.	Squilla,	It.
Reie,	Dan.	Camarao,	Port.
Garnaal,	Dut.	Morskoi ratshok,	Rus.
Chevrette,	Fr.	Camaron,	Sp.
Garnele,	Ger.	Raka,	Sw.
Jinghi,	Hind.		

Shrimps, in natural history, are classed as macrourous decapodous crustacea, of the families Alpheadæ, Crangonidæ, Pontoniæ, comprising the genera acetes, alpheus, crangon, palemon, rhynchocinetes, sergestes, stenopus, etc., *q.v.*

Acetes, *Milne-Edwards*, shrimps analogous to sergestes in its confirmation, but placed at a distance from all the animals of the same order by the absence of the last two pairs of feet. A. Indicus.

Alpheadæ shrimps are stouter in their forms than those of the Palemonidæ, but they are not depressed as the Crangonidæ are; the genera are atya, hymenocera, alpheus, pontonia, antonomea, curidina, nika, and atkanus.

Alpheus, *Fabr.*, the carapace is advanced above the eyes, forming above each of those organs a small vaulted buckler. Some species are found in the Mediterranean, but the greater part in the seas of the Antilles, or in the Indian Ocean.

The type of the Crangonidæ family is the common shrimp, Crangon vulgaris, and no other genera are included in it. The common shrimp has the carapace and abdomen almost entirely smooth, with the exception of one small median spine on the stomachal region.

Some species of alpheus, a genus of snapping shrimps, occur in China and Singapore. The shield shrimp is a species of the genus apus, one of the Apodidæ.

Palemon shrimps are a useful and delicious genus, and are very numerous. P. carcinus of the Indian seas and the Ganges is nearly a foot long.

Shrimps are largely caught in China in baskets, which are baited with wine lees. The baskets are lowered from a boat to the bottom, and after a short time are hauled up and their contents emptied. They are eaten alive by Chinese epicures. They are served up for the table in a vessel which contains yellow wine, strong vinegar, and sesamum oil, and as they leap about vigorously, are eaten.—*Adams; Gray.* See Crustacea.

SHROFF, properly Siraf, from an Arabic word relating to expenditure. He is a financier, a banker, a dealer in money and exchanges; and may be a Rajput, a Brahman, a Kshatriya, a Vaisya, or a Sudra. He discounts hundi or bills of exchange, bonds, promissory notes; deals in bullion, buys and sells ornaments, jewels, gems of all kinds; lends money on pledges and other security. He makes advances on produce, enters into contracts for supplies. Their account-books are kept by double entry, a day-book and ledger.

SHROTRIYA. Sansk. From Shroota, the Veda, a learned Brahman. A Kulin Brahman can marry as many wives as he likes; but there are certain Brahmans in Bengal who find the greatest difficulty in getting married to even one wife, and who generally spend their life in single wretchedness. These are Bangshaja Brahmans of the Shrotriya class. While a Kulin Brahman gets for every wife that he marries a handsome bribe, a Bangshaja Shrotriya Brahman has to pay down a large sum of money to the father of the girl whose hand he seeks to obtain. The consequence is that, owing to their poverty, numbers of Bangshaja Shrotriya Brahmans never get married at all. To remedy this evil, in Eastern Bengal, when in any village the number of unmarried Shrotriya becomes inconveniently large, one of the ghatak of the place—those under-servants of Bidhata who take a prominent part in all marriages—goes to Shrihatta in Sylhet. There, with the assistance of his agents in the district, and by means whether fair or foul, he procures a number of girls, to whom he holds out the prospect of a pleasant settlement in life. The girls may not all be Brahman girls,—some of them may be of the Chandal caste, and others may be young widows; but whatever may be their caste, character, and antecedents, they are huddled together in a boat, often 15 or 16 in number, and taken to the ghat of the Shrotriya village. The faces of the old Shrotriya bachelors become lighted up with joy when they hear of the arrival of the hymeneal boat. The sensation which these highly-favoured boats create in Eastern Bengal is infinitely greater than that produced in Calcutta by the orange-boats of Sylhet, or the mango boats of Malda. The Bangshaja bachelors besiege the boat in numbers. Each one selects a girl according to his taste, a bargain is struck with the ghatak,

and the celebration of the rites of marriage, according to the forms prescribed in the Shastras, soon follows. The plain-looking girl, for whom no Shrotriya may have a fancy, is employed as a maid-servant either of the ghatak himself, or of any other who may stand in need of her service.

SHUGDUF, a litter of the Hejaz, which differs greatly from that used in Syria and other countries. It is composed of two-corded cots, 5 feet long, slung horizontally, and parallel with the camel's sides, about half-way down.—*Burton's Mecca.*

SHUGHAR. Hind. At all the elevated passes in the North-West Himalaya there are a number of square piles of stones, called Shnghar, upon which passengers usually place a piece of qnartz, or attach rags to poles, which are fixed in the middle. There are also several Shughar on the neighbouring heights, sacred to the deota or spirits of the monntains, who are supposed to inhabit the loftiest and most inaccessible points, especially where there is much snow. The Shnghar at the passes are erected by travellers, but those on the higher peaks are commonly made at the expense of some wealthy pilgrim not much accustomed to the mountains, who has succeeded in crossing a pass which is reckoned an arduous undertaking by an inhabitant of the plains.

SHUGHLA. Hind. A travelling-bag or skin for holding water or flour, etc., on a journey. It is made of leather at Peshawur.

SHUGHNAN, a hill state north of Badakhshan; ts chief claims a Grecian origin.

SHUH. Chin. The generic name for species of Atractylodes, used medicinally in China.

SHUJA-KHANI, a fabric of silk and cotton together, and glazed, generally made in striped pieces like gulbadan work. It is also described as a kind of damask flowered silk or silk with satin patterns in it; it is made at Bahawulpur.

SHUJA-nd-DOWLA. In 1764, Shuja-ud-Dowla, the vizir of Oudh, under the pretence of assisting Mir Kasim Ali, invaded Behar, but his army was completely routed, and he was obliged to throw himself on the generosity of the British.

Najm-ud-Dowla died on the 8th May 1766, and was succeeded by his brother Syf-ud-Dowla, a yonth of sixteen.

Syf-ud-Dowla was succeeded in 1770 by his brother Mubarak-nd-Dowla, with whom a new engagement was made. By this engagement the Nawab's stipend was fixed at Rs. 31,81,991. This is the last treaty which was formed with the Nawab. The office of subahdar had now become merely a nominal one, all real power having passed into the hands of the British. In 1872 the stipend was reduced to sixteen lakhs a year.

SHU KING, or book of records, is a work supposed to have been edited by Confucius. It contains the annals of China nearly to the time of Confucius. It is the most ancient book known amongst the Chinese, and its contents are considered sacred. It is arranged in four chapters; the first contains the history of Yaou and Shnn, the second that of Hea, the third that of Shang, and the fourth of Chow, until Ping Wang.

Shu King was translated into Latin by Father Lacharme, a Jesnit missionary of China.

Jin King, or classes of men, is a Chinese book of great authority. In it the sages occupy the first chapter, and in this Confucius is placed high above all others.

Li is a Chinese word of very extensive meaning, sometimes rendered reason, courtesy, propriety, good breeding. The saying is, Li and Wen (learning) make up the whole sum of human excellencies.—*Bowring.*

SHUKL PAKSHA and the Krishna Paksha, are the bright and dark fortnight, the former being the period when the moon is on the increase up to the full, and the latter when it wanes. The first half and the second half of the lnnar month would be more intelligible terms.

SHUMAC or Sumach.

Tum-tum, . . Arab.	Sommaco, . . . It.
Shi-chu-yu, . . . Chin.	Sumakh, ... Pers.
Smak, ... Dut.	Sumagre, ... Port.
Sumac roure, Roux, Fr.	Sumak, . . Rus., Sw.
Schmack, Sumach, Ger.	Zumaque, ... Sp.

The true shumac or snmach, sometimes called young fustic, is the powder of the leaves, pednncles, and young branches of Rhus coriaria, a small deciduous plant, native of the south of Europe, but which is also grown in Syria and Palestine for its powerful astringent properties, which render it valuable for tanning light-colonred leather, and it imparts a beautiful bright yellow dye to cottons, which is rendered permanent by proper mordants. It is principally imported into England from the Ionian Islands and the Morea.

Rhus coriaria, hide or elm-leaved sumach, Tumtum, Arab., Shumuk, Pers., a native of Persia, Syria, Palestine, and the sonth of Europe, about 8 or 10 feet high, divided into numerous irregular branches. It is extensively used for the purpose of tanning. The fruit is acid and astringent, and the seeds are often used as a tonic for exciting the appetite.

Rhus cotinus, Venus-sumach, or wild olive, is a very ornamental shrub, growing wild in the south of Europe, and is used for tanning in Italy. The wood is nsed by the modern Greeks for dyeing wool, which is said to be of a beautifnl rich yellow.

Rhus glabra, smooth-leaved sumach, and another named R. viridifolia, are considered by some botanists as varieties of R. typhina. This species is abundant in North America. Its fruit is very sour. Bees are very fond of the blossoms.

Rhus typhina, fever-rhus, or stag's-horn sumach, is found in every part of North America. The frnit is exceedingly sour, and is even used in some parts as a substitute for vinegar.—*M'Culloch; Simmonds; Hogg; Poole; O'Sh.*

SHUM-SHUM, a range which forms about half the wall of the Aden crater, and reaches an altitude of above 1760 feet. There is a huge crack or slip which cuts above a third off the eastern side of the volcano, and through a portion of this, constituting a narrow gorge or pass, 10 feet wide and 20 or 30 feet high, the road from Steamer Point enters the crater, and leads to the cantonments. Dr. J. P. Malcolmson supposes this to have been the remains of the latest great eruption, of which the effects are chiefly manifest on the table-land on the eastern buttress of Shum-Shum. By this the ancient crater was shattered nearly through its centre, from the northern to the southern pass, breaking into pieces and separating the whole of the eastern side of the edge, of which Seera Island is a fragment. And in these views Dr. Buist concurs.

SHUSH. The ground about Shush is very uneven, and numerous mounds or tepeh are scattered in different directions to a considerable distance, some of them being partly covered with brushwood. The highest tepeh among them, of which Major Rawlinson gives rough measurements in his notes on Khuzistan, lies to the east of the Shover stream, but very near it, and to the west of the river Dizful, which is discernible at some distance, plying its course to the south-east. This mound, which may be the place where the prophet Daniel had his vision (although much has been written to the contrary), commands the whole country. From the top of it are seen the ruins of Ivani-Kherk, beyond the river of Kherkheh about a farsang and a half (perhaps less) to the west. A minar or column, with the ruins of Shahpur, are likewise discernible in a north-westerly direction, on the right side of the above-named river.—*De Bode's Luristan*, ii. p. 194.

SHUSHAH. Arab. A tuft of hair on the poll. When travelling, the shushah is allowed to spread over the greatest portion of the scalp, to act as a protection against the sun; and the hair being shaved off about two inches all round the head, leaves a large circular patch. Nothing can be uglier than such tonsure, and it is contrary to the strict law of Mahomed, who ordered a clean shave, or a general growth of the hair. The Arab, however, knows by experience that though habitual exposure of the scalp to a burning sun may harden the skull, it seldom fails to damage its precious contents. He therefore wears a shushah during his wanderings, and removes it on his return home.—*Burton's Mecca*, i. p. 239.

SHUSTER, a city of Persia, capital of Khuzistan, on the river Karoon. In Scripture it is called Shushan, and the river is named Illai. The Sabæans of Shuster make the sign of the cross, beginning from the right to the left shoulder, then touching the forehead, and lastly the pit of the stomach. Baron Silvester de Sacy, in the Journal des Savans, says, 'The name applied to them, of Christians of St. John, is quite as little founded in reason, since their doctrine (that of the Sabæans) has nothing in common with Christianity, to which they are greatly averse. This name has been bestowed on them erroneously by missionaries and travellers, who fancied they had discovered, in certain of their religious ceremonies, resemblances with some of the rites of the Christian religion.' The Sabæans recognise St. John the Baptist as the greatest prophet, whom they call Paighambar Yahia, and hence their name of the followers of St. John. As some Musalmans believe in the existence of Mahdi, the twelfth Imam, so the Sabæans are of opinion that St. John (Yahia) is still alive, although invisible, and that he inhabits Syria (Sham). He is expected to return among them with Shethel (Seth, son of Adam), who, for his virtues, is supposed to have been taken up to heaven. Independently of their book of Adam, the Sabæans have two other works; the one contains the life of Yahia, and the other is their ritual. The first, which they call the Sidra, is said to contain twelve thousand questions, with appropriate answers.—*De Bode's Arabistan*, ii. p. 172. See Saba.

SHUST'HI. Sansk. She who is worshipped on the sixth (shust'ha) day. Shust'hi, the goddess of fecundity, a Hindu deity, represented as a yellow woman sitting on a cat; regarded by the Hindus as the protectress of children, and is especially worshipped by females who have not been blessed with any. She is also worshipped monthly by women who have lost their children, and is generally invoked by parents as their protectress. The cat being sacred to Shust'hi, the Hindus avoid hurting one, lest the goddess should injure their children. She is honoured with six annual festivals, celebrated chiefly by females.—*Ward's Hindoos*, i. p. 39; *Cole. Myth.* pp. 396.

SHU YEE, the Chinese festival of burnt-offerings to the souls of paupers.

SIAH. Pers. Black. Siah bahi, a day-book, a ledger. Siahi, ink. Siah Koh, the south branch of the Koh-i-Baba.

SIAH POSH KAFIR, a name applied to a mountain race, the ancient Paropamisidæ, the literal meaning being black-clothed infidel. From the Hindu Kush, numerous small streams drain in converging and descending lines to concentrate in one deep glen, which continues its course southwards, joined by frequent streams from the inner slopes of the two ridges of Kashgar and Kafiristan, till, having become a large river, it joins the Knnar at Chigar Sarai. The slopes of this valley and these glens form the homes of the Siah Posh, and each little glen is inhabited by its own tribe, each taking its designation from the name of their respective valley. Masson and Raverty say that three rivers, the Kao, Alingar, and Chigar Sarai, flow through their country. The whole of this country is composed of snowy mountains, deep pine forests, and small but fertile valleys, which produce large quantities of grapes, wild and cultivated, and flocks of sheep and herds of cattle, while the hills are covered with goats. Grain is inferior both in importance and abundance. The common kinds are wheat and millet. The roads are only fit for men on foot, and are often crossed by rivers and torrents, which are passed by means of wooden bridges or of swing bridges, made of ropes of withy or some other pliant tree. All the villages are described as built on the slopes of hills, so that the roof of one house forms the street leading to the one above it, and this is said to be the constant practice of the country. The people have no general name for their nation. Each tribe has its peculiar appellation, for they are all divided into tribes, though not according to genealogy, but to geographical position, each valley being held by a separate tribe. The fair complexion and regular features of the Siah Posh Kafir, the variously-coloured eye and shaded hair, indicate them to belong to the Indo-European family of nations, and disconnect them from the Tajak, the Hazara, the Uzbak, or the Kirghiz. The region now inhabited by the Siah Posh is surrounded by the countries in which the Greek dynasties ruled, and is encircled by the colonies, posts, and garrisons which they are known to have established, and by military colonies of Macedonians at Alexandria ad Caucasum, Arigæum, and Bazira, and of the garrisons of Nysa, Ora, Massaga, Peucelaotis, and Aornis. Those who suppose that the Siah Posh Kafir are descendants of the Greeks, have their speculations strengthened by the fact that many petty princes and chiefs, some of whom are now Muhammadans, but originally Siah Posh, claim descent from the Macedonian hero, and have

preserved vague accounts referable either to their reputed ancestor's marriage with the fair Rozana or to his amour with the captive queen of Massaga. Dr. Wolff supposed them to be descendants of the Israelites. Mohun Lal states that the women possess great beauty, and manage all the out-door business, while their husbands remain in the house, feeding the children in their arms. The Siah Posh place their corpses in deal boxes, and expose them on the summits of hills, like the people of Tibet. The Siah Posh speak a dialect of the Sanskrit, and are said to worship Siva. —*Mohun Lal's Travels; Elphinstone's Caubul; Wolff's Bokhara; MacGregor.* See Kafir.

SIAK, a town 65 miles from the mouth of the Siak river, the entrance of which is on the western side of Bremer's Straits, and about three quarters of a mile wide. Mr. Crawfurd and Dr. Cantor inform us that the roe of enormous size of a kind of shad, which frequents the great river of Siak in Sumatra, constitutes an article of commerce. The Malacca cane, the Heotau of Cochin-China, is the long internodes of the Calamus scipionum of Loureiro. They are brought from Siak; some of them are simply mottled or clouded, others of a brown colour, in consequence, it is said, of their having been smoked. The most slender specimens, with the longest internodes, are the most valued.—*Crawfurd; Cantor; Griffiths.*

SIALKOT, one of the most ancient of the forts and cities of the Panjab, is supposed to have been the capital of Rassalu, whom General Cunningham identifies with the son of Salivahana, the Vikramaditya who overthrew the Saka in A.D. 78. The Sialkot district, lying between lat. 31° 56′ and 32° 50′ N., and long. 74° 16′ and 75° 3′ E., has an area of 1955 square miles, and a population above a million. The fort, which adjoins the city to the westward, is a high oblong mound, with rectangular defences of curtains and round towers, massively built of brick and mortar. Bactria or Indo-Greek coins are found in the ruins, but not in any numbers. The commonest, perhaps, is the copper coin of Apollodotus.

The principal Hindu and Sikh tribes comprise 35,928 Brahmans, 11,734 Rajputs, 19,274 Kshatriyas, 14,264 Aroras, and 86,362 Jats, besides a few Banyas, Gujars, and Ahirs. The Muhammadans include 13,570 Sayyids, 2831 Moghuls, 3079 Pathans, 45,465 Rajputs, 137,065 Jats, 10,263 Gujars, and a small sprinkling of others. The district is in a pleasant, fertile strip under the Himalaya. It produces grain of all kinds, gur, cotton, and flax; its manufactures are country paper, cloth (coarse), soosee, pashmina work, and koftgari or work inlaid in gold.—*Beng. As. Soc. Jour.*, 1854, p. 146; *Imp. Gaz.*
