Blanchard

St. Louis Aug 13th 1904

Dear Sir:—

We have pleasure in handing you with this a copy of " JAPAN IN THE BEGINNING OF THE TWENTIETH CENTURY " .

This book is published with a view of circulating a more general knowledge throughout the world of the progress made by Japan in recent years.

Hoping that you will accept this with our compliments, and assuring you of our highest regard, we are,

Yours very truly,

Commissioner General.

P. S.-- Mr. H. Yamawaki, Secretary of the Dept. of

Agriculture and Commerce, Tokio, Japan, will be

pleased to receive any remarks you may have to make
on this work.

The Librarian of the State University of

California, Cal.

THE JAPAN TIMES

1904

Preface.

The development which Japan has made in all spheres of public activity during the period of only a few decades that have elapsed since she gave up the policy of exclusion is a matter which has secured the acknowledgment of the world. However the knowledge which the same world possesses about things Japanese is at best superficial, partly because Japan is a new member, comparatively speaking, in the family of nations, but chiefly because reliable publications specially compiled for foreign readers and giving a succinct account of the economic and other affairs of Japan have not existed. It was in consideration of this fact that our authorities decided when they made an arrangement to participate in the Louisiana Purchase Exposition to compile some publication calculated to satisfy, at least relatively, this long-felt desideratum. In May of last year the work of compilation was at once started at all the offices of the Department and at the same time the other Departments of State were asked to furnish material relating to their respective provinces. The result of these compilations is embodied in the present publication. It is very much to be regretted that lack of sufficient time has to a considerable extent prevented the compilation from being made in a more satisfactory manner, has caused redundancies in some chapters and omissions in others, has prevented the work, in short, from being as well proportioned and as carefully written as it might otherwise have been. The difficulties experienced by the translators and the printers were for the same reason,—lack of time,—very great. Under these circumstances it was impossible to bring the compilation up to the level of excellence to which I had intended to bring it at first; but I hope that I shall have an opportunity at some time in the near future, to revise a work in which I flatter myself that I have at any rate succeeded in making a beginning, after which subsequent work of emendation and augmentation will be comparatively easy.

May, 1904.

HARUKI YAMAWAKI,

*Secretary of the Department of Agriculture and
Commerce, and Japanese Commissioner for
the Louisiana Purchase Exposition.*

NOT TO BE

JAPAN IN THE BEGINNING OF THE 20TH CENTURY.

PART I INTRODUCTORY.

CHAPTER I—Geography.

**Position - Area and Administrative Divisions—Geographical
Formation—Geological Formation—Climate.**

I. POSITION.

THE TERRITORIES OF JAPAN.—In the north-western corner of the Pacific Ocean and close to the eastern coast of the continent of Asia a chain of islands stretches in an oblique line from north-east to south-west, from the vicinity of the Philippines to the southern extremity of the peninsula of Kamchatka, in Russian Siberia. These countless islands large and small constitute the Empire of Japan. To be more precise, the territories of the Empire consist of five large islands and about six hundred smaller ones. Our most southerly degree of latitude is $21^{\circ} 48'$ N. at the northern extremity of the island of Formosa, and our most northerly degree of latitude is $50^{\circ} 56'$ at the northern extremity of Araitō island, Shumshu district, Chishima province (the Kuriles); while, as regards longitude, the position of "Flower Island," the most westerly of the Pescadores, corresponding to $119^{\circ} 20'$ E. Greenwich, is the limit of our Empire on the west; and the position of Shumshu island, Shumshu district, Chishima province corresponding to $156^{\circ} 32'$ E. Greenwich, is the eastern limit of Japanese territories. In latitude, there-

fore, Japan extends 29 degrees 8 minutes, and in longitude 37 degrees 12 minutes. As the greatest length of each island is, however, generally from south-west to north-east, and as the breadth from east to west is comparatively less, and, furthermore, as the whole series of islands from Formosa in the south to Chishima in the north runs from south-west to north-east almost in one continuous line, Japan contains a smaller extent of land than one would expect from the enormous distance separating its northern from its southern extremity.

The five large islands mentioned above are Honshu, Shikoku, Kyūshu, Hokkaidō and Formosa; then follow as to size the five islands of Sado, Oki, Iki, Tsushima, Awaji and the Pescadores (which are, however, a group of islands), and finally of the three archipelagoes of Chishima, Ogasawara (the Bonin Islands) and Okinawa (the Luchu). Of the above islands Honshu is the broadest. In shape it somewhat resembles the figure of a fabulous dragon with its head erect.

HONSHU.—Honshu is bounded on the north by the Pacific Ocean, while on the north-west it looks across the Sea of Japan towards the Korean peninsula and the eastern coast of Siberia. But for the intervening Inland Sea it would embrace within the curve of its southern extremity the island of Shikoku. As for the lesser islands of Honshu, there are in the Sea of Japan the two islands of Sado and Oki, and in the Pacific Ocean the Ogasawara archipelago which form, in a sense, the southernmost extremity of Honshu. In the famous Inland Sea, off the western coast of the provinces of Kii and Izumi lies the island of Awaji, covering an area of 36 square *ri*, and forming as it were a connecting link between Honshu and Shikoku.

SHIKOKU.—Shikoku is the smallest of the five great islands. Its north-eastern coast faces, across the Inland Sea, the provinces of Kii, Izumi, and the southern coast of the Sanyō-dō route. The island is washed on the south by the Pacific Ocean and is separated at its northern extremity by the Strait of Bungo from the provinces of Buzen and Bungo on the eastern coast of Kyūshu.

KYUSHU.—Kyūshu lies to the west of Honshu and Shikoku and is a large island measuring more from north to south than it does from east to west. The two islands of Iki and Tsushima lie to the

north of Kyūshū and belong to it geographically as well as for administrative purposes. The latter lies opposite the port of Fusan in Korea, from which it is separated by the narrow passage known as the Strait of Korea. It may be noted that the western part of Kyūshū faces the eastern coast of China, though at a greater distance than Tsushima is from the coast of Korea, the intervening seas being the Yellow Sea and the China Sea. Okinawa lies off the southern extremity of the island of Kyūshū and runs in a south-westerly direction. The most southerly island in the Okinawa group is Haterumajima, whose coast-line runs parallel to the eastern coast of northern Formosa and is situated at $24^{\circ} 6' N. L.$ Finally, the western side of the whole archipelago faces the provinces of Chiangsu, Chekiang and Fukien of China, while the eastern side is washed by the waters of the Pacific.

FORMOSA.—Formosa forms the southernmost limit of our territories. It lies due south of the most southern island of the Okinawa archipelago and at no great distance from the northern shore of the island of Luzon, one of the Philippine group, from which it is separated by the Strait of Bashi. The western coast of Formosa faces the province of Fukien, China, and midway between the two lies the Pescadores. The coast is fairly well indented; its principal harbors are Tansui (Tamsui), Anpei (Anping) and Takao, all of which ports supply shipping facilities between the island and the interior of China. The eastern coast of Formosa is, on the other hand, a magnificent line of precipitous cliffs and affords, therefore, very few, if any, good anchorages. The harbor of Kelung is, it is true, a tolerable port, but it is situated on the northern and not on the eastern coast.

The Pescadores group consists of no less than 47 islands, mostly small; and owing to the naturally advantageous position of the group lying half-way between Formosa and the eastern coast of southern China, it serves as a place of refuge for ships sailing along the coast of Formosa and between that coast and the opposite shores of China.

HOKKAIDO.—Hokkaidō, formerly known by the name of Yezo, is a large island situated to the north of Honshū from which it is separated by the Strait of Matsumaye (or Tsugaru, as it is called in some maps). This island is (if we leave out the Kuriles) the north-

ern limit of our Empire, and its western coast lies opposite the northern coast of Korea and the eastern coast of Russian Siberia, while its most northerly point comes close to the southern extremity of the island of Saghalien from which it is only separated by a narrow passage, the Strait of Soya. The coast of Kitami which extends eastward from Cape Soya to the Bay of Nemuro faces the Chishima group and the promontory of Kamchatka and forms, as it were, the southern boundary of the Sea of Okhotsk.

The whole south eastern coast of Hokkaidō proper is washed by the Pacific.

Chishima is a volcanic group stretching north-easterly in an oblique line from the Bay of Nemuro in which Etrup, the most southerly of the group lies, and terminating near the southern extremity of Kamchatka. The whole chain separates the Sea of Okhotsk from the northern Pacific.

GEOGRAPHICAL RELATIONS OF JAPAN TO FOREIGN COUNTRIES.—To describe briefly the geographical relations of our Empire to foreign countries, we find to the east and on the opposite side of the Pacific Ocean the western shores of the British Dominion of Canada as well as those of the United States of America. The harbor of Yokohama lies almost in a straight line with San Francisco, 4,722 nautical miles distant. Then, to the north-west of Japan and on the other side of the Sea of Japan, lies the vast plain of Russian Siberia.

Vladivostock lies opposite the southern part of Hokkaidō, while the northern coast of Korea is separated by the Sea of Japan from the two main divisions of Honsu, viz., San-in and Hoku-riku.

The harbor of Fusan which is situated at the southern extremity of the peninsula of Korea lies close to the northern portion of Kyūshū; while, opposite the main bulk of Kyūshū, lie the provinces of China that are bordering on the Yellow Sea, the Eastern Sea, and the China Sea.

Formosa, being the most southerly possession of the Empire, forms an important station for the carrying on of our intercourse with the islands in the South Pacific and with Australia. Its economic development has, since its annexation to Japan in 1895, been

very striking; and there are great hopes of an increased advance in the same direction.

In regard to geographical position, which naturally bears an important relation to national prosperity, Japan may be said to be advantageously situated, her territories extending in the temperate zone from 21° to 50° N. L., and enjoying in consequence a climate excellently suited for industrial pursuits. It was quite in accordance, therefore, with the nature of things that our forefathers should have called the land "Toyo Ashiwara no Mizuho no Kuni" (Land of Plenteous Ears of Rice in the Plain of Luxuriant Reeds). Moreover the country is, we need hardly remark, one of great natural beauty and is inhabited by a people who are universally acknowledged to possess a singularly refined taste in all artistic matters and whose great attainments in the arts, pure and applied, have always been admitted on all sides.

JAPAN'S UNIQUE NATIONALITY.—Owing to its peculiar geographical position our country constitutes a community distinct in several respects, socially and politically, from the adjacent countries of Asia. The most marked of these distinguishing traits is that Japan has, for more than 2,550 years, been ruled by the same Imperial Family, without a solitary break in the succession, thus offering a strong contrast to China and Korea, where frequent dynastic changes have taken place. Then the great natural valor of the people has guarded like an impregnable wall the coasts of their islands, with the result that never once during these two thousand years and a half has the country been desecrated by foreign aggression. All these facts have enabled our people to maintain intact their peculiar customs and unique nationality; but it cannot of course be denied that in culture, in the arts, in political institutions and in other civilizing factors, Japan has, as a natural and invariable result of geographical proximity, learned much from China, Korea, and even from India, exactly as in mediæval Europe England learned much from France, England and France much from Italy, and Italy much from Greece and Constantinople.

The remark just made of Japan's maintaining intact its peculiar customs and its unique nationality, can hardly be made with strict accuracy to-day, for, owing to the opening up of the country to

foreign intercourse and commerce a little over 50 years ago, a very extraordinary change has come over this Empire, a change which has affected not only the internal state of the country but its external relations as a member of the family of nations as well. It need not be stated here, for the fact is sufficiently well known, how quite recently the intrinsic strength of Japan began to be suddenly recognized all over the world, and how Japan pushed her way to the front rank in the comity of nations.

AMERICAN CONTINENTS.—In fact our country has become a focus of navigation routes in the Pacific and a great market in the Far East. This is what it should be, for to our east we have Canada, the United States of America, Mexico, and the Pacific coast of South America, with all of which we are engaged, or are about to engage, in active commerce. We build our greatest expectations on the United States of America, which is at present our best customer. The leading harbors on its Pacific sea-board, that is San Francisco and Seattle, together with Vancouver and Victoria of British Columbia, are connected with this country by regular steamship lines; and it is easy to see that Japan's commercial relations with Europe will be altered for the better on the completion of the Panama canal.

ASIATIC COUNTRIES.—Then to our north-west we have, as has been already pointed out, the vast extent of Russian Siberia, whose great trans-continental railroad, just completed, brings Europe and Japan nearer to each other than ever they were before. Further, there is Korea which, owing to its proximity, is inviting us to exploit its resources and to stimulate it by the introduction of our industrial and commercial activity. Of course, our commercial relations with China are far more important. We need not point out that this vast empire covers an area of 760,000 square *ri* and contains about 400 million souls. A near relation of ours, this great empire naturally looks to us for help in her endeavors to advance along the path that we have already trodden and to have its vast resources exploited by the money and enterprise of foreign countries. There can be no manner of doubt, therefore, that China's commercial relations with us will become in the future one of far greater importance than they are to-day, especially when the comparative proximity of the two lands is taken into consideration, none of the

Chinese harbors being separated from our harbor of Nagasaki by more than 700 nautical miles. Hongkong, too, though politically forming part of the British dominions, is a place of importance to us in connection with Chinese commerce, serving as it does as an important market for the goods going from Japan to China or *vice versa*. Indeed it occupies the second place on our list in regard to the volume of commercial transactions. It is separated from Nagasaki by 1,070 miles, while between it and the port of Anping, Formosa, the distance is only 300 miles.

SOUTH PACIFIC.—Lastly, turning our eyes southward, we find Australia with its fertile fields and rich resources, while the Philip-pines, Java, Dutch India, British India and so on promise to establish in the future far more active commercial relations with us than are existing at present.

II. AREA AND ADMINISTRATIVE DIVISIONS.

AREA.—The whole area of our Empire covers 27,062 square *ri*, corresponding roughly to the 325th part of the entire land surface of the globe and to 107th part of the entire land extent of the continent of Asia. The whole area is distributed as follows among our principal islands.

Principal islands.	No. of minor islands.	Area (sq. <i>ri</i> .)
Honshu	166½	14,571.12
Hokkaidō	12	5,061.90
Kyūshu	150	2,617.54
Formosa	29	2,253.24
Shikoku	74½	1,180.67
Chishima (32 islands)	—	1,033.46
Okinawa (55 islands)	—	156.91
Sado... ..	—	56.33
Tsushima	5	44.72
Awaji..... ..	1	36.69
Okī	1	21.89
The Pescadores	47	14.33
Iki... ..	1	8.63
Ogasawara (20 islands)	—	4.50

It will thus be seen that, if 100 represents the whole area of the Empire, Honshu occupies 53.84 parts, Hokkaidō 18.70, Kyūshu 9.67, Formosa 8.33, Shikoku 4.36, Chishima 3.82 and the rest 1.28.

Comparing our area with that of some other countries, it is found to be $1/30$ of the area of Russian Siberia, $1/26$ of that of China, double that of Korea, $1/22$ of that of the United States of America, $1\frac{3}{4}$ of that of the British Isles, about $26/100$ less than that of France, and about $29/100$ less than that of Germany.

ADMINISTRATIVE DIVISIONS.—For administrative purposes our country is divided into forty-six prefectures together with Hokkaidō and Formosa, these prefectures being as follows:—Tōkyō, Kyōto, Ōsaka (these three being called *Fu*), Kanagawa, Saitama, Chiba, Ibaragi, Tochigi, Gumma, Nagano, Yamanashi, Shizuoka, Aichi, Miye, Gifu, Shiga, Fukui, Ishikawa, Toyama, Niigata, Fukushima, Miyagi, Yamagata, Akita, Iwate, Aomori, Nara, Wakayama, Hyōgo, Okayama, Hiroshima, Yamaguchi, Shimane, Tottori, Tokushima, Kagawa, Ehime, Kōchi, Nagasaki, Saga, Fukuoka, Kumamoto, Ōita, Miyazaki, Kagoshima, Okinawa (all of which are called *Ken*). Each *Fu* or *Ken* is in turn subdivided into *Shi* (city or urban district) and *Gun* (rural district), the latter of which is further subdivided into *Chō* (town) or *Son* (village). As the administrative system exists at present, the *Shi*, *Chō* and *Son* constitute the smallest division for administrative purposes forming a self-governing entity, while the *Gun* and prefectures attend as direct administrative subdivisions of the country to the affairs of state, being at the same time allowed some degree of autonomy. In Hokkaidō the local administrative system was inaugurated in 1897 while in Okinawa the administrative and self-governing system of its own was inaugurated in the preceding year. At present there are throughout the country (exclusive of Formosa) 638 *Gun*, 58 *Shi* (the administrative districts in Hokkaidō and Okinawa included), 1,054 *Chō*, 13,468 *Son* (exclusive of those of the seven islands of Izu and Ogasawara). The administrative and other matters pertaining to Formosa will be described later on under a separate heading.

HONSHU.

OLD ADMINISTRATIVE DIVISIONS.—The present divisions are traceable to the first administrative divisions marked out by the Imperial Government in July, 1871. After the surrender of the Regency by the Tokugawa Shogunate in the year 1867 and the reinstatement of the Imperial Government, the local administrative system was established by subdividing the country into the three main divisions, of *Fu*, *Han*, and *Ken*, with *Fu-Chiji* (Governor of Fu) *Ken-Chiji* (Governor of Ken), or *Han-shu* (Governor of Han) placed over these divisions respectively. At that time, therefore, the local administration was conducted in conformity with the former Han (or feudal) administrative system. It was in 1872 that the system was completely reorganized, though even then the country was subdivided into as many as 1 *Dō* (colonial organization), 8 *Fu* and 302 *Ken*. Similar amalgamations and separations have frequently been carried out subsequently, till at last the existing local system has been evolved.

Apart from the present administrative subdivisions there survives from former times another system of local subdivisions of historical importance. These divisions are the 8 *Dō* (or routes) and 85 *Kuni* (or provinces). In tracing up the development of this particular system, it is found to have originated in the subjugation of the country by the first Emperor Jimmu, who established a feudal

system and placed in important districts followers of his own who had distinguished themselves, conferring upon them the official title of *Kuni-no-Miyatsuko* or *Agata-nushi*. It will thus be seen that the local subdivisions of provinces were at first of political origin. The subsequent Emperors followed the example set by their ancestor, and marked out the subdivisions of *Kuni* and *Agata* with a *Kuni-tsuko* appointed over each of them. All these subdivisions were determined by geographical considerations. It was however after the great change carried out by the Emperor Temmu (673-685 A.D.) that the names of Kinai and 7 *Dō* were first fixed upon, while, again, between 717 A.D. of the reign of the Empress Gensei (715-723) and the Tencho era (824-833) of the Emperor Junna (824-833) the small subdivisions of *Kuni* and *Gun* were first determined upon. According to the system then elaborated, the whole country was subdivided into Kinai and 8 *Dō* and 68 provinces, with the island of Yezo as a sort of outlying territory. The *Dō* comprised Nankaidō, Tōkaidō, Hokuriku-dō, Tōsan-dō, Sanyō-dō, San-in-dō, and Saikai-dō (or Kyūshū). Kinai was, properly speaking, also one of these *Dō*, but this special designation was given to it in view of the fact that the five provinces of Yamashiro, Yamato, Kawachi, Izumi, and Settsu which constituted Kinai were situated round the then capital of the country. Nankai-dō comprised Kii, Awaji, Awa, Sanuki, Iyo and Tosa (the latter four of which constitute Shikoku). A stretch of land lying on the east of Kinai and extending along the eastern coast of Honshū was called Tōkai-dō. It comprised Iga, Ise, Shima, Owari, Mikawa, Tōtōmi, Suruga, Kai, Izu, Sagami, Musashi, Awa, Kazusa, Shimōsa, and Hitachi, 15 provinces in all. Hokuriku-dō was a stretch of land lying along the Sea of Japan and situated to the north of the central portion of Honshū. It consisted of the seven provinces of Wakasa, Echizen, Kaga, Noto, Etchu, Echigo and Sado. Tōsan-dō lay between Tōkai-dō and Hokuriku-dō and extended northward along the centre of Honshū till it reached its northern extremity, the eight provinces of Ōmi, Mino, Hida, Shinano, Kōzuke, Shimozuke and Mutsu composing it. Sanyō-dō was the southern strip of land of Honshū to the west of Kinai and lying along the Inland Sea. It comprised the eight provinces of Harima, Mimasaku, Bizen, Bitchū, Bingo, Aki, Suwō and Nagato.

San-in-dō was situated at the back of Sanyō-dō, facing the Sea of Japan and contained Tamba, Tango, Tajima, Inaba, Hōki, Izumo, Iwami and Oki. Lastly Saikaidō contained Chikuzen, Chikugo, Buzen, Bungo, Hizen, Higo, Hyūga, Ōsumi, Satsuma, and the two outlying islands of Iki and Tsushima. The island of Yezo now Hokkaidō before it was subdivided into provinces subsequent to the Restoration, was known by the collective name of Yezo.

Although, as described above, our original local subdivisions owe their existence to considerations of administrative convenience, they lost much of this original significance subsequent to the period of the ascendancy of the Genji and Heikê clans, when the real power of the country passed into the hands of the military classes and feudalism gradually came into existence. The powerful clans began to set themselves up in various parts of the country and while some absorbed several provinces, each of the minor clans had to content itself with holding only a part of one province.

Important changes ensued in the local arrangements on the advent of the rehabilitated Imperial Government. In the year 1868 the province of Mutsu was split up into Iwaki, Iwashiro, Rikuzen and Rikuchū, and the province of Dewa into Uzen and Ugo. Further, in 1869, the name Yezo was superseded by that of Hokkaidō and the island thus designated was subdivided into the 11 provinces of Oshima, Shiribeshi, Iburi, Ishikari, Teshiwo, Hidaka, Tokachi, Kushiro, Nemuro, Kitami and Chishima. Hokkaidō was further subdivided into 86 *Gun*, and an "Imperial Colonization Commission" (Kaitakushi) was despatched to take charge of the administration of the island.

In the year 1872 the Okinawa group was given a collective designation, being called the Province of Luchu, and joined to Nankai-dō. In 1875 Saghalien was, as the result of a treaty with Russia, exchanged for the Etrup group which was annexed to Chishima.

It will thus be seen that according to this special system of local subdivisions the country at present comprises 1 Kinai and 8 Dō, with 85 provinces. This classification no longer, however, possesses any of the political importance which once attached to it, but it is still in vogue, side by side with the existing administrative

system. Being the oldest system of this description, it is of some archæological interest as it also serves more or less as indicating a natural and geographical boundary for the manners and customs of the different places.

III. GEOGRAPHICAL FORMATION.

MOUNTAIN RANGES.—Japan is on the whole mountainous, extensive plains being comparatively rare. Owing to the mildness of the climate and the abundance of the rainfall, forests are found everywhere throughout the land, feeding the headwaters of rivers, which in turn intersect the country in almost every direction and serve as means of irrigation as well as highways for transportation. Our country also lies along one of the world's most noted volcanic routes, and the volcanic cones that stand in almost every part tend very much to add to the diversity of the natural scenery and to heighten by contrast the natural beauty of the country, however destructive they may be at times.

FORMATION OF THE RANGES.—The mountain ranges of Japan may be classified into two main divisions, namely Paleozoic and volcanic. These two kinds of ranges intersect each other in many places and generally extend along the central portion of the land, dividing it therefore into two sections and also forming its watershed.

The mountain ranges may by their general formation be divided into two great systems, the northern and the southern. The former extending from north to south, is known by the name of the Saghalien system, as it starts from the Russian island of Saghalien. It passes into our territory at Hokkaidō, where it branches out into several subsidiary ranges. It then takes a south-westerly course, and enters Honshu by the northern coast. In the central portion of Honshu it spreads out into several high ranges. It is here that the Saghalien system encounters the Kunglung system coming from the south.

The Kunglung system, otherwise called the Chinese system,

takes its rise in the Kunglung range in China. After traversing the central portion of the island of Formosa, it divides itself into two sub-ranges, one of which enters Kyūshū from the south-western coast and reaches Honshū *via* Shikoku and the peninsula of Kii. Finally, it passes through the provinces of Yamato, Mikawa and Tōtōmi and ends on the borders of Shinano. The other sub-system enters Honshū from its western coast, separates the San-in and Sanyō-dō regions, and passes along the northern side of Lake Biwa till it enters the province of Hida, where it is met by the other sub-system and also the Saghalien system. The consequence of this meeting is that many lofty peaks are formed in Hida. This encounter of the different systems also results in the sending southward of a chain of volcanic peaks which, beginning in Suruga and Sagami, passes on to the islands of Izu and far into the Pacific Ocean. This chain is known by the name of the Fuji volcanic chain.

HOKKAIDŌ RANGES.—The Paleozoic mountain system in Hokkaidō begins at Cape Soya. After passing along the border of the provinces of Kitami and Teshiwo it meets with, in the central part of the island, the Chishima volcanic mountain system that enters the island from its eastern coast. At the junction several high peaks such as Teshiwo (5,247 *shaku*), Ishikari (6,715 *shaku*), Tokachi (5,979 *shaku*) are formed. This Paleozoic chain separates Hidaka from Tokachi and finally extends southward as far as Cape Erimo.

The volcanic chain mentioned above originates in the western part of Kamchatka and, after extending to the south-west and forming the volcanic archipelago of Chishima, it enters via Kunajiri island the main island of Hokkaidō at the boundary between Nemuro and Kitami. This system encounters another system at the boundary between Kitami and Kushiro and this meeting place of the two mountain systems is marked by such volcanic cones as Raushi-san (5,400) Shari-dake (5,200), Oakan (4,979), and Me-akan (5,336). There is another volcanic chain in the south-western part of the island. It originates in the sea off the coast of northern Teshiwo, enters Kushiro and Iburi, and forms Tarumaye-san (2,929), Noboribetsu

(3,375) and Usu-dake. It enters by way of Volcano Bay the peninsula of Oshima where it forms Komagatake (3,626) and Esan (1,386) and finally crosses over to the main island of Japan *via* the Strait of Tsugaru. This is called the Iburi volcanic system.

Owing to this peculiar geographical formation, the island of Hokkaidō surpasses all the other parts in the Empire in possessing extensive forests and plains, these two measuring no less than 8,900,000 *cho* in area. Hokkaidō therefore is noted for its timbers which are excellent for general architecture and shipbuilding. The Yūbari coal mines situated at the foot of Mount Yūbari are, together with the Poronai and Utashinai coal mines, famous for the coal they produce.

NORTHERN RANGES OF HONSHU.—There are two mountain ranges in the northern part of Honshu. One of them takes its rise on the southern bank of the river Hachinohe, Mutsu. **Kitakami Range.** It then runs southward, enters Rikuchu, and finally reaches the vicinity of the Bay of Matsushima, after extending along the eastern bank of the river Kitakami. In this range Hayai-dake (6,270), Yakushi-dake, and Murone-san are the highest peaks.

The other range arises at the headwaters of the river Abukuma, and stretching southward it enters Hitachi. Reizan and Hayama (3,548) Yadaijin-san and Akai-dake (2,376), Hakko-san **Abukuma Range.** (3,323) and Kaba-san (2,531) and Tsukuba-san (2,897) form the crests of the chain. Of the two, the former range is known by the name of the Kitakami range and the latter by that of the Abukuma range.

VOLCANIC RANGES IN NORTH-EASTERN HONSHU.—There are two ranges of volcanic cones in the north-eastern part of Honshu, the two together forming the backbone of that island. One originates at Osore-yama at Tonami Peninsula and terminates at Asama-yama, Shinano. Yakkōda-san (5,232), Ganju-san (6,797), Zōō-dake (6,481), Ōbandai-san (6,072), Hiuchi-yama (6,539), Komagatake (6,811), Nasu-dake (6,310), Akagi-san (6,431) are the loftiest peaks in this range, which at Nikkō spreads out into a medley of high peaks. This is called the **Toto Volcanic Range.** “Tōtō central volcanic range.” The other is known

by the name of U-yetsu volcanic range and starts from Iwaki-san (5,161), Mutsu. Like the former, it enters Shinano, sending up along its route Chokai-san (6,885), Haguro-san, Gessan (6,780), Yudono-san, Mikagura-san (4,022) and Shirane-san (7,069).

These two ranges form the watershed of the north-eastern section of Honshu and send the rivers taking their rise in it into the Sea of Japan on one hand and into the Pacific Ocean on the other. The forests abounding in the forests of Aomori and Akita-ken are noted for the production of fine timber, while the forests in the Nikkō group produce excellent timbers of *sugi* (Japanese cedar) and *hinoki* (Japanese cypress). Then in the U-yetsu range there is the Ani copper mine in Ugo and the Ozaruzawa copper mine in Rikuchū, while the famous copper mine of Ashiwo is situated in the Nikkō group.

FUJI VOLCANIC RANGES.—The meeting of the Saghalien and the Kunglung mountain systems at the boundary of Shinano and Hida results in great up-heavals of the surface, one of the most noteworthy being the Fuji volcanic range which, with **Mt. Fuji.** Mount Fuji as a centre, extends northward to the headwaters of the river Arakawa at Echigo, and extends southward to the seven islands of Izu, finally terminating in the Ogasawara group. In the northward arm there are, at the boundary between Shinano and Hida, Iwo-zan (10,074 ft.), Norikura-dake (10,447), On-take (10,345). Yatsuga-take (9,675) stands at the boundary between Kai and Shinano. The upheavals of which we speak culminate at last in Mount Fuji, the highest peak in Japan proper with an elevation of 12,450 *shaku* above the sea-level. Mount Fuji possesses the typical shape of a volcanic cone. Except in the height of the summer season, the summit is covered with snow, and its majestic shape is a good landmark for navigators. It ought to be added that the northern arm contains in the central portion of Shinano an extensive plateau with villages situated over 2,500 *shaku* above the sea-level. Lake Suwa, which is situated here, is a big extinct crater, and is situated 2,637 *shaku* above the sea-level.

RANGES IN CENTRAL HONSHU.—There are four subsidiary

ranges in the central part of Honshu, of which the Hida, the Kiso, and the Akaishi ranges belong to the Kunglung system while the remaining Kwantō range forms part of the Saghalien system.

The Hida range originates in Mount Katakari which towers at the boundary between Etchū and Echigo. After forming Mount

Hida Range. Rengê (9,682) and Tateyama (9,372) it enters Hida, and makes that province exceedingly mountainous. The Mozumi and Shikama mines, which are noted for their lead

Kiso Range. and silver, are found in this range. The Kiso range originates in Mount Komagatake (9,934) situated at the headwaters of the river Kiso and extends southward as far as the centre of the province of Mikawa. This range abounds in steep passes and precipitous gorges, as also in dense forests producing the famous "five timbers of Kiso."

The Akaishi range starts with Akaiwa-san (10,206) which stands at the boundary between Shinano and Suruga. After

Akaishi Range. running southward between the basins of the rivers Ōi and Tenryū, it sends up Omugen-zan (7,692) and Kuroboshidake (7,132), and ends at Akiwa-san and Dainichi-san. The

Kwanto Range. Kwantō range forms the boundary of Shinano, Musashi, and Kōzuke, and runs in a south-easterly direction. Kobushi-dake (8,094) and Kumotori-san (6,603) are the highest peaks in this range. The two passes of Sasago (3,488) and Kobo-toke occur in the ridge of the range.

The Kii range comprises the elevations found in Kii, Yamato and Shima. A chain of hills extending from Kōya and Hate-

Kii Range. nashi-dake (3,399) and the Yoshino group containing Takamiyama (4,422) and Odaigahara (5,295) may also be mentioned here. The forests of Yoshino are famous for their cadars.

CHUGOKU RANGES.—The Chūgoku ranges, part of the Kunglung system, enters Honshu and Kyūshu, and form the boundary line between the Sanyō and San-in routes as also a watershed for these two regions, sending rivers, on the one hand, northward to the Sea of Japan and, on the other hand, southward to the Inland Sea. This range extends to the north of Lake Biwa, but its peaks are comparatively low. Mount Jakuji (4,478) on the border of the

three provinces of Suwo, Aki, and Iwami, and Hiyei-zan and Hiradake (4,068) rising from the shores of the lake are the highest peaks in the range.

VOLCANIC RANGES IN CHUGOKU.—At the same time a chain of volcanic cones extends along the western part of Honshu, running almost parallel to the Kunglung range above mentioned. It starts at the northern extremity of the province of Nagato, produces Sambe-san (4,049) at the border of Iwami and Izumo, and Daisen **Haku-zan** (6,194) at Hōki. It passes on to Echizen *via* Tajima, **Volcanic Chain** where it is represented by Dainichi-dake (5,979) situated at the border of Echizen and Hida, and finally ends with Haku-zan (8,712) in Kaga. This volcanic chain is therefore known by the name of Haku-zan volcanic chain.

SHIKOKU RANGES.—The mountain range of Shikoku is also a part of the Kunglung system and comes from Kyūshu. It starts at the western extremity of Shikoku with Jōgashiro-san (3,573). After sending up Mount Ishitsuchi (6,920) and some others at the border of Iyo and Tosa, and forming Isurugi-zan (7,393) at Awa, the highest peak in Shikoku, it passes on to the south of Tokushima, to join the Kii range across the narrow intervening arm of the sea. This range of Shikoku divides the island into two halves, northern and southern, and therefore serves as a watershed for the two divisions. The island has besides, a volcanic chain, also coming from Kyūshu.

KYUSHU RANGES.—Though constituting a link of the Kunglung system in Japan, the mountain range of Paleozoic formation which is found in Kyūshu is comparatively low. At the west it rises on the shore of Higo, extends north-eastward, to send up Kunimi-dake and Obayama (6,550), till, coming to Saga, it crosses over to Shikoku. The volcanic chains, two in number, are **Kirishima** more noteworthy, one of them being called the **and Kirishima chain** and the other the Aso chain. The **Aso Chains.** former originates at a considerable distance to the south, that is, in the sea off the coast of Formosa. After manifesting its presence on the small islands off Satsuma, and on Sakura-jima which is situated in the Bay of Kagoshima, it reaches Kirishima-yama (4,816), after which it disappears into the sea off

Yatsushiro. The Aso chain consists of Tara-dake in the Hizen Peninsula, Onsen-dake (4,470) in the Shimabara Peninsula, and Aso-san (5,577). After proceeding to Bungo, the chain disappears in the sea off Suwo.

FORMOSA RANGES.—Formosa is traversed southward from its central part by the Gyoku-san range which subdivides that section of the island into eastern and western halves. The former district has a coast line composed of abrupt cliffs, while the latter, though on the whole hilly, is fringed by a fertile plain extending as far as the coast and with streams running through **Mt. Niitaka**. It. Gyoku-san or Mount Niitaka (sometimes also called Mount Morrison), which gives its name to this range, is the highest peak in the whole of Japan, rising as it does 14,355 *shaku* above the sea-level. Its summit is often covered by snow even in the hottest season, and was formerly called the "Jewel Mount" by the Chinese. To the east of Hōzan stands Mount Katō (9,108) and to the north Mount Kantaban (9,956), the two peaks forming the extremities of the range. At the northern part of the island, which is also hilly, no regular mountain system is found, excepting a little volcanic group, of which Daiton-san is the most important peak.

PLAINS.—Owing to the hilly nature of the land, the plains in Japan mostly consist of mountain or river valleys, and also the slopes of mountains, so that, strictly speaking, they cannot be called plains at all, at least in the sense in which the term is understood in America, Australia or Siberia. Even if we do regard them as plains, we find them to be comparatively limited in extent compared with the plains of most other countries.

PLAINS IN HOKKAIDO.—Hokkaidō has, however, four real plains, namely, the Ishikari plain, the Tokachi plain, **Ishikari, Tokachi,** the Teshiwo plain, and the Kushiro plain. Of **Teshiwo, and** these the first, which is the basin of the river **Kushiro Plains.** Ishikari, is the most extensive occupying as it does an area of about 37 *ri* by 5 *ri*. The basin of the lower course of the river is extremely fertile, but that in the upper course is rather sandy and consequently less fertile. The second plain is the basin of the river Tokachi and measures

about 20 *ri* both in length and breadth. The soil is fertile. The two rivers are partly navigable. The valley of the river Teshiwo forms the Teshiwo plain, while the Kushiro plain is situated in the southern part of the province of Kushiro. It is comparatively humid and not quite as fertile as the other three.

PLAINS IN HONSHU.—There are about eight plains worth mentioning in the island of Honshu. Of these, two are in the northern part. One of them is formed by the basin of the river Kitakami and lies between the Central volcanic range and the Kitakami range; the other is the basin of the river Abukuma which lies between the Central volcanic range and the Abukuma **Kitakami** range. The Kitakami plain extends from the neighbourhood of the city of Morioka and extends southward as far as Sendai. The soil is generally fertile, especially in the lower part of the basin. The other extends over the two provinces of Iwaki and Iwashiro. It is liable to be flooded in the rainy season, but the soil is good. The two plains are collectively called the plain of Mutsu and are traversed by the trunk line of the Nippon Railroad.

The Aizu plain, though well adapted for cultivation, is extremely limited in extent, being practically the border of Lake Inawashiro. On the other hand the Mogami plain, the **Aizu** valley of the river of the same name, is, though the cold is somewhat severe there in winter, an excellent **Plain** agricultural district. Its resources are likely to prove far more **Mogami** valuable in future than at present when the Government Southern O-u Railroad now extending from Fukushima to Yamagata *via* Yonezawa shall have been completed.

The plain of Echigo, which measures about 40 *ri* from north to south and is watered by the rivers Shinano, Akano **Echigo** and others, is the most important rice-producing district **Plain** in the whole of Japan, the soil being well adapted for the cultivation of what we may well call the national cereal.

The Kwantō plain is the widest alluvial plain in our country and is also one of the most prosperous. It extends over the **Kwantō** four prefectures of Tokyo, Saitama, Chiba, Gumma and **Plain** Ibaragi, and measures between 30 or 40 *ri* in length.

and breadth. This plain is watered by the navigable river Tone, besides possessing lagoons and ponds, and thus enjoys the greatest convenience in the matter of transportation, both by land and water. With the metropolis of the Empire and many other flourishing cities situated in it, this plain is a very important district both from the industrial and the agricultural points of view.

PLAINS IN CENTRAL HONSHU.—The Mino-Owari plain, the most important plain in the central part of Honshu, is the valley of the lower course of the river Kiso and its tributaries. **Mino-Owari Plain** The land is rather low-lying and is therefore subject to the danger of inundation, but it is extremely fertile and is noted as a rice-producing district. Nagoya, the largest city in Japan next to the “three cities”, is situated in this plain, while to the north lies the city of Gifu.

The Kinai plain, the basin of the rivers Yamato and Yedo **Kinai Plain.** and the district of Kyōto and Ōsaka, may be considered as the cradle of our old civilisation and therefore the centre of our ancient history. It contains Kyōto and Ōsaka, the former widely renowned for its natural beauty and fine arts, and the latter for its commerce and manufactures.

In the Sanyō and San-in districts there is, owing to the peculiar geographical formation of the land, no wide plain that deserves any special notice.

PLAINS IN SHIKOKU.—In Shikoku the valley of the river Yoshino and the stretch of flat land lying on the northern sea-coast of Sanuki may be mentioned, though both are limited in extent. The soil is good, and the Yoshino plain is noted for the cultivation of the indigo-plant. The city of Tokushima is situated on the lower course of the above-mentioned river.

PLAINS IN KYUSHU.—The Tsukushi plain, the valley of the river Chikugo, is the most important plain in Kyūshu, on account of **Tsukushi and Chikuzen Plains** its extent, its fertility, and its large production of grain. The Chikuzen plain which faces the Sea of Genkai is also noted for its agricultural products.

PLAINS IN FORMOSA.—In the western section of Formosa a narrow strip of flat alluvial land extends along the coast from north to south, and the section stretching from Shoka to Tainan is widely

noted for the production of rice, sugar cane, and other crops. Colonization is most actively going on in this section.

RIVERS.—Owing to the nature of our geographical formation and the consequent lack of any great distance from sea to sea, the rivers found in our country are comparatively short and rapid. However, some of them are comparatively long with wide alluvial basins, and supply great convenience in the way of transportation. They also form deltas at their mouths and hence give rise to prosperous cities. The case of Ōsaka at the lower course of the river Yodo is a typical example.

At the same time all those rivers are liable to inundations in times of heavy rainfalls, and to lay waste the surrounding districts. Damage inflicted by those inundations on life and property has frequently proved heavy.

RIVERS KITAKAMI AND ABUKUMA.—Honshu enjoys more than any other part of the country the benefits to be derived from rivers as means of supplying irrigation and facilities of transportation. Of the rivers that take their rise in the watershed running across this region and empty themselves into the Pacific Ocean, the Kitakami and the Abukuma, already mentioned, are found in the northern section, the former measuring about 79 *ri* in length and the latter about 77 *ri*. The Kitakami takes its rise in the back part of the province of Rikuchū, and sending off in Rikuzen a branch called the Oinami, empties itself at Ishinomaki into the Bay of Sendai. The Kitakami, flowing from north to south across a plain, is comparatively slow in current and supplies the people along its banks with the benefits of irrigation as well as of river traffic. The Abukuma takes its rise in Asahi-dake and Kinone-dake, Iwashiro, and flowing past the city of Fukushima, empties itself into the Pacific Ocean at the boundary of Rikuzen. For about 35 *ri* in its lower course the river admits of river traffic conducted by boats.

RIVER TONE.—The river Tone, otherwise called the Bandō Taro, rises in a hilly part of Kōzuke and runs for more than 70 *ri* through the extensive alluvial plain of Kwantō already described. Flowing southward it is joined by the river Watarase at Kurihashi, while at the town of Sekiyado it sends out a branch called the Yedogawa. Running further in a south-easterly direction, it enters

the ocean at the harbor of Chōshi. It is connected with several lagoons as Kasumiga-ura and Kita-ura, and is a great highway of communication and transportation between Tokyo and the provinces of Chiba, Ibaragi and Saitama. This advantage has been greatly increased by the junction of the Tone and the Yedo rivers by a canal measuring 2 *ri* in length and 20 yards in breadth. The work was completed in 1890.

RIVER SUMIDA.—The river Sumida, though only 30 *ri* in length, gathers importance from the fact that in its lower course it flows through Tokyo, thereby supplying to the city a great benefit for its traffic.

RIVER FUJI.—The Fuji (38 *ri*), which empties itself into the Gulf of Suruga, and the Oi (46 *ri*) and the Tenryū (60 *ri*) are a source more of damage than of benefit, owing to fact that they contain little water in ordinary times, and become suddenly swollen after rainfalls.

RIVER KISO.—The river Kiso (46 *ri*), which rises in Nishi Chikuma, a district of Shinano, much resembles the Tone as to its basin and its traffic importance. Its principal tributaries are the river Hida in the upper part of its course and the river Ibi in the lower part of its course, the river finally emptying itself into the Bay of Atsuta. The sediments brought down by it form deltas, and indeed the fine net-work into which the lower course is subdivided has no parallel in Japan. As may be seen by a reference to historical records the formation of deltas in this river is extremely rapid.

RIVER YODO.—The river Yodo is an outlet of Lake Biwa: the upper course is called Uji, and the lower part the Aji. It is a comparatively short river, extending only 20 *ri*, but from its situation it serves, together with the adjoining streams of Kitsu and Yamato, as a valuable factor in the prosperity for this district. The alluvial plain in which Ōsaka is situated was mainly formed by this river.

KYOTO CANAL.—A short notice of the Kyoto canal which joins Lake Biwa with the river Kamo may be given here, it being the most important work of the kind recently undertaken in our country. It measures 6,107 *ken* with ramifications altogether measuring 1,620 *ken*. The canal serves for irrigation, as a highway for the

transportation of goods and produce, and also for generating electricity for the city of Kyoto. It was constructed in the year 1890 at a cost of 1,200,000 *yen*.

RIVER KII.—The river Kii, called also in some places the Yoshino and in others the Kiino, comes from Mount Odaigahara and empties itself into the sea in the vicinity of the city of Wakayama. It measures 47 *ri* in length, of which the lower 13 *ri* admit of being traversed by river craft.

RIVERS IN SANYO AND SAN-IN DISTRICTS.—The river basin being extremely limited both in the Sanyō and San-in districts, owing to the existence of a mountain ridge along their border line, the rivers in this region are short. The Gonogawa, which comes from Aki and empties itself into the Sea of Japan in Iwami, is the longest of them, extending to the length of 50 *ri*, of which 20 *ri* are navigated by river craft.

RIVERS KUZURYU AND JINTSU.—To continue the description of the rivers flowing into the Sea of Japan, there are in Hokuriku the rivers Kuzuryū, Jintsū and Imizu. The Kuzuryū rises at the boundary of Mino and, after passing through the city of Fukui, flows into the sea at the seaport town of Mikuni. The Jintsū takes its rise at Mount Kawakami, Hida, and flows into the Bay of Toyama *via* the city of Toyama. The other river, which rises at Mount Dainichi, Hida, also flows into the same bay. The three rivers afford great convenience in the matter of irrigation and partly admit of river traffic. The Imizu, the longest of the three, measures 50 *ri*.

RIVER SHINANO.—The river Shinano is the largest river in Honshu, its principal tributaries being the Sai-gawa and the Unuma-gawa. It comes from the eastern part of Shinano and, after flowing 100 *ri*, empties itself into the sea at the city of Niigata. Owing to the fact that a large number of small streams join it, the river is very wide; but it is shallow and only at the lower course north of Nagaoka it admits of being navigated by small river steamers.

RIVER ONGA-GAWA.—The Onga-gawa flowing to the east of the Shinano comes from Lake Inawashiro, Iwashiro. After running 57 *ri*, it empties itself into the sea at Matsuga-saki, Echigo. This current is more rapid than the other, and only at its lower course can it admit of river traffic. These two rivers while watering the exten-

sive plain of Echigo, supply it also with means of irrigation, carry its traffic, and yield it fish, so that they may properly be regarded as forming a vital factor in the prosperity of the province.

RIVER MOGAMI.—The Mogami (62 *ri*) which takes its rise at Mount Danichi, Echigo, flows into the sea at the harbor of Sakata, after passing near the cities of Yonezawa and Yamagata and collecting a number of streams along the way. The alluvial plains in which the two cities are situated are the work of the river. However, the current is rapid, the Mogami being one of the three most rapid streams in our country, so that the river supplies only small convenience, if any at all, in the way of river traffic.

RIVER ISHIKARI.—In Hokkaidō the existence of an elevation in the central part results in the sending of rivers in four directions, those flowing west being the Ishikari and the Teshiwo, to give only the principal streams, those flowing northward into the Sea of Okhotsk being the minor streams in Kitami, while the Kushiro and Tokachi rivers flow southeastward into the Pacific Ocean. Those in the provinces of Hidaka and Iburi run parallel to each other and southward into the ocean. The river Ishikari is the largest in the whole of Japan, and watering the wide plain of Ishikari, it extends over 167 *ri*. As a large number of small streams join this lordly river, the Ishikari may be considered as conducing to a very large extent to the fertility and prosperity of the western plains of Hokkaidō. For about 50 *ri* in its lower course the river is navigable by river steamers. It rises in Mount Ishikari and joins the sea at the harbor of the same name. The river Uryū is its principal tributary.

RIVER TESHUWO.—The Teshiwo, taking its rise in Mount Teshiwo that stands on the boundary of Ishikari and Kitami, flows into the Sea of Japan after running northward for 74 *ri*. The current is less rapid than that of the Ishikari and is therefore more easily navigable.

RIVER KUSHIRO.—The river Kushiro comes from Lake Kushiro situated in the northern part of the province of the same name. After flowing southward, it empties itself into the ocean at the sea-port town of Kushiro. The current is comparatively slow, and for 20 *ri* in its lower course it admits of being navigated by river steamers.

RIVER TOKACHI.—The river Tokachi rises on the mount of the same name and, after running southward for an aggregate distance of 53 *ri*, it flows into the sea, one branch at Tokachi and the other at Otsu, as the river divides into two branches before it reaches the sea. Although the basin of the river is wide and sufficiently fertile, it is not yet so extensively opened as the plain of Ishikari.

RIVERS IN SHIKOKU.—As the area is limited and a mountain range occupies the central portion of the island of Shikoku, the rivers are separated into those flowing northward and those flowing southward. All of them are short, except the river Yoshino, otherwise called the Shikoku Shiro. It measures 43 *ri*, and waters the plain of Awa. It supplies the means of irrigation and of river traffic, only it often overflows the banks, in the rainy season. The river takes its rise in the northern part of Tosa, and, flowing eastward, empties itself into the sea in the vicinity of the city of Tokushima.

RIVER CHIKUGO.—In Kyūshū the mountain range of sedimentary formation and the two volcanic chains of Aso and Kirishima serve as starting points for rivers, and as the island generally abounds in dense forests which constantly feed the rivers, the volume of water in them is large and easily available for purposes of irrigation. However those that serve as highways of river traffic are few and far between, owing to the state of the current. The river Chikugo (35 *ri*) is the longest and rises in Mount Koko-noye, Bungo. After running in a north-easterly direction, it passes the city of Kurume and enters the sea of Ariyake at Yenotsu. This river waters the plain of Tsukushi, but is often unruly.

RIVER KUMA.—The river Kuma, though only 25 *ri* in length, (or perhaps because of its shortness) is noted, together with the Fuji and the Mogami, as being the most rapid streams in Japan. However its lower course admits of being navigated by river craft for about 6 *ri*. The river rises at the boundary of Hyūga, and, after crossing the province of Higo, it empties itself into the sea at Yatsushiro. The river Sendai, which takes its rise at the boundary of Hyūga and Higo, flows through the northern part of Satsuma, and then enters the sea. Its valley is fertile and the lower course admits of river traffic for 16 *ri*.

RIVERS IN FORMOSA.—As the island of Formosa measures more from north to south than from east to west, while the Gyoku-san range crosses through the centre, all the streams run from this watershed either to the east or to the west. They are all of them short. Some of the streams in the western half of the island are comparatively well supplied with water, but they are liable to be dried up in time of drought, while a heavy rainfall causes the streams to overflow their banks, and to send down volumes of sand to the mouths. The rivers of Formosa therefore present a peculiar feature of their own, compared with those in other places. Indeed the Chinese used to call them brooks and not rivers.

Of these streams the Tansui is the largest in Northern Formosa. It collects the greater part of the water coming down from the elevations in this section. The two streams of Taiko-kan and Shintsu coming from the south join the Tansui, while the Kelung stream comes from the vicinity of the city of Kelung. The Kelung is navigable by river steamers as far as Daitonei (Twa-tutia), situated about 5 *ri* from its mouth. The upper part of the Kelung partly admits of the use of native junks. The Tansui measures about 35 *ri* and empties itself into the Strait of Formosa. The Gê Tansui in the southern part of west Formosa is a stream that flows through the plain in the vicinity of Hōzan. Its basin being comparatively wide, it also serves as means of irrigation. It measures 32 *ri* and the part of Tōko lies at its mouth. There is a stream running across the north of Kagi, but it is of little use for river traffic. Eastern Formosa, being hilly and destitute of any wide plain, has no streams worth mentioning, except, perhaps, the Dakusui which empties itself into the sea at Karenko. Its valley is fertile and it also serves the purpose of irrigation.

LAKES AND PONDS.—The lakes and ponds found in our country may be classified into four kinds, according to origin; viz., tectonic, volcanic, choked up, and coastal. Lake Biwa is the most typical example of a lake formed by depression of tectonic origin. The second comprises those that occupy the craters of extinct volcanoes, while the third group consists of those that have been formed by the choking up of a river basin by certain epigenic

or hypogenic changes. The last group or lagoons are arms of sea enclosed by sand or shingle spit. The principal lakes belonging to the second group are Lake Ashi in Hakone (2,330), Lake Haruna (3,431) on Mount Haruna, Lake Chūzenji (4,340) at Nikkō, etc. Of the lakes, or more properly, ponds, swamps or lagoons belonging to the fourth group may be mentioned Kasumiga-ura, Kita-ura, Saruma-ko, Hachirōgota and others.

LAKE BIWA.—Lake Biwa, which lies in the centre of the province of Omi, is the largest lake in Japan, measuring at its widest part 5 *ri* from east to west and 16 *ri* from north to south, with a circumference of 73 *ri*. Its area is 81 sq. *ri*. It is fed by a large number of small streams flowing into it. Its outlet is the river Seta, which, under the name of the Yodogawa, flows into the Bay of Ōsaka. The cities of Ōtsu and Zézé which stand on the southern shore of the lake with the minor towns of Shiozu and Kaitsu on the opposite coast constitute a centre of collection and distribution of goods that are carried over the lake between the districts in the vicinity of Kyoto and Ōsaka and the districts of Hokuriku and Mino and Owari. However, as a highway of transportation the lake has lost much of its former value consequent on the laying of railways in its vicinity. The lake is also noted for its fine scenery, and the “eight scenes of Ōmi,” together with the beauties of the island of Chikubu-shima that stands in the lake, are widely celebrated.

OTHER LAKES.—Kasumiga-ura measures 36 *ri* in circumference and Kita-ura 15 *ri*. They are really lagoons. The towns lying on the shore of the first named lagoon are connected with Tokyo by steam service. Imba-numa is noted for its fishery and as serving purposes for irrigation to the neighboring fields. There is a scheme afoot for constructing a canal between it and the Bay of Tokyo.

COASTAL INDENTATIONS.—The importance of coastal indentations as a factor in the civilization and prosperity of a country gathers special force in connection with such a sea-girt country as Japan, for which those indentations may be considered as organs of respiration. It is exceedingly fortunate that our coast-line is comparatively well-indented, and extends for a considerable length.

Japan therefore may well be considered as enjoying a great natural gift in this respect and as being well qualified for the carrying on of active commerce with the outside world.

RATIO OF COAST-LINE TO AREA.—The coast-line aggregates 4,432.84 *ri*, all the islands large and small constituting our country being taken into account. This compared to our whole area of 27,061.93 sq. *ri* corresponds to 1 *ri* of coast-line to every 3.64 sq. *ri*. If the ratio is taken for the larger islands alone, there is 1 *ri* of coast-line to every 4.79 sq. *ri*, the aggregate mileage of the coast-line and the area of those islands being 5,556.54 *ri* and 26,635.53 sq. *ri* respectively. The measurement for each of the larger islands is given below:—

Names of islands.	Circumference. <i>ri</i> .	Area per 1 <i>ri</i> coast line. <i>ri</i> .
Honshu	1,952.88	7.42
Shikoku	451.17	2.55
Kyūshu	861.18	2.68
Hokkaidō	583.33	8.66
Chishima (32 islands)	613.21	1.68
Sado	53.30	1.57
Oki	74.70	0.56
Awaji	38.70	0.94
Iki	35.44	0.24
Tsushima	186.27	0.23
Okinawa (55 islands)	315.06	0.50
Ogasawara (20 islands)	71.58	0.08
Formosa	299.72	7.52
The Pescadores	20.00	0.40
Total	5,556.54	4.79

It may be seen from this table that in length of coast-line as compared with area, Shikoku comes first, followed by Kyūshu, while the ratio is smallest in Hokkaidō, Formosa and Honshu, speaking about the principal divisions alone. This explains why the coasts of Shikoku and Kyūshu abound in good anchorages, and why in the islands of Hokkaidō and Formosa and on the Japan Sea coast of Honshu this advantage is less.

PRINCIPAL INDENTATIONS AND HARBORS.—Brief descriptions of

some of the good anchorages that are found in the main island will be given next.

Beginning with the northern extremity of Honshu, there is the Gulf of Mutsu standing on the opposite side of the Tsugaru Strait as seen from Hakodate, Hokkaidō. This gulf is divided into two parts, the eastern section called the Bay of Nobechi and the **Aomori.** western called the Bay of Aomori, the harbors of Nobechi and Aomori occupying the head of the bays of the respective names. Of the two Aomori is far more important and prosperous than the other. It contains over 28,000 inhabitants and has a regular steamship service, run by the Nippon Yūsen Kaisha, to and from the harbors of Muroran and Hakodate, while it is also the northern terminus of the Nippon Railway.

Between Aomori and along the east coast as far as Kinka-san, the coast is comparatively straight and possesses anchorages of only local importance. These are, beginning at the north, the port of Minato which is the terminus of the Shiriuchi Branch of the Nippon Railway; then Miyako and Kamaishi where the Yūsen Kaisha's steamers make a regular call. After passing Kinka-san we have the Bay of Ishinomaki, containing three anchorages, the one at the east being Oginohama, that in the middle, Ishinomaki, and that at the western extremity being Kamaishi, the last being connected by a branch line with the Nippon Railway. These three ports are centres of collection and distribution for goods coming from the wide plain of Kitakami or into it.

The only anchorage existing between the Ishinomaki Bay and Bōsō Peninsula is Chōshi, which lies at the mouth of the river Tone. Steamers regularly ply between it and the places **Choshi.** situated along the Tone or on the shore of Kasumiga-ura and Kita-ura, while the Bōsō Railway connects the place with Tokyo. Moreover, as a line of the Nippon Railway passes Tsuchiura, a port on the shore of Kasumiga-ura, Chōshi and its vicinity enjoy great facilities of communication.

The Bay of Tokyo that lies on the western coast of the Bōsō Peninsula is the most important inlet of Japan, commercially and otherwise. It is bounded on the **Bay of Tokyo.** east by the peninsula of Awa, on the north by the

shores of Kazusa and Shimōsa, while Tokyo and Yokohama with the places intervening between them constitute the western boundary. The peninsula of Misaki stands at the entrance of the bay. From the shore of Kazusa and Shimōsa as far as Tokyo, the water along the coast is comparatively shallow and cannot admit of the approach of a big vessel, but the inlets found south of Yokohama are in general good anchorages.

Yokohama lies 18 miles to the south of Tokyo and is situated on the western shore of the Tokyo Bay. It is a non-freezing port located at $35^{\circ}26'$ N. L. and $139^{\circ}38'$. **Yokohama.** E. L. In respect to the aggregate tonnage of the ships that enter it and to the volume of foreign trade, Yokohama stands foremost in the list of our trading ports. It is provided with all the necessary arrangements for overland and marine transportation and communications. Water-works, parks, hotels, Japanese and foreign banks, firms and companies of all sorts and all the other provisions for comfort and public convenience and utility are complete, while the harbor is provided with piers and breakwaters and is thronged with ships coming from all parts of Europe and America. The water-works supply those ships with wholesome water at a very low charge. Yokohama contains at present over 193,000 inhabitants or 31,700 families.

The Gulf of Sagami lies to the west of the Tokyo Bay, with the peninsula of Izu forming its eastern boundary and Cape Ommaye of Tōtōmi forming the western. There is at the western corner of the gulf the little harbor of Shimizu which **Shimizu.** supplies important shipping facilities to the vicinity. The fact that the Government Tōkaidō Railroad passes along the coast serves to increase considerably the means of transportation and communication. The shores of the gulf are noted for their fishery, while the narrow projection of Miho, which is seen to the best advantage from the harbor of Shimizu, is often referred to in poetry for its fine appearance.

Further westward there is no good anchorage as far as the Sea of Ise, which may be regarded as an extensive bay. It possesses along its coast quite a large number of **The Sea of Ise.** ports. The ports of Handa and Taketoyo are

situated on the eastern coast of the peninsula of Chita which separates the two eastern inlets of the Sea of Ise, namely the Bay of Atsumi and the Bay of Chita, from the sea proper. The most inland inlet of the sea is called the Bay of Atsuta. **Bay of Atsuta.** and into this bay the river Kiso empties itself, as do also a large number of other streams, the result being the formation of several deltas. Atsuta is a prosperous little port situated at no great distance from the city of Nagoya. Its prosperity will be largely increased when the harbor works now going on shall have been completed. On the western shores of the sea are the ports of Kuwana, Yokkaichi, and Tsu, of which Yokkaichi, being a special export port, is the most important. It is connected by a regular steamship service with Yokohama. The harbor of Toba in the province of Shima is situated at the western mouth of the sea. Its waters are very deep.

The Bay of Ōsaka which lies on the western side of the peninsula of Kii, is bounded on the west by the island of Awaji, and is encircled by the three provinces of Settsu, Kawachi, **Osaka.** and Izumi. The city of Ōsaka, the "Manchester of Japan," surpasses all other cities in the Empire for the prosperity of its trades and manufactures, while the city of Sakai that lies a short distance off may claim the name of "Japanese Sheffield," on account of its cutlery industry.

Kobe is situated on the north-eastern shore of the bay mentioned above, its exact location being 35°37' N. L. and 135°24' E. L. It is the western terminus of the Government **Kobe.** Tōkaidō Railroad and the starting point of the Sanyō Railroad, so that both in respect of land and marine communications, it is about as well provided as Yokohama, its only rival in the matter of foreign trade. In fact, so far as the volume of the import trade is concerned, Kobe even surpasses Yokohama, though in the gross volume of the trade, however, it still comes below the other city. Kobe has a better anchorage, however, than Yokohama, its water being deep and permitting large ships to come near the shore where contrivances are provided for the loading and unloading of goods. The principal imports are raw cotton, iron ware, sugar,

cotton yarns, and rice, while rice, matches, fancy matting and tea constitute the principal exports. It may be added that all the conveniences of business and communication, as also those of comfort are as complete in Kobe as in Yokohama.

THE INLAND SEA (Murotsu, Ushimado, Takamatsu, Marugame Tadotsu, Kurê, Ujina, Shimonoseki, etc.).—A narrow trip of sea extending westward from Kobe is the celebrated Inland Sea. It is bounded on the north by the Sanyō-dō districts and on the south by the island of Awaji and by Shikoku. Besides abounding in inlets and harbors, and dotted by innumerable small islands, many of them covered by pine trees, this sea is generally tranquil all the year round. It unfolds new scenes and new wonders as the steamer threads its way between isles and round the bare or wooded curves, so that a voyage through this far-famed sheet of water is delightful beyond description. The sea is subdivided into four sections according to the divisions of the coast of Sanyō-dō, and

Harima-oki. the first of these, the “Harima-oki,” is continuous as far as the Bay of Ōsaka, and washes the shores of Harima and Bizen. This section possesses the ports of Murotsu and Ushimado on the Sanyō-dō side and Takamatsu on the

Bingo-oki. opposite side. The second section called “Bingo-oki” washes Bitchū and Bingo of Sanyō-dō and Sanuki and Iyo of Shikoku. Tamashima and Sasaoka of Bitchū; Tomotsu, Onomichi, and Mihara of Bingo; Marugamê and Tadotsu of Sanuki, and Imaharu of Iyo are the ports lying on both sides

Akino-umi. of this section. The third section called “Akino-umi” washes the coast of Aki on the one hand and that of the north-western coast of Iyo on the other. It is distinguished from the other sections by a larger number of small islands, or which Itsukushima, popularly known as one of the “Three Sights of Japan,” is the most noteworthy. On the Aki side lie the naval port of Kurê and the port of Ujina, while on the opposite coast are found Mitsugahama and Nagahama. The last

Suwo-nada. section at the western extremity of the Inland Sea is “Suwo-nada,” with Murotsu, Tokuyama and Mitajiri, and Shimonoseki as its ports, while the port of Moji in Buzen, Kyūshū, is situated just at the mouth of the sea. Of

Shimonoseki. these both from a historical and a commercial point of view, Shimonoseki is the most important.

On the coast of Shikoku there are only two indentations worth mentioning, one being the Bay of Tosa situated on the Pacific side of the island and the other the port of Uwajima on the Inland Sea side. The latter supplies an anchorage of local importance.

Turning to the northern or the Japan Sea coast of Honshu, the condition of the coast is found to be considerably inferior so far as anchorages are concerned, the coast being already described. Only on the coast of Hōki, Tango, **The Bay of Mi-o (Sakaye, Yonago).** Wakasa, Noto and Ugo are indentations of any importance to be found; while, owing to the prevalence of high waves in winter, voyage along that coast in that season is risky. The inlet on the coast of Hōki is called the Bay of Mi-o. At the bottom of this inlet is the harbor of Sakayê, to the south is another harbor, that of Yonago. These are the only important anchorages in Sanin-dō.

The section of the sea bounded on one side by the projection of Echizen and on the other by that of Tango is the Bay of Wakasa. On the western side lie the port **The Bay of Wakasa, (Miyazu, Maizuru, Tsuruga.)** of Miyazu and the admiralty port of Maizuru, while to the east, round Cape Tateiwa, is situated the Bay of Tsuruga with the harbor of the same name. This is the most important shipping centre in Hokuriku, and, connected by railroad with the provinces in Kinai and Tōkaidō, it is a flourishing place for the collection and distribution of goods coming from the northern sea.

The eastern coast of the peninsula of Noto is, in contrast to the western, rich in indentations, of which the harbor of Nanao facing to the south, another harbor, that of Fushiki, may **Nanao, Fushiki.** be mentioned. Besides being a regular port of call for the Yūsen Kaisha's steamers, Nanao is also connected with Vladivostock by a regular steamship service, and with the provinces of Kinai and Tōkaidō by a railroad. Fushiki, with the cities of Takaoka and Toyama situated not far off, is an important shipping centre for this district.

The coast of Echigo has the harbor of Naoyetsu on the south and the harbor of Niigata on the north, the two cities being connected by a railroad, while Naoyetsu is also connected with Tokyo by a Government line. **Niigata.** Niigata is one of the five open ports first opened to foreign trade. It is situated at $35^{\circ}39'$ N.L. and $139^{\circ}3'$ E. L. But the defective anchorage of the harbor and the remoteness of the district have prevented Niigata from ever becoming a market for foreign trade, and its customs returns are eclipsed by those of other ports opened much later. Owing, however, to the vast output of cereals produced in the fertile plains of the province, Niigata enjoys great prosperity so far as the home trade is concerned.

Proceeding further northward along the coast, there are at the mouth of the river Mogami the harbor of Sakata, and a little further to the north of it the harbor of Nojiro, the latter **Sakata.** of which is connected by railroad with Aomori.

There are comparatively few indentations in Hokkaidō, owing to the nature of its coast-line; in fact there are only three, namely Volcanic Bay in the southern extremity, Ishikari Bay on the western coast and Nemuro Bay on the eastern.

Hakodate, one of the five open ports, is situated at $41^{\circ}45'$ N. L. and $140^{\circ}43'$ E. L. The basin of the harbor covers about 1 *ri* 6 *cho* north and south and 21 *cho* east and west, and, as the water is deep and sheltered on all sides by land, Hakodate supplies an excellent anchorage. The prosperity of the place increased apace with the progress of colonization in the island for whose products it serves as the most important outlet. **Hakodate.** The existence of water-works and the abundant supply, at cheap rates, of excellent Hokkaidō coal make this harbor an excellent calling place for steamers. However, owing to its remoteness from the centre of business and political activity, the volume of foreign trade here is not yet so high as in other places. The chief export goods are marine products, sulphur, etc., while iron ware, salted fish, etc. constitute the principal import goods. With the increased utilization of the Siberian Railroad as a medium of communication between Europe and Asia, Hakodate is sure to become an important calling place for steamers. At the end of 1898, the city contained 78,040 inhabitants.

Otaru, situated in the Ishikari Bay, contained over 70,000 inhabitants at the end of 1901, and being the most important outlet for the marine, agricultural and mining products produced **Otaru.** in the plains of Ishikari and Teshiwo whose coast supplies an excellent fishing ground for herring, its advance has been striking. It is one of the newly opened ports and its harbor-works will be completed a few years hence.

Nemuro and the harbor of Akkeshi on the coast of Kushiro, are, though regular calling places of the Yūsen Kaisha's steamers, comparatively insignificant commercially on account of **Nemuro.** their remote situation. Muroran, situated at the eastern entrance of Volcanic Bay, is an excellent anchorage, and, together with Otaru, exports a large quantity of coal. It is connected with Sapporo and Otaru by a railroad, while there **Muroran.** is a regular steamship service between it and Hakodate. Travellers from Honshu who take the way of Aomori in going to Sapporo or Otaru generally go to Muroran *via* Hakodate.

The coast-line of Kyūshū is comparatively straight in the south-eastern part, but on the other hand the north-western part is well indented. Moji, standing opposite Shimonoseki, a narrow **Moji.** arm of the sea separating, is the most flourishing port in the latter district. Its proximity to the principal coal-mines in Kyūshū and the vast export of coal from it has brought about this marked prosperity of the port. It contains over 36,000 inhabitants. The means of communication and transportation are very complete, the Sanyō Railroad running between Shimonoseki and Kobe on the one hand, and the Kyūshū Railroad starting on the other from this port of Moji. In the year 1899 it was included in the list of open ports, and already its volume of trade threatens to eclipse that of Nagasaki. The export of coal alone amounts to over 3,600,000 tons in a year. The little port of **Wakamatsu.** Wakamatsu situated close to it has suddenly sprung into importance owing to the establishment of the Government Iron Foundry in its neighborhood.

On the northern coast of Kyūshū are found Hakata in Chikuzen, Karatsu in Hizen, and Izuhara in Tsushima, all of them ports of local importance. The admiralty port of Sasebo and the

Sasebo. ancient treaty port of Nagasaki are found round the western extremity of Hizen, while Kuchinotsu lies at the southern end of the peninsula of Shimabara.

Nagasaki is situated at $52^{\circ}45'$ N. L. and $130^{\circ}29'$ E. L. It was opened to foreign commerce no less than 332 years ago when a treaty of commerce were concluded for the first time **Nagasaki.** with the Portuguese. From that time till the opening of the country, Nagasaki was the only common ground of trade carried on between Japan and the outside world. Owing, however, to the transfer of the seat of commercial activity to Yokohama and Kobe, the prosperity of Nagasaki as a trading port has not of late made such a marked advance as that of other places. Still it is a regular calling port for steamers destined to or coming from the ports on the continent of Asia, the Philippines, Australia and Europe, and being provided with railroad connections, it enjoys great facilities in the matter of both maritime and overland transportation. The basin measures 28 *chō* wide. It is sheltered on all sides by hills, and the water in the harbor is deep. All provisions for the convenience of ships, such as water-works, a plentiful supply of coal, and a dockyard (the celebrated Mitsubishi Yard) are complete. In the year 1900 the volume of trade aggregated over 22 million *yen*, the principal goods imported being raw cotton, sugar, kerosene, etc., and the principal export goods being coal, rice, marine products, etc.

At the extremity of the promontory of Udo on the western coast of Higo is situated Misumi, and at the mouth of the river Kuma the harbor of Yatsushiro, the latter being the **Kagoshima.** terminus of the Kyūshū Railroad. At the mouth of the river Chikugo is situated Wakatsu and a little further off Omuda, both of which export the coal of the Miike mine and also other local products. At the southern extremity of Satsuma is found the harbor of Bonotsu, a regular station for shipping connection between Kagoshima and Okinawa. The Gulf of Kagoshima lies at the southern extremity of Kyūshū and contains at its head the harbor of Kagoshima, the most important anchorage in southern Kyūshū. The gulf covers 20 *ri* north and south and 3 to 8 *ri* east and west. The water is deep and forms a good anchorage,

but the means of communication with the rest of the island are not so complete as they will be shortly, when the Government Kagoshima Railroad shall have been completed, to be connected with the Kyūshū Railroad at Yatsushiro *via* Hitoyoshi. This line is now partly open to traffic.

In contrast to the north-western coast, the eastern coast of Kyūshū is devoid of good anchorages. The ports of Ōita and Beppu situated at the bottom of Beppu Bay, and the port of **Beppu Bay**. Saganoseki situated a little further off to the south-east, and finally the port of Saiki situated still further to the south may be mentioned as anchorages of local importance. They are connected by a regular steamship service with Ōsaka, Kobe, Moji, etc. The only anchorages to be mentioned on the coast of Hyūga are Hosojima on the north and Yunotsu on the south, both being regular calling stations of the Ōsaka Shōsen Kaisha's steamers.

Owing to the comparatively straight, unbroken outline of the coast of Formosa, there are only two harbors, Tansui and Kelung, on the northeastern coast, and two others, Anping and Takao, on the south. The former two lose much of their importance as anchorages owing to the fact that they are exposed to strong northeasterly winds in winter, while the two southern ports are subject to the similar disadvantage of being exposed to south-westerly winds in summer.

Tansui is situated about 5 *ri* to the north of Taihoku and at the mouth of the river Tansui. As there are, however, a number of sand-bars in this harbor, steamers of deep draught cannot **Tansui**. enter the basin unless at high-tide. The tea produced in the island is mostly shipped from Tansui harbor, which is therefore crowded with Chinese junks and steamers in the height of the tea season. Tansui is separated from Nagasaki by 640 miles and from Fuchow on the opposite coast of China by 137 miles. It contains about 10,000 inhabitants.

Kelung, about 9 *ri* to the north of Taihoku and 25 miles by sea from Tansui, is the most important shipping station between the island and Japan proper. It is enclosed on three sides by **Kelung**. hills, and the Formosan Government has started the work

of sheltering the exposed side. Coal constitutes the principal item of export, the mineral being produced in the vicinity. The commercial activity of the city is however eclipsed by that of Daitotei (Twatutia) and Manko (Manka), in the suburbs of the city. The distance from Nagasaki is 637 miles, from Shanghai 776 miles, from Amoy 235 miles, and from Fuchow 150 miles. The city contains about 10,000 inhabitants.

Anping which ranks next to Tansui in the volume of trade, is situated about 1 *ri* to the west of Tainan. Steamers have to anchor at a distance of about 1 *ri* from the mouth of the harbor, and they are often cut off from all communications with the land by the strong trade-wind that blows during the summer. A canal connects the harbor with Tainan. The staple export goods are camphor and sugar. Takao about 10 *ri* to the south of Tainan and about 3 *ri* to the south-west of Hōnzan, is the only harbor in Formosa which is sheltered from the trade-winds. The depth of the basin measures 5 to 7 fathoms. Sugar is the staple export, but the commercial prosperity of the place shows rather a retrogression than a advance.

Turning to the eastern coast, there is only one harbor, that of So-ō in the northern part, though it is shallow and is poor as an anchorage. The rest of the coast-line ends abruptly and supplies no good shelter for ships.

IV. GEOLOGICAL FORMATION.

GENERAL REMARKS.—In general outline Japan may be considered to consist of three arcs, one constituted by the stretch of islands extending from Formosa to Kyūshu, the second by Japan proper extending from Kyūshu to Hokkaidō proper, and the third by the Kurile group. The islands composing Japan are apparently a part of the continental system of Asia, but the geological formation is even more complicated than that of the continent. For further particulars on this subject the reader is referred to the section of Mining.

V. CLIMATE.

OCEANIC CURRENTS.—Owing to the fact that Japan is situated both in the temperate and tropical zones, the climate is on the whole mild and salutary. It is further influenced by the seas that girdle the country, the nature of the prevailing winds, etc.

BLACK CURRENT.—Oceanic currents first demand our attention. Of these the “Kuroshio” or Black Current is the most important, for it is owing to its proximity that the climate of Japan, especially of the Pacific districts, is considerably moderated. It is so called from its color, which is deep indigo in fine weather and ashy pale on cloudy days. The Black Current takes its rise near the Equator, being produced by the Pacific Trade Wind. It is at the vicinity of the island of Bashi, the northern-most of the Philippine group, and at about 21° N. L. and 135° E. L. that the current, that has been flowing westward as far as that place, turns north-ward, and thus begins to constitute a Japan current. After running along the eastern coast of Formosa it is divided into a number of currents at about 23° N. L. and 126° E. L. The main current runs E. N. E. and along the southern coast of Kyūshū and Shikoku. Its velocity is extraordinary at this point and the speed with which it flows between the islands of Mikura and Hachijō, of the Izu group of islands, is as much as 40 knots per hour. Proceeding northwards, it turns in a north-easterly direction, to be again divided into two streams at about 38° N. L. The main current gradually bends more and more eastward, and finally reaches the vicinity of 160° E. L. On the other hand the branch current proceeds northward and finally reaches the Aleutian archipelago and the Behring Sea, and is known by the name of the Kamchatka Current. Ships sailing from Yokohama to North America follow the route of this Black Current.

The branch current that is separated from the main current at 28° N. L. passes into the Sea of Japan *via* the arm of the sea separating Kyūshū and Tsushima. From about the central section of Honshū, this current comes closer to the shore of the island, but on proceeding to 41° N. L. and 138° E. L. it is divided into two branches, one of which turns eastward through the Strait of Tsugaru

and disappears near the eastern entrance of the strait, while the other proceeds northward and reaches the western coast of Hokkaidō, finally disappearing in the Sea of Okhotsk.

OTHER CURRENTS.—There are, besides the above, two colder currents, the “Oyashiwo” and the Okhotsk Current, the former of which originates in the vicinity of the Peninsula of Kamchatka, and the other near the mouth of the Amur river.

The Oyashiwo flows downward along the eastern coast of Hokkaidō and Honshu, and reaches as far as the vicinity of Cape Inuboye. This current is of a dark “Oyashiwo” Current. muddy color and can be distinguished at once from the Black Current. Its temperature is 5 or 8 degrees lower than that of the other.

The Okhotsk Current is divided into two streams, one called the Saghalien Current and the other the Liman Current. The former current is first driven northward by the Okhotsk Current. force of the water coming out of the Amur, then courses round the northern tip of Saghalien, to flow down southward along its eastern coast, and finally to divide itself into two streams at about 45° N. L., one Saghalien Current. of which streams, after passing between the islands of Shikotan and Etrup, joins the Oyashiwo. The other proceeds southward, and enters the Sea of Japan, to disappear there owing to its coming into contact with the warm current coming northward.

The Liman Current traverses the eastern coast of the continent of Asia. One branch of it disappears in the vicinity of Vladivostock, while the other proceeds southward through Liman Current. the centre of the Sea of Japan and comes as far south as the vicinity of Hongkong *via* the Korean Straits, the Yellow Sea and the Eastern Sea of China. It is owing to the proximity of this cold current that the districts of China bordering on the two seas have comparatively severe winters.

TEMPERATURE.—Generally stated, the districts bordering on the Pacific differ very much in temperature from those facing the Sea of Japan. In the former the temperature is more moderate than in the other, and while it is warmer in winter it is cooler in

summer. On the other hand, the districts along the Sea of Japan have rigorous winters and hot summers. The marked contrast in the general temperature of the two regions may be explained by the fact that, while the Pacific shores are under the influence of the warm current coming from the sea and are protected by mountain ranges from the winds coming from the north-west, the districts along the Sea of Japan are directly exposed to the cold north-western winds coming from the wide plain of Siberia.

Both from its high latitude and also owing to the influence of the cold wind from Siberia, the temperature of **Hokkaido**. Hokkaidō is low. In winter, and especially in the month of January, the thermometer is generally below zero, and in summer it reaches 21° C. in warmer districts.

In Kyūshū and Shikoku, on the other hand, the temperature stands high owing to their latitude, the influence of **Kyushu and Shikoku**. the warm air coming from the sea, and also to the proximity of the Black Current. The average temperature in summer often exceeds 27° and in winter it rarely falls below 4° .

Formosa is warmer, and is in fact the hottest place in Japan.

Southern Formosa is situated, indeed, in the tropical zone, **Formosa**. and the temperature there does not fall below 15° even in winter, while it records 28° on an average in summer. The two extremes of temperature in Formosa are 35.6° and 4.8°

On comparing the temperature of Japan with that of European and American places situated in the same latitude, it is discovered that in winter our temperature is lower while the opposite is the case in summer. This remark does not, however, **Comparison with other places**. hold good with regard to the comparison between Japan and places on the continent of Asia. In fact the exact reverse is the truth, the summer being warmer and the winter being colder on the continent than in the case of Japan. To give a few examples, Kagoshima is situated nearly in the same latitude as Shanghai, but while its average temperature in July is about 2° below that of the other, it is over 3° higher in January. Akita and Peking are also in the same latitude, but the latter has an average yearly temperature

of 11.8° , that of 0.46 in January, and of 26.2° in July, as against the corresponding figures of 10.3° , 2.5° , and 24.2° at Akita. In a similar way Fusan is about 2° higher in its yearly average than Numazu, but, while in the latter the average in January is 4.9° it is 0.17 in the other. The contrast is more pronounced between Vladivostock and Sapporo situated nearly in the same latitude. The averages in summer do not differ much from each other, but in winter Sapporo is about 8° higher than the other.

This characteristic climatic feature at all those continental places is of course due to the absence of the moderating influence of the sea.

But when a comparison is made between Japan and North America, the temperature of the former is found to be colder in winter and warmer in summer than that of the latter. For instance though the temperature of Niigata and San Francisco, situated nearly in the same latitude, is about the same in spring and autumn, the temperature of Niigata is lower by about 8° in winter though higher by about 15° in summer. Sōya and Vancouver have nearly the same temperature in summer and autumn, but during winter Sōya is colder by 8° to 9° than the other. This comparatively lower temperature in Japan is due to the prevalence in winter of cold winds coming from Siberia.

ATMOSPHERIC PRESSURE.—The average atmospheric pressure throughout Japan is 760 mm., the pressure being, as is generally the case, higher in winter and lower in summer. The difference between the winter pressure and the summer pressure decreases as we go from the east to the west, and while in Okinawa and Formosa it is about 10 mm., it falls to about 5 in eastern Kyūshū, and down even to 4 in Hokkaidō. The usual position of the centres of low and high pressure varies according to the seasons, partly owing to the geographical position of the country. In summer the centre of low atmospheric pressure lies in Korea and Siberia, while the corresponding centre of high pressure is found in the Pacific Ocean east of Japan. In the other three seasons the positions of low and high pressure centres are reversed, the former being in Korea and Siberia and the latter in Honshū or Hokkaidō or in the sea to the north-east of these islands.

PREVAILING WINDS.—The general condition of the atmospheric pressure being such, the winds prevailing in Japan naturally change according to places and seasons. During winter the prevailing wind is from the north-west to be superseded in spring by a wind from the south-west which in turn is replaced in summer by a south-westerly wind. This gradually shifts to the south-east, then to the north-east, and finally resumes in winter the original north-westerly direction. The prevalence of a north-westerly wind in winter is caused by the coming to the south-east of a current of air caused by the high pressure in northern Asia and the lower pressure existing in the Pacific. On the other hand the prevalence of a southerly wind in summer is the effect of the monsoon which originates in the China Sea and the Indian Ocean to neutralize the low pressure caused in summer on the continent. This wind, which bears moisture from the sea, causes rain as it reaches the land, and the heavy rain in the month of June is the effect of this wind.

The coming of a cold wind from the north-west in winter from Korea and Siberia has already been referred to, and the effect of this wind is most severely felt along the shores of Uzen and Ugo and the Hokuriku route which all lie in the direct path of the wind.

About the month of August or September, when the monsoon is about to die away to be superseded by a colder wind, storms very frequently occur, taking the form of what are generally called typhoons.

The storms that occur in Japan may be divided into four kinds, according to their places of origin. One originates to the east of the Philippines or in the China Sea and reaches Honshu *via* the Sea of Japan, the Yellow Sea, and Korea.

The second, also originating to the east of the Philippines, reaches Kyūshū *via* the Eastern Sea, but without entering the China Sea. Then at times the storms come direct from the vicinity of the Philippines to the southern districts of Japan, while another kind of storm comes from southern Siberia, to sweep across Hokkaidō. The second and third kinds are the most common and also the severest.

These storms often attain a velocity of 17 miles an hour and, as they reach 32° N. L. and rage not unfrequently for over 48 hours at a time, they inflict severe damage on crops and property. As the storms occur generally in the flowering season of the earlier or later varieties of rice, the "210th day" or the "220th day" from the beginning of spring according to the lunar calendar, it not infrequently happens that the crop is seriously affected.

In general the winds in Japan are stronger in spring and winter and weaker in the other seasons.

HUMIDITY.—Surrounded as it is by the sea, the degree of humidity is higher in Japan than in continental countries. The average record is 60/100 on an average. The atmosphere along the coast of Hokkaidō contains a larger quantity of moisture than that in any other part of the country. In the vicinity of Cape Erimo the yearly average is 87, while it reaches as high as 95 in July. On the other hand the interior of the island is unusually dry. In Honshu the districts facing the Sea of Japan, that is Uzen and Ugo and Hokuriku, have the highest record, the year's average being over 80. Formosa too has a similarly high record, not falling below 80° all the year round. In the Pescadores even 89 is reached in June.

On the other hand the districts bordering on the Inland Sea, both in Honshu and Shikoku, have the lowest record, which often falls below 60.

RAINFALLS.—Owing to the prevalence of moist winds coming from the sea and the existence of mountain ranges to condense that moisture, the rain-gauge records in Japan a height far above the average in other places.

In Honshu the districts bordering on the Sea of Japan have the highest record which generally exceeds 2,000 mm. in a year, while Kanazawa has as much as 2,500. The north-eastern shore of Kii, Kōchi in Shikoku, Miyazaki and Kagoshima in Kyūshū, also have a high record. But Oshima in Kagoshima has the highest record, reaching as much as 3,300 mm. in a year.

On the other hand Sōya in Hokkaidō has a rainfall of only 700 to 800 in a year, both on account of its latitude and of the comparative scarcity of evaporation from the sea. The districts

bordering on the Inland Sea have also the lowest record, owing to the fact that the moisture coming both from the Pacific and the Sea of Japan is intercepted by the ranges of Shikoku on the one hand and by those running across the boundary between Sanyō and San-in on the other.

In general the rainiest season in Japan is, as already mentioned, the month of June. However this heavy rainfall at this particular season is very important for the cultivation of rice, this being the period of planting.

The fall of snow is heaviest in the Hokuriku districts, where even along the shores it is 3 to 4 *shaku* deep, while in the recesses of the hills the accumulations exceed even 10 or 20 *shaku* in depth. In Shikoku and Kyūshū snowfalls occur very rarely, and in the Pacific coast districts of Honshū they are also very rare. In Tokyo snow does not fall more than four or five times in a year, and does not exceed 5 or 6 *sun* in depth.

CHAPTER II—Population.

History—Number—Density—Urban and Rural Population—Increase of Urban and Rural Population—Households—Social Divisions—The Sexes—Classification as to Age—Marriages—Birth-rate—Death-rate—Normal Increase—Emigration.

I. HISTORY RELATING TO CENSUS RETURNS.

BEFORE THE RESTORATION.—Census returns were made in Japan from ancient times, as it is recorded in authentic records that in the 12th year of the reign of the Emperor Sujin (86 B.C.) an Imperial Rescript was issued ordering the compilation of census returns with the object of levying taxes in kind and imposing labor for public service. Similar returns were also made during the reigns of the Emperors Yūryaku, Seinei, Kensō, and Kinmei (457–571 A. D.). It was, however in the time of the Emperor Kōtoku (645–654 A. D.) that the census business was first arranged in a systematic manner. This Emperor ordered in the year 645 A. D. that regular census registers should be compiled, and that the compilation should be renewed in future every six years. This six year method was also provided in the Taihō code of laws, so called because the first systematic codification of laws was undertaken in the era of Taihō (701–703 A. D.). At any rate it was evidently during the reign of the Emperor Kōtoku that the census returns were for the first time regularly compiled. It is to be regretted that, owing to the remoteness of the period in question, no further particulars can be obtained about the returns of that time. The returns compiled during the reign of the Empress Shōtoku (724–748 A. D.) by the priest Gyoki in the course of his extended tour throughout the country and also those made by the priest Shuzen during the Eikan era (983–984 A. D.) of the Emperor Enyū, are also lost, for whatever record

remains of those compilations gives only meagre information on the entire population of the country at these two periods. Even when the returns were entire they could at best give barely the approximate number of the inhabitants, inasmuch as that number was roughly calculated, evidently, from the number of villages, families, and adults whose services were available for public work.

With the advent of the Tokugawa Regency and especially after peace and order had been perfectly restored and social institutions became properly arranged, the Regency, actuated by various considerations financial and otherwise, began to perceive the necessity of inaugurating a proper system of census returns. The consequence was the issue of an order at various times ordering the compilation of census returns for the whole country. The returns took several different shapes, such as returns on arable land, returns on religion, and returns on personal identification. The returns made in the year 1744 A. D. put the entire population at 26,152,450. The figures fell to 25,917,830 in the returns compiled seven years later. The figures made out in 1751 were 26,061,830, while those in 1828 were over 27,200,000.

AFTER THE RESTORATION.—With the rehabilitation of the Imperial régime the work of compiling census returns was placed under the control of the *ci-devant* Department of Civil Affairs which attended to it with greater precision and energy, as may be seen in the following preamble of Notification No. 170 issued in April of 1871 by the then Daijōkan, now corresponding to the Cabinet, by which notification thirty three rules were provided for making census returns. The preamble stated:—"It is of the utmost importance in the administration affairs of a country to keep accurate account of the number of its families and individuals, for, unless this number is accurately known, the state can hardly attend to its primary duty of extending protection to its subjects. The subjects will also, on their part, enjoy peace and prosperity and can pursue their business unmolested only when they are under the protection of their government, so that should it ever happen that their domicile is absent from the official record, owing either to their own negligence

**Census during
the Tokugawa
Regency.**

**Census Noti-
fication.**

or evasion or from an oversight on the part of the government officials, those people will be practically non-existent in the eyes of the government and will therefore be excluded from the enjoyment of the protection universally extended by the government to its people.

“Lack of uniformity in the local administration from about the time of the Middle Ages has, among other irregularities for which it is accountable, reduced the business of keeping personal registers to a state of disorder; people were allowed to remove their abodes without giving notice to the authorities, and even to evade with impunity the duty of registering themselves in the census record. Accustomed for ages to these irregular practices, people are prone to regard the duty of registration with perfect indifference. It was in view of this circumstance that the rules of keeping census records throughout the country have now been provided, and that the local authorities and the people are hereby enjoined to duly regard the points herein set forth and to carefully attend to them.”

The Government of the time drew, in that way, the attention both of the local authorities and of the people to the great importance of the census, and warned them against faults of omission and commission in the entries of the census registers.

With the abolition in that year of the Department of Civil Affairs, the census business was transferred to the Census Record Bureau of the Department of Finance, to be again transferred in January of 1874 to the control of the **Control of Census Business.** Home Office which subsequently took charge of personal registration as well as of census-taking, till in 1898, when the Law of Personal Registration was put in force, all matters relating to registration were entrusted to the Department of Justice and those connected with census-taking to the Statistical Bureau of the Cabinet.

II. NUMBER OF POPULATION.

PROGRESS DURING THE 28 YEARS (1872-1899).—In surveying the movement of the population in Japan during the 28 years beginning with the year 1872 and ending 1899, it is found that

the population that stood at 33 million souls approximately from 1872 to 1875 inclusive, grew in 1876 to 34 millions approximately; then to 35 millions in 1879, to 36 millions in 1881, and to over 37 millions in 1883, all in round numbers. The figures for 1889 were over 40 millions, while the corresponding figures in 1897, that is eight years later, were 43 millions approximately. In the year 1899 the number stood at 44,260,604 precisely, an increase of 11,149,779 on that of 1872, the yearly rate of increase corresponding to 412,955 on an average. Reserving all particulars about the rate of increase and so forth to be dealt with in special paragraphs, the yearly gross figures are given as follows:—

REGISTERED POPULATION OF JAPAN.

Year.	Males.	Females.	Total.
1872	16,796,158	16,314,667	33,110,825
1873	16,891,729	16,408,946	33,300,675
1874	17,050,521	16,575,157	33,625,678
1875	17,250,420	16,747,029	33,997,449
1876	17,419,785	16,918,619	34,338,404
1877	No returns.	No returns.	No returns.
1878	No returns.	No returns.	No returns.
1879	18,140,822	17,627,762	35,768,584
1880	18,208,890	17,720,170	35,929,060
1881	18,423,274	17,935,720	36,358,994
1882	18,598,998	18,101,120	36,700,118
1883	18,755,242	18,262,060	37,017,302
1884	18,954,770	18,496,994	37,451,764
1885	19,157,877	18,711,110	37,868,987
1886	19,451,491	19,055,686	38,508,177
1887	19,731,732	19,337,959	39,069,691
1888	20,008,445	19,598,789	39,607,234
1889	20,246,336	19,825,684	40,072,020
1890	20,431,097	20,022,364	40,453,461
1891	20,563,416	20,155,261	40,718,677
1892	20,752,366	20,337,574	41,089,940
1893	20,906,464	20,481,848	41,388,313
1894	21,122,899	21,690,316	41,813,215
1895	21,345,750	20,924,870	42,270,620
1896	21,561,023	21,147,241	42,708,264
1897	21,823,651	21,405,212	43,228,863
1898	22,073,896	21,689,257	43,763,153
1899	22,329,925	21,933,681	44,260,604

Note:—The returns for the year 1872 were made on January 29th, those for the 1873 to 1885 years on January 1st, and those from the 1886 to the 1889 years on December 31st. There is a difference of two between the total aggregate of the male and female population for the 1889 year, because there were two cases of death in which the sex of the party who died was unknown.

The population of the island of Formosa and of the group of Pescadores will be described in the special chapter devoted to Formosa.

III. DENSITY OF POPULATION.

RELATIVE DENSITY.—The total area of the Empire (Formosa excluded) being 24,794.36 sq. *ri*, and the actual population, at the end of 1898, 45,402,359, the density of the population per sq. *ri* amounts to 1,831. Taking the relative rate of density in the six main divisions of the country, it is found that the Western section of Honshu with 2,945 comes at the head of the list, followed by 2,880 in the Middle section of Honshu, 2,542 in Shikoku, 2,464 in Kyūshu, 1,309 in the Northern section of Honshu. Hokkaidō with only 141 comes at the bottom of the list.

IN HONSHU.—The greater density in the Western section of Honshu is attributable to the fact that it contains the districts of Kinai where in one place or another the successive Emperors that ascended the Throne fixed their capital during a period of no less than 2,527 years, and where therefore are found many flourishing cities and towns. The presence of such large cities as Tokyo, Yokohama, and Nagoya accounts for the density of the Middle section. In short the presence of 1,399 to 2,945 people per sq. *ri* in the five sections above enumerated is primarily due to the facilities of communication and to the prosperity of trade and industry in those regions.

IN HOKKAIDO.—The scarcity of population in Hokkaidō is due to its remoteness and severe climate, and especially to the fact that comparatively a short space of time has elapsed since the work of colonization was started there. The soil being, however, well adapted for agriculture and stock-breeding while the rivers and shores are rich in aquarin wealth, Hokkaidō will become, at no distant date, far more densely populated, receiving as it does,

at the present moment from the rest of the country from 40,000 to 60,000 per annum.

The following table shows the relative density of population in each section.

Section.	Area (sq. <i>ri</i> .)	Actual Pop.	Pop. per sq. <i>ri</i> .
Middle Honshu	6,145.99	17,708,223	2,880
Northern Honshu	5,071.82	6,639,372	1,309
Western Honshu	3,472.72	10,226,539	2,945
Shikoku	1,180.67	3,000,794	2,542
Kyūshū	2,827.80	6,967,897	2,464
Hokkaidō	6,095.36	859,534	141
Total	24,794.36	45,402,359	1,831

Note:—The Middle section comprises the 17 prefectures of Tokyo, Kanagawa, Saitama, Chiba, Ibaragi, Tochigi, Gumma, Nagano, Yamanashi, Shizuoka, Aichi, Miye, Gifu, Shiga, Fukui, Ishikawa, Toyama; the Northern section comprises the 7 prefectures of Niigata, Fukushima, Miyagi, Yamagata, Akita, Iwate, Aomori; the Western section consists of Kyoto, Ōsaka, Nara, Wakayama, Hyogo, Okayama, Hiroshima, Yamaguchi, Shimane, Tottori; Shikoku comprises Tokushima, Kagawa, Ehime and Kōchi; Kyūshū comprises Nagasaki, Saga, Fukuoka, Kumamoto, Ōita, Miyazaki, Kagoshima, and Okinawa; Hokkaidō covers all the districts under its jurisdiction. This classification holds good for all the tables to be given hereafter.

DENSELY INHABITED PREFECTURES.—To enumerate those prefectures that contain over 3,000 inhabitants per sq. *ri*, we have:—

Prefecture	Area. sq. <i>ri</i> .	Actual population.	Population per. sq. <i>ri</i> .
Tokyo	125.80	2,101,102	16,702
Ōsaka	115.72	1,600,923	13,834
Kagawa	113.50	694,280	6,117
Kanagawa	155.67	926,884	5,954
Aichi	312.78	1,639,611	5,242
Fukuoka	317.81	1,425,625	4,486
Saitama	265.99	1,175,697	4,420
Chiba	326.15	1,275,376	3,910
Saga	160.08	618,679	3,865
Nagasaki	235.15	902,455	5,838
Kyoto	296.55	997,488	3,364
Hyogo	556.68	1,717,634	3,085

The prefectures mentioned above are the most densely populated prefectures in the country, the density in the rest ranging from 1,000 to 3,000, with the exception of Miyazaki which contains 953 and Iwate which has 799. Hokkaidō, as described above, contains only 141, being the most thinly populated of any.

IV. URBAN AND RURAL POPULATION.

RELATIVE DENSITY.—Regarding a place where over 3,000 inhabitants form one community as an urban section, the urban population at the end of 1898 aggregated 10,702,232, the remaining 34,700,127 residing in rural sections. According to the foregoing, out of every 100 the urban population amounted to 24 and the rural population to 76. The particulars are given below.

Section.	Urban.	Rural.	Percentage.	
			Urban.	Rural.
Middle	5,007,323	12,700,900	28	72
Northern	1,381,301	5,258,071	21	79
Western	2,709,596	7,516,943	26	74
Shikoku	418,720	2,582,074	14	86
Kyūshū	944,910	6,022,987	14	86
Hokkaidō	240,382	619,152	28	72
Total	10,720,232	34,700,127	24	76

Note:—The urban population consists of the inhabitants of the *Shi* (cities) established after the institution of the Local Civic Corporation System and those of the *Cho* (towns) containing not less than 3,000 inhabitants. The two urban districts of Naha and Shuri in Okinawa and the districts of Hakkodate, Sapporo, Otaru, Esashi and Fukuyama, all of which contained more than 3,000, have also been included in the total. The population other than urban was all included in the rural population.

MOVEMENT OF THE TWO POPULATIONS.—The population of cities and towns containing not less than 10,000 aggregated 5,500,000 in 1890. In 1894 it grew to over 6,080,000 and in the year 1898 to over 7,130,000. Then that of rural districts which stood at 35,000,000 approximately in 1890, grew to over 36,000,000 in 1893, and to over 38,000,600 in 1898. The movement of the two

sections of the population during the 9 years ended 1898 is shown below :—

Year.	Urban districts of over 10,000 Pop.		Rural districts of less than 10,000 Pop.	
	Actual Pop.	Increase over pre. year per 10,000 Pop.	Actual Pop.	Increase over per. year per 10,000 Pop.
1890	5,504,059	—	35,464,776	—
1891	5,657,493	27.88	35,611,239	4.13
1892	5,768,228	19.57	35,928,619	8.91
1893	5,927,699	27.65	36,133,277	5.70
1894	6,086,310	26.76	36,344,675	5.85
1895	6,210,801	20.45	36,837,425	13.56
1896	6,409,736	32.03	37,090,097	6.86
1897	6,772,042	56.52	37,206,453	3.14
1898	7,136,691	53.85	38,265,668	28.47

RELATIVE INCREASE.—To review the movement of the two classes of population, the rate of increase of the urban population is far more marked than that of the others, for while the rate in 1891 compared with that of the preceding year was 27.88 per 1,000 in the urban districts, it was only 4.13 in the rural. In 1895 the rate in urban districts was 20.45 and in rural districts 13.56, and lastly in 1898 the rate was 53.85 and 28.47 in the respective districts. On the whole the rate during the 9 years under review was about 33 in the urban districts against 10 in the rural, and this marked increase in the urban population is evidently attributable to the rise of trade and industry in cities and the consequent emigration of the rural population to the urban districts.

V. INCREASE OF URBAN POPULATION.

THE number of cities and towns containing not less than 10,000 inhabitants was 122 in 1887. That number increased to 152 in 1892 and to 162 in 1898. The marked increase in the number in 1898 was due to the amalgamation of villages with towns or cities on the occasion of the institution of the Local Civic Corpora-

tion System, as also to the settlement of the people from the villages in the urban districts. The movement of the urban districts as to population from 1886 to 1898 is as follows:—

Year.	Over 10,000	Over 20,000	Over 50,000	Over 100,000	Over 200,000	Over 300,000	Over 400,000	Over 500,000	Total.
1886	69	36	8	1	1	1	0	1	117
1887	69	40	7	3	1	0	1	1	122
1892	89	45	12	3	0	1	1	1	153
1897	88	52	14	3	1	1	0	2	161
1898	84	57	13	3	2	1	0	2	162

The foregoing urban districts being distributed among the main local divisions, the figures at the end of 1898 stood thus:—

Section.	Over 10,000	Over 20,000	Over 50,000	Over 100,000	Over 200,000	Over 300,000	Over 400,000	Over 500,000	Total.
Middle	45	26	2	1	1	0	0	1	76
Northern	15	11	2	0	0	0	0	0	28
Western	11	9	3	1	0	1	0	1	27
Shikoku	5	4	1	0	1	0	0	0	10
Kyūshū	8	6	3	1	0	0	0	0	18
Hokkaidō	0	1	2	1	0	0	0	0	3
—	—	—	—	—	—	—	—	—	—
Total	84	57	13	3	2	1	0	2	162

Next the population of those urban districts containing not less than 50,000 inhabitants at the end of 1898 was as follows:—

ACTUAL POPULATION.

Tokyo	1,440,121	Ōsaka	821,235
Kyoto	353,139	Nagoya	244,145
Kobe	215,780	Yokohama	193,762
Hiroshima	122,306	Nagasaki	107,422
Kanazawa	83,662	Sendai	83,325
Hakodate	78,040	Fukuoka	66,190
Wakayama	63,667	Tokushima	91,501
Kumamoto	61,463	Toyama	59,558
Okayama	58,025	Otaru	56,961
Kagoshima	53,481	Niigata	53,366
Sakai	50,203		

At the end of 1898 the number of rural communities was 13,230, distributed as follows:—

Middle Section	4,821
Northern	2,163
Western	2,982
Shikoku	781
Kyūshū	1,920
Hokkaidō	603
<hr/>	
Total	13,270

Note:—The rural communities represented above comprise those “*Son*” (villages) in the Local Civic Corporation System, and also those “*Cho*” (towns) that contained less than 3,000 inhabitants, besides the rural communities of Okinawa known by the special name of “*Makiri*.”

VI. RELATIVE NUMBER OF PEOPLE IN HOUSEHOLD.

AVERAGE PER FAMILY.—THE number of households at the end of 1898 was 8,182,017 against the population of 45,402,359, the number of people per household therefore amounting to 5.55. The relative rate in the local divisions was as follows:—

Section.	Actual No. of households.	Actual Pop.	Number per household.
Middle... ..	3,160,800	17,708,223	5.60
Northern	1,016,131	6,639,372	6.53
Western	1,994,348	10,226,539	5.13
Shikoku	570,246	3,000,794	5.26
Kyūshū	1,266,697	6,967,897	5.51
Hokkaidō	173,795	859,534	4.95
<hr/>			
Total	8,182,017	45,402,359	5.55

Note:—In the above and in the following two tables, the number of households does not coincide with the number of heads of families because there are sometimes more than one household under single head.

AVERAGE IN URBAN DISTRICTS.—The number of people per household in the urban districts was 4.99, the actual number of

households and of the population being 2,145,316 and 10,702,232 respectively :—

Section.	Actual No. of household.	Actual No. of Pop.	People per household.
Middle... ..	1,021,723	5,007,323	4.90
Northern	237,729	1,381,301	5.81
Western	581,863	2,709,596	4.66
Shikoku	89,021	418,720	4.70
Kyūshu	168,811	944,910	5.21
Hokkaidō	46,169	240,382	4.99
Total	2,145,316	10,702,232	4.99

AVERAGE IN RURAL DISTRICTS.—The number of people in each household in the rural districts is 5.75, the actual number of households and of population being 6,036,701 and 34,700,127 respectively :—

Section.	Actual No. of household.	Actual Pop.	Pop. per household.
Middle... ..	2,139,077	12,700,900	5.94
Northern	778,402	5,258,071	6.75
Western	1,412,485	7,516,943	5.32
Shikoku	481,225	2,582,074	5.37
Kyūshu	1,097,886	6,022,987	5.49
Hokkaidō	127,626	619,152	4.85
Total	6,037,701	34,700,127	5.75

It will be seen from the foregoing tables that the average number of people per household in the urban districts is 4.99 as against 5.75 in the rural, and that while the number per household is larger in the rural districts than the urban, in the Middle, Northern and Western Sections of Honshu and in Shikoku, the exact reverse is the case in Kyūshu and Hokkaidō.

VII. SOCIAL CLASSES.

FOUR DIVISIONS.—Our people are divided into four social classes, namely the members of the Imperial family, Peers,

“Shizoku” and “Heimin.” Of the four classes the Imperial first being the descendants of one or other of the family. Emperors and therefore of Princes or Princesses of the Blood, stand at the head of all the classes. The Peers consists of those courtiers who have inherited one important post or another at the court, of the former feudal lords, and Peers. lastly of those whose distinguished services have obtained for them a patent of nobility. The Peers are of five grades, namely Prince, Marquis, Count, Viscount and Baron, and they enjoy special privileges both politically and socially. The Shizoku. Shizoku are the samurai of oldern days, but at present this title merely serves to indicate the former profession of the holder’s family with no privilege, such as existed formerly, attached to it. The rest are Heimin or commoners, Heimin. whose standing does not differ at all from that of the Shizoku.

The numerical strength of the three classes excepting the highest from 1879 to 1898 is as follow:—

Year.	Peers.		Shizoku.		Heimin.	
	Heads of Families.	Households.	Heads of Families.	Households.	Heads of Families.	Households.
1879	464	2,661	404,389	1,428,968	7,032,893	26,409,592
1882	487	2,717	425,881	1,505,943	7,258 608	37,501,915
1887	588	2,228	425,960	1,528,709	7,629,966	29,475,125
1892	600	3,253	430 135	1,584,171	7,841,550	31,224,647
1897	695	3,828	437,556	1 651,578	8,043,187	33,087,554
1898	706	3,845	439,387	1,666,311	8,180,112	33,468,054

VIII. THE SEXES.

AVERAGE RATIO.—IN comparing the number of males and females, the former are found to exceed the latter, the ratio of males to females ranging between 101.77 and 102.96 to 100 during the 28 years ended 1899.

Year.	Males.	Females.	No. of Males per 100 Females.
1872	16,796,158	16,314,667	102.95
1876	17,419,785	16,918,619	102.96
1883	18,598,998	18,101,120	102.75
1888	19,731,732	19,337,959	102.04
1892	20,752,366	20,337,574	102.04
1892	21,823,651	21,405,212	101.95
1897	22,073,896	21,689,257	101.77
1899	22,329,925	21,930,681	101.82

This excess of males over females holds good in the stages of childhood (below 15 years) and adult life (16 to 65 years), but in the last stage of old age (66 years and over) the relation is reversed. These relations are demonstrated in the following table.

Year.	No. of Males to every 100 Females.		
	Childhood.	Adult.	Old age.
1884	102.19	104.49	84.00
1887	102.27	103.89	82.33
1892	102.18	103.88	82.89
1897	102.41	103.57	83.53
1898	102.29	103.43	82.35

AGE DEMARKATION OF THE SEXES.—In examining the demarkation line as to the age when the number of females begins to exceed that of males, it is found that, according to the returns from 1886 to 1898, this demarkation occurs at the age of 58 to 61, as follows:—

Year.	Females are in excess at the age of	Males are in excess at the age of
1886	58 and over	57 and over
1887	59 " "	59 " "
1888	60 " "	59 " "
1889	61 " "	60 " "
1890	58 " "	57 " "
1891	59 " "	58 " "
1892	58 " "	57 " "
1893	59 " "	58 " "
1894	60 " "	59 " "
1895	60 " "	59 " "
1896	60 " "	59 " "
1897	61 " "	60 " "
1898	61 " "	60 " "

IX. POPULATION AS CLASSIFIED BY AGE.

IN classifying the population by age there are many points to be considered, such as ages of efficient labor, non-efficient labor, conscription service, voting, school attendance, marriage, procreation, longevity, etc., but here only the three subjects of ages of efficient labor and of non-efficient labor, of procreation and of conscription service shall be dealt with.

AGES OF EFFICIENT LABOR AND NON-EFFICIENT LABOR.

—In general our people cannot engage in self-supporting work until they reach the age of about 15, so that the years below 15 must be regarded as age of non-efficient labor, the years between 16 and 65 as ages of efficient labor, and the years above 66 as ages of non-efficient labor. The population of the efficient and non-efficient labor as based on the foregoing standard is shown below :—

Year.	Below 15.	16 to 65.	above 66.
1884	11,842,565	23,458,278	2,142,236
1887	13,087,582	23,826,408	2,152,303
1892	13,702,107	25,120,236	2,265,046
1897	14,195,521	26,602,214	2,429,097
1898	14,366,923	26,989,196	2,404,700

In the foregoing three classes of population shown in per centage, those of non-efficient labor on account of childhood constitute in general 33 out of every 100, those of similar non-efficiency on account of declining age 6, and those of efficient labor the remaining 61. In other words, of every 100 people 61 give support to others and 39 receive support from others. These relations are demonstrated as follows :—

Year.	Below 15 years.	16 to 65 years.	Above 66 years.	Total.
1884	31	63	6	100
1887	33	61	6	100
1892	33	61	6	100
1897	33	61	6	100
1898	33	12	5	100

AGE OF PROCREATION.—Women are not allowed in our Civil Code to marry until they reach full 15 years of age, and hence the age of procreation may be considered as beginning at that age. The years at which sterility commences are not uniform according to persons, the period arriving before 40 in some and after 50 in others. However, the average may be taken as 45 years, so that the period between 15 and 45 years may be regarded as the period of procreation.

According to that standard, the child-bearing portion and the non-procreative portion amount to 44 and 56 respectively, as shown below :—

Year.	Women between 15 and 45.	Women below 15 or above 46.	Pro- creative.	Non- Procreative.
1887	8,498,070	10,838,583	44	56
1892	8,986,358	11,350,172	44	56
1897	9,517,051	11,887,385	44	56
1898	9,661,749	12,026,561	45	55

AGES OF CONSCRIPTION SERVICE.—The male subjects of the Empire are eligible for military service from full 17 to full 40 years. At the end of 1898 year there were 8,034,098 males of those ages, corresponding to 36 out of every 100 males, as below :—

Year.	Population available for service	Per 100. males.
1887	7,220,932	36.60
1892	7,477,507	36.03
1897	7,914,181	36.26
1898	8,034,098	36.40

X. MARRIAGE.

MARRIAGE RULES.—BEFORE giving any data about marriage a brief description of the legislation enacted in connection with marriage may be given here. The marriage age as provided by the Civil Code, begins at full 17 years with males and full 15 with females, and in making the marriage contract the consent of parents or of those who legally represent them is necessary.

However, this consent is dispensed with in the case of those males who have reached the full age of 30 or in that of females who have reached 25. The same Code prohibits polygamy under pain of criminal punishment, the system of monogamy having been legally established more than 10 centuries ago. Women are similarly forbidden to make any polyandrous contracts.

NUMBER OF MARRIAGE CONTRACTS.—The number of marriage contracts during the ten years ending 1900, was 372,102 which corresponds to 8.82 per every 10,000 people, this rate being shown in the following table:—

Year.	Number of marriage contracts.	Per 100 people.
1883	337,456	9.10
1887	334,149	8.55
1892	349,489	8.51
1893	358,389	8.66
1894	361,319	8.64
1895	365,633	8.65
1896	501,777	11.75
1897	365,207	8.45
1898	471,298	10.77
1899	297,117	6.71

Note:—The number of contracts for 1899 covers only those that were reported during that year, those that were reported after that year being excluded. This remark applies also to the tables of birth and death to be mentioned subsequently.

NUMBER OF MARRIED COUPLES.—The number of married couples subsequent to 1886 are as follows:—

	No. of married couples.	Per. 10,000 people.
At the end of 1886	7,289,001	189.29
" " 1887	7,346,670	188.04
" " 1892	7,561,900	184.03
" " 1897	7,892,073	182.56
" " 1898	7,979,383	182.34

As shown in the table, 182.34 to 189.29 out of every 1,000 people are married couples so that in every 1,000 of the population

there are 364.68 to 378.58 married people, the rest being single. This rate is a fairly good record compared with the data in other countries, demonstrating to some extent the easy condition of living in Japan and the domestic stability that obtains there.

XI. BIRTH-RATE.

AVERAGE RATE.—DURING the ten years ended 1899 inclusive, the average births numbered 1,243,014 or 2.95 per 100 people. The birth-rate was larger for males, their birth during the ten years referred to being 104.67 per 100 females. Below is shown a table showing the number of births and the ratio of male and female births from 1872 to 1899.

Year.	Males.	Females.	Total.	Birth-rate per	
				100 Pop.	Males per 100 Females.
1872	290,836	278,198	569,034	1.71	104.54
1877	455,689	434,829	890,518	2.55	104.80
1882	474,189	448,526	922,715	2.49	105.72
1887	542,043	516,094	1,058,137	2.71	105.03
1892	617,234	589,800	1,207,034	2.94	104.65
1893	602,322	576,106	1,178,428	2.85	104.55
1894	620,844	588,139	1,208,983	2.89	105.56
1895	638,895	607,532	1,246,427	2.95	105.16
1896	651,468	630,710	1,282,178	3.00	103.29
1897	683,941	650,184	1,334,125	5.09	105.19
1898	696,131	673,491	1,369,622	3.13	103.36
1899	705,017	666,120	1,371,191	3.10	105.85

XII. DEATH-RATE.

AVERAGE RATE.—During the ten years ended 1899 the average rate of mortality was 880,589 which corresponds to 2.09 per 100 people. The rate of mortality is greater in males than in females,

that of the former being 106.05 per 100 of the latter, as shown below:—

Year.	Males.	Females.	Total.	Mortality per 100 Pop.	Mortality of males per 100 females.
1872	208,092	197,312	405,404	1.22	105.46
1877	324,732	295,574	620,306	1.78	109.86
1882	346,112	322,230	668,342	1.81	107.41
1887	386,132	367,324	753,456	1.93	105.12
1892	452,136	434,852	886,988	2.16	104.82
1893	479,052	458,589	*937,644	2.27	104.46
1894	432,820	407,947	*840,768	2.01	106.10
1895	448,873	403,549	852,422	2.02	111.23
1896	469,485	443,336	*912,822	2.14	105.90
1897	452,383	424,454	876,837	2.03	106.58
1898	459,298	435,204	*894,503	2.04	105.54
1899	474,043	453,002	*927,046	2.09	104.64

Note:—The figures marked with an asterick (*) represent persons whose sex was unknown.

Though on the whole the rate of mortality is greater in males than in females, this is not uniformly the case for males of all ages, as the mortality of females is found to be greater than that of males according to age. For instance the data obtained for 1899 show that, though the rate of mortality is greater for males at the age of not less than ten years, the relative proportion is reversed between 11 and 40 years, to be again restored to the former proportion between 41 and 70. Finally, over 70 the rate of mortality shows a marked decrease for males.

Ages.	Mortality of males per 100 of females.	Ages.	Mortality of males per 100 of females.
1 to 5	113.03	51 to 60	132.22
1 to 10	104.05	61 to 70	119.58
11 to 15	86.34	71 to 80	95.77
16 to 20	84.50	81 to 90	71.49
21 to 30	87.11	91 to 100	51.76
31 to 40	88.68	above 101	25.00
41 to 50	119.99		

XIII. NORMAL INCREASE OF POPULATION.

GENERAL DATA.—Though an approximate idea of the normal increase of population may be obtained by comparing the birth-rates with the death-rates, this can by no means be accurate, inasmuch as there happen omissions in the report of births or deaths, or omissions to register and subsequent corrections. In fact the rate of increase of the population as statistically recorded is much greater than the difference between the birth-rates and the rate of mortality. The rate of yearly increase from 1872 to 1899 and the rate of increase per 100 population are recorded in the following table.

Year.	Increase.	Increase per 100 Pop.
Jan. 29, 1872 to Jan. 1, 1873... ..	189,850	0.57
Jan. 1, 1873 to Jan. 1, 1874... ..	325,003	0.98
Jan. 1, 1874 to Jan. 1, 1875... ..	371,771	1.11
Jan. 1, 1875 to Jan. 1, 1876... ..	349,955	1.00
Jan. 1, 1876 to Jan. 1, 1879... ..	1,430,180	4.16
Jan. 1, 1879 to Jan. 1, 1880... ..	160,476	0.45
Jan. 1, 1880 to Jan. 1, 1881... ..	429,934	1.20
Jan. 1, 1881 to Jan. 1, 1882... ..	341,124	0.94
Jan. 1, 1882 to Jan. 1, 1883... ..	317,184	0.86
Jan. 1, 1883 to Jan. 1, 1884... ..	434,462	1.17
Jan. 1, 1884 to Jan. 1, 1885... ..	417,222	1.11
Jan. 1, 1885 to Jan. 1, 1886... ..	282,230	0.75
Jan. 1, 1886 to end of 1886... ..	355,960	0.93
End of 1886 to end of 1887... ..	562,514	1.46
End of 1887 to end of 1888... ..	537,543	1.38
End of 1888 to end of 1889... ..	464,786	1.17
End of 1889 to end of 1890... ..	381,441	0.95
End of 1890 to end of 1891... ..	265,216	0.66
End of 1891 to end of 1892... ..	371,263	0.91
End of 1892 to end of 1893... ..	298,373	0.73
End of 1893 to end of 1894... ..	424,902	1.03
End of 1894 to end of 1895... ..	457,405	1.09
End of 1895 to end of 1896... ..	437,644	1.04
End of 1896 to end of 1897... ..	520,599	1.22
End of 1867 to end of 1898... ..	534,290	1.24
End of 1898 to end of 1899... ..	497,451	1.14

As may be seen from the foregoing table, the rate of increase is

extremely irregular, being in some years less than $\frac{1}{2}$, in others 1 and in still others 1 and a fraction. However in 1879, 1885, 1886, **Average.** 1891 and 1894 when the rate stood very low, various causes, such as the spread of epidemic diseases, the rise in the market price of commodities, etc. prevented the progress of the population. The average rate of increase during the preceding 28 years amounted to over 1.04 per 100 of the population.

In the relative rate of increase between urban and rural population, that of the former is, as already explained, considerably higher than that of the latter. This increase is however due to an abnormal cause which is operative in all civilized countries, that is to say, the emigration of villagers to towns and cities. As to the normal increase, the rate is higher in rural districts, because there the birth-rate is higher and the rate of mortality lower than the same rates in the urban districts.

During the ten years ending 1897 inclusive, the birth-rate in cities possessing an actual population of not less than 25,000 was 2.30 and the rate of mortality 2.18, per 100 of the population, the increase of population corresponding therefore to 0.12. For the whole country the birth-rate was 2.92 and the rate of mortality 2.07, the balance in favor of increase being 0.85. Thus the rate of increase in cities is less by 0.73 than that for the whole country, as shown below:—

Year.	For the whole country.			For cities of over 25,000 Pop.		
	Births per 100 Pop.	Deaths per 100 Pop.	Balance between births and deaths.	Births per 100 Pop.	Deaths per 100 Pop.	Balance between births and deaths.
1888 ...	2.96	1.90	1.06	2.40	1.07	0.33
1889 ...	3.02	2.02	1.00	2.38	2.15	0.23
1890 ...	2.83	2.04	0.79	2.49	2.37	0.12
1891 ...	2.67	2.10	0.57	2.13	2.28	0.15
1892 ...	2.94	2.16	0.78	2.32	2.37	0.05
1893 ...	2.85	2.27	0.58	2.23	2.19	0.04
1894 ...	2.89	2.01	0.88	2.29	2.00	0.29
1895 ...	2.95	2.02	0.93	2.23	2.19	0.04
1896 ...	3.00	2.14	0.86	2.86	2.02	0.14
1897 ...	3.09	2.03	1.06	2.41	2.14	0.27
Average.	2.92	2.07	0.85	2.30	2.18	0.12

XIV. EMIGRATION AND IMMIGRATION.

EMIGRATION AT HOME.—Apart from the emigration of country people to towns and cities, the emigration to Hokkaidō from the rest of Japan proper deserves special notice, **Hokkaido.** tens of thousand of settlers proceeding thither every year since the work of colonizing that northern island was started soon after the advent of the rehabilitated Imperial régime. This migratory movement is shown in the following table :—

Year.	Males.	Females.	Total.
1872	—	—	13,655
1877	—	—	2,539
1882	2,903	2,636	5,539
1887	4,278	3,509	7,787
1892	24,289	18,419	42,708
1897	36,457	27,893	64,350
1898	37,271	26,358	63,629
1899	25,182	20,212	45,334
1900	26,475	21,643	48,118

According to the returns of the settlers for 1900, 25,927 were engaged in farming, 4,620 in fishery, 1,743 in manufacture, 3,385 in trade and the rest in miscellaneous occupations.

EMIGRATION ABROAD—The emigration to foreign countries is comparatively insignificant, for those that go abroad generally stay there for a limited period, on official duty, for the purpose of prosecuting their studies, with the object of carrying on some business, or as laborers. This remark may also be applied to foreigners in Japan, so that in the present paragraph a few words may be said of the Japanese staying abroad and of the foreigners staying in our country.

JAPANESE STAYING ABROAD.—With increase of intercourse with foreign countries, the number of Japanese going abroad is steadily advancing, so that while in 1889 the number was only 18,688 it grew to 58,785 in the year 1897, to be still further increased to 123,971 in 1900. A review of the preceding 12 years shows the following figures :—

Year.	Males.	Females.	Total.
1889	13,815	4,873	18,688
1890	17,519	6,031	23,950
1891	23,681	8,465	32,146
1892	29,615	9,388	39,003
1893	31,147	10,055	41,202
1894	31,632	9,958	41,590
1895	34,332	11,945	46,277
1896	40,348	13,994	54,342
1897	43,707	15,078	58,785
1898	53,114	17,687	70,801
1899	76,633	22,406	99,039
1900	98,985	24,986	123,971

According to the returns for the last year in the above table, the majority of those temporary emigrants went to the United States of America and its colonies especially Hawaii, also to Korea, England and its colonies, Russia and its colonies, China, France, Peru and Germany. During the same year those temporary emigrants were employed thus:—

Country.	On official duty.	For prosecuting studies.	Engaged in trade.	Others.	Total.
United States and colonies ...	52	554	2,851	86,689	90,146
England and colonies	133	40	512	7,530	8,215
Russia and colonies	15	65	286	3,587	3,953
Holland	4	2	—	—	6
France and colonies	44	36	18	799	897
Portugal and colonies	—	1	—	9	10
Germany	33	162	5	14	214
Belgium	10	5	5	1	21
Italy... ..	7	—	—	6	13
Spain	2	—	—	—	2
Austria	8	13	10	5	36
Peru... ..	1	—	—	693	694
Brazil	7	—	—	2	9
Mexico	6	3	4	32	45
Siam... ..	7	3	29	39	78
Korea	538	16	9,669	5,606	15,829
China	202	40	1,931	1,630	3,803
Total	1,063	940	15,320	106,642	123,971

FOREIGNERS IN JAPAN.—The number of foreigners coming to Japan has been on the increase since the treaty was concluded with the United States of America in 1854 A. D. In 1873 the number stood at 4,190, increased to 4,236 in 1877, to 6,335 in 1882, 7,560 in 1887, and so on, as detailed below.

Year.		Year.	
1889 9,062	1895 8,246
1890 9,707	1896 9,238
1891 9,550	1897 10,531
1892 9,803	1898 11,589
1893 9,633	1899 11,684
1894 5,875	1900 12,664

In the number of foreigners in 1900 as classified according to nationality, the Chinese came at the top of the list, followed by the English, Americans, Germans and French, and so on, as shown in the following table:—

Subjects of	Males.	Females.	Total.
United States of America	833	629	1,462
Hawaii (U. S. A.)	2	—	2
England	1,260	784	2,044
British Dominion in Canada ...	15	29	44
Russia	88	89	177
Holland	42	23	65
France	313	145	458
Portugal	112	61	173
Germany... ..	395	145	540
Belgium	15	7	22
Italy	31	12	43
Spain	30	7	37
Austria-Hungary	51	27	78
Denmark	42	18	60
Switzerland	56	32	88
Sweden and Norway	36	14	50
Greece	10	2	12
Turkey	14	6	20
Peru... ..	1	—	1
Chili	2	—	2
Roumania	5	3	8
Argentine Confederation	—	2	2
Philippines (U. S. A.)	1	—	1

Subjects of	Males.	Females.	Total.
India (England)	7	—	7
Korea	184	9	193
China	5,394	1,496	6,896
Unknown	44	13	57
	<hr/>	<hr/>	<hr/>
Total	8,983	3,553	12,536

The total of this table does not coincide with the other one, because 128 persons forming the diplomatic and consular staff were excluded from the table.

CHAPTER III—Administrative System.

Rights of Sovereignty—Legislature and Legislative Organs— Executive and Executive Organs—Justice and Judicial Organs (with paragraphs on the Codes.)

I. RIGHTS OF SOVEREIGNTY.

ADMINISTRATIVE SYSTEM IN OLDEN DAYS.—Our Empire of Japan is ruled over by an Imperial House of unbroken lineage from the remotest antiquity, for though during the period of more than 2,000 years that has elapsed since the founding of the Empire, the nation has undergone various changes, this glorious dynasty has always remained unchanged.

THE MILITARY ASCENDENCY.—The administrative system was very simple in ancient times. There was no distinct line of demarcation drawn between military and civil affairs, and the whole nation was considered as one big army with the Emperor over it. It was during the "Middle Ages" and after the adoption of the Chinese system of administration, or more especially that of the then dynasty of Tung, that for the first time military and civil affairs were distinctly separated. Soon, however, the warrior classes began little by little to acquire the supreme authority, and to thrust the Court into the background. For more than seven centuries the real sovereignty of the country was vested in one or other of the Regencies that appeared in succession, till, in 1867, the Regency of Tokugawa was made to surrender the power to its rightful and original possessor, and thus the Imperial régime was firmly re-established. One thing that must be strictly kept in mind in this connexion is the fact that, in theory at least, the Emperors remained even during those periods of military ascendancy, the supreme heads of the country and were always regarded as sacred and inviolable.

THE IMPERIAL PREROGATIVE.—The restoration of the Imperial Government was at once followed by many striking changes in the administrative system of the country, as may be inferred from the fact that Japan promulgated her constitution 22 years after and soon began to blossom forth as a constitutional monarchy. This great change naturally led to the sovereign rights of the Emperor in the three domains of legislative, juridical and executive affairs, being strictly defined in the manner given below. The Emperor's prerogative now consists in the

1. Right of convoking, opening, closing or proroguing the Imperial Diet, and of dissolving the House of Representatives.
2. Right of issuing, in case some urgent necessity demands, the exercise of that right when the Imperial Diet is not sitting, Imperial Ordinances which take the place of regularly enacted laws.
3. Right of issuing or of causing to be issued the Ordinances necessary for the carrying out of the laws or for the maintenance of public peace and order, and for the promotion of the welfare of the subjects.
4. Right of determining, excepting those cases especially provided for in the Constitution or in other laws, the organization of the different branches of the administration, the salaries of all civil and military officers, and of appointing and dismissing the same.
5. Right of taking the supreme command of, and determining the organization and peace standing of, the Army and the Navy.
6. Right of declaring war, making peace and concluding treaties.
7. Right of proclaiming a state of siege.
8. Right of conferring titles of nobility, rank, orders and other marks of honor.
9. Right of declaring an amnesty, as well as the right of pardon, commutation of punishments, and rehabilitation.

II. LEGISLATURE AND LEGISLATIVE ORGANS.

CODIFICATION IN EARLY DAYS.—As provided in Art. VII. of the Imperial Constitution, the right of legislation belongs to the Emperor who exercises that right with the approbation of the Imperial Diet.

To briefly review the history of our legislature, the first thing that demands attention is the compilation of a code of laws by Prince Shōtoku during the reign of the Empress Shōmu (724-48 A. D.) and the compilation of the celebrated Taiho code during the reign of the Emperor Mommu (697-718). Though considered very important in those days, these legislative measures were necessarily very simple, at least when they are viewed from the standpoint of to-day, so that their value is mainly historical.

During the periods of military ascendancy and the prevalence of feudalism, the legislature was in an almost chaotic condition and it was not until after the Restoration that this fundamental organ of the administration was brought to a state of some perfection.

THE FIRST LEGISLATIVE WORK AFTER THE RESTORATION.—The first noteworthy legislative work accomplished by the reinstated Imperial Government was the issue, soon after its installation, of an Imperial Rescript by which the first corner-stone of the present Constitutional régime may be said to have been laid. That Rescript proclaimed, among other things, that “conferences shall be convoked all over the country and the affairs of State shall be determined by public discussion.” The first legislative organ

established in pursuance of that policy was the dual **Right House** body consisting of the “Right House” and the **and Left House**. “Left House” created in 1871. The “Right House” was composed of the Heads of Executive Offices of State and the other officials specially nominated by the Government. The “Left House” had to take charge principally of legislative work at the instance of either the Prime Minister or on its own initiative, while the “Right House” had to advise the Prime Minister as to the fitness or otherwise of the resolutions passed by the other House.

The two Houses were abolished in 1874, to be superseded by the Senate (Genrō-in) and the Local Governor's Council. The former was composed of Peers and of men who had rendered distinguished service to the country or who were eminent on account of their erudition, and was to take charge of legislative matters either emanating from the Cabinet or introduced at the instance of the Senate itself. The Senate was also entitled to receive petitions about legislation, so that it may be regarded as a precursor of the present House of Peers.

The Local Governor's Council was something like a national assembly, composed as it was of officially nominated members; for as announced in the Emperor's Rescript addressed to the Council on the occasion of its first sitting, its object was "to attend to the affairs of State as the representative of the people's interests." In the same Rescript the Emperor declared that he had called together the said Council "in pursuance of the solemn promise, given by Us on the occasion of Our accession to the Throne, to summon delegates of Our subjects, to assist Us in the conduct of affairs of State, to make with those delegates arrangements calculated to cement the amicable understanding that prevails between rulers and ruled, and to enable both to co-operate for the common good of the country." The Governors who attended the Council "were under no danger of incurring the displeasure of the Government for any opinion enunciated by them at the meeting."

ORGANS OF POPULAR REPRESENTATION.—The Council thus organized was abolished in 1880, but as meanwhile the system of local and municipal assemblies had been established, the organs for voicing popular opinion were now more satisfactorily arranged. A change in a similar direction was made in the following year when the institution of a national representative assembly in the year 1890 was proclaimed. On the 11th February of 1889 the Imperial Constitution, the Imperial House Law, the Law of the House, the Law of Election of the House of Representatives etc., were promulgated, and in October of the following year the first memorable session of the Imperial Diet was

convoked. In this manner did Japan obtain from her Emperor the great boon of a Constitution.

LEGISLATIVE PROCEDURE.—Projects of laws originate either in the Cabinet or in the Diet, and become law when they obtain the approval of the Emperor and the consent of the Diet. A project coming from the Government is introduced to the Diet after it has been submitted to and discussed by the Cabinet and the Legislative Bureau, and finally receives the sanction of the Emperor. Any project relating to a law connected with the Imperial Constitution must first pass through the hands of the Privy Council.

LEGISLATIVE ORGANS.—Strictly speaking, the legislature may be said to be composed by the two Houses of the Diet, though in a larger sense the Cabinet, the Legislative Bureau, and sometimes the Privy Council may be regarded as forming part of the legislative machinery.

HOUSE OF PEERS.—This House consists of Princes of the Blood, Peers, men of distinguished services or of remarkable erudition, and representatives of the highest-tax paying section of the people. It enjoys practically identical rights in the legislature with the other House.

HOUSE OF REPRESENTATIVES.—This House consists of members elected by the people; and all male subjects of over thirty years old are now eligible for election, there being at present no property or other qualification in consequence of the amendment of the Law of Election. Owing to the same amendment the electorates are no longer divided into small sections as they were before, and at present each prefecture is divided into urban electorates which are independent and rural electorates which return between them a fixed number of members determined according to the number of inhabitants contained in the rural districts.

RIGHTS AND PRIVILEGES OF THE DIET.—It must not be supposed that the Diet enjoys part of the rights of sovereignty, for, as we have already pointed out, these belong exclusively to the Emperor. The rights and privileges enjoyed by the Diet consists of the right of deliberating on legislative measures and of approving of such measures if they are considered to merit such approbation.

Those rights and privileges may be briefly summed up as follows:— (1) the right of receiving petitions from the people, (2) the rights of submitting memorials to the Throne and of representations to the Government, (3) the right of demanding explanations from the Government about administrative affairs, (4) the right of supervising the finances.

LEGISLATIVE FORMS.—There are six legislative forms, namely, Laws, Imperial Ordinances, Ordinances of the Cabinet and of the Departments of State, and Rules and Instructions. All these measures are published in the *Official Gazette*, and the date of the coming in force of a law is, unless otherwise specially determined, after the lapse of full twenty days from its promulgation, while all others are to come in force seven days after the issue of the number of the *Official Gazette* containing them.

A law may supersede an Ordinance, but under no case can an Ordinance supersede a law.

III. EXECUTIVE AND EXECUTIVE ORGANS.

GENERAL REMARKS.—As already mentioned above, the organization of the executive was extremely simple in ancient times, and that the encroachment of the military classes reduced the Court during a long period of over seven centuries to a mere figure-head. The feudal system attained its greatest perfection under the Tokugawa Regency which extended over about three centuries of prosperity.

THE ADMINISTRATIVE POLICY OF THE TOKUGAWA REGENCY.—The Regency adopted a policy of decentralization and, unless required by special occasions, it left the feudal princes to rule their own dominions with perfect freedom. The administrative system of the Regency, a system copied by the feudal princes, was extremely simple. The principal officials who conducted it were the Tairō (Premier), Rōju (Ministers) and Bugyo (Magistrates). The system followed by the Regency was not of much value theoretically but, in the amount of the practical benefit it accomplished, it was a good system, resembling in this the British constitution.

It was after the disappearance of the Regency and the ushering

in of the present Meiji Government that Japan began for the first time to possess a regular and efficient system of administration organs.

THE EXISTING ADMINISTRATIVE SYSTEM.—In the existing administrative system there is the Privy Council as the supreme advisory organ to the Emperor, while on the other hand there is the Cabinet as the central administrative headquarters, having under it nine Departments of State, that is to say, the Departments of Foreign Affairs, Home Affairs, Finance, War, the Navy, Justice, Education, Agriculture and Commerce, and Communications. A Minister of State presides over each Department, and the Government establishes Special Offices to deal with affairs relating to the auditing of the State finances, administrative matters, litigation and police. Each Department has under it a greater or less number of subordinate offices, and in this connection the Home Office stands out most conspicuously as it controls all the local offices and the various civic corporations.

The main points in the three administrative organs, central, local and civic corporations will be described below.

CENTRAL EXECUTIVE ORGANS.—The central administrative organ is divided into executive bodies and advisory bodies. The former consist of the Cabinet, the Departments of State, and special offices, while the Privy Council, Codes Investigation Commission and similar commissions make up the latter.

First about the higher executive bodies with the Cabinet at their head.

The Cabinet is composed of the Ministers of State presided over by the Premier who, in obedience to the Emperor, deals with all matters relating to administration.

The principal matters to be determined by the Cabinet are as follows :—

- a. Drawing up of projects of laws and compilation of Budgets and Settled Accounts.
- b. Matters relating to treaties with foreign countries and to international questions.
- c. Imperial Ordinances relating to official organization or the operation of laws.

- d. Disputes between the Departments of State as to jurisdiction.
- e. Petitions of people sent in either by the Emperor or by the Diet.
- f. Disbursement not covered by the Budget.
- g. Appointments and other movements of officials of *chokunin* rank and of local Governors.

Matters of importance coming under the direct supervision of the Ministers of State may also be laid before a Cabinet Council.

Attached to the Cabinet is the Legislative Bureau which deals with matters relating to the drafting of projects of law or of Ordinances or their amendment or revocation, whether such drafting or amendment is done at the instance of the Cabinet, or of a Department of State or at its own initiation. It is also entitled to express its own opinion about those matters.

The Minister who has charge of a Department of State is empowered to issue Departmental Ordinances and to issue orders to **Departments of State.** the chiefs of the Metropolis Police, the Hokkaidō Administration Office and provincial Offices in connection with matters coming under his direct control.

There are two kinds of special Offices, one independent of the Departments of State while the other is subordinate to them. The Board of Audit and the Administrative Litigation Court belong to the first class. On the **Special Administrative Offices.** other hand there are quite a number of Special Offices subordinate to one or another of the Departments, these being as follows, to mention only those that are important :—

Those that are subordinate to the Home Office :—Metropolitan Police Office, Ise Great Shrine and Great Shrine Construction Offices, Hokkaidō Administration Office, Provincial Offices, Formosan Governor General's Office, Sanitary Laboratory, Blood-serum Laboratory, Vaccine Laboratory, Public Works Inspection Offices, Epidemic Diseases Laboratory.

Those that are subordinate to the Department of Agriculture and Commerce are as follows :—

Forest Inspection Offices, Mining Inspection Offices, Agricultural Experimental Farms, Industrial Laboratory, Geological

Surveying Office, Steel Foundry, Yokohama Silk-Conditioning House, Mineral Fertilizer Surveying Office, Horse Breeding Pastures and Studs, Cattle Breeding Pastures, Sericultural Training Schools, Fishery Training Schools.

Those that are subordinate to the Department of Finance, are:—Inland Revenue Offices, State Monopoly Offices, Customs House.

There are, besides, Post and Telegraph Offices and Telephone Offices under the Department of Communications; Prisons and Penitentiaries under the Department of Justice; legations and consulates under the Foreign Office, various kinds of educational institutions under the Department of Education, military or naval schools under War Office or the Admiralty.

ADVISORY ORGANS OF THE HIGHER EXECUTIVE BODIES.—

The Privy Council is the supreme advisory body to the Emperor and attends to (a) matters relating to the Imperial House Law; (b) matters relating to projects of laws and Ordinances with reference to clauses in and laws and Ordinances pertaining to the Constitution; (c) matters relating to the declaration of a state of siege, to the issue of urgency Ordinances to take the place of laws when the Diet is not sitting, and to punitive provisions of the Constitution; (d) matters relating to treaties and international agreements, matters relating to the organization and rules of the Privy Council; (e) other matters on which it is ordered by the Emperor to deliberate.

Subject to the control of the Prince Minister, the **The Codes Investigation Commission.** Commission draws up drafts relating to the Codes and Laws and Ordinances appertaining thereto, and also investigates matters relating to the putting in force of treaties.

Subject to the control of the Home Minister, this **Central Sanitary Association.** Association submits its opinions on points referred to it by the Minister in regard to public hygiene and epidemics among domestic animals.

Subject to the control of the Home Minister, the

Public Works Commission. Commission submits its opinions on points referred to it by him in regard to various public works.

Subject to the control of the Educational Minister, the **Higher Educational Commission.** Commission submits its opinions on points referred it by him in regard to higher education.

Subject to the Minister of Communications the **Railroad Council.** Council submits its opinions on points referred to it by him in regard to railroads.

LOCAL ADMINISTRATIVE ORGANS.—The local administration system adopted by the Tokugawa Regency was based on the decentralization principal, and the local daimyos were left to do what they liked in the governing of their own dominions. With the the abolition of the feudal system and the re-establishment of the Imperial Government, the administration policy was one of centralization, with the object of bringing affairs in the provinces to a state of uniformity. This policy was attended by some evil, as it did away with some beneficial local customs, but of course this evil was outweighed by the immense improvement effected in the local administration.

Meanwhile the Government saw that the time had arrived for starting the contrary programme of decentralization of authority, and of allowing people to take part in administrative affairs. Thus in 1880 the Provincial Assembly Regulations were enacted, followed in 1884 by the Civic Corporation Regulations. In 1888 the self-government system was in thorough working order, as it exists to-day.

The local administration system is divided into prefectural administration and sub-prefectural (*Gun*) administration. It combines two functions, that of being, on one hand, a part of the great administrative organ of State, and, on the other, of acting as a self-governing mechanism.

Prefectural Administration. As to the former all matters are in the charge of the Governor who has to carry out, under the supervision of the various Ministers of State, Laws and Ordinances, also to attend to all the administrative affairs in his prefecture, and to keep peace and order therein. He is therefore authorized to summon

military help from the nearest headquarters whenever an emergency requires it.

In regard to the self-government arrangement, it may be stated that every prefecture has a prefectural assembly composed of members who represent the people in the urban and rural districts. It discusses and deliberates on financial and other important matters of the locality. The assembly is convoked by the Governor at fixed periods, and the Local Council, which is a permanent institution, takes part on behalf of the assembly in administrative affairs, and attends to all affairs which the assembly cannot see to when it is not in session.

It was in 1878 that the sub-prefectural administrative arrangements were first elaborated in definite form. At present this administration does not differ in its procedure and **Sub-prefectural** principles from the prefectural administration of **Administration** which it forms a part, and, just like the other, its system is twofold, that is it combines ordinary administrative business and self-government business.

The Self-Government System as developed in 1888 is divided into three grades, Prefectural, Sub-Prefectural and Civic Corporations (cities, towns and villages). Of these three divisions **Self-Government** the last one relating to municipal and rural **System.** communities represent the self-government mechanism in its most striking form, for in the other two higher divisions, owing to the greater part they have to play in administrative affairs their self-government function does not lie so distinctively on the surface as in the other. Both legislatively and also practically the municipal and rural communities are *bona fide* self-governing bodies for they are entitled by law to enjoy the rights of juridical persons, also to incur obligations as such, and to arrange all public matters relating to their own communities.

IV. JUSTICE AND ITS ORGANS, WITH PARAGRAPHS ON THE CODES.

GENERAL REMARKS.—The only authentic record worth noting in the history of justice in this country is the existence in the "Middle

Ages" of a special office for dealing with criminal affairs, while during the period of military ascendancy those matters were taken charge of by Censors. Coming down to the Tokugawa Regency, magistrates were made to deal with civil and criminal affairs. They had not, however, any laws to follow, but were obliged to judge each case according to the lights of their own understanding and in conformity with the broad principle of chastising wrong and of upholding right.

The first regular court of justice established by the Meiji Government was the Tokyo Court of Justice established in Tokyo in 1871. Within the following four years one Supreme Court and four Courts of Appeal, besides a number of lower tribunals were established. Several improvements were subsequently carried out, till at last by the Law of Organization of Courts, the present system was developed.

ABOLITION OF THE EXTRA-TERRITORIAL SYSTEM.—The most noteworthy chapter in the history of our judicial system is the doing away in 1899 with the extra-territorial rights which the Western Treaty Powers retained in virtue of the treaties concluded before the Restoration, and the bringing of foreign residents in Japan under the Japanese laws.

ORGANIZATION.—Our judicial system is divided into four grades, that is Supreme Court, Appeal Courts, Local Courts, and District Courts. The last is the lowest tribunal and is conducted by a single Judge, while in the Local Courts three collegiate Judges sit on a case, in the Appeal Courts five collegiate Judges, and in the Supreme Court seven collegiate Judges. Public Procurators are attached to each Court, on commission from the Minister of Justice. It is needless to state that ordinary Judges represent the right of sovereignty of the Emperor and that their function is held sacred and inviolable. Hence their tenure of office is securely guaranteed by the Constitution. Judges are also amenable to special disciplinary laws.

NUMBER OF COURTS.—Both the Judges and Public Procurators secure their appointments by passing the regular examination of Judges and Public Procurators.

The following table shows the number of courts and the staffs as they stood at the end of 1901.

	No.	No. of Judges.	No. of procurators.	Population per one Court.	Area of district per one Court.
Supreme Court ...	1	25	7	45,193,583	24,998.80
Appeal Court ...	7	121	29	6,456,227	3,571.26
Local Court... ..	49	399	140	922,319	510.18
District Court ...	310	557	159	145,786	80.64

BARRISTERS.—It may be added that the barristers are regulated by the Barrister's Law, and that various strict measures are in force with regard to their qualifications, rights and privileges, obligations, etc. They are amenable to the same disciplinary law as that enforced in the case of Judges. .

WORK OF CODIFICATION.—Japan had no written code of laws properly speaking till about 30 years ago. The first attempt made in this direction was the compilation of a criminal code in the year 1870 to be amended three years after. The code was far from being perfect, having been mainly based on our ancient customs modified more or less by Chinese laws.

In 1882 year the Criminal Code and the Code of Criminal Procedure were enforced. The latter was subjected to a thorough amendment in 1889, and similarly the former is about to be amended with the consent of the Diet. The principal statute laws thus far enforced are as follows:—

Imperial Constitution	(issued in 1889)
Law for the Application of Laws	(in 1898)
Law of Nationality	(in 1899)
Criminal Code	(in 1898)
Criminal Procedure	(in 1890)
Civil Code	(in 1896-1898)
Civil Procedure	(in 1890)
Commercial Code	(in 1890-1898)
Insurance Law	(in 1900)
Law relating to the Registration of Real Estate	(in 1899)
Law relating to the Organization of Courts of Law	(in 1890)
Law regarding Ships	(in 1899)
Law regarding Crews of Ships	(do.)

CHAPTER VI.—Land as an Institution.

History—Classification—Burdens—Ownership.

HISTORY.—The history of the land in this country especially as regards the ownership of it, may be briefly divided into three parts. (1) The period of the ancient Imperial régime, (2) the period of military ascendancy and feudalism, and (3) the modern period of the reinstated Imperial régime.

During the first stage all the land belonged theoretically to the Court, but, coming to the period of feudalism and military ascendancy, we find that this power was practically held by the feudal barons. It was by a very precarious tenure that people were allowed to own their own land, but after the Restoration that right of the ownership of land by private individuals was firmly established by law.

In 1867 the Imperial Government issued a proclamation to the effect that the land in the villages should belong to the villagers; in 1874 the land was subdivided into State land and the land belonging to private individuals; and, finally, in the following year it was proclaimed that the title deeds should bear the names of the owners.

CLASSIFICATION OF LANDS.—State land and private land are classified, the former into four and the latter into two categories.

The four categories of State land are as follows:—

1. Land belonging to the Imperial Court, and land belonging to Shinto shrines.
2. Land belonging to Princes of the Blood and land belonging to the central and local Government offices.
3. Mountains, hills, woods and forests, plains, rivers, seas, lakes, ponds, swamps, drainage ways, ditches, embankments, roads, cultivated fields, etc. not belonging to private individuals; also land occupied by railroad tracks, telegraph and telephone posts, premises of lighthouses, places con-

taining historic remains, public parks, graveyards, and all other such land not belonging to private individuals.

4. Land occupied by temples, schools, hospitals, etc. not belonging to private individuals.

The two kinds of private lands are as follows:—

1. Arable land, places of residence, woods and forests covered by title deeds; lands occupied by schools, hospitals, store-houses, pastures, shrines, temples, etc. owned by private individuals or by several persons or by one or several village communities.
2. Land occupied by shrines, graveyards, sewer-ways, reservoirs, embankments, wells, ditches, highways, etc. not belonging to the State.

There are five kinds of land registers, namely national registers, prefectural registers, provincial registers, district registers and town and village registers. Special rules exist for regulating the determination of the various kinds of land.

BURDENS ON LAND.—State land is of course exempted from taxation, and title-deeds are only issued to land coming under the 2nd category. For private lands the title-deeds are given for lands of both kinds, but those under the 1st category alone are subjected to taxation.

Taxable lands are divided into two classes as follows:—

1. Arable lands, dwelling lands, salt-fields, mines and mineral springs.
2. Lakes, ponds, woods, pastures, plains and miscellaneous lands.

Lands newly reclaimed are exempted from taxation during a certain period of years.

The Land Tax which stood at 2.5 per cent. of the assessed value until a few years ago was raised for a period of five years beginning from 1885 to 3.3 per cent. in order to meet the increased Government expenditure occasioned by the so-called post-bellum measures. The limits of five years having expired it was rescinded in 1902. The assessed value of course differs according to local circumstances, relative fertility, and other accidental causes. It is the principle of the Land Tax not to make any alteration according to the relative success of crops.

The Land Tax carries with it two kinds of rate, Local Rate and Municipal or Town or Village Rate. Unless with the approval of the Minister of Home Affairs the former cannot exceed $1/3$ and the latter $1/7$ of the main tax. The two rates are collected from the owners of the lands, except in some special cases.

RIGHT OF OWNERSHIP OF LAND.—The owner of a piece of land is of course entitled to do whatever he likes with his land, provided his act is not illegal and does not infringe on the rights of others. The owner of a piece of land has special privileges and obligations with regard to neighboring pieces of land, these being the right of way and the right of using other's land when one has to build or repair his house or fence, etc. On the other hand a space of $1\frac{1}{2}$ *shaku* from the common boundary line must be left in building a house on one's land, while a window or veranda placed within the distance of less than 3 *shaku* from the common boundary and from which the neighbor's premises can be seen, must be provided with a shutter. Then there are provisions for getting rid of superfluous water on one's land, but of course when such water happens to injure property of any kind in adjacent land situated on a lower level, the owner of the land from which the water came must pay for the damage done.

Besides the right of ownership, there are also the right of superficies, of perpetual lease and of emphyteusis attached to land, but these being dealt with minutely in the Civil Code need not be explained here.

It may, however, be stated that land is liable to be requisitioned when the interests of the public render such a step necessary. For particulars on this head, the Law for the Requisition of Land should, however, be referred to.

A special arrangement exists for the convenience of the trial extraction of minerals, an arrangement which is far more convenient than that relating to the ordinary process of requisition, for in this case of trial extraction the whole business is left under the case of the Chief of the Local Mining Inspection Office in the jurisdiction of which the case has occurred.

Land may constitute the hereditary estate of a Peer, and no land of this kind can be sold, transferred, mortgaged or hypothecated.

PART II.

PRIMARY INDUSTRIES.

SECTION I.

AGRICULTURE.

CHAPTER I—Introductory.

Position of Agriculture in National Polity — Features of Japanese Agriculture—Free-holders and Tenant-farmers.

POSITION OF AGRICULTURE IN NATIONAL POLITY.—The history of agriculture in Japan is coëval with the history of the country itself, for the sovereigns that have successively ascended the Throne since the accession of the first Emperor devoted all their attention to the prosperity and progress of this most important industry of the realm, so that agriculture, though subjected more or less to vicissitudes during that long period, still remains the bulwark of our national prosperity and power. In short, Japan is still essentially an agricultural country.

The development of agriculture has been markedly accelerated since the introduction of the Western sciences and arts after the throwing open of the country to foreign commerce and intercourse fifty years ago. It need not be pointed out that Japan's traditional policy of fostering agriculture will be continued in the future.

FEATURE OF JAPANESE AGRICULTURE.—In describing the condition of agriculture in this country there are two points that stand out prominent. They are (1) agriculture, as it is carried on here, is essentially tillage, and has little to do with stock-farming;

(2) and, as compared with agriculture in Europe and America, the scope of our farming operations is extremely small.

The fact is that our forefathers who mainly subsisted on cereals were further led by religious prejudices to eschew animal food. Then the absence of wide plains, comparatively speaking, naturally obliged our farmers, then as now, to conduct their business on a small scale.

Foreigners not well acquainted with the state of affairs in Japan may be puzzled on being told that the average extent of land tilled by one farming family does not exceed one hectare. They may even wonder how our farmers can subsist on such a small patch of cultivated land; but this surprise, though quite natural for foreigners, will practically disappear when they remember that the system of tillage carried on by our farmers is extremely thorough and careful, and that, as two even three crops are raised on the same field in one year, even a farm measuring only one hectare is really equivalent in productive capacity to a farm of two or three hectares in most other countries. Besides, our farmers are not required to attend to field work all the year round and when the field work makes no great demand upon their time, they can undertake other job work, while the women and children in their families also make themselves useful by raising silkworms, reeling silk or doing other such suitable work.

As the natural result of the peculiar geographical formation of Japan, that is, of its extending so far north and south and including therefore so many degrees of latitude, our system of agriculture presents diverse and distinct features. Moreover, this tendency to diversity was further enhanced during the pre-Restoration days by the division of the country into a large number of practically independent communities. The consequence is that, while in some districts sericulture is predominant, in others tea demands the most attention, while still others have sugar or other products as the staple farm produce. However, owing to the reasons mentioned above, stock-farming is as yet comparatively backward, though the rearing of live stock for tillage or draught work is carried on to no small extent in some districts.

FREE-HOLDERS AND TENANT-FARMERS.—Accurate data about the land tilled by independent farmers and tenant farmers are

not procurable, and the latest returns available are those for 1888. The ratio between the two kinds of farmers stood as follows in 35 prefectures.

	Land tilled by Independent farmers.	Land tilled by Tenant farmers.
Paddy fields	60 per cent.	68 per cent.
Upland fields	40 „	32 „

According to the same returns there were in 38 prefectures about 1,470,000 independent farmers and about 2,000,000 farmers who were partly independent and partly lesses of land belonging to others, while the *bona fide* tenant farmers numbered about 950,000. In other words, the farmers who were partly or wholly tenant farmers aggregated about 3 millions, and therefore about double the number of free-holders. As matters have become less favorable since that time for small free-holders, the ratio of tenant farmers and tenant farmers must have grown more. Indeed the condition of tenant farming is far from being satisfactory, for, according to the investigations made in 1887, out of ten parts of the products of paddy fields throughout the country the landowners obtains about six and the tenant-farmers only four, while in regard to the upland fields the relative ratio was four and a half parts and five and a half respectively. The steady increase of population at a rate far beyond that of tillage land constitutes an important factor in keeping the rents high, for tenant farmers are obliged from sheer necessity to compete for leases, and in raising of course the rents as the natural result of their competition. In extreme cases the share of harvest that falls to the lot of tenant farmers is barely sufficient to pay the cost of the manure applied to the fields.

Such being in general the condition of our tenant-farmers, in most cases they are obliged to depend in tillage on the labor of their own families, while the limited funds they have at their disposal for getting fertilizers or farm implements further hampers them in their work. Under these circumstances, they find it hard to keep up with the progress of the times, and this hard lot is also shared by small free-holders. But the evil does not end here, for our farming classes which constitute 60 per cent of the whole population, are steadily increasing in number, so that those who can afford to do so are

migrating to cities and towns. In view of this circumstance both the Government and the general public are doing their best to improve the mode of tillage, to encourage the use of labor-saving machines and devices, and also to provide various conveniences to encourage their settlement in unexploited places. It may safely be expected that the condition of our farmers will become much better in the near future than it is now.

CHAPTER II.—Factors of Tillage.

Climate—Land—Capital—Labor.

I. CLIMATE.

GENERAL REMARKS.—Owing, as has been already described, to the peculiar geographical formation of the land, the climate of Japan is naturally very much diversified. A somewhat detailed account about the climate being given in the preceeding part, it is enough to explain here the special influence which the climate exerts on the agriculture of the country.

AVERAGE YEARLY TEMPERATURE.—The average yearly temperature in Okinawa and Formosa is above 20° C., while in Hokkaidō where the other extreme is to be found, the average is not more than 5°, according to places. The difference between the maximum and minimum temperatures is greater in the north than in the south, for while in summer the temperature stands comparatively high in the north, in winter, owing to the influence of the severe climate on the continent, the thermometer falls in many places below zero.

The prevailing wind in summer is a moist southerly wind, but in winter the cold northerly wind coming from the continent reigns supreme. The season during which one of these two kinds of wind is exchanged for the other presents a peculiar meteorological aspect. Early in summer the moist southerly wind that begins to prevail brings about the rainy season, while in autumn when the northerly wind begins to take the place of the southerly, the low atmospheric pressures that frequently make their appearance in the south are liable to invade the country and to cause storms. The northerly wind coming from the continent in winter deposits its moisture borne from the Sea of Japan on the districts bordering that sea.

HUMIDITY.—As a rule the moisture is greater in the southern provinces and less in the northern, the rate in the latter being about one half that in the former. It is natural, therefore, that rain

should be copious in summer in the southern districts and that snow should fall to a considerable extent in winter in the northern provinces. The average amount of rain and snow during 1901 or in succeeding year is shown below :

	mm.		mm.
Taihoku	2,228	Niigata	1,765
Kagoshima	2,061	Fukushima	1,233
Ōita	1,614	Aomori	1,282
Nagasaki	1,951	Sapporo	979
Numazu	1,836		

CROPS AS INFLUENCED BY CLIMATE.—The crops raised in Japan are naturally influenced by its climate, and it is principally on account of the copious rain-fall and the high temperature in summer that rice is so universally grown throughout the country. The only drawback is the coming of storms between summer and autumn. Other tropical and sub-tropical plants besides rice are well suited to our country owing to the great heat in summer; but, on the other hand, owing to the rather sudden fall of temperature in winter, even plants growing in the temperate zone can not easily stand the rigor of climate in that season.

In winter, frost comes on almost everywhere throughout the country, while snowfalls are heavy and frequent in the north-eastern districts. It is in these districts, that barley and wheat and rape can be grown with success. However, the weather is apt to become humid at the ripening season of barley and wheat, thereby impairing to no small extent the quality of those grains. The buds of the mulberry and tea plants, too, are frequently damaged by the frost that comes in early spring. The cultivators of those important plants are therefore devising various measures to prevent this injury.

In warmer places the better decomposition of manures and the vigorous growth of plants make it possible to raise in a year two or even three crops on the same field, but the farmers in cooler districts must be contented with only one. The two most convenient crops for puddy fields are rice in summer and barley or *genge* (*Astragalus sinensis*, L.) in winter. When only one crop can be raised, the choice falls on rice.

The choice of crops bears of course an important relation to the economy of farmers, for while their time is occupied all the year

round when the tillage can be carried on throughout the year, they can have more or less time at their disposal when farming operations are suspended in winter. As a general rule our farmers are least busy in winter, and this leisure they employ in repairing their tools and implements or making other arrangement against the coming season.

Stock-farming also bears an important relation to climate, but, as mentioned above, this branch of farming is decidedly secondary, both from traditional custom and from the lack of space available for it. It is, however, gradually coming to the front in the northern districts.

II. LAND.

GENERAL REMARKS.—Classified according to the nature of mother-rocks from which it is derived, the soil of Japan is divisible into several kinds; but according to geological formations only two kinds of soil exist in Japan, generally speaking; these soils being igneous and sedimentary.

Soils derived from igneous works occupy about one-third of the whole area of the country, and as these generally exist on hilly places only a small portion of them can be brought under cultivation. The soil of these cultivable areas is generally loamy and fertile.

ALLUVIAL SOIL.—Soils of sedimentary formation are more widely distributed than the others, generally occupying plains and therefore easily accessible for purpose of cultivation. Of the various kinds of soils of sedimentary formations, those belonging to the Tertiary, Diluvium or Alluvium system occupy a very wide area and generally form the most valuable arable land in the country, while the remainder belongs to Paleozoic or Mesozoic formations and is limited in extent. The soils of Tertiary or Diluvium formations, existing in the northeastern parts of the Main Island in larger proportion than in others, are generally clayey, containing, as we proceed towards the north, a larger quantity of organic matter. They are moderately fertile. The soils of Hokkaidō, also belonging to these two formations, are richer in organic matter which has accumulated for

many centuries. They are therefore far more fertile than the same kind of soils found in the Main Island.

The soils belonging to Alluvium formation are widely distributed throughout the country, and as they occupy level places easily admitting irrigation, they are well adapted for the cultivation of rice. The presence of great number of streams, short in length and rapid in current, explains the wide distribution of alluvium soils in Japan, and why it has a tendency to be sandy. However, owing to the comparative abundance of rain fall, the soil is fairly productive.

NATURAL CLASSIFICATION OF LAND.—The land in Japan proper (exclusive of Formosa) occupies an area of 24,794.36 sq. *ri* which corresponds to 38,555,229 *chō*. This land can be classified as follows as to ownership and kind:—

1ST KIND. (Private Land).

	Area <i>chō</i> .
Land owned by private individuals	14,272,339

(a.) TAXABLE LAND.

Puddy or upland fields	5,045,278
Dwelling land	384,635
Salt fields	7,090
Forests	6,997,571
Plains and pastures	1,075,246
Mineral springs, ponds, swamps and miscellaneous land.	20,967

Total... .. 13,530,788

(b.) LAND EXEMPTED FROM TAXATION
FOR SOME YEARS.

Newly opened land	10,556
Waste land	232,730
Puddy fields... ..	71,721
Upland fields	133,164
Dwelling land	3,230
Salt fields	8,900
Plains and pastures	11,865
Mineral springs, ponds, etc.	3,236

Total... .. 243,286

(c.) LAND EXEMPTED FROM TAXATION AND
UNTAXABLE LAND.

School land	1,660
Premises of shrines	1,164
Cemeteries and graveyards	22,773
Sewer-ways, drainage ponds, etc.	49,638
Embankments	4,027
Railroad track	7,611
Protection forests	401,045
Roads and water-works routes	828
Farm boundaries	9,277
Others	236
	<hr/>
Total... ..	498,265

2ND KIND.

Land belonging to the State and Court	21,394,805
A. Land belonging to the Court, Imperial Mausolea, Shrine premises... ..	3,670,803
B. Land belonging to Princes of the Blood, Government land	80,171
C. Government land, forests, plains; public parks, former foreign concessions, foreign cemeteries, etc.	17,643,063
D. Premises of Government and local institutions, hospitals, etc.	766
	<hr/>
Grand Total	35,667,144

If the grand total is deducted from the gross area of 38,555,229 *chō*, there remain 2,888,085 *chō*, which account for highways, places under water, etc.

CLASSIFICATION OF ARABLE LAND.—The gross area of our arable land is 6,120,519 *chō*, which can be divided as follows according to uses :—

Puddy fields	2,748,575 <i>chō</i> .
Upland fields (containing	2,296,698 ,,
Mulberry fields	222,731 ,,
Tea plantations)	31,889 ,,
Plains and pastures	1,075,246 ,,

PER CENTAGE OF ARABLE LAND.—The whole area of the arable land in Japan is only 15.7 per cent of the whole area of the Empire (exclusive of Formosa): in other words, the whole area of arable land extends over an area of 38,555,229 *chō* as before mentioned. On the other hand the area of paddy and upland fields, amounting to 5,045,273 *chō*, corresponds to only 12.9 per cent. of the whole surface of the country. The comparatively small area of arable land is solely attributable to the hilly nature of our country.

DISTRIBUTION OF ARABLE LAND.—The foregoing extent of arable land is distributed among the local prefectures in the following table:—

Prefecture.	Paddy fields.	Upland fields.	Plains and pastures.	Total.
Tokyo	17,892	42,265	7,664	67,821

CONDITIONS OF ARABLE LAND.—The cultivation of rice being the principal item in the economy of our farmers, the greater part of the arable land consists of rice fields which often occupy places situated in low and wet places and not quite suited for other crops. Of these rice fields 30 per cent admit of receiving a second crop after the harvesting of rice. Upland fields are to be found on the other hand in elevated places where the drainage is good. In districts which are very densely populated or where special agriculture products are to be raised, even the slopes of the hills are utilized for upland farming.

AVERAGE AREA OF CULTIVATED LOTS.—The lots of cultivated fields are extremely small. According to the latest returns 53 per cent of the paddy fields consist of lots measuring less than 5 *se*, while about 74 per cent of upland fields consist of lots of less than 1 *tan*. The average extent of lots (exclusive of Hakkaidō and Formosa) is 4.14 *se* for wet fields and 5.12 *se* for the other. The

lots for wet fields are those registered in the Land Records, and as each lot is further subdivided the real extent of each lot does not exceed 2 *se*. Such an extraordinarily small extent of cultivated fields is principally due to the comparative absence of level plains, to the necessity of irrigation, and also to the fact that tillage is principally done by hand. Besides, the shape of the lot, too, is, as a rule, very irregular, and this necessarily entails serious inconvenience on the cultivator. It is in view of this that of late the question of adjusting farm-lands has begun to attract serious attention in agricultural circles.

IRRIGATION AND DRAINAGE.—Irrigation and drainage being indispensable for the cultivation of rice, provisions for facilitating them have been made since ancient times. The sovereigns of the country have also shown a great solicitude to make these provisions as complete and perfect as possible. The water used for irrigation is either led from rivers or supplied by storing rain-water in reservoirs.

MODE OF IRRIGATION.—The usual mode of irrigation for rice fields consists in leading the water into those fields till it has accumulated there in a sheet suitable in depth and volume. The farm is therefore made very level and is encircled by boundary walls 30 to 34 centimetres in height. While the water is led into the farm from an elevation, it is made at the same time to flow out by an outlet provided at the other end of the farm. The other crops receiving irrigation are generally cotton, indigo and sugar cane, and the irrigation for them consists in leading water into the spaces between the ridges, and causing it to remain there, till it soaks through.

The condition of the rivers naturally bears an important relation to irrigation and also to the success of farming. The recent reckless felling of trees at the head waters of rivers has made the beds of rivers liable to rise, as to obstruct the exit of water from the rice fields, the surface of the rivers being often higher than the water in the farms, and also to cause far more serious damage by overflowing the embankments in time of heavy rain and flooding the fields situated in close proximity. In view of these considerations, the Government is at present doing its best to prevent such ravages

on the part of unruly rivers, and has by means of legislation devised measures for protecting the forests at the headwaters. Farmers are made to organize themselves into irrigation guilds and to make all the required arrangements for the protection of their common interests. All these legislative measures have not yet been completed, but when they are completed, the benefits derived by the farmers from irrigation will be much greater than at present, while the risk of inundation will be minimized. It ought to be added that besides constructing reservoirs wherein to store rainwater, at a place where water for irrigation purposes cannot be easily procured owing to the high situation of the farms, farmers use treadmills or water-mills to raise water. Steam mills are even employed when a large quantity of water is required for elevated farms.

MODE OF DRAINAGE.—The waste water coming from the irrigated fields is led off by a net-work of drainage ways, mostly small open channels, and is finally discharged into rivers. But in low places where this natural method of drainage is not admissible, waste water must be removed either by water mills or by steam pumps. To some limited extent, and especially in places where the waste water is liable to stay, a subterranean drainage system is adopted.

SOME IMPROVED ARRANGEMENTS.—Of the improved arrangements of farming those that are generally carried out are the adjustment of farm-lands, and the improvement of the drainage, irrigation, surface coating of the soil, etc.

I. ADJUSTMENTS OF FARM-LANDS.—As already described in the preceding part, the size of farms in our country being small, their enclosure by walls and farm-fences naturally entails a waste of time and of space that might to be employed to better advantage, not to speak of the danger to which such enclosure gives rise of providing reptiles, rodents and injurious insects with a snug dwelling-place in the boundary lines or paths. The amount of time which our farmers lose owing to the small size of the farms may be easily imagined when it is remembered that though the average area of the farm tilled by one family does not exceed 9 *tan* 3.15 *se*, the different farms making up this average total are generally scattered about, and very rarely situated at one place. It was to

obviate this disadvantage that the Government, with the approval of the Diet, enforced the law for the Adjustments of Farm-Lands, from January, 1900. This measure has been welcomed by the public, and already the provisions set forth in it have been carried out in, 300 places where re-arrangements of fields amounting altogether to over 15,000 *chō* in area, have been effected. Some of the benefits derived from this measure are described below:—

- a. Owing to the size of the lots being enlarged and their shape made regular, farm-work is considerably expedited and farm-animals and labor-saving machinery can be more easily employed.
- b. Owing to the farm-boundaries or paths being straightened and those that are useless destroyed, the productive power of a given extent of land thus treated, is increased at the average rate of 5 per cent.
- c. Drainage and irrigation ways being re-constructed or constructed *ab initio*, both the drainage and irrigation systems can be brought to a state of greater perfection. As the disadvantage arising from an insufficiency of irrigation water or from its excess is done away with, the productive power of the farms is increased.
- d. Farmers being encouraged to exchange their fields for fields owned by others, so as to collect as much as possible in one place the farms owned by one proprietor, all the evils and disadvantages incidental to the scattering of farms owned by one proprietor are done away with or minimized.

II. DRAINAGE.—The drainage of paddy-fields is specially important, for, being generally saturated with water, they are hardly fit to admit of cultivation for the raising of a second crop after the harvest of rice. This is of course a grave economic disadvantage and it is satisfactory to see that with the advance of knowledge among farmers this point has begun to attract their attention, with the result that, in not a few districts, subterranean drainage systems have been constructed. In some places even special implements are used to effect the removal of superfluous water. Upland farms being naturally dry, owing to their situation, do not generally require any attention to be paid to their drainage.

III. IRRIGATION.—Irrigation is universally carried out owing to the necessity of rice cultivation, but very rarely is this irrigation effected for the purpose of increasing the fertility of the farms. In some places, however, the water from the streams flowing close by is led into the farms during winter, to cause it to deposit its sediment and thus to increase the fertility of the farms.

IV. SURFACE COATING OF SOIL.—The mixing of sand with soil which is too clayey, or the addition of clay or vegetable mould to soil which is too light and sandy, has been extensively practised by farmers from early times.

V. BURNING OF SURFACE SOIL.—Surface soil abounding in vegetable matters is often burned in order to diminish their quantity, and in some cases the woods or grass land cleared for cultivation are also burned to improve the soil.

MODE OF UTILIZATION OF ARABLE LAND.—Arable land is utilized to the greatest extent as rice fields, after which come upland farms including tea plantations and mulberry fields. Pastures are very scarce, and are owned by the Government for experimental purposes and by a limited number of stock-farmers.

PADDY-FIELDS.—Though the utilization of land as rice fields is so universal, these fields are, however, far from being utilized as they ought to be, to the utmost extent, chiefly owing to the fact that they are not so largely used for raising the second crop of the year. It is only in Formosa, Okinawa and some parts of Shikoku where the temperature is higher than in the other parts of the country that rice can be raised more than two times in a year. In most other places, the low temperature of the soil, owing to the presence in it of too much moisture, obliges the farmers to content themselves with the cultivation of rice alone. Still owing to the improvements effected, the area of two crop land is gradually increasing, as shown below:—

	chō.	Ratio to whole area of paddy-fields.
One crop fields	1,985,513	71
Two crop fields	755,983	29

The second crop raised after the cultivation of rice is generally barley, rape or *genge* (*Astragalus Siniens. L.*).

UPLAND FARMS.—The most important point in the utilization of dry upland farms consists in the choice of crops to be raised after the preceding crop has been harvested. The Number of crops raised in upland farms are generally grains, rops Raised garden vegetables or crops of industrial value. in a year. Sometimes other crops are raised in the spaces left unoccupied by the crop that is growing. For instance, garden vegetables or sweet potatoes may be planted in fields where barley or wheat is growing.

In general two crops are raised in one field, though in rare cases and in warmer districts as many as four are found; as, for instance (1) barley, (2) indigo, (3) beans, (4) rape.

Mulberry trees and tea shrubs are generally planted in fields set apart for this purpose, and they generally occupy land not well suited for the planting of more important crops, such as the slopes of hills, sandy dunes and such like places. They are also largely planted along the borders and edges of ordinary fields.

As mentioned above, upland fields devoted to the cultivation of grasses for feeding cattle are extremely scarce, and it is only in Hokkaidō and the O-U districts (i.e. the northeastern parts of the Main Island) where stock farming is comparatively thriving that grasses are cultivated to some extent.

RECLAMATION OF LAND.—The reclamation of forests or virgin land belonging either to private individuals or to the State, is going on more or less in Japan proper, exclusive of Formosa and Hokkaidō. Special provisions exist for selling State wild or forest land to people desirous of converting it into ordinary tillage land. To enumerate the kinds of land thus reclaimed recently, the area reclaimed in 1898 was 6,083 *chō*; in 1899, 9,890 *chō*; in 1900, 7,790 *chō*.

RECLAMATION IN HOKKAIDO.—The reclamation is of course far more striking in Hokkaidō, where large tracts yet remain to be brought under cultivation and where the Government has adopted various measures for inviting settlers from other parts of the country, by offering them a fixed rate of land free of price under

certain conditions. The land thus opened up during the last seven years with the aggregate extent of reclamation existing at the end of each year is shown in the following table:—

Year.	Area newly reclaimed.	Total reclaimed area existing at the end of the year.
1893	8,691	65,677
1894	15,899	82,111
1895	15,677	97,806
1896	19,597	115,538
1897	24,697	142,707
1898	28,178	170,293
1899	37,002	215,595
1900	29,586	241,309
1901	35,924	265,785
1902	—	288,925

It is of course out of the question to expect in Japan proper any such striking reclamation. However there exist, even in Japan proper, lands which though still left unutilized for agricultural purposes may with profit be reclaimed by proper care and by the application of improved methods of agriculture. Supposing hilly land which is inclined at an angle of less than 15° is capable of being thus utilized this kind of land is found in Japan proper and Hokkaidō to the following extent:—

	Whole area.	Level land inclined at an angle of less than 15° .	Area under cultivation.	Level land inclined at an angle of less than 15° not yet reclaimed.
	<i>chō.</i>	<i>chō.</i>	<i>chō.</i>	<i>chō.</i>
Honshu	22,636,578	5,602,786	3,777,312	1,825,474
Shikoku	1,790,346	439,671	305,959	133,712
Kyūshū	3,676,347	1,102,666	883,008	219,656
Hokkaidō ...	7,848,783	2,383,889	215,595	2,068,294
Total	35,952,055	9,429,012	5,181,874	4,247,136

Note:—In the foregoing figures the data for Okinawa and the Izu archipelago are not included.

III. CAPITAL.

LAND.—The arable land that forms the basis of our farming covers over 5 million *chō* yielding about 1,000 million *yen* worth of crops every year. Of that sum rice constitutes about 400 million *yen* in value. The value of arable land is estimated at above 7,000 million *yen*.

BUILDINGS.—Farm buildings and outhouses generally form part, in consequence of our farming system, of the farmers' dwelling-houses, and as the farming carried on is on a comparatively small scale, the capital invested on this account is not large. If, however, the dwelling houses of 5 million farming families are included, this particular capital may be estimated at about 290 million *yen*.

WORKING CAPITAL.—Apart from the capital invested in land and buildings for farming purposes, farmers require working capital existing in the following shapes:—

Consolidated	{ Tools and implements. { Live stock.
Floating	

I. TOOLS AND IMPLEMENTS.—From the limited scope of farming and also from the abundant supply of labor, farming in Japan is chiefly carried on by manual labor, partly supplemented by the use of cattle. Implements of any elaborate nature are not, therefore, employed to any great extent, and the tools used are not always made of metal. The tools and implements used in Japan may be divided into these kinds, namely, (1) those for tillage, (2) those for carriage, and those for horses and other domestic animals used for field-work.

While the tools and implements employed are so limited both in kind and in labor-saving capacity, even the number of those tools and implements possessed by our farmers is comparatively small. The farming implements generally possessed by a family cultivating 1 *chō* of wet and dry fields may be something as follows in value:—

	<i>yen.</i>
For field work	2.75
For use in-doors	1.10
For use in storehouse... ..	12.65
<hr/>	
Total	16.50

Estimated at the foregoing rate, the value of the farming tools for the whole cultivated area of 5 million *chō* amounts to 82,500,000 *yen*. However, this estimate applies to districts where tillage is exclusively done by manual labor, so that it is to be raised to some extent when live stock are counted in.

II. LIVE STOCK.—The beasts used in farming are cattle and horses, and their use is greater in the southern districts where horses are generally used, and less in the northern districts in which oxen predominate. On the whole, the number of horses is larger than that of oxen. These beasts are used principally for tillage and as beasts of burden, though to some extent they are also useful, as in other countries, for supplying manure.

Though at present farming chiefly depends on human labor, it is inevitable that this state of things must change with the progress of the times and that our farmers must be prepared to make use to a greater extent of the cheaper labor supplied by machinery and beasts. The utilization of beasts in the field of the labor is all the more necessary in a hilly country like ours, where the employment of any large labor-saving machines is not easily possible. Horses and oxen are in part employed largely in agricultural operations in districts where agriculture has had a greater development than in other districts. In such go-ahead localities, every farmer keeps one or two or even three farm beasts.

At present the number of live stock in our country is out of all proportion to that in Western countries, but this state of things will be radically changed for the better at no distant time, for the public and especially the farmers have become convinced of the necessity of utilizing the labor of beasts.

III. MANURE.—Night soil and stable manure play a most important part as fertilizers, though recently farmers have begun to supplement them with other kinds of fertilizers. These fertilizers

are generally of four kinds, namely, artificial fertilizers, vegetable manures, animal manures, and miscellaneous fertilizers. Of the vegetable manures, rape-seed cakes and bean-cakes are especially predominant. Next to them come animal manures, among which fish guano is most conspicuous. Artificial manures are also employed to no small extent. These fertilizers are either made at home or are imported, and of the imported fertilizers rape-seed and bean-cakes from China are the most important item both in quantity and value.

(a) OUTPUT OF FERTILIZERS.—The following figures show the output of the principal fertilizers made at home in 1902 :—

Kind.	Quantity. <i>kvamme.</i>
Sulphate of lime and other artificial manures	2,379,612
Oil cakes and fish	4,429,851
Rape seed	2,555,901
Cotton seed	426,093
Others	316,218
Dried sardine	362,867
Miscellaneous fish manure	1,730,644

The demand for chemical fertilizers having grown very marked of late, the manufacture of superphosphate of lime and other phosphate manures, and nitrogenous manures has become active.

(b) IMPORT OF FERTILIZERS.—The import of fertilizers from abroad stood as follows in 1901 :—

Kind.	Quantity. <i>kin.</i>	Value. <i>yen.</i>
Ammonium sulphate	4,250,607	334,812
Bones	17,871,008	355,970
Bone dust	242,575	6,157
Dried sardine	4,946,243	153,563
Oil cakes (beans)	3,653,621 (Picul)	8,002,314
Fish	745,489	1,451,361
Others	416,622	667,035
Super-phosphates	35,304,435	603,645
Nitrates of Soda	3,468,938	216,529
Others	—	329,690
Total	12,122,076

Note :—Fractions of a *yen* are omitted.

Though the import of foreign fertilizers of all kinds has been steadily on the increase of late, in no particular kind of

fertilizer has this tendency been more striking than in oil-cakes. In 1892, the import of oil-cakes reached 616,427 piculs valued at 824,652 *yen*. In quantity the import increased five-fold during the next ten years and in value about tenfold. The bulk of the imported oil-cakes consists of bean-cakes coming from northern China, and the marvellous increase in the demand for oil-cakes proves how much our farmers have begun to appreciate the value of nitrogenous manure.

While the consumption of imported and home-made fertilizers is so extensive, at the same time the farmers living in remote districts depend even at present chiefly on manures made at their own homes, such as stable manure, composts, and night soil.

(c) SUPERVISION OF FERTILIZER-BUSINESS.—With the greater use of artificial fertilizers the Government perceived the necessity of providing against the dishonest practices of merchants and manufacturers and of enabling farmers to secure really valuable fertilizers. This resulted in the enforcement in December, 1899, of the Law relating to the Control of Fertilizers. It is not yet possible to ascertain how far this piece of legislation has been successful in its object, but, according to the report made by the inspecting officials whose duty is to supervise the operation of this law, the arrangement has been working satisfactorily at least during 1901 and 1902 which the said report covered.

IV. FODDER.—The comparative insignificance of stock-farming is naturally reflected in the imperfect manner of feeding live-stock, and though oats and such food are excellent for them, the food generally given by our farmer to cattle and horses consists of bran of various kinds, hay or fresh grass.

Here ends this brief description of the working funds of our farmers. Next the banking facilities existing for their benefit will be briefly described.

V. BANKING FACILITIES FOR FARMERS.—In Japan as elsewhere there is a tendency for the wealthier classes to expand in all spheres of activity at the expense of the poorer classes, and it naturally follows that our farmers whose means are generally very limited are in danger of having even these limited means encroached upon by manufactures or merchants of larger resources. Herein

comes the necessity to provide some banking facilities specially for the benefit of the farmers.

BANKS.—The Japan Hypothec Bank (Kangyō Ginko), the Local Hypothec Banks (Nōkō Ginkō), the Colonial Bank (Taku-shoku Ginkō) and the system of Credit Guilds, have all been created with the express object of satisfying this requirement. Those establishments will be briefly described in the following paragraphs, other details about them being reserved for the chapter on Finances.

The preamble of the law relating to this bank succinctly explains the nature of the business to be transacted by the bank.

“It admits of no doubt,” it states, “that the

The Japan Hypothec Bank. comparative lack of development of our agriculture is mainly attributable to absence of proper facilities for supplying funds on the security of real estate. Now, in order to carry to greater prosperity the agriculture of our country and to promote its productive capacity, there are many things to be undertaken, these being the reclamation of new land, the control of rivers, planting of woods, providing of better facilities of irrigation or drainage, improvement of the mode of tillage, supply of cheap fertilizers, and sundry other things. But those improvements cannot from their very nature yield returns until after the lapse of ten or a score of years, so that funds which in trade can yield returns in a very short space of time are entirely out of place in undertaking connected with farming. The funds advanced to farmers must be of longer term and at cheaper rates.”

The bank was established to supply this want, as indicated by the phrase “improvement and development of agriculture and industry,” and transacts loans and payments as follows:—

LOANS.

Loans on Real Estate Loans on credit.

PAYMENTS.

Payments by instalments In less than 50 years.

Payments within fixed period { Within 5 years, the aggregate sum of loans of this kind not to exceed 1/10 of that of loans payable by instalments.

Loans on credit are made only to public bodies such as municipal corporations, towns or villages, or other bodies organized under law.

The bank principally deals, however, with loans of larger amounts, leaving those for smaller amounts to be undertaken by the Local Hypothec Banks which in organization and nature may be regarded as miniature copies of the central Hypothec Bank. The result is that although loans for such costly undertakings as the reclamation of large tracts of land or any similar work can be procured on easy terms from the Japan Hypothec Bank, the farmers of small means who constitute by far the greater majority of the farming population are practically precluded from the benefits supposed to be conferred on the farming community at large by the bank, so that the loans made by the bank generally go to manufacturers and comparatively little to agriculturists.

It ought to be added that the maximum limit of interest is to be determined with the approval of the Minister of Finance.

Started in the same year as their bigger brother and at the rate of one to each administrative locality, the Local Hypothec Banks are joint-stock companies with a capital of not less than 200,000 *yen*. As set forth in the explanation of

Local Hypothec Banks. the Law relating to Local Hypothec Banks, the latter aim at supplying funds to farmers of the middle and lower classes, and even to make loans on credit when applications come from organized bodies. These banks number 46 in all and are also subject to the supervision of the Minister of Finance, and enjoy in return no small assistance from the Treasury. The loans to be made are restricted to the following objects:—

1. Reclamation of land, irrigation, drainage, and improvement of the fertility of the soil.
2. Construction and improvement of farm-roads.
3. Settlement in newly reclaimed places.
4. Purchase of seed, young plants, manure and other materials required in agriculture and industry
5. Purchase of implements, and machines, boats, waggons and beasts for use in farming and manufacture.

6. Construction or repair of buildings for use in farming and manufacture.
7. Improvements in farming and manufacture not included in the foregoing clauses.
8. Adjustment of farm-lands.
9. Undertakings by Credit Guilds, Purchases Guilds, and Produce Guilds of unlimited liability and organized under the Industrial Guilds Law.

The loans to be made for the foregoing objects are under these conditions :—

LOANS.

LOANS ON REAL ESTATE.

1. Payments by yearly instalments ... Within 30 years.
2. Payments within fixed period ... $\left\{ \begin{array}{l} \text{Within 5 years, the aggregate sum of the} \\ \text{loans not to exceed } \frac{1}{2} \text{ of that of loans pay-} \\ \text{able by instalments.} \end{array} \right.$

LOANS ON CREDIT.

1. Payments by yearly instalments ... Within 30 years.
2. Payments within fixed period ... $\left\{ \begin{array}{l} \text{Loans payable within 5 years; and loans} \\ \text{with no such restriction.} \end{array} \right.$

Loans on credit and payable by instalments can be made only to municipal corporations, towns or villages, and public bodies organized under law, while loans on credit with payment within fixed period may be made only under these conditions:—

REPAID WITHIN 5 YEARS.

1. To municipal and other civic corporations or public bodies organized under law.
2. To joint application from not less than 20 persons who are judged thoroughly trustworthy, and who are engaged in agriculture or manufacture.
3. To Credit Guilds, Purchase Guilds, and Produce Guilds of unlimited liability.

The farming classes, however, are as yet unable to enjoy to any satisfactory extent the benefit accruing from those facilities, chiefly because most of our farmers possess only limited means at their disposal, and because loans are necessarily accompanied by elaborate processes.

Hercin comes the necessity of some method which will allow

even small farmers to obtain loans, and it was to supply this want that the Credit Guilds were organized, the object of their establishment being as the provisions in the Law relating to **Credit Guilds**. Industrial Guilds proclaim, to supply to members of the Guilds, the funds required for developing the business of the members, and also of furnishing them with means of saving. The Credit Guilds, therefore, may be compared with the People's Banks existing in Germany.

The Credit Guilds are distinct in nature from the Central and Local Hypothec Banks and indeed from all banks, in that those guilds, like the trade unions existing in England and elsewhere, are intended to promote the common interests of the members, who while obtaining for their own use funds at low rate of interest, are also entitled to participate in the proceeds arising from the investment of the capital of the organization. The members are therefore obliged to contribute to the capital. The guilds of unlimited liability may also procure loans from the local Hypothec Banks or from other quarters.

Though only a few years have elapsed since the coming into operation of the law under which the Credit Guilds are organized, their number has already reached 300 throughout the country, and there is prospect of their growing far more numerous. It is not possible to describe here at any length the result of the working of these petty democratic banks, and it is enough to say that even in places where bankers generally exact interest at the rate of 20 per cent. or so from ordinary clients and as high as 30 to 40 per cent. from small farmers, the guild furnishes loans to its member at about 10 per cent.

The condition of affairs in Hokkaidō being distinct from that in the other parts of Japan proper, and especially owing to the abundance of waste land to be reclaimed and the comparative scantiness of the population, special **The Hokkaido Colonization Bank** banking facilities are required for expediting the exploitation of the resources of the island. To supply this want the present bank was established in the year 1899 as a joint stock company with a capital of 3 million *yen* and for the term of 50 years. This term

may be prolonged, subject to the approval of the following description :—

1. Loans on real estate payable by yearly instalments within the period of 30 years.
2. Loans on real estate payable within 5 years according to fixed period payment system.
3. Loans on shares and debentures of joint stock companies engaged in the opening up of virgin land in Hokkaidō, also to subscribe to debentures issued by such companies.
4. Loans on Hokkaidō products and advances on goods.
5. To accept deposits and custody of objects of value.
6. Loans on credit payable by yearly instalments or within fixed periods to municipal and other civic corporations established under the Hokkaidō civic corporation system and also to legally organized public bodies in Hokkaidō.

The aggregate amount to be invested in business coming under No. 3 may not exceed $\frac{1}{5}$ of the total loans coming under Nos. 1 and 2.

The Government has subscribed about 1,000,000 *yen* to the capital of the bank, and in return for this help it regulates during the space of not more than 30 years from the establishment, the rate of interest on loans advanced on real estate and payable by yearly instalments.

IV. LABOR.

FARMING POPULATION AND HOUSEHOLDS—Though the actual numbers of our farming population are not exactly known, the returns in 1901 put the total population at 28,000,000 with 4,800,000 households approximately. In other words, the farming population, constitute a little over 60 per cent. of the whole population while the number of farmers' households is a little less than 60 per cent. of the total number of households.

The farmers' households contain on an average 5.8 persons, of whom 2.5 persons may be regard as of an age capable of doing effective work. According to this estimate, the number of the farming community of an age to work may be reckoned at 22,000,000. As this number includes landowners who generally lease their land

to tenant-farmers, the actual number of people working on the farms must be somewhat less than the foregoing figures.

TILLAGE LAND AND FARMERS.—At the end of 1899 the land under tillage covered altogether about 5,000,000 *cho*, of which 2,745,000 *cho* were paddy farms and 2,286,000 *cho* were upland farms. The total area being compared with the total number of farming families, the average area of tillage land corresponds to about 1 *cho* per family, while the rate per working man is only 4 *tan* approximately. It may easily be inferred therefore that tillage is mainly carried on by manual labor.

The number of working people required in preparing the land for the various crops and in gathering in those crops—working, of course, according to the methods ordinary in vogue in this country, may be roughly estimated as follows:—

WORKING PEOPLE PER "TAN."

	Men.	Women.		Men.	Women.
Rice	17	9	Rape	10	9
Barley	11	6	Beans	7	5
Wheat	11	6	Indigo	18	12
Rye	12	6	Tobacco ...	25	23
Buckwheat ..	8	3	Cotton	15	19

DEMAND AND SUPPLY OF LABOR.—According to inquiries carried out in 1888 in 38 prefectures, of the agricultural families in Japan 55 per cent. cultivated less than 8 *tan* each, 30 per cent. between 8 *tan* to 1 *cho* 5 *tan*, and only 15 per cent. cultivated over 1 *cho* 5 *tan* each. From these data it is easy to see that farming on a large scale and by the employment of a large number of people is exceptional. It is only in special cases, such as in the season of sericulture or of the curing of tea, that a large number of hands is engaged. Our farmers are generally therefore their own laborers, and farm laborers who make it their regular business to work on land owned by others form an insignificant portion of the farming community. There are, it is true, a very small number of petty farmers who may be open to engagement when the work on their own field is slack. In the height of the farming season, too, such as the season of the planting or gathering

in of rice, neighbors assist each other, and thus supplement the mutual deficiency of hands. As things stand, therefore, except in the limited number of places where manufacturing is being actively carried on or where emigration either abroad or to other parts of Japan is temporarily draining the country of a large proportion of its able-bodied men, there is no likelihood, at least for the time being, of any lack of farm hands being experienced.

CONDITION OF ENGAGEMENT.—Farm laborers may, like other kinds of laborers, be divided into those who are engaged by the year and those who are engaged by the day. The farm laborers generally live in the residences of their employers who, besides supplying them with board, also give them clothes twice a year. In some cases laborers are engaged under the special condition of working one day in their employers' service, to attend the next day to their own work, thus attending to the employers' and their own work on alternate days. Lads are also engaged for the term of 5 or 7 years, and these therefore stand to their masters somewhat in the relation of apprentices to employers. During the term of contract they get their board, clothing and whatever else is a necessity of life from their employers, but very rarely do they get regular wages. Day laborers are of course engaged by the day, and their wages vary according as they bring their own food or are fed by their employers. Very rarely are day laborers contract laborers. Then some are engaged by the month or during some special period, such as the season of sericulture and other work. There are also some work-people who do job work and get paid according to the amount of the work done.

WAGES.—According to the official returns, the average wages of farm laborers were as follows, in 1901.

	Males.	Females.
	<i>sen.</i>	<i>sen.</i>
Day laborer on farm	32.0	20.0
Day laborer in sericulture	33.0	19.5
Operative for reeling silk	—	20.0
Farm laborer engaged by the year	31.82 <i>yen</i>	17.00 <i>yen</i>

In the foregoing table, only laborers engaged by the year get board. The wages, it may be added, vary somewhat according to

districts and seasons, and while some men engaged by the year get as much as 85 *yen* in one place, in others the pay is only 7 *yen*. The day laborer employed in sericulture sometimes gets 1 *yen* a day during the height of the season.

Wages in general show a tendency to advance, as the following figures based on the wages ruling in 1887 will show, these being adopted as the standard of unit (100).

	1901.	1897.	1892.
Day farm laborer (men)	232	204	112
" " (women)	250	199	118
Day sericultural laborer (men)	223	181	117
" " " (women)	201	176	123
Silk-reeling operative	182	166	122
Farm laborer by the year (men)	165	150	{ Wages in 1894 } taken as standard.
" " " (women)	169	156	

Wages are in most cases paid in cash, though to some extent payment is also made in food or clothing.

MIGRATION OF FARMERS.—As shown in the chapter on Population the exodus of the rural population to the cities and towns has grown somewhat striking, and though this migration does not yet show itself in an absolute decrease of the rural population, there can be no doubt that if this tendency becomes aggravated, the evil of a lack of farm hands, such as that complained of in many Western countries, may take place. In Hokkaidō alone, during the 5 years ending 1901, 144,902 farmers settled there, coming from other parts of the country.

CHAPTER III.—Agricultural Products.

Introductory—Food-Stuffs—Products of special Use— Horticultural Products.

I. INTRODUCTORY.

The general tendency of our agricultural industry is to change gradually for the better, as the following data on the staples will prove.

I.

COMPARATIVE TABLE OF YEARLY ACREAGE OF STAPLE FOOD-STUFFS

(fractions below decimal represent *tan* in this and other tables).

	1877.	1882.	1887.	1892.	1897.	1902.
	<i>cho</i> (in	<i>cho</i> (in	<i>cho</i> (in	<i>cho</i> (in	<i>cho</i> (in	<i>cho</i> (in
	thousand).	thousand).	thousand).	thousand).	thousand).	thousand).
Ordinary rice	2,443	2,357	2,391	2,440	2,457	2,499

Italian millet	—	—	87	90	74	70
Buckwheat	—	—	158	161	174	165
Sweet potatoes... ..	—	—	221	243	259	276
Potatoes	—	—	16	21	28	42

II.

STAPLE PRODUCTS OF SPECIAL USE.

	1887.	1892.	1897.	1902.
Cotton	98,478.9	71,431.6	44,444.0	20,700.1
Hemp	14,840.4	18,972.5	22,349.7	16,891.1
Indigo-leaves	50,257.4	44,049.5	50,712.3	37,193.3
Tobacco-leaves	21,803.5	29,059.0	31,477.5	23,946.3
Rape	167,295.1	171,795.0	154,167.0	157,045.1

It will be seen from the following table that the area of cultivation of the staples is showing on the whole a satisfactory increase. Especially is this the case with soja beans, sweet potatoes, and potatoes, among the staple food-stuffs, and hemp and tobacco among the staples for special use. The striking exception is the decrease in the area of the cotton plantations in consequence of the recent large import of foreign cotton. Our sugar industry has also suffered somewhat from foreign competition though it has lately begun to recover its former prosperity, especially since our annexation of Formosa. Here are the figures showing the output of sugar.

	<i>kwamme.</i>
1878	7,424,819
1882	9,696,522
1887	9,904,901
1892	10,120,871
1897	9,550,489

Again, except for some staples of less importance, the yield from the same area has become increased, thanks to the better methods that have of late obtained in farming, as:—

In inquiring into the acreage of mulberry and tea fields which are vitally related to our two export staples, silk and tea, that of

the latter, in contrast to that of the other, shows a striking falling off. One consoling fact is that the output of tea shows an increase, due, principally, to the improved mode of curing.

TABLE SHOWING THE YEARLY AVERAGE OF MULBERRY AND TEA FIELDS.

Year.	Mulberry.		Tea.	
	<i>cho.</i>	<i>tan.</i>	<i>cho.</i>	<i>tan.</i>

TABLE SHOWING THE YEARLY OUTPUT OF COCOONS AND TEA.

Year.	Cocoons.	Tea.
	<i>koku.</i>	<i>kwamme.</i>
1878	942,198	2,761 522
1882	1,328,035	6,514,678
1887	1,219,060	7,011,221
1892	1,480,705	7,211,865
1897	2,121,944	8,471,956
1902	2,549,224	6,783,128

Fruit culture and gardening have made a striking advance recently.

Live stock do not yet show any marked development in numbers though there has been a great improvement in their quality. However as measures for improving both the quality of the live stock and increasing their number are now being carried out, the industry will be surely bettered in the near future. Dairy business is an industry of only recent growth, but its result is entirely satisfactory.

Below will be shown the numbers of cattle and horses during the last 24 years:—

Year.	Cattle.	Horses.
1878	1,080,886	1,545,283
1882	1,160,147	1,644,165
1887	1 020,509	1,537,606
1892	1,094,797	1,554,667
1897	1,214,159	1,592,871
1902	1,275,382	1,515,373

The gross value of the staple agricultural products as calculated on the recent market price is as follows:—

	yen.
Rice	445,439,087
“ Mugi ” (barley, wheat, rye)	124,064,274
Beans	35,952,282
Others	153,872,649
Straw	86,982,360
Cocoons	93,618,991
Silkworm eggs	3,844,126
Mulberry twigs and Silkworm litters... ..	7,953,103
Cured tea	9,037,545
Live Stock (cattle, horse, sheep, swine)	4,953,533
Slaughtered beast... ..	12,540,394
Cattle and horses killed by disease	256,831
Dairy products	4,128,017
Staple manure	23,672,628
Poultry and eggs	17,281,416
<hr/>	
Total	1,023,587,239

Such is the general states of our agricultural industry, and in inquiring into the relation between supply and demand of our principal agricultural products, it is observed that though in food-stuffs the supply at home can generally satisfy the demand, this is not always the case with regard to the raw materials used for industrial purposes, as cotton, hemp, etc. These come, therefore, to no small extent from foreign countries.

II. FOOD-STUFFS.

1. RICE.—There are two varieties of rice, ordinary rice (*Oriza utilisissima*, Keke) and glutinous rice (*O. glutinose*, Lour), Both are cultivated in wet and upland fields. The ordinary rice may be considered as *the* rice, for it constitutes the bulk of the output of this staple cereal. It is used as ordinary diet and also for brewing the national beverage of *sake*, while the other rice is used for making rice dumplings (*mochi*) and is therefore very limited in use.

Rice being cultivated in every place where its cultivation is

possible, from Hokkaidō in the north to Formosa in the south, the area under cultivation is immense as may be seen from the following table.

AREA (FRACTIONS BELOW DECIMAL ARE *tan*) OF CULTIVATION AND OUTPUT OF RICE.

Year.	Acreage. <i>cho.</i>	Output. <i>ko u.</i>
1892	2,760,662.1	41,429,676
1893	2,775,233.9	37,267,418
1894	2,736,494.6	41,859,047
1875	2,784 682.5	39,960.798
1896	2,792,499.4	36,240,351
1897	2,787,181.3	33,039,293
1898	2,817,624.0	47,387,666
1899	2,839,550.2	39,698,258
1900	2,828,479.3	41,466,734
1902	2,847,395.0	36,947,091

The principal centres of rice cultivation are Niigata, Hyogo, Fukuoka, Aichi, Chiba, Toyama, and Fukushima. Both the acreage and output may confidently be expected to become larger with the improvement of farming and the completion of various improvement measures.

2. "MUGI."—The *Mugi* is the staple product for upland fields as rice is for wet fields. Barley and wheat are also cultivated in wet fields as the second crop after rice. Their cultivation is universal, but that of rye is generally confined in the districts of Kinai and in the more southern places. Barley and rye are used as food-stuffs by farmers, who use them mixed with rice. They are also used to some extent as food for cattle and horses. Wheat is used in manufacturing soy and for making confectionary and various sorts of maccaroni, except buckwheat maccaroni for which buckwheat flour is used. The flour made of Japanese wheat is however not quite so good for bread and superior kinds of confectionary, and for those purposes the American flour is extensively imported. In a similar way our barley is not so well adopted for making malt for beer, and the bulk of this fermenting ingredient comes from therefore abroad. An attempt has been made with some success to cultivate in

Japan certain varieties of foreign barley. The acreage and output during the last ten years *are shown below :—

Year.	" Mugi " Acreage.				Output (koku).			
	Barley. (in thou- sand)	Rye. (in thou- sand)	Wheat. (in thou- sand)	Total. (in thou- sand)	Barley. (in thou- sand)	Rye. (in thou- sand)	Wheat. (in thou- sand)	Total. (in thou- sand)
1892	653	650	435	1,739	6,811	6,811	6,060	15,951
1893	654	654	437	1,746	7,193	6,148	3,294	16,636
1894	648	661	442	1,753	8,533	7,316	3,972	19,822
1895	654	672	447	1,774	8,541	7,107	3,978	19,537
1896	651	672	443	1,767	7,853	5,927	3,559	17,340
1897	639	651	458	1,749	8,028	6,165	3,811	18,005
1898	659	681	465	1,806	8,913	7,366	4,181	20,462
1899	657	687	465	1,809	8,512	6,682	4,141	19,335
1900	644	692	468	1,805	8,659	7,495	4,236	20,391
1902	645	476	682	1,804	8,146	3,907	6,372	18,425

The principal *mugi* districts are Hokkaidō, Saitama, Ibaragi, Aichi, Fukuoka, etc. Especially in Hokkaidō the growth of these crops is excellent, the comparative scarcity of rainfall during the ripening season being favorable for it.

3. BEANS.—The use of beans is extensive in Japan. They are used as subsidiary article of diet, also as food for cattle, and as manure. A large import of beans and pancakes from China and Korea explains their extensive use in Japan. Beans of superior quality are largely grown in Hokkaidō, and they are also extensively cultivated in Saitama, Ibaragi, Nagano, Miyagi, etc. There are two principal varieties, namely soja beans and red beans, and both are cultivated during the seasons intervening between the different crops of cereals. The latter is used for making confectionary, etc.

ACREAGE AND OUTPUT.

1895	431,240.4	3,163,683	105,630.7	615,675
1896	440,780.2	2,999,490	103,957.7	576,724
1897	435,604.8	3,100,973	109,280.7	618,804
1898	482,044.1	3,108,708	112,313.6	654,885
1899	455,601.2	3,410,693	120,675.0	822,775
1900	457,673.7	3,562,176	122,786.1	866,448
1902	466,149.1	3,136,909	129,290.9	708,712

4. MILLETS, SORGHUM, BUCKWHEAT.—Millets are cultivated in the hilly districts and are used as food, being eaten mixed with rice. Sorghum is used for making dumplings and buckwheat for making macaroni.

ACREAGE.

Year.	Millet.	Italian Millet.	Sorghum.	Buckwheat.
1894	235,164.2	84,144.4	26,286.9	172,334.0
1895	247,276.7	77,228.9	26,295.3	175,991.8
1896	248,131.7	75,124.4	28,156.8	171,215.5
1897	250,387.7	74,567.6	27,674.9	174,138.2
1898	245,641.3	77,366.3	31,683.5	180,039.6
1899	238,742.0	76,618.8	35,741.8	176,144.4
1900	245,738.6	72,538.3	34,414.1	168,996.0
1902	226,239.8	70,510.7	34,536.6	165,750.2

OUTPUT.

Year.	Millet.	Italian Millet.	Sorghum.	Buckwheat.
1894	2,144,839	999,209	250,474	1,202,372
1895	2,331,506	923,862	243,066	1,192,377
1896	2,548,458	912,154	245,734	1,090,254
1897	2,395,158	806,274	260,414	990,195
1898	2,626,588	901,472	291,852	1,192,807
1899	2,217,154	861,318	377,768	999,410
1900	2,487,187	864,601	384,452	1,285,394
1902	2,003,317	567,299	286,734	948,886

The ordinary millet is grown in larger quantities in Kyūshu than in colder districts and Italian millet is found more in the colder districts than in Kyūshu. Sorghum is chiefly grown in Hokkaidō, Aichi, Gifu, etc. and buckwheat in Kagoshima, Kanagawa, Ibaragi, Nagano, Iwate, Aomori, etc.

5. SWEET POTATOES.—This root-crop is raised as food-stuff both for men and beasts, also for brewing liquor and making starch. It is extensively grown in Kyūshu and Okinawa.

Year.	Acreage. (<i>cho.</i>)	Output. (<i>kwamme.</i>)
1894	238,942.9	495,948,701
1895	340,797.0	711,813,132
1896	255,655.2	725,942,023
1897	259,166.7	662,391,590
1898	267,252.3	716,956,146
1899	268,070.5	661,444,862
1900	271,440.4	756,935,532
1902	276,970.6	712,126,037

6. POTATOES.—Potatoes are used in Japan for food both for the men and beasts and for making liquor and starch. It is grown extensively in Hokkaidō and other districts.

Year.	Acreage. (<i>cho.</i>)	Output. (<i>kwamme.</i>)
1894	23,116.3	49,752,903
1895	23,314.4	44,273,903
1896	25,276.9	44,220,605
1897	28,996.0	58,528,287
1898	36,898.6	34,088,550
1899	37,650.6	64,594,705
1900	38,261.8	71,775,433
1902	42,139.7	53,832,873

The acreage was only 8,850 *cho* in 1882, and it reached about 42,000 in 1902. The root grown in Hokkaidō largely goes to Siberia and Australia, being of superior quality. The appearance of the potato blight in 1900 in the districts lying about Tokyo inflicted serious damage on the crop. The disease has been stamped out.

III. FARM PRODUCTS OF SPECIAL USE.

1. RAPE.—Rape is grown everywhere in Japan as the second crop after rice or other crops.

The rape-seed oil was universally used formerly for purposes of illumination, and even now this is still the case in remote corners of the land. The oil is now largely exported abroad, where it used as a lubricant. The value of rape-seed cake as manure is universally appreciated and is largely used for that purpose.

This crop is cultivated in all those districts where the second crop is possible, and also in Hokkaidō.

The acreage and output are as follows:—

Year.	Acreage. (<i>cho.</i>)	Output. (<i>toku.</i>)
1894	152,400.2	1,006,581
1895	158,858.2	969,917
1896	157,738.8	971,198
1897	154,167.0	1,011,004
1898	150,825.9	1,079,594
1899	148,663.3	1,114,614
1900	153,069.5	1,193,839
1902	157,045.1	1,110,446

2. INDIGO.—The indigo-plant (*Polygonum tinctorium* Lam.) is a special product of Shikoku, especially Tokushima prefecture where the growth of this crop was encouraged by the local Government during the pre-Restoration period. It is of the variety of *Polygonum*. Since the introduction from abroad of a cheaper and more convenient indigo, the sale of home-grown indigo has somewhat declined. But the native indigo still retains a fair sale owing to the permanent nature of the dye; and especially since a new mode of preparing indigo in a less costly way was discovered a few years ago by a Japanese expert, the industry has begun to recover its former prosperity. In Okinawa and Formosa a special variety of indigo is produced.

The acreage and output during the last few years are as follows:—

Year.	Acreage. (<i>cho.</i>)	Output. (<i>kwamme.</i>)
1894	46,851.7	16,087,377
1895	49,079.0	17,373,344
1896	49,190.3	17,918,863
1897	50,712.3	19,415,593
1898	48,872.4	17,758,510
1899	47,824.8	17,044,410
1900	46,180.4	16,582,230
1902	37,193.3	12,495,151

The principal places of production are Tokushima, Aichi, Fukuoka, Okinawa, Saitama, Miye, etc.

3. TOBACCO.—The cultivation of tobacco was formerly carried out, partly with the object of selling the leaves and partly with that of supplying tobacco for home consumption. The leaves in those days were exclusively used as cut tobacco and never as cigars or cigarettes. With the advent of the Tobacco State Monopoly in 1898, a radical change came over the economy of this crop, and the cultivation is now subject to strict official supervision, while at the same time special pains are taken for improving the quality.

Here are the figures representing the acreage and putput during the last few years:—

Year	Acreage. (<i>cho.</i>)	Output. (<i>kwamne.</i>)
1894	35,393.8	9,541,304
1895	35,135.1	8,873,911
1896	32,519.2	8,393,507
1897	31,477.5	8,871,370
1898	29,450.8	9,302,560
1899	41,647.2	10,609,531
1900	37,182.8	10,846,452
1902	23,946.3	8,349,679

Ibaragi, Tochigi, Kagoshima, Kanagawa, Fukushima, Okayama, Aichi, Hiroshima, Kumamoto, Shizuoka are the chief centres of this crop.

4. SUGAR CANE.—This industry is not flourishing as it was formerly, or, more properly speaking, it has not succeeded in keeping up with the progress of the times. Its prosperity in the province of Sanuki, formerly the largest centre of production, has declined very much owing to the comparatively higher cost of production as compared with that in foreign countries. The beet-root cultivation started some time ago in Hokkaidō has not been a success. The consumption of sugar has been largely increased recently, and naturally the import of this article of diet now reaches enormous figures. However, as the industry is steadily growing extensively in Formosa, Okinawa and Kagoshima, the output of home-made sugar may soon show a striking increase. The returns for the last two years are as follows:—

Year.	Acreage. (<i>cho.</i>)	Output. (<i>kwamne.</i>)
1900	23,170.2	154,181,460
1901	24,744.7	134,278,261

5. RUSHES.—The cultivation of various varieties of rushes is extensively carried on in Hiroshima, Okayama, Fukuoka, Ōita, Okinawa, Kagoshima, etc., as they are in enormous demand for the making of mats universally used in Japanese houses as carpets are in Europe and America. The export of fancy matting is also active.

6. COTTON.—Cotton is another crop that has suffered from foreign competition especially since the spinning business has grown active, for the fibres of home-grown cotton are shorter while the goods themselves are more costly than their imported rivals. These principally come from India, China, and America.

The following table will show the vicissitudes which this crop has experienced during the last eight years.

Year.	Acreage. (<i>cho.</i>)	Output. (<i>kuamme</i>).
1894	60,564.0	12,572,971
1895	55,541.0	10,488,569
1896	51,042.5	7,422,061
1897	44,444.0	7,034,253
1898	40,288.1	7,280,530
1899	33,773.2	5,231,955
1900	28,262.2	4,894,322
1902	20,700.1	3,321,047

Ōsaka, Hiroshima, Saitama, Tottori, Aichi, etc. are principal centres of produce.

7. HEMPS.—The cultivation of hemp was formerly more active than it is now, for with no foreign rival to compete with it, its use for weaving fabrics, making fishing nets, etc. was extensive. The appearance of Chinese and Indian hemp in the market has considerably affected the former prosperity of the home industry, as may be seen by a glance at the following table:—

Year.	Acreage. (<i>cho.</i>)	Output. (<i>wammr.</i>)
1894	20,948.6	3,224,094
1895	22,050.4	3,366,784
1896	22,629.2	3,285,730
1897	22,349.7	3,569,159
1898	25,188.0	3,775,917
1899	17,910.6	2,921,954
1900	18,203.0	2,652,774
1902	16,891.1	2,687,586

Hokkaidō, Tochigi, Hiroshima, Miyazaki, Shimane, etc. are the principal districts in which the cultivation of this crop is carried on.

8. FLAX.—Flax fibres are largely used for weaving light stuff for summer wear, and the flax fabrics produced at Echigo and Okinawa enjoy a great reputation from former times. The cultivation is chiefly carried on in those districts as also in Yamagata, Fukushima, etc. The business is sure to attain a greater development in future.

9. STALKS FOR STRAW PLAITS.—The preparation of straw plaits in the prefectures of Tokyo and Okayama is an important minor industry on account of the work it gives to the women and children, especially since the plaits have begun to go abroad.

10. MINT.—Mint is cultivated in Yamagata, Okayama, Chiba, etc., for making essence to be used for medical and other purposes. The foreign demand has contributed to the activity of the cultivation of this subsidiary crop. Yamagata is most noted for the produce of mint.

11. GINSENG.—This medical root was cultivated formerly in such districts as Nikko, Aizu, and Izumo, but, owing to the fact that as a medicine it has lost favour among doctors of the modern school, the prosperity of the business has markedly declined. Its principal market is China, whither the roots are also imported extensively from Korea and even from America. The cultivation and the curing of the roots being rather tedious and costly work, the output is extremely limited. Fukushima, Nagano, Shimane, Tochigi, and Yamagata are the principal districts for this root.

12. PAPER MULBERRY TREES.—The fibres of this tree or rather shrub, are used extensively for manufacturing paper which though not very smooth, is characterized by toughness. Being a hardy plant the tree can be planted almost everywhere and mostly in waste land. Kōchi, Toyama, Yamaguchi, Ehime, Hiroshima, etc. produce large quantities.

13. "MITSUMATA" (*Edgeworthia Papylifera*).—This shrub is also largely used for manufacturing paper, which is smoother though weaker in texture than that made of the other. Since the process of strengthening the texture has been devised by our Printing Bureau the paper made of the fibres of this shrub has come to be highly valued in foreign countries where it is exported to a large

extent. The shrubs are grown in shady places, and are extensively planted in Shizuoka, Yamanashi, Kōchi, Kanagawa, etc.

14. BASKET-WILLOW.—The growing of willow for making baskets, etc., is actively carried on in the province of Tajima. The process of raising the twigs is very simple, for a slip easily takes root. The cultivation of the shrubs and the industry of basket-making have been started in other places, notably in Kōchi.

IV. HORTICULTURAL PRODUCTS.

1. FRUITS.—As the food-stuffs that are ordinarily used by our countrymen contain a large percentage of water, the Japanese have not up to the present used fruit much as dessert. Moreover, deterred by the imperfect facilities of transportation, the business of fruit culture was comparatively neglected. It was after the introduction of the Western style of living and the greater perfection of the means of communication that the industry attained a sudden development. The production of an excellent sort of apple in Hokkaidō and the north-eastern districts of Honshu, as also the successful growth of fruits of the orange family in Kyūshu and other warm districts, are among the results of these changes. Indeed Japan is now exporting to America and Siberia no small quantity of fruits, and there is every possibility of the business of fruit-culture growing far more prosperous, both for consumption at home and for shipment abroad.

From the geographical formation of the country, the fruits grown in Japan are of diverse kinds, and may generally be classified as follows :—

Fruits of the orange family. Mandarin oranges and other oranges, lemons, prunelo, etc.

Apples, pears, cherries, persimmons, plums, grapes, peaches, apricots, loquats, berries, bananas, pine-apples, etc.

The above are distributed geographically as follows :—

ORANGES :—Wakayama, Kagoshima, Ōsaka, Yamaguchi, Shizuoka, Hyogo, Nagasaki, etc.

APPLES :—Hokkaidō, Aomori, Iwate, Yamagata, Miyagi, Fukushima, etc.

GRAPES :—Yamanashi, Niigata, Kanagawa, etc.

CHERRIES :—Hokkaidō, Akita, Yamagata, etc.

BANANAS AND PINE-APPLES :—Formosa, Luchu, and the Bonin Islands.

Pears, persimmons and the rest are grown more or less in every part of the country.

Of those fruits some are of native origin while others are imported. Apples, pears, grapes, cherries, strawberries, etc. that have been introduced from America and other countries are held in great esteem, and have practically superseded the indigenous varieties.

2. FLOWERS AND GARDEN PLANTS.—From natural taste and traditional custom, our countrymen are very fond of flowers and ornamental plants and trees. They spare neither pains nor money on the decoration of even miniature gardens with fantastic rocks and well-shaped trees and plants, but they pride themselves most on their skill in growing dwarf trees and shrubs in pots. Nor do they care less about the cultivation of such flowering plants as crysanthemum, peony, morning-glory, etc. Perhaps we should say, however, that this business partakes somewhat of the nature of art and is not directly related to agriculture, so that it is sufficient to enumerate here the principal flowers of the season. These are :—

SPRING FLOWERS :—Cherry, peach, azalea, peonies, lilies of various kinds, pink, hydrangea, crysanthemum, etc.

SUMMER FLOWERS :—Morning-glory, bush-clover, lotus, crysanthemum, poppies, etc.

AUTUMN FLOWERS :—Crysanthemum, begonia, orchids, flowers of the gentian family, pink, etc.

WINTER FLOWERS :—Crysanthemum, plum, camellia, hayacinth, etc.

3. KITCHEN-GARDENING.—Kitchen-gardening as a business attained marked progress only lately and as a result of the improved facilities of communication. The business of forcing the growth of vegetables by artificial heat has become quite profitable in the suburbs of large cities. The principal vegetables raised are :—

Fruits of the gourd family, peas, beans, etc.

Roots, and bulbs, such as radishes of various kinds, carrots, potatoes, lilies, onions, etc.

Greens of sundry kinds.

Vegetables used for condiments, as ginger, horse-radish, pepper, etc.

4.—PRESERVED FRUITS AND VEGETABLES.—This industry is still comparatively primitive, and the cured fruits and vegetables that are prepared to a large extent are of limited kind being generally pickled plums, sugared orange-peels, jams, dried peeled-radish and edible gourd, tinned fruits and vegetables.

In view of the importance of encouraging horticulture, the Government established in the 1902 fiscal year the Experiment Horticultural Garden at Okitsu, Shizuoka-ken, to deal with the following matters :—

Matters relating to the selection and cultivation of indigenous and foreign fruits and vegetables.

Matters relating to the selection of seeds and saplings.

Matters relating to preserving and curing of fruits, etc.

Matters relating to the distribution of seeds and saplings.

As similar work has been started by not a few of local experimental stations, our horticultural business will most probably show marked improvement at no distant date.

CHAPTER IV.—Sericulture.

History—Present Condition—Egg-cards—Filature.

I. HISTORY.

GOVERNMENT PATRONAGE IN FORMER TIMES.—The first authentic record about the history of sericulture or the art of rearing silkworms in Japan is that in the 4th year of the reign of the Emperor Chuai (195 of the Christian era) Prince Kōman, a grandson of Kōsei, the 11th lineal successor of the Emperor Shih Hwang, of the Tsing dynasty (China), came over and got naturalized in Japan, bringing with him and introducing into this country the Chinese species of silk-worm, which then come to be cultivated extensively in this country. In the 14th year of the reign of the Emperor Ohjin (283 A.D.) Yu Tsu, another Chinese Prince came over and became naturalized in Japan, bringing with him a large number of his own countrymen. As these emigrants knew how to weave silk, they were distributed among different localities in the country, where they were made to teach the inhabitants the art of silk weaving. In those early days the Court took assiduous pain to encourage the industry in the country, and itself set an example in the work of planting mulberry trees and rearing the worms. It issued decrees that some of the taxes to be paid in kind should consist of silk fabrics. From this time onward, history continues to indicate the efforts which were made by succeeding Emperors to encourage the industry, efforts which resulted in the further development of the industry.

Coming down to the Japanese "Middle Ages," we find that silk raising and weaving had come to occupy the principal place among the propulsive industries of the country. Silk had come to be accepted for tributes and contributions to the Imperial Government, while silk fabrics had also come to be used in general for wearing purposes. Under the circumstances, sericulture and weaving became almost universal throughout the country. A sericultural

record compiled in 796 A.D. in the reign of the Emperor Kammu (796 A.D.) mentions the names of 36 provinces scattered over the districts of Kinai, Tōkai, Tōsan, Hōkuriku, San-in, Sanyō, and Nankai. Later, about 927 A.D. in the reign of the Emperor Daigo, the silk producing localities had come to be classified in the order of the various grades of silk they produced, there being then 12 best, 25 medium, and 11 inferior "silk provinces." During the "age of wars" (or the Japanese Dark Ages) that lasted about 700 years, commencing with 939 A.D. in the reign of the Emperor Shujaku, the raising of the worm and weaving of silk could only be carried on in secluded and out-of-the-way places which were comparatively free from the ravages of fire and sword.

With the return of peace under the Tokugawa Shogunate (1615 and downward), the industry began gradually to recover its former prosperity owing to the endeavors of such Daimios as were anxious to bring the people under them back to settled occupations in general, and who were not slow to see the importance of rehabilitating sericulture. For all that, however, the enforcement of rigid sumptuary legislation prohibiting the wearing of all silk fabrics by the common people, had the effect of throwing the industry into a sudden decline as often as recourse to such reactionary measures were made.

THE RESTORATION AND THE INDUSTRY.—With the opening of the trade ports, in 1859, the market for silk and silk stuffs widened all at once, laying the foundations, so to speak, for the permanent prosperity of this industry, and the indefatigable efforts made by the Imperial Government in its endeavors to encourage the industry and secure its further progress, have been crowned with great success so that the fame of Japanese silk has become world-wide and the article commands high prices in the market of the world.

EXPORT OF EGG-CARDS.—Silk as an article of foreign commerce has, however, its own history of ups and downs. The prevalence of the silk-worm epidemic in Europe (soon after the opening of the country) brought about large demand for silk-worm eggs in this country. With the increase in the quantity of the eggs exported, came, however, the practice of sending out egg-cards of inferior quality or carelessly manufactured, while the discovery was made in Europe of the process of producing inoculated eggs.

LEGISLATIVE MEASURES FOR PROTECTING THE INTEREST.—These circumstances had the combined effect of gradually diminishing the exportation of Japanese silk eggs, until they entirely ceased to be sent abroad. About this time demoralization set in, also, in the manufacture of our raw silk and their buyers abroad were loud in their complaints against them. The authorities tried by legislative means to put right this evil tendency and also established at Tomioka, Joshu, a model filature, for which they engaged a French expert as superintendent. This was in 1870 and the step taken was conspicuously effective in reforming to a degree the silk industry of this country. The zeal taken by the Government in the cause of improvement by amending and reframing the laws and regulations bearing on the industry had, however, the misfortune of causing an outcry to be raised about unnecessary official interference, so that about 1877 the Government repealed all those enactments and left the people entirely free, so far as the silk industry was concerned. This turn of affair only served to benefit unscrupulous parties who fraudulently sold with impunity deteriorated goods, and the once good name of Japanese silk came to fall very low indeed abroad. Again the Government set face to check such dishonest practices and this time special care was taken to elaborate rules adapted for local condition of each sericultural district. The Department of Agriculture and Commerce, in order to seek the views of all those parties interested on the question of filature industry, held on several occasions meetings which were attended by noted sericulturists and silk manufacturers. On the strength of the report made and the answers received at these gatherings, the Government in 1885 drew up a model set of regulations for the formation of silk guilds, and distributed these regulations among the prefectural authorities, in order that the latter might each frame sets of regulations to suit the requirements of his own particular district. The consequence was the organization of guilds among those interested in the matter in each locality. In the chapter devoted to Industrial Legislature, given later on, the working of the regulations in question will be found described in some detail. In a similar way, for particulars about the silkworm egg inspection regulations and the establishment of silk conditioning houses the reader is referred to the paragraphs

specially devoted to these two subjects. It may be stated here that the Law for Encouraging the Direct Export of Raw Silk had to be repealed soon after its issue in 1897 as it was discovered that some of the provisions contained in it were at variance with the operation of the revised Treaties.

FEEDING AND REARING.—A high stage of development was attained even in early days as regards the method of feeding and rearing the silkworm, for history records that Prince Shotoku (573—622), told sericulturists that they should rear their worms just in the same way as parents nurse and bring up their infants; that they should think of their worms as they think of their own children; that in adjusting the temperature for the worms, they should judge of what suited them best, making the room neither too warm nor too cool, while giving it good ventilation; and that they should lavish the utmost care on the worms both day and night. The ideas embodied in this teaching of Prince Shōtoku are exactly what are being taught and acted upon to-day. According to “Kaiko Yōiku Tekagami” a work published in 1712, “fire-heating” was already then a common practice in sericulture in Gumma district of Jōshū, and considerable progress had apparently been made in the method of rearing the worm. In 1842 the use of the thermometer was for the first time introduced in the work of sericulture, in Date-gori in Ōshū, and the practice came afterward to be gradually followed by the worm-raisers throughout the country. This new departure forms another step forward in the progress of the industry. As for what led to the application of science on this industry, it was the World’s Fair at Vienna, Austria, in 1872. The official who attended the Fair, came home more or less *au fait* of the scientific side of sericulture, as taught in Austria and Italy. Acting on the representations from these officials, the Government caused a sericultural laboratory to be established at Naitō-shinjuku, a suburb of Tokyo, in 1874, but for a certain reason the place was closed not long after. In 1884 the Government opened in Tokyo the Sangyō Shiken-ba (Silk-worm Disease Laboratory) and three years later had it removed to Nishigahara. All sorts of investigations connected with sericulture were carried out here and young men sent up by sericulturists throughout the Empire were instructed

in the art of silk-worm raising. Furthermore, the Laboratory having from time to time made public the results of its investigations the institution soon proved of very great importance to the sericultural interests of the country. About this time, those interested in the industry in the provinces of Fukushima, Gumma, Nagano and Saitama,—provinces which had had a considerable start of the others in the art of sericulture—started sending out ambulant instructors and otherwise took steps to revive and develop the industry, and these things all contributed largely towards its progress.

PRESENT DATA OF THE INDUSTRY.—From the above brief history of the sericultural industry in this country it will be seen to what a great extent the Imperial Court and Government have always encouraged and protected the industry. The following is a resumé of the condition of the industry as reduced to figures in 1902 :—

Silk-worm raisers, (No. of families engaged)	2,548,228
Egg cards (No. used)	3,894,675
Cocoons (in <i>koku</i>)	2,549,224
Egg-cards manufacturers (by family)	17,259
Silk "seeds" examined	{ those for manufacturing purposes— in cards 5,107,080 those for breeding purpose— No. of moths 41,300,419
Raw silk manufacturers (No. of)	414,511
Raw silk output (in <i>kin</i>)	11,150,879
Raw silk exported (in <i>kin</i>)	8,078,166

Thus it will be seen that silk-producing forms one of the most important industries of Japan. Indeed silk comes close after rice in importance as an article of domestic production while as an article of export it has no compeer. It may even be said that silk holds the balance of Japan's foreign trade.

II. PRESENT CONDITION OF SERICULTURE.

SERICULTURAL POLICY.—It has already been shown how sericulture formed a national industry in early days, silk forming an

article of common wear, how it declined during the "Dark Ages" and also under the Tokugawa Shogunate owing to the sumptuary laws that were passed under that régime, laws which are almost by the way an exact counterpart of those passed in England about the same time, and how the industry has revived in the new era. In the latter respect the provinces of Nagano, Gumma, Fukushima and Saitama, all of which were, comparatively speaking, devoid of good paddy land, were the first to adopt sericulture as the principal industry of the inhabitants. In these provinces there were people even prior to the Restoration who had carried on the industry on an extensive scale. These people forgot, however, that the rearing business being a work of 30 or 40 days it could hardly yield income sufficient to afford them a livelihood for the whole year.

SERICULTURE AS A SUBSIDIARY OCCUPATION.—These things in addition to the recent rise in wages having gradually come to be understood by those concerned, there has in late years grown up a tendency to carry on sericulture as a subsidiary occupation instead of as a main industry. Especially since the Japan-China War this tendency has gone on increasing. Sericulturists have come to see the profitableness of "farming" on a reduced scale for spring, summer, and autumn "crops," rather than undertaking the rearing all at once in spring alone. The statistical figures in this respect for 1901 were as follows:—

Season.	Cards hatched.	Cocoons obtained. (in <i>koku</i> .)
Spring crop (per raiser on average) ...	1.7	1,201
Summer " "	1.2	648
Autumn " "	1.5	818

MULBERRY FARMS.—The mulberry farm of the country is on the whole on the increase and keeps pace with the progress of the sericultural industry. The method of cultivating the plant differs according to the climatic conditions of the different localities. In the north-eastern districts where a comparatively low temperature prevails the plants are allowed to remain unpruned all the year round; but in the south-western provinces where the climatic conditions are quite the opposite, the shoots are pruned

close to the root, while in the "Kwanto" districts where the medium temperature prevails the pruning is done close to the stem, which is allowed to grow to a certain height. Besides, in the mulberry farms as such, the tree is also very largely cultivated so as to form fences, the borders, etc., of farms and farm-houses, it being estimated that the supply of mulberry leaves obtained from these sources forms about a quarter of the whole stock yearly consumed for sericultural purposes throughout the country. The following is a statistical representation of the mulberry farm industry for the ten years ending 1902:—

Year.	Mulberry farms as such <i>cho.</i>	Mulberry trees otherwise grown and estimated <i>cho.</i>	Total <i>cho.</i>
1893	176,218.4	67,140.4	243,358.8
1894	184,772.6	69,117.2	253,889.8
1895	189,909.2	76,255.1	266,164.3
1896	208,047.8	80,889.2	288,937.0
1897	220,008.5	78,195.4	298,203.9
1898	221,603.6	82,709.1	304,312.7
1899	221,862.9	77,733.0	299,595.9
1900	222,713.1	78,058.0	300,789.1
1901	228,202.3	75,257.1	303,459.4
1902	237,215.7	79,930.1	317,145.8

METHODS OF REARING.—The method of rearing the silk worm is not uniform even at present. Some do not at all use "fire heart" leaving the entire process to the conditions of the weather, this method being called the "natural method." Others would have every thing dependent on artificial heating and their method is called "the warm rearing system," while the third group would resort to both of the means above mentioned, and theirs is called the "conventional method." It goes without saying that the "natural method" was the original one, first resorted to in the earliest days of sericulture. Of this method, however, the disadvantages are that the growth of the worm is slow and that the quality of cocoons obtained are often not of good quality.

The "warm rearing system," on the other hand, accelerates the growth of the worm—in a very much less number of days than

other method—and a greater quantity of raw silk may be secured thereby, but the disadvantage of this method is that the worms are often weak in constitution and liable to produce cocoons of unexpected character. For these reasons, the method most extensively followed throughout the country at present is the “conventional.”

SERICULTURAL ECONOMY.—While the economy of silk raising cannot help being affected by the fluctuations in the prices of commodities in general, as also by the condition of the cocoon crop of the year, the profit shows a gradual diminution owing to the general tendency, of late years, of the prices to rise. The following may be given as a fair estimate of the profit and loss of the industry at present:—

EXPENDITURE.

“Seed” Eggs (1 card)	yen.
	1.500
Mulberry leaves... ..	{ 200 <i>kme.</i> 10 <i>sen</i> per <i>kme.</i> }
	20.000
Workers Wages... ..	{ 5 men, 30 <i>sen</i> each 30 women, 20 <i>sen</i> each }
	7.500
Workers Board (12 <i>sen</i> per capita)...	4.200
Miscellaneous expenses (charcoal, tallow, oil, bobbins, etc.)	5.000
Rent	{ Rearing room 47 <i>yen</i> Utensils 80 <i>sen</i> }
	4.800
Interest	{ 7 p. c. per annum or the working capital for 2 months }
	.446
Total	43.446

RECEIPTS.

First class cocoons (8 <i>to</i> at 4 <i>yen</i> 50 <i>sen</i> per <i>to</i>)	36.000
Middle class cocoons (1 <i>to</i> 5 <i>sho</i> at 2 <i>yen</i> per <i>to</i>)	3.000
Third class cocoons (5 <i>sho</i> , 1 <i>yen</i> per <i>to</i>)... ..	.500
Ditto, punctured (1 <i>to</i> 5 <i>sho</i> , 1 <i>yen</i> 50 <i>sen</i> per <i>to</i>)	2.250
Carcass chrysalis (1 <i>koku</i> 8 <i>to</i> , 1 <i>yen</i> per <i>koku</i>)	1.800
Mulberry shoots (20 bundles, 5 <i>sen</i> per bundle)	1.000
Total	44.550
Net Profit	1.104

MARGIN OF PROFIT.—Thus calculated, the net profit dwindles down to very insignificant figure; but sericulture being, as a rule,

carried on by the farmer as a by-industry and one of the rooms of his own dwelling being employed as the rearing room, while the members of his own family attend the worms, what are given above as items of disbursement constitute in effect his own earnings of his family, with the exception of the prices paid for the "seed" eggs and mulberry leaves.

THE OUTPUT.—The quantity of cocoons obtainable differs, of course, according to the crop condition of the year; still on the whole the quantity is on the increase, owing to the progress made in the art of sericulture, the increase being especially notable in the case of autumn cocoons, as may be gathered from the following statistics for the ten years mentioned:—

COCOON CROP FOR THE WHOLE OF JAPAN.

Year.	Total. <i>koku.</i>	Spring crop. <i>koku.</i>	Summer crop. <i>koku.</i>	Autumn crop. <i>koku.</i>
1893	1,686,894	1,225,018	328,591	133,285
1894	1,797,842	1,257,836	373,996	166,010
1895	2,258,173	1,697,803	324,028	236,342
1896	1,831,378	1,384,411	255,438	197,529
1897	2,121,944	1,654,722	278,257	193,965
1898	2,027,339	1,504,351	301,393	221,565
1899	2,512,562	1,817,936	373,142	320,484
1900	2,753,903	2,029,806	377,466	346,631
1901	2,526,181	1,798,672	345,617	381,892
1902	2,549,224	1,774,936	359,772	414,516

CROP RATIO OF EACH SEASON.

Year.	Spring crop. percentage.	Summer crop. percentage.	Autumn crop. percentage.
1893	72	19	9
1894	70	21	9
1895	75	14	11
1896	75	14	11
1897	78	13	9
1898	74	15	11
1899	72	15	13
1900	74	14	12
1901	71	14	15
1902	70	14	16

IMPORT OF CHINESE COCOONS.—No cocoon is at present sent abroad from Japan and the entire output is consumed at home as material for weaving silk fabrics and also for the purpose of manufacturing raw silk for exportation. At the same time from five to six hundred thousand *yen* worth of cocoons is yearly imported from China. The greater part of the importation consists of douppions, which are turned into floss silk and silk thread. The Chinese cocoons were imported as follows:—

Year.	<i>kin.</i>	Year.	<i>kin.</i>
1897... ..	713,929	1900... ..	598,999
1898... ..	458,617	1901... ..	441,371
1899... ..	807,762	1902... ..	649,013

III. EGG-CARDS MAKING.

GENERAL REMARKS.—In the earlier days there were apparently no egg-cards manufacturers separate from the sericulturist, the latter doing his own work of selecting the good cocoons out of his own crop for “seeding” purposes. Nor can any exact data be given as to when the egg-card-making came to form a specialty, though from about the latter part of the 17th century the district of Uyeda in Shinshū and the various provinces in “Kwantō” and Tohoku, were already in the habit of sending out to and supplying the other parts of the country with the “egg-card.” What, in modern times, brought about the sudden prosperity of this special industry, was the prevalence, as already mentioned, of the silk worm epidemic in Europe, which created a demand for Japanese “cards.” It was at the time when the samurai class, deprived of their permanent pensions, took up this business of the egg-card making, as if with one accord. The subsequent decline in the exportation of the “cards,” as already told, almost ruined the entire egg-card industry of the country. Since then, however, with the progress and prosperity that have attended the sericultural industry in general, the special industry in question also revived to such an extent that there is not a locality throughout the

Empire which does not possess its own egg-card manufactures, as the following table shows:—

NO. OF EGG-CARD MANUFACTURERS THROUGHOUT JAPAN.

Year.	For Spring hatching.	For Summer and Autumn hatching.
1898	16,785	7,577
1899	16,409	7,759
1900	16,324	7,587
1901	13,745	8,939
1902	12,923	4,336

THE NURSERY PROCESS.—The progress attained, especially on the scientific side, of sericulture has now come to make it an established principle among those interested in the industry that, in the cultivation of the worms for egg purposes, the temperature should not be artificially raised.

As for fighting the silk worm epidemic, Pasteur's grainage cellulaire method was improved upon and remodelled as the result of investigations carried at the Sericultural Laboratory and this improved method has since proved itself a very efficient means for the purpose for which it was devised. Then the enforcement of the Silk Worm Egg Examination Regulations proved another means of preventing the epidemic from spreading, while on the other hand the examination carried out under the Regulations had also the satisfactory result of raising the standard quality of the eggs. The following table will be interesting in this respect, 1898 being the first year in which the Regulations just mentioned were put in force.

	Spring breed.		Summer and Autumn breed.	
	Passed. percentage.	Rejected.	Passed. percentage.	Rejected.
1898	79	21	75	25
1899	82	18	75	25
1900	82	18	80	20
1901	88	12	87	13
1902	89	11	—	—

ECONOMY OF EGG-CARD MAKING.—The making of egg-cards requires the utmost skill and experience, in addition to the most painstaking care, while the manufacturer must necessarily be guided in this work by a strong sense of responsibility. A manufacturer

thus qualified would consider the following a fair estimate of the ins and outs of his business:—

DISBURSEMENTS.

	<i>yen.</i>
The "seeds" (100 encased moths at 3 <i>sen</i> per head)	3,000
Mulberry leaves (10 <i>sen</i> per <i>kwan</i>)	22,000
Workers hire 10 men at 30 <i>sen</i> each, 30 women at 20 <i>sen</i> each) ...	9,000
Workers board (12 <i>sen</i> a day on an average)	4,800
Rents room 4 <i>yen</i> , utensils 86½ <i>sen</i> , apparatus 4 <i>yen</i>)	8,865
Interest on the working capital for 2 months at 7 p.c. annum) ...	522
Card-paper (60 sheets 3 <i>sen</i> each)... ..	1,800
Miscellaneous expenses	6,800
Total	56,787

RECEIPTS.

Proceeds (6 <i>to</i> of cocoons and 60 egg cards at 1 <i>yen</i> 20 <i>sen</i>)	72,000
Thread Cocoons (2 <i>to</i> at 3 <i>yen</i>)	6,000
Douppions (1 <i>to</i> 5 <i>sho</i> at 1 <i>yen</i> 50 <i>sen</i>)... ..	2,250
Third class Cocoons (5 <i>sho</i> at 12 <i>sen</i>)600
Punctured Cocoons (6 <i>to</i> at 1 <i>yen</i> 20 <i>sen</i>)	7,200
Carcass chrysalis (about 2 <i>koku</i> at 1 <i>yen</i>)	2,000
Waste mulberry shoots (about 22 bundles)... ..	1,100
Total... ..	91,150
Net Profit	34,363

OUTPUT OF "SEED-CARDS."—The yearly production of "seed-cards" is also on the increase in quantity along with the progress of the sericultural industry in general, as may be seen from the following table which gives figures for the years subsequent to the enforcement of the Seed-Cards Examination Regulations:—

Year.	For Spring hatching.		For Summer and Autumn hatching.	
	For manufactur- ing purposes. Cards.	For reproduc- tive purposes. Moths.	For manufactur- ing purposes. Cards.	For reproduc- tive purposes. Moths.
1898	2,559,424	20,572,497	165,394	3,949,821
1899	2,877,532	21,242,568	227,836	4,579,913
1900	3,124,894	27,530,491	277,300	5,922,683
1901	3,378,718	31,239,854	2,002,622	8,141,607
1902	3,025,280	32,072,367	2,081,800	9,228,052

In the above table the figures are only for those cards officially examined and consequently those made for private use are not included.

IV. FILATURE.

FIRST MODEL FILATURE.—The reeling of raw silk having been carried on exclusively by hand-reeling formerly, the product obtained was of the coarse kind unfit for the foreign market.

It was to obviate this defect that the Government established, as already mentioned, a model filature at Tomioka-machi in Gumma prefecture in order to encourage the improved method of machine-reeling. The example thus set before them led those interested in the industry to starting similar establishments on the factory system throughout the country. Even those who were previously contented with hand-reeling, now took up the frame-reeling and adopted the practice of selling their product jointly by unifying its quality. This was decidedly a step forward in the progress of the industry which soon came to be recognized by the farming class as an important by-business. According to the official returns for 1900, the silk turned out by machine-reeling totalled 6,193,869 *kin* against 4,779,575 *kin* by frame-reeling. It is misleading, however, to say that filaturing constitutes a by-industry whenever it is carried on by frame-reeling, because there are establishments managed after the fully developed factory system and yet employing the frame-reeling method. While it is not yet exactly known, how many establishments of this latter kind there are in the country, the statistical returns for the year above mentioned show that in that year the country had 2,072 machine-reeling factories, employing 122,116 pans against 597 frame-reeling establishments employing 55,022 pans, the figures being in each case for factories that employ 10 workers or more.

PRESERVATION OF THE COCOONS.—Owing to the fact that the climatic conditions of Japan are not like those of continental countries where a comparatively high temperature prevails the preservation of cocoons often proves to be a very difficult affair, cases of the deterioration of entire stock not being infrequent. The proper preservation of cocoons forms, therefore, a very important problem. In former days sun-drying was the only method adopted in this respect. The Tomioka Filature was the first to test the baking process

but this method, too, did not give satisfactory results, owing to the climatic peculiarities of the country. Of late, however, many and valuable inventions have been made well answering the purposes of stifling and the subsequent long preservation of cocoons so treated.

THE REELING.—There is no question that the Tomioka Filature proved to be a model establishment and that it fully satisfied the expectations that had been formed of it. It was after a European model and many of this scheme tried in this establishment and imitated at others only proved their unfitness for general adoption in this country. So there came consequently a period of continual changing from one system to another, a conspicuous instance of this kind being the adaptation to a very large extent of the “Kennel” method in place of the “Champon” system and also of “double” instead of “direct” reeling. Very significant progress has also been made in the art of reeling itself, since the opening of the model institution, the following figures furnishing eloquent proof of this statement.

AVERAGE PRODUCE PER PAN.

Year.	Machine reel.	Frame reel.
1900	48 <i>kin</i>	27
1896	39 ”	19
1893	39 ”	22
Increase in 1900 as against 1896 ...	9	8

FILATERING ECONOMY.—In this as in all other industries, the skill of the workers and the cost of the raw stock count for every thing. It is undeniable, however, that the recent general rise in the prices of commodities has also tended to increase the cost of production in filaturing. Below is a table showing the average cost of production per 100 *kin* of raw silk.

Year.	Machine.	Frame.	Average.
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1900	156	129	143
1896	126	108	117
1893	110	82	96
Increase in 1900 as against 1896 ...	30	21	26

It may be interesting to give in this connection a detailed list of the item of expenditure and receipt in filaturing. The following is such a list, the calculations being made on the basis of 100 *kin* :—

MACHINE-REELING.

EXPENDITURE.

	<i>yen.</i>
Cost of cocoons—16 <i>koku</i>	640.000
Girls' wages—267 reelers each 6 <i>sho</i> of cocoons and 10 others doing the rest of the work	41.550
Girls board	27.700
Employees salaries... .. .	14.750

ANNUAL OUTPUT AND EXPORT.—While it is unavoidable that there should be differences in the amount of annual production of raw silk owing to differences in "crop" condition and also in those of proceed therefrom according to market condition, there is no question that on the whole the amounts are on the increase, being encouraged no doubt by the growth of the export trade, as the following table will show:—

Year.	Amount produced. in <i>kin.</i>	Amount exported.	
		in <i>kin.</i>	in <i>yen.</i>
1859	—	487,625	—
1860	—	812,780	—
1861	—	922,424	—
1862	—	2,414,914	—
1863	—	1,294,719	—
1864	—	1,348,164	—
1865	—	941,602	—
1866	—	1,101,546	—
1867	—	1,000,117	—
1868	—	1,123,951	—
1869	—	726,046	5,720,182
1870	—	683,362	4,278,752
1871	—	1,323,435	8,004,144
1872	—	895,500	5,205,237
1873	—	1,202,134	7,208,421
1874	—	979,193	5,302,039

1885	3,174,925	2,457,925	13,033,872
1886	4,592,525	2,635,294	17,321,361
1887	5,124,788	3,103,584	19,280,002
1888	4,148,891	4,677,708	25,916,860
1889	5,511,041	4,126,741	26,616,541
1890	5,425,425	2,110,315	13,859,339
1891	6,799,850	5,325,148	29,356,339
1892	6,850,550	5,406,856	36,299,744
1893	7,709,713	3,712,213	28,167,411
1894	8,104,894	5,484,059	39,353,156
1895	10,020,694	5,810,046	47,866,257
1896	9,017,000	3,918,994	28,830,600
1897	9,609,756	6,919,861	55,630,460
1898	9,248,416	4,837,329	42,047,411
1899	10,964,013	5,946,911	62,627,721
1900	10,973,444	4,630,903	44,657,029
1901	10,972,981	8,697,706	74,667,331
1902	11,158,819	8,078,166	76,859,478

DEMAND AND SUPPLY.—The United States of America is decidedly the best customer of Japanese raw silk, that country taking 50 per cent. or more of the whole amount exported. Next comes France, and then Italy. Other countries buy comparatively little of Japan. The destinations of Japanese raw silk after its exportation may be tabulated as below:—

Destinations.	1898. <i>kin.</i>	1899 <i>kin.</i>	1900. <i>kin.</i>	1901. <i>kin.</i>	1902. <i>kin.</i>
U. S. A.	2,911,240	3,820,477	2,642,918	5,142,376	4,878,494
France	1,630,654	1,803,464	1,200,838	2,035,818	1,575,251

Russia	39,663	30,337	49,846	82,234	87,758
Other countries	4	2	1	8,568	186
Total	4,837,329	5,946,611	4,630,903	8,697,706	8,078,166

Besides the above, waste raw silk is annually exported to the extent of about four million *yen* in value.

It may be noted here, that, the amount of Chinese raw silk and wild silk cocoons has considerably increased of late the importation now aggregating to the value of about one million *yen* a year. The Chinese raw silk is, as compared with the Japanese article, inferior in quality, but its price is lower and it is used for weaving fabrics of home consumption. For a similar reason Tussah silk yarns are imported. The following gives the amounts of the importation from China:—

Year.	Chinese raw silk. <i>kin.</i>	Tussah silk yarns. <i>kin.</i>
1898	7,606	15,760
1899	168,839	151,850
1900	3,288	148,237
1901	631	213,018
1902	50	418,463

The statistics above given conclusively prove that the future of sericulture in Japan in all its branches is brighter than ever. While now and again one hears of the complaints that the increase in wages is eating up all the profit formerly obtained from the industry, it seems nevertheless almost certain that better economy and more business-like methods in carrying on the industry will soon remove all these causes for complaint.

CHAPTER V—Tea-Manufacturing.

History—Present Condition of the Industry—Kinds of Tea—Market.

I. HISTORY.

INTRODUCTION OF TEA-SHRUBS FROM CHINA.—The plantation of the tea-shrubs in Japan first took place in the year 805 when Denkyo Daishi who had crossed over to China for the purpose of completing his study of Buddhism, came home with some tea-shrubs and planted them in a place called Daino-fumoto in the province of Omi. In the following year the famous Kōbō Daishi returned from China also with a supply of tea-plants. In addition to this he also brought with him the art, which he had learned on the continent, of preparing tea-leaves for the purposes for which they are now used. Subsequently in 815 the Imperial Court ordered the plantation of tea-shrubs in the provinces round about Kyoto, Tanba and Harima and also ordered these provinces to send an annual tribute of manufactured leaves to the Court. This was the beginning of tea planting and manufacturing in Japan. The use of tea as a beverage, dates further back, however, by at least 76 years, for the Court calendar of those days already makes mention of the celebrated tea-ceremony. The latter fact would show that tea was already used at that time among the royalty and nobles. On the other hand, the Buddhist priests have always made use brewed tea as a necessary article of their ritual and it is more than probable that the subsequent popular use of this particular kind of beverage originated in this religious practice.

The method of tea making as taught of Kōbō Daishi on his return from China, was to pick the tea twigs and leaves, steam them and then pound them with a pestle and mortar,

afterward making the crushed matter thus obtained into balls. The balls were dried over a fire and then ground into a powder, which was thrown into hot water and stirred up, before it was drunk. That the grinding stones were in use in those days is evident from the fact that there is still to be seen among the old relics, preserved in the Hōshōji Temple of Yamato, a set of these stones which Kōbō Daishi is said to have brought with him from China.

In subsequent years the Imperial Court encouraged the industry of tea plantation laid out within its "forbidden" precincts.

The above facts relate only, it will be seen, to the earliest period of tea-making in Japan. For 400 years or so after its introduction, the use of tea as a beverage was confined to nobles and to the religious orders.

Another Buddhist priest named Eisei-Jenshi who returned home from China in 1191 brought with him a quantity of seeds of tea-plant and planted them on Mt. Sefuri, Chikuzen. He also introduced a new mode of curing, that is to say, pan-curing. His disciple Meikei took a quantity of the seeds from the Sefuri plot and planted them at Togano and Uji, thus laying the foundation of the now flourishing tea industry of Uji.

TEA IN SOCIAL ETIQUETTE.—The planting of tea and the custom of using this beverage spread apace. The custom was still, however, as it was for a long time after its introduction to Europe, aristocratic, and was practically confined to the wealthier classes and to the priests. In course of time the custom of tea-drinking began to wear an aspect of something like a ceremony, with nice and strict canons of etiquette to surround it. It was during the time of the Shogun Yoshimitsu of the Ashikaga Regency that these canons were nicely elaborated by a man named Shuko, and thus the so-called tea-ceremony were first drawn up in a regular form. A special class of persons whose business it was to teach the details of this ceremony next began to make their appearance, and these persons, called "masters of tea-ceremony," occupied an important place in the estimation of the public. In fact all matters relating to social etiquette were practically in charge of these "tea-masters,"

and every feudal baron kept in his service one or more such "masters" upon whom he bestowed a regular salary. Thus the tea-ceremony finally came to play an important part in society as a regulator of social etiquette and as a means of promoting friendship. A big tea-ceremony meeting was a favorite occasion for bringing about meetings and reunions among warriors, courtiers, and other people in the higher ranks of society, and it can not be denied that the strict and sometimes graceful rules enforced by the ceremony tended very much to soften the blunt and rough manners of the warriors, inured to hardships and horrors of battles that occurred very frequently during the later period of the Ashikaga Regency. Nobunaga who succeeded in suppressing the civil strife and Hideyoshi who rose after Nobunaga were both great patrons of the tea cult. No money was spared on the vessels used for the ceremonials, and porcelain bowls and other earthenwares were specially sent for to Luzon, Cochin-China, and China. Hideyoshi very often gave such vessels to his captains when he wished to reward them for distinguished services and these were afterwards preserved as valuable heirlooms in the houses of the captains.

As might have been expected, the tea-ceremony attained great popularity on the advent of the Tokugawa Regency, and during the period of peace lasting for about three centuries which prevailed under that régime.

CURING PROCESS.—Only two kinds of tea were in use till the time of the Tokugawa, namely the pounded tea and pan-fired tea. It was not till 1738 that a new mode of curing tea was invented by a manufacturer of Yamashiro named Sannozo Nagatani. This mode, called at that time "green-curing," consisted in first steaming the leaves, rolling them, and then drying them at a fire, in such a way as to preserve the natural green hue of the leaves. This system of curing, a forerunner of the present Uji system, was received with favor throughout the tea-producing districts. The Gyokuro tea, a modified form of the "green-cured" tea, was first manufactured at Uji in 1835.

It will thus be seen that the original mode of curing tea-leaves consisted in steaming them, then pounding them, and finally rolling them into balls, after which the pan-firing process came into vogue.

Next we have the powdered tea method, and then the Uji "green-curing," and lastly the Gyokuro-tea style. The black tea is the latest innovation, dating only about 27 years back.

FIRST EXPORT OF JAPANESE TEA.—Tea was first exported from Japan about 1750 by some Chinese merchants of Nagasaki. The opening of Yokohama and Kobe to foreign commerce inaugurated a new epoch for the export of our tea which found in those two new open ports and in Nagasaki regular outlet to foreign markets. At first our tea went both to England and America, but, on the development of the tea industry in Ceylon and India, England ceased to patronize the Japanese produce, so that from about 1871 America has been our principal customer.

VICISSITUDES OF THE INDUSTRY.—Just as in the case of silk and other staple export commodities, the history of the export of tea is checkered, consisting as it does of ups and downs, the production and export of tea of bad quality, the inevitable decline, in consequence, of the volume of export, the holding of conferences by all those concerned in the industry to make arrangements calculated to provide against this evil, and then the creation of guilds for the purpose. Further we see the appearance of companies formed with the object of undertaking the export of the goods direct to foreign consumers and thus dispensing with the services of the middle-men, that is of the foreign merchants resident amongst us, the invariable collapse of such companies, the dispatches both of the Government and by the guilds of a number of experts and merchants to Ceylon, China and other places to inspect the condition of the tea manufacture and the tea market in those countries.

The World's Fair at Chicago supplied an important occasion for advertising abroad the merit of our leaves, and the strenuous efforts made by our manufacturers and merchants at that time were attended by a satisfactory result. In other words, the popularity of what may be called our national beverage in the United States and Canada was greatly increased. Meanwhile the arrangements for checking the appearance on the market of inferior tea and for the direct exportation of tea by our own merchants had been completed. These laudable and profitable exertions of our manufacturers and merchants were so much appreciated by the Government that in

1897 it granted for the time being a state aid of 70,000 *yen* a year towards the funds for expanding the foreign market of our tea. In compliance with the instruction of the Government the Central Tea Guild maintains at present branch offices in the United States, Canada, Siberia, France etc., and causes them to take charge of the business of investigating the state of the market in those places and of taking steps to expand the market for the goods.

DIRECT EXPORT.—This aggressive movement on the part of our tea-manufacturers and merchants may well be regarded as constituting a new epoch in the history of our tea industry, for the export business had remained almost exclusively in the hands of resident foreigners during the period of over forty years after the opening of our country to foreign trade in modern times. These merchants re-cured the goods before exporting it, and the men and women employed by them both in Yokohama and Kobe in the height of the tea season numbered or used to number tens of thousands. The re-curing process is now carried on extensively in several tea-producing districts, and the Japanese establishments which are engaged in re-curing and in direct exporting now number more than eleven.

CURING MACHINES.—The process of re-curing and of manufacture has also been considerably simplified by the invention of several machines, among which may be mentioned those invented by Gensaku Harazaki, Kenzō Takabayashi, Hatsutarō Mochizuki, Saikichi Kamo, Kiichirō Usui, Hatsujirō Nakatsu and others. The tea-manufacturing machines, large and small, number over 1,000, and these enable our manufacturers to produce their goods with less cost and labor than before. Nor does the Government neglect to devise measures for promoting the industry. It has for instance created since 1896 an experimental tea manufacturing establishment at Nishigahara, where all matters relating to the planting of the shrub and the manufacture of tea, as also to the improvement of tea-manufacturing machines are attended to.

II. PRESENT CONDITION OF THE INDUSTRY.

AREA UNDER CULTIVATION.—As in the case of the mulberry-plant, the cultivation of the tea-plant is carried out on large

farms or rather plantations specially devoted to the purpose as well as in spare spaces about homesteads and in other kinds of land. The average under cultivation during the last seven years is given below.

Year.	Tea fields. <i>cho.</i>	Tea grown in other lands. (estimates.) <i>cho.</i>	Total. <i>cho.</i>
1896	38,810.1	20,669.0	59,479.1
1897	38,152.5	20,739.6	58,892.1
1898	37,483.3	21,164.7	58,648.0
1899	37,917.5	19,965.6	57,883.1
1900	31,889.5	17,376.6	49,266.1
1901	31,899.2	16,949.0	48,848.2
1902	32,111.5	16,934.6	49,046.1

Shizuoka heads the list of tea-producing districts in the extent of acreage, and contains in fact a little over one-fifth of the whole acreage under tea in this country. Then follow Miye, Ibaragi, Kyoto, Kumamoto, and Fukuoka.

KINDS OF TEA.—Of the different kinds of tea manufactured in Japan, the *Sen-cha* (ordinary green tea) and the *Ban-cha* surpass all the others in output and value, and they are followed in this respect by the *Gyokuro*-tea and black tea. The output of powdered tea, Olong tea and brick tea is far below that of those mentioned above. The output of powdered tea is particularly conspicuous in gradual falling-off. Details as to the output of the different teas are as follows:—

OUTPUT OF TEAS DURING THE LAST 10 YEARS.

Year.	Powdered. <i>kwam.</i>	<i>Gyokuro.</i> <i>kwam.</i>	<i>Sen-cha.</i> <i>kwam.</i>	Black. <i>kwam.</i>	Olong. <i>kwam.</i>	<i>Ban-cha.</i> <i>kwam.</i>	Total. <i>kwam.</i>
1893	6,397	71,355	5,129,446	36,151	8,540	2,388,479	7,640,368
1894	4,435	105,402	5,144,733	48,661	17,244	2,562,757	7,883,232
1895	5,523	91,206	6,077,186	53,401	13,556	2,358,008	8,598,880
1896	4,550	70,340	5,974,209	37,894	16,848	2,396,552	8,500,393
1897	4,304	64,837	5,999,393	30,283	15,880	2,357,259	8,471,956
1898	4,219	70,586	5,919,738	36,069	18,911	2,392,195	8,441,718
1899	4,239	91,570	4,789,164	33,040	11,290	2,589,581	7,518,884
1900	4,325	81,438	4,895,684	35,862	9,365	2,585,514	7,612,881
1901	4,237	75,494	4,637,790	38,310	21,384	2,073,282	6,850,497
1902	4,210	61,171	4,596,265	30,981	24,512	2,066,289	6,783,428

The *Gyokuro*-tea is mostly produced in Kyoto and Niigata, black tea in Kumamoto, and other places in Kyūshū, *Ban-cha* in Shizuokā.

MARKET.—The home consumption of tea comprises the whole of the powdered tea and *Gyokuro* tea, and some of the *Sen-cha*, *Ban-cha*, etc. The *Sen-cha*, *Ban-cha* and black tea constitute the bulk of the teas which go abroad. The United States and Canada take most of the teas shipped abroad, while Russian Siberia takes a small quantity of black tea and brick tea. The distribution of our teas as to consumption is as follows:—

EXPORT AND AMOUNT OF CONSUMPTION AT HOME.

	Total output <i>kin.</i>	Import <i>kin.</i>	Total <i>kin.</i>	Export <i>kin.</i>	Home consumption <i>kin.</i>
1893	47,752,300	57,904	47,810,204	36,443,555	11,366,649
1894	49,270,200	52,186	49,322,386	37,453,587	11,868,799
1895	53,743,000	66,686	53,809,686	38,826,661	14,983,025
1896	53,127,456	97,643	53,222,099	33,241,472	19,980,627
1897	52,949,725	119,617	53,069,342	32,632,683	20,436,659
1898	52,760,738	145,953	52,906,691	30,826,632	22,080,059
1899	46,993,025	51,933	47,044,958	34,731,644	12,313,314
1900	47,576,175	113,985	47,690,110	32,240,147	15,449,963
1901	42,879,444	117,518	42,996,962	32,248,471	10,748,491
1902	42,394,550	125,396	42,519,946	32,759,580	9,760,366

It may be noted that the teas imported come almost exclusively from China.

The ratio of distribution per 1000 as to value of the teas exported was as follows in 1900:—

	Green tea. (<i>Sen-cha</i> and <i>Ban-cha</i> .)	Black tea.
United States	781	960
Canada	203	4
Siberia	—	13
Others	16	23
Total	1,000	1,000

PROSPECT OF THE INDUSTRY.—As may be seen from the tables showing the output and the amount of export, the progress

of the industry is not quite satisfactory; on the contrary there are even signs of a decline, principally on account of the increase in the cost of production and the appearance of rivals in the foreign markets. In some districts the cultivation of tea-plants is being superseded by that of other plants, while in some others the cultivation of tea-plants is beginning to become active. Judged from the state of affairs, more or less changes may take place in a few years in the *locale* of the tea districts.

The Government is, as has been pointed out above, doing its best to promote the industry, and besides granting a subsidy is adopting suitable measures for the improvements of the quality, for providing against the deterioration of the tea, and for keeping those interested in the industry well-posted with regard to the state of markets in foreign countries. The local authorities follow the example set by the central Government and are supplementing the efforts of tea-growers and manufacturers to push the industry to the state of greater prosperity.

CHAPTER VI.—Institutions for Encouraging Agriculture.

**Agricultural Experiment Stations—Agricultural Institutions—
Ambulant Lecturers on Agriculture—Sericulture Institutes—
Silk Conditioning House—Imperial Establishments of
Tea Industry—Animal Epidemic Laboratory—
State Cattle Breeding-Farms—State
Horse Studs and Depots.**

I. AGRICULTURAL EXPERIMENT STATIONS.

GENERAL REMARKS.—About thirty years ago Japan made a first attempt to improve agriculture by scientific methods. For this purpose the Government established many experimental farms, and started trial work on cattle breeding and various other branches of agriculture, at the same time importing from abroad new varieties of domestic animals as well as grains, implements etc. Most of these attempts ended in failure, owing to the fact that there were not at that time a sufficient number of trained men to take charge of this innovation.

Those failures, however, were not in vain, for they taught a valuable lesson to our authorities and caused them to turn their attention to the business of training men qualified to undertake the work. By 1886 the Department of Agriculture and Commerce obtained a sufficient number of the graduates of the then Tokyo Agricultural College, and they were made to act as pioneers of the new movement. These young agriculturists as first addressed themselves to the task of carrying out easy and simple experiments with the help of farmers. The result obtained was quite satisfactory, and was indeed of such description as to deeply impress those farmers with the importance of scientific knowledge of farming, as the three essential ingredients of fertilizers, the selection of seeds and so forth. In

1890 this experimental work was elevated to the dignity of a purely Government enterprise and in consequence an office with experimental land measuring about four acres attached to it was established at Nishigahara near Tokyo. This was the embryo of the present Imperial Agricultural Experiment Station. In the course of time the real value of this enterprise began to be fully appreciated by the general public, more especially from those who were directly interested in agricultural work. In 1893 an Imperial Ordinance relating to the organization of the Imperial Agricultural Experiment Station in Japan was promulgated, and placed this institution on a firm basis with all the necessary expenses yearly appropriated with the consent of the Imperial Diet. At the same time six branch stations were instituted, their sites being selected with due regard to climate, soil, etc. In 1896 three more branch stations were added to the list, thus bringing the total to ten; namely, one main station and nine branch stations, the latter located in the prefectures of Osaka, Miyagi, Ishikawa, Tokushima, Hiroshima, Kumamoto, Shimane, Aichi and Akita.

Those branch stations in the early stage of their existence, had to devote themselves mainly to the work of carrying out simple experiments easily admitting of practical application by our farmers whose scientific knowledge on agriculture was yet poor, while the facilities they had at their disposal of conducting field experiments either individually or by combined efforts were practically absent. In undertaking such experiments the stations had also an eye to induce the farmers to establish in their own respective districts similar organs for promoting the development of agriculture.

During the last ten years the main and branch stations have attended with greater zeal to this important duty of guiding the farmers in the art and science of agriculture. Meanwhile the Government elaborated a measure which had a powerful effect of stimulating our people towards establishing local experimental stations, for in that measure the Government pledged itself to grant every year State aid within the limit of 150,000 *yen* in all. Roused by those circumstances most of the prefectures emulated each other in organizing experimental stations, till at present these number 38 throught the country. The main station was now in the position to make a new departure

in the mode of conducting scientific researches and investigations, and to attend to it on a larger scale than before. In view thereof, in 1899 it divided its work into nine sections, viz., agriculture, agricultural chemistry, entomology, vegetable pathology, tobacco culture, horticulture, stock-breeding, and report and general affairs.

In 1903 it was decided to reduce the number of the stations maintained by the central Government and to transfer them to the control of the respective prefectures wherein they were located, so that those stations may more satisfactorily fulfill the local requirements, while the stations continuing as Government establishments may be enabled to concentrate their work of carrying on investigations capable of wider applications than before. In pursuance of this decision six branch stations were abolished, or rather transferred to the prefectural control in that year, i.e., those in Miyagi, Ishikawa, Tokushima, Hiroshima, Shimane and Aichi. Thus at present one main station at Nishigahara and three branches in the prefectures of Kumamoto, Ōsaka and Akita are maintained by the Government.

THE WORK CARRIED OUT.—As mentioned in the preceding paragraph, the work of the main station is subdivided into nine sections, which attend to the following lines of work :—

SECTION OF AGRICULTURE :—

1. Cultivation of crops.
2. Selection of the different varieties of crops.
3. Rearing and breeding of agricultural plants.
4. Researches in vegetable physiology.
5. Researches in the relation between crops and climate, soil and manure.
6. Examination of seeds and plants.
7. Farm implements and tools, and the amelioration of soil.
8. Distribution of seeds and seed-plants.

SECTION OF AGRICULTURAL CHEMISTRY.—This section is to deal with,

1. Chemical investigations in crops and farm products.
2. Experiments on manure.
3. Micro-organisms present in soils and manures.
4. Agricultural technology.
5. Examination of soils and the crops suitable to them.

6. Investigating and surveying mineral fertilizer deposits.
7. Researches on the productive power of various kinds of soils.

SECTION OF ENTOMOLOGY :—This deals with,

1. Treatment of insect pests and utilization of useful insects.
2. Classification and life history of both injurious and useful insects, and their geographical distribution.

SECTION OF VEGETABLE PATHOLOGY :—This section deals with,

1. Prophylactics and therapeutics of plant diseases caused by fungii and bacteria.
2. Application of pathogenic fungii and bacteria for the destruction of injurious insects.
3. Examination of and experiments on parasiticides.

SECTION OF TOBACCO :—This section deals with,

1. Selection and cultivation of tobacco.
2. Researches on the relation between the quality of tobacco and climate, soil, fertilizers, etc.
3. Investigation on the curing, fermentation and preservation of tobacco-leaf, and on its manufacture.

SECTION OF HORTICULTURE :—This section deals with,

1. Selection, propagation and cultivation of fruits and vegetables.
2. Cross-breeding of horticultural plants.
3. Harvesting and preservation of fruits and vegetables.
4. Forcing of horticultural plants.
5. Distribution of seeds and seed-plants.

SECTION OF STOCK-BREEDING :—This section deals with,

1. Researches on natural and cultivated fodder-plants.
2. Feeding and management of domestic animals.
3. Zootechnics.
4. Distribution of seeds of fodder-plants.

SECTION OF REPORT AND SECTION OF GENERAL AFFAIRS :—These two sections deal with matters relating to compilation and publication of reports and library and matters relating to the general and financial affairs respectively of the main station.

BRANCH STATIONS.—The branch stations attend to one or more subjects of technical work. Thus the Kinai Branch situated in Osaka prefecture is devoted to agricultural work, the Kyūshū Branch in Kumamoto prefecture undertakes the work relating to

entomology and vegetable pathology, and lastly the Riku-u Branch situated in Akita prefecture takes charge of the work of stock-breeding. At the same time both the main and branch stations carry on the following lines of work:—

1. Inspection of fertilizers.
2. Chemical analysis made at the request of the public.
3. Supervision of experiments entrusted to farmers.
4. Information given to inquiries coming from the public.
5. Lectures held at the request of the public.
6. Researches on special agricultural problems.

PRINCIPAL ESSAYS PUBLISHED IN THE REPORTS.—The principal essays heretofore published in the reports compiled by the main station are as follows:—

I.—CLIMATE, SOIL AND WATER.

1. On the seed-exchange of rice.
2. On the influence of sun's rays on the growth of rice-plant.
3. Climatological researches on rice-plant.
4. On the burning of soil.
5. Advantage of periodic drying of paddy-field.
6. On the deep cultivation of paddy-field.
7. On the influence of moisture on the growth of plants.
8. On the volume of irrigation water required in one *tan* of paddy-field.
9. Average quantity of water absorbed and evaporated by one bunch of the rice-plant during the several stages of its growth.
10. On the proper time of discharging the irrigation water from paddy-field.
11. On ammonical springs.
12. On irrigating the paddy-field throughout the winter.

II.—CULTIVATION.

1. On selecting the varieties of upland-rice.
2. On selecting the varieties of rice-plant.
3. On the reproductive power of barley and wheat seed with special reference to weight and specific gravity.

4. On seed selection.
5. On the relation between the reproductive power of the seed of Indian millet and its size and specific weight.
6. The distribution of larger seeds on the ear of Indian millet and its practical application in seed selection.
7. Relation between the germinative power and the color of indigo seed (*Indigofera tinctoria*, L.).
8. Relation between the germinative power and the color of "Genge" seed (*Astragalus cinicus*, L.).
9. The relative vitality and reproductive power of fresh and old rice grains kept in two different places.
10. On the advantages of the proper selection of seeds with regard to the mode of cultivation or manuring.
11. Reproductive power of rice and barley in the various stages of their ripening.
12. Tar as prevention of injury on seeds by birds.
13. On the quantity of seed required in the late sowing of rice.
14. On Japanese indigo (*Polygonum tinctorium*, Lout).
15. On the proper time for sowing barley, wheat and naked barley in Japan.
16. On the proper time of rice-transplantation.
17. Cultivation of soja bean (*Soja hispida*, Maxim) as green manure.
18. On the proper time of applying night soil as manure to wheat or barley crop in districts subjected to heavy snowfall.
19. On the development of root.
20. On cross hybridation.
21. On the superior varieties of principal crops in Japan.
22. On the characteristic qualities of the different varieties of soja beans.
23. Improvements of nursery plot of rice in the north-eastern districts of the Main Island.
24. On the characteristic qualities of the different varieties of rice-plant with special reference to mode of transplantation.
25. Experiments on the number of bunches of rice-plant in a given area of land and the number of plantlets in each bunch.

26. On the growth of paddy and upland rice.
27. Injurious effect of shaking rice-plant in the flowering season.
28. Injurious effect of steeping rice-plant under water.
29. Transplantation of sweet potatoe (*Iponaea batata*, Lam.) and the part of the shoots best suited for young sets.
30. On the direction of ridges for a second crop in paddy-field.
31. On the characteristic qualities of the different varieties of rice-plant.
32. On the valuation and preservation of harvested crops.
33. Experiments on the storing of rice grains.
34. Relation between the quality of rice and its market price.
35. Cultivation of Japanese indigo in the province of Awa.
36. Cultivation of *Mentha* (*Mentha aroensis*, L.) in Yamagata-ken.
37. Cultivation of hemp (*Cannabis sativa*, L.) in the province of Shimotsuke.
38. Cultivation and preparation of ginseng (*Aralia quinquefolia*, A. Gr) in the province of Izumo.
39. On Indigo (*Indigofera tinctoria*, L.)
40. Cultivation of "I-gusa" (*Juncus effusus*, L.) in Hiroshima-ken and Okayama-ken.
41. Apple plantation in Awomori-ken.
42. Cultivation and preparation of hemp in Hiroshima-ken.

III.—MANURE, CHEMICAL ANALYSIS AND AGRICULTURAL TECHNOLOGY.

1. Analysis of the principal commercial manures.
2. On the effect of different nitrogeous manures.
3. Analysis of leguminous plants used for green manuring.
4. Phosphatic manures and their relative efficiency.
5. On the application of phosphatic manures on different kinds of soils.
6. On the absorption of nitrogen phosphoric acid and potash by wheat and barley in the various stages of their growth.
7. On the absorption of nitrogen, phosphoric acid and potash by rice-plant in the various stages of its growth.

8. On the importance of nitrogen, phosphoric acid and potash to various agricultural crops.
9. On the effect of nitrogen on rice-plant grown in different kinds of soils.
10. On the manurial value of Chili *saltpeter and the injurious action of perchlorate contained in it.
11. On the natural resources of nitrogen, phosphoric acid and potash.
12. On the influence of the three manurial ingredients on the quality of rice grains.
13. On the official methods of agricultural chemical analysis.
14. On the relative proportion of carbohydrates in the different varieties of sweet-potato.
15. On the composition of tobacco-leaves attacked by mosaic disease.
16. Proportion of indigo present in the indigo plantlets in the different stages of growth in nursery-beds.
17. Non-albuminoid nitrogenous compounds contained in tobacco-leaves grown in the province of Awa.
18. On the methods of determining the specific weight of seeds by a pycnometer and a common balance.
19. On the preparation of hemp fibre.
20. Sweet potato as material for extracting alcohol.
21. Investigation on Japanese indigo.
22. Chemical analysis during the germination of rice grains.
23. On the relation between the quality and composition of soja beans.

IV.—INSECTS INJURIOUS TO FARM CROPS.

1. Distinction between "Nika-Meichu" (*Jathesia chrysographella*, Merro) and "Sanka-Meichu" (*Schacuobuis bipunctifer*, Wk.)
2. Some egg-parasitic Hymenoptera found in Japan.
3. Lantern flies and leaf-hoppers of the rice-plant found in Japan.
4. Report on the remedy and prevention of Sanka-Meichu " in Tokushima-ken, 1899.
5. Japanese Benthredimidae.

6. A trap-lantern with potassium cyanide can.
7. On the proper period of cutting rice stalks injured by insects, as stalk-borers (*Sathesia chrysoguaphella*, Morre.)
8. On the relation between the injury of "Nika-Meichu" and rice-plants as to the kinds to be selected and the mode of their cultivation.
9. Habit and life history of injurious insects.
10. Effect of heat on the larvae of "Nika-Meichu."
11. On steeping in hot water the rice-straw infested with the larvae of "Nika-Meichu" with the object of destroying them.
12. Experiments on destroying "Sanka-Meichi."
13. Effect of heat on the injurious insects infecting stored grains.
14. Destructive power of oils against "Unka" (*Gassidae* and *Fulgoridae*.)
15. Effect of insecticides on the rice-plants.
16. Destruction of "Ine-Awomushi" (*Naranga difusa*, WKK.)
17. On the concentration and permeability of oils used as insecticides.
18. On the number of eggs laid on a leaf of rice-plant and those contained in the abdomen of a moth caught by a trap-lantern.
19. The period of the flight of "Nika-Meichu."
20. Researches on "Nika-Meichu" damage inflicted on a late variety of rice-plant at Nishigahara, 1900.
21. On the larvae of "Nika-Meichu" escaping from rice-straw.
22. On the hibernation of larvae of "Nika-Meichu" in gramineae plants other than the rice-plants.
23. Researches on the food-plants of "Nika-Meichu" other than the rice-plants.
24. On the number of larvae of "Nika-Meichu" remaining in the stump of rice-plant.
25. On the parts of the rice-stalk most infested by the larvae of "Nika-Meichu."
26. Experiments on the alcoholic extract of pyrethrum (*Kentoyeki*) against "Kakushoku-chingo" (*Scotinophora vermiculata*, Aard.)

27. Insecticides for "Saruhamushi" (*Phaedon incertum*, Boly.)
28. Experiments on the destruction of scale insects.
29. "Kōrogi" (true cricket, *Grylloides Chinensis*, Web.) and "Emma-Kōrogi" (a cricket, *Loxoblemmus haanii*, Sauss.)
30. About the hibernation of "Sanka-Meichu."
31. "Kiri-uji" (*Tipula parva*, Loew.), of the rice-plant.

V.—PLAN-DISEASES.

1. Prevention of the stinking smut of wheat (*Tilletia tritica*, Winter, and *T. laevis*, Kühn.)
2. Prevention of the smut of wheat (*Urocystis occulta*, Rabb.)
3. Prevention of the smut of millet (*Ustilago panici miliacei*, (Pers), Winter.)
4. On the relation between the sowing period of barley and the injury caused by "Shimasusuki" (*Helminthosporium gramineum*, Rabb.)
5. Prevention of the damping-off of the egg-plant.
6. "Kingai" (*Sclerotinia trifoliorum*, Fricks) of "Genge" plant.
7. "Tachigarê" (*Ophiobolus graminis*, Sacc) of barley, naked barley and wheat.
8. "Hagarê" (*Helminthosporium oxyzae*, Miyabe et Hori) of rice-plant.
9. Potato-rot in Nagano-ken (*Phytophthora infestans*, De Bary.)
10. White root-rot of grape and mulberry plantations.
11. A red fungus disease of scale insect (*Aspidiotus perniciosus*, var. *albopunctatus*?)
12. "Imochi" (*Piricularia grisea* (Cook) Sacc) of rice-plant.
13. Smut of barley, naked barley, wheat, etc.
14. "Bakanari" (*Fusarium heterosporium*, Nees.) of rice-plant.
15. Influence of copper sulphate on the growth of plants.
16. "Imochi" of rice-plants in San-in districts.

VI.—TOBACCO CULTURE.

1. On the cultivation of tobacco.
2. On the curing of yellow tobacco-leaf.

3. On the varieties of tobacco most suitable for yellow tobacco.
4. On the sauces for flavoring tobacco.
5. On the nursery bed under cover.
6. On the drying of Japanese tobacco-leaf in flue curing barn.
7. On Turkish tobacco.
8. On cigar leaves.
9. Fertilizer experiments on tobacco.

I. LOCAL AGRICULTURAL EXPERIMENT FARMS.

THE FARMS MAINTAINED BY PREFECTURAL OFFICES.—Apart from the Imperial Experiment Stations above mentioned there are local experiment stations maintained at the local expense and chiefly devoted to the work of practical application and of model-farming.

There are 40 such stations throughout the country, with an outlay of about 403,335 *yen* altogether, or an average of about 100,000 *yen*. At each of the stations a number of experts are on duty, being under the control of the respective local Governors and subject to the supervision of the Minister of Agriculture and Commerce. These farms are not maintained entirely at the local expense, for the Government, with the object of securing the greater efficiency of the service, established in 1897 the provision of granting a certain rate of State aid within the limit of not more than 150,000 *yen* altogether every year.

THE FARMS MAINTAINED BY SUB-PREFECTURAL OFFICES.—Besides, there are experimental stations maintained by sub-prefectural districts, where simple experiments and the work of model-farmings are conducted. There are also lesser experimental stations established by towns or villages or by a body of farmers' sons. The experimental stations established by the sub-prefectural districts number 110 in all.

II.—LOCAL AGRICULTURAL INSTITUTES.

THE local agricultural institutes are maintained by the local treasuries and subject to the supervision of the Minister of Agriculture

and Commerce. The object of these institutes is to impart to farmers' sons and to farming people generally some elementary knowledgs on the general principles of agriculture, surveying, meteorology, physics, chemistry, natural history, veterinary science, farriery, etc. The institutes are also entitled to a share of the 150,000 *yen* fund mentioned above.

At present these establishments exist only in five places, Miye, Aichi, Miyazaki, Aomori and Hokkaidō, and these are turning out every year from 30 to several hundred graduates, who are to play an important part in the interests of local agriculture.

III. AMBULANT LECTURERS ON AGRICULTURE.

LECTURERS on agriculture are appointed in local or sub-local districts to deliver lectures relating to farming and to answer all inquiries addressed to them on the same subject by farmers in the district. They must besides attend to the experimental farming carried on at the public expenses, to the local agricultural shows, and to other such matters. These lecturers have done much to increase the knowledge, practical and scientific, of our farmers. There are altogether 310 such lecturers throughout the country, according to the latest returns.

V. SERICULTURE INSTITUTES.

IMPERIAL INSTITUTES.—In view of the important part played by sericulture in the economy of the country and therefore of the necessity of adopting measures for promoting its interest, the Government attended to this business as early as 1874. Meanwhile febrine, that dreadful disease of the silkworm that had inflicted such terrible injury on the sericultural industry of France and Italy, began to make its appearance. Forced by the necessity of doing something to check such wholesale destruction, the Government established in Tokyo in April of 1884 the Silkworm Disease Laboratory. The result of the experiments there conducted was the adoption of Pasteur's method of "grainage cellulaire." Up to

1886 experiments not only on febrine but also on flacherie and muscardine were continued, and the reports embodying the results were distributed among all the parties concerned. In the same year, and as a result of those experiments the Government issued Rules for the Inspection of Silkworm Eggs. This legislation necessitated the training of men able to conduct the work of inspection. In 1887 a number of students were collected from all parts of the country and were admitted to the sericultural experimental laboratory established at Nishigahara, Kitatoshima, Tokyo, to receive instruction on the diseases of silkworm and on other important matters relating to sericulture. The scope of the teaching was expanded three years later and the standard of the instruction given was raised. Till 1895 the Laboratory conducted experiments on sericulture, distributed the reports compiled by it and also distributed eggs of such varieties of worms as were judged best. At the same time the Laboratory attended to the work of turning out experts on sericulture. Coming to 1896, the scope of the business was expanded with the consent of the Imperial Diet which advised the Government to establish sericultural schools of larger scope and better organization both at Tokyo and Kyoto. Thus in March of the same year the former sericultural Laboratory was superseded by a sericultural school in Tokyo, while, coming to 1889, another institute was started at Kinukasa-mura, Kadono-gari, Kyoto-fu. The two institutes have to take charge of the following matters:—

1. Instruction in sericulture.
2. Experiments and investigations in sericulture.
3. Lecture on sericulture.
4. Distribution of silkworm eggs.
5. The answering of queries.

The courses are of two kinds, main course and special course. In the former which extends over two years, the students are taught the scientific principles and practices of sericulture, while in the other course which lasts for only five months the students are instructed chiefly in the practical side and in the elementary principles of this important art. The number of graduates thus far number 1078

Further, there were 49 men who in 1888, were granted licenses to undertake the examination of silkworm eggs to supplement the

staff of inspectors for the better enforcement of the Rules for the Inspection of Silkworm Eggs, while from 1901 a special course was created at the two sericultural institutes above mentioned for the benefit of experienced sericulturists who wished to acquire some knowledge of the diseases of silkworm. The number of students at this course are:—

	Tokyo.	Kyoto.
1901	40	40
1902	43	40
1903	51	50
Total	134	130

LOCAL SERICULTURE INSTITUTES.

WITH the sudden rise in the prosperity of the sericultural industry soon after the Restoration, people from those places where the industry had just been started flocked to Nagano, Fukushima, Gumma and other districts where sericulture had been carried on from former times, in order to obtain some knowledge on the subject. The result was that several experts in those sericultural districts combined together and established institutes with the object of more conveniently imparting the necessary knowledge to the aspirants. The most notable of such private institutes were the Kakeda Institute in Fukushima-ken, the Takayama Institute in Gumma-ken, and the Kyōshinsha Institute in Saitama. But the training given at those places confined itself almost exclusively to the practical side of the industry. This lack of any scientific side in this system of training stood very much in the way of those graduates from keeping up with the new requirements of the times.

A regular system of sericultural education soon began to be provided in many parts, either as a special course in agricultural schools or as the only course in special sericultural schools or institutes, maintained either out of the public funds or by private

bodies. The sericultural institutes that now exist number 125 altogether.

Y. STATE SILK-CONDITIONING HOUSE.

It was suggested long ago in some quarters that as a means of promoting the export of our silk a regular silk-conditioning house should be established to undertake the weighing of net and condition weight of silk and determine its quality. More than once the matter received the serious attention of both the public and Government, but it was not till 1894 that the arrangements for the establishment of such an institution were finally made and that two silk-conditioning houses were opened, one at Yokohama and the other at Kobe, the former in August of 1896 and the latter in June of the same year. Unfortunately the Kobe establishment had to close its doors in April of 1901, owing to the fact that it had not sufficient business to justify its existence.

On the other hand the business at the Yokohama establishment grew more and more active with the lapse of time, and to-day it is universally regarded as an important organ of our silk industry. The work undertaken at this establishment covers the following subjects:—

1. To determine the net weight of silk.
2. To determine the condition weight of silk.
3. To examine the number of breakages by means of re-reeling the silk and to determine the rate of such breakages per reel.
4. To examine the size of the filaments and to determine their relative uniformity.
5. To examine the relative number of flues and sluffs in the filaments.
6. To determine the elasticity and tenacity of the filaments.
7. To examine the relative quantities of gummy substances present in the filaments and to determine the relative decrease in the quantity incidental to boiling-off.

Of the foregoing seven items the most important are the first four, although the House is prepared to go through all the seven

stages of examination at the request of applicants. Most of the applications made at present are in connection with the determination of condition weight, the next greater number of applications relate to breakages and to the size, after which come the applications about elasticity, tenacity, and the presence of flues and sluffs. Applications about net weight and boiling-off are extremely rare. The number of examinations conducted at the House since its inception are as follows:—

	1896 year.	1897 year.	1898 year.	1899 year.	1900 year.	1901 year.	1902 year.
Gross Weight	—	18	1	68	42	2	161
Net Weight	221	178	232	737	4,007	18,236	38,751
Determination of Grade ..	968	2,431	4,636	8,469	7,079	15,003	28,749
Softening Diminution ...	47	16	15	7	21	2	4
Total	1,236	2,643	4,884	9,281	11,189	33,244	67,665

Note:—Examinations coming under Nos. 3. 4. 5. 6, in the preceding seven items were all included in the foregoing table in the column of "determination of grade."

The reason why the number of applications relating to the determination of net weight showed a sudden increase from 1900, the year of the enforcement of the revised treaty, was due to the fact that our silk merchants, desirous of removing various abuses that had previously existed in the business carried on between them and foreign exporters, had concluded with the latter a special arrangement by which the latter were entitled to demand a certain fixed rate of damages, in case the rate of humidity of the silk exceeded the prescribed limit

At first the House was not quite prepared to meet with the sudden increase in the number of applications that resulted; but owing to the necessary expansion made in 1901 in the scope of its arrangement, to-day it is ready to undertake with promptitude all such applications, so that both in the scope of the work it does and in its efficiency, the House can at present bear comparison with its foreign compeers.

VI. IMPERIAL ESTABLISHMENT OF TEA INDUSTRY.

Placed under the control of the Bureau of Agriculture, the Imperial Establishment of Tea Industry at Nishigahara in Kitatoshima

district, undertakes all the work relating to the cultivation of the tea-plant, the modes of curing the leaves and the improvement thereof, and the answering of all inquires coming from general tea manufactures and dealers. Finally, the establishment carries out inquiries into the state of the tea industry and market at home and abroad. It was established in 1896.

VII. ANIMAL EPIDEMIC LABORATORY.

Japan has often been subject to one or other kind of epidemic, as is shown by the almost constant outbreaks of anthrax that take place in the Kyūshū and Kinai districts where almost every year hundreds of cattle and horses fall victims to that disease. Serious loss has frequently been sustained by our stock farmers owing to the introduction of rinderpest from the continent, while glanders, farcy, rauschbrand, moonblindness, chicken cholera are diseases from which our stock farmers and poultry are suffering. It was to provide against such calamity that in 1891 the Bureau of Agriculture of the Department of Agriculture and Commerce established the Animal-Epidemic Laboratory with the object of ascertaining the best preventive measures to be taken, the work as conducted thus far by the Laboratory having been very beneficial. We may briefly describe it as follows, reserving further details for a future occasion. Its object, then, is to carry out:—

1. Experiments with tuberculine in cases of tuberculosis in cattle.
2. Experiments on Mr. Charvaux's anti-anthrax inoculation.
3. Experiments on the connection of fowl's blood with anthrax.
4. Experiments with regard to injections made in the case of milk cows when they are suffering from tuberculosis and with regard to the feeding of such cows.
5. Experiments to determine the part played by ordinary flies and horse-flies as media in the spread of cattle epidemic.
6. Experiments with regard to the cultivation of the germs of true farcy and glanders and experiments on inoculation with these germs.

7. Experiments on Mallein injections.
8. Experiments on the effect of silver nitrate and solution of perchloride of iron in cases of fowl diphtheria.
9. Experiments on blood-serum injection as preventive against chicken cholera.
10. Investigation with regard to preventive remedies and blood-serum treatment in the case of rinderpest.
11. Experiments in which immunity from anthrax has been effected by means of a certain disease germ.
12. Experiments on blood-serum treatment as a preventive of anthrax.
13. Practical application of the result of Dr. Mereskkowsky's investigations on the subject of getting rid of rodents by means of typhus germs.
14. Experiments on the duration of the efficacy of tuberculin.
15. Experiments on the period of preparing blood-serum for use in case of anthrax.
16. Experiments on the duration of efficacy of blood-serum treatment as preventive against anthrax.
17. Investigation into the effective composition of tuberculin.
18. Experiments on the anti-rauschbrand inoculation.
19. Experiments on blood-serum treatment as preventive against rauschbrand.

VIII. IMPERIAL CATTLE BREEDING FARM.

GENERAL REMARKS.—Japanese cattle being of inferior quality, impure in breed, and therefore coming far below those of the West whether for meat or for milk, the necessity for improving the breed has long been felt, especially in view of the marked advance that has taken place recently in the volume of consumption of milk and meat in our country. The birth-rate too of cattle does not even keep pace with the rate of slaughter. However the question of improving the breed having been regarded as one of greater urgency than that of increasing the birth-rate, and as the importation of costly foreign cattle can hardly be undertaken by private individuals or even by

communal bodies, the Government was obliged to start on its own account number of years ago the Shimosa Breeding Pasture and undertook the business of improving the breed of cattle and horses by hiring out for breeding purpose cattle and horses imported from abroad. Unfortunately, to the keen regret of all concerned, this pasture was abolished not long after. The necessity for re-opening a similar pasture was soon felt by the public, and petitions were sent by our stock farmers to the authorities asking for the restoration of former arrangement. At last the matter was taken up by the Imperial Diet, which passed a representation urging the resumption of measures for improving the breed of cattle and horses. The suggestion was adopted by the Government, and in 1900 the official organization relating to state cattle breeding pasture was enacted and the Nanatsukahara Cattle Breeding Pasture, the 1st station of this kind, was established in May of the same year at Yamauchi Higashimura, Hiba-gōri, Hiroshima-ken. At the same time a special commission was appointed entrusted with the work of drawing up a programme of improvements that might be made and of advising the Department of Agriculture and Commerce on all matters relating to such improvements. The Commission was composed of officials of the Department, Professors of the College of Agriculture of the Imperial Tokyo University and other experts.

PURCHASE OF BREEDING CATTLE.—In the 1900 fiscal year an expert was dispatched abroad to making purchase of cattle and swine for breeding purposes. At the same time Japanese cows were bought in the same way for breeding purposes in the provinces of Hiroshima and Tottori. This purchase both of foreign and domestic cattle was repeated in the following year so that altogether the purchases made during the two years numbered as follows:—

Breed.	Sex.		1900.	1901.	Total.
Ayrshire	Cows	9	11	20
"	Bulls	3	2	5
Simmenthal	Cows	7	8	15
"	Bulls	3	2	5
Native Cattle	Cows	16	5	21
" "	Bulls	—	—	—
Total	{ Cows	32	24	56
	{ Bulls	6	4	10

WORK.—The work undertaken by the State Pasture includes the investigation of all questions

1. Relating to the improvement of the breed and to the breeding and rearing of cattle.
2. Matters relating to the distribution and wider diffusion of breeding cattle.
3. Matters relating to the control of breeding cattle distributed.
4. Matters relating to the calves from cows paired with breeding bulls.

NUMBER OF BREEDING CATTLE.—The number of cattle used for breeding was as follows at the end of March, 1902:—

Breed.	Sex.	Imported.	Native Breed.	Born on the Pasture.	Total.
Ayrshire	Cows	20	—	10	30
"	Bulls	5	—	7	12
Simmenthal	Cows	14	—	6	20
"	Bulls	5	—	6	11
Native	Cows	—	21	1	22
"	Bulls	—	—	—	4
Half-breed	Cows	—	—	4	4
"	Bulls	—	—	4	4
		—	—	—	—
Total	{ Cows	34	21	21	76
	{ Bulls	10	—	17	27

PAIRING AND BREEDING.—The pairing is mostly done in the spring, and the birth-rate is $7\frac{1}{2}$ to 10 in the case of Ayrshires, 6 in the case of Simmenthals, and 5.55 in that of native cattle.

In October of 1901, rules were drawn up to regulate the leasing out for breeding purpose of the bulls kept in the Pasture, the bulls to be paired of course with the proper kind of cows.

MILK AND BUTTER.—The milk supplied by the cows kept in the Pasture is used for feeding the calves born on the Pasture, the remainder being used for making butter, which, however, does not exceed 100 pounds a month at present. Whatever milk remains is sold direct to dairy-men.

SWINE.—The improvement in the breed of swine is also attended to at the Pasture, swines for breeding purposes being imported.

At the end of May, 1902, the number of swine at the Pasture was as follows:—

Breed.	Sex.	Imported.	Native.	Born on the Pasture.	Total.
Large Yorkshire	Sows	4	—	3	7
„ „	Boars	2	—	4	6
Middle „	Sows	2	—	2	4
„ „	Boars	1	—	1	2
Small „	Sows	2	—	3	5
„ „	Boars	1	—	2	3
Berkshire	Sows	6	—	14	20
„	Boars	3	—	12	15
		—	—	—	—
Total.	{ Sows	14	—	22	36
	{ Boars	7	—	19	26

SALE OF BREEDING SWINE.—For the purpose of encouraging the improvement of the breed of swine the Pasture sold during the 1901 fiscal year 36 swine, 18 sows and 18 boars.

IX. IMPERIAL HORSE STUDS AND DEPOTS.

HISTORY.—The breeding of horses being rightly regarded as of vital importance to the prosperity and strength of the country, the Government commenced early in the Meiji era to improve the breed of horses by importing stallions for that purpose. The result was not wholly satisfactory owing to mistakes in the selection of breeds, and also in the pairing. But the interest of the country did not allow this business to be left neglected and the Government, warned by its past failures, decided to carry out thorough preliminary investigations as to the best way of dealing with this important matter, and to appoint a Special Commission for that purpose. At last in July of 1895 a Commission was appointed, and this Commission, as a result of investigations extending till 1897, submitted a report representing among other things the necessity of establishing horse studs and depots. This representation was approved of by the Government. It also obtained the consent of the Imperial Diet. Based on the inquiries carried out by experts dispatched to all the important horse breeding districts in the country, the

programme proposed the establishment of two studs and 10 depots and their completion in about seven years.

In June of 1896 the official arrangements for the establishment of state horse studs and depots were completed, and two studs and three depots were established. At the same time inspectors and other officials to take charge of the breeding business were appointed, and a few years after the Horse Section was created in the Bureau of Agriculture.

The improvement programme aims at completing the arrangements at the two studs and of increasing the number of depots to the prescribed limits, so that 10 per cent. of the breeding stallions required throughout the country may be supplied at those stations. The authorities are also contemplating the enforcement of castration in order to complete the improvement of the breeding programme.

WORK.—The work to be undertaken at the Stud and Depots is regulated as follows:—

A. The Studs are to deal with all

1. Matters relating to the improvement of the breed of horses and all experiments in connection with their breeding and rearing.
2. Matters relating to the supplementing and distribution of breeding stallions.

B. The Depots are to deal with all

1. Matters relating to the breeding of breeding stallions.
2. Matters relating to the breeding stallions.
3. Matters relating to the control of private breeding stallions.
4. Matters relating to the colts born of mares paired with breeding stallions.

NUMBER OF STUDS AND DEPOTS.—At present two studs and nine depots exist. Of the two studs one is located in Aomori-ken and the other in Kagoshima-ken. A depot is located in the prefectures of Iwate, Kumamoto, Miyagi, Akita, Fukushima, Miyazaki, Shimane, Aichi, and Ishikawa.

PURCHASE OF BREEDING HORSES.—Not less than two experts are dispatched abroad every year to effect the purchase of breeding horses. These numbered as follows up to the 1901 fiscal year.

NUMBER OF BREEDING HORSES PURCHASED ABROAD.

Breed.	Sex.	Total.
Pure Arabs	{ Mares	5
	{ Stallions	7
Arabs	{ Mares	6
	{ Stallions	3
Pure Anglo-Arabs	{ Mares	9
	{ Stallions	11
Trotters	{ Mares	5
	{ Stallions	10
Thoroughbreds	{ Mares	3
	{ Stallions	3
Anglo-Arabs	{ Mares	2
	{ Stallions	4
Hackneys	{ Mares	4
	{ Stallions	5
		77

Besides the above, a large number of breeding horses were purchased at home, as follows:—

Mares	191
Stallions	283
474	

PAIRING.—The depots undertake the pairing of the stallions kept therein with mares belonging to private individuals. This was done previously free of charge, but a small fee has been charged since the 1902 fiscal year for pairing with superior stallions, mostly of imported breeds, owing to the fact that too many applications for pairing had been sent in. The necessary permission being of course only given to mares properly qualified, the colts born of the mares by the stallions kept at the Depots are much better than those generally produced.

The object of the Studs is to keep mares and stallions and to supply superior stallions for the Depots, but as these Depots have not yet come up to the prescribed number, the stallions kept at the Studs are allowed to pair to some extent with mares of private people. This pairing was therefore started in the same fiscal year, a fee being charged, as in the case of the Depots.

The number of pairings carried out at the Studs and Depots during the five years ended 1901 is as follows:—

Stallions used for pairing	454
Numbers of mares paired	9,806

It may be noted that at the Studs the pairing with mares kept by private people was started from 1899.

COLTS.—The colts born of mares paired with the stallions kept at the Pastures and Studs are as follows:—

Year.	Foreign Breed.		Half Breed.		Native Breed.		Total.	
	Stallions.	Mares.	Stallions.	Mares.	Stallions.	Mares.	Stallions.	Mares.

Miyazaki Depot	3	—	24	—	—	—	27	—
Shimane Depot	—	—	16	—	—	—	16	—
Aichi Depot... ..	—	—	16	—	—	—	16	—
Total... ..	53	59	291	232	52	—	397	291

Note:—Besides the above O-u and Kyūshū Studs had each 11 farm cattle and the Kumamoto Depot 2 farm cattle.

OTHER AGRICULTURAL ORGANIZATIONS. — The organizations described thus far belong either to the Government or to civic corporations. There are other organizations established under law by bodies of farmers, such as agricultural societies, industrial guilds, guilds relating to farming, tea guilds, cattle and horse guilds, and others. These will be described under the chapter of agricultural legislation to be given later on.

CHAPTER VII.—Stock-Breeding.

History and Existing Condition—Kind of Breed and Number of Live-Stock.

I. HISTORY.

HORNED CATTLE.—Scientific men agree that the horned cattle in Japan must have been introduced from foreign countries. Presuming this theory to be correct, the introduction must have taken place in some remote pre-historic period, for even in the very earliest authentic record, we find many references about the rearing and utilization of cattle. What is specially worth mentioning is the fact that the slaughter of cattle both for food and for sacrifice was an ordinary occurrence in ancient times, so that it was not until after the introduction of Buddhism that the slaughter was forbidden under a severe penalty. The use of milk and even of butter was also known, and remained in vogue down to the period of the Restoration. These two articles, were, it should be noted, used as a sort of drug. Official pastures were established as early as the reign of the Emperor Ankan (534-35 A.D.), while in the time of the Emperor Junna (824-32) cattle could be used instead of currency in the payment of taxes. On the whole, however, cattle were almost solely used till the Restoration as beasts of burden and employed very little for other purposes.

The most noted cattle-rearing centres during the Tokugawa Regency were Tamba, Tango, Tajima, Inaba, Hōki, Oki, Izumo, Mimasaku, Bitchū, Bizen, Bingo, Iyo, Hizen, Higo, Iki, Hyūga, Ōsumi, etc. The inspection of horned cattle and horses was officially conducted there every spring.

OFFICIAL ENCOURAGEMENT OF CATTLE-BREEDING.—Coming to the new régime we find that 15 foreign cattle were purchased at Yokohama from a certain English merchant in 1869. This purchase

may be regarded as the first step in the work of improving cattle-breeding in Japan, as it was certainly the first time that such a purchase was made. The Government did spare neither money nor pains in encouraging the development of the industry, and till 1882 the total sum of the loans advanced to cattle-breeders by way of encouraging the industry amounted to over 125,000 *yen*. At the same time, in order to show the public a model method of breeding, the Home Office established a pasture at Shimōsa. For use at this Shimōsa Stud a large number of horses and sheep were imported, and were either hired out or sold for breeding purpose. Till 1885 when the Stud was transferred to the Imperial Household Department the number of cattle purchased for it totaled 175 bulls and 126 cows mostly of mixed breed. Then 126 bulls or cows were hired out and 44 others were sold.

The abolition of this Stud as a Government undertaking tended very much to arrest the progress of stock breeding, but the ill effects of this step were counteracted when coming to 1900, the Government established a stud in Hiroshima-ken, as was described at greater length under the heading of State Breeding-Farms.

THE HORSE.—The horse appears to have been indigenous to Japan ; at least its use for military purposes was known as far back as our authentic history goes. The present to the Japanese Court of several horses by a king of Kudara (part of Korea) in the 47th year of the Regency of the Empress Jingō (247 A.D.) was perhaps the first instance borne out by authentic record, of the introduction of horses of foreign breed into Japan. A similar present was repeated subsequently by one or other of the rulers of the three independent Kingdoms of Korea, as the peninsula was then divided. Meanwhile the Court paid much attention to the rearing of horses, and in the reign of the Emperor Daigo (898-'93) we find that an Imperial mew was established to take charge of this business. Of a large number of pastures existing throughout the country 39 were brought under official protection, and of that number 32 existing in Musashi, Kai, Shinano and Kōzuke were set apart for the use of the Court. No olden records about pastures in the north-eastern districts of Honshū are to be found, owing to the fact that these districts had not then been completely brought under the rule of the central Govern-

ment. The breeding, however, must have been equally prosperous there as in Kai and Shinano.

With what special importance horses were formerly regarded may be easily seen when it is remembered that they were often given as presents when the donors wished to manifest unusual respect. For instance history records the present of horses by Yoritomo to the ex-Empress Goshirakawa, and the same chief of the Genji clan also offered 1,000 horses to the Todaiji Temple on a certain occasion. These facts also serve to prove that the business of horses rearing must have been extensively carried on in the Kwanto districts, that is, the provinces lying round about the present Tokyo, for Yoritomo had his vice-regal residence at Kamakura. The transfer of the vice-regal seat to Kyoto in the time of the Ashikaga Regency very much affected the prosperity of the horses breeding industry in these eastern provinces.

IMPORTATION OF FOREIGN HORSES IN EARLY DAYS.—Meanwhile as the result of establishment, on a limited scale it is true, of commercial relation between Japan and some of the European countries, foreign horses were frequently brought into our country either as presents by the foreign merchants or at the order of one or order of the various departments of Government in Japan. Perhaps the present of a number of Arabian horses by some Italian and Portuguese during the Tembun era (1534–1554) was the first occasion on which horses were brought from such a great distance into the country. Such importation of foreign horses was especially frequent during the Tokugawa Regency. For instance, during the time of the eighth Shogun the Regency purchased 28 stallions and mares of Persian breed, and distributed them for purpose of breeding among Koganegahara of Shinosa, Mineoka of Awa, Sannohe of Mutsu and others, at each of which places an important pasture existed. The present of 11 stallions and 15 mares of Arabian breed by Napoleon III in 1867 in return for the present of silkworm eggs made to the French Court by the Shogunate may also be mentioned here. Nothing in particular is known about what has become of those horses.

The Regency possessed 20 pastures of its own, among which those at Kogane, Sakura, Mineoka, and Ashitaka were most important. Among the feudal princes, those of Nambu, Sendai, Miharu,

and Kagoshima paid special attention to the business of horse-rearing, and some of them imported Persian or Java horses for improving the breed in their own dominions.

ENCOURAGEMENT BY THE IMPERIAL GOVERNMENT.—The Restoration was a turning point in the activity of this industry as it was in all the other branches of public activity. In 1871 an American expert was engaged and given charge of the stock and general farming, and at the same time two Japanese officials were dispatched to America to study the condition of horse-breeding and the various agricultural industries there. A stud was soon established at Komaba and a depot at Shinjuku, both in the suburbs of Tokyo; and then another depot was established at Katori, Shimosa, where two foreigners were employed. This was soon combined with the sheep pasture that had existed in another part of the same province. Finally, as already mentioned, the Shimosa stud was transferred to the Imperial Household. A portion of the pasture was leased by the Department of Agriculture and Commerce and the breeding work was attended on a limited scale. Even this lasted for only a few years, and with the repeal of all the rules relating to the hiring out of breeding bulls and horses, the Government stock-breeding enterprise was entirely suspended.

The breeding horses imported by the Government from 1877 to 1903 are as follows:—

	Stallion.	Mares.	Total.
Trotter	30	23	53
Perchelon	3	2	5
Clydesdale	1	1	2
Australian... ..	1	—	1
Hungarian	7	2	9
Arabs	9	12	21
Anglo-Arabs	15	11	26
Thoroughbred... ..	5	5	10
Hackney	12	17	29

In Hokkaidō especially while the old Board of Colonization existed, special attention was devoted to encouraging stock-breeding besides encouraging general agricultural work. Mr. Horace Capron

and two other American experts were engaged to take charge of the business. About 19 horses of Trotter breed and 8 of Perchelon breed were imported. The present activity of horse-breeding in the celebrated Niikappu Horse Stud, now belonging to the Court, was a result of the assiduous care which the Hokkaidō Board at first extended to stock-breeding.

The Army, again, undertook a similar enterprise on its own account, and by importing a large number of Arabs, Trotters, etc. hired them to the breeders with the object of improving the native breed.

Nor did general breeders care less about their business, on the contrary they also imported foreign breeding horses to a greater or less extent, the breeds selected for the purpose being Hungarian, Australians, Algerian, Anglo-Norman, Anglo-Arabian; but the returns as to the number thus imported are unknown.

For particulars about the revived interest taken by the Government and general public in horse-breeding, our readers are referred to the chapter on State Breeding-Farms given in the preceding section of this work.

SHEEP.—Sheep did not originally exist in Japan, and indeed it was as late as 1817, that the sheep-rearing was first undertaken in this country, a number of sheep having been imported in that year from China to Yedo. They were kept at the botanical garden in Sugamo, a suburb of Yedo. The wool obtained from those sheep was woven into carpets, and the Government of Yedo was able for the first time to supply itself with home-made carpets, the goods having always come previously from China and Korea. About forty years after, at the request of the magistrate of Hakodate, forty sheep were sent to be reared there.

The history of sheep-rearing after the Restoration is practically identical with that of cattle-rearing or horse-rearing. It is enough, to state here that from the beginning of sheep-rearing in 1874 and the transfer of the Shimosa Stud to the Imperial Household Department, 5,250 sheep were imported, the number of lambs they gave birth being 10,335. The Stud hired out 2,228 and sold 2,334.

So far the business of sheep-rearing by Government has general-

ly been a failure, and it is only at the Imperial Household Stud at Shimosa, the pasture belonging to the Sapporo Agricultural College, the Hokkaidō Stud, and private pastures in Nagasaki and Aomori that the rearing is continued to some extent. However there is no valid reason why this particular branch of stock-breeding should not succeed in Japan. Indeed the result obtained at the Shimōsa Stud and in the provinces of Nagasaki and Aomori tends to prove the possibility of sheep-rearing being carried to success. It was evidently from this consideration that the proprietors of the Koiwai Pasture, Iwate-ken, opened in 1901 this business of sheep-rearing by specially importing for that purpose some dozens of Shropshires from England.

SWINE.—Judging from the ancient records that the surname Ikai (swine-herd) was given to certain individuals in the reign of the Emperor Ankō (454-'56 A. D.), the rearing of swine must have been carried on in Japan from remote antiquity, the beast having probably been imported from either China or Korea. The prohibition of the slaughter of swine for food on account of religious prejudices was a death-blow to the breeding of this beast for slaughter, for we find that business soon disappeared from Japan. However, towards the beginning of the Tokugawa Regency, some people of Nagasaki got a pair of swine on one occasion from Chinese traders, and this led to the rearing of the beast being revived to some limited extent in Kyūshū. But it was in Okinawa that the business attained its greatest prosperity, owing partly, perhaps, to the fact that the people there very much resembled the Chinese in manners and customs. Even to-day Okinawa, except Formosa, shows the best record in swine-breeding of all Japan.

After the Restoration the rearing of swine was conducted as a subsidiary industry to that of cattle, horses and other domestic animals, and when in 1900 a Government cattle depot was established, the business of swine-breeding was made subordinate to it. Ten pigs of Berkshire breed and 12 Yorkshires were imported from England. At the same time the growing demand for pork, both in fresh or cured form, has very much encouraged the breeding of this beast for slaughter among the people.

II. KIND OF BREED AND NUMBER OF LIVE-STOCK.

HORNED CATTLE.—Strictly speaking there was only one original breed of cattle in Japan, chiefly because no care was taken in artificial selection. Indeed there was no need of any artificial selection inasmuch as cattle were practically intended for the single purpose of serving as beast of burden. In this respect our cattle excellently served the purpose, being hardy and strong. But the neglect of care in breeding left its mark in the somewhat deformed appearance of our cattle, for though sufficiently well-shaped in the forward half they are rather ill-formed in the hind quarters. The hilly nature of the country had also no doubt something to do with this peculiarity in the shape of our cattle.

NATIVE VARIETIES.—Though our original cattle are practically uniform in breed, they still admit of being broadly subdivided into two or three varieties, principally by color. One of them is black with small white spots on the belly, the second is brown, while the third is brindled with black and white spots. The black breed, which, by the way, is most valued by our people, predominates in the north-eastern districts and the middle section of Honshū, as also in Shikoku and Kyūshū; the brindled variety is found in Oki and Hirado and other islands, while the brown breed is generally found in the other parts of Kyūshū. Of the three the brindled cattle very much resembles in appearances to the Dutch cattle, and probably this variety may be the descendants of foreign cattle imported at some unknown time into Japan. They also possess comparatively well formed heads. The brown variety apparently came, originally, from Korea.

FOREIGN BREEDS.—The breeding cattle imported since the Restoration from Europe and America must number over 10,000. In breed they were mostly Short-horns, Devons, Ayrshires, and Dutch. The number of breeding cattle during the last few years is shown below:—

Year.	Native Breed.	Foreign Breed.	Mixed Breed.	Total.
1898... ..	1,669	525	431	2,625
1899... ..	1,684	575	533	2,792
1900... ..	1,680	514	692	2,886
1901... ..	1,805	489	811	3,105
1902... ..	1,804	815	561	3,810

BIRTH-RATES.—In 1900 Shimane with 313 headed the list, followed next by Tottori, Okayama, and Hiroshima over 200 each, after which came Hyogo, Kagoshima, Yamaguchi, Fukuoka, and Nagasaki.

The birth-rates in a year are as follows, according to the latest available returns:—

	Cows.	Bulls.	Total.
Native Breed	63,917	55,829	119,746
Foreign Breed	2,507	1,859	4,366
Mixed Breed	15,525	12,183	27,708
Total	81,949	69,871	151,820

In Hiroshima, Shimane and Okayama the births reach every year over 10,000 each, while in Hyogo, Tottori, Kagoshima, Ōita, Kumamoto, and Ehime the number exceed 5,000 each.

NUMBER OF CATTLE.—Lastly the existing number of cattle is as follows:—

Year.	Native Breed.	Mixed Breed.	Foreign Breed.	Total.
1893	1,050,969	44,980	9,252	1,105,201
1894	1,033,384	47,701	10,284	1,091,369
1895	1,068,016	55,769	12,493	1,136,278
1896	1,066,126	69,898	13,737	1,149,761
1897	1,127,730	70,639	15,794	1,214,163
1898	1,135,968	79,157	15,351	1,230,476
1899	1,139,466	95,924	14,475	1,252,865
1900	1,127,016	115,021	19,177	1,261,214
1901	1,148,202	114,333	19,806	1,282,341

At the end of 1900 Okayama and Hiroshima with over 90,000 each came at the head of the list, followed by Nagasaki, Hyogo, Kagoshima, Shimane, Yamaguchi, Ōita and Kumamoto with 80,000 to 50,000 each. On the other hand Ibaragi, Saitama, Tochigi and Toyama had each less than 1,000, Ibaragi with less than 500 coming at the bottom of the list.

THE HORSE.—It is not possible to determine the original breed of horses in Japan. However, a breed of small pony found in Oki, Shikoku, Iki, Okinawa, Awaji, and a part of

Kyūshū and Hokkaidō is regarded as original variety by some experts. Certainly this breed seems to be the oldest variety in Japan. It is characterized by hardihood, by comparatively great strength and by enduring power.

ORIGINAL BREED.—However, the original breed or what is generally understood to be such in Honshū is larger in shape, measuring $4\frac{1}{2}$ to 4.8 *shaku* in stature, and with a constitution and cast of head distinct from the smaller breed mentioned above. If therefore the latter should be regarded as the real original variety the other may be a mixed breed between it and an imported variety.

IMPORT OF FOREIGN BREEDS IN EARLY DAYS.—As to the kinds of foreign horses that were imported into Japan in olden days, the horses that were brought from Korea in ancient time belonged to the Mongolian breed while those that came in Japan during the Tokugawa Shogunate were horses of Persian breed. The former mostly produced horses of heavy type and the latter horses of light type. These two different types can be distinctly seen to-day among our horses, the horses produced at Nambu and Akita belonging to the heavier type and those at Sendai, Miharū and Kagoshima belonging to the lighter variety.

NATIVE VARIETIES.—A brief description of those different varieties is given below.

- a. NAMBU HORSES.—Horses produced at Aomori and Iwate are the largest of all in Japan (larger horses measuring over 5 *shaku*), have broad chests, strong bones and joints, and are mild in disposition, and possessed of great power of endurance. Horses of lighter type are used as mounts and those of heavier build as draught horses.
- b. AKITA HORSES.—Produced at Akita-ken, they are somewhat inferior in build to the former with more or less defect in the proportion of the different parts of the body; have heavy head and long trunk, and are rather dull.
- c. SENDAI HORSES.—The type of horse, bred at Miyagi-ken, is more slight in form than the Nambu horse. It has also a deep chest, a sloping hip, a small head, big sharp eyes, a long weak neck, and slender bones. The blood of the Persian horses imported by a feudal prince of Sendai about

3 centuries ago evidently runs in the veins of these horses, but, owing to the greater intermixtures of the foreign breeds that has recently taken place, the original characteristics are gradually being obliterated.

- d. **MIHARU HORSES.**—Produced at Fukushima-ken they are mettlesome and hence better fitted for mounts than the three preceding breeds. They have thin skin, small heads, large eyes, and somewhat long neck. The chest and forelegs are strong, and the horses can raise their forelegs with great dexterity. They are not fitted for heavy work. These horses have also got some foreign blood in them.
- e. **KAGOSHIMA HORSES.**—Produced at Kagoshima, they are quick and mettlesome and even prove intractable, have small heads, large eyes, and short bodies with level tail. They are mostly used as mounts.

Besides the above varieties, horses more or less different in type are also produced at Kumamōto, Miyazaki, Kōchi, Yamagata, Nagano, Ishikawa, Aichi, Gifu, Ibaraki, Tochigi and Hokkaidō, but it may be broadly stated that the build is generally heavier as we go toward the north and lighter in districts situated in the opposite direction.

IMPORT OF FOREIGN HORSES RECENTLY.—The import of a large number of foreign stud horses by the Court, Government and people since the Restoration has very much improved the type of our horses, which have gradually began to assume a noble cast of face and to acquire nimbleness, making them well suited for mounts. The foreign horses imported mostly belong to American, Hungarian and Algerian breeds, next to which come Arabian, Anglo-Arabian, and Hackney breeds. There are also Thoroughbreds, and Australians while a few are of Anglo-Norman, Clydesdale and Turkish breeds.

NUMBER OF HORSES.—The existing number of horses in Japan is shown below:—

Year.	Native Breed.	Mixed Breed.	Foreign Breed.	Total.
1898	1,555,405	31,488	804	1,587,697
1899	1,504,243	41,767	749	1,546,759
1900	1,484,824	56,048	1,107	1,541,979
1901	1,461,416	70,198	1,559	1,533,173
1902	1,434,831	78,805	1,737	1,515,373

In 1900 Kagoshima with about 115,000 headed the list followed by Kumamoto with 106,000, and Iwate with 95,000. Fukushima, Hokkaidō, Miyazaki, Aomori, Akita, Miyagi, Nagano, Ibaraki, Tochigi, and Ōita with 50,000 to 87,000 came next.

NUMBER OF STUD-STALLIONS.—The number of stud-stallions is as follows:—

Year.	Native Breed.	Mixed Breed.	Foreign Breed.	Total.
1898	4,397	1,317	80	5,794
1899	4,200	1,610	104	5,914
1900	3,616	1,769	141	5,526
1901	3,183	2,251	171	5,605
1902	2,790	2,649	198	5,637

At the end of 1901 Fukushima, Iwate, Aomori, and Kagoshima possessed over 500 stallions each, while Hokkaidō, Miyagi, Akita, Kumamoto, Miyazaki, Nagano and Okinawa possessed over 100. Tokyo, Kyoto, Ōsaka, Nara, Miye, Shiga, Yamaguchi, Wakayama, Tokushima and Kagawa occupied the other extreme.

BIRTH-RATES OF HORSES.—According to the latest returns available, the births during the last three years were as follows:—

	Native Breed.	Mixed Breed.	Foreign Breed.	Total.
1900	91,641	12,834	107	104,582
1901	85,879	15,307	129	101,315
1902	83,558	17,172	166	100,896

Fukushima and Kagoshima had over 10,000 births each, followed by Iwate, Aomori, Akita, Kumamoto, Miyazaki, and Hokkaidō.

SHEEP AND GOATS.—The sheep numbering over 1,200 that were imported from China in 1876 comprised about 800 of Mongolian breed and about 400 of Shanghai breed (originally produced at the north-eastern districts of China), but they never thrived, and generally died of some disease or other. The breed of sheep sent for America by the Shimōsa Pasture mostly consisted of Costswold, Merino, and South-downs. At present there are found only about 2,500 sheep of foreign breed in Japan, they being Merinos, Southdowns (also South-downs interbred with other varieties), and Shropshires.

The goats found in Japan are very rarely of pure blood; most of them, especially those for milk, have more or less of the blood of the Bear or Thibetan breed. Only in Okinawa do we find breed whose flesh is used for food. This breed originally came from China.

Okinawa possesses the largest number of sheep of all the places in Japan, the number reaching over 50,000. Then follows Kagoshima with 67,000 approximately, followed by Nagasaki with about 3,000. The number is extremely small in other districts. The total is as follows:—

Ewes,	42,126.	Ram,	17,788.	Total	59,914.
-------	---------	------	---------	-------	---------

SWINE.—Two native breeds may be regarded as existing, namely the Yato breed and Okinawa breed. The foreign breed very rarely remains pure, except a number of Berkshires and Yorkshires imported by the Government a few years ago. The Berkshires, Portland-China, Chester White and others imported from America more than ten years ago have generally degenerated. Such being the case it is not easy to draw any distinct line of demarkation between native and foreign breeds, so that the two terms as applied to swine are at best very arbitrary. Here is a statement as to the number:—

Native Breed	149,995
Mixed „	28,079
Foreign „	3,102
	<hr/>
Total	181,176

Okinawa contains about 57 per cent. of the whole number, its returns standing at 103,000. Kagoshima with about 37,000 follows it, and then come Chiba and Nagasaki. In many other places the number falls below 1,000.

III. REGISTER.

The only thing worth mentioning about the register of pedigrees of cattle and horses in former time was the fact that in the “Middle

dle Ages" a strict regulation was enforced about making burnt-mark on horses, with the object of providing against the tricks of dishonest dealers. At present no regulation exists about the pedigree of horses or cattle, and the matters are left to the discretion of the people.

IV. SLAUGHTER.

The custom of eating the flesh of animals having been forbidden in former times from religious motives, it was only among the class of social outcasts called *eta* (corresponding to pariah) that the custom of eating flesh existed to some extent. The discontinuation of this custom subsequent to the Restoration brought about a revolution in the butcher business. At the end of 1900 the number of slaughter-houses existed was 1,396 throughout the country. Subjoined is a statement of the slaughter returns:—

Year.	Cattle.	Horses.	Sheep.	Swine.
1893	104,772	30,990	—	—
1894	149,677	31,459	1,404	30,404
1895	160,456	36,026	4,664	41,419
1896	151,959	44,825	4,058	38,637
1897	158,504	41,049	6,805	107,034
1898	167,985	41,478	8,388	108,217
1899	208,877	47,150	7,755	89,219
1900	233,385	53,531	8,329	93,904
1901	199,655	45,442	7,873	106,808
1902	206,030	47,875	7,125	124,263

V. DISEASES OF DOMESTIC BEASTS.

ORIGIN OF THE DISEASES.—No data being available about the diseases of live-stock in former times, the present paragraph gives only a brief outline of those diseases as they have appeared since the Restoration.

Most of those diseases originally came from the Asiatic continent and therefore first made their appearance in districts regularly connected by trade with one place or other on the continent. At present the diseases more or less present a local character. For

instance farcy and glanders generally prevail in the north-eastern parts of Honshu, anthrax in Kyūshu and the districts round about Osaka and Tokyo, rauschbrand in Hyogo, Tottori, Okayama, Yamaguchi, etc., rabies in Tokyo, Kanagawa, Yamaguchi and Kyūshu.

The first case of the appearance of rinderpest was in 1872, the second twenty years after, while it was in 1900 that foot-and-mouth disease first came from Shanghai and wrought serious damage among the milch cows of Tokyo, Kyoto, Kanagawa, Hyogo, and Ishikawa. Other kinds of diseases are comparatively insignificant. Here are two tables showing the diseases record:—

TABLE NO. 1.

Year.	Rinderpest.			Anthrax.				Glanders and Farcy.		
	Cases.	Deaths.	Slaughter	Cases.	Deaths.	Slaughter	Recovery	Cases.	Deaths.	Slaughter

1902 ...	95	95	—	—	1,170	34	106	1,037	522	13	509	107	31	76

Note:—Rauschbrand was separated from anthrax from 1897, they having been mixed together formerly; pseudo-farcy was included in glanders and farcy till 1899, while rabies was first included in 1897 in the list of diseases prevalent among domestic beasts.

VI. VETERINARY SURGEONS AND FARRIERS.

SURGERY.—Before the Restoration the so-called veterinary surgeons were horse and cattle dealers who, besides dealing in these beasts, used to periodically apply needle treatment and other simple methods to the beasts. They were of course up to the trick of cheating in transaction of beasts just as practised by horse-dealers of other countries. The engagement early in the era of a French military veterinary surgeon by the Army was the first step taken by the Government for the introduction into this country of the science and practices of the Western veterinary surgery. By the subsequent establishment of schools of agriculture by the Government and also by local offices this branch of medicine has been reduced to a regular system. Till 1885, there were about 6,000 men who were allowed to practise the art in virtue of their previous experience, but the grant of licenses to men of this class was discontinued in 1890 and from that time onward licenses have been granted only on those who have passed the regular examination or have graduated from the veterinary course at Government or public schools, or at private schools of officially approved standing, either Japanese or foreign. At the end of 1900, 2,545 people had regular licenses and 1,713 provisional licenses.

FARRIERY.—The practice of shoeing horses was formerly unknown in Japan; it was introduced from the West together with the science of veterinary. The regular examination exists, as in the case of veterinary surgeons, for giving licenses to farriers, and this license is granted to those who have passed the examination or have graduated from the course of veterinary surgery or farriery at Government or public schools or at private schools of officially approved standing whether at home or abroad, and also to those who possess the regular license of a veterinary surgeon. At the end of 1900, 2,948 men possessed regular licenses and 730 men provisional licenses.

It ought to be added that in places where the number of veterinary surgeons or farriers is insufficient the Minister of Agriculture and Commerce may grant, on recommendation of the local Governors, the provisional license valid for a limited number of years to those

who are judged to possess sufficient experience either as veterinary surgeons or as farriers.

VII. USE OF LIVE-STOCK.

CATTLE is still principally reared for purposes of tillage and for getting manure, and it was only recently that the rearing of them for their milk and their meat was commenced. The number of sheep reared being still small, wool for weaving is imported in a large quantity from foreign countries, while sheep as mutton principally come from Shanghai, the yearly importation being about 1,000. Swine is also insufficient in number to supply bristles for manufacturing purposes, and these are imported from abroad.

VIII. DAIRY-FARMING AND MEAT-PRESERVING.

The industry is still in a comparatively primitive condition and can hardly supply the growing demand at home. At the end of 1900 there were 23,931 milch cows in Japan, but the milk they produce is almost entirely used while fresh. The bulk of the preserved meat consumed in the country may be said to be imported. Subjoined are two tables giving a statement of the volume of output of dairy products and preserved meat at the end of 1901.

CHAPTER VIII.—Poultry.

History and Existing Condition—Breeds and Number—Eggs.

I. HISTORY AND EXISTING CONDITION.

Poultry in Japan principally comprises hens and cocks, with ducks, geese, and turkies coming next, but at a great distance. The only fact known about poultry in former times was that besides being used for the flesh, cocks were reared for cock-fighting.

Coming to recent times we may mention the engagement of a Chinese expert about 1876 by the Bureau of Agriculture in order to teach a number of persons concerned in the art of artificial incubation of fowls and ducks. Pamphlets were distributed all over the country by the authorities with regard to this method of incubation and also with regard to keeping fowls generally. Meanwhile the public began to take a great interest in the business, and at one time the importation of foreign breeds became highly fashionable. However as the business was conducted in a somewhat speculative manner it soon suffered a collapse. At present the business is not so popular as it was once, but at least it rests on a sounder basis. The reproductive powers of fowls too are considerably better than they were before, and a considerable improvement in the breeds has been effected. An increasing demand on eggs has recently arisen and the import of a large quantity of cheaper Chinese eggs is seriously affecting the prosperity of the Japanese poultry business. As a subsidiary enterprise of the farmers the business does not yet occupy a position of any great importance.

II. BREEDS AND NUMBER.

Before the importation of foreign breeds commenced, the original farm-fowls consisted of four or five varieties among which may

be mentioned a dwarfish kind called Chabo, a longtailed fowl, a fighting cock also reared for its flesh. There were also two kinds of foreign breeds that had been imported during the Tokugawa epoch. Subsequently specimens of almost all the noted foreign breeds have been brought in but their descendants are now rarely of pure breed.

There are only two breeds of ducks, one being the "white-necked" and the other "green-necked." Goose and turkey are not yet reared to any large quantity, they being mostly intended for use of foreign residents. At the end of 1901 the poultry returns stood thus:—

	Number.	Value.
Barn-fowls	10,847,853	3,438,561
Ducks	257,796	128,438
Turkeys	2,021	3,189
Geese	9,169	7,109

III. EGGS.

The eggs produced at home are far from supplying home demand, in consequence of which the quantity of Chinese eggs coming in is steadily on the increase. Subjoined are figures showing the quantity produced at home and of the import from China.

OUT-PUT AT HOME.

	Number.	Value. <i>yen.</i>
Barn-fowls	533,406,628	6,631,481
Ducks	7,823,734	131,496
Turkeys... ..	65,996	4,056
Geese	327,716	8,495

IMPORT FROM CHINA.

Year.	Number.	Value. <i>yen.</i>
1898	46,522,000	490,462
1899	67,280,000	823,088
1900	95,830,000	1,238,661
1901	99,294,000	1,293,565
1902	92,133,000	1,193,0 $\frac{1}{2}$

CHAPTER IX.—Bee-Keeping.

The earliest record about bee-keeping in our history is one regarding the present of honey bees by a Korean Prince to the Empress Kotoku (642-645 A.D.). At present the honey is produced at Iyo, Tosa, Chikuzen, Higo, Tamba, Tsushima, Shimane, Kai, Chikugo, etc. The output cannot be accurately known, but it is roughly estimated at about 200,000 *kin*.

BREEDS.—Generally speaking, there are three varieties of honey bees now in Japan, they being the Japanese breed that originally came from Korea, the Italian variety, and the Cyprian variety. The first is hardy but is far inferior to the foreign breeds in the amount of the honey secreted. The Italian breed, though an excellent collector of honey, cannot stand the cold so well as the Japanese bee, so that it can be kept in the southern districts only. The last variety is best adapted for Japan, both in the large quantity of honey it secretes and on account of its hardy character.

As yet the business of bee-keeping remains in a primitive condition, and both in the keeping and the refining of honey very little care is exercised by our farmers. A little more care employed would be sure to make this business very profitable.

CHAPTER X.—Farmers' Subsidiary Work.

The question of how best to utilize what we may call hours of enforced idleness is one of special importance for the farmers in such a country as Japan where farming is carried on an extremely limited scale and with such attention to minutiae as to leave very little room for further expansion, and where farming work is generally suspended on account of climatic condition during winter. The kinds of subsidiary occupations pursued by our farmers are therefore many. They may be given as follows:—

1. The manufacture of starch, *konnyaku*, *sōmen* (kind of macaroni) frozen buckwheat macaroni, frozen *mochi*, frozen *tōfu*, frozen *konnyaku*, jam, dried persimmon fruits, dried peels of gourd, dried radish peel, etc.
2. The manufacture of mat-facing, straw-plaids, mats used for rearing silkworms, matches, cords, nets, willow-paskets, rush head-gear, straw raincoats, head-gear made of hasks of bamboo-sprouts, coir-ropes, straw-ropes, charcoal-bags, straw-hats, etc.
3. Weaving of fabrics, spinning of yarns, manufacture of silk, paper, and various kinds of basket-work.
4. Extraction of oil, aquiculture, salt-making, charcoal-burning, lime-making, camphor-refining, etc.

In some cases farmers divide their time and labor almost equally between those "odd jobs" and their regular farming work, being therefore partly farmers and partly manufacturers of goods.

CHAPTER.—Agricultural Products in Commerce.

EXPORTS AND IMPORTS.

As is quite natural, the throwing open of the country to foreign commerce has had different effects on the prosperity of different agricultural products, for while some, such as silk, tea, etc. have been raised to a state of extraordinary development by the foreign demand for them, others such as cotton, indigo, etc. have suffered seriously from the competition of foreign products.

A. EXPORTS.

The chief items of agricultural products for export and the amount thereof are given below in unit of thousand:—

		1898 (in thou- sand.)	1899 (in thou- sand.)	1900 (in thou- sand.)	1901 (in thou- sand.)	1902 (in thou- sand.)
Rice	{ picul. yen	1,050 5,920	2,178 10,282	933 3,576	1,301 6,908	1,269 6,679

Ginseng... ..	{ kin yen	356 423	402 476	402 407	419 452	363 309
Mint... ..	{ " "	45 158	76 268	51 228	120 545	113 628
Straw Plaids	{ bundles yen	5,961 2,404	7,134 2,770	8,802 4,025	6,974 2,986	8,611 2,938
Wood Wax	{ kin yen	3,798 609	4,569 642	3,702 561	4,049 610	4,216 789
Cotton	{ " "	824 218	743 209	1,009 323	950 308	754 282

The export of minor items worth mentioning in 1902 was as follows:—

	<i>kin.</i>	<i>yen.</i>
Chillis	804,699	84,889
Oranges	3,255,743	114,863
Potatoes	7,882,380	158,716
Vegetables and Fruits	—	182,106
Plants, Trees, Shrubs, etc.	—	122,459
Seeds	—	79,121
Snake-gourd	3,957,602	118,987
Ginger	2,303,512	317,643
Feathers	365,030	81,171

RICE.—The quantity of rice going abroad being naturally determined by the condition of the crop at home and the condition of the foreign markets, it varies considerably according to the year. The places of destination, though not firmly fixed, are generally Hongkong, Germany, Australia, England, the United States of America, etc. The rice grown in Kyūshū and the districts bordering the Inland Sea is most acceptable to foreign consumers.

RAW SILK.—Raw and waste silk constitute about 30 per cent. of the bulk of the export trade. The United States is the best customer of our silk, taking about 60 per cent. of the entire export, followed by France, Italy, etc. This important export product chiefly come from the central part of Honshū.

TEA.—Tea comes next to raw silk as the most important agricultural product for export trade, though its prosperity has somewhat declined lately owing to the encroachment of Indian and Ceylon teas in the market of the United States, which together with Canada is the best customer for this goods. Green tea is in demand in the above two places while brick tea goes to Russia.

MATTING.—Though it is an industry of comparatively recent origin, matting now occupies an important place in our list of exports. The United States is here again our best customer. Okayama and Hiroshima are the principal centers of produce.

LILY-BULBS.—These bulbs mostly go to the United States and England where they are used for producing the flower.

GROUND-NUTS.—The export has increased lately, the principal

markets being Hongkong, Australia, United States, etc. The fruit is either used for food or for the extraction of oil.

GINSENG.—The export is practically confined to China, and therefore its market is limited.

MINT.—The export of mint shows more or less of an increase, though that increase is necessarily confined within narrow limit. It goes to Hongkong, Germany and the United States.

STRAW-PLAITS.—This product constitutes one of the most important items of our export trade, having recently developed a marked activity, with the tendency of greater improvement of quality in future. The goods are principally exported to England; the United States, Hongkong, Australia, etc., being our next best customers.

VEGETABLE-WAX.—The market shows every sign of shortly becoming enlarged, the principal consumers at present being Hongkong, Germany, the United States, etc.

RAW-COTTON.—Korea and Siberia are the principal customers of the cotton.

B. IMPORTS.

Subjoined is the list of the principal items of agricultural products coming into Japan.

	1898 (in thou- sand.)	1899 (in thou- sand.)	1900 (in thou- sand.)	1901 (in thou- sand.)	1902 (in thou- sand.)

Hides and Leathers	2,922	3,104	2,696	3,344	3,323
	587	719	656	786	813

Minor items worth mentioning in 1902 were as follows:—

	<i>kin.</i>	<i>yen.</i>
Butter	198,457	140,327
Margarine	143,988	51,565
Cheese	72,044	30,312
Coffee	139,377	41,857
Tea	125,396	30,469
Cotton Seeds	56,316,511	787,667
Sesame Seeds... ..	7,945,636	426,753
Grains and Seeds	—	1,231,170
Leaf-tobacco	—	950,816
Land, Tallow and Grease	825,045	105,886
Hairs, Bristles, etc.	220,828	294,410
Wheat	8,653,443	240,050

RICE.—Rice comes in from Korea, Tonquin, British India and Siam, especially when the rice crop fails in our country. The imported rice is generally inferior in quality and is patronized almost exclusively by the poorer classes.

FLOUR.—The import of flour has gone up to large figures recently, owing to the fact that the native product is not well suited for making cakes and other articles of food made of flour. The goods come principally from the United States, Canada, and Australia.

SUGAR.—The import of sugar is also advancing in rapid strides, the consumption of this important article of diet having

remarkably increased of late. Brown sugar comes chiefly from the Philippines, Java, Hongkong and China, while Hongkong is the largest importer of the refined variety, followed by Germany and Hungary.

BEANS.—As raw material for making soy, *tōfu*, *miso*, also as manure the import of the goods amounts to a large quantity. However the figures are gradually falling off owing to the activity recently of bean cultivation in Hokkaidō.

MALT.—The great development recently of the business of brewing beer and the insufficient supply of malt of the required excellence has led to the introduction of a large quantity of foreign malt. However, as the quality of the home-made article is gradually improving, the import may not attain any particular increase in future. Germany, Hungary, and the United States, particularly the first country, supply the bulk of this malt.

RAW COTTON.—A recent extraordinary development of the spinning business and the unsuitedness of native cotton for the purpose, has resulted in a large purchase of this raw material from foreign countries, especially from Bombay, the United States, China, and Egypt.

COCOONS AND TUSSEY YARN.—Both come from China, they being used by our weavers. The latter is regarded with special favor by them, owing to its low price. The import of the former has lately gone down to some extent.

HEMPEN GOODS.—These are coming in a gradually increasing quantities from China, the Philippines and India.

OIL-CAKES.—Of all the cakes imported into this country, bean-cakes form the bulk. The import shows an extraordinary advance, the demand of our farmers for the cakes as fertilizers having become enormous. The bean-cakes are shipped from Newchwang, and the rape-seed cake, which also comes in a greater or less extent, from Shanghai.

FRESH EGGS.—Owing to the growing consumption of eggs at home, the import of eggs from China is very large, the market being very low there. The recent imposition of a heavier tariff on the goods and the steady progress made by the poultry business at home may check any further expansion of the import.

WOOL.—Wool comes from China, Australia, Germany, England, etc., the home supply of this raw material being out of proportion to the demand.

CONDENSED MILK.—This comes from England and the United States. No large increase of the import in future is probable, in view of the fact that the dairy industry is developing steadily at home.

HIDES AND LEATHERS.—These come, especially the former, from Korea most, and then from China, India, etc.

COTTON AND SESAME SEEDS.—These are imported for the expressing of oil from them but their import is falling off. The former is chiefly intended to produce fertilizer from and the latter is used for obtaining cooking oil. Both come from China.

In short, of the principal items of agricultural products exported from Japan, raw silk, tea, mats, straw plaids, and rice figure most on the list, while on the other hand rice, flour, raw cotton, sugar, indigo, oil-cakes, etc. are the principal items on the import list of agricultural products.

CHAPTER XI.—Agricultural Legislation.

Provisions Relating to Protection and Encouragement— Provisions Relating to Calamity.

I. PROVISIONS RELATING TO PROTECTION AND ENCOURAGEMENT.

AGRICULTURAL SOCIETIES. — For the better protection of agricultural interests and the encouragement of the industry, our farmers established early in the era agricultural associations in many parts of the country. However it soon became evident that those organizations could not render effective service unless the Government extended to them some help. Consequently coming to June, 1889, the Law of Agricultural Societies was promulgated with the consent of the Diet, and the Rules of Operation of the same in the following year, the legislature providing among other things a grant of not more than 150,000 *yen* every year to the societies established in conformity with the law. The creation of a society was of course left to the discretion of the farmers themselves, the only interference exercised by the local authorities being the forcing of all those who had not already joined a society established in their own districts to join it. There were in the 1903 fiscal year 46 agricultural societies throughout the country, their expenses amounting altogether to 511,021 *yen* with State aid aggregating 148,496 *yen*.

Besides those societies which were prefectural organizations, there were 561 subordinate societies in rural districts or cities, and over 10,000 in towns and villages.

INDUSTRIAL GUILDS.—The extension of a similar protection to small farmers and small manufacturers was also considered necessary. After repeated failures to devise some legislative measure having for its object the giving of such protection, the Law relating

to Industrial Guilds was at last promulgated in March of 1900 with the consent of the Diet.

As only a short time has intervened since the enforcement of the Law, no specific statement may be given here, except that the provision is likely to prove extremely useful. The number of guilds established under the Law was as follows according to the returns on Oct. 15, 1902 :—

Kind.	Limited Liability.	Guarantee Liability.	Unlimited Liability.	Total.
Credit	87	6	218	311
Sales	31	3	4	38
Purchase	30	3	38	71
Produce... ..	5	—	5	10
Combining more than two Services ...	24	1	26	51
	177	13	291	481
Total... ..	177	13	291	481

Note :—In the table the small number of guilds organized by people who are not themselves engaged in farming are included.

Even prior to the enforcement of the Law a large number of similar guilds existed. In 1898 these numbered 346 with 64,388 members and possessing property valued at 968,141 *yen*. Of these the silk sales guilds were most important, and some of them undertook the sale of silk to the value of about 3 million *yen* a year. Some of them, too, were established as far back as 230 years ago. Then there are several hundred guilds, organized on the rules laid down by the celebrated economist and moralist Ninomiya.

The industrial guilds being considered as corporations of public utility are exempted from the payment of the Income and the Business Taxes, while those established on the limited liability system are entitled to get a loan from the Local Hypothec Banks without security.

As the state of things in Hokkaidō is different from that prevailing in the rest of Japan proper, special legislation of this kind was enacted for it in 1900.

STAPLE PRODUCTS GUILDS.—The existence of guilds organized by business people engaged in the same or in kindred pursuits was recognized several centuries ago, as for instance, in the

ease of the stock-brokers in Yedo (now Tokyo) and Ōsaka. In consequence of these guilds tending to become monopolies, they were once suppressed but this ban was removed after the Restoration. During the space of about thirty years extending to 1900 when the existing Law for Staple Products Guilds was enacted, the history of the organization of guilds by various business interests is exceedingly complicated, owing to the fact that while the necessity of such organizations was universally admitted their imperfect supervision by the local authorities soon destroyed their utility in regard to their original aim of preventing the production of inferior goods and also of giving general protection to the interests. The promulgation in April of 1897 of the Law relating to Staple Export Commodities Guilds marked a new and important departure in the efficiency of legislation of this sort. Indeed this enactment was regarded as imperatively necessary owing to the production and export of an inferior class of goods, and to the consequent injury done to the prosperity of the various branches of trade. Three years after, the scope of this law was expanded, till it took the shape of the existing legislation. A history of the guilds established by the silk interests is similar, for as they constitute one of the most, if not the most, important interest in the national economy, the people engaged in the business were impelled to combine for their common interest and prosperity. At last with the promulgation of the existing law, the special provisions previously established to regulate the silk guilds were abolished, so that these interests now exist under exactly same law as the others.

The existing agricultural guilds number 112 of which 103 are devoted to sericulture and sericultural industries.

ADJUSTMENT OF FARM-LAND.—As the work in connection with the object of adjusting farm-lands has already been described, it is sufficient to state here that the law for regulating this work was promulgated in March of 1899.

STATE AID TO LOCAL AGRICULTURAL EXPERIMENT STATIONS.—The result of maintaining the local experiment stations on local disbursements alone was not quite a success so far as their efficiency was concerned, and the Government has now made a special provision for granting pecuniary aid to those farms, this provision

covering also local agricultural institutes and local experimental fishery laboratories and institutes. This grant-in-aid stood as follows at the end of the 1902 fiscal year:—

	No.	Total Amount of Aid.
Local Experiment Stations... ..	35	67,000
„ Farming Institutes	4	3,200
„ Experimental Fishery Laboratories... ..	21	40,100
„ Fishery Institutes	4	5,200
	—	—
Total	64	115,700

SILK CONDITIONING.—The Silk Conditioning Houses having been described in the preceding part, it is enough to state here that the rules in connection with this official business were enacted in June, 1895.

RULES RELATING TO TEA GUILDS.—The Rules relating to Tea Guilds deserve special notice, as they have proved highly efficient for preventing the appearance of the inferior tea that too frequently impaired the credit of this staple in foreign markets, and in enabling it to hold its ground against the competition of Chinese and Ceylon teas.

The enactment was made in 1884 at the instance of the conference of tea dealers and manufacturers held in Kobe in the preceding year. The Rules do not apply to such prefectures as Gunma, Yamanashi, Nagano, Fukushima, Miyagi, Iwate, Aomori, Akita, Yamagata, Kagawa, Okinawa and Tochigi where the tea industry is of insignificant proportion.

RULES RELATING TO CATTLE AND HORSE GUILDS.—Very strict rules were enforced during the Tokugawa Regency in districts famous for the production of cattle and horses, and especially were the rules for the breeding of horses for military use strict. This salutary custom fell, however, into desuetude with the abolition of the Regency and the re-establishment of the Imperial régime. In 1882 or thereabouts the establishment of cattle or horse guilds by the people was encouraged, but the regulations were far from being efficient as they were before. Finally, in February of 1900 the existing Law relating to Cattle and Horse Guilds was promulgated with the consent of the Imperial Diet, and this Law in conjunction

with the work in the State Studs and Depots already described is now conducing in a marked manner to the interest of the industry. The number of guilds existing at present is as follows :—

Cattle Guilds... ..	25
Horse Guilds	137
Cattle and Horse Guilds	50
Total	<u>212</u>

RULES RELATING TO THE CONTROL OF BREEDING BULLS AND STALLIONS.—In accordance with the Notification issued in 1885, rules for controlling breeding bulls and stallions were left to be drawn up by different local offices. Thanks to the beneficent result of this control the breed of our live stock is gradually improving, half breeds and foreign breeds superseding the inferior native breeds. The number of old cattle are diminishing while the stature of cattle and horses in improving. The following data will serve to make this point clear :—

(1) NUMBER OF BREEDING BULLS.

Year.	Native Breed.	Foreign Breed.	Half Breed.	Total.
1897... ..	1,579	477	342	2,398
1898... ..	1,666	502	421	2,589
1899... ..	1,684	575	533	2,792
1900... ..	1,980	514	692	2,886
1901... ..	1,805	489	811	3,105

(2) STATURE OF BREEDING BULLS.

(The standard measure, 4.4 *shaku*).

Year.	Native Breed.		Foreign Breed.		Half Breed.		Total.	
	Above.	Below.	Above.	Below.	Above.	Below.	Above.	Below.
1897	110	1,469	240	237	99	243	449	1,949
1898	128	2,538	306	196	134	287	568	2,021
1899	167	1,517	326	249	187	346	680	2,121
1900	197	1,483	298	216	272	420	740	2,119
1901	266	1,539	329	160	427	384	1,022	2,083

RULES RELATING TO BREEDING STALLIONS.—Over and above the Notification mentioned in the preceding section the control

of breeding stallions is further regulated by a special law issued in 1897. These legislative provisions require all the breeding stallions to be inspected by competent experts and the inspection has resulted in a marked improvement of the breed, as may be seen from the following data.

(1) NUMBER OF BREEDING STALLIONS.

Year.	Native Breed.	Half Breed.	Foreign Breed.	Total.
1897	5,505	1,145	94	6,744
1898	4,397	1,317	80	5,794
1899	4,200	1,610	104	5,914
1900	3,616	1,769	141	5,526
1901	3,185	2,251	171	5,607

(2) STATURE OF BREEDING STALLIONS.

Year.	Below 4.6 shaku.	Above 4.6 shaku.	Above 4.7 shaku.	Total.
1897	1,505	1,788	3,271	6,744
1898	1,149	1,447	3,198	5,794
1899	1,051	1,572	3,291	5,914
1900	741	1,137	3,648	5,526
1901	626	1,014	3,967	5,607

RULES RELATING TO THE CASTRATION OF HORSES. — The earliest authentic record about the custom of castrating horses occurs in the Kyōhō ear (1715—1737 A.D.) when a large number of Persian horses were presented by some Hollanders to the then Sogun Yoshimune. The Dutchman who brought these horses was the first to introduce into our country the practice of castration as well as the foreign method of breeding horses. Coming to the present régime we find that both the Department of Agriculture and Commerce and the War Office began to perceive the necessity of this practice, and that while in 1880 and 1882 the former issued instructions for the encouragement of it, the latter started as early as 1877 a regular course of instruction to veterinary students. In 1883 the practice was universally applied to war horses. But the public were very slow in availing themselves of those instructions or in following the example set by the Government. The experience gained in the China war by Japan made it more imperative for Japan, however, to adopt this means for the elimination of inferior stallions, and the

promulgation of the existing Law in 1901 was the result. It is provided in this Law that with the exception of approved stallions all other stallions must be castrated at the age of three years, all the expences incidental to the operation to be paid out of the Treasury. The Rules of Operation were issued in 1902, officials were appointed in the Agricultural Bureau to take charge of the business, and finally 94 students were collected in order that they might be initiated into the art at the Military Horse Section.

GAME LAW AND INVESTIGATIONS IN CONNECTION WITH WILD BIRDS.—No regular rules existed formerly for the protection of useful birds and the destruction of injurious insects, except in the single case of the crane which was the only protected bird in this country before the Restoration. It was in 1873 that regular rules about shooting and hunting were promulgated. These rules underwent repeated amendments till they finally took shape in the present Game Law that was promulgated in 1901.

The data about the licenses granted during the recent seven years are given in the following table:—

Year.	License class A.	License class B.
1895	16,376	125,189
1896	16,991	141,556
1897	16,609	174,334
1898	17,198	178,130
1899	16,966	199,808
1900	16,918	202,862
1901	11,102	102,265

Note:—Licenses of class A. are issued to those who use fire-arms while licenses of class B. are issued to those who adopt other methods of killing or capturing games.

The provisions regarding game preserves were first enacted in the present Law. These preserves number 58 in all, with a tendency to increase. The total number of common game preserves is 20, of which 13 existed under the old rules and the rest in conformity with the new.

The new Law has proved effective in checking the reckless destruction of birds due to the enormous number of sportsmen in the country, as is shown by the foregoing table which records the

sudden fall of the number of shooters by about 50 per cent. during the last two years. However no conclusive result can be arrived at on this point until after the lapse of several years more.

Several other new provisions were enacted by the new Law, such as the absolute prohibition both of shooting and hunting in the breeding season, the establishment of game preserves and other such restrictive measures. In future, therefore, the breeding of birds will be more satisfactory than it was during recent years.

Wild birds have, it need hardly be said, an important relation to farming and also to forest planting, not to speak of the fact that their feathers and flesh are useful for various purposes. In view of this, investigations into the varieties of birds found in Japan were started in 1894, these investigation covering the following points:—

1. Kind of food.
2. Geographical distribution.
3. Season of pairing, of laying, etc.
4. Power of multiplication.
5. Natural enemies and friends.
6. Season and extent of migration.
7. Mode of destroying injurious birds.
8. Mode of multiplying useful birds.
9. Relative merit and demerit of the various methods of shooting and hunting.

II. PROVISIONS RELATING TO CALAMITY.

SUPERVISION OF MANURE BUSINESS.—It is a natural consequence that with the progress of farming there should arise a demand for manures which are more efficacious than those naturally procurable. But farmers do not generally possess sufficient knowledge to distinguish genuine fertilizers from those that are spurious. In procuring artificial fertilizers they are therefore liable to be duped by dishonest manufacturers and dealers. Convinced of this fact the Local Office of Nara enforced in its jurisdiction rules requiring the dealers to organize themselves into a guild. The result obtained in Nara-ken was so satisfactory that the Government, at the instance of the Diet, enacted in December of 1901 a law for controlling fertilizers.

This Law compels all those who manufacture or deal in fertilizers to first get a license, to submit samples of their goods to the proper officials for inspection, and also to guarantee the alleged composition of their fertilizers. At the same time the Government has distributed, for the better enforcement of the regulations, 116 fertilizers inspectors among different districts and has also appointed 20 chemists in the State Experimental Farms to take charge of the analysis of fertilizers. The former necessitated the disbursement by the Government of 109,729 *yen* and the latter of 38,597 *yen*.

DESTRUCTION AND PREVENTION OF INJURIOUS INSECTS.—The appearance of injurious insects has often proved disastrous to our farmers. One such case was the devastation wrought by locust in Tokachi, Hokkaidō, from 1880 to 1882.

The prevention of damages done to the crops by injurious insects requiring first of all the united efforts of all the farmers living in any given vicinity, the Government first issued a Notification on this point in 1885 and this was made more perfect in its working in 1896. The appearance of the rice-plant hopper in the very next year throughout the country and the decrease, in consequence, of the year's harvest of rice by 13.8 per cent. of the normal yield, with an extraordinary advance of the market price of rice, at once roused the Government and people to the necessity of devising some preventive measures. Their efforts were crowned with success for no such calamity has since visited the country.

Subsequently the infliction of injuries on the crops by parasitic fungi caused the Government to further amend the regulations and to make them cover, besides injuries from insects, injuries from such lower organisms.

INSPECTION OF SILK-WORM EGGS.—The regulations relating to inspection of silk-worm eggs were first issued in 1886. They left the inspection to be done at the discretion of each locality. This arrangement proved comparatively unsatisfactory and an amendment was subsequently effected as to make the regulations uniform for all the provinces and to make the inspection compulsory not only in the case of the spring breed of silk-worms but also in that of the summer and autumn breeds. The cost of inspection and the incidental expenses come from the different localities, the Govern-

ment confining itself to giving more or less pecuniary assistance, as shown below :—

Fiscal year.	Inspection Expenses.		Aid by Government.	
	<i>yen.</i>		<i>yen.</i>	
1898	259,817.33	1	75,234.71	9
1899	240,277.82	6	69,600.83	1
1900	238,837.83	6	74,124.38	0
1901	321,403.36	4	99,496.17	2

Note:—The whole of the inspection expenses for Okinawa and Hokkaidō (until the 1900 fiscal year) came from the Treasury.

EPIDEMICS OF DOMESTIC BEASTS.—Owing to the presence of various deterrent causes preventing any widespread development of stock-farming, and owing also to the mountainous character of the country, the appearance of any serious epidemic among domestic animals was a thing unknown in the olden days. It was when the rinderpest spread with terrible virulence in Siberia early in the era, that the Government first issued a Notification about the prevention of epidemics beasts. Coming to 1872 we find that rinderpest appeared in various places, and that it re-appeared in 1874 and 1875, while another disease, anthrax, making its appearance in Saitama-ken, in 1881. On each of these and on all similar occasions, measures were adopted for preventing the spread of the epidemic and for compensating the owners of affected animals that were slaughtered. The frequent introduction of afflicted beasts from the continent, especially from Korea, in spite of the various preventive measures taken, led the Government to establish on one occasion special inspection offices for its own use at Fusan and Jinsen, in Korea, in order that it might inspect the cattle shipped there for this country. Such offices were also established at Nagasaki, Kobe, and Yokohama, to inspect the cattle as also the bones and hides coming from Korea, Siberia and Shanghai. Finally by the Notification issued in April of 1900 the stations at Kobe and Nagasaki were made permanent (they had been only temporary at first) and the stations at the other three places were abolished. The following table shows the returns at the two permanent

offices and the expenses disbursed by the Government on account of the epidemics among domestic animals:—

KOBE INSPECTION OFFICE.

Fiscal year.	No. of Cattle.	No. of Sheep.	No. of Bundle of Hides.	No. of Package of Bones.
1898	100	580	2,655	171
1899	44	1,143	11,007	311
1900	96	1,112	7,661	327
1901	433	977	11,109	5,937

NAGASAKI INSPECTION OFFICE.

Fiscal year.	No. of Cattle.	No. of Sheep.	No. of Bundle of Hides.	No. of Package of Bones.
1897	—	42	—	10,998
1898	582	711	1,632	29,822
1899	419	2,225	7,354	34,501
1900	594	1,779	6,799	67,079
1901	1,569	967	22,231	130,998

DISBURSEMENTS FROM THE TREASURY ON ACCOUNT OF CATTLE PLAGUE, ETC.

Fiscal year.	yen.	Fiscal year.	yen.
1896... ..	64,565.021	1899... ..	26,061.475
1897... ..	23,369.522	1900... ..	71,465.922
1898... ..	21,084.619	1901... ..	43,793.753

Since the establishment of the inspection offices, it was only once at Nagasaki, and that time through the negligence of a foreign steamer, that the country suffered from the introduction of afflicted beasts, the entry of such having been stopped in all other cases.

PREVENTION OF TUBERCULOSIS IN DOMESTIC ANIMALS.—The prevalence of tuberculosis among the imported cattle and half-breeds has grown formidable, as shown in the following slaughter-house returns of Tokyo:—

Year.		Half-Breed.			Foreign Breed.		
		Cow.	Bull.	Total.	Cow.	Bull.	Total.
1894	No. of cattle slaughtered	734	284	1,018	6	10	16
	No. of tuberculous cattle	322	105	423	2	4	6
	Per cent. of tuberculous cattle ..	43.86%	36.97%	41.97%	33.30%	40%	37.5%
1895	No. of cattle slaughtered	783	222	1,004	1	5	6
	No. of tuberculous cattle	358	91	449	1	3	4
	Per cent. of tuberculous cattle...	45.77%	40.99%	44.72%	100%	60%	66.66%
1896	No. of cattle slaughtered	897	215	1,112	1	1	2
	No. of tuberculous cattle	347	36	383	1	—	1
	Per cent. of tuberculous cattle...	38.46%	16.74%	34.44%	100%	—	50%
1897	No. of cattle slaughtered	1,265	346	1,611	—	1	1
	No. of tuberculous cattle	344	47	391	—	1	1
	Per cent. of tuberculous cattle...	27.19%	13.58%	24.27%	—	100%	100%
1898	No. of cattle slaughtered	1,888	743	2,631	—	1	1
	No. of tuberculous cattle	585	85	670	—	1	1
	Per cent. of tuberculous cattle...	30.98%	11.44%	25.46%	—	100%	100%

As shown in the above table, of the 5,791 cattle of either foreign or half breed that were slaughtered during the five years under review, no less than 2,332 were affected by tuberculosis, that is to say, 42.7% of the whole. A similar state of things may probably exist in other places, but reports of this sort are not yet accurately known. This disease appears, however, to be rare, if it exists at all, among the indigenous cattle.

The control of cattle suffering from this disease being imperatively necessary both for the improvement of the cattle and for the sake of the public hygiene, a law for preventing tuberculous cattle was promulgated in 1900.

Accordingly inspection is enforced at Yokohama, Kobe and Nagasaki over imported cattle, the object of the inspection being to ascertain the presence or absence of any tuberculous disease in such cattle. Here are the returns for 1901.

	No. of Cattle Inspected.	No. of Tuberculosis Cattle.
Yokohama	37	—
Kobe	207	4
Nagasaki	988	6

As the Law for the Prevention of Tuberculosis in Cattle came into full force in July, 1903, the disease may be stamped out in the near future.

To provide a staff of qualified inspectors at all places of importance, the Government decided to train about 200 such men during the 1902 and 1903 fiscal years. The first batch of 35 students, all of them qualified to secure a license as veterinary surgeon, were admitted in September of 1902. The course extends over two months during which the pupils attend lectures on bacteriology, clinical examination, post-mortem examinations and dissection practices, examination of milk, flesh and urine, and the rules relating to epidemic diseases inflicting domestic beasts.

PRIMARY INDUSTRIES.

SECTION II.

FORESTRY.

Introductory Area and Ownership of the Forests—Forest Zones and Sylvicultural Conditions—Adjustment of the Forests—Exploitation and Treatment of the Forests—Forest-Planting and Transport—Wood-Produce—Official Supervision of the Forests—Education—Legislative Measures.

I. INTRODUCTORY.

THE forests of Japan, her natural ornament, which occupy more than one half the area of the Island Empire, would appear to have exerted an inspiring influence upon the mind of her inhabitants, for their love of forests and the luxuriant sylvan growth is observed to be almost intuitive. We are also inclined to think that the Japanese may owe their patriotism and aesthetic sense to the profoundly sympathetic influence the forests seem to have exercised upon them. They are instinctively aware of their duties,—so to speak—towards the forests as is indicated by the endeavors they never spare to meet the ever increasing demand for the produce of the forest, to change them in accordance with the new requirements and to maintain their supplies permanently.

The forests of Japan, had, while the country was secluded, maintained their primitive character, but with the Restoration the forests underwent a revolution in the extent and modes of their utilization. Besides a considerable increase at home in the demand for timber and fuel not only in connection with industrial and min-

ing enterprises and for ordinary building purposes, but also for use as railroad sleepers and telegraph poles as well as for the manufacture of the various wood articles and paper, the recent development in the carrying trade has caused the traders in forest produce to seek customers abroad, especially in China and Korea. All this has in recent years exercised an unequal influence on Japanese forests so that, while, on the one hand, there are districts where reckless felling and all the evils resulting from it have obliged the Government to exercise control as to cutting, on the other hand there are in some parts of the country vast areas of wooded-land maintaining all its primitive features unaltered.

This anomaly has brought to light the fact that the plans hitherto followed in the management of forests are no longer adequate to meet the future increase of the population and the requirements of the new civilization, but points to the necessity for striving to develop to the full the natural capabilities of the forests by increasing their productive powers by the application of regular technical methods.

II. AREA AND OWNERSHIP OF THE FORESTS.

THE AREA.—According to the latest statistics the area occupied by forests is 23,087,365 *cho*, i.e. over 59 per cent. of the whole area of the country which measures 24,794.36 square *ri* or 38,559,078 *cho*. (The area of Formosa and the Pescadores is not included in the above computation, not having yet been ascertained.)

Of the two divisions in the Japanese forests, "Utilization Forests" and "Protection Forests," the latter are further divided into two kinds, "Absolute" and "Ordinary." The area of the Protection Forests in 1890 was 689,469 *cho* of which 4,803 *cho* belonged to the "Absolute" class and 684,662 *cho* to the "Ordinary" category. All the other forests belong to the Utilization class, measuring 22,397,896

cho. Those forests exclusively maintained for the utilization of their produce are left to be managed by the owners as they like. Those forests of this class which belong to the State and Imperial Household are generally managed and tended in accordance with modern technical rules and bid fair to become greatly improved with regard to their productiveness. But those owned by the people, with the exception of a very small number, are entirely left to nature, nothing being done to increase their utility.

OWNERSHIP OF THE FORESTS.—The areas of the forests of these different ownerships are as follows:—

	<i>cho.</i>
States Forests	13,125,320
Imperial Forests	2,091,785
People's Forests	7,870,260

The people's forests comprise those owned by Shinto and Buddhist temples, communes and private individuals, their respective areas being as follows:—

	<i>cho.</i>
Shinto and Buddhist Temple Forests	167,629
Communal Forests	1,715,754
Private Forests	5,987,877

STATE FORESTS.—The State forests are managed by the Government and by the Imperial Household Department, while over the people's forests the Government merely exercise administrative supervision in accordance with the provisions of the Forest Law.

Of the State forests measuring 13,125,320 *cho*, 7,632,831 *cho* are under the jurisdiction and management of the Agricultural and Commercial Department of the Imperial Government, but 5,492,489 *cho* in Hokkaidō are placed under the control of the Home Department. The forests in Formosa are maintained according to special laws and regulations by the Governor-General under the supervision of the Minister for Home Affairs.

These figures are not, it must be owned, the result of accurate scientific surveying, the statistics relating to the State and Imperial forests being taken from the Government Forest Register compiled according to the Provisional Regulations for Government Forests of 1875 and those relative to the people's forests from the Land Register prepared by the Treasury Department for the purpose of taxation in accordance with the Regulations for the Revision of the Land Tax established in 1873. These registers being based on very rough surveys the figures above mentioned will have to be more or less modified, when the work of forest adjustments and investigation now going on shall have been completed. Inaccuracies are especially likely to be found in the case of the people's forests for, as the years went by, there must have been lands converted from other classes of land into forests and from forests into farm or building lots.

In this period of renovations the areas of forests are subject to changes both absolutely and in respect of proprietorship, as transfers and conversion into other classes of estates are taking place and such changes will not cease until the completion in 1904 of the work of the special State forest adjustment undertaken by the Government.

IMPERIAL FORESTS.—In 1899 States forests in Kanagawa, Yamashiro, Shizuoka, Nagano, Gifu, Aichi, Miye, Aomori, Iwate and Tochigi prefectures and Hokkaidō, to the extent of 3,649,848 *cho* in all, were transferred to the Imperial Household to constitute the Imperial forests. These forests being similar to State forests in their nature and features, it goes without saying that some of them are paying concerns, while others are not. In 1892 the Household Department commenced the work of investigating the Imperial forests, as the result of which some of them have been disposed of from time to time since 1898. In 1889 over 1,370,000 *cho* in Hokkaidō were returned to the State control, while some forests were resold to such temples, Shintō or Buddhist, as had formerly been their possession, in compliance with the regulations established for the special disposal of such forests. Besides, some of those that had been classed as Government property, through error, on

the occasion of the land tax revision in the early year of Meiji were restored to their rightful owners. Such transfer not having yet been completed, it will be years before the area of the Imperial forests becomes fixed. From 1889 to 1900 this kind of his Majesty's property increased by 59,533 *cho* while decreasing by 1,453,342 *cho*, so that the clear loss was 1,383,809 *cho*. The increase was principally due to the correction of the former computation of areas and to the declaration of lands presenting a sylvan appearance as forests, while the chief causes of the decrease were the expropriation of some forests in Hokkaidō and the reclamation and sale of some forests for conversion into arable land.

The Imperial forests are divided into two classes: "Hereditary" and "Ordinary." The former comprises such forests as are so thickly wooded and extensive as to furnish enough material for a regular working plan framed on the basis of economical considerations. Such forests are made extremely difficult of conversion by the Imperial House Law. Hence changes of areas rarely occur except in the forests belonging to the other class. In 1901 there were 997,250 *cho* of the Hereditary class and 1,100,536 *cho* of the Ordinary class.

PRIVATE FORESTS.—The forests owned by civic corporations, religious establishments and private persons are now subject to greater and more frequent changes than the State and Imperial forests because of the recent slackening of Government control over them and the vicissitudes in the economic conditions of the country. And the decrease of the forest area since the Restoration is mainly due to the reckless felling of woods owned by private persons. We have no statistics showing the extent of such reduction, but see them indirectly shown in the increase of land under cultivation and pasturage. Private forests, however, have increased to a certain extent by the purchase of some State or Imperial property.

PLAINS AND MOORS.—Besides the forests above mentioned there are in this country vast areas of land the uses of which are yet undecided. They are known by the name of "Genya" (plains and moors) as distinguished from forests, being a class of land established on the occasion of the land tax revision. In the early years of Meiji the classification of lands was made merely with

regard to their features, without paying any attention to their position or nature or to the relations they bear toward each other. Thus the division of land into Forests and "Genya" seems to have been based on no other consideration than the presence or absence of trees. At present there are over 2,645,322 *cho* of "Genya" which, we may observe, will in the near future, except such portions of them as may from their nature be made into pastures or cultivated land, be mostly converted into forests. This class of land is especially abundant in the northern provinces of the main island and in Hokkaidō. Some of the "Genya" already present quite a woody appearance and bid fair to become perfect forests in no distant futures.

Of the above-mentioned area of the "Genya" 1,434,666 *cho* belong to the State; 157,174 *cho* to His Majesty the Emperor, the remaining 1,053,482 *cho* being either private or communal property.

DISTRIBUTION OF FORESTS.—Forests are found everywhere in the Empire from Formosa on the south to Hokkaidō on the north. But their distribution is varied according to the general shape of the country, the height of the mountains and hills and the density of the population. With the exception of a small number of forests on level ground found here and there, Japanese forests form a long string on the mountains running lengthwise through the middle of the country. In Hokkaidō the mountain ranges which traverse the whole island, lengthwise and crosswise, constitute a splendid forest-area. In the main island a

General features chain of forests begins with Mount Hakodda
of Distribution. in Mutsu. It runs through Rikuchū, then appears
 as Mount Azuma in Uzen, reaches the boundary
 line between Shinano and Echigo, whence it goes on to form the
 Kiso forests, where bending southward it runs in an unbroken
 line from Mount Asama in Shinano to the Imperial forests of
 Fuji and Amagi lying between the provinces of Kai and Suruga. In
 the province of Kii the range starts from Mount Kumano whence
 it runs to meet the woods in the Yoshino districts, Yamato. In
 Shikoku the line crosses the boundary between Sanuki and Awa
 and proceeds over the summit of Mount Ishizuchi to the forests

in Tosa. In Kyūshū the line is continued through Mount Aso and stretches to Mount Kirishima toward the south. Thus the forests of Japan mostly lie in the mountainous districts along the backbone of the country and to Climate. are scarce on the plains along the seaside. Again they are most numerous in the cold regions in the north and considerably less in the warmer regions in the south, as shown in the following table:—

Note:—1. The above table does not include the forests in Formosa and the Kuriles, which are under investigation at present.

2. The "Northern Provinces, Main Island" in the above table comprise the districts under the jurisdiction of the Aomori, Iwate, Akita, Miyagi, Fukushima, Tokyo, Nagano, and Ishikawa Major Forestry Offices, while the "Southern Provinces" comprise the districts under the Ōsaka, Okayama and Hiroshima Offices.

The above table shows that in Hokkaidō and in the northern provinces of the main island, forests occupy 66% of the whole area, while in the Okinawa archipelago only 26% is wooded land. Kyūshū has 34% and the southern provinces of the main island and Shikoku have 53% each. Leaving Hokkaidō, which was opened up to colonization only 30 years ago out of consideration for the present, Japan has high and steep mountains in the north which are densely covered with forests. In the middle of the island, near Mount Fuji, the land reaches the utmost elevation and thence toward the south-west the country becomes more and more open, with a range of hills which possesses only a few high mountains. These geographical features have had much to do with the unequal distribution of forests in the country. The difference of economical development in the various districts was also a powerful agent in this connection. In Shikoku, Kyūshū and the western portion of Honshū or the main island, where civilization made its first appearance in Japan, the people have had better means of transportation than in the other parts of the Empire, and the demand for the timber increasing in proportion to the growth of the population, forests have been rather recklessly felled. This together with the greater need than in other regions for agricultural land must have led to the present scarcity of forest land in these parts. From the standpoint of population, Okinawa with 1 *tan* 2 *se* of forest land per soul rank the lowest; Kyūshū has 2 *tan* 3 *se*; the southern provinces of Honshū, 3 *tan*; Shikoku, 3 *tan* 5 *se*; the northern provinces of Honshū, 5 *tan* 2 *se*; Hokkaidō where the population is smaller than in any other division of the Empire, enjoys by far the greatest share of forests per soul, to wit; 6 *cho* 2 *tan* 7 *se*. In districts having a dense population there are more private and communal forests, especially the former, as compared with State forests, than in districts thinly populated. In the southern provinces of Honshū we have 698,480

cho of State forests against 2,314,296 *cho* of private and communal forests, the ratio being $3\frac{1}{2}$ to 1 in favor of the latter. In Shikoku this ratio is 2 to 1, while in Kyūshū the two classes of forests are of nearly equal extent. On the contrary, in the northern provinces of Honshū private forests occupy only one-half the area of the State forests. In localities abounding in private or communal forests, the State forests are all situated in remote mountain districts, the forests near market towns having facilities for the transportation of timber being owned either by private individuals or by juridical persons. All these forests except a very few have hitherto been managed without any regard to sound principles and are therefore in a very impoverished condition. Some of them have lately been classed as protection forests in accordance with the provisions of the Forest Law. It is indeed in these districts that the greatest number of protection forests is found.

Ill-managed forests are only too numerous everywhere in the Empire, but their producing capacity being made very small in

Districts of consequence of injudicious cutting, in some districts the local forests are inadequate to meet even the ordinary demand for timber. Such is already the case in the southern provinces of Honshū and Kyūshū, where the recent development of mining and industry has produced a considerably increased demand for timber. In those parts the local forests supply little besides wood for the purpose of fuel, and timber is purchased from other districts in yearly increasing quantities. The northern provinces of Honshū and Hokkaidō are yet rich in forests both in regard to area and producing capacity, a great number of forests being still placed outside the utilization domain. There we find forests in the neighborhood of towns and villages, the produce of which being more than sufficient to meet the local needs for building, industrial and mining purpose, is exported to other districts and countries in large quantities. Thus Hokkaidō exports timber to Honshū and to China and Korea for use in house and railroad building. *Hiba* (*Thujaopsis dolabrata*) and *Sugi* (*Cryptomeria japonica*) timber produced in Aomori and Akita prefectures is exported not only to Tokyo and Ōsaka but to Shikoku and Kyūshū.

III. FOREST ZONES AND SYLVICULTURAL CONDITIONS.

The geographical position and features of the land, the climate and the geological nature of the soil exercise manifold influences on the species of trees growing in such land and on their rate of growth.

FOREST ZONES.—Owing to her geographical formation and more particularly to her climatic condition, no place of Japan except a portion of the Kuriles group and a few high mountains, is unfit for the growth of forest trees. We have all species of such trees growing in Japan from those belonging to the Torrid zone to those of the Frigid. Thus Japan is as rich as any country in the world in her arboreal flora. Extremes of temperature are unknown owing to the peculiar distribution of land and water and to the geographical position, the annual average in Formosa being 23° C. and that of Kamikawa in Hokkaidō $5^{\circ}.1$. Taking the averages of the four months from April to July, (months, having, so to speak, the greatest influences on the growth of forest trees) we find that Kyūshū indicates $21^{\circ}.2$; Shikoku $20^{\circ}.9$; the southern provinces of Honshū $20^{\circ}.4$; the northern provinces $18^{\circ}.4$; and in Hakkaidō $12^{\circ}.7$. The annual average is seldom found even in the high mountain districts to fall below 10° C. In comparing these with Dove's recognised standard temperatures, it is found that they are higher by 1° for the summer months and 7° lower for the winter months.

SYLVICULTURAL GEOLOGY. The land occupied by the sylvan flora of Japan has rocks belonging to almost all geological groups from the Achaean to the Cainozoic. They are different in different places and very complex in structure.

The forests in Hokkaidō mostly stand on new volcanic rocks and sedimentary rocks, such as sandstone, tuffs, and conglomerate belonging to the Tertiary system and in a limited space upon Palaeozoic rocks. The forests in the Akita and Aomori prefectures in North Japan are found upon igneous rocks of the Tertiary system. In Central Japan the mountain ranges facing the Pacific Ocean geologically belong to the Achaean and Palaeozoic groups, while the forests in the Kiso districts are flourishing upon granite and other igneous rocks and also upon rocks of the Palaeozoic group.

The forest land in the Muro districts in the province of Kii is geologically porphyry ejected in the Mesozoic era and the Yoshino forests in Yamato belong to the Archaean and Palaeozoic groups. The forests in western portion of Honshū, especially Chugoku, stand upon granite, while those in the provinces of Tamba and Tajima are found upon rocks of the Palaeozoic group. The mountains of Shikoku like Yoshino in Yamato are composed of Palaeozoic and Archaean rocks. In Kyūshū only the southern section belongs to the Palaeozoic group, the greater part being mostly composed of igneous rocks. This country while fundamentally composed of Archaean rocks has other strata upon them, which are ejectamenta from volcanoes in the different periods of geological changes. These occasional additions of igneous rocks have been so large that at present nearly one-third of the forest land in the whole country is composed of such rocks, of which the principal rock belonging to the Archaean period is granite and those that were ejected in the Palaeozoic and Mesozoic periods are granite, porphyry, diorite, porphyrite and others. Of the ejected rocks belonging to the Tertiary and Quaternary periods there is a large number, but those covering larger aers are andesite and basalt.

These rock formations together with other requisites for the growth of forest trees are found to have exercised special influences in accordance with their density and structure upon the generation of the sylvan flora and to possess no small bearing on the formation of forests.

It is a notable fact that among the extensive forests of coniferous trees that have continued to maintain a fine appearance from ancient times, those depending on natural regeneration are mostly found upon igneous rocks, while the majority of those depending on artificial regeneration stand on sedimentary formations.

The fact that geographical and climatic conditions of the country vary in different places as stated above is favorable to the growth of various kinds of forest trees and the fact that the topographical and geological features of the country are also quite different in different places has caused a variety of forest growths to spring up. As it is, no less than eight hundred species and varieties of forest trees are found to be well suited for culture here. But at the

present stage of the development of forest work in this country the economy of forest management does not allow to attach any special importance to not more than ten or twelve species of forest trees.

GEOGRAPHICAL DISTRIBUTION OF THE FORESTS.—The forests of Japan are divided into four groups, viz: Tropical forests, Sub-Tropical forests, Temperate forests and Arctic forests.

TROPICAL FORESTS.—Tropical forests grow in the whole of Formosa, the southern half of Okinawa, the Yayeyama Group and and the Ogasawara Islands. From the standpoint of altitude these forests are found on Niitakayama in Formosa at places below 500 metres where the annual temperature does not fall below 21°C.

Of the tropical flora the banyan heads the list followed by several species of palms and the bamboo. The banyan tree is represented by more than 18 species, all of which are found to be capable of luxuriant growth. But this and other tropical plants do not furnish useful timber except the bamboo, several species of which are found in groves everywhere in these regions, growing with wonderful rapidity and producing huge canes, hard and strong, useful for manufacturing various kinds of utensils as well as for building purposes.

SUB-TROPICAL FORESTS.—The Sub-Tropical forest regions comprise a portion of Okinawa, the whole of Shikoku and Kyūshū and the part of Honshū lying south of 36° N.L. With reference to altitude, places lying 1,900 metres above sea level in Formosa, below 850 metres in Kyūshū and below 500 metres on Mt. Tsukuba in the province of Hitachi, Honshū, belong to this section, all these enjoying an average annual temperature of 13° 21' C.

The Sub-Tropical trees are of numerous species and are highly valued in sylvicultural economy. As the better known parts of Japan, the "beaten tracts" as the tourist would call them, "Japan proper" as the geographer would say, have a dense population and early developed industries, they do not now possess forests enough to meet the local demand for timber. As the result of continued reckless felling that has been going on in these regions for many years, there remain only a few forests preserving their primitive features, and in Honshū it might be said that there are no such forests except within the precincts of the Shinto or Buddhist temples.

The sylvicultural characteristic of Sub-Tropical regions is that they are in possession of broad-leaved evergreens, but as the result of careless cutting and conflagrations deciduous broad-leaved species and the red pine have made intrusions changing the sylvan aspect to a remarkable degree. In accordance with the present features the forests in these regions have to be divided into three classes, broad-leaved evergreen, broadleaved deciduous and pine forests.

TIMBER TREES IN SUB-TROPICAL FORESTS.—The species of chief importance to the sylviculturist among the broad-leaved evergreen trees growing in this zone are no more than the undermentioned:—

Camphor Tree (*Cinnamomum Camphore*, Nees):—Being a native of this zone, the camphor tree grows in Shikoku, Kyūshū, Formosa and the province of Kii in Honshū. This species is sometimes found forming a big forest. It grows everywhere in this zone, if the soil is clayey and fertile, especially in places facing the south and free from cold winds. In Formosa it is found as high forest, either pure or mixed, up to the height of 1000 metres above the sea level. In Kyūshū, Shikoku and the southern provinces of Honshū, old and big trees of this species are found here and there, thanks to the time-honored custom of using them as ornamental groves of both Buddhist and Shinto temples. The timber is somewhat hard and lustrous and has a peculiar odor. It is prized for use in making valuable articles of furniture as well as for ornamental purposes. It lasts well in water and has been valued from ancient times in shipbuilding. In recent years the demand for it as material for the production of camphor valuable in the various branches of industry has very largely increased and forests have been planted both by the Government and by private persons.

Tsuge (*Boxus Sempervirens*, var. *Japonica*, Mak.):—This tree even in the largest specimen measures not more than 50 centimetres in diameter and 15 metres in height. The timber is exceedingly hard and close and fine grained, so that the year-rings can hardly be distinguished. The inner wood is lustrous and pretty and is used not only in fine sculpture but in the

making of valuable articles and nice rules and instruments because of its freedom from shrinkage or expansion, whether wet or dry. The tree grows in Kyūshū, Izu and other provinces, especially in the Kawara and Koshoyama State forests in Kyūshū and in the private forests in Mikura and Miyake islands in Izu. Is a shade-loving tree and grows well in calcareous soil. The young trees are liable to frost damage, hence they must be made to grow under protecting trees. Reproduction by means of planting young shoots or the insertion of sprigs.

Ubame-gashi (*Quercus ilex*. var. *phillyreoides*, F. r.):—The several varieties of *Kashi* (oak) are the most widely distributed of the broad-leaved evergreens. The *Ubame* is found in the southern provinces of Honshū, in Awa, Kazusa and Shimōsa, in Kii and in the southern part of Shikoku. On the shores of Tosa and Kii, they are found growing in pure woods, but in other places mixed with other varieties of *Kashi*. The timber is white with a shade of yellow, is the hardest and heaviest of all timbers produced in Japan. Is used in house building where hardness and strength are required, but the chief use is in charcoal making. Considered as the best fuel wood in Japan.

Ichii-gashi (*Quercus silva*, Bl.): *Shira-gashi* (*Quercus vibrayana*. F.r.): *Aka-gashi* (*Quercus acuta*, Thumb.):—

These three species are the most extensively utilized of all broad-leaved trees. The timber closely resembles that of the *Ubame-gashi*; but its growth is quicker than the growth of trees of that species. Is valued in the making of the handles of agricultural and other tools and implements; also in making wheels and rudders. The *Ichii* is sometimes found growing so big as 55 centimetres in diameter and 30 metres in height, the bole measuring 15 metres. Under the old régime the wood of this tree was highly prized for handles of spears and in the several clans there were strict regulations forbidding the felling of trees of this species. Grows in Kyūshū, Shikoku and the southern provinces of Honshū. Pure woods are rare; found mixed with other species of *Kashi*. Very widely distributed;

fond of shade and grows well under standard trees. This tree is reproduced either naturally or by planting.

The deciduous broad-leaved trees belonging to this zone are mostly found in planted woods, principal species being *Kunugi*, *Konara* and *Shite*.

Kunugi (*Quercus serrata*, Bl.):—This species ranks high among Japanese trees in affording excellent firewood; ranks next only to the oak for use in making charcoal, the far-famed Sakura and Ikeda charcoal being made from this wood. Not found in mountain regions. The home districts of these trees were limited to the neighborhood of the province of Settsu and a part of the Musashi plain. But the trees being easily made to form a coppice under a short-term rotation founded on very economical calculations, they are now found everywhere in the country planted as private property, except in the northern half of Honshu and the whole of Hokkaidō. The bark contains tannin and is therefore used for dyeing purposes and in the curing of skins. The wood is also extensively used as logs for growing thereon *Shiitake*, an edible mushroom.

Konara (*Quercus glandulifera*, Bl.):—Also valued as a firewood and charcoal yielder and commands a large sale. Found as a principal tree in natural mixed forests in the hilly and mountainous districts of Honshu, covering immense tracts; also found in Hokkaidō. Like *Kunugi* it is somewhat fond of light and may grow in any land holding a suitable quantity of moisture within the temperate regions. It is coming into vogue for the making of artificial coppices of this species of oak mixed with *Kunugi*, *Shite* and other trees.

The Pine family is represented by two species: *Akamatsu* or “Red pine” and *Kuromatsu* or “Black pine:”

Akamatsu, or “Red Pine” (*Pinus densiflora*, S. et. Z.):—The most widely distributed of all the coniferous trees in Japan being found from the southern extremity of Kyūshū to the southern portion of Hokkaidō; thrives in all soils except in places where more or less water always stagnates. Is fond of dry, well-drained land yellowish or reddish in color. It takes possession of deforested areas before other kinds of

forest-trees begin to grow. In the southern portion of Honshu it is found in excellent condition at the height of 2,000 metres above the sea. It demands light and hates shade. Forms splendid forests either by natural or artificial regeneration. Mostly found in pure woods; sometimes as mixed woods planted with the bamboo, *Konara* and other trees. Because of its hardy nature and speedy growth, communes, religious establishments and private persons are very fond of planting groves composed of these trees. In the southern and central portions of Honshu, where, in consequence of wanton felling, the soil has been greatly impoverished, the red pine will come to occupy vast areas in the near future. The wood, which is yellowish white with a shade of red, is hard, strong and elastic and contains a large percentage of resinous substances, which makes it proof against moisture; hence prized for use in engineering works and as mining props. Used for building purposes though not nearly equal to *Sugi* and *Hinoki* in this respect. As firewood ranks among the most indispensable kinds of wood used for that purpose. The "pine mushroom" (*Matsutake*), king of table mushrooms, grows in the "red pine" forests in the southern part of Honshu.

Kuromatsu, or "Black Pine" (*Pinus thenbergii*, Parl.):—Like "red pine" it serves various purposes. The wood, of reddish color, is strong and hard and contains a very large percentage of resinous substances. Being very durable is suited for bridge foundations and for use in general earthwork engineering. As firewood, it is valued as a great heat-producer! the root-wood being especially rich in resin is used as torches. Thrives well in sandy soils along the seashore. Found all along the coast of Shikoku, Kyūshū and Honshu; the area covered very extensive.

Besides those we have groves of bamboos in the subtropical regions. Bamboos take rank among useful timbers of Japan. The chief species of bamboos cultivated are *Madake*, *Hachiku* and *Mōsō*.

Madake (*Phyllostachys bambusoides*, Sieb. et Z.) and *Hachiku* (*Phyllostachys puberula*, (Miq.) Munro).—Have been used from ancient times for making various tools and utensils and for

building and ornamental purposes. Recently bamboo work began to be largely exported to Europe and the United States. Extensively cultivated by private persons in the southern part of Honshu, Shikoku and Kyūshu. The neighborhood of Kyoto and Nara abound in splendid bamboo groves. At Yamashina, Kyoto, there are groves producing *Madake* canes measuring 22 centimetres in diameter and 22 metres in length. Bamboo groves are mostly found planted either between plots under culture or on hill-sides. They are rarely of any considerable size. Bamboo planting is fitted for sylviculturists with small capital.

Mōsō (*Phyllostachys nutis*, Rivier):—The largest of the bamboo family; sometimes found of such dimensions as 30 centimetres in diameter and 25 metres in height. Planted in groves mostly in Kyūshu, Kii and the provinces adjacent to it. Valued for the manufacture of tools and utensils.

TEMPERATE FORESTS.—The Temperate sylvan flora extend from the northern half of Honshu to the southern half of the Hokkaidō, between 36° and 43.° N. L., where the average annual temperatures range from 6° to 13° C. The Temperate forests rise in Formosa to the height of 3,500 metres: in Shikoku 1,800 metres; in Central Honshu a little lower, to wit, 1,500 metres; and in South Hokkaidō 500 metres.

These forests cover a large area and not a few of them maintain their primitive features. Being mostly natural woods of splendid trees they form the most important item of Japanese sylvan wealth. But as in these regions the climate gets rather cold and the snow lies on the ground during half the year, the trees are liable to be damaged by snow and require no small amount of tending and protection.

TIMBER TREES IN TEMPERATE FORESTS.—The number of the species of trees belonging to these regions is over 60 but the more important of them are *Hinoki*, *Sugi*, *Hiba*, *Koya-maki*, *Sawara*, *Nezuko*, *Momi*, *Tsuga*, *Ira-momi*, *Bara-momi*, *Himeko-matsu*, *Chōsen-matsu*, *Gayo-matsu* and *Kara-matsu* in the Coniferous class; and *Keyaki*, *Yachidamo*, *Katsura*, *Onara*, *Sawa-gurumi*, *Tochi*, *Kurami*, *Nire*, *Kuri*, *Kiwada*, *Harikiri*, *Enju*, *Hokoyanagi*, *Doro*, *Hōnoki*, *Kashiwa*, *Sakura*, *Buna* and *Kaede* in the Broad-Leafed class.

Hinoki, Fir (*Chamaecyparis obtusa*, S. et Z.) :—The timber is soft, close-grained, strong and tough and has a peculiar scent. Ranks first among Japanese timber trees, being used for building purposes, and as an ornamental wood and in engineering work and naval architecture; also in bridgework. Grows in the southern half of Honshu, Kyūshu and Shikoku. In the provinces of Kii, Yamato, Musashi, Tōtōmi, and Tajima, we find extensive forests of this tree. The natural *Hinoki* forest in Kiso is one of the three best forests in Japan. The natural forests in the Koya mountains in Kii are noted for producing big *Hinoki* tree. The home of this tree is in the central portion of Honshū, in regions from 550 to 1,400 metres above the sea level, but where the atmosphere contains a suitable proportion of moisture, it is found in well-formed woods, either pure or mixed, in both higher or lower districts.

Hiba (*Thujaopsis dolabrata*, S. et. Z.) :—This tree together with *Hinoki*, *Sawara*, *Nezuko* and *Koyamaki* formed the so-called *Goboku* or “Five Trees” under the old régime and enjoyed careful protection at the hands of the feudal authorities. Mostly regenerated naturally; rarely planted. The Aomori districts in the north are noted for having pure woods of *Hiba*. The State forests in the Tsugaru and the Nambu peninsula are nearly pure woods of *Hiba* with a slight intermixture of *Buna*. There are extensive forests of *Hiba* mixed with other coniferous trees, such as *Himeko-matsu* and *Sawara*, in the mountains on the northern frontier of Rikuchū, in Goyosan in Rikuzen and in the mountains in the Tone districts, Kōzuke. The wood grows slowly and the year-rings are extremely narrow. The timber is compact and strong; therefore used for building and engineering purpose. It has lately come to be in great demand for use as railway sleepers, its durability being peerless.

Sugi (*Cryptomeria japonica*, Don.) :—Very widely distributed, being second only to “Red pines” among the conifers in this respect. This tree wants light, grows well in soils having a suitable amount of moisture, is capable of speedy and considerable growth, some specimens being found of such huge dimensions as 2 metres in diameter and 40 metres high. In suitable soils

and atmosphere this tree forms woods throughout Shikoku, Kyūshū and Honshū and even in the southern provinces of Hokkaidō. Splendid specimens of natural pure woods of *Sugi* are found in the Nagakizawa State forests in Akita, while specimens of artificial forests are seen in the private forests in the Yoshino districts in the province of Yamato. The natural forests in Yakujima in Kyūshū are celebrated for producing timbers having very fine and pretty grains known as *Uzura-moku*, partridge grains. The wood is light yellow with a shade of red; used very much like *Hinoki* for building and ornamental purposes and in the manufacture of tools and utensils.

Sawara (*Chamecyparis pisifera*, S. et Z.): *Nezuko* (*Thuja japonica*, Maxim.): *Koya-Maki* (*Sciadopitys verticillata*, S. et Z.):—Naturally these trees are always found in mixed woods, and never as pure woods. In Kiso and in the Kōya mountains there are natural woods of these trees mixed with *Hinoki* and other coniferous species. They are also found in large groups in the provinces of Yamato, Bungo, Satsuma, Ōmi, Iwashiro, Shimotsuke and Uzen, 900 metres to 1,800 metres above the sea-level. The timber of *Sawara* and *Nezuko* is of pretty appearance, but being soft, light and easy to split is mostly used as boards and planks by joiners and carpenters. The *Kōya-maki* grows extremely slowly, its timber is close-grained and containing some resinous substances is very durable in water. It is therefore valued for making water-pails and for use in earth-work engineering.

Momi (*Abias firma*, S. et Z.):—Quite widely distributed, being always found in the primitive mountain forests in the southern provinces of Honshū, Kyūshū and Shikoku. Is a shade-bearing species. After its middle age it grows very fast and in well-adopted soil forms perfect trunk. The timber is light and coarse and undergoes much expansion and contraction, therefore inferior to the timber of other conifers. Owing to the length of its fibres and the possibility of cleaning them by bleaching, it is used almost exclusively as paper pulps. There being a great demand for the pulps the tree may gradually become extinct unless steps are taken for its artificial regenera-

tion. The boxes and cases exported to foreign countries from Japan are mostly made of this wood.

Tsuga (*Tsuga sieboldii*, Carr.) :—In distribution similar to *Momi* and mostly found in woods mixed with *Momi*. Growth very slow; the timber being of compact structure is highly appreciated for ornamental purpose. Used like *Momi* as material for paper and box making.

Himeko-matsu (*Pinus parviflora*, S. et Z.) :—Is found in woods in regions between places elevated 1,600 metres above the sea on the Kōtsuke-Echigo boundary-line and the mountain ranges of Iwashiro. Nearly pure woods are seen in the provinces of Toshima and Shiribeshi, Hokkaidō.

Goyō-matsu (*Pinus pentaphylla*, Mayr.) and *Chōsen-matsu* (*Pinus Koreinsis*, S. et Z.) are found overlapping the Temperate regions and the Arctic. Barely met with in the mountains in the central and northern sections of Honshu. The *Goyō-matsu* is found in the form of a quasi-pure forest in the province of Tokachi, Hokkaidō.

Bara-momi (*Picea polita*, Carr.) and *Ira-momi* (*Picea bicolor*, Mayr.) are very limited in distribution being only found to any great extent on the sides of Mount Fuji, at the height of over 2,000 metres above the sea-level. Generally they are found in solitary clusters on the high mountains. As they possess the useful characteristic of making reasonable growth even in poor and shaded land, they have drawn the attention of the Government authorities as being probably suited for making protection forests intended to preserve the soil. The growth is very slow and the timber being very soft, is inferior to that of other coniferous species for ordinary purposes but is suited for making ceilings and also water-free articles of furniture.

Kara-matsu (*Larix leptolepis*, Gord.) :—Found in natural woods at Mts. Fuji and Asama and the Azumi districts in the province of Shinano. Grows wild in the mountains of Nikkō; nowhere else found in natural woods. It is a decidedly light-demanding species and thrives in dry soils of volcanic origin. The timber is tolerably hard and durable and valued for house and ship-building purposes, as telegraph poles, in civil engine-

ering work and for other uses. The tree grows fast and is free from ordinary dangers incidental to silviculture. Thrives well in any soil however poor, hence it is growing in popularity in Honshu and Hokkaidō.

The broad-leafed trees of the Temperate regions are very numerous and occupy more than one half the area under forest. They are found everywhere in great luxuriance, but single species are rarely seen in the form of a strictly pure forest, although *Konara*, *Kashiwa*, *Onara*, *Kaba*, *Koro-no-ki*, *Han-no-ki*, *Katsura* and *Buna* are widely distributed throughout Honshu and in the southern half of Hokkaidō in almost unmixed woods. All the other species grow in irregular intermixture with other broad-leafed or needle-leafed trees, sheltering and protecting each other so as to preserve the original sylvan features. Below are given chief species of silvicultural importance :

Keyaki (Zelkova Keaki, Sieb.).—No other broad-leafed species is adopted to so many ways of utilization and so highly valued as *Keyaki*. This species is found everywhere in Honshu, Shikoku and Kyūshu, but rarely in pure woods. It grows to enormous dimensions in woods intermixed with shade-bearing species of the broad-leafed family. Loves calcareous soils and the south-eastern sides of mountains, where, when the soil is suitable, it attains perfect growth. Found wild below 1,600 metres in Shikoku and Kyūshu and under 750 metres in the northern section of Honshu. Kiso, Izu, Tōtōmi, Kii, Hyuga, Yamato, Ise and Ōu (the north-eastern districts of the Main Island) are especiall noted for producing big *Keyaki* trees. Requiring a great many years for its full growth, it is unsuited for planting by private silviculturists with small capital. The Government is, however, making their best endeavors to preserve and increase the areas under this species. The timber is very strong, hard, and lustrous; highly valued for building and ornamental purpose; also in naval architecture. *Keyaki* timber which has *Jorin* (ring-like), *Uzura*, (partridge feather), *Tama* (gem) or *Botan* (peony) grain is used for making valuable articles of furniture. *Keyaki* wood is a favorite material for sculptors, being hard and easy to work.

Buna (*Fagus sylvatica*, var. *Sieb.*, Maxim.)—Occupies the largest space next to *Akamatsu*. Found in the hills and mountains in the northern section of Honshu, in the elevated districts in the southern section of Honshu, Shikoku and Kyūshu; also in many provinces of Hokkaidō. Mostly found mixed with *Onara*, *Katsura*, *Shioji*, *Itaya-Kayede* and other trees, but in Aomori, Iwate, Echigo and Yamagata pure woods of vast dimensions are seen in the mountains over 300 metres above the sea. As a firewood and charcoal producer, this is one of the most important species. The timber is little used for building purposes. The Kosaka, Ani and other mines have large *Buna* forests for getting supplies of fuel. This tree grows well in the shade and having the characteristic of growing even when extremely old, it sometimes attains an enormous size. The Ainos in Old Japan are said to have made log-boats of this tree.

Yachidamo (*Fraxinus mandshurica*, Rupr.) and *Katsura* (*Cercidiphyllum japonicum*, S. et Z.)—The only broad-leaved species affording building timbers. Also used for ornamental purposes. Very widely distributed, found in all parts of Hokkaidō and in the mountain valleys in the northern section of Honshu. Thrives best in level ground; excellent pure woods of *Katsura* are seen in the province of Iburi. The timber is soft and compact and possesses elastic powers of a durable character. Hence extensively used of late as railway sleepers; it is chiefly such sleepers that are exported to North China.

Inu-Enju (*Cladorostis amurensis*, var. *floribunda*, Maxim.):—Found in the northern section of Honshu and in South Hokkaidō mixed with other broad-leaved species. The timber is very pretty and is used for making valuable articles of furniture. Exported to China and Korea as railway sleepers.

Kurumi (*Juglans sieboldiana*, Maxim.):—Grows in rich mountain valleys and on low lands in the central and northern sections of Honshu. On the plains of Ishikari and Tokachi in Hokkaidō, it is found in woods mixed with *Yachidamo*, *Katsura*, *Nire* and other trees. The timber is in demand for making railway carriages and for highly ornamental purposes, and also for rifle-stocks.

Harikiri (*Acanthopanax ricinifolium*, S. et Z.):—Grows in wet soils in Shimozuke, Iwashiro and Iwate; and everywhere in Hokkaidō. In rich soil attains considerable dimensions. The timber is somewhat hard and lustrous with well defined grain and whitish in color. Prized for ornamental purposes and for making articles of household furniture. In great demand as railways sleepers like *Yachidamo* and *Katsura*.

Kashiwa (*Quercus dentata*, Thumb.) and *Onara* (*Quercus crispula*, Bl.):—Found in wet places between the mountains in the Nasu and Ōu districts in Honshu and everywhere on the plains of Hokkaido. In Honshu rarely found in pure woods, always growing mixed with other broad-leaf species, but in some parts of Hokkaidō, there are extensive pure woods of these trees. The timber of *Onara* is widely used as sleepers and is one of best producers of firewood and charcoal. *Kashiwa* contains tannin in its bark and is used in curing skins. Otherwise it is not used, except as firewood.

Hoko-yanagi (*Populus tremulus*, var. *villosa*, Mesm.) and “*Doronoki*” (*Populus balsamifera*, var. *suareobenus*, Send):—The two species are most valuable wood in Japan for making match-sticks. The former grows all over Shikoku, Kyūshu, Honshu, and as far north as Hokkaidō, while the latter thrives well in the north-eastern districts of Honshu and Hokkaidō. They grow easily in sandy wet soil, are found forming uniform forests of perfect silvicultural aspect in many parts of Hokkaido. The trees are fond of light and under favorable condition their growth is very rapid, and after 25 years from germination they easily attain the height of 6 metres. Reproduced by seeds or layer or by dividing the roots. They are being planted extensively in private forests.

Kuri (*Castanea vulgaris*, var. *Japonica*, D.C.):—The extent of the growth of this species is exceedingly wide. In Kyūshu and Shikoku and the western parts of Honshu the tree imparts a special aspect to the forests growing on the sides of high hills or on hillocks. In places north to the middle section of Honshū, it grows well on the plains and produces valuable timber. However the specie rarely forms any extensive pure

forest of its own, and generally mixed *Buna*, *Hiba*, *Kiwada*, *Katsura*, *Kayede Sawakurumi*, etc. In the Kobinata State forest found in Tone district, Kōzuke, and in Hiraga district, Ugo, it is found forming pure forests of no small extent. The timber is extremely hard, can stand wet, and on the whole lasts long, is therefore preferred for railway sleepers to any other tree growing in Japan. The sleepers used in the Government Tōkaidō railroad and in the Hankaku railroad are made from the timber of this tree.

Sakura (*Prunus Pseudo cerasus*, var. *spontanea*, Maxim), *Kaede* (*Acer palmatus*, Thumb), *Honoki* (*Magnolia hypolenea*, S. et Z.):—These are not trees of any great sylvicultural importance, and very rarely do they form pure forests of their own, growing mostly, as they do, amidst conifers or broad-leaf trees. However they are of importance for certain special purpose, and as the supply is hardly sufficient to meet demand, their price is comparatively high. In view of this fact, both in State forests and private forests, they are being planted side by side with trees of other sorts.

Tochi (*Æsculus trebunata*, Bl.), *Nire* (*Ulmus campestris*, var. *Learis*, Planch), *Hannoki* (*Alnus Japonica*, S. et Z.), *Toneriko* (*Fraxinus Bungeana*, D.C.), *Saikachi-enoki* (*Gleditechia Japonica*, Miq.), *Yanagi* (*Salix acutiporia*, L.) are deciduous broad-leafed trees not particularly possessing any great sylvicultural value. They are grown in this zone for the purpose of giving protection to primary trees or for maintaining the fertility of forest-land.

FRIGID FORESTS.—Forests in the Frigid zone occupy in the northern half of Hokkaidō and the Kuriles those places where the average yearly temperature does not exceed 6°. In regard to altitude distribution, the zone comprises in Formosa those places that are not less than 3,500 metres from the sea-level, and in the middle section of Honshu all places 1,800 metres above sea level.

TIMBER-TREES IN FRIGID FORESTS.—Timber-trees growing in this region are naturally not so numerous as in those in warmer regions. Indeed as the forests of this zone, except those in Hokkaidō, are located in high altitudes, with poor soil, and subjected to strong

winds, the trees are generally too stunted in growth to be of any value.

In Hokkaidō, however, conifers grow luxuriantly and many primitive forests not yet explored are found. The principal trees in these forests are *Todo-matsu* (*Abies Sachaliensis*, Mast.) and *Yezo-matsu* (*Picea ajanensis*, S. et Z.). Starting from altitudes measuring 450 metres in the southern parts of the island, these trees are found growing luxuriantly in the mountains of Ishikari, Teshio, Tokachi, Nemuro, and Kitami, and lastly in the island of Kunajiri. The Imperial forests at Tarunai, Uryu, Kushiro, and the State forests at Otoneton, Shari and Kunajiri practically consist of extensive pure forests of these trees, presenting a highly regular aspect. The timber of *Todo-matsu* is in large demand for architectural and earth-works, and is indeed most valuable of all the timbers produced in Hokkaidō. The wood is, however, coarse-grained, and light and is liable to bend when exposed alternately to dryness and humidity. Rather close-grained and resinous, the wood is in great demand for architectural work.

Akazo-matsu (*Picea Glehui*, Mast.)—Though valuable as timber next to the two foregoing species, this tree rarely forms a pure forest, is in greater demand than the other two, and commands a higher price. The wood is close-grained and suited for architectural work.

In Etrup and Shikotan of the Kuriles, a species of larch, scientifically termed *Larix daburica*, var. *Japonica*, Max. is found growing, and exposed to inclement climate forms a pure forest of good aspect. The wood is reddish, hard, and well stands wet, and is therefore used in shipbuilding, earthwork and furniture-making.

Shira-kaba (*Betula alba*, var. *vulgaris*, D.C.), *Yama-hannoki* (*Alnus incana*, var. *glanea*, Ait.), *Nagakamado* (*Pirus ancuparia*, var. *Japonica*, Max.) are some of the deciduous broad-leaved trees that are found in this zone either as pure forests or scattered among other trees. They are, however, of small sylvicultural value, and are generally used as firewood by miners or fishermen residing in the vicinity.

There are many other trees growing in the respective zones, but the principal species are generally confined to those above described. As found in natural growth, they either form pure forests or are mixed with other trees. In general conifers occupy in the southern districts elevated places, while forests on the level mostly consist of broad-leafed trees. In the northern districts conifers cover mountain slopes, while on their top and foot broad-leafed trees predominate.

RATIO OF DIFFERENT KINDS OF WOODED-AREAS.—On the whole the different classes of forests exist in the following proportions in the wooded areas of Japan:—

Conifer Forests	21%
Broad-Leafed Forests..	25%
Conifer and Broad-Leafed Forests	45%
Thinly-Stocked or Blank Areas, etc	9%
	<hr/>
Total	100

Bamboo areas, though forming a feature in our forest system and sufficiently profitable in exploitation, are still extremely limited in extent; nor do they show any sign of enlargement in a near future. A description of them has, therefore, been omitted here.

The growing extension of *Aka-matsu* forests recently in Honshu, Shikoku and Kyūshu tended to raise the relative ratio of conifer forests to broad-leafed forests, and this tendency is further accelerated by the greater demand, in consequence of the development of industry and business, for such conifers as *Sugi*, *Hinoki*, and *Karamatsu* which are being planted extensively. In the State forests the relative proportion of the different kinds of forests stands as follows:—

Conifer Forests	11%
Broad-Leafed Forests..	28%
Conifer and Broad-Leafed Forests	49%
Thinly-Stocked or Blank Areas, etc	12%
	<hr/>
Total	100

The forest-areas devoted to conifers will attain before long the proper ratio to which they are entitled from increasing demand upon them.

In the Imperial forests, owing to the greater attention paid to forest aspect, the relative proportion is more satisfactory, as :—

Conifer Forests	23%
Broad-Leafed Forests.. ..	24%
Conifer and Broad-Leafed Forests	49%
Thinly-Stocked or Blank Areas, etc.. ..	4%
Total	100

Both in the State forests or Imperial forests the principal trees are, in conifers, *Aka-matsu*, *Tsuga*, *Todo-matsu*, *Sugi*, *Hinoki*, *Momi*, etc. ; while, in broad-leafed trees *Buna*, different varieties of *Nara* and *Kashi*, *Kaba*, *Kuri*, etc. constitute principal species.

III. ADJUSTMENT OF THE FORESTS.

GENERAL REMARKS.—The work of forest adjustment was attended to by the Court as early as the Konin era (the beginning of the 9th century), when the Emperor of the day issued a proclamation restricting the undue felling of trees and ordering in general the due protection of forests. From about that time till the advent of the Tokugawa Regency, the sylvicultural business fared no better than other industrial affairs, that is, it suffered much from neglect and devastation. With the establishment of the Tokugawa régime, and after about three centuries of this iron administration something like a regular system for protection of forests had been evolved. Different systems prevailed, indeed, in different daimyates but they all had this feature in common, that is to say they originated from necessity of military defense. Stern rules characteristic of a military despotism were therefore enforced for the protection of the forests. It is true that even then forests were divided into utilization forests and protection forests, but even in the case of the former more or less severe restrictions were always enforced. The existence of protection forests was extraordinary both in kind and extent. These comprised forests at the headwaters of rivers, the forests planted to prevent landslips, the forests planted to protect against damage from heavy snowfalls, the forests intended to give shelter to the

water and to invite the collection of fish in it, and forests of other descriptions. For the protection of special kinds of trees the rules enforced were extremely strict. The prohibition trees differed according to places. *Hiba* tree was protected in Aomori, "Prohibition *Sugi* in Akita, while Kiso had "five prohibition trees" Trees." Kii "six," Awa "seven" and Kumamoto "three."

This prohibitive treatment gave rise to the development of the work of utilization and adjustment, and by keeping careful forest records and by adopting a conscientious system of rotation each daimyiate made it a point to secure the constant supply of valuable kinds of timber within its own borders. Whatever advantages Japan now enjoys in the matter of forests, she must be said to owe to this jealous guard kept over her forests of old by the feudal pines.

The protection of the forests having been maintained by despotic rules as was the case in France before the Revolution,—rules which did not originate in any regular economic principles, The Restoration the withdrawal of those rules on the Restoration was and the consequence. The Meiji Government lost no time, Deforestation. however, in taking measures calculated to check this alarming state of affairs. Those measures were, however, not quite calculated to cope with the trouble, and at best could but partially remove it. One of the most serious inconveniences that confronted the Forest authorities was the absence of definite boundaries between one State forest and another or between a State forest and a private forest, so that while in the former case the accurate determination of forest areas was not possible, in the latter case the State frequently claimed forests belonging to the other owners. Again illicit felling or felling due to mistake frequently took place, thereby complicating indescribably the work of proper control. It was primarily with the object of removing this fruitful source of trouble and of thoroughly adjusting the boundaries, that the authorities started in 1890 the first regular programme of treatment.

FIRST ADJUSTMENT PROGRAMME.—This programme is to be completed in 15 years ending 1904. To meet the expense necessary for carrying it out the Government decided to disburse, besides

regular expense, a sum of 855,851 *yen* on account of extraordinary expense. The programme aims in accomplishing the following object:—

1. To inquire into the condition of those State forests and plains (measuring altogether 6,600,000 *cho*) irregularly scattered over the country, to carefully classify them into those that should with benefit be maintained as State property and those that should be transferred to private property; also to clearly define the jurisdiction limit of supervising offices by determining the relative convenience of control and relative economic advantages.
2. To clearly define the boundary between State forests and to provide against illicit felling and felling by mistake.
3. To ascertain the exact area of those State forests of greatest economic importance measuring 1,380,000 *cho* and to prepare accurate forest maps.

From its very nature the work embodied in the foregoing clauses requires a long space of time, but at the same time the elaboration of a definite sylvicultural system demands the speedy completion of the work. It was a very judicious measure, therefore, on the part of the authorities that the programme was adopted as a continuation work so as to preclude it from being altered by any new arrangement that might be made in future.

The working of this programme, which is to be completed this fiscal year, has been highly satisfactory and has imparted for the first time a firm basis of operation to Government forestry policy. The sale of State forests and plains, the opening up of some of them to exploitation by private individuals either by being brought under cultivation or converted into pastures, the elaboration of a high rotation system for other kinds of forest-land—all these and many other things are the fruit of this work of the first programme, which may therefore be said to have inaugurated a new era in the economy of State forests in this country.

SECOND ADJUSTMENT PROGRAMME.—The work started by that programme has been continued by the so-called second programme which came into operation in 1898 to extend till 1903, a Special Forest Account Fund being created for the purpose. The work aimed at in this new programme is one of the highest importance,

being nothing less than the adjustment of the irregular condition of State forests, the expansion of the limit of exploitation, the increase of fertility of forest-land, in short the thorough re-adjustment from the very basis of the economic system of State forests. Started in a concrete form the work involved in this programme consists in determining the forests and plains that may no longer be kept as State property, in the final survey of State forests and plains which should be kept as such, and in the elaboration of plan for working such forests and plains, planting open spaces, undertaking engineering works relating to forests, purchasing such forests as are required, and in short all those matters necessary for determining the system of exploiting State forests and plains. The fund devoted for completing this programme was fixed at 23,025,053 *yen*. The fact that the programme involved such a big outlay at first deterred the authorities from adopting it, but the difficulty was solved by setting it apart as a special account with the revenue supplied by the proceeds of the sale of forests and plains which may no longer be kept as State property. The measure embodying this programme obtained the approval of the Imperial Diet and was finally issued as law in 1898.

The completion of this important programme mainly depending on the sale of unimportant State forests and plains, it is evident that the authorities must carefully regulate this sale so that all the different undertakings in the programme may be regularly carried out according to the prescribed plan of operation.

FINANCIAL PROSPECT OF THE ADJUSTMENT.—The result of the programme will revolutionize the economy of the State forests. Not to speak of an addition of 50,983 *yen* to the Revenue on account of the Land Tax accruing from the forests and plains transferred to private ownership, the adjustment effected will considerably diminish the managing expenses and will improve the efficiency of the work of control. The revenue from the increased felling is especially important, it being estimated that after 1910 the revenue will be four times what it is now. This means an addition of over 3,310,000 *yen* to the State Revenue. After the lapse of one hundred years, by which time the renovated forests, even supposing that the market price will remain as low as it in

now, will have grown to 66 million *yen* a year, about a quarter of the total amount of Revenue to-day. That this forecast is by no means a sanguine one is proved by the experience of the four years that have elapsed since the commencement of the programme.

INVESTIGATION AND ADJUSTMENT OF STATE FORESTS.—The investigation was carried out from 1890 to 1894 into the existing condition of State forests in Shikoku, Kyūshū and Honshū where there are 719,473 such forests, with the object of selecting those forests which should be kept as State property and those which may with advantage be sold to private individuals.

MODE OF FIRST ADJUSTMENT PLAN.—The selection is made by keeping the following points in view:—

1. Those which exist in a lot of over 50 *cho* or in different lots found within the limit of one town or village or within the distance of not more than 2 *ri* from each other, and which can permanently carry out independent sylvicultural work.
2. Those which exist in a lot of less than 50 *cho* but which can without any trouble be managed in consequence of the existence in the same district or in a neighboring district of a State forest or forests measuring over thousands or hundreds of *cho*.
3. Those which, though existing in a lot of less than 10 *cho* or are economically unimportant, are useful for constructing forest-roads, for the transport of wood or for storing wood, building official residences of foresters or for other matters connected with State forests.

The forests coming under any of the foregoing conditions were to be reserved as State property, and the others not satisfying them to be disposed of. Also forests or plains necessary to the farmers living in the neighborhood for getting fodder or grass for manure were to be transferred to private ownership, provided no particular necessity existed for keeping them as State property.

The result of investigation was that of the State forests and plains measuring altogether 8,095,916 *cho*, 7,354,343 *cho* were judged fit to be retained as State property and the remaining 741,573 *cho* unfit for that purpose.

The proceeds obtained by disposing of those unimportant forests and plains are to be used as funds for carrying out the second forestry programme, mentioned above, that is to say, the forest exploitation as work of special account.

SECOND ADJUSTMENT PLAN.—However the selection made was afterward judged to be not entirely satisfactory; it was found in fact to be satisfactory both in respect of omission and of commission, while with the progress of the times, it became necessary to take into a greater considerations than before the question of the public peace and order. It was decided in 1899 to make thorough second investigations based on advanced principles of forest exploitation. The rules to guide the investigation were drawn up and the work was started afresh in that year. The disposal of unimportant forests and plains determined by the second investigation is to be completed in six years from 1899, and during the three years from that year to 1901 inclusive about 51,756 *cho* in 16,113 lots were sold, and a sum of 5,199,198 *yen* was realized by that transaction.

DEMARKATION OF BOUNDARIES AND MEASUREMENT OF STATE FORESTS AND PLAINS.—The exact measurement of forests and accurate forest-maps being absolutely indispensable for conducting scientific treatment of forests, the Government issued in 1884 Notes relating to Boundaries of State forests, and caused the local offices to undertake the demarkation of the boundaries and the measurements of the forests. The formulæ set forth in the Notes were too simple to render the result of the work to be of any great use. They were repeatedly improved, the last in 1899, and the system elaborated in the latter year is now in force.

THE SYSTEM NOW IN FORCE.—That system divides the work into three divisions, viz., demarkation of boundaries, triangular surveying as applied to forests, and contour surveying. On the completion of the work, foundation maps of working plan are to be drawn on a scale of 1/5000.

The final survey carried out according to the foregoing system reached in extent to 29,289 kilometres and 761,349 *cho* 3 *tan* 5.22 *se* in measurement. There remain 2,850 kilometres for which the work of contour surveying has been accomplished but whose measurement still remains to be completed.

ELABORATION OF THE WORKING PLAN.—The treatment of forests without any definite plan being inconsistent with the interests of forest economy in 1890 a provisional working plan was therefore drawn up intended to provide some directions with regard to felling. But with the progress of the first adjustment programme it was possible to apply a more scientific and permanent plan, at least in the case of these forests for which the work of adjustment had been completed. The forests qualified to be dealt with under this permanent plan were those in Ehime, Fukuoka, Kagoshima, Hiroshima, Ōsaka, Ishikawa, Akita, and a few others. The notes drawn up for forming the plan were to this effect:—

1. That the system of silviculture should be maintained in as perfect a condition as possible and that the utmost quantity of timber possible should at the same time be obtained.
2. That a proper care should be exercised in planting and felling, and provisions should be made against damage of wind and fire and insects.
3. That reserves should be provided to counteract the diminution of the crop incidental to such damage.

In the elaboration of the plan a minor forestry office was regarded as a unit of economy, and the determination of a yearly cutting volume was based on the area to be cleared and the crop to be obtained. With the progress of the work of adjustment and the greater light bestowed, in consequence, on the condition of the forests, it was possible, especially as a result of the development of facilities of communication, to draw up a plan of a more perfect description. In 1899 and again in 1901 the necessary amendment was effected in the principle of the working plan. The amendment was chiefly intended to adopt the plan as well as possible to the conditions of a district and of a forest. It was also decided that the improvement of the irregular aspect of the forests should be made in a limited space of time. In short, the plan was made to cover all matters relating to the utilization of timber and the renovation and regeneration of forests, and was intended to procure the maximum income and produce crops best calculated to satisfy the demand on the market.

The permanent working plan as at first elaborated was first put into operation in 1893 and 58,916 *cho* 5 *tan* 9 *se* was adjusted till 1899, while from the time of the carrying in effect of the second adjustment programme to the end of 1901 the forests measuring 30,945 *cho* 7½ *tan* received similar treatment, making altogether 89,862 *cho* 3½ *tan*.

ADJUSTMENT OF THE IMPERIAL FORESTS. — The Imperial forests having been originally transferred from State forests, the conditions requiring adjustment and the elaboration of working plan were practically identical with those of the State forests. As in the case of State forests, therefore, the work of selecting those forests to be retained and those to be disposed of was started in 1892 and completed in 1898 while work of drawing up permanent working plan was commenced in the latter year. The final survey was carried during the nine years ended 1901 for forests extending in aggregate length to 7,076 kilometres and measuring altogether 332,482 *cho* 2.21 *se*. The working plan for 147,205 *cho* in the forests at Fuji, Kiso, Amaki, and Watarae has been completed.

IV. EXPLOITATION AND TREATMENT OF THE FORESTS.

SYLVICULTURAL TREATMENT AND OWNERSHIP.—The working plan and economy of forests differ according as they are owned by private individuals, by the State or by the Imperial Household, for it is naturally expected that, in the forests belonging to the State or to the Imperial Household, the interests of the public and of the nation should be consulted more than in private forests. Consequently the managers of the State forests do not look for speedy returns. In view of this consideration the State and Household forests have elaborated a high forest system and the felling of trees is regulated according to this special system.

Forests also present a different appearance according as they belong to the State, to the Imperial Household or to private individuals. Those belonging to the former two are generally re-

newed as a result of natural growth and are therefore less uniform in composition than those owned by people whose forests receive greater care, the object being to make them yield returns more quickly. The woods at Tōkaidō, already mentioned and those at Muro and Kii, are noteworthy in this respect, the profit derived from them being even larger than the rate in Saxony, where forestry is carried on to greater perfection than anywhere else throughout the world. On the other hand,

Rotation in State and Imperial Forests. affected by this consideration of obtaining quicker returns, privately owned forests do not generally admit of high forest treatment. The State or Household forests are therefore obliged to supply that in which the other forests are deficient and to produce timber-trees and to properly regulate the cutting period. This period is generally as follows for valuable timber-trees:—

	years.
<i>Sugi</i>	80—120
<i>Hinoki</i>	100—150
<i>Hiba</i>	100—150
<i>Aka-matsu</i>	40—100
<i>Kara-matsu</i>	80—100
<i>Kuro-matsu</i>	80—100
<i>Keyaki</i>	150—200
<i>Kusu</i>	150—200

As the economy of ordinary forests does not admit of such high rotation, some of them adopt the medium **Rotation in Private Forests.** rotation system, such as coppice-with-standard systems, and while utilizing the underwood in a comparatively short space of time they leave the over-wood for utilization after it has reached the period of proper maturity. Sometimes the two-storied high forest system is adopted, and by planting light-demanding trees of quicker growth double rotation system is applied.

FOREST FORMATIONS.—In regard to the selection of forestry formations, considerable care is required, for while naturally regenerated forests require reorganization on account of their irregular aspect a pure forest formation is likely to cause trouble in Japan

from wind or snow and also on account of the risks from injurious insects. The result is that the planting, as it is carried on now-a-days, aims at growing two or three different species made to occupy different compartments or groups or suitably mixed together. Then again the silvicultural system as adopted in State forests necessarily differs from that in privately-owned forests, and varies also according to locality. For instance, on mountain slopes clear cutting methods, especially of any wide area, may be inadvisable and selection cutting and shelter-wood system have to be adopted. This selection cutting being, however, inconvenient, the Government is determined to adopt, as far as circumstances permit, the clear cutting method and to entirely renovate silvicultural formation.

The coppice-with-standard system is adopted for a special sort of forestry management, especially for small fire-wood areas worked by private individuals who are aiming at the largest possible returns at within shortest possible periods. This system is of course out of place for a forest of any extensive area.

Bamboo plantations constitute peculiar feature of our silviculture, and is likely to prove highly profitable owing to the growing demand for bamboos. One serious drawback in the management of bamboo groves is the fact that land suited for raising any large bamboo forest is not to be found in Japan, while the more valuable varieties of this species can only be grown in certain limited parts of the country.

Coppice woods are grown to supply firewood, the demand for which is unusually large in Japan. They are generally left to renew themselves, especially when the area is extensive; but those situated in the vicinity of cities and towns are artificially tended, the species chosen for this purpose being generally *Kunugi* and *Konara*.

The treatment of protection forest consists of selection cutting, the style of which must differ according to the character of the forest and to local conditions. The rotation should be regulated according to the following standards:—

Selection Cutting in Protection Forests.

Copice Woods	Not less than 10 years.
Bamboo Woods	Not less than 3 years.
Coppice-with-Standards	} Overwood not less than 30 years, under-wood not less than 10 years.
Timber Forests	

TREATMENT OF STATE FORESTS.—The total area of the forests under regular treatment is being ascertained at present by the Government. At present the data for State forests alone are available, these roughly standing as follows:—

Method of treatment.	per cent.
Clear Cutting Timber-Forests	32
Shelter-Wood Timber-Forests	6
Selection Cutting Timber-Forests	24
Copice	17
Coppice-with-Standard and Bamboo	10
Thinly Stocked Areas, Bare Areas, etc.	11
<hr/>	
Total	100

It will be seen from the above that the timber-forests treatment occupies about 62 per cent. of the whole areas of State forests. The principal growing stock consists of *Buna* (beech) 30 per cent., *Akamatsu* 20 per cent., *Sugi* 12 per cent., *Hinoki* 7 per cent., *Kashi* (oaks) 6 per cent., *Kuromatsu* and *Hiba*, both 4 per cent., the remaining 17 per cent., consisting of conifers and broad-leafed trees. In coppice woods *Kunugi*, *Konara*, and oaks occupy about 85 per cent. while in coppice-in-standard woods *Momi*, *Tsuga*, oak and *Nara* predominate over any other species.

CONVERSION OF WOOD.—The method of conversion of wood have become more and more uniform than ever. There are usually three methods, these being the outcome of customs at different forest districts and in different markets.

STYLES OF CONVERSION.—The Fukagawa timber yard in Tokyo is the most important depot for the wood produced at the northern parts of Middle Honshu. Three different styles of designation are in vogue in this depot corresponding to so many modes of conversion. These are “Motoki,” “Nami-motoki” and “Kawabe-mono.” The first comes from the wood districts of Mino, Hida, Owari, Tōtōmi,

Tosa, Mikawa, etc., with a standard length of not less than 14 *shaku*, the second is applied to woods coming from Kii and measures not less than 14 *shaku*, and the last one is applied to woods produced at Hitachi, Shimozuke, and Musashi with the length of 14 *shaku*. Woods coming from Hokkaidō and the north-eastern parts of Honshu are treated as "Motoki" and therefore possess measure of corresponding length. All these kinds of timber are prepared either as round logs or balks or sawn timbers. The converted timbers of "Motoki" are required to possess the legal standard, but for those of the other two kinds the allowance of 2 to 3 per cent. to the standard measure is conceded.

In general *Sugi*, *Hinoki*, *Matsu*, *Keyaki*, *Momi*, *Tsuga*, *Hiba*, *Yachidamo*, *Hōnoki*, *Katsura*, etc., are converted as sided logs, while *Sugi*, *Hinoki*, *Sawara*, *Tōchi*, etc., appear on the market as round logs.

SEASON OF FELLING.—The season of felling depends of course upon the local conditions, the convenience of transport, etc. but in general the five months beginning with the autumnal equinox and ending with the succeeding February are regarded as the felling season. In such snowy regions as Hokkaidō and the north-eastern districts of Honshu where the means of transport are imperfect, felling must be started in the beginning of the snowy season, so that the timber may be easily carried over the snow. In places where the supply of timber for industrial purposes or firewood is to be kept up all the year round there are arrangements for the uninterrupted felling of the trees.

TRANSPORT OF CONVERTED WOOD.—The transport of converted timber may be divided into two stages, the first being the transport of woods from felling places to depots and the second the transport of the timber from the depots to the markets. In the first stage, chiefly owing to the hilly condition of the forest area in Japan and also to the presence in its proximity of rivers and streams, water ways have been utilized from early times for the conveyance of timber. Indeed economic considerations do not yet allow in most cases the construction of special forest roads. Transport of timber along the middle and lower courses of rivers is generally, as in Bangkok and Rangoon, in the shape of rafts, till the timber reaches depots usually

situated at the mouths of the rivers and therefore easily accessible from the sea.

The facilities supplied by rivers are attended in Japan by a drawback usually unknown in other countries, and that is by the necessity of suspending the river transport during the season of the planting and growth of the rice-plant, when the water of rivers is extensively utilized for the purpose of irrigating the rice-fields. Then there is another drawback in this system, for the distance between the source and mouth of our rivers being comparatively short they are liable to become suddenly overflowed in time of heavy rain. Therefore the river transport of timbers is generally done during the seven months elapsing between the season of the autumnal equinox and that of the spring equinox.

However in consequence of the recent increasing demand for timber and also owing to the extraordinary improvement in the means of communications, coupled with the consideration that river-transport, besides being attended by the drawbacks before mentioned, is liable to injure the quality of the timber, the tendency has gradually set in of making arrangements for land-transport and of constructing forest roads leading either to railroads or high roads. These arrangements are being made in State forests, and the result has proved economically profitable.

MINOR FOREST PRODUCE.—The tendency to a luxuriant undergrowth in Japanese forests, principally due to abundance of moisture, gives the minor produce business a peculiar aspect, for the removal of the undergrowth is of course necessary for the sake of the forest as for that of the undergrowth if the latter is to be utilized as a minor produce.

LITERS.—In forests belonging to the State or in those kept in its custody the people living in the vicinity are generally allowed, under certain conditions, to collect gratis dead branches and leaves to be used as fuel.

GRASSES AND HERBAGE.—Though not so extensive as formerly, the custom still prevails among our people of regarding forests and woodlands as places for getting fuel and fertilizers in the shape of grasses and herbage, so that even at present there is no small number of woodlands containing no growing stock and principally

used by the people for procuring manure grasses and herbage from. It is in those grass-lands that the injurious practice of burning is still carried on, especially in southern districts where farming is more extensively carried on than in the northern and less inhabited districts. The practice alluded to prevails to a larger degree than elsewhere in woods growing on a soil of a granite or Tertiary formations. However as it has been strictly forbidden by law, this injurious custom may entirely disappear in the near future.

MUSHROOMS.—Mushrooms are the most valuable minor forest produce in Japan, there being over ten principal edible fungi growing to a greater or less extent throughout the country. Of these the *Shiitake* is the most important, and constitutes one of the staple export items, its export to China, Hawaii, Hongkong, India, etc., having reached to 860,671 *yen* in value in 1901. The mushroom is produced in larger quantities than elsewhere in Hyūga, Bungo, Kii, Ise, etc., where such species of wood as *Kunugi*, *Konara*, *Soro*, *Shide*, etc., which the mushroom prefers to grow on in preference to other trees abounding in the forests. Sometimes forests are prepared in those districts with the main object of producing the mushroom, and indeed this practice is often found more profitable than the ordinary wood-growing industry. In a forest intended for the growth of mushrooms a system of rotation of from 18 to 25 years is carried on and the forest is therefore managed according to the coppice system. The mushroom, moreover, possesses this special advantage, of growing both in spring and autumn, and naturally there are two varieties, one being more fragrant than the other.

Matsutake (*Armillaria edoides*, Berk) grows in forests of *Akamatsu*, especially those growing on soil of the Tertiary and granite formations found in the southern districts. What is interesting about this edible fungus is that it grows most when a pine forest has become worn out by excessive utilization of its produce. Consequently with the improved forest management that was recently introduced, the output of the fungus has shown a tendency to diminish. This fungus is perhaps more popular than the preceding variety as a culinary dainty. The only defect about it is its delicate texture, and the consequent difficulty of keeping it dry, as can be done satisfactorily with the "Shii" mushroom. Consequently the season of

the "Pine-mushroom" last only about a month in the autumn. The business of tinning the fungus has lately been started, and as the tinned samples are reported to have been favorably received in foreign markets, this mushroom may by proper treatment become a valuable export item like the other variety. It may be added that in the State forests in charge of the Ōsaka and Okayama Major Forest Offices the greater portion of the forest revenues is at present derived from the sale of "Pine-mushrooms" growing in them.

SEEDS, ACORNS, ETC.—Seeds constitute another important minor forest produce. They are collected for various purposes. The seeds of trees of the *Rhus* species are principally used for making wood-wax, which is very much in demand both at home and abroad. In 1901 the export reached 610,000 *yen* worth approximately. It was formerly used for making candles, but at present it is also used for giving lustre to woven goods, lubricating metallic ware to prevent rust, while in Europe it serves the purpose of sealingwax. The trees are grown in the premises of shrines and temples, in public forests owned by private individuals. They grow best in sunny slopes.

The business of collecting seeds to produce seedlings is also a profitable piece of minor work, especially since the work of tree-planting both by the Government and private people has become active. There are at present not a small number of merchants dealing in this special line of seeds. The seeds that are in larger demand than others are those of *Sugi*, followed by those of *Akamatsu*, *Hinoki*, *Kunugi* and *Karamatsu*. The seeds of the *Sugi* and *Hinoki* are produced most at Yoshino, in Yamato, and Muro, in Kii, where a machine of improved style is used for drying the seeds. The seeds of *Kunugi* come from Ikeda, in Settsu, and Nasu, in Shimotsuke, those of *Karamatsu* from Saku district, Shinano, and the seeds of *Aka-matsu* from many places in Kyūshū, Shikoku, and other warm districts.

Further, some acorns and nuts are useful for procuring oils, the seeds collected for the purpose being those of the beech, camelia, *Shikimi*, *Abura-giri*, *Inu-gaya*, walnut, etc. The demand for those oils having been extensive lately owing to great development in the use of machinery, these seed-collectors can often

earn as much as threefold of the daily wages derived from other kinds of work.

BARKS.—The barks of oak trees are valuable for dyeing and tanning, and the oak forests in northern Honshu and Hokkaido produce an abundance of these barks. All those forests are the result of natural growth and have not been artificially stocked with the object of producing the barks. The barks of alders, chestnuts, *Tsuga*, *Nara*, etc. are also used for tanning and dyeing.

STONES.—Except in forests where the removal of stones is inadmissible for important reasons, the utilization of forest-stones is extensively carried on, the demand for stones for various public works having become unusually great recently. Of these stones, granites and andesites are most valuable among igneous rocks. The former come most from the districts bordering on the Inland Sea and the islands situated in it, as also from Mino, Owari, and Mount Tsukuba. Tufa-rocks found in Hakone and Izu, slate-stones in Rikuzen and Kōluka, calcareous stones in Mino are also valuable for building and other purposes. Marble-stones are produced at Kuji district of Hitachi. Then granites supply materials to the potters of Seto and Owari, while the earths used by the potters of Karatsu and Hizen are liparite. It may be stated that the extraordinary demand for stones that has sprung up of late has raised the market price to about double what it was formerly.

On the whole the revenue from minor produce is comparatively small in State forests, as may be seen from these figures: 1892, 119,912 yen; 1895, 73,575 yen; 1898, 117,268 yen; 1901, 158,665 yen. The revenue from mushrooms, barks, seeds and acorns, and stones promises to grow larger, but that from other produce is dwindling chiefly owing to the larger extent of free utilization allowed to the people.

INDUSTRIAL USES OF WOOD.—Though the industrial uses of wood are quite active in our country, the industry as a business is limited in many cases in scope.

CARBONISATION.—This is most important among the industrial uses of wood, work being carried on wherever a broad-leaved forest available for the purpose exists. The *Bicho* charcoal industry in Kumano, Kii, is most famous in this line throughout the country. The carbonisation industry has perceptibly been affected by the

greater use of coal than before as a substitute of charcoal, but as our customs prevent us from dispensing with a large consumption of charcoal, the industry will remain an important one.

Recently the work of procuring vinegar as by-product of carbonisation was started in several places, especially in the southern districts. Eight such workshops were on operation according to the latest inquiries. Other chemical substances besides vinegar are produced at the shops.

The establishment of saw-mills of an improved style is another sign of the development of forest industries, as a recent large demand for sawn-timbers necessitates a certain unity of dimensions and a mode of conversion most convenient for transport. According to the latest available returns there were 14 saw-mills worked by steam, with an aggregate horse-powers of 317, and six saw-mills worked by water power with an aggregate horse power of 52.

MATCH-STICKS.—Though the industry is one of recent origin, it forms one of the most important items of export of our wood industries, there being, according to the latest available returns, 85 workshops employing 3,552 hands. The export reached about 7,400,000 *yen* in 1901. The industry is most active in Hokkaidō, where the timbers from which the sticks are made abound, these being species of aspen and poplars.

THE PULP.—This business is of more recent origin than the preceding industry, but it now occupies almost an equally important place. The pulp consumed in Japan formerly came from abroad, but the steady development of the paper industry having given a powerful incentive to the pulp-making business, Japan now possesses, according to the latest available returns, five mills worked by steam power. *Shirobe, Momi, Toga, Todo-matsu, Yezo-matsu*, etc. are generally requisitioned to supply the raw material. These species are at present found abundantly in Japan.

Other branches of the wood industry are camphor-making, bamboo-ware making, wheelwright, joiner's, turner's, cooper's work, etc. may be mentioned.

Generally speaking the forest industry is destined to show a far greater activity and development in Japan.

Y. FOREST PLANTING AND TRANSPORT.

PLANTING.—The effect of reckless felling soon after the Restoration is glaringly shown to-day in the granite hills of Ōmi, Mino and in the districts bordering on the Inland Sea.

In order to check this wasteful system of felling, in 1875 the Government issued regulations for investigating the condition of State forests, with the special object of ascertaining the extent of the forests that had been felled, while in the following year an experimental forest-planting ground was established at Nishigahara, Oji. Again, in the next year, arrangements were made for encouraging the planting of State forests by private individuals by offering them a certain percentage of the profit arising from the produce of the forests planted in this way. The system has not proved quite as satisfactorily as was expected at first, though the areas planted under these conditions have reached about 80,000 *cho*.

ENCOURAGING PLANTING.—Prior to the carrying into effect of the Civic Corporation System silvicultural works other than those carried on by the Government were few and far between, and it was only in forests belonging to private individuals in Yoshino and Muro that planting was carried on in anything like a systematic manner. Subsequent to the promulgation of that self government organization in which provision about communal funds were made, the idea began gradually to prevail that forest-planting was the best plan for augmenting these funds. The idea gained special force owing to the encouragement and the grant-in-aids extended by the local authorities in accordance with the provisions of the Forest Law subsequently enforced. The result was that during the two years of 1898 and 1899 no less than 426,595 *cho* of communal areas were planted, the number of seedlings and young trees planted totalling 801,022,357. The work generally received more or less assistance from the local authorities, that assistance generally taking the form of technical advice.

PLANTING IN STATE AND IMPERIAL FORESTS.—Meanwhile the work of planting went on steadily in the State forests. At first it mainly consisted of regenerating the cleared areas, and therefore not

much attention could be devoted to the deforested areas. In 1895 the investigation relating to open spaces was completed, and a working plan according to the high forest system was drawn up. From 1899 when the second State forest adjustment programme had been completed, the arrangement of open spaces could be made more satisfactorily than before. Between 1888 and 1898, 43,149.9 *cho* of State forest areas received planting, while during the three years ending 1901 the areas similarly treated reached 34,897 *cho*. In the former total 80 per cent. consisted of the work of regenerating cleared areas, and only 30 of planting waste spaces, while in the latter the open space work comprised 55 per cent., the remaining 45 consisting of regeneration work.

The extent of bare land being comparatively small in forests belonging to the Imperial Household, planting is carried out mostly for regenerating cleared areas, the planted areas of this description amounting to 12,510.4 *cho* during the ten years ending 1901.

METHODS OF PLANTING.—The system followed in planting operations must of course be different according to the locality and other causes, always keeping in view the main object of producing a perfect forest formation capable of returning a regular revenue.

The plans pursued in pursuance of that main object are these:—

1. Natural regeneration.
2. Sowing.
3. Planting of young plants.
4. Planting in dunes and patches of shifting sand.

The first method was almost universally adopted in former times, but this is no longer popular in these days when the knowledge of forest management possessed by foresters has come highly developed, for if that method is the easiest and the least troublesome, nonetheless it is not advisable in view of the necessity of effecting a thorough improvement in our silvicultural conditions. However on steep slopes and in protection forests demanding special treatment this method is still used to extent.

Generally sowing is made to supplement the necessarily fickle operation of the method of natural regeneration. In cases when sowing is carried on by itself it is done by ridge-sowing, broad-cast-

sowing, line-sowing, etc. Oaks, beeches, *Aka-matsu*, etc can be grown satisfactorily by sowing.

However, the planting of young trees is the commonest method in artificial regeneration, this method being adopted in the greater number of cases in State forests and in forests belonging to the Imperial Household. Generally seedlings are transplanted to the woods after they have grown two or three years in the nursery, the tree of planting per *cho* ranging between 4,500 to 6,000 young trees. As it is hardly possible to expect all of them to grow vigorously in the new soil, about 20 or 30 per cent. of the planted young trees must be supplemented in year or two after the transplanting.

The method of planting by means of cuttings is practically identical in operation and result with the method described above, only that this method cannot be adopted for all species of trees. In Higo and Hyuga the regeneration of *Benko Sugi* has been exclusively carried out by this method, while it is similarly applied to *Doro*, *Hakoyanagi*, etc. growing in Hokkaidō, *Hiba* in Aomori and Noto.

In dunes and in plains of shifting sand, works to prevent earth from slipping away should first be constructed, these works generally consisting in straw-work or bramble-work or sometimes in sods. The trees selected for this particular method of planting are generally *Kuromatsu* and *Hageshibari*, mixed at the rate of 3 of the former to 2 of the latter. Planting should be done at the rate of 14,000 to 18,000 per *cho*. Travellers travelling from Shimonoseki to Kobe by the Sanyo Railroad must notice in Bizen and Harima many hills of reddish soil covered with young pine trees planted in terraces. Similar pine-clad terraces are seen along the Tōkaidō route. All those plantations have been made by this particular mode of planting.

EXTENT OF PLANTED AREAS. — The extent and nature of the planting operations carried on in the State forests and in the forests belonging to the Imperial Household during the ten years ending 1901 may be demonstrated by the following figures :—

STATE FORESTS.

	Conifers.		Broad-leaved trees.		Total.	
	Area. (cho).	No. and quantity.	Area. (cho).	No. and quantity.	Area. (cho).	No. and quantity.

KIND OF PLANTED TREES.—As may be seen from the foregoing table, the areas planted with conifers are about nine-fold those planted with broad-leaved trees, and this predominance of conifers over trees of the other description will form a characteristic feature of our future sylvicultural system. The reason why conifers are so much preferred to the other kind of trees is because that with the present activity in the work of house building and in the carrying on of public works the timbers of the conifers are more in demand than that of broad-leaved trees, so that at present except in retired districts most of the sylvicultural undertakings are carried out with the object of producing timbers of conifers.

As to the relative ratio of the different species planted, *Sugi* occupied about 48.3 per cent. of the entire area, pines 25.6 per cent., *Hinoki* 8.8 per cent., *Keyaki* 3.3 per cent., the remaining 1.7 per cent. being planted by two or three different species. Again, in the relative ratio of conifers, *Sugi*, *Aka-matsu*, and *Hinoki* predominated over the others, while in broad-leaved trees *Keyaki*, camphor-trees, *Kunugi*, etc. surpassed the others.

This overwhelming predominance of conifers is a point which

ought to demand the serious consideration of all those interested in our forest policy. There is another fact that similarly demands their attention and that is the growing tendency to prepare pure forests instead of mixed forests. In fact, of the forests thus far stocked no less than 98 per cent. are of pure forests, only 2 per cent. being mixed forests. This remark applies both to conifers and broad-leaved trees. But it should be remembered that a pure forest is liable to give rise to various evils, besides being attended by difficulties in management. Indeed this point has lately begun to be perceived by foresters and others concerned, who acknowledge the advantage of mixing more or less light-demanding species with conifers. At least this is the policy now pursued in State forests, where the planting of broad-leaved trees is attended to so long as circumstances permit.

NURSERY-BEDS.—The efficacy of the work of forest-planting depending essentially on the soundness of the seeds and seedlings and also on the skill of the employed labor the utmost care is exercised in those respects. In the State forests and Imperial Household forests the seeds or seedlings to be used are only those that are collected or grown on the spot. The nursery-beds attached to those forests numbered 407 at the end of 1900, with an aggregate area of 622.1 *cho* for State forests and 111 with an area of 101.9 *cho* for other forests. Then in order to procure as cheaply as possible the labor required in tending the nurseries, and also to facilitate the work of transplanting, these beds are located in places combining as much as possible these two conveniences. They are laid out in as many places as possible.

The seedlings grown in nursery-beds are generally transplanted after full three years' growth in the beds, and when they have attained the height of $1\frac{1}{4}$ to 2 *shaku*. Some species, *Sugi* for instance, admit of being transplanted after two years' growth, while some broad-leaved species, such as *Hiba*, *Koyamaki*, etc. require five or seven years' nursery growth. Of course in places where the injury from game is apprehended even *Sugi* must be left to stand five or six years in the beds. The quantity of seeds sown and the number of seedlings grown in State forests nurseries during the ten years ended 1901 are given in the following table:—

Year.	Conifers.		Broad-Leafed trees.	
	Quantity of Seeds. <i>Koku</i> .	No. of Seedlings.	Quantity of Seeds. <i>Koku</i> .	No. of Seedlings.
1892	{ 18,083 <i>koku</i> . 15,000 No.	5,158,354 No.	18,331	940,109

The sudden activity of the nursery work from 1899 was due to the fact that in that year a special account system was allowed in forestry management. Then the rate of conifers and broad-leafed trees in the seedlings raised amounted to 10 of the former to 1 of the latter. In the conifers, *Sugi*, *Hinoki*, *Kara-matsu*, *Aka-matsu* predominated over others.

TREATMENT OF PLANTED-AREAS.—In newly-planted areas, except in areas of protection planting, the cutting of grass is generally made every year for the space of three years subsequent to the planting. Then during the next ten years the grass-cutting is done every other year. Thinning is carried out for tending the growth of young trees and for preserving the forest-aspect. During the five years ended 1901, 13,588.3 *cho* of State forests were subjected to this thinning process, by which 229,146 cubic *shaku* of wood for industrial uses was obtained, besides, 156,019 stacks of firwood, and 192,630 bundles of branch-litters. These intermediate forest produce are growing more and more valuable owing to the greater demands on them for various purposes.

ARBORICULTURAL EXPERIMENTS.—Arboricultural experiments

were first started at Nishigahara in 1876, but it was not until after 1897 that the work became really brisk. In that year eight experimental nurseries were established in different typical places, and, under the supervision of the chiefs of the nearest Major Forestry Offices, they were made to carry out investigations relative to sylvicultural climate, selection of species best calculated to improve the forestry aspect, germination and growth of young plants, and such subjects. The overseers of the nurseries were made to submit to the Minister of Agriculture and Commerce reports on the results on the investigations. At the same time the central nursery established at Kami Meguro, suburb of Tokyo, under the direct control of the Forestry Bureau, was made to examine the reports sent in from the local offices.

EXOTIC TREES.—The experiments on the exotic species being still incomplete, it is not possible to give any authoritative statement as to the relative adaptability to Japanese soil of the various species planted in the nurseries. Judging from the aspect of growth, the following species are likely to prove a valuable addition to Japanese sylviculture.

Robinia Pseudoacacia, L. (Imported from the U. S. A.). Sown in the nursery in 1900, the plants have already grown to the height of over 4 metres. The principal merits of this species are quick growth, adaptability even to poor soil, and the presence of strong reproductive power, shoots springing up from the side-roots. As a substitute for the indigenous *Hage-shibari* the tree may serve even better than that shrub for the purpose of preventing the drifting of sand and landslip. The wood is also hard and well suited for earthworks.

Pinus rigida (Imported from the U.S.A.). Sown in 1900, the plants have grown over 1 metre high. In respect to strong reproductive power, hardy character, and adaptability even to poor soil, this species resembles our *Aka-matsu* very much, and like it the species is apparently suited for dunes and shifting sands.

Populus monilifera (Imported from the U.S.A.). The young plants measuring 0.7 metre in height were imported from that country in 1899 and transplanted to the nursery. They have

attained the height of over 4 metres. Both in growth and reproductive power they are very strong, being capable of artificial regeneration by cuttings. As material for match-wood, the tree is as excellent as the indigenous popular.

Juniperus Virginiana (Imported from the U.S.A.). Those sown in 1890 have attained the height of $1\frac{1}{2}$ metres, and those in 1900 that of 1 metre. Judging from the experiments thus far carried out, it does not seem difficult to acclimatise the species to Japanese soil. In that case the wood will lead to encouraging our lead-pencil industry, which has failed to attain any marked development for lack of suitable wood.

Of the other exotic species experimentally planted in the nurseries, the German *Alnus glatinosa*, the American *Pinus strobus*, the German *Cedrus deodora*, and some Himalayan species are likely to prove valuable trees for planting in exposed places. The Himalayan *Cedrus deodora* also makes a fine garden ornament.

FOREST-ROADS AND RIVER-TRANSPORT WORK. — Before the Restoration, owing rather to the excessive care exercised by feudal princes for the preservation of their forests and the enforcement of what we may call the "closed door" policy of administration in their dominions, there were grave obstacles to the efficient management of forests and their exploitation. Endeavors have been made for obviating those obstacles, and in such of those State or Imperial Household forests that are of a permanent nature or that admit of financial treatment, the work of constructing forest roads has been carried out so far as circumstances permitted.

FOREST ROADS.—According to the existing rules forest-roads are divided into two kinds, main roads and subsidiary roads. Further, they are divided into railed-roads, cart-tracks, roads made of wood, foot-paths and cattle-paths. The first three are considered as main-roads and the latter two as subsidiary roads. A main-road must be connected with a railroad or with a highway, while a subsidiary-road must be connected with a main-road. A highway, though intended for general traffic, often receives from the Department of Agriculture and Commerce some help towards its extension and repair, provided such highway is judged to facilitate the transport of timber.

Owing to the inconvenience of procuring labor and materials for construction, the cost of constructing forest-roads is generally high, the average per *ri* of main-road amounting to over 6,500 *yen* and that of subsidiary-road to about 4,000 *yen*. The cost of bridge-making is equally high, as a bridge in a forest-road is to be constructed over a rapid stream liable to overflow. This question of expenses very much therefore obstructs the progress of the construction of forest-roads, so that during the ten years beginning in 1892 the roads constructed in State forests have not exceeded 776,677 metres in length, of which the following were constructed from 1898 to 1901:—

	Metres.	Expense. <i>yen.</i>
Main-Roads	132,000	212,575
Subsidiary-Roads	109,600	66,102
Total	241,600	278,677

The roads recently constructed in the Imperial forest areas follows:—

	Metres.	Expense. <i>yen.</i>
Main-Roads	44,140	55,833
Subsidiary-Roads	28,080	26,708
Total	72,220	82,541

Besides the above, the tracks laid with 12 pound-rails in the Imperial forests at Kiso measure 8,212 metres, the expense required being 14,680 *yen*.

In the colder districts, such as Hokkaidō or the north-eastern part of Honshu, the wood is largely carried over hardened snow in winter at a very small expense.

RIVER TRANSPORT OF TIMBERS.—The transport of timber by rivers has been carried on extensively from former days, the conveyance of Kiso wood on the river Kiso, of Nagakizawa wood on the river Noshiro, and of Kitayama wood on the Shingū being some of the important cases of the regular river-transport of timber. However, in order to make rivers serve still more efficiently this purpose, all the obstacles in their course should be removed, the river-banks should

be made strengthened, while in the lower course where a wood-depot is to be formed damming-work should be constructed. From 1899 to 1901 the obstacles were removed over 32,800 metres of river-beds and the stones thus taken out of the bottom covered 49,176 cubic *tsubo*.

VI. WOOD PRODUCE.

GENERAL REMARKS.—Data on forestry yield being unavailable in the case of privately-owned forests, we must content ourselves in this section with giving the data in connection with the State forests measuring about 7,500,000 *cho* and the Imperial forests measuring about 2 millions.

It is hardly necessary to state that the yield from the forests varies considerably according to position and local conditions, and that while the harvest of convertible timber depends upon the species of the trees and their growth, the amount of the financial yield depends upon the locale of the growing stock, the relative facilities of transport, and the demands on the market.

HARVEST OF CONVERTIBLE TIMBERS.—The harvest of State forests continues to increase with the progress of the work of management, and, compared with what it was 10 years ago, the yield at present shows an increase of about 35 per cent. as stated in the following table :—

	1892.	1895.	1898.	1901.
	<i>Shakujime.</i>	<i>Shakujime.</i>	<i>Shakujime.</i>	<i>Shakujime.</i>
Timber... ..	984,464	1,107,941	1,010,621	1,707,813
Firewood	3,361,566	3,544,068	3,609,036	4,158,186
Total	4,346,030	4,652,009	4,619,657	5,865,999
Forest Area (<i>cho</i>)... ..	7,541,633	7,715,793	7,773,155	7,586,201
Yield per <i>cho</i>	0.58	0.58	0.59	0.77

Note :—In the foregoing figures the harvest of root, stump-wood, and faggots is excluded, while fractions of a *shakujime* are also omitted. A *shakujime* measures 12 cubic *shaku* and corresponds to about a third of 1 cubic metre. This remark applies to all the subsequent tables of a similar description.

The increase of the harvest has been brought about by a longer thinning made possible by the improved method of management and by the extension of the utilization area which was in turn due to

development of means of transportation. Indeed the utilization area of State forests increased from about 18 per cent. in 1892 of the whole area to about 21 per cent. in 1901. In other words, the rate of utilization area increased during the period in question by 17 per cent. as against 35 per cent. of the volume of the timber-harvest.

The harvest, according to the foregoing table, increased during the specified period from 0.58 *shaku-jime* per *cho* to 0.78; and these compared with the respective utilization areas correspond to 3.2 to 3.7

The volume of the harvest as compared with the volume of the growing-stock in the State forests is extremely small, and indeed does not reach even one half of what it should be. The reason of this abnormal yield must be sought in the fact that in most of the forests situated in hilly districts the presence of miscellaneous trees is seriously affecting the growth of timber-trees, while in most of the forests the growing-stock has not yet attained the normal "age-classes." Further, the Government is disposed to minimize, till the management programme is completed, the volume of the yearly fellings, while the imperfect means of transport, absolutely considered, very much affect the extent of the utilization area.

FINANCIAL YIELD.—The State-forests, hampered as they are from various inconvenient conditions, are placed in a highly disadvantageous situation, so far as the financial side of yield is concerned. This point is significantly shown in the following figures showing the yield during the 10 years ending 1901:—

	1892. <i>yen.</i>	1895. <i>yen.</i>	1898. <i>yen.</i>	1901 <i>yen.</i>
Timbers	342,556	555,906	767,842	1,369,171
Firewood	213,709	299,449	372,515	486,141
Root, Stump - wood, } Fagots, etc. }	66,324	19,348	28,708	37,880
Minor Produce	120,229	73,755	142,904	158,655
Rent	23,618	25,361	46,323	73,689
Sundries	44,623	24,801	93,374	50,986
Total	811,059	998,620	1,451,666	2,176,522
Total Area (<i>cho</i>)... ..	7,541,633	7,715,793	7,773,155	7,581,201
Yield per <i>cho</i>	0.108	0.129	0.187	0.288

Note:—In the above table, fractions of a *yen* are omitted, except in the figures representing the yield per *cho*.

Though absolutely considered, the yield of only 0.288 *yen* per *cho* is exceedingly small, still it must be regarded with satisfaction on account of the relative progress that it indicates. The record for 1892 as compared with that of 1892 shows an increase of 19 per cent., advanced to 73 per cent. in the next three years, and to 260 per cent. in the subsequent three years. Again, when compared with the utilization area only, instead of the whole area, the yield per *cho* increased during the ten years from 0.647 *yen* to 1.386 *yen*.

This creditable progress, relatively speaking, has been brought about not merely by an increase in the volume of the harvest, but principally by the recent growing demand for timber with the consequent rise of the market price, and by the diminution of transport expenses owing to the greater facilities offered by the improved means of communication. Above all the receipt from timbers has been strikingly increased, these timbers being mostly the timber of conifers such as *Sugi*, *Hinoki*, *Hiba*, *Momi*, *Akamatsu*, etc. Poles produced by thinning were till ten years ago practically destitute of value but these now command a good price on the market. The rapidity with which the yield from timbers has advanced during the ten years under review is indeed remarkable, for while it has been quadrupled during that period the yield from firewood has only been doubled.

EXPENDITURE.—With the increase in the gross yield, the expenditures have necessarily been expanded. In 1892 the expenditure stood at 522,762 *yen*, but during the subsequent ten years the amount has been almost doubled and has risen to 1,029,966 *yen*. This increase, though partly due to the rise of wages and of the price of commodities, a phenomenon inseparable from the progress of the time, was more attributable to the expanded scope of improvement measures:—

Year.	Area.	Management Expense.	Working Expense.	Total.	Expense per <i>cho</i> .
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1892	7,541,633	423,146	99,616	522,762	0.070
1895	7,715,793	402,789	180,085	582,874	0.076
1898	7,773,155	553,016	364,674	917,690	0.118
1901 hs	7,581,201	669,149	330,817	1,029,966	0.137

Note:—The management expense includes salaries of officials, office expenses, travelling expense, repair of offices, etc.; while the working expense comprise the cost of felling, transport, planting and all the other items incidental to the working of forests.

As stated in the foregoing table the average managing expense per *cho* increased during the ten years under review from 0.056 *yen* to 0.082 *yen*, while the average of the working expense increased from 0.013 *yen* to 0.044 *yen*. In other words, while the rate of increase of management expenses is about 60 per cent., that of working expenses is as much as 340 per cent. The ratio of management expense is rather high as compared with working expense, the former constituting, on an average, 68 and the latter 22, if we take the total expense as 100. This comparatively high rate of management expense is explained by the enormous extent of the State forests, and especially the fact that most of them require a thorough re-organization, and all these involve extraordinary trouble and expense. However, the ratio between management expense and working expense is gradually recovering normal proportion, for while in 1892 the management expense bore to the working expense the ratio of 21 to 5, in 1901 the proportion became 21 to 10. The proportion is sure to become more satisfactory when the second forestry adjustment programme now being carried out shall have been completed.

PROFIT.—Forestry yield is obtained by deducting from the gross receipts the working expense, while the net profit consist of what remains after the management expense has been deducted from the remainder. Calculated in that way, the net profit of State-forests stands thus:—

Year.	Total Area.	Gross Receipts.	Gross Disbursements.	Net Profit.	Profit per <i>cho</i> .
1892	7,541,633	811,059	522,762	288,292	0.038
1895	7,715,793	998,620	582,874	415,746	0.054
1898	7,773,155	1,451,666	917,690	533,976	0.069
1901	7,586,201	2,176,522	1,029,966	1,146,556	0.151

The net profit per *cho*, as stated in the foregoing table, has increased from 0.038 to 0.151 compared with the utilization area.

The rate per *cho* was 0.212 *yen* in 1892 and it advanced to 0.72 *yen* ten years after.

DATA ABOUT THE IMPERIAL FORESTS.—As forests that were comparatively regular in aspect were selected as Imperial forests on the occasion of setting apart a part of State forests as property of Imperial estate, the forests belonging to this special class, besides being easy to manage, are rich in conifers and valuable timber-trees, so that the harvest is more satisfactory than that in State forests. The harvest during the ten years commencing in 1892 is stated below:—

	1892.	1895.	1898.	1901.
	<i>Shaku-jime.</i>	<i>Shaku-jime.</i>	<i>Shaku-jime.</i>	<i>Shaku-jime.</i>
Timbers	803,026	588,692	685,193	1,110,324
Firewood	723,321	500,820	555,468	848,316
Total	1,526,347	1,089,512	1,240,661	1,958,140
Total Area	3,478,007	2,108,720	2,091,066	2,093,404
Harvest per <i>cho</i>	0.44	0.51	0.59	0.94

The average harvest per *cho* that was 0.44 in 1892 increased to 0.94 ten years after, an increase of more than two-fold. The statistics on financial side are as follows:—

	1892.	1895.	1898.	1901.
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
Timbers	226,709	327,644	752,585	845,139
Firewood	50,131	50,604	62,867	83,291
Fagots, Stump - Wood, root, etc.... }	163	3,141	3,196	4,636
Minor Produce	13,655	18,619	22,894	29,402
Rent	19,724	29,433	54,770	77,667
Sundries	28,647	30,150	34,346	74,089
Total	340,027	459,591	930,658	1,114,224
Total Area	3,478,007	2,108,720	2,091,066	2,093,404
Yield per <i>cho</i>	0.099	0.218	0.445	0.532

Just as in the case of the State forests, with the progress of the work of management along the economic line, the volume of the harvest and the amount of the gross receipts are gradually increasing, to make a still greater development as that work proceeds. Then the

financial results of the administration of the Imperial forests are somewhat better, owing to the reasons mentioned above, than in the case of the State forests, for the gross receipts that stood at 0.095 *yen* per *cho* in 1892 advanced to 0.533 in 1901. As might naturally be expected, expense has also advanced.

	1892.	1895.	1898.	1901.
Total Area (<i>cho</i>)	3,478,007	2,108,720	2,091,066	2,093,404
Management Expense (<i>yen</i>) ...	106,154	110,138	115,291	147,734
Working Expense (<i>yen</i>)... ..	208,157	195,594	369,954	496,686
	<hr/>	<hr/>	<hr/>	<hr/>
Total (<i>yen</i>)	314,311	305,732	485,245	644,420
Expense per <i>cho</i> (<i>yen</i>)	0.090	0.145	0.232	0.308

In respect to the increase of expense, the Imperial forests are very much like the State forests, for during the period under review the rate per *cho* increased from 0.09 *yen* to 0.308 *yen*.

However, in contrast to the corresponding state of affairs in State forests, the ratio between the management expense and the working expense is entirely reversed, the former constituting only 27 and the latter 73, out of the total expenses of 100. This comparative smallness of the management expense in the Imperial forests is explained by the fact that the forests, owing to their convenient location, and on account of their being comparatively well-organized do not require any large amount of money to be spent on them. Thus while State forests required in 1901 management expense amounting to 0.092 *yen* per *cho* the corresponding figure in Imperial forests was only 0.071. On the other hand, the average working expense of State forests in the year mentioned was 0.045 *yen* per *cho* against 0.337 in case of the other forests. This remarkable difference between the two is ascribable to the fact that while in State forests the forests-produce to be sold is generally done so in the shape of standing-trees, in the Imperial forests whatever produce becomes disposable is directly utilized by the Household itself which of course undertakes the work of conversion.

The net profit from the Imperial forests as calculated by deducting the gross disbursements from the gross receipts was minus 22,640 *yen* in 1892, the loss being at the rate of 0.007 *yen* per *chos*. Subsequently conditions were restored to their normal aspect, for in

1895 net profit grew to 0.045 *yen* per *cho*, to 0.125 in 1898 and to 0.138 in 1901. In other words, during the last seven years out of the ten under review, net profit was increased by 0.093 *yen* per *cho*.

VII. OFFICIAL SUPERVISION OF THE FORESTS.

CONTROLLING OFFICES.—Considerable changes have taken place as to the official repository of power in regard to managing and supervising forests since the feudal princes have surrendered their fiefs to their sovereign liege in 1868. The forests held by them have become converted into State property. Suffice it to state that it was in 1878 that the existing Forestry Bureau was created and that affairs relating to State forests and to forests at large were for the first time placed under the control of a special office and that something like a regular system began to be evolved. This tendency became more manifest with the transfer of the Bureau in 1881 to the control of the Department of Agriculture and Commerce, a Department of State that was created in that year. Subsequently the forestry policy of the Government has gone on acquiring greater importance and consistency.

According to the existing system, the Minister of Agriculture and Commerce is the supreme supervisor of all matters relating to State forests and to forests at large, and, subject to his control, the Forestry Bureau takes charge of all matters relating to the administration and scientific treatment of forests. The staff of the Bureau comprises, besides its director, four forest commissioners and ten clerks, and these attend to the working and treatment of State forests and supervision of private forests.

The right of supervision of private forests is derived from the Forest Law promulgated in 1897. In accordance with the provisions therein set forth, the Government extends to utilization forests suitable economic treatment of a positive nature, while, on the other hand, the negative policy of prohibiting felling and similar restrictive measures is extended to protection forests. In all these matters the respective local Governors are made to act as supervisors in the

first instance, the right of issuing final directions resting with the Minister of Agriculture and Commerce.

The control of State forests is conducted in accordance with Imperial Ordinance No. 18 issued in 1886, by which a regular system of management was elaborated. By that system the management is conducted by sixteen Major Forest Offices and 325 Minor Forest Offices.

FOREST OFFICES AND JURISDICTION.—The following table shows the location, extent of jurisdiction, etc. of the Major Forest Offices.

Names of Major Forest Offices.	Location	State-Forests under Control (in thousand <i>cho</i>).	No. of Minor Forest Offices.	No. of Protection Stations.
Aomori	Aomori, Mutsu...	946	25	113
Akita	Akita, Ugo	1,091	22	94
Iwate	Morioka, Rikuchū	424	16	50
Miyagi	Sendai, Rikuzen	778	20	61
Fukushima	Fukushima, Iwashiro	508	20	81
Tokyo	Tokyo, Musashi	936	31	84
Nagano	Nagano, Shinano	931	17	54
Ishikawa... ..	Kanazawa, Kaga	497	12	39
Ōsaka	Ōsaka, Settsu	69	18	61
Okayama... ..	Okayama, Bizen	108	18	75
Hiroshima	Hiroshima, Aki	174	25	83
Ehime	Matsuyama, Iyo	135	12	49
Kōchi	Kōchi, Tosa	201	19	77
Fukuoka	Fukuoka, Chikuzen... ..	103	20	76
Kumamoto	Kumamoto, Higo	229	26	76
Kagōshima	Kagoshima, Satsuma	446	24	122
Total	7,576	325	1,199

The foregoing table will show that the extent of the Major Forest Office's jurisdiction lies between the two extremes of 1,091,000 *cho* of Akita and 69,000 *cho* of Ōsaka, the average for the whole being 480,000 approximately. A greater diversity is noticeable in the jurisdiction of Minor Forest Offices, this diversity being unavoidable in such a country as Japan where systematic forestry management is still in the inception stage and where means of communication are as yet imperfect, and the formation of forests is irregular. Thus while the Matsuyama Minor Office controls only

2,000 *cho*, that of Iiyama under the Nagano Major Office, controls as much as 396,000 *cho*. The average for all the Offices is 23,000 *cho*. It is natural that, with the progress of the work of economic management, the extent of jurisdiction of a Major and a Minor Forest Office will become more limited.

The number of protection stations also differs according to places. The average number to each Minor Office is three to five, but in some exceptional cases as in that of the Tsunodate Minor Office which is subordinate to the Akita Major Office the number is as many as eight.

The foregoing organization applies to the State-forests under the control of the Department of Agriculture and Commerce but there are other kinds of State-forests in charge of other Departments of State.

The State forests in Hokkaidō and Formosa are subject to the supervision of the Minister of Home Affairs.

The State forests in Okinawa, the seven islands of Izu, and Ogasawara, though belonging to the jurisdiction of the Department of Agriculture and Commerce, are left for the convenience of the local administration, in charge of the respective local authorities who manage them subject to the supervision of the Minister of Agriculture and Commerce.

VIII. FORESTRY EDUCATION.

COLLEGIATE COURSES.—The remark that the progress of industry is a faithful reflection of the progress of education is fittingly exemplified in the case of our forestry industry, for the recent striking development in our forestry economy must be regarded as an outcome of a similarly striking development in sylvicultural education.

It was in 1882 that the Tokyo Dendrological School, the first of its kind in Japan, was established at Nishigahara, but now at no less than 62 institutions the science and art of forestry is taught. Of that number three are imparting collegiate education, five a special course on forestry of secondary education grade, another five

are giving a special course on the same subject of a somewhat lower grade, while the remaining 48 are imparting a general knowledge of forestry as a subsidiary subject to one or another of the main courses of practical education. It ought to be noted here that formerly all the important educational organs on forestry were subjoined to the Department of Agriculture and Commerce, but as it was judged more convenient to have them transferred to the control of the Department of Education, this transfer was effected in 1890.

The College of Agriculture of the Imperial University of Tokyo, the Sapporo Agricultural College, and the High Agricultural and Dendrological School at Iwate, are the three collegiate institutions in question.

In all of those collegiate courses, in compliance with the demand of the Government forestry authorities and of general foresters, special attention is paid to the training of specialists who are to combine adequate scientific and practical knowledge on forestry, and who, on leaving school, are qualified to attend with efficiency to the duty of managing and improving our forests. The Government is giving special encouragement to the study of this useful science, by offering to the graduates comparatively good posts.

The College of Agriculture is also provided with a briefer course on agriculture and dendrology.

SCHOOLS OF SECONDARY GRADE.—The five schools of secondary education grade where a special course on dendrology is taught are as follows:—

Kiso Dendrological School	Nishi Chikuma, Nagano-ken.
Aichi Agricultural and Dendrological School	...				Hekkai-gun, Aichi-ken.
Nara	”	”	”	...	Yoshino-gun, Nara-ken.
Shimane	”	”	”	...	Yatsuka-gun, Shimane-ken.
Arima	”	”	”	...	Arima-gun, Hyogo-ken.

These schools are either public or communal institutions, and are under the direct control of their respective local Governors. The Department of Education confines its interference merely to

matters regarding the unity of national practical education. Those schools receive a subsidy from the Treasury, the object of that subsidy being to encourage the cause of practical education. Then the students enjoy equal treatment as those at ordinary middle schools in respect of conscription service, ordinary civil service, etc.

As these schools do not date back very far, they have not yet turned out any graduates, but the number of students is steadily increasing, the attendance being 418 in all at present.

SCHOOLS OF LOWER GRADE.—The five schools of somewhat lower grade than the preceding ones are apprentice schools enjoying a grant-in-aid from the Treasury and are imparting an elementary knowledge of forestry to the students. The schools are maintained by communities which, from local circumstances, are interested in bringing up young men qualified to attend to forestry management and to exploit the forest industry. The course of instruction extends for three years, and according to the latest available returns the students number 417 for all the schools.

OTHER SCHOOLS TEACHING FORESTRY.—Of the schools whose curriculum includes forestry 37 are of the secondary education grade, and 11 are of the higher primary education grade. Established long time back the list of graduates includes 1,323 for the former and 108 for the latter, while, at present the schools of higher grade have 4,364 attendants and the others 782. As most of those schools teach agriculture, fishery or stock-farming besides giving instruction in forestry, the field of their service is very wide and their service may be easily available even in places where the engagement of forest specialists is not possible.

TRAINING SCHOOLS.—Lastly a short remark may be made about the Forestry Training School established at the Experimental Forestry Station at Meguro under the control of the Forestry Bureau of the Department of Agriculture and Commerce. The school is intended to train men who are to attend to the management of State forests and to engineering work, so that the course of study comprises forestry, geodesic and triangular surveying and topographical-drawing. It is the main idea of this institution to impart

training of a thoroughly practical nature to as many students as possible within the shortest terms compatible with the demand of instruction.

IX. FORESTRY LEGISLATURE.

The Forest Law already mentioned contains provisions about the control of utilization forests, protection forests, forest police, punitive rules, etc. A number of Imperial Ordinances for putting in operation the said law were promulgated at the same time, these Ordinances relating to the Local Forestry Council Rules, Conversion and Release of Protection Forests, Rules for putting the Forest Law into Operation, Rules for compensating Damage of Protection Forests, Rules for managing Protection Forests, Rules relating to the Protection Forest Register, etc. The Register in question is of two kinds, one relating to privately owned forests and to be kept at the respective local offices, and the other relating to State forests and to be kept at the Major Forest Office concerned.

The control of State forests and plains is regulated by the Law relating to State Forests and Plains promulgated in March 1899 and it has attached to it a number of Rules and Regulations for putting it in execution.

The Law relating to the Restoration of State Forests and Plains to Original Owners was issued in April 1899, and by issuing at the same time several rules appertaining thereof measures were devised for returning to original owners State forests and plains incorporated into State property, provided the alleged owner's claim is judged to rest on valid ground. This special arrangement has been adopted in view of the fact that not a few cases of incorporation hastily made soon after the Restoration have subsequently been discovered to have been not quite justifiable.

The existence of the Forestry Fund as an account independent of general account is a special feature in regard to the finance of forests and plains belonging to the State, the fund in question being employed for the special exploitation of forests, such as the survey-

ing of State forests and plains, drawing up of their working plans, their planting, purchase of forests, etc.

The official organization of offices dealing with State forests and plains has been determined either in the shape of Imperial or Departmental Ordinances.

PRIMARY INDUSTRIES.

SECTION III.

MINING AND METALLURGY.

**Introductory—Geological Formation and Mineral Deposits—
Mining and Metallurgy—Condition of Mine-Workers—
Mining Legislation.**

I. INTRODUCTORY.

BEFORE THE RESTORATION.—As a result of the development in our seaborne trade and also in our railroad traffic and our industries in general, the demand for mineral products has increased apace, and the mining industry has become an important factor of the national economy.

Nothing accurate is known about the origin of our mining industry, but history records that, as early as in the 7th or 8th century, gold, silver, copper, iron, coal, and petroleum were produced. At the beginning of the 9th century, the Ikuno silver-gold mine, Handa silver mine, Hosokura silver-lead mine, and the two copper mines of Yoshioka and Osaruzawa were opened up. During the 15th century and the time of the Tokugawa Shogunate, many important mines were opened including the gold-silver mines of Sado, Innai, Kamioka, Mozumi, Serigano, Yamagano, and Shikakago; the Kosaka silver-copper mine: the copper mines of Ashio, Besshi, Ani, Arakawa, Hibira, and Omodani; the Ichinokawa antimony mine; the Kuratani silver-lead mine; the Taniyama tin mine; the Kamaishi iron mine, and the coal mines of Miike, Takashima, and Akaike. The working of these mines was, however, carried on a small scale, and they attracted but little attention. It was subsequent to the Restoration that phenomenal progress has been made in the mining industry.

AFTER THE RESTORATION.—The Government addressed itself to the task of protecting and encouraging the development of mining industry; engaged, in pursuance of that policy, foreigners as mining engineers, geological surveyors, and teachers. At the same time the Government undertook to work the principal mines, where Western methods were adopted in the departments of mining, metallurgy, and conveyance. The idea was to make these mines models for the benefit of private operators. Marked progress has since been made, and the output of minerals has steadily advanced. Such were the gold-silver mines of Sado and Ikuno, and Innai silver mine. Seeing that the private working of mines was becoming pretty extensive, the Government gradually transferred the mines which it was working itself to private exploitation, reserving, however, those which were especially necessary to the State. Moreover, the law relating to mining was instituted to define the right of the mining operator, contributing thereby to the progress of that industry.

The putting in practice of the mining regulations in 1892 swept away all the existing evils that had interfered with a freer and sounder development of the industry and therefore extended a helping and protecting hand to the mining operator. This together with the increase of technical knowledge has led to remarkable progress being made in the mining industry.

II. GEOLOGY AND MINERAL DEPOSITS.

DISTRIBUTION OF THE STRATA.—THE geological formations of the Japanese Isles exist in the following proportions, taking the whole area of the land as 100:—

I. SEDIMENTARY FORMATION.

Archaean	3.78
Palaeozoic	10.24
Mesozoic	7.95
Cainozoic	45.84

67.81

II. IGNEOUS ROCKS.

Older Period	11.27
Younger Period	20.92
											<hr/>
Total	32.19
											<hr/>
											100.00

In other words, the proportion of sedimentary rocks to igneous rocks is 2 to 1 in the whole area, while in the former those belonging to Tertiary and earlier formations bear the proportion of 1 to 2 to those belonging to younger formations.

Archaean	{ Crystalline Schist System Gneiss System	Eclogite, Serpentine, Granite.
Palaeozoic	{ Chichibu System (Carboniferous) Kobotoke System	Peridotite, Gabbro Diabase, Porphyrite.
Mesozoic	{ Triassic Jurassic Cretaceous	Diorite, Diabase, Porphyrite, Porphyry, Periodite, Gabbro, Granite.
Cainozoic	{ Tertiary Quaternary	Liparite, Andesite, Basalt.

GEOLOGICAL FORMATIONS.—The geological formations of the Japanese Isles, composed of the above-mentioned rocks, are in the two arcs of Northern Japan and Southern Japan stretching from Hokkaidō in the northeast to Kyūshū in the southwest, and also a chain of islands of Okinawa and the mountain system of Formosa. Of the foregoing geological divisions Northern and Southern Japan and the Okinawa archipelago are curved towards the southwest.

Then of the two arcs, the outer one facing the east is **Outer Arc**, comparatively perfect in geological formation, the sedimentary rocks composing it being on the whole symmetrically developed. On the other hand, the Inner Arc facing the west is extremely complicated in the formation and **Inner Arc** abounds in crevices and dislocations of strata and in eruptive rocks. Under the circumstances, the distribution of valuable ores and the condition of mineral deposits are peculiar in each arc. Generally speaking, mineral veins **Mineral Deposits in the Two Arcs.** are mostly met with in the region of the Inner Arc and in eruptive rocks or strata intersected by

such; while metal-bearing strata are greater in sedimentary formations found in the Outer Arc. In Formosa the Outer Arc faces the east and its formation is comparatively symmetrical. The formation at its northern part is exceedingly complicated owing to the presence of a big dislocation which geologically intersects it from Okinawa. It is in this northern district that many mineral veins are found.

METAL-BEARING STRATA.—Some metal-beds are found in a highly developed form at the water level of certain strata. Thus copper bearing iron pyrites beds are markedly developed in **Copper.** the crystalline schist and the Chichibu systems, while iron-bearing beds are especially rich in the Chichibu system. Beds of the former description are widely distributed, being found in the province of Totōmi, Kii, Awa, Iyo, Hyūga and Higo. The Hibira and Makimine copper mines of Hyūga and the Itsuki copper mine of Higo are the principal copper deposits present in the Chichibu system. Similarly the principal copper mines belonging to the crystalline schist system are Higashiyama of Awa, Besshi of Iyo, and Kune of Totōmi.

Iron-bearing beds exist principally in the form of either magnetic iron or mica-iron and are found somewhat transformed by the action of granite and calcareous rocks, with both of **Iron.** which the beds are generally found. The principal iron mines are those of Kamaishi and Sen-nin in Rikuchu, Akadani in Echigo, Nakakozaka in Kōzuke, etc.

Manganese. Manganese-beds generally exist in the Mesozoic system in the shape of rounded nodules.

METALLIC-VEINS.—Metal-bearing beds forming veins generally exist either in eruptive rocks or the Tertiary formation. They are also found to some extent in Palaeozoic rocks.

MINES WORKING VEINS.—The principal mines which are working the veins are as follows:—

Auriferous mines:—Hashidate in Echigo, Yamagano in Satsuma, Zuihō and Kinkwaseki in Formosa.

Gold-silver mines:—Aikawa in Sado, Ikuno in Tajima, Innai in Ugo, Ponschikaribetsu in Hokkaidō.

Copper mines:—Ashio in Shimosuke, Osaruzawa, Ani and Arakawa in Ugo, Okoya in Koga, Obiye in Bitchu.

Lead mines:—Hosokura in Rikuzen, Kamioka in Hida.

Antimony mines:—Ichinokawa in Iyo.

Tin mines:—Taniyama in Satsuma.

Of the metal mines existing in Japan, copper mines are the richest, the discovery of new copper veins being not unfrequent even at present. The copper ores of Japan are peculiar in containing more or less of gold or silver or both.

IMPREGNATIONS.—Of the metalliferous deposits, those forming impregnations are especially found in the north of the Inner Arc. At the Kosaka mine in Rikuchū, which has recently raised itself high in the list of copper-silver mines of Japan from its obscure position of a worked-out silver mine, ore deposits impregnating Tertiary tuff, locally known as “Kuromono” (black ores), are being mined.

NON-METALLIC DEPOSITS.—The principal non-metallic deposits in Japan are coal and petroleum. These, as distinguished from metal-bearing strata, are generally developed in the Inner Arc region which comparatively abounds in the Tertiary system, instead of, like the metal strata, in the Outer Arc districts. In Formosa, however, the coal-bearing beds are found in the Tertiary formation existing in the Outer Arc region.

COAL.—The coal existing in Japan is generally bituminous. The greater part of the seams occur in the Tertiary system, none of them in the Carboniferous system. It may be conjectured that the strata belonging to this system were then formed beneath the ocean, and no vegetation existed to supply material for the formation of a coal-bed.

Anthracite The coal-bearing strata existing in the rocks of
Coal-Fields. the Mesozoic era are the anthracite coal-fields found in
Bituminous the provinces of Nagato, Kii and Higo, but they are
Coal-Fields. comparatively insignificant.

It is in the younger Tertiary formation that the coal seams of Japan show a marked development. The principal coal-fields belonging to this class are those in Kyūshū and Hokkaidō, and also those in the Hitachi-Iwaki (Joban) districts.

The Kyūshū coal-fields comprise the extensive coal-strata of Chiku-hō, (two provinces of Chikuzen and Buzen), Miike, and Hizen.

Below will be described briefly the principal coal-measures in Japan.

(A). THE HOKKAIDŌ COAL-FIELDS.

ISHIKARI COAL-MEASURES.

The Sorachi coal-field was the one first discovered among the coal-measures of Ishikari. In the travelling memorandum of Matsuura who undertook an extensive exploration of Hokkaidō and other northern regions about 1855, the discovery of a coal outcrop on the banks of the river Sorachi is mentioned. About three years later, another man named Kimura discovered the outcrop of coal at Poronai while he was engaged in felling timbers. But it was by an American named Mr. Lyman that a definite survey was first undertaken. About 1876 the Hokkaidō Board of Colonization entrusted that gentleman with the work of surveying the coal-fields of Sorachi, Poronai and vicinities. The report submitted by Mr. Lyman declared the presence of coal-fields in the district of Yubari. In 1879 the work of boring an adit at Poronai was started, but it was not till the fall of 1883 that extraction was regularly commenced. From that time till 1890 the Government worked the mine on its own account, but on the creation in that year of the Hokkaidō Tankō Tetsudō Kaisha (Hokkaidō Colliery Railroad Joint Stock Company), the three measures of Sorachi, Ikushumbetsu and Yubari were sold to that establishment. Since then the company has been working those mines on an expanded scale.

The coal-fields of Ishikari extend over the two **Situation.** districts of Yubari and Sorachi of the province of Ishikari, Hokkaidō.

In these coal measures the seams contained in the Yubari measures are the most extensive. The seams are three in number, one of which measures, including parting, 6 to 3 feet and 25 feet. At the depth of 300 feet below these seams occurs another measuring 4 feet in thickness. These **Seams and Quality of Coal.** seams extend 25,000 feet in length, dipping at an angle of from 15 to 20 degrees. The coal-bearing strata of the Sorachi measures dip with suddenness, at 30°—80° angles, and they contain 13 seams each measuring over three feet

in thickness. At present the tenth seam is being worked. The coal-bearing strata at Poronai dip, in the north-western part of the measures, at an angle of from 18 to 40 degrees, though at the south-eastern part the dipping generally makes 50° to 80° angles. Over 20 seams of various thickness occur, but of these only five are workable. The quality of all those measures is excellent, the product at Yubari and Sorachi being specially suited for making gas or coke.

The coal-fields are worked almost exclusively by the **The Condition of Mining.** Hokkaidō Tankō Tetsudō Kaisha, with only a single exception in the neighborhood of this company's concession at Yubari, where in 1903 the working of another concession was commenced by a different establishment. The company is working the fields at Yubari, Sorachi, Poronai and Ikushumbetsu. In the first three mines a compressed air plant is set to supply motor to pumps, coal-breaking machines, ventilators and elevators, and also for locomotives. Electric generators are also on duty to work ventilators, screeners, various machines in the workshops, and also for illumination.

At present the Yubari mine employs about 4,000 men, producing on an average about 1,500 tons in a day. But at Sorachi and Poronai about 2,000 men are at work producing about 500 to 600 tons. The company's railroads connect the pits of all the mines worked by it with the exporting ports of Otaru and Muroran, while four steamers belonging to the company ship the coal to markets both at home and abroad.

(B). THE CHIKU-HŌ COAL-FIELDS.

The Chiku-hō coal-fields produce more than one half of the whole output in Japan, and possess, interlaid between sandstones, shale and conglomerate, a large number of seams of which more than ten are workable. The coals from these seams are of medium quality and bituminous. The penetration of the veins or deposits of volcanic rocks through the seams metamorphoses the coals to natural coke in some places.

Though the date of discovery is not exactly known, evidences go to prove that several beds in this rich coal region must have been exploited more than two centuries ago, while coming to the

middle of the 19th century the coal was shipped to markets situated in adjoining districts. In those days the work was confined to surface seams, and it was not till 1881 when a steam boiler was set at the Meo mine (now forming part of the Katsuno mine), that the extraction in modern style was introduced in this coal region. After that similar appliances were adopted at other mines as Namazuda, Shin-nyū, Meiji, Akaike, etc. About 1889 the reserved beds for use of the Navy at Togawa, Kurate and other places were opened for public exploitation, while about that time the Department of Agriculture and Commerce adopted legislative measures aimed at discouraging the separate existence of small concessions, hence at encouraging their combination. Meanwhile the work of laying railroads through the important districts of Kyūshū advanced apace, by which the facilities of transportation between the coal mines and the harbors of Moji and Wakamatsu were considerably promoted. But what specially stimulated the development of the colliery work in Kyūshū was an extraordinary demand for coal occasioned by the Japan-China War. All those circumstances have combined to carry the work of the Chiku-hō coal-fields to the present state of prosperity.

The Chiku-hō coal-fields extend for the five administrative districts of Tagawa, Kurate, Kaho, Onga, Kasuya, all in Fukuoka-ken, and measuring over 30 miles north and south and

Locality. 8 to 16 miles east to west.

The coal-bearing strata in the Chiku-hō coal-fields may be divided into upper and lower strata as to quality of coal contained.

The coal obtained from the upper seams is inferior in quality but possesses advantages of being easily workable. The principal seams are five in number with the thickness generally varying from 2 to 6 feet. In proportion, the area occupied by the upper strata does not exceed one-fifth of that of the lower strata.

Seams and Quality.

(C.) THE MIIKE COAL-FIELDS.

The discovery of the fields date more than four centuries ago. From 1873 to 1889 the colliery belonged to the Government, but it was subsequent to the latter year, when the Mitsui Firm got the concession, that the work of the colliery began to present a marked activity.

The fields cover $3\frac{1}{2}$ miles east and west and 10 miles north and south, occupying a seaward proportion of Miike district in Fukuoka prefecture and Tamana district in **Locality, Area, etc.** Kumamoto prefecture. The area occupied measures 13,969 acres, while the output in 1902 amounted to 962,091 tons, the aggregate during the thirty years beginning 1873 being 11,737,931 tons.

Several seams occur, but at present the first seam alone is almost exclusively worked. It measures 5 to 25 feet with an average thickness of 8 feet. The seam dips in general with an angle of $5\frac{1}{2}$ degrees. The second seam lying at the depth of 6 **Seams and** to 10 feet under the first possesses the thickness of 5 **Coal.** feet, but this seam is only partially distributed through the fields. The other seams are very irregular in formation and are hardly workable.

The coal, as already stated above, is excellent, being especially suited for making gas and coke and for use in boilers.

The work is carried on at six different places in the colliery, each separated from the other by a natural partition or brick-wall, the largest pit is that called Manda. Its mouth measures 12 feet by 41 feet and the pit reaches the depth of 826 feet.

The Existing Condition. When all the arrangements now going on for conducting work more efficiently than at present have been completed, this pit alone is expected to yield more than 2,000 tons per day.

The pumping appliance at the colliery in on a large scale, the water issuing at the pits averaging 1,200 cubic feet per minute on ordinary days and 2,000 in the time of the rainy season. Seventy-seven pumps are at work, requiring a motor of 15,254 horse-power.

The pumping plant installed on the pit bank at the Manda mine, for instance, has a high-pressure steam cylinder 45 inches in diameter, low-pressure steam cylinder 90 inches in diameter, a water cylinder 22 inches in diameter, and all of 12 feet stroke; and is able to deliver water against a head of 900 feet lifted in three stages of 300 feet each. It is described in the *Encyclopædia Britannica* as "probably the heaviest existing colliery pumping plant" in existence.

At present 2,008 mine-workers and 3,660 workpeople of other

descriptions are employed, the daily output being 3,050 tons. Arrangements for transportation exist in good order, 16 inches of railroad for express purpose of conveying the coal from the colliery to the nearest shore being in operation, while at the shore a ship, a wharf and a big crane are provided. A ship can admit 80 colliers of from 50 to 300 tons. At present 4,000 tons can be coaled in 24 hours. All these facilities of transportation will become far more satisfactory when, with the completion of the improved working arrangements at Manda, a more capacious ship and an additional railroad have been constructed, this work of construction going on at present.

(D.) THE TAKASHIMA COAL-FIELDS.

The date of the discovery of this coal-field is not exactly known, though some evidences exist that the extraction must have been made about two hundred years ago. In 1817 the mine came into the possession of the then chief of the Saga clans and it was during the ownership of this clan, or more precisely in 1867, that a shaft after a European fashion was first sunk. Six years later the ownership passed to the Imperial Government, next year to the late Count Goto, and in 1881 to the Mitsubishi Firm, in whose hands it still remains. Considerable improvement both in the method and scope of working has been effected by that establishment. At one time the daily output exceeded 1,200 tons, and though for a while afterward the output gradually declined, it somewhat revived its former activity when in 1898 new seams were discovered.

At Hajima, one of the three collieries collectively called the Takashima coal-field, a regular shaft was first sunk in 1887, and when in 1890 it came to the possession of the Mitsubishi Firm the second and third shafts were sunk, and these only are now worked, as the work in the first shaft had to be abandoned as a result of a fire that occurred in it in 1897.

The seams at the Takashima mines generally run north-north-east to south-south-west, the dip being from 20 to 20 degrees at the **Seams and Quality.** north-eastern part and from 30 to 50 at the south-western part. There are sixteen seams, of which five are workable.

The directions of the seams at Hajima are on the whole similar to those at Takashima, only the dip is somewhat sharper, making as much as 60 or 70 degrees at the south-western part. There are thirteen seams, of which six are workable. The seams in the two mines exist in identical strata and their workable seams alone measure on an aggregate over forty feet deep, holding, roughly estimated, 160 million tons. The quality of the coal ranks best of all the produce in Japan, being especially suited for making coke.

The working galleries of the mines are in most cases situated under the sea-bed, some of them lying 1,630 feet below the surface of the sea. This requires constant ventilation and the ventilator set at Takashima ventilates on an average 58,000 cubic feet of air every second and that at Hajima 120,000 feet. At present about 3,000 men are at work producing 16,100 tons a month on an average.

The coal-field is situated in the Nishi Hikine district in Nagasaki prefecture and comprises the three small islands named Takashima, Hajima and Nakanoshima lying seven nautical miles from the harbor of Nagasaki. It covers 2,430 acres. In 1902 the output amounted to 189,135 tons. During the 22nd years beginning 1881, when the concession came into the possession of the present leasee, the colliery produced 4,889,567 tons.

PETROLEUM.—Petroleum exist almost exclusively in the Tertiary formations found in the Inner Arc region. It is generally contained in the coarse sandstones interlaid between the layers of impervious shale. The oil-bearing area is very extensive, stretching over Hokkaidō, O-U districts, and the provinces of Echigo, Shinano, and Totōmi. The oil-field of Totōmi existing in the Tertiary system of the Outer Arc region, is comparatively insignificant.

The principal centre of production is Echigo which contains the five principal oil-fields of Higashiyama, Nishiyama, Amaze, Niitsu, and Kubiki, of which the first two are the most important. The Higashiyama oil-field consists of white sandstone and the strata are generally found from 60 to 960 feet below ground. The Amaze oil-field is in alternate

layers of shale and sandstone, and some of the strata lie about 2,562 feet deep. Though the output has somewhat declined, the quality of the oil from this field is the best of all.

The Nishiyama oil-field, though on the whole similar in geological formation to the strata of Amaze, produces oil of inferior quality, and generally lies about 600 feet deep in the ground.

PRINCIPAL PETROLEUM VEINS IN ECHIGO.—Strictly speaking, it was in the 7th year of the reign of the Emperor Tenchi (668 A.D.) that the first authentic record about the petroleum-fields of Echigo occurs. That record states that in that year

General Remarks. “burning earth” and “burning water” were presented from Echigo to the Imperial Court. Though the boring became somewhat active toward the end of the 15th century to the middle of the 16th, still it was not till about 1875 that the business began to acquire some commercial importance. The work was mostly carried on at that time in the districts of Kubiki and Niitsu. With the tapping of the veins at Amaze about ten years afterward, and especially after the work undertaken by the Japan Petroleum Company with regular boring machinery in 1890 had been crowned with success, that something like a boom overtook the petroleum industry of Echigo. The veins at Hire and Urase began to yield oil, while in 1898 the machine boring at Nagamine and the following year at Kamada struck rich beds of oil. From that time till 1902, boring was successfully tried in several other places of Echigo.

At present the principal oil-fields in Echigo are Nagamine, Kamada, and Niitsu. The first is worked by two companies and in 1902 produced 340,000 barrels, more than one-third of the total output in Japan. The crude oil is transported by iron-pipes to a refinery at Amaze separated by over 9 miles from Nagamine, and also to a refinery at Kashiwazaki separated by 11 miles. The later belongs to the Japan Petroleum Company and is perfect in arrangement. It may indeed be regarded as a model oil-refinery in Japan.

The oil-fields at Kumada are exploited by the International Oil Company and an individual concessionaire, and **Kamada.** gave 120,000 barrels in 1902. The company possesses

at Naoyetsu, a place separated by 29 miles, a refinery worked on a large scale.

The oil-fields at Niitsu were originally divided into a large number of concessions worked on a small scale, but they **Niitsu.** have subsequently been amalgamated for the most part, with excellent results as to yield. In 1902 this reached 186,000 barrels.

Hire, Urase, Katsuhosawa, and Tsubakisawa are collectively called the Higashiyama Oil-fields which in 1902 **Higashiyama** produced 265,000 barrels. A number of refineries **Oil-Fields.** for refining the Higashiyama oil are at work at Nagaoka, a place lying 6 miles from the fields.

The Kushiike oil-fields are the newest beds, having struck oil in 1901. The next year the output reached over 28,000 barrels.

GRAPHITE.—Graphite ores occur in Japan either in schistose rocks in which case they exist in laminae or in masses in stratified rocks. Though very widely distributed, this mineral is still left comparatively neglected.

SULPHUR.—Being a volcanic country, Japan is very rich in sulphur, which occurs very frequently in extensive deposits. The principal sulphur mines are Tsurugizan in Rikuchu and Iwaonobori and Rausu in Hokkaidō.

ALLUVIAL DEPOSITS.—Alluvial deposits in Japan are represented by alluvial gold in the district of Esashi in Hokkaidō and iron sand in Chūgoku. The former is detached from auriferous quartz rocks belonging to the Mesozoic period and deposited in the riverbeds, while the later originates from the decomposition of granite magnetic iron. Alluvial gold deposits are also found along the eastern districts of Formosa.

PECULIAR DEVELOPMENT OF JAPANESE MINERAL ORES.—As described in the foregoing paragraphs, mineral ores in Japan, excepting metallic ores, are generally well developed in those districts lying along the Inner Arc. It is very much to be regretted that, owing to the peculiar geological formation of the country, the Carboniferous system of Japan is conspicuous by the absence of coal. However, the comparative abundance of the Tertiary and younger eruptive rocks affords some consolation, as this gives hope

of discovery in future of various mineral deposits. In short, the close relation existing between mineral deposits and an exceedingly complicated geological formation of the Inner Arc region must not be overlooked in investigating the mineral resources of Japan.

III. MINING AND METALLURGY.

GENERAL REMARKS.—As the methods of mining and metallurgy were in a rudimentary stage before the Restoration and as experience or what would be called, in more familiar language “the rule of thumb” was the sole guidance, it is no exaggeration to say that the mining as it is carried on to-day is a complete transformation to what was forty years ago. Moreover, as all the processes of mining, milling and metallurgy were practically conducted by hands, the scope of business was necessarily limited and the output was therefore small, not to speak of the waste of metal. In justice of our old miners, it ought to be added that with no accurate scientific knowledge and labor-saving appliances to assist their work, they developed, especially in the metallurgy of copper, lead and gold and silver ores, a method highly creditable to their ingenuity.

The Restoration inaugurated an important epoch in the annals of the mining industry in this country. In the year 1867, an Englishman named Erasmus Gower introduced for the first time in this country the use of explosives which he employed in the silver-gold mine in Sado, while an American expert named Pumpelly also used an explosive at the Yurap lead mine in Hokkaidō. These are the first instances of the employment of explosives in the mining business in this country. In 1868, Kanzo Nabeshima, then the feudal lord of Saga, in conjunction with Mr. Glover, an Englishman, sunk a European shaft at Takashima. This was the first shaft ever sunk in Japan.

On the advent of the Meji era, the Government undertook the mining business itself and placed the Sado, Ikuno, In-nai, Ani, Kosaka, Kamaishi, and Okuzu metal mines as well as the Takashima and Miike collieries under its direct control, between 1868 and 1884. It engaged as

Introduction of Explosives.
Mining work by Government.

many as 80 foreign experts for those mines, and improvements were zealously effected in various directions. In mining, smelting, and transportation, an example was set to private mining companies of adopting foreign systems. At the same time, that is in 1871, an engineering school was established for diffusing a knowledge of mining and metallurgy. The result was a remarkable advance in these departments of scientific learning.

A large number of private operators profited themselves with the example thus set by the Government, and started mining enterprises on an improved style, and though their undertakings were not always successful, the result was on the whole a remarkable development of the industry. The mining industry now fairly launched and there was little or no necessity for retaining the model mines; at least the Government seems to have taken this view of the matter, for it soon opened the mines under their control to private enterprise.

Especially was the rise of the work of coal-mining noteworthy about this time. And in this Hokkaidō first set an example to the other parts of the country, the coal industry in that northern island dating from 1885. Then followed the exploitation of the coal-fields in the Chiku-hō districts, but it was not till the Japanese coal first began to go abroad, in 1889, that the colliery-work made any striking development. To give some idea of this remark, it may be stated that, whereas 28 years ago Japan had only one colliery employing steam-engines and that her output of this fuel was only about 200,000 tons in a year, to-day engines aggregating over 36,700 horse-powers are at work with the output reaching over 10,000,000 tons. As to demands abroad of Japanese coal, the markets along the coast of China east of Singapore are practically held by it.

The petroleum industry is another mining business that has lately sprung into great importance. An object of curiosity known from olden time under the name of "burning-water," it was first turned in 1890 to real commercial use by tapping the subterranean reservoirs with drill-machines of American style. The success of this innovation has given a powerful impetus to the development of the petroleum industry, and something like a

petroleum boom came over Echigo. To show briefly this state of things by figures, the output of crude oil that did not exceed 80,000 barrels eleven years ago with the conducting iron-pipes extending less than 3 miles altogether, to-day the figures stand at 1,100,000 barrels and 186 miles respectively.

Iron foundry work was carried on from olden days in the provinces of Hōki, Izumo, and some others, the river iron coming from decomposed granite having been used for this purpose. The output of iron was necessarily limited. Eleven years ago the Government was impressed with the necessity of starting the foundry business modelled on a Western style, and an Imperial commission was appointed to institute thorough inquiries into all matters pertaining to this new enterprise. The result of these inquiries was the establishment in 1896 of the Imperial Iron Works at Yawata, Kyūshū. The working programme has not being complete yet in all its details, the quantity of iron produced at the works is still comparatively small though sure to become considerably increased at no distant time. A private iron work at the Kama-ishi iron-mine is also producing more or less iron.

In the mining of precious metals, the output of silver reached a large amount at one time owing to a highly creditable progress which our miners attained in a process of smelting.

Precious Metal Mining. It necessarily declined six or seven years since, owing to the universal fall in the silver market.

On the other hand, as a result of the discovery of alluvial gold deposits in Hokkaidō and the adoption of an improved method of smelting in the gold mines of Kagoshima, Ōsumi and other provinces, the advance of the output has been carried to an almost unprecedented extent.

As to the mining of copper, which occupies such an important place in our mining industry, the output is advancing at a rapid rate, the ores being found almost everywhere throughout the country, while the processes of milling and smelting are being markedly improved and on a larger scale.

OUTPUT OF PRINCIPAL MINES.—In 1902 the principal mines

existing in Japan, with their output, are as follows. Those only are given which, in the case of gold-mines, produce not less than 2,000 ounces; 50,000 ounces in the case of silver-mines, 500 tons in copper-mines, 500 tons in lead-mines, 10,000 tons in iron-mines, 100 tons in antimony-mines, 1,000 tons in manganese-mines and sulphur-mines, 100,000 tons in coal-mines, and 10,000 barrels in petroleum concessions. The output of any single product at Omori, Omotani, Dogamaru, Hosokura and Kune mines does not reach that the respective standard, but they are mentioned here because the output of all the minerals produced by them combinedly reach that standard.)

PRINCIPAL MINES AND OUTPUT (1902).

IV. CONDITION OF MINE-WORKERS.

LABOR AND LIFE OF MINE-WORKERS.—The total number of

persons employed in Japanese mines was 150,169 in June, 1902. These include miners, carriers, pickers, smelting men, machine tenders, iron workers, and pumpmen. Most of these laborers work underground and under uncomfortable circumstances, but in spite of these disadvantages they are generally satisfied with their lot and go to work with light hearts. Some of those workers are natives of the district in which the mine is situated but the greater numbers of them are from other provinces, no small number of whom settle down, form families, and live till their death. These mine-workers generally live in dwellings provided by their employers; those with families in separate rooms and those without families in large common rooms. The dwellings are either thatched or tile-roofed, and the inside of the rooms is comparatively clean, which reflects much credit on them. When mines are remote, provisions are supplied by the mine operators, sometimes at a very low price. Evidently this institution of a cheap supply of food is adopted with a view to checking any movement for the rise of wages on the pretext of a rise in the price of commodities, for it is very difficult to lower wages when once they are raised.

As their calling is attended with some peril, their wages are on a higher scale than those of their confrères in the other walks of life, as shown in the table given below.

In consideration of great risk to which they are exposed, their employers are bound to take care of them, when they meet with accidents while on duty. The employers bear part or the whole of expenses of medical attendance, and, when the patients are treated in hospitals other than those owned by the employers, they are daily paid a sum of money to meet the expenses of such hospitals.

In case of their being disabled, they are given a fair amount of money, and in case of death, generally a sum of five *yen* or upwards is granted to the bereaved families toward the funeral expenses, besides giving some allowance to the families. The following table shows the sums paid, during the three years specified, by some of the mine-owners, under the circumstances already given:—

In respectable mines, mine-workers' mutual aid associations are in existence. The aim of these associations is to extend help to the members in case of emergency. To this end, reserve **Mine-workers' funds** are created by contribution from the members, **Mutual Aid.** and also from the mine operators or other patrons, and disbursements are made from these funds in case of the injury, illness, or death of any of the members. The sums to be contributed by the mine-workers vary according to different associations. In some cases, a certain fixed sum is contributed uniformly by all, while in other cases, sums are contributed in proportion to the positions of the workmen. Such contributions are made every month out of their income. In granting the relief, the amount to be given is fixed, other things being equal, according to the length of time the party to be relieved has been a member of the association, or according to the position of the recipient, or according to both.

EDUCATION OF MINE-WORKERS.—Although in petty mines where only a small number of workmen are employed no provision is made for the education of the miners' children, in larger mines they are educated either in schools established by the mine-owners or in public schools subsidized by the mine-owners. Under such circumstance, the rate of tuition fee is comparatively low.

As to the workers themselves, working as they do underground they apparently look to be of fierce and vicious characters. However they are on the whole meek and obedient. But among those who are termed itinerant miners, who are constantly moving from mine to mine, there are occasionally found blood-thirsty rogues and ruffians.

Peculiar usage exists among miners. The oaths of chiefs and protégés and of bretheren are observed with religious strictness.

The instructions of the "boss" are expected to be **Miners' "Boss."** obeyed whether they are right or wrong. These chiefs are in intimate communication with each other, so that in case a miner goes from one mine to another, seeking employment, etc., he is sure, if he gives the name of his chief, to be kindly treated. His new friends will go to no little trouble to find employment for him and will often give him money

to cover his travelling expenses. This peculiar spirit of fraternity is utilized for the control of miners; and it is difficult for the outsider to realize how implicitly the commands of these chiefs are obeyed and how well order is preserved. But this sympathy between the chief and the followers sometimes aggravates a fight between chiefs themselves and often brings about tragic incidents. Sometimes these retainers of a "boss" cause trouble to the latter's employers. Under such circumstances, one would suppose that strikes must be of frequent occurrence. This is not the case, however. Indeed strikes of miners are almost unheard of, although quarrels among them are very common. This absence of strikes may generally be ascribed to the kind treatment of miners.

V. LEGISLATION.

In describing the legislative measures and administration as, enforced in Japan about mining, the first thing that demands attention is the right of ownership.

RIGHT OF OWNERSHIP.—There are, generally speaking, three kinds of right of ownership as to mines, these being the system of accession, that is to say, the system of ownership by private individuals; (2) the domanical system, that is to say, the system of State ownership; (3) the system of concession, that is to say the system of giving concession on application.

Japan has never adopted the first system; it adhered to the State ownership system from former times and till quite recently, so that when the privilege of working a mine was granted to any private people, this concession was regarded as favor of the Government, and for a certain limited period in return for payment of royalty. That period as mentioned in the Mining Regulations issued in 1873 was 15 years.

The progress of the times did not allow the continuation of such arbitrary system, which was moreover calculated to seriously impair the advance of the mining industry. In 1890 the said Regulations were amended, and with the opera-

tion of the new Regulations two years later the concession system distinctly establishing the right of permanent working was inaugurated, and thus safeguarded the sound development of the mining industry in Japan.

SCOPE OF MINING WORK AND KINDS OF MINES.—In the 1st article of the Regulations it is provided that mining work means trial boring and all works pertaining to it. The inclusion of the work of smelting and so forth to mining work proper is a distinct feature of mining administration of Japan. It is a result of long-established usage and is also due to some extent to the convenience it affords to Government overseers, for boring and smelting have in most cases been combined in Japan and the division of the two was therefore judged troublesome. Moreover the bringing of trial boring and smelting under the same treatment as mining were judged to tend to encouraging the mining industry.

Mineral ores as recognized in law are as follows:—

Gold (alluvial-gold excluded), silver, copper, lead, tin (tin-sand excluded), antimony, quicksilver, zinc, iron, (iron-sand excluded) hematite, manganese, arsenic, plumbago, coals, petroleum, sulphur, bismuth, *cloral-iron*, phosphorus, peat, and asphalt. The last five were added to the list in 1900.

QUALIFICATION OF MINING CONCESSIONAIRES.—At first a foreigner was disqualified from working a mine and was further prevented from becoming a member of a mining establishment, so that the right of working mines was exclusively reserved for Japanese subjects. In consequence of the amendment of the Mining

Regulations in 1900 a business establishment organized by Japanese or foreigners or by both combined is **Privilege of Foreigners.** allowed to work mines, provided such establishment is placed under Japanese laws. This amendment besides conferring a great benefit on foreigners and encouraging the creation of mining establishments organized by foreigners, has proved a means of stimulating the development of the industry.

TRIAL BORING AND WORKING.—Differing from the examples seen in many Western countries, Japanese law does not recognize in the matter of trial extraction the right of priority of discoveries; the right of trial boring is granted to the one who has first

Right of Priority. applied for it. The reason why this system has been adopted in Japan is because the fact of an alleged discovery is exceedingly difficult to verify, while an accidental discovery has no right to claim any special privilege. The concession of trial boring carries with it a great privilege in Japan for no other person is allowed to apply for the trial boring in the concession conceded to the first applicant of the same metal as that for which the concession was made to that applicant (art. XXI).

The non-recognition of the right of priority of the owner of land in which a discovery is made is derived from the fundamental principle of Japanese legislature, and must be regarded as a highly reasonable provision. The period of trial boring is one year, to be extended to another year when such extension is regarded proper and necessary (Art. IX.). In contrast to this limitation in the period of the trial borings, no such limit is enforced in regard to permanent working. Further, though the right of trial boring can not be transferred to a third person or be used as object of hypothecation, the right of permanent boring can be sold or bought or assigned or be made an object of hypothecation (Art XX.)

The fact that the concession of working a mine was at first limited to the space of only 15 years, and that this concession was forbidden from being made use of as object of hypothecation did seriously interfere with the proper development of the industry. The subsequent amendment of the Regulations has removed those two grave defects and to-day concessionaires and capitalists are enabled to invest a large sum in the exploitation of mines.

SCOPE OF A MINING CONCESSION AND SUPERVISION OF THE WORKING.—The scope of a concession is fixed with a definite limit, it being not less than 10,000 *tsubo* for coal and not less than 3,000 *tsubo* for other kind of minerals (Art XLI.), the maximum limit being 600,000 in both cases. The two extremes have been so determined in order to prevent the appearance of too many small concessions on the one hand and the evil of monopoly on the other. However, in case of the combination of more than two concessions the maximum limit may exceed 600,000 *tsubo*.

In view of the fact that our mine-owners and people are too

apt to attend to their own immediate interests at the expense of the permanent interest of the mining industry as a national economy, and that not unfrequently they secure concessions merely with the object of selling them to other people, the Government has deemed it advisable to interfere more or less with the mining business. Thus a concessionaire is obliged to forward to the chief of the Mining Inspection Office in whose jurisdiction the concession is situated the working plan he has drawn up and to obtain for it the approval of the chief before proceeding to work the concession (Arts. XXVI and XXVII). Further, the concession may be revoked by the Minister of Agriculture and Commerce in case the working is suspended for more than a year (Art. XXIX), while he also requires the concessionaire to submit every six months the plan of the existing condition of the mine (Art. XXXI), and also requires him to get his approval whenever a concession is to be amalgamated with another or is to be split up (Art. XLVI). Lastly, when the location and shape of a concession as represented in the application is discovered to differ from the actual location and shape of the bed, the Minister may order the concessionaire to mark out his concession anew, on pain of revoking the concession if this order is not obeyed.

USE OF LAND.—The mining operation involving the use of the surface of land, the interest of a mining concessionaire is often found incompatible with that of the owner of the land. The only way to find a way out of this difficulty is to requisition for the benefit of the concessionaire so much land as is judged necessary for the conduct of his work and to give suitable compensation for this requisition to the owner of the land. It is to regulate these relations the exploitation of natural resource demands that a special chapter is devoted in the existing law to distinctly define the right of mining concessionaires and owners of land. According to the provisions therein contained, the owner of the land cannot refuse permitting to the concessionaire the use of his land required in the mining work, the land required being specified thus:—

**Obligations of Owners
of Land to Mining
Concessionaires.**

For the purpose of sinking shafts or boring pits.

For stowing ores, stones, and earth.

For constructing working paths, roads, railroads, tramways, canals, ditches or pools.

For constructing smelting workshops and other buildings, electric wires, iron-pipes or chains required in mining.

The owner of the land cannot refuse leasing to the mine-owner the land required for making the foregoing provision (Art. LXVII), and the mine-owner in return must give to the owner a suitable compensation by way of rent or damages or must deposit security against rent (Art. L). Further, the mine-owner is obliged, on the request being made by the owner of the land, to purchase the land used by him in mining work for not less than three years. All the disputes between the land-owner and the mine-owner may be submitted to the decision of the chief of the Mining Inspection Office, but when his decision is regarded unsatisfactory by the parties concerned an appeal may be made, in case of lease, to the Minister of Agriculture and Commerce, and to ordinary courts of law in case of other kinds of dispute.

MINING POLICE.—From the very nature of the work not only is the risk to life greater to those engaged in it than in ordinary work, but the work may also involve serious injuries to other parties, by causing, for instance, the depression of the surface level of the land situated in the vicinity of the mine or by causing noxious gas or poisonous matters to spread in the surrounding district. It being judged inadvisable to leave the control of all those matters to ordinary police who can not be properly

Provision to Safeguard qualified for the task, it is provided in Art.

Public Safety. LVIII of the existing Mining Regulations that the following matters shall be attended

to by the respective chiefs of the Mining Inspection Offices, subject to the supervision of the Minister of Agriculture and Commerce:—

Safety of architectural constructions both in the mine and in connection with mining.

Protection of the life and health of workmen.

Protection of the surface of land and of the public interests.

When any cause of danger or of injury to the public interests

in connection with mining is perceived by the chief, he is authorized to order the concessionaire to remove such cause, on pain of ordering the suspension of the work in case of his disobeying the order (Art. LIX), while the supervising authorities may themselves carry out the necessary preventive measures and cause the concessionaires to pay the expense involved in the work.

The Minister of Agriculture and Commerce has further enacted Rules relating to Mining Police, and enforces strict control over such matters as the use of explosives, arrangements for ventilation, subterranean works, construction of chimneys, boilers, milling-shops, smelting-shops etc., provisions against accident, etc. The Chief of the Mining Inspection Office sees to the faithful fulfilment of all the points specified in the Rules.

PROTECTION OF MINE-WORKERS.—In view of the great risk to life and health, special provisions besides those mentioned in the Police Rules are in force for extending protection to mine-workers and their families, these provisions being intended to enforce proper restriction as to the nature of the work, number of working-hours, relief in case of death or injuries sustained in the discharge of duty. Every concessionaire is accordingly ordered to draw up for use in his own particular concession rules relating to workmen, and to submit to it the draft for the approval of the Chief of the Mining Inspection Office (Art. LXIV), the object of this official interference being to provide against unreasonable demand, made by the employers on employees. Further, the Minister of Agriculture and Commerce is authorized by means of Departmental Ordinances to place restrictions on the working-hours of general workmen, and on the kind of work that may be imposed on female workers, and on the working-hours and kind of work for minors (Art. LXXI); also to cause the concessionaire to make suitable relief provisions both for workmen or their families when workmen meet with death or are disabled in the discharge of their duties. The concessionaire is under an obligation to draw up regular rules to deal with such cases, and to put them in practice with the approval of the Chief of the Mining Inspection Office.

TAXES ON MINING.—At first the taxes were of two kinds, one on leases and the other on produce. The former was at the rate

of 1 *yen* for every 500 *tsubo* of metallic mines (except iron); 50 *sen* for every 500 *tsubo* of iron and non-metallic mines. The other tax was at the rate of 3 to 20 per cent. of the value

Original System. of the output. In 1875 the tax on produce was abolished to give encouragement to the progress of the industry. But the imposition of a tax according to the extent of the concession was attended by a serious defect, for it induced the concessionaire to minimize the extent of the leases and therefore tended to prevent the proper exploitation of natural resources. By the further amendment, the original method of imposing two kinds of taxes was restored, but the rate for the lease was reduced to 30 *sen* per 1,000 *tsubo* and the tax on produce, iron

Present System. excluded, 1 per cent. of the value of output (Art. LXXIII). This restoration of the tax on lease was partly effected with the object of restricting the evil of forestalment by speculators, while the tax itself was in conformity with a long-established usage. The tax on produce is determined according to quotations in the principal markets, the selling price to take the place of quotations in the absence of quotations (Art. LXXIV). Those for which the official quotations exist are at present gold, silver, copper, lead, antimony, coal and petroleum.

SAND ORE DIGGINGS.—Sand ore diggings (alluvial gold, iron-sand, tin-sand) are treated by the laws in a manner somewhat distinct from other kinds of ore; in this case the right of priority is accorded to the owner of land containing those ores. But when the owner does not work the ores he is compelled to grant permission to do so to those who are desirous to dig them. The owner is entitled in that case to exact a suitable amount of fee. The working is left uninterfered with, excepting some restrictions of the nature of general Police regulations. However the diggings are allowed only to Japanese subjects and no foreigners whether as a private individual or as member of a company is allowed to undertake the work. In most other respects provisions of the Mining Regulations are correspondingly applied to the digging exploitation.

MINING ADMINISTRATION.—Mining administration necessary presents special features of its own and is distinct from the administration

of other industries. To cite some of the principal points with which mining administration deals they are :

- I. Matters relating to the registration as to the establishment and cancellation of the right, transfer of it, and pecuniary obligation.
 1. Matters relating to the granting of permission for trial or permanent borings.
 2. Matters relating to the annulment of the permission of trial or permanent borings.
- II. Matters relating to the supervision of mining work.
 1. Matters relating to the approval of working plans.
 2. Matters relating to the correct representation of leases and the surveying of the beds.
 3. Matters relating to the amalgamation or splitting up of leases and to their re-arrangement.
- III. Matters relating to mining police.
 1. Matters relating to the protection of public interest.
 2. Matters relating to the protection of mine-workers.
 3. Matters relating to the safety of mines and of architectural constructions therein.
- IV. Matters relating to disputes.
 1. Disputes concerning the lease of land required in carrying on mining work.
 2. Disputes (first instance) concerning the deposits against rent and damage, price of land, etc. between land-owners and concessionaires.

The officials taking charge of all those affairs must possess technical knowledge bearing on those points and they therefore differ from ordinary administrative officials in the nature of the work they have to discharge.

The mining administration affairs are subdivided into categories, central and local. The former are taken charge of by the Director of the Mining Bureau subject to the control of the Minister of Agriculture and Commerce, while for attending to the latter section of business the country is subdivided into five divisions each under a Mining Inspection Office established by the Department of Agriculture and Commerce. The reason why local mining affairs are not left to the control of local administrative offices is because each

kind of mineral should be placed under uniform mode of control irrespective of the place of produce and because different treatments by different local offices would only have the effect of preventing the due development of the industry. The Chief of each Mining Inspection Office is the controlling-power of all the mining affairs occurring in his jurisdiction, and he deals with them either with the approval of the Minister or on his own responsibility, according to the relative gravity of matters. The administrative business relating to sand-ore diggings is practically identical to the foregoing, and therefore requires no special description here.

Statistics relating to the Mining Industry.

For the convenience of reference, statistics relating to the mining industries are given here in the form of appendix. Owing to unavoidable circumstances, these returns are not uniform as to the period they cover, though in most cases they begin in 1893 to end in 1902.

PRIMARY INDUSTRIES.

SECTION IV.

FISHERY.

Introductory—Fishing-Grounds—Fishery and Fishery Industry
—Distribution of the Principal Fish etc.—Finance Standing
of the Fishermen—Agriculture—Salt-Refining—Markets—
Fishery Legislature.

I. INTRODUCTORY.

NUMBERS OF FISHERMEN AND BOATS.—Owing to its geographical position, to the direction of the marine currents in its vicinity and also to the abundance of suitable indentations along the well-wooded coast, Japan is an ideal country for the fishermen. It is not surprising therefore that there are 900,000 families of fishermen or of persons engaged in the marine industry, or over three million individuals, and that the number of fishing boats total over 400,000. Fish and other marine products have constituted from olden times important items of food-stuffs of our people, and this partiality of ours for Lenten fare is also shared by our nearest neighbors the Chinese who have been, for centuries back, principal purchasers of our marine products.

EXPANSION OF FISHERY ENTERPRISE.—With the steady increase of our population and the greater perfection of the means of transportation in the interior, the demand on fishing products has began to show striking advance, an advance further accelerated by an increasing demand from abroad. Under these circumstances, our fishermen can no longer remain satisfied with coasting work alone, but are obliged to a greater extent than ever to venture out into the open sea and even to the distant coasts of Korea and of the South Pacific.

II. FISHING-GROUNDS.

INFLUENCE OF SEA CURRENTS ON FISHING-GROUNDS.—As described in the chapter on climate, the two sets of sea-currents flow along each coast of our country, the Pacific coast and the coast of the Sea of Japan. Each coast is influenced to a greater or less extent by a warmer current coming from the south and a colder current from the north. The predominance of the one or the other makes a great difference in the temperature of the sea. For instance, along the coast northward from Kinkazan, Honshu, the average temperature is below 15° C., while along the eastern coast of Hokkaidō and the Kuriles it is below 10°, owing, in both cases, to the predominance of the colder streams. On the other hand, owing to the presence of warmer currents along the coast southward from the group of islands off Izu as far as the southern extremity of Kyūshu, the average record there is above 20°, while along the coast of the Bonin islands and Oshima off Satsuma, and the eastern coast of Formosa the temperature is as high as 23°. This presence of two different sets of sea-currents on our coasts, while affecting the geographical distribution of the finny tribe, also contributes to the diversity and richness of our marine fauna and flora. A rough description of the seas which surround our islands, of our rivers and lakes will be given below.

1. THE PACIFIC OCEAN.—One side of the whole length of Japan beginning with the Kuriles on the side north extending to Formosa on the south, faces the Pacific Ocean. The Kuriles and Formosa are separated by as many as 29 degrees in latitude, and not only in the climate therefore are these two extremities of Japan widely distinct, but also in the temperature as well as in the depth of the sea a great diversity exists in our country, according to places.

To the north of Kinkazan, in the north-eastern part of Honshu, is situated the famous submarine depression, that is Tuscarora. A warm current passes to the south of this part so that the vicinity is very rich both in fauna and flora, sardine, bonito, **Kinkazan.** pagrus, yellow-tail, tunny, cattle-fish, haliotis, etc. abounding. A cold current runs to the north of this

depression, and in consequence the fauna and flora living to the north and south of Kinkazan are distinct from each other.

In the sea between the southmost archipelago of Japan proper and Formosa there exists a strong warm current. The result is that in this vicinity many kinds of migratory fish are found, especially bonito. The eastern, that is the Pacific shore of Formosa, is precipitous with no good anchorages for ships, and the sea is moreover very deep. The inhabitants too are aborigines, and the fishery as carried on along this coast hardly deserves, therefore, any notice. On the other hand, the sea on the western shore is of moderate depth and the fisheries of sardine, horse-mackerel, "tai" (*pagrus*), shark, grey mullet, etc., are actively carried on. However, during rainy seasons, winter and spring in the northern districts and summer and autumn in the southern districts, fishing is practically suspended.

2. THE SEA OF JAPAN.—A branch of the Black Stream flows through this sea. This branch current runs all the year round along the western coast of Hokkaidō and through the straits of Tsugaru and Sōya. However, at the eastern coast of Korea, especially along the coast northward of Vladivostock, it is found only in summer. The difference between the high and low tides on the opposite coasts does not exceed 1 to 3 *shaku*. At high-tide the current runs northward through the Straits of Korea but on the coast of Japan the tides are very weak and their movement very irregular.

Tunny, bonito and other migratory fish enter this sea along the course of the southern warm current, but in the northern part of the sea, where the influence of a colder current predominates, the principal fish are herring, cod, and the like.

3. THE SEA OF OKHOTSK.—The province of Kitami in Hokkaidō faces this sea, and the fisheries as carried on near the towns of Sōya, Esashi and along the coast in general chiefly consist of herring and salmon. The open sea fishery is not yet developed, but there is every possibility of fisheries such as cod and others attaining a great importance in the near future.

4. INLAND SEAS.—The largest and most important inland sea

in Japan is the Inland Sea already described. The movements of the tides in this enclosed basin of sea are regulated by the three channels of Shimonoseki, Bungo and Kii. The sea is generally shallow, and as the temperature varies considerably according to the seasons, many fish that come in the beginning of the warm season, go away in autumn as the colder season approaches. Sardine, pagrus, grey mullet, etc. abound. The shores of sea are also noted for their flourishing salt refineries.

The inland seas that come next in importance to the Inland Sea are the Sea of Ise, Tokyo Bay, and the Sea of Ariyake. The fauna living in these sea are more or less distinct according to the size of each basin, the depth of water in it and the nature of the sea-bed.

5. RIVERS AND PONDS.—Rivers as fishing ground, do not of course depend on their length and depth alone. In general, salmon find their way up most of the rivers in the northern districts of Honshū and in Hokkaidō, while on the other hand the *Plecoglossus altivelis* is found in most of the rivers in the central and southern part of Honshū.

On Lake Biwa, Shinji, Kasumigaura, and Hachirogata fisheries are actively carried on. The principal fresh-water fish that are found in the rivers and pounds of Japan are carp, Crussian carp, eels, etc.

III. FISHERY AND THE FISHERY INDUSTRY.

1. FISHERMEN.—Our fisheries first attained their greatest development in the Inland Sea, being extended afterwards to the west and to the east, and finally to the north. This being the case the fishing population is densest along the shores of the Inland Sea, and is comparatively less along the shores of the Sea of Japan and the shores of Hokkaidō. The density of the fishing population in the main fishery regions and the rate of population per 1 *ri* of coast line are shown in the following table:—

		Hohshu.	Shikoku.	Kyūshu.	Hokkaidō.	Total.
Coast-Line (<i>ri</i>)... ..		2,705	676	2,406	1,242	7,029
No. of Households		545,937	80,471	228,804	51,920	907,132
Population		1,832,829	324,471	930,878	250,422	3,338,600
Per, <i>ri</i> Coast- line.	{ No. of Households	201.82	119.03	95.09	41.80	129.05
	{ Population... ..	677.57	479.98	386.89	201.62	474.97

Note:—The figures for households and population in the above table include both fishermen and those who are engaged in manufacturing marine products. They are based on the returns carried out in 1891.

2. FISHING-BOATS.—Fishing-boats for use either on the sea or in inland-water number about 420,000. Here are the returns compiled in 1900:—

	Boats over 5 <i>ken</i> in Length.	Boats less than 5 <i>ken</i> in Length.	Total.
* Honshu	4,398	238,238	242,636
Shikoku	334	30,684	31,018
Kyūshu	275	76,397	76,672
Hokkaidō	12,675	59,522	72,197
Total	17,682	404,841	422,523

For all their serviceableness, Japanese fishing-boats are not without defects. For instance they are comparatively frail, and as they are principally made for rowing, they are hardly fit to sail against the wind. The authorities recently begun to take all these points into consideration, with the result that our fishermen are gradually building their boats after the foreign style, and providing them with decks or special apartments protected from the free entrance of water. These improvements are now to be found in our fishing-boats that are pursuing their business on the shores of Korea.

The Government has also encouraged the construction of fishing-boats of the Western style, by enforcing from 1898 the Law for the Encouragement of Pelagic Fishery. The result of that law has been that boats of this new style have gradually began to come into use, as shown in the following table:—

Year.	Boats and Crew receiving Bounties by Law.			Boats Licenced to Pursue Sealing, though without Receiving Bounty.	
	No.	Gross Tonnage.	Crew.	No.	Gross Tonnage.
1898	8	694	214	1	99
1899	14	1,419	379	—	—
1901	15	1,621	392	1	93
1902	14	1,028	296	3	165
	—	—	—	—	—
Total	51	4,762	1,281	5	357

3. FISHING-GEARS.—The different kinds of fishing-gear used in Japan are too numerous to be enumerated here in detail. The principal kinds of gears both for net-fishing and for angling, are as follows:—

The pound-net is extensively used throughout the country. In Hokkaidō it is used for herring and salmon, and in Honshu and

Kyūshu for capturing tunny, yellow-tail, bonito, **Net-Fishing Gears.** etc. A net of this kind sometime measures as long as several thousand yards long. The seine-net is used for capturing sardine, anchovy and other shoal fish. It is, in this country, one of the latest innovations in the line of nets, having been made after an American model. Sometimes a seine-net is of enormous size, extending as long as three miles in length. Then there are drift-nets, grill-nets, trawl-nets, dredge-nets, etc.

There is also another kind of net called *shiki-ami* (spread-net) which is spread on the bottom, and lifted up to catch the fish that happen to enter it.

Angling-gears are of two kinds, viz., long-line and hand-line, the former being a line with a number of short **Angling-Gears.** suspenders. It is left stretched in the water.

There are, besides the above, other fishing devices, as weir and trap generally used in ponds or streams.

The number of different kinds of nets used in the different **Number and Kind of Nets.** parts of the Empire is as follows according to the returns made in 1891:—

Kind.	Honshu.	Shikoku.	Kyūshu.	Hokkaidō.	Total.
Pound-Nets	20,329	876	632	5,551	27,388
Shiki-ami, etc.	19,093	1,160	3,188	6	23,447
Purse Seine, etc.	7,640	326	228	79	8,273
Trawl-Nets, etc.	85,366	6,897	12,439	7,462	112,164
Seines, etc..	21,374	3,463	7,041	1,511	33,389
Drift-Nets and Grill-Nets..	540,252	11,275	24,639	234,830	810,996
"Square-Nets"	6,395	540	1,781	150	8,866
"Throw-Nets"	62,135	2,512	14,797	20	79,464
Total	762,584	27,049	64,745	249,609	1,103,987

4. VALUE OF TAKES OF FISHES AND OF MARINE PRODUCTS.—

The returns showing the value of the takes of fish and of the marine products for the five years ending 1900 are as follows:—

Year.	Takes. <i>yen.</i>	Marine Products. <i>yen.</i>
1896	38,132,001	24,155,239
1897	45,038,816	29,740,358
1898	44,840,022	26,190,460
1899	52,151,878	31,678,766
1900	56,833,150	32,725,411
Average	47,399,173	28,898,047

The returns for 1900 distributed among the main divisions
The Main Districts. of the Empire, the result is as follows:—

	Takes.	Marine Products.
Honshu	34,430,746	16,147,437
Shikoku	4,303,031	2,317,218
Kyūshu	6,251,304	3,630,684
Hokkaidō	11,848,069	10,630,072
Total	56,833,150	32,725,411

The takes made in 1900 may be divided as follows according to the kind of fish. The figures for Hokkaidō
Takes and represent the amount of marine products, there being
Kind of Fish. no returns available for the takes alone.

Kind.	Quantity (<i>kwamme</i>).	Value (<i>yen</i>).
Herring	29,982,824	7,144,072
Sardine	48,739,197	7,306,780
Bonito... ..	10,996,716	4,365,887

Crossian Carp	362,321	194,759
Sea-Weed (algæ)	7,441,117	870,918
Other Kinds	2,135,888	12,587,501
Total	160,342,855	56,833,150

The classification of marine products for 1900 is as follows:—

Kind.	Quantity (<i>kwamme</i>).	Value (<i>yen</i>).
Cuttle-Fish... ..	1,665,493	2,466,004
Beche de mer	94,141	206,757
Sea Ear (dried)	129,555	406,549
Sardine (dried)	2,535,988	914,603
Anchovy (dried)	564,793	277,085
Sardine (boiled and dried) ...	3,142,675	2,138,777
„ (salted)... ..	2,204,532	617,263
Mussel (dried)	63,414	64,117
Bonito (dried and smoked) ...	1,972,460	4,881,303
Tunny („)	164,495	288,809
Prawn (dried)	598,220	682,321
Shark Fin	99,824	264,171
“Kainohashira” (abductor muscle of shell-fish)	9,382	35,663
Mackerel (salted)	1,410,681	556,357
Tunny (salted)	214,848	79,008
Cod (dried)	144,219	131,775
Cod (salted)	317,203	55,651
Salmon (salted)... ..	1,131,194	523,335
“Hoshinori”	148,615	472,211
„ (sheets)... ..	8,297,500	41,736
Herring (dried)... ..	5,749,791	1,204,332
Herring (guano)... ..	26,147,225	7,058,117
Sardine (guano)... ..	4,483,018	1,400,319
Fish Oil	1,679,311	399,648
Yellow-Tail (salted)	781,244	433,898
“Tengusa”	285,642	187,588
“Funori”	257,932	154,066
Others	—	6,755,948
Total	$\left. \begin{array}{l} \text{(kwam.)} \\ \text{(sheets)} \end{array} \right\} \begin{array}{l} 55,995,895 \\ 8,297,500 \end{array}$	32,725,411

IV. DISTRIBUTION OF THE PRINCIPAL FISH, THEIR VALUE, CAPTURE AND MODE OF CURING.

(A). FISH.

1. HERRING (*Clupea pallasii*).—This fish is caught in Hokkaidō, Aomori and Akita. In Hokkaidō the fishing season extends

from March to May. The fishing grounds lie along the western shores. Pond-nets and grill-nets are used. The takes during the five years ending 1900 and the value of these takes were as follows:—

Year.	Quantity (<i>kwan</i>).	Value (<i>yen</i>).
1896... ..	41,028,680	8,340,666
1897... ..	51,818,880	10,650,618
1898... ..	35,083,640	7,289,811
1899... ..	38,057,480	9,047,957
1900... ..	29,982,874	7,144,072
Average	39,194,311	8,494,625

Enormous quantities of this fish being caught at a time, it is not possible to carry out any elaborate process of curing. In general only the part along the backbone and raw are used for food, the other parts being pressed for oil and guano. This guano amounts to 700,000 to 1,000,000 *koku* a year (40 *kwan* equal to 1 *koku*.) The market of guano is vitally related to the prosperity of the Hokkaidō fisheries, and the recent import of bean-cakes from North China, of herring guano from Russian Siberia, and also sardine from Korea, is seriously affecting the markets of Hokkaidō guano. In view of this circumstance, the authorities have lately begun to encourage the preparation of smoked and salted herring, the former among the fishermen of Akita and Aomori, and the latter among those of Hokkaidō. Samples have been sent both to China and Australia.

2. SARDINE (*Clusanodon melanosticta*) AND ANCHOVY (*Engraulis Japonicus*).—These fish are caught almost everywhere along our shores with seine-nets, pond-nets or purse-seines. The greater part of the fish is used as guano, but no small part is used as food, after having been boiled and dried. The yield amounts to about 40 million *kwan* valued at about 6 million *yen*. The returns for last five years are as follows:—

Year.	Quantity (<i>kwan</i>).	Value (<i>yen</i>).
1896... ..	48,610,784	4,601,782
1897... ..	38,392,354	4,893,412
1898... ..	36,633,689	5,711,023
1899... ..	48,735,376	6,579,617
1900... ..	48,749,277	7,310,120
Average	44,224,300	5,819,191

The demand for sardine and anchovy as food-stuff being still limited in Japan, the authorities are encouraging the people to manufacture tinned sardine and anchovy sauce after the French style.

3. **BONITO** (*Thynnus pelamis*).—This fish is found in most parts of our southern seas, and as it haunts warm currents, its area of distribution is comparatively wide. It is chiefly caught by rod and line, the bait used being generally living sardine. The fish is a favorite article of food. The business of making dried and smoked bonito, called “Fushi,” is highly important, it being used for seasoning the dishes. The business is extensively carried on in Tosa and Izu. The returns for the last five year are shown below:—

Year.	Takes (<i>kwam.</i>).	Value (<i>yen.</i>).	Dried Bonito (<i>kwam.</i>).	Value (<i>yen.</i>).
1896... ..	9,070,229	2,407,828	1,094,407	1,796,137
1897... ..	7,736,432	2,754,442	1,228,063	2,974,448
1898... ..	9,060,619	3,404,265	1,472,269	2,951,907
1899... ..	9,688,513	3,931,974	1,375,926	3,376,668
1900... ..	10,990,716	4,347,887	1,972,460	4,881,303
Average	9,309,302	3,369,279	1,428,625	3,196,093

4. “**Tai**” (*Pagrus*).—There are two species of this fish, viz., “**Ma-dai**” (*Pagrus major*) and “**Chi-dai**” (*Cardinalis*). The fish is very widely distributed but its most noted fishing-ground is the Inland Sea where the fish abounds in the intermediary season of spring and summer. They are first gathered together by “driving nets” and then caught by seines hauled by boats. Long lines are also used to some extent for capturing the fish.

The fish is mostly sold raw, and very seldom in a salted form. It is also found very largely in the seas of Korea. The returns during the last five years are as follows:—

Year.	Capture (<i>kwam.</i>).	Value (<i>yen.</i>).
1896	5,117,708	2,214,377
1897	4,752,147	2,609,187
1898	4,445,846	2,695,830
1899	4,178,697	3,316,733
1900	5,228,835	4,109,802
Average	4,744,647	2,989,186

5. "SAWARA" (*Scomberomorus Sinensis*).—This fish frequents more our eastern and south-western seas and less our northern seas. It swims in shoals and is caught by drift-nets. In the Inland Sea it is caught in the spawning season:—

Year.	Capture (<i>kwan</i>).	Value (<i>yen</i>).
1896	1,110,955	393,913
1897	995,351	509,012
1898	1,097,964	624,027
1899	1,044,086	766,093
1900	1,245,047	1,011,187
Average	1,098,881	660,846

6. TUNNIES (*Thunnus schlegelii*).—The fish are found everywhere and caught by means of pound-nets, drift-nets and long-lines. They are generally sold fresh, but are sometimes preserved in salt or used in the same way as dried bonito. The figures for the last five years are:—

Year.	Capture (<i>kwan</i>).	Value (<i>yen</i>)
1896	5,034,733	1,348,413
1897	5,107,859	1,532,091
1898	3,484,084	1,423,123
1899	3,108,426	1,327,268
1900	4,084,156	1,814,704
Average	4,163,852	1,489,120

7. YELLOW-TAIL (*Seriola quinqueradiata*).—This fish is caught mostly in our south-western seas and in the Sea of Japan, with pound-nets, gill-nets and long-lines. It is sold either fresh or salted:—

Year.	Capture (<i>kwan</i>).	Value (<i>yen</i>).
1896	3,854,715	1,056,566
1897	3,547,520	1,128,666
1898	3,345,915	1,108,295
1899	3,784,358	1,683,773
1900	5,462,602	2,224,297
Average	3,999,022	1,440,319

8. MACKEREL (*Scomber colias*).—This fish is caught everywhere by means of *Shiki-ami* ("spread"-nets), seines, and hand-lines. It is mostly preserved in salt. The takes are as follows:—

Year.	Capture (<i>kwam.</i>)	Value (<i>yen.</i>)
1896	6,510,478	1,069,663
1897	5,789,806	1,299,612
1898	6,445,249	1,475,716
1899	5,584,275	1,934,091
1900	7,512,857	2,159,018
Average	6,388,533	1,587,620

9. COD (*Gadus brandti*).—This fish is caught in the northern part of Honshū and along the coast of Hokkaido, long-lines and gill-nets being generally used for capturing it. It is sold in salted or dried state while the oil is valuable as a medicine. The figures for the last five years are as follows:—

Year.	Capture.		Dried Manufacture.		Salted.	
	Quantity. <i>kwam.</i>	Value. <i>yen.</i>	Quantity. <i>kwam.</i>	Value. <i>yen.</i>	Quantity. <i>kwam.</i>	Value. <i>yen.</i>
1896... ..	1,463,991	257,764	213,975	124,434	232,109	33,175
1897... ..	2,311,725	444,934	1,068,104	396,555	286,970	33,577
1898... ..	2,052,252	391,291	1,029,135	380,379	184,745	20,079
1899... ..	2,625,632	539,673	150,650	70,200	290,460	129,512
1900... ..	1,817,148	372,827	144,219	131,775	317,203	55,651
Average	2,054,150	401,298	521,216	220,669	262,297	54,399

10. SALMON (*Oncorhynchus haberi* and *O. Perri*).—Salmon and trout come up the streams flowing into the Sea of Japan or the northern part of the Pacific. They are especially abundant in Hokkaidō and the prefectures of Aomori, Akita and Niigata. In the sea, pound-nets are used while in the rivers seines are generally preferred. Traps are also used in some places. Both salmon and trout are preserved in salt or are tinned. The catches for the last five years are as follows:—

Year.	Salmon.		Trout.	
	Quantity (<i>kwam.</i>)	Value (<i>yen.</i>)	Quantity (<i>kwam.</i>)	Value (<i>yen.</i>)
1896	2,725,360	989,683	2,769,678	300,905
1897	3,528,700	1,411,918	290,723	80,032
1898	3,103,080	1,344,753	263,993	81,312
1899	2,533,440	1,096,217	191,621	86,412
1901	2,045,569	1,023,419	170,273	129,259
Average	2,787,230	1,173,198	737,258	135,584

(B). SHELL-FISH AND MOLLUSKS.

EAR-SHELL, ETC.—Of the shell-fish caught in our seas, ear-shell (*Haliotis*) is of the greatest commercial value, for besides its flesh being largely exported to China the mother-of-pearl obtained from it is in large demand for ornamental purpose. Then comes the oyster (*Ostrea*) in importance. The other shell-fish of commercial value are the Pearl-Oyster (*Avicula*), Mussel (*Mytilus*) Scallop (*Pecten*) Razor shell (*Solen*), *Solecurtus constricta*, *Cytherea meretrix*, *Maetra sulcatoria*, *Arca granosa*, etc. The returns giving the takes and the value are shown below:—

Year.	Ear-Shell.		Oyster.		<i>Cythera</i> .		Mussel.	
	Quantity. <i>kwam.</i>	Value. <i>yen.</i>	Quantity. <i>kwam.</i>	Value. <i>yen.</i>	Quantity. <i>kwam.</i>	Value. <i>yen.</i>	Quantity. <i>kwam.</i>	Value. <i>yen.</i>
1896.....	982,909	338,794	1,304,559	110,181	605,730	36,408	647,493	26,046
1897.....	782,617	363,813	1,098,707	103,903	684,661	59,060	443,604	21,755
1898.....	717,196	391,629	597,350	120,775	1,067,651	100,989	377,078	25,839
1899.....	1,037,572	545,366	963,181	187,039	1,483,388	119,870	258,205	13,403
1900.....	869,563	508,478	993,655	190,091	1,518,622	93,305	296,680	15,330
Average ...	877,971	429,616	991,490	142,398	1,072,010	81,926	404,612	20,475

LOBSTERS (*Palinurus*) AND PRAWNS (*Penaens*).—Of the two the former are caught in the Pacific coast and the latter in the Inland Sea and other inlets. Lobsters are generally caught by gill-nets and prawns by trawl-nets. The takes and value of these crustaceans are shown below:—

Year.	Capture (<i>kwam.</i>).	Value (<i>yen.</i>).
1896	3,440,503	648,982
1897	3,641,732	815,015
1898	3,489,962	883,388
1899	4,588,174	1,095,485
1900	4,200,264	1,345,340
Average	3,872,127	957,642

3. CUTTLE-FISH AND SQUIDS.—They are caught by lines and trawls. In the dried form they rank first on the list of exported marine products:—

Year.	Quantity (<i>kwam</i>).	Value (<i>yen</i>).
1896	10,060,515	1,809,243
1897	8,578,722	1,880,941
1898	7,081,095	1,949,490
1899	7,616,099	2,492,108
1900	7,615,712	2,699,661
Average	8,190,429	2,166,289

(C). SEA-WEEDS.

The sea-weeds that deserve to be mentioned on account of their commercial value are the "Kombu" (*Laminaria*) "Amanori" (*Porphyra tenella*, Kijelhum), "Tengusa" (*Galidium lamouroux*), "Hijiki" (*Cystophyllum I Agardh*), "Arame" (*Ecklonia Hornemanna*), "Wakame" *Undaria Suringar*), all of which are used as food. Then there are the "Funori" *Gloiopeltis J, Agardh* which are used for making paste, and the "Kajime" (*Ecklonia*) from which iodine is extracted:—

Year.	"Kombu."		"Tengusa."	
	Quantity (<i>kwam</i>).	Value (<i>yen</i>).	Quantity (<i>kwam</i>).	Value (<i>yen</i>)
1896	6,097,547	494,562	944,619	238,818
1897	9,066,984	630,461	736,925	195,031
1898	5,053,154	409,228	479,141	146,310
1899	7,965,725	734,129	761,317	201,266
1900	6,454,078	602,777	965,652	252,305
Average	6,927,498	574,231	777,531	206,746

(D). MARINE MAMMALS.

1. WHALES.—The right whale, sulphur-bottom whale, and humpback whale that were formerly caught in very large number in the seas off Kyūshū and Shikoku, but this is no longer the case at present. The sperm whale is found in the Pacific, and the authorities are now encouraging our whalers to start open sea whaling in competition with the foreign whalers. The principal whaling grounds in our seas are Arikawa in Nagasaki, Yobuko in Saga, Senzaki in Yamaguchi, Tsurō and Ukitsu in Kōchi. The capture of whales in these four prefectures recently was as follows:—

Year.	Nagasaki.		Saga.		Yamaguchi.		Kōchi.		Total.	
	No.	Value.	No.	Value.	No.	Value.	No.	Value.	No.	Value.
		<i>yen.</i>		<i>yen.</i>		<i>yen.</i>		<i>yen.</i>		<i>yen.</i>
1893... ..	49	71,957	15	24,650	20	29,400	20	23,122	104	149,129
1894... ..	34	60,885	22	38,000	20	33,200	21	38,164	107	260,249
1895... ..	54	125,953	18	37,350	33	41,120	32	44,022	137	248,445
1896... ..	49	107,563	14	48,530	34	70,590	47	52,214	144	283,397
1897... ..	50	154,424	10	27,620	35	89,050	25	33,978	115	191,500
Average ...	47	104,156	16	35,230	28	52,672	31	38,300	121	226,544

2. THE SEA-OTTERS AND FUR-SEALS.—The sea-otters that were formerly caught in the Kuriles are now practically extinct, and the other haunt the northern Pacific and the Sea of Japan while they are on their way to their northern home in summer. Formely there were rookeries of fur-seals in some islands of the Kuriles and the animal fell mostly into the hands of foreign sealers. Of late owing to the encouragement given by our Government, the capture of these valuable fur animals by our fishermen has become quite satisfactory :—

Year.	Sea Otter. No.	Fur Seal. No.	Total.
1897	26	4,616	4,642
1898	21	4,757	4,778
1899	16	6,518	6,534
1900	11	7,533	7,544
1901	12	7,045	7,057
Average	17	6,094	6,111

In Japan the otter skin commands the market of above 1,000 *yen* a piece while that of the other is about 25 *yen*.

V. THE FINANCIAL STANDING OF THE FISHERMAN.

GENERAL REMARKS.—The only data available for making inquiries into the extent of our fishermen's investments in boats and nest are those of 1891. According to the result
Total Investments. of that year's inquiries the investment amounted to 24,400,000 *yen* approximately, which,

distributed among 900,000 fishing families, corresponds to only about 27 *yen* per family. There are other fishing gear besides, but they are comparatively of small value so that the means which our fishermen have at their disposal must be said to be extremely limited. Below is a table giving the number and value of fishing boats and nets:—

	Fishing-boats.		Nets.	
	No.	Value (<i>yen</i>).	No.	Value (<i>yen</i>).
Honshu	222,942	5,246,974	813,046	2,715,722
Shikoku	29,422	722,471	27,601	1,034,550
Kyūshū	72,378	2,106,847	78,164	6,508,054
Hokkaidō	52,301	1,584,450	249,848	4,481,985
Total	377,043	9,660,742	1,168,659	14,740,311

Such is the economy of our fishing people, but it is evident that it admits of great improvement if they are encouraged to lay by their earnings against the bad times that must necessarily occur from time to time in their business, and if they are further encouraged to make continuous improvements in their methods of fishing.

FINANCIAL CONDITION OF FISHERY IN HOKKAIDO.—Perhaps in no part of the country are such improvements more imperatively necessary than in Hokkaidō. About 550 years have elapsed since the south-western corner of that island was first opened by the settlers from Echizen. The fishery in Hokkaidō was at that time a primitive affair, principally owing to the remoteness of the place from any of the markets, and also owing to the fishermen's ignorance of the best way of disposing of the fish caught. Owing, however, to the introduction of the manufacture of guano on the one hand and to the invention of pound-nets on the other, a strong impulse was imparted to the development of the industry, and this resulted in a striking increase in the export of marine products to Japan proper. On the abolition of the local feudal office in Hokkaidō and the establishment of the Colonial Office in 1869 to take its place, the fishing monopoly formerly given to only a few privileged fishermen was done away with, and at the

same time the excis duty stations were abolished. All the fishermen were allowed to engage in the fishery, and the Government adopted, moreover, a certain arrangement for advancing loans at a low rate of interest to the fishermen, with the object of encouraging the business and also of attracting to the island settlers from other parts of the country. The discontinuation of this loan system on the abolition of the Colonial Office and the inauguration of the local administration system placed the fishermen in an embarrassing situation. Even at present they are obliged in order to obtain their working funds, to have recourse to loans at exorbitant rates of interest, and often they have to pledge beforehand the anticipated catch of the season.

Dependant Condition of Fishermen. Under the circumstances, the lion's share of the profits coming from the fishery goes into the pocket of money-lenders, and it is hardly possible to expect the development of the industry while things continue in this condition.

Economy of Herring Fishery. The number of nets used and the number of capitalists engaged in the herring fishery in Hokkaidō are as follows :—

Year.	Nets.			Fishermen.			Total.
	Pound-Nets.	Gill-Nets.	Other-Nets.	Pound-Nets.	Gill-Nets.	Seines.	
1895	5,088	298,080	279	2,920	10,445	229	13,594
1896	5,099	280,800	314	2,801	10,045	203	13,049
1897	6,161	304,920	315	3,020	11,201	230	14,451
1898	6,302	361,440	341	3,404	12,261	246	15,901

No reliable data about the proceeds and investments of fishery exist, the only returns available for the purpose being those on the proceeds and taxes. These data are as follows :—

(Inquiries based on 86 fishing guilds out of the 124 existing in Hokkaidō.)

Proceeds	7,216,359
Taxes and Public Burdens	391,882
Fishery Tax	274,801
Sundries Incidental to Paying Taxes	21,505
Guild Expenses	39,541
Village Expenses	56,034

The rate per capita of 39,259 members of the guilds is as follows :—

Proceeds	183.00
Taxes... ..	9.98

For obtaining so much proceeds the fishermen required funds amounting to about 9,300,000 *yen*. This is based on the estimate that the sum of 9 million *yen* is used on account of consolidated and working funds, exclusive of the sum required on account of public burdens; and on the estimate that the former form about a third of the sum, and the other the remaining two-thirds. The working funds amounting to 6 million *yen* are generally obtained by loans, and this view has been borne out by the inquiries made into accounts of 88 guilds out of the total 124. The result of the inquiries was as follows:—

FISHERY FUNDS.

	<i>yen.</i>
Funds Comings out of the Fishermen's own Pockets	4,333,767
Funds Obtained by Loans... ..	5,369,926
Loans from the Guilds	2,590,396
Loans from Capitalists Engaged in other Lines of Business in	
Hokkaidō	2,287,224
Loans from other Parts of Japan	492,304
	<hr/>
Total... ..	9,703,693

The following estimates show the accounts of the capital required for one set of pound-net used in the herring fishery:—

	1st class.	2nd class.	3rd class.	4th class.	
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	
Consolidated Funds.	{	Nets, Boats, Tools, etc.	2,500	3,081	
		Construction of Boats and Ships... ..	2,500 {	1,500	
		Purchase of one Fishing ground... ..		500	
		Buildings	1,500	} 4,319

	Ropes, Mats etc.	55		
	Rent of Curing-Grounds	150		
	Total	700		
Grand total		1,250	1,300	1,275

The herring fishery business is, as circumstances stand at present in Hokkaidō, placed in a disadvantageous situation, for during the fishing season which lasts for only two or three months, laborers have to be engaged at comparatively higher rate of wages than they ordinary receive, in addition to which they are to be fed at the expense of employers. Money being very urgently needed and very scarce, the rate of interest demanded is generally exorbitant as shown in the following table:—

Year.	Average rate in Tokyo and Osaka.	Average Bank rate at Hakodate and Osaka.	Average Interest for a Loan of over 1,000 <i>yen.</i>				
			On Negotiable Security.	On Real Estate.	On Marine Products.	On Boats.	On Credit.
			%	%	%	%	%
1895	9.7	12.6	11.6	12.2	12.2	16.4	12.0
1896	9.7	11.0	10.6	11.3	10.9	15.6	10.7
1897	9.9	11.7	11.1	11.8	11.4	12.8	11.1
1898	11.2	12.8	—	—	—	—	—
1899	9.8	11.3	—	—	—	—	—
Average	10.1	11.9	11.1	11.8	11.5	14.9	11.3

If the funds required demand such high rate of interest, the process of curing fish adopted in Hokkaidō is similarly beset with disadvantages. The kettles used in the process do not, for instance, admit of the use of coal. Fagots, far more costly than coal, have to be used, and of course the business of manufacturing marine products leaves therefore only a narrow margin of profit. If, however, the Hokkaidō fishermen were able to procure cheaper money for their consolidated capital and were able to devise at the same time some means of curtailing the working expenses and cost of production, and if on the other they were to inaugurate a new departure in the manufacture of smoked or salted marine products suitable for the foreign market, the industry would be sure to be attended by far greater prosperity than it is at present.

VI. AQUICULTURE.

PRINCIPAL FISH REARED.—Aquiculture is now extensively carried on both in fresh water and in the sea. In fresh water, the raising of carp, snapping turtle, trout, grey mullet, and eel, are most important enterprises, while in the sea the culture of oyster, clams, and the "*Amanori*" is regarded as being the most profitable. In the case of carp and turtle the culture begins with the egg, while in that of grey mullet and eel the fries are let in the rearing-pond. In artificial fecundation of oyster and pearl-oyster (avicula), different kinds of collectors are placed in the water to obtain the spats. In the cultivation of the "*Amanori*" (*Porphyra*) fascines are used to furnish the proper place for the attachment. The inland seas near Tokyo and Hiroshima are noted for this culture of the algae.

AREA AND CONDITION OF HATCHING BEDS.—The following table shows the area of ponds and beds of aquiculture and the value of the fish artificially cultivated:—

	Honshu.	Shikoku.	Kyūshu.	Hok'dō.	Total	
Snapping Turtle.	{ area (<i>tsubo</i>).	13,112	—	219,094	—	232,206
	{ value (<i>yen</i>).	7,698	—	647	—	8,345

	{ " (")	677,578	1,497	65,569	253	744,897

Many hatcheries of salmon and trout exist in Japan, and of these the Government Chitose hatchery in Hokkaidō is the largest. Recently over 10 million salmon fries were hatched at this hatchery. In Hokkaidō there are many private salmon hatcheries, and the liberation of the fry is being extensively carried on. In the northern districts of Honshu, *i. e.*, in the prefectures of Niigata, Akita, and Aomori, salmon hatcheries may be found in many places. The number of salmon fry liberated in those districts are as follows:—

Year.	Chitose (Hokkaidō).	Niigata-ken.	Akita-ken.	Total.
1892	3,626,415	—	—	3,526,415
1893	7,355,640	—	—	7,355,640
1894	2,700,729	—	—	2,700,729
1895	8,549,598	—	—	8,540,598
1896	6,984,178	—	404,989	7,389,167
1897	3,815,588	—	368,952	4,184,540
1898	7,881,222	—	339,466	8,220,688
1899	10,453,486	2,752,145	168,756	13,374,387
1900	10,190,355	2,854,197	334,394	13,378,946
1901	12,665,214	4,330,992	340,000	17,336,206

The rearing of trout is also carried on in many places throughout the country.

VII. SALT-REFINING.

IN JAPAN PROPER.—The salt used in Japan is mostly derived from sea-water, from which it is extracted either by means of the sun's heat alone or by sun's heat supplemented by artificial heat. The mineral salt produced in Japan is hardly worth mentioning, it being extremely small in quantity.

The refining business dates back for more than 20 centuries, for the natural advantage enjoyed by Japan in the manufacture of this essential ingredient of food enabled our people to carry on the business almost everywhere. At

present the work is carried on in no less than 34 prefectures besides Formosa, and the people engaged in the business number over 100,000.

The output differs according to the year, but on an average it reaches about 6 million *koku*. Here is a table giving statistics with regard to industry:—

Year.	Area of Field. <i>cho.</i>	No. of Kettles.	Output. <i>koku.</i>	Output. <i>yen.</i>
1891	7,442.3	16,795	5,507,097	4,075,742
1892	7,483.6	17,293	5,655,795	3,584,093
1893	7,600.1	17,010	6,649,263	3,659,353
1894	7,721.5	17,144	6,325,891	3,483,078
1895	7,507.0	16,253	5,995,052	3,866,674
1896	7,578.3	16,547	5,235,024	7,620,616
1897	7,841.3	18,452	6,178,094	10,104,771
1898	7,906.8	19,075	6,364,979	8,218,514
1899	7,639.8	16,188	5,811,021	7,542,942
1900	7,774.2	17,584	6,591,078	9,388,694

The districts bordering on the Inland Sea produce about eight-tenths of the whole output produced in Japan proper, Kyūshū produce one-tenth approximately, and the rest the remaining one-tenth.

IN FORMOSA.—In Formosa this industry promises to become far more prosperous than in Japan proper, owing to the greater

natural advantages enjoyed by it in this connexion. The figures for the two years specified are given below:—

Year.	Area (<i>cho</i>).	No. of Person Engaged.	Output (<i>koku</i>).
1898	168	1,122	19,726
1899	260	1,336	132,337

It may be added that the industry in that island has had a remarkable development since 1899, though the precise figures in the late years are not yet forthcoming. Salt is now a state monopoly in the island whence an enormous quantity is shipped to Japan proper.

REFINING PROCESSES.—Of the two methods of refining the natural heat system is extensively adopted in Formosa. This process does not practically differ from that seen in some Western countries. To give a brief description of it a circular embankment enclosing a certain empty space is first constructed in the shoal. The space within this embankment is divided into two sections, one being used for concentrating the brine and the other for crystallization. The sea-water is first led into the concentration pond, where it is left to evaporate. After the proper degree of evaporation has been reached, it is next led into the crystallization pond. On further evaporation the salt contained in the water deposits itself on the sand. These deposits are then raked off and conveyed to a store-house. In some parts of northern Formosa a method resembling very much that adopted in Japan proper is followed.

There are two methods of extracting salt by artificial heating from the sea-water, one being called “Agehama” (up-shore style) and the other “Irihama” (in-shore style). The latter is far more popular than the other, and indeed about 90 per cent. of all the salt produced in Japan proper is produced by the “in-shore style.” This style resembles very much the Formosan style. First a suitable plot is marked out on the beach on the occasion of the ebb-tide and is enclosed by embankments. When the sea-water which is let into the plot, has sufficiently evaporated, that is, has evaporated to such an extent as to

cause it to deposit the saline matter it contains, the deposits are collected and transferred to a box-shaped vessel made of either mud or wood. Sea-water is then poured upon the vessel and the thick saline liquid thus obtained is kept in a reservoir, to be afterwards heated in a kettle and evaporated. Sometimes the vessel is dispensed with, and in place of it a basket and a receptacle, generally a pail, are used. This style is commonly used in the salt-fields along the shores of Tokyo Bay.

In the "Up-shore system," the sea-water is sprinkled repeatedly on the shore up the beach; the sand charged with saline ingredients is put into a suitable vessel on which a quantity of sea-water is poured. A thick brine is thus produced and on its being heated, the evaporation causes the salt held in suspension to be deposited.

As the salt industry carried on in Japan was regarded as imperfect in several respects, the Government caused the matter to be inquired into some years ago, and at last in 1898, a model salt refinery was established at Tsudamura, Chiba-ken, and another at Matsunaga, Hiroshima-ken.

VIII. MARKETS.

(A). HOME MARKETS.

GENERAL REMARKS.—As already mentioned in the preceding sections, the gross value of catch of fish in Japan is estimated at about 60 million *yen* a year. Of the manufactured marine products, the dried bonito, guano, salted or dried fish and shell-fish, and seaweeds are principally consumed at home.

VOLUME OF HOME CONSUMPTION.—It is not possible to estimate with anything like accuracy the gross quantity and the value thereof of fish and marine products consumed at home either fresh or in a cured form. However as 8 million *yen* worth of manufactured products out of the total 28,900,000 *yen* is exported abroad, the consumption at home may be roughly estimated at 20,900,000 *yen*, broadly divided as follows:—

	<i>yen.</i>
Dried Bonito and Substitutes	3,464,415
Guano	9,029,457
Dried or Salted Fish or Shell-Fish	8,430,200
Sea-Weeds	1,311,161

I. RAW-FISH MARKETS.

GENERAL REMARKS.—Data are not available as to the amount of fish, etc. consumed in a fresh state, but that this comes up to a large amount admits of no doubt, in view of the great extension of the market recently owing to the improvement of the means of communication. Raw fish come even from Korea to some parts of Japan. Some idea as to the quantity of raw fish consumed at home may be obtained from the statistics of our principal fish-markets. The following gives the value of the raw fish that were sold in those markets in 1896:—

	<i>yen.</i>
Tokyo	3,708,896
Ōsaka	1,479,985
Atsuta (Nagoya)... ..	473,865
Hakata... ..	220,385
Shimonoseki	169,152

The condition of delivery and distribution were as follows at those markets:—

TOKYO (1900).

Imports.		Exports.	
Value.	Delivery.	Value.	Distribution.
<i>yen.</i> 3,708,896	Bōshū 43%	<i>yen.</i> 3,708,896	Tokyo 80%
	Sagami... .. 7.9%		
	Izu 12.0%		
	Suruga 12.0%		
	Kazusa... .. 4.9%		
	Mito and Chōshi ... 12.0%		
	Hokkaidō and San-Riku 8.2%		To provinces 20%

ŌSAKA (1901).

Imports.		Exports.	
Value.	Delivery.	Value.	Distribution.
1,479,985 <i>yen.</i>	Kishū 25%	1,479,985 <i>yen.</i>	Ōsaka and suburbs ... 95%
	Shikoku 20%		Yamato 4%
	Chūgoku 20%		
	Kyūshū 20%		
	Near Shores 6%		
	Izumi 6%		
	Korea 3%		

ATSUTA (1896).

475,865 <i>yen.</i>	Miye 25%	131,238 <i>yen.</i>	Nagoya 10%
	Shizuoka 10%		Gifu 30%
	Chiba 7%		Shiga 30%
	Fukui 5%		
	Ōsaka 8%		
	Near Shores 35%		
		Nagano 20%	

HAKATA (1896).

220,385 <i>yen.</i>	Korea 20%	179,083 <i>yen.</i>	Kumamoto 30%
	Nagasaki 40%		Ōsaka, Yamaguchi ... 10%
	Near Shores 40%		Saga, Ōita 10%
			Fukuoka 50%

SHIMONOSEKI (1896).

169,152 <i>yen.</i>	Nagasaki 40%	161,547 <i>yen.</i>	Ōsaka 25%
	Satsuma 10%		Kyoto 30%
	Tsushima 10%		
	Hirado 15%		Okayama 15%
	Karatsu 5%		
	Wakamatsu 10%		
	Near Shores 5%		Buzen 10%
Gotō 5%	Iyo 20%		

The market price necessarily differs according to locality, but some ideas on this point may be gathered from the following quotations:—

AVERAGE PRICE, (*yen*) PER 10 *kwam*. (1901.)

	Pagrus.	Tunny.	Scorgero- morus.	Halibut.	Mackerel.	Bonito.	Sardine.	Grey Mullet.	Yellow- Tail.
Tokyo	15	11	9	9	7	8	—	—	6
Ōsaka	22	9	11	17	8	10	6	8	9
Shimonoseki	15	10	14	11	9	8	5	8	9
Yonago	9	—	13	4	4	—	3	6	10
Atsuta	18	13	18	10	—	—	—	—	7
Average	16	11	13	10	6	9	5	7	8

The market shows the upward tendency owing to the greater demand, as shown from these figures based on the market in Ōsaka :—

Year.	Amount Delivered. <i>yen</i> .	Sale by Whole- sale Dealers. <i>yen</i> .	Sale by Middlemen. <i>yen</i> .
1892	1,552,650	607,915	202,436
6897	1,241,654	1,379,615	459,422
1901	1,479,985	1,655,538	551,294

MARKET PRICE OF RAW FISH PER 10 *kwam*.

	1892. <i>yen</i> .	1897. <i>yen</i> .	1901. <i>yen</i> .
“ Tai ” (Pagrus)	15.00	18.00	20.00
Tunnies	6.00	7.50	8.50
Yellow-Tail	7.50	8.50	9.50
Bonito	6.30	8.50	9.50
Shark... ..	4.80	5.50	6.50
Lobsters and Prawns	7.50	9.00	11.00

II. CURED FISH MARKETS.

Of the cured marine products the “ Fushi ” is the most important, this being a dried flesh of various kinds of fish and extensively used for cooking purpose throughout the country.

“FUSHI.”—There are several kinds of the *Fushi* (dried and smoked fish just like dried bonito), these being bonito *Fushi*, tunny *Fushi*, mackerel *Fushi*, and *Fushi* made of miscellaneous fish. The principal centres of bonito *Fushi* and their output in 1900, were as follows :—

	Output.	Value.
	<i>kwam.</i>	<i>yen.</i>
Shizuoka	343,598	702,961
Chiba	303,574	675,591
Miye	221,879	868,047
Kagoshima	189,111	323,038
Fukushima	183,352	448,212
Kōchi	159,847	584,702
Ibaragi	108,428	255,177
Others	462,671	1,023,575
	<hr/>	<hr/>
Total... ..	1,972,460	4,881,303

Places and output in 1900 of tunny *Fushi* were as follows :—

	Output.	Value.
	<i>kwam.</i>	<i>yen.</i>
Miyagi	49,384	83,502
Ehime	39,470	81,432
Kagoshima	20,475	20,906
Iwate	13,238	17,617
Wakayama	12,322	20,147
Others	29,606	65,206
	<hr/>	<hr/>
Total	164,495	288,809

The principal markets of *Fushi* are Tokyo and Ōsaka. The delivery and distribution in the two places were as follows in 1896 :—

TOKYŌ.

Imports.			Exports.		
Quantity.	Value.	Percentage of	Quantity.	Value.	Percentage of
<i>kwan.</i>	<i>yen.</i>	Delivery.	<i>kwan.</i>	<i>yen.</i>	Delivery.
617,244	1,230,593	Kōchi 3%	617,244	1,230,593	Tokyo 23.0%
		Kagoshima... 18%			Gumma 10.0%
		Shizuoka ... 14%			Nagano 12.9%

	Ishikawa				

III. FISH-FERTILIZERS.

OUTPUT AND KINDS OF FISH-FERTILIZERS. — The principal centres of fish guano and their output are as follows:—

HERRING (1900).

	Quantity.	Value.
	<i>kwan.</i>	<i>yen.</i>
Hokkaidō... ..	5,725,620	1,197,385
Others	24,171	6,947
Total	5,749,791	1,204,332

GUANO (Herring and Sardine).

	Quantity.	Value.
	<i>kwam.</i>	<i>yen.</i>
Hokkaidō	22,936,920	5,806,765
Aomori	1,049,517	328,472
Chiba	876,030	424,254
Aichi	492,483	169,860
Total	25,354,950	6,809,351

DRIED ANCHOVY.

	Quantity.	Value.
	<i>kwam.</i>	<i>yen.</i>
Chiba	2,220,052	554,510
Shizuoka	569,322	30,270
Nagasaki	423,402	95,864
Kanagawa	250,400	429,800
Others	1,019,842	289,875
Total... ..	4,483,018	1,400,319

The conditions of the delivery and distribution of fish-fertilizers on the markets of Tokyo, Ōsaka, and Hyogo were as follows in 1900:—

TOKYO.

Value.	Percentage of Delivery.	Value.	Percentage of Distribution.	
<i>yen.</i>		<i>yen.</i>		
2,997,659	Hokkaidō 74%	2,862,845	Tokyo... .. 21.2%	
	San-Riku 10%		Chiba 17.7%	
	Near-Shores 16%		Ibaragi, Tochigi } 30.2%	
				Gumma, Miyagi }
				Nagano, Yamanashi }
	Kanagawa, Shizuoka, } 28.8%			
	Aichi, Miye }			
	Others 2.1%

DEMAND ON FISH-FERTILIZERS.—The market of fish-fertilizers has lately gone up to a marked degree owing to the fact that the supply has not kept pace with the demand which went on advancing. This inequilibrium between supply and demand is due to the fact that in consequence of the greater improvement of facilities of transportation, and the better means of sending raw fish to the market, it is now found more profitable to sell fish as raw fish instead of selling it as fertilizer. To fill the gap thus occasioned in the supply of fish-fertilizers a large quantity of bean-cakes has begun to arrive in Japan from North China. The following table will show the movement of our fish-fertilizers and of Chinese bean-cakes during the ten years ending 1900:—

Year.	Home-Made Fish Fertilizers.		Chinese Bean-Cakes.	
	Quantity. <i>kwam.</i>	Value. <i>yen.</i>	Quantity. <i>kwam.</i>	Value. <i>yen.</i>
1891	34,070,628	4,914,188	4,116,592	350,816

Average ...	38,891,592	7,592,450	20,282,109	2,524,415

IV. DRIED OR SALTED FISH.

OUTPUT AND KINDS OF DRIED OR SALTED FISH.—The quantity of dried or salted fish going abroad is as yet insignificant, and they may be regarded as being practically all consumed at home. The places where the principal products of this kind are produced and the output thereof are shown below:—

DRIED ANCHOVY.			
	<i>yen.</i>		<i>yen.</i>

A brief description of principal marine products for export will be given in the following paragraphs:—

1. CUTTLE-FISH.—There are three kinds of cuttle-fish of commercial value, these being “Surume-ika” (*Ommastrephidae*), “Kabuto-ika” (*Sepia*) and “Kensaki-ika” (*Loligo*). The *Sepia* is generally used raw, and only the other two varieties, especially *Ommastrephidae*, are dried. The *Sepia* lives most in bays or inland seas while the other kinds are caught in Kyūshū, Sado and Ōki in the Sea of Japan, and also along the coast of Aomori, Iwate, Miyagi and Hokkaidō. The dried cuttle-fish goes extensively to China, as shown in the following returns giving the average for the ten years ending 1901:—

	<i>kin.</i>	<i>yen.</i>
Hongkong	6,044,123	1,071,078
China	1,186,606	190,606
Others	85,538	15,254
	<hr/>	<hr/>
Total	7,316,267	1,276,938

2. BECHE DE MER.—This is a boiled and dried sea-cucumber and is highly relished by the Chinese. Besides the Japanese product, that caught along the Siberian coast and the South Pacific also goes to China. The South Pacific variety is whitish and devoid of cutaneous projections, while the *Bêche de mer* from Japan and Siberia is black and has projections. It is found mostly in Hokkaidō and along the north-eastern coast of Honshū.

Average yearly export during the said ten years was:—

	<i>kin.</i>	<i>yen.</i>
China	801,378	292,545
Hongkong	71,491	21,542
Others	2,430	2,883
	<hr/>	<hr/>
Total	875,299	316,970

3. SHARK-FINS.—Dried shark-fins are regarded as a dainty by the Chinese. There are two kinds of fins, grey and black, the grey commanding higher price than the other. The fins come in the largest quantities from Oita and Yamaguchi, and our fishermen also cross over to the Korean coast to fish for sharks or rather for their fins:—

	<i>kin.</i>	<i>yen.</i>
China	221,149	83,245
Hongkong	107,150	37,440
Others	12,871	7,238
	<hr/>	<hr/>
Total	341,170	127,923

PRINCIPAL SALTED OR DRIED FISH THAT GO ABROAD.

(1). SALMON AND TROUT.

	<i>kin.</i>	<i>yen.</i>
Hongkong	1,335,741	77,538
China	12,468	609
Others	24,700	1,712
	<hr/>	<hr/>
Total	1,372,909	79,859

(2). DRIED ANCHOVY.

	<i>kin.</i>	<i>yen.</i>
Hongkong	751,073	34,470
China	20,097	823
Others	10,626	525
	<hr/>	<hr/>
Total	781,796	35,818

4. OTHER SALTED OR DRIED FISH.—Salted or dried fish, mostly in the latter form, that are exported abroad mostly go to Southern China. The *Tatsukuri* and cod constitute the bulk of the exports. Other fish of a cheap kind also go there. The recent advance in prices on the fish market stands very much in the way of the greater export of this kind of fish. An attempt is now being made to export salted herring and if this proves satisfactory salted herring will become an important item of export:—

	<i>kin.</i>	<i>yen.</i>
Hongkong	281,444	14,206
China	137,650	8,103
Hawaii	149,921	17,355
United States	17,587	2,336
Korea	237,194	6,771
Others	16,112	1,658
	<hr/>	<hr/>
Total	839,903	50,429

5. DRIED PRAWNS.—Several varieties of prawns belonging to the genus *Penaeus* are boiled and deprived of their shell, and these are known on the market by the common name of dried prawns. The prawns are mostly caught along the shores of the Inland Sea and also in Kyūshū. Dried prawns are mostly destined for China.

	<i>kin.</i>	<i>yen.</i>
Hongkong	780,552	128,257
China	590,307	91,503
Others	406,146	3,037
Total	1,777,005	222,797

6. EAR-SHELL.—This is one of the most favorite marine products with the Chinese, and the export to America is to supply the demand of the Chinese residents there. An export trade has recently sprung up in tinned ear-shells, but the quantity exported is unknown.

	<i>kin.</i>	<i>yen.</i>
Hongkong	885,292	367,629
China... ..	96,414	38,874
United States	24,104	13,991
Others... ..	12,716	104,035
Total	1,018,526	426,976

7. KAINOHASHIRA.—This is the dried abductor muscle of the several varieties of scallop of the genus *Pecten*.

	<i>kin.</i>	<i>yen.</i>
Hongkong	158,749	51,056
China	152,141	50,197
Others... ..	7,201	2,782

England	1,495
Others... ..	1,093
	—
Total	1,869

The “Yako-gai” grows in the sea surrounding the Okinawa Islands Its shell and that of *Heliotis* and *Avicula* supply important materials for ornamental work.

13. “KOMBU” (*Laminaria*).—Several varieties of *Laminaria* grow on the shores of Japan, especially in Hokkaidō and the south-eastern districts of Honshu. The “long Kombu” (*Laminaria angustata*) is exported most of all. The “Kombu” sliced into small threads is extensively used by our people and also to some extent by the Chinese. Shanghai is the principal market, whence the goods are sent to the districts along the Yangtze. The export to northern China is not so great, owing to the fact that the goods produced in Siberia and Manchuria being somewhat cheaper than those from Japan are much in demand there.

“KOMBU.”

14. "KANTEN," (*Colle Vegetable*).—This is made by dissolving the sea-weed *Tengusa* in water. After the refuse is removed the gelatinous infusion is exposed to the cold weather at night and made to congeal. In the daytime this congealed substance is exposed to the sun to make it less watery. "Kanten" is consumed at home and is also exported abroad. The Chinese use it as food, while in the West it is used as a substitute of isinglass and for starching woven goods or for removing the sediments of liquors. The "Kanten" is produced at Ōsaka, Kyoto, Hyogo and Nagano.

A brief description of the principal imported marine products will be given as follows :—

1. SALTED-FISH.—The most important variety of salted fish imported into Japan is salmon. It comes from Russian Siberia and

British Columbia and the United States of America, and generally from the Japanese fishermen who are doing business in those countries to a large extent.

10 YEARS' AVERAGE (1892—1901).

	<i>kin.</i>	<i>yen.</i>
Russian Siberia	11,713,498	566,851

Others... ..	292,727	12,382
	<hr/>	<hr/>
Total	12,988,908	640,381

2. FERTILIZERS.—Herring guano comes chiefly from Russian Siberia and dried anchovy from Korea, both through the hands of Japanese fishermen and merchants. Tho import was formerly free of duty, but in consequence of the enforcement by the Russian authorities of restrictive measures in regard to the fisheries conducted by Japanese fishermen along the Siberian coast, our Government passed some time ago a law imposing an *ad valorem* duty of not more than 50 per cent. on salted fish and guano coming from Siberia and Saghalien. The tariff has not yet been enforced owing to the relaxation of the Russian restrictive measure.

IX. FISHERY LEGISLATURE.

GENERAL REMARKS.—Legislature and institutions pertaining to fishery are as yet comparatively imperfect, as these things have generally been regulated in accordance with ancient usages. This primitive method of regulations having given rise to various troubles the Government put in force from July 1902 the Law of Fishery. At the same times steps were taken for encouraging deep-sea fishery, and state aids have also been granted for the encouragement of fishery education. The matters will be briefly described below.

USAGES AND LEGISLATURE ABOUT FISHERY.—Various usages have existed about fishery-grounds. In general the grounds in the foreshores of fishing village or villages were regarded to belong to those villages. The inhabitants of farming villages situated along the sea shore did not in general care much about the grounds except perhaps for sea-weeds used as manure. The grounds in the foreshore of such villages were therefore left to the exploitation of neighboring fishing communities. With the increase of the fishing population and owing also to the fact that even farmers began to assert their own rights in regard to the foreshores, fishermen were compelled to extend their field to work even to grounds belonging to others, and this very frequently led to trouble. To minimize these troubles the Tokugawa Regency made an enactment in 1741 to the effect that the right of fishing and collecting weeds in the space lying within a line stretched from one headland to another should belong to the farmers living along the shores, but that the right of fishing and collecting weeds in the outer space should be enjoyed in common by the fishermen of all provinces. No fishing community should be allowed to interfere with the collection of weeds by farmers and no farming community should be allowed to interfere with fishing by fishermen. Fishing along the shores should be regulated according to the old usages, but fishing in the open sea should be open even to those who were new to the work.

Certain fees were charged at times for the privilege of the exclusive use of shores, while fishermen eligible for service in the maritime service of the Government were given similar privilege.

This simple regulation established by the Tokugawa Regency was generally adopted by the feudal princes governing seaside domains.

With the Restoration, the practice of exacting fees was abolished and the seas were declared to belong to the State. In all other respects the Government left the matter to be regulated according to existing usages and customs. Coming to 1886 the fishery guild regulations were enacted, but soon this simple legislature proved inadequate to deal with troubles constantly occurring among fishermen, and at last the law in question was promulgated with the consent of the Diet.

ENCOURAGEMENT OF DEEP SEA FISHERIES.—The law for the encouragement of deep sea fisheries was issued in 1897 and State

aids are now granted according to the tonnage of the ships employed in the work and to the number of the crew, provided such ships, whether steamers or sailing ships, engage in specified kinds of fishery approved of by the Government. The development of deep sea fisheries since the enforcement of the law may be inferred from the following table:—

Year.	No. of Ships.	Tonnage.	Sum of State aids.
			<i>yen.</i>
1898	1	90	680
1899	14	1,313	16,240
1900	17	1,888	25,260
1901	22	2,042	28,035

JAPANESE FISHERY ENTERPRISE IN KOREAN WATERS.—Our fishermen were engaged in fishery in Korean waters even before the Restoration, and as their number had grown more and more numerous the Government made special arrangements in 1883 and 1890 with the Korean Government to protect them in their pursuing this business there. In 1897 these fishermen established their own association at Fusan, while in 1900 the Government commenced to grant state aids to the guild established by these men.

ENCOURAGEMENT OF FISHERY BY THE LOCAL AND CENTRAL AUTHORITIES.—The matter relating to encouragement of fishery by the local offices recently made a marked progress. In 1887 the disbursements from the local treasury on account of fishery business amounted to only 1,531 *yen* throughout the land. The sums swelled to 360,000 *yen* in 1901 as shown in the following table:—

Year.	Fishery Expenditure.	Year.	Fishery Expenditure.
	<i>yen.</i>		<i>yen.</i>
1887	1,531	1895	31,593
1888	9,359	1896	50,468
1889	2,860	1897	62,427
1890	6,185	1898	71,687
1891	11,011	1899	108,687
1892	13,475	1900	188,911
1893	28,861	1901	320,417
1894	19,282	1902	360,043

In the foregoing disbursements the appropriation to fishery experimental laboratories and training schools amounted to most, as shown below:—

Year.	Experimental Laboratory.		Training School.		Total.	Expenses. <i>yen.</i>
	New.	Already existing.	New.	Already existing.		
1894	1	1	—	—	2	1,175
1895	1	2	—	—	3	2,715
1896	—	2	—	—	2	2,998
1897	—	2	—	—	2	3,779
1898	1	3	2	2	5	12,336
1899	4	7	—	2	13	34,685
1900	11	18	2	4	35	144,006

1902	4	24	—	4	32	235,643
Total ...	24	79	4	16	123	667,091

The laboratories and schools are allowed to participate in the state aids set apart, as described in the chapter of agricultural education, for encouraging agricultural education:—

Year.	Experimental Laboratory.		School.		Total.	
	No.	Aids.	No.	Aids.	No.	Aids.
	<i>yen.</i>		<i>yen.</i>		<i>yen.</i>	
1900	7	12,200	1	1,200	8	13,400
1901	18	26,000	4	3,900	22	29,900
1902	21	40,100	4	5,200	25	45,300

FISHERY EDUCATION.—The progress of fishery education has been very slow compared with that of agriculture and commerce. About 1889 a course of fishery was created for the first time in the Agricultural College at Komaba, but it was discontinued shortly after. The Fishery Training School of the Japan Fishery Association did much to diffuse knowledge in regard to this important branch of knowledge among the people, and during the ten years of its existence, for it was converted in 1897 into a Government institution, it turned out several hundreds of graduates. Of late, in consequence of the encouragement extended to fishery education by the Government, it has attained a striking improvement, as shown in the appended table:—

District.	Fishery School.		Training School.		State Aids.
	No.	Expenses. <i>yen.</i>	No.	Expenses. <i>yen.</i>

ASSOCIATIONS AND PUBLIC BODIES ON FISHERY.—Of the fishery associations and public bodies the Japan Fishery Association and the Japan Salt Association are the most important. The former was organized in 1883 and contains 5,216 members. It produced, as mentioned above, a large number of graduates in fishery, and in general acts as the headquarters of marine industry of the country. The other body was organized in 1896 with the special purpose of improving the salt industry. The members number 2,600. Both are publishing monthly proceedings. There are besides fishery societies of local importance, and also fishery guilds and sale guilds created in consequence of the Fishery Law.

PART III.

MANUFACTURING INDUSTRY.

CHAPTER I.—General Manufacturing Industry.

History—Administration—Legislative Measures—Principal Exports of Manufactured Goods—Principal Imports of Industrial Goods—Output of Principal Manufactured Goods.

I. HISTORY.

BEFORE THE RESTORATION.—During the peaceful time of the Tokugawa régime, the manufacturing industry received from the feudal princes and the Shogunate itself protection and encouragement. The Shogunate too resumed with Korea the friendship that had been interrupted for some while, connived at our people carrying on secretly commercial transaction with Chinese merchants; and even permitted them to expand similar transaction with the peoples of Annam, Siam, Luzon, India and various countries in the Southern Seas, also with Portugal, Spain, England, Holland and Mexico. The first dawn of our industrial development may be ascribed to this commercial relations with foreign countrymen. In these days many foreign ships used to visit the ports of Kagoshima, Hakata, Goto, Hirado, Sakae, and Nagasaki to trade with our people, while not a few of the latter also crossed over on a similar mission to Siam, Luzon, and several places in the South Seas. It is hardly necessary to state that this contact with foreigners and the trade with them largely contributed either directly or indirectly to the development of our industry. The prohibition suddenly enforced from political consideration during the

Benefit of Foreign Intercourse. era of Kwan-ei, (1704—1710 A.D.) on this foreign trade and intercourse did serious harm to our trade and industry, and hence on our prosperity. One thing that was fortunate was that the prohibition was not absolute, and the two countries of China and Holland were allowed to continue their commercial transactions with us as before; so that the merchants of these two countries brought to Japan foreign goods through the port of Nagasaki which was at that time the only open market in Japan. The permission reserved to the Netherlanders was matter of special importance to our country, serving as it did the connecting link of introducing Western civilization into Japan.

SITUATION OF THE INDUSTRY AT THE TIME OF THE RESTORATION.—As mentioned above, manufacturing industry found congenial atmosphere for its development during the tranquil period of the Tokugawa régime, and indeed many were the industrial articles that were then either improved or newly invented. Principal manufacturing districts and their staple produce were as follows about the time of the Restoration:—

1. **RAW SILK.**—Musashi, Kozuke, Shinano, Kai, Mutsu, etc.
2. **SILK FABRICS.**—Nishijin in Kyoto, (relief silk), Kiri, Ashikaga, Isezaki, Hachioji (plain silk) Kai (“Gunnai-kaiki”) Fukushima (plain silk), Akita (relief silk), Yonezawa (figured silk), Tango, and Nagahama (crêpe silk), Kawagoe (“Nanako”), Hakata (sash) Sendai (skirt for men) etc.
3. **HEMP FABRICS.**—Nara (breached cotton goods), Echigo (“Jofu” goods), Omi (general hempen fabrics and musquito nets), etc.
4. **COTTON FABRICS.**—Kokura (“Kokura-ori”), Kurume (“Kasuri”) Satsuma (“Kasuri”), Yamato (“Kasuri”), Iyo (“Kasuri”), Kawachi and Mikawa (white cotton cloth), Shimotsuke (Maoka cotton cloth).
5. **PORCELAIN.**—Kyoto (Awada and Kiyomizu ware), Owari (Seto-ware), Ise (Banko-ware), Kaga (Kutani-ware), Izumo (Rakusan and Fushina-ware), Awaji (Minpei-ware), Chikuzen (Takatori-ware), Hizen (Arita-ware), Satsuma (Satsuma-ware), Iwaki (Soma-ware), Bizen (Imbe-ware), etc.
6. **LACQUERED-WARES.**—Kyoto (art ware), Noto (Wajima-ware), Kaga (Kanazawa and Yamanaka-ware), Kii (Kuroe-ware), Iwa-

shiro (Aizu-ware), Wakasa (Wakasa-ware), Mutsu (Tsugaru-ware), Dewa (Noto-ware), etc.

7. COPPER WARE.—Kyoto, Kaga, Takaoka, etc.

8. JAPANESE PAPER.—Kyoto, Suruga, Echizen, Mino, Iwami, Tosa, etc,

Other important ware and goods besides those mentioned were gold lacquered ware, carved ware, cutlery, cast iron ware, wood or bamboo or leather ware, mattings, *sake*, and soy.

AFTER THE RESTORATION.—The Restoration has inaugurated a new epoch in our manufacturing industry, and this change was especially marked in regard to the introduction of labor saving machines. Not that their use was unknown before the Restoration; on the contrary even prior to that period their use was encouraged by not a few feudal princes, especially in connection with cotton spinning and weaving. But it was only after the Restoration that the Government made a systematic effort to encourage the use of machinery in the manufacturing industry and established model workshops and factories for that purpose. This official effort was eagerly welcomed by the people who began to make extensive use of machines in the business of manufacturing raw silk. Other industries in the similar line many of which were new to Japan, were cotton and silk spinning, weaving, shipbuilding, iron industries of various sorts, the manufacture of cement, glass, bricks, **New Industries.** matches, paper of foreign style, tobacco, and beer, the refining of sugar, the preparation of india-rubber, the making of paint, artificial fertilizers, coal, gas, coke and the carrying on of electric industries of various sorts, &c. &c. In the manufacturing industry as carried on by hand the introduction of Jacquard, Butten, and other kinds of looms, and the introduction of such dye-stuffs as aniline, alizarine, etc., have imparted a powerful impulse to the development of weaving and of dyeing. In a similar way the use of Western style of kiln and of Western pigments, and the use of gypsum mould and copper lithograph have opened a new path of development for our ceramic industry. The progress too of the fancy-mat making and of the making of straw-plaits has been something striking and the goods as are now turned out for foreign markets display a highly finished workmanship.

THE PROGRESS OF THE INDUSTRY IN RECENT TIMES.—Under these circumstances our manufacturing industry has made great strides during the last two or three decades, so that not only are articles produced for home consumption but also a large quantity of goods for the foreign markets. How great this advance is may be easily inferred from the fact that the volume of manufactured good which did not exceed 10 million *yen* in 1890 advanced to over 89,800,000 in 1902, an increase of about ninefold. The total volume of our export goods of all descriptions advanced during the same period from 55,700,000 to 255,600,000 *yen* both in round numbers, that is to say, 4.6-fold. Again, even if raw silk, straw-plaits, etc. are excluded, the export of industrial commodities occupies about 35 per cent. of the total value of exports. Thus while in 1890 the proportion of industrial commodities exported constituted 18 per cent. of the total volume of export, the percentage advanced over to 35 in 1902. It will be seen therefore that the part played by manufacturing industry in the economy of our export trade is one of supreme importance.

II. ADMINISTRATION OF MANUFACTURING INDUSTRY.

MATTERS relating to manufacturing industry were at first controlled by the Industrial Bureau of the former Department of Industrial Affairs, to be transferred, on the abolition of that Department, to the Department of Agriculture and Commerce. Though the control has remained in this Department from that time to this day, the office that had direct charge of manufacturing affairs has undergone frequent alterations, for the tenure of the Bureau of Industry was precarious and was repeatedly created and abolished and finally combined, as it is still to-day, with the Bureau of Commerce. At present all matters relating to manufacture are under the control of the Bureau of Commerce and Industry, and are in direct charge of the Section of Industry which forms part of the Bureau. The Section in question deals with matters relating to experiment made with the view to improving manufacture and manufactured goods, the position and construction of workshops, the control of boilers, the

employment and engagement of operatives and apprentices together with their relief, education, health, etc. In April 1900 a temporary factory committee was created in the Section of Industry, and was made to inquire into matters concerning factories and operatives.

III. LEGISLATIVE MEASURES RELATING TO MANUFACTURING INDUSTRY.

GENERAL REMARKS.—The first legislative measure enacted about manufacture was that issued by the Department of Agriculture and Commerce in November 1884, when an Ordinance was promulgated about the formation of guilds. The object of that measure was to encourage different interest to form themselves into guilds and to provide against the production of shoddy goods. In December of 1888 regulations relating to patents, designs and trade-marks were issued by Imperial Ordinances, intended to extend protection to inventions, designs and trade-marks, and to encourage the development of manufacture and industry and to protect the interest of business men. In April of 1898 a law relating to guilds of staple export interests was enacted, entitling those engaged in the manufacture or transaction of any staple export commodity to organize themselves, on the approbation of the Minister of Agriculture and Commerce, into a guild and further entitling a guild so formed to compel any one engaged in a similar line to join it. Such a guild was also permitted to form itself into a juridical person. It is needless perhaps to state that the aim of the law in encouraging the formation of a guild was to put a check to all evil practices tending to retard the development of the business. Three years later this law was superseded by another relating to staple commodities interests, and therefore more comprehensive in its scope and operation. About the same time a law relating to industrial guilds was promulgated, the object being that credit guilds, purchase guilds, sales guilds, and production guilds may be organized as economic corporations with the object of furthering the business and economy of the members. In February 1901 rules were issued relating to

the establishment of local and communal industrial experimental laboratories or manufacturing training schools, the object of the enactment being to encourage the improvement and progress of manufacture. It was arranged about the same time that matters relating to the control of boilers, factories and operatives be left in charge of the respective local offices.

IV. PRINCIPAL EXPORTS OF MANUFACTURED GOODS.

POSITION OF MANUFACTURE IN EXPORT TRADE.—The different parts played by manufactured, agricultural, marine and other goods in the economy of export trade and their movement may be seen from the following table.

Kind of Produce.	1902. <i>yen.</i>	1901. <i>yen.</i>	1898. <i>yen.</i>	1890. <i>yen.</i>	Relative Percentage.			
					1902.	1901.	1898.	1890.
Industrial ...	74,788,770	76,050,312	66,422,690	10,090,125	38.0	36.3	41.5	18.0
Agricultural ...	73,336,835	94,507,774	66,184,407	28,776,272	37.8	45.1	41.4	51.6
Fishery ...	5,902,623	5,624,303	4,702,739	3,698,484	3.5	2.7	2.9	6.6
Mining ...	27,459,979	24,102,161	20,357,640	11,098,964	14.2	11.5	12.4	2.00
Miscellaneous...	12,324,339	9,233,027	2,278,635	2,128,002	6.5	4.4	1.5	3.8
Total ...	193,812,546	209,517,577	159,946,111	55,791,847	100	100	100	100

It ought to be noted that raw silk of all sorts and straw-plaits are included under the head of agricultural goods. It will be seen from the foregoing table that manufactured goods have made the most striking development in the export trade, and that while in 1890 their share was only 18 per cent. against 51.6 of agricultural goods the relative proportion became 41.5 and 41.4 respectively in 1898, 34.7 and 43.6 in 1901 and 35.1 and 44.4 in 1902. In other words, agricultural goods that formerly occupied the proud position of being the most important item in the economy of export trade began to be superseded by manufactured goods.

The importance of manufactured goods as a factor in export trade becomes really preponderating when raw silk of all kinds and straw-plaits are counted among them instead of being included in agricultural goods, as shown below:—

	Percentage.					
	1902.	1901.	1898.	1902.	1901.	1898.
Manufactured... ..	127,632,276	145,522,297	113,530,035	66.0	69.4	70.9
Agricultural	20,493,329	25,035,789	19,077,062	10.5	11.9	11.9
Others	45,686,941	38,959,491	27,339,014	23.5	18.7	17.2
Total	193,812,546	209,517,577	159,946,111	100	100	100

The manufactured goods computed in that way have always constituted more than 66 per cent. of the total volume while the agricultural have constituted less than 11.

PRINCIPAL EXPORT ITEMS OF MANUFACTURED GOODS.—Below is given a table showing the movement of the export of staple manufactured goods.

PRINCIPAL EXPORTS OF MANUFACTURED GOODS.

Total	16,525	25,774	91,229	137,293	33,544	37,605

As shown in the foregoing table the staple manufactured exports for 1885 numbered 35 comprising raw silk of all sorts, knitting-work, carpets, iron ware, bronze ware, copper ware, jinrikisha, furniture, glass ware, porcelain and earthenware, cloisonne ware, wall-paper, paper napkin, matches, leather, soap, beer and other liquors, soy, cigarettes, flour, umbrella, lacquered ware, fans, screens, ivory ware, wooden and bamboo ware, etc. The volume of export of all those goods did not exceed 16 million *yen* of which raw silk, contributed 13,000,000 *yen*, porcelain and earthenware 600,000 *yen*, lacquered ware 460,000, each of the rest occupying the level of less than 200,000 *yen*. In 1890 the new items of cotton yarns, towels, cotton crepe, cotton flannel, *habutaye* silk, silk handkerchiefs, and straw-plait made their appearance, bringing up the total export of manufactured goods to 25 million *yen*, an increase of about 50 per cent. compared with that of 1885. Of that sum of 25 millions, raw silk occupied 13 millions, silk handkerchiefs 2,500,000 *yen*, matches 1,400,000 *yen*, porcelain and earthenware 1,200,000 *yen*, lacquered ware 570,000 *yen*, fancy matting 340,000 *yen*, folding and round fans 330,000 *yen*. The export of silk handkerchiefs, to such extent while it was non-existent in 1885 is a noteworthy fact, and equally striking was the advance of the export of matches which did not exceed 60,000 *yen*, in the same year. The export of fancy matting to the extent of 350,000 *yen* is also worth noticing, inasmuch as fancy matting did not figure on the list of export goods in 1885 or at best its export was really insignificant. The appearance for the first time of cotton yarns on the list is also indicative of the progress of our manufactures.

Coming down to 1895 we find that the total export had advanced to 91 million *yen*, an increase of 550 per cent. as against that of 1885 and 350 per cent. against that of 1890. Raw silk with 47 million *yen* continued to occupy the first rank on the list, followed by 8 millions of *habutaye*, 5 millions of silk handkerchiefs, 4,600,000 *yen* of matches, 3,400,000 *yen* of fancy matting, 1,900,000 *yen* of porcelain and earthenware. The items that were specially conspicuous in 1895 were *habutaye* and cotton yarns, the export of the former amounting to about 810,000 *yen* in 1890 and that of the latter to only about 2,000 *yen*. In a similar way the

advance of silk handkerchiefs, *kaiki* silk, matches and fancy matting was also great. In 1900 quite a large number of new items appeared on the list, as white cotton tissue, shirting, cloth, gassed yarn goods, cotton blanket, clocks, lamps, copy-paper, match sticks, brush, toys, boards of tea-chest, etc. The total export reached the figure of 130 million *yen*, an increase of 830 per cent. against that of 1885, 520 against that of 1890, 50 per cent. against that of 1895. The principal items were raw silk with 44 million *yen*, cotton yarns with 20 millions, *habutaye* with 17 millions, matches with 5,700,000 *yen*, silk handkerchiefs with 4,300,000 *yen*, straw, plaits with 4,000,000 *yen*, fancy matting with 3 millions, porcelain and earthenware with 2,400,000, cotton piece goods with 1,700,000 *yen*, hides and leathers with 1,100,000, lacquered ware with 1 million, etc. The figures for cotton yarns and *habutaye* both of which practically began to go abroad from 1890 really striking. In 1902 the nine new items such as tinned provisions, European-style clothes, foot-gears, silk bed-clothes etc. began to figure on the export list which reached over 178½ millions *yen* in value. This shows an increase of 18 fold compared with the total of 1885, of 6.9 fold compared with that of 1890, 1.9 fold compared with that of 1895, and 1.3 fold compared with that of 1900. The export items that reached over million *yen* each numbered 1.7 in 1902, these being as follows:—silk, 76,850,000; *habutaye* silk, 24,680,000 *yen*; cotton fabrics, 19,900,000 *yen*; matches, 8,160,000 *yen*; fancy matting, 6,770,000 *yen*; silk waste, 4,010,000 *yen*; silk handkerchiefs, 3,150,000 *yen*; straw-plaits, 2,930,000 *yen*; *kaiki* silk, 2,670,000 *yen*, etc. all in round numbers. The movement of those staple exports and the ratio of their progress as compared with 1885 are shown below:—

V. PRINCIPAL IMPORTS OF MANUFACTURED GOODS.

POSITION OF MANUFACTURED GOODS IN IMPORT TRADE.—Next the movement of the principal import goods shall be described:—

TABLE SHOWING THE CLASSIFIED TOTAL VALUE OF INDUSTRIAL COMMODITIES.

	Manufactured.	Agricultural.	Fishery.	Mining.	Miscellaneous.	Total.
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1902...	103,340,163	128,019,666	2,011,487	4,589,359	33,358,768	271,319,443
1901...	112,861,302	98,961,390	1,184,828	6,791,320	35,486,436	255,473,276
1900...	141,975,874	93,800,279	2,184,846	6,684,205	41,943,218	286,588,421
1899...	86,424,265	96,667,462	1,212,896	4,195,829	31,550,532	226,050,984
1898...	122,444,710	112,754,614	609,736	3,728,106	3,7733,563	277,270,729
1890...	24,621,570	42,326,361	159,753	10,439,008	4,123,662	81,670,354

RELATIVE PERCENTAGE.

1902...	3.81	4.72	0.07	0.17	1.23	10.00
1901...	4.42	3.87	0.05	0.27	1.39	10.00
1900...	4.96	3.27	0.08	0.23	1.46	10.00
1899...	3.93	4.39	0.06	0.19	1.43	10.00
1898...	4.42	4.07	0.02	0.13	1.36	10.00
1890...	3.02	5.18	0.02	1.28	0.50	10.00

It will be seen from the foregoing table that the import of manufactured goods amounted to 24,600,000 *yen* approximately in 1890, that is to say 30.2 per cent. of the total import against 51.8 per cent. of agricultural imports. The import of manufactured goods rose in 1898 to about fivefold of that of 1890, with the ratio of 44.2 per cent. against 40.7 of agricultural goods. Further, in 1899

the amount of manufactured goods imported were about three and a half times the amount imported in 1890 with the ratio of about 39 per cent. against 42 of agricultural goods. In the following year the import of manufactured goods again rose to the level of 100 million *yen* and to over 570 per cent. of that of 1890, the ratio to the total volume being about 47 per cent. against 32 of agricultural goods. In 1901 the ratio of manufactured goods, out of the total import, occupied 44 per cent. against 38 of agricultural goods, while coming to the next year the relative proportion was reversed, the former corresponding to 38 per cent. and the latter 47 per cent. of the total volume of import.

PRINCIPAL IMPORT ITEMS OF MANUFACTURED GOODS. - Now the import of foreign commodities increases as a rule with the purchasing power of a nation, but it alone cannot prove the condition of industry in the country in question. Nevertheless a careful examination of the movement of imports into our country tends to confirm the progress of our manufacturing industry, seeing that while the import of raw materials, machinery, etc. is increasing that of goods of special sorts is declining or at best making very slow progress. The following table of imports will go to prove this point:—

PRINCIPAL IMPORTS OF MANUFACTURED GOODS.

VI. OUTPUT OF PRINCIPAL MANUFACTURED GOODS.

OUTPUT OF PRINCIPAL MANUFACTURED GOODS.—The industry in which machinery was used, was till about 1887, in a comparatively insignificant state, but it became active two or three years after, and finally received a powerful impetus after the Japan-China war. Appended is a table of the output of our principal manufactured commodities during the last five years:—

Matting for Floor (<i>Hanagoza</i>)... ..	2,183	3,217	2,090	2,460	3,039	4,960

In examining the foregoing table it is found that woven goods with the total value of 150 million *yen* comes at the top of the list, followed by cotton yarns with 94 millions, raw silk with 86 millions, and paper with 19 millions. Other commodities worth mentioning are sugar, earthenware, matches, lacquered ware, ships and boats, machines of all sorts, cement, glass ware, fancy matting, straw-plait, umbrella, bronze and copper ware, etc.

CHAPTER III.—Organization of Manufacturing Industry.

Manufacturing Establishments—Factories and Workpeople.

I. MANUFACTURING ESTABLISHMENTS.

GENERAL REVIEW OF THE PROGRESS.—The introduction of Western sciences and arts has revolutionized so to say the organization of our manufacturing industry, for besides imparting a powerful impulse to its development it has gradually modified many of our manufactures that formerly partook of the nature of domestic industry and caused them to gradually adopt the factory system including the use of elaborate machinery. This tendency has been especially marked since the Japan-China War, when our economic affairs reached a state of unparalleled activity and when factories and workshops on a large scale began to make their appearance in quick succession.

NUMBER OF WORKSHOPS.—The number of workshops employing not less than 10 workpeople and of manufacturing companies is as follows:—

Year.	No. of Workshops.		Total.	No. of Companies.	Ratio of Companies to Workshops.
	With Motor.	Without Motor.			
1900... ..	3,381	3,791	7,172	2,554	36%
1899... ..	2,763	3,788	6,551	2,253	34%
1898... ..	2,003	4,067	6,070	2,164	36%
1897... ..	1,971	4,346	6,317	1,881	39%
1896... ..	1,967	4,403	6,370	1,367	21%

It will be seen from the above that the ratio which manufacturing companies bear to workshop economy made a marked advance, having increased during the period under review from 21 to 36. The ratio will become higher if all the workshops belonging to one company are counted as one, for there are many companies each possessing more than one workshop.

NUMBER OF MANUFACTURING COMPANIES.—The number of manufacturing companies and their financial position are shown as follows:—

NUMBER OF MANUFACTURING COMPANIES.

Year.	No.	Aggregate Capital.	Paid up Capital.	Reserves.
1901	2,477	219,249,806	166,293,003	24,057,360
1900	2,554	216,766,903	158,851,730	17,697,540
1899	2,253	222,673,634	147,783,280	13,467,802
1898	2,164	183,657,016	122,066,653	11,642,993
1897	1,881	165,232,633	105,381,106	7,581,535
1896	1,367	143,617,530	89,900,900	7,404,980

MANUFACTURING COMPANIES CLASSIFIED.—Those companies being classified according to kind, in the year 1900 joint stock companies numbered 986 with gross capital of 180 million *yen*, limited liability companies 1,176 with gross capital of 21 million *yen* and unlimited liability companies 315 with gross capital of 10 million *yen*. Paid up capital amounted to 130 million for the joint stock companies, 19 million *yen* for the limited liability companies, and 10 million *yen* for the unlimited liability companies. Of the capital invested in manufacturing business, that of joint stock constituted about 84 per cent. Of late the establishment of limited liability companies has become quite popular, as may be seen from the fact that their number in 1900 was more than double that of 1896. On the other hand the increase for joint stock companies did not exceed 68 per cent. during the same period. Below is given a list showing capital invested in their respective work by different kinds of companies.

CLASSIFIED LIST OF MANUFACTURING COMPANIES (returns for 1901).

(unit of thousand).

	No. of Companies.	Capital, Total	Capital	Re-

MANUFACTURING INDUSTRIES AND INVESTMENTS.—To examine the condition of all those establishments as to kind of business engaged in and the amount of capital invested, it is found that filature business with 321 establishments surpasses all others as to number, followed by *sake* brewing with 217 and tobacco manufacture with 155. As to amount of capital, the cotton spinning business with 41 million *yen* heads the list, followed by tobacco manufacture with 12,100,000 *yen* approximately, shipbuilding with 10,300,000 *yen*. In the amount of paid up capital, the spinning business with 36 million *yen* also comes at the top, followed by the tobacco manufacture with 11 millions. The capital of 11,400,000 *yen* invested in the weaving business and that of 7,700,000 *yen* in the filature business may also be regarded as being an important factor in our economic activity.

II. FACTORIES AND WORKPEOPLE.

(A.) FACTORIES.

KIND OF FACTORIES AND NUMBER OF WORKPEOPLE.—The number of factories and workpeople employed will throw an important light on the condition of manufacturing industry. In 1900 the number of factories and work-shops employing not less than ten workpeople stood thus :—

THOSE RUN BY MOTORS.

Year.	No. of Workshop.	No. of Plant.	Horse Power.	Workpeople.		
				Males.	Females.	Total.
1896	1,967	5,325	58,172	104,164	169,735	273,889
1897	1,971	5,446	68,331	117,081	174,154	291,235
1898	2,003	5,135	80,586	118,251	171,095	289,246
1899	2,763	4,166	62,131	96,181	184,111	280,292
1900	3,381	4,727	84,816	100,913	181,692	282,605

THOSE NOT RUN BY MOTORS.

1896	4,403	—	—	64,122	76,509	104,631
1897	4,346	—	—	66,777	82,554	149,331
1898	4,067	—	—	58,224	81,328	139,551
1899	3,788	—	—	41,938	70,679	112,617
1900	3,791	—	—	41,643	64,048	105,691

On examining the foregoing table it will be seen that the number of workshops run by motors is slightly larger than that of those not run by motors, the former corresponding to about 47 per cent. of the latter. The utilization or absence of motors depends of course to a great extent on the nature of manufacture conducted, for while in waving business, manufacture of earthenware and lacquer ware, and the brewing of saké the workshops do not utilize in general labor-saving machines, motors are used in most cases in filature spinning, shipbuilding, machine-making, weaving of shirting, cement, paper-mills, beer-brewing, sugar-refining, printing, smelting, etc.

FIVE CLASSES OF FACTORIES.—To give further analysis about factories and workshops, they may be broadly divided into these five different kinds:—

1. Fibre workshops (raw silk, spinning, weaving, cord-making),
2. Machine workshops (machine-making, shipbuilding, furniture-making, casting.)
3. Chemical workshops (ceramics, gas, paper-mill, lacquering, leather-making, workshops for the manufacture of inflammable substances, artificial manures, drugs, etc.)
4. Miscellaneous workshops (brewing, sugar-refining, tobacco-manufacture, tea-curing, cleaning of grains, flour, lemonade, mineral water, confectionary, preserved fruits and vegetables, printing and lithograph, paper work, wood and bamboo ware, leather, feather ware, reeds and straw-plait ware, lacquer ware, etc.)
5. Special workshops (electricity and metallurgy.)

Of the foregoing kinds of workshops, those in the fibre line using motors number 2,300 with the aggregate horse powers of about 38,000 and the aggregate number of workpeople of about 189,000. In number the fibre workshops constituted 77 per cent. of the whole number of workshops using motors, in horse-power about 45 per cent. and in workpeople about 67 per cent. When those fibre workshops not using motor powers are counted in, this kind of workshops constitutes 57 per cent. of the whole number of workshops. The foregoing ratio will be seen from the appended table:—

A. RUN BY MOTORS.

	No. of Workshop.	Horse Power.	No. of Workpeople.
Fibre	2,393	38,571	189,180
Machine	230	5,050	25,502
Chemical	224	12,672	13,743
Miscellaneous	420	8,196	21,862
Special... ..	114	20,223	32,318
Total	3,381	84,712	282,605

B. NOT RUN BY MOTORS.

	No. of Workshop.	No. of Workpeople.
Fibre	1,763	44,978
Machine	184	4,228
Chemical	701	24,744
Miscellaneous... ..	1,041	26,827
Special	102	4,914
Total	3,791	105,691

FIBRE WORKSHOPS.—Fibre workshops as classified according to kind the following result is obtained:—

A. RUN BY MOTORS.

	No. of Workshop.	Horse Power.	No. of Workpeople.
Raw Silk	2,129	7,288	109,336
Spinning	153	25,437	63,388
Weaving	96	5,557	15,389
Others... ..	15	289	1,067
Total	2,393	38,571	189,180

B. NOT RUN BY MOTORS.

	No. of Workshop.	No. of Workpeople.
Raw Silk... ..	429	9,468
Spinning... ..	29	645
Weaving... ..	1,279	33,967
Others	26	898
Total	1,763	44,978

The foregoing table shows that in fibre workshops filatures run by motors constitute 88 per cent. of the whole number, and spinning mills 6.3 per cent., the two taking up 94 per cent. of the whole. Even in the whole number of motor-using workshops of all kinds, these two particular fibre workshops constitute 64 per cent. and 61 per

cent. in the whole number of operatives. The three kinds of business of raw silk, spinning and weaving constitute, when workshops both run by motors and not run by them are combined, 99 per cent. of the whole number of fibre workshops, and the ratio to the total number of workshops of all kinds is as high as 57 per cent., and and in the total number of operatives 59 per cent. Thus fibre workshops may be regarded as forming the bulk of all workshops in Japan, and workshops engaged in the manufacture of raw silk, spinning and weaving the bulk of fibre workshops.

WORKSHOPS RUN ON A LARGER SCALE.—The scope of the business of a workshop does not necessarily depend on the number of operatives employed in it, and in making inquiries as to the relative scope of factory business according to the data supplied by the tables given above and also by taking some other factors into consideration, it is found that among fibre workshops, those that are run on a larger scale than others are spinning mills, power loom factories, and a small portion of filatures; among machine workshops, shipbuilding, vehicle-making, and machine-making; among chemical workshops, those engaged in alkali and cement-making and paper mills; among miscellaneous workshops, some of tobacco, beer, and sugar workshops. Large workshops are also found in the smelting business. In general, larger workshops are run either by the Government or by joint stock companies, while workshops run by private individuals or firms are generally on a small scale.

The following two tables will show those data in some details.

WORKSHOPS RUN BY MOTORS.

(Employing not less than 10 Workpeople).

Kind of Workshop.	No. of Workshop.	No. of Horse Power.	Workshop Employing more than 30 People.	No. of Horse Power.	Workshop Employing more than 50 People.	No. of Horse Power.

VI. WORKPEOPLE.

MALE AND FEMALE OPERATIVES.—In making a somewhat careful examination into the question of factory labor, it is found that, in workshops using motors, male operatives constitute about 100,000 out of the total of 280,000 approximately, the remaining 180,000 being female operatives. There is, therefore, a little over 35 per cent. of males and a little over 64 per cent. of females. When the figures for non-motor workshops are counted in, out of the total of 390,000 operatives male operatives constitute 142,000 or about 36 per cent. and female operatives 245,000 or 64 per cent.

GENERAL AGE CLASSIFICATION OF OPERATIVES.—In regard to age classification, out of the total 280,000 working in motor-using workshops 260,000, that is over 92 per cent. are operatives of not

less than 14 years old. Of the remaining 8 per cent. the bulk, that is to say 82 per cent., consist of girls and only 18 of boys.

WORKSHOPS AND KIND OF OPERATIVES.—The kind of operatives employed differs according to the nature of the workshops. In fibre workshops the majority of operatives are females and children, in machine workshops and special workshops adult males, and in chemical workshops adult males also, except in glass, paper, and match factories. No general remark can be made about the kind of operatives in miscellaneous workshops, but this much can be stated that there are no factories of this kind where a large number of female operatives or children are employed. Below is given a table showing the sex and age classifications of operatives in workshops employing not less than 10 people.

WORKSHOPS RUN BY MOTORS.

DAY AND BOARDING OPERATIVES.—Operatives may further be divided into two kinds, day operatives and boarding operatives, the former residing in the vicinity of the workshops which they attend and the latter those who have been collected from distant places, the majority of them being females. Though the relative proportion of day operatives and boarders in workshops cannot admit of generalization, it may be stated here that the greater part of the latter

belongs to fibre workshops, or more especially filatures, spinning and weaving workshops. In some filature and spinning workshops the majority of operatives are day operatives, while in weaving shops about 70 to 80 per cent. are boarders, and this datum obtained from workshops of certain places may be applied in general to workshops of the same kind throughout the country.

AGE AND SEX CLASSIFICATION OF OPERATIVES FOR SPECIAL KIND OF WORKSHOPS.—No accurate statement as to the age of the majority of operatives employed in any given kind of workshops can easily be elaborated, but broadly stated the greater part of operatives in filature factories are females of 16 to 22 years of age, the number of those from 22 to 30 coming next. Even the youngest are very rarely below 12 or 13. In general, females of from 14 or 20 constitute 50 per cent., those above 20 about 40 per cent., and those below 14 about 10 per cent. of the total number of operatives employed. In spinning mills also girls below 14 constitute a little over 10 per cent. of the whole number, those from 14 to 20 about 50, and those older about 40 per cent., of whom the majority are of 20 to 25 years old. The female operatives in power-loom factories do not differ from those of spinning mills in regard to the age ratio, and those in hand-weaving workshops are similar to those in filatures.

In shipbuilding, vehicle and machine workshops the workpeople employed are almost exclusively adult males, especially in those run on a large scale. Even when boys are employed they are mostly not less than 15 or 16 years of age and in very rare cases 12 or 13. In factories dealing in clock and watches, lamp accessories, shirt-buttons, umbrella-frames, etc., female operatives and children are sometimes employed, but those factories are all on a small scale, and the number of such operatives is small. In chemical workshops, and especially in glass factories boy apprentices of 12 to 13 years are employed to some extent. In some rare cases small number of boy-apprentices of about 10 years old is employed. In paper-mills not a small number of females and children is employed, while in match factories they constitute the bulk of workpeople, the youngest of whom being about 9 years old. This is also the case in tobacco factories, though the number of children under 10 employed in such

factories is smaller than the number employed in match factories. In printing workshops the majority are adult males, sometimes with a sprinkling of children of less than 14 years old.

WORKING-HOURS.—In general the working-hours of operatives are 11 hours a day, but sometimes they extend as long as 16 or 17 hours. In cotton mills 12 hours are standard, both for day and night workers, they being made to take day and night work by turns every two days. In filatures the regulations hours are 13 to 14, in power-loom factories 12. But in hand-weaving workshops a great diversity prevails, the general rule being 12 to 15, according to the season, though in some rare cases the hours are as long as from 16 or 17. In bigger workshops such as shipbuilding yards, vehicle, and machine shops, the working hours are far more regular, being in general 10 hours, with one or two hours of overtimes. In such chemical workshops as cement, glass, and paper in which work is carried on all through the 24 hours, 12 hours is a regular shift both by day and night. In general the regular working-hours in Japanese workshops may be put at 12, with overtime of one or two hours.

WAGES.—Wages are paid in general by the day and according to the amount of work done, though payment by the month also prevails to some extent. In general the account is settled once or twice a month, though in some cases it is settled every six months or once a year. In filature the payment is made according to the amount of work done, and by the month, though in some places a yearly account system prevails. In cotton mills those who receive daily wages constitute about 40 per cent. of the whole and those who receive payment according to the amount of work done, about 60 per cent. The latter mode of payment is becoming more and more fashionable. The account is settled generally twice a month. In hand-weaving workshops the mode of payment is similar to that which prevails in filature, while in power-loom workshops it is similar to that in cotton mills. In such machine workshops as shipbuilding, vehicle and machine, daily payment of wages is general, but at times a piece of work is given out as a job contract to one or more artisans. The account is settled once or twice a month. In match workshops payment is made according to the amount of work done,

as is also the case in tobacco workshops, while in printing workshops the daily wage system and the payment by the amount of work done equally prevail. In general this latter mode is adopted in all those workshops where the amount of work done by workpeople can be definitely computed.

The rate of wages is about 30 *sen* a day for adult males employed in such fibre workshops as flature, cotton mills and weaving-shops, while that of females is about 20 *sen*. In machine workshops engaged in making ships, vehicles and machines the rate is generally high, 50 to 60 on an average, and a skilled artisan gets more than 1 *yen*. In match factories, on the other hand, the rate is much lower, being 12 to 20 *sen* for ordinary female operatives, and 5 to 13 *sen* for little girls. In tobacco factories and printing-shops ordinary females get about 20 *sen* and males about 40 to 50 *sen*.

CHAPTER IV.—Manufacturing Establishments by the Central and Local Governments.

Encouragement and Protection by Central Government —Encouragement and Protection by Offices.

I. ENCOURAGEMENT AND PROTECTION BY CENTRAL GOVERNMENT.

GENERAL REMARKS.—The encouragement and protection of industrial enterprises were carefully looked after even before the Restoration. This was especially the case with the three daimiates of Satsuma, Mito and Saga. They established in the era of Ka-ei (1848–1853) an arsenal after a Western model, and began to turn out guns of foreign pattern. Satsuma even started the manufacture of porcelain and glass-ware and also the work of shipbuilding, all after the Dutch model, while coming down to the era of Bunkyu (1861–1863) we find that it sent for a set of spinning machines to England, and established a pioneer mill in its territories. The construction of a shipyard on Ishikawajima by the Lord of Mito is also a noteworthy event. Nor did the Tokugawa Shogunate neglect to introduce a similar innovation. In fact the shipbuilding industry received from it full attention. During the era of Ansei (1854–1859) it constructed a shipyard at Aku-ura, Hizen, and a similar undertaking was soon arranged at Yokosuka, Sagami, only the Restoration took place before it had been completed. This partially completed shipyard was finished by the Meiji Government which in 1874 constructed another shipyard at Tategami, Hizen. The Yokosuka yard was afterward transferred to the Navy which has since raised it to its present state of efficiency and perfection. The two shipyards in Hizen were hired out to the Mitsubishi Firm in 1884 and finally sold to it three years after, so that the two are now

known by the name of Nagasaki Shipbuilding Yard belonging to the same firm.

The movement started by the Tokugawa and feudal princes by way of encouraging industry and manufactures was vigorously taken up by the Meiji Government. It established in 1872 a model filature at Tomioka, Gumma-ken, with the object of introducing the use of labor-saving contrivance in the manufacture of raw silk, while the operatives trained at this factory spread all

Model over the principal silk districts the art of reeling to
Filature the new style. The filature itself supplied a model to all silk districts and similar establishments rose in quick succession. An undertaking next adopted by the Government in a similar line was the establishment in 1877 at Shimmachi, Gumma-ken, of a silk spinning mill to utilize silk waste and waste cocoons. This innovation also served the salutary purpose of encouraging similar enterprises on the part of private individuals.

Woolen Further, in a similar way, a woollen factory was
Factory. established in the same year at Senju, suburb of Tokyo, and ten years after private woollen factories began to make their appearance in several places. The cotton spinning business also received the attention of the Govern-
Spinning Mill. ment which established in 1881 a model mill at Nukada-gun, Aichi-ken, and Aki-gun, Hiroshima-ken.

About that time 10 sets of spinning plant each of 2,000 spindles were sent for to England and handed over to be paid in ten years instalments to people of different places who were interested in the business. The project that appeared in 1883 in Shiga-ken about hemp spinning received help from the Government which loaned to the promoters the fund required for purchasing a plant.

Hemp Three years later this project developed as Hemp Spin-
Spinning. ning Mill established in that province. The establishment of the Hokkaidō Hemp Company at Sapporo in 1887 received much help from the Government which besides extending to it various conveniences also granted a state aid for six years.

Further, it was the Government that first started the work of manufacturing cement, having established in 1875 a cement factory at Fukagawa, Tokyo, where the burning of white brick

Cement. was undertaken as a subsidiary work. Then the establishment of a glass factory in April 1876 at Shinagawa, Tokyo; the creation of a paper-mill section in the Printing Bureau and the manufacture of foreign style paper besides

Glass Factory. the improvement of the native style paper (the durable Japanese paper known as "Kyokushi" is the invention of the Bureau); launching of the work of machine-making, of soap-making, type-founding, of making

Paper Mill. porcelain in the Western style, of paint-making, also the establishment, as before mentioned, of filatures and the making of arrangements for training female operatives in all such new forms of industry—all these have imparted a powerful impulse to the progress of our manufactures throughout the country. Meanwhile factories modelled after those established by the Government began to be started by our people, and the Government no longer perceiving the necessity of maintaining its model factories began from about 1880 to sell all of them with the exception of the Senju Woollen Factory.

As a means of encouraging the advance of industry and manufacture, the Government has not neglected to open exhibitions at home and to participate in those opened abroad. In **Exhibitions.** 1878 First Domestic Exhibition was held in Tokyo where the succeeding two similar undertakings were also carried out. The Fourth Exhibition opened in 1895 was held in Kyoto and the Fifth in Osaka last year. Besides, Japan participated in the world's fairs held in Vienna, Philadelphia, Chicago and Paris, not to speak of various other international exhibitions of limited scope.

In the matter of legislative measures of protecting and furthering industrial interest, the regulations relating to patents, designs and trade-marks; the establishment of silk conditioning **Other Measures of Industrial Protection** house; the enactment of industrial interests guilds, etc. may be mentioned. Further, the sending out of experts to all the provinces to encourage by lectures and by practical experiments industrial enterprises there; the organizing of the industrial laboratory and of the *saké* brewing laboratory, the sending of student manufacturers and merchants

to foreign countries to investigate the condition of manufactures and trade in those countries economically related to Japan, the hiring out of latest dyeing and weaving machines specially imported for the purpose to the principal dyeing and weaving districts such as Kyoto, Ashikaga, Kiryu, Fukui, Toyama, Yonezawa, etc.—all these measures have contributed to further our manufacturing industry to the present state of marvellous progress within a comparatively short space of times.

II. PROTECTION AND ENCOURAGEMENT BY LOCAL OFFICES AND PUBLIC BODIES.

The local offices and local civic bodies have followed the example set by the central Government and adopted measure for protecting and encouraging manufactures in their respective districts. The Local Office of Kyoto distinguished itself above all others in this respect, for as early as 1870 it established a chemical laboratory which attended to the business of keramics, dyeing, soap-making, etc.; while, in 1872, it sent a number of weavers to Lyon, introduced for the first time a number of Jacquard and Batten looms into the country; established a weaving factory after the Western style in 1874 and a dyeing factory in the following year, and thus laid the foundations of attaining that eminence which Kyoto occupies to-day in the art of weaving and dyeing, or rather continues to occupy, for Kyoto was pre-eminent in these lines before. Other local offices equally adopted similarly salutary measures and the expenses they have incurred on this account must amount to a big figure. Those measures generally took the form of establishing experimental laboratories or training schools, opening local competitive fairs, the hiring out of costly machines, or the advancing of money to enable the manufacturers to purchase them.

CHAPTER V.—Industrial Education.

History—Existing Condition—Apprentice System.

I. HISTORY.

GENERAL REMARKS.—The history of the progress of industrial education after the advent of the Meiji Government may be considered as dating from the creation in 1871 of the Engineering College, subsequently united with the Imperial University of Tokyo—where the subjects of civil engineering, mechanical engineering, ship, building, electrical engineering, architecture, chemical technology, mining, metallurgy, etc. were taught. It followed as a matter of course that the graduates from all those course contributed very much to the progress of industry and to the diffusion of technical knowledge. The establishment in 1881 of Tokyo Polytechnique School, now known as Tokyo Higher Technical School, and the teaching of the subjects of dyeing, weaving, ceramics, mechanical engineering, etc. has also proved similarly beneficial in the development of our industry. Similar institutions were subsequently created both by the Government and by the local offices, so that at the end of 1900 there were, to mention only institutions of higher grade, the Engineering College of the Tokyo Imperial University, the Science and Engineering College of the Kyoto Imperial University, the Tokyo Higher Technical School, the Osaka Higher Technical School, and last of all—it was created quite recently, the Kyoto Higher Technical School. The technical schools of all grades throughout the country numbered in the year in question no less than 1,008 all contributing to the common cause of furthering technical knowledge among our people and promoting the technical and manufacturing industries.

This progress of technical education enabled Japan to gradually dispense with the service of foreign experts, and though some such

are still to be found here, the number is insignificant compared to what it was before.

II. EXISTING CONDITION.

PROTECTION TO TECHNICAL EDUCATION.—With the object of diffusing technical knowledge and of imparting a general idea of science to apprentices, young mechanics and future manufacturers, the Government has been granting from the year 1894 states aid to the amount of 150,000 *yen* every year, and has also made arrangement for turning out teachers qualified to undertake the teaching of those young people.

NUMBER AND KIND OF TECHNICAL SCHOOLS.—The higher grade schools of this standing, some deriving the aid from the fund in question and others not numbered 18, in June 1901.

Quite recently a technical school was started both in Okayama-ken and Ehime-ken.

The foregoing schools, which, by the way, are maintained at local or communal expenses or by private individuals, are classified as follows according to the subjects taught:—

Kind.	No. of Schools.
Dyeing and Weaving	10
Metal and Wood Work	2
Painting, Metal-Inlaying, Design and Carving	1
Painting, Lacquer and Metal-Work, Keramics, Dyeing and Weaving	1
Carving, Lacquer-Work, Casting	1
Wood and Metal Work, Dyeing and Weaving	2
Wood and Metal-Work and Keramics... ..	1
Total	18

The schools teaching dyeing and weaving exclusively are 10 in number, but when other schools which teach dyeing and weaving side by side with other subjects are counted in, the number increases to 13. There are seven schools in which wood and metal-work are taught, if we combine those that are exclusively teaching them with others that teach the same subjects side by side with other subjects.

Each of the other subjects is taught at one school exclusively or two subjects only are taught in combination at one school.

APPRENTICE SCHOOLS.—The apprentice schools, all of them deriving aid from the said fund, numbered 21 in the same year.

Classified according to kind those schools can be divided as follows :—

Kind.	No. of Schools
Dyeing and Weaving	3
Metal and Wood-Work	5
Lacquer-Work... ..	4
Pottery	5
Shipbuilding	1
Others	3
Total... ..	<u>21</u>

Differing from the preceding case, here metal and wood-work and pottery are at the head of the list each with five schools, followed by those of lacquer-work, dyeing and weaving.

COMMERCIAL AND TECHNICAL CONTINUATION SCHOOLS.—Commercial and technical continuation schools next demand attention, for these subjects occupy at present a very important place in short-course commercial and technical education.

These number 34, many of them receiving grant-in-aid from the said fund.

Of the schools mentioned above, some of which are maintained by communities, others by private individuals, those that are exclusively devoted to technical matters are 12, those that combine agricultural, technical and commercial matters 16, the remaining 6 being of a miscellaneous character. Most of those schools are attached to primary schools for the benefit of those who cannot attend school in the daytime.

III. APPRENTICE SYSTEM.

Formerly the apprentice system prevailed universally in all branches of technical and manufacturing work, but with the introduction of the Western system of manufacture and technical work this

custom has began to lose its importance. The scope of the apprentice system has gradually dwindled down, and at present it only retains some semblance of its former status in such ancient lines of business as hand-weaving, pottery, and the dyeing business. It is true even in new branches of work this apprentice system is found, but it is only in factories of small scope. Sometimes even in big factories the system is retained to some extent, as master craftsmen engaged in shipbuilding and other works often take under them a number of boys whom they employ at the factories they attend. However, taking all things into consideration, and especially with the greater necessity of division of labor in most branches of technical work and manufacture, the days of the apprentice system are doomed, to be superseded by regular mode of education.

CHAPTER VI.

MANUFACTURING CORPORATIONS.

That combination of persons having common interests in the prosperity of a given branch of manufacture and industry, so universal nowadays, was first seen in this country in the organization in October 1882 of the spinners' union which exists to-day in a somewhat modified form. It undertakes all matters judged to further the common interests of the members; dispatches, for instance, merchants or experts to Bombay to inspect the condition of the cotton market or of the cotton crop, enters into contract with steamship companies for the import of raw cotton from Bombay. Matters about the regulations of staple commodities guilds have already been mentioned elsewhere, and it is sufficient to state here that at present the organized bodies created for protecting their own respective interests number 192 in all.

CHAPTER VII.

TECHNICAL ASSOCIATIONS.

Scientific Associations relating to manufacture and technical affairs exist in large numbers, the principal of them being:—

Name.	Located in.
Engineering Society	Tokyo.
Japan Weaving Society	”
Tokyo Carving Society	”
Electric Society	”
Japan Lacquer-Work Society	”
Japan Ceramic Society	”
Technological Society	”
Mechanical Engineering Society	”
Shipbuilding Society	”
Society of Chemical Technology	”
Tokyo Export Metallic Ware Society	”
Japan Metallic Art Society	”
Central Weaving Society	Nagoya.

Most of the foregoing societies publish proceedings, some of these publications being:—

Proceedings of the Engineering Society, the Japan Ceramic Art Society, the Technological Society, the Mechanical Engineering Society, the Shipbuilding Society, the Society of Chemical Technology, etc.

CHAPTER VIII.—Protection of Industrial Property. (Patents, Designs and Trademarks)

Introductory—History relating to Protection of Patents, Designs, and Trade-Marks—Protection of Foreign Patents, Designs, and Trade-Marks—Resume of Existing Regulations—Provisions that Specially Concern Foreigners—Statistics of Japanese and Foreign Patents, Designs and Trade-Marks.

I. INTRODUCTORY.

GENERAL REMARKS.—The legislative measures relating to the protection of the right of industrial property comprise in regard to patent-right, designs, and trade-marks the Law of Patent-Right (amended in the existing form in March 1899) the Law of Designs (as before), and the Law of Trade-marks (as before), intended to guarantee the security of the right of both Japanese and foreign inventors and also to ensure honest dealings in business. Similarly illegitimate competition in the matter of house-marks are guarded by the provisions of the Commercial Code issued in 1900. Measures for providing against illegitimate practices other than those connected with house-marks are incomplete, the only provision existing in this direction being confined to prohibition by the Customs Tariff Law (March 1897) of the import of substances spuriously imitating articles covered by patent-right or registered designs or trade-marks. There is no provision for prohibiting the false representation of the place of production. However, the legislative measures for protecting the right of industrial property have lately been carried to a satisfactory state, especially in regard to patents, designs and trade-marks, as will be briefly described below.

II. HISTORY RELATING TO PROTECTION OF PATENTS, DESIGNS AND TRADE-MARKS.

GENERAL REMARKS.—Although the legislation relating to patents, designs and trade-marks was only enacted quite recently, comparatively speaking, this does not of course mean that the Japanese were destitute of inventions or designs, for facts may be abundantly enunciated to prove the contrary. For instance, the arts of ceramics, lacquer-ware, weaving, etc. that were originally imported from Chian have been carried to a special state of perfection by the genius of our people, who also have displayed original taste of their own in the matter of designs and have won in this respect special attention for our goods in foreign markets.

Industrial Protection in Olden Days. However, the idea of protecting inventors and thus encouraging the development of manufacture was not adopted in Japan till the advent of the Government of this era. It is true that from about the time of the Ashikaga Regency a certain sort of monopoly was accorded to manufacturers and technical experts, but this protection was extended with the object of increasing the revenue of the feudal princes that exercised this privilege rather than from any idea of encouraging invention and designs. In a similar way the protection of trade-marks dated from the Restoration and it was enforced because with the development of Japanese trade and that of foreign trade a necessity to adopt suitable measures for protecting trade-marks had become imperative.

The first legislative measure for protecting inventions was promulgated in April 1871 but was rescinded a year after, and for about fourteen years from that time Japanese inventors were left unprotected. We do not mean to say that an invention of meritorious character was not recognized by the Government, for by instituting in December 1882 the Regulations Recognizing Meritorious Acts inventors of distinguished merit were rewarded with the Blue-ribbon medals established in the regulations. In June 1884 the regulations for protecting trade-marks were enacted, and then in the following year the regulations

relating to the protection of patents. In consequence of the restoration of the regulations, 326 cases of invention that had been reported to the local offices subsequent to 1872 were brought under the protection of the regulations. But it was not till December of 1889 that the regulations relating to designs were first elaborated, and at the same time the two cognate legislative measures already existing were amended. A similar amendment was extended ten years later to all the three, and they exist to-day in the present form.

III. PROTECTION OF FOREIGN PATENTS, DESIGNS AND TRADE-MARKS.

THE LAWS AS EXTENDED TO FOREIGNERS.—With the putting in operation of the revised treaties in 1899 the three laws of patent, designs and trade-marks which, like all other laws of the land, had been limited in operation to the Japanese people alone, became operative to foreigners residing in this country.

The dates of the conclusion of revised treaties with different treaty countries are as follows:—

Great Britain and Ireland	July 16, 1894.
United States of America	Nov. 22, 1894.
Italy	Dec. 1, 1894.
Peru	Mar. 2, 1895.
Russia	June 8, 1895.
Denmark	Oct. 19, 1895.
Germany	Apr. 4, 1896.
Sweden-Norway	May 2, 1896.
Belgium	June 2, 1896.
France	Aug. 4, 1896.
Netherland	Sept. 8, 1896.
Switzerland	Nov. 10, 1896.
Spain	Jan. 2, 1897.
Portugal	Jan. 26, 1897.
Austria-Hungary	Dec. 5, 1897.

The revised treaties cover the protection of foreign patents, designs and trade-marks, but according to the agreement between Japan and Germany it was arranged to put in force this protection

of patents, designs and trade-marks from the day of the exchange of ratification of the treaties, that is on November 18th of 1896 and this agreement ensured for the first time in the history of Japan the protection of the right of foreigners in regard to patents, designs and trade-marks. However, with the rest of the treaty Powers the date of the exchange of this mutual protection was as follows:—

Great Britain and Ireland	Jan. 4, 1901.
United States of America	Mar. 8, 1901.
Switzerland	July 9, 1901.
Portugal	Aug. 30, 1901.
Italy	Oct. 12, 1901.
Denmark	Jan. 10, 1898.
Netherland	Feb. 1, 1898.
Sweden-Norway	Feb. 15, 1898.
Belgium	Mar. 11, 1898.
Spain	Sep. 1, 1898.
Austria-Hungary	Nov. 30, 1898.

It is needless to say that a similar protection was extended with the coming in operation of the revised treaties to all the rest of the treaty Powers whose treaties that had been concluded with Japan contained provisions relating to the exchange of this protection.

JAPAN AS MEMBER OF THE INTERNATIONAL LEAGUE FOR THE PROTECTION OF INDUSTRIAL PROPERTY.—The protocol appended to the treaty concluded between Japan and England in July 1894 and the treaties subsequently concluded with the rest of the countries specified the entrance of Japan into the International League for the Protection of Industrial Property, and in pursuance of that agreement Japan joined the League on July 15th, 1899, and thus all necessary arrangements required for protecting foreigners in the matter of industrial property were completed.

IV. RESUME OF THE EXISTING SYSTEM.

GENERAL REMARKS.—According to the existing system all matters relating to patents, designs and trade-marks are controlled by the Patent Bureau of the Department of Agriculture and

Commerce, which adopts a regular system of examination in granting a license in answer to application for patents or in registering a design or trade-mark sent in for registration. An applicant is entitled to appeal for re-examination or for the judgment of the Comptrollers in case the application has been rejected. All cases relating to the invalidity of patents or registrations or to the confirmation of the respective rights are attended to by the Bureau, but when any decision of the Bureau is regarded as being at variance with the law, an applicant may appeal to the Court of Cassation whose decision is final. Then a provisional protection is extended to exhibits placed on view in exhibitions or similar undertakings. Patent agents are subject to the control of the Patent Bureau. The agents duly registered on the list of the Bureau number 193 (according to the returns made in June of 1902.)

PRINCIPAL CLAUSES IN THE LAW OF PATENTS.—The Law extends protection according to priority (Art. 1), while the following inventions are not patentable:—(a) articles of diet and relishes, (b) drugs and process of compounding them, (c) matters prejudicial to public order or morals, (d) matters publicly known prior to the filing of claims (excepting those cases in which, owing to the necessity of trial examinations, the matter embodied in the claim came to public knowledge not more than two years prior to the filing of the application). Then for an additional invention based on the original one, an additional letter-patent may be obtained (Art. 2), a smaller fee being paid both for application and for license. Patents are valid (Art. 19) for 15 years from the date of registration in the official record, and (Art. 3) every year after the issue of the letter-patent the fee is to be paid in advance according to a fixed rate, while for an additional invention based on the original one, the payment of 20 *yen* at one time covers the whole period of the validity of the patent. Further (Arts. 39 & 40) (a) when a patentee who while himself failing to exploit in Japan and without justifiable cause his own invention within three years from the issue of the license or while suspending to make such exploitation for three years, refuses to transfer his right under reasonable condition to a third party applying to him for the said transfer or for permission to use the right; (b) when a patentee fails to pay in the

fee for more than 60 days from the date on which he should have forwarded it; (c) when a patentee not residing in Japan fails to appoint for more than six months and without justifiable reason a proper attorney; in all such cases the Chief of the Bureau is entitled to revoke the patent.

PRINCIPAL CLAUSES IN THE LAW OF DESIGNS.—The designs as protected by the existing Law are those of artistic type used in the form of shape, coloration or figure as applied to industrial property (Art. 1); but designs of the following description are excluded from protection, (a) shape or figure resembling the Imperial coat of arms, the chrysanthemum, (b) figures that are prejudicial to public order or morals, (c) those that have been publicly known prior to the filing of the application or figures &c. resembling those already publicly known (Art. 2). The protection is of course determined according to priority (Arts. 2 & 8). The validity of the right of exclusive use of a design is limited to objects of specified classification as represented by the applicant (Art. 4), and this validity holds good for 10 years from the time of the registration in the official records (Art. 3). A similar process as in the case of patents is in force in paying the fee on the occasion of filing application and of paying the fee every year the after registration; but for a design resembling one previously registered by the applicant, the rate is lower. In a similar way the registered design may lose its validity when the payment of the fee is neglected for more than 60 days or when the grantee of registration not residing in Japan fails to appoint within six months a qualified attorney residing in this country.

PRINCIPAL CLAUSES IN THE LAW OF TRADE-MARKS.—The Law protects all those trade-marks except those (a) that are identical to or resemble in form the Imperial coat of arms, the chrysanthemum; (b) that are identical to or resemble in form the national flags, military or naval flags, or decorations of this country, or national flags of foreign countries; (c) that are prejudicial to public order or morals or are likely to impose upon the public; (d) that are identical to or resemble other registered trade-marks or, when they are to be used for articles of the same nature, to those for which one full year has not elapsed after they have lost

validity; (e) that are identical to or resemble trade-marks which are used by other people prior to the enforcement of the existing Law; (f) that simply represent the ordinary mode of designating goods or places of produce, or the characters, devices or marks customarily used in trade to denote a special grade or quality or shape of the goods, or that merely represent the ordinary style of writing names, house-names, or names of companies or firms (Arts. 1 & 2). However, a mark of an interest organized under approval of the authorities may be used as a trade-mark and protected accordingly (Art. 21). As in the two preceding cases priority secures protection over all others coming subsequently (Arts. 2 & 8), but the validity of an exclusive trade-mark is limited to the special class of objects originally indicated by the applicant (Art. 5). The term of validity of the exclusive use of a trade-mark is 20 years, and is open to renewal (Arts. 3 & 5). The fee is payable with the registration of a trade-mark applied for (Art. 13 of the Law and Arts. 7 & 13 of the Regulation for putting it in Operation). Finally a registered trade-mark is liable to lose its validity in case (a) the place of produce, the quality, etc. of the goods for which it is used are falsely represented subsequent to its registration, (b) or when in case the applicant who does not reside in Japan, does not appoint within six months from the date of the registration a qualified attorney residing in this country (Art. 11).

Y. PROVISIONS THAT SPECIALLY CONCERN FOREIGNERS.

NON-RESIDENT FOREIGN APPLICANTS.—To enumerate those provisions in the existing laws, that specially relate to foreigners, when a foreigner not residing in Japan wishes to secure a latter-patent or to have his design or trade-mark registered, he must file in an application through his attorney appointed from among those in this country. He must further appoint, when his application has been accepted by the Patent Bureau, an attorney to represent him in all dealings with the Bureau and in all possible civil or criminal actions thereof. The neglect to appoint such an attorney without justifiable reason within six months will invalidate, as mentioned above, the

efficacy of his patents or registration (The Law of Patent, Arts. 6 and 38: Law of Designs Arts., 12 and 22; Law of Trade-Marks, Arts. 20 and 9.)

FORM OF DOCUMENTS.—Any document intended to be filed in the Bureau must be written in Japanese, and when it is drawn up in any other language Japanese translation must accompany the original. Further, a foreigner who is not residing in Japan must submit a document properly certifying his nationality, domicile and place of business (Arts. 3, 4 and 9 of the Regulations for putting the Law of Patent in Operation: Art. 8 of the Regulations for putting the Law of Designs in Operation; Art. 17 of the Regulations for putting the Law of Trade-marks in Operation.)

SPECIFICATIONS AND DRAWINGS.—When an application is filed in within the prescribed period of priority as provided in Art. 4 of the International League for the Protection of Industrial Property, application, specifications and drawings certified by the Government of the country of the original application must be submitted (Art. 25 of the Regulations for putting the Law of Patent in Operation; Art. 8 of the Regulations for putting the Law of Designs in Operation; Art. 17 of the Regulations for putting the Law of Trade-marks in Operation).

PROVISIONAL PROTECTION.—During the period of provisional protection extended to an invention or design or trade-mark exhibit in an international exhibition, a similar protection shall be accorded to it in this country during the period of the exhibition, provided the certificate establishing the fact of the provisional protection in the country where the exhibition is held is submitted on the occasion of sending in an application, (Art. 25. of the Law of Patent and Art. 26 of the Regulation, thereof; Art. 22 of the Law of Designs and Art. 8 of the Regulations thereof; Art. 20 of Trade-marks and Art. 7 of the Regulations thereof.)

TERM OF REGISTERED TRADE-MARKS.—A foreign registered trade-mark duly registered in Japan shall be valid during the same period of validity, in the original country, but within the maximum limit of 20 years (Art. 3 of the Law of Trade-marks.)

EXPLOITATION OF PATENTS.—The exploitation of the patented invention must be made in Japan, but, in case a patentee, while

neglecting to do so for more than three years, refuses without justifiable reason to assign or to permit the use of the patent under reasonable conditions by a third party who has applied to him for such assignment or permission, the patent is liable to be revoked. (Art 38 of the Law of Patents.)

VI. STATISTIC OF JAPANESE AND FOREIGN PATENTS, DESIGNS AND TRADE-MARKS.

THE applications for patents filed by Japanese and foreigners and the number of letters-patent granted in Japan during the period indicated are given in the following table:—

Year.	No. of Application.	No. of License Granted.
1885	425	99
1886	1,384	205
1887	906	109

PART IV.

FOREIGN TRADE.

CHAPTER I.

TARIFF SYSTEM.

THE ORIGINAL TARIFF SYSTEM.—The tariff system of Japan was originally based on the treaties concluded with the foreign countries. The treaties concluded with Great Britain, United States of America, France, Russia and Netherlands in the 5th year of Ansei (1858) regulated, by means of the commercial agreement appended to the treaties, all matters relating to the entrance and departure of ships, the import and export of commodities, as well as import and export duties. In June of 1859 the three ports of Yokohama, Nagasaki, and Hakodate were opened to commerce, and customs house was established. Subsequently Kobe, Ōsaka and Niigata were similarly opened, the first in December of 1867, the second in July of 1868, and the last in November of the same year. In May of 1866, as the result of an agreement with the Ministers of Great Britain, France, United States of America and Netherlands the rate of import and export duties was fixed on the basis of 5 per cent. *ad valorem*.

FIRST REVISION.—The idea of drawing up a regular tariff system was mooted frequently and at last coming to 1894, it took definite shape as the Tariff System which was promulgated in 1897. The system divided imports into three main classes, dutiable goods, non-dutiable goods, and prohibited goods. The tariff for dutiable goods ranged from 5 to 40 per cent. *ad valorem*, and divided into 16 grades. The schedule has as standard rate, so to say, 20 per cent. for ordinary refined goods, this rate to decrease in one direc-

tion but to rise in another. (1) Natural produce, (2) scientific instruments and apparatus and raw materials, (3) machinery, (4) half-manufactured materials, (5) articles of ordinary consumption occupy the decreasing side of the schedule, while articles of luxury and liquors and tobacco occupy the other extreme. The tariff in question was put in force in January of 1899.

SUBSEQUENT AMENDMENTS.—Subsequently the tariff received more or less amendment either in the interests of the inland revenue or with the object of encouraging home industries. Thus in the same year the tariff for manufactured tobacco was raised to 100 per cent. *ad valorem*, alcohol to 250 per cent., Chinese liquor, *saké*, and other distilled liquors not mentioned in the list, to 80 to 100 per cent. In the same year raw materials required by the State monopolies and match-making were relieved from all duties as were also artificial and natural fertilizers. In 1901 the rate on tobacco was advanced to 150 per cent. and that on alcohol to 42 *sen* per litre, and at the same time rate on some other imports was also advanced more or less. Further in 1902, in compliance with a resolution of the House of Representatives, a law for putting a duty of 15 to 25 per cent. on raw eggs was promulgated.

TARIFF LAW.—With the putting in force of a regular tariff schedule it was necessary for Japan's tariff autonomy to have a regular tariff law, for no such law had existed in regular shape; there was only a semblance of it in the shape of commercial agreements appended to the old treaties. With the object of filling this serious gap in the tariff legislature of the country, the draft of a tariff law was drawn up after consulting foreign laws on this subject. It was placed before the 13th session of the Imperial Diet, was passed by it in its original form, and at last it became law in 1899.

The establishment of a regular tariff law may be said to have ushered in a new era in the history of our tariff system. By that establishment many matters that formerly led to diplomatic interference have been transferred to the domain of ordinary administrative affairs. For instance, special arrangement has been provided for making protest against the ruling of Customs Chiefs, while it was made possible to determine by Imperial Ordinances places to be

newly opened for commerce or the kinds of commodities to be either exported from or imported into places. Provisions relating to the passage of goods through the interior or through the Customs Houses have already been created in virtue of the law in question. The establishment of bonded warehouses may also be mentioned in this connection.

The temporary storage of imports in Customs sheds provided for by Law No. 82 issue in 1900; the exemption of duty according to Law No. 85 issue in the same year, from goods re-exported in manufactured form within one full year from the time of original import, and the establishment of goods agents in 1901 may also be cited as some of the measures provided for facilitating foreign trade. The enactment in 1902 of rebate arrangement on imported raw sugar in compliance with the proposal of the House of Representatives may also be mentioned here.

CHAPTER II.

DEVELOPMENT OF FOREIGN TRADE.

FOREIGN TRADE IN PRE-RESTORATION DAYS.—The foreign trade of Japan, and indeed even home trade, remained in an insignificant state prior to the discontinuation of the isolation policy, for whatever trade existed in those days was carried on only with China, Korea, Netherlands and Portugal, and even this was limited in scope. Then the setting up of autonômic local governments by the feudal barons and the defective means of communication and transportation necessarily obstructed the free development of trade. It was only after the conclusion of the treaties first with the United States of America, then with Russia, Great Britain, France, Netherlands, etc., as already mentioned, and after the establishment of regular trading ports at Nagasaki, Yokohama, Hakodate, and elsewhere and especially after the abolition of the feudal system in 1868 and the rehabilitation of the Imperial régime, that a new era began with our foreign trade. The introduction of various factors of Western civilization has powerfully accelerated its development.

RECENT PROGRESS OF FOREIGN TRADE.—Below is given a table showing the progress of foreign trade during the last 35 years.

TOTAL VALUE OF EXPORT AND IMPORT OF PRINCIPAL COMMODITIES.

(figures marked with an asterisk denote excess of imports).

Year.	Exports.	Imports.	Total.	Excess of Exports and Imports.

CHAPTER III.

DISTRIBUTION OF TRADE.

TRADE WITH ASIA, EUROPE AND AMERICA.—The commercial importance of the Asiatic Continent to our foreign trade is a fact that need not be insisted on, and the fact that the progress of our trade with the continent is striking redounds much to the credit of our countrymen. In 1882 Europe stood at the head of the list in the volume and value of its exports, followed by America and Asia. In imports Europe headed the list followed by Asia and America. Coming to 1902 the relative positions of these great divisions of the globe were reversed, and in the exports Asia came first followed by America and Europe. In imports also Asia occupied the same position, after which came Europe and America.

RELATIVE PROGRESS OF TRADE WITH ASIA, EUROPE AND AMERICA.—To review the relative progress of the share of the three continents in our trade, between 1882 and 1902 Asia advanced by over sixteen fold in the value of our exports, Europe by 400 per cent., America about 600 per cent., Australia and others by over 335 per cent. In imports the rate of advance between 1882 and 1902 was over 13 and a half fold for Asia, over 550 per cent. for Europe, over 1560 per cent. for America, and over 555 per cent for Australia and others. Details are given in the following tables:—

TOTAL VALUE OF EXPORTS TO VARIOUS COUNTRIES.

CHAPTER IV.

PRINCIPAL EXPORTS.

The principal exports from Japan are raw silk, *habutaye*, cotton yarns, matches, fancy matting, tea, camphor, marine products, copper, coal, etc. Of these raw silk and *habutaye* stand out conspicuous in volume and value, and have in the United States of America and France their best customers. In 1892 the total value of their exports amounted to 40,300,000 *yen* approximately, to be advanced to about 101,540,000 *yen* in 1902. Cotton yarns go mostly to China, Hongkong and Korea, matches and coal to China, Hongkong and British India; fancy matting to the United States of America, etc: marine products to China and Hongkong; copper to Hongkong, England, Germany, etc. Details from 1868 are given below.

TOTAL VALUE OF CHIEF COMMODITIES EXPORTED.

CHAPTER V.

PRINCIPAL IMPORTS.

Of the imports into Japan machineries, iron ware, petroleum, sugar, raw cotton, cotton fabrics, woollen goods, etc. are the principal items. Of the machines locomotives and mules surpass all the rest, the former coming from England and the United States and the latter from England. Iron ware come from the United States, and Russian Asia; sugar from China, Hongkong, and Germany; ginned cotton from the United States, Hongkong and British India; cotton goods from England and Germany; woollen goods from England, Germany, Belgium, and France. The advance in the import of all those articles is due to the development of our industry and to the rise of the scale of living of our people. Among those goods, there are many which Japan has begun to manufacture or is about to manufacture with the exception of woollen goods, so that though the import of raw materials or others ministering to one or another manufacturing industry in this country is destined to advance, that of manufactured goods may be expected to decline. Details regarding the value of principal imports are given in the following table:—

TOTAL VALUE OF COMMODITIES IMPORTED.

(unit of *yen*).

Year.	Locomotive Engines.	Fresh Eggs.	Salted Fish.	Flour.	Aniline Dyes.	Dry Indigo.

CHAPTER VI.

PROVISIONS FOR ENCOURAGING FOREIGN TRADE.

1. CHAMBERS OF COMMERCE:—Commercial and industrial bodies discharging the functions of regular chambers of commerce had previously* existed in Japan even prior to the Restoration, but as an institution owing its origin to regular legislative arrangements the Chamber of Commerce first saw the light in September 1890. Since that time 58 chambers have already been established throughout the country. The regulations about the Chambers of Commerce having proved defective in working, officials were sent to the West to investigate the organization of the institutions as they existed there. A draft was drawn up after careful investigations by the Government and leading business-men into the system of the Western organizations of this description, and a new law was promulgated in March 1902, this law being now in force. To enumerate the principal clauses in the new legislature, the Chamber is; (1) a juridical person; (2) qualified to investigate all measures calculated to encourage trade and industry; (3) to represent to the offices concerned its views about legislature relating to trade and industry and also on all matters relating to the interests of trade and industry; (4) to give reply to the queries referred to it by the offices concerned; (5) to inquire into the situation of trade and industry and to compile statistics bearing on the same subject; (6) to undertake similar inquiries at the request of merchants or manufacturers, and also to guarantee the place of produce, price, etc., of commodities; (7) to appoint, at the request of Government offices, appraisers or consulting agents relating to trade or industry; (8) to act as arbitrator in disputes of merchants or manufacturers at request of the parties concerned; (9) to establish, subject to the approval of the Minister of Agriculture and Commerce, institutions of a commercial or industrial character or to manage them or to make other provisions calculated to encourage trade or industry.

The right of election and the right of eligibility for member-

ship are confined only to Japanese subjects or to juridical persons established under Japanese laws. The right of election is accorded to those who are carrying on in their own names business coming under Arts. 263 and 264 of the Commercial Code; or those who are engaged in manufacturing business coming under those provisions, also to exchanges, mine-owners, and directors of juridical persons undertaking business on a large scale. The qualifications for the enjoyment of the right are precisely specified and only those who possess the right are eligible. The regular number of members must not be more than 50; besides there are "special members" not exceeding one-fifth of the number of regular members. The election is carried on according to the method of ordinary election, compound election and class-election. The expenses for maintaining chambers are to be borne by those enjoying the right of election.

Besides the chambers existing at home, the Japanese subjects residing in the various part of Korea, as Fusan, Mukpho, Gensan and Jinsen have chambers of their own. Though their establishment is subject to the approval of the Japanese Consuls, those chambers do not come under the control of Japanese laws.

A number of legislative measures besides the Law of Chambers of Commerce are in force, to regulate matters relating to the institution.

2. THE HIGHER COUNCIL OF AGRICULTURE, COMMERCE AND INDUSTRY.—The Government does not neglect to make provisions calculated for encouraging foreign trade, on the contrary it has set apart since the 1896-'97 an item of foreign trade expansion expense in the Budget. One of such provisions was the creation of the Higher Council of Agriculture, Commerce and Industry established in 1896 with the object of devising measures for encouraging foreign trade. The council is composed of twenty members apart from a chairman and a vice-chairman. Of the members five are officials of the Departments of Agriculture and Commerce, Foreign Affairs, Finance, and Communications, and the remaining fifteen are business men of note. At first the council deliberated on matters relating to foreign trade alone, as may be seen from the subjects placed before it for deliberation by the Department of Agriculture and Commerce in its first session. Those subjects were as follows:—matters relating to (1) the dispatch of commissioners to the Yangtesking region of

China to investigate the navigation route there, (2) the expansion of banking facilities in connection with foreign trade, (3) the establishment of bonded warehouses under supervision of the Customs Houses, (4) the expansion of sale of the principal exports, (5) correspondence on the situation of foreign markets, (6) marine insurance, (7) control and protection of workmen (the above were placed before the 1896 session of the Diet), (8) the operation of the gold monometallic system and its effect on agriculture, commerce and industry at home, (9) its effect on foreign trade, (10) the measures to be adopted for minimizing the evil side and for increasing the beneficial side of that effect, (11) encouragement of the business of tea exporting, (12) encouragement of exportation of silk (the above were principal subjects discussed in the second session held in 1897.) The council also deliberated on sundry other matters at its own initiation and passed a resolution, to give one of such instances, totally abolishing export duties.

In June, 1897, the organization of the council was amended so as to allow it to deliberate on matters relating to domestic trade as well as on matters relating to foreign trade. The number of the members was at the same time increased from 20 to 30.

3. INSPECTION OF FOREIGN MARKETS.—The Government has been dispatching from 1895 a number of officials and commissioners to foreign countries to cause them to investigate the state of the foreign markets, especially with the object of promoting direct export by our merchants, and also inquiring into other matters calculated to further the interests of foreign trade. Besides Government officials, student commercial agents and student manufacturers, and private individuals experienced in respective lines of trade were despatched on similar missions, the chambers supplying them with either a part or the whole of the travelling expenses. During the eight years from the 1895 to 1901 fiscal years altogether 124 people were sent abroad, some of them to China, others to Europe, and still others to North and South America, and a few to the South Seas, the Strait Settlements, Siberia, Korea, India, the Philippines, etc.

4. INDUSTRIAL GUILDS.—An outline history of legislative measures relating to industrial guilds having been given in a section of Agriculture, a brief survey of the formation of guilds of industrial and commercial interests may be sufficient in this place.

As matters relating to the guilds were left outside the control of Government offices prior to 1884 when rules were enacted requiring the approval of the authorities in forming a guild, it is not possible to ascertain how many guilds of different interests had previously existed throughout the country. The returns drawn up in November 1886 first supply reliable information on this subject. The number was as follows at that time:—

Commercial Guilds	628
Industrial Guilds...	404
Commercial and Industrial Guilds	547
Total...	1,579

On the issue of the Staple Exports Guild Law in 1897, a numbers of guilds organized under the former regulations were abolished, so that at the end of 1889 the guilds numbered as follow:—

Commercial Guilds	538
Industrial Guilds...	442
Commercial and Industrial Guilds	188
Total...	1,168

The replacement of the Law in question by the Staple Commodities Law in 1900 was again followed by change in the figures, thus:—

Commercial Guilds	529
Industrial Guilds...	433
Commercial and Industrial Guilds	187
Total...	1,149

Of the foregoing number of guilds quite a large portion have been established in conformity with the Staple Export Guilds Law and its successor the Staple Commodities Guild Law. This is shown in the following table:—

Year.	Com- mercial.	In- dustrial.	Com. & In'al.	Total.	Dis- solved.	Number existing.
1898	18	18	24	60	—	60
1899	27	26	52	103	—	165
1900	18	13	43	71	2	237
1901	10	11	21	42	4	275
As existing at the end of 1901...	73	62	140	—	—	—

According to the returns made in July, 1902, the guilds engaged in the manufacturing business numbered 61, and those in sales and in manufacture and sales numbered respectively 66 and 150.

5. **STUDENT COMMERCIAL AGENTS AND MANUFACTURERS.**—These constitute one of the regular measures adopted since 1896 as a means of expanding our foreign trade. The object is to send abroad capable young men so that they can get a practical training either at commercial establishments or in factories. The candidates are selected from among those recommended by leading business-men and other influential people of the provinces. A certain amount of pecuniary help is given to the students, though there are some who decline it. All those students, whether receiving help or not, are under the control of our nearest legations or consulates, and the students receiving help are obliged to regularly send a report to the home Government about the given subjects which they are intended to be studying. The number of students and the places where they got training were as follows:—

1896—10; one each at Mexico, Germany, England, France, China, five at the United States of America.

1897—13 (10 continued from the preceding year); one at Bombay, two additional at U.S.A; the rest as above.

1898—16 (13 continued from the preceding year, 4 new, and 2 not receiving help): one each at Mexico, Germany, England, British India, three each at China and France, eight at U.S.A.

1899—47 (15 continued from the preceding year, 27 new, 5 not receiving help): one each at Mexico, England, Belgium, Russia, Siberia, Australia, British India; six at France, five at Germany; 15 at U.S. America; 12 at China.

1900—58 (32 continued from the preceding year, 24 new, 2 not receiving help); 16 at U. S. America; 12 at France, six at Germany, two each at England, Russia and Siberia, one each at Belgium and Australia, 14 at China.

1901—97 (31 continued from the preceding year, 59 new, and 7 without receiving help); 11 each at France and Germany, two each at British Canada, Mexico, Peru, Strait Settlements, and Java, three each at Belgium, Hongkong and Australia, Siberia, one each at Russia, Switzerland, and Philippines, 14 at U. S. America, 25 at China.

6. **COMMERCIAL SAMPLES MUSEUM.**—Japan possesses 38 commercial samples museums, not to mention those that are now being set up.

The Commercial Museum established in premises of the Department of Agriculture and Commerce being the most important of the institutions of this description though not the oldest, deserves to be described here at some length. It was established eight years ago, and contains 23,161 samples of which 12,756 are of foreign and the remaining 10,405 of domestic origin. Besides, there are 4,188 by foreigners and Japanese.

The samples collected by the Museum comprise in regard to domestic produce, commodities that now constitute the principal items of export or are likely to become so in the near future, also those that are competing with imported goods on our market or are qualified to do so. As to the foreign samples collected, they represent commodities of principal import or those that are likely to become so, or those that are actually competing or are likely to do so on foreign markets with the goods exported from Japan. Then samples judged to represent the situation of our industry in all its manifold forms are also placed on view in the Museum, as also raw materials of all descriptions both foreign and Japanese, that are judged capable of being exploited with profit in Japan. The Museum keeps in touch with the movement of our trade and with the situation of all important commodities, and while it serves as a medium of presenting in a business-like way all the succinct points which foreign merchants or manufacturers may wish to know about our goods in opening regular transaction with our merchants or manufacturers, the latter are similarly supplied with all the necessary information about foreign goods. This intermediary function played by the Museum is highly appreciated both by our countrymen as well as by foreigners, so that while the Museum keeps up at the request of our people correspondence with Japanese consulates, foreign museums and such bodies so as to find for their goods suitable markets abroad, the institution extends to similar applications coming from foreign countries an equal amount of attention and satisfaction. In short the Museum is now widely regarded as one of the most convenient institutions both by Japanese and foreigners for keeping

themselves in touch with the situation of commerce and industry both at home and abroad.

With this growing importance of the Museum, the number of samples either presented by Japanese or foreigners or of applications from them to place their samples on view has begun to increase to a marked extent, and the Museum is even now embarrassed to find room for those samples. This is indeed a great advance on the time when the Museum experienced no small difficulty in inducing Japanese or foreign merchants or manufacturers to send samples of their goods to be exhibited in its rooms.

The Museum makes a loan of its exhibits or sometimes spares a number of its exhibits to local museums or shows with the object of more widely extending the benefit for which it was established. It also keeps up a regular correspondence with foreign museums or commercial schools, exchanges printed matters with them, and in short spares no pains for efficiently discharging its function.

7. COMMERCIAL SAMPLE MUSEUMS ABROAD.—The establishment of commercial sample museums in foreign countries was another item included in the foreign trade expansion programme inaugurated in 1895. The museums are placed under the control of the Japanese Consulates and are left in charge of merchants properly qualified for the purpose and also qualified to act as a medium for the conclusion of transactions between Japanese and foreign merchants or manufacturers. The museums thus organized numbered six in the opening year, and were established at Vladivostock, Odessa, Bombay, Singapore, Shasi, and Mexico. In the following year one was established at Amoy. From that time till the 1902 fiscal year several others have been started at different places, but as some whose existence was not justified by results, have been closed, at the end of the year in question the official museums existed at the following places, viz. Shasi, Hangkow, Chunking, Bombay, Newchwang, Singapore, and Bangkok. At the same time a number of private sample museums have been granted state aids, these being the Ping-Yang-Hong at Fuchow, Seoul Commercial Museum at the Korean capital, the Japan-China Commercial Museum at Shanghai, and one at Constantinople. It may be stated that the samples on view at the official commercial museums comprise articles either purchased by

the Government or articles presented by merchants or manufacturers concerned.

8. **EXPERIMENTAL PRODUCTION OF COMMERCIAL COMMODITIES.**—Since 1896 the Government has caused technical schools and workshops to undertake by trust the production of commodities at the request of the Government. The result of this experimental work cannot fail to improve and encourage the respective lines of industry and it has been made public.

9. **INDUSTRIAL REPORTS.**—The Bureaux of the Department of Agriculture and Commerce concerned have been compiling reports since 1895 on industrial subjects respectively left in their charge, especially in their bearing to foreign markets and the situation of production at home. These reports which are supplying a want long felt by all the public are being distributed among the Government Offices, public institutions, and business people. The subjects previously treated were cotton fabrics, umbrellas, wood-ware, rape-seed oil, wood, wax, copper and bronze-ware, silk fabrics, handkerchiefs and other silk-ware, rugs, porcelain and earthenware, cloisonne-ware; cotton yarns, straw-plaits, matches, glass-ware, matting, paper and paper-ware, lacquer-ware, screens, and fans. To this list cigarettes and other manufactured tobacco, brushes, iron-ware, buttons, clocks, soap, cotton blankets, cotton knit-work, cement, cotton undershirts, stockings, beer, *sake* and other liquors, and soy have lately been added.

Besides the reports forwarded by Japanese Consuls, student commercial agents and manufacturers, and also reports embodying the result of investigations made either at home or abroad on industrial matters, have been published and similarly distributed.

PART V.

FINANCES.

CHAPTER I.—Finances.

**Central Finances—Formosan Finances—Local Finances—Debts
—Currency—Money Market—Banks—Clearing-Houses.**

I. CENTRAL FINANCES.

FINANCES BEFORE THE RESTORATION.—Though circumstances made it comparatively easy of accomplishment the work of reinstating the Imperial Government, nevertheless it involved in the adjustment of the finances labor of stupendous description. This was principally due to the necessity of unifying the different financial systems that had been followed for a long period by the 277 **Feudal Fiefs.** feudal daimyates that existed during the pre-Restoration days, systems that were, too, in a state of extreme disorder and complication. The reason is because many of the feudal princes had been compelled by necessity to make various shifts, such as issuing fiat currency, minting debased coins, ordering the payment of taxes in advance or contracting loans. The debts for which the feudal princes thus made themselves responsible were enormous, and these devolved entirely on the Imperial Government.

On the other hand the revenue was in arrears to an astonishing extent, for its only important resource, the Land Tax, did not supply more than one-tenth of the whole expenditure. The Government had therefore to fall back on issuing inconvertible notes to meet this deficit. For several years after the advent of the Restoration, the finances remained in this deplorable condition. In the meanwhile

the Government energetically strove to establish the taxation system on a regular and sound basis. For this the first thing that demanded attention was to definitely define in regard to land the right of fief formerly exercised by the feudal princes and the right of ownership by private individuals. As was generally the case in most other places where feudalism prevailed, this distinction was far from clear; the princes besides exercising the right of control held at the same time a sort of right of ownership over all the land in their respective dominions. The right of ownership was therefore rather the right of tenantry, and the tax or tenant-rate, paid with rice, was the principal source of revenue to the feudal princes. The rate of this so-called tax was not uniform; but it was excessively heavy, ranging from 30 to 70 per cent. of the yield of the field. Some sort of tax was also imposed on manufacture, but this was of course insignificant.

The revenue of the princes was principally devoted to maintaining their military organization and supporting their retainers. The farmers and merchants were therefore made use of merely as tool for supporting this unproductive class.

THE SHOGUNATE.—The Shogunate was peculiarly situated in regard to finances. It exercised the power of control over the feudal princes, but it did not govern directly the people inhabiting the princes' fiefs as apportioned by the Shogunate. The people in those fiefs were not therefore obliged to pay any tax to the central Government, and all their duties in that direction ended with their respective lords. The princes, however, were under obligation to discharge at their own expense the military and other services demanded by the Shogunate, and also to pay tribute, mostly nominal, to it. The ordinary revenue of the Shogunate consisted of the taxes levied in its own dominions, so that in this respect the Shogunate was in a position no better than the feudal princes it had under its control. Indeed the Shogunate's revenue was even less than that of some powerful princes.

FINANCIAL DIFFICULTIES OF THE RESTORED IMPERIAL GOVERNMENT.—The Imperial Government therefore at once found itself confronted by a grave financial complication when, on the fall of the feudal system, the real right of administration passed into its

hand. Moreover the transfer of the power of the central administration to the new Government in 1868 was not accompanied in practice by that of the national revenue. Even the revenue that the Shogunate enjoyed did not wholly go to the revenue of the rehabilitated Government, and yet it had to undertake the gigantic task of thoroughly reorganizing political and social institutions. It was necessary first of all to devise some financial arrangements which all those undertakings absolutely required. As the first step towards consummating these arrangements, the Government had to deal with the important question of the fiefs and pensions of the feudal princes and their retainers. This was the most delicate affair of all, inasmuch as the restoration of the Imperial régime was by no means welcomed by all sections of the people; on the contrary some of them were, for one reason or another, bitterly opposed to it. But for accomplishing this grand work of the unification of administration, which was the primary object of the reinstatement of the Imperial power, it was absolutely necessary to secure the compliance to it of all the influential quarters, and with their compliance to put all the important measures under the new political system. This mighty national movement was fortunately backed by all the powerful feudal princes, who in 1869 surrendered their fiefs of their own accord to the central Government, and thus laid the foundation of the present imposing fabric of the Imperial Government. With the enforcement in 1871 of the local system, the reality of administrative unification was first brought about. The privileges enjoyed by the feudal princes and their retainers were annulled, the whole country was placed under one and the same legislative measures, and all the distinctions of social rank and class were abolished.

PRIVATE INDIVIDUALS AND OWNERSHIP OF LAND.—With regard to the surrender of their fiefs by the feudal princes, which led to the clear setting up of the right of ownership of land by private individuals, those princes were actuated by the noble altruistic principle, acknowledging themselves as subjects of the sovereign and therefore not entitled to any sovereign right over land or to rule people who were subjects of the same rightful lord as themselves. On its own part, the reinstated Government, while maintaining its

authority in accordance with the advanced principles of law, apportioned in a fair and equitable manner the right of ownership of land to private individuals, and paved the way toward laying the foundation of sound finances. The duty of people as tax-payers was for the first time solved properly, and the burden of taxation was made uniform throughout the whole land.

THE LAND TAX.—In establishing the system of finance the Government undertook first of all the re-arrangement of the Land Tax, and this is a measure which should remain prominent in the financial history of the Empire.

It was 1871 that the measures relating to it were taken in hand. In 1873 a law embodying the result of the deliberations and investigations conducted in this connection was promulgated, but it was not till ten year later that the great work of reorganizing the tax had been completed. This taxation measure was one of special importance, in that it first established in a thorough manner the principle of the unification of the taxes.

The principal features in the new Land Tax law were these;—

(a). The establishment in a firm and fixed way of the right of ownership of land by private individuals.

When feudal system was abolished in European countries the central government had to pay a price for the fiefs held by the feudal lords, but in Japan the feudal lords were recompensed with public bonds when they were induced to surrender their dominions.

(b). The removal of all the restrictions that had formerly existed in connection with the ownership of land by private individuals.

During the pre-Restoration days the purchase or sale of land by common people was forbidden; nor were farmers left free in determining the crop they wished to cultivate in their land. The fact was as rice was used as medium for the payment of the Land Tax, and as the production of this cereal was therefore regarded as the most important factor in the economy of the various little states, the feudal governments were apt to interfere in the work of the farmers to the extent of ordering the cultivation of rice even when the soil was not

sued for it. The new Law of Land Tax while confirming indisputably the right of individuals to own land, removed all restrictions on land, and allowed land-owners to sell or mortgage their land or to use it in any way they liked. The discontinuation of that pernicious practice of interference has enabled the farmers to utilize their land to the best advantage, and to further the development of the national resources.

(c). The determination of the official value of land throughout the country.

As the products of the land formed the basis of taxations in former times, the tax-gatherers of each feudal government inspected every year the condition of the harvest in the dominions of such government and determined the rate of the tax payable for the year. There was no fixed rate. The new Government decided to determine the official value of the land and to place the taxation on a basis at once sound and fair. It was a gigantic task, but with admirable energy the Government set about the work, and finally completed it in a comparatively short space of time. The method adopted in determining the official value consisted in taking the average harvest for five years, to convert it into money by taking the average price ruling in the same period, using that price as basis of capitalization and of hence determining the value of the land. The work was concluded in 1881. To carry the valuation to a state of greater perfection and fairness, the re-assessment was carried out in 1899.

(d). The payment of taxes with money.

Taxes were formerly payable in kind, that is in rice or some other such produce. By the enforcement of the new law of taxation and the cessation of the quasi-tenantry nature of the Land Tax, the tax began to be paid with money and by fixed rate according to the official value of the land.

All those changes have considerably reduced the burden of the farmers. The tax was at first fixed at 3 per cent. of the assessed value, but this was reduced to $2\frac{1}{2}$ per cent. in 1877. After having remained unaltered for a long while the rate was

slightly raised, for five years ending 1903, the increase being at the rate of $2\frac{1}{2}$ per cent. of the assessed value for dwelling land in urban districts and $8/1,000$ for other kinds of land. With the expiration of this period the rate was restored to the original rate, that is from 1904.

Such is a brief history of the Land Tax Law. It may be thought strange that this particular tax should have occupied such a prominent position in the finances of the Government in the early stage of its re-instatement. The reason is simply this, that Japan was at that time an almost purely agricultural country and all other forms of industry, such as manufactures, etc., were then in a very primitive state. Thus in the year when the assessment of the value of land was completed, the proceeds of the Land Tax amounted to 43,000,000 *yen* out of the total of 60,000,000 *yen* derived from all kinds of taxes.

NEW TAXES.—With the progress of the country, however, demands on State disbursements necessarily advanced, and the Government was obliged to seek some suitable sources from which new taxes could be collected. The sources from which taxes had been drawn during the pre-Restoration days were thoroughly investigated, and it was decided that some indirect taxes should be imposed. The result was, in 1887 a new indirect tax, in the shape of an income tax was inaugurated.

THE TAX ON SAKE.—Of the indirect taxes newly established, the tax on *sake* was, as it is still to-day, the most important. The system as enforced to-day consists in levying the tax according to the quantity of the liquor brewed, that is per *koku*. The tax was created in 1878. The rate of the tax has been advanced by rather rapid stages, and what was only 4 *yen* per *koku* before the adoption of the so-called post-bellum programme has been raised to 15 *yen*.

EFFECT OF THE JAPAN-CHINA WAR ON NATIONAL FINANCES.—Indeed the expansion of national finances since the Japan-China War has been something extraordinary. Prior to that the expenditure amounted to about 80 million *yen*. In the 1896-'7 fiscal year, when several post-bellum expansion measures had been inaugurated, the corresponding figures rose at one jump to 170 million *yen*, then to 220 million *yen* in the 1899-'8 year, 290 millions in the 1900-'1 year, and 280 millions in the 1902-'3 year. The war, in

short, marks a new era for our finances, as indeed for all other affairs in Japan both public and private.

THE POST-BELLUM PROGRAMME.—The successful conduct of the post-bellum measures demanding the expansion of the finance hand in hand with the development of economic resources, the Government, while raising taxes or floating loans, has not neglected to take such measures as were calculated to encourage the development of economic undertakings, such as the improvement of the monetary system or the establishment of additional important banking mechanisms. This subject of post-bellum finance covering wide field, it is impossible to treat it here at any length, so that the reader who is interested in the subject is advised to consult the History of the Post-bellum Finance published in English by the Imperial Japanese Treasury. All that can be stated here about this great question will be merely categorical. Suffice it here to state that, of the large number of measures undertaken in that programme, the most important are the expansion of national armaments, the establishment of the Iron Foundry, the expansion of the existing railroads and construction of the new, the expansion of the telephone and telegraphic service; the creation of the Imperial Kyoto University and of additional Higher Schools and Technical and Commercial Institutes; the establishment of the Japan Hypothec Bank, of Local Hypothec Banks, Hokkaidō Colonial Bank and of the Formosan Bank; and lastly several other measures for promoting agriculture, manufacture and trade; and then engineering work for controlling unruly rivers. All those measures have been carried out with a view to developing the national resources and industries.

It being impossible to meet with the proceeds of the ordinary revenue the enormous expenses involved in the undertakings contemplated, it was decided that the outlays on account of those extraordinary works should be met by means of the Indemnity and loans, and that the additional requirement on account of ordinary expenditures should be obtained by increased tax measures. In pursuance of this policy these measures were carried out in the 1896-'7 fiscal year, then in the 1898-'9 and lastly in the 1901-'2, the additional proceed from this new source being estimated to amount to 95 million *yen*, as will be demonstrated in the following paragraphs.

The Tax on *Saké* that stood at the rate of 9 *yen* per *koku* in 1896 was raised to 12 in 1898 and 15 in 1901. The latest tax on liquor is that on beer which is at the rate of 7 *yen* per *koku*.
Tax on Sake. The proceeds from the tax on all the different kinds of liquors amount to about 55 million *yen*, so that this source stands at the head of all direct or indirect taxes in the amount it yields to the revenue.

The rate of the Land Tax increased in 1899 to 3.3 per cent of the assessed value brought in an additional revenue of about 8 million *yen*.
Land Tax. but this addition was procurable for only five years ending 1903, when the rate was restored to the original 2½ per cent. One thing to be noted in this connection is the marked advance that has taken place recently in the price of rice, and hence of the capitalized value of land on which the tax is based, the present price being about threefold that prevailing on the occasion of the last assessment. Therefore even at the rate of 3.3 per cent. it practically amounts to only 1 per cent., when considered in connection with that advance.

The Income Tax was at the same time advanced by 1 to 5½ per cent but the creation of the Business Tax in 1896 was a far more important measure. This tax being extremely complicated in its assessment, all that can be stated within the limited space at our disposal is that the tax is imposed according to the proceeds realized from the sales of commodities, the amount of the rental of the buildings, of capital invested, the number of persons employed, etc. The tax is one of special importance in view of its relation to franchise, for a man who pays this tax above a certain limit is entitled to exercise this important right. The relation between the exercise of legislative functions, and the Business Tax has developed a new feature in the history of the national legislature, as it has led to the admission (as the Land Tax did in the case of agriculturists from the first) of the business classes to the exercise of this important privilege, and therefore to establish some balance between agriculturists and business people in the privilege of national representation.

The inauguration of the tobacco monopoly measure by discontinuing the former stamp duty on tobacco was another special financial

Tobacco Monopoly. feature incidental to the post-bellum programme. The monopoly originated from the idea of increasing the revenue from this source and of doing away with the complicated stamp duty and the license duty.

The post-bellum programme has not confined itself, in regard to taxation, to creating new taxes or increasing the rate of the old, for it has at the same time abolished some of the existing taxes and has generally simplified taxation.

The existing taxes, besides those already enumerated, comprise exercise on sugar, soy tax, tax on the issue of convertible notes, tax on bourses, tax on mining, tonnage dues, tax on **Other Taxes.** patent medicines, registration tax, stamp duties, etc.

Then there are proceeds from such Government undertakings as railroads and post and telegraph services, and the proceeds from this sources are steadily increasing.

Customs duties were at first insignificant, for with the tariff fixed, under the then existing treaty, at 5 per cent. *ad valorem*, and with foreign trade remaining inactive, the receipts realized **Customs Duties.** did not for several years exceed 3 million *yen*. The development of the trade was naturally attended by a great increase in the amounts of custom receipts, and in 1898 the receipts, even under the old 5 per cent. rate, amounted to about 9 million *yen*. With the revision of the treaty in the following year, tariff autonomy was partially restored. At the same time export duties were entirely abolished, and the tariff was confined to imports alone. The tariff rate, according to the new arrangement, ranges from 5 to 35 per cent. *ad valorem*, and the enforcement of this new system was at once followed by a marked increase in the receipts. In the 1899 fiscal year, for instance, it amounted to about 16 million *yen*, and excepting the 13,600,000 *yen* in the 1901 fiscal year, that of the other three last years exceeded 16,500,000 *yen*, so that this source now constitutes an important item in our national revenue.

Even from the brief survey given above of the development of our taxation system, it will be seen how our financial system is growing more and more sound with the development of the national economy. At the beginning of the era, the Land Tax was practically the sole resource of revenue for the Government, while to-day the

list contains a large number of taxes some of which even yield a larger revenue than that primary tax.

FINANCIAL ADMINISTRATION.—The reason why the taxation system has been here described at some length arises from our desire to show the soundness of our finance and also because the financial system must occupy a place of special importance in any explanation of the national condition of the new Japan. For other aspects of our finances only a short notice will therefore be given. A brief description of the history of the management of the finances will not however be out of place here. As might have been expected, the financial system was extremely complicated in the beginning of the era, and no regular method existed with regard to financial administration. Each Department of the State was financially independent, and there was no unity in the State finances. On the enforcement in 1871 of the first local administration system, it was arranged that all financial matters should be controlled by the Treasury, while, coming to 1873, a regular procedure was adopted for receipts and payment, and this was a forerunner of the present Budget system. In 1880 the Board of Audit was created and placed under the direct control of the Emperor. Considerable difficulty was experienced in bringing financial administration under the control of the Treasury and the auditing business under that of the Board of Audit, for each Department of the State had been used to separately look after its own money matters, while no definite system had existed in regard to the finances of the State. It was therefore feared that an attempt to unify financial affairs might not be beneficial in its result. Experience has, however, entirely falsified this prediction, and the new arrangement has proved as efficient as it has been beneficial. The year 1882 was indeed a memorable one in the history of Japanese finances, for from that year the sole control by the Treasury of the right of receiving or paying Government money was obtained; and all irregularities that had previously attended this important branch of State affairs were entirely removed. In this year too the Bank of Japan was created, and was made to act as cashier for the Government. To mention other important financial measures, the budgets and settled accounts were made public every year from 1886, while on the occasion of the promulgation of the Imperial

Constitution in 1889, the Law of Finance was amended, and our financial system first assumed the form it presents to-day. The Budgets, as provided in the Constitution, are compiled by the Minister of Finance and carried into effect by him with the approval of the Diet. The settled Accounts are introduced to the Diet also after having been audited by the Board of Audit.

FINANCE AND THE IMPERIAL DIET.—On the advent of the Constitutional régime, a new epoch was inaugurated in financial affairs, so that while previously those affairs were arranged at the discretion of the Government alone, the approval of the Diet is now required for them. The compilation of budgets and the reporting of settled accounts are of course no novel process in the West, but its adoption by Japan is a significant sign proving how Japan has energetically striven to regulate her finances according to the enlightened system of the West.

STATISTICAL TABLES.—Before proceeding to treat other subjects about finances, statistics relating to State expenditures and revenue, proceeds from different items of revenue, and other affairs shall be given first:—

TABLE I.—ANNUAL STATE REVENUE AND EXPENDITURE
PERTAINING TO THE GENERAL ACCOUNT.

(unit of *yen*).

REVENUE.

Fiscal Year.	Ordinary.	Extraordinary.	Total.
1868 (<i>a</i>)	3,664,780	29,424,533	33,089,313
1869 (<i>b</i>)	4,666,056	29,772,349	34,438,405
1870 (<i>c</i>)	10,043,628	10,915,872	20,959,500
1871 (<i>d</i>)	15,340,922	6,803,676	22,144,598
1872 (<i>e</i>)	24,422,742	26,022,431	50,445,173
1873 (<i>f</i>)	70,561,688	14,945,557	85,507,245
1874 (<i>g</i>)	71,090,481	2,355,063	73,445,544
1875 (<i>g</i>)	83,080,575	3,240,502	86,321,077

Note.—The length of term of fiscal years given in this and the following four tables is not uniform; (a) comprises 13 months ending December 31st of 1868; (b) 9 months ending September 30th, 1869; (c) 12 months ending September 30th, 1870; (d) 13 months ending October 31st, 1871; (e) 14 months ending December 31st, 1872; (f) 12 months ending December 31st, of the respective years; (g) 6 months ending June 30th, 1875. The rest comprise 12 months each, 1875 and 1884 fiscal years ending on June 30th and the others on March 31st, of the respective following years.

The figures for 1868 to 1900 fiscal years represent settled accounts; those for 1901, actual accounts as they stood on November of following year, and lastly those for 1902 and 1903 estimates on the budget.

The figures marked by an asterisk (*) denote deficit.

TABLE II.—SOURCES OF THE ANNUAL STATE REVENUE
PERTAINING TO THE GENERAL ACCOUNT.(unit of *yen*).

Fiscal Year.	ORDINARY REVENUE.				Transferred for the Payment of Interest on Deposits.

Note.—For the 1893 fiscal year some of the items belonging to stamp receipts were included, according to their nature, to various headings, instead of being treated according to the ordinary mode of classifying settled accounts. Hence the figures for the same period as given in this table may not agree with those given in other statistical publications.

The figures marked with an asterix (*) include temporary loans incurred on account of the Boxer trouble.

Note :—Of the expenditures for the years prior to 1885, those items which were not assigned to any departments are placed in this table under such departments as they might belong to by their nature.

* In the ordinary and extraordinary expenditures of Home Affairs for 1896 are included those of the Colonial Department which was created in that year and abolished in the next.

EXTRAORDINARY.

II. LOCAL FINANCES.

GENERAL REMARKS.—The civic corporation system was first established in 1878 by the promulgation of the Prefectural Assembly Regulations and the Local Tax Regulations, but it was on the promulgation of the Law for Cities, and Towns and Villages in 1888 and of the Law for Districts and Prefectures in the year 1890 that the civic corporation system was completed. The Law for Districts and Prefectures was amended in 1889.

According to the existing regulations, the expenditures of civic corporations, are determined by estimates for which the approval of the local legislative bodies is necessary. The revenue consists of receipts accruing from the property of the corporations, fees for using such property, and other receipts. Any deficit is met by levying taxes, which are as follows for prefectural finances:—

Land rate not exceeding one-third of the land-tax.

Business tax and miscellaneous taxes.

House tax.

Taxes for civic corporations are:—

Rate on district taxes and prefectural taxes.

Special taxes either direct or indirect.

The District does not levy taxes upon its inhabitants, and the expenses required by it are supplied by the towns and villages contained in it, the ratio to be duly allotted. The allotment is collected by each town or village on the approval of its legislative council, and forwarded to the coffers of the district.

Before any new local tax is levied it must receive the approval of the prefectural or city, town or village legislative council as the case may be. For a tax of importance the sanction of the Ministers of Home Affairs and of Finance must be obtained.

The development of self-government affair is inevitably attended by an increase of expenditure. Less than ten years ago the prefectural and communal revenue aggregated about 59,660,000 *yen* and the expenditure about 48,970,000 *yen*. In 1899 the revenue and expenditure amounted to 145,510,000 *yen* and 120,060,000 *yen* respectively. This increase is chiefly attributable to the greater disbursements

required on account of public works, agriculture, education, industry, sanitary affairs, etc. A tendency in a similar direction must be expected with the progress of times, and the central Government is exercising strict attention to prevent any undue expansion of the local expenses. The following tables will demonstrate the progress of prefectural and communal finances subsequent to 1890 :—

STATISTICS.—Statistics relating to local finances are :—

CHAPTER II.—Loans.

National Loans—Local Loans.

I. NATIONAL LOANS.

GENERAL REMARKS.—As already described in the section of finances, administrative and all other national affairs underwent a radical change at the time of the Restoration and many of the new measures were carried out with funds obtained by raising loans. The amount of loans thus raised early in the era has gone on increasing with the progress of the times, for the State had to adjust its finances, strengthen its armaments, and to devise measures calculated to improve and encourage the development of economic undertakings, communication service, etc. The only instance in which loans were raised for other purposes was in connection with the South-western Civil War and the Japan-China War. The Nine per cent. Sterling Foreign Loan raised at London in April 1870 was the first national loan raised by Japan. This was followed by the floating of the Seven per cent. Sterling Foreign Loan. The former was devoted to laying railroads between Tokyo and Yokohama and between Kobe and Osaka, while the latter was used for supplying funds to those "Shizoku" who had on their own accord surrendered their hereditary pensions and who were entering on a business career.

In March of the same year the "New" and "Old" Loan Regulations were enacted with the object of converting the debts incurred by the feudal princes into national debts, and **First Domestic Loan.** bringing the financial affairs of the country into a state of uniformity. This loan was the first raised at home.

In 1874 the Voluntarily Capitalized Pension Bonds were issued for granting some relief in the form either of cash or bonds to those "Shizoku" who had surrendered their pensions, in **Capitalized Pension Bonds.** order to enable them to procure funds for engaging in business pursuits. The greater part of the cash required for this purpose came from the proceeds of the Foreign Loans above described. In 1876, when the old hereditary pension system was entirely abolished, a regular system for compounding the pensions with capitalized pension bonds was instituted. In 1878 a similar favor of granting pension bonds was extended to Shinto priests who had, in consequence of the change in the administration of the Shinto temples, been deprived in 1871 of their posts and of their means of subsistence.

It was natural that in accomplishing such a grand work as the Restoration the Government should have required an immense amount of money and that it should have been compelled **"Kinsatsu"** to issue paper money to meet a deficit in the treasury. **Exchange Loan Bonds.** But this issue of paper money occasioned great financial disorder. To remedy this state of things, the Government promulgated in 1873 the "Kinsatsu" Exchange Loan Bond Regulations, with the object of withdrawing from circulation paper money in exchange for the bonds, exchange to be made at the request of the owners. In 1884 the withdrawal was carried out on a larger scale than before, in order to bring paper money to par. The issue of the bonds in accordance with the "Kinsatsu" Exchange Loan Bonds was discontinued and instead the Unregistered "Kinsatsu" Exchange Bonds were issued. Coming to 1899, with the object of redeeming 1-yen paper notes and notes of larger denomination, the Government borrowed from the Bank of Japan 22 million yen in the shape of convertible bank notes.

Meanwhile matters relating to the development of industry also received a due share of attention from the Government. In the year 1878 the Government raised the Public Undertakings Loan to the amount of 12,500,000 *yen* and undertook the work of laying the Kyoto-Otsu Railroad, the Tsuruga-Ogaki Railroad, the construction of a new road the Shimizu-goe pass, the drainage of Lake Inawashiro, the supply of water to Nasu plain, etc. Then in 1884 and 1885 the Nakasendo Railroad Loan amounting to 20,000,000 *yen* was raised to connect Tokyo and Kyoto by means of a railroad service through the Nakasendo route. This plan was subsequently abandoned, and part of the fund raised for the purpose was appropriated on account of the work of the Tokaidō Railroad and other railroad the speedy construction of which was necessary. The deficit in the fund was met by raising in 1888 the Railroad Supplementary Loan. From 1893 the Railroad Loan has been raised several times, and the construction of important lines has been completed, with the result that this service has been brought to a state of great efficiency and usefulness.

The Hokkaidō Railroad Loan was established in 1897, the loan to be floated according to the state of the market and as the progress of the work requires.

The outbreak of the South-Western Civil War in 1877 involved big disbursements which could not be met out of the ordinary revenue. Fortunately the Fifteenth National Bank just started about that time had a supply of capital which was too great to be profitably manipulated, so that it asked to the Government to use part of its capital as a loan. The Government accepted this offer, and borrowed a sum of 15,000,000 *yen* as a war fund.

Between 1886 and 1889 a Navy Loan amounting to 17,000,000 *yen* was raised with the object of bringing the Imperial fleet to a state of greater efficiency and making it more adequate to defend our expanded interests. The fund raised was used for establishing a number of admiralties, arsenals, building warships, and also for manufacturing torpedoes and ammunition of war.

Meanwhile as a result of the institutions of the State having

been brought to a state of greater perfection and especially as a result of the proper development of organs of monetary circulation, the scale of rate of interest had begun to fall, so that coming to 1896 the interest for deposits stood at about 3 to 4 per cent. The national bonds bearing interest at the rate of 6 per cent. or over naturally began to rise above par. The time had therefore arrived for consolidating several kinds of loans that had formerly been raised at a higher rate of interest. Accordingly the Treasury promulgated in October of that year the Consolidated Loan Bonds Regulations, in order, on the one hand, of consolidating the loans bearing a higher rate of interest and of reducing the expense of the Treasury as also of the burden of the people, and on the other of unifying the various kinds of loans. The loan bonds to be redeemed by this arrangement were the 6 per cent. "Kinsatsu" Exchange Loan Bonds, 6 per cent. Capitalized Pension Bonds, 6 per cent. Public Undertaking Bonds, 6 per cent. Unregistered "Kinsatsu" Exchange Loan Bonds, 7 per cent. Nakasendō Railroad Bonds, 7 per cent. Voluntarily Capitalized Loan Bonds, 7½-per cent. South-western War Loan, etc. All these loans aggregated over 173,010,000 *yen*. The regulations having been drawn up with the object of unifying all the different kinds of loans, they remain to this day as the fundamental provisions for regulating matters of loans.

In 1894 some trouble in Korea culminated in the outbreak of war between this country and China. The war involved immense expenses as to oblige the Government to promulgate an Urgency Imperial Ordinance entitling it, to float at its own discretion, loans and to contract other kinds of debts. The Imperial Diet that was convoked soon after approved of the measure of disbursing the war expense of 250,000,000 *yen* and of supplying that amount by means of domestic loans. In accordance with this programme the Government raised the War Loan and also got a loan from the Bank of Japan and procured the fund needed in replenishing the war chest. On the conclusion of peace with China in April 1895, it was arranged for the convenience of both parties that the indemnity Japan-China from China should be paid and received at London War Loan. and in English pound sterling. The indemnity was

set apart as a special account, so that it might be afterwards manipulated to greater advantage. At the same time this account led to the opening of a mutual loan arrangement between the Treasury and the Bank of Japan, with the result that a species of short-term national loans was brought into existence.

The glorious termination of that war imparted a powerful impetus to the development of national affairs in all spheres of activity. The Government itself also decided to undertake several important measures for promoting our economic affairs and for supplementing national armaments. With the consent of the Imperial Diet the

Post-Bellum Programme Loans. Government made arrangements for improving the existing system of railroads, constructing the Hokkaidō railroad, establishing a steel foundry, expanding telephone service, creating the tobacco monopoly, strengthening the national defence, etc. These measures appeared in the shape of Public Undertakings Loan promulgated in 1896.

The financial results of the Japan-China War were not confined to those enunciated above, for the annexation of Formosa to Japanese dominions necessitated the raising of a loan for exploiting the resources of the island. This loan is the Formosa Public Undertaking Loan issued in 1899.

In 1897 the Law for readjusting the Capitalized Pension Bonds was promulgated, in order to adjust the capitalized pensions, which therefore required the issue of a loan. However the various matters connected with this loan being yet under investigation, some time must expire before the loan is to be raised.

Besides these mentioned above, there are some contract affairs which involve disbursements not covered by Budgets, and for which the consent of the Diet has been secured. One of them relates to the procuring of the North China Affair Fund (1901 fiscal year), another to a loan to be transferred to the Iron Foundry Working Fund (1902), while there are also the Treasury Bonds, etc. Bonds Regulations issued in 1884 and Law No. 16 issued in 1894 for raising loans. These two latter

legislative measures invest in the Treasury an important privilege of procuring funds with which to meet the prescribed outlays originally arranged to be paid with the proceeds of the year's instalment of loans. For it frequently happens that the Treasury is obliged to fulfill payment while the proceeds from the loan are not yet forthcoming. By virtue of this expedient the Treasury is enabled to raise short-termed loans and thus to meet the necessity of prescribed outlays.

In consequence of the great discretion exercised by the Treasury in adjusting the State finances, and as the Treasury, in pursuance of that judicious policy, has converted and consolidated loans bearing higher rates of interest, of the 21 different loans heretofore raised by the Government (Treasury Bonds and short-termed loans excepted), 11 have already been redeemed or converted and consolidated, and there remain at present 10 loans which the Empire has yet to redeem.

The redemption of the loans was previously made by redeeming the prescribed instalment for such of the loans whose redemption was regulated in that way; also by converting and consolidating old loans, and also by redeeming by drawings a certain amount of bonds. Later the Government, with the consent of

Mode of the Diet, made an arrangement for purchasing, when-
Redemption. ever the state of the market favored such purchases, loan bonds, and of redeeming them by this process. This was duly provided by Law No. 5 issued in 1896. This purchasing method and the drawing method have since been availed of for redeeming loan bonds, and for adjusting State finances.

The history and all the circumstances relating to the origin of national loans having been described in this section, it remains for us to give some brief account of the items of those loans with their respective amounts, the classification of the loans, and some other financial subjects.

ITEMS OF NATIONAL LOANS.—The loans heretofore raised by the Imperial Government, excepting the Treasury Bonds and short-termed loans, number 21, to which one loan to be newly raised some time in future to be added, making in all 22 items, as appended in the following table:—

EXISTING LOANS.

Name.	Date of Issue of Regulations or Conclusion of Contract.	Rate of Interest.	Months for Paying Interest.

The items of short-term loans, that is to say, the Exchequer bonds and temporary loans are given below. Of these items, those that are remaining are Exchequer bonds, temporary loans contracted for adjusting balance of receipts and disbursements of Exchequer, the loan appropriated on account of the Formosan Public Undertaking Fund, and the loan on account of the North China Affair. There is only one loan to be contracted in future, according to the prescribed programme, and that is a loan appropriated on account of the Iron Foundry Working Fund. The particulars are as appended in the table.

AMOUNT OF THE DEBTS.—As mentioned in the preceding paragraph, the first loan ever raised by the Imperial Government was the 9 per cent. foreign loan, while in respect to redemption

the repayment in 1872 of the first instalment of the Old Loan was the first. From that time forward the raising of new loans was generally alternated by the redemption of the old, and though the amount remaining unpaid necessarily differed according to the times, in general it grew larger with lapse of time. The Capitalized Pension Loan raised in 1877 amounted to an immense sum, as it was involved a momentous change in the social organization of the country. The sum was no less than 173,900,000 *yen* in round numbers, and the incurring of this enormous loan raised at one bound the total sum of the State liabilities. The Consolidated Loan raised in accordance with the Regulations promulgated in 1886 was still larger, as it amounted to 175,000,000 *yen*. However as this loan was raised with the primary object of converting and consolidating loans bearing higher rates of interest, the flotation of this loan, nominally stupendous as it was, did not materially alter the sum total of the State liabilities. The outbreak of the Japan-China War in 1894 and the necessity it occasioned of the war loan and temporary loans swelled all at once the loans of the State, and this tendency was further accelerated by the appearance of the Public Undertakings Loan required by the various post-bellum measures. At the end of the 1902 fiscal year, the national debts reached the figures of no less than 584,620,000 *yen* approximately. Appended are the tables demonstrating the vicissitudes of the national loans since the first loan of the 9-per cent. foreign loan was raised.

Year.	Amount of Loans.	Amount Redeemed.	Amount Remaining at the End of the Year.	Debt per Capita.

Notes :—* The population of Formosa is included in the returns for this and subsequent years, and as the census returns for 1901 and 1902 are not forthcoming, those for 1900 were tentatively used for those two years.

The loans given in the foregoing table sum up to 1,345,016,553 *yen*, while the amount redeemed totalled 749,373,027.500 *yen* (the total amount of the loans divided by 32, the number of years intervening between April 1870 and March 1902, the average of loan contracted per year amounts to 42,031,767 *yen* and the redemption made averages 23,417,907 *yen* approximately). Hence the amount remaining unredeemed at the end of March 31st, 1900, was 595,643,525.500 *yen*. The unredeemed amount distributed among the different loans, the following table is obtained:—

National Debts.	Amount		Amount

On examining the amount of interest paid for the national debts that are bearing interest, the rate of interest show a gradual falling off, but the aggregate amount paid on this account has increased to a greater or less extent, this increase being especially striking in 1877.

National Loans.

CLASSIFICATION OF NATIONAL DEBTS.—The national debts incurred by the Government since the beginning of the era amount to a large sum, as mentioned in the preceding parts. But it must not be forgotten that all those debts have generally been occasioned by the reorganization of the national institutions, the adjustment of the finances, and the development of civil and military affairs. None of them have been engendered by deficit in the ordinary revenue of the State. It is true some debts have been contracted by war, but their sum is comparatively small. This point will be made clear by the following table in which the debts, (Exchequer bonds and temporary loans excluded), are classified according to the object for which they were raised.

(unit of *yen*).

	Object of Debt.	Name of Loan.	Amount Raised.	Amount Redeemed.	Amount not yet Redeemed.	
Reorganization of Public Institutions.	Feudal Governments' Debts Consolidated.	New Loan	12,422,825	12,422,825	—

		Grand Total... ..	857,505,350	317,111,825	540,393,525

It will be seen from the foregoing table that the national debts incurred for military purposes number four, the amount of their loans corresponding to less than 27.3 per cent. of the whole sum (the debt incurred for civil wars corresponds to only 16.3 per cent. approximately), and this item therefore is the largest; then come the debts incurred for the reorganization of public institutions. These debts number six and their aggregate amount

corresponds to about 27.1 per cent. of the whole sum, and therefore almost equal to the item above mentioned. The five debts resulting from the financial adjustment measures correspond to about 26.7 per cent., a ratio differing much from the preceding two. The debts which economic undertakings occasioned are the largest as to number, though their aggregate sum does not exceed about 18.2 per cent. of the whole amount. There is only one raised for the purpose of exploiting the new territory of the Empire, and its amount does not exceed .7 per cent., and is therefore the smallest item of all. The two items of economic undertakings and the exploitation of the new territory are, however, destined to grow larger with the lapse of time. Coming to the ratio which each item of redemption bears to the aggregate amount redeemed, that ratio is in the case of the financial adjustment amount to about 38.4 per cent., in the case of the military item about 36.6 per cent., economic undertakings about 18.3 per cent., reorganization of public institutions about 5.7 per cent., and the exploitation of the new territory about 1 per cent.

The amount of loans, of redemption, and of the sum not yet redeemed being classified according to foreign and domestic debts, the following figures are obtained:—

Kind.	Amount of Loan.	Amount Redeemed.	Amount not yet Redeemed.
Domestic	743,283,350	300,519,824	442,763,526
Foreign	114,220,000	16,592,000	97,630,000
Total	857,505,350	317,111,825	540,393,525

Further classification being made into those bearing interest and those not bearing interest and also into those that have issued bonds and those that have not, the following comparison is obtained:—

Ratio of Interest-Bearing Loans and Those not Bearing Interest.

INTEREST-BEARING.

Kind.	Amount of Loan.	Amount Redeemed.	Amount
			not yet Redeemed.

Note:—That portion of the South-Western Civil War Loan which had been paid off in 1883 when the rate of interest was revised was included in the item of the old rate of interest, and the remainder in that of the new rate.

II. LOCAL DEBTS.

As already mentioned, the debts contracted by the feudal princes were converted into the public loans of the Imperial Government and were thus brought under a uniform system. For a considerable period from the advent of the **First Local Loans**. Imperial régime local loans were practically non-existent, nor were there any regular rules in force to regulate this branch of local finance. It was as late as 1890, when the local Government system had been completed, that regular provisions relating to local loans were enacted for the first time.

According to the provisions now in force, the prefectural and communal corporations are allowed to raise loans only for the purpose of redeeming older debts or when it is impossible to meet with the ordinary revenue extraordinary disbursements **Objects of Local Loans**. occasions of an unavoidable nature or by undertakings judged to confer a permanent benefit on the corporations. But a loan cannot be raised unless the details relating to it have been voted by the legislative organ of the corporation and unless such decision has been approved by the Ministers of Home Affairs and of Finance. However this restrictive provision may not apply to short-termed loans redeemable in not more than three years

Though local loans are subject to such restrictions, the development of the self-government system and the expansion of local expenditure occasion disbursements which can not be easily met out of the ordinary revenue. Then again the frequent occurrences of calamities and disasters have further obliged the prefectures and corporative bodies to resort to loan expedients, and the result has been that the local loans have attained enormous proportions. The supervising authorities are exercising the utmost care to put a judicious check on this tendency.

CHAPTER V.—Currency System.

Existing System and its History—Effect of the Coinage System on the Finance and Economy of the Country.

I. EXISTING SYSTEM AND ITS HISTORY.

GOLD COINAGE SYSTEM.—The existing currency system is based on the Coinage System promulgated in the year 1897, and which ushered in the gold standard in this country. The principal points in the currency system are these:—

1. The unit of the coinage shall be 2 *fun* of pure gold (11.574 grains), and shall be one half the value of the old gold unit.
2. The gold coins shall be of three denominations, 5 *yen* coins, 10 *yen* coins, and 20 *yen* coins, and the gold coins issued under the old coinage law shall have double the value of the coins of corresponding denominations issued under the new coinage law.
3. Subsidiary silver pices shall be of three denominations, 10 *sen* pieces, 20 *sen* pieces, and 50 *sen* pieces. The 5 *sen* silver pieces issued under the old coinage system shall remain in circulation as before.
4. Subsidiary copper coins shall be of three denominations, 5-*sen* nickel pieces, 1-*sen* copper pieces and 5-*rin* copper pieces. The 2-*sen* pieces, 1-*sen* pieces, 5-*rin* and 1-*rin* pieces, issued before shall continue in circulation as before.
5. The circulation of 1 *yen* silver coin that was used as legal tender to any amount at the rate of 1 *yen* gold piece was prohibited on April 1, 1898, and its withdrawal from circulation was effected on July 31st of the same year.

A brief history of the development of the existing monetary system shall be described in the following paragraphs.

FIRST PERIOD.

One of the first things which the Imperial Government attempted in the way of internal reform was to unify the currency system with the object of securing its stability. The promulgation of the New Coinage Regulations in 1871 first laid the basis of a sound monetary system. The regulations adopted 1 *yen* gold piece weighing 23.15 grains as the unit of standard, and minted 2 *yen*, 5 *yen*,

10 *yen*, and 20 *yen* pieces. Subsidiary coins con-

First Coinage Regulation consisted of silver and copper pieces, the former being

of four denominations of 5-*sen*, 10-*sen*, 20-*sen* and 50-*sen* and the other also of four denominations,

1-*rin* 5-*rin* 1-*sen*, 2-*sen* (5-*sen* nickel pieces were first minted in 1889.) At the same time the Government issued 1-*yen* silver coin equal in weight and quality to the Mexican dollars that were circulating extensively at that time in the Far East. The 1-*yen*

coins called "trade dollar" having been issued to

Trade "Dollar" serve the convenience of merchants engaged in foreign trade, they were acceptable only within

the limits of the treaty ports. The relative value of the 1-*yen* silver pieces was fixed at the rate of 100 silver *yen* to 101 gold *yen*, that is to say at the rate of 1 of gold to about 16.014 of silver. (By Notification issued in 1876, 100 *yen* in silver coins was made equal in value to 100 *yen* in gold, the rate being 1 of gold to about 16.174 of silver.)

SECOND PERIOD.

The gold mono-metallism that was adopted early in the era began to be seriously affected from about 1873, when the gold price of silver fell very considerably in Europe and America, so that whereas at first the relative value was 1 of gold to 16 of silver, it fell to one of gold to 19 or 20 of silver. Situated as Japan was in the midst of silver using countries, it was decided, for the sake of promoting transactions with those countries, to

Reduced to Bi-Metallism. make the trade dollar legal tender throughout the country and to allow it to be circulated to any amount side by side with the gold coins. In conse-

quence of this new arrangement put in force in 1878, the monetary system of Japan was no longer gold mono-metallism, but was changed to a system of gold and silver bi-metallism.

THIRD PERIOD.

The paper notes issued by the Treasury in 1868 were a result of imperious necessity of meeting the various urgent calls of expenditure occasioned by the inauguration of the new Government. At first they were convertible notes, but coming to 1871, they began to suffer depreciation. A similar remark applies to the bank notes issued in virtue of the Notional Bank Regulations promulgated in 1872. They were at first convertible **Paper and Bank Notes.** into specie, but when in 1876 the Regulations were amended to the effect that the bank notes were convertible into inconvertible Treasury notes, they were brought down to the same level of inconvertibility as the other kind of notes. Though those notes were reduced to that unlucky position, the evil resulting therefrom was not yet serious, owing to the fact that the amount of the two kinds of notes was still comparatively small. The outbreak of the South-Western Civil war in 1877 and the issue of 27 million *yen* at one time by the Government and also the issue of no small amount by the banks at once inflated the volume of inconvertible notes. This tendency was further accelerated, for as a result of amendment of the National Bank Regulations in 1876 the creation of new banks followed in quick succession. At the end of 1879 therefore the volume of inconvertible paper money swelled to as much as 34,000,000 *yen*. The evil effect of this condition of the currency soon began to make itself felt in every direction; the price of commodities rose rapidly, specie left the country, the imports continued to exceed the exports, public bonds continued to come down to an alarming extent, and in short it seriously impaired the prosperity of trade and industry.

The Government adopted measures calculated to remedy this disastrous state of affairs. From 1880 systematic efforts were made to accomplish this adjustment, and to redeem the paper **Currency Adjustment.** money. In pursuance of that resolution the Government began to hoard specie. Coming to 1883 we find

that it amended the National Bank Regulations. It afterwards caused the banks to deposit specie reserves with the Bank of Japan that had been established in 1884, and this central bank was made to issue convertible notes on the bases of the specie reserves it had in its vault.

The redemption of the inconvertible notes and the issue of convertible notes to take their place reduced the volume of notes in circulation, and restored their value to par. At the same time the exodus of specie was stopped, trade revived, prices and the rate of interest fell, and the market and industry began to recover their normal state of activity. Meanwhile the specie reserves against Government notes went on accumulating, so that the Government was in the position in June of 1885, to give notice that specie payment would be resumed from January 1886 and that the inconvertible notes would be redeemed with silver specie. Thus the important object of financial adjustment was at last realized.

The circulation of Government notes was prohibited not later than December 31st of 1899, while that of bank notes was similarly prohibited on December 9th of the same year. It was announced at the same time that during the five years after the notice of withdrawal from circulation a holder of those notes would be entitled to have them exchanged for convertible legal notes. This period has not yet come to an end.

FOURTH PERIOD.

With the redemption of paper money by silver after 1886 and the placing of paper on par with silver, the monetary system of Japan, though theoretically a bi-metallic system, practically became one of silver. Though this financial state was an outcome of unavoidable circumstances, this change of the gold mono-metallic system into a silver standard system proved highly disastrous for our country. For the fall of silver that began to take place about 1877 kept on at greater rate, and was still more accelerated owing to the conversion of many silver countries into gold countries.

It is true that the United States of America made an attempt to check this downward course by adopting the Sherman act and by convening an International Monetary System Conference. These efforts ended in a failure and the fall continued with unabated force.

This movement of the silver market inflicted no small injuries on our national economy, so that the Government at last decided to institute inquiries into the question of monetary standard, and appointed in 1892 a commission charged with this special task. The commission was composed of officials of the Departments of State and business-men at large. The points which the commission were asked to deliberate on and discuss were, (1) the causes of the recent fluctuation in the price of gold and silver, and their general effect; (2) the effect of those fluctuations on the economic condition of the country; (3) whether, in view of these fluctuations, there was any need of making a change in the coinage system of the country, and if so what system ought to be adopted, and what measures should be taken for effecting that change. The commission sat for about two years, and after having made careful investigations into the subject came to the conclusion that our coinage system required a change, and that the change should be the adoption of the gold standard. The Government, however, had at that time no fund at its disposal to enable it to carry out this decision of the commission. Fortunately the Japan-China war and the indemnity paid by China enabled the Government to procure that fund.

FIFTH PERIOD.

This Indemnity reached Japan at a very opportune moment so far as the change of the coinage system was concerned, for it came just when the Government, impelled by necessity, was thinking of carrying out the change just referred to and when the time for making that change had in fact come. Determined to effect this important monetary change, the Government introduced in 1897 the Coinage Bill to the Diet. The bill with the approval of both Houses, was passed in March of the same year, and put in force on

October 1st of the same year, as briefly described at the beginning of this chapter.

As soon as the adoption of a gold standard had been decided upon, the Government began purchasing abroad gold bullion with part of the Indemnity, and the bullion brought home was handed over to the Imperial Mint with instruction to stamp the gold coins with the greatest possible speed. The Mint attended to the work with great energy, and minted over 76,000,000 *yen* gold coins from July 30th to April of the following year.

II. EFFECT OF THE COINAGE REFORM ON THE FINANCE AND ECONOMY OF THE COUNTRY.

GENERAL REMARKS.—As only not more than six years have elapsed since the putting in operation of the new coinage system, it is not yet possible to define with any precision the effects which the new system has had upon the economic condition of the country. There have been, moreover, other accidental causes in operation since that time, such as, for example, the abnormal influence exerted on our economical system by the sudden expansion of Government and private enterprises after the Japan-China War, the outbreak of the North China trouble, the failure of the rich crop, the coming into operation of the revised tariff laws, etc.

BENEFIT OF THE NEW CURRENCY SYSTEM.—All those things have tended to complicate the economic condition of the country, rendering it extremely difficult to point out in any clear manner the effects attending the adoption of the gold standard. However the result of the new coinage system may be broadly stated, in the following paragraphs:—

The adoption of the gold standard has placed our currency system on a firm basis and relieved it from those fluctuations that had constantly disturbed the market while it rested on silver basis. Not only did **Stability of Currency System.** these fluctuations always affect the standard of price, but they also placed our currency system in a position of great insecurity, inasmuch as the specie

reserves against convertible notes of the Bank of Japan, which principally consisted of silver, constantly fluctuated in price. The adoption of the gold standard has rendered the basis of the currency system stable and firm, as it has made the standard of price secure and free from fluctuations. Had Japan remained to be a silver country, her credit among the gold countries now that the price of silver has steadily gone down, would have fallen in value on the other hand, while her liabilities would have increased. The result would have manifested itself in the exodus of specie, and the weakening of the stability of the convertible system, even to the extent of imperilling the security of the monetary system. From all those risks and also from other unexpected risks incidental to them, the country has been exempted, thanks to the adoption of the gold standard.

The change of the coinage system, while it did not disturb the relation of creditors and debtors that had existed, has rendered that relation one of greater security

**Smooth Operation
of Commercial
Transactions.**

and therefore has tended to facilitate the smooth operation of commercial transactions. The reason why the change of the coinage system has not disturbed the relation that had existed between creditors and debtors, is not far to seek. It will be remembered that, prior to that change, the legal relative value of gold and silver was at the rate of one of gold to 16.174 of silver. But in actual price the rate stood at 1 to 31 to 35, and the transactions were carried on the standard of silver. The new coinage system reduced by one half the weight of gold in the 1-yen gold pieces and 2 *fun* (11.574 grains) was fixed on as the weight of a 1-yen gold piece. In other words, ratio of gold to silver became to bear the ratio of 1 to 32.348. The consequence was that the only change that attended the adoption of the standard consisted in the transfer of the standard of price from silver to gold, and that the actual one-yen standard remained unchanged.

While the silver system was in force, the fluctuation in the price of silver constantly affected the interests of creditors

and debtors. The sense of insecurity which the people naturally felt owing to that cause very much obstructed business transactions, while on the other hand this insecurity imparted to those transactions a feature of speculation. All these things did not fail to seriously affect our social economy. By the adoption of the gold standard the evils of insecure relation between creditors and debtors and the obstructions standing in the way of transactions have been removed, and the system of credit has been encouraged and developed.

The prices are no longer influenced by the fluctuations of the price of silver, and are therefore prevented from making any undue advance. Owing to the stability

Market Prices of Commodities. of the standard of value in consequence of the adoption of the gold standard, any fluctuations affecting the market prices of commodities are regulated by the normal relation of supply and demand, and therefore the complicating feature incidental to the constant changes of the price of silver has been eliminated from the market. If any relation exists even to-day between the currency and the prices of commodities, that is solely attributable to the volume of the former, and the changes arising from the changes in the value of the currency have entirely disappeared. This stability in the standard of value has, it is hardly necessary to point out, introduced order and system into business transactions, both domestic and foreign. It is easy to conceive how, had Japan still remained a silver country, the market prices of commodities, now that the price of silver is steadily declining, would have been far higher than at present, and how, in foreign trade, imports would have always exceeded exports. Salaried people would be placed in a very unfortunate position, for their earnings would lose more or less of their purchasing value and the amount of the salaries and wages would be merely nominal. Moreover the presence of the silver standard would seriously hamper the rise of legitimate and useful enterprises. Thanks to the adoption of the gold standard Japan has escaped from all those causes of evils.

The new coinage system has placed financial measures and useful undertakings on a sound basis. Since the adoption of the gold system and since the standard of value has been made stable and secure, it has been possible, on the one hand, to render all the financial measures of the Government sound and free from unexpected changes, and on the other to place tradal and industrial enterprises on a similarly sound basis. In short those enterprises are freed from risks of unexpected changes and dangers of miscalculations inseparable from the varying changes of the value of silver.

The exchange business with gold-using countries has been made stable and the sound development of foreign trade has been secured by the new coinage system. The trade with silver-using countries has also advanced satisfactorily, instead of being subjected to any difficulties. Indeed the exchange rate with gold-using countries has been made practically stable, and free from all those sudden changes that frequently appeared formerly. The result has been a powerful and healthy stimulus to the development of our trade with gold-countries.

During the four years prior to the carrying into effect of the gold standard, that is from 1893 to 1896 inclusive, the imports from gold-using countries averaged 74,500,000 *yen* a year. The average during the five years commencing 1898 when the gold system was established amounted to 144,500,000 *yen* being about double the former average. Further, the average of Japanese exports to gold-using countries during the four years and the five years both specified above, was 74,800,000 and 117,500,000 *yen* respectively, showing an advance of over 57 per cent. The trade with silver-using countries, in spite of the presence of deterring influences in the shape of the constant fluctuations of the silver market, has also shown a prosperous condition, probably owing to the development of our productive enterprise, of the means of transportation, and of the increase of the foreign

demand for our goods. During the first four years in question the imports from the principal silver countries averaged 35,700,000 *yen*, against the corresponding figure of 61,200,000 *yen* for the other five years, an increase of about 71 per cent. In exports to those countries the average that stood at 30,300,000 *yen* in the first period advanced to 83,000,000 *yen*, an increase of over 174 per cent.

The advantage which the new coinage system confers on Japan in connection with her foreign payments is not small.

This is indeed an important thing when it is remembered that Japan's creditors are principally gold-using countries, so that Japan, had she remained as a silver country, would have to pay in the ever-fluctuating silver the principle and interest of her foreign loans, the price of her purchases, travelling-expense, etc. Not to speak of the great uncertainty in transactions and the great inconvenience in remittance, the loss which Japan would have to incur on that account would not be small. For instance, for one and the same amount of liabilities, absolutely speaking, Japan would have to bear in that case a heavier burden. From all these evils Japan has been relieved by the adoption of the gold standard.

The benefit of international community in economic affairs has been established by the new coinage system, for it cannot be denied that of all the various devices

Closer Economic that may be made use of for bringing
Relation with different countries into closer economic
Foreign Countries. relation with each other, the identity of the coinage system constitutes the most potent cause. Now as a result of the adoption of the gold standard, Japan's money market has been brought directly into touch with the central markets of the world. The closer relation thus brought about has led to the capital of other gold countries flowing into this country and contributing to the development of its economic enterprises. The loans raised by Japan in London or the bonds issued there have induced European and American capitalists to constantly invest their money in our loan bonds, which have

therefore began to be regularly quoted on the London market, the amount of transaction showing a steady increase. Again, foreign capitalists have become willing to supply municipal loans or loans of business concerns, and they are also disposed to invest in various undertakings of Japan. This circumstance may partly be due to the actual state of our trade and manufacture having become better known among foreign capitalists, but it can not be denied that it is principally a result of the adoption of the gold standard in our country and to the removal of various obstacles that formerly stood in the way of the introduction of foreign capital.

As briefly enumerated above, the result of the adoption of the gold mono-metallism has been far-reaching, for while it has placed our monetary system on a firm and sound basis and has promoted our financial and economic stability and sound development, it has enhanced the credit of the country in the world's markets. The truth of the foregoing remarks will be further demonstrated by the appended tables, returns about exports and imports being referred to the chapter of Trade.

CHAPTER IV—The Condition of the Money Market.

Introductory—History and Existing Condition—Prices of Commodities—Wages—Quotation of Stocks and Shares.

I. INTRODUCTORY.

GENERAL REMARKS.—In reviewing the actual condition of the money market in the early part of the era, we find that there existed practically no regular organs of the money market. To make matters worse, the defective communications and obstacles standing in the way of intercourse between one place and other, always impeded the circulation of money while causing the supply of funds far from sufficient. The result was manifested in the high rate of interest and of the difficulties that lay in the way of anybody obtaining monetary accommodation.

Nor was this state of affairs improved in any striking way on the advent of the new Government. In the first place it had to issue paper money to meet the requirements of the State, and this issue of inconvertible notes was especially marked from 1873 to 1878. The amount issued on the occasion of the South-Western Civil War alone was as much as 27,000,000 *yen*. The evil due to the presence of this disturbing element in the money market was made still worse by the presence of bank notes which were issued by the national banks the number of which had been very much increased in consequence of the amendment of the National Bank Regulations in 1876. In 1880 the amount of bank notes issued reached over 34,400,000 *yen*, and the volume of Government and bank notes totalled at that time no less than 159,300,000 *yen*. The banks by advancing

loans to a considerable extent tried to foster trade and manufactures, but this policy merely served to impart an artificial stimulus to them. Paper money continued to fall below par, and in 1881 it stood at the rate of 1.79 *yen* to 1 *yen* of silver. The market price of commodities and the rate of interest began to advance more and more, the imports to exceed the exports, specie to flow out of the country, and the price of stocks and shares to decline. Under the circumstances, *bona fide* trade and industry began to flag and decline and only speculative enterprises flourished. In short, finance and economics were placed in an extremely perilous situation. Various suggestions were advanced in some quarters to remedy this state of affairs. Some suggested that a foreign loan of 50,000,000 *yen* should be raised and the paper money should be redeemed, while others were of opinion that 50,000,000 *yen* premium loan bonds should be issued both at home and abroad, and that the proceeds thus procured should be applied towards redeeming the paper money. These schemes, however, ended in smoke. The Financial authorities

decided to accomplish the work of redemption by resorting to ordinary measures, in other words by means of revenue surplus and by setting apart every year a certain amount of reserves for this purpose. The work of redemption carried out in pursuance of that praiseworthy resolution was begun by the Government from 1881. At the same time the Government established a central bank, with the object of facilitating the smooth circulation of money. All these judicious measures adopted by the Government soon made themselves felt on the market. The condition of economic affairs underwent a marked change for the better, and paper money gradually rose again to par. The restoration of the relative value of paper money naturally caused a reaction. Market prices began to fall, business to droop, and the money market to slacken. Complaints about business depression were heard throughout the country. However this reaction was a temporary phenomenon and soon passed away.

From 1886 in which year the successful adjustment of paper currency was accomplished, to the outbreak of the war with China in 1894, there took place a quiet and orderly progress in the condition of monetary circulation of the country.

In 1890, there was indeed a short period of stringency as the

result of an excess of the imports over the exports by about 25,000,000 *yen*, and in consequence of the poor crops of rice in the previous year, so that in February of that year the average rate of discount in the money market of Tokyo stood upon daily balance at 3.1 *sen* per 100 *yen*. Yet after this the rate of interest became reduced gradually, until in June, 1893, the average discount rate stood upon daily balance at 1.7 *sen* per 100 *yen*,—the market price of the Government Consolidated Loan Bonds ranging between 108 *yen* and 110 *yen*. All this while, the foreign trade of the country was always in our favor, and new industrial enterprises began to appear, as an effect of the rise of prices caused by the fall in the price of silver. In the latter half of 1893, however, the rate of interest commenced to rise, from the increasing demand for capital caused by new industrial undertakings. But the rise in the rate of interest was especially marked in the early part of 1894 when grave disturbance arose in Korea, and on the breaking out of the war with China, in August of the same year, the average rate of discount upon daily balance rose to 20 *sen* or more per 100 *yen*. During the war, all new industrial undertakings were naturally suspended, but fortunately for only a few months, and the signing of the Treaty of Shimonoseki, and the tightness of the money market during the war, caused by the issuing of the war-loan, &c., began to slacken,—the average rate of discount falling, in October, 1895, to below 2.5 *sen* per 100 *yen* upon daily balance. At the same time, the prices kept on rising, being caused by the depreciation of silver which kept on increasing since 1893; so that apparently a bright prospect was presented for new industrial enterprises. Added to this, the expectation that the Chinese indemnity of 230,000,000 taels would be soon transported home, thus supplying plentiful capital to our money market, brought about reaction, from the state of temporary cession of all undertakings during the war to that of great industrial expansion immediately succeeding it. The prices of shares and stocks rose remarkably, new companies began to be created in large numbers, while old companies hastened to increase their capitals. The excited state of the money market at this time may be judged from the

fact that the rights for stocks, for which but a few *yen* as earnest money had been paid in, usually commanded high prices. The state of things being such, the total amount of capital subscribed for new companies or for the expansion of old undertakings during 1894 aggregated some 339,840,000 *yen*. When to this was added the amount which had been already invested in industrial enterprises, the total capital was calculated at that time to come up to the immense sum of about 939,540,000 *yen*. It was apparent, however, that it was beyond the economic resources of the nation to meet such an immense and sudden demand for capital. Besides, owing to the decrease in our export trade with the United States of America, on account of the prevailing economical distress in that country, and to the increased purchasing power of the lower classes at home, a result of the war time disbursements by the Government, as well as to the increased demand for machineries and raw materials used in manufacture, a necessary accompaniment of the sudden industrial expansion,—owing to these causes, in 1895 imports exceeded over exports by about 53,830,000 *yen*; while in the following year there was even a larger excess of about 56,150,000 *yen*, owing to a remarkably increased importation of rice on account of the poor crops of rice in the preceding year and the increased importation of machineries and raw materials.

Such being the economic condition of the country, the rate of interest kept on steadily rising since about August of 1896; in December of the same year, the average discount rate in Tokyo stood upon daily balance at 2.7 *sen* or more per 100 *yen*; in 1897 the rate kept on rising until in December it stood upon daily balance at 3 *sen* or more per 100 *yen*. The stringency of the money market began to be generally felt, so that in that year 101 cases of the bills drawn on the union banks of Tokyo were dishonored, though these amounted in money altogether to only about 62,500 *yen*. Unfortunately the rice crops of 1897 were even poorer than in the previous year and there took place also increased imports to take advantage of the old tariff rates in view of the coming into operation of the new tariff regulations. These things combined to bring up the excess of imports over exports to about 111,740,000 *yen*. The tightness of the money market grew greater

and the rate of interest became higher, so that between April and May, 1898, the average discount rate in Tokyo stood upon daily balance at 3.2 *sen* per 100 *yen* and the Consolidated Loan Bonds showed the signs of depreciating to below 90 *yen*. There were during the first half of the same year 60 cases of the bills drawn on the union banks of Tokyo, amounting to about 51,400 *yen*, which could not be collected.

It is not surprising that under these circumstances there should happen a number of cases of newly established companies or old companies with expanded capital failing to secure the **Economic Reaction.** payment of the subscriptions. And the poor crops of rice during successive years could not affect the market and to depress business. For these reasons, many industrial companies found exceedingly difficult to maintain themselves, and the spectre of a panic stared at our economic community. The Finance Minister at the time, now decided to employ the remaining portion of the Chinese indemnity for relieving the prevailing distress, and subscribed some 3,740,000 *yen* to the debentures issued by the Hypothec Bank of Japan, and instructed it to make loans to embarrassed companies having promising prospects. Moreover, the Government bought up from the market the Loan Bonds to the amount in face value of about 38,700,000 *yen*. Thus was our economic community barely saved from an impending catastrophe.

After this, the money market became easier and the rate of interest showed a tendency to fall. In December, 1898, the average discount rate in Tokyo stood upon daily balance at **Improvement.** about 2.8 *sen* per 100 *yen*; and in January, 1899, it stood at 2.7 *sen*, becoming still less in September, namely 2 *sen* per 100 *yen*, owing to the rich rice harvest in the preceding year, and the restoration of parity between the imports and exports in the foreign trade on account of the increased export of silk, *habutaye*, copper, etc., in 1899.

This encouraging state of affairs seemed to continue to exist in October as in September, when, owing to the Transvaal difficulties, the stringency of the money market became manifest in England, the very centre of the world's money market. The Bank of Eng-

land commenced raising its rate of interest and to absorb gold into its coffers, and India also, in view of its intended adoption of the gold standard, began to take steps to absorb gold. There commenced now in October and November, the export of gold from this country to India. These things led the Bank of Japan to raise its rate of discount on November 10th, from 1.6 *sen* per 100 *yen* upon daily balance to 1.7 *sen*, which further led the general discount rate in Tokyo to be raised in the same month on an average to 2.3 *sen* per 100 *yen*. The money market was now getting tighter, and on the 27th day of the same month, the Bank of Japan again raised its discount rate to 1.9 *sen* per 100 *yen* upon daily balance. The latter fact was, however, misunderstood by the public and the rumor spread throughout Tokyo that the Bank of Japan ceased to make loans. At this, there spread considerable alarms and, for three or four days, the prices of stocks and shares underwent a rapid depreciation and there seemed at one time that some sort of panic was impending. The real situation of monetary matters, however, soon became known and the market returned to its normal condition. Yet owing to the after-effect of these disturbances and to the fact that the end of the year was at hand, the tightness of the money market yet continued to prevail and the Bank of Japan was barely enabled to tide over this difficult season by making an excess-issue of its notes.

Coming to 1900 we find that the money market continued to tighten, and that the Bank of Japan raised the rate of discount on daily balances to 2.2 *sen* in March, then to **Market in 1900.** 2.6 *sen* in April, and lately to 2.7 *sen* in July.

This was the highest level ever reached in recent years. This action on the part of the central bank was reflected on the general market, for after July the rate of discount in Tokyo remained at a level of 3 *sen* or even more. The outbreak of the North China trouble in June and the despatch of a large army by Japan introduced another element of disturbance in our economic market. This effect was felt most keenly by our merchants and manufacturers engaged in the export trade to China, for the exports to North China were completely stopped. The stoppage of the export of spinning yarns involved all these concerned in serious

difficulties, and the quotation of negotiable bonds fell to an extent rarely known before.

The market did not improve at the beginning of 1901, for though the general state of things somewhat changed for the better the business classes, warned by their bitter previous experiences, were vigilantly on their guard, and refrained from undertaking any new projects. **Market in 1901.** The demand for funds declined, and dullness prevailed over the market. At this juncture the 79th Bank and the Naniwa Bank of Osaka which had been struggling against the increasing difficulties collapsed, and with their collapse two or three others were either declared bankrupt or stopped payment. The result was that something like a panic overtook the market of Osaka.

Coming to the second half of the same year we find that the market somewhat recovered its normal aspect, and what with the activity of the export trade and the satisfactory prospects of the rice crop, the public mind regained more or less its normal composure. Nonetheless the economic circles still maintained their cautious mood; the money market continued dull and business could not yet recover its normal activity.

The market continued inactive even after it entered into 1902, so that with no fresh demands appearing for funds and with the balance of import and export of specie always in favor of the former, the supply of funds remained to be in excess over demand. Such being the state of economic market the Bank of Japan lowered on March 19th the rate of discount from $2\frac{1}{2}$ *sen* to 2.2 *sen*. This lowering did not much invite applications for loans, inasmuch as the current rate in Tokyo had already stood from the beginning of the year at $2\frac{1}{2}$ or 2.6 *sen*. To make the matters worse, the hope entertained that the demands for money must become active with the arrival of silk and tea seasons were falsified owing to the bad harvest of tea and barley. Naturally therefore the complaint about tradal depression was heard in a louder voice than it was before. Far more serious was the effect of frost damage of mulberry trees, so that the season when the money-market usually presents a brisk appearance passed without any perceptible change for the better. The consequence was even at

this end of the silk season the Bank of Japan had the issue margin of as much as 20 million *yen* left, and as, in the meanwhile, the import of specie had always exceeded the export, the specie reserves of the bank grew to over 76 million *yen*, with the immediate prospect of further increase. Then whatever reassuring sign the stock market indicated about this time by anticipating the further lowering of the rate of interest by the Bank of Japan, that was suddenly checked by an unexpected amendment of the Bourse Regulations on June 3rd. In view of these circumstances, the bank again lowered the official rate of interest by 0.2 *sen*. This act on the part of the central bank was at once reflected on the money market of the city, and the banks hastened to reduce all round the scale of interest, the rate for fixed deposits from 7 to 6½ per cent, that of daily current account from 1½ to 1.2 *sen*, and that of petty account from 1.8 to 1½ *sen*. This decrease of the rate of interest was of no avail, owing to untoward circumstances, i.e., the prevalence of unseasonable weather during the summer months with the gloomy prospect, in consequence, of the crop of rice in the fall. Further, the continued excess of exports over imports in the second-half of the year, and the steady inflow of specie pushed the amount of specie reserves of the Bank of Japan above the level of 80 million *yen*. Again the bank lowered the rate of daily balance by 2 *sen* on October 3rd, and two days after the metropolitan banks lowered the daily rate for loan to 1.8 *sen* or 2 *sen*. About this time the Government caused the Industrial Bank of Japan to sell abroad the loan bonds to the extent of 50 million *yen*. At the same time the export of silk, *habutaye* and other important export items became active and these causes naturally led to the arrival of specie in a larger sum. The result was the specie reserves of the bank almost reached the level of 100 million *yen* in the early part of December. Under such circumstances, and also owing to the continued slump in business, the demands for money could not but be inactive, and early in December the bank's record left the issue-margin of as much as 20 million *yen*, an unusual phenomenon for the end of the year. The bank therefore lowered the rate of interest by 0.1 *sen* on December 9th, and even then the loans made by the bank to general public did not exceed 36 million at

the end of the middle of the month. This state of affairs underwent a sudden change coming to the last decade, when demands for money suddenly began to become active, the market was all at once tightened, and in a few days the central bank had to advance loans amounting to 19,280,000 *yen*. At the end of the year the loan account to general public stood at 55 million *yen*, this being about 2 million more compared with the corresponding figures in the preceding year. It goes without saying that the current rate of interest was somewhat raised by the city bankers, i.e., by 0.2 to 0.3 *sen* in daily balance. However, all things considered, the market passed 1902 in a very quiet state.

STATISTICS:—Below are appended tables giving the fluctuations of the rate of interest, the market prices of commodities and the quotations of negotiable bonds in recent years.

CHAPTER V—Banks.

History — Banks.

I. HISTORY.

BEFORE THE RESTORATION.—Prior to the Restoration the people were not in the habit of uniting efforts or capital for the common interest of their business. The only organization that existed at that time in this direction was in the shape of guilds or unions. They were generally organizations by a body of different interests, aimed at holding a general meeting once a year or month, so that all the people engaged in the same line of business might be brought together, know one another, become friends, and consult their common interests. These organizations were, however, far from flourishing and the scope of their interest was exceedingly limited. The banking organization could not of course make any development worthy of notice. However it was not unfit for fulfilling the requirements of the times. The exchange business system, was, for instance, comparatively well developed. There existed two kinds of exchange merchants, one class called as “Hon-ryogaé” and the other known by the name of “Zêni-ryogaé.” The former, also called “Goyô-ryogaé,” were a sort of bankers who managed official funds. They kept in custody the “Exchange Merchants.” taxes, in kind or cash, and settled their accounts for their patrons with bills of exchange. The Mitsui-Gumi (the predecessor of the present Mitui Firm) and the “Ten People Guild” were the most important establishments of this kind. There was also another set of exchange business for the feudal princes. All these may be regarded as the bankers of those days.

AFTER THE RESTORATION.—Even after the Restoration, the bankers who were entrusted with the task of managing official funds

were called "exchange merchants for the Treasury," and this fact serves to show how even in former days a certain fixed usage existed in connection with the banking business.

As soon as the Restoration had been consummated, the new Government lost no time in adjusting financial matters and in devising measures calculated for the promotion of foreign trade. The first office created to take this business in charge was the Commercial Office, soon after superseded by the Foreign Trade Office which was subjoined to the Financial Office. The Foreign Trade Office approached the leading merchants in the three cities of Tokyo, Osako, and Kyoto and in the five open ports of Yokohama, Kobe, Nagasaki, Niigata, and Hakodate and persuaded them to issue paper notes convertible into gold. Owing, however, to the absence of a regular system of protection and supervision, the project ended in a failure. In December of 1871 the Tokyo Chamber applied for permission to establish a bank to be called the Tokyo Bank with a capital of 7,000,000 *yen*, and invested with the privilege of issuing paper money. The application was not entertained owing to the fact that the scheme was based on the idea of getting the capital both from the Government and people. Though the matter was therefore dropped, it deserves mention as the first attempt towards establishing a bank modelled on the Western system.

PIONEER BANKS.—Meanwhile the Vice-Minister Hirobumi Ito of Finance, now Marquis Ito, who was dispatched to America in 1870 had sent home a report on the result of his inquiries into the banking system of that country. Based on that report the Government issued in November of 1872 the National Bank Regulations, the first legislative measure enacted by the Meiji Government. Four national banks were established under the regulations, which provided, among other things, for the convertibility of the bank notes into gold specie. It soon transpired that the notes into gold could not maintain the convertible system, as the excess issue had caused their depression. The banks therefore were threatened with ruin. It happened that the Government conceived at that time the idea of adjusting the hereditary pension system, and to issue for that purpose the Hereditary Pension Bonds to the extent of over 170 million *yen*. Taking opportunity of this financial measure the

Bank Regulations were amended in August, 1876, the new regulations allowing the banks to use the public bonds as security against their notes and to redeem them with Government notes. This amendment gave a powerful impulse to the creation of banks, so that within a few years they numbered as many as 153. But as the bank notes were convertible with the Government notes, they were really inconvertible notes.

DISCONTINUATION OF THE NATIONAL BANK SYSTEM.—Under the circumstance, the Government decided to devise measures for adjusting the monetary system, aiming at the inauguration of the convertible notes institution. The first important step taken for accomplishing that great end was another amendment of the National Bank Regulations, and the elaboration of the programme of bank notes redemption to be effected by 1897.

While the part which the national banks played in the economic development of the country was indeed important, those establishment did not fail to profit themselves from the privilege accorded them by the Government. By this time only six out of the 150 banks that were created had been ordered to dissolve by the Government. Others that had ceased to exist did so by voluntarily wounding themselves on the expiration of their terms, or as a result of amalgamation with other banks. But by far the greater number availed themselves of the privilege accorded to them by the laws relating to the time-expired national banks and were converted into private banks. By February 1899 the last national bank system ceased to exist. However the notes that had been circulating for a long period could not be withdrawn from the market all at once, so that the Government proclaimed that it would effect their redemption by December of 1904, so that by that time this relic of the old financial system shall have disappeared entirely from the country.

BANKING FACILITIES FOR FOREIGN TRADE.—In November of 1879, in accordance with the National Bank Regulations, a bank was established at Yokohama with a capital of 3,000,000 *yen*. This bank was intended to supply the banking facilities required by foreign trade and also to issue notes convertible into specie. This was the origin of the Yokohama Specie Bank. However

the note-issuing part of the object was not put into effect owing to the fact that it was fraught with grave difficulty in view of the great depreciation at that time of the value of paper money. Consequently the bank has principally devoted itself to supplying banking facilities to export and import merchants, and though at times it experienced some adversity, its business continued to prosper and expand. It should be noted that the Government placed it under a special legislative arrangement, for its business being distinct in nature from that of an ordinary bank it had been found to be inconvenient to subject it to the same regulations. This consideration led to the promulgation of the Yokohama Specie Bank Regulations.

FIRST PRIVATE BANKS.—Side by side with the national banks there existed no small number of private banks and also establishments which though not officially regarded as banks were engaged in a similar line of business. In 1884 these two latter kinds of banks numbered 954 with an aggregate capital of 34,252,735 *yen*. In general all matters relating to these establishments were left to the discretion of the parties concerned, and the local Governors were only allowed to interfere when public order and peace or the legitimate development of business were threatened. However, in view of a greater increase of the number of such establishments, it was decided to devise some method of controlling and protecting them. It was in pursuance of that end that in August of 1889 the Bank Regulations and the Saving Banks Regulations were drawn up and promulgated, to come into operation from January of 1891. With the postponement of the period of putting the Commercial Code into operation, the regulations in question were also postponed, and in the same way when part of the Code was put into operation in July of 1893 the two laws were also enforced in July, next year. In consequence of the enforcement of the regulations the private banks thus began to become regular banking establishments.

PROVISIONS FOR AMALGAMATION.—The legislative measures for regulating the banking business having been gradually completed, the banks of all descriptions were able to carry on their business with increasing activity. In this connection the want of suitable arrangements for dealing with cases of amalgamation was regarded as inconvenient,

and it was thought that some means for effecting such amalgamation by dispensing with preliminary formalities should be provided. In April of 1896 the Law relating to the Amalgamation of Banks was promulgated, this enabling banks to amalgamate by a very simple process with other establishments, besides conferring benefit to the general money market. Not a small number of banks have availed themselves of this provision and have been united to other concerns.

THE BANK OF JAPAN.—As already described, the amendment of the National Banks Regulations having imparted a powerful impulse to the creation of banks of this description, their number soon reached as many as 153 and the notes issued by them to a big figure of 34,426,351 *yen*. The creation subsequently of the Yokohama Specie Bank further added to this activity of the banking business. One serious defect was the absence of a central organ and of provisions for establishing regular channels of monetary circulation throughout the country. The time of establishing a central bank the idea of which had long attracted the attention of the parties having been judged matured in 1882, on June 27th of the same year the Bank of Japan Regulations were enacted, and the bank was formally opened to business on October 10th of that year. The objects that underlay the establishment of the bank were manifold, for it was intended to act as a pivot of the national finance, to assist the banking business throughout the country, to promote the smooth operation of the money market, to regulate the rate of interest, to develop the business of discounting bills, and above all to devise measures calculated to invite the inflow of specie. At the same time the bank had to attend to the equally important business of unifying the currency system of the country by means of the issue of convertible notes and by adjusting the existing monetary system and further to place on a sound basis this vital financial institution of the country. The bank applied itself zealously to all those matters, and its credit began steadily to rise and the scope of its business expanded. The confidence which it enjoyed from the Government has led to its being entrusted, as is also to-day, with the task of administering official money, this considerably enlarging the scope of its business. In view of all these considerations the bank increased its capital in March, 1887. During the Japan-

China war, the bank fulfilled to the satisfaction of the Government and of general public the important trust it enjoyed in monetary matters of the country, and discharged its duty with efficiency and success. On the cessation of the war, the bank increased its capital; established new branches and agents at several important places in the country and in short made the arrangements required by the expansion of its business. The bank too was given the important task of managing the Indemnity when Japan received it from China, while the part it played in the adjustment of the coinage system was qually distinguished. It is hardly necessary to add that the Bank of Japan enjoys at this moment brighter prospects than ever.

As mentioned above, the bank was invested with the privilege of issuing convertible silver notes, but this issue was for a while suspended as the exercies of such a power was thought premature at the time of the establishment of the bank. In 1884 the Silver Convertible Notes Regulations were promulgated, to be amended in August of 1888. That amendment determined the amount of specie reserve and of the issue of notes. By the amendment effected in two years later the scope of the two was further expanded. When the gold standard system was adopted by the Government in October 1897 the silver convertible notes were as a matter of course altered into gold convertible notes. This was a memorable innovation in the history of the finance of the country. Another noteworthy change, though not of equal importance, was the expansion of the amount of specie reserves and of the issue of notes, for though with the development of economic affairs the scope of monetary circulation and of credit was markedly improved, the demand for currency was largely increased as compared with what it was about 1890. This economic requirement was satisfied in 1897.

The banking organs relating to trade having been created one after another, they numbered 1,500 in 1896 with the Bank of Japan at the head of the list.

BANKING ORGANS FOR TRADE AND INDUSTRY.—In contrast to this satisfactory provision for trade, that relating to agriculture and manufacture still remained unsatisfactory. The banks attending to the interest of those industrial pursuits must be distinct in nature from those for trade, for it is impossible to expect from agriculture

and manufacture any success in a short space of time, while at the same time the profit derived from the undertakings is incomparatively small. Hence it follows that funds to be used for agricultural or manufactural undertakings must be of long term and at a cheap rate. It was long maintained therefore by all those concerned in the matters that banking organs for promoting the interest of farmers and manufacturers should be established as quickly as possible. At last in April, 1896, the Law relating to the Hypothec Bank of Japan and the Law relating to the Local Hypothec Banks were promulgated, the former to act as the central organ and the latter as local organs, and both to attend to the business of supplying loans on long terms and at a cheap rate to farmers and manufacturers with the view of encouraging the development of industrial undertakings. The Hypothec Bank was opened to business on August 2nd of the next year with a capital of 10 million *yen*. From 1898 the banks of this particular kind began to be started in many prefectures. Only a few years having elapsed since the creation of those banks, it is not yet possible to say anything definitely as to the effect they produced on agriculture and manufactures. It may safely be stated however that they are conferring an immense benefit on the development of economic pursuits.

The central and local Hypothec Banks being banking organs for making loans principally on real estates, their establishment did not promote to any particular extent the interest of all those who wished to get loans on negotiable bonds. The same reason which demanded the establishment of special banks for farmers and manufacturers therefore demanded the creation of banks to satisfy this special requirement of this special class of people. Indeed the absence of banks of this particular kind was a serious defect in the banking system of Japan. In 1900, therefore, the Law relating to the Japan Industrial Bank was promulgated, and the bank was opened to business on April 11th, 1902, with the capital of 10 million *yen*.

BANKING ORGANS FOR OUTLYING DISTRICTS.—Banking facilities for the outlying parts of the Empire have received the proper attention of the authorities. The creation of a special kind of bank for Formosa

was a matter of urgent importance, for everything in that island being in an initiary stage, the exploitation of its resources and the encouragement of economic undertakings demanded banking facilities adopted to the condition of the place. In March of 1897 the Law relating to the Bank of Formosa was passed, the bank to have a capital of 5 million *yen*. It need hardly be stated that the organization of this bank was distinct from that of the banks in Japan proper, and that it was adapted to the special circumstances prevailing in the island. The bank was opened to business on September 26th of 1899.

In a similar way Hokkaidō required a banking organ suited for supplying the funds needed in exploiting the land. The result was the promulgation in 1899 of the Law relating to the Hokkaidō Colonization Bank. The object of the bank does not differ much from that of the Local Hypothec Banks, only the circumstance prevailing in Hokkaidō being different from those in Japan proper, the creation of a bank of this sort was necessary for this northern island. For instance, while the local Hypothec Banks are mainly devoted to advancing long-term loans on the security of real estate, the Hokkaido Bank, besides making loans on real states, accepts agricultural produce and negotiable bonds as objects of security, and also deals with matters relating to the issue of debenture bonds, deposits, and advances on goods. The capital of the bank is 3 million *yen* and it was opened to business on April 31st of 1900.

OBLIGATIONS AND PRIVILEGES OF BANKS UNDER OFFICIAL PATRONAGE.—The Bank of Japan, the Yokohama Specie Bank, the Hypothec Bank of Japan, the Local Hypothec Banks, the Hokkaidō Colonization Bank, the Bank of Formosa, and the Japan Industrial Bank have all been established under official protection of one description or another, and in consequence of that protection more or less restriction is placed on their business operations. For instance the banks must get the approval of the Government for their articles of association, and must also obtain the approval of the Minister of Finance even in carrying out business operations within their respective legitimate province. Then the authorities sometimes appoint one or two overseers for the purpose of efficiently controlling those establishments, while the Governors, Presidents or Directors

are either directly nominated by the Government or appointed by it after they have been elected by the general meeting of shareholders of the respective banks. In returns for all these inconveniences, the banks enjoy various privileges sufficient to compensate them.

II. VARIOUS BANKS.

NATIONAL BANKS.—Established in conformity with the National Bank Regulations already mentioned, the national banks were the first banking establishments that were organized in Japan on the Western model.

The main causes that led to the creation of these financial institutions were to supply banking facilities required in trade and also to redeem Government paper money issued to an amount out of proportion to the demand of the market. These banks were organized in the main after the pattern of the American national bank system, and were allowed to issue bank notes convertible in specie. According to the National Bank Regulations the "Kinsatsu" Exchange Bonds which were newly issued for the redemption of the Government paper money in circulation, were to be deposited by national banks as security for the same amount of bank notes issued, which, however, might not exceed 60 per cent. of their capital. Besides, they were obliged to keep specie reserve for the redemption of the notes and equal in value to 40 per cent. of their capital, so that two thirds of the notes issued were always covered by specie reserve. But the price of specie was steadily rising at that time, producing a considerable difference between specie and paper, so that as soon as the bank notes were issued, so much demand for redemption was made on the banks, that these notes never obtained any extensive circulation in the market. The natural consequence was that only a few national banks were established and even these were soon placed in a deplorable condition, so much so that the National Bank Regulations could not be upheld in full operation, and the Government was soon induced to introduce some revisions in the Regulations. By the amendment made in 1876

the national banks were now allowed to place as security for the bank notes the new Hereditary Pension Bonds besides the "Kinsatsu" Exchange Bonds. It ought to be remembered that the Pension Bonds were issued in a large amount at that time and the general depreciation of public bonds appeared almost certain, unless some special measures were devised to prevent it. The most important point in the amendments was that the obligation of the note-conversion in specie was abolished, and that any kind of Government paper currency might now be kept as reserve against note-redemption. At the same time the amount of reserve was reduced to 25 per cent. of the capital. These amendments gave a strong impulse to the formation of new national banks; indeed they sprang up so rapidly that the Government was now resolved to check this tendency, by putting a limit to the amounts of notes the banks might issue. Still they kept on increasing from year to year, until at last paper currency considerably fell below par and the consequent rise of price of commodities. When about 1878 the value of paper currency was further falling, with no immediate prospect of amelioration, the Government decided to make a radical reform in the banking system of the country, and after much deliberation this arduous task was commenced in 1882 by the creation of the Bank of Japan, so that the national bank system might be replaced by that of the single central bank of issue. In 1884 the Convertible Bank Notes Regulations were enacted by which the privilege of issuing notes was exclusively lodged in the hands of the Bank of Japan. Meanwhile, certain revisions and additions were introduced in 1883 in the National Bank Regulations, providing, among other things, that the national banks were, on the expiration of their term of character, to give up their privilege of issue, but allowed to continue their business as private banks; besides proper measures were introduced to effect by degrees the redemption of their notes. Two laws were enacted for facilitating the change, one (Law No. 7, 1896) to regulate the winding of national banks on the expiration of their term of charter and the other (Law No. 11, same year) being the regulations for the special winding of national banks prior to it. The latter law induced many national banks to hasten reorganising themselves into private banks; hence only seven national banks remained as such until the expiration of

the term of their charter. The last closed its business as bank in February 1901 and thus the change was completed sooner and easier than had been expected.

1. THE BANK OF JAPAN.—The Bank of Japan, the central banking organ of Japan, was founded in the form of a joint stock company in accordance with the Imperial Ordinance for the Bank of Japan issued in 1882. Its authorized capital was at first 10,000,000 *yen* but was twice increased making the present amount of 30,000,000 *yen* fully paid up.

This bank has the privilege to issue convertible bank notes on the security of gold or silver coins and bullion equal to the amount of the notes issued, and to issue further those notes on the security of Government bonds and Treasury bills, or other bonds or commercial bills of a reliable nature, within the limit of 120,000,000 *yen*. This amount was limited to 85,000,000 *yen* before 1899 and to 70 million *yen* before 1890.

The notes issued in excess of the said amount are subject to a tax of 5 per cent. or more per annum of the amount of the same.

The following lines of business are conducted by the bank:—

1. To discount or purchase Government bills, bills of exchange, commercial bills, etc.; 2. to buy or sell gold or silver bullion; 3. to make loans on the security of gold or silver coins or bullion; 4. to make collection of bills for banks, companies and merchants, who are regular customers; 5. to receive deposits in current accounts and accept the custody of object of value, such as gold, silver, other precious metals and documents; 6. to make advance in current accounts or loans for fixed periods upon the security of Government bonds, Exchequer bills or other bonds and shares guaranteed by the Government.

In addition, the bank is entrusted with the management of the Treasury fund.

2. THE YOKOHAMA SPECIE BANK.—The Yokohama Specie Bank was founded in 1879 with the authorized capital of 3,000,000 *yen* for furnishing financial facilities for the foreign trade of the country. It was at first supported by the Government in various

directions. For instance, it was entrusted with the management of several million *yen* of the Treasury Reserve Fund and thus to possess an ample amount of capital for discounting foreign bills of exchange. In 1882, when the Bank of Japan was established, all those kinds of support were withdrawn, and instead of them the Bank of Japan was made to rediscount foreign bills of exchange upon the demand of the Specie Bank to an amount not exceeding 20,000,000 *yen* a year at the rate of 2 per cent. In March 1887, regulations for the Specie Bank were promulgated and at the same time the capital was raised to 6,000,000 *yen*. The consequent growth of its transactions necessitated the further increase of its capital to 12,000,000 *yen* in the same year. In 1899 the capital was again doubled, making 24,000,000 *yen* of which 18,000,000 *yen* are now paid up.

The following lines of business are transacted by the bank :—

1. Foreign exchanges ; 2. inland exchanges ; 3. loans ; 4. deposits of money and custody of objects of value ; 5. discount and collection of bills of exchange, promissory notes and other cheques ; 6. exchange of coins. The bank may also buy or sell public bonds, gold or silver bullions and foreign coins, if the condition of business demands it. The bank may also be entrusted with affairs bearing on foreign loans and the management of public money for international account.

3. THE HYPOTHEC BANK OF JAPAN.—The Hypothec Bank of Japan was founded in 1884 as a joint stock company with a capital of 10,000,000 *yen* under the special patronage and control of the Government. The object of the bank was, as is still the case, for the furnishing of long-period loan at low rate of interest for purposes of agriculture and industry. It is to serve as the central organ of credit for agricultural and industrial enterprises of larger scale throughout the whole country, as the local Hypothec Banks undertake similar business in the respective localities.

The chief lines of business transacted by the bank are as follows :—

To make on the security of immovable property, loans redeemable in annual instalments within the limit of period of not more than fifty years ; to make loans on a similar security,

redeemable at a fixed term of not more than five years, provided the total amount of such loans not exceeds one-tenth of the total amount of loans redeemable in annual instalments; (The amount of loans made on the security of any immovable property may not exceed two-thirds of the value thereof, as appraised by the bank); to make loans without security to Prefectures, Districts, Cities, Towns and other public bodies organized by law; to take up the mortgage debentures of Local Hypothec Banks; to accept the custody of gold and silver bullions and negotiable instruments.

The bank is authorized, when at least one-fourth of its nominal capital is paid up, to issue mortgage debentures up to an amount not exceeding ten times its paid up capital, provided the amount of such debentures does not exceed the total amount of outstanding loans redeemable in annual instalments and the debentures of Local Hypothec Bank in hand. These debentures shall be redeemed at least twice a year by means of drawings in proportion to the total amount of redemption of loans redeemable in annual instalments in the same year and the debentures of Local Hypothec Banks in hand. Besides, for each issue of debentures premiums of various amounts varying from ten to one thousand *yen* are allotted to a certain number of the debentures determined by drawings. This is the single exception in the midst of the general prohibition of lottery or any lottery-like system, specially allowed to the Hypothec Bank, in order to attract smaller capitals to the subscription of its debentures. The Government guarantees profit for ten years from the founding of the bank, when the profit does not reach 5 per cent of the paid-up capital.

4. THE LOCAL HYPOTHEC BANKS.—The Local Hypothec Banks were established in 1896 in accordance with the Law for the Local Hypothec Banks as local organs of credit for the same object as that of the Hypothec Bank, each with a capital of two hundred thousand *yen* or upwards. As a general rule each bank has for its business district the whole part of the prefecture where it is established, each prefecture having one bank, but it is provided that if the circumstances require, a prefecture may be divided into

two or more business districts, but this provision has not as yet been made use of.

The following lines of business are transacted by these banks:—

To make, on the security of immovable property, loans redeemable in annual instalments within the limit of period of not more than thirty years; to make loans on a similar security, redeemable in a fixed term of not more than five years, provided the total amount of such loans does not exceed one-fifth of the total amount of loans redeemable in annual instalments, (loans made on the security of any immovable property may not exceed two-thirds of the value thereof, as appraised by the banks); to make loans on the same conditions without security to Cities, Towns, Villages and other public bodies organized by law; to make loans without security, redeemable in a fixed term of not more than five years to more than twenty persons combined with joint liability, who are engaged in agriculture or industry and whose reliability is recognized; to receive fixed deposits and accept the custody of gold and silver bullion and negotiable instruments. Besides, the banks may be entrusted with the receipt and disbursement of the public funds of prefectures. Each of these banks is authorized, when at least one-fourth of its capital is paid up, to issue mortgage debentures, to an amount not exceeding five times its paid up capital. Such debentures may not, however, exceed the total amount of outstanding loans redeemable in annual instalments. The debentures shall be redeemed at least twice a year by means of drawings, in proportion to the amount of the redemption of the said loans. In accordance with the provisions of the Law for giving support to the Local Hypothec Banks, the Government gave over to the prefectures funds with which to subscribe to the shares of the respective Local Hypothec Banks. The amount of the said funds is limited by the law at the rate of 70 *yen* per 100 *cho* of taxable lands in each prefecture, excepting building sites, mineral spring lots and swamps, and the total amount assigned to each prefecture may, under no circumstances, be more than 300,000 *yen*, nor may it exceed one-third of the paid up capital of each bank.

5. THE HOKKAIDO COLONIZATION BANK.—The Hokkaidō Colonization Bank has for its object the promotion of enterprises of colonization and exploitation of Hokkaidō, as is indicated by its name. It was established by law issued in 1889 in the form of a joint stock company with a capital of 3,000,000 *yen* and is allowed to transact the following lines of business:—

To make on the security of immovable property loans redeemable in annual instalments within the limit of period of not more than thirty years, or redeemable in a fixed term of not more than five years; to make loans against the pledge of shares and debentures issued by joint stock companies undertaking various works for exploiting the resources of the island, and to take up debentures of such companies up to an amount not exceeding one-fifth of the total sum of outstanding loans above mentioned; to make loans or issue bills of exchange on the security of agricultural products in the island; to take up deposits; to accept the custody of objects of value; to make without security loans redeemable in annual instalments or in fixed period to municipal districts, towns and villages placed under the civic corporation law of Hokkaidō and other public bodies recognized by law. This bank is authorized to issue mortgage debentures to an amount not exceeding five times its paid up capital. The debentures, however, may not exceed the total amount of outstanding loans redeemable in annual instalments. The debentures shall be redeemed at least twice a year by means of drawings, in proportion to the total amount of repayment of said loans.

In order to give support to the bank, the Government subscribed 1,000,000 *yen* of its shares and for the first ten years the dividends on these shares are to be added to the reserve fund of the bank.

THE BANK OF FORMOSA.—The Bank of Formosa was created in 1897 for the purpose of promoting the economical development of the island. It is a joint stock company with a capital of five million *yen*, and is endowed with the privilege of issuing bank notes convertible in silver *yen* against the reserve of gold or silver coins or bullion and Government bonds, treasury bills, notes of the Bank of Japan, any other negotiable papers or commercial bills of reliable

nature. The amount of notes not covered by specie reserve is limited to 5,000,000 *yen* and may in no case exceed the amount of notes issued against specie reserve. Notes issued beyond this limit in case of emergency are subject to a tax of five per cent. or more per annum. The Government has subscribed one million *yen* of the shares of the bank and dividends paid to these shares are added to the reserve fund of the bank for the first five years, for which period the Government is engaged not to transfer its shares. The Government has further made an advance of 2,000,000 *yen* in silver to the bank with no interest, to be added to the specie reserve for bank notes issued.

The following lines of business are transacted by this bank:—

1. To discount bills of exchange and other commercial bills; 2. exchange business; 3. to collect bills for companies or merchants who are regular customers of the bank; 4. to make loans on the security of immovable or movable property of a reliable nature; 5. to open current accounts; 6. to accept the custody of objects of value, such as gold and silver coins, precious metals and documents; 7. to buy or sell gold or silver bullion; 8. to act as agent for other banks.

6. THE INDUSTRIAL BANK OF JAPAN.—Established in April, 1902, the Industrial Bank of Japan is a joint stock company with a capital of 10,000,000 *yen* of which 2,500,000 *yen* are paid up. As the Hypothec Bank and the Local Hypothec Banks are intended to furnish long and cheap loans on the security of immovable property for agricultural and industrial enterprises, especially for the former, the Industrial Bank has for its special object to handle with bonds and shares of various kinds. It may be regarded as a kind of *crédit mobilier*, while the former are *crédits fonciers* with special forms and purposes.

The business allowed to the bank by the law comprises:—

1. To make loans on the pledge of public loan bonds, local loan bonds, companies' debentures and shares; 2. to subscribe or make up public loan bonds, local loan bonds and companies' debentures; 3. to accept deposit of money and custody of valuable objects; and 4. to transact various kinds of trust business with local loan bonds, companies' debentures and shares.

Thus, loans without security or on the security of other than negotiable papers and discounts of bills are not within the scope of the bank's business. In order to enable it to obtain necessary amount of capital for carrying out its object, the bank is also endowed with the privilege of issuing debentures to an amount of five times its paid up capital, which, however, may not exceed the total amount of advances made by the bank, the local loan bonds and companies' debentures appropriated by it. Besides, for the first five years the dividend of 5 per cent. against its paid up capital is guaranteed by the Government.

7. **ORDINARY BANKS.**—At the beginning of the era, there were no regulations so far as ordinary banks were concerned, except that their establishment was subject to the approval of the authorities. Under such a system or want of system, much inconvenience was felt by the Government in the way of the administrative control of those institutions, and the issue of regulations to deal with ordinary banks was called for repeatedly, but this desire was long not fulfilled. It was in 1890 that the general regulations for trade and companies were first established by the Commercial Code, while the Laws for Ordinary Banks and for Savings Banks were issued, the three to go in force simultaneously on 1st June, 1891. However the operation of the Code was twice postponed, and that of the two laws were similarly held back. Subsequently, after introducing in 1893 certain amendments in the Commercial Code and the Law for putting it in force their operation was announced to run from 1st July of the same year, and the two laws in question also came in force from the same date. By the new laws, ordinary banks were put under the control of the Minister of Finance, the permission of the said Minister being required for the establishment of a new bank; he is also empowered to order at any time investigations into the conditions of the business and property of the bank. Besides, provisions were made about business hours and days of rest, the obligation of making report on business, and the publication of property list and balance sheet in newspapers for each half year, etc.

8. **SAVINGS BANKS.**—According to the existing law for Savings Banks which came in force on 1st July, 1893, Savings Banks

must be joint stock companies with a capital of not less than 30,000 *yen*. They may take up minor deposits from the general public on a compound interest system, and in order to safeguard the interest of the depositors they have to consign to the Deposit Office of the Treasury national or local loan bonds bearing interest, corresponding in value to one-fourth of the deposits received, for which the depositors concerned have a preferential right. In case, however, the national or local loan bonds consigned exceed in value one half of the capital of the bank consigning them, the excess may be replaced by commercial bills or other reliable shares and stocks of any company. In other respects the regulations for ordinary banks apply also to savings banks.

CHAPTER VI.—Clearing Houses.

Introductory—Various Clearing Houses.

I. INTRODUCTORY.

GENERAL REMARKS.—Though the custom of using commercial bills in trade existed long ago, it was only in recent years that a clearing house modelled on the Western system was established in Japan. The Osaka Clearing House established in December 1879 was the pioneer institution of this kind in Japan. Then followed the Clearing Houses of Tokyo, Kobe, Yokohama, and Kyoto. All these establishments partly partake in their organization and working system of the Houses of London and New York. The Japanese clearing houses business, though more or less subjected to vicissitudes, has, on the whole, made a satisfactory progress, as the perusal of the following section will show.

1. THE TOKYO CLEARING-HOUSE.—The Tokyo Clearing-House commenced its business at the end of 1887, with a perceptible good result, but the subsequent development of banking business necessitated the organization of the clearing-house, and in 1881 the new clearing-house, as it now stands was established. Its organization was mainly based on those of clearing-houses in Europe and America. The number of associated banks at the end of 1901 was 36, besides the Bank of Japan.

2. THE KYOTO CLEARING-HOUSE.—The Kyoto Clearing-House was founded in 1888; the number of associated banks in December 1901 was 21.

3. THE ŌSAKA CLEARING-HOUSE.—The Ōsaka Clearing-House founded in 1879 is the first of all clearing-houses established in our country. In Ōsaka, the centre of trade in our country since old time, checks and bills were in use long before the Restoration. The number of associated banks in December, 1901, was 33.

4. THE KOBE CLEARING-HOUSE.—The Kobe Clearing-House

was founded in 1897; the number of associated banks was 16 in December 1901.

5. THE YOKOHAMA CLEARING-HOUSE.—The Yokohama Clearing-House was founded in 1900; it had 12 associated banks in December, 1901.

The Nagoya Clearing-House is the latest establishment, having been founded in September, 1902. At the end of that year it had 19 associated banks.

Note:—The foregoing table is based on the report of the Yokohama Specie Bank. As the bills on Shanghai payable on sight for the month of April could not be quoted, the quotation of bills payable after ten days was used instead.

PART VI.

ARMY AND THE NAVY. (THE RED CROSS SOCIETY OF JAPAN.)

CHAPTER I.—Army.

Introductory—Distributions of the Standing Army—The Personnel on Peace Standing—Factories—Appointments of Officers—The Complement of Non-Commissioned Officers—Recruiting of Privates—Education—Punishment and Goals—Medical Affairs.

I. INTRODUCTORY.

GENERAL REMARKS.—In ancient times when the civil and military affairs were one and indivisible, all the adults in the realm were obliged to offer their services in the army with the emperor of the day as the commander-in-chief as already described under Section I.

After the real power of the country had passed into the hands of military clans, first the Heike, then the Genji, after which came the Hōjō, the Ashikaga, and so on till this military usurpation terminated with the Tokugawa,—that is, it was after feudalism had been ushered in, that a class of professional soldiers made their appearance. Both the leaders and their retainers trained their sons in their own profession which therefore became a hereditary one.

This system of hereditary soldiery ceased to exist with reinstatement of the Imperial régime in the Restoration, and the vacancy thus created in the military ranks was filled with the adults of the country of all classes, and at last the system of hereditary soldiers was superseded by that of conscription. The successful consummation of this grand work of social revolution without any heavy price being paid in bloodshed or in the other national disasters usually incidental to such mighty changes, reflects great credit on the solidarity of our national system and on the tremendous influence enjoyed by the Imperial court.

In the very beginning of the new era, one of the seven departments of state, as administrative affairs were subdivided at that time, took charge of military and naval affairs. It was in 1871 that the organization of the Department was subjected to thorough readjustment, and that a line of remarkation began to be drawn up between the land and sea services, till coming to the following year the separation of the two main services was completed and the War and the Naval Departments were made independent offices.

II. ORGANIZATION OF THE STANDING ARMY.

The Organization of the Standing Army is as follows:—

ORGANIZATION OF THE STANDING ARMY.

	Location of Divisional Head-Quarters.	Infantry.		Cavalry.		Field Artillery.		Engineer's Battalion.	Commis-sariat Bat-talion.	Locality of Garrison of Various Corps.

III. PERSONNEL ON PEACE STANDING.

According to the inquiries carried out at the end of the year 1901 the strength of commanding staff on peace standing is as follows:—

Kind of Service.	Active Service.	1st Reserve.	Land-Wehr.	Total.
General and Non-Combatant of } Equivalent Rank }	110	27	10	147
Gendarmes	91	54	27	127
Infantry	4,427	1,654	873	6,954
Cavalry	421	95	28	544
Artillery	1,519	239	98	1,856
Engineering	474	98	42	614
Commissariat	252	73	34	359
Paymaster	712	307	168	1,187
Surgeon	932	526	128	1,586
Veterinary Surgeon	148	45	27	220
Band	7	—	—	7
^a Total	9,093	3,118	1,435	13,646
1900	8,608	2,400	1,165	12,173
1899	7,994	1,931	994	10,916
1898	7,400	1,496	865	9,761
1897	6,632	1,340	776	8,784
1896	5,785	1,345	528	7,658

IV. FACTORIES.

ARSENALS.—Subjoined to the Military Arms and Ammunition Office, the Arsenals manufacture and repair all sorts of arms required in the Army and also ammunition for the fleets. The Arsenals are situated in Tokyo and Ōsaka, the former undertaking to manufacture small arms, cartridges, and the implements and tools pertaining to small arms. It maintains at Meguro, Itabashi and Iwahana the powder factories. The Ōsaka Arsenal undertakes the manufacture of guns, cannon-balls, and other objects of a like nature, and maintains the powder factory at Uji and the arm workshop at Moji.

In 1901 the operatives employed at the Tokyo Arsenal numbered 2,064,480 men and 96,325 women, in all 2,160,805 calculated

according to the number of days the operatives attended work. Computed in the same number, the Ōsaka Arsenal employed in the same year 1,461,916 men and 37,641 women, in all 1,499,557.

SENJU WOOLEN FACTORY.—This factory undertakes the weaving of woolen goods. In 1901 it employed 144,381 men and 173,745 women, in all 318,126 computed according to the numbers of days each operative attended work.

ADMINISTRATION OF HORSE AFFAIRS.—The administration of affairs connected with military horses may be divided into three stages from the commencement of the era. In the first period, that is from 1868 to 1872, the supply of chargers was obtained by purchase from the stock-farmers and distributed at once among the troops. In the second period, that is from 1873 to 1874 year, the horses purchased from the stock-farmers were first trained before being distributed. In the third period, that is 1881 and on, colts were purchased, and were distributed after they had been fed by the army veterinarians. In order to facilitate the business of making this purchase the Horse Supply Office has been established, with has its headquarters in Tokyo and seven branches in the provinces. At the branches, cultivated fields, pastures, and grass-land are provided, these measuring in all 10,502 *cho*.

V. APPOINTMENTS OF THE OFFICERS.

In the beginning of the military system early in the present era the complement of officers and non-combatants of equivalent rank was made up of those who had held a corresponding post in the service of the previously existing feudal governments, and also with those qualified for the posts and selected from among the candidates in general.

OFFICERS OF VARIOUS CORPS.—The officers of infantry, cavalry and commissariat services are appointed from among the following who have undergone the following routine of study either in the troops or at the Shikan Gakko (Officers' School):

- a. Those who have graduated from the central military preparatory school.

- b. Those who have graduated from the Government or public ordinary middle schools or schools recognized by the Education Minister as institutions of equal standing or those who possess scholarship equal to that of those graduates and who have passed with success the entrance examination.

PAYMASTERS.—The paymasters are appointed from among those Lieutenants or Sub-Lieutenants on active service at the various corps who, having been admitted through entrance examination to the Paymaster School, have gone through the regular course there, or those who come under any of the following heads and have gone through the required training at the Paymaster School.

- a. Those students of the Colleges of Law of the Imperial Universities or of the Higher Commercial Schools who on application have been elected as paymaster candidates and who as such have gone through the respective courses at those institutions.
- b. The graduates of the foregoing institutions or of the graduates of foreign institutions of equal standing who have applied for the paymastership.

SURGEONS.—The complement of army surgeons is filled with those coming under the following headings who have acquired the required knowledge at the infantry corps or at military hospitals:—

- a. The students of the Colleges of Medicine of the Imperial Universities or of a special school for medicine or of a local medical school regarded as of equal standing by the Minister of Education as the ordinary middle schools, and who have applied for admission to the service and who have graduated from the respective institutions.
- b. The graduates of the above-mentioned institutions (or the graduates of foreign institutions possessing equal scholarship) who have applied for admission to the service.
- c. The graduates of the Army Surgeons School.
- d. The one-year volunteers possessing either the license of medicine or of pharmacy who have applied for admission to the service.

MILITARY VETERINARY SURGEONS.—The staff of Military Veterinary Surgeons is supplemented with those coming under the fol-

lowing heads, and who have acquired the required knowledge at the Remounting Corps.

- a. The students of the course of Veterinary Surgery of the Colleges of Agriculture of the Imperial Universities or of the Practical Veterinary Course at the said Colleges who have gone through the prescribed course at such a college.
- b. The graduates of the above-mentioned institution (or of foreign schools regarded as of equal standing) who have applied for admission to the service.
- c. The one-year volunteers possessing the license of veterinarians who apply for admission to the service.

BAND-MASTERS.—The band-masters are appointed from among the assistant band-masters who have served with distinction for at least three years on active service.

VI. THE COMPLEMENT OF NON-COMMISSIONED OFFICERS.

The complement of non-commissioned officers is supplemented of as follows:—

GENDARMES.—The non-commissioned officers are recruited from among the lance-corporals of the corps who have been with the colors for not less than two years or from among the non-commissioned officers of the infantry, cavalry, artillery, engineering and commissariat corps who have been with the colors for not less than six years and who have passed the recruiting examination.

NON-COMMISSIONED OFFICERS OF VARIOUS CORPS.—Of the non-commissioned officers in these corps, those belonging to the longer term service are appointed from among those who are not on the active or reserve service of the army or the navy and who have passed the admission examination; or from among the privates who have applied for admission to the services and who have received a suitable education. The non-Commissioned officers of shorter-term service are appointed from among the lance-corporals who have been with the colors for at least two years from the date of enrolment and who are qualified to undertake the service.

FOREMEN OF GUNNERY WORKSHOPS.—The foremen of gunnery workshops are appointed from among those not on active service or on either the reserves of the army or the navy who have graduated from the Gunnery Artisan School or from among the privates of various corps who, having been selected on examination in the first year of their service, have also graduated from the same institution.

FOREMEN OF FARRIERY.—The foremen of farriery are appointed from among those not on the active or reserve force of the army or the navy and who have graduated from the farriery course at the Veterinary Surgery School, or from among the farriers of the cavalry, artillery or commissariat corps who on applying for admission to the service have been judged to possess qualification equal to non-commissioned officers and who have passed the required course of study at the Veterinary Surgery School.

FOREMEN OF TAILOR AND SHOE-WORKSHOPS.—The foremen of tailor and shoe-workshops are appointed from among tailor-privates and shoemaker-privates attached to the different corps.

MEDICAL ASSISTANTS.—Medical assistants are recruited from among male nurses not on the active or reserve service of the army or the navy who, having been selected on examination, have received the necessary education.

PAYMASTER-CLERKS.—Paymaster-clerks are appointed from among the non-commissioned officers of the various corps who have served with the colors for at least three years and who have received the necessary education at the Paymasters School.

BAND-SERGEANTS.—Band sergeants are appointed from among the bands-men who have been on active service for not less than two years and who are judged to possess qualifications equal to those of non-commissioned officers.

VII. RECRUITING OF PRIVATES.

The privates were at first recruited from the various feudal governments, the number determined according to the amount of

their fief. This system prevailed till 1873. Early that year the conscription system was first instituted, and **Conscription** males who have reached the age of twenty men were **Service.** all included in the army list. Thus the system of recruiting was completely changed. Since that time the system has undergone frequent modifications, till it has assumed its existing form. To briefly enumerate the fundamental points in the existing system, first.

All the Japanese male subjects from full seven-
Classification teen years old to full forty are liable to military
of the Service. service.

The service is divided into active service, *landwehr* service, depôt service, and landsturm service.

The active service is divided into service with the colors and with the first reserve, the former to extend over three years and to be obligatory on all who have attained the age of full twenty years. Service with the first reserve is obligatory on all who have finished the service with the colors and lasts four years and four months.

The landwehr reserve lasts five years and is organized of those who finished the first reserve service.

The depôt service is divided into the first depôt service and the second depôt service, the former to last seven years and four months and the late one year and four months. The first depôt service is organized with those who have not been enlisted for active service while the second depôt service is organized with those who have not been enlisted for the first depôt service.

The landsturm service is divided into the first and second divisions, the former to be organized with those who have completed the term of the landwehr service and the first depôt service and the second division includes all those who are not on the other services.

In 1901 all the males liable to conscription service numbers
Number Eligible ed 539,282 throughout the country. They were
for Conscription. distributed as follows as the result of conscription
service examination :—

Distribution.	Number.	Percentage.
Levied for Service (Active and 1st and 2nd Depôt Service).	187,907	34.84
Levy Postponed	108,016	20.03
Levy Exempted	194,003	35.98
Service Exempted	34,278	6.36
Others	15,076	2.79
Total	539,282	100.00

VIII. EDUCATION.

THE STAFF COLLEGE.—This institution enables young officers of distinguished ability to study the higher branches of military science and also to acquire those knowledge necessary for all who wish to conduct investigations pertaining to military affairs.

THE ARTILLERY AND ENGINEERING SCHOOL.—Sub-Lieutenants of artillery and engineering corps are taught here all the science required for discharging the duties of officers in the artillery and engineering corps.

THE OFFICERS' SCHOOL.—This school is composed of cadets of various corps who receive the education necessary to subordinate officers. The term of study is one year, and every year about 450 cadets are admitted.

THE MILITARY TRAINING SCHOOL (Toyama Gakko).—This school is principally devoted giving to students sent from the infantry corps training in tactics, shooting exercises, fencing and gymnastics, with the object of promoting their efficiency in the service. The term of study is from two or seven months and the number of students to be admitted determined every year.

THE CENTRAL MILITARY PREPARATORY SCHOOL.—This school is attended by the graduates of Local Military Preparatory Schools with which it is regulary connected, and gives to the students a general education and also the preliminary military education necessary for military cadets. It is devoted to training cadets of various corps. The term lasts two years and every year about three hundred students are admitted.

THE LOCAL MILITARY PREPARATORY SCHOOLS.—These schools give a general education and military training to those boys who aspire to become officers. The schools are connected with the Central Military Preparatory School. There are six schools of this description, these being located at Tokyo, Sendai, Ōsaka, Nagoya, Hiroshima, and Kumamoto. Each admits about 50 students every year. The term extends for three years.

THE MILITARY RIDING SCHOOL.—The school collects from the different cavalry corps students who wish to receive a training in tactics and riding. The term extends for about eleven months and the number of students to be admitted is fixed beforehand every year.

THE MILITARY FIELD ARTILLERY SHOOTING SCHOOL.—This collects students from the Field Artillery corps to give training on tactics and shooting exercises in field artillery. The term lasts two or three months and the number of students to be admitted is determined every year.

THE MILITARY FORTS ARTILLERY SHOOTING SCHOOL.—This school collects students from the Fort Artillery corps to give them a training in the subjects of fortification, tactics and shooting. The term extends for two or three months and the number of students to be admitted is determined every year.

THE MILITARY PAYMASTER SCHOOL.—This school trains those desirous to become military paymasters, the candidates to be admitted being the applicants from among Lieutenants and Sub-Lieutenants admitted on examination, and also applicants from among the graduates of the Colleges of Law of the Imperial Universities and of the Higher Commercial School. There are two courses, one of two years and the other of six months. The number of students to be admitted is determined every year.

THE ARMY SURGERY SCHOOL.—The students of this school consist of the surgeons of the Army Medical corps and also of the licensed medical practitioners and pharmacists who wish to become army surgeons on active service. The first class students are taught for four months and the second class for one year. The number to be admitted is determined every year.

THE MILITARY VETERINARY SURGERY SCHOOL.—The students

of this school consist of veterinary surgeons of the Military Veterinary Surgeons corps who receive training in this particular branch of science; also the farriery-foremen of the various corps are trained in the science of farriery. The course of study extends for from three to nine months, and the number of students to be admitted is determined every year.

THE MILITARY GUNNERY AND MECHANICS WORK SCHOOL.—The school trains those who wish to become foremen-smiths, foremen-saddlers, foremen-gunsmiths, foremen of wood mechanics, and foremen of casting work. The course of study extends for one to two years, and the number to be admitted is fixed every year.

THE MILITARY BAND SCHOOL.—The school gives training to those desirous to become band-men. The course of study is about one year and the number to be admitted is determined every year.

IX. PUNISHMENT AND GAOLS.

THE COURT-MARTIAL.—In 1872 the Court-Martial was established, and the Garrison Central and Branch Detention House Regulations were also enacted, and all matters relating to military justice and criminal procedure were first brought under a regular system. In 1883 the Military Criminal Procedure was elaborated; it was amended in 1888, and it remains to-day in this amended form.

The Court-Martial deals all criminal offences committed by combatants and non-combatants, and it enforces the Military Criminal Code and the ordinary criminal provisions.

The Court-Martial is divided into the Higher Court and the Divisional Court. The latter is established in each Military Division and deals with criminal matters that have happened within its jurisdiction. The Higher Court is established at Tokyo and deals with Criminal matters relating to officers of the rank of Generals; it also deals with the cases of appeals made against the judgment of a Divisional Court-Martial.

The Military Justice comprises the officers of *Kensatsu-kan* (Prosecutors), *Riji* (Preliminary Judges), *Rokuji* (Clerks), *Hanshi-*

cho (Chief Judge) and *Hanshi* (Collegiate Judges). They are presided, in the case of a Divisional Court, by the Commander of the Division, and, in the case of the Higher Court, by the Minister of War. The *Kansatsu-kan* takes charge of matters relating to prosecution of crimes; the *Riji* of the examination of cases, corresponding to preliminary examination of the ordinary court; and the *Rokuji* corresponds in function to clerks of the ordinary court. They are all civil officials. The *Hanshi-cho* and *Hanshi* are military officers and five of them are to sit over a case. The *Riji* takes part in judgment, though he does not enjoy the voting right. The Court-Martial is composed of the *Hanshi-cho*, the *Hanshi*, and the *Riji*, the *Rokuji* and the *Kensatsukan* being outside the limit. A judgment acquires validity on the approval of the Emperor or of the supervising chief, according to the official rank of the defendant or the relative gravity of the office. Then it is declared and carried into effect.

MILITARY GAOLS.—In 1876 Rules relating to the Qualification of Military Gaolers were first provided. The Military Gaols, others wise called Garrison Gaols, are located at places possessing garrison and Divisional Court-Martials. The Garrison Commanders are made to control the gaols. These gaols confine combatants or non-combatants who have been convicted either by the Military or ordinary laws of an offence not graver than misdemeanor and who are still connected with their respective services.

X. MEDICAL AFFAIRS.

THE establishment in 1868 of the Temporary Military Hospital in Tokyo was the origin of this institution in Japan. The system has undergone changes several times, and it now exists in the form of the Garrison Hospital Regulations enacted in February of 1898. A military hospital is located, according to the provisions of the regulations, at each place possessing a military garrison. It takes care of all cases requiring medical treatment that appear among the troops, takes charge of the keeping and supply of medical stuff and instruments, and also undertakes the education of surgeon-privates

and surgeon-non-commissioned officers. All the expenses relating to the medical treatment of those receiving treatment at the hospital are borne by the Government, except for those who occupy the rank of special sergeants or above and for the one-year volunteers.

CHAPTER II.—The Navy.

Personnel on Peace Standing—Naval Works—Complement of the Personnel—The List of the Imperial Fleet—Education—Punishment—Health and Hygiene—Hydrography and Chart.

I. INTRODUCTORY.

GENERAL REMARKS.—Though nothing definite is known about the maritime affairs in ancient times, this much can be stated with certainty that the art of navigation seems to have been tolerably well developed in Japan about 26 or 27 centuries ago, that is to say about six or seven centuries before the Christian era, for history records of the existence of intercourse as that remote period between this country and Korea. Coming down to the period corresponding to the 15th or 16th centuries after Christ something like a regular navigation service connected Japan with the neighboring countries, especially Korea and China. Soon the scope of the maritime enterprises was expanded and our ships began to cross over to the South Seas, Siam, India, and even to the American continent. There is reason to believe that these ocean-going ships must have numbered about two hundred at that time. It was an irreparable loss to the country that this enterprise was sternly suppressed by the Tokugawa Shogunate about the middle part of the 17th century of the Christian era, and that it should, from religious prejudice, enforce the exclusion policy, for the Shogunate prohibited on pain of severe penalty the building of big ships, and the maritime trade that was going to flourish was thus throtled to death.

The naval warfare forms a comparatively unimportant chapter so far as the ancient history of Japan is concerned. To enumerate those that are worthy of mentioning, in the first place we have the expedition

of Korea by the Empress Jingo in the 2nd century A.D. About ten centuries after, the naval battle at Dannoura between the Genji and Heike clans may be noted. The invasion of Kyūshū by Kublai Kahn's armada in the next century is perhaps the most memorable event of foreign invasion that ever occurred in Japan within the period of authentic history. The annihilation of that armada was even more complete than the equally memorable destruction by England of the Spanish Armada. Towards the close of the same century Japan took the offensive against China, and several encounters occurred between Hideyoshi's fleet with that of Korea off the coast of that Peninsula. It ought to be remembered, however, that the warships of those days were not properly warships as the term is now understood, for they were merely armed merchant-men and even fishing junks. There was no fleet properly so called in time of peace.

It was only recently that Japan obtained warships built in modern style. The warships of this type that the Tokugawa Regency purchased from abroad towards its later days numbered over ten, while more or less warships were also purchased by the feudal lords of the clans of Satsuma and Tosa. All those were the first warships that Japan ever had. However there was no central naval office at that time, and the art of navigation and naval science was in a primitive state.

As already mentioned in the preceding chapter, it was in 1872 that Army and the Navy were separated and the latter was elevated to the dignity of an independent Department of the State. In the same year the Naval Academy, Magazine, Hospital, and Court-Martial were established; Yokosuka Dockyard and workshop were transferred to the control of the Naval Department. The Naval Magazine was the forerunner of the Naval Arsenal. In 1873 the Temporary Admiralty was created, and this was the origin of the present admiralty system. In 1896 that office was replaced by Tokai Admiralty established at Yokohama. Two years after the Central Staff Board was created, and was made to attend to matters relating to national defence and the efficiency of the service, both land and sea forces. At the same time a naval engineering school was established subjoined to the Naval Academy, to be separated into an independent institution three years later. In 1884 the

Tokai Admiralty was removed to Yokosuka and received the new name of Yokosuka Admiralty. Two years later it was ordained to establish an admiralty at Kure, Sasebo, Maizuru and Muroran. The Naval Section was established in the Central Staff Board, and coming to 1888 the Naval staff was separated and was elevated to the dignity of an independent office under the style of the Naval Staff Board. In the same year the Naval College was started. Next year the two Admiralties at Kure and Sasebo were opened. In 1900 the Naval Comptroller Board, the Tokyo Naval Arsenal, the Shimose Powder Factory, and the Naval Coal Reserve were established. Also an education board was created to control all the educational institutions in the Navy. In 1901 the Maizuru Admiralty was opened.

II. PERSONNEL ON PEACE STANDING.

At the end of 1901 the strength of Commanding staff on peace standing was as follows:—

THE PERSONNEL.

Kind of Service.	Active Service.	1st Reserve.	2nd Reserve.	Total
Admiral and Non-Combatant of Equivalent Rank } 47	22	14	83	
Senior Officer	639	22	60	721
Junior Officer	1,060	23	70	1,153
Cadet	330	—	—	330
Special Warrant Officer	631	10	54	695
Warrant Officer	5,802	163	—	5,965
Seaman	22,036	4,036	1,793	27,865
Student	834	—	—	834
Total	31,379	4,276	1,991	37,646

III. NAVAL WORKS.

At the end of 1901 the data relating to the Naval works were as follows:—

NAVAL WORKS.

Works.	No. of Engines.	H.P.	No. of Operatives Computed by the Number of Attendance.	Aggregate Wages of Operatives. <i>yen.</i>
Yokosuka Dockyard... ..	28	564	1,513,691.87	780,048
Kure " 	17	510	1,390,054.00	731,531
Sasebo " 	9	816	945,317.68	483,254
Maizuru " 	—	—	1,651.50	1,042
Yokosuka Arsenal	2	50	307,973.15	153,119
Kure " 	41	2,797	2,035,548.46	1,040,699
Sasebo " 	2	40	174,371.69	88,050
Maizuru " 	—	—	401.40	319
Tokyo " 	9	239	462,587.73	227,088
Shimose Powder Factory... ..	1	62	61,222.83	23,565
Total	109	5,078	6,892,820.31	3,528,718

Note:—The Maizuru Dockyard and Arsenal were opened on October 1st of 1901.

IV. COMPLEMENT OF THE PERSONNEL.

THE HIGHER SERVICE.—Concerning the method of complementing the personnel of the higher service no authentic record relating to the initial stage of the navy remains. It was very likely, however, that those officers who were employed on board the warships belonging to the Shogunate or the feudal princes got commission for the Navy of the Imperial Government. Also, the commission was given to the few who had studied the naval science in foreign countries and sometimes the graduates of the Naval Academy, as is the case at present. According to the Naval Appointment Regulations now in force, the Naval Engineers are filled with the graduates of the Naval Engineering School, while Surgeons, Paymasters, Constructors, Pharmatists, etc. are filled with the graduates of the Naval Institutions for the respective services, also the graduates of the Colleges of the Imperial Universities or of the institutions of equal standing.

COMPLEMENT OF THE STAFF OF WARRANT OFFICERS AND SEAMEN.—In the year 1872 Rules relating to the Levy of Seamen were promulgated, and they inaugurated the system of conscription service for the fleet. The conscription service system is supplemented by the Voluntary Service System promulgated in 1899. The Conscription Rules were put in force for the first times in 1885. At present the levying is carried on both by the conscription and voluntary service systems Chief Warrant Officers are filled with Warrant Officers of merit and the latter with seamen of merit.

VI. EDUCATION.

THE NAVAL STAFF COLLEGE.—Founded in 1888 the college gives higher education to officers and engineers.

THE NAVAL ACADEMY.—Subordinate to the Board of Naval Education, the school educates those who aspire to become officers. It was founded in 1872 and was originally located in Tokyo. At present it is situated at Edajima, Hiroshima-ken.

THE NAVAL ENGINEERING SCHOOL.—Founded in 1878 as subordinate to the Naval Academy, it was converted into an independent institution three years later. The school instructs those who wish to become naval engineers.

THE NAVAL SURGERY SCHOOL.—The school gives higher course of science on naval surgeons and also teaches surgeon-cadets to qualify them for the service. It is controlled by the Director of Surgery Bureau of the Navy.

THE PAYMASTER TRAINING SCHOOL.—The school teaches the necessary knowledge to Paymaster cadets and also to the men in the service. It is controlled by the Paymaster Bureau.

THE NAVAL GUNNERY TRAINING SCHOOL, THE TORPEDO PRACTICE TRAINING SCHOOL, AND THE ENGINEERING PRACTICE TRAINING SCHOOL.—All those institutions give training to the men on the respective services.

VII. PUNISHMENT.

The first regular office to manage matters relating to admiralty punishment was established in 1872. With the elaboration of the Admiralty Code of Punishment, a Permanent Admiralty Court was established at Tokyo and at all the places possessing admiralties. The fleet holds a court of justice as circumstance requires.

VIII. HEALTH AND HYGIENE.

With the inauguration of the Naval Department in 1872 a Naval Hospital was founded in Tokyo. When in December of 1884

the Yokohama Admiralty was established, a Naval Hospital was also founded there, the Admiralty to control the Tokyo Naval Hospital. In November of 1888 that Hospital was abolished. At present each admiralty maintains its own hospital, so that we have a hospital at Yokosuka, Kure, Sasebo, and Maizuru.

IX. HISTORY OF HYDROGRAPHY AND CHART.

It was about the year 1872 that a reliable chart of the seas in the Far East was first drawn by Japan. We had another chart much earlier than that, for in the 12th year of Bunkwa (1815) and at the time of the Tokugawa Shogunate the celebrated hydrographer of the day, Chukei Ino, compiled one that was highly valuable. In 1862, the authorities of the time prepared, according to the method taught by the Dutchmen, a chart for part of the Sea of Ise. The sounding having been incomplete while the art of printing was imperfect, the chart did not much serve the purpose of any practical utility. The sailors of those days were therefore obliged to use the charts prepared by Dutchmen and English.

In 1871 the Hydrographical Bureau was created and the work of hydrography was commenced in a regular manner. The task involved serious difficulty, owing to the fact that the business was quite novel to the country and could not, therefore, obtain specialists qualified for it. The late Rear-Admiral Yanagi who was ordered to take charge of the business experienced innumerable difficulties. He himself possessed the best knowledge on the subject at that time, having learned mathematics and surveying at Nagasaki from the Dutchmen. He, in conjunction with the commander of the British Surveying Ship "Sylvia," started the work of sounding the coast of the Inland Sea and of Hokkaido. (It may be remarked here that the Naval chart No. 991 published by the English Hydrographical Office was based on this combined sounding; in Japan it appeared in the shape of Naval chart No. 2). Next the chart of Kamai-shi on the Pacific coast of Honshu was made, based on the result of sounding carried by Japanese experts alone. This was No. 1 chart of Japan and was adopted for use by our navigators. During

the 32 years that have elapsed since that time, the work was attended to with greater efficiency and diligence, and soon the agreement was concluded with many of the Western Powers for the exchange of our charts with those compiled by them. Our charts have been frequently exhibited in international exhibitions, as those held in Holland, France, America, etc. and have been received with appreciation. The charts thus far prepared number 278. At the same time the Hydrographical Registers were compiled, those relating to Hokkaido and the "Southern islands" published in 1873. The other records worth mentioning are the Hydrographical Registers round the coast of Japan (18 vols.), the Japan Hydrographical Work (5 vols.), the China Hydrographical Work (9 vols.), the Korean Hydrography, the Amur Coast Hydrography, the Fiji Archipelago Hydrography, the Pacific Navigation Route, and so forth.

The hydrographical business of Japan stands conspicuous as work completed by our countymen without the help of foreign specialists.

THE RED CROSS SOCIETY OF JAPAN.

The Red Cross Society of Japan owes its origin to the South-western Civil War that occurred in 1877. It was called at that time the Universal Benevolence Society (Haku-ai Sha) and was devoted to the work of tending wounded officers and men. This civil war that lasted from February to September of that year was the most disastrous and sanguinary internal trouble our country has experienced since the Restoration as it was the last that ever occurred. The sad spectacle of hundreds of wounded officers and men both of the Government and rebel troops dying or having to endure intense suffering owing to a lack of proper medical treatment appealed strongly to a number of men philanthropically disposed of the necessity of devising some measures for alleviating to some extent in the interest of humanity this misery of war. These organized, with the support of their friends, and on the model of similar benevolent institutions existing in the West a society to which they gave the above-mentioned name. The rules of the association were hurriedly

drawn up and on May 1st of that year application was forwarded to the Commander-in-chief's headquarters at Kumamoto for permission to dispatch a medical corps to the front to tend on the wounded men both on the side of the Government and on that of the rebels. Permission was granted and thus the benevolent work with which the Geneva Society is identified was, for the first time, carried out in Japan.

This philanthropic organization that was established at first to meet the urgent requirements of the time, was converted into a permanent institution after the close of the war. Officials were sent to all parts of the country to persuade the people to become members of the society, and in short every effort was taken to make the preparation in time of place as complete as possible so that it might do good service in time of emergency.

Coming to 1886, Japan joined the Red Cross Convention of Geneva, and the Haku-ai Sha amended its articles of association in May of the following year and changed its name to the Red Cross Society of Japan. At the same time the society was placed under the patronage of their Majesties the Emperor and Empress, and under the auspices of the Imperial Household Department and of the Army and the Navy. In carrying out that thorough reorganization and improvement the society aspired to be admitted into the circle of the Red Cross Societies existing in the West. This aspiration was soon gratified, and the Red Cross Society of Japan was, in due course, allowed by the Head Association at Geneva, to conclude a compact of mutual friendship and help with the sister associations of Europe.

On the carrying into effect of the revised Civil Code, it was decided to convert, in accordance with the provisions of the Code, the society into a corporation. This conversion was effected in 1901. At the same time the Government issued by Imperial Ordinance the Regulations relating to the Red Cross Society of Japan. The regulations, besides establishing in a distinct manner the relations existing between the Government and the society, placed the latter on a sound and firm basis.

The society gets almost universal support from the people at large and the rate at which the members are increasing in num-

ber has never been paralleled. At the end of 1887 the list contained only about 2,100 names, but the end of June of 1902 it had risen to no less than 796,045. The number of new admissions has been especially rapid since the Japan-China war, as many as a hundred thousand new members being received every year. With this great increase in the number of members, the amount of the regular subscription to the funds of the society also showed a great advance. It reached 2,153,202 *yen* and a fraction at the end of June 1902.

The work undertaken by the society makes a creditable record, and it was especially on the occasion of the war in question that the society discharged its duty with signal efficiency. During that war 1,587 men and women attended the service, and the scope of their work comprised the Reserve Army Hospitals at Hiroshima and nine other places, the temporary military hospitals in China and Korea, the permanent war hospitals, and also the conveyance by sea of invalid officers and men. Further, the society attended to such of the prisoners at Tokyo and other three places as were under medical treatment and of course undertook the nursing and medical service when the Imperial troops were dispatched to Formosa to suppress the insurgents. Altogether 101,423 invalids including 1,484 prisoners were cared for by the officials and nurses of the society.

The part which the society played during the Boxer trouble was equally distinguished. The society dispatched on that occasion 476 officials and nurses who were made to attend to the medical and nursing service at the Military Reserve Hospital in Hiroshima and at Taku and Tientsin. The society's hospital steamers *Hakuai Maru* and the *Kosai Maru* rendered invaluable service on this occasion and kept on conveying invalids from Northern China to Hiroshima. These sister steamers, it may be added, had been built soon after the Japan-China war as a result of the experience acquired during that time, and the Boxer trouble supplied unique opportunity for testing the new system. It need hardly be added that the test was attended by the most complete success. The invalids looked after by the society at the time numbered 11,348 including 245 French officers and 4 Austrians.

Apart from the two memorable cases of war service mentioned above, the society has also undertaken several times to nurse people who were wounded in calamities accidental and natural. Among the principal cases of this kind in which the service of the society were requisitioned, we may mention the eruption of Mount Bandai in the province of Iwashiro in 1888, the shipwreck of the Turkish man-of-war in 1890 off the coast of Kii, the disastrous earthquake in the following year in Mino and Owari, the tidal waves in the Sanriku districts, the earthquake at Akita in 1896, and the fire at Hachioji (Tokyo prefecture) in 1897. Besides, the local branches of the society undertook on many occasions the same benevolent work every time floods and other disasters overtook the provinces near to them.

Any imperfection formerly felt in the internal arrangement of the society's work,—and there were many points not satisfactory, has been removed since the Japan-China war, and the society is no longer subject to inconvenience arising from the insufficiency of materials and *personnel*. This efficient arrangement is also seen at all the local branches. According to the returns compiled in June of 1902, the society's medical force comprised 279 doctors, 1,558 nurses, 640 assistant nurses, besides 634 students and 128 pupils.

The society maintains a regular system of training nurses, this system put in operation from 1890. At the head office the term of training extends for three years of which one half is devoted to science of nursing and the other half to practical side. At a branch office the term is one year shorter, the two years being equally divided to scientific and practical training. From 1896 a briefer course was created for turning out under-nurses. The term of this special course extends for ten months, equally divided into science and practice training.

The Red Cross Hospital was opened in 1885 at Iida-machi, Tokyo, and is an organ indispensable for training officials and nurses needed for the corps of the society. With the change of the title of the society and the expansion of its scope, the hospital was newly erected, on a much enlarged system, in the premises of the Imperial Household's land at Shibuya, a suburb of Tokyo. The work of construction was completed in 1891. The hospital undertakes in

time of peace the training of doctors and nurses, so that it may with promptitude discharge its duty in time of war or other emergency. In order to render the training as efficient as possible patients suffering from disease are admitted to the hospital for treatment. Of the people thus cared for, those who have means are made to pay for the medication and board, but those who are poor are given treatment free of charge. In time of war the hospital is converted into a reserve military hospital, as it was actually the case on the occasion of the Japan-China war, when the hospital was converted into No. 3 branch hospital of the Tokyo Reserve Military Hospital and took under it a number of invalids both Japanese and foreign.

PART VII.

COMMUNICATIONS.

CHAPTER I.—Post.

Introductory—Official Organization—Transmission and Delivery—Kinds and Fees of Mail Matter—Foreign Mail and Parcel Post—Receipts and Disbursements.

I. INTRODUCTORY.

GENERAL REMARKS.—It was in 1871 that the postal system modelled on the Western mail service was first adopted in Japan. It must not be supposed that that was the first post system ever originated in Japan, for though in an imperfect form the service had long existed in our country. The **In Ancient Times.** “post station” system that was first established in the second year of the reign of the Empress Jingo (202 A. D.), when the Empress undertook an expedition against Korea, marked, theoretically speaking, the appearance of an embryonic postal service administration. The rudimentary system was brought to greater perfection in 646 A. D. by the introduction of the various administrative institutions, of the Tung Dynasty, China. The setting up of the Regency Office at Kama-kura by Yoritomo was followed by a further improvement in the system and in the conveyance of letters by carriers. The mode of managing roads and ferries in this connection was specially well arranged at that time. The carrier system, however, received a serious reverse during the Regency of the Ashikaga, and by

prolonged civil disorders that marked the administration of that weak Regency. In fact the system was practically suspended.

With the rise of Nobunaga the service was restored; old roads and bridges were repaired, and Hideyoshi that succeeded Nobunaga carried the service to a state of greater perfection. The service, though very much developed **In Modern Times.** and expanded as compared with that which had been prevailing in the period of Taikwa, was confined to the conveyance of official letters, so that the general public did not participate in the benefit.

The system was very much advanced during the Tokugawa period and it was then made much more efficient and comprehensive in operation. Official letters were regularly despatched by the Shogunate to the province by carriers, and the feudal lords residing in the provinces also employed regular carriers to act as messengers between their fiefs and the residential seat of the Shogunate. What was still more noteworthy was the fact that the private post service was first brought into existence. This originated in the thrice-a-month system of correspondence that had been maintained between the Shogunate's retainers on duty at the Castle of Ōsaka and their families in Yedo. The shrewd merchants of Ōsaka took a hint from this system of correspondence and some of them opened a regular system of carriers to convey private letters between the three important cities of Yedo, Kyoto and Ōsaka. The business proved quite remunerative as indeed it proved highly convenient to the people. For more than two centuries this primitive system of postal service was in vogue in Japan.

On the advent of the Imperial Government it was decided to run the postal service modelled on the Western system as an official undertaking, as it perceived that the business could not **After the Restoration.** be carried on with efficiency and benefit as private enterprises.. In January of 1871 the new Postal Service System was promulgated, and was put in force by way of trial between Tokyo, Osaka and Kyoto in March of the same year. The hour of transmission was previously announced and a number of carriers were despatched every day. The benefit of correspondence was extended to all the towns and villages

lying along the trunk route connecting the three principal cities. The local authorities were made to take charge of the business of transmitting the mails from one post to another and also the sale of postal stamps.

This system highly imperfect as it was compared with the one now in operation was however memorable improvement with what had been in operation before, and for the first time the general community or strictly speaking a limited portion of the general community was enabled to participate in the benefit of the postal service. The new departure thus inaugurated was carried to greater perfection and improvements were made in quick succession. In March of the 1872 year a thrice-a-day service was opened for the city of Tokyo and for the delivery of both letters and newspapers. Soon a five-time-a-day service was established between Tokyo and Yokohama, and it was announced at the same time that people were forbidden to engage as their business the transmission and delivery of letters not bearing postage stamps.

It was April of 1873 postal fee was made uniform irrespective of distance, except in case of city mails and suburban extra fee mails. In November of that year the post cards and wrappers were issued, and in the same year the Post Exchange Contract was concluded with the United States of America. In June of the following year Japan joined the International Postal Union, by which the arrangement of postal communication between Japan and the foreign countries was somewhat completed. In view of this the British Post Office that had been existing in Yokohama, Kobe and Nagasaki were withdrawn in December of 1879, while a year hence the French Post Office at Yokohama was also withdrawn, and the postal administrative autonomy was first secured by Japan. In December of 1882 were issued new Postal Regulations which inaugurated various new departures, such as the abolition of the system of city postal service, local postal service and suburban extra postal fee system. In other words, the rate of fee was made uniform for the whole country. In December of 1884 the postal card with reply paid was issued. By the further amendment of the regulations carried out in August of 1889 the fee for forwarding periodically printed matters was reduced by one half, the weight allowed for

the fourth class matters, that is books, drawings, pictures, sample, and patterns, was increased fourfold, a new item of seeds of agricultural produce was added to the fourth class matter category. In June of 1892 the Parcel Post Regulations were issued and were enforced from October of the same year. In June of the same year the military post service was established for the benefit of the troops dispatched to Korea in connection with the insurrection that had broken out in that country. In a similar way the field post service was organized on the occasion of the Japan-China War and the means of correspondence between the front and the home country was provided. The special facilities for transmitting seeds of agricultural produce were made more efficient in operation, by setting apart such mail matter as fifth class matter and by reducing the rate of fee to one half of what was before. A part of the Postal Regulations was amended in 1899, and while making the allowances of weight more liberal, the rate of fee for first and second class mail matter was somewhat advanced.

LATEST IMPROVEMENTS.—Such in the main is the history of our postal service since it was inaugurated early in the era. It serves to demonstrate with what great strides this important factor of civilization has developed in Japan. The improvement so far effected was sufficiently striking and has entirely transformed the costly and primitive system that had prevailed before the Restoration. Still the service went on improving to satisfy with greater efficiency the new demand engendered by the progress of society and of economic affairs. It was in consideration of this requirement that in March, 1900, the Postal Regulations and the Parcel Post Regulations were further improved so that they might be adopted to the requirements of the new circumstances. The new regulations were put in force from October 1st of the same year. This last amendment may be regarded as constituting a new chapter in the history of our postal service, for the improvement it effected was as complete as circumstances required. The principal features of the service as improved by the last amendment may be enumerated as follows:—

1. The amendment sets forth with greater distinctness the principle

declaring the postal service to be a Government monopoly. Provisions of similar import had existed previously but it was considered necessary to make this amendment in order to define with greater accuracy the legitimate field of action of those engaged in the business of carrying postal matter.

2. The secrecy of letters was guarded with greater strictness. This had also been provided for previously in accordance with the arrangements for safeguarding the secrecy of letters referred to in the Imperial Constitution. The amendment in question was directed towards safeguarding in this connection the action of those who are to deal with letters.

3. The amendment enacted a new provision for extending to post offices and officials various privileges calculated to ensure the prompt and safe treatment of mail matter.

4. The reimbursement in case of damage that had previously been confined to parcels with value declared has been extended in scope and made to include ordinary mail matter.

5. The collecting of trade charge system that had previously been confined in operation to the parcel post has been extended to ordinary mail matter.

6. The letter-cards were newly issued and the system of private cards has been instituted.

7. The collection of cash system has been newly instituted and a provision for collecting cash against documents of value by safe and sure means has been made.

8. The nature of postal fees has been made more distinct than before, so that the treatment of the National Tax Law concerning arrears in payment is now applicable to the fee.

9. A new provision has been made for altering the address of or withdrawing mail matter or withdrawing the application of trade charges or collection of cash.

Minor changes carried out by the amendment were those relating to fees for mail matter, of registered mails, of value declared mails, etc. In December of 1901 the fee for value declared mail matter was altered, and envelopes and wrappers for sending such matter were issued at the same time to ensure their safe transmission.

II. OFFICIAL ORGANIZATION.

The efficiency of the service depending to no small extent on the relative perfection of the organization of offices devoted to it, the history of the change of the organization shall be briefly described in this section.

CENTRAL OFFICE OF CONTROL.—On the occasion of the inauguration of the Western postal system all matters in connection with this system were under the control of the Department of Civil Affairs, to be transferred, on the abolition of that Department to the Department of Finance, next to the Department of Agriculture and Commerce, and lastly to the Department of Communications which was created in December of 1885. In that way the departments having direct charge of postal business have been frequently changed, and at present the Bureau of Communications holds the power of dealing with matters relating to posts, postal money orders, postal savings, telegraph, and telephone.

CONTROL OF LOCAL POSTAL SERVICE.—At first the control of local postal service was undertaken by the local administrative offices, but this system was discontinued in 1883 when the Postal Districts Regulations were elaborated and the provincial districts were marked out into a regular system of postal sections each subordinate to the other. Each main post section had under it a number of postal sub-sections with a postal office established in it. The main postal section was made to control the services at all the post offices existing in its jurisdiction. By changes and revisions subsequently carried out the 1st class Post and Telegraph Offices are now generally made to attend to the duty of controlling postal and telegraph matter. These Offices at present number 16 throughout the country.

POST OFFICES AND AGENCIES.—At first the post offices were classified into 1st to 4th grades, with post agencies constituting the fifth grade. In 1886 the regular post offices were subdivided into three grades, and in the same year a postal office and a telegraph office that had previously existed as independent establishments were, according to local circumstances, combined into one

office, and made to undertake the dual services. At present most of these offices undertake in addition the telephone service. The post agencies were first established in 1875 in places separated by a greater or less distance from either a regular post office or a branch office. Many of them have since been entrusted with the business of postal savings and parcel post services.

During the inception stage of the service, *i.e.* in 1871, the number of offices did not exceed 180. The offices newly established next year alone numbered 980. The expansion of the service went on with unabated force, so that by the end of 1882 the offices reached as many as 5,527. As the creation of new offices was determined upon according to the request of the local offices only, and without any interference from the central authorities, the distribution of the offices was not well proportioned to the relative density of the population. The authorities therefore decided to interfere and to turn out those offices that were judged not worth maintaining. The adoption of this new policy was soon shown in the number of offices, which began from 1883 to diminish more or less rapidly. The result was that the number had declined to 4,094 by the end of 1889 that is to say 1,433 less than that at the end of 1882. The proper balance between the number of offices and the relative density of population having been duly established, any change that was to be made in the future was in the direction of addition instead of diminution. The new departure began to operate after 1890, and new offices were created as circumstances required. By the end of the 1902 fiscal year the number had grown to 5,485 (consisting of 16 1st-class offices, 79 2nd-class offices, 3,984 3rd-class offices, 45 branch offices, and 1,353 agencies). This number corresponds to the ratio of 1 office per 4.52 square *ri* and per 8,343 people.

PARCEL POST SERVICE.—The parcel post service was, in the year of its inception, that is in 1892, confined only to the post offices situated in the principal cities, and therefore it was undertaken at only 287 offices. The service was gradually extended, and since 1900 no postal office that has been dealing with ordinary mail matter has not undertaken the parcel service as well.

POST SERVICE IN CHINA AND KOREA.—In April of 1876 Japan

opened its own post office at Shanghai, China, and that was the first foreign office established abroad. In December of the same year a similar office was started at Fusan, Korea. Since that time a large number of postal offices have been set up in these countries, so that at the end of the 1902 year 22 such outlying offices were counted, these being located at the following places:—

CHINA:—Shanghai, Tientsin, Chefoo, Suchow, Hangchow, Shasi, Amoi, Hankow, Peking, Fuchow, Newchwang, Nanking.

KOREA:—Fusan, Gensan, Ninsen, Mukpo, Chinnanpo, Masan, Kunsan, Songjin, Seoul, Pingyang.

III. TRANSMISSION AND DELIVERY.

TRANSMISSION.—The postal routes as subdivided in 1883 were of three classes; viz., main, medium, and minor lines.

As the system exists to-day it consists of railroads, water ways, sailed track and ordinary highways. Each of them is subdivided into four grades according to the relative importance of the service. With Tokyo as the starting line, the lines connecting it with the Governor-General's Office of Formosa, the Hokkaidō administration Office, the places where Military Division or Admiralties are located, and lastly with places where trade or manufacture is actively carried on—these lines are set apart as the 1st class service routes, the remaining three routes being determined according to their relative importance. The number of transmission service is also arranged according to the grade of the routes. For the 1st-class routes four services a day from two extremes for ordinary mail-matter, and not more three services a day for parcel post. One service is reduced for each lower grade route, and for the 4th grade the number of service is to be determined according to the local requirement. At the end of the 1902 year the postal routes thus determined extended as follows in unit of Japanese *ri*:—

	1st Class.	2nd Class.	3rd Class.	4th Class.	Inter- mediary.	Total.
Ordinary Mail ...	3,083	5,196	7,763	6,063	515	22,619
Parcel Post ...	3,050	5,051	7,715	6,043	469	22,328

Note:—In the above total 1,728 *ri* in railroad service and 8,067 *ri* in waterway are comprised.

DELIVERY.—Regular rules relating to delivery were first fixed in 1883 by drawing up the Postal Delivery Limit Regulations. The delivery limit was first established at that time. This was further amended in 1885 by arranging the urban delivery limit. According to the two systems all the places within the radius of 6 *cho* from one city or town or village proper are included within the delivery limit of a postal office situated in such city or town or village, the places outside that radius being excluded from the delivery limit. In 1885 the standard of delivery service was changed, and the grade of that service was determined according to the number of items of mail matter requiring to be handled, and in 1891 another amendment in a similar direction was made.

The delivery service of parcel post requiring somewhat different treatment to that of ordinary mail matter, it was laid down in 1893 that except at specified offices the number of delivery should be confined to once a day, that number being capable of an increase according to local conditions. In the same year it was arranged that the transmission routes of parcel matter should be made distinct for the present from that of ordinary mail matter, and that the number of transmission services and the mode thereof should be arranged for each route. In 1900 the number of services was regularly fixed within a certain limit, and it was announced that in places where the ordinary postal routes and parcel post routes do not require separation the two may be transmitted by the same service. However the main principle that the two services should be carried on distinct routes was left unchanged.

IV. KIND OF MAIL MATTER AND FEE.

LIST OF MAIL MATTER.—As a result of changes and amendments extended to the Regulations which were first issued in 1871 as already described, the list of mail matter at present embraces the following:—

1st Class	Letters.
2nd Class	Postal Cards.
3rd Class	Periodicals issued not less than once a month.

4th Class	{ Books, Printed Matter, Business Forms, Photographs, Pictures, Drawings, Samples and Designs of Goods, Natural History Specimens.
5th Class	

Note:—Postal cards must be those issued by the Government or must conform with the prescribed forms determined by the Government, while matter coming under the 3rd class must previously obtain the acknowledgement of the Department of Communications. Mail matter coming under the 3rd and lower classes must not be sealed.

FEE.—The fee was graded at first according to the distance of transmission, but in less than two years after the inception of the postal system the fee was made almost uniform irrespective of distance, and the amendment in 1883 completed this arrangement.

SPECIAL TREATMENT OF MAIL MATTER.—A brief account will be given below of the special treatment of mail matter.

a. EXPRESS DELIVERY.—This service was at first extended to all mail matter requiring prompt delivery. In 1873 a special delivery service was established for benefit of those living in the places not possessing post offices, or places which being on a branch postal route could not enjoy the benefit of delivery service every day. In 1882 the two modes of services were combined into one under the style of “express delivery,” the operation being divided into urban and suburban services. The fee for urban delivery was divided into two kinds, according to the size of a city, while that for suburban service was collected according to distance of transmission. By that year’s amendment the express delivery matter was confined to registered letters alone, and the fee was made payable in advance. Subsequently parcel post and value-declared mail matter were included in the list of the express delivery mail matter.

b. “POSTE RESTANTE.”—Initiated in 1873, the benefit of this service was extended to letters only, the period of keeping such letters in custody at the post office of destination being three months. Next year the service was extended to other kinds of mail matter besides letters, and by the amended Postal Regulations of 1900, the period of keeping this kind of mail matter was limited to thirty days. At the same time the service of giving notice to the sender of the arrival of a *poste restante* mail for

him was inaugurated, such notice to be given only when the prescribed fee has been paid in.

c. DELIVERY CERTIFICATE.—The delivery certificate system was started for the first time in 1892. The service is extended only to parcel post, registered letters, and value-declared ordinary mails.

d. REGISTRATION.—This service took its origin in the system inaugurated in 1871 for sending replies or receipts by an addressee to a sender who forwarded to the other any mail matter of special importance. The addressee had to pay double fee. This service was superseded in November of the same year by the system of simpler registration. A uniform amount of fee is paid over and above the ordinary postal fee.

e. VALUE-DECLARED MAIL.—In 1892 when the parcel post service was brought into existence, this arrangement was adopted and subsequently it was extended to ordinary mail matter containing valuable articles, although no registered mail matter can be treated as value declared matter. The amount of value to be declared was at first limited to not more than 15 *yen*, but afterwards the limit has been raised to 1,000 *yen*. Value-declared mail matter must bear a regulation wrapper issued by the Communications Department.

f. COLLECTION OF TRADE CHARGES.—The collection of trade charge system was an innovation adopted in 1896 in connection with the parcel post service. The amount to be collected was at first limited to not more than 50 *yen*. With the expansion of the value-declared mail service in 1900 the collection was raised to 300 *yen* at the same time.

g. COLLECTION OF CASH.—This service was adopted in 1900. The amount of one collection is limited to 300 *yen*.

FRANK POST.—The foregoing description applies to mail matter on which fees are paid. A short remark will next be made on the system of frank post, which was first enacted in 1872. At that time the representations, petitions and the like sent to Government offices were free of charge; also letters between post offices and postal officials relating to postal business were also franked. Manuscripts for newspapers were also franked, provided they were in open envelope

and weighed not more than 4 *momme*, and this privilege was extended in 1876 to samples of seeds of agricultural produce and experimental samples provided they could be regarded as of public utility. This arrangement has since been modified and by the amended Postal Law promulgated in 1900 it was provided that only mail matter relating to post, postal money orders, postal savings banks, telegraphs and telephones were to be sent free of charge. Other things that were transmitted as franks were military postal matter, and on the occasion of the Japan-China war mail matter sent from the front by troops, fleet, military offices, and combatants and civilians were exempted from any fee, except those that were treated in accordance with the International Postal League.

VOLUME OF ORDINARY MAIL SERVICE.—The quantity of mail matter has shown remarkable progress with the development of the mechanism of the service and as a result of greater activity of correspondence among the people. In 1872 the mail matter transmitted (including foreign mail, this remark applying to the figures mentioned afterwards in this paragraph) numbered 2,500,0000, in 1882 they increased to 99,300,000; in 1892 to 2,778,000,000; and in the 1902 fiscal year to 899,880,000. The transmission per one of the population that numbered six and a fraction ten years ago has now increased to over 19. The relative number of transmissions of mail matter by our post offices will be shown below:—

ORDINARY MAIL MATTER.

Year.	Letters.	Post-Cards.	Newspapers and Magazines.
1893	83,658,531	158,147,967	56,968,571
1894	97,899,192	190,692,558	80,415,635
1895	113,425,548	228,503,898	78,963,325
1896	126,872,386	262,867,761	86,803,337
1897	148,254,148	287,069,246	88,266,273
1898	160,391,547	327,261,448	90,871,444
1899	152,122,551	330,859,267	109,028,464
1900	175,922,981	395,249,632	133,391,078
1901	190,951,188	436,673,345	139,116,263
1902	208,563,145	483,986,374	148,770,343

Ordinary Mail Matter.

Year.	Ordinary Mail Matter.		Parcels.	Total.

Y. FOREIGN MAIL AND PARCEL POST.

HISTORY OF FOREIGN MAIL.—When the great work of the Restoration had been accomplished, and intercourse with foreign countries became closer, the necessity of adopting more expeditious means of reciprocal correspondence began to be keenly felt. The Government, therefore, made an arrangement about foreign mail service and notified the public to that effect in March, 1872, though at that time the means of internal communication was yet far from complete. However, in those days, the foreign mail service could be carried on by our Government only through the Postal Agencies of Great Britain, the United States of America and France which were actually conducting postal business in our open ports, Yokohama, Kobe and Nagasaki. When the Postal Convention concluded between the United States of America and Japan, came into operation on January 1st of 1875 the direct exchange of mail matter with foreign countries was for the first time effected. On this memorable day the United States Post Offices established in our country were closed. Since that time, the management of foreign mails has been markedly developed and improved by the earnest and persevering efforts of the authorities and it has secured so much confidence both at home and abroad, that any necessity for continuing British and French Postal Agencies was no longer perceived, with the result that the former were closed

on December 31st of 1880 and the latter on March 31st of the following year. But in those days, correspondence with all foreign countries besides the United States of America, could be transmitted only through the medium of that country, in accordance with the stipulations of the Postal Convention concluded between Japan and the United States of America. The rate of foreign postage was consequently high and caused much inconvenience.

In May, 1876, H. I. J. M's Envoy Extraordinary and Minister Plenipotentiary at the Court of the German Emperor, sent a telegram to the Department of Foreign Affairs here, inquiring whether the Government intended to take part in the International Postal Congress which was to meet in Paris the next year. After deliberation, the Japanese Government decided to take part in the Congress, and instructed him to request the Swiss Government to propose our admission into the Post Union. As a result of the negotiation our country obtained the full right of entering the General Postal Union in 1877.

The Government promulgated General Postal Union Treaty in Imperial Ordinance No. 45 on June 19th of that year, and on the same day the revised table of foreign postage was published in Imperial Ordinance No. 46, which was to take effect on the following day. The revised rates of postage were much lower and more uniform than the former rates, so the operation of the foreign mail service was greatly facilitated. On the occasion of the International Postal Congress convened at Paris on the first day of May, of 1878, Japan caused its Envoy Extraordinary and Minister Plenipotentiary in Paris and another gentleman to attend the Congress, with full power to complete the arrangements. On the first day of June of the same year, the Universal Postal Union Convention was concluded and signed by the plenipotentiaries of our and other countries. The new convention was promulgated in March of the following year in Imperial Ordinance No. 11, to take effect on the first day of April.

It was three years after the formation of the Universal Postal Union that Japan joined it, and therefore our country, while being the first country in the Far East that was admitted into it, was not much behind even some Occidental countries in profiting by

this international postal service. At present about 58 countries are on the list of the Union, and of that number 32 joined after Japan had been admitted into it.

Since this country was first represented by its delegates at the second Postal Congress in Paris in 1878 it has been represented at every Postal Congress held subsequently and has contributed more or less to the work of amending the Universal Postal Convention.

The foreign postage rates were often modified but the final and thoroughgoing revision took place especially in 1897 in connection with the change of our monetary system, and the rate then fixed upon is the rate at present in force. In September of 1900 exchange of registered articles with trade charges was opened between our country and Germany, Austria-Hungary, Belgium, Switzerland, Luxemburg and Roumania. On June 20th of 1902 which was the 25th anniversary of the admission of Japan into the Universal Postal Union, a ceremony was carried out by our authorities to celebrate the occasion. In December of the same year Japan joined the Universal Postal League relating to value-declared letters and postal boxes.

HISTORY OF FOREIGN PARCEL POST.—The foreign parcel post service was first established in 1879 when an agreement was concluded with the Colonial Government of Hongkong. At first only eight post offices, namely, those in Tokyo, Osaka, Kyoto, Yokohama, Kobe, Nagasaki, Hakodate and Niigata were authorized to receive foreign parcels. These parcels were treated in the same manner as articles sent by letter post, but in 1890 a treaty for the exchange of parcels was concluded with Canada, in 1894 with Germany, in 1895 with Great Britain, and in 1898 with France. In 1901, parcel post was begun with Siam through the intermediary of the Hongkong Postal Administration. The number of offices authorized to transact this business have been increased, and now every Post Office is vested with this power. However the efficiency of the service was not considered quite satisfactory inasmuch as the parcel post agreement in question did not undertake special treatment, as that relating to value declared business, collection of trade charges, express delivery, the withdrawal of mail matters or alteration of address. It was therefore not quite satisfactory. Japan applied to the Government of Switzerland on the 25th anniversary of its admission to the

Universal Postal Service for permission to join the International Parcel Post Convention concluded at Washington, U. S. A. The permission being obtained in time that convention was carried into effect from December of 1902.

As a result of Japan's having joined the Convention the Parcel Post Agreements previously concluded with Germany and France have been rescinded as a matter of course.

NUMBER OF FOREIGN MAIL MATTER.—In the 1902 fiscal year the number of ordinary mail matter dispatched abroad or arriving in Japan were as follows:—

ASIA.

	No. of Dispatches.	No. of Arrivals.
China	1,836,341	1,148,978
Korea	1,747,436	988,027
British Colonies	186,508	193,379
Russia	133,967	51,547
British India	49,173	74,749
The Philippines	46,677	33,796
Netherland Colonies	14,688	15,883
French Colonies	9,792	15,714
Siam	9,511	4,163
Portuguese Colonies	4,732	3,884
Others	14,590	17,239

EUROPE.

Great Britain	362,912	636,418
Germany	257,642	353,173
France	116,146	172,589
Austria	25,897	23,647
Russia	34,341	40,043
Italy	41,396	31,296
Belgium	16,314	16,669
Hungary	9,517	8,264
Switzerland	21,030	19,756
Netherland	14,100	14,846
Denmark	4,450	4,771
Spain	4,924	5,879
Norway... ..	6,050	5,488
Sweden... ..	3,904	3,474
Portugal	844	2,619
Others	5,396	6,088

AMERICA.

United States of America	1,042,942	1,277,461
Canada... ..	102,288	139,780
Mexico	4,749	2,387
Peru	2,640	3,772
Others	6,953	5,280

AFRICA.

Egypt	4,630	12,022

British Colonies	86,223	39,688
French Colonies	6,547	11,110
Others	487	242

In the 1902 fiscal year therefore the foreign mails numbered over 6,776,000 in dispatches and over 7,010,000 in arrivals.

NUMBER OF FOREIGN PARCELS.—As foreign parcel post mails were exchanged up to the same year only with Great Britain, Germany, France and Canada, the dispatches in that year numbered only 10,377 and the arrivals 13,311. Of those numbers, those exchanged with Great Britain constituted the bulk.

MAIL AND PARCELS IN CHINA AND KOREA :—During the same year the Japanese post offices in China and Korea dealt with altogether 2,900,335 ordinary mails and parcels put together.

VI. RECEIPTS AND DISBURSEMENTS.

ACCOUNT RELATING TO ORDINARY MAIL MATTER. —The receipts of ordinary postal matter necessarily made striking progress with the advance of the service. In 1873 the receipts amounted to only 225,000 *yen* in round numbers, to be advanced to over 1,140,000

yen in 1879 and lastly to over 11,600,000 *yen* approximately in the 1902 fiscal year. In a similar way the disbursements that stood at over 231,000 *yen* in 1873 advanced to over 1,000,900 *yen* in 1879 and finally to over 7,840,000 *yen* approximately in the 1902 fiscal year. This point is more clearly shown in the following figures giving receipts and disbursement during the last nine years:—

RECEIPT AND DISBURSEMENTS RELATING TO ORDINARY
MAIL MATTER.

Fiscal Year.	Receipts.	Disbursements.	Disbursements
			per 100 <i>yen</i> Receipts.
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1894	4,730,092	2,875,627	60.8
1895	5,224,207	3,183,359	60.9
1896	5,973,611	3,729,777	62.4
1897	6,579,667	4,296,789	65.3
1898	7,294,851	5,073,240	69.5
1899	9,648,437	6,022,788	62.4
1900	10,508,995	6,616,923	63.0
1901	10,677,937	7,286,030	68.2
1902	11,609,679	7,840,885	67.5

ACCOUNT RELATING TO PARCEL POST.—The ordinary receipts from the parcel post were 195,400 *yen* approximately in the 1894 fiscal year, as against the disbursements amounting to about 298,000 *yen*. Since then the receipts have increased from 15 to more than 60 per cent every year, while the other account has advanced at the rate of from 10 to over 40 per cent. though in the 1896 fiscal year the number of offices dealing with the parcel post owing to a sudden increase of the rate rose as high as 90 per cent. In general disbursements have surpassed receipts, the rate of the former being 153 against 100 of the other in the 1894 fiscal year, and 117 against 100 in the 1901 fiscal year. In the following year the two accounts were brought almost to a proper balance.

The following table will demonstrate the relative amount of receipts and disbursements:—

Fiscal Year.	Receipts.	Disbursements.	Disbursements per 100 <i>yen</i> Receipts.
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1894	195,493	298,672	152.8
1895	281,363	353,801	125.7
1896	468,524	699,685	149.3
1897	723,335	988,501	136.7
8988	883,887	1,013,946	114.7
1809	1,065,975	1,404,901	131.8
1900	1,338,873	1,642,332	122.7
1901	1,540,561	1,800,669	116.9
1902	1,684,263	1,690,467	100.4

CHAPTER II.—Postal Money Orders.

Domestic Service—Foreign Service—Receipts and Disbursements.

I. DOMESTIC MONEY ORDERS.

HISTORY.—The postal money order business was inaugurated about four years later than the general post service, that is in January of 1875. As banking facilities had not yet advanced much at that time this convenient mode of remittance was eagerly welcomed by the public, so that although the ordinary money order service alone was undertaken the amount of money dealt with reached as much as 2,120,000 *yen* approximately in the opening year of the service. The necessarily imperfect organization of local post offices and the difficulty that existed with regard to supplying outlying offices with funds obliged the authorities to restrict the amount of the remittance made by a single person, except when the remittances were drawn on Tokyo, Kyoto, Osaka, Yokohama or Kobe. Later this unrestricted remittance was extended to all places possessing provincial administration offices, but as it was discovered that businessmen began to abuse this service for the purpose of remitting large amount of money, the Government was soon obliged to limit more or less the amount of postal remittance.

In 1885 the principle embodied in the postal money order system was extended to the telegraph service and at the same time the petty money order service was inaugurated and the fee for the use of ordinary money order was somewhat reduced.

Several alterations and improvements have since been effected. To mention some of them, in April, 1890, the payment of a fee in cash was superseded by payment with postal stamps, and in the following year the 3rd class post offices were made to deal with the money order business even on Sundays and other holidays. Ten years after this all-the-year round-system was enforced throughout the

country. During the Japan-China war the field postal money business was established for the benefit of those at the front, while in April of 1899 the maximum limit of a single money order that had been fixed at not more than 30 *yen* was increased to 50 *yen*. The system of paying money orders at residences was adopted in January of 1900 and was first put into effect in the principal cities, to be afterward extended gradually throughout the country. In October of the same year the Postal Money Order Law was enforced and several amendments were effected, as, for instance, the abolition of the system of limiting the number of orders to be issued in one day for the same person, and the increase of maximum limit of the petty money order from 3 to 5 *yen*. In April of 1901 a provision was made for the transfer of a money order by means of crossing it. In consequence of all such improvements the service has been carried to the state of greater perfection and efficiency than it was before.

STATISTICS OF THE SERVICE;—The progress of the service since its inception is shown below.—

Year.	No. of Offices.	Domestic Order.	
		No of Application.	Amount of Money.
			<i>yen.</i>
1875	222	115,703	2,123,146
1882	678	630,713	9,188,262
1892	2,276	2,944,622	23,872,453
1902	5,514	8,955,295	89,788,407

II. FOREIGN MONEY ORDERS.

HISTORY.—The foreign postal money order service was first established in December of 1897 by an agreement with the Hong-kong Postal Administration for the exchange of postal money orders. The Yokohama Post Office opened this service for the first time in Japan in January 1880 and other offices were soon after given the same privilege. Since March of the same year the exchange of money orders with every colony in Australasia and the Straits

Settlements has been carried on. Arrangement for the exchange of postal money orders was concluded with Great Britain in 1881 and through the intermediary of the postal Administration of Great Britain money orders have been exchanged with Germany since January 1883, and with British India through Honkong. In the following year, another agreement was concluded with France. In February, 1885, arrangements were concluded for the exchange of postal money orders with all the countries of Europe and America and all the British colonies through the intermediary of the Postal Administration of Great Britain. An agreement was also concluded with the United States of America that year. In that year also, our country joined the International Postal Money Order Agreement which had been formed in accordance with the stipulations of Article XIII of the Universal Postal Convention concluded at the Universal Postal Congress assembled at Paris in 1878. At first Japan transacted direct exchange of money orders with only Germany, Austria-Hungary, Bulgaria, Switzerland, Luxemburg, Roumania and Belgium, while with other countries the exchange was effected through the intermediary of the Postal Administrations of Great Britain and Hongkong. The same agreements were concluded with Italy in 1886, and with Canada, in 1889. As to the international postal money orders "the Arrangement concerning the Service of Postal Money Order" concluded at the Universal Postal Congress which met in Washington in 1897 is in operation at present.

STATISTICS OF THE SERVICE.—The following figures will demonstrate the development of this service since its inception:—

Year.	Foreign Orders.			
	Orders Issued.		Orders Received.	
	No. of Application.	Amount of Money.	No. of Application.	Amount of Money.
1875	—	—	—	—
1882	316	5,570	108	2,279
1892	2,309	59,938	3,957	167,699
1902	8,407	244,560	52,437	3,817,522

III.—RECEIPTS AND DISBURSEMENTS.

Ordinary receipts stood at 260,000 *yen* approximately in 1894, to be advanced to about 816,000 *yen* in the year 1902. On the other hand disbursements amounted to about 295,000 *yen* and about 837,000 *yen* respectively. In 1894 the disbursements were at the rate of about 113 *yen* per 100 *yen* of receipt, and this ratio decreased 103 *yen* per 100 *yen* in 1902. Details may be gathered from the appended table.

RECEIPTS AND DISBURSEMENTS OF POSTAL MONEY ORDER SERVICE.

Fiscal Year.	Receipts. <i>yen.</i>	Disbursements. <i>yen.</i>
1894	260,235	295,572
1895	314,115	324,646
1896	327,134	378,175
1897	384,702	430,727
1898	409,929	541,316
1899	519,084	754,060
1900	643,206	778,633
1901	687,561	826,161
1902	816,331	837,193

CHAPTER III.—Postal Savings Banks.

GENERAL REMARKS.—This postal institution that has been in operation in the Occident from a long time back was, however, non-existent in Japan, until lately and our people thus lacked a convenient mode of laying by their little savings. In April of 1875 the Savings Bank Regulations were put in force by way of trial in Tokyo, and in December of the same year the service was extended throughout the country. Every possible expedient was brought into requisition for encouraging the people to avail themselves of this useful provision. This encouragement not unfrequently led on the part of the people to the abusing of the service, for some people did not scruple, especially in time of tradal inactivity, to make use of the savings service as a means of investing the funds for which they could find other more satisfactory mode of investment, thereby swelling the volume of deposits to such big figures that it was even beyond the power of the Government to turn such an amount of money to good account. Consequently the authorities were not unfrequently obliged to lower the rate of interest on the deposits so as to prevent this abuse by the people. When in 1893 the ordinary Savings Bank Regulations were issued, and savings banks were created in many parts of the country, the business of the postal savings was somewhat affected. The post bank then introduced various changes in its business arrangements, simplified the mode of procedure and moreover somewhat raised the rate of interest. Coming to 1899 the post bank began to recover its former prosperity, and this state of things has continued to attend it side by side with the increasing progress of the ordinary saving bank business.

In March of 1900 the postal stamp saving service was established for the benefit of school-children, while in April of the following year the arrangement was made for accepting deposits made in the shape of national, local or municipal loan bonds or their coupons, the kind of documents to be acceptable being determined at the same time. In October of the same year the special Postal Saving

Deposits Regulation were enacted for the benefit of Japanese subjects residing in foreign countries not possessing Japanese post offices.

The limit of saving deposits at first ranged between the two extremes of 10 *sen* and 100 *yen* per annum, the yearly total, including interest, not to exceed 500 *yen* for a single person. These restrictions have frequently been modified, and at present a single deposit by any one person is limited not to less than 10 *sen*, and the deposit in one day by a single person must not exceed 50 *yen*, the aggregate deposits, including interest, not to exceed 500 *yen*. These limits may not be adhered to for philanthropic institutions. At the same time provision was made by which a depositor could purchase Government loan bonds in the custody of the Post Office, which provision has therefore enabled a depositor to keep a deposit exceeding the regulation limit, though part of the deposit may consist in loan bonds.

RATE OF INTERESTS.—The rate of interest of postal savings was at first fixed at 3 per cent. per annum, raised to 4 per cent., then to 5 per cent., next 6 per cent. and lastly to 7.2 per cent. the high water mark in the history of rate of postal saving institution. This happened in April 1881. The rate was then reduced and at present it stands at 4.8 per cent. In adding the interest to the principal it was at first done every six months, without prescribing any fixed period. Afterward the period of counting it was made in the months of June and December, and at present it is made only one time in the year, and on March 31st.

AMOUNT OF SAVINGS DEPOSITS.—The amount of savings deposits has on the whole made a satisfactory progress. For instance, at the end of 1885 it reached over 9,050,000 *yen*, which was more than 210 times that of the corresponding sum at the end of the year after the inception of the service. For several years subsequently the total amount underwent more or less fluctuation, though the movement was steadily in the direction of increase up to 1889. The occurrence of disastrous floods that year and the following year in many parts of the country occasioned the withdrawing of no small sum. During the outbreak of the Japan-China war the level of total sum that had gone on increasing before that time

was again brought down, but on the termination of the war and especially as a result of the war reward below 50 *yen* in amount having been given in the shape of deposit certificate the record at once rose to a high level. This was however temporary, for the economic disaster that followed the war ended in reducing the total. As result of the expansion of the service and of the encouragement extended to saving, the deposit business somewhat began to recover its former prosperity from 1899, till coming to March, 1903, the record of 1896 was broken. One thing that is satisfactory amidst these constant fluctuations in the volume of deposits is the fact that the number of depositors has steadily advanced, showing that the lower classes have began to a greater extent than before to acquire the habit of thrift and diligence. The introduction of the postal stamp deposits service in 1900 also seems to have been an important means in regard to this increase of the number of depositors.

STATISTICS OF THE SERVICE:—The movement of the saving bank business during the last ten years is demonstrated below by a table.

POSTAL SAVINGS BANKS.

At the End of March 31st.	Deposits. <i>yen.</i>	Number of Depositors.	Average per one Depositor. <i>yen.</i>
1894	26,134,566	1,059,740	24.7
1895	25,865,201	1,107,829	23.3
1896	28,932,396	1,222,128	23.7
1897	28,215,914	1,272,317	22.2
1898	25,717,034	1,252,559	20.5
1899	21,968,529	1,239,669	17.7
1900	23,411,135	1,396,147	16.8
1901	23,965,437	1,979,640	12.1
1902	27,196,802	2,363,335	11.5
1903	29,554,725	2,859,143	10.3

In the matter of postal savings bank business there is no particular account to be called receipts. On the other hand, disbursements show a gradual increase in consequence of the rise of the price of commodities. In 1894 they amounted to about 193,000 *yen*, and the correspondent sum in 1902 was 549,000 *yen* approximately.

CHAPTER IV.—Telegraph.

Domestic Telegraph—Organization of the Service—Foreign Telegraph—Telegraphic Construction—Telegraph Apparatus and Materials.

I. DOMESTIC TELEGRAPH.

GENERAL REMARKS.—It was in 1868 that Japan possessed for the first time the service of telegraph, but the introduction of telegraph instrument took place much earlier, for in 1853 two sets of the instrument were presented by Commodore Perry to the Tokugawa Shogunate. They were never applied to practical purpose. In fact the Shogunate was at that time in the throes of death and had no time to devote to studying telegraphy. Nor did the majority of the people possess any knowledge about this great civilizing factor: they rather detested the apparatus as outlandish, and the sets were left to mould and decay in a storehouse.

It was destined for the Restoration Government to inaugurate this important service of communication. That Government sent for an expert to England and in 1867 Tokyo and Yokohama, separated by 20 miles, were first connected by telegraph. This pioneer line suffered much from the persecution and maltreatment of the ignorant masses, who betrayed their simplicity by regarding telegraphy as a sort of watch-craft, and taxed the patience of the Government by frequently injuring the line. The task of guarding it alone was no easy matter. Fortunately, while the Government was firmly resolved to maintain the service and did not spare trouble and expense to improve it, the people too were soon convinced of the utility and importance of the service, so that the telegraph lines were no longer in danger of demolition. In 1873 the Telegraph Code and the Telegraph Service Rules were promulgated, and the service was for the first time placed on a regular basis. However it was not till the outbreak of the civil war in Kyushū that the telegraph service could demonstrate with convincing efficacy its usefulness and

importance. After that time and especially owing to the Emperor's tour round Japan in the following year of that trouble, the progress of the telegraph business was very rapid, and many were the telegraph offices that were newly opened at that time. At the same time the country joined the Universal Telegraph Union, and thus both internally and externally the telegraph service was placed on a fair road of satisfactory development.

The state of market after the civil war and a sudden activity of business occasioned impressed the people with the necessity of telegraphic communications. The same people who only a few years before regarded telegraph with awe and superstition now began to vie each other in applying to the authorities for the construction of lines in their own districts, and even offered to contribute the money required for the work. The authorities decided to avail themselves of this new tendency on the part of the people, accepted the contribution in cases where the acceptance was regarded useful, and thus by the combined efforts of Government and people the telegraph service was expanded. This was the state of affairs prevailing about 1881, and it may be regarded as the first period of expansion.

The fall of paper considerably below par in consequence of its excessive issue on the occasion of the civil trouble in Kyushū and the marked rise of the price of commodities, and the reaction that began to make appearance about 1883 by the issue of convertible bank notes naturally resulted in largely bringing down the market prices, with a depression of trade. This state of affairs could not but affect the Government work, and its telegraphic business therefore did suffer much. On account of this fact, and also owing to the lines having already been constructed by that time through all the important districts, the authorities decided to suspend the policy of progress and advance and to adopt instead one of conservation.

This period of temporary halt in the work of expansion was utilized for perfecting the internal arrangements of the service. It was on that occasion that by the amendment of the Telegraphic Service Regulations the fee was made uniform throughout the country irrespective of distance, that the system of running the service as a contract work at telegraph offices situated in minor

towns was began, and that the post and telegraph offices were combined.

At the same time the external relation was carried to the state of greater perfection. Japan dispatched a delegate to the meeting of the Universal Telegraph Convention to represent its views about the international service, and in 1884 our country joined the International League for the protection of submarine cables, the rules relating to it being enforced in Japan two years later. About 1890 therefore our telegraphic system both in internal and external relations was completed, so far as the circumstances of the time required.

Meanwhile the state of the economic market had begun to recover its normal activity, while the Constitutional régime was inaugurated. The policy of expansion was once more resumed, and several new lines were constructed and a number of new offices were started.

The Japan-China war supplied an unusual occasion for displaying the efficacy of the service. The lines for the use of the Army were specially constructed through the interior of Korea, while watch-towers were constructed at the important places along the coast of Japan, to be connected with the nearest telegraph offices. The new lines were extended to a long length both by land and sea. The termination of the war and the annexation of Formosa to our dominion was signaled by the laying of a cable between it and Japan proper. Then the cable connecting the island and Fuchow was purchased from the Chinese Government. The lines in the interior of Japan proper were also added to a large extent, as the experience during the war had demonstrated that the service was not quite satisfactory and efficient in time of unusual stress. Needless to add that a sudden rise of all business activity subsequent to the war has also been a cause of the expansion of the service.

In 1899 from considerations of an economic and financial nature the rate of fee of domestic service was slightly raised, and in the following year the Telegraph Law and rules pertaining to it were amended.

STATISTICS OF THE SERVICE.—The following figures will serve to indicate the main features of the development of this important branch of communication work in Japan :—

Year.	No. of Offices.	Mileage	Total Mileage	No. of Telegrams (<i>thousand</i>).
		Routes. <i>ri.</i>	of Lines. <i>ri.</i>	
1872	18	160	185	81
1882	185	1,990	5,116	2,979
1892	633	3,557	10,052	5,412
1902	2,202	7,612	33,567	17,605

Telegraph business has undoubtedly been more or less affected since the telephone service was inaugurated with great activity in 1898. The reason why telegraph receipts made an increase in 1899 compared with those of the preceding year in spite of a decrease in the total number of transmissions, was due to the rate of the fee being raised. The decrease both of the number of transmission and amount of receipts in 1901 compared with the corresponding figures in the preceding year was a result of general economic depression.

NUMBER OF TRANSMISSION OF TELEGRAMS AND RECEIPTS AND DISBURSEMENTS.

Fiscal Year.	Telegrams per 100 People.	Receipts.	Disbursements.	Disbursements per 100 <i>yen</i> Receipts.
		<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1894	19.7	2,185,011	1,196,779	54.8
1895	21.8	2,405,570	1,297,135	53.9
1896	25.6	2,449,188	1,584,575	64.7
1897	32.6	3,107,780	1,995,237	64.2
1898	34.3	3,254,717	2,734,156	84.0
1899	32.2	3,753,011	3,442,211	91.7
1900	36.7	4,307,082	4,007,524	93.0
1901	35.6	4,077,004	4,365,048	107.1
1902	38.2	4,314,673	4,486,059	104.0

II. ORGANIZATION OF THE SERVICE.

CENTRAL OFFICE OF CONTROL.—At the outset the telegraphic business had neither a special office nor special officers to take care of it, and it was in 1871 when the Public Works Department was established that an office specially devoted to this business was for the first time created under control of that Department.

The Department of Communications which was established in 1885 was next made to manage the telegraphic service, and this has been the case since that time.

Though the seat of the controlling power in this service thus underwent frequent changes the Government has strictly adhered to the principal set down from the first and has made it as a monopoly of its own. This was a happy arrangement, when it is remembered that owing to some misarrangement at first there are even at present some countries whose governments can not yet succeed to secure the right of monopoly of the service.

LOCAL OFFICES OF CONTROL.—The Department of Communications established at first in the principal places throughout the country offices which were made to supervise the subordinate telegraphic offices respectively placed under them. Subsequently these supervising offices were kept only at places possessing local administrative offices. At present these supervising centres number eighteen in all, and these, subject to the control of the central office, look to the business carried on in their jurisdiction.

OFFICES OF TELEGRAPHIC OPERATIONS.—The offices that have charge of the technical part of the business, were known by different names in different periods, but since they have been amalgamated with post offices situated in the same districts they have been known by the name of post and telegraph offices, divided into three grades. These offices are of two grades, namely second class and third class.

a. **FIRST-CLASS OFFICES.**—These are the eighteen supervising offices mentioned in the foregoing part of this section, and they are known by the name of First-class Post and Telegraph Offices. Besides attending to matters of ordinary post and telegraph service, they also undertake the work of telegraphic construction. The First-class Office located at Nagasaki is one of special importance, in that it is the terminus for foreign telegrams coming to Japan or wired from Japan.

b. **SECOND-CLASS OFFICES**—These number over ninety and are located at so many cities and towns throughout the country. They are principally devoted to dealing with the technical part of the business.

c. **THIRD-CLASS OFFICES.**—These being located at places of less importance than others possessing either First-class or Second-class Offices, receipts are often found to fall below disbursements, so that there is not much room, if indeed any at all, for improving the service out of the profits of the offices. In view of this consideration, the special arrangement is made with regard to their organization, and they are generally run as contract work. The chief of an office of this grade draws no regular salary but simply gets a certain amount of allowance. Appointed by the Minister of Communications according to the prescribed rules of appointment, the chief gets from the Government a certain amount of money with which to work and manage his office. Besides, he is under obligation to supply an office at his own expence. The offices of this lower grade number about 4,000 throughout the country, and one-third of them undertake to attend to the telegraphic service.

SUBSIDIARY ORGANS.—Subsidiary organs exist in the shape of telegraphic agencies one kind of which being run either as private or Government enterprise. The private enterprise is generally supplied by railway companies which maintain the telegraphic service at their stations. As a result of certain arrangement these special telegraph offices offer their service to the general public, and for this service they get from the Government a sum of money equal in amount to not less than one-third of the fee they receive from applicants, the rate of fee being equal to that enforced at Government offices. The agencies maintained by the Government are found in places not yet possessing regular telegraph offices. Lastly, there is another kind of agency of a lower grade, which simply receives messages for transmission from people to forward them to the nearest telegraph office. These agencies, also conducted as contract work, are maintained in the principal parts of a large city.

TELEGRAPH OFFICES ABROAD.— Besides all those offices maintained in the interior the Government also possesses a telegraph office at Fusan, Seoul, and Jinsen, all in Korea.

Such is, in short, the organization of our telegraphic service,

and though a large number are being newly established every year, still on account of a greater expence than in the case of post office, the total number does not come up to that of the other kind of offices. Nontheless the telegraph offices of all grades total about 2,200 throughout the country. In more thickly populated districts of Japan proper, that is in Kyūshu and Shikoku the offices are at the rate of one per 9 square *ri* approximately. It is to be conceivable that with the work advancing at the present rate, all the post offices in Japan will be connected before long with telegraph lines.

III. FOREIGN TELEGRAPH.

GENERAL REMARKS.—It was in 1879 that Japan joined the International Telegraph Convention. Previous to this whenever an International Telegraph Conference was held abroad, our Government had sent in accordance with the advice of the Ministers of Holland, Austria, Denmark and others, a delegate to attend the meetings, to listen to the debates and make investigations. At this time our Government did not yet see the necessity of joining the Convention, but it agreed to become a member in the said year through the intermediary of the Russian Government by which time our telegraph department had made considerable progress. Japan dispatched a delegate whenever an international conference of this service was afterward held, and not unfrequently Japan offered various suggestions on occasions of such conferences. The position of Japan in the International Convention suddenly underwent a great change after the Japan-China war, for after that Japan's share in the central maintenance fund that had been previously one of the fourth class rate was raised all at once to one of first class. In 1884 Japan joined the International Convention for the Protection of Submarine Cables.

The foreign telegraph service in Japan was commenced in 1871 when the Great Northern Telegraph Company laid cables between Nagasaki, Shanghai and Vladivostock. After the completion of a telegraph line between Tokyo and Nagasaki two years after, the

Japanese telegraph offices accepted foreign telegrams, but, as our country had not yet joined the International Telegraph Convention at that time it could have no direct communication with foreign countries; the transmission of messages was limited therefore by the boundaries of the Empire; all communications beyond Nagasaki being entrusted to the Great Northern Telegraph Company.

In 1883, an agreement was entered into between our Government and the Government of Korea for laying the Japan-Korea cable, and the work of laying it was undertaken by the Great Northern Telegraph Company. The cable was opened for service in February of the following year.

Korea subsequently constructed lines in its interior and, joining them with the Japanese telegraph offices, entered into connection with the service of the rest of the world. However as that country had not yet joined the International Telegraph Convention and was not acquainted with the particulars about foreign telegraph service, Japan had to bear the responsibility for the foreign telegrams coming from or destined for that country.

Japan next approached the Great Northern Telegraph Company and induced it to add new cables connecting Nagasaki with Shanghai on one hand and with Vladivostock on the other. Amidst all these active expansion enterprises of Japan one thing that had always been regarded with regret by the Government was the fact that the cable laid between our two outlying islands of Tsushima and Iki belonged to the said Telegraph Company. The charge imposed on this particular section was far higher than that prevailing in the rest of Japan. This itself was highly inconvenient as it indeed interfered with the uniform rate system adopted by our Government, and even affected Japan's autonomy in its own telegraphic administration. After repeated conferences with the company, at last in 1871 the cable became Japanese property. Thus the telegraphic administration over all the Japanese dominions, as they then existed, was brought under the sole control of the Government, and its autonomy in this respect was now for the first time complete.

In 1898 the Government purchased from the Chinese Govern-

ment the cable laid between Formosa and Fuchow, and this line was made to attend to foreign telegrams. It will thus be seen that though situated in a remote corner of the Far East, Japan began to be connected with the Asiatic continent by four different cables, that is with those reaching Vladivostock, Shanghai, Fusan and Fuchow.

With the opening of the Vancouver-Queensland cable on December 8th, 1902, and then of the San Francisco-Manila cable the transmission of telegrams between Japan and Europe and America is no longer necessarily wired *via* Europe but is able to take a cheaper and perhaps quicker service *via* either Australia and the Pacific or Manila. When a Pacific cable directly connecting Japan and North America is laid, as is proposed, Japan will occupy a central position linking together the two hemispheres, and her situation as a medium of communication for the world's trade will have nothing to desire for further.

The foreign telegram service in Japan being regulated identically as in all the countries on the list of the International Convention, it would be superflous to make any further reference to this subject.

The activity of foreign telegraph service in Japan has advanced with great strides. About 1873 the number of this kind of telegrams dealt with in Japan did not exceed 1,000 a year. In 1883 the number became 23,000: in 1893 to 100,000; and in 1902 to 600,000. This growth of our foreign telegraph service is an index to the development of our national prosperity and trade.

The foreign telegrams dispatched by Japan are transmitted along two main routes, one going to Vladivostock and the other to Shanghai, the former called the northern and the latter the eastern line. The Japan-Europe-American service, that is the eastern line, is triforked at Hongkong, the three lines being the Shanghai-Honkong-Madras line, Shanghai-Hongkong-Australia-Pacific line, and Shanghai-Hongkong-Manila line. An applicant may select at will which of the three the telegram sent in by him should take. The time occupied in transmission is five or six hours at the earlist and 24 hours at the outmost.

IV. TELEGRAPHIC LINES CONSTRUCTION.

LEGISLATIVE MEASURES RELATING TO THE CONSTRUCTION.—

In the early part of the work of telegraphic construction ordinary roads or railway tracks were generally used in the construction of the lines, and the use of privately owned land was avoided so far as circumstances permitted. Therefore in those days no special rules about this work were in force, and it was in 1874 that a regular arrangement was made as to compensation in case private land was requisitioned for telegraph work, for by that time the necessity of using private land had become unavoidable with the expansion of the business. Similarly, coming to 1884, a regular arrangement was drawn up as to the disbursement of necessary expenses when the location of a telegraph line was to be removed in compliance with the request of private individuals. The requisition of private land that had formerly been settled by usage was embodied in a regular enactment in 1889. The law in question provided rules about the requisition, but this measure involved another enactment in the following year, the Telegraph and Telephone Lines Construction Regulations. The fact was the enforcement of the law of requisition was attended now and then by no small inconvenience when the owner of a land over which the wire had to pass wished to undertake some architectural work upon it. These regulations continue in force to this day.

PROGRESS OF THE WORK.—The telegraph lines were constructed as already described above, between Tokyo and Yokohama and Ōsaka and Kobe about 1869. But this work was, strictly considered, merely experimental. It was in the construction of the Tokyo-Nagasaki and Tokyo-Aomori lines that the work was first begun in a regular way. The construction of the two lines was completed between 1871 and 1874, next the work of extending the Tokyo-Aomori line to Hokkaidō across the Strait of Tsugaru, was started. The Great Northern Telegraph Company was made to undertake the work. The route, together with the Hakodate-Sapporo line, was to form part of the trunk route of Japan, and it is along this route that all the First-class Offices are situated to-day. The extension

of the lines through the districts in Kyūshū occurred between 1874 and 1877, the construction of a circuit round Shikoku was in 1876-1879 and the connection of San-in, Hokuriku and Uzen and Ugo districts with the rest of country took place in 1876-1882. Then between 1884 and 1892 a line was constructed round the island of Hokkaidō.

EXISTING LINES IN OPERATION.—At the end of 1901 the total lines in operation on land were at the rate of 2.67 *ri* per 10 square *ri*, the exact figures of the land and submarine lines being as follows:—

	Length of the Lines.	Lines in Operation.
Lines on Land	6,608 <i>ri</i> .	32,267 <i>ri</i> .
Submarine Lines	2,130 miles.	2,758 miles.

UNDERGROUND LINES.—Thus far Japan had not possessed any underground lines, but in such thickly populated cities as Tokyo and Ōsaka the construction of this kind of lines has become necessary, especially in Tokyo. The lines diverging from the central office in Tokyo to all the parts of Japan number more than 170, and they branch off to their respective destinations at point only a short way off from the office, and in the streets where traffic is most active and houses are built closely together. The existence of electric light wires and telephone wires makes the matter still worse. This is regarded as highly inconvenient, and the matter will be far from mended if the telegraph and other lines are additionally constructed according to the aerial method. The work of preservation alone would not be an easy task. Indeed there are hardly rooms left even at present to admit the further construction of new lines. Consequently it was decided to convert at least a part of the aerial lines in underground system and in 1902 this work was started for a portion of the Central Office and Shinagawa section, which forms the first station of the Tōkaidō telegraph route. The work is still going on.

SERVICE OF FOREIGN EXPERTS.—From 1869 when the line was first constructed between Tokyo and Yokohama the work of construction was carried on till 1877 under the supervision of foreign experts with Japanese assistants under them. These assistants obtained in course

of time sufficient knowledge to undertake the work on their own responsibility. At the same time the graduates of the course of electric engineering increased in number, and they were able after a time to take charge of the work without the help of foreign experts.

JAPANESE EXPERTS NO LONGER NEEDING FOREIGN HELP.—As a natural result of this advance of Japanese technical and scientific knowledge of electricity, the service of the foreign experts was dispensed with from about 1880. However Japan was still obliged to depend upon the service of foreigners in the work of laying cables, and it was by them that the Hakodate-Aomori cable and the Shikoku cable were constructed. In course of time the Japanese experts became fully qualified for the work, and the laying of additional cables at the Strait of Tsugaru and Shikoku was done by them, as also the work at Gotō, in Hizen.

THE FORMOSA-ŌSUMI.—By far the most important work accomplished by them was the laying of cables between Ōsumi and Formosa, and indeed this latter feat deserves special mention in the history of our telegraph business, as it stands a permanent proof of the advance of telegraphic engineering in Japan. The work was planned by the War Office, as it was one of special importance in connection with the maintenance and exploitation of the new territory of Formosa. In 1895 soundings were carried out, and next year the cable steamer *Okinawa Maru* which had been ordered into a dockyard at Glasgow, arrived. The work was launched in July of the same year, and by September of that year the laying was finished for the Ohama-Oshima and Oshima-Okinawa trunk lines and the Ohama-Tanegashima and Tanegashima-Yakujima branch lines. Owing to the unfavorable condition of the sea work was suspended, to be resumed in April of the following year. At last on May 30th of the same year the Ōsumi-Formosa cable was completed.

The trunk line measures 870 nautical miles in length making with the branches altogether 1,045.3 miles. The trunk line consists of two circuits, one being the Ohama-Naha section and the other the Naha-Kelung circuit. It starts at Ohama, Ōsumi province, and reaches Okinawa *via* Oshima. Then it reaches *via*

Yayeyama the place called Hasshakumon, Formosa, being separated by a little over one *ri* from Kelung. This trunk line contains more or less land lines constructed on various island lying on the route.

V. TELEGRAPHIC APPARATUS AND MATERIALS.

A descriptions will be next given of the apparatus and materials used in our telegraph service.

WIRES.—At first No. 8 iron wires were exclusively used, except in place where a special sort of wires was required, but to economize the cost of construction No. 11 iron wires were adopted. For several years afterwards this grade of wire was exclusively used in preference to others. They are no longer used now, except in constructing street lines and other short lines. Evidence confirming this fact was obtained quite accidentally in 1890 when for testing the telegraph and telephone composite system and long distance telephone service two lines of No. 12 hard copper wires were constructed between Tokyo and Ōsaka. It happened just at that time that the telegraph business between the two cities was unusually busy, so that the two lines just constructed at that time for another object were temporary utilized for the ordinary telegraph service. The result obtained emphatically demonstrated that the copper wires possessed better power of transmission than the No. 8 iron wires. The rate of speed did not differ much when instruments worked by hand were used, but with automatic instruments the copper wires showed about double speed. The experiments carried out in Ōsaka in 1891 proved that whereas 1,076 *letters* could be obtained per minute when the copper wires were used the corresponding number for the iron wires was only 491.

In cities possessing a large number of electric wires aerial rubber cables or lead covered paper aerial cables are used instead of ordinary bare aerial wires, or otherwise, for owing to the crowding of telephone and electric light wires, the use of ordinary wires is judged risky for the efficiency of the service.

TELEGRAPH POLES.—*Sugi* (*Cryptomeria japonica*) *Hinoki*

(*Chamæcyparis obtusa*.) and other kind of trees are not available for the posts until after they have grown 30 to 40 years. The period of preservation does not exceed six or seven years in ordinary circumstances. Here comes in the necessity of providing some devices for prolonging that period. At first Japan adopted for this purpose the charring and tarring methods, but after the experience of several years they were found to be not quite satisfactory, so that they were discontinued in 1879. A tarred post could be preserved for only seven or eight years. An injection of copper sulphate was next adopted, a method in 1871 by a French expert, and now known as Boucherizing treatment. This method was first tried in 1879 when the Tokyo-Kofu line was constructed. In the following year the central authorities ordered the electric engineers to adopt this method. Besides copper sulphate treatment that with carbolium, creosote and other chemical compounds is being experimented upon.

As to the exact period of the preservation of Boucherized poles, it is not possible to give a final verdict, the experiments not yet being concluded. So far as the result thus far obtained goes, this treatment seems to be far better than the other methods previously used, for in ground of a proper nature the poles thus treated appear to last 15 to 16 years, that is to say, twice the period of non-injected poles.

INSULATORS.—At first foreign-made insulators commonly called the earthenware insulators were used. These, however, were found to be inferior in quality and not quite satisfactory for preventing leakage, not to speak of their being rather costly. The consequence was that the authorities gave orders to the potters of Arita, Imari, Seto, etc. to make insulators. They succeeded in making one of good quality and cheap in price, so that from about 1875 the home-made insulators began to be used in place of the imported articles, and at present these are exclusively used. This may be regarded as the first step in the improvement of the insulator service.

These insulators were generally of single cap insulator but as this kind of insulator was discovered to be unsuited for a long circuit service, in 1883 double cap insulators were used for the Tokyo-Nagasaki circuit. The result was highly satisfactory, the

the leakage and the danger of mixing being considerably minimized. The single-insulators have gradually been superseded by the double, and this change marks the second stage in the improvement of the insulator-service. It may be noted that so far as the experiments made in Japan go the ratio of breakage of double-insulators has been ascertained to be 2.6 per cent. against 3.9 of the other.

For packing the bolt to the cap of the insulators a mixture of sulphur and brimstone has heretofore been made use of but this is not entirely satisfactory, so that experiments are now carried on with the object of discovering a better composition.

APPARATUS.—The apparatus first used for the Tokyo-Yokohama line was the Bregnet needle machines, ordered abroad in 1869 with all the other apparatus and materials required in the work. Two years later it was decided to adopt the Simens and Morse apparatus, the machines and other necessary accessories being ordered from England. These apparatus are yet to be seen in many parts of the country. In 1873 a workshop for making telegraphic apparatus was first established, the work being carried on under the direction of a foreign expert. It mainly consisted in making repairs. For the first time in 1878 Japan manufactured Morse instruments herself, ten sets in all. They were entirely manufactured by hand, as the complete set of machinery required in the work had not been provided at the workshop. Later on the knowledge of making the Morse and other apparatus has made so much advance that at present Japan supplies almost all the home demand for the instrument and its accessories. In 1880 a wire-shop was established and the wires used in the service were manufactured. This business was transferred to a private concern in 1887. At present the manufacture of copper wires is carried on extensively in Japan, but in iron-wire work we have not been so successful, and in fact for the supply of this particular kind of wires Japan has to depend even now on the help of foreign countries.

The history of the work of telegraph machine-making in Japan from the inception of the service, may be divided into three stages, the period of training and apprenticeship, extending from 1873 to about 1880; the period of imitation extending to about 1887, and the last period which came next may be regarded as the period of

improvement and of original work. Improvements and original work began to be most *en evidence* in 1896.

DUPLEX TELEGRAPHY.—The duplex system was first used in 1880 for the Yokohama-Kobe line, and it was also adopted for other lines constructed later on. After the introduction of the use of the double current key and retardation-coil in 1893 the duplex method began to be worked with special success. All of these apparatus in use were manufactured at home, with only a few exceptions.

AUTOMATIC RECORDER.—Wheatstone's automatic recorder was first introduced in 1882, and was used in the Tokyo-Ōsaka service, and its practical utility was confirmed with special effect in 1889. The machine used at that time was purchased from England, as that imported seven years before was also brought from that country; but in some details of construction the former had been much improved. With that recorder it was found possible to receive 400 words per minute, the current used being one of 25 mili-Ampier. This recorder is still used in almost all the parts of the country. About that time the shunted condenser were first experimentally used for automatic machines. Coming to 1891 the automatic machine was put up both at Ōsaka and at Shimonoseki, and the transmission was undertaken for the first time according to the duplex automatic system. It was at that time that the retardation coil was first used for duplex telegraphy.

RECEIVER.—At first the Morse ink-writer was universally used for transmitting or receiving the messages, but as a result of the experiment carried out in 1887 telephone apparatus was substituted for the Morse ink-writer. This contrivance is generally used at present at all the offices which have not to deal with many messages. The apparatus now used for the purpose is one of Delville or Solid-back type.

The Morse ink-writer being attended in its use by some defects, in 1894 the sounder machine was first used instead of it in Tokyo, and this apparatus is now used extensively in Japan.

REFLECTING GALVANOMETER.—When the work of laying a cable between Ōsumi and Formosa had been completed the reflecting galvanometer adapted for a submarine cable was adopted, but in 1899 it was superseded at the three offices of Ohama, Naha and

Kelung by Muirhead's syphon recorder, so that a complete duplex system was commenced between the three offices in question. In the intermediary stations of Kuji and Yayeyama the reflecting apparatus is still in use as the operation there is limited to certain hours in the day, and the business therefore is not brisk.

AUTOMATIC REPEATER.—The automatic repeater contrivance was first adopted at Kobe, but it was of the ordinary Morse system, and the speed was very slow. The adoption in 1893 at Aomori of the latest repeater board as a substitute of the old system, marked an advance in repeater operations. The double current automatic duplex repeater was next adopted at that place, while owing to the greater activity of the business and the construction of new lines, with the greater need of automatic repeaters, in 1897 a high speed simplex and duplex repeater, simplex repeater and double current duplex and simplex repeaters were adopted for the Tokyo-Sapporo circuit. In the following years the latter was adopted for several other lines. Then coming to 1900 the Hakodate-Nemuro, Tokyo-Ohama and Sakata-Hakodate lines got repeaters of double current single system; in 1901 the Tokyo-Otaru line obtained a high-grade repeater. In that year automatic telegraphy instruments and repeater apparatus were distributed among the principal telegraph offices, to be used as reserves. The quadruplex automatic repeater is now being experimented with.

DOUBLE CURRENT KEY SYSTEM.—In 1882 when trouble occurred between Japan and Korea the double current key system was first used between Tokyo and Nagasaki, in order to expedite the transmission of messages the number of which had suddenly increased. Up to 1894 or 1895 the contrivance was not in much demand, owing to the fact that lines of long circuit operation were not many. The condition of things has undergone a marked change since that time, and with a large increase in the number of long circuit lines the double current key has begun to be in greater demand than before.

QUADRUPLEX APPARATUS.—In 1890 a number of quadruplex telegraph apparatus were purchased both from England and America, and two years later the quadruplex system was first used for the copper wires of the Tokyo-Ōsaka lines. In the following

year this instrument was also adopted for the Tokyo-Sendai and the Ōsaka-Shimonoseki lines, and its use has therefore become quite extensive. What is to be noted about it is that these instruments are now being made in Japan, and that the originals were even improved upon somewhat.

In 1891 a contrivance for facilitating the superintendence of the operations was adopted and this testing machine which, by the way, has been manufactured at home was set up at Tokyo and Ōsaka in 1899. This example will be followed in the other principal offices.

SYNCHRONIC SIGNALLER.—The synchronic signal of noon that had been carried on by hand-worked switch began to be conducted by an automatic time switch made in Japan. The subsequent appearance of the double current signal system required the improvement of the instrument, so that coming to 1899 the double current automatic time switch was devised and manufactured, and operated with excellent result at the three offices of Tokyo, Nagoya and Ōsaka. The instrument has been distributed among all the other principal places, and this mid-day signal is now working quite satisfactory.

WIRELESS TELEGRAPHY.—Wireless telegraphy was first investigated in 1886 and in June of that year it was experimented upon with success along the upper banks of the river Sumida over a distance of 120 yards and at the coast of Tsukiji at a distance of 80 yards. Coming to 1898 the wireless telegraphy with electric waves was experimented in the Bay of Tokyo, and then in the following year between Tsukiji and Shinagawa fort, a distance of 3 nautical miles. The result was satisfactory in both cases. Further on in 1900 a similar experiment was carried out in the same bay and between Yawata, Kazusa province, and Funabashi, Shimōsa province, the two places being 11 miles apart. This and the experiment carried on between Funabashi, mentioned above, and Otsu, Sagami province, a distance of 34 miles, were similarly successful. Similar experiments since undertaken have been attended by satisfactory results, so that arrangements are now being made to carry out experiments on a larger scale and over longer distance. The cable steamer *Okinawa Maru* is about to be fitted with the instrument.

BATTERY.—The common battery system being more economical than the ordinary one, it is now taking the place of the battery.

Since 1902, 420 chrolide accumulators have been used with excellent results in place of the 6,645 Daniel batteries that had been previously in use. This new arrangement will be extended to all other offices where a large number of the Daniel's is used.

CHAPTER V.—Telephone Service.

Introductory—Technical Matters.

I. INTRODUCTORY.

GENERAL REMARKS.—Telephones were first used in this country in 1877, and they were principally short distance telephones. However after the experiment carried out with success in 1888 between Tokyo and Atami, telephones began to become largely used as public means of communication. The scope of the Experiments. operations was next extended as far as Shizuoka, and then to Osaka, and with success in both cases.

At first there was talk of leaving the telephone business to private enterprise, but this idea was given up and it was decided that the business should be undertaken by the Govern-

The Service Opened. ment as part of the telegraph enterprise. The working principle being settled in that way, the Government at once proceeded to carry the business into effect. In December 1890 the service was opened in Tokyo and in Yokohama and also between the two places.

The people did not appreciate at first the benefits of the service and the number of subscribers was therefore extremely limited in the two cities. This state of affairs lasted for only a short while, comparatively speaking, and in 1893 when the **Growing Demand** service was opened in Osaka and in Kobe and **on the Service.** between these towns, the number of applications for subscription reached a considerable number.

Gradually the value of the service began to be appreciated, so that by 1895, owing to limit of accommodation applicants who could not yet get telephone connection numbered more than 4,000. Meanwhile petitions arrived at the central authorities from many cities in the provinces requesting that a telephone service should be opened in

their districts. In consideration of this and other matters of a like nature, the Government made up its mind to largely expand the scope of the business. Accordingly it drew up, with the consent of the Diet, a programme to devote during the seven years ending the 1902 fiscal year a sum of over 12,800,000 *yen* to the work of expanding the scope of the business. The programme contemplated the establishment of the business in Kyoto, Nagoya, Nagasaki, Shimonoseki, Sapporo, Hakodate, Sendai, Kumamoto, etc., to extend limit of the business already carried on in other cities, and finally to bring all those cities into telephone connection with each other. Acting upon that plan, in 1899 the long distance service was opened between Tokyo, Yokohama, Osaka, Kyoto, and other cities, and the scope of the business in those cities was also enlarged.

As already mentioned all matters relating to telephones were at first regulated according to the provisions of the Telegraph Service Regulations, but in the Telegraph Law enacted in 1900 special provisions relating to telephone were distinctly set forth. Then the Telephone Exchange Rules that were drawn up on the occasion of the commencement of the service, were also thoroughly recast in 1897.

DATA OF THE SERVICE.—About thirteen years have elapsed since the service was inaugurated in Japan, and the record of progress during that interval of time has been something remarkable, as shown in the following description.

At the end of 1890 there were only two telephone exchange offices and 16 telephone call offices; **Number of Telephone Offices.** these figures grew at the end of 1895 to 4 and 24 respectively, to 27 and 151 respectively together with 134 automatic telephone at the end of 1902.

At the end of 1890 the subscribers numbered **Number of Subscribers.** only 343; advanced to 2,858 at the end of 1895, and further to 29,941 at the end of 1902.

At the end of 1890 the ratio of subscribers per **Ratio of Subscribers** 10,000 peoples was only two, to be increased to per 10,000 People. 14 five years after, and lastly to 60 at the end of 1902.

The number of applicants for connection being beyond the scope of the provisions, there are quite a large number of non-connected subscribers. At the end of 1895 these non-connected subscribers numbered over 4,000, and the number rose to no less than 23,300 approximately at the end of 1902.

At the end of 1890 the telephone circuits totalled 50 *ri* with the lines in operation extending to 331 *ri*; to rise to 178 *ri* and 2,156 *ri* respectively, five years later, and to be further advanced by 1902 to 1,039 *ri* and 43,345 *ri* respectively.

The progress of the financial side of the business was quite commensurate with that of the technical side. In the year of inception ordinary receipts fell short of disbursements by over 2,300 *yen*. This was the only case of financial failure, for subsequently the balance was always on the side of excess of receipts. This excess amounted to about 7,900 *yen* in 1891, grew to about 50,800 *yen* in 1895, and lastly to 984,600 *yen* approximately in 1902.

The following table will give a complete survey of the financial progress of the business from the 1892 fiscal year:—

TELEPHONE RECEIPTS AND DISBURSEMENTS.

Fiscal year.	Receipts.	Disbursements.	Balance in Favor of Receipts.
	<i>yen.</i>	<i>yen.</i>	<i>yen.</i>
1892... ..	48,069	32,722	15,347
1893... ..	94,959	52,849	42,110
1894... ..	132,967	75,229	57,738
1895... ..	142,431	91,549	50,882
1896... ..	150,444	113,605	36,839
1897... ..	228,505	179,612	48,893
1898... ..	574,332	324,038	250,294
1899... ..	1,035,957	630,474	405,483
1900... ..	1,513,912	964,900	549,012
1901... ..	1,810,411	1,175,982	634,429
1902... ..	2,263,626	1,278,991	984,635

II. TECHNICAL MATTERS.

A. STREET TELEPHONE LINES.

AERIAL BARE WIRES.—When the service was first opened in 1890, owing to the small number of applicants the work was on the overhead wire system, B. W. G. No. 18 hard copper wires being used. From about 1892 No. 17 hard copper wires were exclusively adopted, though in such places as Hokkaidō and the north-eastern districts of Honshū which are liable to snowstorms No. 14 zinc coated iron wires had to be used. Then in Tokyo also No. 17 wires were found liable to injury from storms, so that since 1898 No. 17 silicated copper wires have been used.

AERIAL CABLES.—From about 1891 overhead rubber cables were adopted for places traversed by many electric wires, while with the advent of the telephone service expansion programme in 1890 the underground cable system was adopted for Tokyo, Ōsaka, Yokohama, Kobe, Kyoto and Nagoya. This underground portion was, however, to be confined to trunk lines, the rest to be made with lead-covered paper cables. For other telephone offices overhead cables of the same kind are to be employed, though rubber cables are used when the wires are stretched across the street and in places where only a short distance has to be traversed. The cables are generally of two kinds, one containing 100 centres and the other 50. On rare occasions one with 26 centres is used.

UNDERGROUND WIRES.—Underground wires have, as mentioned above, been laid in Tokyo, Ōsaka, Yokohama, Kobe, Kyoto, and Nagoya since 1896, the length of these wires extending with the lapse of year. For conduits iron pipes alone were at first used, but later on earthenware pipes have been adopted at the same time, one or the other to be used according to the requirement and circumstances of the locality. The iron pipes are imported, but one kind of the two earthenware pipes in use is made at home, the other imported from America. Those coming from America are MacRoy conduits, and these are exclusively used in Nagoya and some times in Tokyo to some extent.

THE UNDERGROUND CABLES OF LEAD-COVERED KIND.—They

contained at first 200 centres, afterward they were increased to 300 and lately to 400.

CIRCUIT.—At first the single wire system was adopted but from 1895 it has been superseded by the metallic system, so that at the present time all connections consist of the double.

POLES.—Both in the urban and suburban districts *Sugi* timbers are used for poles, though iron poles are used for the junction of cables and naked wires. The timber poles are either Boucheringed, or are coated with an anti-putrefaction preparation.

ARMS.—Arms are made of *Keyaki* wood for a pole supporting not more than eight wires, but when the number is more than 12 an iron arm is used.

B. SUBURBAN TELEPHONE WIRES.

ROUTES.—The lines are all of naked aerial wires especially constructed for the telephone service, though the lines that are not of much importance may be constructed in the spare rooms of the existing telegraph poles. Sometimes the existing telegraph wires are used, so that they are made to fulfill the service both of the telegraph and the telephone business.

CIRCUIT.—It is entirely on the metallic system. In a circuit of short distance the multiple system is used, while in another that is operated comparatively little, four offices are connected by one circuit. Then telephone and telegraph service is sometimes made interchangeable as to the utilization of each other's circuit, the telephone wires doing service for telegraph wires in some cases and the telegraph wires returning the service for telephone in other cases. In the former the Cahilo's system or Schiwnsky system is used while the composite system of the American Long Distance Telephone Company is adopted in the latter.

WIRES.—Hard copper wires are generally used, the size being B. W. G. No. 8 or No. 12 or No. 14 according to the distance of a given line. For a line of short distance or for a circuit of not much importance, zinc coated No. 8 or No. 11 iron wires are sometimes used, while bimetallic wires or steel wires are used where, as in the case of crossing a river, the distance between the poles is comparatively long. In the strait separating Moji and Shimonoseki

8-centred steel wires insulated by gutter-percha, that is to say, two lines of 4 circuit submarine telephone wires, are used.

C. APPARATUS AT THE SUBSCRIBERS' HOUSES AND AT TELEPHONE CALL OFFICES.

APPARATUS.—It was in 1877, that is to say, the very next year after Prof. Alexander Graham Bell's invention of workable apparatus was made public that the instrument was first introduced into Japan. Afterward the Edison, Blake, Belton and Ader types arrived. The Gower apparatus that arrived in Japan about 1887 having been judged to be well suited for the purpose, the receivers of this type were adopted for use of subscribers when in 1890 the exchange offices were first established in Tokyo and Yokohama. The battery used for transmitter and receiver was of the primary battery type. From 1895 a magnetic-motor was also used. In the same year, in consequence of the expansion of the city telephone business and also of the construction of long distance telephone, it was decided to replace the Gower apparatus by either the Solid-back or Derville type, the former being judged to be not quite satisfactory for working a long-distance service. At present the subscribers get either the Solid-back or the Derville, while the latter is exclusively used either in a city or on a short-distance service. Desk-telephones also use the Solid-back.

At all telephone offices also the Solid-back is a rule, as also is the case of the automatic call offices established recently in cities or in places situated close to cities.

ARRESTERS.—Formerly the Hibberd Fuze apparatus was used, but of late it has been superseded by the No. 12 arrester made by the Western Electric Company, as the latter is more securely provided against the danger of strong currents and of thunder.

BATTERIES.—At the time the Gower apparatus was used the Daniel was used both for local and signal circuit, but with the disuse of the Gower the Leclanche was adopted, though in place of the Solid-back the Fuller battery was adopted.

D. APPARATUS AT TELEPHONE EXCHANGE OFFICES.

EXCHANGE APPARATUS.—At the time of the commencement of

the service the standard switch board made by the Western Electric Company was adopted, and with an increase of the number of subscribers the apparatus at the exchange offices in Tokyo and Ōsaka was substituted in 1893 with the series multiple switch board manufactured by the same company. At the same time the Mann's instrument was set up at the Kobe Office. In 1895 the expansion of the business led to the offices in Tokyo, Ōsaka, Yokohama and Kobe adopting a still more perfect type, this time the parallel switch board with self-restoring drop also by the same company. This is the type now in use at all the principle exchange offices throughout the country. The authorities are thinking of setting up in the course of this year the lamp signal switch board at the Shitaya Branch Office in Tokyo and of installing the common battery system board at the office in Kyoto. It may be noted that the standard board makes 100 connections; the series multiple switch board 240, the parallel multiple switch board 300 to 450; and the universal battery composite type 630.

The operator's transmitter was at first the Blake type; then the Berthon and Ericsson were used, but at present they have all been disused in favor of the Solid-back.

TOLL BOARD.—At first for the Tokyo-Yokohama and Osaka-Kobe service the standard switch board was used as also in the case of city service, but when that board was superseded shortly after by the parallel switch board type, the toll board combining calculagraph to designate the conclusion of a conversation was installed.

CHIEF OPERATOR'S BOARD, ARRESTERS AND TESTING SET.—With the adoption of the parallel testing set switch board the operator's board for supervising the work of the operation began to be set in operation. For the testing service at first the set board provided with a mica lightning rod was used, while the paraffin wire was used for cross and premise lines. With the adoption of the parallel multiple switch board No. 4 main distributing boards and the intermediate distributing boards made by the Western Electric Company were adopted. For small exchange offices a handy testing distributing board and with No. 4 A-type arresters and Fuze boards were adopted.

POWER PLANT.—In exchange offices where the parallel switch

boards are in operation the power plant is necessary. At the offices in Tokyo and Yokohama the gas motor supplemented by electric motor is in use, while in Ōsaka, Kobe, Nagasaki and Kyoto electric motor supplemented by kerosene motor is in operation. For the battery the chloride accumulator is used, though at Yokohama and Kobe the Hagen accumulator is used at the same time. The machine made by the Crocker Wheeler Company is used for the purpose of replenishing the current and of giving signals.

At exchange offices where either series multiple switch boards or standard switch boards are adopted the monochromic accumulator is used, while for transmission and signalling the role-changer is used.

CHAPTER VI.—The Personnel.

How the Staff is Recruited

POST AND TELEGRAPH SCHOOL.—For the purpose of training those who have to attend to the management and operation of post and telegraph affairs the Government maintains the Post and Telegraph School. This institution was established in 1869, when a number of the Shubunkan School in Kanagawa-ken were selected to receive instruction in the technical part of the business under Mr. Gilbert, an Englishman. As the machine in vogue at that time was of the letter indicating type, and therefore very simple in operation the students easily mastered the principles of the system. The introduction of far more complicated Morse invention was followed by the establishment of a special course of training, so that a school-room was opened for that purpose in the premises of the Department of Public Works. In 1873 this was enlarged and made into a regular school, the main school being in Tokyo and a branch school in Ōsaka. The branch school was once abolished, then restored and finally given up, but the head school was expanded in scope under the new name of the Tokyo Telegraph School and made to teach, besides the technical knowledge of communication, the knowledge of electric machines, batteries, wires, etc. as also a practical knowledge of construction. In 1890 a course of post affairs was created in the school to train students qualified to take charge of post service. Two years later the standing of candidates for admission was determined to be equal to that of the graduates of ordinary middle schools. In 1899 the courses were again changed, into those of management and those of technical operation. In the former the students who were to attend to the duty of managing post and telegraph business were taught while in the other the students were taught the science and practice of telegraphy and telephone. The standing of the courses was at the same time elevated. The course of study extends for two years for

both courses, and the graduates are under obligation to give their services to the Department of Communications for five years dating from the period of graduation. With the revision of the courses in 1899 a special course giving special technical teaching on all matters connected with electric communication was created, the students being selected from among these who were attending to the business of electric communication in the Department. The course of study is one year and the term of obligatory service five years.

The graduates trained by the Department since the establishment of the special class-room in 1871 numbered, up to March 31, 1903, 36 in the course of management, 1,888 in the course of technical department, and 131 in the special course, in all 2,255.

TRANSPORTATION.

CHAPTER I.—Railroads.

Official Organization—Legislative Measures—Railroad Lines—Rolling Stock—Capital—Volume of Traffic—Receipts and Disbursements.

I. OFFICIAL ORGANIZATION.

GENERAL REMARKS.—It was in November of 1869 that the Government decided to start the work of railroad construction, and caused the then existing Department of Civil Affairs and of Finance to conduct the business. In March of the following year the Department appointed railroad officials, and these on the splitting up of this dual Department into two independent offices, were transferred to the Department of Civil Affairs. Again the control of railroad matter passed into the hands of the Department of Public Works when this was created in October of the same year. The Department established a special Bureau to attend to this business, but the Department was abolished in December of 85 and the Railroad Bureau was placed under the direct management of the Cabinet. At the same time it was affiliated to the Home Office. This connection with the Home Office came to an end in July of 1892 when the Department of Communications was created, and naturally the Railroad Bureau. This occurred in November, 1893, was brought under the control of the new Department. With the progress of the times railroad business had grown so expanded in scope, that it was decided to divide the controlling office into two bureaux. This division was carried out in August of 1897. One bureau was made to attend to the work of supervision and the other bureau to traffic and construction. The new

office was called the Railroad and Construction Bureau, and this division of labor is still continued to this day.

Prior to this, in April of 1896 a new Department of State for Colonial Affairs having been created, the railroads in Hokkaidō were detached from the control of the Communication Department and were transferred to that of the new Department, but as this office was abolished in September of the following year the Hokkaidō railroad business was again restored to the Department of Communications.

II. LEGISLATIVE MEASURES.

GENERAL REMARKS.—The first legislative measure relating to railroad was published in February of 1872 to provide general rules about railroad work. It was amended soon after. About the same time, Punitive Rules relating to Railroad were promulgated. In September of that year Supplementary Rules relating to Conveyance of Goods on Railroads and also the freight tariff were determined and made public. In January of 1874 it was proclaimed that in future any change of the tariff of railroad passengers and goods would be determined at the discretion of the Department of Public Affairs. In pursuance of that announcement, in November of that year rules relating to luggage were enacted. It was announced in October of 1879 that cases in the Punitive Rules relating to Railroads that clashed with a provision in the Criminal Code would be determined according to Art. 5 of the Code.

Then in July of 1883 it was enacted that the General Rules relating to Railroads and the Punitive Rules thereof would apply correspondingly to private railroads. Rules relating to the Conveyance of Explosives on Railroads and to the treatment thereof were made public in April of 1885 in the form of Notification No. 14 of the Department of Public Works. The Regulations relating to the Finances of Railroads were provided that year. But a legislative measure of far greater importance was the promulgation in May of 1887 of the Regulations of Private Railroads and in June of 1892 of the Law of Railroad Construction prescribing the route along

which Government railroads were to be laid. In that year also was elaborated the organization of the Railroad Council. The Law relating to Railroad Construction in Hokkaidō was issued in 1896, and in March of 1900 was enacted the Law of Private Railroad is to supersede the Private Railroad Regulations. At the same time the Law of Railroad Traffic was enacted. Such is in brief the history of Japanese railroad legislation.

PRINCIPAL POINTS IN PRIVATE RAILROAD LAW.—Below will be enumerated those points in the Law of Private Railroads that deserve special notice :—

1. Railroad shares must not be acquired except by the payment of money.
2. Unless in virtue of a decision arrived at by a general meeting of share holders and with the sanction of the Minister concerned, no railroad can be chartered or hired or its management entrusted to others.
3. Unless with the sanction of the Minister concerned and after not less than one-fourth of the share capital has been paid up, no railroad company may issue debenture bonds.
4. With the approval of the Minister, a company may contract a loan by mortgaging its railroad with accessories, but they must not be used as object of right of mortgage.
5. The debenture bonds and loans together must not exceed the total sum of the paid-up capital.
6. No company must declare dividends unless after the principal and interest of the bonds and loans payable every year have been subtracted from the proceeds.
7. Except in cases specially approved of the gauge must always measure 3ft 6 inches.
8. The Minister concerned may order an alteration of tariff rate, when such alteration is judged necessary for the sake of public interest.
9. The tariff rate of third-class passengers must not exceed 2 *sen* per mile. (This may be increased to no more than 4 *sen* for a distance not exceeding 2 miles.)
10. A company shall be held responsible to offer its lines in accordance with the provisions determined by law or

ordinance, for the use of the Army or the Navy either in time of war or in time of peace.

11. The Government reserve the right of purchasing the line with all its appurtenance after full 25 years from the granting of a permanent charter.

III. RAILROAD LINES.

GENERAL REMARKS.—The service which possessed lines extending altogether 4,237 miles on March 31st of 1903 had at its inception in 1872 only one short line, that is the Shimbashi-Yokohama line. It was the original idea of the Government to lay a trunk line from Tokyo to Kobe and Ōsaka and Kyoto. The Tokyo-Yokohama line and a line starting from the vicinity of Lake Biwa and terminating at Tsuruga were to form deflections. For the trunk line extending from Tokyo to Kyoto the programme originally adopted the Nakasendo route. But a result of the final survey demonstrated that the route involved stupendous labor and expense, many steep hills and passes being present along it. Therefore that route was abandoned and the Tōkaidō route was adopted as a substitute. Consequently the Takasaki-Uyeda line that had been intended as part of the trunk line and the Uyeda-Naoyetsu line that had been selected to facilitate the conveyance of construction materials had to form combinedly an independent section known by the name of the Shinyetsu line.

The programme of construction as contemplated at first consisted in the main in the shape as indicated above. In 1889 however, the construction of the Ofuna-Yokosuka section was decided upon.

The routes indicated in the Law of Railroad Construction are to be undertaken in principle by the State, but some provision for the modification of this general rule existed to meet applications made by any private railroad company for permission to lay its own line along a route comprised in the Government programme but the construction of which was not yet taken in hand. But in allowing a private company to construct its own line along such a route the Government had to get the consent of the Diet, as is still the

case. The official routes thus transferred to private enterprises are not few.

FIRST PERIOD CONSTRUCTION PROGRAMME.—Of the routes included in the construction programme, those that required to be more speedily constructed than the others were singled out and were set apart to be called collectively the First Period Construction Programme. These lines, extended altogether over 1,900 miles approximately, and in their case the work of construction had to be completed in twelve years from the commencement. According to the inquiries carried out on March 31st of 1903, 1101 miles out of that length, that is more than one half of the whole, had already been opened to traffic.

SECOND PERIOD CONSTRUCTION PROGRAMME.—The lines left behind after selecting the First Period Programme form the so-called Second Period Programme extending altogether over 2,525 miles approximately. Of that mileage 674 miles have already been given over to private companies with the approval of Diet. Of the 674 miles thus conceded to private companies 395 miles had already been opened to service according to the reports sent in on March 31st of 1903.

PRIVATE RAILROADS.—The pioneer of private railroad enterprises in Japan is the Nippon Railroad Company which obtained in November of 1881 a charter for laying the Tokyo-Aomori line. It was a rather bold undertaking at that time, for the people had not yet possessed sufficient experience in the work while the length of the line, several hundred miles in all, necessitated the investment of quite a large amount of capital. Then there were no data to form any reliable estimates on profit and loss, so that the estimates made were at best purely conjectural. In view of all those circumstances the Government, in compliance with the request of the company, decided to guarantee its profit within a certain limit and moreover extended every possible convenience tending to further the work. In June of the following year the company started the work on the Tokyo-Mayeabashi line, and 1883 the Uyeno-Kumagaye section was opened to traffic. Thus the period of private railroad enterprises was ushered in. Since then private railroad work has made its

appearance in quick succession, and side by side with the State railroad work has contributed to promoting the activity of railroad enterprises in Japan. Indeed the rise of private undertakings of this special sort has been remarkably active. This was especially the case in the two years of 1896 and 1897. At the end of the former year alone applications for provisional charters numbered 555. Naturally the mileage under traffic of private railroads went on advancing, the mileage opened in the two years of 1897 and 1898 alone extending over 400 miles each.

PROGRESS OF RAILROAD WORK.—The following figures gave progress of railroad work from 1872 :—

Fiscal Year.	Government.	Private.	Total.
At the end of	m. ch.	m. ch.	m. ch.
1872	18.00	—	18.00
1877	65.11	—	65.11
1882	170.66	—	170.66
1887	300.43	293.24	593.67
1892	550.49	1,320.28	1,870.77
1893	557.49	1,381.03	1,938.52
1894	580.69	1,537.35	2,118.24
1895	593.22	1,697.21	2,290.43
1896	631.62	1,875.29	2,507.11
1897	661.65	2,287.05	2,948.70
1898	768.37	2,652.13	3,420.50
1899	832.72	2,806.00	3,638.72
1900	949.69	2,905.16	3,855.05
1901	1,059.48	2,966.48	4,026.16
1902	1,226.56	3,010.60	4,237.36

LINES UNDER DIFFERENT OWNERSHIP.—To classify the mileage existing at the end of the 1902 fiscal year according to the condition of management and possessorship, the mileage under the management of the Department of Communications headed the list with 1,062 miles, closely followed by the Nippon Railroad Company with 857. Then came the Kyūshū Railroad with 416, and the Sanyō Railroad with 334.

LINES CLASSIFIED ACCORDING TO MILEAGE.—The condition of railroads being examined according to the length of lines, the following table is obtained :—

	Under 20 Miles.	20-50 Miles.	50-100 Miles.	100-200 Miles.	200-500 Miles.	500 and above	Total.
No. of Establishments...	14	19	3	2	3	2	42
Mileage (m. and ch.) ...	178.70	596.46	225.30	358.53	958.27	1,919.50	4,237.36
Percentage	4.2	14.1	5.3	8.5	22.6	45.3	100.

The foregoing table shows that the number of establishments is largest for lines measuring from 20 to 50 miles, the next largest being those measuring under 20 miles. As to mileage those establishments owning or managing over 500 miles contribute about one half of the total mileage under traffic.

LINES CLASSIFIED ACCORDING TO GAUGE.—The regulation gauge of Japanese railroad is 3 feet 6 inches, but it is 2 feet 6 inches for light railroad. According to the inquiries made on March 31st of 1903, the mileage under the regulation gauge totalled 4,174 miles 1 chain and that of the 2 ft. 6 inches gauge 63 miles 35 chains. Therefore the latter constituted only 1.5 per cent, out of the whole 100 under traffic.

MILEAGE AND GEOGRAPHICAL DIVISIONS.—The existing mileage under traffic is further classified as follows according to the natural geographical divisions of the country, and also the ratio of mileage to population.

Natural Division.	Area Exclu- sive of Out- laying Islands. (sq. Miles).	Population.	Railroad Mileage (m. ch.).	Mileage per 100 sq. Miles. (Miles).	Mileage per 10,000 People. (Miles).
Honshū	86,329	34,196,471	3,223.21	3.68	0.78
Kyūshū	13,771	6,586,682	448.27	3.20	0.54
Hokkaidō	30,123	1,003,751	390.39	1.24	3.71
Shikoku	6,858	2,961,714	75.29	1.10	0.20
Total	137,081	44,748,618	4,237.36		

IV. ROLLING STOCK.

TOTAL NUMBER OF VEHICLES.—It is natural that with the extension of traffic mileage and with the advance of the volume of traffic, amount of rolling stock should also increase. The number existing each year from inauguration of the service is given below:—

Fiscal Year.	Locomotives.			Passenger Cars.			Wagons.		
	Gov.	Private.	Total.	Gov.	Private.	Total.	Gov.	Private.	Total.
At the end of									
1872	10	—	10	58	—	58	75	—	75
1877	38	—	38	160	—	160	320	—	320
1882	47	—	47	240	—	240	503	—	503
1887	53	30	83	313	138	451	887	364	1,251
1892	133	185	318	630	739	1,369	1,753	2,819	4,572
1893	142	211	353	647	806	1,453	1,851	3,365	5,316
1894	167	273	440	678	968	1,646	2,112	4,321	6,413
1895	171	351	522	705	1,238	1,943	2,235	5,156	7,391
1896	183	429	612	796	1,475	2,271	2,328	6,582	8,910
1897	258	636	894	871	2,029	2,900	2,930	8,541	11,471
1898	317	786	1,103	989	2,837	3,811	3,295	10,827	14,122
1899	343	871	1,214	1,022	3,129	4,151	3,729	12,822	16,551
1900	387	892	1,279	1,085	3,331	4,416	4,291	14,046	18,337
1901	407	943	1,350	1,122	3,407	4,529	5,112	14,708	19,820
1902	453	975	1,428	1,327	3,537	4,864	5,644	15,861	21,505

CAPACITY AND WEIGHT OF VEHICLES.—The foregoing figures simply indicate the numbers of vehicles, and do not make any discrimination as to their relative capacity. This capacity naturally advancing with the progress of the railroad business, the locomotives that have to draw them are consequently required to possess greater drawing power. Hence in drawing capacity a given number of vehicles as they existed formerly was much less than same number of vehicles to-day. According to the latest inquiries the aggregate weight of 1,428 locomotives totals 63,142 tons, an average of 4.2 tons per one locomotive. Then 4,864 cars possess seating accommodations for 187,049 persons, an average of 38.5 seats per one car; while 21,055 goods wagons possess the freight capacity of 47,509 tons, this being an average of 6.9 tons per one wagon.

RATIO OF VEHICLES MILEAGE.—The ratio of vehicles to mileage under traffic is, according to the latest inquiries, 33.7 locomotives, 114.8 passenger cars and 575 wagons per 100 miles.

V. CAPITAL.

MODE OF COMPUTATION.—The capital invested in the railroad business is divided into two accounts, one on account of construction and the other on account of operation or working. The mode of

computing the capital was somewhat different formerly compared to what it is at present. Thus prior to the 1886 fiscal year the yearly disbursements were added up in the State railroads to the account already existing. The principle of railroad finance was first definitely arranged by the enactment in December of 1885 of the Railroad Finance Regulations. In accordance with the provisions of the regulations the *bona fide* investment was set apart out of the total disbursements made from the beginning of the service, and the capital to be given below is therefore based on the result of that estimate.

INVESTMENTS OF STATE AND PRIVATE LINES.—The capital invested in railroad work reached 520,940,963 *yen* according to the inquiries made in March of 1903. Of that sum the State railways share amounted to 247,765,963 *yen* and that of private companies the remaining 273,175,000 *yen*. However, the preceding figures do not represent the amount actually invested. They are only the nominal amount. The amount actually invested as calculated in the year mentioned above was as follows:—

	<i>yen.</i>
Government Railroads	144,395,060
Private Railroads	231,808,970
Total	376,204,030

The above sum distributed among the various accounts, the following table is obtained.

GOVERNMENT RAILROADS.

Items.	<i>yen.</i>
Consolidated Capital	141,945,060
Working Capital	200,000
Stores Funds	2,250,000
Total	144,395,060

PRIVATE RAILROADS.

Items.	<i>yen.</i>
Consolidated Capital	216,749,888
Stores	4,749,471
Others (Temporary Construction Disbursements, etc.)	10,309,611
Total	231,808,970

FINANCIAL RESOURCES OF RAILROADS.—As to the sources from which the capital was derived, for the State railroads the bulk consists of the proceeds of loans (the amendment of Railroad Construction Law provides that the proceeds other than those of loans may be used on account of railroad work) and a part of proceeds from traffic receipts. In the private railroads the capital generally consists of share capital, though not unfrequently they procure funds by means of debenture bonds or ordinary loans. The capital of private railroad companies distributed among the different items of sources, the following result is obtained:—

	<i>yen.</i>
By Share Capital	202,603,626
By Debenture Bonds	12,852,600
By Loans... ..	6,734,668
Others (as, for instance, transferred from Receipt Account)	9,618,076
	<hr/>
Total	231,808,970

It will be seen from the above that the capital of Japanese private railroad companies consists of share-capital to the extent of 87 per cent. of whole sum, the rest supplied by debenture bonds or loans. The funds procured by bonds or loans constitute a temporary account and are temporarily made to take the place of instalment of share-capital to be paid in. This point presents a distinct feature in the railroad finance of Japan as compared with that of Western countries. In the latter debenture bonds are regarded from the first as legitimate source of railroad funds, but in Japan they are issued when the payment of the subscription is judged difficult or when there is no time to call in the share-capital by ordinary process. They are issued as a temporary expedient, and are therefore regarded as temporary resource.

COST OF CONSTRUCTION AND TRAFFIC MILEAGE.—The foregoing capital comprising all those accounts relating to lines not yet open to traffic, it is not possible to give an accurate comparison between the capital and traffic receipts and disbursements and similar matters. Therefore for the convenience of making this exact

comparison, the cost of construction disbursed during the last nine years on account of traffic miles alone will be given below:—

Fiscal Year.	Government.	Private.	Total.
1894	37,650,657	54,927,766	92,578,423
1895	39,279,435	66,109,351	105,388,786
1896	43,658,043	67,253,598	110,906,641
1897	46,317,417	105,298,041	151,615,458
1898	60,050,614	144,725,478	204,776,092
1899	69,979,049	173,444,231	243,423,280
1900	85,573,511	191,230,391	276,803,902
1901	100,590,209	202,804,045	303,394,254
1902	125,714,859	213,231,933	338,946,792

The average cost of construction for the past few years' account as mentioned in the foregoing table amounts to 102,482 *yen* per one mile of State lines and 70,912 *yen* per one mile of private lines, the average of the two being 80,059 *yen*.

VI. VOLUME OF TRAFFIC.

DATA RELATING TO PASSENGER AND FREIGHT TRAFFIC.—

Data relating to passenger and freight traffic requiring complicated inquiries, it is not possible to obtain reliable figures for the years prior to 1889. The only data available for those early years consist of the number of passengers and the tonnage of goods. They are however devoid of any great value for investigating the exact state of railroad traffic. For that purpose the data for demonstrating the extent of utilization of the service both by passengers and goods must be obtained. In other words the passenger mileage (calculating the mileage of travel by passengers) and goods ton mileage (calculating the mileage of the conveyance of goods) are necessary for giving accurate statistics on railroad traffic business. Consequently the returns from 1890 which have been compiled on the principle explained will be given below:—

PASSENGER TRAFFIC.

Fiscal Year.	Government.	Private.	Total.
1891	11,265,383	11,575,247	22,840,630
1892	12,873,547	15,590,168	28,463,715
1893	14,444,327	18,090,836	32,535,163
1894	14,883,986	21,639,321	36,523,307
1895	18,764,387	30,451,191	49,215,578
1896	22,750,749	43,478,370	66,229,119
1897	27,922,577	57,175,600	85,098,177
1898	31,590,764	67,471,125	99,067,889
1899	28,663,683	73,452,259	102,115,942
1900	31,944,856	81,766,015	113,710,871

Note :—The figures marked with (*) indicate charges incidental to arrival and sending of goods.

RELATION BETWEEN PASSENGER AND FREIGHT TRAFFIC.—

As shown in the preceding table, though in the returns of latest year's traffic volume, in one or two items a slight decrease is noticed, on the whole the volume indicates a steady advance, showing

how the railroad service is contributing very much to the exploitation of industries and to their development. One cannot but regret, however, that the degree to which our people make use of this important factory of civilization and prosperity is still comparatively limited. The volume of passenger traffic for the last year given above compared with the population, the ratio per one person does not exceed only 2.4 ridings and 42 miles of travel in a year. At the same time this comparatively imperfect utilization of railroad by our people is not without a consoling side, in that it serves as a sign of future hopefulness of the business. The existing condition of the traffic service lends powerful support to the reasonableness of this conjecture, for whereas in most other countries the volume of goods traffic and the receipts thereof surpasses those of passenger traffic, the former being the principal item of revenue and the latter subordinate to it—in Japan the relative position of the two is reversed, the volume and receipts of passenger traffic always exceeding those of the other. This state of railroad traffic in Japan is entirely attributable to the fact that the progress of the country is not yet so perfect as in the West. Already signs are discernible that our railroad business will develop before long a normal feature as seen in Europe and America, for as shown in the following figures the ratio of volume and revenue of goods traffic to the volume and revenue of passenger traffic is steadily advancing. The arrival of that period will not only enable our railroads to discharge their function with more efficiency than is the case at present, but will at the same time serve as a clear proof that our economic enterprises have reached a stage of real activity and prosperity. In short, any amount of room exists for the future development of our railroad business.

RATIO OF FREIGHT RECEIPTS PER 100 OF
PASSENGER RECEIPTS.

Fiscal year.		Fiscal Year.	
1890 34.5	1896 46.0
1891 39.5	1897 48.0
1892 43.6	1898 52.5
1893 47.4	1899 54.3
1894 52.9	1900 58.1
1895 48.9	1901 63.7
		1902 69.1

The average traffic mileage of passengers and goods and the average receipts per one mile are shown below, the increase of the average passenger fare being attributable to the advance of the rate carried out in view of the general advance of the market price of commodities.

Fiscal year.	Per One Passenger.		Per One Ton of Goods.	
	Mileage.	Fare per One Mile.	Mileage.	Freight per One Mile.
	Mile.	sen.	Mile.	sen.
1891	21	1.10	37	2.69
1892	20	1.11	51	2.06
1893	20	1.10	48	2.02
1894	23	1.03	54	1.94
1895	22	1.07	53	1.99
1896	18	1.13	46	1.94
1897	17	1.16	48	1.97
1898	16	1.20	48	2.15
1899	17	1.37	51	2.12
1900	17	1.39	51	2.11
1901	17	1.45	55	2.00

The average volume of traffic per one mile and per one day computed on the returns for the latest year mentioned in the table, the ratio for passenger amounts to 1,313 and that for goods 547 tons.

VII. TRAFFIC RECEIPTS AND DISBURSEMENTS.

GENERAL REMARKS.—To review the returns from the commencement of the service to the 1901 fiscal year the receipts for 1873 totalled about 441,000 *yen* as against the disbursement amounting to over 232,000 *yen*, yielding a profit of over 208,00 *yen*. In 1876 the receipts amounted to 1,284,060 *yen* and the disbursements to over 434,000 *yen*, leaving a net profit of over 850,000 *yen*. In the following year the receipts fell off while the disbursements increased, and the result was that the amount of net profit did not reach even one half of the profit in the preceding year. Coming to 1878 year the normal aspect was somewhat recovered, though the

net profit did not exceed 456,000 *yen* in round numbers. Matters continued improving from 1879 to 1881, the profit for the last-mentioned year amounting to over 1,030,000 *yen*. In the following year owing to traffic expense having gone up compared with the receipts, the net profit fell to about 910,000 *yen*. The opening of several private railroads and the better facilities afforded to railroad travelling resulted in more or less of an increase of the traffic receipts in 1883, but in the following three years the record again sustained a slight fall, from which, however, it recovered once more in 1887. The profit was unusually great in the two following years it having exceeded 2,470,000 *yen* in the first and 3,530,000 *yen* in the second. From that time onward the receipts have steadily continued to advance, to 16,400,000 *yen* in the 1895 fiscal year and to 26,410,000 *yen* in the 1902 fiscal year, both being in round numbers.

Private railroad companies are entitled to undertake at the same time warehousing and carriage business and also the extraction of coal and other minerals. The receipts of this special kind are indicated by an asterisk in the following tables:—

EARNINGS.

(unit of *yen*).

Fiscal year.	Government Railroads.	Private Railroads.	Total.
1873	441,615	—	441,615

1900... ..	12,095	5,592	6,467
1901... ..	12,215	5,964	6,251
1902... ..	12,570	6,146	6,424

ITEMS OF RAILROAD ACCOUNT.—Receipts accruing from railroad traffic are classified into three main headings, namely, passenger car receipts, wagon receipts, and miscellaneous receipts; then traffic expenses are divided into four classes, maintenance expense, locomotive expense, transportation expense and general expense. These different items were as follows in the 1902 fiscal year:—

TRAFFIC RECEIPTS.

Items.	<i>yen.</i>	Per Centage.
Passenger Car Receipts... ..	30,039,870	58.1
Wagon Receipts	19,934,142	38.6
Miscellaneous Receipts	1,706,783	3.3
Total	51,680,795	100.0

TRAFFIC EXPENSES.

Maintenance Expense	5,474,979	21.7
Locomotive Expense	10,140,771	40.1
Transportation Expense	6,619,857	26.2
General Expense (Including Taxes) ...	3,033,781	12.0
Total	25,269,388	100.0

In comparing, on the basis of the same year's returns, the ratio which traffic receipts bear to cost of construction of lines under traffic, it is found that it amounts to 7.4 per cent. for the State lines and 8 for the private lines, the average being 7.8 per cent.

CHAPTER II.—Ships and Shipping Business.

Ships—Shipbuilding—Sailors—Life-Boat Business—Protection to Navigation—Nautical Signals—Open Ports.

I. SHIPS.

GENERAL REMARKS.—Ships as originally existed in Japan were those known by the name of junks. In construction and size they were utterly unsuited for ocean service. With the adoption of the polity of enlightened progress by the Imperial Government and the encouragement of marine navigation the list of foreign-patterned ships steadily went on increasing in number. In reviewing the history of our carrying trade during these last thirty four or five years it is found that the number and tonnage of steamers steadily increased up to the end of 1893. The Japan-China war of 1894—1895 years served as an occasion of introducing epoch-making change in the condition of carrying trade, for so remarkable has been its progress since that time and so many were the steamers that were added to the list, that at the end of 1902 they numbered altogether 1,441 with an aggregate tonnage of 610,446 tons. Compared with the list at the end of 1893 the number increased twofold and the freight capacity threefold. The case was somewhat different with sailing ships, for though they continued to increase both in number and tonnage up to 1888, they began to fall off after that year, this downward movement reaching the climax in 1896. At the end of that year the ships of this class numbered 644 representing 44,055 tons altogether. After 1898, however, another change came over this branch of shipping activity. At the end of that year the aggregate increased at one jump to three times as much as it was in the preceding year. This tendency continued in the succeeding years, so that at the end of 1901 the ships of this type numbered 4,020 with no less than 336,436 tons altogether. In the following

year the corresponding figures fell slightly, being 3,977 and 336,154 respectively. This remarkable increase both in the number of vessels and in their tonnage compared with what it was before is to be sought in the fact that, in consequence of the amendment of the Ship Inspection Law, the *koku* system of computing the capacity that had previously been adopted for quite a large number of ships was superseded by the ordinary method of computation by tonnage. Naturally this resulted in a large increase in the gross tonnage. The increase of steamers has also had a stimulating influence on the construction of subsidiary vessels of this particular type.

NUMBER AND TONNAGE.—The principle of the survival of the fittest has driven the native junks to the wall, for not only are they not up to the requirements of modern navigation, but the Government has decided to restrict the building of ships of this type. Below is given a table showing the number and tonnage of ships from 1870, and especially during the last ten years:—

Year.	Steamers.		Sailing Ships.		Junks (over 50 <i>koku</i>).	
	No.	Tonnage.	No.	Tonnage.	No.	<i>koku</i> Tonnage.
1870... ..	35	15,498	11	2,454	?	?
1872... ..	96	23,364	35	8,320	18,640	3,312,281
1877... ..	183	49,105	75	13,648	18,964	3,251,425
1882... ..	344	42,199	428	48,985	17,331	2,930,842
1887... ..	486	115,365	798	64,416	17,194	2,851,247
1892... ..	642	165,764	780	49,085	18,205	3,069,816
1893... ..	680	176,915	749	48,303	17,209	2,878,462
1894... ..	745	273,419	722	46,959	17,300	2,876,131
1895... ..	827	341,369	702	44,794	17,360	2,960,887
1896... ..	899	373,588	644	44,055	17,612	3,066,128
1897... ..	1,032	438,779	715	48,130	19,097	3,320,284
1898... ..	1,130	477,430	1,914	170,894	19,099	3,049,035
1899... ..	1,221	510,007	3,322	286,923	18,479	2,713,646
1900... ..	1,329	543,365	3,850	320,571	18,796	2,785,114
1901... ..	1,395	583,532	4,020	336,436	19,758	2,921,565
1902... ..	1,441	610,446	3,977	336,154	18,743	2,351,950

Note:—The tonnage as given in the table was the registered tonnage prior to 1884 inclusive, after which the gross tonnage computation has been used. The *koku* used for indicating the freight capacity of Japanese junks amounts to one-tenth of a gross ton.

TWO MAIN CLASSES OF SHIPS.—It should be noted here that Japanese ships and boats are divided, according to the provisions of the Law of Ships, into two main classes, that is those which require shipping certificates and those which do not require such certificates. (Art. 20 of the Law of Ships provides that ships below 20 gross tonnage or the *koku* freight capacity not exceeding 200 *koku*, lighters or boats worked by the use of oars alone need not require shipping certificates). The ships requiring the certificate are called “registered ships” and those not requiring it “unregistered ships.” It is hardly necessary to add that the ships of the registered class form the mainstay of the maritime trade, and those of the unregistered type are accessories to them. Hence it is sufficient to give here data about the registered class ships alone. Before doing so a brief remark will be made on the relative number, kind, etc. of registered and unregistered ships during the last ten years:—

Year.	Registered Ships.			Unregistered Ships.		
	Steamers.	“Tonnage” Sailing Ships.	“ <i>koku</i> ” Sailing Ships.	Steamer.	“Tonnage” Sailing Ships.	“ <i>koku</i> ” Sailing Ships.
1893	400	218	—	280	531	17,209
1894	461	196	—	284	526	17,300
1895	528	173	—	299	529	17,360
1896	570	165	—	329	479	17,612
1897	626	171	—	406	544	19,097
1898	674	1,310	—	456	604	19,099
1899	753	2,783	222	468	539	18,257
1900	859	3,309	911	470	541	17,885
1901	969	3,565	1,355	426	455	18,403
1902	1,033	3,591	1,260	408	386	17,483

CARRYING CAPACITY OF SHIPS.—The average carrying capacity of ships flying Japanese flag increases or decreases with the progress of times and according to kind, for though the carrying capacity should enlarge with the extension of scope of navigation, the progress of trade or of shipbuildings business, this remark can apply only to ships of one and the same class, placed under the same circumstance. But the ships differing in construction or kind, or differing in the nature of service cannot make any... uniform progress

in their average carrying trade. In making further inquiries, the average carrying capacity of steamers of registered class that was 427 tons in 1887 and 419 in 1892, jumped at one bound to 572 in 1894. The average recorded after 1895 was even as high as 689 tons. This extraordinary increase of the average tonnage was chiefly attributable to the purchase of many large steamers on the occasion of the Japan-China war and also after it. The average of "tonnage" sailing ships was 135 tons in 1887, 143 in 1892, 160 in 1897. Coming to 1902 it fell down to only 92 tons.

NUMBER OF SHIPS CLASSIFIED BY CARRYING CAPACITY.—The number of registered ships classified according to size, the bulk for "tonnage" sailing ships consisted during the last ten years of those ranging from 20 to 100 tons; those of 100–500 tons followed next, while only a small number were of over 500 tons. This progressive diminution of number with an increase of carriage capacity is also seen in steamers, for those of over 5,000 tons did not exceed one-fiftieth of the whole number even at the time when big steamers reached the highest record. The following table showing the comparative statement of registered tonnage, etc. will further explain this point:—

STEAMERS.

Year.	20—100 Tons.	100—1000 Tons.	1000—5000 Tons.	Over 5000 Tons.	Total.
1893	119	225	56	—	400
1894	132	242	76	1	461
1895	148	266	113	1	528
1896	157	287	125	1	570
1897	175	311	132	8	626
1898	202	328	130	14	674
1899	262	343	132	16	753
1900	349	351	142	17	859
1901	427	372	150	20	969
1902	479	372	162	20	1,033

"TONNAGE" SAILING SHIPS.

Year.	20—100	100—500	Over 500	Total.
	Tons.	Tons.	Tons.

1895... ..	68	98	7	173
1896... ..	67	91	7	165
1897... ..	69	95	7	171
1898... ..	635	668	7	1,310
1899... ..	1,752	1,025	6	2,783
1900... ..	2,201	1,104	4	3,309
1901... ..	2,362	2,201	2	4,565
1902... ..	2,348	1,241	2	3,591

NUMBER OF SHIPS CLASSIFIED BY TYPES.—To classify the registered ships according to their type and the material used in their construction of the frame-work, steamers were generally built of wood at first. With the expansion of the service and the increase of carrying capacity, iron or steel-framed steamers have increased in number. Then in the relative number of iron-frame or steel-frame steamers, the latter were at first very small, not exceeding one-sixth of the whole in 1892. The ratio gradually advanced till the relative position was reversed after 1899. At the end of 1902 steel-frame steamers constituted 17 per cent., the iron-frame steamers 12 per cent., and the iron-wood composite steamers 1 per cent., in the whole number of registered steamers. The state of things was entirely different with registered sailing-ships. Prior to 1897 there was only one iron-framed vessel and between 1898 and 1900 one steel-framed vessel, the rest having wooden-frames. The following table gives the relative number of ships built during the last ten years, and classified according to the nature of the material of which they were built:—

STEAMERS.

Year.	Steel or Steel-Iron.	Iron.	Iron-Wood.	Wood.	Total.
1893	18	91	12	279	400
1894	35	112	11	303	461
1895	46	131	11	340	528
1896	60	138	11	361	570
1897	81	136	12	397	626
1898	94	125	12	443	674
1899	116	123	13	501	753
1900	136	130	13	580	859
1901	154	135	13	667	969
1902	171	129	13	720	1,033

"TONNAGE" SAILING SHIPS.

Year.	Steel or Iron.	Wood.	Total.
1893	1	217	218
1894	1	195	196
1895	1	172	173
1896	1	164	165
1897	1	170	171
1898	1	1,309	1,310
1899	1	2,782	2,783
1900	1	3,308	3,309
1901	—	3,565	3,565
1902	—	3,591	3,591

NUMBER OF SHIPS AS TO AGE.—To classify the number of registered ships as to age, at the end of 1902 the ships (steamers and sailing ships combined) that were five to ten years old numbered most, followed by those under five years, while those above ten years gradually dwindled in number with their increase in age. For the registered steamers the order of the relative superiority of number was as follows as to age: 5 to 10 years, under 5 years, 10 to 15 years, 15 to 20 years, 20 to 25 years. The foregoing classification also holds good for "tonnage" sailing ships. However the condition differed slightly for "koku tonnage" sailing ships, for in this case the number of ships less than 5 years old was less than that of those 10 to 15 years old.

NUMBER OF SHIPS ON DIFFERENT SERVICES.—According to the

existing laws and ordinances bearing on navigation and ships, there are four kinds of service, these being ocean service, territorial sea service, coasting-service, and inland-water service. The same legislative measures provide strict regulations about the kind, tonnage, construction, etc., and only those that are judged seaworthy are permitted to run on the service.

The registered ships classified according to the different kinds of service were distributed as follows at the end of 1902.

OCEAN-GOING SERVICE.—87 steamers with 287,794 gross tonnage, 5 “tonnage” sailing ships with 598 gross tonnage.

TERRITORIAL SEA SERVICE.—269 steamers with 237,098 gross tonnage; 3,369 “tonnage” sailing ships with 318,355 gross tonnage, 1,002 “*koku tonnage*” sailing ships with 480,759 *koku*.

COASTING SERVICE.—332 steamers with 43,613 gross tonnage.

INLAND-WATER SERVICE.—339 steamers with 3,557 gross tonnage.

Besides, there were in the same year other ships which could not be included in the above list owing to the fact that they had not yet undergone fresh examination after the term of the certificate they obtained before had expired, or that they had not yet received the certificate even when they underwent the examination. Among the ships of this extra class there were 6 steamers with 2,565 gross tonnage, 217 “tonnage” sailing ships with 9,230 gross tonnage, 258 “*koku*” sailing ships with 67,663 *koku*.

II. SHIPBUILDING.

GENERAL REMARKS.—It goes without saying that the carrying trade being inseparably connected with shipbuilding work, the expansion of the one depends upon the activity of the other. As might naturally be expected, the shipbuilding work of Japan that had formerly been confined to the building of Japanese junks alone underwent, with the advent of the new order of things, a radical change in the nature of its work and began to include the building of foreign-shaped ships. With only imperfect experience and with insufficient materials, Japanese shipbuilders could at first build only

sailing ships and small steamers, so that Japan had to depend on foreign shipyards whenever any large steamers had to be built. Steadily and gradually our builders acquired greater experience and knowledge, and the industry, encouraged by the putting in operation in October 1896 of the Law for Encouraging Shipbuilding, has begun with energy to make a new departure. Though only a few years have elapsed since that time, already our shipbuilders have succeeded in building large steamers well qualified to be placed on a foreign service. They have even built some steamers to the order of foreign countries. One serious defect however, still, remains unremoved in our shipbuilding industry. That is our inability to get a supply of the necessary materials at home. It is satisfactory, however, to think that the steel-making industry has been started here and there that there is great hope of our shipbuilders being supplied before long with home-made materials which they must now order abroad. When that time has arrived a new epoch will dawn on the shipbuilding industry of Japan.

NUMBER OF FOREIGN-BUILT AND HOME-BUILT SHIPS.—Though the supply of ships of large displacement can to-day be satisfied at home, Japan is still more or less dependent in this matter on foreign countries. The relative proportion of foreign-built ships and home-built ships in Japan is shown with greater accuracy by the following statement:—

Year.	Built at Home.				Purchased Abroad.			
	Steamers.		Sailing Ships.		Steamers.		Sailing Ships.	
	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.
1870-'72 ...	13	250	1	50	71	17,179	34	8,660
1873-'77 ...	43	1,178	32	2,448	77	34,826	29	6,987
1878-'82 ...	149	8,899	431	39,568	18	2,946	47	13,486
1883-'87 ...	95	8,846	113	10,718	32	24,849	9	2,376
1888-'92 ...	147	23,172	63	5,357	40	42,124	1	440
1893 ...	26	3,967	4	459	10	13,036	2	1,778
1894 ...	33	5,847	10	1,311	38	96,072	—	—
1895 ...	47	8,977	6	951	35	96,424	2	572
1896 ...	36	5,860	11	1,061	27	34,891	—	—
1897 ...	57	10,698	18	2,472	22	67,454	—	—
1898 ...	54	13,929	202	20,836	10	44,110	1	114
1899 ...	53	18,157	216	20,342	9	25,474	1	83
1900 ...	53	15,308	193	17,873	13	28,492	2	235
1901 ...	71	31,829	202	20,259	12	16,344	1	113
1902 ...	67	16,328	137	13,035	10	20,634	—	—

Note:—The tonnage consisted of registered tonnage prior to 1889, after which year the gross tonnage has been adopted.

The foregoing table demonstrates that in the matter of building sailing-ships, the industry began to show great activity from about 1876. After 1889 the sailing-ships purchased abroad numbered only one or at most two every year. At present Japan builds all the sailing ships she wants. On the other hand, though the number of foreign-built steamers fell below that of the home-built ones after 1876 in respect to tonnage this superiority of home-built ships occurred only in 1878—1883 years, the tonnage of foreign-built steamers generally surpassing that of the other in most other years. This relative superiority of the tonnage of foreign-built steamers was owing to the fact that the art of shipbuilding had not yet advanced sufficiently at that time in Japan to allow of her undertaking the building of ships of large displacement.

AVERAGE TONNAGE OF HOME-BUILT AND FOREIGN-BUILT SHIPS.—The relative average tonnage of the two classes of ships will make this point still more clear:—

Year.	Average Tonnage of Home Built Ships.		Average Tonnage of Foreign Built Ships.	
	Steamers.	Sailing Ships.	Steamers.	Sailing Ships.
1870-'72	19	50	242	255
1873-'78	274	77	452	241
1879-'82	60	92	164	287
1883-'88	93	95	777	264
1889-'92	158	85	1,053	440
1893-'97	178	138	2,105	588
1898-1902	321	97	2,557	109

TONNAGE AND TYPE OF HOME-BUILT SHIPS.—In order to explain the latest condition of our shipbuilding industry, the displacement and construction of newly built ships at home during the last four years will be shown in the following table:—

TONNAGE OF REGISTERED SHIPS BUILT AT HOME.

Year.	Steamers.					Sailing Ships.			
	20-100.	100-1000.	1000-5000.	Over 5000.	Total.	20-100.	100-500.	Over 500.	Total.
1898	198	278	2	1	479	635	662	4	1,301
1899	258	290	4	2	554	1,750	1,018	3	2,771
1900	342	300	9	2	653	2,201	1,098	3	3,302
1901	417	318	15	4	754	2,362	1,196	1	3,559
1902	469	320	20	4	813	2,348	1,236	1	3,585

CONSTRUCTION OF REGISTERED SHIPS BUILT AT HOME.

Year.	Steamers.					Sailing Ships.		
	Steel or Steel-Iron.	Iron.	Iron-Wood.	Wood.	Total.	Steel or Iron.	Wood.	Total.
1898	22	16	4	437	479	1	1,300	1,301
1899	37	16	5	496	554	1	2,770	2,771
1900	56	18	6	573	653	1	3,301	3,302
1901	70	22	6	656	754	—	3,559	3,559
1902	81	19	6	707	813	—	3,585	3,585

Sailing ships being now almost wholly made at home, the relation of home-built sailing ships and foreign-built sailing ships as to tonnage and construction is practically identical with that explained at some length in the first chapter concerning the general condition of sailing-ships in Japan. As to steamers, the smaller vessels not exceeding 100 tons numbered most, being followed by those ranging from 100 to 1,000 tons, steamers above 1,000 tons being comparatively scarce. In regard to construction the majority of the vessels were of wood, followed by steel-framed and iron-framed vessels, and lastly by wood-iron composite vessels. Comparing the foregoing particulars with the details as specified in the first chapter, it can be seen that while vessels under 1,900 tons displacement were mostly built at home those of large displacement came from foreign dockyards. Then in construction the wooden vessels were in most cases built at home, steel and wood-iron composite vessels being built at home and foreign dockyards in nearly equally proportion. But in regard to iron-framed vessels the share contributed by home shipyards was very small.

SHIPYARDS.—Our shipbuilding yards have considerably been increased in number. At the end of 1892 they numbered only 60, and the number grew to 106 six years later, and then to 1,666 at the end of 1902.

PROTECTION OF SHIPBUILDING WORK.—A few words should be said concerning the Law of Encouraging Shipbuilding mentioned

above. The encouragement bestowed by this law is in the form of bounties granted to ships built according to the rules prescribed by that law. They must also be built at the shipyards possessing the qualifications determined by this law. The bounty is 12 *yen* per ton of the body of the ship for steamer of not more than 700 or not less than 1,000 gross tonnage. The rate is 20 *yen* for one exceeding 1,000 tons. Further, the additional bounty at the rate of 5 *yen* per one horse-power is granted on the engine.

The steamers built or in course of building at our shipyards from the enforcement of the law in question to the end of 1902 number 33 with an aggregate gross tonnage amounting to about 80,091.

III. SHIPS CREW.

LEGISLATIVE MEASURE.—The first legislative measure was that issued by the Government in June 1896. It related to the license examination of captains, mates and engineers for foreign-shaped ships. The measure provided that unless possessing the licenses granted in accordance with the provisions contained in it no person could become captain or mate or engineer for a foreign-style ship of not less than 100 registered tonnage and 50 effective horse-powers. The measure has more than once been subjected to amendment until it finally assumed its present form. The existing law was issued in 1896.

OFFICERS.—The ship's officers comprise, according to the law, captains, first and second mates, chief and first engineers, all of whom are required to possess the proper license to be qualified for their respective services. No discrimination with regard to nationality is enforced with regard to this qualification, and those who are legally qualified according to the Japanese law are permitted, no matter what nationality they belong to, to be officers of ships flying the Japanese flag. Appended is a statement giving particulars of the number of the licensed officers and of the relative number of Japanese and foreign officers from 1882 to 1887 and also during the last ten years.

LICENSED OFFICERS.

Years.	1st Class.		2nd Class.		Captains 2nd Class and Mates.	Chief Eng- iners.	Engineers.	Total.

The foregoing table shows that the number of Japanese officers of all classes and grades is steadily advancing. This was also the case with foreign officers prior to 1898, but since then, as a result of legislative changes, their number has gone down quite suddenly. To carry the comparison still further, the management of craft of larger displacement had to be left at first, owing to the peculiar circumstances of the case, in charge of foreign officers, so that Japanese officers had to content themselves with being captains and engineers of ships of smaller displacement. As the system of nautical education has since then become more and more perfect and as the number of Japanese trained under that system has increased, there are at

the present time many Japanese sailors as well qualified to manage first class steamers as foreigners.

TRAINING OF OFFICERS AND MEN.—The organs now existing for the purpose of training officers and men are the Nautical College conducted under the direct supervision of the Government, Merchant Navigation Schools of a briefer course established under the Technical Education Law, and lastly the Sailors Home.

The Nautical College originated in the Mitsubishi Merchant Navigation School established in 1875 by the Mitsubishi Firm in accordance with the instruction of the Government. It was converted seven years later into a Government institution. The Nautical College trains boys who are to become officers of the highest grade both in the art of navigation and in that of engineering. The graduates are enrolled in the Naval Reserve list, and hence subject to observe the rules enforced in the Naval service.

SAILORS HOME.—The Sailors Home was established in August of 1880 for the purpose of training officers and sailors and also for according protection to them and their families. The home has been receiving a State Subsidy of 10,000 *yen* since 1896.

PILOTS.—Rules relating to pilots and pilotage were first enacted in December of 1876, the rules applicable only to ships of foreign pattern. In consequence of that enactment only properly qualified persons were permitted, as is also the case at present, to discharge the duty of pilots. The existing Pilotage Law that was promulgated in 1899 and it provides that no person not qualified according to the law, may act as a pilot in the pilotage roads; that the pilots must be Japanese subjects who have passed the prescribed examination and whose names appear in the official pilotage list.

Formerly the pilotage licence was granted to people of all nationalities, provided they were qualified according to the Japanese law, but as mentioned above the restriction as to nationality was enforced by the new Pilotage Law, with this reservation, however, that within the limit of five years from the enforcement of that law the Minister of State concerned is entitled to grant the license to properly qualified foreigners. Consequently the pilotage list still contains quite a large number of foreigners. The appended statement will make this point clear:—

PILOTAGE LIST.

Year.	Japanese.	Foreigners.	Total.
1879	1	18	19
1882	5	15	20
1887	4	12	16
1892	6	17	23
1893	7	17	24
1894	8	14	22
1895	9	18	27
1896	9	19	28
1897	8	18	26
1898	6	18	24
1899	5	18	23
1900	5	17	22
1901	7	19	26
1902	8	18	26

IV. LIFE-BOAT PROVISIONS.

The existing legal provisions about life-boat affairs were issued in 1899. The law provides that life-boat matters are dealt with by mayors of municipal or headmen of rural, corporations, and they are entitled, in carrying out the rescue business, to requisition the service of men and ships, wagons, horses and other necessary matters. The mayors and headmen have to deal with salvage and to settle expenses incidental to the rescue, and they are also under obligation to furnish a rescue report to the captain when the latter makes a request to have it. However when the attempt of rescue fails the expenses required have to be defrayed out of the State Treasury. The Life-boat Law also contains provisions to flotsam and jetsam.

The Japan Life-boat Association was established in November 1889. At first it possessed only two rescue stations, one at Yojima and the other at Tadotsu, both in the province of Sanuki. With the expansion of the scope of the work, and especially since the State decided in 1897 to grant 20,000 *yen* every year, the number of main stations has been increased to 21 with 17 branches and 6 life-boat associations.

V. PROTECTION TO NAVIGATION.

GENERAL REMARKS.—That the prosperity of Japan is inseparably connected with the prosperity of her carrying trade is a foregone conclusion, considering the situation of the country. Japan therefore has faithfully adhered since 1870 to the national policy of encouraging carrying trade, and especially to maintain an active and efficient ocean service.

Two different systems of protection are adopted in this connection, one being special protection accorded to special service and therefore limited to special kind of shippers while the other is general protection and therefore accessible to all shippers who fulfill certain prescribed conditions. The two systems being therefore distinct in nature and possessing distinct history had better be described under separate headings.

SPECIAL PROTECTION.—The protection given for the first time to our shippers was more than special; it was not merely to help their business, it was really to support their very existence. It was with this end in view that in 1870 the Government caused the Reiganjima Navigation Company to run with two steamers a monthly service between Tokyo and Ōsaka. When two years later that company was wound up, and the Japan Mail Steamship Company was created, the Government sold to the new company the steamers it had in its possession and made them to carry on regular coasting services.

After three years this company ceased to exist, but its disappearance did not much affect the prosperity of the maritime business of Japan, for by that time the Mitsubishi Steamship Company had been in existence for some years.

Mitsubishi S. S. Company. This Company was the next recipient of the Government protection, and had a number of steamers belonging to the Government sold to it in easy terms. The carrying trade of Japan made at the same time a noteworthy departure, for its scope of operation was extended to Shanghai to which a regular service was established. Both on this and also on the regular coasting service the Government granted a certain amount of subsidy.

In 1882 the Kyōdō Unyu Kaisha (Union Steamship Company) was established and the Government protected its business, on condition that the company would run certain regular service.

The amalgamation of the Steamship Company and the Mitsubishi Steamship Company in 1885 and the establishment, as result of this amalgamation, the present Nippon Yusen Kaisha was an occasion of altering somewhat the system of giving protection. The new system consisted in guaranteeing the profit of the company and his was agreed

to for fifteen years from the date of the creation of the company. The guaranteeing of the profit was limited within a certain fixed rate of dividend to the paid-up capital of the company. In return for this protection the company was made to open various new regular services, both domestic and foreign. In 1887 the guaranteeing of profit was altered into granting a certain fixed amount of subsidy. In the following year another steamship company, the Ōsaka Shosen Kaisha, was granted a subsidy for eight years for consideration of running regular services on prescribed routes. The subsidy to the two companies ceased with the expiration of the respective contracts, so that this special form of protection is no longer in vogue.

PROTECTION OF FOREIGN SERVICES.—With the discontinuation of this system of protecting certain shippers another and more comprehensive method of encouraging foreign services and of protecting them has been adopted. In pursuance of that policy, protection was granted in 1896 on the Yokohama-Adelaide service; in 1898 on the Shanghai-Hankow, Shanghai-Suchow, and Shanghai-Hangchow services; in 1899 on the Hankow-Ichang services. Those services were somewhat altered soon after, while at the same time several subsidized lines were newly established. The subsidized lines now run by Japanese shippers in accordance with the order of the Minister of Communications are as follows:—

Yokohama-Melbourne, Yokohama-Bombay, Japan-Europe, Hongkong-Seattle-Yokohama-Shanghai, Kobe-North China, Kobe-Vladivostock, Kobe-Oturu, Aomori-Muroran, Hongkong-San Francisco, Shanghai-Hankow, Hankow, Ichang, Kobe-Korea, Shanghai-Suchow, Shanghai-Hangchow, Suchow-Hangchow, Japan Sea.

SUBSIDIZED LOCAL LINES.—Besides, there are other subsidized liner of local importance, these being undertaken under help from the Formosan Government, Hokkaidō Government and Prefectural Governments, as follows:—

SUBSIDIZED BY THE FORMOSAN GOVERNMENT:—Tamsui-Tokosu, Kelung-Kobe (two), Takao-Yokohama, Kelung-coasting, Tamsui-Hongkong, Amping-Hongkong, Fuchow-Hongkong, Fuchow-Santuugao, Fuchow-Hinghwa, Amoy-Shima services.

SUBSIDIZED BY THE HOKKAIDŌ GOVERNMENT:—Nemuro-Hakodate, Nemuro-Shana, Nemuro-Abashiri, Otaru-Wakanai, Wakanai-Abashiri, Hakodate-Otaru, Otaru-Teshio, Hakodate-Otsu, Ishikari river services.

SUBSIDIZED BY PREFECTURAL GOVERNMENTS CONCERNED:—Ogasawara group (4), Oshima group (Kagoshima), Oki group and main island, Sakijima (Okinawa), Okinawa islands services.

GENERAL PROTECTION.—Besides the protection given to special routes for maintaining regular service necessary for keeping up regular facilities of conveyance and intercourse, protection is extended, in accordance with the Law of Encouraging Navigation, to service of other descriptions irrespective of shippers or routes, with the object of furthering in general the cause of general shipping trade. This protection in the form of subsidy is given to all those services which satisfy the conditions specified in the law in question. To be more in detail, the law subsidises steamers which come up to the standard mentioned in the provisions and which carry on regular service between Japan and foreign coast or along the coast of foreign countries. The subsidy is at the rate of 25 *sen* per ton per 1,000 miles covered, and for steamers that are not less than 1,000 gross tonnage capable to develop the speed of 10 knots per hour. The rate increases with an increase of tonnage and speed.

RETURNS RELATING TO GENERAL PROTECTION.—The number of steamers, gross tonnage and the distance traversed by them since the law was put into operation are given in the appended table:—

Fiscal Year.	Number.	Gross Tonnage.	Distance Traversed. Miles.
1879—... ..	11	48,596	251,740
1898—... ..	24	115,102	771,647
1899—... ..	29	130,461	1,164,708
1900—... ..	18	74,530	543,906
1901—... ..	15	57,199	471,321
1902—... ..	15	49,446	477,561

VI. NAUTICAL SIGNALS.

GENERAL REMARKS.—It was in May of 1866 that Japan agreed in accordance with Art. XI of the tariff convention concluded with Great Britain, France, United States of America, and Holland to construct after foreign style nautical signals in the vicinity of the open ports. To fulfill this agreement the Government of the day purchased from England a set of necessary lighthouse materials, and also engaged an expert from the same country.

KINDS OF SIGNALS.—The nautical signals of Japan are divided according to construction and method of maintenance into three classes, namely, Government, communal and private. The private signals numbered over 100 formerly, but they were far from satisfactory in construction and working. At last the Government decided to prohibit the building of signals by private individuals in 1885, and a notification to that effect was issued in that year. It was provided that the construction of new private signals for the use of public would be prohibited in the future; that the old signals that had not been exacting due should be discontinued by 1895; that the due-collecting signals the establishment of which was permitted for a specified period should be stopped on the arrival of that period, and finally for other signals of the same kind that had no fixed period of existence such period should with the approval of the supervising authorities, be determined. Even at present, therefore, more or less private signals exist.

On the other hand the number of signals constructed and maintained by civic corporations is gradually increasing as is also the case with the Government signals.

NUMBER OF SIGNALS.—The appended table will explain the condition of the work since 1869 when Japan constructed for the first time nautical signals after Western pattern. Here is the table:—

Year.	Government.	Communal or Private.		Total.
1869	9	108		117
1872	32	101		133
1877	55	100		155
1882	66	145		211
1887	78	140		218
1892	106	35	89	230
1898	140	45	21	206
1902	172	53	15	240

VII. OPEN PORTS.

NUMBER OF THE PORTS.—At present there exist 30 ports open to foreign trade, these being Yokohama, Kobe, Nagasaki, Hakodate, Niigata, Ebisu, Osaka, Shimizu, Taketoyo, Yokkaichi, Itozaki, Shimonoseki, Moji, Hakata, Karatsu, Kuchinotsu, Misumi, Izuhara, Sasuna, Shikami, Naba, Hamada, Sakaye, Miyazu, Tsuruga, Nanao (southern basin), Fushiki, Otaru, Kushiro and Muroran. With the object of maintaining order and tranquility in such of the ports having busier shipping traffic Harbor Regulations were issued in 1898. Three ports of Yokohama, Kobe and Nagasaki were at once placed under this legislation, which was also extended two years later to Moji.

SHIPPING RETURNS OF THE FOUR PORTS.—The number of ships, both Japanese and foreign, that have entered and cleared those four ports since the enforcement of the regulations is given in the appended statement:—

Year.	Yokohama.		Kobe.		Nagasaki.		Moji.	
	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.

PART VIII.

EDUCATION.

Introductory—General Education—Higher Education Technical Education—Libraries.

I. INTRODUCTORY.

IN THE PRE-RESTORATION DAYS.—Education in Japan dates from remote antiquity, and the national traits of faithfulness, filial piety, as well as valor have received from education a powerful stimulus. Intercourse with China and Korea naturally left on our educational system a peculiar stamp of its own, and Japan owed very much to these two neighbors in respect of her science and art. Whatever may have been the moving force of our education in its early stages, there exist ample authentic evidences attesting how even in ancient times culture and learning attained a high degree of development. Then followed centuries of intellectual retrogression occasioned by the incessant civil strifes of the "Middle Ages," to be succeeded by the revival and renaissance of the period of the Tokugawa. It ought to be remembered, however, that education as it was known prior to the Restoration was extremely narrow in scope and limited in operation. In fact it practically consisted in belles-lettres and what are called humanity studies, the latter based on the Chinese and Japanese classics. It has been only since the Restoration that education in its modern sense has first been planted on our soil and that the system has been subjected to a thorough change.

AFTER THE RESTORATION.—True to national tradition, the Government bestowed special attention on matters of education, and in the very first year of the era several institutions were either

created or thoroughly re-organized. The year 1869 saw the establishment of an Imperial University, while two years later educational affairs were entrusted to an independent Department of State. Next year the educational system was drawn up and proclaimed, and the utmost efforts were made to promote the cause of general and higher education. Since then, in accordance with the requirements of the times, amendments of the system and improvement of the arrangement have been carried out frequently, till we witness the very full provisions as are existing to-day. In describing the existing educational system, a brief survey of the administrative organizations bearing upon it should first be given.

EDUCATIONAL ADMINISTRATION.—The Department of Education superintends the educational affairs of the country besides maintaining institutions essential for the State. In a similar way each local office superintends the educational affairs in its own jurisdiction and maintains at its own expense the schools required in it, and this remark also applies to each district, municipal or rural corporation. The institutions maintained by the Department are called Government institutions while those maintained by local, district or corporation expenses are called public or communal schools. The latter are of two kinds, one of them established in conformity with the order of the Government and the other established at the initiation of the body public concerned. Normal schools, middle schools and higher girls' schools are schools which the provincial offices are obliged to maintain in their jurisdiction, the number to be one or more according to circumstances. The schools which a municipal or rural corporation is under obligation to maintain are primary schools. All the other kinds of schools maintained by all these public bodies are maintained by such bodies of their own accord and of course with the approval of the central Government.

Besides, there are schools established by private individuals on their own account, and these are called private schools.

Being under the direct control of the Department of State, all matters relating to the establishment or abolition or re-organization of the Government institutions are solely determined by the Department, while all matters relating to the establishment or discontinuation or re-organization of prefectural schools are carried out

by the respective prefectural offices with the approval of the Minister of Education, while the appointment or relief from office of directors and teachers is made by the prefectural Governors concerned. It ought to be added that the directors of normal schools are civil officials of the higher civil service. Matters relating to schools maintained by districts and municipal or rural corporations are carried out with the approval of the Minister of Education, when they relate to the establishment, abolition or re-organization of higher girls' schools, middle schools and technical schools. The prefectural Governors concerned arrange on their own sole responsibility all those matters relating to schools of other descriptions. Similarly matters relating to the establishment, abolition or re-organization of private schools are dealt with by the prefectural Governors as in the case of district or communal schools.

Government schools are allowed, in accordance with the Law of Special Finance, to set apart as permanent funds of the schools, the income and other receipts, and in a similar way public or communal schools are allowed to create their permanent funds by setting apart their income of whatever description.

Matters relating to the establishment, abolition or re-organization of kindergartens, or public libraries as also to the appointment and relief from office of the staff thereof are generally dealt with according to the corresponding process of the schools mentioned above. Then in case private individuals apply to the authorities for permission to establish and maintain at their own expense schools, kindergartens, or public libraries, the Minister of Education or the prefectural Governors concerned give permission when they judge that such permission should be accorded. Those private institutions then receive similar treatment and privilege as public institutions of the corresponding character.

The qualifications of the members on the staff of the Government schools are determined according to that section in the Civil Appointment Regulations that relates to teachers, while the qualifications of public or private schools are limited only to those who possess the license granted either by the Minister of Education or by local Governors, according to the kind of the schools. The teachers of both the Government and public schools are entitled to

a pension either for themselves or to their families, in accordance with the respective legislative measures provided for the purpose.

The administrative affairs relating to education are, as described above, taken charge of by the Department of Education, prefectural offices, district offices and civic corporations. In the Department of Education several bureaux and sections are established to deal with educational affairs, and, besides, school-inspectors are appointed to inspect the condition of the schools throughout the country. The prefectural offices also keep their own school-inspectors and assistant school-inspectors are appointed or relieved of office as officials of the higher civil service. The district also keeps its own inspectors to superintend its education, but in civic corporations this duty is undertaken by officials who have to attend to it as additional function.

Appended is a table showing the condition of the various educational institutions existing at the end of 1901 fiscal year:—

II. GENERAL EDUCATION.

A. KINDERGARTENS.

The first kindergarten in Japan was established in Tokyo in 1876. The number has since been considerably increased, so that at present every province has one or more kindergartens. The necessity of an institution for the training of qualified nurse having come to be felt, a nurse course was newly

opened in 1878 in the kindergarten affiliated to the Tokyo Womens' Normal School. The example set in Tokyo has since been followed in many provinces.

According to the existing provisions the number of children to be taken into a kindergarten is limited to 100, which number could in special circumstances be increased to 150. Each nurse has to take charge of not more than 40 children. According to the inquiries instituted at the end 1901 fiscal year, there were 254 kindergartens throughout the country and they comprised one Government establishment, 181 public establishments, and 72 private establishments. The number of nurses totalled 671 of which six were in Government establishments, 496 in public institutions and 169 in private establishments. The pupils numbered 23,671.

B. PRIMARY SCHOOLS.

HISTORY.—Family schools and schools maintained by the local feudal fiefs were in olden days the seats of learning, the former being mostly for children of the plebeian class and the latter for those of the *samurai*. The schools maintained by the fiefs taught first of all Chinese classics, then penmanship and arithmetic while the humbler schools taught penmanship, reading and counting. The education in those days was, therefore, far from perfect, absolutely speaking, but such as it was it satisfied the requirements of the time, and, especially as it was supplemented by the influence of a rigid domestic education, it attained the principal end of education, that is, it formed character and it supplied culture.

Not a few primary schools based somewhat on the Western model were established soon after the Restriction, but it was not till 1871 that schools of this grade, based on an entirely new system began to make their appearance. In that year the Department of Education brought under its direct control the six primary schools in Tokyo and at the same time it distributed among all the places throughout the country the rules put in force in those six schools. In the following year the school system was elaborated and the whole country was divided into 53,760 primary school sections each with one primary school. This elaboration of the system marks the new era in our education, for it was followed by the creation for the first time of communal and public primary schools.

The system underwent amendments and revisions on many occasions, the last change taking place in 1900. That change was caused by the existing Primary School Law. At the same time rules for putting it in operation were promulgated.

KINDS OF SCHOOLS.—Primary schools are divided into ordinary primary schools and higher primary schools. The two may either exist separately or in combination, in which latter case the schools are called ordinary and higher primary schools.

The term of an ordinary primary school extends four years and that of a higher primary school two to four years according to circumstances. The subjects taught at the ordinary primary schools are morals, reading, arithmetic and gymnastics. Drawing, singing or hand-work, either one or more, may be added according to local circumstances, while for girls a sewing lesson may be added. The subjects at the higher primary schools comprise morals, reading, arithmetic, history, geography, science, drawing, singing and gymnastics. For girls the subject of sewing may be added. For a higher primary school of two year course either science or singing or both may be dispensed with, or a lesson on hand-work may be added; for one of three year course the subject of singing may be dispensed with and on the other hand elementary lesson in agriculture, hand-work or business, may be added. Lastly the lesson in English may be added to the curriculum of the four year course in higher primary school.

At both ordinary and higher primary schools a continuation course may be established for the benefit of those who have graduated from the prescribed course of study, the term of this course not to exceed two years. The programme of study is different according to local circumstances.

The text-books used by primary schools are selected by local text-book committees from among the text-books compiled by the Department of Education or those prepared by private individuals and contained in the approved list. The selection is determined on the approval of the local Governors concerned. As a rule a text-book adopted has to be used for four years, after which the selection is to be made anew.

SCHOOL ATTENDANCE.—The school-age of children extends eight

years commencing from the age of full six years and ending at full fourteen. Parents or those who act for them are under obligation to send to school the children who have reached the school-age, the sending to commence at the beginning of the first school year after the attainment by the child of its school-age. It ought to be added that those who engage children who have not completed the course of elementary education are ordered not to object to those children attending school.

ESTABLISHMENT, MAINTENANCE, FEE.—A municipal or rural community is under obligation to establish and maintain one or more primary schools sufficient to admit children of school-age residing in its jurisdiction. When, however, a rural community is judged to be incapable of bearing this obligation alone, it may enter into an agreement with another community placed in proximity and they may both maintain one primary school in common. Then, in case of the scarcity of children sufficient to form one school, a village may entrust the schooling of its children to a neighboring village possessing one.

The expense required for establishing and maintaining a school must be paid by the corporation concerned, but when a rural corporation is judged to be unable to pay the whole cost the district in which it is contained may give a suitable amount of grant-in-aid. In the case of a district unable to discharge this duty or in the case of a municipal corporation unable to pay the cost required for primary schools, the obligation of making good the deficit devolves on the local treasury.

No primary school can exact a fee from its pupils, unless special circumstances exist to allow it, with the approval of the local Governor, to collect the fee. The amount of this fee may not exceed for ordinary primary schools 20 *sen* a month in the case of a school existing in a municipal district, and 10 *sen* in the case of a town or village school. For a higher primary school the amount may not exceed 60 *sen* a month in the case of a municipal school and 30 *sen* in the case of a town or village school. Children of poor families unable to pay the fee may be exempted either entirely or in part. The fee may also be reduced for a family sending more than two children at the same time.

TEACHERS.—There are three kinds of teachers, regular licensed teachers who are qualified to teach all the subjects in the regular courses, special teachers who have to undertake the teaching of special subjects such as drawing, singing, sewing, English, agriculture, etc. Lastly there are assistant teachers who assist the regular licensed teachers.

Teachers must have a regular license which is of two kinds, one being good for all the country and the other good for only one particular locality. The latter, called a "prefectural licence," is granted by the local authorities to those who have graduated from the prefectural normal school or other schools approved of by the Minister of Education, or those who have passed the prescribed license examination. The other license called "national license," is granted to those teachers of distinguished service who have been in the service for more than ten years; also those who, after having graduated from a higher normal school, have served not less than three years as regular licensed teachers in a city or rural primary school. This license is also granted to those who have graduated from a special course of study at a school approved by the Minister of Education, provided they have been on the teaching staff of a primary school for not less than three years.

TREATMENT OF TEACHERS.—There is fixed schedule of salary for primary school teachers. This extends between the minimum of 6 *yen* and the maximum of 20 *yen* for an assistant teacher, the corresponding limit being 8 to 40 *yen* for a special licensed teacher, and 10 to 75 *yen* for a regular licensed teacher. The maximum for the last kind of teacher may be increased to 100 *yen* provided the teacher in question has rendered distinguished service to the cause of education. Further, special allowances of greater or less amount may be granted to those who undertake to teach more than 30 hours a week, while under no circumstances is the salary of a teacher reduced without his consent.

In the case a teacher dies while on active service or after he has retired, a sum of money corresponding to three times the salary he had drawn the month preceding his death, is given to his family. A special allowance over and above that sum may be granted in the case of a school-master or teacher who has rendered distinguish-

ed service. A school-master or teacher who has sustained injury or contracted disease in the discharge of his duty is allowed his medical expenses. In general, according to local circumstances, houses may be provided or house-rent granted to school-masters or teachers.

A regular licensed teacher of meritorious service who has been on the service for more than five years in one and same province receives an additional allowance of 24 *yen* a year and an assistant teacher similarly qualified receives an allowance of 18 *yen* a year. For every additional five years a regular teacher gets an extra 18 *yen* a year and an assistant 12 *yen*.

A licensed teacher who undertakes the teaching of a single-class primary school may receive an extra allowance of 24 *yen* a year, and in a similar way a teacher discharging service at a multiple-class school situated in a remote district may get extra allowance of 18 *yen*.

The outlay involved in those special allowances described above is to be disbursed by the National Treasury in accordance with the Law relating to State Aid to Primary School Teachers.

SCHOOL STATISTICS.—According to the returns compiled at the end of 1901 fiscal year there were 20,284 primary schools throughout the country together with 6726 branches, making a total of 27,010. Teachers on duty numbered 102,700 and pupils in attendance 4,980,604. The ratio of daily attendance was 85.50 per 100 on the school record. Ordinary primary schools provided with the continuation course numbered 2,113 and higher primary schools possessing similar accommodations 26, making a total of 2,339. The children of school-going age numbered 7,566,886 of which 6,487,499 reached the limit of attendance, the remaining 969,397 not reaching that limit. The ratio of attendance per 100 children who reached the limit of attendance was 93.78 for boys and 81.80 for girls, the average being 88.05.

C. BLIND AND DEAF-AND-DUMB SCHOOLS, NORMAL SCHOOLS ETC.

1. BLIND AND DEAF-AND-DUMB SCHOOLS.—It was in 1878 that a blind and deaf-and-dumb school was first established in Japan. It was established at Kyoto by private individuals. It ought to be added, however, that even before the Restoration there were provisions for teaching the art of acupuncture and shampooing to the blind who

were thus provided with a means of earning a livelihood. The teaching, however, was simple and hardly deserved the name of education as the term is understood to-day. The first blind and deaf-and-dumb school mentioned above was subsequently converted into a municipal institution, and, owing to the grant of money and building made to it by the Imperial Court, it has been considerably expanded in scope. The school is now known by the name of the Kyoto Municipal Blind and Deaf-and-Dumb School.

Following the worthy example set by the people of Kyoto, the citizens of Tokyo also established in 1880 a similar institution of their own, which was transferred to the management of the Department of Education. Under the new management the school has very much enlarged its scope, and it is now a model institution of its kind.

The Tokyo Blind and Deaf-and-Dumb School is divided into two departments, ordinary and technical. The blind students in the ordinary course are taught reading, arithmetic and oratory, and those in the technical course music, acupuncture and shampooing. The deaf and dumb students in the ordinary course are taught reading, penmanship, composition, arithmetic, also written conversation and gymnastics. In the technical course they are taught drawing and painting, sculpture, cabinet-work and sewing. In general every student is made to attend to the ordinary course and to one or more subjects in the technical course; but, according to the request of the parents, this arrangement may be somewhat modified. The term of study lasts three years for blind students learning shampooing and for others it lasts five years. According to the returns made in March 1902 blind and deaf-and-dumb schools both Government and private numbered fifteen, with 79 teachers and 797 students.

2. NORMAL SCHOOLS:—In 1872 a normal school was established in Tokyo and for the first time a provision for training primary school teachers was created. The schools that had previously existed were private schools or family schools and no institution existed for giving special instruction and training for teachers. In the following year six Government normal schools were established at so many different places, while at the same time a women's normal school was established in Tokyo for training women teachers. In 1875

each prefecture was made to establish its own normal school, and in 1877 the Department of Education announced that it would disburse 50,000 *yen* a year as grant-in-aid to all the prefectural normal school expenses throughout the country. The sum was increased to 70,000 *yen* during the subsequent three years.

With the appearance of prefectural normal schools the Government normal schools that had previously created ceased to exist, and only the Tokyo Normal School and the Tokyo Women's Normal School were left remaining to serve as models for prefectural normal schools. Shortly after a special course for training middle school teachers was established at the Tokyo Normal School.

In 1886 the Normal School Regulations were promulgated, providing that the normal schools should be divided into higher and ordinary normal schools, the former, one in number and that one located at Tokyo, to be placed under the direct control of the Minister of Education, and the latter, one in every province, to be controlled by the local Office. In 1897 the regulations in question were superseded by new regulations, the provisions of the two legislative measures however remaining practically identical in the main.

To describe the system of ordinary normal schools as they exist at present, these institutions are schools where those who wish to become primary school teachers are trained. Each prefecture must have at least one normal school which may be divided into male and female departments. In some prefectures independent female normal schools are established. All these schools are under the control of the respective local Governors and the expenses required are paid out of the local treasury. The school expenses of the students are supplied by the same treasury, and in return for this help the students are obliged to give their services at one or another primary school in the prefecture, for ten years in the case of men and five years in the case of women. The schools may also keep students who pay their own school expenses.

In March, 1902, 54 normal schools existed throughout the country with teachers numbering 1,032 and with students of three different courses (main, brief and preparatory) totalling 13,900 and those of training course 4,082.

Each normal school has subjoined to it a model primary school,

which at the same time serves the purpose of giving to the students practical experience in teaching. Further, to give similar opportunities to the girl-students and students of kindergarten nurses, a kindergarten is also provided at some normal schools.

3. HIGHER NORMAL SCHOOLS.—Higher Normal Schools are places where teachers qualified to teach at normal schools, middle schools and higher girls schools are trained. There are two higher normal schools, one at Tokyo and the other at Hiroshima. Placed under the control of the Minister of Education, the outlay is paid out of the State Treasury, while the school expenses of the students are supplied by the respective schools. In return for this help, the students are under obligation to attend for ten years to the work of education at places specified by the Government.

4. THE HIGHER WOMEN'S NORMAL SCHOOL.—This school trains female students who are to become teachers of normal and higher girl's schools. The Tokyo Higher Women's Normal School is the only institution of this kind existing in Japan. The school is managed by the Minister of Education and the schooling expenses of the students are paid by the school. The students are therefore under obligation to attend to work of education for five years from the date of their graduation.

5. MIDDLE SCHOOLS.—Established for the first time in 1872, the middle schools as originally arranged were schools where boys intended for business or who aspired to enter higher institutions were taught. The regulations provided two kinds of middle schools, ordinary and higher, the former established in the provinces and therefore prefectural establishments and the latter Government schools established at important local centres. The regulations that are now in force are those amended in 1901. They provide that one or more middle schools are to be established in every prefecture, the exact number to be determined according to local requirements. The outlay is of course to be met out of the local treasury. A district or a rural or municipal corporation may establish either singly or in combination a middle school of its own, but only when such establishment does not interfere with the work of primary education. Private individuals may also establish a middle school in conformity with the regulations.

In general the number of students of one middle school is fixed at not more than 400 which number may be raised to 600 under special circumstances. A single class must not contain more than 50 students, and the number of teachers must be at the rate of at least two per class for a school containing not more than five classes. For every additional class above five the number of teachers must increase at the rate of $1\frac{1}{2}$ per class.

6. HIGHER GIRL'S SCHOOLS.—In 1872 one girl's school was established in Tokyo and another in Kyoto, the former being a Government and the latter a prefectural institution. Similar schools have been created in almost every prefecture and district throughout the country. Indeed the Higher Girl's School Regulations enacted in 1889 made the establishment of this kind of school in the provinces compulsory. The regulations now in force were those revised in 1901. They provide that a higher girl's school give general education of a higher class to girls, and that one or more schools be established and maintained. Provisions similar to those for middle schools apply in the case of communal schools or schools established and maintained by private individuals.

III. HIGHER EDUCATION.

1. THE IMPERIAL UNIVERSITIES.—The Imperial Universities, one in Tokyo and the other in Kyoto, are maintained by the State Treasury in accordance with the Imperial Universities Regulations.

a. THE TOKYO IMPERIAL UNIVERSITY.—The Tokyo Imperial University, which consists of the defunct Tokyo University, the Engineering College (created in 1885) and the Tokyo Agricultural and Dendrological College (affiliated in 1890), had its origin in the "Institute of Western Knowledge" that existed in the latter days of the Tokugawa Shogunate. It was transferred to the control of the Department of Education of the rehabilitated Imperial Government in 1871. The Tokyo Medical College was united to it six-years after and with this union the name was again changed to the Tokyo University.

The University comprises six colleges, namely Law, Medicine, Engineering, Literature, Science, and Agriculture. The College of

Law is subdivided into two courses, that of law proper and that of politics; and in the same way the College of Medicine consists of the courses of medicine and pharmacy. The College of Engineering consists of nine courses; namely, civil engineering, mechanical engineering, shipbuilding, electric engineering, technology of arms, architecture, chemical technology, technology of explosives, mining and metallurgy. The College of Literature includes philosophy, Japanese classics, Chinese classics, Japanese history, general history, philology, English literature, German literature, and French literature. The College of Science is made up of eight courses, mathematics, astronomy, pure physics, chemistry, zoology, botany, and geology. Lastly the College of Agriculture comprises the courses of agriculture, agricultural chemistry and veterinary medicine.

The number of chairs is 29 for the College of Law, 27 for the College of Medicine, 29 for the College of Engineering, 21 for the College of Literature, 21 for the College of Science, and 22 for the College of Agriculture.

The students who have finished the University preparatory course in a High School are admitted to colleges of their own choice. When, however, the number of candidates is in excess of the accommodation in a given college than admission is made by competitive examination. In case the number of applicants for admission falls short of the number of places vacant, the deficiency may be filled up with the graduates of schools judged by the Minister of Education to be of equal standing with the University preparatory course or those who have passed the examination arranged by the colleges concerned and conducted at the respective High Schools, the examination to be suited to the scholarship of the Schools.

The term of study is not fixed for the College of Law, the diploma being given to those who have passed four academic examinations. In the course of pharmacy of the College of Medicine it lasts four years while in all the other colleges it is three years.

Besides the regular courses mentioned above there is a post-graduate course, the term of which lasts five years. This special establishment is known by the name of "University Hall." The students of Law studying at the Hall are precluded during the first

two years from attending to any work not connected with the subject of their special study: and the students of Literature may not attend to any work not connected with their study, unless with the consent of the College of Literature. These two kinds of Hall students are also prohibited from residing elsewhere than in Tokyo. The Hall students of Medicine, Engineering, Science and Agriculture are under obligation to devote themselves for the first two years to their respective courses of study; nor may they attend to work not connected with the subjects of their study unless with the consent of the Deans of their respective colleges. At the end of the two years the students have to report to their Deans the progress they have made in studies. This report is to be submitted at the end of every year by the students of Law and Literature studying in the Hall. The reports are then submitted by the Deans to the examination of the faculty meeting.

Those students of the Hall who wish to obtain the degree of "Hakushi" shall submit at the end of the prescribed five years to the Deans an essay on their special subject of investigations. A committee will be elected from among the members of the faculty to examine the essays submitted. The applicants for the degree may be required to undergo examination when it is judged necessary by the Committee.

The provisions apart from class-rooms are the library for the whole University; hospital with all the accommodations pertaining thereunto for the College of Medicine; the historigraphical works and reports of linguistic investigations of the Japanese language for the College of Literature; the Tokyo Observatory for the College of Science, the Observatory undertaking astronomical observations and the compilation of almanacs. The same College has also attached to it the botanical garden, seismic observatory, and marine laboratory, while the College of Agriculture has a nursery bed, veterinary hospital, orchard, and training forests.

At the end of March, 1902, the faculty of all the University Colleges comprised 104 professors, 51 assistant professors, 72 lecturers, and 18 foreign professors, making a total of 245. The alumni as computed from the foundation numbered 1,336 for the College of Law, 715 for the College of Medicine, 1,072 for the College of

Engineering, 542 for the College of Literature, 380 for the College of Science, 481 for the College of Agriculture, in all 4,521. The students numbered 467 for the University Hall, 969 for the College of Law, (besides 26 in the elective course), 398 for the College of Medicine (besides 124 in the elective course), 421 for the College of Engineering (besides 6 in the elective course), 285 for the College of Literature (besides 17 in the elective course), 65 for the College of Science (besides 3 in the elective course), 65 in the College of Agriculture (besides 275 in the practical course), in all 3,121 classified into 2,670 students proper and 451 students in the elective and practical course, including 11 foreign students.

b. THE KYOTO IMPERIAL UNIVERSITY.—Established at Kyoto in June 1897 by Imperial Ordinance, the University had at first only the combined College of Science Engineering. In July 1899 the Colleges of Law and of Medicine were added. The Collegiate provisions are not in conformity with the Imperial Ordinance relating to Universities, so that the University possesses only the Colleges of Law, Medicine, and Science and Engineering, no College of Literature yet existing.

The College of Law comprises the two courses of Law and Politics, the College of Medicine contains only the one course of Medicine, and the College of Science and Engineering the following eight courses; viz., mathematics, physics, pure chemistry, chemical technology, civil engineering, mechanical engineering, electric engineering, and mining and metallurgy. The qualification for admission is equal to that for the Tokyo Imperial University. The term of study extends three years for the Colleges of Law and Science and Engineering, and no students are allowed to remain in one course for more than six years. The term for the College of Medicine lasts four years, and no student may remain in it for eight years or above.

Outsiders may attend lectures in one or more subjects at a college when there is room for them.

In the College of Medicine licensed practitioners may be admitted as elective students. Their term may not exceed one year. The number of chairs is 24 at the College of Law, 27 at the College of Medicine, and 26 at the College of Science and Engineering.

2. HIGHER SCHOOLS.—There are eight Higher Schools, respectively designated the First to Sixth Higher Schools, the Seventh Zōshikan Higher School and the Yamaguchi Higher School. They are all Government institutions. The First Higher School is located at Tokyo, the Second at Sendai, the Third at Kyoto, the Fourth at Kanazawa, the Fifth at Kumamoto, the Sixth at Okayama and the Seventh at Kagoshima. The Yamaguchi Higher School is at Yamaguchi.

The Higher Schools were formerly called Higher Middle Schools and in 1886 five such schools were created at so many places, and gave instruction to those young men who wished to enter the University or to enter business. The schools were allowed to establish courses on law, medicine, engineering, literature, science, agriculture and commerce. The courses of medicine were in general separate establishments. At the same time there were the Yamaguchi Higher Middle School and Zōshikan Higher Middle School which were originally founded by private individuals but were placed under the control of the Government.

In 1894 the Imperial Ordinance relating to Higher Schools was issued to supersede the Higher Middle School Regulations, and the new title of Higher School was given to those institutions. According to the regulations, the main object of the Higher Schools was to teach the students on special subjects, and to give at the same time and subordinate to this main work, a preparatory education for those who aspired to enter the university. The Third Higher School which previously opened the law course in 1889 established the engineering course in 1894, and the Fifth Higher School opened that same course at the same time. In 1895 the Kagoshima Zōshikan High School was abolished, and it was announced that the special course of study established at the Third Higher School would be closed by 1900. In that year the Sixth Higher School and in the following year the Seventh Zōshikan Higher School were founded. In the same year the medical departments attached to the First to the Fifth Higher Schools were completely separated and converted into special medical schools.

3. SPECIAL SCHOOLS OF MEDICINE.—The Medical Schools are situated in Chiba, Sendai, Okayama, Kanazawa, and Nagasaki.

They were formerly medical departments of the Higher Middle Schools and the Higher Schools. In April 1901 they were converted into independent institutions. Prior to the detachment, a course of pharmacy was added to each medical department. The Special School of Medicine is connected with the prefectural hospital of the place where it is situated, and the students are thus given opportunities of acquiring experience and of attending to clinical lectures.

4. THE TOKYO FINE ART SCHOOL.—This school was established in November of 1888 though strictly speaking this was not the first art institution in Japan, for as early as 1876 an art school was established by the Department of Public Works and students were taught on the subjects of painting and sculpture. In 1884 the Committee for the Investigation of Drawing was appointed in the Department of Education and in the following year Commissioners on painting and drawing were appointed. Both the Committee and Commissioners were made to carry out inquiries into the subject of art education with special bearing on painting. The inquiries resulted in the creation of the Tokyo Fine Art School, and it was opened for work in 1889. The course of study was divided into two departments, one being the ordinary course lasting two years and the other the special course lasting three years. The practical education in the former consisted of instruction in painting and moulding while in the other it consisted of painting, sculpture, and applied art, the last divided into metal-work and lacquer-work. The organization has since been changed several times, with the result that the school has finally attained its present state of comparative perfection. At present the school consists of four departments; namely, painting, design, sculpture, and applied art, the last divided into glyptic art, metal-laying, metal-casting, and lacquer-work. Architecture is lacking for the present. The course of study lasts four years in each department, and there is one year of preparatory study in each department.

5. THE TOKYO FOREIGN LANGUAGE SCHOOL.—This school was at first established in April of 1897, as an institution affiliated to the Higher Commercial School. Two years later it was separated and made an independent school under the above-mentioned title.

The school has a precursor which existed as early as 1874. In that year the two courses of English and French that formed part of the then University Institution and the Language School in the Foreign Office teaching German, Russian and Chinese were combined under the name of Tokyo Foreign Language School. At the same time the Tokyo English Language School was founded and the department of English in the Foreign Language School was transferred to it. In 1880 the department of the Korean language was created, while in 1884 the Higher Commercial School was founded, subordinate to the Language School. Next year the Language School and the Commercial School were combined into one institution bearing the title of the Tokyo Commercial School. Two years later the department relating to foreign languages was abolished. Eleven years later the school was resuscitated, as described before. The present school contains the eight departments of English, French, German, Russian, Spanish, Chinese, and Korean. The course of study extends for three years.

6. THE TOKYO MUSIC SCHOOL.—The appointment in the Department of Education of a number of Commissioners on music in 1879 was the origin of this school. In the following year a music teacher was engaged from America. He and some Japanese experts were made to carry out an investigation on matters musical both foreign and Japanese, and especially on the songs and arts that had previously existed in our country. Those that were available were set to music with or without modification, while some new airs were composed, and for the first time the adapted music was taught to the students of the Tokyo Normal School, the Tokyo Women's Normal School, and the Peer's School. A number of students were also taken by the Commissioners, and those students may be regarded as the first regular music students in Japan. In 1887 the scope of the education was enlarged, resulting in the creation of the Tokyo Music School. In 1893 the School was subjoined to the Higher Normal School, to be again converted into one independent institution in 1899.

The school contains five different departments namely, the preparatory department, the main department, the special department, the teachers' department, and the elective department. The main

department is further subdivided into the vocal course, instrument course, and singing course. The teachers' department is also subdivided into *A.* section and *B.* section, the former to train teachers qualified to teach in normal or middle schools and higher girl's school, the latter in primary schools. The term of study lasts one year for the preparatory department, three years for the main department, two years for the special, two years and seven months for *A.* section teacher's course and one year for *B.* section. The term for the elective department is not definitely fixed.

IV. TECHNICAL EDUCATION.

GENERAL REMARKS.—The importance of encouraging technical education was early recognized by the Government, especially in recent times. The promulgation in 1894 of the Rules relating to Apprentice Schools, of the Rules relating to Agricultural Schools in 1883, the Rules of Elementary Agricultural Schools in 1894 may be mentioned among the legislative measures pertaining to industrial education. In a similar way the Rules relating to Commercial Schools were issued in 1884 while the Rules relating to Technical Continuation Schools were issued in 1893, this latter kind of school being intended to give technical education of secondary or lower grade. The cause of technical education received in 1894 powerful encouragement, for in that year the Law for subsidizing Technical Education was passed, by which law the State pledged itself to give grant-in-aid to technical schools judged useful for promoting technical education. At first the sum set apart on this account by the Treasury was 150,000 *yen* a year, but this has been gradually increased with the expansion of this particular branch of education and at the present time the outlay amounts to 320,000 *yen*. This sum is voted every year by the Diet and comprises the expense on account of training teachers for technical schools. In 1899 the Technical Education Regulations were enacted and at the same time the Rules relating to different kinds of technical schools were drawn up. In 1900 similar rules relating to fishery schools were issued, and in a year later the Rules relating to the Technical

Continuation Schools were amended and the details about their working were made public. All these endeavors made by the authorities to encourage technical education were eagerly responded to by the people, so that technical schools were founded, one after another, in quick succession. At present the technical schools of the higher and lower grades number 240 and the Technical Continuation Schools 1,021.

A. SCHOOLS RELATING TO MANUFACTURE.

1. HIGHER TECHNICAL SCHOOLS.—There are three Higher Technical Schools, these being the Tokyo Higher Technical School, the Osaka Higher Technical School and the Kyoto Higher Technical School. They are all Government institutions.

a. THE TOKYO HIGHER TECHNICAL SCHOOL.—Founded in 1881 under the style of the Tokyo Technical School it assumed its present name in 1900. The school devotes itself to giving instruction both theoretical and practical to those who aspire to engage in manufacturing and technical work. It contains six different departments, these being dyeing, ceramics, applied chemistry, mechanics, electricity, and designs as applied to the manufacturing industry. The dyeing department is further subdivided into dyeing proper and weaving, while the department of electricity is subdivided into electrical engineering and chemical electricity. The school has attached to it an apprentice course.

b. THE ŌSAKA HIGHER TECHNICAL SCHOOL.—This school was founded in the city of Osaka in 1896 and it aims at educating those who have to engage in industrial work. The courses provided in it are mechanical engineering, chemical technology, and shipbuilding. The chemical department is subdivided into five different branches, these being applied chemistry, dyeing, ceramics, brewing and metallurgy. The shipbuilding department is subdivided into the two branches of hull work and machinery.

c. THE KYOTO TECHNICAL SCHOOL.—This is the latest of the three, having been established in 1902. The school educates those who wish to engage in manufacturing industry or to become teachers in technical schools. This school comprises the three courses of dyeing, weaving and designing.

2. TECHNICAL SCHOOLS.—The Technical Schools are institu-

tions which teach technical education of secondary grade. They are either prefectural or communal schools. The curriculum of the schools of this kind comprises morals, reading, composition, mathematics, physics, chemistry, drawing, gymnastics, and practical training on the technical subjects taught. Geography, history, natural history, foreign languages, political economy, statute laws, and book-keeping may be added to the curriculum, the number of such additional subjects to be one or more, according to circumstances.

The technical subjects in which a practical training is to be imparted on the students are selected from the following, the number of such subjects to be one or more according to circumstances:—Civil engineering, metal-work, shipbuilding, electricity, wood-work, mining, dyeing, ceramics, designing.

3. APPRENTICE SCHOOLS.—The school of this kind is intended to give the necessary teaching to those desirous of becoming mechanics. It is either a prefectural or communal establishment, and may be attached to either an ordinary primary or a higher primary school. The subjects taught are morals, arithmetic, geometry, physics, chemistry, drawing, and practical training on one or more technical subjects. All those subjects, with the exception of morals, may be made either optional or may be suitably modified according local requirements, while the technical subjects for giving practical training may be limited to those easily accessible to the school. The term of study ranges from six months to four years, and the teaching may be conducted on Sundays and in the evening besides at ordinary hours. It may also be limited in certain season.

B. SCHOOLS RELATING TO AGRICULTURAL EDUCATION.

1. HIGHER AGRICULTURAL INSTITUTIONS:—There are besides the College of Agriculture of the Tokyo Imperial University, two higher institutions devoted to agricultural education, and these are the Sapporo Agricultural College and the Morioka Higher Agricultural and Dendrological School, both being Government establishments.

a. THE SAPPORO AGRICULTURAL COLLEGE:—Founded at Sapporo, Hokkaidō, in 1875, this institution gives education in the higher branches of agriculture, theoretical and applied, and other subjects required in the work of exploiting the island of Hokkaidō.

The courses consist of main course, preparatory course, civil engineering course, forestry course, and practical agriculture course. One conspicuous feature in this institution is the possessing of about 6,000 *chō* of an arable land, a large tract forest land, about 200 horses and cattle, a botanical garden measuring about 34,800 *tsubo*, and a museum containing over 12,000 specimens. These are quite sufficient to satisfy the demand of the faculty and students for materials and opportunities both of scientific researches and practical training.

b. THE MORIOKA HIGHER AGRICULTURAL AND DENDROLOGICAL SCHOOL.—The school was opened only in April, 1903, the courses provided being agriculture, dendrology and a veterinary course.

2. AGRICULTURAL SCHOOLS OF CLASS A.—The schools belonging to this category are either prefectural or communal schools and are intended to give a scientific and practical training to farmers or their sons. The main aim kept in view is to impart necessary knowledge to future farmers of the middle class. The subject taught is mainly agriculture, but besides it the subjects of sericulture, forestry, and veterinary surgery may be provided, the number of subjects to be one or more.

A school of this kind has to provide itself with suitable accommodation for giving practical training to the students, this accommodation differing in nature according to the kind of the principal subject taught.

3. AGRICULTURAL SCHOOLS OF CLASS B.—A school of this category is lower in grade than the one mentioned in the preceding paragraph and the term of study is not to exceed three years. The object of this school is, (a) to impart an elementary agricultural knowledge to those who finished their primary education, and (b) to teach farmers within a short period of time on agricultural subjects closely connected with the local circumstances.

For those who belong to the former class the term extends for two to three years, while the term may not exceed one year for the students of the latter class. The longer term school may be a permanent establishment but the other may be temporary, and the class-rooms may be provisionally established at

different places. A school of this grade may be either a prefectural or communal establishment.

In October 1902 the record of the two grades of schools read as follows:—

Number of Schools	93
Number of Teachers	733
Number of Students	9,763
Number of Graduates	1,755

C. SCHOOLS RELATING TO FISHERY.

The schools of this description are comparatively small in number. There is only one institution where higher education on the subject is taught, and that is the Fishery School under control of the Department of Agriculture and Commerce. The other fishery schools are intended to give technical education on fishery of secondary or lower grade and are maintained either by a prefecture or a community. The course of study at all those schools is generally divided into fishing, manufacture and fecundation. Some schools adopt one or more of the foregoing subjects as special courses of study. These courses of study may be established side by side with those on marine navigation or on other technical subjects.

In October of 1902 the fishery education record read as follows:—

Number of Schools	6
Number of Teachers	26
Number of Students	351
Number of Graduates	8

D. SCHOOLS RELATING TO COMMERCIAL EDUCATION,

1. HIGHER COMMERCIAL SCHOOLS.—The schools of this grade are two in number, namely the Tokyo Higher Commercial School and the Kobe Higher Commercial School, both being maintained by the Government.

a. THE TOKYO HIGHER COMMERCIAL SCHOOL.—The school was founded in 1885, and during the subsequent 17 years it was the only place where higher education on commerce was

given. The school course divided into preparatory, main, and professional departments.

b. THE KOBE HIGHER COMMERCIAL SCHOOLS.—This was opened at Kobe in April 1903 and is intended to satisfy the growing demand for commercial education which demand could not be easily met by the Tokyo institution alone. In standing and all other respects the younger school is identical with the older school.

2. COMMERCIAL SCHOOLS OF CLASS A.—The schools belonging to this category are designed to give technical education on commerce of secondary or lower grade, and are maintained either by a prefecture or by a community. The first school of this kind was founded in 1884, and since then the number has considerably increased some of the schools being even higher than the regulation standard. The candidates for admission must be graduates of the four year course of a higher primary school or those of equal scholarship. An examination in a foreign language may be insisted on prior to admission to the school. In general a preparatory course is provided for the benefit of the graduates.

3. COMMERCIAL SCHOOLS OF CLASS B.—The schools of the grade admit those who are not less than ten years old and who have finished the four year course in the ordinary primary school. The term of study extends for not more than three years. The subjects of study are nearly equal to those in the grade A. schools. These inferior schools may add some other subject of study suitable to local circumstance or may create a special course. The school is a prefectural or communal establishment.

The record of the commercial schools of the two grades read as follow in October 1902:—

Number of Schools	48
Number of Teachers	650
Number of Students... ..	11,735
Number of Graduates	1,592

E. SCHOOLS RELATING TO NAVIGATION.

THE only institution where a higher course of nautical

education is imparted is the Nautical College maintained by the Department of Communications.

1. NAUTICAL SCHOOLS OF CLASS A.—The schools of this class devote themselves to training mariners of the higher class. The course of study is subdivided into navigation and engineering, and the subjects of teaching comprise morals, reading, composition, mathematics, physics, geography, a foreign language, drawing, gymnastics, and practical lessons on technical subjects. Besides, chemistry, statute law, and other subjects allied to nautical work may be added.

2. NAUTICAL SCHOOLS OF CLASS B.—Being a school where seamen of a lower class than those in the above-mentioned schools are trained, its course of study does not generally exceed two years, and it admits graduates of primary schools. As yet no nautical school of this inferior class actually exists.

The figures with regard to navigation schools was as follows in October 1902 :—

Number of Schools	7
Number of Teachers	53
Number of Students	784
Number of Graduates	4

F. TECHNICAL CONTINUATION SCHOOLS.

The Technical Continuation Schools are places where elementary knowledge on technical subjects is given to those who are either actually engaged in technical business or are desirous to enter such business. They are at the same time intended to supplement primary education. This being their object, the Technical Continuation Schools present very irregular aspects in points of details. The subjects taught are agriculture, manufacture, commerce and fishery, and in most cases one school combines two or more subjects. The term of study is also diverse, extending for two or three years in some schools and in others only six months or so. Then some may collect a fee, of not more than 30 *sen* at most, while no fee is collected in others. Teachers of this kind of schools are generally teachers of primary schools who attend to this particular business in their spare hours, and the number of these teachers does not exceed three or

four for one school, besides the schoolmaster. Provisions for training teachers of this sort are now sufficiently maintained, for some of the local technical schools provide a special course to answer this purpose, and the summer schools opened every year under the patronage of the Department of Education also offer excellent opportunities to primary school teachers and other desirous of being initiated into the subject.

In schools of this class candidates for admission must have at least completed the ordinary primary school course. However a special arrangement exists for the benefit of those who have not yet finished that course.

It was in 1894 that the term Technical Continuation Schools was first officially adopted. In that year 22 schools of this grade were founded, the number being increased to 186 by June 1901. After that year some schools were converted into schools of another nature while a few were closed; on the whole the cause of this branch of education is making steady progress. Of those schools about one-third are enjoying a grant-in-aid from the Treasury. The latest returns on the Schools are as follows:—

Number of Schools	221
Number of Teachers	431
Number of Students... ..	12,992
Number of Graduates	1,779

G. TECHNICAL EDUCATION FUNDS.

As mentioned in the preceding part, the Government has been paying since 1894 no small sum, comparatively speaking, towards the encouragement of technical education. The schools enjoying this help are generally technical schools maintained by the public funds, and those maintained by industrial or commercial association may also participate in the benefit. The sum set apart on this account was at first limited to 150,000 but has since been increased till at present it amounts to 320,000 *yen*. This increase was owing to the founding of a large number of new technical and commercial schools subsequent to the coming into operation of the encouragement programme. At first there were about forty or fifty schools that were allowed to participate in the fund, but the cor-

responding number increased to 179 in March 1901 and to 210 a year after.

Theoretically the help from the funds may come up to the level of the sum disbursed by the founders of a school for maintaining it, but owing to large number of schools entitled to the allowance from the funds, the rate of the help generally ranges from 16 to 25 per cent of the amount of maintenance.

H. TRAINING OF TECHNICAL SCHOOL TEACHERS.

With the advance of technical education and the increase of the number of schools of this description and of the students, provisions for supplying teachers qualified to undertake the teaching are required. In pursuance of that object the Department issued in April 1899 Rules relating to Technical Education Teachers, which were amended two years after with the object of enlarging the scope of operation. Some details of the working of this provision will be mentioned below.

1. HELP TO STUDENTS ASPIRING TO BECOME TEACHERS OF TECHNICAL SCHOOLS.—The sum of 6 *yen* a month is being furnished by the Department of Education to those students who engage to become teachers of technical schools after their graduation, the students being those of the following institution:—course of agriculture (both main and practical) of the College of Agriculture of the Tokyo Imperial University, Tokyo Higher Commercial School, Tokyo Higher Technical School, Tokyo Nautical College, Tokyo Fine Art School, Fishery School (under control of the Department of Agriculture and Commerce).

2. TRAINING SCHOOLS.—The College of Agriculture, the Tokyo Higher Commercial and the Higher Technical Schools also establish teachers' training courses of agriculture, commerce and technology respectively, and teachers qualified to teach at the Technical Continuation Schools are being trained.

V. LIBRARIES.

The Imperial Library is a Government establishment and is situated in Tokyo. It was established in 1872 in the premises of the Museum controlled by the Department of Education. It is the pioneer institution of the kind in Japan.

In March 1902, the Library contained 363,661 volumes of Japanese and Chinese works, 54,931 volumes of foreign works, in all 418,592, volumes. During the one year ending the above date the Library was open 334 days, and was visited by 133,803 persons, the daily average of 400. The accommodation being judged inadequate to satisfy the growing number of visitors and of the books, pictures, etc. to be kept, the work of constructing new building has been started.

Of the local libraries, the one in Kyoto is the oldest, followed by the two in Osaka. At that particular date libraries of all kinds existing throughout the country numbered 49 containing 408,570 volumes of books, etc. The visitors to the local libraries numbered 107,790, the daily average of 10 persons, during the one year mentioned above. Of these libraries the most noteworthy in the relative perfection of their accommodation are the library belonging to the Imperial Education Society in Tokyo and the library maintained by the prefecture of Kyoto. The library maintained by the prefecture of Miyagi comes next. The rest are of smaller scope and visited by a smaller number of people.

SUPPLEMENT.

FORMOSA.

Introductory—Agriculture—Fishery—Forestry—Mining—
Trade—Finance—Communications—Education,
Sanitation and Religion.

I. INTRODUCTORY.

A. GEOGRAPHY.

GENERAL REMARKS.—The districts under the jurisdiction of the Governor-General's Office of Formosa comprise Formosa, Hoko-tō (the Pescadores) and all the islands lying about them. Formosa extends from $21^{\circ}10'$ to $25^{\circ}30'$ N. latitude and from $119^{\circ}10'$ to $122^{\circ}10'$ E. longitude. The Tropic of Cancer runs almost through its centre and the southern half of Formosa therefore belongs to the tropical zone.

The accurate geodesic surveying of Formosa being not yet completed, the positions of the principal places can only be approximately indicated, as follows:—

Name of Place.	North Latitude.	East Longitude.
Kelung... ..	$25^{\circ} 8'$	$121^{\circ} 45'$
Tansui	$25^{\circ} 10'$	$121^{\circ} 25'$
Taihoku (Taipeh)	$25^{\circ} 4'$	$121^{\circ} 28'$
Taichu	$24^{\circ} 2'$	$120^{\circ} 40'$
Tainan	$22^{\circ} 59'$	$120^{\circ} 47'$
Anpei (Anping)	$22^{\circ} 59'$	$120^{\circ} 13'$
Takao	$22^{\circ} 36'$	$120^{\circ} 16'$
Hoko-tō (the Pescadores)	$23^{\circ} 33'$	$119^{\circ} 34'$
Kōshun... ..	$22^{\circ} 4'$	$120^{\circ} 47'$
Karenko	$23^{\circ} 55'$	$121^{\circ} 35'$

The area of Formosa can only be approximately given, for the extensive work of surveying started some years ago is not

yet completed. According to the latest available returns **Area.** the area of Formosa proper measures about 2,260 square *ri*, while that of the Pescadores and other islands covers about 13 square *ri*. The area of Formosa proper being classified according to elevation, the following table is obtained:—

Elevation (metre)				Area (sq. <i>Ri</i> .)			
Above	100	About	1,474.491
"	500	"	984.923
"	1,000	"	486.923
"	1,500	"	223.923
"	2,000	"	111.11
"	2,500	"	48.8
"	3,000	"	17.45

For further descriptions of the geography of Formosa the reader is referred to the Introductory chapter of this work.

B. FAUNA AND FLORA.

GENERAL REMARKS.—A brief description of the fauna and flora of Formosa will now be given.

According to Wallace's "Geographical Distribution of Animals," the fauna of Formosa belongs to the Oriental section which comprises the south-eastern part of the continent of Asia.

Fauna. and the islands lying south thereof. A certain Western authority states that the mammals found in Formosa number 35 as to species, and of these 14 are peculiar to this island. There are 196 species of birds, according to Mr. Tada of the College of Sciences of the Imperial Tokyo University, and of that number 31 are judged to be peculiar to this place. Then there are several species of saurians very rarely met with elsewhere. Some of the snakes are poisonous. Of fish may be mentioned species of *Scalachaiclei* and *Balordei*; then carps, eels, etc., while of molluces may be mentioned species of *Pecten*, *Tridacua*, *Chiton*, *Murex*, *Oclapada*, etc. Oysters are extensively cultivated. A large number of insects are found, some of them being extremely beautiful.

According to Mr. Grisebach's formulae of geographical distribution of plants, the flora of Formosa belongs to the extreme south division of the China-Japan zone and is practically identical with that of the trade wind zone region of India. The Formosan flora is

further divisible into three main parts. For instance, the flora of hills and plains presents characteristics possessed by the flora of India and Southern China, the southern flora has qualities more or less in common with the flora of the Philippines, while the flora in mountainous districts much resembles that of Japan proper, middle China and Himalaya.

According to Mr. Augustine Henry's exploration, Formosa contains 1,429 species of plants, exclusive of algæ, as follows:—

Phanerogamia	1283
Filices	131
Zycopodiaceæ	}	15
Marsiliaceæ											
Equisetaceæ											
—											
1,429											

As 20 species of acclimatized plants and 81 species of cultivated plants are included in the above figures, the plants indigenous to the island are reduced to 1,328 of which the flowering plant number 1182 and the flowerless plants the remaining 146. Mr. Henry's investigation is not complete, however, as it did not extend to the backwood regions. Especially in Ericaceæ and Coniferæ his investigation has been found incomplete. His list contains only 6 plants of the latter order, but 16 more have already been discovered.

According to the investigations so far carried out by our scientific experts, 103 species divided into 79 genera are judged to be peculiar to Formosa, though the genera themselves also exist elsewhere.

It is curious to observe that the majority of acclimatized plants are of American origin, as, for instance, *Psidium guyala*, *Ascrepias curassavica*, *Mirabilis jazapa*, *Tycopersicum esculentum*, etc. Another thing that is noteworthy in this respect is the fact that plants peculiar to Australia, as *Acacia*, are found in plains and hills, the *Acacia* growing luxuriantly in southern Formosa. These plants evidently came from the South Pacific and acclimatized in some remote time.

Prof. Honda, of the Imperial Tokyo University, who has

investigated the forest zones of the island, tabulates them as follows:—

		Forest Zone.	Extent of Zone.
Tropical Forest.	Banyan Zone.	Below 1,500 ft.	Below 2,000 ft.
Broad-Leafed Evergreens }	Torrid Forest {	Camphore Zone	1,500 to 3,500 ft. 500 to 4,500 ft.
		Quercus-Pasania Zone	3,500 to 6,000 ft. 1,500 to 8,500 ft.
Temperate Forest	{	Chamaecyparis & Araucaria Zone	6,000 to 7,000 ft. 5,500 to 7,500 ft.
		Picea Zone ...	7,000 to 8,500 ft. 6,500 to 9,000 ft.
		Tsuya Zone ...	8,500 to 10,500 ft. 8,000 to 11,000 ft.
Conifers.	Frigid Forest ...	Abies Zone ...	Above 10,500 ft. Above 10,000 ft.

In the Tropical forest 18 species of banyan trees is found, the principal species being *Ficus retuca* and *Ficus Wigh-tiana*. In the Torrid forest the principal trees are *Cinnamomum camphora*, various species of *Quercus*, *Pasania cuspidata*, and others. In the Temperate forest the principal trees are several species of *Chamaecyparis*, *Picea*, *Tsuya* and others. Finally the Frigid forest contains *Abies*, *Juniperus*, *Pirus*, and a few others. It may also be noted in conclusion that the forest zone of the mountainous regions somewhat resembles the Californian flora, especial-yl in the possession of *Libocedrus*, *Chamaecyparis*, *Taxaceæ*, and others.

C. HISTORY.

GENERAL REMARKS.—The history of Formosa may be divided into six parts, namely (1) period of chaos, (2) Dutch occupation, (3) Spanish occupation, (4) period of native kingdom (5) Chinese rule, (6) annexation by Japan.

1. PERIOD OF CHAOS.—By the “Period of Chaos” is meant that period when the island had no definite government to rule it and when it was a haunt of outlaws from China and other places who used it as their hiding-place.

The discovery of Formosa, so far as authentic history goes, took place in the beginning of the 7th century of the Christian era, during the reign of the Sui dynasty in China.

But the sovereign rulers of China of that dynasty and most of the others that succeeded it, did not trouble themselves much about annexing the island as part and parcel of their dominions, and the outlaws who invariably made their appearance on every occasion of dynastic changes in China and also of other people

also placed outside the pale of Chinese control were left unmolested masters of the island. The number of such political outlaws who came over to Formosa was especially numerous when the present Manchu Dynasty overthrew the Dynasty of Ming.

Nor were outlaws from Japan altogether absent from the island; on the contrary, they also came to the island and used it as their base of operation. They were in most cases buccaneers who occupied themselves as pirates along the coast of China. Their stay in the island was therefore temporary, and very seldom they settled down, as the refugees from China generally did. It is interesting to note that the name "Formosa" was given to the island by the Portuguese navigators, and signifies "The Beautiful."

2. THE DUTCH OCCUPATION.—The Dutch occupied the Pescadores in 1622, probably out of rivalry to the Portuguese who had planted their colony at Maccao, and to the Spaniards who had already held Luzon, one of the Philippine group. It should be added that this occupation of the Pescadores by the Dutch, at first objected to by China, afterward obtained the assent of that Government. It agreed, under certain conditions, to allow the Dutch to occupy the Pescadores and Formosa. The Dutch East India Company was made to govern the island. The Dutch erected a fort at Anpin and Tainan, the two receiving the Dutch titles of Zeelandia and Providentia respectively. The Dutch Colony numbered 600 and their garrison about 2,200, while the Chinese settlers numbered from 25,000 to 30,000 families. The Japanese were also in the island, though their number is unknown. They generally lived there to carry on trade with western people residing in the Far East, for about this period the Shogunate of Japan encouraged our people to undertake foreign trade and a large numbers of our trading ships navigated in the South Sea. The Dutch administrator was once placed in hot water as a result of his unjust treatment of a Japanese trading ship. To give a brief account of this interesting episode, that ship was plundered by the Dutch inhabitants on the Pescadores as she took shelter there on her way to Fuchow. The Magistrate of Nagasaki, in whose jurisdiction the

foreign trade business of Japan was placed, sent an experienced South Sea trader to Formosa to demand damage. So strongly did this trader represent the case entrusted to him, that at one time the incident even threatened to bring about a serious trouble between this country and Holland. At last the Dutch gave way, and at the instance of the Governor-General stationed at Batavia the administrator in Formosa was replaced and thus Japan carried her points in this affair.

The Dutch rules were by no means liked by the Chinese in the island for the latter had many grudges to entertain against the others. Especially did the Chinese fret against the imposition of taxes from which they had been left free before the arrival of the "intruders." This souldering sense of hostility of the Chinese at last broke out ablaze in their organized attempt to dethrone the Dutch sway by a bold coup. In 1652 the leading malcontents in the neighborhood of Providential, that is Tainan, openly rose against the Dutch garrison and colony. They pressed them hard. A Dutch contingent from Zeelandia arrived on the scene of trouble in a hurry, and with the help of a force of the friendly aborigines, at last succeeded in suppressing the insurrection. About 4,000 insurgents were killed in the last battle.

Meanwhile the power of Holland began to wane in Europe, and this of course affected the Dutch influence in the Far East. The Japanese too had disappeared from the island, for Japan had changed her policy about foreign intercourse and prohibited her people from venturing abroad.

In 1661 the Chinese general named Chêng Kung, better known as Koxinga by the Western people, who refused to swear allegiance to the new Manchu Dynasty demanded of the Dutch administrator in the island that he evacuate the place, and when this was refused Chêng invaded the Pescadores and Zeelandia at the head of 20,000 men. The Dutch consul in the island sent the alarming intelligence to Batavia and asked the immediate dispatch of reinforcements. Batavian Government at first tried to arrive at some sort of compromise with the invading army and as a measure towards that end recalled the consul. Chêng would not listen to this proposal and invested Zeelandia. The garrison held out for seven months, when it was forced to surrender. This occurred in January, 1662, so that the Dutch occupation of the island lasted 38 years.

3. THE SPANISH OCCUPATION.—The Spanish occupation of the island was almost contemporaneous with that of the Dutch, for it took place in May, 1626. The two rival colonies divided their spheres of influence, so to say, and while the Dutch established themselves in the middle and southern Formosa the Spaniards held the northern part. They stationed their garrison at the present Kelung which they called San Salvador and also at Tansui which they called Santiago. The rival colonies that had already been looking askance at each other at last came to blows in 1642. The Dutch were victorious and the Spanish occupation was at an end in the 16th year of its existence.

4. THE PERIOD OF NATIVE KINGDOM.—Koxinga who drove the Dutch out of the island was one of the most illustrious of the remnant of Chinese captains who faithfully defended the fallen cause of the Ming Dynasty and withstood the ascendancy of the new Manchu rulers. He and his little band of compatriots raised their rebellious banner in southern China, but they were dislodged from one position after another by the superior force of the Imperialists till at last they were cornered in the little island of Amoy. Then it was that these faithful adherents of the fallen dynasty began to direct their attention to Formosa and decided to obtain there a more secure and extensive footing.

The cause which Koxinga upheld was however doomed to fall even after his removal to the new place. The "Legitimists," as Koxinga and his adherents called themselves, at first devoted their attention to procure means to carry on their operations against the "Usurper's" army and for this purpose to open wild land in northern and middle Formosa. Leaving a part of the men to garrison the important places, all the rest betook themselves to the peaceful work of reclaiming the virgin soil. Though Koxinga's principal design never bore fruit, this peaceful undertaking that was subordinate to it proved a lasting source of benefit for the island, in that it was during the short tenure of Koxinga's ascendancy that a large tract of level land in the vicinity of Hozan, Koshun, Kagi, Shoka, Shinchiku, Taihoku and others was brought under cultivation.

Circumstances not favoring Koxinga to carry into execution his

resolution to make a descent on the Manchu dominions, he next turned his attention to expanding the area of footing towards the south, and to add Luzon to his base of operations, for Luzon at that time contained a large number of Chinese who espoused in common with Koxinga the cause of the Ming Dynasty. A plan was concerted between Koxinga and his Luzon friends for the overthrow of the Spanish rulers. This was discovered before it was mature, and the Spanish massacred as many as 24,000 Chinese in cold blood. About this time the sad intelligence reached Formosa of the assassination in Burmah of the last legitimate heir of Ming Dynasty. This was a death-blow to the ambition of Koxinga, and he himself was carried away by decease a few months afterward. After the death of Koxinga the cause of the "Legitimatists" went from bad to worse, for his son Ko-shung on whom fell the mantle of Koxinga, could not naturally enjoy sufficient prestige among his captains to command their faithful obedience. He himself lacked the enthusiasm of his father, while the disaffection that made its appearance among the captains made the matter worse. Chêng Ko-shwang in May, 1683, the Manchu Government sent an expedition against him and occupied the Pescadores. Chêng Ko-shwang surrendered with all his captains in July of that year and with this the ascendancy of the Koxinga family in the island terminated.

5. THE PERIOD OF CHINESE RULE.—The surrender of Ko-swang gave rise to a practical question of what should China do with Formosa; in other words, whether China should leave the island to shift for itself or whether it should be brought under the sway of her dominion. The latter view prevailed and Formosa was placed under the jurisdiction of the Province of Fukien.

During the space of over two centuries, from 1684, when Formosa was brought under Chinese rule, to 1895 when it was ceded to our country, Formosa proved more a source of trouble and humiliation and less that of benefit to China. Insurrections frequently broke out in the island and in one or two cases the insurrectionists held for some while the control of the island in their hands; Nor was China less troubled about the island in her foreign relations, on the contrary Formosa constantly involved its owners in humilia-

ting and awkward positions. The savages in this island very frequently plundered ships and murdered the crews wrecked on the dangerous coast of the island, and such occurrences of course occasioned trouble between China and the foreign governments to which the ships belonged. Once a trouble was occasioned on that account with the United States of America and next with Japan. The case with Japan was specially serious. As the Chinese Government refused to hold itself responsible for the murder of some Luchu fishermen by the savage aborigines, Japan sent an expedition against them, to inflict upon them a severe chastisement. The diplomatic negotiations that were next opened on the subject between Japan and China did not proceed smoothly at first, for the latter refused to pay indemnity for acts committed by the aborigines of Formosa. The negotiations that were in imminent danger of rupture were at last amicably terminated, and China was prevailed upon at the eleventh hour to listen to the demand of Japan and to pay the indemnity.

Another important part which Formosa played in China's foreign relation occurred in 1884 when war broke out between China and France about Annam, and when the squadron of the latter occupied the Pescadores and sealed the ports of Formosa.

Warned by such international troubles which Formosa frequently engendered, China determined to bring affairs in the island to better order and method. In pursuance of that resolution, Formosa with all its adjoining islands was detached from Fukuién and elevated to the dignity of an independent province. The first Governor appointed was the celebrated Liu Ming-Chwén under whose energetic administration Formosa began to prosper as never it did before. But fate was against China in regard to this island, and China had to lose the island forever and cede it to Japan, the formal transfer of the island taking place on June 2nd, 1895.

5. ANNEXATION BY JAPAN.—The annexation was merely formal, for the islanders, instigated by their last Governor Liu—for Liu had resigned his place years ago as his progressive system of administration was not regarded with favor by the central Government—, rebelled against their new rulers.

The new rulers had therefore to undertake the double task of

subjugation and administrations. The suppression of these hostile movements on the part of the islanders was concluded in about a year and the island was placed on March 31st, 1896, under the civil administration of the Governor-General's Office, while within two years from the ratification of the Treaty of Peace, that is by April, 1897, the natives were to decide whether they would swear allegiance to the new rulers or preferred to remain as Chinese subjects.

The administration policy of the Governor-General judiciously combined moderation and severity. The natives were left free and unmolested in their old customs and manners even when those practices were regarded injurious, as, for instance, the custom of foot-finding of women. Even in regard to the deleterious habit of opium-smoking, the Government did not prohibit it all at once; instead it adopted measures for eradicating this vicious habit by gradual process.

At the same time the authorities sternly repressed all those acts inimical to the maintenance of order in the island, and in this the Government was confronted with the most arduous task in suppressing the disorderly practices of the so-called "armed raiders" who constituted a perennial source of grave evil for the maintenance of order in the island, when it was held by China. The raiders were originally refugees or settlers from southern China, and were a sort of professional freebooters who exist almost everywhere in China, and who are known under different names in different places. The former Chinese officers and officials who were on duty in the island, out of spite to the Japanese authorities, stooped to join hands with their old foes, and abetted and instigated them to rise against the new rulers of the island. For about three years from the formal transfer of the island to Japan the troops stationed in the various parts of the island devoted themselves to quelling the risings of those raiders. By 1898 the raiders had had enough thrashing from the soldiery and constabulary force and were given opportunities to take the oath of allegiance to their new rulers and to become as law-abiding people. The raiders eagerly availed themselves of this opportunity and took the oath, and in northern Formosa at least peace was completely restored.

Matters were not so satisfactory in districts remote from the

seat of the Government, especially in middle and southern Formosa. They had grown even more troublesome as they were reinforced by bands of confirmed peace-breakers coming from the northern districts.

In order to purge completely once for all this standing menace to peace and prosperity in that district the Governor-General carried out in about six months beginning at the end of 1901, an organized clearing movement. It was a completely success, for while it entirely shattered whatever power of resistance that the raiders and banditti retained, it impressed powerfully on all the other classes in the island of the futility of any attempt at resisting the Imperial Government. Thus in eight years from the annexation of the island peace was completely restored, and apparently the island has been relieved from this source of trouble from which the Chinese rulers had been constantly annoyed.

It should be added that the law-abiding people of the island being equally interested with the authorities in the restoration of order, tendered their services for attaining this common end. For this purpose they organized themselves into voluntary corps charged with the task of preserving peace and order in their own districts.

D. POPULATION.

1. TOTAL POPULATION.—The latest census returns put the total population of Formosa and the Pescadores as follows:—

District.	No. of Family.	Male.	Female.	Total.	Ratio of Females per 100 of Males.	
					People from Japan Proper.	Natives.
Taihoku	60,484	161,349	132,972	294,321	60.25	83.89

Grand Total	558,786	1,579,288	1,345,784	2,925,072	57.36	85.69

Note:—In the above figures the inhabitants of Botel Tobago Island in the jurisdiction of Taito are not included, the returns about them being lacking. Nor are the officers and men of the garrison included. However the figures include the actual number of aborigines. There were besides five families, consisting of 8 males, who lived among the aborigines' communities in the jurisdiction of Koshun.

The foregoing figures classified according to the origin of the three main divisions of people, in Formosa, that is, people from Japan proper, native islanders, and aborigines, the following three tables are obtained:—

a. PEOPLE FROM JAPAN PROPER.

District.	No. of Resident Family.	No. of People Actually Residing.		
		Male.	Female.	Total.

Ako	59	3,529	9,458	8,822	18,280
Koshun	53	1,698	3,977	3,806	7,783
Taito	185	7,417	18,322	17,733	36,065
Grand Total	618	18,424	48,411	45,904	94,315

2. RELATIVE DENSITY.—According to the returns compiled at the end of 1900, the relative density of population in the various districts of Formosa was as follows:—

District.	Number of Pop'n. per 1 squ. <i>ri</i> .		Total.	Ratio of People from Japan Proper per 1,000 Islanders.
	People from Japan Proper.	Native Islanders.		
Taihoku	77	2,606	2,683	29.44
Taichu	13	2,076	2,089	6.49
Tainan	16	1,868	1,884	8.57
Gilan	34	3,016	3,050	11.42
Taito... ..	2	78	80	29.20
Pescadores ...	72	3,686	3,758	19.59
Grand Total ...	25	1,805	1,830	14.12
1899	22	1,750	1,772	12.61
1898	17	1,725	1,742	9.88
1897	11	1,800	1,811	6.05
1896	7	1,718	1,752	4.11

Note:—In the above figures the returns on the aborigines are not included, the investigations about the area of the aborigines' districts being not yet completed. The figures for 1896 include a small number of persons who could not be ascertained whether they were native islanders or people from Japan proper.

3. HUMAN RACES IN THE ISLANDS.—For the sake of convenience the human races in the island may be divided into three main classes as mentioned in the preceding paragraph; namely, (1) people from Japan proper, (2) native islanders, and (3) aborigines.

History records the fact that the Japanese voyaged to Formosa for trade and even settled there as early as three centuries ago, while it was quite probable that the natives of Okinawa, placed in close proximity with Formosa, must have had frequent occasions, whether on their own accord or drifted on the sea, to mingle with the Formosans. However it is not scientifically possible to determine whether or not the blood of the Japanese runs in that of the islanders. All that can be stated here is that the regular presence of people from Japan proper began with the annexation of the island to Japan in 1895. Their number is still far below that of either the natives or the aborigines, nor are intermarriages between the two carried on to any perceptible extent. Though numerically small, they occupy

intellectually the foremost position and are the master race of the island.

The native islanders, by whom are meant natives of Chinese origin, are broadly divided into two main classes; namely, settlers from Fukien and settlers from Canton. The former are earlier.

Settlers from the opposite coast of China must have arrived at the island from a remote period, considering the geographical proximity of the two places; but it was at the beginning of the reign of the present Manchu Dynasty that the large exodus from China for Formosa took place, as already explained in the section relating to the history of the island. The Fukien settlers, besides being earlier comers, are more numerous than those from Canton, the latter numbering about one-third of the others. One thing that should not be forgotten about those settlers from China is the fact that whatever development Formosa attained formerly in economic matters was solely attributable to the exertions of those settlers.

The aborigines reside in the hilly places running through the central part of the island, in a part of plains in eastern Formosa and on Botel Tobago Island. Anthropologically, these aborigines belong to the Malay race, and their language, though more or less differing according to tribes, is also very much akin to Malay. The aborigines are capable of being classified into a large number of groups, but they may be broadly divided into nine classes as follows:—

- | | |
|--|-----------------------------|
| 1. Ataiyol | } on Formosa Proper. |
| 2. Vonum | |
| 3. Tseo | |
| 4. Tsarisen | |
| 5. Paiwan | |
| 6. Puyuma | |
| 7. Amis | |
| 8. Peipo | |
| 9. Yarui on Botel Tobago Island | |

Of the foregoing nine tribes, Peipo sometimes called Peipo-hoan or Sek-hoan, possesses an interesting feature that distinguishes it from the others. This tribe originally occupied the western plains

of the island, but in consequence of the arrival there of the Dutch and the Chinese settlers, their superiors intellectually, the Peipo either lost their original characteristics or become entirely extinct. The remnants that are found to-day can hardly be distinguished both in their exterior and their intellectual standard from the Chinese settlers with whom they live as neighbors.

C. ADMINISTRATIVE SYSTEM.

1. **THE GOVERNOR-GENERAL'S OFFICE.**—Since the Office was established on June 17th, 1895, more or less changes have taken place in the administrative system of the island. The system now in force was that revised in November, 1901. The **Administrative System.** new system is that of two stages while the old one was of three; in other words, whereas, according to the old arrangement, administrative business had to pass three stages before it can reach the people or the Governor-General's Office, only two stages intervene in the existing system which therefore bring the authorities and people into closer touch.

The Governor-General's Office consists of the Civil Affairs Bureau and the Military and Naval Staff. The former **Organization** is further subdivided into several offices dealing with **of the Office.** Police Affairs, General Affairs, Finance, Communications, Trade and Industry, and Public Works.

2. **LOCAL ADMINISTRATION.**—At first three prefectures and four district offices were established to look after the administration of the island, but as a result of administrative rearrangements carried out in November, 1901, they were abolished and in place of them 20 district offices were established, situated at the following places:—

Taihoku, Kelung, Gilan, Shinko, Toshiyen, Shinchiku, Byoritsu, Taichu, Shokwa, Nanto, Toroku, Kagi, Ensuiko, Tainan, Banshoryo, Hozan, Ako, Koshun, Taito, Hoko (the Pescadores).

Under each district office a number of communal offices exist to serve as mediums between the Government and local **Communal Offices.** people. These offices number about 563 in all. They are intended to become in time organs of local self-government.

The Peace Corps system is a relic of the Chinese rule and attends, subject to regular Police offices, to preserving peace in the respective districts. A unit of corps is made up of **Peace Corps.** ten families placed under the control of one of the seniors. The Peace Corps possess a Volunteer Band composed of adult males. This is chiefly intended to provide against the raid of armed banditti and also against calamities, as fire, flood, etc.

3. **LEGISLATURE.**—The Governor-General is empowered in virtue of his own authority to pass sentence inflicting a confinement not exceeding one year in term or a fine not exceeding 200 *yen*. In ordinary cases, however, the legislative affairs are determined by the Governor-General's High Council consisting of the Governor-General, the Director of Civil Affairs Bureau, Officers on the Military and Naval Staffs, Chief Councillor, Councillors, Chief Judge and Chief Procurator of the Appeal Court, Chief Police Commissioner, Directors of the Bureaux. A decision of the Council acquires validity on approval of the Emperor, but in case of urgent need that approval may be obtained afterward.

All the laws and regulations in force in Japan proper are not enforced in Formosa, but only those that are specified for the new dominion are in force. In civil and commercial affairs a portion of the codes is enforced over the Japanese from Japan proper and also in regard to matters which relate in common to those Japanese and natives. Matters which relate to Chinese and natives are to be dealt with according to pre-established usages. This expedient is also followed in settling matters about land when they relate to Japanese from Japan proper and natives. In criminal affairs all the inhabitants in the island are subject to the Criminal Code and Code of Criminal Procedure.

4. **JUDICIARY.**—The judiciary system is dual, that is it consists of Local Courts which deal with matters relating to first instance and the Appeal Court whose judgment is final. Three Local Courts and five Branch Courts exist, the former at Taihoku, Taichu, and Tainan and the latter at Shinchiku, Gilan, Kagi, Hozan and Hoko. The Appeal Court is located at Taihoku. The qualifications of judges and procurators do not differ from those

established in Japan proper. In the Local Court judgement is given by a single judge but in the Appeal Court a college three judges sit over a case.

The barrister's service and rules are in vogue in the island as in Japan proper.

II. AGRICULTURE.

A. TILLAGE.

1. NATURAL CLASSIFICATION OF LAND.—Of the area of Formosa measuring 2,260 sq. *ri* (about 3,500,000 *cho*) the greater part is occupied by hilly places. There are only four plains of some extent, these being the plain extending from Shokwa Areas of Plains to Hozan, a district round about Taihoku, Gilan and Hills. and Taitō. All these plains consist of quarternary formation. Presuming that places more than 100 metres above sea level are hills and forest-land and those of lower elevation plains available for cultivation, the whole land in Formosa may be classified as follows:—

Hills and Forest-land... ..	2,250,000	<i>cho</i>
Plains and Arable-land	1,264,852	,,
	<hr/>	
Total	3,514,852	<i>cho</i>

2. CLASSIFICATION OF ARABLE-LAND.—As in the case of Japan proper, the arable-land in Formosa may be divided into paddy-fields and upland-fields, the former capable of receiving the cultivation of rice twice a year.

Rice being a staple article of diet, its Area of Paddy-Fields cultivation receives the largest share of and Upland Fields. attention from the native farmers, and the area of paddy-fields is therefore larger than that of any other as follows:—

	<i>Ko.</i>	per centage.
Paddy Fields	213,165.06	55.9
Upland Fields	168,317.95	44.1
Total	381,483.01	100.0

Note:—1 *ko* corresponds to about 9.724 *tan*.

3. CULTIVATION.—The natives, being too much disposed to depend upon the natural advantage which the climate extends to them, are content with a simple mode of cultivation which yields a comparatively small amount of harvest. As it is, though paddy-fields give two harvests of rice, the profit which the farmers derive from them does not exceed 20 to 30 *yen* per *ko*. The advantages which bountiful nature bestows upon the islanders are indeed so great that the Formosa farmer can even obtain three crops in one year, two crops of rice and one crop of either a cruciferous or leguminous plant.

One special feature in the tillage prevailing in the island is a greater utilization of the labor of beasts than in **Mode of Tillage.** Japan proper, especially buffaloes. Implements used in the cultivation with buffaloes are also ingenious.

4. PRINCIPAL PRODUCTS.—Of the principal agricultural products, tea, rice, sugar-cane, fibre-plants, etc. deserve first attention, and they will be described below briefly.

a. TEA.

1. KINDS.—There are two kinds of tea produced in Formosa, and they are Oolong-tea and wrapper-tea.

Curing is done entirely by hand. The process is divided into several stages, the preliminary process being undertaken by farmers and the finishing or recurring process by tea-merchants.

Oolong Tea. In the preliminary manufacture the leaves are dried in the sun three times. This is done with the object of causing their fermentation and to bring out a flavor peculiar to this tea. After the leaves are dried, they are then fired twice in the pan, then dried by weak fire. This fire-drying is performed three times. From the first sun-drying to the last fire-drying in about 7.50 hours are required for the spring leaves, 5.54 for the summer leaves, 7.38 for the autumn leaves, and 7.13 for those of winter. The

whole process being guided solely by experience and without depending upon the help of instruments, properly so-called, the utmost attention is demanded of the manufacturers. Four *kin* of green leaves produce about 1 *kin* of half-manufactured leaves, so that supposing that 1 *ko* of tea-farms yields 2,000 *kin* of green leaves, the farmer can get 500 *kin* of half-manufactured tea from so much area of tea-plantation.

The finishing process done by the merchants is simple, and consists first in assorting the leaves by passing them through sieves and then drying them in the pan for about seven or eight hours. The leaves are then packed.

The Oolong tea manufactured in that manner stands midway in taste between black tea and green tea, and possesses a peculiar strong flavor, while it is devoid of either bitter or stringent taste.

Wrapper tea derives its name from the fact that the tea of this special sort is contained in a paper-wrapper, before it is packed in a box. This tea is a recent innovation, dating only 20 years back. The principal point that distinguishes this tea from the Oolong is that, in manufacturing it, a flavor of certain kinds of flowers is imparted to the leaves. Four different flowers are used for this purpose, so that the wrapper-tea is broadly divided into four brands, according to the kind of flower used.

2. EXPORT.—The custom returns on the recent export of Oolong and wrapper teas are quoted below.

EXPORT OF OOLONG TEA.

(unit of *yen*).

b RICE.

1. YIELD.—Two harvests of rice are obtained, as mentioned before, from paddy-fields of Formosa, and as these fields constitute over 55 per cent. of the whole area of arable-land, the quantity of rice produced ought to amount to immense figures, if cultivation is conducted with more care. At present, however, the output is comparatively small, as demonstrated by the following returns showing the crop of 1901.

		Area (<i>ko</i>)	Harvest (<i>koku</i>).	Remark.
1st Harvest	{ Ordinary Rice ...	155,232.08	3,494,241	Success.
	{ Glutinous Rice ...	13,301.41	230,878	Success.
2nd Harvest	{ Ordinary Rice ...	140,902.89	1,975,256	Drought and Injuries of Insects.
	{ Glutinous Rice ...	12,470.15	131,620	

The average yield in the earlier harvest was only 22.1 *koku* even when the circumstances were so favorable, while that in the

later harvest was less than 8 *koku*. Such small yield is essentially due to the defective mode of cultivation.

2. SUPPLY AND DEMAND.—The supply of ice exceeds demand in the island, so that the export to China and Japan proper far exceeds the import from those places to the island, as shown below :—

	Import (picul)	Value (<i>yen</i>)	Export (picul)	Value (<i>yen</i>)
1901	39,900	154,437	633,697	2,156,752
1900	43,136	167,383	760,046	2,276,360
1899	675,897	2,584,968	401,129	1,263,474
1898	249,031	870,609	149,646	2,168,339
1897	56,492	182,248	738,146	1,799,763
1896	236,324	765,834	387,178	913,292

3. MODE OF CULTIVATION.—The mode of cultivation may be said to be essentially similar as that prevailing in Japan proper. The planting for the earlier crop is done in northern Formosa in the beginning or middle of February and the harvesting is made five months afterward. For the second crop the planting is performed in the middle or at the end of June and the harvesting at the end of October or the beginning of November. In southern Formosa the corresponding periods are about a month earlier.

The varieties of rice differ according as they are grown for the earlier harvest or the later harvest, and taken altogether there are about one hundred varieties of rice.

4. QUALITY.—In quality the Formosan rice is brittle and is devoid of lustre and tenacity. The proportion of immature rice is larger than that grown in Japan proper, so that the ratio of diminution incidental to husking amounts to over 10 per cent., such a large quantity being reduced to powder in husking.

c. SUGAR-CANE.

Sugar-cane must have been cultivated in the island for two centuries at the least, but it was only forty years ago that the industry received a powerful stimulus, owing to a marked rise of the sugar market at that time.

1 PLANTING DISTRICTS AND OUTPUT.—The plant is cultivated throughout the island but the districts where its planting is most

active are in southern Formosa and places lying between 22° 25' and 23° 48' N. L.

The area of cultivation in recent years is as follows:—

Year.	Area (<i>ko</i>).	Yield (<i>kin</i>).	Remark.
1900	16,576.26	270,865,055	Drought
1899	31,921.80	342,343,940	Land Requisitioned by Railroad work.
1898	34,446.24	235,915,319	—
Year.	No. of Refinery.	Output.	Value.
1900	1,093	47,943,822	2,637,078
1899	1,275	81,696,235	3,887,538
1898	1,388	70,259,578	2,912,330

2. EXPORT.—At present sugar goes only to China and Japan proper, though formerly it was shipped to Australia, British India New Zealand, America and England. The custom returns are as follows:—

Year.	Value.	Year.	Value.
1901	695,920	1898	1,984,375
1900	2,207,084	1897	1,494,042
1899	1,586,945	1896	1,529,460

The principal shipping outlets are Takao and Anping.

3. SITUATION OF THE INDUSTRY.—Owing to various causes, such as the removal of large capitalists to China, the disturbance by the armed banditti, and so forth, the industry appears to have somewhat declined since the annexation of the island by Japan. In order to restore the industry to its former prosperity and further to push it to a state of development commensurate with the advantages which the island now enjoys in these respects, the Formosan Government has adopted since 1902 a special programme of encouraging the development of the industry. According to this programme the output of sugar may easily be increased fivefold of the amount which is about 80 million *kin*.

d. FIBRE-PLANTS.

1. CHINA GRASS—This plant, though planted everywhere in the island, is principally grown in northern Formosa. The greater part of the output goes to China and Japan proper. The export returns for recent years are as follows:—

Year.	<i>kin.</i>	Year.	<i>kin.</i>
1901	2,561,807	1898	2,712,791
1900	2,314,647	1897	2,659,882
1899	1,915,663	1896	2,037,443

2. JUTE.—This is of less importance to the above, being inferior in quality and less valuable. The output and export are shown below :—

Year.	Output. Area (<i>ko</i>).	Output (<i>kin</i>).	Export <i>kin.</i>
1901	1,411.18	1,650,481	532,839
1900	1,155.44	1,481,548	205,330
1899	1,494.63	1,442,022	138,992
1898	1,386.27	1,104,635	97,181

e. DYE-PLANTS.

1. WILD INDIGO.—The plant is principally cultivated in northern Formosa, and, though its export has dwindled recently, there is much hope of the cultivation of this plant growing more extensive, as it yields excellent dye-stuff. The output is as follow :—

Year.	Area (<i>ko</i>).	Output (<i>kin</i>).
1900	607.99	815,068
1899	98.50	57,395
1898	132.00	88,200

Some Japanese are making indigo-balls with this indigo, and the output of the balls amounted to 59,625 *kin*, valued at 24,508 *yen* in 1898 and to 52,563 *kin* valued at 34,863 *yen* in 1899.

TREE INDIGO.—This plant is also a principal product of northern Formosa. Acreage and output are as follows :—

Year.	Acreage (<i>ko</i>).	Output (<i>kin</i>).
1900	2,424.81	7,109,214
1899	2,762.90	5,493,122
1898	2,208.40	3,004,674

The “mud-balls” made with this plant were produced to the extent of 1,225,998 *kin* valued at 74,836 *yen* in 1899 and 1,701,662 *kin* valued at 97,847 *yen* in 1898.

f. TOBACCO.

Though the cultivation of tobacco dates a long time back in the

island, yet the industry has not prospered to the extent which might be expected from its natural adaptation to its climate, chiefly owing to the fact that cheap tobacco used to come in from China, and also because the natives smoke opium to a large extent. The greater profit which accrued to tea-planting must also be responsible for this strange phenomenon. The acreage and output of tobacco are as follows:—

Year.		<i>ko.</i>	<i>kin.</i>
1901	654.40	682,917
1900	240.18	606,620
1899	180.67	196,976
1898	248.49	490,900

The import, chiefly from China and Japan proper, makes these figures:—

Year.	<i>yen.</i>	Year.	<i>yen.</i>
1901 357,901	1898 1,386,135
1900 202,042	1897 819,623
1899 478,490	1896 430,279

Attempts are being made by several tobacco-growers from Japan proper to cultivate foreign varieties in southern Formosa.

B. LIVE STOCK.

Swine is by far the most important item of stock-farming in the island, the natives being very fond of pork. The supply being inadequate to meet the demand, over 100,000 swine used to come in every year from China. Even at present about 30,000 heads are imported. The Government have been taking pains to encourage the development of this industry and have imported superior breeds of swine and cattle from abroad. The native breed of swine consists solely of the black-haired variety, and by way of experiment a number of white-haired Yorkshire have been imported. The number of various kinds of live-stock, existing in the island, is given in the following table.

Year.	Buffalo.	Cattle.	Swine.	Goat.	Horse.
1900 167,687	63,619	635,183	97,141	39
1901 168,283	66,937	700,902	10,804	34

Year.	POULTRY.		
	Fowl.	Duck.	Goose.
1900	2,607,898	661,408	55,135
1901	2,589,700	557,002	62,784

Epidemics have been inflicting havoc on the industry, the diseases generally brought with swine imported from China. Since 1898 the authorities have enforced prevention measures. The following about epidemic returns will give some idea of the extent of damage done by the diseases.

Year.		No. of cases.	Killed by Disease or Slaughtered.	No. of Recovery.
From Jan.—May 1902...	{ Cattle.	2,028	1,858	148
	{ Swine.	702	529	129
1901	{ "	1,730	1,584	121
	{ "	1,205	1,117	69
1900	{ "	177	153	19
	{ "	2,513	2,237	276
Total	{ "	3,935	3,595	288
	{ "	4,420	3,883	474

The slaughter returns are not accurate, as slaughters carried out in remote places are not duly reported. The following may however prove useful.

Year.	No. of Slaughter-House.	Buffalo.	Cattle.	Swine.	Goat.
1901	168	6,253	5,037	242,786	13,979
1900	125	7,204	5,149	274,750	22,209

There was a small number of horses slaughtered but it was insignificant.

III. FISHERY.

A. ORDINARY FISHERY.

Fishery is still highly primitive in the island and this kind of natural resources that abound along the coast is practically left unutilized. According to the latest available returns, the number

of families engaged in fishery, side by side with other pursuits, is as follows:—

Number of Families	11,143	{	Males	23,601
			Females	11,989
			Total	35,590

Those families pursuing the business as their principal occupation number as follows:—

Number of Families	7,112	{	Males	14,281
			Females	8 264
			Total	22,545

Both fishing-boats and gears are highly imperfect. One thing that is noteworthy is that artificial fecundation is being carried to some extent.

B. SALT MANUFACTURE.

1. SALT ADMINISTRATIONS.—Salt was a state monopoly while the island was ruled by China, but on the advent of the new régime, the system was abandoned and salt manufacturers were left free. The result of this new departure was a failure, and inflicted harm on both the manufacturers and the consumers. This was due to the fact that the removal of official interference was at once followed by a large increase of the number of manufacturers who were, in consequence, obliged to sell their goods at a very narrow margin of profit or even by incurring loss. Then, whereas formerly something like a uniform price was maintained throughout the island, with the adoption of the new system, people residing in remote districts had to pay a far higher price on account of cost of transport for this important article of living. This contrast between the old and new arrangements will be made clear from the following comparison of the prevailing prices under the two systems:—

	Price per 100 <i>Kin.</i>
Official Price in Days of Chinese Rule.	1.40 to 1.60 <i>yen.</i>
Average Market Quotation under new Rule.	0.70 to 9.00 <i>yen.</i>

In view of those circumstances, the Government decided to

review the monopoly system and this was enforced from May 15th, 1899.

2. GOVERNMENT MONOPOLY.—At present the Salt Monopoly Offices are established at nine different places and they have charge of the purchase of salt.

The sale is entrusted to the men belonging to the Salt Seller's Guild, which exists under official control. The Guild is organized solely with natives and is made to maintain selling offices at 20 places and branch offices at 79 places, the central office being located at Taihoku. The Guild is also made to undertake by contract the business of transporting salt.

3. SALT-FIELDS.—The area of salt-fields has increased with great strides since the resuscitation of the monopoly system, for while the fields that were left in waste shortly after the adoption of the free competition method have been revised with the return of brighter hope, while a large number of fields has also been newly laid out under official sanction. At present about 515 *cho* are engaged in manufacture, while 339 *cho* are about to be laid out. Then permission has been given to construct new fields measuring altogether 847 *cho*. These figures show a great advance compared with what was existing in the time of Chinese rule, when the fields measured only about 400 *cho*.

IV. FORESTRY.

A. GENERAL CONDITION OF FORESTS.

I. EXTENT OF FORESTS.—The forests exist in the range of hills longitudinally traversing the island and also in the aborigines' quarters situated in the eastern region. Though the exact extent of all those wooded areas is not yet known, it may be roughly estimated at 2,116,000 *cho* at least, that is to say, about 60 per cent. of the whole area of the island. The natural resource of this particular description must be considered as immense, when it is remembered that vast primeval forests exist in many parts of the region of the aborigines.

2. PRINCIPAL SPECIES.—The sylvan flora of the island being still imperfectly known, it is not possible to give any definite list of principal timber-trees in the island. Some of those trees have already been mentioned in the paragraph of flora given in the preceding part of this section.

B. CAMPHOR.

Camphor being one of the most important wood products in the island, deserves mention at some length. Besides it is in Formosa that the world's supply of natural camphor is obtained.

1. CONDITION EXISTING BEFORE THE ENFORCEMENT OF THE MONOPOLY.—The camphor administration was at first mainly conducted along the old usage that had prevailed before the island was annexed to Japan. The authorities issued license to refiners, restricted the districts where the refining could be carried on but left the licensed persons to make free use of camphor trees within those districts. But this method did not keep proper balance between supply and demand, for the refiners, who in most cases had only a limited capital at their disposal, were led to produce a larger amount than the market required and therefore to keep the price very low. What was far more serious was the fact that the absence of control of the felling of the trees naturally tempted the refiners to use only those portions of the trees that yield the largest percentage of camphor with the minimum of trouble and expense. The waste of the trees was therefore extensive. Then the refiners, in order to increase the margin of profit, too often resorted to the fraudulent device of mixing camphor with rubbish. The system therefore was a grave defect so far as the interest of refiners and the proper utilization of camphor were concerned. In those days therefore the camphor market stood so low that the refiners could barely pay the tax of 10 *yen* for camphor and 3 *yen* for camphor oil, each per 100 *kin*.

2. GOVERNMENT MONOPOLY.—All those facts convinced the authorities to convert the camphor industry into a state monopoly and the new departure was made on August 5th, 1899. By this system the authorities put a limit on the quantity of manufacture,

the season of manufacture, the districts where it could be carried out, and the number of kilns. Moreover certain rate of prices was fixed for the trees.

The enforcement of the monopoly system, though at first complained of by a section of the people who were deprived temporarily of means of subsistence, has proved a great boon to such of those who, in virtue of their established character, were allowed to engage in the work of refining, for whereas formerly the lion's share of profit of the refining business went to the pocket of capitalists, the business was for the first time placed on a firm footing. At present the refiners have simply to sell their goods to the Government at the proper rate determined according to the state of the market, while all the troubles and expense involved in providing against the raid of hostile aborigines residing in the vicinity have now been transferred to the shoulders of the Government.

The enforcement of the monopoly has metamorphosed the quality of Formosa camphor, for the refiners, who are under strict order to sell their half-refined camphor to the Government alone, get a higher price, as their quality is superior.

3. MONOPOLY AGENT.—The half-refined goods thus procured by the authorities are mainly sold to a monopoly agent, at present a British firm, which is obliged to observe various conditions incidental to this sole privilege, besides depositing with the Government a security amounting to 1,900,000 *yen*.

4. MODE OF REFINING.—The refining process that was formerly prevailing in the island was quite primitive. Soon after the annexation of the island, the Japanese process was introduced and has at last entirely superseded the native method. To give one significant illustration of the superiority of the new process over the native one, it may be observed that the native refiners were first enabled by that mode of refining to obtain camphor oil. This important by-product formerly went with the waste.

5. SUPPLY OF RAW MATERIAL.—Camphor-trees being found in the primeval forests which have not yet been accurately explored, it is impossible to estimate the supply of raw material that exists in the island. It may, however, be stated that the supply of camphor-trees

can last 40 or 50 years according to the present rate of conversion. The supply may also be expected to be permanent as the authorities have been planting millions of young camphor plants in suitable places.

V. MINING.

1. GENERAL REMARKS.—The mineral resources of Formosa at present consist of gold, coal, sulphur and petroleum with a greater or smaller quantity of building stones.

2. GOLD.—Gold exists both in the shape of veins or rather lode and of alluvial deposits.

The lodes occur in Tertiary formation. At present seven gold mines are worked, but of these the mines at Kinkwaseki, Kyufun and Botan are the most important. The mining in those mines is carried on partly in Western style and partly in the old simple style.

Alluvial deposits occur in the vicinity of all those mines and are especially rich along the course of the river Kelung. They are exclusively worked by natives who attend to their business in a rude simple style. However the output of placer digging sometimes surpasses that of regular mines, as may be seen from the following returns.

Year.	Output of Gold Mine. (<i>momme</i>).	Output of Placer-digging. (<i>momme</i>).	Total. (<i>momme</i>).
1899	32,610.00	7,148.63	39,758.63
1900	92,451.38	9,473.40	101,924.78
1901	15,422.54	127,785.14	283,207.68

3. COAL.—Coal occur in Tertiary formation, and is found throughout the island, though richer towards the north and poorer towards the south.

In general there are nine seams, each separated from the other by a deep layer of sand-stones and shales. The seam is in most cases comparatively thin, generally 2 to 4 feet.

The mining is at present left to native workers who extract the mineral on the old laborious style.

Data about coal-mining are as follows:—

	1899.	1900.	1901.
Number of Concession	39	41	42
Total Area of Concession (<i>tsubo</i>) ...	3,266,320	3,970,563	3,934,742
Output (<i>ton</i>)... ..	29,811	41,944	62,703

4. SULPHUR.—Sulphur deposits occur, to mention only those that are important, in the neighborhood of Mt. Daiton, situated due north of Taihoku, and on Kizan island in the jurisdiction of Gilan. Data are as follows:—

	1899.	1900.	1901.
Number of Concession	7	4	5
Total Area of Concession (<i>tsubo</i>) ...	332,795	249,705	294,205
Output (<i>kin</i>)	958,100	1,231,168	2,732,860

5. PETROLEUM.—Indications of the presence of petroleum veins are discovered along the elevated districts bordering on the central mountain ranges and the plains contiguous to them, but as yet petroleum is a potential source of wealth and is still left practically unexploited.

VI. TRADE.

1. GENERAL REMARKS.—On account of the lack of regular shipping facilities between the island and the opposite coast of China, imperfect communication in the interior, absence of ordinary banking organs and of a reliable and accurate system of weights and measures, trade in Formosa was in a backward state, and it was only after it came under Japanese rule that the change for the better has markedly began to manifest itself, for the new Government, anxious to push this important factor of national prosperity to a level of the mother country, has energetically endeavored to remove all those causes standing in the way of its development.

2. TRADE WITH JAPAN PROPER.—Trade with the mother country may be said to date from 1897, by which time order had been to a large extent restored in the island. The following returns give a survey of the progress of this particular branch of Formosan trade in recent years:—

EXPORT TO MOTHER COUNTRY.

(Value in *yen*).

Item.	1901.	1900.	1899.	1898.	1897.

3. FOREIGN TRADE.—China declared in 1858 to open ports in Formosa to foreign trade, and in 1863 the four ports of Takao, Anpei, Tamsui and Kelung were opened. The following table reviews the progress of trade in those ports, that is practically in the whole of the island, since their opening to trade in 1863. The figures, however, include the volume of trade with the mother country which was at first represented by China and lately by Japan.

FOREIGN TRADE UNDER CHINESE RULE.

Year.	Tamsui and Kelung (tael).	Takao and Anpei (tael).	Total.
1863	247,366	347,867	595,233
1864	659,881	927,405	1,587,286
1865	710,628	1,893,455	2,604,083
1866	862	1,862,313	2,724,567
1867	782,339	1,832,648	2,614,987
1868	822,846	1,296,679	2,119,525
1869	759,657	1,537,796	2,797,455
1870	985,766	2,144,899	3,130,665
1871	1,239,820	2,277,961	3,517,781
1872	1,493,944	2,159,280	3,653,224
1873	1,445,910	1,829,898	3,275,808

VII. FINANCE.

1. REVENUE.—The principal sources of revenue do not differ much as to kind from those that were prevailing before the island was converted into a territory of Japan. Nor do the rates of the various kind of taxes differ much from what they were in olden days. At present the principal items of ordinary revenue are taxes on land, tea, mining, excise on sugar, percentage fee on the transfer and mortgage of real estate, export dues, customs tariff, tonnage dues, receipts from Government undertakings and a few others.

The relative importance of those sources of revenue is shown in the following table:—

REVENUE (From 1896 to 1902 Fiscal Year).

I. ORDINARY REVENUE.

Note :—Figures for 1902 represent estimate, those for all others being settled account.

2. EXPENDITURE. — It is unavoidable that the expenditure should advance in such a newly acquired territory as Formosa, where the Government is confronted with the necessity of undertaking many new things involving big disbursements and also of undoing other things which the previous mal-administration of the Chinese Government had inflicted on the island. Some idea about this point may be gathered from the following table:—

EXPENDITURE (From 1896 to 1902 year).

I. ORDINARY EXPENDITURE.

A glance at the two foregoing tables will show that Formosa can not yet claim to be financially independent, and that it is obliged to seek help from the mother country. However the prospect of the island finance is quite bright, as judged from what it has experienced so far. The subsidy from the mother country shows a gradual falling-off, from over 6,900,000 *yen* in 1896 to only 2,300,000 *yen* approximately in 1902, for the supplementary fund procured by means of loans to meet the demand of useful public undertakings should properly be left out of account in this calculation. Comparison made between ordinary revenue and ordinary expenditure must be considered as decidedly satisfactory, for while in the year 1899 the two were practically balanced, in the following two years the revenue exceeded the other account. The account for 1902, being an estimate, can not give a definite illustration, though the expenditure is estimated to exceed the revenue by about half a million *yen*. It may confidently be expected therefore that, when all such undertakings, as construction of railroad, adjustment of land and many other useful enterprises which at present constitute principal outlays are completed, Formosan finance is sure to show a bright record.

3. **BANKING ORGANS AND CURRENCY SYSTEM.**—Properly speaking, both banking organs and a currency system were lacking in Formosa before it was brought under the Japanese sway. In fact no particular necessity was felt about them, in that the **Banking** trade, besides being practically controlled by Chinese **Organs.** merchants residing on the opposite coast of China, and by a small number of resident foreigners, was insignificant, for Formosa had only a few products to sell and could buy only a little of foreign goods.

The establishment of a number of branch offices by the Thirty-fourth Bank of Osaka soon after the advent of the new régime and the establishment of the Formosan Bank, the central banking organ in the island, in 1899 have ushered in a new order of things that were adopted for the requirements of the time. Data of this central bank were mentioned under the section of Finance.

Whatever currency Formosa possessed consisted in copper and silver coins minted by other countries. These, moreover, were not circulated according to their denomination, they were **Currency.** used by weight. Practically therefore they were nothing less than bullion, and Formosa was a silver bullion mono-metallic country, if it is possible to use such a term. The 1-*yen* silver coins which Japan introduced into Formosa found there a ready welcome, and those coins were not mutilated as old foreign silver and as they were finer they were preferred by the natives in preference to all others.

The established custom in the island being in favor of silver currency, the authorities decided, when they adopted in 1897 gold mono-metallism in Japan proper, to regard a Formosan currency system as an exception, and to leave this new dominion as a sort of silver country. It was decided at the same time that the official quotation of the gold price of silver should be determined and proclaimed from time to time, and that the silver quotations prevailing at Hongkong and Shanghai should be adopted for determining this standard price for Formosa, so that the intimate tradal relation existing between the island and China should be promoted as much as possible.

The first official quotation was fixed at 1037 pieces of stamped silver *yen* against 1,000 *yen* of gold, or 1 *yen* piece against 0.964

yen of silver. The Formosan coins bore a stamped mark because they were the pieces that had been withdrawn from circulation in Japan proper in consequence of the adoption of the gold standard and because the authorities had to provide against the trouble and risk of exchanging the withdrawn coins with gold.

The determination of the official quotation on the silver price prevailing in China was soon judged to be subject to inconvenience, for very often that price was not uniform with the quotation in the world's silver market. At present, therefore, the official quotation is based on the price ruling on that market.

The silver currency, both stamped pieces and subsidiary coins, that was put for circulation in Formosa from September 1900 to May 1902 reached a rather large volume. At the same time other coins and the Formosan Bank note were in circulation, so that the total reached the following amount:—

	<i>yen.</i>
Stamped <i>yen</i> Pieces	23,657,428
Subsidiary Coins	1,345,799
Foreign Coins	3,228,856
Nickel and Copper Pieces	223,000
Formosan Bank Notes	3,353,631
	<hr/>
Total	31,808,714

The foregoing volume seems to be too excessive for Formosa, where trade is still primitive and industry is but poorly developed. But it must be remembered that the natives can not yet divest themselves of their simple custom of secretly hoarding silver. Consequently the amount thus withdrawn from circulation must be quite large. It is hardly necessary to add that the custom of the natives towards currency being so primitive they do not themselves care at all about monetary system.

VIII. COMMUNICATIONS.

In this chapter will be briefly described the conspicuous features in the communication affairs of Formosa, that is to say, railroad and highways.

1. RAILROAD.—Formosa possessed even before its annexation by Japan about 62 miles of railroad laid between Kelung and Shimehiku via Taihoku. This line was built during the Governorship of Liu mentioned in the preceding part of this section. The railroad was, however, poor in construction and defective in working. Gradient erred on the side of excess while curve erred on that of the opposite nature. Traffic management was so defective that even fares and freights were almost daily subject to changes, not to say nothing about irregularity of time-table. In justice to the energetic administration, comparatively speaking of Liu, it ought to be added, however, that this line proved immensely beneficial to our troops of subjugation sent at first to restore order in the island, for Formosa was notorious, as is also the case even to-day, for the absence of regular highways.

With the restoration of peace, a number of capitalists in Japan proper promoted the Formosan Railway Company with the idea of laying railroads in the island by obtaining some help from the Formosan Government. This undertaking flashed Private Railroad Enterprise in the plan and the company was wound a few months after its creation, for further investigations had convinced the promoters that even with the help which the Government promised to accord them, it would be hardly possible to derive any satisfactory profit from this business.

With this disappearance of private enterprise, the Government decided to undertake the scheme on its own account. In 1900 the Formosan Undertaking Loan Law, mainly compiled with the object of laying railroads, was approved by the Diet and promulgated, and the programme of laying Government Railroad Programme a trunk line through Formosa and of improving the existing line was elaborated. This programme

contemplated an outlay of 28,800,000 *yen* spread over ten years to end with the 1909 fiscal year.

The improvement of the existing line first demanded the attention of the authorities. The work was started in the 1899 fiscal year. The whole line was thoroughly reconstructed, and as even the old track was abandoned in greater part the Kelung-Shinchiku line existing at present is a complete metamorphosis of the old line, both in engineering work and traffic management.

At the same time the work of laying a new line, about 170 miles from Shinchiku to Takao, was commenced from both termini.

Of that length the Takao-Kagi section, extending 65 miles 60 chains, was completed in April, 1903 and opened to traffic, while in the northern half the Shinchiku-Sanshaka section of 32 miles 12 chains was opened to traffic in October of the same year.

Besides the trunk line, a deflection to Tansui, 13 miles 12 chains, was built in August of 1902 and the shipping facilities of that harbor were considerably improved.

Considering the condition of things in Formosa, the railroad business can hardly be called a paying investment. Nevertheless traffic receipts and disbursements have begun to present a satisfactory aspect. Thus in the 1902 fiscal year receipts were

estimated to almost cover ordinary disbursements, the former put at 722,535 *yen* and the latter at 724,021 *yen*.

The disbursement account shows an excess of only 38,000 *yen* approximately compared with that of the preceding year, but the excess of the other account amounts to as much as 240,380 *yen*.

2. LIGHT RAILROAD.—There are two kinds of light railroad in Formosa, one constructed for military purposes and the other for ordinary purposes. The former was the first thing which our subjugation army had to attend to on their arrival in the island, as this was absolutely necessary for their operation. The line was laid in a hurry between Shinchiku, the southern terminus of the then existing Formosan railroad, and Hozan, the two extremities being separated by 185 miles. With such creditable celerity was the work conduct-

ed that it was completed in a few months and for the first time in its history the northern and the southern halves of the island obtained a complete line of overland communications, though it was necessarily imperfect. With the construction of a regular track, the light railroad that connected the same places was removed, and at present the light tracks originally laid for military purposes altogether measure 125 miles, trunk line and deflections added together.

The light railroad constructed for ordinary use is yet an insignificant affair, comparatively speaking, for at present the working line that between Koshun and Taihanroku, measures only 2½ miles.

The other lines contemplated are:—

	m.	ch.
Rokko—Shokwa	7.	34
Banshoryo—Nanshiko	19.	55
Hozan—Ako	10.	55
Gilan—Suwo	15.	00
		<hr/>
Total	52.	64

It ought to be added that the light railroads in Formosa are pushed by men.

3. HIGHWAYS.—It may properly be said that highways, as the word is used in ordinary places, do not exist in Formosa, for whatever road there is in the island is not better than animal tracks. This absence of the most common means of intercourse and communication may be accounted for from the fact that the islanders used to carry on intercourse more with the people on the opposite coast and less among themselves, while transportation of goods was made almost exclusively on men's backs. The presence of many unruly streams across the roads must have also deterred the construction of good highways. In order to improve this serious defect the Governor-General issued Regulations of Roads in 1900, and surveying has been completed for most of the contemplated routes. In many parts of Tainan and vicinity the work of road-making has been completed, or is about to be completed.

IX. EDUCATION, HYGIENE, RELIGION.**A. EDUCATION.**

1. GENERAL REMARKS.—Educational affairs in Formosa are divided into three departments according to as many classes of people residing in it, that is to say, (1) education for people from Japan proper, (2) education for the natives of Chinese origin, and (3) education for the aborigines.

2. FOR JAPANESE FROM JAPAN PROPER.—The provision for giving instruction to people from Japan proper consists of primary schools only where their children receive elementary instruction. Thirteen schools of this description exist in various parts of the island. According to the latest report, the teaching staff comprised 60 teachers and the pupils numbered about 2,000. The curriculum is identical with that prevailing in the mother country, so that the pupils taught in a Formosan school are easily enabled to follow the study even when they are transferred to a school there.

3. FOR THE NATIVES.—Educational arrangements for the natives are receiving the best attention of the authorities. The Medical School, Japanese Language School, Normal School, and Communal Schools all exist for the benefit of their children or their brothers and sisters.

The Medical School may be regarded as the only school of the kind existing in the Far East devoted to giving a regular course of modern science and practice of medicine to students of Chinese origin. Situated in Taihoku, its course covers five years, the instruction given in Japanese. At present over 130 students attend school and already three graduates have been sent out.

The National Language School was originally intended to serve a double purpose, one being to give training to ordinary Japanese in the native languages to qualify them to act as interpreters, translators and as officials, and the other object being to teach Japanese to the islanders. The department for the native has been considerably modified, and at present it comprises several departments, as technical course (railroad, telegraph, agriculture), secondary education course, and girls' course.

The Normal School exists to train native youths as teachers of

native primary schools. A number of graduates have already been turned out.

Communal Schools present the most flourishing aspect for they are institutions where the Formosan native boys receive elementary education. At present 130 schools and branch schools of this grade exist in various parts of the island. The teaching staff comprises 521 teachers and the attendance numbers 18,149. Besides there are about 1800 "family-schools" kept mostly in old style by native schoolmasters, and they possess as many as 32,000 attendants approximately.

4. FOR THE ABORIGINES.—The National Language Training School is the first institution established by the Government. Originally it was intended to teach only the sons and brothers of the islanders, but as more perfect educational organs for them have since been erected, at present this school is devoted to giving elementary instruction to the children of aborigines. The school list contains 723 such pupils. The institutions bearing the name of the National Language Training Schools number five main schools and about eleven branch schools, all situated in the aborigine's districts or at places adjoining them.

5. GIRL'S EDUCATION.—The only place where girls are exclusively taught is a girl's department established at Shiringai of the National Language School. There the girls are taught in subjects of elementary education and also in some handicraft work. A number of little girls also receive education at several communal schools, but in classes of their own, for the Formosan natives are strict against co-education, faithfully adhering to the antiquated Confucian maxim that men and women should not sit in the same room after they have grown above seven years old. The authorities are trying to disillusion the natives of this absurd notion.

The other educational institutions are missionary schools, both by foreigners and Japanese Buddhists; a museum and a library.

B. HYGIENE.**1. PUBLIC HYGIENE.**

1. **GENERAL REMARKS.**—Matters of public hygiene necessarily show a deplorable defect in Formosa; in fact any provision on this subject may be said to have been practically absent formerly.

2. **WATER-SUPPLY.**—The only thing worth mentioning in this respect is the boring of a number of artesian wells in Taihoku during the Governorship of Liu, by engaging for that purpose several well-diggers from Japan.

The well-boring was extensively carried out by the new rulers of the island and in Taihoku and neighborhood alone over 800 wells have been bored. The well-water obtained from them is not judged absolutely wholesome, though far superior and healthier than the contaminated river water and the water from the shallow native wells, both of which the native were accustomed to use formerly as drinking-water. This fruitful source of epidemics in Formosa has therefore been deprived of much of its virulence.

In Kelung and Tansui, where the supply of wholesome water was even more defective than in Taihoku, water-works have already been constructed. Well-borings have also been accomplished in several other places, while investigations are being conducted at Taihoku and other towns for constructing regular water-works.

3. **STREET IMPROVEMENTS AND SEWERAGE.**—The streets in all the cities of Formosa are now undergoing thorough re-construction, for besides being narrow and defective in the facilities of communication, they have obstructed considerably the drainage of refuse water. At the sametime the re-construction or more properly a new construction of sewer-ways is being carried on in several of those cities, for sewer-ways, in the ordinary acceptance of the term, have been absent in them.

This work of street improvement and sewerage construction is being carried on a large scale in Taichu (Mid-Formosa) than in other cities, for the Government, in anticipation of the important part which the place is destined to play in the island where it occupies the central position, has decided to undertake this work while it admits of easier and cheaper execution, for at present

Taichu is the least populous and flourishing of all the cities in the island. The programme of the work involves an outlay of about 1,200,000 *yen*, and, started in the 1899 fiscal year, about a fourth part of the contemplated work has been completed.

4. PROVISIONS AGAINST EPIDEMIC DISEASES.—The appearance in May, 1896, of pest in Anping occasioned the necessity of enforcing some preventive measures, and this was the first instance in the history of Formosa of the enforcement of such sanitary provision. The authorities had to experience considerable trouble at first, owing to the ignorance of the people. They regarded the Government measures at best with indifference and withheld from rendering any cooperative service, without which an official business of this kind can never be a success.

The Government subsequently modified the rules originally transplanted wholesale from Japan proper to satisfy the urgent need of the occasion, and made them more amenable to the obtuse notions of the natives. They have acquired some knowledge of the importance of the preventive measures and in some places lockup hospitals have been established with the contributions of the people, while in a larger number of places the inhabitants have organized themselves into sanitary corporations.

Though in a highly imperfect way owing to lack of proper provision Quarantine regulations were also enforced in Kelung, Tansui, Anping, Takao and Rokko in September, 1896, when cases of pest were reported from several places on the opposite coast of China. By the beginning of the 1899 fiscal year a *bona fide* arrangement had been completed at Kelung, and rules specially applicable to Formosa were enforced. The central quarantine office exists at Kelung and a branch at Tansui and other ports.

2. MEDICAL AFFAIRS.

1. HOSPITALS.—At present the authorities maintain a Government hospital at Taihoku, Kelung, Shinchiku, Taichu, Kāgi, Tainan, Hozan, Gilan, Taito, and Hokō (Pescadores), with a number of branch hospitals established at less important places.

2. MEDICAL PRACTITIONERS.—There are several kinds of medical practitioners doing business in the island. First there are doctors

who in return for some official protection, are made to take charge of matters of sanitary administration as assistants and advisers of regular officials. At first such doctors numbered 150, for at that time the presence of regular practitioners possessing knowledge of modern medicine was small in the island. As these doctors have subsequently increased in number, the necessity of maintaining so many official doctors was no longer felt and at present they number 76.

Licensed practitioners from Japan proper number 43.

Lastly there are native practitioners who are permitted to pursue the occupation in deference to their previous experience, for though these men are, devoid of knowledge of modern medicine, and are not qualified for the task, the natives from their custom are still disposed to seek their help. These quasi-practitioners number 1,938.

3. OPIUM.

1. OPIUM ADMINISTRATION.—The question of opium-smoking was one of the gravest affairs which demanded the foremost attention of the Governor General's Office as soon as it was installed in the island. In other words, it had to adopt either one of these alternatives; namely, should the Government prohibit, as in Japan proper, this deleterious practice in the island? or should the Government adopt a policy of toleration in deference to the long-established custom among the natives, vicious as that custom is?

At last the policy of moderation prevailed, and the Government decided to adopt the scheme of gradual suppression and to effect by that means the eradication of the evil from this new dominion.

2. MODUS OPERANDI.—In pursuance of that policy, the authorities drew up a regular programme of opium administration, combining the two functions both of permission and discouragement. In other words, that programme issued special permission only to confirmed smokers. This permission had to be given under strict control, so that it may act in perfect unison with the main aim of gradual suppression. To effect this object, a list of licensed smokers had to be compiled, the Government had to control the supply of opium in its hands, and the sale of this drug had to be restricted to licensed agents, while the Police to enforce strict vigilance to prevent all practices infringing the rules of opium-smoking. At the

same time medical practitioners and others were enjoined to inculcate, whenever they had opportunities, the evil of smoking among the people at large, and school-teachers were also bidden to explain in the schoolrooms to their pupils the injurious effect of this habit.

3. LICENSED SMOKERS.—The first list drawn up toward the end of 1897 as to the number of regular smokers contained only 51,581. This was considerably below the mark, for the authorities, judging from various data, had estimated the number of smokers at about 180,000. It was evident that a greater part of smokers did not report themselves at all from the desire of evading the fee of the smoking license which was fixed at the rate of from 20 *sen* to 3 *yen* a month. The grades of the license were therefore abolished and in place of monthly payment the fee was reduced to only 30 *sen* irrespective of grades and at one time only. At the same time the Police were made to exercise strict vigilance to prevent concealment. In September, 1900, the list compiled in that way was completed and it contained 169,064 smokers. This was judged fairly accurate nearly coinciding with the estimate number of 180,000, for no small number of smokers must have either died or given up the practice since that estimate was compiled more than three years ago.

Since that time the number of licensed smokers has gone on declining, either through death or discontinuance, and at the end of March, 1902, it stood at 152,044. It is hardly necessary to add that those smokers are only natives of the island, for people of Japan proper and also foreigners are strictly forbidden from indulging in this vile and injurious practice. The authorities are confident that judging from past experiences they may be enabled to eradicate the baneful custom from this island in about thirty or forty years.

4. OPIUM AGENTS.—The privilege of selling opium is granted only to natives of established standing. At the end of March, 1902, these agents numbered 1,254 throughout the island.

C. RELIGIONS.

The religions in vogue in the island are Buddhism and Christianity, for that kind of ancestor-worship that previously existed and still exists in the island can hardly deserve the title of religion.

1. **BUDDHISM.**—This is by far the most flourishing religion, and possesses over 90 preaching places and about 30,000 believers. The Buddhist propagandists are mostly from Japan proper.

2. **CHRISTIANITY.**—Christianity in the island may be classified into three national divisions for the sake of convenience; namely, Catholics who are relics of the old Spanish occupation, the English Protestant Church, and lastly the Christianity propagated by Japanese missionaries. Of the three, the English Protestantism conducted by Rev. William Campbell appears to be most active and prosperous. The churches of all sects and nationalities number about 90 and their believers about 10,000.

THE END.

WEIGHT AND MEASURES.

The	Kin=160 <i>momme</i>	=1.325 lb. <i>avoirdupois</i> .
